Glossary ........................................................................................................... 526
Amazon S3 REST API Introduction

Welcome to the Amazon Simple Storage Service API Reference. This guide explains the Amazon Simple Storage Service (Amazon S3) application programming interface (API). It describes various API operations, related request and response structures, and error codes. The current version of the Amazon S3 API is 2006-03-01.

Amazon S3 supports the REST API.

**Note**
Support for SOAP over HTTP is deprecated, but it is still available over HTTPS. However, new Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

Read the following about authentication and access control before going to specific API topics.

Requests to Amazon S3 can be authenticated or anonymous. Authenticated access requires credentials that AWS can use to authenticate your requests. When making REST API calls directly from your code, you create a signature using valid credentials and include the signature in your request. For information about various authentication methods and signature calculations, see Authenticating Requests (AWS Signature Version 4) (p. 14).

Making REST API calls directly from your code can be cumbersome. It requires you to write the necessary code to calculate a valid signature to authenticate your requests. We recommend the following alternatives instead:

- Use the AWS SDKs to send your requests (see Sample Code and Libraries). With this option, you don't need to write code to calculate a signature for request authentication because the SDK clients authenticate your requests by using access keys that you provide. Unless you have a good reason not to, you should always use the AWS SDKs.
- Use the AWS CLI to make Amazon S3 API calls. For information about setting up the AWS CLI and example Amazon S3 commands see the following topics:
  
  Set Up the AWS CLI in the Amazon Simple Storage Service Developer Guide.

  Using Amazon S3 with the AWS Command Line Interface in the AWS Command Line Interface User Guide.

You can have valid credentials to authenticate your requests, but unless you have permissions you cannot create or access Amazon S3 resources. For example, you must have permissions to create an S3 bucket or get an object from your bucket. If you use root credentials of your AWS account, you have all the permissions. However, using root credentials is not recommended. Instead, we recommend that you create IAM users in your account and manage user permissions. For more information, see Managing Access Permissions to Your Amazon S3 Resources in the Amazon Simple Storage Service Developer Guide.
# Common Request Headers

The following table describes headers that can be used by various types of Amazon S3 REST requests.

<table>
<thead>
<tr>
<th>Header Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authorization</td>
<td>The information required for request authentication. For more information, go to The Authentication Header in the Amazon Simple Storage Service Developer Guide. For anonymous requests this header is not required.</td>
</tr>
<tr>
<td>Content-Length</td>
<td>Length of the message (without the headers) according to RFC 2616. This header is required for PUTs and operations that load XML, such as logging and ACLs.</td>
</tr>
<tr>
<td>Content-Type</td>
<td>The content type of the resource in case the request content in the body. Example: text/plain</td>
</tr>
<tr>
<td>Content-MD5</td>
<td>The base64 encoded 128-bit MD5 digest of the message (without the headers) according to RFC 1864. This header can be used as a message integrity check to verify that the data is the same data that was originally sent. Although it is optional, we recommend using the Content-MD5 mechanism as an end-to-end integrity check. For more information about REST request authentication, go to REST Authentication in the Amazon Simple Storage Service Developer Guide.</td>
</tr>
<tr>
<td>Date</td>
<td>The current date and time according to the requester. Example: Wed, 01 Mar 2006 12:00:00 GMT. When you specify the Authorization header, you must specify either the x-amz-date or the Date header.</td>
</tr>
<tr>
<td>Expect</td>
<td>When your application uses 100-continue, it does not send the request body until it receives an acknowledgment. If the message is rejected based on the headers, the body of the message is not sent. This header can be used only if you are sending a body. Valid Values: 100-continue</td>
</tr>
<tr>
<td>Host</td>
<td>For path-style requests, the value is s3.amazonaws.com. For virtual-style requests, the value is BucketName.s3.amazonaws.com. For more information, go to Virtual Hosting in the Amazon Simple Storage Service Developer Guide. This header is required for HTTP 1.1 (most toolkits add this header automatically); optional for HTTP/1.0 requests.</td>
</tr>
<tr>
<td>x-amz-content-sha256</td>
<td>When using signature version 4 to authenticate request, this header provides a hash of the request payload. For more information see Signature Calculations for the Authorization Header: Transferring Payload in a Single Chunk (AWS Signature Version 4) (p. 18). When uploading object in chunks, you set the value to STREAMING-AWS4-HMAC-SHA256-PAYLOAD to indicate that the signature covers only headers and that there is</td>
</tr>
</tbody>
</table>
### Header Name | Description
---|---
| | no payload. For more information, see [Signature Calculations for the Authorization Header: Transferring Payload in Multiple Chunks (Chunked Upload) (AWS Signature Version 4) (p. 29)].
| x-amz-date | The current date and time according to the requester. Example: Wed, 01 Mar 2006 12:00:00 GMT. When you specify the Authorization header, you must specify either the x-amz-date or the Date header. If you specify both, the value specified for the x-amz-date header takes precedence.
| x-amz-security-token | This header can be used in the following scenarios:
  * Provide security tokens for Amazon DevPay operations - Each request that uses Amazon DevPay requires two x-amz-security-token headers: one for the product token and one for the user token. When Amazon S3 receives an authenticated request, it compares the computed signature with the provided signature. Improperly formatted multi-value headers used to calculate a signature can cause authentication issues.
  * Provide security token when using temporary security credentials - When making requests using temporary security credentials you obtained from IAM you must provide a security token using this header. To learn more about temporary security credentials, go to [Making Requests](#).

This header is required for requests that use Amazon DevPay and requests that are signed using temporary security credentials.
# Common Response Headers

The following table describes response headers that are common to most AWS S3 responses.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Content-Length</strong></td>
<td>The length in bytes of the body in the response.</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Default</td>
<td>None</td>
</tr>
<tr>
<td><strong>Content-Type</strong></td>
<td>The MIME type of the content. For example, Content-Type: text/html; charset=utf-8</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Default</td>
<td>None</td>
</tr>
<tr>
<td><strong>Connection</strong></td>
<td>specifies whether the connection to the server is open or closed.</td>
</tr>
<tr>
<td>Type</td>
<td>Enum</td>
</tr>
<tr>
<td>Valid Values</td>
<td>open</td>
</tr>
<tr>
<td>Default</td>
<td>None</td>
</tr>
<tr>
<td><strong>Date</strong></td>
<td>The date and time Amazon S3 responded, for example, Wed, 01 Mar 2006 12:00:00 GMT.</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Default</td>
<td>None</td>
</tr>
<tr>
<td><strong>ETag</strong></td>
<td>The entity tag is a hash of the object. The ETag reflects changes only to the contents of an object, not its metadata. Whether or not it is depends on how the object was created and how it is encrypted as described below:</td>
</tr>
<tr>
<td></td>
<td>- Objects created by the PUT Object, POST Object, or Copy operation, or through the AWS Management Console, and are encrypted by SSE-S3 or plaintext, have ETags that are an MD5 digest of their object data.</td>
</tr>
<tr>
<td></td>
<td>- Objects created by the PUT Object, POST Object, or Copy operation, or through the AWS Management Console, and are encrypted by SSE-C or SSE-KMS, have ETags that are not an MD5 digest of their object data.</td>
</tr>
<tr>
<td></td>
<td>- If an object is created by either the Multipart Upload or Part Copy operation, the ETag is not an MD5 digest, regardless of the method of encryption.</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td><strong>Server</strong></td>
<td>The name of the server that created the response.</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Default</td>
<td>AmazonS3</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>x-amz-delete-marker</td>
<td>Specifies whether the object returned was (true) or was not (false) a delete marker.</td>
</tr>
<tr>
<td></td>
<td>Type: Boolean</td>
</tr>
<tr>
<td></td>
<td>Valid Values: true</td>
</tr>
<tr>
<td></td>
<td>Default: false</td>
</tr>
<tr>
<td>x-amz-id-2</td>
<td>A special token that is used together with the x-amz-request-id header to help AWS troubleshoot problems. For information about AWS support using these request IDs, see Troubleshooting Amazon S3.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
</tr>
<tr>
<td>x-amz-request-id</td>
<td>A value created by Amazon S3 that uniquely identifies the request. This value is used together with the x-amz-id-2 header to help AWS troubleshoot problems. For information about AWS support using these request IDs, see Troubleshooting Amazon S3.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
</tr>
<tr>
<td>x-amz-version-id</td>
<td>The version of the object. When you enable versioning, Amazon S3 generates a random number for objects added to a bucket. The value is UTF-8 encoded and URL ready. When you PUT an object in a bucket where versioning has been suspended, the version ID is always null.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td></td>
<td>Valid Values: null</td>
</tr>
<tr>
<td></td>
<td>Default: null</td>
</tr>
</tbody>
</table>
Error Responses

This section provides reference information about Amazon S3 errors.

Note
SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

Topics
- REST Error Responses (p. 6)
- List of Error Codes (p. 7)

REST Error Responses

When there is an error, the header information contains:

- Content-Type: application/xml
- An appropriate 3xx, 4xx, or 5xx HTTP status code

The body or the response also contains information about the error. The following sample error response shows the structure of response elements common to all REST error responses.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<Error>
  <Code>NoSuchKey</Code>
  <Message>The resource you requested does not exist</Message>
  <Resource>/mybucket/myfoto.jpg</Resource>
  <RequestId>4442587FB7D0A2F9</RequestId>
</Error>
```

The following table explains the REST error response elements

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Code</td>
<td>The error code is a string that uniquely identifies an error condition. It is meant to be read and understood by programs that detect and handle errors by type. For more information, see List of Error Codes (p. 7).</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td></td>
<td>Ancestor: Error</td>
</tr>
<tr>
<td>Error</td>
<td>Container for all error elements.</td>
</tr>
<tr>
<td></td>
<td>Type: Container</td>
</tr>
<tr>

<td>Ancestor: None</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Message</td>
<td>The error message contains a generic description of the error condition in English. It is intended for a human audience. Simple programs display the message directly to the end user if they encounter an error condition they don't know how or don't care to handle. Sophisticated programs with more exhaustive error handling and proper internationalization are more likely to ignore the error message.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>RequestId</td>
<td>ID of the request associated with the error.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>Resource</td>
<td>The bucket or object that is involved in the error.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
</tbody>
</table>

Many error responses contain additional structured data meant to be read and understood by a developer diagnosing programming errors. For example, if you send a Content-MD5 header with a REST PUT request that doesn't match the digest calculated on the server, you receive a BadDigest error. The error response also includes as detail elements the digest we calculated, and the digest you told us to expect. During development, you can use this information to diagnose the error. In production, a well-behaved program might include this information in its error log.

For information about general response elements, go to Error Responses.

## List of Error Codes

The following table lists Amazon S3 error codes.

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
<th>HTTP Status Code</th>
<th>SOAP Fault Code Prefix</th>
</tr>
</thead>
<tbody>
<tr>
<td>AccessDenied</td>
<td>Access Denied</td>
<td>403</td>
<td>Forbidden</td>
</tr>
<tr>
<td>AccountProblem</td>
<td>There is a problem with your AWS account that prevents the operation from completing successfully. Please use Contact Us.</td>
<td>403</td>
<td>Forbidden</td>
</tr>
<tr>
<td>AmbiguousGrantByEmailAddress</td>
<td>The email address you provided is associated with more than one account.</td>
<td>400</td>
<td>Bad Request</td>
</tr>
<tr>
<td>BadDigest</td>
<td>The Content-MD5 you specified did not match what we received.</td>
<td>400</td>
<td>Bad Request</td>
</tr>
<tr>
<td>Error Code</td>
<td>Description</td>
<td>HTTP Status Code</td>
<td>SOAP Fault Code Prefix</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------------</td>
<td>------------------------</td>
</tr>
<tr>
<td>BucketAlreadyExists</td>
<td>The requested bucket name is not available. The bucket namespace is shared by all users of the system. Please select a different name and try again.</td>
<td>409 Conflict</td>
<td>Client</td>
</tr>
<tr>
<td>BucketAlreadyOwnedByYou</td>
<td>Your previous request to create the named bucket succeeded and you already own it. You get this error in all AWS regions except US East (N. Virginia) region, us-east-1. In us-east-1 region, you will get 200 OK, but it is no-op (if bucket exists it Amazon S3 will not do anything).</td>
<td>409 Conflict (in all regions except US East (N. Virginia) region).</td>
<td>Client</td>
</tr>
<tr>
<td>BucketNotEmpty</td>
<td>The bucket you tried to delete is not empty.</td>
<td>409 Conflict</td>
<td>Client</td>
</tr>
<tr>
<td>CredentialsNotSupported</td>
<td>This request does not support credentials.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>CrossLocationLoggingProhibited</td>
<td>Cross-location logging not allowed. Buckets in one geographic location cannot log information to a bucket in another location.</td>
<td>403 Forbidden</td>
<td>Client</td>
</tr>
<tr>
<td>EntityTooSmall</td>
<td>Your proposed upload is smaller than the minimum allowed object size.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>EntityTooLarge</td>
<td>Your proposed upload exceeds the maximum allowed object size.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>ExpiredToken</td>
<td>The provided token has expired.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>IllegalVersioningConfigurationException</td>
<td>Indicates that the versioning configuration specified in the request is invalid.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>IncompleteBody</td>
<td>You did not provide the number of bytes specified by the Content-Length HTTP header</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>IncorrectNumberOfFilesInPostRequest</td>
<td>POST requires exactly one file upload per request.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>InlineDataTooLarge</td>
<td>Inline data exceeds the maximum allowed size.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>InternalError</td>
<td>We encountered an internal error. Please try again.</td>
<td>500 Internal Server Error</td>
<td>Server</td>
</tr>
<tr>
<td>Error Code</td>
<td>Description</td>
<td>HTTP Status Code</td>
<td>SOAP Fault Code Prefix</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>------------------</td>
<td>------------------------</td>
</tr>
<tr>
<td>InvalidAccessKeyId</td>
<td>The AWS access key Id you provided does not exist in our records.</td>
<td>403 Forbidden</td>
<td>Client</td>
</tr>
<tr>
<td>InvalidAddressingHeader</td>
<td>You must specify the Anonymous role.</td>
<td>N/A</td>
<td>Client</td>
</tr>
<tr>
<td>InvalidArgument</td>
<td>Invalid Argument</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>InvalidBucketName</td>
<td>The specified bucket is not valid.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>InvalidBucketState</td>
<td>The request is not valid with the current state of the bucket.</td>
<td>409 Conflict</td>
<td>Client</td>
</tr>
<tr>
<td>InvalidDigest</td>
<td>The Content-MD5 you specified is not valid.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>InvalidEncryptionAlgorithmError</td>
<td>The encryption request you specified is not valid. The valid value is AES256.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>InvalidLocationConstraint</td>
<td>The specified location constraint is not valid. For more information about regions, see How to Select a Region for Your Buckets.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>InvalidObjectState</td>
<td>The operation is not valid for the current state of the object.</td>
<td>403 Forbidden</td>
<td>Client</td>
</tr>
<tr>
<td>InvalidPart</td>
<td>One or more of the specified parts could not be found. The part might not have been uploaded, or the specified entity tag might not have matched the part's entity tag.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>InvalidPartOrder</td>
<td>The list of parts was not in ascending order. Parts list must specified in order by part number.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>InvalidPayer</td>
<td>All access to this object has been disabled.</td>
<td>403 Forbidden</td>
<td>Client</td>
</tr>
<tr>
<td>InvalidPolicyDocument</td>
<td>The content of the form does not meet the conditions specified in the policy document.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>InvalidRange</td>
<td>The requested range cannot be satisfied.</td>
<td>416 Requested Range Not Satisfiable</td>
<td>Client</td>
</tr>
<tr>
<td>InvalidRequest</td>
<td>Please use AWS4-HMAC-SHA256.</td>
<td>400 Bad Request</td>
<td>N/A</td>
</tr>
<tr>
<td>InvalidRequest</td>
<td>SOAP requests must be made over an HTTPS connection.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>Error Code</td>
<td>Description</td>
<td>HTTP Status Code</td>
<td>SOAP Fault Code Prefix</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------------</td>
<td>------------------------</td>
</tr>
<tr>
<td>InvalidRequest</td>
<td>S3 Transfer Acceleration is not supported for buckets with non-DNS compliant names.</td>
<td>400 Bad Request</td>
<td>N/A</td>
</tr>
<tr>
<td>InvalidRequest</td>
<td>S3 Transfer Acceleration is not supported for buckets with periods (.) in their names.</td>
<td>400 Bad Request</td>
<td>N/A</td>
</tr>
<tr>
<td>InvalidRequest</td>
<td>S3 Transfer Accelerate endpoint only supports virtual style requests.</td>
<td>400 Bad Request</td>
<td>N/A</td>
</tr>
<tr>
<td>InvalidRequest</td>
<td>S3 Transfer Accelerate is not configured on this bucket.</td>
<td>400 Bad Request</td>
<td>N/A</td>
</tr>
<tr>
<td>InvalidRequest</td>
<td>S3 Transfer Accelerate is disabled on this bucket.</td>
<td>400 Bad Request</td>
<td>N/A</td>
</tr>
<tr>
<td>InvalidRequest</td>
<td>S3 Transfer Acceleration is not supported on this bucket. Contact AWS Support for more information.</td>
<td>400 Bad Request</td>
<td>N/A</td>
</tr>
<tr>
<td>InvalidRequest</td>
<td>S3 Transfer Acceleration cannot be enabled on this bucket. Contact AWS Support for more information.</td>
<td>400 Bad Request</td>
<td>N/A</td>
</tr>
<tr>
<td>InvalidSecurity</td>
<td>The provided security credentials are not valid.</td>
<td>403 Forbidden</td>
<td>Client</td>
</tr>
<tr>
<td>InvalidSOAPRequest</td>
<td>The SOAP request body is invalid.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>InvalidStorageClass</td>
<td>The storage class you specified is not valid.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>InvalidTargetBucketForLogging</td>
<td>The target bucket for logging does not exist, is not owned by you, or does not have the appropriate grants for the log-delivery group.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>InvalidToken</td>
<td>The provided token is malformed or otherwise invalid.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>InvalidURI</td>
<td>Couldn't parse the specified URI.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>KeyTooLongError</td>
<td>Your key is too long.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>MalformedACLError</td>
<td>The XML you provided was not well-formed or did not validate against our published schema.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>MalformedPOSTRequest</td>
<td>The body of your POST request is not well-formed multipart/form-data.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>Error Code</td>
<td>Description</td>
<td>HTTP Status Code</td>
<td>SOAP Fault Code Prefix</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>------------------</td>
<td>------------------------</td>
</tr>
<tr>
<td>MalformedXML</td>
<td>This happens when the user sends malformed xml (xml that doesn't conform to the published xsd) for the configuration. The error message is, &quot;The XML you provided was not well-formed or did not validate against our published schema.&quot;</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>MaxMessageLengthExceeded</td>
<td>Your request was too big.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>MaxPostPreDataLengthExceededError</td>
<td>Your POST request fields preceding the upload file were too large.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>MetadataTooLarge</td>
<td>Your metadata headers exceed the maximum allowed metadata size.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>MethodNotAllowed</td>
<td>The specified method is not allowed against this resource.</td>
<td>405 Method Not Allowed</td>
<td>Client</td>
</tr>
<tr>
<td>MissingAttachment</td>
<td>A SOAP attachment was expected, but none were found.</td>
<td>N/A</td>
<td>Client</td>
</tr>
<tr>
<td>MissingContentTypeLength</td>
<td>You must provide the Content-Length HTTP header.</td>
<td>411 Length Required</td>
<td>Client</td>
</tr>
<tr>
<td>MissingRequestBodyError</td>
<td>This happens when the user sends an empty xml document as a request. The error message is, &quot;Request body is empty.&quot;</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>MissingSecurityElement</td>
<td>The SOAP 1.1 request is missing a security element.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>MissingSecurityHeader</td>
<td>Your request is missing a required header.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>NoLoggingStatusForKey</td>
<td>There is no such thing as a logging status subresource for a key.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>NoSuchBucket</td>
<td>The specified bucket does not exist.</td>
<td>404 Not Found</td>
<td>Client</td>
</tr>
<tr>
<td>NoSuchKey</td>
<td>The specified key does not exist.</td>
<td>404 Not Found</td>
<td>Client</td>
</tr>
<tr>
<td>NoSuchLifecycleConfiguration</td>
<td>The lifecycle configuration does not exist.</td>
<td>404 Not Found</td>
<td>Client</td>
</tr>
<tr>
<td>Error Code</td>
<td>Description</td>
<td>HTTP Status Code</td>
<td>SOAP Fault Code Prefix</td>
</tr>
<tr>
<td>----------------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>------------------</td>
<td>------------------------</td>
</tr>
<tr>
<td>NoSuchUpload</td>
<td>The specified multipart upload does not exist. The upload ID might be invalid, or the multipart upload might have been aborted or completed.</td>
<td>404 Not Found</td>
<td>Client</td>
</tr>
<tr>
<td>NoSuchVersion</td>
<td>Indicates that the version ID specified in the request does not match an existing version.</td>
<td>404 Not Found</td>
<td>Client</td>
</tr>
<tr>
<td>NotImplemented</td>
<td>A header you provided implies functionality that is not implemented.</td>
<td>501 Not Implemented</td>
<td>Server</td>
</tr>
<tr>
<td>NotSignedUp</td>
<td>Your account is not signed up for the Amazon S3 service. You must sign up before you can use Amazon S3. You can sign up at the following URL: <a href="https://aws.amazon.com/s3">https://aws.amazon.com/s3</a></td>
<td>403 Forbidden</td>
<td>Client</td>
</tr>
<tr>
<td>NoSuchBucketPolicy</td>
<td>The specified bucket does not have a bucket policy.</td>
<td>404 Not Found</td>
<td>Client</td>
</tr>
<tr>
<td>OperationAborted</td>
<td>A conflicting conditional operation is currently in progress against this resource. Try again.</td>
<td>409 Conflict</td>
<td>Client</td>
</tr>
<tr>
<td>PermanentRedirect</td>
<td>The bucket you are attempting to access must be addressed using the specified endpoint. Send all future requests to this endpoint.</td>
<td>301 Moved Permanently</td>
<td>Client</td>
</tr>
<tr>
<td>PreconditionFailed</td>
<td>At least one of the preconditions you specified did not hold.</td>
<td>412 Precondition Failed</td>
<td>Client</td>
</tr>
<tr>
<td>Redirect</td>
<td>Temporary redirect.</td>
<td>307 Moved Temporarily</td>
<td>Client</td>
</tr>
<tr>
<td>RestoreAlreadyInProgress</td>
<td>Object restore is already in progress.</td>
<td>409 Conflict</td>
<td>Client</td>
</tr>
<tr>
<td>RequestIsNotMultiPartContent</td>
<td>Bucket POST must be of the enclosure-type multipart/form-data.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>RequestTimeout</td>
<td>Your socket connection to the server was not read from or written to within the timeout period.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>RequestTimeTooSkewed</td>
<td>The difference between the request time and the server’s time is too large.</td>
<td>403 Forbidden</td>
<td>Client</td>
</tr>
<tr>
<td>RequestTorrentOfBucketError</td>
<td>Requesting the torrent file of a bucket is not permitted.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>Error Code</td>
<td>Description</td>
<td>HTTP Status Code</td>
<td>SOAP Fault Code Prefix</td>
</tr>
<tr>
<td>----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>------------------</td>
<td>-----------------------</td>
</tr>
<tr>
<td>SignatureDoesNotMatch</td>
<td>The request signature we calculated does not match the signature you provided. Check your AWS secret access key and signing method. For more information, see REST Authentication and SOAP Authentication for details.</td>
<td>403 Forbidden</td>
<td>Client</td>
</tr>
<tr>
<td>ServiceUnavailable</td>
<td>Reduce your request rate.</td>
<td>503 Service Unavailable</td>
<td>Server</td>
</tr>
<tr>
<td>SlowDown</td>
<td>Reduce your request rate.</td>
<td>503 Slow Down</td>
<td>Server</td>
</tr>
<tr>
<td>TemporaryRedirect</td>
<td>You are being redirected to the bucket while DNS updates.</td>
<td>307 Moved Temporarily</td>
<td>Client</td>
</tr>
<tr>
<td>TokenRefreshRequired</td>
<td>The provided token must be refreshed.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>TooManyBuckets</td>
<td>You have attempted to create more buckets than allowed.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>UnexpectedContent</td>
<td>This request does not support content.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>UnresolvableGrantByEmailAddress</td>
<td>The email address you provided does not match any account on record.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
<tr>
<td>UserKeyMustBeSpecified</td>
<td>The bucket POST must contain the specified field name. If it is specified, check the order of the fields.</td>
<td>400 Bad Request</td>
<td>Client</td>
</tr>
</tbody>
</table>
Authenticating Requests (AWS Signature Version 4)

Every interaction with Amazon S3 is either authenticated or anonymous. This section explains request authentication with the AWS Signature Version 4 algorithm.

Note
If you use the AWS SDKs (see Sample Code and Libraries) to send your requests, you don’t need to read this section because the SDK clients authenticate your requests by using access keys that you provide. Unless you have a good reason not to, you should always use the AWS SDKs. In regions that support both signature versions, you can request AWS SDKs to use specific signature version. For more information, see Specifying Signature Version in Request Authentication in the Amazon Simple Storage Service Developer Guide. You need to read this section only if you are implementing the AWS Signature Version 4 algorithm in your custom client.

Authentication with AWS Signature version 4 provides some or all of the following, depending on how you choose to sign your request:

- **Verification of the identity of the requester** – Authenticated requests require a signature that you create by using your access keys (access key ID, secret access key). For information about getting access keys, see Understanding and Getting Your Security Credentials in the AWS General Reference. If you are using temporary security credentials, the signature calculations also require a security token. For more information, see Requesting Temporary Security Credentials in the IAM User Guide.

- **In-transit data protection** – In order to prevent tampering with a request while it is in transit, you use some of the request elements to calculate the request signature. Upon receiving the request, Amazon S3 calculates the signature by using the same request elements. If any request component received by Amazon S3 does not match the component that was used to calculate the signature, Amazon S3 will reject the request.

- **Protect against reuse of the signed portions of the request** – The signed portions (using AWS Signatures) of requests are valid within 15 minutes of the timestamp in the request. An unauthorized party who has access to a signed request can modify the unsigned portions of the request without affecting the request’s validity in the 15 minute window. Because of this, we recommend that you maximize protection by signing request headers and body, making HTTPS requests to Amazon S3, and by using the \texttt{s3:x-amz-content-sha256} condition key (see Amazon S3 Signature Version 4 Authentication Specific Policy Keys (p. 45)) in AWS policies to require users to sign S3 request bodies.
Note
Amazon S3 supports Signature Version 4, a protocol for authenticating inbound API requests to AWS services, in all AWS regions. At this time, AWS regions created before January 30, 2014 will continue to support the previous protocol, Signature Version 2. Any new regions after January 30, 2014 will support only Signature Version 4 and therefore all requests to those regions must be made with Signature Version 4. For more information about AWS Signature Version 2, see Signing and Authenticating REST Requests in the Amazon Simple Storage Service Developer Guide.

Authentication Methods

You can express authentication information by using one of the following methods:

- **HTTP Authorization header** – Using the HTTP Authorization header is the most common method of authenticating an Amazon S3 request. All of the Amazon S3 REST operations (except for browser-based uploads using POST requests) require this header. For more information about the Authorization header value, and how to calculate signature and related options, see Authenticating Requests: Using the Authorization Header (AWS Signature Version 4) (p. 16).

- **Query string parameters** – You can use a query string to express a request entirely in a URL. In this case, you use query parameters to provide request information, including the authentication information. Because the request signature is part of the URL, this type of URL is often referred to as a presigned URL. You can use presigned URLs to embed clickable links, which can be valid for up to seven days, in HTML. For more information, see Authenticating Requests: Using Query Parameters (AWS Signature Version 4) (p. 35).

Amazon S3 also supports browser-based uploads that use an HTTP POST requests. With an HTTP POST request, you can upload content to Amazon S3 directly from the browser. For information about authenticating POST requests, see Browser-Based Uploads Using POST in the Amazon Simple Storage Service Developer Guide.

Introduction to Signing Requests

Authentication information that you send in a request must include a signature. To calculate a signature, you first concatenate select request elements to form a string, referred to as the string to sign. You then use a signing key to calculate the hash-based message authentication code (HMAC) of the string to sign.

In AWS Signature Version 4, you don’t use your secret access key to sign the request. Instead, you first use your secret access key to create a signing key. The signing key is scoped to a specific region and service, and it never expires.

The following diagram illustrates the general process of computing a signature.
The string to sign depends on the request type. For example, when you use the HTTP Authorization header or the query parameters for authentication, you use a varying combination of request elements to create the string to sign. For an HTTP POST request, the POST policy in the request is the string you sign. For more information about computing string to sign, follow links provided at the end of this section.

For signing key, the diagram shows series of calculations, where result of each step you feed into the next step. The final step is the signing key.

Upon receiving an authenticated request, Amazon S3 servers re-create the signature by using the authentication information that is contained in the request. If the signatures match, Amazon S3 processes your request; otherwise, the request is rejected.

For more information about authenticating requests, see the following topics:

- Authenticating Requests: Using the Authorization Header (AWS Signature Version 4) (p. 16)
- Authenticating Requests: Using Query Parameters (AWS Signature Version 4) (p. 35)
- Authenticating Requests in Browser-Based Uploads Using POST (AWS Signature Version 4) (p. 48)

### Authenticating Requests: Using the Authorization Header (AWS Signature Version 4)

#### Topics

- Overview (p. 16)
- Signature Calculations for the Authorization Header: Transferring Payload in a Single Chunk (AWS Signature Version 4) (p. 18)
- Signature Calculations for the Authorization Header: Transferring Payload in Multiple Chunks (Chunked Upload) (AWS Signature Version 4) (p. 29)

#### Overview

Using the HTTP Authorization header is the most common method of providing authentication information. Except for POST requests (p. 350) and requests that are signed by using query parameters, all Amazon S3 bucket operations (p. 65) and object operations (p. 301) use the Authorization request header to provide authentication information.

The following is an example of the Authorization header value. Line breaks are added to this example for readability:

```
Authorization: AWS4-HMAC-SHA256
Credential=AKIAIOSFODNN7EXAMPLE/20130524/us-east-1/s3/aws4_request,
SignedHeaders=host;range;x-amz-date,
Signature=fe5f80f77d5fa3beca038a248ff027d0445342fe2855ddc963176630326f1024
```

The following is the properly formatted version of the same Authorization header:

```
Authorization: AWS4-HMAC-SHA256
Credential=AKIAIOSFODNN7EXAMPLE/20130524/us-east-1/s3/aws4_request,
SignedHeaders=host;range;x-amz-date,
Signature=fe5f80f77d5fa3beca038a248ff027d0445342fe2855ddc963176630326f1024
```

Note the following:

- There is space between the first two components, AWS4-HMAC-SHA256 and Credential
- The subsequent components, Credential, SignedHeaders, and Signature are separated by a comma.
The following table describes the various components of the Authorization header value in the preceding example:

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AWS4-HMAC-SHA256</td>
<td>The algorithm that was used to calculate the signature. You must provide this value when you use AWS Signature Version 4 for authentication. The string specifies AWS Signature Version 4 (AWS4) and the signing algorithm (HMAC-SHA256).</td>
</tr>
<tr>
<td>Credential</td>
<td>Your access key ID and the scope information, which includes the date, region, and service that were used to calculate the signature. This string has the following form: <code>&lt;your-access-key-id&gt;/&lt;date&gt;/&lt;aws-region&gt;/&lt;aws-service&gt;/aws4_request</code> Where: • <code>&lt;date&gt;</code> value is specified using YYYYMMDD format. • <code>&lt;aws-service&gt;</code> value is s3 when sending request to Amazon S3.</td>
</tr>
<tr>
<td>SignedHeaders</td>
<td>A semicolon-separated list of request headers that you used to compute Signature. The list includes header names only, and the header names must be in lowercase. For example: <code>host;range;x-amz-date</code></td>
</tr>
<tr>
<td>Signature</td>
<td>The 256-bit signature expressed as 64 lowercase hexadecimal characters. For example: <code>fe5f80f77d5fa3beca038a248ff027d0445342fe2855dcd963176630326f1024</code> Note that the signature calculations vary depending on the option you choose to transfer the payload.</td>
</tr>
</tbody>
</table>

The signature calculations vary depending on the method you choose to transfer the request payload. S3 supports the following options:

- **Transfer payload in a single chunk** – In this case, you have the following signature calculation options:
  - **Signed payload option** – You can optionally compute the entire payload checksum and include it in signature calculation. This provides added security but you need to read your payload twice or buffer it in memory.

  For example, in order to upload a file, you need to read the file first to compute a payload hash for signature calculation and again for transmission when you create the request. For smaller payloads, this approach might be preferable. However, for large files, reading the file twice can be inefficient, so you might want to upload data in chunks instead.

  We recommend you include payload checksum for added security.

- **Unsigned payload option** – Do not include payload checksum in signature calculation.
For step-by-step instructions to calculate signature and construct the Authorization header value, see Signature Calculations for the Authorization Header: Transferring Payload in a Single Chunk (AWS Signature Version 4) (p. 18).

- **Transfer payload in multiple chunks (chunked upload)** – In this case you transfer payload in chunks. You can transfer a payload in chunks regardless of the payload size.

You can break up your payload into chunks. These can be fixed or variable-size chunks. By uploading data in chunks, you avoid reading the entire payload to calculate the signature. Instead, for the first chunk, you calculate a seed signature that uses only the request headers. The second chunk contains the signature for the first chunk, and each subsequent chunk contains the signature for the chunk that precedes it. At the end of the upload, you send a final chunk with 0 bytes of data that contains the signature of the last chunk of the payload. For more information, see Signature Calculations for the Authorization Header: Transferring Payload in Multiple Chunks (Chunked Upload) (AWS Signature Version 4) (p. 29).

When you send a request, you must tell Amazon S3 which of the preceding options you have chosen in your signature calculation, by adding the `x-amz-content-sha256` header with one of the following values:

- If you choose chunked upload options, set the header value to `STREAMING-AWS4-HMAC-SHA256-PAYLOAD`.
- If you choose to upload payload in a single chunk, set the header value to the payload checksum (signed payload option), or set the value to the literal string `UNSIGNED-PAYLOAD` (unsigned payload option).

Upon receiving the request, Amazon S3 re-creates the string to sign using information in the Authorization header and the date header. It then verifies with authentication service the signatures match. The request date can be specified by using either the HTTP Date or the `x-amz-date` header. If both headers are present, `x-amz-date` takes precedence.

If the signatures match, Amazon S3 processes your request; otherwise, your request will fail.

For more information, see the following topics:

Signature Calculations for the Authorization Header: Transferring Payload in a Single Chunk (AWS Signature Version 4) (p. 18)

Signature Calculations for the Authorization Header: Transferring Payload in Multiple Chunks (Chunked Upload) (AWS Signature Version 4) (p. 29)

**Signature Calculations for the Authorization Header: Transferring Payload in a Single Chunk (AWS Signature Version 4)**

When using the Authorization header to authenticate requests, the header value includes, among other things, a signature. The signature calculations vary depending on the choice you make for transferring the payload (Overview (p. 16)). This section explains signature calculations when you choose to transfer the payload in a single chunk. The example section (see Examples: Signature Calculations (p. 24)) shows signature calculations and resulting Authorization headers that you can use as a test suite to verify your code.

**Important**

When transferring payload in a single chunk, you can optionally choose to include the payload hash in the signature calculations, referred as signed payload (if you don’t include it, the payload
is considered unsigned). The signing procedure discussed in the following section applies to both, but note the following differences:

- **Signed payload option** – You include the payload hash when constructing the canonical request (that then becomes part of StringToSign, as explained in the signature calculation section). You also specify the same value as the x-amz-content-sha256 header value when sending the request to S3.

- **Unsigned payload option** – You include the literal string UNSIGNED-PAYLOAD when constructing a canonical request, and set the same value as the x-amz-content-sha256 header value when sending the request to S3.

When you send your request to S3, the x-amz-content-sha256 header value informs S3 whether the payload is signed or not. Amazon S3 can then create signature accordingly for verification.

**Calculating a Signature**

To calculate a signature, you first need a string to sign. You then calculate a HMAC-SHA256 hash of the string to sign by using a signing key. The following diagram illustrates the process, including the various components of the string that you create for signing.

When Amazon S3 receives an authenticated request, it computes the signature and then compares it with the signature that you provided in the request. For that reason, you must compute the signature by using the same method that is used by Amazon S3. The process of putting a request in an agreed-upon form for signing is called canonicalization.

The following table describes the functions that are shown in the diagram. You need to implement code for these functions.
<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lowercase()</td>
<td>Convert the string to lowercase.</td>
</tr>
<tr>
<td>Hex()</td>
<td>Lowercase base 16 encoding.</td>

<td>}</td>
</tr>
</tbody>
</table>
**Task 1: Create a Canonical Request**

This section provides an overview of creating a canonical request.

The following is the canonical request format that Amazon S3 uses to calculate a signature. For signatures to match, you must create a canonical request in this format:

```
<HTTPMethod>
<CanonicalURI>
<CanonicalQueryString>
<CanonicalHeaders>
<SignedHeaders>
<HashedPayload>
```

Where:

- **HTTPMethod** is one of the HTTP methods, for example GET, PUT, HEAD, and DELETE.
- **CanonicalURI** is the URI-encoded version of the absolute path component of the URI—everything starting with the "/" that follows the domain name and up to the end of the string or to the question mark character (?) if you have query string parameters. The URI in the following example, `http://s3.amazonaws.com/examplebucket/myphoto.jpg`, is the absolute path and you don’t encode the "/" in the absolute path:

```
http://s3.amazonaws.com/examplebucket/myphoto.jpg
```

**Note**

You do not normalize URI paths for requests to Amazon S3. For example, you may have a bucket with an object named "my-object//example//photo.user". Normalizing the path changes the object name in the request to "my-object/example/photo.user". This is an incorrect path for that object.

- **CanonicalQueryString** specifies the URI-encoded query string parameters. You URI-encode name and values individually. You must also sort the parameters in the canonical query string alphabetically by key name. The sorting occurs after encoding. The query string in the following URI example is `prefix=somePrefix&marker=someMarker&max-keys=20`:

```
```

The canonical query string is as follows (line breaks are added to this example for readability):

```
UriEncode("marker") + "=" + UriEncode("someMarker") + "&" +
UriEncode("max-keys") + "=" + UriEncode("20") + "&" +
UriEncode("prefix") + "=" + UriEncode("somePrefix")
```

When a request targets a subresource, the corresponding query parameter value will be an empty string (""). For example, the following URI identifies the ACL subresource on the `examplebucket` bucket:

```
http://s3.amazonaws.com/examplebucket?acl
```

The **CanonicalQueryString** in this case is as follows:

```
UriEncode("acl") + "=" + ""
```

If the URI does not include a '?', there is no query string in the request, and you set the canonical query string to an empty string ("""). You will still need to include the "\n".
• **CanonicalHeaders** is a list of request headers with their values. Individual header name and value pairs are separated by the newline character ("\n"). Header names must be in lowercase. You must sort the header names alphabetically to construct the string, as shown in the following example:

```
Lowercase(<HeaderName1>) + "+Trim(<value>) + "\n"
Lowercase(<HeaderName2>) + "+Trim(<value>) + "\n"
...
Lowercase(<HeaderNameN>) + "+Trim(<value>) + "\n"
```

The `Lowercase()` and `Trim()` functions used in this example are described in the preceding section.

The **CanonicalHeaders** list must include the following:

- HTTP host header.
- If the Content-Type header is present in the request, you must add it to the **CanonicalHeaders** list.
- Any `x-amz-*` headers that you plan to include in your request must also be added. For example, if you are using temporary security credentials, you need to include `x-amz-security-token` in your request. You must add this header in the list of **CanonicalHeaders**.

**Note**
The `x-amz-content-sha256` header is required for all AWS Signature Version 4 requests. It provides a hash of the request payload. If there is no payload, you must provide the hash of an empty string.

The following is an example **CanonicalHeaders** string. The header names are in lowercase and sorted.

```
host:s3.amazonaws.com
x-amz-content-sha256:e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
x-amz-date:20130708T220855Z
```

**Note**
For the purpose of calculating an authorization signature, only the host and any `x-amz-*` headers are required; however, in order to prevent data tampering, you should consider including all the headers in the signature calculation.

- **SignedHeaders** is an alphabetically sorted, semicolon-separated list of lowercase request header names. The request headers in the list are the same headers that you included in the **CanonicalHeaders** string. For example, for the previous example, the value of **SignedHeaders** would be as follows:

```
host;x-amz-content-sha256;x-amz-date
```

- **HashedPayload** is the hexadecimal value of the SHA256 hash of the request payload.

```
Hex(SHA256Hash(<payload>))
```

If there is no payload in the request, you compute a hash of the empty string as follows:

```
Hex(SHA256Hash(""))
```

The hash returns the following value:

```
e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
```
For example, when you upload an object by using a PUT request, you provide object data in the body. When you retrieve an object by using a GET request, you compute the empty string hash.

**Task 2: Create a String to Sign**

This section provides an overview of creating a string to sign. For step-by-step instructions, see Task 2: Create a String to Sign in the AWS General Reference.

The string to sign is a concatenation of the following strings:

```
"AWS4-HMAC-SHA256" + "\n" +
timeStampISO8601Format + "\n" +
<Scope> + "\n" +
Hex(SHA256Hash(<CanonicalRequest>))
```

The constant string AWS4-HMAC-SHA256 specifies the hash algorithm that you are using, HMAC-SHA256. The timestamp is the current UTC time in ISO 8601 format (for example, 20130524T000000Z).

Scope binds the resulting signature to a specific date, an AWS region, and a service. Thus, your resulting signature will work only in the specific region and for a specific service. The signature is valid for seven days after the specified date.

```
date.Format(<YYYYMMDD>) + "/" + <region> + "/" + <service> + "/aws4_request"
```

For Amazon S3, the service string is s3. For a list of region strings, see Regions and Endpoints in the AWS General Reference. The region column in this table provides the list of valid region strings.

The following scope restricts the resulting signature to the us-east-1 region and Amazon S3.

```
20130606/us-east-1/s3/aws4_request
```

**Note**

Scope must use the same date that you use to compute the signing key, as discussed in the following section.

**Task 3: Calculate Signature**

In AWS Signature Version 4, instead of using your AWS access keys to sign a request, you first create a signing key that is scoped to a specific region and service. For more information about signing keys, see Introduction to Signing Requests (p. 15).

```
DateKey = HMAC-SHA256("AWS4"+"<SecretAccessKey>", "<YYYYMMDD>")
DateRegionKey = HMAC-SHA256(<DateKey>, "<aws-region>")
DateRegionServiceKey = HMAC-SHA256(<DateRegionKey>, "<aws-service>")
SigningKey = HMAC-SHA256(<DateRegionServiceKey>, "aws4_request")
```

**Note**

This signing key is valid for seven days from the date specified in the DateKey hash.

For a list of region strings, see Regions and Endpoints in the AWS General Reference.

Using a signing key enables you to keep your AWS credentials in one safe place. For example, if you have multiple servers that communicate with Amazon S3, you share the signing key with those servers; you
don’t have to keep a copy of your secret access key on each server. Signing key is valid for up to seven
days. So each time you calculate signing key you will need to share the signing key with your servers. For
more information, see Authenticating Requests (AWS Signature Version 4) (p. 14).

The final signature is the HMAC-SHA256 hash of the string to sign, using the signing key as the key.

HMAC-SHA256(SigningKey, StringToSign)

For step-by-step instructions on creating a signature, see Task 3: Create a Signature in the AWS General
Reference.

Examples: Signature Calculations

You can use the examples in this section as a reference to check signature calculations in your code. For
additional references, see Signature Version 4 Test Suite of the AWS General Reference. The calculations
shown in the examples use the following data:

- Example access keys.
- Request timestamp of 20130524T000000Z (Fri, 24 May 2013 00:00:00 GMT).
- Bucket name examplebucket.
- The bucket is assumed to be in the US East (N. Virginia) region. The credential Scope and the Signing
  Key calculations use us-east-1 as the region specifier. For information about other regions, see
  Regions and Endpoints in the AWS General Reference.
- You can use either path-style or virtual hosted–style requests. The following examples show how to
  sign a virtual hosted–style request, for example:

  https://examplebucket.s3.amazonaws.com/photos/photo1.jpg

  For more information, see Virtual Hosting of Buckets in the Amazon Simple Storage Service Developer
  Guide.

Example: GET Object

The following example gets the first 10 bytes of an object (test.txt) from examplebucket. For more
information about the API action, see GET Object (p. 317).

```
GET /test.txt HTTP/1.1
Host: examplebucket.s3.amazonaws.com
x-amz-date:20130524T000000Z
Authorization: SignatureToBeCalculated
Range: bytes=0-9
x-amz-content-sha256:e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
x-amz-date: 20130524T000000Z
```

Because this GET request does not provide any body content, the x-amz-content-sha256 value is the
hash of the empty request body. The following steps show signature calculations and construction of the
Authorization header.
1. **StringToSign**
   a. **CanonicalRequest**

   ```
   GET
   /test.txt
   host:examplebucket.s3.amazonaws.com
   range:bytes=0-9
   x-amz-content-sha256:e3b0c44298f1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
   x-amz-date:20130524T000000Z
   host;range;x-amz-content-sha256;x-amz-date
   e3b0c44298f1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
   ```

   In the canonical request string, the last line is the hash of the empty request body. The third line is empty because there are no query parameters in the request.

   b. **StringToSign**

   ```
   AWS4-HMAC-SHA256
   20130524T000000Z
   20130524/us-east-1/s3/aws4_request
   7344ae5b7ee6c3e7e6b0fe0640412a37625d1fbff95c48bb2dc43964946972
   ```

2. **SigningKey**

   ```
   signing key = HMAC-SHA256(HMAC-SHA256(HMAC-SHA256(HMAC-SHA256("AWS4" +
            "<YourSecretAccessKey>"),"20130524"),"us-east-1"),"s3"),"aws4_request")
   ```

3. **Signature**

   ```
   f0e8bdb87c964420e857bd35b5d6ed310bd44f0170aba48dd91039c6036db41
   ```

4. **Authorization header**

   The resulting Authorization header is as follows:

   ```
   AWS4-HMAC-SHA256 Credential=AKIAIOSFODNN7EXAMPLE/20130524/us-east-1/s3/aws4_request,SignedHeaders=host;range;x-amz-content-sha256;x-amz-date,Signature=f0e8bdb87c964420e857bd35b5d6ed310bd44f0170aba48dd91039c6036db41
   ```

**Example: PUT Object**

This example PUT request creates an object (testfile.text) in examplebucket. The example assumes the following:

- You are requesting REDUCED_REDUNDANCY as the storage class by adding the x-amz-storage-class request header. For information about storage classes, see Storage Classes in the Amazon Simple Storage Service Developer Guide.
- The content of the uploaded file is a string, "Welcome to Amazon S3." The value of x-amz-content-sha256 in the request is based on this string.

For information about the API action, see PUT Object (p. 377).
The following steps show signature calculations.

1. **StringToSign**
   a. **CanonicalRequest**

```
PUT /test%24file.text

date:Fri, 24 May 2013 00:00:00 GMT
host:examplebucket.s3.amazonaws.com
x-amz-content-sha256:44ce7dd67c959e0d3524ffac1771dfba87d2b6b4e99e42034a8b803f8b072
x-amz-date:20130524T000000Z
x-amz-storage-class:REDUCED_REDUNDANCY
```

In the canonical request, the third line is empty because there are no query parameters in the request. The last line is the hash of the body, which should be same as the x-amz-content-sha256 header value.

   b. **StringToSign**

```
AWS4-HMAC-SHA256 20130524T000000Z 20130524/us-east-1/s3/aws4_request
9e0e90d9c76de8fa5b200d8c849cd5b8dc7a3be3951ddb7f6a76b4158342019d
```

2. **SigningKey**

```
signing key = HMAC-SHA256(HMAC-SHA256(HMAC-SHA256(HMAC-SHA256("AWS4" + "<YourSecretAccessKey>"),"20130524");"us-east-1");"s3");"aws4_request")
```

3. **Signature**

```
98ad721746da40c64f1a55b78f14c238d841ea1380cd77a1b5971af0ece108bd
```

4. **Authorization header**

   The resulting Authorization header is as follows:

```
AWS4-HMAC-SHA256 Credential=AKIAIOSFODDN7EXAMPLE/20130524/us-east-1/s3/aws4_request,SignedHeaders=date;host;x-amz-content-sha256;x-amz-date;x-amz-storage-class,Signature=98ad721746da40c64f1a55b78f14c238d841ea1380cd77a1b5971af0ece108bd
```

**Example: GET Bucket Lifecycle**

The following GET request retrieves the lifecycle configuration of examplebucket. For information about the API action, see GET Bucket lifecycle (p. 132).
Signature Calculation: Transfer Payload in a Single Chunk

GET ?lifecycle HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Authorization: SignatureToBeCalculated
x-amz-date: 20130524T000000Z
x-amz-content-sha256:e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855

Because the request does not provide any body content, the x-amz-content-sha256 header value is the hash of the empty request body. The following steps show signature calculations.

1. **StringToSign**

   a. **CanonicalRequest**

   ```
   GET
   /lifecycle
   host:examplebucket.s3.amazonaws.com
   x-amz-content-sha256:e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
   x-amz-date:20130524T000000Z
   host;x-amz-content-sha256;x-amz-date
   e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
   ```

   In the canonical request, the last line is the hash of the empty request body.

   b. **StringToSign**

   ```
   AWS4-HMAC-SHA256
   20130524T000000Z
   20130524/us-east-1/s3/aws4_request
   9766c798316ff2757b517bc739a67f6213b4ab36dd5a2f94eaebf79c7395ca
   ```

2. **SigningKey**

   ```
   signing key = HMAC-SHA256(HMAC-SHA256(HMAC-SHA256(HMAC-SHA256("AWS4" +
   "<YourSecretAccessKey>")","20130524"),"us-east-1"),"s3"),"aws4_request")
   ```

3. **Signature**

   ```
   f6a454ca298b7d68078a5d1bdfb9be0d65c699e0f91ac7a200a0136783543
   ```

4. **Authorization header**

   The resulting Authorization header is as follows:

   ```
   AWS4-HMAC-SHA256 Credential=AKIAIOSFODNN7EXAMPLE/20130524/us-east-1/s3/aws4_request,SignedHeaders=host;x-amz-content-sha256;x-amz-date,Signature=fea454ca298b7d68078a5d1bdfb9be0d65c699e0f91ac7a200a0136783543
   ```

Example: Get Bucket (List Objects)

The following example retrieves a list of objects from examplebucket bucket. For information about the API action, see GET Bucket (List Objects) Version 1 (p. 99).

GET ?max-keys=2&prefix=J HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Authorization: SignatureToBeCalculated
Because the request does not provide a body, the value of `x-amz-content-sha256` is the hash of the empty request body. The following steps show signature calculations.

1. **StringToSign**
   a. **CanonicalRequest**
      
      ```
      GET
      /
      max-keys=2&prefix=J
      host:examplebucket.s3.amazonaws.com
      x-amz-content-sha256:e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
      x-amz-date:20130524T000000Z
      host;x-amz-content-sha256;x-amz-date
      e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
      ```
      
      In the canonical string, the last line is the hash of the empty request body.

   b. **StringToSign**
      
      ```
      AWS4-HMAC-SHA256
      20130524T000000Z
      20130524/us-east-1/s3/aws4_request
      df57d21db20da04d7fa30298dd4488ba3a2b47ca3a489c74750e0f1e7df1b9b7
      ```

   c. **Signature**
      
      ```
      34b48302e7b5fa45bde8084f4b7868a86f0a534bc59db6670ed5711ef69dc6f7
      ```

   d. **Authorization header**
      The resulting Authorization header is as follows:
      
      ```
      AWS4-HMAC-SHA256 Credential=AKIAIOSFODNN7EXAMPLE/20130524/us-east-1/s3/aws4_request,SignedHeaders=host;x-amz-content-sha256;x-amz-date,Signature=34b48302e7b5fa45bde8084f4b7868a86f0a534bc59db6670ed5711ef69dc6f7
      ```
Signature Calculations for the Authorization Header: Transferring Payload in Multiple Chunks (Chunked Upload) (AWS Signature Version 4)

As described in the Overview (p. 16), when authenticating requests using the Authorization header, you have an option of uploading the payload in chunks. You can send data in fixed size or variable size chunks. This section describes the signature calculation process in chunked upload, how you create the chunk body, and how the delayed signing works where you first upload the chunk, and send its signature in the subsequent chunk. The example section (see Example: PUT Object (p. 32)) shows signature calculations and resulting Authorization headers that you can use as a test suite to verify your code.

**Note**
When transferring data in a series of chunks, you must use the Content-Length HTTP header to explicitly specify the total content length (object length in bytes plus metadata in each chunk). This requires you to pre-compute the total length of the payload, including the metadata you send in each chunk, before starting your request. The x-amz-decoded-content-length header contains the size of the object length in bytes.

Each chunk signature calculation includes the signature of the previous chunk. To begin, you create a seed signature using only the headers. You use the seed signature in the signature calculation of the first chunk. For each subsequent chunk, you create a chunk signature that includes the signature of the previous chunk. Thus, the chunk signatures are chained together; that is, the signature of chunk $n$ is a function $F(chunk \ n, \ signature(chunk \ n-1))$. The chaining ensures that you send the chunks in the correct order.

To perform a chunked upload, do the following:

1. Decide the payload chunk size. You need this when you write the code.
   
   Chunk size must be at least 8 KB. We recommend a chunk size of at least 64 KB for better performance. This chunk size applies to all chunks except the last one. The last chunk you send can be smaller than 8 KB. If your payload is small and can fit into one chunk, then it can be smaller than the 8 KB.

2. Create the seed signature for inclusion in the first chunk. For more information, see Calculating the Seed Signature (p. 29).

3. Create the first chunk and stream it. For more information, see Defining the Chunk Body (p. 32).

4. For each subsequent chunk, calculate the chunk signature that includes the previous signature in the string you sign, construct the chunk, and send it. For more information, see Defining the Chunk Body (p. 32).

5. Send the final additional chunk, which is the same as the other chunks in the construction, but it has zero data bytes. For more information, see Defining the Chunk Body (p. 32).

**Calculating the Seed Signature**

The following diagram illustrates the process of calculating the seed signature.
The following table describes the functions that are shown in the diagram. You need to implement code for these functions.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lowercase()</td>
<td>Convert the string to lowercase.</td>

</tbody>
</table>
Amazon Simple Storage Service API Reference
Signature Calculation: Transfer Payload in Multiple Chunks

Function

Description

Important

The standard UriEncode functions provided by your
development platform may not work because of
diﬀerences in implementation and related ambiguity
in the underlying RFCs. We recommend that you write
your own custom UriEncode function to ensure that your
encoding will work.
The following is an example UriEncode() function in Java.
public static String UriEncode(CharSequence input, boolean
encodeSlash) {
StringBuilder result = new StringBuilder();
for (int i = 0; i < input.length(); i++) {
char ch = input.charAt(i);
if ((ch >= 'A' && ch <= 'Z') || (ch >= 'a'
&& ch <= 'z') || (ch >= '0' && ch <= '9') || ch == '_' ||
ch == '-' || ch == '~' || ch == '.') {
result.append(ch);
} else if (ch == '/') {
result.append(encodeSlash ? "%2F" : ch);
} else {
result.append(toHexUTF8(ch));
}
}
return result.toString();
}

For information about the signing process, see Signature Calculations for the Authorization Header:
Transferring Payload in a Single Chunk (AWS Signature Version 4) (p. 18). The process is the same, except
that the creation of CanonicalRequest diﬀers as follows:
• In addition to the request headers you plan to add, you must include the following headers:

Header

Description

x-amz-contentsha256

This header is required for all AWS Signature Version 4 requests. Set the
value to STREAMING-AWS4-HMAC-SHA256-PAYLOAD to indicate that the
signature covers only headers and that there is no payload.

Content-Encoding

Set the value to aws-chunked.
Amazon S3 supports multiple content encodings. For example:
Content-Encoding : aws-chunked,gzip

That is, you can specify your custom content-encoding when using
Signature Version 4 streaming API.

Note

Amazon S3 stores the resulting object without the aws-chunked
encoding. Therefore, when you retrieve the object, it is not awschunked encoded.

API Version 2006-03-01
31


Amazon Simple Storage Service API Reference
Signature Calculation: Transfer Payload in Multiple Chunks

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-decoded-content-length</td>
<td>Set the value to the length, in bytes, of the data to be chunked, without counting any metadata. For example, if you are uploading a 4 GB file, set the value to 4294967296. This is the raw size of the object to be uploaded (data you want to store in Amazon S3).</td>
</tr>
<tr>
<td>Content-Length</td>
<td>Set the value to the actual size of the transmitted HTTP body, which includes the length of your data (value set for x-amz-decoded-content-length) plus, chunk metadata. Each chunk has metadata, such as the signature of the previous chunk. Chunk calculations are discussed in the following section.</td>
</tr>
</tbody>
</table>

You send the first chunk with the seed signature. You must construct the chunk as described in the following section.

**Defining the Chunk Body**

All chunks include some metadata. Each chunk must conform to the following structure:

```
string(IntHexBase(chunk-size)) + ";chunk-signature=" + signature + 
+ chunk-data + 
```

Where:

- `IntHexBase()` is a function that you write to convert an integer chunk-size to hexadecimal. For example, if chunk-size is 65536, hexadecimal string is "10000".
- `chunk-size` is the size, in bytes, of the chunk-data, without metadata. For example, if you are uploading a 65 KB object and using a chunk size of 64 KB, you upload the data in three chunks: the first would be 64 KB, the second 1 KB, and the final chunk with 0 bytes.
- `signature` For each chunk, you calculate the signature using the following string to sign. For the first chunk, you use the seed-signature as the previous signature.

The size of the final chunk data that you send is 0, although the chunk body still contains metadata, including the signature of the previous chunk.

**Example: PUT Object**

You can use the examples in this section as a reference to check signature calculations in your code. Before you review the examples, note the following:

- The signature calculations in these examples use the following example security credentials.
Signature Calculation: Transfer Payload in Multiple Chunks

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>AWSAccessKeyId</td>
<td>AKIAIOSFODNN7EXAMPLE</td>
</tr>
<tr>
<td>AWSSecretAccessKey</td>
<td>wJalrXUttnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY</td>
</tr>
</tbody>
</table>

- All examples use the request time stamp 20130524T000000Z (Fri, 24 May 2013 00:00:00 GMT).
- All examples use examplebucket as the bucket name.
- The bucket is assumed to be in the US East (N. Virginia) Region, and the credential Scope and the Signing Key calculations use us-east-1 as the Region specifier. For more information, see Regions and Endpoints in the Amazon Web Services General Reference.
- You can use either path style or virtual-hosted style requests. The following examples use virtual-hosted style requests, for example:

https://examplebucket.s3.amazonaws.com/photos/photo1.jpg

For more information, see Virtual Hosting of Buckets in the Amazon Simple Storage Service Developer Guide.

Example: PUT Object

The following example sends a PUT request to upload an object. The signature calculations assume the following:

- You are uploading a 65 KB text file, and the file content is a one-character string made up of the letter 'a'.
- The chunk size is 64 KB. As a result, the payload is uploaded in three chunks, 64 KB, 1 KB, and the final chunk with 0 bytes of chunk data.
- The resulting object has the key name chunkObject.txt.
- You are requesting REDUCED_REDUNDANCY as the storage class by adding the x-amz-storage-class request header.

For information about the API action, see PUT Object (p. 377). The general request syntax is as follows:

PUT /examplebucket/chunkObject.txt HTTP/1.1
Host: s3.amazonaws.com
x-amz-date: 20130524T000000Z
x-amz-storage-class: REDUCED_REDUNDANCY
Authorization: SignatureToBeCalculated
x-amz-content-sha256: STREAMING-AWS4-HMAC-SHA256-PAYLOAD
Content-Encoding: aws-chunked
x-amz-deoded-content-length: 66560
Content-Length: 66824
<Payload>

The following steps show signature calculations.

1. **Seed signature — Create String to Sign**

   1. **CanonicalRequest**

      PUT /examplebucket/chunkObject.txt
Amazon Simple Storage Service API Reference
Signature Calculation: Transfer Payload in Multiple Chunks

In the canonical request, the third line is empty because there are no query parameters in the request. The last line is the constant string provided as the value of the hashed Payload, which should be same as the value of `x-amz-content-sha256` header.

2. **StringToSign**

```
AWS4-HMAC-SHA256  
20130524T000000Z  
20130524/us-east-1/s3/aws4_request  
cee3fed04b70f867d036f722359b0b1f2f0e5dc0efadbc082b76c460e316455
```

**Note**
For information about each of line in the string to sign, see the diagram that explains seed signature calculation.

2. **SigningKey**

```
signing_key = HMAC-SHA256(HMAC-SHA256(HMAC-SHA256(HMAC-SHA256("AWS4" + "<YourSecretAccessKey>", "20130524"), "us-east-1"), "s3"), "aws4_request")
```

3. **Seed Signature**

```
4f232c4386841ef735655705268965c44a0e4690baa4adea153f7db9fa80a0a9
```

4. **Authorization header**

The resulting Authorization header is as follows:

```
AWS4-HMAC-SHA256 Credential=AKIAIOSFODNN7EXAMPLE/20130524/us-east-1/s3/aws4_request, SignedHeaders=content-encoding;content-length;host;x-amz-content-sha256;x-amz-date;x-amz-decoded-content-length;x-amz-storage-class, Signature=4f232c4386841ef735655705268965c44a0e4690baa4adea153f7db9fa80a0a9
```

5. **Chunk 1: (65536 bytes, with value 97 for letter 'a')**

1. **Chunk string to sign:**

```
AWS4-HMAC-SHA256-PAYLOAD  
20130524T000000Z  
20130524/us-east-1/s3/aws4_request  
4f232c4386841ef735655705268965c44a0e4690baa4adea153f7db9fa80a0a9  
e3b0c44298fccc149afbf4c8996f92427ae41e4649b34ca495991b7852b855  
bf718b6f653bebcb184e1479f1935b8da974d701b893afccf49e701f3e2f9f9c5a
```

**Note**
For information about each line in the string to sign, see the preceding diagram that shows various components of the string to sign (for example, the last three lines are, previous-signature, hash(""), and hash(current-chunk-data)).
Using Query Parameters

2. Chunk signature:

   3. Chunk data sent:
      0;chunk-signature=b6c6e8a5354eaf15b3cb7646744f4275b71ea724fed81ceeb9323e279d449df9

---

Authenticating Requests: Using Query Parameters (AWS Signature Version 4)

As described in the authentication overview (see Authentication Methods (p. 15)), you can provide authentication information using query string parameters. Using query parameters to authenticate
requests is useful when you want to express a request entirely in a URL. This method is also referred as presigning a URL.

A use case scenario for presigned URLs is that you can grant temporary access to your Amazon S3 resources. For example, you can embed a presigned URL on your website or alternatively use it in command line client (such as Curl) to download objects.

The following is an example presigned URL.

https://s3.amazonaws.com/examplebucket/test.txt
?X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=<your-access-key-id>/20130721/us-east-1/s3/aws4_request
&X-Amz-Date=20130721T201207Z
&X-Amz-Expires=86400
&X-Amz-SignedHeaders=host
&X-Amz-Signature=<signature-value>

In the example URL, note the following:

- The line feeds are added for readability.
- The X-Amz-Credential value in the URL shows the "/" character only for readability. In practice, it should be encoded as %2F. For example:

&X-Amz-Credential=<your-access-key-id>%2F20130721%2Fus-east-1%2Fs3%2Faws4_request

The following table describes the query parameters in the URL that provide authentication information.

<table>
<thead>
<tr>
<th>Query String Parameter Name</th>
<th>Example Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>X-Amz-Algorithm</td>
<td>Identifies the version of AWS Signature and the algorithm that you used to calculate the signature. For AWS Signature Version 4, you set this parameter value to AWS4-HMAC-SHA256. This string identifies AWS Signature Version 4 (AWS4) and the HMAC-SHA256 algorithm (HMAC-SHA256).</td>
</tr>
<tr>
<td>X-Amz-Credential</td>
<td>In addition to your access key ID, this parameter also provides scope (AWS region and service) for which the signature is valid. This value must match the scope you use in signature calculations, discussed in the following section. The general form for this parameter value is as follows: <code>&lt;your-access-key-id&gt;/&lt;date&gt;/&lt;AWS-region&gt;/&lt;AWS-service&gt;/aws4_request</code>. For example: <code>AKIAIOSFODNN7EXAMPLE/20130721/us-east-1/s3/aws4_request</code>. For Amazon S3, the <code>&lt;AWS-service&gt;</code> string is <code>s3</code>. For a list of S3 AWS-region strings, see Regions and Endpoints in the AWS General Reference.</td>
</tr>
<tr>
<td>X-Amz-Date</td>
<td>The date and time format must follow the ISO 8601 standard, and must be formatted with the &quot;yyyyMMddTThhmmssZ&quot; format. For</td>
</tr>
</tbody>
</table>
Calculating a Signature

The following diagram illustrates the signature calculation process.

### Calculating a Signature

The following diagram illustrates the signature calculation process.

### Query String Parameter Name | Example Value
---|---
X-Amz-Expires | Provides the time period, in seconds, for which the generated presigned URL is valid. For example, 86400 (24 hours). This value is an integer. The minimum value you can set is 1, and the maximum is 604800 (seven days).

A presigned URL can be valid for a maximum of seven days because the signing key you use in signature calculation is valid for up to seven days.

X-Amz-SignedHeaders | Lists the headers that you used to calculate the signature. The following headers are required in the signature calculations:

- The HTTP host header.
- Any x-amz-* headers that you plan to add to the request.

**Note**

For added security, you should sign all the request headers that you plan to include in your request.

X-Amz-Signature | Provides the signature to authenticate your request. This signature must match the signature Amazon S3 calculates; otherwise, Amazon S3 denies the request. For example, 733255ef022bec3f2a8701cd61d4b371f3f28c9f193a1f02279211d48d5193

Signature calculations are described in the following section.

**Calculating a Signature**
The following table describes the functions that are shown in the diagram. You need to implement code for these functions.

</tbody>
</table>
Amazon Simple Storage Service API Reference
An Example

Function

Description

Important

The standard UriEncode functions provided by your
development platform may not work because of
diﬀerences in implementation and related ambiguity
in the underlying RFCs. We recommend that you write
your own custom UriEncode function to ensure that your
encoding will work.
The following is an example UriEncode() function in Java.
public static String UriEncode(CharSequence input, boolean
encodeSlash) {
StringBuilder result = new StringBuilder();
for (int i = 0; i < input.length(); i++) {
char ch = input.charAt(i);
if ((ch >= 'A' && ch <= 'Z') || (ch >= 'a'
&& ch <= 'z') || (ch >= '0' && ch <= '9') || ch == '_' ||
ch == '-' || ch == '~' || ch == '.') {
result.append(ch);
} else if (ch == '/') {
result.append(encodeSlash ? "%2F" : ch);
} else {
result.append(toHexUTF8(ch));
}
}
return result.toString();
}

For more information about the signing process (details of creating a canonical request, string to sign,
and signature calculations), see Signature Calculations for the Authorization Header: Transferring
Payload in a Single Chunk (AWS Signature Version 4) (p. 18). The process is generally the same except
that the creation of CanonicalRequest in a presigned URL diﬀers as follows:
• You don't include a payload hash in the Canonical Request, because when you create a presigned URL,
you don't know the payload content because the URL is used to upload an arbitrary payload. Instead,
you use a constant string UNSIGNED-PAYLOAD.
• The Canonical Query String must include all the query parameters from the preceding table except
for X-Amz-Signature.
• Canonical Headers must include the HTTP host header. If you plan to include any of the x-amz-*
headers, these headers must also be added for signature calculation. You can optionally add all other
headers that you plan to include in your request. For added security, you should sign as many headers
as possible.

An Example
Suppose you have an object test.txt in your examplebucket bucket. You want to share this object
with others for a period of 24 hours (86400 seconds) by creating a presigned URL.
https://s3.amazonaws.com/examplebucket/test.txt
?X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE%2F20130524%2Fus-east-1%2Fs3%2Faws4_request
&X-Amz-Date=20130524T000000Z&X-Amz-Expires=86400&X-Amz-SignedHeaders=host
&X-Amz-Signature=<signature-value>

API Version 2006-03-01
39


The following steps illustrate first the signature calculations and then construction of the presigned URL. The example makes the following additional assumptions:

- Request timestamp is Fri, 24 May 2013 00:00:00 GMT.
- The bucket is in the US East (N. Virginia) region, and the credential Scope and the Signing Key calculations use us-east-1 as the region specifier. For more information, see Regions and Endpoints in the AWS General Reference.

You can use this example as a test case to verify the signature that your code calculates; however, you must use the same bucket name, object key, time stamp, and the following example credentials:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>AWSAccessKeyId</td>
<td>AKIAIOSFODNN7EXAMPLE</td>
</tr>
<tr>
<td>AWSSecretAccessKey</td>
<td>wJalrXUtncFEMI/K7MDEm/bPxFpFiCYEXAMPLEKEY</td>
</tr>
</tbody>
</table>

1. **StringToSign**
   a. **CanonicalRequest**

   ```
   GET
   /test.txt
   X-Amz-Algorithm=AWS4-HMAC-SHA256&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE
   %2F20130524%2Fus-east-1%2Fs3%2Faws4_request&X-Amz-Date=20130524T000000Z&X-Amz-Expires=86400&X-Amz-SignedHeaders=host
   host:examplebucket.s3.amazonaws.com
   ```

   b. **StringToSign**

   ```
   AWS4-HMAC-SHA256
   20130524T000000Z
   20130524/us-east-1/s3/aws4_request
   3bfa293879f6447bbcd7b001decf97f4a54d650c8942174ae0a9121cf58ad04
   ```

2. **SigningKey**

   ```
   signing_key = HMAC-SHA256(HMAC-SHA256(HMAC-SHA256(HMAC-SHA256("AWS4" + "<YourSecretAccessKey>"),"20130524"),"us-east-1"),"s3"),"aws4_request")
   ```

3. **Signature**

   ```
   aeeed9bbcd4d02ee5c0109b85d86835f995330da4c265957d157751f604d404
   ```

Now you have all information to construct a presigned URL. The resulting URL for this example is shown as follows (you can use this to compare your presigned URL):

```
https://examplebucket.s3.amazonaws.com/test.txt?X-Amz-Algorithm=AWS4-HMAC-SHA256&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE%2F20130524%2Fus-east-1%2Fs3%2Faws4_request&X-Amz-Date=20130524T000000Z&X-Amz-Expires=86400&X-Amz-SignedHeaders=host&X-Amz-Signature=aeeed9bbcd4d02ee5c0109b85d86835f995330da4c265957d157751f604d404
```
For authenticated requests, unless you are using the AWS SDKs, you have to write code to calculate signatures that provide authentication information in your requests. Signature calculation in AWS Signature Version 4 (see Authenticating Requests (AWS Signature Version 4) (p. 14)) can be a complex undertaking, and we recommend that you use the AWS SDKs whenever possible.

This section provides examples of signature calculations written in Java and C#. The code samples send the following requests and use the HTTP Authorization header to provide authentication information:

- **PUT object** – Separate examples illustrate both uploading the full payload at once and uploading the payload in chunks. For information about using the Authorization header for authentication, see Authenticating Requests: Using the Authorization Header (AWS Signature Version 4) (p. 16).
- **GET object** – This example generates a presigned URL to get an object. Query parameters provide the signature and other authentication information. Users can paste a presigned URL in their browser to retrieve the object, or you can use the URL to create a clickable link. For information about using query parameters for authentication, see Authenticating Requests: Using Query Parameters (AWS Signature Version 4) (p. 35).

The rest of this section describes the examples in Java and C#. The topics include instructions for downloading the samples and for executing them.

### Signature Calculation Examples Using Java (AWS Signature Version 4)

The Java sample that shows signature calculation can be downloaded at https://s3.amazonaws.com/aws-java-sdk/samples/AWSS3SigV4JavaSamples.jar. In RunAllSamples.java, the main() function executes sample requests to create an object, retrieve an object, and create a presigned URL for the object. The sample creates an object from the text string provided in the code:

```java
PutS3ObjectSample.putS3Object(bucketName, regionName, awsAccessKey, awsSecretKey);
GetS3ObjectSample.getS3Object(bucketName, regionName, awsAccessKey, awsSecretKey);
PresignedUrlSample.getPresignedUrlToS3Object(bucketName, regionName, awsAccessKey, awsSecretKey);
PutS3ObjectChunkedSample.putS3ObjectChunked(bucketName, regionName, awsAccessKey, awsSecretKey);
```

To test the examples on a Linux-based computer

The following instructions are for the Linux operating system.

1. At a command prompt, change the directory to the directory that contains AWSS3SigV4JavaSamples.jar.
2. Extract the source files from AWSS3SigV4JavaSamples.jar.

   ```bash
   jar xvf AWSS3SigV4JavaSamples.jar
   ```
3. In a text editor, open the file `/com/amazonaws/services/s3/samples/RunAllSamples.java`. Update code with the following information:

- The name of a bucket where the new object can be created.

  **Note**
  
The examples use a virtual-hosted style request to access the bucket. To avoid potential errors, ensure that your bucket name conforms to the bucket naming rules as explained in **Bucket Restrictions and Limitations** in the *Amazon Simple Storage Service Developer Guide*.

- AWS region where the bucket resides.

  If bucket is in the US East (N. Virginia) region, use `us-east-1` to specify the region. For a list of other AWS regions, go to Amazon Simple Storage Service (S3) in the *AWS General Reference*.

4. Compile the source code and store the compiled classes into the `bin/` directory.

   ```
   javac -d bin -source 6 -verbose com
   ```

5. Change the directory to `bin/`, and then execute `RunAllSamples`.

   ```
   java com.amazonaws.services.s3.sample.RunAllSamples
   ```

   The code runs all the methods in `main()`. For each request, the output will show the canonical request, the string to sign, and the signature.

---

**Examples of Signature Calculations Using C# (AWS Signature Version 4)**

The C# sample that shows signature calculation can be downloaded at [http://docs.aws.amazon.com/AmazonS3/latest/API/samples/AmazonS3SigV4_Samples_CSharp.zip](http://docs.aws.amazon.com/AmazonS3/latest/API/samples/AmazonS3SigV4_Samples_CSharp.zip). In `Program.cs`, the `main()` function executes sample requests to create an object, retrieve an object, and create a presigned URL for the object. The code for signature calculation is in the `Signers` folder.

