Run the following commands from the AWS CLI to delete and restart your RStudioServerPro app.

1. Delete the RStudioServerPro application by using your current domain id.

```
aws sagemaker delete-app \
    --domain-id <domainId> \
    --user-profile-name domain-shared \
    --app-type RStudioServerPro \
    --app-name default
```

2. Re-create the RStudioServerPro application.

```
aws sagemaker create-app \
    --domain-id <domainId> \
    --user-profile-name domain-shared \
    --app-type RStudioServerPro \
    --app-name default
```

Manage billing and cost

To track the costs associated with your RStudio environment, you can use the AWS Billing and Cost Management service. AWS Billing and Cost Management provides useful tools to help you gather information related to your cost and usage, analyze your cost drivers and usage trends, and take action to budget your spending. For more information, see What is AWS Billing and Cost Management?.

The following describes components required to run RStudio on Amazon SageMaker and how each component factors into billing for your RStudio instance.

- RStudio License –You must purchase an RStudio license. There is no additional charge for using your RStudio license with Amazon SageMaker. For more information about your RStudio license, see RStudio license.

- RSession - These are RStudio working sessions launched by end users. You are charged while the RSession is running.
- RStudio Server - A multi-tenant server manages all the RSessions. You can choose the instance type to run RStudio Server on, and pay the related costs. The default instance, "system", is free, but you can choose to pay for higher tiers. For more information about the available instance types for your RStudio Server, see RStudioServerPro instance type.

Tracking billing at user level

To track billing at the user level using Cost Allocation Tags, see Using Cost Allocation Tags.

Diagnose issues and get support

The following sections describe how to diagnose issues with RStudio on Amazon SageMaker. To get support for RStudio on Amazon SageMaker, contact Amazon SageMaker support. For help with purchasing an RStudio license or modifying the number of license seats, contact sales@rstudio.com.

Upgrade your version

If you receive a warning that there is a version mismatch between your RSession and RStudioServerPro apps, then you must upgrade the version of your RStudioServerPro app. For more information, see Upgrade the RStudio Version.

View Metrics and Logs

You can monitor your workflow performance while using RStudio on Amazon SageMaker. View data logs and information about metrics with the RStudio administrative dashboard or Amazon CloudWatch.

View your RStudio logs from the RStudio administrative dashboard

You can view metrics and logs directly from the RStudio administrative dashboard.

1. Log in to your **Amazon SageMaker domain**.
2. Navigate to the RStudio administrative dashboard following the steps in RStudio administrative dashboard.
3. Select the **Logs** tab.

View your RStudio logs from Amazon CloudWatch Logs

Amazon CloudWatch monitors your AWS resources and the applications that you run on AWS in real time. You can use Amazon CloudWatch to collect and track metrics, which are variables that you can measure for your resources and applications. To ensure that your RStudio apps have permissions for Amazon CloudWatch, you must include the permissions described in Amazon SageMaker domain overview. You don't need to do any setup to gather Amazon CloudWatch Logs.

The following steps show how to view Amazon CloudWatch Logs for your RSession.

These logs can be found in the `/aws/sagemaker/studio` log stream from the AWS CloudWatch console.

1. Open the CloudWatch console at https://console.aws.amazon.com/cloudwatch/.
2. Select `Logs` from the left side. From the dropdown menu, select `Log groups`.
3. On the `Log groups` screen, search for `aws/sagemaker/studio`. Select the Log group.
4. On the `aws/sagemaker/studio Log group` screen, navigate to the `Log streams` tab.
5. To find the logs for your domain, search `Log streams` using the following format:

```
<DomainId>/domain-shared/rstudioserverpro/default
```

Use RStudio on Amazon SageMaker

With RStudio support in Amazon SageMaker, you can put your production workflows in place and take advantage of SageMaker features. The following topics show how to launch an RStudio session and complete key workflows. For information about managing RStudio on SageMaker, see Manage RStudio on Amazon SageMaker.

For information about the onboarding steps to create an Amazon SageMaker domain with RStudio enabled, see Amazon SageMaker domain overview.

For information about the AWS Regions that RStudio on SageMaker is supported in, see Supported Regions and Quotas.

Topics

- Collaborate in RStudio
- Base R image

- RSession application colocation
- Open RStudio Launcher and launch RSessions
- Publish to RStudio Connect
- Access Amazon SageMaker features with RStudio on Amazon SageMaker

Collaborate in RStudio

To share your RStudio project, you can connect RStudio to your Git repo. For information on setting this up, see Version Control with Git and SVN.

Note: Project sharing and realtime collaboration are not currently supported when using RStudio on Amazon SageMaker.

Base R image

When launching your RStudio instance, the Base R image serves as the basis of your instance. This image extends the r-session-complete Docker image.

This Base R image includes the following:

- R v4.0 or higher
- `awscli`, `sagemaker`, and `boto3` Python packages
- Reticulate package for R SDK integration

RSession application colocation

Users can create multiple RSession applications on the same instance. Each instance type supports up to four colocated RSession applications. This applies to each user independently. For example, if two users create applications, then SageMaker allocates different underlying instances to each user. Each of these instances would support 4 RSession applications.

Customers only pay for the instance type used regardless of how many Rsession applications are running on the instance. If a user creates an RSession with a different associated instance type, then a new underlying instance is created.

Open RStudio Launcher and launch RSessions

> **Important**
>
> Custom IAM policies that allow Amazon SageMaker Studio or Amazon SageMaker Studio Classic to create Amazon SageMaker resources must also grant permissions to add tags to those resources. The permission to add tags to resources is required because Studio and Studio Classic automatically tag any resources they create. If an IAM policy allows Studio and Studio Classic to create resources but does not allow tagging, "AccessDenied" errors can occur when trying to create resources. For more information, see Provide Permissions for Tagging SageMaker Resources.
> AWS Managed Policies for Amazon SageMaker that give permissions to create SageMaker resources already include permissions to add tags while creating those resources.

The following topics show how to use the RStudio Launcher to launch RSessions.

Open RStudio Launcher

Open the RStudio launcher using the following set of procedures that matches your environment.

Open RStudio Launcher from the Amazon SageMaker Console

1. Open the Amazon SageMaker console at https://console.aws.amazon.com/sagemaker/.
2. From the left navigation, select **RStudio**.
3. Under **Get Started**, select the domain and user profile to launch.
4. Choose **Launch RStudio**.

Open RStudio Launcher from Amazon SageMaker Studio

1. Navigate to Studio following the steps in Launch Amazon SageMaker Studio.
2. Under **Applications**, select **RStudio**.
3. From the RStudio landing page, choose **Launch application**.

Open RStudio Launcher from the AWS CLI

The procedure to open the RStudio Launcher using the AWS CLI differs depending on the method used to manage your users.

IAM Identity Center

1. Use the AWS access portal to open your Amazon SageMaker domain.
2. Modify the URL path to "/rstudio/default" as follows.

```
#Studio URL
https://<domain-id>.studio.<region>.sagemaker.aws/jupyter/default/lab

#modified URL
https://<domain-id>.studio.<region>.sagemaker.aws/rstudio/default
```

IAM

To open the RStudio Launcher from the AWS CLI in IAM mode, complete the following procedure.

1. Create a presigned URL using the following command.

```
aws sagemaker create-presigned-domain-url --region <REGION> \
    --domain-id <DOMAIN-ID> \
    --user-profile-name <USER-PROFILE-NAME>
```

2. Append *&redirect=RStudioServerPro* to the generated URL.
3. Navigate to the updated URL.

Launch RSessions

After you've launched the RStudio Launcher, you can create a new RSession.

1. Select **New Session**.
2. Enter a **Session Name**.
3. Select an instance type that your RSession runs on. This defaults to `ml.t3.medium`.
4. Select an Image that your RSession uses as the kernel.
5. Select Start Session.
6. After your session has been created, you can start it by selecting the name.

> **Note**
>
> If you receive a warning that there is a version mismatch between your RSession and RStudioServerPro apps, then you must upgrade the version of your RStudioServerPro app. For more information, see Upgrade the RStudio Version.

Suspend your RSessions

1. From the RStudio Launcher, identify the RSession that you want to suspend.
2. Select **Suspend** for the session.

Delete your RSessions

1. From the RStudio Launcher, identify the RSession that you want to delete.
2. Select **Quit** for the session. This opens a new **Quit Session** window.
3. From the **Quit Session** window, select **Force Quit**, to end all child processes in the session.
4. Select **Quit Session** to confirm deletion of the session.

Publish to RStudio Connect

RStudio Connect enables data scientists to publish insights, dashboard and web applications from RStudio on Amazon SageMaker. For more information, see Host RStudio Connect and Package Manager for ML development in RStudio on Amazon SageMaker.

For more information on RStudio Connect, see the RStudio Connect User Guide.

Access Amazon SageMaker features with RStudio on Amazon SageMaker

One of the benefits of using RStudio on Amazon SageMaker is the integration of Amazon SageMaker features. This includes integration with Amazon SageMaker Studio Classic and Reticulate.

Use Amazon SageMaker Studio Classic and RStudio on Amazon SageMaker

Your Amazon SageMaker Studio Classic and RStudio instances share the same Amazon EFS file system. This means that files that you import and create using Studio Classic can be accessed

using RStudio and vice versa. This allows you to work on the same files using both Studio Classic and RStudio without having to move your files between the two. For more information on this workflow, see the Announcing Fully Managed RStudio on Amazon SageMaker for Data Scientists blog.

Use Amazon SageMaker SDK with reticulate

The reticulate package is used as an R interface to Amazon SageMaker Python SDK to make API calls to Amazon SageMaker. The reticulate package translates between R and Python objects, and Amazon SageMaker provides a serverless data science environment to train and deploy Machine Learning (ML) models at scale. For general information about the reticulate package, see R Interface to Python.

For a blog that outlines how to use the reticulate package with Amazon SageMaker, see Using R with Amazon SageMaker.

The following examples show how to use reticulate for specific use cases.

- For a notebook that describes how to use reticulate to do batch transform to make predictions, see Batch Transform Using R with Amazon SageMaker.
- For a notebook that describes how to use reticulate to conduct hyperparameter tuning and generate predictions, see Hyperparameter Optimization Using R with Amazon SageMaker.

Get started with Code Editor in Amazon SageMaker Studio

Code Editor, based on Code-OSS, Visual Studio Code - Open Source, helps you write, test, debug, and run your analytics and machine learning code. Code Editor extends and is fully integrated with Amazon SageMaker Studio. It also supports integrated development environment (IDE) extensions available in the Open VSX Registry.

Code Editor has the AWS Toolkit for VS Code extension pre-installed, which enables connections to AWS services such as Amazon CodeWhisperer, a general purpose, machine learning-powered code generator that provides code recommendations in real time. For more information about extensions, see Code Editor Connections and Extensions.

> **Important**
>
> As of November 30, 2023, the previous Amazon SageMaker Studio experience is now named Amazon SageMaker Studio Classic. The following section is specific to using the

updated Studio experience. For information about using the Studio Classic application, see Amazon SageMaker Studio Classic.

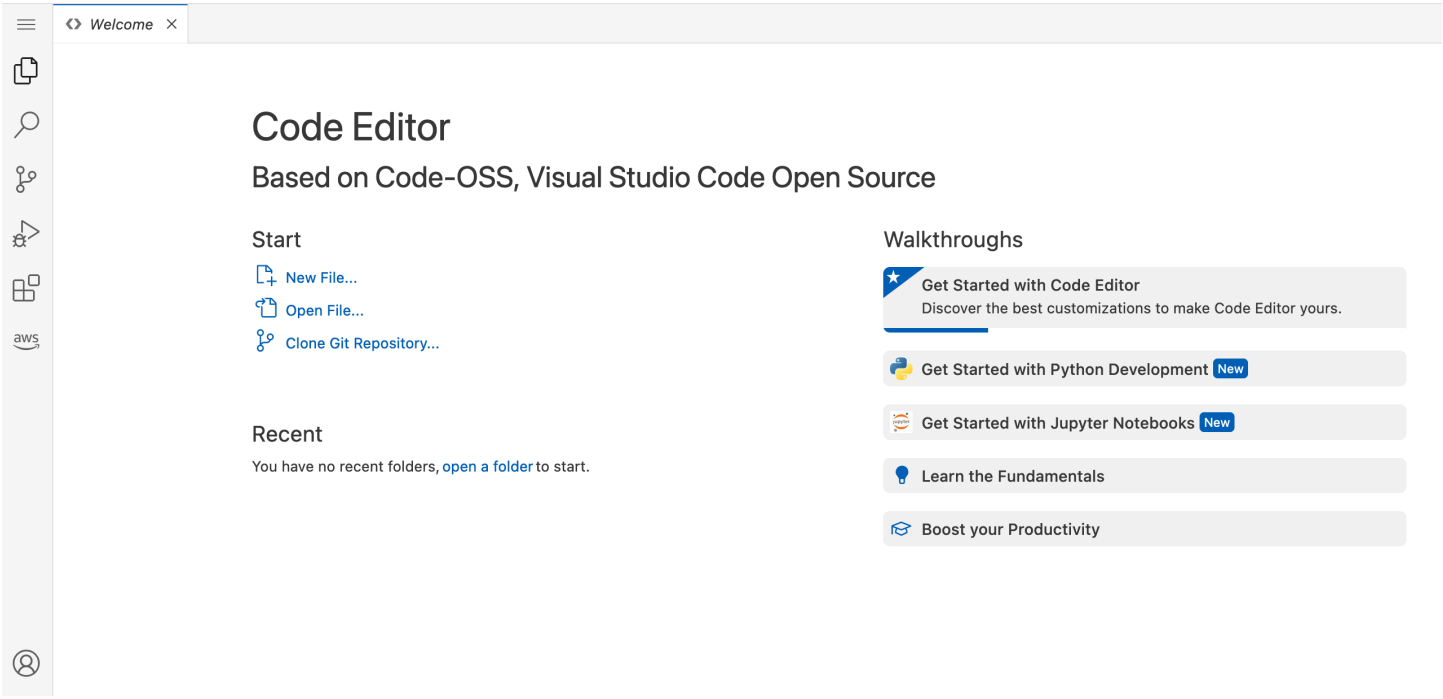
To launch Code Editor, create a Code Editor private space. The Code Editor space uses a single Amazon Elastic Compute Cloud (Amazon EC2) instance for your compute and a single Amazon Elastic Block Store (Amazon EBS) volume for your storage. Everything in your space such as your code, Git profile, and environment variables are stored on the same Amazon EBS volume. The volume has 3000 IOPS and a throughput of 125 MBps. Your administrator has configured the default Amazon EBS storage settings for your space.

The default storage size is 5 GB, but your administrator can increase the amount of space you get. For more information, see Change the default storage size.

You can scale your compute up or down by changing the Amazon EC2 instance type that runs your Code Editor application. Before you change the associated instance type, you must first stop your Code Editor space. For more information, see Code Editor application instances and images.

Your administrator might provide you with a lifecycle configuration to customize your environment. You can specify the lifecycle configuration when you create the space. For more information, see Code Editor lifecycle configurations.

You can also bring your own file storage system if you have an Amazon EFS volume.



Topics

Code Editor user guide

The topics in this section provide guides for using Code Editor, including how to launch, add connections to AWS services, shut down resources, and more. After creating a Code Editor space, you can access your Code Editor session directly through the browser.

Within your Code Editor environment, you can do the following:

- Access all artifacts persisted in your home directory
- Clone your GitHub repositories and commit changes
- Access the SageMaker Python SDK

You can return to Studio to review any assets created in your Code Editor environment such as experiments, pipelines, or training jobs.

Topics

Check the version of Code Editor

The following steps show how to check the version of your Code Editor application.

To check the Code Editor application version

1. Launch and run a Code Editor space and navigate to the Code Editor application UI. For more information, see Launch a Code Editor application in Studio.

2. In the upper-left corner of the Code Editor UI, choose the menu button (). Then, choose **Help**. Then, choose **About**.

> **Note**
>
> The current release of SageMaker Code Editor is based off of version 1.83.1 of Code-OSS, Visual Studio Code - Open Source.

Code Editor application instances and images

Only some instances are compatible with Code Editor applications. You can choose the instance type that is compatible with your use case from the **Instance** dropdown menu.

The **Fast launch** instances start up much faster than the other instances. For more information about fast launch instance types in Studio, Available Studio Classic Instance Types.

> **Note**
>
> If you use a GPU instance type when configuring your Code Editor application, you must also use a GPU-based image. The Code Editor space UI automatically selects a compatible image when you select your instance type.

Within a space, your data is stored in an Amazon EBS volume that persists independently from the life of an instance. You won't lose your data when you change instances. If your Code Editor space is `Running`, you must stop your space before changing instance types.

The following table lists the ARNs of the available Code Editor CPU and GPU images for each Region.

Region	CPU	GPU
us-east-1	arn:aws:sagemaker:us-east-1:885854791233:image/sagemaker-distribution-cpu	arn:aws:sagemaker:us-east-1:885854791233:image/sagemaker-distribution-gpu

us-east-2	arn:aws:sagemaker:us-east-2:37914896644:image/sagemaker-distribution-cpu	arn:aws:sagemaker:us-east-2:37914896644:image/sagemaker-distribution-gpu
us-west-1	arn:aws:sagemaker:us-west-1:053634841547:image/sagemaker-distribution-cpu	arn:aws:sagemaker:us-west-1:053634841547:image/sagemaker-distribution-gpu
us-west-2	arn:aws:sagemaker:us-west-2:542918446943:image/sagemaker-distribution-cpu	arn:aws:sagemaker:us-west-2:542918446943:image/sagemaker-distribution-gpu
af-south-1	arn:aws:sagemaker:af-south-1:238384257742:image/sagemaker-distribution-cpu	arn:aws:sagemaker:af-south-1:238384257742:image/sagemaker-distribution-gpu

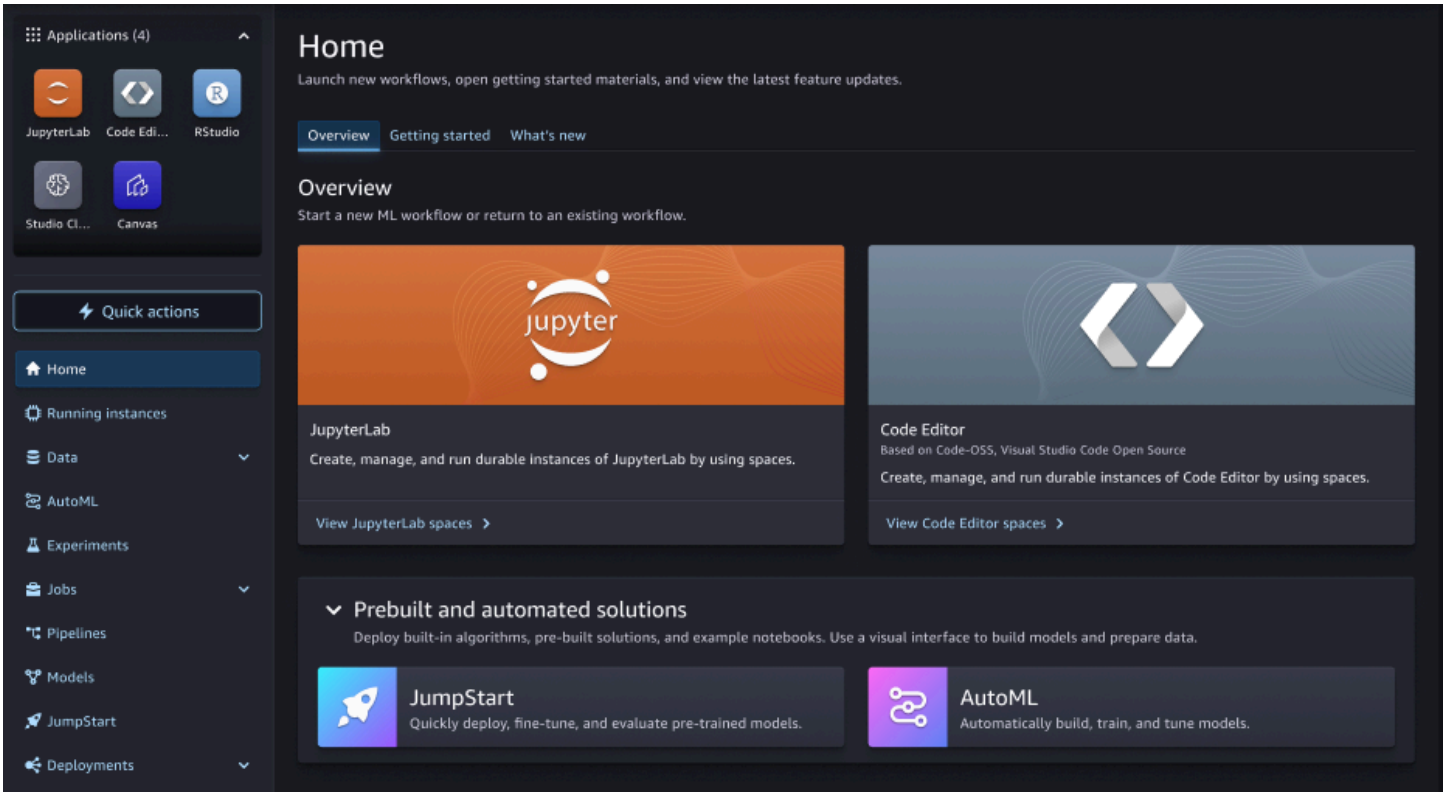
If you encounter instance limits, contact your administrator. To get more storage and compute for a user, administrators can request an increase to a user's AWS quotas. For more information about requesting a quota increase, see Amazon SageMaker endpoints and quotas.

Launch a Code Editor application in Studio

To configure and access your Code Editor integrated development environment through Studio, you must create a Code Editor space. For more information about spaces in Studio, see Amazon SageMaker Studio spaces.



The following procedure shows how to create and run a Code Editor space.

To create and run a Code Editor space

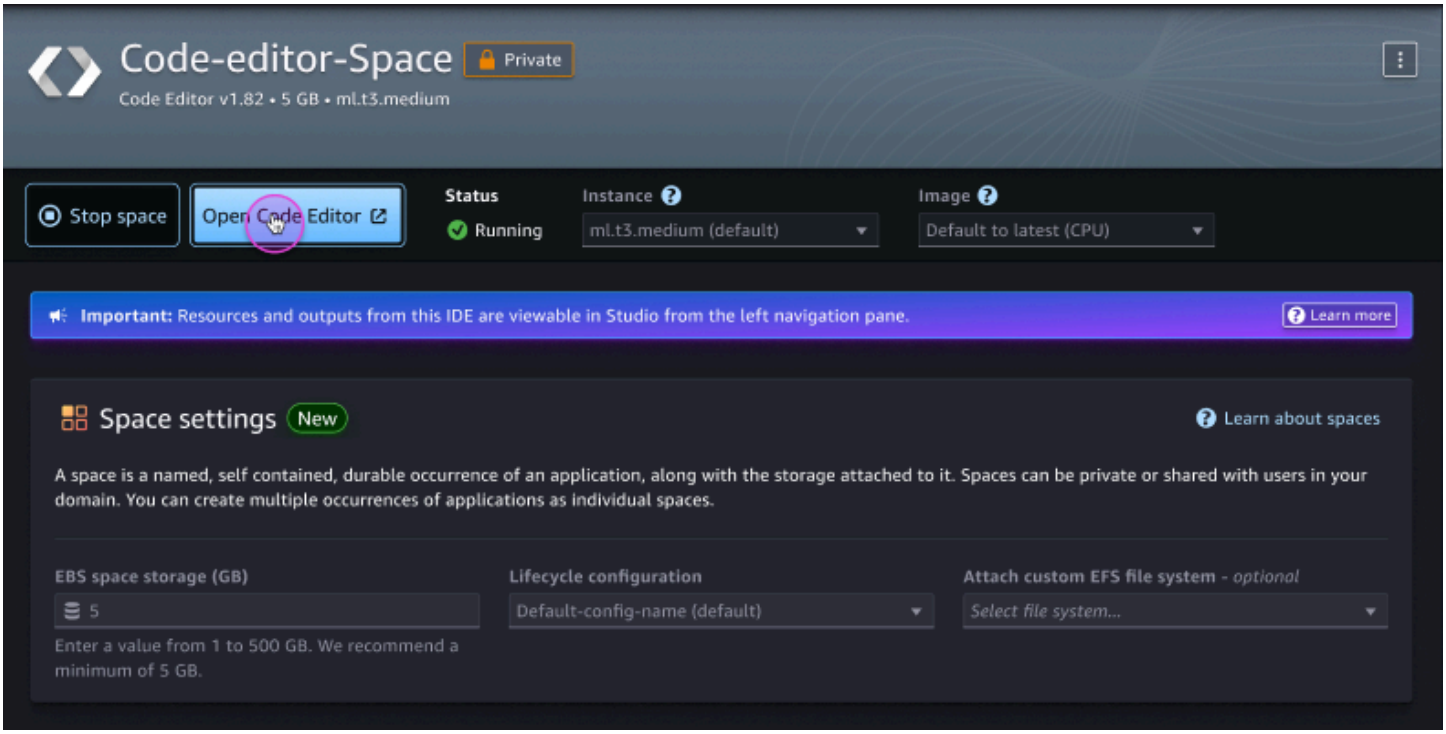
1. Launch the updated Studio experience. For more information, see Launch Amazon SageMaker Studio.
2. Do one of the following:
   - Within the updated Amazon SageMaker Studio UI, select **Code Editor** from the **Applications** menu.
   - Within the updated Amazon SageMaker Studio UI, choose **View Code Editor spaces** in the **Overview** section of the Studio homepage.
3. In the upper-right corner of the Code Editor landing page, choose **Create Code Editor space**.
4. Enter a name for your Code Editor space. The name must be 1–62 characters in length using letters, numbers, and dashes only.
5. Choose **Create space**.
6. After the space is created, you have some options before you choose to run the space:
   - You can edit the **Storage (GB)**, **Lifecycle Configuration**, or **Attach custom EFS file system** settings. Options for these settings are available based on administrator specification.

- From the **Instance** dropdown menu, you can choose the instance type most compatible with your use case. From the **Image** dropdown menu, you can choose a SageMaker Distribution image or a custom image provided by your administrator.

  If you use a GPU instance type when configuring your Code Editor application, you must also use a GPU-based image. Within a space, your data is stored in an Amazon EBS volume that persists independently from the life of an instance. You won't lose your data when you change instances.

> **Note**
>
> To update space settings, you must first stop your space. If your Code Editor uses an instance with NVMe instance stores, any data stored on the NVMe store is deleted when the space is stopped.

7. After updating your settings, choose **Run Space** in the space detail page.
8. After the status of the space is `Running`, choose **Open Code Editor** to go to your Code Editor session.



Within the Code Editor Studio landing page, you can filter and manage existing spaces.

To manage your Code Editor spaces

1. Navigate to the Code Editor Studio landing page and filter your Code Editor spaces by **Private to me** or **Running**.
2. Do one of the following:
   - Within the Code Editor Studio landing page, in the row of the space name of your choice, you can **Stop**, **Start**, or **Open** that space in the **Action** column.
   - Choose the name of a space in the Code Editor Studio landing page. This takes you to the space detail page where you can also **Stop**, **Start**, or **Open** that space or update the space settings.

Launch a Code Editor application using the AWS CLI

To configure and access your Code Editor integrated development environment through the AWS Command Line Interface (AWS CLI), you must create a Code Editor space. Be sure to meet the Prerequisites before going through the following steps. Use the following procedure to create and run a Code Editor space.

To create and run a Code Editor space

1. Access a space using AWS Identity and Access Management (IAM) or AWS IAM Identity Center authentication. For more information about accessing spaces using the AWS CLI, see *Accessing spaces using the AWS Command Line Interface* in Amazon SageMaker Studio spaces.
2. Create an application and specify `CodeEditor` as the `app-type` using the following command.

   If you use a GPU instance type when creating your Code Editor application, you must also use a GPU-based image.

```
aws sagemaker create-app \
--domain-id domain-id \
--space-name space-name \
--app-type CodeEditor \
--app-name default \
--resource-spec "SageMakerImageArn=arn:aws:sagemaker:region:account-
id:image/sagemaker-distribution-cpu"
```

For more information about available Code Editor image ARNs, see Code Editor application instances and images.

3. After the Code Editor application is in service, launch the application using a presigned URL. You can use the `describe-app` API to check if your application is in service. Use the `create-presigned-domain-url` API to create a presigned URL:

```
aws sagemaker create-presigned-domain-url \
--domain-id domain-id \
--space-name space-name \
--user-profile-name user-profile-name \
--session-expiration-duration-in-seconds 43200 \
--landing-uri app:CodeEditor:
```

4. Open the generated URL to start working in your Code Editor application.

Clone a repository in Code Editor

You can navigate through folders and clone a repository in the **Explorer** window of the Code Editor application UI.

To clone a repository, go through the following steps:

To clone a repository

1. Open your Code Editor application in the browser, and choose the **Exploration** button () in the left navigation pane.
2. Choose **Clone Repository** in the **Explorer** window. Then, provide a repository URL or pick a repository source in the prompt.
3. Choose a folder to clone your repository into. Note that the default Code Editor folder is `/home/sagemaker-user/`. Cloning your repository may take some time.
4. To open the cloned repository, choose either **Open in New Window** or **Open**.
5. To return to the Code Editor application UI homepage, choose **Cancel**.
6. Within the repository, a prompt asks if you trust the authors of the files in your new repository. You have two choices:

a. To trust the folder and enable all features, choose **Yes, I trust the authors**.

b. To browse the repository content in *restricted mode*, choose **No, I don't trust the authors**.

   In restricted mode, tasks are not allowed to run, debugging is disabled, workspace settings are not applied, and extensions have limited functionality.

   To exit restricted mode, trust the authors of all files in your current folder or its parent folder, and enable all features, choose **Manage** in the **Restricted Mode** banner.

Code Editor Connections and Extensions

Code Editor supports IDE connections to AWS services as well as extensions available in the Open VSX Registry.

Connections to AWS

Code Editor environments are integrated with the AWS Toolkit for VS Code to add connections to AWS services. To get started with connections to AWS services, you must have valid AWS Identity and Access Management (IAM) credentials. For more information, see Authentication and access for the AWS Toolkit for Visual Studio Code.

Within your Code Editor environment, you can add connections to:

- AWS Explorer – View, modify, and deploy AWS resources in Amazon S3, CloudWatch, and more.

  Accessing certain features within AWS Explorer requires certain AWS permissions. For more information, see Authentication and access for the AWS Toolkit for Visual Studio Code.
- Amazon CodeWhisperer – Build applications faster with AI-powered code suggestions.

  To use Amazon CodeWhisperer with Code Editor, you must add the following permissions to your SageMaker execution role.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "CodeWhispererPermissions",
      "Effect": "Allow",
      "Action": ["codewhisperer:GenerateRecommendations"],
      "Resource": "*"
```

```
    }
  ]
}
```

For more information, see Creating IAM policies and Adding and removing IAM identity permissions in the *IAM User Guide*.

Extensions

Code Editor supports IDE extensions available in the Open VSX Registry.

To get started with extensions in your Code Editor environment, choose the **Extensions** icon () in the left navigation pane. Here, you can configure connections to AWS by installing the AWS Toolkit. For more information, see Installing the AWS Toolkit for Visual Studio Code.

In the search bar, you can search directly for additional extensions through the Open VSX Registry, such as the AWS Toolkit, Jupyter, Python, and more.

Log out and shut down resources

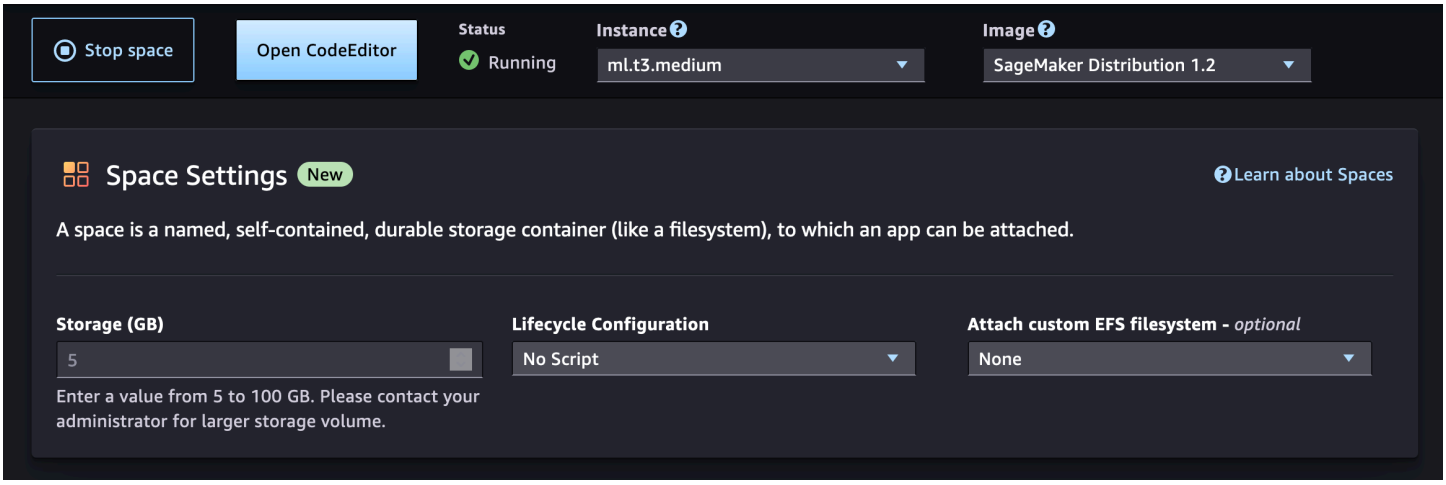
In the upper-left corner of the Code Editor environment, choose the menu icon (). Then, choose **SageMaker: Log out**.

Stop your space through Studio

To stop your Code Editor space in Studio use the following steps:

To stop your Code Editor space in Studio

1. Return to the Code Editor landing page by doing one of the following:
   a. In the navigation bar in the upper-left corner, choose **Code Editor**.
   b. Alternatively, in the left navigation pane, choose **Code Editor** in the **Applications** menu.
2. Find the name of the Code Editor space you created. If the status of your space is **Running**, choose **Stop** in the **Action** column. You can also stop your space directly in the space detail page by choosing **Stop space**. The space may take some time to stop.



Additional resources such as SageMaker endpoints, Amazon EMR (Amazon EMR) clusters and Amazon Simple Storage Service (Amazon S3) buckets created from Studio are not automatically deleted when your space instance shuts down. To stop accruing charges from resources, delete any additional resources. For more information, see Delete unused resources.

Shut down resources using the AWS CLI

You can delete your Code Editor application and space using the AWS Command Line Interface (AWS CLI).

- DeleteApp
- DeleteSpace

Code Editor administrator guide

You can use Code Editor with an On-Demand Instance for faster start-up time, and configurable storage. You can launch a Code Editor application through Amazon SageMaker Studio or through the AWS CLI. You can also edit Code Editor default settings within the domain console. For more information, see View and edit domains.

Topics

- Prerequisites
- Give your users access to private spaces
- Change the default storage size
- Code Editor lifecycle configurations
- Customize environments using custom images

Prerequisites

To use Code Editor, based on Code-OSS, Visual Studio Code - Open Source, first onboard to Amazon SageMaker domain and create a user profile. For more information, see Amazon SageMaker domain overview.

If you are interacting with your Code Editor application using the AWS CLI, you must also complete the following prerequisites.

- Update the AWS CLI by following the steps in Installing the current AWS CLI Version.
- From your local machine, run `aws configure` and provide your AWS credentials. For information about AWS credentials, see Understanding and getting your AWS credentials.

To get more storage and compute for your application, you can request an increase to your AWS quotas. For more information about requesting a quota increase, see Amazon SageMaker endpoints and quotas.

Give your users access to private spaces

> **Important**
>
> Custom IAM policies that allow Amazon SageMaker Studio or Amazon SageMaker Studio Classic to create Amazon SageMaker resources must also grant permissions to add tags to those resources. The permission to add tags to resources is required because Studio and Studio Classic automatically tag any resources they create. If an IAM policy allows Studio and Studio Classic to create resources but does not allow tagging, "AccessDenied" errors can occur when trying to create resources. For more information, see Provide Permissions for Tagging SageMaker Resources.
> AWS Managed Policies for Amazon SageMaker that give permissions to create SageMaker resources already include permissions to add tags while creating those resources.

This section provides a policy that grants user access to private spaces. You can also use the policy to restrict private spaces and applications that are associated with them to the owner associated with the user profile.

You must provide your users with permissions to the following:

- Private spaces

- The user profile required for access to the private spaces

To provide permissions, attach the following policy to the IAM roles of your users.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {

      "Effect": "Allow",
      "Action": [

        }
      }
    },
    {
      "Sid": "SMStudioRestrictCreatePrivateSpaceAppsToOwnerUserProfile",
      "Effect": "Allow",
      "Action": [
        "sagemaker:CreateApp",
        "sagemaker:DeleteApp"
      ],
      "Resource": "arn:aws:sagemaker:{{Region}}:{{AccountId}}:app/
${sagemaker:DomainId}/*",
      "Condition": {
        "ArnLike": {
          "sagemaker:OwnerUserProfileArn": "arn:aws:sagemaker:
${aws:Region}:${aws:PrincipalAccount}:user-profile/${sagemaker:DomainId}/
${sagemaker:UserProfileName}"
        },
        "StringEquals": {
          "sagemaker:SpaceSharingType": [
            "Private"
          ]
        }
      }
    },
  ]
}
```

Change the default storage size

You can change the default storage settings of your users. You can also change the default storage settings based on your organizational requirements and the needs of your users.

To change the storage size of your users, do the following:

1. Update the Amazon EBS storage settings in the domain.
2. Create a user profile and specify the storage settings within it.

Use the following AWS Command Line Interface (AWS CLI) command to update the domain.

```
aws --region $REGION sagemaker update-domain \
--domain-id $DOMAIN_ID \
--default-user-settings '{
    "SpaceStorageSettings": {
        "DefaultEbsStorageSettings":{
            "DefaultEbsVolumeSizeInGb":5,
            "MaximumEbsVolumeSizeInGb":100
        }
    }
}'
```

Use the following AWS CLI command to create the user profile and specify the default storage settings.

```
aws --region $REGION sagemaker create-user-profile \
--domain-id $DOMAIN_ID \
--user-profile-name $USER_PROFILE_NAME \
--user-settings '{
    "SpaceStorageSettings": {
        "DefaultEbsStorageSettings":{
            "DefaultEbsVolumeSizeInGb":5,
            "MaximumEbsVolumeSizeInGb":100
        }
    }
}'
```

Use the following AWS CLI commands to update the default storage settings in the user profile.

```
aws --region $REGION sagemaker update-user-profile \
--domain-id $DOMAIN_ID \
--user-profile-name $USER_PROFILE_NAME \
--user-settings '{
    "SpaceStorageSettings": {
        "DefaultEbsStorageSettings":{
            "DefaultEbsVolumeSizeInGb":25,
            "MaximumEbsVolumeSizeInGb":200
```

```
        }
    }
}'
```

Code Editor lifecycle configurations

You can use Code Editor lifecycle configurations to automate customization for your Studio environment. This customization includes installing custom packages, configuring extensions, preloading datasets, and setting up source code repositories.

The following instructions use the AWS Command Line Interface (AWS CLI) to create, attach, debug, and detach lifecycle configurations for the `CodeEditor` application type:

- Create and attach lifecycle configurations in Studio
- Debug lifecycle configurations in Studio
- Detach lifecycle configurations in Studio

Create and attach lifecycle configurations in Studio

The following section provides AWS CLI commands to create a lifecycle configuration, attach a lifecycle configuration when creating a new user profile, and attach a lifecycle configuration when updating a user profile. For prerequisites and general steps on creating and attaching lifecycle configurations in Studio, see Create and associate a lifecycle configuration.

When creating your Studio lifecycle configuration with the `create-studio-lifecycle-config` command, be sure to specify that the `studio-lifecycle-config-app-type` is *`CodeEditor`*. The following example shows how to create a new Studio lifecycle configuration for your Code Editor application.

```
aws sagemaker create-studio-lifecycle-config \
--studio-lifecycle-config-name my-code-editor-lcc \
--studio-lifecycle-config-content $LCC_CONTENT \
--studio-lifecycle-config-app-type CodeEditor
```

Note the ARN of the newly created lifecycle configuration that is returned. When attaching a lifecycle configuration, provide this ARN within the `LifecycleConfigArns` list of `CodeEditorAppSettings`.

You can attach a lifecycle configuration when creating a user profile or domain. The following example shows how to create a new user profile with the lifecycle configuration attached. You can also create a new domain with a lifecycle configuration attached by using the create-domain command.

```
# Create a new UserProfile
aws sagemaker create-user-profile \
--domain-id domain-id \
--user-profile-name user-profile-name \
--user-settings '{
"CodeEditorAppSettings": {
  "LifecycleConfigArns":
    [lifecycle-configuration-arn-list]
  }
}'
```

You can alternatively attach a lifecycle configuration when updating a user profile or domain. The following example shows how to update a user profile with the lifecycle configuration attached. You can also update a new domain with a lifecycle configuration attached by using the update-domain command.

```
# Update a UserProfile
aws sagemaker update-user-profile \
--domain-id domain-id \
--user-profile-name user-profile-name \
--user-settings '{
"CodeEditorAppSettings": {
  "LifecycleConfigArns":
    [lifecycle-configuration-arn-list]
  }
}'
```

Debug lifecycle configurations in Studio

For instructions on debugging lifecycle configurations in Studio, see Debug lifecycle configurations.

To find the logs for a specific application, search the log streams using the following format:

```
domain-id/space-name/CodeEditor/default/LifecycleConfigOnStart
```

Detach lifecycle configurations in Studio

For steps on detaching lifecycle configurations in Studio, see Detach lifecycle configurations.

To detach a lifecycle configuration using the AWS CLI, remove the desired lifecycle configuration from the list of lifecycle configurations attached to the resource. Then pass the list as part of the respective command:

- update-user-profile
- update-domain

For example, the following command removes all lifecycle configurations for the Code Editor application attached to the domain.

```
aws sagemaker update-domain --domain-id domain-id \
--default-user-settings '{
"CodeEditorAppSettings": {
  "LifecycleConfigArns":
    []
  }
}'
```

Create a lifecycle configuration to clone repositories into a Code Editor application

This section shows how to clone a repository and create a Code Editor application with the lifecycle configuration attached.

1. From your local machine, create a file named `my-script.sh` with the following content:

   ```
   #!/bin/bash
   set -eux
   ```

2. Clone the repository of your choice in your lifecycle configuration script.

   ```
   export REPOSITORY_URL="https://github.com/aws-samples/sagemaker-studio-lifecycle-config-examples.git"
   git -C /home/sagemaker-user clone $REPOSITORY_URL
   ```

3. After finalizing your script, create and attach your lifecycle configuration. For more information, see Create and attach lifecycle configurations in Studio.

4. Create your Code Editor application with the lifecycle configuration attached.

```
aws sagemaker create-app \
--domain-id domain-id \
--space-name space-name \
--app-type CodeEditor \
--app-name default \
--resource-spec "SageMakerImageArn=arn:aws:sagemaker:region:image-account-
id:image/sagemaker-distribution-
cpu,LifecycleConfigArn=arn:aws:sagemaker:region:user-account-id:studio-lifecycle-
config/my-code-editor-lcc,InstanceType=ml.t3.large"
```

   For more information about available Code Editor image ARNs, see Code Editor application instances and images.

Create a lifecycle configuration to install Code Editor extensions

This section shows how to create a lifecycle configuration to install extensions from the Open VSX Registry in your Code Editor environment.

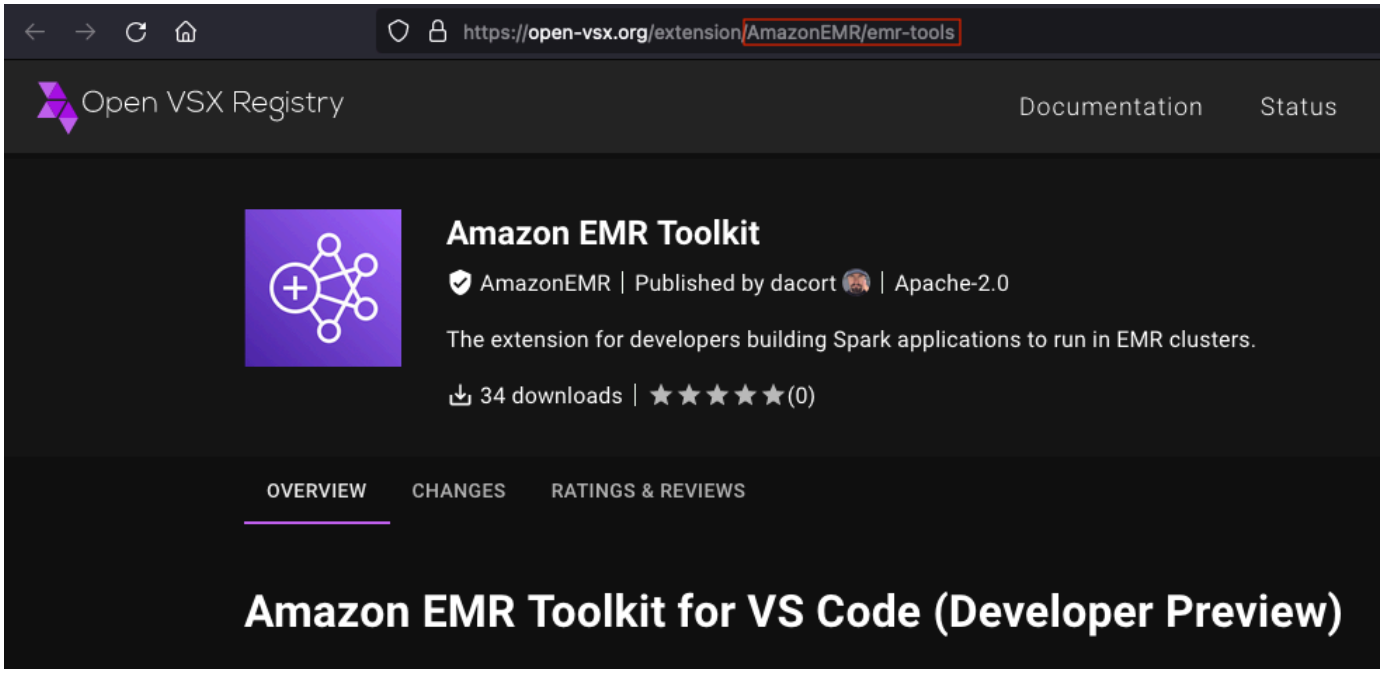
1. From your local machine, create a file named `my-script.sh` with the following content:

```
#!/bin/bash
set -eux
```

2. Within the script, install the Open VSX Registry extension of your choice:

```
sagemaker-code-editor --install-extension AmazonEMR.emr-tools --extensions-dir /
opt/amazon/sagemaker/sagemaker-code-editor-server-data/extensions
```

   You can retrieve the extension name from the URL of the extension in the Open VSX Registry. The extension name to use in the `sagemaker-code-editor` command should contain all text that follows `https://open-vsx.org/extension/` in the URL. Replace all instances of a slash (/) with a period (.). For example, `AmazonEMR/emr-tools` should be `AmazonEMR.emr-tools`.



3. After finalizing your script, create and attach your lifecycle configuration. For more information, see Create and attach lifecycle configurations in Studio.
4. Create your Code Editor application with the lifecycle configuration attached:

```
aws sagemaker create-app \
--domain-id domain-id \
--space-name space-name \
--app-type CodeEditor \
--app-name default \
--resource-spec "SageMakerImageArn=arn:aws:sagemaker:region:image-account-
id:image/sagemaker-distribution-
cpu,LifecycleConfigArn=arn:aws:sagemaker:region:user-account-id:studio-lifecycle-
config/my-code-editor-lcc,InstanceType=ml.t3.large"
```

For more information about available Code Editor image ARNs, see Code Editor application instances and images. For more information about connections and extensions, see Code Editor Connections and Extensions.

Customize environments using custom images

If you need functionality that is different than what's provided by SageMaker distribution, you can bring your own image with your custom extensions and packages. You can also use it to personalize the Code Editor UI for your own branding or compliance needs.

For requirements for your image, see Dockerfile specifications.

For a tutorial that helps you create an image that your users can access to run their Code Editor environment, see Provide users with access to custom images.

Topics

Dockerfile specifications

The image that you specify in your Dockerfile must match the specifications in the following sections to create the image successfully.

Running the image

- `Entrypoint` – We recommend embedding the entry point into the image using the Docker `CMD` or `Entrypoint` instructions. You can also configure `ContainerEntrypoint` and `ContainerArguments` that are passed to the container at runtime. For more information, see `CodeEditorAppImageConfig`.
- `EnvVariables` – With Studio, you can configure `ContainerEnvironment` variables that are made available to a container. The environment variable is overwritten with the environment variables from SageMaker. To provide you with a better experience, the environment variables are usually `AWS_` and `SageMaker_namespaced` to give priority to platform environments.

  The following are the environment variables:

  - `AWS_REGION`
  - `AWS_DEFAULT_REGION`
  - `AWS_CONTAINER_CREDENTIALS_RELATIVE_URI`
  - `SAGEMAKER_SPACE_NAME`

Specifications for the user and file system

- `WorkingDirectory` – The Amazon EBS volume for your space is mounted on the path `/home/sagemaker-user`. You can't change the mount path. Use the `WORKDIR` instruction to set the working directory of your image to a folder within `/home/sagemaker-user`.

- `UID` – The user ID of the Docker container. UID=1000 is a supported value. You can add sudo access to your users. The IDs are remapped to prevent a process running in the container from having more privileges than necessary.
- `GID` – The group ID of the Docker container. GID=100 is a supported value. You can add sudo access to your users. The IDs are remapped to prevent a process running in the container from having more privileges than necessary.
- Meta data directories – The `/opt/.sagemakerinternal` and `/opt/ml` directories that are used by AWS. The meta data file in `/opt/ml` contains meta data about resources such as `DomainId`.

  Use the following command to show the file system contents:

  ```
  cat /opt/ml/metadata/resource-metadata.json
  {"AppType":"CodeEditor","DomainId":"example-domain-id","UserProfileName":"example-
  user-profile-name","ResourceArn":"arn:aws:sagemaker:AWS
   Region:111122223333;:app/domain-ID/user-ID/CodeEditor/
  default","ResourceName":"default","AppImageVersion":"current"}
  ```

- Logging directories – `/var/log/studio` are reserved for the logging directories of Code Editor and the extensions associated with it. We recommend that you don't use the folders in creating your image.

Health check and URL for applications

- `Base URL` – The base URL for the BYOI application must be `codeeditor/default`. You can only have one application and it must always be named `default`.
- Health check endpoint – You must host your Code Editor server at 0.0.0.0 port 8888 for SageMaker to detect it.
- Authentication – You must pass `--without-connection-token` when opening `sagemaker-code-editor` to allow SageMaker to authenticate your users.

> **Note**
>
> If you are using Amazon SageMaker Distribution as the base image, these requirements are already taken care of as part of the included `entrypoint-code-editor` script.

Dockerfile samples

The following is a sample Dockerfile that meets the specifications listed in the previous sections to create an image from scratch using a micromamba base environment:

```
FROM mambaorg/micromamba:latest
ARG NB_USER="sagemaker-user"
ARG NB_UID=1000
ARG NB_GID=100

USER root

RUN micromamba install -y --name base -c conda-forge sagemaker-code-editor

USER $NB_UID

CMD eval "$(micromamba shell hook --shell=bash)"; \
    micromamba activate base; \
    sagemaker-code-editor --host 0.0.0.0 --port 8888 \
        --without-connection-token \
        --base-path "/CodeEditor/default"
```

The following is a sample Dockerfile that meets the specifications listed in the previous sections to create an image based on Amazon SageMaker Distribution:

```
FROM public.ecr.aws/sagemaker/sagemaker-distribution:latest-cpu
ARG NB_USER="sagemaker-user"
ARG NB_UID=1000
ARG NB_GID=100
ENV MAMBA_USER=$NB_USER

USER root

 # install scrapy in the base environment
RUN micromamba install -y --name base -c conda-forge scrapy

 # download VSCodeVim
RUN \
  wget https://github.com/VSCodeVim/Vim/releases/download/v1.27.2/vim-1.27.2.vsix \
  -P /tmp/exts/ --no-check-certificate

 # Install the extension
RUN \
```

```
  extensionloc=/opt/amazon/sagemaker/sagemaker-code-editor-server-data/extensions \
  && sagemaker-code-editor \
    --install-extension "/tmp/exts/vim-1.27.2.vsix" \
    --extensions-dir "${extensionloc}"

USER $MAMBA_USER
ENTRYPOINT ["entrypoint-code-editor"]
```

Provide users with access to custom images

This documentation provides step-by-step instructions to provide your users with access to custom images for their Code Editor environments. You can use the information on this page to create custom environments for your user's workflows. The process involves utilizing:

- Docker
- AWS Command Line Interface
- Amazon Elastic Container Registry
- Amazon SageMaker AWS Management Console

After following the guidance on this page, Code Editor users on the Amazon SageMaker domain will have access to the custom image and environment from their Code Editor spaces to empower their machine learning workflows.

> **Important**
>
> This page assumes that you have the AWS Command Line Interface and Docker installed on your local machine.

To have your users successfully run their image within Code Editor, you must do the following:

To have your users successfully run the image

1. Create the Dockerfile
2. Build the image from the Dockerfile
3. Upload the image to Amazon Elastic Container Registry
4. Attach the image to your Amazon SageMaker domain
5. Have your users access the image from their Code Editor space

Step 1: Create the Dockerfile

Create a Dockerfile to define the steps needed to create the environment needed to run the application in your user's container.

> **Important**
>
> Your Dockerfile must meet the specifications provided in Dockerfile specifications.

For sample Dockerfiles in the correct format, see Dockerfile samples.

Step 2: Build the Dockerfile

In the same directory as your Dockerfile, build your image using the following command:

```
docker build -t username/imagename:tag your-account-id.dkr.ecr.AWS
 Region.amazonaws.com/your-repository-name:tag
```

> **Important**
>
> Your image must be tagged in the following format: *123456789012*.dkr.ecr.your-region.amazonaws.com/*your-repository-name*:*tag*
> You won't be able to push it to an Amazon Elastic Container Registry repository otherwise.

Step 3: Push the image to the Amazon Elastic Container Registry repository

After you've built your image, log in to your Amazon ECR repository using the following command:

```
aws ecr get-login-password --region AWS Region | docker login --username AWS --
password-stdin 123456789012.dkr.ecr.AWS Region.amazonaws.com
```

After you've logged in, push your Dockerfile using the following command:

```
docker push 123456789012.dkr.ecr.AWS Region.amazonaws.com/your-repository-name:tag
```

Step 4: Attach image to the Amazon SageMaker domain of your users

After you've pushed the image, you must access it from your Amazon SageMaker domain using either the SageMaker console or the AWS CLI.

Attach the image using the SageMaker console

Use the following procedure to attach the image to a SageMaker domain through the SageMaker console :

1. Open the SageMaker console.
2. Under **Admin configurations**, choose **Domains**.
3. From the list of **domains**, select a domain.
4. Open the **Environment** tab.
5. For **Custom images for personal Studio apps**, choose **Attach image**.
6. Specify the image source. You can create a new image or choose an existing image.
7. Choose **Next**.
8. Choose **Code Editor** as the application type.
9. Choose **Submit**.

Attach the image using the AWS CLI

Use the following procedure to attach the image to a SageMaker domain through the AWS CLI :

1. Create a SageMaker image. The role ARN must have the `AmazonSageMakerFullAccess` policy attached.

```
aws sagemaker create-image \
    --image-name code-editor-custom-image \
    --role-arn arn:aws:iam::account-id:role/service-role/execution-role
```

2. Create a SageMaker image version from the image. Pass the unique tag value that you chose when you pushed the image to Amazon ECR.

```
aws sagemaker create-image-version \
    --image-name code-editor-custom-image \
    --base-image repository-uri:tag
```

3. Create a configuration file called `app-image-config-input.json`. The application image configuration is used as configuration for running a SageMaker image as a Code Editor application. You may also specify your `ContainerConfig` arguments here.

```
{
    "AppImageConfigName": "code-editor-app-image-config",
    "CodeEditorAppImageConfig":
    {
        "ContainerConfig":
        {}
    }
}
```

4. Create the `AppImageConfig` using the application image configuration file that you created.

```
aws sagemaker create-app-image-config \
    --cli-input-json file://app-image-config-input.json
```

5. Create a configuration file, named `updateDomain.json`. Be sure to specify your domain ID.

```
{
    "DomainId": "domain-id",
    "DefaultUserSettings": {
        "CodeEditorAppSettings": {
            "CustomImages": [
                {
                    "ImageName": "code-editor-custom-image",
                    "AppImageConfigName": "code-editor-app-image-config"
                }
            ]
        }
    }
}
```

6. Call the `UpdateDomain` command with the configuration file as input.

> **Note**
>
> You must delete all of the applications in your domain before updating the domain with the new image. Note that you only need to delete applications; you **do not** need to delete user profiles or shared spaces. For instructions on deleting applications, choose one of the following options.

- If you use the SageMaker console, run through Step 1 to 5d and Step 6 to 7d of the Delete a domain (Console) section.
- If you use the AWS CLI, run through Step 1 to 3 of the Delete a domain (AWS CLI) section.

```
aws sagemaker update-domain --cli-input-json file://updateDomain.json
```

Step 5: Have your users access the image from their Code Editor space

Your users can now select the image that you've attached to their domain from their Code Editor space.

For more information on selecting a custom image, see Launch a Code Editor application in Studio.

SageMaker HyperPod

SageMaker HyperPod helps you provision resilient clusters for running machine learning (ML) workloads and developing state-of-the-art models such as large language models (LLMs), diffusion models, and foundation models (FMs). It accelerates development of FMs by removing undifferentiated heavy-lifting involved in building and maintaining large-scale compute clusters powered by thousands of accelerators such as AWS Trainium and NVIDIA A100 and H100 Graphical Processing Units (GPUs). When accelerators fail, self-healing clusters automatically detect and replace the faulty hardware on the fly so that you can focus on running ML workloads for weeks and months without disruption. Additionally, with SageMaker HyperPod, you can customize your computing environment to best suit your needs and configure it with the Amazon SageMaker distributed training libraries to achieve optimal performance on AWS.

Operating clusters

You can create, configure, and maintain SageMaker HyperPod clusters graphically through the console user interface (UI) and programmatically through the AWS command line interface (CLI) or AWS SDK for Python (Boto3). With Amazon VPC, you can secure the cluster network and also take advantage of configuring your cluster with resources in your VPC, such as Amazon FSx for Lustre, which offers the fastest throughput. You can also give different IAM roles to cluster instance

groups, and limit actions that your cluster resources and users can operate. To learn more, see the section called "Operate SageMaker HyperPod".

Configuring your ML environment

SageMaker HyperPod runs the section called "SageMaker HyperPod DLAMI", which sets up an ML environment on the HyperPod clusters. You can configure additional customizations to the DLAMI by providing lifecycle scripts to support your use case. To learn more about how to set up lifecycle scripts, see the section called "Getting started with SageMaker HyperPod" and the section called "SageMaker HyperPod lifecycle configuration best practices".

Scheduling jobs

After you successfully create a HyperPod cluster, cluster users can log into the cluster nodes (such as head or controller node, log-in node, and worker node) and schedule jobs for running machine learning workloads. To learn more, see the section called "Run jobs on HyperPod clusters".

Resiliency against hardware failures

SageMaker HyperPod runs health checks on cluster nodes and provides a workload auto-resume functionality. With the cluster resiliency features of HyperPod, you can resume your workload from the last checkpoint you saved, after faulty nodes are replaced with healthy ones in clusters with more than 16 nodes. To learn more, see the section called "Cluster resiliency".

Logging and managing clusters

You can find SageMaker HyperPod resource utilization metrics and lifecycle logs in Amazon CloudWatch, and manage SageMaker HyperPod resources by tagging them. Each `CreateCluster` API run creates a distinct log stream, named in `<cluster-name>-<timestamp>` format. In the log stream, you can check the host names, the name of failed lifecycle scripts, and outputs from the failed scripts such as `stdout` and `stderr`. For more information, see the section called "Cluster management".

Compatible with SageMaker tools

Using SageMaker HyperPod, you can configure clusters with AWS optimized collective communications libraries offered by SageMaker, such as the SageMaker distributed data parallelism (SMDDP) library. The SMDDP library implements the `AllGather` operation optimized to the AWS compute and network infrastructure for the most performant SageMaker machine learning instances powered by NVIDIA A100 GPUs. To learn more, see the section called "Run distributed training workloads with Slurm on SageMaker HyperPod".

Topics

SageMaker HyperPod prerequisites

The following sections walk you through prerequisites you need to prepare before you get started with SageMaker HyperPod.

Topics

SageMaker HyperPod quotas

You can create SageMaker HyperPod clusters given the quotas for *cluster usage* in your AWS account.

> **Important**
>
> To learn more about SageMaker HyperPod pricing, see the section called "SageMaker HyperPod pricing" and Amazon SageMaker Pricing.

View Amazon SageMaker HyperPod quotas using the AWS Management Console

Look up the default and applied values of a *quota*, also referred to as a *limit*, for *cluster usage*, which is used for SageMaker HyperPod.

1. Open the Service Quotas console.
2. In the left navigation pane, choose **AWS services**.
3. From the **AWS services** list, search for and select **Amazon SageMaker**.
4. In the **Service quotas** list, you can see the service quota name, applied value (if it's available), AWS default quota, and whether the quota value is adjustable.
5. In the search bar, type **cluster usage**. This shows quotas for cluster usage, applied quotas, and the default quotas.

To increase Amazon SageMaker HyperPod quotas using the AWS Management Console

Increase your quotas at the account or resource level.

1. To increase the quota of instances for *cluster usage*, select the quota that you want to increase.
2. If the quota is adjustable, you can request a quota increase at either the account level or resource level based on the value listed in the **Adjustability** column.
3. For **Increase quota value**, enter the new value. The new value must be greater than the current value.
4. Choose **Request**.
5. To view any pending or recently resolved requests in the console, navigate to the **Request history** tab from the service's details page, or choose **Dashboard** from the navigation pane. For pending requests, choose the status of the request to open the request receipt. The initial status of a request is **Pending**. After the status changes to **Quota requested**, you see the case number with AWS Support. Choose the case number to open the ticket for your request.

To learn more about requesting a quota increase in general, see Requesting a Quota Increase in the *AWS Service Quotas User Guide*.

Set up IAM users and roles for SageMaker HyperPod users and resources

> **Important**
>
> Custom IAM policies that allow Amazon SageMaker Studio or Amazon SageMaker Studio Classic to create Amazon SageMaker resources must also grant permissions to add tags to those resources. The permission to add tags to resources is required because Studio and Studio Classic automatically tag any resources they create. If an IAM policy allows Studio and Studio Classic to create resources but does not allow tagging, "AccessDenied" errors can occur when trying to create resources. For more information, see Provide Permissions for Tagging SageMaker Resources.
> AWS Managed Policies for Amazon SageMaker that give permissions to create SageMaker resources already include permissions to add tags while creating those resources.

There are three main layers of SageMaker HyperPod users: *AWS account admin*, *cluster administrators* (such as cloud architects), and *cluster users* (such as machine learning scientists). The AWS account admin should set up IAM users by attaching the right permissions or policies for cluster administrators. For cluster administrators, the AWS account admin also should create IAM roles that the cluster administrators can use for SageMaker HyperPod clusters to assume to run and communicate with necessary AWS resources, such as Amazon S3, Amazon CloudWatch, and AWS Systems Manager (SSM). Finally, cluster administrators can grant cluster users permissions to log into the SageMaker HyperPod clusters through SSM Agent.

Topics

Set up IAM users for cluster administrators

Cluster administrators are cloud architects who operate and configure SageMaker HyperPod clusters, performing the tasks in the section called “Operate SageMaker HyperPod”. The following policy example includes the minimum set of permissions for cluster administrators to run the SageMaker HyperPod core APIs and manage any cluster within your AWS account.

```
{
```

```
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "sagemaker:CreateCluster",
                "sagemaker:ListClusters"
            ],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "sagemaker:DeleteCluster",
                "sagemaker:DescribeCluster",
                "sagemaker:DescribeClusterNode",
                "sagemaker:ListClusterNodes",
                "sagemaker:UpdateCluster",
                "sagemaker:UpdateClusterSoftware"
            ],
            "Resource": "arn:aws:sagemaker:region:account-id:cluster/*"
        }
    ]
}
```

To grant permissions to access the SageMaker console, use the sample policy provided at Permissions Required to Use the Amazon SageMaker Console.

To grant permissions to access the SSM console, use the sample policy provided at Using the AWS Systems Manager console in the *AWS Systems Manager User Guide*.

You might also consider attaching the `AmazonSageMakerFullAccess` policy to the IAM users; however, note that the `AmazonSageMakerFullAccess` policy grants permissions to the entire SageMaker API calls, features, and resources.

For guidance on IAM users in general, see IAM users in the *AWS Identity and Access Management User Guide*.

Set up IAM users for cluster users

Cluster users are machine learning engineers who log into and run ML workloads on SageMaker HyperPod cluster nodes provisioned by cluster administrators. For cluster users in your AWS

account, you should grant the permission `"ssm:StartSession"` to run the SSM `start-session` command. The following is a policy example for IAM users.

IAM permissions to all resources

Add the following policy to give an IAM user SSM session permissions to connect to an SSM target for all resources.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ssm:StartSession",
                "ssm:TerminateSession"
            ],
            "Resource": "*"
        }
    ]
}
```

IAM role for SageMaker HyperPod

For SageMaker HyperPod clusters to run and communicate with necessary AWS resources, you need to attach the managed `AmazonSageMakerClusterInstanceRolePolicy` to the cluster instance groups. Given this AWS managed policy, SageMaker HyperPod cluster instance groups assume the role to communicate with Amazon CloudWatch, Amazon S3, and AWS Systems Manager Agent (SSM Agent). This managed policy is the minimum requirement for SageMaker HyperPod resources to run properly, so you must provide an IAM role with this policy to all instance groups. The `AmazonSageMakerClusterInstanceRolePolicy` has the following permissions:

- **logs** - Needed to allow SageMaker HyperPod to publish log streams.
- **cloudwatch** – Needed to allow SageMaker HyperPod to post CloudWatch metrics.
- **s3** - Needed to allow SageMaker HyperPod to list and retrieve files from an Amazon S3 bucket in your account with the prefix `sagemaker-`.
- **ssmmessages** - Needed to allow the SSM Agent to communicate with the SSM backend services. Principals can use SSM Agent for creating and opening control and data channels. SageMaker starts and manages the SSM Agent when it initiates a cluster instance.

Tip

Depending on your preference on designing the level of permissions for multiple instance groups, you can also set up multiple IAM roles and attach them to different instance groups. When you set up your cluster user access to specific SageMaker HyperPod cluster nodes, the nodes assume the role with the selective permissions you manually attached. When you, as a AWS account admin or cluster administrator, set up the cluster user access to specific cluster nodes through AWS Systems Manager (see also the section called "Set up AWS Systems Manager and Run As for cluster user access control"), the cluster nodes assume the role with the selective permissions you manually attach.

After you are done with creating IAM roles, make notes of their names and ARNs. You use the roles when creating a SageMaker HyperPod cluster, granting the correct permissions required for each instance group to communicate with necessary AWS resources.

(Optional) Additional permissions for using SageMaker HyperPod with Amazon Virtual Private Cloud

If you want to use your own Amazon Virtual Private Cloud (VPC) instead of the default SageMaker VPC, you should add the following additional permissions to the IAM role for SageMaker HyperPod.

```
{
    "Effect": "Allow",
    "Action": [
        "ec2:CreateNetworkInterface",
        "ec2:CreateNetworkInterfacePermission",
        "ec2:DeleteNetworkInterface",
        "ec2:DeleteNetworkInterfacePermission",
        "ec2:DescribeNetworkInterfaces",
        "ec2:DescribeVpcs",
        "ec2:DescribeDhcpOptions",
        "ec2:DescribeSubnets",
        "ec2:DescribeSecurityGroups",
        "ec2:DetachNetworkInterface"
    ],
    "Resource": "*"
}
{
    "Effect": "Allow",
    "Action": "ec2:CreateTags",
```

```
    "Resource": [
        "arn:aws:ec2:*:*:network-interface/*"
    ]
}
```

The following list breaks down which permissions are needed to enable SageMaker HyperPod cluster functionalities when you configure the cluster with your own Amazon VPC.

- The following `ec2` permissions are required to enable configuring a SageMaker HyperPod cluster with your VPC.

```
{
    "Effect": "Allow",
    "Action": [
        "ec2:CreateNetworkInterface",
        "ec2:CreateNetworkInterfacePermission",
        "ec2:DeleteNetworkInterface",
        "ec2:DeleteNetworkInterfacePermission",
        "ec2:DescribeNetworkInterfaces",
        "ec2:DescribeVpcs",
        "ec2:DescribeDhcpOptions",
        "ec2:DescribeSubnets",
        "ec2:DescribeSecurityGroups"
    ],
    "Resource": "*"
}
```

- The following `ec2` permission is required to enable the SageMaker HyperPod auto-resume functionality.

```
{
    "Effect": "Allow",
    "Action": [
        "ec2:DetachNetworkInterface"
    ],
    "Resource": "*"
}
```

- The following `ec2` permission allows SageMaker HyperPod to create tags on the network interfaces within your account.

```
{
    "Effect": "Allow",
    "Action": "ec2:CreateTags",
    "Resource": [
        "arn:aws:ec2:*:*:network-interface/*"
    ]
}
```

Set up AWS Systems Manager and Run As for cluster user access control

the section called "SageMaker HyperPod DLAMI" comes with AWS Systems Manager (SSM) out of the box to help you manage access to your SageMaker HyperPod cluster instance groups. This section describes how to create operating system (OS) users in your SageMaker HyperPod clusters and associate them with IAM users and roles. This is useful to authenticate SSM sessions using the credentials of the OS user account.

Enable Run As in your AWS account

As an AWS account admin or a cloud administrator, you can manage access to SageMaker HyperPod clusters at an IAM role or user level by using the Run As feature in SSM. With this feature, you can start each SSM session using the OS user associated to the IAM role or user.

To enable Run As in your AWS account, follow the steps in Turn on Run As support for Linux and macOS managed nodes. If you already created OS users in your cluster, make sure that you associate them with IAM roles or users by tagging them as guided in **Option 2** of step 5 under **To turn on Run As support for Linux and macOS managed nodes**.

Set up Linux users using an Amazon FSx file system attached to SageMaker HyperPod as a shared space

To complete setting up cluster users to access a HyperPod cluster through SSM and a shared space, you need to configure a script for adding users while preparing lifecycle configuration scripts for creating a HyperPod cluster. In the GitHub repository introduced in the section the section called "Start with base lifecycle scripts provided by HyperPod", there is a script named `add_users.sh` that reads user data from `shared_users.txt`. Note that you'll need to upload the two files as part of preparing and uploading lifecycle scripts to an S3 bucket, which you'll learn in the section the section called "Getting started with SageMaker HyperPod" and the section the section called "Set up a multi-user environment through the Amazon FSx shared space".

(Optional) Set up SageMaker HyperPod with your Amazon VPC

If you don't provide a VPC, SageMaker HyperPod uses the default SageMaker VPC. To set up a SageMaker HyperPod cluster with your Amazon VPC, check the following items.

- If you want to use your own VPC to connect SageMaker HyperPod with AWS resources in your VPC, you need to provide the VPC name, ID, AWS Region, subnet ID, and security group ID when you create SageMaker HyperPod. If you want to create a new VPC, see Create a default VPC or Create a VPC in the *Amazon Virtual Private Cloud User Guide*.
- It is important that you should create all your resources in the same AWS Region and Availability Zone, and configure security group rules to allow connection between the resources in your VPC. For example, assume that you create a VPC in `us-west-2`. You should create a subnet in this VPC in Availability Zone `us-west-2a`, and create a security group that allows all incoming (inbound) traffic from inside the security group and all outbound traffic.
- You also need to ensure that your VPC has connection to Amazon Simple Storage Service (S3). If you configure a VPC, SageMaker HyperPod instance groups don't have access to the internet, and therefore can't connect to Amazon S3 for accessing or storing files such as lifecycle scripts, training data, and model artifacts. To establish connection with Amazon S3 while using VPC, you should create a VPC endpoint. By creating a VPC endpoint, you can allow the SageMaker HyperPod instance groups to access the S3 buckets within the same VPC. We recommend that you also create a custom policy that only allows requests from your private VPC to access your S3 buckets. For more information, see Endpoints for Amazon S3 in the *AWS PrivateLink Guide*.
- If you want to create a HyperPod cluster with EFA-enabled instances, make sure that you set up a security group to allow all inbound and outbound traffic to and from the security group itself. To learn more, see Step 1: Prepare an EFA-enabled security group in the *Amazon EC2 User Guide*.

(Optional) Set up SageMaker HyperPod with Amazon FSx for Lustre

To start using SageMaker HyperPod and mapping data paths between the cluster and your FSx for Lustre file system, select one of the AWS Regions supported by SageMaker HyperPod. After choosing the AWS Region you prefer, you also should determine which Availability Zone (AZ) to use. If you use SageMaker HyperPod compute nodes in AZs different from the AZs where your FSx for Lustre file system is set up within the same AWS Region, there might be communication and network overhead. We recommend that you to use the same physical AZ as the one for the SageMaker HyperPod service account to avoid any cross-AZ traffic between SageMaker HyperPod clusters and your FSx for Lustre file system. Also, make sure that you have configured it with

your VPC. If you want to use Amazon FSx as the main file system for storage, you must configure SageMaker HyperPod clusters with VPC.

Getting started with SageMaker HyperPod

Get started with creating your first SageMaker HyperPod cluster and learn the cluster operation functionalities of SageMaker HyperPod.

You can create a SageMaker HyperPod cluster through the SageMaker console UI or the AWS CLI commands. This tutorial shows how to create a new SageMaker HyperPod cluster with Slurm, which is a popular workload scheduler software. After you go through this tutorial, you will know how to log into the cluster nodes using the AWS Systems Manager commands (`aws ssm`). After you complete this tutorial, see also the section called "Operate SageMaker HyperPod" to learn more about the SageMaker HyperPod basic oparations, and the section called "Run jobs on HyperPod clusters" to learn how to schedule jobs on the provisioned cluster.

Topics

- Using the SageMaker HyperPod console UI
- Using the AWS CLI commands for the SageMaker HyperPod APIs

Using the SageMaker HyperPod console UI

Create your first SageMaker HyperPod cluster using the SageMaker HyperPod console UI.

Create your first SageMaker HyperPod cluster with Slurm

The following tutorial demonstrates how to create a new SageMaker HyperPod cluster and set it up with Slurm through the SageMaker console UI. Following the tutorial, you'll create a HyperPod cluster with three Slurm nodes, `my-controller-group`, `my-login-group`, and `worker-group-1`.

1. Open the Amazon SageMaker console at https://console.aws.amazon.com/sagemaker/.
2. Choose **HyperPod Clusters** in the left navigation pane.
3. On the **SageMaker HyperPod Clusters** page, choose **Create cluster**.
4. In **Step 1: Cluster settings**, specify a name for the new cluster. Skip the **Tags** section.
5. In **Step 2: Instance groups**, add instance groups. Each instance group can be configured differently, and you can create a heterogeneous cluster that consists of multiple instance groups with various instance types. For lifecycle configuration scripts to run on the instance

group during cluster creation, you can start with using the sample lifecycle scripts provided in the Awsome Distributed Training GitHub repository.

a. For **Instance group name**, specify a name for the instance group. For this tutorial, create three instance groups named `my-controller-group`, `my-login-group`, and `worker-group-1`.

b. For **Select instance type**, choose the instance for the instance group. For this tutorial, select `ml.c5.xlarge` for `my-controller-group`, `ml.m5.4xlarge` for `my-login-group`, and `ml.trn1.32xlarge` for `worker-group-1`. If you receive an error due to resource limit, make sure that you change the instance type to what you already have in your account or request quotas by following the instructions at the section called "SageMaker HyperPod quotas".

c. For **Quantity**, specify an integer not exceeding the instance quota for cluster usage. For this tutorial, enter **1** for all three groups.

d. For **S3 path to lifecycle script files**, enter the Amazon S3 path in which your lifecycle scripts are stored. If you don't have lifecycle scripts, go through the following substeps to use the base lifecycle scripts provided by the SageMaker HyperPod service team.

   i. Clone the Awsome Distributed Training GitHub repository.

   ```
   git clone https://github.com/aws-samples/awsome-distributed-training/
   ```

   ii. Under `1.architectures/5.sagemaker_hyperpods/LifecycleScripts/base-config`, you can find a set of base lifecycle scripts. To learn more about the lifecycle scripts, see also the section called "Prepare lifecycle scripts for setting up Slurm on SageMaker HyperPod".

   iii. Write a Slurm configuration file and save it as `provisioning_params.json`. In the file, specify basic Slurm configuration parameters to properly assign Slurm nodes to the SageMaker HyperPod cluster instance groups. For example, the `provisioning_params.json` should be similar to the following based on the HyperPod cluster instance group configured through the previous steps 5a, 5b, and 5c.

   ```
   {
       "version": "1.0.0",
       "workload_manager": "slurm",
       "controller_group": "my-controller-group",
       "login_group": "my-login-group",
   ```

```
    "worker_groups": [
        {
            "instance_group_name": "worker-group-1",
            "partition_name": "partition-1"
        }
    ]
}
```

iv. Upload the scripts to your Amazon S3 bucket. Create an S3 bucket with a path in the following format: `s3://sagemaker-<unique-s3-bucket-name>/<lifecycle-script-directory>/src`. You can create this bucket using the Amazon S3 console.

> **Note**
>
> You must prefix `sagemaker-` to the S3 bucket path, because the ??? with `AmazonSageMakerClusterInstanceRolePolicy` only allows principals to access S3 buckets with this specific prefix.

e. For **Directory path to your on-create lifecycle script**, enter the file name of the lifecycle script under **S3 path to lifecycle script files**.

f. For **IAM role**, choose the IAM role you created using the `AmazonSageMakerClusterInstanceRolePolicy` from the section the section called "IAM role for SageMaker HyperPod".

g. For **Threads per core** under **Advanced configuration**, specify 1 for disabling multi-threading and 2 for enabling multi-threading. To find which instance type supports multi-threading, see the reference table of CPU cores and threads per CPU core per instance type in the *Amazon Elastic Compute Cloud User Guide*.

6. In **Step 3: Advanced configuration**, set up network settings within, and in and out of, the cluster. Select your own VPC if you already have one that gives SageMaker access to your VPC. If you don't have one but want to create a new VPC, follow the instructions at Create a VPC in the *Amazon Virtual Private Cloud User Guide*. You can leave it as **no VPC** to use the default SageMaker VPC.

7. In **Step 4: Review and create**, review the configuration you've set from step 1 to 3 and finish submitting the cluster creation request.

8. The new cluster should appear under **Clusters** in the main pane of the SageMaker HyperPod console. You can check the status of it displayed under the **Status** column.

9. After the status of the cluster turns to `InService`, cluster users can start logging into the cluster nodes. For more information about accessing the cluster nodes and running ML workloads, see the section called "Run jobs on HyperPod clusters".

Delete the cluster and clean resources

After you have successfully tested creating a SageMaker HyperPod cluster, it continues running in the `InService` state until you delete the cluster. We recommend that you delete any clusters created using on-demand SageMaker instances when not in use to avoid incurring continued service charges based on on-demand pricing. In this tutorial, you have created a cluster that consists of two instance groups. One of them uses a C5 instance, so make sure you delete the cluster by following the instructions at the section called "Delete a SageMaker HyperPod cluster".

However, if you have created a cluster with reserved compute capacity, the status of the clusters does not affect service billing.

To clean up the lifecycle scripts from the S3 bucket used for this tutorial, go to the S3 bucket you used during cluster creation and remove the files entirely.

If you have tested running any workloads on the cluster, make sure if you have uploaded any data or if your job saved any artifacts to different S3 buckets or file system services such as Amazon FSx for Lustre and Amazon Elastic File System. To prevent any incurring charges, delete all artifacts and data from the storage or file system.

Using the AWS CLI commands for the SageMaker HyperPod APIs

Create your first SageMaker HyperPod cluster using the AWS CLI commands for HyperPod.

Create your first SageMaker HyperPod cluster with Slurm

The following tutorial demonstrates how to create a new SageMaker HyperPod cluster and set it up with Slurm through the AWS CLI commands for SageMaker HyperPod. Following the tutorial, you'll create a HyperPod cluster with three Slurm nodes, `my-controller-group`, `my-login-group`, and `worker-group-1`.

1. First, prepare and upload lifecycle scripts to an S3 bucket. During cluster creation, HyperPod runs them in each instance group. Upload lifecycle scripts to S3 using the following command.

```
aws s3 sync \
    ~/local-dir-to-lifecycle-scripts/* \
```

```
s3://sagemaker-<unique-s3-bucket-name>/<lifecycle-script-directory>/src
```

> **Note**
>
> The S3 bucket path should start with a prefix `sagemaker-`, because the ??? with `AmazonSageMakerClusterInstanceRolePolicy` only allows access to S3 buckets that starts with the specific prefix.

If you are starting from scratch, use sample lifecycle scripts provided in the Awsome Distributed Training GitHub repository. The following sub-steps show how to download, what to modify, and how to upload the sample lifecycle scripts to an S3 bucket.

a. Download a copy of the lifecycle script samples to a directory on your local computer.

```
git clone https://github.com/aws-samples/awsome-distributed-training/
```

b. Go into the directory `1.architectures/5.sagemaker_hyperpods/LifecycleScripts/base-config`, where you can find a set of lifecycle scripts.

```
cd awsome-distributed-training/1.architectures/5.sagemaker_hyperpods/
LifecycleScripts/base-config
```

To learn more about the lifecycle script samples, see the section called “Prepare lifecycle scripts for setting up Slurm on SageMaker HyperPod”.

c. Write a Slurm configuration file and save it as `provisioning_params.json`. In the file, specify basic Slurm configuration parameters to properly assign Slurm nodes to the SageMaker HyperPod cluster instance groups. In this tutorial, set up three Slurm nodes named `my-controller-group`, `my-login-group`, and `worker-group-1`, as shown in the following example configuration `provisioning_params.json`.

```
{
    "version": "1.0.0",
    "workload_manager": "slurm",
    "controller_group": "my-controller-group",
    "login_group": "my-login-group",
    "worker_groups": [
        {
            "instance_group_name": "worker-group-1",
```

```
            "partition_name": "partition-1"
        }
    ]
}
```

d. Upload the scripts to `s3://sagemaker-<unique-s3-bucket-name>/<lifecycle-script-directory>/src`. You can do so by using the S3 console, or by running the following AWS CLI S3 command.

```
aws s3 sync \
    ~/local-dir-to-lifecycle-scripts/* \
    s3://sagemaker-<unique-s3-bucket-name>/<lifecycle-script-directory>/src
```

2. Prepare a CreateCluster request file in JSON format and save as `create_cluster.json`. The following request example is based on the Slurm nodes defined in the `provisioning_params.json` in step 1c. For `ExecutionRole`, provide the ARN of the IAM role you created with the managed `AmazonSageMakerClusterInstanceRolePolicy` in the section called "Prerequisites". If you receive an error due to resource limit, make sure that you change the instance type to what you already have in your account or request quotas by following the instructions at the section called "SageMaker HyperPod quotas".

```
{
    "ClusterName": "my-hyperpod-cluster",
    "InstanceGroups": [
        {
            "InstanceGroupName": "my-controller-group",
            "InstanceType": "ml.c5.xlarge",
            "InstanceCount": 1,
            "LifeCycleConfig": {
              "SourceS3Uri": "s3://sagemaker-<unique-s3-bucket-name>/<lifecycle-
script-directory>/src",
              "OnCreate": "on_create.sh"
            },
            "ExecutionRole": "${ROLE}",
            "ThreadsPerCore": 1
        },
        {
            "InstanceGroupName": "my-login-group",
            "InstanceType": "ml.m5.4xlarge",
            "InstanceCount": 1,
            "LifeCycleConfig": {
```

```
                "SourceS3Uri": "s3://sagemaker-<unique-s3-bucket-name>/<lifecycle-
script-directory>/src",
                "OnCreate": "on_create.sh"
            },
            "ExecutionRole": "${ROLE}",
            "ThreadsPerCore": 1
        },
        {
            "InstanceGroupName": "worker-group-1",
            "InstanceType": "ml.trn1.32xlarge",
            "InstanceCount": 1,
            "LifeCycleConfig": {
                "SourceS3Uri": "s3://sagemaker-<unique-s3-bucket-name>/<lifecycle-
script-directory>/src",
                "OnCreate": "on_create.sh"
            },
            "ExecutionRole": "${ROLE}",
            "ThreadsPerCore": 1
        }
    ]
}
```

3. Run the following command to create the cluster.

```
aws sagemaker create-cluster --cli-input-json file://complete/path/to/
create_cluster.json
```

This should return the ARN of the created cluster.

4. Run `describe-cluster` to check the status of the cluster.

```
aws sagemaker describe-cluster --cluster-name my-hyperpod-cluster
```

After the status of the cluster turns to **`InService`**, proceed to the next step.

5. Run `list-cluster-nodes` to check the details of the cluster nodes.

```
aws sagemaker list-cluster-nodes --cluster-name my-hyperpod-cluster
```

This returns a response, and the `InstanceId` is what your cluster users need for logging (`aws ssm`) into them. For more information about logging into the cluster nodes and running ML workloads, see the section called “Run jobs on HyperPod clusters”.

Delete the cluster and clean resources

After you have successfully tested creating a SageMaker HyperPod cluster, it continues running in the `InService` state until you delete the cluster. We recommend that you delete any clusters created using on-demand SageMaker capacity when not in use to avoid incurring continued service charges based on on-demand pricing. In this tutorial, you have created a cluster that consists of two instance groups. One of them uses a C5 instance, so make sure you delete the cluster by running the following command.

```
aws sagemaker delete-cluster --cluster-name my-hyperpod-cluster
```

To clean up the lifecycle scripts from the S3 bucket used for this tutorial, go to the S3 bucket you used during cluster creation and remove the files entirely.

If you have tested running any model training workloads on the cluster, also check if you have uploaded any data or if your job has saved any artifacts to different S3 buckets or file system services such as Amazon FSx for Lustre and Amazon Elastic File System. To prevent incurring charges, delete all artifacts and data from the storage or file system.

Operate SageMaker HyperPod

This section walks you through how to operate SageMaker HyperPod through the SageMaker console UI or AWS CLI.

Topics

Using the SageMaker HyperPod console UI

The following topics provide guidance on how to operate SageMaker HyperPod through the console UI.

Topics

- Edit a SageMaker HyperPod cluster
- Delete a SageMaker HyperPod cluster

Create a SageMaker HyperPod cluster

See the following instructions on creating a new SageMaker HyperPod cluster through the SageMaker HyperPod console UI.

1. Open the Amazon SageMaker console at https://console.aws.amazon.com/sagemaker/.
2. Choose **HyperPod Clusters** in the left navigation pane.
3. In the SageMaker HyperPod landing page, choose **Create cluster**.
4. In **Step 1: Cluster settings**, set up basic information for the cluster.
   a. For **Cluster name**, specify a name for the new cluster.
   b. For **Tags**, add key and value pairs to the new cluster and manage the cluster as an AWS resource. To learn more, see Tagging your AWS resources.
5. In **Step 2: Instance groups**, choose **Create instance group**. Each instance group can be configured differently, and you can create a heterogeneous cluster that consists of multiple instance groups with various instance types. In the **Create an instance group** configuration pop-up window, fill the instance group configuration information.
   a. For **Instance group name**, specify a name for the instance group.
   b. For **Select instance type**, choose the instance for the instance group.
   c. For **Quantity**, specify an integer not exceeding the instance quota for cluster usage.
   d. For **Amazon S3 path to lifecycle script files**, enter the S3 path in which your lifecycle scripts are stored.
   e. For **Directory path to your on-create lifecycle script**, enter the file name of the lifecycle script under **S3 path to lifecycle script files**.
   f. For IAM role, choose the IAM role you have created for SageMaker HyperPod resources, following the section the section called “Set up IAM users and roles for SageMaker HyperPod users and resources”.
   g. For **Advanced configuration**, you can set Threads per core, specify 1 for disabling multi-threading and 2 for enabling multi-threading. To find which instance type supports multi-threading, see the reference table of CPU cores and threads per CPU core per instance type in the *Amazon EC2 User Guide*.

6. In **Step 3: Advanced configuration**, configure optional network settings within cluster and in-and-out of the cluster. Select your own VPC if you already have one that gives SageMaker access to your resources under the VPC. If you want to create a new VPC, see Create a default VPC or Create a VPC in the *Amazon Virtual Private Cloud User Guide*. If you don't make any selections, it picks up the default VPC of your account.

   > **Note**
   >
   > If you want to use your own VPC, you should add additional permissions to the IAM role for SageMaker HyperPod clusters. To learn more, see the section called "(Optional) Set up SageMaker HyperPod with your Amazon VPC".

7. In **Step 4: Review and create**, review the configuration you have set from **Step 1** to **Step 3** and finish submitting the cluster creation request.

Browse your SageMaker HyperPod clusters

Under **Clusters** on the SageMaker HyperPod console main page, all created clusters should appear listed under the **Clusters** section, which provides a summary view of clusters, their ARNs, status, and creation time.

View details of each SageMaker HyperPod cluster

Under **Clusters** on the console main page, the cluster **Names** are activated as links. Choose the cluster name link to see details of each cluster.

Edit a SageMaker HyperPod cluster

1. Under **Clusters**, choose the cluster you want to update.
2. Choose **Actions** button, and choose **Edit cluster**.
3. In the **Edit <your-cluster>** page, you can edit the configurations of existing instance groups, add more instance groups, and change tags for the cluster. After making changes, choose **Submit**. Note that currently you cannot reduce or delete existing instance groups.
   a. In the **Configure instance groups** section, you can add more instance groups by choosing **Create cluster group**.
   b. In the **Configure instance groups** section, you can choose one of the instance groups, and choose **Edit** to change its configuration.
   c. In the **Tags** section, you can update tags for the cluster.

Delete a SageMaker HyperPod cluster

1. Under **Clusters**, choose the cluster you want to delete.
2. Choose **Actions**, and choose **Delete cluster**.
3. In the pop-up window for cluster deletion, review the cluster information carefully to confirm that you chose the right cluster to delete.
4. After you reviewed the cluster information, choose **Yes, delete cluster**.
5. In the text field to confirm this deletion, type **`delete`**.
6. Choose **Delete** on the lower right corner of the pop-up window to finish sending the cluster deletion request.

Using the AWS CLI

The following topics provide guidance on writing SageMaker HyperPod API request files in JSON format and run them using the AWS CLI commands.

Topics

Create a new cluster

1. Prepare lifecycle configuration scripts and upload them to an S3 bucket, such as `s3://sagemaker-<your-s3-bucket>/<lifecycle-script-directory>/src/`. The following step 2 assumes that there's an entry point script named on`_create.sh` in the specified S3 bucket.

> **Important**
>
> Make sure that you set the S3 path to start with `s3://sagemaker-`. The the section called "IAM role for SageMaker HyperPod" has the managed `AmazonSageMakerClusterInstanceRolePolicy` attached, which allows access to S3 buckets with the specific prefix `sagemaker-`.

2. Prepare a CreateCluster API request file in JSON format. The following request example is based on the nodes needed for groups defined in the `provisioning_params.json` in Step 1.2. The minimum requirement for Slurm is one controller and one worker group. For `ExecutionRole`, provide the ARN of the IAM role you created with the managed `AmazonSageMakerClusterInstanceRolePolicy` from the section the section called "IAM role for SageMaker HyperPod".

```
// create_cluster.json
{
    // Required
    "ClusterName": "your-hyperpod-cluster",
    // Required
    "InstanceGroups": [
        {
            "InstanceGroupName": "controller-group",
            "InstanceType": "ml.m5.xlarge",
            "InstanceCount": 1,
            "LifeCycleConfig": {
                "SourceS3Uri": "s3://sagemaker-<your-s3-bucket>/<lifecycle-script-
directory>/src/",
                "OnCreate": "on_create.sh"
            },
            "ExecutionRole": "arn:aws:iam::111122223333:role/iam-role-for-cluster",
            "ThreadsPerCore": 1
        },
        {
            "InstanceGroupName": "worker-group-1",
            "InstanceType": "ml.p4d.xlarge",
            "InstanceCount": 1,
            "LifeCycleConfig": {
                "SourceS3Uri": "s3://sagemaker-<your-s3-bucket>/<lifecycle-script-
directory>/src/",
                "OnCreate": "on_create.sh"
```

```
            },
            "ExecutionRole": "arn:aws:iam::111122223333:role/iam-role-for-cluster",
            "ThreadsPerCore": 1
        }
    ],
    // Optional
    "Tags": [
        {
           "Key": "string",
           "Value": "string"
        }
    ],
    // Optional
    "VpcConfig": {
        "SecurityGroupIds": [ "string" ],
        "Subnets": [ "string" ]
    }
}
```

Depending on how you designed the cluster structure through your lifecycle scripts, you can add and configure multiple instance groups under the `InstanceGroups` request parameter.

For the `Tags` request parameter, you can add custom tags for managing the SageMaker HyperPod cluster as an AWS resource. You can add tags to your cluster in the same way you add them in other AWS services that support tagging. To learn more about tagging AWS resources in general, see Tagging AWS Resources User Guide.

For the `VpcConfig` request parameter, specify the information of a VPC you want to use. For more information, see the section called "(Optional) Set up SageMaker HyperPod with your Amazon VPC".

3. Run the following command to submit the `CreateCluster` API request.

```
aws sagemaker create-cluster \
    --cli-input-json file://complete/path/to/create_cluster.json
```

This should return the ARN of the new cluster.

Describe a cluster

Run `describe-cluster` to check the status of the cluster. You can specify either the name or the ARN of the cluster.

```
aws sagemaker describe-cluster --cluster-name your-hyperpod-cluster
```

After the status of the cluster turns to **`InService`**, proceed to the next step. Using this API, you can also retrieve failure messages from running other HyperPod API operations.

List details of cluster nodes

Run `list-cluster-nodes` to check the key information of the cluster nodes.

```
aws sagemaker list-cluster-nodes --cluster-name your-hyperpod-cluster
```

This returns a response, and the `InstanceId` is what you need to use for logging (using `aws ssm`) into them.

Describe details of a cluster node

Run `describe-cluster-node` to retrieve details of a cluster node. You can get the cluster node ID from list-cluster-nodes output. You can specify either the name or the ARN of the cluster.

```
aws sagemaker describe-cluster-node \
    --cluster-name your-hyperpod-cluster \
    --node-id i-111222333444555aa
```

List clusters

Run `list-clusters` to list all clusters in your account.

```
aws sagemaker list-clusters
```

You can also add additional flags to filter the list of clusters down. To learn more about what this command runs at low level and additional flags for filtering, see the ListClusters API reference.

Update cluster configuration

Run `update-cluster` to update the configuration of a cluster.

1. Create an `UpdateCluster` request file in JSON format. Make sure that you specify the right cluster name and instance group name to update. You can change the instance type, the number of instances, the lifecycle configuration entrypoint script, and the path to the script.

   a. For `ClusterName`, specify the name of the cluster you want to update.

   b. For `InstanceGroupName`

      i. To update an existing instance group, specify the name of the instance group you want to update.

      ii. To add a new instance group, specify a new name not existing in your cluster.

   c. For `InstanceType`

      i. To update an existing instance group, you must match the instance type you initially specified to the group.

      ii. To add a new instance group, specify an instance type you want to configure the group with.

   d. For `InstanceCount`

      i. To update an existing instance group, specify an integer greater than the current number of instances. Currently, you can only increase the number of instances.

      ii. To add a new instance group, specify an integer greater or equal to 1.

   e. For `LifeCycleConfig`, you can change both `SourceS3Uri` and `OnCreat` values as you want to update the instance group.

   f. For `ExecutionRole`

      i. For updating an existing instance group, keep using the same IAM role you attached during cluster creation.

      ii. For adding a new instance group, specify an IAM role you want to attach.

   g. For `TreadsPerCore`

      i. For updating an existing instance group, keep using the same value you specified during cluster creation.

      ii. For adding a new instance group, you can choose any value from the allowed options per instance type. For more information, search the instance type and see the **Valid treads per core** column in the reference table at CPU cores and threads per CPU core per instance type in the *Amazon EC2 User Guide*.

   The following code snippet is a JSON request file template you can use. For more information about the request syntax and parameters of this API, see the UpdateCluster API reference.

```
// update_cluster.json
{
    // Required
    "ClusterName": "name-of-cluster-to-update",
    // Required
    "InstanceGroups": [
        {
            "InstanceGroupName": "name-of-instance-group-to-update",
            "InstanceType": "ml.m5.xlarge",
            "InstanceCount": 1,
            "LifeCycleConfig": {
                "SourceS3Uri": "s3://sagemaker-<your-s3-bucket>/<lifecycle-script-
directory>/src/",
                "OnCreate": "on_create.sh"
            },
            "ExecutionRole": "arn:aws:iam::111122223333:role/iam-role-for-cluster",
            "ThreadsPerCore": 1
        },
        // add more blocks of instance groups as needed
        { ... }
    ]
}
```

2. Run the following `update-cluster` command to submit the request.

```
aws sagemaker update-cluster \
    --cli-input-json file://complete/path/to/update_cluster.json
```

Update the SageMaker HyperPod platform software of a cluster

Run `update-cluster-software` to update existing clusters with software and security patches provided by the SageMaker HyperPod service. For `--cluster-name`, specify either the name or the ARN of the cluster to update.

> **Important**
>
> Note that you must back up your work before running this API. The patching process replaces the root volume with the updated AMI, which means that your previous data stored in the instance root volume will be lost. Make sure that you back up your data from

the instance root volume to Amazon S3 or Amazon FSx for Lustre. For more information, see the section called "Use the backup script provided by SageMaker HyperPod".

```
aws sagemaker update-cluster-software --cluster-name your-hyperpod-cluster
```

This command calls the UpdateClusterSoftware API. After the API call, SageMaker HyperPod updates the cluster instances to use the latest the section called "SageMaker HyperPod DLAMI" and runs your lifecycle scripts in the S3 bucket that you specified during cluster creation or update. The SageMaker HyperPod service team regularly rolls out new the section called "SageMaker HyperPod DLAMI"s for enhancing security and improving user experiences. We recommend that you always keep updating to the latest SageMaker HyperPod DLAMI. For future SageMaker HyperPod DLAMI updates for security patching, follow up with the section called "HyperPod release notes".

Tip

If the security patch fails, you can retrieve failure messages by running the `DescribeCluster` API as instructed at the section called "Describe a cluster".

Note

You can only run this API programatically. The patching functionality is not implemented in the SageMaker HyperPod console UI.

Use the backup script provided by SageMaker HyperPod

SageMaker HyperPod provides a script to back up and restore your data at `1.architectures/5.sagemaker-hyperpod/patching-backup.sh` in the *Awsome Distributed Training GitHub repository*. The script provides the following two functions.

To back up data to an S3 bucket before patching

```
sudo bash patching-backup.sh --create <s3-buckup-bucket-path>
```

After you run the command, the script checks `squeue` if there are queued jobs, stops Slurm if there's no job in the queue, backs up `mariadb`, and copies local items on disc defined under `LOCAL_ITEMS`. You can add more files and directories to `LOCAL_ITEMS`.

```
# Define files and directories to back up.
LOCAL_ITEMS=(
    "/var/spool/slurmd"
    "/var/spool/slurmctld"
    "/etc/systemd/system/slurmctld.service"
    "/home/ubuntu/backup_slurm_acct_db.sql"
    # ... Add more items as needed
)
```

Also, you can add custom code to the provided script to back up any applications for your use case.

To restore data from an S3 bucket after patching

```
sudo bash patching-backup.sh --restore <s3-buckup-bucket-path>
```

Delete a cluster

Run `delete-cluster` to delete a cluster. You can specify either the name or the ARN of the cluster.

```
aws sagemaker delete-cluster --cluster-name your-hyperpod-cluster
```

SageMaker HyperPod lifecycle configuration best practices

SageMaker HyperPod offers always up-and-running compute clusters, which are highly customizable as you can write lifecycle scripts to tell SageMaker HyperPod how to set up the cluster resources. The following topics are best practices for preparing lifecycle scripts to set up SageMaker HyperPod clusters with open source workload manager tools.

Prepare lifecycle scripts for setting up Slurm on SageMaker HyperPod

The following topics discuss how to prepare lifecycle scripts to set up Slurm on SageMaker HyperPod.

Topics

- High-level overview

- Start with base lifecycle scripts provided by HyperPod
- What particular configurations HyperPod manages in Slurm configuration files
- Mount Amazon FSx for Lustre to your HyperPod cluster
- Validate the JSON configuration files before creating a Slurm cluster on HyperPod
- Validate runtime before running production workloads on a Slurm cluster on HyperPod
- Develop lifecycle scripts interactively on a cluster node
- Update a cluster with new or updated lifecycle scripts
- Considerations

High-level overview

The following procedure is the main flow of provisioning a HyperPod cluster and setting it up with Slurm. The steps are put in order of a ***bottom-up*** approach.

1. Plan how you want to create Slurm nodes on a HyperPod cluster. For example, if you want to configure two Slurm nodes, you'll need to set up two instance groups in a HyperPod cluster.
2. Prepare a `provisioning_params.json` file, which is a the section called "Configuration form for provisioning Slurm nodes on HyperPod". `provisioning_params.json` should contain Slurm node configuration information to be provisioned on the HyperPod cluster. This should reflect the design of Slurm nodes from Step 1.
3. Prepare a set of lifecycle scripts to set up Slurm on HyperPod to install software packages and set up an environment in the cluster for your use case. You should structure the lifecycle scripts to collectively run in order in a central Python script (`lifecycle_script.py`), and write an entrypoint shell script (on`_create.sh`) to run the Python script. The entrypoint shell script is what you need to provide to a HyperPod cluster creation request later in Step 5.

   Also, note that you should write the scripts to expect `resource_config.json` that will be generated by HyperPod during cluster creation. `resource_config.json` contains HyperPod cluster resource information such as IP addresses, instance types, and ARNs, and is what you need to use for configuring Slurm.
4. Collect all the files from the previous steps into a folder.

```
### lifecycle_files // your local folder
    ### provisioning_params.json
    ### on_create.sh
```

```
    ### lifecycle_script.py
    ### ... // more setup scrips to be fed into lifecycle_script.py
```

5. Upload all the files to an S3 bucket. Copy and keep the S3 bucket path. Note that you should create an S3 bucket path starting with `sagemaker-` because you need to choose an the section called "IAM role for SageMaker HyperPod" attached with `AmazonSageMakerClusterInstanceRolePolicy`, which only allows S3 bucket paths starting with the prefix `sagemaker-`. The following command is an example command to upload all the files to an S3 bucket.

```
aws s3 cp --recursive ./lifecycle_files s3://sagemaker-hyperpod-lifecycle/src
```

6. Prepare a HyperPod cluster creation request.
   - Option 1: If you use the AWS CLI, write a cluster creation request in JSON format (`create_cluster.json`) following the instructions at the section called "Create a new cluster".
   - Option 2: If you use the SageMaker console UI, fill the **Create a cluster** request form in the HyperPod console UI following the instructions at the section called "Create a SageMaker HyperPod cluster".

   At this stage, make sure that you create instance groups in the same structure that you planned in Step 1 and 2. Also, make sure that you specify the S3 bucket from Step 5 in the request forms.
7. Submit the cluster creation request. HyperPod provisions a cluster based on the request, and then creates a `resource_config.json` file in the HyperPod cluster instances, and sets up Slurm on the cluster running the lifecycle scripts.

The following section walks you through and dives deep into details on how to organize configuration files and lifecycle scripts to work properly during HyperPod cluster creation.

Start with base lifecycle scripts provided by HyperPod

This section walks you through every component of the basic flow of setting up Slurm on HyperPod in a ***top-down*** approach. It starts from preparing a HyperPod cluster creation request to run the `CreateCluster` API, and dives deep into the hierarchical structure down to lifecycle scripts. Use the sample lifecycle scripts provided in the Awsome Distributed Training GitHub repository. Clone the repository by running the following command.

```
git clone https://github.com/aws-samples/awsome-distributed-training/
```

The base lifecycle scripts for setting up a Slurm cluster on SageMaker HyperPod are available at 1.architectures/5.sagemaker_hyperpods/LifecycleScripts/base-config.

```
cd awsome-distributed-training/1.architectures/5.sagemaker_hyperpods/LifecycleScripts/
base-config
```

The following flowchart shows a detailed overview of how you should design the base lifecycle scripts. The descriptions below the diagram and the procedural guide explain how they work during the HyperPod `CreateCluster` API call.

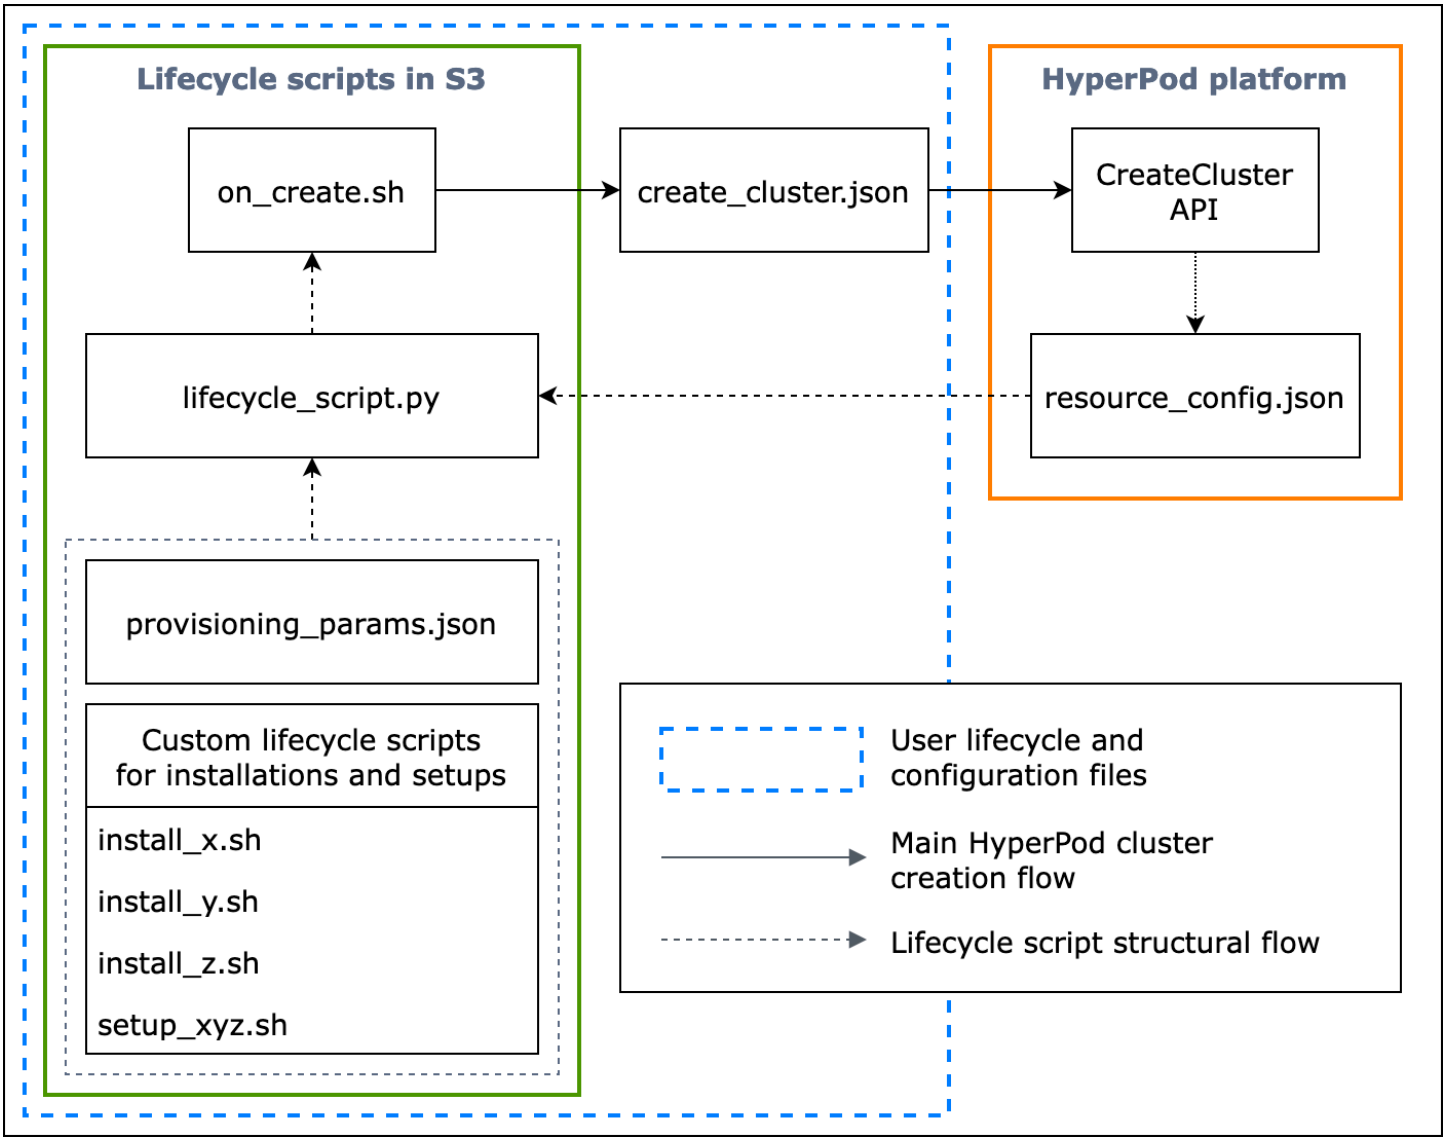


Figure: *A detailed flow chart of HyperPod cluster creation and the structure of lifecycle scripts. (1) The dashed arrows are directed to where the boxes are "called into" and shows the flow of configuration files and lifecycle scripts preparation. It starts from preparing `provisioning_params.json` and lifecycle scripts. These are then coded*

*in `lifecycle_script.py` for a collective execution in order. And the execution of the `lifecycle_script.py` script is done by the `on_create.sh` shell script, which to be run in the HyperPod instance terminal. (2) The solid arrows show the main HyperPod cluster creation flow and how the boxes are "called into" or "submitted to". `on_create.sh` is required for cluster creation request, either in `create_cluster.json` or the **Create a cluster** request form in the console UI. After you submit the request, HyperPod runs the `CreateCluster` API based on the given configuration information from the request and the lifecycle scripts. (3) The dotted arrow indicates that the HyperPod platform creates `resource_config.json` in the cluster instances during cluster resource provisioning. `resource_config.json` contains HyperPod cluster resource information such as the cluster ARN, instance types, and IP addresses. It is important to note that you should prepare the lifecycle scripts to expect the `resource_config.json` file during cluster creation. For more information, see the procedural guide below.*

The following procedural guide explains what happens during HyperPod cluster creation and how the base lifecycle scripts are designed.

1. `create_cluster.json` – To submit a HyperPod cluster creation request, you prepare a `CreateCluster` request file in JSON format. In this best practices example, we assume that the request file is named `create_cluster.json`. Write `create_cluster.json` to provision a HyperPod cluster with instance groups. The best practice is to add the same number of instance groups as the number of Slurm nodes you plan to configure on the HyperPod cluster. Make sure that you give distinctive names to the instance groups that you'll assign to Slurm nodes you plan to set up.

   Also, you are required to specify an S3 bucket path to store your entire set of configuration files and lifecycle scripts to the field name `InstanceGroups.LifeCycleConfig.SourceS3Uri` in the `CreateCluster` request form, and specify the file name of an entrypoint shell script (assume that it's named `on_create.sh`) to `InstanceGroups.LifeCycleConfig.OnCreate`.

   > **Note**
   >
   > If you are using the **Create a cluster** submission form in the HyperPod console UI, the console manages filling and submitting the `CreateCluster` request on your behalf, and runs the `CreateCluster` API in the backend. In this case, you don't need to create `create_cluster.json`; instead, make sure that you specify the correct cluster configuration information to the **Create a cluster** submission form.

2. on_create.sh – For each instance group, you need to provide an entrypoint shell script, on_create.sh, to run commands, run scripts to install software packages, and set up the HyperPod cluster environment with Slurm. The two things you need to prepare are a provisioning_params.json required by HyperPod for setting up Slurm and a set of lifecycle scripts for installing software packages. This script should be written to find and run the following files as shown in the sample script at on_create.sh.

   > **Note**
   >
   > Make sure that you upload the entire set of lifecycle scripts to the S3 location you specify in create_cluster.json. You should also place your provisioning_params.json in the same location.

   a. provisioning_params.json – This is a the section called "Configuration form for provisioning Slurm nodes on HyperPod". The on_create.sh script finds this JSON file and defines environment variable for identifying the path to it. Through this JSON file, you can configure Slurm nodes and storage options such as Amazon FSx for Lustre for Slurm to communicate with. In provisioning_params.json, make sure that you assign the HyperPod cluster instance groups using the names you specified in create_cluster.json to the Slurm nodes appropriately based on how you plan to set them up.

      The following diagram shows an example of how the two JSON configuration files create_cluster.json and provisioning_params.json should be written to assign HyperPod instance groups to Slurm nodes. In this example, we assume a case of setting up three Slurm nodes: controller (management) node, log-in node (which is optional), and compute (worker) node.

      > **Tip**
      >
      > To help you validate these two JSON files, the HyperPod service team provides a validation script, validate-config.py. To learn more, see the section called "Validate the JSON configuration files before creating a Slurm cluster on HyperPod".

`create_cluster.json` for HyperPod cluster resource config

```
{
    "ClusterName": "your-hyperpod-cluster",
    "InstanceGroups": [
        {
            "InstanceGroupName": "controller-machine",
            "InstanceType": "ml.c5.xlarge",
            "InstanceCount": 1,
            "LifeCycleConfig": {
                "SourceS3Uri": "s3://sagemaker-<unique-s3-bucket-path>/src",
                "OnCreate": "on_create.sh"
            },
            "ExecutionRole": "${ROLE}",
            "ThreadsPerCore": 1
        },
        {
            "InstanceGroupName": "login-group",
            "InstanceType": "ml.m5.4xlarge",
            "InstanceCount": 1,
            "LifeCycleConfig": {
                "SourceS3Uri": "s3://sagemaker-<unique-s3-bucket-path>/src",
                "OnCreate": "on_create.sh"
            },
            "ExecutionRole": "${ROLE}",
            "ThreadsPerCore": 1
        },
        {
            "InstanceGroupName": "compute-nodes",
            "InstanceType": "ml.trn1.32xlarge",
            "InstanceCount": 4,
            "LifeCycleConfig": {
                "SourceS3Uri": "s3://sagemaker-<unique-s3-bucket-path>/src",
                "OnCreate": "on_create.sh"
            },
            "ExecutionRole": "${ROLE}",
            "ThreadsPerCore": 1
        }
    ],

```

`provisioning_params.json` for Slurm config

```
{
    "version": "1.0.0",
    "workload_manager": "slurm",
    "controller_group": "controller-machine",
    "login_group": "login-group",
    "worker_groups": [{
        "instance_group_name": "compute-nodes",
        "partition_name": "dev"
    }],
    "fsx_dns_name": "fs-12345678a90b01cde.
        fsx.us-west-2.amazonaws.com ",
    "fsx_mountname": "1abcdefg"
}
```

Figure: *Direct comparison between `create_cluster.json` for HyperPod cluster creation and `provisiong_params.json` for Slurm configuration. The number of instance groups in `create_cluster.json` should match with the number of nodes you want to configure as Slurm nodes. In case of the example in the figure, three Slurm nodes will be configured on a HyperPod cluster of three instance groups. You should assign the HyperPod cluster instance groups to Slurm nodes by specifying the instance group names accordingly.*

b. `resource_config.json` – During cluster creation, the `lifecycle_script.py` script is written to expect a `resource_config.json` file from HyperPod. This file contains information about the cluster, such as instance types and IP addresses.

   When you run the `CreateCluster` API, HyperPod creates a resource configuration file at `/opt/ml/config/resource_config.json` based on the `create_cluster.json` file. The file path is saved to the environment variable named `SAGEMAKER_RESOURCE_CONFIG_PATH`.

Important

The `resource_config.json` file is auto-generated by the HyperPod platform, and you DO NOT need to create it. The following code is to show an example of `resource_config.json` that would be created from the cluster creation based on `create_cluster.json` in the previous step, and to help you understand what happens in the backend and how an auto-generated `resource_config.json` would look.

```
{
    "ClusterConfig": {
        "ClusterArn": "arn:aws:sagemaker:us-west-2:111122223333:cluster/
abcde01234yz",
        "ClusterName": "your-hyperpod-cluster"
    },
    "InstanceGroups": [
        {
            "Name": "controller-machine",
            "InstanceType": "ml.c5.xlarge",
            "Instances": [
                {
                    "InstanceName": "controller-machine-1",
                    "AgentIpAddress": "111.222.333.444",
                    "CustomerIpAddress": "111.222.333.444",
                    "InstanceId": "i-12345abcedfg67890"
                }
            ]
        },
        {
            "Name": "login-group",
            "InstanceType": "ml.m5.xlarge",
            "Instances": [
                {
                    "InstanceName": "login-group-1",
                    "AgentIpAddress": "111.222.333.444",
                    "CustomerIpAddress": "111.222.333.444",
                    "InstanceId": "i-12345abcedfg67890"
                }
            ]
```

```
        },
        {
            "Name": "compute-nodes",
            "InstanceType": "ml.trn1.32xlarge",
            "Instances": [
                {
                    "InstanceName": "compute-nodes-1",
                    "AgentIpAddress": "111.222.333.444",
                    "CustomerIpAddress": "111.222.333.444",
                    "InstanceId": "i-12345abcedfg67890"
                },
                {
                    "InstanceName": "compute-nodes-2",
                    "AgentIpAddress": "111.222.333.444",
                    "CustomerIpAddress": "111.222.333.444",
                    "InstanceId": "i-12345abcedfg67890"
                },
                {
                    "InstanceName": "compute-nodes-3",
                    "AgentIpAddress": "111.222.333.444",
                    "CustomerIpAddress": "111.222.333.444",
                    "InstanceId": "i-12345abcedfg67890"
                },
                {
                    "InstanceName": "compute-nodes-4",
                    "AgentIpAddress": "111.222.333.444",
                    "CustomerIpAddress": "111.222.333.444",
                    "InstanceId": "i-12345abcedfg67890"
                }
            ]
        }
    ]
}
```

c. `lifecycle_script.py` – This is the main Python script that collectively runs lifecycle scripts setting up Slurm on the HyperPod cluster while being provisioned. This script reads in `provisioning_params.json` and `resource_config.json` from the paths that are specified or identified in on`_create.sh`, passes the relevant information to each lifecycle script, and then runs the lifecycle scripts in order.

   Lifecycle scripts are a set of scripts that you have a complete flexibility to customize to install software packages and set up necessary or custom configurations during cluster creation, such as setting up Slurm, creating users, installing Conda or Docker.

The sample `lifecycle_script.py` script is prepared to run other base lifecycle scripts in the repository, such as launching Slurm deamons (`start_slurm.sh`), mounting Amazon FSx for Lustre (`mount_fsx.sh`), and setting up MariaDB accounting (`setup_mariadb_accounting.sh`) and RDS accounting (`setup_rds_accounting.sh`). You can also add more scripts, package them under the same directory, and add code lines to `lifecycle_script.py` to let HyperPod run the scripts. For more information about the base lifecycle scripts, see 3.1 Lifecycle scripts in the `README.md` file in the *Awsome Distributed Training GitHub repository*.

In addition to the default setups, more scripts for installing the following software are available under the `utils` folder. The `lifecycle_script.py` file is already prepared to include code lines for running the installation scripts, so see the following items to search those lines and uncomment to activate them.

i. The following code lines are for installing Docker, Enroot, and Pyxis. These packages are required to run Docker containers on a Slurm cluster. You can switch it on and off using the `enable_docker_enroot_pyxis` parameter in the `config.py` file.

```
# Install Docker/Enroot/Pyxis
if Config.enable_docker_enroot_pyxis:
    ExecuteBashScript("./utils/install_docker.sh").run()
    ExecuteBashScript("./utils/install_enroot_pyxis.sh").run(node_type)
```

ii. To install DCGM Exporter and EFA node exporter, search and uncomment the following code lines. This also requires having Docker installed.

```
ExecuteBashScript("./utils/install_dcgm_exporter.sh").run()
ExecuteBashScript("./utils/install_efa_node_exporter.sh").run()
```

iii. To install Slurm exporter and Prometheus on the controller node, search and uncomment the following code lines.

```
ExecuteBashScript("./utils/install_slurm_exporter.sh").run()
ExecuteBashScript("./utils/install_prometheus.sh").run()
```

To learn more about the base lifecycle scripts and dive deep, see 3.1 Lifecycle scripts in `README.md` file under the HyperPod folder in the *Awsome Distributed Training GitHub repository*.

3. Make sure that you upload all configuration files and setup scripts from **Step 2** to the S3 bucket you provide in the `CreateCluster` request in **Step 1**. For example, assume that your `create_cluster.json` has the following.

```
"LifeCycleConfig": {
    "SourceS3URI": "s3://sagemaker-hyperpod-lifecycle/src",
    "OnCreate": "on_create.sh"
}
```

Then, your `"s3://sagemaker-hyperpod-lifecycle/src"` should contain `on_create.sh`, `lifecycle_script.py`, `provisioning_params.json`, and all other setup scripts. Assume that you have prepared the files in a local folder as follows.

```
### lifecycle_files // your local folder
    ### provisioning_params.json
    ### on_create.sh
    ### lifecycle_script.py
    ### ... // more setup scrips to be fed into lifecycle_script.py
```

To upload the files, use the S3 command as follows.

```
aws s3 cp --recursive ./lifecycle_scripts s3://sagemaker-hyperpod-lifecycle/src
```

What particular configurations HyperPod manages in Slurm configuration files

When you create a Slurm cluster on HyperPod, the HyperPod agent sets up the `slurm.conf` and `gres.conf` files at `/opt/slurm/etc/` to manage the Slurm cluster based on your HyperPod cluster creation request and lifecycle scripts. The following list shows which specific parameters the HyperPod agent handles and overwrites.

> **Important**
>
> We strongly recommend that you **do not** change these parameters managed by HyperPod.

- In `slurm.conf`, HyperPod sets up the following basic parameters: `ClusterName`, `SlurmctldHost`, `PartitionName`, and `NodeName`.

Also, to enable the the section called “Auto-resume” functionality, HyperPod requires the `TaskPlugin` and `SchedulerParameters` parameters set as follows. The HyperPod agent sets up these two parameters with the required values by default.

```
TaskPlugin=task/none
SchedulerParameters=permit_job_expansion
```

- In `gres.conf`, HyperPod manages NodeName for GPU nodes.

Mount Amazon FSx for Lustre to your HyperPod cluster

To mount an Amazon FSx for Lustre shared file system to your HyperPod cluster, set up the following.

1. Use your Amazon VPC.
   a. For HyperPod cluster instances to communicate within your VPC, make sure that you attach the the section called “(Optional) Additional permissions for using SageMaker HyperPod with Amazon Virtual Private Cloud” to the IAM role for SageMaker HyperPod.
   b. In `create_cluster.json`, include the following VPC information.

   ```
   "VpcConfig": {
       "SecurityGroupIds": [ "string" ],
       "Subnets": [ "string" ]
   }
   ```

   For more tips about setting up Amazon VPC, see the section called “(Optional) Set up SageMaker HyperPod with your Amazon VPC”.
2. To finish configuring Slurm with Amazon FSx for Lustre, specify the Amazon FSx DNS name and Amazon FSx mount name in `provisioning_params.json` as shown in the figure in the the section called “Start with base lifecycle scripts provided by HyperPod” section. You can find the Amazon FSx information either from the Amazon FSx for Lustre console in your account or by running the following AWS CLI command, `aws fsx describe-file-systems`.

   ```
   "fsx_dns_name": "fs-12345678a90b01cde.fsx.us-west-2.amazonaws.com",
   "fsx_mountname": "1abcdefg"
   ```

Validate the JSON configuration files before creating a Slurm cluster on HyperPod

To validate the JSON configuration files before submitting a cluster creation request, use the configuration validation script `validate-config.py`. This script parses and compares your HyperPod cluster configuration JSON file and Slurm configuration JSON file, and identifies if there's any resource misconfiguration between the two files and also across Amazon EC2, Amazon VPC, and Amazon FSx resources. For example, to validate the `create_cluster.json` and `provisioning_params.json` files from the the section called “Start with base lifecycle scripts provided by HyperPod” section, run the validation script as follows.

```
python3 validate-config.py --cluster-config create_cluster.json --provisioning-
parameters provisioning_params.json
```

The following is an example output of a successful validation.

```
##  Validated instance group name worker-group-1 is correct ...
##  Validated subnet subnet-012345abcdef67890 ...
##  Validated security group sg-012345abcdef67890 ingress rules ...
##  Validated security group sg-012345abcdef67890 egress rules ...
##  Validated FSx Lustre DNS name fs-012345abcdef67890.fsx.us-east-1.amazonaws.com
##  Validated FSx Lustre mount name abcdefgh
# Cluster Validation succeeded
```

Validate runtime before running production workloads on a Slurm cluster on HyperPod

To check the runtime before running any production workloads on a Slurm cluster on HyperPod, use the runtime validation script `hyperpod-precheck.py`. This script checks if the Slurm cluster has all packages installed for running Docker, if the cluster has a properly mounted FSx for Lustre file system and a user directory sharing the file system, and if the Slurm deamon is running on all compute nodes.

To run the script on multiple nodes at once, use `srun` as shown in the following example command of running the script on a Slurm cluster of 8 nodes.

```
# The following command runs on 8 nodes
srun -N 8 python3 hyperpod-precheck.py
```

> **Note**
>
> To learn more about the validation script such as what runtime validation functions the script provides and guidelines to resolve issues that don't pass the validations, see Runtime validation before running workloads in the *Awsome Distributed Training GitHub repository*.

Develop lifecycle scripts interactively on a cluster node

This section explains how you can interactively develop lifecycle scripts without repeatedly creating and deleting a HyperPod cluster.

1. Create a HyperPod cluster with the base lifecycle scripts.
2. Log in to a cluster node.
3. Develop a script (`configure_xyz.sh`) by editing and running it repeatedly on the node.
   a. HyperPod runs the lifecycle scripts as the root user, so we recommend that you run the `configure_xyz.sh` as the root user while developing to make sure that the script is tested under the same condition while run by HyperPod.
4. Integrate the script into `lifecycle_script.py` by adding a code line similar to the following.

```
ExecuteBashScript("./utils/configure_xyz.sh").run()
```

5. Upload the updated lifecycle scripts to the S3 bucket that you initially used for uploading the base lifecycle scripts.
6. Test the integrated version of `lifecycle_script.py` by creating a new HyperPod cluster.

Update a cluster with new or updated lifecycle scripts

There are three ways to update the HyperPod software.

- The `UpdateClusterSoftware` API for patching the HyperPod software re-runs the lifecycle scripts on the entire instance group.
- The `UpdateCluster` API only runs the lifecycle scripts for new instance groups.
- You can also run lifecycle scripts directly in the HyperPod instances.

Considerations

Consider the following when using SageMaker HyperPod.

- HyperPod runs the section called "SageMaker HyperPod DLAMI" on each instance of a cluster, and the AMI has pre-installed software packages complying compatibilities between them and HyperPod functionalities. Note that if you reinstall any of the pre-installed packages, you are responsible for installing compatible packages and note that some HyperPod functionalities might not work as expected.

Run jobs on SageMaker HyperPod clusters

The following topics provide procedures and examples of accessing compute nodes and running ML workloads on provisioned SageMaker HyperPod clusters. Depending on how you have set up the environment on your HyperPod cluster, there are many ways to run ML workloads on HyperPod clusters. Examples of running ML workloads on HyperPod clusters are also provided in the Awsome Distributed Training GitHub repository. The following topics walk you through how to log in to the provisioned HyperPod clusters and get you started with running sample ML workloads.

Topics

- Access your SageMaker HyperPod cluster nodes
- Schedule a Slurm job on a SageMaker HyperPod cluster
- Run Docker containers on a Slurm compute node on SageMaker HyperPod
- Run distributed training workloads with Slurm on SageMaker HyperPod

Access your SageMaker HyperPod cluster nodes

You can access your **InService** cluster through AWS Systems Manager (SSM) by running the AWS CLI command `aws ssm start-session` with the SageMaker HyperPod cluster host name in format of `sagemaker-cluster:[cluster-id]_[instance-group-name]-[instance-id]`. You can retrieve the cluster ID, the instance ID, and the instance group name from the SageMaker HyperPod console or by running `describe-cluster` and `list-cluster-nodes` from the AWS CLI commands for SageMaker HyperPod. For example, if your cluster ID is `aa11bbbbb222`, the cluster node name is `controller-group`, and the cluster node ID is `i-111222333444555aa`, the SSM `start-session` command should be the following.

> **Note**
>
> If you haven't set up AWS Systems Manager, follow the instructions provided at the section called “Set up AWS Systems Manager and Run As for cluster user access control”.

