```

[CT.EMR.PR.3] Mengharuskan konfigurasi keamanan Amazon Elastic MapReduce (EMR) dikonfigurasi dengan enkripsi disk lokal volume EBS menggunakan kunci AWS KMS

Kontrol ini memeriksa apakah konfigurasi keamanan Amazon EMR dikonfigurasi dengan enkripsi disk lokal diaktifkan, menggunakan enkripsi volume EBS dan. AWS KMS

- Tujuan kontrol: Enkripsi data saat istirahat
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::EMR::SecurityConfiguration`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.EMR.PR.3

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.EMR.PR.3
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.EMR.PR.3 contoh template

Penjelasan

Untuk data saat istirahat, EMR menyediakan opsi untuk mengenkripsi penyimpanan disk lokal. Penyimpanan lokal terdiri dari volume penyimpanan instans EC2 dan penyimpanan Amazon Elastic Block Store (EBS) terlampir, yang disediakan bersama klaster Anda. Opsi enkripsi EBS mengenkripsi volume perangkat root EBS dan volume penyimpanan terlampirnya. Opsi enkripsi EBS hanya tersedia ketika Anda menentukan AWS Key Management Service sebagai penyedia kunci Anda. AWS Control Tower merekomendasikan penggunaan enkripsi EBS.

Pertimbangan penggunaan

- Jika Anda membuat klaster di Wilayah tempat enkripsi Amazon EC2 volume EBS diaktifkan secara default untuk akun Anda, volume EBS dienkripsi meskipun enkripsi disk lokal tidak diaktifkan.
- Dengan enkripsi disk lokal diaktifkan dalam konfigurasi keamanan, pengaturan EMR Amazon lebih diutamakan daripada pengaturan Amazon EC2 untuk instans EC2 cluster encryption-by-default .

Remediasi untuk kegagalan aturan

Dalam `EncryptionConfiguration` parameter, atur nilai `EnableAtRestEncryption` ke true, dan berikan `AtRestEncryptionConfiguration` konfigurasi, yang berisi `LocalDiskEncryptionConfiguration` konfigurasi yang disetel `EnableEbsEncryption` ke true.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Konfigurasi keamanan Amazon EMR - Contoh

Konfigurasi keamanan Amazon EMR yang dikonfigurasi dengan enkripsi EBS menggunakan. AWS KMS Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```

[CT.EMR.PR.4] Mengharuskan konfigurasi keamanan Amazon Elastic MapReduce (EMR) dikonfigurasi untuk mengenkripsi data dalam perjalanan

Kontrol ini memeriksa apakah konfigurasi keamanan EMR Amazon dikonfigurasi untuk memerlukan enkripsi dalam perjalanan.

- Tujuan kontrol: Enkripsi data dalam perjalanan
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::EMR::SecurityConfiguration`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.EMR.PR.4

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.EMR.PR.4
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.EMR.PR.4 contoh template

Penjelasan

Untuk data dalam perjalanan, konfigurasi keamanan EMR memberi Anda dua opsi. Anda dapat membuat sertifikat PEM, memasukkannya ke dalam file, dan mereferensikannya dari Amazon S3, atau Anda dapat menerapkan penyedia kustom sertifikat di Java dan menentukan jalur S3 ke JAR. Dalam kedua kasus tersebut, EMR mengunduh artefak ke setiap node di cluster secara otomatis, dan kemudian menggunakannya untuk mengimplementasikan fitur enkripsi open-source dan in-transit.

Untuk informasi selengkapnya tentang bagaimana sertifikat ini digunakan dengan teknologi big data yang berbeda, lihat dokumentasi Amazon EMR.

> **Pertimbangan penggunaan**
>
> - Beberapa mekanisme enkripsi dikaitkan dengan enkripsi dalam transit. Mekanisme ini adalah fitur sumber terbuka, khusus aplikasi, dan mungkin berbeda menurut rilis EMR Amazon. Untuk informasi selengkapnya, lihat Enkripsi dalam perjalanan di Panduan Manajemen EMR Amazon.

Remediasi untuk kegagalan aturan

Dalam `EncryptionConfiguration` parameter, atur `EnableInTransitEncryption` parameter ke true, dan berikan `InTransitEncryptionConfiguration` konfigurasi.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Konfigurasi keamanan Amazon EMR - Contoh

          EnableAtRestEncryption: false
```

AWS Glue kontrol

Topik

- [CT.GLUE.PR.1] Memerlukan AWS Glue pekerjaan untuk memiliki konfigurasi keamanan terkait

[CT.GLUE.PR.1] Memerlukan AWS Glue pekerjaan untuk memiliki konfigurasi keamanan terkait

Kontrol ini memeriksa apakah suatu AWS Glue pekerjaan memiliki konfigurasi keamanan terkait.

- Tujuan kontrol: Enkripsi data saat istirahat
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif

- Jenis sumber daya: `AWS::Glue::Job`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.GLUE.PR.1

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.GLUE.PR.1
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: Templat contoh CT.GLUE.PR.1

Penjelasan

Di AWS Glue, konfigurasi keamanan berisi properti yang diperlukan saat Anda menulis data terenkripsi. Konfigurasi keamanan untuk AWS Glue pekerjaan harus dikonfigurasi untuk menentukan cara data dienkripsi pada target Amazon S3. Enkripsi membantu melindungi data dari akses dan paparan yang tidak sah.

Remediasi untuk kegagalan aturan

Atur `SecurityConfiguration` parameter ke nama konfigurasi AWS Glue keamanan.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

AWS Glue pekerjaan - Contoh

AWS Glue Pekerjaan yang dikonfigurasi dengan konfigurasi keamanan terkait. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "GlueJob": {
        "Type": "AWS::Glue::Job",
        "Properties": {
            "Command": {
                "Name": "glueetl",
                "ScriptLocation": "s3://example-glue-script-bucket/scripts"
            },
            "Name": "sample-glue-job",
            "Role": {
```

```
                "Ref": "IAMRole"
            },
            "GlueVersion": "2.0",
            "SecurityConfiguration": {
                "Ref": "GlueSecurityConfig"
            }
        }
    }
}
```

Contoh YAMAL

```
GlueJob:
  Type: AWS::Glue::Job
  Properties:
    Command:
      Name: glueetl
      ScriptLocation: s3://example-glue-script-bucket/scripts
    Name: sample-glue-job
    Role: !Ref 'IAMRole'
    GlueVersion: '2.0'
    SecurityConfiguration: !Ref 'GlueSecurityConfig'
```

Spesifikasi aturan CT.GLUE.PR.1

```
# ####################################

GuardDuty Kontrol Amazon

Topik

- [CT.GUARDDUTY.PR.1] Memerlukan GuardDuty detektor Amazon agar perlindungan Amazon S3 diaktifkan

[CT.GUARDDUTY.PR.1] Memerlukan GuardDuty detektor Amazon agar perlindungan Amazon S3 diaktifkan

Kontrol ini memeriksa apakah perlindungan Amazon S3 diaktifkan pada detektor Amazon GuardDuty .

- Tujuan kontrol: Menetapkan pencatatan dan pemantauan
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::GuardDuty::Detector`
- AWS CloudFormation aturan penjaga: CT.GUARDDUTY.PR.1spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.GUARDDUTY.PR.1spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.GUARDDUTY.PR.1contoh template

Penjelasan

Amazon GuardDuty memantau ancaman terhadap sumber daya Amazon S3 Anda dengan menganalisis peristiwa AWS CloudTrail manajemen dan peristiwa data CloudTrail S3. Sumber data ini memantau berbagai jenis aktivitas. Misalnya, peristiwa CloudTrail manajemen untuk S3 mencakup operasi yang mencantumkan atau mengonfigurasi bucket S3, sepertiListBuckets,, dan. `DeleteBuckets` `PutBucketReplication` Contoh peristiwa data untuk S3 termasuk operasi API tingkat objek, seperti `GetObject`, `ListObjects`, `DeleteObject`, dan `PutObject`.

GuardDuty Pemantauan Amazon atas peristiwa AWS CloudTrail manajemen aktif secara default untuk semua akun yang telah diaktifkan GuardDuty, dan tidak dapat dikonfigurasi. Log peristiwa data Amazon S3 adalah sumber data yang dapat dikonfigurasi di. GuardDuty

AWS Control Tower merekomendasikan agar Anda mengaktifkan perlindungan Amazon S3. GuardDuty Jika fitur tidak diaktifkan, tidak GuardDuty dapat sepenuhnya memantau atau menghasilkan temuan untuk akses mencurigakan ke data yang disimpan di bucket Amazon S3 Anda.

Remediasi untuk kegagalan aturan

Atur `DataSources.S3Logs` menjadi BETUL.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

GuardDuty Detektor - Contoh

GuardDuty Detektor Amazon dengan perlindungan Amazon S3 diaktifkan. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "GuardDutyDetector": {
        "Type": "AWS::GuardDuty::Detector",
        "Properties": {
            "Enable": true,
            "DataSources": {
                "S3Logs": {
                    "Enable": true
                }
            }
        }
    }
}
```

Contoh YAMAL

```
GuardDutyDetector:
  Type: AWS::GuardDuty::Detector
```

```
  Properties:
    Enable: true
    DataSources:
      S3Logs:
        Enable: true
```

CT.GUARDDUTY.PR.1spesifikasi aturan

```

      DataSources:
        S3Logs:
          Enable: false
```

AWS Identity and Access Management Kontrol (IAM)

Topik

- [CT.IAM.PR.1] Mengharuskan kebijakan inline AWS Identity and Access Management (IAM) tidak memiliki pernyataan yang menyertakan “*” dalam elemen Aksi dan Sumber Daya
- [CT.IAM.PR.2] Mengharuskan kebijakan yang dikelola pelanggan AWS Identity and Access Management (IAM) tidak berisi pernyataan yang menyertakan “*” dalam elemen Tindakan dan Sumber Daya
- [CT.IAM.PR.3] Mengharuskan kebijakan yang dikelola pelanggan AWS Identity and Access Management (IAM) tidak memiliki tindakan layanan wildcard
- [CT.IAM.PR.4] Mengharuskan pengguna AWS Identity and Access Management(IAM) tidak memiliki kebijakan sebaris atau terkelola yang dilampirkan
- [CT.IAM.PR.5] Mengharuskan kebijakan sebaris AWS Identity and Access Management (IAM) tidak memiliki tindakan layanan wildcard

[CT.IAM.PR.1] Mengharuskan kebijakan inline AWS Identity and Access Management (IAM) tidak memiliki pernyataan yang menyertakan “*” dalam elemen Aksi dan Sumber Daya

Kontrol ini memeriksa bahwa kebijakan inline AWS Identity and Access Management (IAM) tidak menyertakan`Effect`: `Allow` with: `*` over `ActionResource`:. `*`

- Tujuan kontrol: Menegakkan hak istimewa paling sedikit
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya:`AWS::IAM::Policy`,`AWS::IAM::Role`,`AWS::IAM::User`, `AWS::IAM::Group`
- AWS CloudFormation aturan penjaga: CT.IAM.PR.1spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.IAM.PR.1spesifikasi aturan

- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.IAM.PR.1 contoh templat

Penjelasan

Kebijakan IAM mendefinisikan serangkaian hak istimewa yang diberikan kepada pengguna, grup, atau peran. Sejalan dengan saran keamanan standar industri, AWS sarankan agar kebijakan Anda memberikan hak istimewa paling sedikit, yang berarti hanya memberikan izin yang diperlukan untuk melakukan tugas. Bila Anda memberikan hak administratif penuh alih-alih set izin minimum yang diperlukan pengguna, Anda dapat mengekspos sumber daya ke tindakan yang tidak diinginkan.

Alih-alih mengizinkan hak administratif penuh, tentukan tindakan spesifik yang harus dilakukan pengguna Anda, lalu buat kebijakan yang memungkinkan pengguna hanya melakukan tugas-tugas tersebut. Lebih aman untuk memulai dengan set izin minimum dan memberikan izin tambahan bila diperlukan. Jangan mulai dengan izin lunak dan coba kencangkan nanti.

Hapus kebijakan IAM yang memiliki pernyataan dengan`Effect`: `Allow` yang mengizinkan`Action`: `*` over`Resource`:`*`.

> Pertimbangan penggunaan
>
> - Kontrol ini hanya berlaku untuk kebijakan inline IAM dengan pernyataan yang berisi `Effect` dari `Allow` dan yang berisi elemen `Action` dan. `Resource`

Remediasi untuk kegagalan aturan

Hapus pernyataan kebijakan sebaris IAM dengan`Effect`: `Allow` yang mengizinkan`Action`: `*` over`Resource`:. `*`

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Kebijakan IAM - Contoh Satu

Kebijakan inline IAM dikonfigurasi untuk memungkinkan pengambilan objek dari bucket Amazon S3. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "IAMPolicy": {
        "Type": "AWS::IAM::Policy",
        "Properties": {
            "PolicyName": "sample-inline-policy",
            "Roles": [
                {
                    "Ref": "IAMRole"
                }
            ],
            "PolicyDocument": {
                "Version": "2012-10-17",
                "Statement": [
                    {
                        "Effect": "Allow",
                        "Action": [
                            "s3:GetObject"
                        ],
                        "Resource": [
                            "arn:aws:s3:::samplebucket/*"
                        ]
                    }
                ]
            }
        }
    }
}
```

Contoh YAMAL

```
IAMPolicy:
  Type: AWS::IAM::Policy
  Properties:
    PolicyName: sample-inline-policy
    Roles:
      - !Ref 'IAMRole'
    PolicyDocument:
      Version: '2012-10-17'
      Statement:
        - Effect: Allow
```

```
          Action:
            - s3:GetObject
          Resource:
            - arn:aws:s3:::samplebucket/*
```

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Peran IAM - Contoh Dua

Peran IAM dikonfigurasi dengan kebijakan sebaris yang memungkinkan pengambilan objek dari bucket Amazon S3. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "IAMRole": {
        "Type": "AWS::IAM::Role",
        "Properties": {
            "AssumeRolePolicyDocument": {
                "Version": "2012-10-17",
                "Statement": [
                    {
                        "Effect": "Allow",
                        "Principal": {
                            "AWS": {
                                "Ref": "AWS::AccountId"
                            }
                        },
                        "Action": [
                            "sts:AssumeRole"
                        ]
                    }
                ]
            },
            "Policies": [
                {
                    "PolicyName": "sample-inline-policy",
                    "PolicyDocument": {
                        "Version": "2012-10-17",
                        "Statement": [
                            {
```

```
                                "Effect": "Allow",
                                "Action": [
                                    "s3:GetObject"
                                ],
                                "Resource": [
                                    "arn:aws:s3:::samplebucket/*"
                                ]
                            }
                        ]
                    }
                }
            ]
        }
    }
}
```

Contoh YAMAL

```
IAMRole:
  Type: AWS::IAM::Role
  Properties:
    AssumeRolePolicyDocument:
      Version: '2012-10-17'
      Statement:
        - Effect: Allow
          Principal:
            AWS: !Ref 'AWS::AccountId'
          Action:
            - sts:AssumeRole
    Policies:
      - PolicyName: sample-inline-policy
        PolicyDocument:
          Version: '2012-10-17'
          Statement:
            - Effect: Allow
              Action:
                - s3:GetObject
              Resource:
                - arn:aws:s3:::samplebucket/*
```

CT.IAM.PR.1spesifikasi aturan

```
# ####################################
##       Rule Specification        ##
####################################
#
# Rule Name:
#   iam_inline_policy_no_statements_with_admin_access_check
#
# Description:
#   This control checks that AWS Identity and Access Management (IAM) inline policies
 do not include "Effect": "Allow" with "Action": "*" over "Resource": "*".
#
# Reports on:
#   AWS::IAM::Policy, AWS::IAM::Role, AWS::IAM::User, AWS::IAM::Group
#
# Evaluates:
# AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document does not contain any IAM policy, IAM role, IAM user or
 IAM group resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an IAM policy resource
#       And: The policy has no statements with 'Effect' set to 'Allow'
#      Then: SKIP
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an IAM policy resource
#       And: The policy has a statement with 'Effect' set to 'Allow'
#       And: The policy does not have both Action and resource statements
#      Then: SKIP
#   Scenario: 4
```

```
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an IAM role, IAM user or IAM group resources
#       And: 'Policies' is not provided or is an empty list
#      Then: SKIP
#   Scenario: 5
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an IAM role, IAM user or IAM group resources
#       And: 'Policies' is provided as a non-empty list
#       And: All IAM policy documents in 'Policies' have no statements with 'Effect'
 set to 'Allow'
#      Then: SKIP
#   Scenario: 6
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an IAM policy resource
#       And: The policy has a statement with 'Effect' set to 'Allow'
#       And: The policy statement has one or more Action statements and one or more
 Resource statements
#       And: At least one Action statement allows all actions (Action value of '*')
#       And: At least one Resource statement is a wildcard representing all resources
 (Resource value of '*')
#      Then: FAIL
#   Scenario: 7
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an IAM role, IAM user or IAM group resources
#       And: 'Policies' is provided as a non-empty list
#       And: IAM policy document in 'Policies' has a statement with 'Effect' set to
 'Allow'
#       And: The policy has one or more 'Action' statements
#       And: At least one Action statement allows all actions (Action value of '*')
#       And: At least one Resource statement is a wildcard representing all resources
 (Resource value of '*')
#      Then: FAIL
#   Scenario: 8
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an IAM policy resource
#       And: The policy has a statement with 'Effect' set to 'Allow'
#       And: The policy has one or more Action statements and one or more Resource
 statements
#       And: No Action statements allow administrator access (Action value of '*')
```

```
#       And: No Resources are wildcards representing all resources (Resource value of
 '*')
#      Then: PASS
#   Scenario: 9
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an IAM role, IAM user or IAM group resources
#       And: 'Policies' is provided as a non-empty list
#       And: IAM policy document in 'Policies' has a statement with 'Effect' set to
 'Allow'
#       And: The policy has one or more 'Action' statements
#       And: No Action statements allow administrator access (Action value of '*')
#       And: No Resources are wildcards representing all resources (Resource value of
 '*')
#      Then: PASS

CT.IAM.PR.1 contoh templat

Anda dapat melihat contoh artefak pengujian PASS dan FAIL untuk kontrol proaktif AWS Control Tower.

Contoh PASS - Gunakan template ini untuk memverifikasi pembuatan sumber daya yang sesuai.

```
Resources:
  IAMRole:
    Type: AWS::IAM::Role
    Properties:
      AssumeRolePolicyDocument:
        Version: '2012-10-17'
        Statement:
        - Effect: Allow
          Principal:
            AWS:
              Ref: AWS::AccountId
          Action:
          - sts:AssumeRole
```

```
  IAMPolicy:
    Type: AWS::IAM::Policy
    Properties:
      PolicyName:
        Fn::Sub: ${AWS::StackName}-inline-policy
      Roles:
      - Ref: IAMRole
      PolicyDocument:
        Version: '2012-10-17'
        Statement:
        - Effect: Allow
          Action:
          - s3:GetObject
          Resource:
          - arn:aws:s3:::examplebucket/*
```

Contoh GAGAL - Gunakan templat ini untuk memverifikasi bahwa kontrol mencegah pembuatan sumber daya yang tidak sesuai.

```
Resources:
  IAMRole:
    Type: AWS::IAM::Role
    Properties:
      AssumeRolePolicyDocument:
        Version: '2012-10-17'
        Statement:
        - Effect: Allow
          Principal:
            AWS:
              Ref: AWS::AccountId
          Action:
          - sts:AssumeRole
  IAMPolicy:
    Type: AWS::IAM::Policy
    Properties:
      PolicyName:
        Fn::Sub: ${AWS::StackName}-inline-policy
      Roles:
      - Ref: IAMRole
      PolicyDocument:
```

```
        Version: '2012-10-17'
        Statement:
        - Effect: Allow
          Action: '*'
          Resource: '*'
```

[CT.IAM.PR.2] Mengharuskan kebijakan yang dikelola pelanggan AWS Identity and Access Management (IAM) tidak berisi pernyataan yang menyertakan “*” dalam elemen Tindakan dan Sumber Daya

Kontrol ini memeriksa apakah kebijakan yang dikelola pelanggan AWS Identity and Access Management (IAM) tidak termasuk`Effect`: `Allow` with`Action`: `*` over`Resource`:`*`.

- Tujuan kontrol: Menegakkan hak istimewa paling sedikit
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::IAM::ManagedPolicy`
- AWS CloudFormation aturan penjaga: CT.IAM.PR.2spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.IAM.PR.2spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.IAM.PR.2contoh template

Penjelasan

Kebijakan IAM mendefinisikan serangkaian hak istimewa yang diberikan kepada pengguna, grup, atau peran. Sejalan dengan saran keamanan standar industri, AWS sarankan agar kebijakan Anda memberikan hak istimewa paling sedikit, yang berarti hanya memberikan izin yang diperlukan untuk melakukan tugas. Saat Anda memberikan hak istimewa penuh alih-alih set izin minimum yang diperlukan pengguna, Anda dapat mengekspos sumber daya ke tindakan yang tidak diinginkan.

Alih-alih mengizinkan hak istimewa penuh, tentukan tindakan spesifik yang harus dilakukan pengguna Anda, lalu buat kebijakan yang memungkinkan pengguna hanya melakukan tugas-tugas

tersebut. Lebih aman untuk memulai dengan set izin minimum dan memberikan izin tambahan bila diperlukan. Jangan mulai dengan izin lunak dan coba kencangkan nanti.

Hapus kebijakan IAM yang memiliki pernyataan dengan`Effect`: `Allow` yang mengizinkan`Action`: * over`Resource`:*.

> Pertimbangan penggunaan
>
> - Kontrol ini hanya memeriksa kebijakan yang dikelola pelanggan IAM. Itu tidak memeriksa kebijakan inline dan AWS-managed.
> - Kontrol ini hanya berlaku untuk kebijakan inline IAM dengan pernyataan yang berisi `Effect` dari `Allow` dan yang berisi elemen `Action` dan. `Resource`

Remediasi untuk kegagalan aturan

Hapus pernyataan kebijakan sebaris IAM dengan`Effect`: `Allow` yang mengizinkan`Action`: * over`Resource`:. *

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Kebijakan Terkelola IAM - Contoh

Kebijakan terkelola IAM dikonfigurasi untuk memungkinkan pengambilan objek dari bucket Amazon S3. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "IAMManagedPolicy": {
        "Type": "AWS::IAM::ManagedPolicy",
        "Properties": {
            "Roles": [
                {
                    "Ref": "IAMRole"
                }
            ],
            "PolicyDocument": {
                "Version": "2012-10-17",
                "Statement": [
                    {
```

```
                        "Effect": "Allow",
                        "Action": [
                            "s3:GetObject"
                        ],
                        "Resource": [
                            "arn:aws:s3:::samplebucket/*"
                        ]
                    }
                ]
            }
        }
    }
}
```

Contoh YAMAL

```
IAMManagedPolicy:
  Type: AWS::IAM::ManagedPolicy
  Properties:
    Roles:
      - !Ref 'IAMRole'
    PolicyDocument:
      Version: '2012-10-17'
      Statement:
        - Effect: Allow
          Action:
            - s3:GetObject
          Resource:
            - arn:aws:s3:::samplebucket/*
```

CT.IAM.PR.2spesifikasi aturan

```

          Action: '*'
          Resource: '*'
```

[CT.IAM.PR.3] Mengharuskan kebijakan yang dikelola pelanggan AWS Identity and Access Management (IAM) tidak memiliki tindakan layanan wildcard

Kontrol ini memeriksa bahwa AWS Identity and Access Management (IAM) kebijakan yang dikelola pelanggan tidak berisi pernyataan`Effect`: `Allow` with`Action`: `Service:*` (misalnya, s3: *) untuk AWS layanan individual, dan bahwa kebijakan tersebut tidak menggunakan kombinasi dengan a. `NotAction` `Effect` `Allow`

- Tujuan kontrol: Menegakkan hak istimewa paling sedikit
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::IAM::ManagedPolicy`
- AWS CloudFormation aturan penjaga: CT.IAM.PR.3spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.IAM.PR.3spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.IAM.PR.3contoh template

Penjelasan

Saat Anda menetapkan izin Layanan AWS, penting untuk mencakup tindakan IAM yang diizinkan dalam kebijakan IAM Anda. Kami menyarankan Anda memberikan izin hak istimewa paling sedikit dengan membatasi kebijakan IAM hanya untuk tindakan yang diperlukan. Kebijakan yang terlalu permisif dapat menyebabkan eskalasi hak istimewa, jika kebijakan tersebut dilampirkan pada prinsipal IAM yang mungkin tidak memerlukan izin.

> Pertimbangan penggunaan
>
> - Kontrol ini hanya memeriksa kebijakan yang dikelola pelanggan IAM. Itu tidak memeriksa kebijakan inline dan AWS-managed.
> - Kontrol ini hanya berlaku untuk kebijakan yang dikelola pelanggan IAM dengan pernyataan yang berisi `Effect` dari `Allow` dengan elemen `Action` atau `NotAction` yang ada.

Remediasi untuk kegagalan aturan

Hapus pernyataan dari kebijakan yang dikelola pelanggan IAM dengan`Effect`: `Allow` and: `service:*` atau `ActionEffect`: and. `Allow` `NotAction`

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Kebijakan Terkelola IAM - Contoh

Kebijakan terkelola IAM dikonfigurasi untuk mengizinkan tindakan Amazon `ListBucket` S3. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "IAMManagedPolicy": {
        "Type": "AWS::IAM::ManagedPolicy",
```

```
        "Properties": {
            "Roles": [
                {
                    "Ref": "IAMRole"
                }
            ],
            "PolicyDocument": {
                "Version": "2012-10-17",
                "Statement": [
                    {
                        "Effect": "Allow",
                        "Action": [
                            "s3:ListBucket"
                        ],
                        "Resource": [
                            "*"
                        ]
                    }
                ]
            }
        }
    }
}
```

Contoh YAMAL

```
IAMManagedPolicy:
  Type: AWS::IAM::ManagedPolicy
  Properties:
    Roles:
      - !Ref 'IAMRole'
    PolicyDocument:
      Version: '2012-10-17'
      Statement:
        - Effect: Allow
          Action:
            - s3:ListBucket
          Resource:
            - '*'
```

CT.IAM.PR.3spesifikasi aturan

```
# ####################################
##       Rule Specification        ##
####################################
#
# Rule Name:
#   iam_managed_policy_no_statements_with_full_access_check
#
# Description:
#   This control checks that AWS Identity and Access Management (IAM) customer-
managed policies do not contain statements of "Effect": "Allow" with "Action":
 "Service:*" (for example, s3:*) for individual Layanan AWS, and that the policies do
 not use the combination of "NotAction" with an "Effect" of "Allow".
#
# Reports on:
#   AWS::IAM::ManagedPolicy
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document does not contain any IAM Managed Policy resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an IAM Managed Policy resource
#       And: The policy has no statements with 'Effect' set to 'Allow'
#      Then: SKIP
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an IAM Managed Policy resource
#       And: The policy has a statement with 'Effect' set to 'Allow'
#       And: The policy has one or more 'Action' statements
#       And: At least one 'Action' statement allows full access to a service ('Action'
 has a value 'service:*')
#      Then: FAIL
#   Scenario: 4
```

```
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an IAM Managed Policy resource
#       And: The policy has a statement with 'Effect' set to 'Allow'
#       And: The policy has one or more 'NotAction' statements
#      Then: FAIL
#   Scenario: 5
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an IAM Managed Policy resource
#       And: The policy has a statement with 'Effect' set to 'Allow'
#       And: The policy has one or more 'Action' statements
#       And: No 'Action' statements allow full access to a service ('Action' does not
 have a value 'service:*')
#      Then: PASS

          Resource: '*'
```

[CT.IAM.PR.4] Mengharuskan pengguna AWS Identity and Access Management(IAM) tidak memiliki kebijakan sebaris atau terkelola yang dilampirkan

Kontrol ini memeriksa apakah pengguna AWS Identity and Access Management (IAM) Anda memiliki kebijakan inline atau terkelola (AWS dan pelanggan) yang dilampirkan secara langsung. Sebagai gantinya, pengguna IAM harus mewarisi izin dari grup atau peran IAM.

- Tujuan kontrol: Menegakkan hak istimewa paling sedikit
- Implementasi: Aturan AWS CloudFormation Penjaga

- Kontrol perilaku: Proaktif
- Jenis sumber daya:`AWS::IAM::User`,`AWS::IAM::Policy`, `AWS::IAM::ManagedPolicy`
- AWS CloudFormation aturan penjaga: CT.IAM.PR.4spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.IAM.PR.4spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.IAM.PR.4contoh template

Penjelasan

Secara default, pengguna IAM, grup, dan peran tidak memiliki akses ke AWS sumber daya. Kebijakan IAM memberikan hak istimewa kepada pengguna, grup, atau peran. Kami menyarankan Anda menerapkan kebijakan IAM secara langsung ke grup dan peran, tetapi tidak untuk pengguna. Seiring bertambahnya jumlah pengguna, menetapkan hak istimewa di grup atau tingkat peran mengurangi kompleksitas manajemen akses. Mengurangi kompleksitas manajemen akses pada gilirannya dapat mengurangi kesempatan bagi kepala sekolah untuk menerima atau mempertahankan hak istimewa yang berlebihan secara tidak sengaja.

Remediasi untuk kegagalan aturan

Konfigurasikan pengguna IAM untuk mewarisi izin dari grup IAM.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Pengguna IAM - Contoh

Pengguna IAM dikonfigurasi tanpa kebijakan IAM atau lampiran kebijakan terkelola. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "IAMUser": {
        "Type": "AWS::IAM::User"
    }
}
```

Contoh YAMAL

```
IAMUser:
  Type: AWS::IAM::User
```

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Kebijakan IAM - Contoh

Kebijakan IAM dikonfigurasi tanpa asosiasi pengguna IAM. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "IAMPolicy": {
        "Type": "AWS::IAM::Policy",
        "Properties": {
            "PolicyDocument": {
                "Version": "2012-10-17",
                "Statement": [
                    {
                        "Effect": "Allow",
                        "Action": [
                            "cloudformation:DescribeStacks"
                        ],
                        "Resource": "*"
                    }
                ]
            },
            "PolicyName": "sample-policy",
            "Roles": [
                {
                    "Ref": "IAMRole"
                }
            ]
        }
```

```
    }
}
```

Contoh YAMAL

```
IAMPolicy:
  Type: AWS::IAM::Policy
  Properties:
    PolicyDocument:
      Version: '2012-10-17'
      Statement:
        - Effect: Allow
          Action:
            - cloudformation:DescribeStacks
          Resource: '*'
    PolicyName: sample-policy
    Roles:
      - !Ref 'IAMRole'
```

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Kebijakan Terkelola IAM - Contoh

Kebijakan terkelola IAM dikonfigurasi tanpa asosiasi pengguna IAM. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "IAMManagedPolicy": {
        "Type": "AWS::IAM::ManagedPolicy",
        "Properties": {
            "PolicyDocument": {
                "Version": "2012-10-17",
                "Statement": [
                    {
                        "Effect": "Allow",
                        "Action": [
```

```
                            "cloudformation:DescribeStacks"
                        ],
                        "Resource": "*"
                    }
                ]
            }
        }
    }
}
```

Contoh YAMAL

```
IAMManagedPolicy:
  Type: AWS::IAM::ManagedPolicy
  Properties:
    PolicyDocument:
      Version: '2012-10-17'
      Statement:
        - Effect: Allow
          Action:
            - cloudformation:DescribeStacks
          Resource: '*'
```

CT.IAM.PR.4spesifikasi aturan

```
# ####################################
##       Rule Specification        ##
####################################
#
# Rule Identifier:
#   iam_user_no_policies_check
#
# Description:
#   This control checks whether your AWS Identity and Access Management (IAM) user has
 inline or managed (AWS and customer) policies directly attached. Instead, IAM users
 should inherit permissions from IAM groups or roles.
#
# Reports on:
```

```
#   AWS::IAM::User, AWS::IAM::Policy, AWS::IAM::ManagedPolicy
#
# Evaluates:
# AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document does not contain any IAM user, policy or managed policy
 resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an IAM user resource
#       And: 'Policies' or 'ManagedPolicyArns' have been specified as a non-empty list
#      Then: FAIL
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an IAM policy or managed policy resource
#       And: 'Users' has been specified and is a non-empty list
#      Then: FAIL
#   Scenario: 4
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an IAM user resource
#       And: 'Policies' has not been been specified or is an empty list
#       And: 'ManagedPolicyArns' has not been been specified or is an empty list
#      Then: PASS
#   Scenario: 5
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an IAM policy or managed policy resource
#       And: 'Users' has not been specified or is an empty list
#      Then: PASS

CT.IAM.PR.4contoh template

Anda dapat melihat contoh artefak pengujian PASS dan FAIL untuk kontrol proaktif AWS Control Tower.

Contoh PASS - Gunakan template ini untuk memverifikasi pembuatan sumber daya yang sesuai.

```
Resources:
  IAMUser:
    Type: AWS::IAM::User
    Properties: {}
```

Contoh GAGAL - Gunakan templat ini untuk memverifikasi bahwa kontrol mencegah pembuatan sumber daya yang tidak sesuai.

```
Resources:
  IAMUser:
    Type: AWS::IAM::User
    Properties:
      ManagedPolicyArns:
      - arn:aws:iam::aws:policy/AdministratorAccess
```

[CT.IAM.PR.5] Mengharuskan kebijakan sebaris AWS Identity and Access Management (IAM) tidak memiliki tindakan layanan wildcard

Kontrol ini memeriksa apakah kebijakan inline AWS Identity and Access Management (IAM) tidak termasuk`Effect`: `Allow` with`Action`: `Service:*` (misalnya s3: *) untuk individu Layanan AWS atau menggunakan kombinasi `NotAction` dengan a. `Effect` `Allow`

- Tujuan kontrol: Menegakkan hak istimewa paling sedikit
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya:`AWS::IAM::Policy`,`AWS::IAM::Role`,`AWS::IAM::User`, `AWS::IAM::Group`
- AWS CloudFormation aturan penjaga: CT.IAM.PR.5spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.IAM.PR.5spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.IAM.PR.5contoh template

Penjelasan

Saat Anda menetapkan izin Layanan AWS, penting untuk mencakup tindakan IAM yang diizinkan dalam kebijakan IAM Anda. Anda harus membatasi tindakan IAM hanya pada tindakan yang diperlukan. Ini membantu Anda memberikan izin hak istimewa paling sedikit. Kebijakan yang terlalu permisif dapat menyebabkan eskalasi hak istimewa jika kebijakan tersebut dilampirkan pada prinsipal IAM yang mungkin tidak memerlukan izin.

Pertimbangan penggunaan

- Kontrol ini hanya berlaku untuk kebijakan inline IAM dengan pernyataan yang berisi `Effect` dari `Allow` dengan `Action` atau elemen hadir `NotAction`
- Kontrol ini hanya berlaku untuk peran IAM, sumber daya pengguna atau grup dengan satu atau beberapa kebijakan inline dan sumber daya kebijakan IAM dengan satu atau beberapa pernyataan yang dikonfigurasi

Remediasi untuk kegagalan aturan

Hapus pernyataan dari kebijakan sebaris IAM dengan`Effect`: `Allow` dan: `service:*` atau `ActionEffect`: `Allow` dan. `NotAction`

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Kebijakan Inline IAM - Contoh Satu

Peran IAM dikonfigurasi dengan kebijakan inline yang memungkinkan tindakan `ListBucket` S3. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "IAMRole": {
        "Type": "AWS::IAM::Role",
        "Properties": {
            "AssumeRolePolicyDocument": {
                "Version": "2012-10-17",
                "Statement": [
                    {
                        "Effect": "Allow",
                        "Principal": {
```

```
                            "AWS": {
                                "Ref": "AWS::AccountId"
                            }
                        },
                        "Action": [
                            "sts:AssumeRole"
                        ]
                    }
                ]
            },
            "Policies": [
                {
                    "PolicyDocument": {
                        "Version": "2012-10-17",
                        "Statement": [
                            {
                                "Effect": "Allow",
                                "Action": [
                                    "s3:ListBucket"
                                ],
                                "Resource": [
                                    "*"
                                ]
                            }
                        ]
                    },
                    "PolicyName": "sample-policy"
                }
            ]
        }
    }
}
```

Contoh YAMAL

```
IAMRole:
  Type: AWS::IAM::Role
  Properties:
    AssumeRolePolicyDocument:
      Version: '2012-10-17'
      Statement:
```

```
        - Effect: Allow
          Principal:
            AWS: !Ref 'AWS::AccountId'
          Action:
            - sts:AssumeRole
    Policies:
      - PolicyDocument:
          Version: '2012-10-17'
          Statement:
            - Effect: Allow
              Action:
                - s3:ListBucket
              Resource:
                - '*'
        PolicyName: sample-policy
```

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Kebijakan Inline IAM - Contoh Dua

Pengguna IAM dikonfigurasi dengan kebijakan sebaris yang memungkinkan tindakan `ListBucket` S3. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "IAMUser": {
        "Type": "AWS::IAM::User",
        "Properties": {
            "Policies": [
                {
                    "PolicyDocument": {
                        "Version": "2012-10-17",
                        "Statement": [
                            {
                                "Effect": "Allow",
                                "Action": [
                                    "s3:ListBucket"
                                ],
                                "Resource": [
```

```
                                        "*"
                                    ]
                                }
                            ]
                        },
                        "PolicyName": "sample-policy"
                    }
                ]
            }
        }
}
```

Contoh YAMAL

```
IAMUser:
  Type: AWS::IAM::User
  Properties:
    Policies:
      - PolicyDocument:
          Version: '2012-10-17'
          Statement:
            - Effect: Allow
              Action:
                - s3:ListBucket
              Resource:
                - '*'
        PolicyName: sample-policy
```

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Kebijakan Inline IAM - Contoh Tiga

Grup IAM dikonfigurasi dengan kebijakan sebaris yang memungkinkan tindakan `ListBucket` S3. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
```

```
    "IAMGroup": {
        "Type": "AWS::IAM::Group",
        "Properties": {
            "Policies": [
                {
                    "PolicyDocument": {
                        "Version": "2012-10-17",
                        "Statement": [
                            {
                                "Effect": "Allow",
                                "Action": [
                                    "s3:ListBucket"
                                ],
                                "Resource": [
                                    "*"
                                ]
                            }
                        ]
                    },
                    "PolicyName": "sample-policy"
                }
            ]
        }
    }
}
```

Contoh YAMAL

```
IAMGroup:
  Type: AWS::IAM::Group
  Properties:
    Policies:
      - PolicyDocument:
          Version: '2012-10-17'
          Statement:
            - Effect: Allow
              Action:
                - s3:ListBucket
              Resource:
                - '*'
        PolicyName: sample-policy
```

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Kebijakan Inline IAM - Contoh Empat

Kebijakan IAM terkait dengan peran IAM sebagai kebijakan inline dan dikonfigurasi untuk memungkinkan tindakan S3. `ListBucket` Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "IAMPolicy": {
        "Type": "AWS::IAM::Policy",
        "Properties": {
            "PolicyName": "sample-policy",
            "Roles": [
                {
                    "Ref": "IAMRole"
                }
            ],
            "PolicyDocument": {
                "Version": "2012-10-17",
                "Statement": [
                    {
                        "Effect": "Allow",
                        "Action": [
                            "s3:ListBucket"
                        ],
                        "Resource": [
                            "*"
                        ]
                    }
                ]
            }
        }
    }
}
```

Contoh YAMAL

```
IAMPolicy:
  Type: AWS::IAM::Policy
  Properties:
    PolicyName: sample-policy
    Roles:
      - !Ref 'IAMRole'
    PolicyDocument:
      Version: '2012-10-17'
      Statement:
        - Effect: Allow
          Action:
            - s3:ListBucket
          Resource:
            - '*'
```

CT.IAM.PR.5spesifikasi aturan

```
# ####################################
##       Rule Specification        ##
####################################
#
# Rule Name:
#   iam_inline_policy_no_statements_with_full_access_check
#
# Description:
#   This control checks whether AWS Identity and Access Management (IAM) inline
 policies do not include "Effect": "Allow" with "Action": "Service:*" (e.g. s3:*)
 for individual Layanan AWS or use the combination of "NotAction" with an "Effect" of
 "Allow".
#
# Reports on:
#   AWS::IAM::Policy, AWS::IAM::Role, AWS::IAM::User, AWS::IAM::Group
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
```

```
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document does not contain any IAM policy, IAM role, IAM user or
 IAM group resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an IAM policy resource
#       And: The policy has no statements with 'Effect' set to 'Allow'
#      Then: SKIP
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an IAM role, IAM user or IAM group resource
#       And: 'Policies' is not provided or is an empty list
#      Then: SKIP
#   Scenario: 4
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an IAM role, IAM user or IAM group resource
#       And: 'Policies' is provided as a non-empty list
#       And: All IAM policy documents in 'Policies' have no statements with 'Effect'
 set to 'Allow'
#      Then: SKIP
#   Scenario: 5
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an IAM policy resource
#       And: The policy has a statement with 'Effect' set to 'Allow'
#       And: The policy has one or more 'Action' statements
#       And: 'Action' statement allows full access to a service ('Action' has a value
 'service:*')
#      Then: FAIL
#   Scenario: 6
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an IAM policy resource
#       And: The policy has a statement with 'Effect' set to 'Allow'
#       And: The policy has one or more 'NotAction' statements
#      Then: FAIL
#   Scenario: 7

AWS Key Management Service (AWS KMS) kontrol

Topik

- [CT.KMS.PR.1] Memerlukan siapa pun AWS KMS key untuk memiliki rotasi yang dikonfigurasi
- [CT.KMS.PR.2] Mengharuskan kunci AWS Key Management Service asimetris dengan bahan kunci RSA yang digunakan untuk enkripsi memiliki panjang kunci lebih besar dari 2048 bit
- [CT.KMS.PR.3] Memerlukan kebijakan AWS Key Management Service kunci untuk memiliki pernyataan yang membatasi pembuatan AWS KMS hibah untuk layanan AWS

[CT.KMS.PR.1] Memerlukan siapa pun AWS KMS key untuk memiliki rotasi yang dikonfigurasi

Kontrol ini memeriksa apakah rotasi kunci diaktifkan untuk kunci yang dikelola AWS KMS pelanggan.

- Tujuan kontrol: Enkripsi data saat istirahat
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::KMS::Key`
- AWS CloudFormation aturan penjaga: CT.KMS.PR.1spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.KMS.PR.1spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.KMS.PR.1contoh template

Penjelasan

Rotasi kunci meminimalkan kemungkinan eksposur kunci ke pengguna jahat. Praktik terbaik kriptografi mencegah penggunaan ulang kunci enkripsi secara ekstensif. Rotasi kunci secara teratur membantu Anda memenuhi persyaratan keamanan dan kepatuhan organisasi.

> **Pertimbangan penggunaan**
>
> - Kontrol ini hanya berlaku untuk AWS KMS enkripsi simetris, kunci yang dikelola pelanggan.

Remediasi untuk kegagalan aturan

Setel `EnableKeyRotation` ke kunci `true` AWS KMS enkripsi simetris.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

AWS KMS key - Contoh

AWS KMS kunci terkelola pelanggan yang dikonfigurasi dengan rotasi kunci diaktifkan. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "KMSKey": {
        "Type": "AWS::KMS::Key",
        "Properties": {
            "PendingWindowInDays": 7,
            "KeyPolicy": {
                "Version": "2012-10-17",
                "Id": "sample-policy",
                "Statement": [
                    {
                        "Sid": "Enable IAM User Permissions",
                        "Effect": "Allow",
                        "Principal": {
                            "AWS": {
                                "Fn::Sub": "arn:${AWS::Partition}:iam::
${AWS::AccountId}:root"
                            }
                        },
                        "Action": "kms:*",
                        "Resource": "*"
                    }
                ]
            },
            "EnableKeyRotation": true
        }
    }
}
```

Contoh YAMAL

```
KMSKey:
  Type: AWS::KMS::Key
  Properties:
    PendingWindowInDays: 7
    KeyPolicy:
      Version: 2012-10-17
      Id: sample-policy
      Statement:
        - Sid: Enable IAM User Permissions
          Effect: Allow
          Principal:
            AWS: !Sub 'arn:${AWS::Partition}:iam::${AWS::AccountId}:root'
          Action: kms:*
          Resource: '*'
    EnableKeyRotation: true
```

CT.KMS.PR.1contoh template

Anda dapat melihat contoh artefak pengujian PASS dan FAIL untuk kontrol proaktif AWS Control Tower.

Contoh PASS - Gunakan template ini untuk memverifikasi pembuatan sumber daya yang sesuai.

```
Resources:
  Key:
    Type: AWS::KMS::Key
    Properties:
      PendingWindowInDays: 7
      KeyPolicy:
        Version: 2012-10-17
        Id: example-policy
        Statement:
        - Sid: Enable IAM User Permissions
          Effect: Allow
          Principal:
            AWS:
              Fn::Sub: arn:${AWS::Partition}:iam::${AWS::AccountId}:root
          Action: kms:*
          Resource: '*'
      EnableKeyRotation: true
```

Contoh GAGAL - Gunakan templat ini untuk memverifikasi bahwa kontrol mencegah pembuatan sumber daya yang tidak sesuai.

```
Resources:
  Key:
    Type: AWS::KMS::Key
    Properties:
      PendingWindowInDays: 7
      KeyPolicy:
        Version: 2012-10-17
        Id: example-policy
        Statement:
        - Sid: Enable IAM User Permissions
          Effect: Allow
          Principal:
            AWS:
              Fn::Sub: arn:${AWS::Partition}:iam::${AWS::AccountId}:root
          Action: kms:*
          Resource: '*'
      EnableKeyRotation: false
```

[CT.KMS.PR.2] Mengharuskan kunci AWS Key Management Service asimetris dengan bahan kunci RSA yang digunakan untuk enkripsi memiliki panjang kunci lebih besar dari 2048 bit

Kontrol ini memeriksa apakah kunci AWS KMS asimetris dengan bahan kunci RSA, yang digunakan untuk enkripsi dan dekripsi, untuk menggunakan spesifikasi kunci dengan panjang kunci lebih besar dari 2048 bit (yaitu, spesifikasi kunci selain). `RSA_2048`

- Tujuan kontrol: Enkripsi data saat istirahat
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::KMS::Key`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.KMS.PR.2

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.KMS.PR.2

- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.KMS.PR.2 contoh template

Penjelasan

AWS Control Tower merekomendasikan penggunaan spesifikasi kunci RSA dengan panjang kunci lebih besar dari 2048 bit, saat Anda menggunakan kunci tersebut untuk enkripsi dan dekripsi. Spesifikasi kunci menentukan apakah kunci KMS simetris atau asimetris. Ini juga menentukan jenis bahan kunci, dan algoritma yang didukungnya. AWS KMS mendukung kunci KMS asimetris yang mewakili RSA terkait secara matematis atau kurva eliptik (ECC) public dan private key pair. Kunci KMS dengan key pair RSA dapat digunakan untuk enkripsi dan dekripsi, atau untuk penandatanganan dan verifikasi (tetapi tidak keduanya). AWS KMS mendukung beberapa panjang kunci untuk persyaratan keamanan yang berbeda.

> Pertimbangan penggunaan
>
> - Kontrol ini hanya berlaku untuk kunci KMS dengan spesifikasi kunci RSA, yang dikonfigurasi untuk enkripsi dan dekripsi.

Remediasi untuk kegagalan aturan

Untuk kunci KMS dengan keyspec RSA, yang dikonfigurasi untuk enkripsi dan dekripsi (`KeyUsageofENCRYPT_DECRYPT`), atur `KeySpec` parameter ke spesifikasi kunci selain. `RSA_2048`

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

AWS KMS key - Contoh

Kunci AWS KMS asimetris yang dikonfigurasi untuk enkripsi dan dekripsi, dengan spesifikasi kunci. `RSA_4096` Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "Key": {
        "Type": "AWS::KMS::Key",
        "Properties": {
```

```
            "KeyPolicy": {
                "Version": "2012-10-17",
                "Id": "example-policy",
                "Statement": [
                    {
                        "Sid": "Enable IAM User Permissions",
                        "Effect": "Allow",
                        "Principal": {
                            "AWS": {
                                "Fn::Sub": "arn:${AWS::Partition}:iam::
${AWS::AccountId}:root"
                            }
                        },
                        "Action": "kms:*",
                        "Resource": "*"
                    }
                ]
            },
            "KeyUsage": "ENCRYPT_DECRYPT",
            "KeySpec": "RSA_4096"
        }
    }
}
```

Contoh YAMAL

```
Key:
  Type: AWS::KMS::Key
  Properties:
    KeyPolicy:
      Version: '2012-10-17'
      Id: example-policy
      Statement:
        - Sid: Enable IAM User Permissions
          Effect: Allow
          Principal:
            AWS: !Sub 'arn:${AWS::Partition}:iam::${AWS::AccountId}:root'
          Action: kms:*
          Resource: '*'
    KeyUsage: ENCRYPT_DECRYPT
    KeySpec: RSA_4096
```

Spesifikasi aturan CT.KMS.PR.2

```
# ####################################

#   kms_asymmetric_rsa_keyspec_check
#
# Description:
#   This control checks whether an AWS KMS asymmetric key with RSA key material, which
 is used for encryption and decryption, to use a key spec with a key length greater
 than 2048 bits (that is, a key spec other than 'RSA_2048').
#
# Reports on:
#   AWS::KMS::Key
#
# Evaluates:
# AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document does not contain any KMS key resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a KMS key resource
#       And: 'KeyUsage' has been provided and is a value other than 'ENCRYPT_DECRYPT'
#      Then: SKIP
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a KMS key resource
```

```
#       And: 'KeyUsage' has not been provided or has been provided and is set to
 'ENCRYPT_DECRYPT'
#       And: 'KeySpec' has not been provided or has been provided and is set to a
#            key spec other than an RSA key spec (does not begin with 'RSA_')
#      Then: SKIP
#   Scenario: 4
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a KMS key resource
#       And: 'KeyUsage' has not been provided or has been provided and is set to
 'ENCRYPT_DECRYPT'
#       And: 'KeySpec' has been provided and is set to an RSA key spec (begins with
 'RSA_')
#       And: 'KeySpec' has been set to a disallowed RSA key spec ('RSA_2048')
#      Then: FAIL
#   Scenario: 5
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a KMS key resource
#       And: 'KeyUsage' has not been provided or has been provided and is set to
 'ENCRYPT_DECRYPT'
#       And: 'KeySpec' has been provided and is set to an RSA key spec (begins with
 'RSA_')
#       And: 'KeySpec' has not been set to a disallowed RSA key spec ('RSA_2048')
#      Then: PASS

CT.KMS.PR.2 contoh template

Anda dapat melihat contoh artefak pengujian PASS dan FAIL untuk kontrol proaktif AWS Control Tower.

Contoh PASS - Gunakan template ini untuk memverifikasi pembuatan sumber daya yang sesuai.

```
Resources:
  Key:
    Type: AWS::KMS::Key
    Properties:
      KeyPolicy:
        Version: '2012-10-17'
        Id: example-policy
        Statement:
        - Sid: Enable IAM User Permissions
          Effect: Allow
          Principal:
            AWS:
              Fn::Sub: arn:${AWS::Partition}:iam::${AWS::AccountId}:root
          Action: kms:*
          Resource: '*'
      KeyUsage: ENCRYPT_DECRYPT
      KeySpec: RSA_4096
```

Contoh GAGAL - Gunakan templat ini untuk memverifikasi bahwa kontrol mencegah pembuatan sumber daya yang tidak sesuai.

```
Resources:
  Key:
    Type: AWS::KMS::Key
    Properties:
      KeyPolicy:
        Version: '2012-10-17'
        Id: example-policy
        Statement:
        - Sid: Enable IAM User Permissions
          Effect: Allow
          Principal:
            AWS:
              Fn::Sub: arn:${AWS::Partition}:iam::${AWS::AccountId}:root
          Action: kms:*
          Resource: '*'
      KeyUsage: ENCRYPT_DECRYPT
      KeySpec: RSA_2048
```

[CT.KMS.PR.3] Memerlukan kebijakan AWS Key Management Service kunci untuk memiliki pernyataan yang membatasi pembuatan AWS KMS hibah untuk layanan AWS

Kontrol ini memeriksa apakah AWS KMS kunci memiliki pernyataan kebijakan kunci terkait yang membatasi pembuatan AWS KMS hibah untuk AWS layanan saja.

- Tujuan kontrol: Menegakkan hak istimewa paling sedikit
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::KMS::Key`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.KMS.PR.3

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.KMS.PR.3
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.KMS.PR.3 contoh template

Penjelasan

Pengguna dengan izin untuk membuat hibah untuk kunci KMS (`kms:CreateGrant`) dapat menggunakan hibah untuk memungkinkan pengguna dan peran lain, termasuk AWS layanan, untuk menggunakan kunci KMS (prinsipal penerima hibah). Prinsipal penerima hibah dapat berupa identitas Anda sendiri Akun AWS, atau identitas dari akun atau organisasi yang berbeda.

Dengan menolak pembuatan AWS KMS hibah kecuali permintaan tersebut berasal dari suatu AWS layanan, Anda mencegah hibah diberikan langsung ke kepala sekolah selain prinsipal AWS layanan, dan Anda mengurangi peluang penyalahgunaan hibah. `kms:GrantIsForAWSResource`Kondisi ini membantu memeriksa apakah `CreateGrant` operasi dipanggil oleh AWS layanan yang terintegrasi dengan AWS KMS, atas nama kepala sekolah lain. `aws:PrincipalIsAWSService`Kondisi ini membantu memeriksa apakah `CreateGrant` operasi dipanggil langsung oleh kepala AWS layanan.

> Pertimbangan penggunaan
>
> - Jika Anda harus menggunakan ketentuan tambahan pada hibah Anda, atau jika Anda harus mengeluarkan AWS KMS hibah langsung ke kepala IAM Anda untuk kunci yang dikelola pelanggan, jangan aktifkan kontrol ini. Kontrol ini memerlukan pernyataan kebijakan yang menolak pembuatan AWS KMS hibah untuk kunci KMS yang dikelola pelanggan Anda, jika permintaan tersebut tidak berasal dari layanan yang terintegrasi dengan AWS KMS, atau dari prinsipal AWS layanan. AWS

Remediasi untuk kegagalan aturan

Konfigurasikan pernyataan AWS KMS kebijakan yang menolak akses ke `kms:CreateGrant` operasi untuk semua prinsipal ketika `kms:GrantIsForAWSResource` dan `aws:PrincipalIsAWSService` kondisi keduanya salah, menggunakan operator kondisi. `BoolIfExists`

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

AWS KMS key - Contoh

An AWS KMS key, dikonfigurasi untuk menolak pembuatan AWS KMS hibah di mana `CreateGrant` permintaan tidak berasal dari prinsipal AWS layanan. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```

```

Kontrol Amazon Kinesis

Topik

- [CT.KINESIS.PR.1] Memerlukan aliran data Amazon Kinesis apa pun agar enkripsi saat istirahat dikonfigurasi

[CT.KINESIS.PR.1] Memerlukan aliran data Amazon Kinesis apa pun agar enkripsi saat istirahat dikonfigurasi

Kontrol ini memeriksa apakah aliran data Amazon Kinesis dienkripsi saat istirahat dengan enkripsi sisi server.

- Tujuan kontrol: Enkripsi data saat istirahat
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::Kinesis::Stream`
- AWS CloudFormation aturan penjaga: CT.KINESIS.PR.1spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.KINESIS.PR.1spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.KINESIS.PR.1contoh template

Penjelasan

Enkripsi sisi server adalah fitur dalam aliran data Amazon Kinesis yang mengenkripsi data secara otomatis, sebelum data diam, dengan menggunakan file. AWS KMS key Data dienkripsi sebelum ditulis ke lapisan penyimpanan aliran Kinesis, dan didekripsi setelah diambil dari penyimpanan. Akibatnya, data Anda dienkripsi saat istirahat dalam layanan aliran data Amazon Kinesis.

Remediasi untuk kegagalan aturan

Tentukan `StreamEncryption` konfigurasi, dengan `EncryptionType` diatur ke `KMS` dan `KeyId` atur ke AWS KMS key pengenal.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Aliran Data Kinesis Amazon - Contoh

Amazon Kinesis data stream dikonfigurasi untuk mengenkripsi data saat istirahat dengan enkripsi sisi server, menggunakan file. AWS KMS key Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "KinesisStream": {
        "Type": "AWS::Kinesis::Stream",
        "Properties": {
```

```
            "RetentionPeriodHours": 168,
            "ShardCount": 3,
            "StreamEncryption": {
                "EncryptionType": "KMS",
                "KeyId": {
                    "Ref": "KMSKey"
                }
            }
        }
    }
}
```

Contoh YAMAL

```
KinesisStream:
  Type: AWS::Kinesis::Stream
  Properties:
    RetentionPeriodHours: 168
    ShardCount: 3
    StreamEncryption:
      EncryptionType: KMS
      KeyId: !Ref 'KMSKey'
```

#
# Description:
#   This control checks whether Amazon Kinesis data streams are encrypted at rest with
 server-side encryption.
#
# Reports on:
#   AWS::Kinesis::Stream
```

```
#
# Evaluates:
# AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document does not contain any Kinesis stream resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an Kinesis stream resource
#       And: 'StreamEncryption' has not been provided
#      Then: FAIL
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an Kinesis stream resource
#       And: 'StreamEncryption' has been provided
#       And: 'StreamEncryption.EncryptionType' has not been provided or provided as an
 empty string
#       And: 'StreamEncryption.KeyId' has not been provided or provided as an empty
 string or invalid local reference
#      Then: FAIL
#   Scenario: 4
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an Kinesis stream resource
#       And: 'StreamEncryption' has been provided
#       And: 'StreamEncryption.EncryptionType' has been provided as a non-empty string
#       And: 'StreamEncryption.KeyId' has not been provided or provided as an empty
 string or invalid local reference
#      Then: FAIL
#   Scenario: 5
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an Kinesis stream resource
#       And: 'StreamEncryption' has been provided
```

```
#       And: 'StreamEncryption.EncryptionType' has not been provided or provided as an
 empty string
#       And: 'StreamEncryption.KeyId' has been provided as a non-empty string or valid
 local reference
#      Then: FAIL
#   Scenario: 6
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an Kinesis stream resource
#       And: 'StreamEncryption' has been provided
#       And: 'StreamEncryption.EncryptionType' has been provided as a non-empty string
#       And: 'StreamEncryption.KeyId' has been provided as a non-empty string or valid
 local reference
#      Then: PASS

CT.KINESIS.PR.1contoh template

Anda dapat melihat contoh artefak pengujian PASS dan FAIL untuk kontrol proaktif AWS Control Tower.

Contoh PASS - Gunakan template ini untuk memverifikasi pembuatan sumber daya yang sesuai.

```
Resources:
  KMSKey:
    Type: AWS::KMS::Key
    Properties:
      PendingWindowInDays: 7
      KeyPolicy:
```

```
        Version: 2012-10-17
        Id: example-key-policy
        Statement:
        - Sid: Enable IAM User Permissions
          Effect: Allow
          Principal:
            AWS:
              Fn::Sub: arn:${AWS::Partition}:iam::${AWS::AccountId}:root
          Action: kms:*
          Resource: '*'
      KeySpec: SYMMETRIC_DEFAULT
  KinesisStream:
    Type: AWS::Kinesis::Stream
    Properties:
      RetentionPeriodHours: 168
      ShardCount: 3
      StreamEncryption:
        EncryptionType: KMS
        KeyId:
          Ref: KMSKey
```

Contoh GAGAL - Gunakan templat ini untuk memverifikasi bahwa kontrol mencegah pembuatan sumber daya yang tidak sesuai.

```
Resources:
  KinesisStream:
    Type: AWS::Kinesis::Stream
    Properties:
      RetentionPeriodHours: 168
      ShardCount: 3
```

AWS Lambda kontrol

Topik

- [CT.LAMBDA.PR.2] Memerlukan kebijakan AWS Lambda fungsi untuk melarang akses publik
- [CT.LAMBDA.PR.3] Memerlukan AWS Lambda fungsi untuk berada di Amazon Virtual Private Cloud (VPC) yang dikelola pelanggan

- [CT.LAMBDA.PR.4] Memerlukan izin AWS Lambda lapisan untuk memberikan akses ke AWS organisasi atau spesifik Akun AWS
- [CT.LAMBDA.PR.5] Memerlukan URL AWS Lambda fungsi untuk menggunakan otentikasi AWS berbasis IAM
- [CT.LAMBDA.PR.6] Memerlukan kebijakan CORS URL AWS Lambda fungsi untuk membatasi akses ke asal tertentu

[CT.LAMBDA.PR.2] Memerlukan kebijakan AWS Lambda fungsi untuk melarang akses publik

Kontrol ini memeriksa apakah kebijakan berbasis sumber daya AWS Lambda fungsi melarang akses publik.

- Tujuan kontrol: Batasi akses jaringan
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::Lambda::Permission`
- AWS CloudFormation aturan penjaga: CT.LAMBDA.PR.2spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.LAMBDA.PR.2spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.LAMBDA.PR.2contoh template

Penjelasan

Fungsi Lambda tidak boleh diakses publik, karena mungkin mengizinkan akses yang tidak diinginkan ke kode Anda yang disimpan dalam fungsi.

Remediasi untuk kegagalan aturan

Saat mengatur `Principal` ke`*`, berikan salah satu`SourceAccount`,`SourceArn`, atau`PrincipalOrgID`. Saat menyetel `Principal` ke kepala layanan (misalnya, s3.amazonaws.com), berikan salah satu atau. `SourceAccount` `SourceArn`

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

AWS Lambda Kebijakan Fungsi - Contoh Satu

AWS Lambda kebijakan fungsi dikonfigurasi dengan prinsipal Akun AWS ID. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
    "LambdaPermission": {
        "Type": "AWS::Lambda::Permission",
        "Properties": {
            "Action": "lambda:InvokeFunction",
            "FunctionName": {
                "Ref": "LambdaFunction"
            },
            "Principal": {
                "Ref": "AWS::AccountId"
            }
        }
    }
}
```

Contoh YAMAL

```
LambdaPermission:
  Type: AWS::Lambda::Permission
  Properties:
    Action: lambda:InvokeFunction
    FunctionName: !Ref 'LambdaFunction'
    Principal: !Ref 'AWS::AccountId'
```

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

AWS Lambda Kebijakan Fungsi - Contoh Dua

AWS Lambda kebijakan fungsi dikonfigurasi dengan pokok wildcard dan kondisi akun sumber. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
    "LambdaPermission": {
        "Type": "AWS::Lambda::Permission",
        "Properties": {
            "Action": "lambda:InvokeFunction",
            "FunctionName": {
                "Ref": "LambdaFunction"
            },
            "Principal": "*",
            "SourceAccount": {
                "Ref": "AWS::AccountId"
            }
        }
    }
}
```

Contoh YAMAL

```
LambdaPermission:
  Type: AWS::Lambda::Permission
  Properties:
    Action: lambda:InvokeFunction
    FunctionName: !Ref 'LambdaFunction'
    Principal: '*'
    SourceAccount: !Ref 'AWS::AccountId'
```

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

AWS Lambda Kebijakan Fungsi - Contoh Tiga

AWS Lambda kebijakan fungsi dikonfigurasi dengan prinsip layanan dan kondisi ARN sumber. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
    "LambdaPermission": {
        "Type": "AWS::Lambda::Permission",
        "Properties": {
            "Action": "lambda:InvokeFunction",
            "FunctionName": {
                "Ref": "LambdaFunction"
            },
            "Principal": "s3.amazonaws.com",
            "SourceArn": {
                "Fn::GetAtt": [
                    "S3Bucket",
                    "Arn"
                ]
            }
        }
    }
}
```

Contoh YAMAL

```
LambdaPermission:
  Type: AWS::Lambda::Permission
  Properties:
    Action: lambda:InvokeFunction
    FunctionName: !Ref 'LambdaFunction'
    Principal: s3.amazonaws.com
    SourceArn: !GetAtt 'S3Bucket.Arn'
```

CT.LAMBDA.PR.2spesifikasi aturan

```
# ##################################
##       Rule Specification        ##
#####################################
#
# Rule Identifier:
#   lambda_function_public_access_prohibited_check
#
```

```
# Description:
#   This control checks whether an AWS Lambda function resource-based policy prohibits
 public access.
#
# Reports on:
#   AWS::Lambda::Permission
#
# Evaluates:
# AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document does not contain any Lambda permission resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a Lambda permission resource
#       And: 'FunctionUrlAuthType' has been provided with a value of 'NONE'
#      Then: FAIL
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a Lambda permission resource
#       And: 'Principal' has been provided with a wildcard value ('*')
#       And: 'SourceAccount' has not been provided or provided with an empty string
 value
#       And: 'SourceArn' has not been provided or provided with an empty string value
 or non-valid local reference
#       And: 'PrincipalOrgID' has not been provided or provided with an empty string
 value
#      Then: FAIL
#   Scenario: 4
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a Lambda permission resource
#       And: 'Principal' has been provided with value that does not match an AWS
 Account ID, AWS IAM ARN or
#            wildcard value ('*')
```

```
#       And: 'SourceAccount' has not been provided or provided with an empty string
 value
#       And: 'SourceArn' has not been provided or provided with an empty string value
 or non-valid local reference
#      Then: FAIL
#   Scenario: 5
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a Lambda permission resource
#       And: 'Principal' has been provided with an AWS Account ID or AWS IAM ARN value
#      Then: PASS
#   Scenario: 6
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a Lambda permission resource
#       And: 'Principal' has been provided with a wildcard value ('*')
#       And: At least one of 'SourceAccount', 'SourceArn' or 'PrincipalOrgID' have been
 provided with non-empty string
#            values (or a valid local reference for 'SourceArn')
#      Then: PASS
#   Scenario: 7
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a Lambda permission resource
#       And: 'Principal' has been provided with value that does not match an AWS
 Account ID or AWS IAM ARN
#       And: At least one of 'SourceAccount', 'SourceArn' have been provided with non-
empty string values (or a valid
#            local reference for 'SourceArn')
#      Then: PASS

```

[CT.LAMBDA.PR.3] Memerlukan AWS Lambda fungsi untuk berada di Amazon Virtual Private Cloud (VPC) yang dikelola pelanggan

Kontrol ini memeriksa apakah fungsi AWS Lambda telah dikonfigurasi dengan akses ke sumber daya di Amazon Virtual Private Cloud (VPC) yang dikelola pelanggan.

- Tujuan kontrol: Batasi akses jaringan
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::Lambda::Function`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.LAMBDA.PR.3

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.LAMBDA.PR.3
- Untuk contoh CloudFormation template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.LAMBDA.PR.3 contoh templat

Penjelasan

AWS Lambda fungsi dapat ditautkan ke subnet pribadi dalam virtual private cloud (VPC) di Akun AWS Anda untuk terhubung ke sumber daya seperti database, instance cache, atau layanan internal. Pastikan bahwa subnet dan kelompok keamanan yang digunakan memungkinkan akses ke sumber daya yang diperlukan.

Pertimbangan penggunaan

- Kontrol ini tidak mengevaluasi konfigurasi perutean subnet VPC untuk menentukan jangkauan publik.
- Kontrol ini tidak mendukung Fungsi AWS Lambda @Edge. Lambda @Edge tidak mendukung fungsi yang dikonfigurasi dengan akses ke sumber daya di dalam VPC Anda.

- Fungsi Lambda tidak dapat terhubung langsung ke VPC dengan tenancy instans khusus. Untuk terhubung ke sumber daya dalam VPC khusus, sambungkan ke VPC kedua dengan penyewaan default.

Remediasi untuk kegagalan aturan

Di`VpcConfig`, berikan `SubnetIds` properti dengan satu atau beberapa ID Subnet, dan berikan `SecurityGroupIds` properti dengan satu atau beberapa ID Grup Keamanan.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Fungsi AWS Lambda - Contoh

Fungsi AWS Lambda dikonfigurasi untuk mengakses sumber daya dalam VPC. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
    "LambdaFunction": {
        "Type": "AWS::Lambda::Function",
        "Properties": {
            "Role": {
                "Fn::GetAtt": "LambdaFunctionRole.Arn"
            },
            "Handler": "index.handler",
            "Code": {
                "ZipFile": "def handler(event, context):\n    print(\"sample function
\")\n"
            },
            "Runtime": "python3.9",
            "VpcConfig": {
                "SubnetIds": [
                    {
                        "Fn::GetAtt": [
                            "SubnetOne",
                            "SubnetId"
                        ]
                    },
                    {
                        "Fn::GetAtt": [
```

```
                            "SubnetTwo",
                            "SubnetId"
                        ]
                    }
                ],
                "SecurityGroupIds": [
                    {
                        "Fn::GetAtt": [
                            "SecurityGroup",
                            "GroupId"
                        ]
                    }
                ]
            }
        }
    }
}
```

Contoh YAMAL

```
LambdaFunction:
  Type: AWS::Lambda::Function
  Properties:
    Role: !GetAtt 'LambdaFunctionRole.Arn'
    Handler: index.handler
    Code:
      ZipFile: "def handler(event, context):\n    print(\"sample function\")\n"
    Runtime: python3.9
    VpcConfig:
      SubnetIds:
        - !GetAtt 'SubnetOne.SubnetId'
        - !GetAtt 'SubnetTwo.SubnetId'
      SecurityGroupIds:
        - !GetAtt 'SecurityGroup.GroupId'
```

Spesifikasi aturan CT.LAMBDA.PR.3

##       Rule Specification        ##
#####################################
#
# Rule Identifier:
#   lambda_inside_vpc_check
#
# Description:
#   This control checks whether an AWS Lambda function has been configured with access
 to resources in a customer-managed Amazon Virtual Private Cloud (VPC).
#
# Reports on:
#   AWS::Lambda::Function
#
# Evaluates:
# AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document does not contain any Lambda function resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a Lambda function resource
#       And: 'VpcConfig' has not been provided
#      Then: FAIL
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a Lambda function resource
#       And: 'VpcConfig' has been provided
#       And: 'SubnetIds' in 'VpcConfig' has been provided as a non-empty list that
 contains non-empty strings or valid
#            local references
#       And: 'SecurityGroupIds' in 'VpcConfig' has not been been provided or has been
 provided as an empty list
#      Then: FAIL
#   Scenario: 4
```

```
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a Lambda function resource
#       And: 'VpcConfig' has been provided
#       And: 'SecurityGroupIds' in 'VpcConfig' has been provided as a non-empty list
 that contains non-empty strings
#            or valid local references
#       And: 'SubnetIds' in 'VpcConfig' has not been been provided or has been provided
 as an empty list
#      Then: FAIL
#   Scenario: 5
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a Lambda function resource
#       And: 'VpcConfig' has been provided
#       And: 'SecurityGroupIds' in 'VpcConfig' has been provided as a non-empty list
 that contains non-empty strings or
#            valid local references
#       And: 'SubnetIds' in 'VpcConfig' has been provided as a non-empty list that
 contains non-empty strings or valid
#            local references
#      Then: PASS

              print("example")
      Runtime: python3.9
```

[CT.LAMBDA.PR.4] Memerlukan izin AWS Lambda lapisan untuk memberikan akses ke AWS organisasi atau spesifik Akun AWS

Kontrol ini memeriksa apakah izin AWS Lambda lapisan telah dikonfigurasi untuk memberikan akses ke AWS organisasi atau khusus Akun AWS saja, dengan memastikan bahwa akses publik dari semua Akun AWS belum diberikan ke lapisan.

- Tujuan kontrol: Menegakkan hak istimewa paling sedikit
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::Lambda::LayerVersionPermission`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.LAMBDA.PR.4

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.LAMBDA.PR.4
- Untuk contoh CloudFormation template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.LAMBDA.PR.4 contoh templat

Penjelasan

Secara default, lapisan yang Anda buat bersifat pribadi untuk Anda Akun AWS. Namun, Anda dapat berbagi lapisan dengan akun lain atau menjadikannya publik, secara opsional.

Lapisan publik memungkinkan akses yang tidak diinginkan ke kode sumber dan aplikasi Anda. Lapisan Lambda publik dapat mengekspos informasi berharga tentang akun, sumber daya, dan proses internal Anda.

Remediasi untuk kegagalan aturan

Atur `OrganizationId` parameter ke ID AWS organisasi, atau atur `Principal` parameter ke Akun AWS ID.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

AWS Lambda izin lapisan - Contoh satu

URL izin AWS Lambda versi yang dikonfigurasi untuk memberikan izin penggunaan lapisan ke semua akun dalam organisasi. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
    "LayerVersionPermission": {
        "Type": "AWS::Lambda::LayerVersionPermission",
        "Properties": {
            "Action": "lambda:GetLayerVersion",
            "LayerVersionArn": {
                "Ref": "LayerVersion"
            },
            "OrganizationId": "o-abc123defg"
        }
    }
}
```

Contoh YAMAL

```
LayerVersionPermission:
  Type: AWS::Lambda::LayerVersionPermission
  Properties:
    Action: lambda:GetLayerVersion
    LayerVersionArn: !Ref 'LayerVersion'
    OrganizationId: o-abc123defg
```

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

AWS Lambda izin lapisan - Contoh dua

URL izin AWS Lambda versi yang dikonfigurasi untuk memberikan izin penggunaan lapisan untuk file Akun AWS. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
    "LayerVersionPermission": {
        "Type": "AWS::Lambda::LayerVersionPermission",
        "Properties": {
            "Action": "lambda:GetLayerVersion",
            "LayerVersionArn": {
                "Ref": "LayerVersion"
            },
            "Principal": "123456789012"
        }
    }
}
```

Contoh YAMAL

```
LayerVersionPermission:
  Type: AWS::Lambda::LayerVersionPermission
  Properties:
    Action: lambda:GetLayerVersion
    LayerVersionArn: !Ref 'LayerVersion'
    Principal: '123456789012'
```

Spesifikasi aturan CT.LAMBDA.PR.4

```
# ##################################
##       Rule Specification        ##
```

```
####################################
#
# Rule Identifier:
#   lambda_layer_public_access_prohibited_check
#
# Description:
#   This control checks whether an AWS Lambda layer permission has been configured to
 grant access to an AWS organization or to a specific Akun AWS only, by ensuring that
 public access from all Akun AWS has not been granted to a layer.
#
# Reports on:
#   AWS::Lambda::LayerVersionPermission
#
# Evaluates:
# AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document does not contain any Lambda layer version permission
 resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a Lambda layer version permission resource
#       And: 'OrganizationId' has not been provided
#       And: 'Principal' has been provided and set to '*'
#      Then: FAIL
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a Lambda layer version permission resource
#       And: 'OrganizationId' has not been provided
#       And: 'Principal' has been provided and set to a non-empty string value other
 than '*'
#      Then: PASS
#   Scenario: 4
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
```

```
#       And: The input document contains a Lambda layer version permission resource
#       And: 'OrganizationId' has been provided as a non-empty string
#      Then: PASS

```

[CT.LAMBDA.PR.5] Memerlukan URL AWS Lambda fungsi untuk menggunakan otentikasi AWS berbasis IAM

Kontrol ini memeriksa apakah URL AWS Lambda fungsi dikonfigurasi untuk menggunakan otentikasi yang didasarkan pada IAM.

- Tujuan kontrol: Menegakkan hak istimewa paling sedikit
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::Lambda::Url`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.LAMBDA.PR.5

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.LAMBDA.PR.5
- Untuk contoh CloudFormation template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.LAMBDA.PR.5 contoh templat

Penjelasan

Anda dapat mengontrol akses ke URL fungsi Lambda menggunakan `AuthType` parameter, dikombinasikan dengan kebijakan berbasis sumber daya yang dilampirkan ke fungsi spesifik Anda. Konfigurasi kedua komponen ini menentukan siapa yang dapat memanggil atau melakukan tindakan administratif lainnya pada URL fungsi Anda.

`AuthType`Parameter menentukan cara Lambda mengautentikasi atau mengotorisasi permintaan ke URL fungsi Lambda Anda (titik akhir). Pengaturan `AuthType` ke `NONE` berarti bahwa Lambda tidak melakukan otentikasi apa pun sebelum memanggil fungsi Anda. Namun, kebijakan berbasis sumber daya fungsi Anda selalu berlaku, dan kebijakan tersebut harus memberikan akses publik sebelum URL fungsi Lambda (titik akhir) Anda dapat menerima permintaan.

Remediasi untuk kegagalan aturan

Atur `AuthType` parameter ke `AWS_IAM`

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

AWS Lambda fungsi URL - Contoh

URL AWS Lambda fungsi (endpoint) yang dikonfigurasi dengan otentikasi berbasis AWS IAM. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
    "FunctionUrl": {
        "Type": "AWS::Lambda::Url",
        "Properties": {
            "TargetFunctionArn": {
                "Fn::GetAtt": [
                    "LambdaFunction",
                    "Arn"
                ]
            },
            "AuthType": "AWS_IAM"
        }
    }
}
```

Contoh YAMAL

```
FunctionUrl:
  Type: AWS::Lambda::Url
  Properties:
    TargetFunctionArn: !GetAtt 'LambdaFunction.Arn'
```

```
    AuthType: AWS_IAM
```

Spesifikasi aturan CT.LAMBDA.PR.5

```
# ####################################
##       Rule Specification        ##
####################################
#
# Rule Identifier:
#   lambda_function_url_auth_check
#
# Description:
#   This control checks whether an AWS Lambda function URL is configured to use
 authentication that's
based on AWS IAM.
#
# Reports on:
#   AWS::Lambda::Url
#
# Evaluates:
# AWS CloudFormation, AWS CloudFormation hook

      AuthType: NONE
```

[CT.LAMBDA.PR.6] Memerlukan kebijakan CORS URL AWS Lambda fungsi untuk membatasi akses ke asal tertentu

Kontrol ini memeriksa apakah URL AWS Lambda fungsi dikonfigurasi dengan kebijakan berbagi sumber daya lintas asal (CORS) yang tidak memberikan akses ke semua asal.

- Tujuan kontrol: Batasi akses jaringan
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::Lambda::Url`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.LAMBDA.PR.6

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.LAMBDA.PR.6
- Untuk contoh CloudFormation template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.LAMBDA.PR.6 contoh templat

Penjelasan

Cross-Origin Resource Sharing (CORS) adalah mekanisme berdasarkan HTTP-header, yang memungkinkan server untuk menunjukkan asal (domain, skema, atau port) selain miliknya sendiri, dari mana browser harus mengizinkan pemuatan sumber daya.

Jika Anda menetapkan wildcard origin (`*`) dalam kebijakan CORS, Anda mengizinkan kode yang berjalan di browser dari asal mana pun untuk mendapatkan akses ke URL fungsi Anda.

Remediasi untuk kegagalan aturan

Dalam `Cors` parameter, pastikan bahwa nilai `AllowOrigins` tidak mengandung wildcard asal (`*`, `http://*` dan`https://*`)

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

AWS Lambda Fungsi URL - Contoh

AWS Lambda URL fungsi dikonfigurasi dengan kebijakan berbagi sumber daya lintas asal (CORS) yang membatasi akses ke asal tertentu. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
    "FunctionUrl": {
        "Type": "AWS::Lambda::Url",
        "Properties": {
            "TargetFunctionArn": {
                "Fn::GetAtt": [
                    "LambdaFunction",
                    "Arn"
                ]
            },
            "AuthType": "AWS_IAM",
            "Cors": {
                "AllowOrigins": [
                    "https://example.com"
                ]
            }
        }
    }
}
```

Contoh YAMAL

```
FunctionUrl:
  Type: AWS::Lambda::Url
  Properties:
    TargetFunctionArn: !GetAtt 'LambdaFunction.Arn'
    AuthType: AWS_IAM
    Cors:
      AllowOrigins:
        - https://example.com
```

Spesifikasi aturan CT.LAMBDA.PR.6

```

Kontrol Amazon MQ

Topik

- [CT.MQ.PR.1] Memerlukan broker Amazon MQ ActiveMQ untuk menggunakan mode penerapan aktif/siaga untuk ketersediaan tinggi
- [CT.MQ.PR.2] Mewajibkan broker MQ Amazon MQ Rabbit untuk menggunakan mode cluster multi-AZ untuk ketersediaan tinggi

[CT.MQ.PR.1] Memerlukan broker Amazon MQ ActiveMQ untuk menggunakan mode penerapan aktif/siaga untuk ketersediaan tinggi

Kontrol ini memeriksa apakah broker Amazon MQ ActiveMQ dikonfigurasi dalam mode penerapan aktif/siaga.

- Tujuan kontrol: Meningkatkan ketahanan, Meningkatkan ketersediaan
- Implementasi: aturan AWS CloudFormation penjaga

- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::AmazonMQ::Broker`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.MQ.PR.1

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.MQ.PR.1
- Untuk contoh AWS CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.MQ.PR.1 contoh template

Penjelasan

Mode penerapan aktif/siaga Amazon MQ ActiveMQ membantu Anda mencapai ketersediaan tinggi untuk broker Amazon MQ Anda di satu wilayah. Mode penerapan aktif/siaga Amazon MQ mencakup dua instance broker, yang dikonfigurasi dalam pasangan redundan di berbagai zona ketersediaan.

> **Pertimbangan penggunaan**
>
> - Kontrol ini hanya berlaku untuk broker Amazon MQ dengan tipe mesin ACTIVEMQ.

Remediasi untuk kegagalan aturan

Untuk broker Amazon MQ dengan tipe mesin ACTIVEMQ, atur properti ke ACTIVE_STANDBY_MULTI_AZ. DeploymentMode

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Broker Amazon MQ ActiveMQ - Contoh

Broker Amazon MQ ActiveMQ yang dikonfigurasi dalam mode penerapan aktif/siaga. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
```

```
    "MQBroker": {
        "Type": "AWS::AmazonMQ::Broker",
        "Properties": {
            "AutoMinorVersionUpgrade": true,
            "BrokerName": "sample-broker",
            "EngineVersion": "5.17.2",
            "HostInstanceType": "mq.m5.large",
            "PubliclyAccessible": false,
            "Users": [
                {
                    "ConsoleAccess": true,
                    "Username": {
                        "Fn::Sub": "{{resolve:secretsmanager:
${MQBrokerSecret}::username}}"
                    },
                    "Password": {
                        "Fn::Sub": "{{resolve:secretsmanager:
${MQBrokerSecret}::password}}"
                    }
                }
            ],
            "EngineType": "ACTIVEMQ",
            "DeploymentMode": "ACTIVE_STANDBY_MULTI_AZ"
        }
    }
}
```

Contoh YAMAL

```
MQBroker:
  Type: AWS::AmazonMQ::Broker
  Properties:
    AutoMinorVersionUpgrade: true
    BrokerName: sample-broker
    EngineVersion: 5.17.2
    HostInstanceType: mq.m5.large
    PubliclyAccessible: false
    Users:
      - ConsoleAccess: true
        Username: !Sub '{{resolve:secretsmanager:${MQBrokerSecret}::username}}'
        Password: !Sub '{{resolve:secretsmanager:${MQBrokerSecret}::password}}'
```

```
    EngineType: ACTIVEMQ
    DeploymentMode: ACTIVE_STANDBY_MULTI_AZ
```

```

[CT.MQ.PR.2] Mewajibkan broker MQ Amazon MQ Rabbit untuk menggunakan mode cluster multi-AZ untuk ketersediaan tinggi

Kontrol ini memeriksa apakah broker Amazon MQ RabbitMQ dikonfigurasi dalam mode penyebaran cluster, untuk memungkinkan ketersediaan tinggi.

- Tujuan kontrol: Meningkatkan ketahanan, Meningkatkan ketersediaan
- Implementasi: aturan AWS CloudFormation penjaga

- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::AmazonMQ::Broker`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.MQ.PR.2

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.MQ.PR.2
- Untuk contoh AWS CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.MQ.PR.2 contoh template

Penjelasan

Penerapan klaster Amazon MQ untuk RabbitMQ membantu Anda mencapai ketersediaan tinggi untuk broker MQ Amazon Anda di satu wilayah. Cluster RabbitMQ mencakup tiga instance broker, yang dikonfigurasi dalam cluster di berbagai zona ketersediaan.

> **Pertimbangan penggunaan**
>
> - Kontrol ini hanya berlaku untuk broker Amazon MQ dengan tipe mesin RABBITMQ.

Remediasi untuk kegagalan aturan

Untuk broker Amazon MQ dengan tipe mesin RABBITMQ, atur properti ke CLUSTER_MULTI_AZ. DeploymentMode

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Broker Amazon MQ RabbitMQ - Contoh

Broker Amazon MQ RabbitMQ dikonfigurasi dalam mode penyebaran cluster. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
```

```
    "MQBroker": {
        "Type": "AWS::AmazonMQ::Broker",
        "Properties": {
            "AutoMinorVersionUpgrade": true,
            "BrokerName": "sample-mq-broker",
            "EngineVersion": "3.10.10",
            "HostInstanceType": "mq.m5.large",
            "PubliclyAccessible": false,
            "Users": [
                {
                    "ConsoleAccess": true,
                    "Username": {
                        "Fn::Sub": "{{resolve:secretsmanager:
${MQBrokerSecret}::username}}"
                    },
                    "Password": {
                        "Fn::Sub": "{{resolve:secretsmanager:
${MQBrokerSecret}::password}}"
                    }
                }
            ],
            "EngineType": "RABBITMQ",
            "DeploymentMode": "CLUSTER_MULTI_AZ"
        }
    }
}
```

Contoh YAMAL

```
MQBroker:
  Type: AWS::AmazonMQ::Broker
  Properties:
    AutoMinorVersionUpgrade: true
    BrokerName: sample-mq-broker
    EngineVersion: 3.10.10
    HostInstanceType: mq.m5.large
    PubliclyAccessible: false
    Users:
      - ConsoleAccess: true
        Username: !Sub '{{resolve:secretsmanager:${MQBrokerSecret}::username}}'
        Password: !Sub '{{resolve:secretsmanager:${MQBrokerSecret}::password}}'
```

```
    EngineType: RABBITMQ
    DeployMentMode: CLUSTER_MULTI_AZ
```

Amazon Managed Streaming untuk Apache Kafka (Amazon MSK) kontrol

Topik

- [CT.MSK.PR.1] Memerlukan Amazon Managed Streaming untuk Apache Kafka Kafka (Amazon MSK) cluster untuk menegakkan enkripsi dalam perjalanan antar node broker cluster
- [CT.MSK.PR.2] Memerlukan Amazon Managed Streaming untuk Apache Kafka Kafka (Amazon MSK) cluster untuk dikonfigurasi dengan dinonaktifkan PublicAccess

[CT.MSK.PR.1] Memerlukan Amazon Managed Streaming untuk Apache Kafka Kafka (Amazon MSK) cluster untuk menegakkan enkripsi dalam perjalanan antar node broker cluster

Kontrol ini memeriksa apakah cluster MSK Amazon dikonfigurasi untuk mengenkripsi data dalam perjalanan antara node broker cluster.

- Tujuan kontrol: Enkripsi data dalam perjalanan
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::MSK::Cluster`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.MSK.PR.1

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.MSK.PR.1
- Untuk contoh AWS CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.MSK.PR.1 contoh template

Penjelasan

Amazon MSK menggunakan TLSv1.2. Secara default, ini mengenkripsi data dalam perjalanan antara broker kluster MSK Amazon Anda. Namun, Anda dapat mengganti default ini pada saat Anda membuat cluster.

> **Pertimbangan penggunaan**
>
> - Meskipun kami sangat menyarankan untuk mengaktifkan enkripsi dalam transit, ini dapat menambahkan overhead CPU tambahan dan latensi beberapa milidetik. Sebagian besar kasus penggunaan tidak sensitif terhadap perbedaan ini, dan besarnya dampaknya bergantung pada konfigurasi klaster, klien, dan profil penggunaan Anda.

Remediasi untuk kegagalan aturan

Di EncryptionInfo properti, berikan `EncryptionInTransit` konfigurasi dan atur nilai `InCluster` ke true. Jika tidak, hilangkan `InCluster` properti untuk mengadopsi nilai default true.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Amazon MSK Cluster - Contoh

Cluster MSK Amazon dikonfigurasi untuk mengenkripsi data dalam perjalanan antara node broker cluster. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
    "MSKCluster": {
        "Type": "AWS::MSK::Cluster",
        "Properties": {
            "BrokerNodeGroupInfo": {
                "ClientSubnets": [
                    {
                        "Ref": "SubnetOne"
                    },
                    {
                        "Ref": "SubnetTwo"
                    }
                ],
                "InstanceType": "kafka.t3.small",

[CT.MSK.PR.2] Memerlukan Amazon Managed Streaming untuk Apache Kafka Kafka (Amazon MSK) cluster untuk dikonfigurasi dengan dinonaktifkan PublicAccess

Kontrol ini memeriksa apakah klaster MSK Amazon dikonfigurasi untuk melarang akses publik ke broker klaster melalui properti. PublicAccess

- Tujuan kontrol: Batasi akses jaringan
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::MSK::Cluster`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.MSK.PR.2

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.MSK.PR.2
- Untuk contoh AWS CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.MSK.PR.2 contoh template

Penjelasan

Amazon MSK memberi Anda opsi untuk mengaktifkan akses publik ke broker cluster MSK Amazon yang menjalankan Apache Kafka versi 2.6.0 atau yang lebih baru. Untuk alasan keamanan, Anda tidak dapat mengaktifkan akses publik saat membuat klaster MSK Amazon. Namun, Anda dapat memperbarui cluster yang ada agar dapat diakses publik.

> **Pertimbangan penggunaan**
>
> - Selain mengonfigurasi PublicAccess properti, kondisi prasyarat lainnya diperlukan saat Anda mengaktifkan akses publik ke kluster MSK Amazon. Untuk informasi selengkapnya

tentang mengonfigurasi kluster MSK Amazon untuk akses publik, lihat Akses Publik di Panduan Pengembang MSK Amazon.

Remediasi untuk kegagalan aturan

Dalam parameter BrokerNodeGroupInfo. ConnectivityInfo. PublicAccess, atur nilai Type ke DISABLED, atau untuk mengadopsi nilai default DISABLED, jangan berikan PublicAccess konfigurasi.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Amazon MSK Cluster - Contoh

Cluster MSK Amazon dikonfigurasi untuk melarang akses publik ke broker klaster melalui properti. PublicAccess Contoh ditunjukkan di JSON dan YAMAL.

```
# ####################################
##       Rule Specification        ##
####################################
#
# Rule Identifier:
#   msk_public_access_check
#
# Description:
#   This control checks whether an Amazon MSK cluster is configured to disallow public
 access to cluster brokers by means of the PublicAccess property.
#
# Reports on:
#   AWS::MSK::Cluster
#
# Evaluates:
# AWS CloudFormation, AWS CloudFormation hook
```

```
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document does not contain any Amazon MSK cluster resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an Amazon MSK cluster resource
#       And: 'BrokerNodeGroupInfo' has not been provided
#      Then: SKIP
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an MSK cluster resource
#       And: 'BrokerNodeGroupInfo' has been provided
#       And: 'Type' in 'ConnectivityInfo.PublicAccess' has been provided and
#            set to a value other than 'DISABLED'
#      Then: FAIL
#   Scenario: 4
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an Amazon MSK cluster resource
#       And: 'BrokerNodeGroupInfo' has been provided
#       And: 'Type' in 'ConnectivityInfo.PublicAccess' has not been provided
#      Then: PASS
#   Scenario: 5
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an Amazon MSK cluster resource
#       And: 'BrokerNodeGroupInfo' has been provided
#       And: 'Type' in 'ConnectivityInfo.PublicAccess' has been provided and
#            set to 'DISABLED'
#      Then: PASS

#

Kontrol Amazon Neptunus

Topik

- [CT.NEPTUNE.PR.1] Memerlukan cluster DB Amazon Neptunus untuk mengaktifkan otentikasi basis data (IAM) AWS Identity and Access Management
- [CT.NEPTUNE.PR.2] Memerlukan cluster DB Amazon Neptunus agar perlindungan penghapusan diaktifkan
- [CT.NEPTUNE.PR.3] Memerlukan cluster DB Amazon Neptunus agar enkripsi penyimpanan diaktifkan
- [CT.NEPTUNE.PR.4] Memerlukan klaster DB Amazon Neptunus untuk mengaktifkan ekspor CloudWatch Amazon Log untuk log audit
- [CT.NEPTUNE.PR.5] Memerlukan cluster DB Amazon Neptunus untuk mengatur periode retensi cadangan lebih besar dari atau sama dengan tujuh hari

[CT.NEPTUNE.PR.1] Memerlukan cluster DB Amazon Neptunus untuk mengaktifkan otentikasi basis data (IAM) AWS Identity and Access Management

Kontrol ini memeriksa apakah klaster AWS Identity and Access Management Amazon Neptunus mengaktifkan autentikasi database (IAM).

- Tujuan kontrol: Menerapkan hak istimewa paling sedikit, Gunakan otentikasi yang kuat
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::Neptune::DBCluster`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.NEPTUNE.PR.1

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.NEPTUNE.PR.1
- Untuk contoh CloudFormation template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.NEPTUNE.PR.1 contoh templat

Penjelasan

Anda dapat menggunakan AWS Identity and Access Management (IAM) untuk mengautentikasi ke instans DB Neptunus atau cluster DB Anda. IAM memungkinkan Anda untuk mengelola akses ke sumber daya database Anda secara terpusat, alih-alih mengelola akses secara individual pada setiap instans atau cluster DB.

Remediasi untuk kegagalan aturan

Tetapkan nilai `IamAuthEnabled` parameter ke true.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Cluster Amazon Neptunus - Contoh

Neptunus Cluster dikonfigurasi AWS dengan otentikasi database IAM diaktifkan. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
    "NeptuneDBCluster": {
        "Type": "AWS::Neptune::DBCluster",
        "Properties": {
            "IamAuthEnabled": true
        }
    }
}
```

Contoh YAMAL

```
NeptuneDBCluster:
  Type: AWS::Neptune::DBCluster
  Properties:
    IamAuthEnabled: true
```

Spesifikasi aturan CT.NEPTUNE.PR.1

```
# ####################################
##       Rule Specification        ##
####################################
#
# Rule Identifier:
#   neptune_cluster_iam_database_authentication_check
#
# Description:
#   This control checks whether an Amazon Neptune cluster has AWS Identity and Access
 Management (IAM) database authentication enabled.
#
# Reports on:
#   AWS::Neptune::DBCluster
#
# Evaluates:
# AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
```

```
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document does not contain any Neptune DB cluster resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a Neptune DB cluster resource
#       And: 'IamAuthEnabled' has not been provided
#      Then: FAIL
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a Neptune DB cluster resource
#       And: 'IamAuthEnabled' has been provided and set to a value other than
 bool(true)
#      Then: FAIL
#   Scenario: 4
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a Neptune DB cluster resource
#       And: 'IamAuthEnabled' has been provided and set to bool(true)
#      Then: PASS

 is_cfn_hook(%INPUT_DOCUMENT, %NEPTUNE_CLUSTER_TYPE) {
    check(%INPUT_DOCUMENT.%NEPTUNE_CLUSTER_TYPE.resourceProperties)
        <<
        [CT.NEPTUNE.PR.1]: Require an Amazon Neptune DB cluster to have AWS Identity
 and Access Management (IAM) database authentication enabled
        [FIX]: Set the value of the 'IamAuthEnabled' parameter to true.
        >>
}

#
# Parameterized Rules
#
rule check(neptune_cluster) {
    %neptune_cluster {
        # Scenario 2
        IamAuthEnabled exists
        # Scenarios 3 and 4
        IamAuthEnabled == true
    }
}

#
# Utility Rules
#
rule is_cfn_template(doc) {
    %doc {
        AWSTemplateFormatVersion exists  or
        Resources exists
    }
}

rule is_cfn_hook(doc, RESOURCE_TYPE) {
    %doc.%RESOURCE_TYPE.resourceProperties exists
```

```
}
```

CT.NEPTUNE.PR.1 contoh templat

Anda dapat melihat contoh artefak pengujian PASS dan FAIL untuk kontrol proaktif AWS Control Tower.

Contoh PASS - Gunakan template ini untuk memverifikasi pembuatan sumber daya yang sesuai.

```
Resources:
  NeptuneDBCluster:
    Type: AWS::Neptune::DBCluster
    Properties:
      IamAuthEnabled: true
```

Contoh GAGAL - Gunakan templat ini untuk memverifikasi bahwa kontrol mencegah pembuatan sumber daya yang tidak sesuai.

```
Resources:
  NeptuneDBCluster:
    Type: AWS::Neptune::DBCluster
    Properties:
      IamAuthEnabled: false
```

[CT.NEPTUNE.PR.2] Memerlukan cluster DB Amazon Neptunus agar perlindungan penghapusan diaktifkan

Kontrol ini memeriksa apakah klaster Amazon Neptunus mengaktifkan perlindungan penghapusan.

- Tujuan kontrol: Tingkatkan ketersediaan, Lindungi konfigurasi
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::Neptune::DBCluster`

- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.NEPTUNE.PR.2

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.NEPTUNE.PR.2
- Untuk contoh CloudFormation template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.NEPTUNE.PR.2 contoh template

Penjelasan

Perlindungan penghapusan klaster menambahkan lapisan perlindungan tambahan terhadap penghapusan database yang tidak disengaja, atau penghapusan oleh entitas yang tidak sah. Cluster Neptunus tidak dapat dihapus saat perlindungan penghapusan diaktifkan. Perlindungan penghapusan harus dinonaktifkan terlebih dahulu, sebelum permintaan penghapusan berhasil.

Remediasi untuk kegagalan aturan

Tetapkan nilai `DeletionProtection` parameter ke true.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Cluster Amazon Neptunus - Contoh

Cluster Amazon Neptunus yang dikonfigurasi dengan perlindungan penghapusan diaktifkan. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
    "NeptuneDBCluster": {
        "Type": "AWS::Neptune::DBCluster",
        "Properties": {
            "DeletionProtection": true
        }
    }
}
```

Contoh YAMAL

```
NeptuneDBCluster:
  Type: AWS::Neptune::DBCluster
  Properties:
    DeletionProtection: true
```

Spesifikasi aturan CT.NEPTUNE.PR.2

```

CT.NEPTUNE.PR.2 contoh template

Anda dapat melihat contoh artefak pengujian PASS dan FAIL untuk kontrol proaktif AWS Control Tower.

Contoh PASS - Gunakan template ini untuk memverifikasi pembuatan sumber daya yang sesuai.

```
Resources:
```

```
  NeptuneDBCluster:
    Type: AWS::Neptune::DBCluster
    Properties:
      DeletionProtection: true
```

Contoh GAGAL - Gunakan templat ini untuk memverifikasi bahwa kontrol mencegah pembuatan sumber daya yang tidak sesuai.

```
Resources:
  NeptuneDBCluster:
    Type: AWS::Neptune::DBCluster
    Properties:
      DeletionProtection: false
```

[CT.NEPTUNE.PR.3] Memerlukan cluster DB Amazon Neptunus agar enkripsi penyimpanan diaktifkan

Kontrol ini memeriksa apakah kluster Amazon Neptunus mengaktifkan enkripsi penyimpanan.

- Tujuan kontrol: Enkripsi data saat istirahat
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::Neptune::DBCluster`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.NEPTUNE.PR.3

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.NEPTUNE.PR.3
- Untuk contoh CloudFormation template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.NEPTUNE.PR.3 contoh templat

Penjelasan

Instans terenkripsi Neptunus menyediakan lapisan perlindungan data tambahan, karena mereka membantu mengamankan data Anda dari akses tidak sah ke penyimpanan yang mendasarinya. Enkripsi Neptunus membantu meningkatkan perlindungan data aplikasi Anda yang digunakan di cloud. Anda juga dapat menggunakannya untuk memenuhi persyaratan kepatuhan untuk data-at-rest enkripsi.

Pertimbangan penggunaan

- Kontrol ini hanya memeriksa apakah `StorageEncrypted` properti disediakan dan disetel ke `true.` Saat Anda membuat instans DB Neptunus terenkripsi, Anda juga dapat menyediakan pengenal kunci AWS KMS untuk kunci enkripsi Anda melalui properti. `KmsKeyId` Jika Anda tidak menentukan pengenal kunci AWS KMS, Neptunus menggunakan kunci enkripsi Amazon RDS default (aws/rds) untuk instans DB Neptunus baru Anda.

Remediasi untuk kegagalan aturan

Atur `StorageEncrypted` ke `true`.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Cluster Amazon Neptunus - Contoh

Cluster Amazon Neptunus yang dikonfigurasi dengan enkripsi penyimpanan diaktifkan. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
    "NeptuneDBCluster": {
        "Type": "AWS::Neptune::DBCluster",
        "Properties": {
            "StorageEncrypted": true
        }
    }
}
```

Contoh YAMAL

```
NeptuneDBCluster:
  Type: AWS::Neptune::DBCluster
  Properties:
    StorageEncrypted: true
```

Spesifikasi aturan CT.NEPTUNE.PR.3

```

```

[CT.NEPTUNE.PR.4] Memerlukan klaster DB Amazon Neptunus untuk mengaktifkan ekspor CloudWatch Amazon Log untuk log audit

Kontrol ini memeriksa apakah klaster Amazon Neptunus dikonfigurasi untuk mengirim log audit ke Amazon Logs. CloudWatch

- Tujuan kontrol: Menetapkan pencatatan dan pemantauan
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::Neptune::DBCluster`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.NEPTUNE.PR.4

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.NEPTUNE.PR.4
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.NEPTUNE.PR.4 contoh templat

Penjelasan

Anda dapat mengonfigurasi kluster Amazon Neptunus DB untuk mempublikasikan data log audit ke grup log di Amazon Logs. CloudWatch Menyimpan data log audit klaster Neptunus DB di CloudWatch Amazon Logs memungkinkan Anda melakukan analisis data log secara real-time, dan juga menggunakan CloudWatch Amazon untuk membuat alarm dan melihat metrik.

Remediasi untuk kegagalan aturan

Dalam `EnableCloudwatchLogsExports` parameter, atur entri ke audit nilai.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Cluster Amazon Neptunus - Contoh

Cluster Amazon Neptunus yang dikonfigurasi untuk mengekspor log audit ke Amazon Logs. CloudWatch Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
    "NeptuneDBCluster": {
        "Type": "AWS::Neptune::DBCluster",
        "Properties": {
            "EnableCloudwatchLogsExports": [
                "audit"
            ]
        }
    }
}
```

Contoh YAMAL

```
NeptuneDBCluster:
  Type: AWS::Neptune::DBCluster
  Properties:
    EnableCloudwatchLogsExports:
      - audit
```

Spesifikasi aturan CT.NEPTUNE.PR.4

```

[CT.NEPTUNE.PR.5] Memerlukan cluster DB Amazon Neptunus untuk mengatur periode retensi cadangan lebih besar dari atau sama dengan tujuh hari

Kontrol ini memeriksa apakah kluster Amazon Neptunus DB telah mengonfigurasi pencadangan otomatis dengan periode retensi yang disetel ke 7 hari atau lebih (>=7). Periode retensi default adalah satu hari.

- Tujuan kontrol: Meningkatkan ketahanan
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::Neptune::DBCluster`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.NEPTUNE.PR.5

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.NEPTUNE.PR.5

- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.NEPTUNE.PR.5 contoh templat

Penjelasan

Amazon Neptunus mencadangkan volume cluster Anda secara otomatis, dan menyimpan data pemulihan selama periode retensi cadangan. Backup bersifat kontinu dan inkremental. Anda dapat mengembalikan ke titik mana pun dalam periode retensi cadangan, dengan cepat. Tidak ada dampak performa atau gangguan layanan basis data yang terjadi saat data cadangan ditulis.

Remediasi untuk kegagalan aturan

Atur `BackupRetentionPeriod` parameter ke nilai integer antara 7 dan 35 hari (inklusif).

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Cluster Amazon Neptunus - Contoh

Cluster Amazon Neptunus yang dikonfigurasi dengan periode retensi cadangan tujuh (7) hari. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
    "NeptuneDBCluster": {
        "Type": "AWS::Neptune::DBCluster",
        "Properties": {
            "BackupRetentionPeriod": 7
        }
    }
}
```

Contoh YAMAL

```
NeptuneDBCluster:
  Type: AWS::Neptune::DBCluster
  Properties:
    BackupRetentionPeriod: 7
```

Spesifikasi aturan CT.NEPTUNE.PR.5

```

CT.NEPTUNE.PR.5 contoh templat

Anda dapat melihat contoh artefak pengujian PASS dan FAIL untuk kontrol proaktif AWS Control Tower.

Contoh PASS - Gunakan template ini untuk memverifikasi pembuatan sumber daya yang sesuai.

```
Resources:
  NeptuneDBCluster:
    Type: AWS::Neptune::DBCluster
```

```
    Properties:
      BackupRetentionPeriod: 7
```

Contoh GAGAL - Gunakan templat ini untuk memverifikasi bahwa kontrol mencegah pembuatan sumber daya yang tidak sesuai.

```
Resources:
  NeptuneDBCluster:
    Type: AWS::Neptune::DBCluster
    Properties:
      BackupRetentionPeriod: 1
```

AWS Network Firewall kontrol

Topik

- [CT.NETWORK-FIREWALL.PR.1] Memerlukan kebijakan AWS Network Firewall firewall apa pun untuk memiliki grup aturan terkait
- [CT.NETWORK-FIREWALL.PR.2] Memerlukan kebijakan AWS Network Firewall firewall apa pun untuk menjatuhkan atau meneruskan paket penuh stateless secara default ketika tidak cocok dengan aturan
- [CT.NETWORK-FIREWALL.PR.3] Memerlukan kebijakan AWS Network Firewall firewall apa pun untuk menjatuhkan atau meneruskan paket yang terfragmentasi secara default ketika tidak cocok dengan aturan stateless
- [CT.NETWORK-FIREWALL.PR.4] Mewajibkan grup AWS Network Firewall aturan apa pun untuk memuat setidaknya satu aturan
- [CT.NETWORK-FIREWALL.PR.5] Memerlukan AWS Network Firewall firewall untuk digunakan di beberapa Availability Zone

[CT.NETWORK-FIREWALL.PR.1] Memerlukan kebijakan AWS Network Firewall firewall apa pun untuk memiliki grup aturan terkait

Kontrol ini memeriksa apakah ada setidaknya satu grup aturan stateful atau stateless yang terkait dengan kebijakan firewall. AWS Network Firewall

- Tujuan kontrol: Batasi akses jaringan
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::NetworkFirewall::FirewallPolicy`
- AWS CloudFormation aturan penjaga: CT.NETWORK-FIREWALL.PR.1spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.NETWORK-FIREWALL.PR.1spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.NETWORK-FIREWALL.PR.1contoh template

Penjelasan

Kebijakan firewall menentukan cara firewall Anda memantau dan menangani lalu lintas di Amazon Virtual Private Cloud (Amazon VPC). Konfigurasi kelompok aturan stateless dan stateful membantu memfilter paket dan arus lalu lintas, dan untuk menentukan pengaturan penanganan lalu lintas default.