```csharp
PutS3ObjectSample.Run(awsRegion, bucketName, "MySampleFile.txt");
Console.WriteLine("\n\n************************************************");
PutS3ObjectChunkedSample.Run(awsRegion, bucketName, "MySampleFileChunked.txt");
Console.WriteLine("\n\n************************************************");
GetS3ObjectSample.Run(awsRegion, bucketName, "MySampleFile.txt");
Console.WriteLine("\n\n************************************************");
PresignedUrlSample.Run(awsRegion, bucketName, "MySampleFile.txt");
```

**To test the examples with Microsoft Visual Studio 2010 or later**

1. Extract the `.zip` file.
2. Start Visual Studio, and then open the `.sln` file.
3. Update the `App.config` file with valid security credentials.
4. Update the code as follows:

   - In `Program.cs`, provide the bucket name and the AWS region where the bucket resides. The sample creates an object in this bucket.
5. Execute the code.
6. To verify that the object was created, copy the presigned URL that the program creates, and then paste it in a browser window.
Authenticating Requests: Browser-Based Uploads Using POST (AWS Signature Version 4)

Amazon S3 supports HTTP POST requests so that users can upload content directly to Amazon S3. Using HTTP POST to upload content simplifies uploads and reduces upload latency where users upload data to store in Amazon S3. This section describes how you authenticate HTTP POST requests. For more information about HTTP POST requests, how to create a form, create a POST policy, and an example, see Authenticating Requests in Browser-Based Uploads Using POST (AWS Signature Version 4) (p. 48).

To authenticate an HTTP POST request you do the following:

1. The form must include the following fields to provide signature and relevant information that Amazon S3 can use to re-calculate the signature upon receiving the request:

<table>
<thead>
<tr>
<th>Element Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>policy</td>
<td>The Base64-encoded security policy that describes what is permitted in the request. For signature calculation this policy is the string you sign. Amazon S3 must get this policy so it can re-calculate the signature.</td>
</tr>
<tr>
<td>x-amz-algorithm</td>
<td>The signing algorithm used. For AWS Signature Version 4, the value is AWS4-HMAC-SHA256.</td>
</tr>
<tr>
<td>x-amz-credential</td>
<td>In addition to your access key ID, this provides scope information you used in calculating the signing key for signature calculation.</td>
</tr>
<tr>
<td></td>
<td>It is a string of the following form:</td>
</tr>
<tr>
<td></td>
<td><code>&lt;your-access-key-id&gt;/&lt;date&gt;/&lt;aws-region&gt;/&lt;aws-service&gt;/aws4_request</code></td>
</tr>
<tr>
<td></td>
<td>For example:</td>
</tr>
<tr>
<td></td>
<td>AKIAIOSFODNN7EXAMPLE/20130728/us-east-1/s3/aws4_request.</td>
</tr>
<tr>
<td></td>
<td>For Amazon S3, the <code>aws-service</code> string is s3. For a list of Amazon S3 <code>aws-region</code> strings, see Regions and Endpoints in the AWS General Reference.</td>
</tr>
<tr>
<td>x-amz-date</td>
<td>It is the date value in ISO8601 format. For example, 20130728T000000Z.</td>
</tr>
<tr>
<td></td>
<td>It is the same date you used in creating the signing key. This must also be the same value you provide in the policy (x-amz-date) that you signed.</td>
</tr>
<tr>
<td>x-amz-signature</td>
<td>(AWS Signature Version 4) The HMAC-SHA256 hash of the security policy.</td>
</tr>
</tbody>
</table>

2. The POST policy must include the following elements:
Calculating a Signature

The following diagram illustrates the signature calculation process.

1. **StringToSign**
   - Base64 encoded security policy

2. **Signing Key**
   - DataKey = HMAC-SHA256("AWS4-HMAC-SHA256" + "SecretAccessKey", "yyyyMMdd")
   - DatRegionKey = HMAC-SHA256(DataKey, "aws_region")
   - DatRegionServiceKey = HMAC-SHA256(DataRegionKey, "aws-service")
   - SigningKey = HMAC-SHA256(SigningKey, "aws4_request")

3. **Signature**
   - HMAC-SHA256 (SigningKey, StringToSign)

To Calculate a Signature

1. Create a policy using UTF-8 encoding.
2. Convert the UTF-8-encoded policy to Base64. The result is the string to sign.
3. Create the signature as an HMAC-SHA256 hash of the string to sign. You will provide the signing key as key to the hash function.
4. Encode the signature by using hex encoding.

For more information about creating HTML forms, security policies, and an example, see the following subtopics:

- Creating an HTML Form (Using AWS Signature Version 4) (p. 50)
Amazon S3 Signature Version 4 Authentication Specific Policy Keys

The following table shows the policy keys related Amazon S3 Signature Version 4 authentication that can be in Amazon S3 policies. In a bucket policy, you can add these conditions to enforce specific behavior when requests are authenticated by using Signature Version 4. For example policies, see Bucket Policy Examples Using Signature Version 4 Related Condition Keys (p. 46).

Applicable Keys for `s3:*` Actions or any of the Amazon S3 Actions

<table>
<thead>
<tr>
<th>Applicable Keys</th>
<th>Description</th>
</tr>
</thead>
</table>
| `s3:signatureversion` | Identifies the version of AWS Signature that you want to support for authenticated requests. For authenticated requests, Amazon S3 supports both Signature Version 4 and Signature Version 2. You can add this condition in your bucket policy to require a specific signature version.  
Valid values:  
"AWS" identifies Signature Version 2  
"AWS4-HMAC-SHA256" identifies Signature Version 4 |
| `s3:authType`         | Amazon S3 supports various methods of authentication (see Authenticating Requests (AWS Signature Version 4) (p. 14). You can optionally use this condition key to restrict incoming requests to use a specific authentication method. For example, you can allow only the HTTP Authorization header to be used in request authentication.  
Valid values:  
REST-HEADER  
REST-QUERY-STRING  
POST |
| `s3:signatureAge`     | The length of time, in milliseconds, that a signature is valid in an authenticated request.  
In Signature Version 4, the signing key is valid for up to seven days (see Introduction to Signing Requests (p. 15). Therefore, the signatures are also valid for up to seven days. You can use this condition to further limit the signature age. |
### Applicable Keys

<table>
<thead>
<tr>
<th>Description</th>
<th>Example value: 100</th>
</tr>
</thead>
<tbody>
<tr>
<td>You can use this condition key to disallow unsigned content in your bucket.</td>
<td></td>
</tr>
<tr>
<td>When you use Signature Version 4, for requests that use the Authorization header, you add the \texttt{x-amz-content-sha256} header in the signature calculation and then set its value to the hash payload.</td>
<td></td>
</tr>
<tr>
<td>You can use this condition key in your bucket policy to deny any uploads where payloads are not signed. For example:</td>
<td></td>
</tr>
<tr>
<td>- Deny uploads that use presigned URLs. For more information, see Authenticating Requests: Using Query Parameters (AWS Signature Version 4) (p. 35).</td>
<td></td>
</tr>
<tr>
<td>- Deny uploads that use Authorization header to authenticate requests but don't sign the payload. For more information, see Signature Calculations for the Authorization Header: Transferring Payload in a Single Chunk (AWS Signature Version 4) (p. 18).</td>
<td></td>
</tr>
<tr>
<td>Valid value: \texttt{UNSIGNED-PAYLOAD}</td>
<td></td>
</tr>
</tbody>
</table>

### Bucket Policy Examples Using Signature Version 4 Related Condition Keys

Deny any Amazon S3 action on the \texttt{examplebucket} to anyone if request is authenticated using Signature Version 4.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "Test",
            "Effect": "Deny",
            "Principal": "*",
            "Action": "s3:*",
            "Resource": "arn:aws:s3:::examplebucket/*",
            "Condition": {
                "StringEquals": {
                    "s3:signatureversion": "AWS4-HMAC-SHA256"
                }
            }
        }
    ]
}
```

The following bucket policy denies any Amazon S3 action on objects in \texttt{examplebucket} if the signature is more than ten minutes old.
The following bucket policy allows only requests that use the Authorization header for request authentication. Any POST or presigned URL requests will be denied.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "Allow only requests that use Authorization header for request authentication. Deny POST or presigned URL requests.",
            "Effect": "Deny",
            "Principal": "*",
            "Action": "s3:*",
            "Resource": "arn:aws:s3:::examplebucket3/*",
            "Condition": {
                "StringNotEquals": {
                    "s3:authType": "REST-HEADER"
                }
            }
        }
    ]
}
```

The following bucket policy denies any uploads that use presigned URLs.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "Allow only requests that use Authorization header for request authentication. Deny POST or presigned URL requests.",
            "Effect": "Deny",
            "Principal": "*",
            "Action": "s3:*",
            "Resource": "arn:aws:s3:::examplebucket3/*",
            "Condition": {
                "StringNotEquals": {
                    "s3:x-amz-content-sha256": "UNSIGNED-PAYLOAD"
                }
            }
        }
    ]
}
```
Authenticating Requests in Browser-Based Uploads Using POST (AWS Signature Version 4)

Topics
- Calculating a Signature (p. 49)
- Creating an HTML Form (Using AWS Signature Version 4) (p. 50)
- Creating a POST Policy (p. 54)
- Examples: Browser-Based Upload using HTTP POST (Using AWS Signature Version 4) (p. 59)
- Additional Considerations for Browser-Based Uploads (p. 61)

Amazon S3 supports HTTP POST requests so that users can upload content directly to Amazon S3. By using POST, end users can authenticate requests without having to pass data through a secure intermediary node that protects your credentials. Thus, HTTP POST has the potential to reduce latency.

The following figure shows an Amazon S3 upload using a POST request.

### Uploading Using POST

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>The user accesses your page from a web browser.</td>
</tr>
<tr>
<td>2</td>
<td>Your web page contains an HTTP form that contains all the information necessary for the user to upload content to Amazon S3.</td>
</tr>
</tbody>
</table>
The user uploads content to Amazon S3 through the web browser.

The process for sending browser-based POST requests is as follows:

1. Create a security policy specifying conditions restricting what you want to allow in the request, such as bucket name where objects can be uploaded, key name prefixes that you want to allow for the object being created.
2. Create signature that is based on the policy. For authenticated requests, the form must include a valid signature and the policy.
3. Create an HTML form that your users can access in order to upload objects to your Amazon S3 bucket.

The following section describes how to create a signature to authenticate a request. For information about creating forms and security policies, see Creating an HTML Form (Using AWS Signature Version 4) (p. 50).

Calculating a Signature

For authenticated requests, the HTML form must include fields for a security policy and a signature.

- A security policy (see Creating a POST Policy (p. 54)) controls what is allowed in the request.
- The security policy is the StringToSign (see Introduction to Signing Requests (p. 15)) in your signature calculation.

To Calculate a signature

1. Create a policy using UTF-8 encoding.
2. Convert the UTF-8-encoded policy bytes to Base64. The result is the StringToSign.
3. Create a signing key.
4. Use the signing key to sign the StringToSign using HMAC-SHA256 signing algorithm.

For more information about creating HTML forms, security policies, and an example, see the following:

- Creating an HTML Form (Using AWS Signature Version 4) (p. 50)
- Creating a POST Policy (p. 54)
- Examples: Browser-Based Upload using HTTP POST (Using AWS Signature Version 4) (p. 59)
- Additional Considerations for Browser-Based Uploads (p. 61)
Creating an HTML Form (Using AWS Signature Version 4)

To allow users to upload content to Amazon S3 by using their browsers (HTTP POST requests), you use HTML forms. HTML forms consist of a form declaration and form fields. The form declaration contains high-level information about the request. The form fields contain detailed request information.

This section describes how to create HTML forms. For a working example of browser-based upload using HTTP POST and related signature calculations for request authentication, see Examples: Browser-Based Upload using HTTP POST (Using AWS Signature Version 4) (p. 59).

The form and policy must be UTF-8 encoded. You can apply UTF-8 encoding to the form by specifying charset=UTF-8 in the content attribute. The following is an example of UTF-8 encoding in the HTML heading.

```html
<html>
<head>
  ...
  <meta http-equiv="Content-Type" content="text/html; charset=UTF-8" />
  ...
</head>
<body>
```

Following is an example of UTF-8 encoding in a request header.

```
Content-Type: text/html; charset=UTF-8
```

**Note**
The form data and boundaries (excluding the contents of the file) cannot exceed 20K.

### HTML Form Declaration

The HTML form declaration has the following three attributes:

- **action** – The URL that processes the request, which must be set to the URL of the bucket. For example, if the name of your bucket is examplebucket, the URL is http://examplebucket.s3.amazonaws.com/.

  **Note**
The key name is specified in a form field.

- **method** – The method must be POST.

- **enctype** – The enclosure type (enctype) must be set to multipart/form-data for both file uploads and text area uploads. For more information about enctype, see RFC 1867.

This is a form declaration for the bucket examplebucket.

```html
<form action="http://examplebucket.s3.amazonaws.com/" method="post"
enctype="multipart/form-data">
```
# HTML Form Fields

The following table describes a list of fields that you can use within a form. Among other fields, there is a signature field that you can use to authenticate requests. There are fields for you to specify the signature calculation algorithm (x-amz-algorithm), the credential scope (x-amz-credential) that you used to generate the signing key, and the date (x-amz-date) used to calculate signature. Amazon S3 uses this information to re-create the signature. If the signatures match, Amazon S3 processes the request.

**Note**

The variable `${filename}` is automatically replaced with the name of the file provided by the user and is recognized by all form fields. If the browser or client provides a full or partial path to the file, only the text following the last slash (/) or backslash (\) will be used (e.g., `C:\Program Files\directory1\file.txt` will be interpreted as `file.txt`). If no file or file name is provided, the variable is replaced with an empty string.

If you don’t provide elements required for authenticated requests, such as the policy element, the request is assumed to be anonymous and will succeed only if you have configured the bucket for public read and write.

<table>
<thead>
<tr>
<th>Element Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
</table>
| acl           | An Amazon S3 access control list. If an invalid access control list is specified, Amazon S3 denies the request. For more information about ACLs, see [Using Amazon S3 ACLs](https://docs.aws.amazon.com/AmazonS3/latest/dev/acl.html).
|               | Type: String
|               | Default: private
<p>|               | Valid Values: private | public-read | public-read-write | aws-exec-read | authenticated-read | bucket-owner-read | bucket-owner-full-control |
|               | No                                                                                                                                          |          |
| Cache-Control | REST-specific headers. For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/API/REST-Object.PUT.html">PUT Object</a> (p. 377). |          |
| Content-Type  |                                                                                                                                              | No       |
| Content-Disposition |                                                                                                                                              |          |
| Content-Encoding |                                                                                                                                              |          |
| Expires       | The key name of the uploaded object.                                                                                                                                                                   |          |
| key           | To use the file name provided by the user, use the <code>${filename}</code> variable. For example, if you upload a file <code>photo1.jpg</code> and you specify <code>/user/user1/${filename}</code> as key name, the file is stored as <code>/user/user1/photo1.jpg</code>. For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/API/REST-Object.PUT.html">Object Key and Metadata</a> in the <a href="https://docs.aws.amazon.com/AmazonS3/latest/API/REST-Object.PUT.html">Amazon Simple Storage Service Developer Guide</a>. | Yes      |</p>
<table>
<thead>
<tr>
<th>Element Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>policy</td>
<td>The Base64-encoded security policy that describes what is permitted in the request. For authenticated requests a policy is required. Requests without a security policy are considered anonymous and will succeed only on a publicly writable bucket.</td>
<td>Required for authenticated requests</td>
</tr>
<tr>
<td>success_action_redirect</td>
<td>The URL to which the client is redirected upon successful upload.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>If <code>success_action_redirect</code> is not specified, or Amazon S3 cannot interpret the URL, Amazon S3 returns the empty document type that is specified in the <code>success_action_status</code> field. If the upload fails, Amazon S3 returns an error and does not redirect the user to another URL.</td>
<td></td>
</tr>
<tr>
<td>success_action_status</td>
<td>The status code returned to the client upon successful upload if <code>success_action_redirect</code> is not specified. Valid values are 200, 201, or 204 (default). If the value is set to 200 or 204, Amazon S3 returns an empty document with the specified status code. If the value is set to 201, Amazon S3 returns an XML document with a 201 status code. For information about the content of the XML document, see POST Object (p. 350). If the value is not set or is invalid, Amazon S3 returns an empty document with a 204 status code. <strong>Note</strong> Some versions of the Adobe Flash player do not properly handle HTTP responses with an empty body. To support uploads through Adobe Flash, we recommend setting <code>success_action_status</code> to 201.</td>
<td>No</td>
</tr>
<tr>
<td>x-amz-algorithm</td>
<td>The signing algorithm used to authenticate the request. For AWS Signature Version 4, the value is AWS4-HMAC-SHA256. This field is required if a policy document is included with the request.</td>
<td>Required for authenticated requests</td>
</tr>
<tr>
<td>Element Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>------------------------</td>
</tr>
<tr>
<td>x-amz-credential</td>
<td>In addition to your access key ID, this field also provides scope information identifying region and service for which the signature is valid. This should be the same scope you used in calculating the signing key for signature calculation. It is a string of the following form: <code>&lt;your-access-key-id&gt;/&lt;date&gt;/&lt;aws-region&gt;/&lt;aws-service&gt;/aws4_request</code> For example: AKIAIOSFODNN7EXAMPLE/20130728/us-east-1/s3/aws4_request For Amazon S3, the <code>aws-service</code> string is <code>s3</code>. For a list of Amazon S3 <code>aws-region</code> strings, see <a href="https://aws.amazon.com/documentation/general/latest">Regions and Endpoints in the AWS General Reference</a>. This is required if a policy document is included with the request.</td>
<td>Required for authenticated requests</td>
</tr>
<tr>
<td>x-amz-date</td>
<td>It is the date value in ISO8601 format. For example, <code>20130728T000000Z</code>. It is the same date you used in creating the signing key (for example, 20130728). This must also be the same value you provide in the policy (x-amz-date) that you signed. This is required if a policy document is included with the request.</td>
<td>Required for authenticated requests</td>
</tr>
<tr>
<td>x-amz-security-token</td>
<td>A security token used by Amazon DevPay and session credentials. If the request is using Amazon DevPay, it requires two <code>x-amz-security-token</code> form fields: one for the product token and one for the user token. For more information, see <a href="https://aws.amazon.com/documentation/s3/user-guide/">Using DevPay</a> in the Amazon Simple Storage Service Developer Guide. If the request is using session credentials, it requires one <code>x-amz-security-token</code> form. For more information, see <a href="https://docs.aws.amazon.com/IdentityAndAccessManagement/latest/UserGuide/using-temporary-credentials.html">Requesting Temporary Security Credentials</a> in the IAM User Guide.</td>
<td>No</td>
</tr>
<tr>
<td>x-amz-signature</td>
<td>(AWS Signature Version 4) The HMAC-SHA256 hash of the security policy. This field is required if a policy document is included with the request.</td>
<td>Required for authenticated requests</td>
</tr>
</tbody>
</table>
Creating a POST Policy

Topics
- Expiration (p. 55)
- Condition Matching (p. 55)
- Conditions (p. 55)
- Character Escaping (p. 58)

The policy required for making authenticated requests using HTTP POST is a UTF-8 and Base64 encoded document written in JavaScript Object Notation (JSON) that specifies conditions that the request must meet. Depending on how you design your policy document, you can control the access granularity per-upload, per-user, for all uploads, or according to other designs that meet your needs.

This section describes the POST policy. For example signature calculations using POST policy, see Examples: Browser-Based Upload using HTTP POST (Using AWS Signature Version 4) (p. 59).

Note
Although the policy document is optional, we highly recommend that you use one in order to control what is allowed in the request. If you make the bucket publicly writable, you have no control at all over which users can write to your bucket.

The following is an example of a POST policy document.

```json
{  "expiration": "2007-12-01T12:00:00.000Z",  "conditions": [    {"acl": "public-read"},    {"bucket": "johnsmith"},    ["starts-with", "$key", "user/eric/"],  ]}
```
The POST policy always contains the expiration and conditions elements. The example policy uses two condition matching types (exact matching and starts-with matching). The following sections describe these elements.

Expiration

The expiration element specifies the expiration date and time of the POST policy in ISO8601 GMT date format. For example, 2013-08-01T12:00:00.000Z specifies that the POST policy is not valid after midnight GMT on August 1, 2013.

Condition Matching

Following is a table that describes condition matching types that you can use to specify POST policy conditions (described in the next section). Although you must specify one condition for each form field that you specify in the form, you can create more complex matching criteria by specifying multiple conditions for a form field.

<table>
<thead>
<tr>
<th>Condition Match Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Exact Matches</strong></td>
<td>The form field value must match the value specified. This example indicates that the ACL must be set to public-read:</td>
</tr>
<tr>
<td></td>
<td>{&quot;acl&quot;: &quot;public-read&quot; }</td>
</tr>
<tr>
<td></td>
<td>This example is an alternate way to indicate that the ACL must be set to public-read:</td>
</tr>
<tr>
<td></td>
<td>[ &quot;eq&quot;, &quot;$acl&quot;, &quot;public-read&quot; ]</td>
</tr>
<tr>
<td><strong>Starts With</strong></td>
<td>The value must start with the specified value. This example indicates that the object key must start with user/user1:</td>
</tr>
<tr>
<td></td>
<td>[&quot;starts-with&quot;, &quot;$key&quot;, &quot;user/user1/&quot;]</td>
</tr>
<tr>
<td><strong>Matching Any Content</strong></td>
<td>To configure the POST policy to allow any content within a form field, use starts-with with an empty value (&quot;&quot;). This example allows any value for success_action_redirect:</td>
</tr>
<tr>
<td></td>
<td>[&quot;starts-with&quot;, &quot;$success_action_redirect&quot;, &quot;&quot; ]</td>
</tr>
<tr>
<td><strong>Specifying Ranges</strong></td>
<td>For form fields that accept a range, separate the upper and lower limit with a comma. This example allows a file size from 1 to 10 MiB:</td>
</tr>
<tr>
<td></td>
<td>[&quot;content-length-range&quot;, 1048579, 10485760]</td>
</tr>
</tbody>
</table>

The specific conditions supported in a POST policy are described in Conditions (p. 55).

Conditions

The conditions in a POST policy is an array of objects, each of which is used to validate the request. You can use these conditions to restrict what is allowed in the request. For example, the preceding policy conditions requires the following:
• Request must specify `johnsmith` bucket name.
• Object key name must have the `user/eric` prefix.
• Object ACL must be set to `public-read`.

Each form field that you specify in a form (except `x-amz-signature`, `file`, `policy`, and field names that have an `x-ignore-` prefix) must appear in the list of conditions.

**Note**
All variables within the form are expanded prior to validating the POST policy. Therefore, all condition matching should be against the expanded form fields. Suppose you want to restrict your object key name to a specific prefix (`user/user1`). In this case, you set the key form field to `user/user1/${filename}`). Your POST policy should be `[ "starts-with", "$key", "user/user1/" ] (do not enter [ "starts-with", "$key", "user/user1/${filename}" ]). For more information, see Condition Matching (p. 55).

Policy document conditions are described in the following table.

<table>
<thead>
<tr>
<th>Element Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>acl</td>
<td>Specifies the ACL value that must be used in the form submission. This condition supports exact matching and <code>starts-with</code> condition match type discussed in the following section.</td>
</tr>
<tr>
<td>bucket</td>
<td>Specifies the acceptable bucket name. This condition supports exact matching condition match type.</td>
</tr>
<tr>
<td>content-length-range</td>
<td>The minimum and maximum allowable size for the uploaded content. This condition supports <code>content-length-range</code> condition match type.</td>
</tr>
<tr>
<td>Cache-Control</td>
<td>REST-specific headers. For more information, see POST Object (p. 350). This condition supports exact matching and <code>starts-with</code> condition match type.</td>
</tr>
<tr>
<td>Content-Type</td>
<td></td>
</tr>
<tr>
<td>Content-Disposition</td>
<td></td>
</tr>
<tr>
<td>Content-Encoding</td>
<td></td>
</tr>
<tr>
<td>Expires</td>
<td></td>
</tr>
<tr>
<td>key</td>
<td>The acceptable key name or a prefix of the uploaded object. This condition supports exact matching and <code>starts-with</code> condition match type.</td>
</tr>
<tr>
<td>success_action_redirect</td>
<td>The URL to which the client is redirected upon successful upload. This condition supports exact matching and <code>starts-with</code> condition match type.</td>
</tr>
<tr>
<td>redirect</td>
<td></td>
</tr>
<tr>
<td>success_action_status</td>
<td>The status code returned to the client upon successful upload if <code>success_action_redirect</code> is not specified.</td>
</tr>
<tr>
<td>Element Name</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>x-amz-algorithm</td>
<td>The signing algorithm that must be used during signature calculation. For AWS Signature Version 4, the value is \texttt{AWS4-HMAC-SHA256}. This condition supports exact matching.</td>
</tr>
</tbody>
</table>
| x-amz-credential  | The credentials that you used to calculate the signature. It provides access key ID and scope information identifying region and service for which the signature is valid. This should be the same scope you used in calculating the signing key for signature calculation. It is a string of the following form: 
\[
<\text{your-access-key-id}>/\text{<date>}/\text{<aws-region>}/\text{<aws-service>}/\text{aws4_request}
\]
For example: 
\[
\text{AKIAIOSFODNN7EXAMPLE/20130728/us-east-1/s3/aws4_request}
\]
For Amazon S3, the \texttt{aws-service} string is \texttt{s3}. For a list of Amazon S3 \texttt{aws-region} strings, see Regions and Endpoints in the \textit{AWS General Reference}. This is required if a POST policy document is included with the request. This condition supports exact matching. |
| x-amz-date        | The date value specified in the ISO8601 formatted string. For example, \texttt{20130728T000000Z}. The date must be same that you used in creating the signing key for signature calculation. This is required if a POST policy document is included with the request. This condition supports exact matching. |
| x-amz-security-token | Amazon DevPay security token. Each request that uses Amazon DevPay requires two \texttt{x-amz-security-token} form fields: one for the product token and one for the user token. As a result, the values must be separated by commas. For example, if the user token is \texttt{eW91dHV1ZQ==} and the product token is \texttt{b0hnNVNKWVJIQTAE=}, you set the POST policy entry to: \{ "x-amz-security-token": "eW91dHV1ZQ==,b0hnNVNKWVJIQTAE=" \}. For more information about Amazon DevPay, see Using DevPay in the \textit{Amazon Simple Storage Service Developer Guide}. |
| x-amz-meta-*      | User-specified metadata. This condition supports exact matching and starts-with condition match type. |
Character Escaping

Characters that must be escaped within a POST policy document are described in the following table.

<table>
<thead>
<tr>
<th>Escape Sequence</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\</td>
<td>Backslash</td>
</tr>
<tr>
<td>$</td>
<td>Dollar symbol</td>
</tr>
<tr>
<td>\b</td>
<td>Backspace</td>
</tr>
<tr>
<td>\f</td>
<td>Form feed</td>
</tr>
<tr>
<td>\n</td>
<td>New line</td>
</tr>
<tr>
<td>\r</td>
<td>Carriage return</td>
</tr>
<tr>
<td>\t</td>
<td>Horizontal tab</td>
</tr>
<tr>
<td>\v</td>
<td>Vertical tab</td>
</tr>
<tr>
<td>\uXXXXX</td>
<td>All Unicode characters</td>
</tr>
</tbody>
</table>

Now that you are acquainted with forms and policies, and understand how signing works, you can try a POST upload example. You need to write the code to calculate the signature. The example provides a sample form, and a POST policy that you can use to test your signature calculations. For more information, see Examples: Browser-Based Upload using HTTP POST (Using AWS Signature Version 4) (p. 59).
Examples: Browser-Based Upload using HTTP POST (Using AWS Signature Version 4)

File Upload

This example provides a sample POST policy and a form that you can use to upload a file. The topic uses the example policy and fictitious credentials to show you the workflow and resulting signature and policy hash. You can use this data as test suite to verify your signature calculation code.

The example uses the following example credentials the signature calculations. You can use these credentials to verify your signature calculation code. However, you must then replace these with your own credentials when sending requests to AWS.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>AWSAccessKeyId</td>
<td>AKIAIOSFODNN7EXAMPLE</td>
</tr>
<tr>
<td>AWSSecretAccessKey</td>
<td>wJalrXUtFEMI/K7MDENG/bPxfiCYEXAMPLEKEY</td>
</tr>
</tbody>
</table>

Sample Policy and Form

The following POST policy supports uploads to Amazon S3 with specific conditions.

```json
{
  "expiration": "2015-12-30T12:00:00.000Z",
  "conditions": [
    {"bucket": "sigv4examplebucket"},
    {"starts-with", "$key", "user/user1/"},
    {"acl": "public-read"},
    {"success_action_redirect": "http://sigv4examplebucket.s3.amazonaws.com/successful_upload.html"},
    {"starts-with", "$Content-Type", "image/*"},
    {"x-amz-meta-uuid": "14365123651274"},
    {"x-amz-server-side-encryption": "AES256"},
    {"starts-with", "$x-amz-meta-tag", ""},
    {"x-amz-credential": "AKIAIOSFODNN7EXAMPLE/20151229/us-east-1/s3/aws4_request"},
    {"x-amz-algorithm": "AWS4-HMAC-SHA256"},
    {"x-amz-date": "20151229T000000Z" }]
}
```

This POST policy sets the following conditions on the request:

- The upload must occur before noon UTC on December 30, 2015.
- The content can be uploaded only to the sigv4examplebucket. The bucket must be in the region that you specified in the credential scope (x-amz-credential form parameter), because the signature you provided is valid only within this scope.
- You can provide any key name that starts with user/user1. For example, user/user1/MyPhoto.jpg.
- The ACL must be set to public-read.
- If the upload succeeds, the user's browser is redirected to http://sigv4examplebucket.s3.amazonaws.com/successful_upload.html.
- The object must be an image file.
- The x-amz-meta-uuid tag must be set to 14365123651274.
- The x-amz-meta-tag can contain any value.

The following is a Base64-encoded version of this POST policy. You use this value as your StringToSign in signature calculation.

```
eyAiZXhwaXJhdGlvbiI6ICIyMDE1LTEyLTMwVDEyOjAwOjAwLjAwMFoiLA0KICAiY29uZGl0aW9ucyI6ICJsYXNzdGFzaG9uIGJhY2tldCA9MjAxNTEyMjIwMDAwWiIgfQ0KICByZWZpcmVudCB7IngtYW16IjogIkpXZ1w6IiwiaWNvZGluZ3MiaWQiOiAiMjAxNTEyMjlUMDAwMDAwWiIgICByZWZpcmVudCB7InVzZXIiOjI7Imluc3RhbmNlIjogIkpXZ19fX2Fkb2JlIiwgICByZWFkIjogIkpXZ1w6IiwgICByZWN0aW9uIjogIkpXZ1w6IiwgICB9fQ0KICBd
```

When you copy/paste the preceding policy, it should only have newlines (not carriage return and new line) for your computed hash to match this value.

Using example credentials to create a signature, the signature value is as follows (in signature calculation, the date is same as the x-amz-date in the policy (20151229):

46503978d3596de22955b4b18d6dfbd54e8c5958727d5d0cc1119c60fc9

The following example form specifies the preceding POST policy and supports a POST request to the sigv4examplebucket. Copy/paste the content in a text editor and save it as exampleform.html. You can then upload image files to the specific bucket using the exampleform.html. You request will succeed if you signature you provide matches the signature Amazon S3 calculates.

**Note**
You must update the bucket name, dates, credential, policy, and signature with valid values for this to successfully upload to S3.

```
<html>
<head>
  <meta http-equiv="Content-Type" content="text/html; charset=UTF-8" />
</head>
<body>
<form action="http://sigv4examplebucket.s3.amazonaws.com/" method="post" enctype="multipart/form-data">
  Key to upload:
  <input type="input" name="key" value="user/user1/${filename}" />
  <input type="hidden" name="acl" value="public-read" />
  <input type="hidden" name="success_action_redirect" value="http://sigv4examplebucket.s3.amazonaws.com/successful_upload.html" />
  Content-Type:
  <input type="input" name="Content-Type" value="image/jpeg" />
  <input type="hidden" name="x-amz-meta-uuid" value="14365123651274" />
  <input type="hidden" name="x-amz-server-side-encryption" value="AES256" />
  <input type="hidden" name="X-Amz-Credential" value="AKIAIOSFODNN7EXAMPLE/20151229/us-east-1/s3/aws4_request" />
  <input type="text" name="X-Amz-Algorithm" value="AWS4-HMAC-SHA256" />
  <input type="text" name="X-Amz-Date" value="20151229T000000Z" />
  Tags for File:
  <input type="input" name="x-amz-meta-tag" value="" />
  <input type="hidden" name="Policy" value="<Base64-encoded policy string>" />
  <input type="hidden" name="X-Amz-Signature" value="<signature-value>" />
  File:
  <input type="file" name="file" />
</form>
</body>
</html>
```
Additional Considerations for Browser-Based Uploads

This section discusses additional considerations for uploading objects with an HTTP POST request.

**POST with Adobe Flash**

This section describes how to use POST with Adobe Flash.

**Adobe Flash Player Security**

By default, the Adobe Flash Player security model prohibits making network connections to servers outside the domain that serves the Adobe Flash (.swf) file.

To override the default, you must upload a publicly readable crossdomain.xml file to the bucket that will accept POST uploads. Here is a sample crossdomain.xml file:

```xml
<?xml version="1.0"?>
<!DOCTYPE cross-domain-policy SYSTEM "http://www.macromedia.com/xml/dtds/cross-domain-policy.dtd">
<cross-domain-policy>
  <allow-access-from domain="*" secure="false" />
</cross-domain-policy>
```

For more information about the Adobe Flash security model, go to the Adobe web site.

When you add the crossdomain.xml file to your bucket, any Adobe Flash Player can connect to the crossdomain.xml file within your bucket. However, crossdomain.xml does not grant access to the Amazon S3 bucket.

**Other Adobe Flash Considerations**

The FileReference class in the Adobe Flash API adds the Filename form field to the POST request. When you build an Adobe Flash application that uploads files to Amazon S3 by using the FileReference class, include the following condition in your policy:

```js
['starts-with', '$Filename', '']
```

Some versions of the Adobe Flash Player do not properly handle HTTP responses that have an empty body. To configure POST to return a response that does not have an empty body, set success_action_status to 201. Then, Amazon S3 will return an XML document with a 201 status code. For information about using this as an optional element (currently the only allowed value is the content of the XML document), see POST Object (p. 350). For information about form fields, see HTML Form Fields (p. 51).
Operations on the Service

This section describes operations you can perform on the Amazon S3 service.

Topics
- GET Service (p. 62)

GET Service

Description

This implementation of the GET operation returns a list of all buckets owned by the authenticated sender of the request.

To authenticate a request, you must use a valid AWS Access Key ID that is registered with Amazon S3. Anonymous requests cannot list buckets, and you cannot list buckets that you did not create.

Requests

Syntax

GET / HTTP/1.1
Host: s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

This implementation of the operation does not use request elements.

</table>

**Special Errors**

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).
Examples

Sample Request

The GET operation on the Service endpoint (s3.amazonaws.com) returns a list of all of the buckets owned by the authenticated sender of the request.

```
GET / HTTP/1.1
Host: s3.amazonaws.com
Date: Wed, 01 Mar 2006 12:00:00 GMT
Authorization: authorization string
```

Sample Response

```
<?xml version="1.0" encoding="UTF-8"?>
<ListAllMyBucketsResult xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <Owner>
    <ID>bcaf1fffd86f461ca5fbd08103f4f</ID>
    <DisplayName>webfile</DisplayName>
  </Owner>
  <Buckets>
    <Bucket>

DELETE Bucket

Description

This implementation of the DELETE operation deletes the bucket named in the URI. All objects (including all object versions and delete markers) in the bucket must be deleted before the bucket itself can be deleted.

Requests

Syntax

```
DELETE / HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))
```

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

This implementation of the operation does not use request elements.

Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

This implementation of the operation does not return response elements.

Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

Examples

Sample Request

This request deletes the bucket named "quotes".

API Version 2006-03-01
67
DELETE / HTTP/1.1
Host: quotes.s3.amazonaws.com
Date: Wed, 01 Mar 2006 12:00:00 GMT
Authorization: authorization string

Sample Response

HTTP/1.1 204 No Content
x-amz-id-2: JuKZqmXuiwFeDQxhD7MSktsKobSzWA1QELbTMTAgkKdBXz7J1l/jGhDeJ3j6s80

DELETE Bucket analytics

Description

This implementation of the DELETE operation deletes an analytics configuration (identified by the analytics configuration ID) from the bucket.

To use this operation, you must have permissions to perform the s3:PutAnalyticsConfiguration action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources in the Amazon Simple Storage Service Developer Guide.

For information about Amazon S3 analytics feature, see Amazon S3 Analytics – Storage Class Analysis in the Amazon Simple Storage Service Developer Guide.

Requests

Syntax

DELETE /?analytics&id=analytics-configuration-ID HTTP/1.1
Host: bucketname.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

Request Parameters

This implementation of DELETE uses the parameter in the following table.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>The ID that identifies the analytics configuration. Type: String Default: None Valid Characters for id: a-z A-Z 0-9 - _ .</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

This implementation of the operation does not use request elements.
Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Examples

Sample Request

The following DELETE request deletes the analytics configuration with the ID list1.

```
DELETE ?/analytics&id=list1 HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Date: Wed, 14 May 2014 02:11:22 GMT
Authorization: signatureValue
```

Sample Response

The following successful response shows Amazon S3 returning a 204 No Content response. The analytics configuration with the ID list1 for the bucket has been removed.

```
HTTP/1.1 204 No Content

DELETE Bucket cors

Description

Deletes the cors configuration information set for the bucket.

To use this operation, you must have permission to perform the s3:PutBucketCORS action. The bucket owner has this permission by default and can grant this permission to others.

For information more about cors, go to Enabling Cross-Origin Resource Sharing in the Amazon Simple Storage Service Developer Guide.

Requests

Syntax

DELETE /?cors HTTP/1.1
Host: bucketname.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

This implementation of the operation does not use request elements.

Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Examples

Example 1: Retrieve cors subresource

The following DELETE request deletes the cors subresource from the specified bucket. This action removes cors configuration that is stored in the subresource.

Sample Request

DELETE /?cors HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Date: Tue, 13 Dec 2011 19:14:42 GMT
Authorization: signatureValue

Sample Response

HTTP/1.1 204 No Content
x-amz-id-2: OFmF1Wsh/PpBuzZ0JFRC55ZGVmQW4SHJ7xVDqKwhEdJmf3q63RtrvH8ZuxW1Bo15
x-amz-request-id: OCF038E9BCF63097
Date: Tue, 13 Dec 2011 19:14:42 GMT
Server: AmazonS3
Content-Length: 0

DELETE Bucket encryption

Description

This implementation of the DELETE operation removes default encryption from the bucket. For information about the Amazon S3 default encryption feature, see Amazon S3 Default Bucket Encryption in the Amazon Simple Storage Service Developer Guide.

To use this operation, you must have permissions to perform the s3:PutEncryptionConfiguration action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources in the Amazon Simple Storage Service Developer Guide.

Requests

Syntax

DELETE /?encryption HTTP/1.1
Host: bucketname.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

This implementation of the operation does not use request elements.

Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Examples

Sample Request

The following DELETE request deletes default encryption from the bucket.

DELETE /?encryption HTTP/1.1
Sample Response

The following successful response shows Amazon S3 returning a 204 No Content response confirming that default encryption has been removed from the bucket.

```
HTTP/1.1 204 No Content
x-amz-id-2: 0FmFfWsh/PpBuzZ0JFRC55ZGVmQW4SHJ7xVDqKwhEdImf3q63RtrvH8ZuxW1Bo15
x-amz-request-id: 0CF038E9BCF63097
Date: Wed, 06 Sep 2017 12:00:00 GMT
Server: AmazonS3
```

DELETE Bucket inventory

Description

This implementation of the DELETE operation deletes an inventory configuration (identified by the inventory configuration ID) from the bucket.

To use this operation, you must have permissions to perform the s3:PutInventoryConfiguration action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources in the Amazon Simple Storage Service Developer Guide.

For information about the Amazon S3 inventory feature, see Amazon S3 Inventory in the Amazon Simple Storage Service Developer Guide.

Requests

Syntax

DELETE /?inventory&id=inventory-configuration-ID HTTP/1.1
Host: bucketname.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

Request Parameters

This implementation of DELETE uses the parameter in the following table.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>The ID that identifies the inventory configuration.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid Characters for id: a-z A-Z 0-9 - _</td>
<td></td>
</tr>
</tbody>
</table>

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

This implementation of the operation does not use request elements.
Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Examples

Sample Request

The following DELETE request deletes the inventory configuration with the ID list1.

```
DELETE ?/inventory&id=list1 HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Date: Wed, 14 May 2014 02:11:22 GMT
Authorization: signatureValue
```

Sample Response

The following successful response shows Amazon S3 returning a 204 No Content response. The inventory configuration with the ID list1 for the bucket has been removed.

```
HTTP/1.1 204 No Content
x-amz-id-2: 0FmFIWsh/PpBuzZ0JPFC55ZGVmQW4SHJ7xVDgKwhEdJmf3q63BtrvH8ZuxW1Bo15
x-amz-request-id: 0CF038E9BCF63097
Date: Wed, 14 May 2014 02:11:22 GMT
Server: AmazonS3
```

DELETE Bucket lifecycle

Description

Deletes the lifecycle configuration from the specified bucket. Amazon S3 removes all the lifecycle configuration rules in the lifecycle subresource associated with the bucket. Your objects never expire, and Amazon S3 no longer automatically deletes any objects on the basis of rules contained in the deleted lifecycle configuration.

To use this operation, you must have permission to perform the s3:PutLifecycleConfiguration action. By default, the bucket owner has this permission and the bucket owner can grant this permission to others.

There is usually some time lag before lifecycle configuration deletion is fully propagated to all the Amazon S3 systems.

For more information about the object expiration, go to Elements to Describe Lifecycle Actions in the Amazon Simple Storage Service Developer Guide.

Requests

Syntax

DELETE /?lifecycle HTTP/1.1
Host: bucketname.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

This implementation of the operation does not use request elements.

Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).
Examples

Sample Request

The following DELETE request deletes the lifecycle subresource from the specified bucket. This removes lifecycle configuration stored in the subresource.

```
DELETE /?lifecycle HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Date: Wed, 14 Dec 2011 05:37:16 GMT
Authorization: signatureValue
```

Sample Response

The following successful response shows Amazon S3 returning a 204 No Content response. Objects in your bucket no longer expire.

```
HTTP/1.1 204 No Content
x-amz-id-2: Uuag1LuByRx9e6j5OnimrSAMPLEtRPfTa0Aa=
x-amz-request-id: 656c76696e6725SAMPLE5657374
Date: Wed, 14 Dec 2011 05:37:16 GMT
Connection: keep-alive
Server: AmazonS3
```

DELETE Bucket metrics

Description

Deletes a metrics configuration for the Amazon CloudWatch request metrics (specified by the metrics configuration ID) from the bucket. Note that this doesn't include the daily storage metrics.

To use this operation, you must have permissions to perform the s3:PutMetricsConfiguration action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources in the Amazon Simple Storage Service Developer Guide.

For information about CloudWatch request metrics for Amazon S3, see Monitoring Metrics with Amazon CloudWatch in the Amazon Simple Storage Service Developer Guide.

Requests

Syntax

```
DELETE /?metrics&id=Id HTTP/1.1
```
HOST: BucketName.s3.amazonaws.com
Content-Length: length
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

Request Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>The ID used to identify the metrics configuration.</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Request Headers

This operation uses only Request Headers common to most requests. For more information, see Common Request Headers (p. 2).

Request Elements

This operation does not use request elements.

Responses

Response Headers

The operation returns response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

This implementation of the operation does not return response elements.

Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

Examples

Sample Request

Delete the metric configuration with a specified ID, which disables the CloudWatch metrics with the ExampleMetrics value for the FilterId dimension.

DELETE /?metrics&id=ExampleMetrics HTTP/1.1
Host: examplebucket.s3.amazonaws.com
x-amz-date: Thu, 15 Nov 2016 00:17:21 GMT
Authorization: signatureValue

Sample Response

Delete the metric configuration with a specified ID, which disables the CloudWatch metrics with the ExampleMetrics value for the FilterId dimension.
Related Resources

- GET Bucket metrics (p. 144)
- PUT Bucket metrics (p. 260)
- List Bucket Metrics Configurations (p. 193)

DELETE Bucket policy

Description

This implementation of the DELETE operation uses the policy subresource to delete the policy on a specified bucket. To use the operation, you must have DeletePolicy permissions on the specified bucket and be the bucket owner.

If you do not have DeletePolicy permissions, Amazon S3 returns a 403 Access Denied error. If you have the correct permissions, but are not a user of the bucket owner account, Amazon S3 returns a 405 Method Not Allowed error. If the bucket doesn't have a policy, Amazon S3 returns a 204 No Content error. There are restrictions about who can create bucket policies and which objects in a bucket they can apply to. For more information, go to Using Bucket Policies.

Requests

Syntax

DELETE /?policy HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

This implementation of the operation does not use request elements.

Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

The response elements contain the status of the DELETE operation including the error code if the request failed.

Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).
Examples

Sample Request

This request deletes the bucket named BucketName.

```
DELETE /?policy HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: Tue, 04 Apr 2010 20:34:56 GMT
Authorization: signatureValue
```

Sample Response

```
HTTP/1.1 204 No Content
x-amz-id-2: Uuag1LuByRx9e6j5OnimrSAMPLEtRPFt9GFg==
x-amz-request-id: 656c76696e72SAMPLE5657374
Date: Tue, 04 Apr 2010 20:34:56 GMT
Connection: keep-alive
Server: AmazonS3
```

Related Resources

- PUT Bucket (p. 205)
- DELETE Object (p. 311)
DELETE Bucket replication

Description

Deletes the replication subresource associated with the specified bucket.

This operation requires permission for the `s3:DeleteReplicationConfiguration` action. For more information about permissions, go to Using Bucket Policies and User Policies in the Amazon Simple Storage Service Developer Guide.

**Note**
There is usually some time lag before replication configuration deletion is fully propagated to all the Amazon S3 systems.

For more information about the replication, go to Cross-Region Replication in the Amazon Simple Storage Service Developer Guide.

Requests

Syntax

DELETE /?replication HTTP/1.1
Host: bucketname.s3.amazonaws.com
Date: date
Authorization: authorization string

For more information about Authorization, see Authenticating Requests (AWS Signature Version 4) (p. 14).

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

This implementation of the operation does not use request elements.

Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Examples

The following DELETE request deletes the replication subresource from the specified bucket. This removes the replication configuration set for the bucket.
DELETE /?replication HTTP/1.1  
Host: examplebucket.s3.amazonaws.com  
Date: Wed, 11 Feb 2015 05:37:16 GMT  
Authorization: authorization string  

Amazon S3 returns a 204 No Content response upon successfully deleting the replication subresource. Amazon S3 will no longer replicate any new objects you create in the examplebucket bucket.

HTTP/1.1 204 No Content  
x-amz-id-2: Uuag1LuByRx9e6jSOnimrSAMPLEtRPfTaOAa==  
x-amz-request-id: 656c76696e672example  
Date: Wed, 11 Feb 2015 05:37:16 GMT  
Connection: keep-alive  
Server: AmazonS3

Related Resources

DELETE Bucket tagging

Description

This implementation of the DELETE operation uses the tagging subresource to remove a tag set from the specified bucket.

To use this operation, you must have permission to perform the s3:PutBucketTagging action. By default, the bucket owner has this permission and can grant this permission to others.

Requests

Syntax

DELETE /?tagging HTTP/1.1
Host: bucketname.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

This implementation of the operation does not use request elements.

Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Examples

Sample Request

The following DELETE request deletes the tag set from the specified bucket.

DELETE /?tagging HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Date: Wed, 14 Dec 2011 05:37:16 GMT
Authorization: signatureValue
Sample Response

The following successful response shows Amazon S3 returning a 204 No Content response. The tag set for the bucket has been removed.

HTTP/1.1 204 No Content
Date: Wed, 25 Nov 2009 12:00:00 GMT
Connection: close
Server: AmazonS3

Related Resources

- GET Bucket tagging (p. 174)
- PUT Bucket tagging (p. 285)
DELETE Bucket website

Description

This operation removes the website configuration for a bucket. Amazon S3 returns a 200 OK response upon successfully deleting a website configuration on the specified bucket. You will get a 200 OK response if the website configuration you are trying to delete does not exist on the bucket. Amazon S3 returns a 404 response if the bucket specified in the request does not exist.

This DELETE operation requires the S3:DeleteBucketWebsite permission. By default, only the bucket owner can delete the website configuration attached to a bucket. However, bucket owners can grant other users permission to delete the website configuration by writing a bucket policy granting them the S3:DeleteBucketWebsite permission.

For more information about hosting websites, go to Hosting Websites on Amazon S3 in the Amazon Simple Storage Service Developer Guide.

Requests

Syntax

```
DELETE /?website HTTP/1.1
Host: bucketname.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))
```

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

This operation does not use request elements.

Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

This implementation of the operation does not return response elements.
Examples

Sample Request

This request deletes the website configuration on the specified bucket.

```text
DELETE ?website HTTP/1.1
Host: example-bucket.s3.amazonaws.com
Date: Thu, 27 Jan 2011 12:00:00 GMT
Authorization: signatureValue
```

Sample Response

```text
HTTP/1.1 204 No Content
x-amz-id-2: aws-s3integ-s3ws-31008.sea31.amazon.com
x-amz-request-id: AF1DD829D3B49707
Date: Thu, 03 Feb 2011 22:10:26 GMT
Server: AmazonS3
```

Related Resources

- GET Bucket website (p. 180)
- PUT Bucket website (p. 292)
GET Bucket (List Objects) Version 2

Description

This implementation of the GET operation returns some or all (up to 1,000) of the objects in a bucket. You can use the request parameters as selection criteria to return a subset of the objects in a bucket. A 200 OK response can contain valid or invalid XML. Make sure to design your application to parse the contents of the response and handle it appropriately.

To use this implementation of the operation, you must have READ access to the bucket.

Important

This section describe the latest revision of the API. We recommend that you use this revised API, GET Bucket (List Objects) version 2, for application development. For backward compatibility, Amazon S3 continues to support the prior version of this API, GET Bucket (List Objects) version 1. For more information about the previous version, see GET Bucket (List Objects) Version 1 (p. 99).

Note

To get a list of your buckets, see GET Service (p. 62).

Requests

Syntax

GET /?list-type=2 HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

Request Parameters

This implementation of GET uses the parameters in the following table.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>delimiter</td>
<td>A delimiter is a character you use to group keys.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>If you specify a prefix, all keys that contain the same string between the</td>
<td></td>
</tr>
<tr>
<td></td>
<td>prefix and the first occurrence of the delimiter after the prefix are grouped</td>
<td></td>
</tr>
<tr>
<td></td>
<td>under a single result element called CommonPrefixes. If you don't specify</td>
<td></td>
</tr>
<tr>
<td></td>
<td>the prefix parameter, the substring starts at the beginning of the key. The</td>
<td></td>
</tr>
<tr>
<td></td>
<td>keys that are grouped under the CommonPrefixes result element are not</td>
<td></td>
</tr>
<tr>
<td></td>
<td>returned elsewhere in the response.</td>
<td></td>

<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>encoding-type</td>
<td>Requests Amazon S3 to encode the response and specifies the encoding</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>method to use.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>An object key can contain any Unicode character. However, XML 1.0 parsers</td>
<td></td>
</tr>
<tr>
<td></td>
<td>cannot parse some characters, such as characters with an ASCII value from</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>-----------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------</td>
</tr>
<tr>
<td>0 to 10.</td>
<td>For characters that are not supported in XML 1.0, you can add this parameter to request that Amazon S3 encode the keys in the response.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid value: url</td>
<td></td>
</tr>
<tr>
<td>max-keys</td>
<td>Sets the maximum number of keys returned in the response body. If you want to retrieve fewer than the default 1,000 keys, you can add this to your request.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>The response might contain fewer keys, but it will never contain more. If there are additional keys that satisfy the search criteria, but these keys were not returned because max-keys was exceeded, the response contains &lt;IsTruncated&gt;true&lt;/IsTruncated&gt;. To return the additional keys, see NextContinuationToken.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: 1000</td>
<td></td>
</tr>
<tr>
<td>prefix</td>
<td>Limits the response to keys that begin with the specified prefix. You can use prefixes to separate a bucket into different groupings of keys. (You can think of using prefix to make groups in the same way you’d use a folder in a file system.)</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>list-type</td>
<td>Version 2 of the API requires this parameter and you must set its value to 2.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: The value is always 2.</td>
<td></td>
</tr>
<tr>
<td>continuation token</td>
<td>When the Amazon S3 response to this API call is truncated (that is, IsTruncated response element value is true), the response also includes the NextContinuationToken element, the value of which you can use in the next request as the continuation-token to list the next set of objects.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>• The continuation token is an opaque value that Amazon S3 understands.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Amazon S3 lists objects in UTF-8 character encoding in lexicographical order.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------</td>
</tr>
<tr>
<td>fetch-owner</td>
<td>By default, the API does not return the owner information in the response. If you want the owner information in the response, you can specify this parameter with the value set to true.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: false</td>
<td></td>
</tr>
<tr>
<td>start-after</td>
<td>If you want the API to return key names after a specific object key in your key space, you can add this parameter. Amazon S3 lists objects in UTF-8 character encoding in lexicographical order. This parameter is valid only in your first request. In case the response is truncated, you can specify this parameter along with the continuation-token parameter, and then Amazon S3 will ignore this parameter.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

</table>
### Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

### Examples

#### Example 1: Listing Keys

This request returns the objects in `BucketName`. The request specifies the `list-type` parameter, which indicates version 2 of the API.

**Sample Request**

```
GET /?list-type=2 HTTP/1.1
Host: bucket.s3.amazonaws.com
x-amz-date: 20160430T233541Z
Authorization: authorization string
Content-Type: text/plain
```
Sample Response

```xml
<?xml version="1.0" encoding="UTF-8"?>
  <Name>bucket</Name>
  <Prefix/>
  <KeyCount>205</KeyCount>
  <MaxKeys>1000</MaxKeys>
  <IsTruncated>false</IsTruncated>
  <Contents>
    <Key>my-image.jpg</Key>
    <LastModified>2009-10-12T17:50:30.000Z</LastModified>
    <ETag>"fba9dede5f27731c9771645a39863328"</ETag>
    <Size>434234</Size>
    <StorageClass>STANDARD</StorageClass>
  </Contents>
  <Contents>
  ...
  </Contents>
</ListBucketResult>
```

Example 2: Listing Keys Using the max-keys, prefix, and start-after Parameters

In addition to the list-type parameter indicating the version 2 of the API, the request also specifies additional parameters to retrieve up to 3 keys in the quotes bucket that start with E and occur lexicographically after ExampleGuide.pdf.

Sample Request

```
GET /?list-type=2&max-keys=3&prefix=E&start-after=ExampleGuide.pdf HTTP/1.1
Host: quotes.s3.amazonaws.com
x-amz-date: 20160430T232933Z
Authorization: authorization string
```

Sample Response

```
HTTP/1.1 200 OK
x-amz-id-2: gyB+3jrPnzkN98EajxHXR3u7EFM67bNgSAxexeEHn4C/7GRnfTXxReKUQF281fP
x-amz-request-id: 3B3C7C75673C630
Date: Sat, 30 Apr 2016 23:29:37 GMT
Content-Type: application/xml
Content-Length: length
Connection: close
Server: AmazonS3

<?xml version="1.0" encoding="UTF-8"?>
  <Name>quotes</Name>
  <Prefix>E</Prefix>
  <StartAfter>ExampleGuide.pdf</StartAfter>
  <KeyCount>1</KeyCount>
  <MaxKeys>3</MaxKeys>
  <IsTruncated>false</IsTruncated>
  <Contents>
    <Key>ExampleObject.txt</Key>
    <LastModified>2013-09-17T18:07:53.000Z</LastModified>
    <ETag>"599bab3ed2c697f1d26842727561fd94"</ETag>
    <Size>857</Size>
  </Contents>
</ListBucketResult>
```
Example 3: Listing Keys Using the prefix and delimiter Parameters

This example illustrates the use of the prefix and the delimiter parameters in the request. For this example, we assume that you have the following keys in your bucket:

- sample.jpg
- photos/2006/January/sample.jpg
- photos/2006/February/sample2.jpg
- photos/2006/February/sample3.jpg
- photos/2006/February/sample4.jpg

The following GET request specifies the delimiter parameter with value `/`.

```
GET /?list-type=2&delimiter=/ HTTP/1.1
Host: example-bucket.s3.amazonaws.com
x-amz-date: 20160430T235931Z
Authorization: authorization string
```

The key sample.jpg does not contain the delimiter character, and Amazon S3 returns it in the Contents element in the response. However, all other keys contain the delimiter character. Amazon S3 groups these keys and returns a single CommonPrefixes element with prefix value `photos/` that is a substring from the beginning of these keys to the first occurrence of the specified delimiter.

```
  <Name>example-bucket</Name>
  <Prefix></Prefix>
  <KeyCount>2</KeyCount>
  <MaxKeys>1000</MaxKeys>
  <Delimiter>/</Delimiter>
  <IsTruncated>false</IsTruncated>
  <Contents>
    <Key>sample.jpg</Key>
    <LastModified>2011-02-26T01:56:20.000Z</LastModified>
    <ETag>&quot;bf1d737a4d46a19f3bced6905cc8b902&quot;</ETag>
    <Size>142863</Size>
    <StorageClass>STANDARD</StorageClass>
  </Contents>
  <CommonPrefixes>
    <Prefix>photos/</Prefix>
  </CommonPrefixes>
</ListBucketResult>
```

The following GET request specifies the delimiter parameter with value `/`, and the prefix parameter with value `photos/2006/`.

```
GET /?list-type=2&prefix=photos/2006/&delimiter=/ HTTP/1.1
Host: example-bucket.s3.amazonaws.com
x-amz-date: 20160501T000433Z
Authorization: authorization string
```

```
  <Name>example-bucket</Name>
  <Prefix>photos/2006/</Prefix>
  <KeyCount>5</KeyCount>
  <MaxKeys>1000</MaxKeys>
  <Delimiter>/</Delimiter>
  <IsTruncated>false</IsTruncated>
  <Contents>
    <Key>sample.jpg</Key>
    <LastModified>2011-02-26T01:56:20.000Z</LastModified>
    <ETag>&quot;bf1d737a4d46a19f3bced6905cc8b902&quot;</ETag>
    <Size>142863</Size>
    <StorageClass>STANDARD</StorageClass>
  </Contents>
  <CommonPrefixes>
    <Prefix>photos/2006/</Prefix>
  </CommonPrefixes>
</ListBucketResult>
```
In response, Amazon S3 returns only the keys that start with the specified prefix. Further, it uses the delimiter character to group keys that contain the same substring until the first occurrence of the delimiter character after the specified prefix. For each such key group Amazon S3 returns one CommonPrefixes element in the response. The keys grouped under this CommonPrefixes element are not returned elsewhere in the response. The value returned in the CommonPrefixes element is a substring from the beginning of the key to the first occurrence of the specified delimiter after the prefix.

```
  <Name>example-bucket</Name>
  <Prefix>photos/2006/</Prefix>
  <KeyCount>3</KeyCount>
  <MaxKeys>1000</MaxKeys>
  <Delimiter>/</Delimiter>
  <IsTruncated>false</IsTruncated>
  <Contents>
    <Key>photos/2006/</Key>
    <LastModified>2016-04-30T23:51:29.000Z</LastModified>
    <ETag>&quot;d41d8cd98f00b204e9800998ecf8427e&quot;</ETag>
    <Size>0</Size>
    <StorageClass>STANDARD</StorageClass>
  </Contents>
  <CommonPrefixes>
    <Prefix>photos/2006/February/</Prefix>
  </CommonPrefixes>
  <CommonPrefixes>
    <Prefix>photos/2006/January/</Prefix>
  </CommonPrefixes>
</ListBucketResult>
```

Example 4: Using a Continuation Token

In this example, the initial request returns more than 1,000 keys. In response to this request, Amazon S3 returns the IsTruncated element with the value set to true and with a NextContinuationToken element.

```
GET /?list-type=2 HTTP/1.1
Host: bucket.s3.amazonaws.com
Date: Mon, 02 May 2016 23:17:07 GMT
Authorization: authorization string

HTTP/1.1 200 OK
x-amz-id-2: gyB+3jRPnkN98ZajxHXr3u7EFM67bNgSAxexeEHndCX/7GRnfTXxReKUQF28IfP
x-amz-request-id: 3B3C7C725673C630
Date: Sat, 30 Apr 2016 23:29:37 GMT
Content-Type: application/xml
Content-Length: length
Connection: close
Server: AmazonS3

  <Name>bucket</Name>
  <Prefix></Prefix>
  <NextContinuationToken>1ueGcxLPRx1Tr/XYExHnhbYlgveDs2J/wm36Hy4vbOwM=</NextContinuationToken>
  <KeyCount>1000</KeyCount>
  <MaxKeys>1000</MaxKeys>
  <IsTruncated>true</IsTruncated>
  <Contents>
```
In the following subsequent request, we include a continuation-token query parameter in the request with value of the <NextContinuationToken> from the preceding response.

```
GET /?list-type=2 HTTP/1.1
GET /?list-type=2&continuation-token=1ueGcxLPRx1Tr/XYEXHnhbYlgveDs2J/wm36Hy4vbOwM= HTTP/1.1
Host: bucket.s3.amazonaws.com
Date: Mon, 02 May 2016 23:17:07 GMT
Authorization: authorization string
```

Amazon S3 returns a list of the next set of keys starting where the previous request ended.

```
HTTP/1.1 200 OK
x-amz-id-2: gyB+3jRPnrkN98ZajxHXr3u7EFM67bNgSAXexeEHNndCX/7GRnfTXxReKU6P2HfP
x-amz-request-id: 3B3C7C725673C630
Date: Sat, 30 Apr 2016 23:29:37 GMT
Content-Type: application/xml
Content-Length: length
Connection: close
Server: AmazonS3
  <Name>bucket</Name>
  <Prefix></Prefix>
  <ContinuationToken>1ueGcxLPRx1Tr/XYEXHnhbYlgveDs2J/wm36Hy4vbOwM=</ContinuationToken>
  <KeyCount>112</KeyCount>
  <MaxKeys>1000</MaxKeys>
  <IsTruncated>false</IsTruncated>
  <Contents>
    <Key>happyface.jpg</Key>
    <LastModified>2014-11-21T19:40:05.000Z</LastModified>
    <ETag>"70ee1738b6b21e2c8a43f3a5ab0eee71"</ETag>
    <Size>1111</Size>
    <StorageClass>STANDARD</StorageClass>
  </Contents>
  ...
</ListBucketResult>
```

GET Bucket (List Objects) Version 1

Description

**Important**
This API has been revised. We recommend that you use the newer version, GET Bucket (List Objects) version 2, when developing applications. For more information, see GET Bucket (List Objects) Version 2 (p. 89). For backward compatibility, Amazon S3 continues to support GET Bucket (List Objects) version 1.

This implementation of the GET operation returns some or all (up to 1,000) of the objects in a bucket. You can use the request parameters as selection criteria to return a subset of the objects in a bucket. A 200 OK response can contain valid or invalid XML. Be sure to design your application to parse the contents of the response and handle it appropriately.

To use this implementation of the operation, you must have READ access to the bucket.

**Note**
To get a list of your buckets, see GET Service (p. 62).

Requests

**Syntax**

GET / HTTP/1.1  
Host: BucketName.s3.amazonaws.com  
Date: date  
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

**Request Parameters**

This implementation of GET uses the parameters in the following table to return a subset of the objects in a bucket.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
</table>
| delimiter  | A delimiter is a character you use to group keys.  
If you specify a prefix, all keys that contain the same string between the prefix and the first occurrence of the delimiter after the prefix are grouped under a single result element called CommonPrefixes. If you don't specify the prefix parameter, the substring starts at the beginning of the key. The keys that are grouped under the CommonPrefixes result element are not returned elsewhere in the response.  
Type: String  
Default: None | No |
| encodingtype | Requests Amazon S3 to encode the response and specifies the encoding method to use.  
An object key can contain any Unicode character. However, XML 1.0 parsers cannot parse some characters, such as characters with an ASCII value from | No |
### Request Elements

This implementation of the operation does not use request elements.

### Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

### Responses

### Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

---

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>max-keys</td>
<td>Sets the maximum number of keys returned in the response body. If you want to retrieve fewer than the default 1,000 keys, you can add this to your request. The response might contain fewer keys, but it never contains more. If there are additional keys that satisfy the search criteria, but these keys were not returned because max-keys was exceeded, the response contains <code>&lt;IsTruncated&gt;true&lt;/IsTruncated&gt;</code>. To return the additional keys, see marker.</td>
<td>No</td>
</tr>
<tr>
<td>prefix</td>
<td>Limits the response to keys that begin with the specified prefix. You can use prefixes to separate a bucket into different groupings of keys. (You can think of using prefix to make groups in the same way you would use a folder in a file system.)</td>
<td>No</td>

<tr>
<td><strong>IsTruncated</strong></td>
<td>Specifies whether (true) or not (false) all of the results were returned. If</td>
</tr>
<tr>
<td></td>
<td>the number of results exceeds that specified by MaxKeys, all of the results</td>
</tr>
</tbody>
</table>
### Name | Description
--- | ---
NextMarker | When the response is truncated (that is, the `IsTruncated` element value in the response is true), you can use the key name in this field as a marker in the subsequent request to get next set of objects. Amazon S3 lists objects in UTF-8 character encoding in lexicographical order. **Note** This element is returned only if you specify a delimiter request parameter. If the response does not include the `NextMarker` and it is truncated, you can use the value of the last `Key` in the response as the marker in the subsequent request to get the next set of object keys.

*Type: String*

Ancestor: `ListBucketResult`

Owner | Bucket owner.

*Type: String*

Children: `DisplayName`, `ID`

Ancestor: `ListBucketResult.Contents` | `CommonPrefixes`

Prefix | Keys that begin with the indicated prefix.

*Type: String*

Ancestor: `ListBucketResult`

Size | Size in bytes of the object.

*Type: String*

Ancestor: `ListBucketResult.Contents`

StorageClass | `STANDARD` | `STANDARD_IA` | `REDUCED_REDUNDANCY` | `GLACIER`

*Type: String*

Ancestor: `ListBucketResult.Contents`

### Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

### Examples

#### Sample Request

This request returns the objects in `BucketName`.

```
GET / HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: Wed, 12 Oct 2009 17:50:00 GMT
Authorization: authorization string
```

API Version 2006-03-01
Sample Response

         <DisplayName>mtd@amazon.com</DisplayName>
      </Owner>
   </Contents>
</ListBucketResult>

Sample Request Using Request Parameters

This example lists up to 40 keys in the quotes bucket that start with N and occur lexicographically after Ned.

GET //quotes/?prefix=N&marker=Ned&max-keys=40 HTTP/1.1
Host: quotes.s3.amazonaws.com
Date: Wed, 01 Mar 2006 12:00:00 GMT
Authorization: authorization string

Sample Response

HTTP/1.1 200 OK
x-amz-id-2: gyB+3jRPnrK98ZajxHXr3u7EFM67bNgSArxexeEHndCX/7GRnfTxxReKUQF28IFP
x-amz-request-id: 3B3C7C725673C630
Date: Wed, 01 Mar 2006 12:00:00 GMT
Content-Type: application/xml
Content-Length: 302
Connection: close
Server: AmazonS3

<?xml version="1.0" encoding="UTF-8"?>
   <Name>quotes</Name>
   <Prefix>N</Prefix>
   <Marker>Ned</Marker>
</ListBucketResult>
Sample Request Using Prefix and Delimiter

For this example, we assume that you have the following keys in your bucket:

sample.jpg
photos/2006/January/sample.jpg
photos/2006/February/sample2.jpg
photos/2006/February/sample3.jpg
photos/2006/February/sample4.jpg

The following GET request specifies the delimiter parameter with value /.

```
GET /?delimiter=/ HTTP/1.1
Host: example-bucket.s3.amazonaws.com
Date: Wed, 01 Mar 2006 12:00:00 GMT
Authorization: authorization string
```

The key sample.jpg does not contain the delimiter character, and Amazon S3 returns it in the Contents element in the response. However, all other keys contain the delimiter character. Amazon S3 groups these keys and returns a single CommonPrefixes element with prefix value photos/ that is a substring from the beginning of these keys to the first occurrence of the specified delimiter.

```
  <Name>example-bucket</Name>
  <Prefix/></Prefix>
  <Marker></Marker>
  <MaxKeys>1000</MaxKeys>
  <Delimiter>/</Delimiter>
  <IsTruncated>false</IsTruncated>
  <Contents>
    <Key>sample.jpg</Key>
    <LastModified>2011-02-26T01:56:20.000Z</LastModified>
  </Contents>
</ListBucketResult>
```
The following GET request specifies the delimiter parameter with the value /, and the prefix parameter with the value photos/2006/.

GET /?prefix=photos/2006/&delimiter=/ HTTP/1.1
Host: example-bucket.s3.amazonaws.com
Date: Wed, 01 Mar 2006 12:00:00 GMT
Authorization: authorization string

In response, Amazon S3 returns only the keys that start with the specified prefix. Further, it uses the delimiter character to group keys that contain the same substring until the first occurrence of the delimiter character after the specified prefix. For each such key group, Amazon S3 returns one <CommonPrefixes> element in the response. The keys grouped under this CommonPrefixes element are not returned elsewhere in the response. The value returned in the CommonPrefixes element is a substring from the beginning of the key to the first occurrence of the specified delimiter after the prefix.

Get Bucket accelerate

Description

This implementation of the GET operation uses the accelerate subresource to return the Transfer Acceleration state of a bucket, which is either Enabled or Suspended. Amazon S3 Transfer Acceleration is a bucket-level feature that enables you to perform faster data transfers to and from Amazon S3.

To use this operation, you must have permission to perform the s3:GetAccelerateConfiguration action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources in the Amazon Simple Storage Service Developer Guide.

You set the Transfer Acceleration state of an existing bucket to Enabled or Suspended by using the PUT Bucket accelerate (p. 211) operation.

A GET accelerate request does not return a state value for a bucket that has no transfer acceleration state. A bucket has no Transfer Acceleration state, if a state has never been set on the bucket.

This implementation of the GET operation returns the following responses:

- If the transfer acceleration state is set to Enabled on a bucket, the response is:
  ```xml
    <Status>Enabled</Status>
  </AccelerateConfiguration>
  ```

- If the transfer acceleration state is set to Suspended on a bucket, the response is:
  ```xml
    <Status>Suspended</Status>
  </AccelerateConfiguration>
  ```

- If the transfer acceleration state on a bucket has never been set to Enabled or Suspended, the response is:
  ```xml
  ```

For more information on transfer acceleration, see Transfer Acceleration in the Amazon Simple Storage Service Developer Guide.

Requests

Syntax

GET //?accelerate HTTP/1.1
Host: bucketname.s3.amazonaws.com
Content-Length: length
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))
Request Parameters
This implementation of the operation does not use request parameters.

Request Headers
This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements
This implementation of the operation does not use request elements.