```
$ aws ssm start-session \
    --target sagemaker-cluster:aa11bbbbb222_controller-group-i-111222333444555aa \
    --region us-west-2
Starting session with SessionId: s0011223344aabbccdd
root@ip-111-22-333-444:/usr/bin#
```

Note that this initially connects you as the root user. Before running jobs, switch to the ubuntu user by running the following command.

```
root@ip-111-22-333-444:/usr/bin# sudo su - ubuntu
ubuntu@ip-111-22-333-444:/usr/bin#
```

For advanced settings for practical use of HyperPod clusters, see the following topics.

Topics

- Additional tips for accessing your SageMaker HyperPod cluster nodes
- Set up a multi-user environment through the Amazon FSx shared space
- Set up a multi-user environment by integrating HyperPod clusters with Active Directory

Additional tips for accessing your SageMaker HyperPod cluster nodes

Use the `easy-ssh.sh` script provided by HyperPod for simplifying the connection process

To make the previous process into a single line command, the HyperPod team provides the `easy-ssh.sh` script that retrieves your cluster information, aggregates them into the SSM command, and connects to the compute node. You don't need to manually look for the required HyperPod cluster information as this script runs `describe-cluster` and `list-cluster-nodes` commands and parses the information needed for completing the SSM command. The following example commands show how to run the `easy-ssh.sh` script. If it runs successfully, you'll be connected to the cluster as the root user. It also prints a code snippet to set up SSH by adding the HyperPod cluster as a remote host through an SSM proxy. By setting up SSH, you can connect your local development environment such as Visual Studio Code with the HyperPod cluster.

```
$ chmod +x easy-ssh.sh
$ ./easy-ssh.sh -c <node-group> <cluster-name>
Cluster id: <cluster_id>
Instance id: <instance_id>
Node Group: <node-group>
Add the following to your ~/.ssh/config to easily connect:

$ cat <<EOF >> ~/.ssh/config
Host <cluster-name>
  User ubuntu
  ProxyCommand sh -c "aws ssm start-session  --target sagemaker-
cluster:<cluster_id>_<node-group>-<instance_id> --document-name AWS-StartSSHSession --
parameters 'portNumber=%p'"
EOF

Add your ssh keypair and then you can do:

$ ssh <cluster-name>

aws ssm start-session --target sagemaker-cluster:<cluster_id>_<node-
group>-<instance_id>

Starting session with SessionId: s0011223344aabbccdd
root@ip-111-22-333-444:/usr/bin#
```

Note that this initially connects you as the root user. Before running jobs, switch to the ubuntu user by running the following command.

```
root@ip-111-22-333-444:/usr/bin# sudo su - ubuntu
ubuntu@ip-111-22-333-444:/usr/bin#
```

Set up for easy access with SSH by using the HyperPod compute node as a remote host

To further simplify access to the compute node using SSH from a local machine, the `easy-ssh.sh` script outputs a code snippet of setting up the HyperPod cluster as a remote host as shown in the previous section. The code snippet is auto-generated to help you directly add to the `~/.ssh/config` file on your local device. The following procedure shows how to set up for easy access using SSH through the SSM proxy, so that you or your cluster users can directly run `ssh <cluster-name>` to connect to the HyperPod cluster node.

1. On your local device, add the HyperPod compute node with a user name as a remote host to the `~/.ssh/config` file. The following command shows how to append the auto-generated code snippet from the `easy-ssh.sh` script to the `~/.ssh/config` file. Make sure that you copy it from the auto-generated output of the `easy-ssh.sh` script that has the correct cluster information.

```
$ cat <<EOF >> ~/.ssh/config
Host <cluster-name>
  User ubuntu
  ProxyCommand sh -c "aws ssm start-session  --target sagemaker-
cluster:<cluster_id>_<node-group>-<instance_id> --document-name AWS-StartSSHSession
 --parameters 'portNumber=%p'"
EOF
```

2. On the HyperPod cluster node, add the public key on your local device to the `~/.ssh/authorized_keys` file on the HyperPod cluster node.

   a. Print the public key file on your local machine.

   ```
   $ cat ~/.ssh/id_rsa.pub
   ```

   This should return your key. Copy the output of this command.

   (Optional) If you don't have a public key, create one by running the following command.

   ```
   $ ssh-keygen -t rsa -q -f "$HOME/.ssh/id_rsa" -N ""
   ```

   b. Connect to the cluster node and switch to the user to add the key. The following command is an example of accessing as the `ubuntu` user. Replace `ubuntu` to the user name for which you want to set up the easy access with SSH.

   ```
   $ ./easy-ssh.sh -c <node-group> <cluster-name>
   $ sudo su - ubuntu
   ubuntu@ip-111-22-333-444:/usr/bin#
   ```

   c. Open the `~/.ssh/authorized_keys` file and add the public key at the end of the file.

   ```
   ubuntu@ip-111-22-333-444:/usr/bin# vim ~/.ssh/authorized_keys
   ```

After you finish setting up, you can connect to the HyperPod cluster node as the user by running a simplified SSH command as follows.

```
$ ssh <cluster-name>
ubuntu@ip-111-22-333-444:/usr/bin#
```

Also, you can use the host for remote development from an IDE on your local device, such as Visual Studio Code Remote - SSH.

Set up a multi-user environment through the Amazon FSx shared space

You can use the Amazon FSx shared space to manage a multi-user environment in a Slurm cluster on SageMaker HyperPod. If you have configured your Slurm cluster with Amazon FSx during the HyperPod cluster creation, this is a good option for setting up workspace for your cluster users. Create a new user and setup the home directory for the user on the Amazon FSx shared file system.

> **Tip**
>
> To allow users to access your cluster through their user name and dedicated directories, you should also associate them with IAM roles or users by tagging them as guided in **Option 2** of step 5 under the procedure **To turn on Run As support for Linux and macOS managed nodes** provided at Turn on Run As support for Linux and macOS managed nodes in the AWS Systems Manager User Guide. See also the section called "Set up AWS Systems Manager and Run As for cluster user access control".

To set up a multi-user environment while creating a Slurm cluster on SageMaker HyperPod

The SageMaker HyperPod service team provides a script `add_users.sh` as part of the base lifecycle script samples.

1. Prepare a text file named `shared_users.txt` that you need to create in the following format. The first column is for user names, the second column is for unique user IDs, and the third column is for the user directories in the Amazon FSx shared space.

   ```
   username1,uid1,/fsx/username1
   username2,uid2,/fsx/username2
   ...
   ```

2. Make sure that you upload the `shared_users.txt` and `add_users.sh` files to the S3 bucket for HyperPod lifecycle scripts. While the cluster creation, cluster update, or cluster software update is in progress, the `add_users.sh` reads in the `shared_users.txt` and sets up the user directories properly.

To create new users and add to an existing Slurm cluster running on SageMaker HyperPod

1. On the head node, run the following command to save a script that helps create a user. Make sure that you run this with sudo permissions.

```
$ cat > create-user.sh << EOL
#!/bin/bash

set -x

# Prompt user to get the new user name.
read -p "Enter the new user name, i.e. 'sean':
" USER

# create home directory as /fsx/<user>
# Create the new user on the head node
sudo useradd \$USER -m -d /fsx/\$USER --shell /bin/bash;
user_id=\$(id -u \$USER)

# add user to docker group
sudo usermod -aG docker \${USER}

# setup SSH Keypair
sudo -u \$USER ssh-keygen -t rsa -q -f "/fsx/\$USER/.ssh/id_rsa" -N ""
sudo -u \$USER cat /fsx/\$USER/.ssh/id_rsa.pub | sudo -u \$USER tee /fsx/\$USER/.ssh/
authorized_keys

# add user to compute nodes
read -p "Number of compute nodes in your cluster, i.e. 8:
" NUM_NODES
srun -N \$NUM_NODES sudo useradd -u \$user_id \$USER -d /fsx/\$USER --shell /bin/
bash;

# add them as a sudoer
read -p "Do you want this user to be a sudoer? (y/N):
" SUDO
if [ "\$SUDO" = "y" ]; then
```

```
        sudo usermod -aG sudo \$USER
        sudo srun -N \$NUM_NODES sudo usermod -aG sudo \$USER
        echo -e "If you haven't already you'll need to run:\n\nsudo visudo /
etc/sudoers\n\nChange the line:\n\n%sudo   ALL=(ALL:ALL) ALL\n\nTo\n\n%sudo
 ALL=(ALL:ALL) NOPASSWD: ALL\n\nOn each node."
fi
EOL
```

2. Run the script with the following command. You'll be prompted for adding the name of a user and the number of compute nodes that you want to allow the user to access.

```
$ bash create-user.sh
```

3. Test the user by running the following commands.

```
$ sudo su - <user> && ssh $(srun hostname)
```

4. Add the user information to the `shared_users.txt` file, so the user will be created on any new compute nodes or new clusters.

Set up a multi-user environment by integrating HyperPod clusters with Active Directory

In practical use cases, HyperPod clusters are typically used by multiple users: machine learning (ML) researchers, software engineers, data scientists, and cluster administrators. They edit their own files and run their own jobs without impacting each other's work. To set up a multi-user environment, use the Linux user and group mechanism to statically create multiple users on each instance through lifecycle scripts. However, the drawback to this approach is that you need to duplicate user and group settings across multiple instances in the cluster to keep a consistent configuration across all instances when you make updates such as adding, editing, and removing users.

To solve this, you can use Lightweight Directory Access Protocol (LDAP) and LDAP over TLS/SSL (LDAPS) to integrate with a directory service such as AWS Directory Service for Microsoft Active Directory. To learn more about setting up Active Directory and a multi-user environment in a HyperPod cluster, see the blog post Integrate HyperPod clusters with Active Directory for seamless multi-user login.

Schedule a Slurm job on a SageMaker HyperPod cluster

You can launch training jobs using the standard Slurm `sbatch` or `srun` commands. For example, to launch an 8-node training job, you can run `srun -N 8 --exclusive train.sh` SageMaker HyperPod supports training in a range of environments, including `conda`, `venv`, `docker`, and `enroot`. You can configure an ML environment by running lifecycle scripts on your SageMaker HyperPod clusters. You also have an option to attach a shared file system such as Amazon FSx, which can also be used as a virtual environment.

The following example shows how to run a job for training Llama-2 with the Fully Sharded Data Parallelism (FSDP) technique on a SageMaker HyperPod cluster with an Amazon FSx shared file system. You can also find more examples from the Awsome Distributed Training GitHub repository.

> **Tip**
>
> All SageMaker HyperPod examples are available in the `3.test_cases` folder of the Awsome Distributed Training GitHub repository.

1. Clone the Awsome Distributed Training GitHub repository, and copy the training job examples to your Amazon FSx file system.

   ```
   $ TRAINING_DIR=/fsx/users/my-user/fsdp
   $ git clone https://github.com/aws-samples/awsome-distributed-training/
   ```

2. Run the `create_conda_env.sh` script. This creates a `conda` environment on your Amazon FSx file system. Make sure that the file system is accessible to all nodes in the cluster.
3. Build the virtual Conda environment by launching a single node slurm job as follows.

   ```
   $ srun -N 1 /path_to/create_conda_env.sh
   ```

4. After the environment is built, you can launch a training job by pointing to the environment path on the shared volume. You can launch both single-node and multi-node training jobs with the same setup. To launch a job, create a job launcher script (also called an entry point script) as follows.

   ```
   #!/usr/bin/env bash
   set -ex
   ```

```
ENV_PATH=/fsx/users/my_user/pytorch_env
TORCHRUN=$ENV_PATH/bin/torchrun
TRAINING_SCRIPT=/fsx/users/my_user/pt_train.py

WORLD_SIZE_JOB=$SLURM_NTASKS
RANK_NODE=$SLURM_NODEID
PROC_PER_NODE=8
MASTER_ADDR=(`scontrol show hostnames \$SLURM_JOB_NODELIST | head -n 1`)
MASTER_PORT=$(expr 10000 + $(echo -n $SLURM_JOBID | tail -c 4))

DIST_ARGS="--nproc_per_node=$PROC_PER_NODE \
           --nnodes=$WORLD_SIZE_JOB \
           --node_rank=$RANK_NODE \
           --master_addr=$MASTER_ADDR \
           --master_port=$MASTER_PORT \
          "

$TORCHRUN $DIST_ARGS $TRAINING_SCRIPT
```

> **Tip**
>
> If you want to make your training job more resilient against hardware failures by using the auto-resume capability of SageMaker HyperPod, you need to properly set up the environment variable `MASTER_ADDR` in the entrypoint script. To learn more, see the section called “Auto-resume”.

This tutorial assumes that this script is saved as `/fsx/users/my_user/train.sh`.

5. With this script in the shared volume at `/fsx/users/my_user/train.sh`, run the following `srun` command to schedule the Slurm job.

```
$ cd /fsx/users/my_user/
$ srun -N 8 train.sh
```

Run Docker containers on a Slurm compute node on SageMaker HyperPod

To run Docker containers with Slurm on SageMaker HyperPod, you need to use Enroot and Pyxis. The Enroot package helps convert Docker images into a runtime that Slurm can understand, while

the Pyxis enables scheduling the runtime as a Slurm job through an `srun` command, `srun --container-image=`*`docker/image:tag`*.

> **Tip**
>
> The Docker, Enroot, and Pyxis packages should be installed during cluster creation as part of running the lifecycle scripts as guided in the section called "Start with base lifecycle scripts provided by HyperPod". Use the base lifecycle scripts provided by the HyperPod service team when creating a HyperPod cluster. Those base scripts are set up to install the packages by default. In the `config.py` script, there's the `Config` class with the boolean type parameter for installing the packages set to `True` (`enable_docker_enroot_pyxis=True`). This is called by and parsed in the `lifecycle_script.py` script, which calls `install_docker.sh` and `install_enroot_pyxis.sh` scripts from the `utils` folder. The installation scripts are where the actual installations of the packages take place. Additionally, the installation scripts identify if they can detect NVMe store paths from the instances they are run on and set up the root paths for Docker and Enroot to `/opt/dlami/nvme`. The default root volume of any fresh instance is mounted to `/tmp` only with a 100GB EBS volume, which runs out if the workload you plan to run involves training of LLMs and thus large size Docker containers. If you use instance families such as P and G with local NVMe storage, you need to make sure that you use the NVMe storage attached at `/opt/dlami/nvme`, and the installation scripts take care of the configuration processes.

To check if the root paths are set up properly

On a compute node of your Slurm cluster on SageMaker HyperPod, run the following commands to make sure that the lifecycle script worked properly and the root volume of each node is set to `/opt/dlami/nvme/*`. The following commands shows examples of checking the Enroot runtime path and the data root path for 8 compute nodes of a Slurm cluster.

```
$ srun -N 8 cat /etc/enroot/enroot.conf | grep "ENROOT_RUNTIME_PATH"
ENROOT_RUNTIME_PATH        /opt/dlami/nvme/tmp/enroot/user-$(id -u)
... // The same or similar lines repeat 7 times
```

```
$ srun -N 8 cat /etc/docker/daemon.json
{
    "data-root": "/opt/dlami/nvme/docker/data-root"
```

```
}
... // The same or similar lines repeat 7 times
```

After you confirm that the runtime paths are properly set to `/opt/dlami/nvme/*`, you're ready to build and run Docker containers with Enroot and Pyxis.

To test Docker with Slurm

1. On your compute node, try the following commands to check if Docker and Enroot are properly installed.

```
$ docker --help
$ enroot --help
```

2. Test if Pyxis and Enroot installed correctly by running one of the NVIDIA CUDA Ubuntu images.

```
$ srun --container-image=nvidia/cuda:XX.Y.Z-base-ubuntuXX.YY nvidia-smi
pyxis: importing docker image: nvidia/cuda:XX.Y.Z-base-ubuntuXX.YY
pyxis: imported docker image: nvidia/cuda:XX.Y.Z-base-ubuntuXX.YY
DAY MMM DD HH:MM:SS YYYY
+-----------------------------------------------------------------------------+
| NVIDIA-SMI 470.141.03   Driver Version: 470.141.03   CUDA Version: XX.YY    |
|-------------------------------+----------------------+----------------------+
| GPU  Name        Persistence-M| Bus-Id        Disp.A | Volatile Uncorr. ECC |

```

To run a test Slurm job with Docker

After you have completed setting up Slurm with Docker, you can bring any pre-built Docker images and run using Slurm on SageMaker HyperPod. The following is a sample use case that walks you through how to run a training job using Docker and Slurm on SageMaker HyperPod. It shows an example job of model-parallel training of the Llama 2 model with the SageMaker model parallelism (SMP) library.

1. If you want to use one of the pre-built ECR images distributed by SageMaker or DLC, make sure that you give your HyperPod cluster the permissions to pull ECR images through the [the section]

called “IAM role for SageMaker HyperPod”. If you use your own or an open source Docker image, you can skip this step. Add the following permissions to the the section called “IAM role for SageMaker HyperPod”. In this tutorial, we use the SMP Docker image pre-packaged with the SMP library .

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ecr:BatchCheckLayerAvailability",
                "ecr:BatchGetImage",
                "ecr-public:*",
                "ecr:GetDownloadUrlForLayer",
                "ecr:GetAuthorizationToken",
                "sts:*"
            ],
            "Resource": "*"
        }
    ]
}
```

2. On the compute node, clone the repository and go to the folder that provides the example scripts of training with SMP.

```
$ git clone https://github.com/aws-samples/awsome-distributed-training/
$ cd awsome-distributed-training/3.test_cases/17.SM-modelparallelv2
```

3. In this tutorial, run the sample script `docker_build.sh` that pulls the SMP Docker image, build the Docker container, and runs it as an Enroot runtime. You can modify this as you want.

```
$ cat docker_build.sh
#!/usr/bin/env bash

region=us-west-2
dlc_account_id=658645717510
aws ecr get-login-password --region $region | docker login --username AWS --password-
stdin $dlc_account_id.dkr.ecr.$region.amazonaws.com

docker build -t smpv2 .
```

```
enroot import -o smpv2.sqsh  dockerd://smpv2:latest
```

```
$ bash docker_build.sh
```

4. Create a batch script to launch a training job using `sbatch`. In this tutorial, the provided sample script launch_training_enroot.sh launches a model-parallel training job of the 70-billion-parameter Llama 2 model with a synthetic dataset on 8 compute nodes. A set of training scripts are provided at 3.test_cases/17.SM-modelparallelv2/scripts, and `launch_training_enroot.sh` takes `train_external.py` as the entrypoint script.

> **Important**
>
> To use the a Docker container on SageMaker HyperPod, you must mount the `/var/log` directory from the host machine, which is the HyperPod compute node in this case, onto the `/var/log` directory in the container. You can set it up by adding the following variable for Enroot.
>
> ```
> "${HYPERPOD_PATH:="/var/log/aws/clusters":"/var/log/aws/clusters"}"
> ```

```
$ cat launch_training_enroot.sh
#!/bin/bash

To find the downloadable code examples, see Run a model-parallel training job using the SageMaker model parallelism library, Docker and Enroot with Slurm in the *Awsome Distributed Training GitHub repository*. For more information about distributed training with a Slurm cluster

on SageMaker HyperPod, proceed to the next topic at the section called "Run distributed training workloads with Slurm on SageMaker HyperPod".

Run distributed training workloads with Slurm on SageMaker HyperPod

SageMaker HyperPod is specialized for workloads of training large language models (LLMs) and foundation models (FMs). Such workloads often require the adoption of various parallelism techniques and optimized operations for ML infrastructure and resources. Using SageMaker HyperPod, you can take advantage of complimentary SageMaker distributed training frameworks: the SageMaker distributed data parallelism (SMDDP) library that offers collective communication operations optimized for AWS, and the SageMaker model parallelism (SMP) library that implements various model parallelism techniques.

Topics

- Using SMDDP on a SageMaker HyperPod
- Using SMP on a SageMaker HyperPod cluster

Using SMDDP on a SageMaker HyperPod

The SMDDP library is a collective communication library that improves compute performance of distributed data parallel training. The SMDDP library works with open source distributed training frameworks: PyTorch distributed data parallel (DDP), PyTorch fully sharded data parallelism (FSDP), DeepSpeed, and Megatron-DeepSpeed. The SMDDP library addresses communications overhead of the key collective communication operations by offering the following for SageMaker HyperPod.

- The library offers `AllGather` optimized for AWS. `AllGather` is a key operation used in sharded data parallel training, which is a memory-efficient data parallelism technique offered by popular libraries such as the SageMaker model parallelism (SMP) library, DeepSpeed Zero Redundancy Optimizer (ZeRO), and PyTorch Fully Sharded Data Parallelism (FSDP).
- The library performs optimized node-to-node communication by fully utilizing the AWS network infrastructure and the SageMaker ML instance topology.

To run sample data-parallel training jobs

Explore the following distributed training samples implementing data parallelism techniques using the SMDDP library.

- `awsome-distributed-training/3.test_cases/12.SM-dataparallel-FSDP`

- awsome-distributed-training/3.test_cases/13.SM-dataparallel-deepspeed

To set up an environment for using the SMDDP library on SageMaker HyperPod

The following are the training environment requirements for using the SMDDP library on SageMaker HyperPod.

- PyTorch v2.0.1 and later
- CUDA v11.8 and later
- `libstdc++` runtime version greater than 3
- Python v3.10.x and later
- `ml.p4d.24xlarge` and `ml.p4de.24xlarge`, which are supported instance types by the SMDDP library
- `imdsv2` enabled on training host

Depending on how you want to run the distributed training job, there are two options to install the SMDDP library: a direct installation using the SMDDP binary file, and using the SageMaker Deep Learning Containers (DLCs) pre-installed with the SMDDP library. Docker images pre-installed with the SMDDP library or the URLs to the SMDDP binary files are listed at Supported Frameworks in the SMDDP library documentation.

To install the SMDDP library on the SageMaker HyperPod DLAMI

- `pip install --no-cache-dir https://smdataparallel.s3.amazonaws.com/binary/pytorch/`*`<pytorch-version>/cuXYZ/YYYY-MM-DD/smdistributed_dataparallel-X.Y.Z-cp310-cp310-linux_x86_64`*`.whl`

> **Note**
>
> If you work in a Conda environment, ensure that you install PyTorch using `conda install` instead of `pip`.
>
> ```
> conda install pytorch==X.Y.Z  torchvision==X.Y.Z torchaudio==X.Y.Z pytorch-cuda=X.Y.Z -c pytorch -c nvidia
> ```

To use the SMDDP library on a Docker container

- The SMDDP library is pre-installed on the SageMaker Deep Learning Containers (DLCs). To find the list of SageMaker framework DLCs for PyTorch with the SMDDP library, see Supported Frameworks in the SMDDP library documentation. You can also bring your own Docker container with required dependencies installed to use the SMDDP library. To learn more about setting up a custom Docker container to use the SMDDP library, see also the section called "Create your own docker container with the library".

> **Important**
>
> To use the SMDDP library in a Docker container, you must mount the `/var/log` directory from the host machine onto `/var/log` in the container. This can be done by adding the following option when running your container.
>
> ```
> docker run <OTHER_OPTIONS> -v /var/log:/var/log ...
> ```

To learn how to run data-parallel training jobs with SMDDP in general, see the section called "How to run a distributed training job with the SMDDP library".

Using SMP on a SageMaker HyperPod cluster

The SageMaker model parallelism (SMP) library offers various state-of-the-art model parallelism techniques such as fully sharded data parallelism, expert parallelism, mixed precision training with FP16/BF16 and FP8 data types, and tensor parallelism. The SMP library is also compatible with open source frameworks such as PyTorch FSDP, NVIDIA Megatron, and NVIDIA Transformer Engine.

To run a sample model-parallel training workload

The SageMaker service teams provide sample training jobs implementing model parallelism with the SMP library at `awsome-distributed-training/3.test_cases/17.SM-modelparallelv2`.

SageMaker HyperPod cluster resiliency

SageMaker HyperPod provides the following cluster resiliency features.

Topics

- Cluster health check
- Auto-resume
- How to replace a faulty node not being auto-resumed by HyperPod

Cluster health check

This section describes the set of health checks that SageMaker HyperPod uses to regularly monitor cluster instance health for issues with devices such as accelerators (GPU and Trainium cores) and networking (EFA).

Category	Utility name	Instance type compatibility	Description
Accelerator	DCGM policies	GPU	Each instance in the cluster continuou sly monitors all GPU-related policies including XID errors with NVIDIA DCGM.
	NVIDIA SMI	GPU	nvidia-smi utility is a well-known CLI to manage and monitor GPUs. The built-in health checker parses the output from `nvidia-smi` to determine the health of the instance.
	Neuron sysfs	Trainium	For Trainium-powered instances , the health of the Neuron devices is determined by reading counters from Neuron sysfs

			propagated directly by the Neuron driver.
Network	EFA	GPU and Trainium	To aid in the diagnostic of Elastic Fabric Adaptor (EFA) devices, the EFA health checker runs a series of connectivity tests using all available EFA cards within the instance.
Stress	DCGM Diagnostic	GPU	DCGM diagnostics level 2 is used to exercise the GPUs in the system and put them under pressure to get a thorough insight of the health.
	CPU stress	GPU and Trainium	CPU health is determined using the Linux stress tool, which runs multiple threads to achieve 100% CPU utilization and perform I/O operations.

Auto-resume

This section describes how to run a training job with the SageMaker HyperPod auto-resume functionality, which provides a zero-touch resiliency infrastructure to automatically recover a training job from the last saved checkpoint in the event of a hardware failure for clusters with more than 16 nodes.

With the auto-resume functionality, if a job fails due to a hardware failure or any transient issues in-between training, SageMaker HyperPod auto-resume starts the node replacement workflow and restarts the job after the faulty nodes are replaced.

Using the SageMaker HyperPod auto-resume functionality with Slurm

When you use SageMaker HyperPod auto-resume with Slurm, you should run the job inside an exclusive allocation acquired either by using `salloc` or `sbatch`. In any case, you need to modify the entrypoint script to make sure that all setup steps run in a single `srun` command when resuming the job. Through the entrypoint script, it is important to set up the environment on the replaced node to be consistent with the environment that the job step was running before it was stopped. The following precedure shows how to prepare an entrypoint script to keep the environment consistent and run it as a single `srun` command.

> **Tip**
>
> If you use `sbatch`, you can keep the batch script simple by creating a separate script for setting up the environment and using a single `srun` command.

1. Create a script using the following code example and save it as `train_auto_resume.sh`. This script deploys training environment setups assuming that there is no manual configuration previously made to the replaced node. This ensures that the environment is node-agnostic, so that when a node is replaced, the same environment is provisioned on the node before resuming the job.

   > **Note**
   >
   > The following code example shows how to discover the Slurm node list associated with the job. Do not use the `$SLURM_JOB_NODELIST` environment variable provided by Slurm, because its value might be outdated after SageMaker HyperPod auto-resumes the job. The following code example shows how to define a new `NODE_LIST` variable to replace `SLURM_JOB_NODELIST`, and then set up the `MASTER_NODE` and `MASTER_ADDR` variables off of the `NODE_LIST` variable.

```
#!/bin/bash
```

```
# Filename: train_auto_resume.sh
# Sample containerized script to launch a training job with a single srun which can
 be auto-resumed.

# Place your training environment setup here.
# Example: Install conda, docker, activate virtual env, etc.

# Get the list of nodes for a given job
NODE_LIST=$(scontrol show jobid=$SLURM_JOBID | \ # Show details of the SLURM job
            awk -F= '/NodeList=/{print $2}' | \  # Extract NodeList field
            grep -v Exc)                         # Exclude nodes marked as excluded

# Determine the master node from the node list
MASTER_NODE=$(scontrol show hostname $NODE_LIST | \ # Convert node list to hostnames
              head -n 1)                            # Select the first hostname as
 master node

# Get the master node address
MASTER_ADDR=$(scontrol show node=$MASTER_NODE | \ # Show node information
              awk -F= '/NodeAddr=/{print $2}' | \ # Extract NodeAddr
              awk '{print $1}')                   # Print the first part of NodeAddr

# Torchrun command to launch the training job
torchrun_cmd="torchrun --nnodes=$SLURM_NNODES \
                       --nproc_per_node=1 \
                       --node_rank=$SLURM_NODE \
                       --master-addr=$MASTER_ADDR \
                       --master_port=1234 \
                       <your_training_script.py>"

# Execute the torchrun command in the 'pytorch' Conda environment,
# streaming output live
/opt/conda/bin/conda run --live-stream -n pytorch $torchrun_cmd
```

Tip

You can use the preceding script to add more commands for installing any additional dependencies for your job. However, we recommend that you keep the dependency installation scripts to the set of lifecycle scripts that are used during cluster creation.

If you use a virtual environment hosted on a shared directory, you can also utilize this script to activate the virtual environment.

2. Launch the job with SageMaker HyperPod auto-resume enabled by adding the flag `--auto-resume=1` to indicate that the `srun` command should be automatically retried in case of hardware failure.

> **Note**
>
> If you have set up a resource allocation using `sbatch` or `salloc`, you can run multiple `srun` commands within the allocation. In the event of a failure, the SageMaker HyperPod auto-resume functionality only operates in the current job step of the `srun` command with the flag `--auto-resume=1`. In other words, activating auto-resume in an `srun` command doesn't apply to other `srun` commands launched within a resource allocation session.

The following are `srun` command examples with `auto-resume` enabled.

Using sbatch

Because most of the logic for setting up the environment is already in `train_auto_resume.sh`, the batch script should be simple and similar to the following code example. Assume that the following batch script is saved as `batch.sh`.

```
#!/bin/bash
#SBATCH --nodes 2
#SBATCH --exclusive
srun --auto-resume=1 train_auto_resume.sh
```

Run the preceding batch script using the following command.

```
sbatch batch.sh
```

Using salloc

Start by acquiring an exclusive allocation, and run the `srun` command with the `--auto-resume` flag and the entrypoint script.

```
salloc -N 2 --exclusive
srun --auto-resume=1 train_auto_resume.sh
```

How to replace a faulty node not being auto-resumed by HyperPod

The HyperPod auto-resume functionality monitors if the state of your Slurm nodes turns to `fail` or down. You can check the state of Slurm nodes by running `sinfo`.

If you have a node stuck with an issue but not being fixed by the HyperPod auto-resume functionality, we recommend you to run the following command to change the state of the node to `fail`.

```
scontrol update node=<ip-ipv4> state=fail reason="Action:Replace"
```

In the preceding command example, replace *<ip-ipv4>* with the Slurm node name (host name) of the faulty instance you want to replace.

After running this command, the node should go into the `fail` state, waits for the currently running jobs to finish, is replaced with a healthy instance, and is recovered with the same host name. This process takes time depending on the available instances in your Availability Zone and the time it takes to run your lifecycle scripts. During the update and replacement processes, avoid changing the state of the node manually again or restarting the Slurm controller; doing so can lead to a replacement failure. If the node does not get recovered nor turn to the `idle` state after a long time, contact AWS Support.

If the faulty node is continuously stuck in the `fail` state, the last resort you might try is to manually force change the node state to down. This requires administrator privileges (sudo permissions).

> **Warning**
>
> Proceed carefully before you run the following command as it forces kill all jobs, and you might lose all unsaved work.

```
scontrol update node=<ip-ipv4> state=down reason="Action:Replace"
```

SageMaker HyperPod cluster management

The following topics discuss logging and managing SageMaker HyperPod clusters.

Logging SageMaker HyperPod events

All events and logs from SageMaker HyperPod are saved to Amazon CloudWatch under the log group name `/aws/sagemaker/Clusters/[ClusterName]/[ClusterID]`. Every call to the `CreateCluster` API creates a new log group. The following list contains all of the available log streams collected in each log group.

Log Group Name	Log Stream Name
`/aws/sagemaker/Clusters/[ClusterName]/[ClusterID]`	`LifecycleConfig/[instance-group-name]/[instance-id]`

Logging SageMaker HyperPod at instance level

You can access the LifecycleScript logs published to CloudWatch during cluster instance configuration. Every instance within the created cluster generates a separate log stream, distinguishable by the `LifecycleConfig/[instance-group-name]/[instance-id]` format.

All logs that are written to `/var/log/provision/provisioning.log` are uploaded to the preceding CloudWatch stream. Sample LifecycleScripts at `1.architectures/5.sagemaker_hyperpods/LifecycleScripts/base-config` redirect their `stdout` and `stderr` to this location. If you are using your custom scripts, write your logs to the `/var/log/provision/provisioning.log` location for them to be available in CloudWatch.

Tagging resources

AWS Tagging system helps manage, identify, organize, search for, and filter resources. SageMaker HyperPod supports tagging, so you can manage the clusters as an AWS resource. During cluster creation or editing an existing cluster, you can add or edit tags for the cluster. To learn more about tagging in general, see Tagging your AWS resources.

Using the SageMaker HyperPod console UI

When you are creating a new cluster and editing a cluster, you can add, remove, or edit tags.

Using the SageMaker HyperPod APIs

When you write a CreateCluster or UpdateCluster API request file in JSON format, edit the `Tags` section.

Using the AWS CLI tagging commands for SageMaker

To tag a cluster

Use `aws sagemaker add-tags` as follows.

```
aws sagemaker add-tags --resource-arn cluster_ARN --tags Key=string,Value=string
```

To untag a cluster

Use `aws sagemaker delete-tags` as follows.

```
aws sagemaker delete-tags --resource-arn cluster_ARN --tag-keys "tag_key"
```

To list tags for a resource

Use `aws sagemaker list-tags` as follows.

```
aws sagemaker list-tags --resource-arn cluster_ARN
```

SageMaker HyperPod references

Find more information and references about using SageMaker HyperPod in the following topics.

Topics

- SageMaker HyperPod pricing
- SageMaker HyperPod APIs
- SageMaker HyperPod forms
- SageMaker HyperPod DLAMI
- SageMaker HyperPod API permissions reference
- SageMaker HyperPod commands in AWS CLI

- SageMaker HyperPod Python modules in AWS SDK for Python (Boto3)

SageMaker HyperPod pricing

The following topics provide information about SageMaker HyperPod pricing. To find more details on price per hour for using SageMaker HyperPod instances, see also Amazon SageMaker Pricing.

Capacity requests

You can allocate on-demand or reserved compute capacity with SageMaker for use on SageMaker HyperPod. On-demand cluster creation allocates available capacity from the SageMaker on-demand capacity pool. Alternatively, you can request reserved capacity to ensure access by submitting a ticket for a quota increase. Inbound capacity requests are prioritized by SageMaker and you receive an estimated time for capacity allocation.

Service billing

When you provision a compute capacity on SageMaker HyperPod, you are billed for the duration of the capacity allocation. SageMaker HyperPod billing appears in your anniversary bills with a line item for the type of capacity allocation (on-demand, reserved), the instance type, and the time spent on using the instance.

To submit a ticket for a quota increase, see the section called “SageMaker HyperPod quotas”.

SageMaker HyperPod APIs

The following list is a full set of SageMaker HyperPod APIs for submitting action requests in JSON format to SageMaker through AWS CLI or AWS SDK for Python (Boto3).

- CreateCluster
- DeleteCluster
- DescribeCluster
- DescribeClusterNode
- ListClusterNodes
- ListClusters
- UpdateCluster
- UpdateClusterSoftware

SageMaker HyperPod forms

To configure the Slurm workload manager tool on HyperPod, you should create a Slurm configuration file required by HyperPod using the provided form.

Configuration form for provisioning Slurm nodes on HyperPod

The following code is the Slurm configuration form you should prepare to properly set up Slurm nodes on your HyperPod cluster. You should complete this form and upload it as part of a set of lifecycle scripts during cluster creation. To learn how this form should be prepared throughout HyperPod cluster creation processes, see the section called “SageMaker HyperPod lifecycle configuration best practices”.

```
// Save as provisioning_params.json.
{
    "version": "1.0.0",
    "workload_manager": "slurm",
    "controller_group": "string",
    "login_group": "string",
    "worker_groups": [
        {
            "instance_group_name": "string",
            "partition_name": "string"
        }
    ],
    "fsx_dns_name": "string",
    "fsx_mountname": "string"
}
```

- `version` – Required. This is the version of the HyperPod provisioning parameter form. Keep it to `1.0.0`.
- `workload_manager` – Required. This is for specifying which workload manager to be configured on the HyperPod cluster. Keep it to `slurm`.
- `controller_group` – Required. This is for specifying the name of the HyperPod cluster instance group you want to assign to Slurm controller (head) node.
- `login_group` – Optional. This is for specifying the name of the HyperPod cluster instance group you want to assign to Slurm login node.
- `worker_groups` – Required. This is for setting up Slurm worker (compute) nodes on the HyperPod cluster.

  - `instance_group_name` – Required. This is for specifying the name of the HyperPod instance group you want to assign to Slurm worker (compute) node.
  - `partition_name` – Required. This is for specifying the partition name to the node.
- `fsx_dns_name` – Optional. If you want to set up your Slurm nodes on the HyperPod cluster to communicate with Amazon FSx, specify the FSx DNS name.
- `fsx_mountname` – Optional. If you want to set up your Slurm nodes on the HyperPod cluster to communicate with Amazon FSx, specify the FSx mount name.

SageMaker HyperPod DLAMI

The SageMaker HyperPod agent runs a SageMaker HyperPod DLAMI, which is built on top of AWS Deep Learning Base GPU AMI (Ubuntu 20.04).

The SageMaker HyperPod DLAMI is bundled with additional packages to support open source tools such as Slurm and dependencies, and SageMaker HyperPod cluster software packages to support features such as cluster health check and auto-resume. To follow up with HyperPod software updates that the HyperPod service team distributes through the DLAMI, see the section called "HyperPod release notes".

SageMaker HyperPod API permissions reference

> **Important**
>
> Custom IAM policies that allow Amazon SageMaker Studio or Amazon SageMaker Studio Classic to create Amazon SageMaker resources must also grant permissions to add tags to those resources. The permission to add tags to resources is required because Studio and Studio Classic automatically tag any resources they create. If an IAM policy allows Studio and Studio Classic to create resources but does not allow tagging, "AccessDenied" errors can occur when trying to create resources. For more information, see Provide Permissions for Tagging SageMaker Resources.
> AWS Managed Policies for Amazon SageMaker that give permissions to create SageMaker resources already include permissions to add tags while creating those resources.

When you are setting up access control for allowing to run SageMaker HyperPod API operations and writing a permissions policy that you can attach to IAM users for cloud administrators, use the following table as a reference.

Amazon SageMaker API Operations	Required Permissions (API Actions)	Resources
CreateCluster	sagemaker:CreateCluster	arn:aws:sagemaker: *region*:*account-id* :cluster/ *cluster-id*
DeleteCluster	sagemaker:DeleteCluster	arn:aws:sagemaker: *region*:*account-id* :cluster/ *cluster-id*
DescribeCluster	sagemaker:DescribeCluster	arn:aws:sagemaker: *region*:*account-id* :cluster/ *cluster-id*
DescribeClusterNode	sagemaker:DescribeClusterNode	arn:aws:sagemaker: *region*:*account-id* :cluster/ *cluster-id*
ListClusterNodes	sagemaker:ListClusterNodes	arn:aws:sagemaker: *region*:*account-id* :cluster/ *cluster-id*
ListClusters	sagemaker:ListClusters	arn:aws:sagemaker: *region*:*account-id* :cluster/ *cluster-id*
UpdateCluster	sagemaker:UpdateCluster	arn:aws:sagemaker: *region*:*account-id* :cluster/ *cluster-id*

UpdateClusterSoftware	`sagemaker:UpdateClusterSoftware`	`arn:aws:sagemaker:region:account-id :cluster/ cluster-id`

For a complete list of permissions and resource types for SageMaker APIs, see Actions, resources, and condition keys for Amazon SageMaker in the *AWS Service Authorization Reference*.

SageMaker HyperPod commands in AWS CLI

The following are the AWS CLI commands for SageMaker HyperPod to run the core HyperPod API operations.

- create-cluster
- delete-cluster
- describe-cluster
- describe-cluster-node
- list-cluster-nodes
- list-clusters
- update-cluster
- update-cluster-software

SageMaker HyperPod Python modules in AWS SDK for Python (Boto3)

The following are the methods of the AWS SDK for Python (Boto3) client for SageMaker to run the core HyperPod API operations.

- create_cluster
- delete_cluster
- describe_cluster
- describe_cluster_node
- list_cluster_nodes
- list_clusters
- update_cluster

- update_cluster_software

SageMaker HyperPod FAQ

Use the following frequently asked questions to troubleshoot problems with using SageMaker HyperPod.

Q. Why can I not find log groups of my SageMaker HyperPod cluster in Amazon CloudWatch?

By default, agent logs and instance start-up logs are sent to the HyperPod platform account's CloudWatch. In case of user lifecycle scripts, lifecycle configuration logs are sent to your account's CloudWatch.

If you use the sample lifecycle scripts provided by the HyperPod service team, you can expect to find the lifecycle configuration logs written to `/var/log/provision/provisioning.log`, and you wouldn't encounter this problem.

However, if you use custom paths for collecting logs from lifecycle provisioning and can't find the log groups appearing in your account's CloudWatch, it might be due to mismatches in the log file paths specified in your lifecycle scripts and what the CloudWatch agent running on the HyperPod cluster instances looks for. In this case, it means that you need to properly set up your lifecycle scripts to send logs to the CloudWatch agent, and also set up the CloudWatch agent configuration accordingly. To resolve the problem, choose one of the following options.

- **Option 1:** Update your lifecycle scripts to write logs to `/var/log/provision/provisioning.log`.
- **Option 2:** Update the CloudWatch agent to look for your custom paths for logging lifecycle provisioning.
  1. Each HyperPod cluster instance contains a CloudWatch agent configuration file in JSON format at `/opt/aws/amazon-cloudwatch-agent/sagemaker_cwagent_config.json`. In the configuration file, find the field name `logs.logs_collected.files.collect_list.file_path`. With the default setup by HyperPod, the key-value pair should be `"file_path": "/var/log/provision/provisioning.log"` as documented at the section called "Logging SageMaker HyperPod at instance level". The following code snippet shows how the JSON file looks with the HyperPod default configuration.

     ```
     "logs": {
     ```

```
    "logs_collected": {
        "files": {
            "collect_list": [
                {
                    "file_path": "/var/log/provision/provisioning.log",
                    "log_group_name": "/aws/sagemaker/Clusters/[ClusterName]/
[ClusterID]",
                    "log_stream_name": "LifecycleConfig/[InstanceGroupName]/
{instance_id}",
                    "retention_in_days": -1
                }
            ]
        }
    },
    "force_flush_interval": 3
}
```

2. Replace the value for the "`file_path`" field name with the custom path you use in your lifecycle scripts. For example, if you have set up your lifecycle scripts to write to `/var/log/custom-provision/custom-provisioning.log`, update the value to match with it as follows.

```
"file_path": "/var/log/custom-provision/custom-provisioning.log"
```

3. Restart the CloudWatch agent with the configuration file to finish applying the custom path. For example, the following CloudWatch command shows how to restart the CloudWatch agent with the CloudWatch agent configuration file from step 1. For more information, see also Troubleshooting the CloudWatch agent.

```
sudo /opt/aws/amazon-cloudwatch-agent/bin/amazon-cloudwatch-agent-ctl \
    -a fetch-config -m ec2 -s -c \
    file:/opt/aws/amazon-cloudwatch-agent/sagemaker_cwagent_config.json
```

Q. What particular configurations does HyperPod manage in Slurm configuration files such as `slurm.conf` and `gres.conf`?

When you create a Slurm cluster on HyperPod, the HyperPod agent sets up the `slurm.conf` and `gres.conf` files at `/opt/slurm/etc/` to manage the Slurm cluster based on your HyperPod cluster creation request and lifecycle scripts. The following list shows what specific parameters the HyperPod agent handles and overwrites.

> **Important**
>
> We strongly recommend that you DON'T change these parameters managed by HyperPod.

- In `slurm.conf`, HyperPod sets up the following basic parameters: `ClusterName`, `SlurmctldHost`, `PartitionName`, and `NodeName`.

  Also, to enable the the section called "Auto-resume" functionality, HyperPod requires the `TaskPlugin` and `SchedulerParameters` parameters set as follows. The HyperPod agent sets up these two parameters with the required values by default.

  ```
  TaskPlugin=task/none
  SchedulerParameters=permit_job_expansion
  ```

- In `gres.conf`, HyperPod manages `NodeName` for GPU nodes.

Q. How do I run Docker on Slurm nodes on HyperPod?

To help you run Docker on your Slurm nodes running on HyperPod, the HyperPod service team provides setup scripts that you can include as part of the lifecycle configuration for cluster creation. To learn more, see the section called "Start with base lifecycle scripts provided by HyperPod" and the section called "Run Docker containers on a Slurm compute node on SageMaker HyperPod".

Q. How do I use local NVMe store of P instances for launching Docker or Enroot containers with Slurm?

Because the default root volume of your head node usually is limited by 100GB EBS volume, you need to set up Docker and Enroot to use local NVMe instance store. To learn how to set up NVMe store and use it for launching Docker containers, see the section called "Run Docker containers on a Slurm compute node on SageMaker HyperPod".

Q. How to set up EFA security groups?

If you want to create a HyperPod cluster with EFA-enabled instances, make sure that you set up a security group to allow all inbound and outbound traffic to and from the security group itself. To learn more, see Step 1: Prepare an EFA-enabled security group in the *Amazon EC2 User Guide*.

Amazon SageMaker HyperPod release notes

See the following release notes to track the latest updates for Amazon SageMaker HyperPod.

SageMaker HyperPod release notes: April 24, 2024

Bug fixes

- Fixed a bug with the `ThreadsPerCore` parameter in the `ClusterInstanceGroupSpecification` API. With the fix, the `CreateCluster` and `UpdateCluster` APIs properly take and apply the user input through `ThreadsPerCore`. This fix is effective on HyperPod clusters created after April 24, 2024. If you had issues with this bug and want to get this fix applied to your cluster, you need to create a new cluster. Make sure that you back up and restore your work while moving to a new cluster following the instructions at the section called "Use the backup script provided by SageMaker HyperPod".

SageMaker HyperPod release notes: March 27, 2024

HyperPod software patch

The HyperPod service team distributes software patches through the section called "SageMaker HyperPod DLAMI". See the following details about the latest HyperPod DLAMI.

- In this release of the HyperPod DLAMI, Slurm is built with REST service (`slurmestd`) with JSON, YAML, and JWT support.
- Upgraded Slurm to v23.11.3

Upgrade steps

- Run the following command to call the UpdateClusterSoftware API to update your existing HyperPod clusters with the latest HyperPod DLAMI. To find more instructions, see the section called "Update the SageMaker HyperPod platform software of a cluster".

> **Important**
>
> Back up your work before running this API. The patching process replaces the root volume with the updated AMI, which means that your previous data stored in the instance root volume will be lost. Make sure that you back up your data from the instance

root volume to Amazon S3 or Amazon FSx for Lustre. For more information, see the section called "Use the backup script provided by SageMaker HyperPod".

```
aws sagemaker update-cluster-software --cluster-name your-cluster-name
```

Note

Note that you should run the AWS CLI command to update your HyperPod cluster. Updating the HyperPod software through SageMaker HyperPod console UI is currently not available.

Improvements

- Increased auto-resume service timeout to 60 minutes.
- Improved instance replacement process to not restart the Slurm controller.
- Improved error messages from running lifecycle scripts, such as download errors and instance health check errors on instance start-up.

Bug fixes

- Fixed a bug with chrony service that caused an issue with time synchronization.
- Fixed a bug with parsing `slurm.conf`.
- Fixed an issue with NVIDIA `go-dcgm` library.

SageMaker HyperPod release notes: March 14, 2024

HyperPod software patch

The HyperPod service team distributes software patches through the section called "SageMaker HyperPod DLAMI". See the following details about the latest HyperPod DLAMI.

- Upgraded Slurm to v23.11.1
- Added OpenPMIx v4.2.6 for enabling Slurm with PMIx.
- Built upon the AWS Deep Learning Base GPU AMI (Ubuntu 20.04) released on 2023-10-26

- A complete list of pre-installed packages in this HyperPod DLAMI in addition to the base AMI
  - Slurm: v23.11.1
  - OpenPMIx : v4.2.6
  - Munge: v0.5.15
  - `aws-neuronx-dkms`: v2.*
  - `aws-neuronx-collectives`: v2.*
  - `aws-neuronx-runtime-lib`: v2.*
  - `aws-neuronx-tools`: v2.*
  - SageMaker HyperPod software packages to support features such as cluster health check and auto-resume

Upgrade steps

- Run the following command to call the UpdateClusterSoftware API to update your existing HyperPod clusters with the latest HyperPod DLAMI. To find more instructions, see the section called "Update the SageMaker HyperPod platform software of a cluster".

> **Important**
>
> Back up your work before running this API. The patching process replaces the root volume with the updated AMI, which means that your previous data stored in the instance root volume will be lost. Make sure that you back up your data from the instance root volume to Amazon S3 or Amazon FSx for Lustre. For more information, see the section called "Use the backup script provided by SageMaker HyperPod".

```
aws sagemaker update-cluster-software --cluster-name your-cluster-name
```

> **Note**
>
> Note that you should run the AWS CLI command to update your HyperPod cluster. Updating the HyperPod software through SageMaker HyperPod console UI is currently not available.

Improvements

- HyperPod now properly supports passing partition names provided through `provisioning_params.json` and creates partitions appropriately based on provided inputs. For more information about `provisioning_params.json`, see the section called "SageMaker HyperPod forms" and the section called "SageMaker HyperPod lifecycle configuration best practices".

SageMaker HyperPod release notes: February 15, 2024

New features

- Added a new `UpdateClusterSoftware` API for SageMaker HyperPod security patching. When security patches become available, we recommend you to update existing SageMaker HyperPod clusters in your account by running `aws sagemaker update-cluster-software --cluster-name` *`your-cluster-name`*. To follow up with future security patches, keep tracking this Amazon SageMaker HyperPod release notes page. To learn how the `UpdateClusterSoftware` API works, see the section called "Update the SageMaker HyperPod platform software of a cluster".

SageMaker HyperPod release notes: November 29, 2023

New features

- Launched Amazon SageMaker HyperPod at AWS re:Invent 2023.

HyperPod software patch

The HyperPod service team distributes software patches through the section called "SageMaker HyperPod DLAMI". See the following details about the latest HyperPod DLAMI.

- Built upon the AWS Deep Learning Base GPU AMI (Ubuntu 20.04) released on 2023-10-18
- A complete list of pre-installed packages in this HyperPod DLAMI in addition to the base AMI
  - Slurm: v23.02.3
  - Munge: v0.5.15
  - `aws-neuronx-dkms`: v2.*
  - `aws-neuronx-collectives`: v2.*

- `aws-neuronx-runtime-lib`: v2.*
- `aws-neuronx-tools`: v2.*
- SageMaker HyperPod software packages to support features such as cluster health check and auto-resume

Use generative AI in SageMaker notebook environments

Jupyter AI is an open-source extension of JupyterLab integrating generative AI capabilities into Jupyter notebooks. Through the Jupyter AI chat interface and magic commands, users experiment with code generated from natural language instructions, explain existing code, ask questions about their local files, generate entire notebooks, and more. The extension connects Jupyter notebooks with large language models (LLMs) that users can use to generate text, code, or images, and to ask questions about their own data. Jupyter AI supports generative model providers such as AI21, Anthropic, AWS (SageMaker JumpStart and Amazon Bedrock), Cohere, and OpenAI.

The extension's package is included in Amazon SageMaker Distribution version 1.2 and onwards. Amazon SageMaker Distribution is a Docker environment for data science and scientific computing used as the default image of JupyterLab notebook instances. Users of different IPython environments can install Jupyter AI manually.

In this section, we provide an overview of Jupyter AI capabilities and demonstrate how to configure models provided by SageMaker JumpStart or Amazon Bedrock from JupyterLab or Studio Classic notebooks. For more in-depth information on the Jupyter AI project, refer to its documentation. Alternatively, you can refer to the blog post *Generative AI in Jupyter* for an overview and examples of key Jupyter AI capabilities.

Before using Jupyter AI and interacting with your LLMs, make sure that you satisfy the following prerequisites:

- For models hosted by AWS, you should have the ARN of your SageMaker endpoint or have access to Amazon Bedrock. For other model providers, you should have the API key used to authenticate and authorize requests to your model. Jupyter AI supports a wide range of model providers and language models, refer to the list of its supported models to stay updated on the latest available models. For information on how to deploy a model in SageMaker JumpStart, see Deploy a Model in the SageMaker JumpStart documentation. You need to request access to Amazon Bedrock to use it as your model provider.

- Ensure that Jupyter AI libraries are present in your environment. If not, install the required package by following the instructions in Install Jupyter AI.
- Familiarize yourself with the capabilities of Jupyter AI in Jupyter AI Features.
- Configure the target models you wish to use by following the instructions in Configure your model provider.

After completing the prerequisite steps, you can proceed to Use Jupyter AI in JupyterLab or Studio Classic.

Topics

Install Jupyter AI

For Amazon SageMaker Distribution users, we recommend selecting the SageMaker Distribution image version 1.2 or later. No further installation is necessary. Users of JupyterLab in Studio can choose the version of their Amazon SageMaker Distribution when creating a space.

For users of other IPython environments, the version of the recommended Jupyter AI package depends on the version of JupyterLab they are using.

The Jupyter AI distribution consists of two packages.

- `jupyter_ai`: This package provides a JupyterLab extension and a native chat user interface (UI). It acts as a conversational assistant using the large language model of your choice.
- `jupyter_ai_magics`: This package provides the IPython `%%ai` and `%ai` magic commands with which you can invoke a large language model (LLM) from your notebook cells.

> **Note**
>
> Installing `jupyter_ai` also installs `jupyter_ai_magics`. However, you can install `jupyter_ai_magics` independently without JupyterLab or `jupyter_ai`. The magic

commands `%%ai` and `%ai` work in any IPython kernel environment. If you only install `jupyter_ai_magics`, you can't use the chat UI.

For users of JupyterLab 3, in particular Studio Classic users, we recommend installing `jupyter-ai` version 1.5.x or any later 1.x version. However, we highly recommend using Jupyter AI with JupyterLab 4. The `jupyter-ai` version compatible with JupyterLab 3 may not allow users to set additional model parameters such as temperature, top-k and top-p sampling, max tokens or max length, or user acceptance license agreements.

For users of JupyterLab 4 environments that do not use SageMaker Distribution, we recommend installing `jupyter-ai` version 2.5.x or any later 2.x version.

See the installation instructions in the *Installation* section of Jupyter AI documentation.

Jupyter AI Features

You can access Jupyter AI capabilities through two distinct methods: using the chat UI or using magic commands within notebooks.

From the chat user interface AI assistant

The chat interface connects you with Jupyternaut, a conversational agent that uses the language model of your choice.

After launching a JupyterLab application installed with Jupyter AI, you can access the chat interface by choosing the chat icon

in the left navigation panel. First-time users are prompted to configure their model. See Configure your model provider in the chat UI for configuration instructions.

Using the chat UI, you can:

- **Answer questions**: For instance, you can ask Jupyternaut to create a Python function that adds CSV files to an Amazon S3 bucket. Subsequently, you can refine your answer with a follow-up question, such as adding a parameter to the function to choose the path where the files are written.

- **Interact with files in JupyterLab**: You can include a portion of your notebook in your prompt by selecting it. Then, you can either replace it with the model's suggested answer or manually copy the answer to your clipboard.
- **Generate entire notebooks** from prompts: By starting your prompt with `/generate`, you trigger a notebook generation process in the background without interrupting your use of Jupyternaut. A message containing the link to the new file is displayed upon completion of the process.
- **Learn from and ask questions about local files**: Using the `/learn` command, you can teach an embedding model of your choice about local files and then ask questions about those files using the `/ask` command. Jupyter AI stores the embedded content in a local FAISS vector database, then uses retrieval-augmented generation (RAG) to provide answers based on what it has learned. To erase all previously learned information from your embedding model, use `/learn -d`.

For a complete list of features and detailed instructions on their usage, see the Jupyter AI chat interface documentation. To learn about how to configure access to a model in Jupyternaut, see Configure your model provider in the chat UI.

From notebook cells

Using `%%ai` and `%ai` magic commands, you can interact with the language model of your choice from your notebook cells or any IPython command line interface. The `%%ai` command applies your instructions to the entire cell, whereas `%ai` apply them to the specific line.

The following example illustrates an `%%ai` magic command invoking an Anthropic Claude model to output an HTML file containing the image of a white square with black borders.

```
%%ai anthropic:claude-v1.2 -f html
Create a square using SVG with a black border and white fill.
```

To learn about the syntax of each command, use `%ai help`. To list the providers and models supported by the extension, run `%ai list`.

For a complete list of features and detailed instructions on their usage, see the Jupyter AI magic commands documentation. In particular, you can customize the output format of your model using the `-f` or `--format` parameter, allow variable interpolation in prompts, including special `In` and `Out` variables, and more.

To learn about how to configure the access to a model, see Configure your model provider in a notebook.

Configure your model provider

> **Note**
>
> In this section, we assume that the language and embedding models that you plan to use are already deployed. For models provided by AWS, you should already have the ARN of your SageMaker endpoint or access to Amazon Bedrock. For other model providers, you should have the API key used to authenticate and authorize requests to your model. Jupyter AI supports a wide range of model providers and language models, refer to the list of its supported models to stay updated on the latest available models. For information on how to deploy a model provided by SageMaker JumpStart, see Deploy a Model in the SageMaker JumpStart documentation. You need to request access to Amazon Bedrock to use it as your model provider.

The configuration of Jupyter AI varies depending on whether you are using the chat UI or magic commands.

Configure your model provider in the chat UI

> **Note**
>
> You can configure several LLMs and embedding models following the same instructions. However, you must configure at least one **Language model**.

To configure your chat UI

1. In JupyterLab, access the chat interface by choosing the chat icon

   

   in the left navigation panel.
2. Choose the configuration icon

   

   in the top right corner of the left pane. This opens the Jupyter AI configuration panel.

3. Fill out the fields related to your service provider.

- **For models provided by SageMaker JumpStart or Amazon Bedrock**
  - In the **language model** dropdown list, select `sagemaker-endpoint` for models deployed with SageMaker JumpStart or `bedrock` for models managed by Amazon Bedrock.
  - The parameters differ based on whether your model is deployed on SageMaker or Amazon Bedrock.
    - For models deployed with SageMaker JumpStart:
      - Enter the name of your endpoint in **Endpoint name**, and then the AWS Region in which your model is deployed in **Region name**. To retrieve the ARN of the SageMaker endpoints, navigate to https://console.aws.amazon.com/sagemaker/ and then choose **Inference** and **Endpoints** in the left menu.
      - Paste the JSON of the **Request schema** tailored to your model, and the corresponding **Response path** for parsing the model's output.

        > **Note**
        >
        > You can find the request and response format of various of SageMaker JumpStart foundation models in the following example notebooks. Each notebook is named after the model it demonstrates.

    - For models managed by Amazon Bedrock: Add the AWS profile storing your AWS credentials on your system (optional), and then the AWS Region in which your model is deployed in **Region name**.
  - (Optional) Select an embedding model to which you have access. Embedding models are used to capture additional information from local documents, enabling the text generation model to respond to questions within the context of those documents.
  - Choose **Save Changes** and navigate to the left arrow icon

    

    in the top left corner of the left pane. This opens the Jupyter AI chat UI. You can start interacting with your model.
- **For models hosted by third-party providers**
  - In the **language model** dropdown list, select your provider ID. You can find the details of each provider, including their ID, in Jupyter AI list of model providers.

- (Optional) Select an embedding model to which you have access. Embedding models are used to capture additional information from local documents, enabling the text generation model to respond to questions within the context of those documents.
- Insert your models' API keys.
- Choose **Save Changes** and navigate to the left arrow icon

  

  in the top left corner of the left pane. This opens the Jupyter AI chat UI. You can start interacting with your model.

The following snapshot is an illustration of the chat UI configuration panel set to invoke a Flan-t5-small model provided by SageMaker JumpStart and deployed in SageMaker.

Pass extra model parameters and custom parameters to your request

Your model may need extra parameters, like a customized attribute for user agreement approval or adjustments to other model parameters such as temperature or response length. We recommend configuring these settings as a start up option of your JupyterLab application using a Lifecycle Configuration. For information on how to create a Lifecycle Configuration and attach it to your domain, or to a user profile from the SageMaker console, see Create and associate a lifecycle configuration. You can choose your LCC script when creating a space for your JupyterLab application.

Use the following JSON schema to configure your extra parameters:

```
{
  "AiExtension": {
    "model_parameters": {
      "<provider_id>:<model_id>": { Dictionary of model parameters which is unpacked
 and passed as-is to the provider.}
    }
  }
}
```

The following script is an example of a JSON configuration file that you can use when creating a JupyterLab application LCC to set the maximum length of an AI21 Labs Jurassic-2 model deployed on Amazon Bedrock. Increasing the length of the model's generated response can prevent the systematic truncation of your model's response.

```
#!/bin/bash
set -eux

mkdir -p /home/sagemaker-user/.jupyter

json='{"AiExtension": {"model_parameters": {"bedrock:ai21.j2-mid-v1": {"model_kwargs":
 {"maxTokens": 200}}}}}'
# equivalent to %%ai bedrock:ai21.j2-mid-v1 -m {"model_kwargs":{"maxTokens":200}}

# File path
file_path="/home/sagemaker-user/.jupyter/jupyter_jupyter_ai_config.json"

#jupyter --paths
```

```
# Write JSON to file
echo "$json" > "$file_path"

# Confirmation message
echo "JSON written to $file_path"

restart-jupyter-server

# Waiting for 30 seconds to make sure the Jupyter Server is up and running
sleep 30
```

The following script is an example of a JSON configuration file for creating a JupyterLab application LCC used to set additional model parameters for an Anthropic Claude model deployed on Amazon Bedrock.

```
#!/bin/bash
set -eux

mkdir -p /home/sagemaker-user/.jupyter

json='{"AiExtension": {"model_parameters": {"bedrock:anthropic.claude-v2":
{"model_kwargs":{"temperature":0.1,"top_p":0.5,"top_k":25
0,"max_tokens_to_sample":2}}}}}'
# equivalent to %%ai bedrock:anthropic.claude-v2 -m {"model_kwargs":
{"temperature":0.1,"top_p":0.5,"top_k":250,"max_tokens_to_sample":2000}}

# File path
file_path="/home/sagemaker-user/.jupyter/jupyter_jupyter_ai_config.json"

#jupyter --paths

# Write JSON to file
echo "$json" > "$file_path"

# Confirmation message
echo "JSON written to $file_path"

restart-jupyter-server

# Waiting for 30 seconds to make sure the Jupyter Server is up and running
sleep 30
```

Once you have attached your LCC to your domain, or user profile, add your LCC to your space when launching your JupyterLab application. To ensure that your configuration file is updated by the LCC, run `more ~/.jupyter/jupyter_jupyter_ai_config.json` in a terminal. The content of the file should correspond to the content of the JSON file passed to the LCC.

Configure your model provider in a notebook

To invoke a model via Jupyter AI within JupyterLab or Studio Classic notebooks using the `%%ai` and `%ai` magic commands

1. Install the client libraries specific to your model provider in your notebook environment. For example, when using OpenAI models, you need to install the `openai` client library. You can find the list of the client libraries required per provider in the *Python package(s)* column of the Jupyter AI Model providers list.

   > **Note**
   >
   > For models hosted by AWS, `boto3` is already installed in the SageMaker Distribution image used by JupyterLab, or any Data Science image used with Studio Classic.

2. - **For models hosted by AWS**

     Ensure that your execution role has the permission to invoke your SageMaker endpoint for models provided by SageMaker JumpStart or that you have access to Amazon Bedrock.

   - **For models hosted by third-party providers**

     Export your provider's API key in your notebook environment using environment variables. You can use the following magic command. Replace the `provider_API_key` in the command by the environment variable found in the *Environment variable* column of the Jupyter AI Model providers list for your provider.

     ```
     %env provider_API_key=your_API_key
     ```

Use Jupyter AI in JupyterLab or Studio Classic

Use language models from the chat UI

Compose your message in the chat UI text box to start interacting with your model. To clear the message history, use the `/clear` command.

> **Note**
>
> Clearing the message history does not erase the chat context with the model provider.

Use language models from notebook cells

Before using the `%%ai` and `%ai` commands to invoke a language model, load the IPython extension by running the following command in a JupyterLab or Studio Classic notebook cell.

```
%load_ext jupyter_ai_magics
```

- **For models hosted by AWS:**
  - To invoke a model deployed in SageMaker, pass the string `sagemaker-endpoint:`*`endpoint-name`* to the `%%ai` magic command with the required parameters below, then add your prompt in the following lines.

    The following table lists the required and optional parameters when invoking models hosted by SageMaker or Amazon Bedrock.

Parameter Name	Parameter	Short Version	Description
Request schema	`--request-schema`	`-q`	**Required**: The JSON object the endpoint expects, with the prompt being substituted into any value that matches the string literal `<prompt>`.

Parameter Name	Parameter	Short Version	Description
Region name	`--region-name`	`-n`	**Required**: The AWS Region where the model is deployed.
Response path	`--response-path`	`-p`	**Required**: A JSONPath string used to extract the language model's output from the JSON response of the endpoint.

Parameter Name	Parameter	Short Version	Description
Extra model parameters	`--model-parameters`	`-m`	**Optional**: A JSON value specifying additional parameters to be passed to the model. The accepted value is parsed into a dictionary, unpacked, and directly passed to the provider class. This is useful when the endpoint or the model requires custom parameters. For example, in Llama 2 models when accepting the End User License Agreement (EULA) is necessary, you can pass the EULA acceptance to the endpoint using `-m {"endpoint_kwargs":{"CustomAttributes":"accept_eula=true"}}` . Alternatively, you can use the `-m` parameter to pass extra model

Parameter Name	Parameter	Short Version	Description
			parameters, such as setting the maximum number of tokens for a model's generated response. For example, when working with an AI21 Labs Jurassic model: `-m {"model_kwargs":{"maxTokens":256}} .`
Output format	`--format`	`-f`	**Optional**: The IPython display used to render the output. It can be any of the following values `[code|html|image|json|markdown|math|md|text]`, provided that the invoked model supports the specified format.

The following command invokes a Llama2-7b model hosted by SageMaker.

```
%%ai sagemaker-endpoint:jumpstart-dft-meta-textgeneration-llama-2-7b -q
 {"inputs":"<prompt>","parameters":
{"max_new_tokens":64,"top_p":0.9,"temperature":0.6,"return_full_text":false}}
```

```
 -n us-east-2 -p [0].generation -m {"endpoint_kwargs":
{"CustomAttributes":"accept_eula=true"}} -f text
Translate English to French:
sea otter => loutre de mer
peppermint => menthe poivrée
plush girafe => girafe peluche
cheese =>
```

The following example invokes a Flan-t5-small model hosted by SageMaker.

```
%%ai sagemaker-endpoint:hf-text2text-flan-t5-small --request-
schema={"inputs":"<prompt>","parameters":{"num_return_sequences":4}} --region-
name=us-west-2 --response-path=[0]["generated_text"] -f text
What is the atomic number of Hydrogen?
```

- To invoke a model deployed in Amazon Bedrock, pass the string `bedrock:`*`model-name`* to the `%%ai` magic command with any optional parameter defined in the list of parameters for invoking models hosted by SageMaker JumpStart or Amazon Bedrock, then add your prompt in the following lines.

  The following example invokes an AI21 Labs Jurassic-2 model hosted by Amazon Bedrock.

  ```
  %%ai bedrock:ai21.j2-mid-v1 -m {"model_kwargs":{"maxTokens":256}} -f code
  Write a function in python implementing a bubbble sort.
  ```

- **For models hosted by third-party providers**

  To invoke a model hosted by third-party providers, pass the string *`provider-id`*`:`*`model-name`* to the `%%ai` magic command with an optional `Output format`, then add your prompt in the following lines. You can find the details of each provider, including their ID, in the Jupyter AI list of model providers.

  The following command asks an Anthropic Claude model to output an HTML file containing the image of a white square with black borders.

  ```
  %%ai anthropic:claude-v1.2 -f html
  Create a square using SVG with a black border and white fill.
  ```

Label data with a human-in-the-loop

To train a machine learning model, you need a large, high-quality, labeled dataset. You can label your data using Amazon SageMaker Ground Truth. Choose from one of the Ground Truth built-in task types or create your own custom labeling workflow. To improve the accuracy of your data labels and reduce the total cost of labeling your data, use Ground Truth enhanced data labeling features like automated data labeling and annotation consolidation.

Topics

Use Amazon SageMaker Ground Truth to Label Data

To train a machine learning model, you need a large, high-quality, labeled dataset. Ground Truth helps you build high-quality training datasets for your machine learning models. With Ground Truth, you can use workers from either Amazon Mechanical Turk, a vendor company that you choose, or an internal, private workforce along with machine learning to enable you to create a labeled dataset. You can use the labeled dataset output from Ground Truth to train your own models. You can also use the output as a training dataset for an Amazon SageMaker model.

Depending on your ML application, you can choose from one of the Ground Truth built-in task types to have workers generate specific types of labels for your data. You can also build a custom labeling workflow to provide your own UI and tools to workers labeling your data. To learn more about the Ground Truth built in task types, see Built-in Task Types. To learn how to create a custom labeling workflow, see Creating Custom Labeling Workflows.

In order to automate labeling your training dataset, you can optionally use *automated data labeling*, a Ground Truth process that uses machine learning to decide which data needs to be labeled by humans. Automated data labeling may reduce the labeling time and manual effort required. For more information, see Automate Data Labeling. To create a custom labeling workflow, see Creating Custom Labeling Workflows.

Use either pre-built or custom tools to assign the labeling tasks for your training dataset. A *labeling UI template* is a webpage that Ground Truth uses to present tasks and instructions to your workers. The SageMaker console provides built-in templates for labeling data. You can use these templates to get started , or you can build your own tasks and instructions by using our HTML 2.0 components. For more information, see Creating Custom Labeling Workflows.

Use the workforce of your choice to label your dataset. You can choose your workforce from:

- The Amazon Mechanical Turk workforce of over 500,000 independent contractors worldwide.
- A private workforce that you create from your employees or contractors for handling data within your organization.
- A vendor company that you can find in the AWS Marketplace that specializes in data labeling services.

For more information, see Create and Manage Workforces.

You store your datasets in Amazon S3 buckets. The buckets contain three things: The data to be labeled, an input manifest file that Ground Truth uses to read the data files, and an output manifest file. The output file contains the results of the labeling job. For more information, see Use Input and Output Data.

Events from your labeling jobs appear in Amazon CloudWatch under the `/aws/sagemaker/LabelingJobs` group. CloudWatch uses the labeling job name as the name for the log stream.

Are You a First-time User of Ground Truth?

If you are a first-time user of Ground Truth, we recommend that you do the following:

1. **Read Getting started**—This section walks you through setting up your first Ground Truth labeling job.
2. **Explore other topics**—Depending on your needs, do the following:
   - **Explore built-in task types**— Use built-in task types to streamline the process of creating a labeling job. See Built-in Task Types to learn more about Ground Truth built-in task types.
   - **Manage your labeling workforce**—Create new work teams and manage your existing workforce. For more information, see Create and Manage Workforces.
   - **Learn about streaming labeling jobs**— Create a streaming labeling job and send new dataset objects to workers in real time using a perpetually running labeling job. Workers continuously

receive new data objects to label as long as the labeling job is active and new objects are being sent to it. To learn more, see Ground Truth Streaming Labeling Jobs.

3. **See the `Reference`**—This section describes operations to automate Ground Truth operations.

Getting started

This video shows you how to setup and use Amazon SageMaker Ground Truth. (Length: 9:37)

To get started using Amazon SageMaker Ground Truth, follow the instructions in the following sections. The sections here explain how to use the console to create a labeling job, assign a public or private workforce, and send the labeling job to your workforce. You can also learn how to monitor the progress of a labeling job.

If you want to create a custom labeling workflow, see Creating Custom Labeling Workflows for instructions.

Before you create a labeling job, you must upload your dataset to an Amazon S3 bucket. For more information, see Use Input and Output Data.

Topics

Step 1: Before You Begin

Before you begin using the SageMaker console to create a labeling job, you must set up the dataset for use. Do this:

1. Save two images at publicly available HTTP URLs. The images are used when creating instructions for completing a labeling task. The images should have an aspect ratio of around 2:1. For this exercise, the content of the images is not important.
2. Create an Amazon S3 bucket to hold the input and output files. The bucket must be in the same Region where you are running Ground Truth. Make a note of the bucket name because you use it during step 2.

Ground Truth requires all S3 buckets that contain labeling job input image data have a CORS policy attached. To learn more about this change, see CORS Permission Requirement.

3. You can create an IAM role or let SageMaker create a role with the AmazonSageMakerFullAccess IAM policy. Refer to Creating IAM roles and assign the following permissions policy to the user that is creating the labeling job:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "sagemakergroundtruth",
            "Effect": "Allow",
            "Action": [
                "cognito-idp:CreateGroup",
                "cognito-idp:CreateUserPool",
                "cognito-idp:CreateUserPoolDomain",
                "cognito-idp:AdminCreateUser",
                "cognito-idp:CreateUserPoolClient",
                "cognito-idp:AdminAddUserToGroup",
                "cognito-idp:DescribeUserPoolClient",
                "cognito-idp:DescribeUserPool",
                "cognito-idp:UpdateUserPool"
            ],
            "Resource": "*"
        }
    ]
}
```

Next

Step 2: Create a Labeling Job

Step 2: Create a Labeling Job

In this step you use the console to create a labeling job. You tell Amazon SageMaker Ground Truth the Amazon S3 bucket where the manifest file is stored and configure the parameters for the job. For more information about storing data in an Amazon S3 bucket, see Use Input and Output Data.

To create a labeling job

1. Open the SageMaker console at https://console.aws.amazon.com/sagemaker/.
2. From the left navigation, choose **Labeling jobs**.
3. Choose **Create labeling job** to start the job creation process.
4. In the **Job overview** section, provide the following information:
   - **Job name** – Give the labeling job a name that describes the job. This name is shown in your job list. The name must be unique in your account in an AWS Region.
   - **Label attribute name** – Leave this unchecked as the default value is the best option for this introductory job.
   - **Input data setup** – Select **Automated data setup**. This option allows you to automatically connect to your input data in S3.
   - **S3 location for input datasets** – Enter the S3 location where you added the images in step 1.
   - **S3 location for output datasets** – The location where your output data is written in S3.
   - **Data type** – Use the drop down menu to select **Image**. Ground Truth will use all images found in the S3 location for input datasets as input for your labeling job.
   - **IAM role** – Create or choose an IAM role with the AmazonSageMakerFullAccess IAM policy attached.
5. In the **Task type** section, for the **Task category** field, choose **Image**.
6. In the **Task selection** choose **Bounding box**.
7. Choose **Next** to move on to configuring your labeling job.

Next

Step 3: Select Workers

Step 3: Select Workers

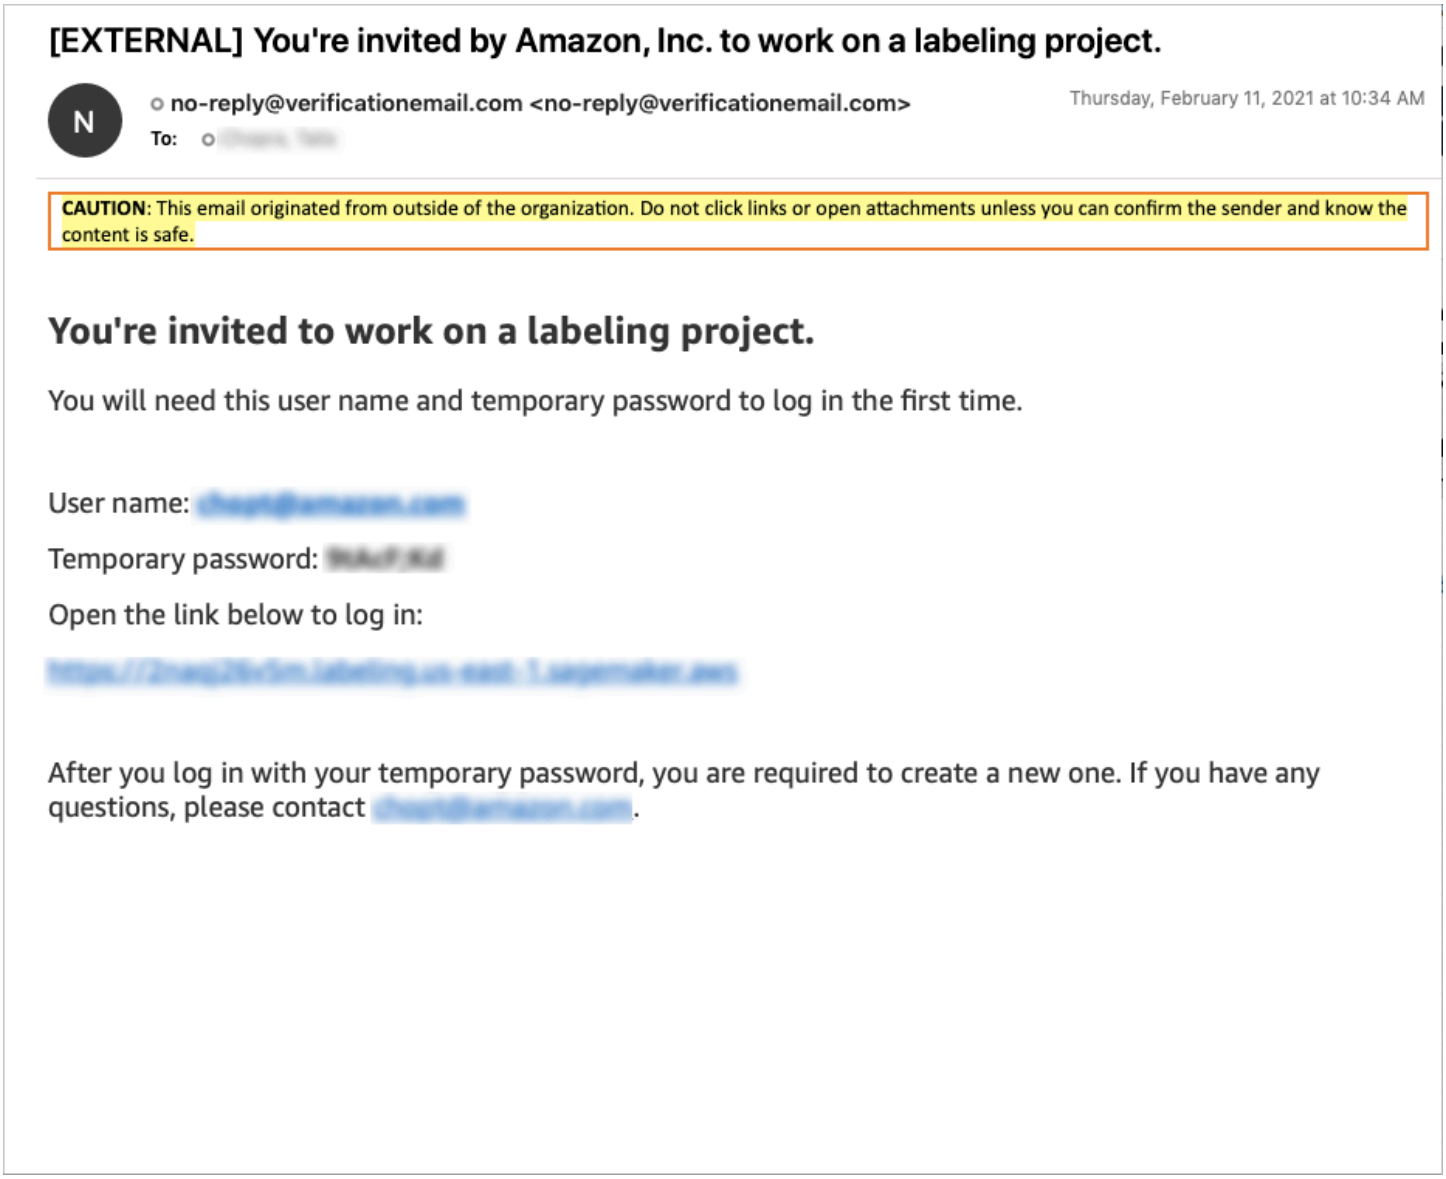
In this step you choose a workforce for labeling your dataset. It is recommended that you create a private workforce to test Amazon SageMaker Ground Truth. Use email addresses to invite the members of your workforce. If you create a private workforce in this step you won't be able to import your Amazon Cognito user pool later. If you want to create a private workforce using an Amazon Cognito user pool, see Manage a Private Workforce (Amazon Cognito) and use the Mechanical Turk workforce instead in this tutorial.

> **Tip**
>
> To learn about the other workforce options you can use with Ground Truth, see Create and Manage Workforces.

To create a private workforce:

1. In the **Workers** section, choose **Private**.
2. If this is your first time using a private workforce, in the **Email addresses** field, enter up to 100 email addresses. The addresses must be separated by a comma. You should include your own email address so that you are part of the workforce and can see data object labeling tasks.
3. In the **Organization name** field, enter the name of your organization. This information is used to customize the email sent to invite a person to your private workforce. You can change the organization name after the user pool is created through the console.
4. In the **Contact email** field enter an email address that members of the workforce use to report problems with the task.

If you add yourself to the private workforce, you will receive an email that looks similar to the following. **Amazon, Inc.** is replaced by the organization you enter in step 3 of the preceding procedure. Select the link in the email to log in using the temporary password provided. If prompted, change your password. When you successfully log in, you see the worker portal where your labeling tasks appear.



[EXTERNAL] You're invited by Amazon, Inc. to work on a labeling project.

no-reply@verificationemail.com <no-reply@verificationemail.com>

Thursday, February 11, 2021 at 10:34 AM

To:

CAUTION: This email originated from outside of the organization. Do not click links or open attachments unless you can confirm the sender and know the content is safe.

You're invited to work on a labeling project.

You will need this user name and temporary password to log in the first time.

User name:

Temporary password:

Open the link below to log in:

After you log in with your temporary password, you are required to create a new one. If you have any questions, please contact .

> **Tip**
>
> You can find the link to your private workforce's worker portal in the **Labeling workforces** section of the Ground Truth area of the SageMaker console. To see the link, select the **Private** tab. The link is under the **Labeling portal sign-in URL** header in **Private workforce summary**.

If you choose to use the Amazon Mechanical Turk workforce to label the dataset, you are charged for labeling tasks completed on the dataset.

To use the Amazon Mechanical Turk workforce:

1. In the **Workers** section, choose **Public**.
2. Set a **Price per task**.
3. If applicable, choose **The dataset does not contain adult content** to acknowledge that the sample dataset has no adult content. This information enables Amazon SageMaker Ground Truth to warn external workers on Mechanical Turk that they might encounter potentially offensive content in your dataset.
4. Choose the check box next to the following statement to acknowledge that the sample dataset does not contain any personally identifiable information (PII). This is a requirement to use Mechanical Turk with Ground Truth. If your input data does contain PII, use the private workforce for this tutorial.

   You understand and agree that the Amazon Mechanical Turk workforce consists of independent contractors located worldwide and that you should not share confidential information, personal information or protected health information with this workforce.

Next

Step 4: Configure the Bounding Box Tool

Step 4: Configure the Bounding Box Tool

Finally you configure the bounding box tool to give instructions to your workers. You can configure a task title that describes the task and provides high-level instructions for the workers. You can provide both quick instructions and full instructions. Quick instructions are displayed next to the image to be labeled. Full instructions contain detailed instructions for completing the task. In this example, you only provide quick instructions. You can see an example of full instructions by choosing **Full instructions** at the bottom of the section.

To configure the bounding box tool

1. In the **Task description** field type in brief instructions for the task. For example:

   ```
   Draw a box around any objects in the image.
   ```

   Replace *objects* with the name of an object that appears in your images.

2. In the **Labels** field, type a category name for the objects that the worker should draw a bounding box around. For example, if you are asking the worker to draw boxes around football players, you could use "Football Player" in this field.
3. The **Short instructions** section enables you to create instructions that are displayed on the page with the image that your workers are labeling. We suggest that you include an example of a correctly drawn bounding box and an example of an incorrectly drawn box. To create your own instructions, use these steps:

   a. Select the text between **GOOD EXAMPLE** and the image placeholder. Replace it with the following text:

      ```
      Draw the box around the object with a small border.
      ```

   b. Select the first image placeholder and delete it.

   c. Choose the image button and then enter the HTTPS URL of one of the images that you created in step 1. It is also possible to embed images directly in the short instructions section, however this section has a quota of 100 kilobytes (including text). If your images and text exceed 100 kilobytes, you receive an error.

   d. Select the text between **BAD EXAMPLE** and the image placeholder. Replace it with the following text:

      ```
      Don't make the bounding box too large or cut into the object.
      ```

   e. Select the second image placeholder and delete it.

   f. Choose the image button and then enter the HTTPS URL of the other image that you created in step 1.
4. Select **Preview** to preview the worker UI. The preview opens in a new tab, and so if your browser blocks pop ups you may need to manually enable the tab to open. When you add one or more annotations to the preview and then select **Submit** you can see a preview of the output data your annotation would created.
5. After you have configured and verified your instructions, select **Create** to create the labeling job.

If you used a private workforce, you can navigate to the worker portal that you logged into in Step 3: Select Workers of this tutorial to see your labeling tasks. The tasks may take a few minutes to appear.

Next

Step 5: Monitoring Your Labeling Job

Step 5: Monitoring Your Labeling Job

After you create your labeling job, you see a list of all the jobs that you have created. You can use this list to monitor that status of your labeling jobs. The list has the following fields:

- **Name** – The name that you assigned the job when you created it.
- **Status** – The completion status of the job. The status can be one of Complete, Failed, In progress, or Stopped.
- **Labeled objects/total** – Shows the total number of objects in the labeling job and how many of them have been labeled.
- **Creation time** – The date and time that you created the job.

You can also clone, chain, or stop a job. Select a job and then select one of the following from the **Actions** menu:

- **Clone** – Creates a new labeling job with the configuration copied from the selected job. You can clone a job when you want to change to the job and run it again. For example, you can clone a job that was sent to a private workforce so that you can send it to the Amazon Mechanical Turk workforce. Or you can clone a job to rerun it against a new dataset stored in the same location as the original job.
- **Chain** – Creates a new labeling job that can build upon the data and models (if any) of a stopped, failed, or completed job. For more information about the use cases and how to use it, see Chaining Labeling Jobs.
- **Stop** – Stops a running job. You cannot restart a stopped job. You can clone a job to start over or chain the job to continue from where it left off. Labels for any already labeled objects are written to the output file location. For more information, see Output Data.

Label Images

Use Ground Truth to label images. Select one of the following built in task types to learn more about that task type. Each page includes instructions to help you create a labeling job using that task type.

> **Tip**
>
> To learn more about supported file types and input data quotas, see Input Data.

Topics

- Bounding Box
- Image Semantic Segmentation
- Auto-Segmentation Tool
- Image Classification (Single Label)
- Image Classification (Multi-label)
- Image Label Verification

Bounding Box

The images used to train a machine learning model often contain more than one object. To classify and localize one or more objects within images, use the Amazon SageMaker Ground Truth bounding box labeling job task type. In this context, localization means the pixel-location of the bounding box.

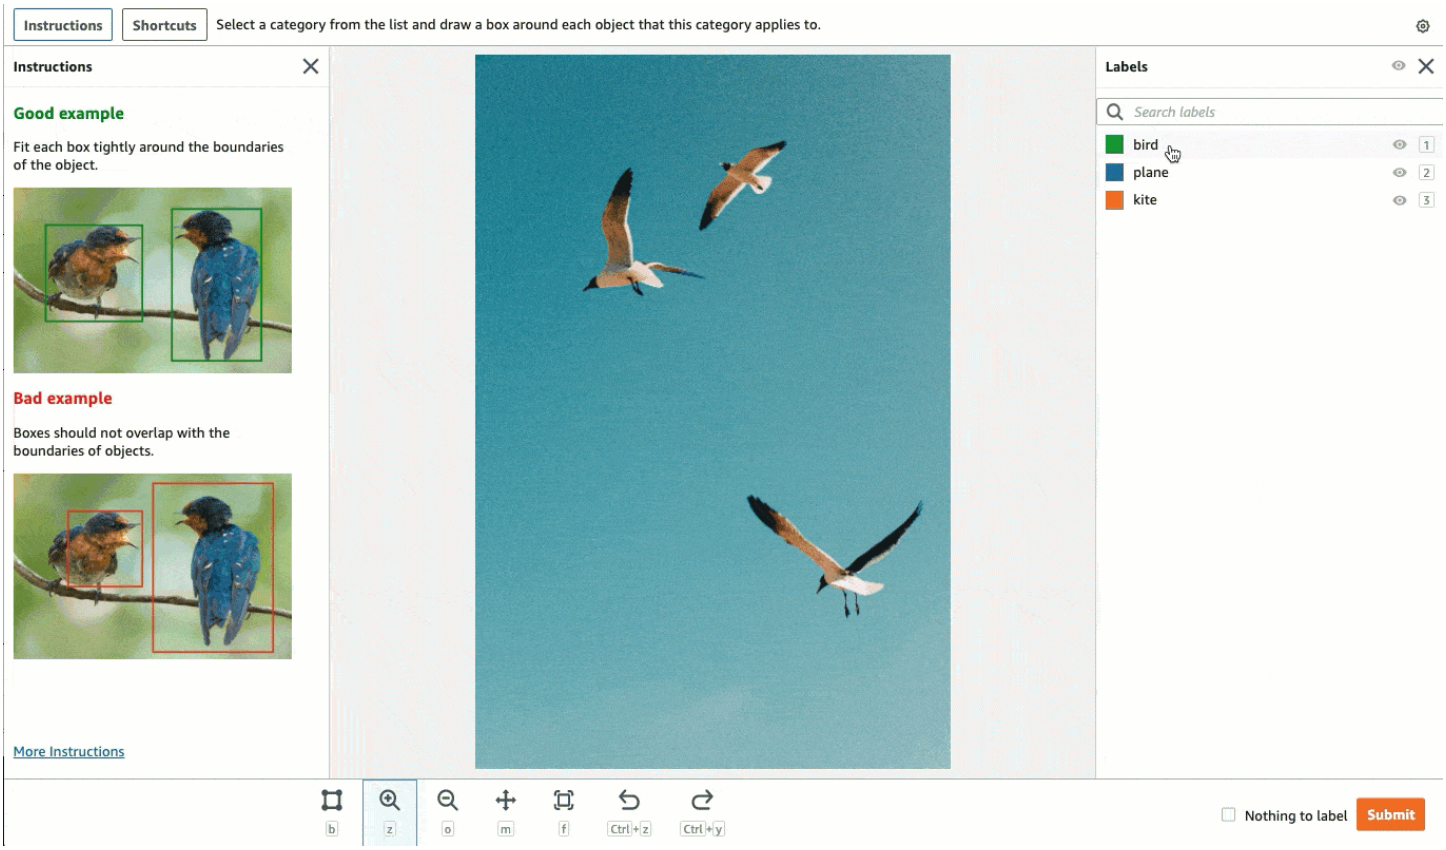
You create a bounding box labeling job using the Ground Truth section of the Amazon SageMaker console or the `CreateLabelingJob` operation.

> **Important**
>
> For this task type, if you create your own manifest file, use `"source-ref"` to identify the location of each image file in Amazon S3 that you want labeled. For more information, see Input Data.

Creating a Bounding Box Labeling Job (Console)

You can follow the instructions Create a Labeling Job (Console) to learn how to create a bounding box labeling job in the SageMaker console. In Step 10, choose **Image** from the **Task category** drop down menu, and choose **Bounding box** as the task type.

Ground Truth provides a worker UI similar to the following for labeling tasks. When you create the labeling job with the console, you specify instructions to help workers complete the job and up to 50 labels that workers can choose from.



Create a Bounding Box Labeling Job (API)

To create a bounding box labeling job, use the SageMaker API operation `CreateLabelingJob`. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the **See Also** section of `CreateLabelingJob`.

Follow the instructions on Create a Labeling Job (API) and do the following while you configure your request:

- Pre-annotation Lambda functions for this task type end with `PRE-BoundingBox`. To find the pre-annotation Lambda ARN for your Region, see PreHumanTaskLambdaArn .
- Annotation-consolidation Lambda functions for this task type end with `ACS-BoundingBox`. To find the annotation-consolidation Lambda ARN for your Region, see AnnotationConsolidationLambdaArn.

The following is an example of an AWS Python SDK (Boto3) request to create a labeling job in the US East (N. Virginia) Region. All parameters in red should be replaced with your specifications and resources.

```
response = client.create_labeling_job(
    LabelingJobName='example-bounding-box-labeling-job',
    LabelAttributeName='label',
    InputConfig={
        'DataSource': {
            'S3DataSource': {
                'ManifestS3Uri': 's3://bucket/path/manifest-with-input-data.json'
            }
        },
        'DataAttributes': {
            'ContentClassifiers': [
                'FreeOfPersonallyIdentifiableInformation'|'FreeOfAdultContent',
            ]
        }
    },
    OutputConfig={
        'S3OutputPath': 's3://bucket/path/file-to-store-output-data',
        'KmsKeyId': 'string'
    },
    RoleArn='arn:aws:iam::*:role/*',
    LabelCategoryConfigS3Uri='s3://bucket/path/label-categories.json',
    StoppingConditions={
        'MaxHumanLabeledObjectCount': 123,
        'MaxPercentageOfInputDatasetLabeled': 123
    },
    HumanTaskConfig={
        'WorkteamArn': 'arn:aws:sagemaker:region:*:workteam/private-crowd/*',
        'UiConfig': {
            'UiTemplateS3Uri': 's3://bucket/path/worker-task-template.html'
        },
        'PreHumanTaskLambdaArn': 'arn:aws:lambda:us-east-1:432418664414:function:PRE-
BoundingBox',
        'TaskKeywords': [
            'Bounding Box',
        ],
        'TaskTitle': 'Bounding Box task',
        'TaskDescription': 'Draw bounding boxes around objects in an image',
        'NumberOfHumanWorkersPerDataObject': 123,
        'TaskTimeLimitInSeconds': 123,
```

```
        'TaskAvailabilityLifetimeInSeconds': 123,
        'MaxConcurrentTaskCount': 123,
        'AnnotationConsolidationConfig': {
            'AnnotationConsolidationLambdaArn': 'arn:aws:lambda:us-
east-1:432418664414:function:ACS-BoundingBox'
          }
        },
    Tags=[
        {
            'Key': 'string',
            'Value': 'string'
        },
    ]
)
```

Provide a Template for Bounding Box Labeling Jobs

If you create a labeling job using the API, you must supply a worker task template in `UiTemplateS3Uri`. Copy and modify the following template. Only modify the `short-instructions`, `full-instructions`, and `header`. Upload this template to S3, and provide the S3 URI for this file in `UiTemplateS3Uri`.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-bounding-box
    name="boundingBox"
    src="{{ task.input.taskObject | grant_read_access }}"
    header="please draw box"
    labels="{{ task.input.labels | to_json | escape }}"
  >

    <full-instructions header="Bounding box instructions">
      <ol><li><strong>Inspect</strong> the image</li><li><strong>Determine</strong>
      if the specified label is/are visible in the picture.</li>
      <li><strong>Outline</strong> each instance of the specified label in the image
 using the provided “Box” tool.</li></ol>
      <ul><li>Boxes should fit tight around each object</li>
      <li>Do not include parts of the object are overlapping or that cannot be seen,
 even though you think you can interpolate the whole shape.</li>
      <li>Avoid including shadows.</li>
      <li>If the target is off screen, draw the box up to the edge of the image.</li>

    </full-instructions>
```

```
    <short-instructions>
      <h3><span style="color: rgb(0, 138, 0);">Good example</span></h3>
      <p>Enter description of a correct bounding box label and add images</p>
      <h3><span style="color: rgb(230, 0, 0);">Bad example</span></h3>
      <p>Enter description of an incorrect bounding box label and add images</p>
    </short-instructions>

  </crowd-bounding-box>
</crowd-form>
```

Bounding Box Output Data

Once you have created a bounding box labeling job, your output data will be located in the Amazon S3 bucket specified in the `S3OutputPath` parameter when using the API or in the **Output dataset location** field of the **Job overview** section of the console.

For example, the output manifest file of a successfully completed single-class bounding box task will contain the following:

```
[
  {
    "boundingBox": {
      "boundingBoxes": [
        {
          "height": 2832,
          "label": "bird",
          "left": 681,
          "top": 599,
          "width": 1364
        }
      ],
      "inputImageProperties": {
        "height": 3726,
        "width": 2662
      }
    }
  }
]
```

The `boundingBoxes` parameter identifies the location of the bounding box drawn around an object identified as a "bird" relative to the top-left corner of the image which is taken to

be the (0,0) pixel-coordinate. In the previous example, **`left`** and **`top`** identify the location of the pixel in the top-left corner of the bounding box relative to the top-left corner of the image. The dimensions of the bounding box are identified with **`height`** and **`width`**. The `inputImageProperties` parameter gives the pixel-dimensions of the original input image.

When you use the bounding box task type, you can create single- and multi-class bounding box labeling jobs. The output manifest file of a successfully completed multi-class bounding box will contain the following:

```
[
  {
    "boundingBox": {
      "boundingBoxes": [
        {
          "height": 938,
          "label": "squirrel",
          "left": 316,
          "top": 218,
          "width": 785
        },
        {
          "height": 825,
          "label": "rabbit",
          "left": 1930,
          "top": 2265,
          "width": 540
        },
        {
          "height": 1174,
          "label": "bird",
          "left": 748,
          "top": 2113,
          "width": 927
        },
        {
          "height": 893,
          "label": "bird",
          "left": 1333,
          "top": 847,
          "width": 736
        }
      ],
      "inputImageProperties": {
```

```
        "height": 3726,
        "width": 2662
      }
    }
  }
]
```

To learn more about the output manifest file that results from a bounding box labeling job, see Bounding Box Job Output.

To learn more about the output manifest file generated by Ground Truth and the file structure the Ground Truth uses to store your output data, see Output Data.

Image Semantic Segmentation

To identify the contents of an image at the pixel level, use an Amazon SageMaker Ground Truth semantic segmentation labeling task. When assigned a semantic segmentation labeling job, workers classify pixels in the image into a set of predefined labels or classes. Ground Truth supports single and multi-class semantic segmentation labeling jobs.

Images that contain large numbers of objects that need to be segmented require more time. To help workers (from a private or vendor workforce) label these objects in less time and with greater accuracy, Ground Truth provides an AI-assisted auto-segmentation tool. For information, see Auto-Segmentation Tool.

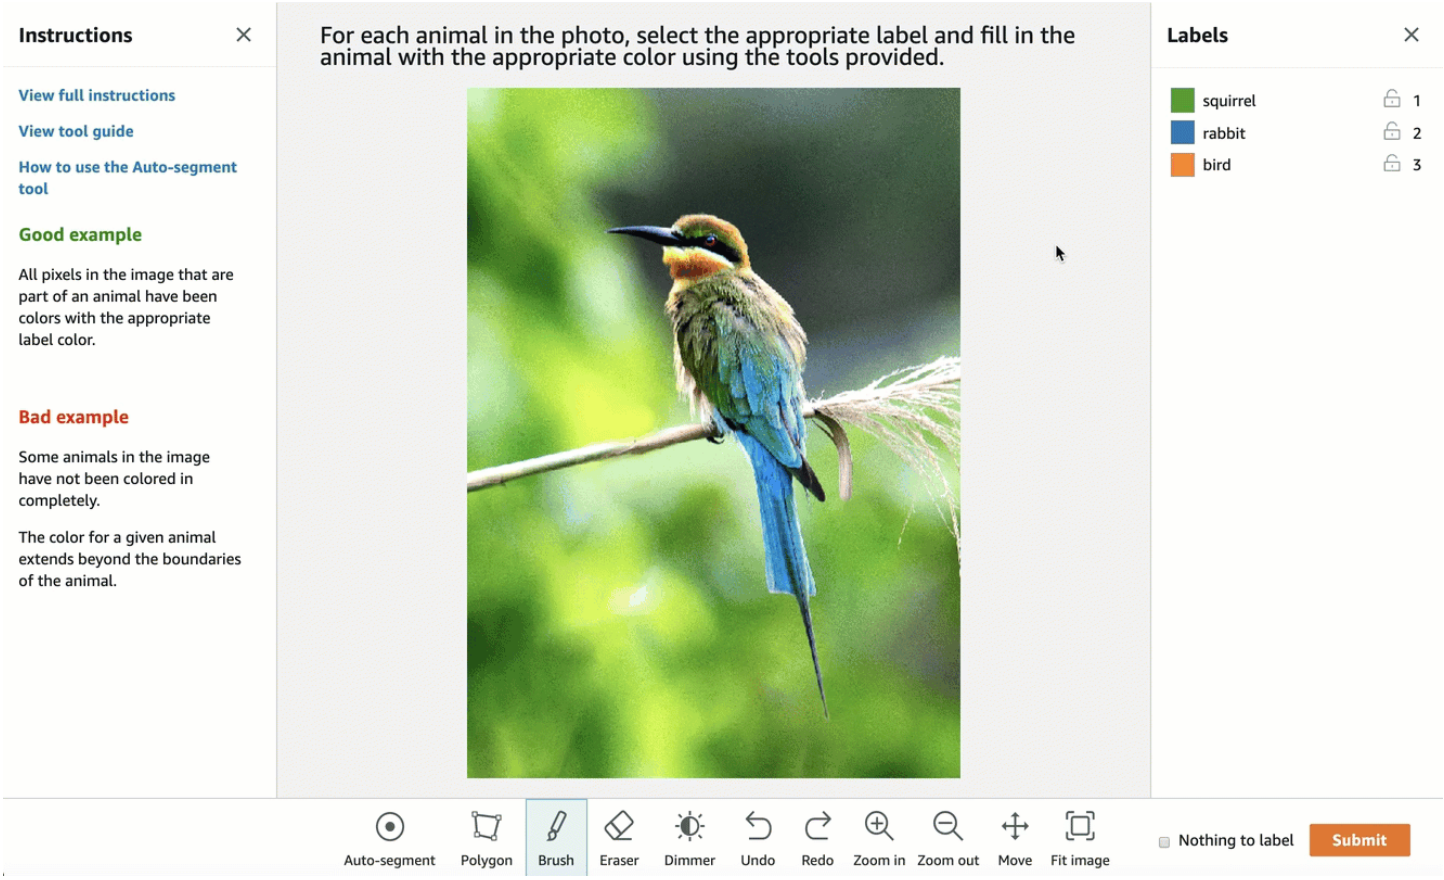
You create a semantic segmentation labeling job using the Ground Truth section of the Amazon SageMaker console or the `CreateLabelingJob` operation.

> **Important**
>
> For this task type, if you create your own manifest file, use `"source-ref"` to identify the location of each image file in Amazon S3 that you want labeled. For more information, see Input Data.

Creating a Semantic Segmentation Labeling Job (Console)

You can follow the instructions Create a Labeling Job (Console) to learn how to create a semantic segmentation labeling job in the SageMaker console. In Step 10, choose **Image** from the **Task category** drop down menu, and choose **Semantic segmentation** as the task type.

Ground Truth provides a worker UI similar to the following for labeling tasks. When you create the labeling job with the console, you specify instructions to help workers complete the job and labels that workers can choose from.



Create a Semantic Segmentation Labeling Job (API)

To create a semantic segmentation labeling job, use the SageMaker API operation `CreateLabelingJob`. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the **See Also** section of `CreateLabelingJob`.

Follow the instructions on Create a Labeling Job (API) and do the following while you configure your request:

- Pre-annotation Lambda functions for this task type end with `PRE-SemanticSegmentation`. To find the pre-annotation Lambda ARN for your Region, see PreHumanTaskLambdaArn .
- Annotation-consolidation Lambda functions for this task type end with `ACS-SemanticSegmentation`. To find the annotation-consolidation Lambda ARN for your Region, see AnnotationConsolidationLambdaArn.

The following is an example of an AWS Python SDK (Boto3) request to create a labeling job in the US East (N. Virginia) Region. All parameters in red should be replaced with your specifications and resources.

```
response = client.create_labeling_job(
    LabelingJobName='example-semantic-segmentation-labeling-job',
    LabelAttributeName='label',
    InputConfig={
        'DataSource': {
            'S3DataSource': {
                'ManifestS3Uri': 's3://bucket/path/manifest-with-input-data.json'
            }
        },
        'DataAttributes': {
            'ContentClassifiers': [
                'FreeOfPersonallyIdentifiableInformation'|'FreeOfAdultContent',
            ]
        }
    },
    OutputConfig={
        'S3OutputPath': 's3://bucket/path/file-to-store-output-data',
        'KmsKeyId': 'string'
    },
    RoleArn='arn:aws:iam::*:role/*',
    LabelCategoryConfigS3Uri='s3://bucket/path/label-categories.json',
    StoppingConditions={
        'MaxHumanLabeledObjectCount': 123,
        'MaxPercentageOfInputDatasetLabeled': 123
    },
    HumanTaskConfig={
        'WorkteamArn': 'arn:aws:sagemaker:region:*:workteam/private-crowd/*',
        'UiConfig': {
            'UiTemplateS3Uri': 's3://bucket/path/worker-task-template.html'
        },
        'PreHumanTaskLambdaArn': 'arn:aws:lambda:us-east-1:432418664414:function:PRE-
SemanticSegmentation,
        'TaskKeywords': [
            'Semantic Segmentation',
        ],
        'TaskTitle': 'Semantic segmentation task',
        'TaskDescription': 'For each category provided, segment out each relevant
 object using the color associated with that category',
        'NumberOfHumanWorkersPerDataObject': 123,
```

```
        'TaskTimeLimitInSeconds': 123,
        'TaskAvailabilityLifetimeInSeconds': 123,
        'MaxConcurrentTaskCount': 123,
        'AnnotationConsolidationConfig': {
            'AnnotationConsolidationLambdaArn': 'arn:aws:lambda:us-
east-1:432418664414:function:ACS-SemanticSegmentation'
        },
    Tags=[
        {
            'Key': 'string',
            'Value': 'string'
        },
    ]
)
```

Provide a Template for Semantic Segmentation Labeling Jobs

If you create a labeling job using the API, you must supply a worker task template in `UiTemplateS3Uri`. Copy and modify the following template. Only modify the `short-instructions`, `full-instructions`, and `header`.

Upload this template to S3, and provide the S3 URI for this file in `UiTemplateS3Uri`.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-semantic-segmentation
    name="crowd-semantic-segmentation"
    src="{{ task.input.taskObject | grant_read_access }}"
    header="Please segment out all pedestrians."
    labels="{{ task.input.labels | to_json | escape }}"
  >
    <full-instructions header="Segmentation instructions">
      <ol><li><strong>Read</strong> the task carefully and inspect the image.</li>
      <li><strong>Read</strong> the options and review the examples provided to
 understand more about the labels.</li>
      <li><strong>Choose</strong> the appropriate label that best suits an object and
 paint that object using the tools provided.</li></ol>
    </full-instructions>
    <short-instructions>
      <h2><span style="color: rgb(0, 138, 0);">Good example</span></h2>
      <p>Enter description to explain a correctly done segmentation</p>
      <p><br></p><h2><span style="color: rgb(230, 0, 0);">Bad example</span></h2>
      <p>Enter description of an incorrectly done segmentation</p>
```

```
    </short-instructions>
  </crowd-semantic-segmentation>
</crowd-form>
```

Semantic Segmentation Output Data

Once you have created a semantic segmentation labeling job, your output data will be located in the Amazon S3 bucket specified in the `S3OutputPath` parameter when using the API or in the **Output dataset location** field of the **Job overview** section of the console.

To learn more about the output manifest file generated by Ground Truth and the file structure the Ground Truth uses to store your output data, see Output Data.

To see an example of an output manifest file for a semantic segmentation labeling job, see 3D Point Cloud Semantic Segmentation Output.

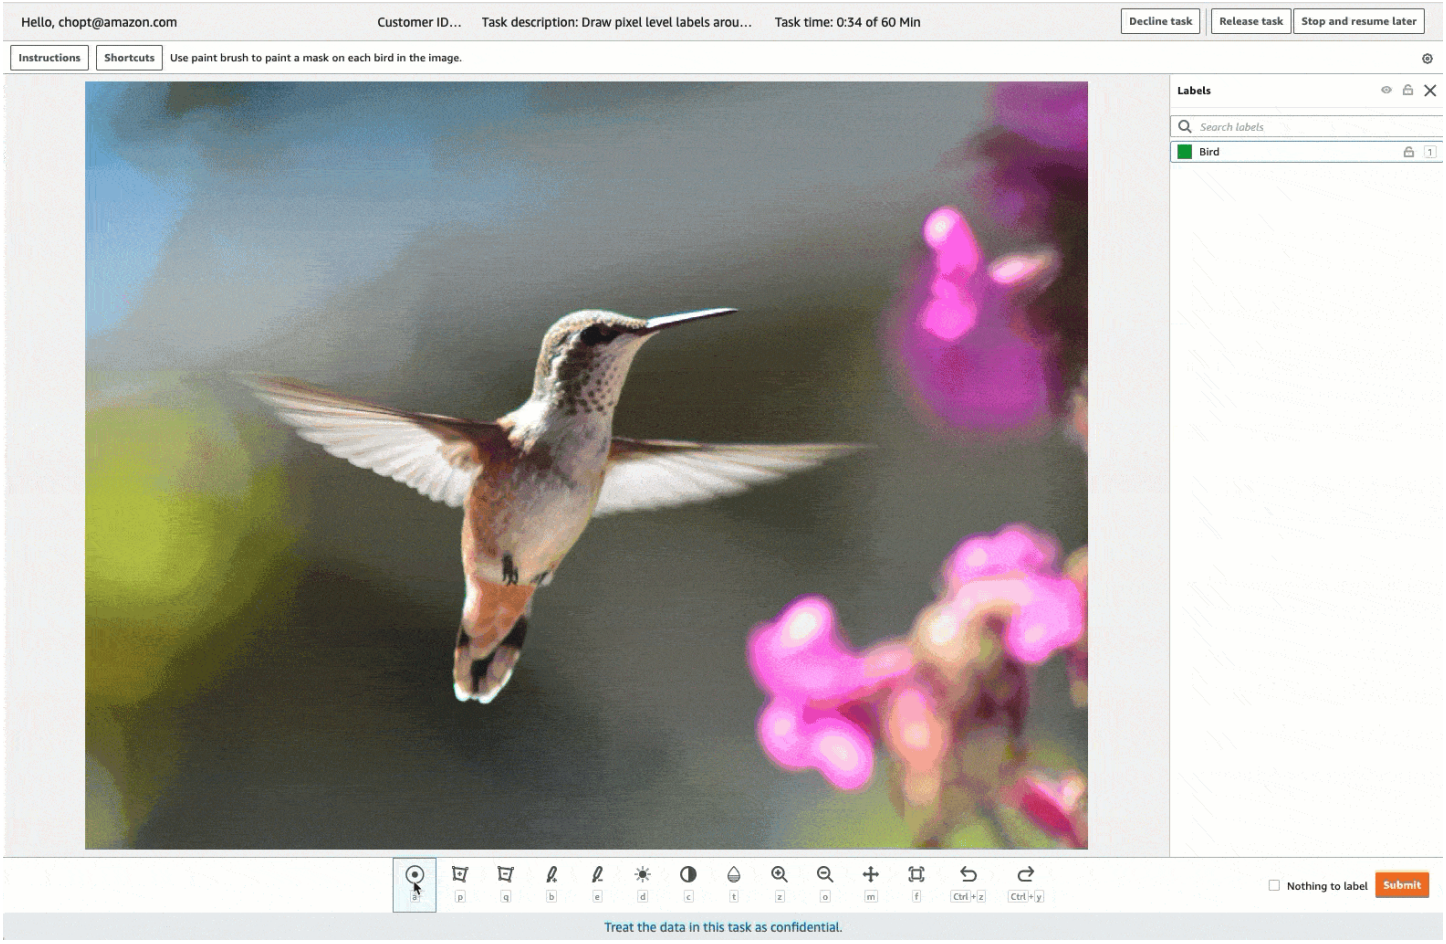
Auto-Segmentation Tool

Image segmentation is the process of dividing an image into multiple segments, or sets of labeled pixels. In Amazon SageMaker Ground Truth, the process of identifying all pixels that fall under a given label involves applying a colored filler, or "mask", over those pixels. Some labeling job tasks contain images with a large numbers of objects that need to be segmented. To help workers label these objects in less time and with greater accuracy, Ground Truth provides an auto-segmentation tool for segmentation tasks assigned to private and vendor workforces. This tool uses a machine learning model to automatically segment individual objects in the image with minimal worker input. Workers can refine the mask generated by the auto-segmentation tool using other tools found in the worker console. This helps workers complete image segmentation tasks faster and more accurately, resulting in lower cost and higher label quality.

> **Note**
>
> The auto-segmentation tool is available for segmentation tasks that are sent to a private workforce or vendor workforce. It isn't available for tasks sent to the public workforce (Amazon Mechanical Turk).

Tool Preview

When workers are assigned a labeling job that provides the auto-segmentation tool, they are provided with detailed instructions on how to use the tool. For example, a worker might see the following in the worker console:



Workers can use **View full instructions** to learn how to use the tool. Workers will need to place a point on four extreme-points (top-most, bottom-most, left-most, and right-most points) of the object of interest, and the tool will automatically generate a mask for the object. Workers can further-refine the mask using the other tools provided, or by using the auto-segment tool on smaller portions of the object that were missed.

Tool Availability

The auto-segmentation tool automatically appears in your workers' consoles if you create a semantic segmentation labeling job using the Amazon SageMaker console. While creating a semantic segmentation job in the SageMaker console, you will be able to preview the tool while

creating worker instructions. To learn how to create a semantic segmentation labeling job in the SageMaker console, see Getting started.

If you are creating a custom instance segmentation labeling job in the SageMaker console or creating an instance- or semantic-segmentation labeling job using the Ground Truth API, you need to create a custom task template to design your worker console and instructions. To include the auto-segmentation tool in your worker console, ensure that the following conditions are met in your custom task template:

- For semantic segmentation labeling jobs created using the API, the `<crowd-semantic-segmentation>` is present in the task template. For custom instance segmentation labeling jobs, the `<crowd-instance-segmentation>` tag is present in the task template.
- The task is assigned to a private workforce or vendor workforce.
- The images to be labeled are Amazon Simple Storage Service Amazon S3) objects that have been pre-signed for the Worker so that they can access it. This is true if the task template includes the `grant_read_access` filter. For information about the `grant_read_access` filter, see Adding automation with Liquid.

The following is an example of a custom task template for a custom instance segmentation labeling job, which includes the `<crowd-instance-segmentation/>` tag and the `grant_read_access` Liquid filter.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-instance-segmentation
    name="crowd-instance-segmentation"
    src="{{ task.input.taskObject | grant_read_access }}"
    labels="['Car','Road']"
   <full-instructions header="Segmentation instructions">
      Segment each instance of each class of objects in the image.
    </full-instructions>

    <short-instructions>
      <p>Segment each instance of each class of objects in the image.</p>

      <h3 style="color: green">GOOD EXAMPLES</h3>
      <img src="path/to/image.jpg" style="width: 100%">
      <p>Good because A, B, C.</p>

      <h3 style="color: red">BAD EXAMPLES</h3>
```

```
      <img src="path/to/image.jpg" style="width: 100%">
      <p>Bad because X, Y, Z.</p>
    </short-instructions>
  </crowd-instance-segmentation>
</crowd-form>
```

Image Classification (Single Label)

Use an Amazon SageMaker Ground Truth image classification labeling task when you need workers to classify images using predefined labels that you specify. Workers are shown images and are asked to choose one label for each image.

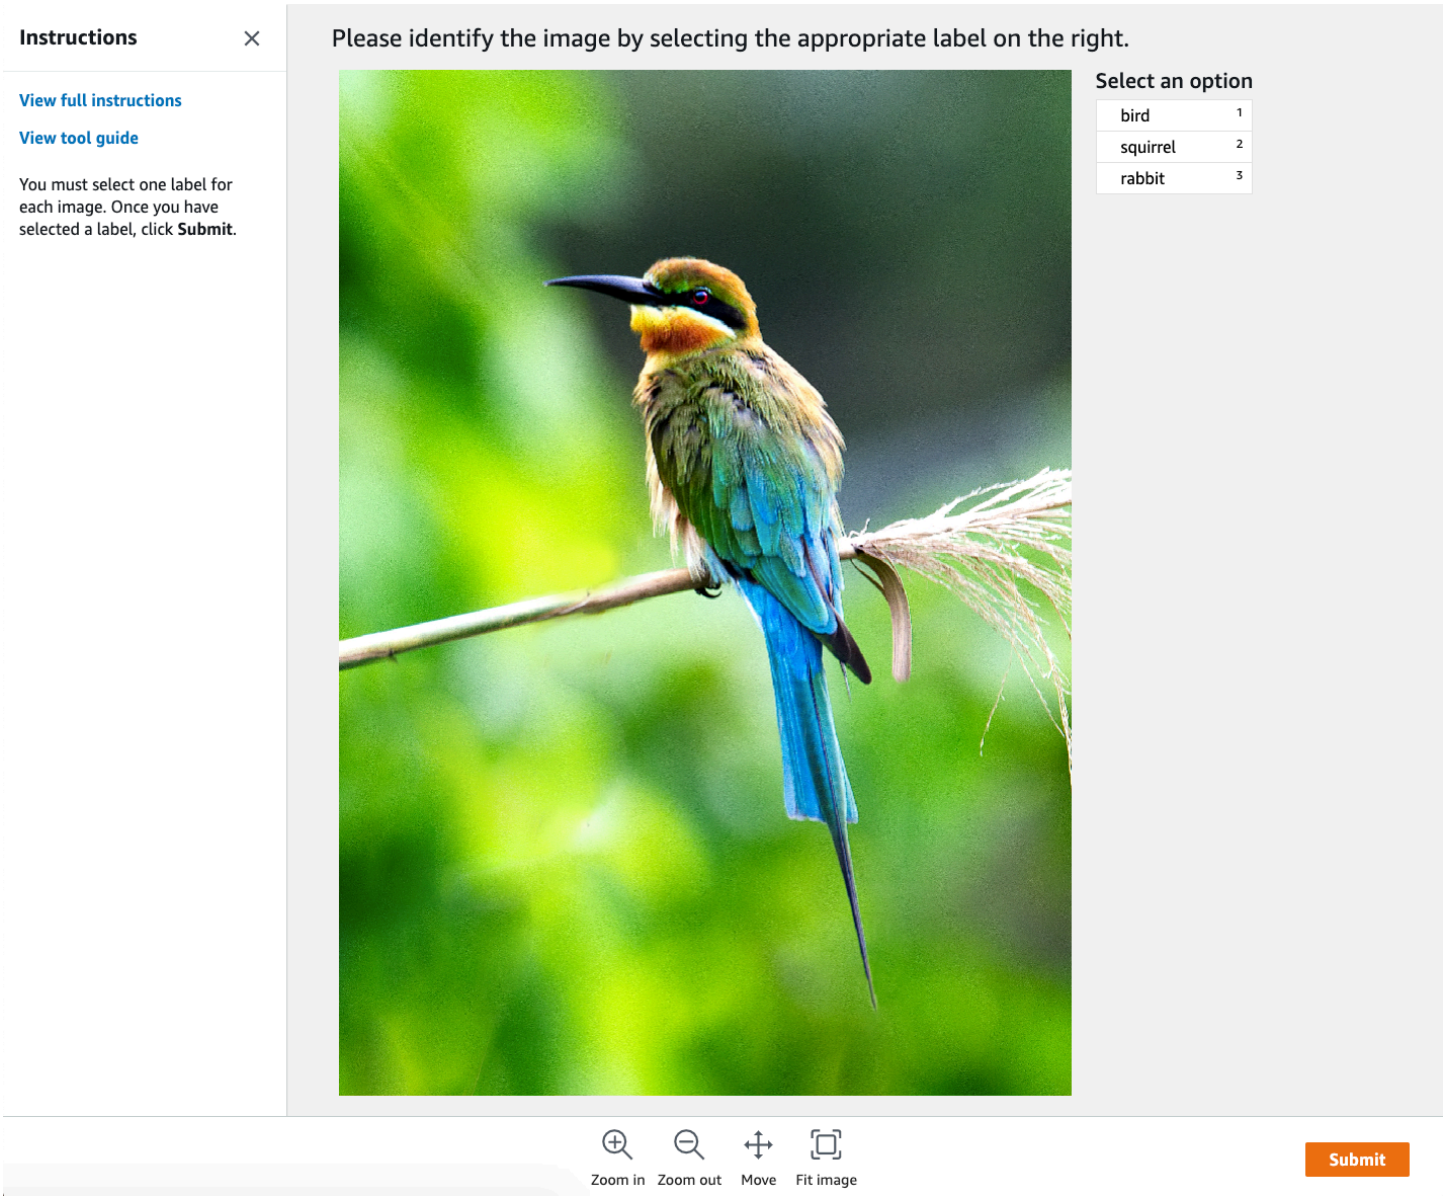
You can create an image classification labeling job using the Ground Truth section of the Amazon SageMaker console or the `CreateLabelingJob` operation.

> **Important**
>
> For this task type, if you create your own manifest file, use `"source-ref"` to identify the location of each image file in Amazon S3 that you want labeled. For more information, see Input Data.

Create an Image Classification Labeling Job (Console)

You can follow the instructions Create a Labeling Job (Console) to learn how to create a image classification labeling job in the SageMaker console. In Step 10, choose **Image** from the **Task category** drop down menu, and choose **Image Classification (Single Label)** as the task type.

Ground Truth provides a worker UI similar to the following for labeling tasks. When you create the labeling job with the console, you specify instructions to help workers complete the job and labels that workers can choose from.



Create an Image Classification Labeling Job (API)

To create an image classification labeling job, use the SageMaker API operation `CreateLabelingJob`. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the **See Also** section of `CreateLabelingJob`.

Follow the instructions on Create a Labeling Job (API) and do the following while you configure your request:

- Pre-annotation Lambda functions for this task type end with `PRE-ImageMultiClass`. To find the pre-annotation Lambda ARN for your Region, see PreHumanTaskLambdaArn .

- Annotation-consolidation Lambda functions for this task type end with `ACS-ImageMultiClass`. To find the annotation-consolidation Lambda ARN for your Region, see AnnotationConsolidationLambdaArn.

The following is an example of an AWS Python SDK (Boto3) request to create a labeling job in the US East (N. Virginia) Region. All parameters in red should be replaced with your specifications and resources.

```
response = client.create_labeling_job(
    LabelingJobName='example-image-classification-labeling-job',
    LabelAttributeName='label',
    InputConfig={
        'DataSource': {
            'S3DataSource': {
                'ManifestS3Uri': 's3://bucket/path/manifest-with-input-data.json'
            }
        },
        'DataAttributes': {
            'ContentClassifiers': [
                'FreeOfPersonallyIdentifiableInformation'|'FreeOfAdultContent',
            ]
        }
    },
    OutputConfig={
        'S3OutputPath': 's3://bucket/path/file-to-store-output-data',
        'KmsKeyId': 'string'
    },
    RoleArn='arn:aws:iam::*:role/*',
    LabelCategoryConfigS3Uri='s3://bucket/path/label-categories.json',
    StoppingConditions={
        'MaxHumanLabeledObjectCount': 123,
        'MaxPercentageOfInputDatasetLabeled': 123
    },
    HumanTaskConfig={
        'WorkteamArn': 'arn:aws:sagemaker:region:*:workteam/private-crowd/*',
        'UiConfig': {
            'UiTemplateS3Uri': 's3://bucket/path/worker-task-template.html'
        },
        'PreHumanTaskLambdaArn': 'arn:aws:lambda:us-east-1:432418664414:function:PRE-
ImageMultiClass,
        'TaskKeywords': [
            Image classification',
```

```
        ],
        'TaskTitle': 'Image classification task',
        'TaskDescription': 'Carefully inspect the image and classify it by selecting
 one label from the categories provided.',
        'NumberOfHumanWorkersPerDataObject': 123,
        'TaskTimeLimitInSeconds': 123,

        'MaxConcurrentTaskCount': 123,
        'AnnotationConsolidationConfig': {
            'AnnotationConsolidationLambdaArn': 'arn:aws:lambda:us-
east-1:432418664414:function:ACS-ImageMultiClass'
        },
    Tags=[
        {
            'Key': 'string',
            'Value': 'string'
        },
    ]
)
```

Provide a Template for Image Classification Labeling Jobs

If you create a labeling job using the API, you must supply a worker task template in `UiTemplateS3Uri`. Copy and modify the following template. Only modify the `short-instructions`, `full-instructions`, and `header`.

Upload this template to S3, and provide the S3 URI for this file in `UiTemplateS3Uri`.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-image-classifier
    name="crowd-image-classifier"
    src="{{ task.input.taskObject | grant_read_access }}"
    header="please classify"
    categories="{{ task.input.labels | to_json | escape }}"
  >
    <full-instructions header="Image classification instructions">
      <ol><li><strong>Read</strong> the task carefully and inspect the image.</li>
      <li><strong>Read</strong> the options and review the examples provided to
 understand more about the labels.</li>
      <li><strong>Choose</strong> the appropriate label that best suits the image.</
li></ol>
    </full-instructions>
```

```
    <short-instructions>
      <h3><span style="color: rgb(0, 138, 0);">Good example</span></h3>
      <p>Enter description to explain the correct label to the workers</p>
      <h3><span style="color: rgb(230, 0, 0);">Bad example</span></h3><p>Enter
 description of an incorrect label</p>
    </short-instructions>
  </crowd-image-classifier>
</crowd-form>
```

Image Classification Output Data

Once you have created an image classification labeling job, your output data will be located in the Amazon S3 bucket specified in the `S3OutputPath` parameter when using the API or in the **Output dataset location** field of the **Job overview** section of the console.

To learn more about the output manifest file generated by Ground Truth and the file structure the Ground Truth uses to store your output data, see Output Data.

To see an example of an output manifest file from an image classification labeling job, see Classification Job Output.

Image Classification (Multi-label)

Use an Amazon SageMaker Ground Truth multi-label image classification labeling task when you need workers to classify multiple objects in an image. For example, the following image features a dog and a cat. You can use multi-label image classification to associate the labels "dog" and "cat" with this image.

When working on a multi-label image classification task, workers should choose all applicable labels, but must choose at least one. When creating a job using this task type, you can provide up to 50 label-categories.

When creating a labeling job in the console, Ground Truth doesn't provide a "none" category for when none of the labels applies to an image. To provide this option to workers, include a label similar to "none" or "other" when you create a multi-label image classification job.

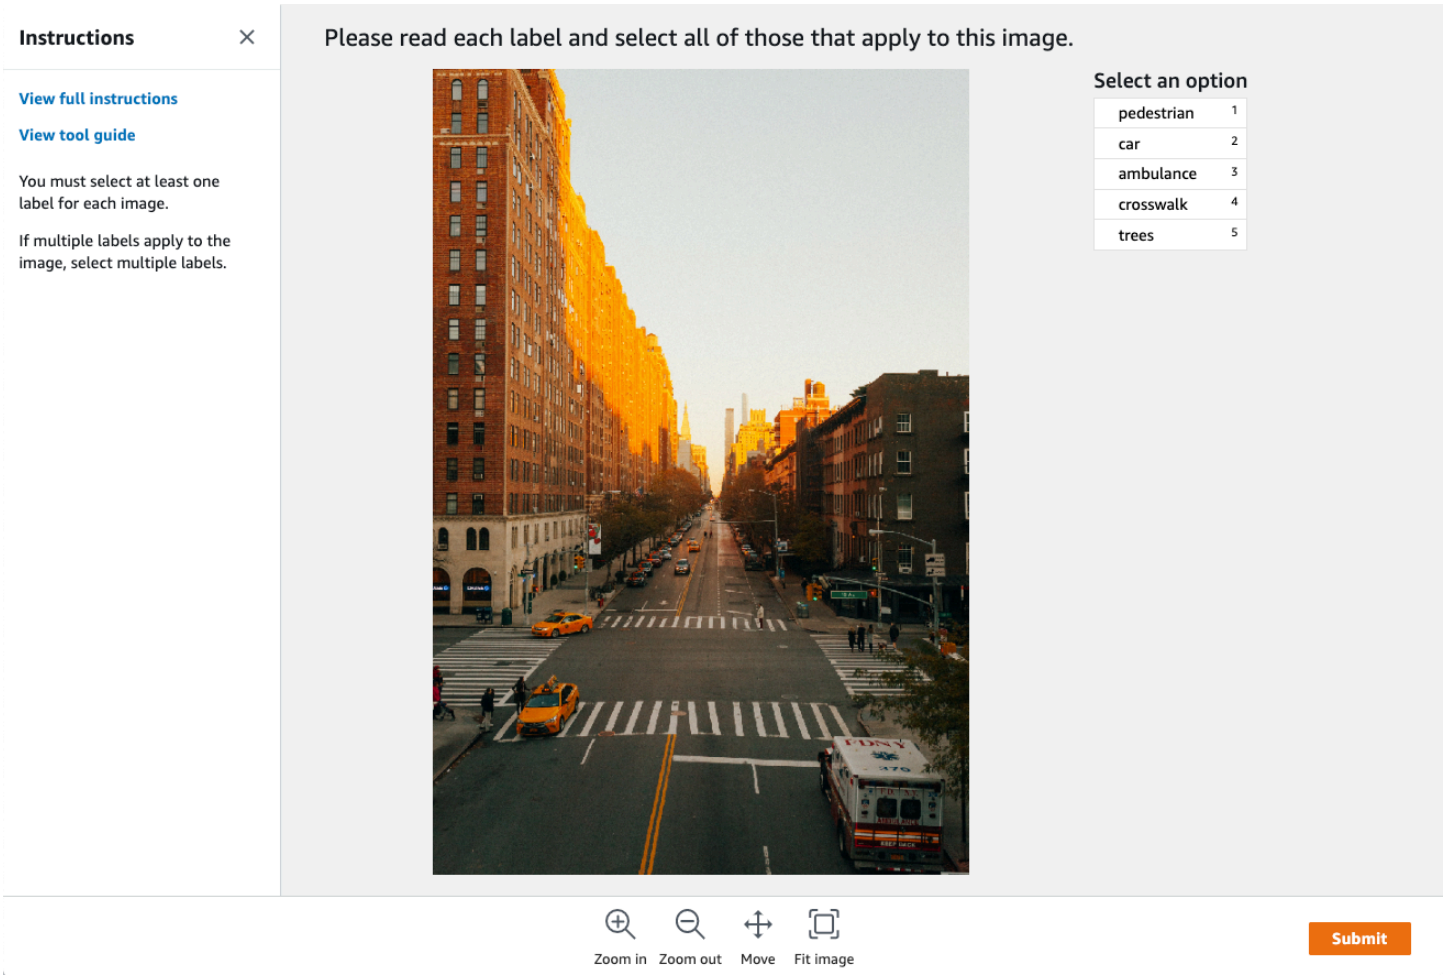
To restrict workers to choosing a single label for each image, use the Image Classification (Single Label) task type.