Remediasi untuk kegagalan aturan

Dalam `FirewallPolicy` definisi, lihat satu atau lebih kelompok aturan di `StatefulRuleGroupReferences` atau`StatelessRuleGroupReferences`.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

AWS Network Firewall Kebijakan Firewall - Contoh

AWS Network Firewall kebijakan firewall dikonfigurasi dengan asosiasi grup aturan stateful dan stateless. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
    "FirewallPolicy": {
        "Type": "AWS::NetworkFirewall::FirewallPolicy",
        "Properties": {
```

```
            "FirewallPolicyName": "sample-firewall-policy",
            "FirewallPolicy": {
                "StatelessDefaultActions": [
                    "aws:forward_to_sfe"
                ],
                "StatelessFragmentDefaultActions": [
                    "aws:drop"
                ],
                "StatefulRuleGroupReferences": [
                    {
                        "ResourceArn": {
                            "Ref": "StatefulRuleGroup"
                        }
                    }
                ],
                "StatelessRuleGroupReferences": [
                    {
                        "ResourceArn": {
                            "Ref": "StatelessRuleGroup"
                        },
                        "Priority": 100
                    }
                ]
            }
        }
    }
}
```

Contoh YAMAL

```
FirewallPolicy:
  Type: AWS::NetworkFirewall::FirewallPolicy
  Properties:
    FirewallPolicyName: sample-firewall-policy
    FirewallPolicy:
      StatelessDefaultActions:
        - aws:forward_to_sfe
      StatelessFragmentDefaultActions:
        - aws:drop
      StatefulRuleGroupReferences:
        - ResourceArn: !Ref 'StatefulRuleGroup'
```

```
      StatelessRuleGroupReferences:
        - ResourceArn: !Ref 'StatelessRuleGroup'
          Priority: 100
```

```

[CT.NETWORK-FIREWALL.PR.2] Memerlukan kebijakan AWS Network Firewall firewall apa pun untuk menjatuhkan atau meneruskan paket penuh stateless secara default ketika tidak cocok dengan aturan

Kontrol ini memeriksa apakah kebijakan AWS Network Firewall firewall dikonfigurasi dengan tindakan default stateless yang ditentukan pengguna untuk paket lengkap.

- Tujuan kontrol: Batasi akses jaringan
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::NetworkFirewall::FirewallPolicy`
- AWS CloudFormation aturan penjaga: CT.NETWORK-FIREWALL.PR.2spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.NETWORK-FIREWALL.PR.2spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.NETWORK-FIREWALL.PR.2contoh template

Penjelasan

Kebijakan firewall menentukan bagaimana firewall Anda memantau dan menangani lalu lintas di Amazon VPC. Anda mengonfigurasi grup aturan stateless dan stateful untuk memfilter paket dan arus lalu lintas. Default untuk `Pass` dapat memungkinkan lalu lintas yang tidak diinginkan.

Remediasi untuk kegagalan aturan

Di dalam`FirewallPolicy`, termasuk salah satu `aws:drop` atau `aws:forward_to_sfe` di`StatelessDefaultActions`.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

AWS Network Firewall Kebijakan Firewall - Contoh Satu

AWS Network Firewall kebijakan firewall dikonfigurasi dengan tindakan default stateless untuk menjatuhkan paket penuh. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
    "FirewallPolicy": {
        "Type": "AWS::NetworkFirewall::FirewallPolicy",
        "Properties": {
            "FirewallPolicyName": {
                "Fn::Sub": "${AWS::StackName}-sample"
            },
            "FirewallPolicy": {
                "StatelessFragmentDefaultActions": [
                    "aws:forward_to_sfe"
                ],
                "StatelessDefaultActions": [
                    "aws:drop"
                ]
            }
        }
    }
}
```

Contoh YAMAL

```
FirewallPolicy:
  Type: AWS::NetworkFirewall::FirewallPolicy
  Properties:
    FirewallPolicyName: !Sub '${AWS::StackName}-sample'
    FirewallPolicy:
      StatelessFragmentDefaultActions:
        - aws:forward_to_sfe
      StatelessDefaultActions:
        - aws:drop
```

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

AWS Network Firewall Kebijakan Firewall - Contoh Dua

AWS Network Firewall kebijakan firewall dikonfigurasi dengan tindakan default stateless untuk meneruskan paket penuh ke mesin aturan stateful untuk pemeriksaan lebih lanjut. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
    "FirewallPolicy": {
        "Type": "AWS::NetworkFirewall::FirewallPolicy",
        "Properties": {
            "FirewallPolicyName": {
                "Fn::Sub": "${AWS::StackName}-sample"
            },
            "FirewallPolicy": {
                "StatelessFragmentDefaultActions": [
                    "aws:forward_to_sfe"
                ],
                "StatelessDefaultActions": [
                    "aws:forward_to_sfe"
                ]
            }
        }
    }
}
```

Contoh YAMAL

```
FirewallPolicy:
  Type: AWS::NetworkFirewall::FirewallPolicy
  Properties:
    FirewallPolicyName: !Sub '${AWS::StackName}-sample'
    FirewallPolicy:
      StatelessFragmentDefaultActions:
        - aws:forward_to_sfe
      StatelessDefaultActions:
        - aws:forward_to_sfe
```

CT.NETWORK-FIREWALL.PR.2contoh template

Anda dapat melihat contoh artefak pengujian PASS dan FAIL untuk kontrol proaktif AWS Control Tower.

Contoh PASS - Gunakan template ini untuk memverifikasi pembuatan sumber daya yang sesuai.

```
Resources:
  FirewallPolicy:
    Type: AWS::NetworkFirewall::FirewallPolicy
    Properties:
      FirewallPolicyName:
        Fn::Sub: ${AWS::StackName}-example
      FirewallPolicy:
        StatelessFragmentDefaultActions:
        - aws:forward_to_sfe
        StatelessDefaultActions:
        - aws:drop
```

Contoh GAGAL - Gunakan templat ini untuk memverifikasi bahwa kontrol mencegah pembuatan sumber daya yang tidak sesuai.

```
Resources:
  FirewallPolicy:
    Type: AWS::NetworkFirewall::FirewallPolicy
    Properties:
      FirewallPolicyName:
```

```
        Fn::Sub: ${AWS::StackName}-example
      FirewallPolicy:
        StatelessFragmentDefaultActions:
        - aws:pass
        StatelessDefaultActions:
        - aws:pass
```

[CT.NETWORK-FIREWALL.PR.3] Memerlukan kebijakan AWS Network Firewall firewall apa pun untuk menjatuhkan atau meneruskan paket yang terfragmentasi secara default ketika tidak cocok dengan aturan stateless

Kontrol ini memeriksa apakah kebijakan AWS Network Firewall firewall dikonfigurasi dengan tindakan default untuk menjatuhkan atau meneruskan paket terfragmentasi, ketika paket tidak cocok dengan aturan stateless.

- Tujuan kontrol: Batasi akses jaringan
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::NetworkFirewall::FirewallPolicy`
- AWS CloudFormation aturan penjaga: CT.NETWORK-FIREWALL.PR.3spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.NETWORK-FIREWALL.PR.3spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.NETWORK-FIREWALL.PR.3contoh template

Penjelasan

Kebijakan firewall menentukan bagaimana firewall Anda memantau dan menangani lalu lintas di Amazon VPC. Anda mengonfigurasi grup aturan stateless dan stateful untuk memfilter paket dan arus lalu lintas. Default untuk `Pass` dapat memungkinkan lalu lintas yang tidak diinginkan.

Remediasi untuk kegagalan aturan

Di dalam`FirewallPolicy`, termasuk salah satu `aws:drop` atau `aws:forward_to_sfe` di`StatelessFragmentDefaultActions`.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

AWS Network Firewall Kebijakan Firewall - Contoh Satu

AWS Network Firewall kebijakan firewall dikonfigurasi dengan tindakan default stateless untuk menjatuhkan paket yang terfragmentasi. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
    "FirewallPolicy": {
        "Type": "AWS::NetworkFirewall::FirewallPolicy",
        "Properties": {
            "FirewallPolicyName": {
                "Fn::Sub": "${AWS::StackName}-sample"
            },
            "FirewallPolicy": {
                "StatelessDefaultActions": [
                    "aws:forward_to_sfe"
                ],
                "StatelessFragmentDefaultActions": [
                    "aws:drop"
                ]
            }
        }
    }
}
```

Contoh YAMAL

```
FirewallPolicy:
  Type: AWS::NetworkFirewall::FirewallPolicy
  Properties:
    FirewallPolicyName: !Sub '${AWS::StackName}-sample'
    FirewallPolicy:
```

```
      StatelessDefaultActions:
        - aws:forward_to_sfe
      StatelessFragmentDefaultActions:
        - aws:drop
```

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

AWS Network Firewall Kebijakan Firewall - Contoh Dua

AWS Network Firewall kebijakan firewall dikonfigurasi dengan tindakan default stateless untuk meneruskan paket terfragmentasi ke mesin aturan stateful untuk pemeriksaan lebih lanjut. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
    "FirewallPolicy": {
        "Type": "AWS::NetworkFirewall::FirewallPolicy",
        "Properties": {
            "FirewallPolicyName": {
                "Fn::Sub": "${AWS::StackName}-sample"
            },
            "FirewallPolicy": {
                "StatelessDefaultActions": [
                    "aws:forward_to_sfe"
                ],
                "StatelessFragmentDefaultActions": [
                    "aws:forward_to_sfe"
                ]
            }
        }
    }
}
```

Contoh YAMAL

```
FirewallPolicy:
```

```
  Type: AWS::NetworkFirewall::FirewallPolicy
  Properties:
    FirewallPolicyName: !Sub '${AWS::StackName}-sample'
    FirewallPolicy:
      StatelessDefaultActions:
        - aws:forward_to_sfe
      StatelessFragmentDefaultActions:
        - aws:forward_to_sfe
```

CT.NETWORK-FIREWALL.PR.3spesifikasi aturan

```
# ####################################
##       Rule Specification        ##
####################################
#
# Rule Identifier:
#   netfw_policy_default_action_fragment_packets_check
#
# Description:
#   This control checks whether an AWS Network Firewall firewall policy is configured
 with a default action to drop or forward fragmented packets, when the packets do not
 match a stateless rule.
#
# Reports on:
#   AWS::NetworkFirewall::FirewallPolicy
#
# Evaluates:
# AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document does not contain any Network Firewall firewall policy
 resources
#      Then: SKIP
#   Scenario: 2
```

```
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a Network Firewall firewall policy resource
#       And: 'StatelessFragmentDefaultActions' has not been provided in
 'FirewallPolicy'
#      Then: FAIL
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a Network Firewall firewall policy resource
#       And: 'StatelessFragmentDefaultActions' has been provided in 'FirewallPolicy' as
 an empty list
#      Then: FAIL
#   Scenario: 4
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a Network Firewall firewall policy resource
#       And: 'StatelessFragmentDefaultActions' has been provided in 'FirewallPolicy' as
 a list that does not contain
#             one of 'aws:drop' or 'aws:forward_to_sfe'
#      Then: FAIL
#   Scenario: 5
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a Network Firewall firewall policy resource
#       And: 'StatelessFragmentDefaultActions' has been provided in 'FirewallPolicy' as
 a list that contains either
#            'aws:drop' or 'aws:forward_to_sfe'
#      Then: PASS

#
# Constants

```

CT.NETWORK-FIREWALL.PR.3contoh template

Anda dapat melihat contoh artefak pengujian PASS dan FAIL untuk kontrol proaktif AWS Control Tower.

Contoh PASS - Gunakan template ini untuk memverifikasi pembuatan sumber daya yang sesuai.

```
Resources:
  FirewallPolicy:
    Type: AWS::NetworkFirewall::FirewallPolicy
    Properties:
      FirewallPolicyName:
        Fn::Sub: ${AWS::StackName}-example
      FirewallPolicy:
        StatelessDefaultActions:
        - aws:forward_to_sfe
        StatelessFragmentDefaultActions:
        - aws:drop
```

Contoh GAGAL - Gunakan templat ini untuk memverifikasi bahwa kontrol mencegah pembuatan sumber daya yang tidak sesuai.

```
Resources:
  FirewallPolicy:
    Type: AWS::NetworkFirewall::FirewallPolicy
    Properties:
      FirewallPolicyName:
        Fn::Sub: ${AWS::StackName}-example
      FirewallPolicy:
        StatelessDefaultActions:
        - aws:pass
        StatelessFragmentDefaultActions:
        - aws:pass
```

[CT.NETWORK-FIREWALL.PR.4] Mewajibkan grup AWS Network Firewall aturan apa pun untuk memuat setidaknya satu aturan

Kontrol ini memeriksa apakah grup aturan AWS Network Firewall stateless berisi aturan.

- Tujuan kontrol: Batasi akses jaringan
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::NetworkFirewall::RuleGroup`
- AWS CloudFormation aturan penjaga: CT.NETWORK-FIREWALL.PR.4spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.NETWORK-FIREWALL.PR.4spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.NETWORK-FIREWALL.PR.4contoh template

Penjelasan

Grup aturan berisi aturan yang menentukan bagaimana firewall Anda memproses lalu lintas di VPC Anda. Grup aturan tanpa kewarganegaraan yang kosong, ketika ada dalam kebijakan firewall, mungkin memberi kesan bahwa grup aturan akan memproses lalu lintas. Namun, ketika grup aturan stateless kosong, itu tidak memproses lalu lintas.

> Pertimbangan penggunaan
>
> - Kontrol ini hanya berlaku untuk kelompok aturan AWS Network Firewall tanpa kewarganegaraan.

Remediasi untuk kegagalan aturan

Berikan satu atau lebih aturan AWS Network Firewall tanpa kewarganegaraan di dalam `RuleGroup.RulesSource.StatelessRulesAndCustomActions.StatelessRules` properti.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

AWS Network Firewall Grup Aturan - Contoh

AWS Network Firewall grup aturan dikonfigurasi dengan aturan stateless. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
    "NetworkFirewallRuleGroup": {
        "Type": "AWS::NetworkFirewall::RuleGroup",
        "Properties": {
            "RuleGroupName": {
                "Fn::Sub": "${AWS::StackName}-sample"
            },
            "Capacity": 100,
            "Description": "Sample rule group",
            "Type": "STATELESS",
            "RuleGroup": {
                "RulesSource": {
                    "StatelessRulesAndCustomActions": {
                        "StatelessRules": [
                            {
                                "RuleDefinition": {
```

```
                                        "MatchAttributes": {
                                            "Sources": [
                                                {
                                                    "AddressDefinition": "0.0.0.0/0"
                                                }
                                            ],

```

[CT.NETWORK-FIREWALL.PR.5] Memerlukan AWS Network Firewall firewall untuk digunakan di beberapa Availability Zone

Kontrol ini memeriksa apakah AWS Network Firewall firewall digunakan di beberapa Availability Zones (AZ), untuk mengizinkan failover otomatis antara AZ.

- Tujuan kontrol: Meningkatkan ketahanan
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::NetworkFirewall::Firewall`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.NETWORK-FIREWALL.PR.5

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.NETWORK-FIREWALL.PR.5
- Untuk contoh AWS CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.NETWORK-FIREWALL.PR.5 contoh template

Penjelasan

Infrastruktur AWS global dibangun di sekitar Wilayah AWS dan Availability Zones. Wilayah AWS menyediakan beberapa Availability Zones (AZ), terpisah secara fisik dan terisolasi. AZ ini dihubungkan oleh latensi rendah, throughput tinggi, dan jaringan yang sangat redundan. Anda dapat merancang dan mengoperasikan aplikasi dan database yang gagal di antara Availability Zones tanpa gangguan, secara otomatis. Availability Zone lebih tersedia, toleran terhadap kesalahan, dan skalabel daripada infrastruktur pusat data tunggal atau ganda tradisional.

Remediasi untuk kegagalan aturan

Dalam SubnetMappings parameter, berikan setidaknya dua entri yang merujuk ke subnet di Availability Zone yang berbeda.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

AWS Network Firewall Firewall - Contoh

AWS Network Firewall Firewall dikonfigurasi untuk menyebarkan di dua subnet di Availability Zone yang berbeda. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
    "Firewall": {
        "Type": "AWS::NetworkFirewall::Firewall",
        "Properties": {
            "FirewallName": "SampleFirewall",
            "FirewallPolicyArn": {
                "Ref": "FirewallPolicy"
            },
            "VpcId": {
                "Ref": "VPC"
            },
            "Description": "Sample firewall",
            "SubnetMappings": [
                {
                    "SubnetId": {
                        "Ref": "SubnetOne"
                    }
                },
                {
```

```
                    "SubnetId": {
                        "Ref": "SubnetTwo"
                    }
                }
            ]
        }
    }
}
```

Contoh YAMAL

```
Firewall:
  Type: AWS::NetworkFirewall::Firewall
  Properties:
    FirewallName: SampleFirewall
    FirewallPolicyArn: !Ref 'FirewallPolicy'
    VpcId: !Ref 'VPC'
    Description: Sample firewall
    SubnetMappings:
      - SubnetId: !Ref 'SubnetOne'
      - SubnetId: !Ref 'SubnetTwo'
```

Spesifikasi aturan CT.NETWORK-FIREWALL.PR.5

```
# ####################################

- [CT.OPENSEARCH.PR.16] Memerlukan domain OpenSearch Layanan Amazon untuk menggunakan versi TLS minimum TLSv1.2

[CT.OPENSEARCH.PR.1] Memerlukan Elasticsearch domain untuk mengenkripsi data saat istirahat

Kontrol ini memeriksa apakah Elasticsearch domain telah encryption-at-rest diaktifkan.

- Tujuan kontrol: Enkripsi data saat istirahat
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::Elasticsearch::Domain`
- AWS CloudFormation aturan penjaga: CT.OPENSEARCH.PR.1spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.OPENSEARCH.PR.1spesifikasi aturan
- Untuk contoh AWS CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.OPENSEARCH.PR.1 contoh templat

Penjelasan

Untuk lapisan keamanan tambahan untuk data sensitif Anda OpenSearch, Anda harus mengonfigurasi Anda OpenSearch untuk dienkripsi saat istirahat. Domain Elasticsearch menawarkan enkripsi data saat istirahat. Fitur ini digunakan AWS KMS untuk menyimpan dan mengelola kunci enkripsi Anda. Untuk melakukan enkripsi, ia menggunakan algoritma Advanced Encryption Standard dengan kunci 256-bit (AES-256).

Remediasi untuk kegagalan aturan

Di dalam`EncryptionAtRestOptions`, atur `Enabled` ke`true`.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Domain Elasticsearch - Contoh

Domain Elasticsearch dikonfigurasi dengan encryption-at-rest diaktifkan. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
    "ElasticsearchDomain": {
        "Type": "AWS::Elasticsearch::Domain",
        "Properties": {
```

```
            "ElasticsearchVersion": 7.1,
            "ElasticsearchClusterConfig": {
                "InstanceCount": "1",
                "InstanceType": "t3.small.elasticsearch"
            },
            "EBSOptions": {
                "EBSEnabled": true,

```

[CT.OPENSEARCH.PR.2] Memerlukan Elasticsearch domain untuk dibuat di VPC Amazon yang ditentukan pengguna

Kontrol ini memeriksa apakah Elasticsearch domain dikonfigurasi dengan pengaturan opsi VPC yang menentukan target Amazon VPC.

- Tujuan kontrol: Batasi akses jaringan
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::Elasticsearch::Domain`
- AWS CloudFormation aturan penjaga: Spesifikasi T.OPENSEARCH.PR.2 aturan C

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi T.OPENSEARCH.PR.2 aturan C

- Untuk contoh AWS CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.OPENSEARCH.PR.2 contoh template

Penjelasan

Domain Elasticsearch yang digunakan dalam VPC dapat berkomunikasi dengan sumber daya VPC melalui jaringan AWS pribadi, tanpa perlu melintasi internet publik. Konfigurasi ini meningkatkan postur keamanan dengan membatasi akses ke data dalam perjalanan. VPC menyediakan sejumlah kontrol jaringan yang membantu menciptakan akses aman ke domain Elasticsearch, termasuk ACL jaringan dan grup keamanan. Security Hub merekomendasikan agar Anda memigrasikan domain Elasticsearch publik ke VPC untuk memanfaatkan kontrol ini.

Remediasi untuk kegagalan aturan

Di dalam`VPCOptions`, atur `SubnetIds` ke daftar dengan satu atau beberapa ID subnet Amazon EC2.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Domain Elasticsearch - Contoh

Domain Elasticsearch yang dikonfigurasi untuk digunakan dalam VPC Amazon melalui pengaturan opsi VPC. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
    "ElasticsearchDomain": {
        "Type": "AWS::Elasticsearch::Domain",

[CT.OPENSEARCH.PR.3] Memerlukan Elasticsearch domain untuk mengenkripsi data yang dikirim antar node

Kontrol ini memeriksa apakah Elasticsearch domain telah mengaktifkan node-to-node enkripsi.

- Tujuan kontrol: Enkripsi data dalam perjalanan
- Implementasi: aturan AWS CloudFormation penjaga

- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::Elasticsearch::Domain`
- AWS CloudFormation aturan penjaga: CT.OPENSEARCH.PR.3spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.OPENSEARCH.PR.3spesifikasi aturan
- Untuk contoh AWS CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.OPENSEARCH.PR.3 contoh templat

Penjelasan

HTTPS (TLS) dapat membantu mencegah penyerang potensial menguping atau memanipulasi lalu lintas jaringan menggunakan, atau serangan serupa. person-in-the-middle Hanya koneksi terenkripsi melalui HTTPS (TLS) yang diizinkan. Mengaktifkan node-to-node enkripsi untuk domain Elasticsearch memastikan bahwa komunikasi intra-cluster dienkripsi dalam perjalanan.

> Pertimbangan penggunaan
>
> - Penalti kinerja dapat dikaitkan dengan konfigurasi ini. Anda harus mengetahui dan menguji trade-off kinerja sebelum mengaktifkan opsi ini.

Remediasi untuk kegagalan aturan

Di dalam`NodeToNodeEncryptionOptions`, atur `Enabled` ke`true`.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Domain Elasticsearch - Contoh

Domain Elasticsearch yang dikonfigurasi dengan node-to-node enkripsi diaktifkan. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
    "ElasticsearchDomain": {
        "Type": "AWS::Elasticsearch::Domain",

```

[CT.OPENSEARCH.PR.4] Memerlukan Elasticsearch domain untuk mengirim log kesalahan ke Amazon CloudWatch Logs

Kontrol ini memeriksa apakah Elasticsearch domain dikonfigurasi untuk mengirim log kesalahan ke grup CloudWatch log Amazon Logs.

- Tujuan kontrol: Menetapkan pencatatan dan pemantauan
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::Elasticsearch::Domain`

- AWS CloudFormation aturan penjaga: CT.OPENSEARCH.PR.4spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.OPENSEARCH.PR.4spesifikasi aturan
- Untuk contoh AWS CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.OPENSEARCH.PR.4 contoh templat

Penjelasan

Aktifkan log kesalahan (ES_APPLICATION_LOGS) untuk domain Elasticsearch dan kirim log tersebut ke Log untuk penyimpanan dan respons. CloudWatch Log kesalahan domain dapat membantu audit keamanan dan akses, dan dapat membantu mendiagnosis masalah ketersediaan.

Remediasi untuk kegagalan aturan

Di dalamnya`LogPublishingOptions`, berikan `ES_APPLICATION_LOGS` konfigurasi, atur `Enabled` ke`true`, dan atur `CloudWatchLogsLogGroupArn` ke ARN grup CloudWatch log Amazon Logs yang valid.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Domain Elasticsearch - Contoh

Domain Elasticsearch dikonfigurasi untuk mengirim log kesalahan ke Amazon CloudWatch Logs. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
    "ElasticsearchDomain": {
        "Type": "AWS::Elasticsearch::Domain",
        "Properties": {
            "ElasticsearchVersion": 7.1,
            "ElasticsearchClusterConfig": {
                "InstanceCount": "1",
                "InstanceType": "t3.small.elasticsearch"
            },
```

```
            "EBSOptions": {
                "EBSEnabled": true,
                "Iops": "3000",
                "VolumeSize": "10",
                "VolumeType": "gp3"
            },
            "AccessPolicies": {
                "Version": "2012-10-17",
                "Statement": [
                    {
                        "Effect": "Deny",
                        "Principal": {
                            "AWS": "*"
                        },
                        "Action": "es:*",
                        "Resource": "*"
                    }
                ]
            },
            "LogPublishingOptions": {
                "ES_APPLICATION_LOGS": {
                    "CloudWatchLogsLogGroupArn": {
                        "Fn::GetAtt": [
                            "LogGroup",
                            "Arn"
                        ]
                    },
                    "Enabled": true
                }
            }
        }
    }
}
```

Contoh YAMAL

```
ElasticsearchDomain:
  Type: AWS::Elasticsearch::Domain
  Properties:
    ElasticsearchVersion: 7.1
    ElasticsearchClusterConfig:
```

```
      InstanceCount: '1'
      InstanceType: t3.small.elasticsearch
    EBSOptions:
      EBSEnabled: true
      Iops: '3000'
      VolumeSize: '10'
      VolumeType: gp3
    AccessPolicies:
      Version: '2012-10-17'
      Statement:
        - Effect: Deny
          Principal:
            AWS: '*'
          Action: es:*

```

[CT.OPENSEARCH.PR.5] Memerlukan Elasticsearch domain untuk mengirim log audit ke Amazon CloudWatch Logs

Kontrol ini memeriksa apakah Elasticsearch domain dikonfigurasi untuk mengirim log audit ke grup CloudWatch log Amazon Logs.

- Tujuan kontrol: Menetapkan pencatatan dan pemantauan

- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::Elasticsearch::Domain`
- AWS CloudFormation aturan penjaga: CT.OPENSEARCH.PR.5spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.OPENSEARCH.PR.5spesifikasi aturan
- Untuk contoh AWS CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.OPENSEARCH.PR.5 contoh templat

Penjelasan

Log audit sangat dapat disesuaikan. Mereka memungkinkan Anda melacak aktivitas pengguna di cluster Elasticsearch Anda, termasuk keberhasilan dan kegagalan otentikasi, permintaan, perubahan indeks OpenSearch, dan kueri penelusuran yang masuk.

> Pertimbangan penggunaan
>
> - Kontrol ini mengharuskan domain Elasticsearch harus memiliki opsi keamanan lanjutan yang dikonfigurasi.
> - Untuk mengaktifkan opsi keamanan lanjutan pada domain Elasticsearch melalui `AdvancedSecurityOptions` properti, Anda harus mengaktifkan enkripsi data saat istirahat (dengan cara`EncryptionAtRestOptions`), node-to-node enkripsi (dengan cara`NodeToNodeEncryptionOptions`), dan menerapkan koneksi HTTPS (dengan cara). `DomainEndpointOptions`

Remediasi untuk kegagalan aturan

Di dalamnya`LogPublishingOptions`, berikan `AUDIT_LOGS` konfigurasi, atur `Enabled` ke`true`, dan atur `CloudWatchLogsLogGroupArn` ke ARN grup CloudWatch log Amazon Logs yang valid.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Domain Elasticsearch - Contoh

Domain Elasticsearch yang dikonfigurasi untuk mengirim log audit ke Amazon CloudWatch Logs. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```

[CT.OPENSEARCH.PR.6] Memerlukan Elasticsearch domain untuk memiliki kesadaran zona dan setidaknya tiga node data

Kontrol ini memeriksa apakah ElasticSearch domain dikonfigurasi dengan setidaknya tiga node data dan kesadaran zona diaktifkan.

- Tujuan kontrol: Meningkatkan ketersediaan
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::Elasticsearch::Domain`
- AWS CloudFormation aturan penjaga: CT.OPENSEARCH.PR.6spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.OPENSEARCH.PR.6spesifikasi aturan
- Untuk contoh AWS CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.OPENSEARCH.PR.6 contoh templat

Penjelasan

Domain Elasticsearch membutuhkan setidaknya tiga node data untuk ketersediaan tinggi dan toleransi kesalahan. Menerapkan domain Elasticsearch dengan setidaknya tiga node data memastikan bahwa operasi cluster dapat dilanjutkan jika node gagal.

Remediasi untuk kegagalan aturan

Di dalam`ElasticsearchClusterConfig`, atur `ZoneAwarenessEnabled` ke`true`, dan atur `InstanceCount` ke nilai integer lebih besar dari atau sama dengan tiga.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Domain Elasticsearch - Contoh

Domain Elasticsearch yang dikonfigurasi dengan tiga node data dan kesadaran zona diaktifkan. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
    "ElasticsearchDomain": {
        "Type": "AWS::Elasticsearch::Domain",

```

CT.OPENSEARCH.PR.6spesifikasi aturan

```
# ####################################
##       Rule Specification        ##
####################################
#
# Rule Identifier:
#   elasticsearch_data_node_fault_tolerance_check
#
# Description:
#   This control checks whether Elasticsearch domains are configured with at least
 three data nodes and zone awareness enabled.
#
# Reports on:
#   AWS::Elasticsearch::Domain
#
# Evaluates:
# AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document does not contain any Elasticsearch domain resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an Elasticsearch domain resource
#       And: 'ElasticsearchClusterConfig' has not been provided
#      Then: FAIL
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an Elasticsearch domain resource
#       And: 'ElasticsearchClusterConfig' has been provided
#       And: 'ZoneAwarenessEnabled' in 'ElasticsearchClusterConfig' has not been
 provided
#             or provided and set to a value other than bool(true)
#       And: 'InstanceCount' in 'ElasticsearchClusterConfig' has not been provided or
```

```
#             provided and set to an integer value less than three (< 3)
#      Then: FAIL
#   Scenario: 4
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an Elasticsearch domain resource
#       And: 'ElasticsearchClusterConfig' has been provided
#       And: 'ZoneAwarenessEnabled' in 'ElasticsearchClusterConfig' has been provided
#             and set to bool(true)
#       And: 'InstanceCount' in 'ElasticsearchClusterConfig' has not been provided or
#             provided and set to an integer value less than three (< 3)
#      Then: FAIL
#   Scenario: 5
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an Elasticsearch domain resource
#       And: 'ElasticsearchClusterConfig' has been provided
#       And: 'ZoneAwarenessEnabled' in 'ElasticsearchClusterConfig' has not been
 provided
#             or provided and set to a value other than bool(true)
#       And: 'InstanceCount' in 'ElasticsearchClusterConfig' has been provided and set
 to
#             an integer value greater than or equal to three (>= 3)
#      Then: FAIL
#   Scenario: 6
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an Elasticsearch domain resource
#       And: 'ElasticsearchClusterConfig' has been provided
#       And: 'ZoneAwarenessEnabled' in 'ElasticsearchClusterConfig' has been provided
#             and set to bool(true)
#       And: 'InstanceCount' in 'ElasticsearchClusterConfig' has been provided and set
 to
#             an integer value greater than or equal to three (>= 3)
#      Then: PASS

        InstanceCount: 2
```

[CT.OPENSEARCH.PR.7] Memerlukan Elasticsearch domain untuk memiliki setidaknya tiga node master khusus

Kontrol ini memeriksa apakah Elasticsearch domain dikonfigurasi dengan setidaknya tiga node master khusus.

- Tujuan kontrol: Meningkatkan ketersediaan
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::Elasticsearch::Domain`
- AWS CloudFormation aturan penjaga: CT.OPENSEARCH.PR.7 spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.OPENSEARCH.PR.7 spesifikasi aturan
- Untuk contoh AWS CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.OPENSEARCH.PR.7 contoh templat

Penjelasan

Domain Elasticsearch membutuhkan setidaknya tiga node master khusus untuk ketersediaan tinggi dan toleransi kesalahan. Sumber daya node master khusus dapat tegang selama penerapan biru/hijau simpul data, karena node tambahan harus dikelola. Menerapkan domain Elasticsearch dengan setidaknya tiga node master khusus memastikan bahwa kapasitas sumber daya node master yang cukup ada, dan operasi cluster dapat dilanjutkan jika node gagal.

Remediasi untuk kegagalan aturan

Di dalam`ElasticsearchClusterConfig`, atur `DedicatedMasterEnabled` ke`true`, dan atur `DedicatedMasterCount` ke nilai integer lebih besar dari atau sama dengan tiga, atau hilangkan `DedicatedMasterCount` properti untuk mengadopsi nilai default tiga.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Domain Elasticsearch - Contoh Satu

Domain Elasticsearch dikonfigurasi dengan tiga node master khusus melalui properti. `DedicatedMasterCount` Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
    "ElasticsearchDomain": {
        "Type": "AWS::Elasticsearch::Domain",
        "Properties": {
            "ElasticsearchVersion": 7.1,
            "EBSOptions": {
                "EBSEnabled": true,
                "Iops": "3000",
                "VolumeSize": "10",
                "VolumeType": "gp3"
            },
            "AccessPolicies": {
                "Version": "2012-10-17",
                "Statement": [
                    {
                        "Effect": "Deny",
                        "Principal": {
                            "AWS": "*"
                        },
                        "Action": "es:*",
                        "Resource": "*"
                    }
                ]
            },
            "ElasticsearchClusterConfig": {
                "InstanceType": "t3.small.elasticsearch",
                "DedicatedMasterEnabled": true,
                "DedicatedMasterCount": 3
            }
        }
    }
}
```

Contoh YAMAL

```
ElasticsearchDomain:
  Type: AWS::Elasticsearch::Domain
  Properties:
```

```
    ElasticsearchVersion: 7.1
    EBSOptions:
      EBSEnabled: true
      Iops: '3000'
      VolumeSize: '10'
      VolumeType: gp3
    AccessPolicies:
      Version: '2012-10-17'
      Statement:
        - Effect: Deny
          Principal:
            AWS: '*'
          Action: es:*
          Resource: '*'
    ElasticsearchClusterConfig:
      InstanceType: t3.small.elasticsearch
      DedicatedMasterEnabled: true
      DedicatedMasterCount: 3
```

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Domain Elasticsearch - Contoh Dua

Domain Elasticsearch dikonfigurasi dengan tiga node master khusus melalui default CloudFormation AWS. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
    "ElasticsearchDomain": {
        "Type": "AWS::Elasticsearch::Domain",
        "Properties": {
            "ElasticsearchVersion": 7.1,
            "EBSOptions": {
                "EBSEnabled": true,
                "Iops": "3000",
                "VolumeSize": "10",
                "VolumeType": "gp3"
            },
            "AccessPolicies": {
```

```
                "Version": "2012-10-17",
                "Statement": [
                    {
                        "Effect": "Deny",
                        "Principal": {
                            "AWS": "*"
                        },
                        "Action": "es:*",
                        "Resource": "*"
                    }
                ]
            },
            "ElasticsearchClusterConfig": {
                "InstanceType": "t3.small.elasticsearch",
                "DedicatedMasterEnabled": true
            }
        }
    }
}
```

Contoh YAMAL

```
ElasticsearchDomain:
  Type: AWS::Elasticsearch::Domain
  Properties:
    ElasticsearchVersion: 7.1
    EBSOptions:
      EBSEnabled: true
      Iops: '3000'
      VolumeSize: '10'
      VolumeType: gp3
    AccessPolicies:
      Version: '2012-10-17'
      Statement:
        - Effect: Deny
          Principal:
            AWS: '*'
          Action: es:*
          Resource: '*'
    ElasticsearchClusterConfig:
      InstanceType: t3.small.elasticsearch
```

```
      DedicatedMasterEnabled: true
```

CT.OPENSEARCH.PR.7 spesifikasi aturan

```
# ####################################
##       Rule Specification        ##
####################################
#
# Rule Identifier:
#   elasticsearch_primary_node_fault_tolerance_check
#
# Description:
#   This control checks whether Elasticsearch domains are configured with at least
 three dedicated master nodes.
#
# Reports on:
#   AWS::Elasticsearch::Domain
#
# Evaluates:
# AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document does not contain any Elasticsearch domain resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an Elasticsearch domain resource
#       And: 'ElasticsearchClusterConfig' has not been provided
#      Then: FAIL
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an Elasticsearch domain resource
```

```
#       And: 'ElasticsearchClusterConfig' has been provided
#       And: 'DedicatedMasterEnabled' in 'ElasticsearchClusterConfig' has not been
 provided
#             or provided and set to a value other than bool(true)
#       And: 'DedicatedMasterCount' in 'ElasticsearchClusterConfig' has not been
 provided or
#             provided and set to an integer value less than three (< 3)
#      Then: FAIL
#   Scenario: 4
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an Elasticsearch domain resource
#       And: 'ElasticsearchClusterConfig' has been provided
#       And: 'DedicatedMasterEnabled' in 'ElasticsearchClusterConfig' has not been
 provided
#             or provided and set to a value other than bool(true)
#       And: 'DedicatedMasterCount' in 'ElasticsearchClusterConfig' has been provided
 and set to
#             an integer value greater than or equal to three (>= 3)
#      Then: FAIL
#   Scenario: 5
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an Elasticsearch domain resource
#       And: 'ElasticsearchClusterConfig' has been provided
#       And: 'DedicatedMasterEnabled' in 'ElasticsearchClusterConfig' has been provided
#             and set to bool(true)
#       And: 'DedicatedMasterCount' in 'ElasticsearchClusterConfig' has been provided
 and set
#            to an integer value less than three (< 3)
#      Then: FAIL
#   Scenario: 6
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook

CT.OPENSEARCH.PR.7 contoh templat

Anda dapat melihat contoh artefak pengujian PASS dan FAIL untuk kontrol proaktif AWS Control Tower.

Contoh PASS - Gunakan template ini untuk memverifikasi pembuatan sumber daya yang sesuai.

```
Resources:
  ElasticsearchDomain:
    Type: AWS::Elasticsearch::Domain
    Properties:
      ElasticsearchVersion: 7.1
      ElasticsearchClusterConfig:
        InstanceType: t3.small.elasticsearch
        DedicatedMasterEnabled: true
      EBSOptions:
        EBSEnabled: true
        Iops: '3000'
        VolumeSize: '10'
        VolumeType: gp3
      AccessPolicies:
        Version: '2012-10-17'
        Statement:
        - Effect: Deny
          Principal:
            AWS: '*'
          Action: es:*
          Resource: '*'
```

Contoh PASS - Gunakan template ini untuk memverifikasi pembuatan sumber daya yang sesuai.

```
Resources:
  ElasticsearchDomain:
    Type: AWS::Elasticsearch::Domain
    Properties:
      ElasticsearchVersion: 7.1
      ElasticsearchClusterConfig:
        InstanceType: t3.small.elasticsearch
        DedicatedMasterEnabled: true
```

```
        DedicatedMasterCount: 3
      EBSOptions:
        EBSEnabled: true
        Iops: '3000'
        VolumeSize: '10'
        VolumeType: gp3
      AccessPolicies:

          Action: es:*
          Resource: '*'
```

[CT.OPENSEARCH.PR.8] Memerlukan domain Layanan Elasticsearch untuk menggunakan versi TLS minimum dari TLSv1.2

Kontrol ini memeriksa apakah domain Layanan Elasticsearch dikonfigurasi untuk memerlukan HTTPS dengan versi TLS minimum TLSv1.2.

- Tujuan kontrol: Enkripsi data dalam perjalanan
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::Elasticsearch::Domain`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.OPENSEARCH.PR.8

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.OPENSEARCH.PR.8
- Untuk contoh AWS CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.OPENSEARCH.PR.8 contoh template

Penjelasan

HTTPS (TLS) dapat membantu mencegah penyerang potensial menggunakan person-in-the-middle, atau serangan serupa, untuk menguping atau memanipulasi lalu lintas jaringan. Hanya koneksi terenkripsi melalui HTTPS (TLS) yang diizinkan. Mengenkripsi data dalam perjalanan dapat memengaruhi kinerja. Anda harus menguji aplikasi Anda dengan fitur ini untuk memahami profil kinerja dan efek TLS. TLS 1.2 menyediakan beberapa peningkatan keamanan dibandingkan versi TLS sebelumnya.

Remediasi untuk kegagalan aturan

Di dalam`DomainEndpointOptions`, atur `EnforceHTTPS` ke `true` dan atur `TLSSecurityPolicy` ke nilai dengan versi TLS minimum TLSv1.2.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Domain Elasticsearch - Contoh

Domain Elasticsearch yang dikonfigurasi untuk mengharuskan semua lalu lintas ke domain tiba melalui HTTPS dengan versi TLS minimum TLSv1.2. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
    "ElasticsearchDomain": {
        "Type": "AWS::Elasticsearch::Domain",
        "Properties": {
            "ElasticsearchVersion": 7.1,

[CT.OPENSEARCH.PR.9] Memerlukan domain OpenSearch Layanan Amazon untuk mengenkripsi data saat istirahat

Kontrol ini memeriksa apakah domain OpenSearch Layanan Amazon telah encryption-at-rest diaktifkan.

- Tujuan kontrol: Enkripsi data saat istirahat
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif

- Jenis sumber daya: `AWS::OpenSearchService::Domain`
- AWS CloudFormation aturan penjaga: CT.OPENSEARCH.PR.9spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.OPENSEARCH.PR.9spesifikasi aturan
- Untuk contoh AWS CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.OPENSEARCH.PR.9 contoh templat

Penjelasan

Untuk lapisan keamanan tambahan untuk data sensitif, Anda harus mengonfigurasi domain OpenSearch Layanan Anda untuk dienkripsi saat istirahat. Saat Anda mengonfigurasi enkripsi data saat istirahat, AWS KMS menyimpan dan mengelola kunci enkripsi Anda. Untuk melakukan enkripsi, AWS KMS gunakan algoritma Advanced Encryption Standard dengan kunci 256-bit (AES-256).

Remediasi untuk kegagalan aturan

Di dalam`EncryptionAtRestOptions`, atur `Enabled` ke`true`.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Domain OpenSearch Layanan Amazon - Contoh

Domain OpenSearch Layanan Amazon yang dikonfigurasi dengan encryption-at-rest diaktifkan Contoh ditampilkan di JSON dan di YAMAL.

```

[CT.OPENSEARCH.PR.10] Memerlukan domain OpenSearch Layanan Amazon untuk dibuat di Amazon VPC yang ditentukan pengguna

Kontrol ini memeriksa apakah domain OpenSearch Layanan Amazon dikonfigurasi dengan pengaturan opsi VPC yang menentukan target Amazon VPC.

- Tujuan kontrol: Batasi akses jaringan
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::OpenSearchService::Domain`
- AWS CloudFormation aturan penjaga: CT.OPENSEARCH.PR.10spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.OPENSEARCH.PR.10spesifikasi aturan

- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.OPENSEARCH.PR.10 contoh templat

Penjelasan

Pastikan OpenSearch domain tidak melekat pada subnet publik. Lihat `Resource-based policies` di Panduan Pengembang OpenSearch Layanan Amazon. Pastikan juga bahwa VPC Anda dikonfigurasi sesuai dengan praktik terbaik yang disarankan. Lihat `Security best practices for your VPC` di Panduan Pengguna Amazon VPC.

OpenSearch domain yang digunakan dalam VPC dapat berkomunikasi dengan sumber daya VPC melalui AWS jaringan pribadi, tanpa perlu melintasi internet publik. Konfigurasi ini meningkatkan postur keamanan dengan membatasi akses ke data dalam perjalanan. VPC menyediakan sejumlah kontrol jaringan untuk mengamankan akses ke OpenSearch domain, termasuk ACL jaringan dan grup keamanan. AWS Control Tower merekomendasikan agar Anda memigrasikan OpenSearch domain publik ke VPC untuk memanfaatkan kontrol ini.

Remediasi untuk kegagalan aturan

Di dalam`VPCOptions`, atur `SubnetIds` ke daftar dengan satu atau lebih ID subnet aAmazon EC2.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Domain OpenSearch Layanan Amazon - Contoh

Domain OpenSearch Layanan Amazon yang dikonfigurasi untuk digunakan dalam VPC Amazon melalui pengaturan opsi VPC. Contoh ditunjukkan di JSON dan YAMAL.

[CT.OPENSEARCH.PR.11] Memerlukan domain OpenSearch Layanan Amazon untuk mengenkripsi data yang dikirim antar node

Kontrol ini memeriksa apakah domain OpenSearch Layanan Amazon mengaktifkan node-to-node enkripsi.

- Tujuan kontrol: Enkripsi data dalam perjalanan
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::OpenSearchService::Domain`
- AWS CloudFormation aturan penjaga: CT.OPENSEARCH.PR.11spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.OPENSEARCH.PR.11spesifikasi aturan
- Untuk contoh AWS CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.OPENSEARCH.PR.11 contoh templat

Penjelasan

HTTPS (TLS) dapat membantu mencegah penyerang potensial menguping atau memanipulasi lalu lintas jaringan menggunakan, atau serangan serupa. person-in-the-middle Hanya koneksi terenkripsi melalui HTTPS (TLS) yang diizinkan. Mengaktifkan node-to-node enkripsi untuk OpenSearch domain memastikan bahwa komunikasi intra-cluster dienkripsi dalam perjalanan.

> Pertimbangan penggunaan
>
> - Penalti kinerja dapat dikaitkan dengan konfigurasi ini. Anda harus mengetahui trade-off kinerja dan mengujinya sebelum mengaktifkan opsi ini.

Remediasi untuk kegagalan aturan

Di dalam`NodeToNodeEncryptionOptions`, atur `Enabled` ke`true`.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Domain OpenSearch Layanan Amazon - Contoh

Domain OpenSearch Layanan Amazon yang dikonfigurasi dengan node-to-node enkripsi diaktifkan. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
    "OpenSearchServiceDomain": {

```

[CT.OPENSEARCH.PR.12] Memerlukan domain OpenSearch Layanan Amazon untuk mengirim log kesalahan ke Amazon CloudWatch Logs

Kontrol ini memeriksa apakah domain OpenSearch Layanan Amazon dikonfigurasi untuk mengirim log kesalahan ke grup CloudWatch log Amazon Logs.

- Tujuan kontrol: Menetapkan pencatatan dan pemantauan
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::OpenSearchService::Domain`
- AWS CloudFormation aturan penjaga: CT.OPENSEARCH.PR.12spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.OPENSEARCH.PR.12spesifikasi aturan
- Untuk contoh AWS CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.OPENSEARCH.PR.12 contoh templat

Penjelasan

Aktifkan log kesalahan (ES_APPLICATION_LOGS) untuk domain OpenSearch Layanan dan kirim log tersebut ke Log Amazon CloudWatch untuk penyimpanan dan respons. Log kesalahan domain dapat membantu audit keamanan dan akses, dan dapat membantu mendiagnosis masalah ketersediaan.

Remediasi untuk kegagalan aturan

Di dalamnya`LogPublishingOptions`, berikan `ES_APPLICATION_LOGS` konfigurasi, atur `Enabled` ke`true`, dan atur `CloudWatchLogsLogGroupArn` ke ARN grup CloudWatch log Amazon Logs yang valid.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Domain OpenSearch Layanan Amazon - Contoh

Domain OpenSearch Layanan Amazon yang dikonfigurasi untuk mengirim log kesalahan ke Amazon CloudWatch Logs. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```

[CT.OPENSEARCH.PR.13] Memerlukan domain OpenSearch Layanan Amazon untuk mengirim log audit ke Amazon CloudWatch Logs

Kontrol ini memeriksa apakah domain OpenSearch Layanan Amazon dikonfigurasi untuk mengirim log audit ke grup CloudWatch log Amazon Logs.

- Tujuan kontrol: Menetapkan pencatatan dan pemantauan
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::OpenSearchService::Domain`
- AWS CloudFormation aturan penjaga: CT.OPENSEARCH.PR.13spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.OPENSEARCH.PR.13spesifikasi aturan
- Untuk contoh AWS CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.OPENSEARCH.PR.13 contoh templat

Penjelasan

Log audit sangat dapat disesuaikan. Mereka memungkinkan Anda melacak aktivitas pengguna di OpenSearch klaster Anda, termasuk keberhasilan dan kegagalan otentikasi, permintaan, perubahan indeks OpenSearch, dan kueri penelusuran yang masuk.

> Pertimbangan penggunaan
>
> - Penerbitan log audit memerlukan opsi keamanan lanjutan untuk diaktifkan di domain OpenSearch Layanan Amazon.
> - Untuk mengaktifkan opsi keamanan lanjutan pada domain OpenSearch Layanan Amazon, Anda harus mengaktifkan enkripsi data saat istirahat melalui `EncryptionAtRestOptions` properti, node-to-node enkripsi melalui `NodeToNodeEncryptionOptions` properti, dan menerapkan koneksi HTTPS melalui `EnforceHTTPS` properti di dalamnya`DomainEndpointOptions`.

Remediasi untuk kegagalan aturan

Di dalamnya`LogPublishingOptions`, berikan `AUDIT_LOGS` konfigurasi, atur `Enabled` ke `true` dan `CloudWatchLogsLogGroupArn` ke ARN grup CloudWatch log Amazon Logs yang valid.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Domain OpenSearch Layanan Amazon - Contoh

Domain OpenSearch Layanan Amazon yang dikonfigurasi untuk mengirim log audit ke Amazon CloudWatch Logs. Contoh ditunjukkan di JSON dan YAMAL.

CT.OPENSEARCH.PR.13spesifikasi aturan

```
# ####################################
##       Rule Specification        ##
####################################
#
# Rule Identifier:
#   opensearch_audit_logging_enabled_check
#
# Description:
#   This control checks whether Amazon OpenSearch Service domains are configured to
 send audit logs to an Amazon CloudWatch Logs log group.
#
```

```
# Reports on:
#   AWS::OpenSearchService::Domain
#
# Evaluates:
# AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document does not contain any OpenSearch Service domain
 resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an OpenSearch Service domain resource
#       And: 'LogPublishingOptions' has not been provided
#      Then: FAIL
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an OpenSearch Service domain resource
#       And: 'LogPublishingOptions' has been provided
#       And: 'AUDIT_LOGS' in 'LogPublishingOptions' has not been provided
#      Then: FAIL
#   Scenario: 4
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an OpenSearch Service domain resource
#       And: 'LogPublishingOptions' has been specified
#       And: 'AUDIT_LOGS' in 'LogPublishingOptions' has been provided
#       And: 'Enabled' in 'AUDIT_LOGS' has not been provided or provided and set to
#            a value other than bool(true)
#       And: 'CloudWatchLogsLogGroupArn' in 'AUDIT_LOGS' has not been provided or
 provided
#            as an empty string or invalid local reference
#      Then: FAIL
#   Scenario: 5
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
```

```
#       And: The input document contains an OpenSearch Service domain resource
#       And: 'LogPublishingOptions' has been specified
#       And: 'AUDIT_LOGS' in 'LogPublishingOptions' has been provided
#       And: 'Enabled' in 'AUDIT_LOGS' has been provided and set to bool(true)
#       And: 'CloudWatchLogsLogGroupArn' in 'AUDIT_LOGS' has not been provided or
 provided
#            as an empty string or invalid local reference
#      Then: FAIL
#   Scenario: 6
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an OpenSearch Service domain resource
#       And: 'LogPublishingOptions' has been specified
#       And: 'AUDIT_LOGS' in 'LogPublishingOptions' has been provided
#       And: 'Enabled' in 'AUDIT_LOGS' has not been provided or provided and set to
#            a value other than bool(true)
#       And: 'CloudWatchLogsLogGroupArn' in 'AUDIT_LOGS' has been provided as a non-
empty string
#            or valid local reference
#      Then: FAIL
#   Scenario: 7
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an OpenSearch Service domain resource
#       And: 'LogPublishingOptions' has been specified
#       And: 'AUDIT_LOGS' in 'LogPublishingOptions' has been provided
#       And: 'Enabled' in 'AUDIT_LOGS' has been provided and set to bool(true)
#       And: 'CloudWatchLogsLogGroupArn' in 'AUDIT_LOGS' has been provided as a non-
empty string
#            or valid local reference
#      Then: PASS

[CT.OPENSEARCH.PR.14] Memerlukan domain OpenSearch Layanan Amazon untuk memiliki kesadaran zona dan setidaknya tiga node data

Kontrol ini memeriksa apakah domain OpenSearch Layanan Amazon dikonfigurasi dengan setidaknya tiga node data dan kesadaran zona diaktifkan.

- Tujuan kontrol: Meningkatkan ketersediaan
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::OpenSearchService::Domain`
- AWS CloudFormation aturan penjaga: CT.OPENSEARCH.PR.14spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.OPENSEARCH.PR.14spesifikasi aturan
- Untuk contoh AWS CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.OPENSEARCH.PR.14 contoh templat

Penjelasan

OpenSearch Domain membutuhkan setidaknya tiga node data untuk ketersediaan tinggi dan toleransi kesalahan. Menyebarkan OpenSearch domain dengan setidaknya tiga node data memastikan bahwa cluster dapat tetap beroperasi jika node gagal.

Remediasi untuk kegagalan aturan

Di dalam`ClusterConfig`, atur `ZoneAwarenessEnabled` ke `true` dan `InstanceCount` ke nilai integer lebih besar dari atau sama dengan tiga.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Domain OpenSearch Layanan Amazon - Contoh

Domain OpenSearch Layanan Amazon yang dikonfigurasi dengan tiga node data dan kesadaran zona diaktifkan. Contoh ditunjukkan di JSON dan YAMAL.

```
# ####################################
##       Rule Specification        ##
####################################
#
# Rule Identifier:
#   opensearch_data_node_fault_tolerance_check
#
# Description:
#   This control checks whether Amazon OpenSearch Service domains are configured with
 at least three data nodes and zone awareness enabled.
#
# Reports on:
#   AWS::OpenSearchService::Domain
#
# Evaluates:
# AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document does not contain any OpenSearch Service domain
 resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an OpenSearch Service domain resource
#       And: 'ClusterConfig' has not been provided
```

```
#      Then: FAIL
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an OpenSearch Service domain resource
#       And: 'ClusterConfig' has been provided
#       And: 'ZoneAwarenessEnabled' in 'ClusterConfig' has not been provided
#             or provided and set to a value other than bool(true)
#       And: 'InstanceCount' in 'ClusterConfig' has not been provided or
#             provided and set to an integer value less than three (< 3)
#      Then: FAIL
#   Scenario: 4
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an OpenSearch Service domain resource
#       And: 'ClusterConfig' has been provided
#       And: 'ZoneAwarenessEnabled' in 'ClusterConfig' has been provided
#             and set to bool(true)
#       And: 'InstanceCount' in 'ClusterConfig' has not been provided or
#             provided and set to an integer value less than three (< 3)
#      Then: FAIL
#   Scenario: 5
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an OpenSearch Service domain resource
#       And: 'ClusterConfig' has been provided
#       And: 'ZoneAwarenessEnabled' in 'ClusterConfig' has not been provided
#             or provided and set to a value other than bool(true)
#       And: 'InstanceCount' in 'ClusterConfig' has been provided and set to
#             an integer value greater than or equal to three (>= 3)
#      Then: FAIL
#   Scenario: 6
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an OpenSearch Service domain resource
#       And: 'ClusterConfig' has been provided
#       And: 'ZoneAwarenessEnabled' in 'ClusterConfig' has been provided
#             and set to bool(true)
#       And: 'InstanceCount' in 'ClusterConfig' has been provided and set to
#             an integer value greater than or equal to three (>= 3)
#      Then: PASS

[CT.OPENSEARCH.PR.15] Memerlukan domain OpenSearch Layanan Amazon untuk menggunakan kontrol akses berbutir halus

Kontrol ini memeriksa apakah domain OpenSearch Layanan Amazon telah mengaktifkan kontrol akses berbutir halus.

- Tujuan kontrol: Menegakkan hak istimewa paling sedikit
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::OpenSearchService::Domain`
- AWS CloudFormation aturan penjaga: CT.OPENSEARCH.PR.15spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.OPENSEARCH.PR.15spesifikasi aturan
- Untuk contoh AWS CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.OPENSEARCH.PR.15 contoh templat

Penjelasan

Kontrol akses berbutir halus menawarkan cara tambahan untuk mengontrol akses ke data Anda di Layanan Amazon. OpenSearch

> Pertimbangan penggunaan
>
> - Kontrol akses berbutir halus mengharuskan opsi keamanan lanjutan harus diaktifkan di domain Layanan Amazon OpenSearch .
> - Untuk mengaktifkan opsi keamanan lanjutan pada domain OpenSearch Layanan Amazon, Anda harus mengaktifkan enkripsi data saat istirahat melalui `EncryptionAtRestOptions` properti, node-to-node enkripsi melalui

`NodeToNodeEncryptionOptions` properti, dan menerapkan koneksi HTTPS melalui `EnforceHTTPS` properti di dalamnya`DomainEndpointOptions`.

Remediasi untuk kegagalan aturan

Di dalam`AdvancedSecurityOptions`, atur `Enabled` ke`true`, atur `InternalUserDatabaseEnabled` ke `true` atau`false`, dan atur `MasterUserOptions` dengan konfigurasi opsi untuk pengguna utama Anda.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Domain OpenSearch Layanan Amazon - Contoh

Domain OpenSearch Layanan Amazon yang dikonfigurasi dengan kontrol akses berbutir halus. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```

[CT.OPENSEARCH.PR.16] Memerlukan domain OpenSearch Layanan Amazon untuk menggunakan versi TLS minimum TLSv1.2

Kontrol ini memeriksa apakah domain OpenSearch Layanan Amazon dikonfigurasi untuk memerlukan HTTPS dengan versi TLS minimum TLSv1.2.

- Tujuan kontrol: Enkripsi data dalam perjalanan
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::OpenSearchService::Domain`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.OPENSEARCH.PR.16

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.OPENSEARCH.PR.16
- Untuk contoh AWS CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.OPENSEARCH.PR.16 contoh templat

Penjelasan

HTTPS (TLS) dapat membantu mencegah penyerang potensial menggunakan person-in-the-middle, atau serangan serupa, untuk menguping atau memanipulasi lalu lintas jaringan. Hanya koneksi terenkripsi melalui HTTPS (TLS) yang diizinkan. Mengenkripsi data dalam perjalanan dapat memengaruhi kinerja. Anda harus menguji aplikasi Anda dengan fitur ini untuk memahami profil kinerja dan efek TLS. TLS 1.2 menyediakan beberapa peningkatan keamanan dibandingkan versi TLS sebelumnya.

Remediasi untuk kegagalan aturan

Di dalam`DomainEndpointOptions`, atur `EnforceHTTPS` ke `true` dan atur `TLSSecurityPolicy` ke nilai dengan versi TLS minimum TLSv1.2..

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Domain OpenSearch Layanan Amazon - Contoh

Domain OpenSearch Layanan Amazon yang dikonfigurasi untuk mengharuskan semua lalu lintas ke domain tiba melalui HTTPS dengan versi TLS minimum TLSv1.2. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```

# Description:
```

```
#   This control checks whether Amazon OpenSearch Service domains are configured to
 require HTTPS with a minimum TLS version of TLSv1.2.
#
# Reports on:
#   AWS::OpenSearchService::Domain
#
# Evaluates:
# AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document does not contain any OpenSearch Service domain
 resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an OpenSearch Service domain resource
#       And: 'DomainEndpointOptions' has not been provided
#      Then: FAIL
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an OpenSearch Service domain resource
#       And: 'DomainEndpointOptions' has been provided
#       And: 'EnforceHTTPS' in 'DomainEndpointOptions' has not been provided or
#            has been provided and set to a value other than bool(true)
#       And: 'TLSSecurityPolicy' in 'DomainEndpointOptions' has not been provided or
#            has been provided and set to a value not in the list of allowed TLS
 policies
#      Then: FAIL
#   Scenario: 4
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an OpenSearch Service domain resource
#       And: 'DomainEndpointOptions' has been provided
#       And: 'EnforceHTTPS' in 'DomainEndpointOptions' has been provided and set to
 bool(true)
#       And: 'TLSSecurityPolicy' in 'DomainEndpointOptions' has not been provided or
```

```
#            has been provided and set to a value not in the list of allowed TLS
 policies
#      Then: FAIL
#   Scenario: 5
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an OpenSearch Service domain resource
#       And: 'DomainEndpointOptions' has been provided
#       And: 'EnforceHTTPS' in 'DomainEndpointOptions' has not been provided or
#            has been provided and set to a value other than bool(true)
#       And: 'TLSSecurityPolicy' in 'DomainEndpointOptions' has been provided and set
#            to a value in the list of allowed TLS policies
#      Then: FAIL
#   Scenario: 6
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an OpenSearch Service domain resource
#       And: 'DomainEndpointOptions' has been provided

Kontrol Amazon Relational Database Service (Amazon RDS)

Topik

- [CT.RDS.PR.1] Mengharuskan instans database Amazon RDS dikonfigurasi dengan beberapa Availability Zone
- [CT.RDS.PR.2] Memerlukan instans atau cluster database Amazon RDS agar pemantauan yang ditingkatkan dikonfigurasi
- [CT.RDS.PR.3] Memerlukan klaster Amazon RDS agar perlindungan penghapusan dikonfigurasi

- [CT.RDS.PR.4] Memerlukan kluster basis data Amazon RDS agar otentikasi database AWS IAM dikonfigurasi
- [CT.RDS.PR.5] Memerlukan instans database Amazon RDS agar upgrade versi minor dikonfigurasi
- [CT.RDS.PR.6] Memerlukan kluster basis data Amazon RDS untuk mengonfigurasi backtracking
- [CT.RDS.PR.7] Mengharuskan instans basis data Amazon RDS agar otentikasi IAM dikonfigurasi
- [CT.RDS.PR.8] Memerlukan instance database Amazon RDS agar cadangan otomatis dikonfigurasi
- [CT.RDS.PR.9] Memerlukan kluster basis data Amazon RDS untuk menyalin tag ke snapshot
- [CT.RDS.PR.10] Memerlukan instance database Amazon RDS untuk menyalin tag ke snapshot
- [CT.RDS.PR.11] Memerlukan instance database Amazon RDS untuk memiliki konfigurasi VPC
- [CT.RDS.PR.12] Memerlukan langganan acara Amazon RDS agar peristiwa klaster penting dikonfigurasi
- [CT.RDS.PR.13] Memerlukan instans Amazon RDS apa pun agar perlindungan penghapusan dikonfigurasi
- [CT.RDS.PR.14] Memerlukan instance database Amazon RDS untuk mengekspor log ke Amazon CloudWatch Logs melalui properti EnableCloudwatchLogsExports
- [CT.RDS.PR.15] Mengharuskan instans Amazon RDS tidak membuat grup keamanan DB
- [CT.RDS.PR.16] Memerlukan kluster basis data Amazon RDS agar enkripsi saat istirahat dikonfigurasi
- [CT.RDS.PR.17] Memerlukan langganan pemberitahuan acara Amazon RDS agar peristiwa instance database penting dikonfigurasi
- [CT.RDS.PR.18] Memerlukan langganan pemberitahuan acara Amazon RDS agar peristiwa grup parameter basis data penting dikonfigurasi
- [CT.RDS.PR.19] Memerlukan langganan pemberitahuan acara Amazon RDS agar peristiwa grup keamanan basis data penting dikonfigurasi
- [CT.RDS.PR.20] Memerlukan instance database Amazon RDS untuk tidak menggunakan port default mesin database
- [CT.RDS.PR.21] Memerlukan cluster Amazon RDS DB untuk memiliki nama pengguna administrator yang unik
- [CT.RDS.PR.22] Memerlukan instance database Amazon RDS untuk memiliki nama pengguna administrator yang unik
- [CT.RDS.PR.23] Memerlukan instans database Amazon RDS agar tidak dapat diakses publik

- [CT.RDS.PR.24] Memerlukan instance database Amazon RDS agar enkripsi saat istirahat dikonfigurasi
- [CT.RDS.PR.25] Memerlukan cluster basis data Amazon RDS untuk mengekspor log ke Amazon Logs melalui properti CloudWatch EnableCloudwatchLogsExports
- [CT.RDS.PR.26] Memerlukan Proxy DB Layanan Amazon Relational Database Service untuk memerlukan koneksi Transport Layer Security (TLS)
- [CT.RDS.PR.27] Memerlukan grup parameter cluster DB Amazon Relational Database Service untuk meminta koneksi Transport Layer Security (TLS) untuk tipe engine yang didukung
- [CT.RDS.PR.28] Memerlukan grup parameter DB Amazon Relational Database Service untuk meminta koneksi Transport Layer Security (TLS) untuk tipe engine yang didukung
- [CT.RDS.PR.29] Memerlukan klaster Amazon RDS yang tidak dikonfigurasi agar dapat diakses publik melalui properti " PubliclyAccessible
- [CT.RDS.PR.30] Mengharuskan instans database Amazon RDS memiliki enkripsi saat istirahat yang dikonfigurasi untuk menggunakan kunci KMS yang Anda tentukan untuk jenis mesin yang didukung

[CT.RDS.PR.1] Mengharuskan instans database Amazon RDS dikonfigurasi dengan beberapa Availability Zone

Kontrol ini memeriksa apakah ketersediaan tinggi dikonfigurasi untuk instans database Amazon Relational Database Service (RDS) Amazon Relational Database Service (RDS).

- Tujuan kontrol: Meningkatkan ketersediaan
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::RDS::DBInstance`
- AWS CloudFormation aturan penjaga: CT.RDS.PR.1spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.RDS.PR.1spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.RDS.PR.1contoh template

Penjelasan

Instans database Amazon RDS (DB) harus dikonfigurasi untuk beberapa Availability Zone (AZ). Konfigurasi ini meningkatkan ketersediaan data yang disimpan. Penerapan ke beberapa Availability Zone memungkinkan failover otomatis, jika Availability Zone mengalami pemadaman, dan selama pemeliharaan RDS reguler.

Pertimbangan penggunaan

- Kontrol ini hanya berlaku untuk jenis mesin Amazon RDS DB `mariadbmysql`,`oracle-ee`,`oracle-ee-cdb`,`oracle-se2`,`oracle-se2-cdb`,`postgres`, `sqlserver-eesqlserver-se`, `sqlserver-ex` dan`sqlserver-web`.
- Kontrol ini hanya berlaku ketika `Engine` properti disediakan. Itu tidak berlaku saat memulihkan dari snapshot DB atau snapshot cluster di mana `Engine` belum disetel secara eksplisit.

Remediasi untuk kegagalan aturan

Atur `MultiAZ` ke `true`.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Amazon RDS DB Instans - Contoh

Instans database Amazon RDS dikonfigurasi dengan beberapa Availability Zone. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
    "DBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
            "Engine": "postgres",
            "EngineVersion": 14.2,
            "DBInstanceClass": "db.m5.large",
            "StorageType": "gp2",
            "AllocatedStorage": 5,
            "MasterUsername": {
```

```
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
            },
            "MultiAZ": true
        },
        "DeletionPolicy": "Delete"
    }
}
```

Contoh YAMAL

```
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    MultiAZ: true
  DeletionPolicy: Delete
```

CT.RDS.PR.1spesifikasi aturan

```

[CT.RDS.PR.2] Memerlukan instans atau cluster database Amazon RDS agar pemantauan yang ditingkatkan dikonfigurasi

Kontrol ini memeriksa apakah pemantauan yang disempurnakan diaktifkan untuk instans Amazon Relational Database Service (RDS).

- Tujuan kontrol: Menetapkan pencatatan dan pemantauan
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::RDS::DBInstance`
- AWS CloudFormation aturan penjaga: CT.RDS.PR.2spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.RDS.PR.2spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.RDS.PR.2contoh template

Penjelasan

Di Amazon RDS, pemantauan yang ditingkatkan memfasilitasi respons yang lebih cepat terhadap perubahan kinerja di infrastruktur yang mendasarinya. Perubahan kinerja ini dapat mengakibatkan kurangnya ketersediaan data. Pemantauan yang disempurnakan memberikan metrik real-time dari sistem operasi tempat instans RDS DB Anda berjalan. Agen, yang diinstal pada instance, dapat memperoleh metrik lebih akurat daripada yang mungkin dari lapisan hypervisor.

Metrik pemantauan yang disempurnakan berguna ketika Anda ingin melihat bagaimana berbagai proses atau utas pada instans database (DB) menggunakan CPU.

Pertimbangan penggunaan

- Kontrol ini hanya berlaku untuk jenis mesin Amazon RDS DB`aurora`,`aurora-mysql`,`aurora-postgresql`,`mariadb`,`mysql`,`oracle-ee`,`oracle-ee-cdb`,`oracle-se2`,`oracle-se2-cdb`,`postgres`, `sqlserver-ee``sqlserver-se`, `sqlserver-ex` dan `sqlserver-web`
- Kontrol ini hanya berlaku ketika `Engine` properti disediakan. Itu tidak berlaku saat memulihkan dari snapshot DB atau snapshot cluster di mana `Engine` belum disetel secara eksplisit.

Remediasi untuk kegagalan aturan

Setel `MonitoringInterval` ke nilai yang didukung (1, 5, 10, 15, 30, 60), dan atur `MonitoringRoleArn` ke ARN peran AWS IAM.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Amazon RDS DB Instans - Contoh

Instans Amazon RDS DB dikonfigurasi dengan pemantauan yang disempurnakan. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
    "DBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
            "Engine": "postgres",
            "EngineVersion": 14.2,
            "DBInstanceClass": "db.m5.large",
            "StorageType": "gp2",
            "AllocatedStorage": 5,
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
            },
            "MonitoringInterval": 30,
            "MonitoringRoleArn": {
                "Fn::GetAtt": [
                    "MonitoringIAMRole",
                    "Arn"
                ]
            }
        },
        "DeletionPolicy": "Delete"
    }
}
```

Contoh YAMAL

```
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
```

```
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    MonitoringInterval: 30
    MonitoringRoleArn: !GetAtt 'MonitoringIAMRole.Arn'
  DeletionPolicy: Delete
```

CT.RDS.PR.2spesifikasi aturan

```
# ####################################
##       Rule Specification        ##
####################################
#
# Rule Identifier:
#   rds_instance_enhanced_monitoring_enabled_check
#
# Description:
#   This control checks whether enhanced monitoring is activated for Amazon Relational
 Database Service (RDS) instances.
#
# Reports on:
#   AWS::RDS::DBInstance
#
# Evaluates:
# AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document does not contain any RDS DB instance resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine' is not one of 'aurora', 'aurora-mysql', 'aurora-postgresql',
 'mariadb', 'mysql',
```

```
#            'oracle-ee', 'oracle-se2', 'oracle-se1', 'oracle-se', 'postgres',

```

[CT.RDS.PR.3] Memerlukan klaster Amazon RDS agar perlindungan penghapusan dikonfigurasi

Kontrol ini memeriksa apakah klaster Amazon Relational Database Service (Amazon RDS) Anda telah mengaktifkan perlindungan penghapusan.

- Tujuan kontrol: Meningkatkan ketersediaan
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::RDS::DBCluster`
- AWS CloudFormation aturan penjaga: CT.RDS.PR.3spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.RDS.PR.3spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.RDS.PR.3contoh template

Penjelasan

Mengaktifkan perlindungan penghapusan klaster adalah lapisan perlindungan tambahan terhadap penghapusan atau penghapusan database yang tidak disengaja oleh entitas yang tidak sah.

Saat perlindungan penghapusan diaktifkan, klaster Amazon RDS tidak dapat dihapus. Sebelum permintaan penghapusan berhasil, perlindungan penghapusan harus dinonaktifkan.

Remediasi untuk kegagalan aturan

Tetapkan nilai `DeletionProtection` parameter ke true.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Amazon RDS DB Cluster - Contoh

Cluster Amazon RDS DB dengan perlindungan penghapusan diaktifkan. Contoh ditunjukkan di JSON dan YAMAL.

Contoh JSON

```
{
    "RDSDBCluster": {
        "Type": "AWS::RDS::DBCluster",
        "Properties": {
            "Engine": "aurora",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${RDSClusterSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${RDSClusterSecret}::password}}"
            },
            "DBSubnetGroupName": {
                "Ref": "TestDBSubnetGroup"
            },
            "DeletionProtection": true
        }
    }
}
```

Contoh YAMAL

```
RDSDBCluster:
  Type: AWS::RDS::DBCluster
  Properties:
    Engine: aurora
    MasterUsername: !Sub '{{resolve:secretsmanager:${RDSClusterSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${RDSClusterSecret}::password}}'
    DBSubnetGroupName: !Ref 'TestDBSubnetGroup'
    DeletionProtection: true
```

CT.RDS.PR.3spesifikasi aturan

```
# ####################################
##       Rule Specification        ##
####################################
#
# Rule Identifier:
#   rds_cluster_deletion_protection_enabled_check
#
# Description:
#   Checks if an Amazon Relational Database Service (Amazon RDS) cluster has deletion
 protection enabled.
#
# Reports on:
#   AWS::RDS::DBCluster
#
# Evaluates:
# AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#  None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or CloudFormation hook
 document
#       And: The input document does not contain any RDS DB cluster resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or CloudFormation hook
 document
#       And: The input document contains an RDS DB cluster resource
#       And: 'DeletionProtection' has not been specified
#      Then: FAIL
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or CloudFormation hook
 document
#       And: The input document contains an RDS DB cluster resource
#       And: 'DeletionProtection' has been specified
#       And: 'DeletionProtection' has been set to bool(false)
#      Then: FAIL
#   Scenario: 4
```

```
#     Given: The input document is an AWS CloudFormation or CloudFormation hook
 document
#       And: The input document contains an RDS DB cluster resource
#       And: 'DeletionProtection' has been specified
#       And: 'DeletionProtection' has been set to bool(true)
#      Then: PASS

[CT.RDS.PR.4] Memerlukan kluster basis data Amazon RDS agar otentikasi database AWS IAM dikonfigurasi

Kontrol ini memeriksa apakah kluster AWS database Amazon Relational Database Service (RDS) (DB) Amazon Relational Database Service (RDS) telah mengaktifkan autentikasi database IAM.

- Tujuan kontrol: Gunakan otentikasi yang kuat
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::RDS::DBCluster`
- AWS CloudFormation aturan penjaga: CT.RDS.PR.4spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.RDS.PR.4spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.RDS.PR.4contoh template

Penjelasan

Autentikasi basis data IAM memungkinkan otentikasi bebas kata sandi ke instance database. Otentikasi menggunakan token otentikasi. Lalu lintas jaringan ke dan dari database dienkripsi menggunakan SSL.

> **Pertimbangan penggunaan**
>
> - Kontrol ini hanya berlaku untuk jenis mesin cluster Amazon RDS DB`aurora`, `aurora-mysql` dan`aurora-postgresql`.

Remediasi untuk kegagalan aturan

Atur `EnableIAMDatabaseAuthentication` ke `true`.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Amazon RDS DB Cluster - Contoh

Amazon RDS DB cluster dikonfigurasi dengan autentikasi database AWS IAM. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "DBCluster": {
        "Type": "AWS::RDS::DBCluster",
        "Properties": {
            "Engine": "aurora-mysql",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::password}}"
            },
            "DBSubnetGroupName": {
                "Ref": "DBSubnetGroup"
            },
            "EnableIAMDatabaseAuthentication": true
        }
```

```
    }
}
```

Contoh YAMAL

```
DBCluster:
  Type: AWS::RDS::DBCluster
  Properties:
    Engine: aurora-mysql
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBClusterSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBClusterSecret}::password}}'
    DBSubnetGroupName: !Ref 'DBSubnetGroup'
    EnableIAMDatabaseAuthentication: true
```

CT.RDS.PR.4spesifikasi aturan

```

[CT.RDS.PR.5] Memerlukan instans database Amazon RDS agar upgrade versi minor dikonfigurasi

Kontrol ini memeriksa apakah upgrade versi minor otomatis diaktifkan untuk instance database Amazon Relational Database Service (RDS) Amazon Relational Database Service (RDS).

- Tujuan kontrol: Kelola kerentanan
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::RDS::DBInstance`
- AWS CloudFormation aturan penjaga: CT.RDS.PR.5spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.RDS.PR.5spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.RDS.PR.5contoh template

Penjelasan

Dengan mengaktifkan upgrade versi minor otomatis, Anda dapat memastikan bahwa pembaruan versi minor terbaru ke sistem manajemen basis data relasional (RDBMS) diinstal. Upgrade ini

mungkin termasuk patch keamanan dan perbaikan bug. Tetap up to date dengan instalasi patch adalah langkah penting dalam mengamankan sistem.

> **Pertimbangan penggunaan**
>
> - Kontrol ini hanya berlaku untuk jenis mesin Amazon RDS DB`aurora`,`aurora-mysql`,`aurora-postgresql`,`mariadb`,`mysql`,`oracle-ee`,`oracle-ee-cdb`,`oracle-se2`,`oracle-se2-cdb`,`postgres`, `sqlserver-ee``sqlserver-se`, `sqlserver-ex`dan`sqlserver-web`.
> - Kontrol ini hanya berlaku ketika `Engine` properti disediakan. Itu tidak berlaku saat memulihkan dari snapshot DB atau snapshot cluster di mana `Engine` belum disetel secara eksplisit.

Remediasi untuk kegagalan aturan

Hilangkan `AutoMinorVersionUpgrade` properti atau atur ke`true`.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Amazon RDS DB Instans - Contoh Satu

Instans Amazon RDS DB dikonfigurasi dengan upgrade versi minor otomatis, diaktifkan dengan cara default. AWS CloudFormation Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "DBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
            "Engine": "postgres",
            "EngineVersion": 14.2,
            "DBInstanceClass": "db.m5.large",
            "StorageType": "gp2",
            "AllocatedStorage": 5,
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
            },
            "MasterUserPassword": {
```

```
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
            }
        },
        "DeletionPolicy": "Delete"
    }
}
```

Contoh YAMAL

```
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
  DeletionPolicy: Delete
```

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Amazon RDS DB Instans - Contoh Dua

Instans Amazon RDS DB dikonfigurasi dengan upgrade versi minor otomatis, diaktifkan melalui properti. `AutoMinorVersionUpgrade` Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "DBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
            "Engine": "postgres",
            "EngineVersion": 14.2,
            "DBInstanceClass": "db.m5.large",
            "StorageType": "gp2",
```

```
            "AllocatedStorage": 5,
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
            },
            "AutoMinorVersionUpgrade": true
        },
        "DeletionPolicy": "Delete"
    }
}
```

Contoh YAMAL

```
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    AutoMinorVersionUpgrade: true
  DeletionPolicy: Delete
```

CT.RDS.PR.5spesifikasi aturan

# ####################################
##       Rule Specification        ##
####################################
#
# Rule Identifier:
#   rds_instance_automatic_minor_version_upgrade_enabled_check
#
# Description:
```

```
#   This control checks whether automatic minor version upgrades are enabled for an
 Amazon Relational Database Service (RDS) database instance.
#
# Reports on:
#   AWS::RDS::DBInstance
#
# Evaluates:
# AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document does not contain any RDS DB instance resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine' is not one of 'aurora', 'aurora-mysql', 'aurora-postgresql',
 'mariadb', 'mysql',
#            'oracle-ee', 'oracle-ee-cdb', 'oracle-se2', 'oracle-se2-cdb',
#            'sqlserver-ee', 'sqlserver-se', 'sqlserver-ex', 'sqlserver-web',
#            'postgres'
#      Then: SKIP
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine' is one of 'aurora', 'aurora-mysql', 'aurora-postgresql',
 'mariadb', 'mysql',
#            'oracle-ee', 'oracle-ee-cdb', 'oracle-se2', 'oracle-se2-cdb',
#            'sqlserver-ee', 'sqlserver-se', 'sqlserver-ex', 'sqlserver-web',
#            'postgres'
#       And: 'AutoMinorVersionUpgrade' has been specified
#       And: 'AutoMinorVersionUpgrade' has been set to bool(false)
#      Then: FAIL
#   Scenario: 4
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
```

```
#       And: 'Engine' is one of 'aurora', 'aurora-mysql', 'aurora-postgresql',
 'mariadb', 'mysql',
#            'oracle-ee', 'oracle-ee-cdb', 'oracle-se2', 'oracle-se2-cdb',
#            'sqlserver-ee', 'sqlserver-se', 'sqlserver-ex', 'sqlserver-web',
#            'postgres'
#       And: 'AutoMinorVersionUpgrade' has not been specified
#      Then: PASS
#   Scenario: 5
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine' is one of 'aurora', 'aurora-mysql', 'aurora-postgresql',
 'mariadb', 'mysql',
#            'oracle-ee', 'oracle-ee-cdb', 'oracle-se2', 'oracle-se2-cdb',
#            'sqlserver-ee', 'sqlserver-se', 'sqlserver-ex', 'sqlserver-web',
#            'postgres'
#       And: 'AutoMinorVersionUpgrade' has been specified
#       And: 'AutoMinorVersionUpgrade' has been set to bool(true)
#      Then: PASS

        Fn::Sub: '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
      AutoMinorVersionUpgrade: false
    DeletionPolicy: Delete
```

[CT.RDS.PR.6] Memerlukan kluster basis data Amazon RDS untuk mengonfigurasi backtracking

Kontrol ini memeriksa apakah klaster database Amazon Relational Database Service (RDS) (DB) Amazon Relational Database Service (RDS) telah mengaktifkan backtracking.

- Tujuan kontrol: Meningkatkan ketahanan
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif

- Jenis sumber daya: `AWS::RDS::DBCluster`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.RDS.PR.6

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.RDS.PR.6
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.RDS.PR.6contoh template

Penjelasan

Cadangan membantu Anda pulih lebih cepat dari insiden keamanan. Backup juga memperkuat ketahanan sistem Anda. Aurora backtracking mengurangi waktu yang diperlukan untuk memulihkan database untuk titik waktu tertentu, dan pemulihan tidak memerlukan pemulihan database.

> Pertimbangan penggunaan
>
> - Kontrol ini hanya berlaku untuk jenis mesin cluster Amazon RDS DB `aurora` dan`aurora-mysql`, dan untuk mode `provisioned` mesin cluster DB dan `parallelquery`
> - Kontrol ini tidak berlaku untuk klaster Amazon RDS DB yang mendukung instance database Aurora Serverless V2 (Misalnya, klaster RDS DB yang dikonfigurasi dengan kompatibel dengan Aurora Serverless V2 dan Aurora.) `ServerlessV2ScalingConfiguration` `EngineVersion`

Remediasi untuk kegagalan aturan

Setel `BacktrackWindow` ke angka antara `1` dan`259200`.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Amazon RDS DB Cluster - Contoh

Amazon RDS DB cluster dikonfigurasi dengan jendela backtrack 720 detik (12 menit). Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "DBCluster": {
        "Type": "AWS::RDS::DBCluster",
        "Properties": {
            "Engine": "aurora-mysql",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::password}}"
            },
            "DBSubnetGroupName": {
                "Ref": "DBSubnetGroup"
            },
            "BacktrackWindow": 720
        }
    }
}
```

Contoh YAMAL

```
DBCluster:
  Type: AWS::RDS::DBCluster
  Properties:
    Engine: aurora-mysql
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBClusterSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBClusterSecret}::password}}'
    DBSubnetGroupName: !Ref 'DBSubnetGroup'
    BacktrackWindow: 720
```

[**`CT.RDS.PR.7`**] Mengharuskan instans basis data Amazon RDS agar otentikasi IAM dikonfigurasi

Kontrol ini memeriksa apakah instans Amazon RDS database (DB) telah mengaktifkan autentikasi database AWS Identity and Access Management (IAM).

- Tujuan kontrol: Gunakan otentikasi yang kuat
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::RDS::DBInstance`
- AWS CloudFormation aturan penjaga: CT.RDS.PR.7spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.RDS.PR.7spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.RDS.PR.7contoh template

Penjelasan

Autentikasi basis data IAM memungkinkan otentikasi ke instance database dengan token otentikasi, bukan kata sandi. Lalu lintas jaringan ke dan dari database dienkripsi dengan SSL.

> **Pertimbangan penggunaan**
>
> - Kontrol ini hanya berlaku untuk jenis mesin Amazon RDS DB`mariadb`, `mysql` dan`postgres`.
> - Kontrol ini hanya berlaku ketika `Engine` properti disediakan. Itu tidak berlaku saat memulihkan dari snapshot DB atau snapshot cluster di mana `Engine` belum disetel secara eksplisit.

Remediasi untuk kegagalan aturan

Atur `EnableIAMDatabaseAuthentication` ke `true`.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Amazon RDS DB Instans - Contoh

Instans Amazon RDS DB dikonfigurasi dengan autentikasi database IAM. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "DBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
            "Engine": "postgres",
            "EngineVersion": 14.2,
            "DBInstanceClass": "db.m5.large",
            "StorageType": "gp2",
            "AllocatedStorage": 5,
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
            },
            "EnableIAMDatabaseAuthentication": true
```

```
        },
        "DeletionPolicy": "Delete"
    }
}
```

Contoh YAMAL

```
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    EnableIAMDatabaseAuthentication: true
  DeletionPolicy: Delete
```

CT.RDS.PR.7spesifikasi aturan

#
# Rule Identifier:
#   rds_instance_iam_authentication_enabled_check
#
# Description:
#   This control checks whether an Amazon RDS database (DB) instance has AWS Identity
 and Access Management (IAM) database authentication activated.
#
# Reports on:
#   AWS::RDS::DBInstance
#
# Evaluates:
# AWS CloudFormation, AWS CloudFormation hook
```

```
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document does not contain any RDS DB instance resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine' is not in-scope database engines - 'mariadb', 'mysql', 'postgres'
#      Then: SKIP
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine' is in-scope database engines - 'mariadb', 'mysql', 'postgres'
#       And: 'EnableIAMDatabaseAuthentication' has not been specified
#      Then: FAIL
#   Scenario: 4
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine' is in-scope database engines - 'mariadb', 'mysql', 'postgres'
#       And: 'EnableIAMDatabaseAuthentication' has been specified
#       And: 'EnableIAMDatabaseAuthentication' has been set to bool(false)
#      Then: FAIL
#   Scenario: 5
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine' is in-scope database engines - 'mariadb', 'mysql', 'postgres'
#       And: 'EnableIAMDatabaseAuthentication' has been specified
#       And: 'EnableIAMDatabaseAuthentication' has been set to bool(true)
#      Then: PASS

```

[CT.RDS.PR.8] Memerlukan instance database Amazon RDS agar cadangan otomatis dikonfigurasi

Kontrol ini memeriksa apakah instans Amazon RDS database (DB) telah mengaktifkan pencadangan otomatis, dan memverifikasi bahwa periode retensi cadangan lebih besar dari atau sama dengan tujuh (7) hari.

- Tujuan kontrol: Meningkatkan ketahanan
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::RDS::DBInstance`
- AWS CloudFormation aturan penjaga: CT.RDS.PR.8spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.RDS.PR.8spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.RDS.PR.8contoh template

Penjelasan

Cadangan membantu Anda pulih lebih cepat dari insiden keamanan, dan mereka memperkuat ketahanan sistem Anda. Amazon RDS menyediakan cara mudah untuk mengonfigurasi snapshot volume instans penuh harian.

> **Pertimbangan penggunaan**
>
> - Kontrol ini hanya berlaku untuk jenis mesin Amazon RDS DB `mariadbmysql`,`oracle-ee`,`oracle-ee-cdb`,`oracle-se2`,`oracle-se2-cdb`,`postgres`, `sqlserver-ee`sql`server-se`, `sqlserver-ex` dan`sqlserver-web`.

- Kontrol ini hanya berlaku ketika `Engine` properti disediakan. Itu tidak berlaku saat memulihkan dari snapshot DB atau snapshot cluster di mana `Engine` belum disetel secara eksplisit.

Remediasi untuk kegagalan aturan

Setel `BackupRetentionPeriod` ke nilai integer antara 7 dan 35 hari (inklusif).

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Amazon RDS DB Instans - Contoh

Instans Amazon RDS DB dikonfigurasi dengan backup otomatis yang dikonfigurasi dan periode retensi cadangan selama 14 hari. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "DBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
            "Engine": "postgres",
            "EngineVersion": 14.2,
            "DBInstanceClass": "db.m5.large",
            "StorageType": "gp2",
            "AllocatedStorage": 5,
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
            },
            "BackupRetentionPeriod": 14
        },
        "DeletionPolicy": "Delete"
    }
}
```

Contoh YAMAL

```
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    BackupRetentionPeriod: 14
  DeletionPolicy: Delete
```

[CT.RDS.PR.9] Memerlukan kluster basis data Amazon RDS untuk menyalin tag ke snapshot

Kontrol ini memeriksa apakah cluster Amazon RDS database (DB) dikonfigurasi untuk menyalin semua tag ke snapshot yang dibuat.

- Tujuan kontrol: Lindungi konfigurasi
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::RDS::DBCluster`
- AWS CloudFormation aturan penjaga: CT.RDS.PR.9spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.RDS.PR.9spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.RDS.PR.9contoh template

Penjelasan

Identifikasi dan inventaris aset infrastruktur Anda adalah aspek penting dari tata kelola dan keamanan. Dengan visibilitas ke semua cluster Amazon RDS DB Anda, Anda dapat menilai postur keamanan mereka dan mengambil tindakan pada area kelemahan potensial. Kami menyarankan Anda menandai snapshot dengan cara yang sama seperti cluster database RDS induknya. Mengaktifkan pengaturan ini memastikan bahwa snapshot mewarisi tag cluster database induknya.

> Pertimbangan penggunaan
>
> - Kontrol ini hanya berlaku untuk jenis mesin cluster Amazon RDS DB`aurora`,`aurora-mysql`, dan`aurora-postgresql`.

Remediasi untuk kegagalan aturan

Atur `CopyTagsToSnapshot` ke `true`.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Amazon RDS DB Cluster - Contoh

Amazon RDS DB cluster dikonfigurasi untuk menyalin tag ke snapshot. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "DBCluster": {
        "Type": "AWS::RDS::DBCluster",
        "Properties": {
            "Engine": "aurora-mysql",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::username}}"
```

```
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::password}}"
            },
            "DBSubnetGroupName": {
                "Ref": "DBSubnetGroup"
            },
            "CopyTagsToSnapshot": true
        }
    }
}
```

Contoh YAMAL

```
DBCluster:
  Type: AWS::RDS::DBCluster
  Properties:
    Engine: aurora-mysql
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBClusterSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBClusterSecret}::password}}'
    DBSubnetGroupName: !Ref 'DBSubnetGroup'
    CopyTagsToSnapshot: true
```

CT.RDS.PR.9spesifikasi aturan

[CT.RDS.PR.10] Memerlukan instance database Amazon RDS untuk menyalin tag ke snapshot

Kontrol ini memeriksa apakah instans Amazon RDS database (DB) dikonfigurasi untuk menyalin semua tag ke snapshot yang dibuat.

- Tujuan kontrol: Lindungi konfigurasi
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::RDS::DBInstance`
- AWS CloudFormation aturan penjaga: CT.RDS.PR.10spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.RDS.PR.10spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.RDS.PR.10contoh template

Penjelasan

Identifikasi dan inventaris aset TI Anda adalah aspek penting dari tata kelola dan keamanan. Dengan visibilitas semua instans RDS DB Anda, Anda dapat menilai postur keamanan mereka dan mengambil tindakan pada area kelemahan potensial. Snapshot harus diberi tag agar sesuai dengan instance database RDS induknya. Mengaktifkan pengaturan ini memastikan bahwa snapshot mewarisi tag dari instance database induknya.

Pertimbangan penggunaan

- Kontrol ini hanya berlaku untuk jenis mesin Amazon RDS DB `mariadbmysql`,`oracle-ee`,`oracle-ee-cdb`,`oracle-se2`,`oracle-se2-cdb`,`postgres`, `sqlserver-eesqlserver-se`, `sqlserver-ex` dan`sqlserver-web`.
- Kontrol ini hanya berlaku ketika `Engine` properti disediakan. Itu tidak berlaku saat memulihkan dari snapshot DB atau snapshot cluster di mana `Engine` belum disetel secara eksplisit.

Remediasi untuk kegagalan aturan

Atur `CopyTagsToSnapshot` ke `true`.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Amazon RDS DB Instans - Contoh

Instans Amazon RDS DB dikonfigurasi untuk menyalin semua tag ke snapshot yang dibuat. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "DBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
            "Engine": "postgres",
            "EngineVersion": 14.2,
            "DBInstanceClass": "db.m5.large",
            "StorageType": "gp2",
            "AllocatedStorage": 5,
```

```
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
            },
            "CopyTagsToSnapshot": true
        },
        "DeletionPolicy": "Delete"
    }
}
```

Contoh YAMAL

```
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    CopyTagsToSnapshot: true
  DeletionPolicy: Delete
```

CT.RDS.PR.10spesifikasi aturan

```
# ####################################

```

[CT.RDS.PR.11] Memerlukan instance database Amazon RDS untuk memiliki konfigurasi VPC

Kontrol ini memeriksa apakah instans Amazon RDS database (DB) digunakan dalam VPC (yaitu, dengan instans EC2-VPC).

- Tujuan kontrol: Batasi akses jaringan
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::RDS::DBInstance`
- AWS CloudFormation aturan penjaga: CT.RDS.PR.11spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.RDS.PR.11spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.RDS.PR.11contoh template

Penjelasan

Amazon Virtual Private Cloud (Amazon VPC) menyediakan sejumlah kontrol jaringan untuk membuat akses aman ke sumber daya RDS. Kontrol ini termasuk titik akhir VPC, ACL jaringan, dan grup keamanan. Untuk memanfaatkan kontrol ini, buat instans Amazon RDS Anda sebagai instans VPC EC2.

Pertimbangan penggunaan

- Kontrol ini hanya berlaku untuk jenis mesin Amazon RDS DB `mariadbmysql`,`oracle-ee`,`oracle-ee-cdb`,`oracle-se2`,`oracle-se2-cdb`,`postgres`, `sqlserver-ee``sqlserver-se`, `sqlserver-ex` dan`sqlserver-web`.
- Kontrol ini hanya berlaku ketika `Engine` properti disediakan. Itu tidak berlaku saat memulihkan dari snapshot DB atau snapshot cluster di mana `Engine` belum disetel secara eksplisit.

Remediasi untuk kegagalan aturan

Tetapkan a`DBSubnetGroupName`.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Amazon RDS DB Instans - Contoh

Instans Amazon RDS DB dikonfigurasi untuk diterapkan di VPC Amazon dengan grup subnet RDS DB. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "DBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
```

```
            "Engine": "postgres",
            "EngineVersion": 14.2,
            "DBInstanceClass": "db.m5.large",
            "StorageType": "gp2",
            "AllocatedStorage": 5,
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
            },
            "DBSubnetGroupName": {
                "Ref": "DBSubnetGroup"
            }
        },
        "DeletionPolicy": "Delete"
    }
}
```

Contoh YAMAL

```
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    DBSubnetGroupName: !Ref 'DBSubnetGroup'
  DeletionPolicy: Delete
```

```

[CT.RDS.PR.12] Memerlukan langganan acara Amazon RDS agar peristiwa klaster penting dikonfigurasi

Kontrol ini memeriksa apakah langganan acara Amazon RDS Anda untuk kluster RDS dikonfigurasi untuk memberi tahu tentang kategori acara dan `maintenance` `failure`.

- Tujuan kontrol: Lindungi konfigurasi
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::RDS::EventSubscription`
- AWS CloudFormation aturan penjaga: CT.RDS.PR.12spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.RDS.PR.12spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.RDS.PR.12contoh template

Penjelasan

Pemberitahuan acara Amazon RDS menggunakan Amazon SNS untuk membuat Anda mengetahui perubahan ketersediaan atau konfigurasi sumber daya RDS Anda. Pemberitahuan ini memungkinkan respons cepat.

Pertimbangan penggunaan

- Kontrol ini hanya berlaku untuk langganan acara Amazon RDS untuk klaster RDS (dari). `SourceType db-cluster`

Remediasi untuk kegagalan aturan

Kapan `SourceType` diatur ke`db-cluster`, atur `Enabled` ke true dan pastikan yang `EventCategories` berisi keduanya `maintenance` dan `failure` nilai.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Langganan Acara Amazon RDS - Contoh Satu

Langganan acara Amazon RDS untuk kluster RDS yang dikonfigurasi untuk memberi tahu semua kategori acara. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "RDSEventSubscription": {
        "Type": "AWS::RDS::EventSubscription",
        "Properties": {
            "SnsTopicArn": {
                "Ref": "SnsTopic"
            },
            "SourceType": "db-cluster",
            "Enabled": true
        }
    }
}
```

Contoh YAMAL

```
RDSEventSubscription:
  Type: AWS::RDS::EventSubscription
  Properties:
```

```
    SnsTopicArn: !Ref 'SnsTopic'
    SourceType: db-cluster
    Enabled: true
```

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Langganan Acara Amazon RDS - Contoh Dua

Langganan acara Amazon RDS untuk kluster RDS yang dikonfigurasi untuk memberi tahu tentang dan kategori acara. `maintenance` `failure` Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "RDSEventSubscription": {
        "Type": "AWS::RDS::EventSubscription",
        "Properties": {
            "SnsTopicArn": {
                "Ref": "SnsTopic"
            },
            "EventCategories": [
                "maintenance",
                "failure"
            ],
            "SourceType": "db-cluster",
            "Enabled": true
        }
    }
}
```

Contoh YAMAL

```
RDSEventSubscription:
  Type: AWS::RDS::EventSubscription
  Properties:
    SnsTopicArn: !Ref 'SnsTopic'
    EventCategories:
      - maintenance
```

```
      - failure
    SourceType: db-cluster
    Enabled: true
```

CT.RDS.PR.12spesifikasi aturan

```
# ####################################
##       Rule Specification        ##
#####################################
#
# Rule Identifier:
#   rds_cluster_event_notifications_configured_check
#
# Description:
#   Checks whether an Amazon RDS event subscriptions for RDS clusters is configured to
 notify on event categories of "maintenance" and "failure".

      - deletion
      SourceType: db-cluster
      Enabled: true
```

[CT.RDS.PR.13] Memerlukan instans Amazon RDS apa pun agar perlindungan penghapusan dikonfigurasi

Kontrol ini memeriksa apakah instans Amazon Relational Database Service (Amazon RDS) telah mengaktifkan perlindungan penghapusan.

- Tujuan kontrol: Meningkatkan ketersediaan
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::RDS::DBInstance`
- AWS CloudFormation aturan penjaga: CT.RDS.PR.13spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.RDS.PR.13spesifikasi aturan

- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.RDS.PR.13contoh template

Penjelasan

Saat aktif, perlindungan penghapusan instance memberikan lapisan perlindungan tambahan terhadap penghapusan database yang tidak disengaja, atau penghapusan oleh entitas yang tidak sah.

Sementara perlindungan penghapusan aktif, instans RDS DB tidak dapat dihapus. Sebelum permintaan penghapusan berhasil, perlindungan penghapusan harus dimatikan.

Pertimbangan penggunaan

- Kontrol ini hanya berlaku untuk jenis mesin Amazon RDS DB `mariadbmysql`,`oracle-ee`,`oracle-ee-cdb`,`oracle-se2`,`oracle-se2-cdb`,`postgres`, `sqlserver-ee``sqlserver-se`, `sqlserver-ex` dan`sqlserver-web`.
- Kontrol ini hanya berlaku ketika `Engine` properti disediakan. Itu tidak berlaku saat memulihkan dari snapshot DB atau snapshot cluster di mana `Engine` belum disetel secara eksplisit.

Remediasi untuk kegagalan aturan

Atur `DeletionProtection` ke `true`.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Amazon RDS DB instans - Contoh

Instans Amazon RDS DB dikonfigurasi dengan perlindungan penghapusan aktif. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "DBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
```

```
            "Engine": "postgres",
            "EngineVersion": 5.7,
            "DBInstanceClass": "db.m5.large",
            "StorageType": "gp2",
            "AllocatedStorage": 5,
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
            },
            "StorageEncrypted": true,
            "DeletionProtection": true
        },
        "DeletionPolicy": "Delete"
    }
}
```

Contoh YAMAL

```
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 5.7
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    StorageEncrypted: true
    DeletionProtection: true
  DeletionPolicy: Delete
```

[CT.RDS.PR.14] Memerlukan instance database Amazon RDS untuk mengekspor log ke Amazon CloudWatch Logs melalui properti EnableCloudwatchLogsExports

Aturan ini memeriksa apakah instans Amazon Relational Database Service (RDS) memiliki semua jenis log yang tersedia yang dikonfigurasi untuk diekspor ke Amazon Logs. CloudWatch

- Tujuan kontrol: Menetapkan pencatatan dan pemantauan
- Implementasi: Aturan AWS CloudFormation Penjaga

- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::RDS::DBInstance`
- AWS CloudFormation aturan penjaga: CT.RDS.PR.14spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.RDS.PR.14spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.RDS.PR.14contoh template

Penjelasan

AWS Control Tower merekomendasikan agar Anda mengaktifkan ekspor log yang relevan untuk semua database Amazon RDS ke Amazon CloudWatch Logs. Database logging menyediakan catatan rinci permintaan yang dibuat untuk RDS. Log basis data dapat membantu audit keamanan dan akses, dan mereka dapat membantu Anda mendiagnosis masalah ketersediaan.

Pertimbangan penggunaan

- Kontrol ini hanya berlaku untuk jenis mesin Amazon RDS DB `mariadbmysql`,`postgres`,`sqlserver-ee`,`sqlserver-se`,`sqlserver-ex`,`sqlserver-web`,`oracle-ee`, `oracle-se2oracle-se1`, dan`oracle-se`.
- Kontrol ini hanya berlaku ketika `Engine` properti disediakan. Itu tidak berlaku saat memulihkan dari snapshot DB atau snapshot cluster di mana `Engine` belum disetel secara eksplisit.
- Prasyarat tambahan mungkin ada untuk mengaktifkan logging berdasarkan jenis mesin database yang Anda pilih. Lihat Memantau file log Amazon RDS di Panduan Pengguna Amazon RDS untuk informasi selengkapnya.

Remediasi untuk kegagalan aturan

Tentukan `EnableCloudwatchLogsExports` dengan daftar semua jenis log yang didukung untuk mesin instance database Amazon RDS.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Amazon RDS DB Instans - Contoh Satu

Instans Amazon RDS DB dikonfigurasi dengan tipe engine `mysql` dan semua jenis log yang didukung, untuk tipe `mysql` engine. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "DBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
            "Engine": "mysql",
            "EngineVersion": 5.7,
            "DBInstanceClass": "db.m5.large",
            "StorageType": "gp2",
            "AllocatedStorage": 5,
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
            },
            "StorageEncrypted": true,
            "EnableCloudwatchLogsExports": [
                "error",
                "general",
                "slowquery",
                "audit"
            ]
        },
        "DeletionPolicy": "Delete"
    }
}
```

Contoh YAMAL

```
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: mysql
```

```
    EngineVersion: 5.7
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    StorageEncrypted: true
    EnableCloudwatchLogsExports:
      - error
      - general
      - slowquery
      - audit
  DeletionPolicy: Delete
```

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Amazon RDS DB Instans - Contoh Dua

Instans Amazon RDS DB dikonfigurasi dengan tipe engine `postgres` dan semua jenis log yang didukung, untuk tipe `postgres` engine. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "DBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
            "Engine": "postgres",
            "EngineVersion": 14.2,
            "DBInstanceClass": "db.m5.large",
            "StorageType": "gp2",
            "AllocatedStorage": 5,
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
            },
            "EnableCloudwatchLogsExports": [
                "postgresql",
                "upgrade"
```

```
            ]
        },
        "DeletionPolicy": "Delete"
    }
}
```

Contoh YAMAL

```
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    EnableCloudwatchLogsExports:
      - postgresql
      - upgrade
  DeletionPolicy: Delete
```

CT.RDS.PR.14spesifikasi aturan

```
# ####################################
##       Rule Specification        ##
####################################
#
# Rule Identifier:
#   rds_instance_logging_enabled_check
#
# Description:
#   This rules checks whether Amazon Relational Database Service (RDS) instances have
 all available log types configured for export to Amazon CloudWatch Logs.
#
# Reports on:
#   AWS::RDS::DBInstance
```

```
#
# Evaluates:
# AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document does not contain any RDS DB instance resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine' is not one of 'mariadb', 'mysql',
#            'oracle-ee', 'oracle-se2', 'oracle-ee-cdb', 'oracle-se2-cdb',
#            'postgres', 'sqlserver-ee', 'sqlserver-se', 'sqlserver-ex', 'sqlserver-
web'
#      Then: SKIP
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine' is one of 'mariadb', 'mysql',
#            'oracle-ee', 'oracle-se2', 'oracle-ee-cdb', 'oracle-se2-cdb',
#            'postgres', 'sqlserver-ee', 'sqlserver-se', 'sqlserver-ex', 'sqlserver-
web'
#       And: 'EnableCloudwatchLogsExports' has not been specified or has been specified
#             and is an empty list
#      Then: FAIL
#   Scenario: 4
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine' is one of 'mariadb', 'mysql',
#            'oracle-ee', 'oracle-se2', 'oracle-ee-cdb', 'oracle-se2-cdb',
#            'postgres', 'sqlserver-ee', 'sqlserver-se', 'sqlserver-ex', 'sqlserver-
web'
#       And: 'EnableCloudwatchLogsExports' has been specified and is a non-empty list
#       And: One or more log types in 'EnableCloudwatchLogsExports' are not supported
 by the specified 'Engine'
```

```
#      Then: FAIL
#   Scenario: 5
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine' is one of 'mariadb', 'mysql',
#            'oracle-ee', 'oracle-se2', 'oracle-ee-cdb', 'oracle-se2-cdb',

CT.RDS.PR.14contoh template

Anda dapat melihat contoh artefak pengujian PASS dan FAIL untuk kontrol proaktif AWS Control Tower.

Contoh PASS - Gunakan template ini untuk memverifikasi pembuatan sumber daya yang sesuai.

```
Resources:
  DBInstanceSecret:
    Type: AWS::SecretsManager::Secret
    Properties:
      Description: RDS DB instance secret
      GenerateSecretString:
        SecretStringTemplate: '{"username": "examplemasteruser"}'
        GenerateStringKey: password
        PasswordLength: 22
        ExcludeCharacters: '"@/\'
  DBInstance:
    Type: AWS::RDS::DBInstance
    Properties:
      Engine: mysql
      EngineVersion: 5.7
      DBInstanceClass: db.m5.large
      StorageType: gp2
      AllocatedStorage: 5
      MasterUsername:
        Fn::Sub: '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
      MasterUserPassword:
        Fn::Sub: '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
      StorageEncrypted: true
      EnableCloudwatchLogsExports:
      - error
      - general
      - slowquery
      - audit
    DeletionPolicy: Delete
```

Contoh GAGAL - Gunakan templat ini untuk memverifikasi bahwa kontrol mencegah pembuatan sumber daya yang tidak sesuai.