Responses

Response Headers
This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements
This implementation of GET returns the following response elements.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| AccelerateConfiguration | Container for the Status response element. Type: Container  
                           | Ancestor: None                                                              |
| Status             | The transfer acceleration state of the bucket. Type: Enum  
                           | Valid Values: Suspended | Enabled  
                           | Ancestor: AccelerateConfiguration |

Special Errors
This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

Examples

Example 1: Retrieve the transfer acceleration configuration for a bucket
The following example shows a GET /?accelerate request to retrieve the transfer acceleration state of the bucket named examplebucket.
GET /?accelerate HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Date: Mon, 11 Apr 2016 12:00:00 GMT
Authorization: authorization string
Content-Type: text/plain

The following is a sample of the response body (only) that shows bucket transfer acceleration is enabled.

```xml
  <Status>Enabled</Status>
</AccelerateConfiguration>
```

Related Resources

- PUT Bucket accelerate (p. 211)
GET Bucket acl

Description
This implementation of the GET operation uses the acl subresource to return the access control list (ACL) of a bucket. To use GET to return the ACL of the bucket, you must have READ_ACP access to the bucket. If READ_ACP permission is granted to the anonymous user, you can return the ACL of the bucket without using an authorization header.

Requests
Syntax

```
GET /?acl HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))
```

Request Parameters
This implementation of the operation does not use request parameters.

Request Headers
This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements
This implementation of the operation does not use request elements.

Responses
Response Headers
This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Related Resources

- GET Bucket Objects (p. 99)
GET Bucket analytics

Description

This implementation of the GET operation returns an analytics configuration (identified by the analytics configuration ID) from the bucket.

To use this operation, you must have permissions to perform the `s3:GetAnalyticsConfiguration` action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources in the Amazon Simple Storage Service Developer Guide.

For information about Amazon S3 analytics feature, see Amazon S3 Analytics – Storage Class Analysis in the Amazon Simple Storage Service Developer Guide.

Requests

Syntax

```
GET /?analytics&id=analytics-configuration-ID HTTP/1.1
Host: bucketname.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))
```

Request Parameters

This implementation of GET uses the parameter in the following table.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>The ID that identifies the analytics configuration. Limited to 64 characters.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid Characters for id: a-z A-Z 0-9 - _</td>
<td></td>
</tr>
</tbody>
</table>

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

This implementation of the operation does not use request elements.
Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

The Examples section shows an example of an analytics configuration XML. The following table describes the XML elements in the analytics configuration returned by the GET request.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AnalyticsConfiguration</td>
<td>Contains the configuration and any analyses for the analytics filter. Type: Container Child: Id, Filter, StorageClassAnalysis Ancestor: None</td>
</tr>
<tr>
<td>And</td>
<td>A conjunction (logical AND) of predicates, which is used in evaluating an analytics filter. The operator must have at least two predicates. Type: String Children: Prefix, Tag Ancestor: Filter</td>
</tr>
<tr>
<td>Bucket</td>
<td>The Amazon Resource Name (ARN) of the bucket where analytics results are published. Type: String Ancestor: S3BucketDestination</td>
</tr>
<tr>
<td>BucketAccountId</td>
<td>The ID of the account that owns the destination bucket where the analytics results are published. Type: String Ancestor: S3BucketDestination</td>
</tr>
<tr>
<td>DataExport</td>
<td>A container used to describe how data related to the storage class analysis should be exported. Type: Container Children: OutputSchemaVersion, Destination Ancestor: StorageClassAnalysis</td>
</tr>
<tr>
<td>Destination</td>
<td>Contains information about where to publish the analytics results. Type: Container Children: S3BucketDestination</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Filter</strong></td>
<td>Specifies an analytics filter. The analytics only includes objects that meet the filter's criteria. Type: Container Children: And Ancestor: AnalyticsConfiguration</td>
</tr>
<tr>
<td><strong>Format</strong></td>
<td>Specifies the output format of the analytics results. Currently, Amazon S3 supports the comma-separated value (CSV) format. Type: String Ancestor: S3BucketDestination Valid values: CSV</td>
</tr>
<tr>
<td><strong>Id</strong></td>
<td>The ID that identifies the analytics configuration. Type: String Ancestor: AnalyticsConfiguration</td>
</tr>
<tr>
<td><strong>Key</strong></td>
<td>The key for a tag. Type: String Ancestor: Tag</td>
</tr>
<tr>
<td><strong>OutputSchemaVersion</strong></td>
<td>The version of the output schema to use when exporting data. Must be V_1. Type: String Ancestor: DataExport Valid values: V_1</td>
</tr>
<tr>
<td><strong>Prefix</strong></td>
<td>The prefix that an object must have to be included in the analytics results. Type: String Ancestor: And</td>
</tr>
<tr>
<td><strong>Prefix</strong></td>
<td>The prefix that is prepended to all analytics results. Type: String Ancestor: S3BucketDestination</td>
</tr>
</tbody>
</table>
### Examples

#### Example: Configure an Analytics Report

The following GET request for the bucket examplebucket returns the inventory configuration with the ID list1.

```
GET /?analytics&id=list1 HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Date: Mon, 31 Oct 2016 12:00:00 GMT
Authorization: authorization string
```

The following is a sample response.

```
HTTP/1.1 200 OK
x-amz-id-2: YgIPIfBiKa2bj0KMgUAdQkf3ShJTOOpXUueF6QKo
x-amz-request-id: 236A8905248E5A02
```
<?xml version="1.0" encoding="UTF-8"?>
<AnalyticsConfiguration xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
    <Id>list1</Id>
    <Filter>
        <And>
            <Prefix>images/</Prefix>
            <Tag>
                <Key>dog</Key>
                <Value>corgi</Value>
            </Tag>
        </And>
    </Filter>
    <StorageClassAnalysis>
        <DataExport>
            <OutputSchemaVersion>V_1</OutputSchemaVersion>
            <Destination>
                <S3BucketDestination>
                    <Format>CSV</Format>
                    <BucketAccountId>123456789012</BucketAccountId>
                    <Bucket>arn:aws:s3:::destination-bucket</Bucket>
                    <Prefix>destination-prefix</Prefix>
                </S3BucketDestination>
            </Destination>
        </DataExport>
    </StorageClassAnalysis>
</AnalyticsConfiguration>

GET Bucket cors

Description

Returns the cors configuration information set for the bucket.

To use this operation, you must have permission to perform the s3:GetBucketCORS action. By default, the bucket owner has this permission and can grant it to others.

To learn more cors, go to Enabling Cross-Origin Resource Sharing in the Amazon Simple Storage Service Developer Guide.

Requests

Syntax

GET /?cors HTTP/1.1
Host: bucketname.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

This implementation of the operation does not use request elements.

Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

This implementation of GET returns the following response elements.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CORSConfiguration</td>
<td>Container for up to 100 CORSRules elements.</td>
</tr>
<tr>
<td></td>

</table>
| ID                | An optional unique identifier for the rule. The ID value can be up to 255 characters long. The IDs help you find a rule in the configuration.  
Type: String  
Ancestor: CORSRule |
| MaxAgeSeconds     | The time in seconds that your browser is to cache the preflight response for the specified resource.  
A CORSRule can have at most one MaxAgeSeconds element.  
Type: Integer (seconds)  
Ancestor: CORSRule |

### Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

### Examples

#### Example 1: Retrieve cors subresource

The following example gets the cors subresource of a bucket.

**Sample Request**

```
GET /?cors HTTP/1.1  
Host: examplebucket.s3.amazonaws.com  
Date: Tue, 13 Dec 2011 19:14:42 GMT  
Authorization: signatureValue
```

**Sample Response**

```
HTTP/1.1 200 OK  
x-amz-id-2: 0FmFIWsh/PpBuZGJFRc55ZGVMqW4SHJ7xVDqKwhEdJmf3q63RtrvH8ZuxW1Bo15  
x-amz-request-id: OCF038E9BCF6309F  
Date: Tue, 13 Dec 2011 19:14:42 GMT  
Server: AmazonS3  
Content-Length: 280
```

```
<CORSConfiguration>  
  <CORSRule>  
    <AllowedOrigin>http://www.example.com</AllowedOrigin>  
    <AllowedMethod>GET</AllowedMethod>  
    <MaxAgeSeconds>3000</MaxAgeSeconds>  
    <ExposeHeader>x-amz-server-side-encryption</ExposeHeader>  
  </CORSRule>  
</CORSConfiguration>
```

GET Bucket encryption

Description

This implementation of the GET operation uses the encryption subresource to return the default encryption configuration for an Amazon S3 bucket. For information about the Amazon S3 default encryption feature, see Amazon S3 Default Bucket Encryption in the Amazon Simple Storage Service Developer Guide.

To use this operation, you must have permission to perform the s3:GetEncryptionConfiguration action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources in the Amazon Simple Storage Service Developer Guide.

Requests

Syntax

GET /?encryption HTTP/1.1
Host: bucketname.s3.amazonaws.com
Content-Length: length
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

This implementation of the operation does not use request elements.

Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

This implementation of GET returns the following response elements.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>

</tr>
</tbody>
</table>
### Name

SSEAlgorithm

### Description

The server-side encryption algorithm to use.

Type: String

Valid Values: AES256, aws:kms

Ancestor: ApplyServerSideEncryptionByDefault

Constraint: Can only be used when you use ApplyServerSideEncryptionByDefault.

---

### Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

### Examples

#### Example 1: Retrieve the Encryption Configuration for an S3 Bucket

The following example shows a GET /?encryption request.

```
GET /?encryption HTTP/1.1  
Host: examplebucket.s3.amazonaws.com  
Date: Wed, 06 Sep 2017 12:00:00 GMT  
Authorization: authorization string  
Content-Length: length
```

The following is a sample of the response.

```
HTTP/1.1 200 OK  
Date: Wed, 06 Sep 2017 12:00:00 GMT  
Transfer-Encoding: chunked  
Server: AmazonS3

  <Rule>  
    <ApplyServerSideEncryptionByDefault>  
      <SSEAlgorithm>aws:kms</SSEAlgorithm>  
      <KMSMasterKeyID>arn:aws:kms:us-east-1:1234/5678example</KMSMasterKeyID>  
    </ApplyServerSideEncryptionByDefault>  
  </Rule>  
</ServerSideEncryptionConfiguration>
```

GET Bucket Inventory

Description

This implementation of the GET operation returns an inventory configuration (identified by the inventory configuration ID) from the bucket.

To use this operation, you must have permissions to perform the s3:GetInventoryConfiguration action. The bucket owner has this permission by default and can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources in the Amazon Simple Storage Service Developer Guide.

For information about the Amazon S3 inventory feature, see Amazon S3 Inventory in the Amazon Simple Storage Service Developer Guide.

Requests

Syntax

GET /?inventory&id=inventory-configuration-ID HTTP/1.1
Host: bucketname.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

Request Parameters

This implementation of GET uses the parameter in the following table.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
</table>
| id        | The ID that identifies the inventory configuration. Type: String
  Default: None
  Valid Characters for id: a-z A-Z 0-9 - _ | Yes |

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

This implementation of the operation does not use request elements.
Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

The Examples section shows an example of an inventory configuration XML. The following table describes the XML elements in the inventory configuration returned by the **GET** request.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AccountId</td>
<td>The ID of the account that owns the destination bucket where the inventory is published. Although optional, we recommend that the value be set to prevent problems if the destination bucket ownership changes. Type: String Ancestor: S3BucketDestination</td>
</tr>
<tr>
<td>Bucket</td>
<td>The Amazon Resource Name (ARN) of the bucket where inventory results are published. Type: String Ancestor: S3BucketDestination</td>
</tr>
<tr>
<td>Destination</td>
<td>Contains information about where to publish the inventory results. Type: Container Children: S3BucketDestination Ancestor: InventoryConfiguration</td>
</tr>
<tr>
<td>Encryption</td>
<td>Contains the type of server-side encryption used to encrypt the inventory results. Type: Container Children: SSE-KMS, SSE-S3 Ancestor: S3BucketDestination</td>
</tr>
<tr>
<td>Field</td>
<td>Contains the optional fields that are included in the inventory results. Multiple Field elements can be contained in OptionalFields. Type: String Ancestor: OptionalFields Valid values: Size, LastModifedDate, StorageClass, ETag, IsMultipartUploaded, ReplicationStatus, EncryptionStatus</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Filter</td>
<td>Specifies an inventory filter. The inventory only includes objects that meet the filter's criteria.</td>
</tr>
<tr>
<td></td>
<td>Type: Container</td>
</tr>
<tr>
<td></td>
<td>Children: Prefix</td>
</tr>
<tr>
<td></td>
<td>Ancestor: InventoryConfiguration</td>
</tr>
<tr>
<td>Format</td>

**Special Errors**

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

**Examples**

**Example: Configure an Inventory Report**

The following GET request for the bucket `examplebucket` returns the inventory configuration with the ID `list1`.

```plaintext
GET /?inventory&id=list1 HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Date: Mon, 31 Oct 2016 12:00:00 GMT
Authorization: authorization string
```

The following is a sample response.

```plaintext
HTTP/1.1 200 OK
x-amz-id-2: YgIPfBiKa2bj0KMgUAdQkpf3ShJTOOpXUueF6QKo
x-amz-request-id: 236A8905248E5A02
Date: Mon, 31 Oct 2016 12:00:00 GMT
Server: AmazonS3
Content-Length: length

<?xml version="1.0" encoding="UTF-8"?>
<InventoryConfiguration xmlns="http://s3.amazonaws.com/doc/2006-03-01/"
  <Id>report1</Id>
  <IsEnabled>true</IsEnabled>
  <Destination>
    <S3BucketDestination>
      <Format>CSV</Format>
      <AccountId>123456789012</AccountId>
      <Bucket>arn:aws:s3:::destination-bucket</Bucket>
      <Prefix>prefix1</Prefix>
      <SSE-S3/>
    </S3BucketDestination>
  </Destination>
</InventoryConfiguration>
```

GET Bucket lifecycle

Description

Note
Bucket lifecycle configuration now supports specifying lifecycle rule using object key name prefix, one or more object tags, or combination of both. Accordingly, this section describes the latest API. The response describes the new filter element that you can use to specify a filter to select a subset of objects to which the rule applies. If you are still using previous version of the lifecycle configuration, it works. For related API description, see GET Bucket lifecycle (deprecated) (p. 519).

Returns the lifecycle configuration information set on the bucket. For information about lifecycle configuration, go to Object Lifecycle Management in the Amazon Simple Storage Service Developer Guide.

To use this operation, you must have permission to perform the s3:GetLifecycleConfiguration action. The bucket owner has this permission, by default. The bucket owner can grant this permission to others. For more information about permissions, see Managing Access Permissions to Your Amazon S3 Resources in the Amazon Simple Storage Service Developer Guide.

Requests

Syntax

GET /?lifecycle HTTP/1.1
Host: bucketname.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

This implementation of the operation does not use request elements.

Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

This implementation of GET returns the following response elements.

</tr>
</tbody>
</table>
### Name

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transition</td>
<td>This action specifies a period in the objects' lifetime when Amazon S3 should transition them to the STANDARD_IA or the GLACIER storage class. When this action is in effect, what Amazon S3 does depends on whether the bucket is versioning-enabled.</td>
</tr>
</tbody>
</table>

- If versioning has never been enabled on the bucket, Amazon S3 transitions the only copy of the object specified storage class.
- Otherwise, when your bucket is versioning-enabled (or versioning is suspended), Amazon S3 transitions only the current versions of objects identified in the rule.

**Note**
A versioning-enabled or versioning-suspended bucket can have many versions of an object. This action has no impact on the noncurrent object versions. To transition noncurrent objects, you must use the NoncurrentVersionTransition action.

GET Bucket location

Description

This implementation of the GET operation uses the location subresource to return a bucket's region. You set the bucket's region using the LocationConstraint request parameter in a PUT Bucket request. For more information, see PUT Bucket (p. 205).

To use this implementation of the operation, you must be the bucket owner.

Requests

Syntax

GET /?location HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

This implementation of the operation does not use request elements.

Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

</tbody>
</table>

When the bucket's region is US East (N. Virginia), Amazon S3 returns an empty string for the bucket's region:

```xml
<LocationConstraint xmlns="http://s3.amazonaws.com/doc/2006-03-01/"/>
```

### Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

### Examples

#### Sample Request

The following request returns the region of the specified bucket.

```
GET /?location HTTP/1.1
Host: myBucket.s3.amazonaws.com
Date: Tue, 09 Oct 2007 20:26:04 +0000
Authorization: signatureValue
```

#### Sample Response

```
<?xml version="1.0" encoding="UTF-8"?>
<LocationConstraint xmlns="http://s3.amazonaws.com/doc/2006-03-01/">EU</LocationConstraint>
```

GET Bucket logging

**Note**
Logging functionality is currently in beta.

**Description**
This implementation of the GET operation uses the logging subresource to return the logging status of a bucket and the permissions users have to view and modify that status. To use GET, you must be the bucket owner.

**Requests**

**Syntax**

```
GET /?logging HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: date
Authorization: authorization string
```

**Request Parameters**
This implementation of the operation does not use request parameters.

**Request Headers**
This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

**Request Elements**
This implementation of the operation does not use request elements.

**Responses**

**Response Headers**
This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

**Response Elements**

<table>
<thead>
<tr>

</table>
### Name | Description
--- | ---

**Grant**  | Container for **Grantee** and **Permission**.  
Type: Container  
Ancestry: BucketLoggingStatus.LoggingEnabled.TargetGrants

**Grantee**  | Container for **EmailAddress** of the person whose logging permissions are displayed.  
Type: Container  

**LoggingEnabled**  | Container for logging information. This element and its children are present when logging is enabled, otherwise, this element and its children are absent.  
Type: Container  
Ancestry: BucketLoggingStatus

**Permission**  | Logging permissions assigned to the **Grantee** for the bucket.  
Type: String  
Valid Values: FULL_CONTROL | READ | WRITE  

**TargetBucket**  | Specifies the bucket whose logging status is being returned. This element specifies the bucket where server access logs will be delivered.  
Type: String  
Ancestry: BucketLoggingStatus.LoggingEnabled

**TargetGrants**  | Container for granting information.  
Type: Container  
Ancestry: BucketLoggingStatus.LoggingEnabled

**TargetPrefix**  | Specifies the prefix for the keys that the log files are being stored under.  
Type: String  
Ancestry: BucketLoggingStatus.LoggingEnabled

### Special Errors
This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).
Examples

Sample Request

The following request returns the logging status for mybucket.

```
GET /logging HTTP/1.1
Host: mybucket.s3.amazonaws.com
Date: Wed, 25 Nov 2009 12:00:00 GMT
Authorization: authorization string
```

Sample Response Showing an Enabled Logging Status

```
HTTP/1.1 200 OK
Date: Wed, 25 Nov 2009 12:00:00 GMT
Connection: close
Server: AmazonS3

<?xml version="1.0" encoding="UTF-8"?>
<BucketLoggingStatus xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <LoggingEnabled>
    <TargetBucket>mybucketlogs</TargetBucket>
    <TargetPrefix>mybucket-access_log-/</TargetPrefix>
    <TargetGrants>
      <Grant>
        <Grantee xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="AmazonCustomerByEmail">
          <EmailAddress>user@company.com</EmailAddress>
          <Permission>READ</Permission>
        </Grantee>
      </Grant>
    </TargetGrants>
  </LoggingEnabled>
</BucketLoggingStatus>
```

Sample Response Showing a Disabled Logging Status

```
HTTP/1.1 200 OK
Date: Wed, 25 Nov 2009 12:00:00 GMT
Connection: close
Server: AmazonS3

<?xml version="1.0" encoding="UTF-8"?>
```

GET Bucket metrics

Description

Gets a metrics configuration for the CloudWatch request metrics (specified by the metrics configuration ID) from the bucket. Note that this doesn't include the daily storage metrics.

To use this operation, you must have permissions to perform the `s3:GetMetricsConfiguration` action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources in the Amazon Simple Storage Service Developer Guide.

For information about CloudWatch request metrics for Amazon S3, see Monitoring Metrics with Amazon CloudWatch in the Amazon Simple Storage Service Developer Guide.

Requests

Syntax

```
GET /?metrics&id=id HTTP/1.1
Host: BucketName.s3.amazonaws.com
x-amz-date: Thu, 15 Nov 2016 00:17:21 GMT
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))
```

Request Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>The ID used to identify the metrics configuration.</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

This implementation of the operation does not use request elements.

Responses

Response Headers

The operation returns response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

The Examples section shows an example of a metrics configuration XML. The following table describes the XML elements in the metrics configuration returned by the GET request.
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>And</td>
<td>A conjunction (logical AND) of predicates, which is used in evaluating a metrics filter. The operator must have at least two predicates, and an object must match all of the predicates in order for the filter to apply.</td>
</tr>
<tr>
<td></td>
<td>Type: Container</td>
</tr>
<tr>
<td></td>
<td>Children: Prefix, Tag</td>
</tr>
<tr>
<td></td>
<td>Ancestor: Filter</td>
</tr>
<tr>
<td>Filter</td>
<td>Specifies a metrics configuration filter. The metrics configuration only includes objects that meet the filter's criteria. A filter must be a prefix, a tag, or a conjunction (MetricsAndOperator).</td>
</tr>
<tr>
<td></td>
<td>Type: Container</td>
</tr>
<tr>
<td></td>
<td>Children: And</td>
</tr>
<tr>
<td></td>
<td>Ancestor: MetricsConfiguration</td>
</tr>
<tr>

</tbody>
</table>

**Special Errors**

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

**Examples**

**First Sample Request**

Retrieve a metrics configuration that filters metrics based on a specified prefix.

```
GET /metrics?Id=Documents HTTP/1.1
Host: examplebucket.s3.amazonaws.com
x-amz-date: Thu, 15 Nov 2016 00:17:21 GMT
Authorization: signatureValue
```

**First Sample Response**

Retrieve a metrics configuration that filters metrics based on a specified prefix.

```
HTTP/1.1 200 OK
x-amz-id-2: ITnGT1y4REMAMPLEPi4hklTXouTf0hccUjo0iCPFEXAMPLEUtBj3M7fPGLWG2SEWp
x-amz-request-id: 51991EXAMPLE5321
Date: Thu, 15 Nov 2016 00:17:22 GMT
Server: AmazonS3
Content-Length: 180

<?xml version="1.0" encoding="UTF-8"?>
  <Id>Documents</Id>
  <Filter>
    <Prefix>documents/</Prefix>
  </Filter>
</MetricsConfiguration>
```

**Second Sample Request**

Retrieve a metrics configuration that enables metrics for objects that start with a particular prefix and also have specific tags applied.

```
GET /metrics?Id=ImportantBlueDocuments HTTP/1.1
Host: examplebucket.s3.amazonaws.com
x-amz-date: Thu, 15 Nov 2016 00:17:21 GMT
Authorization: signatureValue
```

**Second Sample Response**

Retrieve a metrics configuration that enables metrics for objects that start with a particular prefix and also have specific tags applied.

```
HTTP/1.1 200 OK
```

GET Bucket notification

Description

This implementation of the GET operation uses the notification subresource to return the notification configuration of a bucket.

If notifications are not enabled on the bucket, the operation returns an empty NotificationConfiguration element.

By default, you must be the bucket owner to read the notification configuration of a bucket. However, the bucket owner can use a bucket policy to grant permission to other users to read this configuration with the s3:GetBucketNotification permission.

For more information about setting and reading the notification configuration on a bucket, see Setting Up Notification of Bucket Events. For more information about bucket policies, see Using Bucket Policies.

Requests

Syntax

GET /?notification HTTP/1.1  
Host: BucketName.s3.amazonaws.com  
Date: date  
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

This implementation of the operation does not use request elements.

Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

### Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

### Examples

#### Sample Request

This request returns the notification configuration on the bucket quotes.s3.amazonaws.com.

```plaintext
GET ?notification HTTP/1.1
Host: quotes.s3.amazonaws.com
Date: Wed, 15 Oct 2014 16:59:03 GMT
Authorization: authorization string
```

#### Sample Response

This response returns that the notification configuration for the specified bucket.

```
HTTP/1.1 200 OK
```
Related Resources

- PUT Bucket notification (p. 265)
GET Bucket Object versions

Description

You can use the versions subresource to list metadata about all of the versions of objects in a bucket. You can also use request parameters as selection criteria to return metadata about a subset of all the object versions. For more information, see Request Parameters (p. 153).

Note

A 200 OK response can contain valid or invalid XML. Make sure to design your application to parse the contents of the response and handle it appropriately.

To use this operation, you must have READ access to the bucket.

Requests

Syntax

GET /?versions HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

Request Parameters

This implementation of GET uses the parameters in the following table to return a subset of the objects in a bucket.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>delimiter</td>
<td>A delimiter is a character that you specify to group keys. All keys that contain the same string between the prefix and the first occurrence of the delimiter are grouped under a single result element in CommonPrefixes. These groups are counted as one result against the max-keys limitation. These keys are not returned elsewhere in the response. Also, see prefix. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td>encoding-type</td>
<td>Requests Amazon S3 to encode the response and specifies the encoding method to use. An object key can contain any Unicode character; however, XML 1.0 parser cannot parse some characters, such as characters with an ASCII value from 0 to 10. For characters that are not supported in XML 1.0, you can add this parameter to request that Amazon S3 encode the keys in the response. Type: String Default: None</td>
<td>No</td>
</tr>
</tbody>
</table>
### Responses

#### Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

#### Responses

#### Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

**Special Errors**

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).
Examples

Sample Request

The following request returns all of the versions of all of the objects in the specified bucket.

GET /?versions HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: Wed, 28 Oct 2009 22:32:00 +0000
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

Sample Response to GET Versions

<?xml version="1.0" encoding="UTF-8"?>

    </Owner>
    <StorageClass>STANDARD</StorageClass>
  </Version>
</ListVersionsResult>
```

Sample Request Using the Delimiter and the Prefix Parameters

Assume you have the following keys in your bucket, example-bucket.

- photos/2006/January/sample.jpg
- photos/2006/February/sample.jpg
- photos/2006/March/sample.jpg
- videos/2006/March/sample.wmv
- sample.jpg

The following GET versions request specifies the delimiter parameter with value "/".

```
GET /?versions&delimiter=/ HTTP/1.1
Host: example-bucket.s3.amazonaws.com
Date: Wed, 02 Feb 2011 20:34:56 GMT
Authorization: authorization string
```

The list of keys from the specified bucket are shown in the following response.
The response returns the sample.jpg key in a <Version> element. However, because all the other keys contain the specified delimiter, a distinct substring, from the beginning of the key to the first occurrence of the delimiter, from each of these keys is returned in a <CommonPrefixes> element. The key substrings, photos/ and videos/, in the <CommonPrefixes> element indicate that there are one or more keys with these key prefixes.

This is a useful scenario if you use key prefixes for your objects to create a logical folder like structure. In this case you can interpret the result as the folders photos/ and videos/ have one or more objects.

Get information about a bucket's versioning:

```
GET /?versions HTTP/1.1
Host: example-bucket.s3.amazonaws.com
Date: Wed, 02 Feb 2011 19:34:02 GMT
Authorization: authorization string
```

In this case the response will include only objects keys that start with the specified prefix. The value returned in the <CommonPrefixes> element is a substring from the beginning of the key to the first occurrence of the specified delimiter after the prefix.
GET Bucket policy

Description

This implementation of the GET operation uses the policy subresource to return the policy of a specified bucket. To use this operation, you must have GetPolicy permissions on the specified bucket, and you must be the bucket owner.

If you don't have GetPolicy permissions, Amazon S3 returns a 403 Access Denied error. If you have the correct permissions, but you're not the bucket owner, Amazon S3 returns a 405 MethodNotAllowed error. If the bucket does not have a policy, Amazon S3 returns a 404 Policy Not found error. There are restrictions about who can create bucket policies and which objects in a bucket they can apply to. For more information, go to Using Bucket Policies.

Requests

Syntax

GET /?policy HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

This implementation of the operation does not use request elements.

Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

The response contains the (JSON) policy of the specified bucket.

Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).
Examples

Sample Request

The following request returns the policy of the specified bucket.

```
GET ?policy HTTP/1.1
Host: bucket.s3.amazonaws.com
Date: Wed, 28 Oct 2009 22:32:00 GMT
Authorization: authorization string
```

Sample Response

```
HTTP/1.1 200 OK
x-amz-id-2: Uuag1LuByru9p04SAMPLEAtRPfTaOFg==
x-amz-request-id: 656c76696e67SAMPLE57374
Date: Tue, 04 Apr 2010 20:34:56 GMT
Connection: keep-alive
Server: AmazonS3

      "Action":"
    }
  ]
}
```

Related Resources

- GET Bucket Objects (p. 99)
GET Bucket replication

Description

Returns the replication configuration information set on the bucket. For information about replication configuration, see Adding Replication Configuration to a Bucket in the Amazon Simple Storage Service Developer Guide.

This operation requires permissions for the s3:GetReplicationConfiguration action. For more information about permissions, see Using Bucket Policies and User Policies in the Amazon Simple Storage Service Developer Guide.

Requests

Syntax

```
GET /?replication HTTP/1.1
Host: bucketname.s3.amazonaws.com
Date: date
Authorization: authorization string
```

For more information about authorization, see Authenticating Requests (AWS Signature Version 4) (p. 14).

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

This implementation of the operation does not use request elements.

Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

This implementation of GET returns the following response elements.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account</td>
<td>Destination bucket owner account ID. In a cross-account scenario, if you direct Amazon S3 to change replica ownership to the AWS account that owns the destination</td>

<tr>
<td>Prefix</td>
<td>Object key name prefix identifying one or more objects to which the rule applies. Maximum prefix length can be up to 1,024 characters. Overlapping prefixes are not supported. For more information, see Setting Up Cross-Region Replication in the Amazon Simple Storage Service Developer Guide.</td>
</tr>
<tr>
<td>Destination</td>
<td>Container for destination information.</td>
</tr>
<tr>
<td>Bucket</td>
<td>Bucket name for storing replicas of objects identified by the rule.</td>
</tr>
<tr>
<td>StorageClass</td>
<td>Storage class to use for the replicated objects. If you did not set the storage class when you configured the cross-region replication (PUT Bucket replication (p. 275)), this field is not returned.</td>
</tr>
<tr>
<td>AccessControlTranslation</td>
<td>If you set the owner override option in the replication configuration, this element is returned. It identifies replica ownership. If this element is not present, replicas are owned by same AWS account that owns the source object.</td>
</tr>
<tr>
<td>Owner</td>
<td>Identifies the replica ownership.</td>
</tr>
</tbody>
</table>

If replication configuration directs Amazon S3 to replicate objects created with server-side encryption using an AWS KMS-managed key, the response returns the following additional elements. For more
information about replication configuration, see CRR: Replicating Objects Created with SSE Using AWS KMS-Managed Encryption Keys in the Amazon Simple Storage Service Developer Guide.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SourceSelectionCriteria</td>
<td>Container that describes additional filters in identifying source objects that you want to replicate. Type: String Ancestor: Rule</td>
</tr>
<tr>
<td>SseKmsEncryptedObjects</td>
<td>Container element for Status. Type: String Ancestor: SourceSelectionCriteria</td>
</tr>
<tr>
<td>Status</td>
<td>Flag that directs Amazon S3 whether to replicate objects created with server-side encryption using an AWS KMS-managed key. Type: String Ancestor: SseKmsEncryptedObjects</td>
</tr>
<tr>
<td>EncryptionConfiguration</td>
<td>Container that provides encryption-related information. Type: String Ancestor: Destination</td>
</tr>
<tr>
<td>ReplicaKmsKeyID</td>
<td>Provides the AWS KMS Key ID (Key ARN or Alias ARN) for the destination bucket. Amazon S3 uses this key to encrypt replicas. Type: String Ancestor: EncryptionConfiguration</td>
</tr>
</tbody>
</table>

### Special Errors

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
<th>HTTP Status Code</th>
<th>SOAP Fault Code Prefix</th>
</tr>
</thead>
<tbody>
<tr>
<td>NoSuchReplicationConfiguration</td>
<td>The replication configuration does not exist.</td>
<td>404 Not Found</td>
<td>Client</td>
</tr>
</tbody>
</table>

For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).
Examples

Example 1: Retrieve Replication Configuration Information

The following example GET request retrieves replication configuration information set for the examplebucket bucket.

```
GET /?replication HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Date: Tue, 10 Feb 2015 00:17:21 GMT
Authorization: authorization string
```

The following example response shows that replication is enabled on the bucket, and the empty prefix indicates that Amazon S3 will replicate all objects created in the examplebucket bucket. The Destination element shows the target bucket where Amazon S3 creates the object replicas and the storage class (STANDARD_IA) that Amazon S3 uses when creating replicas.

Amazon S3 assumes the specified role to replicate objects on behalf of the bucket owner, which is the AWS account that created the bucket.

```
HTTP/1.1 200 OK

GET Bucket requestPayment

Description
This implementation of the GET operation uses the requestPayment subresource to return the request payment configuration of a bucket. To use this version of the operation, you must be the bucket owner. For more information, see Requester Pays Buckets.

Requests

Syntax
GET ?requestPayment HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: Date
Authorization: authorization string

Request Parameters
This implementation of the operation does not use request parameters.

Request Headers
This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Responses

Response Headers
This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Payer</td>
<td>Specifies who pays for the download and request fees.</td>
</tr>
<tr>
<td></td>
<td>Type: Enum</td>
</tr>
<tr>
<td></td>
<td>Valid Values: Requester</td>
</tr>
<tr>
<td></td>
<td>Ancestor: RequestPaymentConfiguration</td>
</tr>
<tr>
<td>RequestPaymentConfiguration</td>
<td>Container for Payer.</td>
</tr>
<tr>
<td></td>
<td>Type: Container</td>
</tr>
</tbody>
</table>

Special Errors
This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).
Examples

Sample Request

The following request returns the payer for the bucket, colorpictures.

```
GET /requestPayment HTTP/1.1
Host: colorpictures.s3.amazonaws.com
Date: Wed, 01 Mar 2009 12:00:00 GMT
Authorization: authorization string
```

Sample Response

```
HTTP/1.1 200 OK
x-amz-id-2: YgIPIfBiKa2bj0KMg95r/0zo3emzU4dzcD4rcKCHQUAAdQkf3ShJTOOpXUueF6QKo
x-amz-request-id: 236A8905248E5A01
Date: Wed, 01 Mar 2009 12:00:00 GMT
Content-Type: [type]
Content-Length: 0
Connection: close
Server: AmazonS3

<?xml version="1.0" encoding="UTF-8"?>
<RequestPaymentConfiguration xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <Payer>Requester</Payer>
</RequestPaymentConfiguration>
```

This response shows that the bucket is a Requester Pays bucket, meaning the person requesting a download from this bucket pays the transfer fees.

GET Bucket tagging

Description

This implementation of the GET operation uses the tagging subresource to return the tag set associated with the bucket.

To use this operation, you must have permission to perform the s3:GetBucketTagging action. By default, the bucket owner has this permission and can grant this permission to others.

Requests

Syntax

GET /?tagging HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

This implementation of the operation does not use request elements.

Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tagging</td>
<td>Contains the TagSet and Tag elements.</td>
</tr>
<tr>
<td></td>
<td>Type: Container</td>
</tr>
<tr>
<td></td>
<td>Ancestry: None</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td>TagSet</td>
<td>Contains the tag set. Type: Container Ancestry: Tagging</td>
</tr>
<tr>
<td>Tag</td>
<td>Contains the tag information. Type: Container Ancestry: TagSet</td>
</tr>
<tr>
<td>Key</td>
<td>Name of the tag Type: String Ancestry: Tag</td>
</tr>
<tr>
<td>Value</td>
<td>Value of the tag Type: String Ancestry: Tag</td>
</tr>
</tbody>
</table>

**Special Errors**

- **NoSuchTagSetError** - There is no tag set associated with the bucket.

**Examples**

**Sample Request**

The following request returns the tag set of the specified bucket.

```
GET ?tagging HTTP/1.1
Host: bucket.s3.amazonaws.com
Date: Wed, 28 Oct 2009 22:32:00 GMT
Authorization: authorization string
```

**Sample Response**

```
HTTP/1.1 200 OK
Date: Wed, 25 Nov 2009 12:00:00 GMT
Connection: close
Server: AmazonS3

<Tagging>
  <TagSet>
    <Tag>
      <Key>Project</Key>
      <Value>Project One</Value>
    </Tag>
    <Tag>
      <Key>User</Key>
    </Tag>
  </TagSet>
</Tagging>
```

GET Bucket versioning

Description

This implementation of the GET operation uses the versioning subresource to return the versioning state of a bucket. To retrieve the versioning state of a bucket, you must be the bucket owner.

This implementation also returns the MFA Delete status of the versioning state, i.e., if the MFA Delete status is enabled, the bucket owner must use an authentication device to change the versioning state of the bucket.

There are three versioning states:

- If you enabled versioning on a bucket, the response is:

```xml
  <Status>Enabled</Status>
</VersioningConfiguration>
```

- If you suspended versioning on a bucket, the response is:

```xml
  <Status>Suspended</Status>
</VersioningConfiguration>
```

- If you never enabled (or suspended) versioning on a bucket, the response is:

```xml
</VersioningConfiguration>
```

Requests

Syntax

```
GET /?versioning HTTP/1.1
Host: BucketName.s3.amazonaws.com
Content-Length: length
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))
```

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

This implementation of the operation does not use request elements.
Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

This implementation of GET returns the following response elements.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MfaDelete</td>
<td>Specifies whether MFA delete is enabled in the bucket versioning configuration. This element is only returned if the bucket has been configured with MfaDelete. If the bucket has never been so configured, this element is not returned.</td>
</tr>
<tr>
<td></td>
<td>Type: Enum</td>
</tr>
<tr>
<td></td>
<td>Valid Values: Disabled</td>
</tr>
<tr>
<td></td>
<td>Ancestor: VersioningConfiguration</td>
</tr>
<tr>
<td>Status</td>
<td>The versioning state of the bucket.</td>
</tr>
<tr>
<td></td>
<td>Type: Enum</td>
</tr>
<tr>
<td></td>
<td>Valid Values: Suspended</td>
</tr>
<tr>
<td></td>
<td>Ancestor: VersioningConfiguration</td>
</tr>
<tr>
<td>VersioningConfiguration</td>
<td>Container for the Status response element.</td>
</tr>
<tr>
<td></td>
<td>Type: Container</td>
</tr>
<tr>
<td></td>
<td>Ancestor: None</td>
</tr>
</tbody>
</table>

Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

Examples

Sample Request

This example returns the versioning state of myBucket.

```plaintext
GET /?versioning HTTP/1.1
Host: myBucket.s3.amazonaws.com
Date: Wed, 12 Oct 2009 17:50:00 GMT
Authorization: authorization string
Content-Type: text/plain
```
Sample Response

The following is a sample of the response body (only) that shows bucket versioning is enabled.

```xml
  <Status>Enabled</Status>
</VersioningConfiguration>
```

GET Bucket website

Description

This implementation of the GET operation returns the website configuration associated with a bucket. To host website on Amazon S3, you can configure a bucket as website by adding a website configuration. For more information about hosting websites, go to Hosting Websites on Amazon S3 in the Amazon Simple Storage Service Developer Guide.

This GET operation requires the S3:GetBucketWebsite permission. By default, only the bucket owner can read the bucket website configuration. However, bucket owners can allow other users to read the website configuration by writing a bucket policy granting them the S3:GetBucketWebsite permission.

Requests

Syntax

GET /?website HTTP/1.1
Host: bucketname.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

This operation does not use request elements.

Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

The response XML includes same elements that were uploaded when you configured the bucket as website. For more information, see PUT Bucket website (p. 292).
Examples

Sample Request

This request retrieves website configuration on the specified bucket.

```
GET ?website HTTP/1.1
Host: example-bucket.s3.amazonaws.com
Date: Thu, 27 Jan 2011 00:49:20 GMT
Authorization: AWS AKIAIOSFODNN7EXAMPLE:n0Nhek72Ufg/u7Sm5C1dqRLs8XX=
```

Sample Response

```
HTTP/1.1 200 OK
x-amz-id-2: YgIPIfBiKa2bj0KMgUAdQkf3ShJTOOpXUueF6QKo
x-amz-request-id: 3848CD259D811111
Date: Thu, 27 Jan 2011 00:49:26 GMT
Content-Length: 240
Content-Type: application/xml
Transfer-Encoding: chunked
Server: AmazonS3

<?xml version="1.0" encoding="UTF-8"?>

HEAD Bucket

Description

This operation is useful to determine if a bucket exists and you have permission to access it. The operation returns a 200 OK if the bucket exists and you have permission to access it. Otherwise, the operation might return responses such as 404 Not Found and 403 Forbidden.

For information about permissions required for this bucket operation, go to Specifying Permissions in a Policy in the Amazon Simple Storage Service Developer Guide.

Requests

Syntax

HEAD / HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

Request Parameters

This implementation of the operation does not use request parameters.

Request Elements

This implementation of the operation does not use request elements.

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

This implementation of the operation does not return response elements.

Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).
Examples

Sample Request

HEAD / HTTP/1.1  
Date: Fri, 10 Feb 2012 21:34:55 GMT

Date: Fri, 10 2012 21:34:56 GMT  
Server: AmazonS3
List Bucket Analytics Configurations

Description

This implementation of the GET operation returns a list of analytics configurations for the bucket. You can have up to 1,000 analytics configurations per bucket.

This operation supports list pagination and does not return more than 100 configurations at a time. You should always check the IsTruncated element in the response. If there are no more configurations to list, IsTruncated is set to false. If there are more configurations to list, IsTruncated is set to true, and there will be a value in NextContinuationToken. You use the NextContinuationToken value to continue the pagination of the list by passing the value in continuation-token in the request to GET the next page.

To use this operation, you must have permissions to perform the s3:GetAnalyticsConfiguration action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources in the Amazon Simple Storage Service Developer Guide.

For information about Amazon S3 analytics feature, see Amazon S3 Analytics – Storage Class Analysis in the Amazon Simple Storage Service Developer Guide.

Requests

Syntax

GET /?analytics HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

Request Parameters

This implementation of GET uses the parameters in the following table.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
</table>
| continuation-token   | When the Amazon S3 response to this API call is truncated (that is, when the IsTruncated response element value is true), the response also includes the NextContinuationToken element, the value of which you can use in the next request as the continuation-token to list the next page. The continuation token is an opaque value that Amazon S3 understands. Type: String
| Default: None        | No                                                                                                                                                                                                          |          |

Request Elements

This implementation of the operation does not use request elements.
Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

<table>

List Bucket Inventory Configurations

Description

This implementation of the GET operation returns a list of inventory configurations for the bucket. You can have up to 1,000 analytics configurations per bucket.

This operation supports list pagination and does not return more than 100 configurations at a time. Always check the IsTruncated element in the response. If there are no more configurations to list, IsTruncated is set to false. If there are more configurations to list, IsTruncated is set to true, and there is a value in NextContinuationToken. You use the NextContinuationToken value to continue the pagination of the list by passing the value in continuation-token in the request to GET the next page.

To use this operation, you must have permissions to perform the s3:GetInventoryConfiguration action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources in the Amazon Simple Storage Service Developer Guide.

For information about Amazon S3 inventory feature, see Amazon S3 Inventory in the Amazon Simple Storage Service Developer Guide.

Requests

Syntax

GET /?inventory HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: Date

List Bucket Metrics Configurations

Description

This implementation of the GET operation returns a list of Amazon CloudWatch metrics configurations for the bucket. The metrics configurations are only for the request metrics of the bucket and do not provide information on daily storage metrics. You can have up to 1,000 configurations per bucket.

This operation supports list pagination and does not return more than 100 configurations at a time. Always check the IsTruncated element in the response. If there are no more configurations to list, IsTruncated is set to false. If there are more configurations to list, IsTruncated is set to true, and there is a value in NextContinuationToken. You use the NextContinuationToken value to continue the pagination of the list by passing the value in continuation-token in the request to GET the next page.

To use this operation, you must have permissions to perform the s3:GetMetricsConfiguration action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources in the Amazon Simple Storage Service Developer Guide.

For more information about metrics configurations and CloudWatch request metrics, see Monitoring Metrics with Amazon CloudWatch in the Amazon Simple Storage Service Developer Guide.

List Multipart Uploads

Description

This operation lists in-progress multipart uploads. An in-progress multipart upload is a multipart upload that has been initiated using the Initiate Multipart Upload request, but has not yet been completed or aborted.

This operation returns at most 1,000 multipart uploads in the response. 1,000 multipart uploads is the maximum number of uploads a response can include, which is also the default value. You can further limit the number of uploads in a response by specifying the max-uploads parameter in the response. If additional multipart uploads satisfy the list criteria, the response will contain an IsTruncated element with the value true. To list the additional multipart uploads, use the key-marker and upload-id-marker request parameters.

In the response, the uploads are sorted by key. If your application has initiated more than one multipart upload using the same object key, then uploads in the response are first sorted by key. Additionally, uploads are sorted in ascending order within each key by the upload initiation time.

For more information on multipart uploads, see Uploading Objects Using Multipart Upload in the Amazon Simple Storage Service Developer Guide.

For information on permissions required to use the multipart upload API, see Multipart Upload API and Permissions in the Amazon Simple Storage Service Developer Guide.

Requests

Syntax

GET /?uploads HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: Date
Authorization: authorization string

Request Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>delimiter</td>
<td>Character you use to group keys.</td>
<td>No</td>
</tr>
<tr>
<td>encoding-type</td>
<td>Requests Amazon S3 to encode the response and specifies the encoding method to use.</td>
<td>No</td>
</tr>
</tbody>
</table>

All keys that contain the same string between the prefix, if specified, and the first occurrence of the delimiter after the prefix are grouped under a single result element, CommonPrefixes. If you don't specify the prefix parameter, then the substring starts at the beginning of the key. The keys that are grouped under CommonPrefixes result element are not returned elsewhere in the response.

An object key can contain any Unicode character; however, XML 1.0 parser cannot parse some characters, such as characters with an ASCII
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>value from 0 to 10. For characters that are not supported in XML 1.0, you can add this parameter to request that Amazon S3 encode the keys in the response.</td>

Name | Description
--- | ---
Delimiter | Contains the delimiter you specified in the request. If you don't specify a delimiter in your request, this element is absent from the response.
Type: String
Ancestor: ListMultipartUploadsResult

CommonPrefixes | If you specify a delimiter in the request, then the result returns each distinct key prefix containing the delimiter in a CommonPrefixes element. The distinct key prefixes are returned in the Prefix child element.
Type: Container
Ancestor: ListMultipartUploadsResult

CommonPrefixes.Prefix | If the request does not include the Prefix parameter, then this element shows only the substring of the key that precedes the first occurrence of the delimiter character. These keys are not returned anywhere else in the response.

If the request includes the Prefix parameter, then this element shows the substring of the key from the beginning to the first occurrence of the delimiter after the prefix.
Type: String
Ancestor: CommonPrefixes

Examples

Sample Request

The following request lists three multipart uploads. The request specifies the max-uploads request parameter to set the maximum number of multipart uploads to return in the response body.

```
GET /?uploads&max-uploads=3 HTTP/1.1
Host: example-bucket.s3.amazonaws.com
Date: Mon, 1 Nov 2010 20:34:56 GMT
Authorization: authorization string
```

Sample Response

The following sample response indicates that the multipart upload list was truncated and provides the NextKeyMarker and the NextUploadIdMarker elements. You specify these values in your subsequent requests to read the next set of multipart uploads. That is, send a subsequent request specifying key-marker=my-movie2.m2ts (value of the NextKeyMarker element) and upload-id-marker=YW55IGlkZWEgd2h5IGVsdm1uZydz1HVwbG9hZCBmYWlsZWQ (value of the NextUploadIdMarker).

The sample response also shows a case of two multipart uploads in progress with the same key (my-movie.m2ts). That is, the response shows two uploads with the same key. This response shows the uploads sorted by key, and within each key the uploads are sorted in ascending order by the time the multipart upload was initiated.

  </Upload>
</ListMultipartUploadsResult>
Sample Request Using the Delimiter and the Prefix Parameters

Assume you have a multipart upload in progress for the following keys in your bucket, example-bucket.

- photos/2006/January/sample.jpg
- photos/2006/February/sample.jpg
- photos/2006/March/sample.jpg
- videos/2006/March/sample.wmv
- sample.jpg

The following list multipart upload request specifies the delimiter parameter with value "/".

```plaintext
GET /?uploads&delimiter=/ HTTP/1.1
Host: example-bucket.s3.amazonaws.com
Date: Mon, 1 Nov 2010 20:34:56 GMT
Authorization: authorization string
```

The following sample response lists multipart uploads on the specified bucket, example-bucket.

The response returns multipart upload for the sample.jpg key in an <Upload> element.

However, because all the other keys contain the specified delimiter, a distinct substring, from the beginning of the key to the first occurrence of the delimiter, from each of these keys is returned in a <CommonPrefixes> element. The key substrings, photos/ and videos/, in the <CommonPrefixes> element indicate that there are one or more in-progress multipart uploads with these key prefixes.

This is a useful scenario if you use key prefixes for your objects to create a logical folder like structure. In this case you can interpret the result as the folders photos/ and videos/ have one or more multipart uploads in progress.

```xml
  <Bucket>example-bucket</Bucket>
  <KeyMarker/>
  <UploadIdMarker/>
  <NextKeyMarker>sample.jpg</NextKeyMarker>
  <NextUploadIdMarker>Xgw4MJT6ZPAVxpY0SAuGN7q4uWJJM22ZTryg1W99trdp4tp088.PT6.Mh00w2E17eutfAvQfQWoajgE_W2gp
```

API Version 2006-03-01
In addition to the delimiter parameter you can filter results by adding a prefix parameter as shown in the following request.

```
GET /?uploads&delimiter=/&prefix=photos/2006/ HTTP/1.1
Host: example-bucket.s3.amazonaws.com
Date: Mon, 1 Nov 2010 20:34:56 GMT
Authorization: authorization string
```

In this case the response will include only multipart uploads for keys that start with the specified prefix. The value returned in the <CommonPrefixes> element is a substring from the beginning of the key to the first occurrence of the specified delimiter after the prefix.

```
<?xml version="1.0" encoding="UTF-8"?><ListMultipartUploadsResult xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
   <Bucket>example-bucket</Bucket>
   <KeyMarker/>
   <UploadIdMarker/>
   <NextKeyMarker/>
   <NextUploadIdMarker/>
   <Delimiter>/</Delimiter>
   <Prefix>photos/2006/</Prefix>
   <MaxUploads>1000</MaxUploads>
   <IsTruncated>false</IsTruncated>
   <CommonPrefixes>
      <Prefix>photos/2006/February/</Prefix>
   </CommonPrefixes>
   <CommonPrefixes>
      <Prefix>photos/2006/January/</Prefix>
   </CommonPrefixes>
   <CommonPrefixes>
      <Prefix>photos/2006/March/</Prefix>
   </CommonPrefixes>
</ListMultipartUploadsResult>
```

PUT Bucket

**Description**

This implementation of the **PUT** operation creates a new bucket. To create a bucket, you must register with Amazon S3 and have a valid AWS Access Key ID to authenticate requests. Anonymous requests are never allowed to create buckets. By creating the bucket, you become the bucket owner.

Not every string is an acceptable bucket name. For information on bucket naming restrictions, see [Working with Amazon S3 Buckets](https://docs.aws.amazon.com/AmazonS3/latest/userguide/working-with-buckets.html).

By default, the bucket is created in the US East (N. Virginia) region. You can optionally specify a region in the request body. You might choose a region to optimize latency, minimize costs, or address regulatory requirements. For example, if you reside in Europe, you will probably find it advantageous to create buckets in the EU (Ireland) region. For more information, see [How to Select a Region for Your Buckets](https://docs.aws.amazon.com/AmazonS3/latest/userguide/how-to-select-region.html).

**Note**

If you create a bucket in a region other than US East (N. Virginia) region, your application must be able to handle 307 redirect. For more information, go to [Virtual Hosting of Buckets](https://docs.aws.amazon.com/AmazonS3/latest/userguide/virtual-hosting-buckets.html) in the [Amazon Simple Storage Service Developer Guide](https://docs.aws.amazon.com/AmazonS3/latest/userguide/).

When creating a bucket using this operation, you can optionally specify the accounts or groups that should be granted specific permissions on the bucket. There are two ways to grant the appropriate permissions using the request headers.

- Specify a canned ACL using the `x-amz-acl` request header. For more information, see [Canned ACL](https://docs.aws.amazon.com/AmazonS3/latest/userguide/canned-acls.html) in the [Amazon Simple Storage Service Developer Guide](https://docs.aws.amazon.com/AmazonS3/latest/userguide/).
- Specify access permissions explicitly using the `x-amz-grant-read`, `x-amz-grant-write`, `x-amz-grant-read-acp`, `x-amz-grant-write-acp`, `x-amz-grant-full-control` headers. These headers map to the set of permissions Amazon S3 supports in an ACL. For more information, go to [Access Control List (ACL) Overview](https://docs.aws.amazon.com/AmazonS3/latest/userguide/acl-overview.html) in the [Amazon Simple Storage Service Developer Guide](https://docs.aws.amazon.com/AmazonS3/latest/userguide/).

**Note**

You can use either a canned ACL or specify access permissions explicitly. You cannot do both.

**Requests**

**Syntax**

```
PUT / HTTP/1.1
Host: BucketName.s3.amazonaws.com
Content-Length: length
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

<CreateBucketConfiguration xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <LocationConstraint>BucketRegion</LocationConstraint>
</CreateBucketConfiguration>
```

**Note**

The syntax shows some of the request headers. For a complete list, see the Request Headers section.

**Note**

If you send your create bucket request to the `s3.amazonaws.com` endpoint, the request goes to the `us-east-1` region. Accordingly, the signature calculations in Signature Version 4 must...
use us-east-1 as region, even if the location constraint in the request specifies another region where the bucket is to be created.

**Request Parameters**

This implementation of the operation does not use request parameters.

**Request Headers**

This implementation of the operation can use the following request headers in addition to the request headers common to all operations. Request headers are limited to 8 KB in size. For more information, see Common Request Headers (p. 2).

When creating a bucket, you can grant permissions to individual AWS accounts or predefined groups defined by Amazon S3. This results in creation of the Access Control List (ACL) on the bucket. For more information, see Using ACLs. You have the following two ways to grant these permissions:

- **Specify a canned ACL** — Amazon S3 supports a set of predefined ACLs, known as canned ACLs. Each canned ACL has a predefined set of grantees and permissions. For more information, go to Canned ACL.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-acl</td>
<td>The canned ACL to apply to the bucket you are creating. For more information, go to <a href="https://docs.aws.amazon.com/AmazonS3/latest/userguide/CannedACLs.html">Canned ACL</a> in the Amazon Simple Storage Service Developer Guide.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid Values: private</td>
<td>public-read</td>
</tr>
</tbody>
</table>

- **Specify access permissions explicitly** — If you want to explicitly grant access permissions to specific AWS accounts or groups, you use the following headers. Each of these headers maps to specific permissions Amazon S3 supports in an ACL. For more information, go to [Access Control List (ACL) Overview](https://docs.aws.amazon.com/AmazonS3/latest/userguide/UsingAccessControlLists.html). In the header value, you specify a list of grantees who get the specific permission.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-grant-read</td>
<td>Allows grantee to list the objects in the bucket.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: None</td>
<td></td>
</tr>
<tr>
<td>x-amz-grant-write</td>
<td>Allows grantee to create, overwrite, and delete any object in the bucket.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: None</td>
<td></td>
</tr>
</tbody>
</table>
You specify each grantee as a type=value pair, where the type can be one of the following:

- emailAddress — if value specified is the email address of an AWS account
- id — if value specified is the canonical user ID of an AWS account
- uri — if granting permission to a predefined group.

For example, the following x-amz-grant-read header grants list objects permission to the AWS accounts identified by their email addresses.

```
x-amz-grant-read: emailAddress="xyz@amazon.com", emailAddress="abc@amazon.com"
```

For more information see, ACL Overview.

### Response Elements

This implementation of the operation does not return response elements.

### Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

### Examples

#### Sample Request

This request creates a bucket named colorpictures.

```
PUT / HTTP/1.1
Host: colorpictures.s3.amazonaws.com
Content-Length: 0
Date: Wed, 01 Mar 2006 12:00:00 GMT
Authorization: authorization string
```

#### Sample Response

```
HTTP/1.1 200 OK
x-amz-id-2: YgIPIfBiKa2bj0KMg95r/0zo3emzU4dzsD4rcKCHQUAdQkf3ShJTOopXUueF6QKo
x-amz-request-id: 236A8905248E5A01
Date: Wed, 01 Mar 2006 12:00:00 GMT
Location: /colorpictures
Content-Length: 0
Connection: close
Server: AmazonS3
```

#### Sample Request: Setting the region of a bucket

The following request sets the region the bucket to EU.
PUT / HTTP/1.1  
Host: bucketName.s3.amazonaws.com  
Date: Wed, 12 Oct 2009 17:50:00 GMT  
Authorization: authorization string  
Content-Type: text/plain  
Content-Length: 124  

<CreateBucketConfiguration xmlns="http://s3.amazonaws.com/doc/2006-03-01/">  
  <LocationConstraint>EU</LocationConstraint>  
</CreateBucketConfiguration>

Sample Response

Sample Request: Creating a bucket and configuring access permission using a canned ACL

This request creates a bucket named "colorpictures" and sets the ACL to private.

PUT / HTTP/1.1  
Host: colorpictures.s3.amazonaws.com  
Content-Length: 0  
x-amz-acl: private  
Date: Wed, 01 Mar 2006 12:00:00 GMT  
Authorization: authorization string

Sample Response

Sample Request: Creating a bucket and configuring access permissions explicitly

This request creates a bucket named colorpictures and grants WRITE permission to the AWS account identified by an email address.

PUT HTTP/1.1  
Host: colorpictures.s3.amazonaws.com  
x-amz-date: Sat, 07 Apr 2012 00:54:40 GMT  
Authorization: authorization string  
x-amz-grant-write: emailAddress="xyz@amazon.com", emailAddress="abc@amazon.com"

Sample Response

- DELETE Bucket (p. 67)
PUT Bucket accelerate

Description

This implementation of the PUT operation uses the accelerate subresource to set the Transfer Acceleration state of an existing bucket. Amazon S3 Transfer Acceleration is a bucket-level feature that enables you to perform faster data transfers to Amazon S3.

To use this operation, you must have permission to perform the s3:PutAccelerateConfiguration action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources in the Amazon Simple Storage Service Developer Guide.

The Transfer Acceleration state of a bucket can be set to one of the following two values:

- **Enabled** – Enables accelerated data transfers to the bucket.
- **Suspended** – Disables accelerated data transfers to the bucket.

The GET Bucket accelerate (p. 107) operation returns the transfer acceleration state of a bucket.

After setting the Transfer Acceleration state of a bucket to Enabled, it might take up to thirty minutes before the data transfer rates to the bucket increase.

The name of the bucket used for Transfer Acceleration must be DNS-compliant and must not contain periods (".").

For more information about transfer acceleration, see Transfer Acceleration in the Amazon Simple Storage Service Developer Guide.

Requests

Syntax

```
PUT /?accelerate HTTP/1.1
Host: bucketname.s3.amazonaws.com
Content-Length: length
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

Transfer acceleration configuration in the request body
```

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).
Request Body

In the request, you specify the acceleration configuration in the request body. The acceleration configuration is specified as XML. The following is an example of an acceleration configuration used in a request. The Status indicates whether to set the transfer acceleration state to Enabled or Suspended.

```xml
    <Status>transfer acceleration state</Status>
</AccelerateConfiguration>
```

The following table describes the XML elements in the acceleration configuration:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>AccelerateConfiguration</td>
<td>Container for setting the transfer acceleration state. Type: Container Children: Status Ancestor: None</td>
<td>Yes</td>
</tr>
<tr>
<td>Status</td>
<td>Sets the transfer acceleration state of the bucket. Type: Enum Valid Values: Enabled</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Suspended</td>
</tr>
</tbody>
</table>

Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

This implementation of the operation does not return response elements.

Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

Examples

Example 1: Add Transfer Acceleration Configuration to Set Acceleration Status

The following is an example of a PUT `/?accelerate` request that enables transfer acceleration for the bucket named examplebucket.
PUT /?accelerate HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Date: Mon, 11 Apr 2016 12:00:00 GMT
Authorization: authorization string
Content-Type: text/plain
Content-Length: length

  <Status>Enabled</Status>
</AccelerateConfiguration>

The following is an example response:

HTTP/1.1 200 OK
x-amz-id-2: YgIPIfBiKa2bj0KMg95r/0zo3emzU4dzsD4rcKCHQUAdQkf3ShJTOOpXUueF6QNo
x-amz-request-id: 236A8905248E5A01
Date: Mon, 11 Apr 2016 12:00:00 GMT
Content-Length: 0
Server: AmazonS3

Related Resources

- GET Bucket accelerate (p. 107)
- PUT Bucket (p. 205)
PUT Bucket acl

Description

This implementation of the PUT operation uses the acl subresource to set the permissions on an existing bucket using access control lists (ACL). For more information, go to Using ACLs. To set the ACL of a bucket, you must have WRITE_ACP permission.

You can use one of the following two ways to set a bucket's permissions:

- Specify the ACL in the request body
- Specify permissions using request headers

**Note**
You cannot specify access permission using both the body and the request headers.

Depending on your application needs, you may choose to set the ACL on a bucket using either the request body or the headers. For example, if you have an existing application that updates a bucket ACL using the request body, then you can continue to use that approach.

Requests

Syntax

The following request shows the syntax for sending the ACL in the request body. If you want to use headers to specify the permissions for the bucket, you cannot send the ACL in the request body. Instead, see Request Headers section for a list of headers you can use.

```
PUT /?acl HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

<AccessControlPolicy>
  <Owner>
    <ID>ID</ID>
    <DisplayName>EmailAddress</DisplayName>
  </Owner>
  <AccessControlList>
    <Grant>
      <Grantee xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="CanonicalUser">
        <ID>ID</ID>
        <DisplayName>EmailAddress</DisplayName>
      </Grantee>
      <Permission>Permission</Permission>
    </Grant>
    ...
  </AccessControlList>
</AccessControlPolicy>
```

Request Parameters

This implementation of the operation does not use request parameters.
Request Headers

You can use the following request headers in addition to the Common Request Headers (p. 2).

These headers enable you to set access permissions using one of the following methods:

- Specify a canned ACL, or
- Specify the permission for each grantee explicitly

Amazon S3 supports a set of predefined ACLs, known as canned ACLs. Each canned ACL has a predefined set of grantees and permissions. For more information, see Canned ACL. To grant access permissions by specifying canned ACLs, you use the following header and specify the canned ACL name as its value. If you use this header, you cannot use other access control specific headers in your request.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-acl</td>
<td>Sets the ACL of the bucket using the specified canned ACL. For more information, go to Canned ACL in the Amazon Simple Storage Service Developer Guide.</td>
<td>No</td>
</tr>
</tbody>
</table>

If you need to grant individualized access permissions on a bucket, you can use the following "x-amz-grant-permission" headers. When using these headers you specify explicit access permissions and grantees (AWS accounts or a Amazon S3 groups) who will receive the permission. If you use these ACL specific headers, you cannot use x-amz-acl header to set a canned ACL.

**Note**

Each of the following request headers maps to specific permissions Amazon S3 supports in an ACL. For more information go to Access Control List (ACL) Overview.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-grant-read</td>
<td>Allows the specified grantee(s) to list the objects in the bucket.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: None</td>
<td></td>
</tr>
<tr>
<td>x-amz-grant-write</td>
<td>Allows the specified grantee(s) to create, overwrite, and delete any object in the bucket.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: None</td>
<td></td>
</tr>
<tr>
<td>x-amz-grant-read-acp</td>
<td>Allows the specified grantee(s) to read the bucket ACL.</td>
<td>No</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------</td>
</tr>
<tr>
<td>x-amz-grant-write-acp</td>
<td>Allows the specified grantee(s) to write the ACL for the applicable bucket. Type: String Default: None Constraints: None</td>
<td>No</td>
</tr>
<tr>
<td>x-amz-grant-full-control</td>
<td>Allows the specified grantee(s) the READ, WRITE, READ_ACP, and WRITE_ACP permissions on the bucket. Type: String Default: None Constraints: None</td>
<td>No</td>
</tr>
</tbody>
</table>

For each of these headers, the value is a comma-separated list of one or more grantees. You specify each grantee as a type=value pair, where the type can be one of the following:

- `emailAddress` — if value specified is the email address of an AWS account
- `id` — if value specified is the canonical User ID of an AWS account
- `uri` — if granting permission to a predefined Amazon S3 group.

For example, the following `x-amz-grant-write` header grants create, overwrite, and delete objects permission to LogDelivery group predefined by Amazon S3 and two AWS accounts identified by their email addresses.

`x-amz-grant-write: uri="http://acs.amazonaws.com/groups/s3/LogDelivery", emailAddress="xyz@amazon.com", emailAddress="abc@amazon.com"`

For more information, go to [Access Control List (ACL) Overview](#). For more information about bucket logging, go to [Server Access Logging](#).

### Request Elements

If you decide to use the request body to specify an ACL, you must use the following elements.

**Note**

- If you request the request body, you cannot use the request headers to set an ACL.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>AccessControlList</td>
<td>Container for Grant, Grantee, and Permission</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: Container</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestors: AccessControlPolicy</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------</td>
</tr>
<tr>
<td>AccessControlPolicy</td>
<td>Contains the elements that set the ACL permissions for an object per grantee.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestors: None</td>
<td></td>
</tr>
<tr>
<td>DisplayName</td>
<td>Screen name of the bucket owner.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestors: AccessControlPolicy.Owner</td>
<td></td>
</tr>
<tr>
<td>Grant</td>
<td>Container for the grantee and his or her permissions.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: Container</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestors: AccessControlPolicy.AccessControlList</td>
<td></td>
</tr>
<tr>
<td>Grantee</td>
<td>The subject whose permissions are being set. For more information, see Grantee Values (p. 217).</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestors: AccessControlPolicy.AccessControlList.Grant</td>
<td></td>
</tr>
<tr>
<td>ID</td>
<td>ID of the bucket owner, or the ID of the grantee.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td>Owner</td>
<td>Container for the bucket owner's display name and ID.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: Container</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestors: AccessControlPolicy</td>
<td></td>
</tr>
<tr>
<td>Permission</td>
<td>Specifies the permission given to the grantee.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid Values: FULL_CONTROL</td>
<td>WRITE</td>
</tr>
<tr>
<td></td>
<td>Ancestors: AccessControlPolicy.AccessControlList.Grant</td>
<td></td>
</tr>
</tbody>
</table>

**Grantee Values**

You can specify the person (grantee) to whom you're assigning access rights (using request elements) in the following ways:

- By the person's ID:
Responses

Response Headers

The operation returns response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

This operation does not return response elements.

Special Errors

This operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

Examples

Sample Request: Access permissions specified in the body

The following request grants access permission to the existing examplebucket bucket. The request specifies the ACL in the body. In addition to granting full control to the bucket owner, the XML specifies the following grants.

- Grant AllUsers group READ permission on the bucket.
- Grant the LogDelivery group WRITE permission on the bucket.
- Grant an AWS account, identified by email address, WRITE_ACP permission.
- Grant an AWS account, identified by canonical user ID, READ_ACP permission.

```xml
<Grantee xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="CanonicalUser"><ID><replaceable>ID</replaceable></ID><DisplayName><replaceable>GranteesEmail</replaceable></DisplayName></Grantee>

DisplayName is optional and ignored in the request.

- By Email address:

```xml
<Grantee xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="AmazonCustomerByEmail"><EmailAddress><replaceable>Grantees@email.com</replaceable></EmailAddress></Grantee>

The grantee is resolved to the CanonicalUser and, in a response to a GET Object acl request, appears as the CanonicalUser.

- By URI:

```xml
```

PUT ?acl HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Sample Response

HTTP/1.1 200 OK
x-amz-id-2: NxqO3PN1MHXXGwjgv15LLgUoAmFVmG0xtZw2sxePXLhp1vcyouXDrQuaWXcOK0
x-amz-request-id: C651BC9B4E1BD401
Date: Thu, 12 Apr 2012 20:04:28 GMT
Content-Length: 0
Server: AmazonS3

Sample Request: Access permissions specified using headers

The following request uses ACL-specific request headers to grant the following permissions:

- Write permission to the Amazon S3 LogDelivery group and an AWS account identified by the email xyz@amazon.com.
Read permission to the Amazon S3 AllUsers group

```http
PUT ?acl HTTP/1.1
Host: examplebucket.s3.amazonaws.com
x-amz-date: Sun, 29 Apr 2012 22:00:57 GMT
x-amz-grant-write: uri="http://acs.amazonaws.com/groups/s3/LogDelivery",
    emailAddress="xyz@amazon.com"
x-amz-grant-read: uri="http://acs.amazonaws.com/groups/global/AllUsers"
Accept: */*
Authorization: authorization string
```

Sample Response

```
HTTP/1.1 200 OK
x-amz-id-2: Ow9lImt23VF9s6OofOTDZelf7mrryz7d04Mw23FQC14O2052W28Zn+d340/RytoQ
x-amz-request-id: A6A8F01A38EC7138
Date: Sun, 29 Apr 2012 22:01:10 GMT
Content-Length: 0
Server: AmazonS3
```

- DELETE Bucket (p. 67)
- GET Object ACL (p. 329)
PUT Bucket analytics

Description

This implementation of the PUT operation adds an analytics configuration (identified by the analytics ID) to the bucket. You can have up to 1,000 analytics configurations per bucket.

You can choose to have storage class analysis export analysis reports to a comma-separated values (CSV) flat file, see the DataExport request element. Reports are updated daily and are based on the object filters you configure. When selecting data export you specify a destination bucket and optional destination prefix where the file is written. You can export the data to a destination bucket in a different account. However, the destination bucket must be in the same region as the bucket that you are making the PUT analytics configuration to. For more information, see Amazon S3 Analytics – Storage Class Analysis in the Amazon Simple Storage Service Developer Guide.

**Important**

You must create a bucket policy on the destination bucket where the exported file is written to grant permissions to Amazon S3 to write objects to the bucket. For an example policy, see Granting Permissions for Amazon S3 Inventory and Storage Class Analysis.

To use this operation, you must have permissions to perform the s3:PutAnalyticsConfiguration action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources in the Amazon Simple Storage Service Developer Guide.

Requests

Syntax

PUT /?analytics&id=configuration-ID HTTP/1.1
Host: bucketname.s3.amazonaws.com
Content-Length: length
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

*Analytics configuration in the request body*

Request Parameters

This implementation of PUT uses the parameter in the following table.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>The ID identifying the analytics configuration. This ID must match the request element id. Limited to 64 characters.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid Characters for id: a-z A-Z 0-9 - _ .</td>
<td></td>
</tr>
</tbody>
</table>
Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

In the request, you must specify the analytics configuration in the request body, which is specified as XML. The Examples section shows an example of an analytics configuration.

The following table describes the XML elements in the analytics configuration:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>AnalyticsConfiguration</td>
<td>Contains the configuration and any analyses for the analytics filter. Type: Container &lt;br&gt; Children: Id, Filter, StorageClassAnalysis &lt;br&gt; Ancestor: None</td>
<td>Yes</td>
</tr>
<tr>
<td>And</td>
<td>A conjunction (logical AND) of predicates, which is used in evaluating an analytics filter. The operator must have at least two predicates. Type: String &lt;br&gt; Children: Prefix, Tag &lt;br&gt; Ancestor: Filter</td>
<td>No</td>
</tr>
<tr>
<td>Bucket</td>
<td>The Amazon Resource Name (ARN) of the bucket where analytics results are published. This destination bucket must be in the same region as the bucket used for the analytics configuration PUT. Type: String &lt;br&gt; Ancestor: S3BucketDestination</td>
<td>Yes</td>
</tr>
<tr>
<td>BucketAccountId</td>
<td>The ID of the account that owns the destination bucket where the analytics is published. Although optional, we recommend that the value be set to prevent problems if the destination bucket ownership changes. Type: String &lt;br&gt; Ancestor: S3BucketDestination</td>
<td>No</td>
</tr>
<tr>
<td>DataExport</td>
<td>A container used to describe how data related to the storage class analysis should be exported. Type: Container &lt;br&gt; Children: OutputSchemaVersion, Destination</td>
<td>No</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>--------------------</td>
<td>---------------------------------------------------------------------------------------------------</td>
<td>----------</td>
</tr>
<tr>
<td>Destination</td>
<td>Contains information about where to publish the analytics results.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: Container</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Children: S3BucketDestination</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestor: DataExport</td>
<td></td>
</tr>
<tr>
<td>Filter</td>
<td>Specifies an analytics filter. The analytics only includes objects that meet the filter's criteria. If no filter is specified, all of the contents of the bucket are included in the analysis.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: Container</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Children: And</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestor: AnalyticsConfiguration</td>
<td></td>
</tr>
<tr>
<td>Format</td>
<td>Specifies the output format of the analytics results. Currently, Amazon S3 supports the comma-separated value (CSV) format.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestor: S3BucketDestination</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid values: CSV</td>
<td></td>
</tr>
<tr>
<td>Id</td>
<td>The ID that identifies the analytics configuration. This ID must match the request parameter id.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestor: AnalyticsConfiguration</td>
<td></td>
</tr>
<tr>
<td>Key</td>
<td>The key for a tag.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestor: Tag</td>
<td></td>
</tr>
<tr>
<td>OutputSchemaVersion</td>
<td>The version of the output schema to use when exporting data. Must be V_1.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestor: DataExport</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid values: V_1</td>
<td></td>
</tr>
</tbody>
</table>
## Name | Description | Required
--- | --- | ---
Prefix | The prefix that an object must have to be included in the analytics results. Type: String Ancestor: And | No
Prefix | The prefix that is prepended to all analytics results. Type: String Ancestor: S3BucketDestination | No
StorageClassAnalysis | Indicates that data related to access patterns will be collected and made available to analyze the tradeoffs between different storage classes. Type: Container Children: DataExport Ancestor: AnalyticsConfiguration | Yes
S3BucketDestination | Contains the bucket ARN, file format, bucket owner (optional), and prefix (optional) where analytics results are published. Type: Container Children: Format, BucketAccountId, Bucket, Prefix Ancestor: Destination. | Yes
Tag | The tag to use when evaluating an analytics filter. Type: Container Children: Key, Value Ancestor: And | No
Value | The value for a tag. Type: String Ancestor: Tag | Yes

### Responses

#### Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).
Response Elements

This implementation of the operation does not return response elements.

Special Errors

Amazon S3 checks the validity of the proposed AnalyticsConfiguration element and verifies whether the proposed configuration is valid when you call the PUT operation. The following table lists the errors and possible causes.

<table>
<thead>
<tr>
<th>HTTP Error</th>
<th>Code</th>
<th>Cause</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP 400 Bad Request</td>
<td>InvalidArgument</td>
<td>Invalid argument.</td>
</tr>
<tr>
<td>HTTP 403 Forbidden</td>
<td>AccessDenied</td>
<td>You are not the owner of the specified bucket, or you do not have the s3:PutAnalyticsConfiguration bucket permission to set the configuration on the bucket.</td>
</tr>
</tbody>
</table>

For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

Examples

Example 1: Creating an Analytics Configuration

The following PUT request for the bucket examplebucket creates a new or replaces an existing analytics configuration with the ID report1. The configuration is defined in the request body.