> **Important**
>
> For this task type, if you create your own manifest file, use `"source-ref"` to identify the location of each image file in Amazon S3 that you want labeled. For more information, see Input Data.

Create a Multi-Label Image Classification Labeling Job (Console)

You can follow the instructions Create a Labeling Job (Console) to learn how to create a multi-label image classification labeling job in the SageMaker console. In Step 10, choose **Image** from the **Task category** drop down menu, and choose **Image Classification (Multi-label)** as the task type.

Ground Truth provides a worker UI similar to the following for labeling tasks. When you create a labeling job in the console, you specify instructions to help workers complete the job and labels that workers can choose from.



Create a Multi-Label Image Classification Labeling Job (API)

To create a multi-label image classification labeling job, use the SageMaker API operation `CreateLabelingJob`. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the **See Also** section of `CreateLabelingJob`.

Follow the instructions on Create a Labeling Job (API) and do the following while you configure your request:

- Pre-annotation Lambda functions for this task type end with `PRE-ImageMultiClassMultiLabel`. To find the pre-annotation Lambda ARN for your Region, see PreHumanTaskLambdaArn .
- Annotation-consolidation Lambda functions for this task type end with `ACS-ImageMultiClassMultiLabel`. To find the annotation-consolidation Lambda ARN for your Region, see AnnotationConsolidationLambdaArn.

The following is an example of an AWS Python SDK (Boto3) request to create a labeling job in the US East (N. Virginia) Region. All parameters in red should be replaced with your specifications and resources.

```
response = client.create_labeling_job(
    LabelingJobName='example-multi-label-image-classification-labeling-job',
    LabelAttributeName='label',
    InputConfig={
        'DataSource': {
            'S3DataSource': {
                'ManifestS3Uri': 's3://bucket/path/manifest-with-input-data.json'
            }
        },
        'DataAttributes': {
            'ContentClassifiers': [
                'FreeOfPersonallyIdentifiableInformation'|'FreeOfAdultContent',
            ]
        }
    },
    OutputConfig={
        'S3OutputPath': 's3://bucket/path/file-to-store-output-data',
        'KmsKeyId': 'string'
    },
    RoleArn='arn:aws:iam::*:role/*',
    LabelCategoryConfigS3Uri='s3://bucket/path/label-categories.json',
    StoppingConditions={
        'MaxHumanLabeledObjectCount': 123,
        'MaxPercentageOfInputDatasetLabeled': 123
    },
    HumanTaskConfig={
        'WorkteamArn': 'arn:aws:sagemaker:region:*:workteam/private-crowd/*',
        'UiConfig': {
            'UiTemplateS3Uri': 's3://bucket/path/worker-task-template.html'
        },
        'PreHumanTaskLambdaArn': 'arn:aws:lambda:us-east-1:432418664414:function:PRE-
ImageMultiClassMultiLabel',
        'TaskKeywords': [
            'Image Classification',
        ],
        'TaskTitle': 'Multi-label image classification task',
        'TaskDescription': 'Select all labels that apply to the images shown',
        'NumberOfHumanWorkersPerDataObject': 123,
        'TaskTimeLimitInSeconds': 123,
```

```
        'TaskAvailabilityLifetimeInSeconds': 123,
        'MaxConcurrentTaskCount': 123,
        'AnnotationConsolidationConfig': {
            'AnnotationConsolidationLambdaArn': 'arn:aws:lambda:us-
east-1:432418664414:function:ACS-ImageMultiClassMultiLabel'
        },
    Tags=[
        {
            'Key': 'string',
            'Value': 'string'
        },
    ]
)
```

Provide a Template for Multi-label Image Classification

If you create a labeling job using the API, you must supply a worker task template in `UiTemplateS3Uri`. Copy and modify the following template. Only modify the `short-instructions`, `full-instructions`, and `header`.

Upload this template to S3, and provide the S3 URI for this file in `UiTemplateS3Uri`.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-image-classifier-multi-select
    name="crowd-image-classifier-multi-select"
    src="{{ task.input.taskObject | grant_read_access }}"
    header="Please identify all classes in image"
    categories="{{ task.input.labels | to_json | escape }}"
  >
    <full-instructions header="Multi Label Image classification instructions">
      <ol><li><strong>Read</strong> the task carefully and inspect the image.</li>
      <li><strong>Read</strong> the options and review the examples provided to
 understand more about the labels.</li>
       <li><strong>Choose</strong> the appropriate labels that best suit the image.</
li></ol>
    </full-instructions>
    <short-instructions>
      <h3><span style="color: rgb(0, 138, 0);">Good example</span></h3>
      <p>Enter description to explain the correct label to the workers</p>
      <h3><span style="color: rgb(230, 0, 0);">Bad example</span></h3>
      <p>Enter description of an incorrect label</p>
   </short-instructions>
```

```
  </crowd-image-classifier-multi-select>
</crowd-form>
```

Multi-label Image Classification Output Data

Once you have created a multi-label image classification labeling job, your output data will be located in the Amazon S3 bucket specified in the `S3OutputPath` parameter when using the API or in the **Output dataset location** field of the **Job overview** section of the console.

To learn more about the output manifest file generated by Ground Truth and the file structure the Ground Truth uses to store your output data, see Output Data.

To see an example of output manifest files for multi-label image classification labeling job, see Multi-label Classification Job Output.

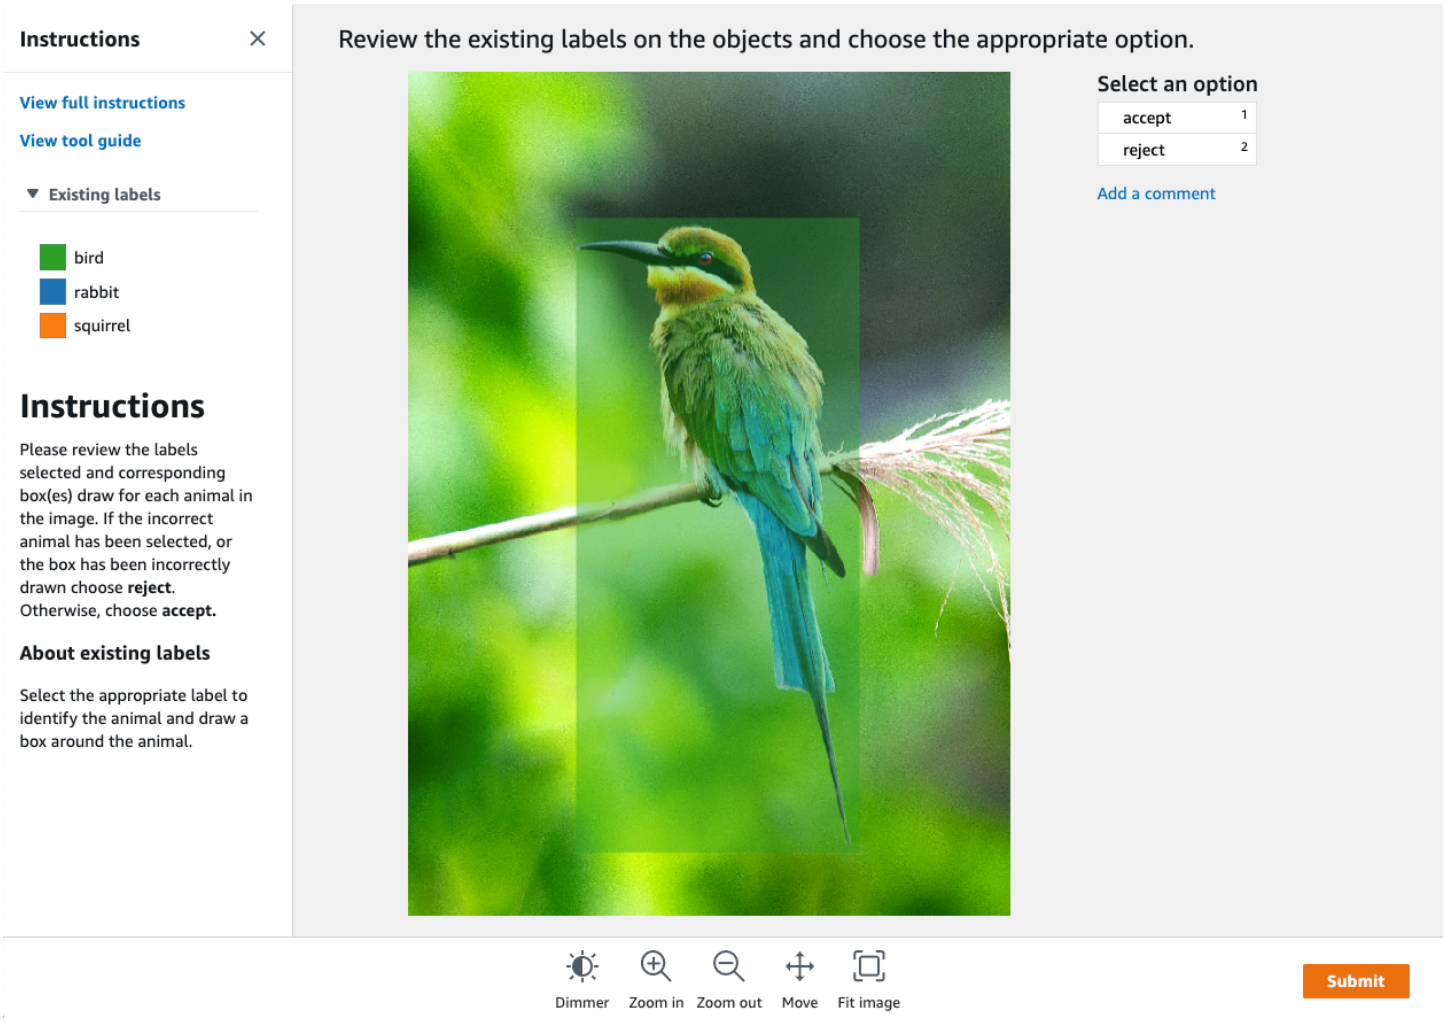
Image Label Verification

Building a highly accurate training dataset for your machine learning (ML) algorithm is an iterative process. Typically, you review and continuously adjust your labels until you are satisfied that they accurately represent the ground truth, or what is directly observable in the real world.

You can use an Amazon SageMaker Ground Truth image label verification task to direct workers to review a dataset's labels and improve label accuracy. Workers can indicate if the existing labels are correct or rate label quality. They can also add comments to explain their reasoning. Amazon SageMaker Ground Truth supports label verification for Bounding Box and Image Semantic Segmentation labels.

You create an image label verification labeling job using the Ground Truth section of the Amazon SageMaker console or the CreateLabelingJob operation.

Ground Truth provides a worker console similar to the following for labeling tasks. When you create the labeling job with the console, you can modify the images and content that are shown. To learn how to create a labeling job using the Ground Truth console, see Create a Labeling Job (Console).



You can create a label verification labeling job using the SageMaker console or API. To learn how to create a labeling job using the Ground Truth API operation `CreateLabelingJob`, see Create a Labeling Job (API).

Use Ground Truth to Label Text

Use Ground Truth to label text. Select one of the following built in task types to learn more about that task type. Each page includes instructions to help you create a labeling job using that task type.

> **Tip**
>
> To learn more about supported file types and input data quotas, see Input Data.

Topics

Named Entity Recognition

To extract information from unstructured text and classify it into predefined categories, use an Amazon SageMaker Ground Truth named entity recognition (NER) labeling task. Traditionally, NER involves sifting through text data to locate noun phrases, called *named entities*, and categorizing each with a label, such as "person," "organization," or "brand." You can broaden this task to label longer spans of text and categorize those sequences with predefined labels that you specify.

When tasked with a named entity recognition labeling job, workers apply your labels to specific words or phrases within a larger text block. They choose a label, then apply it by using the cursor to highlight the part of the text to which the label applies. The Ground Truth named entity recognition tool supports overlapping annotations, in-context label selection, and multi-label selection for a single highlight. Also, workers can use their keyboards to quickly select labels.

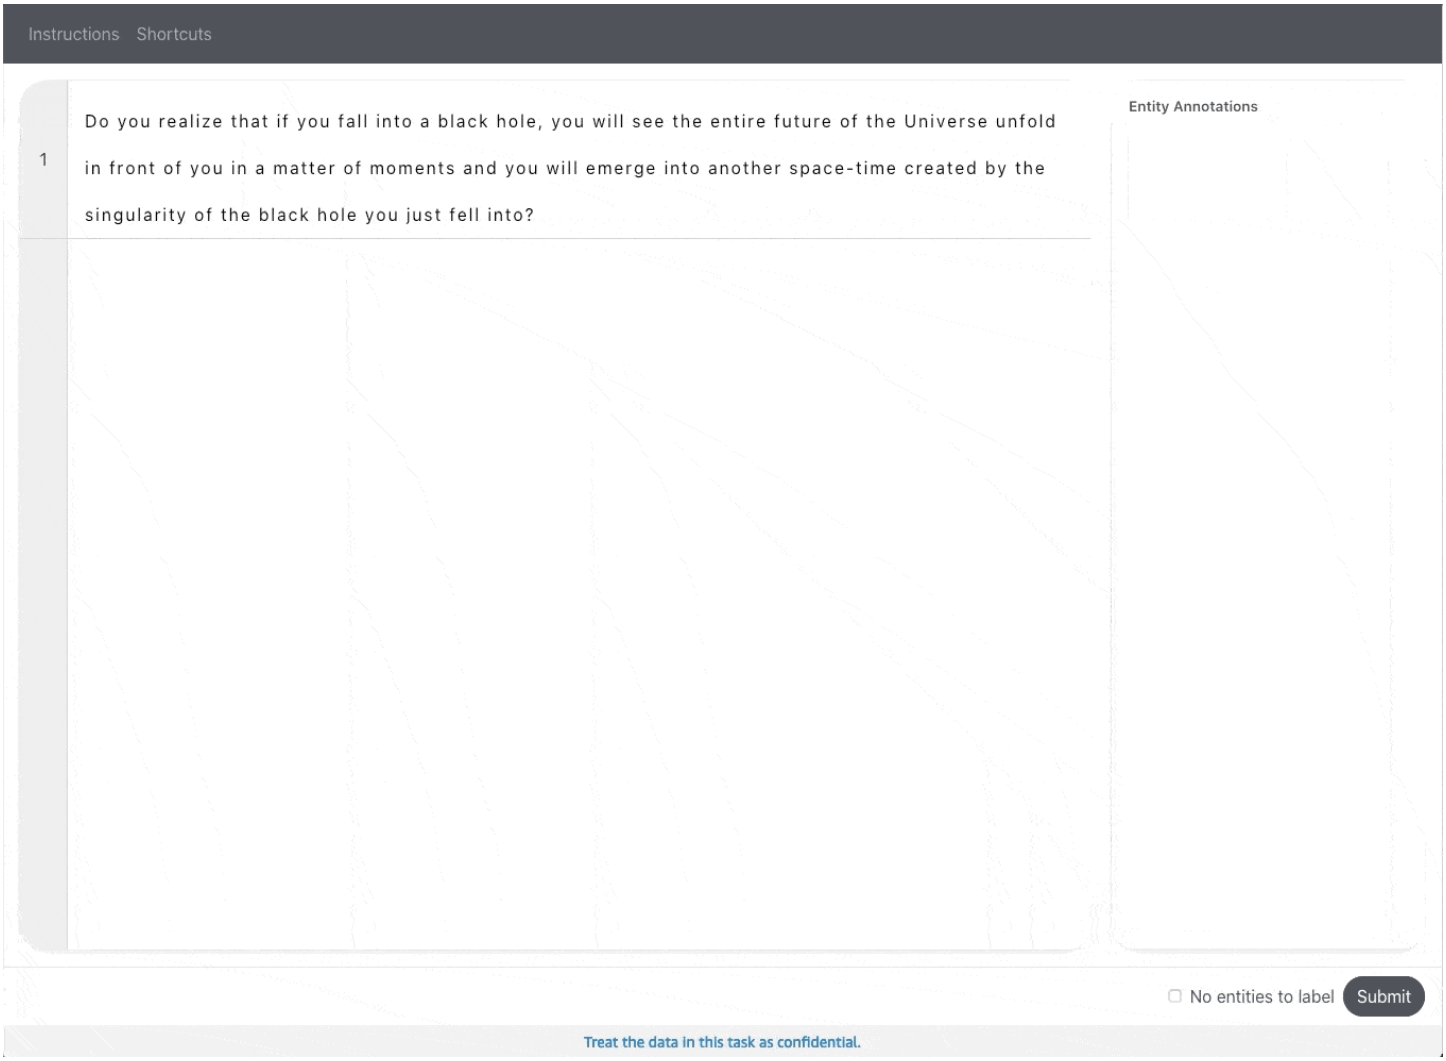
You can create a named entity recognition labeling job using the Ground Truth section of the Amazon SageMaker console or the `CreateLabelingJob` operation.

> **Important**
>
> If you manually create an input manifest file, use `"source"` to identify the text that you want labeled. For more information, see Input Data.

Create a Named Entity Recognition Labeling Job (Console)

You can follow the instructions Create a Labeling Job (Console) to learn how to create a named entity recognition labeling job in the SageMaker console. In Step 10, choose **Text** from the **Task category** drop down menu, and choose **Named entity recognition** as the task type.

Ground Truth provides a worker UI similar to the following for labeling tasks. When you create the labeling job with the console, you specify instructions to help workers complete the job and labels that workers can choose from.



Create a Named Entity Recognition Labeling Job (API)

To create a named entity recognition labeling job, using the SageMaker API operation `CreateLabelingJob`. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the **See Also** section of `CreateLabelingJob`.

Follow the instructions on Create a Labeling Job (API) and do the following while you configure your request:

- Pre-annotation Lambda functions for this task type end with `PRE-NamedEntityRecognition`. To find the pre-annotation Lambda ARN for your Region, see PreHumanTaskLambdaArn .
- Annotation-consolidation Lambda functions for this task type end with `ACS-NamedEntityRecognition`. To find the annotation-consolidation Lambda ARN for your Region, see AnnotationConsolidationLambdaArn.

- You must provide the following ARN for `HumanTaskUiArn`:

```
arn:aws:sagemaker:aws-region:394669845002:human-task-ui/NamedEntityRecognition
```

  Replace *aws-region* with the AWS Region you use to create the labeling job. For example, use `us-west-1` if you create a labeling job in US West (N. California).

- Provide worker instructions in the label category configuration file using the `instructions` parameter. You can use a string, or HTML markup language in the `shortInstruction` and `fullInstruction` fields. For more details, see Provide Worker Instructions in a Label Category Configuration File.

```
"instructions": {"shortInstruction":"<h1>Add header</h1><p>Add Instructions</p>",
 "fullInstruction":"<p>Add additional instructions.</p>"}
```

The following is an example of an AWS Python SDK (Boto3) request to create a labeling job in the US East (N. Virginia) Region. All parameters in red should be replaced with your specifications and resources.

```
response = client.create_labeling_job(
    LabelingJobName='example-ner-labeling-job',
    LabelAttributeName='label',
    InputConfig={
        'DataSource': {
            'S3DataSource': {
                'ManifestS3Uri': 's3://bucket/path/manifest-with-input-data.json'
            }
        },
        'DataAttributes': {
            'ContentClassifiers': [
                'FreeOfPersonallyIdentifiableInformation'|'FreeOfAdultContent',
            ]
        }
    },
    OutputConfig={
        'S3OutputPath': 's3://bucket/path/file-to-store-output-data',
        'KmsKeyId': 'string'
    },
    RoleArn='arn:aws:iam::*:role/*',
    LabelCategoryConfigS3Uri='s3://bucket/path/label-categories.json',
    StoppingConditions={
```

```
        'MaxHumanLabeledObjectCount': 123,
        'MaxPercentageOfInputDatasetLabeled': 123
    },
    HumanTaskConfig={
        'WorkteamArn': 'arn:aws:sagemaker:region:*:workteam/private-crowd/*',
        'UiConfig': {
            'HumanTaskUiArn': 'arn:aws:sagemaker:us-east-1:394669845002:human-task-ui/
NamedEntityRecognition'
        },
        'PreHumanTaskLambdaArn': 'arn:aws:lambda:us-east-1:432418664414:function:PRE-
NamedEntityRecognition',
        'TaskKeywords': [
            'Named entity Recognition',
        ],
        'TaskTitle': 'Named entity Recognition task',
        'TaskDescription': 'Apply the labels provided to specific words or phrases
 within the larger text block.',
        'NumberOfHumanWorkersPerDataObject': 1,
        'TaskTimeLimitInSeconds': 28800,
        'TaskAvailabilityLifetimeInSeconds': 864000,
        'MaxConcurrentTaskCount': 1000,
        'AnnotationConsolidationConfig': {
            'AnnotationConsolidationLambdaArn': 'arn:aws:lambda:us-
east-1:432418664414:function:ACS-NamedEntityRecognition'
        },
    Tags=[
        {
            'Key': 'string',
            'Value': 'string'
        },
    ]
)
```

Provide Worker Instructions in a Label Category Configuration File

You must provide worker instructions in the label category configuration file you identify with the `LabelCategoryConfigS3Uri` parameter in `CreateLabelingJob`. You can use these instructions to provide details about the task you want workers to perform and help them use the tool efficiently.

You provide short and long instructions using `shortInstruction` and `fullInstruction` in the `instructions` parameter, respectively. To learn more about these instruction types, see Creating Instruction Pages.

The following is an example of a label category configuration file with instructions that can be used for a named entity recognition labeling job.

```
{
  "document-version": "2018-11-28",
  "labels": [
    {
      "label": "label1",
      "shortDisplayName": "L1"
    },
    {
      "label": "label2",
      "shortDisplayName": "L2"
    },
    {
      "label": "label3",
      "shortDisplayName": "L3"
    },
    {
      "label": "label4",
      "shortDisplayName": "L4"
    },
    {
      "label": "label5",
      "shortDisplayName": "L5"
    }
  ],
  "instructions": {
    "shortInstruction": "<p>Enter description of the labels that workers have
                        to choose from</p><br><p>Add examples to help workers
understand the label</p>",
    "fullInstruction": "<ol>
                        <li><strong>Read</strong> the text carefully.</li>
                        <li><strong>Highlight</strong> words, phrases, or sections of
the text.</li>
                        <li><strong>Choose</strong> the label that best matches what
you have highlighted.</li>
                        <li>To <strong>change</strong> a label, choose highlighted text
and select a new label.</li>
                        <li>To <strong>remove</strong> a label from highlighted text,
choose the X next to the
                        abbreviated label name on the highlighted text.</li>
```

```
                        <li>You can select all of a previously highlighted text, but
 not a portion of it.</li>
                        </ol>"
  }
}
```

Named Entity Recognition Output Data

Once you have created a named entity recognition labeling job, your output data will be located in the Amazon S3 bucket specified in the `S3OutputPath` parameter when using the API or in the **Output dataset location** field of the **Job overview** section of the console.

To learn more about the output manifest file generated by Ground Truth and the file structure the Ground Truth uses to store your output data, see Output Data.

Text Classification (Single Label)

To categorize articles and text into predefined categories, use text classification. For example, you can use text classification to identify the sentiment conveyed in a review or the emotion underlying a section of text. Use Amazon SageMaker Ground Truth text classification to have workers sort text into categories that you define.

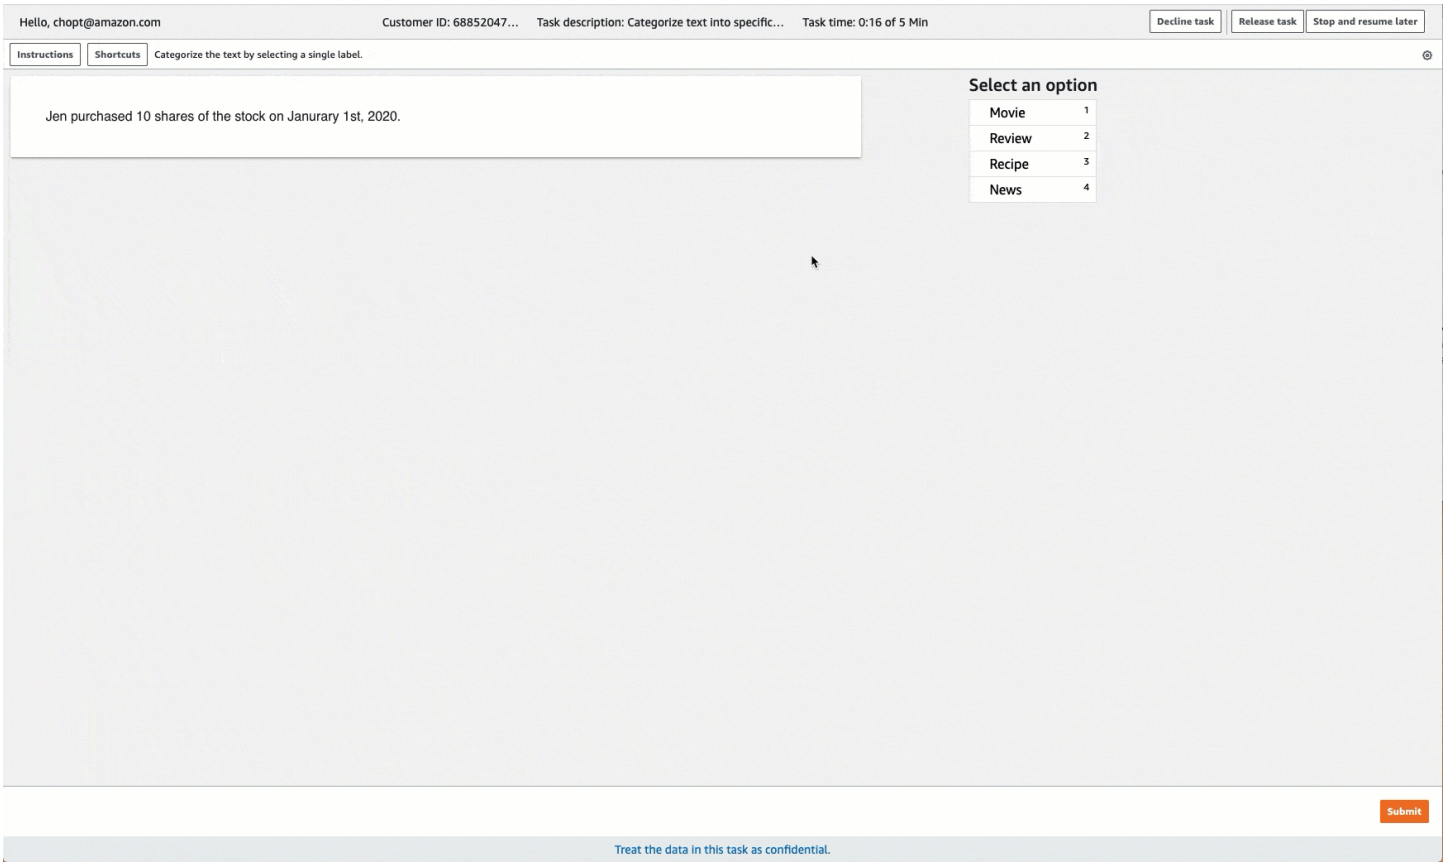
You create a text classification labeling job using the Ground Truth section of the Amazon SageMaker console or the `CreateLabelingJob` operation.

> **Important**
>
> If you manually create an input manifest file, use `"source"` to identify the text that you want labeled. For more information, see Input Data.

Create a Text Classification Labeling Job (Console)

You can follow the instructions Create a Labeling Job (Console) to learn how to create a text classification labeling job in the SageMaker console. In Step 10, choose **Text** from the **Task category** drop down menu, and choose **Text Classification (Single Label)** as the task type.

Ground Truth provides a worker UI similar to the following for labeling tasks. When you create the labeling job with the console, you specify instructions to help workers complete the job and labels that workers can choose from.



Create a Text Classification Labeling Job (API)

To create a text classification labeling job, use the SageMaker API operation `CreateLabelingJob`. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the **See Also** section of `CreateLabelingJob`.

Follow the instructions on Create a Labeling Job (API) and do the following while you configure your request:

- Pre-annotation Lambda functions for this task type end with `PRE-TextMultiClass`. To find the pre-annotation Lambda ARN for your Region, see PreHumanTaskLambdaArn .
- Annotation-consolidation Lambda functions for this task type end with `ACS-TextMultiClass`. To find the annotation-consolidation Lambda ARN for your Region, see AnnotationConsolidationLambdaArn.

The following is an example of an AWS Python SDK (Boto3) request to create a labeling job in the US East (N. Virginia) Region. All parameters in red should be replaced with your specifications and resources.

```
response = client.create_labeling_job(
    LabelingJobName='example-text-classification-labeling-job',
    LabelAttributeName='label',
    InputConfig={
        'DataSource': {
            'S3DataSource': {
                'ManifestS3Uri': 's3://bucket/path/manifest-with-input-data.json'
            }
        },
        'DataAttributes': {
            'ContentClassifiers': [
                'FreeOfPersonallyIdentifiableInformation'|'FreeOfAdultContent',
            ]
        }
    },
    OutputConfig={
        'S3OutputPath': 's3://bucket/path/file-to-store-output-data',
        'KmsKeyId': 'string'
    },
    RoleArn='arn:aws:iam::*:role/*',
    LabelCategoryConfigS3Uri='s3://bucket/path/label-categories.json',
    StoppingConditions={
        'MaxHumanLabeledObjectCount': 123,
        'MaxPercentageOfInputDatasetLabeled': 123
    },
    HumanTaskConfig={
        'WorkteamArn': 'arn:aws:sagemaker:region:*:workteam/private-crowd/*',
        'UiConfig': {
            'UiTemplateS3Uri': 's3://bucket/path/worker-task-template.html'
        },
        'PreHumanTaskLambdaArn': 'arn:aws:lambda:us-east-1:432418664414:function:PRE-
TextMultiClass,
        'TaskKeywords': [
            Text classification',
        ],
        'TaskTitle': Text classification task',
        'TaskDescription': 'Carefully read and classify this text using the categories
 provided.',
        'NumberOfHumanWorkersPerDataObject': 123,
        'TaskTimeLimitInSeconds': 123,
        'TaskAvailabilityLifetimeInSeconds': 123,
        'MaxConcurrentTaskCount': 123,
        'AnnotationConsolidationConfig': {
```

```
            'AnnotationConsolidationLambdaArn': 'arn:aws:lambda:us-
east-1:432418664414:function:ACS-TextMultiClass'
        },
    Tags=[
        {
            'Key': 'string',
            'Value': 'string'
        },
    ]
)
```

Provide a Template for Text Classification Labeling Jobs

If you create a labeling job using the API, you must supply a worker task template in `UiTemplateS3Uri`. Copy and modify the following template. Only modify the `short-instructions`, `full-instructions`, and `header`.

Upload this template to S3, and provide the S3 URI for this file in `UiTemplateS3Uri`.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-classifier
    name="crowd-classifier"
    categories="{{ task.input.labels | to_json | escape }}"
    header="classify text"
  >
    <classification-target style="white-space: pre-wrap">
      {{ task.input.taskObject }}
    </classification-target>
    <full-instructions header="Classifier instructions">
      <ol><li><strong>Read</strong> the text carefully.</li>
      <li><strong>Read</strong> the examples to understand more about the options.</li>
      <li><strong>Choose</strong> the appropriate labels that best suit the text.</
li></ol>
    </full-instructions>
    <short-instructions>
      <p>Enter description of the labels that workers have to choose from</p>
      <p><br></p><p><br></p><p>Add examples to help workers understand the label</p>
      <p><br></p><p><br></p><p><br></p><p><br></p><p><br></p>
    </short-instructions>
  </crowd-classifier>
  </crowd-form>
```

Text Classification Output Data

Once you have created a text classification labeling job, your output data will be located in the Amazon S3 bucket specified in the `S3OutputPath` parameter when using the API or in the **Output dataset location** field of the **Job overview** section of the console.

To learn more about the output manifest file generated by Ground Truth and the file structure the Ground Truth uses to store your output data, see Output Data.

To see an example of an output manifest files from a text classification labeling job, see Classification Job Output.

Text Classification (Multi-label)

To categorize articles and text into multiple predefined categories, use the multi-label text classification task type. For example, you can use this task type to identify more than one emotion conveyed in text.

When working on a multi-label text classification task, workers should choose all applicable labels, but must choose at least one. When creating a job using this task type, you can provide up to 50 label categories.

Amazon SageMaker Ground Truth doesn't provide a "none" category for when none of the labels applies. To provide this option to workers, include a label similar to "none" or "other" when you create a multi-label text classification job.

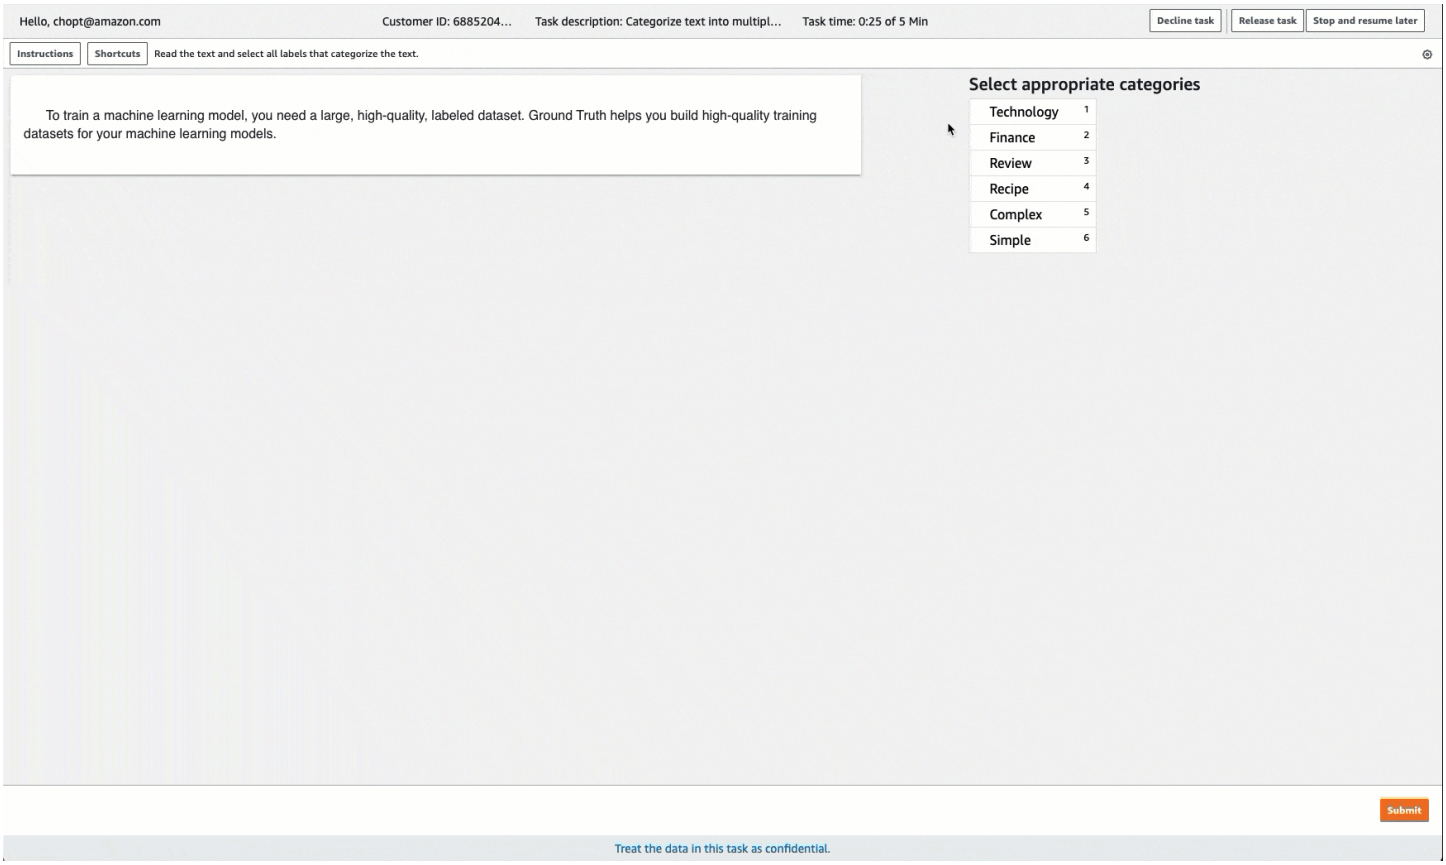
To restrict workers to choosing a single label for each document or text selection, use the Text Classification (Single Label) task type.

> **Important**
>
> If you manually create an input manifest file, use `"source"` to identify the text that you want labeled. For more information, see Input Data.

Create a Multi-Label Text Classification Labeling Job (Console)

You can follow the instructions Create a Labeling Job (Console) to learn how to create a multi-label text classification labeling job in the Amazon SageMaker console. In Step 10, choose **Text** from the **Task category** drop down menu, and choose **Text Classification (Multi-label)** as the task type.

Ground Truth provides a worker UI similar to the following for labeling tasks. When you create the labeling job with the console, you specify instructions to help workers complete the job and labels that workers can choose from.



Create a Multi-Label Text Classification Labeling Job (API)

To create a multi-label text classification labeling job, use the SageMaker API operation `CreateLabelingJob`. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the **See Also** section of `CreateLabelingJob`.

Follow the instructions on Create a Labeling Job (API) and do the following while you configure your request:

- Pre-annotation Lambda functions for this task type end with `PRE-TextMultiClassMultiLabel`. To find the pre-annotation Lambda ARN for your Region, see PreHumanTaskLambdaArn .
- Annotation-consolidation Lambda functions for this task type end with `ACS-TextMultiClassMultiLabel`. To find the annotation-consolidation Lambda ARN for your Region, see AnnotationConsolidationLambdaArn.

The following is an example of an AWS Python SDK (Boto3) request to create a labeling job in the US East (N. Virginia) Region. All parameters in red should be replaced with your specifications and resources.

```
response = client.create_labeling_job(
    LabelingJobName='example-multi-label-text-classification-labeling-job',
    LabelAttributeName='label',
    InputConfig={
        'DataSource': {
            'S3DataSource': {
                'ManifestS3Uri': 's3://bucket/path/manifest-with-input-data.json'
            }
        },
        'DataAttributes': {
            'ContentClassifiers': [
                'FreeOfPersonallyIdentifiableInformation'|'FreeOfAdultContent',
            ]
        }
    },
    OutputConfig={
        'S3OutputPath': 's3://bucket/path/file-to-store-output-data',
        'KmsKeyId': 'string'
    },
    RoleArn='arn:aws:iam::*:role/*',
    LabelCategoryConfigS3Uri='s3://bucket/path/label-categories.json',
    StoppingConditions={
        'MaxHumanLabeledObjectCount': 123,
        'MaxPercentageOfInputDatasetLabeled': 123
    },
    HumanTaskConfig={
        'WorkteamArn': 'arn:aws:sagemaker:region:*:workteam/private-crowd/*',
        'UiConfig': {
            'UiTemplateS3Uri': 's3://bucket/path/custom-worker-task-template.html'
        },
        'PreHumanTaskLambdaArn': 'arn:aws:lambda::function:PRE-
TextMultiClassMultiLabel,
        'TaskKeywords': [
            'Text Classification',
        ],
        'TaskTitle': 'Multi-label text classification task',
        'TaskDescription': 'Select all labels that apply to the text shown',
        'NumberOfHumanWorkersPerDataObject': 123,
        'TaskTimeLimitInSeconds': 123,
```

```
        'TaskAvailabilityLifetimeInSeconds': 123,
        'MaxConcurrentTaskCount': 123,
        'AnnotationConsolidationConfig': {
            'AnnotationConsolidationLambdaArn': 'arn:aws:lambda:us-
east-1:432418664414:function:ACS-TextMultiClassMultiLabel'
        },
    Tags=[
        {
            'Key': 'string',
            'Value': 'string'
        },
    ]
)
```

Create a Template for Multi-label Text Classification

If you create a labeling job using the API, you must supply a worker task template in `UiTemplateS3Uri`. Copy and modify the following template. Only modify the `short-instructions`, `full-instructions`, and `header`.

Upload this template to S3, and provide the S3 URI for this file in `UiTemplateS3Uri`.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-classifier-multi-select
    name="crowd-classifier-multi-select"
    categories="{{ task.input.labels | to_json | escape }}"
    header="Please identify all classes in the below text"
  >
    <classification-target style="white-space: pre-wrap">
      {{ task.input.taskObject }}
    </classification-target>
    <full-instructions header="Classifier instructions">
      <ol><li><strong>Read</strong> the text carefully.</li>
      <li><strong>Read</strong> the examples to understand more about the options.</li>
      <li><strong>Choose</strong> the appropriate labels that best suit the text.</
li></ol>
    </full-instructions>
    <short-instructions>
      <p>Enter description of the labels that workers have to choose from</p>
      <p><br></p>
      <p><br></p><p>Add examples to help workers understand the label</p>
      <p><br></p><p><br></p><p><br></p><p><br></p><p><br></p><p><br></p>
```

```
    </short-instructions>
  </crowd-classifier-multi-select>
  </crowd-form>
```

To learn how to create a custom template, see Creating Custom Labeling Workflows.

Multi-label Text Classification Output Data

Once you have created a multi-label text classification labeling job, your output data will be located in the Amazon S3 bucket specified in the `S3OutputPath` parameter when using the API or in the **Output dataset location** field of the **Job overview** section of the console.

To learn more about the output manifest file generated by Ground Truth and the file structure the Ground Truth uses to store your output data, see Output Data.

To see an example of output manifest files for multi-label text classification labeling job, see Multi-label Classification Job Output.

Label Videos and Video Frames

You can use Ground Truth to classify videos and annotate video frames (still images extracted from videos) using one of the three built-in video task types. These task types streamline the process of creating video and video frame labeling jobs using the Amazon SageMaker console, API, and language-specific SDKs.

- Video clip classification – Enable workers to classify videos into categories you specify. For example, you can use this task type to have workers categorize videos into topics like sports, comedy, music, and education. To learn more, see Video Classification.
- Video frame labeling jobs – Enable workers to annotate video frames extracted from a video using bounding boxes, polylines, polygons or keypoint annotation tools. Ground Truth offers two built-in task types to label video frames:
  - *Video frame object detection*: Enable workers to identify and locate objects in video frames.
  - *Video frame object tracking*: Enable workers to track the movement of objects across video frames.
  - *Video frame adjustment jobs*: Have workers adjust labels, label category attributes, and frame attributes from a previous video frame object detection or object tracking labeling job.
  - *Video frame verification jobs*: Have workers verify labels, label category attributes, and frame attributes from a previous video frame object detection or object tracking labeling job.

If you have video files, you can use the Ground Truth automatic frame extraction tool to extract video frames from your videos. To learn more, see Video Frame Input Data.

> **Tip**
>
> To learn more about supported file types and input data quotas, see Input Data.

Topics

Video Classification

Use an Amazon SageMaker Ground Truth video classification labeling task when you need workers to classify videos using predefined labels that you specify. Workers are shown videos and are asked to choose one label for each video.

You create a video classification labeling job using the Ground Truth section of the Amazon SageMaker console or the CreateLabelingJob operation.

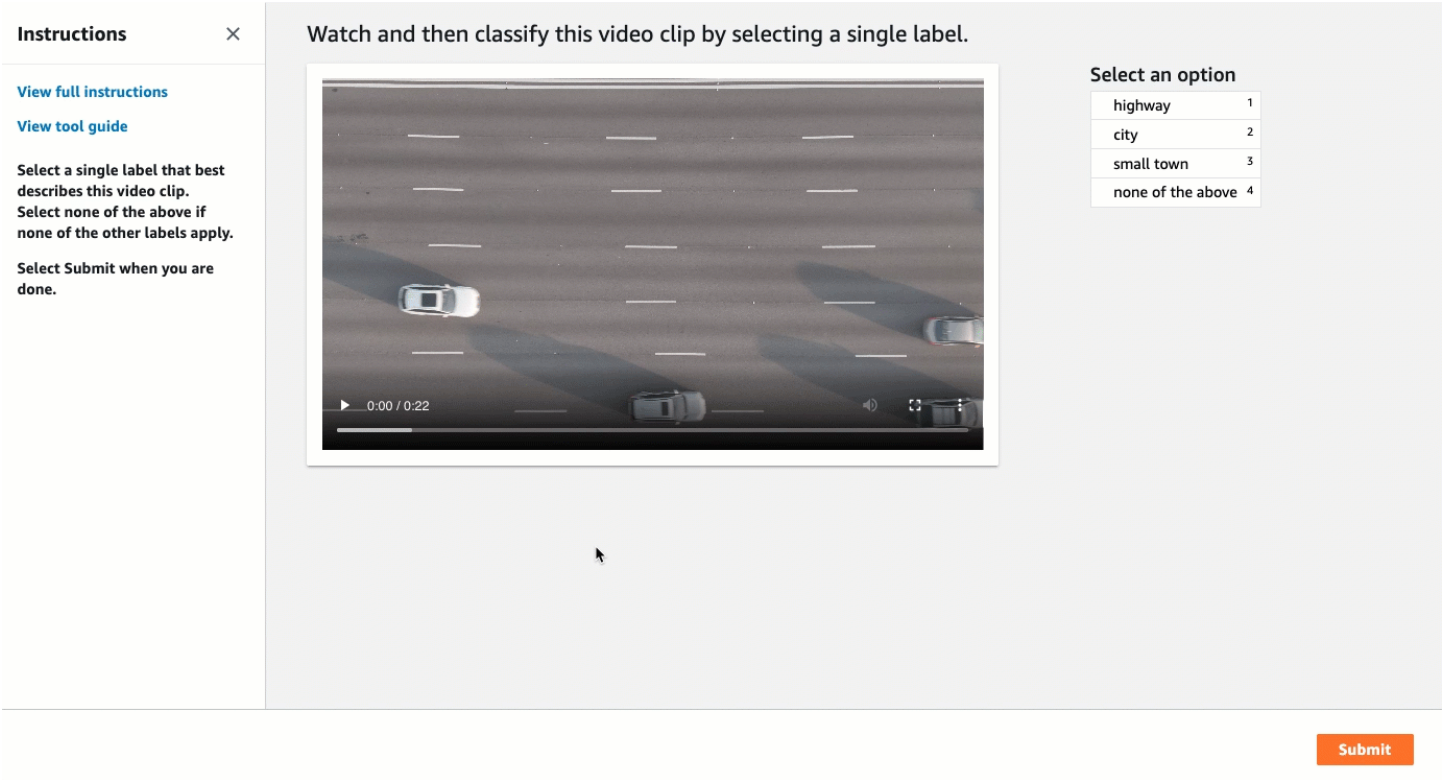
Your video files must be encoded in a format that is supported by the browser used by the work team that labels your data. It is recommended that you verify that all video file formats in your input manifest file display correctly using the worker UI preview. You can communicate supported browsers to your workers using worker instructions. To see supported file formats, see Supported Data Formats.

> **Important**
>
> For this task type, if you create your own manifest file, use `"source-ref"` to identify the location of each video file in Amazon S3 that you want labeled. For more information, see Input Data.

Create a Video Classification Labeling Job (Console)

You can follow the instructions in Create a Labeling Job (Console) to learn how to create a video classification labeling job in the SageMaker console. In step 10, choose **Video** from the **Task category** dropdown list, and choose **Video Classification** as the task type.

Ground Truth provides a worker UI similar to the following for labeling tasks. When you create a labeling job in the console, you specify instructions to help workers complete the job and labels from which workers can choose.



Create a Video Classification Labeling Job (API)

This section covers details you need to know when you create a labeling job using the SageMaker API operation `CreateLabelingJob`. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the **See Also** section of `CreateLabelingJob`.

Follow the instructions on Create a Labeling Job (API) and do the following while you configure your request:

- Use a pre-annotation Lambda function that ends with `PRE-VideoClassification`. To find the pre-annotation Lambda ARN for your Region, see PreHumanTaskLambdaArn .

- Use an annotation-consolidation Lambda function that ends with `ACS-VideoClassification`. To find the annotation-consolidation Lambda ARN for your Region, see AnnotationConsolidationLambdaArn.

The following is an example of an AWS Python SDK (Boto3) request to create a labeling job in the US East (N. Virginia) Region.

```
response = client.create_labeling_job(
    LabelingJobName='example-video-classification-labeling-job',
    LabelAttributeName='label',
    InputConfig={
        'DataSource': {
            'S3DataSource': {
                'ManifestS3Uri': 's3://bucket/path/manifest-with-input-data.json'
            }
        },
        'DataAttributes': {
            'ContentClassifiers': [
                'FreeOfPersonallyIdentifiableInformation'|'FreeOfAdultContent',
            ]
        }
    },
    OutputConfig={
        'S3OutputPath': 's3://bucket/path/file-to-store-output-data',
        'KmsKeyId': 'string'
    },
    RoleArn='arn:aws:iam::*:role/*',
    LabelCategoryConfigS3Uri='s3://bucket/path/label-categories.json',
    StoppingConditions={
        'MaxHumanLabeledObjectCount': 123,
        'MaxPercentageOfInputDatasetLabeled': 123
    },
    HumanTaskConfig={
        'WorkteamArn': 'arn:aws:sagemaker:region:*:workteam/private-crowd/*',
        'UiConfig': {
            'UiTemplateS3Uri': 's3://bucket/path/worker-task-template.html'
        },
        'PreHumanTaskLambdaArn': 'arn:aws:lambda:us-east-1:432418664414:function:PRE-
VideoClassification',
        'TaskKeywords': [
            'Video Classification',
        ],
```

```
        'TaskTitle': 'Video classification task',
        'TaskDescription': 'Select a label to classify this video',
        'NumberOfHumanWorkersPerDataObject': 123,
        'TaskTimeLimitInSeconds': 123,
        'TaskAvailabilityLifetimeInSeconds': 123,
        'MaxConcurrentTaskCount': 123,
        'AnnotationConsolidationConfig': {
            'AnnotationConsolidationLambdaArn': 'arn:aws:lambda:us-
east-1:432418664414:function:ACS-VideoClassification'
        },
    Tags=[
        {
            'Key': 'string',
            'Value': 'string'
        },
    ]
)
```

Provide a Template for Video Classification

If you create a labeling job using the API, you must supply a worker task template in `UiTemplateS3Uri`. Copy and modify the following template by modifying the `short-instructions`, `full-instructions`, and `header`. Upload this template to Amazon S3, and provide the Amazon S3 URI to this file in `UiTemplateS3Uri`.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

             <crowd-form>
                 <crowd-classifier
                   name="crowd-classifier"
                   categories="{{ task.input.labels | to_json | escape }}"
                   header="Please classify video"
                 >
                   <classification-target>
                      <video width="100%" controls/>
                       <source src="{{ task.input.taskObject | grant_read_access }}"
 type="video/mp4"/>
                       <source src="{{ task.input.taskObject | grant_read_access }}"
 type="video/webm"/>
                       <source src="{{ task.input.taskObject | grant_read_access }}"
 type="video/ogg"/>
                     Your browser does not support the video tag.
                     </video>
```

```
                    </classification-target>
                    <full-instructions header="Video classification instructions">
                      <ol><li><strong>Read</strong> the task carefully and inspect the
 video.</li>
                        <li><strong>Read</strong> the options and review the examples
 provided to understand more about the labels.</li>
                        <li><strong>Choose</strong> the appropriate label that best
 suits the video.</li></ol>
                    </full-instructions>
                    <short-instructions>
                      <h3><span style="color: rgb(0, 138, 0);">Good example</span></h3>
                        <p>Enter description to explain the correct label to the
 workers</p>
                        <p><img src="https://d7evko5405gb7.cloudfront.net/
fe4fed9b-660c-4477-9294-2c66a15d6bbe/src/images/quick-instructions-example-
placeholder.png" style="max-width:100%"></p>
                        <h3><span style="color: rgb(230, 0, 0);">Bad example</span></
h3>
                        <p>Enter description of an incorrect label</p>
                        <p><img src="https://d7evko5405gb7.cloudfront.net/
fe4fed9b-660c-4477-9294-2c66a15d6bbe/src/images/quick-instructions-example-
placeholder.png" style="max-width:100%"></p>
                    </short-instructions>
                  </crowd-classifier>
              </crowd-form>
```

Video Classification Output Data

Once you have created a video classification labeling job, your output data is located in the Amazon S3 bucket specified in the `S3OutputPath` parameter when using the API or in the **Output dataset location** field of the **Job overview** section of the console.

To learn more about the output manifest file generated by Ground Truth and the file structure the Ground Truth uses to store your output data, see Output Data.

To see an example of output manifest files for video classification labeling jobs, see Classification Job Output.

Label Video Frames

You can use Ground Truth built-in video frame task types to have workers annotate video frames using bounding boxes, polylines, polygons or keypoints. A *video frame* is a sequence of images that have been extracted from a video.

If you do not have video frames, you can provide video files (MP4 files) and use the Ground Truth automated frame extraction tool to extract video frames. To learn more, see Provide Video Files.

You can use the following built-in video task types to create video frame labeling jobs using the Amazon SageMaker console, API, and language-specific SDKs.

- **Video frame object detection** – Use this task type when you want workers to identify and locate objects in sequences of video frames. You provide a list of categories, and workers can select one category at a time and annotate objects which the category applies to in all frames. For example, you can use this task to ask workers to identify and localize various objects in a scene, such as cars, bikes, and pedestrians.
- **Video frame object tracking** – Use this task type when you want workers to track the movement of instances of objects across sequences of video frames. When a worker adds an annotation to a single frame, that annotation is associated with a unique instance ID. The worker adds annotations associated with the same ID in all other frames to identify the same object or person. For example, a worker can track the movement of a vehicle across a sequences of video frames by drawing bounding boxes associated with the same ID around the vehicle in each frame that it appears.

Use the following topics to learn more about these built-in task types and to how to create a labeling job using each task type. See Task Types to learn more about the annotations tools (bounding boxes, polylines, polygons and keypoints) available for these task types.

Before you create a labeling job, we recommend that you review Video Frame Labeling Job Overview.

Topics

- Video Frame Object Detection
- Video Frame Object Tracking
- Video Frame Labeling Job Overview

Video Frame Object Detection

You can use the video frame object detection task type to have workers identify and locate objects in a sequence of video frames (images extracted from a video) using bounding boxes, polylines, polygons or keypoint *annotation tools*. The tool you choose defines the video frame task type you create. For example, you can use a bounding box video frame object detection task type workers to identify and localize various objects in a series of video frames, such as cars, bikes, and pedestrians.

You can create a video frame object detection labeling job using the Amazon SageMaker Ground Truth console, the SageMaker API, and language-specific AWS SDKs. To learn more, see Create a Video Frame Object Detection Labeling Job and select your preferred method. See Task Types to learn more about the annotations tools you can choose from when you create a labeling job.

Ground Truth provides a worker UI and tools to complete your labeling job tasks: Preview the Worker UI.

You can create a job to adjust annotations created in a video object detection labeling job using the video object detection adjustment task type. To learn more, see Create Video Frame Object Detection Adjustment or Verification Labeling Job.

Preview the Worker UI

Ground Truth provides workers with a web user interface (UI) to complete your video frame object detection annotation tasks. You can preview and interact with the worker UI when you create a labeling job in the console. If you are a new user, we recommend that you create a labeling job through the console using a small input dataset to preview the worker UI and ensure your video frames, labels, and label attributes appear as expected.

The UI provides workers with the following assistive labeling tools to complete your object detection tasks:

- For all tasks, workers can use the **Copy to next** and **Copy to all** features to copy an annotation to the next frame or to all subsequent frames respectively.
- For tasks that include the bounding box tools, workers can use a **Predict next** feature to draw a bounding box in a single frame, and then have Ground Truth predict the location of boxes with the same label in all other frames. Workers can then make adjustments to correct predicted box locations.

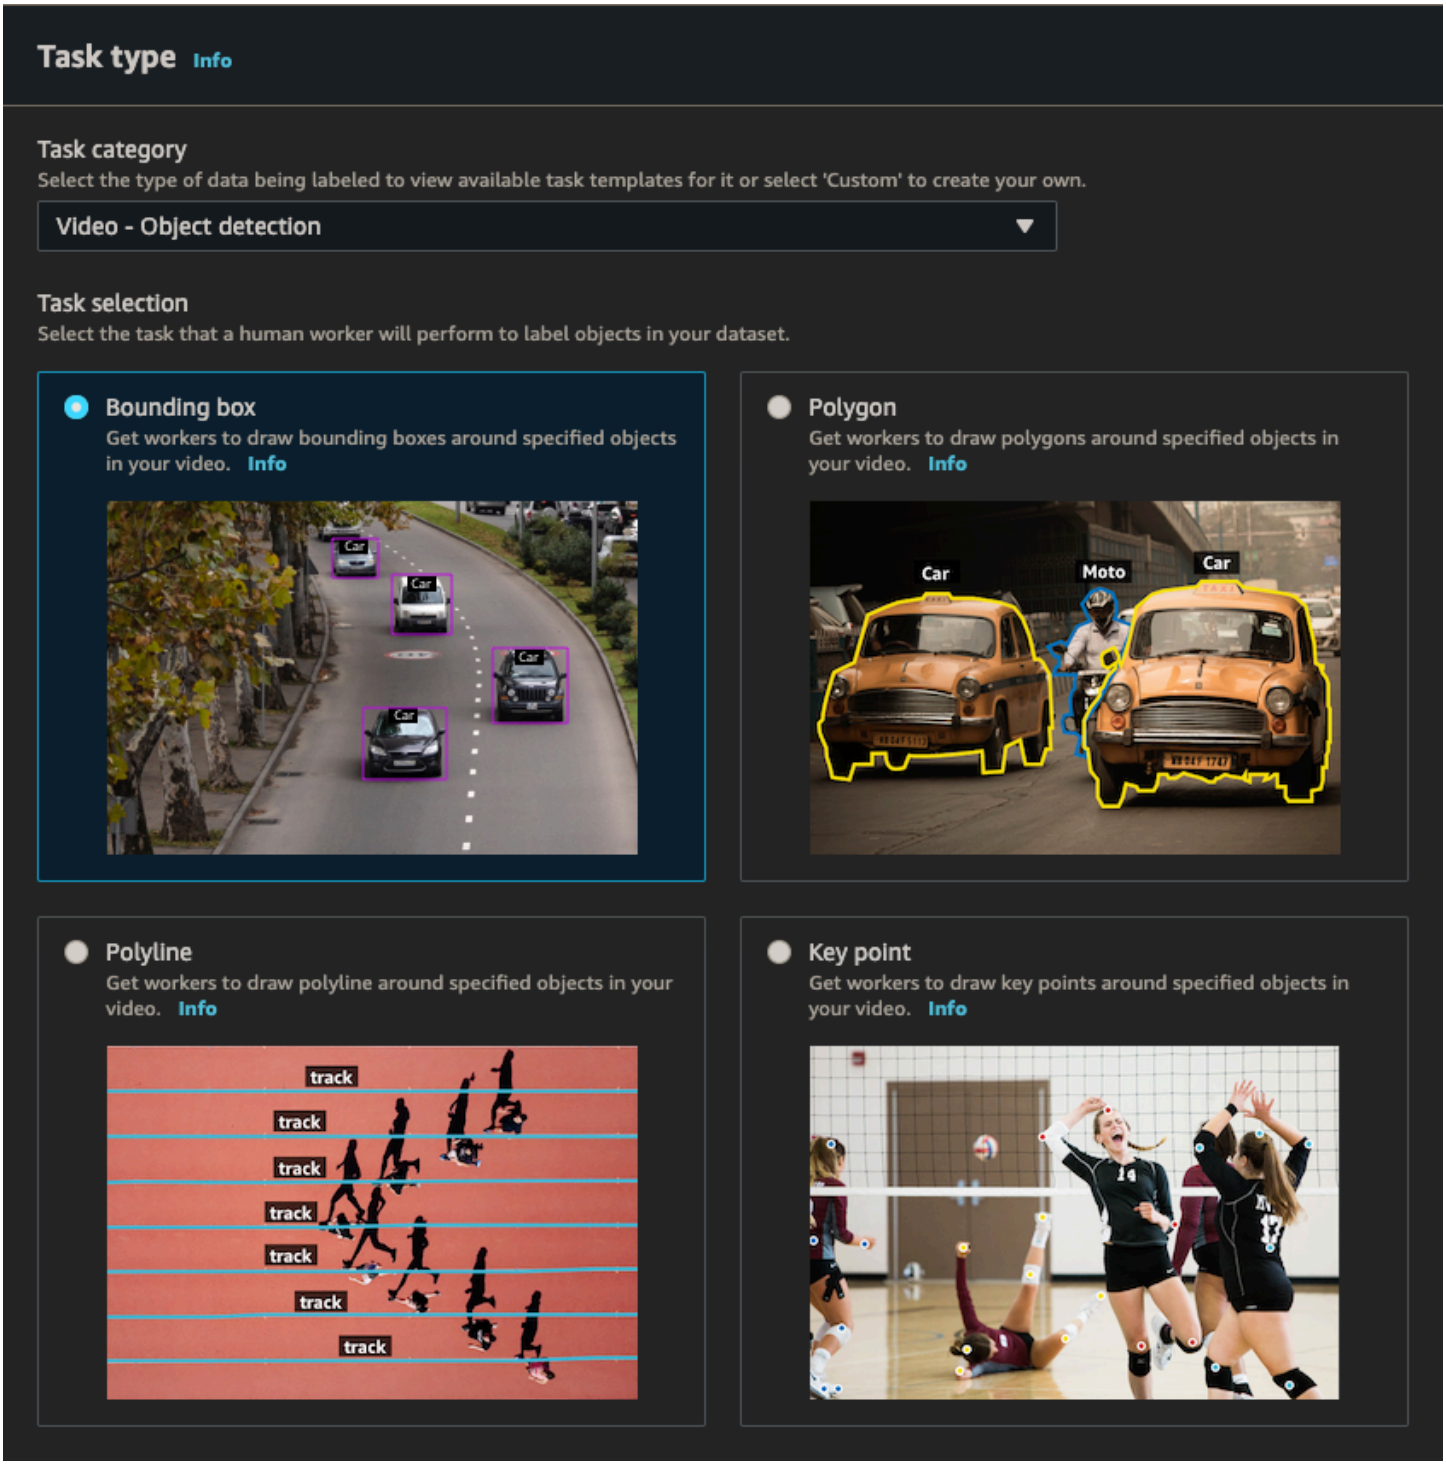
Create a Video Frame Object Detection Labeling Job

You can create a video frame object detection labeling job using the SageMaker console or the `CreateLabelingJob` API operation.

This section assumes that you have reviewed the Video Frame Labeling Job Overview and have chosen the type of input data and the input dataset connection you are using.

Create a Labeling Job (Console)

You can follow the instructions in Create a Labeling Job (Console) to learn how to create a video frame object tracking job in the SageMaker console. In step 10, choose **Video - Object detection** from the **Task category** dropdown list. Select the task type you want by selecting one of the cards in **Task selection**.



Create a Labeling Job (API)

You create an object detection labeling job using the SageMaker API operation `CreateLabelingJob`. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the **See Also** section of `CreateLabelingJob`.

Create a Labeling Job (API) provides an overview of the `CreateLabelingJob` operation. Follow these instructions and do the following while you configure your request:

- You must enter an ARN for `HumanTaskUiArn`. Use `arn:aws:sagemaker:<region>:394669845002:human-task-ui/VideoObjectDetection`. Replace *<region>* with the AWS Region in which you are creating the labeling job.

  Do not include an entry for the `UiTemplateS3Uri` parameter.
- Your `LabelAttributeName` must end in `-ref`. For example, *video-od-labels*`-ref`.
- Your input manifest file must be a video frame sequence manifest file. You can create this manifest file using the SageMaker console, or create it manually and upload it to Amazon S3. For more information, see Input Data Setup.
- You can only use private or vendor work teams to create video frame object detection labeling jobs.
- You specify your labels, label category and frame attributes, the task type, and worker instructions in a label category configuration file. Specify the task type (bounding boxes, polylines, polygons or keypoint) using `annotationType` in your label category configuration file. For more information, see Create a Labeling Category Configuration File with Label Category and Frame Attributes to learn how to create this file.
- You need to provide pre-defined ARNs for the pre-annotation and post-annotation (ACS) Lambda functions. These ARNs are specific to the AWS Region you use to create your labeling job.
  - To find the pre-annotation Lambda ARN, refer to `PreHumanTaskLambdaArn`. Use the Region in which you are creating your labeling job to find the correct ARN that ends with `PRE-VideoObjectDetection`.
  - To find the post-annotation Lambda ARN, refer to `AnnotationConsolidationLambdaArn`. Use the Region in which you are creating your labeling job to find the correct ARN that ends with `ACS-VideoObjectDetection`.
- The number of workers specified in `NumberOfHumanWorkersPerDataObject` must be 1.
- Automated data labeling is not supported for video frame labeling jobs. Do not specify values for parameters in `LabelingJobAlgorithmsConfig`.
- Video frame object tracking labeling jobs can take multiple hours to complete. You can specify a longer time limit for these labeling jobs in `TaskTimeLimitInSeconds` (up to 7 days, or 604,800 seconds).

The following is an example of an AWS Python SDK (Boto3) request to create a labeling job in the US East (N. Virginia) Region.

```
response = client.create_labeling_job(
    LabelingJobName='example-video-od-labeling-job,
    LabelAttributeName='label',
    InputConfig={
        'DataSource': {
            'S3DataSource': {
                'ManifestS3Uri': 's3://DOC-EXAMPLE-BUCKET/path/video-frame-sequence-
input-manifest.json'
            }
        },
        'DataAttributes': {
            'ContentClassifiers': [
                'FreeOfPersonallyIdentifiableInformation'|'FreeOfAdultContent',
            ]
        }
    },
    OutputConfig={
        'S3OutputPath': 's3://DOC-EXAMPLE-BUCKET/prefix/file-to-store-output-data',
        'KmsKeyId': 'string'
    },
    RoleArn='arn:aws:iam::*:role/*',
    LabelCategoryConfigS3Uri='s3://bucket/prefix/label-categories.json',
    StoppingConditions={
        'MaxHumanLabeledObjectCount': 123,
        'MaxPercentageOfInputDatasetLabeled': 123
    },
    HumanTaskConfig={
        'WorkteamArn': 'arn:aws:sagemaker:us-east-1:*:workteam/private-crowd/*',
        'UiConfig': {
            'HumanTaskUiArn: 'arn:aws:sagemaker:us-east-1:394669845002:human-task-ui/
VideoObjectDetection'
        },
        'PreHumanTaskLambdaArn': 'arn:aws:lambda:us-east-1:432418664414:function:PRE-
VideoObjectDetection',
        'TaskKeywords': [
            'Video Frame Object Detection',
        ],
        'TaskTitle': 'Video frame object detection task',
        'TaskDescription': 'Classify and identify the location of objects and people in
 video frames',
```

```
        'NumberOfHumanWorkersPerDataObject': 123,
        'TaskTimeLimitInSeconds': 123,
        'TaskAvailabilityLifetimeInSeconds': 123,
        'MaxConcurrentTaskCount': 123,
        'AnnotationConsolidationConfig': {
            'AnnotationConsolidationLambdaArn': 'arn:aws:lambda:us-
east-1:432418664414:function:ACS-VideoObjectDetection'
        },
    Tags=[
        {
            'Key': 'string',
            'Value': 'string'
        },
    ]
)
```

Create Video Frame Object Detection Adjustment or Verification Labeling Job

You can create an adjustment and verification labeling job using the Ground Truth console or `CreateLabelingJob` API. To learn more about adjustment and verification labeling jobs, and to learn how create one, see Verify and Adjust Labels.

Output Data Format

When you create a video frame object detection labeling job, tasks are sent to workers. When these workers complete their tasks, labels are written to the Amazon S3 output location you specified when you created the labeling job. To learn about the video frame object detection output data format, see Video Frame Object Detection Output. If you are a new user of Ground Truth, see Output Data to learn more about the Ground Truth output data format.

Video Frame Object Tracking

You can use the video frame object tracking task type to have workers track the movement of objects in a sequence of video frames (images extracted from a video) using bounding boxes, polylines, polygons or keypoint *annotation tools*. The tool you choose defines the video frame task type you create. For example, you can use a bounding box video frame object tracking task type to ask workers to track the movement of objects, such as cars, bikes, and pedestrians by drawing boxes around them.

You provide a list of categories, and each annotation that a worker adds to a video frame is identified as an *instance* of that category using an instance ID. For example, if you provide the label category car, the first car that a worker annotates will have the instance ID car:1. The second car

the worker annotates will have the instance ID car:2. To track an object's movement, the worker adds annotations associated with the same instance ID around to object in all frames.

You can create a video frame object tracking labeling job using the Amazon SageMaker Ground Truth console, the SageMaker API, and language-specific AWS SDKs. To learn more, see Create a Video Frame Object Detection Labeling Job and select your preferred method. See Task Types to learn more about the annotations tools you can choose from when you create a labeling job.

Ground Truth provides a worker UI and tools to complete your labeling job tasks: Preview the Worker UI.

You can create a job to adjust annotations created in a video object detection labeling job using the video object detection adjustment task type. To learn more, see Create Video Frame Object Detection Adjustment or Verification Labeling Job.

Preview the Worker UI

Ground Truth provides workers with a web user interface (UI) to complete your video frame object tracking annotation tasks. You can preview and interact with the worker UI when you create a labeling job in the console. If you are a new user, we recommend that you create a labeling job through the console using a small input dataset to preview the worker UI and ensure your video frames, labels, and label attributes appear as expected.

The UI provides workers with the following assistive labeling tools to complete your object tracking tasks:

- For all tasks, workers can use the **Copy to next** and **Copy to all** features to copy an annotation with the same unique ID to the next frame or to all subsequent frames respectively.
- For tasks that include the bounding box tools, workers can use a **Predict next** feature to draw a bounding box in a single frame, and then have Ground Truth predict the location of boxes with the same unique ID in all other frames. Workers can then make adjustments to correct predicted box locations.

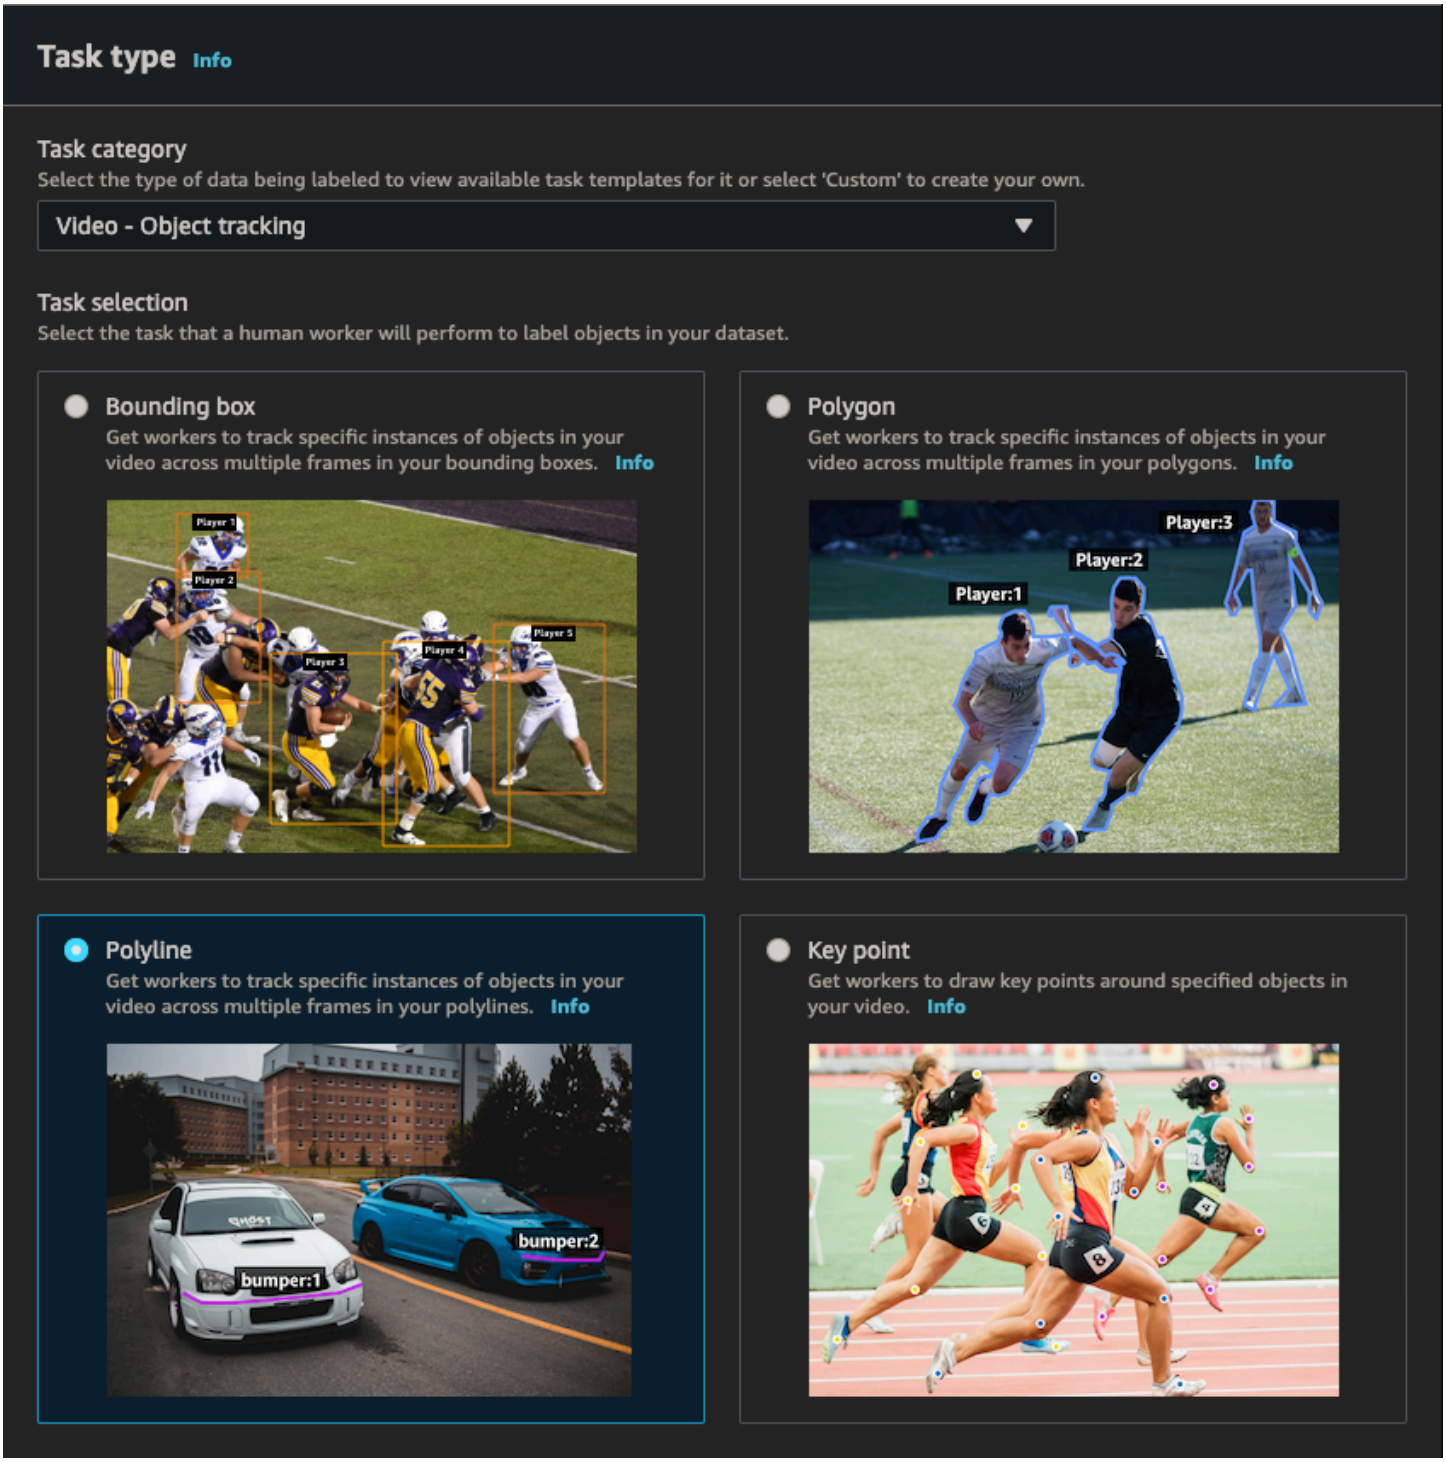
Create a Video Frame Object Tracking Labeling Job

You can create a video frame object tracking labeling job using the SageMaker console or the `CreateLabelingJob` API operation.

This section assumes that you have reviewed the Video Frame Labeling Job Overview and have chosen the type of input data and the input dataset connection you are using.

Create a Labeling Job (Console)

You can follow the instructions in Create a Labeling Job (Console) to learn how to create a video frame object tracking job in the SageMaker console. In step 10, choose **Video - Object tracking** from the **Task category** dropdown list. Select the task type you want by selecting one of the cards in **Task selection**.



Create a Labeling Job (API)

You create an object tracking labeling job using the SageMaker API operation `CreateLabelingJob`. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the **See Also** section of `CreateLabelingJob`.

Create a Labeling Job (API) provides an overview of the `CreateLabelingJob` operation. Follow these instructions and do the following while you configure your request:

- You must enter an ARN for `HumanTaskUiArn`. Use `arn:aws:sagemaker:<region>:394669845002:human-task-ui/VideoObjectTracking`. Replace *<region>* with the AWS Region in which you are creating the labeling job.

  Do not include an entry for the `UiTemplateS3Uri` parameter.
- Your `LabelAttributeName` must end in `-ref`. For example, *ot-labels*`-ref`.
- Your input manifest file must be a video frame sequence manifest file. You can create this manifest file using the SageMaker console, or create it manually and upload it to Amazon S3. For more information, see Input Data Setup. If you create a streaming labeling job, the input manifest file is optional.
- You can only use private or vendor work teams to create video frame object detection labeling jobs.
- You specify your labels, label category and frame attributes, the task type, and worker instructions in a label category configuration file. Specify the task type (bounding boxes, polylines, polygons or keypoint) using `annotationType` in your label category configuration file. For more information, see Create a Labeling Category Configuration File with Label Category and Frame Attributes to learn how to create this file.
- You need to provide pre-defined ARNs for the pre-annotation and post-annotation (ACS) Lambda functions. These ARNs are specific to the AWS Region you use to create your labeling job.
  - To find the pre-annotation Lambda ARN, refer to `PreHumanTaskLambdaArn`. Use the Region in which you are creating your labeling job to find the correct ARN that ends with `PRE-VideoObjectTracking`.
  - To find the post-annotation Lambda ARN, refer to `AnnotationConsolidationLambdaArn`. Use the Region in which you are creating your labeling job to find the correct ARN that ends with `ACS-VideoObjectTracking`.

- The number of workers specified in `NumberOfHumanWorkersPerDataObject` must be 1.
- Automated data labeling is not supported for video frame labeling jobs. Do not specify values for parameters in `LabelingJobAlgorithmsConfig`.
- Video frame object tracking labeling jobs can take multiple hours to complete. You can specify a longer time limit for these labeling jobs in `TaskTimeLimitInSeconds` (up to 7 days, or 604,800 seconds).

The following is an example of an AWS Python SDK (Boto3) request to create a labeling job in the US East (N. Virginia) Region.

```
response = client.create_labeling_job(
    LabelingJobName='example-video-ot-labeling-job,
    LabelAttributeName='label',
    InputConfig={
        'DataSource': {
            'S3DataSource': {
                'ManifestS3Uri': 's3://DOC-EXAMPLE-BUCKET/path/video-frame-sequence-
input-manifest.json'
            }
        },
        'DataAttributes': {
            'ContentClassifiers': [
                'FreeOfPersonallyIdentifiableInformation'|'FreeOfAdultContent',
            ]
        }
    },
    OutputConfig={
        'S3OutputPath': 's3://DOC-EXAMPLE-BUCKET/prefix/file-to-store-output-data',
        'KmsKeyId': 'string'
    },
    RoleArn='arn:aws:iam::*:role/*',
    LabelCategoryConfigS3Uri='s3://bucket/prefix/label-categories.json',
    StoppingConditions={
        'MaxHumanLabeledObjectCount': 123,
        'MaxPercentageOfInputDatasetLabeled': 123
    },
    HumanTaskConfig={
        'WorkteamArn': 'arn:aws:sagemaker:us-east-1:*:workteam/private-crowd/*',
        'UiConfig': {
            'HumanTaskUiArn: 'arn:aws:sagemaker:us-east-1:394669845002:human-task-ui/
VideoObjectTracking'
```

```
        },
        'PreHumanTaskLambdaArn': 'arn:aws:lambda:us-east-1:432418664414:function:PRE-
VideoObjectTracking',
        'TaskKeywords': [
            'Video Frame Object Tracking,
        ],
        'TaskTitle': 'Video frame object tracking task',
        'TaskDescription': Tracking the location of objects and people across video
 frames',
        'NumberOfHumanWorkersPerDataObject': 123,
        'TaskTimeLimitInSeconds': 123,
        'TaskAvailabilityLifetimeInSeconds': 123,
        'MaxConcurrentTaskCount': 123,
        'AnnotationConsolidationConfig': {
            'AnnotationConsolidationLambdaArn': 'arn:aws:lambda:us-
east-1:432418664414:function:ACS-VideoObjectTracking'
        },
    Tags=[
        {
            'Key': 'string',
            'Value': 'string'
        },
    ]
)
```

Create a Video Frame Object Tracking Adjustment or Verification Labeling Job

You can create an adjustment and verification labeling job using the Ground Truth console or `CreateLabelingJob` API. To learn more about adjustment and verification labeling jobs, and to learn how create one, see Verify and Adjust Labels.

Output Data Format

When you create a video frame object tracking labeling job, tasks are sent to workers. When these workers complete their tasks, labels are written to the Amazon S3 output location you specified when you created the labeling job. To learn about the video frame object tracking output data format, see Video Frame Object Tracking Output. If you are a new user of Ground Truth, see Output Data to learn more about the Ground Truth output data format.

Video Frame Labeling Job Overview

Use this page to learn about the object detection and object tracking video frame labeling jobs. The information on this page applies to both of these built-in task types.

The video frame labeling job is unique because of the following:

- You can either provide data objects that are ready to be annotated (video frames), or you can provide video files and have Ground Truth automatically extract video frames.
- Workers have the ability to save work as they go.
- You cannot use the Amazon Mechanical Turk workforce to complete your labeling tasks.
- Ground Truth provides a worker UI, as well as assistive and basic labeling tools, to help workers complete your tasks. You do not need to provide a worker task template.

Use the following topics to learn more.

Topics

Input Data

The video frame labeling job uses *sequences* of video frames. A single sequence is a series of images that have been extracted from a single video. You can either provide your own sequences of video frames, or have Ground Truth automatically extract video frame sequences from your video files. To learn more, see Provide Video Files.

Ground Truth uses sequence files to identify all images in a single sequence. All of the sequences that you want to include in a single labeling job are identified in an input manifest file. Each sequence is used to create a single worker task. You can automatically create sequence files and an input manifest file using Ground Truth automatic data setup. To learn more, see Automated Video Frame Input Data Setup.

To learn how to manually create sequence files and an input manifest file, see Create a Video Frame Input Manifest File.

Job Completion Times

Video and video frame labeling jobs can take workers hours to complete. You can set the total amount of time that workers can work on each task when you create a labeling job. The maximum time you can set for workers to work on tasks is 7 days. The default value is 3 days.

We strongly recommend that you create tasks that workers can complete within 12 hours. Workers must keep the worker UI open while working on a task. They can save work as they go and Ground Truth saves their work every 15 minutes.

When using the SageMaker `CreateLabelingJob` API operation, set the total time a task is available to workers in the `TaskTimeLimitInSeconds` parameter of `HumanTaskConfig`.

When you create a labeling job in the console, you can specify this time limit when you select your workforce type and your work team.

Task Types

When you create a video object tracking or video object detection labeling job, you specify the type of annotation that you want workers to create while working on your labeling task. The annotation type determines the type of output data Ground Truth returns and defines the *task type* for your labeling job.

If you are creating a labeling job using the API operation `CreateLabelingJob`, you specify the task type using the label category configuration file parameter `annotationType`. To learn more, see Create a Labeling Category Configuration File with Label Category and Frame Attributes.

The following task types are available for both video object tracking or video object detection labeling jobs:

- **Bounding box** – Workers are provided with tools to create bounding box annotations. A bounding box is a box that a worker draws around an objects to identify the pixel-location and label of that object in the frame.
- **Polyline** – Workers are provided with tools to create polyline annotations. A polyline is defined by the series of ordered x, y coordinates. Each point added to the polyline is connected to the previous point by a line. The polyline does not have to be closed (the start point and end point do not have to be the same) and there are no restrictions on the angles formed between lines.
- **Polygon** – Workers are provided with tools to create polygon annotations. A polygon is a closed shape defined by a series of ordered x, y coordinates. Each point added to the polygon

is connected to the previous point by a line and there are no restrictions on the angles formed between lines. Two lines (sides) of the polygon cannot cross. The start and end point of a polygon must be the same.

- **Keypoint** – Workers are provided with tools to create keypoint annotations. A keypoint is a single point associated with an x, y coordinate in the video frame.

Workforces

When you create a video frame labeling job, you need to specify a work team to complete your annotation tasks. You can choose a work team from a private workforce of your own workers, or from a vendor workforce that you select in the AWS Marketplace. You cannot use the Amazon Mechanical Turk workforce for video frame labeling jobs.

To learn more about vendor workforces, see Managing Vendor Workforces.

To learn how to create and manage a private workforce, see Use a Private Workforce.

Worker User Interface (UI)

Ground Truth provides a worker user interface (UI), tools, and assistive labeling features to help workers complete your video labeling tasks. You can preview the worker UI when you create a labeling job in the console.

When you create a labeling job using the API operation `CreateLabelingJob`, you must provide an ARN provided by Ground Truth in the parameter `HumanTaskUiArn` to specify the worker UI for your task type. You can use `HumanTaskUiArn` with the SageMaker `RenderUiTemplate` API operation to preview the worker UI.

You provide worker instructions, labels, and optionally, attributes that workers can use to provide more information about labels and video frames. These attributes are referred to as label category attributes and frame attributes respectively. They are all displayed in the worker UI.

Label Category and Frame Attributes

When you create a video object tracking or video object detection labeling job, you can add one or more *label category attributes* and *frame attributes*:

- **Label category attribute** – A list of options (strings), a free form text box, or a numeric field associated with one or more labels. It is used by workers to provide metadata about a label.

- **Frame attribute** – A list of options (strings), a free form text box, or a numeric field that appears on each video frame a worker is sent to annotate. It is used by workers to provide metadata about video frames.

Additionally, you can use label and frame attributes to have workers verify labels in a video frame label verification job.

Use the following sections to learn more about these attributes. To learn how to add label category and frame attributes to a labeling job, use the **Create Labeling Job** sections on the task type page of your choice.

Label Category Attributes

Add label category attributes to labels to give workers the ability to provide more information about the annotations they create. A label category attribute is added to an individual label, or to all labels. When a label category attribute is applied to all labels it is referred to as a *global label category attribute*.

For example, if you add the label category *car*, you might also want to capture additional data about your labeled cars, such as if they are occluded or the size of the car. You can capture this metadata using label category attributes. In this example, if you added the attribute *occluded* to the car label category, you can assign *partial*, *completely*, *no* to the *occluded* attribute and enable workers to select one of these options.

When you create a label verification job, you add labels category attributes to each label you want workers to verify.

Frame level Attributes

Add frame attributes to give workers the ability to provide more information about individual video frames. Each frame attribute you add appears on all frames.

For example, you can add a number-frame attribute to have workers identify the number of objects they see in a particular frame.

In another example, you may want to provide a free-form text box to give workers the ability to provide an answer to a question.

When you create a label verification job, you can add one or more frame attributes to ask workers to provide feedback on all labels in a video frame.

Worker Instructions

You can provide worker instructions to help your workers complete your video frame labeling tasks. You might want to cover the following topics when writing your instructions:

- Best practices and things to avoid when annotating objects.
- The label category attributes provided (for object detection and object tracking tasks) and how to use them.
- How to save time while labeling by using keyboard shortcuts.

You can add your worker instructions using the SageMaker console while creating a labeling job. If you create a labeling job using the API operation `CreateLabelingJob`, you specify worker instructions in your label category configuration file.

In addition to your instructions, Ground Truth provides a link to help workers navigate and use the worker portal. View these instructions by selecting the task type on Worker Instructions.

Declining Tasks

Workers are able to decline tasks.

Workers decline a task if the instructions are not clear, input data is not displaying correctly, or if they encounter some other issue with the task. If the number of workers per dataset object (`NumberOfHumanWorkersPerDataObject`) decline the task, the data object is marked as expired and will not be sent to additional workers.

Video Frame Job Permission Requirements

When you create a video frame labeling job, in addition to the permission requirements found in Assign IAM Permissions to Use Ground Truth, you must add a CORS policy to your S3 bucket that contains your input manifest file.

Add a CORS Permission Policy to S3 Bucket

When you create a video frame labeling job, you specify buckets in S3 where your input data and manifest file are located and where your output data will be stored. These buckets may be the same. You must attach the following Cross-origin resource sharing (CORS) policy to your input and output buckets. If you use the Amazon S3 console to add the policy to your bucket, you must use the JSON format.

JSON

```
[
    {
        "AllowedHeaders": [
            "*"
        ],
        "AllowedMethods": [
            "GET",
            "HEAD",
            "PUT"
        ],
        "AllowedOrigins": [
            "*"
        ],
        "ExposeHeaders": [
            "Access-Control-Allow-Origin"
        ],
        "MaxAgeSeconds": 3000
    }
]
```

XML

```
<?xml version="1.0" encoding="UTF-8"?>
<CORSConfiguration xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
<CORSRule>
    <AllowedOrigin>*</AllowedOrigin>
    <AllowedMethod>GET</AllowedMethod>
    <AllowedMethod>HEAD</AllowedMethod>
    <AllowedMethod>PUT</AllowedMethod>
    <MaxAgeSeconds>3000</MaxAgeSeconds>
    <ExposeHeader>Access-Control-Allow-Origin</ExposeHeader>
    <AllowedHeader>*</AllowedHeader>
</CORSRule>
</CORSConfiguration>
```

To learn how to add a CORS policy to an S3 bucket, see How do I add cross-domain resource sharing with CORS? in the Amazon Simple Storage Service User Guide.

Worker Instructions

This topic provides an overview of the Ground Truth worker portal and the tools available to complete your video frame labeling task. First, select the type of task you are working on from **Topics**.

> **Important**
>
> It is recommended that you complete your task using a Google Chrome or Firefox web browser.

For adjustment jobs, select the original labeling job task type that produced the labels you are adjusting. Review and adjust the labels in your task as needed.

Topics

Work on Video Frame Object Tracking Tasks

Video frame object tracking tasks require you to track the movement of objects across video frames. A video frame is a still image from a video scene.

You can use the worker UI to navigate between video frames and use the tools provided to identify unique objects and track their movement from one from to the next. Use this page to learn how to navigate your worker UI, use the tools provided, and complete your task.

It is recommended that you complete your task using a Google Chrome or Firefox web browser.

> **Important**
>
> If you see annotations have already been added to one or more video frames when you open your task, adjust those annotations and add additional annotations as needed.

Topics

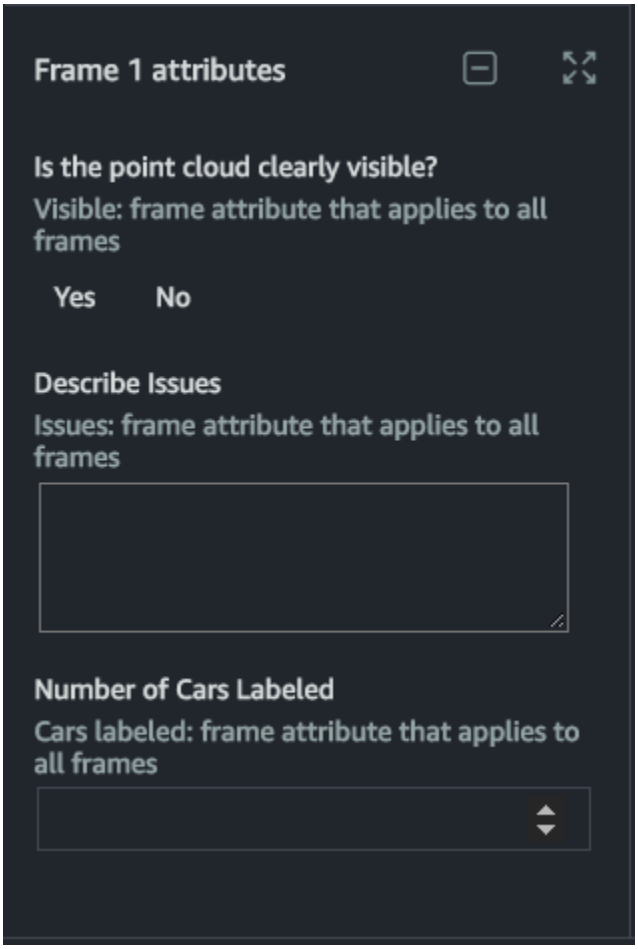
- Navigate the UI
- Bulk Edit Label and Frame Attributes
- Tool Guide
- Icons Guide
- Shortcuts
- Release, Stop and Resume, and Decline Tasks
- Saving Your Work and Submitting

Your Task

When you work on a video frame object tracking task, you need to select a category from the **Label category** menu on the right side of your worker portal to start annotating. After you've chosen a category, use the tools provided to annotate the objects that the category applies to. This annotation will be associated with a unique label ID that should only be used for that object. Use this same label ID to create additional annotations for the same object in all of the video frames that it appears in. Refer to Tool Guide to learn more about the tools provided.

After you've added a label, you may see a downward pointing arrow next to the label in the **Labels** menu. Select this arrow and then select one option for each label attribute you see to provide more information about that label.

You may see frame attributes under the **Labels** menu. These attributes will appear on each frame in your task. Use these attribute prompts to enter additional information about each frame.



After you've added a label, you can quickly add and edit a label category attribute value by using the downward pointing arrow next to the label in the **Labels** menu. If you select the pencil icon next to the label in the **Labels** menu, the **Edit instance** menu will appear. You can edit the label ID, label category, and label category attributes using this menu.

To edit an annotation, select the label of the annotation that you want to edit in the **Labels** menu or select the annotation in the frame. When you edit or delete an annotation, the action will only modify the annotation in a single frame.

If you are working on a task that includes a bounding box tool, use the predict next icon to predict the location of all bounding boxes that you have drawn in a frame in the next frame. If you select a single box and then select the predict next icon, only that box will be predicted in the next frame. If you have not added any boxes to the current frame, you will receive an error. You must add at least one box to the frame before using this feature.

After you've used the predict next icon, review the location of each box in the next frame and make adjustments to the box location and size if necessary.

For all other tools, you can use the **Copy to next** and **Copy to all** tools to copy your annotations to the next or all frames respectively.

Navigate the UI

You can navigate between video frames using the navigation bar in the bottom-left corner of your UI.

Use the play button to automatically move through the entire sequence of frames.

Use the next frame and previous frame buttons to move forward or back one frame at a time. You can also input a frame number to navigate to that frame.

You can zoom in to and out of all video frames. Once you have zoomed into a video frame, you can move around in that frame using the move icon. When you set a new view in a single video frame by zooming and moving within that frame, all video frames are set to the same view. You can reset all video frames to their original view using the fit screen icon. For additional view options, see Icons Guide.

When you are in the worker UI, you see the following menus:

- **Instructions** – Review these instructions before starting your task. Additionally, select **More instructions** and review these instructions.
- **Shortcuts** – Use this menu to view keyboard shortcuts that you can use to navigate video frames and use the tools provided.
- **Help** – Use this option to refer back to this documentation.

Bulk Edit Label and Frame Attributes

You can bulk edit label attributes and frame attributes (attributes).

When you bulk edit an attribute, you specify one or more ranges of frames that you want to apply the edit to. The attribute you select is edited in all frames in that range, including the start and end frames you specify. When you bulk edit label attributes, the range you specify *must* contain the label that the label attribute is attached to. If you specify frames that do not contain this label, you will receive an error.

To bulk edit an attribute you *must* specify the desired value for the attribute first. For example, if you want to change an attribute from *Yes* to *No*, you must select *No*, and then perform the bulk edit.

You can also specify a new value for an attribute that has not been filled in and then use the bulk edit feature to fill in that value in multiple frames. To do this, select the desired value for the attribute and complete the following procedure.

To bulk edit a label or attribute:

1. Use your mouse to right click the attribute you want to bulk edit.
2. Specify the range of frames you want to apply the bulk edit to using a dash (-) in the text box. For example, if you want to apply the edit to frames one through ten, enter `1-10`. If you want to apply the edit to frames two to five, eight to ten and twenty enter `2-5,8-10,20`.
3. Select **Confirm**.

If you get an error message, verify that you entered a valid range and that the label associated with the label attribute you are editing (if applicable) exists in all frames specified.

You can quickly add a label to all previous or subsequent frames using the **Duplicate to previous frames** and **Duplicate to next frames** options in the **Label** menu at the top of your screen.

Tool Guide

Your task will include one or more tools. The tool provided dictates the type of annotations you will create to identify and track objects. Use the following table to learn more about each tool provided.

Tool	Icon	Action	Description
Bounding box		Add a bounding box annotation.	Choose this icon to add a bounding box. Each bounding box you add is associate d with the category you choose from the Label category drop down menu. Select the bounding box or its associated label to adjust it.

Tool	Icon	Action	Description
Bounding box		Predict bounding boxes in the next frame.	Select a bounding box, and then choose this icon to predict the location of that box in the next frame. You can select the icon multiple times in a row to automatically detect the location of box in multiple frames. For example, select this icon 5 times to predict the location of a bounding box in the next 5 frames.
Keypoint		Add a keypoint annotation.	Choose this icon to add a keypoint. Click on an object the image to place the keypoint at that location. Each keypoint you add is associated with the category you choose from the Label category drop down menu. Select a keypoint or its associated label to adjust it.

Tool	Icon	Action	Description
Polyline		Add a polyline annotation.	Choose this icon to add a polyline. To add a polyline, continuously click around the object of interest to add new points. To stop drawing a polyline, select the last point that you placed a second time (this point will be green), or press **Enter** on your keyboard. Each point added to the polyline is connected to the previous point by a line. The polyline does not have to be closed (the start point and end point do not have to be the same) and there are no restrictions on the angles formed between lines. Each polyline you add is associated with the category you choose from the Label category drop down menu. Select

Tool	Icon	Action	Description
			the polyline or its associated label to adjust it.

Tool	Icon	Action	Description
Polygon		Add a polygon annotation.	Choose this icon to add a polygon. To add a polygon, continuously click around the object of interest to add new points. To stop drawing the polygon, select the start point (this point will be green). A polygon is a closed shape defined by a series of points that you place. Each point added to the polygon is connected to the previous point by a line and there are no restrictions on the angles formed between lines. The start and end point must be the same. Each polygon you add is associated with the category you choose from the Label category drop down menu. Select the polygon or its associated label to adjust it.

Tool	Icon	Action	Description
Copy to Next		Copy annotations to the next frame.	If one or more annotations are selected in the current frame, those annotations are copied to the next frame. If no annotations are selected, all annotations in the current frame will be copied to the next frame.
Copy to All		Copy annotations to all subsequent frames.	If one or more annotations are selected in the current frame, those annotations are copied to all subsequent frames. If no annotations are selected, all annotations in the current frame will be copied to all subsequent frames.

Icons Guide

Use this table to learn about the icons you see in your UI. You can automatically select some of these icons using the keyboard shortcuts found in the **Shortcuts** menu.

Icon	Action	Description
	brightness	Choose this icon to adjust the brightness of all video frames.
	contrast	Choose this icon to adjust the contrast of all video frames.
	zoom in	Choose this icon to zoom into all of the video frames.
	zoom out	Choose this icon to zoom out of all of the video frames.
	move screen	After you've zoomed into a video frame, choose this icon to move around in that video frame. You can move around the video frame using your mouse by clicking and dragging the frame in the direction you want it to move. This will change the view in all view frames.
	fit screen	Reset all video frames to their original position.
	undo	Undo an action. You can use this icon to remove a bounding box that you just added, or to undo an adjustment you made to a bounding box.
	redo	Redo an action that was undone using the undo icon.
	delete label	Delete a label. This will delete the bounding box associated with the label in a single frame.
	show or hide label	Select this icon to show a label that has been hidden. If this icon has a slash through it, select it to hide the label.

Icon	Action	Description
	edit label	Select this icon to open the **Edit instance** menu. Use this menu to edit a label category, ID, and to add or edit label attributes.

Shortcuts

The keyboard shortcuts listed in the **Shortcuts** menu can help you quickly select icons, undo and redo annotations, and use tools to add and edit annotations. For example, once you add a bounding box, you can use **P** to quickly predict the location of that box in subsequent frames.

Before you start your task, it is recommended that you review the **Shortcuts** menu and become acquainted with these commands.

Release, Stop and Resume, and Decline Tasks

When you open the labeling task, three buttons on the top right allow you to decline the task (**Decline task**), release it (**Release task**), and stop and resume it at a later time (**Stop and resume later**). The following list describes what happens when you select one of these options:

- **Decline task**: You should only decline a task if something is wrong with the task, such as unclear video frame images or an issue with the UI. If you decline a task, you will not be able to return to the task.
- **Release Task**: Use this option to release a task and allow others to work on it. When you release a task, you loose all work done on that task and other workers on your team can pick it up. If enough workers pick up the task, you may not be able to return to it. When you select this button and then select **Confirm**, you are returned to the worker portal. If the task is still available, its status will be **Available**. If other workers pick it up, it will disappear from your portal.
- **Stop and resume later**: You can use the **Stop and resume later** button to stop working and return to the task at a later time. You should use the **Save** button to save your work before you select **Stop and resume later**. When you select this button and then select **Confirm**, you are returned to the worker portal, and the task status is **Stopped**. You can select the same task to resume work on it.

  Be aware that the person that creates your labeling tasks specifies a time limit in which all tasks much be completed by. If you do not return to and complete this task within that time

limit, it will expire and your work will not be submitted. Contact your administrator for more information.

Saving Your Work and Submitting

You should periodically save your work using the **Save** button. Ground Truth will automatically save your work ever 15 minutes.

When you open a task, you must complete your work on it before pressing **Submit**.

Work on Video Frame Object Detection Tasks

Video frame object detection tasks required you to classify and identify the location of objects in video frames using annotations. A video frame is a still image from a video scene.

You can use the worker UI to navigate between video frames and create annotations to identify objects of interest. Use the sections on this page to learn how to navigate your worker UI, use the tools provided, and complete your task.

It is recommended that you complete your task using a Google Chrome web browser.

> **Important**
>
> If you see annotations have already been added to one or more video frames when you open your task, adjust those annotations and add additional annotations as needed.

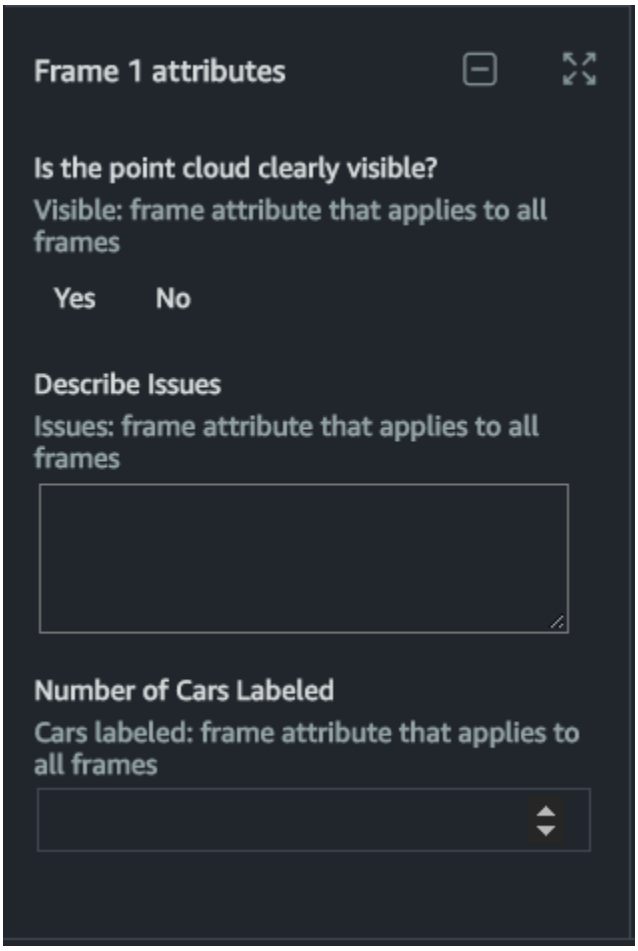
Topics

Your Task

When you work on a video frame object detection task, you need to select a category from the **Label category** menu on the right side of your worker portal to start annotating. After you've chosen a category, draw annotations around objects that this category applies to. To learn more about the tools you see in your worker UI, refer to the Tool Guide.

After you've added a label, you may see a downward pointing arrow next to the label in the **Labels** menu. Select this arrow and then select one option for each label attribute you see to provide more information about that label.

You may see frame attributes under the **Labels** menu. These attributes will appear on each frame in your task. Use these attribute prompts to enter additional information about each frame.



To edit an annotation, select the label of the annotation that you want to edit in the **Labels** menu or select the annotation in the frame. When you edit or delete an annotation, the action will only modify the annotation in a single frame.

If you are working on a task that includes a bounding box tool, use the predict next icon to predict the location of all bounding boxes that you have drawn in a frame in the next frame. If you select a single box and then select the predict next icon, only that box will be predicted in the next frame. If you have not added any boxes to the current frame, you will receive an error. You must add at least one box to the frame before using this feature.

> **Note**
>
> The predict next feature will not overwrite manually created annotations. It will only add annotations. If you use predict next and as a result have more than one bounding box around a single object, delete all but one box. Each object should only be identified with a single box.

After you've used the predict next icon, review the location of each box in the next frame and make adjustments to the box location and size if necessary.

For all other tools, you can use the **Copy to next** and **Copy to all** tools to copy your annotations to the next or all frames respectively.

Navigate the UI

You can navigate between video frames using the navigation bar in the bottom-left corner of your UI.

Use the play button to automatically play through multiple frames.

Use the next frame and previous frame buttons to move forward or back one frame at a time. You can also input a frame number to navigate to that frame.

You can zoom in to and out of all video frames. Once you have zoomed into a video frame, you can move around in that frame using the move icon. When you navigate to a new view in a single video frame by zooming and moving within that frame, all video frames are set to the same view. You can reset all video frames to their original view using the fit screen icon. To learn more, see UI Icon Guide.

When you are in the worker UI, you see the following menus:

- **Instructions** – Review these instructions before starting your task. Additionally, select **More instructions** and review these instructions.

- **Shortcuts** – Use this menu to view keyboard shortcuts that you can use to navigate video frames and use the annotation tools provided.
- **Help** – Use this option to refer back to this documentation.

If you

Bulk Edit Label and Frame Attributes

You can bulk edit label attributes and frame attributes (attributes).

When you bulk edit an attribute, you specify one or more ranges of frames that you want to apply the edit to. The attribute you select is edited in all frames in that range, including the start and end frames you specify. When you bulk edit label attributes, the range you specify *must* contain the label that the label attribute is attached to. If you specify frames that do not contain this label, you will receive an error.

To bulk edit an attribute you *must* specify the desired value for the attribute first. For example, if you want to change an attribute from *Yes* to *No*, you must select *No*, and then perform the bulk edit.

You can also specify a new value for an attribute that has not been filled in and then use the bulk edit feature to fill in that value in multiple frames. To do this, select the desired value for the attribute and complete the following procedure.

To bulk edit a label or attribute:

1. Use your mouse to right click the attribute you want to bulk edit.
2. Specify the range of frames you want to apply the bulk edit to using a dash (`-`) in the text box. For example, if you want to apply the edit to frames one through ten, enter `1-10`. If you want to apply the edit to frames two to five, eight to ten and twenty enter `2-5,8-10,20`.
3. Select **Confirm**.

If you get an error message, verify that you entered a valid range and that the label associated with the label attribute you are editing (if applicable) exists in all frames specified.

You can quickly add a label to all previous or subsequent frames using the **Duplicate to previous frames** and **Duplicate to next frames** options in the **Label** menu at the top of your screen.

Tool Guide

Your task will include one or more tools. The tool provided dictates the type of annotations you will create to identify and label objects. Use the following table to learn more about the tool or tools you may see in your worker UI.

Tool	Icon	Action	Description
Bounding box		Add a bounding box annotation.	Choose this icon to add a bounding box. Each bounding box you add is associate d with the category you choose from the Label category drop down menu. Select the bounding box or its associated label to adjust it.
Predict next		Predict bounding boxes in the next frame.	Select a bounding box, and then choose this icon to predict the location of that box in the next frame. You can select the icon multiple times in a row to automatically detect the location of box in multiple frames. For example, select this icon 5 times to predict the location of a bounding box in the next 5 frames.

Tool	Icon	Action	Description
Keypoint		Add a keypoint annotation.	Choose this icon to add a keypoint. Click on an object the image to place the keypoint at that location. Each keypoint you add is associated with the category you choose from the Label category drop down menu. Select a keypoint or its associated label to adjust it.

Tool	Icon	Action	Description
Polyline		Add a polyline annotation.	Choose this icon to add a polyline. To add a polyline, continuously click around the object of interest to add new points. To stop drawing a polyline, select the last point that you placed a second time (this point will be green), or press **Enter** on your keyboard. Each point added to the polyline is connected to the previous point by a line. The polyline does not have to be closed (the start point and end point do not have to be the same) and there are no restrictions on the angles formed between lines. Each polyline you add is associated with the category you choose from the Label category drop down menu. Select

Tool	Icon	Action	Description
			the polyline or its associated label to adjust it.

Tool	Icon	Action	Description
Polygon		Add a polygon annotation.	Choose this icon to add a polygon. To add a polygon, continuously click around the object of interest to add new points. To stop drawing the polygon, select the start point (this point will be green). A polygon is a closed shape defined by a series of points that you place. Each point added to the polygon is connected to the previous point by a line and there are no restrictions on the angles formed between lines. Two lines (sides) of the polygon cannot cross. A line will become red if it violates this condition. The start and end point must be the same. Each polygon you add is associated with the category you choose from the

Tool	Icon	Action	Description
			Label category drop down menu. Select the polygon or its associated label to adjust it.
Copy to Next		Copy annotations to the next frame.	If one or more annotations are selected in the current frame, those annotations are copied to the next frame. If no annotations are selected, all annotations in the current frame will be copied to the next frame.
Copy to All		Copy annotations to all subsequent frames.	If one or more annotations are selected in the current frame, those annotations are copied to all subsequent frames. If no annotations are selected, all annotations in the current frame will be copied to all subsequent frames.

UI Icon Guide

Use this table to learn about the icons you see in your worker task portal. You can automatically select these icons using the keyboard shortcuts found in the **Shortcuts** menu.

Icon		Description
	brightness	Choose this icon to adjust the brightness of all video frames.
	contrast	Choose this icon to adjust the contrast of all video frames.
	zoom in	Choose this icon to zoom into all of the video frames.
	zoom out	Choose this icon to zoom out of all of the video frames.
	move screen	After you've zoomed into a video frame, choose this icon to move around in that video frame. You can move around in the video frame using your mouse by clicking and dragging the frame in the direction you want it to move. This will change the view in all view frames.
	fit screen	Reset all video frames to their original position.
	undo	Undo an action. You can use this icon to remove a bounding box that you just added, or to undo an adjustment you made to a bounding box.
	redo	Redo an action that was undone using the undo icon.

Icon		Description
	delete label	Delete a label. This will delete the bounding box associated with the label in a single frame.
	show or hide label	Select this icon to show a label that has been hidden. If this icon has a slash through it, select it to hide the label.

Shortcuts

The keyboard shortcuts listed in the **Shortcuts** menu can help you quickly select icons, undo and redo annotations, and use tools to add and edit annotations. For example, once you add a bounding box, you can use **P** to quickly predict the location of that box in subsequent frames.

Before you start your task, it is recommended that you review the **Shortcuts** menu and become acquainted with these commands.

Release, Stop and Resume, and Decline Tasks

When you open the labeling task, three buttons on the top right allow you to decline the task (**Decline task**), release it (**Release task**), and stop and resume it at a later time (**Stop and resume later**). The following list describes what happens when you select one of these options:

- **Decline task**: You should only decline a task if something is wrong with the task, such as unclear video frame images or an issue with the UI. If you decline a task, you will not be able to return to the task.
- **Release Task**: Use this option to release a task and allow others to work on it. When you release a task, you loose all work done on that task and other workers on your team can pick it up. If enough workers pick up the task, you may not be able to return to it. When you select this button and then select **Confirm**, you are returned to the worker portal. If the task is still available, its status will be **Available**. If other workers pick it up, it will disappear from your portal.
- **Stop and resume later**: You can use the **Stop and resume later** button to stop working and return to the task at a later time. You should use the **Save** button to save your work before you select **Stop and resume later**. When you select this button and then select **Confirm**, you are returned to the worker portal, and the task status is **Stopped**. You can select the same task to resume work on it.

Be aware that the person that creates your labeling tasks specifies a time limit in which all tasks much be completed by. If you do not return to and complete this task within that time limit, it will expire and your work will not be submitted. Contact your administrator for more information.

Saving Your Work and Submitting

You should periodically save your work. Ground Truth automatically saves your work every 15 minutes.

When you open a task, you must complete your work before pressing **Submit**.

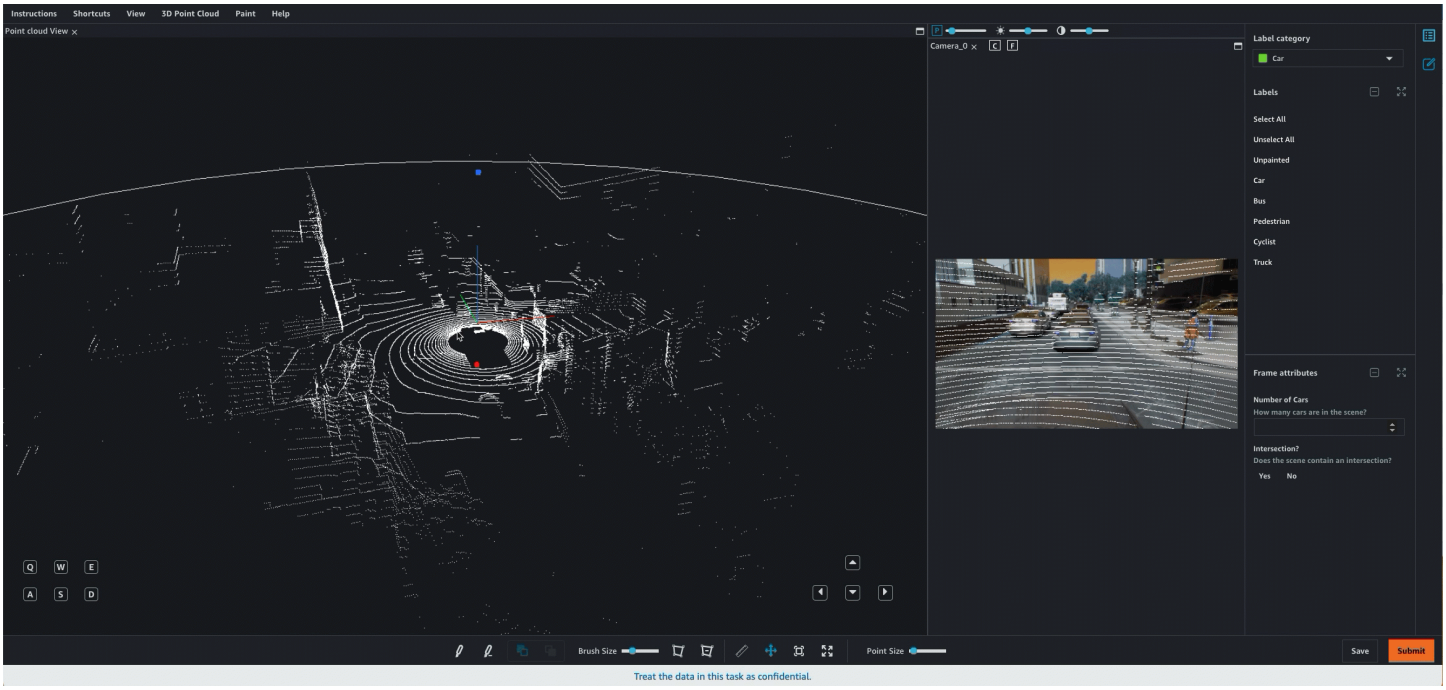
Use Ground Truth to Label 3D Point Clouds

Create a 3D point cloud labeling job to have workers label objects in 3D point clouds generated from 3D sensors like Light Detection and Ranging (LiDAR) sensors and depth cameras, or generated from 3D reconstruction by stitching images captured by an agent like a drone.

3D Point Clouds

Point clouds are made up of three-dimensional (3D) visual data that consists of points. Each point is described using three coordinates, typically `x`, `y`, and `z`. To add color or variations in point intensity to the point cloud, points may be described with additional attributes, such as `i` for intensity or values for the red (`r`), green (g), and blue (b) 8-bit color channels. When you create a Ground Truth 3D point cloud labeling job, you can provide point cloud and, optionally, sensor fusion data.

The following image shows a single, 3D point cloud scene rendered by Ground Truth and displayed in the semantic segmentation worker UI.



LiDAR

A Light Detection and Ranging (LiDAR) sensor is a common type of sensor used to collect measurements that are used to generate point cloud data. LiDAR is a remote sensing method that uses light in the form of a pulsed laser to measure the distances of objects from the sensor. You can provide 3D point cloud data generated from a LiDAR sensor for a Ground Truth 3D point cloud labeling job using the raw data formats described in Accepted Raw 3D Data Formats.

Sensor Fusion

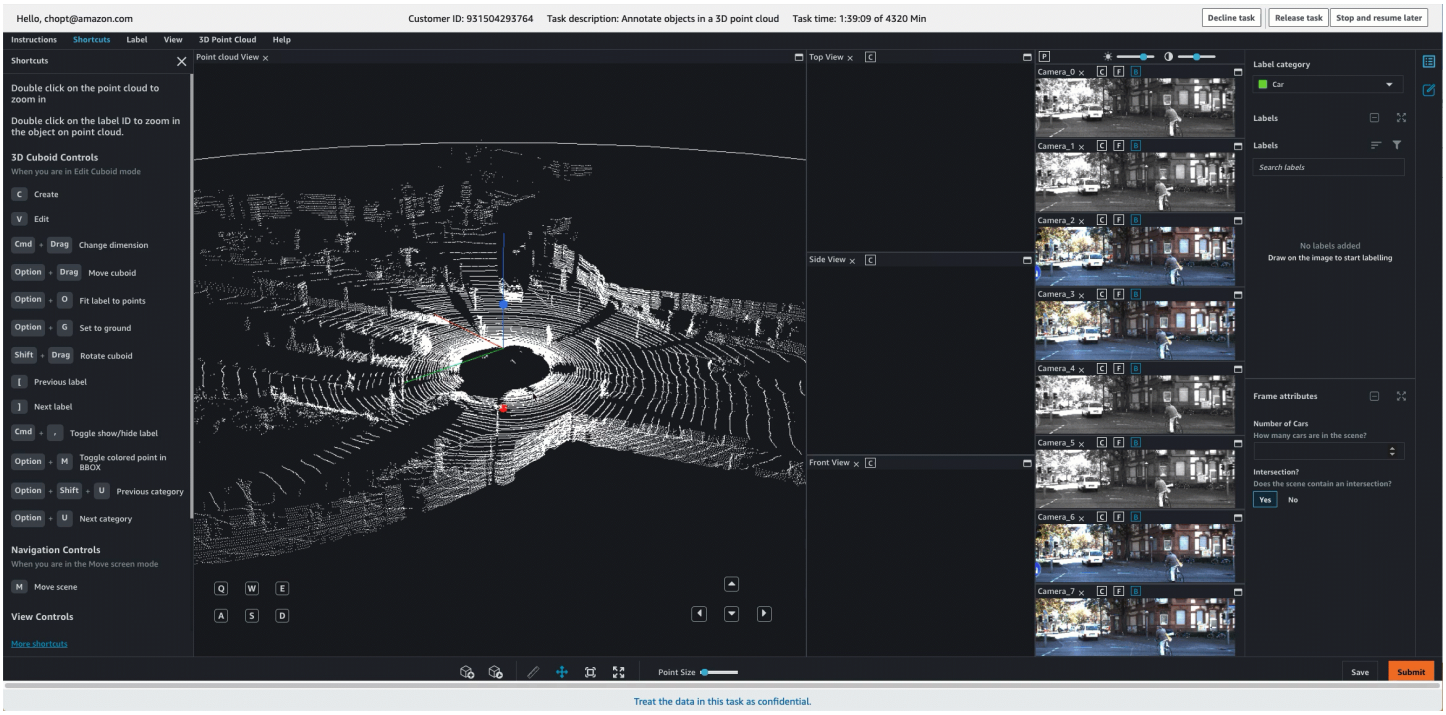
Ground Truth 3D point cloud labeling jobs include a sensor fusion feature that supports video camera sensor fusion for all task types. Some sensors come with multiple LiDAR devices and video cameras that capture images and associate them with a LiDAR frame. To help annotators visually complete your tasks with high confidence, you can use the Ground Truth sensor fusion feature to project annotations (labels) from a 3D point cloud to 2D camera images and vice versa using 3D scanner (such as LiDAR) extrinsic matrix and camera extrinsic and intrinsic matrices. To learn more, see Sensor Fusion.

Label 3D Point Clouds

Ground Truth provides a user interface (UI) and tools that workers use to label or *annotate* 3D point clouds. When you use the object detection or semantic segmentation task types, workers can

annotate a single point cloud frame. When you use object tracking, workers annotate a sequence of frames. You can use object tracking to track object movement across all frames in a sequence.

The following demonstrates how a worker would use the Ground Truth worker portal and tools to annotate a 3D point cloud for an object detection task. For similar visual examples of other task types, see 3D Point Cloud Task types.



Assistive Labeling Tools for Point Cloud Annotation

Ground Truth offers assistive labeling tools to help workers complete your point cloud annotation tasks faster and with more accuracy. For details about assistive labeling tools that are included in the worker UI for each task type, select a task type and refer to the **View the Worker Task Interface** section of that page.

Next Steps

You can create six types of tasks when you use Ground Truth 3D point cloud labeling jobs. Use the topics in 3D Point Cloud Task types to learn more about these *task types* and to learn how to create a labeling job using the task type of your choice.

The 3D point cloud labeling job is different from other Ground Truth labeling modalities. Before creating a labeling job, we recommend that you read 3D Point Cloud Labeling Jobs Overview. Additionally, review input data quotas in 3D Point Cloud and Video Frame Labeling Job Quotas.

For an end-to-end demo using the SageMaker API and AWS Python SDK (boto 3) to create a 3D point cloud labeling job, see create-3D-pointcloud-labeling-job.ipynb in the SageMaker Examples notebook tab.

> **Important**
>
> If you use a notebook instance created before June 5th, 2020 to run this notebook, you must stop and restart that notebook instance for the notebook to work.

Topics

3D Point Cloud Task types

You can use Ground Truth 3D point cloud labeling modality for a variety of use cases. The following list briefly describes each 3D point cloud task type. For additional details and instructions on how to create a labeling job using a specific task type, select the task type name to see its task type page.

- 3D point cloud object detection – Use this task type when you want workers to locate and classify objects in a 3D point cloud by adding and fitting 3D cuboids around objects.
- 3D point cloud object tracking – Use this task type when you want workers to add and fit 3D cuboids around objects to track their movement across a sequence of 3D point cloud frames. For example, you can use this task type to ask workers to track the movement of vehicles across multiple point cloud frames.
- 3D point cloud semantic segmentation – Use this task type when you want workers to create a point-level semantic segmentation mask by painting objects in a 3D point cloud using different colors where each color is assigned to one of the classes you specify.
- 3D point cloud adjustment task types – Each of the task types above has an associated *adjustment* task type that you can use to audit and adjust annotations generated from a 3D point cloud labeling job. Refer to the task type page of the associated type to learn how to create an adjustment labeling job for that task.

3D Point Cloud Object Detection

Use this task type when you want workers to classify objects in a 3D point cloud by drawing 3D cuboids around objects. For example, you can use this task type to ask workers to identify different types of objects in a point cloud, such as cars, bikes, and pedestrians.

For this task type, the *data object* that workers label is a single point cloud frame. Ground Truth renders a 3D point cloud using point cloud data you provide. You can also provide camera data to give workers more visual information about scenes in the frame, and to help workers draw 3D cuboids around objects.

Ground Truth providers workers with tools to annotate objects with 9 degrees of freedom (x,y,z,rx,ry,rz,l,w,h) in three dimensions in both 3D scene and projected side views (top, side, and back). If you provide sensor fusion information (like camera data), when a worker adds a cuboid to identify an object in the 3D point cloud, the cuboid shows up and can be modified in the 2D images. After a cuboid has been added, all edits made to that cuboid in the 2D or 3D scene are projected into the other view.

You can create a job to adjust annotations created in a 3D point cloud object detection labeling job using the 3D point cloud object detection adjustment task type.

If you are a new user of the Ground Truth 3D point cloud labeling modality, we recommend you review 3D Point Cloud Labeling Jobs Overview. This labeling modality is different from other Ground Truth task types, and this page provides an overview of important details you should be aware of when creating a 3D point cloud labeling job.

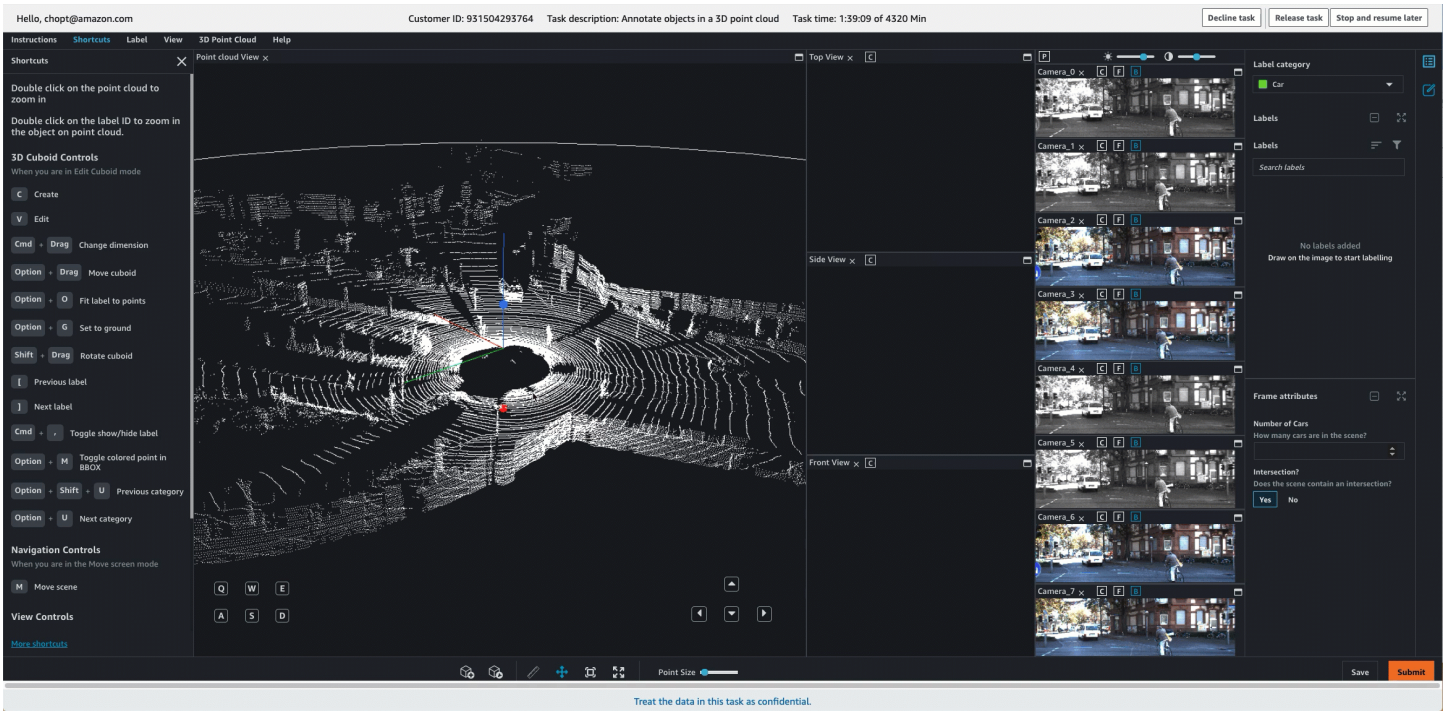
Topics

View the Worker Task Interface

Ground Truth provides workers with a web portal and tools to complete your 3D point cloud object detection annotation tasks. When you create the labeling job, you provide the Amazon Resource Name (ARN) for a pre-built Ground Truth worker UI in the `HumanTaskUiArn` parameter. When you

create a labeling job using this task type in the console, this worker UI is automatically used. You can preview and interact with the worker UI when you create a labeling job in the console. If you are a new user, it is recommended that you create a labeling job using the console to ensure your label attributes, point cloud frames, and if applicable, images, appear as expected.