```
Resources:
  DBInstanceSecret:
    Type: AWS::SecretsManager::Secret
    Properties:
      Description: RDS DB instance secret
      GenerateSecretString:
        SecretStringTemplate: '{"username": "examplemasteruser"}'
        GenerateStringKey: password
        PasswordLength: 22
        ExcludeCharacters: '"@/\'
  DBInstance:
    Type: AWS::RDS::DBInstance
    Properties:
      Engine: mysql
      EngineVersion: 5.7
      DBInstanceClass: db.m5.large
      StorageType: gp2
      AllocatedStorage: 5
      MasterUsername:
        Fn::Sub: '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
      MasterUserPassword:
        Fn::Sub: '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
      StorageEncrypted: true
      EnableCloudwatchLogsExports:
      - error
      - general
      - slowquery
    DeletionPolicy: Delete
```

[CT.RDS.PR.15] Mengharuskan instans Amazon RDS tidak membuat grup keamanan DB

Kontrol ini memeriksa apakah grup keamanan Amazon Relational Database Service (RDS) database (DB) Amazon Relational Database Service (RDS) dibuat oleh, atau terkait dengan, instans RDS DB, karena grup keamanan DB ditujukan untuk platform EC2-Classic saja.

- Tujuan kontrol: Batasi akses jaringan
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif

- Jenis sumber daya:`AWS::RDS::DBInstance`, `AWS::RDS::DBSecurityGroup`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.RDS.PR.15

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.RDS.PR.15
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.RDS.PR.15contoh template

Penjelasan

Kami menyarankan agar semua database Amazon Relational Database Service (RDS) menggunakan grup keamanan Amazon VPC untuk mengamankan akses mereka. Grup keamanan Amazon DB hanya untuk platform EC2-Classic, dan tidak disarankan untuk digunakan.

Remediasi untuk kegagalan aturan

Hilangkan `DBSecurityGroups` properti. Sebagai gantinya, konfigurasikan grup keamanan Amazon VPC melalui properti. `VPCSecurityGroups`

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Amazon RDS DB Instans - Contoh

Instans Amazon RDS DB dikonfigurasi dengan grup keamanan Amazon VPC. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "DBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
            "Engine": "mysql",
            "EngineVersion": 5.7,
            "DBInstanceClass": "db.t3.small",
            "StorageType": "gp2",
```

```
            "AllocatedStorage": 5,
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
            },
            "StorageEncrypted": true,
            "Port": 6733,
            "DBSubnetGroupName": {
                "Ref": "DBSubnetGroup"
            },
            "VPCSecurityGroups": [
                {
                    "Ref": "SecurityGroup"
                }
            ]
        }
    }
}
```

Contoh YAMAL

```
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: mysql
    EngineVersion: 5.7
    DBInstanceClass: db.t3.small
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    StorageEncrypted: true
    Port: 6733
    DBSubnetGroupName: !Ref 'DBSubnetGroup'
    VPCSecurityGroups:
      - !Ref 'SecurityGroup'
```

[CT.RDS.PR.16] Memerlukan kluster basis data Amazon RDS agar enkripsi saat istirahat dikonfigurasi

Kontrol ini memeriksa apakah enkripsi penyimpanan dikonfigurasi pada kluster database Amazon Relational Database Service (RDS) Amazon Relational Database Service (DB) yang tidak dipulihkan dari cluster yang ada.

- Tujuan kontrol: Enkripsi data saat istirahat
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::RDS::DBCluster`

- AWS CloudFormation aturan penjaga: CT.RDS.PR.16spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.RDS.PR.16spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.RDS.PR.16contoh template

Penjelasan

Kami menyarankan Anda mengonfigurasi kluster Amazon RDS DB Anda untuk dienkripsi saat istirahat, untuk memberikan lapisan keamanan tambahan untuk data sensitif Anda. Untuk mengenkripsi cluster dan snapshot RDS DB Anda saat istirahat, aktifkan opsi enkripsi untuk cluster RDS DB Anda. Data yang dienkripsi saat istirahat mencakup penyimpanan yang mendasari untuk cluster DB, cadangan otomatisnya, replika baca, dan snapshot.

Cluster RDS DB terenkripsi menggunakan algoritma enkripsi AES-256 standar terbuka untuk mengenkripsi data Anda di server yang menghosting cluster. Setelah data Anda dienkripsi, Amazon RDS menangani otentikasi akses dan dekripsi data Anda dengan dampak minimal pada kinerja. Anda tidak perlu memodifikasi aplikasi klien database Anda untuk menggunakan enkripsi.

> Pertimbangan penggunaan
>
> - Kontrol ini hanya berlaku untuk klaster Amazon RDS DB yang tidak dipulihkan dari cluster yang ada atau dibuat sebagai replika baca. (Misalnya, kapan `SourceDBClusterIdentifier` atau `ReplicationSourceIdentifier` properti telah disediakan.)

Remediasi untuk kegagalan aturan

Atur `StorageEncrypted` ke `true`.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Amazon RDS DB Cluster - Contoh

Amazon RDS DB cluster dikonfigurasi dengan enkripsi penyimpanan diaktifkan. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "DBCluster": {
        "Type": "AWS::RDS::DBCluster",
        "Properties": {
            "Engine": "aurora-mysql",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::password}}"
            },
            "StorageEncrypted": true
        }
    }
}
```

Contoh YAMAL

```
DBCluster:
  Type: AWS::RDS::DBCluster
  Properties:
    Engine: aurora-mysql
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBClusterSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBClusterSecret}::password}}'
    StorageEncrypted: true
```

```

[CT.RDS.PR.17] Memerlukan langganan pemberitahuan acara Amazon RDS agar peristiwa instance database penting dikonfigurasi

Kontrol ini memeriksa apakah langganan acara Amazon RDS untuk instans RDS dikonfigurasi untuk memberi tahu tentang kategori acara,, dan. `maintenance` `failure` `configuration change`

- Tujuan kontrol: Lindungi konfigurasi
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::RDS::EventSubscription`
- AWS CloudFormation aturan penjaga: CT.RDS.PR.17spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.RDS.PR.17spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.RDS.PR.17contoh template

Penjelasan

Pemberitahuan acara Amazon RDS menggunakan Amazon SNS untuk membuat Anda mengetahui perubahan ketersediaan atau konfigurasi sumber daya RDS Anda. Pemberitahuan ini memungkinkan respons cepat.

Pertimbangan penggunaan

- Kontrol ini hanya berlaku untuk Langganan Acara Amazon RDS untuk instans RDS (dari). `SourceType db-instance`

Remediasi untuk kegagalan aturan

Kapan `SourceType` diatur ke`db-instance`, atur `Enabled` ke true dan pastikan bahwa parameter `EventCategories` berisi`maintenance`,`failure`, dan `configuration change` nilai.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Langganan Acara Amazon RDS - Contoh Satu

Langganan Acara Amazon RDS untuk instans RDS yang dikonfigurasi untuk memberi tahu semua kategori acara. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "RDSEventSubscription": {
        "Type": "AWS::RDS::EventSubscription",
        "Properties": {
            "SnsTopicArn": {
                "Ref": "SnsTopic"
            },
            "SourceType": "db-instance",
            "Enabled": true
        }
    }
}
```

Contoh YAMAL

```
RDSEventSubscription:
  Type: AWS::RDS::EventSubscription
  Properties:
```

```
    SnsTopicArn: !Ref 'SnsTopic'
    SourceType: db-instance
    Enabled: true
```

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Langganan Acara Amazon RDS - Contoh Dua

Langganan Acara Amazon RDS untuk instans RDS yang dikonfigurasi untuk memberi tahu tentang`maintenance`,`failure`, dan kategori acara. `configuration change` Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "RDSEventSubscription": {
        "Type": "AWS::RDS::EventSubscription",
        "Properties": {
            "SnsTopicArn": {
                "Ref": "SnsTopic"
            },
            "EventCategories": [
                "maintenance",
                "failure",
                "configuration change"
            ],
            "SourceType": "db-instance",
            "Enabled": true
        }
    }
}
```

Contoh YAMAL

```
RDSEventSubscription:
  Type: AWS::RDS::EventSubscription
  Properties:
```

```
    SnsTopicArn: !Ref 'SnsTopic'
    EventCategories:
      - maintenance
      - failure
      - configuration change
    SourceType: db-instance
    Enabled: true
```

    Properties:
      SnsTopicArn:
        Ref: SNSTopic
      EventCategories:
      - maintenance
      - failure
      SourceType: db-instance
      Enabled: true
```

[CT.RDS.PR.18] Memerlukan langganan pemberitahuan acara Amazon RDS agar peristiwa grup parameter basis data penting dikonfigurasi

Kontrol ini memeriksa apakah langganan acara Amazon RDS Anda untuk grup parameter RDS dikonfigurasi untuk memberi tahu tentang kategori acara `configuration change`.

- Tujuan kontrol: Lindungi konfigurasi
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::RDS::EventSubscription`
- AWS CloudFormation aturan penjaga: CT.RDS.PR.18spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.RDS.PR.18spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.RDS.PR.18contoh template

Penjelasan

Pemberitahuan acara Amazon RDS menggunakan Amazon SNS untuk membuat Anda mengetahui perubahan ketersediaan atau konfigurasi sumber daya RDS Anda. Pemberitahuan ini memungkinkan respons cepat.

> Pertimbangan penggunaan
>
> - Kontrol ini hanya berlaku untuk langganan acara Amazon RDS untuk grup parameter RDS (`SourceType`dari). `db-parameter-group`

Remediasi untuk kegagalan aturan

Kapan `SourceType` diatur ke`db-parameter-group`, atur `Enabled` ke true dan pastikan bahwa parameter `EventCategories` berisi `configuration change` sebagai nilai.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Langganan Acara Amazon RDS - Contoh Satu

Langganan acara Amazon RDS untuk grup parameter RDS yang dikonfigurasi untuk memberi tahu semua kategori acara. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "RDSEventSubscription": {
        "Type": "AWS::RDS::EventSubscription",
        "Properties": {
            "SnsTopicArn": {
                "Ref": "SnsTopic"
            },
```

```
            "SourceType": "db-parameter-group",
            "Enabled": true
        }
    }
}
```

Contoh YAMAL

```
RDSEventSubscription:
  Type: AWS::RDS::EventSubscription
  Properties:
    SnsTopicArn: !Ref 'SnsTopic'
    SourceType: db-parameter-group
    Enabled: true
```

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Langganan Acara Amazon RDS - Contoh Dua

Langganan acara Amazon RDS untuk grup parameter RDS yang dikonfigurasi untuk memberi tahu tentang kategori acara. `configuration change` Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "RDSEventSubscription": {
        "Type": "AWS::RDS::EventSubscription",
        "Properties": {
            "SnsTopicArn": {
                "Ref": "SnsTopic"
            },
            "EventCategories": [
                "configuration change"
            ],
            "SourceType": "db-parameter-group",
            "Enabled": true
        }
    }
```

```
}
```

Contoh YAMAL

```
RDSEventSubscription:
  Type: AWS::RDS::EventSubscription
  Properties:
    SnsTopicArn: !Ref 'SnsTopic'
    EventCategories:
      - configuration change
    SourceType: db-parameter-group
    Enabled: true
```

CT.RDS.PR.18spesifikasi aturan

####################################
#
# Rule Identifier:
#   rds_pg_event_notifications_configured_check
#
# Description:
#   Checks whether Amazon RDS event subscriptions for RDS parameter groups are
 configured to notify on event categories of 'configuration change'.
#
# Reports on:
#   AWS::RDS::EventSubscription
#
# Evaluates:
# AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
```

```
#     Given: The input document is an AWS CloudFormation or CloudFormation hook
 document
#       And: The input document does not contain any RDS event subscription resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or CloudFormation hook
 document
#       And: The input document contains an RDS event subscription resource
#       And: 'SourceType' is provided and is not 'db-parameter-group'
#      Then: SKIP
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or CloudFormation hook
 document
#       And: The input document contains an RDS event subscription resource
#       And: 'SourceType' is 'db-parameter-group'
#       And: 'Enabled' is not provided or set to bool(false)
#      Then: FAIL
#   Scenario: 4
#     Given: The input document is an AWS CloudFormation or CloudFormation hook
 document
#       And: The input document contains an RDS event subscription resource
#       And: 'SourceType' is provided and is 'db-parameter-group'
#       And: 'Enabled' is provided and set to bool(true)
#       And: 'EventCategories' does not contain 'configuration change'
#      Then: FAIL
#   Scenario: 5
#     Given: The input document is an AWS CloudFormation or CloudFormation hook
 document
#       And: The input document contains an RDS event subscription resource
#       And: 'SourceType' is provided and is 'db-parameter-group'
#       And: 'Enabled' is provided and set to bool(true)
#       And: 'EventCategories' does not exist or is an empty list
#      Then: PASS
#   Scenario: 6
#     Given: The input document is an AWS CloudFormation or CloudFormation hook
 document
#       And: The input document contains an RDS event subscription resource
#       And: 'SourceType' is provided and is 'db-parameter-group'
#       And: 'Enabled' is provided and set to bool(true)
#       And: 'EventCategories' contains 'configuration change'
#      Then: PASS

    Properties:
      SnsTopicArn:
        Ref: SNSTopic
      EventCategories:
      - failure
      SourceType: db-security-group
      Enabled: true
```

[CT.RDS.PR.20] Memerlukan instance database Amazon RDS untuk tidak menggunakan port default mesin database

Kontrol ini memeriksa apakah instance database Amazon Relational Database Service (RDS) dikonfigurasi untuk port database default untuk jenis engine spesifiknya.

- Tujuan kontrol: Batasi akses jaringan
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::RDS::DBInstance`
- AWS CloudFormation aturan penjaga: CT.RDS.PR.20spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.RDS.PR.20spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.RDS.PR.20contoh template

Penjelasan

Jika Anda menggunakan port yang dikenal untuk menyebarkan cluster atau instance Amazon RDS, penyerang dapat menebak informasi tentang cluster atau instance. Penyerang dapat menggunakan informasi ini bersama dengan informasi lain untuk terhubung ke cluster atau instans Amazon RDS, atau untuk mendapatkan informasi tambahan tentang aplikasi Anda.

Ketika Anda mengubah port, Anda juga harus memperbarui string koneksi yang ada yang digunakan untuk terhubung ke port lama. Anda juga harus memeriksa grup keamanan instans DB untuk memastikan bahwa itu termasuk aturan masuk yang memungkinkan konektivitas pada port baru.

Pertimbangan penggunaan

- Kontrol ini hanya berlaku untuk jenis mesin Amazon RDS DB `mariadbmysql`,`oracle-ee`,`oracle-se2`,`oracle-ee-cdb`,`oracle-se2-cdb`,`postgres`, `sqlserver-ee``sqlserver-se`, `sqlserver-ex` dan`sqlserver-web`.

- Kontrol ini hanya berlaku ketika `Engine` properti disediakan. Itu tidak berlaku saat memulihkan dari snapshot DB atau snapshot cluster di mana `Engine` belum disetel secara eksplisit.

Remediasi untuk kegagalan aturan

Tetapkan nilai untuk `Port` itu berbeda dari nilai default untuk jenis mesin instans Amazon RDS DB.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Amazon RDS DB Instans - Contoh Satu

Instans Amazon RDS DB dikonfigurasi dengan port yang berbeda dari port default `mysql` engine. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "DBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
            "Engine": "mysql",
            "EngineVersion": 5.7,
            "DBInstanceClass": "db.m5.large",
            "StorageType": "gp2",
            "AllocatedStorage": 5,
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
            },
            "StorageEncrypted": true,
            "Port": 6733
        },
        "DeletionPolicy": "Delete"
    }
}
```

Contoh YAMAL

```
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: mysql
    EngineVersion: 5.7
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    StorageEncrypted: true
    Port: 6733
  DeletionPolicy: Delete
```

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Amazon RDS DB Instans - Contoh Dua

Instans Amazon RDS DB dikonfigurasi dengan port yang berbeda dari port default `postgres` engine. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "DBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
            "Engine": "postgres",
            "EngineVersion": 14.2,
            "DBInstanceClass": "db.m5.large",

}
```

Contoh YAMAL

```
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    Port: 5723
  DeletionPolicy: Delete
```

CT.RDS.PR.20spesifikasi aturan

```
# ####################################
##       Rule Specification        ##
####################################
#
# Rule Identifier:
#   rds_instance_no_default_ports_check
#
# Description:
#   This control checks whether Amazon Relational Database Service (RDS) database
 instances are configured for default database port for their specific engine types.
#
# Reports on:
#   AWS::RDS::DBInstance
#
# Evaluates:
# AWS CloudFormation, AWS CloudFormation hook
```

```
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document does not contain any Amazon RDS DB instance resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine' is not one of  'mariadb', 'mysql',
#            'oracle-ee', 'oracle-se2', 'oracle-ee-cdb', 'oracle-se2-cdb',
#            'postgres', 'sqlserver-ee', 'sqlserver-se', 'sqlserver-ex', 'sqlserver-
web'
#      Then: SKIP
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine' is one of  'mariadb', 'mysql',
#            'oracle-ee', 'oracle-se2', 'oracle-ee-cdb', 'oracle-se2-cdb',
#            'postgres', 'sqlserver-ee', 'sqlserver-se', 'sqlserver-ex', 'sqlserver-
web'
#       And: 'Port' has not been specified
#      Then: FAIL
#   Scenario: 4
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine' is one of  'mariadb', 'mysql',
#            'oracle-ee', 'oracle-se2', 'oracle-ee-cdb', 'oracle-se2-cdb',
#            'postgres', 'sqlserver-ee', 'sqlserver-se', 'sqlserver-ex', 'sqlserver-
web'
#       And: 'Port' has been specified
#       And: 'Port' value is default port (includes mysql/mariadb port '3306',
 sqlserver
#            port '1433', postgres port '5432', and oracle port '1521')
#      Then: FAIL
#   Scenario: 5
```

```
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine'  is one of 'mariadb', 'mysql'
#       And: 'Port' has been specified
#       And: 'Port' value is not equal to '3306'
#      Then: PASS
#   Scenario: 6
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine' is 'postgres'
#       And: 'Port' has been specified
#       And: 'Port' value is not equal to '5432'
#      Then: PASS
#   Scenario: 7
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine' is one of 'sqlserver-ee', 'sqlserver-se', 'sqlserver-ex',
 'sqlserver-web'
#       And: 'Port' has been specified
#       And: 'Port' value is not equal to '1433'
#      Then: PASS
#   Scenario: 8
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an RDS DB instance resource
#       And: 'Engine' is one of 'oracle-ee', 'oracle-se2', 'oracle-ee-cdb', 'oracle-
se2-cdb',
#       And: 'Port' has been specified
#       And: 'Port' value is not equal to '1521'
#      Then: PASS

[CT.RDS.PR.21] Memerlukan cluster Amazon RDS DB untuk memiliki nama pengguna administrator yang unik

Kontrol ini memeriksa apakah kluster database Amazon Relational Database Service (RDS) (DB) telah mengubah nama pengguna administrator dari nilai defaultnya.

- Tujuan kontrol: Lindungi konfigurasi
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::RDS::DBCluster`
- AWS CloudFormation aturan penjaga: CT.RDS.PR.21spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.RDS.PR.21spesifikasi aturan

- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.RDS.PR.21contoh template

Penjelasan

Saat membuat database Amazon RDS, sebaiknya ubah nama pengguna administrator default menjadi nilai unik. Nama pengguna default adalah pengetahuan publik, dan mereka harus diubah, karena mengubah nama pengguna ini mengurangi risiko akses yang tidak diinginkan.

> Pertimbangan penggunaan
>
> - Kontrol ini hanya berlaku untuk cluster Amazon RDS DB yang mengatur properti. `MasterUsername`

Remediasi untuk kegagalan aturan

Setel `MasterUsername` ke nilai selain `admin` ataupu`postgres`.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Amazon RDS DB Cluster - Contoh

Amazon RDS DB cluster dikonfigurasi dengan nama pengguna administrator yang unik. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "DBCluster": {
        "Type": "AWS::RDS::DBCluster",
        "Properties": {
            "Engine": "aurora-mysql",
            "MasterUsername": "samplemasteruser",
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${RDSClusterSecret}::password}}"
            },
            "DBSubnetGroupName": {
                "Ref": "DBSubnetGroup"
            }
        }
```

```
    }
}
```

Contoh YAMAL

```
DBCluster:
  Type: AWS::RDS::DBCluster
  Properties:
    Engine: aurora-mysql
    MasterUsername: samplemasteruser
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${RDSClusterSecret}::password}}'
    DBSubnetGroupName: !Ref 'DBSubnetGroup'
```

CT.RDS.PR.21spesifikasi aturan

[CT.RDS.PR.22] Memerlukan instance database Amazon RDS untuk memiliki nama pengguna administrator yang unik

Kontrol ini memeriksa apakah database Amazon Relational Database Service (RDS) telah mengubah nama pengguna adminstrator dari nilai defaultnya.

- Tujuan kontrol: Lindungi konfigurasi
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::RDS::DBInstance`
- AWS CloudFormation aturan penjaga: CT.RDS.PR.22spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.RDS.PR.22spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.RDS.PR.22contoh template

Penjelasan

Nama pengguna administratif default pada database Amazon RDS adalah pengetahuan publik. Saat membuat database Amazon RDS, Anda harus mengubah nama pengguna administratif default ke nilai unik, sehingga mengurangi risiko akses yang tidak diinginkan.

> **Pertimbangan penggunaan**
>
> - Kontrol ini hanya berlaku untuk jenis mesin Amazon RDS DB `mariadbmysql`,`oracle-ee`,`oracle-ee-cdb`,`oracle-se2`,`oracle-se2-cdb`,`postgres`,`sqlserver-ee`, `sqlserver-sesqlserver-ex`, dan`sqlserver-web`.

Remediasi untuk kegagalan aturan

Setel `MasterUsername` ke nilai selain `postgres` atau`admin`.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Amazon RDS DB Instans - Contoh

Instans Amazon RDS DB dikonfigurasi dengan nama pengguna administrator khusus. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "DBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
            "Engine": "postgres",
            "EngineVersion": 14.2,
            "DBInstanceClass": "db.m5.large",
            "StorageType": "gp2",
            "AllocatedStorage": 5,
            "MasterUsername": "testUser",
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
            }
        },
        "DeletionPolicy": "Delete"
    }
}
```

Contoh YAMAL

```
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: testUser
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
  DeletionPolicy: Delete
```

CT.RDS.PR.22spesifikasi aturan

```

[CT.RDS.PR.23] Memerlukan instans database Amazon RDS agar tidak dapat diakses publik

Aturan ini memeriksa apakah instans database Amazon Relational Database Service (RDS) database (DB) dapat diakses publik, sebagaimana ditentukan dengan memeriksa properti konfigurasi. `PubliclyAccessible`

- Tujuan kontrol: Batasi akses jaringan
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::RDS::DBInstance`
- AWS CloudFormation aturan penjaga: CT.RDS.PR.23spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.RDS.PR.23spesifikasi aturan

- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.RDS.PR.23contoh template

Penjelasan

`PubliclyAccessible`Properti dalam CloudFormation sumber daya instans RDS menunjukkan apakah instans DB dapat diakses publik. Ketika instans DB dikonfigurasi dengan `PubliclyAccessible` set to`true`, itu adalah instance yang menghadap ke internet dengan nama DNS yang dapat diselesaikan secara publik, yang diselesaikan ke alamat IP publik. Ketika instans DB tidak dapat diakses publik, itu adalah instance internal dengan nama DNS yang menyelesaikan ke alamat IP pribadi.

Kecuali jika Anda bermaksud agar instans RDS Anda dapat diakses publik, jangan mengonfigurasi instance RDS dengan `PubliclyAccessible` nilai yang disetel ke`true`, karena konfigurasi ini memungkinkan lalu lintas yang tidak diinginkan ke instance database Anda.

Remediasi untuk kegagalan aturan

Tetapkan nilai `PubliclyAccessible` ke`false`.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Amazon RDS DB Instans - Contoh

Instans Amazon RDS DB dikonfigurasi sebagai instans internal, melalui konfigurasi yang dapat diakses publik. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "DBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
            "Engine": "postgres",
            "EngineVersion": 14.2,
            "DBInstanceClass": "db.m5.large",
            "StorageType": "gp2",
            "AllocatedStorage": 5,
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
            },
```

```
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
            },
            "PubliclyAccessible": false
        },
        "DeletionPolicy": "Delete"
    }
}
```

Contoh YAMAL

```
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    PubliclyAccessible: false
  DeletionPolicy: Delete
```

    DeletionPolicy: Delete
```

[CT.RDS.PR.24] Memerlukan instance database Amazon RDS agar enkripsi saat istirahat dikonfigurasi

Kontrol ini memeriksa apakah enkripsi penyimpanan diaktifkan untuk instans database Amazon RDS (DB) Anda.

- Tujuan kontrol: Enkripsi data saat istirahat
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::RDS::DBInstance`

- AWS CloudFormation aturan penjaga: CT.RDS.PR.24spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.RDS.PR.24spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.RDS.PR.24contoh template

Penjelasan

Untuk lapisan keamanan tambahan untuk data sensitif Anda di instans Amazon RDS DB, Anda harus mengonfigurasi instans RDS DB agar dienkripsi saat istirahat. Untuk mengenkripsi instans dan snapshot RDS DB Anda saat istirahat, aktifkan opsi enkripsi untuk instans RDS DB Anda. Data yang dienkripsi saat istirahat mencakup penyimpanan yang mendasari untuk instans DB, pencadangan otomatisnya, replika baca, dan snapshot.

Instans Amazon RDS DB terenkripsi menggunakan algoritme enkripsi AES-256 standar terbuka untuk mengenkripsi data Anda di server yang menghosting instans RDS DB Anda. Setelah data Anda dienkripsi, Amazon RDS menangani otentikasi akses dan dekripsi data Anda secara transparan dengan dampak minimal pada kinerja. Anda tidak perlu memodifikasi aplikasi klien database Anda untuk menggunakan enkripsi.

Enkripsi Amazon RDS saat ini tersedia untuk semua mesin database dan jenis penyimpanan. Enkripsi Amazon RDS tersedia untuk sebagian besar kelas instans DB.

Pertimbangan penggunaan

- Kontrol ini hanya berlaku untuk jenis mesin Amazon RDS DB `mariadbmysql`,`oracle-ee`,`oracle-ee-cdb`,`oracle-se2`,`oracle-se2-cdb`,`postgres`, `sqlserver-ee``sqlserver-se`, `sqlserver-ex` dan `sqlserver-web`
- Kontrol ini hanya berlaku ketika `Engine` properti disediakan. Itu tidak berlaku saat memulihkan dari snapshot DB atau snapshot cluster di mana `Engine` belum disetel secara eksplisit.

Remediasi untuk kegagalan aturan

Parameter `StorageEncrypted` harus disetel ke true untuk Instans RDS DB.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Amazon RDS DB instans - Contoh

Instans Amazon RDS DB dengan enkripsi penyimpanan diaktifkan. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "RDSDBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
            "Engine": "postgres",
            "EngineVersion": 14.2,
            "DBInstanceClass": "db.m5.large",
            "StorageType": "gp2",
            "AllocatedStorage": 5,
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:
${RDSDBInstanceSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:
${RDSDBInstanceSecret}::password}}"
            },
            "StorageEncrypted": true
        }
    }
}
```

Contoh YAMAL

```
RDSDBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
```

```
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${RDSDBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:
${RDSDBInstanceSecret}::password}}'
    StorageEncrypted: true
```

CT.RDS.PR.24spesifikasi aturan

[CT.RDS.PR.25] Memerlukan cluster basis data Amazon RDS untuk mengekspor log ke Amazon Logs melalui properti CloudWatch EnableCloudwatchLogsExports

Kontrol ini memeriksa apakah kluster database Amazon RDS memiliki semua jenis log yang tersedia yang diaktifkan untuk diekspor ke Amazon CloudWatch Logs.

- Tujuan kontrol: Menetapkan pencatatan dan pemantauan
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::RDS::DBCluster`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.RDS.PR.25

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.RDS.PR.25
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.RDS.PR.25 contoh template

Penjelasan

AWS Control Tower merekomendasikan agar Anda mengaktifkan ekspor log yang relevan untuk semua kluster database Amazon RDS ke Amazon CloudWatch Logs. Database logging menyediakan catatan rinci permintaan yang dibuat untuk RDS. Log basis data dapat membantu audit keamanan dan akses, dan mereka dapat membantu Anda mendiagnosis masalah ketersediaan.

> **Pertimbangan penggunaan**
>
> - Kontrol ini hanya berlaku untuk jenis mesin cluster Amazon RDS DB`aurora`,, `aurora-mysql``aurora-postgresql`, `mysql` dan`postgres`.

- Prasyarat tambahan mungkin ada untuk mengaktifkan logging berdasarkan jenis mesin database yang Anda pilih. Lihat Memantau file log Amazon Aurora di Panduan Pengguna Amazon Aurora untuk informasi selengkapnya.

Remediasi untuk kegagalan aturan

Tentukan `EnableCloudwatchLogsExports` dengan daftar semua jenis log yang didukung untuk mesin cluster database Amazon RDS.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Amazon RDS database (DB) Cluster - Contoh Satu

Amazon RDS Aurora DB cluster dikonfigurasi dengan semua jenis log yang tersedia diaktifkan untuk ekspor ke Amazon CloudWatch Logs. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "DBCluster": {
        "Type": "AWS::RDS::DBCluster",
        "Properties": {
            "Engine": "aurora",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::password}}"
            },
            "DBSubnetGroupName": {
                "Ref": "DBSubnetGroup"
            },
            "EnableCloudwatchLogsExports": [
                "audit",
                "error",
                "general",
                "slowquery"
            ]
        }
    }
}
```

Contoh YAMAL

```
DBCluster:
  Type: AWS::RDS::DBCluster
  Properties:
    Engine: aurora
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBClusterSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBClusterSecret}::password}}'
    DBSubnetGroupName: !Ref 'DBSubnetGroup'
    EnableCloudwatchLogsExports:
      - audit
      - error
      - general
      - slowquery
```

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Amazon RDS DB Cluster - Contoh Dua

Amazon RDS Multi-AZ Postgres DB cluster dikonfigurasi dengan semua jenis log yang tersedia diaktifkan untuk ekspor ke Amazon Logs. CloudWatch Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "DBCluster": {
        "Type": "AWS::RDS::DBCluster",
        "Properties": {
            "Engine": "aurora",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::password}}"
            },
            "DBSubnetGroupName": {
                "Ref": "DBSubnetGroup"
```

```
            },
            "EnableCloudwatchLogsExports": [
                "audit",
                "error",
                "general",
                "slowquery"
            ]
        }
    }
}
```

Contoh YAMAL

```
DBCluster:
  Type: AWS::RDS::DBCluster
  Properties:
    Engine: aurora
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBClusterSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBClusterSecret}::password}}'
    DBSubnetGroupName: !Ref 'DBSubnetGroup'
    EnableCloudwatchLogsExports:
      - audit
      - error
      - general
      - slowquery
```

Spesifikasi aturan CT.RDS.PR.25

```
# ####################################
##       Rule Specification        ##
####################################
#
# Rule Identifier:
#   rds_cluster_logging_enabled_check
#
# Description:
#   This control checks whether Amazon RDS database clusters have all available log
 types enabled for export to Amazon CloudWatch Logs.
```

```
#
# Reports on:
#   AWS::RDS::DBCluster
#
# Evaluates:
# AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document

      Engine: aurora
```

[CT.RDS.PR.26] Memerlukan Proxy DB Layanan Amazon Relational Database Service untuk memerlukan koneksi Transport Layer Security (TLS)

Kontrol ini memeriksa apakah Proxy DB Amazon Relational Database Service dikonfigurasi untuk memerlukan Transport Layer Security (TLS) untuk koneksi ke proxy.

- Tujuan kontrol: Enkripsi data dalam perjalanan
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif

- Jenis sumber daya: `AWS::RDS::DBProxy`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.RDS.PR.26

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.RDS.PR.26
- Untuk contoh AWS CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.RDS.PR.26 contoh template

Penjelasan

Amazon RDS Proxy dapat bertindak sebagai lapisan keamanan tambahan antara aplikasi klien dan database yang mendasarinya. Misalnya, Anda dapat terhubung ke proksi menggunakan TLS 1.2, meskipun instans DB acuan mendukung TLS versi yang lebih lama. Anda dapat terhubung ke proxy menggunakan peran IAM, bahkan jika proxy terhubung ke database dengan pengguna asli dan metode otentikasi kata sandi. Dengan teknik ini, Anda dapat menerapkan persyaratan otentikasi yang kuat untuk aplikasi database tanpa upaya migrasi yang mahal untuk instans DB itu sendiri.

> Pertimbangan penggunaan
>
> - Untuk informasi umum tentang batasan proxy Amazon RDS, lihat Kuota dan batasan untuk Proxy RDS di Panduan Pengguna Layanan Amazon Relational Database Service.

Remediasi untuk kegagalan aturan

Tetapkan nilai properti requireTLS ke true.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Proksi Amazon RDS DB - Contoh

Proxy Amazon RDS DB dikonfigurasi untuk memerlukan koneksi TLS ke proxy. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "DBProxy": {
        "Type": "AWS::RDS::DBProxy",
        "Properties": {
            "DBProxyName": "sample-db-proxy",
            "EngineFamily": "MYSQL",
            "IdleClientTimeout": 120,
            "RoleArn": {
                "Fn::GetAtt": "ProxySecretAccessRole.Arn"
            },
            "Auth": [
                {
                    "AuthScheme": "SECRETS",
                    "SecretArn": {
                        "Ref": "DBInstanceSecret"
                    },
                    "IAMAuth": "DISABLED"
                }
            ],
            "VpcSubnetIds": [
                {
                    "Ref": "SubnetOne"
                },
                {
                    "Ref": "SubnetTwo"
                }
            ],
            "RequireTLS": true
        }
    }
}
```

Contoh YAMAL

```
DBProxy:
  Type: AWS::RDS::DBProxy
  Properties:
    DBProxyName: sample-db-proxy
    EngineFamily: MYSQL
    IdleClientTimeout: 120
```

```
    RoleArn: !GetAtt 'ProxySecretAccessRole.Arn'
    Auth:
      - AuthScheme: SECRETS
        SecretArn: !Ref 'DBInstanceSecret'
        IAMAuth: DISABLED
    VpcSubnetIds:
      - !Ref 'SubnetOne'
      - !Ref 'SubnetTwo'
    RequireTLS: true
```

[CT.RDS.PR.27] Memerlukan grup parameter cluster DB Amazon Relational Database Service untuk meminta koneksi Transport Layer Security (TLS) untuk tipe engine yang didukung

Kontrol ini memeriksa apakah grup parameter cluster Amazon Relational Database Service DB memerlukan koneksi Transport Layer Security (TLS) untuk tipe engine yang didukung.

- Tujuan kontrol: Enkripsi data dalam perjalanan
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::RDS::DBClusterParameterGroup`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.RDS.PR.27

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.RDS.PR.27
- Untuk contoh AWS CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.RDS.PR.27 contoh templat

Penjelasan

Anda dapat menggunakan Secure Socket Layer (SSL) atau Transport Layer Security (TLS) dari aplikasi Anda untuk mengenkripsi koneksi ke cluster DB yang menjalankan Aurora MySQL, Aurora PostgreSQL, MySQL, atau PostgreSQL. Koneksi SSL/TLS menyediakan lapisan keamanan dengan mengenkripsi data yang bergerak antara klien Anda dan cluster DB.

> **Pertimbangan penggunaan**
>
> - Kontrol ini hanya berlaku untuk grup parameter cluster Amazon RDS DB dengan keluarga`aurora-mysql`,, `aurora-postgresql`postgres, ataumysql.

Remediasi untuk kegagalan aturan

Untuk grup parameter cluster Amazon RDS DB dengan `aurora-mysql` dan `mysql` keluarga, di properti Parameters, tetapkan nilai `require_secure_transport` ke true. Untuk grup parameter cluster Amazon RDS DB dengan `postgres` keluarga `aurora-postgresql` amd, di properti Parameters, tetapkan nilai `rds.force_ssl` ke true.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Grup Parameter Cluster Amazon RDS DB - Contoh Satu

Grup parameter cluster Amazon RDS DB yang dikonfigurasi untuk memerlukan TLS/SSL untuk semua koneksi ke cluster DB MySQL Aurora. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "RDSDBClusterParameterGroup": {
        "Type": "AWS::RDS::DBClusterParameterGroup",
        "Properties": {
            "Description": "sample-db-parameter-group",
            "Family": "aurora-mysql5.7",
            "Parameters": {
                "require_secure_transport": "ON"
            }
        }
    }
}
```

Contoh YAMAL

```
RDSDBClusterParameterGroup:
  Type: AWS::RDS::DBClusterParameterGroup
  Properties:
    Description: sample-db-parameter-group
    Family: aurora-mysql5.7
    Parameters:
      require_secure_transport: 'ON'
```

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Grup Parameter Cluster Amazon RDS DB - Contoh Dua

Grup parameter cluster Amazon RDS DB yang dikonfigurasi untuk memerlukan TLS/SSL untuk semua koneksi ke cluster PostgreSQL DB. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "RDSDBClusterParameterGroup": {
        "Type": "AWS::RDS::DBClusterParameterGroup",
        "Properties": {
            "Description": "sample-db-parameter-group",
            "Family": "postgres14",
            "Parameters": {
                "rds.force_ssl": true
            }
        }
    }
}
```

Contoh YAMAL

```
RDSDBClusterParameterGroup:
  Type: AWS::RDS::DBClusterParameterGroup
  Properties:
    Description: sample-db-parameter-group
    Family: postgres14
    Parameters:
      rds.force_ssl: true
```

Spesifikasi aturan CT.RDS.PR.27

```
# ####################################

#
# Rule Identifier:
#   rds_db_cluster_parameter_group_tls_check
#
# Description:
#   This control checks whether an Amazon RDS DB cluster parameter group requires
 Transport Layer Security (TLS) connections for supported engine types.
#
# Reports on:
#   AWS::RDS::DBClusterParameterGroup
#
# Evaluates:
# AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document does not contain any Amazon RDS DB cluster parameter
 group resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an Amazon RDS DB cluster parameter group
 resource
#       And: 'Family' has not been provided or has been provided and set to an RDS DB
 cluster
#            parameter group family other than 'aurora-mysql', 'aurora-postgresql',
 'postgres',
#            or 'mysql' families
#      Then: SKIP
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an Amazon RDS DB cluster parameter group
 resource
#       And: 'Family' has been provided and set to an 'aurora-mysql' Amazon RDS DB
 cluster parameter
#            group family
#       And: In 'Parameters', 'require_secure_transport' has not been provided, or
```

```
#            has been provided and set to a value other than 'ON'
#      Then: FAIL
#   Scenario: 4
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an Amazon RDS DB cluster parameter group
 resource
#       And: 'Family' has been provided and set to a 'mysql' Amazon RDS DB cluster
 parameter
#            group family
#       And: In 'Parameters', 'require_secure_transport' has not been provided, or
#            has been provided and set to a value other than a boolean true value
#      Then: FAIL
#   Scenario: 5
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an Amazon RDS DB cluster parameter group
 resource
#       And: 'Family' has been provided and set to an 'aurora-postgresql' or 'postgres'
#            Amazon RDS DB cluster parameter group family
#       And: In 'Parameters', 'rds.force_ssl' has not been provided, or has been
 provided
#            and set to a value other than a boolean true value
#      Then: FAIL
#   Scenario: 6
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an Amazon RDS DB cluster parameter group
 resource
#       And: 'Family' has been provided and set to an 'aurora-mysql' RDS DB cluster
 parameter
#            group family
#       And: In 'Parameters', 'require_secure_transport' has been provided and set
#            to 'ON'
#      Then: PASS
#   Scenario: 7
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an Amazon RDS DB cluster parameter group
 resource
#       And: 'Family' has been provided and set to a 'mysql' Amazon RDS DB cluster
 parameter group family
#       And: In 'Parameters', 'require_secure_transport' has been provided and set
#            to a boolean true value
```

```
#      Then: PASS

```

[CT.RDS.PR.28] Memerlukan grup parameter DB Amazon Relational Database Service untuk meminta koneksi Transport Layer Security (TLS) untuk tipe engine yang didukung

Kontrol ini memeriksa apakah grup parameter Amazon Relational Database Service DB memerlukan koneksi Transport Layer Security (TLS), untuk jenis engine yang didukung.

- Tujuan kontrol: Enkripsi data dalam perjalanan
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::RDS::DBParameterGroup`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.RDS.PR.28

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.RDS.PR.28

- Untuk contoh AWS CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.RDS.PR.28 contoh template

Penjelasan

Anda dapat menggunakan Lapisan Soket Aman (SSL) atau Keamanan Lapisan Pengangkutan (TLS) dari aplikasi Anda untuk mengenkripsi koneksi ke instans DB yang menjalankan MariaDB, Microsoft SQL Server, MySQL, Oracle, atau PostgreSQL. Koneksi SSL/TLS menyediakan lapisan keamanan dengan mengenkripsi data yang bergerak antara klien Anda dan instans DB.

> Pertimbangan penggunaan
>
> - Kontrol ini hanya berlaku untuk grup parameter Amazon RDS DB dengan keluarga`postgres`,`sqlserver`, `mariadb` (tidak termasuk `mariadb10.0`mariadb10.4), dan `mysql` (tidak termasuk`mysql5.5`) `mysql5.6`

Remediasi untuk kegagalan aturan

Untuk grup parameter instans Amazon RDS DB dengan `mysql` dan `mariadb` keluarga, di`Parameters`, setel `require_secure_transport` ke`true`. Untuk grup parameter instans Amazon RDS DB dengan `postgres` dan `sqlserver` keluarga, di`Parameters`, setel `rds.force_ssl` ke`true`.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Grup Parameter Amazon RDS DB - Contoh Satu

Grup parameter Amazon RDS DB dikonfigurasi untuk memerlukan TLS/SSL untuk semua koneksi ke instance MariaDB DB. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "RDSDBParameterGroup": {
        "Type": "AWS::RDS::DBParameterGroup",
        "Properties": {
            "Description": "sample-db-parameter-group",
            "Family": "mariadb10.6",
```

```
            "Parameters": {
                "require_secure_transport": true
            }
        }
    }
}
```

Contoh YAMAL

```
RDSDBParameterGroup:
  Type: AWS::RDS::DBParameterGroup
  Properties:
    Description: sample-db-parameter-group
    Family: mariadb10.6
    Parameters:
      require_secure_transport: true
```

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Grup Parameter Amazon RDS DB - Contoh Dua

Grup parameter Amazon RDS DB dikonfigurasi untuk memerlukan TLS/SSL untuk semua koneksi ke instans PostgreSQL DB. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "RDSDBParameterGroup": {
        "Type": "AWS::RDS::DBParameterGroup",
        "Properties": {
            "Description": "sample-db-parameter-group",
            "Family": "postgres14",
            "Parameters": {
                "rds.force_ssl": true
            }
        }
    }
}
```

Contoh YAMAL

```
RDSDBParameterGroup:
  Type: AWS::RDS::DBParameterGroup
  Properties:
    Description: sample-db-parameter-group
    Family: postgres14
    Parameters:
      rds.force_ssl: true
```

Spesifikasi aturan CT.RDS.PR.28

```

[CT.RDS.PR.29] Memerlukan klaster Amazon RDS yang tidak dikonfigurasi agar dapat diakses publik melalui properti " PubliclyAccessible

Kontrol ini memeriksa apakah kluster database Amazon Relational Database Service dikonfigurasi agar dapat diakses publik, atau tidak, sebagaimana ditentukan oleh pengaturan properti. PubliclyAccessible

- Tujuan kontrol: Batasi akses jaringan
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::RDS::DBCluster`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.RDS.PR.29

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.RDS.PR.29
- Untuk contoh AWS CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.RDS.PR.29 contoh template

Penjelasan

PubliclyAccessible Properti di AWS CloudFormation sumber daya kluster Amazon RDS DB menunjukkan apakah cluster DB dapat diakses publik. Ketika instans DB dikonfigurasi dengan PubliclyAccessible properti disetel ke true, titik akhir Domain Name System (DNS) menyelesaikan ke alamat IP publik dari luar virtual private cloud (VPC) cluster DB, dan juga menyelesaikan ke alamat IP pribadi dari dalam VPC cluster DB.

Kecuali jika Anda bermaksud agar klaster Amazon RDS DB dapat diakses publik, jangan mengonfigurasi klaster Amazon RDS DB dengan PubliclyAccessible nilai yang disetel ke true, karena konfigurasi ini memungkinkan lalu lintas yang tidak diinginkan ke instance database Anda.

Remediasi untuk kegagalan aturan

Tetapkan nilai PubliclyAccessible properti ke false.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Amazon RDS DB Cluster - Contoh

Cluster DB Amazon RDS Multi-AZ Postgres yang dikonfigurasi agar tidak dapat diakses publik. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "DBCluster": {
        "Type": "AWS::RDS::DBCluster",
        "Properties": {
            "Engine": "postgres",
            "DBClusterInstanceClass": "db.m6gd.large",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::password}}"
            },
            "DBSubnetGroupName": {
                "Ref": "DBSubnetGroup"
            },
            "AllocatedStorage": 100,
            "StorageType": "io1",
            "Iops": 3000,
            "PubliclyAccessible": false
        }
    }
}
```

Contoh YAMAL

```
DBCluster:
  Type: AWS::RDS::DBCluster
  Properties:
    Engine: postgres
    DBClusterInstanceClass: db.m6gd.large
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBClusterSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBClusterSecret}::password}}'
    DBSubnetGroupName: !Ref 'DBSubnetGroup'
    AllocatedStorage: 100
    StorageType: io1
    Iops: 3000
    PubliclyAccessible: false
```

```

[CT.RDS.PR.30] Mengharuskan instans database Amazon RDS memiliki enkripsi saat istirahat yang dikonfigurasi untuk menggunakan kunci KMS yang Anda tentukan untuk jenis mesin yang didukung

Kontrol ini memeriksa apakah enkripsi penyimpanan diaktifkan untuk instans Amazon RDS database (DB) Anda, dan bahwa enkripsi menggunakan kunci KMS yang Anda tentukan untuk jenis engine yang didukung.

- Tujuan kontrol: Enkripsi data saat istirahat
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::RDS::DBInstance`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.RDS.PR.30

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.RDS.PR.30
- Untuk contoh AWS CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.RDS.PR.30 contoh template

Penjelasan

Sebagai lapisan keamanan tambahan untuk data sensitif Anda di instans Amazon RDS DB, Anda dapat mengonfigurasi instans Amazon RDS DB agar dienkripsi saat istirahat. Untuk mengenkripsi instans Amazon RDS DB dan snapshot saat istirahat, aktifkan opsi enkripsi untuk instans Amazon RDS DB Anda. Data yang dienkripsi saat istirahat mencakup penyimpanan yang mendasari untuk instans DB, pencadangan otomatisnya, replika baca, dan snapshot.

Instans DB terenkripsi Amazon RDS menggunakan algoritme enkripsi AES-256 standar terbuka untuk mengenkripsi data Anda yang berada di server yang menghosting instans Amazon RDS DB Anda. Setelah data Anda dienkripsi, Amazon RDS menangani otentikasi akses dan dekripsi data Anda secara transparan, dengan dampak minimal pada kinerja. Anda tidak perlu memodifikasi aplikasi klien database Anda untuk menggunakan enkripsi.

Enkripsi Amazon RDS tersedia untuk semua mesin database dan jenis penyimpanan. Enkripsi Amazon RDS tersedia untuk sebagian besar kelas instans DB.

Pertimbangan penggunaan

- Kontrol ini hanya berlaku untuk jenis mesin Amazon RDS DB `mariadbmysql`,`oracle-ee`,`oracle-ee-cdb`,`oracle-se2`,`oracle-se2-cdb`,`postgres`, `sqlserver-eesqlserver-se`, dan `sqlserver-web`
- Kontrol ini hanya berlaku ketika `Engine` properti disediakan. Itu tidak berlaku saat memulihkan dari snapshot DB atau snapshot cluster di mana `Engine` belum disetel secara eksplisit.
- Kontrol ini mengharuskan kunci KMS ditentukan untuk sumber daya instans Amazon RDS DB. Ini tidak memeriksa properti kunci KMS yang digunakan, seperti apakah kunci KMS dikelola pelanggan atau dikelola layanan.
- Pertimbangkan untuk menggunakan kunci yang dikelola pelanggan jika Anda ingin kontrol penuh atas kunci KMS, yang mencakup pembuatan dan pemeliharaan kebijakan kunci, kebijakan IAM, dan hibah, serta mengaktifkan dan menonaktifkan kunci, memutar materi kriptografinya, menambahkan tag, membuat alias yang merujuk ke kunci KMS, dan menjadwalkan kunci KMS untuk dihapus.

Remediasi untuk kegagalan aturan

Setel KmsKeyId properti ke ARN AWS KMS key yang dikonfigurasi untuk memberikan izin penggunaan kunci ke Amazon RDS.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Amazon RDS DB instans - Contoh

Instans Amazon RDS DB dengan enkripsi penyimpanan diaktifkan. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "RDSDBInstance": {
        "Type": "AWS::RDS::DBInstance",
```

```
        "Properties": {
            "Engine": "postgres",
            "EngineVersion": 14.2,
            "DBInstanceClass": "db.m5.large",
            "StorageType": "gp2",
            "AllocatedStorage": 5,
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
            },
            "StorageEncrypted": true,
            "KmsKeyId": {
                "Ref": "KMSKey"
            }
        }
    }
}
```

Contoh YAMAL

```
RDSDBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    StorageEncrypted: true
    KmsKeyId: !Ref 'KMSKey'
```

Spesifikasi aturan CT.RDS.PR.30

Kontrol Amazon Redshift

Topik

- [CT.REDSHIFT.PR.1] Memerlukan cluster Amazon Redshift untuk melarang akses publik
- [CT.REDSHIFT.PR.2] Memerlukan cluster Amazon Redshift agar snapshot otomatis dikonfigurasi
- [CT.REDSHIFT.PR.3] Memerlukan klaster Amazon Redshift agar pencatatan audit dikonfigurasi
- [CT.REDSHIFT.PR.4] Memerlukan klaster Amazon Redshift untuk memiliki peningkatan otomatis ke versi utama yang dikonfigurasi
- [CT.REDSHIFT.PR.5] Memerlukan cluster Amazon Redshift untuk meningkatkan perutean VPC
- [CT.REDSHIFT.PR.6] Memerlukan klaster Amazon Redshift untuk memiliki nama pengguna administrator yang unik
- [CT.REDSHIFT.PR.7] Memerlukan cluster Amazon Redshift untuk memiliki nama database yang unik
- [CT.REDSHIFT.PR.8] Memerlukan cluster Amazon Redshift untuk dienkripsi
- [CT.REDSHIFT.PR.9] Mengharuskan grup parameter cluster Amazon Redshift dikonfigurasi untuk menggunakan Secure Sockets Layer (SSL) untuk enkripsi data dalam perjalanan

[CT.REDSHIFT.PR.1] Memerlukan cluster Amazon Redshift untuk melarang akses publik

Kontrol ini memeriksa apakah klaster Amazon Redshift dikonfigurasi untuk melarang akses publik.

- Tujuan kontrol: Batasi akses jaringan
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::Redshift::Cluster`
- AWS CloudFormation aturan penjaga: CT.REDSHIFT.PR.1spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.REDSHIFT.PR.1spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.REDSHIFT.PR.1contoh template

Penjelasan

PubliclyAccessible Atribut konfigurasi klaster Amazon Redshift menunjukkan apakah klaster dapat diakses publik. Ketika cluster dikonfigurasi dengan `PubliclyAccessible` parameter yang disetel ke`true`, itu adalah instance yang menghadap ke internet yang memiliki nama DNS yang dapat diselesaikan secara publik, yang diselesaikan ke alamat IP publik.

Ketika cluster tidak dapat diakses publik, itu adalah instance internal dengan nama DNS yang menyelesaikan ke alamat IP pribadi. Kecuali jika Anda bermaksud agar cluster Anda dapat diakses oleh publik, cluster tidak boleh dikonfigurasi dengan `PubliclyAccessible` set to`true`.

Remediasi untuk kegagalan aturan

Atur `PubliclyAccessible` ke `false`.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Cluster Pergeseran Merah Amazon - Contoh

Cluster Amazon Redshift dikonfigurasi untuk melarang akses publik. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "RedshiftCluster": {
        "Type": "AWS::Redshift::Cluster",
        "Properties": {
            "ClusterType": "single-node",
            "DBName": "sampledb",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:
${RedshiftClusterSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:
${RedshiftClusterSecret}::password}}"
            },
            "NodeType": "ds2.xlarge",
            "PubliclyAccessible": false
        }
    }
}
```

Contoh YAMAL

```
RedshiftCluster:
  Type: AWS::Redshift::Cluster
  Properties:
    ClusterType: single-node
    DBName: sampledb
    MasterUsername: !Sub '{{resolve:secretsmanager:
${RedshiftClusterSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:
${RedshiftClusterSecret}::password}}'
    NodeType: ds2.xlarge
    PubliclyAccessible: false
```

CT.REDSHIFT.PR.1spesifikasi aturan

```
# ####################################

      PubliclyAccessible: true
```

[CT.REDSHIFT.PR.2] Memerlukan cluster Amazon Redshift agar snapshot otomatis dikonfigurasi

Kontrol ini memeriksa apakah klaster Amazon Redshift mengaktifkan snapshot otomatis, dan klaster disetel dengan periode retensi snapshot otomatis yang lebih besar dari atau sama dengan tujuh (7) hari.

- Tujuan kontrol: Meningkatkan ketahanan
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::Redshift::Cluster`
- AWS CloudFormation aturan penjaga: CT.REDSHIFT.PR.2spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.REDSHIFT.PR.2spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.REDSHIFT.PR.2 contoh template

Penjelasan

Cadangan membantu Anda pulih lebih cepat dari insiden keamanan. Mereka memperkuat ketahanan sistem Anda. Amazon Redshift mengambil snapshot periodik secara default. Kontrol ini memeriksa apakah snapshot otomatis dibuat dan disimpan setidaknya selama tujuh hari.

Remediasi untuk kegagalan aturan

Setel `AutomatedSnapshotRetentionPeriod` ke nilai integer lebih besar dari atau sama dengan 7 hari.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Cluster Pergeseran Merah Amazon - Contoh

Cluster Amazon Redshift dikonfigurasi dengan snapshot otomatis aktif. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "RedshiftCluster": {
        "Type": "AWS::Redshift::Cluster",
        "Properties": {
            "ClusterType": "single-node",
            "DBName": "sampledb",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${RedshiftSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${RedshiftSecret}::password}}"
            },
            "NodeType": "ds2.xlarge",
            "AutomatedSnapshotRetentionPeriod": 7
        }
    }
}
```

Contoh YAMAL

```
RedshiftCluster:
  Type: AWS::Redshift::Cluster
```

```
  Properties:
    ClusterType: single-node
    DBName: sampledb
    MasterUsername: !Sub '{{resolve:secretsmanager:${RedshiftSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${RedshiftSecret}::password}}'
    NodeType: ds2.xlarge
    AutomatedSnapshotRetentionPeriod: 7
```

```

[CT.REDSHIFT.PR.3] Memerlukan klaster Amazon Redshift agar pencatatan audit dikonfigurasi

Kontrol ini memeriksa apakah klaster Amazon Redshift telah mengaktifkan pencatatan audit.

- Tujuan kontrol: Menetapkan pencatatan dan pemantauan
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::Redshift::Cluster`
- AWS CloudFormation aturan penjaga: CT.REDSHIFT.PR.3spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.REDSHIFT.PR.3spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.REDSHIFT.PR.3contoh template

Penjelasan

Pencatatan audit Amazon Redshift memberikan informasi tambahan tentang koneksi dan aktivitas pengguna di klaster Anda. Data ini dapat disimpan dan diamankan di Amazon S3, dan dapat membantu untuk audit dan investigasi keamanan.

Remediasi untuk kegagalan aturan

Berikan `LoggingProperties` konfigurasi dan atur `BucketName` ke nama bucket Amazon S3 yang dikonfigurasi untuk menerima log audit Amazon Redshift.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Cluster Pergeseran Merah Amazon - Contoh

Cluster Amazon Redshift dikonfigurasi dengan pencatatan audit diaktifkan. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "RedshiftCluster": {
        "Type": "AWS::Redshift::Cluster",
        "Properties": {
            "ClusterType": "single-node",
            "DBName": "sampledb",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${RedshiftSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${RedshiftSecret}::password}}"
            },
            "NodeType": "dc2.large",
            "PubliclyAccessible": false,
            "LoggingProperties": {
                "BucketName": {
                    "Ref": "S3Bucket"
                },
                "S3KeyPrefix": "sample-cluster-logs"
            }
        }
    }
}
```

Contoh YAMAL

```
RedshiftCluster:
  Type: AWS::Redshift::Cluster
  Properties:
    ClusterType: single-node
    DBName: sampledb
    MasterUsername: !Sub '{{resolve:secretsmanager:${RedshiftSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${RedshiftSecret}::password}}'
    NodeType: dc2.large
    PubliclyAccessible: false
    LoggingProperties:
      BucketName: !Ref 'S3Bucket'
      S3KeyPrefix: sample-cluster-logs
```

CT.REDSHIFT.PR.3spesifikasi aturan

```
# ####################################
##       Rule Specification        ##
####################################
#
# Rule Identifier:
#   redshift_cluster_audit_logging_enabled_check
#
# Description:
#   This control checks whether an Amazon Redshift cluster has audit logging activated.
#
# Reports on:
#   AWS::Redshift::Cluster
#
# Evaluates:
# AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
```

```
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document does not contain any Redshift cluster resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a Redshift cluster resource
#       And: 'LoggingProperties' has not been specified
#      Then: FAIL
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a Redshift cluster resource
#       And: 'LoggingProperties' has been specified
#       And: 'BucketName' on 'LoggingProperties' has been specified and is an empty
 string or invalid local reference
#      Then: FAIL
#   Scenario: 4
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a Redshift cluster resource
#       And: 'LoggingProperties' has been specified
#       And: 'BucketName' on 'LoggingProperties' has been specified and is a non-empty
 string or valid local reference
#      Then: PASS

```

[CT.REDSHIFT.PR.4] Memerlukan klaster Amazon Redshift untuk memiliki peningkatan otomatis ke versi utama yang dikonfigurasi

Kontrol ini memeriksa apakah pemutakhiran versi utama otomatis diaktifkan untuk klaster Amazon Redshift Anda.

- Tujuan kontrol: Kelola kerentanan
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::Redshift::Cluster`
- AWS CloudFormation aturan penjaga: CT.REDSHIFT.PR.4spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.REDSHIFT.PR.4spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.REDSHIFT.PR.4contoh template

Penjelasan

Mengaktifkan pemutakhiran versi utama otomatis memastikan bahwa pembaruan versi utama terbaru ke kluster Amazon Redshift diinstal selama jendela pemeliharaan. Pembaruan ini mungkin termasuk patch keamanan dan perbaikan bug. Tetap up to date dengan instalasi patch adalah langkah penting dalam mengamankan sistem.

Remediasi untuk kegagalan aturan

Setel `AllowVersionUpgrade` properti ke true atau tidak menentukannya (default).

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Cluster Amazon Redshift - Contoh Satu

Cluster Amazon Redshift dengan pemutakhiran versi utama otomatis diaktifkan melalui default. AWS CloudFormation Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "RedshiftCluster": {
        "Type": "AWS::Redshift::Cluster",
        "Properties": {
            "ClusterType": "single-node",
            "DBName": "exampledb",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${RedshiftSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${RedshiftSecret}::password}}"
            },
            "NodeType": "ds2.xlarge"
        }
    }
}
```

Contoh YAMAL

```
RedshiftCluster:
  Type: AWS::Redshift::Cluster
  Properties:
    ClusterType: single-node
    DBName: exampledb
    MasterUsername: !Sub '{{resolve:secretsmanager:${RedshiftSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${RedshiftSecret}::password}}'
    NodeType: ds2.xlarge
```

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Cluster Amazon Redshift - Contoh Dua

Cluster Amazon Redshift dikonfigurasi dengan upgrade versi utama otomatis yang diaktifkan melalui properti. `AllowVersionUpgrade` Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "RedshiftCluster": {
        "Type": "AWS::Redshift::Cluster",
        "Properties": {
            "ClusterType": "single-node",
            "DBName": "exampledb",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${RedshiftSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${RedshiftSecret}::password}}"
            },
            "NodeType": "ds2.xlarge",
            "AllowVersionUpgrade": true
        }
    }
}
```

Contoh YAMAL

```
RedshiftCluster:
  Type: AWS::Redshift::Cluster
  Properties:
    ClusterType: single-node
    DBName: exampledb
    MasterUsername: !Sub '{{resolve:secretsmanager:${RedshiftSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${RedshiftSecret}::password}}'
    NodeType: ds2.xlarge
    AllowVersionUpgrade: true
```

CT.REDSHIFT.PR.4spesifikasi aturan

```

```

[CT.REDSHIFT.PR.5] Memerlukan cluster Amazon Redshift untuk meningkatkan perutean VPC

Kontrol ini memeriksa apakah klaster Amazon Redshift telah meningkatkan perutean VPC yang dikonfigurasi.

- Tujuan kontrol: Batasi akses jaringan
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif

- Jenis sumber daya: `AWS::Redshift::Cluster`
- AWS CloudFormation aturan penjaga: CT.REDSHIFT.PR.5spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.REDSHIFT.PR.5spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.REDSHIFT.PR.5contoh template

Penjelasan

Perutean VPC yang disempurnakan memaksa semua `copy` dan `unload` lalu lintas antara cluster dan repositori data untuk melewati VPC Anda. Dengan peningkatan routing aktif, Anda dapat menggunakan fitur VPC, seperti grup keamanan dan daftar kontrol akses jaringan, untuk mengamankan lalu lintas jaringan. Anda juga dapat menggunakan VPC Flow Logs untuk memantau lalu lintas jaringan.

Remediasi untuk kegagalan aturan

Atur `EnhancedVpcRouting` ke `true`.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Cluster Pergeseran Merah Amazon - Contoh

Cluster Amazon Redshift dikonfigurasi dengan perutean VPC yang disempurnakan. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "RedshiftCluster": {
        "Type": "AWS::Redshift::Cluster",
        "Properties": {
            "ClusterType": "single-node",
            "DBName": "sampledb",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${RedshiftSecret}::username}}"
            },
```

```
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${RedshiftSecret}::password}}"
            },
            "NodeType": "ds2.xlarge",
            "EnhancedVpcRouting": true
        }
    }
}
```

Contoh YAMAL

```
RedshiftCluster:
  Type: AWS::Redshift::Cluster
  Properties:
    ClusterType: single-node
    DBName: sampledb
    MasterUsername: !Sub '{{resolve:secretsmanager:${RedshiftSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${RedshiftSecret}::password}}'
    NodeType: ds2.xlarge
    EnhancedVpcRouting: true
```

```

[CT.REDSHIFT.PR.6] Memerlukan klaster Amazon Redshift untuk memiliki nama pengguna administrator yang unik

Kontrol ini memeriksa apakah klaster Amazon Redshift telah mengubah nama pengguna administrator dari nilai defaultnya.

- Tujuan kontrol: Lindungi konfigurasi
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::Redshift::Cluster`
- AWS CloudFormation aturan penjaga: CT.REDSHIFT.PR.6spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.REDSHIFT.PR.6spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.REDSHIFT.PR.6contoh template

Penjelasan

Saat membuat klaster Amazon Redshift, Anda harus mengubah nama pengguna administrator default menjadi nilai unik. Nama pengguna default adalah pengetahuan publik, jadi mereka harus diubah pada konfigurasi. Mengubah nama pengguna default mengurangi risiko akses yang tidak diinginkan.

Remediasi untuk kegagalan aturan

Setel `MasterUsername` ke nilai selain`awsuser`.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Cluster Pergeseran Merah Amazon - Contoh

Cluster Amazon Redshift dikonfigurasi dengan nama pengguna administrator yang berbeda dari nilai default. `awsuser` Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "RedshiftCluster": {
        "Type": "AWS::Redshift::Cluster",
        "Properties": {
            "ClusterType": "single-node",
            "DBName": "sampledb",
            "MasterUsername": "samplemasterusername",
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:
${RedshiftClusterSecret}::password}}"
            },
            "NodeType": "ds2.xlarge"
        }
    }
}
```

Contoh YAMAL

```
RedshiftCluster:
  Type: AWS::Redshift::Cluster
  Properties:
    ClusterType: single-node
    DBName: sampledb
    MasterUsername: samplemasterusername
    MasterUserPassword: !Sub '{{resolve:secretsmanager:
${RedshiftClusterSecret}::password}}'
    NodeType: ds2.xlarge
```

CT.REDSHIFT.PR.6spesifikasi aturan

[CT.REDSHIFT.PR.7] Memerlukan cluster Amazon Redshift untuk memiliki nama database yang unik

Kontrol ini memeriksa apakah klaster Amazon Redshift telah mengubah nama database-nya dari nilai default.

- Tujuan kontrol: Lindungi konfigurasi
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::Redshift::Cluster`
- AWS CloudFormation aturan penjaga: CT.REDSHIFT.PR.7spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.REDSHIFT.PR.7spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.REDSHIFT.PR.7contoh template

Penjelasan

Saat membuat cluster Redshift, Anda harus mengubah nama database default menjadi nilai unik. Nama default adalah pengetahuan publik, jadi mereka harus diubah pada konfigurasi. Misalnya, nama terkenal dapat menyebabkan akses yang tidak disengaja, jika termasuk dalam kondisi kebijakan IAM.

Remediasi untuk kegagalan aturan

Setel `DBName` ke nama database yang berbeda dari nilai default`dev`.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Cluster Pergeseran Merah Amazon - Contoh

Cluster Amazon Redshift dikonfigurasi dengan nama database yang berbeda dari nilai default. `dev` Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "RedshiftCluster": {
        "Type": "AWS::Redshift::Cluster",
        "Properties": {
            "ClusterType": "single-node",
            "DBName": "sampledb",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:
${RedshiftClusterSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:
${RedshiftClusterSecret}::password}}"
            },
            "NodeType": "dc2.large",
            "PubliclyAccessible": false
        }
    }
}
```

Contoh YAMAL

```
RedshiftCluster:
  Type: AWS::Redshift::Cluster
  Properties:
    ClusterType: single-node
    DBName: sampledb
    MasterUsername: !Sub '{{resolve:secretsmanager:
${RedshiftClusterSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:
${RedshiftClusterSecret}::password}}'
    NodeType: dc2.large
    PubliclyAccessible: false
```

[CT.REDSHIFT.PR.8] Memerlukan cluster Amazon Redshift untuk dienkripsi

Kontrol ini memeriksa apakah cluster Amazon Redshift dienkripsi.

- Tujuan kontrol: Enkripsi data saat istirahat
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::Redshift::Cluster`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.REDSHIFT.PR.8

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.REDSHIFT.PR.8
- Untuk contoh CloudFormation template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.REDSHIFT.PR.8 contoh templat

Penjelasan

Di Amazon Redshift, Anda dapat mengaktifkan enkripsi database untuk cluster Anda, yang membantu melindungi data saat istirahat. Saat Anda mengaktifkan enkripsi untuk cluster, blok data dan metadata sistem dienkripsi untuk cluster dan snapshot-nya.

Remediasi untuk kegagalan aturan

Tetapkan nilai `Encrypted` properti ke true.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Cluster Pergeseran Merah Amazon - Contoh

Cluster Amazon Redshift yang dikonfigurasi dengan enkripsi diaktifkan. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "RedshiftCluster": {
        "Type": "AWS::Redshift::Cluster",
        "Properties": {
            "ClusterType": "single-node",
            "DBName": "sampledb",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${RedshiftSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${RedshiftSecret}::password}}"
            },
            "NodeType": "dc2.large",
            "PubliclyAccessible": false,
            "Encrypted": true
        }
    }
}
```

Contoh YAMAL

```
RedshiftCluster:
```

```
  Type: AWS::Redshift::Cluster
  Properties:
    ClusterType: single-node
    DBName: sampledb
    MasterUsername: !Sub '{{resolve:secretsmanager:${RedshiftSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${RedshiftSecret}::password}}'
    NodeType: dc2.large
    PubliclyAccessible: false
    Encrypted: true
```

CT.REDSHIFT.PR.8 contoh templat

Anda dapat melihat contoh artefak pengujian PASS dan FAIL untuk kontrol proaktif AWS Control Tower.

Contoh PASS - Gunakan template ini untuk memverifikasi pembuatan sumber daya yang sesuai.

```
Resources:
  RedshiftSecret:
```

```
    Type: AWS::SecretsManager::Secret
    Properties:
      Description: Redshift cluster secret
      GenerateSecretString:
        SecretStringTemplate: '{"username": "examplemasterusername"}'
        GenerateStringKey: password
        PasswordLength: 16
        ExcludeCharacters: "'\"@/\\"
  RedshiftCluster:
    Type: AWS::Redshift::Cluster
    Properties:
      ClusterType: single-node
      MasterUsername:
        Fn::Sub: '{{resolve:secretsmanager:${RedshiftSecret}::username}}'
      MasterUserPassword:
        Fn::Sub: '{{resolve:secretsmanager:${RedshiftSecret}::password}}'
      NodeType: dc2.large
      PubliclyAccessible: false
      DBName: exampledb
      Encrypted: true
```

Contoh GAGAL - Gunakan templat ini untuk memverifikasi bahwa kontrol mencegah pembuatan sumber daya yang tidak sesuai.

```
Resources:
  RedshiftSecret:
    Type: AWS::SecretsManager::Secret
    Properties:
      Description: Redshift cluster secret
      GenerateSecretString:

      NodeType: dc2.large
      PubliclyAccessible: false
      DBName: exampledb
      Encrypted: false
```

[CT.REDSHIFT.PR.9] Mengharuskan grup parameter cluster Amazon Redshift dikonfigurasi untuk menggunakan Secure Sockets Layer (SSL) untuk enkripsi data dalam perjalanan

Kontrol ini memeriksa apakah grup parameter cluster Amazon Redshift dikonfigurasi untuk memerlukan enkripsi melalui Secure Sockets Layer (SSL), untuk data dalam perjalanan.

- Tujuan kontrol: Enkripsi data dalam perjalanan
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::Redshift::ClusterParameterGroup`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.REDSHIFT.PR.9

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.REDSHIFT.PR.9
- Untuk contoh CloudFormation template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.REDSHIFT.PR.9 contoh templat

Penjelasan

Di Amazon Redshift, Anda dapat mengaktifkan enkripsi data dalam perjalanan antara kluster Amazon Redshift dan klien SQL melalui JDBC/ODBC. Untuk mendukung koneksi SSL, Amazon Redshift membuat dan menginstal sertifikat pada setiap cluster, yang dikeluarkan AWS Certificate Manager oleh (ACM).

Remediasi untuk kegagalan aturan

Tetapkan entri `Parameters` dengan a `ParameterName` dari `require_ssl` dan benar. `ParameterValue`

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Grup parameter cluster Amazon Redshift - Contoh

Grup parameter klaster Amazon Redshift, dikonfigurasi untuk memerlukan enkripsi data dalam perjalanan. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "ClusterParameterGroup": {
        "Type": "AWS::Redshift::ClusterParameterGroup",
        "Properties": {
            "Description": "Example parameter group",
            "ParameterGroupFamily": "redshift-1.0",
            "Parameters": [
                {
                    "ParameterName": "require_ssl",
                    "ParameterValue": true
                }
            ]
        }
    }
}
```

Contoh YAMAL

```
ClusterParameterGroup:
  Type: AWS::Redshift::ClusterParameterGroup
  Properties:
    Description: Example parameter group
    ParameterGroupFamily: redshift-1.0
    Parameters:
      - ParameterName: require_ssl
        ParameterValue: true
```

Spesifikasi aturan CT.REDSHIFT.PR.9

```
# ####################################
##       Rule Specification        ##
####################################
#
# Rule Identifier:
#   redshift_parameter_group_require_tls_ssl_check
#
# Description:
#   This control checks whether an Amazon Redshift cluster parameter group is
 configured to require
encryption by means of Secure Sockets Layer (SSL), for data in transit.
#
# Reports on:
#   AWS::Redshift::ClusterParameterGroup
#
# Evaluates:
# AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document does not contain any Amazon Redshift cluster parameter
 group resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an Amazon Redshift cluster parameter group
 resource
#       And: 'Parameters' has not been provided or has been provided as an empty list
#      Then: FAIL
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an Amazon Redshift cluster parameter group
 resource
```

```
#       And: 'Parameters' has been provided as a non-empty list that does not contain
 an entry with
#            'ParameterName' set to 'require_ssl' and 'ParameterValue' set to
 bool(true) or a supported
#            boolean string value ('true', 'True', 'TRUE', 'on', 'On' or 'ON')
#      Then: FAIL
#   Scenario: 4
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an Amazon Redshift cluster parameter group
 resource
#       And: Any entry in 'Parameters' with a 'ParameterName' is set to 'require_ssl'
 has a corresponding
#            'ParameterValue' set to a value other than bool(true) or a supported
#            boolean string value ('true', 'True', 'TRUE', 'on', 'On' or 'ON')
#      Then: FAIL
#   Scenario: 5
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains an Amazon Redshift cluster parameter group
 resource
#       And: 'Parameters' has been provided as a non-empty list
#       And: 'Parameters' contains an entry with 'ParameterName' set to 'require_ssl'
 and 'ParameterValue'
#            set to bool(true) or a supported boolean string value ('true', 'True',
 'TRUE', 'on', 'On' or 'ON')
#       And: All entries in 'Parameters' with a 'ParameterName' set to 'require_ssl'
 have a corresponding
#            'ParameterValue' set to bool(true) or a supported boolean string
#            value ('true', 'True', 'TRUE', 'on', 'On' or 'ON')
#      Then: PASS

Kontrol Layanan Penyimpanan Sederhana Amazon (Amazon S3)

Topik

- [CT.S3.PR.1] Memerlukan bucket Amazon S3 agar memblokir pengaturan akses publik yang dikonfigurasi
- [CT.S3.PR.2] Memerlukan bucket Amazon S3 agar pencatatan akses server dikonfigurasi
- [CT.S3.PR.3] Memerlukan bucket Amazon S3 agar versi dikonfigurasi dan kebijakan siklus hidup
- [CT.S3.PR.4] Memerlukan bucket Amazon S3 agar pemberitahuan acara dikonfigurasi
- [CT.S3.PR.5] Mengharuskan bucket Amazon S3 tidak mengelola akses pengguna dengan daftar kontrol akses (ACL)
- [CT.S3.PR.6] Memerlukan bucket Amazon S3 agar kebijakan siklus hidup dikonfigurasi
- [CT.S3.PR.8] Mengharuskan permintaan bucket Amazon S3 menggunakan Secure Socket Layer
- [CT.S3.PR.9] Mengharuskan bucket Amazon S3 mengaktifkan Kunci Objek S3
- [CT.S3.PR.10] Memerlukan bucket Amazon S3 agar enkripsi sisi server dikonfigurasi menggunakan kunci AWS KMS
- [CT.S3.PR.11] Memerlukan bucket Amazon S3 agar versi diaktifkan
- [CT.S3.PR.12] Memerlukan jalur akses Amazon S3 untuk memiliki konfigurasi Block Public Access (BPA) dengan semua opsi disetel ke true

[CT.S3.PR.1] Memerlukan bucket Amazon S3 agar memblokir pengaturan akses publik yang dikonfigurasi

Kontrol ini memeriksa apakah bucket Amazon Simple Storage Service (Amazon S3) memiliki konfigurasi Block Public Access (BPA) tingkat ember.

- Tujuan kontrol: Batasi akses jaringan
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::S3::Bucket`
- AWS CloudFormation aturan penjaga: CT.S3.PR.1spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.S3.PR.1spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.S3.PR.1contoh template

Penjelasan

Blokir Akses Publik di tingkat bucket Amazon S3 menyediakan kontrol untuk memastikan bahwa objek tidak pernah memiliki akses publik. Akses publik diberikan kepada bucket dan objek melalui daftar kontrol akses (ACL), kebijakan bucket, atau keduanya.

Kecuali jika Anda bermaksud agar bucket S3 dapat diakses publik, Anda harus mengonfigurasi fitur Amazon S3 Block Public Access level bucket.

> **Pertimbangan penggunaan**
>
> - Kontrol ini tidak kompatibel dengan bucket Amazon S3 yang memerlukan konfigurasi akses publik.

Remediasi untuk kegagalan aturan

ParameterBlockPublicAcls,BlockPublicPolicy,IgnorePublicAcls, RestrictPublicBuckets harus diatur ke true di bawah tingkat emberPublicAccessBlockConfiguration.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Bucket Amazon S3 - Contoh

Bucket Amazon S3 dengan konfigurasi Blok Akses Publik tingkat bucket yang memastikan objek tidak pernah memiliki akses publik. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "S3Bucket": {
        "Type": "AWS::S3::Bucket",
        "Properties": {
            "PublicAccessBlockConfiguration": {
                "BlockPublicAcls": true,
                "BlockPublicPolicy": true,
                "IgnorePublicAcls": true,
                "RestrictPublicBuckets": true
            }
        }
    }
}
```

Contoh YAMAL

```
S3Bucket:
  Type: AWS::S3::Bucket
  Properties:
    PublicAccessBlockConfiguration:
      BlockPublicAcls: true
      BlockPublicPolicy: true
      IgnorePublicAcls: true
      RestrictPublicBuckets: true
```

CT.S3.PR.1spesifikasi aturan

```

CT.S3.PR.1contoh template

Anda dapat melihat contoh artefak pengujian PASS dan FAIL untuk kontrol proaktif AWS Control Tower.

Contoh PASS - Gunakan template ini untuk memverifikasi pembuatan sumber daya yang sesuai.

```
Resources:
  S3Bucket:
    Type: AWS::S3::Bucket
    Properties:
      PublicAccessBlockConfiguration:
        BlockPublicAcls: true
        BlockPublicPolicy: true
        IgnorePublicAcls: true
        RestrictPublicBuckets: true
```

Contoh GAGAL - Gunakan templat ini untuk memverifikasi bahwa kontrol mencegah pembuatan sumber daya yang tidak sesuai.

```
Resources:
```

```
  S3Bucket:
    Type: AWS::S3::Bucket
    Properties:
      PublicAccessBlockConfiguration:
        BlockPublicAcls: false
        BlockPublicPolicy: false
        IgnorePublicAcls: false
        RestrictPublicBuckets: false
```

[CT.S3.PR.2] Memerlukan bucket Amazon S3 agar pencatatan akses server dikonfigurasi

Kontrol ini memeriksa apakah pencatatan akses server diaktifkan untuk bucket Amazon S3 Anda.

- Tujuan kontrol: Menetapkan pencatatan dan pemantauan
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::S3::Bucket`
- AWS CloudFormation aturan penjaga: CT.S3.PR.2spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.S3.PR.2spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.S3.PR.2contoh template

Penjelasan

Pencatatan akses server menyediakan catatan terperinci tentang permintaan yang dibuat ke ember. Log akses server dapat membantu dalam audit keamanan dan akses.

Remediasi untuk kegagalan aturan

Tetapkan `LoggingConfiguration` pada bucket S3 dan setel secara opsional `DestinationBucketName` ke bucket S3 yang dikonfigurasi untuk menerima Log Akses S3.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Bucket Amazon S3 - Contoh

Bucket Amazon S3 dengan konfigurasi pencatatan akses server. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "S3Bucket": {
        "Type": "AWS::S3::Bucket",
        "Properties": {
            "LoggingConfiguration": {
                "DestinationBucketName": {
                    "Ref": "LoggingBucket"
                }
            }
        }
    }
}
```

Contoh YAMAL

```
S3Bucket:
  Type: AWS::S3::Bucket
  Properties:
    LoggingConfiguration:
      DestinationBucketName: !Ref 'LoggingBucket'
```

CT.S3.PR.2spesifikasi aturan

CT.S3.PR.2contoh template

Anda dapat melihat contoh artefak pengujian PASS dan FAIL untuk kontrol proaktif AWS Control Tower.

Contoh PASS - Gunakan template ini untuk memverifikasi pembuatan sumber daya yang sesuai.

```
Resources:
  Bucket:
    Type: AWS::S3::Bucket
    Properties:
      LoggingConfiguration: {}
```

Contoh GAGAL - Gunakan templat ini untuk memverifikasi bahwa kontrol mencegah pembuatan sumber daya yang tidak sesuai.

```
Resources:
  Bucket:
    Type: AWS::S3::Bucket
    Properties: {}
```

[CT.S3.PR.3] Memerlukan bucket Amazon S3 agar versi dikonfigurasi dan kebijakan siklus hidup

Kontrol ini memeriksa apakah bucket berkemampuan versi Amazon Simple Storage Service (Amazon S3) memiliki kebijakan siklus hidup yang dikonfigurasi.

- Tujuan kontrol: Optimalkan biaya
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::S3::Bucket`
- AWS CloudFormation aturan penjaga: CT.S3.PR.3spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.S3.PR.3spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.S3.PR.3contoh template

Penjelasan

Sebaiknya Anda mengonfigurasi aturan siklus hidup di bucket Amazon S3, karena aturan ini membantu Anda menentukan tindakan yang ingin dilakukan Amazon S3 selama masa pakai objek.

> Pertimbangan penggunaan
>
> - Kontrol ini hanya berlaku untuk bucket Amazon S3 dengan versi diaktifkan.

Remediasi untuk kegagalan aturan

Konfigurasikan bucket berkemampuan versi dengan setidaknya satu aturan siklus hidup aktif.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Amazon S3 Bucket - Contoh Satu

Bucket Amazon S3 dengan versi diaktifkan dan aturan siklus hidup aktif. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "S3Bucket": {
        "Type": "AWS::S3::Bucket",
        "Properties": {
            "VersioningConfiguration": {
                "Status": "Enabled"
            },
            "LifecycleConfiguration": {
                "Rules": [
                    {
                        "Status": "Enabled",
                        "ExpirationInDays": 1,
                        "Id": "FirstRule"
                    }
                ]
            }
        }
    }
}
```

Contoh YAMAL

```
S3Bucket:
  Type: AWS::S3::Bucket
  Properties:
    VersioningConfiguration:
      Status: Enabled
    LifecycleConfiguration:
      Rules:
        - Status: Enabled
          ExpirationInDays: 1
          Id: FirstRule
```

          Id: FirstRule
```

[CT.S3.PR.4] Memerlukan bucket Amazon S3 agar pemberitahuan acara dikonfigurasi

Kontrol ini memeriksa apakah pemberitahuan peristiwa Amazon S3 diaktifkan di bucket Amazon S3 Anda.

- Tujuan kontrol: Menetapkan pencatatan dan pemantauan
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::S3::Bucket`
- AWS CloudFormation aturan penjaga: CT.S3.PR.4spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.S3.PR.4spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.S3.PR.4contoh template

Penjelasan

Dengan mengaktifkan pemberitahuan acara, Anda menerima peringatan di bucket Amazon S3 saat peristiwa tertentu terjadi. Misalnya, Anda dapat diberi tahu tentang pembuatan objek, penghapusan

objek, dan restorasi objek. Pemberitahuan ini dapat mengingatkan tim terkait untuk modifikasi yang tidak disengaja atau disengaja yang dapat menyebabkan akses data yang tidak sah.

Remediasi untuk kegagalan aturan

Tetapkan `NotificationConfiguration` parameter pada bucket Anda dengan salah satu dari`EventBridgeConfiguration`,`LambdaConfigurations`, `QueueConfigurations` atau `TopicConfigurations.`

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Amazon S3 Bucket - Contoh Satu

Bucket Amazon S3 dengan EventBridge notifikasi Amazon dikonfigurasi. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "S3Bucket": {
        "Type": "AWS::S3::Bucket",
        "Properties": {
            "NotificationConfiguration": {
                "EventBridgeConfiguration": {
                    "EventBridgeEnabled": true
                }
            }
        }
    }
}
```

Contoh YAMAL

```
S3Bucket:
  Type: AWS::S3::Bucket
  Properties:
    NotificationConfiguration:
      EventBridgeConfiguration:
        EventBridgeEnabled: true
```

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Amazon S3 Bucket - Contoh Dua

Bucket Amazon S3 dengan notifikasi topik SNS dikonfigurasi. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "S3Bucket": {
        "Type": "AWS::S3::Bucket",
        "Properties": {
            "NotificationConfiguration": {
                "TopicConfigurations": [
                    {
                        "Topic": {
                            "Ref": "SnsTopic"
                        },
                        "Event": "s3:ReducedRedundancyLostObject"
                    }
                ]
            }
        }
    }
}
```

Contoh YAMAL

```
S3Bucket:
  Type: AWS::S3::Bucket
  Properties:
    NotificationConfiguration:
      TopicConfigurations:
        - Topic: !Ref 'SnsTopic'
          Event: s3:ReducedRedundancyLostObject
```

CT.S3.PR.4spesifikasi aturan

      NotificationConfiguration: {}
```

[CT.S3.PR.5] Mengharuskan bucket Amazon S3 tidak mengelola akses pengguna dengan daftar kontrol akses (ACL)

Kontrol ini memeriksa apakah bucket Amazon Simple Storage Service (Amazon S3) memungkinkan izin pengguna melalui daftar kontrol akses.

- Tujuan kontrol: Menegakkan hak istimewa paling sedikit
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::S3::Bucket`
- AWS CloudFormation aturan penjaga: CT.S3.PR.5spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.S3.PR.5spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.S3.PR.5contoh template

Penjelasan

ACL adalah mekanisme kontrol akses lama yang mendahului IAM. Alih-alih ACL, sebaiknya gunakan kebijakan IAM atau kebijakan bucket Amazon S3 untuk mengelola akses ke bucket S3 Anda dengan lebih mudah.

Remediasi untuk kegagalan aturan

Kelola akses ke bucket Amazon S3 dengan kebijakan sumber daya bucket dan kebijakan identitas IAM sebagai gantinya.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Bucket Amazon S3 - Contoh

Bucket Amazon S3 yang tidak mengizinkan izin pengguna melalui daftar kontrol akses dengan menghilangkan properti. `AccessControl` Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "S3Bucket": {
        "Type": "AWS::S3::Bucket",
        "Properties": {}
    }
}
```

Contoh YAMAL

```
S3Bucket:
  Type: AWS::S3::Bucket
  Properties: {}
```

CT.S3.PR.5contoh template

Anda dapat melihat contoh artefak pengujian PASS dan FAIL untuk kontrol proaktif AWS Control Tower.

Contoh PASS - Gunakan template ini untuk memverifikasi pembuatan sumber daya yang sesuai.

```
Resources:
  Bucket:
    Type: AWS::S3::Bucket
    Properties: {}
```

Contoh GAGAL - Gunakan templat ini untuk memverifikasi bahwa kontrol mencegah pembuatan sumber daya yang tidak sesuai.

```
Resources:
  Bucket:
    Type: AWS::S3::Bucket
    Properties:
      AccessControl: Private
```

[CT.S3.PR.6] Memerlukan bucket Amazon S3 agar kebijakan siklus hidup dikonfigurasi

Kontrol ini memeriksa apakah aturan siklus hidup dikonfigurasi untuk bucket Amazon S3.

- Tujuan kontrol: Mengoptimalkan biaya, Meningkatkan ketersediaan
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::S3::Bucket`
- AWS CloudFormation aturan penjaga: CT.S3.PR.6spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.S3.PR.6spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.S3.PR.6contoh template

Penjelasan

Mengonfigurasi aturan siklus hidup di bucket Amazon S3 menentukan tindakan yang ingin dilakukan S3 selama masa pakai objek. Misalnya, Anda dapat mentransisikan objek ke kelas penyimpanan lain, mengarsipkannya, atau menghapusnya setelah jangka waktu tertentu.

Remediasi untuk kegagalan aturan

Konfigurasikan setidaknya satu aturan siklus hidup aktif `LifecycleConfiguration.Rules` dengan menyetel `Status` aturan ke. `Enabled`

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Bucket Amazon S3 - Contoh

Bucket Amazon S3 dikonfigurasi dengan aturan siklus hidup aktif. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "S3Bucket": {
        "Type": "AWS::S3::Bucket",
        "Properties": {
            "LifecycleConfiguration": {
                "Rules": [
                    {
                        "Status": "Enabled",
                        "ExpirationInDays": 1,
                        "Id": "FirstRule"
                    }
                ]
            }
        }
    }
}
```

Contoh YAMAL

```
S3Bucket:
  Type: AWS::S3::Bucket
```

```
  Properties:
    LifecycleConfiguration:
      Rules:
        - Status: Enabled
          ExpirationInDays: 1
          Id: FirstRule
```

CT.S3.PR.6spesifikasi aturan

CT.S3.PR.6contoh template

Anda dapat melihat contoh artefak pengujian PASS dan FAIL untuk kontrol proaktif AWS Control Tower.

Contoh PASS - Gunakan template ini untuk memverifikasi pembuatan sumber daya yang sesuai.

```
Resources:
  S3Bucket:
    Type: AWS::S3::Bucket
    Properties:
      LifecycleConfiguration:
        Rules:
        - Status: Enabled
          ExpirationInDays: 1
          Id: FirstRule
```

Contoh GAGAL - Gunakan templat ini untuk memverifikasi bahwa kontrol mencegah pembuatan sumber daya yang tidak sesuai.

```
Resources:
  S3Bucket:
    Type: AWS::S3::Bucket
    Properties:
      LifecycleConfiguration:
        Rules:
        - Status: Disabled
          ExpirationInDays: 1
          Id: FirstRule
```

[CT.S3.PR.8] Mengharuskan permintaan bucket Amazon S3 menggunakan Secure Socket Layer

Kontrol ini memeriksa apakah kebijakan bucket Amazon S3 memerlukan permintaan untuk menggunakan Secure Socket Layer (SSL).

- Tujuan kontrol: Enkripsi data dalam perjalanan
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::S3::BucketPolicy`
- AWS CloudFormation aturan penjaga: CT.S3.PR.8spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.S3.PR.8spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.S3.PR.8contoh template

Penjelasan

Bucket Amazon S3 harus memiliki kebijakan yang mengharuskan semua permintaan (`Action: S3:*`) untuk menerima transmisi data melalui HTTPS hanya dalam kebijakan sumber daya S3, seperti yang ditunjukkan oleh kunci kondisi. `aws:SecureTransport`

Remediasi untuk kegagalan aturan

Konfigurasikan pernyataan kebijakan bucket Amazon S3 yang menolak akses ke semua prinsip dan tindakan untuk objek bucket dan bucket S3 saat protokol transport aman tidak digunakan.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Kebijakan Bucket Amazon S3 - Contoh

Kebijakan bucket Amazon S3 dikonfigurasi untuk menolak semua akses ke objek bucket dan bucket saat transmisi data tidak melalui HTTPS. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
```

```
    "S3BucketPolicy": {
        "Type": "AWS::S3::BucketPolicy",
        "Properties": {

```

[CT.S3.PR.9] Mengharuskan bucket Amazon S3 mengaktifkan Kunci Objek S3

Kontrol ini memeriksa apakah bucket Amazon Simple Storage Service (Amazon S3) telah dikonfigurasi untuk menggunakan Kunci Objek S3.

- Tujuan kontrol: Lindungi integritas data
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::S3::Bucket`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.S3.PR.9

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.S3.PR.9
- Untuk contoh CloudFormation template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.S3.PR.9 contoh template

Penjelasan

S3 Object Lock memungkinkan Anda untuk menyimpan objek menggunakan model write-once-read-many (WORM). Object Lock dapat membantu mencegah objek dihapus atau ditimpa untuk jangka waktu yang tetap, atau tanpa batas waktu. Anda dapat menggunakan S3 Object Lock untuk memenuhi persyaratan peraturan yang memerlukan penyimpanan WORM, atau untuk menambahkan lapisan perlindungan ekstra terhadap perubahan dan penghapusan objek.

> **Pertimbangan penggunaan**
>
> - Saat Anda membuat bucket Amazon S3 dengan kunci objek diaktifkan, S3 secara otomatis mengaktifkan pembuatan versi untuk bucket.

Remediasi untuk kegagalan aturan

Atur `ObjectLockEnabled` ke `true`.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

S3 bucket - Contoh

Bucket Amazon S3 yang dikonfigurasi dengan kunci objek S3 diaktifkan. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "Bucket": {
        "Type": "AWS::S3::Bucket",
        "Properties": {
            "ObjectLockEnabled": true
        }
    }
}
```

Contoh YAMB

```
Bucket:
  Type: AWS::S3::Bucket
  Properties:
    ObjectLockEnabled: true
```

Spesifikasi aturan CT.S3.PR.9

```
# ####################################
##       Rule Specification        ##
####################################
#
# Rule Identifier:
#   s3_bucket_object_lock_enabled_check
#
# Description:
#   This control checks whether an Amazon Simple Storage Service (Amazon S3) bucket has
 been configured to use S3 Object Lock.
#
# Reports on:
```

```
#   AWS::S3::Bucket
#
# Evaluates:
# AWS CloudFormation, AWS CloudFormation hook
#

CT.S3.PR.9 contoh template

Anda dapat melihat contoh artefak pengujian PASS dan FAIL untuk kontrol proaktif AWS Control Tower.

Contoh PASS - Gunakan template ini untuk memverifikasi pembuatan sumber daya yang sesuai.

```
Resources:
  Bucket:
    Type: AWS::S3::Bucket
    Properties:
      ObjectLockEnabled: true
```

Contoh GAGAL - Gunakan templat ini untuk memverifikasi bahwa kontrol mencegah pembuatan sumber daya yang tidak sesuai.

```
Resources:
  Bucket:
    Type: AWS::S3::Bucket
    Properties:
      ObjectLockEnabled: false
```

[CT.S3.PR.10] Memerlukan bucket Amazon S3 agar enkripsi sisi server dikonfigurasi menggunakan kunci AWS KMS

Kontrol ini memeriksa apakah enkripsi sisi server default diaktifkan pada bucket Amazon S3 yang digunakan. AWS KMS

- Tujuan kontrol: Enkripsi data saat istirahat
- Implementasi: aturan AWS CloudFormation penjaga

- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::S3::Bucket`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.S3.PR.10

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.S3.PR.10
- Untuk contoh CloudFormation template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.S3.PR.10 contoh template

Penjelasan

Server-side encryption (SSE) adalah enkripsi data di tujuannya oleh aplikasi atau layanan yang menerima data. Kecuali Anda menentukan sebaliknya, bucket Amazon S3 menggunakan SSE-S3 secara default untuk mengenkripsi objek. Namun, untuk kontrol tambahan, Anda dapat memilih untuk mengonfigurasi bucket untuk menggunakan enkripsi sisi server dengan AWS KMS kunci (SSE-KMS) sebagai gantinya. Amazon S3 mengenkripsi data Anda pada tingkat objek saat menulis data ke disk di pusat data, dan kemudian mendekripsi AWS data untuk Anda, saat Anda memerlukan akses ke sana.

Remediasi untuk kegagalan aturan

Tetapkan aturan enkripsi `BucketEncryption.ServerSideEncryptionConfiguration` dengan `ServerSideEncryptionByDefault.SSEAlgorithm` konfigurasi `aws:kms` atau `aws:kms:dsse`

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

S3 Bucket - Contoh

Bucket Amazon S3 yang dikonfigurasi dengan enkripsi sisi server AWS Key Management Service default (AWS KMS) (SSE-KMS). Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "S3Bucket": {
        "Type": "AWS::S3::Bucket",
        "Properties": {
```

```
            "BucketEncryption": {
                "ServerSideEncryptionConfiguration": [
                    {
                        "ServerSideEncryptionByDefault": {
                            "SSEAlgorithm": "aws:kms"
                        }
                    }
                ]
            }
        }
    }
}
```

Contoh YAMB

```
S3Bucket:
  Type: AWS::S3::Bucket
  Properties:
    BucketEncryption:
      ServerSideEncryptionConfiguration:
        - ServerSideEncryptionByDefault:
            SSEAlgorithm: aws:kms
```

Spesifikasi aturan CT.S3.PR.10

```

CT.S3.PR.10 contoh template

Anda dapat melihat contoh artefak pengujian PASS dan FAIL untuk kontrol proaktif AWS Control Tower.

Contoh PASS - Gunakan template ini untuk memverifikasi pembuatan sumber daya yang sesuai.

```
Resources:
  Bucket:
    Type: AWS::S3::Bucket
    Properties:
      BucketEncryption:
        ServerSideEncryptionConfiguration:
        - ServerSideEncryptionByDefault:
            SSEAlgorithm: aws:kms
```

Contoh GAGAL - Gunakan templat ini untuk memverifikasi bahwa kontrol mencegah pembuatan sumber daya yang tidak sesuai.

```
Resources:
  Bucket:
    Type: AWS::S3::Bucket
```

```
    Properties: {}
```

[CT.S3.PR.11] Memerlukan bucket Amazon S3 agar versi diaktifkan

Kontrol ini memeriksa apakah bucket Amazon Simple Storage Service (Amazon S3) telah mengaktifkan versi.

- Tujuan kontrol: Meningkatkan ketersediaan
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::S3::Bucket`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.S3.PR.11

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.S3.PR.11
- Untuk contoh CloudFormation template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.S3.PR.11 contoh templat

Penjelasan

Pembuatan versi menyimpan beberapa varian objek dalam bucket Amazon S3 yang sama. Anda dapat menggunakan pembuatan versi untuk melestarikan, mengambil, dan memulihkan setiap versi dari setiap objek yang disimpan di bucket S3 Anda. Dengan pembuatan versi, Anda dapat memulihkan lebih mudah dari tindakan pengguna yang tidak diinginkan dan kegagalan aplikasi.

Pertimbangan penggunaan

- Jika Anda memiliki bucket tidak berversi dengan konfigurasi siklus hidup kedaluwarsa objek, dan jika Anda ingin mempertahankan perilaku penghapusan permanen yang sama saat mengaktifkan pembuatan versi, Anda harus menyetel konfigurasi kedaluwarsa untuk objek noncurrent. Siklus hidup konfigurasi kedaluwarsa noncurrent mengelola penghapusan versi objek noncurrent dalam bucket berkemampuan versi. (Bucket dengan

dukungan versioning akan mempertahankan satu objek versi terkini dan nol atau beberapa versi lama.)

Remediasi untuk kegagalan aturan

Atur `Status` in `VersioningConfiguration` ke Diaktifkan.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

S3 Bucket - Contoh Satu

Bucket Amazon S3 dengan versi diaktifkan. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "Bucket": {
        "Type": "AWS::S3::Bucket",
        "Properties": {
            "VersioningConfiguration": {
                "Status": "Enabled"
            }
        }
    }
}
```

Contoh YAMB

```
Bucket:
  Type: AWS::S3::Bucket
  Properties:
    VersioningConfiguration:
      Status: Enabled
```

Spesifikasi aturan CT.S3.PR.11

```

```
Resources:
  Bucket:
    Type: AWS::S3::Bucket
    Properties: {}
```

[CT.S3.PR.12] Memerlukan jalur akses Amazon S3 untuk memiliki konfigurasi Block Public Access (BPA) dengan semua opsi disetel ke true

Kontrol ini memeriksa apakah jalur akses Amazon S3 telah dikonfigurasi dengan konfigurasi Block Public Access (BPA) yang memiliki semua opsi disetel ke true.

- Tujuan kontrol: Menegakkan hak istimewa paling sedikit
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::S3::AccessPoint`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.S3.PR.12

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.S3.PR.12
- Untuk contoh AWS CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.S3.PR.12 contoh template

Penjelasan

Jalur akses Amazon S3 mendukung pengaturan akses independen yang memungkinkan setiap titik akses memblokir akses publik. Saat membuat titik akses, Anda dapat menentukan pengaturan blokir akses publik yang berlaku pada titik akses tersebut. Untuk setiap permintaan yang dibuat melalui titik akses, Amazon S3 mengevaluasi pengaturan blokir akses publik untuk titik akses tersebut, bucket yang mendasarinya, dan akun pemilik bucket. Jika salah satu pengaturan ini menunjukkan bahwa permintaan tersebut harus diblokir, Amazon S3 menolak permintaan tersebut.

Pertimbangan penggunaan

- Kontrol ini tidak kompatibel dengan jalur akses Amazon S3 yang memerlukan konfigurasi akses publik.
- Amazon S3 saat ini tidak `t support changing an access point` memblokir pengaturan akses publik setelah titik akses dibuat.
- Menambahkan jalur akses Amazon S3 ke bucket tidak mengubah perilaku bucket saat Anda mengakses bucket secara langsung melalui nama bucket atau Amazon Resource Name (ARN). Lihat Mengonfigurasi kebijakan IAM untuk menggunakan titik akses di Panduan Pengguna Amazon S3 untuk informasi tentang opsi untuk mengonfigurasi kebijakan bucket yang mendasari untuk digunakan dengan jalur akses Amazon S3.

Remediasi untuk kegagalan aturan

Di PublicAccessBlockConfiguration bidang, atur nilai BlockPublicAcls,, BlockPublicPolicy IgnorePublicAcls, dan RestrictPublicBuckets ke true, atau hilangkan PublicAccessBlockConfiguration bidang untuk mengadopsi nilai default true untuk properti ini.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Titik Akses Amazon S3 - Contoh

Jalur akses Amazon S3 dengan konfigurasi Blokir Akses Publik yang memastikan permintaan akses publik melalui jalur akses ditolak. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "S3AccessPoint": {
        "Type": "AWS::S3::AccessPoint",
        "Properties": {
            "Bucket": "sample-bucket",
            "Name": "sample-access-point",
            "Policy": {

```

SageMaker Kontrol Amazon

Topik

- [CT.SAGEMAKER.PR.1] Memerlukan instance SageMaker notebook Amazon untuk mencegah akses internet langsung
- [CT.SAGEMAKER.PR.2] Mengharuskan instans SageMaker notebook Amazon untuk digunakan dalam VPC Amazon khusus
- [CT.SAGEMAKER.PR.3] Mengharuskan instance SageMaker notebook Amazon agar akses root tidak diizinkan

[CT.SAGEMAKER.PR.1] Memerlukan instance SageMaker notebook Amazon untuk mencegah akses internet langsung

Kontrol ini memeriksa apakah akses internet langsung tidak diizinkan untuk instance SageMaker notebook Amazon.

- Tujuan kontrol: Batasi akses jaringan
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::SageMaker::NotebookInstance`
- AWS CloudFormation aturan penjaga: CT.SAGEMAKER.PR.1spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.SAGEMAKER.PR.1spesifikasi aturan
- Untuk contoh AWS CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.SAGEMAKER.PR.1contoh template

Penjelasan

Saat Anda mengonfigurasi instans SageMaker notebook tanpa VPC, akses internet langsung diizinkan untuk instans Anda, secara default. Sebagai gantinya, Anda harus mengonfigurasi instance Anda dengan VPC dan mengubah pengaturan default menjadi. `Disable - Access the internet through a VPC`

Untuk melatih atau meng-host model dari notebook, Anda memerlukan akses internet. Untuk mengatur akses internet, pastikan VPC Anda memiliki gateway NAT, dan grup keamanan Anda mengizinkan koneksi keluar.

Pastikan akses ke SageMaker konfigurasi Anda terbatas pada pengguna yang berwenang. Batasi izin IAM pengguna untuk memodifikasi SageMaker pengaturan dan sumber daya.

> Pertimbangan penggunaan
>
> - Untuk mengatur akses internet keluar untuk instance SageMaker notebook Amazon saat kontrol ini diaktifkan - Pertama, kaitkan instance notebook dengan subnet pribadi yang

memiliki akses ke internet, melalui rute default ke instance gateway NAT. Juga, pastikan bahwa kelompok keamanan yang ditugaskan ke instance notebook, dan daftar kontrol akses jaringan (NACL) dari subnet pribadi, memungkinkan lalu lintas keluar ke internet.

Remediasi untuk kegagalan aturan

Atur `DirectInternetAccess` ke `Disabled` dan berikan satu `SubnetId` dan satu atau lebih`SecurityGroupIds`.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Instans SageMaker Notebook Amazon - Contoh

Instans SageMaker notebook Amazon dikonfigurasi dengan akses internet langsung dinonaktifkan. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "SageMakerNoteBookInstance": {
        "Type": "AWS::SageMaker::NotebookInstance",
        "Properties": {
            "InstanceType": "ml.t2.medium",
            "RoleArn": {
                "Fn::GetAtt": [
                    "ExecutionRole",
                    "Arn"
                ]
            },
            "DirectInternetAccess": "Disabled",
            "SubnetId": {
                "Ref": "Subnet"
            },
            "SecurityGroupIds": [
                {
                    "Fn::GetAtt": [
                        "SecurityGroup",
                        "GroupId"
                    ]
                }
            ]
```

```
        }
    }
}
```

Contoh YAMB

```
SageMakerNoteBookInstance:
  Type: AWS::SageMaker::NotebookInstance
  Properties:
    InstanceType: ml.t2.medium
    RoleArn: !GetAtt 'ExecutionRole.Arn'
    DirectInternetAccess: Disabled
    SubnetId: !Ref 'Subnet'
    SecurityGroupIds:
      - !GetAtt 'SecurityGroup.GroupId'
```

CT.SAGEMAKER.PR.1spesifikasi aturan

```
# ####################################

[CT.SAGEMAKER.PR.2] Mengharuskan instans SageMaker notebook Amazon untuk digunakan dalam VPC Amazon khusus

Kontrol ini memeriksa apakah instans SageMaker notebook Amazon dikonfigurasi untuk diluncurkan dalam VPC Amazon khusus.

- Tujuan kontrol: Batasi akses jaringan
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::SageMaker::NotebookInstance`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.SAGEMAKER.PR.2

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.SAGEMAKER.PR.2
- Untuk contoh AWS CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.SAGEMAKER.PR.2 contoh template

Penjelasan

Sebagai praktik terbaik, kami menyarankan agar Anda menyimpan sumber daya Anda di dalam VPC bila memungkinkan, untuk memastikan perlindungan jaringan yang aman dari infrastruktur Anda.

Remediasi untuk kegagalan aturan

Setel `SubnetId` ke pengenal subnet Amazon EC2 dan `SecurityGroupIds` atur ke daftar yang berisi satu atau beberapa pengidentifikasi grup keamanan EC2.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Instans SageMaker Notebook Amazon - Contoh

Instans SageMaker notebook Amazon dikonfigurasi dengan konektivitas Amazon VPC. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "NotebookInstance": {
        "Type": "AWS::SageMaker::NotebookInstance",
        "Properties": {
            "InstanceType": "ml.t2.large",
            "RoleArn": {
                "Fn::GetAtt": [
                    "ExecutionRole",
                    "Arn"
                ]
            },
            "SubnetId": {
                "Fn::GetAtt": [
                    "Subnet",
                    "SubnetId"
                ]
            },
            "SecurityGroupIds": [
                {
                    "Fn::GetAtt": [
                        "SecurityGroup",
                        "GroupId"
                    ]
                }
            ]
        }
    }
}
```

Contoh YAMB

```
NotebookInstance:
  Type: AWS::SageMaker::NotebookInstance
```

```
  Properties:
    InstanceType: ml.t2.large
    RoleArn: !GetAtt 'ExecutionRole.Arn'
    SubnetId: !GetAtt 'Subnet.SubnetId'
    SecurityGroupIds:
      - !GetAtt 'SecurityGroup.GroupId'
```

Spesifikasi aturan CT.SAGEMAKER.PR.2

```
# ####################################

    Properties:
      InstanceType: ml.t2.large
      RoleArn: example-role-arn
```

[CT.SAGEMAKER.PR.3] Mengharuskan instance SageMaker notebook Amazon agar akses root tidak diizinkan

Kontrol ini memeriksa apakah instance SageMaker notebook Amazon mengizinkan akses root.

