What Is AWS Import/Export?

AWS Import/Export is a service that accelerates transferring large amounts of data into and out of AWS using physical storage appliances, bypassing the Internet. AWS Import/Export supports transfers data directly onto and off of storage devices you own using the Amazon high-speed internal network.

Overview of AWS Import/Export

AWS Import/Export accelerates transferring data between the AWS cloud and portable storage devices that you mail to us. AWS Import/Export is a good choice if you have 16 terabytes (TB) or less of data to import into Amazon Simple Storage Service or Amazon Elastic Block Store (Amazon EBS). You can also export data from Amazon S3 with AWS Import/Export.

Your data load typically begins the next business day after your storage device arrives at AWS. After the data export or import completes, we return your storage device. For most data sets, AWS Import/Export can be significantly faster than Internet transfer and more cost-effective than upgrading your connectivity. AWS Import/Export does not support export from Amazon EBS.

Important
This guide assumes that you are an Amazon S3 user or an Amazon Elastic Compute Cloud (EC2) user for Amazon EBS data. If that is not the case, see the Amazon S3 Getting Started Guide or Amazon EC2 Getting Started Guide for Amazon EBS data.

As an alternative, AWS Snowball (Snowball), is generally faster and cheaper to use than AWS Import/Export for importing data into Amazon Simple Storage Service (Amazon S3). For more information on Snowball, see the AWS Snowball User Guide.

AWS Import/Export Functionality

Using AWS Import/Export provides the following functionality:

- **Migrate up to 16 TB of data per job into the AWS Cloud** – Mail us one or more storage devices with your data on them. We load your data to the AWS cloud, and then return your storage device(s).
- **Content Distribution** – We can export data from Amazon S3 onto one or more of your storage devices for delivery to your customers.
- **Direct Data Interchange** – If you regularly receive content on portable storage devices from your business associates, you can have them send it directly to AWS for import into Amazon EBS or Amazon S3.
- **Off-Site Backup** – Send full or incremental backups to Amazon S3 for reliable and redundant off-site storage.
- **Disaster Recovery** – In the event you need to quickly retrieve a large backup stored in Amazon S3, use AWS Import/Export to transfer the data to a portable storage device and deliver it to your site.

Are you a first-time user of AWS Import/Export?

If you are a first-time user of the AWS Import/Export, these links will help you get started quickly.

- Creating Amazon S3 Import Jobs (p. 27)
Available Tools, Libraries, and Interfaces

AWS Import/Export provides a command line tool for creating import and export jobs, without writing any code. For applications requiring programming interface, AWS SDK provides Java, .NET and PHP libraries to create and manage import and export jobs. You can also optionally use the REST interface when working with AWS Import/Export.

There are also third party tools that support AWS Import/Export. For more information, go to http://aws.amazon.com/importexport/disk/tools.

AWS Import/Export Jobs

Topics

- Jobs Overview (p. 2)
- Encryption (p. 2)
- Job Types (p. 3)
- Related Concepts (p. 4)

This section describes AWS Import/Export jobs and job types.

Jobs Overview

You create an AWS Import/Export job in two steps. First, you submit a job request to AWS. Each AWS Import/Export job corresponds to exactly one storage device. You submit your job request by using the AWS Import/Export command line tool, which requires no programming. If your application requires a programmatic interface, you can use the AWS SDK or the REST API. Second, you send your storage device to AWS. We use our high bandwidth network to import your data into AWS or export data from AWS to your storage device, then return your device.

You must submit a separate job request for each device.

Note

You can send multiple devices in the same shipment. If you do, however, there are specific guidelines and limitations that govern what devices you can ship and how your devices must be packaged. If your shipment is not prepared and packed correctly, AWS Import/Export cannot process your jobs. Regardless of how many devices you ship at one time, you must submit a separate job request for each device. For complete details about packaging requirements when shipping multiple devices, see Shipping Multiple Devices (p. 61).

Encryption

For added security, AWS Import/Export supports the following data encryption methods:

PIN-code encryption

Hardware-based device encryption that uses a physical PIN pad for access to the data.

TrueCrypt software encryption

Disk encryption using TrueCrypt, which is an open-source encryption application.
AWS Import/Export requires encryption with all export jobs. For export jobs, you can use either hardware encryption or software encryption. Optionally, you can use both methods.

We strongly recommend encrypting your data for all import jobs.

For import to Amazon S3, AWS supports device-level encryption using PIN-code encryption or TrueCrypt software encryption, or both. If you prefer, you can encrypt the file objects on your device using any software encryption you choose. AWS must be able to list the objects on your device without having to decrypt the device, but we do not decrypt the objects.

For import to Amazon EBS, AWS supports device-level encryption using PIN-code encryption or software encryption of your choice, or both. AWS does not decrypt software-encrypted devices when importing to Amazon EBS; rather we import a direct copy of the complete device.

When you create an import or export job, you must provide the PIN code or password for the encryption method you choose. For more information, see Encrypting Your Data (p. 57).

### Job Types

For each job type, the following table summarizes the source of the data, either your device or an Amazon S3 bucket, where the data will be moved to, and the result you can expect when the job is complete.

#### Import to Amazon S3

<table>
<thead>
<tr>
<th>Source</th>
<th>Target</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Files on a device file system.</td>
<td>• Objects in an existing Amazon S3 bucket.</td>
<td>• One object for each file.</td>
</tr>
<tr>
<td>• One device per import job.</td>
<td>• One bucket per import job.</td>
<td>• Files and directories can be excluded or renamed using manifest file options.</td>
</tr>
<tr>
<td>• We recommend encrypting your data. See Encrypting Your Data (p. 57).</td>
<td>• If you encrypted your data, AWS decrypts the data before performing the import.</td>
<td>• AWS erases your device after every import job prior to shipping.</td>
</tr>
</tbody>
</table>

#### Export from Amazon S3

<table>
<thead>
<tr>
<th>Source</th>
<th>Target</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Objects in one or more Amazon S3 buckets.</td>
<td>• Files on your storage device.</td>
<td>• One file for each object.</td>
</tr>
<tr>
<td>• You can export from multiple buckets for each export job.</td>
<td>• One device per export job.</td>
<td>• You can export from more than one bucket and specify which files to export using manifest file options.</td>
</tr>
<tr>
<td>• AWS requires device encryption on all export jobs. See Encrypting Your Data (p. 57).</td>
<td>• AWS formats your device.</td>
<td>• You will need to use one of the supported encryption mechanisms to access the encrypted files.</td>
</tr>
<tr>
<td></td>
<td>• AWS copies your data to an encrypted device or to an encrypted file container on your device, or both.</td>
<td></td>
</tr>
</tbody>
</table>

#### Import to Amazon EBS

<table>
<thead>
<tr>
<th>Source</th>
<th>Target</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Entire device.</td>
<td>• One Amazon EBS snapshot.</td>
<td>• One snapshot per import job.</td>
</tr>
<tr>
<td>• One device per import job.</td>
<td>• One snapshot per import job.</td>
<td>• If you send a PIN-code protected device, AWS will use the PIN code you provide to access the device.</td>
</tr>
<tr>
<td>• We recommend encrypting your device.</td>
<td>• If your data is encrypted using software encryption, AWS does not decrypt your data.</td>
<td>• If your data is encrypted using software encryption, AWS does not decrypt your data.</td>
</tr>
</tbody>
</table>
Important
An Amazon EBS import creates a virtual copy of your device as a single image. The maximum size of an Amazon EBS volume is 16 TB. Note that the maximum capacity of a device is independent of the amount of data stored on the device.

Related Concepts

- To learn more about Amazon S3, see Introduction to Amazon S3.
- To learn more about Amazon EBS, go to Amazon Elastic Block Store.
- If you need assistance with your AWS Import/Export job, contact AWS Support Center.

Pricing

You are not charged for the time required to erase your device following an import, and you are not charged for the time required to decrypt or encrypt your device.

Return Shipping

Return shipping charges are dependent on the location of your AWS storage and your return shipping destination. Any applicable return shipping expenses will be charged once your package is ready for shipment to your return shipping address.
Getting Started

The Getting Started section provides step-by-step instructions to set up and create an AWS Import/Export job.

Before You Use AWS Import/Export

AWS Import/Export supports data upload and download from Amazon Simple Storage Service (Amazon S3) buckets and data upload to Amazon Elastic Block Store (Amazon EBS) snapshots. The AWS Import/Export Getting Started steps assume you already use Amazon S3 or Amazon EBS.

Using AWS Import/Export With Amazon S3

To upload or download data from Amazon S3, you need to be familiar with Amazon S3, have an existing Amazon S3 account, and own the Amazon S3 buckets that the data will be imported into, or out of. For more information, see the Amazon S3 Getting Started Guide.

Using AWS Import/Export With Amazon EBS

To upload data to an Amazon EBS snapshot for Amazon EC2, you need to have an existing Amazon EC2 instance to associate with the data, and an Amazon S3 bucket to store AWS Import/Export log files. For more information about Amazon EC2 and Amazon EBS, see Amazon Elastic Block Store.

Logging Imports and Exports

You must own the Amazon S3 bucket that you use for logging.

Sign Up for AWS

To use AWS Import/Export, you need an AWS account. If you already have an AWS account, you are automatically signed up for the AWS Import/Export service. If you do not have an AWS account, see the Amazon Web Services home page to sign up.

Next: Download the AWS Import/Export Web Service Tool (p. 6).
Download the AWS Import/Export Web Service Tool

You can create an AWS Import/Export job using a command line tool, which requires no programming. If your application requires programmatic access, you can use the AWS SDK for Java or the REST API to send requests to AWS. This getting started uses the AWS Import/Export Web Service Tool, an open-source command line tool for creating and managing your import and export jobs.

**Important**
The AWS Import/Export Web Service Tool requires Java SE 8 to run.

**To download the AWS Import/Export Web Service Tool**

2. Extract the zipped content to a directory on your computer.

You also have the option of using the AWS Command Line Interface (AWS CLI) to create and manage your AWS Import/Export jobs. For information on installing and using the AWS CLI, see Getting Set Up with the AWS Command Line Interface in the AWS Command Line Interface User Guide. The AWS CLI reference for AWS Import/Export commands, along with helpful examples, can be found in the importexport commands section of the AWS CLI Reference.

Your next task is to add your AWS credentials to the AWSCredentials.properties file.

Next: Save Your Credentials to a File (p. 6).

Save Your Credentials to a File

AWS Import/Export uses AWS Identity and Access Management (IAM) to control which users in your AWS account can create, modify, view, or cancel AWS Import/Export jobs. We strongly recommend that you create IAM users and use the credentials for those IAM users to create and manage AWS Import/Export jobs. For more information, see Controlling Access to AWS Import/Export Jobs (p. 22).
In this step, you will add your AWS IAM user credentials to the AWSCredentials.properties file that the AWS Import/Export Web Service Tool provides for you. The following procedure takes you through the necessary steps.

**To save your access credentials to a file**

1. Locate your IAM access credentials. If you do not have IAM access credentials, you will need to create them or have someone who has permission to administer IAM create them for you. For more information, see *Administering Access Keys for IAM Users*.

   **Note**
   When you create an access key, it's the only opportunity you have to view and save the secret access key for that user. Make sure you download the access key and save it in a secure location. You will not be able to view the secret access key using the AWS Management Console again later; if it becomes unavailable, you will have to create a new access key.

2. Go to the directory where you installed the AWS Import/Export Web Service tool.
3. Open the AWSCredentials.properties file from this directory using any text editor.
4. Update the file by providing your `accessKeyId` and `secretKey`. The following is an example of a credentials file.

   ```properties
   # Fill in your AWS Access Key ID and Secret Access Key
   # http://aws.amazon.com/security-credentials
   accessKeyId:<Your Access Key ID>
   secretKey:<Your Secret Key>
   ```

5. Save the file.

   **Important**
   To protect your credentials, be sure to save the file to a secure location. This Getting Started assumes that you saved your credentials in the same directory as the Import/Export Web Service Tool, so that directory should be in a secure location. If your credentials file is in a different location, you can modify your command line to reference that location.

Now, you are ready to create a sample import or export job.

**Next:**

- Create an Import Job (p. 8).
- Create Your First Amazon S3 Export Job (p. 16).
Create an Import Job

You can create an import job to move data from your hardware storage device to an Amazon S3 bucket or an Amazon EBS snapshot.

The following sections present the steps to accomplish the tasks for each type of import.

- To upload data to an Amazon S3 bucket that your AWS account owns: Create Your First Amazon S3 Import Job (p. 8).
- To upload data to an Amazon EBS snapshot: Create Your First Amazon EBS Import Job (p. 12).

Create Your First Amazon S3 Import Job

With an Amazon S3 import, AWS uploads individual files from your device to objects in an Amazon S3 bucket that's owned by your AWS account.

We recommend encrypting your data prior to sending it to us. For import to Amazon S3, you can provide a PIN-code protected device, or you can encrypt your data by using TrueCrypt software encryption, or both. You must provide the PIN code or password in the manifest when you create the import job. For more information, see Encrypting Your Data (p. 57).

If you encrypt your data, the data is decrypted using the PIN code or TrueCrypt password you provide. Your device's file system is mounted on an AWS Import/Export data loading station and each file is uploaded as an object in your Amazon S3 bucket. You can optionally manage directories and file names as part of the load process.

After the import operation completes, AWS Import/Export erases your device before shipping it.

You must submit a separate job request for each device.

**Note**

You can send multiple devices in the same shipment. If you do, however, there are specific guidelines and limitations that govern what devices you can ship and how your devices must be packaged. If your shipment is not prepared and packed correctly, AWS Import/Export cannot process your jobs. Regardless of how many devices you ship at one time, you must submit a separate job request for each device. For complete details about packaging requirements when shipping multiple devices, see Shipping Multiple Devices (p. 61).

For more information, see Guidelines and Limitations (p. 121)

You must submit a separate job request for each device.

**To create an Amazon S3 import job**

1. Create a manifest file.
2. Prepare your device for shipping.
3. Send a `CreateJob` request.
   
   AWS Import/Export sends a response with a `SIGNATURE` file and job information.

4. Copy the `SIGNATURE` file to your device.

5. Send a `GetShippingLabel` request (p. 114).

6. Ship your device.

**Tip**

You can create an Amazon S3 bucket using AWS Management Console. For more information, go to [http://docs.aws.amazon.com/AmazonS3/latest/UG/CreatingaBucket.html](http://docs.aws.amazon.com/AmazonS3/latest/UG/CreatingaBucket.html).

These steps assume that you have signed up for an AWS account and created your `AWScredentials.properties` file as described in the earlier tasks.

### Create a Manifest File

The manifest file is a YAML-formatted text file that tells AWS how to handle your job. It consists of a set of name-value pairs that supply required information, such as your device ID, TrueCrypt password, and return address. For more information about YAML, see [http://yaml.org](http://yaml.org).

The AWS Import/Export Web Service Tool provides three examples of manifest files that you can modify for your import and export jobs.

1. Go to the `Examples` folder in the folder where you installed the AWS Import/Export Web Service Tool.

2. Open the `S3-import-manifest.txt` file in a text editor.

   ```yaml
   manifestVersion: 2.0
   generator: Text editor
   bucket: [Enter import bucket]
   deviceId: [Enter device serial number]
   eraseDevice: yes
   notificationEmail: [Email addresses, semicolon separated]
   pinCode: [Optional - PIN code]
   trueCryptPassword: [Optional - password]
   serviceLevel: standard
   returnAddress:
     name: [Your name]
     company: [Optional - your company]
     street1: [Your street]
     street2: [Optional - additional street info]
     street3: [Optional - additional street info]
     city: [Your city]
     stateOrProvince: [Required for USA and Canada. Your state or province.]
     postalCode: [Your postal code]
     country: [Your country]
     phoneNumber: [Contact number]
   ```

   **Important**
   
   When shipping devices internationally except within the European Union you must include the customs option in the manifest. For more information about the customs manifest option, see [Customs Manifest File Option (p. 71)](http://docs.aws.amazon.com/AmazonS3/latest/UG/CreatingaBucket.html).

3. In the file, replace all text in brackets with the appropriate values. Delete any unused optional lines.

4. Provide the name of the existing Amazon S3 bucket that your AWS account owns where you want to upload your data. AWS Import/Export loads the data to a single bucket. For the `bucket` option provide only the name of your bucket, for example `s3examplebucket`.

---

---
5. For the `eraseDevice` field, specify `yes` to acknowledge that AWS will erase your device following the import operation before shipping it. If the `eraseDevice` field is missing or if the value is not `yes`, the job request will fail.

6. For the `notificationEmail` field, enter one or more email addresses, separated by semicolons, so we can contact you if there are any problems. If the `notificationEmail` field is missing or empty, the job request will fail.

7. Save the file as `MyS3ImportManifest.txt` in the same folder as your `AWSCredentials.properties` file.

For more information about manifest file options, see Creating Import Manifests (p. 32).

**Prepare Your Device for Import**

Next, you prepare your device for import.

1. Optionally encrypt your data by using one of the encryption mechanisms supported by AWS.
   
   For added security, we strongly recommend that you encrypt your data. You can encrypt the drive or create an encrypted file container on your device. For more information, see Encrypting Your Data (p. 57).

2. Verify that all file names are valid. File names must use standard ASCII or UTF-8 character encoding. Any file with a name that is not a valid ASCII or UTF-8 string is not imported.

3. Copy your data to the device. Do not ship the only copy of your data. AWS will erase your device, even if we cannot perform an import.

If your device is not properly prepared for import, AWS might erase the device and return it without processing the request. If we are unable to erase the data on the device, we will schedule it for destruction and our support team will contact you using the email address specified in the manifest file. For more information, see Shipping Your Storage Device (p. 55).

**Send a CreateJob Request**

Now that you have your credentials file and manifest file in place, you send a `CreateJob` request to AWS Import/Export. You submit a separate `CreateJob` request for each device.

1. Open a command prompt (or, on a Mac, use the Terminal application), and change to the directory where you unzipped the AWS Import/Export tool.

2. Enter the following `CreateJob` request on the command line.

   ```bash
   CmdPrompt> java -jar lib/AWSImportExportWebServiceTool-1.0.jar CreateJob Import MyS3ImportManifest.txt .
   ```

   The `CreateJob` request includes a directory name for where you want the `SIGNATURE` file saved. In this example, the closing period (.) at the end of the command refers to the current directory. Either include the period, as shown above, or replace it with a directory path.

   If there is an error, AWS Import/Export returns an error message.

   If there are no errors in the request, AWS Import/Export returns a `JOB CREATED` response. The following is a sample response.

   ```text
   JOB CREATED
   JobId: ABCDE
   JobType: Import
   ```
Your job expires after 30 days. If you do not send a device, there is no charge.

After your job is created, the Amazon S3 bucket policy for the bucket that you specified at job creation will automatically be updated with the temporary permissions necessary to import the data on your device into Amazon S3. For more information, see Automatic Resource Policy Updates (p. 24).

Copy the Signature File

In response to your CreateJob request, AWS writes a file named SIGNATURE to your computer. The SIGNATURE file contains a signature, which is an encrypted string that allows us to authenticate your device and match it to your job request.

Locate the SIGNATURE file in the directory you specified in your job request and copy it to the root directory of your storage device. The file name must be named SIGNATURE and it must be in the device's root directory.

Each device you send must include the unique SIGNATURE file for that device and that JOBID. AWS Import/Export validates the SIGNATURE file on your storage device before starting the data load. If the SIGNATURE file is missing or invalid (for example, if it is associated with a different job request), AWS Import/Export will not perform the data load and we will return your storage device.

Send a GetShippingLabel Request

Generate, print out, and attach your pre-paid shipping label through the AWS Import/Export Web Service Tool's GetShippingLabel action. For detailed instructions, see Generating Your Pre-Paid Shipping Label (p. 60).

Ship Your Device

It is essential that you prepare your device properly before shipping.

**Note**

You can send multiple devices in the same shipment. If you do, however, there are specific guidelines and limitations that govern what devices you can ship and how your devices must be packaged. If your shipment is not prepared and packed correctly, AWS Import/Export cannot process your jobs. Regardless of how many devices you ship at one time, you must submit a separate job request for each device. For complete details about packaging requirements when shipping multiple devices, see Shipping Multiple Devices (p. 61).

1. Pack the power supply, power cable, and interface cables with your storage device. Without these, we can't transfer your data and will return your device.
2. Generate, print out, and attach your pre-paid shipping label.

For detailed instructions for preparing and shipping your device, see Shipping Your Storage Device (p. 55).
3. Arrange for UPS to pick up your package by calling them directly or take your package to a UPS package drop off facility to be shipped to AWS. You will not have to pay UPS for the shipping charges but AWS will add these charges to the fee charged for processing your device. If you are shipping internationally, see International Considerations for Mailing Your Storage Device (p. 63).

**Important**
Your job expires after 30 days. If you do not send a device, there is no charge. You are billed only after AWS Import/Export receives your device. If we receive your package after your job expires, we will return your device. You will only be charged for the shipping fees, if any.

Now, you have explored the getting started steps of AWS Import/Export. To learn more about the product, see Where Do I Go from Here? (p. 20).

### Create Your First Amazon EBS Import Job

An Amazon EBS import creates a virtual copy of your device as a single image. In such an import job, your device's file system won't be automatically mounted to an Amazon EC2 instance. Note that the maximum size of an Amazon EBS volume is 16 TB. Note also that the maximum capacity of a device is independent of the amount of data stored on the device.

If your device is encrypted, then the device image is also encrypted. AWS does not decrypt your device before importing the device image.

After the import operation completes, AWS Import/Export erases your device before shipping it.

You must submit a separate job request for each device.

**Note**
You can send multiple devices in the same shipment. If you do, however, there are specific guidelines and limitations that govern what devices you can ship and how your devices must be packaged. If your shipment is not prepared and packed correctly, AWS Import/Export cannot process your jobs. Regardless of how many devices you ship at one time, you must submit a separate job request for each device. For complete details about packaging requirements when shipping multiple devices, see Shipping Multiple Devices (p. 61).

For more information, see Guidelines and Limitations (p. 121).

**To create an Amazon EBS import job**

1. Create a manifest file.
2. Prepare your device for shipping.
3. Send a `CreateJob` request.

   AWS Import/Export sends a response and a PDF file with a barcode and job information.
4. Attach the signature barcode to your device.
5. Send a `GetShippingLabel` (p. 114) request.
6. Ship your device.

In your request, you must identify an existing Amazon S3 bucket for logging. Your AWS account must own the bucket.

**Tip**
You can create a bucket using AWS S3 Console. For more information, see http://docs.aws.amazon.com/AmazonS3/latest/UG/CreatingaBucket.html.
Create Your First Amazon EBS Import Job

These steps assume that you have signed up for an AWS account and created your AWSCredentials.properties file as described in the earlier tasks.

Create a Manifest File

The manifest file is a YAML-formatted text file that tells AWS how to handle your job. It consists of a set of name-value pairs that supply required information, such as your device ID, log bucket, and return address. For more information about YAML, see http://yaml.org.

The AWS Import/Export Web Service Tool provides three examples of manifest files that you can modify for your import and export jobs.

1. Go to the Examples folder in the folder where you installed the AWS Import/Export Web Service Tool.
2. Open the ebs-import-manifest.txt file in a text editor.

```
manifestVersion: 3.0
deviceId: [Enter device serial number]
pinCode: [Optional - PIN code]
logPrefix: [Optional - a prefix for your log bucket]
logBucket:[Your log bucket]
generator: AWS Import/Export Command Line Tool
eraseDevice: yes
notificationEmail: [Email addresses, semicolon separated]
returnAddress:
  name:[Your name]
  company:[Optional - your company]
  street1:[Your street]
  street2:[Optional - additional street info]
  street3:[Optional - additional street info]
  city:[Your city]
stateOrProvince:[Required for USA and Canada. Your state or province.]
postalCode:[Your postal code]
country:[Your country]
phoneNumber:[Contact number]
operations:
  - destination: ebs-snapshot
    source: device
    region: us-east-1 | us-west-1 | us-west-2 | eu-west-1 | ap-southeast-1
    deviceCapacityGreaterThan1TB: [yes|no]
```

Important
When shipping devices internationally except within the European Union you must include the customs option in the manifest. For more information about the customs-related manifest options, see Customs Manifest File Option (p. 71).