The following is a GIF of the 3D point cloud object detection worker task interface. If you provide camera data for sensor fusion in the world coordinate system, images are matched up with scenes in the point cloud frame. These images appear in the worker portal as shown in the following GIF.

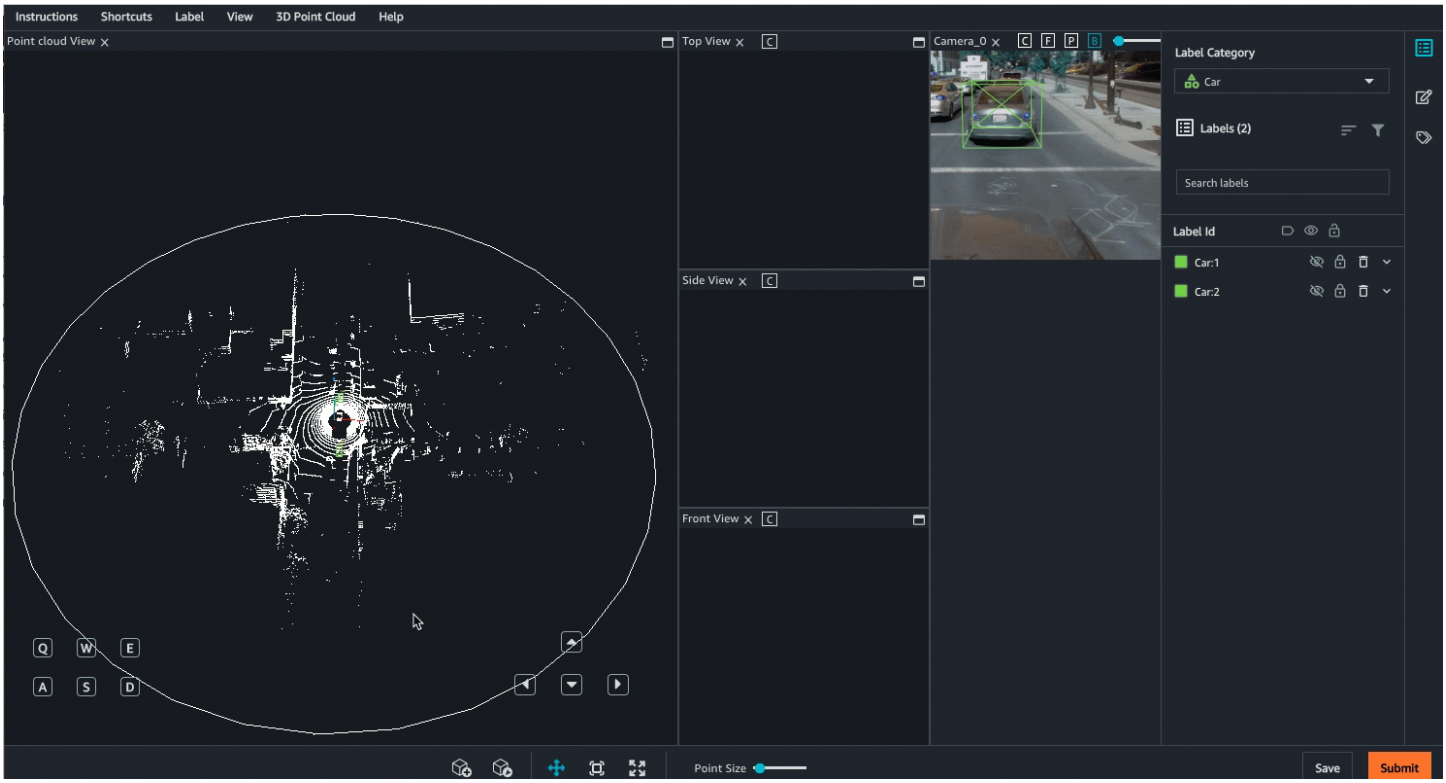


Worker can navigate in the 3D scene using their keyboard and mouse. They can:

- Double click on specific objects in the point cloud to zoom into them.
- Use a mouse-scroller or trackpad to zoom in and out of the point cloud.
- Use both keyboard arrow keys and Q, E, A, and D keys to move Up, Down, Left, Right. Use keyboard keys W and S to zoom in and out.

Once a worker places a cuboid in the 3D scene, a side-view will appear with the three projected side views: top, side, and back. These side-views show points in and around the placed cuboid and help workers refine cuboid boundaries in that area. Workers can zoom in and out of each of those side-views using their mouse.

The following video demonstrates movements around the 3D point cloud and in the side-view.



Additional view options and features are available in the **View** menu in the worker UI. See the worker instruction page for a comprehensive overview of the Worker UI.

Assistive Labeling Tools

Ground Truth helps workers annotate 3D point clouds faster and more accurately using machine learning and computer vision powered assistive labeling tools for 3D point cloud object tracking tasks. The following assistive labeling tools are available for this task type:

- **Snapping** – Workers can add a cuboid around an object and use a keyboard shortcut or menu option to have Ground Truth's autofit tool snap the cuboid tightly around the object.
- **Set to ground** – After a worker adds a cuboid to the 3D scene, the worker can automatically snap the cuboid to the ground. For example, the worker can use this feature to snap a cuboid to the road or sidewalk in the scene.
- **Multi-view labeling** – After a worker adds a 3D cuboid to the 3D scene, a side panel displays front, side, and top perspectives to help the worker adjust the cuboid tightly around the object. In all of these views, the cuboid includes an arrow that indicates the orientation, or heading of the object. When the worker adjusts the cuboid, the adjustment will appear in real time on all of the views (that is, 3D, top, side, and front).

- **Sensor fusion** – If you provide data for sensor fusion, workers can adjust annotations in the 3D scenes and in 2D images, and the annotations will be projected into the other view in real time. Additionally, workers will have the option to view the direction the camera is facing and the camera frustum.
- **View options** – Enables workers to easily hide or view cuboids, label text, a ground mesh, and additional point attributes like color or intensity. Workers can also choose between perspective and orthogonal projections.

Create a 3D Point Cloud Object Detection Labeling Job

You can create a 3D point cloud labeling job using the SageMaker console or API operation, `CreateLabelingJob`. To create a labeling job for this task type you need the following:

- A single-frame input manifest file. To learn how to create this type of manifest file, see Create a Point Cloud Frame Input Manifest File. If you are a new user of Ground Truth 3D point cloud labeling modalities, you may also want to review Accepted Raw 3D Data Formats.
- A work team from a private or vendor workforce. You cannot use Amazon Mechanical Turk for video frame labeling jobs. To learn how to create workforces and work teams, see Create and Manage Workforces.

Additionally, make sure that you have reviewed and satisfied the Assign IAM Permissions to Use Ground Truth.

Use one of the following sections to learn how to create a labeling job using the console or an API.

Create a Labeling Job (Console)

You can follow the instructions Create a Labeling Job (Console) in order to learn how to create a 3D point cloud object detection labeling job in the SageMaker console. While you are creating your labeling job, be aware of the following:

- Your input manifest file must be a single-frame manifest file. For more information, see Create a Point Cloud Frame Input Manifest File.
- Optionally, you can provide label category and frame attributes. Workers can assign one or more of these attributes to annotations to provide more information about that object. For example, you might want to use the attribute *occluded* to have workers identify when an object is partially obstructed.

- Automated data labeling and annotation consolidation are not supported for 3D point cloud labeling tasks.
- 3D point cloud object detection labeling jobs can take multiple hours to complete. You can specify a longer time limit for these labeling jobs when you select your work team (up to 7 days, or 604800 seconds).

Create a Labeling Job (API)

This section covers details you need to know when you create a labeling job using the SageMaker API operation `CreateLabelingJob`. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the **See Also** section of `CreateLabelingJob`.

Create a Labeling Job (API), provides an overview of the `CreateLabelingJob` operation. Follow these instructions and do the following while you configure your request:

- You must enter an ARN for `HumanTaskUiArn`. Use `arn:aws:sagemaker:<region>:394669845002:human-task-ui/PointCloudObjectDetection`. Replace *<region>* with the AWS Region you are creating the labeling job in.

  There should not be an entry for the `UiTemplateS3Uri` parameter.
- Your input manifest file must be a single-frame manifest file. For more information, see Create a Point Cloud Frame Input Manifest File.
- You specify your labels, label category and frame attributes, and worker instructions in a label category configuration file. To learn how to create this file, see Create a Labeling Category Configuration File with Label Category and Frame Attributes.
- You need to provide pre-defined ARNs for the pre-annotation and post-annotation (ACS) Lambda functions. These ARNs are specific to the AWS Region you use to create your labeling job.
  - To find the pre-annotation Lambda ARN, refer to `PreHumanTaskLambdaArn`. Use the Region you are creating your labeling job in to find the correct ARN. For example, if you are creating your labeling job in us-east-1, the ARN will be `arn:aws:lambda:us-east-1:432418664414:function:PRE-3DPointCloudObjectDetection`.
  - To find the post-annotation Lambda ARN, refer to `AnnotationConsolidationLambdaArn`. Use the Region you are creating your labeling job in to find the correct ARN. For example,

if you are creating your labeling job in us-east-1, the ARN will be `arn:aws:lambda:us-east-1:432418664414:function:ACS-3DPointCloudObjectDetection`.

- The number of workers specified in `NumberOfHumanWorkersPerDataObject` must be 1.
- Automated data labeling is not supported for 3D point cloud labeling jobs. You should not specify values for parameters in `LabelingJobAlgorithmsConfig`.
- 3D point cloud object detection labeling jobs can take multiple hours to complete. You can specify a longer time limit for these labeling jobs in `TaskTimeLimitInSeconds` (up to 7 days, or 604,800 seconds).

Create a 3D Point Cloud Object Detection Adjustment or Verification Labeling Job

You can create an adjustment or verification labeling job using the Ground Truth console or `CreateLabelingJob` API. To learn more about adjustment and verification labeling jobs, and to learn how create one, see Verify and Adjust Labels.

When you create an adjustment labeling job, your input data to the labeling job can include labels, and yaw, pitch, and roll measurements from a previous labeling job or external source. In the adjustment job, pitch, and roll will be visualized in the worker UI, but cannot be modified. Yaw is adjustable.

Ground Truth uses Tait-Bryan angles with the following intrinsic rotations to visualize yaw, pitch and roll in the worker UI. First, rotation is applied to the vehicle according to the z-axis (yaw). Next, the rotated vehicle is rotated according to the intrinsic y'-axis (pitch). Finally, the vehicle is rotated according to the intrinsic x''-axis (roll).

Output Data Format

When you create a 3D point cloud object detection labeling job, tasks are sent to workers. When these workers complete their tasks, labels are written to the Amazon S3 bucket you specified when you created the labeling job. The output data format determines what you see in your Amazon S3 bucket when your labeling job status (LabelingJobStatus) is `Completed`.

If you are a new user of Ground Truth, see Output Data to learn more about the Ground Truth output data format. To learn about the 3D point cloud object detection output data format, see 3D Point Cloud Object Detection Output.

3D Point Cloud Object Tracking

Use this task type when you want workers to add and fit 3D cuboids around objects to track their movement across 3D point cloud frames. For example, you can use this task type to ask workers to track the movement of vehicles across multiple point cloud frames.

For this task type, the data object that workers label is a sequence of point cloud frames. A *sequence* is defined as a temporal series of point cloud frames. Ground Truth renders a series of 3D point cloud visualizations using a sequence you provide and workers can switch between these 3D point cloud frames in the worker task interface.

Ground Truth providers workers with tools to annotate objects with 9 degrees of freedom: (x,y,z,rx,ry,rz,l,w,h) in three dimensions in both 3D scene and projected side views (top, side, and back). When a worker draws a cuboid around an object, that cuboid is given a unique ID, for example `Car:1` for one car in the sequence and `Car:2` for another. Workers use that ID to label the same object in multiple frames.

You can also provide camera data to give workers more visual information about scenes in the frame, and to help workers draw 3D cuboids around objects. When a worker adds a 3D cuboid to identify an object in either the 2D image or the 3D point cloud, and the cuboid shows up in the other view.

You can adjust annotations created in a 3D point cloud object detection labeling job using the 3D point cloud object tracking adjustment task type.

If you are a new user of the Ground Truth 3D point cloud labeling modality, we recommend you review 3D Point Cloud Labeling Jobs Overview. This labeling modality is different from other Ground Truth task types, and this page provides an overview of important details you should be aware of when creating a 3D point cloud labeling job.

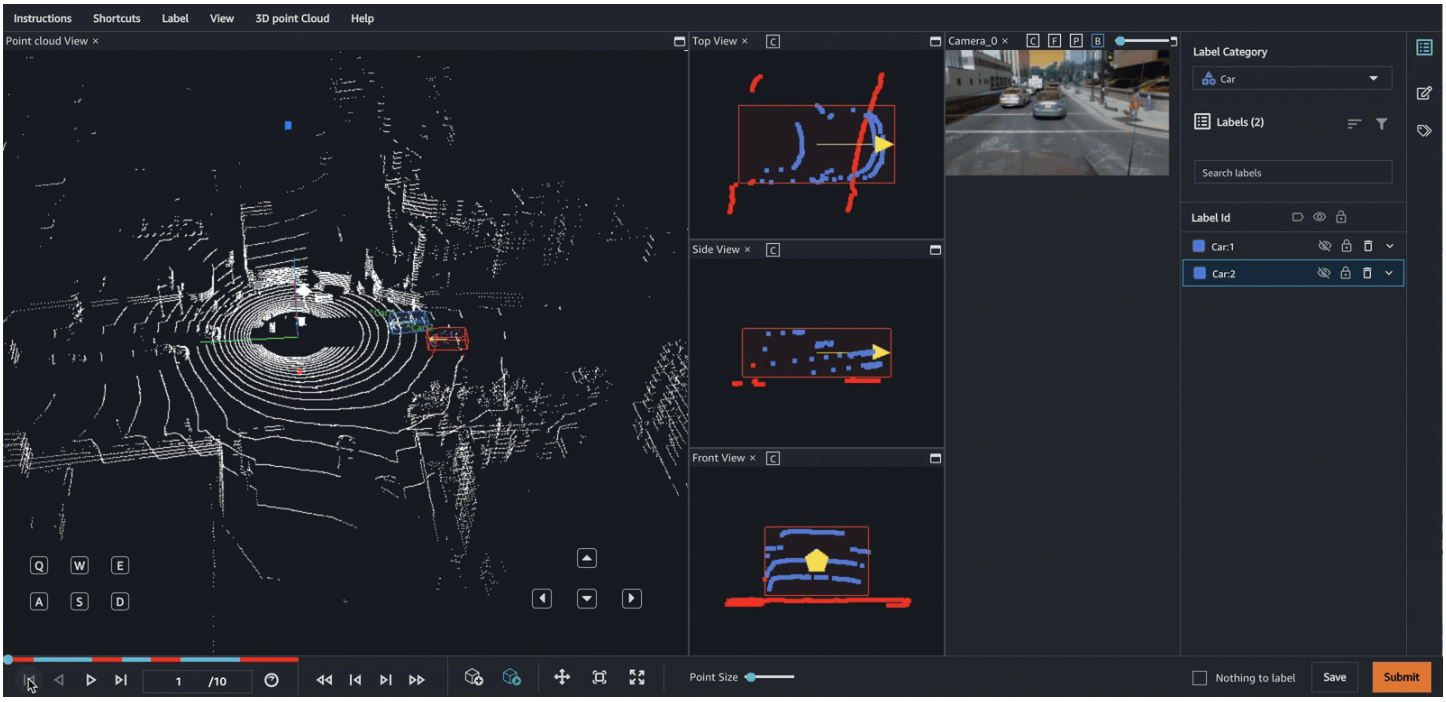
Topics

View the Worker Task Interface

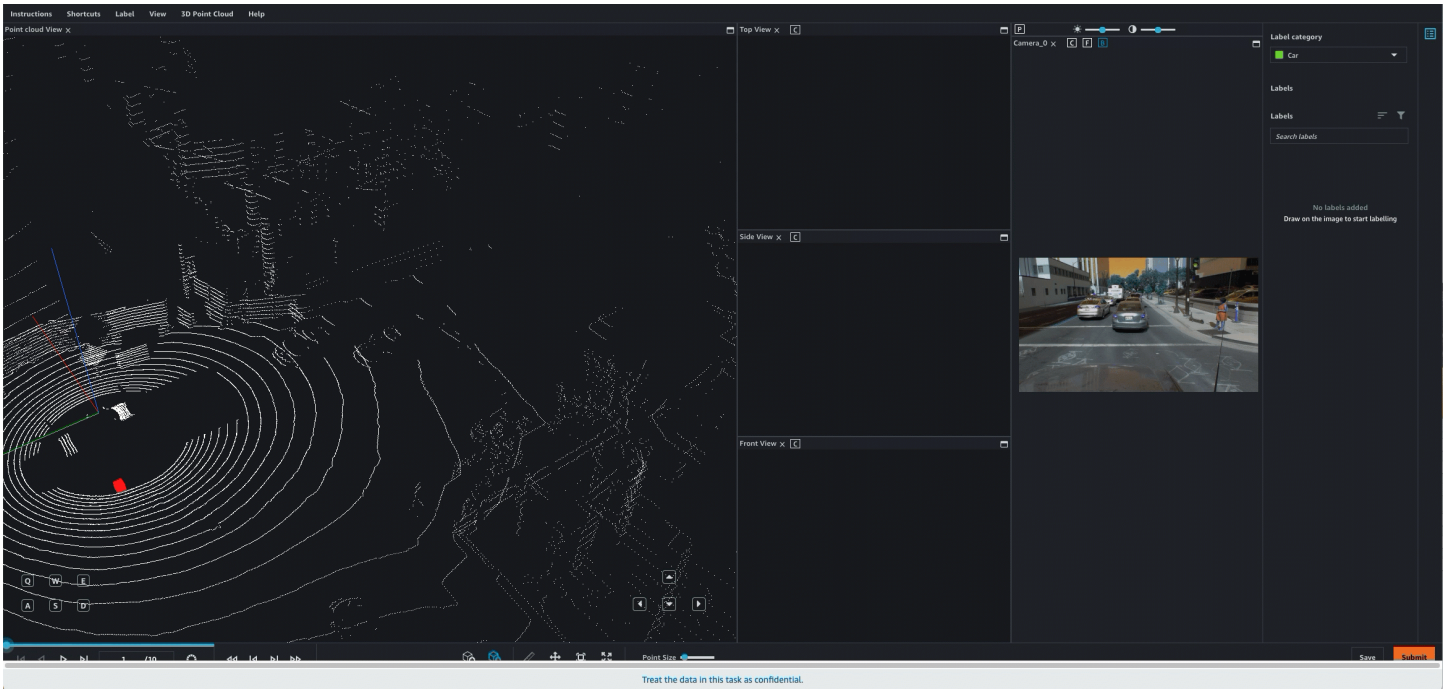
Ground Truth provides workers with a web portal and tools to complete your 3D point cloud object tracking annotation tasks. When you create the labeling job, you provide the Amazon Resource

Name (ARN) for a pre-built Ground Truth UI in the `HumanTaskUiArn` parameter. When you create a labeling job using this task type in the console, this UI is automatically used. You can preview and interact with the worker UI when you create a labeling job in the console. If you are a new use, it is recommended that you create a labeling job using the console to ensure your label attributes, point cloud frames, and if applicable, images, appear as expected.

The following is a GIF of the 3D point cloud object tracking worker task interface and demonstrates how the worker can navigate the point cloud frames in the sequence. The annotating tools are a part of the worker task interface. They are not available for the preview interface.



Once workers add a single cuboid, that cuboid is replicated in all frames of the sequence with the same ID. Once workers adjust the cuboid in another frame, Ground Truth will interpolate the movement of that object and adjust all cuboids between the manually adjusted frames. The following GIF demonstrates this interpolation feature. In the navigation bar on the bottom-left, red-areas indicate manually adjusted frames.



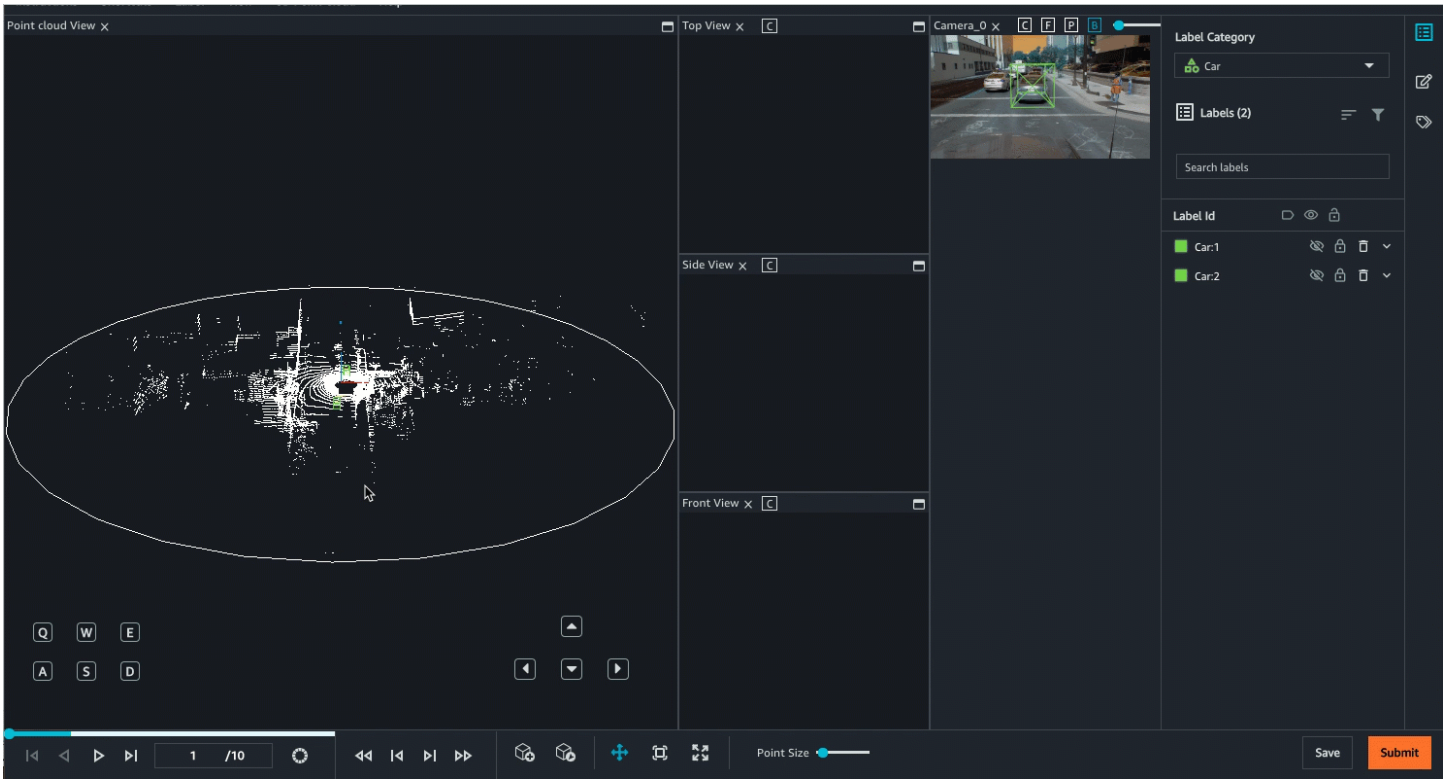
If you provide camera data for sensor fusion, images are matched up with scenes in point cloud frames. These images appear in the worker portal as shown in the following GIF.

Worker can navigate in the 3D scene using their keyboard and mouse. They can:

- Double click on specific objects in the point cloud to zoom into them.
- Use a mouse-scroller or trackpad to zoom in and out of the point cloud.
- Use both keyboard arrow keys and Q, E, A, and D keys to move Up, Down, Left, Right. Use keyboard keys W and S to zoom in and out.

Once a worker places a cuboids in the 3D scene, a side-view will appear with the three projected side views: top, side, and back. These side-views show points in and around the placed cuboid and help workers refine cuboid boundaries in that area. Workers can zoom in and out of each of those side-views using their mouse.

The following video demonstrates movements around the 3D point cloud and in the side-view.



Additional view options and features are available. See the worker instruction page for a comprehensive overview of the Worker UI.

Worker Tools

Workers can navigate through the 3D point cloud by zooming in and out, and moving in all directions around the cloud using the mouse and keyboard shortcuts. If workers click on a point in the point cloud, the UI will automatically zoom into that area. Workers can use various tools to draw 3D cuboid around objects. For more information, see **Assistive Labeling Tools**.

After workers have placed a 3D cuboid in the point cloud, they can adjust these cuboids to fit tightly around cars using a variety of views: directly in the 3D cuboid, in a side-view featuring three zoomed-in perspectives of the point cloud around the box, and if you include images for sensor fusion, directly in the 2D image.

View options that enable workers to easily hide or view label text, a ground mesh, and additional point attributes. Workers can also choose between perspective and orthogonal projections.

Assistive Labeling Tools

Ground Truth helps workers annotate 3D point clouds faster and more accurately using UX, machine learning and computer vision powered assistive labeling tools for 3D point cloud object tracking tasks. The following assistive labeling tools are available for this task type:

- **Label autofill** – When a worker adds a cuboid to a frame, a cuboid with the same dimensions and orientation is automatically added to all frames in the sequence.
- **Label interpolation** – After a worker has labeled a single object in two frames, Ground Truth uses those annotations to interpolate the movement of that object between those two frames. Label interpolation can be turned on and off.
- **Bulk label and attribute management** – Workers can add, delete, and rename annotations, label category attributes, and frame attributes in bulk.
  - Workers can manually delete annotations for a given object before or after a frame. For example, a worker can delete all labels for an object after frame 10 if that object is no longer located in the scene after that frame.
  - If a worker accidentally bulk deletes all annotations for a object, they can add them back. For example, if a worker deletes all annotations for an object before frame 100, they can bulk add them to those frames.
  - Workers can rename a label in one frame and all 3D cuboids assigned that label are updated with the new name across all frames.
  - Workers can use bulk editing to add or edit label category attributes and frame attributes in multiple frames.
- **Snapping** – Workers can add a cuboid around an object and use a keyboard shortcut or menu option to have Ground Truth's autofit tool snap the cuboid tightly around the object's boundaries.
- **Fit to ground** – After a worker adds a cuboid to the 3D scene, the worker can automatically snap the cuboid to the ground. For example, the worker can use this feature to snap a cuboid to the road or sidewalk in the scene.
- **Multi-view labeling** – After a worker adds a 3D cuboid to the 3D scene, a side -panel displays front and two side perspectives to help the worker adjust the cuboid tightly around the object. Workers can annotation the 3D point cloud, the side panel and the adjustments appear in the other views in real time.
- **Sensor fusion** – If you provide data for sensor fusion, workers can adjust annotations in the 3D scenes and in 2D images, and the annotations will be projected into the other view in real time.
- **Auto-merge cuboids** – Workers can automatically merge two cuboids across all frames if they determine that cuboids with different labels actually represent a single object.

- **View options** – Enables workers to easily hide or view label text, a ground mesh, and additional point attributes like color or intensity. Workers can also choose between perspective and orthogonal projections.

Create a 3D Point Cloud Object Tracking Labeling Job

You can create a 3D point cloud labeling job using the SageMaker console or API operation, `CreateLabelingJob`. To create a labeling job for this task type you need the following:

- A sequence input manifest file. To learn how to create this type of manifest file, see Create a Point Cloud Sequence Input Manifest. If you are a new user of Ground Truth 3D point cloud labeling modalities, we recommend that you review Accepted Raw 3D Data Formats.
- A work team from a private or vendor workforce. You cannot use Amazon Mechanical Turk for 3D point cloud labeling jobs. To learn how to create workforces and work teams, see Create and Manage Workforces.

Additionally, make sure that you have reviewed and satisfied the Assign IAM Permissions to Use Ground Truth.

To learn how to create a labeling job using the console or an API, see the following sections.

Create a Labeling Job (API)

This section covers details you need to know when you create a labeling job using the SageMaker API operation `CreateLabelingJob`. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the **See Also** section of `CreateLabelingJob`.

Create a Labeling Job (API) provides an overview of the `CreateLabelingJob` operation. Follow these instructions and do the following while you configure your request:

- You must enter an ARN for `HumanTaskUiArn`. Use `arn:aws:sagemaker:<region>:394669845002:human-task-ui/PointCloudObjectTracking`. Replace *<region>* with the AWS Region you are creating the labeling job in.

  There should not be an entry for the `UiTemplateS3Uri` parameter.
- Your `LabelAttributeName` must end in `-ref`. For example, *ot-labels*`-ref`.

- Your input manifest file must be a point cloud frame sequence manifest file. For more information, see Create a Point Cloud Sequence Input Manifest.
- You specify your labels, label category and frame attributes, and worker instructions in a label category configuration file. For more information, see Create a Labeling Category Configuration File with Label Category and Frame Attributes to learn how to create this file.
- You need to provide pre-defined ARNs for the pre-annotation and post-annotation (ACS) Lambda functions. These ARNs are specific to the AWS Region you use to create your labeling job.
  - To find the pre-annotation Lambda ARN, refer to `PreHumanTaskLambdaArn`. Use the Region you are creating your labeling job in to find the correct ARN that ends with `PRE-3DPointCloudObjectTracking`.
  - To find the post-annotation Lambda ARN, refer to `AnnotationConsolidationLambdaArn`. Use the Region you are creating your labeling job in to find the correct ARN that ends with `ACS-3DPointCloudObjectTracking`.
- The number of workers specified in `NumberOfHumanWorkersPerDataObject` should be 1.
- Automated data labeling is not supported for 3D point cloud labeling jobs. You should not specify values for parameters in `LabelingJobAlgorithmsConfig`.
- 3D point cloud object tracking labeling jobs can take multiple hours to complete. You can specify a longer time limit for these labeling jobs in `TaskTimeLimitInSeconds` (up to 7 days, or 604,800 seconds).

Create a Labeling Job (Console)

You can follow the instructions Create a Labeling Job (Console) in order to learn how to create a 3D point cloud object tracking labeling job in the SageMaker console. While you are creating your labeling job, be aware of the following:

- Your input manifest file must be a sequence manifest file. For more information, see Create a Point Cloud Sequence Input Manifest.
- Optionally, you can provide label category attributes. Workers can assign one or more of these attributes to annotations to provide more information about that object. For example, you might want to use the attribute *occluded* to have workers identify when an object is partially obstructed.
- Automated data labeling and annotation consolidation are not supported for 3D point cloud labeling tasks.

- 3D point cloud object tracking labeling jobs can take multiple hours to complete. You can specify a longer time limit for these labeling jobs when you select your work team (up to 7 days, or 604800 seconds).

Create a 3D Point Cloud Object Tracking Adjustment or Verification Labeling Job

You can create an adjustment and verification labeling job using the Ground Truth console or `CreateLabelingJob` API. To learn more about adjustment and verification labeling jobs, and to learn how create one, see Verify and Adjust Labels.

When you create an adjustment labeling job, your input data to the labeling job can include labels, and yaw, pitch, and roll measurements from a previous labeling job or external source. In the adjustment job, pitch, and roll will be visualized in the worker UI, but cannot be modified. Yaw is adjustable.

Ground Truth uses Tait-Bryan angles with the following intrinsic rotations to visualize yaw, pitch and roll in the worker UI. First, rotation is applied to the vehicle according to the z-axis (yaw). Next, the rotated vehicle is rotated according to the intrinsic y'-axis (pitch). Finally, the vehicle is rotated according to the intrinsic x''-axis (roll).

Output Data Format

When you create a 3D point cloud object tracking labeling job, tasks are sent to workers. When these workers complete their tasks, their annotations are written to the Amazon S3 bucket you specified when you created the labeling job. The output data format determines what you see in your Amazon S3 bucket when your labeling job status (LabelingJobStatus) is `Completed`.

If you are a new user of Ground Truth, see Output Data to learn more about the Ground Truth output data format. To learn about the 3D point cloud object tracking output data format, see 3D Point Cloud Object Tracking Output.

3D Point Cloud Semantic Segmentation

Semantic segmentation involves classifying individual points of a 3D point cloud into pre-specified categories. Use this task type when you want workers to create a point-level semantic segmentation mask for 3D point clouds. For example, if you specify the classes `car`, `pedestrian`, and `bike`, workers select one class at a time, and color all of the points that this class applies to the same color in the point cloud.

For this task type, the data object that workers label is a single point cloud frame. Ground Truth generates a 3D point cloud visualization using point cloud data you provide. You can also provide camera data to give workers more visual information about scenes in the frame, and to help workers paint objects. When a worker paints an object in either the 2D image or the 3D point cloud, the paint shows up in the other view.

You can adjust annotations created in a 3D point cloud object detection labeling job using the 3D point cloud semantic segmentation adjustment task type.

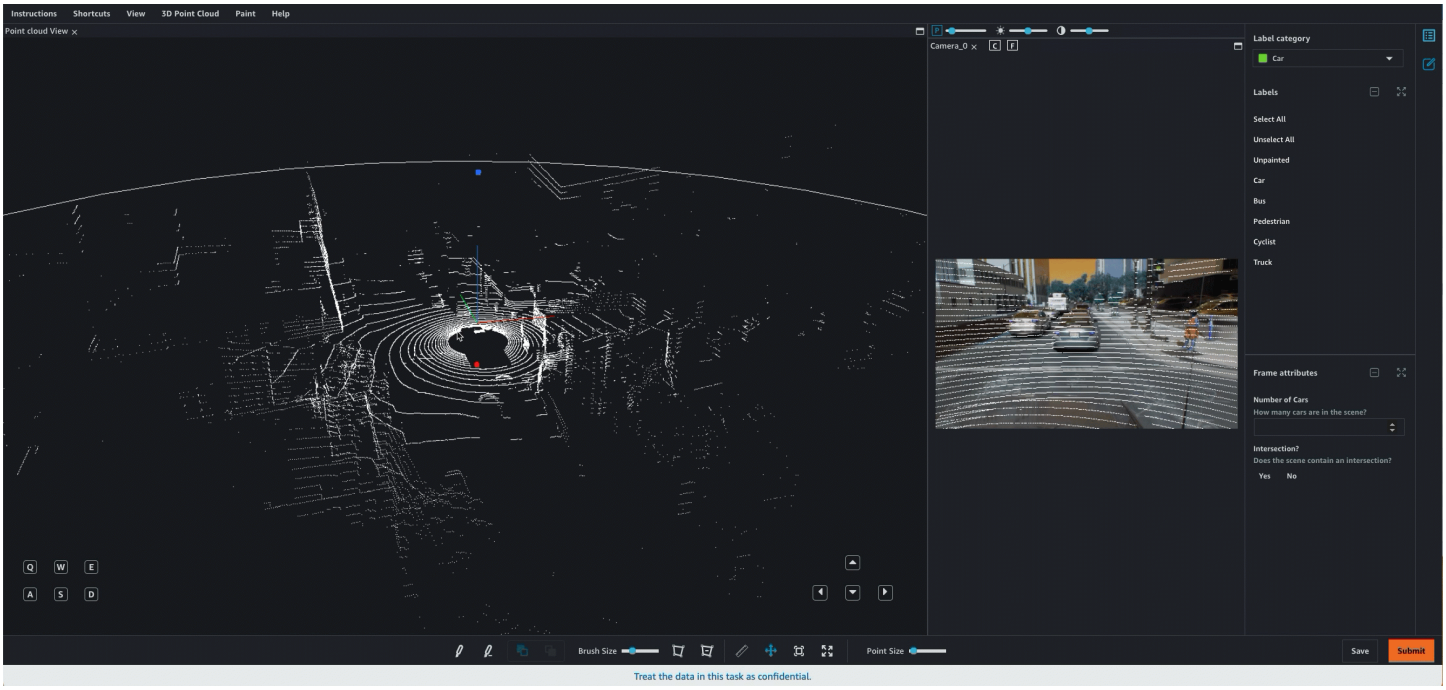
If you are a new user of the Ground Truth 3D point cloud labeling modality, we recommend you review 3D Point Cloud Labeling Jobs Overview. This labeling modality is different from other Ground Truth task types, and this topic provides an overview of important details you should be aware of when creating a 3D point cloud labeling job.

Topics

View the Worker Task Interface

Ground Truth provides workers with a web portal and tools to complete your 3D point cloud semantic segmentation annotation tasks. When you create the labeling job, you provide the Amazon Resource Name (ARN) for a pre-built Ground Truth UI in the `HumanTaskUiArn` parameter. When you create a labeling job using this task type in the console, this UI is automatically used. You can preview and interact with the worker UI when you create a labeling job in the console. If you are a new use, it is recommended that you create a labeling job using the console to ensure your label attributes, point cloud frames, and if applicable, images, appear as expected.

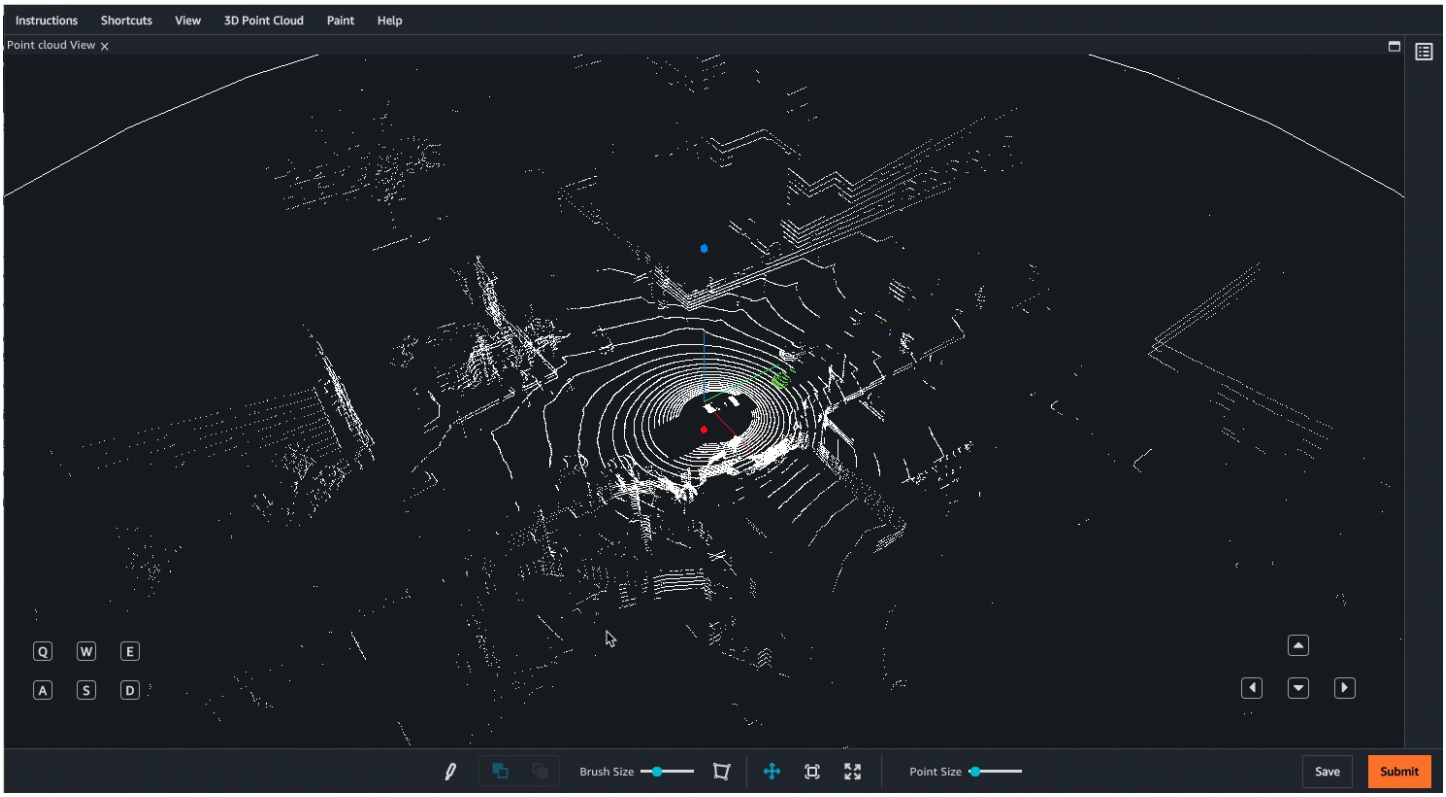
The following is a GIF of the 3D point cloud semantic segmentation worker task interface. If you provide camera data for sensor fusion, images are matched with scenes in the point cloud frame. Workers can paint objects in either the 3D point cloud or the 2D image, and the paint appears in the corresponding location in the other medium. These images appear in the worker portal as shown in the following GIF.



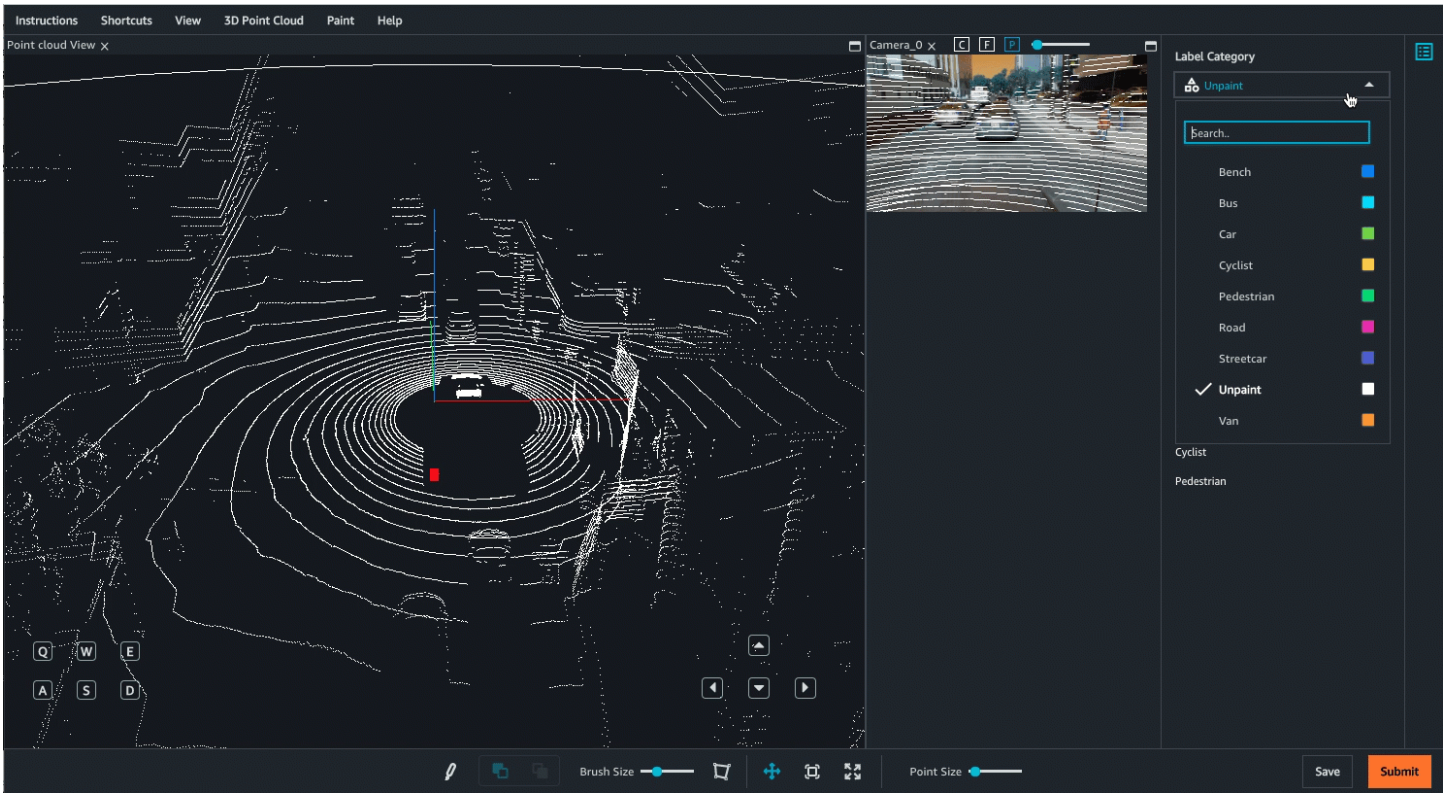
Worker can navigate in the 3D scene using their keyboard and mouse. They can:

- Double click on specific objects in the point cloud to zoom into them.
- Use a mouse-scroller or trackpad to zoom in and out of the point cloud.
- Use both keyboard arrow keys and Q, E, A, and D keys to move Up, Down, Left, Right. Use keyboard keys W and S to zoom in and out.

The following video demonstrates movements around the 3D point cloud. Workers can hide and re-expand all side views and menus. In this GIF, the side-views and menus have been collapsed.



The following GIF demonstrates how a worker can label multiple objects quickly, refine painted objects using the Unpaint option and then view only points that have been painted.



Additional view options and features are available. See the worker instruction page for a comprehensive overview of the Worker UI.

Worker Tools

Workers can navigate through the 3D point cloud by zooming in and out, and moving in all directions around the cloud using the mouse and keyboard shortcuts. When you create a semantic segmentation job, workers have the following tools available to them:

- A paint brush to paint and unpaint objects. Workers paint objects by selecting a label category and then painting in the 3D point cloud. Workers unpaint objects by selecting the Unpaint option from the label category menu and using the paint brush to erase paint.
- A polygon tool that workers can use to select and paint an area in the point cloud.
- A background paint tool, which enables workers to paint behind objects they have already annotated without altering the original annotations. For example, workers might use this tool to paint the road after painting all of the cars on the road.
- View options that enable workers to easily hide or view label text, a ground mesh, and additional point attributes like color or intensity. Workers can also choose between perspective and orthogonal projections.

Create a 3D Point Cloud Semantic Segmentation Labeling Job

You can create a 3D point cloud labeling job using the SageMaker console or API operation, `CreateLabelingJob`. To create a labeling job for this task type you need the following:

- A single-frame input manifest file. To learn how to create this type of manifest file, see Create a Point Cloud Frame Input Manifest File. If you are a new user of Ground Truth 3D point cloud labeling modalities, we recommend that you review Accepted Raw 3D Data Formats.
- A work team from a private or vendor workforce. You cannot use Amazon Mechanical Turk workers for 3D point cloud labeling jobs. To learn how to create workforces and work teams, see Create and Manage Workforces.
- A label category configuration file. For more information, see Create a Labeling Category Configuration File with Label Category and Frame Attributes.

Additionally, make sure that you have reviewed and satisfied the Assign IAM Permissions to Use Ground Truth.

Use one of the following sections to learn how to create a labeling job using the console or an API.

Create a Labeling Job (Console)

You can follow the instructions Create a Labeling Job (Console) in order to learn how to create a 3D point cloud semantic segmentation labeling job in the SageMaker console. While you are creating your labeling job, be aware of the following:

- Your input manifest file must be a single-frame manifest file. For more information, see Create a Point Cloud Frame Input Manifest File.
- Automated data labeling and annotation consolidation are not supported for 3D point cloud labeling tasks.
- 3D point cloud semantic segmentation labeling jobs can take multiple hours to complete. You can specify a longer time limit for these labeling jobs when you select your work team (up to 7 days, or 604800 seconds).

Create a Labeling Job (API)

This section covers details you need to know when you create a labeling job using the SageMaker API operation `CreateLabelingJob`. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the **See Also** section of `CreateLabelingJob`.

The page, Create a Labeling Job (API), provides an overview of the `CreateLabelingJob` operation. Follow these instructions and do the following while you configure your request:

- You must enter an ARN for `HumanTaskUiArn`. Use `arn:aws:sagemaker:<region>:394669845002:human-task-ui/PointCloudSemanticSegmentation`. Replace *`<region>`* with the AWS Region you are creating the labeling job in.

  There should not be an entry for the `UiTemplateS3Uri` parameter.
- Your `LabelAttributeName` must end in `-ref`. For example, *`ss-labels`*`-ref`.
- Your input manifest file must be a single-frame manifest file. For more information, see Create a Point Cloud Frame Input Manifest File.
- You specify your labels and worker instructions in a label category configuration file. See Create a Labeling Category Configuration File with Label Category and Frame Attributes to learn how to create this file.

- You need to provide a pre-defined ARNs for the pre-annotation and post-annotation (ACS) Lambda functions. These ARNs are specific to the AWS Region you use to create your labeling job.
  - To find the pre-annotation Lambda ARN, refer to `PreHumanTaskLambdaArn`. Use the Region you are creating your labeling job in to find the correct ARN. For example, if you are creating your labeling job in us-east-1, the ARN will be `arn:aws:lambda:us-east-1:432418664414:function:PRE-3DPointCloudSemanticSegmentation`.
  - To find the post-annotation Lambda ARN, refer to `AnnotationConsolidationLambdaArn`. Use the Region you are creating your labeling job in to find the correct ARN. For example, if you are creating your labeling job in us-east-1, the ARN will be `arn:aws:lambda:us-east-1:432418664414:function:ACS-3DPointCloudSemanticSegmentation`.
- The number of workers specified in `NumberOfHumanWorkersPerDataObject` should be 1.
- Automated data labeling is not supported for 3D point cloud labeling jobs. You should not specify values for parameters in `LabelingJobAlgorithmsConfig`.
- 3D point cloud semantic segmentation labeling jobs can take multiple hours to complete. You can specify a longer time limit for these labeling jobs in `TaskTimeLimitInSeconds` (up to 7 days, or 604800 seconds).

Create a 3D Point Cloud Semantic Segmentation Adjustment or Verification Labeling Job

You can create an adjustment and verification labeling job using the Ground Truth console or `CreateLabelingJob` API. To learn more about adjustment and verification labeling jobs, and to learn how create one, see Verify and Adjust Labels.

Output Data Format

When you create a 3D point cloud semantic segmentation labeling job, tasks are sent to workers. When these workers complete their tasks, their annotations are written to the Amazon S3 bucket you specified when you created the labeling job. The output data format determines what you see in your Amazon S3 bucket when your labeling job status (`LabelingJobStatus`) is `Completed`.

If you are a new user of Ground Truth, see Output Data to learn more about the Ground Truth output data format. To learn about the 3D point cloud object detection output data format, see 3D Point Cloud Semantic Segmentation Output.

3D-2D Point Cloud Object Tracking

Use this task type when you want workers to link 3D point cloud annotations with 2D images annotations and also link 2D image annotations among various cameras. Currently, Ground Truth supports cuboids for annotation in a 3D point cloud and bounding boxes for annotation in 2D videos. For example, you can use this task type to ask workers to link the movement of a vehicle in 3D point cloud with its 2D video. Using 3D-2D linking, you can easily correlate point cloud data (like the distance of a cuboid) to video data (bounding box) for up to 8 cameras.

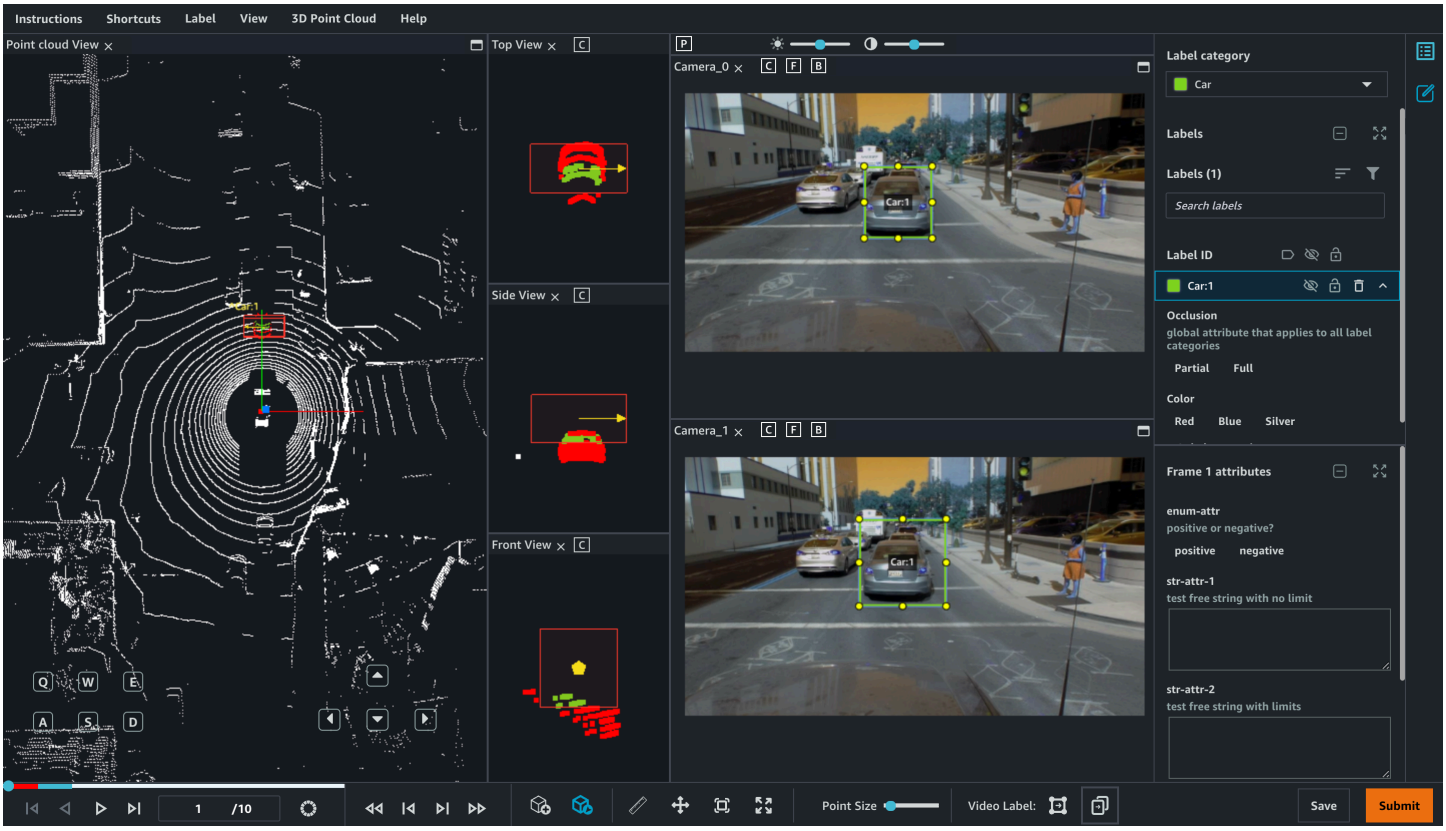
Ground Truth provides workers with tools to annotate cuboids in a 3D point cloud and bounding boxes in up to 8 cameras using the same annotation UI. Workers can also link various bounding boxes for the same object across different cameras. For example, a bounding box in camera1 can be linked to a bounding box in camera2. This lets you to correlate an object across multiple cameras using a unique ID.

> **Note**
>
> Currently, SageMaker does not support creating a 3D-2D linking job using the console. To create a 3D-2D linking job using the SageMaker API, see Create a Labeling Job (API).

Topics

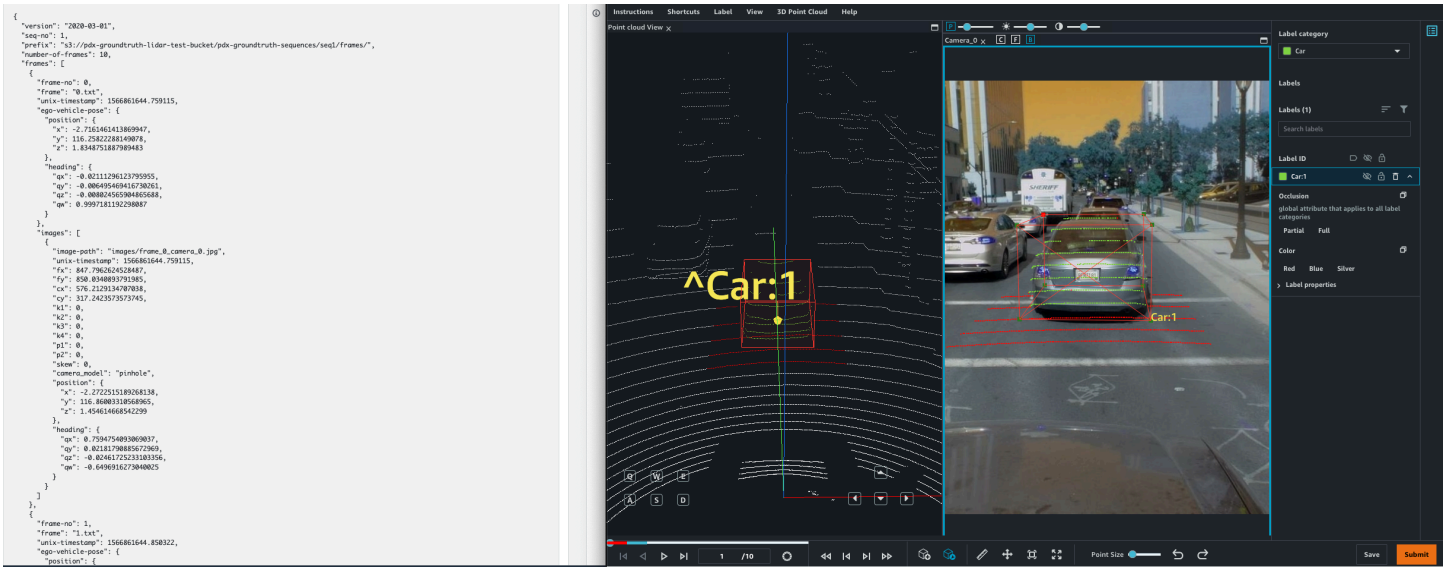
View the Worker Task Interface

Ground Truth provides workers with a web portal and tools to complete your 3D-2D object tracking annotation tasks. When you create the labeling job, you provide the Amazon Resource Name (ARN) for a pre-built Ground Truth UI in the `HumanTaskUiArn` parameter. To use the UI when you create a labeling job for this task type using the API, you need to provide the `HumanTaskUiArn`. You can preview and interact with the worker UI when you create a labeling job through the API. The annotating tools are a part of the worker task interface. They are not available for the preview interface. The following image demonstrates the worker task interface used for the 3D-2D point cloud object tracking annotation task.



When interpolation is enabled by default. After a worker adds a single cuboid, that cuboid is replicated in all frames of the sequence with the same ID. If the worker adjusts the cuboid in another frame, Ground Truth interpolates the movement of that object and adjust all cuboids between the manually adjusted frames. Additionally, using the camera view section, a cuboid can be shown with a projection (using to B button for "toggle labels" in the camera view) that provides the worker with a reference from the camera images. The accuracy of the cuboid to image projection is based on accuracy of calibrations captured in the extrinsic and intrinsinc data.

If you provide camera data for sensor fusion, images are matched up with scenes in point cloud frames. Note that the camera data should be time synchronized with the point cloud data to ensure an accurate depiction of point cloud to imagery over each frame in the sequence as shown in the following image.



The manifest file holds the extrinsic and intrinsic data and the pose to allow the cuboid projection on the camera image to be shown by using the **P button**.

Worker can navigate in the 3D scene using their keyboard and mouse. They can:

- Double click on specific objects in the point cloud to zoom into them.
- Use a mouse-scroller or trackpad to zoom in and out of the point cloud.
- Use both keyboard arrow keys and Q, E, A, and D keys to move Up, Down, Left, Right. Use keyboard keys W and S to zoom in and out.

Once a worker places a cuboids in the 3D scene, a side-view appears with the three projected side views: top, side, and front. These side-views show points in and around the placed cuboid and help workers refine cuboid boundaries in that area. Workers can zoom in and out of each of those side-views using their mouse.

The worker should first select the cuboid to draw a corresponding bounding box on any of the camera views. This links the cuboid and the bounding box with a common name and unique ID.

The worker can also first draw a bounding box, select it and draw the corresponding cuboid to link them.

Additional view options and features are available. See the worker instruction page for a comprehensive overview of the Worker UI.

Worker Tools

Workers can navigate through the 3D point cloud by zooming in and out, and moving in all directions around the cloud using the mouse and keyboard shortcuts. If workers click on a point in the point cloud, the UI automatically zooms into that area. Workers can use various tools to draw 3D cuboid around objects. For more information, see **Assistive Labeling Tools** in the following discussion.

After workers have placed a 3D cuboid in the point cloud, they can adjust these cuboids to fit tightly around cars using a variety of views: directly in the 3D point cloud, in a side-view featuring three zoomed-in perspectives of the point cloud around the box, and if you include images for sensor fusion, directly in the 2D image.

Additional view options enable workers to easily hide or view label text, a ground mesh, and additional point attributes. Workers can also choose between perspective and orthogonal projections.

Assistive Labeling Tools

Ground Truth helps workers annotate 3D point clouds faster and more accurately using UX, machine learning and computer vision powered assistive labeling tools for 3D point cloud object tracking tasks. The following assistive labeling tools are available for this task type:

- **Label autofill** – When a worker adds a cuboid to a frame, a cuboid with the same dimensions, orientation and xyz position is automatically added to all frames in the sequence.
- **Label interpolation** – After a worker has labeled a single object in two frames, Ground Truth uses those annotations to interpolate the movement of that object between all the frames. Label interpolation can be turned on and off. It is on by default. For example, if a worker working with 5 frames adds a cuboid in frame 2, it is copied to all the 5 frames. If the worker then makes adjustments in frame 4, frame 2 and 4 now act as two points, through which a line is fit. The cuboid is then interpolated in frames 1,3 and 5.
- **Bulk label and attribute management** – Workers can add, delete, and rename annotations, label category attributes, and frame attributes in bulk.
  - Workers can manually delete annotations for a given object before and after a frame, or in all frames. For example, a worker can delete all labels for an object after frame 10 if that object is no longer located in the scene after that frame.

  - If a worker accidentally bulk deletes all annotations for a object, they can add them back. For example, if a worker deletes all annotations for an object before frame 100, they can bulk add them to those frames.
  - Workers can rename a label in one frame and all 3D cuboids assigned that label are updated with the new name across all frames.
  - Workers can use bulk editing to add or edit label category attributes and frame attributes in multiple frames.
- **Snapping** – Workers can add a cuboid around an object and use a keyboard shortcut or menu option to have Ground Truth's autofit tool snap the cuboid tightly around the object's boundaries.
- **Fit to ground** – After a worker adds a cuboid to the 3D scene, the worker can automatically snap the cuboid to the ground. For example, the worker can use this feature to snap a cuboid to the road or sidewalk in the scene.
- **Multi-view labeling** – After a worker adds a 3D cuboid to the 3D scene, a side-panel displays front and two side perspectives to help the worker adjust the cuboid tightly around the object. Workers can annotation the 3D point cloud, the side panel and the adjustments appear in the other views in real time.
- **Sensor fusion** – If you provide data for sensor fusion, workers can adjust annotations in the 3D scenes and in 2D images, and the annotations are projected into the other view in real time. To learn more about the data for sensor fusion, see Understand Coordinate Systems and Sensor Fusion.
- **Auto-merge cuboids** – Workers can automatically merge two cuboids across all frames if they determine that cuboids with different labels actually represent a single object.
- **View options** – Enables workers to easily hide or view label text, a ground mesh, and additional point attributes like color or intensity. Workers can also choose between perspective and orthogonal projections.

Input Data Format

You can create a 3D-2D object tracking job using the SageMaker API operation, `CreateLabelingJob`. To create a labeling job for this task type you need the following:

- A sequence input manifest file. To learn how to create this type of manifest file, see Create a Point Cloud Sequence Input Manifest. If you are a new user of Ground Truth 3D point cloud labeling modalities, we recommend that you review Accepted Raw 3D Data Formats.

- You specify your labels, label category and frame attributes, and worker instructions in a label category configuration file. For more information, see Create a Labeling Category Configuration File with Label Category and Frame Attributes to learn how to create this file. The following is an example showing a label category configuration file for creating a 3D-2D object tracking job.

```

> You need to provide `BoundingBox` and `Cuboid` as annotationType in the label category configuration file to create a 3D-2D object tracking job.

Create a 3D-2D Point Cloud Object Tracking Labeling Job

You can create a 3D-2D point cloud labeling job using the SageMaker API operation, `CreateLabelingJob`. To create a labeling job for this task type you need the following:

- A work team from a private or vendor workforce. You cannot use Amazon Mechanical Turk for 3D point cloud labeling jobs. To learn how to create workforces and work teams, see Create and Manage Workforces.
- Add a CORS policy to an S3 bucket that contains input data in the Amazon S3 console. To set the required CORS headers on the S3 bucket that contains your input images in the S3 console, follow the directions detailed in CORS Permission Requirement.
- Additionally, make sure that you have reviewed and satisfied the Assign IAM Permissions to Use Ground Truth.

To learn how to create a labeling job using the API, see the following sections.

Create a Labeling Job (API)

This section covers details you need to know when you create a 3D-2D object tracking labeling job using the SageMaker API operation `CreateLabelingJob`. This API defines this operation for all AWS SDKs. To see a list of language-specific SDKs supported for this operation, review the **See Also** section of `CreateLabelingJob`.

Create a Labeling Job (API) provides an overview of the `CreateLabelingJob` operation. Follow these instructions and do the following while you configure your request:

- You must enter an ARN for `HumanTaskUiArn`. Use `arn:aws:sagemaker:<region>:394669845002:human-task-ui/PointCloudObjectTracking`. Replace *<region>* with the AWS Region you are creating the labeling job in.

  There should not be an entry for the `UiTemplateS3Uri` parameter.
- Your `LabelAttributeName` must end in `-ref`. For example, *ot-labels*`-ref`.
- Your input manifest file must be a point cloud frame sequence manifest file. For more information, see Create a Point Cloud Sequence Input Manifest. You also need to provide a label category configuration file as mentioned above.
- You need to provide pre-defined ARNs for the pre-annotation and post-annotation (ACS) Lambda functions. These ARNs are specific to the AWS Region you use to create your labeling job.
  - To find the pre-annotation Lambda ARN, refer to `PreHumanTaskLambdaArn`. Use the Region you are creating your labeling job in to find the correct ARN that ends with `PRE-3DPointCloudObjectTracking`.
  - To find the post-annotation Lambda ARN, refer to `AnnotationConsolidationLambdaArn`. Use the Region you are creating your labeling job in to find the correct ARN that ends with `ACS-3DPointCloudObjectTracking`.
- The number of workers specified in `NumberOfHumanWorkersPerDataObject` should be 1.
- Automated data labeling is not supported for 3D point cloud labeling jobs. You should not specify values for parameters in `LabelingJobAlgorithmsConfig`.
- 3D-2D object tracking labeling jobs can take multiple hours to complete. You can specify a longer time limit for these labeling jobs in `TaskTimeLimitInSeconds` (up to 7 days, or 604,800 seconds).

> **Note**
>
> After you have successfully created a 3D-2D object tracking job, it shows up on the console under labeling jobs. The task type for the job is displayed as **Point Cloud Object Tracking**.

Output Data

When you create a 3D-2D object tracking labeling job, tasks are sent to workers. When these workers complete their tasks, their annotations are written to the Amazon S3 bucket you specified when you created the labeling job. The output data format determines what you see in your Amazon S3 bucket when your labeling job status (LabelingJobStatus) is `Completed`.

If you are a new user of Ground Truth, see Output Data to learn more about the Ground Truth output data format. To learn about the 3D-2D point cloud object tracking output data format, see 3D-2D Object Tracking Point Cloud Object Tracking Output.

3D Point Cloud Labeling Jobs Overview

This topic provides an overview of the unique features of a Ground Truth 3D point cloud labeling job. You can use the 3D point cloud labeling jobs to have workers label objects in a 3D point cloud generated from a 3D sensors like LiDAR and depth cameras or generated from 3D reconstruction by stitching images captured by an agent like a drone.

Job Pre-processing Time

When you create a 3D point cloud labeling job, you need to provide an input manifest file. The input manifest file can be:

- A *frame input manifest file* that has a single point cloud frame on each line.
- A *sequence input manifest file* that has a single sequence on each line. A sequence is defined as a temporal series of point cloud frames.

For both types of manifest files, *job pre-processing time* (that is, the time before Ground Truth starts sending tasks to your workers) depends on the total number and size of point cloud frames you provide in your input manifest file. For frame input manifest files, this is the number of lines in your manifest file. For sequence manifest files, this is the number of frames in each sequence multiplied by the total number of sequences, or lines, in your manifest file.

Additionally, the number of points per point cloud and the number of fused sensor data objects (like images) factor into job pre-processing times. On average, Ground Truth can pre-process 200 point cloud frames in approximately 5 minutes. If you create a 3D point cloud labeling job with a large number of point cloud frames, you might experience longer job pre-processing times. For example, if you create a sequence input manifest file with 4 point cloud sequences, and each sequence contains 200 point clouds, Ground Truth pre-processes 800 point clouds and so your job pre-processing time might be around 20 minutes. During this time, your labeling job status is `InProgress`.

While your 3D point cloud labeling job is pre-processing, you receive CloudWatch messages notifying you of the status of your job. To identify these messages, search for `3D_POINT_CLOUD_PROCESSING_STATUS` in your labeling job logs.

For **frame input manifest files**, your CloudWatch logs will have a message similar to the following:

```
{
    "labeling-job-name": "example-point-cloud-labeling-job",
    "event-name": "3D_POINT_CLOUD_PROCESSING_STATUS",
    "event-log-message": "datasetObjectId from: 0 to 10, status: IN_PROGRESS"
}
```

The event log message, `datasetObjectId from: 0 to 10, status: IN_PROGRESS` identifies the number of frames from your input manifest that have been processed. You receive a new message every time a frame has been processed. For example, after a single frame has processed, you receive another message that says `datasetObjectId from: 1 to 10, status: IN_PROGRESS`.

For **sequence input manifest files**, your CloudWatch logs will have a message similar to the following:

```
{
    "labeling-job-name": "example-point-cloud-labeling-job",
    "event-name": "3D_POINT_CLOUD_PROCESSING_STATUS",
    "event-log-message": "datasetObjectId: 0, status: IN_PROGRESS"
}
```

The event log message, `datasetObjectId from: 0, status: IN_PROGRESS` identifies the number of sequences from your input manifest that have been processed. You receive a new message every time a sequence has been processed. For example, after a single sequence

has processed, you receive a message that says `datasetObjectId from: 1, status: IN_PROGRESS` as the next sequence begins processing.

Job Completion Times

3D point cloud labeling jobs can take workers hours to complete. You can set the total amount of time that workers can work on each task when you create a labeling job. The maximum time you can set for workers to work on tasks is 7 days. The default value is 3 days.

It is strongly recommended that you create tasks that workers can complete within 12 hours. Workers must keep the worker UI open while working on a task. They can save work as they go and Ground Truth will save their work every 15 minutes.

When using the SageMaker `CreateLabelingJob` API operation, set the total time a task is available to workers in the `TaskTimeLimitInSeconds` parameter of `HumanTaskConfig`.

When you create a labeling job in the console, you can specify this time limit when you select your workforce type and your work team.

Workforces

When you create a 3D point cloud labeling job, you need to specify a work team that will complete your point cloud annotation tasks. You can choose a work team from a private workforce of your own workers, or from a vendor workforce that you select in the AWS Marketplace. You cannot use the Amazon Mechanical Turk workforce for 3D point cloud labeling jobs.

To learn more about vendor workforce, see Managing Vendor Workforces.

To learn how to create and manage a private workforce, see Use a Private Workforce.

Worker User Interface (UI)

Ground Truth provides a worker user interface (UI), tools, and assistive labeling features to help workers complete your 3D point cloud labeling tasks.

You can preview the worker UI when you create a labeling job in the console.

When you create a labeling job using the API operation `CreateLabelingJob`, you must provide an ARN provided by Ground Truth in the parameter `HumanTaskUiArn` to specify the worker UI for your task type. You can use `HumanTaskUiArn` with the SageMaker `RenderUiTemplate` API operation to preview the worker UI.

You provide worker instructions, labels, and optionally, label category attributes that are displayed in the worker UI.

Label Category Attributes

When you create a 3D point cloud object tracking or object detection labeling job, you can add one or more *label category attributes*. You can add *frame attributes* to all 3D point cloud task types:

- **Label category attribute** – A list of options (strings), a free form text box, or a numeric field associated with one or more labels. It is used by workers to to provide metadata about a label.
- **Frame attribute** – A list of options (strings), a free form text box, or a numeric field that appears on each point cloud frame a worker is sent to annotate. It is used by workers to provide metadata about frames.

Additionally, you can use label and frame attributes to have workers verify labels in a 3D point cloud label verification job.

Use the following sections to learn more about these attributes. To learn how to add label category and frame attributes to a labeling job, use the **Create Labeling Job** section on the task type page of your choice.

Label Category Attributes

Add label category attributes to labels to give workers the ability to provide more information about the annotations they create. A label category attribute is added to an individual label, or to all labels. When a label category attribute is applied to all labels it is referred to as a *global label category attribute*.

For example, if you add the label category *car*, you might also want to capture additional data about your labeled cars, such as if they are occluded or the size of the car. You can capture this metadata using label category attributes. In this example, if you added the attribute *occluded* to the car label category, you can assign *partial*, *completely*, *no* to the *occluded* attribute and enable workers to select one of these options.

When you create a label verification job, you add labels category attributes to each label you want workers to verify.

Frame Attributes

Add frame attributes to give workers the ability to provide more information about individual point cloud frames. You can specify up to 10 frame attributes, and these attributes will appear on all frames.

For example, you can add a frame attribute that allows workers to enter a number. You may want to use this attribute to have workers identify the number of objects they see in a particular frame.

In another example, you may want to provide a free-form text box to give workers the ability to provide a free form answer to a question.

When you create a label verification job, you can add one or more frame attributes to ask workers to provide feedback on all labels in a point cloud frame.

Worker Instructions

You can provide worker instructions to help your workers complete your point cloud labeling tasks. You might want to use these instructions to do the following:

- Best practices and things to avoid when annotating objects.
- Explanation of the label category attributes provided (for object detection and object tracking tasks), and how to use them.
- Advice on how to save time while labeling by using keyboard shortcuts.

You can add your worker instructions using the SageMaker console while creating a labeling job. If you create a labeling job using the API operation `CreateLabelingJob`, you specify worker instructions in your label category configuration file.

In addition to your instructions, Ground Truth provides a link to help workers navigate and use the worker portal. View these instructions by selecting the task type on Worker Instructions.

Declining Tasks

Workers are able to decline tasks.

Workers decline a task if the instructions are not clear, input data is not displaying correctly, or if they encounter some other issue with the task. If the number of workers per dataset object (`NumberOfHumanWorkersPerDataObject`) decline the task, the data object is marked as expired and will not be sent to additional workers.

3D Point Cloud Labeling Job Permission Requirements

When you create a 3D point cloud labeling job, in addition to the permission requirements found in Assign IAM Permissions to Use Ground Truth, you must add a CORS policy to your S3 bucket that contains your input manifest file.

Add a CORS Permission Policy to S3 Bucket

When you create a 3D point cloud labeling job, you specify buckets in S3 where your input data and manifest file are located and where your output data will be stored. These buckets may be the same. You must attach the following Cross-origin resource sharing (CORS) policy to your input and output buckets. If you use the Amazon S3 console to add the policy to your bucket, you must use the JSON format.

JSON

```
[
        {
            "AllowedHeaders": [
                "*"
            ],
            "AllowedMethods": [
                "GET",
                "HEAD",
                "PUT"
            ],
            "AllowedOrigins": [
                "*"
            ],
            "ExposeHeaders": [
                "Access-Control-Allow-Origin"
            ],
            "MaxAgeSeconds": 3000
        }
    ]
```

XML

```
<?xml version="1.0" encoding="UTF-8"?>
    <CORSConfiguration xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
    <CORSRule>
        <AllowedOrigin>*</AllowedOrigin>
```

```
        <AllowedMethod>GET</AllowedMethod>
        <AllowedMethod>HEAD</AllowedMethod>
        <AllowedMethod>PUT</AllowedMethod>
        <MaxAgeSeconds>3000</MaxAgeSeconds>
        <ExposeHeader>Access-Control-Allow-Origin</ExposeHeader>
        <AllowedHeader>*</AllowedHeader>
    </CORSRule>
    </CORSConfiguration>
```

To learn how to add a CORS policy to an S3 bucket, see How do I add cross-domain resource sharing with CORS? in the Amazon Simple Storage Service User Guide.

Worker Instructions

This topic provides an overview of the Ground Truth worker portal and the tools available to complete your 3D Point Cloud labeling task. First, select the type of task you are working on from **Topics**.

For adjustment jobs, select the original labeling job task type that produced the labels you are adjusting. Review and adjust the labels in your task as needed.

> **Important**
>
> It is recommended that you complete your task using a Google Chrome or Firefox web browser.

3D Point Cloud Semantic Segmentation

Use this page to become familiarize with the user interface and tools available to complete your 3D point cloud semantic segmentation task.

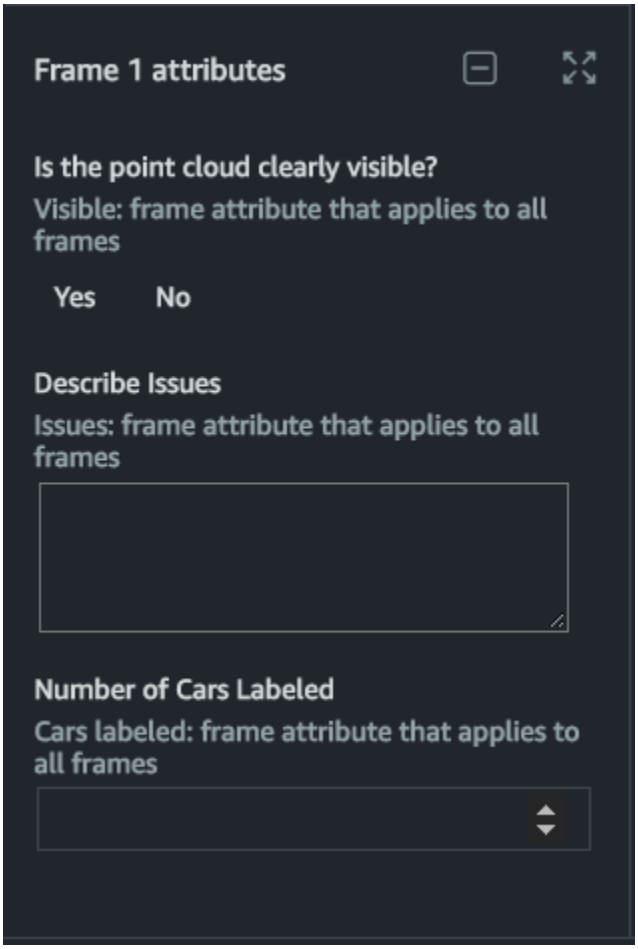
Topics

Your Task

When you work on a 3D point cloud semantic segmentation task, you need to select a category from the **Annotations** menu on the right side of your worker portal using the drop down menu **Label Categories**. After you've selected a category, use the paint brush and polygon tools to paint each object in the 3D point cloud that this category applies to. For example, if you select the category **Car**, you would use these tools to paint all of the cars in the point cloud. The following video demonstrates how to use the paint brush tool to paint an object.

If you see one or more images in your worker portal, you can paint in the images or paint in the 3D point cloud and the paint will show up in the other medium.

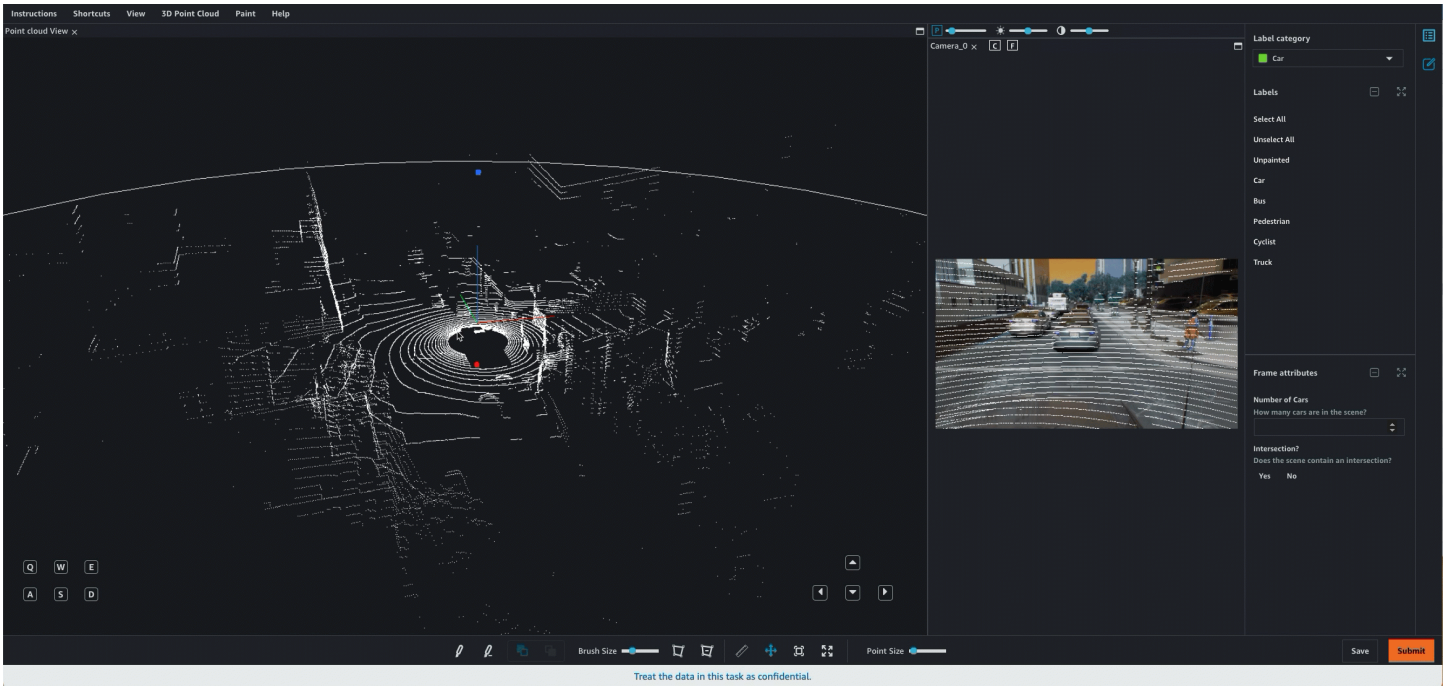
You may see frame attributes under the **Labels** menu. Use these attribute prompts to enter additional information about the point cloud.



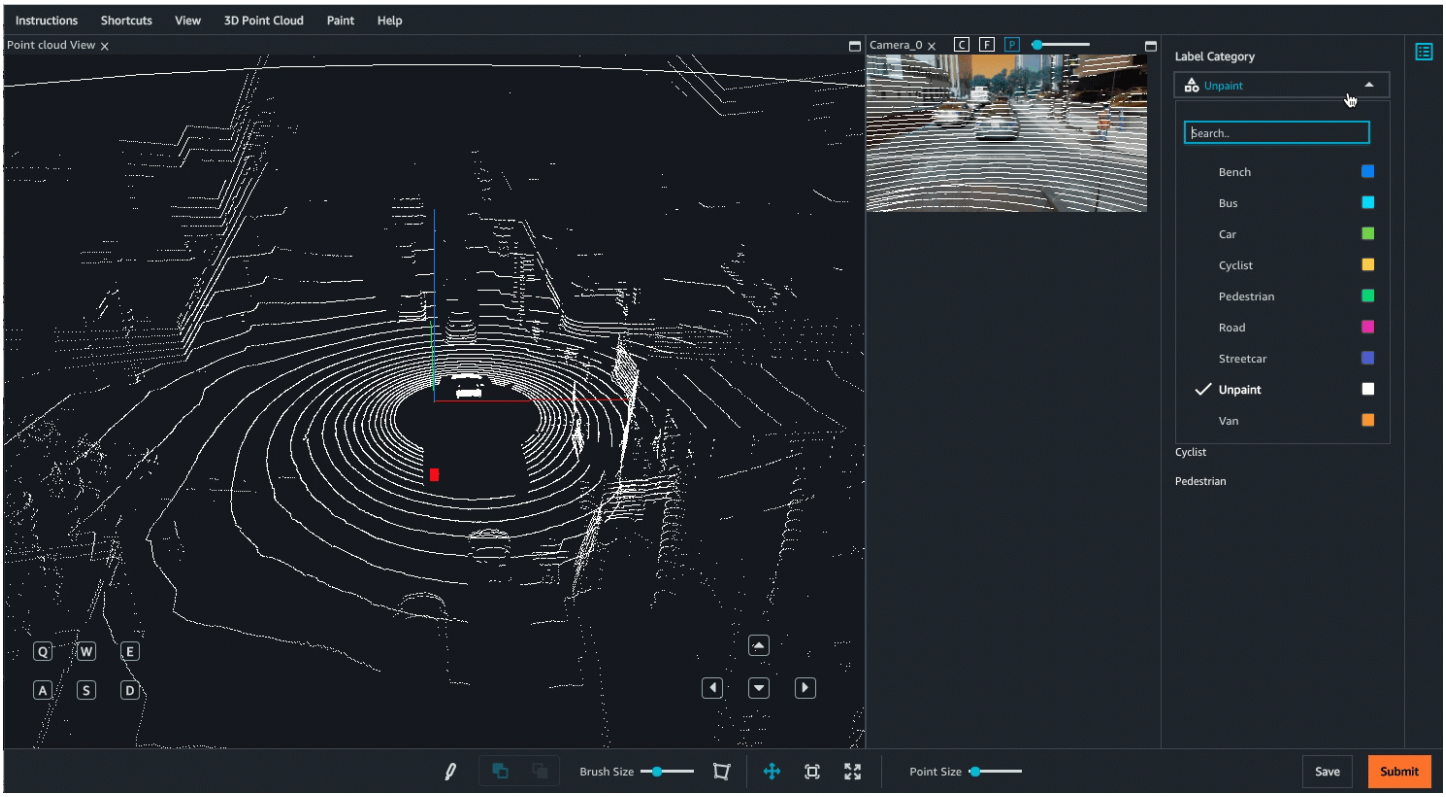
Important

If you see that objects have already been painted when you open the task, adjust those annotations.

The following video includes an image that can be annotated. You may not see an image in your task.



After you've painted one or more objects using a label category, you can select that category from the Label Category menu on the right to only view points painted for that category.

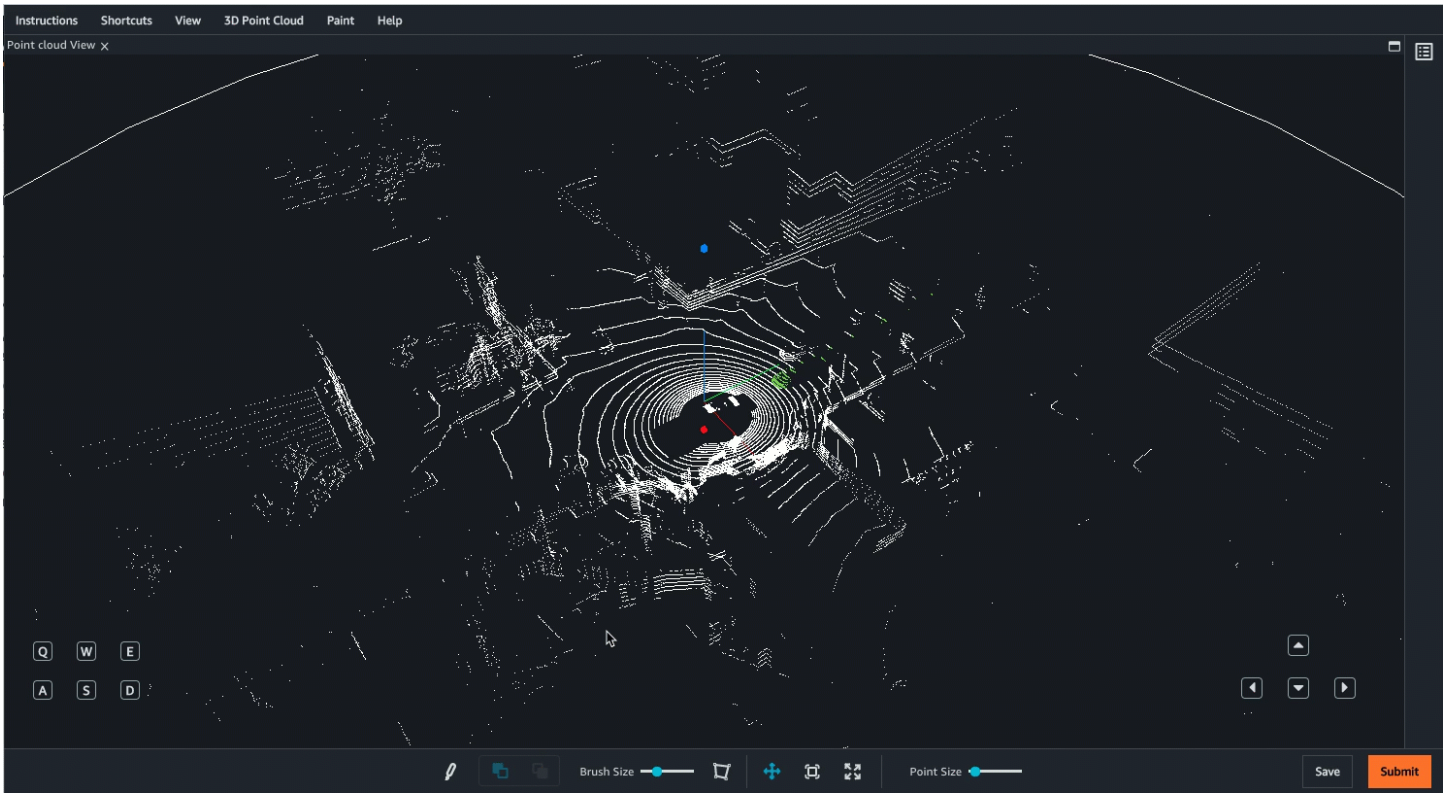


Navigate the UI

You can navigate in the 3D scene using their keyboard and mouse. You can:

- Double click on specific objects in the point cloud to zoom into them.
- Use a mouse-scroller or trackpad to zoom in and out of the point cloud.
- Use both keyboard arrow keys and Q, E, A, and D keys to move Up, Down, Left, Right. Use keyboard keys W and S to zoom in and out.

The following video demonstrates movements around the 3D point cloud and in the side-view. You can hide and re-expand all side views using the full screen icon. In this GIF, the side-views and menus have been collapsed.



When you are in the worker UI, you see the following menus:

- **Instructions** – Review these instructions before starting your task.
- **Shortcuts** – Use this menu to view keyboard shortcuts that you can use to navigate the point cloud and use the annotation tools provided.
- **View** – Use this menu to toggle different view options on and off. For example, you can use this menu to add a ground mesh to the point cloud, and to choose the projection of the point cloud.

- **3D Point Cloud** – Use this menu to add additional attributes to the points in the point cloud, such as color, and pixel intensity. Note that some or all of these options may not be available.
- **Paint** – Use this menu to modify the functionality of the paint brush.

When you open a task, the move scene icon is on, and you can move around the point cloud using your mouse and the navigation buttons in the point cloud area of the screen. To return to the original view you see when you first opened the task, choose the reset scene icon.

After you select the paint icon, you can add paint to the point cloud and images (if included). You must select the move scene icon again to move to another area in the 3D point cloud or image.

To collapse all panels on the right and make the 3D point cloud full screen, select the full screen icon.

For the camera images and side-panels, you have the following view options:

- **C** – View the camera angle on point cloud view.
- **F** – View the frustum, or field of view, of the camera used to capture that image on point cloud view.
- **P** – View the point cloud overlaid on the image.

Icon Guide

Use this table to learn about the icons available in your worker task portal.

Icon	Name	Description
	brush	Choose this icon to turn on the brush tool. To use with this tool, choose and move over the objects that you want to paint with your mouse. After you choose it, everything you paint be associated with the category you chose.
	polygon	Choose this icon to use the polygon paint tool. Use this tool to draw polygons around objects that you want to paint. After you choose it, everything you draw a polygon around will be associated with the category you have chosen.

Icon	Name	Description
	reset scene	Choose this icon to reset the view of the point cloud, side panels, and if applicable, all images to their original position when the task was first opened.
	move scene	Choose this icon to move the scene. By default, this icon will be selected when you first start a task.
	full screen	Choose this icon to make the 3D point cloud visualiza tion full screen, and to collapse all side panels.

Icon	Name	Description
	ruler	Use this icon to measure distances, in meters, in the point cloud. You may want to use this tool if your instructions ask you to annotate all objects in a given distance from the center of the cuboid or the object used to capture data. When you select this icon, you can place the starting point (first marker) anywhere in the point cloud by selecting it with your mouse. The tool will automatically use interpolation to place a marker on the closest point within threshold distance to the location you select, otherwise the marker will be placed on ground. If you place a starting point by mistake, you can use the Escape key to revert marker placement. After you place the first marker, you see a dotted line and a dynamic label that indicates the distance you have moved away from the first marker. Click somewhere else on the point cloud to place a second marker. When you place the second marker, the dotted line becomes solid, and the distance is set. After you set a distance, you can edit it by selecting either marker. You can delete a ruler by selecting anywhere on the ruler and using the Delete key on your keyboard.

Shortcuts

The shortcuts listed in the **Shortcuts** menu can help you navigate the 3D point cloud and use the paint tool.

Before you start your task, it is recommended that you review the **Shortcuts** menu and become acquainted with these commands.

Release, Stop and Resume, and Decline Tasks

When you open the labeling task, three buttons on the top right allow you to decline the task (**Decline task**), release it (**Release task**), and stop and resume it at a later time (**Stop and resume later**). The following list describes what happens when you select one of these options:

- **Decline task**: You should only decline a task if something is wrong with the task, such as an issue with the 3D point cloud, images or the UI. If you decline a task, you will not be able to return to the task.
- **Release Task**: If you release a task, you loose all work done on that task. When the task is released, other workers on your team can pick it up. If enough workers pick up the task, you may not be able to return to it. When you select this button and then select **Confirm**, you are returned to the worker portal. If the task is still available, its status will be **Available**. If other workers pick it up, it will disappear from your portal.
- **Stop and resume later**: You can use the **Stop and resume later** button to stop working and return to the task at a later time. You should use the **Save** button to save your work before you select **Stop and resume later**. When you select this button and then select **Confirm**, you are returned to the worker portal, and the task status is **Stopped**. You can select the same task to resume work on it.

  Be aware that the person that creates your labeling tasks specifies a time limit in which all tasks much be completed by. If you do not return to and complete this task within that time limit, it will expire and your work will not be submitted. Contact your administrator for more information.

Saving Your Work and Submitting

You should periodically save your work. Ground Truth will automatically save your work ever 15 minutes.

When you open a task, you must complete your work on it before pressing **Submit**.

3D Point Cloud Object Detection

Use this page to become familiarize with the user interface and tools available to complete your 3D point cloud object detection task.

Topics

- Navigate the UI
- Icon Guide
- Shortcuts
- Release, Stop and Resume, and Decline Tasks
- Saving Your Work and Submitting

Your Task

When you work on a 3D point cloud object detection task, you need to select a category from the **Annotations** menu on the right side of your worker portal using the **Label Categories** menu. After you've chosen a category, use the add cuboid and fit cuboid tools to fit a cuboid around objects in the 3D point cloud that this category applies to. After you place a cuboid, you can modify its dimensions, location, and orientation directly in the point cloud, and the three panels shown on the right.

If you see one or more images in your worker portal, you can also modify cuboids in the images or in the 3D point cloud and the edits will show up in the other medium.

If you see cuboids have already been added to the 3D point cloud when you open your task, adjust those cuboids and add additional cuboids as needed.

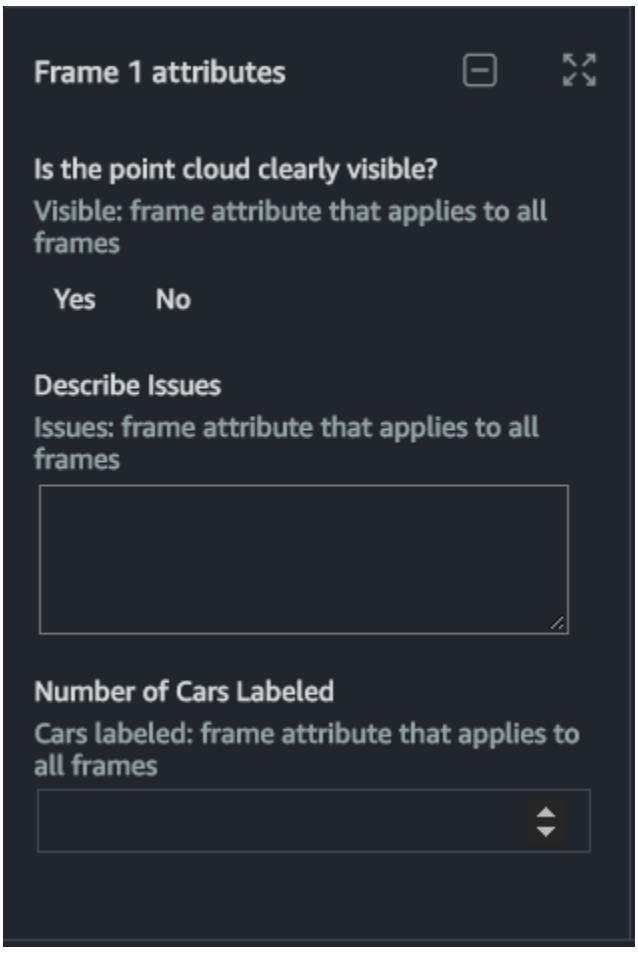
To edit a cuboid, including moving, re-orienting, and changing cuboid dimensions, you must use shortcut keys. You can see a full list of shortcut keys in the **Shortcuts** menu in your UI. The following are important key-combinations that you should become familiar with before starting your labeling task.

Mac Command	Windows Command	Action
Cmd + Drag	Ctrl + Drag	Modify the dimensions of the cuboid.
Option + Drag	Alt + Drag	Move the cuboid.
Shift + Drag	Shift + Drag	Rotate the cuboid.
Option + O	Alt + O	Fit the cuboid tightly around the points it has been drawn around. Before using the

Mac Command	Windows Command	Action
		option, make sure the cuboid fully-surrounds the object of interest.
Option + G	Alt + G	Set the cuboid to the ground.

Individual labels may have one or more label attributes. If a label has a label attribute associated with it, it will appear when you select the downward pointing arrow next to the label from the **Label Id** menu. Fill in required values for all label attributes.

You may see frame attributes under the **Labels** menu. Use these attribute prompts to enter additional information about each frame.



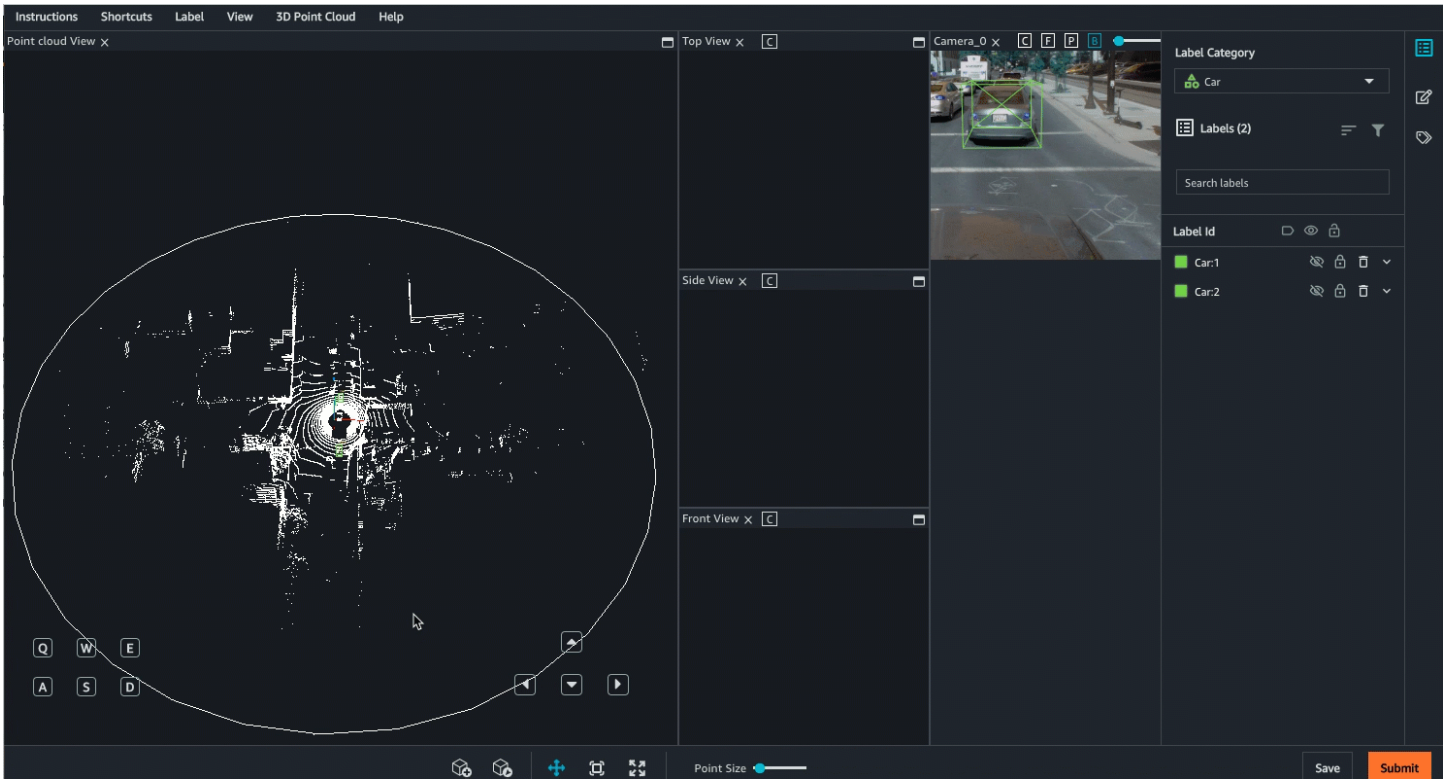
Navigate the UI

You can navigate in the 3D scene using your keyboard and mouse. You can:

- Double click on specific objects in the point cloud to zoom into them.
- You can use the [and] keys on your keyboard to zoom into and move from one label to the next. If no label is selected, when you select [or], the UI will zoom into the first label in the **Lable Id** list.
- Use a mouse-scroller or trackpad to zoom in and out of the point cloud.
- Use both keyboard arrow keys and Q, E, A, and D keys to move Up, Down, Left, Right. Use keyboard keys W and S to zoom in and out.

Once you place a cuboids in the 3D scene, a side-view will appear with three projected views: top, side, and back. These side-views show points in and around the placed cuboid and help workers refine cuboid boundaries in that area. Workers can zoom in and out of each of those side-views using their mouse.

The following video demonstrates movements around the 3D point cloud and in the side-view.



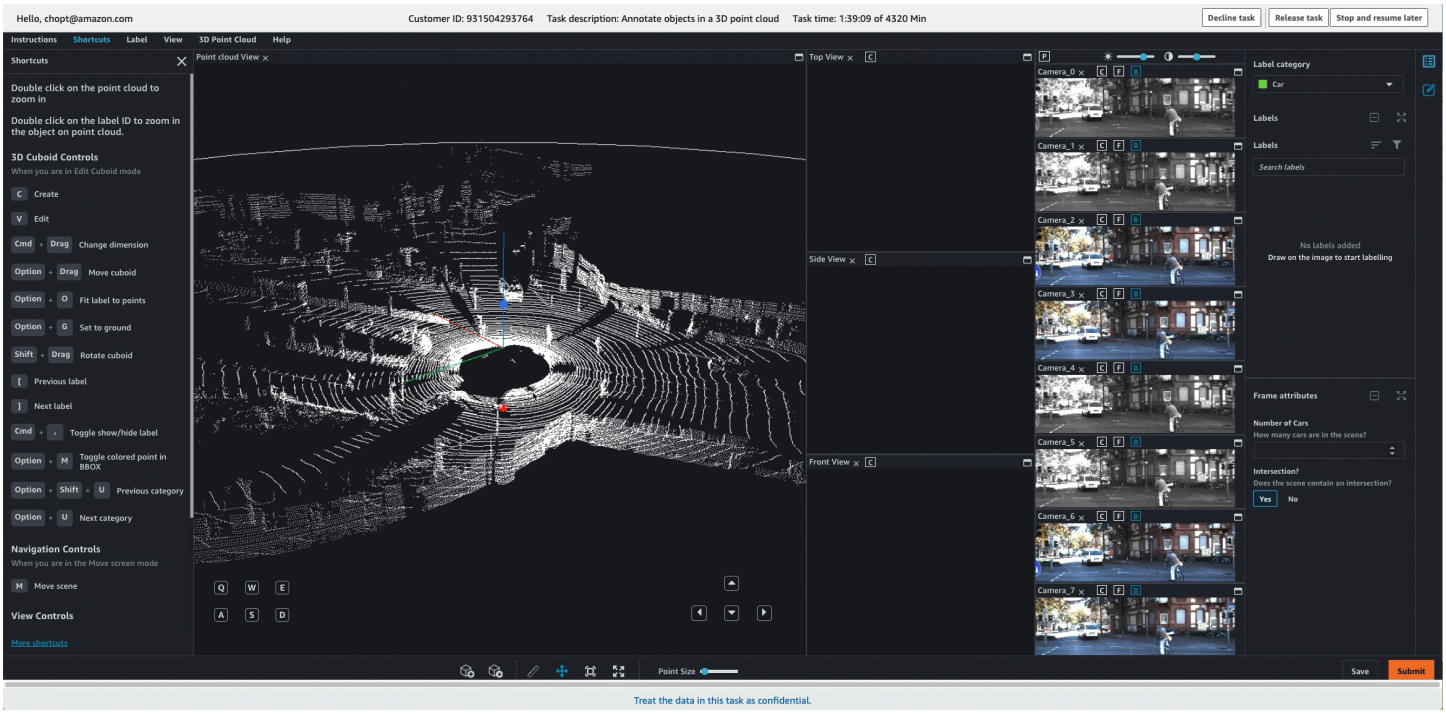
When you are in the worker UI, you see the following menus:

- **Instructions** – Review these instructions before starting your task.
- **Shortcuts** – Use this menu to view keyboard shortcuts that you can use to navigate the point cloud and use the annotation tools provided.

- **Label** – Use this menu to modify a cuboid. First, select a cuboid, and then choose an option from this menu. This menu includes assistive labeling tools like setting a cuboid to the ground and automatically fitting the cuboid to the object's boundaries.
- **View** – Use this menu to toggle different view options on and off. For example, you can use this menu to add a ground mesh to the point cloud, and to choose the projection of the point cloud.
- **3D Point Cloud** – Use this menu to add additional attributes to the points in the point cloud, such as color, and pixel intensity. Note that these options may not be available.

When you open a task, the move scene icon is on, and you can move around the point cloud using your mouse and the navigation buttons in the point cloud area of the screen. To return to the original view you see when you first opened the task, choose the reset scene icon. Resetting the view will not modify your annotations.

After you select the add cuboid icon, you can add cuboids to the 3D point cloud visualization. Once you've added a cuboid, you can adjust it in the three views (top, side, and front) and in the images (if included).



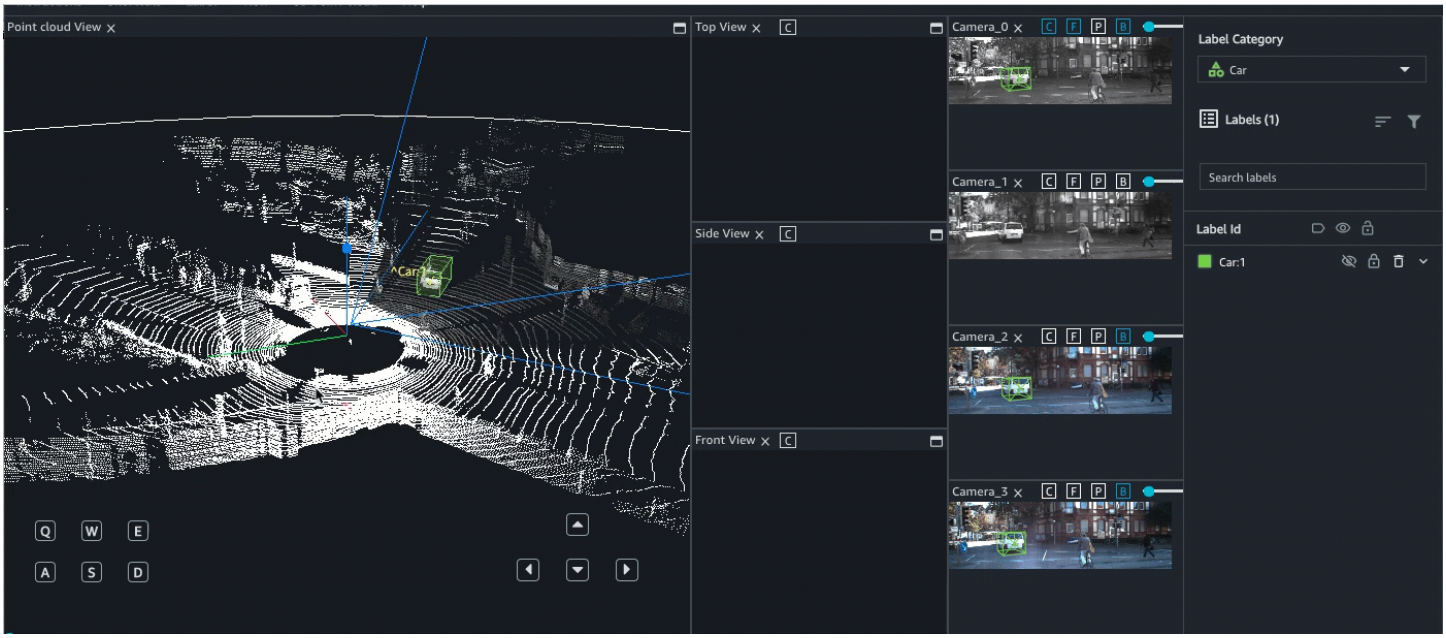
You must choose the move scene icon again to move to another area in the 3D point cloud or image.

To collapse all panels on the right and make the 3D point cloud full-screen, choose the full screen icon.

If camera images are included, you may have the following view options:

- **C** – View the camera angle on point cloud view.
- **F** – View the frustum, or field of view, of the camera used to capture that image on point cloud view.
- **P** – View the point cloud overlaid on the image.
- **B** – View cuboids in the image.

The following video demonstrates how to use these view options. The **F** option is used to view the field of view of the camera (the gray area), the **C** options shows the direction the camera is facing and angle of the camera (blue lines), and the **B** option is used to view the cuboid.



Icon Guide

Use this table to learn about the icons you see in your worker task portal.

Icon		Description
	add cuboid	Choose this icon to add a cuboid. Each cuboid you add is associated with the category you chose.
	edit cuboid	Choose this icon to edit a cuboid. After you have added a cuboid, you can edit its dimensions, location, and

Icon		Description
		orientation. After a cuboid is added, it automatically switches to edit cuboid mode.
	ruler	Use this icon to measure distances, in meters, in the point cloud. You may want to use this tool if your instructions ask you to annotate all objects in a given distance from the center of the cuboid or the object used to capture data. When you select this icon, you can place the starting point (first marker) anywhere in the point cloud by selecting it with your mouse. The tool will automatically use interpolation to place a marker on the closest point within threshold distance to the location you select, otherwise the marker will be placed on ground. If you place a starting point by mistake, you can use the Escape key to revert marker placement. After you place the first marker, you see a dotted line and a dynamic label that indicates the distance you have moved away from the first marker. Click somewhere else on the point cloud to place a second marker. When you place the second marker, the dotted line becomes solid, and the distance is set. After you set a distance, you can edit it by selecting either marker. You can delete a ruler by selecting anywhere on the ruler and using the Delete key on your keyboard.
	reset scene	Choose this icon to reset the view of the point cloud, side panels, and if applicable, all images to their original position when the task was first opened.
	move scene	Choose this icon to move the scene. By default, this icon is chosen when you first start a task.

Icon		Description
	full screen	Choose this icon to make the 3D point cloud visualiza tion full screen, and to collapse all side panels.
	show labels	Show labels in the 3D point cloud visualization, and if applicable, in images.
	hide labels	Hide labels in the 3D point cloud visualization, and if applicable, in images.
	delete labels	Delete a label.

Shortcuts

The shortcuts listed in the **Shortcuts** menu can help you navigate the 3D point cloud and use tools to add and edit cuboids.

Before you start your task, it is recommended that you review the **Shortcuts** menu and become acquainted with these commands. You need to use some of the 3D cuboid controls to edit your cuboid.

Release, Stop and Resume, and Decline Tasks

When you open the labeling task, three buttons on the top right allow you to decline the task (**Decline task**), release it (**Release task**), and stop and resume it at a later time (**Stop and resume later**). The following list describes what happens when you select one of these options:

- **Decline task**: You should only decline a task if something is wrong with the task, such as an issue with the 3D point cloud, images or the UI. If you decline a task, you will not be able to return to the task.
- **Release Task**: If you release a task, you loose all work done on that task. When the task is released, other workers on your team can pick it up. If enough workers pick up the task, you may not be able to return to it. When you select this button and then select **Confirm**, you are returned to the worker portal. If the task is still available, its status will be **Available**. If other workers pick it up, it will disappear from your portal.

- **Stop and resume later**: You can use the **Stop and resume later** button to stop working and return to the task at a later time. You should use the **Save** button to save your work before you select **Stop and resume later**. When you select this button and then select **Confirm**, you are returned to the worker portal, and the task status is **Stopped**. You can select the same task to resume work on it.

  Be aware that the person that creates your labeling tasks specifies a time limit in which all tasks much be completed by. If you do not return to and complete this task within that time limit, it will expire and your work will not be submitted. Contact your administrator for more information.

Saving Your Work and Submitting

You should periodically save your work. Ground Truth will automatically save your work ever 15 minutes.

When you open a task, you must complete your work on it before pressing **Submit**.

3D Point Cloud Object Tracking

Use this page to become familiarize with the user interface and tools available to complete your 3D point cloud object detection task.

Topics

Your Task

When you work on a 3D point cloud object tracking task, you need to select a category from the **Annotations** menu on the right side of your worker portal using the **Label Categories** menu. After you've selected a category, use the add cuboid and fit cuboid tools to fit a cuboid around objects

in the 3D point cloud that this category applies to. After you place a cuboid, you can modify its location, dimensions, and orientation directly in the point cloud, and the three panels shown on the right. If you see one or more images in your worker portal, you can also modify cuboids in the images or in the 3D point cloud and the edits will show up in the other medium.

> **Important**
>
> If you see cuboids have already been added to the 3D point cloud frames when you open your task, adjust those cuboids and add additional cuboids as needed.

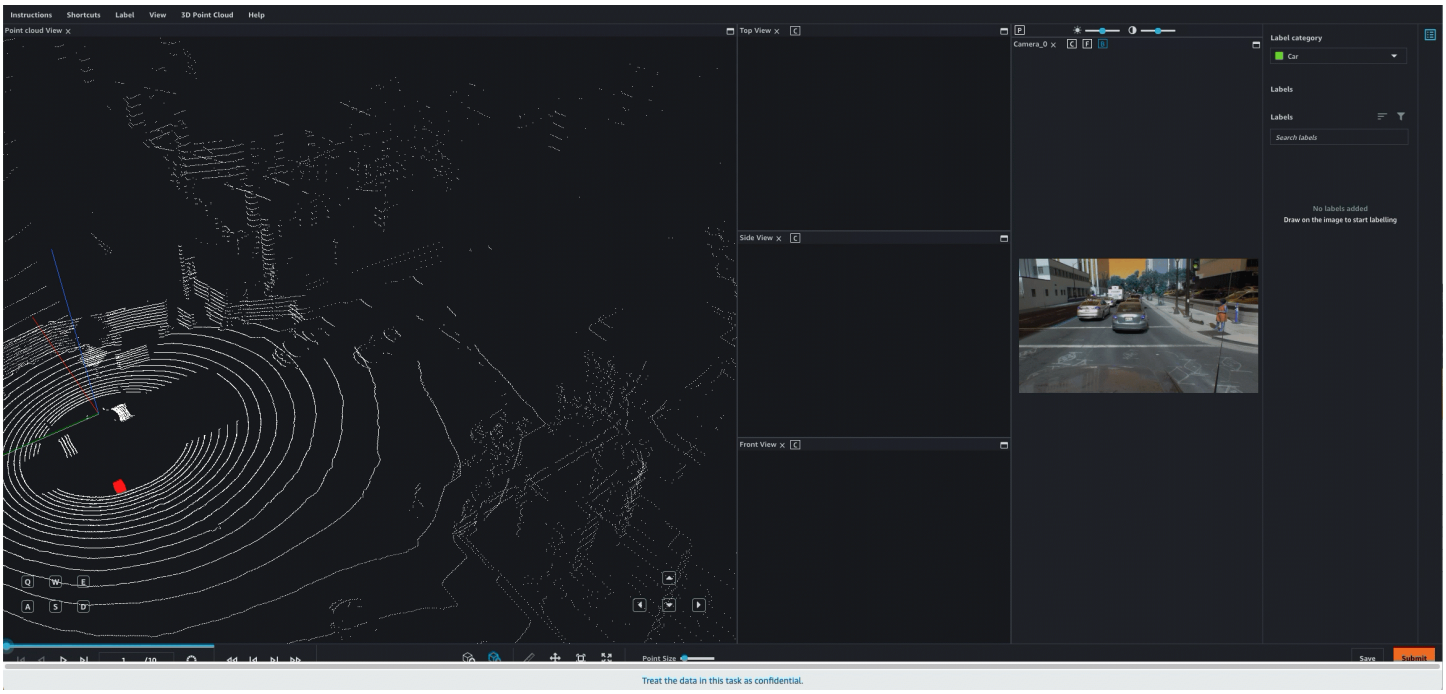
To edit a cuboid, including moving, re-orienting, and changing cuboid dimensions, you must use shortcut keys. You can see a full list of shortcut keys in the **Shortcuts** menu in your UI. The following are important key-combinations that you should become familiar with before starting your labeling task.

Mac Command	Windows Command	Action
Cmd + Drag	Ctrl + Drag	Modify the dimensions of the cuboid.
Option + Drag	Alt + Drag	Move the cuboid.
Shift + Drag	Shift + Drag	Rotate the cuboid.
Option + O	Alt + O	Fit the cuboid tightly around the points it has been drawn around. Before using the option, make sure the cuboid fully-surrounds the object of interest.
Option + G	Alt + G	Set the cuboid to the ground.

When you open your task, two frames will be loaded. If your task includes more than two frames, you need to use the navigation bar in the lower-left corner, or the load frames icon to load additional frames. You should annotate and adjust labels in all frames before submitting.

After you fit a cuboid tightly around the boundaries of an object, navigate to another frame using the navigation bar in the lower-left corner of the UI. If that same object has moved to a new location, add another cuboid and fit it tightly around the boundaries of the object. Each time you manually add a cuboid, you see the frame sequence bar in the lower-left corner of the screen turn red where that frame is located temporally in the sequence.

Your UI automatically infers the location of that object in all other frames after you've placed a cuboid. This is called *interpolation*. You can see the movement of that object, and the inferred and manually created cuboids using the arrows. Adjust inferred cuboids as needed. The following video demonstrates how to navigate between frames. The following video shows how, if you add a cuboid in one frame, and then adjust it in another, your UI will automatically infer the location of the cuboid in all of the frames in-between.

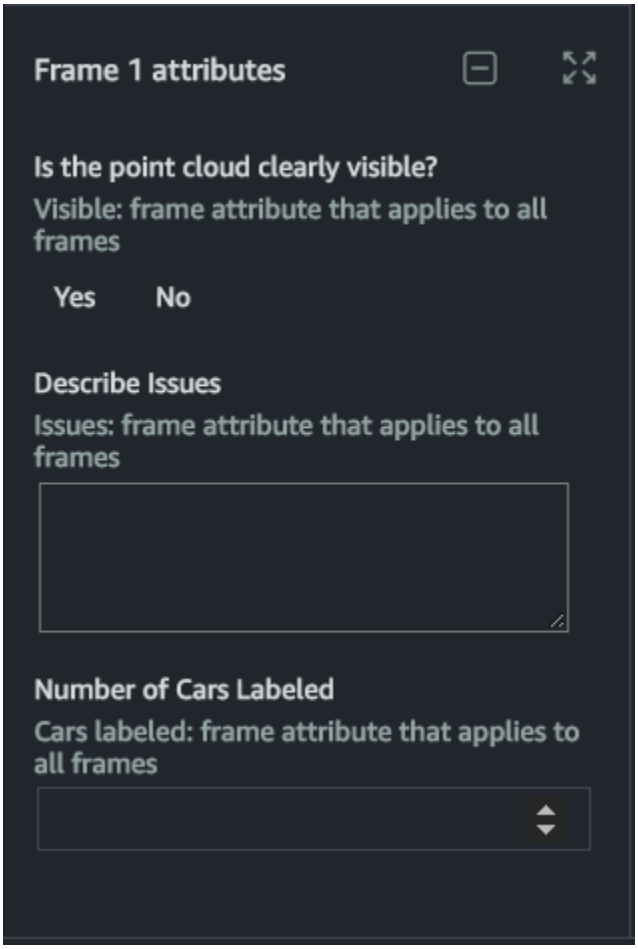


Tip

You can turn off the automatic cuboid interpolation across frames using the 3D Point Cloud menu item. Select **3D Point Cloud** from the top-menu, and then select **Interpolate Cuboids Across Frames**. This will uncheck this option and stop cuboid interpolation. You can reselect this item to turn cuboid interpolation back on.
Turning cuboid interpolation off will not impact cuboids that have already been interpolated across frames.

Individual labels may have one or more label attributes. If a label has a label attribute associated with it, it will appear when you select the downward pointing arrow next to the label from the **Label Id** menu. Fill in required values for all label attributes.

You may see frame attributes under the **Label Id** menu. These attributes will appear on each frame in your task. Use these attribute prompts to enter additional information about each frame.



Navigate the UI

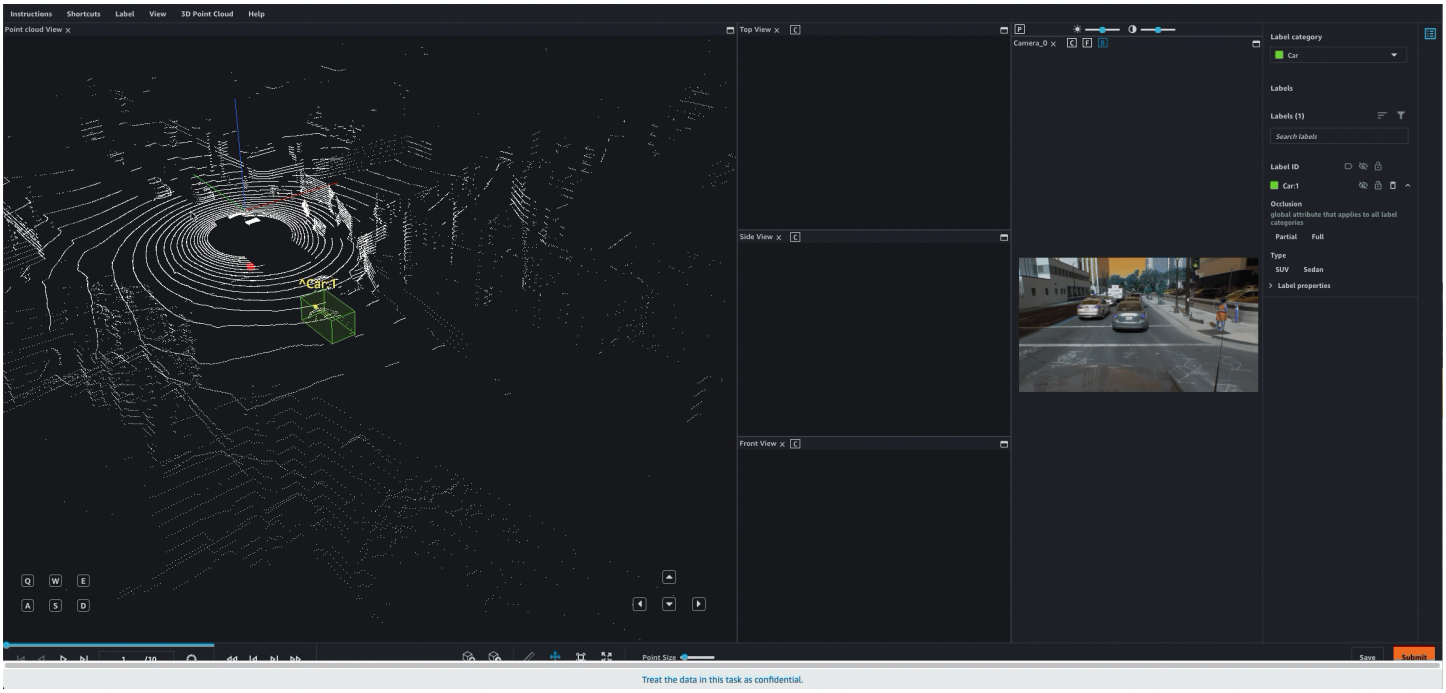
You can navigate in the 3D scene using your keyboard and mouse. You can:

- Double click on specific objects in the point cloud to zoom into them.
- You can use the [and] keys on your keyboard to zoom into and move from one label to the next. If no label is selected, when you select [or], the UI will zoom into the first label in the **Label Id** list.
- Use a mouse-scroller or trackpad to zoom in and out of the point cloud.

- Use both keyboard arrow keys and Q, E, A, and D keys to move Up, Down, Left, Right. Use keyboard keys W and S to zoom in and out.

Once you place a cuboids in the 3D scene, a side-view will appear with three projected views: top, side, and back. These side-views show points in and around the placed cuboid and help workers refine cuboid boundaries in that area. Workers can zoom in and out of each of those side-views using their mouse.

The following video demonstrates movements around the 3D point cloud and in the side-view.



When you are in the worker UI, you see the following menus:

- **Instructions** – Review these instructions before starting your task.
- **Shortcuts** – Use this menu to view keyboard shortcuts that you can use to navigate the point cloud and use the annotation tools provided.
- **Label** – Use this menu to modify a cuboid. First, select a cuboid, and then choose an option from this menu. This menu includes assistive labeling tools like setting a cuboid to the ground and automatically fitting the cuboid to the object's boundaries.
- **View** – Use this menu to toggle different view options on and off. For example, you can use this menu to add a ground mesh to the point cloud, and to choose the projection of the point cloud.
- **3D Point Cloud** – Use this menu to add additional attributes to the points in the point cloud, such as color, and pixel intensity. Note that these options may not be available.

When you open a task, the move scene icon is on, and you can move around the point cloud using your mouse and the navigation buttons in the point cloud area of the screen. To return to the original view you see when you first opened the task, choose the reset scene icon.

After you select the add cuboid icon, you can add cuboids to the point cloud and images (if included). You must select the move scene icon again to move to another area in the 3D point cloud or image.

To collapse all panels on the right and make the 3D point cloud full-screen, choose the full screen icon.

If camera images are included, you may have the following view options:

- **C** – View the camera angle on point cloud view.
- **F** – View the frustum, or field of view, of the camera used to capture that image on point cloud view.
- **P** – View the point cloud overlaid on the image.
- **B** – View cuboids in the image.

The following video demonstrates how to use these view options. The **F** option is used to view the field of view of the camera (the gray area), the **C** options shows the direction the camera is facing and angle of the camera (blue lines), and the **B** option is used to view the cuboid.

Delete Cuboids

You can select a cuboid or label ID and:

- Delete an individual cuboid in the current frame you are viewing.
- Delete all cuboids with that label ID before or after the frame you are viewing.
- Delete all cuboids with that label ID in all frames.

A common use-case for cuboid deletion is if the object leaves the scene.

You can use one or more of these options to delete both manually placed and interpolated cuboids with the same label ID.

- To delete all cuboids before or after the frame you are currently on, select the cuboid, select the **Label** menu item at the top of the UI and then select one of **Delete in previous frames** or **Delete in next frames**. Use the Shortcuts menu to see the shortcut keys you can use for these options.
- To delete a label in all frames, select **Delete in all frames** from the **Labels** menu, or use the shortcut **Shift + Delete** on your keyboard.
- To delete an individual cuboid from a single frame, select the cuboid and either select the trashcan icon
  ()
  next to that label ID in the **Label ID** sidebar on the right or use the Delete key on your keyboard to delete that cuboid.

If you have manually placed more than one cuboid with the same label in different frames, when you delete one of the manually placed cuboids, all interpolated cuboids adjust. This adjustment happens because the UI uses manually placed cuboids as anchor points when calculating the location of interpolated cuboid. When you remove one of these anchor points, the UI must recalculate the position of interpolated cuboids.

If you delete a cuboid from a frame, but later decide that you want to get it back, you can use the **Duplicate to previous frames** or **Duplicate to next frames** options in the **Label** menu to copy the cuboid into all the previous or all of the following frames, respectively.

Bulk Edit Label Category and Frame Attributes

You can bulk edit label attributes and frame attributes.

When you bulk edit an attribute, you specify one or more ranges of frames that you want to apply the edit to. The attribute you select is edited in all frames in that range, including the start and end frames you specify. When you bulk edit label attributes, the range you specify *must* contain the label that the label attribute is attached to. If you specify frames that do not contain this label, you will receive an error.

To bulk edit an attribute you *must* specify the desired value for the attribute first. For example, if you want to change an attribute from *Yes* to *No*, you must select *No*, and then perform the bulk edit.

You can also specify a new value for an attribute that has not been filled in and then use the bulk edit feature to fill in that value in multiple frames. To do this, select the desired value for the attribute and complete the following procedure.

To bulk edit a label or attribute:

1. Use your mouse to right click the attribute you want to bulk edit.
2. Specify the range of frames you want to apply the bulk edit to using a dash (-) in the text box. For example, if you want to apply the edit to frames one through ten, enter `1-10`. If you want to apply the edit to frames two to five, eight to ten and twenty enter `2-5,8-10,20`.
3. Select **Confirm**.

If you get an error message, verify that you entered a valid range and that the label associated with the label attribute you are editing (if applicable) exists in all frames specified.

You can quickly add a label to all previous or subsequent frames using the **Duplicate to previous frames** and **Duplicate to next frames** options in the **Label** menu at the top of your screen.

Icon Guide

Use this table to learn about the icons you see in your worker task portal.

Icon		Description
	add cuboid	Choose this icon to add a cuboid. Each cuboid you add is associated with the category you chose.
	edit cuboid	Choose this icon to edit a cuboid. After you add a cuboid, you can edit its dimensions, location, and orientation. After a cuboid is added, it automatically switches to edit cuboid mode.
	ruler	Use this icon to measure distances, in meters, in the point cloud. You may want to use this tool if your instructions ask you to annotate all objects in a given distance from the center of the cuboid or the object used to capture data. When you select this icon, you can place the starting point (first marker) anywhere in the point cloud by selecting it with your mouse. The tool will automatically use interpolation to place a marker on the closest point within threshold distance to the location you select, otherwise the marker will be placed on ground. If you place a starting point by mistake, you can use the Escape key to revert marker placement. After you place the first marker, you see a dotted line and a dynamic label that indicates the distance you have moved away from the first marker. Click somewhere else on the point cloud to place a second marker. When you place the second marker, the dotted line becomes solid, and the distance is set. After you set a distance, you can edit it by selecting either marker. You can delete a ruler by selecting anywhere on the ruler and using the Delete key on your keyboard.

Icon		Description
	reset scene	Choose this icon to reset the view of the point cloud, side panels, and if applicable, all images to their original position when the task was first opened.
	move scene	Choose this icon to move the scene. By default, this icon is chosen when you first start a task.
	full screen	Choose this icon to make the 3D point cloud visualiza tion full screen and to collapse all side panels.
	load frames	Choose this icon to load additional frames.
	hide labels	Hide labels in the 3D point cloud visualization, and if applicable, in images.
	show labels	Show labels in the 3D point cloud visualization, and if applicable, in images.
	delete labels	Delete a label. This option can only be used to delete labels you have manually created or adjusted.

Shortcuts

The shortcuts listed in the **Shortcuts** menu can help you navigate the 3D point cloud and use tools to add and edit cuboids.

Before you start your task, it is recommended that you review the **Shortcuts** menu and become acquainted with these commands. You need to use some of the 3D cuboid controls to edit your cuboid.

Release, Stop and Resume, and Decline Tasks

When you open the labeling task, three buttons on the top right allow you to decline the task (**Decline task**), release it (**Release task**), and stop and resume it at a later time (**Stop and resume later**). The following list describes what happens when you select one of these options:

- **Decline task**: You should only decline a task if something is wrong with the task, such as an issue with the 3D point clouds, images or the UI. If you decline a task, you will not be able to return to the task.
- **Release Task**: Use this option to release a task and allow others to work on it. When you release a task, you loose all work done on that task and other workers on your team can pick it up. If enough workers pick up the task, you may not be able to return to it. When you select this button and then select **Confirm**, you are returned to the worker portal. If the task is still available, its status will be **Available**. If other workers pick it up, it will disappear from your portal.
- **Stop and resume later**: You can use the **Stop and resume later** button to stop working and return to the task at a later time. You should use the **Save** button to save your work before you select **Stop and resume later**. When you select this button and then select **Confirm**, you are returned to the worker portal, and the task status is **Stopped**. You can select the same task to resume work on it.

  Be aware that the person that creates your labeling tasks specifies a time limit in which all tasks much be completed by. If you do not return to and complete this task within that time limit, it will expire and your work will not be submitted. Contact your administrator for more information.

Saving Your Work and Submitting

You should periodically save your work. Ground Truth will automatically save your work ever 15 minutes.

When you open a task, you must complete your work on it before pressing **Submit**.

Verify and Adjust Labels

When the labels on a dataset need to be validated, Amazon SageMaker Ground Truth provides functionality to have workers verify that labels are correct or to adjust previous labels.

These types of jobs fall into two distinct categories:

- *Label verification* — Workers indicate if the existing labels are correct, or rate their quality, and can add comments to explain their reasoning. Workers will not be able to modify or adjust labels.

  If you create a 3D point cloud or video frame label adjustment or verification job, you can choose to make label category attributes (not supported for 3D point cloud semantic segmentation) and frame attributes editable by workers.
- *Label adjustment* — Workers adjust prior annotations and, if applicable, label category and frame attributes to correct them.

The following Ground Truth built-in task types support adjustment and verification labeling jobs:

- Bounding box
- Semantic segmentation
- 3D point cloud object detection, 3D point cloud object tracking, and 3D point cloud semantic segmentation
- All video frame object detection and video frame object tracking task types — bounding box, polyline, polygon and keypoint

> **Tip**
>
> For 3D point cloud and video frame labeling verification jobs, it is recommended that you add new label category attributes or frame attributes to the labeling job. Workers can use these attribute to verify individual labels or the entire frame. To learn more about label category and frame attributes, see Worker User Interface (UI) for 3D point cloud and Worker User Interface (UI) for video frame.

You can start a label verification and adjustment jobs using the SageMaker console or the API.

Topics

- Requirements to Create Verification and Adjustment Labeling Jobs
- Create a Label Verification Job (Console)
- Create a Label Adjustment Job (Console)
- Start a Label Verification or Adjustment Job (API)
- Label Verification and Adjustment Data in the Output Manifest

- Cautions and Considerations

Requirements to Create Verification and Adjustment Labeling Jobs

To create a label verification or adjustment job, the following criteria must be satisfied.

- For non streaming labeling jobs: The input manifest file you use must contain the label attribute name (`LabelAttributeName`) of the labels that you want adjusted. When you chain a successfully completed labeling job, the output manifest file is used as the input manifest file for the new, chained job. To learn more about the format of the output manifest file Ground Truth produces for each task type, see Output Data.

  For streaming labeling jobs: The Amazon SNS message you sent to the Amazon SNS input topic of the adjustment or verification labeling job must contain the label attribute name of the labels you want adjusted or verified. To see an example of how you can create an adjustment or verification labeling job with streaming labeling jobs, see this Jupyter Notebook example in GitHub.
- The task type of the verification or adjustment labeling job must be the same as the task type of the original job unless you are using the Image Label Verification task type to verify bounding box or semantic segmentation image labels. See the next bullet point for more details about the video frame task type requirements.
- For video frame annotation verification and adjustment jobs, you must use the same annotation task type used to create the annotations from the previous labeling job. For example, if you create a video frame object detection job to have workers draw bounding boxes around objects, and then you create a video object detection adjustment job, you must specify *bounding boxes* as the annotation task type. To learn more video frame annotation task types, see Task Types.
- The task type you select for the adjustment or verification labeling job must support an audit workflow. The following Ground Truth built-in task types support adjustment and verification labeling jobs: bounding box, semantic segmentation, 3D point cloud object detection, 3D point cloud object tracking, and 3D point cloud semantic segmentation, and all video frame object detection and video frame object tracking task types — bounding box, polyline, polygon and keypoint.

Create a Label Verification Job (Console)

Bounding box and semantic segmentation labeling jobs are created by choosing the **Label verification** task type in the console. To create a verification job for 3D point cloud and video frame task types, you must choose the same task type as the original labeling job and choose to display existing labels. Use one of the following sections to create a label verification job for your task type.

Topics

Create an Image Label Verification Job (Console)

Use the following procedure to create a bounding box or semantic segmentation verification job using the console. This procedure assumes that you have already created a bounding box or semantic segmentation labeling job and its status is Complete. This the labeling job that produces the labels you want verified.

To create an image label verification job:

1. Open the SageMaker console at https://console.aws.amazon.com/sagemaker/ and choose **Labeling jobs**.
2. Start a new labeling job by chaining a prior job or start from scratch, specifying an input manifest that contains labeled data objects.
3. In the **Task type** pane, select **Label verification**.
4. Choose **Next**.
5. In the **Workers** section, choose the type of workforce you would like to use. For more details about your workforce options see Create and Manage Workforces.
6. (Optional) After you've selected your workforce, specify the **Task timeout** and **Task expiration time**.
7. In the **Existing-labels display options** pane, the system shows the available label attribute names in your manifest. Choose the label attribute name that identifies the labels that you want workers to verify. Ground Truth tries to detect and populate these values by analyzing the manifest, but you might need to set the correct value.

8. Use the instructions areas of the tool designer to provide context about what the previous labelers were asked to do and what the current verifiers need to check.

   You can add new labels that workers choose from to verify labels. For example, you can ask workers to verify the image quality, and provide the labels *Clear* and *Blurry*. Workers will also have the option to add a comment to explain their selection.
9. Choose **See preview** to check that the tool is displaying the prior labels correctly and presents the label verification task clearly.
10. Select **Create**. This will create and start your labeling job.

Create a Point Cloud or Video Frame Label Verification Job (Console)

Use the following procedure to create a 3D point cloud or video frame verification job using the console. This procedure assumes that you have already created a labeling job using the task type that produces the types of labels you want to be verified and its status is Complete.

To create an image label verification job:

1. Open the SageMaker console at https://console.aws.amazon.com/sagemaker/ and choose **Labeling jobs**.
2. Start a new labeling job by chaining a prior job or start from scratch, specifying an input manifest that contains labeled data objects.
3. In the **Task type** pane, select the same task type as the labeling job that you chained. For example, if the original labeling job was a video frame object detection keypoint labeling job, select that task type.
4. Choose **Next**.
5. In the **Workers** section, choose the type of workforce you would like to use. For more details about your workforce options see Create and Manage Workforces.
6. (Optional) After you've selected your workforce, specify the **Task timeout** and **Task expiration time**.
7. Toggle on the switch next to **Display existing labels**.
8. Select **Verification**.
9. For **Label attribute name**, choose the name from your manifest that corresponds to the labels that you want to display for verification. You will only see label attribute names for labels that match the task type you selected on the previous screen. Ground Truth tries to detect and populate these values by analyzing the manifest, but you might need to set the correct value.

10. Use the instructions areas of the tool designer to provide context about what the previous labelers were asked to do and what the current verifiers need to check.

    You cannot modify or add new labels. You can remove, modify and add new label category attributes or frame attributes. It is recommended that you add new label category attributes or frame attributes to the labeling job. Workers can use these attribute to verify individual labels or the entire frame.

    By default, preexisting label category attributes and frame attributes will not be editable by workers. If you want to make a label category or frame attribute editable, select the **Allow workers to edit this attribute** check box for that attribute.

    To learn more about label category and frame attributes, see Worker User Interface (UI) for 3D point cloud and Worker User Interface (UI) for video frame.
11. Choose **See preview** to check that the tool is displaying the prior labels correctly and presents the label verification task clearly.
12. Select **Create**. This will create and start your labeling job.

Create a Label Adjustment Job (Console)

Use one of the following sections to create a label verification job for your task type.

Topics

- Create an Image Label Adjustment Job (Console)
- Create a Point Cloud or Video Frame Label Adjustment Job (Console)

Create an Image Label Adjustment Job (Console)

Use the following procedure to create a bounding box or semantic segmentation adjustment labeling job using the console. This procedure assumes that you have already created a bounding box or semantic segmentation labeling job and its status is Complete. This the labeling job that produces the labels you want adjusted.

To create an image label adjustment job (console)

1. Open the SageMaker console at https://console.aws.amazon.com/sagemaker/ and choose **Labeling jobs**.

2. Start a new labeling job by chaining a prior job or start from scratch, specifying an input manifest that contains labeled data objects.
3. Choose the same task type as the original labeling job.
4. Choose **Next**.
5. In the **Workers** section, choose the type of workforce you would like to use. For more details about your workforce options see Create and Manage Workforces.
6. (Optional) After you've selected your workforce, specify the **Task timeout** and **Task expiration time**.
7. Expand **Existing-labels display options** by selecting the arrow next to the title.
8. Check the box next to **I want to display existing labels from the dataset for this job**.
9. For **Label attribute name**, choose the name from your manifest that corresponds to the labels that you want to display for adjustment. You will only see label attribute names for labels that match the task type you selected on the previous screen. Ground Truth tries to detect and populate these values by analyzing the manifest, but you might need to set the correct value.
10. Use the instructions areas of the tool designer to provide context about what the previous labelers were tasked with doing and what the current verifiers need to check and adjust.
11. Choose **See preview** to check that the tool shows the prior labels correctly and presents the task clearly.
12. Select **Create**. This will create and start your labeling job.

Create a Point Cloud or Video Frame Label Adjustment Job (Console)

Use the following procedure to create a 3D point cloud or video frame adjustment job using the console. This procedure assumes that you have already created a labeling job using the task type that produces the types of labels you want to be verified and its status is Complete.

To create a 3D point cloud or video frame label adjustment job (console)

1. Open the SageMaker console: https://console.aws.amazon.com/sagemaker/ and choose **Labeling jobs**.
2. Start a new labeling job by chaining a prior job or start from scratch, specifying an input manifest that contains labeled data objects.
3. Choose the same task type as the original labeling job.
4. Toggle on the switch next to **Display existing labels**.

5. Select **Adjustment**.
6. For **Label attribute name**, choose the name from your manifest that corresponds to the labels that you want to display for adjustment. You will only see label attribute names for labels that match the task type you selected on the previous screen. Ground Truth tries to detect and populate these values by analyzing the manifest, but you might need to set the correct value.
7. Use the instructions areas of the tool designer to provide context about what the previous labelers were asked to do and what the current adjusters need to check.

   You cannot remove or modify existing labels but you can add new labels. You can remove, modify and add new label category attributes or frame attributes.

   Be default, preexisting label category attributes and frame attributes will be editable by workers. If you want to make a label category or frame attribute uneditable, deselect the **Allow workers to edit this attribute** check box for that attribute.

   To learn more about label category and frame attributes, see Worker User Interface (UI) for 3D point cloud and Worker User Interface (UI) for video frame.
8. Choose **See preview** to check that the tool shows the prior labels correctly and presents the task clearly.
9. Select **Create**. This will create and start your labeling job.

Start a Label Verification or Adjustment Job (API)

Start a label verification or adjustment job by chaining a successfully completed job or starting a new job from scratch using the `CreateLabelingJob` operation. The procedure is almost the same as setting up a new labeling job with `CreateLabelingJob`, with a few modifications. Use the following sections to learn what modifications are required to chain a labeling job to create an adjustment or verification labeling job.

When you create an adjustment or verification labeling job using the Ground Truth API, you *must* use a different `LabelAttributeName` than the original labeling job. The original labeling job is the job used to create the labels you want adjusted or verified.

> **Important**
>
> The label category configuration file you identify for an adjustment or verification job in `LabelCategoryConfigS3Uri` of `CreateLabelingJob` must contain the same labels

used in the original labeling job. You can add new labels. For 3D point cloud and video frame jobs, you can add new label category and frame attributes to the label category configuration file.

Bounding Box and Semantic Segmentation

To create a bounding box or semantic segmentation label verification or adjustment job, use the following guidelines to specify API attributes for the `CreateLabelingJob` operation.

- Use the `LabelAttributeName` parameter to specify the output label name that you want to use for verified or adjusted labels. You must use a different `LabelAttributeName` than the one used for the original labeling job.
- If you are chaining the job, the labels from the previous labeling job to be adjusted or verified will be specified in the custom UI template. To learn how to create a custom template, see Create Custom Worker Task Templates.

  Identify the location of the UI template in the `UiTemplateS3Uri` parameter. SageMaker provides widgets that you can use in your custom template to display old labels. Use the `initial-value` attribute in one of the following crowd elements to extract the labels that need verification or adjustment and include them in your task template:

  - crowd-semantic-segmentation—Use this crowd element in your custom UI task template to specify semantic segmentation labels that need to be verified or adjusted.
  - crowd-bounding-box—Use this crowd element in your custom UI task template to specify bounding box labels that need to be verified or adjusted.
- The `LabelCategoryConfigS3Uri` parameter must contain the same label categories as the previous labeling job.
- Use the bounding box or semantic segmentation adjustment or verification lambda ARNs for `PreHumanTaskLambdaArn` and `AnnotationConsolidationLambdaArn`:
  - For bounding box, the adjustment labeling job lambda function ARNs end with `AdjustmentBoundingBox` and the verification lambda function ARNs end with `VerificationBoundingBox`.
  - For semantic segmentation, the adjustment labeling job lambda function ARNs end with `AdjustmentSemanticSegmentation` and the verification lambda function ARNs end with `VerificationSemanticSegmentation`.

3D Point Cloud and Video Frame

- Use the `LabelAttributeName` parameter to specify the output label name that you want to use for verified or adjusted labels. You must use a different `LabelAttributeName` than the one used for the original labeling job.
- You must use the human task UI Amazon Resource Name (ARN) (`HumanTaskUiArn`) used for the original labeling job. To see supported ARNs, see `HumanTaskUiArn`.
- In the label category configuration file, you must specify the label attribute name (`LabelAttributeName`) of the previous labeling job that you use to create the adjustment or verification labeling job in the `auditLabelAttributeName` parameter.
- You specify whether your labeling job is a *verification* or *adjustment* labeling job using the `editsAllowed` parameter in your label category configuration file identified by the `LabelCategoryConfigS3Uri` parameter.
  - For *verification* labeling jobs, you must use the `editsAllowed` parameter to specify that all labels cannot be modified. `editsAllowed` must be set to `"none"` in each entry in `labels`. Optionally, you can specify whether or not label categories attributes and frame attributes can be adjusted by workers.
  - Optionally, for *adjustment* labeling jobs, you can use the `editsAllowed` parameter to specify labels, label category attributes, and frame attributes that can or cannot be modified by workers. If you do not use this parameter, all labels, label category attributes, and frame attributes will be adjustable.

  To learn more about the `editsAllowed` parameter and configuring your label category configuration file, see Label Category Configuration File Schema.
- Use the 3D point cloud or video frame adjustment lambda ARNs for `PreHumanTaskLambdaArn` and `AnnotationConsolidationLambdaArn` for both adjustment and verification labeling jobs:
  - For 3D point clouds, the adjustment and verification labeling job lambda function ARNs end with `Adjustment3DPointCloudSemanticSegmentation`, `Adjustment3DPointCloudObjectTracking`, and `Adjustment3DPointCloudObjectDetection` for 3D point cloud semantic segmentation, object detection, and object tracking respectively.
  - For video frames, the adjustment and verification labeling job lambda function ARNs end with `AdjustmentVideoObjectDetection` and `AdjustmentVideoObjectTracking` for video frame object detection and object tracking respectively.

Ground Truth stores the output data from a label verification or adjustment job in the S3 bucket that you specified in the `S3OutputPath` parameter of the `CreateLabelingJob` operation. For more information about the output data from a label verification or adjustment labeling job, see Label Verification and Adjustment Data in the Output Manifest.

Label Verification and Adjustment Data in the Output Manifest

Amazon SageMaker Ground Truth writes label verification data to the output manifest within the metadata for the label. It adds two properties to the metadata:

- A `type` property, with a value of "`groundtruth/label-verification`.
- A `worker-feedback` property, with an array of `comment` values. This property is added when the worker enters comments. If there are no comments, the field doesn't appear.

The following example output manifest shows how label verification data appears:

```
{
  "source-ref":"S3 bucket location",
  "verify-bounding-box":"1",
  "verify-bounding-box-metadata":
  {
    "class-name": "bad",
    "confidence": 0.93,
    "type": "groundtruth/label-verification",
    "job-name": "verify-bounding-boxes",
    "human-annotated": "yes",
    "creation-date": "2018-10-18T22:18:13.527256",
    "worker-feedback": [
      {"comment": "The bounding box on the bird is too wide on the right side."},
      {"comment": "The bird on the upper right is not labeled."}
    ]
  }
}
```

The worker output of adjustment tasks resembles the worker output of the original task, except that it contains the adjusted values and an `adjustment-status` property with the value of `adjusted` or `unadjusted` to indicate whether an adjustment was made.

For more examples of the output of different tasks, see Output Data.

Cautions and Considerations

To get expected behavior when creating a label verification or adjustment job, carefully verify your input data.

- If you are using image data, verify that your manifest file contains hexadecimal RGB color information.
- To save money on processing costs, filter your data to ensure you are not including unwanted objects in your labeling job input manifest.
- Add required Amazon S3 permissions to ensure your input data is processed correctly.

When you create an adjustment or verification labeling job using the Ground Truth API, you *must* use a different `LabelAttributeName` than the original labeling job.

Color Information Requirements for Semantic Segmentation Jobs

To properly reproduce color information in verification or adjustment tasks, the tool requires hexadecimal RGB color information in the manifest (for example, #FFFFFF for white). When you set up a Semantic Segmentation verification or adjustment job, the tool examines the manifest to determine if this information is present. If it can't find it,Amazon SageMaker Ground Truth displays an error message and the ends job setup.

In prior iterations of the Semantic Segmentation tool, category color information wasn't output in hexadecimal RGB format to the output manifest. That feature was introduced to the output manifest at the same time the verification and adjustment workflows were introduced. Therefore, older output manifests aren't compatible with this new workflow.

Filter Your Data Before Starting the Job

Amazon SageMaker Ground Truth processes all objects in your input manifest. If you have a partially labeled data set, you might want to create a custom manifest using an Amazon S3 Select query on your input manifest. Unlabeled objects individually fail, but they don't cause the job to fail, and they might incur processing costs. Filtering out objects you don't want verified reduces your costs.

If you create a verification job using the console, you can use the filtering tools provided there. If you create jobs using the API, make filtering your data part of your workflow where needed.

Creating Custom Labeling Workflows

This document guides you through the process of setting up a workflow with a custom labeling template. To learn more about starting a labeling job, see Getting started. In that section, when you choose the **Task type**, select **Custom labeling task**, and then follow this section's instructions to configure it.

Topics

For more information about creating custom labeling workflows, see Build a custom data labeling workflow with Amazon SageMaker Ground Truth.

Step 1: Setting up your workforce

In this step you use the console to establish which worker type to use and make the necessary sub-selections for the worker type. It assumes you have already completed the steps up to this point in the Getting started section and have chosen the **Custom labeling task** as the **Task type**.

To configure your workforce.

1. First choose an option from the **Worker types**. There are three types currently available:

   - **Public** uses an on-demand workforce of independent contractors, powered by Amazon Mechanical Turk. They are paid on a per-task basis.
   - **Private** uses your employees or contractors for handling data that needs to stay within your organization.
   - **Vendor** uses third party vendors that specialize in providing data labeling services, available via the AWS Marketplace.
2. If you choose the **Public** option, you are asked to set the **number of workers per dataset object**. Having more than one worker perform the same task on the same object can help

increase the accuracy of your results. The default is three. You can raise or lower that depending on the accuracy you need.

You are also asked to set a **price per task** by using a drop-down menu. The menu recommends price points based on how long it will take to complete the task.

The recommended method to determine this is to first run a short test of your task with a **private** workforce. The test provides a realistic estimate of how long the task takes to complete. You can then select the range your estimate falls within on the **Price per task** menu. If your average time is more than 5 minutes, consider breaking your task into smaller units.

Next

Step 2: Creating your custom worker task template

Step 2: Creating your custom worker task template

A *worker task template* is a file used by Ground Truth to customize the worker user interface (UI), or human task UI. You can create a worker task template using HTML, CSS, JavaScript, Liquid template language, and Crowd HTML Elements. Liquid is used to automate the template, and Crowd HTML Elements can be used to include common annotation tools and provide the logic to submit to Ground Truth.

Use the following topics to learn how you can create a worker task template. You can see a repository of example Ground Truth worker task templates on GitHub.

Topics

Starting with a base template

You can use a template editor in the Ground Truth console to start creating a template. This editor includes a number of pre-designed base templates and an HTML and Crowd HTML Element autofill feature.

To access the Ground Truth custom template editor:

1. Following the instructions in Create a Labeling Job (Console) and select **Custom** for the labeling job **Task type**.
2. When you select **Next**, you will be able to access the template editor and base templates in the **Custom labeling task setup** section.
3. (Optional) Select a base template from the drop-down menu under **Templates**. If you prefer to create a template from scratch, choose **Custom** from the drop down-menu for a minimal template skeleton.

Developing templates locally

While you need to be in the console to test how your template will process incoming data, you can test the look and feel of your template's HTML and custom elements in your browser by adding this code to the top of your HTML file.

Example

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
```

This loads the necessary code to render the custom HTML elements. Use this if you want to develop your template's look and feel in your preferred editor rather than in the console.

Remember, though, this will not parse your variables. You may want to replace them with sample content while developing locally.

Using External Assets

Amazon SageMaker Ground Truth custom templates allow external scripts and style sheets to be embedded. For example, the following code block demonstrates how you would add a style sheet located at `https://www.example.com/my-enhancement-styles.css` to your template.

Example

```
<script src="https://www.example.com/my-enhancment-script.js"></script>
<link rel="stylesheet" type="text/css" href="https://www.example.com/my-enhancement-
styles.css">
```

If you encounter errors, ensure that your originating server is sending the correct MIME type and encoding headers with the assets.

For example, the MIME and encoding types for remote scripts are: `application/javascript;CHARSET=UTF-8`.

The MIME and encoding type for remote stylesheets are: `text/css;CHARSET=UTF-8`.

Track your variables

In the process of building the sample below, there will be a step that adds variables to it to represent the pieces of data that may change from task to task, worker to worker. If you're starting with one of the sample templates, you will need to make sure you're aware of the variables it already uses. When you create your pre-annotation AWS Lambda script, its output will need to contain values for any of those variables you choose to keep.

The values you use for the variables can come from your manifest file. All the key-value pairs in your data object are provided to your pre-annotation Lambda. If it's a simple pass-through script, matching keys for values in your data object to variable names in your template is the easiest way to pass those values through to the tasks forms your workers see.

A simple sample

All tasks begin and end with the `<crowd-form> </crowd-form>` elements. Like standard HTML `<form>` elements, all of your form code should go between them.

For a simple tweet-analysis task, use the `<crowd-classifier>` element. It requires the following attributes:

- *name* - the variable name to use for the result in the form output.
- *categories* - a JSON formatted array of the possible answers.
- *header* - a title for the annotation tool

As children of the `<crowd-classifier>` element, you must have three regions.

- *<classification-target>* - the text the worker will classify based on the options specified in the `categories` attribute above.
- *<full-instructions>* - instructions that are available from the "View full instructions" link in the tool. This can be left blank, but it is recommended that you give good instructions to get better results.
- *<short-instructions>* - a more brief description of the task that appears in the tool's sidebar. This can be left blank, but it is recommended that you give good instructions to get better results.

A simple version of this tool would look like this.

Example of using `crowd-classifier`

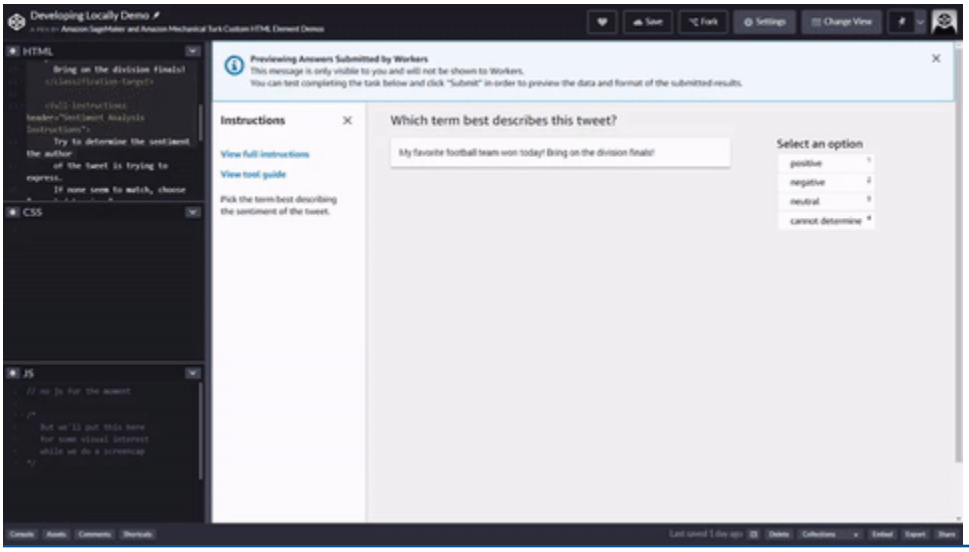
```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-classifier
    name="tweetFeeling"
    categories="['positive','negative','neutral', 'unclear']"
    header="Which term best describes this tweet?"
  >
     <classification-target>
      My favorite football team won today!
      Bring on the division finals!
    </classification-target>

    <full-instructions header="Sentiment Analysis Instructions">
      Try to determine the sentiment the author
      of the tweet is trying to express.
      If none seem to match, choose "cannot determine."
    </full-instructions>

    <short-instructions>
      Pick the term best describing the sentiment
      of the tweet.
    </short-instructions>

  </crowd-classifier>
</crowd-form>
```

You can copy and paste the code into the editor in the Ground Truth labeling job creation workflow to preview the tool, or try out a demo of this code on CodePen.



Adding automation with Liquid

Our custom template system uses Liquid for automation. It is an open source inline markup language. In Liquid, the text between single curly braces and percent symbols is an instruction or *tag* that performs an operation like control flow or iteration. Text between double curly braces is a variable or *object* that outputs its value.

The most common use of Liquid will be to parse the data coming from your **pre-annotation Lambda** and pull out the relevant variables to create the task. The `taskInput` object returned by your Pre-annotation Lambda will be available as the `task.input` object in your templates.

The properties in your manifest's data objects are passed into your Pre-annotation Lambda as the `event.dataObject`. A simple pass-through script simply returns that object as the `taskInput` object. You would represent values from your manifest as variables as follows.

Example Manifest data object

```
{
  "source": "This is a sample text for classification",
  "labels": [ "angry" , "sad" , "happy" , "inconclusive" ],
  "header": "What emotion is the speaker feeling?"
}
```

Example Sample HTML using variables

```
<crowd-classifier
  name='tweetFeeling'
```

```
  categories='{{ task.input.labels | to_json }}'
  header='{{ task.input.header }}' >
<classification-target>
  {{ task.input.source }}
</classification-target>
```

Note the addition of " | to_json" to the labels property above. That's a filter to turn the array into a JSON representation of the array. Variable filters are explained in the next section.

The following list includes two types of Liquid tags that you may find useful to automate template input data processing. If you select one of the following tag-types, you will be redirected to the Liquid documentation.

- Control flow: Includes programming logic operators like if/else, unless, and case/when.
- Iteration: Enables you to run blocks of code repeatedly using statements like for loops.

  For an example of an HTML template that uses Liquid elements to create a for loop, see translation-review-and-correction.liquid.html in GitHub.

For more information and documentation, visit the Liquid homepage.

Variable filters

In addition to the standard Liquid filters and actions, Ground Truth offers a few additional filters. Filters are applied by placing a pipe (|) character after the variable name, then specifying a filter name. Filters can be chained in the form of:

Example

```
{{ <content> | <filter> | <filter> }}
```

Autoescape and explicit escape

By default, inputs will be HTML escaped to prevent confusion between your variable text and HTML. You can explicitly add the escape filter to make it more obvious to someone reading the source of your template that the escaping is being done.

escape_once

escape_once ensures that if you've already escaped your code, it doesn't get re-escaped on top of that. For example, so that & doesn't become &.

skip_autoescape

`skip_autoescape` is useful when your content is meant to be used as HTML. For example, you might have a few paragraphs of text and some images in the full instructions for a bounding box.

> **Use `skip_autoescape` sparingly**
>
> The best practice in templates is to avoid passing in functional code or markup with `skip_autoescape` unless you are absolutely sure you have strict control over what's being passed. If you're passing user input, you could be opening your workers up to a Cross Site Scripting attack.

to_json

`to_json` will encode what you feed it to JSON (JavaScript Object Notation). If you feed it an object, it will serialize it.

grant_read_access

`grant_read_access` takes an S3 URI and encodes it into an HTTPS URL with a short-lived access token for that resource. This makes it possible to display to workers photo, audio, or video objects stored in S3 buckets that are not otherwise publicly accessible.

Example of the filters

Input

```
auto-escape: {{ "Have you read 'James & the Giant Peach'?" }}
explicit escape: {{ "Have you read 'James & the Giant Peach'?" | escape }}
explicit escape_once: {{ "Have you read 'James &amp; the Giant Peach'?" |
 escape_once }}
skip_autoescape: {{ "Have you read 'James & the Giant Peach'?" | skip_autoescape }}
to_json: {{ jsObject | to_json }}
grant_read_access: {{ "s3://mybucket/myphoto.png" | grant_read_access }}
```

Example

Output

```
auto-escape: Have you read &#39;James &amp; the Giant Peach&#39;?
explicit escape: Have you read &#39;James &amp; the Giant Peach&#39;?
```

```
explicit escape_once: Have you read &#39;James &amp; the Giant Peach&#39;?
skip_autoescape: Have you read 'James & the Giant Peach'?
to_json: { "point_number": 8, "coords": [ 59, 76 ] }
grant_read_access: https://s3.amazonaws.com/mybucket/myphoto.png?<access token and
 other params>
```

Example of an automated classification template.

To automate the simple text classification sample, replace the tweet text with a variable.

The text classification template is below with automation added. The changes/additions are highlighted in bold.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-classifier
    name="tweetFeeling"
    categories="['positive', 'negative', 'neutral', 'cannot determine']"
    header="Which term best describes this tweet?"
  >
    <classification-target>
       {{ task.input.source }}
    </classification-target>

    <full-instructions header="Analyzing a sentiment">
      Try to determine the feeling the author
      of the tweet is trying to express.
      If none seem to match, choose "other."
    </full-instructions>

    <short-instructions>
      Pick the term best describing the sentiment
      of the tweet.
    </short-instructions>

  </crowd-classifier>
</crowd-form>
```

The tweet text that was in the prior sample is now replaced with an object. The `entry.taskInput` object uses `source` (or another name you specify in your pre-annotation Lambda) as the property name for the text and it is inserted directly in the HTML by virtue of being between double curly braces.

End-to-end demos

You can view the following end-to-end demos which include sample Lambda function:

- Demo Template: Annotation of Images with `crowd-bounding-box`
- Demo Template: Labeling Intents with `crowd-classifier`

Step 3: Processing with AWS Lambda

In this step, you learn how to create and specify the two types of AWS Lambda functions that are required to create a custom labeling workflow:

- *Pre-annotation Lambda*: This function initiates for and pre-processes each data object sent to your labeling job prior to sending it to workers.
- *Post-annotation Lambda*: This function processes the results once workers submit a task. If you specify multiple workers per data object, this function may include logic to consolidate annotations.

If you are a new user of Lambda and Ground Truth, we recommend that you use the pages in this section as follows:

1. First, review Pre-annotation and Post-annotation Lambda Function Requirements.
2. Then, use the page Required Permissions To Use AWS Lambda With Ground Truth to learn about security and permission requirements to use your pre-annotation and post-annotation Lambda functions in a Ground Truth custom labeling job.
3. Next, you need to visit the Lambda console or use Lambda's APIs to create your functions. Use the section Create Lambda Functions for a Custom Labeling Workflow to learn how to create Lambda functions.
4. To learn how to test your Lambda functions, see Test Pre-Annotation and Post-Annotation Lambda Functions.
5. After you create pre-processing and post-processing Lambda functions, select them from the **Lambda functions** section that comes after the code editor for your custom HTML in the Ground Truth console. To learn how to use these functions in a `CreateLabelingJob` API request, see Create a Labeling Job (API).

For a custom labeling workflow tutorial that includes example pre-annotation and post-annotation Lambda functions, in the "Demo Template: Annotation of Images with `crowd-bounding-box`" document.

- Create Lambda Functions for a Custom Labeling Workflow
- Test Pre-Annotation and Post-Annotation Lambda Functions

Pre-annotation and Post-annotation Lambda Function Requirements

Use this section to learn about the syntax of the requests sent to pre-annotation and post-annotation Lambda functions, and the response syntax that Ground Truth requires to run a custom labeling workflow.

Topics

- Pre-annotation Lambda
- Post-annotation Lambda

Pre-annotation Lambda

Before a labeling task is sent to the worker, your pre-annotation Lambda function is invoked.

Ground Truth sends your Lambda function a JSON-formatted request to provide details about the labeling job and the data object. The following table contains the pre-annotation request schemas. Each parameter is described below.

Data object identified with "source-ref"

```
{
    "version": "2018-10-16",
    "labelingJobArn": <labelingJobArn>
    "dataObject" : {
        "source-ref": <s3Uri>
    }
}
```

Data object identified with "source"

```
{
    "version": "2018-10-16",
    "labelingJobArn": <labelingJobArn>
    "dataObject" : {
        "source": <string>
    }
}
```

- `version` (string): This is a version number used internally by Ground Truth.
- `labelingJobArn` (string): This is the Amazon Resource Name, or ARN, of your labeling job. This ARN can be used to reference the labeling job when using Ground Truth API operations such as `DescribeLabelingJob`.
- The `dataObject` (JSON object): The key contains a single JSON line, either from your input manifest file or sent from Amazon SNS. The JSON line objects in your manifest can be up to 100 kilobytes in size and contain a variety of data. For a very basic image annotation job, the `dataObject` JSON may just contain a `source-ref` key, identifying the image to be annotated. If the data object (for example, a line of text) is included directly in the input manifest file, the data object is identified with `source`. If you create a verification or adjustment job, this line may contain label data and metadata from the previous labeling job.

The following table includes code block examples of a pre-annotation request. Each parameter in these example requests is explained below the tabbed table.

Data object identified with "source-ref"

```
{
    "version": "2018-10-16",
    "labelingJobArn": "arn:aws:sagemaker:<aws_region>:<aws_account_number>:labeling-
job/<labeling_job_name>"
    "dataObject" : {
        "source-ref": "s3://<input-data-bucket>/<data-object-file-name>"
    }
}
```

Data object identified with "source"

```
{
    "version": "2018-10-16",
    "labelingJobArn": "arn:aws:sagemaker:<aws_region>:<aws_account_number>:labeling-job/<labeling_job_name>"
    "dataObject" : {
        "source": "Sue purchased 10 shares of the stock on April 10th, 2020"
    }
}
```

In return, Ground Truth requires a response formatted like the following:

Example of expected return data

```
{
    "taskInput": <json object>,
    "isHumanAnnotationRequired": <boolean> # Optional
}
```

In the previous example, the `<json object>` needs to contain *all* the data your custom worker task template needs. If you're doing a bounding box task where the instructions stay the same all the time, it may just be the HTTP(S) or Amazon S3 resource for your image file. If it's a sentiment analysis task and different objects may have different choices, it is the object reference as a string and the choices as an array of strings.

Implications of `isHumanAnnotationRequired`

This value is optional because it defaults to `true`. The primary use case for explicitly setting it is when you want to exclude this data object from being labeled by human workers.

If you have a mix of objects in your manifest, with some requiring human annotation and some not needing it, you can include a `isHumanAnnotationRequired` value in each data object. You can add logic to your pre-annotation Lambda to dynamically determine if an object requires annotation, and set this boolean value accordingly.

Examples of Pre-annotation Lambda Functions

The following, basic pre-annotation Lambda function accesses the JSON object in `dataObject` from the initial request, and returns it in the `taskInput` parameter.

```
import json

def lambda_handler(event, context):
    return {
        "taskInput":  event['dataObject']
    }
```

Assuming the input manifest file uses `"source-ref"` to identify data objects, the worker task template used in the same labeling job as this pre-annotation Lambda must include a Liquid element like the following to ingest `dataObject`:

```
{{ task.input.source-ref | grant_read_access }}
```

If the input manifest file used `source` to identify the data object, the work task template can ingest `dataObject` with the following:

```
{{ task.input.source }}
```

The following pre-annotation Lambda example includes logic to identify the key used in `dataObject`, and to point to that data object using `taskObject` in the Lambda's return statement.

```
import json

def lambda_handler(event, context):

    # Event received
    print("Received event: " + json.dumps(event, indent=2))

    # Get source if specified
    source = event['dataObject']['source'] if "source" in event['dataObject'] else None

    # Get source-ref if specified
    source_ref = event['dataObject']['source-ref'] if "source-ref" in
 event['dataObject'] else None
```

```
    # if source field present, take that otherwise take source-ref
    task_object = source if source is not None else source_ref

    # Build response object
    output = {
        "taskInput": {
            "taskObject": task_object
        },
        "humanAnnotationRequired": "true"
    }

    print(output)
    # If neither source nor source-ref specified, mark the annotation failed
    if task_object is None:
        print(" Failed to pre-process {} !".format(event["labelingJobArn"]))
        output["humanAnnotationRequired"] = "false"

    return output
```

Post-annotation Lambda

When all workers have annotated the data object or when `TaskAvailabilityLifetimeInSeconds` has been reached, whichever comes first, Ground Truth sends those annotations to your post-annotation Lambda. This Lambda is generally used for Consolidate Annotations.

> **Tip**
>
> To see an example of a post-consolidation Lambda function, see annotation_consolidation_lambda.py in the aws-sagemaker-ground-truth-recipe GitHub repository.

The following code block contains the post-annotation request schema. Each parameter is described in the following bulleted list.

```
{
    "version": "2018-10-16",
    "labelingJobArn": <string>,
    "labelCategories": [<string>],
```

```
    "labelAttributeName": <string>,
    "roleArn" : <string>,
    "payload": {
        "s3Uri": <string>
    }
}
```

- `version` (string): A version number used internally by Ground Truth.
- `labelingJobArn` (string): The Amazon Resource Name, or ARN, of your labeling job. This ARN can be used to reference the labeling job when using Ground Truth API operations such as `DescribeLabelingJob`.
- `labelCategories` (list of strings): Includes the label categories and other attributes you either specified in the console, or that you include in the label category configuration file.
- `labelAttributeName` (string): Either the name of your labeling job, or the label attribute name you specify when you create the labeling job.
- `roleArn` (string): The Amazon Resource Name (ARN) of the IAM execution role you specify when you create the labeling job.
- `payload` (JSON object): A JSON that includes an `s3Uri` key, which identifies the location of the annotation data for that data object in Amazon S3. The second code block below shows an example of this annotation file.

The following code block contains an example of a post-annotation request. Each parameter in this example request is explained below the code block.

Example of an post-annotation Lambda request

```
{
    "version": "2018-10-16",
    "labelingJobArn": "arn:aws:sagemaker:us-west-2:111122223333:labeling-job/labeling-
job-name",
    "labelCategories": ["Ex Category1","Ex Category2", "Ex Category3"],
    "labelAttributeName": "labeling-job-attribute-name",
    "roleArn" : "arn:aws:iam::111122223333:role/role-name",
    "payload": {
        "s3Uri": "s3://DOC-EXAMPLE-BUCKET/annotations.json"
    }
}
```

> **Note**
>
> If no worker works on the data object and `TaskAvailabilityLifetimeInSeconds` has been reached, the data object is marked as failed and not included as part of post-annotation Lambda invocation.

The following code block contains the payload schema. This is the file that is indicated by the `s3Uri` parameter in the post-annotation Lambda request `payload` JSON object. For example, if the previous code block is the post-annotation Lambda request, the following annotation file is located at `s3://DOC-EXAMPLE-BUCKET/annotations.json`.

Each parameter is described in the following bulleted list.

Example of an annotation file

```
[
    {
        "datasetObjectId": <string>,
        "dataObject": {
            "s3Uri": <string>,
            "content": <string>
        },
        "annotations": [{
            "workerId": <string>,
            "annotationData": {
                "content": <string>,
                "s3Uri": <string>
            }
       }]
    }
]
```

- `datasetObjectId` (string): Identifies a unique ID that Ground Truth assigns to each data object you send to the labeling job.
- `dataObject` (JSON object): The data object that was labeled. If the data object is included in the input manifest file and identified using the `source` key (for example, a string), `dataObject` includes a `content` key, which identifies the data object. Otherwise, the location of the data object (for example, a link or S3 URI) is identified with `s3Uri`.

- `annotations` (list of JSON objects): This list contains a single JSON object for each annotation submitted by workers for that `dataObject`. A single JSON object contains a unique `workerId` that can be used to identify the worker that submitted that annotation. The `annotationData` key contains one of the following:
  - `content` (string): Contains the annotation data.
  - `s3Uri` (string): Contains an S3 URI that identifies the location of the annotation data.

The following table contains examples of the content that you may find in payload for different types of annotation.

Named Entity Recognition Payload

```
[
    {
      "datasetObjectId": "1",
      "dataObject": {
        "content": "Sift 3 cups of flour into the bowl."
      },
      "annotations": [
        {
          "workerId": "private.us-west-2.ef7294f850a3d9d1",
          "annotationData": {
            "content": "{\"crowd-entity-annotation\":{\"entities\":[{\"endOffset
\":4,\"label\":\"verb\",\"startOffset\":0},{\"endOffset\":6,\"label\":\"number
\",\"startOffset\":5},{\"endOffset\":20,\"label\":\"object\",\"startOffset\":15},
{\"endOffset\":34,\"label\":\"object\",\"startOffset\":30}]}}"
          }
        }
      ]
    }
]
```

Semantic Segmentation Payload

```
[
    {
      "datasetObjectId": "2",
      "dataObject": {
        "s3Uri": "s3://DOC-EXAMPLE-BUCKET/gt-input-data/images/bird3.jpg"
      },
      "annotations": [
```

```
        {
          "workerId": "private.us-west-2.ab1234c5678a919d0",
          "annotationData": {
            "content": "{\"crowd-semantic-segmentation\":{\"inputImageProperties\":
{\"height\":2000,\"width\":3020},\"labelMappings\":{\"Bird\":{\"color\":\"#2ca02c
\"}},\"labeledImage\":{\"pngImageData\":\"iVBOR...\"}}}"
          }
        }
      ]
    }
  ]
```

Bounding Box Payload

```
[
    {
      "datasetObjectId": "0",
      "dataObject": {
        "s3Uri": "s3://DOC-EXAMPLE-BUCKET/gt-input-data/images/bird1.jpg"
      },
      "annotations": [
        {
          "workerId": "private.us-west-2.ab1234c5678a919d0",
          "annotationData": {
            "content": "{\"boundingBox\":{\"boundingBoxes\":[{\"height\":2052,
\"label\":\"Bird\",\"left\":583,\"top\":302,\"width\":1375}],\"inputImageProperties
\":{\"height\":2497,\"width\":3745}}}"
          }
        }
      ]
    }
 ]
```

Your post-annotation Lambda function may contain logic similar to the following to loop through and access all annotations contained in the request. For a full example, see annotation_consolidation_lambda.py in the aws-sagemaker-ground-truth-recipe GitHub repository. In this GitHub example, you must add your own annotation consolidation logic.

```
for i in range(len(annotations)):
    worker_id = annotations[i]["workerId"]
    annotation_content = annotations[i]['annotationData'].get('content')
```

```
    annotation_s3_uri = annotations[i]['annotationData'].get('s3uri')
    annotation = annotation_content if annotation_s3_uri is None else
s3_client.get_object_from_s3(
        annotation_s3_uri)
    annotation_from_single_worker = json.loads(annotation)

    print("{} Received Annotations from worker [{}] is [{}]"
            .format(log_prefix, worker_id, annotation_from_single_worker))
```

Tip

When you run consolidation algorithms on the data, you can use an AWS database service to store results, or you can pass the processed results back to Ground Truth. The data you return to Ground Truth is stored in consolidated annotation manifests in the S3 bucket specified for output during the configuration of the labeling job.

In return, Ground Truth requires a response formatted like the following:

Example of expected return data

```
[
   {
        "datasetObjectId": <string>,
        "consolidatedAnnotation": {
            "content": {
                "<labelattributename>": {
                    # ... label content
                }
            }
        }
    },
   {
        "datasetObjectId": <string>,
        "consolidatedAnnotation": {
            "content": {
                "<labelattributename>": {
                    # ... label content
                }
            }
        }
    }
```

```
    .
    .
    .
]
```

At this point, all the data you're sending to your S3 bucket, other than the `datasetObjectId`, is in the `content` object.

When you return annotations in `content`, this results in an entry in your job's output manifest like the following:

Example of label format in output manifest

```
{  "source-ref"/"source" : "<s3uri or content>",
   "<labelAttributeName>": {
        # ... label content from you
    },
   "<labelAttributeName>-metadata": { # This will be added by Ground Truth
        "job_name": <labelingJobName>,
        "type": "groundTruth/custom",
        "human-annotated": "yes",
        "creation_date": <date> # Timestamp of when received from Post-labeling Lambda
    }
}
```

Because of the potentially complex nature of a custom template and the data it collects, Ground Truth does not offer further processing of the data.

Required Permissions To Use AWS Lambda With Ground Truth

You may need to configure some or all the following to create and use AWS Lambda with Ground Truth.

- You need to grant an IAM role or user (collectively, an IAM entity) permission to create the pre-annotation and post-annotation Lambda functions using AWS Lambda, and to choose them when creating the labeling job.
- The IAM execution role specified when the labeling job is configured needs permission to invoke the pre-annotation and post-annotation Lambda functions.
- The post-annotation Lambda functions may need permission to access Amazon S3.

Use the following sections to learn how to create the IAM entities and grant permissions described above.

Topics

Grant Permission to Create and Select an AWS Lambda Function

If you do not require granular permissions to develop pre-annotation and post-annotation Lambda functions, you can attach the AWS managed policy `AWSLambda_FullAccess` to a user or role. This policy grants broad permissions to use all Lambda features, as well as permission to perform actions in other AWS services with which Lambda interacts.

To create a more granular policy for security-sensitive use cases, refer to the documentation Identity-based IAM policies for Lambda in the to AWS Lambda Developer Guide to learn how to create an IAM policy that fits your use case.

Policies to Use the Lambda Console

If you want to grant an IAM entity permission to use the Lambda console, see Using the Lambda console in the AWS Lambda Developer Guide.

Additionally, if you want the user to be able to access and deploy the Ground Truth starter pre-annotation and post-annotation functions using the AWS Serverless Application Repository in the Lambda console, you must specify the *<aws-region>* where you want to deploy the functions (this should be the same AWS Region used to create the labeling job), and add the following policy to the IAM role.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "VisualEditor0",
            "Effect": "Allow",
            "Action": [
                "serverlessrepo:ListApplicationVersions",
                "serverlessrepo:GetApplication",
```

```
                "serverlessrepo:CreateCloudFormationTemplate"
            ],
            "Resource": "arn:aws:serverlessrepo:<aws-region>:838997950401:applications/
aws-sagemaker-ground-truth-recipe"
        },
        {
            "Sid": "VisualEditor1",
            "Effect": "Allow",
            "Action": "serverlessrepo:SearchApplications",
            "Resource": "*"
        }
    ]
}
```

Policies to See Lambda Functions in the Ground Truth Console

To grant an IAM entity permission to view Lambda functions in the Ground Truth console when the user is creating a custom labeling job, the entity must have the permissions described in Grant IAM Permission to Use the Amazon SageMaker Ground Truth Console, including the permissions described in the section Custom Labeling Workflow Permissions.

Grant IAM Execution Role Permission to Invoke AWS Lambda Functions

If you add the IAM managed policy AmazonSageMakerGroundTruthExecution to the IAM execution role used to create the labeling job, this role has permission to list and invoke Lambda functions with one of the following strings in the function name: `GtRecipe`, `SageMaker`, `Sagemaker`, `sagemaker`, or `LabelingFunction`.

If the pre-annotation or post-annotation Lambda function names do not include one of the terms in the preceding paragraph, or if you require more granular permission than those in the `AmazonSageMakerGroundTruthExecution` managed policy, you can add a policy similar to the following to give the execution role permission to invoke pre-annotation and post-annotation functions.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action":
                "lambda:InvokeFunction",
            "Resource": [
```

```
                "arn:aws:lambda:<region>:<account-id>:function:<pre-annotation-lambda-
name>",
                "arn:aws:lambda:<region>:<account-id>:function:<post-annotation-lambda-
name>"
            ]
        }
    ]
}
```

Grant Post-Annotation Lambda Permissions to Access Annotation

As described in Post-annotation Lambda, the post-annotation Lambda request includes the location of the annotation data in Amazon S3. This location is identified by the `s3Uri` string in the `payload` object. To process the annotations as they come in, even for a simple pass through function, you need to assign the necessary permissions to the post-annotation Lambda execution role to read files from the Amazon S3.

There are many ways that you can configure your Lambda to access annotation data in Amazon S3. Two common ways are:

- Allow the Lambda execution role to assume the SageMaker execution role identified in `roleArn` in the post-annotation Lambda request. This SageMaker execution role is the one used to create the labeling job, and has access to the Amazon S3 output bucket where the annotation data is stored.
- Grant the Lambda execution role permission to access the Amazon S3 output bucket directly.

Use the following sections to learn how to configure these options.

Grant Lambda Permission to Assume SageMaker Execution Role

To allow a Lambda function to assume a SageMaker execution role, you must attach a policy to the Lambda function's execution role, and modify the trust relationship of the SageMaker execution role to allow Lambda to assume it.

1. Attach the following IAM policy to your Lambda function's execution role to assume the SageMaker execution role identified in `Resource`. Replace *222222222222* with an AWS account ID. Replace *sm-execution-role* with the name of the assumed role.

```
{
    "Version": "2012-10-17",
```

```
    "Statement": {
        "Effect": "Allow",
        "Action": "sts:AssumeRole",
        "Resource": "arn:aws:iam::222222222222:role/sm-execution-role"
    }
}
```

2. Modify the trust policy of the SageMaker execution role to include the following `Statement`. Replace *222222222222* with an AWS account ID. Replace *my-lambda-execution-role* with the name of the assumed role.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::222222222222:role/my-lambda-execution-role"
            },
            "Action": "sts:AssumeRole"
        }
    ]
}
```

Grant Lambda Execution Role Permission to Access S3

You can add a policy similar to the following to the post-annotation Lambda function execution role to give it S3 read permissions. Replace *DOC-EXAMPLE-BUCKET* with the name of the output bucket you specify when you create a labeling job.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject"
            ],
            "Resource": "arn:aws:s3:::DOC-EXAMPLE-BUCKET/*"
        }
    ]
```

```
}
```

To add S3 read permissions to a Lambda execution role in the Lambda console, use the following procedure.

Add S3 read permissions to post-annotation Lambda:

1. Open the **Functions** page in the Lambda console.
2. Choose the name of the post-annotation function.
3. Choose **Configuration** and then choose **Permissions**.
4. Select the **Role name** and the summary page for that role opens in the IAM console in a new tab.
5. Select **Attach policies**.
6. Do one of the following:
   - Search for and select **`AmazonS3ReadOnlyAccess`** to give the function permission to read all buckets and objects in the account.
   - If you require more granular permissions, select **Create policy** and use the policy example in the preceding section to create a policy. Note that you must navigate back to the execution role summary page after you create the policy.
7. If you used the `AmazonS3ReadOnlyAccess` managed policy, select **Attach policy**.

   If you created a new policy, navigate back to the Lambda execution role summary page and attach the policy you just created.

Create Lambda Functions for a Custom Labeling Workflow

You can create a Lambda function using the Lambda console, the AWS CLI, or an AWS SDK in a supported programming language of your choice. Use the AWS Lambda Developer Guide to learn more about each of these options:

- To learn how to create a Lambda function using the console, see Create a Lambda function with the console.
- To learn how to create a Lambda function using the AWS CLI, see Using AWS Lambda with the AWS Command Line Interface.

- Select the relevant section in the table of contents to learn more about working with Lambda in the language of your choice. For example, select Working with Python to learn more about using Lambda with the AWS SDK for Python (Boto3).

Ground Truth provides pre-annotation and post-annotation templates through an AWS Serverless Application Repository (SAR) *recipe*. Use the following procedure to select the Ground Truth recipe in the Lambda console.

Use the Ground Truth SAR recipe to create pre-annotation and post-annotation Lambda functions:

1. Open the **Functions** page on the Lambda console.
2. Select **Create function**.
3. Select **Browse serverless app repository**.
4. In the search text box, enter **aws-sagemaker-ground-truth-recipe** and select that app.
5. Select **Deploy**. The app may take a couple of minutes to deploy.

   Once the app deploys, two functions appear in the **Functions** section of the Lambda console: `serverlessrepo-aws-sagema-GtRecipePreHumanTaskFunc-<id>` and `serverlessrepo-aws-sagema-GtRecipeAnnotationConsol-<id>`.
6. Select one of these functions and add your custom logic in the **Code** section.
7. When you are finished making changes, select **Deploy** to deploy them.

Test Pre-Annotation and Post-Annotation Lambda Functions

You can test your pre-annotation and post annotation Lambda functions in the Lambda console. If you are a new user of Lambda, you can learn how to test, or *invoke*, your Lambda functions in the console using the Create a Lambda function tutorial with the console in the AWS Lambda Developer Guide.

You can use the sections on this page to learn how to test the Ground Truth pre-annotation and post-annotation templates provided through an AWS Serverless Application Repository (SAR).

Topics

- Prerequisites
- Test the Pre-annotation Lambda Function

- Test the Post-Annotation Lambda Function

Prerequisites

You must do the following to use the tests described on this page.

- You need access to the Lambda console, and you need permission to create and invoke Lambda functions. To learn how to set up these permissions, see Grant Permission to Create and Select an AWS Lambda Function.
- If you have not deployed the Ground Truth SAR recipe, use the procedure in Create Lambda Functions for a Custom Labeling Workflow to do so.
- To test the post-annotation Lambda function, you must have a data file in Amazon S3 with sample annotation data. For a simple test, you can copy and paste the following code into a file and save it as `sample-annotations.json` and upload this file to Amazon S3. Note the S3 URI of this file—you need this information to configure the post-annotation Lambda test.

```
[{"datasetObjectId":"0","dataObject":{"content":"To train a machine learning model,
 you need a large, high-quality, labeled dataset. Ground Truth helps you build
 high-quality training datasets for your machine learning models."},"annotations":
[{"workerId":"private.us-west-2.0123456789","annotationData":{"content":"{\"crowd-
entity-annotation\":{\"entities\":[{\"endOffset\":8,\"label\":\"verb\",\"startOffset
\":3},{\"endOffset\":27,\"label\":\"adjective\",\"startOffset\":11},{\"endOffset
\":33,\"label\":\"object\",\"startOffset\":28},{\"endOffset\":51,\"label\":
\"adjective\",\"startOffset\":46},{\"endOffset\":65,\"label\":\"adjective\",
\"startOffset\":53},{\"endOffset\":74,\"label\":\"adjective\",\"startOffset\":67},
{\"endOffset\":82,\"label\":\"adjective\",\"startOffset\":75},{\"endOffset\":102,
\"label\":\"verb\",\"startOffset\":97},{\"endOffset\":112,\"label\":\"verb\",
\"startOffset\":107},{\"endOffset\":125,\"label\":\"adjective\",\"startOffset
\":113},{\"endOffset\":134,\"label\":\"adjective\",\"startOffset\":126},{\"endOffset
\":143,\"label\":\"object\",\"startOffset\":135},{\"endOffset\":169,\"label
\":\"adjective\",\"startOffset\":153},{\"endOffset\":176,\"label\":\"object\",
\"startOffset\":170}]}}"}}]},{"datasetObjectId":"1","dataObject":{"content":"Sift
 3 cups of flour into the bowl."},"annotations":[{"workerId":"private.us-
west-2.0123456789","annotationData":{"content":"{\"crowd-entity-annotation\":
{\"entities\":[{\"endOffset\":4,\"label\":\"verb\",\"startOffset\":0},{\"endOffset
\":6,\"label\":\"number\",\"startOffset\":5},{\"endOffset\":20,\"label\":\"object
\",\"startOffset\":15},{\"endOffset\":34,\"label\":\"object\",\"startOffset
\":30}]}}"}}]},{"datasetObjectId":"2","dataObject":{"content":"Jen purchased 10
 shares of the stock on Janurary 1st, 2020."},"annotations":[{"workerId":"private.us-
west-2.0123456789","annotationData":{"content":"{\"crowd-entity-annotation
\":{\"entities\":[{\"endOffset\":3,\"label\":\"person\",\"startOffset\":0},
```

```
{\"endOffset\":13,\"label\":\"verb\",\"startOffset\":4},{\"endOffset\":16,\"label
\":\"number\",\"startOffset\":14},{\"endOffset\":58,\"label\":\"date\",\"startOffset
\":40}]}}"}}]},{"datasetObjectId":"3","dataObject":{"content":"The narrative
 was interesting, however the character development was weak."},"annotations":
[{"workerId":"private.us-west-2.0123456789","annotationData":{"content":"{\"crowd-
entity-annotation\":{\"entities\":[{\"endOffset\":29,\"label\":\"adjective\",
\"startOffset\":18},{\"endOffset\":73,\"label\":\"adjective\",\"startOffset
\":69}]}}"}}]}]
```

- You must use the directions in Grant Post-Annotation Lambda Permissions to Access Annotation to give your post-annotation Lambda function's execution role permission to assume the SageMaker execution role you use to create the labeling job. The post-annotation Lambda function uses the SageMaker execution role to access the annotation data file, `sample-annotations.json`, in S3.

Test the Pre-annotation Lambda Function

Use the following procedure to test the pre-annotation Lambda function created when you deployed the Ground Truth AWS Serverless Application Repository (SAR) recipe.

Test the Ground Truth SAR recipe pre-annotation Lambda function

1. Open the **Functions** page in the Lambda console.
2. Select the pre-annotation function that was deployed from the Ground Truth SAR recipe. The name of this function is similar to `serverlessrepo-aws-sagema-GtRecipePreHumanTaskFunc-<id>`.
3. In the **Code source** section, select the arrow next to **Test**.
4. Select **Configure test event**.
5. Keep the **Create new test event** option selected.
6. Under **Event template**, select **SageMaker Ground Truth PreHumanTask**.
7. Give your test an **Event name**.
8. Select **Create**.
9. Select the arrow next to **Test** again and you should see that the test you created is selected, which is indicated with a dot by the event name. If it is not selected, select it.
10. Select **Test** to run the test.

After you run the test, you can see the **Execution results**. In the **Function logs**, you should see a response similar to the following:

```
START RequestId: cd117d38-8365-4e1a-bffb-0dcd631a878f Version: $LATEST
Received event: {
  "version": "2018-10-16",
  "labelingJobArn": "arn:aws:sagemaker:us-east-2:123456789012:labeling-job/example-
job",
  "dataObject": {
    "source-ref": "s3://sagemakerexample/object_to_annotate.jpg"
  }
}
{'taskInput': {'taskObject': 's3://sagemakerexample/object_to_annotate.jpg'},
 'isHumanAnnotationRequired': 'true'}
END RequestId: cd117d38-8365-4e1a-bffb-0dcd631a878f
REPORT RequestId: cd117d38-8365-4e1a-bffb-0dcd631a878f Duration: 0.42 ms Billed
 Duration: 1 ms Memory Size: 128 MB Max Memory Used: 43 MB
```

In this response, we can see the Lambda function's output matches the required pre-annotation response syntax:

```
{'taskInput': {'taskObject': 's3://sagemakerexample/object_to_annotate.jpg'},
 'isHumanAnnotationRequired': 'true'}
```

Test the Post-Annotation Lambda Function

Use the following procedure to test the post-annotation Lambda function created when you deployed the Ground Truth AWS Serverless Application Repository (SAR) recipe.

Test the Ground Truth SAR recipe post-annotation Lambda

1. Open the **Functions** page in the Lambda console.
2. Select the post-annotation function that was deployed from the Ground Truth SAR recipe. The name of this function is similar to `serverlessrepo-aws-sagema-GtRecipeAnnotationConsol-<id>`.
3. In the **Code source** section, select the arrow next to **Test**.
4. Select **Configure test event**.
5. Keep the **Create new test event** option selected.
6. Under **Event template**, select **SageMaker Ground Truth AnnotationConsolidation**.

7. Give your test an **Event name**.
8. Modify the template code provided as follows:

   - Replace the Amazon Resource Name (ARN) in `roleArn` with the ARN of the SageMaker execution role you used to create the labeling job.
   - Replace the S3 URI in `s3Uri` with the URI of the `sample-annotations.json` file you added to Amazon S3.

   After you make these modifications, your test should look similar to the following:

```
{
  "version": "2018-10-16",
  "labelingJobArn": "arn:aws:sagemaker:us-east-2:123456789012:labeling-job/example-job",
  "labelAttributeName": "example-attribute",
  "roleArn": "arn:aws:iam::222222222222:role/sm-execution-role",
  "payload": {
    "s3Uri": "s3://your-bucket/sample-annotations.json"
  }
}
```

9. Select **Create**.
10. Select the arrow next to **Test** again and you should see that the test you created is selected, which is indicated with a dot by the event name. If it is not selected, select it.
11. Select the **Test** to run the test.

After you run the test, you should see a `-- Consolidated Output --` section in the **Function Logs**, which contains a list of all annotations included in `sample-annotations.json`.

Demo Template: Annotation of Images with `crowd-bounding-box`

When you chose to use a custom template as your task type in the Amazon SageMaker Ground Truth console, you reach the **Custom labeling task panel**. There you can choose from multiple base templates. The templates represent some of the most common tasks and provide a sample to work from as you create your customized labeling task's template. If you are not using the console, or as an additional recourse, see Amazon SageMaker Ground Truth Sample Task UIs for a repository of demo templates for a variety of labeling job task types.

This demonstration works with the **BoundingBox** template. The demonstration also works with the AWS Lambda functions needed for processing your data before and after the task. In the Github repository above, to find templates that work with AWS Lambda functions, look for `{{ task.input.<property name> }}` in the template.

Topics

Starter Bounding Box custom template

This is the starter bounding box template that is provided.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-bounding-box
    name="boundingBox"
    src="{{ task.input.taskObject | grant_read_access }}"
    header="{{ task.input.header }}"
    labels="{{ task.input.labels | to_json | escape }}"
  >

    <!-- The <full-instructions> tag is where you will define the full instructions of
 your task. -->
    <full-instructions header="Bounding Box Instructions" >
      <p>Use the bounding box tool to draw boxes around the requested target of
 interest:</p>
      <ol>
        <li>Draw a rectangle using your mouse over each instance of the target.</li>
        <li>Make sure the box does not cut into the target, leave a 2 - 3 pixel
 margin</li>
        <li>
          When targets are overlapping, draw a box around each object,
          include all contiguous parts of the target in the box.
```

```
          Do not include parts that are completely overlapped by another object.
        </li>
        <li>
          Do not include parts of the target that cannot be seen,
          even though you think you can interpolate the whole shape of the target.
        </li>
        <li>Avoid shadows, they're not considered as a part of the target.</li>
        <li>If the target goes off the screen, label up to the edge of the image.</li>
      </ol>
    </full-instructions>

    <!-- The <short-instructions> tag allows you to specify instructions that are
 displayed in the left hand side of the task interface.
    It is a best practice to provide good and bad examples in this section for quick
 reference. -->
    <short-instructions>
      Use the bounding box tool to draw boxes around the requested target of interest.
    </short-instructions>
  </crowd-bounding-box>
</crowd-form>
```

The custom templates use the Liquid template language, and each of the items between double curly braces is a variable. The pre-annotation AWS Lambda function should provide an object named `taskInput` and that object's properties can be accessed as `{{ task.input.<property name> }}` in your template.

Your own Bounding Box custom template

As an example, assume you have a large collection of animal photos in which you know the kind of animal in an image from a prior image-classification job. Now you want to have a bounding box drawn around it.

In the starter sample, there are three variables: `taskObject`, `header`, and `labels`.

Each of these would be represented in different parts of the bounding box.

- `taskObject` is an HTTP(S) URL or S3 URI for the photo to be annotated. The added `| grant_read_access` is a filter that will convert an S3 URI to an HTTPS URL with short-lived access to that resource. If you're using an HTTP(S) URL, it's not needed.
- `header` is the text above the photo to be labeled, something like "Draw a box around the bird in the photo."

- `labels` is an array, represented as `['item1', 'item2', ...]`. These are labels that can be assigned by the worker to the different boxes they draw. You can have one or many.

Each of the variable names come from the JSON object in the response from your pre-annotation Lambda, The names above are merely suggested, Use whatever variable names make sense to you and will promote code readability among your team.

> **Only use variables when necessary**
>
> If a field will not change, you can remove that variable from the template and replace it with that text, otherwise you have to repeat that text as a value in each object in your manifest or code it into your pre-annotation Lambda function.

Example : Final Customized Bounding Box Template

To keep things simple, this template will have one variable, one label, and very basic instructions. Assuming your manifest has an "animal" property in each data object, that value can be re-used in two parts of the template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-bounding-box
    name="boundingBox"
    labels="[ '{{ task.input.animal }}' ]"
    src="{{ task.input.source-ref | grant_read_access }}"
    header="Draw a box around the {{ task.input.animal }}."
  >
    <full-instructions header="Bounding Box Instructions" >
      <p>Draw a bounding box around the {{ task.input.animal }} in the image. If
      there is more than one {{ task.input.animal }} per image, draw a bounding
      box around the largest one.</p>
      <p>The box should be tight around the {{ task.input.animal }} with
      no more than a couple of pixels of buffer around the
      edges.</p>
      <p>If the image does not contain a {{ task.input.animal }}, check the <strong>
      Nothing to label</strong> box.
    </full-instructions>
    <short-instructions>
      <p>Draw a bounding box around the {{ task.input.animal }} in each image. If
      there is more than one {{ task.input.animal }} per image, draw a bounding
```

```
      box around the largest one.</p>
    </short-instructions>
  </crowd-bounding-box>
</crowd-form>
```

Note the re-use of `{{ task.input.animal }}` throughout the template. If your manifest had all of the animal names beginning with a capital letter, you could use `{{ task.input.animal | downcase }}`, incorporating one of Liquid's built-in filters in sentences where it needed to be presented lowercase.

Your manifest file

Your manifest file should provide the variable values you're using in your template. You can do some transformation of your manifest data in your pre-annotation Lambda, but if you don't need to, you maintain a lower risk of errors and your Lambda will run faster. Here's a sample manifest file for the template.

```
{"source-ref": "<S3 image URI>", "animal": "horse"}
{"source-ref": "<S3 image URI>", "animal" : "bird"}
{"source-ref": "<S3 image URI>", "animal" : "dog"}
{"source-ref": "<S3 image URI>", "animal" : "cat"}
```

Your pre-annotation Lambda function

As part of the job set-up, provide the ARN of an AWS Lambda function that can be called to process your manifest entries and pass them to the template engine.

> **Naming your Lambda function**
>
> The best practice in naming your function is to use one of the following four strings as part of the function name: `SageMaker`, `Sagemaker`, `sagemaker`, or `LabelingFunction`. This applies to both your pre-annotation and post-annotation functions.

When you're using the console, if you have AWS Lambda functions that are owned by your account, a drop-down list of functions meeting the naming requirements will be provided to choose one.

In this very basic example, you're just passing through the information from the manifest without doing any additional processing on it. This sample pre-annotation function is written for Python 3.7.

```
import json

def lambda_handler(event, context):
    return {
        "taskInput": event['dataObject']
    }
```

The JSON object from your manifest will be provided as a child of the `event` object. The properties inside the `taskInput` object will be available as variables to your template, so simply setting the value of `taskInput` to `event['dataObject']` will pass all the values from your manifest object to your template without having to copy them individually. If you wish to send more values to the template, you can add them to the `taskInput` object.

Your post-annotation Lambda function

As part of the job set-up, provide the ARN of an AWS Lambda function that can be called to process the form data when a worker completes a task. This can be as simple or complex as you want. If you want to do answer consolidation and scoring as it comes in, you can apply the scoring and/or consolidation algorithms of your choice. If you want to store the raw data for offline processing, that is an option.

Provide permissions to your post-annotation Lambda

The annotation data will be in a file designated by the `s3Uri` string in the `payload` object. To process the annotations as they come in, even for a simple pass through function, you need to assign `S3ReadOnly` access to your Lambda so it can read the annotation files.
In the Console page for creating your Lambda, scroll to the **Execution role** panel. Select **Create a new role from one or more templates**. Give the role a name. From the **Policy templates** drop-down, choose **Amazon S3 object read-only permissions**. Save the Lambda and the role will be saved and selected.

The following sample is in Python 2.7.

```
import json
import boto3
from urlparse import urlparse

def lambda_handler(event, context):
```

```
    consolidated_labels = []

    parsed_url = urlparse(event['payload']['s3Uri']);
    s3 = boto3.client('s3')
    textFile = s3.get_object(Bucket = parsed_url.netloc, Key = parsed_url.path[1:])
    filecont = textFile['Body'].read()
    annotations = json.loads(filecont);

    for dataset in annotations:
        for annotation in dataset['annotations']:
            new_annotation = json.loads(annotation['annotationData']['content'])
            label = {
                'datasetObjectId': dataset['datasetObjectId'],
                'consolidatedAnnotation' : {
                'content': {
                    event['labelAttributeName']: {
                        'workerId': annotation['workerId'],
                        'boxesInfo': new_annotation,
                        'imageSource': dataset['dataObject']
                        }
                    }
                }
            }
            consolidated_labels.append(label)

    return consolidated_labels
```

The post-annotation Lambda will often receive batches of task results in the event object. That batch will be the `payload` object the Lambda should iterate through. What you send back will be an object meeting the API contract.

The output of your labeling job

You'll find the output of the job in a folder named after your labeling job in the target S3 bucket you specified. It will be in a subfolder named `manifests`.

For a bounding box task, the output you find in the output manifest will look a bit like the demo below. The example has been cleaned up for printing. The actual output will be a single line per record.

Example : JSON in your output manifest

```
{
```

```
  "source-ref":"<URL>",
  "<label attribute name>":
    {
       "workerId":"<URL>",
       "imageSource":"<image URL>",
       "boxesInfo":"{\"boundingBox\":{\"boundingBoxes\":[{\"height\":878, \"label\":
\"bird\", \"left\":208, \"top\":6, \"width\":809}], \"inputImageProperties\":{\"height
\":924, \"width\":1280}}}"},
  "<label attribute name>-metadata":
    {
      "type":"groundTruth/custom",
      "job_name":"<Labeling job name>",
      "human-annotated":"yes"
    },
  "animal" : "bird"
}
```

Note how the additional `animal` attribute from your original manifest is passed to the output manifest on the same level as the `source-ref` and labeling data. Any properties from your input manifest, whether they were used in your template or not, will be passed to the output manifest.

Demo Template: Labeling Intents with `crowd-classifier`

If you choose a custom template, you'll reach the **Custom labeling task panel**. There you can select from multiple starter templates that represent some of the more common tasks. The templates provide a starting point to work from in building your customized labeling task's template.

In this demonstration, you work with the **Intent Detection** template, which uses the `crowd-classifier` element, and the AWS Lambda functions needed for processing your data before and after the task.

Topics

- Starter Intent Detection custom template
- Your Intent Detection custom template
- Your pre-annotation Lambda function
- Your post-annotation Lambda function
- Your labeling job output

Starter Intent Detection custom template

This is the intent detection template that is provided as a starting point.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-classifier
    name="intent"
    categories="{{ task.input.labels | to_json | escape }}"
    header="Pick the most relevant intention expressed by the below text"
  >
    <classification-target>
      {{ task.input.utterance }}
    </classification-target>

    <full-instructions header="Intent Detection Instructions">
        <p>Select the most relevant intention expressed by the text.</p>
        <div>
           <p><strong>Example: </strong>I would like to return a pair of shoes</p>
           <p><strong>Intent: </strong>Return</p>
        </div>
    </full-instructions>

    <short-instructions>
      Pick the most relevant intention expressed by the text
    </short-instructions>
  </crowd-classifier>
</crowd-form>
```

The custom templates use the Liquid template language, and each of the items between double curly braces is a variable. The pre-annotation AWS Lambda function should provide an object named `taskInput` and that object's properties can be accessed as `{{ task.input.<property name> }}` in your template.

Your Intent Detection custom template

In the starter template, there are two variables: the `task.input.labels` property in the `crowd-classifier` element opening tag and the `task.input.utterance` in the `classification-target` region's content.

Unless you need to offer different sets of labels with different utterances, avoiding a variable and just using text will save processing time and creates less possibility of error. The template used in

this demonstration will remove that variable, but variables and filters like `to_json` are explained in more detail in the `crowd-bounding-box` demonstration article.

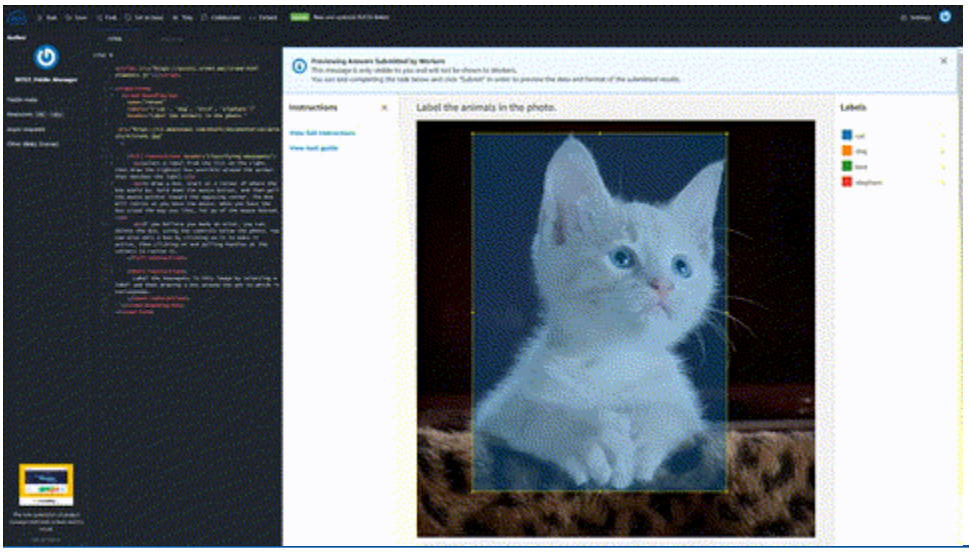
Styling Your Elements

Two parts of these custom elements that sometimes get overlooked are the `<full-instructions>` and `<short-instructions>` regions. Good instructions generate good results.

In the elements that include these regions, the `<short-instructions>` appear automatically in the "Instructions" pane on the left of the worker's screen. The `<full-instructions>` are linked from the "View full instructions" link near the top of that pane. Clicking the link opens a modal pane with more detailed instructions.

You can not only use HTML, CSS, and JavaScript in these sections, you are encouraged to if you believe you can provide a strong set of instructions and examples that will help workers complete your tasks with better speed and accuracy.

Example Try out a sample with JSFiddle



Try out an example `<crowd-classifier>` task. The example is rendered by JSFiddle, therefore all the template variables are replaced with hard-coded values. Click the "View full instructions" link to see a set of examples with extended CSS styling. You can fork the project to experiment with your own changes to the CSS, adding sample images, or adding extended JavaScript functionality.

Example : Final Customized Intent Detection Template

This uses the example `<crowd-classifier>` task, but with a variable for the `<classification-target>`. If you are trying to keep a consistent CSS design among a series of

different labeling jobs, you can include an external stylesheet using a `<link rel...>` element the same way you'd do in any other HTML document.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-classifier
    name="intent"
    categories="['buy', 'eat', 'watch', 'browse', 'leave']"
    header="Pick the most relevant intent expressed by the text below"
  >
    <classification-target>
      {{ task.input.source }}
    </classification-target>

    <full-instructions header="Emotion Classification Instructions">
      <p>In the statements and questions provided in this exercise, what category of
 action is the speaker interested in doing?</p>
          <table>
            <tr>
              <th>Example Utterance</th>
              <th>Good Choice</th>
            </tr>
            <tr>
              <td>When is the Seahawks game on?</td>
              <td>
                eat<br>
                <greenbg>watch</greenbg>
                <botchoice>browse</botchoice>
              </td>
            </tr>
            <tr>
              <th>Example Utterance</th>
              <th>Bad Choice</th>
            </tr>
            <tr>
              <td>When is the Seahawks game on?</td>
              <td>
                buy<br>
                <greenbg>eat</greenbg>
                <botchoice>watch</botchoice>
              </td>
            </tr>
```

```
          </table>
    </full-instructions>

    <short-instructions>
      What is the speaker expressing they would like to do next?
    </short-instructions>
  </crowd-classifier>
</crowd-form>
<style>
  greenbg {
    background: #feee23;
    display: block;
  }

  table {
    *border-collapse: collapse; /* IE7 and lower */
    border-spacing: 0;
  }

  th, tfoot, .fakehead {
    background-color: #8888ee;
    color: #f3f3f3;
    font-weight: 700;
  }

  th, td, tfoot {
      border: 1px solid blue;
  }

  th:first-child {
    border-radius: 6px 0 0 0;
  }

  th:last-child {
    border-radius: 0 6px 0 0;
  }

  th:only-child{
    border-radius: 6px 6px 0 0;
  }

  tfoot:first-child {
    border-radius: 0 0 6px 0;
  }
```

```
  tfoot:last-child {
    border-radius: 0 0 0 6px;
  }

  tfoot:only-child{
    border-radius: 6px 6px;
  }

  td {
    padding-left: 15px ;
    padding-right: 15px ;
  }

  botchoice {
    display: block;
    height: 17px;
    width: 490px;
    overflow: hidden;
    position: relative;
    background: #fff;
    padding-bottom: 20px;
  }

  botchoice:after {
    position: absolute;
    bottom: 0;
    left: 0;
    height: 100%;
    width: 100%;
    content: "";
    background: linear-gradient(to top,
       rgba(255,255,255, 1) 55%,
       rgba(255,255,255, 0) 100%
    );
    pointer-events: none; /* so the text is still selectable */
  }
</style>
```

Example : Your manifest file

If you are preparing your manifest file manually for a text-classification task like this, have your data formatted in the following manner.

```
{"source": "Roses are red"}
{"source": "Violets are Blue"}
{"source": "Ground Truth is the best"}
{"source": "And so are you"}
```

This differs from the manifest file used for the "Demo Template: Annotation of Images with `crowd-bounding-box`" demonstration in that `source-ref` was used as the property name instead of `source`. The use of `source-ref` designates S3 URIs for images or other files that must be converted to HTTP. Otherwise, `source` should be used like it is with the text strings above.

Your pre-annotation Lambda function

As part of the job set-up, provide the ARN of an AWS Lambda that can be called to process your manifest entries and pass them to the template engine.

This Lambda function is required to have one of the following four strings as part of the function name: `SageMaker`, `Sagemaker`, `sagemaker`, or `LabelingFunction`.

This applies to both your pre-annotation and post-annotation Lambdas.

When you're using the console, if you have Lambdas that are owned by your account, a drop-down list of functions meeting the naming requirements will be provided to choose one.

In this very basic sample, where you have only one variable, it's primarily a pass-through function. Here's a sample pre-labeling Lambda using Python 3.7.

```
import json

def lambda_handler(event, context):
    return {
        "taskInput":  event['dataObject']
    }
```

The `dataObject` property of the `event` contains the properties from a data object in your manifest.

In this demonstration, which is a simple pass through, you just pass that straight through as the `taskInput` value. If you add properties with those values to the `event['dataObject']` object, they will be available to your HTML template as Liquid variables with the format `{{ task.input.<property name> }}`.

Your post-annotation Lambda function

As part of the job set up, provide the ARN of an Lambda function that can be called to process the form data when a worker completes a task. This can be as simple or complex as you want. If you want to do answer-consolidation and scoring as data comes in, you can apply the scoring or consolidation algorithms of your choice. If you want to store the raw data for offline processing, that is an option.

> **Set permissions for your post-annotation Lambda function**
>
> The annotation data will be in a file designated by the `s3Uri` string in the `payload` object. To process the annotations as they come in, even for a simple pass through function, you need to assign `S3ReadOnly` access to your Lambda so it can read the annotation files.
> In the Console page for creating your Lambda, scroll to the **Execution role** panel. Select **Create a new role from one or more templates**. Give the role a name. From the **Policy templates** drop-down, choose **Amazon S3 object read-only permissions**. Save the Lambda and the role will be saved and selected.

The following sample is for Python 3.7.

```
import json
import boto3
from urllib.parse import urlparse

def lambda_handler(event, context):
    consolidated_labels = []

    parsed_url = urlparse(event['payload']['s3Uri']);
    s3 = boto3.client('s3')
    textFile = s3.get_object(Bucket = parsed_url.netloc, Key = parsed_url.path[1:])
    filecont = textFile['Body'].read()
    annotations = json.loads(filecont);

    for dataset in annotations:
        for annotation in dataset['annotations']:
            new_annotation = json.loads(annotation['annotationData']['content'])
            label = {
                'datasetObjectId': dataset['datasetObjectId'],
                'consolidatedAnnotation' : {
                'content': {
```

```
                    event['labelAttributeName']: {
                        'workerId': annotation['workerId'],
                        'result': new_annotation,
                        'labeledContent': dataset['dataObject']
                        }
                    }
                }
            }
            consolidated_labels.append(label)

    return consolidated_labels
```

Your labeling job output

The post-annotation Lambda will often receive batches of task results in the event object. That batch will be the `payload` object the Lambda should iterate through.

You'll find the output of the job in a folder named after your labeling job in the target S3 bucket you specified. It will be in a subfolder named `manifests`.

For an intent detection task, the output in the output manifest will look a bit like the demo below. The example has been cleaned up and spaced out to be easier for humans to read. The actual output will be more compressed for machine reading.

Example : JSON in your output manifest

```
[
  {
    "datasetObjectId":"<Number representing item's place in the manifest>",
     "consolidatedAnnotation":
     {
       "content":
       {
         "<name of labeling job>":
         {
           "workerId":"private.us-east-1.XXXXXXXXXXXXXXXXXXXXX",
           "result":
           {
             "intent":
             {
                 "label":"<label chosen by worker>"
             }
           },
```

```
            "labeledContent":
            {
              "content":"<text content that was labeled>"
            }
          }
        }
      }
    },
  "datasetObjectId":"<Number representing item's place in the manifest>",
      "consolidatedAnnotation":
      {
        "content":
        {
          "<name of labeling job>":
          {
            "workerId":"private.us-east-1.6UDLPKQZHYWJQSCA4MBJBB7FWE",
            "result":
            {
              "intent":
              {
                  "label": "<label chosen by worker>"
              }
            },
            "labeledContent":
            {
              "content": "<text content that was labeled>"
            }
          }
        }
      }
    },
      ...
      ...
      ...
]
```

This should help you create and use your own custom template.

Custom Workflows via the API

When you have created your custom UI template (Step 2) and processing Lambda functions (Step 3), you should place the template in an Amazon S3 bucket with a file name format of: `<FileName>.liquid.html`.

Use the `CreateLabelingJob` action to configure your task. You'll use the location of a custom template (Step 2: Creating your custom worker task template) stored in a *<filename>*`.liquid.html` file on S3 as the value for the `UiTemplateS3Uri` field in the `UiConfig` object within the `HumanTaskConfig` object.

For the AWS Lambda tasks described in Step 3: Processing with AWS Lambda, the post-annotation task's ARN will be used as the value for the `AnnotationConsolidationLambdaArn` field, and the pre-annotation task will be used as the value for the `PreHumanTaskLambdaArn`.

Create a Labeling Job

You can create a labeling job in the Amazon SageMaker console and by using an AWS SDK in your preferred language to run `CreateLabelingJob`. After a labeling job has been created, you can track worker metrics (for private workforces) and your labeling job status using CloudWatch.

Before you create a labeling job it is recommended that you review the following pages, as applicable:

- You can specify your input data using an automatic data setup in the console, or an input manifest file in either the console or when using `CreateLabelingJob` API. For automated data setup, see Automated Data Setup. To learn how to create an input manifest file, see Use an Input Manifest File.
- Review labeling job input data quotas: Input Data Quotas.

After you have chosen your task type, use the topics on this page to learn how to create a labeling job.

If you are a new Ground Truth user, we recommend that you start by walking through the demo in Getting started.

> **Important**
>
> Ground Truth requires all S3 buckets that contain labeling job input image data to have a CORS policy attached. To learn more, see CORS Permission Requirement.

Topics

- Built-in Task Types

- Creating Instruction Pages
- Create a Labeling Job (Console)
- Create a Labeling Job (API)
- Create a Streaming Labeling Job
- Create a Labeling Category Configuration File with Label Category and Frame Attributes

Built-in Task Types

Amazon SageMaker Ground Truth has several built-in task types. Ground Truth provides a worker task template for built-in task types. Additionally, some built in task types support Automate Data Labeling. The following topics describe each built-in task type and demo the worker task templates that are provided by Ground Truth in the console. To learn how to create a labeling job in the console using one of these task types, select the task type page.

Label Images	Label Text	Label Videos and Video Frames	Label 3D Point Clouds
• Bounding Box • Image Classification (Single Label) • Image Classification (Multi-label) • Image Semantic Segmentation • Verify and Adjust Labels	• Named Entity Recognition • Text Classification (Single Label) • Text Classification (Multi-label)	• Video Classification • Video Frame Object Detection • Video Frame Object Tracking	• 3D Point Cloud Object Detection • 3D Point Cloud Object Tracking • 3D Point Cloud Semantic Segmentation

Note

Each of the video frame and 3D point cloud task types has an *adjustment* task type that you use to verify and adjust labels from a previous labeling job. Select a video frame or 3D point cloud task type page above to learn how to adjust labels created using that task type.

Creating Instruction Pages

Create custom instructions for labeling jobs to improve your worker's accuracy in completing their task. You can modify the default instructions that are provided in the console or you can create your own. The instructions are shown to the worker on the page where they complete their labeling task.

There are two kinds of instructions:

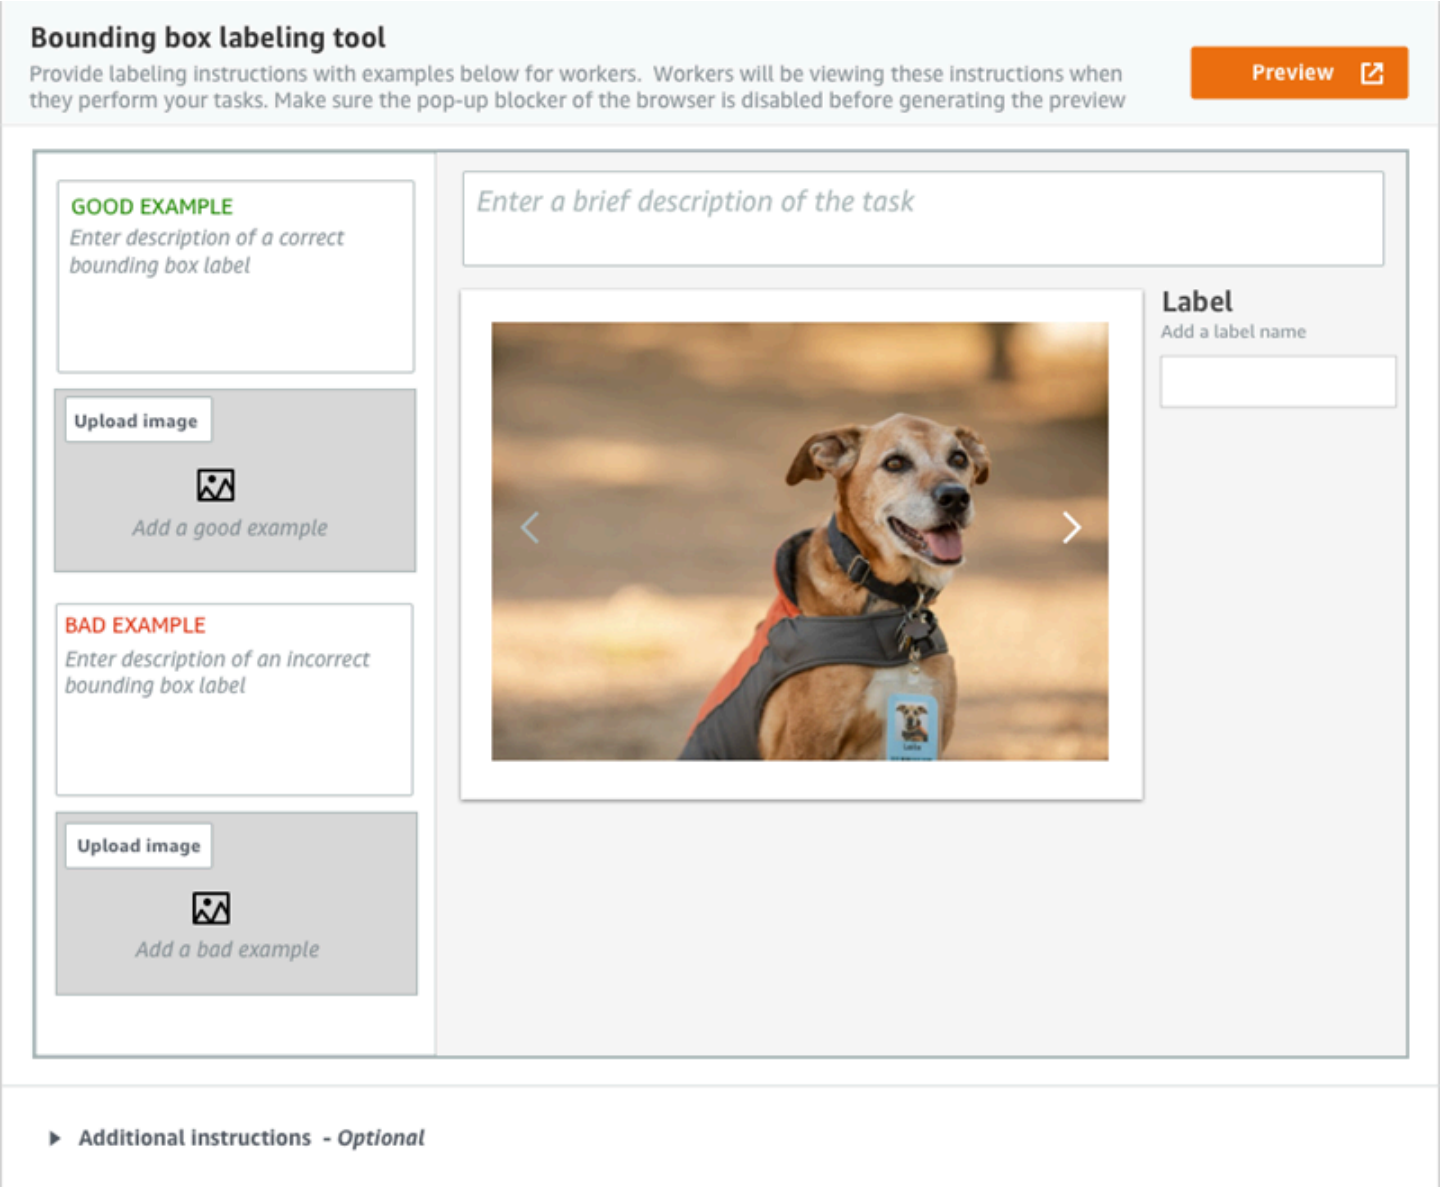
- *Short instructions*—instructions that are shown on the same webpage where the worker completes their task. These instructions should provide an easy reference to show the worker the correct way to label an object.
- *Full instructions*—instructions that are shown on a dialog box that overlays the page where the worker completes their task. We recommend that you provide detailed instructions for completing the task with multiple examples showing edge cases and other difficult situations for labeling objects.

Create instructions in the console when you are creating your labeling job. Start with the existing instructions for the task and use the editor to modify them to suit your labeling job.

> **Note**
>
> Once you create your labeling job, it will automatically start and you will not be able to modify your worker instructions. If you need to change your worker instructions, stop the labeling job that you created, clone it, and modify your worker instructions before creating a new job.
> You can clone a labeling job in the console by selecting the labeling job and then selecting **Clone** in the **Actions** menu.
> To clone a labeling job using the Amazon SageMaker API or your preferred Amazon SageMaker SDK, make a new request to the `CreateLabelingJob` operation with the same specifications as your original job after modifying your worker instructions.

Short Instructions

Short instructions appear on the same web page that workers use to label your data object. For example, the following is the editing page for a bounding box task. The short instructions panel is on the left.



Keep in mind that a worker will only spend seconds looking at the short instructions. Workers must be able to scan and understand your information quickly. In all cases it should take less time to understand the instructions than it takes to complete the task. Keep these points in mind:

- Your instructions should be clear and simple.
- Pictures are better than words. Create a simple illustration of your task that your workers can immediately understand.
- If you must use words, use short, concise examples.
- Your short instructions are more important than your full instructions.

The Amazon SageMaker Ground Truth console provides an editor so that you can create your short instructions. Replace the placeholder text and images with instructions for your task. Preview the worker's task page by choosing **Preview**. The preview will open in a new window, be sure to turn off pop-up blocking so that the window will show.

Full Instructions

You can provide additional instructions for your workers in a dialog box that overlays the page where workers label your data objects. Use full instructions to explain more complex tasks and to show workers the proper way to label edge cases or other difficult objects.

You can create full instructions using an editor in the Ground Truth console. As with quick instructions, keep the following in mind:

- Workers will want detailed instruction the first few times that the complete your task. Any information that they *must* have should be in the quick instructions.
- Pictures are more important than words.
- Text should be concise.
- Full instructions should supplement the short instructions. Don't repeat information that appears in the short instructions.

The Ground Truth console provides an editor so that you can create your full instructions. Replace the placeholder text and images with instructions for your task. Preview the full instruction page by choosing **Preview**. The preview will open in a new window, be sure to turn off pop-up blocking so that the window will show.

Add example images to your instructions

Images provide useful examples for your workers. To add a publicly accessible image to your instructions:

- Place the cursor where the image should go in the instructions editor.
- Click the image icon in the editor toolbar.
- Enter the URL of your image.

If your instruction image in Amazon S3 is not publicly accessible:

- As the image URL, enter: {{ 'https://s3.amazonaws.com/*your-bucket-name*/*image-file-name*' | grant_read_access }}.
- This renders the image URL with a short-lived, one-time access code appended so the worker's browser can display it. A broken image icon is displayed in the instructions editor, but previewing the tool displays the image in the rendered preview.

Create a Labeling Job (Console)

You can use the Amazon SageMaker console to create a labeling job for all of the Ground Truth built-in task types and custom labeling workflows. For built-in task types, we recommend that you use this page alongside the page for your task type. Each task type page includes specific details on creating a labeling job using that task type.

You need to provide the following to create a labeling job in the SageMaker console:

- An input manifest file in Amazon S3. You can place your input dataset in Amazon S3 and automatically generate a manifest file using the Ground Truth console (not supported for 3D point cloud labeling jobs).

  Alternatively, you can manually create an input manifest file. To learn how, see Input Data.
- An Amazon S3 bucket to store your output data.
- An IAM role with permission to access your resources in Amazon S3 and with a SageMaker execution policy attached. For a general solution, you can attach the managed policy, AmazonSageMakerFullAccess, to an IAM role and include `sagemaker` in your bucket name.

  For more granular policies, see the section called “IAM Permissions”.

  3D point cloud task types have additional security considerations. Learn more.
- A work team. You create a work team from a workforce made up of Amazon Mechanical Turk workers, vendors, or your own private workers.To lean more, see Create and Manage Workforces.

  You cannot use the Mechanical Turk workforce for 3D point cloud or video frame labeling jobs.
- If you are using a custom labeling workflow, you must save a worker task template in Amazon S3 and provide an Amazon S3 URI for that template. For more information, see Step 2: Creating your custom worker task template.
- (Optional) An AWS KMS key ARN if you want SageMaker to encrypt the output of your labeling job using your own AWS KMS encryption key instead of the default Amazon S3 service key.

- (Optional) Existing labels for the dataset you use for your labeling job. Use this option if you want workers to adjust, or approve and reject labels.
- If you want to create an adjustment or verification labeling job, you must have an output manifest file in Amazon S3 that contains the labels you want adjusted or verified. This option is only supported for bounding box and semantic segmentation image labeling jobs and 3D point cloud and video frame labeling jobs. It is recommended that you use the instructions on Verify and Adjust Labels to create a verification or adjustment labeling job.

> **Important**
>
> Your work team, input manifest file, output bucket, and other resources in Amazon S3 must be in the same AWS Region you use to create your labeling job.

When you create a labeling job using the SageMaker console, you add worker instructions and labels to the worker UI that Ground Truth provides. You can preview and interact with the worker UI while creating your labeling job in the console. You can also see a preview of the worker UI on your built-in task type page.

To create a labeling job (console)

1. Sign in to the SageMaker console at https://console.aws.amazon.com/sagemaker/.
2. In the left navigation pane, choose **Labeling jobs**.
3. On the **Labeling jobs** page, choose **Create labeling job**.
4. For **Job name**, enter a name for your labeling job.
5. (Optional) If you want to identify your labels with a key, select **I want to specify a label attribute name different from the labeling job name**. If you do not select this option, the labeling job name you specified in the previous step will be used to identify your labels in your output manifest file.
6. Choose a data setup to create a connection between your input dataset and Ground Truth.

   - For **Automated data setup**:
     - Follow the instructions in Automated Data Setup for image, text, and video clip labeling jobs.
     - Follow the instructions in Automated Video Frame Input Data Setup for video frame labeling jobs.

- For **Manual data setup**:
  - For **Input dataset location**, provide the location in Amazon S3 in which your input manifest file is located. For example, if your input manifest file, manifest.json, is located in **example-bucket**, enter **s3://example-bucket/manifest.json**.
  - For **Output dataset location**, provide the location in Amazon S3 where you want Ground Truth to store the output data from your labeling job.

7. For **IAM Role**, choose an existing IAM role or create an IAM role with permission to access your resources in Amazon S3, to write to the output Amazon S3 bucket specified above, and with a SageMaker execution policy attached.
8. (Optional) For **Additional configuration**, you can specify how much of your dataset you want workers to label, and if you want SageMaker to encrypt the output data for your labeling job using an AWS KMS encryption key. To encrypt your output data, you must have the required AWS KMS permissions attached to the IAM role you provided in the previous step. For more details, see the section called “IAM Permissions”.
9. In the **Task type** section, under **Task category**, use the dropdown list to select your task category.
10. In **Task selection**, choose your task type.
11. (Optional) Provide tags for your labeling job to make it easier to find in the console later.
12. Choose **Next**.
13. In the **Workers** section, choose the type of workforce you would like to use. For more details about your workforce options see Create and Manage Workforces.
14. (Optional) After you've selected your workforce, specify the **Task timeout**. This is the maximum amount of time a worker has to work on a task.

    For 3D point cloud annotation tasks, the default task timeout is 3 days. The default timeout for text and image classification and label verification labeling jobs is 5 minutes. The default timeout for all other labeling jobs is 60 minutes.
15. (Optional) For bounding box, semantic segmentation, video frame, and 3D point cloud task types, you can select **Display existing labels** if you want to display labels for your input data set for workers to verify or adjust.

    For bounding box and semantic segmentation labeling jobs, this will create an adjustment labeling job.

    For 3D point cloud and video frame labeling jobs:

- Select **Adjustment** to create an adjustment labeling job. When you select this option, you can add new labels but you cannot remove or edit existing labels from the previous job. Optionally, you can choose label category attributes and frame attributes that you want workers to edit. To make an attribute editable, select the check box **Allow workers to edit this attribute** for that attribute.

  Optionally, you can add new label category and frame attributes.
- Select **Verification** to create an adjustment labeling job. When you select this option, you cannot add, modify, or remove existing labels from the previous job. Optionally, you can choose label category attributes and frame attributes that you want workers to edit. To make an attribute editable, select the check box **Allow workers to edit this attribute** for that attribute.

  We recommend that you can add new label category attributes to the labels that you want workers to verify, or add one or more frame attributes to have workers provide information about the entire frame.

For more information, see Verify and Adjust Labels.

16. Configure your workers' UI:

- If you are using a built-in task type, specify workers instructions and labels.
  - For image classification and text classification (single and multi-label) you must specify at least two label categories. For all other built-in task types, you must specify at least one label category.
  - (Optional) If you are creating a 3D point cloud or video frame labeling job, you can specify label category attributes (not supported for 3D point cloud semantic segmentation) and frame attributes. Label category attributes can be assigned to one or more labels. Frame attributes will appear on each point cloud or video frame workers label. To learn more, see Worker User Interface (UI) for 3D point cloud and Worker User Interface (UI) for video frame.
  - (Optional) Add **Additional instructions** to help your worker complete your task.
- If you are creating a custom labeling workflow you must :
  - Enter a custom template in the code box. Custom templates can be created using a combination of HTML, the Liquid templating language and our pre-built web components. Optionally, you can choose a base-template from the drop-down menu to get started.

- Specify pre-annotation and post-annotation lambda functions. To learn how to create these functions, see Step 3: Processing with AWS Lambda.

17. (Optional) You can select **See preview** to preview your worker instructions, labels, and interact with the worker UI. Make sure the pop-up blocker of the browser is disabled before generating the preview.
18. Choose **Create**.

After you've successfully created your labeling job, you are redirected to the **Labeling jobs** page. The status of the labeling job you just created is **In progress**. This status progressively updates as workers complete your tasks. When all tasks are successfully completed, the status changes to **Completed**.

If an issue occurs while creating the labeling job, its status changes to **Failed**.

To view more details about the job, choose the labeling job name.

Next Steps

After your labeling job status changes to **Completed**, you can view your output data in the Amazon S3 bucket that you specified while creating that labeling job. For details about the format of your output data, see Output Data.

Create a Labeling Job (API)

To create a labeling job using the Amazon SageMaker API, you use the `CreateLabelingJob` operation. For specific instructions on creating a labeling job for a built-in task type, see that task type page. To learn how to create a streaming labeling job, which is a labeling job that runs perpetually, see Create a Streaming Labeling Job.

To use the `CreateLabelingJob` operation, you need the following:

- A worker task template (`UiTemplateS3Uri`) or human task UI ARN (`HumanTaskUiArn`) in Amazon S3.
  - For 3D point cloud jobs, video object detection and tracking jobs, and NER jobs, use the ARN listed in `HumanTaskUiArn` for your task type.
  - If you are using a built-in task type other than 3D point cloud tasks, you can add your worker instructions to one of the pre-built templates and save the template (using a .html or .liquid extension) in your S3 bucket. Find the pre-build templates on your task type page.

- If you are using a custom labeling workflow, you can create a custom template and save the template in your S3 bucket. To learn how to built a custom worker template, see Step 2: Creating your custom worker task template. For custom HTML elements that you can use to customize your template, see Crowd HTML Elements Reference. For a repository of demo templates for a variety of labeling tasks, see Amazon SageMaker Ground Truth Sample Task UIs .

- An input manifest file that specifies your input data in Amazon S3. Specify the location of your input manifest file in `ManifestS3Uri`. For information about creating an input manifest, see Input Data. If you create a streaming labeling job, this is optional. To learn how to create a streaming labeling job, see Create a Streaming Labeling Job.
- An Amazon S3 bucket to store your output data. You specify this bucket, and optionally, a prefix in `S3OutputPath`.
- A label category configuration file. Each label category name must be unique. Specify the location of this file in Amazon S3 using the `LabelCategoryConfigS3Uri` parameter. The format and label categories for this file depend on the task type you use:
  - For image classification and text classification (single and multi-label) you must specify at least two label categories. For all other task types, the minimum number of label categories required is one.
  - For named entity recognition tasks, you must provide worker instructions in this file. See Provide Worker Instructions in a Label Category Configuration File for details and an example.
  - For 3D point cloud and video frame task type, use the format in Create a Labeling Category Configuration File with Label Category and Frame Attributes.
  - For all other built-in task types and custom tasks, your label category configuration file must be a JSON file in the following format. Identify the labels you want to use by replacing `label_1`, `label_2`,`...`,`label_n` with your label categories.

```
{
    "document-version": "2018-11-28"
    "labels": [
        {"label": "label_1"},
        {"label": "label_2"},
        ...
        {"label": "label_n"}
    ]
}
```

- An AWS Identity and Access Management (IAM) role with the AmazonSageMakerGroundTruthExecution managed IAM policy attached and with permissions to access your S3 buckets. Specify this role in `RoleArn`. To learn more about this policy, see Use IAM Managed Policies with Ground Truth. If you require more granular permissions, see the section called "IAM Permissions".

  If your input or output bucket name does not contain `sagemaker`, you can attach a policy similar to the following to the role that is passed to the `CreateLabelingJob` operation.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject"
            ],
            "Resource": [
                "arn:aws:s3:::my_input_bucket/*"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "s3:PutObject"
            ],
            "Resource": [
                "arn:aws:s3:::my_output_bucket/*"
            ]
        }
    ]
}
```

- A pre-annotation and post-annotation (or annotation-consolidation) AWS Lambda function Amazon Resource Name (ARN) to process your input and output data.
  - Lambda functions are predefined in each AWS Region for built-in task types. To find the pre-annotation Lambda ARN for your Region, see PreHumanTaskLambdaArn. To find the annotation-consolidation Lambda ARN for your Region, see AnnotationConsolidationLambdaArn.

  - For custom labeling workflows, you must provide a custom pre- and post-annotation Lambda ARN. To learn how to create these Lambda functions, see Step 3: Processing with AWS Lambda.

- A work team ARN that you specify in `WorkteamArn`. You receive a work team ARN when you subscribe to a vendor workforce or create a private workteam. If you are creating a labeling job for a video frame or point cloud task type, you cannot use the Amazon Mechanical Turk workforce. For all other task types, to use the Mechanical Turk workforce, use the following ARN. Replace *`region`* with the AWS Region you are using to create the labeling job.

  `arn:aws:sagemaker:region:394669845002:workteam/public-crowd/default`

  If you use the Amazon Mechanical Turk workforce, use the `ContentClassifiers` parameter in `DataAttributes` of `InputConfig` to declare that your content is free of personally identifiable information and adult content.

  Ground Truth *requires* that your input data is free of personally identifiable information (PII) if you use the Mechanical Turk workforce. If you use Mechanical Turk and do not specify that your input data is free of PII using the `FreeOfPersonallyIdentifiableInformation` flag, your labeling job will fail. Use the `FreeOfAdultContent` flag to declare that your input data is free of adult content. SageMaker may restrict the Amazon Mechanical Turk workers that can view your task if it contains adult content.

  To learn more about work teams and workforces, see Create and Manage Workforces.

- If you use the Mechanical Turk workforce, you must specify the price you'll pay workers for performing a single task in **`PublicWorkforceTaskPrice`**.

- To configure the task, you must provide a task description and title using `TaskDescription` and **`TaskTitle`** respectively. Optionally, you can provide time limits that control how long the workers have to work on an individual task (**`TaskTimeLimitInSeconds`**) and how long tasks remain in the worker portal, available to workers (`TaskAvailabilityLifetimeInSeconds`).

- (Optional) For some task types, you can have multiple workers label a single data object by inputting a number greater than one for the `NumberOfHumanWorkersPerDataObject` parameter. For more information about annotation consolidation, see Consolidate Annotations.

- (Optional) To create an automated data labeling job, specify one of the ARNs listed in LabelingJobAlgorithmSpecificationArn in `LabelingJobAlgorithmsConfig`. This ARN identifies the algorithm used in the automated data labeling job. The task type associated with this ARN must match the task type of the `PreHumanTaskLambdaArn` and

`AnnotationConsolidationLambdaArn` you specify. Automated data labeling is supported for the following task types: image classification, bounding box, semantic segmentation, and text classification. The minimum number of objects allowed for automated data labeling is 1,250, and we strongly suggest providing a minimum of 5,000 objects. To learn more about automated data labeling jobs, see Automate Data Labeling.

- (Optional) You can provide `StoppingConditions` that cause the labeling job to stop if one the conditions is met. You can use stopping conditions to control the cost of the labeling job.

Examples

The following code examples demonstrate how to create a labeling job using `CreateLabelingJob`. For additional examples, we recommend you use one of the **Ground Truth Labeling Jobs** Jupyter notebooks in the SageMaker Examples section of a SageMaker notebook instance. To learn how to use a notebook example from the SageMaker Examples, see Example Notebooks. You can also see these example notebooks on GitHub in the SageMaker Examples repository.

AWS SDK for Python (Boto3)

The following is an example of an AWS Python SDK (Boto3) request to create a labeling job for a built-in task type in the US East (N. Virginia) Region using a private workforce. Replace all *`red-italized text`* with your labeling job resources and specifications.

```
response = client.create_labeling_job(
    LabelingJobName="example-labeling-job",
    LabelAttributeName="label",
    InputConfig={
        'DataSource': {
            'S3DataSource': {
                'ManifestS3Uri': "s3://bucket/path/manifest-with-input-data.json"
            }
        },
        'DataAttributes': {
            'ContentClassifiers': [
                "FreeOfPersonallyIdentifiableInformation"|"FreeOfAdultContent",
            ]
        }
    },
    OutputConfig={
        'S3OutputPath': "s3://bucket/path/file-to-store-output-data",
```

```
        'KmsKeyId': "string"
    },
    RoleArn="arn:aws:iam::*:role/*",
    LabelCategoryConfigS3Uri="s3://bucket/path/label-categories.json",
    StoppingConditions={
        'MaxHumanLabeledObjectCount': 123,
        'MaxPercentageOfInputDatasetLabeled': 123
    },
    HumanTaskConfig={
        'WorkteamArn': "arn:aws:sagemaker:region:*:workteam/private-crowd/*",
        'UiConfig': {
            'UiTemplateS3Uri': "s3://bucket/path/custom-worker-task-template.html"
        },
        'PreHumanTaskLambdaArn': "arn:aws:lambda:us-
east-1:432418664414:function:PRE-tasktype",
        'TaskKeywords': [
            "Images",
            "Classification",
            "Multi-label"
        ],
        'TaskTitle': "Multi-label image classification task",
        'TaskDescription': "Select all labels that apply to the images shown",
        'NumberOfHumanWorkersPerDataObject': 1,
        'TaskTimeLimitInSeconds': 3600,
        'TaskAvailabilityLifetimeInSeconds': 21600,
        'MaxConcurrentTaskCount': 1000,
        'AnnotationConsolidationConfig': {
            'AnnotationConsolidationLambdaArn': "arn:aws:lambda:us-
east-1:432418664414:function:ACS-"
        },
    Tags=[
        {
            'Key': "string",
            'Value': "string"
        },
    ]
)
```

AWS CLI

The following is an example of an AWS CLI request to create a labeling job for a built-in task type in the US East (N. Virginia) Region using the Amazon Mechanical Turk workforce. For

more information, see start-human-loop in the *AWS CLI Command Reference*. Replace all *red-italized text* with your labeling job resources and specifications.

```
$ aws --region us-east-1 sagemaker create-labeling-job \
--labeling-job-name "example-labeling-job" \
--label-attribute-name "label" \
--role-arn "arn:aws:iam::account-id:role/role-name" \
--input-config '{
        "DataAttributes": {
            "ContentClassifiers": [
                "FreeOfPersonallyIdentifiableInformation",
                "FreeOfAdultContent"
            ]
        },
        "DataSource": {
            "S3DataSource": {
                "ManifestS3Uri": "s3://bucket/path/manifest-with-input-data.json"
            }
        }
    }' \
--output-config '{
        "KmsKeyId": "",
        "S3OutputPath": "s3://bucket/path/file-to-store-output-data"
    }' \
--human-task-config '{
        "AnnotationConsolidationConfig": {
            "AnnotationConsolidationLambdaArn": "arn:aws:lambda:us-
east-1:432418664414:function:ACS-"
        },
        "TaskAvailabilityLifetimeInSeconds": 21600,
        "TaskTimeLimitInSeconds": 3600,
        "NumberOfHumanWorkersPerDataObject": 1,
        "PreHumanTaskLambdaArn":  "arn:aws:lambda:us-
east-1:432418664414:function:PRE-tasktype",
        "WorkteamArn": "arn:aws:sagemaker:us-east-1:394669845002:workteam/public-
crowd/default",
        "PublicWorkforceTaskPrice": {
            "AmountInUsd": {
                "Dollars": 0,
                "TenthFractionsOfACent": 6,
                "Cents": 3
            }
        },
```

```
        "TaskDescription": "Select all labels that apply to the images shown",
        "MaxConcurrentTaskCount": 1000,
        "TaskTitle": "Multi-label image classification task",,
        "TaskKeywords": [
            "Images",
            "Classification",
            "Multi-label"
        ],
        "UiConfig": {
            "UiTemplateS3Uri": "s3://bucket/path/custom-worker-task-template.html"
        }
    }'
```

For more information about this operation, see CreateLabelingJob. For information about how to use other language-specific SDKs, see See Also in the `CreateLabelingJobs` topic.

Create a Streaming Labeling Job

Streaming labeling jobs enable you to send individual data objects in real time to a perpetually running, streaming labeling job. To create a streaming labeling job, you must create an Amazon SNS *input topic* and specify this topic in `CreateLabelingJob` parameters `InputConfig` of `SnsDataSource`. Optionally, you can also create an Amazon SNS *output topic* and specify it in `OutputConfig`if you want to receive label data in real time.

> **Important**
>
> If you are a new user of Ground Truth streaming labeling jobs, it is recommended that you review Ground Truth Streaming Labeling Jobs before creating a streaming labeling job.

Use the following sections to create the resources that you need and can use to create a streaming labeling job:

- Learn how to create SNS topics with the permissions required for Ground Truth streaming labeling jobs by following the steps in Create Amazon SNS Input and Output Topics. Your SNS topics must be created in the same AWS Region as your labeling job.
- See Subscribe an Endpoint to Your Amazon SNS Output Topic to learn how to set up an endpoint to receive labeling task output data at a specified endpoint each time a labeling task is completed.

- To learn how to configure your Amazon S3 bucket to send notifications to your Amazon SNS input topic, see Set up Amazon S3 Bucket Event Notifications.
- Optionally, add data objects that you want to have labeled as soon as the labeling job starts to your input manifest. For more information, see Create a Manifest File (Optional).
- There are other resources required to create a labeling job, such as an IAM role, Amazon S3 bucket, a worker task template and label categories. These are described in the Ground Truth documentation on creating a labeling job. For more information, see Create a Labeling Job.

> **Important**
>
> When you create a labeling job you must provide an IAM execution role. Attach the AWS managed policy **AmazonSageMakerGroundTruthExecution** to this role to ensure it has required permissions to execute your labeling job.

When you submit a request to create a streaming labeling job, the state of your labeling job is `Initializing`. Once the labeling job is active, the state changes to `InProgress`. Do not send new data objects to your labeling job or attempt to stop your labeling job while it is in the `Initializing` state. Once the state changes to `InProgress`, you can start sending new data objects using Amazon SNS and the Amazon S3 configuration.

Topics

- Create Amazon SNS Input and Output Topics
- Set up Amazon S3 Bucket Event Notifications
- Create a Manifest File (Optional)
- Example: Use SageMaker API To Create Streaming Labeling Job
- Stop a Streaming Labeling Job

Create Amazon SNS Input and Output Topics

You need to create an Amazon SNS input to create a streaming labeling job. Optionally, you may provide an Amazon SNS output topic.

When you create an Amazon SNS topic to use in your streaming labeling job, note down the topic Amazon Resource Name (ARN). The ARN will be the input values for the parameter `SnsTopicArn` in `InputConfig` and `OutputConfig` when you create a labeling job.

Create an Input Topic

Your input topic is used to send new data objects to Ground Truth. To create an input topic, follow the instructions in Creating an Amazon SNS topic in the Amazon Simple Notification Service Developer Guide.

Note down your input topic ARN and use it as input for the `CreateLabelingJob` parameter `SnsTopicArn` in `InputConfig`.

Create an Output Topic

If you provide an output topic, it is used to send notifications when a data object is labeled. When you create a topic, you have the option to add an encryption key. Use this option to add a AWS Key Management Service customer managed key to your topic to encrypt the output data of your labeling job before it is published to your output topic.

To create an output topic, follow the instructions in Creating an Amazon SNS topic in the Amazon Simple Notification Service Developer Guide.

If you add encryption, you must attach additional permission to the topic. See Add Encryption to Your Output Topic (Optional). for more information.

> **Important**
>
> To add a customer managed key to your output topic while creating a topic in the console, do not use the **(Default) alias/aws/sns** option. Select a customer managed key that you created.

Note down your input topic ARN and use it in your `CreateLabelingJob` request in the parameter `SnsTopicArn` in `OutputConfig`.

Add Encryption to Your Output Topic (Optional)

To encrypt messages published to your output topic, you need to provide an AWS KMS customer managed key to your topic. Modify the following policy and add it to your customer managed key to give Ground Truth permission to encrypt output data before publishing it to your output topic.

Replace *`<account_id>`* with the ID of the account that you are using to create your topic. To learn how to find your AWS account ID, see Finding Your AWS Account ID.

```
{
    "Id": "key-console-policy",
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "Enable IAM User Permissions",
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::<account_id>:root"
            },
            "Action": "kms:*",
            "Resource": "*"
        },
        {
            "Sid": "Allow access for Key Administrators",
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::<account_id>:role/Admin"
            },
            "Action": [
                "kms:Create*",
                "kms:Describe*",
                "kms:Enable*",
                "kms:List*",
                "kms:Put*",
                "kms:Update*",
                "kms:Revoke*",
                "kms:Disable*",
                "kms:Get*",
                "kms:Delete*",
                "kms:TagResource",
                "kms:UntagResource",
                "kms:ScheduleKeyDeletion",
                "kms:CancelKeyDeletion"
            ],
            "Resource": "*"
        }
    ]
}
```

Additionally, you must modify and add the following policy to the execution role that you use to create your labeling job (the input value for `RoleArn`).

Replace *<account_id>* with the ID of the account that you are using to create your topic. Replace *<region>* with the AWS Region you are using to create your labeling job. Replace *<key_id>* with your customer managed key ID.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "sid1",
      "Effect": "Allow",
      "Action": [
        "kms:Decrypt",
        "kms:GenerateDataKey"
      ],
      "Resource": "arn:aws:kms:<region>:<account_id>:key/<key_id>"
    }
  ]
}
```

For more information on creating and securing keys, see Creating Keys and Using Key Policies in the AWS Key Management Service Developer Guide.

Subscribe an Endpoint to Your Amazon SNS Output Topic

When a worker completes a labeling job task from a Ground Truth streaming labeling job, Ground Truth uses your output topic to publish output data to one or more endpoints that you specify. To receive notifications when a worker finishes a labeling task, you must subscribe an endpoint to your Amazon SNS output topic.

To learn how to add endpoints to your output topic, see Subscribing to an Amazon SNS topic in the *Amazon Simple Notification Service Developer Guide*.

To learn more about the output data format that is published to these endpoints, see Output Data.

> **Important**
>
> If you do not subscribe an endpoint to your Amazon SNS output topic, you will not receive notifications when new data objects are labeled.

Set up Amazon S3 Bucket Event Notifications

You can add an event notification to your Amazon S3 bucket using the Amazon S3 console, API, and language specific AWS SDKs, or the AWS Command Line Interface. Set up this event to send notifications to the same Amazon SNS input topic that you specify using `SnsTopicArn` in `InputConfig` when you create a labeling job. Do not set up event notifications using the same Amazon S3 location that you specified for `S3OutputPath` in `OutputConfig` – doing so may result in unwanted data objects being processed by Ground Truth for labeling.

You decide the types of events that you want to send to your Amazon SNS topic. Ground Truth creates a labeling job when you send object creation events.

The event structure sent to your Amazon SNS input topic must be a JSON message formatted using the same structure found in Event message structure.

To see examples of how you can set up an event notification for your Amazon S3 bucket using the Amazon S3 console, AWS SDK for .NET, and AWS SDK for Java, follow this walkthrough, Walkthrough: Configure a bucket for notifications (SNS topic or SQS queue) in the Amazon Simple Storage Service User Guide.

Create a Manifest File (Optional)

When you create a streaming labeling job, you have the one time option to add objects (such as images or text) to an input manifest file that you specify in `ManifestS3Uri` of `CreateLabelingJob`. When the streaming labeling job starts, these objects are sent to workers or added to the Amazon SQS queue if the total number of objects exceed `MaxConcurrentTaskCount`. The results are added to the Amazon S3 path that you specify when creating the labeling job periodically as workers complete labeling tasks. Output data is sent to any endpoint that you subscribe to your output topic.

If you want to provide initial objects to be labeled, create a manifest file that identifies these objects and place it in Amazon S3. Specify the S3 URI of this manifest file in `ManifestS3Uri` within `InputConfig`.

To learn how to format your manifest file, see Input Data. To use the SageMaker console to automatically generate a manifest file (not supported for 3D point cloud task types), see Automated Data Setup.

Example: Use SageMaker API To Create Streaming Labeling Job

The following is an example of an AWS Python SDK (Boto3) request that you can use to start a streaming labeling job for a built-in task type in the US East (N. Virginia) Region. For more details about each parameter below see `CreateLabelingJob`. To learn how you can create a labeling job using this API and associated language specific SDKs, see Create a Labeling Job (API).

In this example, note the following parameters:

- `SnsDataSource` – This parameter appears in `InputConfig` and `OutputConfig` and is used to identify your input and output Amazon SNS topics respectively. To create a streaming labeling job, you are required to provide an Amazon SNS input topic. Optionally, you can also provide an Amazon SNS output topic.
- `S3DataSource` – This parameter is optional. Use this parameter if you want to include an input manifest file of data objects that you want labeled as soon as the labeling job starts.
- `StoppingConditions` – This parameter is ignored when you create a streaming labeling job. To learn more about stopping a streaming labeling job, see Stop a Streaming Labeling Job.
- Streaming labeling jobs do not support automated data labeling. Do not include the `LabelingJobAlgorithmsConfig` parameter.