- Tujuan kontrol: Menegakkan hak istimewa paling sedikit
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::SageMaker::NotebookInstance`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.SAGEMAKER.PR.3

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.SAGEMAKER.PR.3
- Untuk contoh AWS CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.SAGEMAKER.PR.3 contoh template

Penjelasan

Secara default, saat Anda membuat instance notebook, pengguna yang masuk ke instance notebook tersebut memiliki akses root. Karena pengguna dengan akses root memiliki hak administrator, pengguna memiliki akses untuk mengedit semua file pada instance notebook dengan akses root diaktifkan. Sesuai dengan prinsip hak istimewa yang paling rendah, untuk alasan keamanan, sebaiknya Anda membatasi akses root ke sumber daya instans bila memungkinkan, untuk menghindari penyediaan izin yang berlebihan secara tidak disengaja.

> Pertimbangan penggunaan
>
> - Konfigurasi siklus hidup yang terkait dengan instance SageMaker notebook Amazon selalu berjalan dengan akses root, bahkan jika Anda mematikan akses root untuk pengguna.

Remediasi untuk kegagalan aturan

Atur `RootAccess` ke `Disabled`.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Instans SageMaker Notebook Amazon - Contoh

Instans SageMaker notebook Amazon yang dikonfigurasi dengan akses root dimatikan. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "NotebookInstance": {
        "Type": "AWS::SageMaker::NotebookInstance",
        "Properties": {
            "InstanceType": "ml.t2.large",
            "RoleArn": {
                "Fn::GetAtt": [
                    "ExecutionRole",
                    "Arn"
                ]
            },
            "RootAccess": "Disabled"
        }
    }
}
```

Contoh YAMB

```
NotebookInstance:
  Type: AWS::SageMaker::NotebookInstance
  Properties:
    InstanceType: ml.t2.large
    RoleArn: !GetAtt 'ExecutionRole.Arn'
    RootAccess: Disabled
```

Spesifikasi aturan CT.SAGEMAKER.PR.3

```

```

Kontrol Layanan Antrian Sederhana Amazon (Amazon SQS)

Topik

- [CT.SQS.PR.1] Memerlukan antrian Amazon SQS apa pun agar antrian huruf mati dikonfigurasi
- [CT.SQS.PR.2] Memerlukan antrian Amazon SQS apa pun agar enkripsi saat istirahat dikonfigurasi

[CT.SQS.PR.1] Memerlukan antrian Amazon SQS apa pun agar antrian huruf mati dikonfigurasi

Kontrol ini memeriksa apakah antrian Amazon SQS dikonfigurasi dengan antrian huruf mati.

- Tujuan kontrol: Meningkatkan ketahanan
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::SQS::Queue`
- AWS CloudFormation aturan penjaga: CT.SQS.PR.1spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.SQS.PR.1spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.SQS.PR.1contoh template

Penjelasan

Tugas utama antrian huruf mati adalah menangani siklus hidup pesan yang tidak dikonsumsi. Antrian huruf mati memungkinkan Anda menyisihkan dan mengisolasi pesan yang tidak berhasil. `t be processed correctly, so you can determine why their processing didn`

> **Pertimbangan penggunaan**
>
> - Kontrol ini hanya berlaku untuk antrian Amazon SQS yang tidak dikonfigurasi sebagai antrian huruf mati dengan properti. `RedriveAllowPolicy`

Remediasi untuk kegagalan aturan

Buat `RedrivePolicy` dengan `deadLetterTargetArn` nilai yang `s set to the ARN of an Amazon SQS dead-letter queue. For Amazon SQS dead-letter queues, instead provide a redrive configuration in the` RedriveAllowPolicy 'properti.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Antrian Amazon SQS - Contoh

Antrian Amazon SQS dikonfigurasi untuk mengirim pesan ke antrean huruf mati, jika pesan tidak berhasil diproses (dikonsumsi). Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "SQSQueue": {
        "Type": "AWS::SQS::Queue",
        "Properties": {
            "RedrivePolicy": {
                "deadLetterTargetArn": {
                    "Fn::GetAtt": [
                        "DLQQueue",
                        "Arn"
                    ]
                },
                "maxReceiveCount": 3
            }
        }
    }
}
```

Contoh YAMB

```
SQSQueue:
  Type: AWS::SQS::Queue
  Properties:
    RedrivePolicy:
      deadLetterTargetArn: !GetAtt 'DLQQueue.Arn'
      maxReceiveCount: 3
```

CT.SQS.PR.1spesifikasi aturan

```
# ####################################

CT.SQS.PR.1contoh template

Anda dapat melihat contoh artefak pengujian PASS dan FAIL untuk kontrol proaktif AWS Control Tower.

Contoh PASS - Gunakan template ini untuk memverifikasi pembuatan sumber daya yang sesuai.

```
Resources:
  SQSQueue:
    Type: AWS::SQS::Queue
    Properties:
      RedrivePolicy:
        deadLetterTargetArn:
          Fn::GetAtt: [DLQQueue, Arn]
        maxReceiveCount: 3
  DLQQueue:
    Type: AWS::SQS::Queue
    Properties:
      RedriveAllowPolicy:
        redrivePermission: allowAll
```

Contoh GAGAL - Gunakan templat ini untuk memverifikasi bahwa kontrol mencegah pembuatan sumber daya yang tidak sesuai.

```
Resources:
  SQSQueue:
```

```
    Type: AWS::SQS::Queue
    Properties: {}
```

[CT.SQS.PR.2] Memerlukan antrian Amazon SQS apa pun agar enkripsi saat istirahat dikonfigurasi

Kontrol ini memeriksa apakah antrian Amazon SQS dienkripsi saat istirahat.

- Tujuan kontrol: Enkripsi data saat istirahat
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::SQS::Queue`
- AWS CloudFormation aturan penjaga: CT.SQS.PR.2spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.SQS.PR.2spesifikasi aturan
- Untuk contoh AWS CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.SQS.PR.2 contoh template

Penjelasan

Enkripsi sisi server (SSE) memungkinkan Anda mengirimkan data sensitif dalam antrian terenkripsi. Untuk melindungi konten pesan dalam antrian, SSE menggunakan kunci KMS.

Remediasi untuk kegagalan aturan

Setel `SqsManagedSseEnabled` ke `true` atau setel AWS KMS key pengenal di `KmsMasterKeyId` properti.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Antrian Amazon SQS - Contoh Satu

Antrian Amazon SQS dikonfigurasi untuk mengenkripsi data saat istirahat dengan enkripsi sisi server diaktifkan, dengan menggunakan kunci enkripsi terkelola SQS (SSE-SQS). Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "SQSQueue": {
        "Type": "AWS::SQS::Queue",
        "Properties": {
            "SqsManagedSseEnabled": true
        }
    }
}
```

Contoh YAMB

```
SQSQueue:
  Type: AWS::SQS::Queue
  Properties:
    SqsManagedSseEnabled: true
```

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

Antrian Amazon SQS - Contoh Dua

Antrian Amazon SQS dikonfigurasi untuk mengenkripsi data saat istirahat dengan enkripsi sisi server diaktifkan, melalui (SSE-KMS). AWS KMS Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "SQSQueue": {
        "Type": "AWS::SQS::Queue",
        "Properties": {
            "KmsMasterKeyId": {
                "Ref": "KMSKey"
            }
        }
    }
}
```

Contoh YAMB

```
SQSQueue:
  Type: AWS::SQS::Queue
  Properties:
    KmsMasterKeyId: !Ref 'KMSKey'
```

CT.SQS.PR.2spesifikasi aturan

    Type: AWS::SQS::Queue
    Properties: {}
```

AWS Step Functions kontrol

Topik

- [CT.STEPFUNCTIONS.PR.1] Memerlukan mesin status agar logging diaktifkan AWS Step Functions
- [CT.STEPFUNCTIONS.PR.2] Memerlukan mesin status agar penelusuran diaktifkan AWS Step FunctionsAWS X-Ray

[CT.STEPFUNCTIONS.PR.1] Memerlukan mesin status agar logging diaktifkan AWS Step Functions

Kontrol ini memeriksa apakah mesin AWS Step Functions status telah mengaktifkan logging.

- Tujuan kontrol: Menetapkan pencatatan dan pemantauan
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::StepFunctions::StateMachine`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.STEPFUNCTIONS.PR.1

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.STEPFUNCTIONS.PR.1
- Untuk contoh CloudFormation template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.STEPFUNCTIONS.PR.1 contoh templat

Penjelasan

Mendefinisikan konfigurasi logging untuk mesin status Anda memungkinkan Anda melacak riwayat dan hasil eksekusi mereka. Konfigurasi ini memungkinkan Anda melacak peristiwa gagal yang terjadi pada mesin status, dan wawasan tentang kesalahan ini dapat membantu Anda saat Anda memecahkan masalah.

Remediasi untuk kegagalan aturan

Masuk`LoggingConfiguration`, setel `Level` ke `ERROR` atau`ALL`, dan atur `Destinations` ke daftar dengan satu atau beberapa ARN grup CloudWatch log Amazon Logs yang valid.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

AWS Step Functions Mesin Negara - Contoh

AWS Step Functions mesin status dikonfigurasi untuk mengirim log ke Amazon CloudWatch Logs. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "StateMachine": {
        "Type": "AWS::StepFunctions::StateMachine",
        "Properties": {

[CT.STEPFUNCTIONS.PR.2] Memerlukan mesin status agar penelusuran diaktifkan AWS Step FunctionsAWS X-Ray

Kontrol ini memeriksa apakah mesin AWS Step Functions status telah mengaktifkan AWS X-Ray penelusuran.

- Tujuan kontrol: Menetapkan pencatatan dan pemantauan
- Implementasi: aturan AWS CloudFormation penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::StepFunctions::StateMachine`
- AWS CloudFormation aturan penjaga: Spesifikasi aturan CT.STEPFUNCTIONS.PR.2

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: Spesifikasi aturan CT.STEPFUNCTIONS.PR.2

- Untuk contoh CloudFormation template PASS dan FAIL yang terkait dengan kontrol ini, lihat: Templat contoh CT.STEPFUNCTIONS.PR.2

Penjelasan

Konfigurasi penelusuran memungkinkan mesin status Anda mengirim data penelusuran AWS X-Ray, sehingga Anda dapat memvisualisasikan komponen mesin status Anda, mengidentifikasi kemacetan kinerja, dan memecahkan masalah permintaan yang mengakibatkan kesalahan.

Remediasi untuk kegagalan aturan

Di `TracingConfiguration` properti, tetapkan nilai `Enabled` ke true.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

AWS Step Functions Mesin Negara - Contoh

Mesin AWS Step Functions status dikonfigurasi untuk mengirim data jejak ke AWS X-Ray. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "StateMachine": {
        "Type": "AWS::StepFunctions::StateMachine",
        "Properties": {
            "StateMachineType": "STANDARD",
            "DefinitionString": "{\"StartAt\": \"Sample\",\"States\":
 {\"Sample\": {\"Type\": \"Task\", \"Resource\":\"arn:aws:lambda:us-
east-1:111122223333:function:SampleFunction\", \"End\": true}}}",
            "RoleArn": {
                "Fn::GetAtt": [
                    "StepFunctionExecutionRole",
                    "Arn"
                ]
            },
            "LoggingConfiguration": {
                "Level": "ALL",
                "Destinations": [
                    {
                        "CloudWatchLogsLogGroup": {
                            "LogGroupArn": {
```

```
                                "Fn::GetAtt": [
                                    "LogGroup",
                                    "Arn"
                                ]
                            }
                        }
                    }
                ]
            },
            "TracingConfiguration": {
                "Enabled": true
            }
        }
    }
}
```

Contoh YAMB

```

      Destinations:
        - CloudWatchLogsLogGroup:
            LogGroupArn: !GetAtt 'LogGroup.Arn'
    TracingConfiguration:
      Enabled: true
```

Spesifikasi aturan CT.STEPFUNCTIONS.PR.2

```
# ####################################
##       Rule Specification        ##
```

```
####################################
#
# Rule Identifier:
#   step_functions_state_machine_tracing_enabled_check
#
# Description:
#   This control checks whether an AWS Step Functions state machine has AWS X-Ray
 tracing enabled.
#
# Reports on:
#   AWS::StepFunctions::StateMachine
#
# Evaluates:
# AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document does not contain any StepFunctions state machine
 resources
#      Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a StepFunctions state machine resource
#       And: 'TracingConfiguration' has not been provided
#      Then: FAIL
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a StepFunctions state machine resource
#       And: 'TracingConfiguration' has been provided
#       And: In 'TracingConfiguration', 'Enabled' has not been provided or provided and
 set to a value other
#            than bool(true)
#      Then: FAIL
#   Scenario: 4
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
 document
#       And: The input document contains a StepFunctions state machine resource
```

```
#       And: 'TracingConfiguration' has been provided
#       And: In 'TracingConfiguration', 'Enabled' has been provided and set to
 bool(true)
#      Then: PASS

AWS WAF kontrol regional

Topik

- [CT.WAF-REGIONAL.PR.1] Mengharuskan aturan AWS WAF regional apa pun untuk memiliki kondisi
- [CT.WAF-REGIONAL.PR.2] Memerlukan daftar kontrol akses web AWS WAF regional (ACL) untuk memiliki aturan atau grup aturan

[CT.WAF-REGIONAL.PR.1] Mengharuskan aturan AWS WAF regional apa pun untuk memiliki kondisi

Kontrol ini memeriksa apakah AWS WAF Classic Regional aturan berisi kondisi apa pun.

- Tujuan kontrol: Batasi akses jaringan
- Implementasi: Aturan AWS CloudFormation Penjaga

- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::WAFRegional::Rule`
- AWS CloudFormation aturan penjaga: CT.WAF-REGIONAL.PR.1spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.WAF-REGIONAL.PR.1spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.WAF-REGIONAL.PR.1contoh template

Penjelasan

Aturan regional AWS WAF (firewall aplikasi web) dapat berisi beberapa kondisi. Kondisi hitungan aturan memungkinkan untuk inspeksi lalu lintas, berdasarkan tindakan yang ditentukan, seperti`allow`,`block`, atau`count`. Tanpa kondisi apa pun, lalu lintas berlalu tanpa inspeksi. Aturan AWS WAF Regional tanpa syarat, tetapi dengan nama atau tag yang menunjukkan`allow`,, atau `blockcount`, dapat menyebabkan asumsi yang tidak akurat bahwa salah satu tindakan tersebut terjadi.

Remediasi untuk kegagalan aturan

Berikan satu atau lebih ketentuan AWS WAF aturan di dalam `Predicates` properti.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

AWS WAF Classic Regional Aturan - Contoh

AWS WAF Classic Regional aturan dikonfigurasi dengan predikat kecocokan IP. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "WafRegionalRule": {
        "Type": "AWS::WAFRegional::Rule",
        "Properties": {
            "Name": "SampleRule",
            "MetricName": "SampleRuleMetric",
```

```
            "Predicates": [
                {
                    "DataId": {
                        "Ref": "IPSet"
                    },
                    "Negated": false,
                    "Type": "IPMatch"
                }
            ]
        }
    }
}
```

Contoh YAMB

```
WafRegionalRule:
  Type: AWS::WAFRegional::Rule
  Properties:
    Name: SampleRule
    MetricName: SampleRuleMetric
    Predicates:
      - DataId: !Ref 'IPSet'
        Negated: false
        Type: IPMatch
```

CT.WAF-REGIONAL.PR.1spesifikasi aturan

```

CT.WAF-REGIONAL.PR.1contoh template

Anda dapat melihat contoh artefak pengujian PASS dan FAIL untuk kontrol proaktif AWS Control Tower.

Contoh PASS - Gunakan template ini untuk memverifikasi pembuatan sumber daya yang sesuai.

```
Resources:
  IPSetDenylist:
    Type: AWS::WAFRegional::IPSet
    Properties:
      Name: IPSet for deny listed IP addresses
      IPSetDescriptors:
      - Type: IPV4
        Value: 192.0.2.44/32
  WafRegionalRule:
    Type: AWS::WAFRegional::Rule
    Properties:
      Name: ExampleRule
      MetricName: ExampleRuleMetric
      Predicates:
      - DataId:
          Ref: IPSetDenylist
        Negated: false
        Type: "IPMatch"
```

Contoh GAGAL - Gunakan templat ini untuk memverifikasi bahwa kontrol mencegah pembuatan sumber daya yang tidak sesuai.

```
Resources:
  WafRegionalRule:
    Type: AWS::WAFRegional::Rule
    Properties:
      Name: ExampleRule
      MetricName: ExampleRuleMetric
```

[CT.WAF-REGIONAL.PR.2] Memerlukan daftar kontrol akses web AWS WAF regional (ACL) untuk memiliki aturan atau grup aturan

Kontrol ini memeriksa apakah ACL AWS WAF Classic Regional web berisi aturan WAF atau grup aturan.

- Tujuan kontrol: Batasi akses jaringan
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::WAFRegional::WebACL`
- AWS CloudFormation aturan penjaga: CT.WAF-REGIONAL.PR.2spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.WAF-REGIONAL.PR.2spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.WAF-REGIONAL.PR.2contoh template

Penjelasan

Daftar kontrol akses web AWS WAF regional (ACL) dapat berisi kumpulan aturan dan kelompok aturan yang memeriksa dan mengontrol permintaan web. Jika ACL web kosong, lalu lintas web dapat lewat tanpa terdeteksi atau ditindaklanjuti oleh WAF, tergantung pada tindakan default.

Remediasi untuk kegagalan aturan

Berikan satu atau lebih AWS WAF aturan di dalam `Rules` properti.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

AWS WAF Classic Regional web ACL - Contoh

AWS WAF Classic Regional web ACL dikonfigurasi dengan aturan untuk memblokir permintaan berdasarkan kecocokan set IP. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "WafRegionalWebAcl": {
        "Type": "AWS::WAFRegional::WebACL",
        "Properties": {
            "Name": "SampleWebACL",
            "DefaultAction": {
                "Type": "ALLOW"
            },
            "MetricName": "SampleWebACLMetric",
            "Rules": [
                {
                    "Action": {
                        "Type": "BLOCK"
                    },
                    "Priority": 1,
                    "RuleId": {
                        "Ref": "IPSetRule"
                    }
                }
            ]
        }
    }
}
```

Contoh YAMB

```
WafRegionalWebAcl:
  Type: AWS::WAFRegional::WebACL
  Properties:
    Name: SampleWebACL
    DefaultAction:
      Type: ALLOW
    MetricName: SampleWebACLMetric
```

```
    Rules:
      - Action:
          Type: BLOCK
        Priority: 1
        RuleId: !Ref 'IPSetRule'
```

AWS WAF kontrol

Topik

- [CT.WAF.PR.1] Memerlukan aturan AWS WAF global apa pun untuk memiliki kondisi
- [CT.WAF.PR.2] Memerlukan ACL web AWS WAF global apa pun untuk memiliki aturan atau grup aturan

[CT.WAF.PR.1] Memerlukan aturan AWS WAF global apa pun untuk memiliki kondisi

Kontrol ini memeriksa apakah aturan AWS WAF Classic global berisi kondisi apa pun.

- Tujuan kontrol: Batasi akses jaringan
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::WAF::Rule`
- AWS CloudFormation aturan penjaga: CT.WAF.PR.1spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.WAF.PR.1spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.WAF.PR.1 contoh templat

Penjelasan

Aturan global WAF dapat berisi beberapa kondisi. Ketentuan aturan memungkinkan inspeksi lalu lintas dan mengambil tindakan yang ditentukan (izinkan, blokir, atau hitung). Tanpa kondisi apa pun, lalu lintas berlalu tanpa inspeksi. Aturan global WAF tanpa kondisi, tetapi dengan nama atau tag yang menyarankan izinkan, blokir, atau hitung, dapat menyebabkan asumsi yang salah bahwa salah satu tindakan tersebut terjadi.

Remediasi untuk kegagalan aturan

Berikan satu atau lebih ketentuan AWS WAF aturan di dalam `Predicates` properti.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

AWS WAF Classic Aturan Global - Contoh

AWS WAF Classic aturan global dikonfigurasi dengan predikat kecocokan IP. Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "WAFRule": {
        "Type": "AWS::WAF::Rule",
        "Properties": {
            "Name": "SampleWAFRule",
            "MetricName": "SampleWAFRuleMetric",
            "Predicates": [
                {
                    "DataId": {
                        "Ref": "IPSet"
                    },
                    "Negated": false,
                    "Type": "IPMatch"
                }
            ]
        }
    }
}
```

Contoh YAMB

```
WAFRule:
  Type: AWS::WAF::Rule
  Properties:
    Name: SampleWAFRule
    MetricName: SampleWAFRuleMetric
    Predicates:
```

```
      - DataId: !Ref 'IPSet'
        Negated: false
        Type: IPMatch
```

```

AWS WAFV2 kontrol

Topik

- [CT.WAFV2.PR.1] Memerlukan ACL AWS WAFV2 web agar tidak kosong
- [CT.WAFV2.PR.2] Memerlukan grup AWS WAFV2 aturan agar tidak kosong

[CT.WAFV2.PR.1] Memerlukan ACL AWS WAFV2 web agar tidak kosong

Kontrol ini memeriksa apakah ACL AWS WAFV2 web berisi aturan WAF atau grup aturan WAF.

- Tujuan kontrol: Batasi akses jaringan
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::WAFv2::WebACL`
- AWS CloudFormation aturan penjaga: CT.WAFV2.PR.1spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.WAFV2.PR.1spesifikasi aturan

- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.WAFV2.PR.1contoh template

Penjelasan

Daftar kontrol akses web (ACL) yang dilampirkan ke WAFv2 dapat berisi kumpulan aturan dan grup aturan. Aturan dirancang untuk memeriksa dan mengontrol permintaan web. Jika ACL web kosong, lalu lintas web berlalu tanpa terdeteksi atau ditindaklanjuti oleh firewall aplikasi web (WAF).

Remediasi untuk kegagalan aturan

Berikan satu atau lebih AWS WAFV2 aturan di dalam `Rules` properti.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

AWS WAFV2 web ACL - Contoh

AWS WAFV2 web ACL dikonfigurasi dengan aturan untuk memblokir permintaan berdasarkan pernyataan kecocokan skrip lintas situs (XSS). Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "WAFv2WebACL": {
        "Type": "AWS::WAFv2::WebACL",
        "Properties": {
            "Scope": "REGIONAL",
            "Description": "Sample WebACL",
            "DefaultAction": {
                "Allow": {}
            },
            "VisibilityConfig": {
                "SampledRequestsEnabled": true,
                "CloudWatchMetricsEnabled": true,
                "MetricName": "SampleWebACLMetric"
            },
            "Rules": [
                {
                    "Name": "SampleXssRule",
                    "Priority": 0,
                    "Action": {
```

```
                        "Block": {}
                    },
                    "VisibilityConfig": {
                        "SampledRequestsEnabled": true,
                        "CloudWatchMetricsEnabled": true,
                        "MetricName": "SampleXssMatchMetric"
                    },
                    "Statement": {
                        "XssMatchStatement": {
                            "FieldToMatch": {
                                "AllQueryArguments": {}
                            },
                            "TextTransformations": [
                                {
                                    "Priority": 1,
                                    "Type": "NONE"
                                }
                            ]
                        }
                    }
                }
            ]
        }
    }
}
```

CT.WAFV2.PR.1contoh template

Anda dapat melihat contoh artefak pengujian PASS dan FAIL untuk kontrol proaktif AWS Control Tower.

Contoh PASS - Gunakan template ini untuk memverifikasi pembuatan sumber daya yang sesuai.

```
Resources:
  WAFv2WebACL:
    Type: AWS::WAFv2::WebACL
    Properties:
      Scope: REGIONAL
      Description: Example WebACL
      DefaultAction:
        Allow: {}
      VisibilityConfig:
        SampledRequestsEnabled: true
        CloudWatchMetricsEnabled: true
        MetricName: ExampleWebACLMetric
      Rules:
      - Name: ExampleXssRule
        Priority: 0
        Action:
          Block: {}
        VisibilityConfig:
          SampledRequestsEnabled: true
          CloudWatchMetricsEnabled: true
          MetricName: ExampleXssMatchMetric
        Statement:
          XssMatchStatement:
            FieldToMatch:
              AllQueryArguments: {}
            TextTransformations:
            - Priority: 1
              Type: NONE
```

Contoh GAGAL - Gunakan templat ini untuk memverifikasi bahwa kontrol mencegah pembuatan sumber daya yang tidak sesuai.

```
Resources:
  WAFv2WebACL:
    Type: AWS::WAFv2::WebACL
    Properties:
      Scope: REGIONAL
```

```
      Description: Example WebACL
      DefaultAction:
        Allow: {}
      VisibilityConfig:
        SampledRequestsEnabled: true
        CloudWatchMetricsEnabled: true
        MetricName: ExampleWebACLMetric
```

[CT.WAFV2.PR.2] Memerlukan grup AWS WAFV2 aturan agar tidak kosong

Kontrol ini memeriksa apakah grup AWS WAFV2 aturan berisi aturan.

- Tujuan kontrol: Batasi akses jaringan
- Implementasi: Aturan AWS CloudFormation Penjaga
- Kontrol perilaku: Proaktif
- Jenis sumber daya: `AWS::WAFv2::RuleGroup`
- AWS CloudFormation aturan penjaga: CT.WAFV2.PR.2spesifikasi aturan

Detail dan contoh

- Untuk detail tentang perilaku PASS, FAIL, dan SKIP yang terkait dengan kontrol ini, lihat: CT.WAFV2.PR.2spesifikasi aturan
- Untuk contoh CloudFormation Template PASS dan FAIL yang terkait dengan kontrol ini, lihat: CT.WAFV2.PR.2contoh template

Penjelasan

Grup AWS WAFV2 aturan dapat berisi beberapa aturan. Aturan dirancang untuk memeriksa dan mengontrol permintaan web. Ketika grup AWS WAFV2 aturan kosong dikaitkan dengan ACL web, dan ACL web tidak terkait dengan aturan atau grup aturan lain, lalu lintas web berlalu tanpa terdeteksi atau ditindaklanjuti oleh firewall aplikasi web (WAF).

Remediasi untuk kegagalan aturan

Berikan satu atau lebih AWS WAFV2 aturan di dalam `Rules` properti.

Contoh berikut menunjukkan bagaimana menerapkan remediasi ini.

AWS WAFV2 Grup Aturan - Contoh

AWS WAFV2 grup aturan dikonfigurasi dengan aturan untuk memblokir permintaan berdasarkan pernyataan kecocokan skrip lintas situs (XSS). Contoh ini ditunjukkan di JSON dan di YAMAL.

Contoh JSON

```
{
    "WAFv2RuleGroup": {
        "Type": "AWS::WAFv2::RuleGroup",

CT.WAFV2.PR.2contoh template

Anda dapat melihat contoh artefak pengujian PASS dan FAIL untuk kontrol proaktif AWS Control Tower.

Contoh PASS - Gunakan template ini untuk memverifikasi pembuatan sumber daya yang sesuai.

```
Resources:
  WAFv2RuleGroup:
    Type: AWS::WAFv2::RuleGroup
    Properties:
      Scope: REGIONAL
      Description: Example Rule Group
      VisibilityConfig:
        SampledRequestsEnabled: true
        CloudWatchMetricsEnabled: true
        MetricName: SampleRuleGroupMetrics
      Capacity: 1000
      Rules:
      - Name: TestXssRule
        Priority: 0
        Action:
          Block: {}
        VisibilityConfig:
          SampledRequestsEnabled: true
          CloudWatchMetricsEnabled: true
```

```
          MetricName: ExampleXssMatchMetric
        Statement:
          XssMatchStatement:
            FieldToMatch:
              AllQueryArguments: {}
            TextTransformations:
            - Priority: 1
              Type: NONE
```

Contoh GAGAL - Gunakan templat ini untuk memverifikasi bahwa kontrol mencegah pembuatan sumber daya yang tidak sesuai.

```
Resources:
  WAFv2RuleGroup:
    Type: AWS::WAFv2::RuleGroup
    Properties:
      Scope: REGIONAL
      Description: Example Rule Group
      VisibilityConfig:
        SampledRequestsEnabled: true
        CloudWatchMetricsEnabled: true
        MetricName: ExampleRuleGroupMetric
      Capacity: 1000
      Rules: []
```

Standar Security Hub

AWS Control Tower terintegrasi dengan AWS Security Hub untuk menyediakan kontrol detektif yang membantu Anda memantau AWS lingkungan. Integrasi ini dilakukan dengan standar Security Hub, yang disebut Service-Managed Standard: AWS Control Tower.

Standar yang Dikelola Layanan: AWS Control Tower mendukung subset kontrol dalam standar Praktik Terbaik Keamanan AWS Dasar (FSBP). Untuk mempelajari lebih lanjut tentang standar ini dan untuk melihat kontrol yang tersedia, lihat Standar yang Dikelola Layanan: AWS Control Tower. Untuk informasi lebih umum tentang standar Security Hub, lihat Standar dan kontrol keamanan di Security Hub, di Panduan Pengguna AWS Security Hub.

Standar ini hanya tersedia untuk pelanggan AWS Control Tower yang telah membuat standar di konsol AWS Control Tower. AWS Control Tower menciptakan standar untuk Anda saat Anda mengaktifkan kontrol Security Hub pertama di konsol AWS Control Tower. Saat Anda mengaktifkan kontrol pertama, jika Anda belum mengaktifkan Security Hub, AWS Control Tower juga mengaktifkan Security Hub untuk Anda.

Setelah membuat standar ini, Anda dapat melihat kontrol detektif Security Hub bersama kontrol AWS Control Tower lainnya, di konsol AWS Control Tower dan di Security Hub.

Kontrol perilaku

- Tidak ada kontrol yang diaktifkan secara otomatis saat Anda membuat standar ini di AWS Control Tower.
- Kontrol Security Hub hanya aktif pada level OU, tidak untuk semua AWS Control Tower OU (jika tidak diaktifkan untuk semua), dan tidak untuk akun individual.
- Saat Security Hub menambahkan kontrol baru, kontrol baru tidak ditambahkan ke Standar yang Dikelola Layanan Security Hub: AWS Control Tower secara otomatis.

Mengaktifkan atau menghapus kontrol untuk Standar yang Dikelola Layanan

Untuk menghindari penyimpangan, selalu aktifkan dan hapus kontrol untuk Standar yang Dikelola Layanan melalui layanan AWS Control Tower, baik di konsol atau dengan memanggil AWS Control Tower API, dan. `EnableControl` `DisableControl` Saat Anda mengubah status pengaktifan kontrol di AWS Control Tower, perubahan tersebut juga tercermin di Security Hub.

> **Note**
>
> Jika Anda menonaktifkan kontrol Standar yang Dikelola Layanan melalui konsol Security Hub, akun anggota AWS Control Tower akan memasuki state of control drift. Dalam situasi ini, AWS Control Tower tidak menerima temuan Security Hub untuk kontrol yang Anda nonaktifkan. Anda harus menyelesaikan penyimpangan ini sebelum AWS Control Tower berhasil menerapkan kontrol ke unit organisasi dan akun anggota terdaftar Anda.

Anda dapat menghapus standar ini di konsol AWS Control Tower dengan menonaktifkan semua kontrol dalam standar. Ini menghapus standar untuk semua akun terkelola dan Wilayah yang diatur di AWS Control Tower. Menghapus standar tidak menonaktifkan Security Hub untuk akun Anda.

> **Kontrol usang**
>
> Kontrol bernama [SH.S3.4] S3 bucket harus mengaktifkan enkripsi sisi server tidak digunakan lagi, efektif 18 Juli 2023. Itu dihapus dari perpustakaan kontrol pada 18 Agustus 2023. Untuk informasi selengkapnya, lihat AWS Control Tower menghentikan dua kontrol.

Skor dan temuan Security Hub

Berdasarkan status kontrol, Security Hub menghitung skor keamanan untuk Service-Managed Standard: AWS Control Tower. Skor keamanan dan temuan kontrol ini hanya tersedia di Security Hub. Item ini tidak tersedia di AWS Control Tower.

> **Note**
>
> Saat Anda membuat Service-Managed Standard: AWS Control Tower dan mengaktifkan kontrol untuknya, Security Hub mungkin memerlukan waktu hingga 18 jam untuk menghasilkan temuan untuk kontrol yang menggunakan aturan AWS Config terkait layanan dasar yang sama dengan kontrol dari standar Security Hub lainnya yang diaktifkan. Untuk informasi selengkapnya, lihat Menjadwalkan untuk menjalankan pemeriksaan keamanan di Panduan Pengguna AWS Security Hub.

Security Hub mengontrol pelaporan drift

Saat melaporkan penyimpangan untuk kontrol yang merupakan bagian dari Standar yang AWS Security Hub Dikelola Layanan, AWS Control Tower menerima pembaruan status harian dari Security Hub. Jika tidak ada pembaruan yang diterima, AWS Control Tower memverifikasi apakah drift telah terjadi. Jika demikian, AWS Control Tower melaporkan drift. Jika kontrol menunjukkan drift, AWS Control Tower mengirimkan notifikasi Amazon SNS ke saluran AWS Control `security-aggregate-notification` Tower. Anda harus berlangganan notifikasi SNS ini untuk menerima informasi tentang akun spesifik mana yang terpengaruh oleh drift kontrol Security Hub. Untuk informasi selengkapnya tentang drift kontrol Security Hub di AWS Control Tower, lihatDrift kontrol Security Hub.

Meskipun kontrol aktif di setiap Wilayah yang diatur, AWS Control Tower mengirimkan peristiwa AWS Security Hub Finding ke Wilayah home AWS Control Tower saja.

Remediasi penyimpangan

Saat drift dilaporkan, Anda dapat memperbaiki situasi dengan memilih Registrasi ulang OU di halaman Organizations di konsol AWS Control Tower, atau dengan menonaktifkan dan mengaktifkan kembali kontrol yang berada dalam keadaan hanyut, baik melalui konsol, atau melalui AWS Control Tower API.

> **Note**
>
> Anda dapat mengaktifkan dan mengelola beberapa kontrol Security Hub dari AWS Control Tower, dengan Security Hub Service-managed Standard: AWS Control Tower.

Wilayah yang Tidak Didukung

Penting untuk diketahui bahwa beberapa kontrol Security Hub tidak beroperasi di Wilayah AWS tempat tertentu di mana AWS Control Tower tersedia, karena Wilayah tersebut tidak mendukung fungsionalitas dasar yang diperlukan. Akibatnya, saat Anda menerapkan kontrol Security Hub melalui AWS Control Tower, kontrol tersebut mungkin tidak beroperasi di semua Wilayah yang Anda atur dengan AWS Control Tower. Untuk informasi selengkapnya tentang kontrol Security Hub yang tidak dapat digunakan di Wilayah tertentu, lihat dokumentasi referensi Security Hub mengontrol.

AWS Wilayah berikut tidak mendukung kontrol yang merupakan bagian dari Standar yang dikelola Layanan Security Hub: AWS Control Tower

- Wilayah Asia Pasifik (Hong Kong), ap-timur-1
- Wilayah Asia Pasifik (Jakarta), ap-tenggara - 3
- Wilayah Asia Pasifik (Osaka), ap-timur laut-3
- Wilayah Eropa (Milan), eu-selatan-1
- Wilayah Afrika (Cape Town), af-selatan-1
- Wilayah Timur Tengah (Bahrain), saya-selatan-1
- Israel (Tel Aviv), di pusat-1
- Wilayah Timur Tengah (UEA), saya-sentral-1
- Wilayah Eropa (Spanyol), eu-selatan-2
- Wilayah Asia Pasifik (Hyderabad), ap-selatan-2
- Wilayah Eropa (Zurich), eu-central-2
- Wilayah Asia Pasifik (Melbourne) ap-tenggara - 4

Anda dapat melihat Wilayah untuk setiap kontrol di konsol AWS Control Tower.

Standar AWS Security Hub yang Dikelola Layanan Tertentu: Kontrol AWS Control Tower memiliki Wilayah yang spesifik dan tidak didukung

- Sh.documentDB.3 —eu-utara-1 kita-barat-1
- Sh.DynamoDB.3 —ap-timur laut-2, ca-pusat-1, eu-utara-1
- SH.EC2.23 —ap-selatan-1
- SH.EKS.1 —us-barat-1

- SH.RDS.12 —sa-timur-1
- SH.RDS.15 —sa-timur-1

Kontrol yang meningkatkan perlindungan kedaulatan digital

Kedaulatan digital berarti kontrol atas aset digital. AWS Control Tower menawarkan sekelompok kontrol yang dirancang untuk meningkatkan postur tata kelola kedaulatan digital Anda. Pilar postur ini adalah sebagai berikut:

- Residensi data: Kontrol atas lokasi data Anda.

  Untuk informasi selengkapnya, lihat Kontrol yang meningkatkan perlindungan residensi data.
- Akses terperinci: Pembatasan akses yang membatasi semua akses ke data Anda, kecuali akses tersebut diminta oleh Anda, atau oleh mitra yang Anda percayai.

  Untuk informasi selengkapnya, lihat Wilayah menolak kontrol diterapkan pada OU.
- Enkripsi: Fitur dan kontrol yang membantu Anda mengenkripsi data, baik dalam perjalanan, saat istirahat, atau dalam memori.

Misalnya, lihat kontrol CT.APPSYNC.PR.5: Memerlukan cache AWS AppSync GraphQL API agar enkripsi diaktifkan saat istirahat.

- Ketahanan: Kemampuan untuk mempertahankan operasi melalui gangguan atau pemutusan, yang penting dalam kasus peristiwa seperti gangguan rantai pasokan, gangguan jaringan, dan bencana alam.

  Misalnya, lihat kontrol CT.NETWORK-FIREWALL.PR.5: Memerlukan firewall AWS Network Firewall untuk diterapkan di beberapa Availability Zone.

Anda dapat membaca lebih lanjut tentang kedaulatan digital dan AWS di blog: Ikrar Kedaulatan AWS Digital: Kontrol tanpa kompromi.

Kontrol preventif yang membantu kedaulatan digital

Kontrol pencegahan ini dirancang untuk membantu Anda dengan postur tata kelola kedaulatan digital Anda.

Kelompok kontrol ini membantu Anda mematuhi persyaratan peraturan kedaulatan digital karena mereka mencegah tindakan, menegakkan konfigurasi, dan mendeteksi perubahan sumber daya yang memengaruhi residensi data, pembatasan akses terperinci, enkripsi, dan kemampuan ketahanan.

Ini adalah kontrol opsional dengan panduan Pencegahan, diimplementasikan dengan kebijakan kontrol AWS layanan (SCP). Mereka tidak digunakan pada OU apa pun secara default. Anda dapat mengaktifkannya melalui konsol AWS Control Tower, atau melalui AWS Control Tower API

Di konsol AWS Control Tower, Anda dapat melihat kontrol ini bersama-sama di bawah tab Grup di halaman Kategori.

Topik

- CT.APPSYNC.PV.1: Mengharuskan AWS AppSync GraphQL API dikonfigurasi dengan visibilitas pribadi
- CT.EC2.PV.1: Memerlukan snapshot Amazon EBS dibuat dari volume EC2 terenkripsi
- CT.EC2.PV.2: Mengharuskan volume Amazon EBS terlampir dikonfigurasi untuk mengenkripsi data saat istirahat
- CT.EC2.PV.3: Mengharuskan snapshot Amazon EBS tidak dapat dipulihkan secara publik
- CT.EC2.PV.4: Mengharuskan API langsung Amazon EBS tidak dipanggil
- CT.EC2.PV.5: Larang penggunaan impor dan ekspor Amazon EC2 VM

- CT.EC2.PV.6: Larang penggunaan tindakan Amazon EC2 dan API yang tidak digunakan lagi RequestSpotFleet RequestSpotInstances
- CT.KMS.PV.1: Memerlukan kebijakan AWS KMS kunci untuk memiliki pernyataan yang membatasi pembuatan AWS KMS hibah untuk layanan AWS
- CT.KMS.PV.2: Mengharuskan kunci AWS KMS asimetris dengan bahan kunci RSA yang digunakan untuk enkripsi tidak memiliki panjang kunci 2048 bit
- CT.KMS.PV.3: Mengharuskan AWS KMS kunci dikonfigurasi dengan pemeriksaan keamanan penguncian kebijakan bypass diaktifkan
- CT.KMS.PV.4: Mengharuskan kunci yang AWS KMS dikelola pelanggan (CMK) dikonfigurasi dengan materi utama yang berasal dari AWS CloudHSM
- CT.KMS.PV.5: Mengharuskan kunci yang AWS KMS dikelola pelanggan (CMK) dikonfigurasi dengan materi kunci yang diimpor
- CT.KMS.PV.6: Mengharuskan kunci yang AWS KMS dikelola pelanggan (CMK) dikonfigurasi dengan materi kunci yang berasal dari penyimpanan kunci eksternal (XKS)
- CT.LAMBDA.PV.1: Memerlukan URL AWS Lambda fungsi untuk menggunakan otentikasi AWS berbasis IAM
- CT.LAMBDA.PV.2: Memerlukan URL AWS Lambda fungsi untuk dikonfigurasi untuk akses hanya oleh prinsipal di dalam Akun AWS

CT.APPSYNC.PV.1: Mengharuskan AWS AppSync GraphQL API dikonfigurasi dengan visibilitas pribadi

Kontrol ini melarang pembuatan AppSync API AWS publik dengan mengharuskan API dikonfigurasi dengan visibilitas pribadi. Konfigurasi ini memastikan bahwa API hanya dapat diakses dari VPC.

Layanan:AWS AppSync

- Tujuan kontrol: Batasi akses jaringan
- Implementasi: Kebijakan kontrol layanan (SCP)
- Kontrol perilaku: Pencegahan
- Pemilik kontrol: AWS Control Tower
- Grup: Kedaulatan digital

ResourceTypes: `AWS::AppSync::GraphQLApi`

Berikut adalah artefak SCP untuk kontrol ini.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "CTAPPSYNCPV1",
            "Effect": "Deny",
            "Action": "appsync:CreateGraphqlApi",
            "Resource": "*",
            "Condition": {
                "StringNotEquals": {
                    "appsync:Visibility": "PRIVATE"
                }
            }
        }
    ]
}
```

CT.EC2.PV.1: Memerlukan snapshot Amazon EBS dibuat dari volume EC2 terenkripsi

Kontrol ini melarang pembuatan snapshot baru yang didasarkan pada volume EBS yang tidak terenkripsi.

Kontrol ini tidak mencegah pembuatan snapshot EBS yang tidak terenkripsi yang dibuat melalui operasi ". CopySnapshot AWS Control Tower merekomendasikan untuk mengaktifkan enkripsi EBS secara default untuk memastikan bahwa enkripsi diterapkan pada salinan snapshot yang tidak terenkripsi. Untuk informasi selengkapnya, lihat Skenario enkripsi di Panduan Pengguna Amazon EC2 untuk Instans Linux.

Layanan: Amazon EC2

- Tujuan kontrol: Enkripsi data saat istirahat
- Implementasi: Kebijakan kontrol layanan (SCP)
- Kontrol perilaku: Pencegahan
- Pemilik kontrol: AWS Control Tower
- Grup: Kedaulatan digital

ResourceTypes: `AWS::::Account`

Berikut adalah artefak SCP untuk kontrol ini.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "CTEC2PV1",
            "Effect": "Deny",
            "Action": [
                "ec2:CreateSnapshot",
                "ec2:CreateSnapshots"
            ],
            "Resource": "arn:*:ec2:*:*:volume/*",
            "Condition": {
                "Bool": {
                    "ec2:Encrypted": "false"
                }
            }
        }
    ]
}
```

CT.EC2.PV.2: Mengharuskan volume Amazon EBS terlampir dikonfigurasi untuk mengenkripsi data saat istirahat

Kontrol ini melarang melampirkan volume EBS yang tidak terenkripsi ke instans EC2 yang berjalan atau dihentikan.

Kontrol ini tidak mencegah penggantian volume root yang didukung EBS untuk instance yang sedang berjalan dengan volume yang tidak terenkripsi, melalui `CreateReplaceRootVolumeTask` CreateReplaceRootVolumeTask operasi., AWS Control Tower merekomendasikan untuk mengaktifkan enkripsi EBS secara default. Untuk informasi tentang enkripsi EBS secara default, lihat Enkripsi secara default di Panduan Pengguna Amazon EC2 untuk Instans Linux.

Layanan: Amazon EC2

- Tujuan kontrol: Enkripsi data saat istirahat
- Implementasi: Kebijakan kontrol layanan (SCP)
- Kontrol perilaku: Pencegahan
- Pemilik kontrol: AWS Control Tower

- Grup: Kedaulatan digital

Jenis sumber daya: `AWS::EC2::Volume`

Berikut adalah artefak SCP untuk kontrol ini.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "CTEC2PV2",
            "Effect": "Deny",
            "Action": "ec2:AttachVolume",
            "Resource": "arn:*:ec2:*:*:volume/*",
            "Condition": {
                "Bool": {
                    "ec2:Encrypted": "false"
                }
            }
        }
    ]
}
```

CT.EC2.PV.3: Mengharuskan snapshot Amazon EBS tidak dapat dipulihkan secara publik

Kontrol ini melarang berbagi snapshot EBS dengan semua akun. AWS

Kontrol ini mencegah snapshot EBS yang tidak terenkripsi dibuat publik, dengan melarang berbagi snapshot EBS dengan semua. Akun AWS Snapshot dan snapshot terenkripsi dengan kode produk AWS Marketplace tidak dapat dipublikasikan. Untuk mencegah berbagi snapshot secara publik, AWS Control Tower merekomendasikan untuk mengaktifkan blokir akses publik untuk snapshot. Untuk informasi selengkapnya, lihat Memblokir akses publik untuk snapshot di Panduan Pengguna Amazon EC2 untuk Instans Linux.

Layanan: Amazon EC2

- Tujuan kontrol: Menegakkan hak istimewa paling sedikit
- Implementasi: Kebijakan kontrol layanan (SCP)
- Kontrol perilaku: Pencegahan
- Pemilik kontrol: AWS Control Tower

- Grup: Kedaulatan digital

Jenis sumber daya: `AWS::::Account`

Berikut adalah artefak SCP untuk kontrol ini.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "CTEC2PV3",
            "Effect": "Deny",
            "Action": "ec2:ModifySnapshotAttribute",
            "Resource": "arn:*:ec2:*::snapshot/*",
            "Condition": {
                "StringEquals": {
                    "ec2:Add/group": "all"
                }
            }
        }
    ]
}
```

CT.EC2.PV.4: Mengharuskan API langsung Amazon EBS tidak dipanggil

Kontrol ini melarang penggunaan semua API langsung EBS, khususnya termasuk, StartSnapshot, PutSnapshotBlockGetSnapshot, dan. CompleteSnapshot

Jangan aktifkan kontrol ini jika Anda menggunakan API langsung EBS, baik secara langsung maupun melalui produk mitra AWS cadangan.

Layanan: Amazon EBS

- Tujuan kontrol: Menegakkan hak istimewa paling sedikit
- Implementasi: Kebijakan kontrol layanan (SCP)
- Kontrol perilaku: Pencegahan
- Pemilik kontrol: AWS Control Tower
- Grup: Kedaulatan digital

Jenis sumber daya: `AWS::::Account`

Berikut adalah artefak SCP untuk kontrol ini.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "CTEC2PV4",
            "Effect": "Deny",
            "Action": "ebs:*",
            "Resource": "*"
        }
    ]
}
```

CT.EC2.PV.5: Larang penggunaan impor dan ekspor Amazon EC2 VM

Kontrol ini melarang penggunaan API Impor/Ekspor Amazon EC2 VM yang dapat digunakan untuk mengimpor dan mengekspor data instans, snapshot, gambar, dan volume EC2.

Jika Anda perlu menggunakan fungsi Impor/Ekspor VM, jangan aktifkan kontrol ini. Kontrol ini tidak mencegah pembatalan tugas impor, ekspor, atau konversi VM Impor/Ekspor yang ada.

Layanan: Amazon EC2

- Tujuan kontrol: Menerapkan hak istimewa paling sedikit, Lindungi konfigurasi
- Implementasi: Kebijakan kontrol layanan (SCP)
- Kontrol perilaku: Pencegahan
- Pemilik kontrol: AWS Control Tower
- Grup: Kedaulatan digital

Jenis sumber daya: `AWS::::Account`

Berikut adalah artefak SCP untuk kontrol ini.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "CTEC2PV5",
            "Effect": "Deny",
```

```
            "Action": [
                "ec2:CreateInstanceExportTask",
                "ec2:ExportImage",
                "ec2:ImportImage",
                "ec2:ImportSnapshot",
                "ec2:ImportInstance",
                "ec2:ImportVolume"
            ],
            "Resource": "*"
        }
    ]
}
```

CT.EC2.PV.6: Larang penggunaan tindakan Amazon EC2 dan API yang tidak digunakan lagi RequestSpotFleet RequestSpotInstances

Kontrol ini melarang penggunaan Amazon `ec2:RequestSpotFleet` EC2 `ec2:RequestSpotInstances` dan API, karena mereka adalah API lama tanpa investasi yang direncanakan.

Kontrol ini menyangkal `ec2:RequestSpotFleet` dan `ec2:RequestSpotInstances` bertindak untuk semua kepala sekolah IAM. Jika Anda perlu menggunakan tindakan ini, jangan aktifkan kontrol ini. Kontrol ini tidak mencegah pembatalan atau modifikasi armada spot atau permintaan instans spot yang ada.

Layanan: Amazon EC2

- Tujuan kontrol: Menerapkan hak istimewa paling sedikit, Lindungi konfigurasi
- Implementasi: Kebijakan kontrol layanan (SCP)
- Kontrol perilaku: Pencegahan
- Pemilik kontrol: AWS Control Tower
- Grup: Kedaulatan digital

Jenis sumber daya: `AWS::EC2::SpotFleet`

Berikut adalah artefak SCP untuk kontrol ini.

```
{
    "Version": "2012-10-17",
    "Statement": [
```

```
        {
            "Sid": "CTEC2PV6",
            "Effect": "Deny",
            "Action": [
                "ec2:RequestSpotFleet",
                "ec2:RequestSpotInstances"
            ],
            "Resource": "*"
        }
    ]
}
```

CT.KMS.PV.1: Memerlukan kebijakan AWS KMS kunci untuk memiliki pernyataan yang membatasi pembuatan AWS KMS hibah untuk layanan AWS

Kontrol ini mensyaratkan bahwa AWS KMS hibah dikeluarkan hanya untuk Layanan AWS s yang terintegrasi dengan AWS KMS, atau kepada Layanan AWS kepala sekolah.

Kontrol ini melarang pembuatan AWS KMS hibah untuk kunci KMS Anda, ketika permintaan tidak berasal dari Layanan AWS yang terintegrasi dengan AWS KMS, atau dari prinsipal layanan. AWS Jika Anda perlu mengeluarkan AWS KMS hibah langsung ke kepala IAM Anda untuk kunci yang dikelola pelanggan, jangan aktifkan kontrol ini.

Layanan:AWS Key Management Service, (AWS KMS)

- Tujuan kontrol: Menegakkan hak istimewa paling sedikit
- Implementasi: Kebijakan kontrol layanan (SCP)
- Kontrol perilaku: Pencegahan
- Pemilik kontrol: AWS Control Tower
- Grup: Kedaulatan digital

Jenis sumber daya: `AWS::KMS::Key`

Berikut adalah artefak SCP untuk kontrol ini.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "CTKMSPV1",
```

```
            "Effect": "Deny",
            "Action": "kms:CreateGrant",
            "Resource": "*",
            "Condition": {
                "BoolIfExists": {
                    "kms:GrantIsForAWSResource": "false",
                    "aws:PrincipalIsAWSService": "false"
                }
            }
        }
    ]
}
```

CT.KMS.PV.2: Mengharuskan kunci AWS KMS asimetris dengan bahan kunci RSA yang digunakan untuk enkripsi tidak memiliki panjang kunci 2048 bit

Kontrol ini melarang pembuatan kunci KMS yang digunakan untuk enkripsi dan dekripsi yang juga memiliki spesifikasi kunci. `RSA_2048` Ini mengharuskan Anda menggunakan `KeySpec` nilai selain `RSA_2048` saat membuat kunci KMS asimetris yang digunakan untuk enkripsi dan dekripsi.

Layanan:AWS Key Management Service (AWS KMS);

- Tujuan kontrol: Enkripsi data saat istirahat, Enkripsi data dalam perjalanan
- Implementasi: Kebijakan kontrol layanan (SCP)
- Kontrol perilaku: Pencegahan
- Pemilik kontrol: AWS Control Tower
- Grup: Kedaulatan digital

Jenis sumber daya: `AWS::KMS::Key`

Berikut adalah artefak SCP untuk kontrol ini.

```
{

            "Action": "kms:CreateKey",
            "Resource": "*",
```

```
            "Condition": {
                "StringEquals": {
                    "kms:KeyUsage": "ENCRYPT_DECRYPT",
                    "kms:KeySpec": "RSA_2048"
                }
            }
        }
    ]
}
```

CT.KMS.PV.3: Mengharuskan AWS KMS kunci dikonfigurasi dengan pemeriksaan keamanan penguncian kebijakan bypass diaktifkan

Kontrol ini melarang melewati pemeriksaan keamanan penguncian kebijakan kunci KMS saat membuat kunci KMS atau memperbarui kebijakan utamanya, karena melewati pemeriksaan ini meningkatkan risiko bahwa kunci KMS menjadi tidak dapat dikelola.

Layanan:AWS Key Management Service (AWS KMS)

- Tujuan kontrol: Menerapkan hak istimewa paling sedikit, Lindungi konfigurasi
- Implementasi: Kebijakan kontrol layanan (SCP)
- Kontrol perilaku: Pencegahan
- Pemilik kontrol: AWS Control Tower
- Grup: Kedaulatan digital

Jenis sumber daya: `AWS::KMS::Key`

Berikut adalah artefak SCP untuk kontrol ini.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "CTKMSPV3",
            "Effect": "Deny",
            "Action": [
                "kms:CreateKey",
                "kms:PutKeyPolicy"
            ],
            "Resource": "*",
```

```
            "Condition": {
                "Bool": {
                    "kms:BypassPolicyLockoutSafetyCheck": "true"
                }
            }
        }
    ]
}
```

CT.KMS.PV.4: Mengharuskan kunci yang AWS KMS dikelola pelanggan (CMK) dikonfigurasi dengan materi utama yang berasal dari AWS CloudHSM

Kontrol ini melarang pembuatan kunci KMS yang tidak memiliki asal kunci. `AWS_CLOUDHSM`

Kontrol ini membatasi pembuatan kunci KMS untuk kunci yang menggunakan asal material kunci tertentu. Ini cocok saat menerapkan strategi manajemen kunci KMS yang mengharuskan semua kunci KMS ke toko kunci khusus berdasarkan AWS Cloud HSM. Sebelum menerapkan penggunaan kunci eksklusif yang materi utamanya berada di klaster AWS CloudHSM, evaluasi dengan cermat trade-off yang didokumentasikan di bagian penyimpanan kunci AWS CloudHSM dari Panduan Pengembang AWS KMS.

Layanan:AWS Key Management Service, (AWS KMS)

- Tujuan kontrol: Enkripsi data saat istirahat, Enkripsi data dalam perjalanan
- Implementasi: Kebijakan kontrol layanan (SCP)
- Kontrol perilaku: Pencegahan
- Pemilik kontrol: AWS Control Tower
- Grup: Kedaulatan digital

Jenis sumber daya: `AWS::KMS::Key`

Berikut adalah artefak SCP untuk kontrol ini.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "CTKMSPV4",
            "Effect": "Deny",
```

```
            "Action": "kms:CreateKey",
            "Resource": "*",
            "Condition": {
                "StringNotEquals": {
                    "kms:KeyOrigin": "AWS_CLOUDHSM"
                }
            }
        }
    ]
}
```

CT.KMS.PV.5: Mengharuskan kunci yang AWS KMS dikelola pelanggan (CMK) dikonfigurasi dengan materi kunci yang diimpor

Kontrol ini melarang pembuatan kunci KMS yang tidak memiliki asal kunci. `EXTERNAL`

Kontrol ini membatasi pembuatan kunci KMS untuk kunci yang menggunakan asal material kunci tertentu. Sangat cocok ketika menegakkan strategi manajemen kunci KMS yang mengharuskan semua kunci KMS untuk menggunakan bahan kunci impor. Sebelum menerapkan penggunaan kunci eksklusif dengan materi kunci impor, evaluasi dengan cermat trade-off yang didokumentasikan di bagian Importing key material untuk AWS KMS keys dari AWS KMS Developer Guide.”

Layanan:AWS Key Management Service, (AWS KMS)

- Tujuan kontrol: Enkripsi data saat istirahat, Enkripsi data dalam perjalanan
- Implementasi: Kebijakan kontrol layanan (SCP)
- Kontrol perilaku: Pencegahan
- Pemilik kontrol: AWS Control Tower
- Grup: Kedaulatan digital

Jenis sumber daya: `AWS::KMS::Key`

Berikut adalah artefak SCP untuk kontrol ini.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "CTKMSPV5",
            "Effect": "Deny",
```

```
            "Action": "kms:CreateKey",
            "Resource": "*",
            "Condition": {
                "StringNotEquals": {
                    "kms:KeyOrigin": "EXTERNAL"
                }
            }
        }
    ]
}}
```

CT.KMS.PV.6: Mengharuskan kunci yang AWS KMS dikelola pelanggan (CMK) dikonfigurasi dengan materi kunci yang berasal dari penyimpanan kunci eksternal (XKS)

Kontrol ini melarang pembuatan kunci KMS yang tidak memiliki asal kunci. `EXTERNAL_KEY_STORE`

Kontrol ini membatasi pembuatan kunci KMS untuk kunci yang menggunakan asal material kunci tertentu. Sangat cocok ketika menegakkan strategi manajemen kunci KMS yang mengharuskan semua kunci KMS ke toko kunci eksternal, toko kunci khusus. Sebelum menerapkan penggunaan eksklusif kunci yang materi utamanya berada di penyimpanan kunci eksternal, evaluasi dengan cermat trade-off yang didokumentasikan di bagian penyimpanan kunci Eksternal dari Panduan Pengembang AWS KMS.

Layanan:AWS Key Management Service, (AWS KMS)

            "Condition": {
                "StringNotEquals": {
                    "kms:KeyOrigin": "EXTERNAL_KEY_STORE"
                }
            }
        }
    ]
}
```

CT.LAMBDA.PV.1: Memerlukan URL AWS Lambda fungsi untuk menggunakan otentikasi AWS berbasis IAM

Kontrol ini melarang pembuatan dan pembaruan konfigurasi URL fungsi Lambda, itu tidak mencegah penghapusan konfigurasi URL fungsi Lambda.

Layanan:AWS Lambda

- Tujuan kontrol: Menegakkan hak istimewa paling sedikit
- Implementasi: Kebijakan kontrol layanan (SCP)
- Kontrol perilaku: Pencegahan
- Pemilik kontrol: AWS Control Tower
- Grup: Kedaulatan digital

ResourceTypes: `AWS::Lambda::Url`

Berikut adalah artefak SCP untuk kontrol ini.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "CTLAMBDAPV1",
            "Effect": "Deny",
            "Action": [
                "lambda:CreateFunctionUrlConfig",
                "lambda:UpdateFunctionUrlConfig"
            ],
```

```
            "Resource": "arn:*:lambda:*:*:function:*",
            "Condition": {
                "StringNotEquals": {
                    "lambda:FunctionUrlAuthType": "AWS_IAM"
                }
            }
        }
    ]
}
```

CT.LAMBDA.PV.2: Memerlukan URL AWS Lambda fungsi untuk dikonfigurasi untuk akses hanya oleh prinsipal di dalam Akun AWS

Kontrol ini memerlukan kebijakan berbasis sumber daya AWS Lambda fungsi untuk hanya memberikan akses ke prinsipal IAM yang berada di Anda. Akun AWS

Kontrol ini membatasi akses lintas akun ke fungsi Lambda dengan membatasi prinsip IAM yang diizinkan dalam kebijakan sumber daya fungsi Lambda ke yang ada di akun yang sama dengan fungsi Lambda.

Layanan:AWS Lambda

- Tujuan kontrol: Menegakkan hak istimewa paling sedikit
- Implementasi: Kebijakan kontrol layanan (SCP)
- Kontrol perilaku: Pencegahan
- Pemilik kontrol: AWS Control Tower
- Grup: Kedaulatan digital

ResourceTypes: `AWS::Lambda::Url`

Berikut adalah artefak SCP untuk kontrol ini.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {

                        "arn:aws:iam::${aws:PrincipalAccount}:*",
                        "${aws:PrincipalAccount}"
                    ]
                },
                "ArnNotLike": {
                    "aws:PrincipalArn": "arn:aws:iam::*:role/AWSControlTowerExecution"
                }
            }
        }
    ]
}
```

Kontrol yang meningkatkan perlindungan residensi data

Kontrol pilihan ini melengkapi postur residensi data perusahaan Anda. Dengan menerapkan kontrol ini bersama-sama, Anda dapat mengatur lingkungan multi-akun untuk membantu mendeteksi dan menghambat pembuatan, pembagian, atau penyalinan data yang disengaja atau tidak disengaja, di luar Wilayah atau Wilayah yang Anda pilih. AWS

Kontrol ini berlaku pada tingkat OU, dan berlaku untuk semua akun anggota dalam OU.

> **Important**
>
> AWS Layanan global tertentu, seperti AWS Identity and Access Management (IAM) dan AWS Organizations, dibebaskan dari kontrol ini. Anda dapat mengidentifikasi layanan yang dikecualikan dengan meninjau Wilayah menolak SCP, yang ditunjukkan dalam kode contoh. Layanan dengan “*” setelah pengenal mereka dikecualikan, karena semua tindakan diizinkan ketika notasi “*” diberikan. SCP ini pada dasarnya berisi daftar tindakan yang diizinkan secara eksplisit, dan semua tindakan lainnya ditolak. Anda tidak dapat menolak akses ke Wilayah asal Anda.

Video: Aktifkan kontrol residensi data

Video ini (5:58) menjelaskan cara mengaktifkan kontrol residensi data dengan kontrol AWS Control Tower. Untuk tampilan yang lebih baik, pilih ikon di sudut kanan bawah video untuk memperbesarnya ke layar penuh. Captioning tersedia.

> **Note**
>
> AWS Control Tower tidak lagi mendukung pencarian daftar kontrol berdasarkan Kategori, seperti yang ditunjukkan dalam video ini. Untuk mengidentifikasi kontrol Residensi Data dengan mudah, kami sarankan Anda mengurutkan daftar kontrol berdasarkan Tanggal Rilis. Kontrol dengan tanggal rilis 30 November 2021 adalah kontrol yang sama dalam kategori Residensi Data yang ditampilkan dalam video.
> Video ini mencakup istilah pagar pembatas, AWS Control Tower istilah lama yang digunakan untuk kontrol. Kami memperbarui istilah untuk lebih selaras dengan penggunaan industri dan AWS layanan lainnya. Istilah-istilah ini identik untuk tujuan kami.

Panduan Video untuk Mengaktifkan Kontrol Residensi Data di AWS Control Tower.

Topik

- Larang akses internet untuk instans VPC Amazon yang dikelola oleh pelanggan
- Larang koneksi Jaringan Pribadi Virtual Amazon (VPN)
- Larang jaringan lintas wilayah untuk Amazon EC2, CloudFront Amazon AWS , dan Akselerator Global
- Mendeteksi apakah alamat IP publik untuk penskalaan otomatis Amazon EC2 diaktifkan melalui konfigurasi peluncuran
- Mendeteksi apakah instance replikasi untuk AWS Database Migration Service bersifat publik
- Mendeteksi apakah snapshot Amazon EBS dapat dipulihkan oleh semua akun AWS
- Mendeteksi apakah instans Amazon EC2 memiliki alamat IPv4 publik terkait
- Mendeteksi apakah setelan Amazon S3 untuk memblokir akses publik ditetapkan sebagai true untuk akun
- Mendeteksi apakah titik akhir Amazon EKS diblokir dari akses publik
- Mendeteksi apakah domain OpenSearch Layanan Amazon ada di Amazon VPC
- Mendeteksi apakah ada node master cluster EMR Amazon yang memiliki alamat IP publik
- Mendeteksi apakah kebijakan fungsi AWS Lambda yang dilampirkan pada sumber daya Lambda memblokir akses publik
- Mendeteksi apakah ada rute publik di tabel rute untuk Internet Gateway (IGW)
- Mendeteksi apakah klaster Amazon Redshift diblokir dari akses publik
- Mendeteksi apakah instans SageMaker notebook Amazon memungkinkan akses internet langsung

- Mendeteksi apakah ada subnet VPC Amazon yang diberi alamat IP publik
- Mendeteksi apakah dokumen AWS Systems Manager yang dimiliki oleh akun bersifat publik

Larang akses internet untuk instans VPC Amazon yang dikelola oleh pelanggan

Kontrol ini melarang akses internet untuk instans Amazon Virtual Private Cloud (VPC) yang dikelola oleh pelanggan, bukan oleh layanan. AWS

> **Important**
>
> Jika Anda menyediakan akun Account Factory dengan pengaturan akses internet VPC diaktifkan, setelan Account Factory akan menggantikan kontrol ini. Untuk menghindari mengaktifkan akses internet untuk akun yang baru disediakan, Anda harus mengubah pengaturan di Account Factory. Untuk informasi selengkapnya, lihat Panduan: Konfigurasikan AWS Control Tower Tanpa VPC.

- Kontrol ini tidak berlaku untuk VPC yang dikelola oleh AWS layanan.
- VPC yang ada yang memiliki akses internet mempertahankan akses internet mereka. Ini hanya berlaku untuk instance baru. Setelah kontrol ini diterapkan, akses tidak dapat diubah.

Ini adalah kontrol preventif dengan panduan elektif. Secara default, kontrol ini tidak diaktifkan pada OU mana pun.

Artefak untuk kontrol ini adalah kebijakan kontrol layanan (SCP) berikut.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "GRDISALLOWVPCINTERNETACCESS",
      "Effect": "Deny",
      "Action": [
        "ec2:CreateInternetGateway",
        "ec2:AttachInternetGateway",
        "ec2:CreateEgressOnlyInternetGateway",
        "ec2:AttachEgressOnlyInternetGateway",
        "ec2:CreateDefaultVpc",
        "ec2:CreateDefaultSubnet",
```

```
        "ec2:CreateCarrierGateway"
      ],
      "Resource": [
        "*"
      ],
      "Condition": {
        "ArnNotLike": {
          "aws:PrincipalArn": [
            "arn:aws:iam::*:role/AWSControlTowerExecution"
          ]
        }
      }
    }
  ]
}
```

Larang koneksi Jaringan Pribadi Virtual Amazon (VPN)

Kontrol ini mencegah koneksi Virtual Private Network (VPN) (Site-to-Site VPN dan Client VPN) ke Amazon Virtual Private Cloud (VPC).

> **Note**
>
> VPC yang ada yang memiliki akses internet mempertahankan akses internet mereka.

Ini adalah kontrol preventif dengan panduan elektif. Secara default, kontrol ini tidak diaktifkan pada OU mana pun.

Artefak untuk kontrol ini adalah kebijakan kontrol layanan (SCP) berikut.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "GRDISALLOWVPNCONNECTIONS",
      "Effect": "Deny",
      "Action": [
        "ec2:CreateVPNGateway",
        "ec2:AttachVPNGateway",
        "ec2:CreateCustomerGateway",
        "ec2:CreateVpnConnection",
```

```
        "ec2:ModifyVpnConnection",
        "ec2:CreateClientVpnEndpoint",
        "ec2:ModifyClientVpnEndpoint",
        "ec2:AssociateClientVpnTargetNetwork",
        "ec2:AuthorizeClientVpnIngress"
      ],
      "Resource": [
        "*"
      ]
    }
  ]
}
```

Larang jaringan lintas wilayah untuk Amazon EC2, CloudFront Amazon AWS , dan Akselerator Global

Kontrol ini mencegah konfigurasi koneksi jaringan lintas wilayah dari Amazon EC2, CloudFront Amazon AWS , dan layanan Global Accelerator. Ini mencegah pengintip VPC dan mengintip gateway transit.

> **Note**
>
> Kontrol ini mencegah peering VPC Amazon EC2 dan gateway transit Amazon EC2 mengintip dalam satu Wilayah, serta lintas Wilayah. Untuk alasan ini, kontrol ini dapat memengaruhi beban kerja tertentu selain postur residensi data Anda.

Ini adalah kontrol preventif dengan panduan elektif. Secara default, kontrol ini tidak diaktifkan pada OU mana pun.

Artefak untuk kontrol ini adalah kebijakan kontrol layanan (SCP) berikut.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "GRDISALLOWCROSSREGIONNETWORKING",
      "Effect": "Deny",
      "Action": [
        "ec2:CreateVpcPeeringConnection",
        "ec2:AcceptVpcPeeringConnection",
        "ec2:CreateTransitGatewayPeeringAttachment",
```

```
        "ec2:AcceptTransitGatewayPeeringAttachment",
        "cloudfront:CreateDistribution",
        "cloudfront:UpdateDistribution",
        "globalaccelerator:Create*",
        "globalaccelerator:Update*"
      ],
      "Resource": [
        "*"
      ]
    }
  ]
}
```

Mendeteksi apakah alamat IP publik untuk penskalaan otomatis Amazon EC2 diaktifkan melalui konfigurasi peluncuran

Kontrol ini mendeteksi apakah grup Auto Scaling Amazon EC2 mengaktifkan alamat IP publik melalui konfigurasi peluncuran.

Ini adalah kontrol detektif dengan panduan elektif. Secara default, kontrol ini tidak diaktifkan pada OU mana pun.

Di konsol:

- Aturan menunjukkan status Non-compliant jika konfigurasi peluncuran untuk grup penskalaan otomatis menetapkan nilai bidang yang ditetapkan sebagai True. **`AssociatePublicIpAddress`**

Artefak untuk kontrol ini adalah AWS Config aturan berikut.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rule to detect whether public IP addresses for Amazon
 EC2 Auto Scaling are enabled through launch configurations

Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'

Resources:
  AutoscalingLaunchConfigPublicIpDisabled:
    Type: AWS::Config::ConfigRule
    Properties:
```

```
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Detects whether Amazon EC2 Auto Scaling groups have public IP
 addresses enabled through launch configurations. This rule is NON_COMPLIANT if
 the launch configuration for an Auto Scaling group has the value of the field
 AssociatePublicIpAddress set as True.
      Scope:
        ComplianceResourceTypes:
          - AWS::AutoScaling::LaunchConfiguration
      Source:
        Owner: AWS
        SourceIdentifier: AUTOSCALING_LAUNCH_CONFIG_PUBLIC_IP_DISABLED
```

Mendeteksi apakah instance replikasi untuk AWS Database Migration Service bersifat publik

Kontrol ini mendeteksi apakah instance replikasi AWS Database Migration Service bersifat publik.

Ini adalah kontrol detektif dengan panduan elektif. Secara default, kontrol ini tidak diaktifkan pada OU mana pun.

Di konsol:

- Aturan menunjukkan status Non-compliant jika nilai **`PubliclyAccessible`** bidang ditetapkan sebagai True.

Artefak untuk kontrol ini adalah AWS Config aturan berikut.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rule to detect whether replication instances for AWS
 Database Migration Service are public

Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'

  MaximumExecutionFrequency:
    Type: String
    Default: 24hours
    Description: The frequency at which AWS Config will run evaluations for the rule.
    AllowedValues:
      - 1hour
      - 3hours
```

```
      - 6hours
      - 12hours
      - 24hours

Mappings:
  Settings:
    FrequencyMap:
      1hour   : One_Hour
      3hours  : Three_Hours
      6hours  : Six_Hours
      12hours : Twelve_Hours
      24hours : TwentyFour_Hours

Resources:
  DmsReplicationNotPublic:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Detects whether AWS Database Migration Service replication instances
 are public. The rule is NON_COMPLIANT if the value of the PubliclyAccessible field is
 set as True.
      Source:
        Owner: AWS
        SourceIdentifier: DMS_REPLICATION_NOT_PUBLIC
      MaximumExecutionFrequency:
        !FindInMap
        - Settings
        - FrequencyMap
        - !Ref MaximumExecutionFrequency
```

Mendeteksi apakah snapshot Amazon EBS dapat dipulihkan oleh semua akun AWS

Kontrol ini mendeteksi apakah semua AWS akun memiliki akses untuk memulihkan snapshot Amazon EBS.

Ini adalah kontrol detektif dengan panduan elektif. Secara default, kontrol ini tidak diaktifkan pada OU mana pun.

Di konsol:

- Aturan menunjukkan status Non-compliant jika ada snapshot yang memiliki **`RestorableByUserIds`** bidang yang disetel ke nilai Semua. Dalam hal ini, snapshot Amazon EBS bersifat publik.

Artefak untuk kontrol ini adalah AWS Config aturan berikut.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rule to detect whether Amazon EBS snapshots are
 restorable by all AWS accounts

Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'

  MaximumExecutionFrequency:
    Type: String
    Default: 24hours
    Description: The frequency at which AWS Config will run evaluations for the rule.
    AllowedValues:
      - 1hour
      - 3hours
      - 6hours
      - 12hours
      - 24hours

Mappings:
  Settings:
    FrequencyMap:
      1hour   : One_Hour
      3hours  : Three_Hours
      6hours  : Six_Hours
      12hours : Twelve_Hours
      24hours : TwentyFour_Hours

Resources:
  EbsSnapshotPublicRestorableCheck:
    Type: AWS::Config::ConfigRule

    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Detects whether all AWS accounts have access to restore Amazon EBS
 snapshots. The rule is NON_COMPLIANT if any snapshots have the RestorableByUserIds
 field set to the value All. In that case, the Amazon EBS snapshots are public.
      Source:
        Owner: AWS
        SourceIdentifier: EBS_SNAPSHOT_PUBLIC_RESTORABLE_CHECK
      MaximumExecutionFrequency:
```

```
        !FindInMap
        - Settings
        - FrequencyMap
        - !Ref MaximumExecutionFrequency
```

Mendeteksi apakah instans Amazon EC2 memiliki alamat IPv4 publik terkait

Kontrol ini mendeteksi apakah instans Amazon Elastic Compute Cloud (Amazon EC2) memiliki alamat IPv4 publik terkait. Kontrol ini hanya berlaku untuk alamat IPv4.

Ini adalah kontrol detektif dengan panduan elektif. Secara default, kontrol ini tidak diaktifkan pada OU mana pun.

Di konsol:

- Aturan menunjukkan status Non-compliant jika bidang IP publik ada di item konfigurasi instans Amazon EC2.

Artefak untuk kontrol ini adalah AWS Config aturan berikut.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rule to detect whether any Amazon EC2 instance has an
 associated public IPv4 address

Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'

Resources:
  Ec2InstanceNoPublicIp:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Detects whether an Amazon Elastic Compute Cloud (Amazon EC2)
 instance has an associated public IPv4 address. The rule is NON_COMPLIANT if the
 public IP field is present in the Amazon EC2 instance configuration item.
      Scope:
        ComplianceResourceTypes:
        - AWS::EC2::Instance
      Source:
        Owner: AWS
```

```
        SourceIdentifier: EC2_INSTANCE_NO_PUBLIC_IP
```

Mendeteksi apakah setelan Amazon S3 untuk memblokir akses publik ditetapkan sebagai true untuk akun

Kontrol ini secara berkala mendeteksi apakah pengaturan Amazon S3 yang diperlukan untuk memblokir akses publik dikonfigurasi sebagai true untuk akun, bukan untuk bucket atau titik akses.

Di konsol:

- Aturan menunjukkan status Non-compliant jika setidaknya salah satu pengaturan salah.

Ini adalah kontrol detektif dengan panduan elektif. Secara default, kontrol ini tidak diaktifkan pada OU mana pun.

Artefak untuk kontrol ini adalah AWS Config aturan berikut.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rule to check whether Amazon S3 settings to block
 public access are set as true for the account.

Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
  PublicAccessBlockSetting:
    Type: 'String'
    Default: 'True'
  MaximumExecutionFrequency:
    Type: String
    Default: 24hours
    Description: The frequency at which AWS Config will run evaluations for the rule.
    AllowedValues:
      - 1hour
      - 3hours
      - 6hours
      - 12hours
      - 24hours

Mappings:
  Settings:
    FrequencyMap:
```

```
      1hour   : One_Hour
      3hours  : Three_Hours
      6hours  : Six_Hours
      12hours : Twelve_Hours
      24hours : TwentyFour_Hours

Resources:
  CheckForS3PublicAccessBlock:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Checks the Amazon S3 settings to block public access are set as true
 for the account. The rule is non-compliant if at-least one of the settings is false.
      Source:

Mendeteksi apakah titik akhir Amazon EKS diblokir dari akses publik

Kontrol ini mendeteksi apakah titik akhir Amazon Elastic Kubernetes Service (Amazon EKS) diblokir dari akses publik.

Ini adalah kontrol detektif dengan panduan elektif. Secara default, kontrol ini tidak diaktifkan pada OU mana pun.

Di konsol:

- Aturan menunjukkan status Non-compliant jika titik akhir dapat diakses publik.

Artefak untuk kontrol ini adalah AWS Config aturan berikut.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rule to detect whether an Amazon EKS endpoint is
 blocked from public access

Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'

  MaximumExecutionFrequency:
    Type: String
    Default: 24hours
    Description: The frequency at which AWS Config will run evaluations for the rule.
    AllowedValues:
      - 1hour
      - 3hours
      - 6hours
      - 12hours
      - 24hours

Mappings:
  Settings:
    FrequencyMap:
      1hour   : One_Hour
      3hours  : Three_Hours
      6hours  : Six_Hours
      12hours : Twelve_Hours
      24hours : TwentyFour_Hours

Tolak akses AWS berdasarkan AWS Wilayah yang diminta

Kontrol ini sering disebut sebagai Region deny control, atau landing zone Region deny control.

Kontrol ini melarang akses ke operasi yang tidak terdaftar di layanan global dan regional di luar Wilayah yang ditentukan. Itu mencakup semua Wilayah di mana AWS Control Tower tidak tersedia, serta semua Wilayah yang tidak dipilih untuk tata kelola di halaman pengaturan zona pendaratan. Tindakan diperbolehkan seperti biasa di Wilayah dengan status yang Diatur.

> **Note**
>
> AWS Layanan global tertentu, seperti AWS Identity and Access Management (IAM) dan AWS Organizations, dibebaskan dari kontrol residensi data. Layanan tersebut ditentukan dalam kode contoh SCP yang berikut.

Ini adalah kontrol elektif dengan panduan pencegahan. Ini adalah kontrol utama yang terkait dengan tindakan penolakan Wilayah. Untuk informasi selengkapnya, lihat Konfigurasikan wilayah tolak kontrol.

Format untuk kontrol ini didasarkan pada SCP berikut.

```

                "ArnNotLike": {
                    "aws:PrincipalARN": [
                        "arn:aws:iam::*:role/AWSControlTowerExecution"
                    ]
                }
            }
        }
    ]
}
```

Berdasarkan contoh format SCP ini, AWS Control Tower menambahkan Wilayah yang diatur ke dalam pernyataan. `aws:RequestedRegion` Anda tidak dapat mengecualikan Wilayah asal Anda. Tindakan yang tidak tercantum dalam SCP tidak diizinkan.

> **Batasan**
>
> Kontrol penolakan Wilayah OU tunduk pada batasan kunci kondisi `aws:RequestedRegion`global dan Kebijakan Kontrol Layanan (SCP) secara umum.

Wilayah menolak kontrol diterapkan pada OU

Kontrol ini biasanya disebut sebagai kontrol penolakan Wilayah OU, atau kontrol penolakan Wilayah yang dapat dikonfigurasi.

Kontrol ini melarang akses ke operasi yang tidak terdaftar di wilayah global dan regional Layanan AWS, di luar Wilayah yang ditentukan untuk unit organisasi (OU).

Jika Anda menerapkan kontrol ini, konfigurasi untuk OU dapat bertentangan dengan versi landing zone dari kontrol ini. Untuk informasi selengkapnya, lihat “Evaluasi kebijakan kontrol SCP” diWilayah menolak kontrol diterapkan pada OU.

CT.MULTISERVICE.PV.1: Tolak akses AWS berdasarkan permintaan Wilayah AWS untuk unit organisasi

Layanan: Beberapa AWS layanan

- Tujuan kontrol: Lindungi konfigurasi
- Implementasi: Kebijakan kontrol layanan (SCP)
- Kontrol perilaku: Pencegahan
- Pemilik kontrol: AWS Control Tower
- Grup: Kedaulatan digital

> **Batasan**
>
> Kontrol penolakan Wilayah OU tunduk pada batasan kunci kondisi `aws:RequestedRegion`global dan Kebijakan Kontrol Layanan (SCP) secara umum.

Aktifkan kontrol ini dari konsol

Di konsol AWS Control Tower, Anda dapat melihat OU tempat kontrol ini diaktifkan, jika ada, dengan menavigasi ke halaman Detail kontrol untuk kontrol ini.

Untuk mengaktifkan kontrol ini dari halaman Detail kontrol

1. Pilih Aktifkan kontrol di kanan atas
2. Pilih target OU, lalu pilih Berikutnya untuk melanjutkan.
3. Pilih Wilayah yang ingin Anda aktifkan. Anda harus memilih setidaknya satu Wilayah.
4. Anda dapat menambahkan NotActionelemen, prinsip IAM, dan tag.
5. Anda akan dapat melihat ringkasan nilai yang Anda pilih sebelum mengaktifkan kontrol.
6. Pilih Aktifkan kontrol di kanan bawah.

CT.MULTISERVICE.PV.1: Tolak akses AWS berdasarkan permintaan Wilayah AWS untuk unit organisasi

Wilayah OU menolak kontrol, CT.MULTISERVICE.PV.1, dapat dikonfigurasi. Anda dapat memilih OU tertentu yang berlaku, daripada menerapkannya ke seluruh landing zone AWS Control Tower Anda. Kontrol ini menerima satu atau lebih parameter, seperti, ExemptedPrincipalARN AllowedRegions, dan ExemptedActions, yang menggambarkan operasi yang diizinkan untuk akun yang merupakan bagian dari OU ini.

- AllowedRegions: Menentukan Wilayah yang dipilih, di mana OU diizinkan untuk beroperasi. Parameter ini wajib.
- ExemptedPrincipalARN: Menentukan prinsip-prinsip IAM yang dibebaskan dari kontrol ini, sehingga mereka diizinkan untuk mengoperasikan layanan tertentu secara global. AWS
- ExemptedActions: Menentukan tindakan yang dikecualikan dari kontrol ini, sehingga tindakan diperbolehkan.

Interaksi antara Wilayah terpisah menolak kontrol untuk landing zone dan OU bisa rumit untuk diprediksi. Mereka dapat diprediksi dengan logika di mana SCP dievaluasi oleh. AWS

Evaluasi kebijakan kontrol SCP

Proses evaluasi kebijakan melibatkan pemeriksaan semua kebijakan yang berlaku, mulai dari yang paling permisif dan secara bertahap bergerak menuju yang paling ketat. SCP apa pun yang diterapkan pada tingkat Root akan memengaruhi semua akun dan OU, kecuali jika diganti dengan kebijakan yang lebih spesifik.

Logika Evaluasi: Saat permintaan dibuat untuk melakukan tindakan (misalnya, meluncurkan instans Amazon EC2), AWS evaluasi kebijakan untuk menentukan apakah tindakan tersebut diizinkan atau ditolak. Logika evaluasi mengikuti aturan-aturan ini:

- Penolakan Eksplisit Mengesampingkan Semua: Jika ada kebijakan yang secara eksplisit menolak tindakan yang diminta, penolakan itu lebih diutamakan daripada semua kebijakan lainnya.
- Explicit Allow Overrides Implicit Deny: Jika kebijakan secara eksplisit mengizinkan tindakan dan tidak ada kebijakan tingkat tinggi yang secara eksplisit menyangkalnya, tindakan tersebut diizinkan.
- Inherited Allow and No Explicit Deny: Jika tidak ada izin atau penolakan eksplisit pada tingkat yang diminta, AWS lihat kebijakan tingkat yang lebih tinggi. Jika ada izin yang diwariskan dan tidak ada penolakan eksplisit, tindakan tersebut diperbolehkan.

- Penolakan Eksplisit di Tingkat yang Lebih Tinggi: Jika ada penolakan eksplisit dalam kebijakan tingkat yang lebih tinggi, tetapi tidak ada izin atau penolakan eksplisit pada tingkat yang diminta, tindakan tersebut ditolak.

Untuk informasi lebih lanjut tentang logika evaluasi, lihat evaluasi SCP dalam AWS Organizations dokumentasi.

> **Note**
>
> Dengan kontrol ini, Anda dapat mengizinkan apa pun Wilayah AWS di tingkat OU, bahkan jika landing zone Anda tidak mengatur Wilayah itu, dengan desain. Kami menyarankan agar Anda berhati-hati saat mengizinkan Wilayah yang tidak diatur oleh zona landing zone AWS Control Tower Anda.

Contoh CLI

Contoh ini menunjukkan cara mengaktifkan kontrol ini, dengan parameter, dari CLI.

```
aws controltower enable-control \
    --target-identifier arn:aws:organizations::01234567890:ou/o-EXAMPLE/ou-zzxx-
zzx0zzz2 \
    --control-identifier arn:aws:controltower:us-east-1::control/EXAMPLE_NAME \
    --parameters '[{"key":"AllowedRegions","value":["us-east-1","us-
west-2"]},{"key":"ExemptedPrincipalArns","value":["arn:aws:iam::*:role/
ReadOnly","arn:aws:sts::*:assumed-role/ReadOnly/*"]},{"key":"ExemptedActions","value":
["logs:DescribeLogGroups","logs:StartQuery","logs:GetQueryResults"]}]'
```

Memvalidasi parameter

Saat Anda memasukkan parameter ke dalam kontrol penolakan Wilayah OU, AWS Control Tower memvalidasi sintaks parameter dan memeriksanya terhadap tipe data JSON. AWS Control Tower tidak membuat validasi semantik untuk kebenaran khusus domain. Ini adalah pendekatan yang sama yang diikuti oleh AWS Organizations.

Parameter untuk kontrol ini dimasukkan melalui skema JSON.

Berikut adalah template SCP dari contoh skema JSON untuk kontrol penolakan Wilayah OU-level. Di konsol AWS Control Tower, Anda dapat melihatnya di tab Artefacts pada halaman Detail kontrol.

Skema contoh singkat ini menunjukkan bahwa AllowedRegions, ExemptedActionsdan ExemptedPrincipalArnsparameter menerima daftar string. Selain itu, Anda dapat menambahkan deskripsi ke skema, atau membatasi nilai yang diizinkan menjadi subset dari nilai yang telah ditentukan sebelumnya, menggunakan tipe enumerasi (). `enums`

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "CTMULTISERVICEPV1",
            "Effect": "Deny",
            "NotAction": [
                {{ExemptedActions}}
                ...
                "s3:CreateMultiRegionAccessPoint",
                "s3:DeleteMultiRegionAccessPoint",
                "s3:DescribeMultiRegionAccessPointOperation",
                "s3:GetAccountPublicAccessBlock",
                "s3:GetBucketLocation"
                ...
            ],
            "Resource": "*",
            "Condition": {
                "StringNotEquals": {
                    "aws:RequestedRegion": {{AllowedRegions}}
                },
                "ArnNotLike": {
                    "aws:PrincipalARN": [
                        "arn:aws:iam::*:role/AWSControlTowerExecution",
                        {{ExemptedPrincipalARNs}}
                    ]
                }
            }
        }
    ]
}
```

Contoh berikut menunjukkan artefak SCP penuh untuk kontrol. Ini menunjukkan tindakan dan prinsip yang dikecualikan secara default ketika Anda menerapkan kontrol ini ke OU. Ingat itu AllowedRegionsadalah parameter wajib untuk kontrol ini. Anda dapat melihat versi terbaru SCP ini di konsol AWS Control Tower.

            }
        }
    ]
}
```

Kontrol opsional

Kontrol opsional di AWS Control Tower diterapkan pada level OU. Anda dapat mengaktifkan dan menonaktifkan kontrol opsional ini melalui konsol AWS Control Tower, atau melalui API kontrol.

AWS Control Tower menawarkan beberapa jenis kontrol opsional:

- Kontrol proaktif, yang didasarkan pada AWS CloudFormation kait.
- Kontrol Security Hub, yang didasarkan pada AWS Config aturan — kontrol ini dimiliki oleh Security Hub dan terintegrasi dengan AWS Control Tower, melalui Standar yang Dikelola Layanan: AWS Control Tower.

- Kontrol kedaulatan digital, yang merupakan kontrol elektif berdasarkan SCP dan AWS Config aturan, diterapkan dalam AWS Control Tower. Grup ini mencakup kontrol residensi data.
- Kontrol yang sangat disarankan, yang didasarkan pada SCP dan AWS Config aturan, diterapkan dalam AWS Control Tower.
- Kontrol elektif, yang didasarkan pada SCP dan AWS Config aturan, diterapkan dalam AWS Control Tower.

Kontrol yang sangat direkomendasikan dan elektif yang dimiliki oleh AWS Control Tower bersifat opsional, yang berarti Anda dapat menyesuaikan tingkat penegakan hukum untuk OU di landing zone Anda dengan memilih mana yang akan diaktifkan. Kontrol opsional tidak diaktifkan secara default. Untuk informasi selengkapnya tentang kontrol opsional, lihat halaman referensi kontrol berikut di bagian berikutnya.

> **Note**
>
> Penting untuk diketahui bahwa beberapa kontrol detektif di AWS Control Tower tidak beroperasi di Wilayah AWS tempat tertentu di mana AWS Control Tower tersedia, karena Wilayah tersebut tidak mendukung fungsionalitas dasar yang diperlukan. Akibatnya, saat Anda menerapkan kontrol detektif, kontrol mungkin tidak beroperasi di semua Wilayah yang Anda atur dengan AWS Control Tower. Untuk detailnya, lihat Keterbatasan kontrol.
> Anda dapat melihat Wilayah untuk setiap kontrol di konsol AWS Control Tower.
> Untuk informasi selengkapnya tentang kontrol detektif yang tidak dapat digunakan di Wilayah tertentu, lihat dokumentasi daftar layanan Regional untuk mempelajari lebih lanjut tentang Wilayah yang tersedia AWS Config . Jika kontrol detektif diimplementasikan sebagai AWS Config aturan terkelola, lihat dokumentasi referensi Security Hub mengontrol.

Kontrol yang sangat disarankan

Kontrol yang sangat disarankan dimiliki oleh AWS Control Tower. Mereka didasarkan pada praktik terbaik untuk lingkungan multi-akun yang dirancang dengan baik. Kontrol ini tidak diaktifkan secara default, dan kontrol tersebut dapat dinonaktifkan melalui konsol AWS Control Tower atau API kontrol. Setelah itu, Anda akan menemukan referensi untuk setiap kontrol yang sangat disarankan yang tersedia di AWS Control Tower.

Topik

- Larang Tindakan sebagai Pengguna Root
- Mendeteksi Apakah Enkripsi Diaktifkan untuk Volume Amazon EBS Terlampir ke Instans Amazon EC2
- Deteksi Apakah Lalu Lintas TCP Masuk yang Tidak Dibatasi Diizinkan
- Deteksi Apakah Koneksi Internet Tanpa Batas Melalui SSH Diizinkan
- Mendeteksi Apakah MFA untuk Pengguna Root Diaktifkan
- Deteksi Apakah Akses Baca Publik ke Bucket Amazon S3 Diizinkan
- Deteksi Apakah Akses Tulis Publik ke Bucket Amazon S3 Diizinkan
- Mendeteksi Apakah Volume Amazon EBS Terlampir ke Instans Amazon EC2
- Mendeteksi Apakah Optimasi Amazon EBS Diaktifkan untuk Instans Amazon EC2
- Mendeteksi Apakah Akses Publik ke Instans Basis Data Amazon RDS Diaktifkan
- Deteksi Apakah Akses Publik ke Snapshot Basis Data Amazon RDS Diaktifkan
- Mendeteksi Apakah Enkripsi Penyimpanan Diaktifkan untuk Instans Basis Data Amazon RDS
- Mendeteksi apakah akun telah AWS CloudTrail atau CloudTrail Lake diaktifkan

Larang Pembuatan Kunci Akses untuk Pengguna Root

Mengamankan AWS akun Anda dengan melarang pembuatan kunci akses untuk pengguna root. Sebaiknya Anda membuat kunci akses untuk pengguna IAM atau pengguna IAM Identity Center, yang memberikan izin terbatas untuk berinteraksi dengan akun Anda. AWS Ini adalah kontrol preventif dengan panduan yang sangat disarankan. Secara default, kontrol ini tidak diaktifkan.

Artefak untuk kontrol ini adalah SCP berikut.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "GRRESTRICTROOTUSERACCESSKEYS",
            "Effect": "Deny",
            "Action": "iam:CreateAccessKey",
            "Resource": [
                "*"
            ],
            "Condition": {
                "StringLike": {
                    "aws:PrincipalArn": [
```

```
                        "arn:aws:iam::*:root"
                    ]
                }
            }
        }
    ]
}
```

Larang Tindakan sebagai Pengguna Root

Mengamankan AWS akun Anda dengan melarang akses akun dengan kredensyal pengguna root, yang merupakan kredensyal pemilik akun yang memungkinkan akses tidak terbatas ke semua sumber daya di akun. Sebagai gantinya, kami menyarankan Anda membuat pengguna IAM Identity Center untuk interaksi sehari-hari dengan AWS akun Anda. Ini adalah kontrol preventif dengan panduan yang sangat disarankan. Secara default, kontrol ini tidak diaktifkan.

Artefak untuk kontrol ini adalah SCP berikut.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "GRRESTRICTROOTUSER",
      "Effect": "Deny",
      "Action": "*",
      "Resource": [
        "*"
      ],
      "Condition": {
        "StringLike": {
          "aws:PrincipalArn": [
            "arn:aws:iam::*:root"
          ]
        }
      }
    }
  ]
}
```

Mendeteksi Apakah Enkripsi Diaktifkan untuk Volume Amazon EBS Terlampir ke Instans Amazon EC2

Kontrol ini mendeteksi apakah volume Amazon EBS yang dilampirkan ke instans Amazon EC2 dienkripsi. Kontrol ini tidak mengubah status akun. Ini adalah kontrol detektif dengan bimbingan yang sangat disarankan. Secara default, kontrol ini tidak diaktifkan pada OU mana pun.

Artefak untuk kontrol ini adalah AWS Config aturan berikut.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check for encryption of all storage volumes
 attached to compute
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
Resources:
  CheckForEncryptedVolumes:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Checks whether EBS volumes that are in an attached state are
 encrypted.
      Source:
        Owner: AWS
        SourceIdentifier: ENCRYPTED_VOLUMES
      Scope:
        ComplianceResourceTypes:
          - AWS::EC2::Volume
```

Deteksi Apakah Lalu Lintas TCP Masuk yang Tidak Dibatasi Diizinkan

Kontrol ini membantu mengurangi eksposur server terhadap risiko dengan mendeteksi apakah lalu lintas TCP masuk yang tidak dibatasi diizinkan. Ini mendeteksi apakah koneksi internet diaktifkan ke instans Amazon EC2 melalui layanan seperti Remote Desktop Protocol (RDP). Kontrol ini tidak mengubah status akun. Ini adalah kontrol detektif dengan bimbingan yang sangat disarankan. Secara default, kontrol ini tidak diaktifkan.

> **Note**
>
> Kontrol ini gagal jika ada aturan dalam grup keamanan yang mengizinkan lalu lintas masuk dari `0.0.0.0/0` atau `::/0` untuk port tersebut.

Artefak untuk kontrol ini adalah AWS Config aturan berikut.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check whether security groups that are in
 use disallow unrestricted incoming TCP traffic to the specified ports.
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
  blockedPort1:
    Type: String
    Default: '20'
    Description: Blocked TCP port number.
  blockedPort2:
    Type: String
    Default: '21'
    Description: Blocked TCP port number.
  blockedPort3:
    Type: String
    Default: '3389'
    Description: Blocked TCP port number.
  blockedPort4:
    Type: String
    Default: '3306'
    Description: Blocked TCP port number.
  blockedPort5:
    Type: String
    Default: '4333'
    Description: Blocked TCP port number.
Conditions:
  blockedPort1:
    Fn::Not:
    - Fn::Equals:
      - ''
      - Ref: blockedPort1
  blockedPort2:
    Fn::Not:

        Owner: AWS
        SourceIdentifier: RESTRICTED_INCOMING_TRAFFIC
```

Deteksi Apakah Koneksi Internet Tanpa Batas Melalui SSH Diizinkan

Kontrol ini mendeteksi apakah koneksi internet diizinkan melalui layanan jarak jauh seperti protokol Secure Shell (SSH). Kontrol ini tidak mengubah status akun. Ini adalah kontrol detektif dengan bimbingan yang sangat disarankan. Secara default, kontrol ini tidak diaktifkan.

> **Note**
>
> Kontrol ini gagal jika ada aturan dalam grup keamanan yang mengizinkan lalu lintas masuk dari `0.0.0.0/0` atau `::/0` untuk lalu lintas SSH.

Artefak untuk kontrol ini adalah AWS Config aturan berikut.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check whether security groups that are in
 use disallow SSH
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
Resources:
  CheckForRestrictedSshPolicy:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Checks whether security groups that are in use disallow unrestricted
 incoming SSH traffic.
```

```
      Scope:
        ComplianceResourceTypes:
        - AWS::EC2::SecurityGroup
      Source:
        Owner: AWS
        SourceIdentifier: INCOMING_SSH_DISABLED
```

Mendeteksi Apakah MFA untuk Pengguna Root Diaktifkan

Kontrol ini mendeteksi apakah otentikasi multi-faktor (MFA) diaktifkan untuk pengguna root akun manajemen. MFA mengurangi risiko kerentanan dari otentikasi lemah dengan memerlukan kode otentikasi tambahan setelah nama pengguna dan kata sandi berhasil. Kontrol ini tidak mengubah status akun. Ini adalah kontrol detektif dengan bimbingan yang sangat disarankan. Secara default, kontrol ini tidak diaktifkan.

Artefak untuk kontrol ini adalah AWS Config aturan berikut.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to require MFA for root access to accounts
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
  MaximumExecutionFrequency:
    Type: String
    Default: 24hours
    Description: The frequency that you want AWS Config to run evaluations for the
 rule.
    AllowedValues:
    - 1hour
    - 3hours
    - 6hours
    - 12hours
    - 24hours
Mappings:
  Settings:
    FrequencyMap:
      1hour   : One_Hour
      3hours  : Three_Hours
      6hours  : Six_Hours

Deteksi Apakah Akses Baca Publik ke Bucket Amazon S3 Diizinkan

Kontrol ini mendeteksi apakah akses baca publik diizinkan ke bucket Amazon S3. Ini membantu Anda menjaga akses aman ke data yang disimpan dalam ember. Kontrol ini tidak mengubah status akun. Ini adalah kontrol detektif dengan bimbingan yang sangat disarankan. Secara default, kontrol ini tidak diaktifkan.

Artefak untuk kontrol ini adalah AWS Config aturan berikut.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check that your S3 buckets do not allow
 public access
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
Resources:
  CheckForS3PublicRead:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Checks that your S3 buckets do not allow public read access. If an
 S3 bucket policy or bucket ACL allows public read access, the bucket is noncompliant.
      Source:
        Owner: AWS
        SourceIdentifier: S3_BUCKET_PUBLIC_READ_PROHIBITED
      Scope:
        ComplianceResourceTypes:
```

```
          - AWS::S3::Bucket
```

Deteksi Apakah Akses Tulis Publik ke Bucket Amazon S3 Diizinkan

Kontrol ini mendeteksi apakah akses tulis publik diizinkan ke bucket Amazon S3. Ini membantu Anda menjaga akses aman ke data yang disimpan dalam ember. Kontrol ini tidak mengubah status akun. Ini adalah kontrol detektif dengan bimbingan yang sangat disarankan. Secara default, kontrol ini tidak diaktifkan.

Artefak untuk kontrol ini adalah AWS Config aturan berikut.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check that your S3 buckets do not allow
 public access
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
Resources:
  CheckForS3PublicWrite:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Checks that your S3 buckets do not allow public write access. If an
 S3 bucket policy or bucket ACL allows public write access, the bucket is noncompliant.
      Source:
        Owner: AWS
        SourceIdentifier: S3_BUCKET_PUBLIC_WRITE_PROHIBITED
      Scope:
        ComplianceResourceTypes:
          - AWS::S3::Bucket
```

Mendeteksi Apakah Volume Amazon EBS Terlampir ke Instans Amazon EC2

Kontrol ini mendeteksi apakah perangkat volume Amazon EBS tetap ada secara independen dari instans Amazon EC2. Kontrol ini tidak mengubah status akun. Ini adalah kontrol detektif dengan bimbingan yang sangat disarankan. Secara default, kontrol ini tidak diaktifkan.

Artefak untuk kontrol ini adalah AWS Config aturan berikut.

```
AWSTemplateFormatVersion: 2010-09-09
```

```
Description: Configure AWS Config rules to check whether EBS volumes are attached to
 EC2 instances
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
  deleteOnTermination:
    Type: 'String'
    Default: 'None'
    Description: 'Check for Delete on termination'
Conditions:
  deleteOnTermination:
    Fn::Not:
    - Fn::Equals:
      - 'None'
      - Ref: deleteOnTermination
Resources:
  CheckForEc2VolumesInUse:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Checks whether EBS volumes are attached to EC2 instances
      InputParameters:
        deleteOnTermination:
          Fn::If:
            - deleteOnTermination
            - Ref: deleteOnTermination
            - Ref: AWS::NoValue
      Source:
        Owner: AWS
        SourceIdentifier: EC2_VOLUME_INUSE_CHECK
      Scope:
        ComplianceResourceTypes:
          - AWS::EC2::Volume
```

Mendeteksi Apakah Optimasi Amazon EBS Diaktifkan untuk Instans Amazon EC2

Mendeteksi apakah instans Amazon EC2 diluncurkan tanpa volume Amazon EBS yang dioptimalkan untuk kinerja. Volume Amazon EBS yang dioptimalkan meminimalkan perselisihan antara Amazon EBS I/O dan lalu lintas lain dari instans Anda. Kontrol ini tidak mengubah status akun. Ini adalah kontrol detektif dengan bimbingan yang sangat disarankan. Secara default, kontrol ini tidak diaktifkan.

Artefak untuk kontrol ini adalah AWS Config aturan berikut.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check whether EBS optimization is enabled
 for your EC2 instances that can be EBS-optimized
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
Resources:
  CheckForEbsOptimizedInstance:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Checks whether EBS optimization is enabled for your EC2 instances
 that can be EBS-optimized
      Source:
        Owner: AWS
        SourceIdentifier: EBS_OPTIMIZED_INSTANCE
      Scope:
        ComplianceResourceTypes:
          - AWS::EC2::Instance
```

Mendeteksi Apakah Akses Publik ke Instans Basis Data Amazon RDS Diaktifkan

Mendeteksi apakah instans database Amazon RDS Anda mengizinkan akses publik. Anda dapat mengamankan instans database Amazon RDS Anda dengan melarang akses publik. Kontrol ini tidak mengubah status akun. Ini adalah kontrol detektif dengan bimbingan yang sangat disarankan. Secara default, kontrol ini tidak diaktifkan.

Artefak untuk kontrol ini adalah AWS Config aturan berikut.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check whether Amazon RDS instances are not
 publicly accessible.
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
Resources:
  CheckForRdsPublicAccess:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
```

```
      Description: Checks whether the Amazon Relational Database Service
 (RDS) instances are not publicly accessible. The rule is non-compliant if the
 publiclyAccessible field is true in the instance configuration item.
      Source:
        Owner: AWS
        SourceIdentifier: RDS_INSTANCE_PUBLIC_ACCESS_CHECK
      Scope:
        ComplianceResourceTypes:
          - AWS::RDS::DBInstance
```

Deteksi Apakah Akses Publik ke Snapshot Basis Data Amazon RDS Diaktifkan

Mendeteksi apakah snapshot database Amazon RDS Anda mengaktifkan akses publik. Anda dapat melindungi informasi Anda dengan menonaktifkan akses publik. Kontrol ini tidak mengubah status akun. Ini adalah kontrol detektif dengan bimbingan yang sangat disarankan. Secara default, kontrol ini tidak diaktifkan.