3. In the file, replace all text in brackets with the appropriate values. Delete any unused optional lines.
4. Provide the name of the existing Amazon S3 bucket for logging. For the logBucket option, provide only the name of your bucket, for example s3examplebucket.
5. For the eraseDevice field, specify yes to acknowledge that AWS will erase your device following the import operation before shipping it. If the eraseDevice field is missing or if the value is not yes, the job request will fail.
6. For the notificationEmail field, enter one or more email addresses, separated by semicolons, so we can contact you if there are any problems. If the notificationEmail field is missing or empty, the job request will fail.
7. The destination subfield in the operations option specifies that the data is imported into an Amazon EBS snapshot. Change the region parameter to specify the correct region.
8. The deviceCapacityGreaterThan1TB subfield specifies if the device capacity is larger than 1 TB. AWS Import/Export supports Amazon EBS imports of 16 TB.

9. Save the file as MyEBSImportManifest.txt in the same folder as your AWSCredentials.properties file.

For more information about manifest file options, see Manifest File Options Reference (p. 68).

**Prepare Your Device for Import**

Next, you need to prepare your device for import.

1. Optionally encrypt your data. For added security, we strongly recommend that you encrypt your data. If your device requires a PIN code for access, you must provide the PIN code to enable AWS to access the device. The entire device image is imported. AWS does not decrypt your device.

2. Copy your data to the device. Do not ship the only copy of your data. AWS will erase your device, even if we cannot perform an import.

**Send a CreateJob Request**

Now that you have your credentials file and manifest file in place, you send a CreateJob request to AWS Import/Export.

You send a separate CreateJob request for each device.

1. Open a command prompt (or, on a Mac, use the Terminal application), and change to the directory where you unzipped the AWS Import/Export tool.

2. Enter the following CreateJob request on the command line.

   ```
   CmdPrompt>java -jar lib/AWSImportExportWebServiceTool-1.0.jar CreateJob Import MyEBSImportManifest.txt .
   ```

   The CreateJob request includes a directory name for where you want the shipping instructions PDF file saved. In this example, the closing period (.) at the end of the command refers to the current directory. Either include the period, as shown above, or replace it with a directory path.

   If there is an error, AWS Import/Export returns an error message.

   If there are no errors in the request, AWS Import/Export returns a JOB CREATED response. The following is a sample response.

   ```
   JOB CREATED

   JobId: ABCDE
   JobType: Import

   Shipping instructions saved to C:\DirectoryName\.shipping-instructions-ABCDE.pdf

   SHIPPING INSTRUCTIONS:

   1. Open the Shipping Instructions file with a PDF reader.
   2. Print out the Shipping Instructions which includes the AWS Shipping Address and Signature barcode.
   3. Follow the directions in the PDF file, which includes cutting out and securely attaching the Signature barcode to your device.

   *IMPORTANT* - Failure to attach the Signature barcode to your device will prevent
Your job expires after 30 days. If you do not send a device, there is no charge.

**Attach the Signature Barcode**

After the `CreateJob` request completes successfully, AWS Import/Export places the shipping instructions and a barcode as a PDF file in the directory you specified in the `CreateJob` request. AWS Import/Export also places a copy of the PDF file in the Amazon S3 bucket that you specified with the logBucket manifest option. The name of the PDF file is `shipping-instructions-YOURJOBID.pdf` where `YOURJOBID` is the name of the job for your request.

Print the PDF and attach the signature barcode securely to your device.

You must submit a separate job request for each device, and each job request generates a unique barcode. AWS Import/Export validates the barcode on your storage device before starting the data load. If the barcode is invalid (for example, it doesn't match your device), it's missing, or it's illegible, AWS Import/Export will not perform the data load and we will return your storage device.

**Important**

Attach the signature barcode securely to your device, with tape on all four sides. Do not delete, alter, or obscure the signature barcode in any way. If the signature barcode is separated from your device, we cannot validate it and we will return your device without performing the data load.

**Send a GetShippingLabel Request**

Generate, print out, and attach your pre-paid shipping label through the AWS Import/Export Web Service Tool's `GetShippingLabel` action. For detailed instructions, see Generating Your Pre-Paid Shipping Label (p. 60).

**Ship Your Device**

It is essential that you prepare your device properly before shipping.

**Note**

If an error occurs during the `CreateJob` process, an error message will indicate the cause. You can then either get the shipping instructions from the Amazon S3 bucket, or you can retry the download using the `GetShipInfo` operation. For more information, see Getting Shipping Information (p. 65).

1. Attach the signature barcode securely to your device.
2. Pack the `power supply`, `power cable`, and `interface cables` with your storage device. Without these, we can't transfer your data and will return your device.
3. Generate, print out, and attach your pre-paid shipping label.

   For detailed instructions for preparing and shipping your device, see Shipping Your Storage Device (p. 55).

4. Arrange for UPS to pick up your package by calling them directly or take your package to a UPS package drop off facility to be shipped to AWS. You will not have to pay UPS for the shipping charges but AWS will add these charges to the fee charged for processing your device. If you are shipping internationally, see International Considerations for Mailing Your Storage Device (p. 63).

**Important**

Your job expires after 30 days. If you do not send a device, there is no charge. You are billed only after AWS Import/Export receives your device. If we receive your package after your job expires, we will return your device. You will only be charged for the shipping fees, if any.
If your device is not properly prepared for shipping and import, AWS might need to erase the device and return it without processing the request. If we are unable to erase the data on the device, we will schedule it for destruction and our support team will contact you using the email address specified in the manifest file. For more information, see Shipping Your Storage Device (p. 55).

Now, you have explored the getting started steps of AWS Import/Export. To learn more about the product, see Where Do I Go from Here? (p. 20).

Create an Export Job

Now that you're signed up and have downloaded the AWS Import/Export Web Service Tool, you can create an export job to download your data from Amazon S3 buckets owned by your AWS account to your storage device.

**Important**
You must create the job and get a response from AWS before you can send your storage device to us for download.

Now, you are ready to submit your create export job request.

Create Your First Amazon S3 Export Job (p. 16).

Create Your First Amazon S3 Export Job

An Amazon S3 export transfers individual objects from Amazon S3 buckets owned by your AWS account to your device, creating one file for each object. You can export from more than one bucket and you can specify which files to export using manifest file options.

AWS Import/Export requires encryption with all export jobs. You must either provide a PIN-code protected device with hardware encryption or instruct AWS to encrypt the device using TrueCrypt software encryption with a password that you supply. If you provide a PIN-code protected device, you can optionally specify TrueCrypt encryption in addition.

For added security for your data while the device is in transit, AWS Import/Export formats your device before beginning the data load. Any data that is stored on the device when you sent the device to AWS will be lost. AWS copies your data to an encrypted file container on your device. If you specify software encryption, you will need to decrypt the data using TrueCrypt encryption software. For more information, see Encrypting Your Data (p. 57).

**Important**
If you lose your password or device PIN code, you will not be able to decrypt your device. AWS will not provide your password or PIN code if you lose them.

You must submit a separate job request for each device.

**Note**
You can send multiple devices in the same shipment. If you do, however, there are specific guidelines and limitations that govern what devices you can ship and how your devices must be packaged. If your shipment is not prepared and packed correctly, AWS Import/Export cannot...
process your jobs. Regardless of how many devices you ship at one time, you must submit a separate job request for each device. For complete details about packaging requirements when shipping multiple devices, see Shipping Multiple Devices (p. 61).

For more information, see Guidelines and Limitations (p. 121)

Note
Export from Amazon EBS to a storage device is not currently supported.

Tip
You can create a bucket using the AWS Management Console. For more information, see Creating a Bucket.

To create an Amazon S3 export job

1. Configure your Amazon S3 buckets.
2. Create a manifest file.
3. Prepare your device for shipping.
4. Send a CreateJob request.
   AWS Import/Export sends a response with a SIGNATURE file and job information.
5. Copy the SIGNATURE file to your device.
6. Ship your device.

These steps assume that you have signed up for an AWS account and created your AWS credentials.properties file as described in the earlier tasks.

Configure Your Amazon S3 Buckets

Before you create your export job, make sure that the Amazon S3 buckets that you're exporting data from are properly configured by doing the following.

Set Lifecycle Management Configuration

With Amazon S3, you can manage the lifecycle of objects in an Amazon S3 bucket. You can schedule objects for archival in Amazon Glacier, or to be deleted on an expiration date. For more information about Amazon S3 lifecycle configurations, see Object Lifecycle Management in the Amazon Simple Storage Service Developer Guide.

With AWS Import/Export Disk, you can export data only from Amazon S3. This constraint is important if you have Amazon S3 lifecycle configuration rules in place to move data from Amazon S3 into Amazon Glacier. In this case, you should make sure that the lifecycle rules don't move the Amazon S3 objects and buckets that you want to export into Amazon Glacier before your export job is completed. Data that was moved into Amazon Glacier by these lifecycle rules before the Disk job finishes exporting isn't exported to your disk.

Disable Requester Pays

Before you create your export job, make sure that the Requester Pays property is disabled on the buckets you're exporting data from. If you don't do this, any export jobs created for Requester Pays buckets fail. For more information on how to do this in the Amazon S3 Management Console, see Configure Requester Pays by Using the Amazon S3 Console in the Amazon Simple Storage Service Developer Guide.

Create a Manifest File

The manifest file is a YAML-formatted text file that instructs AWS about how to handle your job. It consists of a set of name-value pairs that supply required information such as your device ID, log bucket, return address, and so on. For more information about YAML, go to http://yaml.org.
The AWS Import/Export Web Service Tool provides three examples of manifest files that you can modify for your import and export jobs.

1. Go to the Examples folder in the folder where you installed the AWS Import/Export Web Service Tool.
2. Open the S3-export-manifest.txt file in a text editor.

```
manifestVersion:2.0
generator:text editor
deviceId:[Enter device serial number]
fileSystem:[NTFS| EXT4]
pinCode: [PIN code]
trueCryptPassword: [password]
serviceLevel:expeditedShipping
targetDirectory: /
recoveryDirectory:EXPORT-RECOVERY
logBucket:[Your log bucket]
notificationEmail:[Email addresses, semicolon separated]
operations:
  - exportBucket:[Your bucket]
returnAddress:
  name:[Your name]
  company:[Optional - your company]
  street1:[Your street]
  street2:[Optional - additional street info]
  street3:[Optional - additional street info]
  city:[Your city]
  stateOrProvince:[Required for USA and Canada. Your state or province.]
  postalCode:[Your postal code]
  country:[Your country]
  phoneNumber:[Contact number]
```

Important
When shipping devices internationally except within the European Union you must include the customs option in the manifest. For more information about the customs-related manifest options, see Customs Manifest File Option (p. 71).

3. In the file, replace all text in brackets with the appropriate values. Delete any unused optional lines.
4. Provide a device PIN code or an encryption password. AWS uses the PIN code or password you provide to encrypt your data. You will need the same PIN code or password to decrypt your data after you receive the data back from AWS. If you do not provide a PIN code or password in your manifest, the CreateJob request will fail.
5. Provide the name of the existing Amazon S3 bucket containing the data to export, a bucket name to save your log data. For the logBucket and exportBucket options provide only the name of the bucket, for example s3examplebucket.

   Note
   For export, your Amazon S3 log bucket and your Amazon S3 export bucket must be in the same region. If your buckets are in different regions, your job request will fail.

6. Save the file as MyS3ExportManifest.txt in the same folder as your AWS Credentials.properties file.

For more information about manifest file options, see Creating Export Manifests (p. 50).

Send a CreateJob Request

Now that you have your credentials file and manifest file in place, you send a CreateJob request to AWS Import/Export. You send a separate CreateJob request for each device.
1. Open a command prompt (or, on a Mac, use the Terminal application), and change to the directory where you unzipped the AWS Import/Export tool.

2. Enter the following CreateJob request on the command line.

   ```
   cmdPrompt>java -jar lib/AWSImportExportWebServiceTool-1.0.jar CreateJob Export MyS3ExportManifest.txt .
   ```

   The CreateJob request includes a directory name for where you want the SIGNATURE file saved. In this example, the closing period (.) at the end of the command refers to the current directory. Either include the period, as shown above, or replace it with a directory path.

   If there is an error, AWS Import/Export returns an error message.

   If there are no errors in the request, AWS Import/Export returns a JOB CREATED response. The following is a sample response.

   ```
   JOB CREATED
   JobId: TC44P
   JobType: Export
   ****************************************
   * AwsShippingAddress                   *
   ****************************************
   Please call GetShippingLabel API to retrieve shipping address
   ****************************************
   * SignatureFileContents                *
   ****************************************
   version:2.0
   signingMethod:HmacSHA1
   jobId:TC44P
   signature:BBAqQ/E+R7bdXRVR1s9vTi5t7Aps=
   Writing SignatureFileContents to C:\ImportExportWebServiceTool\.\SIGNATURE
   ```

   Your job expires after 30 days. If you do not send a device, there is no charge.

   After your job is created, the Amazon S3 bucket policy for the bucket that you specified at job creation will automatically be updated with the temporary permissions necessary to export the data to your device from Amazon S3. For more information, see Automatic Resource Policy Updates (p. 24).

**Copy the Signature File**

In response to your CreateJob request, AWS writes a file named SIGNATURE to your computer. The SIGNATURE file contains a signature, which is an encrypted string that allows us to authenticate your device and match it to your job request.

Locate the SIGNATURE file in the directory that you specified in your job request and copy it to the root directory of your storage device. The file name must be named SIGNATURE and it must be in the device's root directory.

Each device you send must include the unique SIGNATURE file for that device and that JOBID. AWS Import/Export validates the SIGNATURE file on your storage device before starting the data load. If the SIGNATURE file is missing or invalid (for example, if it is associated with a different job request), AWS Import/Export will not perform the data load and we will return your storage device.

**Send a GetShippingLabel Request**

Generate, print out, and attach your pre-paid shipping label through the AWS Import/Export Web Service Tool’s GetShippingLabel action. For detailed instructions, see Generating Your Pre-Paid Shipping Label (p. 60).
Ship Your Device

It is essential that you prepare your device properly before shipping. If your device is not properly prepared for shipping and export, AWS might need to erase the device and return it without processing the request. If we are unable to erase the data on the device, we will schedule it for destruction and our support team will contact you using the email address specified in the manifest file. For more information, see Shipping Your Storage Device (p. 55).

1. Pack the power supply, power cable, and interface cables with your storage device. Without these, we can't transfer your data and will return your device.
2. Generate, print out, and attach your pre-paid shipping label.
   For detailed instructions for preparing and shipping your device, see Shipping Your Storage Device (p. 55).
3. Arrange for UPS to pick up your package by calling them directly or take your package to a UPS package drop off facility to be shipped to AWS. You will not have to pay UPS for the shipping charges but AWS will add these charges to the fee charged for processing your device. If you are shipping internationally, see International Considerations for Mailing Your Storage Device (p. 63).

Important
Your job expires after 30 days. If you do not send a device, there is no charge. You are billed only after AWS Import/Export receives your device. If we receive your package after your job expires, we will return your device. You will only be charged for the shipping fees, if any.

Now, you have explored the getting started steps of AWS Import/Export. To learn more about the product, see Where Do I Go from Here? (p. 20).

Where Do I Go from Here?

Topics
- Working with Import Jobs (p. 20)
- Working with Export Jobs (p. 20)
- Managing Your Jobs (p. 21)
- Pricing Information (p. 21)

The Getting Started section provided a step-by-step experience of creating a job. Now you can learn more about the service.

Working with Import Jobs

This section describes the process of importing data into AWS. You can import data to Amazon Simple Storage Service (Amazon S3) buckets owned by your AWS account, and Amazon Elastic Block Store (Amazon EBS) snapshots. Amazon EBS snapshots can be converted into volumes for use with Amazon Elastic Compute Cloud (EC2). For more information, see Working with Import Jobs (p. 27).

Working with Export Jobs

This section describes the process of exporting data from Amazon S3 buckets owned by your AWS account. AWS Import/Export doesn't support export jobs from Amazon EBS. For more information, see Working with Export Jobs (p. 48).
Managing Your Jobs

AWS Import/Export tools and API provide you ways to manage your job easily. For example, after creating a job, you can update or cancel it. You can also get list of all your jobs or get status of a specific job. For more information, see Managing Your Jobs (p. 64).

Pricing Information

As with all AWS services, you pay only for the resources that you use. For more information on AWS Import/Export pricing model, go to AWS Import/Export detail page.
Using IAM with AWS Import/Export

Topics

- Controlling Access to AWS Import/Export Jobs (p. 22)
- Automatic Resource Policy Updates (p. 24)

AWS Identity and Access Management (IAM) is a service that enables Amazon Web Services (AWS) customers to manage users and user permissions in AWS. AWS Import/Export users must have certain permissions to access AWS Import/Export actions, such as CreateJob and GetStatus. An AWS account that creates an Amazon S3 import or export job must also own the buckets that will be used for the import, export, or logging operations.

**Note**

Only IAM users can create AWS Import/Export jobs. Assumed roles can't be used to create a job.

Controlling Access to AWS Import/Export Jobs

AWS Import/Export integrates with AWS Identity and Access Management (IAM), which allows you to control which actions a user can perform.

By default, IAM users have no access to AWS Import/Export actions. If you want IAM users to be able to work with AWS Import/Export, you must grant them permissions. You do this by creating an IAM policy that defines which Import/Export actions the IAM user is allowed to perform. You then attach the policy to the IAM user or to an IAM group that the user is in.

You can give IAM users of your AWS account access to all AWS Import/Export actions or to a subset of them. For more information on the different AWS Import/Export actions, see Actions (p. 94).

Related IAM Documentation

- AWS Identity and Access Management (IAM) detail page
- What Is IAM? in the AWS Identity and Access Management documentation
- Managing IAM Policies in the AWS Identity and Access Management documentation

Example IAM User Policies for AWS Import/Export

This section shows three simple policies for controlling access to AWS Import/Export. AWS Import/Export does not support resource-level permissions, so in policies for Import/Export, the "Resource" element is always "*", which means all resources.

**Allow read-only access to the jobs created under the AWS account**

The following policy only allows access to the ListJobs and GetStatus actions, which are read-only actions.
Allow full access to all AWS Import/Export jobs created under the AWS account

The following policy allows access to all AWS Import/Export actions.

```json
{
"Version": "2012-10-17",
"Statement": [
  {
    "Effect": "Allow",
    "Action": ["importexport:ListJobs", "importexport:GetStatus"],
    "Resource": "*"
  }
]
}
```

Deny a set of actions from an IAM user

By default, all permissions are denied; if you do not explicitly grant access to Import/Export actions, users are not allowed to perform those actions. It's also possible to explicitly deny access to specific actions. This might be useful if one policy (or statement in a policy) grants access to a set of actions, but you want to exclude one or more individual actions.

The following policy contains two statements. The first statement allows access to all the AWS Import/Export actions. The second statement explicitly denies access to UpdateJob. If new actions are added to AWS Import/Export, this policy automatically grants permission for those new actions because of the first statement. However, the user will always be denied access to the UpdateJob action, even if that action is explicitly allowed in another policy.

```json
{
"Version": "2012-10-17",
"Statement": [
  {
    "Effect": "Allow",
    "Action": ["importexport:*"],
    "Resource": "*
  },
  {
    "Effect": "Deny",
    "Action": ["importexport:UpdateJob"],
    "Resource": "*"
  }
]
}
```
Automatic Resource Policy Updates

When you create an AWS Import/Export job for Amazon S3, the related resource-based policies will be updated automatically by the AWS Import/Export service. These resource-based policy updates have associated expiration dates set for seven months after the job was created or updated.

If you change the resource-based policies while your job is in progress, your import or export may fail. We highly recommend that you review the following policy updates that will be implemented on the buckets involved in your AWS Import/Export job. There are no automatic Amazon EBS related updates for your resources, so you'll need to ensure the Amazon EBS policies and permissions are correct for resources.

Topics
- Automatically Updated Log Bucket Policy (p. 24)
- Automatically Updated Import Bucket Policy (p. 24)
- Automatically Updated Export Bucket Policy (p. 25)
- Amazon EBS Policies and Permissions (p. 26)
- Related Topics (p. 26)

Automatically Updated Log Bucket Policy

For all import and export jobs, that have an Amazon S3 bucket for logging, the following policy will be automatically applied to the log bucket.

Example Amazon S3 Log Bucket Policy

```
"Version":"2012-10-17",
"Statement":[
  {
    "Effect": "Allow",
    "Action": "sts:AssumeRole",
    "Principal": {
      "Service": "importexport-disk.amazonaws.com"
    }
  },
  {
    "Sid":"AddCannedAcl",
    "Effect":"Allow",
    "Principal": {"AWS": [{"arn:aws:iam::111122223333:root","arn:aws:iam::444455556666:root"}],
    "Action":
    ["s3:GetBucketLocation","s3:PutObject","s3:AbortMultipartUpload","s3:ListMultipartUploadParts","s3:ListBucket","
    "Resource":["arn:aws:s3:::examplebucket/*"]
  }
]}
```

Automatically Updated Import Bucket Policy

For importing data into Amazon S3, the following policy will automatically applied to the import bucket:
Example Amazon S3 Import Bucket Policy

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "Service": "importexport-disk.amazonaws.com"
      },
      "Action": [
        "s3:PutObject",
        "s3:AbortMultipartUpload",
        "s3:ListMultipartUploadParts"
      ],
      "Resource": [
        "arn:aws:s3:::examplebucket/*"
      ],
      "Condition": {
        "DateLessThan": {
          "aws:CurrentTime": "<7 months from when the job is created/updated>"
        }
      }
    },
    {
      "Effect": "Allow",
      "Principal": {
        "Service": "importexport-disk.amazonaws.com"
      },
      "Action": [
        "s3:GetObject"
      ],
      "Resource": [
        "arn:aws:s3:::examplebucket"
      ],
      "Condition": {
        "DateLessThan": {
          "aws:CurrentTime": "<7 months from when the job is created/updated>"
        }
      }
    }
  ]
}
```

Automatically Updated Export Bucket Policy

For exporting data from Amazon S3, the following policy will automatically applied to the export bucket:

Example Amazon S3 Export Bucket Policy

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "Service": "importexport-disk.amazonaws.com"
      },
      "Action": [
        "s3:GetObject"
      ],
      "Resource": [
        "arn:aws:s3:::examplebucket"
      ],
      "Condition": {
        "DateLessThan": {
          "aws:CurrentTime": "<7 months from when the job is created/updated>"
        }
      }
    }
  ]
}
```
Amazon EBS Policies and Permissions

The only permissions required for import to Amazon EBS are the previously listed permissions for the Amazon S3 log bucket.

For more information, go to:

- Amazon S3: Using IAM Policies

Related Topics

For more information, on Amazon S3 policies, see Using IAM Policies in the Amazon Simple Storage Service Developer Guide.
Creating Amazon S3 Import Jobs

With an Amazon S3 import, AWS uploads individual files from your device to objects in an Amazon S3 bucket. One device is loaded to one bucket. Your device's file system is mounted on an AWS Import/Export data loading station and each file is uploaded as an object in your Amazon S3 bucket. You can optionally manage directories and filenames as part of the load process.

You must submit a separate job request for each device.

For more information, see Guidelines and Limitations (p. 121)

Import to Amazon S3 Process

Import Job Process

1. You create an `AWSCredentials.properties` file that contains your `accessKeyId` and `secretKey` associated with your AWS account. For more information, see Save Your Credentials to a File (p. 6).

2. You create an import manifest file that specifies how to transfer data from your storage device to a single Amazon S3 bucket. For more information, see Creating an Import Manifest File (p. 32).

3. You initiate an import job by sending a `CreateJob` request that includes the manifest file. You send a separate CreateJob request for each device. Your job expires after 30 days. If you do not send a device, there is no charge. You can send a CreateJob request using the AWS Import/Export Tool, the AWS Command Line Interface (CLI), the AWS SDK for Java, or the AWS REST API. The easiest method is the AWS Import/Export Tool. For details, see

   - Sending a CreateJob Request Using the AWS Import/Export Web Service Tool (p. 40)
   - Sending a CreateJob Request Using the AWS SDK for Java (p. 41)
   - Sending a CreateJob Request Using the REST API (p. 44)

4. AWS Import/Export sends a response that includes a job ID, a signature value, and saves a `SIGNATURE` file to your computer.
You will need this information in subsequent steps.

<table>

<td>5</td>
<td>Optionally, you encrypt your device or create an encrypted file container using TrueCrypt. If you use an encrypted container, name the container <code>&lt;JOBID&gt;.tc</code>, using the Job ID from the CreateJob request. For example, KSVDJ.tc. For more information, see Encrypting Your Data (p. 57).</td>
</tr>
<tr>
<td>6</td>
<td>You copy the SIGNATURE file to the root directory of your storage device. You can use the file AWS sent or copy the SignatureFileContents values from the response into a new text file named SIGNATURE. The file name must be SIGNATURE, and the file must be in the device's root directory. Each device you send must include the unique SIGNATURE file for that device and that JOBID. AWS Import/Export validates the SIGNATURE file on your storage device before starting the data load. If the SIGNATURE file is missing invalid (for example, if it is associated with a different job request), AWS Import/Export will not perform the data load and we will return your storage device. As in the following example.</td>
</tr>
<tr>
<td>7</td>
<td>You copy your data to your storage device. AWS Import/Export loads the data from your device to a single Amazon S3 bucket. Note that when uploading data to Amazon S3, the file path on your storage device determines the corresponding object key. For example, if your storage device has an images top level folder with a file sample.jpg, the uploaded file/object key will be images/sample.jpg. File names must use UTF-8 character encoding. Any file with a name that is not a valid UTF-8 string is not imported. For information on storage device requirements, see Storage Device Requirements (p. 55).</td>
</tr>
<tr>
<td>8</td>
<td>You ship the device and cables to AWS through UPS. Make sure to include your job ID on the device you are shipping and use the pre-paid shipping label, see Shipping Your Storage Device (p. 55) for information on how to print your label. Otherwise, your download might be delayed. <strong>Note</strong> You can send multiple devices in the same shipment. If you do, however, there are specific guidelines and limitations that govern what devices you can ship and how your devices must be packaged. If your shipment is not prepared and packed correctly, AWS Import/Export cannot process your jobs. Regardless of how many devices you ship at one time, you must submit a separate job request for each device. For complete details about packaging requirements when shipping multiple devices, see Shipping Multiple Devices (p. 61). Your job expires after 30 days. If we receive your package after your job expires, we will return your device. You will only be charged for the shipping fees, if any.</td>
</tr>
</tbody>
</table>
Creating Amazon EBS Import Jobs

AWS Import/Export uploads your device to Amazon Elastic Block Store (Amazon EBS) snapshots. Amazon EBS snapshots can be converted into volumes for use with Amazon Elastic Compute Cloud (Amazon EC2).

If you are using AWS Import/Export to upload data to Amazon EBS, we assume you are an Amazon Elastic Compute Cloud (Amazon EC2) user and are familiar with the Amazon EBS concepts volumes and snapshots. To learn more about Amazon EBS, go to Amazon Elastic Block Store.

An Amazon EBS import creates a virtual copy of your device as a single image. The device's file system won't be automatically mounted to an Amazon EC2 instance. The maximum size of an Amazon EBS volume is 16 TB. Note that the maximum capacity of a device is independent of the amount of data stored on the device.

You must submit a separate job request for each device.

For more information, see Guidelines and Limitations (p. 121)

Import to Amazon EBS Process

1. You copy your data to your storage device. Do not send the only copy of your data. AWS will erase your device. For added security, we strongly recommend using encryption. AWS does not decrypt your data.

2. You create an AWSCredentials.properties that contains the accessKeyId and secretKey associated with your AWS account. For more information, see Save Your Credentials to a File (p. 6).
You create an import manifest file that specifies the operation, Amazon EBS, the region, and return shipping address. For more information, see Import to Amazon EBS Manifest File Options (p. 82).

You initiate an import job by sending a `CreateJob` request that includes the manifest file. You must submit a separate job request for each device.

Your job expires after 30 days. If you do not send a device, there is no charge.

You can send a `CreateJob` request using the AWS Import/Export Tool, the AWS Command Line Interface (CLI), the AWS SDK for Java, or the AWS REST API. The easiest method is the AWS Import/Export Tool. For details, see

- Sending a CreateJob Request Using the AWS Import/Export Web Service Tool (p. 40)
- Sending a CreateJob Request Using the AWS SDK for Java (p. 41)
- Sending a CreateJob Request Using the REST API (p. 44)

AWS Import/Export sends a response that includes a job ID, shipping instructions, a PDF file, and a link to generate a pre-paid shipping label.

The PDF file contains job information, shipping instructions, and a barcode.

You must submit a separate job request for each device, and each job request generates a unique barcode.

AWS Import/Export validates the barcode on your storage device before starting the data load. If the barcode is invalid (for example, it doesn't match your device), it's missing, or it's illegible, AWS Import/Export will not perform the data load and we will return your storage device.

You print the PDF. For an example of the PDF, see The Import PDF File (p. 31).

You cut out the barcode portion of the printed PDF, and tape it to your device. You must send the device using the pre-paid shipping label. See Shipping Your Storage Device (p. 55) for information on how to print your label.

**Important**
Attach the signature barcode securely to your device, with tape on all four sides. Do not delete, alter, or obscure the signature barcode in any way. If the signature barcode is separated from your device, we cannot validate it and we will return your device without performing the data load.

You ship the device, the cables, and the printed bar code to AWS. Otherwise, your device might be returned unprocessed.

**Note**
You can send multiple devices in the same shipment. If you do, however, there are specific guidelines and limitations that govern what devices you can ship and how your devices must be packaged. If your shipment is not prepared and packed correctly, AWS Import/Export cannot process your jobs. Regardless of how many devices you ship at one time, you must submit a separate job request for each device. For complete details about packaging requirements when shipping multiple devices, see Shipping Multiple Devices (p. 61).

**Important**
Your job expires after 30 days. If you do not send a device, there is no charge. You are billed only after AWS Import/Export receives your device. If we receive your package after your job expires, we will return your device. You will only be charged for the shipping fees, if any.
AWS Import/Export Developer Guide
Import to Amazon EBS Process

8 AWS Import/Export uses the bar code to identify and authenticate your data load.

Once your storage device arrives at AWS, your data load typically begins by the end of the next business day. The time line for loading your data depends on a number of factors, including the availability of an import station, the amount of data to load, and the data transfer rate of your device.

AWS displays your Amazon EBS snapshot in the list of EBS Snapshots for your account within the AWS Management Console for Amazon EC2. For instructions to find your snapshots in the Amazon EC2 Console, see Your Amazon EBS Snapshot in the AWS Management Console (p. 31).

9 Following the import operation, AWS will erase the device, even if the import was not successful. In cases where we are unable to erase the data on the device, we will schedule it for destruction. In this case, our support teams will contact you over the email address specified in the Manifest file.

10 We repack your storage device and ship it to the return address you provided in your manifest file. We do not ship to post office boxes.

The Import PDF File

The AWS response to the CreateJob request includes your job ID, AWS shipping address, and saves a PDF file to your computer. The PDF file contains shipping instructions with a unique bar code to identify and authenticate your device. Following is an example PDF file.

AWS Import/Export Shipping Instructions

Create Date: 12/5/14
JOBID: 796CK
Device ID: ASD321
Amazon EC2 Region: us-east-1

To prepare and send your job:

1. Cut out the barcode below and securely attach it to your storage device (external hard drive, internal SATA drive, or USB flash drive) with clear tape.
2. Pack your storage device. For external hard drives please make sure to enclose your USB or eSATA connector and powersupply.
3. Get your shipping label by using the GetShippingLabel API endpoint

IMPORTANT
We cannot process your job without the bar code below attached to your device.

--- CUT HERE ---

796CK

As noted in Import to Amazon EBS Process (p. 29), you must print the PDF, tape the bar code to your device, and follow the shipping instructions on the page.

Your Amazon EBS Snapshot in the AWS Management Console

You can monitor the status of your Amazon EBS import job in the AWS Management Console. Once your data begins importing to an Amazon EBS snapshot, you can find the Snapshot ID and its status in the AWS Management Console for Amazon EC2.
Creating Import Manifests

Topics

- Import Manifest Examples (p. 32)
- Configuring Common Import Manifest Options (p. 33)
- Working with Amazon S3 Import Manifests (p. 34)

You provide your job information and specify how to transfer your data between your storage device and AWS by creating a manifest file. The manifest file is a YAML-formatted text file that instructs AWS about how to handle your job. It consists of a set of name-value pairs that supply required information such as your device ID, log bucket, return address, and so on. For more information about YAML, go to http://yaml.org.

Import Manifest Examples

Each type of import job has a set of required options.

This sample Amazon S3 import manifest file includes only the required options.

```
manifestVersion: 2.0;
returnAddress:
  name: Jane Roe
  company: Example Corp.
  street1: 123 Any Street
  city: Anytown
  stateOrProvince: WA
  postalCode: 91011-1111
  phoneNumber: 206-555-1111
  country: USA
  deviceId: 49382
```
Configuring Common Import Manifest Options

These options are common to Amazon S3 and Amazon EBS import jobs.

Topics

- Shipping Devices Internationally (p. 33)
- Expediting the Return of Your Storage Device (p. 33)
- Specifying Device Erase After Import (p. 34)
- Preventing Log File Name Collisions (p. 34)

For a complete list of manifest options, see Manifest File Options Reference (p. 68). For examples of import manifest options, see Configuring Common Import Manifest Options (p. 33).

Shipping Devices Internationally

When shipping devices internationally except within the European Union you must include the customs option in the manifest. For more information about the customs related manifest options, see Customs Manifest File Option (p. 71).

Expediting the Return of Your Storage Device

When returning your device to a U.S. address from a U.S. region bucket, you can use the serviceLevel manifest option to upgrade your shipping. The default serviceLevel option is standard shipping, which includes free ground domestic shipping. When you specify expeditedShipping, your device is delivered using two-day shipping for an additional fee.
Specifying Device Erase After Import

After every import operation, even if the import was not successful, AWS Import/Export will erase the contents of your storage device to safeguard the data during return shipment. AWS overwrites all writable blocks on your device with zeros. You will need to repartition and format your device after we return it to you. You must include eraseDevice: Yes in your import manifest to acknowledge that your device will be erased. If we are unable to erase the data on the device, we will schedule it for destruction and our support team will contact you using the email address specified in the manifest file notificationEmail field.

<table>
<thead>
<tr>
<th>eraseDevice: yes</th>
</tr>
</thead>
<tbody>
<tr>
<td>notificationEmail: <a href="mailto:john.doe@example.com">john.doe@example.com</a></td>
</tr>
</tbody>
</table>

Preventing Log File Name Collisions

The AWS Import/Export process generates a log file. The log file name always ends with the phrase import-log- followed by your JobId. There is a remote chance that you already have an object with this name. To avoid a key collision, you can add an optional prefix to the log file by adding the logPrefix option in the manifest. AWS Import/Export takes the string value specified for this option and inserts it between the bucket name and log report name. The following manifest option sets the prefix for the log key.

| logPrefix: logs/ |

For example, if your job ID is 53TX4, the log file is saved to http://s3.amazonaws.com/mybucket/logs/import-log-53TX4.

**Note**
We do not include a forward slash (/) automatically. If you don't include the slash at the end of the value for logPrefix, the value is concatenated to the log file name. For example, if your logPrefix is logs the log file key your key would become logsimport-log-JobId instead of logs/import-log-JobId.

logPrefix + import-log-JOBID cannot be longer than 1024 bytes. If it is, AWS Import/Export returns an InvalidManifestField error from the CreateJob action.

Working with Amazon S3 Import Manifests

These options are used with Amazon S3 import jobs.

**Topics**
- Handling Gzip Files (p. 34)
- Excluding Files and Directories (p. 35)
- Manipulating Amazon S3 Object Key Names for AWS Import/Export (p. 36)

Handling Gzip Files

When importing Gzip compressed files you can set the setContentEncodingForGzFiles option to yes. This adds the Content-Encoding header, in addition to the Content-Type header, when the Gzip compressed files are uploaded. The Content-Encoding header helps most browsers render these files correctly.

setContentEncodingForGzFiles: yes
Additionally, the extensions, .gz and .gzip are ignored when setting the Content-Type header if the file has been compressed with Gzip.

For example, if `setContentEncodingForGzFiles` is set to "yes", the compressed file compressed using Gzip `text1.html.gz`, is uploaded with the following HTTP headers:

- Content-Encoding: gzip
- Content-Type: text/html

The gzip compressed file, `text2.html`, is uploaded with the following HTTP headers:

- Content-Encoding: gzip
- Content-Type: text/html

The non-compressed file, `text3.html`, is uploaded with the following HTTP headers:

- Content-Type: text/html

**Note**

When `setContentEncodingForGzFiles` is set to yes, only files that are gzip compressed will contain a Content-Encoding header. We look at the first few bytes of all imported files to see if they are compressed using Gzip. If so, they get the Content-Encoding header regardless of the file extension.

The gzip compressed file, `text.gz`, is uploaded with the following HTTP headers using the `defaultContentType` specified in the manifest file:

- Content-Encoding: gzip
- Content-Type: binary/octet-stream

### Excluding Files and Directories

#### Topics

- Excluding Files (p. 35)
- Excluding Directories (p. 36)
- Excluding Recycle Bin (p. 36)
- Excluding Lost+Found (p. 36)

You can instruct AWS Import/Export not to import some of the directories and files on your storage device. This is a convenient feature that allows you to keep a directory structure intact, but avoid uploading unwanted files and directories. Use the `ignore` option to specify directories, files, or file types on your storage device to ignore. Use standard Java regular expressions to specify naming patterns. For information about Java regular expressions, go to http://download.oracle.com/javase/tutorial/essential/regex/. The following examples show Java regular expressions that are commonly used in a manifest.

#### Excluding Files

The following example uses the `ignore` option with two Java regular expressions to exclude files with suffix ending with a tilde and `.swp`.

```plaintext
ignore:
  - .*~$
```
The following ignore option excludes all the files on the storage device with the .psd extension.

```ignore
- \.*\swp$
```

The log report includes all ignored files, including the SIGNATURE file you added at the root of your storage device.

### Excluding Directories

The following ignore option specifies that the backup directory at the root of your storage device will be excluded from the import.

```ignore
- ^backup/$
```

**Important**

When specifying a path that includes a file separator, for example, `images/myImages/sampleImage.jpg`, make sure to use a forward slash, `/`, and not a back slash.

The following ignore option ignores all the content in the images/myImages directory.

```ignore
- ^images/myImages/$
```

### Excluding Recycle Bin

Many storage devices include recycle bins. You may not want to upload the recycle bin in the import process. To skip the recycle bin on Windows computers you specify the following ignore option. The regular expression in the first line applies to NTFS file systems formatted for Windows Vista and Windows 7. The regular expression in the second line applies to NTFS file systems on Windows 2000, Windows XP and Windows NT. And the regular expression in the third line applies to the FAT file system.

```ignore
- ^\$Recycle\bin/
- ^RECYCLER/
- ^RECYCLED/
```

### Excluding Lost+Found

The Java regular expression in the following ignore statement prevents the lost+found directory from being uploaded.

```ignore
- ^lost\+found/
```

### Manipulating Amazon S3 Object Key Names for AWS Import/Export

**Topics**
The file path on your AWS Import/Export storage device determines the corresponding object key when AWS imports your data to an Amazon S3 bucket. For example, if your storage device has an images top-level folder with a file sample.jpg, the uploaded file/object key will be images/sample.jpg.

You can use the substitutions option to change object key names when importing to Amazon S3. For example, you can add prefixes or suffixes to file names. For more information, see Working with Amazon S3 Substitutions (p. 37).

### Specifying Key Prefix

The AWS Import/Export prefix mechanism allows you to create a logical grouping of the objects in a bucket. The `prefix` value is similar to a directory name that enables you to store similar data under the same directory in a bucket. For example, if your Amazon S3 bucket name is `my-bucket`, and you set `prefix` to `my-prefix/`, and the file on your storage device is `/jpgs/sample.jpg`, then `sample.jpg` would be loaded to `https://s3.amazonaws.com/my-bucket/my-prefix/jpgs/sample.jpg`. If the prefix is not specified, `sample.jpg` would be loaded to `https://s3.amazonaws.com/my-bucket/jpgs/sample.jpg`. You can specify a prefix by adding the `prefix` option in the manifest.

**Important**

We do not include a forward slash (/) automatically. If you don't include the slash at the end of the value for `prefix`, the value is concatenated to the file name. For example, if your prefix is `images` and you import the file `sample.jpg`, your key would become `imagessample.jpg` instead of `images/sample.jpg`.

```
prefix: my-prefix/
```

### Working with Amazon S3 Substitutions

The `substitutions` option is helpful for changing file names, appending prefixes or suffixes to file names, or other name changes during an Amazon S3 import or export job. For import jobs, use the `substitutions` option to change object key names. For export jobs, use the `substitutions` option to change names to write to your file system. For example, use the following entry to replace all the uppercase "A", "B" and "C" letters in your file names and directories with lowercase letters on the object key names before the data is uploaded to your Amazon S3 bucket.

The `substitutions` option can only be used when `manifestVersion` is set to 2.0, and is not available for Amazon EBS import jobs.

```
substitutions:
  "A" : "a"
  "B" : "b"
  "C" : "c"
```

**Important**

Avoid attempting to replace an entire value with an empty string. For import jobs, an empty string causes the import to fail and report a "400 InvalidSubstitution" error in the log. Also, avoid substitutions that result in multiple files mapping to the same file name. For import jobs, when multiple files map to the same file name, the behavior is undefined. For export jobs, when multiple files map to the same file name, the object falls into the recovery process. For more information about the recovery process, see Collecting Files That Have Naming Errors (p. 53).

The `substitutions` option is applied after any `prefix` options are applied. First, the `prefix` option determines what Amazon S3 data to copy, then, the `substitutions` option determines the value to
write. For export jobs, if a `targetDirectory` option is specified, the substitutions option is applied to the `targetDirectory` value while it is writing to your device.

**Example: Using Both Prefix and Substitutions Options**

```plaintext
prefix: myprefix$COLON$
substitutions:
    
    
```

When you use the preceding options, you can enter a fully qualified file name on your device, such as:

```plaintext
/backup/$COLON$/"computer1"/c$/image.dat
```

AWS Import/Export performs the substitution and the file name becomes the following object name on Amazon S3.

```plaintext
myprefix:backup:/"computer1"/c:/image.dat
```

**Example: Using Substitutions, Prefix, and targetDirectory Options**

```plaintext
substitutions:
    
    
```

operations:
    
    - exportBucket: mybucket
    prefix: myprefix,
    targetDirectory: data,

When you use the preceding options, you can enter an Amazon S3 object name, such as:

```plaintext
mybucket/myprefix,/backup/:/computer1/c:/image.dat
```

AWS Import/Export performs the substitution, and the object name becomes the following fully qualified file name on your device.

```plaintext
/data$COMMA$/myprefix$COMMA$/backup/$COLON$/computer1/c$COLON$/image.dat
```

**Example: Changing Name Space Encoding**

In most cases the file system name space requirements are more restrictive than the Amazon S3 name space requirements, and you might need to map between valid file system names and the Amazon S3 key name space. For an import job, you can take advantage of the more expressive name space support in Amazon S3 by encoding the file name with information that is decoded before upload. In the following example, character encoding for a colon is converted to a colon in the Amazon S3 name space:

```plaintext
substitutions:
    
    
```

For an export job, you can handle characters that don't map to the file system.

```plaintext
substitutions:
    
    
```
Mapping Uppercase Characters to Lowercase Characters

You can define a rule to substitute all uppercase characters for file names with the equivalent lowercase characters for object names in your import job. For example, use the following entry to replace all the uppercase characters in your file names with lowercase letters for an entire alphabet. List all the letters in the alphabet (you need to specify each one) with the uppercase letters on the left side of the option parameter and lowercase letters on the right side of the option parameter (where "..." represents all the characters between C and Y):

```
substitutions:
  "A" : "a"
  "B" : "b"
  "C" : "c"
  ...
  "Y" : "y"
  "Z" : "z"
```

For more information, see the substitutions option in Common Manifest File Options (p. 68).

Mapping File Directories to the Amazon S3 Root

Amazon S3 performs well even when there are millions of files in the same bucket. To import your data efficiently into Amazon S3 using AWS Import/Export, you might decide to eliminate your subdirectories. If you name your directories carefully, such that none of the names of the directories are substrings of your file names, you can use the substitutions manifest option to remove the directory from the key name. The following example assumes you have a directory structure that divides your data across the three subdirectories, ZZ1, ZZ2, ZZ3 in your file system.

```
ZZ1/
ZZ2/
ZZ3/
```

To remove the directory name from the Amazon S3 key names, define the following substitutions option in your manifest file:

```
substitutions:
  "ZZ1/" : ""
  "ZZ2/" : ""
  "ZZ3/" : ""
```

All of the files will be stored in the Amazon S3 bucket root.

**Important**

None of the files within the subdirectories should contain the substitutions strings in their file names (such as "ZZ1/", "ZZ2/", or "ZZ3/"). If two files have the same name, both files are uploaded to Amazon S3, but you will only retain the bytes of the last file transferred. Use the forward slash (/) as the file separator character. Don't use the back-slash (\) or double back-slash (\\).

Sending CreateJob Requests

**Topics**

- Sending a CreateJob Request Using the AWS Import/Export Web Service Tool (p. 40)
- Sending a CreateJob Request Using the AWS SDK for Java (p. 41)
**Sending a CreateJob Request Using the AWS Import/Export Web Service Tool**

The easiest way to send a CreateJob request is by using the AWS Import/Export Tool.

**To send a CreateJob request using the AWS Import/Export Web Service Tool**

1. Click the following link to download the AWS Import/Export Web Service Tool:
   
   
   Extract the zipped content to a directory on your computer.

2. Open a command prompt (or a terminal application), and change to the directory where you unzipped the AWS Import/Export Web Service Tool.

3. Enter the CreateJob request on the command line, specifying either Import or Export and the manifest file name.

   For an Import job, enter the following CreateJob request on the command line.
   
   ```bash
   CmdPrompt>java -jar lib/AWSImportExportWebServiceTool-1.0.jar CreateJob Import MyImportManifest.txt .
   ```

   For an Export job, enter the following CreateJob request on the command line.
   
   ```bash
   CmdPrompt>java -jar lib/AWSImportExportWebServiceTool-1.0.jar CreateJob Export MyExportManifest.txt .
   ```

   The CreateJob request includes a directory name for where you want the SIGNATURE file saved. In this example, the closing period (.) at the end of the command refers to the current directory. Either include the period, as shown preceding, or replace it with a directory path.

   If there is an error, AWS Import/Export returns an error message.

   If there are no errors in the request, AWS Import/Export returns a JOB CREATED response.

   **Note**
   
   For export, your Amazon S3 log bucket and your Amazon S3 export bucket must be in the same region. If your buckets are in different regions, your job request will fail.

   For an Amazon S3 import or export job, the response includes a job ID, a signature value, and saves a SIGNATURE file to your computer.

   For an Amazon EBS import job, the response includes a job ID and shipping instructions. It also places a PDF file on your computer and in the Amazon S3 log bucket you identified in your manifest. The PDF file contains job information, shipping instructions, and a barcode.
The following examples show an import job response and an export job response.

**Example import job response**

<table>
<thead>
<tr>
<th>JOB CREATED</th>
</tr>
</thead>
<tbody>
<tr>
<td>JobId: ABCDE</td>
</tr>
<tr>
<td>JobType: Import</td>
</tr>
<tr>
<td>****************************************</td>
</tr>
<tr>
<td>* AwsShippingAddress *</td>
</tr>
<tr>
<td>****************************************</td>
</tr>
<tr>
<td>Please call GetShippingLabel API to retrieve shipping address</td>
</tr>
<tr>
<td>****************************************</td>
</tr>
<tr>
<td>* SignatureFileContents *</td>
</tr>
<tr>
<td>****************************************</td>
</tr>
<tr>
<td>version:2.0</td>
</tr>
<tr>
<td>signingMethod:HmacSHA1</td>
</tr>
<tr>
<td>jobId:ABCDE-VALIDATE-ONLY</td>
</tr>
<tr>
<td>signature:cbfdUuhhmauYS+ABCl5R9heDK/V=</td>
</tr>
<tr>
<td>Writing SignatureFileContents to cmdPrompt.SIGNATURE</td>
</tr>
<tr>
<td>Please use GetShippingLabel API endpoint to print your shipping label.</td>
</tr>
</tbody>
</table>

**Example export job response**

<table>
<thead>
<tr>
<th>JOB CREATED</th>
</tr>
</thead>
<tbody>
<tr>
<td>****************************************</td>
</tr>
<tr>
<td>* RECEIVED SUCCESSFUL RESPONSE *</td>
</tr>
<tr>
<td>****************************************</td>
</tr>
<tr>
<td>jobId: ETU5V</td>
</tr>
<tr>
<td>signature: f7+7Dabe30tqvZkFFjlI0K5KUHg=</td>
</tr>
<tr>
<td>jobType: Export</td>
</tr>
<tr>
<td>****************************************</td>
</tr>
<tr>
<td>* signatureFileContents - write this to a file called *</td>
</tr>
<tr>
<td>* SIGNATURE in the root of your disk *</td>
</tr>
<tr>
<td>****************************************</td>
</tr>
<tr>
<td>version:2.0</td>
</tr>
<tr>
<td>signingMethod:HmacSHA1</td>
</tr>
<tr>
<td>jobId:ETU5V</td>
</tr>
<tr>
<td>signature:f7+7Dabe30tqvZkFFjlI0K5KUHg=</td>
</tr>
<tr>
<td>Please use GetShippingLabel API endpoint to print your shipping label.</td>
</tr>
</tbody>
</table>

The **Getting Started (p. 5)** section provides step-by-step examples of creating import and export jobs using the AWS Import/Export Web Services Tool.

**Sending a CreateJob Request Using the AWS SDK for Java**

The AWS SDK for Java exposes an API to create an import job or an export job. You can then use the information in the response to send your storage device to AWS.

**Create Job Process**

1. Create an instance of the AmazonImportExportClient class by providing your AWS credentials.

2. Create an instance of the CreateJobRequest class by providing job information, such as the job type and the manifest.
Send the create job request by calling the
AmazonImportExportClient.createRequest method.

The following Java code sample demonstrates creating an import job using the preceding steps.