```
PUT /?analytics&id=report1 HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Date: Mon, 31 Oct 2016 12:00:00 GMT
Authorization: authorization string
Content-Length: length

<?xml version="1.0" encoding="UTF-8"?>
<AnalyticsConfiguration xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <Id>report1</Id>
  <Filter>
    <And>
      <Prefix>images/</Prefix>
      <Tag>
        <Key>dog</Key>
        <Value>corgi</Value>
      </Tag>
    </And>
  </Filter>
  <StorageClassAnalysis>
    <DataExport>
      <OutputSchemaVersion>V_1</OutputSchemaVersion>
      <Destination>
        <S3BucketDestination>
          <Format>CSV</Format>
          <BucketAccountId>123456789012</BucketAccountId>
          <Bucket>arn:aws:s3:::destination-bucket</Bucket>
          <Prefix>destination-prefix</Prefix>
        </S3BucketDestination>
      </Destination>
    </DataExport>
  </StorageClassAnalysis>
</AnalyticsConfiguration>
```
The following is a sample response.

```
HTTP/1.1 200 OK
x-amz-id-2: YgIPIfBiKa2bj0KMg95r/0zo3emzU4dzsD4rcKCHQUAAdQkf3ShJTOOpXUueF6QKo
x-amz-request-id: 236A8905248E5A01
Date: Mon, 31 Oct 2016 12:00:00 GMT
Content-Length: 0
Server: AmazonS3
```

PUT Bucket cors

Description

Sets the cors configuration for your bucket. If the configuration exists, Amazon S3 replaces it.

To use this operation, you must be allowed to perform the s3:PutBucketCORS action. By default, the bucket owner has this permission and can grant it to others.

You set this configuration on a bucket so that the bucket can service cross-origin requests. For example, you might want to enable a request whose origin is http://www.example.com to access your Amazon S3 bucket at my.example.bucket.com by using the browser's XMLHttpRequest capability.

To enable cross-origin resource sharing (CORS) on a bucket, you add the cors subresource to the bucket. The cors subsresource is an XML document in which you configure rules that identify origins and the HTTP methods that can be executed on your bucket. The document is limited to 64 KB in size. For example, the following cors configuration on a bucket has two rules:

- The first CORSRule allows cross-origin PUT, POST and DELETE requests whose origin is https://www.example.com origins. The rule also allows all headers in a pre-flight OPTIONS request through the Access-Control-Request-Headers header. Therefore, in response to any pre-flight OPTIONS request, Amazon S3 will return any requested headers.
- The second rule allows cross-origin GET requests from all the origins. The '*' wildcard character refers to all origins.

```xml
<CORSConfiguration>
  <CORSRule>
    <AllowedOrigin>http://www.example.com</AllowedOrigin>
    <AllowedMethod>PUT</AllowedMethod>
    <AllowedMethod>POST</AllowedMethod>
    <AllowedMethod>DELETE</AllowedMethod>
    <AllowedHeader>*</AllowedHeader>
  </CORSRule>
  <CORSRule>
    <AllowedOrigin>*</AllowedOrigin>
    <AllowedMethod>GET</AllowedMethod>
  </CORSRule>
</CORSConfiguration>
```

The cors configuration also allows additional optional configuration parameters as shown in the following cors configuration on a bucket. For example, this cors configuration allows cross-origin PUT and POST requests from http://www.example.com.

```xml
<CORSConfiguration>
  <CORSRule>
    <AllowedOrigin>http://www.example.com</AllowedOrigin>
    <AllowedMethod>PUT</AllowedMethod>
    <AllowedMethod>POST</AllowedMethod>
    <AllowedMethod>DELETE</AllowedMethod>
    <AllowedHeader>*</AllowedHeader>
    <MaxAgeSeconds>300</MaxAgeSeconds>
    <ExposeHeader>x-amz-server-side-encryption</ExposeHeader>
  </CORSRule>
</CORSConfiguration>
```
In the preceding configuration, CORSRule includes the following additional optional parameters:

- **MaxAgeSeconds**—Specifies the time in seconds that the browser will cache an Amazon S3 response to a pre-flight OPTIONS request for the specified resource. In this example, this parameter is 3000 seconds. Caching enables the browsers to avoid sending pre-flight OPTIONS request to Amazon S3 for repeated requests.
- **ExposeHeader**—Identifies the response header (in this case x-amz-server-side-encryption) that you want customers to be able to access from their applications (for example, from a JavaScript XMLHttpRequest object).

When Amazon S3 receives a cross-origin request (or a pre-flight OPTIONS request) against a bucket, it evaluates the cors configuration on the bucket and uses the first CORSRule rule that matches the incoming browser request to enable a cross-origin request. For a rule to match, the following conditions must be met:

- The request's Origin header must match AllowedOrigin elements.
- The request method (for example, GET, PUT, HEAD and so on) or the Access-Control-Request-Method header in case of a pre-flight OPTIONS request must be one of the AllowedMethod elements.
- Every header specified in the Access-Control-Request-Headers request header of a pre-flight request must match an AllowedHeader element.

For more information about CORS, go to Enabling Cross-Origin Resource Sharing in the Amazon Simple Storage Service Developer Guide.

## Requests

### Syntax

```plaintext
PUT /?cors HTTP/1.1
Host: bucketname.s3.amazonaws.com
Content-Length: length
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))
Content-MD5: MD5

<CORSConfiguration>
  <CORSRule>
    <AllowedOrigin>Origin you want to allow cross-domain requests from</AllowedOrigin>
    <AllowedOrigin>...<AllowedOrigin>
    ... <AllowedMethod>HTTP method</AllowedMethod>
    <AllowedMethod>...<AllowedMethod>
    ... <MaxAgeSeconds>Time in seconds your browser to cache the pre-flight OPTIONS response for a resource</MaxAgeSeconds>
    <AllowedHeader>Headers that you want the browser to be allowed to send</AllowedHeader>
    <AllowedHeader>...<AllowedHeader>
    ... <ExposeHeader>Headers in the response that you want accessible from client application</ExposeHeader>
    <ExposeHeader>...<ExposeHeader>
  </CORSRule>
  ...<CORSRule>
</CORSRule>
```

API Version 2006-03-01

228
Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content-MD5</td>
<td>The base64-encoded 128-bit MD5 digest of the data. This header must be used as a message integrity check to verify that the request body was not corrupted in transit. For more information, go to RFC 1864. Type: String Default: None</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Request Elements

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
</table>
| CORSConfiguration | Container for up to 100 CORSRules elements.  
Type: Container  
Children: CORSRules  
Ancestor: None | Yes |
| CORSRule     | A set of origins and methods (cross-origin access that you want to allow). You can add up to 100 rules to the configuration.  
Type: Container  
Children: AllowedOrigin, AllowedMethod, MaxAgeSeconds, ExposeHeader, ID.  
Ancestor: CORSConfiguration | Yes |
| ID           | A unique identifier for the rule. The ID value can be up to 255 characters long. The IDs help you find a rule in the configuration.  
Type: String  
Ancestor: CORSRule | No |
| AllowedMethod| An HTTP method that you want to allow the origin to execute. Each CORSRule must identify at least one origin and one method.  
Type: Enum (GET, PUT, HEAD, POST, DELETE) | Yes |
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>AllowedOrigin</td>
<td>An origin that you want to allow cross-domain requests from. This can contain at most one * wild character. Each CORSRule must identify at least one origin and one method. The origin value can include at most one &quot;<em>&quot; wild character. For example, &quot;http://</em>.example.com&quot;. You can also specify only * as the origin value allowing all origins cross-domain access.</td>
<td>Yes</td>
</tr>
<tr>
<td>AllowedHeader</td>
<td>Specifies which headers are allowed in a pre-flight OPTIONS request via the Access-Control-Request-Headers header. Each header name specified in the Access-Control-Request-Headers header must have a corresponding entry in the rule. Amazon S3 will send only the allowed headers in a response that were requested. This can contain at most one * wild character.</td>
<td>No</td>
</tr>
<tr>
<td>MaxAgeSeconds</td>
<td>The time in seconds that your browser is to cache the preflight response for the specified resource. A CORSRule can have at most one MaxAgeSeconds element. Type: Integer (seconds)</td>
<td>No</td>
</tr>
<tr>
<td>ExposeHeader</td>
<td>One or more headers in the response that you want customers to be able to access from their applications (for example, from a JavaScript XMLHttpRequest object). You add one ExposeHeader element in the rule for each header.</td>
<td>No</td>
</tr>
</tbody>
</table>

**Responses**

**Response Headers**

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).
Response Elements

This implementation of the operation does not return response elements.

Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

Examples

The following examples add the cors subresource to a bucket.

Example : Configure cors

Sample Request

The following PUT request adds the cors subresource to a bucket (examplebucket).

```
PUT /?cors HTTP/1.1
Host: examplebucket.s3.amazonaws.com
x-amz-date: Tue, 21 Aug 2012 17:54:50 GMT
Content-MD5: 8dYiLeWFZyGgVQ5F14W==
Authorization: authorization string
Content-Length: 216

<CORSConfiguration>
  <CORSRule>
    <AllowedOrigin>http://www.example.com</AllowedOrigin>
    <AllowedMethod>PUT</AllowedMethod>
    <AllowedMethod>POST</AllowedMethod>
    <AllowedMethod>DELETE</AllowedMethod>
    <AllowedHeader>*</AllowedHeader>
    <MaxAgeSeconds>3000</MaxAgeSeconds>
    <ExposeHeader>x-amz-server-side-encryption</ExposeHeader>
  </CORSRule>
  <CORSRule>
    <AllowedOrigin>*</AllowedOrigin>
    <AllowedMethod>GET</AllowedMethod>
    <AllowedHeader>*</AllowedHeader>
    <MaxAgeSeconds>3000</MaxAgeSeconds>
  </CORSRule>
</CORSConfiguration>
```

Sample Response

```
HTTP/1.1 200 OK
x-amz-id-2: CCshOvbOPfxzhW4AdycCqHj/Ck3F9Q0v1XXw3rrHj+GcBo2SOOahvEJfPisZB7B
x-amz-request-id: BDC4B83DF5096B8B
Date: Tue, 21 Aug 2012 17:54:50 GMT
Server: AmazonS3
```

PUT Bucket encryption

Description

This implementation of the PUT operation uses the encryption subresource to set the default encryption state of an existing bucket.

This implementation of the PUT operation sets default encryption for a buckets using server-side encryption with Amazon S3-managed keys SSE-S3 or AWS KMS-managed Keys (SSE-KMS) bucket. For information about the Amazon S3 default encryption feature, see Amazon S3 Default Bucket Encryption in the Amazon Simple Storage Service Developer Guide.

Important
This operation requires AWS Signature Version 4. For more information, see Authenticating Requests (AWS Signature Version 4) (p. 14).

To use this operation, you must have permissions to perform the s3:PutEncryptionConfiguration action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources in the Amazon Simple Storage Service Developer Guide.

Requests

Syntax

PUT /?encryption HTTP/1.1
Host: bucketname.s3.amazonaws.com
Content-Length: length
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

default encryption configuration in the request body

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Body

In the request, you specify the encryption configuration in the request body. The encryption configuration is specified as XML, as shown in the following examples that show setting encryption using SSE-S3 or SSE-KMS.

The following is an example of the request body for setting SSE-S3.

```xml
  <Rule>
    <ApplyServerSideEncryptionByDefault>
      <SSEAlgorithm>AES256</SSEAlgorithm>
    </ApplyServerSideEncryptionByDefault>
  </Rule>
</ServerSideEncryptionConfiguration>
```
The following is an example of the request body for setting SSE-KMS.

```xml
  <Rule>
    <ApplyServerSideEncryptionByDefault>
      <SSEAlgorithm>aws:kms</SSEAlgorithm>
      <KMSMasterKeyID>arn:aws:kms:us-east-1:1234/5678example</KMSMasterKeyID>
    </ApplyServerSideEncryptionByDefault>
  </Rule>
</ServerSideEncryptionConfiguration>
```

The following table describes the XML elements in the encryption configuration:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ApplyServerSideEncryptionByDefault</strong></td>
<td>Container for setting server-side encryption by default.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: Container</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Children: SSEAlgorithm, KMSMasterKeyID</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestor: Rule</td>
<td></td>
</tr>
<tr>
<td><strong>KMSMasterKeyID</strong></td>
<td>The AWS KMS master key ID used for the SSE-KMS encryption.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestor: ApplyServerSideEncryptionByDefault</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraint: Can only be used when you set the value of SSEAlgorithm as aws:kms. The default aws/s3 AWS KMS master key is used if this element is absent while the SSEAlgorithm is aws:kms.</td>
<td></td>
</tr>
<tr>
<td><strong>Rule</strong></td>
<td>Container for server-side encryption by default configuration.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: Container</td>

<tr>
<td><strong>ServerSideEncryptionConfiguration</strong></td>
<td>Container for the server-side encryption by default configuration rule.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: Container</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Children: Rule</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestor: None</td>
<td></td>
</tr>
</tbody>
</table>
**Name** | **Description** | **Required**
--- | --- | ---
SSEAlgorithm | The server-side encryption algorithm to use. Type: String Valid Values: AES256, aws:kms Ancestor: ApplyServerSideEncryptionByDefault Constraint: Can only be used when you use ApplyServerSideEncryptionByDefault. | Yes

### Responses

#### Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see [Common Response Headers](p. 4).

#### Response Elements

This implementation of the operation does not return response elements.

#### Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see [Error Responses](p. 6).

### Examples

#### Example 1: Set the Default Encryption Configuration for an S3 Bucket

The following is an example of a PUT `/?encryption` request that specifies to use AWS KMS encryption.

```plaintext
PUT /?encryption HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Date: Wed, 06 Sep 2017 12:00:00 GMT
Authorization: authorization string
Content-Length: length

  <Rule>
    <ApplyServerSideEncryptionByDefault>
      <SSEAlgorithm>aws:kms</SSEAlgorithm>
      <KMSMasterKeyID>arn:aws:kms:us-east-1:1234/5678example</KMSMasterKeyID>
    </ApplyServerSideEncryptionByDefault>
  </Rule>
</ServerSideEncryptionConfiguration>
```

The following is an example response:

```
HTTP/1.1 100 Continue
```

- GET Bucket encryption (p. 122)
- DELETE Bucket encryption (p. 73)
PUT Bucket inventory

Description

This implementation of the PUT operation adds an inventory configuration (identified by the inventory ID) to the bucket. You can have up to 1,000 inventory configurations per bucket.

Amazon S3 inventory generates inventories of the objects in the bucket on a daily or weekly basis, and the results are published to a flat file. The bucket that is inventoried is called the source bucket, and the bucket where the inventory flat file is stored is called the destination bucket. The destination bucket must be in the same AWS Region as the source bucket.

When you configure an inventory for a source bucket, you specify the destination bucket where you want the inventory to be stored, and whether to generate the inventory daily or weekly. You can also configure what object metadata to include and whether to inventory all object versions or only current versions. For more information, see Amazon S3 Inventory in the Amazon Simple Storage Service Developer Guide.

Important

You must create a bucket policy on the destination bucket to grant permissions to Amazon S3 to write objects to the bucket in the defined location. For an example policy, see Granting Permissions for Amazon S3 Inventory and Storage Class Analysis.

To use this operation, you must have permissions to perform the s3:PutInventoryConfiguration action. The bucket owner has this permission by default and can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources in the Amazon Simple Storage Service Developer Guide.

Requests

Syntax

PUT /?inventory&id=configuration-ID HTTP/1.1
Host: bucketname.s3.amazonaws.com
Content-Length: length
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

Inventory configuration in the request body

Request Parameters

This implementation of PUT uses the parameter in the following table.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>The ID identifying the inventory configuration. This ID must match the request element id. Limited to 64 characters.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid Characters for id: a-z A-Z 0-9 - _</td>
<td></td>
</tr>
</tbody>
</table>
Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

In the request, you must specify the inventory configuration in the request body, which is specified as XML. The Examples section shows an example of an inventory configuration.

The following table describes the XML elements in the inventory configuration:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>AccountId</td>
<td>The ID of the account that owns the destination bucket.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Although optional, we recommend that the value be set to prevent problems if the destination bucket ownership changes.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestor: S3BucketDestination</td>
<td></td>
</tr>
<tr>
<td>Bucket</td>
<td>The Amazon Resource Name (ARN) of the bucket where inventory results are published. This destination bucket must be in the same AWS Region as the source bucket.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestor: S3BucketDestination</td>
<td></td>
</tr>
<tr>
<td>Destination</td>
<td>Contains information about where to publish the inventory results.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: Container</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Children: S3BucketDestination</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestor: InventoryConfiguration</td>
<td></td>
</tr>
<tr>
<td>Encryption</td>
<td>Contains the type of server-side encryption to use to encrypt the inventory.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: Container</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Children: SSE-KMS, SSE-S3</td>
<td></td>
</tr>
<tr>
<td></td>

Special Errors

Amazon S3 checks the validity of the proposed InventoryConfiguration element and verifies whether the proposed configuration is valid when you call the PUT operation. The following table lists the errors and possible causes.

<table>
<thead>
<tr>
<th>HTTP Error</th>
<th>Code</th>
<th>Cause</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP 400 Bad Request</td>
<td>InvalidArgument</td>
<td>Invalid argument.</td>
</tr>
<tr>
<td>HTTP 403 Forbidden</td>
<td>AccessDenied</td>
<td>You are not the owner of the specified bucket, or you do not have the s3:PutInventoryConfiguration bucket permission to set the configuration on the bucket.</td>
</tr>
</tbody>
</table>

For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

Examples

Example 1: Creating an Inventory Configuration

The following PUT request for the bucket examplebucket creates a new or replaces an existing inventory configuration with the ID report1. The configuration is defined in the request body.

```
PUT /?inventory&id=report1 HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Date: Mon, 31 Oct 2016 12:00:00 GMT
Authorization: authorization string
Content-Length: length

<?xml version="1.0" encoding="UTF-8"?>
<InventoryConfiguration xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <Id>report1</Id>
  <IsEnabled>true</IsEnabled>
  <Filter>
    <Prefix>filterPrefix</Prefix>
  </Filter>
  <Destination>
    <S3BucketDestination>
      <Format>CSV</Format>
      <AccountId>123456789012</AccountId>
      <Bucket>arn:aws:s3:::destination-bucket</Bucket>
      <Prefix>prefix1</Prefix>
      <Encryption>
        <SSE-KMS>
          <KeyId>arn:aws:kms:us-west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab</KeyId>
        </SSE-KMS>
      </Encryption>
    </S3BucketDestination>
    <Schedule>
      <Frequency>Daily</Frequency>
    </Schedule>
    <IncludedObjectVersions>All</IncludedObjectVersions>
    <OptionalFields>
      <Field>Size</Field>
      <Field>LastModifiedDate</Field>
      <Field>ETag</Field>
    </OptionalFields>
  </Destination>
</InventoryConfiguration>
```
<Field>StorageClass</Field>
<Field>IsMultipartUploaded</Field>
<Field>ReplicationStatus</Field>
<Field>EncryptionStatus</Field>
</OptionalFields>
</InventoryConfiguration>

The following is a sample response.

HTTP/1.1 200 OK
x-amz-id-2: YgIPIfBiKa2bj0KMg95r/0zo3emsU4dzsD4rcKCHQUAdQkf3ShJTOOpXUueF6QKo
x-amz-request-id: 236A8905248E5A01
Date: Mon, 31 Oct 2016 12:00:00 GMT
Content-Length: 0
Server: AmazonS3

Related Resources

- GET Bucket Inventory (p. 126)
- DELETE Bucket inventory (p. 75)
- List Bucket Inventory Configurations (p. 188)
PUT Bucket lifecycle

Description

Creates a new lifecycle configuration for the bucket or replaces an existing lifecycle configuration. For information about lifecycle configuration, go to Object Lifecycle Management in the Amazon Simple Storage Service Developer Guide.

Note

Bucket lifecycle configuration now supports specifying a lifecycle rule using an object key name prefix, one or more object tags, or a combination of both. Accordingly, this section describes the latest API. The previous version of the API supported filtering based only on an object key name prefix, which is supported for backward compatibility. For the related API description, see PUT Bucket lifecycle (deprecated) (p. 509).

Permissions

By default, all Amazon S3 resources are private, including buckets, objects, and related subresources (for example, lifecycle configuration and website configuration). Only the resource owner (that is, the AWS account that created it) can access the resource. The resource owner can optionally grant access permissions to others by writing an access policy. For this operation, a user must get the s3:PutLifecycleConfiguration permission.

You can also explicitly deny permissions. Explicit deny also supersedes any other permissions. If you want to block users or accounts from removing or deleting objects from your bucket, you must deny them permissions for the following actions:

- s3:DeleteObject
- s3:DeleteObjectVersion
- s3:PutLifecycleConfiguration

For more information about permissions, see Managing Access Permissions to Your Amazon S3 Resources in the Amazon Simple Storage Service Developer Guide.

Requests

Syntax

PUT /?lifecycle HTTP/1.1
Host: bucketname.s3.amazonaws.com
Content-Length: length
Date: date
Authorization: authorization string
Content-MD5: MD5
Lifecycle configuration in the request body

For details about authorization string, see Authenticating Requests (AWS Signature Version 4) (p. 14).

Request Parameters

This implementation of the operation does not use request parameters.
Request Headers

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content-MD5</td>
<td>The base64-encoded 128-bit MD5 digest of the data. This header must be used as a message integrity check to verify that the request body was not corrupted in transit. For more information, see RFC 1864.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

Request Body

You specify the lifecycle configuration in your request body. The lifecycle configuration is specified as XML consisting of one or more rules.

```
<LifecycleConfiguration>
  <Rule>
    ...  
  </Rule>
  <Rule>
    ...  
  </Rule>
...</LifecycleConfiguration>
```

Each rule consists of the following:

- Filter identifying a subset of objects to which the rule applies. The filter can be based on a key name prefix, object tags, or a combination of both.
- Status whether the rule is in effect.
- One or more lifecycle transition and expiration actions that you want Amazon S3 to perform on the objects identified by the filter. If the state of your bucket is versioning-enabled or versioning-suspended, you can have many versions of the same object (one current version and zero or more noncurrent versions). Amazon S3 provides predefined actions that you can specify for current and noncurrent object versions.

For example,

```
<LifecycleConfiguration>
  <Rule>
    <Filter>
      <Prefix>key-prefix</Prefix>
    </Filter>
    <Status>rule-status</Status>
    One or more Transition/Expiration lifecycle actions.
  </Rule>
</LifecycleConfiguration>
```

For more information, see Object Lifecycle Management in the Amazon Simple Storage Service Developer Guide.
For more information, see Lifecycle Configuration Elements in the Amazon Simple Storage Service Developer Guide.

The following table describes the XML elements in the lifecycle configuration:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>AbortIncompleteMultipartUpload</td>
<td>Container for specifying when an incomplete multipart upload becomes eligible for an abort operation. When you specify this lifecycle action, the rule cannot specify a tag-based filter. For more information, see Lifecycle Configuration Elements in the Amazon Simple Storage Service Developer Guide.</td>
<td>Yes, if no other action is specified for the rule.</td>
</tr>
<tr>
<td>And</td>
<td>Container for specify rule filters. These filters determine the subset of objects to which the rule applies. Type: String Ancestor: Rule</td>
<td>Yes, if you specify more than one filter condition (for example, one prefix and one or more tags).</td>
</tr>
<tr>
<td>Date</td>
<td>Date when you want Amazon S3 to take the action. For more information, see Lifecycle Rules: Based on a Specific Date in the Amazon Simple Storage Service Developer Guide. The date value must conform to the ISO 8601 format. The time is always midnight UTC. Type: String Ancestor: Expiration or Transition</td>
<td>Yes, if Days and ExpiredObjectDeleteMarker are absent.</td>
</tr>
<tr>
<td>Days</td>
<td>Specifies the number of days after object creation when the specific rule action takes effect. Type: Nonnegative Integer when used with Transition, Positive Integer when used with Expiration. Ancestor: Expiration, Transition.</td>
<td>Yes, if Date and ExpiredObjectDeleteMarker are absent.</td>
</tr>
<tr>
<td>DaysAfterInitiation</td>
<td>Specifies the number of days after initiating a multipart upload when the multipart upload must be completed. If it does not complete by the specified number of days, it becomes eligible. Yes, if ancestor is specified.</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
<td>----------</td>
</tr>
<tr>
<td>for an abort operation and Amazon S3 aborts the incomplete multipart upload. Type: Positive Integer. Ancestor: AbortIncompleteMultipartUpload.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| Expiration | This action specifies a period in an object's lifetime when Amazon S3 should take the appropriate expiration action. The action Amazon S3 takes depends on whether the bucket is versioning-enabled.  
- If versioning has never been enabled on the bucket, Amazon S3 deletes the only copy of the object permanently.  
- Otherwise, if your bucket is versioning-enabled (or versioning is suspended), the action applies only to the current version of the object. A versioning-enabled bucket can have many versions of the same object, one current version, and zero or more noncurrent versions. Instead of deleting the current version, Amazon S3 makes it a noncurrent version by adding a delete marker as the new current version. **Important**  
If your bucket state is versioning-suspended, Amazon S3 creates a delete marker with version ID null.  
If you have a version with version ID null, then Amazon S3 overwrites that version. **Note**  
To set expiration for noncurrent objects, you must use the NoncurrentVersionExpiration action. | Yes, if no other action is present in the Rule. |
<p>| Type: Container | Children: Days or Date | Ancestor: Rule |</p>
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filter</td>
<td>Container for elements that describe the filter identifying a subset of objects to which the lifecycle rule applies. If you specify an empty filter (&lt;Filter&gt;&lt;/Filter&gt;), the rule applies to all objects in the bucket. Type: String Children: Prefix, Tag Ancestor: Rule</td>
<td>Yes</td>
</tr>
<tr>
<td>ID</td>
<td>Unique identifier for the rule. The value cannot be longer than 255 characters. Type: String Ancestor: Rule</td>
<td>No</td>
</tr>
<tr>
<td>Key</td>
<td>Specifies the key of a tag. A tag key can be up to 128 Unicode characters in length. Tag keys that you specify in a lifecycle rule filter must be unique. For more information, see Object Tagging in the Amazon Simple Storage Service Developer Guide. Type: String Ancestor: Tag</td>
<td>Yes, if &lt;Tag&gt; parent is specified.</td>
</tr>
<tr>
<td>LifecycleConfiguration</td>
<td>Container for lifecycle rules. You can add as many as 1,000 rules. Type: Container Children: Rule Ancestor: None</td>
<td>Yes</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------------------------</td>
</tr>
<tr>
<td>ExpiredObjectDeleteMarker</td>
<td>On a versioned bucket (versioning-enabled or versioning-suspended bucket), you can add this element in the lifecycle configuration to direct Amazon S3 to delete expired object delete markers. For an example, see Example 7: Removing Expired Object Delete Markers in the Amazon Simple Storage Service Developer Guide. On a nonversioned bucket, adding this element in a policy is meaningless because you cannot have delete markers and the element doesn't do anything. For more information, see Lifecycle Configuration Elements in the Amazon Simple Storage Service Developer Guide. When you specify this lifecycle action, the rule cannot specify a tag-based filter. Type: String Valid values: true</td>
<td>Yes, if Date and Days are absent.</td>
</tr>
<tr>
<td>NoncurrentDays</td>
<td>Specifies the number of days an object is noncurrent before Amazon S3 can perform the associated action. For information about the noncurrent days calculations, see How Amazon S3 Calculates When an Object Became Noncurrent in the Amazon Simple Storage Service Developer Guide. Type: Nonnegative Integer when used with NoncurrentVersionTransition, Positive Integer when used with NoncurrentVersionExpiration.</td>
<td>Yes</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------------------------</td>
</tr>
<tr>
<td>NoncurrentVersionExpiration</td>
<td>Specifies when noncurrent object versions expire. Upon expiration, Amazon S3 permanently deletes the noncurrent object versions. You set this lifecycle configuration action on a bucket that has versioning enabled (or suspended) to request that Amazon S3 delete noncurrent object versions at a specific period in the object's lifetime. Type: Container Children: NoncurrentDays Ancestor: Rule</td>
<td>Yes, if no other action is present in the Rule.</td>
</tr>
<tr>
<td>NoncurrentVersionTransition</td>
<td>Container for the transition rule that describes when noncurrent objects transition to the STANDARD_IA or GLACIER storage class. If your bucket is versioning-enabled (or versioning is suspended), you can set this action to request that Amazon S3 transition noncurrent object versions at a specific period in the object's lifetime. Type: Container Children: NoncurrentDays and StorageClass Ancestor: Rule</td>
<td>Yes, if no other action is present in the Rule.</td>
</tr>
<tr>
<td>Prefix</td>
<td>Object key prefix identifying one or more objects to which the rule applies. Empty prefix (&lt;Prefix&gt;&lt;/Prefix&gt;) indicates there is no filter based on key prefix. There can be at most one Prefix in a lifecycle rule Filter. Type: String Ancestor: Filter or And (if you specify multiple filters such as a prefix and one or more tags).</td>
<td>No</td>
</tr>
<tr>
<td>Rule</td>
<td>Container for a lifecycle rule. A lifecycle configuration can contain as many as 1,000 rules. Type: Container Ancestor: LifecycleConfiguration</td>
<td>Yes</td>
</tr>
<tr>

</table>
### Responses

#### Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

#### Response Elements

This implementation of the operation does not return response elements.
Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

Examples

Example 1: Add lifecycle configuration - bucket not versioning-enabled

The following lifecycle configuration specifies two rules, each with one action.

- The Transition action requests Amazon S3 to transition objects with the "documents/" prefix to the GLACIER storage class 30 days after creation.
- The Expiration action requests Amazon S3 to delete objects with the "logs/" prefix 365 days after creation.

```xml
<LifecycleConfiguration>
  <Rule>
    <ID>id1</ID>
    <Filter>
      <Prefix>documents/</Prefix>
    </Filter>
    <Status>Enabled</Status>
    <Transition>
      <Days>30</Days>
      <StorageClass>GLACIER</StorageClass>
    </Transition>
  </Rule>
  <Rule>
    <ID>id2</ID>
    <Filter>
      <Prefix>logs/</Prefix>
    </Filter>
    <Status>Enabled</Status>
    <Expiration>
      <Days>365</Days>
    </Expiration>
  </Rule>
</LifecycleConfiguration>
```

The following is a sample PUT /?lifecycle request that adds the preceding lifecycle configuration to the examplebucket bucket.

```
PUT /?lifecycle HTTP/1.1
Host: examplebucket.s3.amazonaws.com
x-amz-date: Wed, 14 May 2014 02:11:21 GMT
Content-MD5: q6yJDl1kcaGGfb3QLY69A==
Authorization: authorization string
Content-Length: 415

<LifecycleConfiguration>
  <Rule>
    <ID>id1</ID>
    <Filter>
      <Prefix>documents/</Prefix>
    </Filter>
    ...
The following is a sample response.

HTTP/1.1 200 OK
x-amz-id-2: r+qR7+nhXtJDDlJ0JYcd+lj5nM/rUPliiZ/fNbDoGd3JUE8NWLHHSvPfwWpdc
x-amz-request-id: 9E26D08072A8EF9E
Date: Wed, 14 May 2014 02:11:22 GMT
Content-Length: 0
Server: AmazonS3

Example 2: Add lifecycle configuration - bucket is versioning-enabled

The following lifecycle configuration specifies two rules, each with one action for Amazon S3 to perform. You specify these actions when your bucket is versioning-enabled or versioning is suspended:

- The NoncurrentVersionExpiration action requests Amazon S3 to expire noncurrent versions of objects with the "logs/" prefix 100 days after the objects become noncurrent.
- The NoncurrentVersionTransition action requests Amazon S3 to transition noncurrent versions of objects with the "documents/" prefix to the GLACIER storage class 30 days after they become noncurrent.

```xml
<LifeCycleConfiguration>
  <Rule>
    <ID>DeleteAfterBecomingNonCurrent</ID>
    <Filter>
      <Prefix>logs/</Prefix>
    </Filter>
    <Status>Enabled</Status>
    <NoncurrentVersionExpiration>
      <NoncurrentDays>100</NoncurrentDays>
    </NoncurrentVersionExpiration>
  </Rule>
  <Rule>
    <ID>TransitionAfterBecomingNonCurrent</ID>
    <Filter>
      <Prefix>documents/</Prefix>
    </Filter>
    <Status>Enabled</Status>
    <NoncurrentVersionTransition>
      <NoncurrentDays>30</NoncurrentDays>
      <StorageClass>GLACIER</StorageClass>
    </NoncurrentVersionTransition>
  </Rule>
</LifeCycleConfiguration>
```
The following is a sample PUT /?lifecycle request that adds the preceding lifecycle configuration to the examplebucket bucket.

```xml
<LifeCycleConfiguration>
  <Rule>
    <ID>DeleteAfterBecomingNonCurrent</ID>
    <Filter>
      <Prefix>logs/</Prefix>
    </Filter>
    <Status>Enabled</Status>
    <NoncurrentVersionExpiration>
      <NoncurrentDays>1</NoncurrentDays>
    </NoncurrentVersionExpiration>
  </Rule>
  <Rule>
    <ID>TransitionSoonAfterBecomingNonCurrent</ID>
    <Filter>
      <Prefix>documents/</Prefix>
    </Filter>
    <Status>Enabled</Status>
    <NoncurrentVersionTransition>
      <NoncurrentDays>0</NoncurrentDays>
      <StorageClass>GLACIER</StorageClass>
    </NoncurrentVersionTransition>
  </Rule>
</LifeCycleConfiguration>
```

The following is a sample response.

```
HTTP/1.1 200 OK
x-amz-id-2: aXQ+KbIrmMmoO//3bMdDTw/CnjArwje+J49Hf+j44yRb/VmbIkqIO5A+PT98Cp/6k07hf+LD2mY=
x-amz-request-id: 0D7EC4C10381EB1
Date: Wed, 14 May 2014 02:21:50 GMT
Content-Length: 0
Server: AmazonS3
```

**Additional Examples**

Lifecycle configuration topic in the developer guide provides additional examples. For more information, go to Examples of Lifecycle Configuration.

- DELETE Bucket lifecycle (p. 77)
PUT Bucket logging

Description

Note
The logging implementation of PUT Bucket is a beta feature.

This implementation of the PUT operation uses the logging subresource to set the logging parameters for a bucket and to specify permissions for who can view and modify the logging parameters. To set the logging status of a bucket, you must be the bucket owner.

The bucket owner is automatically granted FULL_CONTROL to all logs. You use the Grantee request element to grant access to other people. The Permissions request element specifies the kind of access the grantee has to the logs.

To enable logging, you use LoggingEnabled and its children request elements.

To disable logging, you use an empty BucketLoggingStatus request element:

```xml
```

For more information about creating a bucket, see PUT Bucket (p. 205). For more information about returning the logging status of a bucket, see GET Bucket logging (p. 141).

Requests

Syntax

PUT /?logging HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

Request elements vary depending on what you're setting.

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>BucketLoggingStatus</td>
<td>Container for logging status information.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: Container</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Children: LoggingEnabled</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestry: None</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-------------------------------------------------------------------------------------------------</td>
<td>----------</td>
</tr>
<tr>
<td>EmailAddress</td>
<td>E-mail address of the person being granted logging permissions. Type: String Children: None</td>
<td>No</td>
</tr>
<tr>
<td>Grant</td>
<td>Container for the grantee and his/her logging permissions. Type: Container Children: Grantee, Permission</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Ancestry: BucketLoggingStatus.LoggingEnabled.TargetGrants</td>
<td></td>
</tr>
<tr>
<td>Grantee</td>
<td>Container for EmailAddress of the person being granted logging permissions. For more information, see Grantee Values (p. 258). Type: Container Children: EmailAddress</td>
<td>No</td>
</tr>
<tr>
<td>LoggingEnabled</td>
<td>Container for logging information. This element is present when you are enabling logging (and not present when you are disabling logging). Type: Container Children: Grant, TargetBucket, TargetPrefix</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Ancestry: BucketLoggingStatus</td>
<td></td>
</tr>
<tr>
<td>Permission</td>
<td>Logging permissions given to the Grantee for the bucket. The bucket owner is automatically granted FULL_CONTROL to all logs delivered to the bucket. This optional element enables you grant access to others. Type: String Valid Values: FULL_CONTROL</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>READ</td>
<td>WRITE Children: None Ancestry: BucketLoggingStatus.LoggingEnabled.TargetGrants.Grant</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>--------------</td>
<td>------------------------------------------------------------------------------</td>
<td>----------</td>
</tr>
<tr>
<td>TargetBucket</td>
<td>Specifies the bucket where you want Amazon S3 to store server access logs. You can have your logs delivered to any bucket that you own, including the same bucket that is being logged. You can also configure multiple buckets to deliver their logs to the same target bucket. In this case you should choose a different TargetPrefix for each source bucket so that the delivered log files can be distinguished by key. Type: String Children: None Ancestry: BucketLoggingStatus.LoggingEnabled</td>
<td>No</td>
</tr>
<tr>
<td>TargetGrants</td>
<td>Container for granting information. Type: Container Children: Grant, Permission Ancestry: BucketLoggingStatus.LoggingEnabled</td>
<td>No</td>
</tr>
<tr>
<td>TargetPrefix</td>
<td>This element lets you specify a prefix for the keys that the log files will be stored under. Type: String Children: None Ancestry: BucketLoggingStatus.LoggingEnabled</td>
<td>No</td>
</tr>
</tbody>
</table>

**Grantee Values**

You can specify the person (grantee) to whom you're assigning access rights (using request elements) in the following ways:

- By the person's ID:

  ```xml
  <Grantee xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="CanonicalUser"><ID><replaceable>ID</replaceable></ID><DisplayName><replaceable>GranteesEmail</replaceable></DisplayName></Grantee>
  ```

  DisplayName is optional and ignored in the request.

- By Email address:

  ```xml
  <Grantee xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="AmazonCustomerByEmail"><EmailAddress><replaceable>Grantees@email.com</replaceable></EmailAddress></Grantee>
  ```

  The grantee is resolved to the CanonicalUser and, in a response to a GET Object acl request, appears as the CanonicalUser.

- By URI:
Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

This implementation of the operation does not return response elements.

Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

Examples

Sample Request

This request enables logging and gives the grantee of the bucket READ access to the logs.

```
PUT ?logging HTTP/1.1
Host: quotes.s3.amazonaws.com
Content-Length: 214
Date: Wed, 25 Nov 2009 12:00:00 GMT
Authorization: authorization string

<?xml version="1.0" encoding="UTF-8"?>
<BucketLoggingStatus xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <LoggingEnabled>
    <TargetBucket>mybucketlogs</TargetBucket>
    <TargetPrefix>/mybucket-access_log-/</TargetPrefix>
    <TargetGrants>
      <Grant>
        <Grantee xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="AmazonCustomerByEmail">
          <EmailAddress>user@company.com</EmailAddress>
        </Grantee>
        <Permission>READ</Permission>
      </Grant>
    </TargetGrants>
  </LoggingEnabled>
</BucketLoggingStatus>
```

Sample Response

```
HTTP/1.1 200 OK
x-amz-id-2: YgIPIfBiKa2bj0KMg95r/0zo3emsU4dzsD4rcKCHQUAdQkf3ShJTOOpXUueF6QKo
x-amz-request-id: 236A8905248E5A01
Date: Wed, 01 Mar 2006 12:00:00 GMT
```
Sample Request Disabling Logging

This request disables logging on the bucket, quotes.

```
PUT ?logging HTTP/1.1
Host: quotes.s3.amazonaws.com
Content-Length: 214
Date: Wed, 25 Nov 2009 12:00:00 GMT
Authorization: authorization string

<?xml version="1.0" encoding="UTF-8"?>
```

Sample Response

```
HTTP/1.1 200 OK
x-amz-id-2: YgIPIfBiKa2bj0KMg95r/0zo3emzU4dzsD4rcKCHQUAdQkf3ShJTOOpXUueF6QKo
x-amz-request-id: 236A8905248E5A01
Date: Wed, 01 Mar 2006 12:00:00 GMT
```

PUT Bucket metrics

Description

Sets or updates a metrics configuration for the CloudWatch request metrics (specified by the metrics configuration ID) from the bucket. If you're updating an existing metrics configuration, note that this is a full replacement of the existing metrics configuration. If you don't include the elements you want to keep, they are erased.

To use this operation, you must have permissions to perform the s3:PutMetricsConfiguration action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources in the Amazon Simple Storage Service Developer Guide.

For information about CloudWatch request metrics for Amazon S3, see Monitoring Metrics with Amazon CloudWatch in the Amazon Simple Storage Service Developer Guide.

Requests

Syntax

```
PUT /metrics?id=id HTTP/1.1
HOST: BucketName.s3.amazonaws.com
Content-Length: length
Date: date
```
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

Metrics configuration in the request body.

Request Parameters

This implementation of PUT uses the parameter in the following table.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>The ID used to identify the metrics configuration.</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

In the request, you must specify the metrics configuration in the request body, which is specified as XML. The Examples section shows an example of a metrics configuration.

The following table describes the XML elements in the metrics configuration:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>And</td>
<td>A conjunction (logical AND) of predicates, which is used in evaluating a metrics filter. The operator must have at least two predicates in any combination, and an object must match all of the predicates for the filter to apply. Type: Container Children: Prefix, Tag Ancestor: Filter</td>
<td>No</td>
</tr>
<tr>
<td>Filter</td>
<td>Specifies a metrics configuration filter. The metrics configuration includes only objects that meet the filter’s criteria. A filter must be a prefix, a tag, or a conjunction (And). There’s a limit of 11 predicates for each filter, of which there can be one prefix and up to ten tags in a single filter. Type: Container Children: And</td>
<td>No</td>
</tr>
<tr>
<td>Id</td>
<td>The ID used to identify the metrics configuration. Type: String Ancestor: MetricsConfiguration</td>
<td>Yes</td>
</tr>
<tr>
<td>Key</td>
<td>The name of the tag.</td>
<td>No</td>
</tr>
</tbody>
</table>
### Responses

#### Response Headers

The operation returns response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

#### Response Elements

This implementation of the operation does not return response elements.

#### Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

#### Examples

### First Sample Request

Put a metric configuration that enables metrics for an entire bucket.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>MetricsConfiguration</td>
<td>Specifies the metrics configuration for CloudWatch request metrics on this bucket.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: Container</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestor: None</td>
<td></td>
</tr>
<tr>
<td>Prefix</td>
<td>The prefix that an object must have to be included in the metrics results.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestor: And</td>
<td></td>
</tr>
<tr>
<td>Tag</td>
<td>A key-value name pair, used to organize objects by association.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: Container</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Children: Key, Value,</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestor: And</td>
<td></td>
</tr>
<tr>
<td>Value</td>
<td>The value of the tag.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestor: Tag</td>
<td></td>
</tr>
</tbody>
</table>
First Sample Response
Put a metric configuration that enables metrics for an entire bucket.

HTTP/1.1 204 No Content
x-amz-id-2: ITnGT1y4REXAMPLEPi4hklTXouTf0hccUjo0iCPEXAMPLEEtBj3M7fPGLW02SEWp
x-amz-request-id: 51991EXAMPLE5321
Date: Thu, 15 Nov 2016 00:17:22 GMT
Server: AmazonS3

Second Sample Request
Put a metrics configuration that enables metrics for objects that start with a particular prefix and also have specific tags applied.

PUT /?metrics&id=ImportantBlueDocuments HTTP/1.1
Host: examplebucket.s3.amazonaws.com
x-amz-date: Thu, 15 Nov 2016 00:17:29 GMT
Authorization: signatureValue

PUT Bucket notification

Description

The Amazon S3 notification feature enables you to receive notifications when certain events happen in your bucket. For more information about event notifications, go to Configuring Event Notifications in the Amazon Simple Storage Service Developer Guide.

Using this API, you can replace an existing notification configuration. The configuration is an XML file that defines the event types that you want Amazon S3 to publish and the destination where you want Amazon S3 to publish an event notification when it detects an event of the specified type.

By default, your bucket has no event notifications configured. That is, the notification configuration will be an empty NotificationConfiguration.

<NotificationConfiguration>
</NotificationConfiguration>

This operation replaces the existing notification configuration with the configuration you include in the request body.

After Amazon S3 receives this request, it first verifies that any Amazon Simple Notification Service (Amazon SNS) or Amazon Simple Queue Service (Amazon SQS) destination exists, and that the bucket owner has permission to publish to it by sending a test notification. In the case of AWS Lambda destinations, Amazon S3 verifies that the Lambda function permissions grant Amazon S3 permission to invoke the function from the Amazon S3 bucket. For more information, go to Configuring Notifications for Amazon S3 Events in the Amazon Simple Storage Service Developer Guide.

You can disable notifications by adding the empty NotificationConfiguration element.

By default, only the bucket owner can configure notifications on a bucket. However, bucket owners can use a bucket policy to grant permission to other users to set this configuration with s3:PutBucketNotification permission.

Note

The PUT notification is an atomic operation. For example, suppose your notification configuration includes SNS topic, SQS queue, and Lambda function configurations. When you send a PUT request with this configuration, Amazon S3 sends test messages to your SNS topic. If the message fails, the entire PUT operation will fail, and Amazon S3 will not add the configuration to your bucket.

Requests

Syntax

PUT /?notification HTTP/1.1
Host: bucketname.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

<NotificationConfiguration>
  <TopicConfiguration>
    <Id>ConfigurationId</Id>
    <Filter>
      <S3Key>
        <FilterRule>
Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

<table>

</tbody>
</table>
Name | Description | Required
--- | --- | ---
**TopicConfiguration** | Container for specifying an SNS topic configuration for the notification. Type: Container Children: An Id, Filter, Topic, and one, or more Event. Ancestor: NotificationConfiguration | No
**Value** | Specifies the object key name prefix or suffix to filter on. Type: String Ancestor: FilterRule | No

## Responses

### Response Headers

In addition to the common response headers (see Common Response Headers (p. 4)), if the configuration in the request body includes only one TopicConfiguration specifying only the `s3:ReducedRedundancyLostObject` event type, the response will also include the `x-amz-sns-test-message-id` header containing the message ID of the test notification sent to topic.

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

### Response Elements

This implementation of the operation does not return response elements.

### Special Errors

Amazon S3 checks the validity of the proposed NotificationConfiguration element and verifies whether the proposed configuration is valid when you call the PUT operation. The following table lists the errors and possible causes.

<table>
<thead>
<tr>
<th>HTTP Error</th>
<th>Code</th>
<th>Cause</th>
</tr>
</thead>
</table>
| HTTP 400 Bad Request | InvalidArgument | The following conditions can cause this error:  
- A specified event is not supported for notifications.  
- A specified destination ARN does not exist or is not well-formed. Verify the destination ARN.  
- A specified destination is in a different region than the bucket. You must use a destination that resides in the same region as the bucket.  
- The bucket owner does not have appropriate permissions on the specified destination.  
- An object key name filtering rule defined with overlapping prefixes, overlapping suffixes, or overlapping combinations of prefixes and suffixes for the same event types. |
For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

Examples

Example 1: Configure Notification to Invoke a cloud function in Lambda

The following notification configuration includes `CloudFunctionConfiguration`, which identifies the event type for which Amazon S3 can invoke a cloud function and the name of the cloud function to invoke.

```xml
<NotificationConfiguration>
  <CloudFunctionConfiguration>
    <Id>ObjectCreatedEvents</Id>
    <CloudFunction>arn:aws:lambda:us-west-2:35667example:function:CreateThumbnail</CloudFunction>
    <Event>s3:ObjectCreated:*</Event>
  </CloudFunctionConfiguration>
</NotificationConfiguration>
```

The following PUT uploads the notification configuration. The operation replaces the existing notification configuration.

```
PUT http://s3.amazonaws.com/examplebucket?notification= HTTP/1.1
User-Agent: s3curl 2.0
Host: s3.amazonaws.com
Pragma: no-cache
Accept: */*
Proxy-Connection: Keep-Alive
Authorization: authorization string
Date: Mon, 13 Oct 2014 23:14:52 +0000
Content-Length: length

[request body]
```

The following is a sample response.

```
HTTP/1.1 200 OK
x-amz-id-2: 8+FlwagBSoT2gpMaGlfcUKrKFR5W3OeS7UohoBb17j+kqvP52cSF1gJ5coLd53d2
x-amz-request-id: E5BA4600A3937335
Date: Fri, 31 Oct 2014 01:49:50 GMT
Content-Length: 0
Server: AmazonS3
```

Example 2: Configure a Notification with Multiple Destinations

The following notification configuration includes the topic and queue configurations:
- A topic configuration identifying an SNS topic for Amazon S3 to publish events of the s3:ReducedRedundancyLostObject type.
- A queue configuration identifying an SQS queue for Amazon S3 to publish events of the s3:ObjectCreated:* type.

```xml
<NotificationConfiguration>
  <TopicConfiguration>
    <Topic>arn:aws:sns:us-east-1:356671443308:s3notificationtopic2</Topic>
    <Event>s3:ReducedRedundancyLostObject</Event>
  </TopicConfiguration>
  <QueueConfiguration>
    <Queue>arn:aws:sqs:us-east-1:356671443308:s3notificationqueue</Queue>
    <Event>s3:ObjectCreated:*</Event>
  </QueueConfiguration>
</NotificationConfiguration>
```

The following PUT request against the notification subresource of the examplebucket bucket sends the preceding notification configuration in the request body. The operation replaces the existing notification configuration on the bucket.

```
PUT http://s3.amazonaws.com/examplebucket?notification= HTTP/1.1
User-Agent: s3curl 2.0
Host: s3.amazonaws.com
Pragma: no-cache
Accept: */*
Proxy-Connection: Keep-Alive
Authorization: authorization string
Date: Mon, 13 Oct 2014 22:58:43 +0000
Content-Length: 391
Expect: 100-continue
```

The following is a sample response.

```
HTTP/1.1 200 OK
x-amz-id-2: SlvJLkfunoAGILZK3KqHSSUq4kwbudkrROMESoHOpDacULy+cXRoR1Svrfoyvg2A
x-amz-request-id: BB1BA8E12D6A80B7
Date: Mon, 13 Oct 2014 22:58:44 GMT
Content-Length: 0
Server: AmazonS3
```

**Example 3: Configure a Notification with Object Key Name Filtering**

The following notification configuration contains a queue configuration identifying an Amazon SQS queue for Amazon S3 to publish events to of the s3:ObjectCreated:Put type. The events will be published whenever an object that has a prefix of images/ and a .jpg suffix is PUT to a bucket. For more examples of notification configurations that use filtering, go to [Configuring Event Notifications](#) in the Amazon Simple Storage Service Developer Guide.

```xml
<NotificationConfiguration>
  <QueueConfiguration>
    <Id>1</Id>
    <Filter>
      <S3Key>
        <FilterRule>
          <Name>prefix</Name>
          <Value>images/</Value>
        </FilterRule>
      </S3Key>
    </Filter>
  </QueueConfiguration>
</NotificationConfiguration>
```
The following PUT request against the notification subresource of the examplebucket bucket sends the preceding notification configuration in the request body. The operation replaces the existing notification configuration on the bucket.

```plaintext
PUT http://s3.amazonaws.com/examplebucket?notification= HTTP/1.1
User-Agent: s3curl 2.0
Host: s3.amazonaws.com
Pragma: no-cache
Accept: */*
Proxy-Connection: Keep-Alive
Authorization: authorization string
Date: Mon, 13 Oct 2014 22:58:43 +0000
Content-Length: length
Expect: 100-continue
```

The following is a sample response.

```plaintext
HTTP/1.1 200 OK
x-amz-id-2: SlvJLkfunoAGILZK3QhSSUq4kwbudkrROMEsHoPmDalULy+cxRoR1Svrfoyvg2A
x-amz-request-id: BB1BA8E12D6A80B7
Date: Mon, 13 Oct 2014 22:58:44 GMT
Content-Length: 0
Server: AmazonS3
```

Related Resources

- GET Bucket notification (p. 148)
PUT Bucket policy

Description

This implementation of the PUT operation uses the policy subresource to add to or replace a policy on a bucket. If the bucket already has a policy, the one in this request completely replaces it. To perform this operation, you must be the bucket owner.

If you are not the bucket owner but have PutBucketPolicy permissions on the bucket, Amazon S3 returns a 405 Method Not Allowed. In all other cases for a PUT bucket policy request that is not from the bucket owner, Amazon S3 returns 403 Access Denied. There are restrictions about who can create bucket policies and which objects in a bucket they can apply to. For more information, go to Using Bucket Policies.

Requests

Syntax

PUT /?policy HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

Policy written in JSON

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

The body is a JSON string containing the policy contents containing the policy statements.

Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

PUT response elements return whether the operation succeeded or not.

Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).
Examples

Sample Request

The following request shows the PUT individual policy request for the bucket.

```
PUT /?policy HTTP/1.1
Host: bucket.s3.amazonaws.com
Date: Tue, 04 Apr 2010 20:34:56 GMT
Authorization: authorization string

{
  "Version": "2008-10-17",
  "Id": "aaaa-bbbb-cccc-dddd",
  "Statement": [
    {
      "Effect": "Allow",
      "Sid": "1",
      "Principal": {
        "AWS": ["111122223333", "444455556666"]
      },
      "Action": ["s3:*"],
      "Resource": ["arn:aws:s3:::bucket/*"]
    }
  ]
}
```

Sample Response

```
HTTP/1.1 204 No Content
x-amz-id-2: Uuag1LuByR50imru9SAMPLEAtRPfTa0Fg==
x-amz-request-id: 656c76696e672773263764
Date: Tue, 04 Apr 2010 20:34:56 GMT
Connection: keep-alive
Server: AmazonS3
```

Related Resources

- PUT Bucket (p. 205)
- DELETE Bucket (p. 67)
PUT Bucket replication

Description

In a versioning-enabled bucket, this operation creates a new replication configuration (or replaces an existing one, if present). Amazon S3 stores the configuration in the replication subresource associated with the bucket. If the replication subresource does not exist, Amazon S3 creates it. If it does exist, Amazon S3 replaces the configuration stored in the subresource. For information about replication configuration, see Cross-Region Replication in the Amazon Simple Storage Service Developer Guide.

Important

If you have an object expiration lifecycle policy in your non-versioned bucket and you want to maintain the same permanent delete behavior when you enable versioning, you must add a noncurrent expiration policy. The noncurrent expiration lifecycle policy will manage the deletes of the noncurrent object versions in the version-enabled bucket. (A version-enabled bucket maintains one current and zero or more noncurrent object versions.) For more information, see Lifecycle and Versioning in the Amazon Simple Storage Service Developer Guide.

This operation requires permissions for the s3:PutReplicationConfiguration action. For more information about permissions, see Using Bucket Policies and User Policies in the Amazon Simple Storage Service Developer Guide.

Requests

Syntax

```
PUT /?replication HTTP/1.1
Host: bucketname.s3.amazonaws.com
Content-Length: length
Date: date
Authorization: authorization string
Content-MD5: MD5

Replication configuration XML in the body
```

For more information about authorization, see Authenticating Requests (AWS Signature Version 4) (p. 14).

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content-MD5</td>
<td>The base64-encoded 128-bit MD5 digest of the data. This header must be used as a message integrity check to verify that the request body was not corrupted in transit. For more information, see RFC 1864. Type: String</td>
<td>Yes</td>
</tr>
</tbody>
</table>
Request Body

You specify the replication configuration in the request body. The configuration includes one or more rules. Each rule provides information, such as a key name prefix that identifies objects with specific prefixes that you want to replicate (an empty prefix indicates all objects), rule status, and details relevant to the destination.

The destination details include the bucket where you want replicas stored and, optionally, the storage class you want to use to store the replicas.

Amazon S3 acts only on rules with the status `Enabled`. The configuration also identifies an IAM role for Amazon S3 to assume so that Amazon S3 can copy objects. This role must have sufficient permissions to read objects from the source bucket and replicate them into the target bucket.

```
<ReplicationConfiguration>
  <Role>iam-role-arn</Role>
  <Rule>
    <ID>Rule-1</ID>
    <Status>Enabled</Status>
    <Prefix>key-prefix</Prefix>
    <Destination>
      <Bucket>arn:aws:s3:::bucket-name</Bucket>
      <StorageClass>optional-destination-storage-class-override</StorageClass>
      <Account>The destination bucket owner account ID used if owner override is used</Account>
      <AccessControlTranslation>
        <Owner>Destination</Owner>
      </AccessControlTranslation>
    </Destination>
  </Rule>
  <Rule>
    <ID>Rule-2</ID>
    ...
  </Rule>
  ...
</ReplicationConfiguration>
```

In the `<Destination>`, both `<StorageClass>` and `<AccessControlTranslation>` are optional. If you specify the `<AccessControlTranslation>` element to change the replica ownership to the destination bucket owner, you must also specify the `<Account>` element.

The following table describes the XML elements in the replication configuration:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account</td>
<td>Destination bucket owner account ID. In a cross-account scenario, if you direct Amazon S3 to change replica ownership to the AWS account that owns the destination bucket by adding the AccessControlTranslation element, this is the account ID of the destination bucket owner. For more information, see Cross-Region Replication Additional Configuration: Change Account Ownership.</td>
<td>Yes, if you specify the AccessControlTranslation element.</td>
</tr>
<tr>

Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

This implementation of the operation does not return response elements.

Special Errors

Amazon S3 checks the validity of the proposed AnalyticsConfiguration element and verifies whether the proposed configuration is valid when you call the PUT operation. The following table lists the errors and possible causes.

<table>
<thead>
<tr>
<th>HTTP Error</th>
<th>Code</th>
<th>Cause</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP 400</td>
<td>InvalidRequest</td>
<td>&lt;Account&gt; element must be specified if the &lt;Owner&gt; in &lt;AccessControlTranslation&gt; has a value.</td>
</tr>
<tr>
<td>HTTP 400</td>
<td>InvalidArgument</td>
<td>&lt;Account&gt; element is empty and must contain a valid account ID.</td>
</tr>
<tr>
<td>HTTP 400</td>
<td>InvalidArgument</td>
<td>The AWS account specified in the &lt;Account&gt; element must match the destination bucket owner.</td>
</tr>
</tbody>
</table>

For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

Examples

Example 1: Add Replication Configuration

The following is a sample PUT request that creates a replication subresource on the specified bucket and saves the replication configuration in it. The replication configuration specifies a rule to replicate to the exampletargetbucket bucket any new objects created with the key name prefix TaxDocs.
After you add a replication configuration to your bucket, Amazon S3 assumes the IAM role specified in the configuration to replicate objects on behalf of the bucket owner, which is the AWS account that created the bucket.

```
PUT /?replication HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Date: Wed, 11 Feb 2015 02:11:21 GMT
Content-MD5: q6yJD1lkcbAGFb3QLY69A==
Authorization: authorization string
Content-Length: 406

<ReplicationConfiguration>
  <Role>arn:aws:iam::35667example:role/CrossRegionReplicationRoleForS3</Role>
  <Rule>
    <ID>rule1</ID>
    <Prefix>TaxDocs</Prefix>
    <Status>Enabled</Status>
    <Destination>
      <Bucket>arn:aws:s3:::exampletargetbucket</Bucket>
    </Destination>
  </Rule>
<ReplicationConfiguration>
```

The following is a sample response:

```
HTTP/1.1 200 OK
x-amz-id-2: r+qR7+nhXtJDDIJ0JJYcd+1j5nM/rUFiiiz/FnBDOSd3JUE8NWLHNXmvPfwMpdc
x-amz-request-id: 9E26D08072A8EE9E
Date: Wed, 11 Feb 2015 02:11:22 GMT
Content-Length: 0
Server: AmazonS3
```

If you want Amazon S3 to replicate objects having key name prefixes other than TaxDocs, you can add more rules to the replication configuration. However, you cannot set two rules that specify overlapping prefixes, implying two rules for the same set of objects. For example, Amazon S3 responds with an error if you attempt to set the following replication configuration on a bucket:

```
<ReplicationConfiguration>
  <Role>arn:aws:iam::35667example:role/CrossRegionReplicationRoleForS3</Role>
  <Rule>
    <ID>rule1</ID>
    <Prefix>TaxDocs</Prefix>
    <Status>Enabled</Status>
    <Destination>
      <Bucket>arn:aws:s3:::exampletargetbucket1</Bucket>
    </Destination>
  </Rule>
  <Rule>
    <ID>rule2</ID>
    <Prefix>TaxDocs/2015</Prefix>
    <Status>Enabled</Status>
    <Destination>
      <Bucket>arn:aws:s3:::exampletargetbucket1</Bucket>
    </Destination>
  </Rule>
<ReplicationConfiguration>
```

In this non-working replication configuration, note the following:

- The first rule requests Amazon S3 to replicate objects with the key name prefix TaxDocs to a bucket.
- The second rule requests Amazon S3 to replicate objects with the key name prefix TaxDocs/2015.
Suppose that you upload an object with key name `TaxDocs/2015/doc1.pdf`, the key name prefix satisfies both rules. Amazon S3 does not support adding replication configuration with rules that specify overlapping prefixes.

You can optionally specify the storage class for the object replicas as shown in the XML fragment, which directs Amazon S3 to use the `STANDARD_IA` storage class when creating object replicas:

```xml
<Destination>
  <Bucket>arn:aws:s3:::exampletargetbucket1</Bucket>
  <StorageClass>STANDARD_IA</StorageClass>
</Destination>
```

**Example 2: Change Replica Owner in Cross-Account Scenario**

For more information, see Cross-Region Replication Additional Configuration: Change Replica Owner in the *Amazon Simple Storage Service Developer Guide*.

PUT Bucket requestPayment

Description

This implementation of the PUT operation uses the requestPayment subresource to set the request payment configuration of a bucket. By default, the bucket owner pays for downloads from the bucket. This configuration parameter enables the bucket owner (only) to specify that the person requesting the download will be charged for the download. For more information, see Requester Pays Buckets.

Requests

Syntax

```plaintext
PUT ?requestPayment HTTP/1.1
Host: BucketName.s3.amazonaws.com
Content-Length: length
Date: date
Authorization: signatureValue

<RequestPaymentConfiguration xmlns="http://s3.amazonaws.com/doc/2006-03-01/"
  <Payer>
  </Payer>
</RequestPaymentConfiguration>
```

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Payer</td>
<td>Specifies who pays for the download and request fees.</td>
</tr>
<tr>
<td></td>
<td>Type: Enum</td>
</tr>
<tr>
<td></td>
<td>Valid Values: Requester</td>
</tr>
<tr>
<td></td>
<td>Ancestor: RequestPaymentConfiguration</td>
</tr>
<tr>
<td>RequestPaymentConfiguration</td>
<td>Container for Payer.</td>
</tr>
<tr>
<td></td>
<td>Type: Container</td>
</tr>
</tbody>
</table>
Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

This implementation of the operation does not return response elements.

Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

Examples

Sample Request

This request creates a Requester Pays bucket named "colorpictures."

```
PUT ?requestPayment HTTP/1.1
Host: colorpictures.s3.amazonaws.com
Content-Length: 173
Date: Wed, 01 Mar 2006 12:00:00 GMT
Authorization: authorization string

<RequestPaymentConfiguration xmlns="http://s3.amazonaws.com/doc/2006-03-01/"
  <Payer>Requester</Payer>
</RequestPaymentConfiguration>
```

Sample Response

```
HTTP/1.1 200 OK
x-amz-id-2: YgIPIfBiKa2bj0KMg95r/0zo3emzU4dzsD4rcKCHgQUADqkf3ShJTOOpXUueF6QXo
x-amz-request-id: 236A8905248E5A01
Date: Wed, 01 Mar 2006 12:00:00 GMT
Location: /colorpictures
Connection: close
Server: AmazonS3
```

PUT Bucket tagging

Description

This implementation of the PUT operation uses the tagging subresource to add a set of tags to an existing bucket.

Use tags to organize your AWS bill to reflect your own cost structure. To do this, sign up to get your AWS account bill with tag key values included. Then, to see the cost of combined resources, organize your billing information according to resources with the same tag key values. For example, you can tag several resources with a specific application name, and then organize your billing information to see the total cost of that application across several services. For more information, see Cost Allocation and Tagging in About AWS Billing and Cost Management.

To use this operation, you must have permission to perform the s3:PutBucketTagging action. By default, the bucket owner has this permission and can grant this permission to others.

Requests

Syntax

The following request shows the syntax for sending tagging information in the request body.

```
PUT /?tagging HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

<Tagging>
  <TagSet>
    <Tag>
      <Key>Tag Name</Key>
      <Value>Tag Value</Value>
    </Tag>
  </TagSet>
</Tagging>
```

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

Content-MD5 will be a required header for this operation.

Request Elements

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tagging</td>
<td>Container for the TagSet and Tag elements. Type: String</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Ancestors: None</td>
<td></td>
</tr>
</tbody>
</table>
Amazon Simple Storage Service API Reference

Responses

Response Headers

The operation returns response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

This operation does not return response elements.

Special Errors

- InvalidTagError - The tag provided was not a valid tag. This error can occur if the tag did not pass input validation. See the CostAllocation docs for a description of valid tags.
- MalformedXMLError - The XML provided does not match the schema.
- OperationAbortedError - A conflicting conditional operation is currently in progress against this resource. Please try again.
- InternalError - The service was unable to apply the provided tag to the bucket.

Examples

Sample Request: Add tag set to a bucket

The following request adds a tag set to the existing examplebucket bucket.

PUT ?tagging HTTP/1.1
Host: examplebucket.s3.amazonaws.com
<Tagging>
  <TagSet>
    <Tag>
      <Key>Project</Key>
      <Value>Project One</Value>
    </Tag>
    <Tag>
      <Key>User</Key>
      <Value>jsmith</Value>
    </Tag>
  </TagSet>
</Tagging>

Sample Response

HTTP/1.1 204 No Content
x-amz-id-2: YgIPIfBiKa2bj0KMgUAdQkf3ShJTOOpxUueF6QKo
x-amz-request-id: 236A8905248E5A01
Date: Wed, 01 Oct 2012 12:00:00 GMT

Related Resources

- GET Bucket tagging (p. 174)
- DELETE Bucket tagging (p. 85)
PUT Bucket versioning

Description

This implementation of the PUT operation uses the versioning subresource to set the versioning state of an existing bucket. To set the versioning state, you must be the bucket owner.

You can set the versioning state with one of the following values:

- **Enabled**—Enables versioning for the objects in the bucket
  
  All objects added to the bucket receive a unique version ID.

- **Suspended**—Disables versioning for the objects in the bucket
  
  All objects added to the bucket receive the version ID null.

If the versioning state has never been set on a bucket, it has no versioning state; a GET versioning request does not return a versioning state value.

If the bucket owner enables MFA Delete in the bucket versioning configuration, the bucket owner must include the `x-amz-mfa` request header and the `Status` and the `MfaDelete` request elements in a request to set the versioning state of the bucket.

**Important**

If you have an object expiration lifecycle policy in your non-versioned bucket and you want to maintain the same permanent delete behavior when you enable versioning, you must add a noncurrent expiration policy. The noncurrent expiration lifecycle policy will manage the deletes of the noncurrent object versions in the version-enabled bucket. (A version-enabled bucket maintains one current and zero or more noncurrent object versions.) For more information, see [Lifecycle and Versioning](https://docs.aws.amazon.com/AmazonS3/latest/userguide/lifecycle-versioning.html) in the *Amazon Simple Storage Service Developer Guide*.

For more information about creating a bucket, see [PUT Bucket](https://docs.aws.amazon.com/AmazonS3/latest/API/REST-Bucket-PUT.html). For more information about returning the versioning state of a bucket, see [GET Bucket Versioning Status](https://docs.aws.amazon.com/AmazonS3/latest/API/GET-Bucket-Versioning.html).

Requests

Syntax

```
PUT /?versioning HTTP/1.1
Host: BucketName.s3.amazonaws.com
Content-Length: length
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))
x-amz-mfa: [SerialNumber] [TokenCode]

  <Status>
    <VersioningState/>
  </Status>
  <MfaDelete>
    <MfaDeleteState/>
  </MfaDelete>
</VersioningConfiguration>
```

Note the space between `[SerialNumber]` and `[TokenCode].`

Request Parameters

This implementation of the operation does not use request parameters.
### Request Headers

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-mfa</td>
<td>The value is the concatenation of the authentication device's serial number, a space, and the value displayed on your authentication device. Type: String Default: None Condition: Required to configure the versioning state if versioning is configured with MFA Delete enabled.</td>
<td>Conditional</td>
</tr>
</tbody>
</table>

### Request Elements

<table>
<thead>
<tr>

Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

This implementation of the operation does not return response elements.

Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

Examples

Sample Request

The following request enables versioning for the specified bucket.

```
PUT /?versioning HTTP/1.1
Host: bucket.s3.amazonaws.com
Date: Wed, 01 Mar 2006 12:00:00 GMT
Authorization: authorization string
Content-Type: text/plain
Content-Length: 124

  <Status>Enabled</Status>
</VersioningConfiguration>
```

Sample Response

```
HTTP/1.1 200 OK
x-amz-id-2: YgIPIfBiRabOOGm95r/0zo3emzU4dzsD4rcKCHQUAdQkGf3ShJTOOpXUueF6Qk0
x-amz-request-id: 236A8905248E5A01
Date: Wed, 01 Mar 2006 12:00:00 GMT
```

Sample Request

The following request suspends versioning for the specified bucket.

```
PUT /?versioning HTTP/1.1
Host: bucket.s3.amazonaws.com
Date: Wed, 12 Oct 2009 17:50:00 GMT
Authorization: authorization string
Content-Type: text/plain
Content-Length: 124

  <Status>Suspended</Status>
</VersioningConfiguration>
```

API Version 2006-03-01
Sample Response

HTTP/1.1 200 OK
x-amz-id-2: YgIPIfBi2abj0KMg95x/0zo3emzU4dzsD4rcKCHQvdDqfr3SHJTOOpXUueF6QKo
x-amz-request-id: 236A8905248E5A01
Date: Wed, 01 Mar 2006 12:00:00 GMT

Sample Request

The following request enables versioning and MFA Delete on a bucket.

PUT /?versioning HTTP/1.1
Host: bucket.s3.amazonaws.com
Date: Wed, 12 Oct 2009 17:50:00 GMT
x-amz-mfa:[SerialNumber] [TokenCode]
Authorization: authorization string
Content-Type: text/plain
Content-Length: 124

  <Status>Enabled</Status>
  <MfaDelete>Enabled</MfaDelete>
</VersioningConfiguration>

Note the space between [SerialNumber] and [TokenCode] and that you must include Status whenever you use MfaDelete.

Sample Response

HTTPS/1.1 200 OK
x-amz-id-2: YgIPIfBi2abj0KMg95x/0zo3emzU4dzsD4rcKCHQvdDqfr3SHJTOOpXUueF6QKo
x-amz-request-id: 236A8905248E5A01
Date: Wed, 01 Mar 2006 12:00:00 GMT

Location: /colorpictures
Content-Length: 0
Connection: close
Server: AmazonS3

Related Resources

- DELETE Bucket (p. 67)
- PUT Bucket (p. 205)
PUT Bucket website

Description

Sets the configuration of the website that is specified in the website subresource. To configure a bucket as a website, you can add this subresource on the bucket with website configuration information such as the file name of the index document and any redirect rules. For more information, go to Hosting Websites on Amazon S3 in the Amazon Simple Storage Service Developer Guide.