Artefak untuk kontrol ini adalah AWS Config aturan berikut.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Checks if Amazon Relational Database Service (Amazon RDS) snapshots are
 public.
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
Resources:
  CheckForRdsStorageEncryption:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Checks if Amazon Relational Database Service (Amazon RDS) snapshots
 are public. The rule is non-compliant if any existing and new Amazon RDS snapshots are
 public.
      Source:
        Owner: AWS
        SourceIdentifier: RDS_SNAPSHOTS_PUBLIC_PROHIBITED
      Scope:
        ComplianceResourceTypes:
          - AWS::RDS::DBSnapshot
```

Mendeteksi Apakah Enkripsi Penyimpanan Diaktifkan untuk Instans Basis Data Amazon RDS

Mendeteksi instans database Amazon RDS yang tidak dienkripsi saat istirahat. Anda dapat mengamankan instans basis data Amazon RDS saat istirahat dengan mengenkripsi penyimpanan dasar untuk instans database dan pencadangan otomatis, Read Replicas, dan snapshot. Kontrol ini tidak mengubah status akun. Ini adalah kontrol detektif dengan bimbingan yang sangat disarankan. Secara default, kontrol ini tidak diaktifkan.

Artefak untuk kontrol ini adalah AWS Config aturan berikut.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check whether storage encryption is enabled
 for your RDS DB instances
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
Resources:
  CheckForRdsStorageEncryption:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Checks whether storage encryption is enabled for your RDS DB
 instances.
      Source:
        Owner: AWS
        SourceIdentifier: RDS_STORAGE_ENCRYPTED
      Scope:
        ComplianceResourceTypes:
          - AWS::RDS::DBInstance
```

Mendeteksi apakah akun telah AWS CloudTrail atau CloudTrail Lake diaktifkan

Kontrol ini mendeteksi apakah akun telah AWS CloudTrail atau CloudTrail Lake diaktifkan. Aturannya adalah NON_COMPLIANT jika salah satu CloudTrail atau CloudTrail Lake tidak diaktifkan di akun. Ini adalah kontrol detektif dengan bimbingan yang sangat disarankan. Secara default, kontrol ini tidak diaktifkan pada OU apa pun.

Artefak untuk kontrol ini adalah AWS Config aturan berikut.

```
AWSTemplateFormatVersion: 2010-09-09
```

```
 Description: Configure AWS Config rules to detect whether an account has AWS
CloudTrail or CloudTrail Lake enabled.

 Parameters:
   ConfigRuleName:
     Type: 'String'
     Description: 'Name for the Config rule'

 Resources:
   CheckForCloudtrailEnabled:
     Type: AWS::Config::ConfigRule
     Properties:
       ConfigRuleName: !Sub ${ConfigRuleName}
       Description: Detects whether an account has AWS CloudTrail or CloudTrail Lake
enabled. The rule is NON_COMPLIANT if either CloudTrail or CloudTrail Lake is not
enabled in an account.
       Source:
         Owner: AWS
         SourceIdentifier: CLOUD_TRAIL_ENABLED
```

Kontrol elektif

Kontrol pilihan memungkinkan Anda untuk mengunci atau melacak upaya untuk melakukan tindakan yang umumnya dibatasi di lingkungan AWS perusahaan. Kontrol ini tidak diaktifkan secara default, dan dapat dinonaktifkan. Setelah itu, Anda akan menemukan referensi untuk kontrol elektif yang tersedia di AWS Control Tower. Kontrol elektif khusus untuk residensi data dikumpulkan ke dalam bagian terpisah,. Kontrol yang meningkatkan perlindungan residensi data

Larang Perubahan Konfigurasi Enkripsi untuk Bucket Amazon S3 [Sebelumnya: Aktifkan Enkripsi saat Istirahat untuk Arsip Log]

Kontrol ini melarang perubahan enkripsi untuk semua bucket Amazon S3. Ini adalah kontrol preventif dengan panduan elektif. Secara default, kontrol ini tidak diaktifkan.

Artefak untuk kontrol ini adalah kebijakan kontrol layanan (SCP) berikut.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "GRAUDITBUCKETENCRYPTIONENABLED",
            "Effect": "Deny",
            "Action": [
                "s3:PutEncryptionConfiguration"
            ],
            "Resource": ["*"],
            "Condition": {
                "ArnNotLike": {
                    "aws:PrincipalARN":"arn:aws:iam::*:role/AWSControlTowerExecution"
                }
            }
        }
    ]
}
```

Larang Perubahan Konfigurasi Logging untuk Bucket Amazon S3 [Sebelumnya: Aktifkan Pencatatan Akses untuk Arsip Log]

Kontrol ini melarang perubahan pada konfigurasi logging untuk semua bucket Amazon S3. Ini adalah kontrol preventif dengan panduan elektif. Secara default, kontrol ini tidak diaktifkan.

Artefak untuk kontrol ini adalah SCP berikut.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "GRAUDITBUCKETLOGGINGENABLED",
            "Effect": "Deny",
            "Action": [
                "s3:PutBucketLogging"
            ],
            "Resource": ["*"],
            "Condition": {
                "ArnNotLike": {
                    "aws:PrincipalARN":"arn:aws:iam::*:role/AWSControlTowerExecution"
                }
            }
        }
    ]
}
```

Larang Perubahan Kebijakan Bucket untuk Bucket Amazon S3 [Sebelumnya: Larang Perubahan Kebijakan pada Arsip Log]

Kontrol ini melarang perubahan kebijakan bucket untuk semua bucket Amazon S3. Ini adalah kontrol preventif dengan panduan elektif. Secara default, kontrol ini tidak diaktifkan.

Artefak untuk kontrol ini adalah SCP berikut.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "GRAUDITBUCKETPOLICYCHANGESPROHIBITED",
            "Effect": "Deny",
            "Action": [
                "s3:PutBucketPolicy"
            ],
            "Resource": ["*"],
            "Condition": {
                "ArnNotLike": {
                    "aws:PrincipalARN":"arn:aws:iam::*:role/AWSControlTowerExecution"
                }
            }
        }
```

```
    ]
}
```

Larang Perubahan Konfigurasi Siklus Hidup untuk Bucket Amazon S3 [Sebelumnya: Tetapkan Kebijakan Retensi untuk Arsip Log]

Kontrol ini melarang perubahan konfigurasi siklus hidup untuk semua bucket Amazon S3. Ini adalah kontrol preventif dengan panduan elektif. Secara default, kontrol ini tidak diaktifkan.

Artefak untuk kontrol ini adalah SCP berikut.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "GRAUDITBUCKETRETENTIONPOLICY",
            "Effect": "Deny",
            "Action": [
                "s3:PutLifecycleConfiguration"
            ],
            "Resource": ["*"],
            "Condition": {
                "ArnNotLike": {
                    "aws:PrincipalARN":"arn:aws:iam::*:role/AWSControlTowerExecution"
                }
            }
        }
    ]
}
```

Larang Perubahan Konfigurasi Replikasi untuk Bucket Amazon S3

Mencegah perubahan pada cara bucket Amazon S3 Anda telah disiapkan untuk menangani replikasi di dalam Wilayah atau di seluruh Wilayah. Misalnya, jika Anda menyiapkan bucket dengan replikasi satu wilayah, untuk membatasi lokasi data Amazon S3 Anda menjadi satu Wilayah AWS (dengan demikian menonaktifkan penyalinan objek otomatis dan asinkron di seluruh bucket ke bucket lainnya Wilayah AWS), kontrol ini mencegah pengaturan replikasi tersebut diubah. Ini adalah kontrol preventif dengan panduan elektif. Secara default, kontrol ini tidak diaktifkan.

Artefak untuk kontrol ini adalah SCP berikut.

```
{
```

```
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "GRRESTRICTS3CROSSREGIONREPLICATION",
            "Effect": "Deny",
            "Action": [
                "s3:PutReplicationConfiguration"
            ],
            "Resource": [
                "*"
            ]
        }
    ]
}
```

Larang Hapus Tindakan di Bucket Amazon S3 Tanpa MFA

Melindungi bucket Amazon S3 Anda dengan meminta MFA untuk menghapus tindakan. MFA memerlukan kode otentikasi tambahan setelah nama pengguna dan kata sandi berhasil. Ini adalah kontrol preventif dengan panduan elektif. Secara default, kontrol ini tidak diaktifkan.

Artefak untuk kontrol ini adalah SCP berikut.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "GRRESTRICTS3DELETEWITHOUTMFA",
            "Effect": "Deny",
            "Action": [
                "s3:DeleteObject",
                "s3:DeleteBucket"
            ],
            "Resource": [
                "*"
            ],
            "Condition": {
                "BoolIfExists": {
                    "aws:MultiFactorAuthPresent": [
                        "false"
                    ]
                }
            }
```

```
        }
    ]
}
```

Mendeteksi Apakah MFA Diaktifkan untuk AWS Pengguna IAM

Kontrol ini mendeteksi apakah MFA diaktifkan AWS untuk pengguna IAM. Anda dapat melindungi akun Anda dengan mewajibkan MFA untuk semua AWS pengguna di akun. MFA memerlukan kode otentikasi tambahan setelah nama pengguna dan kata sandi berhasil. Kontrol ini tidak mengubah status akun. Ini adalah kontrol detektif dengan panduan elektif. Secara default, kontrol ini tidak diaktifkan.

Artefak untuk kontrol ini adalah AWS Config aturan berikut.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check whether the IAM users have MFA enabled
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
  MaximumExecutionFrequency:
    Type: String
    Default: 1hour
    Description: The frequency that you want AWS Config to run evaluations for the
 rule.
    AllowedValues:
    - 1hour
    - 3hours
    - 6hours
    - 12hours
    - 24hours
Mappings:
  Settings:
    FrequencyMap:
      1hour   : One_Hour
      3hours  : Three_Hours
      6hours  : Six_Hours
      12hours : Twelve_Hours
      24hours : TwentyFour_Hours
Resources:
  CheckForIAMUserMFA:
    Type: AWS::Config::ConfigRule
    Properties:
```

```
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Checks whether the AWS Identity and Access Management users have
 multi-factor authentication (MFA) enabled. The rule is COMPLIANT if MFA is enabled.
      Source:
        Owner: AWS
        SourceIdentifier: IAM_USER_MFA_ENABLED
      MaximumExecutionFrequency:
        !FindInMap
          - Settings
          - FrequencyMap
          - !Ref MaximumExecutionFrequency
```

Mendeteksi Apakah MFA Diaktifkan untuk Pengguna AWS IAM Konsol AWS

Melindungi akun Anda dengan mewajibkan MFA untuk semua pengguna AWS IAM di konsol. MFA mengurangi risiko kerentanan dari otentikasi lemah dengan memerlukan kode otentikasi tambahan setelah nama pengguna dan kata sandi berhasil. Kontrol ini mendeteksi apakah MFA diaktifkan. Kontrol ini tidak mengubah status akun. Ini adalah kontrol detektif dengan panduan elektif. Secara default, kontrol ini tidak diaktifkan.

Artefak untuk kontrol ini adalah AWS Config aturan berikut.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check whether MFA is enabled for all AWS IAM
 users that use a console password.
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
  MaximumExecutionFrequency:
    Type: String
    Default: 1hour
    Description: The frequency that you want AWS Config to run evaluations for the
 rule.
    AllowedValues:
    - 1hour
    - 3hours
    - 6hours
    - 12hours
    - 24hours
Mappings:
  Settings:
    FrequencyMap:
```

```
      1hour   : One_Hour
      3hours  : Three_Hours
      6hours  : Six_Hours
      12hours : Twelve_Hours
      24hours : TwentyFour_Hours
Resources:
  CheckForIAMUserConsoleMFA:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Checks whether AWS Multi-Factor Authentication (MFA) is enabled for
 all AWS Identity and Access Management (IAM) users that use a console password. The
 rule is COMPLIANT if MFA is enabled.
      Source:
        Owner: AWS
        SourceIdentifier: MFA_ENABLED_FOR_IAM_CONSOLE_ACCESS
      MaximumExecutionFrequency:
        !FindInMap
          - Settings
          - FrequencyMap
          - !Ref MaximumExecutionFrequency
```

Deteksi Apakah Pembuatan Versi untuk Bucket Amazon S3 Diaktifkan

Mendeteksi apakah bucket Amazon S3 Anda diaktifkan untuk pembuatan versi. Pembuatan versi memungkinkan Anda memulihkan objek dari penghapusan atau penimpaan yang tidak disengaja. Kontrol ini tidak mengubah status akun. Ini adalah kontrol detektif dengan panduan elektif. Secara default, kontrol ini tidak diaktifkan.

Artefak untuk kontrol ini adalah AWS Config aturan berikut.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check whether versioning is enabled for your
 S3 buckets.
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
Resources:
  CheckForS3VersioningEnabled:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
```

```
    Description: Checks whether versioning is enabled for your S3 buckets.
    Source:
      Owner: AWS
      SourceIdentifier: S3_BUCKET_VERSIONING_ENABLED
    Scope:
      ComplianceResourceTypes:
        - AWS::S3::Bucket
```

Larang pengelolaan jenis sumber daya, modul, dan kait dalam registri AWS CloudFormation

Kontrol elektif ini melarang pengelolaan jenis ekstensi berikut dalam AWS CloudFormation registri: jenis sumber daya, modul, dan kait. Untuk informasi selengkapnya tentang AWS CloudFormation ekstensi, lihat Menggunakan AWS CloudFormation registri.

> **Note**
>
> Anda harus mengaktifkan kontrol ini ketika Anda mengaktifkan kontrol proaktif di lingkungan Anda.

- Tujuan kontrol: Lindungi konfigurasi
- Implementasi Kebijakan pengendalian layanan (SCP)
- Kontrol perilaku: Pencegahan
- Panduan kontrol: Pilihan
- Pemilik kontrol: AWS Control Tower
- ID Kontrol: CT.CLOUDFORMATION.PR.1
- Tingkat keparahan: Kritis
- AWS Layanan: AWS CloudFormation
- Jenis sumber daya: `AWS::CloudFormation::HookDefaultVersion`, `AWS::CloudFormation::HookTypeConfig`, `AWS::CloudFormation::HookVersion`, `AWS::CloudFormation::ModuleDefaultVersion`, `AWS::CloudFormation::ModuleVersion`, `AWS::CloudFormation::ResourceDefaultVersion`, `AWS::CloudFormation::ResourceVersion`

Contoh berikut menunjukkan artefak SCP untuk kontrol ini.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "GRDISALLOWMODIFICATIONCFNREGISTRY",
            "Effect": "Deny",
            "Action": [
                "cloudformation:RegisterType",
                "cloudformation:DeregisterType",
                "cloudformation:SetTypeConfiguration",
                "cloudformation:SetTypeDefaultVersion",
                "cloudformation:PublishType"
            ],
            "Resource": [
                "*"
            ],
            "Condition": {
                "ArnNotLike": {
                    "aws:PrincipalARN": "arn:aws:iam::*:role/AWSControlTowerExecution"
                }
            }
        }
    ]
}
```

Layanan terintegrasi

AWS Control Tower adalah layanan yang dibangun di atas AWS layanan lain, untuk membantu Anda menyiapkan lingkungan yang dirancang dengan baik. Bab ini memberikan gambaran singkat tentang layanan ini, termasuk informasi konfigurasi tentang layanan yang mendasarinya dan cara kerjanya di AWS Control Tower.

Untuk informasi lebih lanjut tentang cara mengukur lingkungan yang dirancang dengan baik, pelajari tentang Well-Architected ToolAWS . Lihat juga Panduan Lingkungan Cloud Manajemen dan Tata Kelola.

Topik

- Menyebarkan Lingkungan dengan AWS CloudFormation
- Memantau Acara dengan CloudTrail
- Memantau Sumber Daya dan Layanan dengan CloudWatch
- Mengatur Konfigurasi Sumber Daya dengan AWS Config
- Mengelola Izin untuk Entitas dengan IAM
- AWS Key Management Service
- Jalankan Fungsi Komputasi Tanpa Server dengan Lambda
- Kelola Akun Melalui AWS Organizations
- Simpan Objek dengan Amazon S3
- Pantau lingkungan Anda dengan Security Hub
- Akun penyediaan melalui AWS Service Catalog
- Lacak Peringatan Melalui Layanan Pemberitahuan Sederhana Amazon
- Membangun Aplikasi Terdistribusi dengan AWS Step Functions

Menyebarkan Lingkungan dengan AWS CloudFormation

AWS CloudFormation memungkinkan Anda untuk membuat dan menyediakan penyebaran AWS infrastruktur yang dapat diprediksi dan berulang kali. Ini membantu Anda memanfaatkan AWS produk untuk membangun aplikasi yang sangat andal, sangat terukur, dan hemat biaya di cloud tanpa khawatir membuat dan mengonfigurasi infrastruktur yang mendasarinya. AWS AWS CloudFormation memungkinkan Anda untuk menggunakan file template untuk membuat dan menghapus koleksi

sumber daya bersama-sama sebagai satu unit (tumpukan). Untuk informasi selengkapnya, lihat Panduan Pengguna AWS CloudFormation.

AWS Control Tower menggunakan AWS CloudFormation stackset untuk menerapkan kontrol pada akun. Untuk informasi selengkapnya tentang cara AWS CloudFormation dan AWS Control Tower bekerja sama, lihat Menciptakan AWS Control Tower sumber daya dengan AWS CloudFormation.

Memantau Acara dengan CloudTrail

AWS Control Tower mengonfigurasi AWS CloudTrail untuk mengaktifkan pencatatan dan audit terpusat. Dengan CloudTrail, akun manajemen dapat meninjau tindakan administratif dan peristiwa siklus hidup untuk akun anggota.

CloudTrail membantu Anda memantau AWS lingkungan Anda di cloud dengan menyimpan riwayat panggilan AWS API untuk akun Anda. Misalnya, Anda dapat mengidentifikasi pengguna dan akun yang memanggil AWS API untuk layanan yang mendukung CloudTrail, alamat IP sumber dari mana panggilan dilakukan, dan waktu ketika panggilan terjadi. Anda dapat mengintegrasikan CloudTrail ke dalam aplikasi menggunakan API, mengotomatiskan pembuatan jejak untuk organisasi Anda, memeriksa status jejak Anda, dan mengontrol cara administrator mengaktifkan dan menonaktifkan CloudTrail log. Untuk informasi selengkapnya, lihat Panduan Pengguna AWS CloudTrail.

Memantau Sumber Daya dan Layanan dengan CloudWatch

Amazon CloudWatch menyediakan solusi pemantauan yang andal, terukur, dan fleksibel yang dapat Anda mulai gunakan dalam hitungan menit. Anda tidak perlu lagi mengatur, mengelola, dan menskalakan sistem dan infrastruktur pemantauan Anda sendiri. Untuk informasi selengkapnya, lihat Panduan CloudWatch Pengguna Amazon.

Untuk informasi selengkapnya tentang cara CloudWatch kerja Amazon dengan AWS Control Tower, lihat Pemantauan.

Mengatur Konfigurasi Sumber Daya dengan AWS Config

AWS Config memberikan tampilan rinci tentang sumber daya yang terkait dengan AWS akun Anda, termasuk bagaimana mereka dikonfigurasi, bagaimana mereka terkait satu sama lain, dan bagaimana konfigurasi dan hubungan mereka telah berubah dari waktu ke waktu. Untuk informasi selengkapnya, silakan lihat Panduan Developer AWS Config.

AWS Config sumber daya yang disediakan oleh AWS Control Tower ditandai secara otomatis dengan `aws-control-tower` dan nilainya. `managed-by-control-tower`

Untuk informasi selengkapnya tentang cara AWS Config memonitor dan merekam sumber daya di AWS Control Tower, dan cara tagihannya kepada Anda, lihatPantau perubahan sumber daya dengan AWS Config.

AWS Control Tower digunakan Aturan AWS Config untuk mengimplementasikan kontrol detektif. Untuk informasi selengkapnya, lihat Tentang kontrol di AWS Control Tower.

Mengelola Izin untuk Entitas dengan IAM

AWS Identity and Access Management (IAM) adalah AWS layanan untuk mengontrol akses ke AWS layanan lain. Dengan IAM, Anda dapat mengelola pengguna, kredensi keamanan secara terpusat — seperti kunci akses, dan izin — yang menentukan AWS sumber daya yang dapat diakses oleh pengguna dan aplikasi Anda.

Saat Anda mengatur landing zone, sejumlah grup dapat dibuat secara AWS IAM Identity Center otomatis, jika Anda memilih IAM sebagai penyedia identitas Anda. Grup ini memiliki set izin yang merupakan kebijakan izin yang telah ditentukan sebelumnya dari IAM. Pengguna akhir Anda juga dapat menggunakan IAM untuk menentukan ruang lingkup izin untuk pengguna IAM dan entitas lain dalam akun anggota.

AWS Identity and Access Management (IAM) menyederhanakan cara Anda mengelola akses ke AWS akun dan aplikasi bisnis. Anda dapat mengontrol akses IAM Identity Center dan izin pengguna di semua AWS akun Anda di AWS Control Tower.

Untuk informasi selengkapnya, lihat Panduan Pengguna AWS IAM Identity Center.

Jika Anda berbasis di sebuah Wilayah AWS yang tidak mendukung IAM, Anda dapat membawa penyedia identitas lain, untuk mengatur dan memelihara pengguna dan grup Anda sendiri secara manual.

AWS Key Management Service

AWS Key Management Service (AWS KMS) memungkinkan Anda untuk membuat dan mengontrol kunci yang melindungi data Anda. AWS Control Tower secara opsional memungkinkan Anda mengenkripsi data Anda dengan kunci AWS KMS enkripsi. Untuk selengkapnya AWS KMS, lihat Panduan PengembangAWS KMS.

Untuk informasi tentang cara mengatur AWS KMS kunci dengan AWS Control Tower, lihat Langkah 2. Konfigurasikan dan luncurkan landing zone Anda .

Jalankan Fungsi Komputasi Tanpa Server dengan Lambda

Dengan AWS Lambda, Anda dapat menjalankan kode tanpa menyediakan atau mengelola server. Anda dapat menjalankan kode untuk berbagai jenis aplikasi atau layanan backend — tanpa perlu overhead administrasi tambahan. Saat Anda mengunggah kode, Lambda dapat menjalankan dan menskalakan kode dengan ketersediaan tinggi. Anda dapat mengatur kode Anda untuk memicu dari AWS layanan lain secara otomatis, atau Anda dapat memanggilnya langsung dari web atau aplikasi seluler apa pun.

Misalnya, peran tertentu dalam akun audit AWS Control Tower dapat diasumsikan secara terprogram, sehingga Anda dapat meninjau akun lain menggunakan Lambda. Selain itu, Anda dapat menggunakan peristiwa siklus hidup AWS Control Tower untuk memicu fungsi Lambda.

Kelola Akun Melalui AWS Organizations

AWS Organizations adalah layanan manajemen akun yang memungkinkan Anda mengkonsolidasikan beberapa AWS akun ke dalam organisasi yang Anda buat dan kelola secara terpusat. Dengan Organizations, Anda dapat membuat akun anggota dan mengundang akun yang ada untuk bergabung dengan organisasi Anda. Anda dapat mengatur akun tersebut ke dalam grup dan melampirkan kontrol berbasis kebijakan. Untuk informasi selengkapnya, lihat Panduan Pengguna AWS Organizations.

Di AWS Control Tower, Organizations membantu mengelola penagihan secara terpusat; mengontrol akses, kepatuhan, dan keamanan; dan berbagi sumber daya di seluruh akun anggota AWS Anda. Akun dikelompokkan ke dalam kelompok logis, yang disebut unit organisasi (OU). Untuk informasi selengkapnya tentang Organizations, lihat PanduanAWS Organizations Pengguna.

AWS Control Tower menggunakan OU berikut:

- Root — Kontainer induk untuk semua akun dan semua OU lainnya di landing zone Anda.
- Keamanan - OU ini berisi akun arsip log, akun audit, dan sumber daya yang mereka miliki.
- Sandbox - OU ini dibuat saat Anda mengatur landing zone Anda. Itu dan OU anak lainnya di landing zone Anda berisi akun anggota Anda. Ini adalah akun yang diakses pengguna akhir Anda untuk melakukan pekerjaan pada AWS sumber daya.

> **Note**
>
> Anda dapat menambahkan OU tambahan di landing zone melalui konsol AWS Control Tower di halaman Unit Organisasi.

Pertimbangan

OU yang dibuat melalui AWS Control Tower dapat memiliki kontrol yang diterapkan padanya. OU yang dibuat di luar AWS Control Tower tidak dapat, secara default. Namun, Anda dapat mendaftarkan OU tersebut. Setelah Anda mendaftarkan OU, Anda dapat menerapkan kontrol untuk itu dan akunnya. Untuk informasi tentang mendaftarkan OU, lihatDaftarkan unit organisasi yang ada dengan AWS Control Tower.

Simpan Objek dengan Amazon S3

Amazon Simple Storage Service (Amazon S3) adalah penyimpanan untuk internet. Anda dapat menggunakan Amazon S3 untuk menyimpan dan mengambil data sebanyak apa pun kapan pun, dari mana pun di web. Anda dapat menyelesaikan tugas-tugas ini menggunakan antarmuka web yang sederhana dan intuitif. AWS Management ConsoleUntuk informasi selengkapnya, lihat Panduan Pengguna Layanan Penyimpanan Sederhana Amazon.

Saat menyiapkan landing zone, bucket Amazon S3 dibuat di akun arsip log untuk memuat semua log di semua akun di landing zone Anda.

Pantau lingkungan Anda dengan Security Hub

AWS Control Tower terintegrasi dengan AWS Security Hub melalui standar Security Hub yang disebut Service-Managed Standard: AWS Control Tower. Untuk informasi selengkapnya, lihat Standar Security Hub.

Akun penyediaan melalui AWS Service Catalog

AWS Service Catalog memungkinkan administrator TI untuk membuat, mengelola, dan mendistribusikan portofolio produk yang disetujui kepada pengguna akhir, yang kemudian memiliki akses produk yang mereka butuhkan di portal yang dipersonalisasi. Produk umum termasuk server, database, situs web, atau aplikasi yang digunakan menggunakan AWS sumber daya.

Anda dapat mengontrol pengguna yang memiliki akses ke produk tertentu, yang memungkinkan Anda menegakkan kepatuhan terhadap standar bisnis organisasi, mengelola siklus hidup produk, dan membantu pengguna menemukan dan meluncurkan produk dengan percaya diri. Untuk informasi selengkapnya, lihat Panduan Administrator Service Catalog.

Di AWS Control Tower, administrator cloud pusat dan pengguna akhir Anda dapat menyediakan akun khusus di landing zone Anda menggunakan AWS Service Catalog produk, yang disebut “cetak biru khusus”. Untuk informasi selengkapnya, lihat Langkah 2. Buat AWS Service Catalog produk.

AWS Control Tower juga dapat menggunakan Service Catalog API untuk mengotomatiskan penyediaan dan pembaruan akun lebih lanjut. Untuk detailnya, lihat Panduan Pengembang AWS Service Catalog.

Transisi ke jenis produk AWS Service Catalog Eksternal

AWS Service Catalog mengubah dukungan untuk produk Terraform Open Source dan menyediakan produk ke jenis produk baru, yang disebut Eksternal. Untuk mempelajari lebih lanjut tentang transisi ini, tinjau Memperbarui produk Terraform Open Source yang ada dan produk yang disediakan ke jenis produk Eksternal di panduan administrator.AWS Service Catalog

Perubahan ini memengaruhi akun yang sudah ada yang Anda buat atau daftarkan dengan kustomisasi pabrik akun AWS Control Tower. Untuk mentransisikan akun ini ke jenis produk Eksternal, Anda perlu membuat perubahan di AWS Control Tower AWS Service Catalog dan AWS Control Tower.

Untuk transisi ke jenis produk Eksternal

1. Tingkatkan Mesin Referensi Terraform Anda yang ada AWS Service Catalog untuk menyertakan dukungan untuk jenis produk Sumber Terbuka Eksternal dan Terraform. Untuk petunjuk tentang memperbarui Mesin Referensi Terraform Anda, tinjau Repositori.AWS Service Catalog GitHub
2. Di AWS Service Catalog, duplikat semua produk Terraform Open Source yang ada (cetak biru), dengan duplikat menggunakan jenis produk Eksternal yang baru. Jangan hentikan cetak biru Terraform Open Source yang ada.
3. Di AWS Control Tower, perbarui setiap akun menggunakan cetak biru Terraform Open Source untuk menggunakan cetak biru Eksternal yang baru.
    a. Untuk memperbarui cetak biru, Anda harus terlebih dahulu menghapus cetak biru Terraform Open Source sepenuhnya. Untuk detail selengkapnya, tinjau Hapus cetak biru dari akun.

b. Tambahkan cetak biru Eksternal baru ke akun yang sama. Untuk detail selengkapnya, tinjau Tambahkan cetak biru ke akun AWS Control Tower.

4. Setelah semua akun yang menggunakan cetak biru Sumber Terraform diperbarui ke cetak biru Eksternal, kembali ke AWS Service Catalog dan hentikan produk apa pun yang menggunakan Terraform Open Source sebagai jenis produk.
5. Ke depan, semua akun yang dibuat atau terdaftar menggunakan kustomisasi pabrik akun AWS Control Tower harus mereferensikan cetak biru menggunakan AWS CloudFormationatau jenis produk Eksternal.

   Untuk cetak biru yang dibuat menggunakan jenis produk Eksternal, AWS Control Tower hanya mendukung penyesuaian akun yang menggunakan templat Terraform dan mesin referensi Terraform. Untuk mempelajari lebih lanjut, tinjau Pengaturan untuk penyesuaian.

> **Note**
>
> AWS Control Tower tidak mendukung Terraform Open Source sebagai jenis produk saat membuat akun baru. Untuk mempelajari lebih lanjut tentang perubahan ini, tinjau Memperbarui produk Terraform Open Source yang ada dan produk yang disediakan ke jenis produk Eksternal dalam panduan administrator.AWS Service Catalog AWS Service Catalog akan mendukung pelanggan melalui transisi jenis produk ini, sesuai kebutuhan. Hubungi perwakilan akun Anda untuk meminta bantuan.

Lacak Peringatan Melalui Layanan Pemberitahuan Sederhana Amazon

Amazon Simple Notification Service (Amazon SNS) adalah layanan web yang memungkinkan aplikasi, pengguna akhir, dan perangkat untuk mengirim dan menerima notifikasi langsung dari cloud. Untuk informasi lebih lanjut, lihat Panduan Developer Amazon Simple Notification Service.

AWS Control Tower menggunakan Amazon SNS untuk mengirim peringatan terprogram ke alamat email akun manajemen dan akun audit Anda. Peringatan ini membantu Anda mencegah drift di dalam landing zone Anda. Untuk informasi selengkapnya, lihat Mendeteksi dan mengatasi penyimpangan di AWS Control Tower.

Kami juga menggunakan Amazon Simple Notification Service untuk mengirim pemberitahuan kepatuhan dari AWS Config.

> **Tip**
>
> Salah satu cara terbaik untuk menerima pemberitahuan kepatuhan kontrol AWS Control Tower (di akun audit Anda) adalah dengan berlangganan`AggregateConfigurationNotifications`. Ini adalah layanan yang membantu Anda memeriksa kepatuhan. Ini memberi Anda data nyata tentang AWS Config aturan yang keluar dari kepatuhan. AWS Config secara otomatis memelihara daftar akun di OU Anda.
>
> Anda harus berlangganan secara manual, menggunakan email atau jenis langganan apa pun yang memungkinkan SNS. Pernyataan tersebut `arn:aws:sns:`*`homeregion`*`:`*`account`*`:aws-controltower-AggregateSecurityNotifications` mengarah ke akun audit Anda.

Membangun Aplikasi Terdistribusi dengan AWS Step Functions

AWS Step Functions membuatnya mudah untuk mengoordinasikan komponen aplikasi terdistribusi sebagai serangkaian langkah dalam alur kerja visual. Anda dapat dengan cepat membangun dan menjalankan mesin status untuk mengeksekusi langkah-langkah aplikasi Anda secara andal dan dapat diskalakan. Untuk informasi selengkapnya, silakan lihat Panduan Developer AWS Step Functions.

Manajemen identitas dan akses di AWS Control Tower

Untuk melakukan operasi apa pun di landing zone Anda, seperti menyediakan akun di Account Factory atau membuat unit organisasi (OU) baru di konsol AWS Control Tower, baik AWS Identity and Access Management (IAM) atau AWS IAM Identity Center mengharuskan Anda untuk mengautentikasi bahwa Anda adalah pengguna yang disetujui. AWS Misalnya, jika Anda menggunakan konsol AWS Control Tower, Anda mengautentikasi identitas Anda dengan memberikan AWS kredensil Anda, seperti yang disediakan oleh administrator Anda.

Setelah Anda mengautentikasi identitas Anda, IAM mengontrol akses Anda AWS dengan sekumpulan izin yang ditentukan pada serangkaian operasi dan sumber daya tertentu. Jika Anda seorang administrator akun, Anda dapat menggunakan IAM untuk mengontrol akses pengguna IAM lainnya ke sumber daya yang terkait dengan akun Anda.

Topik

- Autentikasi
- Kontrol akses
- Bekerja dengan AWS IAM Identity Center dan AWS Control Tower
- Gambaran umum tentang mengelola izin akses ke sumber daya AWS Control Tower Anda
- Mencegah peniruan identitas lintas layanan
- Menggunakan kebijakan berbasis identitas (kebijakan IAM) untuk AWS Control Tower

Autentikasi

Anda memiliki akses ke AWS salah satu jenis identitas berikut:

- AWS pengguna root akun — Ketika Anda pertama kali membuat AWS akun, Anda mulai dengan identitas yang memiliki akses lengkap ke semua AWS layanan dan sumber daya di akun. Identitas ini disebut pengguna root AWS akun. Anda memiliki akses ke identitas ini ketika Anda masuk dengan alamat email dan kata sandi yang Anda gunakan untuk membuat akun. Kami sangat menyarankan agar Anda tidak menggunakan pengguna root untuk tugas sehari-hari, bahkan tugas administratif. Sebagai gantinya, patuhi praktik terbaik menggunakan pengguna root hanya untuk membuat pengguna Pusat Identitas IAM pertama Anda (disarankan) atau pengguna IAM (bukan praktik terbaik dalam sebagian besar kasus penggunaan). Kemudian, kunci kredensial pengguna

akar dengan aman dan gunakan kredensial itu untuk melakukan beberapa tugas manajemen akun dan layanan saja. Untuk informasi selengkapnya, lihat Kapan harus masuk sebagai pengguna root.

- Pengguna IAM — Pengguna IAM adalah identitas dalam AWS akun Anda yang memiliki izin khusus dan disesuaikan. Anda dapat menggunakan kredensil pengguna IAM untuk masuk guna mengamankan AWS halaman web seperti Konsol AWS Manajemen, Forum AWS Diskusi, atau Pusat Dukungan. AWS AWS praktik terbaik merekomendasikan agar Anda membuat pengguna IAM Identity Center alih-alih pengguna IAM, karena ada lebih banyak risiko keamanan saat Anda membuat pengguna IAM yang memiliki kredensi jangka panjang.

  Jika Anda harus membuat pengguna IAM untuk tujuan tertentu, selain kredensi masuk, Anda dapat membuat kunci akses untuk setiap pengguna IAM. Anda dapat menggunakan kunci ini ketika Anda memanggil AWS layanan secara terprogram, baik melalui salah satu dari beberapa SDK atau dengan menggunakan AWS Command Line Interface (CLI). Alat SDK dan CLI menggunakan access key untuk menandatangani permintaan Anda secara kriptografis. Jika Anda tidak menggunakan AWS alat, Anda harus menandatangani permintaan sendiri. AWS Control Tower mendukung Signature Version 4, protokol untuk mengautentikasi permintaan API masuk. Untuk informasi selengkapnya tentang mengautentikasi permintaan, lihat Proses Penandatanganan Versi Tanda Tangan 4 di Referensi AWS Umum.

- IAM role – IAM role adalah identitas IAM yang dapat Anda buat di akun Anda yang memiliki izin spesifik. Peran IAM mirip dengan pengguna IAM dalam hal itu adalah AWS identitas, dan memiliki kebijakan izin yang menentukan apa yang dapat dan tidak dapat dilakukan identitas. AWSNamun, alih-alih secara unik terkait dengan satu orang, peran dimaksudkan untuk menjadi dapat diambil oleh siapa pun yang membutuhkannya. Selain itu, peran tidak memiliki kredensial jangka panjang standar seperti kata sandi atau kunci akses yang terkait dengannya. Sebagai gantinya, saat Anda mengambil peran, kredensial keamanan sementara untuk sesi peran Anda akan diberikan. Peran IAM dengan kredensial temporer berguna dalam situasi berikut:

  - Akses pengguna federasi — Alih-alih membuat pengguna IAM, Anda dapat menggunakan identitas yang ada dari AWS Directory Service, direktori pengguna perusahaan Anda, atau penyedia identitas web. Ini dikenal sebagai pengguna federasi. AWS memberikan peran kepada pengguna federasi ketika akses diminta melalui penyedia identitas. Untuk informasi lebih lanjut tentang pengguna gabungan, lihat Pengguna Gabungan dan Peran di Panduan Pengguna IAM.

  - AWS Akses layanan — Peran layanan adalah peran IAM yang diasumsikan oleh layanan untuk melakukan tindakan di akun Anda atas nama Anda. Ketika Anda mengatur beberapa lingkungan AWS layanan, Anda harus menentukan peran untuk layanan untuk mengambil alih. Peran layanan ini harus mencakup semua izin yang diperlukan untuk layanan untuk mengakses AWS sumber daya yang dibutuhkan. Peran layanan bervariasi dari layanan ke layanan, tetapi

banyak yang memungkinkan Anda untuk memilih izin Anda selama Anda memenuhi persyaratan yang didokumentasikan untuk layanan tersebut. Peran layanan hanya menyediakan akses dalam akun Anda dan tidak dapat digunakan untuk memberikan akses ke layanan dalam akun lain. Anda dapat membuat, memodifikasi, dan menghapus peran layanan dari dalam IAM. Misalnya, Anda dapat membuat peran yang memungkinkan Amazon Redshift untuk mengakses bucket Amazon S3 atas nama Anda dan kemudian memuat data yang tersimpan di bucket ke dalam klaster Amazon Redshift. Untuk informasi selengkapnya, lihat Membuat Peran untuk Mendelegasikan Izin ke AWS Layanan di Panduan Pengguna IAM.

- Aplikasi yang berjalan di Amazon EC2 - Anda dapat menggunakan peran IAM untuk mengelola kredensi sementara untuk aplikasi yang berjalan pada instans Amazon EC2 dan membuat permintaan CLI atau API. AWS AWS Ini lebih baik untuk menyimpan kunci akses dalam instans Amazon EC2. Untuk menetapkan AWS peran ke instans Amazon EC2 dan membuatnya tersedia untuk semua aplikasinya, Anda membuat profil instans yang dilampirkan ke instans. Profil instans berisi peran dan memungkinkan program yang berjalan di instans Amazon EC2 untuk mendapatkan kredensi sementara. Untuk informasi selengkapnya, lihat Menggunakan IAM role untuk memberikan izin ke aplikasi yang berjalan di instans Amazon EC2 dalam Panduan pengguna IAM.

- Otentikasi pengguna IAM Identity Center ke portal pengguna IAM Identity Center dikendalikan oleh direktori yang telah Anda sambungkan ke IAM Identity Center. Namun, otorisasi ke AWS akun yang tersedia untuk pengguna akhir dari dalam portal pengguna ditentukan oleh dua faktor:
  - Siapa yang telah diberi akses ke AWS akun tersebut di konsol Pusat AWS Identitas IAM. Untuk informasi selengkapnya, lihat Akses Masuk Tunggal di AWS IAM Identity Center Panduan Pengguna.
  - Tingkat izin apa yang telah diberikan kepada pengguna akhir di konsol Pusat Identitas AWS IAM untuk memungkinkan mereka akses yang sesuai ke akun tersebut. AWS Untuk informasi selengkapnya, lihat Set Izin di PanduanAWS IAM Identity Center Pengguna.

Kontrol akses

Untuk membuat, memperbarui, menghapus, atau mencantumkan sumber daya AWS Control Tower, atau AWS sumber daya lain di landing zone, Anda memerlukan izin untuk melakukan operasi, dan Anda memerlukan izin untuk mengakses sumber daya terkait. Selain itu, untuk melakukan operasi secara terprogram, Anda memerlukan kunci akses yang valid.

Bagian berikut menjelaskan cara mengelola izin untuk AWS Control Tower:

Topik

- Gambaran umum tentang mengelola izin akses ke sumber daya AWS Control Tower Anda
- Menggunakan kebijakan berbasis identitas (kebijakan IAM) untuk AWS Control Tower

Bekerja dengan AWS IAM Identity Center dan AWS Control Tower

Di AWS Control Tower, IAM Identity Center memungkinkan administrator cloud pusat dan pengguna akhir untuk mengelola akses ke beberapa AWS akun dan aplikasi bisnis. Secara default, AWS Control Tower menggunakan layanan ini untuk mengatur dan mengelola akses ke akun yang dibuat melalui Account Factory, kecuali Anda telah memilih opsi untuk mengelola sendiri identitas dan kontrol akses Anda.

Untuk informasi selengkapnya tentang memilih provder identitas, lihatPanduan Pusat Identitas IAM.

Untuk tutorial singkat tentang cara mengatur pengguna IAM Identity Center dan izin di AWS Control Tower, Anda dapat melihat video ini (6:23). Untuk tampilan yang lebih baik, pilih ikon di sudut kanan bawah video untuk memperbesarnya ke layar penuh. Captioning tersedia.

Panduan Video Menyiapkan Pusat Identitas AWS IAM di AWS Control Tower.

Tentang menyiapkan AWS Control Tower dengan IAM Identity Center

Saat Anda pertama kali menyiapkan AWS Control Tower, hanya pengguna pengguna root dan pengguna IAM dengan izin yang benar yang dapat menambahkan pengguna IAM Identity Center. Namun, setelah pengguna akhir ditambahkan dalam AWSAccountFactorygrup, mereka dapat membuat pengguna Pusat Identitas IAM baru dari wizard Account Factory. Untuk informasi selengkapnya, lihat Menyediakan dan mengelola akun dengan Account Factory.

Jika Anda memilih default yang disarankan, AWS Control Tower menyiapkan landing zone Anda dengan direktori yang telah dikonfigurasi sebelumnya yang membantu Anda mengelola identitas pengguna dan sistem masuk tunggal, sehingga pengguna Anda memiliki akses gabungan di seluruh akun. Saat menyiapkan landing zone, direktori default ini dibuat untuk berisi grup pengguna dan set izin.

> **Note**
>
> Anda dapat mendelegasikan administrasi AWS IAM Identity Center di organisasi Anda ke akun selain akun manajemen, dengan menggunakan fitur administrator yang didelegasikan

dari Pusat Identitas IAM. Jika Anda memilih untuk menggunakan fitur ini, ketahuilah bahwa Administrator dengan akses untuk mengelola keanggotaan grup juga dapat mengelola grup yang ditetapkan ke akun manajemen. Untuk informasi lebih lanjut, lihat posting blog ini, berjudul, Memulai dengan administrasi delegasi AWS SSO

Grup pengguna, peran, dan set izin

Grup pengguna mengelola peran khusus yang ditentukan dalam akun bersama Anda. Peran menetapkan set izin yang dimiliki bersama. Semua anggota grup mewarisi set izin, atau peran, yang terkait dengan grup. Anda dapat membuat grup baru untuk pengguna akhir akun anggota Anda, sehingga Anda hanya dapat menetapkan peran yang diperlukan untuk tugas tertentu yang dilakukan grup.

Set izin yang tersedia mencakup berbagai persyaratan izin pengguna yang berbeda, seperti akses hanya-baca, akses administratif AWS Control Tower, dan akses Service Catalog. Set izin ini memungkinkan pengguna akhir Anda untuk menyediakan AWS akun mereka sendiri di landing zone Anda dengan cepat, dan sesuai dengan pedoman perusahaan Anda.

Untuk tips merencanakan alokasi pengguna, grup, dan izin Anda, lihat Rekomendasi untuk menyiapkan grup, peran, dan kebijakan

Untuk informasi selengkapnya tentang cara menggunakan layanan ini dalam konteks AWS Control Tower, lihat topik berikut di PanduanAWS IAM Identity Center Pengguna.

- Untuk menambahkan pengguna, lihat Menambahkan Pengguna.
- Untuk menambahkan pengguna ke grup, lihat Menambahkan Pengguna ke Grup.
- Untuk mengedit properti pengguna, lihat Mengedit Properti Pengguna.
- Untuk menambahkan grup, lihat Menambahkan Grup.

Warning

AWS Control Tower menyiapkan direktori Pusat Identitas IAM Anda di Wilayah asal Anda. Jika Anda mengatur landing zone di Wilayah lain dan kemudian menavigasi ke konsol Pusat Identitas IAM, Anda harus mengubah Wilayah ke wilayah asal Anda. Jangan hapus konfigurasi Pusat Identitas IAM Anda di Wilayah rumah Anda.

Hal yang perlu diketahui tentang akun IAM Identity Center dan AWS Control Tower

Berikut adalah beberapa hal baik yang perlu diketahui saat bekerja dengan akun pengguna IAM Identity Center di AWS Control Tower.

- Jika akun pengguna AWS IAM Identity Center dinonaktifkan, Anda akan mendapatkan pesan galat saat mencoba menyediakan akun baru di Account Factory. Anda dapat mengaktifkan kembali pengguna Pusat Identitas IAM Anda di konsol Pusat Identitas IAM.
- Jika Anda menentukan alamat email pengguna IAM Identity Center baru saat memperbarui produk yang disediakan yang terkait dengan akun yang dijual oleh Account Factory, AWS Control Tower akan membuat akun pengguna IAM Identity Center baru. Akun pengguna yang dibuat sebelumnya tidak dihapus. Jika Anda memilih untuk menghapus alamat email pengguna IAM Identity Center sebelumnya dari AWS IAM Identity Center, lihat Menonaktifkan Pengguna.
- AWS IAM Identity Center telah terintegrasi dengan Azure Active Directory, dan Anda dapat menghubungkan Azure Active Directory yang ada ke AWS Control Tower.
- Untuk informasi selengkapnya tentang bagaimana perilaku AWS Control Tower berinteraksi dengan AWS IAM Identity Center dan berbagai sumber identitas, lihat Pertimbangan untuk Mengubah Sumber Identitas Anda dalam dokumentasi AWS IAM Identity Center.

Grup Pusat Identitas IAM untuk AWS Control Tower

AWS Control Tower menawarkan grup yang telah dikonfigurasi sebelumnya untuk mengatur pengguna yang melakukan tugas tertentu di akun Anda. Anda dapat menambahkan pengguna dan menetapkan mereka ke grup ini secara langsung di Pusat Identitas IAM. Melakukannya mencocokkan set izin ke pengguna dalam grup dalam akun Anda. Grup berikut dibuat saat Anda mengatur landing zone Anda.

AWSAccountFactory

Akun	Set izin	Deskripsi
Akun manajemen	AWSServiceCatalogEndUserAccess	Grup ini hanya digunakan di akun ini untuk menyediakan akun baru menggunakan Account Factory.

AWSServiceCatalogAdmins

Akun	Set izin	Deskripsi
Akun manajemen	AWSServiceCatalogAdminFullAccess	Grup ini hanya digunakan di akun ini untuk melakukan perubahan administratif pada Account Factory. Pengguna di grup ini tidak dapat menyediakan akun baru kecuali mereka juga berada di AWSAccountFactorygrup.

AWSControlTowerAdmins

Akun	Set izin	Deskripsi
Akun manajemen	AWSAdministratorAccess	Pengguna grup ini di akun ini adalah satu-satunya yang memiliki akses ke konsol AWS Control Tower.
Akun arsip log	AWSAdministratorAccess	Pengguna memiliki akses administrator di akun ini.
Akun audit	AWSAdministratorAccess	Pengguna memiliki akses administrator di akun ini.
Akun anggota	AWSOrganizationsFullAccess	Pengguna memiliki akses penuh ke Organizations di akun ini.

AWSSecurityAuditPowerUsers

Akun	Set izin	Deskripsi
Akun manajemen	AWSPowerUserAccess	Pengguna dapat melakukan tugas pengembangan aplikasi

Akun	Set izin	Deskripsi
		dan dapat membuat dan mengkonfigurasi sumber daya dan layanan yang mendukung pengembangan aplikasi AWS sadar.
Akun arsip log	AWSPowerUserAccess	Pengguna dapat melakukan tugas pengembangan aplikasi dan dapat membuat dan mengkonfigurasi sumber daya dan layanan yang mendukung pengembangan aplikasi AWS sadar.
Akun audit	AWSPowerUserAccess	Pengguna dapat melakukan tugas pengembangan aplikasi dan dapat membuat dan mengkonfigurasi sumber daya dan layanan yang mendukung pengembangan aplikasi AWS sadar.
Akun anggota	AWSPowerUserAccess	Pengguna dapat melakukan tugas pengembangan aplikasi dan dapat membuat dan mengkonfigurasi sumber daya dan layanan yang mendukung pengembangan aplikasi AWS sadar.

AWSSecurityAuditors

Akun	Set izin	Deskripsi
Akun manajemen	AWSReadOnlyAccess	Pengguna memiliki akses hanya-baca ke semua AWS

Akun	Set izin	Deskripsi
		layanan dan sumber daya di akun ini.
Akun arsip log	AWSReadOnlyAccess	Pengguna memiliki akses hanya-baca ke semua AWS layanan dan sumber daya di akun ini.
Akun audit	AWSReadOnlyAccess	Pengguna memiliki akses hanya-baca ke semua AWS layanan dan sumber daya di akun ini.
Akun anggota	AWSReadOnlyAccess	Pengguna memiliki akses hanya-baca ke semua AWS layanan dan sumber daya di akun ini.

AWSLogArchiveAdmins

Akun	Set izin	Deskripsi
Akun arsip log	AWSAdministratorAccess	Pengguna memiliki akses administrator di akun ini.

AWSLogArchiveViewers

Akun	Set izin	Deskripsi
Akun arsip log	AWSReadOnlyAccess	Pengguna memiliki akses hanya-baca ke semua AWS layanan dan sumber daya di akun ini.

AWSAuditAccountAdmins

Akun	Set izin	Deskripsi
Akun audit	AWSAdministratorAccess	Pengguna memiliki akses administrator di akun ini.

Gambaran umum tentang mengelola izin akses ke sumber daya AWS Control Tower Anda

Setiap AWS sumber daya dimiliki oleh Akun AWS, dan izin untuk membuat atau mendapatkan akses ke sumber daya diatur oleh kebijakan izin. Administrator akun dapat melampirkan kebijakan izin pada identitas IAM (yaitu pengguna, grup, dan peran). Beberapa layanan (seperti AWS Lambda) juga mendukung melampirkan kebijakan izin ke sumber daya.

> **Note**
>
> Administrator akun (atau administrator) adalah pengguna dengan hak administrator. Untuk informasi selengkapnya tentang administrator, lihat Praktik Terbaik IAM dalam Panduan Pengguna IAM.

Ketika Anda bertanggung jawab untuk memberikan izin kepada pengguna atau peran, Anda harus mengetahui dan melacak pengguna dan peran yang memerlukan izin, sumber daya yang setiap pengguna dan peran memerlukan izin, dan tindakan spesifik yang harus diizinkan untuk mengoperasikan sumber daya tersebut.

Topik

- Sumber daya dan operasi AWS Control Tower
- Tentang kepemilikan sumber daya
- Kelola akses ke sumber daya
- Tentukan elemen kebijakan: Tindakan, Efek, dan Prinsip
- Menentukan kondisi dalam kebijakan

Sumber daya dan operasi AWS Control Tower

Di AWS Control Tower, sumber daya utamanya adalah landing zone. AWS Control Tower juga mendukung jenis sumber daya tambahan, kontrol, kadang-kadang disebut sebagai pagar pembatas. Namun, untuk AWS Control Tower, Anda dapat mengelola kontrol hanya dalam konteks landing zone yang ada. Kontrol dapat disebut sebagai subresource.

Sumber daya dan subsumber daya AWS memiliki Nama Sumber Daya Amazon (ARN) unik yang terkait dengannya, seperti yang ditunjukkan pada contoh berikut.

AWS Control Tower menyediakan serangkaian operasi API untuk bekerja dengan sumber daya AWS Control Tower. Untuk daftar operasi yang tersedia, lihat AWS Control Tower, AWS Control Tower Referensi API AWS Control Tower.

Untuk informasi selengkapnya tentang AWS CloudFormation sumber daya di AWS Control Tower, lihat Panduan AWS CloudFormation Pengguna.

Tentang kepemilikan sumber daya

AWS Akun memiliki sumber daya yang dibuat di akun, terlepas dari siapa yang membuat sumber daya. Secara khusus, pemilik sumber daya adalah AWS akun entitas utama (yaitu, pengguna Akun AWS root, pengguna Pusat Identitas IAM, pengguna IAM, atau peran IAM) yang mengautentikasi permintaan pembuatan sumber daya. Contoh berikut menggambarkan cara kerjanya:

- Jika Anda menggunakan kredensi pengguna root AWS akun AWS akun Anda untuk menyiapkan landing zone, AWS akun Anda adalah pemilik sumber daya.
- Jika Anda membuat pengguna IAM di AWS akun Anda dan memberikan izin untuk menyiapkan landing zone kepada pengguna tersebut, pengguna dapat menyiapkan landing zone selama akun mereka memenuhi prasyarat. Namun, AWS akun Anda, tempat pengguna berada, memiliki sumber daya landing zone.
- Jika Anda membuat peran IAM di AWS akun dengan izin untuk menyiapkan landing zone, siapa pun yang dapat mengambil peran tersebut dapat menyiapkan landing zone. AWS Akun Anda, tempat perannya berada, memiliki sumber daya landing zone.

Kelola akses ke sumber daya

Kebijakan izin menjelaskan siapa yang memiliki akses ke suatu objek. Bagian berikut menjelaskan opsi yang tersedia untuk membuat kebijakan izin.

> **Note**
>
> Bagian ini membahas penggunaan IAM dalam konteks AWS Control Tower. Bagian ini tidak memberikan informasi yang mendetail tentang layanan IAM. Untuk dokumentasi IAM lengkap, lihat Apa yang Dimaksud dengan IAM? dalam Panduan Pengguna IAM. Untuk informasi tentang sintaksis dan deskripsi kebijakan IAM, lihat Referensi Kebijakan IAMAWS dalam Panduan Pengguna IAM.

Kebijakan yang melekat pada identitas IAM disebut sebagai kebijakan berbasis identitas (kebijakan IAM). Kebijakan yang dilampirkan pada sumber daya disebut sebagai kebijakan berbasis-sumber daya.

> **Note**
>
> AWS Control Tower hanya mendukung kebijakan berbasis identitas (kebijakan IAM).

Topik

- Tentang kebijakan berbasis identitas (kebijakan IAM)
- Buat peran dan tetapkan izin
- Kebijakan berbasis sumber daya

Tentang kebijakan berbasis identitas (kebijakan IAM)

Anda dapat melampirkan kebijakan ke identitas IAM Anda. Misalnya, Anda dapat melakukan hal berikut:

- Lampirkan kebijakan izin ke pengguna atau grup di akun Anda — Untuk memberikan izin pengguna untuk membuat sumber daya AWS Control Tower, seperti menyiapkan landing zone, Anda dapat melampirkan kebijakan izin ke pengguna atau grup tempat pengguna tersebut berada.
- Melampirkan kebijakan izin pada peran (memberikan izin lintas akun) – Anda dapat melampirkan kebijakan izin berbasis identitas ke peran IAM untuk memberikan izin lintas akun. Misalnya, administrator untuk satu AWS akun (Akun A) dapat membuat peran yang memberikan izin lintas akun ke akun lain (AWS Akun B), atau administrator dapat membuat peran yang memberikan izin ke layanan lain. AWS

1. Administrator Akun A membuat peran IAM dan melampirkan kebijakan izin ke peran yang memberikan izin untuk mengelola sumber daya di Akun A.
2. Administrator Akun A melampirkan kebijakan kepercayaan ke peran tersebut. Kebijakan mengidentifikasi Akun B sebagai kepala sekolah yang dapat mengambil peran.
3. Sebagai prinsipal, administrator Akun B dapat memberikan izin kepada pengguna di Akun B untuk mengambil peran tersebut. Dengan mengasumsikan peran tersebut, pengguna di Akun B dapat membuat atau mendapatkan akses ke sumber daya di Akun A.
4. Untuk memberikan AWS layanan kemampuan (izin) untuk mengambil peran, prinsipal yang Anda tentukan dalam kebijakan kepercayaan dapat berupa AWS layanan.

Buat peran dan tetapkan izin

Peran dan izin memberi Anda akses ke sumber daya, di AWS Control Tower, dan di AWS layanan lainnya, termasuk akses terprogram ke sumber daya.

Untuk memberikan akses, tambahkan izin ke pengguna, grup, atau peran Anda:

- Pengguna dan grup di AWS IAM Identity Center:

  Buat rangkaian izin. Ikuti petunjuk dalam Buat set izin dalam Panduan PenggunaAWS IAM Identity Center .
- Pengguna yang dikelola di IAM melalui penyedia identitas:

  Buat peran untuk federasi identitas. Ikuti petunjuk dalam Membuat peran untuk penyedia identitas pihak ketiga (federasi) di Panduan Pengguna IAM.
- Pengguna IAM:
  - Buat peran yang dapat diambil pengguna Anda. Ikuti petunjuk dalam Membuat peran untuk pengguna IAM dalam Panduan Pengguna IAM.
  - (Tidak disarankan) Pasang kebijakan langsung ke pengguna atau tambahkan pengguna ke grup pengguna. Ikuti petunjuk di Menambahkan izin ke pengguna (konsol) dalam Panduan Pengguna IAM.

Untuk informasi selengkapnya tentang penggunaan IAM untuk mendelegasikan izin, lihat Manajemen Akses dalam Panduan Pengguna IAM.

> **Note**
>
> Saat menyiapkan zona landing zone AWS Control Tower, Anda memerlukan pengguna atau peran dengan kebijakan AdministratorAccessterkelola. (arn:aws:iam: :aws:policy/) AdministratorAccess

Untuk membuat peran untuk Layanan AWS (konsol IAM)

1. Masuk ke AWS Management Console dan buka konsol IAM di https://console.aws.amazon.com/iam/.
2. Di panel navigasi konsol IAM, pilih Peran, dan lalu pilih Buat peran.
3. Untuk jenis entitas Tepercaya, pilih Layanan AWS.
4. Untuk kasus Layanan atau penggunaan, pilih layanan, lalu pilih kasus penggunaan. Kasus penggunaan ditentukan oleh layanan untuk menyertakan kebijakan kepercayaan yang diperlukan layanan.
5. Pilih Berikutnya.
6. Untuk kebijakan Izin, opsi bergantung pada kasus penggunaan yang Anda pilih:
   - Jika layanan menentukan izin untuk peran tersebut, Anda tidak dapat memilih kebijakan izin.
   - Pilih dari serangkaian kebijakan izin terbatas.
   - Pilih dari semua kebijakan izin.
   - Pilih kebijakan tanpa izin, buat kebijakan setelah peran dibuat, lalu lampirkan kebijakan ke peran.
7. (Opsional) Tetapkan batas izin. Ini adalah fitur lanjutan yang tersedia untuk peran layanan, tetapi bukan peran tertaut layanan.
   a. Buka bagian Setel batas izin, lalu pilih Gunakan batas izin untuk mengontrol izin peran maksimum.

      IAM menyertakan daftar kebijakan yang AWS dikelola dan dikelola pelanggan di akun Anda.

   b. Pilih kebijakan yang akan digunakan untuk batas izin.
8. Pilih Berikutnya.
9. Untuk nama Peran, opsi bergantung pada layanan:
   - Jika layanan menentukan nama peran, Anda tidak dapat mengedit nama peran.

- Jika layanan mendefinisikan awalan untuk nama peran, Anda dapat memasukkan akhiran opsional.
- Jika layanan tidak menentukan nama peran, Anda dapat memberi nama peran.

> **Important**
>
> Saat Anda memberi nama peran, perhatikan hal berikut:
>
> - Nama peran harus unik di dalam diri Anda Akun AWS, dan tidak dapat dibuat unik berdasarkan kasus.
>
> Misalnya, jangan membuat peran bernama keduanya **`PRODROLE`** dan**`prodrole`**. Ketika nama peran digunakan dalam kebijakan atau sebagai bagian dari ARN, nama peran tersebut peka huruf besar/kecil, namun ketika nama peran muncul kepada pelanggan di konsol, seperti selama proses masuk, nama peran tersebut tidak peka huruf besar/kecil.
> - Anda tidak dapat mengedit nama peran setelah dibuat karena entitas lain mungkin mereferensikan peran tersebut.

10. (Opsional) Untuk Deskripsi, masukkan deskripsi untuk peran tersebut.
11. (Opsional) Untuk mengedit kasus penggunaan dan izin untuk peran, di Langkah 1: Pilih entitas tepercaya atau Langkah 2: Tambahkan izin, pilih Edit.
12. (Opsional) Untuk membantu mengidentifikasi, mengatur, atau mencari peran, tambahkan tag sebagai pasangan nilai kunci. Untuk informasi selengkapnya tentang penggunaan tanda di IAM, lihat Menandai sumber daya IAM di Panduan Pengguna IAM.
13. Tinjau peran lalu pilih Buat peran.

Cara menggunakan editor kebijakan JSON untuk membuat kebijakan

1. Masuk ke AWS Management Console dan buka konsol IAM di https://console.aws.amazon.com/iam/.
2. Pada panel navigasi di sebelah kiri, pilih Kebijakan.

   Jika ini pertama kalinya Anda memilih Kebijakan, akan muncul halaman Selamat Datang di Kebijakan Terkelola. Pilih Memulai.
3. Di bagian atas halaman, pilih Buat kebijakan.
4. Di bagian Editor kebijakan, pilih opsi JSON.

5. Masukkan atau tempel dokumen kebijakan JSON. Untuk detail bahasa kebijakan IAM, lihat Referensi kebijakan JSON IAM.
6. Selesaikan peringatan keamanan, kesalahan, atau peringatan umum yang dihasilkan selama validasi kebijakan, lalu pilih Berikutnya.

> **Note**
>
> Anda dapat beralih antara opsi editor Visual dan JSON kapan saja. Namun, jika Anda melakukan perubahan atau memilih Berikutnya di editor Visual, IAM dapat merestrukturisasi kebijakan Anda untuk mengoptimalkannya bagi editor visual. Untuk informasi selengkapnya, lihat Restrukturisasi kebijakan dalam Panduan Pengguna IAM.

7. (Opsional) Saat membuat atau mengedit kebijakan AWS Management Console, Anda dapat membuat templat kebijakan JSON atau YAMB yang dapat Anda gunakan dalam AWS CloudFormation templat.

   Untuk melakukannya, di editor Kebijakan pilih Tindakan, lalu pilih Buat CloudFormation templat. Untuk mempelajari selengkapnya AWS CloudFormation, lihat referensi jenisAWS Identity and Access Management sumber daya di PanduanAWS CloudFormation Pengguna.
8. Setelah selesai menambahkan izin ke kebijakan, pilih Berikutnya.
9. Pada halaman Tinjau dan buat, masukkan Nama kebijakan dan Deskripsi (opsional) untuk kebijakan yang Anda buat. Tinjau Izin yang ditentukan dalam kebijakan ini untuk melihat izin yang diberikan oleh kebijakan Anda.
10. (Opsional) Tambahkan metadata ke kebijakan dengan melampirkan tanda sebagai pasangan nilai kunci. Untuk informasi selengkapnya tentang penggunaan tanda di IAM, lihat Menandai sumber daya IAM di Panduan Pengguna IAM.
11. Pilih Buat kebijakan untuk menyimpan kebijakan baru Anda.

Untuk menggunakan editor visual dalam pembuatan kebijakan

1. Masuk ke AWS Management Console dan buka konsol IAM di https://console.aws.amazon.com/iam/.
2. Pada panel navigasi di sebelah kiri, pilih Kebijakan.

   Jika ini pertama kalinya Anda memilih Kebijakan, akan muncul halaman Selamat Datang di Kebijakan Terkelola. Pilih Memulai.

3. Pilih Buat kebijakan.
4. Di bagian Editor kebijakan, temukan bagian Pilih layanan, lalu pilih Layanan AWS. Anda bisa menggunakan kotak pencarian di bagian atas untuk membatasi hasil pada daftar layanan. Anda bisa memilih hanya satu layanan pada blok izin editor visual. Untuk memberikan akses ke lebih dari satu layanan, tambahkan beberapa blok izin dengan memilih Tambahkan lebih banyak izin.
5. Di Tindakan yang diizinkan, pilih tindakan yang akan ditambahkan ke kebijakan. Anda bisa memilih tindakan dengan cara berikut:

   - Pilih kotak centang untuk semua tindakan.
   - Pilih Tambahkan tindakan untuk memasukkan nama tindakan tertentu. Anda dapat menggunakan karakter wildcard (*) untuk menentukan beberapa tindakan.
   - Pilih satu grup Tingkat akses untuk memilih semua tindakan untuk tingkat akses tersebut (misalnya, Baca, Tulis, atau Daftar).
   - Perluas setiap grup Tingkat akses untuk memilih tindakan individu.

   Secara default, kebijakan yang Anda buat mengizinkan tindakan yang Anda pilih. Sebaliknya, untuk menolak tindakan terpilih, pilih Beralih ke menolak izin. Karena IAM menolak secara default, kami merekomendasikan sebagai praktik terbaik keamanan agar Anda mengizinkan hanya tindakan dan sumber daya yang diperlukan pengguna saja. Buat pernyataan JSON untuk menolak izin hanya jika Anda ingin mengganti izin secara terpisah yang diizinkan oleh pernyataan atau kebijakan lain. Kami sarankan Anda membatasi jumlah izin penolakan seminim mungkin karena dapat meningkatkan kesulitan izin pemecahan masalah.
6. Untuk Sumber Daya, bila layanan dan tindakan yang Anda pilih di langkah sebelumnya tidak mendukung pilihan sumber daya tertentu, semua sumber daya diperbolehkan dan Anda tidak bisa mengedit bagian ini.

   Jika Anda memilih satu atau lebih tindakan yang mendukungizin tingkat sumber daya, maka editor visual akan mendaftar sumber daya tersebut. Kemudian Anda bisa memperluas Sumber Daya untuk menentukan sumber daya bagi kebijakan Anda.

   Anda dapat menentukan sumber daya dengan cara berikut:

   - Pilih Tambahkan ARN untuk menentukan sumber daya berdasarkan Nama Sumber Daya Amazon (ARN) mereka. Anda dapat menggunakan editor ARN visual atau mendaftar ARN secara manual. Untuk informasi selengkapnya tentang sintaks ARN, lihat Amazon Resource Names (ARN) di Panduan Pengguna IAM. Untuk informasi tentang penggunaan ARN dalam

`Resource` elemen kebijakan, lihat elemen kebijakan IAM JSON: Sumber daya dalam Panduan Pengguna IAM.

- Pilih Apa saja di akun ini di samping sumber daya untuk memberikan izin ke sumber daya apa pun dari jenis itu.
- Pilih Semua untuk memilih semua sumber daya untuk layanan ini.

7. (Opsional) Pilih Ketentuan permintaan - opsional untuk menambahkan kondisi ke kebijakan yang Anda buat. Kondisi membatasi efek dari pernyataan kebijakan JSON. Misalnya, Anda dapat menentukan bahwa pengguna diizinkan melakukan tindakan pada sumber daya hanya ketika permintaan pengguna tersebut terjadi di rentang waktu tertentu. Anda juga dapat menggunakan kondisi yang umum digunakan untuk membatasi apakah pengguna harus diautentikasi dengan menggunakan perangkat otentikasi multi-faktor (MFA). Atau Anda bisa meminta agar permintaan yang berasal dari rentang alamat IP tertentu. Untuk daftar semua kunci konteks yang dapat Anda gunakan dalam kondisi kebijakan, lihat Tindakan, sumber daya, dan kunci kondisi untuk AWS layanan di Referensi Otorisasi Layanan.

   Anda bisa memilih kondisi dengan cara berikut:

   - Gunakan kotak centang untuk memilih kondisi yang biasa dipakai.
   - Pilih Tambahkan kondisi lain untuk menentukan kondisi lain. Pilih Condition Key, Qualifier, dan Operator kondisi, lalu masukkan Nilai. Untuk menambahkan lebih dari satu nilai, pilih Tambah. Anda dapat mempertimbangkan nilai-nilai sebagai terhubung oleh `OR` operator logis. Setelah selesai, pilih Tambahkan kondisi.

   Untuk menambahkan lebih dari satu kondisi, pilih Tambahkan kondisi lain lagi. Ulangi seperlunya. Setiap kondisi berlaku hanya untuk blok izin editor visual yang satu ini. Semua kondisi haruslah benar agar blok izin dapat dianggap cocok. Dengan kata lain, pertimbangkan kondisi yang akan dihubungkan oleh `AND` operator logis.

   Untuk informasi selengkapnya tentang elemen Kondisi, lihat elemen kebijakan IAM JSON: Kondisi dalam Panduan Pengguna IAM.

8. Untuk menambahkan lebih banyak blok izin, pilih Tambahkan izin lainnya. Untuk setiap blok, ulangi langkah 2 sampai 5.

> **Note**
>
> Anda dapat beralih antara opsi editor Visual dan JSON kapan saja. Namun, jika Anda melakukan perubahan atau memilih Berikutnya di editor Visual, IAM dapat merestrukturisasi kebijakan Anda untuk mengoptimalkannya bagi editor visual. Untuk informasi selengkapnya, lihat Restrukturisasi kebijakan dalam Panduan Pengguna IAM.

9. (Opsional) Saat membuat atau mengedit kebijakan AWS Management Console, Anda dapat membuat templat kebijakan JSON atau YAMB yang dapat Anda gunakan dalam AWS CloudFormation templat.

   Untuk melakukannya, di editor Kebijakan pilih Tindakan, lalu pilih Buat CloudFormation templat. Untuk mempelajari selengkapnya AWS CloudFormation, lihat referensi jenisAWS Identity and Access Management sumber daya di PanduanAWS CloudFormation Pengguna.
10. Setelah selesai menambahkan izin ke kebijakan, pilih Berikutnya.
11. Pada halaman Tinjau dan buat, masukkan Nama kebijakan dan Deskripsi (opsional) untuk kebijakan yang Anda buat. Tinjau Izin yang ditentukan dalam kebijakan ini untuk memastikan bahwa Anda telah memberikan izin yang dimaksud.
12. (Opsional) Tambahkan metadata ke kebijakan dengan melampirkan tanda sebagai pasangan nilai kunci. Untuk informasi selengkapnya tentang penggunaan tanda di IAM, lihat Menandai sumber daya IAM di Panduan Pengguna IAM.
13. Pilih Buat kebijakan untuk menyimpan kebijakan baru Anda.

Untuk memberikan akses terprogram

Pengguna membutuhkan akses terprogram jika mereka ingin berinteraksi dengan AWS luar. AWS Management ConsoleCara untuk memberikan akses terprogram tergantung pada jenis pengguna yang mengakses AWS.

Untuk memberi pengguna akses terprogram, pilih salah satu opsi berikut.

Pengguna mana yang membutuhkan akses terprogram?	Untuk	Oleh
Identitas tenaga kerja (Pengguna yang dikelola di Pusat Identitas IAM)	Gunakan kredenal sementara untuk menandatangani permintaan terprogram ke AWS CLI, AWS SDK, atau API. AWS	Mengikuti petunjuk untuk antarmuka yang ingin Anda gunakan. • Untuk AWS CLI, lihat Mengkonfigurasi yang akan AWS CLI digunakan AWS IAM Identity Center dalam PanduanAWS Command Line Interface Pengguna. • Untuk AWS SDK, alat, dan AWS API, lihat autentikasi Pusat Identitas IAM di Panduan Referensi AWS SDK dan Alat.
IAM	Gunakan kredenal sementara untuk menandatangani permintaan terprogram ke AWS CLI, AWS SDK, atau API. AWS	Mengikuti petunjuk dalam Menggunakan kredensi sementara dengan AWS sumber daya di Panduan Pengguna IAM.
IAM	(Tidak direkomendasikan) Gunakan kredenal jangka panjang untuk menandatangani permintaan terprogram ke AWS CLI, AWS SDK, atau API. AWS	Mengikuti petunjuk untuk antarmuka yang ingin Anda gunakan. • Untuk mengetahui AWS CLI, lihat Mengautentikasi menggunakan kredensi pengguna IAM di Panduan Pengguna.AWS Command Line Interface

Pengguna mana yang membutuhkan akses terprogram?	Untuk	Oleh
		• Untuk AWS SDK dan alat bantu, lihat Mengautentikasi menggunakan kredensil jangka panjang di Panduan ReferensiAWS SDK dan Alat. • Untuk AWS API, lihat Mengelola kunci akses untuk pengguna IAM di Panduan Pengguna IAM.

Melindungi dari penyerang

Untuk informasi selengkapnya tentang cara membantu melindungi dari penyerang saat Anda memberikan izin kepada prinsipal AWS layanan lain, lihat. Kondisi opsional untuk hubungan kepercayaan peran Anda Dengan menambahkan kondisi tertentu ke kebijakan Anda, Anda dapat membantu mencegah jenis serangan tertentu, yang dikenal sebagai serangan wakil bingung, yang terjadi jika entitas memaksa entitas yang lebih istimewa untuk melakukan tindakan, seperti dengan peniruan identitas lintas layanan. Untuk informasi umum tentang kondisi kebijakan, lihat jugaMenentukan kondisi dalam kebijakan.

Untuk informasi selengkapnya tentang penggunaan kebijakan berbasis identitas dengan AWS Control Tower, lihat. Menggunakan kebijakan berbasis identitas (kebijakan IAM) untuk AWS Control Tower Untuk informasi lebih lanjut tentang pengguna, grup, peran, dan izin, lihat Identitas (Pengguna, Grup, dan Peran) dalam Panduan Pengguna IAM.

Kebijakan berbasis sumber daya

Layanan lain, seperti Amazon S3, juga mendukung kebijakan izin berbasis sumber daya. Misalnya, Anda dapat melampirkan kebijakan ke bucket S3 untuk mengelola izin akses ke bucket tersebut. AWS Control Tower tidak mendukung kebijakan berbasis sumber daya.

Tentukan elemen kebijakan: Tindakan, Efek, dan Prinsip

Anda dapat mengatur dan mengelola landing zone melalui konsol AWS Control Tower, atau API landing zone. Untuk menyiapkan landing zone, Anda harus menjadi pengguna IAM dengan izin administratif sebagaimana didefinisikan dalam kebijakan IAM.

Elemen-elemen berikut adalah yang paling dasar yang dapat Anda identifikasi dalam suatu kebijakan:

- Sumber daya – Dalam kebijakan, Anda menggunakan Amazon Resource Name (ARN) untuk mengidentifikasi sumber daya yang diatur kebijakan. Untuk informasi selengkapnya, lihat Sumber daya dan operasi AWS Control Tower.
- Tindakan – Anda menggunakan kata kunci tindakan untuk mengidentifikasi operasi sumber daya yang ingin Anda izinkan atau tolak. Untuk informasi tentang jenis tindakan yang tersedia untuk dilakukan, lihat Tindakan yang ditentukan oleh AWS Control Tower.
- Efek – Anda menentukan efek ketika pengguna meminta tindakan tertentu—baik mengizinkan maupun menolak. Jika Anda tidak secara eksplisit memberikan akses ke (mengizinkan) sumber daya, akses akan ditolak secara implisit. Anda juga dapat secara eksplisit menolak akses ke sumber daya, yang mungkin Anda lakukan untuk memastikan bahwa pengguna tidak dapat mengaksesnya, meskipun ada akses memberikan kebijakan yang berbeda.
- Principal — Dalam kebijakan berbasis identitas (kebijakan IAM), pengguna yang melekat pada kebijakan tersebut adalah prinsipal implisit. Untuk kebijakan berbasis sumber daya, Anda menentukan pengguna, akun, layanan, atau entitas lain yang diinginkan untuk menerima izin (berlaku hanya untuk kebijakan berbasis sumber daya). AWS Control Tower tidak mendukung kebijakan berbasis sumber daya.

Untuk mempelajari selengkapnya tentang sintaksis dan deskripsi kebijakan IAM, lihat Referensi Kebijakan IAMAWS dalam Panduan Pengguna IAM.

Menentukan kondisi dalam kebijakan

Ketika Anda memberikan izin, Anda dapat menggunakan bahasa kebijakan IAM untuk menentukan kondisi ketika kebijakan harus berlaku. Misalnya, Anda mungkin ingin kebijakan diterapkan hanya setelah tanggal tertentu. Untuk informasi selengkapnya tentang menentukan kondisi dalam bahasa kebijakan, lihat Kondisi dalam Panduan Pengguna IAM.

Untuk menyatakan kondisi, Anda dapat menggunakan kunci kondisi yang telah ditentukan. Tidak ada kunci kondisi khusus untuk AWS Control Tower. Namun, ada tombol kondisi AWS-wide yang dapat

Anda gunakan sesuai kebutuhan. Untuk daftar lengkap tombol AWS-wide, lihat Kunci yang Tersedia untuk Ketentuan di Panduan Pengguna IAM.

Mencegah peniruan identitas lintas layanan

Pada tahun AWS, peniruan lintas layanan dapat mengakibatkan masalah wakil yang membingungkan. Ketika satu layanan memanggil layanan lain, peniruan identitas lintas layanan terjadi jika satu layanan memanipulasi layanan lain untuk menggunakan izinnya untuk bertindak atas sumber daya pelanggan dengan cara yang tidak diizinkan. Untuk mencegah serangan ini, AWS sediakan alat untuk membantu Anda melindungi data Anda, sehingga hanya layanan dengan izin yang sah yang dapat memperoleh akses ke sumber daya di akun Anda.

Sebaiknya gunakan `aws:SourceArn` dan `aws:SourceAccount` ketentuan dalam kebijakan Anda, untuk membatasi izin yang diberikan AWS Control Tower ke layanan lain untuk akses ke sumber daya Anda.

- Gunakan `aws:SourceArn` jika Anda hanya ingin satu sumber daya dikaitkan dengan akses lintas layanan.
- Gunakan `aws:SourceAccount` jika Anda ingin mengizinkan sumber daya apa pun di akun itu dikaitkan dengan penggunaan lintas layanan.
- Jika `aws:SourceArn` nilainya tidak berisi ID akun, seperti ARN untuk bucket Amazon S3, Anda harus menggunakan kedua kondisi tersebut untuk membatasi izin.
- Jika Anda menggunakan kedua kondisi, dan jika `aws:SourceArn` nilainya berisi ID akun, `aws:SourceAccount` nilai dan akun dalam `aws:SourceArn` nilai harus menunjukkan ID akun yang sama saat digunakan dalam pernyataan kebijakan yang sama

Untuk informasi selengkapnya dan contoh tambahan, lihat Kondisi opsional untuk hubungan kepercayaan peran Anda.

Menggunakan kebijakan berbasis identitas (kebijakan IAM) untuk AWS Control Tower

Topik ini memberikan contoh kebijakan berbasis identitas yang menunjukkan bagaimana administrator akun dapat melampirkan kebijakan izin ke identitas IAM (yaitu, pengguna, grup, dan peran) dan dengan demikian memberikan izin untuk melakukan operasi pada sumber daya AWS Control Tower.

> **Important**
>
> Kami menyarankan Anda terlebih dahulu meninjau topik pengantar yang menjelaskan konsep dasar dan opsi yang tersedia bagi Anda untuk mengelola akses ke sumber daya AWS Control Tower Anda. Untuk informasi selengkapnya, lihat Gambaran umum tentang mengelola izin akses ke sumber daya AWS Control Tower Anda.

Izin yang Diperlukan untuk Menggunakan AWS Control Tower Console

AWS Control Tower membuat tiga peran secara otomatis saat Anda menyiapkan landing zone. Ketiga peran tersebut diperlukan untuk memungkinkan akses konsol. AWS Control Tower membagi izin menjadi tiga peran sebagai praktik terbaik untuk membatasi akses ke serangkaian tindakan dan sumber daya minimal.

Tiga peran yang dibutuhkan

- AWSControlTowerAdmin peran
- AWSControlTowerStackSetRole
- AWSControlTowerCloudTrailRole

Kami menyarankan Anda membatasi akses ke kebijakan kepercayaan peran Anda untuk peran ini. Untuk informasi selengkapnya, lihat Kondisi opsional untuk hubungan kepercayaan peran Anda.

AWSControlTowerAdmin peran

Peran ini memberi AWS Control Tower akses ke infrastruktur penting untuk mempertahankan landing zone. `AWSControlTowerAdmin`Peran tersebut membutuhkan kebijakan terkelola terlampir dan kebijakan kepercayaan peran untuk peran IAM. Kebijakan kepercayaan peran adalah kebijakan berbasis sumber daya, yang menentukan prinsip mana yang dapat mengambil peran tersebut.

Berikut contoh cuplikan untuk kebijakan kepercayaan peran ini:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
```

```
      "Principal": {
        "Service": "controltower.amazonaws.com"
      },
      "Action": "sts:AssumeRole"
    }
  ]
}
```

Untuk membuat peran ini dari AWS CLI, dan memasukkannya ke dalam file bernama`trust.json`, berikut adalah contoh perintah CLI:

```
aws iam create-role --role-name AWSControlTowerAdmin --path /service-role/ --assume-
role-policy-document file://trust.json
```

Peran ini membutuhkan dua kebijakan IAM.

1. Kebijakan inline, misalnya:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ec2:DescribeAvailabilityZones",
            "Resource": "*"
        }
    ]
}
```

2. Kebijakan terkelola yang mengikuti, yaitu`AWSControlTowerServiceRolePolicy`.

AWSControlTowerServiceRolePolicy

AWSControlTowerServiceRolePolicyIni adalah kebijakan AWSterkelola yang mendefinisikan izin untuk membuat dan mengelola sumber daya AWS Control Tower, seperti AWS CloudFormation stackset dan instance tumpukan, file AWS CloudTrail log, agregator konfigurasi untuk AWS Control Tower, AWS Organizations serta akun dan unit organisasi (OU) yang diatur oleh AWS Control Tower.

Pembaruan kebijakan terkelola ini dirangkum dalam tabel,Kebijakan terkelola untuk AWS Control Tower.

Untuk informasi selengkapnya, lihat AWSControlTowerServiceRolePolicydi Panduan Referensi Kebijakan Terkelola AWS.

Nama Kebijakan Terkelola: `AWSControlTowerServiceRolePolicy`

Artefak JSON untuk `AWSControlTowerServiceRolePolicy` adalah sebagai berikut:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "cloudformation:CreateStack",
                "cloudformation:CreateStackInstances",
                "cloudformation:CreateStackSet",
                "cloudformation:DeleteStack",
                "cloudformation:DeleteStackInstances",
                "cloudformation:DeleteStackSet",
                "cloudformation:DescribeStackInstance",
                "cloudformation:DescribeStacks",
                "cloudformation:DescribeStackSet",
                "cloudformation:DescribeStackSetOperation",
                "cloudformation:ListStackInstances",
                "cloudformation:UpdateStack",
                "cloudformation:UpdateStackInstances",
                "cloudformation:UpdateStackSet"
            ],
            "Resource": [
                "arn:aws:cloudformation:*:*:type/resource/AWS-IAM-Role"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "account:EnableRegion",
                "account:ListRegions",
                "account:GetRegionOptStatus"
            ],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": [
```

```
                "cloudformation:CreateStack",
                "cloudformation:CreateStackInstances",
                "cloudformation:CreateStackSet",
                "cloudformation:DeleteStack",
                "cloudformation:DeleteStackInstances",
                "cloudformation:DeleteStackSet",
                "cloudformation:DescribeStackInstance",
                "cloudformation:DescribeStacks",
                "cloudformation:DescribeStackSet",
                "cloudformation:DescribeStackSetOperation",
                "cloudformation:GetTemplate",
                "cloudformation:ListStackInstances",
                "cloudformation:UpdateStack",
                "cloudformation:UpdateStackInstances",
                "cloudformation:UpdateStackSet"
            ],
            "Resource": [
                "arn:aws:cloudformation:*:*:stack/AWSControlTower*/*",
                "arn:aws:cloudformation:*:*:stack/StackSet-AWSControlTower*/*",
                "arn:aws:cloudformation:*:*:stackset/AWSControlTower*:*",
                "arn:aws:cloudformation:*:*:stackset-target/AWSControlTower*/*"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "cloudtrail:CreateTrail",
                "cloudtrail:DeleteTrail",
                "cloudtrail:GetTrailStatus",
                "cloudtrail:StartLogging",
                "cloudtrail:StopLogging",
                "cloudtrail:UpdateTrail",
                "cloudtrail:PutEventSelectors",
                "logs:CreateLogStream",
                "logs:PutLogEvents",
                "logs:PutRetentionPolicy"
            ],
            "Resource": [
                "arn:aws:logs:*:*:log-group:aws-controltower/CloudTrailLogs:*",
                "arn:aws:cloudtrail:*:*:trail/aws-controltower*"
            ]
        },
        {
            "Effect": "Allow",
```

```
            "Action": [
                "s3:GetObject"
            ],
            "Resource": [
                "arn:aws:s3:::aws-controltower*/*"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "sts:AssumeRole"
            ],
            "Resource": [
                "arn:aws:iam::*:role/AWSControlTowerExecution",
                "arn:aws:iam::*:role/AWSControlTowerBlueprintAccess"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "cloudtrail:DescribeTrails",
                "ec2:DescribeAvailabilityZones",
                "iam:ListRoles",
                "logs:CreateLogGroup",
                "logs:DescribeLogGroups",
                "organizations:CreateAccount",
                "organizations:DescribeAccount",
                "organizations:DescribeCreateAccountStatus",
                "organizations:DescribeOrganization",
                "organizations:DescribeOrganizationalUnit",
                "organizations:DescribePolicy",
                "organizations:ListAccounts",
                "organizations:ListAccountsForParent",
                "organizations:ListAWSServiceAccessForOrganization",
                "organizations:ListChildren",
                "organizations:ListOrganizationalUnitsForParent",
                "organizations:ListParents",
                "organizations:ListPoliciesForTarget",
                "organizations:ListTargetsForPolicy",
                "organizations:ListRoots",
                "organizations:MoveAccount",
                "servicecatalog:AssociatePrincipalWithPortfolio"
            ],
            "Resource": "*"
```

```
        },
        {
            "Effect": "Allow",
            "Action": [
                "iam:GetRole",
                "iam:GetUser",

        "Service": [
          "controltower.amazonaws.com"
         ]
      },
      "Action": "sts:AssumeRole"
    }
  ]
}
```

Kebijakan inline adalah`AWSControlTowerAdminPolicy`:

```
{
```

```
    "Version": "2012-10-17",
    "Statement": [
        {
            "Action": "ec2:DescribeAvailabilityZones",
            "Resource": "*",
            "Effect": "Allow"
        }
    ]
}
```

AWSControlTowerStackSetRole

AWS CloudFormation mengasumsikan peran ini untuk menerapkan set tumpukan di akun yang dibuat oleh AWS Control Tower. Kebijakan Inline:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Action": [
                "sts:AssumeRole"
            ],
            "Resource": [
                "arn:aws:iam::*:role/AWSControlTowerExecution"
            ],
            "Effect": "Allow"
        }
    ]
}
```

Kebijakan kepercayaan

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "Service": "cloudformation.amazonaws.com"
            },
            "Action": "sts:AssumeRole"
        }
```

```
    ]
}
```

AWSControlTowerCloudTrailRole

AWS Control Tower memungkinkan CloudTrail sebagai praktik terbaik dan menyediakan peran ini CloudTrail. CloudTrailmengasumsikan peran ini untuk membuat dan menerbitkan CloudTrail log. Kebijakan Inline:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Action": "logs:CreateLogStream",
            "Resource": "arn:aws:logs:*:*:log-group:aws-controltower/CloudTrailLogs:*",
            "Effect": "Allow"
        },
        {
            "Action": "logs:PutLogEvents",
            "Resource": "arn:aws:logs:*:*:log-group:aws-controltower/CloudTrailLogs:*",
            "Effect": "Allow"
        }
    ]
}
```

Kebijakan kepercayaan

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "Service": "cloudtrail.amazonaws.com"
            },
            "Action": "sts:AssumeRole"
        }
    ]
}
```

AWSControlTowerBlueprintAccess persyaratan peran

AWS Control Tower mengharuskan Anda untuk membuat `AWSControlTowerBlueprintAccess` peran di akun hub cetak biru yang ditentukan, dalam organisasi yang sama.

Nama peran

Nama peran harus`AWSControlTowerBlueprintAccess`.

Kebijakan kepercayaan peran

Peran harus diatur untuk mempercayai prinsip-prinsip berikut:

- Prinsipal yang menggunakan AWS Control Tower di akun manajemen.
- `AWSControlTowerAdmin`Peran dalam akun manajemen.

Contoh berikut menunjukkan kebijakan kepercayaan paling tidak memiliki hak istimewa:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "AWS": [
                    "arn:aws:iam::ManagementAccountId:role/AWSControlTowerAdmin",
                    "arn:aws:iam::ManagementAccountId:role/YourControlTowerUserRole"
                ]
            },
            "Action": "sts:AssumeRole",
            "Condition": {}
        }
    ]
}
```

Izin peran

Anda diminta untuk melampirkan kebijakan yang dikelola AWSServiceCatalogAdminFullAccesske peran tersebut.

AWSServiceRoleForAWSControlTower

Peran ini memberi AWS Control Tower akses ke akun Arsip Log, akun Audit, dan akun anggota, untuk operasi yang penting untuk mempertahankan landing zone, seperti memberi tahu Anda tentang sumber daya yang hanyut.

`AWSServiceRoleForAWSControlTower`Peran tersebut membutuhkan kebijakan terkelola terlampir dan kebijakan kepercayaan peran untuk peran IAM.

Kebijakan terkelola untuk peran ini: `AWSControlTowerAccountServiceRolePolicy`

Kebijakan kepercayaan peran:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "Service": "controltower.amazonaws.com"
            },
            "Action": "sts:AssumeRole"
        }
    ]
}
```

AWSControlTowerAccountServiceRolePolicy

Kebijakan yang AWSdikelola ini memungkinkan AWS Control Tower memanggil AWS layanan yang menyediakan konfigurasi akun otomatis dan tata kelola terpusat atas nama Anda.

Kebijakan ini berisi izin minimum AWS Control Tower untuk menerapkan penerusan AWS Security Hub temuan untuk sumber daya yang dikelola oleh kontrol Security Hub yang merupakan bagian dari Standar yang dikelola Layanan Security Hub: AWS Control Tower, dan mencegah perubahan yang membatasi kemampuan mengelola akun pelanggan. Ini adalah bagian dari proses deteksi AWS Security Hub drift latar belakang yang tidak secara langsung diprakarsai oleh pelanggan.

Kebijakan ini memberikan izin untuk membuat EventBridge aturan Amazon, khususnya untuk kontrol Security Hub, di setiap akun anggota, dan aturan ini harus menentukan EventPattern persisnya. Selain itu, aturan hanya dapat beroperasi berdasarkan aturan yang dikelola oleh prinsipal layanan kami.

Prinsipal layanan: `controltower.amazonaws.com`

Artefak JSON untuk `AWSControlTowerAccountServiceRolePolicy` adalah sebagai berikut:

```
{
 "Version": "2012-10-17",
 "Statement": [
  {
  //For creating the managed rule
   "Sid": "AllowPutRuleOnSpecificSourcesAndDetailTypes",
   "Effect": "Allow",
   "Action": "events:PutRule",
   "Resource": "arn:aws:events:*:*:rule/*ControlTower*",
   "Condition": {
    "ForAnyValue:StringEquals": {
     "events:source": "aws.securityhub"
    },
    "Null": {
     "events:detail-type": "false"
    },
    "StringEquals": {
     "events:ManagedBy": "controltower.amazonaws.com",
     "events:detail-type": "Security Hub Findings - Imported"
    }
   }
  },
  // Other operations to manage the managed rule
  {
   "Sid": "AllowOtherOperationsOnRulesManagedByControlTower",
   "Effect": "Allow",
   "Action": [
    "events:DeleteRule",
    "events:EnableRule",
    "events:DisableRule",
    "events:PutTargets",
    "events:RemoveTargets"
   ],
   "Resource": "arn:aws:events:*:*:rule/*ControlTower*",
   "Condition": {
    "StringEquals": {
     "events:ManagedBy": "controltower.amazonaws.com"
    }
   }
  },
```

```
  // More managed rule permissions
  {
   "Sid": "AllowDescribeOperationsOnRulesManagedByControlTower",
   "Effect": "Allow",
   "Action": [
    "events:DescribeRule",
    "events:ListTargetsByRule"
   ],
   "Resource": "arn:aws:events:*:*:rule/*ControlTower*"
  },
  // Add permission to publish the security notifications to SNS
  {
   "Sid": "AllowControlTowerToPublishSecurityNotifications",
   "Effect": "Allow",
   "Action": "sns:publish",
   "Resource": "arn:aws:sns:*:*:aws-controltower-AggregateSecurityNotifications",
   "Condition": {
    "StringEquals": {
     "aws:PrincipalAccount": "${aws:ResourceAccount}"
    }
   }
  },
  // For drift verification
  {
   "Sid": "AllowActionsForSecurityHubIntegration",
   "Effect": "Allow",
   "Action": [
    "securityhub:DescribeStandardsControls",
    "securityhub:GetEnabledStandards"
   ],
   "Resource": "arn:aws:securityhub:*:*:hub/default"
  }
 ]
}
```

Pembaruan kebijakan terkelola ini dirangkum dalam tabel,Kebijakan terkelola untuk AWS Control Tower.

Kebijakan terkelola untuk AWS Control Tower

AWS mengatasi banyak kasus penggunaan umum dengan menyediakan kebijakan IAM mandiri yang dibuat dan dikelola oleh. AWSKebijakan terkelola memberikan izin yang diperlukan untuk kasus

penggunaan umum sehingga Anda tidak perlu menyelidiki izin apa yang diperlukan. Untuk informasi selengkapnya, lihat Kebijakan TerkelolaAWS dalam Panduan Pengguna IAM.

Perubahan	Deskripsi	Tanggal
AWSControlTowerAccountServiceRolePolicy—Kebijakan baru	AWS Control Tower menambahkan peran terkait layanan baru yang memungkinkan AWS Control Tower membuat dan mengelola aturan peristiwa, dan berdasarkan aturan tersebut, untuk mengelola deteksi drift untuk kontrol yang terkait dengan Security Hub. Perubahan ini diperlukan agar pelanggan dapat melihat sumber daya yang hanyut di konsol, ketika sumber daya tersebut terkait dengan kontrol Security Hub yang merupakan bagian dari Standar yang dikelola Layanan Security Hub: AWS Control Tower.	22 Mei 2023
AWSControlTowerServiceRolePolicy – Pembaruan pada kebijakan yang sudah ada	AWS Control Tower menambahkan izin baru yang memungkinkan AWS Control Tower melakukan panggilan ke`EnableRegion` ,`ListRegions` , dan `GetRegionOptStatus` API yang diterapkan oleh layanan Manajemen AWS Akun, agar keikutsertaan Wilayah AWS tersedia untuk	6 April 2023

Perubahan	Deskripsi	Tanggal
	akun pelanggan di landing zone (Akun manajemen, akun arsip log, akun Audit, akun anggota OU). Perubahan ini diperlukan agar pelanggan dapat memiliki opsi untuk memperluas tata kelola Wilayah oleh AWS Control Tower ke dalam Wilayah keikutsertaan.	

Perubahan	Deskripsi	Tanggal
AWSControlTowerServiceRolePolicy – Pembaruan pada kebijakan yang sudah ada	AWS Control Tower menambahkan izin baru yang memungkinkan AWS Control Tower `AWSControlTowerBlueprintAccess` berperan dalam akun blueprint (hub), yang merupakan akun khusus dalam suatu organisasi, yang berisi cetak biru yang telah ditentukan sebelumnya yang disimpan dalam satu atau beberapa Produk Service Catalog. AWS Control Tower mengambil `AWSControlTowerBlueprintAccess` peran untuk melakukan tiga tugas: membuat Portofolio Service Catalog, menambahkan cetak biru Produk yang diminta, dan membagikan Portofolio ke akun anggota yang diminta pada waktu penyediaan akun. Perubahan ini diperlukan agar pelanggan dapat menyediakan akun yang disesuaikan melalui AWS Control Tower Account Factory.	28 Oktober 2022

Perubahan	Deskripsi	Tanggal
AWSControlTowerServiceRolePolicy – Pembaruan pada kebijakan yang sudah ada	AWS Control Tower menambahkan izin baru yang memungkinkan pelanggan menyiapkan AWS CloudTrail jejak tingkat organisasi, mulai dari landing zone versi 3.0. CloudTrail Fitur berbasis organisasi mengharuskan pelanggan untuk mengaktif kan akses tepercaya untuk CloudTrail layanan, dan pengguna atau peran IAM harus memiliki izin untuk membuat jejak tingkat organisasi di akun manajemen .	Juni 20, 2022

Perubahan	Deskripsi	Tanggal
AWSControlTowerServiceRolePolicy – Pembaruan pada kebijakan yang sudah ada	AWS Control Tower menambahkan izin baru yang memungkinkan pelanggan menggunakan enkripsi kunci KMS. Fitur KMS memungkinkan pelanggan untuk menyediakan kunci KMS mereka sendiri untuk mengenkripsi log mereka. CloudTrail Pelanggan juga dapat mengubah kunci KMS selama pembaruan atau perbaikan landing zone. Saat memperbarui kunci KMS, AWS CloudFormation perlu izin untuk memanggil API. AWS CloudTrail `PutEventSelector` Perubahan kebijakan adalah mengizinkan AWSControlTowerAdminperan memanggil AWS CloudTrail `PutEventSelector` API.	28 Juli 2021
AWS Control Tower mulai melacak perubahan	AWS Control Tower mulai melacak perubahan untuk kebijakan yang AWS dikelola.	27 Mei 2021

Keamanan di AWS Control Tower

Keamanan cloud di AWS adalah prioritas tertinggi. Sebagai AWS pelanggan, Anda mendapat manfaat dari pusat data dan arsitektur jaringan yang dibangun untuk memenuhi persyaratan organisasi yang paling sensitif terhadap keamanan.

Keamanan adalah tanggung jawab bersama antara Anda AWS dan Anda. Model tanggung jawab bersama menggambarkan ini sebagai keamanan cloud dan keamanan di cloud:

- Keamanan cloud — AWS bertanggung jawab untuk melindungi infrastruktur yang menjalankan AWS layanan di AWS Cloud. AWS juga memberi Anda layanan yang dapat Anda gunakan dengan aman. Efektivitas keamanan kami diuji dan diverifikasi secara rutin oleh auditor pihak ketiga sebagai bagian dari program kepatuhan AWS. Untuk mempelajari tentang program kepatuhan yang berlaku untuk AWS Control Tower, lihat AWS Layanan dalam Lingkup menurut Program Kepatuhan.
- Keamanan di cloud — Tanggung jawab Anda ditentukan oleh AWS layanan yang Anda gunakan. Anda juga bertanggung jawab atas faktor lain, termasuk sensitivitas data, persyaratan perusahaan, serta hukum dan peraturan yang berlaku.

Dokumentasi ini membantu Anda memahami cara menerapkan model tanggung jawab bersama saat menggunakan AWS Control Tower. Topik berikut menunjukkan cara mengonfigurasi AWS Control Tower untuk memenuhi tujuan keamanan dan kepatuhan Anda. Anda juga mempelajari cara menggunakan AWS layanan lain yang membantu Anda memantau dan mengamankan sumber daya AWS Control Tower Anda.

Perlindungan Data di AWS Control Tower

Model tanggung jawab AWS bersama model tanggung berlaku untuk perlindungan data di AWS Control Tower. Seperti yang dijelaskan dalam model AWS ini, bertanggung jawab untuk melindungi infrastruktur global yang menjalankan semua AWS Cloud. Anda bertanggung jawab untuk mempertahankan kendali atas konten yang di-host pada infrastruktur ini. Anda juga bertanggung jawab atas tugas-tugas konfigurasi dan manajemen keamanan untuk Layanan AWS yang Anda gunakan. Lihat informasi yang lebih lengkap tentang privasi data dalam Pertanyaan Umum Privasi Data. Lihat informasi tentang perlindungan data di Eropa di pos blog Model Tanggung Jawab Bersama dan GDPR AWS di Blog Keamanan AWS .

Untuk tujuan perlindungan data, kami menyarankan Anda melindungi Akun AWS kredensyal dan mengatur pengguna individu dengan AWS IAM Identity Center atau AWS Identity and Access Management (IAM). Dengan cara itu, setiap pengguna hanya diberi izin yang diperlukan untuk memenuhi tanggung jawab tugasnya. Kami juga menyarankan supaya Anda mengamankan data dengan cara-cara berikut:

- Gunakan autentikasi multi-faktor (MFA) pada setiap akun.
- Gunakan SSL/TLS untuk berkomunikasi dengan sumber daya. AWS Kami mensyaratkan TLS 1.2 dan menganjurkan TLS 1.3.
- Siapkan API dan pencatatan aktivitas pengguna dengan AWS CloudTrail.
- Gunakan solusi AWS enkripsi, bersama dengan semua kontrol keamanan default di dalamnya Layanan AWS.
- Gunakan layanan keamanan terkelola lanjut seperti Amazon Macie, yang membantu menemukan dan mengamankan data sensitif yang disimpan di Amazon S3.
- Jika Anda memerlukan modul kriptografi tervalidasi FIPS 140-2 saat mengakses AWS melalui antarmuka baris perintah atau API, gunakan titik akhir FIPS. Lihat informasi yang lebih lengkap tentang titik akhir FIPS yang tersedia di Standar Pemrosesan Informasi Federal (FIPS) 140-2.

Kami sangat merekomendasikan agar Anda tidak pernah memasukkan informasi identifikasi yang sensitif, seperti nomor rekening pelanggan Anda, ke dalam tanda atau bidang isian bebas seperti bidang Nama. Ini termasuk saat Anda bekerja dengan AWS Control Tower atau lainnya Layanan AWS menggunakan konsol, API AWS CLI, atau AWS SDK. Data apa pun yang Anda masukkan ke dalam tanda atau bidang isian bebas yang digunakan untuk nama dapat digunakan untuk log penagihan atau log diagnostik. Saat Anda memberikan URL ke server eksternal, kami sangat menganjurkan supaya Anda tidak menyertakan informasi kredensial di dalam URL untuk memvalidasi permintaan Anda ke server itu.

> **Note**
>
> Pencatatan aktivitas pengguna ditangani AWS CloudTrail secara otomatis di AWS Control Tower saat Anda mengatur landing zone.

Untuk informasi selengkapnya tentang perlindungan data, lihat postingan blog Model Tanggung Jawab Bersama AWS dan GDPR di Blog Keamanan AWS . AWS Control Tower menyediakan opsi

berikut yang dapat Anda gunakan untuk membantu mengamankan konten yang ada di landing zone Anda:

Topik

- Enkripsi saat Data Tidak Berpindah
- Enkripsi Saat Data Berpindah
- Batasi Akses ke Konten

Enkripsi saat Data Tidak Berpindah

AWS Control Tower menggunakan bucket Amazon S3 dan database Amazon DynamoDB yang dienkripsi saat istirahat menggunakan Amazon S3-Managed Keys (SSE-S3) untuk mendukung landing zone Anda. Enkripsi ini dikonfigurasi secara default saat Anda mengatur landing zone. Secara opsional, Anda dapat mengonfigurasi landing zone untuk mengenkripsi sumber daya dengan kunci enkripsi KMS. Anda juga dapat membuat enkripsi saat istirahat untuk layanan yang Anda gunakan di landing zone Anda untuk layanan yang mendukungnya. Untuk informasi selengkapnya, lihat bagian keamanan dokumentasi online layanan tersebut.

Enkripsi Saat Data Berpindah

AWS Control Tower menggunakan Transport Layer Security (TLS) dan enkripsi sisi klien untuk enkripsi saat transit guna mendukung landing zone Anda. Selain itu, mengakses AWS Control Tower memerlukan penggunaan konsol, yang hanya dapat diakses melalui titik akhir HTTPS. Enkripsi ini dikonfigurasi secara default saat Anda mengatur landing zone.

Batasi Akses ke Konten

Sebagai praktik terbaik, Anda harus membatasi akses ke subset pengguna yang sesuai. Dengan AWS Control Tower, Anda dapat melakukan ini dengan memastikan bahwa administrator cloud pusat dan pengguna akhir Anda memiliki izin IAM yang tepat atau, dalam kasus pengguna IAM Identity Center, bahwa mereka berada dalam grup yang benar.

- Untuk informasi selengkapnya tentang peran dan kebijakan untuk entitas IAM, lihat Panduan Pengguna IAM.
- Untuk informasi selengkapnya tentang grup Pusat Identitas IAM yang dibuat saat Anda menyiapkan landing zone, lihatGrup Pusat Identitas IAM untuk AWS Control Tower.

Validasi Kepatuhan untuk AWS Control Tower

AWS Control Tower adalah layanan yang dirancang dengan baik yang dapat membantu organisasi Anda memenuhi kebutuhan kepatuhan Anda dengan kontrol dan praktik terbaik. Selain itu, auditor pihak ketiga menilai keamanan dan kepatuhan sejumlah layanan yang dapat Anda gunakan di landing zone Anda sebagai bagian dari beberapa program AWS kepatuhan. Program ini mencakup SOC, PCI, FedRAMP, HIPAA, dan lainnya.

Untuk daftar AWS layanan dalam lingkup program kepatuhan tertentu, lihat AWS Layanan dalam Lingkup berdasarkan Program Kepatuhan. Untuk informasi umum, lihat Program Kepatuhan AWS.

Anda dapat mengunduh laporan audit pihak ketiga menggunakan AWS Artifact. Untuk informasi selengkapnya, lihat Mengunduh Laporan di AWS Artifak di AWS Artifact Panduan Pengguna.

Tanggung jawab kepatuhan Anda saat menggunakan AWS Control Tower ditentukan oleh sensitivitas data Anda, tujuan kepatuhan perusahaan Anda, serta hukum dan peraturan yang berlaku. AWS menyediakan sumber daya berikut untuk membantu kepatuhan:

- Panduan Memulai Cepat Keamanan dan Kepatuhan — Panduan penerapan ini membahas pertimbangan arsitektur dan memberikan langkah-langkah untuk menerapkan lingkungan dasar yang berfokus pada keamanan dan kepatuhan. AWS
- Arsitektur untuk Keamanan dan Kepatuhan HIPAA di Amazon Web Services — Whitepaper ini menjelaskan bagaimana perusahaan dapat menggunakan AWS untuk membuat aplikasi yang sesuai dengan HIPAA.
- AWS Sumber Daya Kepatuhan — Kumpulan buku kerja dan panduan ini mungkin berlaku untuk industri dan lokasi Anda.
- AWS Config AWS Layanan ini menilai seberapa baik konfigurasi sumber daya Anda mematuhi praktik internal, pedoman industri, dan peraturan.
- AWS Security Hub— AWS Layanan ini memberikan pandangan komprehensif tentang keadaan keamanan Anda di dalamnya AWS yang membantu Anda memeriksa kepatuhan Anda terhadap standar industri keamanan dan praktik terbaik.