```
response = client.create_labeling_job(
    LabelingJobName= 'example-labeling-job',
    LabelAttributeName='label',
    InputConfig={
        'DataSource': {
            'S3DataSource': {
                'ManifestS3Uri': 's3://bucket/path/manifest-with-input-data.json'
            },
            'SnsDataSource': {
                'SnsTopicArn': 'arn:aws:sns:us-east-1:123456789012:your-sns-input-
topic'
            }
        },
        'DataAttributes': {
            'ContentClassifiers': [
                'FreeOfPersonallyIdentifiableInformation'|'FreeOfAdultContent',
            ]
        }
    },
    OutputConfig={
```

```
        'S3OutputPath': 's3://bucket/path/file-to-store-output-data',
        'KmsKeyId': 'string',
        'SnsTopicArn': 'arn:aws:sns:us-east-1:123456789012:your-sns-output-topic'
    },
    RoleArn='arn:aws:iam::*:role/*',
    LabelCategoryConfigS3Uri='s3://bucket/path/label-categories.json',
    HumanTaskConfig={
        'WorkteamArn': 'arn:aws:sagemaker:us-east-1:*:workteam/private-crowd/*',
        'UiConfig': {

        'AnnotationConsolidationConfig': {
            'AnnotationConsolidationLambdaArn': 'arn:aws:lambda:us-
east-1:432418664414:function:ACS-tasktype'
            }
        },
    Tags=[
        {
            'Key': 'string',
            'Value': 'string'
        },
    ]
)
```

Stop a Streaming Labeling Job

You can manually stop your streaming labeling job using the operation StopLabelingJob.

If your labeling job remains idle for over 10 days, it is automatically stopped by Ground Truth. In this context, a labeling job is considered *idle* if no objects are sent to the Amazon SNS input topic and no objects remain in your Amazon SQS queue, waiting to be labeled. For example, if no data objects are fed to the Amazon SNS input topic and all the objects fed to the labeling job are

already labeled, Ground Truth starts a timer. After the timer starts, if no items are received within a 10 day period, the labeling job is stopped.

When a labeling job is stopped, its status is `STOPPING` while Ground Truth cleans up labeling job resources and unsubscribes your Amazon SNS topic from your Amazon SQS queue. The Amazon SQS is *not* deleted by Ground Truth because this queue may contain unprocessed data objects. You should manually delete the queue if you want to avoid incurring additional charges from Amazon SQS. To learn more, see Amazon SQS pricing .

Create a Labeling Category Configuration File with Label Category and Frame Attributes

When you create a 3D point cloud or video frame labeling job using the Amazon SageMaker API operation `CreateLabelingJob`, you use a label category configuration file to specify your labels and worker instructions. Optionally, you can also provide the following in your label category attribute file:

- You can provide *label category attributes* for video frame and 3D point cloud object tracking and object detection task types. Workers can use one or more attributes to give more information about an object. For example, you may want to use the attribute *occluded* to have workers identify when an object is partially obstructed. You can either specify a label category attribute for a single label using the `categoryAttributes` parameter, or for all labels using the `categoryGlobalAttributes` parameter.
- You can provide *frame attributes* for video frame and 3D point cloud object tracking and object detection task types using `frameAttributes`. When you create a frame attribute, it appears on each frame or point cloud in the worker task. In video frame labeling jobs, these are attributes that workers assign to an entire video frame. For 3D point cloud labeling jobs, these attributes are applied to a single point cloud. Use frame attributes to have workers provide more information about the scene in a specific frame or point cloud.
- For video frame labeling jobs, you use the label category configuration file to specify the task type (bounding box, polyline, polygon, or keypoint) sent to workers.

For workers, specifying values for label category attributes and frame attributes will be optional.

> **Important**
>
> You should only provide a label attribute name in `auditLabelAttributeName` if you are running an audit job to verify or adjust labels. Use this parameter to input the

LabelAttributeName used in the labeling job that generated the annotations you want your worker to adjust. When you create a labeling job in the console, if you did not specify a label attribute name, the **Name** of your job is used as the LabelAttributeName.

Topics

Label Category Configuration File Schema

The following table lists elements you can and must include in your label category configuration file.

Note

The parameter `annotationType` is only supported for video frame labeling jobs.

Parameter	Required	Accepted Values	Description

`frameAttributes`	No	A list of JSON objects.
		
		Required Parameters in each JSON Object:
		
		`name`, `type`, `description`
		
		`minimum` and `maximum` are required if `type` is `"number"`
		
		Optional Parameters in each JSON Object:
			Use this parameter to create a frame attribute that is applied to all frames or 3D point clouds in your labeling job. See the third table in this section for more information.

Parameter	Required	Accepted Values	Description
		`enum`, `editsAllowed` , `isRequired`	

`categoryGlobalAttributes`	No	A list of JSON objects.
		
		Required Parameters in each JSON Object:
		
		`name`, `type`
		
		`minimum` and `maximum` are required if `type` is `"number"`
		
		Optional Parameters in each JSON Object:
		
		`description` , `enum`, `editsAllowed` , `isRequired`
			Use this parameter to create label category attributes that are applied to all labels you specify in `labels`.
			See the third table in this section for more information.

Parameter	Required	Accepted Values	Description

`labels`	Yes	A list of up to 30 JSON objects
		
		Required Parameters in each JSON Object:
		
		`label`
		
		Optional Parameters in each JSON Object:
		
		`categoryAttributes` , `editsAllowed`
			Use this parameter to specify your labels, or classes. Add one `label` for each class.
			
			To add a label category attribute to a label, add `categoryAttributes` to that label.
			
			Use `editsAllowed` to specify whether or not a label can be edited in an adjustment labeling job. Set `editsAllowed` to `"none"` for verification labeling jobs.
			
			See the following table for more information.

Parameter	Required	Accepted Values	Description

`annotationType` (only supported for video frame labeling jobs)	No	String
		
		Accepted Parameters:
		
		`BoundingBox` , `Polyline`, `Polygon`, `Keypoint`
		
		Default:
		
		`BoundingBox`
			Use this to specify the task type for your video frame labeling jobs. For example, for a polygon video frame object detection task, choose `Polygon`.
			
			If you do not specify an `annotationType` when you create a video frame labeling job, Ground Truth will use `BoundingBox` by default.

Parameter	Required	Accepted Values	Description
`instructions`	No	A JSON object **Required Parameters in each JSON Object:** `"shortInstruction"` , `"fullInstruction"`	Use this parameter to add worker instructions to help your workers complete their tasks. For more information about worker instructions, see Worker Instructions. Short instructions must be under 255 characters and long instruction must be under 2,048 characters. For more information, see Creating Worker Instructions.

Parameter	Required	Accepted Values	Description
`auditLabelAttributeName`	Required for adjustment and verification task types	String	Enter the LabelAttributeName used in the labeling job you want to adjust annotations of. Only use this parameter if you are creating an adjustment job for video frame and 3D point cloud object detection, object tracking, or 3D point cloud semantic segmentation.

The following table describes the parameters that you can and must use to create a list of `Labels`. Each parameter should be included in a JSON object.

Parameter	Required	Accepted Values	Description
`label`	Yes	String	The name of the label category that is displayed to workers. Each label category name must be unique.
`categoryAttributes`	No	A list of JSON objects. **Required Parameters in each JSON Object:**	Use this parameter to add label category attributes to specific labels you specify in `labels`.

Parameter	Required	Accepted Values	Description

		`name`, `type`
		
		`minimum` and `maximum` required if `type` is `"number"`
		
		Optional Parameters in each JSON Object:
		
		`description` , `enum`, `editsAllowed` , `isRequired`
			To add one or more label category attributes to a label, include the `categoryAttributes` JSON object in the same `labels` JSON object as that `label`. See the following table for more information.

Parameter	Required	Accepted Values	Description
`editsAllowed`	No	String **Supported Values**: `"none"`: no modifications are not allowed. or `"any"` (Default): all modifications are allowed.	Specifies whether or not a label can be edited by workers. For video frame or 3D point cloud *adjustment* labeling jobs, add this parameter to one or more JSON objects in the `labels` list to specify whether or not a worker can edit a label. For 3D point cloud and video frame *verification* labeling jobs, add this parameter with the value `"none"` to each JSON object in the `labels` list. This will make all labels uneditable.

The following table describes the parameters that you can and must use to create a frame attributes using `frameAttributes` and label category attribute using the `categoryGlobalAttributes` and `categoryAttributes` parameters.

Parameter	Required	Accepted Values	Description
`name`	Yes	String	Use this parameter to assign a name to your label category

Parameter	Required	Accepted Values	Description
			or frame attribute. This is the attribute name that workers see. Each label category attribute name in your label category configuration file must be unique. Global label category attributes and label specific label category attributes cannot have the same name.

Parameter	Required	Accepted Values	Description
`type`	Yes	String **Required Values**: `"string"` or `"number"`	Use this parameter to define the label category or frame attribute type. If you specify `"string"` for `type` and provide an `enum` value for this attribute, workers will be able to choose from one of the choices you provide. If you specify `"string"` for `type` and do not provide an `enum` value, workers can enter free form text. If you specify `number` for `type`, worker can enter a number between the `minimum` and `maximum` numbers you specify.

Parameter	Required	Accepted Values	Description
`enum`	No	List of strings	Use this parameter to define options that workers can choose from for this label category or frame attribute. Workers can choose one value specified in `enum`. For example, if you specify `["foo", "buzz", "bar"]` for `enum`, workers can choose one of `foo`, `buzz`, or `bar`. You must specify `"string"` for `type` to use an `enum` list.
`description`	`frameAttributes` : Yes `categoryAttributes` or `categoryGlobalAttributes` : No	String	Use this parameter to add a description of the label category or frame attribute. You can use this field to give workers more information about the attribute. This field is only required for frame attributes.

Parameter	Required	Accepted Values	Description
`minimum` and `maximum`	Required if attribute `type` is `"number"`	Integers	Use these parameters to specify minimum and maximum (inclusive) values workers can enter for numeric label category or frame attributes. You must specify `"number"` for `type` to use `minimum` and `maximum`.
`editsAllowed`	No	String **Required Values**: `"none"`: no modifications are not allowed. or `"any"` (Default): all modifications are allowed.	Specifies whether or not a label category or frame attribute can be edited by workers. For video frame or 3D point cloud *adjustment* and *verification* labeling jobs, add this parameter to label category and frame attribute JSON objects to specify whether or not a worker can edit an attribute.

Parameter	Required	Accepted Values	Description
`isRequired`	No	Boolean	Specifies whether workers are required to annotate an attribute. Workers cannot submit the job until all required attributes are annotated.

Label and label category attribute quotas

You can specify up to 10 label category attributes per class. This 10-attribute quotas includes global label category attributes. For example, if you create four global label category attributes, and then assign three label category attributes to label X, that label will have 4+3=7 label category attributes in total. For all label category and label category attribute limits, refer to the following table.

Type	Min	Max
Labels (`Labels`)	1	30
Label name character quota	1	16
Label category attributes per label (sum of `categoryAttributes` and `categoryGlobalAttributes`)	0	10
Free form text entry label category attributes per label (sum of `categoryAttributes` and `categoryGlobalAttributes`).	0	5

Type	Min	Max
Frame attributes	0	10
Free form text entry attributes in `frameAttributes` .	0	5
Attribute name character quota (`name`)	1	16
Attribute description character quota (`description`)	0	128
Attribute type characters quota (`type`)	1	16
Allowed values in the `enum` list for a `string` attribute	1	10
Character quota for a value in `enum` list	1	16
Maximum characters in free form text response for free form text `frameAttributes`	0	1000
Maximum characters in free form text response for free form text `categoryAttributes` and `categoryGlobalAttributes`	0	80

Example: Label Category Configuration Files for 3D Point Cloud Labeling Jobs

Select a tab in the following tables to see examples of 3D point cloud label category configuration files for object detection, object tracking, semantic segmentation, adjustment, and verification labeling jobs.

3D Point Cloud Object Tracking and Object Detection

The following is an example of a label category configuration file that includes label category attributes for a 3D point cloud object detection or object tracking labeling job. This example includes a two frame attributes, which will be added to all point clouds submitted to the labeling job. The `Car` label will include four label category attributes—`X`, `Y`, `Z`, and the global attribute, `W`.

```
{
    "documentVersion": "2020-03-01",
    "frameAttributes": [
        {
            "name":"count players",
            "description":"How many players to you see in the scene?",
            "type":"number"
        },
        {
            "name":"select one",
            "description":"describe the scene",
            "type":"string",
            "enum":["clear","blurry"],
            "isRequired":true
        },
    ],
    "categoryGlobalAttributes": [
        {
            "name":"W",
            "description":"label-attributes-for-all-labels",
            "type":"string",
            "enum": ["foo", "buzz", "biz"]
        }
    ],
    "labels": [
        {
            "label": "Car",
            "categoryAttributes": [
                {
```

```
                    "name":"X",
                    "description":"enter a number",
                    "type":"number",
                },
                {
                    "name":"Y",
                    "description":"select an option",
                    "type":"string",
                    "enum":["y1", "y2"]
                },
                {
                    "name":"Z",
                    "description":"submit a free-form response",
                    "type":"string",
                }
            ]
        },
        {
            "label": "Pedestrian",
            "categoryAttributes": [...]
        }
    ],
    "instructions": {"shortInstruction":"Draw a tight Cuboid",
 "fullInstruction":"<html markup>"}
}
```

3D Point Cloud Semantic Segmentation

The following is an example of a label category configuration file for a 3D point cloud semantic segmentation labeling job.

Label category attributes are not supported for 3D point cloud semantic segmentation task types. Frame attributes are supported. If you provide label category attributes for a semantic segmentation labeling job, they will be ignored.

```
{
    "documentVersion": "2020-03-01",
    "frameAttributes": [
        {
            "name":"count players",
            "description":"How many players to you see in the scene?",
            "type":"number"
        },
```

```
        {
            "name":"select one",
            "description":"describe the scene",
            "type":"string",
            "enum":["clear","blurry"]
        },
    ],
    "labels": [
        {
            "label": "Car",
        },
        {
            "label": "Pedestrian",
        },
        {
            "label": "Cyclist",
        }
    ],
    "instructions": {"shortInstruction":"Select the appropriate label and
 paint all objects in the point cloud that it applies to the same color",
 "fullInstruction":"<html markup>"}
}
```

Select a tab in the following table to see an example of a label category configuration file for 3D point cloud verification or adjustment labeling jobs.

3D Point Cloud Adjustment

The following is an example of a label category configuration file for a 3D point cloud object detection or object tracking adjustment labeling job. For 3D point cloud semantic segmentation adjustment labeling jobs, `categoryGlobalAttributes` and `categoryAttributes` are not supported.

You must include `auditLabelAttributeName` to specify the label attribute name of the previous labeling job that you use to create the adjustment labeling job. Optionally, you can use the `editsAllowed` parameter to specify whether or not a label or frame attribute can be edited.

```
{
    "documentVersion": "2020-03-01",
    "frameAttributes": [
```

```
        {
            "name":"count players",
            "description":"How many players to you see in the scene?",
            "type":"number"
        },
        {
            "name":"select one",
            "editsAllowed":"none",
            "description":"describe the scene",
            "type":"string",
            "enum":["clear","blurry"]
        },
    ],
    "categoryGlobalAttributes": [
        {
            "name":"W",
            "editsAllowed":"any",
            "description":"label-attributes-for-all-labels",
            "type":"string",
            "enum": ["foo", "buzz", "biz"]
        }
    ],
    "labels": [
        {
            "label": "Car",
            "editsAllowed":"any",
            "categoryAttributes": [
                {
                    "name":"X",
                    "description":"enter a number",
                    "type":"number"
                },
                {
                    "name":"Y",
                    "description":"select an option",
                    "type":"string",
                    "enum":["y1", "y2"],
                    "editsAllowed":"any"
                },
                {
                    "name":"Z",
                    "description":"submit a free-form response",
                    "type":"string",
                    "editsAllowed":"none"
```

```
                }
            ]
        },
        {
            "label": "Pedestrian",
            "categoryAttributes": [...]
        }
    ],
    "instructions": {"shortInstruction":"Draw a tight Cuboid",
 "fullInstruction":"<html markup>"},
    // include auditLabelAttributeName for label adjustment jobs
    "auditLabelAttributeName": "myPrevJobLabelAttributeName"
}
```

3D Point Cloud Verification

The following is an example of a label category configuration file you may use for a 3D point cloud object detection or object tracking verification labeling job. For a 3D point cloud semantic segmentation verification labeling job, `categoryGlobalAttributes` and `categoryAttributes` are not supported.

You must include `auditLabelAttributeName` to specify the label attribute name of the previous labeling job that you use to create the verification labeling job. Additionally, you must use the `editsAllowed` parameter to specify that no labels can be edited.

```
{
    "documentVersion": "2020-03-01",
    "frameAttributes": [
        {
            "name":"count players",
            "editsAllowed":"any",
            "description":"How many players to you see in the scene?",
            "type":"number"
        },
        {
            "name":"select one",

Example: Label Category Configuration Files for Video Frame Labeling Jobs

The annotation tools available to your worker and task type used depends on the value you specify for `annotationType`. For example, if you want workers to use key points to track changes in the pose of specific objects across multiple frames, you would specify `Keypoint` for the `annotationType`. If you do not specify an annotation type, `BoundingBox` will be used by default.

The following is an example of a video frame keypoint label category configuration file with label category attributes. This example includes two frame attributes, which will be added to all frames submitted to the labeling job. The `Car` label will include four label category attributes—X, Y, Z, and the global attribute, `W`.

```
{

Select a tab from the following table to see examples of label category configuration files for video frame adjustment and verification labeling jobs.

Video Frame Adjustment

The following is an example of a label category configuration file you may use for a video frame adjustment labeling job.

You must include `auditLabelAttributeName` to specify the label attribute name of the previous labeling job that you use to create the verification labeling job. Optionally, you can use the `editsAllowed` parameter to specify whether or not labels, label category attributes, or frame attributes can be edited.

```
{
    "documentVersion": "2020-03-01",
```

```
    "frameAttributes": [
        {
            "name":"count players",
            "editsAllowed":"none",
            "description":"How many players to you see in the scene?",
            "type":"number"
        },
        {
            "name":"select one",
            "description":"describe the scene",
            "type":"string",
            "enum":["clear","blurry"]
        },
    ],
    "categoryGlobalAttributes": [
        {
            "name":"W",
            "editsAllowed":"any",
            "description":"label-attributes-for-all-labels",
            "type":"string",
            "enum": ["foo", "buz", "buz2"]
        }
    ],
    "labels": [
        {
            "label": "Car",
            "editsAllowed":"any",
            "categoryAttributes": [
                {
                    "name":"X",
                    "description":"enter a number",
                    "type":"number",
                    "editsAllowed":"any"
                },
                {
                    "name":"Y",
                    "description":"select an option",
                    "type":"string",
                    "enum": ["y1", "y2"],
                    "editsAllowed":"any"
                },
                {
                    "name":"Z",
                    "description":"submit a free-form response",
```

```
                    "type":"string",
                    "editsAllowed":"none"
                }
            ]
        },
        {
            "label": "Pedestrian",
            "editsAllowed":"none",
            "categoryAttributes": [...]
        }
    ],
    "annotationType":"Keypoint",
    "instructions": {"shortInstruction":"add example short instructions here",
 "fullInstruction":"<html markup>"},
    // include auditLabelAttributeName for label adjustment jobs
    "auditLabelAttributeName": "myPrevJobLabelAttributeName"
}
```

Video Frame Verification

The following is an example of a label category configuration file for a video frame labeling job.

You must include `auditLabelAttributeName` to specify the label attribute name of the previous labeling job that you use to create the verification labeling job. Additionally, you must use the `editsAllowed` parameter to specify that no labels can be edited.

```
{
    "documentVersion": "2020-03-01",
    "frameAttributes": [
        {
            "name":"count players",
            "editsAllowed":"none",
            "description":"How many players to you see in the scene?",
            "type":"number"
        },
        {
            "name":"select one",
            "editsAllowed":"any",
            "description":"describe the scene",
            "type":"string",
            "enum":["clear","blurry"]
        },
    ],
```

```
    "categoryGlobalAttributes": [
        {
            "name":"W",
            "editsAllowed":"none",
            "description":"label-attributes-for-all-labels",
            "type":"string",
            "enum": ["foo", "buz", "buz2"]
        }
    ],
    "labels": [
        {
            "label": "Car",
            "editsAllowed":"none",
            "categoryAttributes": [
                {
                    "name":"X",
                    "description":"enter a number",
                    "type":"number",
                    "editsAllowed":"any"
                },
                {
                    "name":"Y",
                    "description":"select an option",
                    "type":"string",
                    "enum": ["y1", "y2"],
                    "editsAllowed":"any"
                },
                {
                    "name":"Z",
                    "description":"submit a free-form response",
                    "type":"string",
                    "editsAllowed":"none"
                }
            ]
        },
        {
            "label": "Pedestrian",
            "editsAllowed":"none",
            "categoryAttributes": [...]
        }
    ],
    "annotationType":"Keypoint",
    "instructions": {"shortInstruction":"add example short instructions here",
"fullInstruction":"<html markup>"},
```

```
    // include auditLabelAttributeName for label adjustment jobs
    "auditLabelAttributeName": "myPrevJobLabelAttributeName"
}
```

Creating Worker Instructions

Create custom instructions for labeling jobs to improve your worker's accuracy in completing their task. Your instructions are accessible when workers select the **Instructions** menu option in the worker UI. Short instructions must be under 255 characters and long instruction must be under 2,048 characters.

There are two kinds of instructions:

- **Short instructions** – These instructions are shown to works when they select **Instructions** in the worker UI menu. They should provide an easy reference to show the worker the correct way to label an object.
- **Full instructions** – These instructions are shown when workers select **More Instructions** in instructions the pop-up window. We recommend that you provide detailed instructions for completing the task with multiple examples showing edge cases and other difficult situations for labeling objects.

For 3D point cloud and video frame labeling jobs, you can add worker instructions to your label category configuration file. You can use a single string to create instructions or you can add HTML mark up to customize the appearance of your instructions and add images. Make sure that any images you include in your instructions are publicly available, or if your instructions are in Amazon S3, that your workers have read-access so that they can view them.

Use Input and Output Data

The input data that you provide to Amazon SageMaker Ground Truth is sent to your workers for labeling. You choose the data to send to your workers by creating a single manifest file that defines all of the data that requires labeling or by sending input data objects to an ongoing, streaming labeling job to be labeled in real time.

The output data is the result of your labeling job. The output data file, or *augmented manifest file*, contains label data for each object you send to the labeling job and metadata about the label assigned to data objects.

When you use image classification (single and multi-label), text classification (single and multi-label), object detection, and semantic segmentation built in task types to create a labeling job, you can use the resulting augmented manifest file to launch a SageMaker training job. For a demonstration of how to use an augmented manifest to train an object detection machine learning model with Amazon SageMaker, see object_detection_augmented_manifest_training.ipynb. For more information, see Provide Dataset Metadata to Training Jobs with an Augmented Manifest File.

Topics

Input Data

The input data are the data objects that you send to your workforce to be labeled. There are two ways to send data objects to Ground Truth for labeling:

- Send a list of data objects that require labeling using an input manifest file.
- Send individual data objects in real time to a perpetually running, streaming labeling job.

If you have a dataset that needs to be labeled one time, and you do not require an ongoing labeling job, create a standard labeling job using an input manifest file.

If you want to regularly send new data objects to your labeling job after it has started, create a streaming labeling job. When you create a streaming labeling job, you can optionally use an input manifest file to specify a group of data that you want labeled immediately when the job starts. You can continuously send new data objects to a streaming labeling job as long as it is active.

> **Note**
>
> Streaming labeling jobs are only supported through the SageMaker API. You cannot create a streaming labeling job using the SageMaker console.

The following task types have special input data requirements and options:

- For 3D point cloud labeling job input data requirements, see 3D Point Cloud Input Data.
- For video frame labeling job input data requirements, see Video Frame Input Data.

Topics

Use an Input Manifest File

Each line in an input manifest file is an entry containing an object, or a reference to an object, to label. An entry can also contain labels from previous jobs and for some task types, additional information.

Input data and the manifest file must be stored in Amazon Simple Storage Service (Amazon S3). Each has specific storage and access requirements, as follows:

- The Amazon S3 bucket that contains the input data must be in the same AWS Region in which you are running Amazon SageMaker Ground Truth. You must give Amazon SageMaker access to the data stored in the Amazon S3 bucket so that it can read it. For more information about Amazon S3 buckets, see Working with Amazon S3 buckets.
- The manifest file must be in the same AWS Region as the data files, but it doesn't need to be in the same location as the data files. It can be stored in any Amazon S3 bucket that is accessible to the AWS Identity and Access Management (IAM) role that you assigned to Ground Truth when you created the labeling job.

> **Note**
>
> 3D point cloud and video frame task types have different input manifest requirements and attributes.
> For 3D point cloud task types, refer to Create an Input Manifest File for a 3D Point Cloud Labeling Job.

For video frame task types, refer to Create a Video Frame Input Manifest File.

The manifest is a UTF-8 encoded file in which each line is a complete and valid JSON object. Each line is delimited by a standard line break, \n or \r\n. Because each line must be a valid JSON object, you can't have unescaped line break characters. For more information about data format, see JSON Lines.

Each JSON object in the manifest file can be no larger than 100,000 characters. No single attribute within an object can be larger than 20,000 characters. Attribute names can't begin with $ (dollar sign).

Each JSON object in the manifest file must contain one of the following keys: `source-ref` or `source`. The value of the keys are interpreted as follows:

- `source-ref` – The source of the object is the Amazon S3 object specified in the value. Use this value when the object is a binary object, such as an image.
- `source` – The source of the object is the value. Use this value when the object is a text value.

The following is an example of a manifest file for files stored in an Amazon S3 bucket:

```
{"source-ref": "S3 bucket location 1"}
{"source-ref": "S3 bucket location 2"}
   ...
{"source-ref": "S3 bucket location n"}
```

Use the `source-ref` key for image files for bounding box, image classification (single and multi-label), semantic segmentation, and video clips for video classification labeling jobs. 3D point cloud and video frame labeling jobs also use the `source-ref` key but these labeling jobs require additional information in the input manifest file. For more information see 3D Point Cloud Input Data and Video Frame Input Data.

The following is an example of a manifest file with the input data stored in the manifest:

```
{"source": "Lorem ipsum dolor sit amet"}
{"source": "consectetur adipiscing elit"}
   ...
{"source": "mollit anim id est laborum"}
```

Use the `source` key for single and multi-label text classification and named entity recognition labeling jobs.

You can include other key-value pairs in the manifest file. These pairs are passed to the output file unchanged. This is useful when you want to pass information between your applications. For more information, see Output Data.

Automated Data Setup

You can use the automated data setup to create manifest files for your labeling jobs in the Ground Truth console using images, videos, video frames, text (.txt) files, and comma-separated value (.csv) files stored in Amazon S3. When you use automated data setup, you specify an Amazon S3 location where your input data is stored and the input data type, and Ground Truth looks for the files that match that type in the location you specify.

> **Note**
>
> Ground Truth does not use an AWS KMS key to access your input data or write the input manifest file in the Amazon S3 location that you specify. The user or role that creates the labeling job must have permissions to access your input data objects in Amazon S3.

Before using the following procedure, ensure that your input images or files are correctly formatted:

- Image files – Image files must comply with the size and resolution limits listed in the tables found in Input File Size Quota.
- Text files – Text data can be stored in one or more .txt files. Each item that you want labeled must be separated by a standard line break.
- CSV files – Text data can be stored in one or more .csv files. Each item that you want labeled must be in a separate row.
- Videos – Video files can be any of the following formats: .mp4, .ogg, and .webm. If you want to extract video frames from your video files for object detection or object tracking, see Provide Video Files.
- Video frames – Video frames are images extracted from a videos. All images extracted from a single video are referred to as a *sequence of video frames*. Each sequence of video frames must have unique prefix keys in Amazon S3. See Provide Video Frames. For this data type, see Automated Video Frame Input Data Setup

> **Important**
>
> For video frame object detection and video frame object tracking labeling jobs, see Automated Video Frame Input Data Setup to learn how to use the automated data setup.

Use these instructions to automatically set up your input dataset connection with Ground Truth.

Automatically connect your data in Amazon S3 with Ground Truth

1. Navigate to the **Create labeling job** page in the Amazon SageMaker console at https://console.aws.amazon.com/sagemaker/.

   This link puts you in the North Virginia (us-east-1) AWS Region. If your input data is in an Amazon S3 bucket in another Region, switch to that Region. To change your AWS Region, on the navigation bar, choose the name of the currently displayed Region.
2. Select **Create labeling job**.
3. Enter a **Job name**.
4. In the section **Input data setup**, select **Automated data setup**.
5. Enter an Amazon S3 URI for **S3 location for input datasets**.
6. Specify your **S3 location for output datasets**. This is where your output data is stored.
7. Choose your **Data type** using the dropdown list.
8. Use the drop down menu under **IAM Role** to select an execution role. If you select **Create a new role**, specify the Amazon S3 buckets that you want grant this role permission to access. This role must have permission to access the S3 buckets you specified in Steps 5 and 6.
9. Select **Complete data setup**.

The following GIF demonstrates how to use the automated data setup for image data. This example will create a file, `dataset-YYMMDDTHHMMSS.manifest` in the Amazon S3 bucket `example-groundtruth-images` where *YYMMDDTHHmmSS* indicates the year (YY), month (MM), day (DD) and time in hours (HH), minutes (mm) and seconds (ss), that the input manifest file was created.

Supported Data Formats

When you create an input manifest file for a built-in task types manually, your input data must be in one of the following support file formats for the respective input data type. To learn about automated data setup, see Automated Data Setup.

Tip

When you use the automated data setup, additional data formats can be used to generate an input manifest file for video frame and text based task types.

Task Types	Input Data Type	Support Formats	Example Input Manifest Line
Bounding Box, Semantic Segmentation, Image Classification (Single Label and Multi-label), Verify and Adjust Labels	Image	.jpg, .jpeg, .png	`{"source-ref": "s3://DOC-EXAMPLE-BUCKET1/example-image.png "}`
Named Entity Recognition, Text Classification (Single and Multi-Label)	Text	Raw text	`{"source": "Lorem ipsum dolor sit amet"}`
Video Classification	Video clips	.mp4, .ogg, and .webm	`{"source-ref": "s3:///example-video.mp4 "}`
Video Frame Object Detection, Video Frame Object Tracking (bounding boxes, polylines, polygons or keypoint)	Video frames and video frame sequence files (for Object Tracking)	**Video frames**: .jpg, .jpeg, .png **Sequence files**: .json	Refer to Create a Video Frame Input Manifest File.
3D Point Cloud Semantic Segmentation, 3D Point Cloud Object Detection, 3D	Point clouds and point cloud sequence files (for Object Tracking)	**Point clouds**: Binary pack format and ASCII. For more information see	Refer to Create an Input Manifest File for a 3D Point Cloud Labeling Job.

Task Types	Input Data Type	Support Formats	Example Input Manifest Line
Point Cloud Object Tracking		Accepted Raw 3D Data Formats. **Sequence files**: .json	

Ground Truth Streaming Labeling Jobs

If you want to perpetually send new data objects to Amazon SageMaker Ground Truth to be labeled, use a streaming labeling job. Streaming labeling jobs allow you to:

- Send new dataset objects to workers in real time using a perpetually running labeling job. Workers continuously receive new data objects to label as long as the labeling job is active and new objects are being sent to it.
- Gain visibility into the number of objects that have been queued and are waiting to be labeled. Use this information to control the flow of data objects sent to your labeling job.
- Receive label data for individual data objects in real time as workers finish labeling them.

Ground Truth streaming labeling jobs remain active until they are manually stopped or have been idle for more than 10 days. You can intermittently send new data objects to workers while the labeling job is active.

If you are a new user of Ground Truth streaming labeling jobs, it is recommended that you review How It Works.

Use Create a Streaming Labeling Job to learn how to create a streaming labeling job.

> **Note**
>
> Ground Truth streaming labeling jobs are only supported through the SageMaker API.

Topics

- How It Works
- Send Data to a Streaming Labeling Job

- Manage Labeling Requests with an Amazon SQS Queue
- Receive Output Data from a Streaming Labeling Job
- Duplicate Message Handling

How It Works

When you create a Ground Truth streaming labeling job, the job remains active until it is manually stopped, remains idle for more than 10 days, or is unable to access input data sources. You can intermittently send new data objects to workers while it is active. A worker can continue to receive new data objects in real time as long as the total number of tasks currently available to the worker is less than the value in `MaxConcurrentTaskCount`. Otherwise, the data object is sent to a queue that Ground Truth creates on your behalf in Amazon Simple Queue Service (Amazon SQS) for later processing. These tasks are sent to workers as soon as the total number of tasks currently available to a worker falls below `MaxConcurrentTaskCount`. If a data object is not sent to a worker after 14 days, it expires. You can view the number of tasks pending in the queue and adjust the number of objects you send to the labeling job. For example, you may decrease the speed at which you send objects to the labeling job if the backlog of pending objects moves above a threshold.

Send Data to a Streaming Labeling Job

You can optionally submit input data to a streaming labeling job one time when you create the labeling job using an input manifest file. Once the labeling job has started and the state is `InProgress`, you can submit new data objects to your labeling job in real time using your Amazon SNS input topic and Amazon S3 event notifications.

Submit Data Objects When you Start the Labeling Job (One Time):

- **Use an Input Manifest File** – You can optionally specify an input manifest file Amazon S3 URI in `ManifestS3Uri` when you create the streaming labeling job. Ground Truth sends each data object in the manifest file to workers for labeling as soon as the labeling job starts. To learn more, see Create a Manifest File (Optional).

  After you submit a request to create the streaming labeling job, its status will be `Initializing`. Once the labeling job is active, the state changes to `InProgress` and you can start using the real-time options to submit additional data objects for labeling.

Submit Data Objects in Real Time:

- **Send data objects using Amazon SNS messages** – You can send Ground Truth new data objects to label by sending an Amazon SNS message. You will send this message to an Amazon SNS input topic that you create and specify when you create your streaming labeling job. For more information, see Send Data Objects Using Amazon SNS.
- **Send data objects by placing them in an Amazon S3 bucket** – Each time you add a new data object to an Amazon S3 bucket, you can prompt Ground Truth to process that object for labeling. To do this, you add an event notification to the bucket so that it notifies your Amazon SNS input topic each time a new object is added to (or *created in*) that bucket. For more information, see Send Data Objects using Amazon S3. This option is not available for text-based labeling jobs such as text classification and named entity recognition.

> **Important**
>
> If you use the Amazon S3 configuration, do not use the same Amazon S3 location for your input data configuration and your output data. You specify the S3 prefix for your output data when you create a labeling job.

Send Data Objects Using Amazon SNS

You can send data objects to your streaming labeling job using Amazon Simple Notification Service (Amazon SNS). Amazon SNS is a web service that coordinates and manages the delivery of messages to and from *endpoints* (for example, an email address or AWS Lambda function). An Amazon SNS *topic* acts as a communication channel between two or more endpoints. You use Amazon SNS to send, or *publish*, new data objects to the topic specified in the `CreateLabelingJob` parameter `SnsTopicArn` in `InputConfig`. The format of these messages is the same as a single line from an input manifest file.

For example, you may send a piece of text to an active text classification labeling job by publishing it to your input topic. The message that you publish may look similar to the following:

```
{"source": "Lorem ipsum dolor sit amet"}
```

To send a new image object to an image classification labeling job, your message may look similar to the following:

```
{"source-ref": "s3://awsexamplebucket/example-image.jpg"}
```

> **Note**
>
> You can also include custom deduplication IDs and deduplication keys in your Amazon SNS messages. To learn more, see Duplicate Message Handling.

When Ground Truth creates your streaming labeling job, it subscribes to your Amazon SNS input topic.

Send Data Objects using Amazon S3

You can send one or more new data objects to a streaming labeling job by placing them in an Amazon S3 bucket that is configured with an Amazon SNS event notification. You can set up an event to notify your Amazon SNS input topic anytime a new object is created in your bucket. You must specify this same Amazon SNS input topic in the `CreateLabelingJob` parameter `SnsTopicArn` in `InputConfig`.

Anytime you configure an Amazon S3 bucket to send notifications to Amazon SNS, Ground Truth will publish a test event, `"s3:TestEvent"`, to ensure that the topic exists and that the owner of the Amazon S3 bucket specified has permission to publish to the specified topic. It is recommended that you set up your Amazon S3 connection with Amazon SNS before starting a streaming labeling job. If you do not, this test event may register as a data object and be sent to Ground Truth for labeling.

> **Important**
>
> If you use the Amazon S3 configuration, do not use the same Amazon S3 location for your input data configuration and your output data. You specify the S3 prefix for your output data when you create a labeling job.
> For image-based labeling jobs, Ground Truth requires all S3 buckets to have a CORS policy attached. To learn more, see CORS Permission Requirement.

Once you have configured your Amazon S3 bucket and created your labeling job, you can add objects to your bucket and Ground Truth either sends that object to workers or places it on your Amazon SQS queue.

To learn more, see Set up Amazon S3 Bucket Event Notifications.

> **Important**
>
> This option is not available for text-based labeling jobs such as text classification and named entity recognition.

Manage Labeling Requests with an Amazon SQS Queue

When Ground Truth creates your streaming labeling job, it creates an Amazon SQS queue in the AWS account used to create the labeling job. The queue name is `GroundTruth-`*`labeling_job_name`* where *`labeling_job_name`* is the name of your labeling job, in lowercase letters. When you send data objects to your labeling job, Ground Truth either sends the data objects directly to workers or places the task in your queue to be processed at a later time. If a data object is not sent to a worker after 14 days, it expires and is removed from the queue. You can setup an alarm in Amazon SQS to detect when objects expire and use this mechanism to control the volume of objects you send to your labeling job.

> **Important**
>
> Modifying, deleting, or sending objects directly to the Amazon SQS queue associated with your streaming labeling job may lead to job failures.

Receive Output Data from a Streaming Labeling Job

Your Amazon S3 output bucket is periodically updated with new output data from your streaming labeling job.

Optionally, you can specify an Amazon SNS output topic. Each time a worker submits a labeled object, a notification with the output data is sent to that topic. You can subscribe an endpoint to your SNS output topic to receive notifications or trigger events when you receive output data from a labeling task. Use an Amazon SNS output topic if you want to do real time chaining to another streaming job and receive an Amazon SNS notifications each time a data object is submitted by a worker.

To learn more, see Subscribe an Endpoint to Your Amazon SNS Output Topic.

Duplicate Message Handling

For data objects sent in real time, Ground Truth guarantees idempotency by ensuring each unique object is only sent for labeling once, even if the input message referring to that object is received multiple times (duplicate messages). To do this, each data object sent to a streaming labeling job is assigned a *deduplication ID*, which is identified with a *deduplication key*.

If you send your requests to label data objects directly through your Amazon SNS input topic using Amazon SNS messages, you can optionally choose a custom deduplication key and deduplication IDs for your objects. For more information, see Specify A Deduplication Key and ID in an Amazon SNS Message.

If you do not provide your own deduplication key, or if you use the Amazon S3 configuration to send data objects to your labeling job, Ground Truth uses one of the following for the deduplication ID:

- For messages sent directly to your Amazon SNS input topic, Ground Truth uses the SNS message ID.
- For messages that come from an Amazon S3 configuration, Ground Truth creates a deduplication ID by combining the Amazon S3 URI of the object with the sequencer token in the message.

Specify A Deduplication Key and ID in an Amazon SNS Message

When you send a data object to your streaming labeling job using an Amazon SNS message, you have the option to specify your deduplication key and deduplication ID in one of the following ways. In all of these scenarios, identify your deduplication key with `dataset-objectid-attribute-name`.

Bring Your Own Deduplication Key and ID

Create your own deduplication key and deduplication ID by configuring your Amazon SNS message as follows. Replace *`byo-key`* with your key and *`UniqueId`* with the deduplication ID for that data object.

```
{
    "source-ref":"s3://bucket/prefix/object1",
    "dataset-objectid-attribute-name":"byo-key",
    "byo-key":"UniqueId"
}
```

Your deduplication key can be up to 140 characters. Supported patterns include: `"^[$a-zA-Z0-9](-*[a-zA-Z0-9])*"`.

Your deduplication ID can be up to 1,024 characters. Supported patterns include: `^(https|s3)://([^/]+)/?(.*)$`.

Use an Existing Key for your Deduplication Key

You can use an existing key in your message as the deduplication key. When you do this, the value associated with that key is used for the deduplication ID.

For example, you can specify use the `source-ref` key as your deduplication key by formatting your message as follows:

```
{
    "source-ref":"s3://bucket/prefix/object1",
    "dataset-objectid-attribute-name":"source-ref"
}
```

In this example, Ground Truth uses `"s3://bucket/prefix/object1"` for the deduplication id.

Find Deduplication Key and ID in Your Output Data

You can see the deduplication key and ID in your output data. The deduplication key is identified by `dataset-objectid-attribute-name`.

When you use your own custom deduplication key, your output contains something similar to the following:

```
"dataset-objectid-attribute-name": "byo-key",
"byo-key": "UniqueId",
```

When you do not specify a key, you can find the deduplication ID that Ground Truth assigned to your data object as follows. The $*label-attribute-name*`-object-id` parameter identifies your deduplication ID.

```
{
    "source-ref":"s3://bucket/prefix/object1",
    "dataset-objectid-attribute-name":"$label-attribute-name-object-id"
```

```
    "label-attribute-name" :0,
    "label-attribute-name-metadata": {...},
    "$label-attribute-name-object-id":"<service-generated-key>"
}
```

For *<service-generated-key>*, if the data object came through an Amazon S3 configuration, Ground Truth adds a unique value used by the service and emits a new field keyed by $*sequencer* which shows the Amazon S3 sequencer used. If object was fed to SNS directly, Ground Truth use the SNS message ID.

> **Note**
>
> Do not use the $ character in your label attribute name.

Input Data Quotas

Input datasets used in semantic segmentation labeling jobs have a quota of 20,000 items. For all other labeling job types, the dataset size quota is 100,000 items. To request an increase to the quota for labeling jobs other than semantic segmentation jobs, review the procedures in AWS Service Quotas to request a quota increase.

Input image data for active and non-active learning labeling jobs must not exceed size and resolution quotas. *Active learning* refers to labeling job that use automated data labeling. *Non-active learning* refers to labeling jobs that don't use automated data labeling.

Additional quotas apply for label categories for all task types, and for input data and labeling category attributes for 3D point cloud and video frame task types.

Input File Size Quota

Input files can't exceed the following size- quotas for both active and non-active learning labeling jobs. There is no input file size quota for videos used in video classification labeling jobs.

Labeling Job Task Type	Input File Size Quota
Image classification	40 MB
Bounding box (Object detection)	40 MB

Labeling Job Task Type	Input File Size Quota
Semantic segmentation	40 MB
Bounding box (Object detection) label adjustment	40 MB
Semantic segmentation label adjustment	40 MB
Bounding box (Object detection) label verification	40 MB
Semantic segmentation label verification	40 MB

Input Image Resolution Quotas

Image file resolution refers to the number of pixels in an image, and determines the amount of detail an image holds. Image resolution quotas differ depending on the labeling job type and the SageMaker built-in algorithm used. The following table lists the resolution quotas for images used in active and non-active learning labeling jobs.

Labeling Job Task Type	Resolution Quota - Non Active Learning	Resolution Quota - Active Learning
Image classification	100 million pixels	3840 x 2160 pixels (4 K)
Bounding box (Object detection)	100 million pixels	3840 x 2160 pixels (4 K)
Semantic segmentation	100 million pixels	1920 x 1080 pixels (1080 p)
Object detection label adjustment	100 million pixels	3840 x 2160 pixels (4 K)
Semantic segmentation label adjustment	100 million pixels	1920 x 1080 pixels (1080 p)
Object detection label verification	100 million pixels	Not available

Labeling Job Task Type	Resolution Quota - Non Active Learning	Resolution Quota - Active Learning
Semantic segmentation label verification	100 million pixels	Not available

Label Category Quotas

Each labeling job task type has a quota for the number of label categories you can specify. Workers select label categories to create annotations. For example, you may specify label categories *car*, *pedestrian*, and *biker* when creating a bounding box labeling job and workers will select the *car* category before drawing bounding boxes around cars.

> **Important**
>
> Label category names cannot exceed 256 characters.
> All label categories must be unique. You cannot specify duplicate label categories.

The following label category limits apply to labeling jobs. Quotas for label categories depend on whether you use the SageMaker API operation `CreateLabelingJob` or the console to create a labeling job.

Labeling Job Task Type	Label Category Quota - API	Label Category Quota - Console
Image classification (Multi-label)	50	50
Image classification (Single label)	Unlimited	30
Bounding box (Object detection)	50	50
Label verification	Unlimited	30

Labeling Job Task Type	Label Category Quota - API	Label Category Quota - Console
Semantic segmentation (with active learning)	20	10
Semantic segmentation (without active learning)	Unlimited	10
Named entity recognition	Unlimited	30
Text classification (Multi-la bel)	50	50
Text classification (Single label)	Unlimited	30
Video classification	30	30
Video frame object detection	30	30
Video frame object tracking	30	30
3D point cloud object detection	30	30
3D point cloud object tracking	30	30
3D point cloud semantic segmentation	30	30

3D Point Cloud and Video Frame Labeling Job Quotas

The following quotas apply for 3D point cloud and video frame labeling job input data.

Labeling Job Task Type	Input Data Quota
Video frame object detection	2,000 video frames (images) per sequence

Labeling Job Task Type	Input Data Quota
Video frame object detection	10 video frame sequences per manifest file
Video frame object tracking	2,000 video frames (images) per sequence
Video frame object tracking	10 video frame sequences per manifest file
3D point cloud object detection	100,000 point cloud frames per labeling job
3D point cloud object tracking	100,000 point cloud frame sequences per labeling job
3D point cloud object tracking	500 point cloud frames in each sequence file

When you create a video frame or 3D point cloud labeling job, you can add one or more *label category attributes* to each label category that you specify to have workers provide more information about an annotation.

Each label category attribute has a single label category attribute `name`, and a list of one or more options (values) to choose from. To learn more, see Worker User Interface (UI) for 3D point cloud labeling jobs and Worker User Interface (UI) for video frame labeling jobs.

The following quotas apply to the number of label category attributes names and values you can specify for labeling jobs.

Labeling Job Task Type	Label Category Attribute (name) Quota	Label Category Attribute Values Quota
Video frame object detection	10	10
Video frame object tracking	10	10
3D point cloud object detection	10	10
3D point cloud object tracking	10	10

Labeling Job Task Type	Label Category Attribute (name) Quota	Label Category Attribute Values Quota
3D point cloud semantic segmentation	10	10

Filter and Select Data for Labeling

You can use the Amazon SageMaker console to select a portion of your dataset for labeling. The data must be stored in an Amazon S3 bucket. You have three options:

- Use the full dataset.
- Choose a randomly selected sample of the dataset.
- Specify a subset of the dataset using a query.

The following options are available in the **Labeling jobs** section of the SageMaker console after selecting **Create labeling job**. To learn how to create a labeling job in the console, see Getting started. To configure the dataset that you use for labeling, in the **Job overview** section, choose **Additional configuration**.

Use the Full Dataset

When you choose to use the **Full dataset**, you must provide a manifest file for your data objects. You can provide the path of the Amazon S3 bucket that contains the manifest file or use the SageMaker console to create the file. To learn how to create a manifest file using the console, see Automated Data Setup.

Choose a Random Sample

When you want to label a random subset of your data, select **Random sample**. The dataset is stored in the Amazon S3 bucket specified in the **Input dataset location** field.

After you have specified the percentage of data objects that you want to include in the sample, choose **Create subset**. SageMaker randomly picks the data objects for your labeling job. After the objects are selected, choose **Use this subset**.

SageMaker creates a manifest file for the selected data objects. It also modifies the value in the **Input dataset location** field to point to the new manifest file.

Specify a Subset

You can specify a subset of your data objects using an Amazon S3 SELECT query on the object file names.

The SELECT statement of the SQL query is defined for you. You provide the WHERE clause to specify which data objects should be returned.

For more information about the Amazon S3 SELECT statement, see Selecting Content from Objects.

Choose **Create subset** to start the selection, and then choose **Use this subset** to use the selected data.

SageMaker creates a manifest file for the selected data objects. It also updates the value in the **Input dataset location** field to point to the new manifest file.

3D Point Cloud Input Data

To create a 3D point cloud labeling job, you must create an input manifest file. Use this topic to learn the formatting requirements of the input manifest file for each task type. To learn about the raw input data formats Ground Truth accepts for 3D point cloud labeling jobs, see the section Accepted Raw 3D Data Formats.

Use your labeling job task type to choose a topics on Create an Input Manifest File for a 3D Point Cloud Labeling Job to learn about the formatting requirements for each line of your input manifest file.

Topics

- Accepted Raw 3D Data Formats
- Create an Input Manifest File for a 3D Point Cloud Labeling Job
- Understand Coordinate Systems and Sensor Fusion

Accepted Raw 3D Data Formats

Ground Truth uses your 3D point cloud data to render a 3D scenes that workers annotate. This section describes the raw data formats that are accepted for point cloud data and sensor fusion data for a point cloud frame. To learn how to create an input manifest file to connect your raw input data files with Ground Truth, see Create an Input Manifest File for a 3D Point Cloud Labeling Job.

For each frame, Ground Truth supports Compact Binary Pack Format (.bin) and ASCII (.txt) files. These files contain information about the location (x, y, and z coordinates) of all points that make up that frame, and, optionally, information about the pixel color of each point for colored point clouds. When you create a 3D point cloud labeling job input manifest file, you can specify the format of your raw data in the `format` parameter.

The following table lists elements that Ground Truth supports in point cloud frame files to describe individual points.

Symbol	Value
x	The x coordinate of the point.
y	The y coordinate of the point.
z	The z coordinate of the point.
i	The intensity of the point.
r	The red color channel component. An 8-bit value (0-255).
g	The green color channel component. An 8-bit value (0-255)
b	The blue color channel component. An 8-bit value (0-255)

Ground Truth assumes the following about your input data:

- All of the positional coordinates (x, y, z) are in meters.
- All the pose headings (qx, qy, qz, qw) are measured in Spatial Quaternions .

Compact Binary Pack Format

The Compact Binary Pack Format represents a point cloud as an ordered set of a stream of points. Each point in the stream is an ordered binary pack of 4-byte float values in some variant of the

form xyzirgb. The x, y, and z elements are required and additional information about that pixel can be included in a variety of ways using i, r, g, and b.

To use a binary file to input point cloud frame data to a Ground Truth 3D point cloud labeling job, enter binary/ in the format parameter for your input manifest file and replace with the order of elements in each binary pack. For example, you may enter one of the following for the format parameter.

- binary/xyzi – When you use this format, your point element stream would be in the following order: x1y1z1i1x2y2z2i2...
- binary/xyzrgb – When you use this format, your point element stream would be in the following order: x1y1z1r1g1b1x2y2z2r2g2b2...
- binary/xyzirgb – When you use this format, your point element stream would be in the following order: x1y1z1i1r1g1b1x2y2z2i2r2g2b2...

When you use a binary file for your point cloud frame data, if you do not enter a value for format, the default pack format binary/xyzi is used.

ASCII Format

The ASCII format uses a text file to represent a point cloud, where each line in the ASCII point cloud file represents a single point. Each point is a line the text file and contains white space separated values, each of which is a 4-byte float ASCII values. The x, y, and z elements are required for each point and additional information about that point can be included in a variety of ways using i, r, g, and b.

To use a text file to input point cloud frame data to a Ground Truth 3D point cloud labeling job, enter text/ in the format parameter for your input manifest file and replace with the order of point elements on each line.

For example, if you enter text/xyzi for format, your text file for each point cloud frame should look similar to the following:

```
x1 y1 z1 i1
x2 y2 z2 i2
...
...
```

If you enter text/xyzrgb, your text file should look similar to the following:

```
x1 y1 z1 r1 g1 b1
x2 y2 z2 r2 g2 b1
...
...
```

When you use a text file for your point cloud frame data, if you do not enter a value for `format`, the default format `text/xyzi` will be used.

Point Cloud Resolution Limits

Ground Truth does not have a resolution limit for 3D point cloud frames. However, we recommend that you limit each point cloud frame to 500K points for optimal performance. When Ground Truth renders the 3D point cloud visualization, it must be viewable on your workers' computers, which depends on workers' computer hardware. Point cloud frames that are larger than 1 million points may not render on standard machines, or may take too long to load.

Create an Input Manifest File for a 3D Point Cloud Labeling Job

When you create a labeling job, you provide an input manifest file where each line of the manifest describes a unit of task to be completed by annotators. The format of your input manifest file depends on your task type.

- If you are creating a 3D point cloud **object detection** or **semantic segmentation** labeling job, each line in your input manifest file contains information about a single 3D point cloud frame. This is called a *point cloud frame input manifest*. To learn more, see Create a Point Cloud Frame Input Manifest File.
- If you are creating a 3D point cloud **object tracking** labeling job, each line of your input manifest file contains a sequence of 3D point cloud frames and associated data. This is called a *point cloud sequence input manifest*. To learn more, see Create a Point Cloud Sequence Input Manifest.

Create a Point Cloud Frame Input Manifest File

The manifest is a UTF-8 encoded file in which each line is a complete and valid JSON object. Each line is delimited by a standard line break, \n or \r\n. Because each line must be a valid JSON object, you can't have unescaped line break characters. In the single-frame input manifest file, each line in the manifest contains data for a single point cloud frame. The point cloud frame data can either be stored in binary or ASCII format (see Accepted Raw 3D Data Formats). This is the manifest file formatting required for 3D point cloud object detection and semantic segmentation. Optionally, you can also provide camera sensor fusion data for each point cloud frame.

Ground Truth supports point cloud and video camera sensor fusion in the world coordinate system for all modalities. If you can obtain your 3D sensor extrinsic (like a LiDAR extrinsic), we recommend that you transform 3D point cloud frames into the world coordinate system using the extrinsic. For more information, see Sensor Fusion.

However, if you cannot obtain a point cloud in world coordinate system, you can provide coordinates in the original coordinate system that the data was captured in. If you are providing camera data for sensor fusion, it is recommended that you provide LiDAR sensor and camera pose in the world coordinate system.

To create a single-frame input manifest file, you will identify the location of each point cloud frame that you want workers to label using the `source-ref` key. Additionally, you must use the `source-ref-metadata` key to identify the format of your dataset, a timestamp for that frame, and, optionally, sensor fusion data and video camera images.

The following example demonstrates the syntax used for an input manifest file for a single-frame point cloud labeling job. The example includes two point cloud frames. For details about each parameter, see the table following this example.

Important

Each line in your input manifest file must be in JSON Lines format. The following code block shows an input manifest file with two JSON objects. Each JSON object is used to point to and provide details about a single point cloud frame. The JSON objects have been expanded for readability, but you must minimize each JSON object to fit on a single line when creating an input manifest file. An example is provided under this code block.

```

                "qz": -0.02461725233103356,
                "qw": -0.6496916273040025
            },
            "camera-model": "pinhole"
        }]
    }
}
```

When you create an input manifest file, you must collapse your JSON objects to fit on a single line. For example, the code block above would appear as follows in an input manifest file:

```
{"source-ref":"s3://awsexamplebucket/examplefolder/frame1.bin","source-ref-metadata":
{"format":"binary/xyzi","unix-timestamp":1566861644.759115,"ego-vehicle-pose":
{"position":
{"x":-2.7161461413869947,"y":116.25822288149078,"z":1.8348751887989483},"heading":
{"qx":-0.02111296123795955,"qy":-0.006495469416730261,"qz":-0.008024565904865688,"qw":0.9997181
awsexamplebucket/lidar_singleframe_dataset/someprefix/","images":

```

The following table shows the parameters you can include in your input manifest file:

Parameter	Required	Accepted Values	Description
`source-ref`	Yes	String **Accepted string value format**: `s3://<bucket-name> /<folder-name> /point-cloud-frame-file`	The Amazon S3 location of a single point cloud frame.

Parameter	Required	Accepted Values	Description
`source-ref-metadata`	Yes	JSON object **Accepted parameters**: `format`, `unix-timestamp` , `ego-vehicle-pose` , `position`, `prefix`, `images`	Use this parameter to include additional information about the point cloud in `source-ref` , and to provide camera data for sensor fusion.

Parameter	Required	Accepted Values	Description
`format`	No	String **Accepted string values**: `"binary/xyz" ,"binary/xyzi" ,"binary/xyzrgb" ,"binary/xyzirgb" ,"text/xyz" ,"text/xyzi" ,"text/xyzrgb" ,"text/xyzirgb"` **Default Values**: When the file identified in `source-ref` has a .bin extension, `binary/xyzi` When the file identified in `source-ref` has a .txt extension, `text/xyzi`	Use this parameter to specify the format of your point cloud data. For more information, see Accepted Raw 3D Data Formats.
`unix-timestamp`	Yes	Number A unix timestamp.	The unix timestamp is the number of seconds since January 1st, 1970 until the UTC time that the data was collected by a sensor.

Parameter	Required	Accepted Values	Description
`ego-vehicle-pose`	No	JSON object	The pose of the device used to collect the point cloud data. For more information about this parameter, see Include Vehicle Pose Information in Your Input Manifest.
`prefix`	No	String **Accepted string value format**: `s3://<bucket-name> /<folder-name>/`	The location in Amazon S3 where your metadata, such as camera images, is stored for this frame. The prefix must end with a forward slash: `/`.
`images`	No	List	A list of parameters describing color camera images used for sensor fusion. You can include up to 8 images in this list. For more information about the parameters required for each image, see Include Camera Data in Your Input Manifest.

Include Vehicle Pose Information in Your Input Manifest

Use the ego-vehicle location to provide information about the location of the vehicle used to capture point cloud data. Ground Truth use this information to compute LiDAR extrinsic matrix.

Ground Truth uses extrinsic matrices to project labels to and from the 3D scene and 2D images. For more information, see Sensor Fusion.

The following table provides more information about the `position` and orientation (`heading`) parameters that are required when you provide ego-vehicle information.

Parameter	Required	Accepted Values	Description
`position`	Yes	JSON object **Required Parameters**: `x`, `y`, and `z`. Enter numbers for these parameters.	The translation vector of the ego vehicle in the world coordinate system.
`heading`	Yes	JSON Object **Required Parameters**: `qx`, `qy`, `qz`, and `qw`. Enter numbers for these parameters.	The orientation of the frame of reference of the device or sensor mounted on the vehicle sensing the surroundi ng, measured in quaternions, (`qx`, `qy`, `qz`, `qw`) in the a coordinate system.

Include Camera Data in Your Input Manifest

If you want to include video camera data with a frame, use the following parameters to provide information about each image. The **Required** column below applies when the `images` parameter is

included in the input manifest file under `source-ref-metadata`. You are not required to include images in your input manifest file.

If you include camera images, you must include information about the camera `position` and `heading` used the capture the images in the world coordinate system.

If your images are distorted, Ground Truth can automatically undistort them using information you provide about the image in your input manifest file, including distortion coefficients (`k1`, `k2`, `k3`, `k4`, `p1`, `p1`), the camera model and the camera intrinsic matrix. The intrinsic matrix is made up of focal length (`fx`, `fy`), and the principal point (`cx`, `cy`). See Intrinsic Matrix to learn how Ground Truth uses the camera intrinsic. If distortion coefficients are not included, Ground Truth will not undistort an image.

Parameter	Required	Accepted Values	Description
`image-path`	Yes	String **Example of format**: *<folder-name> /<imagefile.png>*	The relative location, in Amazon S3 of your image file. This relative path will be appended to the path you specify in `prefix`.
`unix-timestamp`	Yes	Number	The unix timestamp is the number of seconds since January 1st, 1970 until the UTC time that the data was collected by a camera.
`camera-model`	No	String: **Accepted Values**: `"pinhole" , "fisheye"` **Default**:	The model of the camera used to capture the image. This information is used to undistort camera images.

Parameter	Required	Accepted Values	Description
		`"pinhole"`	
`fx, fy`	Yes	Numbers	The focal length of the camera, in the x (`fx`) and y (`fy`) directions.
`cx, cy`	Yes	Numbers	The x (`cx`) and y (`cy`) coordinates of the principal point.
`k1, k2, k3, k4`	No	Number	Radial distortion coefficients. Supported for both **fisheye** and **pinhole** camera models.
`p1, p2`	No	Number	Tangential distortion coefficients. Supported for **pinhole** camera models.
`skew`	No	Number	A parameter to measure the skew of an image.
`position`	Yes	JSON object **Required Parameters**: `x`, `y`, and `z`. Enter numbers for these parameters.	The location or origin of the frame of reference of the camera mounted on the vehicle capturing images.

Parameter	Required	Accepted Values	Description
`heading`	Yes	JSON Object **Required Parameters**: qx, qy, qz, and qw. Enter numbers for these parameters.	The orientation of the frame of reference of the camera mounted on the vehicle capturing images, measured using quaternions, (qx, qy, qz, qw), in the world coordinate system.

Point Cloud Frame Limits

You can include up to 100,000 point cloud frames in your input manifest file. 3D point cloud labeling job have longer pre-processing times than other Ground Truth task types. For more information, see Job Pre-processing Time.

Create a Point Cloud Sequence Input Manifest

The manifest is a UTF-8 encoded file in which each line is a complete and valid JSON object. Each line is delimited by a standard line break, \n or \r\n. Because each line must be a valid JSON object, you can't have unescaped line break characters. In the point cloud sequence input manifest file, each line in the manifest contains a sequence of point cloud frames. The point cloud data for each frame in the sequence can either be stored in binary or ASCII format. For more information, see Accepted Raw 3D Data Formats. This is the manifest file formatting required for 3D point cloud object tracking. Optionally, you can also provide point attribute and camera sensor fusion data for each point cloud frame. When you create a sequence input manifest file, you must provide LiDAR and video camera sensor fusion data in a world coordinate system.

The following example demonstrates the syntax used for an input manifest file when each line in the manifest is a sequence file. Each line in your input manifest file must be in JSON Lines format.

```
{"source-ref": "s3://awsexamplebucket/example-folder/seq1.json"}
{"source-ref": "s3://awsexamplebucket/example-folder/seq2.json"}
```

The data for each sequence of point cloud frames needs to be stored in a JSON data object. The following is an example of the format you use for a sequence file. Information about each frame is included as a JSON object and is listed in the `frames` list. This is an example of a sequence file with two point cloud frame files, `frame300.bin` and `frame303.bin`. The `...` is used to indicated where you should include information for additional frames. Add a JSON object for each frame in the sequence.

The following code block includes a JSON object for a single sequence file. The JSON object has been expanded for readability.

```
{
  "seq-no": 1,
  "prefix": "s3://awsexamplebucket/example_lidar_sequence_dataset/seq1/",
  "number-of-frames": 100,
  "frames":[
    {
        "frame-no": 300,
        "unix-timestamp": 1566861644.759115,
        "frame": "example_lidar_frames/frame300.bin",
        "format": "binary/xyzi",
        "ego-vehicle-pose":{
            "position": {
                "x": -2.7161461413869947,
                "y": 116.25822288149078,
                "z": 1.8348751887989483
            },
            "heading": {
                "qx": -0.02111296123795955,

            "k1": 0,
            "k2": 0,
```

```
            "k3": 0,
            "k4": 0,
            "p1": 0,
            "p2": 0,
            "skew": 0,
            "position": {
                "x": -2.2722515189268138,
                "y": 116.86003310568965,
                "z": 1.454614668542299
            },
            "heading": {
                "qx": 0.7594754093069037,
                "qy": 0.02181790885672969,
                "qz": -0.02461725233103356,
                "qw": -0.6496916273040025
            },
            "camera-model": "pinhole"
        }]
    },
    {
        "frame-no": 303,
        "unix-timestamp": 1566861644.759115,
        "frame": "example_lidar_frames/frame303.bin",
        "format": "text/xyzi",
        "ego-vehicle-pose":{...},
        "images":[{...}]
    },
     ...
  ]
}
```

The following table provides details about the top-level parameters of a sequence file. For detailed information about the parameters required for individual frames in the sequence file, see Parameters for Individual Point Cloud Frames.

Parameter	Required	Accepted Values	Description
`seq-no`	Yes	Integer	The ordered number of the sequence.
`prefix`	Yes	String	The Amazon S3 location where the

Parameter	Required	Accepted Values	Description
		Accepted Values: `s3://<bucket-name> /<prefix>/`	sequence files are located. The prefix must end with a forward slash: `/`.
`number-of-frames`	Yes	Integer	The total number of frames included in the sequence file. This number must match the total number of frames listed in the `frames` parameter in the next row.
`frames`	Yes	List of JSON objects	A list of frame data. The length of the list must equal `number-of-frames` . In the worker UI, frames in a sequence will be the same as the order of frames in this array. For details about the format of each frame, see Parameters for Individual Point Cloud Frames.

Parameters for Individual Point Cloud Frames

The following table shows the parameters you can include in your input manifest file.

Parameter	Required	Accepted Values	Description
`frame-no`	No	Integer	A frame number. This is an optional identifier specified by the customer to identify the frame within a sequence. It is not used by Ground Truth.
`unix-timestamp`	Yes	Number	The unix timestamp is the number of seconds since January 1st, 1970 until the UTC time that the data was collected by a sensor. The timestamp for each frame must be different and timestamps must be sequential because they are used for cuboid interpola tion. Ideally, this should be the real timestamp when the data was collected. If this is not available , you must use an incremental sequence of timestamps, where the first frame in your sequence file corresponds to the

Parameter	Required	Accepted Values	Description
			first timestamp in the sequence.
`frame`	Yes	String **Example of format** *<folder-name> /<sequence-file.json>*	The relative location, in Amazon S3 of your sequence file. This relative path will be appended to the path you specify in `prefix`.

Parameter	Required	Accepted Values	Description
`format`	No	String **Accepted string values**: `"binary/xyz" ,"binary/xyzi" ,"binary/xyzrgb" ,"binary/xyzirgb" ,"text/xyz" ,"text/xyzi" ,"text/xyzrgb" ,"text/xyzirgb"` **Default Values**: When the file identified in `source-ref` has a .bin extension, `binary/xyzi` When the file identified in `source-ref` has a .txt extension, `text/xyzi`	Use this parameter to specify the format of your point cloud data. For more information, see Accepted Raw 3D Data Formats.
`ego-vehicle-pose`	No	JSON object	The pose of the device used to collect the point cloud data. For more information about this parameter , see Include Vehicle Pose Information in Your Input Manifest.

Parameter	Required	Accepted Values	Description
`prefix`	No	String **Accepted string value format**: `s3://<bucket-name> /<folder-name>/`	The location in Amazon S3 where your metadata, such as camera images, is stored for this frame. The prefix must end with a forward slash: `/`.
`images`	No	List	A list parameters describing color camera images used for sensor fusion. You can include up to 8 images in this list. For more information about the parameters required for each image, see Include Camera Data in Your Input Manifest.

Include Vehicle Pose Information in Your Input Manifest

Use the ego-vehicle location to provide information about the pose of the vehicle used to capture point cloud data. Ground Truth use this information to compute LiDAR extrinsic matrices.

Ground Truth uses extrinsic matrices to project labels to and from the 3D scene and 2D images. For more information, see Sensor Fusion.

The following table provides more information about the `position` and orientation (`heading`) parameters that are required when you provide ego-vehicle information.

Parameter	Required	Accepted Values	Description
`position`	Yes	JSON object **Required Parameters**: `x`, `y`, and `z`. Enter numbers for these parameters.	The translation vector of the ego vehicle in the world coordinate system.
`heading`	Yes	JSON Object **Required Parameters**: `qx`, `qy`, `qz`, and `qw`. Enter numbers for these parameters.	The orientation of the frame of reference of the device or sensor mounted on the vehicle sensing the surrounding, measured in quaternions, (`qx`, `qy`, `qz`, `qw`) in the a coordinate system.

Include Camera Data in Your Input Manifest

If you want to include color camera data with a frame, use the following parameters to provide information about each image. The **Required** column in the following table applies when the `images` parameter is included in the input manifest file. You are not required to include images in your input manifest file.

If you include camera images, you must include information about the `position` and orientation (`heading`) of the camera used the capture the images.

If your images are distorted, Ground Truth can automatically undistort them using information you provide about the image in your input manifest file, including distortion coefficients (`k1`, `k2`, `k3`, `k4`, `p1`, `p1`), camera model and focal length (`fx`, `fy`), and the principal point (`cx`, `cy`). To learn more about these coefficients and undistorting images, see Camera calibration With OpenCV. If distortion coefficients are not included, Ground Truth will not undistort an image.

Parameter	Required	Accepted Values	Description
`image-path`	Yes	String **Example of format**: *<folder-name> /<imagefile.png>*	The relative location, in Amazon S3 of your image file. This relative path will be appended to the path you specify in `prefix`.
`unix-timestamp`	Yes	Number	The timestamp of the image.

`camera-model`	No	String:
		
		Accepted Values:
		
		`"pinhole" , "fisheye"`
		
		Default:
		
		`"pinhole"`
			The model of the camera used to capture the image. This information is used to undistort camera images.

`fx, fy`	Yes	Numbers	The focal length of the camera, in the x (`fx`) and y (`fy`) directions.
`cx, cy`	Yes	Numbers	The x (`cx`) and y (`cy`) coordinates of the principal point.
`k1, k2, k3, k4`	No	Number	Radial distortion coefficients. Supported for both **fisheye** and **pinhole** camera models.

Parameter	Required	Accepted Values	Description
`p1, p2`	No	Number	Tangential distortion coefficients. Supported for **pinhole** camera models.
`skew`	No	Number	A parameter to measure any known skew in the image.
`position`	Yes	JSON object **Required Parameters**: x, y, and z. Enter numbers for these parameters.	The location or origin of the frame of reference of the camera mounted on the vehicle capturing images.
`heading`	Yes	JSON Object **Required Parameters**: qx, qy, qz, and qw. Enter numbers for these parameters.	The orientation of the frame of reference of the camera mounted on the vehicle capturing images, measured using quaternions, (qx, qy, qz, qw).

Sequence File and Point Cloud Frame Limits

You can include up to 100,000 point cloud frame sequences in your input manifest file. You can include up to 500 point cloud frames in each sequence file.

Keep in mind that 3D point cloud labeling job have longer pre-processing times than other Ground Truth task types. For more information, see Job Pre-processing Time.

Understand Coordinate Systems and Sensor Fusion

Point cloud data is always located in a coordinate system. This coordinate system may be local to the vehicle or the device sensing the surroundings, or it may be a world coordinate system. When you use Ground Truth 3D point cloud labeling jobs, all the annotations are generated using the coordinate system of your input data. For some labeling job task types and features, you must provide data in a world coordinate system.

In this topic, you'll learn the following:

- When you *are required to* provide input data in a world coordinate system or global frame of reference.
- What a world coordinate is and how you can convert point cloud data to a world coordinate system.
- How you can use your sensor and camera extrinsic matrices to provide pose data when using sensor fusion.

Coordinate System Requirements for Labeling Jobs

If your point cloud data was collected in a local coordinate system, you can use an extrinsic matrix of the sensor used to collect the data to convert it to a world coordinate system or a global frame of reference. If you cannot obtain an extrinsic for your point cloud data and, as a result, cannot obtain point clouds in a world coordinate system, you can provide point cloud data in a local coordinate system for 3D point cloud object detection and semantic segmentation task types.

For object tracking, you must provide point cloud data in a world coordinate system. This is because when you are tracking objects across multiple frames, the ego vehicle itself is moving in the world and so all of the frames need a point of reference.

If you include camera data for sensor fusion, it is recommended that you provide camera poses in the same world coordinate system as the 3D sensor (such as a LiDAR sensor).

Using Point Cloud Data in a World Coordinate System

This section explains what a world coordinate system (WCS), also referred to as a *global frame of reference*, is and explains how you can provide point cloud data in a world coordinate system.

What is a World Coordinate System?

A WCS or global frame of reference is a fixed universal coordinate system in which vehicle and sensor coordinate systems are placed. For example, if multiple point cloud frames are located in different coordinate systems because they were collected from two sensors, a WCS can be used to translate all of the coordinates in these point cloud frames into a single coordinate system, where all frames have the same origin, (0,0,0). This transformation is done by translating the origin of each frame to the origin of the WCS using a translation vector, and rotating the three axes (typically x, y, and z) to the right orientation using a rotation matrix. This rigid body transformation is called a *homogeneous transformation*.

A world coordinate system is important in global path planning, localization, mapping, and driving scenario simulations. Ground Truth uses the right-handed Cartesian world coordinate system such as the one defined in ISO 8855, where the x axis is forward toward the car's movement, y axis is left, and the z axis points up from the ground.

The global frame of reference depends on the data. Some datasets use the LiDAR position in the first frame as the origin. In this scenario, all the frames use the first frame as a reference and device heading and position will be near the origin in the first frame. For example, KITTI datasets have the first frame as a reference for world coordinates. Other datasets use a device position that is different from the origin.

Note that this is not the GPS/IMU coordinate system, which is typically rotated by 90 degrees along the z-axis. If your point cloud data is in a GPS/IMU coordinate system (such as OxTS in the open source AV KITTI dataset), then you need to transform the origin to a world coordinate system (typically the vehicle's reference coordinate system). You apply this transformation by multiplying your data with transformation metrics (the rotation matrix and translation vector). This will transform the data from its original coordinate system to a global reference coordinate system. Learn more about this transformation in the next section.

Convert 3D Point Cloud Data to a WCS

Ground Truth assumes that your point cloud data has already been transformed into a reference coordinate system of your choice. For example, you can choose the reference coordinate system of the sensor (such as LiDAR) as your global reference coordinate system. You can also take point clouds from various sensors and transform them from the sensor's view to the vehicle's reference coordinate system view. You use the a sensor's extrinsic matrix, made up of a rotation matrix and translation vector, to convert your point cloud data to a WCS or global frame of reference.

Collectively, the translation vector and rotation matrix can be used to make up an *extrinsic matrix*, which can be used to convert data from a local coordinate system to a WCS. For example, your LiDAR extrinsic matrix may be composed as follows, where R is the rotation matrix and T is the translation vector:

```
LiDAR_extrinsic = [R T;0 0 0 1]
```

For example, the autonomous driving KITTI dataset includes a rotation matrix and translation vector for the LiDAR extrinsic transformation matrix for each frame. The pykitti python module can be used for loading the KITTI data, and in the dataset `dataset.oxts[i].T_w_imu` gives the LiDAR extrinsic transform for the i^{th} frame with can be multiplied with points in that frame to convert them to a world frame - `np.matmul(lidar_transform_matrix, points)`. Multiplying a point in LiDAR frame with a LiDAR extrinsic matrix transforms it into world coordinates. Multiplying a point in the world frame with the camera extrinsic matrix gives the point coordinates in the camera's frame of reference.

The following code example demonstrates how you can convert point cloud frames from the KITTI dataset into a WCS.

```
import pykitti
import numpy as np

basedir = '/Users/nameofuser/kitti-data'
date = '2011_09_26'
drive = '0079'

# The 'frames' argument is optional - default: None, which loads the whole dataset.
# Calibration, timestamps, and IMU data are read automatically.
# Camera and velodyne data are available via properties that create generators
# when accessed, or through getter methods that provide random access.
data = pykitti.raw(basedir, date, drive, frames=range(0, 50, 5))

# i is frame number
i = 0

# lidar extrinsic for the ith frame
lidar_extrinsic_matrix = data.oxts[i].T_w_imu

# velodyne raw point cloud in lidar scanners own coordinate system
points = data.get_velo(i)
```

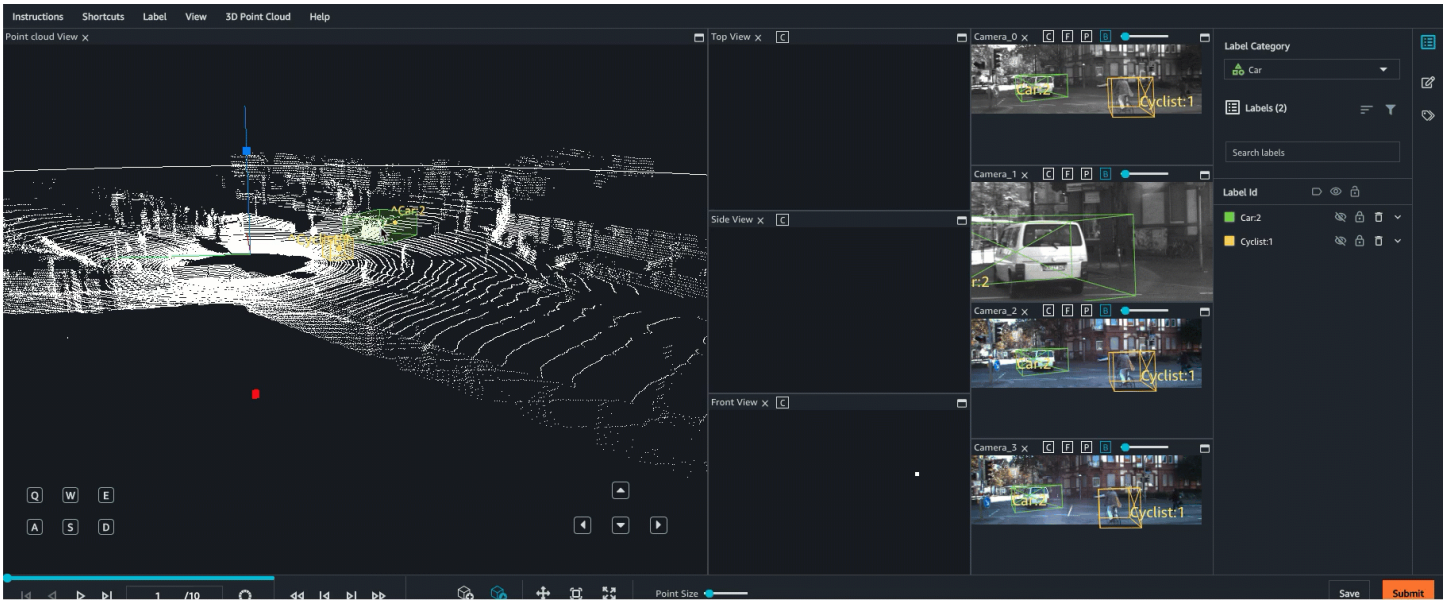
```
# transform points from lidar to global frame using lidar_extrinsic_matrix
def generate_transformed_pcd_from_point_cloud(points, lidar_extrinsic_matrix):
    tps = []
    for point in points:
        transformed_points = np.matmul(lidar_extrinsic_matrix, np.array([point[0],
 point[1], point[2], 1], dtype=np.float32).reshape(4,1)).tolist()
        if len(point) > 3 and point[3] is not None:
            tps.append([transformed_points[0][0], transformed_points[1][0],
 transformed_points[2][0], point[3]])

    return tps

# customer transforms points from lidar to global frame using lidar_extrinsic_matrix
transformed_pcl = generate_transformed_pcd_from_point_cloud(points,
 lidar_extrinsic_matrix)
```

Sensor Fusion

Ground Truth supports sensor fusion of point cloud data with up to 8 video camera inputs. This feature allows human labellers to view the 3D point cloud frame side-by-side with the synchronized video frame. In addition to providing more visual context for labeling, sensor fusion allows workers to adjust annotations in the 3D scene and in 2D images and the adjustment are projected into the other view. The following video demonstrates a 3D point cloud labeling job with LiDAR and camera sensor fusion.



For best results, when using sensor fusion, your point cloud should be in a WCS. Ground Truth uses your sensor (such as LiDAR), camera, and ego vehicle pose information to compute extrinsic and intrinsic matrices for sensor fusion.

Extrinsic Matrix

Ground Truth uses sensor (such as LiDAR) extrinsic and camera extrinsic and intrinsic matrices to project objects to and from the point cloud data's frame of reference to the camera's frame of reference.

For example, in order to project a label from the 3D point cloud to camera image plane, Ground Truth transforms 3D points from LiDAR's own coordinate system to the camera's coordinate system. This is typically done by first transforming 3D points from LiDAR's own coordinate system to a world coordinate system (or a global reference frame) using the LiDAR extrinsic matrix. Ground Truth then uses the camera inverse extrinsic (which converts points from a global frame of reference to the camera's frame of reference) to transform the 3D points from world coordinate system obtained in previous step into the camera image plane. The LiDAR extrinsic matrix can also be used to transform 3D data into a world coordinate system. If your 3D data is already transformed into world coordinate system then the first transformation doesn't have any impact on label translation, and label translation only depends on the camera inverse extrinsic. A view matrix is used to visualize projected labels. To learn more about these transformations and the view matrix, see Ground Truth Sensor Fusion Transformations.

Ground Truth computes these extrinsic matrices by using LiDAR and camera *pose data* that you provide: `heading` (in quaternions: `qx`, `qy`, `qz`, and `qw`) and `position` (`x`, `y`, `z`). For the vehicle, typically the heading and position are described in vehicle's reference frame in a world coordinate system and are called a *ego vehicle pose*. For each camera extrinsic, you can add pose information for that camera. For more information, see Pose.

Intrinsic Matrix

Ground Truth use the camera extrinsic and intrinsic matrices to compute view metrics to transform labels to and from the 3D scene to camera images. Ground Truth computes the camera intrinsic matrix using camera focal length (`fx`, `fy`) and optical center coordinates (`cx`,`cy`) that you provide. For more information, see Intrinsic and Distortion.

Image Distortion

Image distortion can occur for a variety of reasons. For example, images may be distorted due to barrel or fish-eye effects. Ground Truth uses intrinsic parameters along with distortion co-efficient

to undistort images you provide when creating 3D point cloud labeling jobs. If a camera image is already been undistorted, all distortion coefficients should be set to 0.

For more information about the transformations Ground Truth performs to undistort images, see Camera Calibrations: Extrinsic, Intrinsic and Distortion.

Ego Vehicle

To collect data for autonomous driving applications, the measurements used to generate point cloud data and are taken from sensors mounted on a vehicle, or the *ego vehicle*. To project label adjustments to and from the 3D scene and 2D images, Ground Truth needs your ego vehicle pose in a world coordinate system. The ego vehicle pose is comprised of position coordinates and orientation quaternion.

Ground Truth uses your ego vehicle pose to compute rotation and transformations matrices. Rotations in 3 dimensions can be represented by a sequence of 3 rotations around a sequence of axes. In theory, any three axes spanning the 3D Euclidean space are enough. In practice, the axes of rotation are chosen to be the basis vectors. The three rotations are expected to be in a global frame of reference (extrinsic). Ground Truth does not a support body centered frame of reference (intrinsic) which is attached to, and moves with, the object under rotation. To track objects, Ground Truth needs to measure from a global reference where all vehicles are moving. When using Ground Truth 3D point cloud labeling jobs, z specifies the axis of rotation (extrinsic rotation) and yaw Euler angles are in radians (rotation angle).

Pose

Ground Truth uses pose information for 3D visualizations and sensor fusion. Pose information you input through your manifest file is used to compute extrinsic matrices. If you already have an extrinsic matrix, you can use it to extract sensor and camera pose data.

For example in the autonomous driving KITTI dataset, the pykitti python module can be used for loading the KITTI data. In the dataset `dataset.oxts[i].T_w_imu` gives the LiDAR extrinsic transform for the i^{th} frame and it can be multiplied with the points to get them in a world frame - `matmul(lidar_transform_matrix, points)`. This transform can be converted into position (translation vector) and heading (in quaternion) of LiDAR for the input manifest file JSON format. Camera extrinsic transform for `cam0` in i^{th} frame can be calculated by `inv(matmul(dataset.calib.T_cam0_velo, inv(dataset.oxts[i].T_w_imu)))` and this can be converted into heading and position for `cam0`.

```
import numpy
```

```
rotation = [[ 9.96714314e-01, -8.09890350e-02,  1.16333982e-03],
 [ 8.09967396e-02,  9.96661051e-01, -1.03090934e-02],
 [-3.24531964e-04,  1.03694477e-02,  9.99946183e-01]]

origin= [1.71104606e+00,
          5.80000039e-01,
          9.43144935e-01]

from scipy.spatial.transform import Rotation as R

# position is the origin
position = origin
r = R.from_matrix(np.asarray(rotation))

# heading in WCS using scipy
heading = r.as_quat()
print(f"pose:{position}\nheading: {heading}")
```

Position

In the input manifest file, `position` refers to the position of the sensor with respect to a world frame. If you are unable to put the device position in a world coordinate system, you can use LiDAR data with local coordinates. Similarly, for mounted video cameras you can specify the position and heading in a world coordinate system. For camera, if you do not have position information, please use (0, 0, 0).

The following are the fields in the position object:

1. x (float) – x coordinate of ego vehicle, sensor, or camera position in meters.
2. y (float) – y coordinate of ego vehicle, sensor, or camera position in meters.
3. z (float) – z coordinate of ego vehicle, sensor, or camera position in meters.

The following is an example of a `position` JSON object:

```
{
    "position": {
        "y": -152.77584902657554,
        "x": 311.21505956090624,
        "z": -10.854137529636024
```

```
      }
}
```

Heading

In the input manifest file, `heading` is an object that represents the orientation of a device with respect to world frame. Heading values should be in quaternion. A quaternion is a representation of the orientation consistent with geodesic spherical properties. If you are unable to put the sensor heading in world coordinates, please use the identity quaternion (`qx = 0, qy = 0, qz = 0, qw = 1`). Similarly, for cameras, specify the heading in quaternions. If you are unable to obtain extrinsic camera calibration parameters, please also use the identity quaternion.

Fields in `heading` object are as follows:

1. `qx` (float) - x component of ego vehicle, sensor, or camera orientation.
2. `qy` (float) - y component of ego vehicle, sensor, or camera orientation.
3. `qz` (float) - z component of ego vehicle, sensor, or camera orientation.
4. `qw` (float) - w component of ego vehicle, sensor, or camera orientation.

The following is an example of a `heading` JSON object:

```
{
    "heading": {
        "qy": -0.7046155108831117,
        "qx": 0.034278837280808494,
        "qz": 0.7070617895701465,
        "qw": -0.04904659893885366
      }
}
```

To learn more, see Compute Orientation Quaternions and Position.

Compute Orientation Quaternions and Position

Ground Truth requires that all orientation, or heading, data be given in quaternions. A quaternions is a representation of the orientation consistent with geodesic spherical properties that can be used to approximate of rotation. Compared to Euler angles they are simpler to compose and avoid the problem of gimbal lock. Compared to rotation matrices they are more compact, more numerically stable, and more efficient.

You can compute quaternions from a rotation matrix or a transformation matrix.

If you have a rotation matrix (made up of the axis rotations) and translation vector (or origin) in world coordinate system instead of a single 4x4 rigid transformation matrix, then you can directly use the rotation matrix and translation vector to compute quaternions. Libraries like scipy and pyqaternion can help. The following code-block shows an example using these libraries to compute quaternion from a rotation matrix.

```
import numpy

rotation = [[ 9.96714314e-01, -8.09890350e-02,  1.16333982e-03],
 [ 8.09967396e-02,  9.96661051e-01, -1.03090934e-02],
 [-3.24531964e-04,  1.03694477e-02,  9.99946183e-01]]

origin = [1.71104606e+00,
          5.80000039e-01,
          9.43144935e-01]

from scipy.spatial.transform import Rotation as R
# position is the origin
position = origin
r = R.from_matrix(np.asarray(rotation))
# heading in WCS using scipy
heading = r.as_quat()
print(f"position:{position}\nheading: {heading}")
```

A UI tool like 3D Rotation Converter can also be useful.

If you have a 4x4 extrinsic transformation matrix, note that the transformation matrix is in the form `[R T; 0 0 0 1]` where `R` is the rotation matrix and `T` is the origin translation vector. That means you can extract rotation matrix and translation vector from the transformation matrix as follows.

```
import numpy as np

transformation
= [[ 9.96714314e-01, -8.09890350e-02,  1.16333982e-03, 1.71104606e+00],
   [ 8.09967396e-02,  9.96661051e-01, -1.03090934e-02, 5.80000039e-01],
   [-3.24531964e-04,  1.03694477e-02,  9.99946183e-01, 9.43144935e-01],
   [              0,               0,               0,              1]]
```

```
transformation  = np.array(transformation )
rotation = transformation[0:3][0:3]
translation= transformation[0:3][3]

from scipy.spatial.transform import Rotation as R
# position is the origin translation
position = translation
r = R.from_matrix(np.asarray(rotation))
# heading in WCS using scipy
heading = r.as_quat()
print(f"position:{position}\nheading: {heading}")
```

With your own setup, you can compute an extrinsic transformation matrix using the GPS/IMU position and orientation (latitude, longitude, altitude and roll, pitch, yaw) with respect to the LiDAR sensor on the ego vehicle. For example, you can compute pose from KITTI raw data using `pose = convertOxtsToPose(oxts)` to transform the oxts data into a local euclidean poses, specified by 4x4 rigid transformation matrices. You can then transform this pose transformation matrix to a global reference frame using the reference frames transformation matrix in the world coordinate system.

```
struct Quaternion
{
    double w, x, y, z;
};

Quaternion ToQuaternion(double yaw, double pitch, double roll) // yaw (Z), pitch (Y),
 roll (X)
{
    // Abbreviations for the various angular functions
    double cy = cos(yaw * 0.5);
    double sy = sin(yaw * 0.5);
    double cp = cos(pitch * 0.5);
    double sp = sin(pitch * 0.5);
    double cr = cos(roll * 0.5);
    double sr = sin(roll * 0.5);

    Quaternion q;
    q.w = cr * cp * cy + sr * sp * sy;
    q.x = sr * cp * cy - cr * sp * sy;
    q.y = cr * sp * cy + sr * cp * sy;
    q.z = cr * cp * sy - sr * sp * cy;
```

```
    return q;
}
```

Ground Truth Sensor Fusion Transformations

The following sections go into greater detail about the Ground Truth sensor fusion transformations that are performed using the pose data you provide.

LiDAR Extrinsic

In order to project to and from a 3D LiDAR scene to a 2D camera image, Ground Truth computes the rigid transformation projection metrics using the ego vehicle pose and heading. Ground Truth computes rotation and translation of a world coordinates into the 3D plane by doing a simple sequence of rotations and translation.

Ground Truth computes rotation metrics using the heading quaternions as follows:

$$M = \begin{pmatrix} 1 - 2y^2 - 2z^2 & 2xy + 2zw & 2xz - 2yw \\ 2xy - 2zw & 1 - 2x^2 - 2z^2 & 2yz + 2xw \\ 2xz + 2yw & 2yz - 2xw & 1 - 2x^2 - 2y^2 \end{pmatrix}$$

Here, `[x, y, z, w]` corresponds to parameters in the `heading` JSON object, `[qx, qy, qz, qw]`. Ground Truth computes the translation column vector as `T = [poseX, poseY, poseZ]`. Then the extrinsic metrics is simply as follows:

```
LiDAR_extrinsic = [R T;0 0 0 1]
```

Camera Calibrations: Extrinsic, Intrinsic and Distortion

Geometric camera calibration, also referred to as *camera resectioning*, estimates the parameters of a lens and image sensor of an image or video camera. You can use these parameters to correct for lens distortion, measure the size of an object in world units, or determine the location of the camera in the scene. Camera parameters include intrinsics and distortion coefficients.

Camera Extrinsic

If the camera pose is given, then Ground Truth computes the camera extrinsic based on a rigid transformation from the 3D plane into the camera plane. The calculation is the same as the one

used for the LiDAR Extrinsic, except that Ground Truth uses camera pose (`position` and `heading`) and computes the inverse extrinsic.

```
camera_inverse_extrinsic = inv([Rc Tc;0 0 0 1]) #where Rc and Tc are camera pose
components
```

Intrinsic and Distortion

Some cameras, such as pinhole or fisheye cameras, may introduce significant distortion in photos. This distortion can be corrected using distortion coefficients and the camera focal length. To learn more, see Camera calibration With OpenCV in the OpenCV documentation.

There are two types of distortion Ground Truth can correct for: radial distortion and tangential distortion.

Radial distortion occurs when light rays bend more near the edges of a lens than they do at its optical center. The smaller the lens, the greater the distortion. The presence of the radial distortion manifests in form of the *barrel* or *fish-eye* effect and Ground Truth uses Formula 1 to undistort it.

Formula 1:

$$x_{corrected} = x(1 + k_1 r^2 + k_2 r^4 + k_3 r^6)$$
$$y_{corrected} = y(1 + k_1 r^2 + k_2 r^4 + k_3 r^6)$$

Tangential distortion occurs because the lenses used to take the images are not perfectly parallel to the imaging plane. This can be corrected with Formula 2.

Formula 2:

$$x_{corrected} = x + [2p_1 xy + p_2(r^2 + 2x^2)]$$
$$y_{corrected} = y + [p_1(r^2 + 2y^2) + 2p_2 xy]$$

In the input manifest file, you can provide distortion coefficients and Ground Truth will undistort your images. All distortion coefficients are floats.

- k1, k2, k3, k4 – Radial distortion coefficients. Supported for both fisheye and pinhole camera models.
- p1 ,p2 – Tangential distortion coefficients. Supported for pinhole camera models.

If images are already undistorted, all distortion coefficients should be 0 in your input manifest.

In order to correctly reconstruct the corrected image, Ground Truth does a unit conversion of the images based on focal lengths. If a common focal length is used with a given aspect ratio for both axes, such as 1, in the upper formula we will have a single focal length. The matrix containing these four parameters is referred to as the *in camera intrinsic calibration matrix*.

$$\begin{Bmatrix} x \\ y \\ w \end{Bmatrix} = \begin{Bmatrix} f_x & 0 & c_x \\ 0 & f_y & c_y \\ 0 & 0 & 1 \end{Bmatrix} \begin{Bmatrix} X \\ Y \\ Z \end{Bmatrix}$$

While the distortion coefficients are the same regardless of the camera resolutions used, these should be scaled with the current resolution from the calibrated resolution.

The following are float values.

- fx - focal length in x direction.
- fy - focal length in y direction.
- cx - x coordinate of principal point.
- cy - y coordinate of principal point.

Ground Truth use the camera extrinsic and camera intrinsic to compute view metrics as shown in the following code block to transform labels between the 3D scene and 2D images.

```
def generate_view_matrix(intrinsic_matrix, extrinsic_matrix):
    intrinsic_matrix = np.c_[intrinsic_matrix, np.zeros(3)]
```

```
    view_matrix = np.matmul(intrinsic_matrix, extrinsic_matrix)
    view_matrix = np.insert(view_matrix, 2, np.array((0, 0, 0, 1)), 0)
    return view_matrix
```

Video Frame Input Data

When you create a video frame object detection or object tracking labeling job, you can choose video files (MP4 files) or video frames for input data. All worker tasks are created using video frames, so if you choose video files, use the Ground Truth frame extraction tool to extract video frames (images) from your video files.

For both of these options, you can use the **Automated data setup** option in the Ground Truth section of the Amazon SageMaker console to set up a connection between Ground Truth and your input data in Amazon S3 so that Ground Truth knows where to look for your input data when creating your labeling tasks. This creates and stores an input manifest file in your Amazon S3 input dataset location. To learn more, see Automated Video Frame Input Data Setup.

Alternatively, you can manually create sequence files for each sequence of video frames that you want labeled and provide the Amazon S3 location of an input manifest file that references each of these sequences files using the `source-ref` key. To learn more, see Create a Video Frame Input Manifest File.

Choose Video Files or Video Frames for Input Data

When you create a video frame object detection or object tracking labeling job, you can provide a sequence of video frames (images) or you can use the Amazon SageMaker console to have Ground Truth automatically extract video frames from your video files. Use the following sections to learn more about these options.

Provide Video Frames

Video frames are sequences of images extracted from a video file. You can create a Ground Truth labeling job to have workers label multiple sequences of video frames. Each sequence is made up of images extracted from a single video.

To create a labeling job using video frame sequences, you must store each sequence using a unique key name prefix in Amazon S3. In the Amazon S3 console, key name prefixes are folders. So in the Amazon S3 console, each sequence of video frames must be located in its own folder in Amazon S3.

For example, if you have two sequences of video frames, you might use the key name prefixes `sequence1/` and `sequence2/` to identify your sequences. In this example, your sequences may be located in `s3://DOC-EXAMPLE-BUCKET/video-frames/sequence1/` and `s3://DOC-EXAMPLE-BUCKET/video-frames/sequence2/`.

If you are using the Ground Truth console to create an input manifest file, all of the sequence key name prefixes should be in the same location in Amazon S3. For example, in the Amazon S3 console, each sequence could be in a folder in `s3://DOC-EXAMPLE-BUCKET/video-frames/`. In this example, your first sequence of video frames (images) may be located in `s3://DOC-EXAMPLE-BUCKET/video-frames/sequence1/` and your second sequence may be located in `s3://DOC-EXAMPLE-BUCKET/video-frames/sequence2/`.

> **Important**
>
> Even if you only have a single sequence of video frames that you want workers to label, that sequence must have a key name prefix in Amazon S3. If you are using the Amazon S3 console, this means that your sequence is located in a folder. It cannot be located in the root of your S3 bucket.

When creating worker tasks using sequences of video frames, Ground Truth uses one sequence per task. In each task, Ground Truth orders your video frames using UTF-8 binary order.

For example, video frames might be in the following order in Amazon S3:

```
[0001.jpg, 0002.jpg, 0003.jpg, ..., 0011.jpg]
```

They are arranged in the same order in the worker's task: `0001.jpg, 0002.jpg, 0003.jpg, ..., 0011.jpg`.

Frames might also be ordered using a naming convention like the following:

```
[frame1.jpg, frame2.jpg, ..., frame11.jpg]
```

In this case, `frame10.jpg` and `frame11.jpg` come before `frame2.jpg` in the worker task. Your worker sees your video frames in the following order: `frame1.jpg, frame10.jpg, frame11.jpg, frame2.jpg, ..., frame9.jpg`.

Provide Video Files

You can use the Ground Truth frame splitting feature when creating a new labeling job in the console to extract video frames from video files (MP4 files). A series of video frames extracted from a single video file is referred to as a *sequence of video frames*.

You can either have Ground Truth automatically extract all frames, up to 2,000, from the video, or you can specify a frequency for frame extraction. For example, you can have Ground Truth extract every 10^{th} frame from your videos.

You can provide up to 50 videos when you use automated data setup to extract frames, however your input manifest file cannot reference more than 10 video frame sequence files when you create a video frame object tracking and video frame object detection labeling job. If you use the automated data setup console tool to extract video frames from more than 10 video files, you will need to modify the manifest file the tool generates or create a new one to include 10 video frame sequence files or less. To learn more about these quotas, see 3D Point Cloud and Video Frame Labeling Job Quotas.

To use the video frame extraction tool, see Automated Video Frame Input Data Setup.

When all of your video frames have been successfully extracted from your videos, you will see the following in your S3 input dataset location:

- A key name prefix (a folder in the Amazon S3 console) named after each video. Each of these prefixes leads to:
  - A sequence of video frames extracted from the video used to name that prefix.
  - A sequence file used to identify all of the images that make up that sequence.
- An input manifest file with a .manifest extension. This identifies all of the sequence files that will be used to create your labeling job.

All of the frames extracted from a single video file are used for a labeling task. If you extract video frames from multiple video files, multiple tasks are created for your labeling job, one for each sequence of video frames.

Ground Truth stores each sequence of video frames that it extracts in your Amazon S3 location for input datasets using a unique key name prefix. In the Amazon S3 console, key name prefixes are folders.

Input Data Setup

When you create a video frame labeling job, you need to let Ground Truth know where to look for your input data. You can do this in one of two ways:

- You can store your input data in Amazon S3 and have Ground Truth automatically detect the input dataset used for your labeling job. See Automated Video Frame Input Data Setup to learn more about this option.
- You can create an input manifest file and sequence files and upload them to Amazon S3. See Manual Input Data Setup to learn more about this option.

Topics

Automated Video Frame Input Data Setup

You can use the Ground Truth automated data setup to automatically detect video files in your Amazon S3 bucket and extract video frames from those files. To learn how, see Provide Video Files.

If you already have video frames in Amazon S3, you can use the automated data setup to use these video frames in your labeling job. For this option, all video frames from a single video must be stored using a unique prefix. To learn about the requirements to use this option, see Provide Video Frames.

Select one of the following sections to learn how to set up your automatic input dataset connection with Ground Truth.

Provide Video Files and Extract Frames

Use the following procedure to connect your video files with Ground Truth and automatically extract video frames from those files for video frame object detection and object tracking labeling jobs.

> **Note**
>
> If you use the automated data setup console tool to extract video frames from more than 10 video files, you will need to modify the manifest file the tool generates or create a new one to include 10 video frame sequence files or less. To learn more, see Provide Video Files.

Make sure your video files are stored in an Amazon S3 bucket in the same AWS Region that you perform the automated data setup in.

Automatically connect your video files in Amazon S3 with Ground Truth and extract video frames:

1. Navigate to the **Create labeling job** page in the Amazon SageMaker console: https://console.aws.amazon.com/sagemaker/groundtruth.

   Your input and output S3 buckets must be located in the same AWS Region that you create your labeling job in. This link puts you in the North Virginia (us-east-1) AWS Region. If your input data is in an Amazon S3 bucket in another Region, switch to that Region. To change your AWS Region, on the navigation bar, choose the name of the currently displayed Region.
2. Select **Create labeling job**.
3. Enter a **Job name**.
4. In the section **Input data setup**, select **Automated data setup**.
5. Enter an Amazon S3 URI for **S3 location for input datasets**. An S3 URI looks like the following: `s3://DOC-EXAMPLE-BUCKET/path-to-files/`. This URI should point to the Amazon S3 location where your video files are stored.
6. Specify your **S3 location for output datasets**. This is where your output data is stored. You can choose to store your output data in the **Same location as input dataset** or **Specify a new location** and entering the S3 URI of the location that you want to store your output data.
7. Choose **Video Files** for your **Data type** using the dropdown list.
8. Choose **Yes, extract frames for object tracking and detection tasks**.
9. Choose a method of **Frame extraction**.

   - When you choose **Use all frames extracted from the video to create a labeling task**, Ground Truth extracts all frames from each video in your **S3 location for input datasets**, up

to 2,000 frames. If a video in your input dataset contains more than 2,000 frames, the first 2,000 are extracted and used for that labeling task.

- When you choose **Use every *x* frame from a video to create a labeling task**, Ground Truth extracts every x^{th} frame from each video in your **S3 location for input datasets**.

  For example, if your video is 2 seconds long, and has a frame rate of 30 frames per second, there are 60 frames in your video. If you specify 10 here, Ground Truth extracts every 10^{th} frame from your video. This means the 1^{st}, 10^{th}, 20^{th}, 30^{th}, 40^{th}, 50^{th}, and 60^{th} frames are extracted.

10. Choose or create an IAM execution role. Make sure that this role has permission to access your Amazon S3 locations for input and output data specified in steps 5 and 6.
11. Select **Complete data setup**.

Provide Video Frames

Use the following procedure to connect your sequences of video frames with Ground Truth for video frame object detection and object tracking labeling jobs.

Make sure your video frames are stored in an Amazon S3 bucket in the same AWS Region that you perform the automated data setup in. Each sequence of video frames should have a unique prefix. For example, if you have two sequences stored in `s3://DOC-EXAMPLE-BUCKET/video-frames/sequences/`, each should have a unique prefix like `sequence1` and `sequence2` and should both be located directly under the `/sequences/` prefix. In the example above, the locations of these two sequences is: `s3://DOC-EXAMPLE-BUCKET/video-frames/sequences/sequence1/` and `s3://DOC-EXAMPLE-BUCKET/video-frames/sequences/sequence2/`.

Automatically connect your video frame in Amazon S3 with Ground Truth:

1. Navigate to the **Create labeling job** page in the Amazon SageMaker console: https://console.aws.amazon.com/sagemaker/groundtruth.

   Your input and output S3 buckets must be located in the same AWS Region that you create your labeling job in. This link puts you in the North Virginia (us-east-1) AWS Region. If your input data is in an Amazon S3 bucket in another Region, switch to that Region. To change your AWS Region, on the navigation bar, choose the name of the currently displayed Region.
2. Select **Create labeling job**.
3. Enter a **Job name**.

4. In the section **Input data setup**, select **Automated data setup**.
5. Enter an Amazon S3 URI for **S3 location for input datasets**.

   This should be the Amazon S3 location where your sequences are stored. For example, if you have two sequences stored in `s3://DOC-EXAMPLE-BUCKET/video-frames/sequences/sequence1/`, `s3://DOC-EXAMPLE-BUCKET/video-frames/sequences/sequence2/`, enter `s3://DOC-EXAMPLE-BUCKET/video-frames/sequences/` here.
6. Specify your **S3 location for output datasets**. This is where your output data is stored. You can choose to store your output data in the **Same location as input dataset** or **Specify a new location** and entering the S3 URI of the location that you want to store your output data.
7. Choose **Video frames** for your **Data type** using the dropdown list.
8. Choose or create an IAM execution role. Make sure that this role has permission to access your Amazon S3 locations for input and output data specified in steps 5 and 6.
9. Select **Complete data setup**.

These procedures will create an input manifest in the Amazon S3 location for input datasets that you specified in step 5. If you are creating a labeling job using the SageMaker API or, AWS CLI, or an AWS SDK, use the Amazon S3 URI for this input manifest file as input to the parameter `ManifestS3Uri`.

Manual Input Data Setup

Choose the manual data setup option if you have created sequence files for each of your video frame sequences, and a manifest file listing references to those sequences files.

Create a Video Frame Input Manifest File

Ground Truth uses the input manifest file to identify the location of your input dataset when creating labeling tasks. For video frame object detection and object tracking labeling jobs, each line in the input manifest file identifies the location of a video frame sequence file. Each sequence file identifies the images included in a single sequence of video frames.

Use this page to learn how to create a video frame sequence file and an input manifest file for video frame object tracking and object detection labeling jobs.

If you want Ground Truth to automatically generate your sequence files and input manifest file, see Automated Video Frame Input Data Setup.

Create a Video Frame Sequence Input Manifest

In the video frame sequence input manifest file, each line in the manifest is a JSON object, with a `"source-ref"` key that references a sequence file. Each sequence file identifies the location of a sequence of video frames. This is the manifest file formatting required for all video frame labeling jobs.

The following example demonstrates the syntax used for an input manifest file:

```
{"source-ref": "s3://DOC-EXAMPLE-BUCKET/example-folder/seq1.json"}
{"source-ref": "s3://DOC-EXAMPLE-BUCKET/example-folder/seq2.json"}
```

Create a Video Frame Sequence File

The data for each sequence of video frames needs to be stored in a JSON data object. The following is an example of the format you use for a sequence file. Information about each frame is included as a JSON object and is listed in the `frames` list. The following JSON has been expanded for readability.

```
{
 "seq-no": 1,
 "prefix": "s3://mybucket/prefix/video1/",
 "number-of-frames": 3,
 "frames":[
   {"frame-no": 1, "unix-timestamp": 1566861644, "frame": "frame0001.jpg" },
   {"frame-no": 2, "unix-timestamp": 1566861644, "frame": "frame0002.jpg" },
   {"frame-no": 3, "unix-timestamp": 1566861644, "frame": "frame0003.jpg" }
 ]
}
```

The following table provides details about the parameters shown in the this code example.

Parameter	Required	Accepted Values	Description
`seq-no`	Yes	Integer	The ordered number of the sequence.
`prefix`	Yes	String **Accepted Values**:	The Amazon S3 location where the

Parameter	Required	Accepted Values	Description
		`s3://<bucket-name> /<prefix>/`	sequence files are located. The prefix must end with a forward slash: `/`.
`number-of-frames`	Yes	Integer	The total number of frames included in the sequence file. This number must match the total number of frames listed in the `frames` parameter in the next row.

`frames`	Yes	List of JSON objects
		
		Required:
		
		`frame-no`, `frame`
		
		Optional:
		
		`unix-timestamp`
			A list of frame data. The length of the list must equal `number-of-frames` . In the worker UI, frames in a sequence are ordered in UTF-8 binary order. To learn more about this ordering, see Provide Video Frames.

`frame-no`	Yes	Integer	The frame order number. This will determine the order of a frame in the sequence.

Parameter	Required	Accepted Values	Description
`unix-timestamp`	No	Integer	The unix timestamp of a frame. The number of seconds since January 1st, 1970 until the UTC time when the frame was captured.
`frame`	Yes	String	The name of a video frame image file.

Output Data

The output from a labeling job is placed in the Amazon S3 location that you specified in the console or in the call to the CreateLabelingJob operation. Output data appears in this location when the workers have submitted one or more tasks, or when tasks expire. Note that it may take a few minutes for output data to appear in Amazon S3 after the worker submits the task or the task expires.

Each line in the output data file is identical to the manifest file with the addition of an attribute and value for the label assigned to the input object. The attribute name for the value is defined in the console or in the call to the `CreateLabelingJob` operation. You can't use `-metadata` in the label attribute name. If you are running an image semantic segmentation, 3D point cloud semantic segmentation, or 3D point cloud object tracking job, the label attribute must end with `-ref`. For any other type of job, the attribute name can't end with `-ref`.

The output of the labeling job is the value of the key-value pair with the label. The label and the value overwrites any existing JSON data in the input file with the new value.

For example, the following is the output from an image classification labeling job where the input data files were stored in an Amazon S3 *`AWSDOC-EXAMPLE-BUCKET`* and the label attribute name was defined as *`sport`*. In this example the JSON object is formatted for readability, in the actual output file the JSON object is on a single line. For more information about the data format, see JSON Lines.

```
{
```

```
    "source-ref": "s3://AWSDOC-EXAMPLE-BUCKET/image_example.png",
    "sport":0,
    "sport-metadata":
    {
        "class-name": "football",
        "confidence": 0.00,
        "type":"groundtruth/image-classification",
        "job-name": "identify-sport",
        "human-annotated": "yes",
        "creation-date": "2018-10-18T22:18:13.527256"
    }
}
```

The value of the label can be any valid JSON. In this case the label's value is the index of the class in the classification list. Other job types, such as bounding box, have more complex values.

Any key-value pair in the input manifest file other than the label attribute is unchanged in the output file. You can use this to pass data to your application.

The output from a labeling job can be used as the input to another labeling job. You can use this when you are chaining together labeling jobs. For example, you can send one labeling job to determine the sport that is being played. Then you send another using the same data to determine if the sport is being played indoors or outdoors. By using the output data from the first job as the manifest for the second job, you can consolidate the results of the two jobs into one output file for easier processing by your applications.

The output data file is written to the output location periodically while the job is in progress. These intermediate files contain one line for each line in the manifest file. If an object is labeled, the label is included. If the object hasn't been labeled, it is written to the intermediate output file identically to the manifest file.

Output Directories

Ground Truth creates several directories in your Amazon S3 output path. These directories contain the results of your labeling job and other artifacts of the job. The top-level directory for a labeling job is given the same name as your labeling job; the output directories are placed beneath it. For example, if you named your labeling job **`find-people`**, your output would be in the following directories:

```
s3://AWSDOC-EXAMPLE-BUCKET/find-people/activelearning
```

```
s3://AWSDOC-EXAMPLE-BUCKET/find-people/annotations
s3://AWSDOC-EXAMPLE-BUCKET/find-people/inference
s3://AWSDOC-EXAMPLE-BUCKET/find-people/manifests
s3://AWSDOC-EXAMPLE-BUCKET/find-people/training
```

Each directory contains the following output:

Active Learning Directory

The `activelearning` directory is only present when you are using automated data labeling. It contains the input and output validation set for automated data labeling, and the input and output folder for automatically labeled data.

Annotations Directory

The `annotations` directory contains all of the annotations made by the workforce. These are the responses from individual workers that have not been consolidated into a single label for the data object.

There are three subdirectories in the `annotations` directory.

- The first, `worker-response`, contains the responses from individual workers. This contains a subdirectory for each iteration, which in turn contains a subdirectory for each data object in that iteration. The worker response data for each data object is stored in a timestamped JSON file that contains the answers submitted by each worker for that data object, and if you use a private workforce, metadata about those workers. To learn more about this metadata, see Worker Metadata.
- The second, `consolidated-annotation`, contains information required to consolidate the annotations in the current batch into labels for your data objects.
- The third, `intermediate`, contains the output manifest for the current batch with any completed labels. This file is updated as the label for each data object is completed.

> **Note**
>
> We recommend that you do not use files that are not mentioned in the documentation.

Inference Directory

The `inference` directory is only present when you are using automated data labeling. This directory contains the input and output files for the SageMaker batch transform used while labeling data objects.

Manifest Directory

The `manifest` directory contains the output manifest from your labeling job. There is one subdirectory in the manifest directory, `output`. The `output` directory contains the output manifest file for your labeling job. The file is named `output.manifest`.

Training Directory

The `training` directory is only present when you are using automated data labeling. This directory contains the input and output files used to train the automated data labeling model.

Confidence Score

When you have more than one worker annotate a single task, your label results from annotation consolidation. Ground Truth calculates a confidence score for each label. A *confidence score* is a number between 0 and 1 that indicates how confident Ground Truth is in the label. You can use the confidence score to compare labeled data objects to each other, and to identify the least or most confident labels.

You should not interpret the value of a confidence score as an absolute value, or compare confidence scores across labeling jobs. For example, if all of the confidence scores are between 0.98 and 0.998, you should only compare the data objects with each other and not rely on the high confidence scores.

You should not compare the confidence scores of human-labeled data objects and auto-labeled data objects. The confidence scores for humans are calculated using the annotation consolidation function for the task, while the confidence scores for automated labeling are calculated using a model that incorporates object features. The two models generally have different scales and average confidence.

For a bounding box labeling job, Ground Truth calculates a confidence score per box. You can compare confidence scores within one image or across images for the same labeling type (human or auto). You can't compare confidence scores across labeling jobs.

If a single worker annotates a task (`NumberOfHumanWorkersPerDataObject` is set to 1 or in the console, you enter 1 for **Number of workers per dataset object**), the confidence score is set to `0.00`.

Worker Metadata

Ground Truth provides information that you can use to track individual workers in task output data. The following data is located in the directories under the `worker-response` located in the Annotations Directory:

- The `acceptanceTime` is the time that the worker accepted the task. The format of this date and time stamp is `YYYY-MM-DDTHH:MM:SS.mmmZ` for the year (`YYYY`), month (`MM`), day (`DD`), hour (`HH`), minute (`MM`), second (`SS`) and millisecond (`mmm`). The date and time are separated by a **T**.
- The `submissionTime` is the time that the worker submitted their annotations using the **Submit** button. The format of this date and time stamp is `YYYY-MM-DDTHH:MM:SS.mmmZ` for the year (`YYYY`), month (`MM`), day (`DD`), hour (`HH`), minute (`MM`), second (`SS`) and millisecond (`mmm`). The date and time are separated by a **T**.
- `timeSpentInSeconds` reports the total time, in seconds, that a worker actively worked on that task. This metric does not include time when a worker paused or took a break.
- The `workerId` is unique to each worker.
- If you use a private workforce, in `workerMetadata`, you see the following.
  - The `identityProviderType` is the service used to manage the private workforce.
  - The `issuer` is the Cognito user pool or OIDC Identity Provider (IdP) issuer associated with the work team assigned to this human review task.
  - A unique `sub` identifier refers to the worker. If you create a workforce using Amazon Cognito, you can retrieve details about this worker (such as the name or user name) using this ID using Amazon Cognito. To learn how, see Managing and Searching for User Accounts in Amazon Cognito Developer Guide.

The following is an example of the output you may see if you use Amazon Cognito to create a private workforce. This is identified in the `identityProviderType`.

```
"submissionTime": "2020-12-28T18:59:58.321Z",
"acceptanceTime": "2020-12-28T18:59:15.191Z",
"timeSpentInSeconds": 40.543,
"workerId": "a12b3cdefg4h5i67",
"workerMetadata": {
```

```
    "identityData": {
        "identityProviderType": "Cognito",
        "issuer": "https://cognito-idp.aws-region.amazonaws.com/aws-region_123456789",
        "sub": "aaaaaaaa-bbbb-cccc-dddd-eeeeeeeeeeee"
    }
}
```

The following is an example of the `workerMetadata` you may see if you use your own OIDC IdP to create a private workforce:

```
"workerMetadata": {
        "identityData": {
            "identityProviderType": "Oidc",
            "issuer": "https://example-oidc-ipd.com/adfs",
            "sub": "aaaaaaaa-bbbb-cccc-dddd-eeeeeeeeeeee"
        }
}
```

To learn more about using private workforces, see Use a Private Workforce.

Output Metadata

The output from each job contains metadata about the label assigned to data objects. These elements are the same for all jobs with minor variations. The following example shows the metadata elements:

```
    "confidence": 0.00,
    "type": "groundtruth/image-classification",
    "job-name": "identify-animal-species",
    "human-annotated": "yes",
    "creation-date": "2020-10-18T22:18:13.527256"
```

The elements have the following meaning:

- `confidence` – The confidence that Ground Truth has that the label is correct. For more information, see Confidence Score.
- `type` – The type of classification job. For job types, see Built-in Task Types.
- `job-name` – The name assigned to the job when it was created.
- `human-annotated` – Whether the data object was labeled by a human or by automated data labeling. For more information, see Automate Data Labeling.

- `creation-date` – The date and time that the label was created.

Classification Job Output

The following are sample outputs (output manifest files) from an image classification job and a text classification job. They include the label that Ground Truth assigned to the data object, the value for the label, and metadata that describes the label.

In addition to the standard metadata elements, the metadata for a classification job includes the text value of the label's class. For more information, see Image Classification - MXNet.

The red, italicized text in the examples below depends on labeling job specifications and output data.

```
{
    "source-ref":"s3://AWSDOC-EXAMPLE-BUCKET/example_image.jpg",
    "species":"0",
    "species-metadata":
    {
        "class-name": "dog",
        "confidence": 0.00,
        "type": "groundtruth/image-classification",
        "job-name": "identify-animal-species",
        "human-annotated": "yes",
        "creation-date": "2018-10-18T22:18:13.527256"
    }
}
```

```
{
    "source":"The food was delicious",
    "mood":"1",
    "mood-metadata":
    {
        "class-name": "positive",
        "confidence": 0.8,
        "type": "groundtruth/text-classification",
        "job-name": "label-sentiment",
        "human-annotated": "yes",
        "creation-date": "2020-10-18T22:18:13.527256"
    }
}
```

Multi-label Classification Job Output

The following are example output manifest files from a multi-label image classification job and a multi-label text classification job. They include the labels that Ground Truth assigned to the data object (for example, the image or piece of text) and metadata that describes the labels the worker saw when completing the labeling task.

The label attribute name parameter (for example, `image-label-attribute-name`) contains an array of all of the labels selected by at least one of the workers who completed this task. This array contains integer keys (for example, `[1,0,8]`) that correspond to the labels found in `class-map`. In the multi-label image classification example, `bicycle`, `person`, and `clothing` were selected by at least one of the workers who completed the labeling task for the image, `exampleimage.jpg`.

The `confidence-map` shows the confidence score that Ground Truth assigned to each label selected by a worker. To learn more about Ground Truth confidence scores, see Confidence Score.

The red, italicized text in the examples below depends on labeling job specifications and output data.

The following is an example of a multi-label image classification output manifest file.

```
{
    "source-ref": "s3://AWSDOC-EXAMPLE-BUCKET/example_image.jpg",
    "image-label-attribute-name":[1,0,8],
    "image-label-attribute-name-metadata":
       {
        "job-name":"labeling-job/image-label-attribute-name",
        "class-map":
            {
                "1":"bicycle","0":"person","8":"clothing"
            },
        "human-annotated":"yes",
        "creation-date":"2020-02-27T21:36:25.000201",
        "confidence-map":
            {
                "1":0.95,"0":0.77,"8":0.2
            },
        "type":"groundtruth/image-classification-multilabel"
        }
}
```

The following is an example of a multi-label text classification output manifest file. In this example, `approving`, `sad` and `critical` were selected by at least one of the workers who completed the labeling task for the object `exampletext.txt` found in `AWSDOC-EXAMPLE-BUCKET`.

```
{
    "source-ref": "AWSDOC-EXAMPLE-BUCKET/text_file.txt",
    "text-label-attribute-name":[1,0,4],
    "text-label-attribute-name-metadata":
       {
        "job-name":"labeling-job/text-label-attribute-name",
        "class-map":
            {
                "1":"approving","0":"sad","4":"critical"
            },
        "human-annotated":"yes",
        "creation-date":"2020-02-20T21:36:25.000201",
        "confidence-map":
            {
                "1":0.95,"0":0.77,"4":0.2
            },
        "type":"groundtruth/text-classification-multilabel"
        }
}
```

Bounding Box Job Output

The following is sample output (output manifest file) from a bounding box job. For this task, three bounding boxes are returned. The label value contains information about the size of the image, and the location of the bounding boxes.

The `class_id` element is the index of the box's class in the list of available classes for the task. The `class-map` metadata element contains the text of the class.

The metadata has a separate confidence score for each bounding box. The metadata also includes the `class-map` element that maps the `class_id` to the text value of the class. For more information, see Object Detection - MXNet.

The red, italicized text in the examples below depends on labeling job specifications and output data.

```
{
    "source-ref": "s3://AWSDOC-EXAMPLE-BUCKET/example_image.png",
```

```
    "bounding-box-attribute-name":
    {
        "image_size": [{ "width": 500, "height": 400, "depth":3}],
        "annotations":
        [
            {"class_id": 0, "left": 111, "top": 134,
                    "width": 61, "height": 128},
            {"class_id": 5, "left": 161, "top": 250,
                     "width": 30, "height": 30},
            {"class_id": 5, "left": 20, "top": 20,
                     "width": 30, "height": 30}
        ]
    },
    "bounding-box-attribute-name-metadata":
    {
        "objects":
        [
            {"confidence": 0.8},
            {"confidence": 0.9},
            {"confidence": 0.9}
        ],
        "class-map":
        {
            "0": "dog",
            "5": "bone"
        },
        "type": "groundtruth/object-detection",
        "human-annotated": "yes",
        "creation-date": "2018-10-18T22:18:13.527256",
        "job-name": "identify-dogs-and-toys"
    }
}
```

The output of a bounding box adjustment job looks like the following JSON. Note that the original JSON is kept intact and two new jobs are listed, each with “adjust-” prepended to the original attribute’s name.

```
{
    "source-ref": "S3 bucket location",
    "bounding-box-attribute-name":
    {
        "image_size": [{ "width": 500, "height": 400, "depth":3}],
        "annotations":
```

```
        [
            {"class_id": 0, "left": 111, "top": 134,
                    "width": 61, "height": 128},
            {"class_id": 5, "left": 161, "top": 250,
                     "width": 30, "height": 30},
            {"class_id": 5, "left": 20, "top": 20,
                     "width": 30, "height": 30}
        ]
    },
    "bounding-box-attribute-name-metadata":
    {
        "objects":
        [
            {"confidence": 0.8},
            {"confidence": 0.9},
            {"confidence": 0.9}
        ],
        "class-map":
        {
            "0": "dog",
            "5": "bone"
        },
        "type": "groundtruth/object-detection",
        "human-annotated": "yes",
        "creation-date": "2018-10-18T22:18:13.527256",
        "job-name": "identify-dogs-and-toys"
    },
    "adjusted-bounding-box":
    {
        "image_size": [{ "width": 500, "height": 400, "depth":3}],
        "annotations":
        [
            {"class_id": 0, "left": 110, "top": 135,
                    "width": 61, "height": 128},
            {"class_id": 5, "left": 161, "top": 250,
                     "width": 30, "height": 30},
            {"class_id": 5, "left": 10, "top": 10,
                     "width": 30, "height": 30}
        ]
    },
    "adjusted-bounding-box-metadata":
    {
        "objects":
        [
```

```
            {"confidence": 0.8},
            {"confidence": 0.9},
            {"confidence": 0.9}
        ],
        "class-map":
        {
            "0": "dog",
            "5": "bone"
        },
        "type": "groundtruth/object-detection",
        "human-annotated": "yes",
        "creation-date": "2018-11-20T22:18:13.527256",
        "job-name": "adjust-bounding-boxes-on-dogs-and-toys",
        "adjustment-status": "adjusted"
    }
}
```

In this output, the job's `type` doesn't change, but an `adjustment-status` field is added. This field has the value of `adjusted` or `unadjusted`. If multiple workers have reviewed the object and at least one adjusted the label, the status is `adjusted`.

Named Entity Recognition

The following is an example output manifest file from a named entity recognition (NER) labeling task. For this task, seven `entities` are returned.

In the output manifest, the JSON object, `annotations`, includes a list of the `labels` (label categories) that you provided.

Worker responses are in a list named `entities`. Each entity in this list is a JSON object that contains a `label` value that matches one in the `labels` list, an integer `startOffset` value for labeled span's starting Unicode offset, and an integer `endOffset` value for the ending Unicode offset.

The metadata has a separate confidence score for each entity. If a single worker labeled each data object, the confidence value for each entity will be zero.

The red, italicized text in the examples below depends on labeling job inputs and worker responses.

```

            {
                "confidence": 0
            },
            {
                "confidence": 0
            }
```

```
        ]
    }
}
```

Label Verification Job Output

The output (output manifest file) of a bounding box verification job looks different than the output of a bounding box annotation job. That's because the workers have a different type of task. They're not labeling objects, but evaluating the accuracy of prior labeling, making a judgment, and then providing that judgment and perhaps some comments.

If human workers are verifying or adjusting prior bounding box labels, the output of a verification job would look like the following JSON. The red, italicized text in the examples below depends on labeling job specifications and output data.

```
{
    "source-ref":"s3://AWSDOC-EXAMPLE-BUCKET/image_example.png",
    "bounding-box-attribute-name":
    {
        "image_size": [{ "width": 500, "height": 400, "depth":3}],
        "annotations":
        [
            {"class_id": 0, "left": 111, "top": 134,
                    "width": 61, "height": 128},
            {"class_id": 5, "left": 161, "top": 250,
                     "width": 30, "height": 30},
            {"class_id": 5, "left": 20, "top": 20,
                     "width": 30, "height": 30}
        ]
    },
    "bounding-box-attribute-name-metadata":
    {
        "objects":
        [
            {"confidence": 0.8},
            {"confidence": 0.9},
            {"confidence": 0.9}
        ],
        "class-map":
        {
            "0": "dog",
            "5": "bone"
        },
```

```
        "type": "groundtruth/object-detection",
        "human-annotated": "yes",
        "creation-date": "2018-10-18T22:18:13.527256",
        "job-name": "identify-dogs-and-toys"
    },
    "verify-bounding-box-attribute-name":"1",
    "verify-bounding-box-attribute-name-metadata":
    {
        "class-name": "bad",
        "confidence": 0.93,
        "type": "groundtruth/label-verification",
        "job-name": "verify-bounding-boxes",
        "human-annotated": "yes",
        "creation-date": "2018-11-20T22:18:13.527256",
        "worker-feedback": [
            {"comment": "The bounding box on the bird is too wide on the right side."},
            {"comment": "The bird on the upper right is not labeled."}
        ]
    }
}
```

Although the `type` on the original bounding box output was `groundtruth/object-detection`, the new `type` is `groundtruth/label-verification`. Also note that the `worker-feedback` array provides worker comments. If the worker doesn't provide comments, the empty fields are excluded during consolidation.

Semantic Segmentation Job Output

The following is the output manifest file from a semantic segmentation labeling job. The value of the label for this job is a reference to a PNG file in an Amazon S3 bucket.

In addition to the standard elements, the metadata for the label includes a color map that defines which color is used to label the image, the class name associated with the color, and the confidence score for each color. For more information, see Semantic Segmentation Algorithm.

The red, italicized text in the examples below depends on labeling job specifications and output data.

```
{
    "source-ref": "s3://AWSDOC-EXAMPLE-BUCKET/example_city_image.png",
    "city-streets-ref": "S3 bucket location",
    "city-streets-ref-metadata": {
      "internal-color-map": {
```

```
        "0": {
           "class-name": "BACKGROUND",
           "confidence": 0.9,
           "hex-color": "#ffffff"
        },
        "1": {
           "class-name": "buildings",
           "confidence": 0.9,
           "hex-color": "#2acf59"
        },
        "2":  {
           "class-name": "road",
           "confidence": 0.9,
           "hex-color": "#f28333"
         }
     },
     "type": "groundtruth/semantic-segmentation",
     "human-annotated": "yes",
     "creation-date": "2018-10-18T22:18:13.527256",
     "job-name": "label-city-streets",
     },
     "verify-city-streets-ref":"1",
     "verify-city-streets-ref-metadata":
     {
        "class-name": "bad",
        "confidence": 0.93,
        "type": "groundtruth/label-verification",
        "job-name": "verify-city-streets",
        "human-annotated": "yes",
        "creation-date": "2018-11-20T22:18:13.527256",
        "worker-feedback": [
            {"comment": "The mask on the leftmost building is assigned the wrong side
 of the road."},
            {"comment": "The curb of the road is not labeled but the instructions say
 otherwise."}
        ]
     }
}
```

Confidence is scored on a per-image basis. Confidence scores are the same across all classes within an image.

The output of a semantic segmentation adjustment job looks similar to the following JSON.

```
{
    "source-ref": "s3://AWSDOC-EXAMPLE-BUCKET/example_city_image.png",
    "city-streets-ref": "S3 bucket location",
    "city-streets-ref-metadata": {
      "internal-color-map": {
        "0": {
           "class-name": "BACKGROUND",
           "confidence": 0.9,
           "hex-color": "#ffffff"
        },
        "1": {
           "class-name": "buildings",
           "confidence": 0.9,
           "hex-color": "#2acf59"
        },
        "2":  {
           "class-name": "road",
           "confidence": 0.9,
           "hex-color": "#f28333"
       }
     },
     "type": "groundtruth/semantic-segmentation",
     "human-annotated": "yes",
     "creation-date": "2018-10-18T22:18:13.527256",
     "job-name": "label-city-streets",
     },
     "adjusted-city-streets-ref": "s3://AWSDOC-EXAMPLE-BUCKET/example_city_image.png",
     "adjusted-city-streets-ref-metadata": {
      "internal-color-map": {
        "0": {
           "class-name": "BACKGROUND",
           "confidence": 0.9,
           "hex-color": "#ffffff"
        },
        "1": {
           "class-name": "buildings",
           "confidence": 0.9,
           "hex-color": "#2acf59"
        },
        "2":  {
           "class-name": "road",
           "confidence": 0.9,
           "hex-color": "#f28333"
```

```
        }
      },
      "type": "groundtruth/semantic-segmentation",
      "human-annotated": "yes",
      "creation-date": "2018-11-20T22:18:13.527256",
      "job-name": "adjust-label-city-streets",
      }
}
```

Video Frame Object Detection Output

The following is the output manifest file from a video frame object detection labeling job. The *red, italicized text* in the examples below depends on labeling job specifications and output data.

In addition to the standard elements, the metadata includes a class map that lists each class that has at least one label in the sequence. The metadata also includes `job-name` which is the name you assigned to the labeling job. For adjustment tasks, If one or more bounding boxes were modified, there is an `adjustment-status` parameter in the metadata for audit workflows that is set to `adjusted`.