This PUT operation requires the S3:PutBucketWebsite permission. By default, only the bucket owner can configure the website attached to a bucket; however, bucket owners can allow other users to set the website configuration by writing a bucket policy that grants them the S3:PutBucketWebsite permission.

Requests

Syntax

PUT /?website HTTP/1.1
Host: bucketname.s3.amazonaws.com
Date: date
Content-Length: ContentLength
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

<WebsiteConfiguration xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
 <!-- website configuration information. -->
</WebsiteConfiguration>

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

You can use a website configuration to redirect all requests to the website endpoint of a bucket, or you can add routing rules that redirect only specific requests.

- To redirect all website requests sent to the bucket's website endpoint, you add a website configuration with the following elements. Because all requests are sent to another website, you don't need to provide index document name for the bucket.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>WebsiteConfiguration</td>
<td>The root element for the website configuration</td>
<td>Yes</td>
</tr>
<tr>
<td>Type: Container</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

API Version 2006-03-01
292
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>RedirectAllRequestsTo</td>
<td>Describes the redirect behavior for every request to this bucket's website endpoint. If this element is present, no other siblings are allowed.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: Container</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestors: WebsiteConfiguration</td>
<td></td>
</tr>
<tr>
<td>HostName</td>
<td>Name of the host where requests will be redirected.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestors: RedirectAllRequestsTo</td>
<td></td>
</tr>
<tr>
<td>Protocol</td>
<td>Protocol to use (http, https) when redirecting requests. The default is the protocol that is used in the original request.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestors: RedirectAllRequestsTo</td>
<td></td>
</tr>
</tbody>
</table>

- If you want granular control over redirects, you can use the following elements to add routing rules that describe conditions for redirecting requests and information about the redirect destination. In this case, the website configuration must provide an index document for the bucket, because some requests might not be redirected.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>WebsiteConfiguration</td>
<td>Container for the request</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: Container</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestors: None</td>
<td></td>
</tr>
<tr>
<td>IndexDocument</td>
<td>Container for the Suffix element.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: Container</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestors: WebsiteConfiguration</td>
<td></td>
</tr>
<tr>
<td>Suffix</td>
<td>A suffix that is appended to a request that is for a directory on the website endpoint (e.g., if the suffix is index.html and you make a request to samplebucket/images/, the data that is returned will be for the object with the key name images/index.html)</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>The suffix must not be empty and must not include a slash character.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestors: WebsiteConfiguration.IndexDocument</td>
<td></td>
</tr>
<tr>
<td>ErrorDocument</td>
<td>Container for the Key element</td>
<td>No</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>----------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------</td>
</tr>
<tr>
<td>Key</td>
<td>The object key name to use when a 4XX class error occurs. This key identifies the page that is returned when such an error occurs. Type: String. Ancestors: WebsiteConfiguration.ErrorDocument. Condition: Required when ErrorDocument is specified.</td>
<td>Conditional</td>
</tr>
<tr>
<td>RoutingRules</td>
<td>Container for a collection of RoutingRule elements. Type: Container. Ancestors: WebsiteConfiguration.</td>
<td>No</td>
</tr>
<tr>
<td>RoutingRule</td>
<td>Container for one routing rule that identifies a condition and a redirect that applies when the condition is met. Type: String. Ancestors: WebsiteConfiguration.RoutingRules. Condition: In a RoutingRules container, there must be at least one of RoutingRule element.</td>
<td>Yes</td>
</tr>
<tr>
<td>Condition</td>
<td>A container for describing a condition that must be met for the specified redirect to apply. For example: • If request is for pages in the /docs folder, redirect to the /documents folder. • If request results in HTTP error 4xx, redirect request to another host where you might process the error. Type: Container. Ancestors: WebsiteConfiguration.RoutingRules.RoutingRule.</td>
<td>No</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------------</td>
</tr>
<tr>
<td>KeyPrefixEquals</td>
<td>The object key name prefix when the redirect is applied. For example, to redirect requests for ExamplePage.html, the key prefix will be ExamplePage.html. To redirect request for all pages with the prefix docs/, the key prefix will be /docs, which identifies all objects in the docs/ folder.</td>
<td>Conditional</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Condition: Required when the parent element Condition is specified and sibling HttpErrorCodeReturnedEquals is not specified. If both conditions are specified, both must be true for the redirect to be applied.</td>
<td></td>
</tr>
<tr>
<td>HttpErrorCodeReturnedEquals</td>
<td>The HTTP error code when the redirect is applied. In the event of an error, if the error code equals this value, then the specified redirect is applied.</td>
<td>Conditional</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Condition: Required when parent element Condition is specified and sibling KeyPrefixEquals is not specified. If both are specified, then both must be true for the redirect to be applied.</td>
<td></td>
</tr>
<tr>
<td>Redirect</td>
<td>Container for redirect information. You can redirect requests to another host, to another page, or with another protocol. In the event of an error, you can specify a different error code to return.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td>Protocol</td>
<td>The protocol to use in the redirect request.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid Values: http, https</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Condition: Not required if one of the siblings is present</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------</td>
</tr>
<tr>
<td>HostName</td>
<td>The host name to use in the redirect request. Type: String. Ancestors: WebsiteConfiguration.RoutingRules.RoutingRule.Redirect. Condition: Not required if one of the siblings is present.</td>
<td>No</td>
</tr>
<tr>
<td>ReplaceKeyPrefixWith</td>
<td>The object key prefix to use in the redirect request. For example, to redirect requests for all pages with prefix docs/ (objects in the docs/ folder) to documents/, you can set a condition block with KeyPrefixEquals set to docs/ and in the Redirect set ReplaceKeyPrefixWith to /documents. Type: String. Ancestors: WebsiteConfiguration.RoutingRules.RoutingRule.Redirect. Condition: Not required if one of the siblings is present. Can be present only if ReplaceKeyWith is not provided.</td>
<td>No</td>
</tr>
<tr>
<td>ReplaceKeyWith</td>
<td>The specific object key to use in the redirect request. For example, redirect request to error.html. Type: String. Ancestors: WebsiteConfiguration.RoutingRules.RoutingRule.Redirect. Condition: Not required if one of the sibling is present. Can be present only if ReplaceKeyPrefixWith is not provided.</td>
<td>No</td>
</tr>
</tbody>
</table>

Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

This implementation of the operation does not return response elements.
Examples

Example 1: Configure bucket as a website (add website configuration)

The following request configures a bucket example.com as a website. The configuration in the request specifies index.html as the index document. It also specifies the optional error document, SomeErrorDocument.html.

PUT ?website HTTP/1.1
Host: example.com.s3.amazonaws.com
Content-Length: 256
Date: Thu, 27 Jan 2011 12:00:00 GMT
Authorization: signatureValue

<WebsiteConfiguration xmlns='http://s3.amazonaws.com/doc/2006-03-01/'>
  <IndexDocument>
    <Suffix>index.html</Suffix>
  </IndexDocument>
  <ErrorDocument>
    <Key>SomeErrorDocument.html</Key>
  </ErrorDocument>
</WebsiteConfiguration>

Amazon S3 returns the following sample response.

HTTP/1.1 200 OK
x-amz-id-2: YgIPifBiKa2bj0KMgUAoQkф3ShJTOOpXUueF6QKo
x-amz-request-id: 80CD4368BD211111
Date: Thu, 27 Jan 2011 00:00:00 GMT
Content-Length: 0
Server: AmazonS3

Example 2: Configure bucket as a website but redirect all requests

The following request configures a bucket www.example.com as a website; however, the configuration specifies that all GET requests for the www.example.com bucket's website endpoint will be redirected to host example.com.

PUT ?website HTTP/1.1
Host: www.example.com.s3.amazonaws.com
Content-Length: length-value
Date: Thu, 27 Jan 2011 12:00:00 GMT
Authorization: signatureValue

<WebsiteConfiguration xmlns='http://s3.amazonaws.com/doc/2006-03-01/'>
  <RedirectAllRequestsTo>
    <HostName>example.com</HostName>
  </RedirectAllRequestsTo>
</WebsiteConfiguration>

This redirect can be useful when you want to serve requests for both http://www.example.com and http://example.com, but you want to maintain the website content in only one bucket, in this case example.com. For more information, go to Hosting Websites on Amazon S3 in the Amazon Simple Storage Service Developer Guide.
Example 3: Configure bucket as a website and also specify optional redirection rules

Example 1 is the simplest website configuration. It configures a bucket as a website by providing only an index document and an error document. You can further customize the website configuration by adding routing rules that redirect requests for one or more objects. For example, suppose your bucket contained the following objects:

index.html
docs/article1.html
docs/article2.html

If you decided to rename the folder from docs/ to documents/, you would need to redirect requests for prefix /docs to documents/. For example, a request for docs/article1.html will need to be redirected to documents/article1.html.

In this case, you update the website configuration and add a routing rule as shown in the following request:

```xml
<WebsiteConfiguration xmlns='http://s3.amazonaws.com/doc/2006-03-01/'>
  <IndexDocument>
    <Suffix>index.html</Suffix>
  </IndexDocument>
  <ErrorDocument>
    <Key>Error.html</Key>
  </ErrorDocument>
  <RoutingRules>
    <RoutingRule>
      <Condition>
        <KeyPrefixEquals>docs/</KeyPrefixEquals>
      </Condition>
      <Redirect>
        <ReplaceKeyPrefixWith>documents/</ReplaceKeyPrefixWith>
      </Redirect>
    </RoutingRule>
  </RoutingRules>
</WebsiteConfiguration>
```

Example 4: Configure bucket as a website and redirect errors

You can use a routing rule to specify a condition that checks for a specific HTTP error code. When a page request results in this error, you can optionally reroute requests. For example, you might route requests to another host and optionally process the error. The routing rule in the following requests redirects requests to an EC2 instance in the event of an HTTP error 404. For illustration, the redirect also inserts a object key prefix report-404/ in the redirect. For example, if you request a page ExamplePage.html and it results in a HTTP 404 error, the request is routed to a page report-404/testPage.html on the specified EC2 instance. If there is no routing rule and the HTTP error 404 occurred, then Error.html would be returned.

```xml
<WebsiteConfiguration xmlns='http://s3.amazonaws.com/doc/2006-03-01/'>
  <IndexDocument>
    <Suffix>index.html</Suffix>
  </IndexDocument>
  <ErrorDocument>
    <Key>Error.html</Key>
  </ErrorDocument>
  <RoutingRules>
    <RoutingRule>
      <Condition>
        <HttpErrors code='404'>
      </Condition>
      <Redirect>
        <ReplaceKeyPrefixWith>report-404/</ReplaceKeyPrefixWith>
      </Redirect>
    </RoutingRule>
  </RoutingRules>
</WebsiteConfiguration>
```
Example 5: Configure a bucket as a website and redirect folder requests to a page

Suppose you have the following pages in your bucket:

images/photo1.jpg
images/photo2.jpg
images/photo3.jpg

Now you want to route requests for all pages with the images/ prefix to go to a single page, errorpage.html. You can add a website configuration to your bucket with the routing rule shown in the following request:

```
PUT ?website HTTP/1.1
Host: www.example.com.s3.amazonaws.com
Content-Length: 481
Date: Thu, 27 Jan 2011 12:00:00 GMT
Authorization: signatureValue

<WebsiteConfiguration xmlns='http://s3.amazonaws.com/doc/2006-03-01/
  <IndexDocument>
    <Suffix>index.html</Suffix>
  </IndexDocument>
  <ErrorDocument>
    <Key>Error.html</Key>
  </ErrorDocument>

  <RoutingRules>
    <RoutingRule>
      <Condition>
        <KeyPrefixEquals>images/</KeyPrefixEquals>
      </Condition>
      <Redirect>
        <HostName>ec2-11-22-333-44.compute-1.amazonaws.com</HostName>
        <ReplaceKeyWith>errorpage.html</ReplaceKeyWith>
      </Redirect>
    </RoutingRule>
  </RoutingRules>
</WebsiteConfiguration>
```
</Redirect>
</RoutingRule>
</RoutingRules>
</WebsiteConfiguration>
Delete Multiple Objects

**Description**

The Multi-Object Delete operation enables you to delete multiple objects from a bucket using a single HTTP request. If you know the object keys that you want to delete, then this operation provides a suitable alternative to sending individual delete requests (see DELETE Object (p. 311)), reducing per-request overhead.

The Multi-Object Delete request contains a list of up to 1000 keys that you want to delete. In the XML, you provide the object key names, and optionally, version IDs if you want to delete a specific version of the object from a versioning-enabled bucket. For each key, Amazon S3 performs a delete operation and returns the result of that delete, success, or failure, in the response. Note that, if the object specified in the request is not found, Amazon S3 returns the result as deleted.

The Multi-Object Delete operation supports two modes for the response; verbose and quiet. By default, the operation uses verbose mode in which the response includes the result of deletion of each key in your request. In quiet mode the response includes only keys where the delete operation encountered an
error. For a successful deletion, the operation does not return any information about the delete in the response body.

When performing a Multi-Object Delete operation on an MFA Delete enabled bucket, that attempts to delete any versioned objects, you must include an MFA token. If you do not provide one, the entire request will fail, even if there are non versioned objects you are attempting to delete. If you provide an invalid token, whether there are versioned keys in the request or not, the entire Multi-Object Delete request will fail. For information about MFA Delete, see MFA Delete.

Finally, the Content-MD5 header is required for all Multi-Object Delete requests. Amazon S3 uses the header value to ensure that your request body has not be altered in transit.

Requests

Syntax

```
POST /?delete HTTP/1.1
Host: bucketname.s3.amazonaws.com
Authorization: authorization string
Content-Length: Size
Content-MD5: MD5

<?xml version="1.0" encoding="UTF-8"?>
<Delete>
    <Quiet>true</Quiet>
    <Object>
        <Key>Key</Key>
        <VersionId>VersionId</VersionId>
    </Object>
    <Object>
        <Key>Key</Key>
    </Object>
    ...
</Delete>
```

Request Parameters

The Multi-Object Delete operation requires a single query string parameter called "delete" to distinguish it from other bucket POST operations.

Request Headers

This operation uses the following Request Headers in addition to the request headers common to most requests. For more information, see Common Request Headers (p. 2).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content-MD5</td>
<td>The base64-encoded 128-bit MD5 digest of the data. This header must be used as a message integrity check to verify that the request body was not corrupted in transit. For more information, go to RFC 1864. Type: String</td>
<td>Yes</td>
</tr>
<tr>
<td>Content-Length</td>
<td>Length of the body according to RFC 2616.</td>
<td>Yes</td>
</tr>
</tbody>
</table>
### Name

> **Description**

- **Type:** String
- **Default:** None

#### x-amz-mfa

The value is the concatenation of the authentication device's serial number, a space, and the value that is displayed on your authentication device.

- **Type:** String
- **Default:** None
- **Condition:** Required to permanently delete a versioned object if versioning is configured with MFA Delete enabled.

#### Request Elements

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delete</td>
<td>Container for the request. Ancestor: None</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Ancestor: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: Container</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Children: One or more Object elements and an optional Quiet element.</td>
<td></td>
</tr>
<tr>
<td>Quiet</td>
<td>Element to enable quiet mode for the request. When you add this element, you must set its value to true. Ancestor: Delete Type: Boolean Default: false</td>
<td>No</td>
</tr>
<tr>
<td>Object</td>
<td>Container element that describes the delete request for an object. Ancestor: Delete Type: Container Children: Key element and an optional VersionId element.</td>
<td>Yes</td>
</tr>
<tr>
<td>Key</td>
<td>Key name of the object to delete. Ancestor: Object Type: String</td>
<td>Yes</td>
</tr>
<tr>
<td>VersionId</td>
<td>VersionId for the specific version of the object to delete. Ancestor: Object Type: String</td>
<td>No</td>
</tr>
</tbody>
</table>
Responses

Response Headers

This operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

<table>

<td>Type: String  String</td>
</tr>
<tr>
<td></td>
<td>Ancestor: Deleted  String</td>
</tr>
<tr>
<td>DeleteMarker</td>
<td>DeleteMarker element with a true value indicates that the request accessed a delete marker.  String</td>
</tr>
<tr>
<td></td>
<td>If a specific delete request either creates or deletes a delete marker, Amazon S3 returns this element in the response with a value of true. This is only the case when your Multi-Object Delete request is on a bucket that has versioning enabled or suspended. For more information about delete markers, go to Object Versioning.  String</td>
</tr>
<tr>
<td></td>
<td>Type: Boolean  Boolean</td>
</tr>
<tr>
<td></td>
<td>Ancestor: Deleted  Boolean</td>
</tr>
<tr>
<td>DeleteMarkerVersionId</td>
<td>Version ID of the delete marker accessed (deleted or created) by the request.  String</td>
</tr>
</tbody>
</table>

API Version 2006-03-01

304
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>If the specific delete request in the Multi-Object Delete either creates or deletes a delete marker, Amazon S3 returns this element in response with the version ID of the delete marker. When deleting an object in a bucket with versioning enabled, this value is present for the following two reasons:</td>
</tr>
<tr>
<td></td>
<td>• You send a non-versioned delete request, that is, you specify only object key and not the version ID. In this case, Amazon S3 creates a delete marker and returns its version ID in the response.</td>
</tr>
<tr>
<td></td>
<td>• You send a versioned delete request, that is, you specify an object key and a version ID in your request; however, the version ID identifies a delete marker. In this case, Amazon S3 deletes the delete marker and returns the specific version ID in response. For information about versioning, go to <a href="https://docs.aws.amazon.com/AmazonS3/latest/userguide/object-versioning.html">Object Versioning</a>.</td>

Examples

Example 1: Multi-Object Delete resulting in mixed success/error response

This example illustrates a Multi-Object Delete request to delete objects that result in mixed success and errors response.

Sample Request

The following Multi-Object Delete request deletes two objects from a bucket (bucketname). In this example, the requester does not have permission to delete the sample2.txt object.

```
POST /?delete HTTP/1.1
Host: bucketname.s3.amazonaws.com
Accept: */*
X-Amz-Date: Wed, 30 Nov 2011 03:39:05 GMT
Content-MD5: p5/WA/oEr30qrEEl21PAgw==
Authorization: AWS AKIAIOSFODNN7EXAMPLE:W0qPYCLE6JwkZAD1ei6hp9XZIee=
Content-Length: 125
Connection: Keep-Alive

<Delete>
  <Object>
    <Key>sample1.txt</Key>
  </Object>
  <Object>
    <Key>sample2.txt</Key>
  </Object>
</Delete>
```

Sample Response

The response includes a DeleteResult element that includes a Deleted element for the item that Amazon S3 successfully deleted and an Error element that Amazon S3 did not delete because you didn't have permission to delete the object.

```
HTTP/1.1 200 OK
X-Amz-Id-2: 5h4FxSNCUS7wP5z9z92eGCGWVsMnRuVxVETa4H3H3LvvH6VAIr0jU7tH9kM7X+njXx
X-Amz-Request-Id: A437B3B641629AEE
Date: Fri, 02 Dec 2011 01:53:42 GMT
Content-Type: application/xml
Server: AmazonS3
Content-Length: 251

<?xml version="1.0" encoding="UTF-8"?>
<DeleteResult xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <Deleted>
    <Key>sample1.txt</Key>
  </Deleted>
</DeleteResult>
```
Example 2: Deleting Object from a Versioned Bucket

If you delete an item from a versioning enabled bucket, all versions of that object remain in the bucket; however, Amazon S3 inserts a delete marker. For more information, go to Object Versioning.

The following scenarios describe the behavior of a Multi-Object Delete request when versioning is enabled for your bucket.

Case 1 - Simple Delete

The following sample the Multi-Object Delete request specifies only one key.

```xml
<Delete>
  <Object>
    <Key>SampleDocument.txt</Key>
  </Object>
</Delete>
```

Because versioning is enabled on the bucket, Amazon S3 does not delete the object. Instead, it adds a delete marker for this object. The response indicates that a delete marker was added (the DeleteMarker element in the response as a value of true) and the version number of the delete marker it added.

```xml
<DeleteResult xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <Deleted>
    <Key>SampleDocument.txt</Key>
    <DeleteMarker>true</DeleteMarker>
    <DeleteMarkerVersionId>NeQt5xeFTfgfPJD8B4CGWnkSLtluMr1ls</DeleteMarkerVersionId>
  </Deleted>
</DeleteResult>
```

Case 2 - Versioned Delete

The following Multi-Object Delete attempts to delete a specific version of an object

```xml
<Delete>
  <Object>
    <Key>SampleDocument.txt</Key>
    <DeleteMarker>true</DeleteMarker>
  </Object>
</Delete>
```

```
<DeleteResult xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <Deleted>
    <Key>SampleDocument.txt</Key>
    <DeleteMarker>true</DeleteMarker>
    <DeleteMarkerVersionId>NeQt5xeFTfgfPJD8B4CGWnkSLtluMr1ls</DeleteMarkerVersionId>
  </Deleted>
</DeleteResult>
```
In this case, Amazon S3 deletes the specific object version from the bucket and returns the following response. In the response, Amazon S3 returns the key and version ID of the object deleted.

```
HTTP/1.1 200 OK
x-amz-id-2: P3xqrhuhYxlrefdw3rEzmJh8z5KDtGzb+/FB7oiQA5cI9Yaxd8olYXC7d1111xx+
x-amz-request-id: 264A17BF16E9E80A
Date: Wed, 30 Nov 2011 03:39:32 GMT
Content-Type: application/xml
Server: AmazonS3
Content-Length: 219

<?xml version="1.0" encoding="UTF-8"?>
<DeleteResult xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
    <Deleted>
        <Key>SampleDocument.txt</Key>
        <VersionId>OYcLXagmS.WaD..oyH4KRguB95_YhLa7</VersionId>
    </Deleted>
</DeleteResult>
```

**Case 3 - Versioned Delete of a Delete Marker**

In the preceding example, the request refers to a delete marker (instead of an object), then Amazon S3 deletes the delete marker. The effect of this operation is to make your object reappear in your bucket. Amazon S3 returns a response that indicates the delete marker it deleted (DeleteMarker element with value true) and the version ID of the delete marker.

```
HTTP/1.1 200 OK
x-amz-id-2: IFPuZrtolxDEmWnKose9JlSZe6ywFtye3Hq3T2iAeOZE4XHa6NKvAJcPp51zZaBr
x-amz-request-id: D6B284C0c9B0S5E4E
Date: Wed, 30 Nov 2011 03:43:25 GMT
Content-Type: application/xml
Server: AmazonS3
Content-Length: 331

<?xml version="1.0" encoding="UTF-8"?>
<DeleteResult xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
    <Deleted>
        <Key>SampleDocument.txt</Key>
        <VersionId>OYcLXagmS.WaD..oyH4KRguB95_YhLa7</VersionId>
        <DeleteMarker>true</DeleteMarker>
        <DeleteMarkerVersionId>NeQt5xeFTfgPJD884CGWnkSLtluMr11s</DeleteMarkerVersionId>
    </Deleted>
</DeleteResult>
```

In general, when a Multi-Object Delete request results in Amazon S3 either adding a delete marker or removing a delete marker, the response returns the following elements.
Example

```xml
<DeleteMarker>true</DeleteMarker>
<DeleteMarkerVersionId>NeQt5xeFTgfPJJD8B4CGWnkSLtluMr11s</DeleteMarkerVersionId>
```

Example 3: Malformed XML in the Request

This example shows how Amazon S3 responds to a request that includes a malformed XML document.

Sample Request

The following request sends a malformed XML document (missing the `Delete` end element).

```
POST /?delete HTTP/1.1
Host: bucketname.s3.amazonaws.com
Accept: */*
x-amz-date: Wed, 30 Nov 2011 03:39:05 GMT
Content-MD5: p5/WA/oEr30qrEEl21PAqw==
Authorization: AWS AKIAIOSFODNN7EXAMPLE:W0qPYCLE6Jwk2AD1ei6hp9ZXIee=
Content-Length: 104
Connection: Keep-Alive

<Delete>
  <Object>
    <Key>404.txt</Key>
  </Object>
  <Object>
    <Key>a.txt</Key>
  </Object>
</Delete>
```

Sample Response

The response returns the Error messages that describe the error.

```
HTTP/1.1 200 OK
x-amz-id-2: P3xqrhuhYx1refdw3rEzmJh8s5KDttGzb+/FB7oiQaScI9Yaxd8olYXc7d1111ab+
x-amz-request-id: 264A17BF16E9E80A
Date: Wed, 30 Nov 2011 03:39:32 GMT
Content-Type: application/xml
Server: AmazonS3
Content-Length: 207

<?xml version="1.0" encoding="UTF-8"?>
<Error>
  <Code>MalformedXML</Code>
  <Message>The XML you provided was not well-formed or did not validate against our published schema</Message>
  <RequestId>264A17BF16E9E80A</RequestId>
  <HostId>P3xqrhuhYx1refdw3rEzmJh8s5KDttGzb+/FB7oiQaScI9Yaxd8olYXc7d1111ab+</HostId>
</Error>
```

DELETE Object

Description

The DELETE operation removes the null version (if there is one) of an object and inserts a delete marker, which becomes the current version of the object. If there isn't a null version, Amazon S3 does not remove any objects.

Versioning

To remove a specific version, you must be the bucket owner and you must use the versionId subresource. Using this subresource permanently deletes the version. If the object deleted is a delete marker, Amazon S3 sets the response header, x-amz-delete-marker, to true.

If the object you want to delete is in a bucket where the bucket versioning configuration is MFA Delete enabled, you must include the x-amz-mfa request header in the DELETE versionId request. Requests that include x-amz-mfa must use HTTPS.

For more information about MFA Delete, go to Using MFA Delete. To see sample requests that use versioning, see Sample Request (p. 313).

You can delete objects by explicitly calling the DELETE Object API or configure its lifecycle (see PUT Bucket lifecycle (p. 244)) to enable Amazon S3 to remove them for you. If you want to block users or accounts from removing or deleting objects from your bucket you must deny them s3:DeleteObject, s3:DeleteObjectVersion and s3:PutLifeCycleConfiguration actions.

Requests

Syntax

DELETE /ObjectName HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: date
Content-Length: length
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-mfa</td>
<td>The value is the concatenation of the authentication device's serial number, a space, and the value displayed on your authentication device.</td>
<td>Conditional</td>
</tr>
</tbody>
</table>
Request Elements

This implementation of the operation does not use request elements.

Responses

Response Headers

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-delete-marker</td>
<td>Specifies whether the versioned object that was permanently deleted was (true) or was not (false) a delete marker. In a simple DELETE, this header indicates whether (true) or not (false) a delete marker was created.</td>
</tr>
<tr>
<td></td>
<td>Type: Boolean</td>
</tr>
<tr>
<td></td>
<td>Valid Values: true</td>
</tr>
<tr>
<td></td>
<td>Default: false</td>
</tr>
<tr>
<td>x-amz-version-id</td>
<td>Returns the version ID of the delete marker created as a result of the DELETE operation. If you delete a specific object version, the value returned by this header is the version ID of the object version deleted.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
</tr>
</tbody>
</table>

Response Elements

This implementation of the operation does not return response elements.

Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

Examples

Sample Request

The following request deletes the object, my-second-image.jpg.

```
DELETE /my-second-image.jpg HTTP/1.1
Host: bucket.s3.amazonaws.com
Date: Wed, 12 Oct 2009 17:50:00 GMT
Authorization: authorization string
Content-Type: text/plain
```

Sample Response

```
HTTP/1.1 204 NoContent
```
Sample Request Deleting a Specified Version of an Object

The following request deletes the specified version of the object, `my-third-image.jpg`.

```
DELETE /my-third-image.jpg?versionId=UIORUnfndfiufdisojhr398493jfdkjFJjkndnqUifhbw89493jJFJ
HTTP/1.1
Host: bucket.s3.amazonaws.com
Date: Wed, 12 Oct 2009 17:50:00 GMT
Authorization: authorization string
Content-Type: text/plain
Content-Length: 0
```

Sample Response

```
HTTP/1.1 204 NoContent
x-amz-id-2: LriYPLdmOdAiIfgSm/F1YsViT1LW94/xUQxsMsF7xiEblaoIIOIx1+zbwZ163pt7
x-amz-request-id: 0A49CE4060975EAC
x-amz-version-id: UIORUnfndfiufdisojhr398493jfdkjFJjkndnqUifhbw89493jJFJ
Date: Wed, 12 Oct 2009 17:50:00 GMT
Content-Length: 0
Connection: close
Server: AmazonS3
```

Sample Response if the Object Deleted is a Delete Marker

```
HTTP/1.1 204 NoContent
x-amz-id-2: LriYPLdmOdAiIfgSm/F1YsViT1LW94/xUQxsMsF7xiEblaoIIOIx1+zbwZ163pt7
x-amz-request-id: 0A49CE4060975EAC
x-amz-version-id: 3/L4kqt3lpXroDSTMj+rmSpX3d1brHY+MTRCxf3vjVHB40fR8XgdRQbUMLuo
x-amz-delete-marker: true
Date: Wed, 12 Oct 2009 17:50:00 GMT
Content-Length: 0
Connection: close
Server: AmazonS3
```

Sample Request Deleting a Specified Version of an Object in an MFA-Enabled Bucket

The following request deletes the specified version of the object, `my-third-image.jpg`, which is stored in an MFA-enabled bucket.

```
DELETE /my-third-image.jpg?versionId=UIORUnfndfiuf HTTP/1.1
Host: bucket.s3.amazonaws.com
Date: Wed, 12 Oct 2009 17:50:00 GMT
x-amz-mfa: [SerialNumber] [AuthenticationCode]
Authorization: authorization string

DELETE Object tagging

Description

This implementation of the DELETE operation uses the tagging subresource to remove the entire tag set from the specified object. For more information about managing object tags, see Object Tagging in the Amazon Simple Storage Service Developer Guide.

To use this operation, you must have permission to perform the s3:DeleteObjectTagging action.

To delete tags of a specific object version, add the versionId query parameter in the request. You will need permission for the s3:DeleteObjectVersionTagging action.

Requests

Syntax

DELETE ObjectKey/?tagging HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

This implementation of the operation does not use request elements.

Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Examples

Sample Request

The following DELETE request deletes the tag set from the specified object.

DELETE exampleobject/?tagging HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Sample Response

The following successful response shows Amazon S3 returning a 204 No Content response. The tag set for the object has been removed.

HTTP/1.1 204 No Content
Date: Wed, 25 Nov 2016 12:00:00 GMT
Connection: close
Server: AmazonS3

- PUT Object tagging (p. 414)
- GET Object tagging (p. 333)
GET Object

Description

This implementation of the GET operation retrieves objects from Amazon S3. To use GET, you must have READ access to the object. If you grant READ access to the anonymous user, you can return the object without using an authorization header.

An Amazon S3 bucket has no directory hierarchy such as you would find in a typical computer file system. You can, however, create a logical hierarchy by using object key names that imply a folder structure. For example, instead of naming an object sample.jpg, you can name it photos/2006/February/sample.jpg.

To get an object from such a logical hierarchy, specify the full key name for the object in the GET operation. For a virtual hosted-style request example, if you have the object photos/2006/February/sample.jpg, specify the resource as /photos/2006/February/sample.jpg. For a path-style request example, if you have the object photos/2006/February/sample.jpg in the bucket named examplebucket, specify the resource as /examplebucket/photos/2006/February/sample.jpg. For more information about request types, see HTTP Host Header Bucket Specification in the Amazon Simple Storage Service Developer Guide.

To distribute large files to many people, you can save bandwidth costs by using BitTorrent. For more information, see Amazon S3 Torrent in the Amazon Simple Storage Service Developer Guide. For more information about returning the ACL of an object, see GET Object ACL (p. 329).

If the object you are retrieving is a GLACIER storage class object, the object is archived in Amazon Glacier. You must first restore a copy using the POST Object restore (p. 362) API before you can retrieve the object. Otherwise, this operation returns an InvalidObjectStateError error. For information about archiving objects in Amazon Glacier, go to Object Lifecycle Management in the Amazon Simple Storage Service Developer Guide.

If you encrypt an object by using server-side encryption with customer-provided encryption keys (SSE-C) when you store the object in Amazon S3, then when you GET the object, you must use the headers documented in the section Specific Request Headers for Server-Side Encryption with Customer-Provided Encryption Keys (p. 321). For more information about SSE-C, go to Server-Side Encryption (Using Customer-Provided Encryption Keys) in the Amazon Simple Storage Service Developer Guide.

Assuming you have permission to read object tags (permission for the s3:GetObjectVersionTagging action), the response also returns the x-amz-tagging-count header that provides the count of number of tags associated with the object. You can use the "GET Object tagging" API (see GET Object tagging (p. 333)) to retrieve the tag set associated with an object.

Permissions

You need the s3:GetObject permission for this operation. For more information, go to Specifying Permissions in a Policy in the Amazon Simple Storage Service Developer Guide. If the object you request does not exist, the error Amazon S3 returns depends on whether you also have the s3:ListBucket permission.

- If you have the s3:ListBucket permission on the bucket, Amazon S3 will return an HTTP status code 404 ("no such key") error.
- If you don't have the s3:ListBucket permission, Amazon S3 will return an HTTP status code 403 ("access denied") error.
Versioning

By default, the GET operation returns the current version of an object. To return a different version, use the versionId subresource.

**Note**
If the current version of the object is a delete marker, Amazon S3 behaves as if the object was deleted and includes x-amz-delete-marker: true in the response.

For more information about versioning, see PUT Bucket versioning (p. 288) To see sample requests that use versioning, see Sample Request Getting a Specified Version of an Object (p. 325).

Requests

**Syntax**

```
GET /ObjectName HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))
Range: bytes=byte_range
```

**Request Parameters**

There are times when you want to override certain response header values in a GET response. For example, you might override the Content-Disposition response header value in your GET request.

You can override values for a set of response headers using the query parameters listed in the following table. These response header values are sent only on a successful request, that is, when status code 200 OK is returned. The set of headers you can override using these parameters is a subset of the headers that Amazon S3 accepts when you create an object. The response headers that you can override for the GET response are Content-Type, Content-Language, Expires, Cache-Control, Content-Disposition, and Content-Encoding. To override these header values in the GET response, you use the request parameters described in the following table.

**Note**
You must sign the request, either using an Authorization header or a pre-signed URL, when using these parameters. They cannot be used with an unsigned (anonymous) request.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>response-content-type</td>
<td>Sets the Content-Type header of the response.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>response-content-language</td>
<td>Sets the Content-Language header of the response.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>response-expires</td>
<td>Sets the Expires header of the response.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
</tbody>
</table>
## Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>response-cache-control</td>
<td>Sets the Cache-Control header of the response.</td>
<td>No</td>
</tr>
<tr>
<td>response-content-disposition</td>
<td>Sets the Content-Disposition header of the response.</td>
<td>No</td>
</tr>
<tr>
<td>response-content-encoding</td>
<td>Sets the Content-Encoding header of the response.</td>
<td>No</td>
</tr>
</tbody>
</table>

### Request Headers

This implementation of the operation can use the following request headers in addition to the request headers common to all operations. Request headers are limited to 8 KB in size. For more information, see Common Request Headers (p. 2).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Range</td>
<td>Downloads the specified range bytes of an object. For more information about the HTTP Range header, go to <a href="http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.35">http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.35</a>.</td>
<td>No</td>
</tr>
<tr>
<td>If-Modified-Since</td>
<td>Return the object only if it has been modified since the specified time, otherwise return a 304 (not modified). See Consideration 2 after the table.</td>
<td>No</td>
</tr>
<tr>
<td>If-Unmodified-Since</td>
<td>Return the object only if it has not been modified since the specified time, otherwise return a 412 (precondition failed). See Consideration 1 after the table.</td>
<td>No</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>----------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------</td>
</tr>
<tr>
<td>If-Match</td>
<td>Return the object only if its entity tag (ETag) is the same as the one specified; otherwise, return a 412 (precondition failed). See Consideration 1 after the table.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: None</td>
<td></td>
</tr>
<tr>
<td>If-None-Match</td>
<td>Return the object only if its entity tag (ETag) is different from the one specified; otherwise, return a 304 (not modified). See Consideration 2 after the table.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: None</td>
<td></td>
</tr>
</tbody>
</table>

**Note**

Encryption request headers, like `x-amz-server-side-encryption`, should not be sent for GET requests if your object uses server-side encryption with AWS KMS–managed encryption keys (SSE-KMS) or server-side encryption with Amazon S3–managed encryption keys (SSE-S3). If your object does use these types of keys, you’ll get an HTTP 400 BadRequest error.

Note the following additional considerations about the preceding request headers:

- **Consideration 1** – If both of the If-Match and If-Unmodified-Since headers are present in the request as follows:

  If-Match condition evaluates to true, and;

  If-Unmodified-Since condition evaluates to false;

  then, S3 returns 200 OK and the data requested. For more information about conditional requests, see RFC 7232.

- **Consideration 2** – If both of the If-None-Match and If-Modified-Since headers are present in the request as follows:

  If-None-Match condition evaluates to false, and;

  If-Modified-Since condition evaluates to true;

  then, S3 returns 304 Not Modified response code. For more information about conditional requests, see RFC 7232.
Specific Request Headers for Server-Side Encryption with Customer-Provided Encryption Keys

When you retrieve an object from Amazon S3 that was encrypted by using server-side encryption with customer-provided encryption keys (SSE-C), you must use the following request headers. For more information about SSE-C, go to Server-Side Encryption (Using Customer-Provided Encryption Keys) in the Amazon Simple Storage Service Developer Guide.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-server-side-encryption-customer-algorithm</td>
<td>Specifies the algorithm to use to when decrypting the requested object. Type: String Default: None Valid Values: AES256 Constraints: Must be accompanied by valid x-amz-server-side-encryption-customer-key and x-amz-server-side-encryption-customer-key-MD5 headers.</td>
<td>Yes</td>
</tr>
<tr>
<td>x-amz-server-side-encryption-customer-key</td>
<td>Specifies the customer-provided base64-encoded encryption key to use to decrypt the requested object. This value is used to perform the decryption and then it is discarded; Amazon does not store the key. The key must be appropriate for use with the algorithm specified in the x-amz-server-side-encryption-customer-algorithm header. Type: String Default: None Constraints: Must be accompanied by valid x-amz-server-side-encryption-customer-algorithm and x-amz-server-side-encryption-customer-key-MD5 headers.</td>
<td>Yes</td>
</tr>
<tr>
<td>x-amz-server-side-encryption-customer-key-MD5</td>
<td>Specifies the base64-encoded 128-bit MD5 digest of the customer-provided encryption key according to RFC 1321. If this header is included in your request, Amazon S3 uses it for a message integrity check to ensure that the encryption key was transmitted without error. Type: String Default: None Constraints: Must be accompanied by valid x-amz-server-side-encryption-customer-algorithm and x-amz-server-side-encryption-customer-key headers.</td>
<td>No</td>
</tr>
</tbody>
</table>

Request Elements

This implementation of the operation does not use request elements.
Responses

Response Headers

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-delete-marker</td>
<td>Specifies whether the object retrieved was (true) or was not (false) a delete marker. If false, this response header does not appear in the response.</td>
</tr>
<tr>
<td></td>
<td>Type: Boolean</td>
</tr>
<tr>
<td></td>
<td>Valid Values: true</td>
</tr>
<tr>
<td></td>
<td>Default: false</td>
</tr>
<tr>
<td>x-amz-expiration</td>
<td>Amazon S3 returns this header if an Expiration action is configured for the object as part of the bucket's lifecycle configuration. The header value includes an &quot;expiry-date&quot; component and a URL-encoded &quot;rule-id&quot; component. Note that for versioning-enabled buckets, this header applies only to current versions; Amazon S3 does not provide a header to infer when a noncurrent version will be eligible for permanent deletion. For more information, see PUT Bucket lifecycle (p. 244).</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>x-amz-meta-*</td>
<td>Headers starting with this prefix are user-defined metadata. Each one is stored and returned as a set of key-value pairs. Amazon S3 doesn't validate or interpret user-defined metadata.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>x-amz-replication-status</td>
<td>Amazon S3 can return this header if your request involves a bucket that is either a source or destination in a cross-region replication.</td>
</tr>
<tr>
<td></td>
<td>In cross-region replication you have a source bucket on which you configure replication and destination bucket where Amazon S3 stores object replicas. When you request an object (GET Object) or object metadata (HEAD Object) from these buckets, Amazon S3 will return the x-amz-replication-status header in the response as follow:</td>
</tr>
<tr>
<td></td>
<td>• If requesting object from the source bucket — Amazon S3 will return the x-amz-replication-status header if object in your request is eligible for replication.</td>
</tr>
<tr>
<td></td>
<td>For example, suppose in your replication configuration you specify object prefix &quot;TaxDocs&quot; requesting Amazon S3 to replicate objects with key prefix &quot;TaxDocs&quot;. Then any objects you upload with this key name prefix, for example &quot;TaxDocs/document1.pdf&quot;, is eligible for replication. For any object request with this key name prefix Amazon S3 will return the x-amz-replication-status header with value PENDING, COMPLETED or FAILED indicating object replication status.</td>
</tr>
<tr>
<td></td>
<td>• If requesting object from the destination bucket — Amazon S3 will return the x-amz-replication-status header with value REPLICA if object in your request is a replica that Amazon S3 created.</td>
</tr>
<tr>
<td></td>
<td>For more information, go to Cross-Region Replication in the Amazon Simple Storage Service Developer Guide.</td>
</tr>
<tr>
<td>Header</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
|  | Valid Values: PENDING, COMPLETED, FAILED, REPLICA  
Type: String |
| x-amz-server-side-encryption | If the object is stored using server-side encryption either with an AWS KMS or an Amazon S3-managed encryption key, the response includes this header with the value of the encryption algorithm used.  
Type: String |
| x-amz-server-side-encryption-aws-kms-key-id | If the x-amz-server-side-encryption is present and has the value of aws:kms, this header specifies the ID of the AWS Key Management Service (KMS) master encryption key that was used for the object.  
Type: String |
| x-amz-server-side-encryption-customer-algorithm | If server-side encryption with customer-provided encryption keys decryption was requested, the response will include this header confirming the decryption algorithm used.  
Type: String  
Valid Values: AES256 |
| x-amz-server-side-encryption-customer-key-MD5 | If server-side encryption with customer-provided encryption keys decryption was requested, the response includes this header to provide roundtrip message integrity verification of the customer-provided encryption key.  
Type: String |
| x-amz-storage-class | Provides storage class information of the object. Amazon S3 returns this header for all objects except for Standard storage class objects.  
For more information, go to Storage Classes in Amazon Simple Storage Service Developer Guide.  
Type: String  
Default: None |
| x-amz-restore | Provides information about the object restoration operation and expiration time of the restored object copy.  
For more information about archiving objects and restoring them, go to Transitioning Objects: General Considerations in the Amazon Simple Storage Service Developer Guide.  
Type: String  
Default: None |
| x-amz-tagging-count | Returns the count of the tags associated with the object. This header is returned only if the count is greater than zero.  
Type: String  
Default: None |
### Header

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-version-id</td>
<td>Returns the version ID of the retrieved object if it has a unique version ID. Type: String, Default: None</td>
</tr>
<tr>
<td>x-amz-website-redirect-location</td>
<td>When a bucket is configured as a website, you can set this metadata on the object so the website endpoint will evaluate the request for the object as a 301 redirect to another object in the same bucket or an external URL. Type: String, Default: None</td>
</tr>
</tbody>
</table>

### Response Elements

This implementation of the operation does not return response elements.

### Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

### Examples

#### Sample Request

The following request returns the object, my-image.jpg.

```
GET /my-image.jpg HTTP/1.1
Host: bucket.s3.amazonaws.com
Date: Mon, 3 Oct 2016 22:32:00 GMT
Authorization: authorization string
```

#### Sample Response

```
HTTP/1.1 200 OK
x-amz-id-2: eftixk72a6Ap51TqcoF8eFidJG9Z/2mkiDFu8yU9AS1ed4OpIszj7UDNEHGran
x-amz-request-id: 318BC8BC148832E5
Date: Mon, 3 Oct 2016 22:32:00 GMT
Last-Modified: Wed, 12 Oct 2009 17:50:00 GMT
ETag: "fba9dede5f27731c9771645a39863328"
Content-Length: 434234

[434234 bytes of object data]
```

If the object had tags associated with it, S3 returns the x-amz-tagging-count header with tag count.

```
HTTP/1.1 200 OK

Last-Modified: Fri, 17 Dec 2010 18:10:41 GMT
ETag: "0332beea7bf845f176c5c0d1ae7cf07"
Accept-Ranges: bytes
Content-Type: text/plain
Content-Length: 22
Server: AmazonS3
[object data not shown]
Sample Request with a Range Header

The following request specifies the HTTP Range header to retrieve the first 10 bytes of an object. For more information about the HTTP Range header, go to http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html.

```
GET /example-object HTTP/1.1
Host: example-bucket.s3.amazonaws.com
x-amz-date: Fri, 28 Jan 2011 21:32:02 GMT
Range: bytes=0-9
Authorization: AWS AKIAIOSFODNN7EXAMPLE:Yxg83MZaEgh30Z3l0rLo5RTX11o=
```

**Note**

Amazon S3 doesn't support retrieving multiple ranges of data per GET request.

Sample Response

In the following sample response, note that the header values are set to the values specified in the true request.

```
HTTP/1.1 206 Partial Content
x-amz-id-2: MzRISOwyjmupCzjJ11WC0615TTAzm7/JypPGXLh00VFGCJaaO3KW/hRAqKOpIEEp
x-amz-request-id: 47622117804B3E11
Date: Fri, 28 Jan 2011 21:32:09 GMT
x-amz-meta-title: the title
Last-Modified: Fri, 28 Jan 2011 20:10:32 GMT
ETag: "b2419b1e3fd45d596ee22bdf62aaa2f"
Accept-Ranges: bytes
Content-Range: bytes 0-9/443
Content-Type: text/plain
Content-Length: 10
Server: AmazonS3

[10 bytes of object data]
```

Sample: Get an Object Stored Using Server-Side Encryption with Customer-Provided Encryption Keys

If an object is stored in Amazon S3 using server-side encryption with customer-provided encryption keys, Amazon S3 needs encryption information so that it can decrypt the object before sending it to you in response to a GET request. You provide the encryption information in your GET request using the relevant headers (see Specific Request Headers for Server-Side Encryption with Customer-Provided Encryption Keys (p. 321)), as shown in the following example request.

```
GET /example-object HTTP/1.1
Host: example-bucket.s3.amazonaws.com
Accept: */*
Authorization: authorization string

GET Object ACL

Description

This implementation of the GET operation uses the acl subresource to return the access control list (ACL) of an object. To use this operation, you must have READ_ACP access to the object.

Versioning

By default, GET returns ACL information about the current version of an object. To return ACL information about a different version, use the versionId subresource.

To see sample requests that use Versioning, see Sample Request Getting the ACL of the Specific Version of an Object (p. 331).

Requests

Syntax

```
GET /ObjectName?acl HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))
Range: bytes=byte_range
```

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

This implementation of the operation does not use request elements.

Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

<table>
<thead>

GET Object tagging

Description

This implementation of the GET operation returns the tags associated with an object. You send the GET request against the tagging subresource associated with the object.

To use this operation, you must have permission to perform the s3:GetObjectTagging action. By default, the GET operation returns information about current version of an object. For a versioned bucket, you can have multiple versions of an object in your bucket. To retrieve tags of any other version, use the versionId query parameter. You also need permission for the s3:GetObjectVersionTagging action.

By default, the bucket owner has this permission and can grant this permission to others.

Requests

Syntax

GET /ObjectName?tagging HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

This implementation of the operation does not use request elements.

Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

<table>

## Examples

### Sample Request

The following request returns the tag set of the specified object.

```
GET /example-object?tagging HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Date: Thu, 22 Sep 2016 21:33:08 GMT
Authorization: authorization string
```

### Sample Response

```
HTTP/1.1 200 OK
Date: Thu, 22 Sep 2016 21:33:08 GMT
Server: AmazonS3
<?xml version="1.0" encoding="UTF-8"?>
<Tagging xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <TagSet>
    <Tag>
      <Key>tag1</Key>
      <Value>val1</Value>
    </Tag>
    <Tag>
      <Key>tag2</Key>
      <Value>val2</Value>
    </Tag>
  </TagSet>
</Tagging>
```

- PUT Object tagging (p. 414)
GET Object torrent

Description

This implementation of the GET operation uses the torrent subresource to return torrent files from a bucket. BitTorrent can save you bandwidth when you're distributing large files. For more information about BitTorrent, see Amazon S3 Torrent.

Note

You can get torrent only for objects that are less than 5 GB in size and that are not encrypted using server-side encryption with customer-provided encryption key.

To use GET, you must have READ access to the object.

Requests

Syntax

GET /ObjectName?torrent HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

This implementation of the operation does not use request elements.

Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

This implementation of the operation does not return response elements.

Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).
Examples

Getting Torrent Files in a Bucket

This example retrieves the Torrent file for the "Nelson" object in the "quotes" bucket.

```
GET /quotes/Nelson?torrent HTTP/1.0
Host: bucket.s3.amazonaws.com
Date: Wed, 28 Oct 2009 22:32:00 GMT
Authorization: authorization string
```

Sample Response

```
HTTP/1.1 200 OK
x-amz-request-id: 7CD745EBB7AB5ED9
Date: Wed, 25 Nov 2009 12:00:00 GMT
Content-Disposition: attachment; filename=Nelson.torrent;
Content-Type: application/x-bittorrent
Content-Length: 537
Server: AmazonS3

<body: a Bencoded dictionary as defined by the BitTorrent specification>
```

Related Resources

- GET Object (p. 317)
HEAD Object

Description

The HEAD operation retrieves metadata from an object without returning the object itself. This operation is useful if you are interested only in an object's metadata. To use HEAD, you must have READ access to the object.

A HEAD request has the same options as a GET operation on an object. The response is identical to the GET response except that there is no response body.

If you encrypt an object by using server-side encryption with customer-provided encryption keys (SSE-C) when you store the object in Amazon S3, then when you retrieve the metadata from the object, you must use the headers documented in the section Specific Request Headers for Server-Side Encryption with Customer-Provided Encryption Keys (p. 340). For more information about SSE-C, go to Server-Side Encryption (Using Customer-Provided Encryption Keys) in the Amazon Simple Storage Service Developer Guide.

Permissions

You need the s3:GetObject permission for this operation. For more information, go to Specifying Permissions in a Policy in the Amazon Simple Storage Service Developer Guide. If the object you request does not exist, the error Amazon S3 returns depends on whether you also have the s3:ListBucket permission.

- If you have the s3:ListBucket permission on the bucket, Amazon S3 will return a HTTP status code 404 ("no such key") error.
- If you don't have the s3:ListBucket permission, Amazon S3 will return a HTTP status code 403 ("access denied") error.

Versioning

By default, the HEAD operation retrieves metadata from the current version of an object. If the current version is a delete marker, Amazon S3 behaves as if the object was deleted. To retrieve metadata from a different version, use the versionId subresource. For more information, see Versions in the Amazon Simple Storage Service Developer Guide.

To see sample requests that use versioning, see Sample Request Getting Metadata from a Specified Version of an Object (p. 345).

Requests

Syntax

HEAD /ObjectName HTTP/1.1
Host: BucketName.s3.amazonaws.com
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))
Date: date

Request Parameters

This implementation of the operation does not use request parameters.
# Request Headers

This implementation of the operation can use the following request headers in addition to the request headers common to all operations. Request headers are limited to 8 KB in size. For more information, see [Common Request Headers](#).  

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Range</td>
<td>Downloads the specified range bytes of an object. For more information about the HTTP Range header, go to <a href="http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.35">http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.35</a>.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: None</td>
<td></td>
</tr>
<tr>
<td>If-Modified-Since</td>
<td>Return the object only if it has been modified since the specified time, otherwise return a 304 (not modified).</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>See Consideration 2 after the table.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: None</td>
<td></td>
</tr>
<tr>
<td>If-Unmodified-Since</td>
<td>Return the object only if it has not been modified since the specified time, otherwise return a 412 (precondition failed).</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>See Consideration 1 after the table.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: None</td>
<td></td>
</tr>
<tr>
<td>If-Match</td>
<td>Return the object only if its entity tag (ETag) is the same as the one specified; otherwise, return a 412 (precondition failed).</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>See Consideration 1 after the table.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: None</td>
<td></td>
</tr>
<tr>
<td>If-None-Match</td>
<td>Return the object only if its entity tag (ETag) is different from the one specified; otherwise, return a 304 (not modified).</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>See Consideration 2 after the table.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>
Note

Encryption request headers, like `x-amz-server-side-encryption`, should not be sent for GET requests if your object uses server-side encryption with AWS KMS–managed encryption keys (SSE-KMS) or server-side encryption with Amazon S3–managed encryption keys (SSE-S3). If your object does use these types of keys, you'll get an HTTP 400 BadRequest error.

Note the following additional considerations about the preceding request headers:

- **Consideration 1** – If both of the `If-Match` and `If-Unmodified-Since` headers are present in the request as follows:

  If-Match condition evaluates to true, and;

  If-Unmodified-Since condition evaluates to false;

  then, S3 returns 200 OK and the data requested. For more information about conditional requests, see [RFC 7232](https://tools.ietf.org/html/rfc7232).

- **Consideration 2** – If both of the `If-None-Match` and `If-Modified-Since` headers are present in the request as follows:

  If-None-Match condition evaluates to false, and;

  If-Modified-Since condition evaluates to true;

  then, S3 returns 304 Not Modified response code. For more information about conditional requests, see [RFC 7232](https://tools.ietf.org/html/rfc7232).

Specific Request Headers for Server-Side Encryption with Customer-Provided Encryption Keys

When you retrieve metadata from an object stored in Amazon S3 that was encrypted by using server-side encryption with customer-provided encryption keys (SSE-C), you must use the following request headers. For more information about SSE-C, go to Server-Side Encryption (Using Customer-Provided Encryption Keys) in the Amazon Simple Storage Service Developer Guide.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
</table>
| `x-amz-server-side-encryption-customer-algorithm` | Specifies the algorithm to use when decrypting the requested object.  
Type: String  
Default: None  
Valid Values: AES256  
Constraints: Must be accompanied by valid `x-amz-server-side-encryption-customer-key` and `x-amz-server-side-encryption-customer-key-MD5` headers. | Yes      |
### Responses

#### Request Elements

This implementation of the operation does not use request elements.

#### Response Headers

This implementation of the operation can include the following response headers in addition to the response headers common to all responses. For more information, see Common Response Headers (p. 4).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-expiration</td>
<td>Amazon S3 will return this header if an Expiration action is configured for the object as part of the bucket's lifecycle configuration. The header value includes an &quot;expiry-date&quot; component and a URL-encoded &quot;rule-id&quot; component. Note that for versioning-enabled buckets, this header applies only to current versions; Amazon S3 does not provide a header to infer when a noncurrent version will be eligible for permanent deletion. For more information, see PUT Bucket lifecycle (p. 244).</td>
</tr>
</tbody>
</table>

Type: String
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-meta-*</td>
<td>Headers starting with this prefix are user-defined metadata. Each one is stored and returned as a set of key-value pairs. Amazon S3 doesn't validate or interpret user-defined metadata. Type: String</td>
</tr>
<tr>
<td>x-amz-missing-meta</td>
<td>This header is set to the number of metadata entries that were not returned in x-amz-meta headers. This can happen if you create metadata using an API like SOAP that supports more flexible metadata than the REST API. For example, with SOAP, you can create metadata with values that are not valid HTTP headers. Type: String</td>
</tr>
<tr>
<td>x-amz-replication-status</td>
<td>Amazon S3 can return this header if your request involves a bucket that is either a source or destination in a cross-region replication.</td>
</tr>
<tr>
<td></td>
<td>In cross-region replication you have a source bucket on which you configure replication and destination bucket where Amazon S3 stores object replicas. When you request an object (GET Object) or object metadata (HEAD Object) from these buckets, Amazon S3 will return the x-amz-replication-status header in the response as follow:</td>
</tr>
<tr>
<td></td>
<td>• If requesting object from the source bucket — Amazon S3 will return the x-amz-replication-status header if object in your request is eligible for replication.</td>
</tr>
<tr>
<td></td>
<td>For example, suppose in your replication configuration you specify object prefix &quot;TaxDocs&quot; requesting Amazon S3 to replicate objects with key prefix &quot;TaxDocs&quot;. Then any objects you upload with this key name prefix, for example &quot;TaxDocs/document1.pdf&quot;, is eligible for replication. For any object request with this key name prefix Amazon S3 will return the x-amz-replication-status header with value PENDING, COMPLETED or FAILED indicating object replication status.</td>
</tr>
<tr>
<td></td>
<td>• If requesting object from the destination bucket — Amazon S3 will return the x-amz-replication-status header with value REPLICA if object in your request is a replica that Amazon S3 created.</td>
</tr>
<tr>
<td></td>
<td>For more information, go to Cross-Region Replication in the Amazon Simple Storage Service Developer Guide.</td>
</tr>
<tr>
<td></td>
<td>Valid Values: PENDING, COMPLETED, FAILED, REPLICA</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td>x-amz-restore</td>
<td>If the object is an archived object (an object whose storage class is GLACIER), the response includes this header if either the archive restoration is in progress (see POST Object restore (p. 362)) or an archive copy is already restored. If an archive copy is already restored, the header value indicates when Amazon S3 is scheduled to delete the object copy. For example, x-amz-restore: ongoing-request=&quot;false&quot;, expiry-date=&quot;Fri, 23 Dec 2012 00:00:00 GMT&quot; If the object restoration is in progress, the header will return the value ongoing-request=&quot;true&quot;. For more information about archiving objects, see Transitioning Objects: General Considerations in the Amazon Simple Storage Service Developer Guide</td>
</tr>
<tr>
<td>x-amz-server-side-encryption</td>
<td>If the object is stored using server-side encryption either with an AWS KMS or an Amazon S3-managed encryption key, the response includes this header with the value of the encryption algorithm used. Type: String Default: None</td>
</tr>
<tr>
<td>x-amz-server-side-encryption-aws-kms-key-id</td>
<td>If the x-amz-server-side-encryption is present and has the value of aws:kms, this header specifies the ID of the AWS Key Management Service (KMS) master encryption key that was used for the object. Type: String</td>
</tr>
<tr>
<td>x-amz-server-side-encryption-customer-algorithm</td>
<td>If server-side encryption with customer-provided encryption keys(SSE-C) decryption was requested, the response will include this header confirming the decryption algorithm used. Type: String Valid Values: AES256</td>
</tr>
<tr>
<td>x-amz-server-side-encryption-customer-key-MD5</td>
<td>If SSE-C decryption was requested, the response includes this header to provide roundtrip message integrity verification of the customer-provided encryption key. Type: String</td>
</tr>
<tr>
<td>x-amz-storage-class</td>
<td>Provides storage class information of the object. Amazon S3 returns this header for all objects except for Standard storage class objects. For more information, go to Storage Classes in Amazon Simple Storage Service Developer Guide. Type: String Default: None</td>
</tr>
</tbody>
</table>
**Name**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-version-id</td>
<td>The version ID of the object returned.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
</tbody>
</table>

**Response Elements**

**Response Elements**

This implementation of the operation does not return response elements.

**Special Errors**

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

**Examples**

**Sample Request**

The following request returns the metadata of an object.

```
HEAD /my-image.jpg HTTP/1.1
Host: bucket.s3.amazonaws.com
Date: Wed, 28 Oct 2009 22:32:00 GMT
Authorization: AWS AKIAIOSFODNN7EXAMPLE:02236Q3V0RonhpaBX5sCYVf1bNRuU=
```

**Sample Response**

```
HTTP/1.1 200 OK
x-amz-id-2: ef8yU9AS1ed4OpIszj7UDNEHGran
x-amz-request-id: 318BC8BC143432E5
x-amz-version-id: 3HL4kqtJlcpXroDTDmjVBH40Nrjfkd
Date: Wed, 28 Oct 2009 22:32:00 GMT
Last-Modified: Sun, 1 Jan 2006 12:00:00 GMT
ETag: "fba9dede5f277731c9771645a39863328"
Content-Length: 434234
Content-Type: text/plain
Connection: close
Server: AmazonS3
```

If the object is scheduled to expire according to a lifecycle configuration set on the bucket, the response returns the `x-amz-expiration` tag with information about when Amazon S3 will delete the object. For more information, see Transitioning Objects: General Considerations in the Amazon Simple Storage Service Developer Guide.

```
HTTP/1.1 200 OK
x-amz-id-2: azQRZtQJ2m1P8R+TIsG9h0VuC/Dmi8JmjXUMq7snk+LKSJeurtmfxzSlGhR46GzSJ
x-amz-request-id: 0EFF61CCE3F24A26
Date: Mon, 17 Dec 2012 02:26:39 GMT
Last-Modified: Mon, 17 Dec 2012 02:14:10 GMT
x-amz-expiration: expiry-date="Fri, 21 Dec 2012 00:00:00 GMT", rule-id="Rule for testfile.txt"
ETag: "54b0c58c7ce9f2a8b551351102ee0938"
```
### Sample Request Getting Metadata from a Specified Version of an Object

The following request returns the metadata of the specified version of an object.

```
HEAD /my-image.jpg?versionId=3HL4kqCxf3vjVBH40Nrjfkd HTTP/1.1
Host: bucket.s3.amazonaws.com
Date: Wed, 28 Oct 2009 22:32:00 GMT
Authorization: AWS AKIAIOSFODNN7EXAMPLE:02236Q3V0WpaBX5sCYVf1bNRuU=
```

### Sample Response to a Versioned HEAD Request

```
HTTP/1.1 200 OK
x-amz-id-2: eftixk72a6Ap51TngqC8F8epIszj7UDNEHGran
x-amz-request-id: 318BC8BC143432E5
x-amz-version-id: 3HL4kqtJlcpXrof3vjVBH40Nrjfkd
Date: Wed, 28 Oct 2009 22:32:00 GMT
Last-Modified: Sun, 1 Jan 2006 12:00:00 GMT
ETag: "fba9dede5f27731c9771645a39863328"
Content-Length: 434334
Content-Type: text/plain
Connection: close
Server: AmazonS3
```

### Sample Request for an Amazon Glacier Object

For an archived object, the `x-amz-restore` header provides the date when the restored copy expires, as shown in the following response. Even if the object is stored in Amazon Glacier, all object metadata is still available.

```
HEAD /my-image.jpg HTTP/1.1
Host: bucket.s3.amazonaws.com
Date: 13 Nov 2012 00:28:38 GMT
Authorization: AWS AKIAIOSFODNN7EXAMPLE:02236Q3V0RonhpaBX5sCYVf1bNRuU=
```

### Sample Response - Glacier Object

If the object is already restored, the `x-amz-restore` header provides the date when the restored copy will expire, as shown in the following response.

```
HTTP/1.1 200 OK
x-amz-id-2: FSVaTMjrmBp31zs1NwwBZeu7M19i8UbxMBi0A8AirHANJBo+hEftBuiESACOMJp
x-amz-request-id: E5CEFCB143EB505A
x-amz-restore: ongoing-request="false", expiry-date="Wed, 07 Nov 2012 00:00:00 GMT"
Last-Modified: Mon, 15 Oct 2012 21:58:07 GMT
ETag: "1accb31fcf202eba0c0f41fa2f09b4d7"
Accept-Ranges: bytes
Content-Type: binary/octet-stream
Content-Length: 300
```

API Version 2006-03-01

345
If the restoration is in progress, then the x-amz-restore header returns a message accordingly.

HTTP/1.1 200 OK
x-amz-id-2: b+V2mDiMHTdy1myoUBptvjmJl95H9U/OSUm/jRtHxjh0+pCk5SvByL4xu2TDv4GM
x-amz-request-id: E2E7B6AE4E9BD2B
Date: Tue, 13 Nov 2012 00:43:32 GMT
x-amz-restore: ongoing-request="true"
ETag: "1accb31fcf20e0fa0c0f41fa2f09b4d7"
Accept-Ranges: bytes
Content-Type: binary/octet-stream
Content-Length: 300
Server: AmazonS3

OPTIONS object

Description

A browser can send this preflight request to Amazon S3 to determine if it can send an actual request with the specific origin, HTTP method, and headers.

Amazon S3 supports cross-origin resource sharing (CORS) by enabling you to add a cors subresource on a bucket. When a browser sends this preflight request, Amazon S3 responds by evaluating the rules that are defined in the cors configuration.

If cors is not enabled on the bucket, then Amazon S3 returns a 403 Forbidden response.

For more information about CORS, go to Enabling Cross-Origin Resource Sharing in the Amazon Simple Storage Service Developer Guide.

Requests

Syntax

```
OPTIONS /ObjectName HTTP/1.1
Host: BucketName.s3.amazonaws.com
Origin: Origin
Access-Control-Request-Method: HTTPMethod
Access-Control-Request-Headers: RequestHeader
```

Request Parameters

This operation does not introduce any specific request parameters, but it may contain any request parameters that are required by the actual request.

Request Headers

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Origin</td>
<td>Identifies the origin of the cross-origin request to Amazon S3. For example, <a href="http://www.example.com">http://www.example.com</a>.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Access-Control-Request-Method</td>
<td>Identifies what HTTP method will be used in the actual request.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Access-Control-Request-Headers</td>
<td>A comma-delimited list of HTTP headers that will be sent in the actual request.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>For example, to put an object with server-side encryption, this preflight request will determine if it can include the x-amz-server-side-encryption header with the request.</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td>Default: None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Request Elements**

This implementation of the operation does not use request elements.

**Responses**

**Response Headers**

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access-Control-Allow-Origin</td>
<td>The origin you sent in your request. If the origin in your request is not allowed, Amazon S3 will not include this header in the response.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>Access-Control-Max-Age</td>
<td>How long, in seconds, the results of the preflight request can be cached.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>Access-Control-Allow-Methods</td>
<td>The HTTP method that was sent in the original request. If the method in the request is not allowed, Amazon S3 will not include this header in the response.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>Access-Control-Allow-Headers</td>
<td>A comma-delimited list of HTTP headers that the browser can send in the actual request. If any of the requested headers is not allowed, Amazon S3 will not include that header in the response, nor will the response contain any of the headers with the Access-Control prefix.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>Access-Control-Expose-Headers</td>
<td>A comma-delimited list of HTTP headers. This header provides the JavaScript client with access to these headers in the response to the actual request.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
</tbody>
</table>

**Response Elements**

This implementation of the operation does not return response elements.
Examples

Example: Send a preflight OPTIONS request to a cors enabled bucket

A browser can send this preflight request to Amazon S3 to determine if it can send the actual PUT request from http://www.example.com origin to the Amazon S3 bucket named examplebucket.

Sample Request

```
OPTIONS /exampleobject HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Origin: http://www.example.com
Access-Control-Request-Method: PUT
```

Sample Response

```
HTTP/1.1 200 OK
x-amz-id-2: 6SvaESv3VULYPLik5LLl7lSPPPtSnBvDdGmnlkX1nfU7uS2mIDF6td6WKNjYMXZ
x-amz-request-id: BDC4B83DF5096BBE
Date: Wed, 21 Aug 2012 23:09:55 GMT
Etag: "1f1a1af11111111111111c11aed1dal"
Access-Control-Allow-Origin: http://www.example.com
Access-Control-Allow-Methods: PUT
Access-Control-Expose-Headers: x-amz-request-id
Content-Length: 0
Server: AmazonS3
```

POST Object

Description

The POST operation adds an object to a specified bucket using HTML forms. POST is an alternate form of PUT that enables browser-based uploads as a way of putting objects in buckets. Parameters that are passed to PUT via HTTP Headers are instead passed as form fields to POST in the multipart/form-data encoded message body. You must have WRITE access on a bucket to add an object to it. Amazon S3 never stores partial objects: if you receive a successful response, you can be confident the entire object was stored.

Amazon S3 is a distributed system. If Amazon S3 receives multiple write requests for the same object simultaneously, all but the last object written will be overwritten.

To ensure that data is not corrupted traversing the network, use the Content-MD5 form field. When you use this form field, Amazon S3 checks the object against the provided MD5 value. If they do not match, Amazon S3 returns an error. Additionally, you can calculate the MD5 value while posting an object to Amazon S3 and compare the returned ETag to the calculated MD5 value. The ETag only reflects changes to the contents of an object, not its metadata.

Note
To configure your application to send the Request Headers prior to sending the request body, use the 100-continue HTTP status code. For POST operations, this helps you avoid sending the message body if the message is rejected based on the headers (e.g., authentication failure or redirect). For more information on the 100-continue HTTP status code, go to Section 8.2.3 of http://www.ietf.org/rfc/rfc2616.txt.

You can optionally request server-side encryption where Amazon S3 encrypts your data as it writes it to disks in its data centers and decrypts it for you when you access it. You have option of providing your own encryption key or you can use the AWS-managed encryption keys. For more information, go to Using Server-Side Encryption in the Amazon Simple Storage Service Developer Guide.

Versioning

If you enable versioning for a bucket, POST automatically generates a unique version ID for the object being added. Amazon S3 returns this ID in the response using the x-amz-version-id response header.

If you suspend versioning for a bucket, Amazon S3 always uses null as the version ID of the object stored in a bucket.

For more information about returning the versioning state of a bucket, see GET Bucket (Versioning Status) (p. 177).

Amazon S3 is a distributed system. If you enable versioning for a bucket and Amazon S3 receives multiple write requests for the same object simultaneously, all of the objects will be stored.

To see sample requests that use versioning, see Sample Request (p. 360).

Requests

Syntax

### Request Parameters

This implementation of the operation does not use request parameters.

### Form Fields

This operation can use the following form fields.
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>AWSAccessKeyId</td>
<td>The AWS access key ID of the owner of the bucket who grants an Anonymous user access for a request that satisfies the set of constraints in the policy. Type: String</td>
<td>Conditional</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: Required if a policy document is included with the request.</td>
<td></td>
</tr>
<tr>
<td>acl</td>
<td>Specifies an Amazon S3 access control list. If an invalid access control list is specified, an error is generated. For more information on ACLs, go to Access Control List (ACL) Overview in the Amazon Simple Storage Service Developer Guide. Type: String</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Default: private</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid Values: private</td>
<td>public-read</td>
</tr>
<tr>
<td>Cache-Control, Content-Type, Content-Disposition, Content-Encoding, Expires</td>
<td>REST-specific headers. For more information, see PUT Object (p. 377). Type: String</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>file</td>
<td>File or text content. The file or text content must be the last field in the form. You cannot upload more than one file at a time. Type: File or text content Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>key</td>
<td>The name of the uploaded key. To use the file name provided by the user, use the ${filename} variable. For example, if the user Betty uploads the file lolcatz.jpg and you specify /user/betty/${filename}, the key name will be /user/betty/lolcatz.jpg. For more information, go to Object Key and Metadata in the Amazon Simple Storage Service Developer Guide. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-----------</td>
</tr>
<tr>
<td>policy</td>
<td>Security Policy describing what is permitted in the request. Requests without a security policy are considered anonymous and work only on publicly writable buckets. For more information, go to HTML Forms and Upload Examples.</td>
<td>Conditional</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: Policy is required if the bucket is not publicly writable.</td>
<td></td>
</tr>
<tr>
<td>success_action_redirect</td>
<td>The URL to which the client is redirected upon successful upload.</td>
<td>No</td>
</tr>
<tr>
<td>redirect</td>
<td>If success_action_redirect is not specified, Amazon S3 returns the empty document type specified in the success_action_status field.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>If Amazon S3 cannot interpret the URL, it acts as if the field is not present.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>If the upload fails, Amazon S3 displays an error and does not redirect the user to a URL.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>The redirect field name is deprecated and support for the redirect field name will be removed in the future.</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------</td>
</tr>
<tr>
<td>success_action_status</td>
<td>The status code returned to the client upon successful upload if success_action_redirect is not specified.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Accepts the values 200, 201, or 204 (default).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>If the value is set to 200 or 204, Amazon S3 returns an empty document with a 200 or 204 status code.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>If the value is set to 201, Amazon S3 returns an XML document with a 201 status code.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>If the value is not set or if it is set to an invalid value, Amazon S3 returns an empty document with a 204 status code.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Note</td>
<td>Some versions of the Adobe Flash player do not properly handle HTTP responses with an empty body. To support uploads through Adobe Flash, we recommend setting success_action_status to 201.</td>
<td></td>
</tr>
<tr>
<td>tagging</td>
<td>Specifies set of tags to add to the object using the following encoding scheme.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td><code>&lt;Tagging&gt;</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>&lt;TagSet&gt;</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>&lt;Tag&gt;</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>&lt;Key&gt;Tag Name&lt;/Key&gt;</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>&lt;Value&gt;Tag Value&lt;/Value&gt;</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>&lt;Tag&gt;</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td>...</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>&lt;/TagSet&gt;</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>&lt;/Tagging&gt;</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td>For more information, go to <a href="https://docs.aws.amazon.com/AmazonS3/latest/API/API_ObjectTagging.html">Object Tagging</a> in the <em>Amazon Simple Storage Service Developer Guide</em>.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------</td>
</tr>
<tr>
<td>x-amz-storage-class</td>
<td>Storage class to use for storing the object.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: STANDARD</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid Values: STANDARD</td>
<td>STANDARD_IA</td>
</tr>
<tr>
<td></td>
<td>Constraints: You cannot specify GLACIER as the storage class. To transition objects to the GLACIER storage class you can use lifecycle configuration.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>For more information about storage classes, go to Using DevPay.</td>
<td></td>
</tr>
<tr>
<td>x-amz-meta-*</td>
<td>Headers starting with this prefix are user-defined metadata. Each one is stored and returned as a set of key-value pairs. Amazon S3 doesn't validate or interpret user-defined metadata. For more information, see PUT Object (p. 377).</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>

</tbody>
</table>
### Server-Side Encryption Specific Request Form Fields

You can optionally request Amazon S3 to encrypt data at rest using server-side encryption. Server-side encryption is about data encryption at rest, that is, Amazon S3 encrypts your data as it writes it to disks in its data centers and decrypts it for you when you access it.

For more information, go to [Protecting Data Using Server-Side Encryption](https://docs.aws.amazon.com/AmazonS3/latest/API/s3-server-side-encryption.html) in the _Amazon Simple Storage Service Developer Guide_.

Depending on whether you want to use AWS-managed encryption keys or provide your own encryption keys, you use the following form fields:

- **Use AWS-managed encryption keys** — If you want Amazon S3 to manage keys used to encrypt data, you specify the following form fields in the request.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-server-side-encryption</td>
<td>Specifies a server-side encryption algorithm to use when Amazon S3 creates an object.</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Type: String
### Name | Description | Required
--- | --- | ---
Valid Value: aws:kms, AES256 |  |

| x-amz-server-side-encryption-aws-kms-key-id | If the x-amz-server-side-encryption is present and has the value of aws:kms, this header specifies the ID of the AWS Key Management Service (KMS) master encryption key that was used for the object. Type: String | Yes, if the value of x-amz-server-side-encryption is aws:kms |

| x-amz-server-side-encryption-context | If x-amz-server-side-encryption is present, and if its value is aws:kms, this header specifies the encryption context for the object. The value of this header is a base64-encoded UTF-8 string holding JSON with the encryption context key-value pairs. Type: String | No |

**Note**
If you specify x-amz-server-side-encryption:aws:kms, but do not provide x-amz-server-side-encryption-aws-kms-key-id, the default AWS KMS key will be used to protect the data.

- Use customer-provided encryption keys — If you want to manage your own encryption keys, you must provide all the following form fields in the request.

**Note**
If you use this feature, the ETag value that Amazon S3 returns in the response will not be the MD5 of the object.

| x-amz-server-side-encryption-customer-algorithm | Specifies the algorithm to use to when encrypting the object. Type: String Default: None Valid Value: AES256 Constraints: Must be accompanied by valid x-amz-server-side-encryption-customer-key and x-amz-server-side-encryption-customer-key-MD5 fields. | Yes |

<p>| x-amz-server-side-encryption-customer-key | Specifies the customer-provided base64-encoded encryption key for Amazon S3 to use in encrypting data. This value is used to store the object and then it is discarded; Amazon does not store the encryption key. The key must be appropriate for use with the algorithm specified in the x-amz-server-side-encryption-customer-algorithm header. Type: String Default: None | Yes |</p>
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-server-side-encryption-customer-key-MD5</td>
<td>Specifies the base64-encoded 128-bit MD5 digest of the encryption key according to RFC 1321. Amazon S3 uses this header for a message integrity check to ensure the encryption key was transmitted without error.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: Must be accompanied by valid x-amz-server-side-encryption-customer-algorithm and x-amz-server-side-encryption-customer-key-MD5 fields.</td>
<td></td>
</tr>
</tbody>
</table>

**Responses**

**Response Headers**

This implementation of the operation can include the following response headers in addition to the response headers common to all responses. For more information, see Common Response Headers (p. 4).

| Name                                      | Description                                                                                                                                                                                                 |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| x-amz-expiration                          | Amazon S3 will return this header if an Expiration action is configured for the object as part of the bucket's lifecycle configuration. The header value includes an "expiry-date" component and a URL encoded "rule-id" component. Note that for version-enabled buckets, this header only applies to current versions; Amazon S3 does not provide a header to infer when a noncurrent version will be eligible for permanent deletion. For more information, see PUT Bucket lifecycle (p. 244). |
|                                           | Type: String                                                                                                                                   |

| success_action_redirect, redirect         | The URL to which the client is redirected on successful upload.                                                                                   |
|                                           | Type: String                                                                                                                                   |

| Ancestor: PostResponse                    |                                                                                                                                            |

| x-amz-server-side-encryption              | If you specified server-side encryption either with AWS KMS encryption or AWS-Managed encryption in your POST request, the response includes this header. It confirms the encryption algorithm that Amazon S3 used to encrypt the object. |
|                                           | Type: String                                                                                                                                   |

| x-amz-server-side-encryption-aws-kms-key-id | If the x-amz-server-side-encryption is present and has the value of aws:kms, this header specifies the |
|                                            |                                                                                                                                            |

</tbody>
</table>
Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

Examples

Sample Request

```plaintext
POST /Neo HTTP/1.1
Content-Length: 4
Host: quotes.s3.amazonaws.com
Date: Wed, 01 Mar 2006 12:00:00 GMT
Authorization: authorization string
Content-Type: text/plain
Expect: the 100-continue HTTP status code

ObjectContent
```

Sample Response with Versioning Suspended

The following shows a sample response when bucket versioning is suspended.