```java
AmazonImportExportClient client =
    new AmazonImportExportClient(
        new PropertiesCredentials(
            ImportCreateJobSample.class.getResourceAsStream("AWSCredentials.properties")));
String manifest = readManifestFile(manifestFilePath);
CreateJobRequest createRequest = new
    CreateJobRequest().withManifest(manifest).withJobType("Import");
CreateJobResult createResult = client.createJob(createRequest);
```

The following Java code sample demonstrates creating an export job using the preceding steps.

```java
AmazonImportExportClient client =
    new AmazonImportExportClient(
        new PropertiesCredentials(
            ImportCreateJobSample.class.getResourceAsStream("AWSCredentials.properties")));
String manifest = readManifestFile(manifestFilePath);
CreateJobRequest createRequest = new
    CreateJobRequest().withManifest(manifest).withJobType("Export");
CreateJobResult createResult = client.createJob(createRequest);
```

To send a CreateJob request and print the response using Java

1. Create a properties file, AWSCredentials.properties, and provide the Access Key ID and Secret Key value for your IAM user. For more information, see Using IAM with AWS Import/Export (p. 22).

   Following is an example credentials file.

   ```
   accessKey:<Your Access Key ID>
   secretKey:<Your Secret Key>
   ```

   **Note**
   You cannot use the same AWSCredentials.properties file that you use with the AWS Import/Export Web Service tool. The fields are not the same.

   The AWSCredentials.properties file must be saved in the same directory as the produced .class file. Thus, if your class is in a package, or if your IDE puts your .class files in a different location, you will have to determine the appropriate directory to save your properties file. Also, the path to your manifest file must be explicit, including the full path to the file (such as C:\\Users\\UserName\\MyManifest.txt).

2. Create a manifest file describing your job.

   For an example manifest, see Create Your First Amazon S3 Import Job (p. 8) or Create Your First Amazon S3 Export Job (p. 16).

3. Copy the following Java class to a file in your project.

   ```java
   import java.io.BufferedReader;
   import java.io.FileReader;
   import java.io.IOException;
   ```
import com.amazonaws.auth.PropertiesCredentials;
import com.amazonaws.services.importexport.AmazonImportExportClient;
import com.amazonaws.services.importexport.model.CreateJobRequest;
import com.amazonaws.services.importexport.model.CreateJobResult;

public class ImportExportCreateJobSample {
    private static String manifestFilePath = "[Provide-Explicit-Manifest-File-Path]";
    
    public static void main(String[] args) throws IOException {
        AmazonImportExportClient client =
                new AmazonImportExportClient(
                        new PropertiesCredentials(
                                ImportExportCreateJobSample.class.getResourceAsStream("AWSCredentials.properties")));

        String manifest = readManifestFile(manifestFilePath);

        CreateJobRequest createRequest = new CreateJobRequest().withManifest(manifest).
                withJobType("[Import|Export]");

        // Call service.
        CreateJobResult createResult = client.createJob(createRequest);

        // Process result.
        System.out.println();
        System.out.println();
        System.out.println("********************************");
        System.out.println("* RECEIVED SUCCESSFUL RESPONSE *");
        System.out.println("********************************");
        System.out.println("jobId: " + createResult.getJobId());
        System.out.println("signature: " + createResult.getSignature());
        System.out.println("jobType: " + createResult.getJobType());
        System.out.println();
        System.out.println("*******************************************************");
        System.out.println("* signatureFileContents - write this to a file called *");
        System.out.println("* SIGNATURE in the root of your disk                  *");
        System.out.println("*******************************************************");
        System.out.println(createResult.getSignatureFileContents());
        System.out.println();
        System.out.println();
        System.out.println("*******************************");
        System.out.println("* Obtain shipping information *");
        System.out.println(createResult.getAwsShippingAddress());
    }

    public static String readManifestFile(String filename) throws IOException {
        StringBuilder manifest = new StringBuilder();
        BufferedReader input = new BufferedReader(new FileReader(filename));
        try {
            String line = null;
            while ((line = input.readLine()) != null) {
                manifest.append(line);
                manifest.append(System.getProperty("line.separator"));
            }
        } finally {
            input.close();
        }
        return manifest.toString();
    }
}

4. Update the code by providing your manifest file path and specifying Import or Export for the job type.
5. Run the code.
For an Amazon S3 import or export job, AWS Import/Export sends a response that includes a job ID, a signature value, and information on how to print your pre-paid shipping label. The response also saves a SIGNATURE file to your computer.

For an AWS EBS import job, AWS Import/Export sends a response that includes a job ID and shipping instructions. It also places a PDF file in the Amazon S3 log bucket you identified in your manifest. The PDF file contains job information, shipping instructions, and a barcode.

### Sending a CreateJob Request Using the REST API

If your application requires programmatic access to AWS Import/Export and the AWS SDK does not meet your requirements you can program directly using the REST API.

**To create a job using the REST API**

1. Create a manifest file describing your job.
   - **For an example manifest, see Create Your First Amazon S3 Import Job (p. 8) or Create Your First Amazon S3 Export Job (p. 16).**
2. URL encode the manifest file.
3. Sign the request.
   - For more information, go to Making Query Requests (p. 91).
4. Send a `CreateJob` request, specifying `JobType=Import` or `JobType=Export`.

Following is a sample `CreateJob` request for an import job. The request includes the URL encoded manifest file in the body of the request as the `Manifest` option value. The request also shows the other required string parameters.

```
POST / HTTP/1.1
content-type:application/x-www-form-urlencoded;charset=utf-8
host: https://importexport.amazonaws.com
content-length:579

Action=CreateJob&Manifest=manifestVersion%3A%202.0%0A%0Abucket%3A%20myBucket%0AeraseDevice%3A%20yes%0AreturnAddress%3A%20%0Aname%3A%20Amazon.com%20ATTN%20Joe%0Astreet1%3A%201200%2012th%20Ave%20S.%0Acity%3A%20Seattle%0AstateOrProvince%3A%20WA%0ApostalCode%3A%2098114%0AphoneNumber%3A%20206-266-0000%0Acountry%3A%20USA%0AJobType=Import%0ASignatureVersion=2&SignatureMethod=HmacSHA256%0AVersion=2010-06-01&Signature=%2FVfkltRB0oSUil1sWxRzN8rw%3D
```

For an Amazon S3 import or export job, AWS Import/Export sends a response that includes a job ID, a signature value, and information on how to print your pre-paid shipping label.

For an AWS EBS import job, AWS Import/Export sends a response that includes a job ID and shipping instructions. It also places a PDF file in the Amazon S3 log bucket you identified in your manifest. The PDF file contains job information, shipping instructions, and a barcode.

For more information about creating a job using the REST API, go to CreateJob (p. 98). You can validate the manifest and parameter values without creating a job by setting the ValidateOnly parameter to true.
Viewing Import Logs

After successfully transferring data between AWS and your portable storage device, AWS Import/Export generates a log and saves it to Amazon S3 as an object.

Topics
- Log Files (p. 45)
- Amazon S3 and Amazon EBS Log File Fields (p. 45)
- Status Codes (p. 47)

Log Files

The log file is a UTF-8 encoded CSV file that contains, among other things, information about each file loaded to or from your storage device.

With Amazon S3 import jobs, AWS Import/Export saves the log to the same Amazon S3 bucket as your data.

With Amazon EBS jobs, AWS Import/Export saves the log to the bucket you specified in the logBucket option in your manifest file.

For an import job, the log name ends with the phrase import-log- followed by your JOBID. For an export job, the log name ends with the phrase export-log- followed by your JOBID. For example, if the import JOBID is 53TX4, the log name ends in import-log-53TX4. By default, if you do not set logPrefix in the manifest file, a job loaded to mybucket with the JOBID of 53TX4 loads the logs to http://mybucket.s3.amazonaws.com/import-log-53TX4. If you set logPrefix to logs/, the log location is http://s3.amazonaws.com/mybucket/logs/import-log-53TX4.

For an export job, the log name ends with the phrase export-log- followed by your JOBID. For example, if the JOBID is 53TX4, the log file name would end in http://s3.amazonaws.com/mybucket/logs/export-log-53TX4.

Note
If you have a log object with the same key name as an existing Amazon S3 object, the new log overwrites the existing object. You can use the logPrefix option to prevent object collisions.

Viewing the log files

You can download your log using the AWS Management Console. For more information, go to http://aws.amazon.com/console/.

Amazon S3 and Amazon EBS Log File Fields

The following table describes the fields in an Amazon S3 or Amazon EBS log file.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DateTime</td>
<td>The date and time when we processed a file, for example, Wed Nov 12 11:07:34 PST 2008.</td>
</tr>
<tr>
<td>File</td>
<td>The name of the file in the root directory of your storage device, for example, /images/image.jpg.</td>
</tr>
<tr>
<td>Status</td>
<td>Specifies either an AWS Import/Export status or one of the standard Amazon S3 REST web server HTTP status codes, for example, 200. For more information, see Error and Status Codes (p. 117).</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Code</td>
<td>Specifies either an AWS Import/Export code, such as <strong>Ignore</strong> when the <strong>Status</strong> is 103, or the standard Amazon S3 REST error codes, for example, <strong>OK</strong>.</td>
</tr>
<tr>
<td>Key</td>
<td>Specifies where AWS Import/Export loads the file in Amazon S3. The key includes the bucket name and any prefix settings set in the manifest file, for example, <code>/mybucket/myprefix/images/image.jpg</code>.</td>
</tr>
<tr>
<td>MD5</td>
<td>The checksum of the object stored in Amazon S3 identified by <strong>Key</strong>, for example, <code>d2a22fcab097sample32c544</code>. <strong>Note</strong> Objects imported into Amazon S3 use the public Amazon S3 API actions. Smaller objects are uploaded by Import/Export using <strong>PUT Object</strong>, and larger objects are uploaded using <strong>Multipart Upload</strong>. Objects created by <strong>PUT Object</strong> have <strong>ETags</strong> that are an MD5 digest of their object data. However, objects created by <strong>Multipart Upload</strong> have <strong>ETags</strong> that are not MD5 digests. Therefore, <strong>ETags</strong> from S3 might not match your local MD5 sums. With AWS Import/Export import jobs, we compute the MD5 sum before uploading each part, and provide it as input to <strong>UploadPart</strong>. The MD5 sum of the entire file is then written to one of our internal logs. Once the upload is complete, all data on the disk is automatically re-read to calculate MD5 sums to compare against the MD5 sums of the imported objects. If, for any reason, the software reads an MD5 sum that doesn’t match, the entire workflow will fail. For more information, see <strong>Failed Jobs</strong> (p. 67). For more information on how <strong>ETags</strong> and MD5 sums are computed in Amazon S3, see <strong>Common Response Headers</strong> in the <strong>Amazon Simple Storage Service API Reference</strong>.</td>
</tr>
<tr>
<td>Bytes</td>
<td>The number of bytes stored in Amazon S3 for the object identified by <strong>Key</strong>, for example, <code>57344</code>.</td>
</tr>
<tr>
<td>Content-Type</td>
<td>The value of the <strong>Content-Type</strong> header stored in Amazon S3, for example, <code>image/jpeg</code>.</td>
</tr>
<tr>
<td>ETag</td>
<td>The <strong>ETag</strong> value of the object in Amazon S3.</td>
</tr>
</tbody>
</table>

**Sample Amazon S3 Log File**

The following shows a sample Amazon S3 import log file.

<table>
<thead>
<tr>
<th>DateTime</th>
<th>File</th>
<th>Status</th>
<th>Code</th>
<th>Key</th>
<th>MD5</th>
<th>Bytes</th>
<th>Content-Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tue 03 Feb 2009 21:57:43 GMT</td>
<td>SIGNATURE</td>
<td>103</td>
<td>Ignore</td>
<td></td>
<td></td>
<td>90</td>
<td>application/octet-stream</td>
</tr>
<tr>
<td>Tue 03 Feb 2009 21:57:43 GMT</td>
<td>Notice.txt</td>
<td>200</td>
<td>OK</td>
<td>MyBucket/images/Notice.txt</td>
<td>f60fe317bc497b128b32748d5264</td>
<td>164</td>
<td>text/plain</td>
</tr>
</tbody>
</table>

<td>OK</td>
<td>MyBucket/images/chewie.TIF</td>
<td>823d17b05321b96d41f174f5bca7f7</td>
<td>458</td>
<td>image/tiff</td>
</tr>
</tbody>
</table>
Creating Amazon S3 Export Jobs

An Amazon S3 export transfers individual objects from Amazon S3 buckets to your device, creating one file for each object. You can export from more than one bucket and you can specify which files to export using manifest file options.

Note
You cannot export Amazon S3 objects that have been transitioned to Amazon Glacier Storage Class using Amazon S3 Object Lifecycle Management. Before sending an Amazon S3 export job, check your lifecycle configuration rules to ensure that your objects will be available in Amazon S3 standard class until the export is complete. For more information, see Object Lifecycle Management in the Amazon S3 Developer Guide.

You must submit a separate job request for each device.

For more information, see Guidelines and Limitations (p. 121)

Amazon S3 Export Process

Export Job Process

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>You create an export manifest file that specifies how to load data onto your device, including an encryption PIN code or password and details such as the name of the bucket that contains the data to export. For more information, see The Export Manifest File (p. 50). If you are going to mail us multiple storage devices, you must create a manifest file for each storage device.</td>
</tr>
</tbody>
</table>
| 2 | You initiate an export job by sending a CreateJob request that includes the manifest file. You must submit a separate job request for each device. Your job expires after 30 days. If you do not send a device, there is no charge.   

You can send a CreateJob request using the AWS Import/Export Tool, the AWS Command Line Interface (CLI), the AWS SDK for Java, or the AWS REST API. The easiest method is the AWS Import/Export Tool. For details, see

Sending a CreateJob Request Using the AWS Import/Export Web Service Tool (p. 40)
Sending a CreateJob Request Using the AWS SDK for Java (p. 41)
Sending a CreateJob Request Using the REST API (p. 44)
AWS Import/Export Developer Guide

Amazon S3 Export Process

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>AWS Import/Export sends a response that includes a job ID, a signature value, and information on how to print your pre-paid shipping label. The response also saves a SIGNATURE file to your computer. You will need this information in subsequent steps.</td>
</tr>
<tr>
<td>4</td>
<td>You copy the SIGNATURE file to the root directory of your storage device. You can use the file AWS sent or copy the SignatureFileContents values from the response into a new text file named SIGNATURE. The file name must be SIGNATURE, and the file must be in the device's root directory. Each device you send must include the unique SIGNATURE file for that device and that JOBID. AWS Import/Export validates the SIGNATURE file on your storage device before starting the data load. If the SIGNATURE file is missing invalid (if, for instance, it is associated with a different job request), AWS Import/Export will not perform the data load and we will return your storage device. As in the following example.</td>
</tr>
</tbody>
</table>

```
****************************************
* SignatureFileContents                *
****************************************
version:2.0
signingMethod:HmacSHA1
jobId:QTEST
signature:cbfdUuhhmauYS+ABCl5R9heDK/V=```
| 5    | Generate, print, and attach the pre-paid shipping label to the exterior of your package. See Shipping Your Storage Device (p. 55) for information on how to get your pre-paid shipping label. |
| 6    | You ship the device and cables to AWS through UPS. Make sure to include your job ID on the shipping label and on the device you are shipping. Otherwise, your job might be delayed. Your job expires after 30 days. If we receive your package after your job expires, we will return your device. You will only be charged for the shipping fees, if any. You must submit a separate job request for each device. |

**Note**

You can send multiple devices in the same shipment. If you do, however, there are specific guidelines and limitations that govern what devices you can ship and how your devices must be packaged. If your shipment is not prepared and packed correctly, AWS Import/Export cannot process your jobs. Regardless of how many devices you ship at one time, you must submit a separate job request for each device. For complete details about packaging requirements when shipping multiple devices, see Shipping Multiple Devices (p. 61). |
| 7    | AWS Import/Export validates the signature on the root drive of your storage device. If the signature doesn't match the signature from the CreateJob response, AWS Import/Export can't load your data. Once your storage device arrives at AWS, your data transfer typically begins by the end of the next business day. The time line for exporting your data depends on a number of factors, including the availability of an export station, the amount of data to export, and the data transfer rate of your device. |
| 8    | AWS reformat your device and encrypts your data using the PIN code or password you provided in your manifest. |
Creating Export Manifests

You provide your job information and specify how to transfer your data between your storage device and AWS by creating a manifest file. The manifest file is a YAML-formatted text file. It consists of a set of name-value pairs that supply required information such as your device ID, log bucket, return address, and so on. For more information about YAML, go to http://yaml.org.

Import and export manifest files use a common set of options and also options that are unique to each type.

A set of customs manifest file options is required for any storage device shipped internationally.

For a complete list of manifest options, go to Manifest File Options Reference (p. 68).

Export Manifest Example

An S3 export job has a set of required options.

This sample Amazon S3 export manifest file includes only the required options.

```yaml
manifestVersion: 2.0
generator: text editor
deviceId: ABCDE
pinCode: 4321
trueCryptPassword: SimpleButEasilyCrackedEXAMPLE
fileSystem: NTFS
serviceLevel: expeditedShipping
targetDirectory:/
recoveryDirectory: EXPORT-RECOVERY
logBucket: ImportExportBucket
notificationEmail: jane.roe@example.net
operations:
  - exportBucket: ImportExportBucket
    returnAddress:
      name: Jane Roe
      company: Example Corp.
      street1: 123 Any Street
      city: Anytown
      stateOrProvince: WA
      postalCode: 91011-1111
      phoneNumber: 206-555-1111
      country: USA
```

For a complete list of manifest options, see Manifest File Options Reference (p. 68). For examples of commonly used manifest options, see Working with Amazon S3 Export Manifests (p. 50).
• Shipping Internationally (p. 51)
• Expediting the Return of Your Storage Device (p. 51)
• Preventing Log File Name Collisions (p. 51)

This section gives examples of using export manifest options.

Shipping Internationally

When shipping devices internationally except within the European Union you must include the customs option in the manifest. For more information about the customs related manifest options, see Customs Manifest File Option (p. 71).

Expediting the Return of Your Storage Device

When returning your device to a U.S. address from a U.S. region bucket, you can use the serviceLevel manifest option to upgrade your shipping. The default serviceLevel option is standard shipping, which includes free ground domestic shipping. When you specify expeditedShipping, your device is delivered using two-day shipping for an additional fee.

Preventing Log File Name Collisions

The logPrefix option defines a string AWS Import/Export inserts between the bucket name and log report name to prevent name collisions. The log file name always ends with the phrase export-log-followed by your JobId.

Example path and file name without logPrefix:

Example path and file name with logPrefix set to logs/:
http://mybucket.s3.amazonaws.com/logs/export-log-53TX4

Note
We do not include a slash (/) automatically. If you don't include the slash at the end of the value for logPrefix, the value is concatenated to the log file name. For example, if your logPrefix is taxonomy and your root directory contains the file phylum.jpg, your key would become taxonomyphylum.jpg instead of taxonomy/phylum.jpg.

logPrefix + export-log-JOBID cannot be longer than 1024 bytes. If it is, AWS Import/Export returns an InvalidManifestField error from the CreateJob action.

Managing File Exports

Topics
• Operations Export Manifest Option (p. 52)
• Limiting the Exported Data (p. 52)
• Exporting Data From Multiple Buckets (p. 52)
• Specifying the Target Directory (p. 53)

You may need to limit which files are exported from a bucket. For instance, you might not want all of the files in a bucket, or you may have too many files for a single device and need to export to multiple devices.

This section describes how to configure the operations manifest file option to manage those tasks.
If you need to export files from multiple buckets, you can specify multiple exportBucket options in the same manifest file.

**Operations Export Manifest Option**

The operations manifest option specifies a list of one or more export operations. AWS Import/Export exports keys in alphabetical order. That is, it carries out the operations in the order listed and then in the alphabetical order of the keys affected by each export operation. The files on the storage device remain in strict alphabetical order even if the data to export exceeds the capacity of the storage device; AWS Import/Export does not, for example, squeeze in an extra file or two that are out of order just because there is room on the storage device. This alphabetical order enables you to continue the export easily: create a new export job using the key of the last file exported as the beginMarker in your new export job.

The operations subfields prefix, beginMarker, and endMarker limit the data exported from a bucket.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prefix</td>
<td>Restricts the keys exported to those located in the path specified by prefix.</td>
</tr>
<tr>
<td>beginMarker</td>
<td>Limits the keys exported to those that occur alphabetically after this option value.</td>
</tr>
<tr>
<td>endMarker</td>
<td>A subfield of operations that limits the keys exported to those that occur alphabetically before and including the key that matches endMarker. Any keys that are prefixed by endMarker are not included.</td>
</tr>
</tbody>
</table>

AWS Import/Export uses the entire key when naming the objects exported to your storage device. For example, AWS Import/Export would map the key `starwars.s3.amazonaws.com/images/jedi.jpg` to the following file on your storage device `/starwars/images/jedi.jpg`. For Microsoft Windows, AWS Import/Export would map the same key to `\starwars\images\jedi.jpg`.

The following sections talk in depth about some of the export fields you use with operations.

**Limiting the Exported Data**

Use beginMarker and endMarker to specify the beginning and the ending of the keys to export.

The export job starts with the key after the beginMarker. In other words, the beginMarker is not included in the export job, although the endMarker is included. For example, the following options export all of the keys that occur alphabetically between `html/index.html` and `images/kate.jpg`.

The export will not include `html/index.html`, will include `images/kate.jpg`, and will not include `images/kate.png`.

```plaintext
operations:
- exportBucket: mybucket
  beginMarker: html/index.html
  endMarker: images/kate.jpg
```

**Note**

It's possible to construct an export operation that includes no keys. For example, if you specify image for prefix and foo for endMarker, there would be no matching keys because foo comes alphabetically before image.

**Exporting Data From Multiple Buckets**

To export multiple subsets of data from one or more buckets, specify multiple exportBucket operations followed by appropriate export options. Each dash (-) after operations specifies a new set.
of data to export. Each entry requires an `exportBucket` manifest option. The following example shows four data sets to export from three different buckets: `mybucket`, `lost`, and `threescompany`.

All buckets must be in the same Amazon S3 region and you must have read permissions on each bucket and each object.

**To export data from more than one bucket**

Use `exportBucket` to specify each bucket you want to export data from.

In the following example, AWS Import/Export exports all keys under `/images` in `mybucket` to `starwars/image-backup` on the storage device.

```plaintext
operations:
- exportBucket: mybucket
  prefix: images
  beginMarker: images/starwars/jedi.jpg
  endMarker: images/starwars/masterwindoo.jpg
- exportBucket: lost
- exportBucket: threescompany
  prefix: images
  endMarker: images/characters/mrfurley.jpg
```

The order in which AWS Import/Export exports keys is the order of the operations you specify in the `operations` manifest option, and then within each operation, by the alphabetical order of the keys to be exported. In the previous procedure, for example, AWS Import/Export exports all of the keys from `mybucket` in alphabetical order, and then from `lost` in alphabetical order.