```
{
    "source-ref": "s3://DOC-EXAMPLE-BUCKET/example-path/input-manifest.json",
    "CarObjectDetection-ref": "s3://AWSDOC-EXAMPLE-BUCKET/output/labeling-job-name/
annotations/consolidated-annotation/output/0/SeqLabel.json",
    "CarObjectDetection-ref-metadata": {
        "class-map": {
            "0": "car",
            "1": "bus"
        },
        "job-name": "labeling-job/labeling-job-name",
        "human-annotated": "yes",
        "creation-date": "2021-09-29T05:50:35.566000",
        "type": "groundtruth/video-object-detection"
        }
}
```

Ground Truth creates one output sequence file for each sequence of video frames that was labeled. Each output sequence file contains the following:

- All annotations for all frames in a sequence in the `detection-annotations` list of JSON objects.
- For each frame that was annotated by a worker, the frame file name (`frame`), number (`frame-no`), a list of JSON objects containing annotations (`annotations`), and if applicable, `frame-attributes`. The name of this list is defined by the task type you use: `polylines`, `polygons`, `keypoints`, and for bounding boxes, `annotations`.

Each JSON object contains information about a single annotation and associated label. The following table outlines the parameters you'll see for each video frame task type.

Task Type	Parameters
Bounding Box	Box dimensions: `height` and `width` Box top, left corner pixel location: `top` and `left`
Keypoint	Keypoint vertices: `{ "x": int, "y": int }`
Polygon	A list of polygon vertices: `vertices` Polygon vertices: `{ "x": int, "y": int }` A polygon is a closed shape and so the first point will also represent the last point.
Polyline	A list of polyline vertices: `vertices` Polyline vertices: `{ "x": int, "y": int }`

In addition to task type specific values, you will see the following in each JSON object:

- Values of any `label-category-attributes` that were specified for that label.
- The `class-id` of the box. Use the `class-map` in the output manifest file to see which label category this ID maps to.

The following is an example of a `SeqLabel.json` file from a bounding box video frame object detection labeling job. This file will be located under `s3://`*`your-output-bucket`*`/`*`output-prefix`*`/annotations/consolidated-annotation/output/`*`annotation-number`*`/`

```
{
    "detection-annotations": [
        {
            "annotations": [
                {
                    "height": 41,

Video Frame Object Tracking Output

The following is the output manifest file from a video frame object tracking labeling job. The *red, italicized text* in the examples below depends on labeling job specifications and output data.

In addition to the standard elements, the metadata includes a class map that lists each class that has at least one label in the sequence of frames. The metadata also includes `job-name` which is the name you assigned to the labeling job. For adjustment tasks, If one or more bounding boxes were modified, there is an `adjustment-status` parameter in the metadata for audit workflows that is set to `adjusted`.

```
{
    "source-ref": "s3://DOC-EXAMPLE-BUCKET/example-path/input-manifest.json",
    "CarObjectTracking-ref": "s3://AWSDOC-EXAMPLE-BUCKET/output/labeling-job-name/
annotations/consolidated-annotation/output/0/SeqLabel.json",
    "CarObjectTracking-ref-metadata": {
        "class-map": {
            "0": "car",
            "1": "bus"
        },
        "job-name": "labeling-job/labeling-job-name",
        "human-annotated": "yes",
        "creation-date": "2021-09-29T05:50:35.566000",
        "type": "groundtruth/video-object-tracking"
```

```
        }
}
```

Ground Truth creates one output sequence file for each sequence of video frames that was labeled. Each output sequence file contains the following:

- All annotations for all frames in a sequence in the `tracking-annotations` list of JSON objects.
- For each frame that was annotated by a worker, the frame (`frame`), number (`frame-no`), a list of JSON objects containing annotations (`annotations`), and if applicable, frame attributes (`frame-attributes`). The name of this list is defined by the task type you use: `polylines`, `polygons`, `keypoints`, and for bounding boxes, `annotations`.

  Each JSON object contains information about a single annotation and associated label. The following table outlines the parameters you'll see for each video frame task type.

Task Type	Parameters
Bounding Box	Box dimensions: `height` and `width` Box top, left corner pixel location: `top` and `left`
Keypoint	Keypoint vertices: `{ "x": int, "y": int }`
Polygon	A list of polygon vertices: `vertices` Polygon vertices: `{ "x": int, "y": int }` A polygon is a closed shape and so the first point will also represent the last point.
Polyline	A list of polyline vertices: `vertices` Polyline vertices: `{ "x": int, "y": int }`

  In addition to task type specific values, you will see the following in each JSON object:

- Values of any `label-category-attributes` that were specified for that label.
- The `class-id` of the box. Use the `class-map` in the output manifest file to see which label category this ID maps to.
- An `object-id` which identifies an instance of a label. This ID will be the same across frames if a worker identified the same instance of an object in multiple frames. For example, if a car appeared in multiple frames, all bounding boxes uses to identify that car would have the same `object-id`.
- The `object-name` which is the instance ID of that annotation.

The following is an example of a `SeqLabel.json` file from a bounding box video frame object tracking labeling job. This file will be located under `s3://`*`your-output-bucket`*`/`*`output-prefix`*`/annotations/consolidated-annotation/output/`*`annotation-number`*`/`

3D Point Cloud Semantic Segmentation Output

The following is the output manifest file from a 3D point cloud semantic segmentation labeling job.

In addition to the standard elements, the metadata for the label includes a color map that defines which color is used to label the image, the class name associated with the color, and the confidence score for each color. Additionally, there is an `adjustment-status` parameter in the metadata for audit workflows that is set to `adjusted` if the color mask is modified. If you added one or more `frameAttributes` to your label category configuration file, worker responses for frame attributes are in the JSON object, `dataset-object-attributes`.

The *your-label-attribute*-ref parameter contains the location of a compressed file with a .zlib extension. When you uncompress this file, it contains an array. Each index in the array corresponds to the index of an annotated point in the input point cloud. The value of the array at a given index gives the class of the point at the same index in the point cloud, based on the semantic color map found in the color-map parameter of the metadata.

You can use Python code similar to the following to decompress a .zlib file:

```
import zlib
from array import array

# read the label file
compressed_binary_file = open(zlib_file_path/file.zlib, 'rb').read()

# uncompress the label file
binary_content = zlib.decompress(compressed_binary_file)

# load labels to an array
my_int_array_data = array('B', binary_content);

print(my_int_array_data)
```

The code block above will produce an output similar to the following. Each element of the printed array contains the class of a point at the that index in the point cloud. For example, my_int_array_data[0] = 1 means point[0] in the input point cloud has a class 1. In the following output manifest file example, class 0 corresponds with "Background", 1 with Car, and 2 with Pedestrian.

```
>> array('B', [1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1,
 1, 1, 1, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 2, 2, 2, 2, 2, 2, 2, 2, 2, 2, 2])
```

The following is an example of a semantic segmentation 3D point cloud labeling job output manifest file. The red, italicized text in the examples below depends on labeling job specifications and output data.

```

3D Point Cloud Object Detection Output

The following is sample output from a 3D point cloud objected detection job. For this task type, the data about 3D cuboids is returned in the `3d-bounding-box` parameter, in a list named `annotations`. In this list, each 3D cuboid is described using the following information.

- Each class, or label category, that you specify in your input manifest is associated with a `class-id`. Use the `class-map` to identify the class associated with each class ID.
- These classes are used to give each 3D cuboid an `object-name` in the format `<class>:<integer>` where `integer` is a unique number to identify that cuboid in the frame.
- `center-x`, `center-y`, and `center-z` are the coordinates of the center of the cuboid, in the same coordinate system as the 3D point cloud input data used in your labeling job.
- `length`, `width`, and `height` describe the dimensions of the cuboid.
- `yaw` is used to describe the orientation (heading) of the cuboid in radians.

> **Note**
>
> `yaw` is now in the right-handed Cartesian system. Since this feature was added on September 02, 2022 19:02:17 UTC, you can convert the `yaw` measurement in the output data prior to that using the following (all units are in radians):
>
> ```
> old_yaw_in_output = pi - yaw
> ```

- In our definition, +x is to the right, +y is to the forward, and +z is up from the ground plane. The rotation order is x - y - z. The `roll`, `pitch` and `yaw` are represented in the right-handed Cartesian system. In 3D space, `roll` is along the x-axis, `pitch` is along the y-axis and `yaw` is along the z-axis. All three are counterclockwise.
- If you included label attributes in your input manifest file for a given class, a `label-category-attributes` parameter is included for all cuboids for which workers selected label attributes.

If one or more cuboids were modified, there is an `adjustment-status` parameter in the metadata for audit workflows that is set to `adjusted`. If you added one or more `frameAttributes` to your label category configuration file, worker responses for frame attributes are in the JSON object, `dataset-object-attributes`.

The *`red, italicized text`* in the examples below depends on labeling job specifications and output data. The ellipses (`...`) denote a continuation of that list, where additional objects with the same format as the proceeding object can appear.

3D Point Cloud Object Tracking Output

The following is an example of an output manifest file from a 3D point cloud object tracking labeling job. The *red, italicized text* in the examples below depends on labeling job specifications and output data. The ellipses (`...`) denote a continuation of that list, where additional objects with the same format as the proceeding object can appear.

In addition to the standard elements, the metadata includes a class map that lists each class that has at least one label in the sequence. If one or more cuboids were modified, there is an `adjustment-status` parameter in the metadata for audit workflows that is set to `adjusted`.

```
{
   "source-ref": "s3://AWSDOC-EXAMPLE-BUCKET/myfolder/seq1.json",
    "lidar-label-attribute-ref": "s3://<CustomerOutputLocation>/<labelingJobName>/
annotations/consolidated-annotation/output/<datasetObjectId>/SeqLabel.json",
    "lidar-label-attribute-ref-metadata": {
        "objects":
        [
            {
                "frame-no": 300,
                "confidence": []
            },
            {
                "frame-no": 301,
                "confidence": []
            },
            ...
        ],
        'class-map': {'0': 'Car', '1': 'Person'},
        'type': 'groundtruth/point_cloud_object_tracking',
```

```
        'human-annotated': 'yes',
        'creation-date': '2019-11-12T01:18:14.271944',
        'job-name': 'identify-3d-objects',
        "adjustment-status": "adjusted"
    }
}
```

In the above example, the cuboid data for each frame in `seq1.json` is in `SeqLabel.json` in the Amazon S3 location, `s3://<customerOutputLocation>/<labelingJobName>/annotations/consolidated-annotation/output/<datasetObjectId>/SeqLabel.json`. The following is an example of this label sequence file.

For each frame in the sequence, you see the `frame-number`, `frame-name`, if applicable, `frame-attributes`, and a list of `annotations`. This list contains 3D cubiods that were drawn for that frame. Each annotation includes the following information:

- An `object-name` in the format `<class>:<integer>` where `class` identifies the label category and `integer` is a unique ID across the dataset.
- When workers draw a cuboid, it is associated with a unique `object-id` which is associated with all cuboids that identify the same object across multiple frames.
- Each class, or label category, that you specified in your input manifest is associated with a `class-id`. Use the `class-map` to identify the class associated with each class ID.
- `center-x`, `center-y`, and `center-z` are the coordinates of the center of the cuboid, in the same coordinate system as the 3D point cloud input data used in your labeling job.
- `length`, `width`, and `height` describe the dimensions of the cuboid.
- `yaw` is used to describe the orientation (heading) of the cuboid in radians.

> **Note**
>
> `yaw` is now in the right-handed Cartesian system. Since this feature was added on September 02, 2022 19:02:17 UTC, you can convert the `yaw` measurement in the output data prior to that using the following (all units are in radians):
>
> ```
> old_yaw_in_output = pi - yaw
> ```

- In our definition, +x is to the right, +y is to the forward, and +z is up from the ground plane. The rotation order is x - y - z. The `roll`, `pitch` and `yaw` are represented in the right-handed

Cartesian system. In 3D space, `roll` is along the x-axis, `pitch` is along the y-axis and `yaw` is along the z-axis. All three are counterclockwise.

- If you included label attributes in your input manifest file for a given class, a `label-category-attributes` parameter is included for all cuboids for which workers selected label attributes.

3D-2D Object Tracking Point Cloud Object Tracking Output

The following is an example of an output manifest file from a 3D point cloud object tracking labeling job. The *red, italicized text* in the examples below depends on labeling job specifications and output data. The ellipses (`...`) denote a continuation of that list, where additional objects with the same format as the proceeding object can appear.

In addition to the standard elements, the metadata includes a class map that lists each class that has at least one label in the sequence. If one or more cuboids were modified, there is an `adjustment-status` parameter in the metadata for audit workflows that is set to `adjusted`.

```

In the above example, the cuboid data for each frame in `seq2.json` is in `SeqLabel.json` in the Amazon S3 location, `s3://<customerOutputLocation>/<labelingJobName>/annotations/consolidated-annotation/output/<datasetObjectId>/SeqLabel.json`. The following is an example of this label sequence file.

For each frame in the sequence, you see the `frame-number`, `frame-name`, if applicable, `frame-attributes`, and a list of `annotations`. This list contains 3D cubiods that were drawn for that frame. Each annotation includes the following information:

- An `object-name` in the format `<class>:<integer>` where `class` identifies the label category and `integer` is a unique ID across the dataset.
- When workers draw a cuboid, it is associated with a unique `object-id` which is associated with all cuboids that identify the same object across multiple frames.
- Each class, or label category, that you specified in your input manifest is associated with a `class-id`. Use the `class-map` to identify the class associated with each class ID.
- `center-x`, `center-y`, and `center-z` are the coordinates of the center of the cuboid, in the same coordinate system as the 3D point cloud input data used in your labeling job.
- `length`, `width`, and `height` describe the dimensions of the cuboid.
- `yaw` is used to describe the orientation (heading) of the cuboid in radians.

> **Note**
>
> `yaw` is now in the right-handed Cartesian system. Since this feature was added on September 02, 2022 19:02:17 UTC, you can convert the `yaw` measurement in the output data prior to that using the following (all units are in radians):
>
> ```
> old_yaw_in_output = pi - yaw
> ```

- In our definition, +x is to the right, +y is to the forward, and +z is up from the ground plane. The rotation order is x - y - z. The `roll`, `pitch` and `yaw` are represented in the right-handed Cartesian system. In 3D space, `roll` is along the x-axis, `pitch` is along the y-axis and `yaw` is along the z-axis. All three are counterclockwise.
- If you included label attributes in your input manifest file for a given class, a `label-category-attributes` parameter is included for all cuboids for which workers selected label attributes.

The cuboid and bounding box for an object are linked through a common object-id.

Enhanced Data Labeling

Amazon SageMaker Ground Truth manages sending your data objects to workers to be labeled. Labeling each data object is a *task*. Workers complete each task until the entire labeling job is complete. Ground Truth divides the total number of tasks into smaller *batches* that are sent to workers. A new batch is sent to workers when the previous one is finished.

Ground Truth provides two features that help improve the accuracy of your data labels and reduce the total cost of labeling your data:

- *Annotation consolidation* helps to improve the accuracy of your data object labels. It combines the results of multiple workers' annotation tasks into one high-fidelity label.
- *Automated data labeling* uses machine learning to label portions of your data automatically without having to send them to human workers.

Topics

Control the Flow of Data Objects Sent to Workers

Depending on the type of labeling job you create, Amazon SageMaker Ground Truth sends data objects to workers in batches or in a streaming fashion. You can control the flow of data objects to workers in the following ways:

- For both types of labeling jobs, you can use `MaxConcurrentTaskCount` to control the total number of data objects available to all workers at a given point in time when the labeling job is running.
- For streaming labeling jobs, you can control the flow of data objects to workers by monitoring and controlling the number of data objects sent to the Amazon SQS associated with your labeling job.

Use the following sections to learn more about these options. To learn more about streaming labeling jobs, see Ground Truth Streaming Labeling Jobs.

Topics

Use MaxConcurrentTaskCount to Control the Flow of Data Objects

`MaxConcurrentTaskCount` defines the maximum number of data objects that can be labeled by human workers at the same time. If you use the console, this parameter is set to 1,000. If you use `CreateLabelingJob`, you can set this parameter to any integer between 1 and 1,000, inclusive.

When you start a labeling job using an input manifest file, Ground Truth does the following:

1. For each data object listed in your input manifest file, one or more tasks are created, depending on the value you specify for `NumberOfHumanWorkersPerDataObject`. For example, if you set the number of workers per data object to 3, 3 tasks will be created for each dataset object. To be marked as successfully labeled, at least one worker must label the object. Alternatively, the tasks can expire or be declined.
2. If you are using the Mechanical Turk workforce, Ground Truth first sends a batch of 10 dataset objects to your workers. It uses this small batch to set up the labeling job and to make sure that the job is correctly configured.
3. Next, Ground Truth sends `MaxConcurrentTaskCount` number of dataset objects to workers. For example, if you have 2,000 input data objects in your input manifest file and have set the number of workers per data object to 3 and set `MaxConcurrentTaskCount` to 900, the first 900 data objects in your input manifest are sent to workers, corresponding to 2,700 tasks (900 x 3). This is the first full-sized set of objects sent to workers.
4. What happens next depends on the type of labeling job you create. This step assumes one or more dataset objects in your input manifest file, or sent using an Amazon SNS input data source (in a streaming labeling job) were not include in the set sent to workers in step 3.
   - **Streaming labeling job**: As long as the total number of objects available to workers is equal to `MaxConcurrentTaskCount`, all remaining dataset objects on your input manifest file and that you send in real time using Amazon SNS are placed on an Amazon SQS queue. When the total number of objects available to workers falls below `MaxConcurrentTaskCount` minus `NumberOfHumanWorkersPerDataObject`, a new data object from the queue is used to create `NumberOfHumanWorkersPerDataObject`-tasks, which are sent to workers in real time.
   - **Non-streaming labeling job**: As workers finish labeling one set of objects, up to `MaxConcurrentTaskCount` times `NumberOfHumanWorkersPerDataObject` number of new tasks will be sent to workers. This process is repeated until all data objects in the input manifest file are labeled.

Use Amazon SQS to Control the Flow of Data Objects to Streaming Labeling Jobs

When you create a streaming labeling job, an Amazon SQS queue is automatically created in your account. Data objects are only added to the Amazon SQS queue when the total number of objects sent to workers is above `MaxConcurrentTaskCount`. Otherwise, objects are sent directly to workers.

You can use this queue to manage the flow of data objects to your labeling job. To learn more, see Manage Labeling Requests with an Amazon SQS Queue .

Consolidate Annotations

An *annotation* is the result of a single worker's labeling task. *Annotation consolidation* combines the annotations of two or more workers into a single label for your data objects. A label, which is assigned to each object in the dataset, is a probabilistic estimate of what the true label should be. Each object in the dataset typically has multiple annotations, but only one label or set of labels.

You decide how many workers annotate each object in your dataset. Using more workers can increase the accuracy of your labels, but also increases the cost of labeling. To learn more about Ground Truth pricing, see Amazon SageMaker Ground Truth pricing .

If you use the Amazon SageMaker console to create a labeling job, the following are the defaults for the number of workers who can annotate objects:

- Text classification—3 workers
- Image classification—3 workers
- Bounding boxes—5 workers
- Semantic segmentation—3 workers
- Named entity recognition—3 workers

When you use the `CreateLabelingJob` operation, you set the number of workers to annotate each data object with the `NumberOfHumanWorkersPerDataObject` parameter. You can override the default number of workers that annotate a data object using the console or the `CreateLabelingJob` operation.

Ground Truth provides an annotation consolidation function for each of its predefined labeling tasks: bounding box, image classification, name entity recognition, semantic segmentation, and text classification. These are the functions:

- Multi-class annotation consolidation for image and text classification uses a variant of the Expectation Maximization approach to annotations. It estimates parameters for each worker and uses Bayesian inference to estimate the true class based on the class annotations from individual workers.
- Bounding box annotation consolidates bounding boxes from multiple workers. This function finds the most similar boxes from different workers based on the Jaccard index, or intersection over union, of the boxes and averages them.
- Semantic segmentation annotation consolidation treats each pixel in a single image as a multi-class classification. This function treats the pixel annotations from workers as "votes," with more information from surrounding pixels incorporated by applying a smoothing function to the image.
- Named entity recognition clusters text selections by Jaccard similarity and calculates selection boundaries based on the mode, or the median if the mode isn't clear. The label resolves to the most assigned entity label in the cluster, breaking ties by random selection.

You can use other algorithms to consolidate annotations. For information, see Create Your Own Annotation Consolidation Function.

Create Your Own Annotation Consolidation Function

You can choose to use your own annotation consolidation function to determine the final labels for your labeled objects. There are many possible approaches for writing a function and the approach that you take depends on the nature of the annotations to consolidate. Broadly, consolidation functions look at the annotations from workers, measure the similarity between them, and then use some form of probabilistic judgment to determine what the most probable label should be.

If you want to use other algorithms to create annotation consolidations functions, you can find the worker responses in the `[project-name]/annotations/worker-response` folder of the Amazon S3 bucket where you direct the job output.

Assess Similarity

To assess the similarity between labels, you can use one of the following strategies, or you can use one that meets your data labeling needs:

- For label spaces that consist of discrete, mutually exclusive categories, such as multi-class classification, assessing similarity can be straightforward. Discrete labels either match or do not match.

- For label spaces that don't have discrete values, such as bounding box annotations, find a broad measure of similarity. For bounding boxes, one such measure is the Jaccard index. This measures the ratio of the intersection of two boxes with the union of the boxes to assess how similar they are. For example, if there are three annotations, then there can be a function that determines which annotations represent the same object and should be consolidated.

Assess the Most Probable Label

With one of the strategies detailed in the previous sections in mind, make some sort of probabilistic judgment on what the consolidated label should be. In the case of discrete, mutually exclusive categories, this can be straightforward. One of the most common ways to do this is to take the results of a majority vote between the annotations. This weights the annotations equally.

Some approaches attempt to estimate the accuracy of different annotators and weight their annotations in proportion to the probability of correctness. An example of this is the Expectation Maximization method, which is used in the default Ground Truth consolidation function for multi-class annotations.

For more information about creating an annotation consolidation function, see Step 3: Processing with AWS Lambda.

Automate Data Labeling

If you choose, Amazon SageMaker Ground Truth can use active learning to automate the labeling of your input data for certain built-in task types. *Active learning* is a machine learning technique that identifies data that should be labeled by your workers. In Ground Truth, this functionality is called automated data labeling. Automated data labeling helps to reduce the cost and time that it takes to label your dataset compared to using only humans. When you use automated labeling, you incur SageMaker training and inference costs.

We recommend using automated data labeling on large datasets because the neural networks used with active learning require a significant amount of data for every new dataset. Typically, as you provide more data, the potential for high accuracy predictions goes up. Data will only be auto-labeled if the neural network used in the auto-labeling model can achieve an acceptably high level of accuracy. Therefore, with larger datasets, there is more potential to automatically label the data because the neural network can achieve high enough accuracy for auto-labeling. Automated data labeling is most appropriate when you have thousands of data objects. The minimum number of objects allowed for automated data labeling is 1,250, but we strongly suggest providing a minimum of 5,000 objects.

Automated data labeling is available only for the following Ground Truth built-in task types:

- Image Classification (Single Label)
- Image Semantic Segmentation
- Object detection (Bounding Box)
- Text Classification (Single Label)

Streaming labeling jobs do not support automated data labeling.

To learn how to create a custom active learning workflow using your own model, see Set up an active learning workflow with your own model.

Input data quotas apply for automated data labeling jobs. See Input Data Quotas for information about dataset size, input data size and resolution limits.

> **Note**
>
> Before you use an the automated-labeling model in production, you need to fine-tune or test it, or both. You might fine-tune the model (or create and tune another supervised model of your choice) on the dataset produced by your labeling job to optimize the model's architecture and hyperparameters. If you decide to use the model for inference without fine-tuning it, we strongly recommend making sure that you evaluate its accuracy on a representative (for example, randomly selected) subset of the dataset labeled with Ground Truth and that it matches your expectations.

How it Works

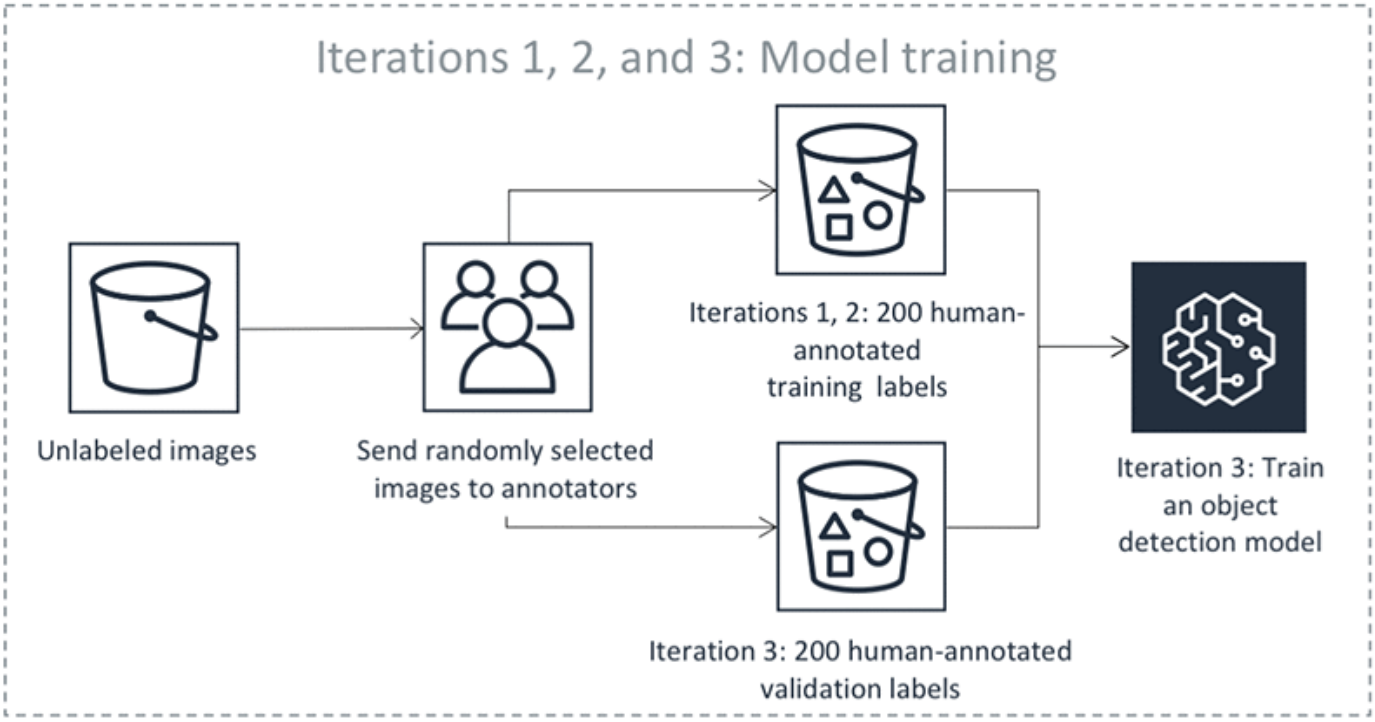
You enable automated data labeling when you create a labeling job. This is how it works:

1. When Ground Truth starts an automated data labeling job, it selects a random sample of input data objects and sends them to human workers. If more than 10% of these data objects fail, the labeling job will fail. If the labeling job fails, in addition to reviewing any error message Ground Truth returns, check that your input data is displaying correctly in the worker UI, instructions are clear, and that you have given workers enough time to complete tasks.
2. When the labeled data is returned, it is used to create a training set and a validation set. Ground Truth uses these datasets to train and validate the model used for auto-labeling.

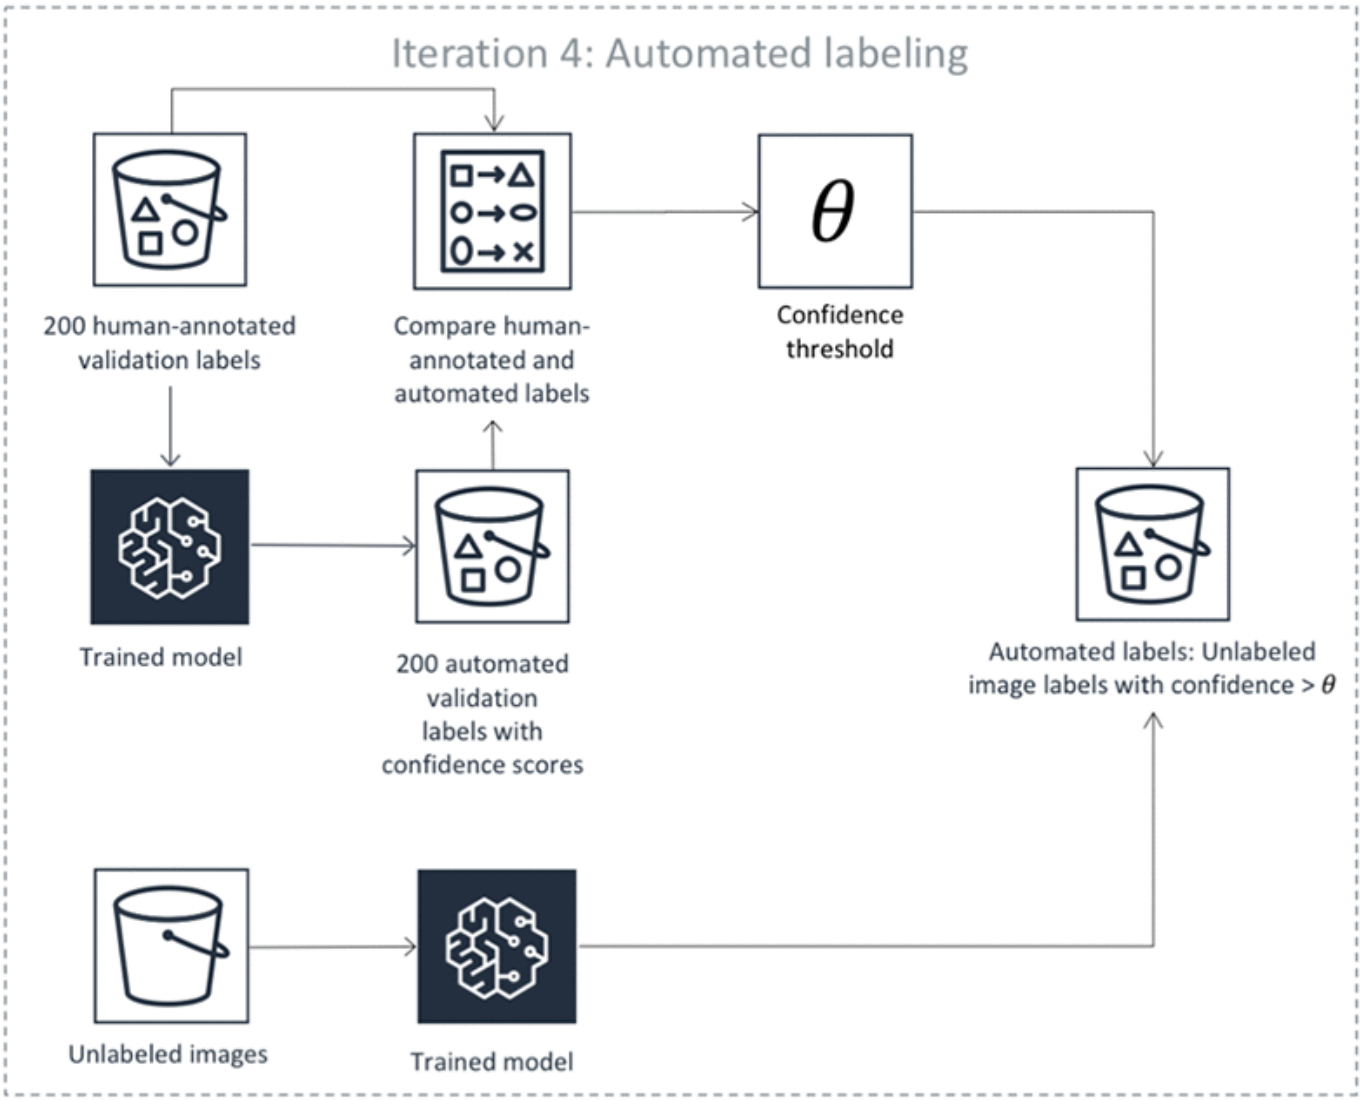
3. Ground Truth runs a batch transform job, using the validated model for inference on the validation data. Batch inference produces a confidence score and quality metric for each object in the validation data.
4. The auto labeling component will use these quality metrics and confidence scores to create a *confidence score threshold* that ensures quality labels.
5. Ground Truth runs a batch transform job on the unlabeled data in the dataset, using the same validated model for inference. This produces a confidence score for each object.
6. The Ground Truth auto labeling component determines if the confidence score produced in step 5 for each object meets the required threshold determined in step 4. If the confidence score meets the threshold, the expected quality of automatically labeling exceeds the requested level of accuracy and that object is considered auto-labeled.
7. Step 6 produces a dataset of unlabeled data with confidence scores. Ground Truth selects data points with low confidence scores from this dataset and sends them to human workers.
8. Ground Truth uses the existing human-labeled data and this additional labeled data from human workers to update the model.
9. The process is repeated until the dataset is fully labeled or until another stopping condition is met. For example, auto-labeling stops if your human annotation budget is reached.

The preceding steps happen in iterations. Select each tab in the following table to see an example of the processes that happen in each iteration for an object detection automated labeling job. The number of data objects used in a given step in these images (for example, 200) is specific to this example. If there are fewer than 5,000 objects to label, the validation set size is 20% of the whole dataset. If there are more than 5,000 objects in your input dataset, the validation set size is 10% of the whole dataset. You can control the number of human labels collected per active learning iteration by changing the value for `MaxConcurrentTaskCount` when using the API operation `CreateLabelingJob`. This value is set to 1,000 when you create a labeling job using the console. In the active learning flow illustrated under the **Active Learning** tab, this value is set to 200.

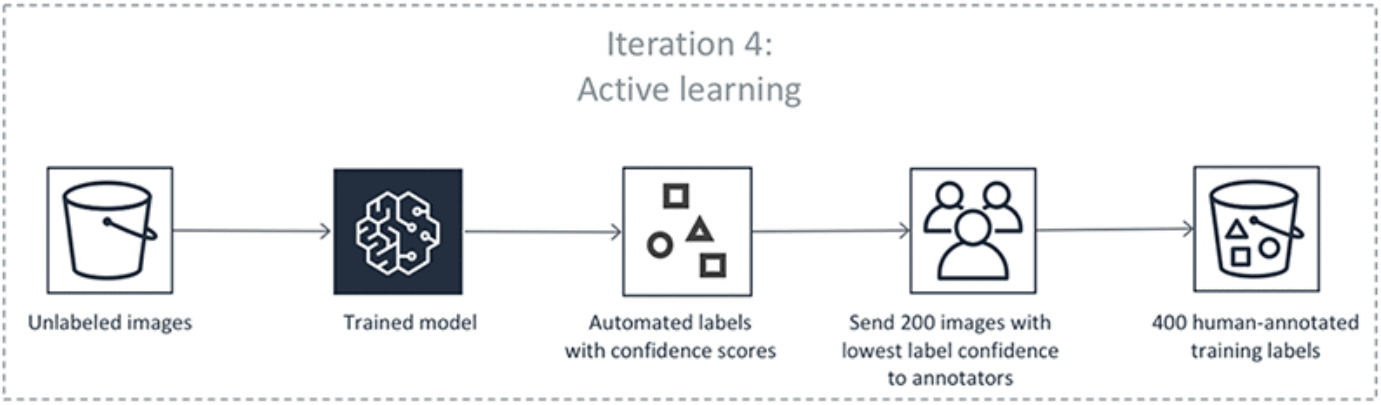
Model Training



Automated Labeling



Active Learning



Accuracy of Automated Labels

The definition of *accuracy* depends on the built-in task type that you use with automated labeling. For all task types, these accuracy requirements are pre-determined by Ground Truth and cannot be manually configured.

- For image classification and text classification, Ground Truth uses logic to find a label-prediction confidence level that corresponds to at least 95% label accuracy. This means Ground Truth expects the accuracy of the automated labels to be at least 95% when compared to the labels that human labelers would provide for those examples.
- For bounding boxes, the expected mean Intersection Over Union (IoU) of the auto-labeled images is 0.6. To find the mean IoU, Ground Truth calculates the mean IoU of all the predicted and missed boxes on the image for every class, and then averages these values across classes.
- For semantic segmentation, the expected mean IoU of the auto-labeled images is 0.7. To find the mean IoU, Ground Truth takes the mean of the IoU values of all the classes in the image (excluding the background).

At every iteration of Active Learning (steps 3-6 in the list above), the confidence threshold is found using the human-annotated validation set so that the expected accuracy of the auto-labeled objects satisfies certain predefined accuracy requirements.

Create an Automated Data Labeling Job (Console)

To create a labeling job that uses automated labeling in the SageMaker console, use the following procedure.

To create an automated data labeling job (console)

1. Open the Ground Truth **Labeling jobs** section of the SageMaker console: https://console.aws.amazon.com/sagemaker/groundtruth.
2. Using Create a Labeling Job (Console) as a guide, complete the **Job overview** and **Task type** sections. Note that auto labeling is not supported for custom task types.
3. Under **Workers**, choose your workforce type.
4. In the same section, choose **Enable automated data labeling**.
5. Using Step 4: Configure the Bounding Box Tool as a guide, create worker instructions in the section ***Task Type*** **labeling tool**. For example, if you chose **Semantic segmentation** as your labeling job type, this section is called **Semantic segmentation labeling tool**.

6. To preview your worker instructions and dashboard, choose **Preview**.
7. Choose **Create**. This creates and starts your labeling job and the auto labeling process.

You can see your labeling job appear in the **Labeling jobs** section of the SageMaker console. Your output data appears in the Amazon S3 bucket that you specified when creating the labeling job. For more information about the format and file structure of your labeling job output data, see Output Data.

Create an Automated Data Labeling Job (API)

To create an automated data labeling job using the SageMaker API, use the `LabelingJobAlgorithmsConfig` parameter of the `CreateLabelingJob` operation. To learn how to start a labeling job using the `CreateLabelingJob` operation, see Create a Labeling Job (API).

Specify the Amazon Resource Name (ARN) of the algorithm that you are using for automated data labeling in the LabelingJobAlgorithmSpecificationArn parameter. Choose from one of the four Ground Truth built-in algorithms that are supported with automated labeling:

- Image Classification (Single Label)
- Image Semantic Segmentation
- Object detection (Bounding Box)
- Text Classification (Single Label)

When an automated data labeling job finishes, Ground Truth returns the ARN of the model it used for the automated data labeling job. Use this model as the starting model for similar auto-labeling job types by providing the ARN, in string format, in the InitialActiveLearningModelArn parameter. To retrieve the model's ARN, use an AWS Command Line Interface (AWS CLI) command similar to the following.

```
# Fetch the mARN of the model trained in the final iteration of the previous labeling
 job.Ground Truth
pretrained_model_arn = sagemaker_client.describe_labeling_job(LabelingJobName=job_name)
['LabelingJobOutput']['FinalActiveLearningModelArn']
```

To encrypt data on the storage volume attached to the ML compute instance(s) that are used in automated labeling, include an AWS Key Management Service (AWS KMS) key in the

`VolumeKmsKeyId` parameter. For information about AWS KMS keys, see What is AWS Key Management Service? in the *AWS Key Management Service Developer Guide*.

For an example that uses the `CreateLabelingJob` operation to create an automated data labeling job, see the **object_detection_tutorial** example in the **SageMaker Examples**, **Ground Truth Labeling Jobs** section of a SageMaker notebook instance. To learn how to create and open a notebook instance, see Create a Notebook Instance. To learn how to access SageMaker example notebooks, see Example Notebooks.

Amazon EC2 Instances Required for Automated Data Labeling

The following table lists the Amazon Elastic Compute Cloud (Amazon EC2) instances that you need to run automated data labeling for training and batch inference jobs.

Automated Data Labeling Job Type	Training Instance Type	Inference Instance Type
Image classification	ml.p3.2xlarge*	ml.c5.xlarge
Object detection (bounding box)	ml.p3.2xlarge*	ml.c5.4xlarge
Text classification	ml.c5.2xlarge	ml.m4.xlarge
Semantic segmentation	ml.p3.2xlarge*	ml.p3.2xlarge*

* In the Asia Pacific (Mumbai) Region (ap-south-1) use ml.p2.8xlarge instead.

Ground Truth manages the instances that you use for automated data labeling jobs. It creates, configures, and terminates the instances as needed to perform your job. These instances don't appear in your Amazon EC2 instance dashboard.

Set up an active learning workflow with your own model

You can create an active learning workflow with your own algorithm to run training and inferences in that workflow to auto-label your data. The notebook bring_your_own_model_for_sagemaker_labeling_workflows_with_active_learning.ipynb demonstrates this using the SageMaker built-in algorithm, BlazingText. This notebook provides an AWS CloudFormation stack that you can use to execute this workflow using AWS Step Functions. You can find the notebook and supporting files in this GitHub repository.

You can also find this notebook in the SageMaker Examples repository. See Use Example Notebooks to learn how to find an Amazon SageMaker example notebook.

Chaining Labeling Jobs

Amazon SageMaker Ground Truth can reuse datasets from prior jobs in two ways: cloning and chaining.

Cloning copies the setup of a prior labeling job and allows you to make additional changes before setting it to run.

Chaining uses not only the setup of the prior job, but also the results. This allows you to continue an incomplete job and add labels or data objects to a completed job. Chaining is a more complex operation.

For data processing:

- Cloning uses the prior job's *input* manifest, with optional modifications, as the new job's input manifest.
- Chaining uses the prior job's *output* manifest as the new job's input manifest.

Chaining is useful when you need to:

- Continue a labeling job that was manually stopped.
- Continue a labeling job that failed mid-job, after fixing issues.
- Switch to automated data labeling after manually labeling part of a job (or the other way around).
- Add more data objects to a completed job and start the job from there.
- Add another annotation to a completed job. For example, you have a collection of phrases labeled for topic, then want to run the set again, categorizing them by the topic's implied audience.

In Amazon SageMaker Ground Truth you can configure a chained labeling job with either the console or the API.

Key Term: Label Attribute Name

The *label attribute name* (`LabelAttributeName` in the API) is a string used as the key for the key-value pair formed with the label that a worker assigns to the data object.

The following rules apply for the label attribute name:

- It can't end with `-metadata`.
- The names `source` and `source-ref` are reserved and can't be used.
- For semantic segmentation labeling jobs, , it must end with `-ref`. For all other labeling jobs, it *can't* end with `-ref`. If you use the console to create the job, Amazon SageMaker Ground Truth automatically appends `-ref` to all label attribute names except for semantic segmentation jobs.
- For a chained labeling job, if you're using the same label attribute name from the originating job and you configure the chained job to use auto-labeling, then if it had been in auto-labeling mode at any point, Ground Truth uses the model from the originating job.

In an output manifest, the label attribute name appears similar to the following.

```
"source-ref": "<S3 URI>",
"<label attribute name>": {
  "annotations": [{
    "class_id": 0,
    "width": 99,
    "top": 87,
    "height": 62,
    "left": 175
  }],
  "image_size": [{
    "width": 344,
    "depth": 3,
    "height": 234
  }]
},
"<label attribute name>-metadata": {
  "job-name": "<job name>",
  "class-map": {
    "0": "<label attribute name>"
  },
  "human-annotated": "yes",
  "objects": [{
    "confidence": 0.09
```

```
    }],
    "creation-date": "<timestamp>",
    "type": "groundtruth/object-detection"
  }
```

If you're creating a job in the console and don't explicitly set the label attribute name value, Ground Truth uses the job name as the label attribute name for the job.

Start a Chained Job (Console)

Choose a stopped, failed, or completed labeling job from the list of your existing jobs. This enables the **Actions** menu.

From the **Actions** menu, choose **Chain**.

Job Overview Panel

In the **Job overview** panel, a new **Job name** is set based on the title of the job from which you are chaining this one. You can change it.

You may also specify a label attribute name different from the labeling job name.

If you're chaining from a completed job, the label attribute name uses the name of the new job you're configuring. To change the name, select the check box.

If you're chaining from a stopped or failed job, the label attribute name uses to the name of the job from which you're chaining. It's easy to see and edit the value because the name check box is checked.

Attribute label naming considerations

- **The default** uses the label attribute name Ground Truth has selected. All data objects without data connected to that label attribute name are labeled.
- **Using a label attribute name** not present in the manifest causes the job to process *all* the objects in the dataset.

The **input dataset location** in this case is automatically selected as the output manifest of the chained job. The input field is not available, so you cannot change it.

Adding data objects to a labeling job

You cannot specify an alternate manifest file. Manually edit the output manifest from the previous job to add new items before starting a chained job. The Amazon S3 URI helps you locate where you are storing the manifest in your Amazon S3 bucket. Download the manifest file from there, edit it locally on your computer, and then upload the new version to replace it. Make sure you are not introducing errors during editing. We recommend you use JSON linter to check your JSON. Many popular text editors and IDEs have linter plugins available.

Start a Chained Job (API)

The procedure is almost the same as setting up a new labeling job with `CreateLabelingJob`, except for two primary differences:

- **Manifest location:** Rather than use your original manifest from the prior job, the value for the `ManifestS3Uri` in the `DataSource` should point to the Amazon S3 URI of the *output manifest* from the prior labeling job.
- **Label attribute name:** Setting the correct `LabelAttributeName` value is important here. This is the key portion of a key-value pair where labeling data is the value. Sample use cases include:
  - **Adding new or more specific labels to a completed job** — Set a new label attribute name.
  - **Labeling the unlabeled items from a prior job** — Use the label attribute name from the prior job.

Use a Partially Labeled Dataset

You can get some chaining benefits if you use an augmented manifest that has already been partially labeled. Check the **Label attribute name** check box and set the name so that it matches the name in your manifest.

If you're using the API, the instructions are the same as those for starting a chained job. However, be sure to upload your manifest to an Amazon S3 bucket and use it instead of using the output manifest from a prior job.

The **Label attribute name** value in the manifest has to conform to the naming considerations discussed earlier.

Ground Truth Security and Permissions

Use the topics on this page to learn about Ground Truth security features and how to configure AWS Identity and Access Management (IAM) permissions to allow a user or role to create a labeling job. Additionally, learn how to create an *execution role*. An execution role is the role that you specify when you create a labeling job. This role is used to start your labeling job.

If you are a new user and want to get started quickly, or if you do not require granular permissions, see Use IAM Managed Policies with Ground Truth.

For more information about IAM users and roles, see Identities (Users, Groups, and Roles) in the IAM User Guide.

To learn more about using IAM with SageMaker, see Identity and Access Management for Amazon SageMaker.

Topics

CORS Permission Requirement

Earlier in 2020, widely used browsers like Chrome and Firefox changed their default behavior for rotating images based on image metadata, referred to as EXIF data. Previously, browsers would always display images in exactly the manner in which they are stored on disk, which is typically unrotated. After the change, images now rotate according to a piece of image metadata called *orientation value*. This has important implications for the entire machine learning (ML) community. For example, if applications that annotate images do not consider the EXIF orientation, they may display images in unexpected orientations, resulting in incorrect labels.

Starting with Chrome 89, AWS can no longer automatically prevent the rotation of images because the web standards group W3C has decided that the ability to control rotation of images violates the web's Same-origin Policy. Therefore, to ensure human workers annotate your input images in a predictable orientation when you submit requests to create a labeling job, you must add a CORS header policy to the Amazon S3 buckets that contain your input images.

> **Important**
>
> If you do not add a CORS configuration to the Amazon S3 buckets that contain your input data, labeling tasks for those input data objects will fail.

If you create a job through the Ground Truth console, CORS is enabled by default. If all of your input data is *not* located in the same Amazon S3 bucket as your input manifest file, you must add a CORS configuration to all Amazon S3 buckets that contain input data using the following instructions.

If you are using the `CreateLabelingJob` API to create a Ground Truth labeling job, you can add a CORS policy to an Amazon S3 bucket that contains input data in the S3 console. To set the required CORS headers on the Amazon S3 bucket that contain your input images in the Amazon S3 console, follow the directions detailed in How do I add cross-domain resource sharing with CORS?. Use the following CORS configuration code for the buckets that host your images. If you use the Amazon S3 console to add the policy to your bucket, you must use the JSON format.

> **Important**
>
> If you create a 3D point cloud or video frame labeling job, you must add additional rules to your CORS configuration. To learn more, see 3D Point Cloud Labeling Job Permission Requirements and Video Frame Job Permission Requirements respectively.

JSON

```

Assign IAM Permissions to Use Ground Truth

Use the topics in this section to learn how to use AWS Identity and Access Management (IAM) managed and custom policies to manage access to Ground Truth and associated resources.

You can use the sections on this page to learn the following:

- How to create IAM policies that grant a user or role permission to create a labeling job. Administrators can use IAM policies to restrict access to Amazon SageMaker and other AWS services that are specific to Ground Truth.
- How to create a SageMaker *execution role*. An execution role is the role that you specify when you create a labeling job. The role is used to start and manage your labeling job.

The following is an overview of the topics you'll find on this page:

- If you are getting started using Ground Truth, or you do not require granular permissions for your use case, it is recommended that you use the IAM managed policies described in Use IAM Managed Policies with Ground Truth.
- Learn about the permissions required to use the Ground Truth console in Grant IAM Permission to Use the Amazon SageMaker Ground Truth Console. This section includes policy examples that grant an IAM entity permission to create and modify private work teams, subscribe to vendor work teams, and create custom labeling workflows.
- When you create a labeling job, you must provide an execution role. Use Create a SageMaker Execution Role for a Ground Truth Labeling Job to learn about the permissions required for this role.

Use IAM Managed Policies with Ground Truth

SageMaker and Ground Truth provide AWS managed policies that you can use to create a labeling job. If you are getting started using Ground Truth and you do not require granular permissions for your use case, it is recommended that you use the following policies:

- `AmazonSageMakerFullAccess` – Use this policy to give a user or role permission to create a labeling job. This is a broad policy that grants a entity permission to use SageMaker features,

as well as features of necessary AWS services through the console and API. This policy gives the entity permission to create a labeling job and to create and manage workforces using Amazon Cognito. To learn more, see AmazonSageMakerFullAccess Policy.

- `AmazonSageMakerGroundTruthExecution` – To create an *execution role*, you can attach the policy `AmazonSageMakerGroundTruthExecution` to a role. An execution role is the role that you specify when you create a labeling job and it is used to start your labeling job. This policy allows you to create both streaming and non-streaming labeling jobs, and to create a labeling job using any task type. Note the following limits of this managed policy.
  - **Amazon S3 permissions**: This policy grants an execution role permission to access Amazon S3 buckets with the following strings in the name: `GroundTruth`, `Groundtruth`, `groundtruth`, `SageMaker`, `Sagemaker`, and `sagemaker` or a bucket with an object tag that includes `SageMaker` in the name (case insensitive). Make sure your input and output bucket names include these strings, or add additional permissions to your execution role to grant it permission to access your Amazon S3 buckets. You must give this role permission to perform the following actions on your Amazon S3 buckets: `AbortMultipartUpload`, `GetObject`, and `PutObject`.
  - **Custom Workflows**: When you create a custom labeling workflow, this execution role is restricted to invoking AWS Lambda functions with one of the following strings as part of the function name: `GtRecipe`, `SageMaker`, `Sagemaker`, `sagemaker`, or `LabelingFunction`. This applies to both your pre-annotation and post-annotation Lambda functions. If you choose to use names without those strings, you must explicitly provide `lambda:InvokeFunction` permission to the execution role used to create the labeling job.

To learn how to attach an AWS managed policy to a user or role, refer to Adding and removing IAM identity permissions in the IAM User Guide.

Grant IAM Permission to Use the Amazon SageMaker Ground Truth Console

To use the Ground Truth area of the SageMaker console, you need to grant permission to an entity to access SageMaker and other AWS services that Ground Truth interacts with. Required permissions to access other AWS services depends on your use-case:

- Amazon S3 permissions are required for all use cases. These permissions must grant access to the Amazon S3 buckets that contain input and output data.
- AWS Marketplace permissions are required to use a vendor workforce.
- Amazon Cognito permission are required for private work team setup.

- AWS KMS permissions are required to view available AWS KMS keys that can be used for output data encryption.
- IAM permissions are required to either list pre-existing execution roles, or to create a new one. Additionally, you must use add a `PassRole` permission to allow SageMaker to use the execution role chosen to start the labeling job.

The following sections list policies you may want to grant to a role to use one or more functions of Ground Truth.

Topics

Ground Truth Console Permissions

To grant permission to a user or role to use the Ground Truth area of the SageMaker console to create a labeling job, attach the following policy to the user or role. The following policy will give an IAM role permission to create a labeling job using a built-in task type task type. If you want to create a custom labeling workflow, add the policy in Custom Labeling Workflow Permissions to the following policy. Each `Statement` included in the following policy is described below this code block.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "SageMakerApis",
            "Effect": "Allow",
            "Action": [
                "sagemaker:*"
            ],
            "Resource": "*"
        },
        {
            "Sid": "KmsKeysForCreateForms",
            "Effect": "Allow",
```

```
            "Action": [
                "kms:DescribeKey",
                "kms:ListAliases"
            ],
            "Resource": "*"
        },
        {
            "Sid": "AccessAwsMarketplaceSubscriptions",
            "Effect": "Allow",
            "Action": [
                "aws-marketplace:ViewSubscriptions"
            ],
            "Resource": "*"
        },
        {
            "Sid": "SecretsManager",
            "Effect": "Allow",
            "Action": [
                "secretsmanager:CreateSecret",
                "secretsmanager:DescribeSecret",
                "secretsmanager:ListSecrets"
            ],
            "Resource": "*"
        },
        {
            "Sid": "ListAndCreateExecutionRoles",

                "iam:ListRoles",
                "iam:CreateRole",
                "iam:CreatePolicy",
                "iam:AttachRolePolicy"
            ],
            "Resource": "*"
        },
        {
            "Sid": "PassRoleForExecutionRoles",
            "Effect": "Allow",
            "Action": [
                "iam:PassRole"
            ],
            "Resource": "*",
            "Condition": {
                "StringEquals": {
```

```
                    "iam:PassedToService": "sagemaker.amazonaws.com"
                }
            }
        },
        {
            "Sid": "GroundTruthConsole",
            "Effect": "Allow",
            "Action": [
                "groundtruthlabeling:*",
                "lambda:InvokeFunction",
                "lambda:ListFunctions",
                "s3:GetObject",
                "s3:PutObject",
                "s3:ListBucket",
                "s3:GetBucketCors",
                "s3:PutBucketCors",
                "s3:ListAllMyBuckets",
                "cognito-idp:AdminAddUserToGroup",
                "cognito-idp:AdminCreateUser",
                "cognito-idp:AdminDeleteUser",
                "cognito-idp:AdminDisableUser",
                "cognito-idp:AdminEnableUser",
                "cognito-idp:AdminRemoveUserFromGroup",
                "cognito-idp:CreateGroup",
                "cognito-idp:CreateUserPool",
                "cognito-idp:CreateUserPoolClient",
                "cognito-idp:CreateUserPoolDomain",
                "cognito-idp:DescribeUserPool",
                "cognito-idp:DescribeUserPoolClient",
                "cognito-idp:ListGroups",
                "cognito-idp:ListIdentityProviders",
                "cognito-idp:ListUsers",
                "cognito-idp:ListUsersInGroup",
                "cognito-idp:ListUserPoolClients",
                "cognito-idp:ListUserPools",
                "cognito-idp:UpdateUserPool",
                "cognito-idp:UpdateUserPoolClient"
            ],
            "Resource": "*"
        }
    ]
}
```

This policy includes the following statements. You can scope down any of these statements by adding specific resourses to the `Resource` list for that statement.

`SageMakerApis`

This statement includes `sagemaker:*`, which allows the user to perform all SageMaker API actions. You can reduce the scope of this policy by restricting users from performing actions that are not used to create and monitoring a labeling job.

`KmsKeysForCreateForms`

You only need to include this statement if you want to grant a user permission to list and select AWS KMS keys in the Ground Truth console to use for output data encryption. The policy above grants a user permission to list and select any key in the account in AWS KMS. To restrict the keys that a user can list and select, specify those key ARNs in `Resource`.

`SecretsManager`

This statement gives the user permission to describe, list, and create resources in AWS Secrets Manager required to create the labeling job.

`ListAndCreateExecutionRoles`

This statement gives a user permission to list (`ListRoles`) and create (`CreateRole`) IAM roles in your account. It also grants the user permission to create (`CreatePolicy`) policies and attach (`AttachRolePolicy`) policies to entities. These are required to list, select, and if required, create an execution role in the console.

If you have already created an execution role, and want to narrow the scope of this statement so that users can only select that role in the console, specify the ARNs of the roles you want the user to have permission to view in `Resource` and remove the actions `CreateRole`, `CreatePolicy`, and `AttachRolePolicy`.

`AccessAwsMarketplaceSubscriptions`

These permissions are required to view and choose vendor work teams that you are already subscribed to when creating a labeling job. To give the user permission to *subscribe* to vendor work teams, add the statement in Vendor Workforce Permissions to the policy above

`PassRoleForExecutionRoles`

This is required to give the labeling job creator permission to preview the worker UI and verify that input data, labels, and instructions display correctly. This statement gives an entity permissions to pass the IAM execution role used to create the labeling job to SageMaker to render and preview the worker UI. To narrow the scope of this policy, add the role ARN of the execution role used to create the labeling job under `Resource`.

`GroundTruthConsole`

- `groundtruthlabeling` – This allows a user to perform actions required to use certain features of the Ground Truth console. These include permissions to describe the labeling job status (`DescribeConsoleJob`), list all dataset objects in the input manifest file (`ListDatasetObjects`), filter the dataset if dataset sampling is selected (`RunFilterOrSampleDatasetJob`), and to generate input manifest files if automated data labeling is used (`RunGenerateManifestByCrawlingJob`). These actions are only available when using the Ground Truth console and cannot be called directly using an API.
- `lambda:InvokeFunction` and `lambda:ListFunctions` – these actions give users permission to list and invoke Lambda functions that are used to run a custom labeling workflow.
- `s3:*` – All Amazon S3 permissions included in this statement are used to view Amazon S3 buckets for automated data setup (`ListAllMyBuckets`), access input data in Amazon S3 (`ListBucket`, `GetObject`), check for and create a CORS policy in Amazon S3 if needed (`GetBucketCors` and `PutBucketCors`), and write labeling job output files to S3 (`PutObject`).
- `cognito-idp` – These permissions are used to create, view and manage and private workforce using Amazon Cognito. To learn more about these actions, refer to the Amazon Cognito API References.

Custom Labeling Workflow Permissions

Add the following statement to a policy similar to the one in Ground Truth Console Permissions to give a user permission to select pre-existing pre-annotation and post-annotation Lambda functions while creating a custom labeling workflow.

```
{
    "Sid": "GroundTruthConsoleCustomWorkflow",
    "Effect": "Allow",
    "Action": [
        "lambda:InvokeFunction",
        "lambda:ListFunctions"
    ],
```

```
    "Resource": "*"
}
```

To learn how to give an entity permission to create and test pre-annotation and post-annotation Lambda functions, see Required Permissions To Use Lambda With Ground Truth.

Private Workforce Permissions

When added to a permissions policy, the following permission grants access to create and manage a private workforce and work team using Amazon Cognito. These permissions are not required to use an OIDC IdP workforce.

```
{
    "Effect": "Allow",
    "Action": [
        "cognito-idp:AdminAddUserToGroup",
        "cognito-idp:AdminCreateUser",
        "cognito-idp:AdminDeleteUser",
        "cognito-idp:AdminDisableUser",
        "cognito-idp:AdminEnableUser",
        "cognito-idp:AdminRemoveUserFromGroup",
        "cognito-idp:CreateGroup",
        "cognito-idp:CreateUserPool",
        "cognito-idp:CreateUserPoolClient",
        "cognito-idp:CreateUserPoolDomain",
        "cognito-idp:DescribeUserPool",
        "cognito-idp:DescribeUserPoolClient",
        "cognito-idp:ListGroups",
        "cognito-idp:ListIdentityProviders",
        "cognito-idp:ListUsers",
        "cognito-idp:ListUsersInGroup",
        "cognito-idp:ListUserPoolClients",
        "cognito-idp:ListUserPools",
        "cognito-idp:UpdateUserPool",
        "cognito-idp:UpdateUserPoolClient"
        ],
    "Resource": "*"
}
```

To learn more about creating private workforce using Amazon Cognito, see Create and Manage Amazon Cognito Workforce.

Vendor Workforce Permissions

You can add the following statement to the policy in Grant IAM Permission to Use the Amazon SageMaker Ground Truth Console to grant an entity permission to subscribe to a vendor workforce.

```
{
    "Sid": "AccessAwsMarketplaceSubscriptions",
    "Effect": "Allow",
    "Action": [
        "aws-marketplace:Subscribe",
        "aws-marketplace:Unsubscribe",
        "aws-marketplace:ViewSubscriptions"
    ],
    "Resource": "*"
}
```

Create a SageMaker Execution Role for a Ground Truth Labeling Job

When you configure your labeling job, you need to provide an *execution role*, which is a role that SageMaker has permission to assume to start and run your labeling job.

This role must give Ground Truth permission to access the following:

- Amazon S3 to retrieve your input data and write output data to an Amazon S3 bucket. You can either grant permission for an IAM role to access an entire bucket by providing the bucket ARN, or you can grant access to the role to access specific resources in a bucket. For example, the ARN for a bucket may look similar to `arn:aws:s3:::awsexamplebucket1` and the ARN of a resource in an Amazon S3 bucket may look similar to `arn:aws:s3:::awsexamplebucket1/prefix/file-name.png`. To apply an action to all resources in an Amazon S3 bucket, you can use the wild card: `*`. For example, `arn:aws:s3:::awsexamplebucket1/prefix/*`. For more information, see Amazon Amazon S3 Resources in the Amazon Simple Storage Service User Guide.
- CloudWatch to log worker metrics and labeling job statuses.
- AWS KMS for data encryption. (Optional)
- AWS Lambda for processing input and output data when you create a custom workflow.

Additionally, if you create a streaming labeling job, this role must have permission to access:

- Amazon SQS to create an interact with an SQS queue used to manage labeling requests.

- Amazon SNS to subscribe to and retrieve messages from your Amazon SNS input topic and to send messages to your Amazon SNS output topic.

All of these permissions can be granted with the `AmazonSageMakerGroundTruthExecution` managed policy *except*:

- Data and storage volume encryption of your Amazon S3 buckets. To learn how to configure these permissions, see Encrypt Output Data and Storage Volume with AWS KMS.
- Permission to select and invoke Lambda functions that do not include `GtRecipe`, `SageMaker`, `Sagemaker`, `sagemaker`, or `LabelingFunction` in the function name.
- Amazon S3 buckets that do not include either `GroundTruth`, `Groundtruth`, `groundtruth`, `SageMaker`, `Sagemaker`, and `sagemaker` in the prefix or bucket name or an object tag that includes `SageMaker` in the name (case insensitive).

If you require more granular permissions than the ones provided in `AmazonSageMakerGroundTruthExecution`, use the following policy examples to create an execution role that fits your specific use case.

Topics

- Built-In Task Types (Non-streaming) Execution Role Requirements
- Built-In Task Types (Streaming) Execution Role Requirements
- Execution Role Requirements for Custom Task Types
- Automated Data Labeling Permission Requirements

Built-In Task Types (Non-streaming) Execution Role Requirements

The following policy grants permission to create a labeling job for a built-in task type. This execution policy does not include permissions for AWS KMS data encryption or decryption. Replace each red, italicized ARN with your own Amazon S3 ARNs.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "S3ViewBuckets",
            "Effect": "Allow",
```

```
            "Action": [
                "s3:ListBucket",
                "s3:GetBucketLocation"
            ],
            "Resource": [
                "arn:aws:s3:::<input-bucket-name>",
                "arn:aws:s3:::<output-bucket-name>"
            ]
        },
        {
            "Sid": "S3GetPutObjects",
            "Effect": "Allow",
            "Action": [
                "s3:AbortMultipartUpload",
                "s3:GetObject",
                "s3:PutObject"
            ],
            "Resource": [
                "arn:aws:s3:::<input-bucket-name>/*",
                "arn:aws:s3:::<output-bucket-name>/*"
            ]
        },
        {
            "Sid": "CloudWatch",
            "Effect": "Allow",
            "Action": [
                "cloudwatch:PutMetricData",
                "logs:CreateLogStream",
                "logs:CreateLogGroup",
                "logs:DescribeLogStreams",
                "logs:PutLogEvents"
            ],
            "Resource": "*"
        }
    ]
}
```

Built-In Task Types (Streaming) Execution Role Requirements

If you create a streaming labeling job, you must add a policy similar to the following to the execution role you use to create the labeling job. To narrow the scope of the policy, replace the `*` in `Resource` with specific AWS resources that you want to grant the IAM role permission to access and use.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:AbortMultipartUpload",
                "s3:GetObject",
                "s3:PutObject"
            ],
            "Resource": [
                "arn:aws:s3:::<input-bucket-name>/*",
                "arn:aws:s3:::<output-bucket-name>/*"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject"
            ],
            "Resource": "*",
            "Condition": {
                "StringEqualsIgnoreCase": {
                    "s3:ExistingObjectTag/SageMaker": "true"
                }
            }
        },
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetBucketLocation",
                "s3:ListBucket"
            ],
            "Resource": [
                "arn:aws:s3:::<input-bucket-name>",
                "arn:aws:s3:::<output-bucket-name>"
            ]
        },
        {
            "Sid": "CloudWatch",
            "Effect": "Allow",
            "Action": [
                "cloudwatch:PutMetricData",
```

```
                "logs:CreateLogStream",
                "logs:CreateLogGroup",
                "logs:DescribeLogStreams",
                "logs:PutLogEvents"
            ],
            "Resource": "*"
        },
        {
            "Sid": "StreamingQueue",
            "Effect": "Allow",
            "Action": [
                "sqs:CreateQueue",
                "sqs:DeleteMessage",
                "sqs:GetQueueAttributes",
                "sqs:GetQueueUrl",
                "sqs:ReceiveMessage",
                "sqs:SendMessage",
                "sqs:SendMessageBatch",
                "sqs:SetQueueAttributes"
            ],
            "Resource": "arn:aws:sqs:*:*:*GroundTruth*"
        },
        {
            "Sid": "StreamingTopicSubscribe",
            "Effect": "Allow",
            "Action": "sns:Subscribe",
            "Resource": [
                "arn:aws:sns:<aws-region>:<aws-account-number>:<input-topic-name>",
                "arn:aws:sns:<aws-region>:<aws-account-number>:<output-topic-name>"
            ],
            "Condition": {
                "StringEquals": {
                    "sns:Protocol": "sqs"
                },
                "StringLike": {
                    "sns:Endpoint": "arn:aws:sns:<aws-region>:<aws-account-
number>:*GroundTruth*"
                }
            }
        },
        {
            "Sid": "StreamingTopic",
            "Effect": "Allow",
            "Action": [
```

```
                "sns:Publish"
            ],
            "Resource": [
                "arn:aws:sns:<aws-region>:<aws-account-number>:<input-topic-name>",
                "arn:aws:sns:<aws-region>:<aws-account-number>:<output-topic-name>"
            ]
        },
        {
            "Sid": "StreamingTopicUnsubscribe",
            "Effect": "Allow",
            "Action": [
                "sns:Unsubscribe"
            ],
            "Resource": [
                "arn:aws:sns:<aws-region>:<aws-account-number>:<input-topic-name>",
                "arn:aws:sns:<aws-region>:<aws-account-number>:<output-topic-name>"
            ]
        }
    ]
}
```

Execution Role Requirements for Custom Task Types

If you want to create a custom labeling workflow, add the following statement to an execution role policy like the ones found in Built-In Task Types (Non-streaming) Execution Role Requirements or Built-In Task Types (Streaming) Execution Role Requirements.

This policy gives the execution role permission to `Invoke` your pre-annotation and post-annotation Lambda functions.

```
{
    "Sid": "LambdaFunctions",
    "Effect": "Allow",
    "Action": [
        "lambda:InvokeFunction"
    ],
    "Resource": [
        "arn:aws:lambda:<region>:<account-id>:function:<pre-annotation-lambda-name>",
        "arn:aws:lambda:<region>:<account-id>:function:<post-annotation-lambda-name>"
    ]
}
```

Automated Data Labeling Permission Requirements

If you want to create a labeling job with automated data labeling enabled, you must 1) add one policy to the IAM policy attached to the execution role and 2) update the trust policy of the execution role.

The following statement allows the IAM execution role to be passed to SageMaker so that it can be used to run the training and inference jobs used for active learning and automated data labeling respectively. Add this statement to an execution role policy like the ones found in Built-In Task Types (Non-streaming) Execution Role Requirements or Built-In Task Types (Streaming) Execution Role Requirements. Replace *arn:aws:iam::<account-number>:role/<role-name>* with the execution role ARN. You can find your IAM role ARN in the IAM console under **Roles**.

```
{
    "Effect": "Allow",
    "Action": [
        "iam:PassRole"
    ],
    "Resource": "arn:aws:iam::<account-number>:role/<execution-role-name>",
    "Condition": {
        "StringEquals": {
            "iam:PassedToService": [
                "sagemaker.amazonaws.com"
            ]
        }
    }
}
```

The following statement allows SageMaker to assume the execution role to create and manage the SageMaker training and inference jobs. This policy must be added to the trust relationship of the execution role. To learn how to add or modify an IAM role trust policy, see Modifying a role in the IAM User Guide.

```
{
    "Version": "2012-10-17",
    "Statement": {
        "Effect": "Allow",
        "Principal": {"Service": "sagemaker.amazonaws.com" },
        "Action": "sts:AssumeRole"
    }
}
```

Encrypt Output Data and Storage Volume with AWS KMS

You can use AWS Key Management Service (AWS KMS) to encrypt output data from a labeling job by specifying a customer managed key when you create the labeling job. If you use the API operation `CreateLabelingJob` to create a labeling job that uses automated data labeling, you can also use a customer managed key to encrypt the storage volume attached to the ML compute instances to run the training and inference jobs.

This section describes the IAM policies you must attach to your customer managed key to enable output data encryption and the policies you must attach to your customer managed key and execution role to use storage volume encryption. To learn more about these options, see Output Data and Storage Volume Encryption.

Encrypt Output Data using KMS

If you specify an AWS KMS customer managed key to encrypt output data, you must add an IAM policy similar to the following to that key. This policy gives the IAM execution role that you use to create your labeling job permission to use this key to perform all of the actions listed in `"Action"`. To learn more about these actions, see AWS KMS permissions in the AWS Key Management Service Developer Guide.

To use this policy, replace the IAM service-role ARN in `"Principal"` with the ARN of the execution role you use to create the labeling job. When you create a labeling job in the console, this is the role you specify for **IAM Role** under the **Job overview** section. When you create a labeling job using `CreateLabelingJob`, this is ARN you specify for `RoleArn`.

```
{
    "Sid": "AllowUseOfKmsKey",
    "Effect": "Allow",
    "Principal": {
        "AWS": "arn:aws:iam::111122223333:role/service-role/example-role"
    },
    "Action": [
        "kms:Encrypt",
        "kms:Decrypt",
        "kms:ReEncrypt*",
        "kms:GenerateDataKey*",
        "kms:DescribeKey"
    ],
    "Resource": "*"
```

```
}
```

Encrypt Automated Data Labeling ML Compute Instance Storage Volume

If you specify a `VolumeKmsKeyId` to encrypt the storage volume attached to the ML compute instance used for automated data labeling training and inference, you must do the following:

- Attach permissions described in Encrypt Output Data using KMS to the customer managed key.
- Attach a policy similar to the following to the IAM execution role you use to create your labeling job. This is the IAM role you specify for `RoleArn` in `CreateLabelingJob`. To learn more about the `"kms:CreateGrant"` action that this policy permits, see `CreateGrant` in the AWS Key Management Service API Reference.

```
{
"Version": "2012-10-17",
"Statement":
 [
   {
    "Effect": "Allow",
    "Action": [
       "kms:CreateGrant"
    ],
    "Resource": "*"
  }
]
}
```

To learn more about Ground Truth storage volume encryption, see Use Your KMS Key to Encrypt Automated Data Labeling Storage Volume (API Only).

Using Amazon SageMaker Ground Truth in an Amazon Virtual Private Cloud

Amazon Virtual Private Cloud (Amazon VPC) is a service with which you can launch AWS resources in a logically isolated virtual network that you define. You can create and run a Ground Truth labeling job inside of an Amazon VPC instead of connecting over the internet. When you launch a labeling job in an Amazon VPC, communication between your VPC and Ground Truth is conducted entirely and securely within the AWS network.

A Ground Truth labeling job in Amazon VPC follows the same behavior as PrivateLink Endpoints. For more information, see Shared subnets.

This guide shows how you can use Ground Truth in an Amazon VPC in the following ways:

1. Run an Amazon SageMaker Ground Truth Labeling Job in an Amazon Virtual Private Cloud
2. Use Amazon VPC Mode from a Private Worker Portal

Run an Amazon SageMaker Ground Truth Labeling Job in an Amazon Virtual Private Cloud

Amazon SageMaker Ground Truth supports the following functionalities.

- You can use Amazon S3 bucket policies to control access to buckets from specific Amazon VPC endpoints, or specific VPCs. If you launch a labeling job and your input data is located in an Amazon S3 bucket with access restricted to users in your VPC, you can add a bucket policy to also grant a Ground Truth endpoint permission to access the bucket. To learn more, see Allow Ground Truth to Access VPC Restricted Amazon S3 Buckets.
- You can launch an automated data labeling job in your VPC. You use a VPC configuration to specify VPC subnets and security groups. SageMaker uses this configuration to launch the training and inference jobs used for automated data labeling in your VPC. To learn more, see Create an Automated Data Labeling Job in a VPC.

You may want to use these options in any of the following ways.

- You can use both of these methods to launch a labeling job using a VPC-protected Amazon S3 bucket with automated data labeling enabled.
- You can launch a labeling job using any built-in task type using a VPC-protected bucket.
- You can launch a custom labeling workflow using a VPC-protected bucket. Ground Truth interacts with your pre-annotation and post-annotation Lambda functions using an AWS PrivateLink endpoint.

We recommend that you review Prerequisites to Run a Ground Truth Labeling Job in a VPC before you create a labeling job in an Amazon VPC.

Prerequisites to Run a Ground Truth Labeling Job in a VPC

Review the following prerequisites before you create a Ground Truth labeling job in an Amazon VPC.

- If you are a new user of Ground Truth, review Getting started to learn how to create a labeling job.
- If your input data is located in a VPC-protected Amazon S3 bucket, your workers must access the worker portal from your VPC.

  > **Note**
  >
  > When you launch a labeling job in your VPC, you must use a private work team. To learn more about creating a private work team, see Use a Private Workforce.

- If you want to launch an automated data labeling job in your VPC, review the following prerequisites.
  - Use the instructions in Create an Amazon S3 VPC Endpoint. Training and inference containers used in the automated data labeling workflow use this endpoint to communicate with your buckets in Amazon S3.
  - Review Automate Data Labeling to learn more about this feature. Note that automated data labeling is supported for the following built-in task types: Image Classification (Single Label), Image Semantic Segmentation, Bounding Box, and Text Classification (Single Label). Streaming labeling jobs do not support automated data labeling.

- Review the Ground Truth Security and Permissions section and ensure that you have met the following conditions.
  - The user creating the labeling job has all necessary permissions
  - You have created an IAM execution role with required permissions. If you do not require fine-tuned permissions for your use case, we recommend you use the IAM managed policies described in Grant General Permissions To Get Started Using Ground Truth.
  - Allow your VPC to have access to the `sagemaker-labeling-data-`*`region`* and `sm-bxcb-`*`region`*`-saved-task-states` S3 buckets. These are system owned regionalized S3 buckets that are accessed from worker portal when worker is working on a task. We use these buckets to interact with system managed data.

Allow Ground Truth to Access VPC Restricted Amazon S3 Buckets

The following sections provide details about the permissions Ground Truth requires to launch labeling jobs using Amazon S3 buckets that have access restricted to your VPC and VPC endpoints. To learn how to restrict access to an Amazon S3 bucket to a VPC, see Controlling access from VPC

endpoints with bucket policies in the Amazon Simple Storage Service User Guide guide. To learn how to add a policy to an S3 bucket, see Adding a bucket policy using the Amazon S3 console.

Note

Modifying policies on existing buckets can cause `IN_PROGRESS` Ground Truth jobs to fail. We recommend you start new jobs using a new bucket. If you want to continue using the same bucket, you can do one of the following.

- Wait for an `IN_PROGRESS` job to finish.
- Terminate the job using the console or the AWS CLI.

You can restrict Amazon S3 bucket access to users in your VPC using an AWS PrivateLink endpoint. For example, the following S3 bucket policy allows access to a specific bucket, *<bucket-name>*, from *<vpc>* and the endpoint *<vpc-endpoint>* only. When you modify this policy, you must replace all *red-italized text* with your resources and specifications.

Note

The following policy *denies* all entities *other than* users within a VPC to perform the actions listed in `Action`. If you do not include actions in this list, they are still accessible to any entity that has access to this bucket and permission to perform those actions. For example, if a user has permission to perform `GetBucketLocation` on your Amazon S3 bucket, the policy below does not restrict the user from performing this action outside of your VPC.

```
{
 "Version": "2012-10-17",
 "Id": "Policy1415115909152",
 "Statement": [
  {
   "Sid": "Access-to-specific-VPCE-only",
   "Principal": "*",
   "Action": [
    "s3:GetObject",
    "s3:PutObject"
   ],
   "Effect": "Deny",
```

```
    "Resource": [
     "arn:aws:s3:::<bucket-name>",
     "arn:aws:s3:::<bucket-name>/*"
    ],
    "Condition": {
     "StringNotEquals": {
      "aws:sourceVpce": [
       "<vpc-endpoint>",
       "<vpc>"
      ]
     }
    }
   }
  ]
}
```

Ground Truth must be able to perform the following Amazon S3 actions on the S3 buckets you use to configure the labeling job.

```
"s3:AbortMultipartUpload",
"s3:GetObject",
"s3:PutObject",
"s3:ListBucket",
"s3:GetBucketLocation"
```

You can do this by adding a Ground Truth endpoint to the bucket policy like the one previously mentioned. The following table includes Ground Truth service endpoints for each AWS Region. Add an endpoint in the same AWS Region you use to run your labeling job to your bucket policy.

AWS Region	Ground Truth endpoint
us-east-2	vpce-02569ba1c40aad0bc
us-east-1	vpce-08408e335ebf95b40
us-west-2	vpce-0ea07aa498eb78469
ca-central-1	vpce-0d46ea4c9ff55e1b7
eu-central-1	vpce-0865e7194a099183d

AWS Region	Ground Truth endpoint
eu-west-2	vpce-0bccd56798f4c5df0
eu-west-1	vpce-0788e7ed8628e595d
ap-south-1	vpce-0d7fcda14e1783f11
ap-southeast-2	vpce-0b7609e6f305a77d4
ap-southeast-1	vpce-0e7e67b32e9efed27
ap-northeast-2	vpce-007893f89e05f2bbf
ap-northeast-1	vpce-0247996a1a1807dbd

For example, the following policy restricts `GetObject` and `PutObject` actions on:

- An Amazon S3 bucket to users in a VPC (<vpc>)
- A VPC endpoint (*<vpc-endpoint>*)
- A Ground Truth service endpoint (*<ground-truth-endpoint>*)

```
{
    "Version": "2012-10-17",
    "Id": "1",
    "Statement": [
        {
            "Sid": "DenyAccessFromNonGTandCustomerVPC",
            "Effect": "Deny",
            "Principal": "*",
            "Action": [
                "s3:GetObject",
                "s3:PutObject"
            ],
            "Resource": [
                "arn:aws:s3:::<bucket-name>",
                "arn:aws:s3:::<bucket-name>/*"
            ],
            "Condition": {
                "ForAllValues:StringNotEquals": {
```

```
                    "aws:sourceVpce": [
                        "<vpc-endpoint>",
                        "<ground-truth-endpoint>"
                    ],
                    "aws:SourceVpc": "<vpc>"
                }
            }
        }
    ]
}
```

If you want a user to have permission to launch a labeling job using the Ground Truth console, you must also add the user's ARN to the bucket policy using the `aws:PrincipalArn` condition. This user must also have permission to perform the following Amazon S3 actions on the bucket you use to launch the labeling job.

```
"s3:GetObject",
"s3:PutObject",
"s3:ListBucket",
"s3:GetBucketCors",
"s3:PutBucketCors",
"s3:ListAllMyBuckets",
```

The following code is an example of a bucket policy that restricts permission to perform the actions listed in `Action` on the S3 bucket `<bucket-name>` to the following.

- *<role-name>*
- The VPC endpoints listed in `aws:sourceVpce`
- Users within the VPC named *<vpc>*

```
{
    "Version": "2012-10-17",
    "Id": "1",
    "Statement": [
        {
            "Sid": "DenyAccessFromNonGTandCustomerVPC",
            "Effect": "Deny",
            "Principal": "*",
            "Action": [
                "s3:GetObject",
```

```
                "s3:PutObject"
            ],
            "Resource": [
                "arn:aws:s3:::<bucket-name>/*",
                "arn:aws:s3:::<bucket-name>"
            ],
            "Condition": {
                "ForAllValues:StringNotEquals": {
                    "aws:sourceVpce": [
                        "<vpc-endpoint>",
                        "<ground-truth-endpoint>"
                    ],
                    "aws:PrincipalArn": "arn:aws:iam::<aws-account-id>:role/<role-
name>",
                    "aws:SourceVpc": "<vpc>"
                }
            }
        }
    ]
}
```

> **Note**
>
> The Amazon VPC interface endpoints and the protected Amazon S3 buckets you use for input and output data must be located in the same AWS Region that you use to create the labeling job.

After you have granted Ground Truth permission to access your Amazon S3 buckets, you can use one of the topics in Create a Labeling Job to launch a labeling job. Specify the VPC-restricted Amazon S3 buckets for your input and output data buckets.

Create an Automated Data Labeling Job in a VPC

To create an automated data labeling job using an Amazon VPC, you provide a VPC configuration using the Ground Truth console or `CreateLabelingJob` API operation. SageMaker uses the subnets and security groups you provide to launch the training and inferences jobs used for automated labeling.

> **Important**
>
> Before you launch an automated data labeling job with a VPC configuration, make sure you have created an Amazon S3 VPC endpoint using the VPC you want to use for the labeling job. To learn how, see Create an Amazon S3 VPC Endpoint.
> Additionally, if you create an automated data labeling job using a VPC-restricted Amazon S3 bucket, you must follow the instructions in Allow Ground Truth to Access VPC Restricted Amazon S3 Buckets to give Ground Truth permission to access the bucket.

Use the following procedures to learn how to add a VPC configuration to your labeling job request.

Add a VPC configuration to an automated data labeling job (console):

1. Follow the instructions in Create a Labeling Job (Console) and complete each step in the procedure, up to step 15.
2. In the **Workers** section, select the checkbox next to **Enable automated data labeling**.
3. Maximize the **VPC configuration** section of the console by selecting the arrow.
4. Specify the **Virtual private cloud (VPC)** that you want to use for your automated data labeling job.
5. Choose the dropdown list under **Subnets** and select one or more subnets.
6. Choose the dropdown list under **Security groups** and select one or more groups.
7. Complete all remaining steps of the procedure in Create a Labeling Job (Console).

Add a VPC configuration to an automated data labeling job (API):

To configure a labeling job using the Ground Truth API operation, `CreateLabelingJob`, follow the instructions in Create an Automated Data Labeling Job (API) to configure your request. In addition to the parameters described in this documentation, you must include a `VpcConfig` parameter in `LabelingJobResourceConfig` to specify one or more subnets and security groups using the following schema.

```
"LabelingJobAlgorithmsConfig": {
      "InitialActiveLearningModelArn": "string",
      "LabelingJobAlgorithmSpecificationArn": "string",
      "LabelingJobResourceConfig": {
```

```
         "VolumeKmsKeyId": "string",
         "VpcConfig": {
            "SecurityGroupIds": [ "string" ],
            "Subnets": [ "string" ]
         }
      }
}
```

The following is an example of an AWS Python SDK (Boto3) request to create an automated data labeling job in the US East (N. Virginia) Region using a private workforce. Replace all *red-italicized text* with your labeling job resources and specifications. To learn more about the `CreateLabelingJob` operation, see the Create a Labeling Job (API) tutorial and CreateLabelingJob API documentation.

```
import boto3
client = boto3.client(service_name='sagemaker')

response = client.create_labeling_job(
    LabelingJobName="example-labeling-job",
    LabelAttributeName="label",
    InputConfig={
        'DataSource': {
            'S3DataSource': {
                'ManifestS3Uri': "s3://bucket/path/manifest-with-input-data.json"
            }
        }
    },
    "LabelingJobAlgorithmsConfig": {
      "LabelingJobAlgorithmSpecificationArn": "arn:aws:sagemaker:us-
east-1:027400017018:labeling-job-algorithm-specification/tasktype",
      "LabelingJobResourceConfig": {
         "VpcConfig": {
            "SecurityGroupIds": [ "sg-01233456789", "sg-987654321" ],
            "Subnets": [ "subnet-e0123456", "subnet-e7891011" ]
         }
      }
    },
    OutputConfig={
        'S3OutputPath': "s3://bucket/path/file-to-store-output-data",
        'KmsKeyId': "string"
    },
    RoleArn="arn:aws:iam::*:role/*",
    LabelCategoryConfigS3Uri="s3://bucket/path/label-categories.json",
```

```
    StoppingConditions={
        'MaxHumanLabeledObjectCount': 123,
        'MaxPercentageOfInputDatasetLabeled': 123
    },
    HumanTaskConfig={
        'WorkteamArn': "arn:aws:sagemaker:region:*:workteam/private-crowd/*",
        'UiConfig': {
            'UiTemplateS3Uri': "s3://bucket/path/custom-worker-task-template.html"
        },
        'PreHumanTaskLambdaArn': "arn:aws:lambda:us-
east-1:432418664414:function:PRE-tasktype",
        'TaskKeywords': [
            "Images",
            "Classification",
            "Multi-label"
        ],
        'TaskTitle': "Add task title here",
        'TaskDescription': "Add description of task here for workers",
        'NumberOfHumanWorkersPerDataObject': 1,
        'TaskTimeLimitInSeconds': 3600,
        'TaskAvailabilityLifetimeInSeconds': 21600,
        'MaxConcurrentTaskCount': 1000,
        'AnnotationConsolidationConfig': {
            'AnnotationConsolidationLambdaArn': "arn:aws:lambda:us-
east-1:432418664414:function:ACS-tasktype"
        },
    Tags=[
        {
            'Key': "string",
            'Value': "string"
        },
    ]
)
```

Use Amazon VPC Mode from a Private Worker Portal

To restrict worker portal access to labelers working inside of your Amazon VPC, you can add a VPC configuration when you create a Ground Truth private workforce. You can also add a VPC configuration to an existing private workforce. Ground Truth automatically creates VPC interface endpoints in your VPC and sets up AWS PrivateLink between your VPC endpoint and the Ground Truth services. The worker portal URL associated with the workforce can be accessed from your VPC. The worker portal URL can also be accessed from public internet until you set the restriction

on the public internet. When you delete the workforce or remove the VPC configuration from your workforce, Ground Truth automatically deletes the VPC endpoints associated with the workforce.

> **Note**
>
> There can be only one VPC supported for a workforce.

Point Cloud and video tasks do not support loading through a VPC.

The guide demonstrates how to complete the necessary steps to add and delete an Amazon VPC configuration to your workforce, and satisfy the prerequisites.

Prerequisites

To run a Ground Truth labeling job in Amazon VPC, review the following prerequisites.

- You have an Amazon VPC configured that you can use. If you have not configured a VPC, follow these instructions for creating a VPC.
- Depending on how a Worker Task Template is written, labeling data stored in an Amazon S3 bucket may be accessed directly from Amazon S3 during labeling tasks. In these cases, the VPC network must be configured to allow traffic from the device used by the human labeler to the S3 bucket containing labeling data.
- Follow View and update DNS attributes for your VPC to enable DNS hostnames and DNS resolution for your VPC.

> **Note**
>
> There are two ways to configure your VPC for your workforce. You can do this through the console or the AWS SageMaker CLI.

Using the SageMaker console to manage a VPC config

You can use the SageMaker console to add or remove a VPC configuration. You can also delete an existing workforce.

Adding a VPC configuration to your workforce

Create a private workforce

- Create a private workforce using Amazon Cognito
- Create a private workforce using OpenID Connect (OIDC) Identity Provider(IdP).

After you have created your private workforce, add a VPC configuration to it.

1. Navigate to Amazon SageMaker Runtime in your console.
2. Select **Labeling workforces** in the left panel.
3. Select **Private** to access your private workforce. After your **Workforce status** is **Active**, select **Add** next to **VPC**.
4. When you are prompted to configure your VPC, provide the following:
   a. Your **VPC**
   b. **Subnets**
      i. Ensure that your VPC has an existing subnet
   c. **Security groups**
      i.
      > **Note**
      >
      > You cannot select more than 5 security groups.
   d. After filling in this information, choose **Confirm**.
5. After you choose **Confirm**, you are redirected back to the **Private** page under **Labeling workforces**. You should see a green banner at the top that reads **Your private workforce update with VPC configuration was successfully initialized.** The workforce status is **Updating**. Next to the **Delete workforce** button is the **Refresh** button, which can be used to retrieve the latest **Workforce status**. After the workforce status has changed to **Active**, the VPC endpoint ID is updated as well.

Removing a VPC configuration from your workforce

Use the following information to remove a VPC configuration from your workforce using the console.

1. Navigate to Amazon SageMaker Runtime in your console.

2. Select **Labeling workforces** in the left panel.
3. Find and select your workforce.
4. Under **Private workforce summary**, find **VPC** and choose **Remove** next to it.
5. Select **Remove**.

Deleting a workforce through the console

If you delete a workforce, you should not have any teams associated with it. You can delete a workforce only if the workforce status is **Active** or **Failed**.

Use the following information to delete a workforce using the console.

1. Navigate to Amazon SageMaker Runtime in your console.
2. Select **Labeling workforces** in the left panel.
3. Find and select your workforce.
4. Choose **Delete workforce**.
5. Choose **Delete**.

Using the SageMaker AWS API to manage a VPC config

Use the following sections to learn more about managing a VPCs configuration, while maintaining the right level of access to the work team.

Create a workforce with a VPC configuration

If the account already has a workforce, then you must delete it first. You can also update the workforce with VPC configuration.

```
aws sagemaker create-workforce --cognito-config '{"ClientId": "app-client-
id","UserPool": "Pool_ID",}' --workforce-vpc-config \
" {\"VpcId\": \"vpc-id\", \"SecurityGroupIds\": [\"sg-0123456789abcdef0\"], \"Subnets
\": [\"subnet-0123456789abcdef0\"]}" --workforce-name workforce-name
{
    "WorkforceArn": "arn:aws:sagemaker:us-west-2:xxxxxxxxx:workforce/workforce-name"
}
```

Describe the workforce and make sure the status is `Initializing`.

```
aws sagemaker describe-workforce --workforce-name workforce-name
{
    "Workforce": {
        "WorkforceName": "workforce-name",
        "WorkforceArn": "arn:aws:sagemaker:us-west-2:xxxxxxxxx:workforce/workforce-
name",
        "LastUpdatedDate": 1622151252.451,
        "SourceIpConfig": {
            "Cidrs": []
        },
        "SubDomain": "subdomain.us-west-2.sagamaker.aws.com",
        "CognitoConfig": {
            "UserPool": "Pool_ID",
            "ClientId": "app-client-id"
        },
        "CreateDate": 1622151252.451,
        "WorkforceVpcConfig": {
            "VpcId": "vpc-id",
            "SecurityGroupIds": [
                "sg-0123456789abcdef0"
            ],
            "Subnets": [
                "subnet-0123456789abcdef0"
            ]
        },
        "Status": "Initializing"
    }
}
```

Navigate to the Amazon VPC console. Select **Endpoints** from the left panel. There should be two VPC endpoints created in your account.

Adding a VPC configuration your workforce

Update a non-VPC private workforce with a VPC configuration using the following command.

```
aws sagemaker update-workforce --workforce-name workforce-name\
```

```
--workforce-vpc-config "{\"VpcId\": \"vpc-id\", \"SecurityGroupIds\":
 [\"sg-0123456789abcdef0\"], \"Subnets\": [\"subnet-0123456789abcdef0\"]}"
```

Describe the workforce and make sure the status is `Updating`.

```
aws sagemaker describe-workforce --workforce-name workforce-name
{
    "Workforce": {
        "WorkforceName": "workforce-name",
        "WorkforceArn": "arn:aws:sagemaker:us-west-2:xxxxxxxxx:workforce/workforce-
name",
        "LastUpdatedDate": 1622151252.451,
        "SourceIpConfig": {
            "Cidrs": []
        },
        "SubDomain": "subdomain.us-west-2.sagamaker.aws.com",
        "CognitoConfig": {
            "UserPool": "Pool_ID",
            "ClientId": "app-client-id"
        },
        "CreateDate": 1622151252.451,
        "WorkforceVpcConfig": {
            "VpcId": "vpc-id",
            "SecurityGroupIds": [
                "sg-0123456789abcdef0"
            ],
            "Subnets": [
                "subnet-0123456789abcdef0"
            ]
        },
        "Status": "Updating"
    }
}
```

Navigate to your Amazon VPC console. Select **Endpoints** from the left panel. There should be two VPC endpoints created in your account.

Removing a VPC configuration from your workforce

Update a VPC private workforce with an empty VPC configuration to remove VPC resources.

```
aws sagemaker update-workforce --workforce-name workforce-name\
--workforce-vpc-config "{}"
```

Describe the workforce and make sure the status is `Updating`.

```
aws sagemaker describe-workforce --workforce-name workforce-name
{
    "Workforce": {
        "WorkforceName": "workforce-name",
        "WorkforceArn": "arn:aws:sagemaker:us-west-2:xxxxxxxxx:workforce/workforce-
name",
        "LastUpdatedDate": 1622151252.451,
        "SourceIpConfig": {
            "Cidrs": []
        },
        "SubDomain": "subdomain.us-west-2.sagamaker.aws.com",
        "CognitoConfig": {
            "UserPool": "Pool_ID",
            "ClientId": "app-client-id"
        },
        "CreateDate": 1622151252.451,
        "Status": "Updating"
    }
}
```

Naviagate to your Amazon VPC console. Select **Endpoints** from the left panel. The two VPC endpoints should be deleted.

Restrict public access to the worker portal while maintaining access through a VPC

The workers in a VPC or non-VPC worker portal are be able to see the labeling job tasks assigned to them. The assignment comes from assigning workers in a work team through OIDC groups. It is the customer's responsibility to restrict the access to their public worker portal by setting the `sourceIpConfig` in their workforce.

> **Note**
>
> You can restrict access to the worker portal only through the SageMaker API. This cannot be done through the console.

Use the following command to restrict public access to the worker portal.

```
aws sagemaker update-workforce --region us-west-2 \
--workforce-name workforce-demo --source-ip-config '{"Cidrs":["10.0.0.0/16"]}'
```

After the `sourceIpConfig` is set on the workforce, the workers can access the worker portal in VPC but not through public internet.

> **Note**
>
> You can not set the `sourceIP` restriction for worker portal in VPC.

Output Data and Storage Volume Encryption

With Amazon SageMaker Ground Truth, you can label highly sensitive data, stay in control of your data, and employ security best practices. While your labeling job is running, Ground Truth encrypts data in transit and at rest. Additionally, you can use AWS Key Management Service (AWS KMS) with Ground Truth to do the following:

- Use a customer managed key to encrypt your output data.
- Use AWS KMS customer managed key with your automated data labeling job to encrypt the storage volume attached to the compute instance used for model training and inference.

Use the topics on this page to learn more about these Ground Truth security features.

Use Your KMS Key to Encrypt Output Data

Optionally, you can provide an AWS KMS customer managed key when you create a labeling job, which Ground Truth uses to encrypt your output data.

If you don't provide a customer managed key, Amazon SageMaker uses the default AWS managed key for Amazon S3 for your role's account to encrypt your output data.

If you provide a customer managed key, you must add the required permissions to the key described in Encrypt Output Data and Storage Volume with AWS KMS. When you use the API operation `CreateLabelingJob`, you can specify your customer managed key ID using the parameter `KmsKeyId`. See the following procedure to learn how to add a customer managed key when you create a labeling job using the console.

To add an AWS KMS key to encrypt output data (console):

1. Complete the first 7 steps in Create a Labeling Job (Console).
2. In step 8, select the arrow next to **Additional configuration** to expand this section.
3. For **Encryption key**, select the AWS KMS key that you want to use to encrypt output data.
4. Complete the rest of steps in Create a Labeling Job (Console) to create a labeling job.

Use Your KMS Key to Encrypt Automated Data Labeling Storage Volume (API Only)

When you create a labeling job with automated data labeling using the `CreateLabelingJob` API operation, you have the option to encrypt the storage volume attached to the ML compute instances that run the training and inference jobs. To add encryption to your storage volume, use the parameter `VolumeKmsKeyId` to input an AWS KMS customer managed key. For more information about this parameter, see `LabelingJobResourceConfig`.

If you specify a key ID or ARN for `VolumeKmsKeyId`, your SageMaker execution role must include permissions to call `kms:CreateGrant`. To learn how to add this permission to an execution role, see Create a SageMaker Execution Role for a Ground Truth Labeling Job.

> **Note**
>
> If you specify an AWS KMS customer managed key when you create a labeling job in the console, that key is *only* used to encrypt your output data. It is not used to encrypt the storage volume attached to the ML compute instances used for automated data labeling.

Workforce Authentication and Restrictions

Ground Truth enables you to use your own private workforce to work on labeling jobs. A *private workforce* is an abstract concept which refers to a set of people who work for you. Each labeling job is created using a work team, composed of workers in your workforce. Ground Truth supports private workforce creation using Amazon Cognito.

A Ground Truth workforce maps to a Amazon Cognito user pool. A Ground Truth work team maps to a Amazon Cognito user group. Amazon Cognito manages the worker authentication. Amazon Cognito supports Open ID connection (OIDC) and customers can set up Amazon Cognito federation with their own identity provider (IdP).

Ground Truth only allows one workforce per account per AWS Region. Each workforce has a dedicated Ground Truth work portal login URL.

You can also restrict workers to a Classless Inter-Domain Routing (CIDR) block/IP address range. This means annotators must be on a specific network to access the annotation site. You can add up to ten CIDR blocks for one workforce. To learn more, see Manage Private Workforce Using the Amazon SageMaker API.

To learn how you can create a private workforce, see Create a Private Workforce (Amazon Cognito).

Restrict Access to Workforce Types

Amazon SageMaker Ground Truth work teams fall into one of three workforce types: public (with Amazon Mechanical Turk), private, and vendor. To restrict user access to a specific work team using one of these types or the work team ARN, use the `sagemaker:WorkteamType` and/or the `sagemaker:WorkteamArn` condition keys. For the `sagemaker:WorkteamType` condition key, use string condition operators. For the `sagemaker:WorkteamArn` condition key, use Amazon Resource Name (ARN) condition operators. If the user attempts to create a labeling job with a restricted work team, SageMaker returns an access denied error.

The policies below demonstrate different ways to use the `sagemaker:WorkteamType` and `sagemaker:WorkteamArn` condition keys with appropriate condition operators and valid condition values.

The following example uses the `sagemaker:WorkteamType` condition key with the `StringEquals` condition operator to restrict access to a public work team. It accepts condition values in the following format: *`workforcetype`*`-crowd`, where *`workforcetype`* can equal `public`, `private`, or `vendor`.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "RestrictWorkteamType",
            "Effect": "Deny",
            "Action": "sagemaker:CreateLabelingJob",
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "sagemaker:WorkteamType": "public-crowd"
                }
            }
        }
    ]
}
```

The following policies show how to restrict access to a public work team using the `sagemaker:WorkteamArn` condition key. The first shows how to use it with a valid IAM regex-variant of the work team ARN and the `ArnLike` condition operator. The second shows how to use it with the `ArnEquals` condition operator and the work team ARN.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "RestrictWorkteamType",
            "Effect": "Deny",
            "Action": "sagemaker:CreateLabelingJob",
            "Resource": "*",
            "Condition": {
                "ArnLike": {
                    "sagemaker:WorkteamArn": "arn:aws:sagemaker:*:*:workteam/public-
crowd/*"
                }
            }
        }
    ]
}
```

```
{
    "Version": "2012-10-17",
```

```
    "Statement": [
        {
            "Sid": "RestrictWorkteamType",
            "Effect": "Deny",
            "Action": "sagemaker:CreateLabelingJob",
            "Resource": "*",
            "Condition": {
                "ArnEquals": {
                    "sagemaker:WorkteamArn": "arn:aws:sagemaker:us-
west-2:394669845002:workteam/public-crowd/default"
                }
            }
        }
    ]
}
```

Monitor Labeling Job Status

To monitor the status of your labeling jobs, you can set up an Amazon CloudWatch Events (CloudWatch Events) rule for Amazon SageMaker Ground Truth (Ground Truth) to send an event to CloudWatch Events when a labeling job status changes to `Completed`, `Failed`, or `Stopped` or when a worker accepts, declines, submits, or returns a task.

Once you create a rule, you can add a *target* to it. CloudWatch Events uses this target to invoke another AWS service to process the event. For example, you can create a target using a Amazon Simple Notification Service (Amazon SNS) topic to send a notification to your email when a labeling job status changes.

Prerequisites:

To create a CloudWatch Events rule, you will need an AWS Identity and Access Management (IAM) role with an events.amazonaws.com trust policy attached. The following is an example of an events.amazonaws.com trust policy.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "",
      "Effect": "Allow",
      "Principal": {
```

```
        "Service": [
          "events.amazonaws.com"
        ]
      },
      "Action": "sts:AssumeRole"
    }
  ]
}
```

Topics

- Send Events to CloudWatch Events
- Set Up a Target to Process Events
- Labeling Job Expiration
- Declining Tasks

Send Events to CloudWatch Events

To configure a CloudWatch Events rule to get status updates, or *events*, for your Ground Truth labeling jobs, use the AWS Command Line Interface (AWS CLI) `put-rule` command. You can filter events that are sent to your rule by status change. For example, you can create a rule that notifies you only if a labeling job status changes to `Completed`. When using the `put-rule` command, specify the following to receive labeling job statuses:

- `\"source\":[\"aws.sagemaker\"]`
- `\"detail-type\":[\"SageMaker Ground Truth Labeling Job State Change\"]`

To configure a CloudWatch Events rule to watch for all status changes, use the following command and replace the placeholder text. For example, replace *"GTLabelingJobStateChanges"* with a unique CloudWatch Events rule name and *"arn:aws:iam::111122223333:role/MyRoleForThisRule"* with the Amazon Resource Number (ARN) of an IAM role with an events.amazonaws.com trust policy attached.

```
aws events put-rule --name "GTLabelingJobStateChanges"
    --event-pattern "{\"source\":[\"aws.sagemaker\"],\"detail-type\":[\"SageMaker
 Ground Truth Labeling Job State Change\"]}"
    --role-arn "arn:aws:iam::111122223333:role/MyRoleForThisRule"
    --region "region"
```

To filter by job status, use the `\"detail\":{\"LabelingJobStatus\":[\"Status\"]}}"` syntax. Valid values for *`Status`* are `Completed`, `Failed`, and `Stopped`.

The following example creates a CloudWatch Events rule that notifies you when a labeling job in us-west-2 (Oregon) changes to `Completed`.

```
aws events put-rule --name "LabelingJobCompleted"
    --event-pattern "{\"source\":[\"aws.sagemaker\"],\"detail-type\":[\"SageMaker
 Ground Truth Labeling Job State Change\"], \"detail\":{\"LabelingJobStatus\":
[\"Completed\"]}}"
    --role-arn "arn:aws:iam::111122223333:role/MyRoleForThisRule"
    --region us-west-2
```

The following example creates a CloudWatch Events rule that notifies you when a labeling job in us-east-1 (Virginia) changes to `Completed` or `Failed`.

```
aws events put-rule --name "LabelingJobCompletedOrFailed"
    --event-pattern "{\"source\":[\"aws.sagemaker\"],\"detail-type\":[\"SageMaker
 Ground Truth Labeling Job State Change\"], \"detail\":{\"LabelingJobStatus\":
[\"Completed\", \"Failed\"]}}"
    --role-arn "arn:aws:iam::111122223333:role/MyRoleForThisRule"
    --region us-east-1
```

To learn more about the `put-rule` request, see Event Patterns in CloudWatch Events in the *Amazon CloudWatch Events User Guide*.

Set Up a Target to Process Events

After you have created a rule, events similar to the following are sent to CloudWatch Events. In this example, the labeling job `test-labeling-job`'s status changed to `Completed`.

```
{
    "version": "0",
    "id": "111e1111-11d1-111f-b111-1111b11dcb11",
    "detail-type": "SageMaker Ground Truth Labeling Job State Change",
    "source": "aws.sagemaker",
    "account": "111122223333",
    "time": "2018-10-06T12:26:13Z",
    "region": "us-east-1",
    "resources": [
        "arn:aws:sagemaker:us-east-1:111122223333:labeling-job/test-labeling-job"
```

```
    ],
    "detail": {
        "LabelingJobStatus": "Completed"
    }
}
```

To process events, you need to set up a target. For example, if you want to receive an email when your labeling job status changes, use a procedure in Setting Up Amazon SNS Notifications in the *Amazon CloudWatch User Guide* to set up an Amazon SNS topic and subscribe your email to it. Once you have create a topic, you can use it to create a target.

To add a target to your CloudWatch Events rule

1. Open the CloudWatch console: https://console.aws.amazon.com/cloudwatch/home
2. In the navigation pane, choose **Rules**.
3. Choose the rule that you want to add a target to.
4. Choose **Actions**, and then choose **Edit**.
5. Under **Targets**, choose **Add Target** and choose the AWS service you want to act when a labeling job status change event is detected.
6. Configure your target. For instructions, see the topic for configuring a target in the AWS documentation for that service.
7. Choose **Configure details**.
8. For **Name**, enter a name and, optionally, provide details about the purpose of the rule in **Description**.
9. Make sure that the check box next to **State** is selected so that your rule is listed as **Enabled**.
10. Choose **Update rule**.

Labeling Job Expiration

If your labeling job is not completed after 30 days, it will expire. If your labeling job expires, you can chain the job to create a new labeling job that will only send unlabeled data to workers. For more information, and to learn how to create a labeling job using chaining, see Chaining Labeling Jobs.

Declining Tasks

Workers are able to decline tasks.

Workers decline a task if the instructions are not clear, input data is not displaying correctly, or if they encounter some other issue with the task. If the number of workers per dataset object (`NumberOfHumanWorkersPerDataObject`) decline the task, the data object is marked as expired and will not be sent to additional workers.

Use Amazon SageMaker Ground Truth Plus to Label Data

Amazon SageMaker Ground Truth Plus is a turnkey data labeling service that uses an expert workforce to deliver high-quality annotations quickly and reduces costs by up to 40%. Using SageMaker Ground Truth Plus, data scientists and business managers, such as data operations managers and program managers, can create high-quality training datasets without having to build labeling applications and manage labeling workforces on their own. You can get started with Amazon SageMaker Ground Truth Plus by uploading data along with the labeling requirements in Amazon S3.

Why use SageMaker Ground Truth Plus?

To train a machine learning (ML) model, data scientists need large, high-quality, labeled datasets. As ML adoption grows, labeling needs increase. This forces data scientists to spend weeks on building data labeling workflows and managing a data labeling workforce. Unfortunately, this slows down innovation and increases cost. To ensure data scientists can spend their time building, training, and deploying ML models, data scientists typically task other in-house teams consisting of data operations managers and program managers to produce high-quality training datasets. However, these teams typically don't have access to skills required to deliver high-quality training datasets, which affects ML results. As a result, you look for a data labeling partner that can help them create high-quality training datasets at scale without consuming their in-house resources.

When you upload the data, SageMaker Ground Truth Plus sets up the data labeling workflows and operates them on your behalf. From there, an expert workforce trained on a varierty of machine learning (ML) tasks performs data labeling. SageMaker Ground Truth Plus currently offers two types of expert workforce: an Amazon employed workforce and a curated list of third-party vendors. SageMaker Ground Truth Plus provides you with the flexibility to choose the labeling workforce. AWS experts select the best labeling workforce based on your project requirements. For example, if you need people proficient in labeling audio files, specify that in the guidelines provided to SageMaker Ground Truth Plus, and the service automatically selects labelers with those skills.

> **Important**
>
> SageMaker Ground Truth Plus does not support PHI, PCI or FedRAMP certified data, and you should not provide this data to SageMaker Ground Truth Plus.

How does SageMaker Ground Truth Plus work?

There are five main components to a workflow.

- Requesting a project
- Creating a project team
- Accessing the project portal to monitor progress of training datasets and review labeled data
- Creating a batch
- Receiving the labeled data

How do I use SageMaker Ground Truth Plus?

If you are a first-time user of SageMaker Ground Truth Plus, use Getting Started with Amazon SageMaker Ground Truth Plus. get started. To access SageMaker Ground Truth Plus using the SageMaker console, you must be in US East (N. Virginia) (`us-east-1`).

Getting Started with Amazon SageMaker Ground Truth Plus.

The guide demonstrates how to complete the necessary steps to start an Amazon SageMaker Ground Truth Plus project, review labels, and satisfy SageMaker Ground Truth Plus prerequisites.

To get started using SageMaker Ground Truth Plus, review Set Up Amazon SageMaker Ground Truth Plus Prerequisites and Core Components of Amazon SageMaker Ground Truth Plus.

Set Up Amazon SageMaker Ground Truth Plus Prerequisites

Use the following information to sign up for an AWS account. If you already have an AWS account, skip this step.

Sign up for an AWS account

If you do not have an AWS account, complete the following steps to create one.

To sign up for an AWS account

1. Open https://portal.aws.amazon.com/billing/signup.
2. Follow the online instructions.

   Part of the sign-up procedure involves receiving a phone call and entering a verification code on the phone keypad.

   When you sign up for an AWS account, an *AWS account root user* is created. The root user has access to all AWS services and resources in the account. As a security best practice, assign administrative access to a user, and use only the root user to perform tasks that require root user access.

AWS sends you a confirmation email after the sign-up process is complete. At any time, you can view your current account activity and manage your account by going to https://aws.amazon.com/ and choosing **My Account**.

Create a user with administrative access

After you sign up for an AWS account, secure your AWS account root user, enable AWS IAM Identity Center, and create an administrative user so that you don't use the root user for everyday tasks.

Secure your AWS account root user

1. Sign in to the AWS Management Console as the account owner by choosing **Root user** and entering your AWS account email address. On the next page, enter your password.

   For help signing in by using root user, see Signing in as the root user in the *AWS Sign-In User Guide*.
2. Turn on multi-factor authentication (MFA) for your root user.

   For instructions, see Enable a virtual MFA device for your AWS account root user (console) in the *IAM User Guide*.

Create a user with administrative access

1. Enable IAM Identity Center.

For instructions, see Enabling AWS IAM Identity Center in the *AWS IAM Identity Center User Guide*.

2. In IAM Identity Center, grant administrative access to a user.

   For a tutorial about using the IAM Identity Center directory as your identity source, see Configure user access with the default IAM Identity Center directory in the *AWS IAM Identity Center User Guide*.

Sign in as the user with administrative access

- To sign in with your IAM Identity Center user, use the sign-in URL that was sent to your email address when you created the IAM Identity Center user.

  For help signing in using an IAM Identity Center user, see Signing in to the AWS access portal in the *AWS Sign-In User Guide*.

Assign access to additional users

1. In IAM Identity Center, create a permission set that follows the best practice of applying least-privilege permissions.

   For instructions, see Create a permission set in the *AWS IAM Identity Center User Guide*.

2. Assign users to a group, and then assign single sign-on access to the group.

   For instructions, see Add groups in the *AWS IAM Identity Center User Guide*.

Core Components of Amazon SageMaker Ground Truth Plus

The following terms are key to understanding the capabilities of SageMaker Ground Truth Plus:

- **Project**: Each qualified engagement with an AWS expert results in a SageMaker Ground Truth Plus project. A project can be in the pilot or production stage.
- **Batch**: A batch is a collection of similar recurring data objects such as images, video frames and text to be labeled. A project can have multiple batches.
- **Metrics**: Metrics are data about your SageMaker Ground Truth Plus project for a specific date or over a date range.

- **Task type**: SageMaker Ground Truth Plus supports five task types for data labeling. You can also have a custom task type. These include text, image, video, audio, and 3D point cloud.
- **Data objects**: Individual items that are to be labeled.

Request a Project

To use Amazon SageMaker Ground Truth Plus, get started by requesting a project.

1. Under the Ground Truth tab of Amazon SageMaker, choose **Plus**.
2. On the **SageMaker Ground Truth Plus** page, choose **Request project**.
3. A page titled **Request a project** opens. The page includes fields for **General information** and **Project overview**. Enter the following information

    a. Under **General information**, enter your **First name**, **Last name** and **Business email address**. An AWS expert uses this information for contacting you to discuss the project after you submit the request.

    b. Under **Project overview**, enter your **Project name** and **Project description**. Choose the **Task type** based on your data and use case. You can also indicate if your data contains personally identifiable information (PII).

    c. Create or select an IAM role that grants SageMaker Ground Truth Plus permissions to perform a labeling job by choosing one of the options below.

        i. You can **Create an IAM role** that provides access to any S3 bucket you specify.

        ii. You can **Enter a custom IAM role ARN**.

        iii. You can choose an existing role.

        iv. If you use an existing role or a custom IAM role ARN, make sure you have the following IAM role and trust policy.

        IAM role

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject",
```

```
                "s3:GetBucketLocation",
                "s3:ListBucket",
                "s3:PutObject"
            ],
            "Resource": [
                "arn:aws:s3:::your-bucket-name",
                "arn:aws:s3:::your-bucket-name/*"
                //Ex: "arn:aws:s3:::input-data-to-label/*"
            ]
        }
    ]
}
```