```plaintext
HTTP/1.1 100 Continue
HTTP/1.1 200 OK
x-amz-id-2: LriYPLdm0dAifgSm/F1ysViT1LW94/xUQxMsF7xiEb1a0wIOIx1l+zbwZ163pt7
x-amz-request-id: 0A49CE4060975EAC
x-amz-version-id: default
Date: Wed, 12 Oct 2009 17:50:00 GMT
ETag: "1b2cf535f27731c974343645a3985328"
Content-Length: 0
Connection: close
Server: AmazonS3
```

Notice in this response the version ID is null.

Sample Response with Versioning Enabled

The following shows a sample response when bucket versioning is enabled.

```plaintext
HTTP/1.1 100 Continue
HTTP/1.1 200 OK
x-amz-id-2: LriYPLdm0dAifgSm/F1ysViT1LW94/xUQxMsF7xiEb1a0wIOIx1l+zbwZ163pt7
x-amz-request-id: 0A49CE4060975EAC
x-amz-version-id: 43jfkodU8493jnFJD9fjj3HNNVf3dsQUIFDMSidfo38jfdsjGFDSIRp
Date: Wed, 01 Mar 2006 12:00:00 GMT
ETag: "828ef39df9a96f00ad9f27c383fc9ac7f"
Content-Length: 0
Connection: close
Server: AmazonS3
```

- GET Object (p. 317)
POST Object restore

Description

This operation performs the following types of requests:

- select – Perform a select query on an archived object
- restore an archive – Restore an archived object

To use this operation, you must have permission to perform the s3:RestoreObject and s3:GetObject actions. The bucket owner has this permission by default and can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources in the Amazon Simple Storage Service Developer Guide.

Querying Archives with Select Requests

You use a select type of request to perform SQL queries on archived objects. The archived objects that are being queried by the select request must be formatted as uncompressed comma-separated values (CSV) files. You can run queries and custom analytics on your archived data without having to restore your data to a hotter Amazon S3 tier. For an overview about select requests, see Querying Archived Objects in the Amazon Simple Storage Service Developer Guide.

When making a select request, do the following:

- Define an output location for the output of your select query. This location must be an Amazon S3 bucket in the same AWS Region as the bucket containing the archive object that is being queried. The AWS account that initiates the job must have permissions to write to the S3 bucket. You can specify the storage class and encryption for the output objects stored in the bucket. For more information about output, see Querying Archived Objects in the Amazon Simple Storage Service Developer Guide.

When you're setting the S3 structure in the request body, it might be helpful to read the following topics:

- PUT Object (p. 377)
- Managing Access with ACLs in the Amazon Simple Storage Service Developer Guide
- Protecting Data Using Server-Side Encryption in the Amazon Simple Storage Service Developer Guide

- Define the SQL expression to use for the SELECT for your query in the SelectParameters structure in the request body. You can use expressions like the following examples.

  - The following expression returns all records from the specified object.
    
      ```
      SELECT * FROM Object
      ```

  - Assuming that you are not using any headers for data stored in the object, you can specify columns using positional headers.

    ```
    SELECT s._1, s._2 FROM Object s WHERE s._3 > 100
    ```

  - If you have headers and you set the fileHeaderInfo in the CSV structure in the request body to USE, you can specify headers in the query. (If you set the fileHeaderInfo field to IGNORE, the first row is skipped for the query.) You cannot mix ordinal positions with header column names.

    ```
    SELECT s.Id, s.FirstName, s.SSN FROM S3Object s
    ```
For more information about using SQL with Amazon Glacier select restore, see Amazon Glacier Select SQL Reference in the Amazon Glacier Developer Guide.

When making a select request, you can also do the following:

- Specify the Expedited tier to expedite your queries. For more information about tiers, see the next section, Restoring Archives.
- Specify details about the data serialization format of both the input object being queried and the serialization of the CSV-encoded query results.

The following are additional important facts about the select feature:

- The output results are new Amazon S3 objects. Unlike archive retrievals, they are stored until explicitly deleted—manually or through a lifecycle policy.
- You can issue more than one select request on the same Amazon S3 object. There is no de-duplication of the requests, so you must be careful not to issue duplicate requests.
- A select request is accepted, even if the object has already been restored in Amazon S3. A select request doesn’t return error response 409.

**Restoring Archives**

A restore type of request restores a temporary copy of an archived object. You can optionally provide a version ID to restore a specific object version. If a version ID is not provided, it restores the current version.

An object in the Glacier storage class is an archived object. To access the object, you must first initiate a restore request, which restores a copy of the archived object. The time it takes restore jobs to finish depends on which data access tier you specify, Expedited, Standard, or Bulk.

In a restore request, you specify the number of days that you want the restored copy to exist. After the specified period, Amazon S3 deletes the temporary copy. Note that the object remains archived. Amazon S3 deletes only the restored copy.

When restoring an archived object (or using a select request), you can specify one of the following options in the Tier element of the request body:

- **Expedited** – Allows you to quickly access your data when occasional urgent requests for a subset of archives are required. For all but the largest archived object (250 MB+), data accessed using Expedited retrievals are typically made available within 1–5 minutes.
- **Standard** – Allows you to access any of your archived objects within several hours. Standard retrievals typically finish within 3–5 hours. This is the default tier.
- **Bulk** – The lowest-cost data access option in Amazon Glacier, enabling you to retrieve large amounts, even petabytes, of data inexpensively in a day. Bulk access typically completes within 5–12 hours.

For more information about archive retrieval options and provisioned capacity for Expedited data access, see Restoring Archived Objects in the Amazon Simple Storage Service Developer Guide.

You can obtain restoration status by sending a HEAD request. In the response, these operations return the x-amz-restore header with restoration status information.

After restoring an archived object, you can update the restoration period by reissuing this request with the new period. Amazon S3 updates the restoration period relative to the current time and charges only for the request—there are no data transfer charges.
You cannot issue another restore request when Amazon S3 is actively processing your first restore request for the same object. However, after Amazon S3 restores a copy of the object, you can send restore requests to update the expiration period of the restored object copy.

If your bucket has a lifecycle configuration with a rule that includes an expiration action, the object expiration overrides the life span that you specify in a restore request. For example, if you restore an object copy for 10 days but the object is scheduled to expire in 3 days, Amazon S3 deletes the object in 3 days. For more information about lifecycle configuration, see PUT Bucket lifecycle (p. 244) and Object Lifecycle Management in Amazon Simple Storage Service Developer Guide.

Requests

Syntax

POST /ObjectName?restore&versionId=VersionID HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))
Content-MD5: MD5

request body

Note

The syntax shows some of the request headers. For a complete list, see the Request Headers section of this topic.

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content-MD5</td>
<td>The base64-encoded 128-bit MD5 digest of the data. This header must be used as a message integrity check to verify that the request body was not corrupted in transit. For more information, see RFC 1864. Type: String Default: None</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Request Elements

The following XML example shows the request body for restoring an archive.

```xml
<RestoreRequest>
  <Days>2</Days>
  <GlacierJobParameter>
    <Tier>Bulk</Tier>
  </GlacierJobParameter>
</RestoreRequest>
```
The following table explains the XML for an archive restore in the request body.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>RestoreRequest</td>
<td>Container for restore information.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: Container</td>
<td></td>
</tr>
<tr>
<td>Days</td>
<td>Lifetime of the restored (active) copy. The minimum number of days that you can restore an object from Amazon Glacier is 1. After the object copy reaches the specified lifetime, Amazon S3 removes the copy from the bucket. This is a required element if you are restoring an archive. Do not use with a SELECT type of request. Type: Positive integer Ancestors: RestoreRequest</td>
<td>Yes, if restoring an archive.</td>
</tr>
<tr>
<td>GlacierJobParameters</td>
<td>Container for Glacier job parameters. Do not use with a SELECT type of request. Type: Container Ancestors: RestoreRequest</td>
<td>No</td>
</tr>
<tr>
<td>Tier</td>
<td>The data access tier to use when restoring the archive. Standard is the default. Type: Enum Valid values: Expedited</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Standard</td>
<td>Bulk Ancestors: GlacierJobParameters</td>
</tr>
</tbody>
</table>

The following XML shows the request body for a select query on an archived object.

```
<RestoreRequest>
  <Type>SELECT</Type>
  <Tier>Expedited</Tier>
  <Description>Job description</Description>
  <SelectParameters>
    <Expression>Select * from Object</Expression>
    <ExpressionType>SQL</ExpressionType>
    <InputSerialization>
      <CSV>
        <FileHeaderInfo>IGNORE</FileHeaderInfo>
        <RecordDelimiter>
        <FieldDelimiter>,</FieldDelimiter>
        <QuoteCharacter>"</QuoteCharacter>
        <QuoteEscapeCharacter>"</QuoteEscapeCharacter>
        <Comments>#</Comments>
      </CSV>
    </InputSerialization>
    <OutputSerialization>
      <CSV>
    </OutputSerialization>
  </SelectParameters>
</RestoreRequest>
```
The following tables explain the XML for a SELECT in the request body.

<table>

Ancestors: RestoreRequest
### Description
The optional description for the request.
- **Type**: String
- **Ancestors**: RestoreRequest
- **Required**: No

### SelectParameters
Describes the parameters for select job request.
- **Type**: Container
- **Ancestors**: RestoreRequest
- **Required**: Yes, if request type is SELECT.

### OutputLocation
Describes the location that receives the results of the select restore request.
- **Type**: Container for Amazon S3
- **Ancestors**: RestoreRequest
- **Required**: Yes, if request type is SELECT.

#### The SelectParameters container element contains the following elements.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Expression</strong></td>
<td>The SQL expression. For example:</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>• The following SQL expression retrieves the first column of the data from</td>
<td></td>
</tr>
<tr>
<td></td>
<td>the object stored in CSV format.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>```</td>
<td></td>
</tr>
<tr>
<td></td>
<td>SELECT s._1 FROM Object s</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• The following SQL expression returns everything from the object.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>SELECT * FROM Object</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>

<td></td>
<td>Default: ,</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestors: CSV</td>
<td></td>
</tr>
<tr>
<td>QuoteCharacter</td>
<td>A single character used for escaping when the field delimiter is part of the value. Consider this example in a CSV file: &quot;a, b&quot; The use of quotation marks makes this value a single field because you are wrapping the value in quotation marks. If you don't specify the quotation marks, the comma is a field delimiter (which makes it two separate field values, a and b). Type: String</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Default: &quot;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestors: CSV</td>
<td></td>
</tr>
<tr>
<td>QuoteEscapeCharacter</td>
<td>A single character used for escaping the quotation mark character inside an already escaped value. For example, the value &quot;&quot;&quot; a , b &quot;&quot;&quot; is parsed as &quot; a , b &quot;. Type: String</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Default: &quot;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestors: CSV</td>
<td></td>
</tr>
<tr>
<td>FileHeaderInfo</td>
<td>Describes the first line in the input data. It is one of the ENUM values. • NONE: First line is not a header. • IGNORE: First line is a header, but you can't use the header values to indicate the column in an expression. You can use column position (such as _1, _2, ...) to indicate the column (SELECT s._1 FROM OBJECT s).</td>
<td>No</td>
</tr>
</tbody>
</table>
**Name** | **Description** | **Required**  
--- | --- | ---  
| **Use** | First line is a header, and you can use the header value to identify a column in an expression (SELECT "name" FROM OBJECT). |  
Type: Enum  
Valid values: NONE | USE | IGNORE  
Ancestors: CSV  
| **Comments** | A single character used to indicate that a row should be ignored when the character is present at the start of that row. You can specify any character to indicate a comment line. | No  
Type: String  
Ancestors: CSV  

---  

The CSV container element (inside OutputSerialization) contains the following elements.

| Name | Description | Required  
--- | --- | ---  
| **QuoteFields** | Indicates whether to use quotation marks around output fields. | No  
| • ALWAYS: Always use quotation marks for output fields.  
| • ASNEEDED: Use quotation marks for output fields when needed. |  
Type: Enum  
Valid values: ALWAYS | ASNEEDED  
Default: AsNeeded  
Ancestors: CSV  
| **RecordDelimiter** | A single character used to separate individual records in the output. Instead of the default value, you can specify an arbitrary delimiter. | No  
Type: String  
Default: \n  
Ancestors: CSV  
| **FieldDelimiter** | A single character used to separate individual fields in a record. You can specify an arbitrary delimiter. | No  
Type: String  
Default: ,  
Ancestors: CSV
### QuoteCharacter

A single character used for escaping when the field delimiter is part of the value. For example, if the value is `a, b`, then Amazon S3 wraps this field value in quotation marks as follows: "a, b".

- **Type**: String
- **Default**: 
- **Ancestors**: CSV

### QuoteEscapeCharacter

A single character used for escaping the quotation mark character inside an already escaped value. For example, if the value is "a, b", then Amazon S3 wraps the value in quotation marks as follows: ""a, b"".

- **Type**: String
- **Ancestors**: CSV

</tr>
<tr>
<td></td>
<td>Ancestors: TagSet</td>
<td></td>
</tr>
</tbody>
</table>

### The Tag container element (inside TagSet) contains the following elements.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key</td>
<td>Name of the tag.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestors: Tag</td>
<td></td>
</tr>
<tr>
<td>Value</td>
<td>Value of the tag.</td>
<td>No</td>
</tr>
</tbody>
</table>
The MetadataEntry container element (inside UserMetadata) contains the following key-value pair elements to store with an object.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>MetadataKey</td>
<td>The metadata key.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestors: Tag</td>
<td></td>
</tr>
<tr>
<td>MetadataEntry</td>
<td>The metadata value.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestors:</td>
<td></td>
</tr>
</tbody>
</table>

Responses

A successful operation returns either 200 OK or 202 Accepted status code.

- If the object copy is not previously restored, then Amazon S3 returns 202 Accepted in the response.
- If the object copy is previously restored, Amazon S3 returns 200 OK in the response.

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

This operation does not return response elements.

Special Errors

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
<th>HTTP Status Code</th>
<th>SOAP Fault Code Prefix</th>
</tr>
</thead>
<tbody>
<tr>
<td>RestoreAlreadyInProgress</td>
<td>Object restore is already in progress. (This error does not apply to SELECT type requests.)</td>
<td>409 Conflict</td>
<td>Client</td>
</tr>
<tr>
<td>GlacierExpeditedRetrievalNotAvailable</td>
<td>Glacier expedited retrievals are currently not available. Try again later. (Returned if there is insufficient capacity to process the Expedited request. This error only</td>
<td>503</td>
<td>N/A</td>
</tr>
</tbody>
</table>
### Examples

#### Restore an Object for Two Days Using the Expedited Retrieval Option

The following restore request restores a copy of the `photo1.jpg` object from Amazon Glacier for a period of two days using the expedited retrieval option.

```xml
POST /photo1.jpg?restore HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Date: Mon, 22 Oct 2012 01:49:52 GMT
Authorization: authorization string
Content-Length: content length

<RestoreRequest>
  <Days>2</Days>
  <GlacierJobParameters>
    <Tier>Expedited</Tier>
  </GlacierJobParameters>
</RestoreRequest>
```

If the `examplebucket` does not have a restored copy of the object, Amazon S3 returns the following 202 Accepted response.

```http
HTTP/1.1 202 Accepted
x-amz-id-2: GFihv3y6+kE7KG11GEkQhU7/2/chR3Yb2fCbe2S04nxI423Dwqg2XiQOB/U1lzYqVpILZNRc0w=
x-amz-request-id: 9F341CD3C4BA79E0
Date: Sat, 20 Oct 2012 23:54:05 GMT
Content-Length: 0
Server: AmazonS3
```

If a copy of the object is already restored, Amazon S3 returns a 200 OK response, and only updates the restored copy's expiry time.

#### Query an Archive with a SELECT Request

The following is an example select restore request.

```xml
POST /object-one.csv?restore HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Date: Sat, 20 Oct 2012 23:54:05 GMT
Authorization: authorization string
Content-Length: content length

<RestoreRequest xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <Type>SELECT</Type>
  <Tier>Expedited</Tier>
  <Description>this is a description</Description>
  <SelectParameters>
    <InputSerialization/>
  </SelectParameters>
</RestoreRequest>
```
Amazon S3 returns the following 202 Accepted response.

HTTP/1.1 202 Accepted
x-amz-id-2: GFihv3y6+kE7KG11GEkQhU7/2/chR3Yb2fCb2S04nxI423Dqw2XiQ0B/UYlzYqvFiB1ZNRCovw=
x-amz-request-id: 9F341CD3C4BA79E0
x-amz-restore-output-path: js-test-s3/qE8nk5M0XIj-LuZE2HXNw6empQm3znLkHlMWInRyPS-Orl2Wouj6LyYm-neTvml-btz3wbBxfMhPykd3jkl-1vZE7w42/
Date: Sat, 20 Oct 2012 23:54:05 GMT
Content-Length: 0
Server: AmazonS3

PUT Object

Description

This implementation of the PUT operation adds an object to a bucket. You must have WRITE permissions on a bucket to add an object to it.

Amazon S3 never adds partial objects; if you receive a success response, Amazon S3 added the entire object to the bucket.

Amazon S3 is a distributed system. If it receives multiple write requests for the same object simultaneously, it overwrites all but the last object written. Amazon S3 does not provide object locking; if you need this, make sure to build it into your application layer or use versioning instead.

To ensure that data is not corrupted traversing the network, use the Content-MD5 header. When you use this header, Amazon S3 checks the object against the provided MD5 value and, if they do not match, returns an error. Additionally, you can calculate the MD5 while putting an object to Amazon S3 and compare the returned ETag to the calculated MD5 value.

Note
To configure your application to send the request headers prior to sending the request body, use the 100-continue HTTP status code. For PUT operations, this helps you avoid sending the message body if the message is rejected based on the headers (e.g., because of authentication failure or redirect). For more information on the 100-continue HTTP status code, go to Section 8.2.3 of http://www.ietf.org/rfc/rfc2616.txt.

You can optionally request server-side encryption where Amazon S3 encrypts your data as it writes it to disks in its data centers and decrypts it for you when you access it. You have the option to provide your own encryption key or use AWS-managed encryption keys. For more information, go to Using Server-Side Encryption in the Amazon Simple Storage Service Developer Guide.

Versioning

If you enable versioning for a bucket, Amazon S3 automatically generates a unique version ID for the object being stored. Amazon S3 returns this ID in the response using the x-amz-version-id response header. If versioning is suspended, Amazon S3 always uses null as the version ID for the object stored. For more information about returning the versioning state of a bucket, see GET Bucket versioning (p. 177).

If you enable versioning for a bucket, when Amazon S3 receives multiple write requests for the same object simultaneously, it stores all of the objects.

To see sample requests that use versioning, see Sample Request (p. 387).

Storage Class Options

Amazon S3 uses the Standard storage class by default to store newly created objects. The Standard storage class provides high durability and high availability. Depending on the performance needs in your use case scenario, you can optionally specify other storage classes. For more information, go to Storage Classes in the Amazon Simple Storage Service Developer Guide.

Access Permissions

When uploading an object, you can optionally specify the accounts or groups that should be granted specific permissions on your object. There are two ways to grant the appropriate permissions using the request headers:
• Specify a canned (predefined) ACL using the `x-amz-acl` request header. For more information, see Canned ACL in the Amazon Simple Storage Service Developer Guide.

• Specify access permissions explicitly using the `x-amz-grant-read`, `x-amz-grant-read-acp`, and `x-amz-grant-write-acp`, `x-amz-grant-full-control` headers. These headers map to the set of permissions Amazon S3 supports in an ACL. For more information, go to Access Control List (ACL) Overview in the Amazon Simple Storage Service Developer Guide.

**Note**
You can either use a canned ACL or specify access permissions explicitly. You cannot do both.

If these headers are used to change the object ACLs to something other than the default, the requester must have `s3:PutObjectAcl` included in the list of permitted actions in their AWS Identity and Access Management (IAM) policy. For more information about permissions, see Permissions for Object Operations and Managing Access Permissions to Your Amazon S3 Resources in the Amazon Simple Storage Service Developer Guide.

## Requests

### Syntax

```plaintext
PUT /ObjectName HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))
```

**Note**
The syntax shows some of the request headers. For a complete list, see the Request Headers section.

### Request Parameters

This implementation of the operation does not use request parameters.

### Request Headers

This implementation of the operation can use the following request headers in addition to the request headers common to all operations. Request headers are limited to 8 KB in size. For more information, see Common Request Headers (p. 2).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cache-Control</td>
<td>Can be used to specify caching behavior along the request/reply chain. For more information, go to <a href="http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.9.">http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.9.</a></td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>

</tr>
<tr>
<td>Expires</td>
<td>The date and time at which the object is no longer able to be cached. For more information, go to <a href="http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.21">http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.21</a>.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: None</td>
<td></td>
</tr>
<tr>
<td>x-amz-meta-</td>
<td>Headers starting with this prefix are user-defined metadata. Within the PUT request header, the user-defined metadata is limited to 2 KB in size. User-defined metadata is a set of key-value pairs. The size of user-defined metadata is measured by taking the sum of the number of bytes in the UTF-8 encoding of each key and value. Amazon S3 doesn't validate or interpret user-defined metadata.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: None</td>
<td></td>
</tr>
<tr>
<td>x-amz-storage-class</td>
<td>If you don't specify, Standard is the default storage class. Amazon S3 supports other storage classes. For more information, go to <a href="http://docs.aws.amazon.com/AmazonS3/latest/API/storage-classes.html">Storage Classes</a> in the Amazon Simple Storage Service Developer Guide.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: Enum</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: STANDARD</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid Values: `STANDARD</td>
<td>STANDARD_IA</td>
</tr>
<tr>
<td></td>
<td>Constraints: You cannot specify GLACIER as the storage class. To transition objects to the GLACIER storage class, you can use lifecycle configuration. For more information, go to <a href="http://docs.aws.amazon.com/AmazonS3/latest/API/lifecycle-configuration.html">Object Lifecycle Management</a> in the Amazon Simple Storage Service Developer Guide.</td>
<td></td>
</tr>
</tbody>
</table>
### Requests

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-tagging</td>
<td>Specifies a set of one or more tags you want to associated with the object. These tags are stored in the tagging subresource associated with the object. To specify tags on an object, the requester must have s3:PutObjectTagging included in the list of permitted actions in their IAM policy. For more information about adding tags to an object, Object Tagging Management in the Amazon Simple Storage Service Developer Guide. Type: String Default: None Constraints: The encoding for tags will be URL query parameter encoding. The maximum size of this header is limited to 2 K.</td>
<td>No</td>
</tr>
<tr>
<td>x-amz-website-redirect-location</td>
<td>If the bucket is configured as a website, redirects requests for this object to another object in the same bucket or to an external URL. Amazon S3 stores the value of this header in the object metadata. For information about object metadata, go to Object Key and Metadata. In the following example, the request header sets the redirect to an object (anotherPage.html) in the same bucket: x-amz-website-redirect-location: / anotherPage.html In the following example, the request header sets the object redirect to another website: x-amz-website-redirect-location: <a href="http://www.example.com/">http://www.example.com/</a> For more information about website hosting in Amazon S3, go to sections Hosting Websites on Amazon S3 and How to Configure Website Page Redirects in the Amazon Simple Storage Service Developer Guide. Type: String Default: None Constraints: The value must be prefixed by, &quot;/&quot;, &quot;http://&quot; or &quot;https://&quot;. The length of the value is limited to 2 KB.</td>
<td>No</td>
</tr>
</tbody>
</table>

### Access Control List (ACL) Specific Request Headers

Additionally, you can use the following access control–related headers with this operation. By default, all objects are private: only the owner has full control. When adding a new object, you can grant permissions to individual AWS accounts or predefined Amazon S3 groups. These permissions are then used to create the Access Control List (ACL) on the object. For more information, go to Using ACLs.
You can use one of the following two ways to grant these permissions:

- **Specify a canned ACL** — Amazon S3 supports a set of predefined ACLs, known as canned ACLs. Each canned ACL has a predefined set of grantees and permissions. For more information, go to [Canned ACL](#).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-acl</td>
<td>The canned ACL to apply to the object. For more information, see Canned ACL in the Amazon Simple Storage Service Developer Guide.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: private</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid Values: private</td>
<td>public-read</td>
</tr>
</tbody>
</table>

- **Specify access permissions explicitly** — If you want to explicitly grant access permissions to specific AWS accounts or a group, you use the following headers. Each of the following headers maps to specific permissions Amazon S3 supports in an ACL. For more information, go to [Access Control List (ACL) Overview](#). In the header value, you specify a list of grantees who get the specific permission.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-grant-read</td>
<td>Allows grantee to read the object data and its metadata.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: None</td>
<td></td>
</tr>
<tr>
<td>x-amz-grant-write</td>
<td>Not applicable. This applies only when granting permission on a bucket.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: None</td>
<td></td>
</tr>
<tr>
<td>x-amz-grant-read-acp</td>
<td>Allows grantee to read the object ACL.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: None</td>
<td></td>
</tr>
</tbody>
</table>
You specify each grantee as a `type=value` pair, where the type can be one of the following:

- **emailAddress** – if value specified is the email address of an AWS account
  
  **Important**
  
  You cannot use an email address to specify a grantee for any AWS region that was created after 12/8/2014. The following regions were created after 12/8/2014: US East (Ohio), Canada (Central), Asia Pacific (Mumbai), Asia Pacific (Seoul), EU (Frankfurt), EU (London), EU (Paris), China (Beijing), China (Ningxia), and AWS GovCloud (US) regions.
  
- **id** – if value specified is the canonical user ID of an AWS account
- **uri** – if granting permission to a predefined group.

For example, the following `x-amz-grant-read` header grants read object data and its metadata permission to the AWS accounts identified by their email addresses.

```plaintext
x-amz-grant-read: emailAddress="xyz@amazon.com", emailAddress="abc@amazon.com"
```

### Server-Side Encryption Specific Request Headers

You can optionally request Amazon S3 to encrypt data at rest using server-side encryption. Server-side encryption is about data encryption at rest, that is, Amazon S3 encrypts your data as it writes it to disks in its data centers and decrypts it for you when you access it. Depending on whether you want to use AWS-managed encryption keys or provide your own encryption keys, you use the following headers:

- **Use AWS-managed encryption keys** — If you want Amazon S3 to manage keys used to encrypt data, you specify the following header in the request.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-server-side-encryption</td>
<td>Specifies a server-side encryption algorithm to use when Amazon S3 creates an object.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid Value: <code>aws:kms</code>, <code>AES256</code></td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>-----------------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------------</td>
</tr>
<tr>
<td>x-amz-server-side-encryption-aws-kms-key-id</td>
<td>If the x-amz-server-side-encryption is present and has the value of aws:kms, this header specifies the ID of the AWS Key Management Service (KMS) master encryption key that was used for the object.</td>
<td>Yes, if the value of x-amz-server-side-encryption is aws:kms</td>
</tr>
<tr>
<td>x-amz-server-side-encryption-context</td>
<td>If x-amz-server-side-encryption is present, and if its value is aws:kms, this header specifies the encryption context for the object. The value of this header is a base64-encoded UTF-8 string holding JSON with the encryption context key-value pairs.</td>
<td>No</td>
</tr>
</tbody>
</table>

**Note**  
If you specify x-amz-server-side-encryption:aws:kms, but do not provide x-amz-server-side-encryption-aws-kms-key-id, the default AWS KMS key will be used to protected the data.

**Important**  
All GET and PUT requests for an object protected by AWS KMS will fail if not made via SSL or by using SigV4.

- Use customer-provided encryption keys— If you want to manage your own encryption keys, you must provide all the following headers in the request.

**Note**  
If you use this feature, the ETag value that Amazon S3 returns in the response will not be the MD5 of the object.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-server-side-encryption-customer-algorithm</td>
<td>Specifies the algorithm to use to when encrypting the object.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid Value: AES256</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: Must be accompanied by valid x-amz-server-side-encryption-customer-key and x-amz-server-side-encryption-customer-key-MD5 headers.</td>
<td></td>
</tr>
<tr>
<td>x-amz-server-side-encryption-customer-key</td>
<td>Specifies the customer-provided base64-encoded encryption key for Amazon S3 to use in encrypting data. This value is used to store the object and then is discarded; Amazon does not store the encryption key. The key must be appropriate for use</td>
<td>Yes</td>
</tr>
</tbody>
</table>

- Use customer-provided encryption keys— If you want to manage your own encryption keys, you must provide all the following headers in the request.

**Note**  
If you use this feature, the ETag value that Amazon S3 returns in the response will not be the MD5 of the object.
### Responses

#### Response Headers

This implementation of the operation can include the following response headers in addition to the response headers common to all responses. For more information, see Common Response Headers (p. 4).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>x-amz-server-side-encryption</code></td>
<td>If you specified server-side encryption either with an AWS KMS or Amazon S3-managed encryption key in your PUT request, the response includes this header. It confirms the encryption algorithm that Amazon S3 used to encrypt the object. Type: String</td>
</tr>
<tr>
<td><code>x-amz-server-side-encryption-aws:kms</code></td>
<td>If the <code>x-amz-server-side-encryption</code> is present and has the value of <code>aws:kms</code>, this header specifies the ID of the AWS Key Management Service (KMS) master encryption key that was used for the object.</td>
</tr>
<tr>
<td><code>x-amz-expiration</code></td>
<td>If the object expiration is configured (see PUT Bucket lifecycle (p. 244)), the response includes this header. It includes the <code>expiry-date</code> and <code>rule-id</code> key-value pairs providing object expiration information. The value of the <code>rule-id</code> is URL encoded. Type: String</td>
</tr>
</tbody>
</table>

For more information on Server-Side Encryption with Customer-Provided Encryption Keys (SSE-C), go to Protecting Data Using Server-Side Encryption with Customer-Provided Encryption Keys (SSE-C) in the Amazon Simple Storage Service Developer Guide.
### Name

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aws-kms-key-id</td>
<td>Type: String</td>
</tr>
<tr>
<td>x-amz-server-side-encryption</td>
<td>If server-side encryption with customer-provided encryption keys encryption was requested, the response will include this header confirming the encryption algorithm used. Type: String Valid Values: AES256</td>
</tr>
<tr>
<td>x-amz-server-side-encryption-</td>
<td>If server-side encryption using customer-provided encryption keys was requested, the response returns this header to provide roundtrip message integrity verification of the customer-provided encryption key. Type: String</td>
</tr>
<tr>
<td>customer-key-md5</td>
<td></td>
</tr>
<tr>
<td>x-amz-version-id</td>
<td>Version of the object. Type: String</td>
</tr>
</tbody>
</table>

### Response Elements

This implementation of the operation does not return response elements.

### Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

### Examples

#### Example 1: Upload an Object

**Sample Request**

The following request stores the image `my-image.jpg` in the bucket `myBucket`.

```text
PUT /my-image.jpg HTTP/1.1
Host: myBucket.s3.amazonaws.com
Date: Wed, 12 Oct 2009 17:50:00 GMT
Authorization: authorization string
Content-Type: text/plain
Content-Length: 11434
x-amz-meta-author: Janet
Expect: 100-continue
[11434 bytes of object data]
```

**Sample Response with Versioning Suspended**

```text
HTTP/1.1 100 Continue

HTTP/1.1 200 OK
x-amz-id-2: LriYPlmdOdAifgsSm/F1YsV1T1LW94/xUQxMsF7xiEbla0/wI1OIx1L+zbtZ163pt7
```
If an expiration rule created on the bucket using lifecycle configuration applies to the object, you get a response with an `x-amz-expiration` header as shown in the following response. For more information, see Transitioning Objects: General Considerations in the Amazon Simple Storage Service Developer Guide.

```plaintext
HTTP/1.1 100 Continue
HTTP/1.1 200 OK
x-amz-id-2: LriYPLdmOdai1fG3m/F1YsVi771LW94/xUQxMsF7xiElba0wI1Olxl+zbw163pt7
x-amz-expiration: expiry-date="Fri, 23 Dec 2012 00:00:00 GMT", rule-id="1"
ETag: "1b2cf535f27731c974343645a3985328"
```

Sample Response with Versioning Enabled

If the bucket has versioning enabled, the response includes the `x-amz-version-id` header.

```plaintext
HTTP/1.1 100 Continue
HTTP/1.1 200 OK
x-amz-id-2: LriYPLdmOdai1fG3m/F1YsVi771LW94/xUQxMsF7xiElba0wI1Olxl+zbw163pt7
x-amz-version-id: 43jfkodU8493jnFJD9fjj3HNNVfadsQUIFDMsldf038fjdsjGFDSIRp
```

Example 2: Upload an Object (Specify Storage Class)

**Sample Request: Specifying reduced redundancy storage class**

The following request stores the image, `my-image.jpg`, in the bucket, `myBucket`. The request specifies `x-amz-storage-class` header to request object be stored using the REDUCED_REDUNDANCY storage class.

```plaintext
PUT /my-image.jpg HTTP/1.1
Host: myBucket.s3.amazonaws.com
Date: Wed, 12 Oct 2009 17:50:00 GMT
Authorization: authorization string
Content-Type: image/jpeg
Content-Length: 11434
Expect: 100-continue
x-amz-storage-class: REDUCED_REDUNDANCY

Sample Response
```

HTTP/1.1 100 Continue
Example 3: Upload an Object (Specify Access Permission Explicitly)

Sample Request: Uploading an object and specifying access permissions explicitly

The following request stores the file TestObject.txt in the bucket myBucket. The request specifies various ACL headers to grant permission to AWS accounts specified using canonical user ID and email address.

```
PUT TestObject.txt HTTP/1.1
Host: myBucket.s3.amazonaws.com
x-amz-date: Fri, 13 Apr 2012 05:40:14 GMT
Authorization: authorization string
x-amz-grant-write-acp: id=8a6925ce4adf588a4532142d3f74dd8c71fa124ExampleCanonicalUserID
x-amz-grant-full-control: emailAddress="ExampleUser@amazon.com"
    emailAddress="ExampleUser1@amazon.com",
    emailAddress="ExampleUser2@amazon.com"
Content-Length: 300
Expect: 100-continue
Connection: Keep-Alive

...Object data in the body...
```

Sample Response

```
HTTP/1.1 200 OK
x-amz-id-2: RUxG2sZJUfS+ezeAS2i0Xj6w/ST6xqF/8pFNHjTjTrECW56SCAUWGg+7QLVoj1GH

Server: AmazonS3
```

Example 4: Upload an Object (Specify Access Permission Using Canned ACL)

Sample Request: Using a canned ACL to set access permissions

The following request stores the file TestObject.txt in the bucket myBucket. The request uses an x-amz-acl header to specify a canned ACL to grant READ permission to the public.

```
...Object data in the body...
```

Sample Response

```
HTTP/1.1 200 OK
x-amz-id-2: RUxG2sZJUfS+ezeAS2i0Xj6w/ST6xqF/8pFNHjTjTrECW56SCAUWGg+7QLVoj1GH
x-amz-request-id: dd038b344cf9553547f8b395a814b274
Date: Fri, 13 Apr 2012 05:54:57 GMT
ETag: "dd038b344cf9553547f8b395a814b274"
Content-Length: 0
Server: AmazonS3
```
Authorization: authorization string
Content-Length: 300
Expect: 100-continue
Connection: Keep-Alive

...Object data in the body...

Sample Response

HTTP/1.1 200 OK
x-amz-id-2: Yd6FSJxFQueTYJ/3dB07miqfVMXXW0S2Hijo3WFs4bZ6oe2QCvXasXLzdMfASd
x-amz-request-id: 80DF413BB3D28A25
Date: Fri, 13 Apr 2012 05:54:59 GMT
ETag: "dd03b344cf9533547f8b395a814b274"
Content-Length: 0
Server: AmazonS3

Example 5: Upload an Object (Request Server-Side Encryption Using Customer-Provided Encryption Key)

In this upload object example, you request server-side encryption and provide an encryption key.

PUT /example-object HTTP/1.1
Host: example-bucket.s3.amazonaws.com
Accept: */*
Authorization: authorization string
Date: Wed, 28 May 2014 19:31:11 +0000
x-amz-server-side-encryption-customer-key:g0lCfA3Dv40jZs5SQJ1zuLRFqtI5WorC/8SEEXAMPLE
x-amz-server-side-encryption-customer-key-MD5: ZjQrne1X/iTcskbY2example
x-amz-server-side-encryption-customer-algorithm:AES256

In the response, Amazon S3 returns the encryption algorithm and MD5 of the encryption key you specified when uploading the object. Note that the ETag returned is not the MD5 of the object.

HTTP/1.1 200 OK
x-amz-id-2: 7qoYGN7uMuFuYS6m7a4lszh6in+hcceE+4DXPmDZ7C9KucjnzC1gI5msha16fbMG
x-amz-request-id: 06437EDD40C407C7
Date: Wed, 28 May 2014 19:31:12 GMT
x-amz-server-side-encryption-customer-key: AES256
x-amz-server-side-encryption-customer-key-MD5: ZjQrne1X/iTcskbY2example
ETag: "ae891237c20e7595c5f479e6ece02c642f59"

Example 6: Upload an Object and Specify Tags

In this upload object request, you specify the optional x-amz-tagging header to add tags to the object.

PUT /example-object HTTP/1.1
Host: example-bucket.s3.amazonaws.com
Accept: */*
Authorization: authorization string
Date: Thu, 22 Sep 2016 21:58:13 GMT
x-amz-tagging: tag1=value1&tag2=value2

[... bytes of object data]

After the object is created, S3 stores the specified object tags in the tagging subresource associated with the object.

- POST Object (p. 350)
- GET Object (p. 317)
PUT Object - Copy

Description

This implementation of the PUT operation creates a copy of an object that is already stored in Amazon S3. A PUT copy operation is the same as performing a GET and then a PUT. Adding the request header, x-amz-copy-source, makes the PUT operation copy the source object into the destination bucket.

Note
You can store individual objects of up to 5 TB in Amazon S3. You create a copy of your object up to 5 GB in size in a single atomic operation using this API. However, for copying an object greater than 5 GB, you must use the multipart upload Upload Part - Copy (p. 459) API. For conceptual information, see Copy Object Using the REST Multipart Upload API in the Amazon Simple Storage Service Developer Guide.

When copying an object, you can preserve most of the metadata (default) or specify new metadata. However, the ACL is not preserved and is set to private for the user making the request.

Important
Amazon S3 Transfer Acceleration does not support cross region copies. You will get a 400 Bad Request error if you request a cross region copy using a Transfer Acceleration endpoint. For more information about transfer acceleration, see Transfer Acceleration in the Amazon Simple Storage Service Developer Guide.

All copy requests must be authenticated and cannot contain a message body. Additionally, you must have READ access to the source object and WRITE access to the destination bucket. For more information, see REST Authentication.

To copy an object only under certain conditions, such as whether the ETag matches or whether the object was modified before or after a specified date, use the request headers x-amz-copy-source-if-match, x-amz-copy-source-if-none-match, x-amz-copy-source-if-unmodified-since, or x-amz-copy-source-if-modified-since.

Note
All headers prefixed with x-amz- must be signed, including x-amz-copy-source.

You can use this operation to change the storage class of an object that is already stored in Amazon S3 using the x-amz-storage-class request header. For more information, go to Storage Classes in the Amazon Simple Storage Service Developer Guide.

The source object that you are copying can be encrypted or unencrypted. If the source object is encrypted, it can be encrypted by server-side encryption using AWS-managed encryption keys or by using a customer-provided encryption key. When copying an object, you can request that Amazon S3 encrypt the target object by using either the AWS-managed encryption keys or by using your own encryption key, regardless of what form of server-side encryption was used to encrypt the source or if the source object was not encrypted. For more information about server-side encryption, go to Using Server-Side Encryption in the Amazon Simple Storage Service Developer Guide.

There are two opportunities for a copy request to return an error. One can occur when Amazon S3 receives the copy request and the other can occur while Amazon S3 is copying the files. If the error occurs before the copy operation starts, you receive a standard Amazon S3 error. If the error occurs during the copy operation, the error response is embedded in the 200 OK response. This means that a 200 OK response can contain either a success or an error. Make sure to design your application to parse the contents of the response and handle it appropriately.

If the copy is successful, you receive a response that contains the information about the copied object.

Note
If the request is an HTTP 1.1 request, the response is chunk encoded. Otherwise, it will not contain the content-length and you will need to read the entire body.
Versioning

By default, x-amz-copy-source identifies the current version of an object to copy. (If the current version is a delete marker, Amazon S3 behaves as if the object was deleted.) To copy a different version, use the versionId subresource.

If you enable versioning on the target bucket, Amazon S3 generates a unique version ID for the object being copied. This version ID is different from the version ID of the source object. Amazon S3 returns the version ID of the copied object in the x-amz-version-id response header in the response.

If you do not enable versioning or suspend it on the target bucket, the version ID Amazon S3 generates is always null.

If the source object's storage class is GLACIER, then you must first restore a copy of this object before you can use it as a source object for the copy operation. For more information, see POST Object restore (p. 362).

To see sample requests that use versioning, see Sample Request: Copying a specified version of an object (p. 404).

Access Permissions

When copying an object, you can optionally specify the accounts or groups that should be granted specific permissions on the new object. There are two ways to grant the permissions using the request headers:

• Specify a canned ACL using the x-amz-acl request header. For more information, see Canned ACL in the Amazon Simple Storage Service Developer Guide.

• Specify access permissions explicitly using the x-amz-grant-read, x-amz-grant-read-acp, x-amz-grant-write-acp, and x-amz-grant-full-control headers. These headers map to the set of permissions Amazon S3 supports in an ACL. For more information, go to Access Control List (ACL) Overview in the Amazon Simple Storage Service Developer Guide.

Note
You can use either a canned ACL or specify access permissions explicitly. You cannot do both.

Requests

Syntax

<table>
<thead>
<tr>
<th>PUT /destinationObject HTTP/1.1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host: destinationBucket.s3.amazonaws.com</td>
</tr>
<tr>
<td>x-amz-copy-source: /source_bucket/sourceObject</td>
</tr>
<tr>
<td>x-amz-metadata-directive: metadata_directive</td>
</tr>
<tr>
<td>x-amz-copy-source-if-match: etag</td>
</tr>
<tr>
<td>x-amz-copy-source-if-none-match: etag</td>
</tr>
<tr>
<td>x-amz-copy-source-if-unmodified-since: time_stamp</td>
</tr>
<tr>
<td>x-amz-copy-source-if-modified-since: time_stamp</td>
</tr>
<tr>
<td>&lt;request metadata&gt;</td>
</tr>
<tr>
<td>Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))</td>
</tr>
<tr>
<td>Date: date</td>
</tr>
</tbody>
</table>

Note
The syntax shows only some of the request headers. For a complete list, see the Request Headers section.
Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

This implementation of the operation can use the following request headers in addition to the request headers common to all operations. Request headers are limited to 8 KB in size. For more information, see Common Request Headers (p. 2).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-copy-source</td>
<td>The name of the source bucket and key name of the source object, separated by a slash (/).</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>This string must be URL-encoded. Additionally, the source bucket must be valid and you must have READ access to the valid source object.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>If the source object is archived in Amazon Glacier (storage class of the object is GLACIER), you must first restore a temporary copy using the POST Object restore (p. 362). Otherwise, Amazon S3 returns the 403 ObjectNotInActiveTierError error response.</td>
<td></td>
</tr>
<tr>
<td>x-amz-metadata-directive</td>
<td>Specifies whether the metadata is copied from the source object or replaced with metadata provided in the request.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>• If copied, the metadata, except for the version ID, remains unchanged. In addition, the server-side-encryption, storage-class, and website-redirect-location metadata from the source is not copied. If you specify this metadata explicitly in the copy request, Amazon S3 adds this metadata to the resulting object. If you specify headers in the request specifying any user-defined metadata, Amazon S3 ignores these headers. • If replaced, all original metadata is replaced by the metadata you specify.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: COPY</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid values: COPY</td>
<td>REPLACE</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------</td>
</tr>
<tr>
<td></td>
<td>Constraints: Values other than COPY or REPLACE result in an immediate 400-based error response. You cannot copy an object to itself unless the MetadataDirective header is specified and its value set to REPLACE.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>For information on supported metadata, see Common Request Headers (p. 2)</td>
<td></td>
</tr>
<tr>
<td>x-amz-copy-source-if-match</td>
<td>Copies the object if its entity tag (ETag) matches the specified tag; otherwise, the request returns a 412 HTTP status code error (failed precondition).</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>See Consideration 1 after the table.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: This header can be used with x-amz-copy-source-if-unmodified-since, but cannot be used with other conditional copy headers.</td>
<td></td>
</tr>
<tr>
<td>x-amz-copy-source-if-none-match</td>
<td>Copies the object if its entity tag (ETag) is different than the specified ETag; otherwise, the request returns a 412 HTTP status code error (failed precondition).</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>See Consideration 2 after the table.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: This header can be used with x-amz-copy-source-if-modified-since, but cannot be used with other conditional copy headers.</td>
<td></td>
</tr>
<tr>
<td>x-amz-copy-source-if-unmodified-since</td>
<td>Copies the object if it hasn't been modified since the specified time; otherwise, the request returns a 412 HTTP status code error (failed precondition).</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>See Consideration 1 after the table.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: This must be a valid HTTP date. This header can be used with x-amz-copy-source-if-match, but cannot be used with other conditional copy headers.</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------</td>
</tr>
<tr>
<td>x-amz-copy-source-if-modified-since</td>
<td>Copies the object if it has been modified since the specified time; otherwise, the request returns a 412 HTTP status code error (failed condition). See Consideration 2 after the table.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: This must be a valid HTTP date. This header can be used with x-amz-copy-source-if-none-match, but cannot be used with other conditional copy headers.</td>
<td></td>
</tr>
<tr>
<td>x-amz-storage-class</td>
<td>If you don't specify, Standard is the default storage class. Amazon S3 supports other storage classes. For more information, go to Storage Classes in the Amazon Simple Storage Service Developer Guide.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: Enum</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: STANDARD</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid Values: STANDARD</td>
<td>STANDARD_IA</td>
</tr>
<tr>
<td></td>
<td>Constraints: You cannot specify GLACIER as the storage class. To transition objects to the GLACIER storage class, you can use lifecycle configuration. For more information, go to Object Lifecycle Management in the Amazon Simple Storage Service Developer Guide.</td>
<td></td>
</tr>
</tbody>
</table>
### Name: x-amz-tagging-directive

<table>
<thead>
<tr>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies whether the object tags are copied from the source object or replaced with tags provided in the request.</td>
<td>No</td>
</tr>
</tbody>
</table>

- If copied, the tagset remains unchanged.
- If replaced, all original tagset is replaced by the tags you specify.

S3 copies tags by default if you don't specify tagging directive.

If tagging directive is REPLACE, you specify any tags in url format in the `x-amz-tagging` header similar to PUT object with tags.

If tagging directive is REPLACE, but you don't specify the `x-amz-tagging` in the request, the destination object will not have any tags.

- Type: String
- Default: COPY
- Valid values: COPY | REPLACE
- Constraints: Values other than COPY or REPLACE result in an immediate 400-based error response.
### Name: x-amz-website-redirect-location

**Description:** If the bucket is configured as a website, redirects requests for this object to another object in the same bucket or to an external URL. Amazon S3 stores the value of this header in the object metadata. For information about object metadata, go to Object Key and Metadata.

In the following example, the request header sets the redirect to an object (anotherPage.html) in the same bucket:

```plaintext
x-amz-website-redirect-location: /anotherPage.html
```

In the following example, the request header sets the object redirect to another website:

```plaintext
x-amz-website-redirect-location: http://www.example.com/
```

For more information about website hosting in Amazon S3, go to sections Hosting Websites on Amazon S3 and How to Configure Website Page Redirects in the Amazon Simple Storage Service Developer Guide.

**Type:** String

**Default:** None

**Constraints:** The value must be prefixed by, "/", "http://" or "https://". The length of the value is limited to 2 K.

---

Note the following additional considerations about the preceding request headers:

**Consideration 1** – If both of the `x-amz-copy-source-if-match` and `x-amz-copy-source-if-unmodified-since` headers are present in the request as follows:

- `x-amz-copy-source-if-match` condition evaluates to true, and;
- `x-amz-copy-source-if-unmodified-since` condition evaluates to false;

then, S3 returns 200 OK and copies the data.

**Consideration 2** – If both of the `x-amz-copy-source-if-none-match` and `x-amz-copy-source-if-modified-since` headers are present in the request as follows:

- `x-amz-copy-source-if-none-match` condition evaluates to false, and;
- `x-amz-copy-source-if-modified-since` condition evaluates to true;

then, S3 returns 412 Precondition Failed response code.
Server-Side Encryption Specific Request Headers

If you want your target object encrypted, you will need to provide appropriate encryption related request headers depending on whether you want to use AWS-managed encryption keys or provide your own encryption key:

- If you want the target object encrypted using server-side encryption with an AWS-managed encryption key, you provide the following request header.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-server-side-encryption</td>
<td>Specifies a server-side encryption algorithm to use when Amazon S3 creates an object.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid Value: aws:kms, AES256</td>
<td></td>
</tr>
<tr>
<td>x-amz-server-side-encryption-aws-kms-key-id</td>
<td>If the x-amz-server-side-encryption is present and has the value of aws:kms, this header specifies the ID of the AWS Key Management Service (KMS) master encryption key that was used for the object.</td>
<td>Yes, if the value of x-amz-server-side-encryption is aws:kms</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td>x-amz-server-side-encryption-context</td>
<td>If x-amz-server-side-encryption is present, and if its value is aws:kms, this header specifies the encryption context for the object. The value of this header is a base64-encoded UTF-8 string holding JSON with the encryption context key-value pairs.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
</tbody>
</table>

Note
If you specify x-amz-server-side-encryption:aws:kms, but do not provide x-amz-server-side-encryption-aws-kms-key-id, the default AWS KMS key will be used to protected the data.

Important
All GET and PUT requests for an object protected by AWS KMS will fail if not made via SSL or by using SigV4.

For more information on Server-Side Encryption with Amazon KMS-Managed Keys (SSE-KMS), go to Protecting Data Using Server-Side Encryption with AWS KMS-Managed Keys in the Amazon Simple Storage Service Developer Guide.

- If you want the target object encrypted using server-side encryption with an encryption key you provide, you must provide encryption information using the following headers.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-server-side-encryption-customer-algorithm</td>
<td>Specifies the algorithm to use to when encrypting the object.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
</tbody>
</table>
### Amazon Simple Storage Service API Reference

#### Requests

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>x-amz-server-side-encryption-customer-key</strong></td>
<td>Specifies the customer-provided base64-encoded encryption key for Amazon S3 to use in encrypting data. This value is used to store the object and then is discarded; Amazon does not store the encryption key. The key must be appropriate for use with the algorithm specified in the x-amz-server-side-encryption-customer-algorithm header.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: Must be accompanied by valid x-amz-server-side-encryption-customer-algorithm and x-amz-server-side-encryption-customer-key-MD5 headers.</td>
<td></td>
</tr>
<tr>
<td><strong>x-amz-server-side-encryption-customer-key-MD5</strong></td>
<td>Specifies the base64-encoded 128-bit MD5 digest of the encryption key according to RFC 1321. Amazon S3 uses this header as a message integrity check to ensure the encryption key was transmitted without error.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: Must be accompanied by valid x-amz-server-side-encryption-customer-algorithm and x-amz-server-side-encryption-customer-key headers.</td>
<td></td>
</tr>
</tbody>
</table>

- If the source object is encrypted using server-side encryption with customer-provided encryption keys, you must use the following headers providing encryption information so that Amazon S3 can decrypt the object for copying.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>x-amz-copy-source-server-side-encryption-customer-algorithm</strong></td>
<td>Specifies the algorithm to use when decrypting the source object.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid Value: AES256</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: Must be accompanied by valid x-amz-copy-source-server-side-encryption-customer-key and x-amz-copy-source-server-side-encryption-customer-key-MD5 headers.</td>
<td></td>
</tr>
<tr>
<td><strong>x-amz-copy-source-server-side</strong></td>
<td>Specifies the customer-provided base64-encoded encryption key for Amazon S3 to use to decrypt the source object. After</td>
<td>Yes</td>
</tr>
</tbody>
</table>
### Requests

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>-encryption-customer-key</td>
<td>the copy operation, Amazon S3 will discard this key. The encryption key provided in this header must be one that was used when the source object was created.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: Must be accompanied by valid x-amz-copy-source-server-side-encryption-customer-algorithm and x-amz-copy-source-server-side-encryption-customer-key-MD5 headers.</td>
<td></td>
</tr>
<tr>
<td>x-amz-copy-source-server-side-encryption-customer-key-MD5</td>
<td>Specifies the base64-encoded 128-bit MD5 digest of the encryption key according to RFC 1321. Amazon S3 uses this header for a message integrity check to ensure the encryption key was transmitted without error.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: Must be accompanied by valid x-amz-copy-source-server-side-encryption-customer-algorithm and x-amz-copy-source-server-side-encryption-customer-key headers.</td>
<td></td>
</tr>
</tbody>
</table>

### Access Control List (ACL) Specific Request Headers

Additionally, you can use the following access control–related headers with this operation. By default, all objects are private; only the owner has full access control. When adding a new object, you can grant permissions to individual AWS accounts or predefined groups defined by Amazon S3. These permissions are then added to the Access Control List (ACL) on the object. For more information, go to [Using ACLs](https://docs.aws.amazon.com/AmazonS3/latest/userguide/using-acl.html). This operation enables you to grant access permissions using one of the following two methods:

- **Specify a canned ACL** — Amazon S3 supports a set of predefined ACLs, known as canned ACLs. Each canned ACL has a predefined set of grantees and permissions. For more information, go to [Canned ACL](https://docs.aws.amazon.com/AmazonS3/latest/userguide/canned-acls.html).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-acl</td>
<td>The canned ACL to apply to the object.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: private</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid Values: private</td>
<td>public-read</td>
</tr>
</tbody>
</table>
### Requests

**Specify access permissions explicitly** — If you want to explicitly grant access permissions to specific AWS accounts or groups, you can use the following headers. Each of these headers maps to specific permissions Amazon S3 supports in an ACL. For more information, go to Access Control List (ACL) Overview. In the header, you specify a list of grantees who get the specific permission.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-grant-read</td>
<td>Allows grantee to read the object data and its metadata.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: None</td>
<td></td>
</tr>
<tr>
<td>x-amz-grant-write</td>
<td>Not applicable. This applies only when granting access permissions on a bucket.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: None</td>
<td></td>
</tr>
<tr>
<td>x-amz-grant-read-acp</td>
<td>Allows grantee to read the object ACL.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: None</td>
<td></td>
</tr>
<tr>
<td>x-amz-grant-write-acp</td>
<td>Allows grantee to write the ACL for the applicable object.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: None</td>

</tbody>
</table>

You specify each grantee as a `type=value` pair, where the type can be one of the following:

- **emailAddress** – if value specified is the email address of an AWS account
- **id** – if value specified is the canonical user ID of an AWS account
• **uri** – if granting permission to a predefined group.

For example, the following `x-amz-grant-read` header grants read object data and its metadata permission to the AWS accounts identified by their email addresses.

```
x-amz-grant-read: emailAddress="xyz@amazon.com", emailAddress="abc@amazon.com"
```

### Request Elements

This implementation of the operation does not use request elements.

### Responses

#### Response Headers

This implementation of the operation can include the following response headers in addition to the response headers common to all responses. For more information, see [Common Response Headers](#).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>x-amz-expiration</code></td>
<td>Amazon S3 will return this header if an <em>Expiration</em> action is configured for the object as part of the bucket's lifecycle configuration. The header value includes an &quot;expiry-date&quot; component and a URL-encoded &quot;rule-id&quot; component. Note that for version-enabled buckets, this header applies only to current versions; Amazon S3 does not provide a header to infer when a noncurrent version will be eligible for permanent deletion. For more information, see <a href="#">PUT Bucket lifecycle</a>.  Type: String</td>
</tr>
<tr>
<td><code>x-amz-copy-source-version-id</code></td>
<td>Version of the source object that was copied.                                                                                              Type: String</td>
</tr>
<tr>
<td><code>x-amz-server-side-encryption</code></td>
<td>If you specified server-side encryption either with an AWS KMS or Amazon S3-managed encryption key in your copy request, the response includes this header. It confirms the encryption algorithm that Amazon S3 used to encrypt the object.  Type: String</td>
</tr>
<tr>
<td><code>x-amz-server-side-encryption-aws-kms-key-id</code></td>
<td>If the <code>x-amz-server-side-encryption</code> is present and has the value of <code>aws:kms</code>, this header specifies the ID of the AWS Key Management Service (KMS) master encryption key that was used for the object.  Type: String</td>
</tr>
<tr>
<td><code>x-amz-server-side-encryption-customer-algorithm</code></td>
<td>If server-side encryption with customer-provided encryption keys (SSE-C) encryption was requested, the response will include this header confirming the encryption algorithm used for the destination object.  Type: String</td>
</tr>
</tbody>
</table>
Name | Description
--- | ---
Valid Values: AES256 | x-amz-server-side-encryption-customer-key-MD5
If SSE-C encryption was requested, the response includes this header to provide roundtrip message integrity verification of the customer-provided encryption key used to encrypt the destination object.
Type: String | x-amz-version-id
Version of the copied object in the destination bucket.
Type: String

Response Elements

Name | Description
--- | ---
CopyObjectResult | Container for all response elements.
Type: Container
Ancestor: None | ETag
Returns the ETag of the new object. The ETag reflects changes only to the contents of an object, not its metadata. The source and destination ETag will be identical for a successfully copied object.
Type: String
Ancestor: CopyObjectResult | LastModified
Returns the date the object was last modified.
Type: String
Ancestor: CopyObjectResult

Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

Examples

Sample Request

This example copies my-image.jpg into the bucket, bucket, with the key name my-second-image.jpg.

```
PUT /my-second-image.jpg HTTP/1.1
Host: bucket.s3.amazonaws.com
Date: Wed, 28 Oct 2009 22:32:00 GMT
x-amz-copy-source: /bucket/my-image.jpg
```
Authorization: authorization string

Sample Response

HTTP/1.1 200 OK
x-amz-id-2: eftixk72aD6Ap51TnqcoF8eFidJG9Z/2mkiDFu8yU9AS1ed4OpIzzj7UDNEHGran
x-amz-request-id: 318BC8BC148832E5
x-amz-copy-source-version-id: 3/L4kqtJ1cpXroDTdMj+rmSpX3d1brHY+xMTRCxf3vjV8d40Nrt8XgRQbpUMLuo
x-amz-version-id: QUpfdndhf8438MNFDN93jdnJFkdmqnh893
Date: Wed, 28 Oct 2009 22:32:00 GMT
Connection: close
Server: AmazonS3

<?xml version="1.0" encoding="UTF-8"?>
<CopyObjectResult>
  <LastModified>2009-10-28T22:32:00</LastModified>
  <ETag>"9b2cf535f27731c974343645a3985328"</ETag>
</CopyObjectResult>

x-amz-version-id returns the version ID of the object in the destination bucket, and x-amz-copy-source-version-id returns the version ID of the source object.

Sample Request: Copying a specified version of an object

The following request copies the key my-image.jpg with the specified version ID and copies it into the bucket and gives it the key my-second-image.jpg.

PUT /my-second-image.jpg HTTP/1.1
Host: bucket.s3.amazonaws.com
Date: Wed, 28 Oct 2009 22:32:00 GMT
x-amz-copy-source: /bucket/my-image.jpg?versionId=3/L4kqtJ1cpXroDTdMj+rmSpX3d1brHY+xMTRCxf3vjV8d40Nrt8XgRQbpUMLuo
Authorization: authorization string

Success Response: Copying a versioned object into a version enabled bucket

The following response shows that an object was copied into a target bucket where Versioning is enabled.

HTTP/1.1 200 OK
x-amz-id-2: eftixk72aD6Ap51TnqcoF8eFidJG9Z/2mkiDFu8yU9AS1ed4OpIzzj7UDNEHGran
x-amz-request-id: 318BC8BC148832E5
x-amz-version-id: QUpfdndhf8438MNFDN93jdnJFkdmqnh893
x-amz-copy-source-version-id: 09df8234529fjs0dfi0W52935029wefdj
Date: Wed, 28 Oct 2009 22:32:00 GMT
Connection: close
Server: AmazonS3

<?xml version="1.0" encoding="UTF-8"?>
<CopyObjectResult>
  <LastModified>2009-10-28T22:32:00</LastModified>
  <ETag>"9b2cf535f27731c974343645a3985328"</ETag>
</CopyObjectResult>
Success Response: Copying a versioned object into a version-suspended bucket

The following response shows that an object was copied into a target bucket where versioning is suspended. Note that the parameter <VersionId> does not appear.

```
HTTP/1.1 200 OK
x-amz-id-2: eftixk72aD6Ap51TmqcoF8efIdJG9Z/2mkiDFu8yU9AS1ed4OpIszzj7UDNEHGran
x-amz-request-id: 31BBBC4148832B5

Date: Wed, 28 Oct 2009 22:32:00 GMT
Connection: close
Server: AmazonS3

<?xml version="1.0" encoding="UTF-8"?>
<CopyObjectResult>
  <LastModified>2009-10-28T22:32:00</LastModified>
  <ETag>"9b2cf535f27731c974343645a3985328"</ETag>
</CopyObjectResult>
```

Sample: Copy from unencrypted object to an object encrypted with server-side encryption with customer-provided encryption keys

The following example specifies the HTTP PUT header to copy an unencrypted object to an object encrypted with server-side encryption with customer-provided encryption keys (SSE-C).

```
PUT /exampleDestinationObject HTTP/1.1
Host: example-destination-bucket.s3.amazonaws.com
x-amz-server-side-encryption-customer-algorithm: AES256
x-amz-server-side-encryption-customer-key: Base64(YourKey)
x-amz-server-side-encryption-customer-key-MD5: Base64(MD5(YourKey))
x-amz-metadata-directive: metadataDirective
x-amz-copy-source: /example_source_bucket/exampleSourceObject
x-amz-copy-source-if-match: etag
x-amz-copy-source-if-none-match: etag
x-amz-copy-source-if-unmodified-since: time_stamp
x-amz-copy-source-if-modified-since: time_stamp
<request metadata>
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))
Date: date
```

Sample: Copy from an object encrypted with SSE-C to an object encrypted with SSE-C

The following example specifies the HTTP PUT header to copy an object encrypted with server-side encryption with customer-provided encryption keys to an object encrypted with server-side encryption with customer-provided encryption keys for key rotation.

```
PUT /exampleDestinationObject HTTP/1.1
Host: example-destination-bucket.s3.amazonaws.com
x-amz-server-side-encryption-customer-algorithm: AES256
x-amz-server-side-encryption-customer-key: Base64(NewKey)
x-amz-server-side-encryption-customer-key-MD5: Base64(MD5(NewKey))
```
x-amz-metadata-directive: metadata_directive
x-amz-copy-source: /source_bucket/sourceObject
x-amz-copy-source-if-match: etag
x-amz-copy-source-if-none-match: etag
x-amz-copy-source-if-unmodified-since: time_stamp
x-amz-copy-source-if-modified-since: time_stamp
x-amz-copy-source-server-side-encryption-customer-algorithm: AES256
x-amz-copy-source-server-side-encryption-customer-key: Base64(OldKey)
x-amz-copy-source-server-side-encryption-customer-key-MD5: Base64(MD5(OldKey))
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))
Date: date

PUT Object acl

Description

This implementation of the PUT operation uses the acl subresource to set the access control list (ACL) permissions for an object that already exists in a bucket. You must have WRITE_ACP permission to set the ACL of an object.

You can use one of the following two ways to set an object's permissions:

- Specify the ACL in the request body, or
- Specify permissions using request headers

Depending on your application needs, you may choose to set the ACL on an object using either the request body or the headers. For example, if you have an existing application that updates an object ACL using the request body, then you can continue to use that approach.

Versioning

The ACL of an object is set at the object version level. By default, PUT sets the ACL of the current version of an object. To set the ACL of a different version, use the versionId subresource.

To see sample requests that use versioning, see Sample Request: Setting the ACL of a specified object version (p. 412).

Requests

Syntax

The following request shows the syntax for sending the ACL in the request body. If you want to use headers to specify the permissions for the object, you cannot send the ACL in the request body. Instead, see the Request Headers section for a list of headers you can use.

```
PUT /ObjectName?acl HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

<AccessControlPolicy>
  <Owner>
    <ID>ID</ID>
    <DisplayName>EmailAddress</DisplayName>
  </Owner>
  <AccessControlList>
    <Grant>
      <Grantee xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="CanonicalUser">
        <ID>ID</ID>
        <DisplayName>EmailAddress</DisplayName>
      </Grantee>
      <Permission>Permission</Permission>
    </Grant>
    ...
  </AccessControlList>
</AccessControlPolicy>
```
**Note**  
The syntax shows some of the request headers. For a complete list see the Request Headers section.

### Request Parameters

This implementation of the operation does not use request parameters.

### Request Headers

You can use the following request headers in addition to the [Common Request Headers (p. 2)](#).

#### Access Control List (ACL) Specific Request Headers

These headers enable you to set access permissions using one of the following methods:

- Specify canned ACL, or
- Specify the permission for each grantee explicitly

Amazon S3 supports a set of predefined ACLs, known as canned ACLs. Each canned ACL has a predefined set of grantees and permissions. For more information, see [Canned ACL](#). To grant access permissions by specifying canned ACLs, you use the following header and specify the canned ACL name as its value. If you use this header, you cannot use other access control-specific headers in your request.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-acl</td>
<td>Sets the ACL of the object using the specified canned ACL. For more information, go to <a href="#">Canned ACL</a> in the Amazon Simple Storage Service Developer Guide.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid Values: private</td>
<td>public-read</td>
</tr>
<tr>
<td></td>
<td>Default: private</td>
<td></td>
</tr>
</tbody>
</table>

If you need to grant individualized access permissions on an object, you can use the following `x-amz-grant-permission` headers. When using these headers you specify explicit access permissions and grantees (AWS accounts or Amazon S3 groups) who will receive the permission. If you use these ACL specific headers, you cannot use `x-amz-acl` header to set a canned ACL.

**Note**  
Each of the following request headers maps to specific permissions Amazon S3 supports in an ACL. For more information, go to [Access Control List (ACL) Overview](#).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-grant-read</td>
<td>Allows the specified grantee to list the objects in the bucket.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: None</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------</td>
</tr>
<tr>
<td>x-amz-grant-write</td>
<td>Not applicable when granting access permissions on objects. You can use this when granting access permissions on buckets. Type: String Default: None Constraints: None</td>
<td>No</td>
</tr>
<tr>
<td>x-amz-grant-read-acp</td>
<td>Allows the specified grantee to read the bucket ACL. Type: String Default: None Constraints: None</td>
<td>No</td>
</tr>
<tr>
<td>x-amz-grant-write-acp</td>
<td>Allows the specified grantee to write the ACL for the applicable bucket. Type: String Default: None Constraints: None</td>
<td>No</td>
</tr>
<tr>
<td>x-amz-grant-full-control</td>
<td>Allows the specified grantee the READ, WRITE, READ_ACP, and WRITE_ACP permissions on the bucket. Type: String Default: None Constraints: None</td>
<td>No</td>
</tr>
</tbody>
</table>

For each of these headers, the value is a comma-separated list of one or more grantees. You specify each grantee as a type=value pair, where the type can be one of the following:

- emailAddress — if value specified is the email address of an AWS account
- id — if value specified is the canonical user ID of an AWS account
- uri — if granting permission to a predefined group.

For example, the following x-amz-grant-read header grants list objects permission to the two AWS accounts identified by their email addresses.