**Note**

AWS Import/Export exports keys in parallel, but the finished order of files on the storage device is by operation and then alphabetical. This functionality becomes important when the storage device has insufficient capacity to hold all of the data that needs to be exported. This ordering enables you to easily continue the export with a new export job using the key of the last key exported as your `beginMarker` in your new export job.

**Specifying the Target Directory**

AWS Import/Export gives you the ability to specify the location for the exported files on your storage device using the `export` manifest options `operations` and `targetDirectory`.

**To export data to a specific directory**

Use the `targetDirectory` to specify the directory on the storage device you want to export files into.

In the following example, AWS Import/Export exports the contents of the bucket named `bucket-data-comes-from` to the directory, `myexport/stuff`, on the storage device.

The default `targetDirectory` is the bucket name.

```plaintext
operations:
- exportBucket: bucket-data-comes-from
  targetDirectory: myexport/stuff
```

**Collecting Files That Have Naming Errors**

Amazon S3 object keys might contain characters that are incompatible with the file system you specified in your manifest. When AWS Import/Export exports files to your device, we attempt to remove illegal characters and map the Amazon S3 keys as closely as possible to a file name that is permitted by the file
system. If a file name cannot be mapped, the file is copied to a directory named EXPORT-RECOVERY. You can optionally specify a different directory name by specifying the `recoveryDirectory` option in your export manifest.

Files are written to the recovery directory beginning in a subdirectory named 0000. The files are named sequentially from 0000 to 9999, then a new subdirectory named 0001 is created, and so on. This process continues until one of the following conditions occurs:

- All files are stored
- The file system is full
- 100 million files are written to the `recoveryDirectory` directory
- The `recoveryDirectory` directory exceeds the file system's maximum file size limit

For example, if your recovery directory is named EXPORT-RECOVERY, your hierarchy of files and directories will look similar to this:

```
EXPORT-RECOVERY/
  0000/
    0000
    0001
    ...
    9999
  0001/
    ...
    9999
```

**Viewing Import/Export Logs**

After transferring data between AWS and your portable storage device, AWS Import/Export generates a log file. The log file is a CSV file that contains, among other things, information about each file loaded to or from your storage device. With export jobs, AWS Import/Export saves the log files to the bucket you specify with the `logBucket` manifest option.

**Note**

For export, your Amazon S3 log bucket and your Amazon S3 export bucket must be in the same region. If your buckets are in different regions, your job request will fail.

The log file name of an export job always ends with the phrase `export-log-` followed by your `JOBID`. For example, if the `JOBID` is `53TX4`, the log file name would end in `export-log-53TX4`.

**Note**

If you have a log file name with the same name as an existing Amazon S3 object, the new log file overwrites the existing object. You can use the `logPrefix` field to prevent object collisions. For more information about the `logPrefix`, see Preventing Log File Name Collisions (p. 51).

**Sample Log File**

AWS Import/Export uses the same set of fields in an import or an export log. For more information about log files and descriptions of log file fields, see Amazon S3 and Amazon EBS Log File Fields (p. 45).
Shipping Your Storage Device

Topics

• Storage Device Requirements (p. 55)
• Preparing Your Storage Device for Amazon S3 Import and Export Jobs (p. 56)
• Preparing Your Storage Device for Amazon EBS Import Jobs (p. 57)
• Encrypting Your Data (p. 57)
• Packing Your Storage Device (p. 59)
• Generating Your Pre-Paid Shipping Label (p. 60)
• Shipping Multiple Devices (p. 61)
• Mailing Your Storage Device (p. 62)

The following sections explain how to prepare and ship your storage device to AWS.

You must use UPS as your carrier to send packages to AWS, and you must use the pre-paid shipping label generated by the AWS Import/Export Web Service Tool. AWS returns packages using UPS or DHL.

Your device will be delivered to an AWS sorting facility and then forwarded by Amazon to the AWS data center. UPS will only have tracking information to the sorting facility. AWS updates the job status when the package is received by the AWS data center. When you send a GetStatus command, the status of your job will not show At AWS until the shipment has been received at the AWS data center.

Important
Any packages that arrive at an AWS sorting facility without the pre-paid shipping label attached will be returned without AWS performing the job request, and you will be charged for any applicable return shipping charges and device-handling fees. If you cannot use the pre-paid shipping label, contact AWS Support Center before shipping your device.

Storage Device Requirements

To connect your storage device to one of our AWS Import/Export stations, your device must meet the following requirements:

• Compatible with Red Hat Linux and warranted by the manufacturer to support eSATA, USB 3.0, or USB 2.0 interface on Linux.
• Maximum device size is 14 inches/35 centimeters high by 19 inches/48 centimeters wide by 36 inches/91 centimeters deep (8Us in a standard 19 inch/48 centimeter rack).
• Maximum weight is 50 pounds/22.5 kilograms.
• Maximum device capacity is 16 TB for Amazon Simple Storage Service (Amazon S3) and Amazon EBS jobs.
• Power requirements vary by region. For more information, go to the Selecting Your Storage Device section on the AWS Import/Export Product Details page.

Important
If you’re not using internal drives, you must ship your storage device with its power supply, power cable, and interface cables. Without these components, we can’t transfer your data and
Preparing Your Storage Device for Amazon S3 Import and Export Jobs

The process for preparing your storage device is as follows. Individual steps are described in detail in the following topics.

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Ensure that your storage device conforms to AWS requirements. For more information, see Storage Device Requirements (p. 55).</td>
</tr>
<tr>
<td>2</td>
<td>For import to Amazon S3, you can encrypt your data before you send the device. For export to Amazon S3, you provide a PIN code or password that we will use to encrypt your data. For more information, see Encrypting Your Data (p. 57).</td>
</tr>
<tr>
<td>3</td>
<td>Label both your device and package with the JobId value from the CreateJob response.</td>
</tr>
<tr>
<td>4</td>
<td>Copy the SIGNATURE value to a file named SIGNATURE in the root directory of your storage device.</td>
</tr>
<tr>
<td>5</td>
<td>Generate, print, and attach the pre-paid shipping label to the exterior of your package. See Shipping Your Storage Device (p. 55) for information on how to get your pre-paid shipping label.</td>
</tr>
<tr>
<td>6</td>
<td>Pack your power supply, power cable, and interface cables along with your device. <strong>Important</strong> Secure your device within the shipping box to prevent shifting in transit. For example, wrapping your device in bubble wrap will help prevent shifting and give added protection from damage.</td>
</tr>
</tbody>
</table>

Copying the Signature Value

For Amazon S3 import or export jobs, your storage device must have on its root directory a file named SIGNATURE. The CreateJob response includes the SignatureFileContents text and a file named SIGNATURE in its response. The file name must be SIGNATURE, all caps, and it must be in the device's root directory.

To copy the signature value to your storage device

1. Locate the SIGNATURE on your computer, or create a file named SIGNATURE and copy the SignatureFileContents text into it.

   You can also get the SignatureFileContents value by submitting a GetStatus request.

   The file name, SIGNATURE, must be all caps.

2. Copy the SIGNATURE file to your storage device in the root directory.

   Each device you send must include the unique SIGNATURE file for that device and that JOBID. AWS Import/Export validates the SIGNATURE file on your storage device before starting the data load. If the SIGNATURE file is missing or invalid (if, for instance, it is associated with a different job request), AWS Import/Export will not perform the data load and we will return your storage device.
Preparing Your Storage Device for Amazon EBS Import Jobs

The process for preparing your storage device is as follows. Individual steps are described in detail in the following topics.

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Ensure that your storage device conforms to AWS requirements. For more information, see Storage Device Requirements (p. 55).</td>
</tr>
<tr>
<td>2</td>
<td>Print the PDF file from the CreateJob response and tape the bar code portion to your device. Be especially careful to attach the right barcode to the right device. You submit a separate job request for each device, and each job request generates a unique barcode. <strong>Important</strong> - Attach the signature barcode securely to your device, with tape on all four sides. Do not delete, alter, or obscure the signature barcode in any way. AWS Import/Export uses the signature barcode to validate your storage device before starting the data load. If the signature barcode is separated from your device, we cannot validate it and we will return your device without performing the data load.</td>
</tr>
<tr>
<td>3</td>
<td>Generate, print, and attach the pre-paid shipping label to the exterior of your package. See Shipping Your Storage Device (p. 55) for information on how to get your pre-paid shipping label.</td>
</tr>
<tr>
<td>4</td>
<td>Pack your power supply, power cable, and interface cables along with your device. <strong>Important</strong> - Secure your device within the shipping box to prevent shifting in transit. For example, wrapping your device in bubble wrap will help prevent shifting and give added protection from damage.</td>
</tr>
</tbody>
</table>

Encrypting Your Data

For added security, AWS Import/Export supports the following data encryption methods:

**PIN-code encryption**
- Hardware-based device encryption that uses a physical PIN pad for access to the data.

**TrueCrypt software encryption**
- Disk encryption using TrueCrypt, which is an open-source encryption application.

For export from Amazon S3, AWS always requires data encryption, either by using a PIN-code device with hardware-based encryption or by using TrueCrypt software encryption. For added security, you can use both methods. You will need to provide the PIN or password, or both, in your manifest file.

For import jobs, we strongly recommend encrypting your data. For import to Amazon S3, you can use a PIN-code device with hardware-based encryption or TrueCrypt software to encrypt your data before sending it to AWS Import/Export. You will need to include your PIN code or TrueCrypt password in your import manifest and the TrueCrypt password in your export manifest.

For import to Amazon EBS you can use a PIN-code device with hardware-based encryption or any software encryption method you choose, or both. AWS uses your PIN to access a PIN-code device, but does not decrypt software-encrypted data for import to Amazon EBS. You will need to include your PIN in your import manifest.
Using PIN-Code Device Encryption

You can supply a storage device that uses hardware-based device encryption with a physical PIN pad for all import or export jobs. If you do so, you must provide the PIN code in your manifest.

Using TrueCrypt Encryption for Import to Amazon S3

TrueCrypt is an open-source disk encryption application. TrueCrypt is the only device encryption software supported by AWS Import/Export. AWS also supports hardware-based encryption. For more information, see Encrypting Your Data (p. 57).

If you have not installed TrueCrypt 7.1a, you will need to install it first.

Note

The developer no longer supports TrueCrypt 7.1a. However, you can still download TrueCrypt 7.1a and use the application without charge to encrypt your device.

To ensure that we can decrypt your device, choose the following options when creating a TrueCrypt volume:

- Create a new TrueCrypt volume. AWS Import/Export supports only TrueCrypt volumes created as non-system partitions or encrypted file containers.

  Do not use the Encrypt the system partition or the entire system drive option.

- Select either the Create an encrypted file container option or the Encrypt a non-system partition/drive option.

- For Volume Type, select Standard TrueCrypt volume. Do not create a hidden volume.

- If you are creating an encrypted file container, for Volume Location, create a file in your device's home directory and name the file <JOBID>.tc, where <JOBID> is the job ID associated with the device. For example, 1B23C.tc.

- If you are encrypting a non-system partition, for Volume Location, select the partition to be encrypted. For Volume Creation Mode, if your volume already contains files, select Encrypt partition in place. TrueCrypt will not format the partition or erase any files. Encrypt partition in place takes longer than encrypting an empty volume. If the partition is empty, select Create encrypted volume and format it.

- For Encryption Options, use AES for the Encryption Algorithm and RIPEMD-160 for the Hash Algorithm.

- Create a password for your TrueCrypt volume. You will include this password in the job manifest that you create with the AWS Import/Export tool. Without this password, we won't be able to access any data on the encrypted partition. Keep the following in mind when creating your password:
  
  Don't include commas in your password.

  Don't lose your password, or you will not be able to decrypt your device. AWS Import/Export will not send the password with the encrypted device.

  If you are prompted to select a volume format, select NTFS.

After you create your TrueCrypt volume, use TrueCrypt to mount the volume and then copy your files into the volume. Your device must contain only one partition or container and no other files. If you use a file container, the container must be named <JOBID>.tc, using the job ID associated with the device. Copy the SIGNATURE file to the root directory of the encrypted volume.

When you complete your manifest file in preparation for submitting a job request, include the password for the trueCryptPassword option. When AWS receives your device, we will attempt to mount the device. If the volume is encrypted, we decrypt it using the password you supplied. If the volume is not encrypted, we will look for a container file named <JOBID>.tc, using the job ID associated with the device. We will decrypt the container using the password you supplied.
Following a successful import, we will erase the device and ship it to the address provided on your manifest.

If any of the following conditions occur, AWS will erase your device without performing the import and ship it to the address provided on your manifest:

- You specified a TrueCrypt password in your manifest, but the partition is not encrypted or no encrypted container named <JOBID>.tc exists on the device.
- More than one container exists on the device.
- More than one partition exists on the device.
- AWS is not able to decrypt the partition or the container.

If we are unable to erase the data on the device, we will schedule it for destruction and our support team will contact you using the email address specified in the manifest file.

**Using TrueCrypt Encryption with Export from Amazon S3**

When you create an Export to Amazon S3 job, you specify a PIN code or a TrueCrypt password in the export manifest. If you supply a TrueCrypt password, AWS creates a TrueCrypt encrypted volume in a file container on your device using the password you provided, and then copies the data to the container. The container is named JOBID.tc, using the job ID associated with your device.

**Important**
Do not lose your password, or you will not be able to decrypt your device. AWS Import/Export will not send the password with the encrypted device.

**Decrypting the TrueCrypt Container**

When you receive your device, you will use TrueCrypt with the password you provided with your export manifest to decrypt the container and mount the volume.

**To decrypt the TrueCrypt container**

1. If you have not installed TrueCrypt 7.1a, you will need to install it first.
   **Note**
   The developer no longer supports TrueCrypt 7.1a. However, you can still download TrueCrypt 7.1a and use the application without charge to decrypt your device.

2. Open TrueCrypt.
3. Click **Volume, Select File**.
4. Click the name of the TrueCrypt container file located on your device, and click **Open**.
5. Click **Volume, Mount Volume**.
6. Type the password from the export manifest in to the **Password** box and click **OK**.

The encrypted container is mounted as a volume on your computer.

**Packing Your Storage Device**

This section describes how to pack your media.
To pack your storage device

1. Make sure that you package your equipment appropriately. UPS can provide packing guidelines.

   Important
   Although AWS has a number of internal controls and procedures to prevent loss, damage or disclosure of your data, AWS is not responsible for damages associated with loss or inadvertent disclosure of data; or the loss, damage, or destruction of the physical hardware. You should always retain a back-up copy of your data. For information about failed jobs, see Failed Jobs (p. 67).

2. Enclose your device and your device's power supply, power cable, and interface cables.

3. Generate, print, and attach the pre-paid shipping label to the exterior of your package. See Shipping Your Storage Device (p. 55) for information on how to get your pre-paid shipping label.

Generating Your Pre-Paid Shipping Label

This section describes how to generate your pre-paid shipping label for the package you'll send to AWS.

To generate your pre-paid shipping label

1. AWS provides you with a pre-paid shipping label that must be used when sending your device. To generate this label, after you have created your jobs, use the AWS Import/Export Web Service Tool as in the following example:

   Example

   CmdPrompt> java -jar lib/AWSImportExportWebServiceTool-1.0.jar GetShippingLabel

   Note
   The example assumes that lib is the directory that contains the AWS Import/Export Web Service Tool. Run the AWS Import/Export Web Service Tool from the directory where it was installed.

   The system prompts you to enter your job ID, name, company, address, and phone number. If your address doesn't have a postal code, use the placeholder value of 00000. The following is an example of the prompts and fictional values.

   Version: 2012-01-14
   Please enter the job ids each separated by comma: 796CK
   ---Please specify your address---
   Enter name (Required):
   Joe Random
   Enter company (Required):
   ACME Anything
   Enter street1 (Required):
   1234 Main St
   Enter street2 (Optional):
   Suite 101
   Enter street3 (Optional):
   
   Enter city (Required):
   Seattle
   Enter state or province (Required in US and Canada):
   WA
   Enter country (Required):
   USA
   Enter postal code (Required):
   98101
Enter phone number (Required):
206-100-0000
A prepaid shipping label has been uploaded to https://s3.amazonaws.com/MyImportExportBucket/shipping-label-796CK.pdf

The shipping label will look similar to the following example.

2. Pack your storage device in the package.
   
   **Note**
   For external hard drives, please make sure to enclose your power supply and any USB or eSATA connectors.

3. Label each device with a clearly legible JobId.

4. Cut out the pre-paid shipping label and securely attach it to your package.

   **Note**
   If you are having trouble using the pre-paid shipping label, or if you are shipping domestically within Singapore, contact AWS Support Center before shipping your device.

Shipping Multiple Devices

As a general rule, you must ship each device in a separate package. AWS Import/Export will, however, accept multiple devices in a single shipment if you follow the guidelines and limitations that are outlined in this topic.
Note
These requirements are only for shipping multiple devices per package. If you are shipping each device separately, see Packing Your Storage Device (p. 59).

If you ship multiple devices in a single shipment, your shipment must meet all of these criteria:

• Create a separate Import/Export job request, with a unique job ID, for each device.
• You may ship up to eight devices per container.
• The devices must be packed in a hard case designed to safely ship the devices, with a separate slot or compartment for each device.
• Label each slot and each hard drive with the corresponding job ID.
• If the devices require separate power supplies, power cables, and interface cables, be sure all of the necessary components are packaged with each device. Label each component with the corresponding job ID.
• Be sure all the labels are attached securely.
• When you generate your pre-paid shipping label, be sure to type in the job IDs for each included device, separated by commas. To learn more about generating your pre-paid shipping label, see Generating Your Pre-Paid Shipping Label (p. 60).

The following types of devices have additional specific requirements.

• Bare SATA drives — Bare drives require special care. Ship bare SATA drives in specially designed hard cases with a separate slot or compartment for each device.
• Single-spindle external hard disks — Pack your devices securely with bubble wrap or similar material so that the devices cannot shift in the container. It is especially important to include all cables, cords, and power supplies.
• RAID devices — These devices are often not designed for shipping with drives already mounted. Consult the manufacturer’s recommendations for preparing the device for shipping. Pack your devices securely with bubble wrap or similar material so that the devices cannot shift in the container. It is especially important to include all cables, cords, and power supplies.
• Multi-RAID devices — Multi-RAID devices present special packaging problems. We recommend that you take extra precautions to pack these devices securely. Shipping multiple devices per shipment may incur larger return shipping costs.

Note
Shipping multiple devices per shipment may incur larger return shipping costs.

Mailing Your Storage Device

This section contains general guidance on mailing your storage device in a package to AWS. There might be a charge for returning your storage device back to you.

General Considerations for Mailing Your Storage Device

The pre-paid UPS shipping label contains the correct address to ship your storage device to. Your device will be delivered to an AWS sorting facility and then forwarded by Amazon to the AWS data center. Arrange for UPS to pick up your package by calling them directly, or take your package to a UPS package drop off facility to be shipped to AWS. You will not have to pay UPS for the shipping charges, but AWS will add these charges to the fee charged for processing your device.
UPS will only have tracking information to the sorting facility. AWS updates the job status when the package is received by the AWS data center. When you send a `GetStatus` command, the status of your job will not show at AWS until the shipment has been received at the AWS data center.

**Important**
If you ship your storage device without using the pre-paid shipping label, AWS Import/Export will return your storage device without performing the job and you will be charged for any applicable return shipping charges and device-handling fees.

### International Considerations for Mailing Your Storage Device

If you are shipping internationally, you must fill out the correct customs forms and you must pay all duties and taxes on your shipment.

- To find the right customs forms for your package, contact UPS Customer Service on the UPS website. Once you have the correct forms, fill them out as instructed by UPS before shipping your package to AWS.

  **Important**
  When sending or receiving storage devices internationally to and from the United States or Singapore, you must include the customs manifest options. A customs manifest is not required for shipments within the EU. For more information, see Customs Manifest File Option (p. 71).

- Shipping internationally might involve paying duties and taxes. You are responsible for paying all duties and taxes on your shipment. These duties and taxes are not included in the cost of the pre-paid shipping label. Packages with unpaid duties and/or taxes will be refused upon arrival.

- Similarly, you must pay all applicable duties and taxes on international returns sent to addresses outside of the United States or Singapore, if your Amazon S3 bucket is located in the US West (N. California) region or the Asia Pacific (Singapore) region. These duties and taxes will be charged directly by the return shipping carrier upon delivery of your package.

  **Important**
  To access Amazon S3 buckets or Amazon EBS snapshots that are in the EU (Ireland) region, the shipping device must originate from and be shipped back to a location in the European Union.
Managing Your Jobs

Topics

• Listing Your Jobs (p. 64)
• Updating a Job (p. 65)
• Getting Shipping Information (p. 65)
• Getting the Status of Your Jobs (p. 66)
• Canceling a Job (p. 67)
• Failed Jobs (p. 67)

AWS Import/Export service provides ways for you to manage your import and export jobs. You can get the status of a job or list the jobs created by users under your AWS account, and you can modify or delete a job. If your job fails, AWS will notify you.

Listing Your Jobs

You use ListJobs to list jobs. You can only list jobs created by users under your AWS account. You might list jobs so that you can then get their status.

To list your jobs using the command line client

Use the ListJobs command.

> java -jar lib/AWSImportExportWebServiceTool-1.0.jar ListJobs

To list your jobs using REST

Submit a ListJobs request.

POST / HTTP/1.1
content-type:application/x-www-form-urlencoded;charset=utf-8
host: https://importexport.amazonaws.com
content-length:155
Action=ListJobs&SignatureVersion=2
&SignatureMethod=HmacSHA256&Version=2010-06-01&Signature=%2FVfkltRBOoSUi1sWxRzN8rw%3D

You can limit the responses you get by using the MaxJobs parameter. The following example shows how to list up to 25 import jobs. These jobs are listed from newest to oldest.

POST / HTTP/1.1
content-type:application/x-www-form-urlencoded;charset=utf-8
host: https://importexport.amazonaws.com
content-length:163
Action=ListJobs&MaxJobs=25&SignatureVersion=2
&SignatureMethod=HmacSHA256&Version=2010-06-01&Signature=%2FVfkltRBOoSUi1sWxRzN8rw%3D
Updating a Job

You use `UpdateJob` to update the specifics of how you want a job done. You specify a job using the job ID returned in the `CreateJob` response. You update a job request by replacing the original manifest with the manifest you include in this request. You can either modify the original manifest you submitted or start over and create a new manifest file. In either case, the original manifest is discarded.

You can only use `UpdateJob` after submitting a `CreateJob` request, but before the data transfer starts, and you can only use it on jobs you own.

**To update a job using the command line client**

Use the `UpdateJob` command with the new or updated manifest.

```bash
> java -jar lib/AWSImportExportWebServiceTool-1.0.jar UpdateJob JOBID Export C:\DIRECTORY\updatedmanifest.txt
```

**To update a job using REST**

1. Modify the original manifest you submitted or start over and create a new manifest file.
2. URL-encode the manifest file.
3. Send an Update request.

The following example submits the preceding manifest file to update the job identified by `JOBID`.

```plaintext
POST / HTTP/1.1
content-type: application/x-www-form-urlencoded;charset=utf-8
host: https://importexport.amazonaws.com
content-length:741

Action=UpdateJob&JobId=JOBID&Manifest=manifestVersion%3A%201.0%0Abucket%3A%20XMSAGE
AreturnAddress%3A%0A%20%20%20%20name%3A%20Amazon.com%20ATTN%20Joe%20Random%20%0A%20%20%20%20street1%3A%201200%111%20Nosuch%20Ave%20S.%20%20%20%20city%3A%20Seattle%0A%20%20%20%20stateOrProvince%3A%20WA%0A%20%20%20%20postalCode%3A%2098114%0A%20%20%20%20phoneNumber%3A%20206-266-0000%0A%20%20%20%20country%3A%20USA%0AsetContentEncodingForGzFiles%3A%20yes%0Aexpires%3A%20tomorrow%0AcontentLanguage%3A%20Spanish%0Aacl%3A%20public-read%0AcacheControl%3A%20max-age%3D3600&JobType=Import
&SignatureVersion=2&SignatureMethod=HmacSHA256&Version=2010-06-01
&Signature=%2FVfkltRBOoSUllsWxRzN8rw%5D
```

AWS Import/Export returns a response to notify you whether we were able to update your job.