Ketahanan di AWS Control Tower

Infrastruktur AWS global dibangun di sekitar AWS Wilayah dan Zona Ketersediaan.

AWS Wilayah menyediakan beberapa Availability Zone yang terpisah secara fisik dan terisolasi, yang terhubung melalui latensi rendah, throughput tinggi, dan jaringan yang sangat redundan. Availability Zones memungkinkan Anda merancang dan mengoperasikan aplikasi dan database yang secara otomatis gagal di antara Availability Zone tanpa gangguan. Zona Ketersediaan lebih sangat tersedia, lebih toleran kesalahan, dan lebih dapat diskalakan daripadai infrastruktur pusat data tunggal atau multi tradisional.

Untuk daftar Wilayah AWS tempat AWS Control Tower tersedia, lihatBagaimana AWS Wilayah Bekerja Dengan AWS Control Tower.

Wilayah asal Anda didefinisikan sebagai AWS Wilayah tempat landing zone Anda didirikan.

Untuk informasi selengkapnya tentang AWS Wilayah dan Availability Zone, lihat Infrastruktur AWS Global.

Keamanan Infrastruktur di AWS Control Tower

AWS Control Tower dilindungi oleh prosedur keamanan jaringan AWS global yang dijelaskan dalam whitepaper Amazon Web Services: Tinjauan Proses Keamanan.

Anda menggunakan panggilan API yang AWS dipublikasikan untuk akses ke AWS layanan dan sumber daya dalam landing zone Anda melalui jaringan. Kami memerlukan Transport Layer Security (TLS) 1.2 dan merekomendasikan Transport Layer Security (TLS) 1.3 atau yang lebih baru. Klien juga harus mendukung cipher suite dengan perfect forward secrecy (PFS) seperti Ephemeral Diffie-Hellman (DHE) atau Elliptic Curve Ephemeral Diffie-Hellman (ECDHE). Sebagian besar sistem modern seperti Java 7 dan sistem yang lebih baru mendukung mode ini.

Selain itu, permintaan harus ditandatangani dengan menggunakan ID kunci akses dan kunci akses rahasia yang terkait dengan pengguna utama IAM. Atau Anda dapat menggunakan AWS Security Token Service (AWS STS) untuk menghasilkan kredensial keamanan sementara untuk menandatangani permintaan.

Anda dapat mengatur grup keamanan untuk menyediakan keamanan infrastruktur jaringan tambahan untuk beban kerja landing zone AWS Control Tower Anda. Untuk informasi selengkapnya, lihat Panduan: Mengatur Grup Keamanan di AWS Control Tower Dengan AWS Firewall Manager.

Pencatatan dan pemantauan di AWS Control Tower

Pemantauan memungkinkan Anda untuk merencanakan dan menanggapi insiden potensial. Hasil kegiatan pemantauan disimpan dalam file log. Oleh karena itu, logging dan monitoring adalah konsep yang terkait erat, dan merupakan bagian penting dari sifat AWS Control Tower yang dirancang dengan baik.

Saat menyiapkan landing zone, salah satu akun bersama yang dibuat adalah akun arsip log. Ini didedikasikan untuk mengumpulkan semua log secara terpusat, termasuk log untuk semua akun bersama dan anggota Anda. File log disimpan dalam bucket Amazon S3. File log ini memungkinkan administrator dan auditor untuk meninjau tindakan dan peristiwa yang telah terjadi.

Sebagai praktik terbaik, Anda harus mengumpulkan data pemantauan dari semua bagian AWS pengaturan Anda ke dalam log Anda, sehingga Anda dapat lebih mudah men-debug kegagalan multi-titik jika terjadi. AWS menyediakan beberapa alat untuk memantau sumber daya dan aktivitas Anda di landing zone Anda.

Misalnya, status kontrol Anda dipantau terus-menerus. Anda dapat melihat status mereka secara sekilas di konsol AWS Control Tower, atau secara terprogram melalui AWS Control Tower API. Kesehatan dan status akun yang Anda berikan di Account Factory juga dipantau secara konstan.

Melihat tindakan yang dicatat dari halaman Aktivitas

Di konsol AWS Control Tower, halaman Aktivitas memberikan ikhtisar tindakan akun manajemen AWS Control Tower. Untuk menavigasi ke halaman AWS Control Tower Activities, pilih Aktivitas dari navigasi kiri.

Aktivitas yang ditampilkan di halaman Aktivitas adalah aktivitas yang sama yang dilaporkan dalam log AWS CloudTrail peristiwa untuk AWS Control Tower, tetapi ditampilkan dalam format tabel. Untuk mempelajari lebih lanjut tentang aktivitas tertentu, pilih aktivitas dari tabel, lalu pilih Lihat detail.

Anda dapat melihat tindakan dan peristiwa akun anggota di file arsip log.

Bagian berikut menjelaskan pemantauan dan pencatatan di AWS Control Tower dengan lebih detail:

Topik

- Alat terintegrasi untuk pemantauan
- Mencatat Tindakan AWS Control Tower dengan AWS CloudTrail
- Peristiwa Siklus Hidup di AWS Control Tower

- Menggunakan Notifikasi AWS Pengguna dengan AWS Control Tower

Tentang masuk ke AWS Control Tower

AWS Control Tower menyelesaikan pencatatan tindakan dan peristiwa secara otomatis, melalui integrasinya dengan AWS CloudTrail dan AWS Config, dan merekamnya CloudWatch. Semua tindakan dicatat, termasuk tindakan dari akun manajemen AWS Control Tower dan dari akun anggota organisasi Anda. Tindakan dan peristiwa akun manajemen dapat dilihat di halaman Aktivitas di konsol. Anda dapat melihat tindakan dan peristiwa akun anggota di file arsip log.

Jalur tingkat organisasi

AWS Control Tower menyiapkan CloudTrail jejak baru saat Anda menyiapkan landing zone. Ini adalah jejak tingkat organisasi, yang berarti mencatat semua peristiwa untuk akun manajemen dan semua akun anggota dalam organisasi. Fitur ini mengandalkan akses tepercaya untuk memberikan izin akun manajemen untuk membuat jejak di setiap akun anggota.

Untuk informasi selengkapnya tentang AWS Control Tower dan jejak CloudTrail organisasi, lihat Membuat jejak untuk organisasi.

> **Note**
>
> Dalam rilis AWS Control Tower sebelum landing zone versi 3.0, AWS Control Tower membuat jejak akun anggota di setiap akun. Saat Anda memperbarui ke rilis 3.0, CloudTrail jejak Anda menjadi jejak organisasi. Untuk praktik terbaik saat berpindah antar jalur, lihat Praktik terbaik untuk mengubah jejak di CloudTrail Panduan Pengguna.

Saat Anda mendaftarkan akun ke AWS Control Tower, akun Anda diatur oleh AWS CloudTrail jejak untuk organisasi AWS Control Tower. Jika Anda memiliki penerapan CloudTrail jejak yang ada di akun tersebut, Anda mungkin melihat biaya duplikat kecuali Anda menghapus jejak yang ada untuk akun tersebut sebelum Anda mendaftarkannya di AWS Control Tower.

> **Note**
>
> Saat Anda memperbarui ke landing zone versi 3.0, AWS Control Tower menghapus jejak tingkat akun (yang telah dibuat AWS Control Tower) di akun terdaftar atas nama Anda. File log tingkat akun Anda yang ada disimpan di bucket Amazon S3 mereka.

Kebijakan bucket Amazon S3 di akun audit

Di AWS Control Tower, AWS layanan memiliki akses ke sumber daya Anda hanya jika permintaan berasal dari organisasi atau unit organisasi (OU) Anda. `aws:SourceOrgID`Kondisi harus dipenuhi untuk izin menulis apa pun.

Anda dapat menggunakan kunci `aws:SourceOrgID` kondisi dan menyetel nilainya ke ID organisasi di elemen kondisi kebijakan bucket S3 Anda. Kondisi ini memastikan bahwa CloudTrail hanya dapat menulis log atas nama akun dalam organisasi Anda ke bucket S3 Anda; ini mencegah CloudTrail log di luar organisasi Anda menulis ke bucket AWS Control Tower S3 Anda.

Kebijakan ini memulihkan potensi kerentanan keamanan, tanpa memengaruhi fungsionalitas beban kerja Anda yang ada. Kebijakan ditampilkan dalam contoh berikut.

```
S3AuditBucketPolicy:
    Type: AWS::S3::BucketPolicy
    Properties:
      Bucket: !Ref S3AuditBucket
      PolicyDocument:
        Version: 2012-10-17
        Statement:

            Condition:
              StringEquals:
                aws:SourceOrgID: !Ref OrganizationId
          - Sid: AWSBucketDeliveryForOrganizationTrail
            Effect: Allow
            Principal:
              Service:
                - cloudtrail.amazonaws.com
            Action: s3:PutObject
            Resource: !If [IsAccountLevelBucketPermissionRequiredForCloudTrail,
                [!Sub "arn:${AWS::Partition}:s3:::${S3AuditBucket}/
${AWSLogsS3KeyPrefix}/AWSLogs/${Namespace}/*", !Sub "arn:${AWS::Partition}:s3:::
${S3AuditBucket}/${AWSLogsS3KeyPrefix}/AWSLogs/${OrganizationId}/*"],
                !Sub "arn:${AWS::Partition}:s3:::${S3AuditBucket}/
${AWSLogsS3KeyPrefix}/AWSLogs/*/*"]
            Condition:
              StringEquals:
            aws:SourceOrgID: !Ref OrganizationId
```

Untuk informasi selengkapnya tentang kunci kondisi ini, lihat dokumentasi IAM dan posting blog IAM berjudul "Gunakan kontrol yang dapat diskalakan untuk AWS layanan yang mengakses sumber daya Anda.”

Alat terintegrasi untuk pemantauan

Pemantauan adalah bagian penting dalam menjaga keandalan, ketersediaan, dan kinerja AWS Control Tower dan AWS solusi Anda yang lain. AWS menyediakan alat pemantauan berikut untuk mengawasi AWS Control Tower, melaporkan ketika ada sesuatu yang salah, dan mengambil tindakan otomatis bila perlu:

- Amazon CloudWatch memantau AWS sumber daya Anda dan aplikasi yang Anda jalankan AWS secara real time. Anda dapat mengumpulkan dan melacak metrik, membuat dasbor yang disesuaikan, dan mengatur alarm yang memberi tahu Anda atau mengambil tindakan saat metrik tertentu mencapai ambang batas yang ditentukan. Misalnya, Anda dapat CloudWatch melacak penggunaan CPU atau metrik lain dari instans Amazon EC2 Anda dan secara otomatis meluncurkan instans baru bila diperlukan. Untuk informasi selengkapnya, lihat Panduan CloudWatch Pengguna Amazon.
- Amazon CloudWatch Events memberikan aliran peristiwa sistem yang mendekati real-time yang menjelaskan perubahan AWS sumber daya. CloudWatch Peristiwa memungkinkan komputasi berbasis peristiwa otomatis, karena Anda dapat menulis aturan yang mengawasi peristiwa tertentu dan memicu tindakan otomatis di AWS layanan lain saat peristiwa ini terjadi. Untuk informasi selengkapnya, lihat Panduan Pengguna CloudWatch Acara Amazon.
- Amazon CloudWatch Logs memungkinkan Anda memantau, menyimpan, dan mengakses file log Anda dari instans Amazon EC2, CloudTrail, dan sumber lainnya. CloudWatch Log dapat memantau informasi dalam file log dan memberi tahu Anda ketika ambang batas tertentu terpenuhi. Anda juga dapat mengarsipkan data log dalam penyimpanan yang sangat tahan lama. Untuk informasi selengkapnya, lihat Panduan Pengguna Amazon CloudWatch Logs.
- AWS CloudTrailmenangkap panggilan API dan peristiwa terkait yang dibuat oleh atau atas nama AWS akun Anda dan mengirimkan file log ke bucket Amazon S3 yang Anda tentukan. Anda dapat mengidentifikasi pengguna dan akun mana yang dipanggil AWS, alamat IP sumber dari mana panggilan dilakukan, dan kapan panggilan terjadi.

Tip: Anda dapat melihat dan CloudTrail melakukan kueri aktivitas di akun melalui Wawasan CloudWatch Log dan CloudWatch Log. Aktivitas ini mencakup peristiwa siklus hidup AWS Control Tower. CloudWatchKemampuan log memungkinkan Anda melakukan kueri yang lebih terperinci dan akurat daripada yang biasanya dapat Anda gunakan. CloudTrail

Lihat informasi yang lebih lengkap di Mencatat Tindakan AWS Control Tower dengan AWS CloudTrail.

Mencatat Tindakan AWS Control Tower dengan AWS CloudTrail

AWS Control Tower terintegrasi dengan AWS CloudTrail, layanan yang menyediakan catatan tindakan yang diambil oleh pengguna, peran, atau AWS layanan di AWS Control Tower. CloudTrail menangkap tindakan untuk AWS Control Tower sebagai peristiwa. Jika Anda membuat jejak, Anda dapat mengaktifkan pengiriman CloudTrail peristiwa secara berkelanjutan ke bucket Amazon S3, termasuk peristiwa untuk AWS Control Tower.

Jika Anda tidak mengonfigurasi jejak, Anda masih dapat melihat peristiwa terbaru di CloudTrail konsol dalam Riwayat acara. Dengan menggunakan informasi yang dikumpulkan oleh CloudTrail, Anda dapat menentukan permintaan yang dibuat ke AWS Control Tower, alamat IP dari mana permintaan dibuat, siapa yang membuat permintaan, kapan dibuat, dan detail tambahan.

Untuk mempelajari selengkapnya CloudTrail, termasuk cara mengonfigurasi dan mengaktifkannya, lihat PanduanAWS CloudTrail Pengguna.

Informasi AWS Control Tower di CloudTrail

CloudTrail diaktifkan di AWS akun Anda saat Anda membuat akun. Ketika aktivitas peristiwa yang didukung terjadi di AWS Control Tower, aktivitas tersebut direkam dalam suatu CloudTrail peristiwa bersama dengan peristiwa AWS layanan lainnya dalam riwayat Acara. Anda dapat melihat, mencari, dan mengunduh acara terbaru di AWS akun Anda. Untuk informasi selengkapnya, lihat Melihat Acara dengan Riwayat CloudTrail Acara.

> **Note**
>
> Dalam rilis AWS Control Tower sebelum landing zone versi 3.0, AWS Control Tower membuat jejak akun anggota. Saat Anda memperbarui ke rilis 3.0, CloudTrail jejak Anda diperbarui untuk menjadi jejak organisasi. Untuk praktik terbaik saat berpindah antar jalur, lihat Membuat jejak organisasi di Panduan CloudTrail Pengguna.

Direkomendasikan: Buat jejak

Untuk catatan peristiwa yang sedang berlangsung di AWS akun Anda, termasuk peristiwa untuk AWS Control Tower, buat jejak. Jejak memungkinkan CloudTrail untuk mengirimkan file log ke bucket Amazon S3. Secara default, saat Anda membuat jejak di konsol tersebut, jejak diterapkan ke semua Wilayah AWS . Jejak mencatat peristiwa dari semua Wilayah di AWS partisi dan mengirimkan file

log ke bucket Amazon S3 yang Anda tentukan. Selain itu, Anda dapat mengonfigurasi AWS layanan lain untuk menganalisis lebih lanjut dan menindaklanjuti data peristiwa yang dikumpulkan dalam CloudTrail log. Untuk informasi selengkapnya, lihat berikut:

- Gambaran umum untuk Membuat Jejak
- Bersiaplah untuk membuat jejak
- Mengelola CloudTrail biaya
- CloudTrail Layanan dan Integrasi yang Didukung
- Mengkonfigurasi Notifikasi Amazon SNS untuk CloudTrail
- Menerima File CloudTrail Log dari Beberapa Wilayah dan Menerima File CloudTrail Log dari Beberapa Akun

AWS Control Tower mencatat tindakan berikut sebagai peristiwa dalam file CloudTrail log:

API Publik

- `DisableControl`
- `EnableControl`
- `GetControlOperation`
- `ListEnabledControls`

API lainnya

- `SetupLandingZone`
- `UpdateAccountFactoryConfig`
- `ManageOrganizationalUnit`
- `CreateManagedAccount`
- `EnableGuardrail`
- `GetLandingZoneStatus`
- `GetHomeRegion`
- `ListManagedAccounts`
- `DescribeManagedAccount`
- `DescribeAccountFactoryConfig`

- `DescribeGuardrailForTarget`
- `DescribeManagedOrganizationalUnit`
- `ListEnabledGuardrails`
- `ListGuardrailViolations`
- `ListGuardrails`
- `ListGuardrailsForTarget`
- `ListManagedAccountsForGuardrail`
- `ListManagedAccountsForParent`
- `ListManagedOrganizationalUnits`
- `ListManagedOrganizationalUnitsForGuardrail`
- `GetGuardrailComplianceStatus`
- `DescribeGuardrail`
- `ListDirectoryGroups`
- `DescribeSingleSignOn`
- `DescribeCoreService`
- `GetAvailableUpdates`

Setiap peristiwa atau entri log berisi informasi tentang siapa yang membuat permintaan tersebut. Informasi identitas membantu Anda menentukan berikut:

- Apakah permintaan itu dibuat dengan kredenal pengguna root atau AWS Identity and Access Management (IAM).
- Apakah permintaan dibuat dengan kredensial keamanan sementara untuk suatu peran atau pengguna gabungan.
- Apakah permintaan itu dibuat oleh AWS layanan lain.
- Apakah permintaan ditolak karena akses ditolak atau diproses dengan sukses.

Untuk informasi lain, lihat Elemen userIdentity CloudTrail .

Contoh: Entri File Log AWS Control Tower

Trail adalah konfigurasi yang memungkinkan pengiriman peristiwa sebagai file log ke bucket Amazon S3 yang Anda tentukan. CloudTrail file log berisi satu atau lebih entri log. Peristiwa mewakili

permintaan tunggal dari sumber manapun dan mencakup informasi tentang tindakan yang diminta, tanggal dan waktu tindakan, parameter permintaan, dan sebagainya. CloudTrail peristiwa tidak muncul dalam urutan tertentu dalam file log.

Contoh berikut menunjukkan entri CloudTrail log yang menunjukkan struktur entri file log khas untuk acara `SetupLandingZone` AWS Control Tower, termasuk catatan identitas pengguna yang memulai tindakan.

```

Pantau perubahan sumber daya dengan AWS Config

AWS Control Tower memungkinkan AWS Config pada semua akun yang terdaftar, sehingga dapat memantau kepatuhan melalui kontrol detektif, merekam perubahan sumber daya, dan mengirimkan log perubahan sumber daya ke akun arsip log.

Jika versi landing zone Anda lebih awal dari 3.0: Untuk akun terdaftar Anda, AWS Config catat semua perubahan pada sumber daya, untuk semua Wilayah tempat akun beroperasi. Setiap perubahan dimodelkan sebagai item konfigurasi (CI), yang berisi informasi seperti pengidentifikasi sumber daya, Wilayah, tanggal setiap perubahan dicatat, dan apakah perubahan tersebut terkait dengan sumber daya yang diketahui atau yang baru ditemukan.

Jika versi landing zone Anda 3.0 atau yang lebih baru: AWS Control Tower membatasi perekaman untuk sumber daya global, seperti pengguna IAM, grup, peran, dan kebijakan yang dikelola pelanggan, hanya untuk Wilayah asal Anda. Salinan perubahan sumber daya global tidak disimpan di setiap Wilayah. Keterbatasan perekaman sumber daya ini sesuai dengan praktik AWS Config terbaik. Daftar lengkap sumber daya global tersedia dalam AWS Config dokumentasi.

- Untuk mempelajari selengkapnya AWS Config, lihat Cara AWS Config kerjanya.
- Untuk daftar sumber daya yang AWS Config dapat mendukung, lihat Jenis sumber daya yang didukung.
- Untuk mempelajari cara menyesuaikan pelacakan sumber daya di lingkungan AWS Control Tower, lihat posting blog berjudul Kustomisasi pelacakan AWS Config sumber daya di AWS Control Tower.

AWS Control Tower menyiapkan saluran AWS Config pengiriman di semua akun yang terdaftar. Melalui saluran pengiriman ini, ia mencatat semua perubahan yang direkam oleh AWS Config di akun arsip log, di mana mereka disimpan ke folder di bucket Amazon Simple Storage Service.

Mengelola AWS Config biaya di AWS Control Tower

Bagian ini menjelaskan cara AWS Config mencatat dan menagih Anda untuk perubahan sumber daya di akun AWS Control Tower Anda. Informasi ini dapat membantu Anda memahami cara mengelola biaya yang terkait AWS Config, saat Anda menggunakan AWS Control Tower. AWS Control Tower tidak menambahkan biaya tambahan.

> **Note**
>
> Jika versi landing zone Anda 3.0 atau yang lebih baru: AWS Control Tower membatasi AWS Config perekaman untuk sumber daya global, seperti pengguna IAM, grup, peran, dan kebijakan yang dikelola pelanggan, hanya untuk Wilayah asal Anda. Oleh karena itu, beberapa informasi di bagian ini mungkin tidak berlaku untuk landing zone Anda.

AWS Config dirancang untuk mencatat setiap perubahan ke setiap sumber daya, di setiap Wilayah tempat akun beroperasi, sebagai item konfigurasi (CI). AWS Config menagih Anda untuk setiap item konfigurasi yang dihasilkannya.

Bagaimana AWS Config beroperasi

AWS Config mencatat sumber daya di setiap Wilayah, secara terpisah. Beberapa sumber daya global, seperti peran IAM, dicatat satu kali per Wilayah. Misalnya, jika Anda membuat peran IAM baru di akun terdaftar yang beroperasi di lima Wilayah, AWS Config hasilkan lima CI, satu untuk setiap Wilayah. Sumber daya global lainnya, seperti zona yang dihosting Route 53, dicatat hanya sekali di semua Wilayah. Misalnya, jika Anda membuat zona host Route 53 baru di akun terdaftar, buat AWS Config satu CI, terlepas dari berapa banyak Wilayah yang dipilih untuk akun tersebut. Untuk daftar yang membantu Anda membedakan jenis sumber daya ini, lihatSumber daya yang sama dicatat beberapa kali.

> **Note**
>
> Saat AWS Control Tower berfungsi AWS Config, Wilayah dapat diatur oleh AWS Control Tower, atau tidak diatur, dan AWS Config masih mencatat perubahan jika akun beroperasi di Wilayah tersebut.

AWS Config mendeteksi dua jenis hubungan dalam sumber daya

AWS Config membuat perbedaan antara hubungan langsung dan tidak langsung antara sumber daya. Jika sumber daya dikembalikan dalam panggilan API Deskripsikan sumber daya lain, sumber daya tersebut dicatat sebagai hubungan langsung. Ketika Anda mengubah sumber daya dalam hubungan langsung dengan sumber daya lain, AWS Config tidak membuat CI untuk kedua sumber daya.

Misalnya, jika Anda membuat instans Amazon EC2, dan API mengharuskan Anda membuat antarmuka jaringan, AWS Config pertimbangkan instans Amazon EC2 memiliki hubungan langsung dengan antarmuka jaringan. Akibatnya, hanya AWS Config menghasilkan satu CI.

AWS Config mencatat perubahan terpisah untuk hubungan sumber daya yang merupakan hubungan tidak langsung. Misalnya, buat AWS Config dua CI jika Anda membuat grup keamanan dan menambahkan instans Amazon EC2 terkait yang merupakan bagian dari grup keamanan.

Untuk informasi lebih lanjut tentang hubungan langsung dan tidak langsung, lihat Apa itu hubungan langsung dan tidak langsung sehubungan dengan sumber daya?

Anda dapat menemukan daftar hubungan sumber daya dalam AWS Config dokumentasi.

Melihat data AWS Config perekam pada akun terdaftar

AWS Config terintegrasi dengan CloudWatch sehingga Anda dapat melihat AWS Config CI di dasbor. Untuk informasi selengkapnya, lihat posting blog berjudul AWS Config mendukung CloudWatch metrik Amazon.

Secara terprogram, untuk melihat AWS Config data, Anda dapat bekerja dengan AWS CLI, atau Anda dapat menggunakan alat lain. AWS

Kueri data AWS Config perekam pada sumber daya tertentu

Anda dapat menggunakan AWS CLI untuk mengambil daftar perubahan terbaru untuk sumber daya.

Perintah riwayat sumber daya:

- `aws configservice get-resource-config-history --resource-type RESOURCE-TYPE --resource-id RESOURCE-ID --region REGION`

Untuk mempelajari selengkapnya, lihat dokumentasi API untuk `get-config-history`.

Visualisasikan AWS Config data dengan Amazon QuickSight

Anda dapat memvisualisasikan dan meminta sumber daya yang direkam oleh AWS Config seluruh organisasi Anda. Untuk informasi selengkapnya, lihat Memvisualisasikan AWS Config data menggunakan Amazon Athena dan Amazon. QuickSight

Pemecahan Masalah AWS Config di AWS Control Tower

Bagian ini memberikan informasi tentang beberapa masalah yang mungkin Anda temui saat menggunakan AWS Config AWS Control Tower.

AWS Config Biaya tinggi

Jika alur kerja Anda menyertakan proses yang sering membuat, memperbarui, atau menghapus sumber daya, atau menangani sumber daya dalam jumlah besar, alur kerja tersebut dapat menghasilkan sejumlah besar CI. Jika Anda menjalankan proses ini di akun non-produksi, pertimbangkan untuk membuka pendaftaran akun. Anda mungkin perlu menonaktifkan AWS Config perekam untuk akun itu secara manual.

> **Note**
>
> Setelah Anda membatalkan pendaftaran akun, AWS Control Tower tidak dapat menerapkan kontrol detektif atau peristiwa akun log, seperti AWS Config aktivitas, untuk sumber daya di akun tersebut.

Untuk informasi selengkapnya, lihat Membatalkan kelola akun yang terdaftar. Untuk mempelajari cara menonaktifkan AWS Config perekam, lihat Mengelola perekam konfigurasi.

Sumber daya yang sama dicatat beberapa kali

Periksa apakah sumber daya adalah sumber daya global. Untuk zona pendaratan AWS Control Tower sebelum versi 3.0, AWS Config dapat merekam sumber daya global tertentu satu kali untuk

setiap Wilayah AWS Config yang beroperasi. Misalnya, jika AWS Config diaktifkan pada delapan Wilayah, setiap peran direkam delapan kali.

Sumber daya berikut dicatat satu kali untuk setiap Wilayah AWS Config yang beroperasi:

- `AWS::IAM::Group`
- `AWS::IAM::Policy`
- `AWS::IAM::Role`
- `AWS::IAM::User`

Sumber daya global lainnya dicatat hanya sekali. Berikut adalah beberapa contoh sumber daya yang direkam satu kali:

- `AWS::Route53::HostedZone`
- `AWS::Route53::HealthCheck`
- `AWS::ECR::PublicRepository`
- `AWS::GlobalAccelerator::Listener`
- `AWS::GlobalAccelerator::EndpointGroup`
- `AWS::GlobalAccelerator::Accelerator`

AWS Config tidak merekam sumber daya

Sumber daya tertentu memiliki hubungan ketergantungan dengan sumber daya lain. Hubungan ini mungkin langsung atau tidak langsung. Anda dapat menemukan daftar hubungan tidak langsung yang tidak digunakan lagi di FAQ. AWS Config

Peristiwa Siklus Hidup di AWS Control Tower

Beberapa peristiwa yang dicatat oleh AWS Control Tower adalah peristiwa siklus hidup. Tujuan peristiwa siklus hidup adalah untuk menandai penyelesaian tindakan AWS Control Tower tertentu yang mengubah status sumber daya. Peristiwa siklus hidup berlaku untuk sumber daya yang dibuat atau dikelola AWS Control Tower, seperti unit organisasi (OU), akun, dan kontrol.

Karakteristik peristiwa siklus hidup AWS Control Tower

- Untuk setiap peristiwa siklus hidup, log peristiwa menunjukkan apakah tindakan Control Tower yang berasal berhasil diselesaikan, atau gagal.

- AWS CloudTrail secara otomatis mencatat setiap peristiwa siklus hidup sebagai acara layanan non-API AWS . Untuk informasi selengkapnya, lihat Panduan AWS CloudTrail Pengguna.
- Setiap acara siklus hidup juga dikirimkan ke layanan Amazon dan EventBridge Amazon CloudWatch Events.

Peristiwa siklus hidup di AWS Control Tower menawarkan dua manfaat utama:

- Karena peristiwa siklus hidup mendaftarkan penyelesaian tindakan AWS Control Tower, Anda dapat membuat aturan Amazon EventBridge atau aturan CloudWatch Acara Amazon yang dapat memicu langkah selanjutnya dalam alur kerja otomatisasi Anda, berdasarkan status peristiwa siklus hidup.
- Log memberikan detail tambahan untuk membantu administrator dan auditor dalam meninjau jenis aktivitas tertentu di organisasi Anda.

Cara kerja peristiwa siklus hidup

AWS Control Tower mengandalkan beberapa layanan untuk mengimplementasikan tindakannya. Oleh karena itu, setiap peristiwa siklus hidup direkam hanya setelah serangkaian tindakan selesai. Misalnya, saat Anda mengaktifkan kontrol pada OU, AWS Control Tower meluncurkan serangkaian sub-langkah yang mengimplementasikan permintaan. Hasil akhir dari seluruh rangkaian sub-langkah dicatat dalam log sebagai status peristiwa siklus hidup.

- Jika setiap sub-langkah yang mendasari telah berhasil diselesaikan, status peristiwa siklus hidup dicatat sebagai Berhasil.
- Jika salah satu sub-langkah yang mendasari tidak berhasil diselesaikan, status peristiwa siklus hidup dicatat sebagai Gagal.

Setiap peristiwa siklus hidup menyertakan stempel waktu yang dicatat yang menunjukkan kapan tindakan AWS Control Tower dimulai, dan stempel waktu lain yang ditampilkan saat peristiwa siklus hidup selesai, menandai keberhasilan atau kegagalan.

Melihat peristiwa siklus hidup di Control Tower

Anda dapat melihat peristiwa siklus hidup dari halaman Aktivitas di dasbor AWS Control Tower.

- Untuk menavigasi ke halaman Aktivitas, pilih Aktivitas dari panel navigasi kiri.

- Untuk mendapatkan detail lebih lanjut tentang acara tertentu, pilih acara dan kemudian pilih tombol Lihat detail di kanan atas.

Untuk informasi selengkapnya tentang cara mengintegrasikan peristiwa siklus hidup AWS Control Tower ke dalam alur kerja Anda, lihat posting blog ini, Menggunakan peristiwa siklus hidup untuk melacak tindakan AWS Control Tower dan memicu alur kerja otomatis.

Perilaku yang diharapkan dari CreateManagedAccount dan UpdateManagedAccount peristiwa siklus hidup

Saat Anda membuat akun atau mendaftarkan akun di AWS Control Tower, kedua tindakan tersebut memanggil API internal yang sama. Jika ada kesalahan selama proses, biasanya terjadi setelah akun dibuat tetapi tidak sepenuhnya disediakan. Saat Anda mencoba lagi membuat akun setelah kesalahan, atau saat Anda mencoba memperbarui produk yang disediakan, AWS Control Tower melihat bahwa akun tersebut sudah ada.

Karena akun ada, AWS Control Tower merekam peristiwa `UpdateManagedAccount` siklus hidup alih-alih peristiwa `CreateManagedAccount` siklus hidup di akhir permintaan coba lagi. Anda mungkin mengharapkan untuk melihat `CreateManagedAccount` peristiwa lain karena kesalahan. Namun, peristiwa `UpdateManagedAccount` siklus hidup adalah perilaku yang diharapkan dan diinginkan.

Jika Anda berencana untuk membuat atau mendaftarkan akun ke AWS Control Tower menggunakan metode otomatis, program fungsi Lambda UpdateManagedAccountuntuk mencari peristiwa siklus hidup serta peristiwa siklus hidup. CreateManagedAccount

Nama acara siklus hidup

Setiap peristiwa siklus hidup diberi nama sedemikian rupa sehingga sesuai dengan tindakan AWS Control Tower yang berasal, yang juga direkam oleh AWS. CloudTrail Jadi, misalnya, peristiwa siklus hidup yang berasal dari peristiwa AWS Control Tower `CreateManagedAccount` CloudTrail diberi nama. `CreateManagedAccount`

Setiap nama dalam daftar berikut adalah tautan ke contoh detail yang dicatat dalam `JSON` format. Detail tambahan yang ditunjukkan dalam contoh ini diambil dari log CloudWatch peristiwa Amazon.

Meskipun `JSON` tidak mendukung komentar, beberapa komentar telah ditambahkan dalam contoh untuk tujuan penjelasan. Komentar didahului oleh “//” dan muncul di sisi kanan contoh.

Dalam contoh ini, beberapa nama akun dan nama organisasi dikaburkan. An selalu `accountId` merupakan urutan 12 angka, yang telah diganti dengan “xxxxxxxxxxxx” dalam contoh. An `organizationalUnitID` adalah rangkaian huruf dan angka yang unik. Bentuknya dipertahankan dalam contoh.

- `CreateManagedAccount`: Log mencatat apakah AWS Control Tower berhasil menyelesaikan setiap tindakan untuk membuat dan menyediakan akun baru menggunakan pabrik akun.
- `UpdateManagedAccount`: Log mencatat apakah AWS Control Tower berhasil menyelesaikan setiap tindakan untuk memperbarui produk yang disediakan yang terkait dengan akun yang sebelumnya Anda buat dengan menggunakan account factory.
- `EnableGuardrail`: Log mencatat apakah AWS Control Tower berhasil menyelesaikan setiap tindakan untuk mengaktifkan kontrol pada OU yang dibuat oleh AWS Control Tower.
- `DisableGuardrail`: Log mencatat apakah AWS Control Tower berhasil menyelesaikan setiap tindakan untuk menonaktifkan kontrol pada OU yang dibuat oleh AWS Control Tower.
- `SetupLandingZone`: Log mencatat apakah AWS Control Tower berhasil menyelesaikan setiap tindakan untuk menyiapkan landing zone.
- `UpdateLandingZone`: Log mencatat apakah AWS Control Tower berhasil menyelesaikan setiap tindakan untuk memperbarui landing zone yang ada.
- `RegisterOrganizationalUnit`: Log mencatat apakah AWS Control Tower berhasil menyelesaikan setiap tindakan untuk mengaktifkan fitur tata kelola pada OU.
- `DeregisterOrganizationalUnit`: Log mencatat apakah AWS Control Tower berhasil menyelesaikan setiap tindakan untuk menonaktifkan fitur tata kelola pada OU.
- `PrecheckOrganizationalUnit`: Log mencatat apakah AWS Control Tower mendeteksi sumber daya apa pun yang akan mencegah operasi tata kelola Perpanjang selesai dengan sukses.

Bagian berikut menyediakan daftar peristiwa siklus hidup AWS Control Tower, dengan contoh detail yang dicatat untuk setiap jenis peristiwa siklus hidup.

`CreateManagedAccount`

Peristiwa siklus hidup ini mencatat apakah AWS Control Tower berhasil membuat dan menyediakan akun baru menggunakan account factory. Acara ini sesuai dengan peristiwa AWS Control Tower `CreateManagedAccount` CloudTrail . Log peristiwa siklus hidup mencakup `accountName` dan `accountId` dari akun yang baru dibuat, dan `organizationalUnitName` dan `organizationalUnitId` dari OU di mana akun telah ditempatkan.

DisableGuardrail

Peristiwa siklus hidup ini mencatat apakah AWS Control Tower berhasil menonaktifkan kontrol pada OU yang dikelola oleh AWS Control Tower. Acara ini sesuai dengan peristiwa AWS Control Tower `DisableGuardrail` CloudTrail . Log peristiwa siklus hidup mencakup `guardrailId` dan `guardrailBehavior` kontrol, dan `organizationalUnitName` dan `organizationalUnitId` dari OU tempat kontrol dinonaktifkan.

```

PrecheckOrganizationalUnit

Peristiwa siklus hidup ini mencatat apakah AWS Control Tower berhasil melakukan pemeriksaan awal pada OU. Acara ini sesuai dengan peristiwa AWS Control Tower `PrecheckOrganizationalUnit` CloudTrail . Log peristiwa siklus hidup berisi bidang untuk,, dan `failedPrechecks` nilai `IdName`, untuk setiap sumber daya tempat AWS Control Tower telah melakukan pemeriksaan awal selama proses pendaftaran OU.

Log peristiwa juga berisi informasi tentang akun bersarang tempat precheck dilakukan, termasuk, `accountNameaccountId`, dan `failedPrechecks` bidang.

Jika `failedPrechecks` nilainya kosong, itu berarti semua precheck untuk sumber daya itu berhasil lolos.

- Acara ini dipancarkan hanya jika ada kegagalan precheck.
- Acara ini tidak dipancarkan jika Anda mendaftarkan OU kosong.

Contoh acara:

Menggunakan Notifikasi AWS Pengguna dengan AWS Control Tower

Anda dapat menggunakan PemberitahuanAWS Pengguna untuk mengatur saluran pengiriman agar diberi tahu tentang AWS Control Tower peristiwa. Anda akan menerima notifikasi saat ada sebuah peristiwa yang cocok dengan sebuah aturan yang Anda tentukan. Anda dapat menerima pemberitahuan untuk acara melalui beberapa saluran, termasuk email, notifikasi AWS Chatbotobrolan, atau pemberitahuan push Aplikasi SelulerAWS Konsol. Anda juga dapat melihat notifikasi di Pusat Notifikasi Konsol.

AWS Pemberitahuan Pengguna mendukung agregasi, yang dapat mengurangi jumlah notifikasi yang Anda terima selama acara tertentu. Pemberitahuan juga terlihat di Pusat Pemberitahuan Konsol.

Keuntungan berlangganan notifikasi melalui Pemberitahuan AWS Pengguna alih-alih EventBridge meliputi:

- Antarmuka pengguna yang lebih ramah (UI).
- Integrasi dengan AWS konsol, di area bell/notifikasi di bilah navigasi global.
- Dukungan asli untuk pemberitahuan email, tidak perlu mengatur Amazon SNS.
- Terutama, dukungan untuk pemberitahuan push seluler, eksklusif untuk Pemberitahuan AWS Pengguna.

Misalnya, salah satu jenis notifikasi yang mungkin ingin Anda terima adalah jika terdapat temuan kritis dan tingkat keparahan yang tinggi dari Security Hub. Cuplikan kode di JSON untuk mengatur langganan notifikasi mungkin terlihat seperti ini:

```
{
  "detail": {
```

```
    "findings": {
      "Compliance": {
        "Status": ["FAILED", "WARNING", "NOT_AVAILABLE"]
      },
      "RecordState": ["ACTIVE"],
      "Severity": {
        "Label": ["CRITICAL", "HIGH"]
      },
      "Workflow": {
        "Status": ["NEW", "NOTIFIED"]
      }
    }
  }
}
```

Penyaringan acara

- Anda dapat memfilter peristiwa berdasarkan layanan dan nama menggunakan filter yang tersedia di konsol Pemberitahuan AWS Pengguna.
- Anda dapat memfilter peristiwa berdasarkan properti tertentu jika Anda membuat EventBridge filter sendiri dari kode JSON.

Contoh AWS Control Tower acara

Berikut adalah contoh acara umum untuk AWS Control Tower.

- Ini sebuah EventBridge peristiwa.
- Anda dapat berlangganan EventBridge acara (seperti ini) menggunakan Pemberitahuan AWS Pengguna.

```
{
    "version": "0",
    "id": "<id>", // alphanumeric string
    "detail-type": "AWS Service Event via CloudTrail",
    "source": "aws.controltower",
    "account": "<account ID>", // Management account ID.
    "time": "<date>", // Format: yyyy-MM-dd'T'hh:mm:ssZ
    "region": "<region>", // AWS Control Tower home region.
    "resources": [],
    "detail": {
```

```
        "eventVersion": "1.05",
        "userIdentity": {
            "accountId": "121212121212",
            "invokedBy": "AWS Internal"
        },
        "eventTime": "2018-08-30T21:42:18Z", // Timestamp when call was made. Format:
 yyyy-MM-dd'T'hh:mm:ssZ.
        "eventSource": "controltower.amazonaws.com",
        "eventName": "<event name>", // one of the 9 event names in https://
docs.aws.amazon.com/controltower/latest/userguide/lifecycle-events.html
        "awsRegion": "<region>",
        "sourceIPAddress": "AWS Internal",
        "userAgent": "AWS Internal",
        "eventID": "<id>",
        "readOnly": false,
        "eventType": "AwsServiceEvent",
        "serviceEventDetails": {
            // the contents of this object vary depending on the event subtype and
 event state
        }
    }
}
```

Panduan

Bab ini berisi prosedur panduan yang dapat membantu Anda dalam penggunaan AWS Control Tower.

Topik

- Panduan: Pindah dari ALZ ke AWS Control Tower
- Panduan: Mengotomatiskan Penyediaan Akun di AWS Control Tower oleh Service Catalog API
- Panduan: Konfigurasikan AWS Control Tower Tanpa VPC
- Kelola Sumber Daya AWS Control Tower
- Panduan: Mengatur Grup Keamanan di AWS Control Tower Dengan AWS Firewall Manager
- Panduan: Menonaktifkan Zona Pendaratan AWS Control Tower

Panduan: Pindah dari ALZ ke AWS Control Tower

Banyak AWS pelanggan telah mengadopsi solusi AWS Landing Zone (ALZ) untuk menyiapkan lingkungan AWS multi-akun yang aman, sesuai, dan aman. Untuk mengurangi beban pengelolaan landing zone, AWS buat layanan terkelola yang disebut AWS Control Tower.

Tidak ada fitur tambahan yang dijadwalkan untuk ALZ; itu hanya dalam dukungan jangka panjang. Oleh karena itu, kami menyarankan Anda untuk pindah ke layanan AWS Control Tower dari ALZ. Blog yang ditautkan dalam chapter ini memandu Anda melalui berbagai pertimbangan untuk langkah itu, dan ini menjelaskan bagaimana Anda dapat merencanakan migrasi yang sukses dari ALZ ke AWS Control Tower.

Blog: Migrasikan solusi Zona AWS Pendaratan ke AWS Control Tower

AWS Prescriptive Guidance menawarkan dokumentasi yang lebih luas, termasuk langkah-langkah untuk transisi dari ALZ ke AWS Control Tower. Pada dasarnya, Anda akan mengaktifkan tata kelola AWS Control Tower di organisasi Anda yang ada yang menjalankan ALZ, berdasarkan sejumlah prasyarat. Untuk selengkapnya, lihat Transisi dari Zona AWS Pendaratan ke AWS Control Tower.

Panduan: Mengotomatiskan Penyediaan Akun di AWS Control Tower oleh Service Catalog API

AWS Control Tower terintegrasi dengan beberapa AWS layanan lain, seperti AWS Service Catalog. Anda dapat menggunakan API untuk membuat dan menyediakan akun anggota Anda di AWS Control Tower.

Video menunjukkan kepada Anda cara menyediakan akun secara otomatis, secara batch, dengan memanggil AWS Service Catalog API. Untuk penyediaan, Anda akan memanggil `ProvisionProduct`API dari antarmuka baris AWS perintah (CLI), dan Anda akan menentukan file JSON yang berisi parameter untuk setiap akun yang ingin Anda atur. Video menggambarkan menginstal dan menggunakan lingkungan pengembangan AWS Cloud9 untuk melakukan pekerjaan ini. Perintah CLI akan sama jika Anda menggunakan Cloudshell AWS alih-alih Cloud9. AWS

> **Note**
>
> Anda juga dapat menyesuaikan pendekatan ini untuk mengotomatiskan pembaruan akun, dengan memanggil `UpdateProvisionedProduct`API AWS Service Catalog untuk setiap akun. Anda dapat menulis skrip untuk memperbarui akun, satu per satu.

Sebagai metode otomatisasi yang sama sekali berbeda, jika Anda terbiasa dengan Terraform, Anda dapat menyediakan akun dengan AWS Control Tower Account Factory for Terraform (AFT).

Contoh peran administrasi otomatisasi

Berikut adalah contoh templat yang dapat Anda gunakan untuk membantu mengonfigurasi peran administrasi otomatisasi Anda di akun manajemen. Anda akan mengonfigurasi peran ini di akun manajemen Anda sehingga dapat melakukan otomatisasi dengan akses Administrator di akun target.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure the SampleAutoAdminRole

Resources:
  AdministrationRole:
    Type: AWS::IAM::Role
    Properties:
      RoleName: SampleAutoAdminRole
      AssumeRolePolicyDocument:
        Version: 2012-10-17
```

```
        Statement:
          - Effect: Allow
            Principal:
              Service: cloudformation.amazonaws.com
            Action:
              - sts:AssumeRole
      Path: /
      Policies:
        - PolicyName: AssumeSampleAutoAdminRole
          PolicyDocument:
            Version: 2012-10-17
            Statement:
              - Effect: Allow
                Action:
                  - sts:AssumeRole
                Resource:
                  - "arn:aws:iam::*:role/SampleAutomationExecutionRole"
```

Contoh peran eksekusi otomatisasi

Berikut adalah contoh template yang dapat Anda gunakan untuk membantu Anda mengatur peran eksekusi otomatisasi Anda. Anda akan mengonfigurasi peran ini di akun target.

```
AWSTemplateFormatVersion: "2010-09-09"
Description: "Create automation execution role for creating Sample Additional Role."

Parameters:
  AdminAccountId:
    Type: "String"
    Description: "Account ID for the administrator account (typically management,
 security or shared services)."
  AdminRoleName:
    Type: "String"
    Description: "Role name for automation administrator access."
    Default: "SampleAutomationAdministrationRole"
  ExecutionRoleName:
    Type: "String"
    Description: "Role name for automation execution."
    Default: "SampleAutomationExecutionRole"
  SessionDurationInSecs:
    Type: "Number"
    Description: "Maximum session duration in seconds."
    Default: 14400
```

```
Resources:
  # This needs to run after AdminRoleName exists.
  ExecutionRole:
    Type: "AWS::IAM::Role"
    Properties:
      RoleName: !Ref ExecutionRoleName
      MaxSessionDuration: !Ref SessionDurationInSecs
      AssumeRolePolicyDocument:
        Version: "2012-10-17"
        Statement:
          - Effect: "Allow"
            Principal:
              AWS:
                - !Sub "arn:aws:iam::${AdminAccountId}:role/${AdminRoleName}"
            Action:
              - "sts:AssumeRole"
      Path: "/"
      ManagedPolicyArns:
        - "arn:aws:iam::aws:policy/AdministratorAccess"
```

Setelah mengonfigurasi peran ini, Anda memanggil AWS Service Catalog API untuk melakukan tugas otomatis. Perintah CLI diberikan dalam video.

Contoh masukan penyediaan untuk Service Catalog API

Berikut adalah contoh masukan yang dapat Anda berikan ke Service Catalog `ProvisionProduct` API jika Anda menggunakan API untuk menyediakan akun AWS Control Tower:

```
{
  pathId: "lpv2-7n2o3nudljh4e",
  productId: "prod-y422ydgjge2rs",
  provisionedProductName: "Example product 1",
  provisioningArtifactId: "pa-2mmz36cfpj2p4",
  provisioningParameters: [
    {
      key: "AccountEmail",
      value: "abc@amazon.com"
    },
    {
      key: "AccountName",
      value: "ABC"
    },
```

```
    {
      key: "ManagedOrganizationalUnit",
      value: "Custom (ou-xfe5-a8hb8ml8)"
    },
    {
      key: "SSOUserEmail",
      value: "abc@amazon.com"
    },
    {
      key: "SSOUserFirstName",
      value: "John"
    },
    {
      key: "SSOUserLastName",
      value: "Smith"
    }
  ],
  provisionToken: "c3c795a1-9824-4fb2-a4c2-4b1841be4068"
}
```

Untuk informasi selengkapnya, lihat referensi API untuk Service Catalog.

> **Note**
>
> Perhatikan bahwa format string input untuk nilai `ManagedOrganizationalUnit` telah berubah dari `OU_NAME` ke`OU_NAME (OU_ID)`. Video berikut tidak menyebutkan perubahan ini.

Panduan Video

Video ini (6:58) menjelaskan cara mengotomatiskan penerapan akun di AWS Control Tower. Untuk tampilan yang lebih baik, pilih ikon di sudut kanan bawah video untuk memperbesarnya ke layar penuh. Captioning tersedia.

Panduan Video Penyediaan Akun Otomatis di AWS Control Tower.

Panduan: Konfigurasikan AWS Control Tower Tanpa VPC

Topik ini membahas cara mengonfigurasi akun AWS Control Tower Anda tanpa VPC.

Jika beban kerja Anda tidak memerlukan VPC, Anda dapat melakukan hal berikut:

- Anda dapat menghapus AWS Control Tower virtual private cloud (VPC) virtual. VPC ini dibuat saat Anda mengatur landing zone Anda.
- Anda dapat mengubah pengaturan Account Factory sehingga akun AWS Control Tower baru dibuat tanpa VPC terkait.

> **Important**
>
> Jika Anda menyediakan akun Account Factory dengan pengaturan akses internet VPC diaktifkan, setelan Account Factory akan menggantikan kontrol. Larang akses internet untuk instans VPC Amazon yang dikelola oleh pelanggan Untuk menghindari mengaktifkan akses internet untuk akun yang baru disediakan, Anda harus mengubah pengaturan di Account Factory.

Hapus AWS Control Tower VPC

Di luar AWS Control Tower, setiap AWS pelanggan memiliki VPC default, yang dapat Anda lihat di konsol Amazon Virtual Private Cloud (Amazon VPC) di https://console.aws.amazon.com/vpc/. Anda akan mengenali VPC default, karena namanya selalu menyertakan kata (default) di akhir nama.

Saat Anda menyiapkan zona landing zone AWS Control Tower, AWS Control Tower menghapus VPC AWS default Anda dan membuat VPC default AWS Control Tower baru. VPC baru dikaitkan dengan akun manajemen AWS Control Tower Anda. Topik ini mengacu pada VPC baru itu sebagai VPC Control Tower.

Saat Anda melihat AWS Control Tower VPC di konsol VPC Amazon, Anda tidak akan melihat kata (default) di akhir nama. Jika Anda memiliki lebih dari satu VPC, Anda harus menggunakan rentang CIDR yang ditetapkan untuk mengidentifikasi VPC AWS Control Tower yang benar.

Anda dapat menghapus AWS Control Tower VPC, tetapi jika nanti Anda memerlukan VPC di AWS Control Tower, Anda harus membuatnya sendiri.

Untuk menghapus AWS Control Tower VPC

1. Buka konsol Amazon VPC di https://console.aws.amazon.com/vpc/.
2. Cari **VPC** atau pilih VPC dari opsi Service Catalog. Anda kemudian melihat Dasbor VPC.

3. Dari menu di sebelah kiri, pilih VPC Anda. Anda kemudian melihat daftar semua VPC Anda.
4. Identifikasi AWS Control Tower VPC berdasarkan rentang CIDR-nya.
5. Untuk menghapus VPC, pilih Tindakan dan kemudian pilih Hapus VPC.

VPC AWS (default) sudah ada di setiap Wilayah untuk akun manajemen AWS Control Tower. Untuk mengikuti praktik terbaik keamanan, jika Anda memilih untuk menghapus AWS Control Tower VPC, sebaiknya hapus AWS VPC default yang terkait dengan akun manajemen dari semua Wilayah. AWS Oleh karena itu, untuk mengamankan akun manajemen, hapus VPC default dari setiap Wilayah, serta menghapus VPC yang dibuat oleh Control Tower di wilayah asal AWS Control Tower Anda.

Membuat Akun di AWS Control Tower Tanpa VPC

Jika beban kerja pengguna akhir Anda tidak memerlukan VPC, Anda dapat menggunakan metode ini untuk menyiapkan akun pengguna akhir yang tidak memiliki VPC yang dibuat untuk mereka secara otomatis.

Dari dasbor AWS Control Tower, Anda dapat melihat dan mengedit pengaturan konfigurasi jaringan. Setelah Anda mengubah pengaturan sehingga akun AWS Control Tower dibuat tanpa VPC terkait, semua akun baru dibuat tanpa VPC hingga Anda mengubah pengaturan lagi.

Untuk mengkonfigurasi Account Factory untuk membuat akun tanpa VPC

1. Buka browser web, dan navigasikan ke konsol AWS Control Tower di https://console.aws.amazon.com/controltower.
2. Pilih Account Factory dari menu di sebelah kiri.
3. Anda kemudian melihat halaman Account Factory dengan bagian Network Configuration.
4. Perhatikan pengaturan saat ini jika Anda bermaksud memulihkannya nanti.
5. Pilih tombol Edit di bagian Konfigurasi Jaringan.
6. Di halaman konfigurasi jaringan pabrik Edit akun, buka bagian opsi Konfigurasi VPC untuk akun baru.

   Anda dapat mengikuti Opsi 1 atau Opsi 2, atau keduanya, untuk memastikan AWS Control Tower tidak membuat VPC saat menyediakan akun.

   a. Opsi 1 - Menghapus subnet

      - Matikan sakelar sakelar sakelar subnet yang dapat diakses Internet.

    - Atur jumlah maksimum nilai subnet pribadi ke 0.

  b. Opsi 2 - Menghapus AWS Wilayah

    - Hapus setiap kotak centang di kolom Regions for VPC creation.

7. Pilih Simpan.

Kemungkinan Kesalahan

Waspadai kemungkinan kesalahan ini yang dapat terjadi saat Anda menghapus AWS Control Tower VPC atau mengonfigurasi ulang Account Factory untuk membuat akun tanpa VPC.

- Akun manajemen Anda yang ada mungkin memiliki dependensi atau sumber daya di AWS Control Tower VPC, yang dapat menyebabkan kesalahan kegagalan penghapusan.
- Jika Anda membiarkan CIDR default di tempat saat mengatur untuk meluncurkan akun baru tanpa VPC, permintaan Anda gagal dengan kesalahan bahwa CIDR tidak valid.

Panduan: Mengatur Grup Keamanan di AWS Control Tower Dengan AWS Firewall Manager

Video menunjukkan kepada Anda cara menggunakan layanan AWS Firewall Manager untuk memberikan peningkatan keamanan jaringan Anda untuk AWS Control Tower. Anda dapat menetapkan akun administrator keamanan yang diaktifkan untuk menyiapkan grup keamanan. Anda akan melihat bagaimana Anda dapat mengonfigurasi kebijakan keamanan dan menerapkan aturan keamanan untuk organisasi AWS Control Tower Anda, dan bagaimana Anda dapat memulihkan sumber daya yang tidak sesuai dengan menerapkan kebijakan secara otomatis. Anda dapat melihat grup keamanan yang berlaku untuk setiap akun dan sumber daya (seperti instans Amazon EC2) di organisasi Anda.

Anda dapat membuat kebijakan firewall Anda sendiri, atau Anda dapat berlangganan aturan dari vendor tepercaya.

Mengatur Grup Keamanan Dengan AWS Firewall Manager

Video ini (8:02) menjelaskan cara mengatur keamanan infrastruktur jaringan yang lebih baik untuk sumber daya dan beban kerja Anda di AWS Control Tower. Untuk tampilan yang lebih baik, pilih ikon di sudut kanan bawah video untuk memperbesarnya ke layar penuh. Captioning tersedia.

Panduan Video Penyiapan Firewall di AWS Control Tower.

Untuk informasi selengkapnya, lihat dokumentasi tentang cara mengatur AWS WAF.

Panduan: Menonaktifkan Zona Pendaratan AWS Control Tower

AWS Control Tower memungkinkan Anda mengatur dan mengatur AWS lingkungan multi-akun yang aman, yang dikenal sebagai zona pendaratan. Proses pembersihan semua sumber daya yang dialokasikan oleh AWS Control Tower disebut sebagai penonaktifan landing zone.

Jika Anda tidak lagi ingin menggunakan AWS Control Tower, alat penonaktifan otomatis membersihkan sumber daya yang dialokasikan oleh AWS Control Tower. Untuk memulai proses penonaktifan otomatis, navigasikan ke halaman Pengaturan Zona Landing, pilih tab dekomisi, dan pilih Decommission landing zone.

Untuk daftar tindakan yang dilakukan selama penonaktifan, lihat. Ikhtisar proses penonaktifan

> **Warning**
>
> Menghapus semua sumber daya AWS Control Tower secara manual tidak sama dengan penonaktifan. Ini tidak akan memungkinkan Anda untuk mengatur landing zone baru.

Data Anda dan data Anda yang AWS Organizations ada tidak diubah oleh proses penonaktifan, dengan cara berikut.

- AWS Control Tower tidak menghapus data Anda, hanya menghapus bagian dari landing zone yang dibuatnya.
- Setelah proses penonaktifan selesai, beberapa artefak sumber daya tetap ada, seperti bucket Amazon S3 dan grup log Amazon Logs. CloudWatch Sumber daya ini harus dihapus secara manual sebelum Anda mengatur landing zone lain, dan untuk menghindari kemungkinan biaya yang terkait dengan pemeliharaan sumber daya tertentu.
- Anda tidak dapat menggunakan penonaktifan otomatis untuk menghapus landing zone yang telah diatur sebagian. Jika proses penyiapan landing zone Anda gagal, Anda harus menyelesaikan status kegagalan dan mengaturnya sepenuhnya untuk memungkinkan penonaktifan otomatis, atau Anda harus menghapus sumber daya secara manual satu per satu.

Menonaktifkan landing zone adalah proses dengan konsekuensi yang signifikan, dan tidak dapat dibatalkan. Tindakan penonaktifan yang dilakukan oleh AWS Control Tower dan artefak yang tersisa setelah penonaktifan dijelaskan di bagian berikut.

> **Important**
>
> Kami sangat menyarankan agar Anda melakukan proses dekomisioning ini hanya jika Anda berniat untuk berhenti menggunakan landing zone Anda. Tidak mungkin untuk membuat kembali landing zone yang ada setelah Anda menonaktifkannya.

Ikhtisar proses penonaktifan

Saat Anda meminta penonaktifan landing zone, AWS Control Tower melakukan tindakan berikut.

- Menonaktifkan setiap kontrol detektif diaktifkan di landing zone. AWS Control Tower menghapus AWS CloudFormation sumber daya yang mendukung kontrol.
- Menonaktifkan setiap kontrol preventif dengan menghapus kebijakan kontrol layanan (SCP) dari. AWS OrganizationsJika kebijakan kosong (yang seharusnya dilakukan setelah menghapus semua SCP yang dikelola oleh AWS Control Tower), AWS Control Tower melepaskan dan menghapus kebijakan sepenuhnya.
- Menghapus semua cetak biru yang digunakan sebagai. AWS CloudFormation StackSets
- Menghapus semua cetak biru yang digunakan sebagai CloudFormation Tumpukan di semua Wilayah.
- Untuk setiap akun yang disediakan, AWS Control Tower melakukan tindakan berikut selama proses penonaktifan.
  - Menghapus catatan dari setiap akun akun pabrik.
  - Mencabut izin AWS Control Tower ke akun dengan menghapus peran IAM yang dibuat AWS Control Tower (kecuali kebijakan tambahan telah ditambahkan ke dalamnya) dan membuat ulang peran IAM standar. `OrganizationsFullAccessRole`
  - Menghapus catatan akun dari AWS Service Catalog.
  - Menghapus produk dan portofolio akun pabrik dari AWS Service Catalog.
- Menghapus cetak biru untuk akun bersama (Audit dan Arsip Log).
- Mencabut izin AWS Control Tower dari akun bersama dengan menghapus peran IAM yang dibuat AWS Control Tower (kecuali kebijakan tambahan telah ditambahkan ke dalamnya) dan membuat ulang peran IAM. `OrganizationsFullAccessRole`

- Menghapus catatan yang terkait dengan akun bersama.
- Menghapus catatan yang terkait dengan OU yang dibuat pelanggan.
- Menghapus catatan internal yang mengidentifikasi Wilayah asal.

> **Note**
>
> Setelah dinonaktifkan, Anda mungkin ingin menghapus cetak biru Account Factory VPC (`BP_ACCOUNT_FACTORY_VPC`) untuk membersihkan rute dan gateway NAT, jika VPC Anda tidak kosong.

Sumber daya tidak dihapus selama penonaktifan

Menonaktifkan landing zone tidak sepenuhnya membalikkan proses penyiapan AWS Control Tower. Sumber daya tertentu tetap ada, yang dapat dihapus secara manual.

AWS Organizations

Untuk pelanggan tanpa AWS Organizations organisasi yang ada, AWS Control Tower menyiapkan organisasi dengan dua unit organisasi (OU), bernama Security dan Sandbox. Saat Anda menonaktifkan landing zone Anda, hierarki organisasi dipertahankan, sebagai berikut:

- Unit Organisasi (OU) yang Anda buat dari konsol AWS Control Tower tidak dihapus.
- Keamanan dan Sandbox OU tidak dihapus.
- Organisasi tidak dihapus dari AWS Organizations.
- Tidak ada akun di AWS Organizations (bersama, disediakan, atau manajemen) yang dipindahkan atau dihapus.

AWS IAM Identity Center (SSO)

Untuk pelanggan tanpa direktori IAM Identity Center yang ada, AWS Control Tower menyiapkan IAM Identity Center dan mengonfigurasi direktori awal. Saat Anda menonaktifkan landing zone, AWS Control Tower tidak membuat perubahan pada IAM Identity Center. Jika diperlukan, Anda dapat menghapus informasi Pusat Identitas IAM yang disimpan di akun manajemen Anda secara manual. Secara khusus, area ini tidak berubah dengan menonaktifkan:

- Pengguna yang dibuat dengan Account Factory tidak akan dihapus.

- Grup yang dibuat oleh penyiapan AWS Control Tower tidak dihapus.
- Set izin yang dibuat oleh AWS Control Tower tidak dihapus.
- Asosiasi antara akun AWS dan kumpulan izin Pusat Identitas IAM tidak dihapus.
- Direktori IAM Identity Center tidak diubah.

Peran

Selama penyiapan, AWS Control Tower membuat peran tertentu untuk Anda jika Anda menggunakan konsol, atau meminta Anda untuk membuat peran ini jika Anda menyiapkan landing zone melalui API. Saat Anda menonaktifkan landing zone, peran berikut tidak akan dihapus:

- `AWSControlTowerAdmin`
- `AWSControlTowerCloudTrailRole`
- `AWSControlTowerStackSetRole`
- `AWSControlTowerConfigAggregatorRoleForOrganizations`

Bucket Amazon S3

Selama penyiapan, AWS Control Tower membuat bucket di akun logging untuk logging dan akses logging. Saat Anda menonaktifkan landing zone, sumber daya berikut tidak akan dihapus:

- Logging dan logging access S3 bucket di akun logging tidak dihapus.
- Isi bucket akses logging dan logging tidak dihapus.

Akun Bersama

Dua akun bersama (Audit dan Arsip Log) dibuat di OU Keamanan selama penyiapan AWS Control Tower. Saat Anda menonaktifkan landing zone Anda:

- Akun bersama yang dibuat selama penyiapan AWS Control Tower tidak ditutup.
- Peran `OrganizationAccountAccessRole` IAM dibuat ulang untuk menyelaraskan dengan konfigurasi standar. AWS Organizations
- `AWSControlTowerExecution`Peran dihapus.

Akun yang Disediakan

Pelanggan AWS Control Tower dapat menggunakan pabrik akun untuk membuat akun AWS baru. Saat Anda menonaktifkan landing zone Anda:

- Akun yang disediakan yang Anda buat dengan Account Factory tidak ditutup.
- Produk yang disediakan tidak AWS Service Catalog dihapus. Jika Anda membersihkannya dengan menghentikannya, akun mereka dipindahkan ke Root OU.
- VPC yang dibuat AWS Control Tower tidak dihapus, dan AWS CloudFormation stack set (`BP_ACCOUNT_FACTORY_VPC`) terkait tidak dihapus.
- Peran `OrganizationAccountAccessRole` IAM dibuat ulang untuk menyelaraskan dengan konfigurasi standar. AWS Organizations
- `AWSControlTowerExecution`Peran dihapus.

CloudWatch Grup Log Log

Sebuah grup CloudWatch log log,`aws-controltower/CloudTrailLogs`, dibuat sebagai bagian dari cetak biru bernama. `AWSControlTowerBP-BASELINE-CLOUDTRAIL-MANAGEMENT` Grup log ini tidak dihapus. Sebaliknya, cetak biru dihapus dan sumber daya dipertahankan.

- Grup log ini harus dihapus secara manual sebelum Anda mengatur landing zone lain.

> **Note**
>
> Pelanggan di landing zone 3.0 dan yang lebih baru tidak perlu menghapus log akun dan CloudTrail CloudTrail log peran masing-masing yang terdaftar, karena ini dibuat di akun manajemen saja, untuk jejak tingkat organisasi.
> Dimulai dengan landing zone versi 3.2, AWS Control Tower membuat EventBridge aturan, yang disebut`AWSControlTowerManagedRule`. Aturan ini dibuat di setiap akun anggota, untuk semua Wilayah yang diatur. Aturan tidak dihapus secara otomatis selama penonaktifan, jadi Anda harus menghapusnya secara manual dari akun bersama dan anggota untuk semua Wilayah yang diatur sebelum Anda dapat mengatur landing zone di Wilayah baru.

Prosedur untuk cara menghapus sumber daya AWS Control Tower diberikan dalam[Kelola Sumber Daya AWS Control Tower](#).

Kelola Sumber Daya AWS Control Tower

Dokumen ini memberikan petunjuk tentang cara menghapus sumber daya AWS Control Tower secara individual, sebagai bagian dari tugas pemeliharaan dan administrasi rutin. Prosedur yang diberikan dalam pasal ini dimaksudkan hanya untuk menghilangkan sumber daya individu, atau beberapa sumber daya, bila diperlukan. Ini tidak sama dengan menonaktifkan landing zone Anda.

Dua jenis tugas mungkin mengharuskan Anda untuk menghapus sumber daya:

- Untuk menghapus sumber daya saat Anda mengelola landing zone dalam situasi biasa.
- Untuk membersihkan sumber daya yang tersisa setelah penonaktifan otomatis.

> **Warning**
>
> Menghapus sumber daya secara manual tidak akan memungkinkan Anda untuk mengatur landing zone baru. Ini tidak sama dengan penonaktifan. Jika Anda berniat untuk menonaktifkan landing zone AWS Control Tower Anda, ikuti petunjuk Panduan: Menonaktifkan Zona Pendaratan AWS Control Tower sebelum Anda mengambil tindakan apa pun yang dijelaskan dalam Bab ini. Petunjuk dalam Bab ini dapat membantu Anda membersihkan sumber daya yang tersisa setelah penonaktifan otomatis selesai. Bahkan jika Anda menghapus semua sumber daya landing zone Anda secara manual, itu tidak sama dengan menonaktifkan landing zone, dan Anda mungkin dikenakan biaya tak terduga.

Jika Anda perlu menghapus akun dari AWS Control Tower, lihat bagian berikut untuk menutup akun:

- Batalkan kelola akun
- Menutup akun yang dibuat di Account Factory

Apakah saya perlu menonaktifkan alih-alih menghapus?

Jika Anda tidak lagi berniat menggunakan AWS Control Tower untuk perusahaan Anda, atau jika Anda memerlukan pemindahan besar-besaran sumber daya organisasi Anda, Anda mungkin ingin menonaktifkan sumber daya yang dibuat saat pertama kali menyiapkan landing zone Anda.

- Setelah proses penonaktifan selesai, beberapa artefak sumber daya tetap ada, seperti bucket Amazon S3 dan grup log Amazon Logs. CloudWatch

- Anda harus membersihkan sumber daya yang tersisa di akun Anda secara manual sebelum menyiapkan landing zone lain, dan untuk menghindari kemungkinan biaya tak terduga. Untuk informasi selengkapnya, lihat Sumber daya tidak dihapus selama penonaktifan.

> **Warning**
>
> Kami sangat menyarankan agar Anda melakukan proses dekomisioning hanya jika Anda berniat untuk berhenti menggunakan landing zone Anda. Proses ini tidak dapat dibatalkan.

Tentang menghapus sumber daya AWS Control Tower

Prosedur individual dalam Bab ini memandu Anda melalui metode manual untuk menghapus sumber daya AWS Control Tower. Prosedur ini dapat diikuti ketika Anda perlu menghapus sumber daya tertentu dari landing zone Anda.

Sebelum melakukan prosedur ini, kecuali dinyatakan lain, Anda harus masuk ke Wilayah asal untuk landing zone Anda, dan Anda harus masuk sebagai pengguna IAM atau pengguna di IAM Identity Center dengan izin administratif untuk akun manajemen yang berisi landing zone Anda. AWS Management Console

> **Warning**
>
> Ini adalah tindakan destruktif yang dapat memperkenalkan penyimpangan tata kelola ke penyiapan AWS Control Tower Anda. Mereka tidak bisa dibatalkan.

Topik

- Hapus SCP
- Hapus StackSets dan Tumpukan
- Hapus Bucket Amazon S3 di Akun Arsip Log
- Menghapus Portofolio dan Produk Account Factory
- Hapus Peran dan Kebijakan AWS Control Tower
- Bantuan sumber daya AWS Control Tower

Hapus SCP

AWS Control Tower menggunakan kebijakan kontrol layanan (SCP) untuk kontrolnya. Prosedur ini membahas cara menghapus SCP yang secara khusus terkait dengan AWS Control Tower.

Untuk menghapus AWS Organizations SCP

1. Buka konsol Organizations di https://console.aws.amazon.com/organizations/.
2. Buka tab Policies, dan temukan Service Control Policies (SCPs) yang memiliki awalan aws-guardrails- dan lakukan hal berikut untuk setiap SCP:
   a. Lepaskan SCP dari OU terkait.
   b. Hapus SCP.

Hapus StackSets dan Tumpukan

AWS Control Tower menggunakan StackSets dan menumpuk untuk menerapkan Aturan AWS Config terkait dengan kontrol di landing zone Anda. Prosedur berikut berjalan melalui cara menghapus sumber daya khusus ini.

Untuk menghapus AWS CloudFormation StackSets

1. Buka AWS CloudFormation konsol di https://console.aws.amazon.com/cloudformation.
2. Dari menu navigasi kiri, pilih StackSets.
3. Untuk masing-masing StackSet dengan awalan AWSControlTower, lakukan hal berikut. Jika Anda memiliki banyak akun di a StackSet, ini bisa memakan waktu.
   a. Pilih yang spesifik StackSet dari tabel di dasbor. Ini membuka halaman properti untuk itu StackSet.
   b. Di bagian bawah halaman, di tabel Stacks, buat catatan ID AWS akun untuk semua akun di tabel. Salin daftar semua akun.
   c. Dari Tindakan, pilih Hapus tumpukan dari StackSet.
   d. Pada Setel opsi penerapan, dari lokasi Deployment, pilih Menerapkan tumpukan di akun.
   e. Di bidang teks, masukkan ID AWS akun yang Anda buat catatan di langkah 3.b, dipisahkan dengan koma. Misalnya: `123456789012`, `098765431098`, dan sebagainya.
   f. Dari Tentukan wilayah, pilih Tambahkan semua, biarkan parameter lainnya di halaman diatur ke defaultnya, dan pilih Berikutnya.

   g. Pada halaman Ulasan, tinjau pilihan Anda, lalu pilih Hapus tumpukan.
   h. Pada halaman StackSet properti, Anda dapat memulai prosedur ini lagi untuk yang lain StackSets.
4. Proses ini selesai ketika catatan dalam tabel Stacks dari halaman StackSets properti yang berbeda kosong.
5. Ketika catatan dalam tabel Stacks kosong, pilih Hapus StackSet.

Untuk menghapus AWS CloudFormation tumpukan

1. Buka AWS CloudFormation konsol di https://console.aws.amazon.com/cloudformation.
2. Dari dasbor Stacks, cari semua tumpukan dengan awalan. AWSControlTower
3. Untuk setiap tumpukan dalam tabel, lakukan hal berikut:
   a. Pilih kotak centang di sebelah nama tumpukan.
   b. Dari menu Actions, pilih Delete Stack.
   c. Di kotak dialog yang terbuka, tinjau informasi untuk memastikannya akurat, dan pilih Ya, Hapus.

Hapus Bucket Amazon S3 di Akun Arsip Log

Prosedur berikut memandu Anda melalui cara masuk ke akun arsip log sebagai pengguna Pusat Identitas IAM di AWSControlTowerExecutiongrup dan kemudian menghapus bucket Amazon S3 di akun arsip log Anda.

Untuk masuk ke akun arsip log Anda dengan izin yang tepat

1. Buka konsol Organizations di https://console.aws.amazon.com/organizations/.
2. Dari tab Akun, temukan akun Arsip Log.
3. Dari panel kanan yang terbuka, buat catatan nomor akun arsip log.
4. Dari bilah navigasi, pilih nama akun Anda untuk membuka menu akun Anda.
5. Pilih Ganti Peran.
6. Pada halaman yang terbuka, berikan nomor akun untuk akun arsip log di Akun.
7. Untuk Peran, masukkan AWSControlTowerExecution.
8. Nama Tampilan diisi dengan teks.

9. Pilih Warna favorit Anda.
10. Pilih Ganti Peran.

Untuk menghapus ember Amazon S3

1. Buka konsol Amazon S3 di https://console.aws.amazon.com/s3/.
2. Cari nama bucket yang berisi aws-controltower.
3. Untuk setiap ember di tabel, lakukan hal berikut:
   a. Pilih kotak centang untuk ember di tabel.
   b. Pilih Hapus.
   c. Di kotak dialog yang terbuka, tinjau informasi untuk memastikannya akurat, masukkan nama bucket untuk mengonfirmasi, lalu pilih Konfirmasi.

Menghapus Portofolio dan Produk Account Factory

Prosedur berikut memandu Anda melalui cara masuk sebagai pengguna IAM Identity Center di AWSServiceCatalogAdminsgrup dan kemudian membersihkan portofolio dan produk Account Factory Anda.

Untuk masuk ke akun manajemen Anda dengan izin yang tepat

1. Buka URL portal pengguna Anda di *directory-id* .awsapps.com/start
2. Dari AWS Akun, temukan akun Manajemen.
3. Dari AWSServiceCatalogAdminFullAccess, pilih Konsol manajemen untuk masuk ke peran AWS Management Console sebagai ini.

Untuk membersihkan Account Factory

1. Buka konsol Service Catalog di https://console.aws.amazon.com/servicecatalog/.
2. Dari menu navigasi kiri, pilih daftar Portofolio.
3. Dalam tabel Portofolio Lokal, cari portofolio bernama AWS Control Tower Account Factory Portfolio.
4. Pilih nama portofolio itu untuk membuka halaman detailnya.

5. Perluas bagian Constraints pada halaman, dan pilih tombol radio untuk kendala dengan nama produk Control TowerAWS Account Factory.
6. Pilih HAPUS KENDALA.
7. Di kotak dialog yang terbuka, tinjau informasi untuk memastikannya akurat, lalu pilih LANJUTKAN.
8. Dari bagian Produk halaman, pilih tombol radio untuk produk bernama AWS Control Tower Account Factory.
9. Pilih HAPUS PRODUK.
10. Di kotak dialog yang terbuka, tinjau informasi untuk memastikannya akurat, lalu pilih LANJUTKAN.
11. Perluas bagian Pengguna, Grup, dan Peran halaman, dan pilih kotak centang untuk semua catatan dalam tabel ini.
12. Pilih HAPUS PENGGUNA, GRUP ATAU PERAN.
13. Di kotak dialog yang terbuka, tinjau informasi untuk memastikannya akurat, lalu pilih LANJUTKAN.
14. Dari menu navigasi kiri, pilih daftar Portofolio.
15. Dalam tabel Portofolio Lokal, cari portofolio bernama AWS Control Tower Account Factory Portfolio.
16. Pilih tombol radio untuk portofolio itu, lalu pilih HAPUS PORTOFOLIO.
17. Di kotak dialog yang terbuka, tinjau informasi untuk memastikannya akurat, lalu pilih LANJUTKAN.
18. Dari menu navigasi kiri, pilih Daftar produk.
19. Pada halaman produk Admin, cari produk bernama AWS Control Tower Account Factory.
20. Pilih produk untuk membuka halaman detail produk Admin.
21. Dari Tindakan, pilih Hapus produk.
22. Di kotak dialog yang terbuka, tinjau informasi untuk memastikannya akurat, lalu pilih LANJUTKAN.

Hapus Peran dan Kebijakan AWS Control Tower

Prosedur ini memandu Anda melalui cara membersihkan peran dan kebijakan yang dibuat AWS Control Tower saat landing zone Anda disiapkan, atau yang lebih baru.

Untuk menghapus peran Pusat AWSServiceCatalogEndUserAccess Identitas IAM

1. Buka AWS IAM Identity Center konsol di https://console.aws.amazon.com/singlesignon/.
2. Ubah AWS Wilayah Anda ke Wilayah asal Anda, yang merupakan Wilayah tempat Anda pertama kali menyiapkan AWS Control Tower.
3. Dari menu navigasi kiri, pilih AWS akun.
4. Pilih tautan akun manajemen Anda.
5. Pilih dropdown untuk set Izin, pilih AWSServiceCatalogEndUserAccess, lalu pilih Hapus.
6. Pilih AWS akun dari panel kiri.
7. Buka tab Perizinan set.
8. Pilih AWSServiceCatalogEndUserAccessdan hapus.

Untuk menghapus peran IAM

1. Buka konsol IAM di https://console.aws.amazon.com/iam/.
2. Dari menu navigasi kiri, pilih Peran.
3. Dari tabel, cari peran dengan nama AWSControlTower.
4. Untuk setiap peran dalam tabel, lakukan hal berikut:
   a. Pilih kotak centang untuk peran tersebut.
   b. Pilih Hapus peran.
   c. Di kotak dialog yang terbuka, tinjau informasi untuk memastikannya akurat, lalu pilih Ya, hapus.

Untuk menghapus kebijakan IAM

1. Buka konsol IAM di https://console.aws.amazon.com/iam/.
2. Dari menu navigasi kiri, pilih Kebijakan.
3. Dari tabel, cari kebijakan dengan nama AWSControlTower.
4. Untuk setiap kebijakan dalam tabel, lakukan hal berikut:
   a. Pilih kotak centang untuk kebijakan tersebut.
   b. Pilih Tindakan kebijakan, dan Hapus dari menu tarik-turun.
   c. Di kotak dialog yang terbuka, tinjau informasi untuk memastikannya akurat, lalu pilih Hapus.

Bantuan sumber daya AWS Control Tower

Jika Anda mengalami masalah apa pun yang tidak dapat diselesaikan saat menghapus sumber daya AWS Control Tower, hubungi AWS Support.

Cara menonaktifkan landing zone

Untuk menonaktifkan landing zone AWS Control Tower Anda, ikuti prosedur yang diberikan di sini.

> **Note**
>
> Kami menyarankan Anda membatalkan kelola akun Anda yang terdaftar sebelum dinonaktifkan.

1. Arahkan ke halaman Pengaturan Zona Landing di konsol AWS Control Tower.
2. Pilih Donaktifkan landing zone Anda di bagian Donaktifkan landing zone Anda.
3. Dialog muncul, menjelaskan tindakan yang akan Anda lakukan, dengan proses konfirmasi yang diperlukan. Untuk mengonfirmasi maksud Anda untuk menonaktifkan, Anda harus memilih setiap kotak dan mengetik konfirmasi seperti yang diminta.

   > **Important**
   >
   > Proses dekomisioning tidak dapat dibatalkan.

4. Jika Anda mengonfirmasi maksud Anda untuk menonaktifkan landing zone, Anda akan diarahkan ke halaman beranda AWS Control Tower saat penonaktifan sedang berlangsung. Prosesnya mungkin membutuhkan waktu hingga dua jam.
5. Ketika penonaktifan telah berhasil, Anda harus menghapus sumber daya yang tersisa secara manual sebelum menyiapkan landing zone baru dari konsol AWS Control Tower. Sumber daya yang tersisa ini mencakup beberapa bucket Amazon S3 tertentu, organisasi, dan grup CloudWatch log Log.

   > **Note**
   >
   > Tindakan ini mungkin memiliki konsekuensi signifikan untuk aktivitas penagihan dan kepatuhan Anda. Misalnya, kegagalan untuk menghapus sumber daya ini dapat mengakibatkan biaya yang tidak terduga.

Untuk informasi selengkapnya tentang cara menghapus sumber daya secara manual, lihatTentang menghapus sumber daya AWS Control Tower.

6. Jika Anda berniat untuk membuat landing zone baru di AWS Wilayah baru, ikuti langkah tambahan ini. Masukkan perintah berikut melalui CLI:

```
aws organizations disable-aws-service-access --service-principal
 controltower.amazonaws.com
```

Tugas pembersihan manual diperlukan setelah dinonaktifkan

- Anda harus menentukan alamat email yang berbeda untuk arsip Log dan akun Audit jika Anda membuat landing zone baru setelah menonaktifkannya, atau mengikuti prosedur untuk membawa arsip Log atau akun Audit Anda sendiri yang ada.
- Grup CloudWatch log log,`aws-controltower/CloudTrailLogs`, harus dihapus secara manual sebelum Anda mengatur landing zone lain.
- Dua bucket Amazon S3 dengan nama yang dicadangkan untuk log harus dihapus, atau diganti namanya, secara manual.
- Anda harus menghapus, atau mengganti nama, unit organisasi Security dan Sandbox yang ada secara manual.

> **Note**
>
> Sebelum Anda dapat menghapus organisasi AWS Control Tower Security OU, Anda harus terlebih dahulu menghapus akun logging dan audit, tetapi bukan akun manajemen. Untuk menghapus akun ini, Anda harus Kapan harus masuk sebagai pengguna root ke akun audit dan ke akun logging dan menghapusnya satu per satu.

- Anda mungkin ingin menghapus konfigurasi AWS IAM Identity Center (IAM Identity Center) untuk AWS Control Tower secara manual, tetapi Anda dapat melanjutkan dengan konfigurasi IAM Identity Center yang ada.
- Anda mungkin ingin menghapus VPC yang dibuat oleh AWS Control Tower, dan menghapus set CloudFormation tumpukan AWS terkait.

- Sebelum Anda dapat mengatur landing zone baru di AWS Wilayah baru, Anda harus mengikuti langkah-langkah tambahan ini.
  - Masukkan perintah berikut melalui CLI:

    ```
    aws organizations disable-aws-service-access --service-principal
     controltower.amazonaws.com
    ```

  - Hapus aturan terkelola yang tersisa`AWSControlTowerManagedRule`, yang dipanggil, dari akun bersama dan anggota untuk semua Wilayah yang diatur.

Pengaturan setelah menonaktifkan landing zone

Setelah Anda menonaktifkan landing zone Anda, Anda tidak dapat berhasil menjalankan setup lagi sampai pembersihan manual selesai. Selain itu, tanpa pembersihan manual dari sumber daya yang tersisa ini, Anda mungkin dikenakan biaya penagihan yang tidak terduga. Anda harus memperhatikan masalah ini:

- Akun manajemen AWS Control Tower adalah bagian dari AWS Control Tower Root OU. Pastikan peran IAM dan kebijakan IAM ini dihapus dari akun manajemen:
  - Peran:
    - `AWSControlTowerAdmin`
    - `AWSControlTowerCloudTrailRole`
    - `AWSControlTowerStackSetRole`
  - Kebijakan:
    - `AWSControlTowerAdminPolicy`
    - `AWSControlTowerCloudTrailRolePolicy`
    - `AWSControlTowerStackSetRolePolicy`
- Anda mungkin ingin menghapus atau memperbarui konfigurasi IAM Identity Center yang ada untuk AWS Control Tower sebelum Anda menaikkan landing zone lagi, tetapi Anda tidak perlu menghapusnya.
- Anda mungkin ingin menghapus VPC yang dibuat oleh AWS Control Tower.

- Penyiapan gagal jika alamat email yang ditentukan untuk akun pencatatan atau audit dikaitkan dengan AWS akun yang ada. Anda dapat menutup AWS akun, atau menggunakan alamat email yang berbeda untuk mengatur landing zone lagi. Atau, Anda dapat menggunakan kembali akun bersama yang ada ini, dengan fitur yang memungkinkan Anda untuk membawa akun logging dan audit Anda sendiri. Untuk informasi selengkapnya, lihat Pertimbangan untuk membawa akun keamanan atau pencatatan yang ada.
- Penyiapan gagal jika bucket Amazon S3 dengan nama cadangan berikut sudah ada di akun logging:
  - `aws-controltower-logs-{accountId}-{region}`(digunakan untuk ember logging).
  - `aws-controltower-s3-access-logs-{accountId}-{region}`(digunakan untuk bucket akses logging).

  Anda harus mengganti nama atau menghapus bucket ini, atau menggunakan akun lain untuk akun logging.
- Pengaturan gagal jika akun manajemen memiliki grup log yang ada,`aws-controltower/CloudTrailLogs`, di CloudWatch Log. Anda harus mengganti nama atau menghapus grup log.

Sebelum Anda mengatur di yang baru Wilayah AWS

Jika Anda berniat untuk membuat landing zone baru di AWS Wilayah baru, ikuti langkah-langkah tambahan ini.

- Masukkan perintah berikut melalui CLI:

```
aws organizations disable-aws-service-access --service-principal
 controltower.amazonaws.com
```

- Hapus aturan terkelola yang tersisa`AWSControlTowerManagedRule`, dipanggil, dari akun bersama dan anggota untuk semua Wilayah yang diatur.

> **Note**
>
> Anda tidak dapat menyiapkan landing zone baru di organisasi dengan OU tingkat atas bernama Security atau Sandbox. Anda harus mengganti nama atau menghapus OU ini untuk mengatur landing zone lagi.

Memecahkan masalah

Jika Anda mengalami masalah saat menggunakan AWS Control Tower, Anda dapat menggunakan informasi berikut untuk menyelesaikannya sesuai dengan praktik terbaik kami. Jika masalah yang Anda temui berada di luar cakupan informasi berikut, atau jika masih ada setelah Anda mencoba menyelesaikannya, hubungi AWS Support.

Peluncuran Zona Pendaratan Gagal

Penyebab umum kegagalan peluncuran landing zone:

- Kurangnya respons terhadap pesan email konfirmasi.
- AWS CloudFormation StackSet Kegagalan.

Pesan email konfirmasi: Jika akun manajemen Anda berusia kurang dari satu jam, Anda mungkin mengalami masalah saat akun tambahan dibuat.

Tindakan yang harus diambil

Jika Anda mengalami masalah ini, periksa email Anda. Anda mungkin telah dikirimi email konfirmasi yang sedang menunggu tanggapan. Atau, kami sarankan Anda menunggu satu jam, dan kemudian coba lagi. Jika masalah berlanjut, hubungi AWS Support.

Gagal StackSets: Kemungkinan penyebab lain kegagalan peluncuran landing zone adalah AWS CloudFormation StackSet kegagalan. AWS Wilayah Security Token Service (STS) harus diaktifkan di akun manajemen untuk semua AWS Wilayah yang diatur AWS Control Tower, sehingga penyediaan dapat berhasil; jika tidak, kumpulan tumpukan akan gagal diluncurkan.

Tindakan yang harus diambil

Pastikan untuk mengaktifkan semua wilayah titik akhir AWS Security Token Service (STS) yang diperlukan sebelum meluncurkan AWS Control Tower.

Untuk melihat daftar AWS Control Tower Wilayah AWS yang didukung, lihatBagaimana AWS Wilayah Bekerja Dengan AWS Control Tower.

Kesalahan zona pendaratan tidak mutakhir

Jika Anda belum memperbarui landing zone baru-baru ini, Anda mungkin menerima kesalahan saat mencoba mendapatkan kembali akses ke AWS Control Tower. Anda mungkin melihat pesan kesalahan yang mirip dengan yang ini:

```
Unable to access Control Tower
```

Akun Anda sudah tidak aktif terlalu lama. Karena tidak aktif, Anda harus memperbarui landing zone untuk akses ke AWS Control Tower.

Namun, pembaruan landing zone Anda mungkin gagal.

Langkah-langkah yang harus diambil

Masuk ke akun manajemen organisasi Anda, dan masuk sebagai pengguna root. Pengguna IAM atau pengguna Anda di IAM Identity Center harus memiliki izin administrator AWS Control Tower dan menjadi bagian dari grup. AWSControlTowerAdmins Kemudian coba pembaruan lagi.

Penyediaan Akun Baru Gagal

Jika Anda mengalami masalah ini, periksa penyebab umum ini.

Saat Anda mengisi formulir penyediaan akun, Anda mungkin memiliki:

- TagOptions yang ditentukan,
- mengaktifkan notifikasi SNS,
- mengaktifkan pemberitahuan produk yang disediakan.

Coba lagi untuk menyediakan akun Anda, tanpa menentukan salah satu opsi tersebut. Untuk informasi selengkapnya, lihat Menyediakan akun dengan AWS Service Catalog Account Factory .

Penyebab umum lainnya untuk kegagalan:

- Jika Anda membuat paket produk yang disediakan (untuk melihat perubahan sumber daya), penyediaan akun Anda mungkin tetap dalam status Sedang berlangsung tanpa batas waktu.
- Pembuatan akun baru di Account Factory akan gagal sementara perubahan konfigurasi AWS Control Tower lainnya sedang berlangsung. Misalnya, saat proses sedang berjalan untuk

menambahkan kontrol ke OU, Account Factory akan menampilkan pesan kesalahan jika Anda mencoba menyediakan akun.

Untuk memeriksa status tindakan sebelumnya di AWS Control Tower

- Arahkan AWS CloudFormation ke> StackSets
- Periksa setiap set tumpukan yang terkait dengan AWS Control Tower (awalan: "AWSControlTower“)
- Cari AWS CloudFormation StackSets operasi yang masih berjalan.

Jika penyediaan akun Anda memakan waktu lebih dari satu jam, sebaiknya hentikan proses penyediaan dan coba lagi.

Gagal Mendaftarkan Akun yang Ada

Jika Anda mencoba sekali untuk mendaftarkan AWS akun yang ada dan pendaftaran itu gagal, saat Anda mencoba untuk kedua kalinya, pesan kesalahan mungkin memberi tahu Anda bahwa kumpulan tumpukan ada. Untuk melanjutkan, Anda harus menghapus produk yang disediakan di Account Factory.

Jika alasan kegagalan pendaftaran pertama adalah karena Anda lupa membuat `AWSControlTowerExecution` peran di akun sebelumnya, pesan kesalahan yang akan Anda terima dengan benar memberi tahu Anda untuk membuat peran. Namun, ketika Anda mencoba membuat peran, Anda kemungkinan akan menerima pesan kesalahan lain yang menyatakan bahwa AWS Control Tower tidak dapat membuat peran tersebut. Kesalahan ini terjadi karena prosesnya telah selesai sebagian.

Dalam hal ini, Anda harus mengambil dua langkah pemulihan sebelum Anda dapat melanjutkan dengan mendaftarkan akun Anda yang ada. Pertama, Anda harus menghentikan produk yang disediakan Account Factory melalui konsol. AWS Service Catalog Selanjutnya, Anda harus menggunakan AWS Organizations konsol untuk memindahkan akun secara manual dari OU dan kembali ke root. Setelah itu selesai, buat `AWSControlTowerExecution` peran di akun, lalu isi kembali formulir akun Daftarkan.

Kemungkinan penyebab kegagalan pendaftaran lainnya adalah akun tersebut memiliki sumber daya Config AWS yang ada. Dalam hal ini, lihat Mendaftarkan akun yang memiliki AWS Config sumber daya yang ada untuk petunjuk tentang cara mengubah sumber daya yang ada.

Tidak Dapat Memperbarui Akun Akun Factory

Ketika akun dalam keadaan tidak konsisten, akun tidak dapat diperbarui dengan sukses dari Account Factory atau AWS Service Catalog.

Kasus 1: Anda mungkin menemukan pesan kesalahan yang mirip dengan yang ini:

```
AWS Control Tower could not baseline VPC in the managed account because of
existing resource dependencies.
```

Penyebab umum: AWS Control Tower selalu menghapus VPC AWS default selama penyediaan awal. Untuk memiliki VPC AWS default di akun, Anda harus menambahkannya setelah pembuatan akun. AWS Control Tower memiliki VPC defaultnya sendiri yang menggantikan AWS VPC default, kecuali jika Anda menyiapkan Account Factory seperti yang ditunjukkan oleh penelusuran —-sehingga AWS Control Tower tidak menyediakan VPC sama sekali. Maka akun tersebut tidak memiliki VPC. Anda harus menambahkan kembali VPC AWS default jika Anda ingin menggunakannya.

Namun, AWS Control Tower tidak mendukung AWS VPC default. Menyebarkan satu menyebabkan akun memasuki `Tainted` status. Ketika dalam keadaan itu, Anda tidak dapat memperbarui akun melalui AWS Service Catalog.

Tindakan yang harus diambil: Anda harus menghapus VPC default yang Anda tambahkan, dan kemudian Anda akan dapat memperbarui akun.

> **Note**
>
> `Tainted`Status menyebabkan masalah tindak lanjut: Akun yang tidak diperbarui dapat mencegah pengaktifan kontrol pada OU yang menjadi bagiannya.

Kasus 2: Anda mungkin melihat pesan kesalahan yang mirip dengan yang ini:

```
AWS Control Tower detects that your enrolled account has been moved to a
new organizational unit.
```

Penyebab umum: Anda mencoba memindahkan akun dari satu OU terdaftar ke yang lain, tetapi aturan AWS Config lama tetap ada. Akun dalam keadaan tidak konsisten.

Tindakan yang harus diambil:

Jika pemindahan akun dimaksudkan:

- Mengakhiri akun di Service Catalog.
- Daftarkan lagi.
- Konteks/dampak: Aturan AWS Config Deployed tidak cocok dengan konfigurasi yang ditentukan oleh OU tujuan.
- AWS Aturan Config mungkin tetap dari OU sebelumnya, menyebabkan pengeluaran yang tidak diinginkan.
- Upaya untuk mendaftarkan ulang atau memperbarui akun akan gagal karena konflik penamaan sumber daya.

Jika pemindahan akun tidak disengaja:

- Kembalikan akun ke OU aslinya.
- Perbarui akun dari Service Catalog.
- Dalam parameter peluncuran, masukkan OU tempat akun awalnya berada.
- Konteks/dampak: Jika akun tidak dikembalikan ke OU aslinya, statusnya akan tidak konsisten dengan kontrol yang ditentukan oleh OU baru di dalamnya.
- Memperbarui akun bukanlah perbaikan yang valid, karena tidak menghapus AWS Config aturan yang terkait dengan OU sebelumnya.

Tidak Dapat Memperbarui Zona Pendaratan

AWS Control Tower tidak memutar kembali ke versi landing zone sebelumnya jika pembaruan gagal. Anda mungkin menemukan landing zone Anda dalam keadaan tak tentu. Jika demikian, hubungi AWS dukungan.

Pembaruan zona pendaratan mungkin gagal karena beberapa alasan.

- Prasyarat tidak terpenuhi
- AWS Config sumber daya ada di akun tertentu
- Akun tertutup ada

Prasyarat tidak terpenuhi

Pembaruan landing zone harus memenuhi prasyarat yang sama dengan pengaturan landing zone. Sebelum Anda memperbarui, tinjau cek pra-peluncuran.

AWS Config sumber daya ada di akun Security OU

Jangan menambahkan AWS Config sumber daya di akun Audit dan Arsip Log Anda. Proses pembaruan landing zone tidak dapat diselesaikan dengan sumber daya yang ada. Pembatasan ini mirip dengan yang berlaku untuk mendaftarkan akun atau menyiapkan landing zone untuk pertama kalinya. Untuk informasi selengkapnya, lihat Mendaftarkan akun yang memiliki AWS Config sumber daya yang ada.

Akun tertutup ada

Saat akun dalam status Tertutup atau Ditangguhkan, Anda mungkin mengalami masalah saat mencoba memperbarui landing zone. Anda harus menghapus produk yang disediakan di setiap akun yang ditutup sebelum melakukan pembaruan ke landing zone.

Pada halaman produk AWS Service Catalog yang disediakan, Anda mungkin melihat pesan kesalahan yang mirip dengan yang ini:

```
AWSControlTowerExecution role can't be assumed on the account.
```

Penyebab umum: Anda telah menangguhkan akun tanpa menghapus produk yang disediakan.

Tindakan yang harus diambil: Jika Anda melihat kesalahan ini, Anda memiliki dua opsi:

1. Hubungi AWS Support dan buka kembali akun, hapus produk yang disediakan, lalu tutup akun lagi.
2. Hapus sumber daya dari StackSets yang telah menjadi yatim piatu karena penutupan akun. (Opsi ini hanya tersedia jika StackSets memiliki instance dalam keadaan Saat ini yang tidak Anda hapus.)

Untuk menghapus sumber daya dari StackSets, lakukan ini untuk setiap akun yang ditutup:

- Masuk ke masing-masing AWS Control Tower StackSets dan hapus StackInstances dari setiap wilayah, untuk akun yang telah ditutup.
- PENTING: Pilih opsi Retain Stack sehingga hanya StackSet menghapus instance tumpukan. StackSet tidak dapat mengambil peran dari akun yang ditutup, sehingga akan gagal jika mencoba mengambil `AWSControlTowerExecution` peran, yang mengarah ke pesan kesalahan yang Anda terima.

Kesalahan Kegagalan yang Menyebutkan AWS Config

Jika AWS Config diaktifkan di AWS Wilayah mana pun yang didukung oleh AWS Control Tower, Anda mungkin menerima pesan kesalahan karena pra-pemeriksaan gagal. Pesan tersebut mungkin tampaknya tidak menjelaskan masalah secara memadai, karena beberapa perilaku yang mendasarinya. AWS Config

Anda mungkin menerima pesan kesalahan, mirip dengan salah satu dari ini:

- `AWS Control Tower cannot create an AWS Config delivery channel because one already exists. To continue, delete the existing delivery channel and try again`
  `.`
- `AWS Control Tower cannot create an AWS Config configuration recorder because one already exists. To continue, delete the existing delivery channel and try again`
  `.`

Penyebab umum: Ketika AWS Config layanan diaktifkan pada AWS akun, itu membuat perekam konfigurasi dan saluran pengiriman dengan penamaan default. Jika Anda menonaktifkan AWS Config layanan melalui konsol, itu tidak menghapus perekam konfigurasi atau saluran pengiriman. Anda harus menghapusnya melalui CLI, atau memodifikasinya untuk penggunaan AWS Control Tower. Jika AWS Config layanan diaktifkan di salah satu Wilayah yang didukung oleh AWS Control Tower, hal ini dapat mengakibatkan kegagalan ini.

Jika akun memiliki sumber daya AWS Config yang ada, lihat Mendaftarkan akun yang memiliki AWS Config sumber daya yang ada untuk petunjuk tentang cara mengubah sumber daya yang ada.

Tindakan yang harus diambil: Hapus perekam konfigurasi dan saluran pengiriman di semua wilayah yang didukung. Menonaktifkan AWS Config tidak cukup, perekam konfigurasi dan saluran pengiriman harus dihapus melalui CLI. Setelah menghapus perekam konfigurasi dan saluran pengiriman dari CLI, Anda dapat mencoba lagi untuk meluncurkan AWS Control Tower dan mendaftarkan akun.

Jika Anda sedang dalam proses menerapkan produk yang disediakan, Anda harus menghapus produk yang disediakan sebelum Anda mencoba lagi. Jika tidak, Anda mungkin melihat pesan kesalahan yang mirip dengan yang ini:

- `An error occurred` **`(InvalidParametersException)`** `when calling the` **`ProvisionProduct`** `operation: A stack named` *`Stackname`* `already exists.`

Dalam pesan, *`Stackname`*menentukan nama tumpukan.

Berikut adalah beberapa contoh perintah AWS Config CLI yang dapat Anda gunakan untuk menentukan status perekam konfigurasi dan saluran pengiriman Anda.

Lihat perintah:

- `aws configservice describe-delivery-channels`
- `aws configservice describe-delivery-channel-status`
- `aws configservice describe-configuration-recorders`
- `The normal response is something like "name": "default"`

Hapus perintah:

- `aws configservice stop-configuration-recorder --configuration-recorder-name` *`NAME-FROM-DESCRIBE-OUTPUT`*
- `aws configservice delete-delivery-channel --delivery-channel-name` *`NAME-FROM-DESCRIBE-OUTPUT`*
- `aws configservice delete-configuration-recorder --configuration-recorder-name` *`NAME-FROM-DESCRIBE-OUTPUT`*

Untuk informasi lebih lanjut, lihat AWS Config dokumentasi

- Mengelola Perekam Konfigurasi (AWS CLI)
- Mengelola Saluran Pengiriman

Tidak Ada Jalur Peluncuran Ditemukan Kesalahan

Saat Anda mencoba membuat akun baru, Anda mungkin melihat pesan kesalahan yang mirip dengan yang ini:

```
No launch paths found for resource: prod-dpqqfywxxxx
```

Pesan kesalahan ini dihasilkan oleh AWS Service Catalog, yang merupakan layanan terintegrasi yang membantu menyediakan akun di AWS Control Tower.

Penyebab Umum:

- Anda mungkin masuk sebagai root. AWS Control Tower tidak mendukung pembuatan akun saat Anda masuk sebagai pengguna root.
- Pengguna Pusat Identitas IAM Anda belum ditambahkan ke grup izin yang sesuai. Anda mungkin perlu menambahkan pengguna IAM Identity Center Anda ke salah satu grup izin ini: AWSAccountFactory(untuk akses pengguna akhir) atau AWSServiceCatalogAdmins(untuk akses admin).
- Jika Anda diautentikasi sebagai pengguna IAM, Anda harus menambahkannya ke AWS Service Catalog portofolio sehingga memiliki izin yang benar.
- Masalah ini juga terjadi jika Anda memiliki izin yang benar, tetapi AWS Control Tower drift terdeteksi dan perbaikan diperlukan.

Menerima Kesalahan Izin Tidak Cukup

Ada kemungkinan bahwa akun Anda mungkin tidak memiliki izin yang diperlukan untuk melakukan pekerjaan tertentu secara tertentu AWS Organizations. Jika Anda menemukan jenis kesalahan berikut, periksa semua area izin, seperti izin IAM atau IAM Identity Center, untuk memastikan izin Anda tidak ditolak dari tempat-tempat tersebut:

```
You have insufficient permissions to perform AWS Organizations API actions.
```

Jika Anda yakin pekerjaan Anda memerlukan tindakan yang Anda coba, dan Anda tidak dapat menemukan batasan yang relevan, hubungi administrator sistem atau SupportAWS Anda.

Kontrol Detektif tidak berlaku pada akun

Jika Anda baru saja memperluas penerapan AWS Control Tower ke AWS Wilayah baru, kontrol detektif yang baru diterapkan tidak berlaku pada akun baru yang Anda buat di Wilayah mana pun hingga akun individual dalam OU yang diatur oleh AWS Control Tower diperbarui. Kontrol detektif yang ada pada akun yang ada masih berlaku.

Jika Anda mencoba mengaktifkan kontrol detektif sebelum memperbarui akun, Anda mungkin melihat pesan kesalahan yang mirip dengan yang ini:

```
AWS Control Tower can't enable the selected control on this OU. AWS Control
Tower cannot apply the control on the OU ou-xxx-xxxxxxxx, because child
accounts have dependencies that are missing. Update all child accounts
under the OU, then try again.
```

Tindakan yang harus diambil: Perbarui akun.

Untuk memperbarui akun Anda dari konsol AWS Control Tower, lihatKapan harus memperbarui AWS Control Tower OU dan akun.

Untuk memperbarui beberapa akun individual secara terprogram, Anda dapat menggunakan API dari AWS Service Catalog dan AWS CLI untuk mengotomatiskan pembaruan. Untuk informasi selengkapnya tentang cara mendekati proses pembaruan, lihat iniPanduan Video. Anda dapat mengganti UpdateProvisionedProductAPI untuk ProvisionProductAPI yang ditampilkan dalam video.

Jika Anda memiliki kesulitan lebih lanjut dengan mengaktifkan kontrol detektif di akun Anda, hubungi SupportAWS .

Nilai terlampaui kesalahan yang dikembalikan oleh API AWS Organizations

Kemungkinan penyebab

Beban kerja Anda berjalan saat AWS Control Tower menjalankan pemindaian harian untuk memeriksa apakah SCP Anda telah hanyut.

Langkah-langkah untuk diikuti

Jika Anda mengalami pelambatan atau `rate exceeded` kesalahan API, coba langkah-langkah berikut:

- Jalankan beban kerja Anda pada waktu yang berbeda. (Lihat jadwal pemindaian invarian AWS Control Tower SCP menurut Wilayah untuk mengetahui kapan AWS Control Tower menjalankan pemindaian auditnya.)
- Jika Anda memanggil API secara langsung melalui HTTP: Gunakan AWS SDK, yang secara otomatis mencoba ulang tindakan yang gagal
- Meminta peningkatan batas melalui Service Quotas dan Support AWS

Contoh instruksi pemecahan masalah untuk pelambatan API di Elastic Beanstalk dapat ditemukan di sini: `https://aws.amazon.com/premiumsupport/knowledge-center/elastic-beanstalk-api-throttling-errors/`

Gagal memindahkan akun Account Factory langsung dari satu landing zone AWS Control Tower ke landing zone AWS Control Tower lainnya

> **Warning**
>
> Praktik ini tidak memenuhi prasyarat untuk pendaftaran akun yang memenuhi syarat, karena akun yang memenuhi syarat harus menjadi bagian dari Organisasi AWS keseluruhan yang sama, dan setiap organisasi mungkin hanya memiliki satu landing zone. Jika Anda telah mencoba melakukan tindakan ini dan Anda menemukan diri Anda menerima beberapa pesan kesalahan, berikut adalah beberapa informasi yang mungkin membantu.

Untuk memindahkan akun yang telah Anda sediakan melalui Account Factory ke landing zone lain yang dikelola oleh AWS Control Tower, di bawah akun manajemen lain, Anda harus menghapus semua peran IAM dan tumpukan yang terkait dengan akun tersebut dari OU asli. Hapus sumber daya ini dari setiap Wilayah tempat akun digunakan.

> **Note**
>
> Cara terbaik untuk menghapus sumber daya adalah dengan membatalkan penyediaan akun di OU aslinya sebelum Anda mencoba memindahkannya.

Jika Anda tidak menghapus sumber daya, pendaftaran ke OU baru akan gagal, agak spektakuler. Anda mungkin menemukan satu atau beberapa pesan kesalahan, dan Anda akan terus menerima pesan kesalahan serupa hingga peran dan tumpukan yang tersisa dihapus dari setiap Wilayah tempat akun digunakan.

Setiap kali Anda menerima pesan kesalahan, Anda harus menghapus akun dari OU baru, menghapus sumber daya lama yang merupakan subjek pesan kesalahan, dan kemudian mencoba untuk memindahkan akun kembali ke OU baru. Proses ini removing-and-deleting harus diulang untuk

setiap sumber daya yang tersisa, untuk setiap Wilayah di mana akun tersebut digunakan, mungkin 10 atau 20 kali. Kesalahan berulang ini terjadi karena akun disediakan ke dalam OU dengan SCP yang mencegah penghapusan peran IAM. Anda dapat memperpendek proses pemulihan dengan menghapus semua sumber daya akun sebelum Anda mencoba lagi.

Contoh di bawah ini menunjukkan jenis pesan kegagalan yang mungkin Anda terima jika peran dan tumpukan yang tidak dihapus tetap ada. Anda kemungkinan besar akan melihat salah satu pesan ini pada satu waktu, untuk setiap kali Anda mencoba mendaftarkan akun, selama sumber daya lama tetap ada.

Nilai string ID sumber daya telah dimodifikasi untuk contoh. Nilainya tidak akan sama dalam pesan kesalahan yang mungkin Anda terima. Anda mungkin melihat pesan yang mirip dengan contoh berikut:

- `AWS Control Tower cannot create the IAM role` *`aws-controltower-AdministratorExecutionRole`* `because the role already exists. To continue, delete the existing IAM role and try again.`
- `AWS Control Tower cannot create the IAM role` *`aws-controltower-ConfigRecorderRole`* `because the role already exists. To continue, delete the existing IAM role and try again.`
- `AWS Control Tower cannot create the IAM role` *`aws-controltower-ForwardSnsNotificationRole`* `because the role already exists. To continue, delete the existing IAM role and try again.`

Atau Anda mungkin melihat pesan kesalahan tentang kegagalan set tumpukan, mirip dengan yang ini:

```
"Error\":\"StackSetFailState\",
\"Cause\":\"StackSetOperation on AWSControlTowerBP-BASELINE-CLOUDWATCH
with id 8aXXXXf5-e0XX-4XXa-bc4XX-dXXXXXee31
has reached SUCCEEDED state but has 1 NON-CURRENT stack instances;
here is the summary :{ StackSet Id:
AWSControlTowerBP-BASELINE-CLOUDWATCH:40XXXbf2-Xead-46a1-XXXa-eXXXXecb2ee2,
Stack instance Id:
arn:aws:cloudformation:eu-west-1:1X23456789XX:
            stack/StackSet-AWSControlTowerBP-BASELINE-CLOUDWATCH-4feXXXXXX-ecXX-XXc6-
bXXX-4ae678/4feXXXXXX-ecX-4ae123458,
Status: OUTDATED,
```

```
Status Reason: ResourceLogicalId:ForwardSnsNotification,
ResourceType:AWS::Lambda::Function,
ResourceStatusReason:aws-controltower-NotificationForwarder already exists in stack
arn:aws:cloudformation:eu-west-1:1X23456789XX:
            stack/StackSet-AWSControlTowerBP-BASELINE-CLOUDWATCH-4feXXXXXX-ecXX-XXc6-
bXXX-4ae678/4feXXXXXX-ecX-4ae123458.
```

Setelah semua sumber daya yang tersisa dihapus dari OU pertama, Anda akan dapat mengundang, menyediakan, atau mendaftarkan akun ke OU baru dengan sukses.

AWS Support

Jika Anda ingin memindahkan akun anggota yang ada ke paket dukungan yang berbeda, Anda dapat masuk ke setiap akun dengan kredensi akun root, membandingkan paket, dan mengatur tingkat dukungan yang Anda inginkan.

Kami menyarankan Anda memperbarui MFA dan kontak keamanan akun saat Anda membuat perubahan pada paket dukungan Anda.

Jenis garis dasar

Garis dasar di AWS Control Tower adalah sekelompok sumber daya dan konfigurasi spesifik yang dapat Anda terapkan ke target. Target dasar dapat berupa unit organisasi (OU) atau zona pendaratan. Misalnya, Anda dapat mengaktifkan baseline dengan OU yang dipilih sebagai target, untuk mendaftarkan OU tersebut ke AWS Control Tower. Garis dasar juga dapat diaktifkan berdasarkan pengaturan dan konfigurasi landing zone Anda. AWS Control Tower membuat dan menyebarkan sumber daya ke target dengan cara yang ditentukan baseline.

Saat Anda mengaktifkan baseline untuk target, baseline direpresentasikan sebagai AWS CloudFormation sumber daya, yang disebut sumber daya. `EnabledBaseline`

AWS Control Tower mencakup empat jenis dasar penting:

- Satu jenis dapat berlaku untuk OU yang terdaftar di AWS Control Tower, atau ke OU yang ingin Anda daftarkan dengan menerapkan baseline.
- Tiga tipe dasar dapat diterapkan ke landing zone, selama pengaturan awal atau selama pembaruan landing zone.

Jenis dasar yang berlaku di tingkat OU, untuk mendaftar dan memperbarui OU

- Nama: `AWSControlTowerBaseline`

  Deskripsi: Menyiapkan sumber daya dan kontrol wajib untuk akun anggota dalam OU target, yang diperlukan untuk tata kelola AWS Control Tower.

  Pertimbangan: Garis dasar ini mempertahankan pengaturan zona pendaratan Wilayah menolak kontrol. Dengan kata lain, jika Region tidak diizinkan di tingkat landing zone, Region tersebut tidak diperbolehkan untuk OU tersebut ketika Anda memanggil `EnableBaseline` API untuk mendaftarkan OU.

  > **Note**
  >
  > Wilayah tingkat OU menolak kontrol tidak memiliki cara untuk mengizinkan Wilayah yang tidak diizinkan oleh zona pendaratan yang tidak diizinkan oleh Wilayah.

Untuk informasi selengkapnya, lihat Cara SCP bekerja dengan penolakan dalam AWS Organizations dokumentasi.

Rekomendasi: Kami menyarankan Anda mengonfirmasi Wilayah di mana target OU Anda mungkin menjalankan beban kerja, dan memeriksa hasilnya terhadap landing zone Region deny control, sebelum Anda memanggil `EnableBaseline` API untuk OU, atau Anda bisa kehilangan akses ke sumber daya di Wilayah tertentu.

> **Note**
>
> Garis dasar zona pendaratan berperilaku berbeda dari garis dasar tingkat OU.

AWS Control Tower memungkinkan baseline yang berlaku di level landing zone secara otomatis, sebagai bagian dari proses penyiapan dan pembaruan landing zone. Garis dasar untuk landing zone Anda dapat berubah saat Anda mengubah pengaturan landing zone. Misalnya, jika Anda memilih IAM Identity Center, AWS Control Tower dapat mengaktifkan versi terbaru dari `IdentityCenterBaseline` baseline di landing zone Anda.

Anda dapat melihat baseline yang diaktifkan untuk landing zone Anda dengan panggilan `ListEnabledBaselines` API.

Jenis dasar yang mungkin berlaku untuk landing zone Anda

- Nama: `AuditBaseline`

  Deskripsi: Mengatur sumber daya untuk memantau keamanan dan kepatuhan akun di organisasi Anda. Anda tidak dapat mengubah baseline ini, ini diterapkan oleh AWS Control Tower.
- Nama: `LogArchiveBaseline`

  Deskripsi: Menyiapkan repositori pusat untuk log aktivitas API dan konfigurasi sumber daya dari akun di organisasi Anda. Anda tidak dapat mengubah baseline ini, ini diterapkan oleh AWS Control Tower.
- Nama: `IdentityCenterBaseline`

  Deskripsi: Menyiapkan sumber daya bersama untuk IAM Identity Center, yang mempersiapkan `AWSControlTowerBaseline` untuk mengatur akses Pusat Identitas untuk akun.

Pertimbangan: Garis dasar ini hanya berfungsi ketika Anda telah memilih IAM Identity Center sebagai penyedia identitas Anda pada saat Anda mengatur landing zone Anda pada awalnya, atau jika Anda kemudian mengubah pengaturan landing zone Anda untuk mengaktifkan IAM Identity Center untuk landing zone Anda. Jika Anda menggunakan penyedia identitas yang berbeda, Anda tidak akan memiliki akses untuk mengaktifkan baseline ini.

Pendaftaran sebagian akun

Saat Anda bekerja dengan baseline, akun dapat ditempatkan ke dalam status yang disebut Terdaftar sebagian.

Status ini dapat terjadi jika Anda mendaftarkan ulang OU dengan memanggil `ResetEnabledBaseline` API, karena AWS Control Tower hanya menerapkan sumber daya wajib ke akun di OU target. Akun yang kehilangan sumber daya opsional (kontrol) untuk OU induknya ditandai sebagai Terdaftar sebagian.

Jika Anda memindahkan akun yang tidak terdaftar ke OU terdaftar dan kemudian memanggil `ResetEnabledBaseline` API di OU untuk mendaftarkan akun tersebut, AWS Control Tower menerapkan sumber daya yang terkait dengan akun yang `AWSControlTowerBaseline` baru terdaftar. Namun, kontrol opsional yang diaktifkan untuk OU ini tidak diterapkan ke akun. Akun tetap dalam keadaan terdaftar sebagian.

Untuk mendaftarkan akun sepenuhnya, pilih Daftar ulang atau Perbarui akun di konsol. Saat Anda memilih operasi ini dari konsol, AWS Control Tower menerapkan semua sumber daya OU tersebut ke akun yang baru terdaftar, termasuk kontrol opsional yang diaktifkan untuk OU tersebut.

Variasi dalam operasi antara konsol AWS Control Tower dan API untuk baseline

Saat Anda mengubah status tata kelola OU, konsol AWS Control Tower melakukan lebih banyak operasi untuk Anda secara otomatis, dibandingkan dengan mengubah tata kelola melalui API untuk baseline.

Perbedaan

- Mendaftarkan dan menyediakan produk

Saat Anda mendaftarkan OU melalui konsol, AWS Control Tower membuat produk Service Catalog untuk akun anggota OU, sebagai bagian dari pendaftaran setiap akun. Saat Anda mendaftarkan OU melalui `EnableBaseline` API dan AWS Control Tower tidak membuat produk yang disediakan untuk akun anggota di OU. `AWSControlTowerBaseline`

- Deregister ke OU

  Setiap kali Anda membatalkan pendaftaran OU, Anda harus terlebih dahulu menghapus semua akun anggota dan OU bersarang. Kemudian, AWS Control Tower menghapus semua kontrol yang diterapkan ke OU.

  - Jika Anda memilih Hapus OU OU dari konsol, AWS Control Tower melanjutkan ke deregister dan kemudian menghapus OU dari organisasi Anda.
  - Namun, jika Anda membatalkan pendaftaran OU dengan memanggil `DisableBaseline` API untuk menghapus `AWSControlTowerBaseline` dari OU, AWS Control Tower tidak menghapus OU dari organisasi Anda, OU masih ada di organisasi, tidak terdaftar.

Garis dasar dan default versi

Jika zona landing zone AWS Control Tower Anda sudah disiapkan, dan kemudian Anda memilih untuk mengaktifkan baseline landing zone, AWS Control Tower mengaktifkan versi terbaru dari baseline yang kompatibel dengan versi landing zone Anda. Jika Anda memilih untuk mengaktifkan baseline untuk OU yang belum terdaftar di AWS Control Tower, AWS Control Tower menyediakan versi terbaru yang kompatibel dari baseline untuk OU tersebut, secara otomatis.

Kompatibilitas baseline OU dan versi landing zone

Garis dasar AWS Control Tower memungkinkan Anda menetapkan standar tata kelola di tingkat OU, bukan di tingkat landing zone, jika bisnis Anda memerlukannya. Garis dasar yang disebut `AWSControlTowerBaseline` tersedia untuk membantu mendaftarkan OU Anda dengan AWS Control Tower.

> **Note**
>
> Baseline adalah sekelompok kontrol dan sumber daya yang bekerja sama untuk membangun lingkungan tata kelola yang stabil di dalam landing zone Anda.

Saat Anda mengaktifkan baseline pada OU, dengan memanggil `EnableBaseline` API di AWS Control Tower, Anda harus menentukan versi dasar yang kompatibel dengan versi landing zone AWS Control Tower AWS Control Tower saat ini. Setelah Anda menentukan garis dasar, semua akun anggota dalam OU mengikuti garis dasar yang diberikan untuk OU. Dengan kata lain, akun baru disediakan dengan baseline yang diperbarui, dan akun anggota yang ada diatur sesuai dengan baseline baru.

Jika Anda tidak memilih baseline untuk OU dan akun yang ada, versi landing zone menentukan keseluruhan postur tata kelola, secara default. Namun, setiap OU terdaftar di landing zone Anda diberi versi dasar, yang merupakan baseline terbaru yang kompatibel dengan versi landing zone Anda saat ini. Oleh karena itu, setiap akun anggota OU dan terdaftar memiliki baseline terkait, bahkan jika Anda tidak pernah menetapkan baseline secara khusus.

Untuk baseline level OU`AWSControlTowerBaseline`, tabel berikut menunjukkan kompatibilitas baseline dengan versi landing zone AWS Control Tower.

Versi dasar	Versi zona pendaratan	Cetak biru yang disertakan	Termasuk kontrol	Ubah dari baseline sebelumnya	
1.0	2.0 hingga 2.7	BP_BASELINE_CLOUDTRAIL, BP_BASELINE_CLOUDWATCH, BP_BASELINE_CONFIG, BP_BASELINE_ROLES, BP_BASELINE_SERVICE_ROLES, Sumber Daya IAM	Semua kontrol wajib	Tidak ada	
2.0	2,8 hingga 2,9	BP_BASELINE_CLOUDT	Semua kontrol wajib	Menambahkan peran	

Versi dasar	Versi zona pendaratan	Cetak biru yang disertakan	Termasuk kontrol	Ubah dari baseline sebelumnya	
		RAIL, BP_BASELINE_CLOUDWATCH, BP_BASELINE_CONFIG, BP_BASELINE_ROLES, BP_BASELINE_SERVICE_ROLES, Config SLR, sumber daya IAM		AWS Config terkait layanan (SLR) dan cetak biru Config baru untuk menggunakan SLR	
3.0	3.0 hingga 3.1	BP_BASELINE_CLOUDWATCH, BP_BASELINE_CONFIG, BP_BASELINE_ROLES, BP_BASELINE_SERVICE_ROLES, Config SLR, sumber daya IAM	Semua kontrol wajib	AWS Config Cetak biru baru. Ubah untuk merekam sumber daya global hanya di wilayah asal. CloudTrail Cetak biru yang dihapus	

Versi dasar	Versi zona pendaratan	Cetak biru yang disertakan	Termasuk kontrol	Ubah dari baseline sebelumnya	
4.0	3,2 hingga 3,3	BP_BASELINE_CLOUDWATCH, BP_BASELINE_CONFIG, BP_BASELINE_ROLES, BP_BASELINE_SERVICE_LINKED_ROLE, BP_BASELINE_SERVICE_ROLES, Config SLR, sumber daya IAM	Semua kontrol wajib	Cetak biru SLR baru	

Untuk informasi selengkapnya tentang sumber daya tertentu yang dibuat di akun saat menyiapkan landing zone, lihat Sumber daya yang dibuat di akun bersama.

Jika Anda memperbarui landing zone ke versi yang mendukung versi **`AWSControlTowerBaseline`** baseline yang lebih baru, dan versi landing zone baru kompatibel dengan versi baseline yang ada, status OU Anda berubah menjadi Pembaruan yang tersedia.

- Anda dapat terus menggunakan pabrik akun dan fitur lainnya tanpa memperbarui baseline OU segera, kecuali dalam kasus pembaruan landing zone dari 2.x ke 3.x.
- Akun baru yang terdaftar di OU ini menerima sumber daya berdasarkan versi baseline yang ada hingga versi dasar diperbarui (dengan fitur Perluas tata kelola di konsol, atau melalui API). `UpdateEnabledBaseline`
- Setelah Anda memperbarui versi dasar, semua akun dalam OU tersebut menerima sumber daya berdasarkan versi dasar yang baru.

> **Note**
>
> Jika Anda memperbarui landing zone AWS Control Tower dari versi 2.X apa pun ke versi 3.X apa pun, Anda juga harus memperbarui versi dasar pada OU Anda, karena perubahan dari jalur tingkat akun ke tingkat organisasi. AWS CloudTrail Di konsol, OU Anda akan menampilkan status Pembaruan yang diperlukan.

Pertimbangan untuk baseline

- Jika OU Anda memerlukan pembaruan dasar, Anda tidak dapat menyediakan akun baru atau mendaftarkan akun yang ada ke OU tersebut.
- Setelah pembaruan landing zone, jika Anda juga berencana untuk memperbarui baseline OU, Anda harus mendaftarkan ulang OU atau memperbarui versi dasar OU Anda secara terprogram.
- Kami menyarankan Anda memperbarui ke baseline tertinggi yang kompatibel untuk versi landing zone yang Anda gunakan, sehingga Anda mendapatkan semua manfaat dari landing zone dan baseline gabungan. Misalnya, jika Anda memperbarui ke landing zone versi 3.3, Anda dapat tetap menggunakan baseline 3.0, tetapi Anda tidak mendapatkan setiap manfaat dari landing zone versi 3.3 kecuali Anda juga memperbarui ke baseline 4.0.
- Pembaruan dasar tidak dapat diputar kembali.
- Pemberdayaan dasar menargetkan satu OU pada satu waktu. Oleh karena itu, OU bersarang tidak diperbarui secara otomatis saat OU induk diperbarui. Kami menyarankan Anda memperbarui OU induk sebelum memperbarui OU bersarang.
- Saat Anda memanggil `UpdateEnabledBaseline` API atau mendaftarkan ulang OU dari konsol, OU mempertahankan semua kontrol yang diaktifkan sebelum pembaruan dasar.
- Bila beberapa versi baseline kompatibel dengan versi landing zone Anda, Anda harus menggunakan versi baseline terbaru jika Anda mengaktifkan baseline pada OU yang tidak dikelola.

Contoh: Mendaftarkan AWS Control Tower OU hanya dengan API

Panduan contoh ini adalah dokumen pendamping. Untuk penjelasan, peringatan, dan informasi lebih lanjut, lihat. Jenis garis dasar

Prasyarat

Anda harus memiliki OU yang sudah ada yang tidak terdaftar di AWS Control Tower, dan yang ingin Anda daftarkan. Atau, Anda harus memiliki OU terdaftar yang ingin Anda daftarkan ulang untuk tujuan pembaruan.

Daftarkan OU

1. Periksa apakah `IdentityCenterBaseline` diaktifkan untuk landing zone. Jika demikian, dapatkan Identity Center Enabled Baseline identifier.

```
aws controltower list-baselines --query 'baselines[?name==`IdentityCenterBaseline`].
[arn]'
```

```
aws controltower list-enabled-baselines --query 'enabledBaselines[?
baselineIdentifier==`<Identity Center Baseline Arn>`].[arn]'
```

2. Dapatkan ARN dari target OU.

```
aws organizations describe-organizational-unit --organizational-unit-id
 <Organizational Unit ID> --query 'OrganizationalUnit.[Arn]'
```

3. Dapatkan ARN dari baseline. `AWSControlTowerBaseline`

```
aws controltower list-baselines --query 'baselines[?name==`AWSControlTowerBaseline`].
[arn]'
```

4. Buat `AWSControlTowerBaseline` baseline pada target OU.

   Jika Garis Dasar Pusat Identitas diaktifkan:

```
aws controltower enable-baseline --baseline-identifier <AWSControlTowerBaseline ARN>
 --baseline-version <BASELINE VERSION> --target-identifier <OU ARN> --parameters
 '[{"key":"IdentityCenterEnabledBaselineArn","value":"<Identity Center Enabled
 Baseline ARN>"}]'
```

   Jika Garis Dasar Pusat Identitas tidak diaktifkan, hilangkan *`parameters`* bendera, sebagai berikut:

```
aws controltower enable-baseline --baseline-identifier <AWSControlTowerBaseline ARN>
 --baseline-version <BASELINE VERSION> --target-identifier <OU ARN>
```

Registrasi ulang OU

Setelah Anda melakukan pembaruan pada pengaturan landing zone, atau memperbarui versi landing zone Anda, Anda harus mendaftar ulang OU untuk memberi mereka perubahan terbaru. Ikuti langkah-langkah ini untuk mendaftarkan ulang OU secara terprogram, dengan mengatur ulang sumber daya terkait. `EnabledBaseline`

1. Dapatkan ARN dari target OU untuk mendaftar ulang.

```
aws organizations describe-organizational-unit --organizational-unit-id <OU ID> --
query 'OrganizationalUnit.[Arn]'
```

2. Dapatkan ARN `EnabledBaseline` sumber daya untuk target OU.

```
aws controltower list-enabled-baselines --query 'enabledBaselines[?
targetIdentifier==`<OUARN>'`].[arn]'
```

3. Setel ulang Baseline yang Diaktifkan.

```
aws controltower reset-enabled-baseline --enabled-baseline-
identifier <EnabledBaselineArn>
```

Contoh untuk penggunaan API baseline

Bagian ini berisi contoh parameter input dan output untuk API dasar AWS Control Tower.

`DisableBaseline`

Untuk informasi selengkapnya tentang operasi API ini, lihat DisableBaseline.

`DisableBaseline`masukan:

```
{
    "enabledBaselineIdentifier": "arn:aws:controltower:us-
west-2:123456789012:enabledbaseline/AB12CD34EF56GH789"
}
```

`DisableBaseline`keluaran:

```
{
```

```
    "operationIdentifier": "58f12232-26be-4735-a3e9-dd30d90f021f"
}
```

`DisableBaseline`Contoh CLI:

```
aws controltower disable-baseline \
    --enabled-baseline-identifier arn:aws:controltower:us-
west-2:123456789012:enabledbaseline/AB12CD34EF56GH789 \
    --region us-west-2
```

`EnableBaseline`

Untuk informasi selengkapnya tentang operasi API ini, lihat EnableBaseline.

`EnableBaseline`masukan:

```
{
    "baselineIdentifier": "arn:aws:controltower:us-west-2::baseline:17BSJV3IGJ2QSGA2",
    "targetIdentifier": "arn:aws:organizations::123456789012:ou/o-kgj0txdhpa/ou-
r9mj-4j3mzjql",
    "baselineVersion": "3.0",
    "parameters": [
        {
            "key": "IdentityCenterEnabledBaselineArn",
            "value": "arn:aws:controltower:us-west-2:123456789012:enabledbaseline/
XAHCR4CJTSI4W07MZ"
        }
    ]
}
```

`EnableBaseline`keluaran:

```
{
    "operationIdentifier": "58f12232-26be-4735-a3e9-dd30d90f021f",
    "arn": "arn:aws:controltower:us-west-2:123456789012:enabledbaseline/
XAHCR4CJTSI4W07MZ"
}
```

`EnableBaseline`Contoh CLI:

Contoh ini menunjukkan mengaktifkan baseline untuk AWS Organizations organisasi yang memiliki landing zone yang ikut serta ke akses AWS IAM Identity Center, yang dikelola oleh

AWS Control Tower. Untuk mengambil `EnabledBaseline` identifier Pusat Identitas Anda, Anda dapat memanggil `ListEnabledBaselines` API, memfilter pada garis dasar Pusat Identitas: `(arn:aws:controltower:`*`Region`*`::baseline/LN25R72TTG6IGPTQ)`

```
aws controltower list-enabled-baselines \
    --filter baselineIdentifiers=arn:aws:controltower:us-west-2::baseline/
LN25R72TTG6IGPTQ \
    --region us-west-2
```

Respons akan menunjukkan `EnabledBaseline` detail, yang menunjukkan pengenalnya.

```
{
    "enabledBaselines": [
        {
            "arn": "arn:aws:controltower:us-west-2:123456789012:enabledbaseline/
XAHXS7P6C4I453EZC",
            "baselineIdentifier": "arn:aws:controltower:us-west-2::baseline/
LN25R72TTG6IGPTQ",
            "targetIdentifier": "arn:aws:organizations::123456789012:account/o-
aq21sw43de5/123456789012",
            "statusSummary": {
                "status": "SUCCEEDED"
            }
        }
    ]
}
```

> **Note**
>
> Catat nilai ARN dari respons, dan berikan nilai ini sebagai parameter untuk mengaktifkan baseline default.

```
aws controltower enable-baseline \
    --baseline-identifier arn:aws:controltower:us-west-2::baseline/17BSJV3IGJ2QSGA2 \
    --baseline-version 3.0 \
    --target-identifier arn:aws:organizations::123456789012:ou/o-aq21sw43de5/ou-po90-
lk87jh65 \
    --parameters
 '[{"key":"IdentityCenterEnabledBaselineArn","value":"arn:aws:controltower:us-
west-2:123456789012:enabledbaseline/XAHXS7P6C4I453EZC"}]' \
```

```
    --region us-west-2
```

Untuk organisasi dengan landing zone opted-out dari manajemen AWS Control Tower IAM Identity Center, aktifkan baseline tanpa parameter.

```
aws controltower enable-baseline \
    --baseline-identifier arn:aws:controltower:us-west-2::baseline/17BSJV3IGJ2QSGA2 \
    --baseline-version 3.0 \
    --target-identifier arn:aws:organizations::123456789012:ou/o-aq21sw43de5/ou-po90-
lk87jh65 \
    --region us-west-2
```

GetBaseline

Untuk informasi selengkapnya tentang operasi API ini, lihat GetBaseline.

`GetBaseline`masukan:

```
{
    "baselineIdentifier": "arn:aws:controltower:us-west-2::baseline/17BSJV3IGJ2QSGA2"
}
```

`GetBaseline`keluaran:

```
{
    "arn": "arn:aws:controltower:us-west-2::baseline/17BSJV3IGJ2QSGA2",
    "name": "AWSControlTowerBaseline",
    "description": "Sets up resources and mandatory controls for member accounts within
 the target OU, required for AWS Control Tower governance.",
}
```

`GetBaseline`Contoh CLI:

```
aws controltower get-baseline \
    --baseline-identifier arn:aws:controltower:us-west-2::baseline/17BSJV3IGJ2QSGA2 \
    --region us-west-2
```

GetBaselineOperation

Untuk informasi selengkapnya tentang operasi API ini, lihat GetBaselineOperation.

`GetBaselineOperation`masukan:

```
{
    "operationIdentifier": "58f12232-26be-4735-a3e9-dd30d90f021f"
}
```

`GetBaselineOperation`keluaran:

```
{
    "baselineOperation": {
        "operationIdentifier": "58f12232-26be-4735-a3e9-dd30d90f021f",
        "operationType": "DISABLE_BASELINE",
        "status": "FAILED",
        "startTime": "2023-01-12T19:05:00Z",
        "endTime": "2023-01-12T19:45:00Z",
        "statusMessage": "Can't perform DisableBaseline on a parent target with
 governed child OUs"
    }
}
```

`GetBaselineOperation`Contoh CLI:

```
aws controltower get-baseline-operation \
    --operation-identifier 58f12232-26be-4735-a3e9-dd30d90f021f \
    --region us-west-2
```

`GetEnabledBaseline`

Untuk informasi selengkapnya tentang operasi API ini, lihat GetEnabledBaseline.

`GetEnabledBaseline`masukan:

```
{
    "enabledBaselineIdentifier": "arn:aws:controltower:us-
west-2:123456789012:enabledbaseline/XAHCR4CJTSI4W07MZ"
}
```

`GetEnabledBaseline`keluaran:

```
{
    "enabledBaselineDetails": {
```

```
        "arn": "arn:aws:controltower:us-west-2:123456789012:enabledbaseline/
XAHCR4CJTSI4W07MZ",
        "baselineIdentifier": "arn:aws:controltower:us-
west-2::baseline:17BSJV3IGJ2QSGA2",
        "baselineVersion": "3.0",
        "targetIdentifier": "arn:aws:organizations::123456789012:ou/o-kgj0txdhpa/ou-
r9mj-4j3mzjql",
        "statusSummary": {
            "status": "SUCCEEDED",
            "lastOperationIdentifier": "58f12232-26be-4735-a3e9-dd30d90f021f"
        },
        "parameters": [
            {
                "key": "IdentityCenterEnabledBaselineArn",
                "value": "arn:aws:controltower:us-west-2:123456789012:enabledbaseline/
XAHCR4CJTSI4W07MZ"
            }
        ]
    }
}
```

`GetEnabledBaseline`Contoh CLI:

```
aws controltower get-enabled-baseline \
    --enabled-baseline-identifier arn:aws:controltower:us-
west-2:123456789012:enabledbaseline/XAHXS7P6C4I453EZC \
    --region us-west-2
```

`ListBaselines`

Untuk informasi selengkapnya tentang operasi API ini, lihat ListBaselines.

`ListBaselines`input (menggunakan input opsional):

```
{
    "nextToken": "AbCd1234",
    "maxResults": "4"
}
```

`ListBaselines`keluaran:

```
{
```

```
    "baselines": [
        {
            "arn": "arn:aws:controltower:us-west-1::baseline/4T4HA1KMO10S6311",
            "name": "AuditBaseline",
            "description": "Sets up resources to monitor security and compliance of
 accounts in your organization."
        },
        {
            "arn": "arn:aws:controltower:us-west-1::baseline/J8HX46AHS5MIKQPD",
            "name": "LogArchiveBaseline",
            "description": "Sets up a central repository for logs of API activities and
 resource configurations from accounts in your organization."
        },
        {
            "arn": "arn:aws:controltower:us-west-1::baseline/LN25R72TTG6IGPTQ",
            "name": "IdentityCenterBaseline",
            "description": "Sets up shared resources for AWS Identity Center, which
 prepares the AWSControlTowerBaseline to set up Identity Center access for accounts."
        },
        {
            "arn": "arn:aws:controltower:us-west-1::baseline/17BSJV3IGJ2QSGA2",
            "name": "AWSControlTowerBaseline",
            "description": "Sets up resources and mandatory controls for member
 accounts within the target OU, required for AWS Control Tower governance."
        }
    ]
}
```

`ListBaselines`Contoh CLI:

```
aws controltower list-baselines \
    --region us-west-2
```

`ListEnabledBaselines`

Untuk informasi selengkapnya tentang operasi API ini, lihat ListEnabledBaselines.

`ListEnabledBaselines`masukan (tidak ada filter):

```
{
    "nextToken": "bde7-XX0c6fXXXXXX",
    "maxResults": 5
```

```
}
```

`ListEnabledBaselines`input (hanya `baselineIdentifiers` filter):

```
{
    "filter": {
        "baselineIdentifiers": ['arn:aws:controltower:us-
east-1::baseline/17BSJV3IGJ2QSGA2', 'arn:aws:controltower:us-
east-1::baseline/12GZU8CKZKVMS2AW']
    },
    "nextToken": "bde7-XX0c6fXXXXXX",
    "maxResults": 5
}
```

`ListEnabledBaselines`input (hanya `targetIdentifiers` filter):

```
{
    "filter": {
        "targetIdentifiers": ['arn:aws:organizations::123456789012:ou/o-s9511vn103/ou-
xqj7-fex1u317', 'arn:aws:organizations::123456789012:ou/o-s9511vn103/ou-xqj7-11q6n2cf']
    },
    "nextToken": "bde7-XX0c6fXXXXXX",
    "maxResults": 2
}
```

`ListEnabledBaselines`input (`baselineIdentifiers`dan `targetIdentifiers` filter):

```
{
    "filter": {
        "baselineIdentifiers": ['arn:aws:controltower:us-
east-1::baseline/17BSJV3IGJ2QSGA2']
        "targetIdentifiers": ['arn:aws:organizations::123456789012:ou/o-s9511vn103/ou-
xqj7-fex1u317']
    },
    "nextToken": "bde7-XX0c6fXXXXXX",
    "maxResults": 5
}
```

`ListEnabledBaselines`keluaran:

```
{
```

```
    "enabledBaselines": [
        {
            "arn": "arn:aws:controltower:us-east-1:123456789012:enabledbaseline/
XAHCR4CJTSI4W07MZ",
            "baselineIdentifier": "arn:aws:controltower:us-
east-1::baseline:17BSJV3IGJ2QSGA2",
            "baselineVersion": "3.0",
            "targetIdentifier": "arn:aws:organizations::123456789012:ou/o-kgj0txdhpa/
ou-r9mj-4j3mzjql",
            "statusSummary": {
                "status": "SUCCEEDED",
                "lastOperationIdentifier": "58f12232-26be-4735-a3e9-dd30d90f021f"
            }
        },
        {
            "arn": "arn:aws:controltower:us-east-1:123456789012:enabledbaseline/
XAJ9NKW88AA4W9CLL",
            "baselineIdentifier": "arn:aws:controltower:us-
east-1::baseline:17BSJV3IGJ2QSGA2",
            "baselineVersion": "4.0",
            "targetIdentifier": "arn:aws:organizations::123456789012:ou/o-s9511vn103/
ou-xqj7-fex1u317",
            "statusSummary": {
            "status": "FAILED",
                "lastOperationIdentifier": "81e02df1-2b4d-48f0-838f-3833b93dcdc0"
            }
        }
    ],
    "nextToken": "e2bXXXXX6cab"
}
```

Contoh CLI dengan satu jenis filter (`baselineIdentifiers`filter):

```
aws controltower list-enabled-baselines \
    --filter baselineIdentifiers=arn:aws:controltower:us-
west-2::baseline/17BSJV3IGJ2QSGA2,arn:aws:controltower:us-west-2::baseline/
LN25R72TTG6IGPTQ \
    --region us-west-2
```

Contoh CLI menggunakan beberapa filter (`baselineIdentifiers`dan `targetIdentifiers` filter):

```
aws controltower list-enabled-baselines \
```

```
    --filter targetIdentifiers=arn:aws:organizations::123456789012:ou/o-
aq21sw43de5/ou-po90-lk87jh65,baselineIdentifiers=arn:aws:controltower:us-
west-2::baseline/17BSJV3IGJ2QSGA2 \
    --region us-west-2
```

ResetEnabledBaseline

Untuk informasi selengkapnya tentang operasi API ini, lihat ResetEnabledBaseline.

`ResetEnabledbaselinemasukan`:

```
{
    "enabledBaselineIdentifier": "arn:aws:controltower:us-
west-2:123456789012:enabledbaseline/XAJ9NKW88AA4W9CLL"
}
```

`ResetEnabledBaselinekeluaran`:

```
{
    "operationIdentifier": "81e02df1-2b4d-48f0-838f-3833b93dcdc0"
}
```

`ResetEnabledBaselineContoh CLI`:

```
aws controltower reset-enabled-baseline \
    --enabled-baseline-identifier arn:aws:controltower:us-
west-2:123456789012:enabledbaseline/XAHXS7P6C4I453EZC \
    --region us-west-2
```

UpdateEnabledBaseline

Untuk informasi selengkapnya tentang operasi API ini, lihat UpdateEnabledBaseline.

`UpdateEnabledBaselinemasukan`:

```
{
    "enabledBaselineIdentifier": "arn:aws:controltower:us-
east-1:123456789012:enabledbaseline/XAJ9NKW88AA4W9CLL",
    "baselineVersion": "4.0",
    "parameters": [
```

```
        {
            "key": "IdentityCenterEnabledBaselineArn",
            "value": "arn:aws:controltower:us-east-1:123456789012:enabledbaseline/
XAHCR4CJTSI4W07MZ"
        }
    ]
}
```

`UpdateEnabledBaseline`keluaran:

```
{
    "operationIdentifier": "81e02df1-2b4d-48f0-838f-3833b93dcdc0"
}
```

`UpdateEnabledBaseline`Contoh CLI:

```
aws controltower update-enabled-baseline \
    --enabled-baseline-identifier arn:aws:controltower:us-
west-2:123456789012:enabledbaseline/XAHXS7P6C4I453EZC \
    --baseline-version 4.0
    --parameters
 '[{"key":"IdentityCenterEnabledBaselineArn","value":"arn:aws:controltower:us-
west-2:123456789012:enabledbaseline/XAHXS7P6C4I453EZC"}]' \
    --region us-west-2
```

Informasi terkait

Topik ini mencantumkan kasus penggunaan umum dan praktik terbaik untuk kemampuan AWS Control Tower dan penyempurnaan tambahan. Topik ini juga mencakup tautan ke posting blog yang relevan, dokumentasi teknis, dan sumber daya terkait yang dapat membantu Anda saat Anda bekerja dengan AWS Control Tower.

Tutorial dan lab

- AWS Control Tower lab — Laboratorium ini memberikan gambaran umum tingkat tinggi tentang tugas-tugas umum yang terkait dengan AWS Control Tower.
- Di dasbor AWS Control Tower, pilih Dapatkan panduan yang dipersonalisasi jika Anda memiliki kasus penggunaan, tetapi Anda tidak yakin harus mulai dari mana.
- Coba kunjungi daftar YouTube video yang dikuratori yang menjelaskan lebih lanjut tentang cara menggunakan fungsionalitas AWS Control Tower.

Jaringan

Siapkan pola yang dapat diulang dan dikelola untuk jaringan di. AWSPelajari lebih lanjut tentang desain, otomatisasi, dan peralatan yang biasa digunakan oleh pelanggan.

- AWS Arsitektur VPC Mulai Cepat — Panduan Mulai Cepat ini menyediakan fondasi jaringan berdasarkan praktik AWS terbaik untuk infrastruktur AWS Cloud Anda. Ini membangun AWS Virtual Private Network lingkungan dengan subnet publik dan pribadi di mana Anda dapat meluncurkan AWS layanan dan sumber daya lainnya.
- VPC swalayan di AWS Control Tower menggunakan AWS Service Catalog — Posting blog ini menjelaskan cara menyiapkan Account Factory sehingga Anda dapat menyediakan akun dengan VPC yang disesuaikan.
- Menerapkan Serverless Transit Network Orchestrator (STNO) di AWS Control Tower — Posting blog ini menunjukkan cara mengotomatiskan akses konektivitas jaringan di seluruh akun. Blog ini ditujukan untuk administrator AWS Control Tower, atau mereka yang bertanggung jawab untuk mengelola jaringan di AWS lingkungan mereka.

Keamanan, identitas, dan pencatatan

Perluas postur keamanan Anda, integrasikan dengan penyedia identitas eksternal atau yang sudah ada, dan pusatkan sistem logging.

Keamanan

- Mengotomatiskan AWS Security Hub Peringatan dengan peristiwa siklus hidup AWS Control Tower — Posting blog ini menjelaskan cara mengotomatiskan pengaktifan dan konfigurasi Security Hub di lingkungan multi-akun AWS Control Tower pada akun yang ada dan yang baru.
- Mengaktifkan AWS Identity and Access Management - Posting blog ini menjelaskan cara meningkatkan visibilitas keamanan organisasi Anda dengan mengaktifkan dan memusatkan temuan IAM Access Analyzer.
- AWS Systems Manager Parameter Store menyediakan penyimpanan hierarkis yang aman untuk manajemen data konfigurasi dan manajemen rahasia. Anda dapat menggunakannya untuk berbagi informasi konfigurasi di lokasi yang aman, untuk digunakan oleh AWS Systems Manager dan AWS CloudFormation. Misalnya, Anda dapat menyimpan daftar Wilayah tempat Anda ingin menerapkan paket kesesuaian.

Identitas

- Tautkan identitas pengguna Azure AD ke AWS akun dan aplikasi untuk sistem masuk tunggal — Posting blog ini menjelaskan cara menggunakan Azure AD dengan IAM Identity Center dan AWS Control Tower.
- Kelola akses ke AWS secara terpusat untuk pengguna Okta dengan AWS IAM Identity Center — Posting blog ini menjelaskan cara menggunakan Okta dengan IAM Identity Center dan AWS Control Tower.

Pencatatan log

- AWS Solusi Pencatatan Terpusat — Posting solusi ini menjelaskan solusi Pencatatan Terpusat yang memungkinkan organisasi mengumpulkan, menganalisis, dan menampilkan log AWS di beberapa akun dan AWS Wilayah.

- Bawa akun di AWS Control Tower — Postingan blog ini menjelaskan cara menerapkan AWS Control Tower ke AWS organisasi Anda yang ada.
- Perluas tata kelola AWS Control Tower menggunakan paket kesesuaian AWS Config — Posting blog ini menjelaskan cara AWS Config menerapkan paket kesesuaian untuk membantu membawa akun dan organisasi yang ada ke dalam tata kelola oleh AWS Control Tower.
- Cara Mendeteksi dan Mengurangi Pelanggaran Pagar Pembatas dengan AWS Control Tower — Posting blog ini menjelaskan cara menambahkan kontrol dan cara berlangganan notifikasi SNS sehingga Anda dapat diberi tahu melalui email tentang pelanggaran kepatuhan kontrol.

Otomatisasi dan integrasi

Otomatiskan pembuatan akun dan integrasikan peristiwa siklus hidup dengan AWS Control Tower.

- Peristiwa siklus hidup — Posting blog ini menjelaskan cara menggunakan peristiwa siklus hidup dengan AWS Control Tower.
- Mengotomatiskan pembuatan akun — Posting blog ini menjelaskan cara mengatur pembuatan akun otomatis di AWS Control Tower.
- Otomatisasi log aliran Amazon VPC - Posting blog ini menjelaskan cara mengotomatiskan dan memusatkan Log Aliran VPC Amazon di lingkungan multi-akun.

- Otomatiskan penandaan VPC dengan peristiwa siklus hidup AWS Control Tower — Posting blog ini menjelaskan cara mengotomatiskan penandaan sumber daya untuk VPC, melalui peristiwa siklus hidup di AWS Control Tower.
- Manajemen akun otomatis - Posting blog ini menjelaskan cara mengotomatiskan tugas manajemen akun setelah lingkungan AWS Control Tower Anda disiapkan.

Memigrasi beban kerja

Gunakan AWS layanan lain dengan AWS Control Tower untuk membantu migrasi beban kerja.

- CloudEndure migrasi — Posting blog ini menjelaskan cara menggabungkan CloudEndure dan AWS layanan lainnya dengan AWS Control Tower untuk membantu migrasi beban kerja.

Layanan AWS terkait

AWS Control Tower bertindak sebagai lapisan orkestrasi untuk. AWS OrganizationsOleh karena itu, melalui konsol AWS Organizations dan API, Anda memiliki akses ke lebih dari 20 layanan AWS lainnya yang bekerja dengan AWS Control Tower. Layanan tambahan ini tidak dapat diakses secara langsung melalui konsol AWS Control Tower.

- Untuk daftar lengkap layanan yang tersedia untuk AWS Control Tower melalui AWS Organizations, lihat layanan AWS yang dapat Anda gunakan dengan AWS Organizations.
- Untuk mengaktifkan kemampuan multi-akun untuk layanan AWS terkait ini, Anda harus mengaktifkan akses tepercaya. Untuk informasi selengkapnya, lihat Menggunakan AWS Organizations dengan layanan AWS lainnya.

> **Note**
>
> Ingat bahwa AWS IAM Identity Center, AWS Config, dan AWS CloudTrail disiapkan untuk Anda di AWS Control Tower dan terintegrasi sepenuhnya. Anda tidak perlu mengubah akses tepercaya atau pengaturan administrasi yang didelegasikan untuk layanan ini.

- Beberapa AWS layanan yang tersedia AWS Organizations dapat menggunakan administrasi yang didelegasikan, termasuk AWS Systems Manager dan AWS Firewall Manager. Untuk selengkapnya, lihat Mengonfigurasi Administrator Delegasi, dan Mengaktifkan akun administrator

yang didelegasikan untuk Firewall Manager. Lihat juga video ini, Siapkan grup keamanan dengan AWS Firewall Manager.

AWS Marketplace solusi

Temukan solusi dari AWS Marketplace.

- AWS Control Tower Marketplace — AWS Marketplace menawarkan berbagai solusi untuk AWS Control Tower untuk membantu Anda mengintegrasikan perangkat lunak pihak ketiga. Solusi ini membantu memecahkan infrastruktur utama dan kasus penggunaan operasional termasuk manajemen identitas, keamanan untuk lingkungan multi-akun, jaringan terpusat, intelijen operasional, dan informasi keamanan dan manajemen acara (SIEM).

Catatan rilis AWS Control Tower

Bagian berikut menunjukkan detail tentang rilis AWS Control Tower yang memerlukan pembaruan untuk landing zone AWS Control Tower, serta rilis yang dimasukkan ke dalam layanan secara otomatis.

Fitur dan rilis terdaftar dalam urutan kronologis terbalik (terbaru pertama) berdasarkan tanggal di mana mereka secara resmi diumumkan kepada publik. Karena mungkin ada jeda antara ketika fitur atau rilis didokumentasikan dan ketika diumumkan secara resmi, tanggal yang tercantum untuk fitur atau rilis di sini mungkin sedikit berbeda dari tanggal diRiwayat dokumen.

Fitur dirilis pada tahun 2024

Fitur dirilis pada tahun 2023

Fitur dirilis pada tahun 2022

Fitur dirilis pada tahun 2021

Fitur dirilis pada tahun 2020

Fitur dirilis pada 2019

Januari 2024 - Sekarang

Sejak Januari 2024, AWS Control Tower telah merilis pembaruan berikut:

- AWS Control Tower memperbarui dan mengganti nama dua kontrol proaktif
- Kontrol usang tidak lagi tersedia
- AWS Control Tower mendukung `EnabledControl` sumber daya penandaan di AWS CloudFormation
- AWS Control Tower mendukung API untuk pendaftaran dan konfigurasi OU dengan baseline

AWS Control Tower memperbarui dan mengganti nama dua kontrol proaktif

Maret 26, 2024

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

AWS Control Tower telah mengganti nama dua kontrol proaktif agar selaras dengan pembaruan ke Amazon Service. OpenSearch

- [CT.OPENSEARCH.PR.8] Memerlukan domain Layanan Elasticsearch untuk menggunakan TLSv1.2
- [CT.OPENSEARCH.PR.16] Memerlukan domain OpenSearch Layanan Amazon untuk menggunakan TLSv1.2

Kami memperbarui nama kontrol dan artefak untuk dua kontrol ini agar selaras dengan rilis terbaru dari OpenSearch Layanan Amazon, yang sekarang mendukung Transport Layer Security (TLS) versi 1.3 di antara opsi keamanan transportasinya untuk keamanan titik akhir domain.

Untuk menambahkan dukungan untuk TLSv1.3 untuk kontrol ini, kami telah memperbarui artefak dan nama kontrol untuk mencerminkan maksud dari kontrol. Mereka sekarang mengevaluasi versi TLS minimum dari domain layanan. Untuk membuat pembaruan ini di lingkungan Anda, Anda harus Nonaktifkan dan Aktifkan kontrol untuk menyebarkan artefak terbaru.

Tidak ada kontrol proaktif lain yang terpengaruh oleh perubahan ini. Kami menyarankan Anda meninjau kontrol ini, untuk memastikan bahwa mereka memenuhi tujuan kontrol Anda.

Untuk pertanyaan atau masalah, hubungi AWS Support.

Kontrol usang tidak lagi tersedia

Maret 12, 2024

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

AWS Control Tower telah menghentikan beberapa kontrol. Kontrol ini tidak lagi tersedia.

- CT.ATHENA.PR.1
- CT.CODEBUILD.PR.4
- CT.AUTOSCALING.PR.3
- SH.Athena.1
- SH.Codebuild.5
- SH.AutoScaling.4
- SH.SNS.1

- SH.SNS.2

AWS Control Tower mendukung **`EnabledControl`** sumber daya penandaan di AWS CloudFormation

Februari 22, 2024

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

Rilis AWS Control Tower ini memperbarui perilaku `EnabledControl` sumber daya, agar lebih selaras dengan kontrol yang dapat dikonfigurasi, dan untuk meningkatkan kemampuan mengelola lingkungan AWS Control Tower Anda dengan otomatisasi. Dengan rilis ini, Anda dapat menambahkan tag ke `EnabledControl` sumber daya yang dapat dikonfigurasi melalui AWS CloudFormation templat. Sebelumnya, Anda dapat menambahkan tag melalui konsol AWS Control Tower dan API saja.

AWS Control Tower `GetEnabledControlEnableControl`,, dan operasi `ListTagsforResource` API diperbarui dengan rilis ini, karena mereka bergantung pada fungsionalitas `EnabledControl` sumber daya.

Untuk informasi selengkapnya, lihat Menandai `EnabledControl` sumber daya di AWS Control Tower dan `EnabledControl`di Panduan AWS CloudFormation Pengguna.

AWS Control Tower mendukung API untuk pendaftaran dan konfigurasi OU dengan baseline

Februari 14, 2024

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

API ini mendukung pendaftaran OU terprogram dengan `EnableBaseline` panggilan tersebut. Saat Anda mengaktifkan baseline pada OU, akun anggota dalam OU didaftarkan ke dalam tata kelola AWS Control Tower. Peringatan tertentu mungkin berlaku. Misalnya, pendaftaran OU melalui konsol AWS Control Tower memungkinkan kontrol opsional serta kontrol wajib. Saat memanggil API, Anda mungkin perlu menyelesaikan langkah ekstra agar kontrol opsional diaktifkan.

Garis dasar AWS Control Tower mewujudkan praktik terbaik untuk tata kelola AWS Control Tower dari akun OU dan anggota. Misalnya, ketika Anda mengaktifkan baseline pada OU, akun anggota

dalam OU menerima kelompok sumber daya yang ditentukan, termasuk, Pusat Identitas IAM AWS CloudTrail AWS Config, dan peran IAM yang diperlukan AWS .

Garis dasar tertentu kompatibel dengan versi landing zone AWS Control Tower tertentu. AWS Control Tower dapat menerapkan baseline terbaru yang kompatibel ke landing zone Anda, saat Anda mengubah pengaturan landing zone. Untuk informasi selengkapnya, lihat Kompatibilitas baseline OU dan versi landing zone.

Rilis ini mencakup empat hal penting Jenis garis dasar

- `AWSControlTowerBaseline`
- `AuditBaseline`
- `LogArchiveBaseline`
- `IdentityCenterBaseline`

Dengan API baru dan garis dasar yang ditentukan, Anda dapat mendaftarkan OU dan mengotomatiskan alur kerja penyediaan OU Anda. API juga dapat mengelola OU yang sudah berada di bawah tata kelola AWS Control Tower, sehingga Anda dapat mendaftarkan ulang OU setelah pembaruan landing zone. API menyertakan dukungan untuk AWS CloudFormation `EnabledBaseline` sumber daya, yang memungkinkan Anda mengelola OU Anda dengan infrastruktur sebagai kode (IAc).

API dasar

- EnableBaseline, UpdateEnabledBaseline, DisableBaseline: Ambil tindakan pada garis dasar untuk OU.
- GetEnabledBaseline, ListEnabledBaselines: Temukan konfigurasi untuk garis dasar yang diaktifkan.
- GetBaselineOperation: Lihat status operasi dasar tertentu.
- ResetEnabledBaseline: Perbaiki penyimpangan sumber daya pada OU dengan baseline yang diaktifkan (termasuk OU bersarang dan penyimpangan kontrol wajib). Juga memulihkan penyimpangan untuk landing-zone-level Wilayah yang menolak kontrol
- GetBaseline, ListBaselines: Temukan konten baseline AWS Control Tower.

Untuk mempelajari lebih lanjut tentang API ini, tinjau Baseline di Panduan Pengguna AWS Control Tower, dan Referensi API. API baru tersedia di Wilayah AWS tempat AWS Control Tower tersedia,

kecuali Wilayah GovCloud (AS). Untuk daftar Wilayah AWS tempat AWS Control Tower tersedia, lihat Wilayah AWS Tabel.

Januari 2023 - Sekarang

Sejak Januari 2023, AWS Control Tower telah merilis pembaruan berikut:

- Transisi ke jenis produk AWS Service Catalog eksternal baru (fase 3)
- AWS Control Tower landing zone versi 3.3
- Transisi ke jenis produk AWS Service Catalog eksternal baru (fase 2)
- AWS Control Tower mengumumkan kontrol untuk membantu kedaulatan digital
- AWS Control Tower mendukung API landing zone
- AWS Control Tower mendukung penandaan untuk kontrol yang diaktifkan
- AWS Control Tower tersedia di Wilayah Asia Pasifik (Melbourne)
- Transisi ke jenis produk AWS Service Catalog eksternal baru (fase 1)
- API kontrol baru tersedia
- AWS Control Tower menambahkan kontrol tambahan
- Jenis drift baru dilaporkan: akses tepercaya dinonaktifkan
- Empat tambahan Wilayah AWS
- AWS Control Tower tersedia di Wilayah Tel Aviv
- AWS Control Tower meluncurkan 28 kontrol proaktif baru
- AWS Control Tower menghentikan dua kontrol
- AWS Control Tower landing zone versi 3.2
- AWS Control Tower menangani akun berdasarkan ID
- Kontrol detektif Security Hub tambahan tersedia di pustaka kontrol AWS Control Tower
- AWS Control Tower menerbitkan tabel metadata kontrol
- Dukungan Terraform untuk Kustomisasi Account Factory
- AWS Manajemen mandiri IAM Identity Center tersedia untuk landing zone
- AWS Control Tower menangani tata kelola campuran untuk OU
- Tersedia kontrol proaktif tambahan
- Kontrol proaktif Amazon EC2 yang diperbarui
- Tujuh tambahan Wilayah AWS tersedia

- Account Factory untuk penelusuran permintaan kustomisasi akun Terraform (AFT)
- AWS Control Tower landing zone versi 3.1
- Kontrol proaktif umumnya tersedia

Transisi ke jenis produk AWS Service Catalog eksternal baru (fase 3)

Desember 14, 2023

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

AWS Control Tower tidak lagi mendukung Terraform Open Source sebagai jenis produk (cetak biru) saat membuat produk baru. Akun AWS Untuk informasi selengkapnya dan petunjuk tentang memperbarui cetak biru akun Anda, tinjau Transisi ke jenis produk AWS Service Catalog Eksternal.

Jika Anda tidak memperbarui cetak biru akun untuk menggunakan jenis produk Eksternal, Anda hanya dapat memperbarui atau menghentikan akun yang Anda sediakan menggunakan cetak biru Sumber Terraform Open Source.

AWS Control Tower landing zone versi 3.3

Desember 14, 2023

(Pembaruan diperlukan untuk landing zone AWS Control Tower ke versi 3.3. Untuk informasi, lihatPerbarui Zona Pendaratan Anda).

Pembaruan kebijakan bucket S3 di akun AWS Control Tower Audit

Kami telah memodifikasi kebijakan bucket Audit Amazon S3 yang diterapkan AWS Control Tower di akun, sehingga `aws:SourceOrgID` kondisi harus dipenuhi untuk izin menulis apa pun. Dengan rilis ini, AWS layanan memiliki akses ke sumber daya Anda hanya jika permintaan berasal dari organisasi atau unit organisasi (OU) Anda.

Anda dapat menggunakan kunci `aws:SourceOrgID` kondisi dan menyetel nilainya ke ID organisasi di elemen kondisi kebijakan bucket S3 Anda. Kondisi ini memastikan bahwa CloudTrail hanya dapat menulis log atas nama akun dalam organisasi Anda ke bucket S3 Anda; ini mencegah CloudTrail log di luar organisasi Anda menulis ke bucket AWS Control Tower S3 Anda.

Kami membuat perubahan ini untuk memulihkan potensi kerentanan keamanan, tanpa memengaruhi fungsionalitas beban kerja Anda yang ada. Untuk melihat kebijakan yang diperbarui, lihatKebijakan bucket Amazon S3 di akun audit.

Untuk informasi selengkapnya tentang kunci kondisi baru, lihat dokumentasi IAM dan posting blog IAM berjudul "Gunakan kontrol yang dapat diskalakan untuk AWS layanan yang mengakses sumber daya Anda."

Pembaruan kebijakan dalam topik AWS Config SNS

Kami menambahkan kunci `aws:SourceOrgID` kondisi baru ke kebijakan untuk topik AWS Config SNS.Untuk melihat kebijakan yang diperbarui, lihat. Kebijakan topik AWS Config SNS

Pembaruan untuk kontrol wilayah Deny landing zone

- Dihapus`discovery-marketplace:`. Tindakan ini dicakup oleh `aws-marketplace:*` pengecualian.
- Ditambahkan `quicksight:DescribeAccountSubscription`

AWS CloudFormation Template diperbarui

Kami memperbarui AWS CloudFormation template untuk tumpukan bernama `BASELINE-CLOUDTRAIL-MASTER` sehingga tidak menunjukkan penyimpangan ketika AWS KMS enkripsi tidak digunakan.

Transisi ke jenis produk AWS Service Catalog eksternal baru (fase 2)

Desember 7, 2023

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

HashiCorp memperbarui lisensi Terraform mereka. Akibatnya, AWS Service Catalog mengubah dukungan untuk produk Terraform Open Source dan menyediakan produk ke jenis produk baru, yang disebut Eksternal.

Untuk menghindari gangguan pada beban kerja dan AWS sumber daya yang ada di akun Anda, ikuti langkah transisi AWS Control Tower dalam Transisi ke jenis produk AWS Service Catalog Eksternal paling lambat 14 Desember 2023.

AWS Control Tower mengumumkan kontrol untuk membantu kedaulatan digital

November 27, 2023

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

AWS Control Tower mengumumkan 65 kontrol AWS terkelola baru, untuk membantu Anda memenuhi persyaratan kedaulatan digital Anda. Dengan rilis ini, Anda dapat menemukan kontrol ini di bawah grup kedaulatan digital baru di konsol AWS Control Tower. Anda dapat menggunakan kontrol ini untuk membantu mencegah tindakan dan mendeteksi perubahan sumber daya terkait residensi data, pembatasan akses terperinci, enkripsi, dan kemampuan ketahanan. Kontrol ini dirancang untuk memudahkan Anda menangani persyaratan dalam skala besar. Untuk informasi lebih lanjut tentang kontrol kedaulatan digital, lihat. Kontrol yang meningkatkan perlindungan kedaulatan digital

Misalnya, Anda dapat memilih untuk mengaktifkan kontrol yang membantu menegakkan strategi enkripsi dan ketahanan Anda, seperti Memerlukan cache AWS AppSync API agar enkripsi saat transit diaktifkan atau Memerlukan Firewall AWS Jaringan untuk diterapkan di beberapa Availability Zone. Anda juga dapat menyesuaikan kontrol penolakan Wilayah AWS Control Tower untuk menerapkan batasan regional yang paling sesuai dengan kebutuhan bisnis unik Anda.

Rilis ini menghadirkan kemampuan penolakan Wilayah AWS Control Tower AWS yang disempurnakan dengan baik. Anda dapat menerapkan kontrol penolakan Wilayah berparameter baru di tingkat OU, untuk meningkatkan perincian tata kelola, sambil mempertahankan tata kelola Wilayah tambahan di tingkat landing zone. Kontrol penolakan Wilayah yang dapat disesuaikan ini membantu Anda menerapkan batasan regional yang paling sesuai dengan kebutuhan bisnis unik Anda. Untuk informasi selengkapnya tentang kontrol penolakan Wilayah baru yang dapat dikonfigurasi, lihatWilayah menolak kontrol diterapkan pada OU.

Sebagai alat baru untuk peningkatan penolakan Wilayah baru, rilis ini menyertakan API baru`UpdateEnabledControl`, yang memungkinkan Anda mengatur ulang kontrol yang diaktifkan ke pengaturan default. API ini sangat membantu dalam kasus penggunaan di mana Anda perlu menyelesaikan drift dengan cepat, atau untuk menjamin secara terprogram bahwa kontrol tidak dalam keadaan drift. Untuk informasi selengkapnya tentang API baru, lihat AWS Control Tower API Referensi

Kontrol proaktif baru

- CT.APIGATEWAY.PR.6: Memerlukan domain Amazon API Gateway REST untuk menggunakan kebijakan keamanan yang menentukan versi protokol TLS minimum TLSv1.2
- CT.APPSYNC.PR.2: Memerlukan AWS AppSync GraphQL API untuk dikonfigurasi dengan visibilitas pribadi
- CT.APPSYNC.PR.3: Mengharuskan AWS AppSync GraphQL API tidak diautentikasi dengan kunci API

- CT.APPSYNC.PR.4: Memerlukan cache AWS AppSync GraphQL API agar enkripsi saat transit diaktifkan.
- CT.APPSYNC.PR.5: Memerlukan cache AWS AppSync GraphQL API agar enkripsi saat istirahat diaktifkan.
- CT.AUTOSCALING.PR.9: Memerlukan volume Amazon EBS yang dikonfigurasi melalui konfigurasi peluncuran Auto Scaling Amazon EC2 untuk mengenkripsi data saat istirahat
- CT.AUTOSCALING.PR.10: Memerlukan grup Auto Scaling Amazon EC2 untuk AWS hanya menggunakan jenis instans Nitro saat mengganti template peluncuran
- CT.AUTOSCALING.PR.11: Hanya memerlukan jenis instans AWS Nitro yang mendukung enkripsi lalu lintas jaringan antar instans untuk ditambahkan ke grup Auto Scaling Amazon EC2, saat mengganti template peluncuran
- CT.DAX.PR.3: Memerlukan klaster DynamoDB Accelerator untuk mengenkripsi data dalam perjalanan dengan Transport Layer Security (TLS)
- CT.DMS.PR.2: Memerlukan Endpoint AWS Database Migration Service (DMS) untuk mengenkripsi koneksi untuk titik akhir sumber dan target
- CT.EC2.PR.15: Memerlukan instans Amazon EC2 untuk menggunakan jenis instans AWS Nitro saat membuat dari jenis sumber daya `AWS::EC2::LaunchTemplate`
- CT.EC2.PR.16: Memerlukan instans Amazon EC2 untuk menggunakan jenis instans AWS Nitro saat dibuat menggunakan tipe sumber daya `AWS::EC2::Instance`
- CT.EC2.PR.17: Memerlukan host khusus Amazon EC2 untuk menggunakan jenis instans AWS Nitro
- CT.EC2.PR.18: Memerlukan armada Amazon EC2 untuk mengganti hanya template peluncuran tersebut dengan AWS tipe instans Nitro
- CT.EC2.PR.19: Memerlukan instans Amazon EC2 untuk menggunakan jenis instans nitro yang mendukung enkripsi dalam perjalanan antar instance saat dibuat menggunakan tipe sumber daya `AWS::EC2::Instance`
- CT.EC2.PR.20: Memerlukan armada Amazon EC2 untuk mengganti hanya template peluncuran tersebut dengan tipe instans AWS Nitro yang mendukung enkripsi saat transit antar instans
- CT.ELASTICACHE.PR.8: Memerlukan grup ElastiCache replikasi Amazon dari versi Redis yang lebih baru agar otentikasi RBAC diaktifkan
- CT.MQ.PR.1: Memerlukan broker Amazon MQ ActiveMQ untuk menggunakan mode penerapan aktif/siaga untuk ketersediaan tinggi

- CT.MQ.PR.2: Memerlukan broker MQ Amazon MQ Rabbit untuk menggunakan mode cluster multi-AZ untuk ketersediaan tinggi
- CT.MSK.PR.1: Memerlukan cluster Amazon Managed Streaming for Apache Kafka (MSK) untuk menerapkan enkripsi saat transit antar node broker cluster
- CT.MSK.PR.2: Memerlukan cluster Amazon Managed Streaming for Apache Kafka (MSK) untuk dikonfigurasi dengan dinonaktifkan PublicAccess
- CT.NETWORK-FIREWALL.PR.5: Memerlukan firewall AWS Network Firewall untuk digunakan di beberapa Availability Zone
- CT.RDS.PR.26: Memerlukan Proxy Amazon RDS DB untuk meminta koneksi Transport Layer Security (TLS)
- CT.RDS.PR.27: Memerlukan grup parameter cluster Amazon RDS DB untuk meminta koneksi Transport Layer Security (TLS) untuk tipe engine yang didukung
- CT.RDS.PR.28: Memerlukan grup parameter Amazon RDS DB untuk meminta koneksi Transport Layer Security (TLS) untuk jenis engine yang didukung
- CT.RDS.PR.29: Memerlukan klaster Amazon RDS yang tidak dikonfigurasi agar dapat diakses publik melalui properti " PubliclyAccessible
- CT.RDS.PR.30: Mengharuskan instans database Amazon RDS memiliki enkripsi saat istirahat yang dikonfigurasi untuk menggunakan kunci KMS yang Anda tentukan untuk jenis engine yang didukung
- CT.S3.PR.12: Memerlukan jalur akses Amazon S3 untuk memiliki konfigurasi Block Public Access (BPA) dengan semua opsi disetel ke true

Kontrol pencegahan baru

- CT.APPSYNC.PV.1Mengharuskan AWS AppSync GraphQL API dikonfigurasi dengan visibilitas pribadi
- CT.EC2.PV.1Memerlukan snapshot Amazon EBS dibuat dari volume EC2 terenkripsi
- CT.EC2.PV.2Mengharuskan volume Amazon EBS terlampir dikonfigurasi untuk mengenkripsi data saat istirahat
- CT.EC2.PV.3Mengharuskan snapshot Amazon EBS tidak dapat dipulihkan secara publik
- CT.EC2.PV.4Mengharuskan API langsung Amazon EBS tidak dipanggil
- CT.EC2.PV.5Larang penggunaan impor dan ekspor Amazon EC2 VM

- CT.EC2.PV.6Larang penggunaan tindakan Amazon EC2 dan API yang tidak digunakan lagi RequestSpotFleet RequestSpotInstances
- CT.KMS.PV.1Memerlukan kebijakan AWS KMS kunci untuk memiliki pernyataan yang membatasi pembuatan AWS KMS hibah untuk layanan AWS
- CT.KMS.PV.2Mengharuskan kunci AWS KMS asimetris dengan bahan kunci RSA yang digunakan untuk enkripsi tidak memiliki panjang kunci 2048 bit
- CT.KMS.PV.3Mengharuskan AWS KMS kunci dikonfigurasi dengan pemeriksaan keamanan penguncian kebijakan bypass diaktifkan
- CT.KMS.PV.4Mengharuskan kunci yang AWS KMS dikelola pelanggan (CMK) dikonfigurasi dengan materi utama yang berasal dari CloudHSM AWS
- CT.KMS.PV.5Mengharuskan kunci yang AWS KMS dikelola pelanggan (CMK) dikonfigurasi dengan materi kunci yang diimpor
- CT.KMS.PV.6Mengharuskan kunci yang AWS KMS dikelola pelanggan (CMK) dikonfigurasi dengan materi kunci yang berasal dari penyimpanan kunci eksternal (XKS)
- CT.LAMBDA.PV.1Memerlukan URL AWS Lambda fungsi untuk menggunakan otentikasi AWS berbasis IAM
- CT.LAMBDA.PV.2Memerlukan URL AWS Lambda fungsi untuk dikonfigurasi untuk akses hanya oleh prinsipal di dalam Akun AWS
- CT.MULTISERVICE.PV.1: Tolak akses berdasarkan permintaan untuk unit organisasi AWS Wilayah AWS

Kontrol detecive baru yang meningkatkan postur tata kelola kedaulatan digital Anda adalah bagian dari AWS Control Tower Standar yang Dikelola Layanan. AWS Security Hub

Kontrol detektif baru

- SH.ACM.2: Sertifikat RSA yang dikelola oleh ACM harus menggunakan panjang kunci minimal 2.048 bit
- SH.AppSync.5: AWS AppSync GraphQL API tidak boleh diautentikasi dengan kunci API
- SH.CloudTrail.6: Pastikan bucket S3 yang digunakan untuk menyimpan CloudTrail log tidak dapat diakses publik:
- SH.DMS.9: Titik akhir DMS harus menggunakan SSL
- SH.DocumentDB.3: Cuplikan cluster manual Amazon DocumentDB tidak boleh bersifat publik
- SH.DynamoDB.3: Cluster DynamoDB Accelerator (DAX) harus dienkripsi saat istirahat

- SH.EC2.23: EC2 Transit Gateways seharusnya tidak secara otomatis menerima permintaan lampiran VPC
- SH.EKS.1: Titik akhir kluster EKS tidak boleh diakses publik
- SH.ElastiCache.3: grup ElastiCache replikasi harus mengaktifkan failover otomatis
- SH.ElastiCache.4: grup ElastiCache replikasi seharusnya diaktifkan encryption-at-rest
- SH.ElastiCache.5: grup ElastiCache replikasi seharusnya diaktifkan encryption-in-transit
- SH.ElastiCache.6: grup ElastiCache replikasi versi Redis sebelumnya harus mengaktifkan Redis AUTH
- SH.EventBridge.3: bus acara EventBridge khusus harus memiliki kebijakan berbasis sumber daya terlampir
- SH.KMS.4: rotasi AWS KMS kunci harus diaktifkan
- SH.Lambda.3: Fungsi Lambda harus dalam VPC
- SH.MQ.5: Pialang ActiveMQ harus menggunakan mode penerapan aktif/siaga
- SH.MQ.6: Broker RabbitMQ harus menggunakan mode penerapan cluster
- SH.MSK.1: Cluster MSK harus dienkripsi dalam perjalanan di antara node broker
- SH.RDS.12: Autentikasi IAM harus dikonfigurasi untuk cluster RDS
- SH.RDS.15: Cluster RDS DB harus dikonfigurasi untuk beberapa Availability Zone
- SH.S3.17: Ember S3 harus dienkripsi saat istirahat dengan kunci AWS KMS

Untuk informasi selengkapnya tentang kontrol yang ditambahkan ke AWS Control Tower Standar yang AWS Security Hub Dikelola Layanan, lihat Kontrol yang berlaku untuk Standar yang Dikelola Layanan: AWS Control Tower dalam dokumentasi. AWS Security Hub

Untuk daftar yang tidak mendukung kontrol tertentu Wilayah AWS yang merupakan bagian dari AWS Control Tower Standar AWS Security Hub yang Dikelola Layanan, lihat. Wilayah yang Tidak Didukung

Kontrol baru yang dapat dikonfigurasi untuk penolakan Wilayah di tingkat OU

CT.MULTISERVICE.PV.1: Kontrol ini menerima parameter untuk menentukan Wilayah yang dikecualikan, prinsip IAM, dan Tindakan yang diizinkan, pada tingkat OU, bukan untuk seluruh zona landing AWS Control Tower. Ini adalah kontrol preventif, yang diterapkan oleh Kebijakan Kontrol Layanan (SCP).

Untuk informasi selengkapnya, lihat Wilayah menolak kontrol diterapkan pada OU.

`UpdateEnabledControl`API

Rilis AWS Control Tower ini menambahkan dukungan API berikut untuk kontrol:

- `EnableControl`API yang diperbarui dapat mengonfigurasi kontrol yang dapat dikonfigurasi.
- `GetEnabledControl`API yang diperbarui menunjukkan parameter yang dikonfigurasi pada kontrol yang diaktifkan.
- `UpdateEnabledControl`API baru dapat mengubah parameter pada kontrol yang diaktifkan.

Untuk informasi selengkapnya, lihat Referensi API AWS Control Tower.

AWS Control Tower mendukung API landing zone

November 26, 2023

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

AWS Control Tower sekarang mendukung konfigurasi landing zone dan peluncuran menggunakan API. Anda dapat membuat, memperbarui, mendapatkan, membuat daftar, mengatur ulang, dan menghapus zona pendaratan menggunakan API.

API berikut memungkinkan Anda untuk mengatur dan mengelola landing zone Anda secara terprogram menggunakan AWS CloudFormation atau. AWS CLI

AWS Control Tower mendukung API berikut untuk zona pendaratan:

- `CreateLandingZone`—Panggilan API ini membuat landing zone menggunakan versi landing zone dan file manifes.
- `GetLandingZoneOperation`—Panggilan API ini mengembalikan status operasi landing zone tertentu.
- `GetLandingZone`—Panggilan API ini menampilkan detail tentang landing zone yang ditentukan, termasuk versi, file manifes, dan status.
- `UpdateLandingZone`—Panggilan API ini memperbarui versi landing zone atau file manifes.
- `ListLandingZone`—Panggilan API ini mengembalikan satu pengenal landing zone (ARN) untuk pengaturan landing zone di akun manajemen.

- `ResetLandingZone`—Panggilan API ini me-reset landing zone ke parameter yang ditentukan pada pembaruan terbaru, yang dapat memperbaiki drift. Jika landing zone belum diperbarui, panggilan ini mengatur ulang landing zone ke parameter yang ditentukan saat pembuatan.
- `DeleteLandingZone`—Panggilan API ini menonaktifkan landing zone.

Untuk memulai dengan landing zone API, lihatMemulai AWS Control Tower menggunakan API.

AWS Control Tower mendukung penandaan untuk kontrol yang diaktifkan

November 10, 2023

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

AWS Control Tower sekarang mendukung penandaan sumber daya untuk kontrol yang diaktifkan, dari konsol AWS Control Tower atau melalui API. Anda dapat menambahkan, menghapus, atau mencantumkan tag untuk kontrol yang diaktifkan.

Dengan merilis API berikut, Anda dapat mengonfigurasi tag untuk kontrol yang Anda aktifkan di AWS Control Tower. Tag membantu Anda mengelola, mengidentifikasi, mengatur, mencari, dan memfilter sumber daya. Anda dapat membuat tag untuk mengategorikan sumber daya berdasarkan tujuan, pemilik, lingkungan, atau kriteria lainnya.

AWS Control Tower mendukung API berikut untuk penandaan kontrol:

- `TagResource`—Panggilan API ini menambahkan tag ke kontrol yang diaktifkan di AWS Control Tower.
- `UntagResource`—Panggilan API ini menghapus tag dari kontrol yang diaktifkan di AWS Control Tower.
- `ListTagsForResource`—Panggilan API ini mengembalikan tag untuk kontrol yang diaktifkan di AWS Control Tower.

API kontrol AWS Control Tower tersedia di Wilayah AWS tempat AWS Control Tower tersedia. Untuk daftar lengkap tentang Wilayah AWS AWS Control Tower yang tersedia, lihat Tabel AWS Wilayah. Untuk daftar lengkap AWS Control Tower API, lihat Referensi API.

AWS Control Tower tersedia di Wilayah Asia Pasifik (Melbourne)

November 3, 2023

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

AWS Control Tower tersedia di Wilayah Asia Pasifik (Melbourne).

Jika Anda sudah menggunakan AWS Control Tower dan ingin memperluas fitur tata kelola ke Wilayah ini di akun Anda, buka halaman Pengaturan di dasbor AWS Control Tower, pilih Wilayah, lalu perbarui landing zone Anda. Setelah pembaruan landing zone, Anda harus memperbarui semua akun yang diatur oleh AWS Control Tower, untuk membawa akun dan OU Anda di bawah tata kelola di Wilayah baru. Untuk informasi selengkapnya, lihat Tentang Pembaruan.

Untuk daftar lengkap Wilayah di mana AWS Control Tower tersedia, lihat Wilayah AWS Tabel.

Transisi ke jenis produk AWS Service Catalog eksternal baru (fase 1)

Oktober 31, 2023

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

HashiCorp memperbarui lisensi Terraform mereka. Akibatnya, dukungan yang AWS Service Catalog diperbarui untuk produk Terraform Open Source dan menyediakan produk ke jenis produk baru, yang disebut Eksternal.

AWS Control Tower tidak mendukung penyesuaian Account Factory yang bergantung pada jenis produk AWS Service Catalog Eksternal. Untuk menghindari gangguan pada beban kerja dan AWS sumber daya yang ada di akun Anda, ikuti langkah transisi AWS Control Tower dalam urutan yang disarankan ini, sebelum 14 Desember 2023:

1. Tingkatkan Mesin Referensi Terraform Anda yang ada AWS Service Catalog untuk menyertakan dukungan untuk jenis produk Sumber Terbuka Eksternal dan Terraform. Untuk petunjuk tentang memperbarui Mesin Referensi Terraform Anda, tinjau Repositori.AWS Service Catalog GitHub
2. Buka AWS Service Catalog dan duplikat cetak biru Terraform Open Source yang ada untuk menggunakan jenis produk Eksternal yang baru. Jangan hentikan cetak biru Terraform Open Source yang ada.
3. Lanjutkan menggunakan cetak biru Terraform Open Source yang ada untuk membuat atau memperbarui akun di AWS Control Tower.

API kontrol baru tersedia

Oktober 14, 2023

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

AWS Control Tower kini mendukung API tambahan yang dapat Anda gunakan untuk menerapkan dan mengelola kontrol AWS Control Tower, sesuai skala besar. Untuk informasi selengkapnya tentang API kontrol AWS Control Tower, lihat Referensi API.

AWS Control Tower menambahkan API kontrol baru.

- `GetEnabledControl`—Panggilan API memberikan detail tentang kontrol yang diaktifkan.

Kami juga memperbarui API ini:

`ListEnabledControls`—Panggilan API ini mencantumkan kontrol yang diaktifkan oleh AWS Control Tower pada unit organisasi yang ditentukan dan akun yang dikandungnya. Sekarang mengembalikan informasi tambahan dalam suatu `EnabledControlSummary` objek.

Dengan API ini, Anda dapat melakukan beberapa operasi umum secara terprogram. Sebagai contoh:

- Dapatkan daftar semua kontrol yang telah Anda aktifkan dari pustaka kontrol AWS Control Tower.
- Untuk kontrol apa pun yang diaktifkan, Anda bisa mendapatkan informasi tentang Wilayah di mana kontrol didukung, pengenal kontrol (ARN), status drift kontrol, dan ringkasan status kontrol.

API kontrol AWS Control Tower tersedia di Wilayah AWS tempat AWS Control Tower tersedia. Untuk daftar lengkap tentang Wilayah AWS AWS Control Tower yang tersedia, lihat Tabel AWS Wilayah. Untuk daftar lengkap AWS Control Tower API, lihat Referensi API.

AWS Control Tower menambahkan kontrol tambahan

Oktober 5, 2023

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

AWS Control Tower mengumumkan kontrol proaktif dan detektif baru.

Kontrol proaktif di AWS Control Tower diimplementasikan melalui AWS CloudFormation Hooks, yang mengidentifikasi dan memblokir sumber daya yang tidak sesuai sebelum menyediakannya. AWS CloudFormation Kontrol proaktif melengkapi kemampuan kontrol preventif dan detektif yang ada di AWS Control Tower.

Kontrol proaktif baru

- [CT.ATHENA.PR.1] Memerlukan workgroup Amazon Athena untuk mengenkripsi hasil kueri Athena saat istirahat
- [CT.ATHENA.PR.2] Memerlukan workgroup Amazon Athena untuk mengenkripsi hasil kueri Athena saat istirahat dengan kunci (KMS) AWS Key Management Service
- [CT.CLOUDTRAIL.PR.4] Memerlukan penyimpanan data acara AWS CloudTrail Lake untuk mengaktifkan enkripsi saat istirahat dengan AWS KMS kunci
- [CT.DAX.PR.2] Memerlukan klaster Amazon DAX untuk menyebarkan node ke setidaknya tiga Availability Zone
- [CT.EC2.PR.14] Memerlukan volume Amazon EBS yang dikonfigurasi melalui template peluncuran Amazon EC2 untuk mengenkripsi data saat istirahat
- [CT.EKS.PR.2] Memerlukan klaster Amazon EKS untuk dikonfigurasi dengan enkripsi rahasia menggunakan AWS kunci Layanan Manajemen Kunci (KMS)
- [CT.ELASTICLOADBALANCING.PR.14] Memerlukan Network Load Balancer agar penyeimbangan beban lintas zona diaktifkan
- [CT.ELASTICLOADBALANCING.PR.15] Mengharuskan grup target Elastic Load Balancing v2 tidak secara eksplisit menonaktifkan penyeimbangan beban lintas zona
- [CT.EMR.PR.1] Mengharuskan konfigurasi keamanan Amazon EMR (EMR) dikonfigurasi untuk mengenkripsi data saat istirahat di Amazon S3
- [CT.EMR.PR.2] Mengharuskan konfigurasi keamanan Amazon EMR (EMR) dikonfigurasi untuk mengenkripsi data saat istirahat di Amazon S3 dengan kunci AWS KMS
- [CT.EMR.PR.3] Mengharuskan konfigurasi keamanan Amazon EMR (EMR) dikonfigurasi dengan enkripsi disk lokal volume EBS menggunakan kunci AWS KMS
- [CT.EMR.PR.4] Mengharuskan konfigurasi keamanan Amazon EMR (EMR) dikonfigurasi untuk mengenkripsi data dalam perjalanan
- [CT.GLUE.PR.1] Memerlukan pekerjaan AWS Glue untuk memiliki konfigurasi keamanan terkait
- [CT.GLUE.PR.2] Memerlukan konfigurasi keamanan AWS Glue untuk mengenkripsi data di target AWS Amazon S3 menggunakan kunci KMS
- [CT.KMS.PR.2] Mengharuskan kunci AWS KMS asimetris dengan bahan kunci RSA yang digunakan untuk enkripsi memiliki panjang kunci lebih besar dari 2048 bit
- [CT.KMS.PR.3] Memerlukan kebijakan AWS KMS kunci untuk memiliki pernyataan yang membatasi pembuatan AWS KMS hibah untuk layanan AWS

- [CT.LAMBDA.PR.4] Memerlukan izin AWS Lambda lapisan untuk memberikan akses ke AWS organisasi atau AWS akun tertentu
- [CT.LAMBDA.PR.5] Memerlukan URL AWS Lambda fungsi untuk menggunakan otentikasi AWS berbasis IAM
- [CT.LAMBDA.PR.6] Memerlukan kebijakan CORS URL AWS Lambda fungsi untuk membatasi akses ke asal tertentu
- [CT.NEPTUNE.PR.4] Memerlukan cluster DB Amazon Neptunus untuk mengaktifkan ekspor log CloudWatch Amazon untuk log audit
- [CT.NEPTUNE.PR.5] Memerlukan cluster DB Amazon Neptunus untuk mengatur periode retensi cadangan lebih besar dari atau sama dengan tujuh hari
- [CT.REDSHIFT.PR.9] Mengharuskan grup parameter cluster Amazon Redshift dikonfigurasi untuk menggunakan Secure Sockets Layer (SSL) untuk enkripsi data dalam perjalanan

Kontrol proaktif baru ini tersedia dalam komersial di Wilayah AWS mana AWS Control Tower tersedia. Untuk detail selengkapnya tentang kontrol ini, lihatKontrol proaktif. Untuk detail selengkapnya tentang di mana kontrol tersedia, lihatKeterbatasan kontrol.

Kontrol detektif baru

Kontrol baru ditambahkan ke Standar yang Dikelola Layanan Security Hub: AWS Control Tower. Kontrol ini membantu Anda meningkatkan postur tata kelola Anda. Mereka bertindak sebagai bagian dari Security Hub Service-Managed Standard: AWS Control Tower, setelah Anda mengaktifkannya di OU tertentu.

- [SH.Athena.1] Kelompok kerja Athena harus dienkripsi saat istirahat
- [SH.Neptune.1] Cluster DB Neptunus harus dienkripsi saat istirahat
- [SH.Neptune.2] Cluster DB Neptunus harus menerbitkan log audit ke Log CloudWatch
- [SH.Neptune.3] Snapshot cluster DB Neptunus seharusnya tidak bersifat publik
- [SH.Neptune.4] Cluster DB Neptunus harus mengaktifkan perlindungan penghapusan
- [SH.Neptune.5] Cluster DB Neptunus harus mengaktifkan cadangan otomatis
- [SH.Neptune.6] Snapshot cluster DB Neptunus harus dienkripsi saat istirahat
- [SH.Neptune.7] Cluster DB Neptunus harus mengaktifkan otentikasi basis data IAM
- [SH.Neptune.8] Cluster DB Neptunus harus dikonfigurasi untuk menyalin tag ke snapshot
- [SH.RDS.27] Cluster RDS DB harus dienkripsi saat istirahat

Kontrol AWS Security Hub detektif baru tersedia di sebagian besar Wilayah AWS tempat AWS Control Tower tersedia. Untuk detail selengkapnya tentang kontrol ini, lihat Kontrol yang berlaku untuk Service-Managed Standard: AWS Control Tower. Untuk detail selengkapnya tentang di mana kontrol tersedia, lihatKeterbatasan kontrol.

Jenis drift baru dilaporkan: akses tepercaya dinonaktifkan

September 21, 2023

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

Setelah menyiapkan zona landing zone AWS Control Tower, Anda dapat menonaktifkan akses tepercaya ke AWS Control Tower AWS Organizations. Namun, hal itu menyebabkan penyimpangan.

Dengan tipe drift yang dinonaktifkan akses tepercaya, AWS Control Tower memberi tahu Anda kapan jenis drift ini terjadi, sehingga Anda dapat memperbaiki zona landing zone AWS Control Tower. Untuk informasi selengkapnya, lihat Jenis penyimpangan tata kelola.

Empat tambahan Wilayah AWS

September 13, 2023

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

AWS Control Tower sekarang tersedia di Asia Pasifik (Hyderabad), Eropa (Spanyol dan Zurich), dan Timur Tengah (UEA).

Jika Anda sudah menggunakan AWS Control Tower dan ingin memperluas fitur tata kelola ke Wilayah ini di akun Anda, buka halaman Pengaturan di dasbor AWS Control Tower, pilih Wilayah, lalu perbarui landing zone Anda. Setelah pembaruan landing zone, Anda harus memperbarui semua akun yang diatur oleh AWS Control Tower, untuk membawa akun dan OU Anda di bawah tata kelola di Wilayah baru. Untuk informasi selengkapnya, lihat Tentang Pembaruan.

Untuk daftar lengkap Wilayah di mana AWS Control Tower tersedia, lihat Wilayah AWS Tabel.

AWS Control Tower tersedia di Wilayah Tel Aviv

Agustus 28, 2023

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

AWS Control Tower mengumumkan ketersediaan di Wilayah Israel (Tel Aviv).

Jika Anda sudah menggunakan AWS Control Tower dan ingin memperluas fitur tata kelola ke Wilayah ini di akun Anda, buka halaman Pengaturan di dasbor AWS Control Tower, pilih Wilayah, lalu perbarui landing zone Anda. Setelah pembaruan landing zone, Anda harus memperbarui semua akun yang diatur oleh AWS Control Tower, untuk membawa akun dan OU Anda di bawah tata kelola di Wilayah baru. Untuk informasi selengkapnya, lihat Tentang Pembaruan.

Untuk daftar lengkap Wilayah di mana AWS Control Tower tersedia, lihat Wilayah AWS Tabel.

AWS Control Tower meluncurkan 28 kontrol proaktif baru

Juli 24, 2023

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

AWS Control Tower menambahkan 28 kontrol proaktif baru, untuk membantu Anda mengelola AWS lingkungan.

Kontrol proaktif meningkatkan kemampuan tata kelola AWS Control Tower di seluruh AWS lingkungan multi-akun Anda, dengan memblokir sumber daya yang tidak sesuai sebelum disediakan. Kontrol ini membantu mengelola AWS layanan seperti Amazon CloudWatch, Amazon Neptunus, Amazon, dan ElastiCache AWS Step Functions Amazon DocumentDB. Kontrol baru membantu Anda memenuhi tujuan kontrol seperti membuat pencatatan dan pemantauan, mengenkripsi data saat istirahat, atau meningkatkan ketahanan.

Berikut adalah daftar lengkap kontrol baru:

- [CT.APPSYNC.PR.1] Memerlukan GraphQL API agar logging diaktifkan AWS AppSync
- [CT.CLOUDWATCH.PR.1] Memerlukan alarm CloudWatch Amazon agar tindakan dikonfigurasi untuk status alarm
- [CT.CLOUDWATCH.PR.2] Memerlukan grup log CloudWatch Amazon untuk dipertahankan setidaknya selama satu tahun
- [CT.CLOUDWATCH.PR.3] Memerlukan grup log CloudWatch Amazon untuk dienkripsi saat istirahat dengan kunci KMS AWS
- [CT.CLOUDWATCH.PR.4] Memerlukan tindakan alarm Amazon untuk diaktifkan CloudWatch
- [CT.DOCUMENTDB.PR.1] Memerlukan cluster Amazon DocumentDB untuk dienkripsi saat istirahat
- [CT.DOCUMENTDB.PR.2] Memerlukan cluster Amazon DocumentDB agar pencadangan otomatis diaktifkan

- [CT.DYNAMODB.PR.2] Memerlukan tabel Amazon DynamoDB untuk dienkripsi saat istirahat menggunakan kunci AWS KMS
- [CT.EC2.PR.13] Memerlukan instans Amazon EC2 agar pemantauan terperinci diaktifkan
- [CT.EKS.PR.1] Memerlukan klaster Amazon EKS untuk dikonfigurasi dengan akses publik yang dinonaktifkan ke titik akhir server API Kubernetes cluster
- [CT.ELASTICACHE.PR.1] Memerlukan Amazon untuk cluster Redis agar cadangan otomatis diaktifkan ElastiCache
- [CT.ELASTICACHE.PR.2] Memerlukan ElastiCache Amazon untuk cluster Redis agar upgrade versi minor otomatis diaktifkan
- [CT.ELASTICACHE.PR.3] Memerlukan ElastiCache Amazon untuk grup replikasi Redis agar failover otomatis diaktifkan
- [CT.ELASTICACHE.PR.4] Memerlukan grup replikasi Amazon ElastiCache untuk mengaktifkan enkripsi saat istirahat
- [CT.ELASTICACHE.PR.5] Memerlukan ElastiCache Amazon untuk grup replikasi Redis agar enkripsi saat transit diaktifkan
- [CT.ELASTICACHE.PR.6] Memerlukan cluster cache Amazon ElastiCache untuk menggunakan grup subnet khusus
- [CT.ELASTICACHE.PR.7] Memerlukan grup replikasi ElastiCache Amazon dari versi Redis sebelumnya untuk memiliki otentikasi Redis AUTH
- [CT.ELASTICBEANSTALK.PR.3] Memerlukan lingkungan Elastic Beanstalk untuk memiliki konfigurasi logging AWS
- [CT.LAMBDA.PR.3] Memerlukan AWS Lambda fungsi untuk berada di Amazon Virtual Private Cloud (VPC) yang dikelola pelanggan
- [CT.NEPTUNE.PR.1] Memerlukan cluster DB Amazon Neptunus untuk memiliki otentikasi basis data (IAM) AWS Identity and Access Management
- [CT.NEPTUNE.PR.2] Memerlukan cluster DB Amazon Neptunus agar perlindungan penghapusan diaktifkan
- [CT.NEPTUNE.PR.3] Memerlukan cluster DB Amazon Neptunus agar enkripsi penyimpanan diaktifkan
- [CT.REDSHIFT.PR.8] Memerlukan cluster Amazon Redshift untuk dienkripsi
- [CT.S3.PR.9] Mengharuskan bucket Amazon S3 mengaktifkan Kunci Objek S3
- [CT.S3.PR.10] Memerlukan bucket Amazon S3 agar enkripsi sisi server dikonfigurasi menggunakan kunci AWS KMS

- [CT.S3.PR.11] Memerlukan bucket Amazon S3 agar versi diaktifkan
- [CT.STEPFUNCTIONS.PR.1] Memerlukan mesin status agar logging diaktifkan AWS Step Functions
- [CT.STEPFUNCTIONS.PR.2] Memerlukan mesin status agar penelusuran diaktifkan AWS Step Functions AWS X-Ray

Kontrol proaktif di AWS Control Tower diimplementasikan melalui AWS CloudFormation Hooks, yang mengidentifikasi dan memblokir sumber daya yang tidak sesuai sebelum menyediakannya. AWS CloudFormation Kontrol proaktif melengkapi kemampuan kontrol preventif dan detektif yang ada di AWS Control Tower.

Kontrol proaktif baru ini tersedia di semua Wilayah AWS tempat AWS Control Tower tersedia. Untuk detail selengkapnya tentang kontrol ini, lihatKontrol proaktif.

AWS Control Tower menghentikan dua kontrol

Juli 18, 2023

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

AWS Control Tower melakukan tinjauan rutin terhadap kontrol keamanannya untuk memastikan bahwa kontrol tersebut mutakhir dan masih dianggap sebagai praktik terbaik. Dua kontrol berikut telah usang, efektif 18 Juli 2023, dan mereka akan dihapus dari pustaka kontrol, efektif 18 Agustus 2023. Anda tidak dapat lagi mengaktifkan kontrol ini pada unit organisasi mana pun. Anda dapat memilih untuk menonaktifkan kontrol ini sebelum tanggal penghapusan.

- [SH.S3.4] Bucket S3 harus mengaktifkan enkripsi sisi server
- [CT.S3.PR.7] Memerlukan bucket Amazon S3 agar enkripsi sisi server dikonfigurasi

Alasan penghentian

Mulai Januari 2023, Amazon S3 mengonfigurasi enkripsi default pada semua bucket tidak terenkripsi baru dan yang sudah ada untuk menerapkan enkripsi sisi server dengan kunci terkelola S3 (SSE-S3) sebagai tingkat dasar enkripsi untuk objek baru yang diunggah ke bucket ini. Tidak ada perubahan yang dilakukan pada konfigurasi enkripsi default untuk bucket yang sudah ada yang sudah memiliki enkripsi SSE-S3 atau sisi server dengan AWS kunci Key Management Service (AWS KMS) (SSE-KMS) yang dikonfigurasi.

AWS Control Tower landing zone versi 3.2

Juni 16, 2023

(Pembaruan diperlukan untuk landing zone AWS Control Tower ke versi 3.2. Untuk informasi, lihatPerbarui Zona Pendaratan Anda).

AWS Control Tower landing zone versi 3.2 menghadirkan kontrol yang merupakan bagian dari Standar yang AWS Security Hub Dikelola Layanan: AWS Control Tower ke ketersediaan umum. Ini memperkenalkan kemampuan untuk melihat status drift kontrol yang merupakan bagian dari standar ini di konsol AWS Control Tower.

Pembaruan ini mencakup peran terkait layanan (SLR) baru, yang disebut. AWSServiceRoleForAWSControlTower Peran ini membantu AWS Control Tower dengan membuat Aturan EventBridge Terkelola, yang disebut AWSControlTowerManagedRuledi setiap akun anggota. Aturan terkelola ini mengumpulkan peristiwa AWS Security Hub Finding, dari AWS Control Tower dapat menentukan penyimpangan kontrol.

Aturan ini adalah aturan terkelola pertama yang dibuat oleh AWS Control Tower. Aturan tidak digunakan oleh tumpukan; itu diterapkan langsung dari API. EventBridge Anda dapat melihat aturan di EventBridge konsol, atau melalui EventBridge API. Jika `managed-by` bidang diisi, itu akan menampilkan prinsip layanan AWS Control Tower.

Sebelumnya, AWS Control Tower AWSControlTowerExecutionberperan untuk melakukan operasi di akun anggota. Peran dan aturan baru ini lebih selaras dengan prinsip praktik terbaik yang memungkinkan hak istimewa paling sedikit saat melakukan operasi di lingkungan AWS multi-akun. Peran baru ini memberikan izin cakupan ke bawah yang secara khusus memungkinkan: membuat aturan terkelola di akun anggota, mempertahankan aturan terkelola, menerbitkan pemberitahuan keamanan melalui SNS, dan memverifikasi penyimpangan. Untuk informasi selengkapnya, lihat AWSServiceRoleForAWSControlTower.

Pembaruan landing zone 3.2 juga menyertakan StackSet sumber daya baru di akun manajemen`BP_BASELINE_SERVICE_LINKED_ROLE`, yang awalnya menyebarkan peran terkait layanan.

Saat melaporkan drift kontrol Security Hub (di landing zone 3.2 dan versi lebih baru), AWS Control Tower menerima pembaruan status harian dari Security Hub. Meskipun kontrol aktif di setiap Wilayah yang diatur, AWS Control Tower mengirimkan peristiwa AWS Security Hub Finding ke Wilayah home AWS Control Tower saja. Untuk informasi selengkapnya, lihat Security Hub mengontrol pelaporan drift.

Perbarui ke kontrol Tolak Wilayah

Versi landing zone ini juga menyertakan pembaruan ke kontrol Region Deny.

Layanan global dan API ditambahkan

- AWS Billing and Cost Management (`billing:*`)
- AWS CloudTrail (`cloudtrail:LookupEvents`) untuk memungkinkan visibilitas peristiwa global di akun anggota.
- AWS Penagihan Konsolidasi () `consolidatedbilling:*`
- AWS Aplikasi Mobile Console Manajemen (`consoleapp:*`)
- AWS Tingkat Gratis (`freetier:*`)
- AWS Invoicing (`invoicing:*`)
- AWS IQ () `iq:*`
- AWS Pemberitahuan Pengguna (`notifications:*`)
- AWS Kontak Pemberitahuan Pengguna (`notifications-contacts:*`)
- Amazon Payments (`payments:*`)
- AWS Pengaturan Pajak (`tax:*`)

Layanan global dan API dihapus

- Dihapus `s3:GetAccountPublic` karena ini bukan tindakan yang valid.
- Dihapus `s3:PutAccountPublic` karena ini bukan tindakan yang valid.

AWS Control Tower menangani akun berdasarkan ID

Juni 14, 2023

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

AWS Control Tower kini membuat dan mengelola akun yang Anda buat di AWS Account Factory dengan melacak ID akun, bukan alamat email akun.

Saat menyediakan akun, pemohon akun selalu harus memiliki `CreateAccount` dan izin. `DescribeCreateAccountStatus` Set izin ini adalah bagian dari peran Admin, dan diberikan

secara otomatis ketika pemohon mengasumsikan peran Admin. Jika Anda mendelegasikan izin ke akun penyediaan, Anda mungkin perlu menambahkan izin ini secara langsung untuk pemohon akun.

Kontrol detektif Security Hub tambahan tersedia di pustaka kontrol AWS Control Tower

12 Juni 2023

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

AWS Control Tower telah menambahkan sepuluh kontrol AWS Security Hub detektif baru ke perpustakaan kontrol AWS Control Tower. Kontrol baru ini menargetkan layanan seperti API Gateway AWS CodeBuild, Amazon Elastic Compute Cloud (EC2), Amazon Elastic Load Balancer, Amazon Redshift, Amazon, dan. SageMaker AWS WAF Kontrol baru ini membantu Anda meningkatkan postur tata kelola dengan memenuhi tujuan kontrol, seperti Menetapkan pencatatan dan pemantauan, Batasi akses jaringan, dan Enkripsi data saat istirahat.

Kontrol ini bertindak sebagai bagian dari Standar yang Dikelola Layanan Security Hub: AWS Control Tower, setelah Anda mengaktifkannya di OU tertentu.

- [SH.Account.1] Informasi kontak keamanan harus disediakan untuk Akun AWS
- [Sh.apigateway.8] Rute API Gateway harus menentukan jenis otorisasi
- [Sh.apigateway.9] Pencatatan akses harus dikonfigurasi untuk Tahapan API Gateway V2
- [SH. CodeBuild.3] CodeBuild Log S3 harus dienkripsi
- [SH.EC2.25] Template peluncuran EC2 tidak boleh menetapkan IP publik ke antarmuka jaringan
- [SH.ELB.1] Application Load Balancer harus dikonfigurasi untuk mengalihkan semua permintaan HTTP ke HTTPS
- [Sh.Redshift.10] Cluster Redshift harus dienkripsi saat istirahat
- [SH. SageMaker.2] instance SageMaker notebook harus diluncurkan dalam VPC khusus
- [SH. SageMaker.3] Pengguna seharusnya tidak memiliki akses root ke instance SageMaker notebook
- [SH.WAF.10] ACL web WAFV2 harus memiliki setidaknya satu aturan atau kelompok aturan

Kontrol AWS Security Hub detektif baru tersedia di semua Wilayah AWS tempat AWS Control Tower tersedia. Untuk detail selengkapnya tentang kontrol ini, lihat Kontrol yang berlaku untuk Service-Managed Standard: AWS Control Tower.

AWS Control Tower menerbitkan tabel metadata kontrol

Juni 7, 2023

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

AWS Control Tower sekarang menyediakan tabel lengkap metadata kontrol sebagai bagian dari dokumentasi yang diterbitkan. Saat bekerja dengan API kontrol, Anda dapat mencari ControliDentifier API masing-masing kontrol, yang merupakan ARN unik yang terkait dengan masing-masing. Wilayah AWS Tabel mencakup kerangka kerja dan tujuan kontrol yang dicakup oleh setiap kontrol. Sebelumnya, informasi ini hanya tersedia di konsol.

Tabel juga menyertakan metadata untuk kontrol Security Hub yang merupakan bagian dari AWS Security Hub Service-Managed Standard:AWS Control Tower. Untuk detail selengkapnya, lihatTabel metadata kontrol.

Untuk daftar singkat pengidentifikasi kontrol, dan beberapa contoh penggunaan, lihat. Pengidentifikasi sumber daya untuk API dan kontrol

Dukungan Terraform untuk Kustomisasi Account Factory

Juni 6, 2023

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

AWS Control Tower menawarkan dukungan wilayah tunggal untuk Terraform melalui Kustomisasi Account Factory (AFC). Dimulai dengan rilis ini, Anda dapat menggunakan AWS Control Tower dan Service Catalog bersama-sama, untuk menentukan cetak biru akun AFC, di open source Terraform. Anda dapat menyesuaikan yang baru dan yang sudah ada Akun AWS, sebelum Anda menyediakan sumber daya di AWS Control Tower. Secara default, fitur ini memungkinkan Anda untuk menerapkan dan memperbarui akun, dengan Terraform, di Wilayah home AWS Control Tower Anda.

Cetak biru akun menjelaskan sumber daya dan konfigurasi spesifik yang diperlukan saat disediakan. Akun AWS Anda dapat menggunakan cetak biru sebagai templat untuk membuat beberapa Akun AWS dalam skala besar.

Untuk memulai, gunakan Mesin Referensi Terraform aktif. GitHub Mesin Referensi mengonfigurasi kode dan infrastruktur yang diperlukan agar mesin open source Terraform dapat bekerja dengan Service Catalog. Proses penyiapan satu kali ini membutuhkan waktu beberapa menit. Setelah itu, Anda dapat menentukan persyaratan akun khusus Anda di Terraform, lalu menerapkan akun Anda dengan alur kerja pabrik akun AWS Control Tower yang terdefinisi dengan baik. Pelanggan

yang lebih suka bekerja dengan Terraform dapat menggunakan kustomisasi akun AWS Control Tower dalam skala besar dengan AFC, dan mendapatkan akses langsung ke setiap akun setelah disediakan.

Untuk mempelajari cara membuat kustomisasi ini, lihat Membuat Produk dan Memulai Terraform open source di dokumentasi Service Catalog. Fitur ini tersedia di semua Wilayah AWS tempat AWS Control Tower tersedia.

AWS Manajemen mandiri IAM Identity Center tersedia untuk landing zone

Juni 6, 2023

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

AWS Control Tower kini mendukung pilihan penyedia identitas opsional untuk landing zone AWS Control Tower, yang dapat Anda konfigurasikan selama penyiapan atau pembaruan. Secara default, landing zone dipilih untuk menggunakan AWS IAM Identity Center, selaras dengan panduan praktik terbaik yang ditentukan dalam Mengatur Lingkungan Anda Menggunakan Beberapa Akun. AWS Anda sekarang memiliki tiga alternatif:

- Anda dapat menerima default dan mengizinkan AWS Control Tower menyiapkan dan mengelola Pusat Identitas AWS IAM untuk Anda.
- Anda dapat memilih untuk mengelola sendiri Pusat AWS Identitas IAM, untuk mencerminkan kebutuhan bisnis spesifik Anda.
- Anda dapat secara opsional membawa dan mengelola sendiri penyedia identitas pihak ketiga, dengan menghubungkannya melalui IAM Identity Center, jika diperlukan. Anda harus menggunakan opsionalitas penyedia identitas jika lingkungan peraturan Anda mengharuskan Anda untuk menggunakan penyedia tertentu, atau jika Anda beroperasi di Wilayah AWS tempat Pusat Identitas AWS IAM tidak tersedia.

Untuk informasi selengkapnya, lihat Panduan Pusat Identitas IAM.

Pemilihan penyedia identitas di tingkat akun tidak didukung. Fitur ini hanya berlaku untuk landing zone secara keseluruhan. Opsionalitas penyedia identitas AWS Control Tower tersedia di semua Wilayah AWS tempat AWS Control Tower tersedia.

AWS Control Tower menangani tata kelola campuran untuk OU

Juni 1, 2023

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

Dengan rilis ini, AWS Control Tower mencegah kontrol diterapkan ke unit organisasi (OU), jika OU tersebut dalam keadaan tata kelola campuran. Tata kelola campuran terjadi di OU jika akun tidak diperbarui setelah AWS Control Tower memperluas tata kelola ke yang baru Wilayah AWS, atau menghapus tata kelola. Rilis ini membantu Anda menjaga akun anggota OU tersebut dalam kepatuhan yang seragam. Untuk informasi selengkapnya, lihat Hindari tata kelola campuran saat mengonfigurasi Wilayah.

Tersedia kontrol proaktif tambahan

19 Mei 2023

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

AWS Control Tower menambahkan 28 kontrol proaktif baru untuk membantu Anda mengatur lingkungan multi-akun dan memenuhi tujuan kontrol tertentu, seperti enkripsi data saat istirahat, atau membatasi akses jaringan. Kontrol proaktif diimplementasikan dengan AWS CloudFormation kait yang memeriksa sumber daya Anda sebelum disediakan. Kontrol baru dapat membantu mengatur AWS layanan seperti Amazon OpenSearch Service, Amazon EC2 Auto Scaling, Amazon, Amazon SageMaker API Gateway, dan Amazon Relational Database Service (RDS).

Kontrol proaktif didukung di semua iklan di Wilayah AWS mana AWS Control Tower tersedia.

OpenSearch Layanan Amazon

- [CT.OPENSEARCH.PR.1] Memerlukan domain Elasticsearch untuk mengenkripsi data saat istirahat
- [CT.OPENSEARCH.PR.2] Memerlukan domain Elasticsearch untuk dibuat di VPC Amazon yang ditentukan pengguna
- [CT.OPENSEARCH.PR.3] Memerlukan domain Elasticsearch untuk mengenkripsi data yang dikirim antar node
- [CT.OPENSEARCH.PR.4] Memerlukan domain Elasticsearch untuk mengirim log kesalahan ke Amazon Logs CloudWatch
- [CT.OPENSEARCH.PR.5] Memerlukan domain Elasticsearch untuk mengirim log audit ke Amazon Logs CloudWatch
- [CT.OPENSEARCH.PR.6] Memerlukan domain Elasticsearch untuk memiliki kesadaran zona dan setidaknya tiga node data

- [CT.OPENSEARCH.PR.7] Memerlukan domain Elasticsearch untuk memiliki setidaknya tiga node master khusus
- [CT.OPENSEARCH.PR.8] Memerlukan domain Layanan Elasticsearch untuk menggunakan TLSv1.2
- [CT.OPENSEARCH.PR.9] Memerlukan domain Layanan Amazon OpenSearch untuk mengenkripsi data saat istirahat
- [CT.OPENSEARCH.PR.10] Memerlukan domain Layanan Amazon untuk dibuat di OpenSearch VPC Amazon yang ditentukan pengguna
- [CT.OPENSEARCH.PR.11] Memerlukan domain Layanan OpenSearch Amazon untuk mengenkripsi data yang dikirim antar node
- [CT.OPENSEARCH.PR.12] Memerlukan domain Layanan Amazon untuk mengirim log kesalahan ke OpenSearch Amazon Logs CloudWatch
- [CT.OPENSEARCH.PR.13] Memerlukan domain Layanan Amazon untuk mengirim log audit ke OpenSearch Amazon Logs CloudWatch
- [CT.OPENSEARCH.PR.14] Memerlukan domain Layanan OpenSearch Amazon untuk memiliki kesadaran zona dan setidaknya tiga node data
- [CT.OPENSEARCH.PR.15] Memerlukan domain Layanan Amazon OpenSearch untuk menggunakan kontrol akses berbutir halus
- [CT.OPENSEARCH.PR.16] Memerlukan domain Layanan Amazon untuk menggunakan TLSv1.2 OpenSearch

Amazon EC2 Auto Scaling

- [CT.AUTOSCALING.PR.1] Memerlukan grup Auto Scaling Amazon EC2 untuk memiliki beberapa Availability Zone
- [CT.AUTOSCALING.PR.2] Memerlukan konfigurasi peluncuran grup Auto Scaling Amazon EC2 untuk mengonfigurasi instans Amazon EC2 untuk IMDSv2
- [CT.AUTOSCALING.PR.3] Memerlukan konfigurasi peluncuran Auto Scaling Amazon EC2 untuk memiliki batas respons metadata single-hop
- [CT.AUTOSCALING.PR.4] Memerlukan grup Auto Scaling Amazon EC2 yang terkait dengan Amazon Elastic Load Balancing (ELB) agar pemeriksaan kesehatan ELB diaktifkan
- [CT.AUTOSCALING.PR.5] Mengharuskan konfigurasi peluncuran grup Auto Scaling Amazon EC2 tidak memiliki instans Amazon EC2 dengan alamat IP publik

- [CT.AUTOSCALING.PR.6] Memerlukan grup Auto Scaling Amazon EC2 untuk menggunakan beberapa jenis instans
- [CT.AUTOSCALING.PR.8] Memerlukan grup Auto Scaling Amazon EC2 agar templat peluncuran EC2 dikonfigurasi

Amazon SageMaker

- [CT.SAGEMAKER.PR.1] Memerlukan instance notebook Amazon untuk mencegah akses internet langsung SageMaker
- [CT.SAGEMAKER.PR.2] Memerlukan instance notebook Amazon untuk digunakan dalam SageMaker VPC Amazon khusus
- [CT.SAGEMAKER.PR.3] Memerlukan instance notebook Amazon agar akses root tidak diizinkan SageMaker

Amazon API Gateway

- [CT.APIGATEWAY.PR.5] Memerlukan Amazon API Gateway V2 Websocket dan rute HTTP untuk menentukan jenis otorisasi

Amazon Relational Database Service (RDS)

- [CT.RDS.PR.25] Memerlukan kluster basis data Amazon RDS agar logging dikonfigurasi

Untuk informasi selengkapnya, lihat Kontrol proaktif.

Kontrol proaktif Amazon EC2 yang diperbarui

2 Mei 2023

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

AWS Control Tower telah memperbarui dua kontrol proaktif: CT.EC2.PR.3 danCT.EC2.PR.4.

Untuk CT.EC2.PR.3 kontrol yang diperbarui, AWS CloudFormation penerapan apa pun yang mereferensikan daftar awalan untuk sumber daya grup keamanan diblokir dari penerapan, kecuali untuk port 80 atau 443.

Untuk CT.EC2.PR.4 kontrol yang diperbarui, AWS CloudFormation penyebaran apa pun yang mereferensikan daftar awalan untuk sumber daya grup keamanan diblokir jika port 3389, 20, 23, 110, 143, 3306, 8080, 1433, 9200, 9300, 25, 445, 135, 135, 21, 1434, 4333, 5432, 5500, 5500, 5601, 22, 3000, 5000, 8088, 8888.

Tujuh tambahan Wilayah AWS tersedia

April 19, 2023

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

AWS Control Tower sekarang tersedia dalam tujuh tambahan Wilayah AWS: California Utara (San Francisco), Asia Pasifik (Hong Kong, Jakarta, dan Osaka), Eropa (Milan), Timur Tengah (Bahrain), dan Afrika (Cape Town). Wilayah tambahan untuk AWS Control Tower ini, yang disebut Wilayah keikutsertaan, tidak aktif secara default, kecuali Wilayah AS Barat (California Utara), yang aktif secara default.

Beberapa kontrol di AWS Control Tower tidak beroperasi di beberapa tambahan ini Wilayah AWS jika AWS Control Tower tersedia, karena Wilayah tersebut tidak mendukung fungsionalitas dasar yang diperlukan. Untuk detailnya, lihat Keterbatasan kontrol.

Di antara wilayah-wilayah baru ini, CFCT tidak tersedia di Asia Pasifik (Jakarta dan Osaka). Ketersediaan di tempat lain Wilayah AWS tidak berubah.

Untuk informasi selengkapnya tentang cara AWS Control Tower mengelola batasan Wilayah dan kontrol, lihatPertimbangan untuk mengaktifkan AWS Wilayah keikutsertaan.

Titik akhir VPCe yang diperlukan oleh AFT tidak tersedia di Wilayah Timur Tengah (Bahrain). Pelanggan yang menerapkan AFT di Wilayah ini diharuskan untuk menerapkan dengan parameter. `aft_vpc_endpoints=false` Untuk informasi selengkapnya, lihat parameter dalam file README.

AWS Control Tower VPC memiliki dua Availability Zone di Wilayah AS Barat (California N.)`us-west-1`, karena keterbatasan di Amazon EC2. Di AS Barat (California Utara), enam subnet dibagi menjadi dua Availability Zone. Untuk informasi selengkapnya, lihat Ikhtisar AWS Control Tower dan VPC.

AWS Control Tower menambahkan izin baru `AWSControlTowerServiceRolePolicy` yang memungkinkan AWS Control Tower melakukan panggilan ke`EnableRegion`,`ListRegions`, dan `GetRegionOptStatus` API yang diterapkan oleh layanan Manajemen AWS Akun, agar tambahan

ini Wilayah AWS tersedia untuk akun bersama Anda di landing zone (Akun manajemen, akun arsip Log, akun Audit), dan akun anggota OU Anda. Untuk informasi selengkapnya, lihat Kebijakan terkelola untuk AWS Control Tower.

Account Factory untuk penelusuran permintaan kustomisasi akun Terraform (AFT)

Februari 16, 2023

AFT mendukung penelusuran permintaan kustomisasi akun. Setiap kali Anda mengirimkan permintaan kustomisasi akun, AFT menghasilkan token penelusuran unik yang melewati mesin AWS Step Functions status kustomisasi AFT, yang mencatat token sebagai bagian dari pelaksanaannya. Anda dapat menggunakan kueri wawasan Amazon CloudWatch Logs untuk mencari rentang stempel waktu dan mengambil token permintaan. Akibatnya, Anda dapat melihat muatan yang menyertai token, sehingga Anda dapat melacak permintaan penyesuaian akun Anda di seluruh alur kerja AFT. Untuk informasi selengkapnya tentang AFT, lihat Ikhtisar AWS Control Tower Account Factory untuk Terraform. Untuk informasi tentang CloudWatch Log dan Step Functions, lihat berikut ini:

- Apa itu Amazon CloudWatch Logs? di Panduan Pengguna CloudWatch Log Amazon
- Apa itu AWS Step Functions? di Panduan AWS Step Functions Pengembang

AWS Control Tower landing zone versi 3.1

9 Februari 2023

(Pembaruan diperlukan untuk landing zone AWS Control Tower ke versi 3.1. Untuk informasi, lihatPerbarui Zona Pendaratan Anda)

AWS Control Tower landing zone versi 3.1 mencakup pembaruan berikut:

- Dengan rilis ini, AWS Control Tower menonaktifkan pencatatan akses yang tidak perlu untuk bucket logging akses Anda, yang merupakan bucket Amazon S3 tempat log akses disimpan di akun Arsip Log, sambil terus mengaktifkan pencatatan akses server untuk bucket S3. Rilis ini juga mencakup pembaruan pada kontrol Region Deny yang memungkinkan tindakan tambahan untuk layanan global, seperti AWS Support Paket dan AWS Artifact.
- Penonaktifan pencatatan akses server untuk bucket logging akses AWS Control Tower menyebabkan Security Hub membuat temuan untuk bucket logging akses akun Arsip Log, karena AWS Security Hub aturan, pencatatan akses server bucket [S3.9] S3 harus diaktifkan. Sejalan

dengan Security Hub, sebaiknya Anda menekan temuan khusus ini, seperti yang dinyatakan dalam deskripsi Security Hub dari aturan ini. Untuk informasi tambahan, lihat informasi tentang temuan yang ditekan.

- Pencatatan akses untuk bucket logging (reguler) di akun Arsip Log tidak berubah di versi 3.1. Sejalan dengan praktik terbaik, peristiwa akses untuk bucket tersebut direkam sebagai entri log di bucket logging akses. Untuk informasi selengkapnya tentang pencatatan akses, lihat Permintaan logging menggunakan pencatatan akses server di dokumentasi Amazon S3.
- Kami membuat pembaruan kontrol Region Deny. Pembaruan ini memungkinkan tindakan oleh lebih banyak layanan global. Untuk detail SCP ini, lihat Tolak akses AWS berdasarkan AWS Wilayah yang diminta danKontrol yang meningkatkan perlindungan residensi data.

  Layanan global menambahkan:

  - AWS Account Management (`account:*`)
  - AWS Aktifkan (`activate:*`)
  - AWS Artifact (`artifact:*`)
  - AWS Billing Conductor (`billingconductor:*`)
  - AWS Compute Optimizer (`compute-optimizer:*`)
  - AWS Data Pipeline (`datapipeline:GetAccountLimits`)
  - AWS Device Farm(`devicefarm:*`)
  - AWS Marketplace (`discovery-marketplace:*`)
  - Amazon ECR () `ecr-public:*`
  - AWS License Manager (`license-manager:ListReceivedLicenses`)
  - AWS Lightsail () `lightsail:Get*`
  - Penjelajah Sumber Daya AWS (`resource-explorer-2:*`)
  - Amazon S3 (`s3:CreateMultiRegionAccessPoint`,,`s3:GetBucketPolicyStatus`) `s3:PutMultiRegionAccessPointPolicy`
  - AWS Savings Plans (`savingsplans:*`)
  - Pusat Identitas IAM () `sso:*`
  - AWS Support App (`supportapp:*`)
  - AWS Support Rencana (`supportplans:*`)
  - AWS Keberlanjutan () `sustainability:*`
  - AWS Resource Groups Tagging API (`tag:GetResources`)

- AWS Marketplace Wawasan Vendor () `vendor-insights:ListEntitledSecurityProfiles`

Kontrol proaktif umumnya tersedia

Januari 24, 2023

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

Kontrol proaktif opsional, yang sebelumnya diumumkan dalam status pratinjau, sekarang tersedia secara umum. Kontrol ini disebut sebagai proaktif karena mereka memeriksa sumber daya Anda — sebelum sumber daya digunakan — untuk menentukan apakah sumber daya baru mematuhi kontrol yang diaktifkan di lingkungan Anda. Untuk informasi selengkapnya, lihat Kontrol komprehensif membantu dalam penyediaan dan manajemen AWS sumber daya.

Januari - Desember 2022

Pada tahun 2022, AWS Control Tower merilis pembaruan berikut:

- Operasi akun bersamaan
- Kustomisasi Account Factory (AFC)
- Kontrol komprehensif membantu dalam penyediaan dan manajemen AWS sumber daya
- Status kepatuhan dapat dilihat untuk semua AWS Config aturan
- API untuk kontrol dan sumber AWS CloudFormation daya baru
- CFCT mendukung penghapusan set tumpukan
- Retensi log yang disesuaikan
- Perbaikan drift peran tersedia
- AWS Control Tower landing zone versi 3.0
- Halaman Organisasi menggabungkan tampilan OU dan akun
- Mendaftar dan memperbarui akun anggota individu yang lebih mudah
- AFT mendukung kustomisasi otomatis untuk akun AWS Control Tower bersama
- Operasi bersamaan untuk semua kontrol opsional
- Akun keamanan dan pencatatan yang ada

- AWS Control Tower landing zone versi 2.9
- AWS Control Tower landing zone versi 2.8

Operasi akun bersamaan

Desember 16, 2022

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

AWS Control Tower sekarang mendukung tindakan bersamaan di pabrik akun. Anda dapat membuat, memperbarui, atau mendaftarkan hingga lima (5) akun sekaligus. Kirim hingga lima tindakan berturut-turut dan lihat status penyelesaian setiap permintaan, sementara akun Anda selesai dibangun di latar belakang. Misalnya, Anda tidak lagi harus menunggu setiap proses selesai sebelum memperbarui akun lain, atau sebelum Anda mendaftarkan ulang seluruh unit organisasi (OU).

Kustomisasi Account Factory (AFC)

November 28, 2022

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

Kustomisasi pabrik akun memungkinkan Anda menyesuaikan akun baru dan yang sudah ada dari dalam konsol AWS Control Tower. Kemampuan kustomisasi baru ini memberi Anda fleksibilitas untuk menentukan cetak biru akun, yang merupakan AWS CloudFormation templat yang terdapat dalam produk Service Catalog khusus. Cetak biru menyediakan sumber daya dan konfigurasi yang sepenuhnya disesuaikan. Anda juga dapat memilih menggunakan cetak biru yang telah ditentukan sebelumnya, dibuat dan dikelola oleh AWS mitra, yang membantu Anda menyesuaikan akun untuk kasus penggunaan tertentu.

Sebelumnya, pabrik akun AWS Control Tower tidak mendukung kustomisasi akun di konsol. Dengan pembaruan pabrik akun ini, Anda dapat menentukan persyaratan akun sebelumnya dan menerapkannya sebagai bagian dari alur kerja yang terdefinisi dengan baik. Anda dapat menerapkan cetak biru untuk membuat akun baru, mendaftarkan akun lain ke AWS Control Tower, dan memperbarui AWS akun AWS Control Tower yang ada.

Saat Anda menyediakan, mendaftarkan, atau memperbarui akun di pabrik akun, Anda akan memilih cetak biru yang akan diterapkan. Sumber daya yang ditentukan dalam cetak biru disediakan di akun Anda. Ketika akun Anda telah selesai dibangun, semua konfigurasi kustom tersedia untuk digunakan segera.

Untuk memulai dengan menyesuaikan akun, Anda dapat menentukan sumber daya untuk kasus penggunaan yang dimaksudkan dalam produk Service Catalog. Anda juga dapat memilih solusi yang dikelola mitra dari Perpustakaan AWS Memulai. Untuk informasi selengkapnya, lihat Kustomisasi akun dengan Kustomisasi Account Factory (AFC).

Kontrol komprehensif membantu dalam penyediaan dan manajemen AWS sumber daya

November 28, 2022

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

AWS Control Tower sekarang mendukung manajemen kontrol yang komprehensif, termasuk kontrol proaktif opsional baru, yang diimplementasikan melalui AWS CloudFormation kait. Kontrol ini disebut sebagai proaktif karena mereka memeriksa sumber daya Anda — sebelum sumber daya digunakan — untuk menentukan apakah sumber daya baru akan mematuhi kontrol yang diaktifkan di lingkungan Anda.

Lebih dari 130 kontrol proaktif baru membantu Anda memenuhi tujuan kebijakan spesifik untuk lingkungan AWS Control Tower Anda; dengan memenuhi persyaratan kerangka kerja kepatuhan standar industri; dan dengan mengatur interaksi AWS Control Tower di lebih dari dua puluh layanan lainnya. AWS

Pustaka kontrol AWS Control Tower mengklasifikasikan kontrol ini menurut AWS layanan dan sumber daya terkait. Untuk detail selengkapnya, lihat Kontrol proaktif.

Dengan rilis ini, AWS Control Tower juga terintegrasi dengan AWS Security Hub, melalui Security Hub Service-Managed Standard yang baru: AWS Control Tower, yang mendukung standar AWS Foundational Security Best Practices (FSBP). Anda dapat melihat lebih dari 160 kontrol Security Hub bersama kontrol AWS Control Tower di konsol, dan Anda dapat memperoleh skor keamanan Security Hub untuk lingkungan AWS Control Tower Anda. Untuk informasi selengkapnya, lihat Standar Security Hub.

Status kepatuhan dapat dilihat untuk semua AWS Config aturan

November 18, 2022

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

AWS Control Tower sekarang menampilkan status kepatuhan semua AWS Config aturan yang diterapkan ke unit organisasi yang terdaftar di AWS Control Tower. Anda dapat melihat status

kepatuhan semua AWS Config aturan yang memengaruhi akun Anda di AWS Control Tower, terdaftar atau tidak terdaftar, tanpa menavigasi di luar konsol AWS Control Tower. Pelanggan dapat memilih untuk mengatur aturan Config, yang disebut kontrol detektif, di AWS Control Tower, atau mengaturnya secara langsung melalui layanan. AWS Config Aturan yang diterapkan oleh AWS Config ditampilkan, bersama dengan aturan yang diterapkan oleh AWS Control Tower.

Sebelumnya, AWS Config aturan yang diterapkan melalui AWS Config layanan tidak terlihat di konsol AWS Control Tower. Pelanggan harus menavigasi ke AWS Config layanan untuk mengidentifikasi aturan yang tidak sesuai. AWS Config Sekarang Anda dapat mengidentifikasi AWS Config aturan yang tidak sesuai dalam konsol AWS Control Tower. Untuk melihat status kepatuhan semua aturan Config Anda, buka halaman Detail Akun di konsol AWS Control Tower. Anda akan melihat daftar yang menunjukkan status kepatuhan kontrol yang dikelola oleh AWS Control Tower dan aturan Config yang diterapkan di luar AWS Control Tower.

API untuk kontrol dan sumber AWS CloudFormation daya baru

September 1, 2022

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

AWS Control Tower sekarang mendukung manajemen kontrol terprogram, juga dikenal sebagai pagar pembatas, melalui serangkaian panggilan API. AWS CloudFormation Sumber daya baru mendukung fungsionalitas API untuk kontrol. Untuk lebih jelasnya, lihat Mengotomatiskan tugas di AWS Control Tower dan Menciptakan AWS Control Tower sumber daya dengan AWS CloudFormation.

API ini memungkinkan Anda mengaktifkan, menonaktifkan, dan melihat status aplikasi kontrol di pustaka AWS Control Tower. API menyertakan dukungan untuk AWS CloudFormation, sehingga Anda dapat mengelola AWS sumber daya sebagai infrastructure-as-code (IAc). AWS Control Tower menyediakan kontrol preventif dan detektif opsional yang menyatakan maksud kebijakan Anda mengenai seluruh unit organisasi (OU), dan setiap AWS akun dalam OU. Aturan ini tetap berlaku saat Anda membuat akun baru atau membuat perubahan pada akun yang ada.

API yang disertakan dalam rilis ini

- EnableControl— Panggilan API ini mengaktifkan kontrol. Ini memulai operasi asinkron yang menciptakan AWS sumber daya pada unit organisasi yang ditentukan dan akun yang dikandungnya.
- DisableControl— Panggilan API ini mematikan kontrol. Ini memulai operasi asinkron yang menghapus AWS sumber daya pada unit organisasi tertentu dan akun yang dikandungnya.

- GetControlOperation— Mengembalikan status tertentu EnableControlatau DisableControloperasi.
- ListEnabledControls— Daftar kontrol yang diaktifkan oleh AWS Control Tower pada unit organisasi yang ditentukan dan akun yang dikandungnya.

Untuk melihat daftar nama kontrol untuk kontrol opsional, lihatPengidentifikasi sumber daya untuk API dan kontrol, di Panduan Pengguna AWS Control Tower.

CFCT mendukung penghapusan set tumpukan

Agustus 26, 2022

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

Kustomisasi untuk AWS Control Tower (CFCT) sekarang mendukung penghapusan kumpulan tumpukan, dengan menyetel parameter dalam file. `manifest.yaml` Untuk informasi selengkapnya, lihat Hapus set tumpukan.

> **Important**
>
> Saat Anda awalnya menetapkan nilai `enable_stack_set_deletion` to`true`, saat berikutnya Anda memanggil CFCT, SEMUA sumber daya yang dimulai dengan awalan, yang memiliki tag kunci terkait`CustomControlTower-`, dan yang tidak dideklarasikan dalam file manifes`Key:AWS_Solutions, Value: CustomControlTowerStackSet`, akan dipentaskan untuk dihapus.

Retensi log yang disesuaikan

Agustus 15, 2022

(Pembaruan diperlukan untuk landing zone AWS Control Tower. Untuk informasi, lihatPerbarui Zona Pendaratan Anda)

AWS Control Tower kini menyediakan kemampuan untuk menyesuaikan kebijakan retensi untuk bucket Amazon S3 yang menyimpan log AWS Control Tower Anda. CloudTrail Anda dapat menyesuaikan kebijakan penyimpanan log Amazon S3 Anda, dalam beberapa hari atau tahun, hingga maksimal 15 tahun.

Jika Anda memilih untuk tidak menyesuaikan penyimpanan log Anda, pengaturan default adalah 1 tahun untuk pencatatan akun standar, dan 10 tahun untuk pencatatan akses.

Fitur ini tersedia untuk pelanggan lama melalui AWS Control Tower saat Anda memperbarui atau memperbaiki landing zone, dan untuk pelanggan baru melalui proses penyiapan AWS Control Tower.

Perbaikan drift peran tersedia

Agustus 11, 2022

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

AWS Control Tower sekarang mendukung perbaikan untuk drift peran. Anda dapat mengembalikan peran yang diperlukan tanpa perbaikan penuh dari landing zone Anda. Jika jenis perbaikan drift ini diperlukan, halaman kesalahan konsol menyediakan langkah-langkah untuk memulihkan peran, sehingga landing zone Anda sekali lagi tersedia.

AWS Control Tower landing zone versi 3.0

Juli 29, 2022

(Pembaruan diperlukan untuk landing zone AWS Control Tower ke versi 3.0. Untuk informasi, lihatPerbarui Zona Pendaratan Anda)

AWS Control Tower landing zone versi 3.0 mencakup pembaruan berikut:

- Opsi untuk memilih jalur tingkat organisasi, atau memilih keluar dari AWS CloudTrail CloudTrail jalur yang dikelola oleh AWS Control Tower.
- Dua kontrol detektif baru untuk menentukan AWS CloudTrail apakah aktivitas log di akun Anda.
- Opsi untuk mengumpulkan AWS Config informasi tentang sumber daya global di wilayah asal Anda saja.
- Pembaruan ke Wilayah menolak kontrol.
- Pembaruan untuk kebijakan terkelola, AWSControlTowerServiceRolePolicy.
- Kami tidak lagi membuat peran IAM `aws-controltower-CloudWatchLogsRole` dan grup CloudWatch log `aws-controltower/CloudTrailLogs` di setiap akun yang terdaftar. Sebelumnya, kami membuat ini di setiap akun untuk jejak akunnya. Dengan jejak organisasi, kami hanya membuat satu di akun manajemen.

Bagian berikut memberikan rincian lebih lanjut tentang setiap kemampuan baru.

CloudTrail Jalur tingkat organisasi di AWS Control Tower

Dengan landing zone versi 3.0, AWS Control Tower kini mendukung jalur tingkat organisasi AWS CloudTrail .

Saat memperbarui landing zone AWS Control Tower ke versi 3.0, Anda memiliki opsi untuk memilih AWS CloudTrail jalur tingkat organisasi sebagai preferensi logging Anda, atau memilih keluar dari CloudTrail jalur yang dikelola oleh AWS Control Tower. Saat Anda memperbarui ke versi 3.0, AWS Control Tower menghapus jejak tingkat akun yang ada untuk akun terdaftar setelah masa tunggu 24 jam. AWS Control Tower tidak menghapus jejak tingkat akun untuk akun yang tidak terdaftar. Jika pembaruan landing zone Anda tidak berhasil, tetapi kegagalan terjadi setelah AWS Control Tower telah membuat jejak tingkat organisasi, Anda mungkin dikenakan biaya duplikat untuk jalur tingkat organisasi dan tingkat akun, hingga operasi pembaruan Anda berhasil diselesaikan.

Ke depan dari landing zone 3.0, AWS Control Tower tidak lagi mendukung jalur tingkat akun yang mengelola. AWS Sebagai gantinya, AWS Control Tower membuat jejak tingkat organisasi, yang aktif atau tidak aktif, sesuai dengan pilihan Anda.

> **Note**
>
> Setelah memperbarui ke versi 3.0 atau yang lebih baru, Anda tidak memiliki opsi untuk melanjutkan CloudTrail jejak tingkat akun yang dikelola oleh AWS Control Tower.

Tidak ada data logging yang hilang dari log akun agregat Anda, karena log tetap berada di bucket Amazon S3 yang ada di mana mereka disimpan. Hanya jejak yang dihapus, bukan log yang ada. Jika Anda memilih opsi untuk menambahkan jejak tingkat organisasi, AWS Control Tower membuka jalur baru ke folder baru dalam bucket Amazon S3 Anda dan terus mengirimkan informasi pencatatan ke lokasi tersebut. Jika Anda memilih untuk memilih keluar dari jalur yang dikelola oleh AWS Control Tower, log yang ada tetap ada di bucket, tidak berubah.

Konvensi penamaan jalur untuk penyimpanan log

- Log jejak akun disimpan dengan jalur formulir ini: `/org id/AWSLogs/…`
- Log jejak organisasi disimpan dengan jalur formulir ini: `/org id/AWSLogs/org id/…`

Jalur yang dibuat AWS Control Tower untuk jalur tingkat organisasi CloudTrail Anda berbeda dari jalur default untuk jejak tingkat organisasi yang dibuat secara manual, yang akan memiliki bentuk berikut:

- `/AWSLogs/org id/…`

Untuk informasi selengkapnya tentang penamaan CloudTrail jalur, lihat Menemukan file CloudTrail log Anda.

> **Tip**
>
> Jika Anda berencana untuk membuat dan mengelola jejak tingkat akun Anda sendiri, kami sarankan Anda membuat jejak baru sebelum menyelesaikan pembaruan ke AWS Control Tower landing zone versi 3.0, untuk segera memulai pencatatan.

Kapan saja, Anda dapat memilih untuk membuat CloudTrail jalur tingkat akun atau tingkat organisasi baru dan mengelolanya sendiri. Opsi untuk memilih CloudTrail jalur tingkat organisasi yang dikelola oleh AWS Control Tower tersedia selama pembaruan landing zone ke versi 3.0 atau yang lebih baru. Anda dapat memilih dan memilih keluar dari jalur tingkat organisasi, setiap kali Anda memperbarui landing zone Anda.

Jika log Anda dikelola oleh layanan pihak ketiga, pastikan untuk memberikan nama jalur baru ke layanan Anda.

> **Note**
>
> Untuk zona pendaratan di versi 3.0 atau yang lebih baru, AWS CloudTrail jalur tingkat akun tidak didukung oleh AWS Control Tower. Anda dapat membuat dan memelihara jejak tingkat akun Anda sendiri kapan saja, atau Anda dapat memilih jalur tingkat organisasi yang dikelola oleh AWS Control Tower.

Rekam AWS Config sumber daya di wilayah asal saja

Di landing zone versi 3.0, AWS Control Tower telah memperbarui konfigurasi baseline AWS Config sehingga hanya mencatat sumber daya global di Wilayah asal. Setelah Anda memperbarui ke versi 3.0, perekaman sumber daya untuk sumber daya global hanya diaktifkan di Wilayah asal Anda.

Konfigurasi ini dianggap sebagai praktik terbaik. Hal ini direkomendasikan oleh AWS Security Hub dan AWS Config, dan menciptakan penghematan biaya dengan mengurangi jumlah item konfigurasi yang dibuat ketika sumber daya global dibuat, dimodifikasi, atau dihapus. Sebelumnya, setiap kali sumber daya global dibuat, diperbarui, atau dihapus, baik oleh pelanggan atau oleh AWS layanan, item konfigurasi dibuat untuk setiap item di setiap Wilayah yang diatur.

Dua kontrol detektif baru untuk logging AWS CloudTrail

Sebagai bagian dari perubahan AWS CloudTrail jalur tingkat organisasi, AWS Control Tower memperkenalkan dua kontrol detektif baru yang memeriksa apakah diaktifkan. CloudTrail Kontrol pertama memiliki panduan Wajib, dan diaktifkan pada OU Keamanan selama pengaturan atau pembaruan landing zone 3.0 dan yang lebih baru. Kontrol kedua memiliki Panduan yang sangat direkomendasikan, dan secara opsional diterapkan ke OU apa pun selain OU Keamanan, yang sudah memiliki perlindungan kontrol wajib yang diberlakukan.

Kontrol wajib: Mendeteksi apakah akun bersama di bawah unit organisasi Keamanan telah AWS CloudTrail atau CloudTrail Lake diaktifkan

Kontrol yang sangat disarankan: Deteksi apakah akun telah AWS CloudTrail atau CloudTrail Lake diaktifkan

Untuk informasi selengkapnya tentang kontrol baru, lihatAWS Control Tower mengontrol pustaka.

Pembaruan untuk Wilayah menolak kontrol

Kami memperbarui NotActiondaftar di Wilayah menolak kontrol untuk menyertakan tindakan oleh beberapa layanan tambahan, yang tercantum di bawah ini:

```
        “chatbot:*”,
        "s3:GetAccountPublic",
        "s3:DeleteMultiRegionAccessPoint",
        "s3:DescribeMultiRegionAccessPointOperation",
        "s3:GetMultiRegionAccessPoint",
        "s3:GetMultiRegionAccessPointPolicy",
        "s3:GetMultiRegionAccessPointPolicyStatus",
        "s3:ListMultiRegionAccessPoints",
        "s3:GetStorageLensConfiguration",
        “s3:GetStorageLensDashboard",
        “s3:ListStorageLensConfigurations”
        “s3:GetAccountPublicAccessBlock“,,
        “s3:PutAccountPublic",
        “s3:PutAccountPublicAccessBlock“,
```

Panduan Video

Video ini (3:07) menjelaskan cara memperbarui landing zone AWS Control Tower yang ada ke versi 3. Untuk tampilan yang lebih baik, pilih ikon di sudut kanan bawah video untuk memperbesarnya ke layar penuh. Teks tersedia.

Panduan Video untuk Memperbarui Zona Pendaratan AWS Control Tower yang Ada ke Zona Pendaratan 3.

Halaman Organisasi menggabungkan tampilan OU dan akun

Juli 18, 2022

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower)

Halaman Organisasi baru di AWS Control Tower menampilkan tampilan hierarkis semua unit organisasi (OU) dan akun. Ini menggabungkan informasi dari halaman OU dan Akun, yang ada sebelumnya.

Di halaman baru, Anda dapat melihat hubungan antara OU induk dan OU dan akun bersarang mereka, Anda dapat mengambil tindakan pada pengelompokan sumber daya. Anda dapat mengkonfigurasi tampilan halaman. Misalnya, Anda dapat memperluas atau menciutkan tampilan hierarkis, memfilter tampilan untuk melihat akun atau OU saja, memilih untuk hanya melihat akun terdaftar dan OU terdaftar, atau Anda dapat melihat grup sumber daya terkait. Lebih mudah untuk memastikan bahwa seluruh organisasi Anda diperbarui dengan benar.

Mendaftar dan memperbarui akun anggota individu yang lebih mudah

31 Mei 2022

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower)

AWS Control Tower sekarang memberi Anda kemampuan yang lebih baik untuk memperbarui dan mendaftarkan akun anggota satu per satu. Setiap akun menunjukkan kapan tersedia untuk pembaruan, sehingga Anda dapat lebih mudah memastikan bahwa akun anggota Anda menyertakan konfigurasi terbaru. Anda dapat memperbarui landing zone Anda, memulihkan penyimpangan akun, atau mendaftarkan akun ke OU terdaftar, dalam beberapa langkah efisien.

Saat Anda memperbarui akun, Anda tidak perlu menyertakan seluruh unit organisasi (OU) akun di setiap tindakan pembaruan. Akibatnya, waktu yang diperlukan untuk memperbarui akun individu sangat berkurang.

Anda dapat mendaftarkan akun ke AWS Control Tower OU dengan bantuan lebih lanjut dari konsol AWS Control Tower. Akun yang sudah ada yang Anda daftarkan di AWS Control Tower harus tetap memenuhi prasyarat akun, dan Anda harus menambahkan peran tersebut. `AWSControlTowerExecution` Kemudian, Anda dapat memilih OU terdaftar dan mendaftarkan akun ke dalamnya dengan memilih tombol Daftar.

Kami telah memisahkan fungsionalitas akun Daftarkan dari alur kerja Buat akun di pabrik akun, untuk membuat lebih banyak perbedaan antara proses serupa ini, dan membantu menghindari kesalahan penyiapan saat Anda memasukkan informasi akun.

AFT mendukung kustomisasi otomatis untuk akun AWS Control Tower bersama

Mei 27, 2022

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower)

Account Factory for Terraform (AFT) sekarang dapat secara terprogram menyesuaikan dan memperbarui akun Anda yang dikelola oleh AWS Control Tower, termasuk akun manajemen, akun audit, dan akun arsip log, bersama dengan akun terdaftar Anda. Anda dapat memusatkan kustomisasi akun dan memperbarui manajemen, sekaligus melindungi keamanan konfigurasi akun Anda, karena Anda mencakup peran yang melakukan pekerjaan.

AWSAFTExecutionPeran yang ada sekarang menyebarkan penyesuaian di semua akun. Anda dapat mengatur izin IAM dengan batasan yang membatasi akses AWSAFTExecutionperan sesuai dengan persyaratan bisnis dan keamanan Anda. Anda juga dapat secara terprogram mendelegasikan izin penyesuaian yang disetujui dalam peran tersebut, untuk pengguna tepercaya. Sebagai praktik terbaik, kami menyarankan Anda membatasi izin untuk izin yang diperlukan untuk menerapkan penyesuaian yang diperlukan.

AFT sekarang membuat AWSAFTServiceperan baru untuk menyebarkan sumber daya AFT di semua akun terkelola, termasuk akun bersama dan akun manajemen. Sumber daya sebelumnya dikerahkan oleh peran tersebut. AWSAFTExecution

Akun bersama dan manajemen AWS Control Tower tidak disediakan melalui pabrik akun, sehingga akun tersebut tidak memiliki produk yang disediakan sesuai. AWS Service Catalog Oleh karena itu, Anda tidak dapat memperbarui akun bersama dan manajemen di Service Catalog.

Operasi bersamaan untuk semua kontrol opsional

Mei 18, 2022

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower)

AWS Control Tower sekarang mendukung operasi bersamaan untuk kontrol preventif, serta untuk kontrol detektif.

Dengan fitur baru ini, kontrol opsional apa pun sekarang dapat diterapkan atau dihapus secara bersamaan, sehingga meningkatkan kemudahan penggunaan dan kinerja untuk semua kontrol opsional. Anda dapat mengaktifkan beberapa kontrol opsional tanpa menunggu operasi kontrol individu selesai. Satu-satunya waktu terbatas adalah ketika AWS Control Tower sedang dalam proses penyiapan landing zone, atau saat memperluas tata kelola ke organisasi baru.

Fungsionalitas yang didukung untuk kontrol pencegahan:

- Terapkan dan hapus kontrol pencegahan yang berbeda pada OU yang sama.
- Terapkan dan hapus kontrol pencegahan yang berbeda pada OU yang berbeda, secara bersamaan.
- Terapkan dan hapus kontrol pencegahan yang sama pada beberapa OU, secara bersamaan.
- Anda dapat menerapkan dan menghapus kontrol preventif dan detektif, secara bersamaan.

Anda dapat mengalami peningkatan konkurensi kontrol ini di semua versi AWS Control Tower yang dirilis.

Saat Anda menerapkan kontrol preventif ke OU bersarang, kontrol preventif memengaruhi semua akun dan OU yang bersarang di bawah target OU, meskipun akun dan OU tersebut tidak terdaftar di AWS Control Tower. Kontrol preventif diimplementasikan menggunakan Kebijakan Kontrol Layanan (SCP), yang merupakan bagian dari. AWS Organizations Kontrol detektif diimplementasikan menggunakan AWS Config aturan. Guardrails tetap berlaku saat Anda membuat akun baru atau membuat perubahan pada akun Anda yang sudah ada, dan AWS Control Tower memberikan laporan ringkasan tentang bagaimana setiap akun sesuai dengan kebijakan Anda yang diaktifkan. Untuk daftar lengkap kontrol yang tersedia, lihatAWS Control Tower mengontrol pustaka.

Akun keamanan dan pencatatan yang ada

16 Mei 2022

(Tersedia selama pengaturan awal.)

AWS Control Tower sekarang menyediakan opsi bagi Anda untuk menentukan AWS akun yang ada sebagai akun keamanan atau logging AWS Control Tower, selama proses penyiapan landing zone awal. Opsi ini menghilangkan kebutuhan AWS Control Tower untuk membuat akun baru yang dibagikan. Akun keamanan, yang disebut akun Audit secara default, adalah akun terbatas yang memberi tim keamanan dan kepatuhan Anda akses ke semua akun di landing zone Anda. Akun

logging, yang disebut akun Log Archive secara default, berfungsi sebagai repositori. Ini menyimpan log aktivitas API dan konfigurasi sumber daya dari semua akun di landing zone Anda.

Dengan menghadirkan akun keamanan dan pencatatan yang ada, akan lebih mudah untuk memperluas tata kelola AWS Control Tower ke organisasi Anda yang ada, atau pindah ke AWS Control Tower dari landing zone alternatif. Opsi bagi Anda untuk menggunakan akun yang ada ditampilkan selama pengaturan landing zone awal. Ini termasuk pemeriksaan selama proses penyiapan, yang memastikan penerapan berhasil. AWS Control Tower mengimplementasikan peran dan kontrol yang diperlukan pada akun Anda yang ada. Itu tidak menghapus atau menggabungkan sumber daya atau data yang ada di akun ini.

Batasan: Jika Anda berencana untuk membawa AWS akun yang ada ke AWS Control Tower sebagai akun audit dan arsip log, dan jika akun tersebut memiliki AWS Config sumber daya yang ada, Anda harus menghapus AWS Config sumber daya yang ada sebelum dapat mendaftarkan akun ke AWS Control Tower.

AWS Control Tower landing zone versi 2.9

April 22, 2022

(Pembaruan diperlukan untuk landing zone AWS Control Tower ke versi 2.9. Untuk informasi, lihatPerbarui Zona Pendaratan Anda)

AWS Control Tower landing zone versi 2.9 memperbarui notifikasi forwarder Lambda untuk menggunakan runtime Python versi 3.9. Pembaruan ini membahas penghentian Python versi 3.6, yang direncanakan untuk Juli 2022. Untuk informasi terbaru, lihat halaman penghentian Python.

AWS Control Tower landing zone versi 2.8

Februari 10, 2022

(Pembaruan diperlukan untuk landing zone AWS Control Tower ke versi 2.8. Untuk informasi, lihatPerbarui Zona Pendaratan Anda)

AWS Control Tower landing zone versi 2.8 menambahkan fungsionalitas yang selaras dengan pembaruan terbaru pada Praktik Terbaik Keamanan AWS Dasar.

Dalam rilis ini:

- Pencatatan akses dikonfigurasi untuk bucket log akses di akun Arsip Log, untuk melacak akses ke bucket log akses S3 yang ada.

- Dukungan untuk kebijakan siklus hidup ditambahkan. Log akses untuk bucket log akses S3 yang ada disetel ke waktu retensi default 10 tahun.
- Selain itu, rilis ini memperbarui AWS Control Tower untuk menggunakan Peran Tertaut AWS Layanan (SLR) yang disediakan oleh AWS Config, di semua akun terkelola (tidak termasuk akun manajemen), sehingga Anda dapat mengatur dan mengelola aturan Konfigurasi agar AWS Config sesuai dengan praktik terbaik. Pelanggan yang tidak melakukan upgrade akan terus menggunakan peran mereka yang ada.
- Rilis ini merampingkan proses konfigurasi AWS Control Tower KMS untuk mengenkripsi data Config, dan meningkatkan pesan status terkait. CloudTrail
- Rilis ini mencakup pembaruan ke kontrol penolakan Wilayah, untuk memungkinkan `route53-application-recovery` fitur masuk`us-west-2`.
- Pembaruan: Pada 15 Februari 2022, kami menghapus antrian surat mati untuk fungsi AWS Lambda.

Detail tambahan:

- Jika Anda menonaktifkan landing zone, AWS Control Tower tidak menghapus peran AWS Config terkait layanan.
- Jika Anda membatalkan penyediaan akun Account Factory, AWS Control Tower tidak menghapus peran AWS Config terkait layanan.

Untuk memperbarui landing zone Anda ke 2.8, navigasikan ke halaman pengaturan zona pendaratan, pilih versi 2.8, lalu pilih Perbarui. Setelah memperbarui landing zone, Anda harus memperbarui semua akun yang diatur oleh AWS Control Tower, seperti yang diberikan. Manajemen pembaruan konfigurasi di AWS Control Tower

Januari - Desember 2021

Pada tahun 2021, AWS Control Tower merilis pembaruan berikut:

- Wilayah menolak kemampuan
- Fitur residensi data
- AWS Control Tower memperkenalkan penyediaan dan penyesuaian akun Terraform
- Acara siklus hidup baru tersedia
- AWS Control Tower memungkinkan OU bersarang

- Konkurensi kontrol detektif
- Dua Wilayah baru tersedia
- Pencabutan wilayah
- AWS Control Tower bekerja dengan Sistem Manajemen AWS Utama
- Kontrol berganti nama, fungsionalitas tidak berubah
- AWS Control Tower memindai SCP setiap hari untuk memeriksa drift
- Nama yang disesuaikan untuk OU dan akun
- AWS Control Tower landing zone versi 2.7
- Tiga AWS Wilayah baru tersedia
- Mengatur Wilayah yang dipilih saja
- AWS Control Tower sekarang memperluas tata kelola ke OU yang ada di organisasi Anda AWS
- AWS Control Tower menyediakan pembaruan akun massal

Wilayah menolak kemampuan

November 30, 2021

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower.)

AWS Control Tower sekarang menyediakan kemampuan penolakan Wilayah, yang membantu Anda membatasi akses ke AWS layanan dan operasi untuk akun terdaftar di lingkungan AWS Control Tower Anda. Fitur penolakan Wilayah melengkapi fitur pemilihan Wilayah dan pembatalan pilihan Wilayah yang ada di AWS Control Tower. Bersama-sama, fitur-fitur ini membantu Anda mengatasi masalah kepatuhan dan peraturan, sambil menyeimbangkan biaya yang terkait dengan perluasan ke Wilayah tambahan.

Misalnya, AWS pelanggan di Jerman dapat menolak akses ke AWS layanan di Wilayah di luar Wilayah Frankfurt. Anda dapat memilih Wilayah terbatas selama proses penyiapan AWS Control Tower, atau di halaman pengaturan zona pendaratan. Fitur penolakan Wilayah tersedia saat Anda memperbarui versi landing zone AWS Control Tower. AWS Layanan tertentu dikecualikan dari kemampuan penolakan Wilayah. Untuk mempelajari selengkapnya, lihat Konfigurasikan wilayah tolak kontrol.

Fitur residensi data

November 30, 2021

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower)

AWS Control Tower kini menawarkan kontrol yang dibuat khusus untuk membantu memastikan bahwa data pelanggan yang Anda unggah ke AWS layanan hanya terletak di AWS Wilayah yang Anda tentukan. Anda dapat memilih AWS Wilayah atau Wilayah tempat data pelanggan Anda disimpan dan diproses. Untuk daftar lengkap AWS Wilayah di mana AWS Control Tower tersedia, lihat Tabel AWS Wilayah.

Untuk kontrol granular, Anda dapat menerapkan kontrol tambahan, seperti Larang koneksi Amazon Virtual Private Network (VPN), atau Larang akses internet untuk instans VPC Amazon. Anda dapat melihat status kepatuhan kontrol di konsol AWS Control Tower. Untuk daftar lengkap kontrol yang tersedia, lihatAWS Control Tower mengontrol pustaka.

AWS Control Tower memperkenalkan penyediaan dan penyesuaian akun Terraform

November 29, 2021

(Pembaruan opsional untuk zona landing zone AWS Control Tower)

Anda sekarang dapat menggunakan Terraform untuk menyediakan dan memperbarui akun yang disesuaikan melalui AWS Control Tower, dengan AWS Control Tower Account Factory for Terraform (AFT).

AFT menyediakan infrastruktur Terraform tunggal sebagai pipeline kode (IAc), yang menyediakan akun yang dikelola oleh AWS Control Tower. Penyesuaian selama penyediaan membantu memenuhi kebijakan bisnis dan keamanan Anda, sebelum Anda memberikan akun kepada pengguna akhir.

Pipa pembuatan akun otomatis AFT memantau hingga penyediaan akun selesai, dan kemudian berlanjut, memicu modul Terraform tambahan yang meningkatkan akun dengan penyesuaian yang diperlukan. Sebagai bagian tambahan dari proses penyesuaian, Anda dapat mengonfigurasi pipeline untuk menginstal modul Terraform kustom Anda sendiri, dan Anda dapat memilih untuk menambahkan salah satu Opsi Fitur AFT, yang disediakan oleh AWS untuk penyesuaian umum.

Mulailah dengan AWS Control Tower Account Factory for Terraform dengan mengikuti langkah-langkah yang disediakan dalam Panduan Pengguna AWS Control Tower,Terapkan AWS Control Tower Account Factory untuk Terraform (AFT), dan dengan mengunduh AFT untuk instans Terraform Anda. AFT mendukung distribusi Terraform Cloud, Terraform Enterprise, dan Terraform Open Source.

Acara siklus hidup baru tersedia

November 18, 2021

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower)

`PrecheckOrganizationalUnit`Peristiwa mencatat apakah sumber daya apa pun memblokir tugas Perluas tata kelola agar tidak berhasil, termasuk sumber daya di OU bersarang. Untuk informasi selengkapnya, lihat `PrecheckOrganizationalUnit`.

AWS Control Tower memungkinkan OU bersarang

November 16, 2021

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower)

AWS Control Tower sekarang memungkinkan Anda untuk menyertakan OU bersarang sebagai bagian dari landing zone Anda.

AWS Control Tower menyediakan dukungan untuk unit organisasi bersarang (OU), memungkinkan Anda mengatur akun ke dalam beberapa tingkat hierarki, dan untuk menegakkan kontrol preventif secara hierarki. Anda dapat mendaftarkan OU yang berisi OU bersarang, membuat dan mendaftarkan OU di bawah OU induk, dan mengaktifkan kontrol pada OU terdaftar apa pun, terlepas dari kedalamannya. Untuk mendukung fungsi ini, konsol menunjukkan jumlah akun yang diatur dan OU.

Dengan OU bersarang, Anda dapat menyelaraskan AWS Control Tower OU Anda dengan strategi AWS multi-akun, dan Anda dapat mengurangi waktu yang diperlukan untuk mengaktifkan kontrol pada beberapa OU, dengan menerapkan kontrol di tingkat OU induk.

Pertimbangan utama

1. Anda dapat mendaftarkan OU multi-level yang ada dengan AWS Control Tower satu OU sekaligus, dimulai dengan OU tingkat atas dan kemudian melanjutkan ke bawah pohon. Untuk informasi selengkapnya, lihat Perluas dari struktur OU datar ke struktur OU bersarang.
2. Akun langsung di bawah OU terdaftar terdaftar secara otomatis. Akun lebih jauh ke bawah pohon dapat didaftarkan dengan mendaftarkan OU induk langsung mereka.
3. Kontrol preventif (SCP) diwariskan ke bawah hierarki secara otomatis; SCP yang diterapkan ke induk diwarisi oleh semua OU bersarang.
4. Kontrol Detektif (aturan AWS Config) TIDAK diwarisi secara otomatis.

5. Kepatuhan terhadap kontrol detektif dilaporkan oleh masing-masing OU.
6. Penyimpangan SCP pada OU memengaruhi semua akun dan OU di bawahnya.
7. Anda tidak dapat membuat OU bersarang baru di bawah Security OU (Core OU).

Konkurensi kontrol detektif

November 5, 2021

(Pembaruan opsional untuk zona landing zone AWS Control Tower)

Kontrol detektif AWS Control Tower sekarang mendukung operasi bersamaan untuk kontrol detektif, meningkatkan kemudahan penggunaan dan kinerja. Anda dapat mengaktifkan beberapa kontrol detektif tanpa menunggu operasi kontrol individu selesai.

Fungsionalitas yang didukung:

- Aktifkan kontrol detektif yang berbeda pada OU yang sama (misalnya, Deteksi Apakah MFA untuk Pengguna Root Diaktifkan dan Deteksi Apakah Akses Tulis Publik ke Bucket Amazon S3 Diizinkan).
- Aktifkan kontrol detektif yang berbeda pada OU yang berbeda, secara bersamaan.
- Pesan kesalahan pagar pembatas telah diperbaiki untuk memberikan panduan tambahan untuk operasi konkurensi kontrol yang didukung.

Tidak didukung dalam rilis ini:

- Mengaktifkan kontrol detektif yang sama pada beberapa OU secara bersamaan tidak didukung.
- Konkurensi kontrol preventif tidak didukung.

Anda dapat mengalami peningkatan konkurensi kontrol detektif di semua versi AWS Control Tower. Disarankan agar pelanggan yang saat ini tidak menggunakan versi 2.7 melakukan pembaruan landing zone untuk memanfaatkan fitur lain, seperti pemilihan Wilayah dan pembatalan pilihan, yang tersedia dalam versi terbaru.

Dua Wilayah baru tersedia

Juli 29, 2021

(Pembaruan diperlukan untuk zona landing zone AWS Control Tower)

AWS Control Tower sekarang tersedia di dua AWS Wilayah tambahan: Amerika Selatan (Sao Paulo), dan Eropa (Paris). Pembaruan ini memperluas ketersediaan AWS Control Tower ke 15 AWS Wilayah.

Jika Anda baru mengenal AWS Control Tower, Anda dapat langsung meluncurkannya di salah satu Wilayah yang didukung. Selama peluncuran, Anda dapat memilih Wilayah yang Anda inginkan AWS Control Tower untuk membangun dan mengatur lingkungan multi-akun Anda.

Jika Anda sudah memiliki lingkungan AWS Control Tower dan ingin memperluas atau menghapus fitur tata kelola AWS Control Tower di satu atau beberapa Wilayah yang didukung, buka halaman Pengaturan Zona Landing di dasbor AWS Control Tower, lalu pilih Wilayah. Setelah memperbarui landing zone, Anda harus memperbarui semua akun yang diatur oleh AWS Control Tower.

Pencabutan wilayah

Juli 29, 2021

(Pembaruan opsional untuk zona landing zone AWS Control Tower)

Pembatalan pemilihan Wilayah AWS Control Tower meningkatkan kemampuan Anda untuk mengelola jejak geografis sumber daya AWS Control Tower Anda. Anda dapat membatalkan pilihan Wilayah yang tidak lagi Anda inginkan AWS Control Tower untuk mengaturnya. Fitur ini memberi Anda kemampuan untuk mengatasi masalah kepatuhan dan peraturan sambil menyeimbangkan biaya yang terkait dengan perluasan ke Wilayah tambahan.

Pembatalan pilihan wilayah tersedia saat Anda memperbarui versi landing zone AWS Control Tower.

Saat Anda menggunakan Account Factory untuk membuat akun baru atau mendaftarkan akun anggota yang sudah ada sebelumnya, atau saat Anda memilih Perluas Tata Kelola untuk mendaftarkan akun di unit organisasi yang sudah ada sebelumnya, AWS Control Tower menerapkan kemampuan tata kelolanya — yang mencakup pencatatan, pemantauan, dan kontrol terpusat — di Wilayah pilihan Anda di akun. Memilih untuk membatalkan pilihan Wilayah dan menghapus tata kelola AWS Control Tower dari Wilayah tersebut akan menghapus fungsionalitas tata kelola tersebut, tetapi tidak menghambat kemampuan pengguna Anda untuk menerapkan AWS sumber daya atau beban kerja ke Wilayah tersebut.

AWS Control Tower bekerja dengan Sistem Manajemen AWS Utama

Juli 28, 2021

(Pembaruan opsional untuk zona landing zone AWS Control Tower)

AWS Control Tower memberi Anda opsi untuk menggunakan AWS kunci Key Management Service (AWS KMS). Kunci disediakan dan dikelola oleh Anda, untuk mengamankan layanan yang diterapkan AWS Control Tower, termasuk AWS CloudTrail AWS Config, dan data Amazon S3 terkait. AWS Enkripsi KMS adalah tingkat enkripsi yang ditingkatkan melalui enkripsi SSE-S3 yang digunakan AWS Control Tower secara default.

Integrasi dukungan AWS KMS ke AWS Control Tower sejalan dengan Praktik Terbaik Keamanan AWS Dasar, yang merekomendasikan lapisan keamanan tambahan untuk file log sensitif Anda. Anda harus menggunakan kunci yang AWS dikelola KMS (SSE-KMS) untuk enkripsi saat istirahat. AWS Dukungan enkripsi KMS tersedia saat Anda menyiapkan landing zone baru atau saat Anda memperbarui zona landing zone AWS Control Tower yang ada.

Untuk mengonfigurasi fungsionalitas ini, Anda dapat memilih Konfigurasi Kunci KMS selama pengaturan landing zone awal Anda. Anda dapat memilih kunci KMS yang ada, atau Anda dapat memilih tombol yang mengarahkan Anda ke konsol AWS KMS untuk membuat yang baru. Anda juga memiliki fleksibilitas untuk mengubah dari enkripsi default ke SSE-KMS, atau ke kunci SSE-KMS yang berbeda.

Untuk landing zone AWS Control Tower yang ada, Anda dapat melakukan pembaruan untuk mulai menggunakan kunci AWS KMS.

Kontrol berganti nama, fungsionalitas tidak berubah

Juli 26, 2021

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower)

AWS Control Tower merevisi nama dan deskripsi kontrol tertentu untuk mencerminkan maksud kebijakan kontrol dengan lebih baik. Nama dan deskripsi yang direvisi membantu Anda memahami secara lebih intuitif cara-cara kontrol mewujudkan kebijakan akun Anda. Misalnya, kami mengubah sebagian nama kontrol detektif dari “Larang” menjadi “Deteksi” karena kontrol detektif itu sendiri tidak menghentikan tindakan tertentu, hanya mendeteksi pelanggaran kebijakan dan memberikan peringatan melalui dasbor.

Fungsionalitas kontrol, panduan, dan implementasi tetap tidak berubah. Hanya nama dan deskripsi kontrol yang telah direvisi.

AWS Control Tower memindai SCP setiap hari untuk memeriksa drift

Mei 11, 2021

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower)

AWS Control Tower sekarang melakukan pemindaian otomatis harian SCP terkelola Anda untuk memverifikasi bahwa kontrol yang sesuai diterapkan dengan benar dan belum hanyut. Jika pemindaian menemukan penyimpangan, Anda akan menerima pemberitahuan. AWS Control Tower hanya mengirimkan satu notifikasi per masalah drift, jadi jika landing zone Anda sudah dalam keadaan drift, Anda tidak akan menerima pemberitahuan tambahan kecuali item drift baru ditemukan.

Nama yang disesuaikan untuk OU dan akun

April 16, 2021

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower)

AWS Control Tower sekarang memungkinkan Anda untuk menyesuaikan penamaan landing zone Anda. Anda dapat menyimpan nama yang direkomendasikan AWS Control Tower untuk unit organisasi (OU) dan akun inti, atau Anda dapat memodifikasi nama-nama ini selama proses penyiapan landing zone awal.

Nama default yang disediakan AWS Control Tower untuk akun OU dan inti cocok dengan panduan praktik terbaik AWS multi-akun. Namun, jika perusahaan Anda memiliki kebijakan penamaan tertentu, atau jika Anda sudah memiliki OU atau akun yang sudah ada dengan nama yang direkomendasikan yang sama, fungsi OU dan penamaan akun yang baru memberi Anda fleksibilitas untuk mengatasi kendala tersebut.

Terpisah dari perubahan alur kerja selama pengaturan, OU sebelumnya dikenal sebagai Core OU sekarang disebut Security OU, dan OU sebelumnya dikenal sebagai Custom OU sekarang disebut Sandbox OU. Kami membuat perubahan ini untuk meningkatkan keselarasan kami dengan panduan praktik AWS terbaik secara keseluruhan untuk penamaan.

Pelanggan baru akan melihat nama-nama OU baru ini. Pelanggan yang sudah ada akan terus melihat nama asli OU ini. Anda mungkin mengalami beberapa ketidakkonsistenan dalam penamaan OU saat kami memperbarui dokumentasi kami ke nama baru.

Untuk memulai AWS Control Tower dari AWS Management Console, buka konsol AWS Control Tower, dan pilih Siapkan landing zone di kanan atas. Untuk informasi tambahan, Anda dapat membaca tentang perencanaan landing zone AWS Control Tower.

AWS Control Tower landing zone versi 2.7

April 8, 2021

(Pembaruan diperlukan untuk landing zone AWS Control Tower ke versi 2.7. Untuk informasi, lihatPerbarui Zona Pendaratan Anda)

Dengan AWS Control Tower versi 2.7, AWS Control Tower memperkenalkan empat kontrol Log Archive pencegahan wajib baru yang menerapkan kebijakan hanya pada sumber daya AWS Control Tower. Kami telah menyesuaikan panduan tentang empat kontrol Arsip Log yang ada dari wajib ke elektif, karena mereka menetapkan kebijakan untuk sumber daya di luar AWS Control Tower. Perubahan dan ekspansi kontrol ini memberikan kemampuan untuk memisahkan tata kelola Arsip Log untuk sumber daya dalam AWS Control Tower dari tata kelola sumber daya di luar AWS Control Tower.

Keempat kontrol yang diubah dapat digunakan bersama dengan kontrol wajib baru untuk menyediakan tata kelola ke set Arsip Log yang lebih luas. AWS Lingkungan AWS Control Tower yang ada akan membuat keempat kontrol yang diubah ini diaktifkan secara otomatis, untuk konsistensi lingkungan; namun, kontrol elektif ini sekarang dapat dinonaktifkan. Lingkungan AWS Control Tower yang baru harus mengaktifkan semua kontrol elektif. Lingkungan yang ada harus menonaktifkan kontrol yang sebelumnya wajib sebelum menambahkan enkripsi ke bucket Amazon S3 yang tidak digunakan oleh AWS Control Tower.

Kontrol wajib baru:

- Larang Perubahan Konfigurasi Enkripsi untuk AWS Control Tower Membuat Bucket S3 di Arsip Log
- Larang Perubahan Konfigurasi Logging untuk AWS Control Tower Membuat Bucket S3 di Arsip Log
- Larang Perubahan Kebijakan Bucket untuk AWS Control Tower Membuat Bucket S3 di Arsip Log
- Larang Perubahan pada Konfigurasi Siklus Hidup untuk AWS Control Tower Membuat Bucket S3 di Arsip Log

Panduan berubah dari Wajib menjadi Pilihan:

- Larang Perubahan Konfigurasi Enkripsi untuk semua Bucket Amazon S3 [Sebelumnya: Aktifkan Enkripsi saat Istirahat untuk Arsip Log]
- Larang Perubahan pada Konfigurasi Logging untuk semua Bucket Amazon S3 [Sebelumnya: Aktifkan Pencatatan Akses untuk Arsip Log]
- Larang Perubahan Kebijakan Bucket untuk semua Bucket Amazon S3 [Sebelumnya: Larang Perubahan Kebijakan pada Arsip Log]

- Larang Perubahan Konfigurasi Siklus Hidup untuk semua Bucket Amazon S3 [Sebelumnya: Tetapkan Kebijakan Retensi untuk Arsip Log]

AWS Control Tower versi 2.7 menyertakan perubahan pada cetak biru landing zone AWS Control Tower yang dapat menyebabkan ketidakcocokan dengan versi sebelumnya setelah Anda meningkatkan ke 2.7.

- Secara khusus, AWS Control Tower versi 2.7 memungkinkan `BlockPublicAccess` secara otomatis pada bucket S3 yang digunakan oleh AWS Control Tower. Anda dapat menonaktifkan default ini jika beban kerja Anda memerlukan akses di seluruh akun. Untuk informasi selengkapnya tentang apa yang terjadi dengan `BlockPublicaccess` diaktifkan, lihat Memblokir akses publik ke penyimpanan Amazon S3 Anda.
- AWS Control Tower versi 2.7 menyertakan persyaratan untuk HTTPS. Semua permintaan yang dikirim ke bucket S3 yang digunakan oleh AWS Control Tower harus menggunakan secure socket layer (SSL). Hanya permintaan HTTPS yang diizinkan untuk lulus. Jika Anda menggunakan HTTP (tanpa SSL) sebagai titik akhir untuk mengirim permintaan, perubahan ini memberi Anda kesalahan akses ditolak, yang berpotensi merusak alur kerja Anda. Perubahan ini tidak dapat dikembalikan setelah pembaruan 2.7 ke landing zone Anda.

  Kami menyarankan Anda mengubah permintaan Anda untuk menggunakan TLS, bukan HTTP.

Tiga AWS Wilayah baru tersedia

April 8, 2021

(Pembaruan diperlukan untuk zona landing zone AWS Control Tower)

AWS Control Tower tersedia di tiga AWS Wilayah tambahan: Wilayah Asia Pasifik (Tokyo), Wilayah Asia Pasifik (Seoul), dan Wilayah Asia Pasifik (Mumbai). Pembaruan landing zone ke versi 2.7 diperlukan untuk memperluas tata kelola ke Wilayah ini.

Landing zone Anda tidak diperluas secara otomatis ke Wilayah ini ketika Anda melakukan pembaruan ke versi 2.7, Anda harus melihat dan memilihnya di tabel Wilayah untuk dimasukkan.

Mengatur Wilayah yang dipilih saja

Februari 19, 2021

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower)

Pemilihan Wilayah AWS Control Tower memberikan kemampuan yang lebih baik untuk mengelola jejak geografis sumber daya AWS Control Tower Anda. Untuk memperluas jumlah Wilayah tempat Anda menampung AWS sumber daya atau beban kerja — untuk kepatuhan, peraturan, biaya, atau alasan lainnya — Anda sekarang dapat memilih Wilayah tambahan yang akan diatur.

Pemilihan wilayah tersedia saat Anda menyiapkan landing zone baru atau memperbarui versi landing zone AWS Control Tower. Saat Anda menggunakan Account Factory untuk membuat akun baru atau mendaftarkan akun anggota yang sudah ada sebelumnya, atau saat Anda menggunakan Perluas Tata Kelola untuk mendaftarkan akun di unit organisasi yang sudah ada sebelumnya, AWS Control Tower menerapkan kemampuan tata kelola untuk pencatatan, pemantauan, dan kontrol terpusat di Wilayah pilihan Anda di akun. Untuk informasi selengkapnya tentang memilih Wilayah, lihatKonfigurasikan Wilayah AWS Control Tower.

AWS Control Tower sekarang memperluas tata kelola ke OU yang ada di organisasi Anda AWS

Januari 28, 2021

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower)

Perluas tata kelola ke unit organisasi (OU) yang ada (yang tidak ada di AWS Control Tower) dari dalam konsol AWS Control Tower. Dengan fitur ini, Anda dapat membawa OU tingkat atas dan akun yang disertakan di bawah tata kelola AWS Control Tower. Untuk informasi tentang memperluas tata kelola ke seluruh OU, lihat. Daftarkan unit organisasi yang ada dengan AWS Control Tower

Saat Anda mendaftarkan OU, AWS Control Tower melakukan serangkaian pemeriksaan untuk memastikan perpanjangan tata kelola dan pendaftaran akun yang berhasil dalam OU. Untuk informasi lebih lanjut tentang masalah umum yang terkait dengan pendaftaran awal OU, lihatPenyebab umum kegagalan saat pendaftaran atau pendaftaran ulang.

Anda juga dapat mengunjungi halaman web produk AWS Control Tower atau mengunjungi YouTube untuk menonton video tentang memulai AWS Control Tower ini. AWS Organizations

AWS Control Tower menyediakan pembaruan akun massal

Januari 28, 2021

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower)

Dengan fitur pembaruan massal, Anda sekarang dapat memperbarui semua akun di unit AWS Organizations organisasi terdaftar (OU) yang berisi hingga 300 akun, dengan satu klik, dari dasbor

AWS Control Tower. Ini sangat berguna jika Anda memperbarui zona landing zone AWS Control Tower dan juga harus memperbarui akun terdaftar Anda untuk menyelaraskannya dengan versi landing zone saat ini.

Fitur ini juga membantu Anda memperbarui akun saat memperbarui zona landing AWS Control Tower untuk memperluas ke wilayah baru, atau saat Anda ingin mendaftarkan ulang OU untuk memastikan bahwa semua akun di OU tersebut memiliki kontrol terbaru yang diterapkan. Pembaruan akun massal menghilangkan kebutuhan untuk memperbarui satu akun pada satu waktu atau menggunakan skrip eksternal untuk melakukan pembaruan pada beberapa akun.

Untuk informasi tentang memperbarui landing zone, lihatPerbarui Zona Pendaratan Anda.

Untuk informasi tentang mendaftar atau mendaftarkan ulang OU, lihatDaftarkan unit organisasi yang ada dengan AWS Control Tower.

Januari - Desember 2020

Pada tahun 2020, AWS Control Tower merilis pembaruan berikut:

- Konsol AWS Control Tower sekarang terhubung ke aturan AWS Config eksternal
- AWS Control Tower sekarang tersedia di Wilayah tambahan
- Pembaruan pagar pembatas
- Konsol AWS Control Tower menampilkan detail lebih lanjut tentang OU dan akun
- Gunakan AWS Control Tower untuk menyiapkan AWS lingkungan multi-akun baru di AWS Organizations
- Kustomisasi untuk solusi AWS Control Tower
- Ketersediaan umum AWS Control Tower versi 2.3
- Penyediaan akun satu langkah di AWS Control Tower
- Alat penonaktifan AWS Control Tower
- Pemberitahuan acara siklus hidup AWS Control Tower

Konsol AWS Control Tower sekarang terhubung ke aturan AWS Config eksternal

Desember 29, 2020

(Pembaruan diperlukan untuk landing zone AWS Control Tower ke versi 2.6. Untuk informasi, lihatPerbarui Zona Pendaratan Anda)

AWS Control Tower sekarang menyertakan agregator tingkat organisasi, yang membantu mendeteksi aturan Config eksternal. AWS Ini memberi Anda visibilitas di konsol AWS Control Tower untuk melihat keberadaan aturan Config yang dibuat secara eksternal selain aturan AWS Config yang dibuat AWS oleh AWS Control Tower. Agregator memungkinkan AWS Control Tower mendeteksi aturan eksternal dan menyediakan tautan ke konsol AWS Config tanpa perlu AWS Control Tower untuk mendapatkan akses ke akun yang tidak dikelola.

Dengan fitur ini, Anda sekarang memiliki tampilan konsolidasi kontrol detektif yang diterapkan ke akun Anda sehingga Anda dapat melacak kepatuhan dan menentukan apakah Anda memerlukan kontrol tambahan untuk akun Anda. Untuk informasi, lihat Bagaimana AWS Control Tower menggabungkan AWS Config aturan dalam OU dan akun yang tidak dikelola.

AWS Control Tower sekarang tersedia di Wilayah tambahan

November 18, 2020

(Pembaruan diperlukan untuk landing zone AWS Control Tower ke versi 2.5. Untuk informasi, lihatPerbarui Zona Pendaratan Anda)

AWS Control Tower sekarang tersedia di 5 AWS Wilayah tambahan:

- Wilayah Asia Pasifik (Singapura)
- Wilayah Eropa (Frankfurt)
- Wilayah Eropa (London)
- Wilayah Eropa (Stockholm)
- Wilayah Kanada (Pusat)

Penambahan 5 AWS Wilayah ini adalah satu-satunya perubahan yang diperkenalkan untuk AWS Control Tower versi 2.5.

AWS Control Tower juga tersedia di Wilayah AS Timur (Virginia N.), Wilayah AS Timur (Ohio), Wilayah AS Barat (Oregon), Wilayah Eropa (Irlandia), dan Wilayah Asia Pasifik (Sydney). Dengan peluncuran ini AWS Control Tower sekarang tersedia di 10 AWS Wilayah.

Pembaruan landing zone ini mencakup semua Wilayah yang terdaftar dan tidak dapat dibatalkan. Setelah memperbarui landing zone ke versi 2.5, Anda harus memperbarui secara manual semua

akun AWS Control Tower yang terdaftar untuk mengatur di 10 Wilayah yang didukung AWS . Untuk informasi, lihat Konfigurasikan Wilayah AWS Control Tower.

Pembaruan pagar pembatas

Oktober 8, 2020

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower)

Versi yang diperbarui telah dirilis untuk kontrol wajib`AWS-GR_IAM_ROLE_CHANGE_PROHIBITED`.

Perubahan pada kontrol ini diperlukan karena akun yang terdaftar secara otomatis ke AWS Control Tower harus mengaktifkan `AWSControlTowerExecution` peran tersebut. Versi kontrol sebelumnya mencegah peran ini dibuat.

Untuk informasi selengkapnya, lihat Kontrol pembaruan di referensi Kontrol Panduan Pengguna AWS Control Tower.

Konsol AWS Control Tower menampilkan detail lebih lanjut tentang OU dan akun

Juli 22, 2020

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower)

Anda dapat melihat organisasi dan akun Anda yang tidak terdaftar di AWS Control Tower, bersama organisasi dan akun yang terdaftar.

Dalam konsol AWS Control Tower, Anda dapat melihat detail lebih lanjut tentang AWS akun dan unit organisasi (OU) Anda. Halaman Akun sekarang mencantumkan semua akun di organisasi Anda, terlepas dari status OU atau pendaftaran di AWS Control Tower. Anda sekarang dapat mencari, mengurutkan, dan memfilter di semua tabel.

Gunakan AWS Control Tower untuk menyiapkan AWS lingkungan multi-akun baru di AWS Organizations

April 22, 2020

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower)

AWS Organizations pelanggan sekarang dapat menggunakan AWS Control Tower untuk mengelola unit organisasi (OU) dan akun yang baru dibuat dengan memanfaatkan kemampuan baru ini:

- AWS Organizations Pelanggan yang sudah ada sekarang dapat menyiapkan landing zone baru untuk unit organisasi baru (OU) di akun manajemen mereka yang ada. Anda dapat membuat OU baru di AWS Control Tower dan membuat akun baru di OU tersebut dengan tata kelola AWS Control Tower.
- AWS Organizations pelanggan dapat mendaftarkan akun yang ada menggunakan proses pendaftaran akun atau melalui scripting.

AWS Control Tower menyediakan layanan orkestrasi yang menggunakan layanan lain. AWS Ini dirancang untuk organisasi dengan banyak akun dan tim yang mencari cara termudah untuk mengatur AWS lingkungan multi-akun baru atau yang sudah ada dan mengatur dalam skala besar. Dengan organisasi yang diatur oleh AWS Control Tower, administrator cloud tahu bahwa akun di organisasi sesuai dengan kebijakan yang ditetapkan. Pembangun mendapat manfaat karena mereka dapat menyediakan AWS akun baru dengan cepat, tanpa kekhawatiran yang tidak semestinya tentang kepatuhan.

Untuk informasi tentang pengaturan landing zone, lihatRencanakan landing zone AWS Control Tower. Anda juga dapat mengunjungi halaman web produk AWS Control Tower atau mengunjungi YouTube untuk menonton video tentang memulai AWS Control Tower ini. AWS Organizations

Selain perubahan ini, kemampuan penyediaan akun Cepat di AWS Control Tower diubah namanya menjadi akun Enroll. Sekarang memungkinkan pendaftaran akun yang ada serta pembuatan AWS akun baru. Untuk informasi selengkapnya, lihat Daftarkan akun yang ada.

Kustomisasi untuk solusi AWS Control Tower

Maret 17, 2020

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower)

AWS Control Tower sekarang menyertakan implementasi referensi baru yang memudahkan Anda menerapkan templat dan kebijakan khusus ke landing zone AWS Control Tower Anda.

Dengan penyesuaian AWS Control Tower, Anda dapat menggunakan AWS CloudFormation templat untuk menerapkan sumber daya baru ke akun yang ada dan baru dalam organisasi Anda. Anda juga dapat menerapkan kebijakan kontrol layanan kustom (SCP) ke akun tersebut selain SCP yang sudah disediakan oleh AWS Control Tower. Kustomisasi untuk pipeline AWS Control Tower terintegrasi

dengan peristiwa siklus hidup AWS Control Tower dan notifikasi (Peristiwa Siklus Hidup di AWS Control Tower) untuk memastikan bahwa penerapan sumber daya tetap sinkron dengan landing zone Anda.

Dokumentasi penerapan untuk arsitektur solusi AWS Control Tower ini tersedia melalui halaman web AWS Solusi.

Ketersediaan umum AWS Control Tower versi 2.3

Maret 5, 2020

(Pembaruan diperlukan untuk landing zone AWS Control Tower. Untuk informasi, lihatPerbarui Zona Pendaratan Anda.)

AWS Control Tower sekarang tersedia di Wilayah Asia Pasifik (Sydney), selain AWS Wilayah AS Timur (Ohio), AS Timur (Virginia N.), AS Barat (Oregon), dan Eropa (Irlandia). Penambahan Wilayah Asia Pasifik (Sydney) adalah satu-satunya perubahan yang diperkenalkan untuk AWS Control Tower versi 2.3.

Jika Anda belum pernah menggunakan AWS Control Tower sebelumnya, Anda dapat meluncurkannya hari ini di salah satu Wilayah yang didukung. Jika Anda sudah menggunakan AWS Control Tower dan ingin memperluas fitur tata kelola ke Wilayah Asia Pasifik (Sydney) di akun Anda, buka halaman Pengaturan di dasbor AWS Control Tower Anda. Dari sana, perbarui landing zone Anda ke rilis terbaru. Kemudian, perbarui akun Anda satu per satu.

> **Note**
>
> Memperbarui landing zone Anda tidak secara otomatis memperbarui akun Anda. Jika Anda memiliki lebih dari beberapa akun, pembaruan yang diperlukan dapat memakan waktu. Oleh karena itu, kami menyarankan agar Anda menghindari perluasan landing zone AWS Control Tower Anda ke Wilayah di mana Anda tidak memerlukan beban kerja Anda untuk dijalankan.

Untuk informasi tentang perilaku yang diharapkan dari kontrol detektif sebagai hasil dari penyebaran ke Wilayah baru, lihat. Konfigurasikan Wilayah AWS Control Tower

Penyediaan akun satu langkah di AWS Control Tower

Maret 2, 2020

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower)

AWS Control Tower sekarang mendukung penyediaan akun satu langkah melalui konsol AWS Control Tower. Fitur ini memungkinkan Anda untuk menyediakan akun baru dari dalam konsol AWS Control Tower.

Untuk menggunakan formulir yang disederhanakan, navigasikan ke Account Factory di konsol AWS Control Tower, lalu pilih Penyediaan akun Cepat. AWS Control Tower menetapkan alamat email yang sama ke akun yang disediakan dan pengguna masuk tunggal (IAM Identity Center) yang dibuat untuk akun tersebut. Jika Anda mengharuskan kedua alamat email ini berbeda, Anda harus menyediakan akun Anda melalui Service Catalog.

Perbarui akun yang Anda buat melalui penyediaan akun cepat dengan menggunakan Service Catalog dan pabrik akun AWS Control Tower, sama seperti pembaruan ke akun lainnya.

> **Note**
>
> Pada April 2020, kemampuan penyediaan akun Cepat diubah namanya menjadi akun Daftarkan. Pada Juni 2022, kemampuan untuk membuat dan memperbarui akun di konsol AWS Control Tower dipisahkan dari kemampuan untuk mendaftarkan AWS akun. Untuk informasi selengkapnya, lihat Daftarkan akun yang ada.

Alat penonaktifan AWS Control Tower

Februari 28, 2020

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower)

AWS Control Tower sekarang mendukung alat penonaktifan otomatis untuk membantu Anda membersihkan sumber daya yang dialokasikan oleh AWS Control Tower. Jika Anda tidak lagi berniat menggunakan AWS Control Tower untuk perusahaan Anda, atau jika Anda memerlukan pemindahan besar-besaran sumber daya organisasi Anda, Anda mungkin ingin membersihkan sumber daya yang dibuat saat pertama kali menyiapkan landing zone.

Untuk menonaktifkan landing zone Anda dengan menggunakan proses yang sebagian besar otomatis, hubungi AWS Support untuk mendapatkan bantuan dengan langkah-langkah tambahan yang diperlukan. Untuk informasi lebih lanjut tentang penonaktifan, lihat. Panduan: Menonaktifkan Zona Pendaratan AWS Control Tower

Pemberitahuan acara siklus hidup AWS Control Tower

Januari 22, 2020

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower)

AWS Control Tower mengumumkan ketersediaan notifikasi peristiwa siklus hidup. Peristiwa siklus hidup menandai penyelesaian tindakan AWS Control Tower yang dapat mengubah status sumber daya seperti unit organisasi (OU), akun, dan kontrol yang dibuat dan dikelola oleh AWS Control Tower. Peristiwa siklus hidup direkam sebagai AWS CloudTrail peristiwa dan dikirimkan ke Amazon EventBridge sebagai peristiwa.

AWS Control Tower mencatat peristiwa siklus hidup setelah menyelesaikan tindakan berikut yang dapat dilakukan menggunakan layanan: membuat atau memperbarui landing zone; membuat atau menghapus OU; mengaktifkan atau menonaktifkan kontrol pada OU; dan menggunakan pabrik akun untuk membuat akun baru atau memindahkan akun ke OU lain.

AWS Control Tower menggunakan beberapa AWS layanan untuk membangun dan mengatur lingkungan multi-akun AWS praktik terbaik. Diperlukan waktu beberapa menit untuk menyelesaikan tindakan AWS Control Tower. Anda dapat melacak peristiwa siklus hidup di CloudTrail log untuk memverifikasi apakah tindakan AWS Control Tower yang berasal berhasil diselesaikan. Anda dapat membuat EventBridge aturan untuk memberi tahu Anda saat CloudTrail merekam peristiwa siklus hidup atau untuk secara otomatis memicu langkah berikutnya dalam alur kerja otomatisasi Anda.

Januari - Desember 2019

Mulai 1 Januari hingga 31 Desember 2019, AWS Control Tower merilis pembaruan berikut:

- Ketersediaan umum AWS Control Tower versi 2.2
- Kontrol elektif baru di AWS Control Tower
- Kontrol detektif baru di AWS Control Tower
- AWS Control Tower menerima alamat email untuk akun bersama dengan domain berbeda dari akun manajemen
- Ketersediaan umum AWS Control Tower versi 2.1

Ketersediaan umum AWS Control Tower versi 2.2

November 13, 2019

(Pembaruan diperlukan untuk landing zone AWS Control Tower. Untuk informasi, lihatPerbarui Zona Pendaratan Anda.)

AWS Control Tower versi 2.2 menyediakan tiga kontrol preventif baru yang mencegah penyimpangan di akun:

- Larang Perubahan pada Grup CloudWatch Log Amazon Logs yang disiapkan oleh AWS Control Tower
- Larang Penghapusan Otorisasi Agregasi AWS Config yang Dibuat oleh AWS Control Tower
- Larang Penghapusan Arsip Log

Kontrol adalah aturan tingkat tinggi yang menyediakan tata kelola berkelanjutan untuk lingkungan Anda secara keseluruhan AWS . Saat Anda membuat landing zone AWS Control Tower, landing zone dan semua unit organisasi (OU), akun, dan sumber daya sesuai dengan aturan tata kelola yang diberlakukan oleh kontrol yang Anda pilih. Saat Anda dan anggota organisasi Anda menggunakan landing zone, perubahan (disengaja atau disengaja) dalam status kepatuhan ini dapat terjadi. Deteksi drift membantu Anda mengidentifikasi sumber daya yang memerlukan perubahan atau pembaruan konfigurasi untuk menyelesaikan penyimpangan. Untuk informasi selengkapnya, lihat Mendeteksi dan mengatasi penyimpangan di AWS Control Tower.

Kontrol elektif baru di AWS Control Tower

September 05, 2019

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower)

AWS Control Tower sekarang mencakup empat kontrol elektif baru berikut:

- Larang Hapus Tindakan di Bucket Amazon S3 Tanpa MFA
- Larang Perubahan Konfigurasi Replikasi untuk Bucket Amazon S3
- Larang Tindakan sebagai Pengguna Root
- Larang Pembuatan Kunci Akses untuk Pengguna Root

Kontrol adalah aturan tingkat tinggi yang menyediakan tata kelola berkelanjutan untuk lingkungan Anda secara keseluruhan AWS . Guardrails memungkinkan Anda untuk mengekspresikan niat kebijakan Anda. Untuk informasi selengkapnya, lihat Tentang kontrol di AWS Control Tower.

Kontrol detektif baru di AWS Control Tower

Agustus 25, 2019

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower)

AWS Control Tower sekarang mencakup delapan kontrol detektif baru berikut:

- Deteksi Apakah Pembuatan Versi untuk Bucket Amazon S3 Diaktifkan
- Mendeteksi Apakah MFA Diaktifkan untuk Pengguna AWS IAM Konsol AWS
- Mendeteksi Apakah MFA Diaktifkan untuk AWS Pengguna IAM
- Mendeteksi Apakah Optimasi Amazon EBS Diaktifkan untuk Instans Amazon EC2
- Mendeteksi Apakah Volume Amazon EBS Terlampir ke Instans Amazon EC2
- Mendeteksi Apakah Akses Publik ke Instans Basis Data Amazon RDS Diaktifkan
- Deteksi Apakah Akses Publik ke Snapshot Basis Data Amazon RDS Diaktifkan
- Mendeteksi Apakah Enkripsi Penyimpanan Diaktifkan untuk Instans Basis Data Amazon RDS

Kontrol adalah aturan tingkat tinggi yang menyediakan tata kelola berkelanjutan untuk lingkungan Anda secara keseluruhan AWS . Kontrol detektif mendeteksi ketidakpatuhan sumber daya dalam akun Anda, seperti pelanggaran kebijakan, dan memberikan peringatan melalui dasbor. Untuk informasi selengkapnya, lihat Tentang kontrol di AWS Control Tower.

AWS Control Tower menerima alamat email untuk akun bersama dengan domain berbeda dari akun manajemen

Agustus 01, 2019

(Tidak diperlukan pembaruan untuk landing zone AWS Control Tower)

Di AWS Control Tower, Anda sekarang dapat mengirimkan alamat email untuk akun bersama (arsip log dan anggota audit) dan akun anak (dijual menggunakan pabrik akun) yang domainnya berbeda dari alamat email akun manajemen. Fitur ini hanya tersedia saat Anda membuat landing zone baru dan saat Anda menyediakan akun anak baru.

Ketersediaan umum AWS Control Tower versi 2.1

Juni 24, 2019

(Pembaruan diperlukan untuk landing zone AWS Control Tower. Untuk informasi, lihatPerbarui Zona Pendaratan Anda.)

AWS Control Tower sekarang tersedia secara umum dan didukung untuk penggunaan produksi. AWS Control Tower ditujukan untuk organisasi dengan banyak akun dan tim yang mencari cara termudah untuk mengatur AWS lingkungan multi-akun baru mereka dan mengatur dalam skala besar. Dengan AWS Control Tower, Anda dapat membantu memastikan bahwa akun di organisasi Anda sesuai dengan kebijakan yang ditetapkan. Pengguna akhir di tim terdistribusi dapat menyediakan AWS akun baru dengan cepat.

Dengan AWS Control Tower, Anda dapat menyiapkan landing zone yang menggunakan praktik terbaik seperti mengonfigurasi struktur multi-akun menggunakan AWS Organizations, mengelola identitas pengguna, dan akses gabungan, mengaktifkan penyediaan akun melalui Service Catalog AWS IAM Identity Center, dan membuat arsip log terpusat menggunakan dan. AWS CloudTrail AWS Config

Untuk tata kelola yang sedang berlangsung, Anda dapat mengaktifkan kontrol pra-konfigurasi, yang merupakan aturan yang jelas untuk keamanan, operasi, dan kepatuhan. Guardrails membantu mencegah penyebaran sumber daya yang tidak sesuai dengan kebijakan dan terus memantau sumber daya yang diterapkan untuk ketidaksesuaian. Dasbor AWS Control Tower menyediakan visibilitas terpusat ke AWS lingkungan termasuk akun yang disediakan, kontrol diaktifkan, dan status kepatuhan akun.

Anda dapat mengatur lingkungan multi-akun baru dengan satu klik di konsol AWS Control Tower. Tidak ada biaya tambahan atau komitmen di muka untuk menggunakan AWS Control Tower. Anda hanya membayar untuk AWS layanan yang diaktifkan untuk menyiapkan landing zone dan menerapkan kontrol yang dipilih.

Riwayat dokumen

- Pembaruan dokumentasi terbaru: 22 Februari 2024

Tabel berikut menjelaskan perubahan penting pada Panduan Pengguna AWS Control Tower. Untuk notifikasi tentang pembaruan dokumentasi, Anda dapat berlangganan ke umpan RSS.

Perubahan	Deskripsi	Tanggal
Menandai `EnabledControl` sumber daya di AWS CloudFormation	AWS Control Tower mendukung penambahan tag ke `EnabledControl` sumber daya, melalui AWS CloudFormation templat.	Februari 22, 2024
API dasar tersedia	AWS Control Tower merilis API baru untuk mendaftarkan OU secara terprogram.	Februari 14, 2024
AWS Control Tower landing zone versi 3.3	AWS Control Tower landing zone versi 3.3 tersedia.	14 Desember 2023
AWS Control Tower mengumumkan kontrol untuk membantu kedaulatan digital	AWS Control Tower merilis sekelompok kontrol untuk membantu pelanggan dengan persyaratan kedaulatan digital.	27 November 2023
AWS Control Tower mendukung API landing zone	AWS Control Tower mendukung konfigurasi dan peluncuran zona pendaratan menggunakan API baru.	26 November 2023
AWS Control Tower mendukung kontrol yang diaktifkan penandaan	AWS Control Tower mendukung penandaan kontrol yang diaktifkan, di konsol dan dengan API baru.	10 November 2023

AWS Control Tower tersedia di Asia Pasifik (Melbourne) Wilayah AWS	Tersedia di Wilayah Asia Pasifik (Melbourne).	3 November 2023
API kontrol baru tersedia	AWS Control Tower merilis API kontrol baru.	Oktober 14, 2023
AWS Control Tower meluncurkan kontrol baru	AWS Control Tower merilis kontrol proaktif dan detektif baru.	5 Oktober 2023
AWS Control Tower melaporkan penyimpangan dari menonaktifkan akses tepercaya	AWS Control Tower memberi tahu pelanggan saat drift terjadi, jika pelanggan mematikan akses tepercaya ke AWS Control Tower di. AWS Organizations	21 September 2023
AWS Control Tower tersedia dalam empat tambahan Wilayah AWS	Tersedia di Asia Pasifik (Hyderabad), Eropa (Spanyol dan Zurich), dan Timur Tengah (UEA).	13 September 2023
AWS Control Tower tersedia di Wilayah Tel Aviv	AWS Control Tower tersedia di Wilayah Tel Aviv, il-central-1.	28 Agustus 2023
AWS Control Tower meluncurkan 28 kontrol proaktif baru	AWS Control Tower merilis 28 kontrol proaktif baru.	Juli 24, 2023
AWS Control Tower menghentikan 2 kontrol	AWS Control Tower akan menghapus dua kontrol dari pustaka kontrol, efektif 18 Agustus 2023.	Juli 18, 2023
AWS Control Tower landing zone 3.2 tersedia	AWS Control Tower landing zone versi 3.2 tersedia.	Juni 16, 2023

AWS Control Tower menangani akun berdasarkan ID	AWS Control Tower melacak ID AWS akun, bukan alamat email akun.	Juni 14, 2023
Kontrol detektif Security Hub tambahan tersedia	AWS Control Tower menambahkan sepuluh kontrol baru ke pustaka kontrol, untuk Standar yang Dikelola Layanan Security Hub: AWS Control Tower.	12 Juni 2023
AWS Control Tower menerbitkan tabel metadata kontrol	AWS Control Tower sekarang menyediakan tabel metadata kontrol sebagai bagian dari dokumentasi yang diterbitkan.	Juni 7, 2023
Dukungan Terraform untuk Kustomisasi Account Factory	Dukungan wilayah tunggal untuk cetak biru sumber terbuka Terraform di AFC.	6 Juni 2023
AWS Manajemen mandiri IAM tersedia untuk landing zone	AWS Control Tower kini mendukung pelanggan dalam memilih penyedia identitas mereka untuk landing zone.	6 Juni 2023
Peran baru ditambahkan	AWS Control Tower menambahkan peran terkait layanan baru AWSServiceRoleForAWSControlTower, dan kebijakan terkait,. AWSControlTowerAccountServiceRolePolicy	1 Juni 2023
Pembaruan tata kelola campuran	Pembaruan untuk memberi tahu pelanggan tentang tata kelola campuran.	1 Juni 2023

Tersedia kontrol proaktif tambahan	Kontrol proaktif baru membantu Anda dalam mengatur lingkungan multi-akun Anda dan memenuhi tujuan kontrol tertentu.	19 Mei 2023
Tujuh Wilayah tambahan tersedia	AWS Control Tower sekarang tersedia dalam tujuh tambahan Wilayah AWS: California Utara (San Francisco), Asia Pasifik (Hong Kong, Jakarta, dan Osaka), Eropa (Milan), Timur Tengah (Bahrain), dan Afrika (Cape Town).	19 April 2023
Ubah ke kebijakan terkelola	Kami mengubah AWSControlTowerServiceRolePolicysehingga AWS Control Tower dapat memanggil`EnableRegion` ,`ListRegions` , `GetRegionOptStatus` API yang diimplementasikan oleh layanan Manajemen AWS Akun.	6 April 2023
Penelusuran permintaan kustomisasi akun umumnya tersedia	AWS Control Tower sekarang mendukung kemampuan untuk melacak permintaan penyesuaian akun menggunakan alur kerja Account Factory for Terraform (AFT).	16 Februari 2023

Pembaruan praktik terbaik IAM	Panduan yang diperbaru i untuk menyelaraskan dengan rekomendasi praktik terbaik IAM. Untuk informasi selengkapnya, lihat Praktik terbaik keamanan di IAM.	15 Februari 2023
AWS Control Tower landing zone 3.1 tersedia	AWS Control Tower landing zone 3.1 tersedia.	9 Februari 2023
Kontrol proaktif umumnya tersedia	Kontrol proaktif diluncurkan dari status pratinjau hingga ketersediaan umum.	Januari 24, 2023
Operasi akun bersamaan	AWS Control Tower sekarang mendukung hingga lima (5) tindakan bersamaan di pabrik akun. Anda dapat membuat, memperbarui, atau mendaftarkan hingga lima akun sekaligus.	16 Desember 2022
Kontrol proaktif membantu dalam penyediaan sumber daya	AWS Control Tower sekarang mendukung kontrol proaktif, diimplementasikan melalui AWS CloudFormation kait.	28 November 2022
Kustomisasi akun pabrik tersedia	AWS Control Tower sekarang mendukung penyediaan akun dengan templat akun yang dapat disesuaikan, yang disebut cetak biru, langsung dari konsol AWS Control Tower.	28 November 2022

Status kepatuhan dapat dilihat untuk semua AWS Config aturan	AWS Control Tower sekarang menampilkan status kepatuhan semua AWS Config aturan yang diterapkan ke unit organisasi yang terdaftar di AWS Control Tower.	18 November 2022
Ubah ke kebijakan terkelola	Kami mengubah AWSControlTowerServiceRolePolicysehingga AWS Control Tower dapat mengambil `AWSControlTowerBlueprintAccess` peran, yang diperlukan untuk penyesuaian Account Factory.	28 Oktober 2022
API untuk kontrol, AWS CloudFormation sumber daya	AWS Control Tower sekarang mendukung aktivasi dan penonaktifan kontrol melalui serangkaian panggilan API, dan AWS CloudFormation sumber daya baru.	September 1, 2022
CFCT mendukung penghapusan set tumpukan	CFCT mendukung penghapusan kumpulan tumpukan, dengan menetapkan parameter dalam file manifes.	26 Agustus 2022
Retensi log yang disesuaikan	Anda dapat menyesuaikan kebijakan penyimpanan untuk bucket Amazon S3 yang menyimpan CloudTrail log AWS Control Tower Anda, dalam beberapa hari atau tahun, hingga maksimal 15 tahun.	Agustus 15, 2022

Perbaikan drift peran tersedia	AWS Control Tower mendukung perbaikan untuk drift peran, tanpa perbaikan penuh dari landing zone.	Agustus 11, 2022
Versi 3.0 tersedia	AWS Control Tower landing zone versi 3.0 berubah dari jalur berbasis akun menjadi AWS CloudTrail jalur berbasis organisasi, dan memperbar ui kebijakan terkelola untuk mengaktifkan jejak tingkat organisasi. Ini memungkin kan Anda untuk mengumpul kan AWS Config informasi di Wilayah asal Anda saja. Versi 3.0 juga mencakup pembaruan ke wilayah penolakan kontrol, dan dua kontrol detektif baru.	Juli 29, 2022
Halaman Organisasi menggabungkan tampilan OU dan akun	Halaman Organisasi baru di AWS Control Tower menampilkan tampilan hierarkis semua unit Organisasi (OU) dan akun.	18 Juli 2022
Ubah ke kebijakan terkelola	Kami mengubah AWSControlTowerServiceRolePolicysehingga pelanggan dapat memiliki AWS CloudTrail jalur tingkat organisasi untuk mengumpulkan log. AWS CloudTrail	Juni 20, 2022

Mendaftar dan memperbarui akun anggota yang lebih mudah	AWS Control Tower sekarang memberi Anda kemampuan untuk mendaftarkan dan memperbarui akun anggota secara individual, dari dalam landing zone Anda. Setiap akun menunjukkan kapan tersedia untuk pembaruan . Kami memisahkan tombol Daftarkan akun dari alur kerja Buat akun di Account Factory.	31 Mei 2022
AFT mendukung kustomisasi untuk akun bersama	AWS Control Tower Account Factory untuk Terraform sekarang mendukung penyesuaian untuk akun manajemen AWS Control Tower, arsip log, dan akun audit.	Mei 27, 2022
Operasi bersamaan untuk semua kontrol opsional	AWS Control Tower sekarang memungkinkan Anda untuk menerapkan dan menghapus pagar pencegahan opsional secara bersamaan, serta kontrol detektif.	Mei 18, 2022
Akun keamanan dan pencatatan yang ada	AWS Control Tower sekarang mendukung kemampuan untuk menghadirkan akun keamanan dan logging yang ada, daripada membuat akun baru selama pengaturan landing zone.	Mei 16, 2022

Versi 2.9 tersedia	AWS Control Tower landing zone versi 2.9 memperbarui notifikasi forwarder Lambda untuk menggunakan runtime Python versi 3.9.	22 April 2022
Dukungan yang diperbarui untuk praktik AWS terbaik, versi 2.8 tersedia	AWS Control Tower landing zone versi 2.8 memberikan dukungan tambahan untuk memastikan beban kerja dan AWS akun Anda selaras dengan AWS praktik terbaik.	Februari 10, 2022
Wilayah menolak kontrol	AWS Control Tower sekarang menyertakan kontrol yang membantu Anda membatasi akses ke AWS Wilayah, untuk mengatasi masalah kepatuhan dan peraturan.	30 November 2021
Kontrol residensi data	AWS Control Tower kini mendukung kontrol yang membantu Anda mengelola residensi data dengan kontrol granular.	30 November 2021
Pabrik Akun AWS Control Tower untuk Terraform	AWS Control Tower sekarang mendukung Terraform untuk penyediaan dan pembaruan akun otomatis.	29 November 2021

Acara siklus hidup baru tersedia	`PrecheckOrganizationalUnit` Peristiwa mencatat apakah sumber daya apa pun memblokir tugas Perluas tata kelola agar tidak berhasil, termasuk sumber daya di OU bersarang.	18 November 2021
OU bersarang tersedia	AWS Control Tower sekarang memungkinkan landing zone Anda berisi struktur OU bersarang.	November 16, 2021
Konkurensi kontrol detektif	Kontrol detektif AWS Control Tower sekarang mendukung mengaktifkan dan menonaktifkan operasi secara bersamaan.	November 5, 2021
Dua wilayah baru tersedia	AWS Control Tower sekarang tersedia di dua AWS Wilayah baru, Wilayah Eropa (Paris) dan Wilayah Amerika Selatan (São Paulo).	29 Juli 2021
Pencabutan wilayah	Anda dapat membatalkan pilihan AWS Wilayah yang tidak lagi ingin Anda atur melalui AWS Control Tower.	29 Juli 2021
Kunci KMS tersedia	Anda dapat secara opsional membuat atau memilih kunci KMS yang Anda kelola, untuk mengenkripsi data dan sumber daya Anda.	28 Juli 2021

Ubah ke kebijakan terkelola	Kami mengubah AWSControlTowerServiceRolePolicysehingga pelanggan dapat menggunakan kunci enkripsi KMS mereka sendiri untuk AWS CloudTrail log.	28 Juli 2021
Nama kontrol berubah, fungsionalitas tidak berubah	Nama dan deskripsi kontrol tertentu diperbarui untuk lebih mencerminkan niat kebijakan kontrol, tanpa perubahan fungsionalitas.	26 Juli 2021
Pemindaian otomatis SCP terkelola	AWS Control Tower melakukan pemindaian otomatis harian SCP terkelola untuk memeriksa penyimpangan.	11 Mei 2021
Nama yang disesuaikan untuk OU dan akun	AWS Control Tower memungkinkan Anda memberikan nama yang disesuaikan selama proses penyiapan landing zone, untuk OU dan akun penting, tanpa membuat drift.	16 April 2021
Menonaktifkan landing zone adalah layanan mandiri	AWS Control Tower sekarang memungkinkan Anda untuk menonaktifkan landing zone tanpa menghubungi AWS Support. Penonaktifan adalah proses semi-otomatis yang tidak dapat dibatalkan. Ini tidak sama dengan menghapus semua sumber daya AWS Control Tower secara manual.	9 April 2021

Tiga Wilayah tambahan	AWS Control Tower kini tersedia di tiga AWS Wilayah tambahan: Wilayah Asia Pasifik (Tokyo), Wilayah Asia Pasifik (Seoul), dan Wilayah Asia Pasifik (Mumbai).	8 April 2021
Kontrol Arsip Log baru, landing zone versi 2.7 tersedia	Empat kontrol Arsip Log baru menyediakan tata kelola Arsip Log atas sumber daya AWS Control Tower, terpisah dari tata kelola sumber daya di luar AWS Control Tower. Panduan tentang empat kontrol yang ada telah berubah dari wajib menjadi pilihan. Versi 2.7 dari AWS Control Tower landing zone menyertakan persyarat an untuk HTTPS, yang tidak dapat dibatalkan setelah Anda memperbarui.	8 April 2021
Pemilihan wilayah	Pemilihan Wilayah AWS Control Tower memberika n kemampuan yang lebih baik untuk mengelola jejak geografis sumber daya AWS Control Tower Anda. Untuk memperluas jumlah Wilayah tempat Anda menampung AWS sumber daya atau beban kerja — untuk kepatuhan, peraturan, biaya, atau alasan lainnya — Anda sekarang dapat memilih Wilayah tambahan yang akan diatur.	19 Februari 2021

Daftarkan OU dan atur semua akunnya dengan AWS Control Tower sekaligus	AWS Control Tower menambahkan kemampuan untuk mendaftarkan OU, yang merupakan cara untuk membawa beberapa akun ke dalam tata kelola pada saat yang bersamaan.	28 Januari 2021
Beberapa pembaruan akun di OU terdaftar	Anda sekarang dapat memperbarui semua akun di unit AWS Organizations organisasi terdaftar (OU) yang berisi hingga 300 akun, dengan satu klik, dari dasbor AWS Control Tower. Fitur pembaruan beberapa akun, juga disebut sebagai pembaruan massal, menghilangkan kebutuhan untuk memperbarui satu akun pada satu waktu, atau menggunakan skrip eksternal untuk melakukan pembaruan pada beberapa akun secara bersamaan.	28 Januari 2021
Peran baru untuk menggabungkan OU dan akun yang tidak dikelola	Peran baru membantu dalam mendeteksi AWS Config aturan eksternal, sehingga AWS Control Tower tidak perlu mendapatkan akses ke akun yang tidak dikelola.	29 Desember 2020

AWS Control Tower tersedia di lebih banyak AWS Wilayah.	AWS Control Tower sekarang tersedia untuk digunakan di Wilayah Asia Pasifik (Singapura), Wilayah Eropa (Frankfurt), Wilayah Eropa (London), Wilayah Eropa (Stockholm), dan Wilayah Kanada (Tengah). Dengan peluncuran ini AWS Control Tower sekarang tersedia di 10 AWS Wilayah. Pembaruan landing zone ini mencakup semua Wilayah yang terdaftar, dan tidak dapat dibatalkan. Setelah memperbarui landing zone ke versi 2.5, Anda harus memperbarui secara manual semua akun AWS Control Tower yang terdaftar untuk mengatur di 10 Wilayah yang didukung AWS .	18 November 2020
Kontrol pembaruan	Versi yang diperbarui telah dirilis untuk kontrol wajib`AWS-GR_IAM_ROLE_CHANGE_PROHIBITED` . Kontrol yang diperbarui memungkinkan pendaftaran akun otomatis yang lebih mudah.	8 Oktober 2020

Halaman informasi terkait sekarang tersedia untuk AWS Control Tower	Halaman informasi terkait memudahkan Anda menemukan tugas umum yang mungkin bermanfaat setelah menyiapkan landing zone AWS Control Tower Anda.	18 September 2020
Konsol AWS Control Tower menampilkan detail lebih lanjut tentang OU dan akun.	Dalam konsol AWS Control Tower, Anda dapat melihat detail lebih lanjut tentang AWS akun dan unit organisas i (OU) Anda. Halaman 'Akun' sekarang mencantumkan semua akun di organisas i Anda, terlepas dari status OU atau pendaftaran di AWS Control Tower. Anda sekarang dapat mencari, mengurutkan, dan memfilter di semua tabel.	22 Juli 2020
AWS Control Tower memungkinkan organisasi yang ada untuk menyiapkan landing zone	Anda sekarang dapat meluncurkan landing zone untuk AWS Control Tower di organisasi yang ada, untuk membawa organisas i ke dalam tata kelola. Kemampuan penyediaan akun Cepat di AWS Control Tower diubah namanya menjadi akun Enroll dan sekarang memungkinkan pendaftar an akun yang ada serta pembuatan AWS akun baru.	16 April 2020

AWS Control Tower sekarang tersedia di Asia Pasifik	AWS Control Tower sekarang tersedia untuk digunakan di AWS Wilayah Asia Pasifik (Sydney). Rilis ini memerlukan pembaruan manual untuk akun vended, pembaruan hanya jika Anda berencana untuk menjalankan beban kerja di Asia Pasifik (Sydney).	3 Maret 2020
Menonaktifkan zona landing zone AWS Control Tower dimungkinkan	AWS Support dapat membantu Anda menonaktifkan landing zone secara permanen melalui proses yang sebagian besar otomatis yang menjaga organisasi Anda, meskipun beberapa pembersihan manual diperlukan.	27 Februari 2020
Penyediaan akun cepat tersedia di AWS Control Tower	Penyediaan akun cepat memudahkan peluncuran akun anggota baru saat landing zone Anda diperbarui, dengan fitur akun Daftarkan.	20 Februari 2020
Peristiwa siklus hidup dilacak di AWS Control Tower	Peristiwa siklus hidup memberikan detail tambahan untuk peristiwa AWS Control Tower tertentu, untuk mempermudah otomatisasi alur kerja.	12 Desember 2019
Halaman Pengaturan dan Aktivitas tersedia untuk AWS Control Tower	Halaman Pengaturan dan Aktivitas memudahkan untuk memperbarui landing zone Anda dan melihat peristiwa yang dicatat.	November 30, 2019

Kontrol pencegahan tambahan tersedia untuk AWS Control Tower	Kontrol preventif di AWS Control Tower menjaga organisasi dan sumber daya Anda selaras dengan lingkungan Anda.	6 September 2019
Kontrol detektif tambahan tersedia untuk AWS Control Tower	Kontrol Detektif di AWS Control Tower memberikan informasi tentang status organisasi dan sumber daya Anda.	27 Agustus 2019
AWS Control Tower sekarang tersedia secara umum	AWS Control Tower adalah layanan yang menawarkan cara termudah untuk mengatur dan mengatur AWS lingkungan multi-akun Anda dalam skala besar.	24 Juni 2019

Wilayah AWS ketersediaan untuk kontrol AWS Control Tower

Bagian ini berisi tabel yang menunjukkan Wilayah AWS ketersediaan untuk kontrol. Ingatlah bahwa setiap kontrol memiliki pengenal API unik untuk setiap Wilayah tempat AWS Control Tower tersedia. Saat Anda bekerja dengan API kontrol, berikan pengenal untuk Wilayah tempat Anda melakukan panggilan API.

Terakhir diperbarui 28 Maret 2024.

af-south-1

Pengenal kontrol, ARN, dan Wilayah yang didukung
• AWS-GR_AUDIT_BUCKET_DELETION_DILARANG • arn:aws:controltower:af-selatan-1: :kontrol/aws-gr_audit_bucket_deletion_banned • af-south-1, ap-east-1, ap-northeast-1, ap-northeast-2, ap-northeast-1, ap-south-1, ap-southeast-1, ap-southeast-2, ap-southeast-3, ap-southeast-1, eu-central-1, eu-central-1, eu-central-2, eu-north-1, eu-south-1, eu-south-2, eu-west-1, eu-west-2, eu-west-1, me-central-1, saya-south-1, sa-east-1, sa-east-1, us-east-1, us-east-2, us-west-1, us-west-2