```
x-amz-grant-read: emailAddress="xyz@amazon.com", emailAddress="abc@amazon.com"
```

For more information, go to Access Control List (ACL) Overview.

**Request Elements**

If you decide to use the request body to specify an ACL, you must use the following elements.

**Note**

If you use the request body, you cannot use the request headers to set an ACL.
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AccessControlList</td>
<td>Container for ACL information</td>
</tr>
<tr>
<td></td>
<td>Type: Container</td>
</tr>
<tr>
<td></td>
<td>Ancestors: AccessControlPolicy</td>
</tr>
<tr>
<td>AccessControlPolicy</td>
<td>Contains the elements that set the ACL permissions for an object per grantee</td>
</tr>
<tr>
<td></td>
<td>Type: Container</td>
</tr>
<tr>
<td></td>
<td>Ancestors: None</td>
</tr>
<tr>
<td>DisplayName</td>
<td>Screen name of the bucket owner</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td></td>
<td>Ancestors: AccessControlPolicy.Owner</td>
</tr>
<tr>
<td>Grant</td>
<td>Container for the grantee and his or her permissions</td>
</tr>
<tr>
<td></td>
<td>Type: Container</td>
</tr>
<tr>
<td></td>
<td>Ancestors: AccessControlPolicy.AccessControlList</td>
</tr>
<tr>
<td>Grantee</td>
<td>The subject whose permissions are being set.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td></td>
<td>Valid Values: DisplayName</td>
</tr>
<tr>
<td></td>
<td>Ancestors: AccessControlPolicy.AccessControlList.Grant</td>
</tr>
<tr>
<td>ID</td>
<td>ID of the bucket owner, or the ID of the grantee</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td></td>
<td>Ancestors: AccessControlPolicy.Owner or AccessControlPolicy.AccessControlList.Grant</td>
</tr>
<tr>
<td>Owner</td>
<td>Container for the bucket owner's display name and ID</td>
</tr>
<tr>
<td></td>
<td>Type: Container</td>
</tr>
<tr>
<td></td>
<td>Ancestors: AccessControlPolicy</td>
</tr>
<tr>
<td>Permission</td>
<td>Specifies the permission given to the grantee</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td></td>
<td>Valid Values: FULL_CONTROL</td>
</tr>
<tr>
<td></td>
<td>Ancestors: AccessControlPolicy.AccessControlList.Grant</td>
</tr>
</tbody>
</table>

**Grantee Values**

You can specify the person (grantee) to whom you're assigning access rights (using request elements) in the following ways:
• By the person's ID:

```xml
<Grantee xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="CanonicalUser"><ID><replaceable>ID</replaceable></ID><DisplayName><replaceable>GranteesEmail</replaceable></DisplayName></Grantee>
```

DisplayName is optional and ignored in the request.

• By Email address:

```xml
<Grantee xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="AmazonCustomerByEmail"><EmailAddress><replaceable>Grantees@email.com</replaceable></EmailAddress></Grantee>
```

The grantee is resolved to the CanonicalUser and, in a response to a GET Object acl request, appears as the CanonicalUser.

• By URI:

```xml
```

### Responses

#### Response Headers

This implementation of the operation can include the following response headers in addition to the response headers common to all responses. For more information, see Common Response Headers (p. 4).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-version-id</td>
<td>Version of the object whose ACL is being set.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
</tr>
</tbody>
</table>

#### Response Elements

This operation does not return response elements.

#### Special Errors

This operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).
Examples

Sample Request

The following request grants access permission to an existing object. The request specifies the ACL in the body. In addition to granting full control to the object owner, the XML specifies full control to an AWS account identified by its canonical user ID.

```
PUT /my-image.jpg?acl HTTP/1.1
Host: bucket.s3.amazonaws.com
Date: Wed, 28 Oct 2009 22:32:00 GMT
Authorization: authorization string
Content-Length: 124

<AccessControlPolicy>
  <Owner>
    <ID>75aa57f09aa0c8caeb4f8c24e99d10f8e7faeebf76c078efc7c6caea54ba06a</ID>
    <DisplayName>CustomersName@amazon.com</DisplayName>
  </Owner>
  <AccessControlList>
    <Grant>
      <Grantee xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="CanonicalUser">
        <ID>75aa57f09aa0c8caeb4f8c24e99d10f8e7faeeExampleCanonicalUserID</ID>
        <DisplayName>CustomerName@amazon.com</DisplayName>
      </Grantee>
      <Permission>FULL_CONTROL</Permission>
    </Grant>
  </AccessControlList>
</AccessControlPolicy>
```

Sample Response

The following shows a sample response when versioning on the bucket is enabled.

```
HTTP/1.1 200 OK
x-amz-id-2: eftixk72aD6Ap51T9AS1ed4OpIszj7UDNEHGran
x-amz-request-id: 318BC8BC148832E5
x-amz-version-id: 3/L4kqtj1tcpXrof3vjVBH40Nrfk5d
Date: Wed, 28 Oct 2009 22:32:00 GMT
Last-Modified: Sun, 1 Jan 2006 12:00:00 GMT
Content-Length: 0
Connection: close
Server: AmazonS3
```

Sample Request: Setting the ACL of a specified object version

The following request sets the ACL on the specified version of the object.

```
PUT /my-image.jpg?acl&versionId=3HL4kqtJlcpXroDTDmJ+rmSpXd3d1brHY+MrTcxf3vjVBH40Nrfk5d
HTTP/1.1
Host: bucket.s3.amazonaws.com
Date: Wed, 28 Oct 2009 22:32:00 GMT
Authorization: authorization string
Content-Length: 124

<AccessControlPolicy>
  <Owner>
    <ID>75aa57f09aa0c8caeb4f8c24e99d10f8e7faeebf76c078efc7c6caea54ba06a</ID>
  </Owner>
```

- GET Object (p. 317)
PUT Object tagging

Description

This implementation of the PUT operation uses the `tagging` subresource to add a set of tags to an existing object.

A tag is a key/value pair. You can associate tags with an object by sending a PUT request against the tagging subresource associated with the object. You can retrieve tags by sending a GET request. For more information, see GET Object tagging (p. 333).

For tagging related restrictions related to characters and encodings, see Tag Restrictions in the AWS Billing and Cost Management User Guide. Note that S3 limits the maximum number of tags to 10 tags per object.

To use this operation, you must have permission to perform the `s3:PutObjectTagging` action. By default, the bucket owner has this permission and can grant this permission to others.

To put tags of any other version, use the `versionId` query parameter. You also need permission for the `s3:PutObjectVersionTagging` action.

Requests

Syntax

The following request shows the syntax for sending tagging information in the request body.

```xml
PUT /ObjectName?tagging HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))
<Tagging>
  <TagSet>
    <Tag>
      <Key>Tag Name</Key>
      <Value>Tag Value</Value>
    </Tag>
  </TagSet>
</Tagging>
```

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

Content-MD5 will be a required header for this operation.

Request Elements

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tagging</td>
<td>Container for the TagSet and Tag elements. Type: String</td>
<td>Yes</td>
</tr>
</tbody>
</table>
### TagSet
- **Description:** Container for a set of tags
- **Type:** Container
- **Ancestors:** Tagging
- **Required:** Yes

### Tag
- **Description:** Container for tag information.
- **Type:** Container
- **Ancestors:** TagSet
- **Required:** No

### Key
- **Description:** Name of the tag.
- **Type:** String
- **Ancestors:** Tag
- **Required:** Yes, if Tag is specified

### Value
- **Description:** Value of the tag.
- **Type:** String
- **Ancestors:** Tag
- **Required:** No

## Responses

### Response Headers
The operation returns response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

### Response Elements
This operation does not return response elements.

### Special Errors
- **InvalidTagError** - The tag provided was not a valid tag. This error can occur if the tag did not pass input validation. For more information, see Object Tagging in the Amazon Simple Storage Service Developer Guide.
- **MalformedXMLException** - The XML provided does not match the schema.
- **OperationAbortedError** - A conflicting conditional operation is currently in progress against this resource. Please try again.
- **InternalError** - The service was unable to apply the provided tag to the object.

## Examples

### Sample Request: Add tag set to an object
The following request adds a tag set to the existing object `object-key` in the `examplebucket` bucket.
Sample Response

HTTP/1.1 200 OK
x-amz-id-2: YgIPIfBiKa2bj0KMgUAdQkf3ShJTOOpXUueF6QKo

SELECT Object Content (Preview)

Preview Program

This feature is only available as part of a Preview program and is subject to change at any time. If you are interested in participating in the Preview program, see Preview Request Form.

During the Preview program, this feature will only be available in the following regions: US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore) and EU (Ireland).

During the Preview program, the following features are either not supported or are only partially supported:

- **Encryption**: Objects that are encrypted at rest are not supported.
- **Compression**: Only GZIP compression is supported.
- **Format**: Only CSV and JSON formats are supported.
- **Encoding**: Only UTF-8 encoding is supported.

Description

Retrieves object content based on an SQL expression. In the request, along with the SQL expression, you must also specify a data serialization format (JSON, CSV) of the object. Amazon S3 uses this to parse object data into records and returns only records that match the specified SQL expression. In addition, you can specify the data serialization format for the response.

The API requires permission for the s3:GetObject API (you must have read access). Also, this operation does not support anonymous access.

Requests

Syntax

POST /ObjectName?select HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: date
Authorization: authorization string (See Authenticating Requests (AWS Signature Version 4))

Request body goes here

**Note**

The syntax shows some of the request headers. For a complete list, see the "Request Headers" section of this topic.

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

You can use the following request headers in addition to the Common Request Headers (p. 2).
Request Body

The following XML shows the request body:

```xml
<SelectRequest>
  <Expression>SELECT * FROM S3Object</Expression>
  <ExpressionType>SQL</ExpressionType>
  <InputSerialization>
    <CompressionType>GZIP</CompressionType>
    <CSV>
      <FileHeaderInfo>IGNORE</FileHeaderInfo>
      <RecordDelimiter>
      </RecordDelimiter>
      <FieldDelimiter>,</FieldDelimiter>
      <QuoteCharacter>"</QuoteCharacter>
      <QuoteEscapeCharacter>"</QuoteEscapeCharacter>
      <Comments>#$</Comments>
    </CSV>
    <JSON>
      <Type>Document</Type>
    </JSON>
  </InputSerialization>
  <OutputSerialization>
    <CSV>
      <QuoteFields>ASNEEDED</QuoteFields>
      <RecordDelimiter>
      </RecordDelimiter>
      <FieldDelimiter>,</FieldDelimiter>
      <QuoteCharacter>"</QuoteCharacter>
      <QuoteEscapeCharacter>"</QuoteEscapeCharacter>
    </CSV>
    <JSON>
      <RecordDelimiter>
      </RecordDelimiter>
    </JSON>
  </OutputSerialization>
</SelectRequest>
```

In the XML:

- The `InputSerialization` element must specify either CSV or JSON. It describes the format of the data in the object that is being queried.
- The `OutputSerialization` element must specify either CSV or JSON. It describes the format of the data that you want Amazon S3 to return in response.

The following tables explain each of the XML elements in the request body.

<table>

Responses

A successful operation returns either 200 OK status code.

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Body

Because the response size is unknown, Amazon S3 streams the response as a series of frames and includes a Transfer-Encoding header with chunked as its value in the response. The following example shows the response format at the top level:

```
<FRAME 1>
<FRAME 1>
<FRAME 2>
......
<FRAME n>
```

The following diagram shows a frame structure:

![Frame Structure Diagram]

The response includes frames of the following types:

- **Records frame**: Includes one or more records. A record never spans multiple frames. Depending on the size of the result, the response can have one or more of these frames.
- **Continuation frame**: Amazon S3 periodically sends this frame to keep the TCP connection open. These frames appear in response at random. The client must detect the frame type and process accordingly.
- **End frame**: Indicates the end of the SQL expression processing, so the client can close the connection.

Each frame contains the following components:

- **Header**: All frames have the same header length.
- **Type**: Indicates the frame type. The first byte indicates the version (1, 2, 3, and so on in binary format). The last three bytes identify the frame type, as shown in the following examples. A frame in the response can be one of the following types (Amazon S3 converts the type value to binary when constructing the frame):
  - Record(s) frame: 100000000000000000000001 (8388609 in decimal)
  - Continuation frame: 100000000000000000000002 (8388610 in decimal)
  - End frame: 100000000000000000000003 (8388611 in decimal)
- **Payload length**: Indicates the length of the payload.
- **Header checksum**: Indicates the 32 bit checksum of the header fields.
• **Payload**: Can be anything.
• **Payload checksum**: Indicates the 32 bit checksum of the payload.

Each of the frame types is explained in the following sections.

### Record(s) Frame

A frame of this type contains actual data records. Depending on the frame type, the first part of the payload contains an offset field.

Amazon S3 serializes the records frame based on the `OutputSerialization` element that you specify in the request (for example, CSV or JSON). The API ensures that a single record is not spread across multiple frames.

### Continuation Frame

A frame of this type indicates progress and to keep the TCP connection open.

The `offset` indicates the byte offset in your object data where Amazon S3 is processing.

### End Frame

A frame of this type indicates the end of streaming. That is, there are no more frames following this frame, and the client can close the connection.

### Special Errors

The following table contains special errors that `SELECT Object Content` might return.
For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

<table>

API Version 2006-03-01

426
### Examples

#### Example 1: CSV Object

The following select request retrieves all records from an object with data stored in CSV format. The `InputSerialization` element specifies CSV format because the source object is assumed to have data in CSV format. The `OutputSerialization` element directs Amazon S3 to return results in CSV.

```xml
POST /exampleobject.csv?select HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Date: Tue, 17 Oct 2017 01:49:52 GMT
Authorization: authorization string
Content-Length: content length

<Expression>Select * from S3Object</Expression>
```
You can try different queries in the Expression element:

- Assuming you are not using any headers, you can specify columns using positional headers:

  ```
  SELECT s._1, s._2 FROM S3Object s WHERE s._3 > 100
  ```

- If you have headers and you set the fileHeaderInfo to Use, you can specify headers in the expression:

  ```
  SELECT s.Id, s.FirstName, s.SSN FROM S3Object s
  ```

- You can specify functions in the SQL expression:

  ```
  SELECT count(*) FROM S3Object s WHERE s._1 < 1
  ```

The following is a sample response.

```
HTTP/1.1 200 OK
x-amz-id-2: GFihv3y6+kE7KG11GEkQhU7/2/chR3Yb2fCb2S04nxI423Dqw2XiQ0B/UTFzYvFlBlZNRc0w=
x-amz-request-id: 9F341CD3C48A79E0
Date: Tue, 17 Oct 2017 23:54:05 GMT
```

If a copy of the object is already restored, Amazon S3 returns a 200 OK response, updating only the restored copy’s expiry time.

**Example 2: JSON Object**

The following select request retrieves all records from an object with data stored in JSON format. The InputSerialization element specifies JSON format because the source object is assumed to have data in JSON format. The OutputSerialization directs Amazon S3 to return results in CSV.

```
POST /exampleobject.json?select HTTP/1.1
Host: examplebucket.s3.amazonaws.com
```
<SelectRequest>
  <Expression>Select * from S3Object</Expression>
  <ExpressionType>SQL</ExpressionType>
  <InputSerialization>
    <CompressionType>GZIP</CompressionType>
    <JSON>
      <Type>Document</Type>
    </JSON>
  </InputSerialization>
  <OutputSerialization>
    <CSV>
      <QuoteFields>ASNEEDED</QuoteFields>
      <RecordDelimiter>
      </RecordDelimiter>
      <FieldDelimiter>,</FieldDelimiter>
      <QuoteCharacter>"</QuoteCharacter>
      <QuoteEscapeCharacter>"</QuoteEscapeCharacter>
    </CSV>
  </OutputSerialization>
</SelectRequest>

You can try different queries in the Expression element:

- You can filter by string comparison using record keys:
  
  SELECT s.country, s.city from S3Object s where s.city = 'Seattle'

- You can specify functions in the SQL expression:

  SELECT count(*) FROM S3Object s

Notes

The SELECT Object Content operation does not support the following GET Object functionality. For more information, see GET Object (p. 317).

- Range: You cannot specify the range of bytes of an object to return.
- GLACIER storage class: You cannot specify the GLACIER storage class object. For more information, see Storage Classes in the Amazon Simple Storage Service Developer Guide.

- PUT Bucket lifecycle (p. 244)
Abort Multipart Upload

Description

This operation aborts a multipart upload. After a multipart upload is aborted, no additional parts can be uploaded using that upload ID. The storage consumed by any previously uploaded parts will be freed. However, if any part uploads are currently in progress, those part uploads might or might not succeed. As a result, it might be necessary to abort a given multipart upload multiple times in order to completely free all storage consumed by all parts. To verify that all parts have been removed, so you don’t get charged for the part storage, you should call the List Parts (p. 448) operation and ensure the parts list is empty.

For information on permissions required to use the multipart upload API, go to Multipart Upload API and Permissions in the Amazon Simple Storage Service Developer Guide.

Requests

Syntax

```
DELETE /ObjectName?uploadId=UploadId HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: Date
Authorization: authorization string
```

Request Parameters

This operation does not use request parameters.

Request Headers

This operation uses only Request Headers common to most requests. For more information, see Common Request Headers (p. 2).

Request Elements

This operation does not use request elements.

Responses

Response Headers

This operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

This operation does not use response elements.

For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

Examples

Sample Request

The following request aborts a multipart upload identified by its upload ID.

```
DELETE /example-object?uploadId=VXBsb2FkIElEIGZvciBibHZpcmcyBteS1tb3ZpZS5tMnRzIHBwbG9hZ
HTTP/1.1
Host: example-bucket.s3.amazonaws.com
Date: Mon, 1 Nov 2010 20:34:56 GMT
Authorization: authorization string
```

Sample Response

```
HTTP/1.1 204 OK
x-amz-id-2: Weag1LuByRx9e6jS0imru9pO4ZVKnJ2Qz7/C1NpfTWAzRfTaOFg==
x-amz-request-id: 996c76696e672732072657175657374
Date: Mon, 1 Nov 2010 20:34:56 GMT
Content-Length: 0
Connection: keep-alive
Server: AmazonS3
```

Related Actions

Complete Multipart Upload

Description
This operation completes a multipart upload by assembling previously uploaded parts.

You first initiate the multipart upload and then upload all parts using the Upload Parts operation (see Upload Part (p. 454)). After successfully uploading all relevant parts of an upload, you call this operation to complete the upload. Upon receiving this request, Amazon S3 concatenates all the parts in ascending order by part number to create a new object. In the Complete Multipart Upload request, you must provide the parts list. You must ensure the parts list is complete, this operation concatenates the parts you provide in the list. For each part in the list, you must provide the part number and the ETag header value, returned after that part was uploaded.

Processing of a Complete Multipart Upload request could take several minutes to complete. After Amazon S3 begins processing the request, it sends an HTTP response header that specifies a 200 OK response. While processing is in progress, Amazon S3 periodically sends whitespace characters to keep the connection from timing out. Because a request could fail after the initial 200 OK response has been sent, it is important that you check the response body to determine whether the request succeeded.

Note that if Complete Multipart Upload fails, applications should be prepared to retry the failed requests. For more information, go to Amazon S3 Error Best Practices section of the Amazon Simple Storage Service Developer Guide.

For more information on multipart uploads, go to Uploading Objects Using Multipart Upload in the Amazon Simple Storage Service Developer Guide.

For information on permissions required to use the multipart upload API, go to Multipart Upload API and Permissions in the Amazon Simple Storage Service Developer Guide.

Requests

Syntax

```
POST /ObjectName?uploadId=UploadId HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: Date
Content-Length: Size
Authorization: authorization string

<CompleteMultipartUpload>
  <Part>
    <PartNumber>PartNumber</PartNumber>
    <ETag>ETag</ETag>
  </Part>
  ...
</CompleteMultipartUpload>
```

Request Parameters

This operation does not use request parameters.

Request Headers

This operation uses only Request Headers common to most requests. For more information, see Common Request Headers (p. 2)
Request Elements

<table>
<thead>
<tr>
<th>Name</th>

</table>

Responses

Response Headers

The operation uses the following response header, in addition to the response headers common to most requests. For more information, see Common Response Headers (p. 4).

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
</table>
| x-amz-expiration             | Amazon S3 returns this header if an Expiration action is configured for the object as part of the bucket's lifecycle configuration. The header value includes an "expiry-date" component and a URL-encoded "rule-id" component. Note that for versioning-enabled buckets, this header applies only to current versions; Amazon S3 does not provide a header to infer when a noncurrent version will be eligible for permanent deletion. For more information, see PUT Bucket lifecycle (p. 244). |}

| x-amz-server-side-encryption | If you specified server-side encryption either with an AWS KMS or Amazon S3-managed encryption key in your initiate multipart upload request, the response includes this header. It confirms the encryption algorithm that Amazon S3 used to encrypt the object. |
**Header** | **Description**  
--- | ---  
 Type: String  

|x-amz-server-side-encryption-aws-kms-key-id| If the `x-amz-server-side-encryption` is present and has the value of `aws:kms`, this header specifies the ID of the AWS Key Management Service (KMS) master encryption key that was used for the object.  
Type: String  

|x-amz-server-side-encryption-customer-algorithm| If encryption by using server-side encryption with customer-provided encryption keys was requested, the response will include this header confirming the encryption algorithm used.  
Type: String  
Valid Value: AES256  

|x-amz-version-id| Version ID of the newly created object, in case the bucket has versioning turned on.  
Type: String  

**Response Elements**  

| Name | Description  
--- | ---  
CompleteMultipartUploadResult | Container for the response  
Type: Container  
Children: Location, Bucket, Key, ETag  
Ancestors: None  

Location | The URI that identifies the newly created object.  
Type: URI  
Ancestors: CompleteMultipartUploadResult  

Bucket | The name of the bucket that contains the newly created object.  
Type: String  
Ancestors: CompleteMultipartUploadResult  

Key | The object key of the newly created object.  
Type: String  
Ancestors: CompleteMultipartUploadResult  

ETag | Entity tag that identifies the newly created object's data. Objects with different object data will have different entity tags. The entity tag is an opaque string. The entity tag may or may not be an MD5 digest of the object data. If the entity tag is not an MD5 digest of the object data, it will
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>contain one or more nonhexadecimal characters and/or will consist of less than 32 or more than 32 hexadecimal digits. Type: String Ancestors: CompleteMultipartUploadResult</td>
</tr>
</tbody>
</table>

### Special Errors

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EntityTooSmall</td>
<td>Your proposed upload is smaller than the minimum allowed object size. Each part must be at least 5 MB in size, except the last part.</td>
</tr>
<tr>
<td>InvalidPart</td>
<td>One or more of the specified parts could not be found. The part might not have been uploaded, or the specified entity tag might not have matched the part's entity tag.</td>
</tr>
<tr>
<td>InvalidPartOrder</td>
<td>The list of parts was not in ascending order. The parts list must be specified in order by part number.</td>
</tr>
<tr>
<td>NoSuchUpload</td>
<td>The specified multipart upload does not exist. The upload ID might be invalid, or the multipart upload might have been aborted or completed.</td>
</tr>
</tbody>
</table>

For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

### Examples

#### Sample Request

The following Complete Multipart Upload request specifies three parts in the CompleteMultipartUpload element.

```xml
POST /example-object?uploadId=AAAsb2FkIElEIGZvciBlbHZpbcncyWeeSltb3ZpZS5tMnRzIRRwbG9hZA HTTP/1.1
Host: example-bucket.s3.amazonaws.com
Date: Mon, 1 Nov 2010 20:34:56 GMT
Content-Length: 391
Authorization: authorization string

<CompleteMultipartUpload>
  <Part>
    <PartNumber>1</PartNumber>
    <ETag>"a54357aff0632cce46d942af68356b38"</ETag>
  </Part>
  <Part>
    <PartNumber>2</PartNumber>
    <ETag>"0c78aef83f66abc1fa1e8477f296d394"</ETag>
  </Part>
  <Part>
    <PartNumber>3</PartNumber>
  </Part>
</CompleteMultipartUpload>
```
Sample Response

The following response indicates that an object was successfully assembled.

HTTP/1.1 200 OK
x-amz-id-2: Uuag1LuByRx9e6j5Onimru9pO4ZVKnJ2Qz7/C1NPcfTWAtrRPfTaOFg==
x-amz-request-id: 656c76696e6727732072657175657374
Date: Mon, 1 Nov 2010 20:34:56 GMT
Connection: close
Server: AmazonS3

</CompletionMultiPartUploadResult>

Sample Response with Error Specified in Header

The following response indicates that an error occurred before the HTTP response header was sent.

HTTP/1.1 403 Forbidden
x-amz-id-2: Uuag1LuByRx9e6j5Onimru9pO4ZVKnJ2Qz7/C1NPcfTWAtrRPfTaOFg==
x-amz-request-id: 656c76696e6727732072657175657374
Date: Mon, 1 Nov 2010 20:34:56 GMT
Content-Length: 237
Connection: keep-alive
Server: AmazonS3

<?xml version="1.0" encoding="UTF-8"?><Error><Code>AccessDenied</Code><Message>Access Denied</Message><RequestId>656c76696e6727732072657175657374</RequestId><HostId>Uuag1LuByRx9e6j5Onimru9pO4ZVKnJ2Qz7/C1NPcfTWAtrRPfTaOFg==</HostId></Error>

Sample Response with Error Specified in Body

The following response indicates that an error occurred after the HTTP response header was sent. Note that while the HTTP status code is 200 OK, the request actually failed as described in the Error element.

HTTP/1.1 200 OK
x-amz-id-2: Uuag1LuByRx9e6j5Onimru9pO4ZVKnJ2Qz7/C1NPcfTWAtrRPfTaOFg==
x-amz-request-id: 656c76696e6727732072657175657374
Date: Mon, 1 Nov 2010 20:34:56 GMT
Connection: close
Server: AmazonS3

<?xml version="1.0" encoding="UTF-8"?><Error><Code>InternalError</Code></Error>
<Message>We encountered an internal error. Please try again.</Message>
<RequestId>656c76696e6727732072657175657374</RequestId>
<HostId>Uuag1LuByRx9e6j5Onimru9p04ZVKnJ2Qz7/C1NPcfTWAAtRPfTaOFg==</HostId>
</Error>

Related Actions

- Initiate Multipart Upload (p. 438)
- Upload Part (p. 454)
- Abort Multipart Upload (p. 430)
- List Parts (p. 448)
- List Multipart Uploads (p. 196)
Initiate Multipart Upload

Description

This operation initiates a multipart upload and returns an upload ID. This upload ID is used to associate all of the parts in the specific multipart upload. You specify this upload ID in each of your subsequent upload part requests (see Upload Part (p. 454)). You also include this upload ID in the final request to either complete or abort the multipart upload request.

For more information about multipart uploads, see Multipart Upload Overview in the Amazon Simple Storage Service Developer Guide.

If you have configured a lifecycle rule to abort incomplete multipart uploads, the upload must complete within the number of days specified in the bucket lifecycle configuration. Otherwise, the incomplete multipart upload becomes eligible for an abort operation and Amazon S3 aborts the multipart upload. For more information, see Aborting Incomplete Multipart Uploads Using a Bucket Lifecycle Policy in the Amazon Simple Storage Service Developer Guide.

For information about the permissions required to use the multipart upload API, see Multipart Upload API and Permissions in the Amazon Simple Storage Service Developer Guide.

For request signing, multipart upload is just a series of regular requests—you initiate a multipart upload, you send one or more requests to upload parts, and then you complete the multipart upload. You sign each request individually. There is nothing special about signing multipart upload requests. For more information about signing, see Authenticating Requests (AWS Signature Version 4) (p. 14).

Note

After you initiate a multipart upload and upload one or more parts, you must either complete or abort the multipart upload in order to stop getting charged for storage of the uploaded parts. Only after you either complete or abort a multipart upload will Amazon S3 free up the parts storage and stop charging you for the parts storage.

You can optionally request server-side encryption where Amazon S3 encrypts your data as it writes it to disks in its data centers and decrypts it for you when you access it. You have the options of providing your own encryption key, using AWS Key Management Service (KMS) encryption keys, or the Amazon S3-managed encryption keys. If you choose to provide your own encryption key, the request headers you provide in Upload Part (p. 454) and Upload Part - Copy (p. 459) requests must match the headers you used in the request to initiate the upload by using Initiate Multipart Upload (p. 438). For more information, see Protecting Data Using Server-Side Encryption in the Amazon Simple Storage Service Developer Guide.

Requests

Syntax

```
POST /ObjectName?uploads HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))
```

Request Parameters

This operation does not use request parameters.
## Request Headers

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>

</tr>
<tr>
<td></td>
<td>Valid Values: STANDARD</td>
<td>STANDARD_IA</td>
</tr>
<tr>
<td></td>
<td>Constraints: You cannot specify GLACIER as the storage class. To transition objects to the GLACIER storage class, you can use lifecycle configuration. For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/API/LifecycleConfiguration.html">Object Lifecycle Management</a> in the <em>Amazon Simple Storage Service Developer Guide</em>.</td>
<td></td>
</tr>
<tr>
<td>x-amz-website-redirect-location</td>
<td>If the bucket is configured as a website, redirect requests for this object to another object in the same bucket or to an external URL. Amazon S3 stores the value of this header in the object metadata. For information about object metadata, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/API/UsingMetadata.html">Object Key and Metadata</a>. In the following example, the request header sets the redirect to an object (anotherPage.html) in the same bucket: x-amz-website-redirect-location: /anotherPage.html</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>In the following example, the request header sets the object redirect to another website:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>x-amz-website-redirect-location: <a href="http://www.example.com/">http://www.example.com/</a></td>
<td></td>
</tr>
<tr>
<td></td>
<td>For more information about website hosting in Amazon S3, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/userguide/hosting-websites.html">Hosting Websites on Amazon S3</a> and <a href="https://docs.aws.amazon.com/AmazonS3/latest/userguide/hosting-websites.html">How to Configure Website Page Redirects</a> in the <em>Amazon Simple Storage Service Developer Guide</em>.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: The value must be prefixed by, &quot;/&quot;, &quot;http://&quot; or &quot;https://&quot;. The length of the value is limited to 2 K.</td>
<td></td>
</tr>
</tbody>
</table>

**Access Control List (ACL) Specific Request Headers**

Additionally, you can use the following access control-related headers with this operation. By default, all objects are private and only the owner has full access control. When adding a new object, you can grant permissions to individual AWS accounts or predefined groups defined by Amazon S3. These permissions are then added to the Access Control List (ACL) on the object. For more information, see [Access Control List (ACL) Overview](https://docs.aws.amazon.com/AmazonS3/latest/API/AccessControlList.html) in the *Amazon Simple Storage Service Developer Guide*. This operation enables you to grant access permissions using one of the following methods:

- **Specify canned ACL** – Amazon S3 supports a set of predefined ACLs, known as canned ACLs. Each canned ACL has a predefined set of grantees and permissions. For more information, see [Canned ACL](https://docs.aws.amazon.com/AmazonS3/latest/API/CannedACLs.html).
### x-amz-acl

The canned ACL to apply to the object.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-acl</td>
<td>The canned ACL to apply to the object.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: private</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid Values: private</td>
<td>public-read</td>
</tr>
</tbody>
</table>

- **Specify access permissions explicitly** – If you want to explicitly grant access permissions to specific AWS accounts or groups, you can use the following headers. Each of these headers maps to specific permissions Amazon S3 supports in an ACL. For more information, see Access Control List (ACL) Overview. In the header, you specify a list of grantees who get the specific permission.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-grant-read</td>
<td>Allows grantee to read the object data and its metadata.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: None</td>
<td></td>
</tr>
<tr>
<td>x-amz-grant-write</td>
<td>Not applicable.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: None</td>
<td></td>
</tr>
<tr>
<td>x-amz-grant-read-acp</td>
<td>Allows grantee to read the object ACL.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: None</td>
<td></td>
</tr>
<tr>
<td>x-amz-grant-write-acp</td>
<td>Allows grantee to write the ACL for the applicable object.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: None</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------</td>
</tr>
<tr>
<td>x-amz-grant-full-control</td>
<td>Allows grantee the READ, READ_ACP, and WRITE_ACP permissions on the object.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: None</td>
<td></td>
</tr>
</tbody>
</table>

You specify each grantee as a type=value pair, where the type can be one of the following:

- **emailAddress** – If the specified value is the email address of an AWS account.
- **id** – If the specified value is the canonical user ID of an AWS account.
- **uri** – If you are granting permission to a predefined group.

For example, the following `x-amz-grant-read` header grants read object data and its metadata permissions to the AWS accounts identified by their email addresses.

```
x-amz-grant-read: emailAddress="xyz@amazon.com", emailAddress="abc@amazon.com"
```

### Server-Side Encryption–Specific Request Headers

You can optionally request Amazon S3 to encrypt data at rest using server-side encryption. Server-side encryption is about data encryption at rest, that is, Amazon S3 encrypts your data as it writes it to disks in its data centers and decrypts it for you when you access it. Depending on whether you want to use AWS-managed encryption keys or provide your own encryption keys, you use the following headers:

- **Use encryption keys managed by AWS KMS or Amazon S3** – If you want AWS to manage keys used to encrypt data, you specify the following headers in the request.

  ![Table](https://example.com/table.png)

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-server-side-encryption</td>
<td>Specifies a server-side encryption algorithm to use when Amazon S3 creates an object.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid Value: aws:kms, AES256</td>
<td></td>
</tr>
<tr>
<td>x-amz-server-side-encryption-aws-kms-key-id</td>
<td>If the x-amz-server-side-encryption is present and has the value of aws:kms, this header specifies the ID of the AWS Key Management Service (KMS) master encryption key that was used for the object.</td>
<td>Yes, if the value of x-amz-server-side-encryption is aws:kms</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td>x-amz-server-side-encryption-context</td>
<td>If x-amz-server-side-encryption is present, and if its value is aws:kms, this header specifies the encryption context for the object. The value of this header is a base64-encoded UTF-8 string holding JSON with the encryption context key-value pairs.</td>
<td>No</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
<td>----------</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Note**

If you specify `x-amz-server-side-encryption:aws:kms`, but do not provide `x-amz-server-side-encryption-aws-kms-key-id`, the default AWS KMS key will be used to protect the data.

For more information on Server-Side Encryption with Amazon KMS-Managed Keys (SSE-KMS), see Protecting Data Using Server-Side Encryption with AWS KMS-Managed Keys in the Amazon Simple Storage Service Developer Guide.

- Use customer-provided encryption keys – If you want to manage your own encryption keys, you must provide all the following headers in the request.

**Name**

- **x-amz-server-side-encryption-customer-algorithm**
  - Specifies the algorithm to use to when encrypting the object.
  - Type: String
  - Default: None
  - Valid Value: AES256
  - Constraints: Must be accompanied by valid `x-amz-server-side-encryption-customer-key` and `x-amz-server-side-encryption-customer-key-MD5` headers.

- **x-amz-server-side-encryption-customer-key**
  - Specifies the customer-provided base64-encoded encryption key for Amazon S3 to use in encrypting data. This value is used to store the object and then is discarded; Amazon does not store the encryption key. The key must be appropriate for use with the algorithm specified in the `x-amz-server-side-encryption-customer-algorithm` header.
  - Type: String
  - Default: None
  - Constraints: Must be accompanied by valid `x-amz-server-side-encryption-customer-algorithm` and `x-amz-server-side-encryption-customer-key-MD5` headers.

- **x-amz-server-side-encryption-customer-key-MD5**
  - Specifies the base64-encoded 128-bit MD5 digest of the encryption key according to RFC 1321. Amazon S3 uses this header for message integrity check to ensure the encryption key was transmitted without error.
  - Type: String
  - Default: None
  - Constraints: Must be accompanied by valid `x-amz-server-side-encryption-customer-algorithm` and `x-amz-server-side-encryption-customer-key` headers.
For more information on Server-Side Encryption with Customer-Provided Encryption Keys (SSE-C), see Protecting Data Using Server-Side Encryption with Customer-Provided Encryption Keys (SSE-C) in the Amazon Simple Storage Service Developer Guide.

Request Elements

This operation does not use request elements.

Responses

Response Headers

This implementation of the operation can include the following response headers in addition to the response headers common to all responses. For more information, see Common Response Headers (p. 4).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-abort-date</td>
<td>If the bucket has a lifecycle rule configured with an action to abort incomplete multipart uploads and the prefix in the lifecycle rule matches the object name in the request, the response includes this header that indicates when the initiated multipart upload will become eligible for abort operation. For more information, see Aborting Incomplete Multipart Uploads Using a Bucket Lifecycle Policy in the Amazon Simple Storage Service Developer Guide. The response also includes the x-amz-abort-rule-id header that provides the ID of the lifecycle configuration rule that defines this action. Type: String</td>
</tr>
<tr>
<td>x-amz-abort-rule-id</td>
<td>This header is returned along with the x-amz-abort-date header. It identifies the applicable lifecycle configuration rule that defines the action to abort incomplete multipart uploads. Type: String</td>
</tr>
<tr>
<td>x-amz-server-side-encryption</td>
<td>If you specified server-side encryption either with an AWS KMS or Amazon S3-managed encryption key in your initiate multipart upload request, the response includes this header. It confirms the encryption algorithm that Amazon S3 used to encrypt the part you uploaded. Type: String</td>
</tr>
<tr>
<td>x-amz-server-side-encryption-aws-kms-key-id</td>
<td>If the x-amz-server-side-encryption is present and has the value of aws:kms, this header specifies the ID of the AWS Key Management Service (KMS) master encryption key that was used for the object. Type: String</td>
</tr>
<tr>
<td>x-amz-server-side-encryption-customer-algorithm</td>
<td>If server-side encryption with customer-provided encryption keys encryption was requested, the response will include this header confirming the encryption algorithm used. Type: String</td>
</tr>
</tbody>
</table>

Valid Values: AES256
### Name | Description
---|---
x-amz-server-side-encryption-customer-key-MD5 | If server-side encryption using customer-provided encryption key was requested, the response returns this header to provide roundtrip message integrity verification of the customer-provided encryption key. Type: String

### Response Elements

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>InitiateMultipartUploadResult</td>
<td>Container for response. Type: Container Children: Bucket, Key, UploadId Ancestors: None</td>
</tr>
<tr>
<td>Bucket</td>
<td>Name of the bucket to which the multipart upload was initiated. Type: string Ancestors: InitiateMultipartUploadResult</td>
</tr>
<tr>
<td>Key</td>
<td>Object key for which the multipart upload was initiated. Type: String Ancestors: InitiateMultipartUploadResult</td>
</tr>
<tr>
<td>UploadId</td>
<td>ID for the initiated multipart upload. Type: String Ancestors: InitiateMultipartUploadResult</td>
</tr>
</tbody>
</table>

### Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

### Examples

#### Sample Request

This operation initiates a multipart upload for the example-object object.

```
POST /example-object?uploads HTTP/1.1
Host: example-bucket.s3.amazonaws.com
Date: Mon, 1 Nov 2010 20:34:56 GMT
Authorization: authorization string
```
Sample Response

HTTP/1.1 200 OK
x-amz-id-2: Uuaq1LuByRx9e6j50nimru9p04ZVKnJ3Qz7/C1NPcfTWATrPFtTaOGg==
x-amz-request-id: 656c76696e677732072657175657374
Date: Mon, 1 Nov 2010 20:34:56 GMT
Content-Length: 197
Connection: keep-alive
Server: AmazonS3

<?xml version="1.0" encoding="UTF-8"?>
  <Bucket>example-bucket</Bucket>
  <Key>example-object</Key>
  <UploadId>VXBsb2FkIElEIGZvciA2aWWpbmcncyBteS1tb3ZpZS5tMnRzIHVwbG9hZA</UploadId>
</InitiateMultipartUploadResult>

Sample: Initiate multipart upload, using server-side encryption with customer-provided encryption keys

This example initiate multipart upload request specifies server-side encryption with customer-provided encryption keys by adding relevant headers.

POST /example-object?uploads HTTP/1.1
Host: example-bucket.s3.amazonaws.com
Authorization: authorization string
Date: Wed, 28 May 2014 19:34:57 +0000
x-amz-server-side-encryption-customer-key: g0ICfa3Dv4oJZzSSQJ1ZukLRFqtISWorC/8SEEXAMPLE
x-amz-server-side-encryption-customer-key-MD5: ZjQrne1X/iTkscbY2example
x-amz-server-side-encryption-customer-algorithm: AES256

In the response, Amazon S3 returns an UploadId. In addition, Amazon S3 returns the encryption algorithm and the MD5 digest of the encryption key you provided in the request.

HTTP/1.1 200 OK
x-amz-id-2: 36HRCaIGp57F1FvWvVRv3hNm9WoBGfEaCVHCTCt8QMf00qxdHanzUcqfXAbbFWD

• List Multipart Uploads (p. 196)
List Parts

Description

This operation lists the parts that have been uploaded for a specific multipart upload.

This operation must include the upload ID, which you obtain by sending the initiate multipart upload request (see Initiate Multipart Upload (p. 438)). This request returns a maximum of 1,000 uploaded parts. The default number of parts returned is 1,000 parts. You can restrict the number of parts returned by specifying the max-parts request parameter. If your multipart upload consists of more than 1,000 parts, the response returns an IsTruncated field with the value of true, and a NextPartNumberMarker element. In subsequent List Parts requests you can include the part-number-marker query string parameter and set its value to the NextPartNumberMarker field value from the previous response.

For more information on multipart uploads, see Uploading Objects Using Multipart Upload in the Amazon Simple Storage Service Developer Guide.

For information on permissions required to use the multipart upload API, see Multipart Upload API and Permissions in the Amazon Simple Storage Service Developer Guide.

Requests

Syntax

GET /ObjectName?uploadId=UploadId HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: Date
Authorization: authorization string

Request Parameters

This implementation of GET uses the parameters in the following table to return a subset of the objects in a bucket.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>encoding-type</td>
<td>Requests Amazon S3 to encode the response and specifies the encoding method to use.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>An object key can contain any Unicode character; however, XML 1.0 parser cannot parse some characters, such as characters with an ASCII value from 0 to 10. For characters that are not supported in XML 1.0, you can add this parameter to request that Amazon S3 encode the keys in the response.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid value: url</td>
<td></td>
</tr>
<tr>
<td>uploadId</td>
<td>Upload ID identifying the multipart upload whose parts are being listed.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
</tbody>
</table>
### Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default: None</td>
<td></td>
<td></td>
</tr>
<tr>
<td>max-parts</td>
<td>Sets the maximum number of parts to return in the response body.</td>
<td>No</td>
</tr>
<tr>
<td>Type: String</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Default: 1,000</td>
<td></td>
<td></td>
</tr>
<tr>
<td>part-number-marker</td>
<td>Specifies the part after which listing should begin. Only parts with</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>higher part numbers will be listed.</td>
<td></td>
</tr>
<tr>
<td>Type: String</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Default: None</td>
<td></td>
<td></td>

### Examples

#### Sample Request

Assume you have uploaded parts with sequential part numbers starting with 1. The following List Parts request specifies `max-parts` and `part-number-marker` query parameters. The request lists the first two parts that follow part number 1, that is, you will get parts 2 and 3 in the response. If more parts exist, the result is a truncated result and therefore the response will return an `IsTruncated` element with the value true. The response will also return the `NextPartNumberMarker` element with the value 3, which should be used for the value of the `part-number-marker` request query string parameter in the next List Parts request.

```plaintext
GET /example-object?
uploadId=XXBsb2FkIElEIGZvciBlbHZpbmcncyVcdS1tb3ZpZS5tMnRzEEEwbG9hZA&max-parts=2&part-
number-marker=1 HTTP/1.1
Host: example-bucket.s3.amazonaws.com
Date: Mon, 1 Nov 2010 20:34:56 GMT
Authorization: authorization string
```

#### Sample Response

The following is a sample response.

```plaintext
HTTP/1.1 200 OK
x-amz-id-2: Uuag1LuByRx9e6jSOnimru9p04ZVKnJ2Qz7/C1NFcfTWATRPfTaOFg==

Upload Part

Description

This operation uploads a part in a multipart upload.

**Note**
In this operation, you provide part data in your request. However, you have an option to specify your existing Amazon S3 object as a data source for the part you are uploading. To upload a part from an existing object, you use the Upload Part (Copy) operation. For more information, see [Upload Part - Copy](#).

You must initiate a multipart upload (see [Initiate Multipart Upload](#)) before you can upload any part. In response to your initiate request, Amazon S3 returns an upload ID, a unique identifier, that you must include in your upload part request.

Part numbers can be any number from 1 to 10,000, inclusive. A part number uniquely identifies a part and also defines its position within the object being created. If you upload a new part using the same part number that was used with a previous part, the previously uploaded part is overwritten. Each part must be at least 5 MB in size, except the last part. There is no size limit on the last part of your multipart upload.

To ensure that data is not corrupted when traversing the network, specify the `Content-MD5` header in the upload part request. Amazon S3 checks the part data against the provided MD5 value. If they do not match, Amazon S3 returns an error.

**Note**
After you initiate multipart upload and upload one or more parts, you must either complete or abort multipart upload in order to stop getting charged for storage of the uploaded parts. Only after you either complete or abort the multipart upload, Amazon S3 frees up the parts storage and stops charging you for it.

For more information on multipart uploads, go to [Multipart Upload Overview](#) in the *Amazon Simple Storage Service Developer Guide*.

For information on the permissions required to use the multipart upload API, go to [Multipart Upload API and Permissions](#) in the *Amazon Simple Storage Service Developer Guide*.

You can optionally request server-side encryption where Amazon S3 encrypts your data as it writes it to disks in its data centers and decrypts it for you when you access it. You have the option of providing your own encryption key, or you can use the AWS-managed encryption keys. If you choose to provide your own encryption key, the request headers you provide in the request must match the headers you used in the request to initiate the upload by using [Initiate Multipart Upload](#). For more information, go to [Using Server-Side Encryption](#) in the *Amazon Simple Storage Service Developer Guide*.

Requests

Syntax

```
PUT /ObjectName?partNumber=PartNumber&uploadId=UploadId HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: date
Content-Length: Size
Authorization: authorization string
```

API Version 2006-03-01

454
Request Parameters

This operation does not use request parameters.

Request Headers

This implementation of the operation can use the following request headers in addition to the request headers common to all operations. Request headers are limited to 8 KB in size. For more information, see Common Request Headers (p. 2).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content-Length</td>
<td>The size of the part, in bytes. For more information, go to <a href="http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.13">http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.13</a>.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: Integer</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Content-MD5</td>
<td>The base64-encoded 128-bit MD5 digest of the part data. This header can be used as a message integrity check to verify that the part data is the same data that was originally sent. Although it is optional, we recommend using the Content-MD5 mechanism as an end-to-end integrity check. For more information, see RFC 1864.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Expect</td>
<td>When your application uses 100-continue, it does not send the request body until it receives an acknowledgment. If the message is rejected based on the headers, the body of the message is not sent. For more information, go to RFC 2616.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid Values: 100-continue</td>
<td></td>
</tr>
</tbody>
</table>

Server-Side Encryption Specific Request Headers

If you requested server-side encryption using a customer-provided encryption key in your initiate multipart upload request, you must provide identical encryption information in each part upload using the following headers.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-server-side-encryption-customer-algorithm</td>
<td>Specifies the algorithm to use when encrypting the object.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid Value: AES256</td>
<td></td>
</tr>
</tbody>
</table>
### Responses

This operation does not use request elements.

#### Responses

##### Response Headers

This implementation of the operation can include the following response headers in addition to the response headers common to all responses. For more information, see Common Response Headers (p. 4).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-server-side-encryption</td>
<td>If you specified server-side encryption either with an AWS KMS or Amazon S3-managed encryption key in your initiate multipart upload request, the response includes this header. It confirms the encryption algorithm that Amazon S3 used to encrypt the object. Type: String</td>
</tr>
<tr>
<td>x-amz-server-side-encryption-aws:kms</td>
<td>If the x-amz-server-side-encryption is present and has the value of aws:kms, this header specifies the ID of the AWS Key Management Service (KMS) master encryption key that was used for the object.</td>
</tr>
</tbody>
</table>

---

---
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aws-kms-key-id</td>
<td>Type: String</td>
</tr>
<tr>
<td>x-amz-server-side-encryption-customer-algorithm</td>
<td>If server-side encryption with customer-provided encryption keys (SSE-C) encryption was requested, the response will include this header confirming the encryption algorithm used. Type: String Valid Values: AES256</td>
</tr>
<tr>
<td>x-amz-server-side-encryption-customer-key-MD5</td>
<td>If SSE-C encryption was requested, the response includes this header to provide roundtrip message integrity verification of the customer-provided encryption key. Type: String</td>
</tr>
</tbody>
</table>

**Response Elements**

This operation does not use response elements.

**Special Errors**

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
<th>HTTP Status Code</th>
<th>SOAP Fault Code Prefix</th>
</tr>
</thead>
<tbody>
<tr>
<td>NoSuchUpload</td>
<td>The specified multipart upload does not exist. The upload ID might be invalid, or the multipart upload might have been aborted or completed.</td>
<td>404 Not Found</td>
<td>Client</td>
</tr>
</tbody>
</table>

For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

**Examples**

**Sample Request**

The following PUT request uploads a part (part number 1) in a multipart upload. The request includes the upload ID that you get in response to your Initiate Multipart Upload request.

```
PUT /my-movie.m2ts? partNumber=1&uploadId=VCVsb2FkIElEIGZvciBlbZZpbmcncy8teS1tb3ZpZS5tMnRzIHVwbG9hZR HTTP/1.1
Host: example-bucket.s3.amazonaws.com
Date: Mon, 1 Nov 2010 20:34:56 GMT
Content-Length: 10485760
Content-MD5: pUNXr/BjKK5ZGvaRrr0A==
Authorization: authorization string

***part data omitted***
```

**Sample Response**

The response includes the ETag header. You need to retain this value for use when you send the Complete Multipart Upload request.
Sample: Upload a part with an encryption key in the request for server-side encryption

If you initiated a multipart upload, see Sample: Initiate multipart upload, using server-side encryption with customer-provided encryption keys (p. 446), with a request to save an object using server-side encryption with a customer-provided encryption key, each part upload must also include the same set of encryption-specific headers as shown in the following example request.

```
PUT /example-object?
  partNumber=1&uploadId=EXAMPLEJZ6e0YupT2h66iePQQc9lEByDUy4RTpMeoSMLPRp8Z5oluefeSRonpnWnKKG35tI2LB9VDPi

HTTP/1.1 100 Continue
```

In the response, Amazon S3 returns encryption-specific headers providing the encryption algorithm used and MD5 digest of the encryption key you provided in the request.

```
HTTP/1.1 100 Continue
```

- List Parts (p. 448)
- List Multipart Uploads (p. 196)
Upload Part - Copy

Description

Uploads a part by copying data from an existing object as data source. You specify the data source by adding the request header `x-amz-copy-source` in your request and a byte range by adding the request header `x-amz-copy-source-range` in your request.

The minimum allowable part size for a multipart upload is 5 MB. For more information about multipart upload limits, go to Quick Facts in the Amazon Simple Storage Service Developer Guide.

Note

Instead of using an existing object as part data, you might use the Upload Part operation and provide data in your request. For more information, see Upload Part (p. 454).

You must initiate a multipart upload before you can upload any part. In response to your initiate request, Amazon S3 returns a unique identifier, the upload ID, that you must include in your upload part request.

For more information on using the upload part - copy operation, see the following topics:

- For conceptual information on multipart uploads, go to Uploading Objects Using Multipart Upload in the Amazon Simple Storage Service Developer Guide.
- For information on permissions required to use the multipart upload API, go to Multipart Upload API and Permissions in the Amazon Simple Storage Service Developer Guide.
- For information about copying objects using a single atomic operation vs. the multipart upload, go to Operations on Objects in the Amazon Simple Storage Service Developer Guide.
- For information about using server-side encryption with customer-provided encryption keys with the upload part - copy operation, see PUT Object - Copy (p. 391) and Upload Part (p. 454).

Requests

Syntax

```
PUT /ObjectName?partNumber=PartNumber&uploadId=UploadId HTTP/1.1
Host: BucketName.s3.amazonaws.com
x-amz-copy-source: /source_bucket/sourceObject
x-amz-copy-source-range:bytes=first-last
x-amz-copy-source-if-match: etag
x-amz-copy-source-if-none-match: etag
x-amz-copy-source-if-unmodified-since: time_stamp
x-amz-copy-source-if-modified-since: time_stamp
Date: date
Authorization: authorization string
```

Request Parameters

This operation does not use request parameters.

Request Headers

This implementation of the operation can use the following request headers in addition to the request headers common to all operations. Request headers are limited to 8 KB in size. For more information, see Common Request Headers (p. 2).
### Name Description Required

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-copy-source</td>
<td>The name of the source bucket and the source object key name separated by a slash ('/').</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>x-amz-copy-source-range</td>
<td>The range of bytes to copy from the source object. The range value must use the form bytes=first-last, where the first and last are the zero-based byte offsets to copy. For example, bytes=0–9 indicates that you want to copy the first ten bytes of the source.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>This request header is not required when copying an entire source object.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: Integer</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

The following conditional headers are based on the object that the x-amz-copy-source header specifies.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-copy-source-if-match</td>
<td>Perform a copy if the source object entity tag (ETag) matches the specified value. If the value does not match, Amazon S3 returns an HTTP status code 412 precondition failed error.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>See Consideration 1 after the table.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>x-amz-copy-source-if-none-match</td>
<td>Perform a copy if the source object entity tag (ETag) is different than the value specified using this header. If the values match, Amazon S3 returns an HTTP status code 412 precondition failed error.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>See Consideration 2 after the table.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>x-amz-copy-source-if-unmodified-since</td>
<td>Perform a copy if the source object is not modified after the time specified using this header. If the source object is modified, Amazon S3 returns an HTTP status code 412 precondition failed error.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>See Consideration 1 after the table.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
</tbody>
</table>
**Name** | **Description** | **Required**
---|---|---
|x-amz-copy-source-if-modified-since| Perform a copy if the source object is modified after the time specified using this header. If the source object is not modified, Amazon S3 returns an HTTP status code 412 *precondition failed* error. | No
| | See Consideration 2 after the table. | |
| | Type: String | |
| | Default: None | |

Note the following additional considerations about the preceding request headers:

- **Consideration 1** – If both of the `x-amz-copy-source-if-match` and `x-amz-copy-source-if-unmodified-since` headers are present in the request as follows:
  
  x-amz-copy-source-if-match condition evaluates to true, and;
  
  x-amz-copy-source-if-unmodified-since condition evaluates to false;
  
  then, S3 returns `200 OK` and copies the data.

- **Consideration 2** – If both of the `x-amz-copy-source-if-none-match` and `x-amz-copy-source-if-modified-since` headers are present in the request as follows:
  
  x-amz-copy-source-if-none-match condition evaluates to false, and;
  
  x-amz-copy-source-if-modified-since condition evaluates to true;
  
  then, S3 returns `412 Precondition Failed` response code.

**Server-Side Encryption Specific Request Headers**

If you requested server-side encryption using a customer-provided encryption key in your initiate multipart upload request, you must provide identical encryption information in each part upload using the following headers.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-server-side-encryption-customer-algorithm</td>
<td>Specifies the algorithm to use to when encrypting the object.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid Value: AES256</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: Must be accompanied by a valid x-amz-server-side-encryption-customer-key and x-amz-server-side-encryption-customer-key-MD5 headers.</td>
<td></td>
</tr>
</tbody>
</table>
### Requests

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-server-side-encryption-customer-key</td>
<td>Specifies the customer provided base64-encoded encryption key for Amazon S3 to use in encrypting data. This must be the same encryption key specified in the initiate multipart upload request. Type: String Default: None Constraints: Must be accompanied by a valid x-amz-server-side-encryption-customer-algorithm and x-amz-server-side-encryption-customer-key-MD5 headers.</td>
<td>Yes</td>
</tr>
<tr>
<td>x-amz-server-side-encryption-customer-key-MD5</td>
<td>Specifies the base64-encoded 128-bit MD5 digest of the encryption key according to RFC 1321. Amazon S3 uses this header as a message integrity check to ensure the encryption key was transmitted without error. Type: String Default: None Constraints: Must be accompanied by a valid x-amz-server-side-encryption-customer-algorithm and x-amz-server-side-encryption-customer-key headers.</td>
<td>Yes</td>
</tr>
</tbody>
</table>

If the source object is encrypted using server-side encryption with a customer-provided encryption key, you must use the following headers providing encryption information so that Amazon S3 can decrypt the object for copying.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-copy-source-server-side-encryption-customer-algorithm</td>
<td>Specifies algorithm to use when decrypting the source object. Type: String Default: None Valid Value: AES256 Constraints: Must be accompanied by a valid x-amz-copy-source-server-side-encryption-customer-key and x-amz-copy-source-server-side-encryption-customer-key-MD5 headers.</td>
<td>Yes</td>
</tr>
<tr>
<td>x-amz-copy-source-server-side-encryption-customer-key</td>
<td>Specifies the customer provided base-64 encoded encryption key for Amazon S3 to use to decrypt the source object. The encryption key provided in this header must be one that was used when the source object was created. Type: String Default: None Constraints: Must be accompanied by a valid x-amz-copy-source-server-side-encryption-customer-algorithm</td>
<td>Yes</td>
</tr>
</tbody>
</table>
# Request Elements

This operation does not use request elements.

## Versioning

If your bucket has versioning enabled, you could have multiple versions of the same object. By default, `x-amz-copy-source` identifies the current version of the object to copy. If the current version is a delete marker and you don't specify a versionId in the `x-amz-copy-source`, Amazon S3 returns a 404 error, because the object does not exist. If you specify versionId in the `x-amz-copy-source` and the versionId is a delete marker, Amazon S3 returns an HTTP 400 error, because you are not allowed to specify a delete marker as a version for the `x-amz-copy-source`.

You can optionally specify a specific version of the source object to copy by adding the `versionId` subresource as shown in the following example:

```
x-amz-copy-source: /bucket/object?versionId=version id
```

## Responses

### Response Headers

This implementation of the operation can include the following headers in addition to the response headers common to all responses. For more information, see Common Response Headers (p. 4).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amz-copy-source-version-id</td>
<td>The version of the source object that was copied, if you have enabled versioning on the source bucket. Type: String</td>
</tr>
<tr>
<td>x-amz-server-side-encryption</td>
<td>If you specified server-side encryption either with an AWS KMS or Amazon S3-managed encryption key in your initiate multipart</td>
</tr>
</tbody>
</table>
### Name | Description
--- | ---
Upload Request, the response includes this header. It confirms the encryption algorithm that Amazon S3 used to encrypt the object.  
Type: String  |  
`x-amz-server-side-encryption-aws-kms-key-id`  | If the `x-amz-server-side-encryption` is present and has the value of `aws:kms`, this header specifies the ID of the AWS Key Management Service (KMS) master encryption key that was used for the object.  
Type: String  |  
`x-amz-server-side-encryption-customer-algorithm`  | If server-side encryption with customer-provided encryption keys encryption was requested, the response will include this header confirming the encryption algorithm used.  
Type: String  |  
Valid Values: AES256  
`x-amz-server-side-encryption-customer-key-MD5`  | If server-side encryption with customer-provided encryption keys encryption was requested, the response includes this header to provide roundtrip message integrity verification of the customer-provided encryption key.  
Type: String  |

### Response Elements

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| CopyPartResult | Container for all response elements.  
Type: Container  
Ancestor: None  |  
ETag | Returns the ETag of the new part.  
Type: String  
Ancestor: CopyPartResult  |  
LastModified | Returns the date the part was last modified.  
Type: String  
Ancestor: CopyPartResult  |

**Important**  
Part boundaries are factored into ETag calculations, so if the part boundary on the source is different than on the destination, then the ETag data will not match between the two. However, data integrity checks are performed with each copy to ensure that the data written to the destination matches the data at the source.
Special Errors

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
<th>HTTP Status Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>NoSuchUpload</td>
<td>The specified multipart upload does not exist. The upload ID might be invalid, or the multipart upload might have been aborted or completed.</td>
<td>404 Not Found</td>
</tr>
<tr>
<td>InvalidRequest</td>
<td>The specified copy source is not supported as a byte-range copy source.</td>
<td>400 Bad Request</td>
</tr>
</tbody>
</table>

For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

Examples

As the following examples illustrate, when a request succeeds, Amazon S3 returns `<CopyPartResult>` in the body. If you included `versionId` in the request, Amazon S3 returns the version ID in the `x-amz-copy-source-version-id` response header.

Sample Request

The following PUT request uploads a part (part number 2) in a multipart upload. The request specifies a byte range from an existing object as the source of this upload. The request includes the upload ID that you get in response to your Initiate Multipart Upload request.

```plaintext
PUT /newobject?partNumber=2&uploadId=VCVsb2FkIElEIGZvciBlbZZpbmcncyBteS1tb3ZpZS5tMnRzIHVwbG9hZR HTTP/1.1
Host: target-bucket.s3.amazonaws.com
Date: Mon, 11 Apr 2011 20:34:56 GMT
x-amz-copy-source: /source-bucket/sourceobject
x-amz-copy-source-range: bytes=500-6291456
Authorization: authorization string
```

Sample Response

The response includes the ETag value. You need to retain this value to use when you send the Complete Multipart Upload request.

```plaintext
HTTP/1.1 200 OK
x-amz-id-2: Vvag1LuByRx9e6j5Onimru9pO4ZVKnJ3Q27/C1NpcfTWAtpfTaOGf==
x-amz-request-id: 656c76696e726773207657175657374
Date: Mon, 11 Apr 2011 20:34:56 GMT
Server: AmazonS3

<CopyPartResult>
  <LastModified>2009-10-28T22:32:00</LastModified>
  <ETag>"9b2cf535f27731c974343645a3985328"</ETag>
</CopyPartResult>
```

Sample Request

The following PUT request uploads a part (part number 2) in a multipart upload. The request does not specify the optional byte range header, but requests the entire source object copy as part 2. The request includes the upload ID that you got in response to your Initiate Multipart Upload request.
The response structure is similar to the one specified in the preceding example.

**Sample Request**

The following PUT request uploads a part (part number 2) in a multipart upload. The request specifies a specific version of the source object to copy by adding the `versionId` subresource. The byte range requests 6 MB of data, starting with byte 500, as the part to be uploaded.

```
PUT /newobject?
partNumber=2&uploadId=VCVs GUeIGZvcI1bZzpbmcncyBySv3Stb3ZpZS5tMnRzIHvWbGhZR HTTP/1.1
Host: target-bucket.s3.amazonaws.com
Date:  Mon, 11 Apr 2011 20:34:56 GMT
x-amz-copy-source: /source-bucket/sourceobject
Authorization: authorization string
```

**Sample Response**

The response includes the ETag value. You need to retain this value to use when you send the Complete Multipart Upload request.

```
HTTP/1.1 200 OK
x-amz-id-2: Vvag1LuByRx9e6jS0nimru9pO4ZVKnJ3Qz7/C1NPcfTWAtRPfTaOFg==
x-amz-request-id: 65c676696e672773207265715657374
x-amz-copy-source-version-id: 3/L4kqtJ1cpXroDTdmJ+rmSpX3d1brHY
+MTRCxf3vJVBH40Nrr8X8dgRQPbUMLuO
x-amz-copy-source-range:bytes=500-6291456
Date:  Mon, 11 Apr 2011 20:34:56 GMT
Server: AmazonS3

<CopyPartResult>
  <LastModified>2009-10-28T22:32:00</LastModified>
  <ETag>"9b20cf535f27731c974343645a3985328"</ETag>
</CopyPartResult>
```

# Amazon S3 Resources

Following is a table that lists related resources that you'll find useful as you work with this service.

<table>
<thead>
<tr>
<th>Resource</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amazon Simple Storage Service Getting Started Guide</td>
<td>The getting started guide provides a quick tutorial of the service based on a simple use case.</td>
</tr>
<tr>
<td>Amazon Simple Storage Service Developer Guide</td>
<td>The developer guide describes how to accomplish tasks using Amazon S3 operations.</td>
</tr>
<tr>
<td>Amazon S3 Technical FAQ</td>
<td>The FAQ covers the top 20 questions developers have asked about this product.</td>
</tr>
<tr>
<td>Amazon S3 Release Notes</td>
<td>The Release Notes give a high-level overview of the current release. They specifically note any new features, corrections, and known issues.</td>
</tr>
<tr>
<td>Tools for Amazon Web Services</td>
<td>A central starting point to find documentation, code samples, release notes, and other information to help you build innovative applications with AWS SDKs and tools.</td>
</tr>
<tr>
<td>AWS Management Console</td>
<td>The console allows you to perform most of the functions of Amazon S3 without programming.</td>
</tr>
<tr>
<td>Discussion Forums</td>
<td>A community-based forum for developers to discuss technical questions related to Amazon Web Services.</td>
</tr>
<tr>
<td>AWS Support Center</td>
<td>The home page for AWS Technical Support, including access to our Developer Forums, Technical FAQs, Service Status page, and Premium Support.</td>
</tr>
<tr>
<td>AWS Premium Support</td>
<td>The primary web page for information about AWS Premium Support, a one-on-one, fast-response support channel to help you build and run applications on AWS Infrastructure Services.</td>
</tr>
<tr>
<td>Amazon S3 product information</td>
<td>The primary web page for information about Amazon S3.</td>
</tr>
<tr>
<td>Contact Us</td>
<td>A central contact point for inquiries concerning AWS billing, account, events, abuse, etc.</td>

# Document History

The following table describes the important changes to the documentation since the last release of the *Amazon Simple Storage Service API Reference*.

- **API version:** 2006-03-01
- **Latest documentation update:** December 18, 2017

<table>
<thead>
<tr>
<th>Change</th>
<th>Description</th>
<th>Release Date</th>
</tr>
</thead>
</table>
| EU (Paris) Region | Amazon S3 is now available in the EU (Paris) Region. For more information about Amazon S3 regions and endpoints, see *Regions and Endpoints* in the *AWS General Reference*.
   | In this release |
| China (Ningxia) Region | Amazon S3 is now available in the China (Ningxia) Region. For more information about Amazon S3 regions and endpoints, see *Regions and Endpoints* in the *AWS General Reference*.
   | December 11, 2017 |
| Querying archives with SQL | Amazon S3 now supports querying Amazon Glacier data archives with SQL. For more information, see *Querying Archived Objects* in the *Amazon Simple Storage Service Developer Guide*.
   The following API changed:
   - POST Object restore (p. 362) |
| SELECT Object Content (Preview) | Amazon S3 now supports the SELECT Object Content functionality as part of a Preview program. This feature retrieves object content based on an SQL expression.
   The following API has been added:
   - SELECT Object Content (Preview) (p. 417) |
| Support for ORC-formatted Amazon S3 inventory files | Amazon S3 now supports the Apache optimized row columnar (ORC) format in addition to comma-separated values (CSV) file format for inventory output files. For more information, see *Amazon S3 Inventory* in the *Amazon Simple Storage Service Developer Guide*.
   The following APIs are updated accordingly:
   - GET Bucket Inventory (p. 126)
   - PUT Bucket inventory (p. 237) |
| Default encryption for S3 buckets | Amazon S3 default encryption provides a way to set the default encryption behavior for an S3 bucket. You can set default encryption on a bucket so that all objects are encrypted when they are stored in the bucket. The objects are encrypted using server-side encryption with either Amazon S3-managed keys (SSE-S3) or AWS KMS-managed keys (SSE-KMS). For more information, see *Amazon S3 Default Encryption* |

</tbody>
</table>
| Object tagging support | Amazon S3 now supports object tagging. The following new API operations support object tagging:  
  - PUT Object tagging (p. 414)  
  - GET Object tagging (p. 333)  
  - DELETE Object tagging (p. 315) | November 29, 2016 |
|  | In addition, other API operations are updated to support object tagging. For more information, see Object Tagging in the Amazon Simple Storage Service Developer Guide. |  |
| S3 lifecycle now supports object tag based filter | Amazon S3 now supports tag-based filtering in lifecycle configuration. You can now specify a lifecycle rule, in which you can specify a key prefix, one or more object tags, or a combination of both, to select a subset of objects to which the lifecycle rule applies. For more information, see Object Lifecycle Management in the Amazon Simple Storage Service Developer Guide.  
Amazon S3 now supports Expedited and Bulk data retrievals in addition to Standard retrievals when restoring objects archived to Amazon Glacier. | November 29, 2016 |
| CloudWatch request metrics for buckets | Amazon S3 now supports CloudWatch metrics for requests made on buckets. The following new API operations support configuring request metrics:  
  - DELETE Bucket metrics (p. 78)  
  - GET Bucket metrics (p. 144)  
  - PUT Bucket metrics (p. 260)  
|  | For more information, see Monitoring Metrics with Amazon CloudWatch in the Amazon Simple Storage Service Developer Guide. |  |
| Amazon S3 Inventory | Amazon S3 now supports storage inventory. Amazon S3 inventory provides a flat-file output of your objects and their corresponding metadata on a daily or weekly basis for an S3 bucket or a shared prefix (that is, objects that have names that begin with a common string).  
The following new API operations are for storage inventory:  
  - DELETE Bucket inventory (p. 75)  
  - GET Bucket Inventory (p. 126)  
  - PUT Bucket inventory (p. 237)  
  - List Bucket Inventory Configurations (p. 188) | November 29, 2016 |
<p>|  | For more information, see Amazon S3 Storage Inventory in the Amazon Simple Storage Service Developer Guide. |  |</p>
<table>
<thead>
<tr>
<th>Change</th>

<th>Release Date</th>
</tr>
</thead>
</table>
| Amazon S3 Analytics – Storage Class Analysis | The new Amazon S3 analytics – storage class analysis feature observes data access patterns to help you determine when to transition less frequently accessed STANDARD storage to the STANDARD_IA (IA, for infrequent access) storage class. After storage class analysis observes the infrequent access patterns of a filtered set of data over a period of time, you can use the analysis results to help you improve your lifecycle policies. This feature also includes a detailed daily analysis of your storage usage at the specified bucket, prefix, or tag level that you can export to a S3 bucket. The following new API operations are for storage class analysis:  
- DELETE Bucket analytics (p. 69)  
- GET Bucket analytics (p. 113)  
- PUT Bucket analytics (p. 221)  
- List Bucket Analytics Configurations (p. 184)  
For more information, see Amazon S3 Analytics – Storage Class Analysis in the Amazon Simple Storage Service Developer Guide. | November 29, 2016 |
<p>| Added Amazon Glacier retrieval options to POST Object restore (p. 362) | Amazon S3 now supports Expedited and Bulk data retrievals in addition to Standard retrievals when restoring objects archived to Amazon Glacier. For more information, see Restoring Archived Objects in the Amazon Simple Storage Service Developer Guide. | November 21, 2016 |
| US East (Ohio) Region | Amazon S3 is now available in the US East (Ohio) Region. For more information about Amazon S3 regions and endpoints, see Regions and Endpoints in the AWS General Reference. | October 17, 2016 |
| Asia Pacific (Mumbai) region | Amazon S3 is now available in the Asia Pacific (Mumbai) region. For more information about Amazon S3 regions and endpoints, see Regions and Endpoints in the AWS General Reference. | June 27, 2016 |
| GET Bucket (List Objects) API revised | The GET Bucket (List Objects) API has been revised. We recommend that you use the new version, GET Bucket (List Objects) version 2. For more information, see GET Bucket (List Objects) Version 2 (p. 89). | May 4, 2016 |</p>

<tr>
<td></td>
<td>The following new API operations support Transfer Acceleration: GET Bucket accelerate (p. 107) and PUT Bucket accelerate (p. 211).</td>
<td></td>
</tr>
<tr>
<td>Lifecycle support to remove expired object delete marker</td>
<td>Lifecycle configuration expiration action now allows you to direct Amazon S3 to remove expired object delete markers in versioned bucket. For more information, see Elements to Describe Lifecycle Actions in the Amazon Simple Storage Service Developer Guide.</td>
<td>March 16, 2016</td>
</tr>
<tr>
<td>Bucket lifecycle configuration now supports the action to abort incomplete multipart uploads</td>
<td>Bucket lifecycle configuration now supports the AbortIncompleteMultipartUpload action that you can use to direct Amazon S3 to abort multipart uploads that don't complete within a specified number of days after being initiated. When a multipart upload becomes eligible for an abort operation, Amazon S3 deletes any uploaded parts and aborts the multipart upload.</td>
<td>March 16, 2016</td>
</tr>
<tr>
<td></td>
<td>The following API operations have been updated to support the new action:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• PUT Bucket lifecycle (p. 244) – The XML configuration now allows you to specify the AbortIncompleteMultipartUpload action in a lifecycle configuration rule.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• List Parts (p. 448) and Initiate Multipart Upload (p. 438) – Both of these API operations now return two additional response headers (x-amz-abort-date, and x-amz-abort-rule-id) if the bucket has a lifecycle rule that specifies the AbortIncompleteMultipartUpload action. These headers in the response indicate when the initiated multipart upload will become eligible for an abort operation and which lifecycle rule is applicable.</td>
<td></td>

<tr>
<td>Amazon S3 Signature Version 4 now supports unsigned payloads</td>
<td>Amazon S3 Signature Version 4 now supports unsigned payloads when authenticating requests using the Authorization header. Because you don't sign the payload, it does not provide the same security that comes with payload signing, but it provides similar performance characteristics as signature version 2. For more information, see Signature Calculations for the Authorization Header: Transferring Payload in a Single Chunk (AWS Signature Version 4) (p. 18).</td>
<td>January 15, 2016</td>
</tr>
<tr>
<td>Asia Pacific (Seoul) region</td>
<td>Amazon S3 is now available in the Asia Pacific (Seoul) region. For more information about Amazon S3 regions and endpoints, see Regions and Endpoints in the AWS General Reference.</td>
<td>January 6, 2016</td>
</tr>
<tr>
<td>Renamed the US Standard region</td>
<td>Changed the region name string from US Standard to US East (N. Virginia). This is only a region name update, there is no change in the functionality.</td>
<td>December 11, 2015</td>
</tr>
<tr>
<td>New storage class</td>
<td>Amazon S3 now offers a new storage class, STANDARD_IA (IA, for infrequent access) for storing objects. This storage class is optimized for long-lived and less frequently accessed data. For more information, see Storage Classes in the Amazon Simple Storage Service Developer Guide. Lifecycle configuration feature updates now allow you to transition objects to the STANDARD_IA storage class. For more information, see Object Lifecycle Management in the Amazon Simple Storage Service Developer Guide. Previously, the cross-region replication feature used the storage class of the source object for object replicas. Now, when you configure cross-region replication you can specify a storage class for the object replica created in the destination bucket. For more information, see Cross-Region Replication in the Amazon Simple Storage Service Developer Guide.</td>
<td>September 16, 2015</td>
</tr>
<tr>
<td>Event notifications</td>
<td>Amazon S3 event notifications have been updated to add notifications when objects are deleted and to add filtering on object names with prefix and suffix matching. For the relevant API operations, see PUT Bucket notification (p. 265), and GET Bucket notification (p. 148). For more information, see Configuring Amazon S3 Event Notifications in the Amazon Simple Storage Service Developer Guide.</td>
<td>July 28, 2015</td>
</tr>
<tr>
<td>Cross-region replication</td>
<td>Amazon S3 now supports cross-region replication. Cross-region replication is the automatic, asynchronous copying of objects across buckets in different AWS regions. For the relevant API operations, see PUT Bucket replication (p. 275), GET Bucket replication (p. 167) and DELETE Bucket replication (p. 83). For more information, see Enabling Cross-Region Replication in the Amazon Simple Storage Service Developer Guide.</td>

<tbody>
<tr>
<td>Server-side encryption with customer-provided encryption keys</td>
<td>Amazon S3 now supports server-side encryption using customer-provided encryption keys (SSE-C). Server-side encryption enables you to request Amazon S3 to encrypt your data at rest. When using SSE-C, Amazon S3 encrypts your objects with the custom encryption keys that you provide. Since Amazon S3 performs the encryption for you, you get the benefits of using your own encryption keys without the cost of writing or executing your own encryption code.</td>
<td>June 12, 2014</td>
</tr>
<tr>
<td>Lifecycle support for versioning</td>
<td>Prior to this release lifecycle configuration was supported only on nonversioned buckets. Now you can configure lifecycle on both the nonversioned and versioning-enabled buckets.</td>
<td>May 20, 2014</td>
</tr>
<tr>
<td>Amazon S3 now supports Signature Version 4</td>
<td>Amazon S3 now supports Signature Version 4 (SigV4) in all regions, the latest specification for how to sign and authenticate AWS requests.</td>
<td>January 30, 2014</td>
</tr>
</tbody>
</table>

For more information about SSE-C, go to Server-Side Encryption (Using Customer-Provided Encryption Keys) in the Amazon Simple Storage Service Developer Guide.