Getting Shipping Information

You use `GetShipInfo` to get the shipping information for a job. For `manifestVersion` 3.0 jobs, you get a PDF containing shipping instructions with a unique bar code to identify and authenticate your device.

The `GetShipInfo` action is not supported for REST requests, and can only be issues using the command line client. The command line client supports `GetShipInfo` for both `manifestVersion` 2.0 and `manifestVersion` 3.0 jobs.

**To get shipping information using the command line client**
Use the `GetShipInfo` command.

The following command retrieves the shipping information for the job `JOBID`.

```
> java -jar lib/AWSImportExportWebServiceTool-1.0.jar GetShipInfo JOBID
```

If your manifest file for the original order specified `manifestVersion:2.0`, the shipping information is returned in the current window. If your manifest file specified `manifestVersion:3.0` the current window displays the path to a PDF file containing your shipping information with some instructions on what to do with the PDF file.

## Getting the Status of Your Jobs

You might like to know if the job is waiting to start, in progress, or completed. For some operations, such as `CancelJob` and `UpdateJob`, you might use `GetStatus` first because jobs cannot be canceled or updated if their status is completed.

When you ship your device, it will be delivered to a sorting facility, and then forwarded on to an AWS data center. When you send a `GetStatus` command, the status of your job will not show at AWS until the shipment has been received at the AWS data center.

**Note**

If you need assistance with your AWS Import/Export job, contact AWS Support Center.

`GetStatus` returns the status of a specified job. You specify a job using the job ID returned in the `CreateJob` response. Example job statuses are pending, completed, in progress, device error, and expired. For more information about statuses, go to `GetStatus (p. 102)`. You can only get the status of jobs you own.

### To get the status of a job using the command line tool

Use the `GetStatus` command.

The following command returns the status of the job identified by `JOBID`.

```
> java -jar lib/AWSImportExportWebServiceTool-1.0.jar GetStatus JOBID
```

### To get the status of a job using REST

Submit a `GetStatus` request.

The following request returns the status of the job identified by `JOBID`.

```
POST / HTTP/1.1
content-type: application/x-www-form-urlencoded; charset=utf-8
host: https://importexport.amazonaws.com
content-length: 189

Action=GetStatus&JobId=JOBID&JobType=Import&SignatureVersion=2&SignatureMethod=HmacSHA256&Version=2010-06-01&Signature=%2FVfkltRBOoSU1lsWxrN8rw%3D
```

AWS Import/Export returns the status of your job and some fields from the manifest. For more information about the API operation, go to `GetStatus (p. 102)`.
Canceling a Job

You use `CancelJob` to cancel a job. You specify the job to cancel using the job ID returned in the `CreateJob` response. The operation fails if the job is already complete. We can, however, cancel a job in progress. You can only cancel jobs created by users under your AWS account.

To cancel a job using the command line client

Use the `CancelJob` command.

The following command cancels the job `JOBID`.

```bash
> java -jar lib/AWSImportExportWebServiceTool-1.0.jar CancelJob JOBID
```

To cancel a job using REST

Submit a `CancelJob` request.

```text
POST / HTTP/1.1  
content-type:application/x-www-form-urlencoded;charset=utf-8  
host: https://importexport.amazonaws.com  
content-length:189

Action=CancelJob&JobId=JOBID&JobType=Import  
&SignatureVersion=2&SignatureMethod=HmacSHA256&Version=2010-06-01  
&SignatureMethod=%2FVfkltRBOoSUi1sWxRxN8rw%3D
```

AWS Import/Export returns a response to notify you whether we were able to cancel your job. For more information about the API operation, go to `CancelJob (p. 96)`.

Failed Jobs

Sometimes Import/Export jobs may fail due to various reasons such as bad sectors, unsupported file systems, damaged enclosures, shipping damages, or old worn out hardware. If a job fails, AWS will notify you at the email address specified in the manifest file.

It is AWS policy that all devices shipped from AWS facilities must be completely erased or only contain data encrypted by AWS. Failed Import/Export jobs are treated according to this policy.

If an import job fails, we will erase the contents of your device and return it to you. If device erasure cannot be performed, our support team will contact you with further information. Please note that some files may have already been imported into AWS before the job is cancelled.

If an export job fails, we will stop the export job and return your device to you. Please note that some files may have already been exported onto your device before this job was cancelled. These files are encrypted with the encryption PIN code or password you provided. If we are unable to initiate the export job, our support team will contact you with further information.
Manifest File Options Reference

The following sections describe the options in the manifest file.

The common manifest file options apply to all manifest files, including Amazon S3 import and export jobs and Amazon EBS import jobs.

Include the customs manifest file option if you are shipping your device internationally.

Topics
- Common Manifest File Options (p. 68)
- Customs Manifest File Option (p. 71)
- Import to Amazon S3 Manifest File Options (p. 75)
- Import to Amazon EBS Manifest File Options (p. 82)
- Export from Amazon S3 Manifest File Options (p. 85)

Common Manifest File Options

The manifest file includes information related to processing your data and returning your storage device. The following table explains options that are common to all manifest files.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>accessKeyId</td>
<td>The accessKeyId option is deprecated. It is retained only for backward compatibility. Do not use accessKeyId with new AWS Import/Export jobs.</td>
<td>No</td>
</tr>
<tr>
<td>deviceId</td>
<td>Your storage device's serial number or other unique identifier. If your device does not have a unique number, please place a sticker with its own unique identifier onto the device and then enter that identifier as the deviceId. The following is an example device ID.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>deviceID: MyCompany489732</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>generator</td>
<td>A field describing the application that put together the manifest file and submitted the CreateJob or UpdateJob request. The following is an example of generator.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>generator: AWS Import/Export Sample App 1.0</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>logBucket</td>
<td>The Amazon S3 bucket where AWS Import/Export saves your log. You must create a bucket before we can save log data</td>
<td>Yes, except for import</td>
</tr>
</tbody>
</table>
### Common Manifest File Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Required State</th>
</tr>
</thead>
<tbody>
<tr>
<td>logBucket</td>
<td>to it; we do not create the bucket for you. The AWS account creating this job must own this bucket. The following is an example of a logBucket value.</td>
<td>Optional to Amazon S3.</td>
</tr>
<tr>
<td></td>
<td>logBucket: logging-bucket</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: The import bucket for import to Amazon S3, otherwise None.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: Must be an existing Amazon S3 bucket name.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>For export, your Amazon S3 log bucket and your Amazon S3 export bucket must be in the same region. If your buckets are in different regions, your job request will fail.</td>
<td></td>
</tr>
<tr>
<td>logPrefix</td>
<td>A string to insert between the bucket name and log report name to prevent name collisions. For more information, go to Preventing Log File Name Collisions (p. 51). The following is an example of a logPrefix.</td>
<td>Optional to Amazon S3.</td>
</tr>
<tr>
<td></td>
<td>logPrefix: logs/</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>manifestVersion</td>
<td>The version of the manifest specification used to write the manifest file. The manifest version must be 2.0 for import and export to Amazon S3 and 3.0 for import to Amazon EBS.</td>
<td>Optional to Amazon S3.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid Values: 2.0</td>
<td>3.0</td>
</tr>
<tr>
<td>notificationEmail</td>
<td>A semicolon delimited list of email addresses to which you want us to send job completed notification emails.</td>
<td>Optional to Amazon S3.</td>
</tr>
<tr>
<td></td>
<td>notificationEmail: <a href="mailto:joe.doe@example.com">joe.doe@example.com</a></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>
### Common Manifest File Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>returnAddress</td>
<td>The address we return your storage device to after completing the job.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>The returnAddress option includes subfields, as shown in the following example.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>returnAddress:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>name: Jane Roe</td>
<td></td>
</tr>
<tr>
<td></td>
<td>company: Example Corp.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>street1: 123 Any Street</td>
<td></td>
</tr>
<tr>
<td></td>
<td>city: Anytown</td>
<td></td>
</tr>
<tr>
<td></td>
<td>stateOrProvince: WA</td>
<td></td>
</tr>
<tr>
<td></td>
<td>postalCode: 91011-1111</td>
<td></td>

<tr>
<td></td>
<td>phoneNumber: 206-555-1111</td>
<td></td>
</tr>
<tr>
<td></td>
<td>country: USA</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The stateOrProvince subfield is required for USA and Canada. The subfields street2 and street3 are optional.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: Your return address must be a physical street address and not a post office box.</td>
<td></td>
</tr>
<tr>
<td>serviceLevel</td>
<td>The service level for the job. For more information about specifying your job's service levels, go to Expediting the Return of Your Storage Device (p. 33).</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>serviceLevel: expeditedShipping</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: standard</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid Values: standard</td>
<td>expeditedShipping</td>
</tr>
</tbody>
</table>

**Example Import to Amazon S3 Manifest Using Common Options**

The following example is the manifest file content for an import job showing most of the common manifest file options, including expedited shipping. It also includes the bucket option, the eraseDevice option, and the notificationEmail option because they required for Amazon S3 manifest files.

```manifestVersion: 2.0
bucket: data-load-bucket
deviceId: ABCDE
generator: AWS ImportExport Web Service Tool 1.0
logPrefix: logs
logBucket: iemanifest-log-bucket
prefix: imported/
eraseDevice: yes
notificationEmail: john.doe@example.com;jane.roe@example.com
returnAddress:
    name: Jane Roe```
Customs Manifest File Option

When shipping a device internationally, you must include the `customs` manifest file option with its required subfields in your manifest file. AWS Import/Export uses these values to validate your inbound shipment and prepare your outbound customs paperwork. If you exclude these fields from your manifest and the country that we are shipping your storage device to is outside the country of the data-loading facility, your job request will fail.

**Note**
This requirement does not apply to shipments in the European Union. When shipping your device between the EU (Ireland) region data-loading facility and a European Union member nation, you do not need to include the `customs` options.

To access Amazon S3 buckets that are in the EU (Ireland) region, the shipping device must originate from and be shipped back to a location in the European Union.

All of the options in the following table are subfields of the `customs` option, for example:

```json
{  "customs": {    "dataDescription": "This device contains medical test results.",    "encryptedData": true,    "encryptionClassification": "5D992",    "exportCertifierName": "John Doe",    "requiresExportLicense": true,    "deviceValue": 250.00,    "deviceCountryOfOrigin": "Ghana",    "deviceType": "externalStorageDevice"  }
}
```

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>customs</td>
<td>Specify this option to provide information for AWS Import/Export to complete the customs-related paperwork when returning your storage device internationally from the United States, or Singapore.</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Note**
The customs option is not required when shipping devices within the European Union.

All other options described in this table are subfields of this option. The following shows the `customs` option with its required subfields.

```json
{  "customs": {    "dataDescription": "Medical test results.",    "encryptedData": true,    "encryptionClassification": "5D992",    "exportCertifierName": "John Doe",    "requiresExportLicense": true,    "deviceValue": 250.00,    "deviceCountryOfOrigin": "Ghana"  }
}
```
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>deviceType: externalStorageDevice</td>
<td>Provide a brief description of the data you are importing or exporting from AWS Import/Export.</td>
<td>Yes</td>
</tr>
<tr>
<td>typeOfExport: return</td>
<td>dataDescription: This device contains medical test results.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>deviceCountryOfOrigin: Japan</td>
<td>deviceCountryOfOrigin: Japan</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>deviceHTS: 8471.70.4000</td>
<td>deviceHTS: 8471.70.4000</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: 10 digit HTS code.</td>
<td></td>
</tr>
<tr>

<td>deviceValue: 250.00</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: Float</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>
## Customs Manifest File Option

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
</table>
| deviceType        | Specifies the type of device that you are sending. Each device type defaults to an HTS code that's used in your commercial invoice. We use the following default mapping between the device type and HTS code:  
  • externalStorageDevice: 8471.70.4065  
  • usbFlashDrive: 8471.70.9000  
  • sataDrive: 8471.70.2000  
  You can override these default mappings by specifying the deviceHTS option.  
  ```  
  deviceType: usbFlashDrive  
  ```  
  Type: Enum  
  Default: None  
  Valid Values: externalStorageDevice | usbFlashDrive | sataDrive | |
| encryptedData     | Specifies whether the data on your device is encrypted. If yes, then you must include the encryptionClassification option. The following example specifies that the data is encrypted.  
  ```  
  encryptedData: yes  
  ```  
  Type: String  
  Default: None  
  Valid Values: yes | no |
| encryptionClassification | device includes encrypted data, this field allows you to specify the software's classification. When shipping encrypted data to or from the United States the encryption software must be classified as 5D992 under the United States Export Administration Regulations.  
  ```  
  encryptionClassification: 5D992  
  ```  
  Type: String  
  Default: None  
  Condition: Required when encryptedData value is yes. | Yes | Yes | Yes |
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>exportCertifierName</td>
<td>Specifies the name the person or company responsible for shipping the storage device. The following example specifies the certifier's name.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>exportCertifierName: John Doe</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>requiresExportLicense</td>
<td>Specifies whether the import or export of the device or data require a license under the regulations of any applicable country, such as the United States Export Administration Regulations or the International Traffic in Arms Regulations. Note that only devices and data which do not require a license, are classified as EAR99 under United States Export Administration Regulations, and are not subject to the International Traffic in Arms Regulations are eligible for AWS Import/Export.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>requiresExportLicense: no</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid Values: yes</td>
<td>no</td>
</tr>
<tr>
<td>typeOfExport</td>
<td>Specifies the type of export.</td>
<td>Optional</td>
</tr>
<tr>
<td></td>
<td>The value return indicates the shipment is being returned to the country from which it was shipped.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The value temporary indicates the shipment will be returning from the destination country to the AWS data loading facilities country.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The value permanent means that the shipment will remain in the country it is being sent to, and the shipment didn't originate from that country.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>typeOfExport: permanent</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: return</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid Values: return</td>
<td>permanent</td>
</tr>

</table>

**Example Import to Amazon S3 Manifest with Customs Option**

The following example is the manifest file content for an import job to Amazon S3, including Customs option.

```manifestVersion: 2.0
deviceId: ABCDE```
Import to Amazon S3 Manifest File Options

The Amazon S3 import manifest file includes information related to importing your data into Amazon S3 and returning your storage device. This section explains options that are unique to Amazon S3 import manifest files. For information about options that are common to all manifest files, see Common Manifest File Options (p. 68).

Amazon S3 import and export use manifest file version 2.0. Set `manifestVersion` to 2.0 for all Amazon Amazon S3 import and export manifest files.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>bucket</td>
<td>Specifies the Amazon S3 bucket where AWS Import/Export loads your data. You must create a bucket before we can load data into it; we do not create the bucket for you. The AWS account doing the load must own this bucket. The following is an example of a bucket name.</td>
<td>Yes</td>
</tr>
</tbody>
</table>
## Import to Amazon S3 Manifest File Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
</table>
| bucket: data-load-bucket | Type: String  
 Default: None  
 Constraints: Must be an existing Amazon S3 bucket name                                                   |          |
| cacheControl: max-age=3600 | Specifies the value of the Cache-Control HTTP header field for all imported files. We do not validate this value. For more information on cacheControl, please go to [http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.9.](http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.9.)  
 cacheControl: max-age=3600 | No      |
| contentDisposition: attachment | Specifies the Content-Disposition HTTP header to apply to all loaded files. For more details, go to [RFC 2616 section 19.](https://www.w3.org/Protocols/rfc2616/rfc2616-sec19.html) The following is an example contentDisposition value.  
 contentDisposition: attachment | No  |
| Note              | This example causes browsers to prompt to save the Amazon S3 object rather than displaying the object directly in the browser. |          |
| contentLanguage: es | Specifies the value of the HTTP Content-Language header field for all imported files. We do not validate this value. For more information about the Content-Language header, go to [http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.12.](http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.12.)  
 contentLanguage: es | No    |
| Type: String  
 Default: none |                                                                                                           |          |
### Import to Amazon S3 Manifest File Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>contentTypes</td>
<td>Contains a map of case-insensitive strings that are key/value pairs that set the <code>Content-Type</code> header. Each key/value pair contains a key that is the file extension (for example, <code>jpg</code>) and a corresponding value for the <code>Content-Type</code> (for example, <code>image/jpeg</code>). These values take precedence over the default file extension to <code>Content-Type</code> mapping. For more details on the default mappings, see Appendix C: File Extension to MIME Types (p. 131). The following is an example set of key/value pairs.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>contentTypes:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>jpg: image/jpeg</td>
<td></td>
</tr>
<tr>
<td></td>
<td>JPG: image/jpeg</td>
<td></td>
</tr>
<tr>
<td></td>
<td>gif: image/gif</td>
<td></td>
</tr>
<tr>
<td></td>
<td>GIF: image/gif</td>
<td></td>
</tr>
<tr>
<td></td>
<td>mp3: audio/mpeg</td>
<td></td>
</tr>
<tr>
<td></td>
<td>txt: text/plain</td>
<td></td>
</tr>
<tr>
<td></td>
<td>zip: application/zip</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: Map of string to string</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>
| diskTimestampMetadataKey | A user-defined key for adding a storage device's last modified time stamp in the metadata of the content imported to Amazon S3. The value of this key has the same RFC 1123 format as the Amazon S3 Date header: `[ DAY "",

|                      | DD-MON-YYY HH:MM:SS zone time (for example, Wed, 23 Feb 2011 01:55:59 GMT). The key name is prefixed with `x-amz-meta-`. For example, if you specify: | No       |
|                      | diskTimestampMetadataKey: disk-timestamp                      |          |
|                      | the following is the result of a GET operation on the Amazon S3 content:                                                                                                                                   |          |
|                      | Type: String                                                   |          |
|                      | Default: None                                                 |          |
|                      | Constraints: The user-defined key must be a valid HTTP header key (ASCII-only, no colons, no spaces). The key name chosen here must not also be a key name used in the staticMetadata feature. |          |
## Import to Amazon S3 Manifest File Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>eraseDevice</td>
<td>Acknowledges that AWS will erase the contents of your storage device after importing the data.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>All writable blocks on your storage device will be overwritten with zeros. You will need to</td>
<td></td>
</tr>
<tr>
<td></td>
<td>repartition and format your device after the wipe.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The following is an example entry.</td>
<td></td>
</tr>
<tr>
<td></td>

<td></td>
</tr>
</tbody>
</table>
### Import to Amazon S3 Manifest File Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>pinCode</td>
<td>If a storage device with hardware-based encryption was supplied, the PIN code for the device. For more information, see Encrypting Your Data (p. 57).</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td><strong>Important</strong>&lt;br&gt;Do not lose your PIN code, or you will not be able to decrypt your data. AWS Import/Export will not send the PIN code with the encrypted device.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>pinCode: 1234</td>
<td></td>
</tr>
<tr>
<td>prefix</td>
<td>Specifies a string to insert between the bucket name and full path of each file located on your storage device. For more information, see Specifying Key Prefix (p. 37).</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String&lt;br&gt;Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: A key is a sequence of unicode characters whose UTF-8 encoding is at most 1024 bytes long. If the logPrefix + import-log-JOBID is longer than 1024 bytes. AWS Import/Export returns an InvalidmanifestField error from the CreateJob response.</td>
<td></td>
</tr>
<tr>
<td>setContentEncodingForGzFiles</td>
<td>Specifies that files compressed with gzip should have their Content-Encoding header set to gzip and that the Content-Type header should ignore the file endings .gz and .gzip when determining file content types. For more information, see Handling Gzip Files (p. 34). We do not validate this value.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>setContentEncodingForGzFiles: Yes</td>
<td></td>
</tr>
<tr>

<tr>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------</td>
</tr>
</tbody>
</table>
| staticMetadata  | This option defines a user-defined key/value pairs to apply to every file imported into Amazon S3. The key/value pair is prefixed with `x-amz-meta-`. For example, if you specify: `staticMetadata:
  application: MyBackupApp`

  The following is the result of a `GET` operation on the Amazon S3 content:

  x-amz-meta-application: MyBackupApp`

  Type: Map of string to string

  Default: None

  Constraints: The user-defined keys must be valid HTTP header keys (ASCII-only, no colons, no spaces); their values must be ASCII-only. The key name chosen here must not also be a key name used in the `diskTimestampMetadataKey` feature. | No |
| storageClass    | Specifies the Amazon S3 storage class for the import job. For more information about the Amazon S3 storage class, go to the Amazon S3 Developer Guide. | No |

  `storageClass: REDUCED_REDUNDANCY`

  Type: Enum

  Default: STANDARD

  Valid Values: STANDARD | REDUCED_REDUNDANCY |
## Import to Amazon S3 Manifest File Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>substitutions</td>
<td>This option allows you to provide strings to replace existing values (such as object keys or file names) between the Amazon S3 bucket and the designated device during imports or exports. Matches for your provided values are substituted for the existing values before the import or export operation. The values specified on the left side of the colon are replaced with the values on the right side. Substitutions are applied in length order; the longest matching option is applied first. For more information about working with substitutions, see Working with Amazon S3 Substitutions (p. 37).</td>
<td></td>
</tr>
</tbody>
</table>
|                      | substitutions:  
|                      | ""," : "$COMMA$"                                                                                                                                             | No       |
|                      | Type: String                                                                                                                                                                                                 |          |
|                      | Default: None                                                                                                                                                                                                 |          |
| trueCryptPassword    | If the data was encrypted using TrueCrypt, the password that was provided when the device was encrypted. For more information about encrypting data using TrueCrypt, go to Encrypting Your Data (p. 57). The password must not contain an asterisk ("*") or quote character (""'), if the password contains other special characters, enclose the string in double quote characters. The following is an example of trueCryptPassword |
|                      | trueCryptPassword: SimpleButEasilyCrackedEXAMPLE                                                                                                                                                          | No       |
|                      | Type: String                                                                                                                                                                                                 |          |
|                      | Default: none                                                                                                                                                                                                |          |

### Example Import to Amazon S3 Manifest

The following example is the manifest file content for an import job to Amazon S3, including expedited shipping and the required eraseDevice and notificationEmail options.

```plaintext
manifestVersion: 2.0
deviceId: ABCDE
eraseDevice: yes
notificationEmail: john.doe@example.com;jane.roe@example.com
bucket: my-amz-bucket
cacheControl: max-age=3600
contentDisposition: attachment
contentLanguage: en
contentTypes:
  csv: application/vnd.ms-excel
diskTimestampMetadataKey: disk-timestamp
```
Import to Amazon EBS Manifest File Options

The Amazon EBS import manifest file includes information related to importing your data into Amazon EBS and returning your storage device. This section explains options that are unique to Amazon EBS import manifest files. For information about options that are common to all manifest files, see Common Manifest File Options (p. 68).

**Note**
Amazon EBS use manifest file version 3.0. Set `manifestVersion` to 3.0 for all Amazon EBS manifest files.

An Amazon EBS import creates a virtual copy of your device as a single image. The device's file system won't be automatically mounted to an Amazon EC2 instance. The maximum size of an Amazon EBS volume is 16 TB. Note that the maximum capacity of a device is independent of the amount of data stored on the device.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>eraseDevice</td>
<td>A value that acknowledges that AWS will erase the contents of your storage device after importing the data. All writable blocks on your storage device will be overwritten with zeros. You will need to repartition and format your device after the wipe.</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Example**

```
 eraseDevice: yes
```

Type: String

Default: None
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Valid Values: yes</td>
<td>true</td>
</tr>
<tr>
<td>operations</td>
<td>The operations option is a container for one or more subfields. You specify operations parameters by a dash followed by a set of subfields. The following example shows the operations option with the required Amazon EBS subfields.</td>
<td>Yes</td>
</tr>
</tbody>
</table>
|            | operations:       | - destination: ebs-snapshot  
                   | source: device  
                   | region: us-east-1  
                   | deviceCapacityGreaterThan1TB: no |          |
|            | See Operations Subfields (p. 83) for details about each subfield.                                                                                                                                            |          |
|            | Type: String                                               |          |
|            | Default: None                                              |          |
| pinCode    | If a storage device with hardware-based encryption was supplied, the PIN code for the device. For more information, see Encrypting Your Data (p. 57).                                                            | No       |
|            | pinCode: 1234                                              |          |
|            | **Important**                                                                                                                                          |          |
|            | Do not lose your PIN code, or you will not be able to decrypt your data. AWS Import/Export will not send the PIN code with the encrypted device.                                                             |          |
|            | Type: Integer                                              |          |
|            | Default: None                                              |          |

**Operations Subfields**

The following table describes the subfields of the Operations parameter

<table>
<thead>
<tr>
<th>Operations Subfields</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>destination</td>
<td>The destination of the data.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>For an Amazon EBS import operation the destination is ebs-snapshot.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>

</tbody>
</table>

### Example Import to Amazon EBS Manifest

The following example is the manifest file content for an import job to Amazon EBS, including expedited shipping.

```manifest
manifestVersion: 3.0
deviceId: ABCDE
eraseDevice: yes
generator: AWS Import Export Docs
logPrefix: logs
logBucket: iemanifest-bucket
notificationEmail: john.doe@example.com;jane.roe@example.com
operations:
  - destination: ebs-snapshot
    source: device
    region: us-east-1
    deviceCapacityGreaterThan1TB: no
returnAddress:
  name: Jane Roe
  company: Example Corp.
  street1: 123 Any Street
  city: Anytown
  stateOrProvince: WA
  postalCode: 91011-1111
  phoneNumber: 206-555-1111
  country: USA
serviceLevel: expeditedShipping
```
Export from Amazon S3 Manifest File Options

The export manifest file contains information related to exporting your data from Amazon S3 onto your storage device. This section describes options that are unique to export manifest files. For information about options that are common to import and export manifest files, see Common Manifest File Options (p. 68).