The following Amazon S3 REST API operations support headers related to SSE-C.

- GET Object (p. 317)
- HEAD Object (p. 338)
- PUT Object (p. 377)
- PUT Object - Copy (p. 391)
- POST Object (p. 350)
- Initiate Multipart Upload (p. 438)
- Upload Part (p. 454)
- Upload Part - Copy (p. 459)
<table>
<thead>
<tr>

<tr>
<td>Amazon S3 list actions now support encoding-type request parameter</td>
<td>The following Amazon S3 list actions now support encoding-type optional request parameter. &lt;br&gt;<strong>GET Bucket (List Objects) Version 1 (p. 99)</strong>&lt;br&gt;<strong>GET Bucket Object versions (p. 153)</strong>&lt;br&gt;<strong>List Multipart Uploads (p. 196)</strong>&lt;br&gt;<strong>List Parts (p. 448)</strong>&lt;br&gt;An object key can contain any Unicode character; however, the XML 1.0 parser cannot parse some characters, such as characters with an ASCII value from 0 to 10. For characters that are not supported in XML 1.0, you can add this parameter to request that Amazon S3 encode the keys in the response.</td>
<td>November 1, 2013</td>
</tr>
<tr>
<td>SOAP Support Over HTTP Deprecated</td>
<td>SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.</td>
<td>September 19, 2013</td>
</tr>
<tr>
<td>Root domain support for website hosting</td>
<td>Amazon S3 now supports hosting static websites at the root domain. Visitors to your website can access your site from their browser without specifying &quot;www&quot; in the web address (e.g., &quot;example.com&quot;). Many customers already host static websites on Amazon S3 that are accessible from a &quot;www&quot; subdomain (e.g., &quot;www.example.com&quot;). Previously, to support root domain access, you needed to run your own web server to proxy root domain requests from browsers to your website on Amazon S3. Running a web server to proxy requests introduces additional costs, operational burden, and another potential point of failure. Now, you can take advantage of the high availability and durability of Amazon S3 for both &quot;www&quot; and root domain addresses. &lt;br&gt;For an example walkthrough, go to Example: Setting Up a Static Website Using a Custom Domain in the Amazon Simple Storage Service Developer Guide. For conceptual information, go to Hosting Static Websites on Amazon S3 in the Amazon Simple Storage Service Developer Guide.</td>

<td>--------------</td>
</tr>
<tr>
<td>Support for Archiving Data to Amazon Glacier</td>
<td>Amazon S3 now supports a storage option that enables you to utilize Amazon Glacier’s low-cost storage service for data archival. To archive objects, you define archival rules identifying objects and a timeline when you want Amazon S3 to archive these objects to Amazon Glacier. You can easily set the rules on a bucket using the Amazon S3 console or programmatically using the Amazon S3 API or AWS SDKs. To support data archival rules, Amazon S3 lifecycle management API has been updated. For more information, see PUT Bucket lifecycle (p. 244). After you archive objects, you must first restore a copy before you can access the data. Amazon S3 offers a new API for you to initiate a restore. For more information, see POST Object restore (p. 362). For conceptual information, go to Object Lifecycle Management in the Amazon Simple Storage Service Developer Guide.</td>
<td>November 13, 2012</td>
</tr>
<tr>
<td>Support for Website Page Redirects</td>
<td>For a bucket that is configured as a website, Amazon S3 now supports redirecting a request for an object to another object in the same bucket or to an external URL. You can configure redirect by adding the x-amz-website-redirect-location metadata to the object. The object upload API operations PUT Object (p. 377), Initiate Multipart Upload (p. 438), and POST Object (p. 350) allow you to configure the x-amz-website-redirect-location object metadata. For conceptual information, go to How to Configure Website Page Redirects in the Amazon Simple Storage Service Developer Guide.</td>
<td>October 4, 2012</td>
</tr>
<tr>
<td>Cross-Origin Resource Sharing (CORS) support</td>
<td>Amazon S3 now supports Cross-Origin Resource Sharing (CORS). CORS defines a way in which client web applications that are loaded in one domain can interact with or access resources in a different domain. With CORS support in Amazon S3, you can build rich client-side web applications on top of Amazon S3 and selectively allow cross-domain access to your Amazon S3 resources. For more information, see Enabling Cross-Origin Resource Sharing in the Amazon Simple Storage Service Developer Guide.</td>
<td>August 31, 2012</td>
</tr>
<tr>
<td>Cost Allocation Tagging support</td>
<td>Amazon S3 now supports cost allocation tagging, which allows you to label S3 buckets so you can more easily track their cost against projects or other criteria. For more information, see Cost Allocation Tagging in the Amazon Simple Storage Service Developer Guide.</td>
<td>August 21, 2012</td>

<td>Description</td>
<td>Release Date</td>
</tr>
<tr>
<td>--------</td>
<td>-------------</td>
<td>--------------</td>
</tr>
</tbody>
</table>
| Support for hosting static websites in Amazon S3 | Amazon S3 introduces enhanced support for hosting static websites. This includes support for index documents and custom error documents. When using these features, requests to the root of your bucket or a subfolder (e.g., http://mywebsite.com/subfolder) returns your index document instead of the list of objects in your bucket. If an error is encountered, Amazon S3 returns your custom error message instead of an Amazon S3 error message. For API information to configure your bucket as a website, see the following sections:  
- PUT Bucket website (p. 292)  
- GET Bucket website (p. 180)  
- DELETE Bucket website (p. 87) | February 17, 2011 |
<p>| Response Header API Support | The GET Object REST API now allows you to change the response headers of the REST GET Object request for each request. That is, you can alter object metadata in the response, without altering the object itself. For more information, see GET Object (p. 317). | January 14, 2011 |
| Large Object Support | Amazon S3 has increased the maximum size of an object you can store in an S3 bucket from 5 GB to 5 TB. If you are using the REST API you can upload objects of up to 5 GB size in a single PUT operation. For larger objects, you must use the Multipart Upload REST API to upload objects in parts. For conceptual information, go to Uploading Objects Using Multipart Upload in the Amazon Simple Storage Service Developer Guide. For multipart upload API information, see Initiate Multipart Upload (p. 438), Upload Part (p. 454), Complete Multipart Upload (p. 432), List Parts (p. 448), and List Multipart Uploads (p. 196) | December 9, 2010 |
| Multipart upload | Multipart upload enables faster, more flexible uploads into Amazon S3. It allows you to upload a single object as a set of parts. For conceptual information, go to Uploading Objects Using Multipart Upload in the Amazon Simple Storage Service Developer Guide. For multipart upload API information, see Initiate Multipart Upload (p. 438), Upload Part (p. 454), Complete Multipart Upload (p. 432), List Parts (p. 448), and List Multipart Uploads (p. 196) | November 10, 2010 |
| Notifications | The Amazon S3 notifications feature enables you to configure a bucket so that Amazon S3 publishes a message to an Amazon Simple Notification Service (SNS) topic when Amazon S3 detects a key event on a bucket. For more information, see GET Bucket notification (p. 148) and PUT Bucket notification (p. 148). | July 14, 2010 |</p>
<table>

<tr>
<th>Change</th>
<th>Description</th>
<th>Release Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bucket policies</td>
<td>Bucket policies is an access management system you use to set access permissions on buckets, objects, and sets of objects. This functionality supplements and in many cases replaces access control lists.</td>
<td>July 6, 2010</td>
</tr>
<tr>
<td>Reduced Redundancy</td>
<td>Amazon S3 now enables you to reduce your storage costs by storing objects in Amazon S3 with reduced redundancy. For more information, see PUT Object (p. 377).</td>
<td>May 12, 2010</td>
</tr>
<tr>
<td>New region supported</td>
<td>Amazon S3 now supports the Asia Pacific (Singapore) region and therefore new location constraints. For more information, see GET Bucket location (p. 139) and PUT Bucket (p. 205).</td>
<td>April 28, 2010</td>
</tr>
<tr>
<td>Object Versioning</td>
<td>This release introduces object Versioning. All objects now have a key and a version. If you enable versioning for a bucket, Amazon S3 gives all objects added to a bucket a unique version ID. This feature enables you to recover from unintended overwrites and deletions. For more information, see GET Object (p. 317), DELETE Object (p. 311), PUT Object (p. 377), PUT Object Copy (p. 391), or POST Object (p. 350). The SOAP API does not support versioned objects.</td>
<td>February 8, 2010</td>
</tr>
<tr>
<td>New region supported</td>
<td>Amazon S3 now supports the US-West (Northern California) region. The new endpoint is s3-us-west-1.amazonaws.com. For more information, see How to Select a Region for Your Buckets in the Amazon Simple Storage Service Developer Guide.</td>
<td>December 2, 2009</td>
</tr>
<tr>
<td>C# Library Support</td>
<td>AWS now provides Amazon S3 C# libraries, sample code, tutorials, and other resources for software developers who prefer to build applications using language-specific API operations instead of REST or SOAP. These libraries provide basic functions (not included in the REST or SOAP APIs), such as request authentication, request retries, and error handling so that it's easier to get started.</td>
<td>November 11, 2009</td>
</tr>
<tr>
<td>Technical documents reorganized</td>
<td>The API reference has been split out of the Amazon S3 Developer Guide. Now, on the documentation landing page, Amazon Simple Storage Service Documentation, you can select the document you want to view. When viewing the documents online, the links in one document will take you, when appropriate, to one of the other guides.</td>
<td>September 16, 2009</td>

Appendix

Topics
- Appendix: SOAP API (p. 481)
- Appendix: Lifecycle Configuration APIs (Deprecated) (p. 508)

Appendix: SOAP API

Note
SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

This section describes the SOAP API with respect to service, bucket, and object operations. Note that SOAP requests, both authenticated and anonymous, must be sent to Amazon S3 using SSL. Amazon S3 returns an error when you send a SOAP request over HTTP.

The latest Amazon S3 WSDL is available at http://doc.s3.amazonaws.com/2006-03-01/AmazonS3.wsdl.

Topics
- Operations on the Service (SOAP API) (p. 481)
- Operations on Buckets (SOAP API) (p. 482)
- Operations on Objects (SOAP API) (p. 491)
- SOAP Error Responses (p. 506)

Operations on the Service (SOAP API)

Note
SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

This section describes operations you can perform on the Amazon S3 service.

Topics
- ListAllMyBuckets (SOAP API) (p. 481)

ListAllMyBuckets (SOAP API)

Note
SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

The ListAllMyBuckets operation returns a list of all buckets owned by the sender of the request.

Example

Sample Request
Sample Response

Response Body

- Owner:

  This provides information that Amazon S3 uses to represent your identity for purposes of authentication and access control. ID is a unique and permanent identifier for the developer who made the request. DisplayName is a human-readable name representing the developer who made the request. It is not unique, and might change over time. We recommend that you match your DisplayName to your Forum name.

- Name:

  The name of a bucket. Note that if one of your buckets was recently deleted, the name of the deleted bucket might still be present in this list for a period of time.

- CreationDate:

  The time that the bucket was created.

Access Control

You must authenticate with a valid AWS Access Key ID. Anonymous requests are never allowed to list buckets, and you can only list buckets for which you are the owner.

Operations on Buckets (SOAP API)

Note

SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

This section describes operations you can perform on Amazon S3 buckets.

Topics
CreateBucket (SOAP API)

Note
SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

The CreateBucket operation creates a bucket. Not every string is an acceptable bucket name. For information on bucket naming restrictions, see Working with Amazon S3 Buckets.

Note
To determine whether a bucket name exists, use ListBucket and set MaxKeys to 0. A NoSuchBucket response indicates that the bucket is available, an AccessDenied response indicates that someone else owns the bucket, and a Success response indicates that you own the bucket or have permission to access it.

Example Create a bucket named "quotes"

Sample Request

```xml
<CreateBucket xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</CreateBucket>
```

Sample Response

```xml
  <CreateBucketResponse>
    <Bucket>quotes</Bucket>
  </CreateBucketResponse>
</CreateBucketResponse>
```

Elements

- **Bucket**: The name of the bucket you are trying to create.
- **AccessControlList**: The access control list for the new bucket. This element is optional. If not provided, the bucket is created with an access policy that give the requester FULL_CONTROL access.

Access Control

You must authenticate with a valid AWS Access Key ID. Anonymous requests are never allowed to create buckets.
Related Resources

- ListBucket (SOAP API) (p. 484)

DeleteBucket (SOAP API)

Note
SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

The DeleteBucket operation deletes a bucket. All objects in the bucket must be deleted before the bucket itself can be deleted.

Example

This example deletes the "quotes" bucket.

Sample Request

```
<DeleteBucket xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</DeleteBucket>
```

Sample Response

```
<DeleteBucketResponse xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <DeleteBucketResponse>
    <Code>204</Code>
    <Description>No Content</Description>
  </DeleteBucketResponse>
</DeleteBucketResponse>
```

Elements

- Bucket: The name of the bucket you want to delete.

Access Control

Only the owner of a bucket is allowed to delete it, regardless the access control policy on the bucket.

ListBucket (SOAP API)

Note
SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

The ListBucket operation returns information about some of the items in the bucket.

For a general introduction to the list operation, see the Listing Object Keys.

Requests

This example lists up to 1000 keys in the "quotes" bucket that have the prefix "notes."
Syntax

```xml
<ListBucket xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <Prefix>notes</Prefix>
  <Delimiter>/</Delimiter>
  <MaxKeys>1000</MaxKeys>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</ListBucket>
```

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>prefix</td>
<td>Limits the response to keys which begin with the indicated prefix. You can use prefixes to separate a bucket into different sets of keys in a way similar to how a file system uses folders. Type: String</td>
<td>No</td>
</tr>
<tr>
<td>marker</td>
<td>Indicates where in the bucket to begin listing. The list will only include keys that occur lexicographically after marker. This is convenient for pagination: To get the next page of results use the last key of the current page as the marker. Type: String</td>
<td>No</td>
</tr>
<tr>
<td>max-keys</td>
<td>The maximum number of keys you’d like to see in the response body. The server might return fewer than this many keys, but will not return more. Type: String</td>
<td>No</td>
</tr>
<tr>
<td>delimiter</td>
<td>Causes keys that contain the same string between the prefix and the first occurrence of the delimiter to be rolled up into a single result element in the CommonPrefixes collection. These rolled-up keys are not returned elsewhere in the response. Type: String</td>
<td>No</td>
</tr>
</tbody>
</table>

Success Response

This response assumes the bucket contains the following keys:

```
notes/todos.txt
notes/2005-05-23/customer_mtg_notes.txt
```
As you can see, many of the fields in the response echo the request parameters. IsTruncated, Contents, and CommonPrefixes are the only response elements that can contain new information.

Response Elements

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Contents</td>
<td>Metadata about each object returned. Type: XML metadata Ancestor: ListBucketResult</td>
</tr>
<tr>
<td>CommonPrefixes</td>
<td>A response can contain CommonPrefixes only if you specify a delimiter. When you do, CommonPrefixes contains all (if there are any) keys between Prefix and the next occurrence of the string specified by delimiter. In effect, CommonPrefixes lists keys that act like subdirectories in the directory specified by Prefix. For example, if prefix is notes/ and delimiter is a slash (/), in notes/summer/july, the common prefix is notes/summer/. Type: String Ancestor: ListBucketResult</td>
</tr>
<tr>
<td>Delimiter</td>
<td>Causes keys that contain the same string between the prefix and the first occurrence of the delimiter to be rolled up into a single result element in the CommonPrefixes collection. These rolled-up keys are not returned elsewhere in the response.</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Type: String</td>
<td>Ancestor: ListBucketResult</td>
</tr>
<tr>
<td>IsTruncated</td>
<td>Specifies whether (true) or not (false) all of the results were returned. All of the results may not be returned if the number of results exceeds that specified by MaxKeys.</td>
</tr>
<tr>
<td>Type: String</td>
<td>Ancestor: boolean</td>
</tr>
<tr>
<td>Marker</td>
<td>Indicates where in the bucket to begin listing.</td>
</tr>
<tr>
<td>Type: String</td>
<td>Ancestor: ListBucketResult</td>
</tr>
<tr>
<td>MaxKeys</td>
<td>The maximum number of keys returned in the response body.</td>
</tr>
<tr>
<td>Type: String</td>
<td>Ancestor: ListBucketResult</td>
</tr>
<tr>
<td>Name</td>
<td>Name of the bucket.</td>
</tr>
<tr>
<td>Type: String</td>
<td>Ancestor: ListBucketResult</td>
</tr>
<tr>
<td>Prefix</td>
<td>Keys that begin with the indicated prefix.</td>
</tr>
<tr>
<td>Type: String</td>
<td>Ancestor: ListBucketResult</td>
</tr>
</tbody>
</table>

**Response Body**

For information about the list response, see Listing Keys Response.

**Access Control**

To list the keys of a bucket you need to have been granted READ access on the bucket.

**GetBucketAccessControlPolicy (SOAP API)**

*Note*

SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

The GetBucketAccessControlPolicy operation fetches the access control policy for a bucket.

**Example**

This example retrieves the access control policy for the "quotes" bucket.

**Sample Request**
  <Bucket>quotes</Bucket>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</GetBucketAccessControlPolicy>

Sample Response

<AccessControlPolicy>
  <Owner>
    <ID>a9a7b86d6fd2441bf9b1c61be666e9</ID>
    <DisplayName>chriscustomer</DisplayName>
  </Owner>
  <AccessControlList>
    <Grant>
      <Grantee xsi:type="CanonicalUser">
        <ID>a9a7b86d6fd2441bf9b1c61be666e9</ID>
        <DisplayName>chriscustomer</DisplayName>
      </Grantee>
      <Permission>FULL_CONTROL</Permission>
    </Grant>
    <Grant>
      <Grantee xsi:type="Group">
        <URI>http://acs.amazonaws.com/groups/global/AllUsers</URI>
      </Grantee>
      <Permission>READ</Permission>
    </Grant>
  </AccessControlList>
</AccessControlPolicy>

Response Body

The response contains the access control policy for the bucket. For an explanation of this response, see SOAP Access Policy.

Access Control

You must have READ_ACP rights to the bucket in order to retrieve the access control policy for a bucket.

SetBucketAccessControlPolicy (SOAP API)

Note
SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

The SetBucketAccessControlPolicy operation sets the Access Control Policy for an existing bucket. If successful, the previous Access Control Policy for the bucket is entirely replaced with the specified Access Control Policy.

Example

Give the specified user (usually the owner) FULL_CONTROL access to the "quotes" bucket.

Sample Request

  <Bucket>quotes</Bucket>
</SetBucketAccessControlPolicy>
Access Control

You must have WRITE_ACP rights to the bucket in order to set the access control policy for a bucket.

GetBucketLoggingStatus (SOAP API)

**Note**

SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

The `GetBucketLoggingStatus` retrieves the logging status for an existing bucket.

For a general introduction to this feature, see Server Logs.

**Example**

Sample Request

```
<?xml version="1.0" encoding="utf-8"?>
<soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/
  <soap:Body>
      <Bucket>mybucket</Bucket>
      <AWSAccessKeyId>YOUR_AWS_ACCESS_KEY_ID</AWSAccessKeyId>
      <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
      <Signature>YOUR_SIGNATURE_HERE</Signature>
    </GetBucketLoggingStatus>
  </soap:Body>
</soap:Envelope>
```

Sample Response

```
<?xml version="1.0" encoding="utf-8"?>
```
Access Control

Only the owner of a bucket is permitted to invoke this operation.

SetBucketLoggingStatus (SOAP API)

Note

SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

The SetBucketLoggingStatus operation updates the logging status for an existing bucket.

For a general introduction to this feature, see Server Logs.

Example

This sample request enables server access logging for the 'mybucket' bucket, and configures the logs to be delivered to 'mylogs' under prefix 'access_log-'.

Sample Request

```xml
<?xml version="1.0" encoding="utf-8"?>
<soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/
  <soap:Body>
    <SetBucketLoggingStatus xmlns="http://doc.s3.amazonaws.com/2006-03-01">
      <Bucket>myBucket</Bucket>
      <AWSAccessKeyId>YOUR_AWS_ACCESS_KEY_ID</AWSAccessKeyId>
      <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
      <Signature>YOUR_SIGNATURE_HERE</Signature>
      <BucketLoggingStatus>
        <LoggingEnabled>
          <TargetBucket>mylogs</TargetBucket>
          <TargetPrefix>mybucket-access_log-</TargetPrefix>
        </LoggingEnabled>
      </BucketLoggingStatus>
    </SetBucketLoggingStatus>
  </soap:Body>
</soap:Envelope>
```

Sample Response
API Version 2006-03-01
491
PutObjectInline is not suitable for use with large objects. The system limits this operation to working with objects 1MB or smaller. PutObjectInline will fail with the InlineDataTooLargeError status code if the Data parameter encodes an object larger than 1MB. To upload large objects, consider using the non-inline PutObject API, or the REST API instead.

**Example**

This example writes some text and metadata into the "Nelson" object in the "quotes" bucket, give a user (usually the owner) FULL_CONTROL access to the object, and make the object readable by anonymous parties.

**Sample Request**

```
<PutObjectInline xmlns="http://doc.s3.amazonaws.com/2006-03-01">
    <Bucket>quotes</Bucket>
    <Key>Nelson</Key>
    <Metadata>
        <Name>Content-Type</Name>
        <Value>text/plain</Value>
    </Metadata>
    <Metadata>
        <Name>family</Name>
        <Value>Muntz</Value>
    </Metadata>
    <Data>aGEtaGE=</Data>
    <ContentLength>5</ContentLength>
    <AccessControlList>
        <Grant>
            <Grantee xsi:type="CanonicalUser">
                <ID>a9a7b886d6fde241bf91c61be666e9</ID>
                <DisplayName>chriscustomer</DisplayName>
            </Grantee>
            <Permission>FULL_CONTROL</Permission>
        </Grant>
        <Grant>
            <Grantee xsi:type="Group">
                <URI>http://acs.amazonaws.com/groups/global/AllUsers</URI>
            </Grantee>
            <Permission>READ</Permission>
        </Grant>
    </AccessControlList>
    <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
    <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
    <Signature>ruyz3d3P0aTou39dzbqaEXAMPLE</Signature>
</PutObjectInline>
```

**Sample Response**

```
    <PutObjectInlineResponse>
        <ETag>"828ef3fdfa96f00ad9f27c383fc9ac7f"</ETag>
        <LastModified>2006-01-01T12:00:00.000Z</LastModified>
    </PutObjectInlineResponse>
</PutObjectInlineResponse>
```

**Elements**

- **Bucket**: The bucket in which to add the object.
- **Key**: The key to assign to the object.
- **Metadata**: You can provide name-value metadata pairs in the metadata element. These will be stored with the object.
• **Data**: The base 64 encoded form of the data.
• **ContentLength**: The length of the data in bytes.
• **AccessControlList**: An Access Control List for the resource. This element is optional. If omitted, the requester is given **FULL_CONTROL** access to the object. If the object already exists, the preexisting access control policy is replaced.

**Responses**

• **ETag**: The entity tag is an MD5 hash of the object that you can use to do conditional fetches of the object using **GetObjectExtended**. The ETag only reflects changes to the contents of an object, not its metadata.
• **LastModified**: The Amazon S3 timestamp for the saved object.

**Access Control**

You must have **WRITE** access to the bucket in order to put objects into the bucket.

**Related Resources**

• **PutObject (SOAP API)** (p. 493)
• **CopyObject (SOAP API)** (p. 495)

**PutObject (SOAP API)**

**Note**

SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

The **PutObject** operation adds an object to a bucket. The data for the object is attached as a DIME attachment.

To ensure an object is not corrupted over the network, you can calculate the MD5 of an object, PUT it to Amazon S3, and compare the returned Etag to the calculated MD5 value.

If an object already exists in a bucket, the new object will overwrite it because Amazon S3 stores the last write request. However, Amazon S3 is a distributed system. If Amazon S3 receives multiple write requests for the same object nearly simultaneously, all of the objects might be stored, even though only one wins in the end. Amazon S3 does not provide object locking; if you need this, make sure to build it into your application layer.

**Example**

This example puts some data and metadata in the "Nelson" object of the "quotes" bucket, give a user (usually the owner) **FULL_CONTROL** access to the object, and make the object readable by anonymous parties. In this sample, the actual attachment is not shown.

Sample Request

```xml
<PutObject xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <Key>Nelson</Key>
  <Metadata>
    <Name>Content-Type</Name>
  </Metadata>
</PutObject>
```
Sample Response

```
  <PutObjectResponse>
    <ETag>"828ef3fdfa96f00ad9f27c383fc9ac7f"</ETag>
    <LastModified>2006-03-01T12:00:00.183Z</LastModified>
  </PutObjectResponse>
</PutObjectResponse>
```

Elements

- **Bucket**: The bucket in which to add the object.
- **Key**: The key to assign to the object.
- **Metadata**: You can provide name-value metadata pairs in the metadata element. These will be stored with the object.
- **ContentLength**: The length of the data in bytes.
- **AccessControlList**: An Access Control List for the resource. This element is optional. If omitted, the requester is given FULL_CONTROL access to the object. If the object already exists, the preexisting Access Control Policy is replaced.

Responses

- **ETag**: The entity tag is an MD5 hash of the object that you can use to do conditional fetches of the object using GetObjectExtended. The ETag only reflects changes to the contents of an object, not its metadata.
- **LastModified**: The Amazon S3 timestamp for the saved object.

Access Control

To put objects into a bucket, you must have WRITE access to the bucket.

- CopyObject (SOAP API) (p. 495)

CopyObject (SOAP API)

**Note**

SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

**Description**

The `CopyObject` operation creates a copy of an object when you specify the key and bucket of a source object and the key and bucket of a target destination.

When copying an object, you can preserve all metadata (default) or specify new metadata. However, the ACL is not preserved and is set to private for the user making the request. To override the default ACL setting, specify a new ACL when generating a copy request. For more information, see [Using ACLs](#).

All copy requests must be authenticated. Additionally, you must have **read** access to the source object and **write** access to the destination bucket. For more information, see [Using Auth Access](#).

To only copy an object under certain conditions, such as whether the Etag matches or whether the object was modified before or after a specified date, use the request parameters `CopySourceIfUnmodifiedSince`, `CopyIfUnmodifiedSince`, `CopySourceIfMatch`, or `CopySourceIfNoneMatch`.

**Note**

You might need to configure the SOAP stack socket timeout for copying large objects.

**Request Syntax**

```xml
<CopyObject xmlns="http://bucket_name.s3.amazonaws.com/2006-03-01">
  <SourceBucket>source_bucket</SourceBucket>
  <SourceObject>source_object</SourceObject>
  <DestinationBucket>destination_bucket</DestinationBucket>
  <DestinationObject>destination_object</DestinationObject>
  <MetadataDirective>{REPLACE | COPY}</MetadataDirective>
  <Metadata>
    <Name>metadata_name</Name>
    <Value>metadata_value</Value>
  </Metadata>
  ...
  <AccessControlList>
    <Grant>
      <Grantee xsi:type="user_type">
        <ID>user_id</ID>
        <DisplayName>display_name</DisplayName>
      </Grantee>
      <Permission>permission</Permission>
    </Grant>
    ...
  </AccessControlList>
  <CopySourceIfMatch>etag</CopySourceIfMatch>
  <CopySourceIfNoneMatch>etag</CopySourceIfNoneMatch>
  <CopySourceIfModifiedSince>date_time</CopySourceIfModifiedSince>
  <CopySourceIfUnmodifiedSince>date_time</CopySourceIfUnmodifiedSince>
  <AWSAccessKeyId>AWSAccessKeyId</AWSAccessKeyId>
  <Timestamp>Timestamp</Timestamp>
  <Signature>Signature</Signature>
</CopyObject>
```

Response Syntax

```xml
<COPYOBJECTRESPONSE xmlns="http://bucket_name.s3.amazonaws.com/2006-03-01">
  <ETAG>"etag"</ETAG>
  <LASTMODIFIED>timestamp</LASTMODIFIED>
</COPYOBJECTRESPONSE>
```
Response Elements

Following is a list of response elements.

Note
The SOAP API does not return extra whitespace. Extra whitespace is only returned by the REST API.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Etag</td>
<td>Returns the etag of the new object. The ETag only reflects changes to the contents of an object, not its metadata.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td></td>
<td>Ancestor: CopyObjectResult</td>
</tr>
<tr>
<td>LastModified</td>
<td>Returns the date the object was last modified.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td></td>
<td>Ancestor: CopyObjectResult</td>
</tr>
</tbody>
</table>

For information about general response elements, see Using REST Error Response Headers.

Special Errors

There are no special errors for this operation. For information about general Amazon S3 errors, see List of Error Codes (p. 7).

Examples

This example copies the flotsam object from the pacific bucket to the jetsam object of the atlantic bucket, preserving its metadata.

Sample Request

```xml
<CopyObject xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <SourceBucket>pacific</SourceBucket>
  <SourceObject>flotsam</SourceObject>
  <DestinationBucket>atlantic</DestinationBucket>
  <DestinationObject>jetsam</DestinationObject>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2008-02-18T13:54:10.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbq7Rrt5Fmw=</Signature>
</CopyObject>
```

Sample Response

```xml
<CopyObjectResponse xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <ETag>"828ef3fdfa96f00ad9f27c383fc9ac7f"</ETag>
  <LastModified>2008-02-18T13:54:10.183Z</LastModified>
</CopyObjectResponse>
```
This example copies the "tweedledee" object from the wonderland bucket to the "tweedledum" object of the wonderland bucket, replacing its metadata.

Sample Request

```xml
<CopyObject xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <SourceBucket>wonderland</SourceBucket>
  <SourceObject>tweedledee</SourceObject>
  <DestinationBucket>wonderland</DestinationBucket>
  <DestinationObject>tweedledum</DestinationObject>
  <MetadataDirective>REPLACE</MetadataDirective>
  <Metadata>
    <Name>Content-Type</Name>
    <Value>text/plain</Value>
  </Metadata>
  <Metadata>
    <Name>relationship</Name>
    <Value>twins</Value>
  </Metadata>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2008-02-18T13:54:10.183Z</Timestamp>
</CopyObject>
```

Sample Response

```xml
<CopyObjectResponse xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <CopyObjectResponse>
    <ETag>"828ef3fdfa96f00ad9f27c383fc9ac7f"</ETag>
    <LastModified>2008-02-18T13:54:10.183Z</LastModified>
  </CopyObjectResponse>
</CopyObjectResponse>
```

- PutObject (SOAP API) (p. 493)
- PutObjectInline (SOAP API) (p. 491)

GetObject (SOAP API)

**Note**

SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

The `GetObject` operation returns the current version of an object. If you try to `GetObject` an object that has a delete marker as its current version, S3 returns a 404 error. You cannot use the SOAP API to retrieve a specified version of an object. To do that, use the REST API. For more information, see Versioning. For more options, use the `GetObjectExtended` (SOAP API) (p. 503) operation.

Example

This example gets the "Nelson" object from the "quotes" bucket.

Sample Request

```xml
<GetObject xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <SourceBucket>quotes</SourceBucket>
  <SourceObject>Nelson</SourceObject>
</GetObject>
```
Operations on Objects (SOAP API)

Example Request

```xml
<GetObject>
  <Bucket>quotes</Bucket>
  <Key>Nelson</Key>
  <GetMetadata>true</GetMetadata>
  <GetData>true</GetData>
  <InlineData>true</InlineData>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</GetObject>
```

Sample Response

```xml
  <GetObjectResponse>
    <Status>
      <Code>200</Code>
      <Description>OK</Description>
    </Status>
    <Metadata>
      <Name>Content-Type</Name>
      <Value>text/plain</Value>
    </Metadata>
    <Metadata>
      <Name>family</Name>
      <Value>Muntz</Value>
    </Metadata>
    <Data>aGEtaGE=</Data>
    <LastModified>2006-01-01T12:00:00.000Z</LastModified>
    <ETag>&quot;828ef3fdfa96f00ad9f27c383fc9ac7f&quot;</ETag>
  </GetObjectResponse>
</GetObjectResponse>
```

Elements

- **Bucket**: The bucket from which to retrieve the object.
- **Key**: The key that identifies the object.
- **GetMetadata**: The metadata is returned with the object if this is true.
- **GetData**: The object data is returned if this is true.
- **InlineData**: If this is true, then the data is returned, base 64-encoded, as part of the SOAP body of the response. If false, then the data is returned as a SOAP attachment. The InlineData option is not suitable for use with large objects. The system limits this operation to working with 1MB of data or less. A GetObject request with the InlineData flag set will fail with the InlineDataTooLargeError status code if the resulting Data parameter would have encoded more than 1MB. To download large objects, consider calling GetObject without setting the InlineData flag, or use the REST API instead.

Returned Elements

- **Metadata**: The name-value paired metadata stored with the object.
- **Data**: If InlineData was true in the request, this contains the base 64 encoded object data.
- **LastModified**: The time that the object was stored in Amazon S3.
- **ETag**: The object's entity tag. This is a hash of the object that can be used to do conditional gets. The ETag only reflects changes to the contents of an object, not its metadata.

Access Control

You can read an object only if you have been granted READ access to the object.
SOAP Chunked and Resumable Downloads

To provide GET flexibility, Amazon S3 supports chunked and resumable downloads.

Select from the following:

- For large object downloads, you might want to break them into smaller chunks. For more information, see Range GETs (p. 501)
- For GET operations that fail, you can design your application to download the remainder instead of the entire file. For more information, see REST GET Error Recovery (p. 503)

Range GETs

For some clients, you might want to break large downloads into smaller downloads. To break a GET into smaller units, use Range.

Before you can break a GET into smaller units, you must determine its size. For example, the following request gets the size of the bigfile object.

```
<ListBucket xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>bigbucket</Bucket>
  <Prefix>bigfile</Prefix>
  <MaxKeys>1</MaxKeys>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aToU39dzboEAXMEXAMPLE==</Signature>
</ListBucket>
```

Amazon S3 returns the following response.

```
<ListBucketResult xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <Name>quotes</Name>
  <Prefix>N</Prefix>
  <MaxKeys>1</MaxKeys>
  <IsTruncated>false</IsTruncated>
  <Contents>
    <Key>bigfile</Key>
    <LastModified>2006-01-01T12:00:00.000Z</LastModified>
    <ETag>"828ef3fda96f00af9df7ce83fc9ac7f</ETag>
    <Size>2023276</Size>
    <StorageClass>STANDARD</StorageClass>
    <Owner>
      <ID>bcaf1f0d8e41161ca5fb16f0081034f</ID>
      <DisplayName>bigfile</DisplayName>
    </Owner>
  </Contents>
</ListBucketResult>
```

Following is a request that downloads the first megabyte from the bigfile object.

```
  <Bucket>bigbucket</Bucket>
  <Key>bigfile</Key>
  <GetMetadata>true</GetMetadata>
  <GetData>true</GetData>
  <InlineData>true</InlineData>
  <ByteRangeStart>0</ByteRangeStart>
  <ByteRangeEnd>1048576</ByteRangeEnd>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Signature>Iuyz3d3P0aToU39dzboEAXMEXAMPLE==</Signature>
</GetObject>
```
Amazon S3 returns the first megabyte of the file and the Etag of the file.

Amazon S3 returns the following response and the remainder of the file.

To ensure the file did not change since the previous portion was downloaded, specify the IfMatch element. Although the IfMatch element is not required, it is recommended for content that is likely to change.

The following is a request that gets the remainder of the file, using the IfMatch request header.
Versioned GetObject

The following request returns the specified version of the object in the bucket.

```xml
<GetObject xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <Key>Nelson</Key>
  <GetMetadata>true</GetMetadata>
  <GetData>true</GetData>
  <InlineData>true</InlineData>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</GetObject>
```

Sample Response

```xml
  <GetObjectResponse>
    <Status>
      <Code>200</Code>
      <Description>OK</Description>
    </Status>
    <Metadata>
      <Name>Content-Type</Name>
      <Value>text/plain</Value>
    </Metadata>
    <Metadata>
      <Name>family</Name>
      <Value>Muntz</Value>
    </Metadata>
    <Data>aGEtaGE=</Data>
    <LastModified>2006-01-01T12:00:00.000Z</LastModified>
    <ETag>"828ef3fdfa96f00ad9f27c383fc9ac7f"</ETag>
  </GetObjectResponse>
</GetObjectResponse>
```

REST GET Error Recovery

If an object GET fails, you can get the rest of the file by specifying the range to download. To do so, you must get the size of the object using ListBucket and perform a range GET on the remainder of the file. For more information, see GetObjectExtended (SOAP API) (p. 503).

Related Resources

- Operations on Objects (SOAP API) (p. 491)
- GetObjectExtended (SOAP API)

**Note**

SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

GetObjectExtended is exactly like GetObject (SOAP API) (p. 499), except that it supports the following additional elements that can be used to accomplish much of the same functionality provided by HTTP GET headers (go to [http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html](http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html)).
GetObjectExtended supports the following elements in addition to those supported by GetObject:

- **ByteRangeStart**, **ByteRangeEnd**: These elements specify that only a portion of the object data should be retrieved. They follow the behavior of the HTTP byte ranges (go to [http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.35](http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.35)).
- **IfModifiedSince**: Return the object only if the object's timestamp is later than the specified timestamp. ([http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.25](http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.25))
- **IfUnmodifiedSince**: Return the object only if the object's timestamp is earlier than or equal to the specified timestamp. ([http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.28](http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.28))
- **IfMatch**: Return the object only if its ETag matches the supplied tag(s). ([http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.24](http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.24))
- **IfNoneMatch**: Return the object only if its ETag does not match the supplied tag(s). ([http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.26](http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.26))
- **ReturnCompleteObjectOnConditionFailure**: ReturnCompleteObjectOnConditionFailure: If true, then if the request includes a range element and one or both of IfUnmodifiedSince/IfMatch elements, and the condition fails, return the entire object rather than a fault. This enables the If-Range functionality ([http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.27](http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.27)).

**DeleteObject (SOAP API)**

**Note**
SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

The `DeleteObject` operation removes the specified object from Amazon S3. Once deleted, there is no method to restore or undelete an object.

**Note**
If you delete an object that does not exist, Amazon S3 will return a success (not an error message).

**Example**

This example deletes the "Nelson" object from the "quotes" bucket.

**Sample Request**

```xml
<DeleteObject xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <Key>Nelson</Key>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Tensorstamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</DeleteObject>
```

**Sample Response**

```xml
<DeleteObjectResponse xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <DeleteObjectResponse>
    <Code>200</Code>
    <Description>OK</Description>
  </DeleteObjectResponse>
</DeleteObjectResponse>
```

**Elements**

- **Bucket**: The bucket that holds the object.
Key: The key that identifies the object.

Access Control

You can delete an object only if you have WRITE access to the bucket, regardless of who owns the object or what rights are granted to it.

GetObjectAccessControlPolicy (SOAP API)

Note

SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

The GetObjectAccessControlPolicy operation fetches the access control policy for an object.

Example

This example retrieves the access control policy for the "Nelson" object from the "quotes" bucket.

Sample Request

```xml
  <Bucket>quotes</Bucket>
  <Key>Nelson</Key>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</GetObjectAccessControlPolicy>
```

Sample Response

```xml
<AccessControlPolicy>
  <Owner>
    <ID>a9a7b886d5fd24a541bf9b1c61be666e9</ID>
    <DisplayName>chriscustomer</DisplayName>
  </Owner>
  <AccessControlList>
    <Grant>
      <Grantee xsi:type="CanonicalUser">
        <ID>a9a7b841bf9b1c61be666e9</ID>
        <DisplayName>chriscustomer</DisplayName>
      </Grantee>
      <Permission>FULL_CONTROL</Permission>
    </Grant>
    <Grant>
      <Grantee xsi:type="Group">
        <URI>http://acs.amazonaws.com/groups/global/AllUsers</URI>
      </Grantee>
      <Permission>READ</Permission>
    </Grant>
  </AccessControlList>
</AccessControlPolicy>
```

Response Body

The response contains the access control policy for the bucket. For an explanation of this response, SOAP Access Policy.
Access Control

You must have READ_ACP rights to the object in order to retrieve the access control policy for an object.

**SetObjectAccessControlPolicy (SOAP API)**

*Note*

SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

The **SetObjectAccessControlPolicy** operation sets the access control policy for an existing object. If successful, the previous access control policy for the object is entirely replaced with the specified access control policy.

**Example**

This example gives the specified user (usually the owner) FULL_CONTROL access to the "Nelson" object from the "quotes" bucket.

Sample Request

```xml
  <Bucket>quotes</Bucket>
  <Key>Nelson</Key>
  <AccessControlList>
    <Grant>
      <Grantee xsi:type="CanonicalUser">
        <ID>a9a7b86d66f24a52fe8ca5be65f89a64e0193f23000e241bf9b1c61be666e9</ID>
        <DisplayName>chriscustomer</DisplayName>
      </Grantee>
      <Permission>FULL_CONTROL</Permission>
    </Grant>
  </AccessControlList>
  <AWSAccessKeyId>AKIAIOSFODDN7EXAMPLE</AWSAccessKeyId>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</SetObjectAccessControlPolicy>
```

Sample Response

```xml
  <SetObjectAccessControlPolicyResponse>
    <Code>200</Code>
    <Description>OK</Description>
  </SetObjectAccessControlPolicyResponse>
</SetObjectAccessControlPolicyResponse>
```

Access Control

You must have WRITE_ACP rights to the object in order to set the access control policy for a bucket.

**SOAP Error Responses**

*Note*

SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs.

In SOAP, an error result is returned to the client as a SOAP fault, with the HTTP response code 500. If you do not receive a SOAP fault, then your request was successful. The Amazon S3 SOAP fault code is
comprised of a standard SOAP 1.1 fault code (either "Server" or "Client") concatenated with the Amazon S3-specific error code. For example: "Server.InternalError" or "Client.NoSuchBucket". The SOAP fault string element contains a generic, human readable error message in English. Finally, the SOAP fault detail element contains miscellaneous information relevant to the error.

For example, if you attempt to delete the object "Fred", which does not exist, the body of the SOAP response contains a "NoSuchKey" SOAP fault.

The following example shows a sample SOAP error response.

```xml
<soapenv:Body>
  <soapenv:Fault>
    <Faultcode>soapenv:Client.NoSuchKey</Faultcode>
    <Faultstring>The specified key does not exist.</Faultstring>
    <Detail>
      <Key>Fred</Key>
    </Detail>
  </soapenv:Fault>
</soapenv:Body>
```

The following table explains the SOAP error response elements:

<table>
<thead>
<tr>
<th>Name</th>

Appendix: Lifecycle Configuration APIs (Deprecated)

Bucket lifecycle configuration is updated to support filters based on object tags. That is, you can now specify a rule that specifies key name prefix, one or more object tags, or both to select a subset of objects to which the rule applies. The APIs have been updated accordingly. The following topics describes the prior version of the PUT and GET bucket lifecycle operations for backward compatibility.

Topics
- PUT Bucket lifecycle (deprecated) (p. 509)
- GET Bucket lifecycle (deprecated) (p. 519)
PUT Bucket lifecycle (deprecated)

Description

Important
For updated version of this API, see PUT Bucket lifecycle (p. 244). This version has been deprecated. Existing lifecycle configurations will work. For new lifecycle configurations, use the updated API.

Creates a new lifecycle configuration for the bucket or replaces an existing lifecycle configuration. For information about lifecycle configuration, go to Object Lifecycle Management in the Amazon Simple Storage Service Developer Guide.

Permissions

By default, all Amazon S3 resources are private, including buckets, objects, and related subresources (for example, lifecycle configuration and website configuration). Only the resource owner (that is, the AWS account that created it) can access the resource. The resource owner can optionally grant access permissions to others by writing an access policy. For this operation, a user must get the s3:PutLifecycleConfiguration permission.

You can also explicitly deny permissions. Explicit deny also supersedes any other permissions. If you want to block users or accounts from removing or deleting objects from your bucket, you must deny them permissions for the following actions.

- s3:DeleteObject
- s3:DeleteObjectVersion
- s3:PutLifecycleConfiguration

For more information about permissions, see Managing Access Permissions to Your Amazon S3 Resources in the Amazon Simple Storage Service Developer Guide.

Requests

Syntax

PUT /?lifecycle HTTP/1.1
Host: bucketname.s3.amazonaws.com
Content-Length: length
Date: date
Authorization: authorization string
Content-MD5: MD5

Lifecycle configuration in the request body

For details about authorization string, see Authenticating Requests (AWS Signature Version 4) (p. 14).

Request Parameters

This implementation of the operation does not use request parameters.
Request Headers

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content-MD5</td>
<td>The base64-encoded 128-bit MD5 digest of the data. This header must be used as a message integrity check to verify that the request body was not corrupted in transit. For more information, go to RFC 1864. Type: String Default: None</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Request Body

In the request, you specify lifecycle configuration in the request body. The lifecycle configuration is specified as XML. The following is an introductory example lifecycle configuration skeleton. It specifies one rule. The Prefix in the rule identifies objects to which the rule applies. The rule also specifies two actions (Transition and Expiration). Each action specifies a timeline when you want Amazon S3 to perform the action. The Status indicates whether the rule is enabled or disabled.

```
<LifecycleConfiguration>
  <Rule>
    <ID>sample-rule</ID>
    <Prefix>key-prefix</Prefix>
    <Status>rule-status</Status>
    <Transition>
      <Date>value</Date>
      <StorageClass>storage class</StorageClass>
    </Transition>
    <Expiration>
      <Days>value</Days>
    </Expiration>
  </Rule>
</LifecycleConfiguration>
```

If the state of your bucket is versioning-enabled or versioning-suspended, you can have many versions of the same object, one current version, and zero or more noncurrent versions. The following lifecycle configuration specifies the actions (NoncurrentVersionTransition, NoncurrentVersionExpiration) that are specific to noncurrent object versions.

```
<LifecycleConfiguration>
  <Rule>
    <ID>sample-rule</ID>
    <Prefix>key-prefix</Prefix>
    <Status>rule-status</Status>
    <NoncurrentVersionTransition>
      <NoncurrentDays>value</NoncurrentDays>
      <StorageClass>storage class</StorageClass>
    </NoncurrentVersionTransition>
    <NoncurrentVersionExpiration>
      <NoncurrentDays>value</NoncurrentDays>
    </NoncurrentVersionExpiration>
  </Rule>
</LifecycleConfiguration>
```
You can use the multipart upload API to upload large objects in parts. For more information about multipart uploads, see Multipart Upload Overview in the Amazon Simple Storage Service Developer Guide. Using lifecycle configuration, you can direct Amazon S3 to abort incomplete multipart uploads (identified by the key name prefix specified in the rule) if they don't complete within a specified number of days after initiation. When Amazon S3 aborts a multipart upload, it deletes all parts associated with the multipart upload. This ensures that you don't have incomplete multipart uploads with parts that are stored in Amazon S3 and, therefore, you don't have to pay any storage costs for these parts. The following is an example lifecycle configuration that specifies a rule with the AbortIncompleteMultipartUpload action. This action requests Amazon S3 to abort incomplete multipart uploads seven days after initiation.

```
<LifecycleConfiguration>
  <Rule>
    <ID>sample-rule</ID>
    <Prefix>SomeKeyPrefix/</Prefix>
    <Status>rule-status</Status>
    <AbortIncompleteMultipartUpload>
      <DaysAfterInitiation>7</DaysAfterInitiation>
    </AbortIncompleteMultipartUpload>
  </Rule>
</LifecycleConfiguration>
```

The following table describes the XML elements in the lifecycle configuration:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>AbortIncompleteMultipartUpload</td>
<td>Container for specifying when an incomplete multipart upload becomes eligible for an abort operation. Child: DaysAfterInitiation</td>
<td>Yes, if no other action is specified for the rule.</td>
</tr>
<tr>
<td>Date</td>
<td>Date when you want S3 to take the action. For more information, see Lifecycle Rules: Based on a Specific Date in the Amazon Simple Storage Service Developer Guide. The date value must conform to the ISO 8601 format. The time is always midnight UTC.</td>
<td>Yes, if Days and ExpiredObjectDeleteMarker are absent.</td>
</tr>
<tr>
<td>Days</td>
<td>Specifies the number of days after object creation when the specific rule action takes effect. Type: Nonnegative Integer when used with Transition, Positive Integer when used with Expiration.</td>
<td>Yes, if Date and ExpiredObjectDeleteMarker are absent.</td>
</tr>
<tr>
<td>DaysAfterInitiation</td>
<td>Specifies the number of days after initiating a multipart upload when the multipart upload must be completed. If it does not complete by</td>
<td>Yes, if parent tag is specified.</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
<td>----------</td>
</tr>
<tr>
<td>the specified number of days, it becomes eligible for an abort operation and Amazon S3 aborts the incomplete multipart upload. Type: Positive Integer. Ancestor: AbortIncompleteMultipartUpload.</td>
<td><strong>Expiration</strong> This action specifies a period in an object's lifetime when Amazon S3 should take the appropriate expiration action. The action Amazon S3 takes depends on whether the bucket is versioning-enabled. • If versioning has never been enabled on the bucket, Amazon S3 deletes the only copy of the object permanently. • Otherwise, if your bucket is versioning-enabled (or versioning is suspended), the action applies only to the current version of the object. A versioning-enabled bucket can have many versions of the same object, one current version, and zero or more noncurrent versions. Instead of deleting the current version, Amazon S3 makes it a noncurrent version by adding a delete marker as the new current version. <strong>Important</strong> If your bucket state is versioning-suspended, Amazon S3 creates a delete marker with version ID <code>null</code>. If you have a version with version ID <code>null</code>, then Amazon S3 overwrites that version. <strong>Note</strong> To set expiration for noncurrent objects, you must use the NoncurrentVersionExpiration action.</td>
<td>Yes, if no other action is present in the Rule.</td>
</tr>
<tr>
<td>Unique identifier for the rule. The value cannot be longer than 255 characters. Type: String Ancestor: Rule</td>
<td><strong>ID</strong></td>
<td>No</td>
</tr>
<tr>
<td>Type: Container Children: Days or Date Ancestor: Rule</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------</td>
</tr>
</tbody>
</table>
| LifecycleConfiguration | Container for lifecycle rules. You can add as many as 1000 rules. Type: Container  
Children: Rule  
Ancestor: None                                                                                     | Yes      |
| ExpiredObjectDeleteMarker | On a versioned bucket (versioning-enabled or versioning-suspended bucket), you can add this element in the lifecycle configuration to direct Amazon S3 to delete expired object delete markers. For an example, go to Example 8: Removing Expired Object Delete Markers in the Amazon Simple Storage Service Developer Guide.  
On a non-versioned bucket, adding this element in a policy is meaningless because you cannot have delete markers and the element will not do anything.  
Type: String  
Valid values: true | false (the value false is allowed, but it is no-op and Amazon S3 will not take action if the value is false)  
Ancestor: Expiration.                                                                                   | Yes, if | Date and Days are absent. |
| NoncurrentDays        | Specifies the number of days an object is noncurrent before Amazon S3 can perform the associated action. For information about the noncurrent days calculations, see How Amazon S3 Calculates When an Object Became Noncurrent in the Amazon Simple Storage Service Developer Guide.  
Type: Nonnegative Integer when used with NoncurrentVersionTransition, Positive Integer when used with NoncurrentVersionExpiration.  
Ancestor: NoncurrentVersionExpiration or NoncurrentVersionTransition                                         | Yes      |
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>NoncurrentVersionExpiration</td>
<td>Specifies when noncurrent object versions expire. Upon expiration, Amazon S3 permanently deletes the noncurrent object versions. You set this lifecycle configuration action on a bucket that has versioning enabled (or suspended) to request that Amazon S3 delete noncurrent object versions at a specific period in the object's lifetime. Type: Container Children: NoncurrentDays Ancestor: Rule</td>
<td>Yes, if no other action is present in the Rule.</td>
</tr>
<tr>
<td>NoncurrentVersionTransition</td>
<td>Container for the transition rule that describes when noncurrent objects transition to the STANDARD_IA or GLACIER storage class. If your bucket is versioning-enabled (or versioning is suspended), you can set this action to request that Amazon S3 transition noncurrent object versions at a specific period in the object's lifetime. Type: Container Children: NoncurrentDays and StorageClass Ancestor: Rule</td>
<td>Yes, if no other action is present in the Rule.</td>
</tr>
<tr>
<td>Prefix</td>
<td>Object key prefix identifying one or more objects to which the rule applies.</td>
<td>Yes</td>
</tr>
<tr>
<td>Rule</td>
<td>Container for a lifecycle rule. A lifecycle configuration can contain as many as 1000 rules.</td>
<td>Yes</td>
</tr>
<tr>
<td>Status</td>
<td>If Enabled, Amazon S3 executes the rule as scheduled. If Disabled, Amazon S3 ignores the rule.</td>
<td>Yes</td>
</tr>
</tbody>
</table>

API Version 2006-03-01
PUT Bucket lifecycle (deprecated)

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>StorageClass</td>
<td>Specifies the Amazon S3 storage class to which you want the object to transition. Type: String Ancestor: Transition and NoncurrentVersionTransition Valid values: STANDARD_IA</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>This element is required only if you specify one or both its ancestors.</td>
<td></td>
</tr>
<tr>
<td>Transition</td>
<td>This action specifies a period in the objects' lifetime when Amazon S3 should transition them to the STANDARD_IA or the GLACIER storage class. When this action is in effect, what Amazon S3 does depends on whether the bucket is versioning-enabled.</td>
<td>Yes, if no other action is present in the Rule.</td>
</tr>
<tr>
<td></td>
<td>• If versioning has never been enabled on the bucket, Amazon S3 transitions the only copy of the object to the specified storage class.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Otherwise, when your bucket is versioning-enabled (or versioning is suspended) Amazon S3 transitions only the current versions of objects identified in the rule.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> A versioning-enabled bucket can have many versions of an object. This action has no impact on the noncurrent object versions. To transition noncurrent objects, you must use the NoncurrentVersionTransition action.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: Container Children: Days or Date, and StorageClass Ancestor: Rule</td>

Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

This implementation of the operation does not return response elements.

Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).
Examples

Example 1: Add lifecycle configuration - bucket not versioning-enabled

The following lifecycle configuration specifies two rules, each with one action.

- The Transition action requests Amazon S3 to transition objects with the "documents/" prefix to the GLACIER storage class 30 days after creation.
- The Expiration action requests Amazon S3 to delete objects with the "logs/" prefix 365 days after creation.

```
<LifecycleConfiguration>
  <Rule>
    <ID>id1</ID>
    <Prefix>documents/</Prefix>
    <Status>Enabled</Status>
    <Transition>
      <Days>30</Days>
      <StorageClass>GLACIER</StorageClass>
    </Transition>
  </Rule>
  <Rule>
    <ID>id2</ID>
    <Prefix>logs/</Prefix>
    <Status>Enabled</Status>
    <Expiration>
      <Days>365</Days>
    </Expiration>
  </Rule>
</LifecycleConfiguration>
```

The following is a sample PUT /?lifecycle request that adds the preceding lifecycle configuration to the examplebucket bucket.

```
PUT /?lifecycle HTTP/1.1
Host: examplebucket.s3.amazonaws.com
x-amz-date: Wed, 14 May 2014 02:11:21 GMT
Content-MD5: q6yJD1kcbAGGf3QLY69A==
Authorization: authorization string
Content-Length: 415

<LifecycleConfiguration>
  <Rule>
    <ID>id1</ID>
    <Prefix>documents/</Prefix>
    <Status>Enabled</Status>
    <Transition>
      <Days>30</Days>
      <StorageClass>GLACIER</StorageClass>
    </Transition>
  </Rule>
  <Rule>
    <ID>id2</ID>
    <Prefix>logs/</Prefix>
    <Status>Enabled</Status>
    <Expiration>
      <Days>365</Days>
    </Expiration>
  </Rule>
</LifecycleConfiguration>
```
The following is a sample response.

```
HTTP/1.1 200 OK
x-amz-id-2: r+qR7+nhXtJDDIJ0JJYcd+1j5nM/rUFiiiz/fNbdOsd3JUE8NWMLNHXmvFwMpdc
x-amz-request-id: 9E26D08072A8EF9E
Date: Wed, 14 May 2014 02:11:22 GMT
Content-Length: 0
Server: AmazonS3
```

**Example 2: Add lifecycle configuration - bucket is versioning-enabled**

The following lifecycle configuration specifies two rules, each with one action for Amazon S3 to perform. You specify these actions when your bucket is versioning-enabled or versioning is suspended:

- The `NoncurrentVersionExpiration` action requests Amazon S3 to expire noncurrent versions of objects with the "logs/" prefix 100 days after the objects become noncurrent.
- The `NoncurrentVersionTransition` action requests Amazon S3 to transition noncurrent versions of objects with the "documents/" prefix to the GLACIER storage class 30 days after they become noncurrent.

```
<LifecycleConfiguration>
  <Rule>
    <ID>DeleteAfterBecomingNonCurrent</ID>
    <Prefix>logs/</Prefix>
    <Status>Enabled</Status>
    <NoncurrentVersionExpiration>
      <NoncurrentDays>100</NoncurrentDays>
    </NoncurrentVersionExpiration>
  </Rule>
  <Rule>
    <ID>TransitionAfterBecomingNonCurrent</ID>
    <Prefix>documents/</Prefix>
    <Status>Enabled</Status>
    <NoncurrentVersionTransition>
      <NoncurrentDays>30</NoncurrentDays>
      <StorageClass>GLACIER</StorageClass>
    </NoncurrentVersionTransition>
  </Rule>
</LifecycleConfiguration>
```

The following is a sample PUT `/?lifecycle` request that adds the preceding lifecycle configuration to the examplebucket bucket.

```
PUT /?lifecycle HTTP/1.1
Host: examplebucket.s3.amazonaws.com
x-amz-date: Wed, 14 May 2014 02:21:48 GMT
Content-MD5: 96rxH9mDqVNKkaZddgnw==
Authorization: authorization string
Content-Length: 598

<LifecycleConfiguration>
  <Rule>
    <ID>DeleteAfterBecomingNonCurrent</ID>
    <Prefix>logs/</Prefix>
    <Status>Enabled</Status>
    <NoncurrentVersionExpiration>
      <NoncurrentDays>1</NoncurrentDays>
    </NoncurrentVersionExpiration>
  </Rule>
</LifecycleConfiguration>
```
The following is a sample response.

HTTP/1.1 200 OK
x-amz-id-2: aXQ+KbIrMmO6//3bMdDTw/CnjArwje+J49Hf+j44yRb/Vmb1kgl05A+PT98Cp/6k07hf+LD2mY=
x-amz-request-id: 02D7EC4C10381EB1
Date: Wed, 14 May 2014 02:21:50 GMT
Content-Length: 0
Server: AmazonS3

Additional Examples

Lifecycle configuration topic in the developer guide provides additional examples of transitioning objects to storage classes such as STANDARD_IA. For more information, go to Examples of Lifecycle Configuration.

Related Resources

- GET Bucket lifecycle (p. 132)
- POST Object restore (p. 362)
- By default, a resource owner, in this case a bucket owner (the AWS account that created the bucket), can perform any of the operations, and can also grant others permission to perform the operation. For more information, see the following topics in the Amazon Simple Storage Service Developer Guide.
  - Specifying Permissions in a Policy
  - Managing Access Permissions to Your Amazon S3 Resources
GET Bucket lifecycle (deprecated)

Description

Important
For updated version of this API, see GET Bucket lifecycle (p. 132). If you configured bucket lifecycle configuration using the <filter> element, you should see updated version of this topic. This topic is provided for backward compatibility.

Returns the lifecycle configuration information set on the bucket. For information about lifecycle configuration, go to Object Lifecycle Management in the Amazon Simple Storage Service Developer Guide.

To use this operation, you must have permission to perform the s3:GetLifecycleConfiguration action. The bucket owner has this permission, by default. The bucket owner can grant this permission to others. For more information about permissions, see Managing Access Permissions to Your Amazon S3 Resources in the Amazon Simple Storage Service Developer Guide.

Requests

Syntax

GET /?lifecycle HTTP/1.1
Host: bucketname.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (AWS Signature Version 4))

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers (p. 2).

Request Elements

This implementation of the operation does not use request elements.

Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers (p. 4).

Response Elements

This implementation of GET returns the following response elements.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>AbortIncompleteMultipartUpload</td>
<td>Container for specifying when an incomplete multipart upload becomes eligible for an abort operation.</td>
<td>Yes, if no other action is specified for the rule.</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DaysAfterInitiation</td>
<td>Specifies the number of days after initiating a multipart upload when the multipart upload must be completed. If it does not complete by the specified number of days, it becomes eligible for an abort operation and Amazon S3 aborts the incomplete multipart upload.</td>
<td>Yes, if Date is absent.</td>
</tr>
<tr>
<td></td>
<td>Type: Positive Integer.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestor: AbortIncompleteMultipartUpload.</td>
<td></td>
</tr>
<tr>
<td>Date</td>
<td>Date when you want S3 to take the action. For more information, see Lifecycle Rules: Based on a Specific Date in the Amazon Simple Storage Service Developer Guide. The date value must conform to the ISO 8601 format. The time is always midnight UTC.</td>
<td>Yes, if Days and ExpiredObjectDeleteMarker are absent.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestor: Expiration or Transition</td>
<td></td>
</tr>
<tr>
<td>Days</td>
<td>Specifies the number of days after object creation when the specific rule action takes effect. The object's eligibility time is calculated as creation time + the number of days, and rounding the resulting time to the next day midnight UTC.</td>
<td>Yes, if Date and ExpiredObjectDeleteMarker are absent.</td>
</tr>
<tr>
<td></td>
<td>Type: Non-negative Integer when used with Transition, Positive Integer when used with Expiration.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Ancestor: Transition or Expiration.</td>
<td></td>
</tr>
</tbody>
</table>
### Expiration

This action specifies a period in the object's lifetime when Amazon S3 should take the appropriate expiration action. The expiration action occurs only on objects that are eligible according to the period specified in the child `Date` or `Days` element. The action Amazon S3 takes depends on whether the bucket is versioning enabled.

- If versioning has never been enabled on the bucket, Amazon S3 deletes the only copy of the object permanently.
- Otherwise, if your bucket is versioning-enabled (or versioning is suspended), the action applies only to the current version of the object. Buckets with versioning-enabled or versioning-suspended can have many versions of the same object, one current version, and zero or more noncurrent versions.

Instead of deleting the current version, Amazon S3 makes it a noncurrent version by adding a delete marker as the new current version.

**Important**

If your bucket state is versioning-suspended, Amazon S3 creates a delete marker with version ID `null`. If you have a version with version ID `null`, then Amazon S3 overwrites that version.

**Note**

To set expiration for noncurrent objects, you must use the `NoncurrentVersionExpiration` action.

<table>
<thead>
<tr>
<th>Name</th>

</tbody>
</table>

**Type:** Container  
**Children:** Days or Date  
**Ancestor:** Rule
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
</table>
| LifecycleConfiguration| Container for lifecycle rules. You can add as many as 1000 rules.  
Type: Container  
Children: Rule  
Ancestor: None                                                                                                                                                                                                                                                      | Yes            |
| ExpiredObjectDeleteMarker | On a versioned bucket (versioning-enabled or versioning-suspended bucket) this element indicates if Amazon S3 will delete any expired object delete markers in the bucket. For an example, go to Example 8: Specify Expiration Action to Remove Expired Object Delete Markers in the Amazon Simple Storage Service Developer Guide.  
Type: String  
Valid values: true | false (the value false is allowed but it is no-op, Amazon S3 will not take action if the value is false)  
Ancestor: Expiration.                                                                                                                                                                                      | Yes, if Date and Days are absent. |
| NoncurrentDays        | Specifies the number of days an object is noncurrent before Amazon S3 can perform the associated action. For information about the noncurrent days calculations, see Lifecycle Rules Based on the Number of Days in the Amazon Simple Storage Service Developer Guide.  
Type: Nonnegative Integer when used with NoncurrentVersionTransition,  
Positive Integer when used with NoncurrentVersionExpiration.  
Ancestor: NoncurrentVersionExpiration or NoncurrentVersionTransition                                                                                                                                                     | Yes, only if the ancestor is present. |
| NoncurrentVersionExpiration | Specifies when noncurrent object versions expire. Upon expiration, Amazon S3 permanently deletes the noncurrent object versions.  
You set this lifecycle configuration action on a bucket that has versioning enabled (or suspended) to request that Amazon S3 delete noncurrent object versions at a specific period in the object's lifetime.  
Type: Container  
Children: NoncurrentDays  
Ancestor: Rule                                                                                                                                                                                                 | Yes, if no other action is present in the Rule. |

API Version 2006-03-01
523
### Name

**Transition**

**Description**

This action specifies a period in the objects' lifetime when Amazon S3 should transition them to the STANDARD_IA or the GLACIER storage class. When this action is in effect, what Amazon S3 does depends on whether the bucket is versioning-enabled.

- If versioning has never been enabled on the bucket, Amazon S3 transitions the only copy of the object specified storage class.
- Otherwise, when your bucket is versioning-enabled (or versioning is suspended), Amazon S3 transitions only the current versions of objects identified in the rule.

**Note**

A versioning-enabled or versioning-suspended bucket can have many versions of an object. This action has no impact on the noncurrent object versions. To transition noncurrent objects, you must use the NoncurrentVersionTransition action.

**Type:** Container  
**Children:** Days or Date, and StorageClass  
**Ancestor:** Rule

**Required**

Yes, if no other action is present in the **Rule**.

### Special Errors

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
<th>HTTP Status Code</th>
<th>SOAP Fault Code Prefix</th>
</tr>
</thead>
<tbody>
<tr>
<td>NoSuchLifecycleConfiguration</td>
<td>The lifecycle configuration does not exist.</td>
<td>404 Not Found</td>
<td>Client</td>
</tr>
</tbody>
</table>

For general information about Amazon S3 errors and a list of error codes, see Error Responses (p. 6).

### Examples

#### Example 1: Retrieve lifecycle subresource

This example shows a GET request to retrieve the lifecycle subresource from the specified bucket and an example response with the returned lifecycle configuration.

**Sample Request**

```plaintext
GET /?lifecycle HTTP/1.1  
Host: examplebucket.s3.amazonaws.com
```
Sample Response

HTTP/1.1 200 OK
x-amz-id-2: ITnGT1y4RyTmXa3rPi4hklTXouTf0hcUjo0iCFjz6FnfIutBj3M7fPGLW02SEWp
x-amz-request-id: 51991C342C575321
Date: Thu, 15 Nov 2012 00:17:23 GMT
Server: AmazonS3
Content-Length: 358

<?xml version="1.0" encoding="UTF-8"?>
<LifecycleConfiguration xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <Rule>
    <ID>Archive and then delete rule</ID>
    <Prefix>projectdocs/</Prefix>
    <Status>Enabled</Status>
    <Transition>
      <Days>30</Days>
      <StorageClass>STANDARD_IA</StorageClass>
    </Transition>
    <Transition>
      <Days>365</Days>
      <StorageClass>GLACIER</StorageClass>
    </Transition>
    <Expiration>
      <Days>3650</Days>
    </Expiration>
  </Rule>
</LifecycleConfiguration>

## Glossary

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>100-continue</td>
<td>A method that enables a client to see if a server can accept a request before actually sending it. For large PUTs, this can save both time and bandwidth charges.</td>
</tr>
<tr>
<td>account</td>
<td>AWS account associated with a particular developer.</td>
</tr>
<tr>
<td>authentication</td>
<td>The process of proving your identity to the system.</td>
</tr>
<tr>
<td>bucket</td>
<td>A container for objects stored in Amazon S3. Every object is contained within a bucket. For example, if the object named photos/puppy.jpg is stored in the johnsmith bucket, then it is addressable using the URL <a href="http://johnsmith.s3.amazonaws.com/photos/puppy.jpg">http://johnsmith.s3.amazonaws.com/photos/puppy.jpg</a></td>
</tr>
<tr>
<td>canned access policy</td>
<td>A standard access control policy that you can apply to a bucket or object. Valid Values: private</td>
</tr>
<tr>
<td>canonicalization</td>
<td>The process of converting data into a standard format that will be recognized by a service such as Amazon S3.</td>
</tr>
<tr>
<td>consistency model</td>
<td>The method through which Amazon S3 achieves high availability, which involves replicating data across multiple servers within Amazon's data centers. After a &quot;success&quot; is returned, your data is safely stored. However, information about the changes might not immediately replicate across Amazon S3.</td>
</tr>
<tr>
<td>key</td>
<td>The unique identifier for an object within a bucket. Every object in a bucket has exactly one key. Since a bucket and key together uniquely identify each object, Amazon S3 can be thought of as a basic data map between &quot;bucket + key&quot; and the object itself. Every object in Amazon S3 can be uniquely addressed through the combination of the web service endpoint, bucket name, and key, as in <a href="http://doc.s3.amazonaws.com/2006-03-01/AmazonS3.wsdl">http://doc.s3.amazonaws.com/2006-03-01/AmazonS3.wsdl</a>, where &quot;doc&quot; is the name of the bucket, and &quot;2006-03-01/AmazonS3.wsdl&quot; is the key.</td>
</tr>
<tr>
<td>metadata</td>
<td>The metadata is a set of name-value pairs that describe the object. These include default metadata such as the date last modified and standard HTTP metadata such as Content-Type. The developer can also specify custom metadata at the time the Object is stored.</td>
</tr>
<tr>
<td>object</td>
<td>The fundamental entities stored in Amazon S3. Objects consist of object data and metadata. The data portion is opaque to Amazon S3.</td>
</tr>
<tr>
<td><strong>part</strong></td>
<td>The fundamental entities stored in Amazon S3. Objects consist of object data and metadata. The data portion is opaque to Amazon S3.</td>
</tr>
<tr>
<td><strong>service endpoint</strong></td>
<td>The host and port with which you are trying to communicate within the destination URL. For virtual hosted-style requests, this is <em>mybucket.s3.amazonaws.com</em>. For path-style requests, this is <em>s3.amazonaws.com</em></td>
</tr>
</tbody>
</table>