Amazon S3 import and export only use manifest file version 2.0. Set manifestVersion to 2.0 for all Amazon S3 import and export manifest files.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>fileSystem</td>
<td>Specifies the file system on your storage device. The following is an example fileSystem entry.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>fileSystem: NTFS</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid Values: NTFS</td>
<td>EXT4</td>
</tr>
<tr>
<td>operations</td>
<td>A container that takes subfields that specify the operations to perform on each bucket for this job. The subfields are name-value pairs. For example, exportBucket specifies the bucket from which to export data. For more information, see Operations Export Manifest Option (p. 52). The following example shows operations with two subfields, exportBucket and endMarker.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>operations:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- exportBucket: bucket-data-comes-from</td>
<td></td>
</tr>
<tr>
<td></td>
<td>targetDirectory: myexport/stuff</td>
<td></td>
</tr>
<tr>
<td></td>
<td>beginMarker: images/starwars</td>
<td></td>
</tr>
<tr>
<td></td>
<td>endMarker: images/xena</td>
<td></td>
</tr>
<tr>
<td></td>
<td>prefix: exported/</td>
<td></td>
</tr>
<tr>
<td></td>
<td>For information about each subfield, see Operations Subfields (p. 87).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>pinCode</td>
<td>If a storage device with hardware-based encryption was supplied, the PIN code for the device.</td>
<td>Yes*</td>
</tr>
<tr>
<td></td>
<td>*Either pinCode or trueCryptPassword is required for all export jobs. For more information, see Encrypting Your Data (p. 57).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>pinCode: 1234</td>
<td></td>
</tr>
</tbody>
</table>
### Export from Amazon S3 Manifest File Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Important</strong></td>
<td>Do not lose your PIN code, or you will not be able to decrypt your data. AWS Import/Export will not send the PIN code with the encrypted device.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: Integer</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>recoveryDirectory</td>
<td>This is the directory on your storage device where we save files whose filenames AWS Import/Export must change from their keys. This happens often because characters that are valid in keys are not always valid for filenames. The following example names the recovery directory LostAndFound.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>recoveryDirectory: LostAndFound</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: EXPORT-RECOVERY</td>
<td></td>
</tr>
<tr>
<td>substitutions</td>
<td>This option allows you to provide strings to replace existing values (such as object keys or file names) between the Amazon S3 bucket and the designated device during imports or exports. Matches for your provided values are substituted for the existing values before the import or export operation. The values specified on the left side of the colon are replaced with the values on the right side. Substitutions are applied in length order; the longest matching option is applied first. For more information about working with substitutions, see Working with Amazon S3 Substitutions (p. 37).</td>
<td>No</td>
</tr>
</tbody>
</table>
|                   | substitutions: 
|                   |   "," : "]COMMA["                                                                                                                                                                                       |          |
|                   | Type: String                                                                                                                                                                                                 |          |
|                   | Default: None                                                                                                                                                                                               |          |
### Export from Amazon S3 Manifest File Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>trueCryptPassword</td>
<td>AWS Import/Export will use the password to encrypt your data using TrueCrypt during the export. The password must not contain an asterisk (*) or quote character (&quot; &quot;). If the password contains other special characters, enclose the string in double quote characters.</td>
<td>Yes*</td>
</tr>
</tbody>
</table>

*Either pinCode or trueCryptPassword is required for all export jobs. For more information, see Encrypting Your Data (p. 57).

**Important**

Do not lose your password, or you will not be able to decrypt your data. AWS Import/Export will not send the password with the encrypted device.

For more information about encrypting data by using TrueCrypt, go to Encrypting Your Data (p. 57).

The following is an example of `trueCryptPassword`

```
trueCryptPassword: SimpleBut Easily Cracked EXAMPLE
```

**Type:** String  
**Default:** none  

### Operations Subfields

The following table describes the subfields of the Operations parameter.

<table>
<thead>
<tr>
<th>Operations Subfield</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
</table>
| beginMarker         | Indicates where in the bucket to begin exporting data. The export job only includes keys that occur alphabetically after, but not including, `beginMarker`. For example, if `beginMarker` is `alpha` and `endMarker` is `omega`, then keys `alpha-1` and `omega` are exported, but `alpha` and `omega-1` are not exported. This option is convenient for limiting the number of files to export and for splitting large export jobs between multiple devices. The following is an example `beginMarker` value.  

```
operations:
  - exportBucket: bucket-data-comes-from
    beginMarker: images/alpha
    endMarker: images/omega
```

**Type:** String  
**Default:** none  

| endMarker           | Indicates where in the bucket to stop exporting data. The export job only includes keys that occur alphabetically before, but not including, `endMarker`. For example, if `beginMarker` is `alpha` and `endMarker` is `omega`, then keys `alpha` and `omega-1` are exported, but `alpha-1` and `omega` are not exported. This option is convenient for limiting the number of files to export and for splitting large export jobs between multiple devices. The following is an example `endMarker` value.  

```
operations:
  - exportBucket: bucket-data-comes-from
    beginMarker: images/alpha
    endMarker: images/omega
```

**Type:** String  
**Default:** none
## Export from Amazon S3 Manifest File Options

<table>
<thead>
<tr>
<th>Operations Subfield</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>operations:</td>
<td>alphabetically before and including the key that matches endMarker. For example, if beginMarker is alpha and endMarker is omega, then keys alpha-1 and omega are exported, but alpha and omega-1 are not exported. This option is convenient for limiting the number of files to export and splitting large export jobs across multiple devices. The following is an example endMarker value.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>operations:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- exportBucket: bucket-data-comes-from</td>
<td></td>
</tr>
<tr>
<td></td>
<td>beginMarker: images/alpha</td>
<td></td>
</tr>
<tr>
<td></td>
<td>endMarker: images/omega</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: none</td>
<td></td>
</tr>
</tbody>
</table>

### exportBucket

Specifies the Amazon S3 bucket where AWS Import/Export retrieves your data. Each listing under operations must have an exportBucket option. The AWS IAM user that created the job must have read permissions on the bucket and objects. If no other options are specified with the listing, AWS Import/Export exports all files in the bucket to your storage device. The following is an example of an exportBucket name.

```plaintext
operations:
    - exportBucket: bucket-data-comes-from
```

**Type:** String  
**Default:** None  
**Constraints:** Must be an existing Amazon S3 bucket name

**Note**  
For export, your Amazon S3 log bucket and your Amazon S3 export bucket must be in the same region. If your buckets are in different regions, your job request will fail.
### Operations Subfield

<table>
<thead>
<tr>
<th>Operations Subfield</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>prefix</td>
<td>Specifies the path in the exportBucket where AWS Import/Export finds the data to export. All keys that contain the prefix are saved to your storage device. For more information, go to Managing File Exports (p. 51). Note that prefix has a different meaning when used in import manifest files. If the logPrefix + import-log-JOBID is longer than 1024 bytes, AWS Import/Export returns an InvalidManifestField error from the CREATE JOB command. The following example exports all files under the directory images.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>operations:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- prefix: images</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: A key is a sequence of unicode characters whose UTF-8 encoding is at most 1024 bytes long.</td>
<td></td>
</tr>
<tr>
<td>targetDirectory</td>
<td>Indicates where to export the data to on your storage device. In the following example, AWS Import/Export exports the contents of the bucket, bucket-data-comes-from, to myexport/stuff on the storage device.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>operations:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- exportBucket: bucket-data-comes-from</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- targetDirectory: myexport/stuff</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: The specified exportBucket.</td>
<td></td>
</tr>
</tbody>
</table>

### Example Export from Amazon S3 Manifest

The following example is the manifest file content for an export job from Amazon S3, including expedited shipping.

```yaml
manifestVersion: 2.0
deviceId: ABCDE
fileSystem: NTFS
generator: AWS Import Export Docs
logPrefix: logs
logBucket: iemanifest-bucket
notificationEmail: john.doe@example.com;jane.roe@example.com
trueCryptPassword: SimpleButEasilyCrackedEXAMPLE
operations:
  - exportBucket: my-amz-bucket
    targetDirectory: myexport/stuff
    beginMarker: images/starwars
```

89
endMarker: images/xena
prefix: exported/
recoveryDirectory: LostAndFound
returnAddress:
  name: Jane Roe
  company: Example Corp.
  street1: 123 Any Street
  city: Anytown
  stateOrProvince: WA
  postalCode: 91011-1111
  phoneNumber: 206-555-1111
  country: USA
  serviceLevel: expeditedShipping
API Reference

The following sections explain the AWS Import/Export application programming interface (API). The AWS Import/Export API is not compatible with AWS Snowball.

Topics

- Making Query Requests (p. 91)
- Actions (p. 94)
- Common Query Parameters (p. 116)
- Error and Status Codes (p. 117)

Making Query Requests

For AWS Import/Export, query requests are HTTPS requests that use the HTTP verb POST and a query parameter named `Action`.

Topics

- Endpoints (p. 91)
- Structure of an AWS Import/Export POST Request (p. 91)
- Query Authentication (p. 93)

Endpoints

To send requests to AWS Import/Export, use the service endpoint:

https://importexport.amazonaws.com

Note

AWS Import/Export does not support requests over HTTP; the service only supports HTTPS requests.

Structure of an AWS Import/Export POST Request

This section outlines the AWS Import/Export POST requests, which consist of the following:

- **Endpoint**—The AWS Import/Export entry point, as shown following:

  https://importexport.amazonaws.com

- **Action**—The action you want to perform, for example getting the status of an existing job (GetStatus). For a complete list, see Actions (p. 94).

- **Parameters**—A set of parameters common to all AWS Import/Export actions, and any request parameters supported by the AWS Import/Export API. For details, see Common Query Parameters (p. 116).
Examples

Example AWS Import Export POST Request

The following is an AWS Import/Export sample POST request to get the status of a job.

```
POST / HTTP/1.1
content-type: application/x-www-form-urlencoded;charset=utf-8
host: https://importexport.amazonaws.com
content-length: 207

Action=GetStatus&SignatureMethod=HmacSHA256&JobId=JOBID&SignatureVersion=2&Version=2014-12-18&Signature=%2FVfkltRBooSUi1sWxRzN8rw%3D&Timestamp=2014-12-20T22%3A30%3A59.556Z
```

The body of the request is all on one line. However, line feeds have been added to make the examples easier to read.

```
POST / HTTP/1.1
content-type: application/x-www-form-urlencoded;charset=utf-8
host: https://importexport.amazonaws.com
content-length: 207

Action=GetStatus
&JobId=JOBID
&SignatureMethod=HmacSHA256
&SignatureVersion=2
&Version=2014-12-18
&Signature=lBP67vCvGlDMBQ1dofZxg8E8SUEXAMPLE
&Timestamp=2014-12-20T22%3A30%3A59.556Z
```

The first line represents the type of http request.

Lines 2–4 contain the HTTP headers, including the endpoint of the request.

After the HTTP headers, the body of the request contains the list of parameters. Each parameter is separated from the next by an ampersand (&). The `Action` parameter indicates the action to perform. For a list of possible actions, see Actions (p. 94).

Example AWS Import Export POST Response

The following is an AWS Import/Export example response:

```
<CreateJobResponse xmlns="http://importexport.amazonaws.com/"
    xmlns:mm="http://aws.amazon.com">
    <CreateJobResult>
        <JobId>TEST1</JobId>
        <SignatureFileContents>version:2.0
            signingMethod:HmacSHA1
            jobId:WXSSP
            signature:jLbLVp54vBa/vuh/XW1MOMdZUxw=
        </SignatureFileContents>
        <AwsShippingAddress>Please use the GetShippingLabel command to print your pre-paid shipping label</AwsShippingAddress>
        <Signature>O3qG7xnI46ZEm9gi+eOy9dnSS9k=</Signature>
    </CreateJobResult>
    <ResponseMetadata>
        <RequestId>ace8cb5b-0ada-11df-a381-155bec6f7c93</RequestId>
    </ResponseMetadata>
</CreateJobResponse>
```
Query Authentication

You can send requests over HTTPS for AWS Import/Export. When you do, you must include a signature in every request. This section describes how to create the signature. The method described in the following procedure is known as signature version 2.

To create the signature

1. Create the canonicalized query string that you need later in this procedure:
   a. Sort the UTF-8 query string components by parameter name with natural byte ordering.
      The parameters can come from the GET URI or from the POST body (when `Content-Type` is `application/x-www-form-urlencoded`).
   b. URL encode the parameter name and values according to the following rules:
      • Do not URL encode any of the unreserved characters that RFC 3986 defines.
        These unreserved characters are A-Z, a-z, 0-9, hyphen (-), underscore (_), period (.), and tilde (~).
      • Percent encode all other characters with `%XY`, where X and Y are hex characters 0-9 and uppercase A-F.
      • Percent encode extended UTF-8 characters in the form `%XY%ZA....`
      • Percent encode the space character as `%20` (and not +, as common encoding schemes do).
   c. Separate the encoded parameter names from their encoded values with the equals sign (=) (ASCII character 61), even if the parameter value is empty.
   d. Separate the name-value pairs with an ampersand (&) (ASCII character 38).
2. Create the string to sign according to the following pseudo-grammar (the "\n" represents an ASCII newline character).

   ```
   StringToSign = HTTPVerb + "\n" + 
                  ValueOfHostHeaderInLowercase + "\n" + 
                  HTTPRequestURI + "\n" + 
                  CanonicalizedQueryString <from the preceding step>
   ```

   The `HTTPRequestURI` component is the HTTP absolute path component of the URI up to, but not including, the query string. If the `HTTPRequestURI` is empty, use a forward slash ( / ).
3. Calculate an RFC 2104-compliant HMAC with the string you just created, your Secret Access Key as the key, and SHA256 or SHA1 as the hash algorithm.

   For more information, see [http://www.ietf.org/rfc/rfc2104.txt](http://www.ietf.org/rfc/rfc2104.txt).
4. Convert the resulting value to base64.
5. Use the resulting value as the value of the `Signature` request parameter.

   **Important**
   The final signature you send in the request must be URL encoded as specified in RFC 3986 (for more information, see [http://www.ietf.org/rfc/rfc3986.txt](http://www.ietf.org/rfc/rfc3986.txt)). If your toolkit URL encodes your final request, then it handles the required URL encoding of the signature. If your toolkit doesn't
URL encode the final request, then make sure to URL encode the signature before you include it in the request. Most importantly, make sure the signature is URL encoded only once. A common mistake is to URL encode it manually during signature formation, and then again when the toolkit URL encodes the entire request.

**Sample GetStatus Request**

The following request gets the current status of an import job (modified to make the Signature inside the request invalid).

```plaintext
POST / HTTP/1.1
content-type:application/x-www-form-urlencoded;charset=utf-8
host: https://importexport.amazonaws.com
content-length:639

Action=GetStatus&SignatureMethod=HmacSHA256&JobId=JOBID&SignatureVersion=2&Version=2010-06-01&Signature=%2FVfkltRBOoSUi1sWxRzN8rw%3D&Timestamp=2011-06-20T22%3A30%3A59.556Z
```

The following is the string to sign.

The body of the request is all on one line. However, line feeds have been added to make the examples easier to read.

```plaintext
POST
importexport.amazonaws.com
/Action=GetStatus
&JobId=JOBID
&SignatureMethod=HmacSHA256
&SignatureVersion=2
&Version=2010-06-01
```

The following is the signed request.

```plaintext
POST
importexport.amazonaws.com
/Action=GetStatus
&JobId=JOBID
&SignatureMethod=HmacSHA256
&SignatureVersion=2
&Version=2010-06-01
&Signature=%2FVfkltRBOoSUi1sWxRzN8rw%3D
&Timestamp=2011-06-20T22%3A30%3A59.556Z
```

**Actions**

This section describes the web service actions for AWS Import/Export using the Query API request parameters.

**Topics**

- CancelJob (p. 96)
- CreateJob (p. 98)
- GetStatus (p. 102)
• ListJobs (p. 107)
• UpdateJob (p. 111)
• GetShippingLabel (p. 114)

Note
AWS Import/Export does not support SOAP.
CancelJob

Description

This action cancels a specified job. Only the job owner can cancel it. The action fails if the job has already started or is complete.

Request Parameters

For information about the common parameters that all actions use, see Common Query Parameters (p. 116)

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>Specifies the action to invoke.</td>
<td>Yes</td>
</tr>
<tr>

</table>
CancelJob

### Name | Description
---|---
ResponseMetadata | Container for the response metadata.
  - **Type:** String
  - **Ancestor:** CancelJobResponse
  - **Children:** RequestId (p. 96)
Success | Specifies whether (true) or not (false) AWS Import/Export canceled the job.
  - **Type:** Boolean
  - **Valid Values:** true | false
  - **Ancestor:** CancelJobResponse (p. 96).CancelJobResult (p. 96)
  - **Children:** None

### Errors
For a list of common errors, see Error and Status Codes (p. 117).

### Examples

#### Sample Request

```
POST / HTTP/1.1
content-type:application/x-www-form-urlencoded;charset=utf-8
host: https://importexport.amazonaws.com
content-length:188

Action=CancelJob&SignatureMethod=HmacSHA256&JobId=JOBID&SignatureVersion=2&Signature=%2FVfkltRBOoSUi1sWxRzN8rw%3D&Timestamp=2011-06-20T23%3A53%3A37.232Z
```

#### Sample Response

```
<CancelJobResponse xmlns="http://importexport.amazonaws.com/"
  xmlns:xs="http://www.w3.org/2001/XMLSchema">
  ...
  <Success>true</Success>
  ...
  <RequestMetadata>
    ...
    <RequestId>a4f704fc-0ad8-11df-b085-4384d3e37ae5</RequestId>
  </RequestMetadata>
</CancelJobResponse>
```

### Related actions
The following actions are related to CancelJob.

- CreateJob (p. 98)
CreateJob

Description

This action initiates the process of scheduling an upload or download of your data. You include in the request a manifest that describes the data transfer specifics. The response to the request includes a job ID, which you can use in other actions, and a signature that you use to identify your storage device. To get your pre-paid shipping label use the GetShippingLabel (p. 114) command.

Request Parameters

For information about the common parameters that all actions use, see Common Query Parameters (p. 116)

Related actions

The following actions are related to GetStatus.

- ListJobs
ListJobs

Description

This action returns the jobs associated with the requester. AWS Import/Export lists the jobs in reverse chronological order based on the date of creation. For example, if job Test1 was created on 30 December 2009 and Test2 was created 05 February 2010, the ListJobs action would return Test2 followed by Test1.

Request Parameters

For information about the common parameters that all actions use, see Common Query Parameters (p. 116).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>Specifies the action to invoke. Type: String Default: None Valid Value: ListJobs</td>
<td>Yes</td>
</tr>
<tr>
<td>Marker</td>
<td>Specifies the JOBID to start after when listing the jobs created with your account. See MaxJobs. Type: String Default: None Constraints: Must be a valid job ID</td>
<td>No</td>
</tr>
<tr>
<td>MaxJobs</td>
<td>Sets the maximum number of jobs returned in the response. If there are additional jobs that were not returned because MaxJobs was exceeded, the response contains &lt;IsTruncated&gt;true&lt;/IsTruncated&gt;. To return the additional jobs, see Marker. Type: String Default: None Constraints: Must be between 0 and 1000</td>
<td>No</td>
</tr>

Related actions

The following actions are related to ListJobs.

- GetStatus (p. 102)
**UpdateJob**

**Description**

You use this action to change the parameters specified in the original manifest file by supplying a new manifest file. The manifest file attached to this request replaces the original manifest file. You can only use the action after a `CreateJob` request and before the data transfer starts, and you can only use it on jobs you own.

**Request Parameters**

For information about the common parameters that all actions use, see Common Query Parameters (p. 116)

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>

Common Query Parameters

This section lists the requests parameters that all AWS Import/Export actions use. Any action-specific parameters are listed in the topic for the action.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>The action to perform. For a complete list, see Actions (p. 94).</td>
<td>Yes</td>
</tr>
<tr>
<td>AWSAccessKeyId</td>
<td>The accessKeyId option is deprecated. It is retained only for backward compatibility. Do not use accessKeyId with new AWS Import/Export jobs.</td>
<td>No</td>
</tr>
<tr>
<td>Signature</td>
<td>The digital signature you created for the request. For more information see Query Authentication (p. 93).</td>
<td>Yes</td>
</tr>
<tr>
<td>SignatureMethod</td>
<td>The hash algorithm you used to create the request signature.</td>
<td>Yes</td>
</tr>
</tbody>
</table>
### Error and Status Codes

This section describes all AWS Import/Export errors, job, and device status codes, and also status codes you might find in log files.

**Topics**
- Error Response (p. 117)
- Error Codes (p. 117)
- Job and Device Status Codes (p. 118)
- AWS Import/Export Log Status Codes (p. 120)

#### Error Response

The following is the format of an error response when using the Web Service operations.

```xml
<ErrorResponse xmlns="http://importexport.amazonaws.com/"
  <Error>
    <Type>Sender</Type>
    <Code>ExceptionCode</Code>
    <Message>ExceptionMessage</Message>
  </Error>
  <RequestId>a1f5a4c6-0adb-11df-a381-155bec6f7c93</RequestId>
</ErrorResponse>
```

#### Error Codes

There are a number of errors that can occur when using the web service operations. The following table describes those error codes.
<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>HTTP Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>BucketPermissionException</td>
<td>The account specified does not have the appropriate bucket permissions.</td>
<td>400</td>
</tr>
<tr>
<td>CanceledJobIdException</td>
<td>The specified job ID has been canceled and is no longer valid.</td>
<td>400</td>
</tr>
<tr>
<td>ExpiredJobIdException</td>
<td>The specified job ID has expired.</td>
<td>400</td>
</tr>
<tr>
<td>InvalidAddressException</td>
<td>The address specified in the manifest is invalid.</td>
<td>400</td>
</tr>
<tr>
<td>InvalidClientTokenIdException</td>
<td>The AWS access key does not exist.</td>
<td>403</td>
</tr>
<tr>
<td>InvalidCustomsException</td>
<td>One or more customs parameters was invalid. Please correct and resubmit.</td>
<td>400</td>
</tr>
<tr>
<td>InvalidFileSystemException</td>
<td>File system specified in export manifest is invalid.</td>
<td>400</td>
</tr>
<tr>
<td>InvalidJobIdException</td>
<td>The JOBID was missing, not found, or not associated with the AWS account.</td>
<td>400</td>
</tr>
<tr>
<td>InvalidManifestFieldException</td>
<td>One or more manifest fields was invalid. Please correct and resubmit.</td>
<td>400</td>
</tr>
<tr>
<td>InvalidParameterException</td>
<td>Description describing invalid parameter.</td>
<td>400</td>
</tr>
<tr>
<td>MalformedManifestException</td>
<td>Your manifest is not well-formed.</td>
<td>400</td>
</tr>
<tr>
<td>MissingCustomsException</td>
<td>One or more required customs parameters was missing from the manifest.</td>
<td>400</td>
</tr>
<tr>
<td>MissingManifestFieldException</td>
<td>One or more required fields were missing from the manifest file. Please correct and resubmit.</td>
<td>400</td>
</tr>
<tr>
<td>MissingParameterException</td>
<td>One or more required parameters was missing from the request.</td>
<td>400</td>
</tr>
<tr>
<td>MultipleRegionsException</td>
<td>Your manifest file contained buckets from multiple regions. A job is restricted to buckets from one region. Please correct and resubmit.</td>
<td>400</td>
</tr>
<tr>
<td>NoSuchBucketException</td>
<td>The specified bucket does not exist. Create the specified bucket or change the manifest's bucket, exportBucket, or logBucket field to a bucket that the account, as specified by the credentials file, has write permissions to.</td>
<td>400</td>
</tr>
<tr>
<td>OptInRequired</td>
<td>The AWS account needs a subscription to the AWS Import/Export service.</td>
<td>403</td>
</tr>
<tr>
<td>UnableToCancelJobIdException</td>
<td>AWS Import/Export cannot cancel the job.</td>
<td>409</td>
</tr>
<tr>
<td>UnknownOperationException</td>
<td>The specified operation was invalid.</td>
<td>403</td>
</tr>
</tbody>
</table>

**Job and Device Status Codes**

**Topics**
• Device Location Status Codes (p. 119)
• Job Progress Status Codes (p. 119)

Each AWS Import/Export job has both a device location status and job progress status. The device
location status provides details regarding the location of the storage device you mailed to AWS. The job
progress code reflects the status of the data transfer. Some examples are as follows: when your storage
device arrives its status is *Pending*; when we are transferring the data the status is *InProgress*; and
when the data transfer completes successfully the status is *Success*.

**Device Location Status Codes**

The following table describes device location status codes.

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AtAWS</td>
<td>Your device is at AWS.</td>
</tr>
<tr>
<td>NotReceived</td>
<td>AWS has not received your device.</td>
</tr>
<tr>
<td>Returned</td>
<td>Your device has been returned. The SHIPPER tracking number is TRACKING_NUMBER.</td>
</tr>
</tbody>
</table>

**Job Progress Status Codes**

The following table describes job progress status codes.

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Canceled</td>
<td>The job was canceled.</td>
</tr>
<tr>
<td>Complete</td>
<td>The data loaded successfully. The log was saved to LOG_KEY in the bucket LOG_BUCKET.</td>
</tr>
<tr>
<td>DeviceError</td>
<td>The job was aborted. Your device would not function properly.</td>
</tr>
<tr>
<td>Expired</td>
<td>The job expired.</td>
</tr>
<tr>
<td>InProgress</td>
<td>The data on your device is currently being loaded.</td>
</tr>
<tr>
<td>InvalidSignature</td>
<td>The job was aborted. The SIGNATURE file was invalid.</td>
</tr>
<tr>
<td>MissingDevice</td>
<td>The job was aborted. Your device, power supply, or device connectors were missing.</td>
</tr>
<tr>
<td>MissingSignature</td>
<td>The job was aborted. The SIGNATURE file was missing.</td>
</tr>
<tr>
<td>Pending</td>
<td>The specified job has not started.</td>
</tr>
<tr>
<td>SuccessWithError</td>
<td>The data load completed with NUMBER of errors. See LOG_KEY in the bucket LOG_BUCKET for more details.</td>
</tr>
<tr>
<td>UnsupportedDeviceType</td>
<td>The job was aborted. AWS Import/Export requires a USB2 or eSATA connector type, or a 2.5&quot; or 3.5&quot; SATA hard drive.</td>
</tr>
<tr>
<td>UnsupportedFileFormat</td>
<td>The job was aborted. For supported file types, see Guidelines and Limitations (p. 121).</td>
</tr>
</tbody>
</table>
AWS Import/Export Developer Guide

AWS Import/Export Log Status Codes

The job was aborted. AWS Import/Export on US East (N. Virginia) buckets requires a 120 volt 60Hz, compatible power supply. EU buckets require a 230 volt, 50 Hertz compatible power supply that uses a Euro plug (C connector or D connector) or UK plug (BS1363). Singapore buckets require 230 volts, 50 Hertz compatible power supply.

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UnsupportedPowerSupply</td>
<td>The job was aborted. AWS Import/Export on US East (N. Virginia) buckets requires a 120 volt 60Hz, compatible power supply. EU buckets require</td>

<td>508</td>
<td>Device Error. Unable to read the specified file from disk.</td>
</tr>
<tr>
<td>UnableToWrite</td>
<td>508</td>
<td>Device Error. Unable to write data to your storage device.</td>
</tr>
</tbody>
</table>
Guidelines and Limitations

The following section provides guidelines and describes limitations when using the AWS Import/Export service. If any of these limitations are important to your use case, contact AWS Support Center with details.

- AWS Import/Export does not support Server-Side Encryption (SSE) when importing data.
- All objects imported into Amazon S3 have their metadata changed. The only metadata that remains the same is filename and filesize. All other metadata is set as in the following example: `-rw-rw-r-- 1 root root [filesize] Dec 31 1969 [path/filename]`
- To connect your storage device to one of our AWS Import/Export stations, your device must meet the following requirements:
  - The device must be compatible with Red Hat Linux and warranted by the manufacturer to support eSATA, USB 3.0, or USB 2.0 interface on Linux.
  - Maximum device size is 14 inches/35 centimeters high by 19 inches/48 centimeters wide by 36 inches/91 centimeters deep (8Us in a standard 19 inch/48 centimeter rack).
  - Maximum weight is 50 pounds/22.5 kilograms.
  - Maximum file size of a single file or object to be imported is 5 TB. Files and objects larger than 5 TB won't be imported. The over-sized files will be listed in your import job log file.
  - Maximum device capacity is 16 TB for Amazon Simple Storage Service (Amazon S3) and Amazon EBS jobs.
  - Power requirements vary by region. For more information, go to the Selecting Your Storage Device section on the AWS Import/Export Product Details page.
  - You can create up to 50 jobs per day. If you need to create more than 50 jobs, contact your account manager or AWS Support Center.
  - Ship only one device per package. AWS Import/Export will accept multiple devices in a single shipment only for specific devices, with special packaging requirements. For details, see Shipping Multiple Devices (p. 61).
  - AWS Import/Export service does not ship to PO Boxes.
  - Expedited shipping is available only for return shipments from U.S. data loading facilities to U.S. addresses.
  - AWS Import/Export exports only the latest version from an Amazon S3 bucket that has versioning turned on.
  - Amazon DevPay buckets and accounts are not supported. You must use your AWS account credentials and non-DevPay buckets when using AWS Import/Export.
  - Devices must be healthy. Providing an unhealthy device, such as a device with bad sectors or unstable power, may result in a partial import or export. In extreme cases the import or export will be impossible to perform, and AWS Import/Export might destroy the device. For more information, see Failed Jobs (p. 67).
  - Amazon S3 import jobs support the following file systems:
    - NTFS
    - EXT2
    - EXT3
    - EXT4
    - FAT32
    - HFSPlus – supported for importing partitions up to 2 TB in size.
    - exFAT
• Import to Amazon S3 job file names must be written using UTF-8 character encoding. Any file with a
  name that is not a valid UTF-8 string is not imported.
• Amazon S3 export jobs support the following file systems:
  • NTFS
  • EXT4
• With an Amazon S3 export, some objects might be re-mapped during export to different filenames
due to file system limitations. Some of the reasons for remapping filenames include:
  • The source Amazon S3 object has a non UTF-8 key name.
  • The Amazon S3 source has two or more object key names that point to the same file name (for
    instance, folder1/file1 and folder1/folder2/../file1)
  • Too many files exist under one directory.

You can find out whether files were remapped for your job by examining the export log uploaded to
your log bucket.
• If your import job fails, your device will be erased and returned to you. If your export job fails, your
device will be returned to you. For more information, see Failed Jobs (p. 67).
AWS Import/Export Appendices

This AWS Import/Export guide appendix include the following sections.

Topics

- Appendix A: Other Tools and Services (p. 123)
- Appendix B: Examples (p. 123)
- Appendix C: File Extension to MIME Types (p. 131)
- Appendix D: AWS Import/Export Resources (p. 131)

Appendix A: Other Tools and Services

In addition to the AWS Import/Export Web Service Tool and the AWS SDK, there are a number of third party tools and services available to work with AWS Import/Export. For more information, go to http://aws.amazon.com/importexport/tools/.

Appendix B: Examples

Topics

- Import Examples (p. 123)
- Export Examples (p. 127)

Import Examples

This section walks you through creating three sample AWS Import/Export jobs and shows the manifest file's corresponding signature and log files. In these examples, the following files are at the root directory of the storage device. The resulting log files illustrate how manifest fields affect the data load.

- /README
- /NOTICE.txt
- /images/wookie1.jpg
- /images/chewie.gif
- /images/chewie.tif
- /images/resources/chewie.psd

The following sections show different ways to create AWS Import/Export jobs.

Example – TSTD1

The TSTD1 example demonstrates the default behavior using a manifest file with the minimum configuration options. The example files associated with job TSTD1 are:
The following is the contents of `manifest-TSTD1.txt` file.

```
manifestVersion: 2.0
bucket: myawsbucket
deviceId: 3QD0T87T
pinCode:4321
eraseDevice: Yes
notificationEmail: john.doe@example.com;jane.roe@example.com
returnAddress:
  name: Jane Roe
  company: Example Corp.
  street1: 123 Any Street
  city: Anytown
  stateOrProvince: WA
  postalCode: 91011-1111
  phoneNumber: 206-555-1111
  country: USA
```

**Important**

Your return address must be a physical street address that UPS can deliver to.

### TSTD1 Log File

After AWS Import/Export processes this job, the service saves the resulting log file to `http://s3.amazonaws.com/myawsbucket/import-log-TSTD1`. The contents of the log file are shown in the following table.

<table>
<thead>
<tr>
<th>DateTime</th>
<th>File</th>
<th>Status</th>
<th>Code</th>
<th>Key</th>
<th>MD5</th>
<th>Bytes</th>
<th>Content-Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tue 03 Feb 2009 21:57:43 GMT</td>
<td>SIGNATURE</td>
<td>103</td>
<td>Ignored</td>
<td></td>
<td>f60fe317bc497b120332703f59e64</td>
<td>90</td>
<td>text/plain</td>
</tr>
<tr>
<td>Tue 03 Feb 2009 21:57:43 GMT</td>
<td>Notice.txt</td>
<td>200</td>
<td>OK</td>
<td>myawsbucket/Notice.txt</td>
<td>d5a46fa22596d246f1089bb1f000c</td>
<td>13</td>
<td>text/plain</td>
</tr>
<tr>
<td>Tue 03 Feb 2009 21:57:43 GMT</td>
<td>README.txt</td>
<td>200</td>
<td>OK</td>

<td>5fc22dc594e05922831a8e016090</td>
<td>447</td>
<td>image/jpeg</td>
</tr>
<tr>
<td>Tue 03 Feb 2009 21:57:43 GMT</td>
<td>images/chewie.GIF</td>
<td>200</td>
<td>OK</td>
<td>myawsbucket/images/chewie.GIF</td>
<td>5fc22dc594e05922831a8e016090</td>
<td>848</td>
<td>image/jpeg</td>
</tr>
</tbody>
</table>
Example – TSTD2

The TSTD2 example demonstrates the behavior associated with adding the following manifest fields: prefix, and logPrefix, to the manifest file used in TSTD1. The example files associated with job TSTD2 are:

- manifest-TSTD2.txt
- import-log-TSTD2.csv

The following text shows the contents of manifest-TSTD2.txt.

```
manifestVersion: 2.0
bucket: myawsbucket
deviceId: eQD0T87T
pinCode:4321
eraseDevice: Yes
notificationEmail: john.doe@example.com;jane.doe@example.com
returnAddress:
    name: Jane Roe
    company: Example Corp.
    street1: 123 Any Street
    city: Anytown
    stateOrProvince: WA
    postalCode: 91011-1111
    phoneNumber: 206-555-1111
    country: USA
prefix: images/
logPrefix: loadlogs-
```

TSTD2 Log File

After AWS Import/Export processes this job, the service saves the resulting log file to http://s3.amazonaws.com/myawsbucket/import-log-TSTD2. The contents of the log file are shown in the following table.
Example – TSTD3

The TSTD3 example load demonstrates the behavior of the following manifest fields: contentTypes, prefix, and ignore. The example files associated with job TSTD3 are:

- manifest-TSTD3.txt
- import-log-TSTD3.csv

The following text shows the contents of manifest-TSTD3.txt file.

```
manifestVersion: 2.0
bucket: myawsbucket
deviceId: 3QD0T87T
pinCode: 4321
eraseDevice: Yes
notificationEmail: john.doe@example.com;jane.doe@example.com
returnAddress:
  name: Jane Roe
city: Anytown
  stateOrProvince: WA
  postalCode: 91011-1111
  country: USA
prefix: dropoff
contentTypes:
  jpg: application/octet-stream
gif: application/octet-stream
```
TSTD3 Log File

After AWS Import/Export processes this job, the service saves the resulting log file to `http://s3.amazonaws.com/myawsbucket/import-log-TSTD3`. The contents of the log file are shown in the following table.

<table>
<thead>
<tr>
<th>DateTime</th>
<th>File</th>
<th>Status</th>
<th>Code</th>
<th>Key</th>
<th>MD5</th>
<th>Bytes</th>
<th>Content-Type</th>

</tr>
<tr>
<td>Tue 03 Feb 2009</td>
<td>images/chewie.GIF</td>
<td>200</td>
<td>OK</td>
<td>myawsbucket/dropoffimages/</td>
<td>89022dc594e0c5c090b585ba9e70</td>
<td>846</td>
<td>image/gif</td>
</tr>
<tr>
<td>20:57:43 GMT</td>
<td></td>
<td></td>
<td></td>
<td>chewie.GIF</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Tue 03 Feb 2009</td>
<td>images/resources/chewie.psd</td>
<td>108</td>
<td>Ignored</td>
<td>myawsbucket/dropoffimages/chewie.psd</td>
<td>8237897-21b968e034e2347d0</td>
<td>597</td>
<td></td>
</tr>
<tr>
<td>20:57:43 GMT</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Tue 03 Feb 2009</td>
<td>images/chewie.TIF</td>
<td>200</td>
<td>OK</td>
<td>myawsbucket/dropoffimages/chewie.TIF</td>
<td>8237897-21b968e034e2347d0</td>
<td>597</td>
<td>image/tiff</td>
</tr>
<tr>
<td>20:57:43 GMT</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Note**
The `contentTypes` field is case sensitive, so `chewie.TIF` and `chewie.GIF` were not picked up by the `gif` or `tif` `contentTypes` filter. The `prefix` field, `dropoff`, did not have a trailing forward slash, `(/)`, so the key name did not have a delimiter between `dropoff` and the loaded file path.

Export Examples

**Topics**
- Export Files (p. 128)
- Example – TSTDA (p. 128)
- Example – TSTDB (p. 129)
This section walks through example AWS Import/Export jobs and shows the manifest file’s corresponding SIGNATURE and log files.

**Export Files**

The following keys are referenced as part of each export job.

- `/myawsbucket/README`
- `/myawsbucket /NOTICE.txt`
- `/myawsbucket /images/wookie1.jpg`
- `/myawsbucket /images/chewie.gif`
- `/myawsbucket /images/chewie.tif`
- `/myawsbucket /images/resources/chewie.psd`
- `/myawsbucket /backup/images/chewie.gif`
- `/lostbucket/bin/lost.rhtml`
- `/lostbucket/html/directory.html`
- `/lostbucket/images/hurley.jpg`
- `/lostbucket/images/john.jpg`
- `/lostbucket/images/kate.jpg`
- `/lostbucket/images/sawyer.jpg`
- `/lostbucket/index.html`

**Example – TSTDA**

The TSTDA example upload demonstrates the default behavior using a manifest file with the minimum configuration options. The example files associated with job TSTDA are:

- `manifest-TSTDA.txt`
- `export-log-TSTDA.csv`

The following is the contents of `manifest-TSTDA.txt` file.

```manifestVersion: 1.2
deviceId: 532404500021
logBucket: myawsbucket
fileSystem: FAT32
operations:
  - exportBucket: myawsbucket
returnAddress:
  name: Jane Roe
  company: Example Corp.
  street1: 123 Any Street
  city: Anytown
  stateOrProvince: WA
  postalCode: 91011-1111
  phoneNumber: 206-555-1111
  country: USA
```

**TSTDA Log File**

After AWS Import/Export processes this job, the service saves the resulting log file to `http://s3.amazonaws.com/myawsbucket/export-log-TSTDA`. The contents of the log file are shown in the following table.
Example – TSTDB

The TSTDB example upload demonstrates the default behavior using a manifest file with the following configuration options: multiple buckets, targetDirectory, prefix, beginMarker, and endMarker. The example files associated with job TSTDB are:

- manifest-TSTDB.txt
- export-log-TSTDB.csv

The following is the contents of manifest-TSTDB.txt file.

```
manifestVersion: 2.0
deviceId: 532404500021
logBucket: myawsbucket
logPrefix: logs/
fileSystem: NTFS
operations:
  - exportBucket: myawsbucket
    prefix: images
    targetDirectory: starwars/image-backup
  - exportBucket: lostbucket
    beginMarker: html/
    endMarker: images/kate.jpg
returnAddress:
  name: Jane Roe
  company: Example Corp.
  street1: 123 Any Street
  city: Anytown
  stateOrProvince: WA
```
### TSTDB Log File

After AWS Import/Export processes this job, the service saves the resulting log file to `http://s3.amazonaws.com/myawsbucket/export-log-TSTDB`. The contents of the log file are shown in the following table.

<table>
<thead>
<tr>
<th>DateTime</th>
<th>File</th>
<th>Status</th>

</tbody>
</table>
Appendix C: File Extension to MIME Types

AWS Import/Export uses MIME types as defined by the Internet Assigned Numbers Authorities (IANA). To determine MIME type, AWS Import/Export does a case-insensitive lookup against the MIME type table on the IANA website. To see that table, go to http://www.iana.org/assignments/media-types.

Unrecognized file types use the Amazon S3 default Content-Type of application/octet-stream.

Appendix D: AWS Import/Export Resources

The following table lists related resources that you'll find useful as you work with this service.

<table>
<thead>
<tr>
<th>Resource</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>API Reference (p. 91)</td>
<td>Explains the API operations.</td>
</tr>
<tr>
<td>FAQ</td>
<td>Presents frequently asked questions and answers about AWS Import/Export.</td>
</tr>
<tr>
<td>Amazon S3 Discussion Forum</td>
<td>A community-based forum for developers to discuss technical questions related to Amazon S3 and AWS Import/Export.</td>
</tr>
<tr>
<td>AWS Support Center</td>
<td>The home page for AWS Technical Support, including access to our Developer Forums, Technical FAQs, Service Status page, and Premium Support.</td>
</tr>
<tr>
<td>Contact Us</td>
<td>A central contact point for inquiries concerning AWS billing, account, events, abuse etc.</td>
</tr>
<tr>
<td>Legal</td>
<td>Detailed information about the terms of use, privacy policy and other topics.</td>
</tr>
</tbody>
</table>
## Document History

The following table describes the important changes to the documentation since the last release of AWS Import/Export.

- **API version**: 2014-12-18
- **Latest document update**: August 10, 2017

<table>
<thead>
<tr>
<th>Change</th>
<th>Description</th>
<th>Date Changed</th>
</tr>
</thead>
<tbody>
<tr>
<td>AWS Import/Export Authentication Update</td>
<td>The service has been updated. Your AWS account must own the buckets associated with your AWS Import/Export job. In addition, resource-based policies for buckets will be automatically updated by AWS Import/Export when you create jobs associated with those resources. These updated policies have associated expiration dates, to limit how long they affect your resources. For more information, see Automatic Resource Policy Updates (p. 24).</td>
<td>August 10, 2017</td>
</tr>
<tr>
<td>Direct import into Amazon Glacier is no longer supported</td>
<td>If you want to import data into an Amazon Glacier vault, we recommend that you import your data into Amazon S3 and set the lifecycle rule on the Amazon S3 bucket to transition the data into Amazon Glacier.</td>
<td>August 10, 2017</td>
</tr>
<tr>
<td>Pre-paid UPS shipping label</td>
<td>AWS Import/Export uses UPS as the worldwide carrier for all incoming Import/Export job requests. You must use UPS as your carrier to send packages to AWS, and you must use the pre-paid shipping label generated by the AWS Import/Export Web Service Tool. You will not have to pay UPS for the shipping charges, because AWS will add these charges to the fee charged for processing your device. For more information, see Shipping Your Storage Device (p. 55).</td>
<td>January 16, 2015</td>
</tr>
<tr>
<td>Support for PIN-coded devices</td>
<td>AWS Import/Export supports hardware-based device encryption on storages devices that use a physical PIN pad for access to the data. For more information, see Encrypting Your Data (p. 57).</td>
<td>August 11, 2014</td>
</tr>
<tr>
<td>File system support for export</td>
<td>EXT2, EXT3, exFAT, and FAT32 are no longer supported for export from Amazon S3. For more information, see Guidelines and Limitations (p. 121).</td>
<td>May 6, 2014</td>
</tr>
<tr>
<td>AWS IAM Support</td>
<td>AWS Import/Export integrates with AWS Identity and Access Management (IAM), which allows you to control which operations a user can perform. For more information, see Using IAM with AWS Import/Export (p. 22).</td>
<td>February 17, 2014</td>
</tr>
<tr>
<td>Device erasure and TrueCrypt encryption</td>
<td>AWS Import/Export will erase all devices following import to Amazon S3, Amazon EBS, and Amazon Glacier. AWS will encrypt all devices using TrueCrypt prior to performing an export to Amazon S3. See Encrypting Your Data (p. 57).</td>
<td>January 31, 2014</td>
</tr>
<tr>

</tr>
<tr>
<td>New import manifest options for adding metadata</td>
<td>AWS Import/Export has new manifest options for users to better manage their data loads into Amazon S3. For import jobs, you can assign user defined metadata to all objects and a metadata value to store the last modified time stamp for each imported file. See the diskTimestampMetadataKey and staticMetadata options in Import to Amazon S3 Manifest File Options (p. 75).</td>

</tr>
<tr>
<td>A new common manifest option for modifying object keys and filenames</td>
<td>Modify uploaded object keys and downloaded filenames with the substitutions option. This option allows you to specify rules for naming the keys when importing data to Amazon S3, and filenames when exporting data to your device. See the substitutions option in Common Manifest File Options (p. 68)</td>

<tr>
<td>AWS Import/Export US West (N. California) region support</td>
<td>AWS Import/Export now supports importing and exporting data into and out of Amazon S3 buckets in the US West (N. California) region.</td>
<td>February 1, 2011</td>
</tr>
<tr>
<td>AWS Import/Export Asia Pacific (Singapore) region support</td>
<td>AWS Import/Export now supports importing and exporting data into and out of Amazon S3 buckets in the Asia Pacific (Singapore) region.</td>
<td>December 28, 2010</td>
</tr>
<tr>
<td>Support for large objects</td>
<td>AWS Import/Export now supports importing and exporting objects up to 5 TB in size.</td>
<td>December 9, 2010</td>
</tr>
<tr>
<td>AWS Import/Export becomes a web service</td>
<td>AWS Import/Export is now a web service. In previous versions of this product, you used email to create and manage jobs. Those email commands and procedures are being deprecated and will stop working on December 31, 2010. This guide no longer contains those commands.</td>
<td>June 9, 2010</td>
</tr>
<tr>
<td>AWS Import/Export command line interface</td>
<td>In addition to the new web service API, AWS Import/Export now has a command line interface. For more information, go to AWS Import/Export Command Line Quick Reference Card.</td>
<td>June 9, 2010</td>

</tr>
<tr>
<td>New support for internal SATA and 4 TB device capacity limit</td>
<td>AWS Import/Export now supports internal SATA hard drives for data loads in the Amazon S3 standard and EU (Ireland) regions. Additionally, you can now send portable storage devices with capacities up to 4 TB, reducing the number of devices required for large data loads.</td>
<td>March 5, 2010</td>
</tr>
<tr>
<td>International support for AWS Import/Export</td>
<td>Now, you can send and receive storage devices to and from most international locations for loading data to and from US East (N. Virginia) region buckets. For more information, see Shipping Your Storage Device (p. 55).</td>
<td>December 9, 2009</td>
</tr>
<tr>
<td>Support for EU (Ireland) buckets</td>
<td>Now, you can import and export data to and from EU (Ireland) buckets. For more information, see Mailing Your Storage Device (p. 62).</td>
<td>December 9, 2009</td>