Trust policy

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "Service": "sagemaker-ground-truth-plus.amazonaws.com"
            },
            "Action": "sts:AssumeRole"
        }
    ]
}
```

4. Choose **Request a project**.

Once you create a project, you can find it on the **SageMaker Ground Truth Plus** page, under the Projects section. The project status should be **Review in-progress**

> **Note**
>
> You cannot have more than 5 projects with the **Review in progress** status.

Create a Project Team

A project team provides access to the members from your organization or team to track projects, view metrics, and review annotations. You can create a SageMaker Ground Truth Plus project team once you have shared your data in an Amazon S3 bucket.

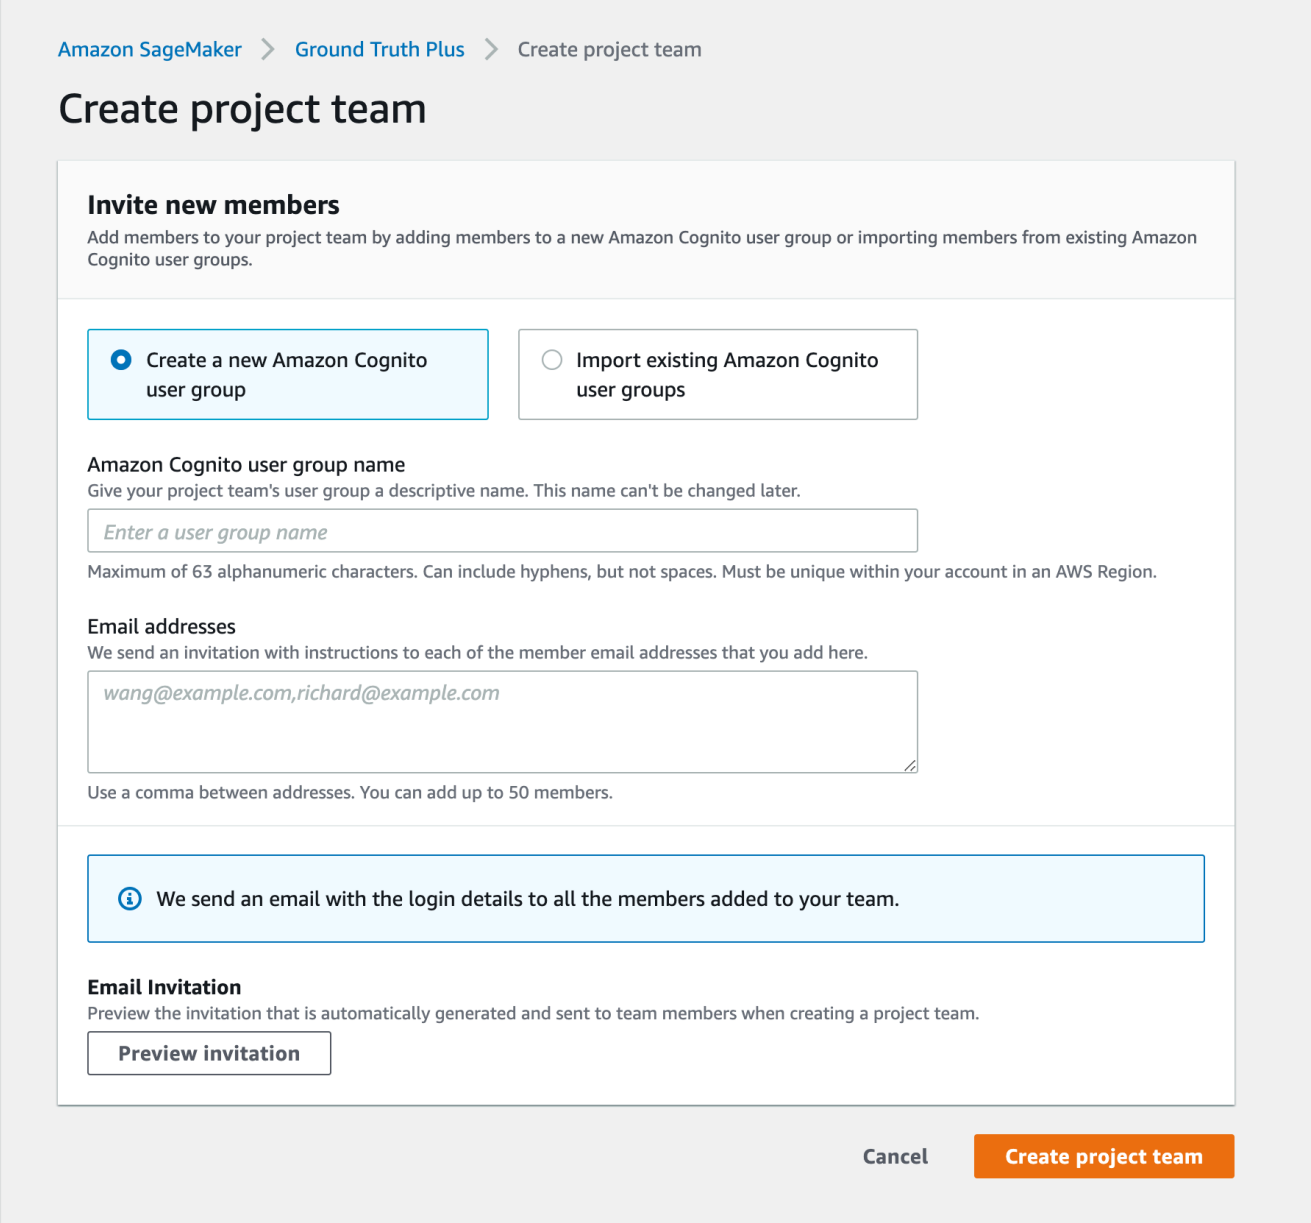
To add team members using Amazon Cognito, you have two options:

1. Create a new Amazon Cognito user group

    a. Enter an **Amazon Cognito user group name**. This name cannot be changed.

    b. Enter the email addresses of up to 50 team members in the **Email addresses** field. The addresses must be separated by a comma.

    c. Choose **Create project team**.



d. Your team members receive an email inviting them to join the SageMaker Ground Truth Plus project team as shown in the following image.

Preview invitation

Hi,

You are invited by {admin email} from {organization name} to join and review a Ground Truth Plus project.

Click on the link below to log into your Ground Truth Plus project.

https://####.labeling.us-east-1.sagemaker.aws

You will need the following username and temporary password provided below to login for the first time.

User name: **{username}**

Temporary password: **{####}**

Once you log in with your temporary password, you will be required to create a new password for your account.

After creating a new password, you can log into your project team to access your Ground Truth Plus project.

For more information, please refer to https://docs.aws.amazon.com/sagemaker/latest/dg/gtp.html.

If you have any questions, please contact us at {admin email}.

2. Import team members from existing Amazon Cognito user groups.

    a. Choose a user pool that you have created. User pools require a domain and an existing user group. If you get an error that the domain is missing, set it in the **Domain name** options on the **App integration** page of the Amazon Cognito console for your group.

    b. Choose an app client. We recommend using a client generated by Amazon SageMaker.

    c. Choose a user group from your pool to import its members.

    d. Choose **Create project team**.

You can view and manage the list of team members through the AWS console.

To add team members after creating the project team:

1. Choose **Invite new members** in the **Members** section.

2. Enter the email addresses of up to 50 team members in the **Email addresses** field. The addresses must be separated by a comma.
3. Choose **Invite new members**

To delete existing team members:

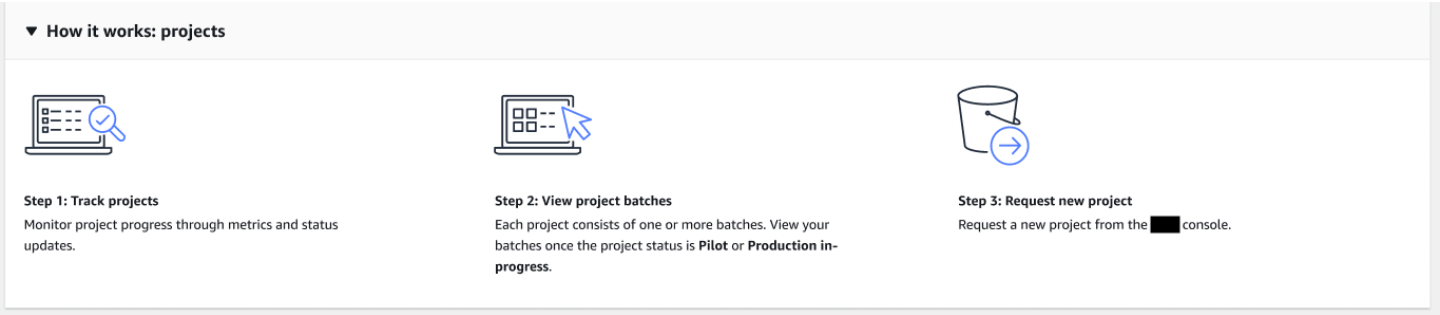
1. Choose the team member to be deleted in the **Members** section.
2. Choose **Delete**.

Once you have added members to your project team, you can open the project portal to access your projects.

Open the Project Portal

Once you have successfully submitted the intake form and created a project team, you can access the SageMaker Ground Truth Plus project by choosing the **Open project portal** on the AWS console.

Each project consists of one or more batches. A *batch* is a collection of recurring similar data objects (text, image, video frame, and point cloud) to be labeled. The project portal provides you with transparency into the data labeling process. You can stay updated about a project, create batches within a project, review the progress of the datasets across multiple projects, and analyze project metrics. The project portal also allows you to review a subset of the labeled data and provide feedback. You can configure the columns displayed in your project and batch table.



You can use the SageMaker Ground Truth Plus project portal to track the following details about your project.

Project name: Each project is identified using a unique name.

Status: A SageMaker Ground Truth Plus project has one of the following status types:

1. **Review in progress**: You have successfully submitted the project request form. An AWS expert is currently reviewing your request.
2. **Request approved**: Your project request is approved. You can now share your data by creating a new batch from the project portal.
3. **Workflow design and setup progress**: An AWS expert is setting up your project.
4. **Pilot in-progress**: Object labeling for the project in the pilot stage is currently in progress.
5. **Pilot complete**: Object labeling is complete and the labeled data is stored in your Amazon S3 bucket.
6. **Pricing complete**: An AWS expert shares the pricing for the production project with you.
7. **Contract executed**: The contract is complete.
8. **Production in-progress**: Labeling for the project in the production stage is in progress.
9. **Production complete**: Object labeling is complete and the labeled data is stored in your Amazon S3 bucket.
10. **Paused**: Project is currently paused at your request.

Task type: SageMaker Ground Truth Plus lets you label five types of tasks that include text, image, video, audio, and point cloud.

Batches: Total number of batches within a project.

Project creation date: Starting date of a project.

Total objects: Total number of objects to be labeled across all batches.

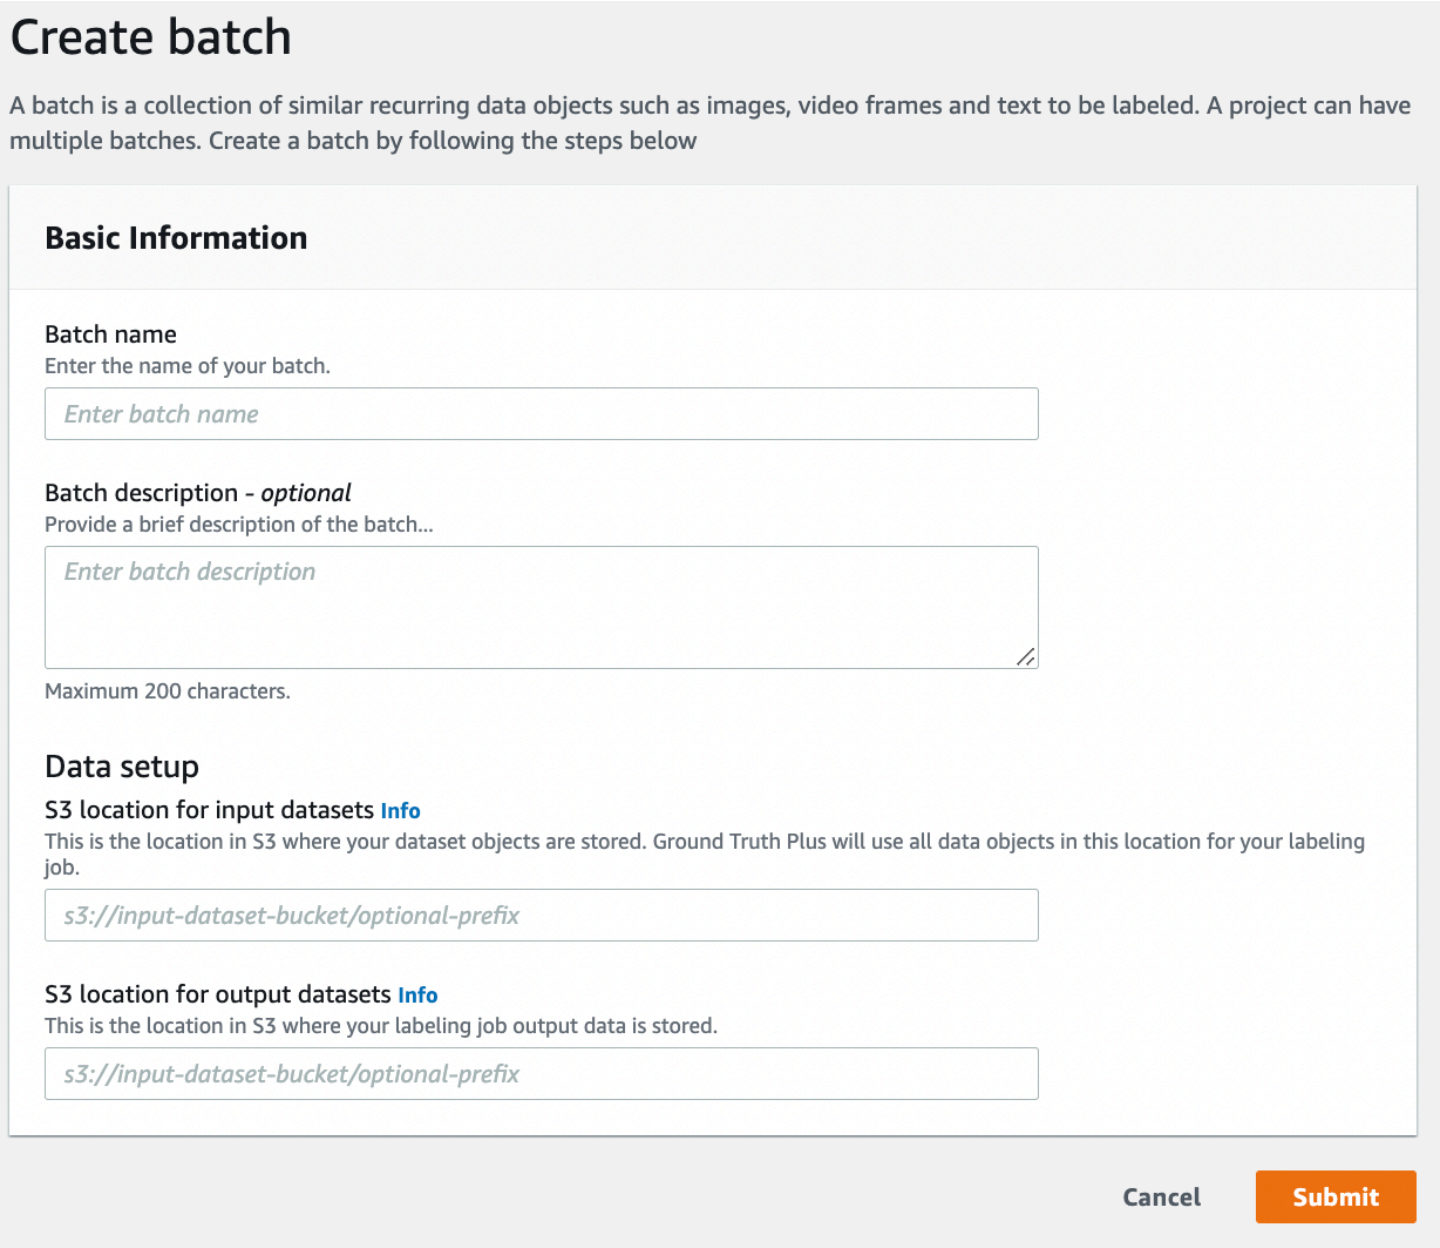
Objects completed: Number of labeled objects.

Remaining objects: Number of objects left to be labeled.

Failed objects: Number of objects that cannot be labeled due to an issue with the input data.

Create a Batch

You can use the project portal to create batches for a project after the project status is changed to **Request approved**.



To create a batch, do the following.

1. Select a project by choosing the project name.
2. A page titled with the project name opens. Under the **Batches** section, choose **Create batch**.
3. Enter the **Batch name**, **Batch description**, **S3 location for input datasets**, and **S3 location for output datasets**.
4. Choose **Submit**.

To create a batch successfully, make sure you meet the following criteria:

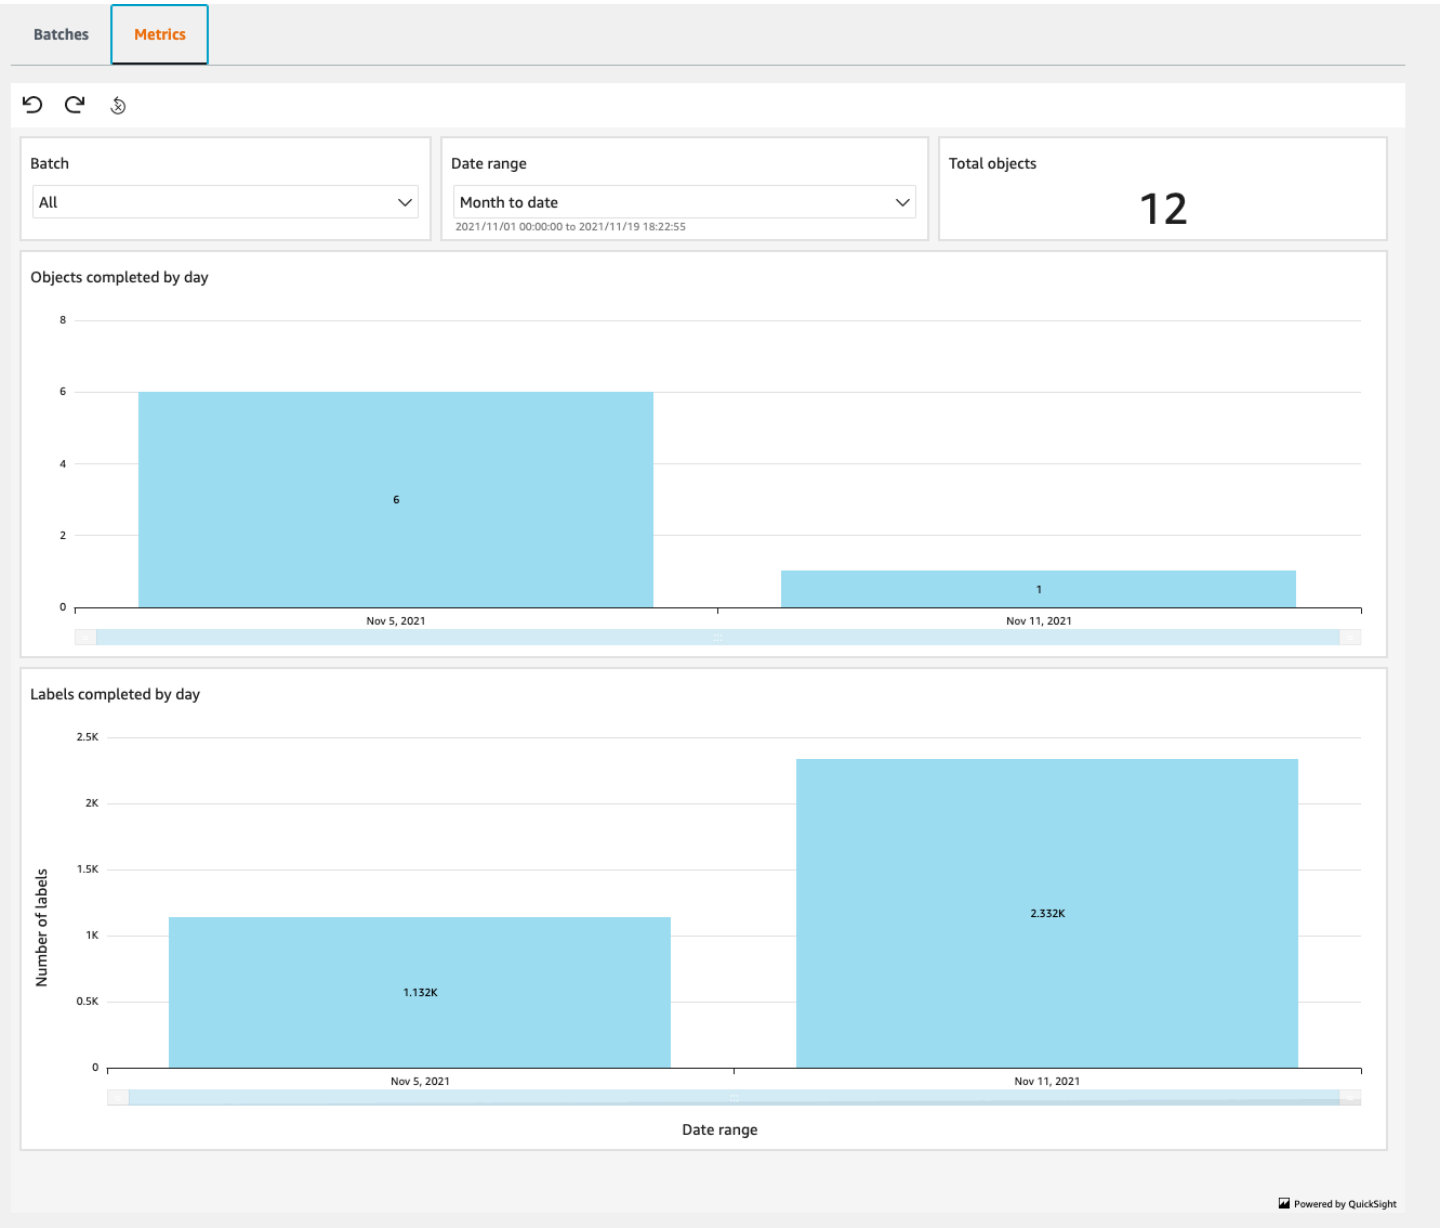
- Your data is in the US East (N. Virginia) Region.
- The maximum size for each file is no more than 2 gigabytes.
- The maximum number of files in a batch is 10,000.
- The total size of a batch is less than 100 gigabytes.
- You have no more than 5 batches with the **Data transfer in-progress** status.

> **Note**
>
> You cannot create a batch before the project status changes to **Request approved**.

Review Metrics

Metrics are data about your SageMaker Ground Truth Plus project for a specific date or over a date range.

You can review metrics for all batches or choose a batch of your choice as shown in the following image.



You can review the following metrics about the batch:

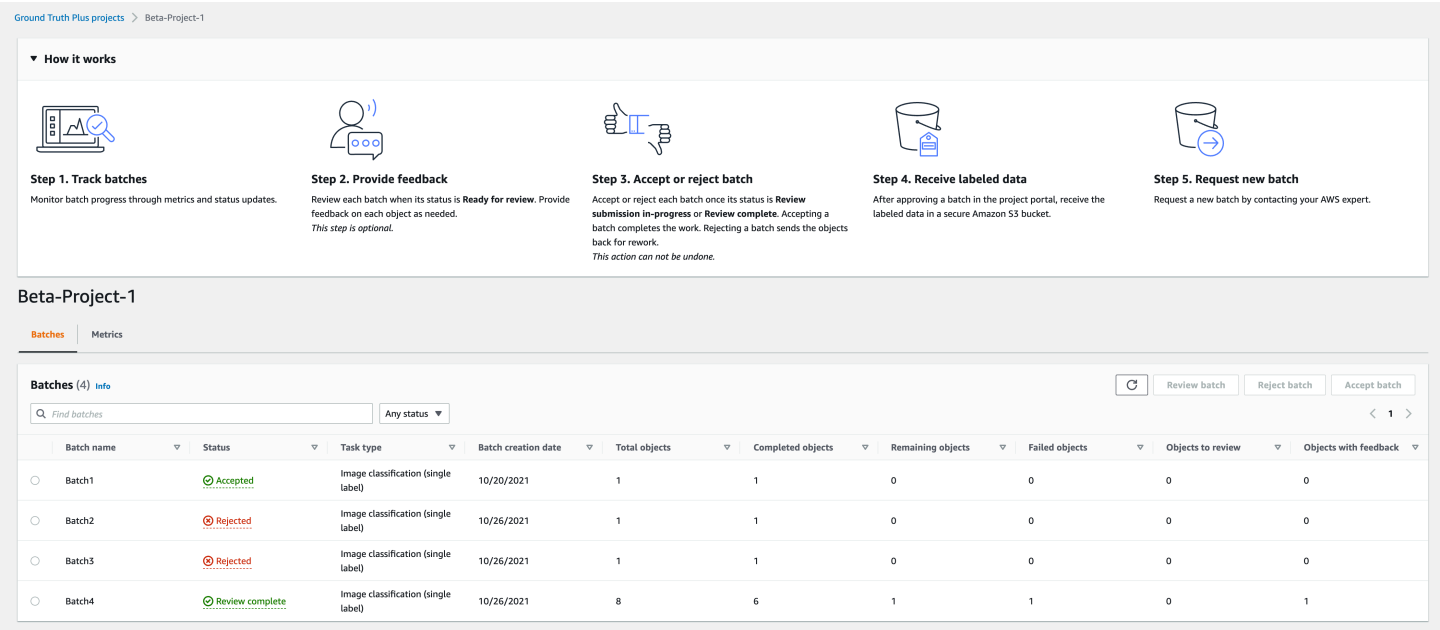
Total objects: Total number of objects in a batch or across all batches.

Objects completed by day: Total numbers of objects labeled on a specific date or over a date range.

Labels completed by day: Total numbers of labels completed on a specific date or over a date range. An object can have more than one label.

Review Batches

Every Amazon SageMaker Ground Truth Plus project consists of one or more batches. Each batch is made up of data objects to be labeled. You can view all the batches for your project using the project portal as shown in the following image.



You can use the SageMaker Ground Truth Plus project portal to track the following details about every batch:

Batch name: Each batch is identified with a unique batch name.

Status: A SageMaker Ground Truth Plus batch has one of the following status types:

1. **Request submitted**: You have successfully submitted a new batch.
2. **Data transfer failed**: Data transfer failed with errors. Check the error reason and create a new batch after fixing the error.
3. **Data received**: We have received your unlabeled input data.
4. **In-progress**: Data labeling is in progress.
5. **Ready for review**: Data labeling is completed. A subset of labeled objects from the batch are ready for you to review. This is an optional step.
6. **Review submission in-progress**: Review feedback is currently being processed.
7. **Review complete**: You have successfully reviewed the batch. Next, you have to accept or reject it. This action can not be undone.

8. **Accepted**: You have accepted the labeled data and will receive it in your Amazon S3 bucket shortly.
9. **Rejected**: Labeled data needs to be reworked.
10. **Sent for rework**: Labeled data is sent for rework. You can review the batch after its status changes to **Ready for review**.
11. **Ready for delivery**: Labeled data is ready to be transferred to your Amazon S3 bucket.
12. **Data delivered**: Object labeling is complete and the labeled data is stored in your Amazon S3 bucket.
13. **Paused**: Batch is paused at your request.

Task type: SageMaker Ground Truth Plus lets you label five types of tasks that include text, image, video, audio, and point cloud.

Batch creation date: Date when the batch was created.

Total objects: Total number of objects to be labeled across a batch.

Completed objects: Number of labeled objects.

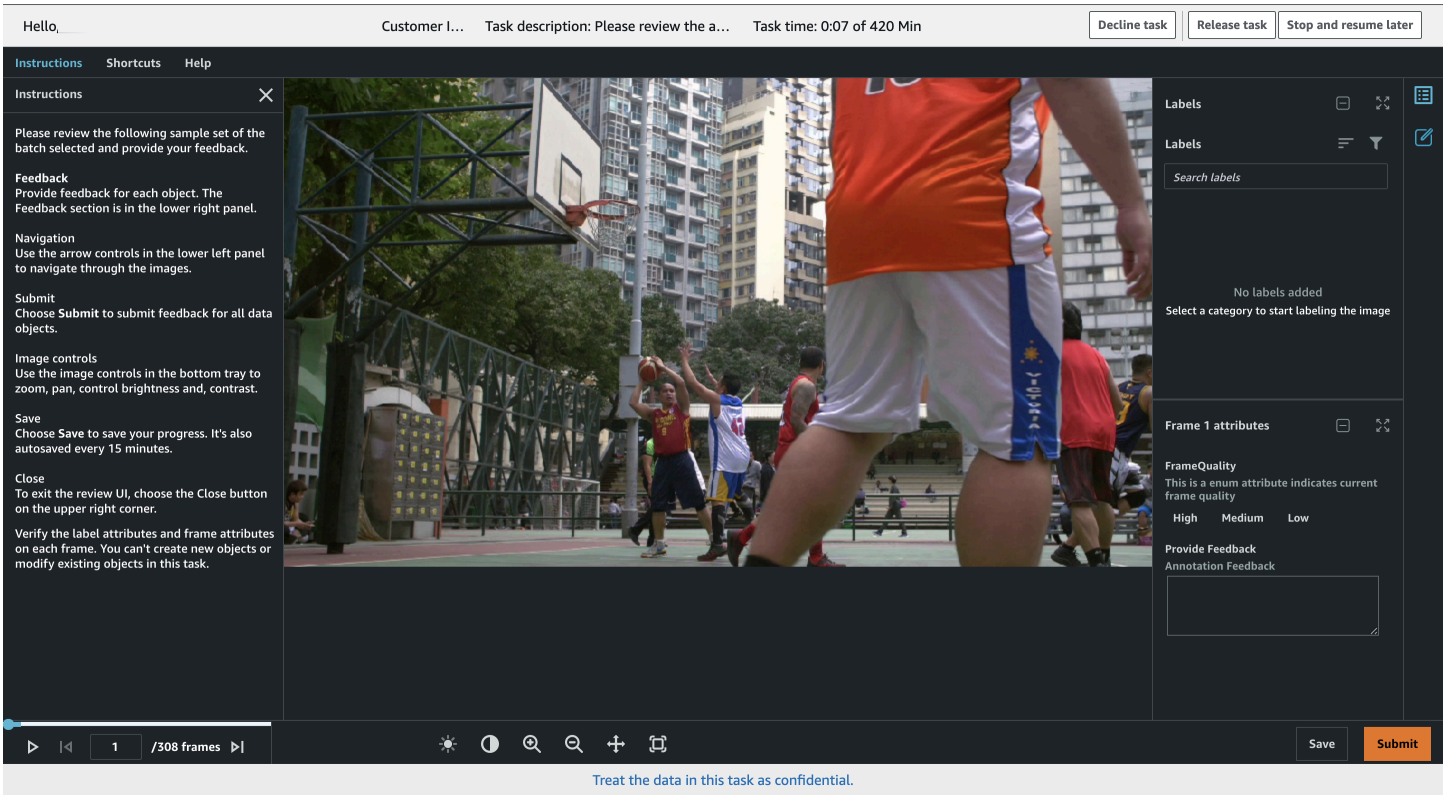
Remaining objects: Number of objects left to be labeled.

Failed objects: Number of objects that cannot be labeled due to an issue with the input data.

Objects to review: Number of objects that are ready for your review.

Objects with feedback: Number of objects that have gotten feedback from the team members.

SageMaker Ground Truth Plus lets you review a sample set of your labeled data (determined during the initial consultation call) through the review UI shown in the following image.



The portal allows your project team members and you to review a small sample set of the labeled objects for each batch. You can provide feedback for each labeled object within that subset through this UI. The review UI allows you to navigate across the subset of labeled objects and provide feedback for those labeled objects.

You can perform the following actions using the review UI.

- Use the arrow controls on the bottom left to navigate through the data objects.
- You can provide feedback for each object. The **Feedback section** is in the right panel. Choose **Submit** to submit feedback for all images.
- Use the image controls in the bottom tray to zoom, pan, and control contrast.
- If you plan on returning to finish up your review, choose **Stop and resume later** on the top right.
- Choose **Save** to save your progress. Your progress is also autosaved every 15 minutes.
- To exit the review UI, choose **Close** on the upper right corner of the review UI.
- You can verify the **Label attributes** and **Frame attributes** on each frame using the panel on the right. You cannot create new objects or modify existing objects in this task.

Accept or Reject Batches

After you have reviewed a batch, you must choose to accept or reject it.

If you accept a batch, the output from that labeling job is placed in the Amazon S3 bucket that you specify. Once the data is delivered to your S3 bucket, the status of your batch changes from **Accepted** to **Data delivered**.

If you reject a batch, you can provide feedback and explain your reasons for rejecting the batch.

SageMaker Ground Truth Plus allows you to provide feedback at the data object level as well as the batch level. You can provide feedback for data objects through the review UI. You can use the project portal to provide feedback for each batch. When you reject a batch, an AWS expert contacts you to determine the rework process and the next steps for the batch.

> **Note**
>
> Accepting or rejecting a batch is a one-time action and cannot be undone. It is necessary to either accept or reject every batch of the project.

Create and Manage Workforces

A *workforce* is the group of workers that you have selected to label your dataset. You can choose either the Amazon Mechanical Turk workforce, a vendor-managed workforce, or you can create your own private workforce to label or review your dataset. Whichever workforce type you choose, Amazon SageMaker takes care of sending tasks to workers.

When you use a private workforce, you also create *work teams*, a group of workers from your workforce that are assigned to specific *jobs*— Amazon SageMaker Ground Truth labeling jobs or Amazon Augmented AI human review tasks. You can have multiple work teams and can assign one or more work teams to each job.

You can use Amazon Cognito or your own private OpenID Connect (OIDC) Identity Provider (IdP) to manage your private workforce and work teams. For more information about the permissions required to manage your workforce this way, see Permissions Required to Use the Amazon SageMaker Ground Truth Console.

Topics

- Using the Amazon Mechanical Turk Workforce

- Managing Vendor Workforces
- Use a Private Workforce

Using the Amazon Mechanical Turk Workforce

The Amazon Mechanical Turk (Mechanical Turk) workforce provides the most workers for your Amazon SageMaker Ground Truth labeling job and Amazon Augmented AI human review task. The Amazon Mechanical Turk workforce is a world-wide resource. Workers are available 24 hours a day, 7 days a week. You typically get the fastest turnaround for your human review tasks and labeling jobs when you use the Amazon Mechanical Turk workforce.

Any Amazon Mechanical Turk workforce billing is handled as part of your Ground Truth or Amazon Augmented AI billing. You do not need to create a separate Mechanical Turk account to use the Amazon Mechanical Turk workforce.

> **Important**
>
> You should not share confidential information, personal information, or protected health information with this workforce. You should not use the Amazon Mechanical Turk workforce when you use Amazon A2I in conjunction with AWS HIPAA-eligible services, such as Amazon Textract and Amazon Rekognition, for workloads containing protected health information.

You can choose Mechanical Turk as your workforce when you create a Ground Truth labeling job or Amazon A2I human review workflow (flow definition). You can create a labeling job and a human review workflow using the SageMaker console and API.

When you use an API operation to create a labeling job or human review workflow, you use the following ARN for the Amazon Mechanical Turk workforce for your `WorkteamArn`. Replace *`region`* with the AWS Region you are using to create the labeling job or human loops. For example, if you create a labeling job in US West (Oregon), replace *`region`* with `us-west-2`.

- `arn:aws:sagemaker:`*`region`*`:394669845002:workteam/public-crowd/default`

Ground Truth and Amazon A2I *require* that your input data is free of personally identifiable information (PII) when you use Mechanical Turk. If you use the Mechanical Turk workforce and do

not specify that your input data is free of PII, your Ground Truth labeling jobs and Augmented AI tasks will fail. You specify that your input data is free of PII when you create a Ground Truth labeling job and when you create a Amazon A2I human loop using a built-in integration or the `StartHumanLoop` operation.

Use the following sections to learn how to use Mechanical Turk with these services.

Topics

- Use Mechanical Turk with Ground Truth
- Use Mechanical Turk with Amazon A2I
- When is Mechanical Turk Not Supported?

Use Mechanical Turk with Ground Truth

You can use Mechanical Turk with Ground Truth when you create a labeling job using the console, or the `CreateLabelingJob` operation.

When you create a labeling job, we recommend you adjust the number of workers that annotate each data object based on the complexity of the job and the quality that you need. Amazon SageMaker Ground Truth uses annotation consolidation to improve the quality of the labels. More workers can make a difference in the quality of the labels for more complex labeling jobs, but might not make a difference for simpler jobs. For more information, see Consolidate Annotations. Note that annotation consolidation is not supported for Amazon A2I human review workflows.

To use Mechanical Turk when you create a labeling job (console):

1. Use the following to create a labeling job using the Ground Truth area of the SageMaker console: Create a Labeling Job (Console).
2. When you are selecting **Worker types** in the **Workers** section, select **Amazon Mechanical Turk**.
3. Specify the total amount of time workers have to complete a task using **Task timeout**.
4. Specify the total amount of time a task remains available to workers in **Task expiration**. This is how long workers have to pick up a task before it fails.
5. Select the **Price per task** using the dropdown list. This is the amount of money a worker receives for completing a single task.
6. (Optional) If applicable, select **The dataset does not contain adult content**. SageMaker may restrict the Mechanical Turk workers that can view your task if it contains adult content.

7. You must read and confirm the following statement by selecting the check box to use the Mechanical Turk workforce. If your input data contains confidential information, personal information, or protected health information, you must select another workforce.

   You understand and agree that the Mechanical Turk workforce consists of independent contractors located worldwide and that you should not share confidential information, personal information, or protected health information with this workforce.

8. (Optional) Select the check box next to **Enable automated data labeling** if you want to enable automated data labeling. To learn more about this feature, see Automate Data Labeling.
9. You can specify the **Number of workers per dataset object** under **Additional configuration**. For example, if you enter 3 in this field, each data object will be labeled by 3 workers.

When you create your labeling job by selecting **Create**, your labeling tasks are sent to Mechanical Turk workers.

To use Mechanical Turk when you create a labeling job (API):

1. Use the following to create a labeling job using the `CreateLabelingJob` operation: Create a Labeling Job (API).
2. Use the following for the `WorkteamArn`. Replace *`region`* with the AWS Region you are using to create the labeling job.

   ```
   arn:aws:sagemaker:region:394669845002:workteam/public-crowd/default
   ```

3. Use `TaskTimeLimitInSeconds` to specify the total amount of time workers have to complete a task.
4. Use `TaskAvailabilityLifetimeInSeconds` to specify the total amount of time a task remains available to workers. This is how long workers have to pick up a task before it fails.
5. Use `NumberOfHumanWorkersPerDataObject` to specify the number of workers per dataset object.
6. Use `PublicWorkforceTaskPrice` to set the price per task. This is the amount of money a worker receives for completing a single task.
7. Use `DataAttributes` to specify that your input data is free of confidential information, personal information, or protected health information.

   Ground Truth *requires* that your input data is free of personally identifiable information (PII) if you use the Mechanical Turk workforce. If you use Mechanical Turk and do not specify that

your input data is free of PII using the `FreeOfPersonallyIdentifiableInformation` flag, your labeling job will fail.

Use the `FreeOfAdultContent` flag to declare that your input data is free of adult content. SageMaker may restrict the Mechanical Turk workers that can view your task if it contains adult content.

You can see examples of how to use this API in the following notebooks, found on GitHub: Ground Truth Jupyter Notebook Examples. You can access these notebooks under the SageMaker Example Notebooks in a notebook instance.

Use Mechanical Turk with Amazon A2I

You can specify that you want to use Mechanical Turk with Amazon A2I when you create a human review workflow, also referred to as a *flow definition*, in the console, or with the `CreateFlowDefinition` API operation. When you use this human review workflow to configure human loops, you must specify that your input data is free of PII.

To use Mechanical Turk when you create a human review workflow (console):

1. Use the following to create a human review workflow in the Augmented AI section of the SageMaker console: Create a Human Review Workflow (Console).
2. When you are selecting **Worker types** in the **Workers** section, select **Amazon Mechanical Turk**.
3. Select the **Price per task** using the dropdown list. This is the amount of money a worker receives for completing a single task.
4. (Optional) You can specify the **Number of workers per dataset object** under **Additional configuration**. For example, if you enter 3 in this field, each data object will be labeled by 3 workers.
5. (Optional) Specify the total amount of time workers have to complete a task using **Task timeout**.
6. (Optional) Specify the total amount of time a task remains available to workers in **Task expiration**. This is how long workers have to pick up a task before it fails.
7. Once you have created your human review workflow, you can use it to configure a human loop by providing its Amazon Resource Name (ARN) in the parameter `FlowDefinitionArn`. You configure a human loop using one of the API operations of a built-in task type, or the Amazon A2I runtime API operation, `StartHumanLoop`. To learn more, see Create and Start a Human Loop.

When you configure your human loop, you must specify that your input data is free of personally identifiable information (PII) using the `FreeOfPersonallyIdentifiableInformation` content classifier in `DataAttributes`. If you use Mechanical Turk and do not specify that your input data is free of PII, your human review tasks will fail.

Use the `FreeOfAdultContent` flag to declare that your input data is free of adult content. SageMaker may restrict the Mechanical Turk workers that can view your task if it contains adult content.

To use Mechanical Turk when you create a human review workflow (API):

1. Use the following to create a human review workflow using the `CreateFlowDefinition` operation: Create a Human Review Workflow (API).
2. Use the following for the `WorkteamArn`. Replace *`region`* with the AWS Region you are using to create the labeling job.

   `arn:aws:sagemaker:`*`region`*`:394669845002:workteam/public-crowd/default`
3. Use `TaskTimeLimitInSeconds` to specify the total amount of time workers have to complete a task.
4. Use `TaskAvailabilityLifetimeInSeconds` to specify the total amount of time a task remains available to workers. This is how long workers have to pick up a task before it fails.
5. Use `TaskCount` to specify the number of workers per dataset object. For example, if you specify 3 for this parameter, each data object will be labeled by 3 workers.
6. Use `PublicWorkforceTaskPrice` to set the price per task. This is the amount of money a worker receives for completing a single task.
7. Once you have created your human review workflow, you can use it to configure a human loop by providing its Amazon Resource Name (ARN) in the parameter `FlowDefinitionArn`. You configure a human loop using one of the API operations of a built-in task type, or the Amazon A2I runtime API operation, `StartHumanLoop`. To learn more, see Create and Start a Human Loop.

   When you configure your human loop, you must specify that your input data is free of personally identifiable information (PII) using the `FreeOfPersonallyIdentifiableInformation` content classifier in `DataAttributes`.

If you use Mechanical Turk and do not specify that your input data is free of PII, your human review tasks will fail.

Use the `FreeOfAdultContent` flag to declare that your input data is free of adult content. SageMaker may restrict the Mechanical Turk workers that can view your task if it contains adult content.

You can see examples of how to use this API in the following notebooks, found on GitHub: Amazon A2I Jupyter Notebook Examples.

When is Mechanical Turk Not Supported?

This workforce is not supported under the following scenarios. In each scenario, you must use a private or vendor workforce.

- This workforce is not supported for Ground Truth video frame labeling jobs and 3D point cloud labeling jobs.
- You cannot use this workforce if your input data contains personally identifiable information (PII).
- Mechanical Turk is not available in some of the AWS special regions. If applicable, refer to the documentation for your special region for more information.

Managing Vendor Workforces

You can use a vendor-managed workforce to label your data using Amazon SageMaker Ground Truth (Ground Truth) and Amazon Augmented AI (Amazon A2I). Vendors have extensive experience in providing data labeling services for the purpose of machine learning. Vendor workforces for these two services must be created and managed seperately through the Amazon SageMaker console.

Vendors make their services available via the AWS Marketplace. You can find details of the vendor's services on their detail page, such as the number of workers and the hours that they work. You can use these details to make estimates of how much the labeling job will cost and the amount of time that you can expect the job to take. Once you have chosen a vendor you subscribe to their services using the AWS Marketplace.

A subscription is an agreement between you and the vendor. The agreement spells out the details of the agreement, such as price, schedule, or refund policy. You work directly with the vendor if there are any issues with your labeling job.

You can subscribe to any number of vendors to meet your data annotation needs. When you create a labeling job or human review worklow you can specify that the job be routed to a specific vendor.

> **Important**
>
> Before you send sensitive data to a vendor, check the vendor's security and compliance practices on their detail page and review the end user license agreement (EULA) that is part of your subscription agreement. You are responsible for ensuring that the vendor meets your compliance requirements for personal or confidential information. Do not share protected health information with this workforce.

You must use the console to subscribe to a vendor workforce. Once you have a subscription, you can use the `ListSubscribedWorkteams` operation to list your subscribed vendors.

To subscribe to a vendor workforce

1. Open the SageMaker console at https://console.aws.amazon.com/sagemaker/.
2. Choose the appropriate page in the SageMaker console.
   - For Ground Truth labeling jobs, choose **Labeling workforces**, choose **Vendor**, and then choose **Find data labeling services**.
   - For Amazon A2I human review workflows, choose **Human review workforces**, choose **Vendor**, and then choose **Find human review services**.
3. The console opens the AWS Marketplace with:
   - data labeling services category selected for Ground Truth
   - human review services category selected for Amazon A2I

   Here you see a list of the vendor services available for this service.
4. Choose a vendor. The AWS Marketplace shows detailed information about the data labeling or human review service. Use this information to determine if the vendor meets your requirements for your task.

5. If the vendor meets your requirements, choose **Continue to subscribe**.
6. Review the details of the subscription. If you agree to the terms, choose **Subscribe** to complete your subscription to the service.

Use a Private Workforce

A **private workforce** is a group of workers that *you* choose. These can be employees of your company or a group of subject matter experts from your industry. For example, if the task is to label medical images, you could create a private workforce of people knowledgeable about the images in question.

Each AWS account has access to a single private workforce per region, and the owner has the ability to create multiple **private work teams** within that workforce. A single private work team is used to complete a labeling job or human review task, or a *job*. You can assign each work team to a separate job or use a single team for multiple jobs. A single worker can be in more than one work team.

Your private workforce can either be created and managed using Amazon Cognito or your own private OpenID Connect (OIDC) Identity Provider (IdP).

If you are a new user of Amazon SageMaker Ground Truth or Amazon Augmented AI and do not require your workers to be managed with your own IdP, it is recommended that you use Amazon Cognito to create and manage your private workforce.

After you create a workforce, in addition to creating and managing work teams, you can do the following:

- Track worker performance
- Create and manage Amazon SNS topics to notify workers when labeling tasks are available
- Manage Private Workforce Access to Tasks Using IP Addresses

> **Note**
>
> Your private workforce is shared between Ground Truth and Amazon A2I. To create and manage private work teams used by Augmented AI, use the Ground Truth section of the SageMaker console.

Topics

Create and Manage Amazon Cognito Workforce

Create and manage your private workforce using Amazon Cognito when you want to create your workforce using the Amazon SageMaker console or you don't want the overhead of managing worker credentials and authentication. When you create a private workforce with Amazon Cognito, it provides authentication, authorization, and user management for your private workers.

Topics

Create a Private Workforce (Amazon Cognito)

When you use Amazon Cognito, you can create a private workforce in one of the following ways:

- Create a new workforce while you are creating your labeling job. To learn how, see Create an Amazon Cognito Workforce When Creating a Labeling Job.
- Create a new workforce before you create your labeling job. To learn how, see Create an Amazon Cognito Workforce Using the Labeling Workforces Page.
- Import an existing workforce after creating a user pool in the Amazon Cognito console. To learn how, see Create a Private Workforce (Amazon Cognito Console).

Once you create a private workforce, that workforce and all work teams and workers associated with it are available to use for all Ground Truth labeling job tasks and Amazon Augmented AI human review workflows tasks.

If you are new to Amazon SageMaker and want to test Ground Truth or Amazon A2I, we suggest that you create a private work team consisting of people from your organization using the console.

Use this work team when creating labeling or human review workflows (flow definitions) to test your worker UI and job workflow.

Topics

Create a Private Workforce (Amazon SageMaker Console)

You can create a private workforce in the Amazon SageMaker console in one of two ways:

- When creating a labeling job in the **Labeling jobs** page of the Amazon SageMaker Ground Truth section.
- Using the **Labeling workforces** page of the Amazon SageMaker Ground Truth section. If you are creating a private workforce for an Amazon A2I human review workflow, use this method.

Both of these methods also create a default work team containing all of the members of the workforce. This private workforce is available to use for both Ground Truth and Amazon Augmented AI jobs.

When you create a private workforce using the console, SageMaker uses Amazon Cognito as an identity provider for your workforce. If you want to use your own OpenID Connect (OIDC) Identity Provider (IdP) to create and manage your private workforce, you must create a workforce using the SageMaker API operation `CreateWorkforce`. To learn more, see Create a Private Workforce (OIDC IdP).

Create an Amazon Cognito Workforce When Creating a Labeling Job

If you haven't created a private workforce when you create your labeling job and you choose to use private workers, you are prompted to create a work team. This will create a private workforce using Amazon Cognito.

To create a workforce while creating a labeling job (console)

1. Open the SageMaker console at https://console.aws.amazon.com/sagemaker/.
2. In the navigation pane, choose **Labeling jobs** and fill in all required fields. For instructions on how to start a labeling job, see Getting started. Choose **Next**.
3. Choose **Private** for the workforce type.

4. In the **Workers** section, enter:

    a. The **Team name**.

    b. Email addresses for up to 100 workforce members. Email addresses are case sensitive. Your workers must log in using the same case used when the address was initially entered. You can add additional workforce members after the job has been created.

    c. The name of your organization. SageMaker uses this to customize the email sent to the workers.

    d. A contact email address for workers to report issues related to the task.

When you create the labeling job, an email is sent to each worker inviting them to join the workforce. After creating the workforce, you can add, delete, and disable workers using the SageMaker console or the Amazon Cognito console.

Create an Amazon Cognito Workforce Using the Labeling Workforces Page

To create and manage your private workforce using Amazon Cognito, you can use the **Labeling workforces** page. When following the instructions below, you have the option to create a private workforce by entering worker emails importing a pre-existing workforce from an Amazon Cognito user pool. To import a workforce, see Create a Private Workforce (Amazon Cognito Console).

To create a private workforce using worker emails

1. Open the Amazon SageMaker console at https://console.aws.amazon.com/sagemaker/.
2. In the navigation pane, choose **Labeling workforces**.
3. Choose **Private**, then choose **Create private team**.
4. Choose **Invite new workers by email**.
5. Paste or type a list of up to 50 email addresses, separated by commas, into the email addresses box.
6. Enter an organization name and contact email.
7. Optionally, choose an SNS topic to which to subscribe the team so workers are notified by email when new Ground Truth labeling jobs become available. Amazon SNS notifications are supported by Ground Truth and are not supported by Augmented AI. If you subscribe workers to receive SNS notifications, they only receive notifications about Ground Truth labeling jobs. They do not receive notifications about Augmented AI tasks.
8. Click the **Create private team** button.

After you import your private workforce, refresh the page. On the **Private workforce summary** page, you can see information about the Amazon Cognito user pool for your workforce, a list of work teams for your workforce, and a list of all of the members of your private workforce.

> **Note**
>
> If you delete all of your private work teams, you have to repeat this process to use a private workforce in that region.

Create a Private Workforce (Amazon Cognito Console)

Amazon Cognito is used to define and manage your private workforce and your work teams. It is a service that you can use to create identities for your workers and authenticate these identities with identity providers. A private workforce corresponds to a single **Amazon Cognito user pool**. Private work teams correspond to **Amazon Cognito user groups** within that user pool.

Example identity providers supported by Amazon Cognito:

- Social sign-in providers such as Facebook and Google
- OpenID Connect (OIDC) providers
- Security Assertion Markup Language (SAML) providers such as Active Directory
- The Amazon Cognito built-in identity provider

For more information, see What Is Amazon Cognito?.

To create a private workforce using Amazon Cognito, you must have an existing Amazon Cognito user pool containing at least one user group. See Tutorial: Creating a User Pool to learn how to create a user pool. See Adding Groups to a User Pool to learn how to add a user group to a pool.

Once your user pool has been created, follow the steps below to create a private workforce by importing that user pool into Amazon SageMaker.

To create a private workforce by importing a Amazon Cognito user pool

1. Open the SageMaker console at https://console.aws.amazon.com/sagemaker/.
2. In the navigation pane, choose **Labeling workforces**.
3. Choose **Private**.

4. Choose **Create private team**. This creates a private workforce and a work team.
5. Choose **Import workers from existing Amazon Cognito user groups**.
6. Choose a user pool that you have created. User pools require a domain and an existing user group. If you get an error that the domain is missing, set it in the **Domain name** options on the **App integration** page of the Amazon Cognito console for your group.
7. Choose an app client. We recommend using a client generated by SageMaker.
8. Choose a user group from your pool to import its members.
9. Optionally choose an Amazon Simple Notification Service (Amazon SNS) topic to which to subscribe the team so that workers are notified by email when new labeling jobs become available. Amazon SNS notifications are supported by Ground Truth and are not supported by Augmented AI. If you subscribe workers to receive SNS notifications, they only receive notifications about Ground Truth labeling jobs. They do not receive notifications about Augmented AI tasks.
10. Choose **Create private team**.

> **Important**
>
> After you create a workforce using an Amazon Cognito user pool, it should not be deleted without first deleting all work teams associated with that pool in the SageMaker console.

After you import your private workforce, refresh the page to see the **Private workforce summary** page. On this page, you can see information about the Amazon Cognito user pool for your workforce, a list of work teams for your workforce, and a list of all of the members of your private workforce. This workforce is now available to use in both Amazon Augmented AI and Amazon SageMaker Ground Truth for human review tasks and data labeling jobs respectively.

Manage a Private Workforce (Amazon Cognito)

After you have created a private workforce using Amazon Cognito, you can create and manage work teams using the Amazon SageMaker console and API operations.

You can do the following using either the SageMaker console or Amazon Cognito console.

- Add and delete work teams.
- Add workers to your workforce and one or more work teams.

- Disable or remove workers from your workforce and one or more workteams. If you add workers to a workforce using the Amazon Cognito console, you must use the same console to remove the worker from the workforce.

You can restrict access to tasks to workers at specific IP addresses using the SageMaker API. For more information, see Manage Private Workforce Using the Amazon SageMaker API.

Topics

- Manage a Workforce (Amazon SageMaker Console)
- Manage a Private Workforce (Amazon Cognito Console)

Manage a Workforce (Amazon SageMaker Console)

You can use the Amazon SageMaker console to create and manage the work teams and individual workers that make up a private workforce.

Use a work team to assign members of your private workforce to a labeling or human review *job*. When you create your workforce using the SageMaker console, there is a work team called **Everyone-in-private-workforce** that enables you to assign your entire workforce to a job. Because an imported Amazon Cognito user pool may contain members that you don't want to include in your work teams, a similar work team is not created for Amazon Cognito user pools.

You have two choices to create a new work team:

- You can create a work team in the SageMaker console and add members from your workforce to the team.
- You can create a user group by using the Amazon Cognito console and then create a work team by importing the user group. You can import more than one user group into each work team. You manage the members of the work team by updating the user group in the Amazon Cognito console. See Manage a Private Workforce (Amazon Cognito Console) for more information.

Create a Work Team Using the SageMaker Console

You can create a new Amazon Cognito user group or import an existing user group using the SageMaker console, on the **Labeling workforces** page. For more information on creating a user group in the Amazon Cognito console, see Manage a Private Workforce (Amazon Cognito Console).

To create a work team using the SageMaker console

1. Open the SageMaker console at https://console.aws.amazon.com/sagemaker/.
2. Choose **Labeling workforces** from the left menu.
3. Under **Private**, choose **Create private team**.
4. Under **Team details**, enter a **Team name**. The name must be unique in your account in an AWS Region.
5. Under **Add workers**, choose a method to add workers to the team using a user group.
   - If you chose **Create a team by adding workers to a new Amazon Cognito user group**, select the workers to add to the team.
   - If you chose **Create a team by importing existing Amazon Cognito user groups**, choose the user groups that are part of the new team.
6. If you select an **SNS topic**, all workers added to the team are subscribed to the Amazon SNS topic and notified when new work items are available to the team. Select from a list of your existing Ground Truth related Amazon SNS topics or select **Create new topic** to open a topic-creation dialog.

   Amazon SNS notifications are supported by Ground Truth and are not supported by Augmented AI. If you subscribe workers to receive SNS notifications, they only receive notifications about Ground Truth labeling jobs. They do not receive notifications about Augmented AI tasks.

Workers in a workteam subscribed to a topic receive notifications when a new Ground Truth labeling job for that team becomes available and when one is about to expire.

Read Create and manage Amazon SNS topics for your work teams for more information about using Amazon SNS topic.

Subscriptions

After you have created a work team, you can see more information about the team and change or set the Amazon SNS topic to which its members are subscribed by visiting the Amazon Cognito console. If you added any team members before you subscribed the team to a topic, you need to manually subscribe those members to that topic. Read Create and manage Amazon SNS topics for your work teams for more information on creating and managing the Amazon SNS topic.

Add or Remove Workers

A *work team* is a group of workers within your workforce to whom you can assign jobs. A worker can be added to more than one work team. Once a worker has been added to a work team, that worker can be disabled or removed.

Add Workers to the Workforce

Adding a worker to the workforce enables you to add that worker to any work team within that work force.

To add workers using the private workforce summary page

1. Open the Amazon SageMaker console at https://console.aws.amazon.com/sagemaker/.
2. Choose **Labeling workforces** to navigate to your private workforce summary page.
3. Choose **Private**.
4. Choose **Invite new workers**.
5. Paste or type a list of email addresses, separated by commas, into the email addresses box. You can have up to 50 email addresses in this list.

Add a Worker to a Work Team

A worker must be added to the workforce before being added to a work team. To add a worker to a work team, first navigate to the **Private workforce summary** page using the steps above.

To add a worker to a work team from the private workforce summary page

1. In the **Private teams** section, choose the team to which you want to add the workers.
2. Choose the **Workers** tab.
3. Choose **Add workers to team** and choose the boxes next to the workers that you want to add.
4. Click **Add workers to team**.

Disable and Remove a Worker from the Workforce

Disabling a worker stops the worker from receiving a job. This action does not remove the worker from the workforce, or from any work team with which the worker is associated. To disable or remove a worker from a work team, first navigate to the private workforce summary page using the steps above.

To deactivate a worker using the private workforce summary page

1. In the **Workers** section, choose the worker that you would like to disable.
2. Choose **Disable**.

If desired, you can subsequently **Enable** a worker after they have been disabled.

You can remove workers from your private workforce directly in the SageMaker console if that worker was added in this console. If you added the worker (user) in the Amazon Cognito console, see Manage a Private Workforce (Amazon Cognito Console) to learn how to remove the worker in the Amazon Cognito console.

To remove a worker using the private workforce summary page

1. In the **Workers** section, choose the worker that you would like to delete.
2. If the worker has not been disabled, choose **Disable**.
3. Select the worker and choose **Delete**.

Manage a Private Workforce (Amazon Cognito Console)

A private workforce corresponds to a single **Amazon Cognito user pool**. Private work teams correspond to **Amazon Cognito user groups** within that user pool. Workers correspond to **Amazon Cognito users** within those groups.

After your workforce has been created, you can add work teams and individual workers through the Amazon Cognito console. You can also delete workers from your private workforce or remove them from individual teams in the Amazon Cognito console.

> **Important**
>
> You can't delete work teams from the Amazon Cognito console. Deleting a Amazon Cognito user group that is associated with an Amazon SageMaker work team will result in an error. To remove work teams, use the SageMaker console.

Create Work Teams (Amazon Cognito Console)

You can create a new work team to complete a job by adding a Amazon Cognito user group to the user pool associated with your private workforce. To add a Amazon Cognito user group to an existing worker pool, see Adding groups to a User Pool.

To create a work team using an existing Amazon Cognito user group

1. Open the SageMaker console at https://console.aws.amazon.com/sagemaker/.
2. In the navigation pane, choose **Workforces**.
3. For **Private teams**, choose **Create private team**.
4. Under **Team details**, give the team a name. The name must be unique in your account in an AWS Region.
5. For **Add workers,** choose **Import existing Amazon Cognito user groups**, and choose one or more user groups that are part of the new team.
6. If you choose an **SNS topic**, all workers added to the team are subscribed to the Amazon Simple Notification Service (Amazon SNS) topic and notified when new work items are available to the team. Choose from a list of your existing SNS topics related to SageMaker Ground Truth or Amazon Augmented AI or choose **Create new topic** to create one.

> **Note**
>
> Amazon SNS notifications are supported by Ground Truth and are not supported by Augmented AI. If you subscribe workers to receive SNS notifications, they only receive notifications about Ground Truth labeling jobs. They do not receive notifications about Augmented AI tasks.

Subscriptions

After you have created a work team, you can see more information about the team and change or set the SNS topic to which its members are subscribed using the Amazon Cognito console. If you added any team members before you subscribed the team to a topic, you need to manually subscribe those members to that topic. For more information, see Create and manage Amazon SNS topics for your work teams.

Add and Remove Workers (Amazon Cognito Console)

When using the Amazon Cognito console to add workers to a work team, you must add a user to the user pool associated with the workforce before adding that user to a user group. Users can be added to a user pool in various ways. For more information, see Signing Up and Confirming User Accounts.

Add a Worker to a Work Team

After a user has been added to a pool, the user can be associated with user groups inside of that pool. After a user has been added to a user group, that user becomes a worker on any work team created using that user group.

To add a user to a user group

1. Open the Amazon Cognito console: https://console.aws.amazon.com/cognito/.
2. Choose **Manage User Pools**.
3. Choose the user pool associated with your SageMaker workforce.
4. Under **General Settings**, choose **Users and Groups** and do one of the following:
   - Choose **Groups**, choose the group that you want to add the user to, and choose **Add users**. Choose the users that you want to add by choosing the plus-icon to the right of the user's name.
   - Choose **Users**, choose the user that you want to add to the user group, and choose **Add to group**. From the dropdown menu, choose the group and choose **Add to group**.

Disable and Remove a Worker From a Work Team

Disabling a worker stops the worker from receiving jobs. This action doesn't remove the worker from the workforce, or from any work team the worker is associated with. To remove a user from a work team in Amazon Cognito, you remove the user from the user group associated with that team.

To deactivate a worker (Amazon Cognito console)

1. Open the Amazon Cognito console: https://console.aws.amazon.com/cognito/.
2. Choose **Manage User Pools**.
3. Choose the user pool associated with your SageMaker workforce.

4. Under **General Settings**, choose **Users and Groups**.
5. Choose the user that you want to disable.
6. Choose **Disable User**.

You can enable a disabled user by choosing **Enable User**.

To remove a user from a user group (Amazon Cognito console)

1. Open the Amazon Cognito console: https://console.aws.amazon.com/cognito/.
2. Choose **Manage User Pools**.
3. Choose the user pool associated with your SageMaker workforce.
4. Under **General Settings**, choose **Users and Groups**.
5. For **User** tab, choose the **X** icon to the right of the group from which you want to remove the user.

Create and Manage OIDC IdP Workforce

Create a private workforce using an OpenID Connect (OIDC) Identity Provider (IdP) when you want to manage and authenticate your workers using your own OIDC IdP. Individual worker credentials and other data will be kept private. Ground Truth and Amazon A2I will only have visibility into worker information you provide through the claims that you send to these services. To create a workforce using an OIDC IdP, your IdP must support *groups* because Ground Truth and Amazon A2I map one or more groups in your IdP to a work team. To learn more, see Send Required and Optional Claims to Ground Truth and Amazon A2I.

If you are a new user of Ground Truth or Amazon A2I, you can test your worker UI and job workflow by creating a private work team and adding yourself as a worker. Use this work team when you create a labeling job or human review workflow. First, create a private OIDC IdP workforce using the instructions in Create a Private Workforce (OIDC IdP). Next, refer to Manage a Private Workforce (OIDC IdP) to learn how to create a work team.

Topics

- Create a Private Workforce (OIDC IdP)
- Manage a Private Workforce (OIDC IdP)

Create a Private Workforce (OIDC IdP)

Create a private workforce using an OpenID Connect (OIDC) Identity Provider (IdP) when you want to authenticate and manage workers using your own identity provider. Use this page to learn how to configure your IdP to communicate with Amazon SageMaker Ground Truth (Ground Truth) or Amazon Augmented AI (Amazon A2I) and to learn how to create a workforce using your own IdP.

To create a workforce using an OIDC IdP, your IdP must support *groups* because Ground Truth and Amazon A2I use one or more groups that you specify to create work teams. You use work teams to specify workers for your labeling jobs and human review tasks. Because groups are not a standard claim, your IdP may have a different naming convention for a group of users (workers). Therefore, you must identify one or more user groups to which a worker belongs using the custom claim `sagemaker:groups` that is sent to Ground Truth or Amazon A2I from your IdP. To learn more, see Send Required and Optional Claims to Ground Truth and Amazon A2I.

You create an OIDC IdP workforce using the SageMaker API operation `CreateWorkforce`. Once you create a private workforce, that workforce and all work teams and workers associated with it are available to use for all Ground Truth labeling job tasks and Amazon A2I human review workflows tasks. To learn more, see Create an OIDC IdP Workforce.

Send Required and Optional Claims to Ground Truth and Amazon A2I

When you use your own IdP, Ground Truth and Amazon A2I use your `Issuer`, `ClientId`, and `ClientSecret` to authenticate workers by obtaining an authentication CODE from your `AuthorizationEndpoint`.

Ground Truth and Amazon A2I will use this CODE to obtain a custom claim from either your IdP's `TokenEndpoint` or `UserInfoEndpoint`. You can either configure `TokenEndpoint` to return a JSON web token (JWT) or `UserInfoEndpoint` to return a JSON object. The JWT or JSON object must contain required and optional claims that you specify. A claim is a key-value pair that contains information about a worker or metadata about the OIDC service. The following table lists the claims that must be included, and that can optionally be included in the JWT or JSON object that your IdP returns.

> **Note**
>
> Some of the parameters in the following table can be specified using a `:` or a `-`. For example, you can specify the groups a worker belongs to using `sagemaker:groups` or `sagemaker-groups` in your claim.

Name	Required	Accepted Format and Values	Description	Example
`sagemaker:groups` or `sagemaker-groups`	Yes	**Data type**: If a worker belongs to a single group, identify the group using a string. If a worker belongs to multiple groups, use a list of up to 10 strings. **Allowable characters**: Regex: [\p{L}\p{M}\p{S}\p{N}\p{P}]+ **Quotas**: 10 groups per worker 63 characters per group name	Assigns a worker to one or more groups. Groups are used to map the worker into work teams.	Example of worker that belongs to a single group: `"work_team1"` Example of a worker that belongs to more than one groups: `["work_team1", "work_team2"]`
`sagemaker:sub` or `sagemaker-sub`	Yes	**Data type**: String	This is mandatory to track a worker identity inside the Ground Truth platform for auditing and to identify tasks worked on by that worker.	`"11101110 1-1234567 89-368705 6437-1111"`

Name	Required	Accepted Format and Values	Description	Example
			For ADFS: Customers must use the Primary Security Identifier (SID).	
`sagemaker:client_id` or `sagemaker-client_id`	Yes	**Data type**: String **Allowable characters**: Regex: [\w+-]+ **Quotes**: 128 characters	A client ID. All tokens must be issued for this client ID.	`"00b600bb-1f00-05d0-bd00-00be00fbd0e0"`
`sagemaker:name` or `sagemaker-name`	Yes	**Data type**: String	The worker name to be displayed in the worker portal.	`"Jane Doe"`

Name	Required	Accepted Format and Values	Description	Example
`email`	No	**Data type**: String	The worker email. Ground Truth uses this email to notify workers that they have been invited to work on labeling tasks. Ground Truth will also use this email to notify your workers when labeling tasks become available if you set up an Amazon SNS topic for a work team that this worker is on.	`"example-email@domain.com"`
`email_verified`	No	**Data type**: Bool **Accepted Values:** `True`, `False`	Indicates if the user email was verified or not.	`True`

The following an example of the JSON object syntax your `UserInfoEndpoint` can return.

```
{
    "sub":"122",
    "exp":"10000",
    "sagemaker-groups":["group1","group2"]
    "sagemaker-name":"name",
    "sagemaker-sub":"122",
    "sagemaker-client_id":"123456"
}
```

Ground Truth or Amazon A2I compares the groups listed in `sagemaker:groups` or `sagemaker-groups` to verify that your worker belongs to the work team specified in the labeling job or human review task. After the work team has been verified, labeling or human review tasks are sent to that worker.

Create an OIDC IdP Workforce

You can create a workforce using the SageMaker API operation `CreateWorkforce` and associated language-specific SDKs. Specify a `WorkforceName` and information about your OIDC IDP in the parameter `OidcConfig`. It is recommended that you configure your OIDC with a place-holder redirect URI, and then update the URI with the worker portal URL after you create the workforce. To learn more, see Configure your OIDC IdP.

The following shows an example of the request. See `CreateWorkforce` to learn more about each parameter in this request.

```
CreateWorkforceRequest: {
    #required fields
    WorkforceName: "example-oidc-workforce",
    OidcConfig: {
        ClientId: "clientId",
        ClientSecret: "secret",
        Issuer: "https://example-oidc-idp.com/adfs",
        AuthorizationEndpoint: "https://example-oidc-idp.com/adfs/oauth2/authorize",
        TokenEndpoint: "https://example-oidc-idp.com/adfs/oauth2/token",
        UserInfoEndpoint: "https://example-oidc-idp.com/adfs/oauth2/userInfo",
        LogoutEndpoint: "https://example-oidc-idp.com/adfs/oauth2/log-out",
        JwksUri: "https://example-oidc-idp.com/adfs/discovery/keys"
    },
    SourceIpConfig: {
        Cidrs: ["string", "string"]
    }
}
```

Configure your OIDC IdP

How you configure your OIDC IdP depends on the IdP you use, and your business requirements.

When you configure your IdP, you must to specify a callback or redirect URI. After Ground Truth or Amazon A2I authenticates a worker, this URI will redirect the worker to the worker portal where the workers can access labeling or human review tasks. To create a worker portal URL, you need

to create a workforce with your OIDC IdP details using the `CreateWorkforce` API operation. Specifically, you must configure your OIDC IdP with required custom sagemaker claims (see the next section for more details). Therefore, it is recommended that you configure your OIDC with a place-holder redirect URI, and then update the URI after you create the workforce. See Create an OIDC IdP Workforce to learn how to create a workforce using this API.

You can view your worker portal URL in the SageMaker Ground Truth console, or using the SageMaker API operation, `DescribeWorkforce`. The worker portal URL is in the `SubDomain` parameter in the response.

> **Important**
>
> Make sure you add the workforce subdomain to your OIDC IdP allow list. When you add the subdomain to your allow list, it must end with `/oauth2/idpresponse`.

To view your worker portal URL after creating a private workforce (Console):

1. Open the SageMaker console at https://console.aws.amazon.com/sagemaker/.
2. In the navigation pane, choose **Labeling workforces**.
3. Select the **Private** tab.
4. In **Private workforce summary** you will see **Labeling portal sign-in URL**. This is your worker portal URL.

To view your worker portal URL after creating a private workforce (API):

When you create a private workforce using `CreateWorkforce`, you specify a `WorkforceName`. Use this name to call `DescribeWorkforce`. The following table includes examples of requests using the AWS CLI and AWS SDK for Python (Boto3).

SDK for Python (Boto3)

```
response = client.describe_workforce(WorkforceName='string')
print(f'The workforce subdomain is: {response['SubDomain']}')
```

AWS CLI

```
$ C:\>  describe-workforce --workforce-name 'string'
```

Validate Your OIDC IdP Workforce Authentication Response

After you have created your OIDC IdP workforce, you can use the following procedure to validate its authentication workflow using cURL. This procedure assumes you have access to a terminal, and that you have cURL installed.

To validate your OIDC IdP authorization response:

1. Get an authorization code using a URI configured as follows:

   ```
   {AUTHORIZE ENDPOINT}?client_id={CLIENT ID}&redirect_uri={REDIRECT
    URI}&scope={SCOPE}&response_type=code
   ```

   a. Replace *{AUTHORIZE ENDPOINT}* with the authorize endpoint for your OIDC IdP.

   b. Replace *{CLIENT ID}* with the Client ID from your OAuth client.

   c. Replace *{REDIRECT URI}* with the worker portal URL. If it is not already present, you must add `/oauth2/idpresponse` to the end of the URL.

   d. If you have a custom scope, use it to replace *{SCOPE}*. If you do not have a custom scope, replace *{SCOPE}* with `openid`.

   The following is an example of a URI after the modifications above are made:

   ```
   https://example.com/authorize?
   client_id=f490a907-9bf1-4471-97aa-6bfd159f81ac&redirect_uri=https%3A%2F%2F
   %2Fexample.labeling.sagemaker.aws
   %2Foauth2%2Fidpresponse&response_type=code&scope=openid
   ```

2. Copy and paste the modified URI from step 1 into your browser and press Enter on your keyboard.
3. Authenticate using your IdP.
4. Copy the authentication code query parameter in the URI. This parameter beings with `code=`. The following is an example of what the response might look like. In this example, copy `code=MCNYDB...` and everything thereafter.

   ```
   https://example.labeling.sagemaker.aws/oauth2/idpresponse?code=MCNYDB....
   ```

5. Open a terminal and enter the following command after making required modifications listed below:

```
curl --request POST \
  --url '{TOKEN ENDPOINT}' \
  --header 'content-type: application/x-www-form-urlencoded' \
  --data grant_type=authorization_code \
  --data 'client_id={CLIENT ID}' \
  --data client_secret={CLIENT SECRET} \
  --data code={CODE} \
  --data 'redirect_uri={REDIRECT URI}'
```

a. Replace *{TOKEN ENDPOINT}* with the token endpoint for your OIDC IdP.

b. Replace *{CLIENT ID}* with the Client ID from your OAuth client.

c. Replace *{CLIENT SECRET}* with the Client Secret from your OAuth client.

d. Replace *{CODE}* with the authentication code query parameter you copied in step 4.

e. Replace *{REDIRECT URI}* with the worker portal URL.

The following is an example of the cURL request after making the modifications described above:

```
curl --request POST \
  --url 'https://example.com/token' \
  --header 'content-type: application/x-www-form-urlencoded' \
  --data grant_type=authorization_code \
  --data 'client_id=f490a907-9bf1-4471-97aa-6bfd159f81ac' \
  --data client_secret=client-secret \
  --data code=MCNYDB... \
  --data 'redirect_uri=https://example.labeling.sagemaker.aws/oauth2/idpresponse'
```

6. This step depends on the type of `access_token` your IdP returns, a plain text access token or a JWT access token.

   - If your IdP does not support JWT access tokens, `access_token` may be plain text (for example, a UUID). The response you see may look similar to the following. In this case, move to step 7.

     ```
     {
       "access_token":"179c144b-fccb-4d96-a28f-eea060f39c13",
       "token_type":"Bearer",
       "expires_in":3600,
     ```

```
  "refresh_token":"ef43e52e-9b4f-410c-8d4c-d5c5ee57631a",
  "scope":"openid"
}
```

- If your IdP supports JWT access tokens, step 5 should generate an access token in JWT format. For example, the response may look similar to the following:

```
{
    "access_token":"eyJh...JV_adQssw5c",
    "refresh_token":"i6mapTIAVSp2oJkgUnCACKKfZxt_H5MBLiqcybBBd04",
    "refresh_token_expires_in":6327,
    "scope":"openid",
    "id_token":"eyJ0eXAiOiJK9...-rDaQzUHl6cQQWNiDpWOl_lxXjQEvQ"
}
```

  Copy the JWT and decode it. You can use python script or a third party website to decode it. For example, you can go to the website https://jwt.io/ and paste the JWT into the **Encoded** box to decode it.

  Make sure the decoded response contains the following:

  - The **Required** SageMaker claims in the table found in Send Required and Optional Claims to Ground Truth and Amazon A2I. If it does not, you must reconfigure your OIDC IdP to contain these claims.
  - The Issuer you specified when you set up the IdP workforce.

7. In a terminal and enter the following command after making required modifications listed below:

```
curl -X POST -H 'Authorization: Bearer {ACCESS TOKEN}' -d '' -k -v {USERINFO
 ENDPOINT}
```

   a. Replace *{USERINFO ENDPOINT}* with the user info endpoint for your OIDC IdP.

   b. Replace *{ACCESS TOKEN}* with the access token in the response you received in step 7. This is the entry for the `"access_token"` parameter.

   The following is an example of the cURL request after making the modifications described above:

```
 curl -X POST -H 'Authorization: Bearer eyJ0eX...' -d '' -k -v https://example.com/
userinfo
```

8. The response to the final step in the procedure above may look similar to the following code block.

   If the `access_token` returned in step 6 was plain text, you must verify that this response contains required information. In this case, the response must contain the **Required** SageMaker claims in the table found in Send Required and Optional Claims to Ground Truth and Amazon A2I. For example, `sagemaker-groups`, `sagamaker-name`.

```
{
    "sub":"122",
    "exp":"10000",
    "sagemaker-groups":["group1","group2"]
    "sagemaker-name":"name",
    "sagemaker-sub":"122",
    "sagemaker-client_id":"123456"
}
```

Next Steps

Once you've created a private workforce using your IdP and verified your IdP authentication response, you can create work teams using your IdP groups. To learn more, see Manage a Private Workforce (OIDC IdP).

You can restrict worker access to tasks to specific IP addresses, and update or delete your workforce using the SageMaker API. To learn more, see Manage Private Workforce Using the Amazon SageMaker API.

Manage a Private Workforce (OIDC IdP)

Once you've created a private workforce using your OpenID Connect (OIDC) Identity Provider (IdP), you can manage your workers using your IdP. For example, you can add, remove, and group workers directly through your IdP.

To add workers to an Amazon SageMaker Ground Truth (Ground Truth) labeling job or Amazon Augmented AI (Amazon A2I) human review task, you create work teams using 1-10 IdP groups and assign that work team to the job or task. You assign a work team to a job or task by specifing that

work team when you create a labeling job (Ground Truth) or a human review workflow (Amazon A2I).

You can only assign one team to each labeling job or human review workflow. You can use the same team to create multiple labeling jobs or human review tasks. You can also create multiple work teams to work on different labeling jobs or human review tasks.

Prerequisites

To create and manage private work teams using your OIDC IdP groups, first you must create a workforce using the SageMaker API operation `CreateWorkforce`. To learn more, see Create a Private Workforce (OIDC IdP).

Add work teams

You can use the SageMaker console to create a private work team using your OIDC IdP workforce on the **Labeling workforces** page under **Ground Truth**. If you are creating a Ground Truth labeling job, you can also create a private work team while creating a labeling job.

> **Note**
>
> You create and manage work teams for Amazon A2I in the Ground Truth area of the SageMaker console.

You can also use the SageMaker API and associated language-specific SDKs to create a private work team.

Use the following procedures to learn how to create a private work team using the SageMaker console and API.

To create a private work team on the Labeling workforces page (console)

1. Go to the Ground Truth area of the SageMaker console: https://console.aws.amazon.com/sagemaker/groundtruth.
2. Select **Labeling workforces**.
3. Select **Private**.
4. In the **Private teams** section, select **Create private team**.

5. In the **Team details** section, enter a **Team name**.
6. In the **Add workers** section, enter the name of a single user group. All workers associated with this group in your IdP are added to this work team.
7. To add more than one user group, select **Add new user group** and enter the names of the user groups you want to add to this work team. Enter one user group per line.
8. (Optional) For Ground Truth labeling jobs, if you provide an email for workers in your JWT, Ground Truth notifies workers when a new labeling task is available if you select an SNS topic.
9. Select **Create private team**.

To create a private work team while creating a Ground Truth labeling job (console)

1. Go to the Ground Truth area of the SageMaker console: https://console.aws.amazon.com/sagemaker/groundtruth.
2. Select **Labeling jobs**.
3. Use the instructions in Create a Labeling Job (Console) to create a labeling job. Stop when you get to the **Workers** section on the second page.
4. Select **Private** for your worker type.
5. Enter a **Team name**.
6. In the **Add workers** section, enter the name of a single user group under **User groups**. All workers associated with this group in your IdP are added to this work team.

   > **Important**
   >
   > The group names you specify for **User groups** must match the group names specified in your OIDC IdP.

7. To add more than one user group, select **Add new user group** and enter the names of the user groups you want to add to this work team. Enter one user group per line.
8. Complete all remaining steps to create your labeling job.

The private team that you create is used for this labeling job, and is listed in the **Labeling workforces** section of the SageMaker console.

To create a private work team using the SageMaker API

You can create a private work team using the SageMaker API operation `CreateWorkteam`.

When you use this operation, list all user groups that you want included in the work team in the `OidcMemberDefinition` parameter `Groups`.

> **Important**
>
> The group names you specify for `Groups` must match the group names specified in your OIDC IdP.

For example, if your user group names are `group1`, `group2`, and `group3` in your OIDC IdP, configure `OidcMemberDefinition` as follows:

```
"OidcMemberDefinition": {
   "Groups": ["group1", "group2", "group3"]
 }
```

Additionally, you must give the work team a name using the `WorkteamName` parameter.

Add or remove IdP groups from work teams

After you've created a work team, you can use the SageMaker API to manage that work team. Use the `UpdateWorkteam` operation to update the IdP user groups included in that work team.

- Use the `WorkteamName` parameter to identify the work team that you want to update.
- When you use this operation, list all user groups that you want included in the work team in the `OidcMemberDefinition` parameter `Groups`. If a user group is associated with a work team and you do *not* include it in this list, that user group is no longer associated with this work team.

Delete a work team

You can delete a work team using the SageMaker console and SageMaker API.

To delete a private work team in the SageMaker console

1. Go to the Ground Truth area of the SageMaker console: https://console.aws.amazon.com/sagemaker/groundtruth.
2. Select **Labeling workforces**.

3. Select **Private**.
4. In the **Private teams** section, select the work team that you want to delete.
5. Select **Delete**.

To delete a private work team (API)

You can delete a private work team using the SageMaker API operation `DeleteWorkteam`.

Manage Individual Workers

When you create a workforce using your own OIDC IdP, you cannot use Ground Truth or Amazon A2I to manage individual workers.

- To add a worker to a work team, add that worker to a group associated with that work team.
- To remove a worker from a work team, remove that worker from all user groups associated with that work team.

Update, Delete, and Describe Your Workforce

You can update, delete, and describe your OIDC IdP workforce using the SageMaker API. The following is a list of API operations that you can use to manage your workforce. For additional details, including how you can locate your workforce name, see Manage Private Workforce Using the Amazon SageMaker API.

- `UpdateWorkforce` – You may want to update a workforce created using your own OIDC IdP to specify a different authorization endpoint, token endpoint, or issuer. You can update any parameter found in `OidcConfig` using this operation.

  You can only update your OIDC IdP configuration when there are no work teams associated with your workforce. To learn how to delete work teams, see Delete a work team.
- `DeleteWorkforce` – Use this operation to delete your private workforce. If you have any work teams associated with your workforce, you must delete those work teams before you delete your work force. For more information, see Delete a work team.
- `DescribeWorkforce` – Use this operation to list private workforce information, including workforce name, Amazon Resource Name (ARN), and, if applicable, allowed IP address ranges (CIDRs).

Manage Private Workforce Using the Amazon SageMaker API

You can use Amazon SageMaker API operations to manage, update, and delete your private workforce. For each API operation linked on this page, you can find a list of supported language-specific SDKs and their documentation in the **See Also** section of the API documentation.

Find Your Workforce Name

Some of the SageMaker workforce-related API operations require your workforce name as input. You can see your Amazon Cognito or OIDC IdP private and vendor workforce names in an AWS Region using the `ListWorkforces` API operation in that AWS Region.

If you created your workforce using your own OIDC IdP, you can find your workforce name in the Ground Truth area of the SageMaker console.

To find your workforce name in the SageMaker console

1. Go to the Ground Truth area of the SageMaker console: https://console.aws.amazon.com/sagemaker/groundtruth.
2. Select **Labeling workforces**.
3. Select **Private**.
4. In the **Private workforce summary** section, locate your workforce ARN. Your workforce name is located at the end of this ARN. For example, if the ARN is `arn:aws:sagemaker:us-east-2:111122223333:workforce/example-workforce`, the workforce name is `example-workforce`.

Restrict Worker Access to Tasks to Allowable IP Addresses

By default, a workforce isn't restricted to specific IP addresses. You can use the `UpdateWorkforce` operation to require that workers use a specific range of IP addresses (CIDRs) to access tasks. If you specify one or more CIDRs, workers who attempt to access tasks using any IP address outside the specified ranges are denied and will get a HTTP 204 No Content error message on the worker portal. You can specify up to 10 CIDR values using `UpdateWorkforce`.

After you have restricted your workforce to one or more CIDRs, the output of `UpdateWorkforce` lists all allowable CIDRs. You can also use the `DescribeWorkforce` operation to view all allowable CIDRs for a workforce.

Update OIDC Identity Provider Workforce Configuration

You may want to update a workforce created using your own OIDC IdP to specify a different authorization endpoint, token endpoint, or issuer. You can update any parameter found in `OidcConfig` using the `UpdateWorkforce` operation.

> **Important**
>
> You can only update your OIDC IdP configuration when there are no work teams associated with your workforce. You can delete a private work team using the `DeleteWorkteam` operation.

Delete a Private Workforce

You can only have one private workforce in each AWS Region. You may want to delete your private workforce in an AWS Region when:

- You want to create a workforce using a new Amazon Cognito user pool.
- You have already created a private workforce using Amazon Cognito and you want to create a workforce using your own OpenID Connect (OIDC) Identity Provider (IdP).

To delete a private workforce, use the `DeleteWorkforce` API operation. If you have any work teams associated with your workforce, you must delete those work teams before you delete your workforce. You can delete a private work team using the `DeleteWorkteam` operation.

Track Worker Performance

Amazon SageMaker Ground Truth logs worker events to Amazon CloudWatch, such as when a worker starts or submits a task. Use Amazon CloudWatch metrics to measure and track throughput across a team or for individual workers.

> **Important**
>
> Worker event tracking is not available for Amazon Augmented AI human review workflows.

Enable Tracking

During the set-up process for a new work team, the permissions for Amazon CloudWatch logging of worker events are created. Since this feature was added in August 2019, work teams created prior to that may not have the correct permissions. If all of your work teams were created before August 2019, create a new work team. It does not need any members and may be deleted after creation, but by creating it, you establish the permissions and apply them to all of your work teams, regardless of when they were created.

Examine Logs

After tracking is enabled, the activity of your workers is logged. Open the Amazon CloudWatch console and choose **Logs** in the navigation pane. You should see a log group named **/aws/sagemaker/groundtruth/WorkerActivity**.

Each completed task is represented by a log entry, which contains information about the worker, their team, the job, when the task was accepted, and when it was submitted.

Example Log entry

```
{
  "worker_id": "cd449a289e129409",
  "cognito_user_pool_id": "us-east-2_IpicJXXXX",
  "cognito_sub_id": "d6947aeb-0650-447a-ab5d-894db61017fd",
  "task_accepted_time": "Wed Aug 14 16:00:59 UTC 2019",
  "task_submitted_time": "Wed Aug 14 16:01:04 UTC 2019",
  "task_returned_time": "",
  "task_declined_time": "",
  "workteam_arn": "arn:aws:sagemaker:us-east-2:############:workteam/private-crowd/
Sample-labeling-team",
  "labeling_job_arn": "arn:aws:sagemaker:us-east-2:############:labeling-job/metrics-
demo",
  "work_requester_account_id": "############",
  "job_reference_code": "############",
  "job_type": "Private",
  "event_type": "TasksSubmitted",
  "event_timestamp": "1565798464"
}
```

A useful data point in each event is the `cognito_sub_id`. You can match that to an individual worker.

1. Open the Amazon SageMaker console at https://console.aws.amazon.com/sagemaker/.
2. Under the **Ground Truth** section, choose **Workforces**.
3. Choose **Private**.
4. Choose the name of a team in the **Private teams** section.
5. In the **Team summary** section, choose the user group identified under **Amazon Cognito user group**. That will take you to the group in the Amazon Cognito console.
6. The **Group** page lists the users in the group. Choose any user's link in the **Username** column to see more information about the user, including a unique **sub** ID.

To get information about all of the team's members, use the ListUsers action (examples) in the Amazon Cognito API.

Use Log Metrics

If you don't want to write your own scripts to process and visualize the raw log information, Amazon CloudWatch metrics provide insights into worker activity for you.

To view metrics

1. Open the CloudWatch console at https://console.aws.amazon.com/cloudwatch/.
2. In the navigation pane, choose **Metrics**.
3. Choose the `AWS/SageMaker/Workteam` name space, then explore the available metrics. For example, selecting the **Workteam** and **Workforce** metrics lets you calculate the average time per submitted task for a specific labeling job.

For more information, see Using Amazon CloudWatch Metrics.

Create and manage Amazon SNS topics for your work teams

Use the procedures in this topic when you want to:

- Create a topic to which you want an existing work team to subscribe.
- Create a topic before you've created a work team.
- Create or modify the work team with an API call, and specify a topic Amazon Resource Name (ARN).

If you create a work team using the console, the console provides an option to create a new topic for the team so that you don't have to perform these steps.

> **Important**
>
> The Amazon SNS feature is not supported by Amazon A2I. If you subscribe your work team to an Amazon SNS topic, workers will only receive notifications about Ground Truth labeling jobs. Workers will not receive notifications about new Amazon A2I human review tasks.

Create the Amazon SNS topic

The steps for creating Amazon SNS topics for work team notifications are similar to the steps in Getting Started in the *Amazon SNS Developer Guide*, with one significant addition—you must add an access policy so that Amazon SageMaker can publish messages to the topic on your behalf.

To add the policy when you create the topic

1. Open the Amazon SNS console at https://console.aws.amazon.com/sns/v3/home.
2. In **Create topic**, enter the name of your topic and then choose **Next steps**.
3. In **Access policy**, choose **Advanced**.
4. In the **JSON editor**, find the `Resource` property, which displays the topic's ARN.
5. Copy the `Resource` ARN value.
6. Before the final closing brace (`]`), add the following policy.

```
   , {
       "Sid": "AwsSagemaker_SnsAccessPolicy",
       "Effect": "Allow",
       "Principal": {
           "Service": "sagemaker.amazonaws.com"
       },
       "Action": "sns:Publish",
       "Resource": "arn:partition:sns:region:111122223333:MyTopic", # ARN of the
topic you copied in the previous step
       "Condition": {
           "ArnLike": {
               "aws:SourceArn":
"arn:partition:sagemaker:region:111122223333:workteam/*" # Workteam ARN
```

```
            },
            "StringEquals": {
                "aws:SourceAccount": "111122223333" # SNS topic account
            }
        }
    }
```

7. Create the topic.

After you create the topic, it appears in your **Topics** summary screen. For more information about creating topics, see Creating a Topic in the *Amazon SNS Developer Guide*.

Manage worker subscriptions

If you subscribe a work team to a topic after you've already created the work team, the individual work team members who were added to the team when the work team was created are not automatically subscribed to the topic. For information about subscribing workers' email addresses to the topic, see Subscribing an Endpoint to an Amazon SNS Topic in the *Amazon SNS Developer Guide*.

The only situation in which workers are automatically subscribed to your topic is when you create or import an Amazon Cognito user group at the time that you create a work team ***and*** you set up the topic subscription when you create that work team. For more information about creating and managing your workteams with Amazon Cognito, see Create Work Teams (Amazon Cognito Console).

Crowd HTML Elements Reference

Crowd HTML Elements are web components, a web standard that abstracts HTML markup, CSS, and JavaScript functionality into an HTML tag or set of tags. Amazon SageMaker provides customers with the ability to design their own custom task templates in HTML.

As a starting point, you can use a template built using Crowd HTML Elements from one of the following GitHub repositories:

- Example task UIs for Amazon SageMaker Ground Truth
- Over 60 example task UIs for Amazon Augmented AI (A2I)

These repositories include templates designed for audio, image, text, video, and other types of data labeling and annotation tasks.

For more information about how to implement custom templates in Amazon SageMaker Ground Truth, see Creating Custom Labeling Workflows. To learn more about custom templates in Amazon Augmented AI, see Create Custom Worker Task Templates.

SageMaker Crowd HTML Elements

The following is a list of Crowd HTML Elements that make building a custom template easier and provide a familiar UI for workers. These elements are supported in Ground Truth, Augmented AI, and Mechanical Turk.

Topics

- crowd-polygon
- crowd-polyline
- crowd-radio-button
- crowd-radio-group
- crowd-semantic-segmentation
- crowd-slider
- crowd-tab
- crowd-tabs
- crowd-text-area
- crowd-toast
- crowd-toggle-button

crowd-alert

A message that alerts the worker to a current situation.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a Liquid template that uses the `<crowd-alert>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <div id="errorBox"></div>

  <crowd-keypoint
    src="{{ task.input.taskObject | grant_read_access }}"
    labels="['Item A', 'Item B', 'Item C']"
    header="Please locate the centers of each item."
    name="annotatedResult">
    <short-instructions>
      Describe your task briefly here and give examples
    </short-instructions>
    <full-instructions>
      Give additional instructions and good/bad examples here
    </full-instructions>
```

```
  </crowd-keypoint>
</crowd-form>

<script>
  var num_obj = 1;

  document.querySelector('crowd-form').onsubmit = function(e) {
    const keypoints = document.querySelector('crowd-keypoint').value.keypoints ||
 document.querySelector('crowd-keypoint')._submittableValue.keypoints;
    const labels = keypoints.map(function(p) {
      return p.label;
    });

    // 1. Make sure total number of keypoints is correct.
    var original_num_labels = document.getElementsByTagName("crowd-keypoint")
[0].getAttribute("labels");

    original_num_labels = original_num_labels.substring(2, original_num_labels.length -
 2).split("\",\"");
    var goalNumKeypoints = num_obj*original_num_labels.length;
    if (keypoints.length != goalNumKeypoints) {
      e.preventDefault();
      errorBox.innerHTML = '<crowd-alert type="error" dismissible>You must add all
 keypoint annotations and use each label only once.</crowd-alert>';
      errorBox.scrollIntoView();
      return;
    }

    // 2. Make sure all labels are unique.
    labelCounts = {};
    for (var i = 0; i < labels.length; i++) {
      if (!labelCounts[labels[i]]) {
        labelCounts[labels[i]] = 0;
      }
      labelCounts[labels[i]]++;
    }
    const goalNumSingleLabel = num_obj;

    const numLabels = Object.keys(labelCounts).length;

    Object.entries(labelCounts).forEach(entry => {
      if (entry[1] != goalNumSingleLabel) {
        e.preventDefault();
```

```
        errorBox.innerHTML = '<crowd-alert type="error" dismissible>You must use each
 label only once.</crowd-alert>';
        errorBox.scrollIntoView();
      }
    })
  };
</script>
```

Attributes

The following attributes are supported by this element.

dismissible

A Boolean switch that, if present, allows the message to be closed by the worker.

type

A string that specifies the type of message to be displayed. The possible values are "info" (the default), "success", "error", and "warning".

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form
- **Child elements**: none

See Also

For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data
- Crowd HTML Elements Reference

crowd-badge

An icon that floats over the top right corner of another element to which it is attached.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a template that uses the <crowd-badge> element. Copy the following code and save it in a file with the extension .html. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-image-classifier
    name="crowd-image-classifier"
    src="https://unsplash.com/photos/NLUkAA-nDdE"
    header="Choose the correct category for this image."
    categories="['Person', 'Umbrella', 'Chair', 'Dolphin']"
  >
    <full-instructions header="Classification Instructions">
      <p>Read the task carefully and inspect the image.</p>
      <p>Choose the appropriate label that best suits the image.</p>
    </full-instructions>

    <short-instructions id="short-instructions">
      <p>Read the task carefully and inspect the image.</p>
      <p>Choose the appropriate label that best suits the image.</p>
      <crowd-badge icon="star" for="short-instructions"/>
    </short-instructions>
  </crowd-image-classifier>
</crowd-form>
```

Attributes

The following attributes are supported by this element.

for

A string that specifies the ID of the element to which the badge is attached.

icon

A string that specifies the icon to be displayed in the badge. The string must be either the name of an icon from the open-source *iron-icons* set, which is pre-loaded, or the URL to a custom icon.

This attribute overrides the *label* attribute.

The following is an example of the syntax that you can use to add an iron-icon to a <crowd-badge> HTML element. Replace *icon-name* with the name of the icon you'd like to use from this Icons set.

```
<crowd-badge icon="icon-name" for="short-instructions"/>
```

label

The text to display in the badge. Three characters or less is recommended because text that is too large will overflow the badge area. An icon can be displayed instead of text by setting the *icon* attribute.

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form
- **Child elements**: none

See Also

For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data
- Crowd HTML Elements Reference

crowd-button

A styled button that represents some action.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a template that uses the <crowd-button> element. Copy the following code and save it in a file with the extension .html. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
```

```
  <crowd-image-classifier
    name="crowd-image-classifier"
    src="https://unsplash.com/photos/NLUkAA-nDdE"
    header="Please select the correct category for this image"
    categories="['Person', 'Umbrella', 'Chair', 'Dolphin']"
  >
    <full-instructions header="Classification Instructions">
      <p>Read the task carefully and inspect the image.</p>
      <p>Choose the appropriate label that best suits the image.</p>
    </full-instructions>
    <short-instructions>
      <p>Read the task carefully and inspect the image.</p>
      <p>Choose the appropriate label that best suits the image.</p>
      <crowd-button>
        <iron-icon icon="question-answer"/>
      </crowd-button>
    </short-instructions>
  </crowd-image-classifier>
</crowd-form>
```

Attributes

The following attributes are supported by this element.

disabled

A Boolean switch that, if present, displays the button as disabled and prevents clicks.

form-action

A switch that either submits its parent crowd-form element, if set to "submit", or resets its parent <crowd-form> element, if set to "reset".

href

The URL to an online resource. Use this property if you need a link styled as a button.

icon

A string that specifies the icon to be displayed next to the button's text. The string must be the name of an icon from the open-source *iron-icons* set, which is pre-loaded. For example, to insert the search iron-icon, use the following:

```
<crowd-button>
```

```
    <iron-icon icon="search"/>
</crowd-button>
```

The icon is positioned to either the left or the right of the text, as specified by the *icon-align* attribute.

To use a custom icon see **icon-url**.

icon-align

The left or right position of the icon relative to the button's text. The default is "left".

icon-url

A URL to a custom image for the icon. A custom image can be used in place of a standard icon that is specified by the *icon* attribute.

loading

A Boolean switch that, if present, displays the button as being in a loading state. This attribute has precedence over the *disabled* attribute if both attributes are present.

target

When you use the `href` attribute to make the button act as a hyperlink to a specific URL, the `target` attribute optionally targets a frame or window where the linked URL should load.

variant

The general style of the button. Use "primary" for primary buttons, "normal" for secondary buttons, "link" for tertiary buttons, or "icon" to display only the icon without text.

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form
- **Child elements**: none

See Also

For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data
- Crowd HTML Elements Reference

crowd-bounding-box

A widget for drawing rectangles on an image and assigning a label to the portion of the image that is enclosed in each rectangle.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a Liquid template that uses the `<crowd-bounding-box>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template. For more examples, see this GitHub repository.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-bounding-box
    name="annotatedResult"
    src="{{ task.input.taskObject | grant_read_access }}"
    header="Draw bounding boxes around all the cats and dogs in this image"
    labels="['Cat', 'Dog']"
  >
    <full-instructions header="Bounding Box Instructions" >
      <p>Use the bounding box tool to draw boxes around the requested target of
 interest:</p>
      <ol>
        <li>Draw a rectangle using your mouse over each instance of the target.</li>
        <li>Make sure the box does not cut into the target, leave a 2 - 3 pixel
 margin</li>
        <li>
          When targets are overlapping, draw a box around each object,
          include all contiguous parts of the target in the box.
          Do not include parts that are completely overlapped by another object.
        </li>
        <li>
          Do not include parts of the target that cannot be seen,
          even though you think you can interpolate the whole shape of the target.
        </li>
        <li>Avoid shadows, they're not considered as a part of the target.</li>
        <li>If the target goes off the screen, label up to the edge of the image.</li>
      </ol>
```

```
    </full-instructions>

    <short-instructions>
      Draw boxes around the requested target of interest.
    </short-instructions>
  </crowd-bounding-box>
</crowd-form>
```

Attributes

The following attributes are supported by this element.

header

The text to display above the image. This is typically a question or simple instruction for the worker.

initial-value

An array of JSON objects, each of which sets a bounding box when the component is loaded. Each JSON object in the array contains the following properties. Bounding boxes set via the `initial-value` property can be adjusted and whether or not a worker answer was adjusted is tracked via an `initialValueModified` boolean in the worker answer output.

- **height** – The height of the box in pixels.
- **label** – The text assigned to the box as part of the labeling task. This text must match one of the labels defined in the *labels* attribute of the <crowd-bounding-box> element.
- **left** – Distance of the top-left corner of the box from the left side of the image, measured in pixels.
- **top** – Distance of the top-left corner of the box from the top of the image, measured in pixels.
- **width** – The width of the box in pixels.

  You can extract the bounding box initial value from a manifest file of a previous job in a custom template using the Liquid templating language:

```
initial-value="[
  {% for box in task.input.manifestLine.label-attribute-name-from-prior-
job.annotations %}
    {% capture class_id %}{{ box.class_id }}{% endcapture %}
    {% assign label = task.input.manifestLine.label-attribute-name-from-prior-job-
metadata.class-map[class_id] %}
```

```
    {
      label: {{label | to_json}},
      left: {{box.left}},
      top: {{box.top}},
      width: {{box.width}},
      height: {{box.height}},
    },
  {% endfor %}
]"
```

labels

A JSON formatted array of strings, each of which is a label that a worker can assign to the image portion enclosed by a rectangle. **Limit:** 10 labels.

name

The name of this widget. It's used as a key for the widget's input in the form output.

src

The URL of the image on which to draw bounding boxes.

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form
- **Child elements**: full-instructions, short-instructions

Regions

The following regions are required by this element.

full-instructions

General instructions about how to draw bounding boxes.

short-instructions

Important task-specific instructions that are displayed in a prominent place.

Output

The following output is supported by this element.

boundingBoxes

An array of JSON objects, each of which specifies a bounding box that has been created by the worker. Each JSON object in the array contains the following properties.

- **height** – The height of the box in pixels.
- **label** – The text assigned to the box as part of the labeling task. This text must match one of the labels defined in the *labels* attribute of the <crowd-bounding-box> element.
- **left** – Distance of the top-left corner of the box from the left side of the image, measured in pixels.
- **top** – Distance of the top-left corner of the box from the top of the image, measured in pixels.
- **width** – The width of the box in pixels.

inputImageProperties

A JSON object that specifies the dimensions of the image that is being annotated by the worker. This object contains the following properties.

- **height** – The height, in pixels, of the image.
- **width** – The width, in pixels, of the image.

Example : Sample Element Outputs

The following are samples of outputs from common use scenarios for this element.

Single Label, Single Box / Multiple Label, Single Box

```
[
  {
    "annotatedResult": {
      "boundingBoxes": [
        {
          "height": 401,
          "label": "Dog",
```

```
          "left": 243,
          "top": 117,
          "width": 187
        }
      ],
      "inputImageProperties": {
        "height": 533,
        "width": 800
      }
    }
  }
]
```

Single Label, Multiple Box

```
[
  {
    "annotatedResult": {
      "boundingBoxes": [
        {
          "height": 401,
          "label": "Dog",
          "left": 243,
          "top": 117,
          "width": 187
        },
        {
          "height": 283,
          "label": "Dog",
          "left": 684,
          "top": 120,
          "width": 116
        }
      ],
      "inputImageProperties": {
        "height": 533,
        "width": 800
      }
    }
  }
]
```

Multiple Label, Multiple Box

```
[
  {
    "annotatedResult": {
      "boundingBoxes": [
        {
          "height": 395,
          "label": "Dog",
          "left": 241,
          "top": 125,
          "width": 158
        },
        {
          "height": 298,
          "label": "Cat",
          "left": 699,
          "top": 116,
          "width": 101
        }
      ],
      "inputImageProperties": {
        "height": 533,
        "width": 800
      }
    }
  }
]
```

You could have many labels available, but only the ones that are used appear in the output.

crowd-card

A box with an elevated appearance for displaying information.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a template designed for sentiment analysis tasks that uses the <crowd-card> element. Copy the following code and save it in a file with the extension .html. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<style>
  h3 {
    margin-top: 0;
  }

  crowd-card {
    width: 100%;
  }

  .card {
    margin: 10px;
  }

  .left {
    width: 70%;
    margin-right: 10px;
    display: inline-block;
    height: 200px;
  }

  .right {
    width: 20%;
    height: 200px;
    display: inline-block;
  }
</style>

<crowd-form>
  <short-instructions>
    Your short instructions here.
  </short-instructions>

  <full-instructions>
    Your full instructions here.
  </full-instructions>

  <div class="left">
```

```
    <h3>What sentiment does this text convey?</h3>
    <crowd-card>
      <div class="card">
        Nothing is great.
      </div>
    </crowd-card>
  </div>

  <div class="right">
    <h3>Select an option</h3>

    <select name="sentiment1" style="font-size: large" required>
      <option value="">(Please select)</option>
      <option>Negative</option>
      <option>Neutral</option>
      <option>Positive</option>
      <option>Text is empty</option>
    </select>
  </div>

  <div class="left">
    <h3>What sentiment does this text convey?</h3>
    <crowd-card>
      <div class="card">
        Everything is great!
      </div>
    </crowd-card>
  </div>

  <div class="right">
    <h3>Select an option</h3>

    <select name="sentiment2" style="font-size: large" required>
      <option value="">(Please select)</option>
      <option>Negative</option>
      <option>Neutral</option>
      <option>Positive</option>
      <option>Text is empty</option>
    </select>
  </div>
</crowd-form>
```

Attributes

The following attributes are supported by this element.

heading

The text displayed at the top of the box.

image

A URL to an image to be displayed within the box.

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form
- **Child elements**: none

See Also

For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data
- Crowd HTML Elements Reference

crowd-checkbox

A UI component that can be checked or unchecked allowing a user to select multiple options from a set.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a Liquid template that uses the `<crowd-checkbox>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
```

```
  <p>Find the official website for: <strong>{{ task.input.company }}</strong></p>
  <p>Do not give Yelp pages, LinkedIn pages, etc.</p>
  <p>Include the http:// prefix from the website</p>
  <crowd-input name="website" placeholder="http://example.com"></crowd-input>

  <crowd-checkbox name="website-found">Website Found</crowd-checkbox>

</crowd-form>
```

Attributes

The following attributes are supported by this element.

checked

A Boolean switch that, if present, displays the check box as checked.

The following is an example of the syntx used to check a checkbox by default.

```
  <crowd-checkbox name="checkedBox" value="checked" checked>This box is checked</crowd-
checkbox>
```

disabled

A Boolean switch that, if present, displays the check box as disabled and prevents it from being checked.

The following is an example of the syntax used to disable a checkbox.

```
  <crowd-checkbox name="disabledCheckBox" value="Disabled" disabled>Cannot be
 selected</crowd-checkbox>
```

name

A string that is used to identify the answer submitted by the worker. This value will match a key in the JSON object that specifies the answer.

required

A Boolean switch that, if present, requires the worker to provide input.

The following is an example of the syntax used to require a checkbox be selected.

```
  <crowd-checkbox name="work_verified" required>Instructions were clear</crowd-
checkbox>
```

value

A string used as the name for the check box state in the output. Defaults to "on" if not specified.

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form
- **Child elements**: none

Output

Provides a JSON object. The `name` string is the object name and the `value`string is the property name for a Boolean value based on the check box state; true if checked, false if not checked.

Example : Sample Element Outputs

Using the same `name` value for multiple boxes.

```
<!-- INPUT -->
<div><crowd-checkbox name="image_attributes" value="blurry"> Blurry </crowd-checkbox></
div>
<div><crowd-checkbox name="image_attributes" value="dim"> Too Dim </crowd-checkbox></
div>
<div><crowd-checkbox name="image_attributes" value="exposed"> Too Bright </crowd-
checkbox></div>
```

```
//Output with "blurry" and "dim" checked
[
  {
    "image_attributes": {
      "blurry": true,
      "dim": true,
      "exposed": false
```

```
    }
  }
]
```

Note that all three color values are properties of a single object.

Using different name values for each box.

```
<!-- INPUT -->
<div><crowd-checkbox name="Stop" value="Red"> Red </crowd-checkbox></div>
<div><crowd-checkbox name="Slow" value="Yellow"> Yellow </crowd-checkbox></div>
<div><crowd-checkbox name="Go" value="Green"> Green </crowd-checkbox></div>
```

```
//Output with "Red" checked
[
  {
    "Go": {
      "Green": false
    },
    "Slow": {
      "Yellow": false
    },
    "Stop": {
      "Red": true
    }
  }
]
```

See Also

For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data
- Crowd HTML Elements Reference

crowd-classifier

A widget for classifying non-image content, such as audio, video, or text.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of an HTML worker task template built using `crowd-classifier`. This example uses the Liquid template language to automate:

- Label categories in the `categories` parameter
- The objects that are being classified in the `classification-target` parameter.

Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
    <crowd-classifier
      name="category"
      categories="{{ task.input.labels | to_json | escape }}"
      header="What type of a document is this?"
    >
      <classification-target>
        <iframe style="width: 100%; height: 600px;" src="{{ task.input.taskObject  |
 grant_read_access }}" type="application/pdf"></iframe>
      </classification-target>

      <full-instructions header="Document Classification Instructions">
        <p>Read the task carefully and inspect the document.</p>
        <p>Choose the appropriate label that best suits the document.</p>
      </full-instructions>

      <short-instructions>
        Please choose the correct category for the document
      </short-instructions>
    </crowd-classifier>
</crowd-form>
```

Attributes

The following attributes are supported by this element.

categories

A JSON formatted array of strings, each of which is a category that a worker can assign to the text. You should include "other" as a category, otherwise the worker my not be able to provide an answer.

header

The text to display above the image. This is typically a question or simple instruction for the worker.

name

The name of this widget. It is used as a key for the widget's input in the form output.

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form
- **Child elements**: classification-target, full-instructions, short-instructions

Regions

The following regions are supported by this element.

classification-target

The content to be classified by the worker. This can be plain text or HTML. Examples of how the HTML can be used include *but are not limited to* embedding a video or audio player, embedding a PDF, or performing a comparison of two or more images.

full-instructions

General instructions about how to do text classification.

short-instructions

Important task-specific instructions that are displayed in a prominent place.

Output

The output of this element is an object using the specified `name` value as a property name, and a string from the `categories` as the property's value.

Example : Sample Element Outputs

The following is a sample of output from this element.

```
[
```

```
  {
    "<name>": {
      "label": "<value>"
    }
  }
]
```

See Also

For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data
- Crowd HTML Elements Reference

crowd-classifier-multi-select

A widget for classifying various forms of content—such as audio, video, or text—into one or more categories. The content to classify is referred to as an *object*.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of an HTML worker task template built using this element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
    <crowd-classifier-multi-select
      name="category"
      categories="['Positive', 'Negative', 'Neutral']"
      header="Select the relevant categories"
      exclusion-category="{ text: 'None of the above' }"
    >
      <classification-target>
        {{ task.input.taskObject }}
      </classification-target>

      <full-instructions header="Text Categorization Instructions">
        <p><strong>Positive</strong> sentiment include: joy, excitement, delight</p>
        <p><strong>Negative</strong> sentiment include: anger, sarcasm, anxiety</p>
```

```
        <p><strong>Neutral</strong>: neither positive or negative, such as stating a
 fact</p>
        <p><strong>N/A</strong>: when the text cannot be understood</p>
        <p>When the sentiment is mixed, such as both joy and sadness, choose both
 labels.</p>
      </full-instructions>

      <short-instructions>
       Choose all categories that are expressed by the text.
      </short-instructions>
    </crowd-classifier-multi-select>
</crowd-form>
```

Attributes

The following attributes are supported by the `crowd-classifier-multi-select` element. Each attribute accepts a string value or string values.

categories

Required. A JSON-formatted array of strings, each of which is a category that a worker can assign to the object.

header

Required. The text to display above the image. This is typically a question or simple instruction for workers.

name

Required. The name of this widget. In the form output, the name is used as a key for the widget's input.

exclusion-category

Optional. A JSON-formatted string with the following format: "`{ text: 'default-value' }`". This attribute sets a default value that workers can choose if none of the labels applies to the object shown in the worker UI.

Element Hierarchy

This element has the following parent and child elements:

- **Parent elements**: crowd-form

- **Child elements**: classification-target, full-instructions, short-instructions

Regions

This element uses the following regions.

classification-target

The content to be classified by the worker. Content can be plain text or an object that you specify in the template using HTML. For example, you can use HTML elements to include a video or audio player, embedding a PDF file, or include a comparison of two or more images.

full-instructions

General instructions about how to classify text.

short-instructions

Important task-specific instructions. These instructions are displayed prominently.

Output

The output of this element is an object that uses the specified `name` value as a property name, and a string from `categories` as the property's value.

Example : Sample Element Outputs

The following is a sample of output from this element.

```
[
  {
    "<name>": {
        labels: ["label_a", "label_b"]
    }
  }
]
```

See Also

For more information, see the following:

- Text Classification (Multi-label)
- Use Amazon SageMaker Ground Truth to Label Data

- Crowd HTML Elements Reference

crowd-entity-annotation

A widget for labeling words, phrases, or character strings within a longer text. Workers select a label, and highlight the text that the label applies to.

> **Important: Self-contained Widget**
>
> Do not use `<crowd-entity-annotation>` element with the `<crowd-form>` element. It contains its own form submission logic and **Submit** button.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a template that uses the `<crowd-entity-annotation>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-entity-annotation
  name="crowd-entity-annotation"
  header="Highlight parts of the text below"
  labels="[{'label': 'person', 'shortDisplayName': 'per', 'fullDisplayName': 'Person'},
 {'label': 'date', 'shortDisplayName': 'dat', 'fullDisplayName': 'Date'}, {'label':
 'company', 'shortDisplayName': 'com', 'fullDisplayName': 'Company'}]"
  text="Amazon SageMaker Ground Truth helps you build highly accurate training datasets
 for machine learning quickly."
>
  <full-instructions header="Named entity recognition instructions">
    <ol>
      <li><strong>Read</strong> the text carefully.</li>
      <li><strong>Highlight</strong> words, phrases, or sections of the text.</li>
      <li><strong>Choose</strong> the label that best matches what you have
 highlighted.</li>
      <li>To <strong>change</strong> a label, choose highlighted text and select a new
 label.</li>
      <li>To <strong>remove</strong> a label from highlighted text, choose the X next
 to the abbreviated label name on the highlighted text.</li>
```

```
      <li>You can select all of a previously highlighted text, but not a portion of
 it.</li>
    </ol>
  </full-instructions>

  <short-instructions>
    Apply labels to words or phrases.
  </short-instructions>

    <div id="additionalQuestions" style="margin-top: 20px">
      <h3>
        What is the overall subject of this text?
      </h3>
      <crowd-radio-group>
        <crowd-radio-button name="tech" value="tech">Technology</crowd-radio-button>
        <crowd-radio-button name="politics" value="politics">Politics</crowd-radio-
button>
      </crowd-radio-group>
    </div>
</crowd-entity-annotation>

<script>
  document.addEventListener('all-crowd-elements-ready', () => {
    document
      .querySelector('crowd-entity-annotation')
      .shadowRoot
      .querySelector('crowd-form')
      .form
      .appendChild(additionalQuestions);
  });
</script>
```

Attributes

The following attributes are supported by this element.

header

The text to display above the image. This is typically a question or simple instruction for the worker.

initial-value

A JSON formatted array of objects, each of which defines an annotation to apply to the text at initialization. Objects contain a `label` value that matches one in the `labels` attribute, an integer `startOffset` value for labeled span's starting unicode offset, and an integer `endOffset` value for the ending unicode offset.

Example

```
[
  {
    label: 'person',
    startOffset: 0,
    endOffset: 16
  },
  ...
]
```

labels

A JSON formatted array of objects, each of which contains:

- **`label`** (required): The name used to identify entities.
- **`fullDisplayName`** (optional): Used for the label list in the task widget. Defaults to the label value if not specified.
- **`shortDisplayName`** (optional): An abbreviation of 3-4 letters to display above selected entities. Defaults to the label value if not specified.

> **`shortDisplayName` is highly recommended**
>
> Values displayed above the selections can overlap and create difficulty managing labeled entities in the workspace. Providing a 3-4 character `shortDisplayName` for each label is highly recommended to prevent overlap and keep the workspace manageable for your workers.

Example

```
[
  {
```

```
    label: 'person',
    shortDisplayName: 'per',
    fullDisplayName: 'person'
  }
]
```

name

Serves as the widget's name in the DOM. It is also used as the label attribute name in form output and the output manifest.

text

The text to be annotated. The templating system escapes quotes and HTML strings by default. If your code is already escaped or partially escaped, see Variable filters for more ways to control escaping.

Element Hierarchy

This element has the following parent and child elements.

- **Child elements**: full-instructions, short-instructions

Regions

The following regions are supported by this element.

full-instructions

General instructions about how to work with the widget.

short-instructions

Important task-specific instructions that are displayed in a prominent place.

Output

The following output is supported by this element.

entities

A JSON object that specifies the start, end, and label of an annotation. This object contains the following properties.

- **label** – The assigned label.
- **startOffset** – The Unicode offset of the beginning of the selected text.
- **endOffset** – The Unicode offset of the first character after the selection.

Example : Sample Element Outputs

The following is a sample of the output from this element.

```
{
  "myAnnotatedResult": {
    "entities": [
      {
        "endOffset": 54,
        "label": "person",
        "startOffset": 47
      },
      {
        "endOffset": 97,
        "label": "event",
        "startOffset": 93
      },
      {
        "endOffset": 219,
        "label": "date",
        "startOffset": 212
      },
      {
        "endOffset": 271,
        "label": "location",
        "startOffset": 260
      }
    ]
  }
}
```

See Also

For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data
- Crowd HTML Elements Reference

crowd-fab

A floating button with an image in its center.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a Liquid template designed for image classification that uses the `<crowd-fab>` element. This template uses JavaScript to enable workers to report issues with the worker UI. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
    <crowd-image-classifier
        src="${image_url}"
        categories="['Cat', 'Dog', 'Bird', 'None of the Above']"
        header="Choose the correct category for the image"
        name="category">

        <short-instructions>
            <p>Read the task carefully and inspect the image.</p>
            <p>Choose the appropriate label that best suits the image.</p>
            <p>If there is an issue with the image or tools, please select
              <b>None of the Above</b>, describe the issue in the text box and click
 the
              button below.</p>
            <crowd-input label="Report an Issue" name="template-issues"></crowd-input>
            <crowd-fab id="button1" icon="report-problem" title="Issue"/>
        </short-instructions>

        <full-instructions header="Classification Instructions">
            <p>Read the task carefully and inspect the image.</p>
            <p>Choose the appropriate label that best suits the image.
            Use the <b>None of the Above</b> option if none of the other labels suit
 the image.</p>
        </full-instructions>

    </crowd-image-classifier>
</crowd-form>

<script>
  [
```

```
    button1,
  ].forEach(function(button) {
    button.addEventListener('click', function() {
      document.querySelector('crowd-form').submit();
    });
  });
</script>
```

Attributes

The following attributes are supported by this element.

disabled

A Boolean switch that, if present, displays the floating button as disabled and prevents clicks.

icon

A string that specifies the icon to be displayed in the center of the button. The string must be either the name of an icon from the open-source *iron-icons* set, which is pre-loaded, or the URL to a custom icon.

The following is an example of the syntax that you can use to add an iron-icon to a `<crowd-fab>` HTML element. Replace *`icon-name`* with the name of the icon you'd like to use from this Icons set.

```
<crowd-fab "id="button1" icon="icon-name" title="Issue"/>
```

label

A string consisting of a single character that can be used instead of an icon. Emojis or multiple characters may result in the button displaying an ellipsis instead.

title

A string that will display as a tool tip when the mouse hovers over the button.

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form

- **Child elements**: none

See Also

For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data
- Crowd HTML Elements Reference

crowd-form

The form wrapper for all custom tasks. Sets and implements important actions for the proper submission of your form data.

If a crowd-button of type "submit" is not included inside the `<crowd-form>` element, it will automatically be appended within the `<crowd-form>` element.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of an image classification template that uses the `<crowd-form>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
    <crowd-image-classifier
        src="${image_url}"
        categories="['Cat', 'Dog', 'Bird', 'None of the Above']"
        header="Choose the correct category for the image"
        name="category">

        <short-instructions>
            <p>Read the task carefully and inspect the image.</p>
            <p>Choose the appropriate label that best suits the image.</p>
        </short-instructions>

        <full-instructions header="Classification Instructions">
```

```
            <p>Read the task carefully and inspect the image.</p>
            <p>Choose the appropriate label that best suits the image.
            Use the <b>None of the Above</b> option if none of the other labels suit
 the image.</p>
        </full-instructions>

    </crowd-image-classifier>
</crowd-form>
```

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: none
- **Child elements**: Any of the UI Template elements

Element Events

The `crowd-form` element extends the standard HTML `form` element and inherits its events, such as `onclick` and `onsubmit`.

See Also

For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data
- Crowd HTML Elements Reference

crowd-icon-button

A button with an image placed in the center. When the user touches the button, a ripple effect emanates from the center of the button.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a Liquid template designed for image classification that uses the `<crowd-icon-button>` element. This template uses JavaScript to enable workers to report issues with the worker UI. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
    <crowd-image-classifier
        src="${image_url}"
        categories="['Cat', 'Dog', 'Bird', 'None of the Above']"
        header="Choose the correct category for the image"
        name="category">

        <short-instructions>
            <p>Read the task carefully and inspect the image.</p>
            <p>Choose the appropriate label that best suits the image.</p>
            <p>If there is an issue with the image or tools, please select
              <b>None of the Above</b>, describe the issue in the text box and click
 the
              button below.</p>
            <crowd-input label="Report an Issue" name="template-issues"/></crowd-input>
            <crowd-icon-button id="button1" icon="report-problem" title="Issue"/>
        </short-instructions>

        <full-instructions header="Classification Instructions">
            <p>Read the task carefully and inspect the image.</p>
            <p>Choose the appropriate label that best suits the image.
            Use the <b>None of the Above</b> option if none of the other labels suit
 the image.</p>
        </full-instructions>

    </crowd-image-classifier>
</crowd-form>

<script>
  [
    button1,
  ].forEach(function(button) {
    button.addEventListener('click', function() {
      document.querySelector('crowd-form').submit();
    });
  });
</script>
```

Attributes

The following attributes are supported by this element.

disabled

A Boolean switch that, if present, displays the button as disabled and prevents clicks.

icon

A string that specifies the icon to be displayed in the center of the button. The string must be either the name of an icon from the open-source *iron-icons* set, which is pre-loaded, or the URL to a custom icon.

The following is an example of the syntax that you can use to add an iron-icon to a `<crowd-icon-button>` HTML element. Replace *`icon-name`* with the name of the icon you'd like to use from this Icons set.

```
<crowd-icon-button id="button1" icon="icon-name" title="Issue"/>
```

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form
- **Child elements**: none

See Also

For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data
- Crowd HTML Elements Reference

crowd-image-classifier

A widget for classifying an image. Use one of the following supported image formats: APNG, BMP, GIF, ICO, JPEG, PNG, SVG. Images do not have a size limit.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of an image classification template that uses the `<crowd-image-classifier>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
    <crowd-image-classifier
        src="${image_url}"
        categories="['Cat', 'Dog', 'Bird', 'None of the Above']"
        header="Choose the correct category for the image"
        name="category">

        <short-instructions>
            <p>Read the task carefully and inspect the image.</p>
            <p>Choose the appropriate label that best suits the image.</p>
        </short-instructions>

        <full-instructions header="Classification Instructions">
            <p>Read the task carefully and inspect the image.</p>
            <p>Choose the appropriate label that best suits the image.
            Use the <b>None of the Above</b> option if none of the other labels suit
 the image.</p>
        </full-instructions>

    </crowd-image-classifier>
</crowd-form>
```

Attributes

The following attributes are required by this element.

categories

A JSON formatted array of strings, each of which is a category that a worker can assign to the image. You should include "other" as a category, so that the worker can provide an answer. You can specify up to 10 categories.

header

The text to display above the image. This is typically a question or simple instruction for the worker.

name

The name of this widget. It is used as a key for the widget's input in the form output.

overlay

Information to be overlaid on the source image. This is for verification workflows of bounding-box, semantic-segmentation, and instance-segmentation tasks.

It is a JSON object containing an object with the name of the task-type in camelCase as the key. That key's value is an object that contains the labels and other necessary information from the previous task.

An example of a `crowd-image-classifier` element with attributes for verifying a bounding-box task follows:

```
<crowd-image-classifier
    name="boundingBoxClassification"
    header="Rate the quality of the annotations based on the background section
       in the instructions on the left hand side."
    src="https://i.imgur.com/CIPKVJo.jpg"
    categories="['good', 'bad', 'okay']"
    overlay='{
        "boundingBox": {
            labels: ["bird", "cat"],
            value: [
                {
                  height: 284,
                  label: "bird",
                  left: 230,
                  top: 974,
                  width: 223
                },
                {
                  height: 69,
                  label: "bird",
                  left: 79,
                  top: 889,
                  width: 247
                }
            ]
        },
    }'
> ... </crowd-image-classifier>
```

A semantic segmentation verification task would use the `overlay` value as follows:

```
<crowd-image-classifier
  name='crowd-image-classifier'
  categories='["good", "bad"]'
  src='URL of image to be classified'
  header='Please classify'
  overlay='{
    "semanticSegmentation": {
      "labels": ["Cat", "Dog", "Bird", "Cow"],
      "labelMappings": {
        "Bird": {
          "color": "#ff7f0e"
        },
        "Cat": {
          "color": "#2ca02c"
        },
        "Cow": {
          "color": "#d62728"
        },
        "Dog": {
          "color": "#2acf59"
        }
      },
      "src": "URL of overlay image",
    }
  }'
> ... </crowd-image-classifier>
```

An instance-segmentation task would use the `overlay` value as follows:

```
<crowd-image-classifier
  name='crowd-image-classifier'
  categories='["good", "bad"]'
  src='URL of image to be classified'
  header='Please classify instances of each category'
  overlay='{
    "instanceSegmentation": {
       "labels": ["Cat", "Dog", "Bird", "Cow"],
       "instances": [
        {
         "color": "#2ca02c",
         "label": "Cat"
        },
        {
```

```
          "color": "#1f77b4",
          "label": "Cat"
         },
         {
          "color": "#d62728",
          "label": "Dog"
         }
        ],
        "src": "URL of overlay image",
    }
  }'
> ... </crowd-image-classifier>
```

src

The URL of the image to be classified.

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form
- **Child elements**: full-instructions, short-instructions, worker-comment

Regions

The following regions are used by this element.

full-instructions

General instructions for the worker on how to classify an image.

short-instructions

Important task-specific instructions that are displayed in a prominent place.

worker-comment

Use this in verification workflows when you need workers to explain why they made the choice they did. Use the text between the opening and closing tags to provide instructions for workers on what information should be included in the comment.

It uses the following attributes:

header

A phrase with a call to action for leaving a comment. Used as the title text for a modal window where the comment is added.

Optional. Defaults to "Add a comment."

link-text

This text appears below the categories in the widget. When clicked, it opens a modal window where the worker may add a comment.

Optional. Defaults to "Add a comment."

placeholder

An example text in the comment text area that is overwritten when worker begins to type. This does not appear in output if the worker leaves the field blank.

Optional. Defaults to blank.

Output

The output of this element is a string that specifies one of the values defined in the *categories* attribute of the <crowd-image-classifier> element.

Example : Sample Element Outputs

The following is a sample of output from this element.

```
[
  {
    "<name>": {
      "label": "<value>"
      "workerComment": "Comment - if no comment is provided, this field will not be
 present"
    }
  }
]
```

See Also

For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data
- Crowd HTML Elements Reference

crowd-image-classifier-multi-select

A widget for classifying an image into one or more categories. Use one of the following supported image formats: APNG, BMP, GIF, ICO, JPEG, PNG, SVG. Images do not have a size limit.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of an HTML worker task template built using this crowd element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-image-classifier-multi-select
    name="animals"
    categories="['Cat', 'Dog', 'Horse', 'Pig', 'Bird']"
    src="https://images.unsplash.com/photo-1509205477838-a534e43a849f?
ixlib=rb-1.2.1&ixid=eyJhcHBfaWQiOjEyMDd9&auto=format&fit=crop&w=1998&q=80"
    header="Please identify the animals in this image"
    exclusion-category="{ text: 'None of the above' }"
  >
    <full-instructions header="Classification Instructions">
      <p>If more than one label applies to the image, select multiple labels.</p>
      <p>If no labels apply, select <b>None of the above</b></p>
    </full-instructions>

    <short-instructions>
      <p>Read the task carefully and inspect the image.</p>
      <p>Choose the appropriate label(s) that best suit the image.</p>
    </short-instructions>
  </crowd-image-classifier-multi-select>
</crowd-form>
```

Attributes

The following attributes are supported by the `crowd-image-classifier-multi-select` element. Each attribute accepts a string value or string values.

categories

Required. A JSON-formatted array of strings, each of which is a category that a worker can assign to the image. A worker must choose at least one category and can choose all categories.

header

Required. The text to display above the image. This is typically a question or simple instruction for workers.

name

Required. The name of this widget. In the form output, the name is used as a key for the widget's input.

src

Required. The URL of the image to be classified.

exclusion-category

Optional. A JSON-formatted string with the following format: "`{ text: 'default-value' }`". This attribute sets a default value that workers can choose if none of the labels applies to the image shown in the worker UI.

Element Hierarchy

This element has the following parent and child elements:

- **Parent elements**: crowd-form
- **Child elements**: full-instructions, short-instructions, worker-comment

Regions

This element uses the following regions

full-instructions

General instructions for the worker on how to classify an image.

short-instructions

Important task-specific instructions. These instructions are displayed prominently.

Output

The output of this element is a string that specifies one or more of the values defined in the `categories` attribute of the `<crowd-image-classifier-multi-select>` element.

Example : Sample Element Outputs

The following is a sample of output from this element.

```
[
  {
    "<name>": {
        labels: ["label_a", "label_b"]
    }
  }
]
```

See Also

For more information, see the following:

- Image Classification (Multi-label)
- Use Amazon SageMaker Ground Truth to Label Data
- Crowd HTML Elements Reference

crowd-input

A box that accepts input data.

> **Cannot be self-closing**
>
> Unlike the `input` element in the HTML standard, this element cannot be self-closed by putting a slash before the ending bracket, e.g. `<crowd-input ... />`. It must be followed with a `</crowd-input>` to close the element.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a Liquid template that uses the `<crowd-input>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <img style="max-width: 35vw; max-height: 50vh" src="{{ task.input.taskObject |
 grant_read_access }}">
  <crowd-input name="tag1" label="Word/phrase 1" required></crowd-input>
  <crowd-input name="tag2" label="Word/phrase 2" required></crowd-input>
  <crowd-input name="tag3" label="Word/phrase 3" required></crowd-input>

  <short-instructions>
    Your custom quick instructions and examples
  </short-instructions>

  <full-instructions>
    Your custom detailed instracutions and more examples
  </full-instructions>
</crowd-form>
```

Attributes

The following attributes are supported by this element.

allowed-pattern

A regular expression that is used with the *auto-validate* attribute to ignore non-matching characters as the worker types.

auto-focus

When the value is set to true, the browser places focus inside the input area after loading. This way, the worker can start typing without having to select it first.

auto-validate

A Boolean switch that, if present, turns on input validation. The behavior of the validator can be modified by the *error-message* and *allowed-pattern* attributes.

disabled

A Boolean switch that, if present, displays the input area as disabled.

error-message

The text to be displayed below the input field, on the left side, if validation fails.

label

A string that is displayed inside a text field.

This text shrinks and rises up above a text field when the worker starts typing in the field or when the *value* attribute is set.

max-length

A maximum number of characters the input will accept. Input beyond this limit is ignored.

min-length

A minimum length for the input in the field

name

Sets the name of the input to be used in the DOM and the output of the form.

placeholder

A string value that is used as placeholder text, displayed until the worker starts entering data into the input, It is not used as a default value.

required

A Boolean switch that, if present, requires the worker to provide input.

type

Takes a string to set the HTML5 `input-type` behavior for the input. Examples include `file` and `date`.

value

A preset that becomes the default if the worker does not provide input. The preset appears in a text field.

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form
- **Child elements**: none

Output

Provides a name string as the property name, and the text that was entered in the field as its value.

Example : Sample JSON Output

The values for multiple elements are output in the same object, with their name attribute value as their property name. Elements with no input do not appear in the output. For example, let's use three inputs:

```
<crowd-input name="tag1" label="Word/phrase 1"></crowd-input>
<crowd-input name="tag2" label="Word/phrase 2"></crowd-input>
<crowd-input name="tag3" label="Word/phrase 3"></crowd-input>
```

This is the output if only two have input:

```
[
  {
    "tag1": "blue",
    "tag2": "red"
  }
]
```

This means any code built to parse these results should be able to handle the presence or absence of each input in the answers.

See Also

For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data
- Crowd HTML Elements Reference

crowd-instance-segmentation

A widget for identifying individual instances of specific objects within an image and creating a colored overlay for each labeled instance.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a Liquid template that uses the <crowd-instance-segmentation>. Copy the following code and save it in a file with the extension .html. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-instance-segmentation
    name="annotatedResult"
    src="{{ task.input.taskObject | grant_read_access }}"
    header="Please label each of the requested objects in this image"
    labels="['Cat', 'Dog', 'Bird']"
  >
    <full-instructions header="Segmentation Instructions">
      <ol>
          <li><strong>Read</strong> the task carefully and inspect the image.</li>
          <li><strong>Read</strong> the options and review the examples provided to
 understand more about the labels.</li>
          <li><strong>Choose</strong> the appropriate label that best suits the
 image.</li>
      </ol>
    </full-instructions>

    <short-instructions>
      <p>Use the tools to label all instances of the requested items in the image</p>
    </short-instructions>
  </crowd-instance-segmentation>
</crowd-form>
```

Use a template similar to the following to allow workers to add their own categories (labels).

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-instance-segmentation
    id="annotator"
    name="myTexts"
    src="{{ task.input.taskObject | grant_read_access }}"
    header="Click Instructions to add new labels."
    labels="['placeholder']"
  >
    <short-instructions>
      <h3>Add a label to describe each type of object in this image.</h3>
      <h3>Cover each instance of each object with a segmentation mask.</h3>
```

```
      <br>
      <h3>
        Add new label
      </h3>
      <crowd-input name="_customLabel" id="customLabel"></crowd-input>
      <crowd-button id="addLabel">Add</crowd-button>

      <br><br><br>
      <h3>
      Manage labels
      </h3>
      <div id="labelsSection"></div>
    </short-instructions>

    <full-instructions>
      Describe your task in more detail here.
    </full-instructions>
  </crowd-instance-segmentation>
</crowd-form>

<script>
  document.addEventListener('all-crowd-elements-ready', function(event) {
    document.querySelector('crowd-instance-segmentation').labels = [];
  });

  function populateLabelsSection() {
    labelsSection.innerHTML = '';
    annotator.labels.forEach(function(label) {
      const labelContainer = document.createElement('div');
      labelContainer.innerHTML = label + ' <a href="javascript:void(0)">(Delete)</a>';
      labelContainer.querySelector('a').onclick = function() {
        annotator.labels = annotator.labels.filter(function(l) {
          return l !== label;
        });
        populateLabelsSection();
      };
      labelsSection.appendChild(labelContainer);
    });
  }

  addLabel.onclick = function() {
    annotator.labels = annotator.labels.concat([customLabel.value]);
    customLabel.value = null;
```

```
    populateLabelsSection();
  };
</script>
```

Attributes

The following attributes are supported by this element.

header

The text to display above the image. This is typically a question or simple instruction for the worker.

labels

A JSON formatted array of strings, each of which is a label that a worker can assign to an instance of an object in the image. Workers can generate different overlay colors for each relevant instance by selecting "add instance" under the label in the tool.

name

The name of this widget. It is used as a key for the labeling data in the form output.

src

The URL of the image that is to be labeled.

initial-value

A JSON object containing the color mappings of a prior instance segmentation job and a link to the overlay image output by the prior job. Include this when you want a human worker to verify the results of a prior labeling job and adjust it if necessary.

The attribute will appear as follows:

```
  initial-value="{
    "instances": [
      {
        "color": "#2ca02c",
        "label": "Cat"
      },
      {
```

```
        "color": "#1f77b4",
        "label": "Cat"
      },
      {
        "color": "#d62728",
        "label": "Dog"
      }
    ],
    "src": {{ "S3 file URL for image" | grant_read_access }}
  }"
```

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form
- **Child elements**: full-instructions, short-instructions

Regions

The following regions are supported by this element.

full-instructions

General instructions about how to do image segmentation.

short-instructions

Important task-specific instructions that are displayed in a prominent place.

Output

The following output is supported by this element.

labeledImage

A JSON Object containing a Base64 encoded PNG of the labels.

instances

A JSON Array containing objects with the instance labels and colors.

- **color** – The hexadecimal value of the label's RGB color in the `labeledImage` PNG.
- **label** – The label given to overlay(s) using that color. This value may repeat, because the different instances of the label are identified by their unique color.

inputImageProperties

A JSON object that specifies the dimensions of the image that is being annotated by the worker. This object contains the following properties.

- **height** – The height, in pixels, of the image.
- **width** – The width, in pixels, of the image.

Example : Sample Element Outputs

The following is an example of output from this element.

```
[
  {
    "annotatedResult": {
      "inputImageProperties": {
        "height": 533,
        "width": 800
      },
      "instances": [
        {
          "color": "#1f77b4",
          "label": "<Label 1>":
        },
        {
          "color": "#2ca02c",
          "label": "<Label 1>":
        },
        {
          "color": "#ff7f0e",
          "label": "<Label 3>":
        },
      ],
      "labeledImage": {
        "pngImageData": "<Base-64 Encoded Data>"
      }
    }
```

```
  }
]
```

crowd-instructions

An element that displays instructions on three tabbed pages, **Summary**, **Detailed Instructions**, and **Examples**, when the worker clicks on a link or button.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a Liquid template that used the `<crowd-instructions>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
   <crowd-instructions link-text="View instructions" link-type="button">
    <short-summary>
      <p>Given an image, write three words or short phrases that summarize its
 contents.</p>
    </short-summary>
    <detailed-instructions>
      <p>Imagine that you are describing an image to a friend or tagging it for a news
 website. Provide three specific words or short phrases that describe it.</p>
    </detailed-instructions>
    <positive-example>
      <p><img src="https://s3.amazonaws.com/cv-demo-images/highway.jpg"/></p>
      <p>
       <ul>
        <li>Highway</li>
        <li>Cars</li>
        <li>Gas station</li>
       </ul>
      </p>
```

```
    </positive-example>
    <negative-example>
      <p><img src="https://s3.amazonaws.com/cv-demo-images/highway.jpg"/></p>
      <p>
       These are not specific enough:
       <ol>
        <li>Trees</li>
        <li>Outside</li>
        <li>Daytime</li>
       </ol>
      </p>
    </negative-example>
 </crowd-instructions>
    <p><strong>Instructions: </strong>Given an image, write three words or short
 phrases that summarize its contents.</p>
    <p>If someone were to see these three words or phrases, they should understand the
 subject and context of the image, as well as any important actions.</p>
 <p>View the instructions for detailed instructions and examples.</p>
 <p><img style="max-width: 100%; max-height: 100%" src="{{ task.input.taskObject |
 grant_read_access }}"></p>
  <crowd-input name="tag1" label="Word/phrase 1" required></crowd-input>
  <crowd-input name="tag2" label="Word/phrase 2" required></crowd-input>
  <crowd-input name="tag3" label="Word/phrase 3" required></crowd-input>
</crowd-form>
```

Attributes

The following attributes are supported by this element.

link-text

The text to display for opening the instructions. The default is **Click for instructions**.

link-type

A string that specifies the type of trigger for the instructions. The possible values are "link" (default) and "button".

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form
- **Child elements**: none

Regions

The following regions are supported by this element.

detailed-instructions

Content that provides specific instructions for a task. This appears on the page of the "Detailed Instructions" tab.

negative-example

Content that provides examples of inadequate task completion. This appears on the page of the "Examples" tab. More than one example may be provided within this element.

positive-example

Content that provides examples of proper task completion. This appears on the page of the "Examples" tab.

short-summary

A brief statement that summarizes the task to be completed. This appears on the page of the "Summary" tab. More than one example may be provided within this element.

crowd-keypoint

Generates a tool to select and annotate key points on an image.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of an Liquid template that uses the `<crowd-keypoint>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
```

```
<crowd-form>
  <div id="errorBox"></div>

  <crowd-keypoint
    src="{{ task.input.taskObject | grant_read_access }}"
    labels="['Item A', 'Item B', 'Item C']"
    header="Please locate the centers of each item."
    name="annotatedResult">
    <short-instructions>
      Describe your task briefly here and give examples
    </short-instructions>
    <full-instructions>
      Give additional instructions and good/bad examples here
    </full-instructions>
  </crowd-keypoint>
</crowd-form>

<script>
  var num_obj = 1;

  document.querySelector('crowd-form').onsubmit = function(e) {
    const keypoints = document.querySelector('crowd-keypoint').value.keypoints ||
 document.querySelector('crowd-keypoint')._submittableValue.keypoints;
    const labels = keypoints.map(function(p) {
      return p.label;
    });

    // 1. Make sure total number of keypoints is correct.
    var original_num_labels = document.getElementsByTagName("crowd-keypoint")
[0].getAttribute("labels");

    original_num_labels = original_num_labels.substring(2, original_num_labels.length -
 2).split("\",\"");
    var goalNumKeypoints = num_obj*original_num_labels.length;
    if (keypoints.length != goalNumKeypoints) {
      e.preventDefault();
      errorBox.innerHTML = '<crowd-alert type="error" dismissible>You must add all
 keypoint annotations and use each label only once.</crowd-alert>';
      errorBox.scrollIntoView();
      return;
    }

    // 2. Make sure all labels are unique.
    labelCounts = {};
```

```
    for (var i = 0; i < labels.length; i++) {
      if (!labelCounts[labels[i]]) {
        labelCounts[labels[i]] = 0;
      }
      labelCounts[labels[i]]++;
    }
    const goalNumSingleLabel = num_obj;

    const numLabels = Object.keys(labelCounts).length;

    Object.entries(labelCounts).forEach(entry => {
      if (entry[1] != goalNumSingleLabel) {
        e.preventDefault();
        errorBox.innerHTML = '<crowd-alert type="error" dismissible>You must use each
 label only once.</crowd-alert>';
        errorBox.scrollIntoView();
      }
    })
  };
</script>
```

Attributes

The following attributes are supported by this element.

header

The text to display above the image. This is typically a question or simple instruction for the worker.

initial-value

An array, in JSON format, of keypoints to be applied to the image on start. For example:

```
initial-value="[
  {
    'label': 'Left Eye',
    'x': 1022,
    'y': 429
  },
  {
    'label': 'Beak',
    'x': 941,
```

```
    'y': 403
  }
]
```

> **Note**
>
> Please note that label values used in this attribute must have a matching value in the `labels` attribute or the point will not be rendered.

labels

An array, in JSON format, of strings to be used as keypoint annotation labels.

name

A string used to identify the answer submitted by the worker. This value will match a key in the JSON object that specifies the answer.

src

The source URI of the image to be annotated.

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form
- **Child elements**: full-instructions, short-instructions

Regions

The following regions are required by this element.

full-instructions

General instructions about how to annotate the image.

short-instructions

Important task-specific instructions that are displayed in a prominent place.

Output

The following output is supported by this element.

inputImageProperties

A JSON object that specifies the dimensions of the image that is being annotated by the worker. This object contains the following properties.

- **height** – The height, in pixels, of the image.
- **width** – The width, in pixels, of the image.

keypoints

An array of JSON objects containing the coordinates and label of a keypoint. Each object contains the following properties.

- **label** – The assigned label for the keypoint.
- **x** – The X coordinate, in pixels, of the keypoint on the image.
- **y** – The Y coordinate, in pixels, of the keypoint on the image.

> **Note**
>
> X and Y coordinates are based on 0,0 being the top left corner of the image.

Example : Sample Element Outputs

The following is a sample output from using this element.

```
[
  {
    "crowdKeypoint": {
      "inputImageProperties": {
        "height": 1314,
        "width": 962
      },
      "keypoints": [
        {
```

```
          "label": "dog",
          "x": 155,
          "y": 275
        },
        {
          "label": "cat",
          "x": 341,
          "y": 447
        },
        {
          "label": "cat",
          "x": 491,
          "y": 513
        },
        {
          "label": "dog",
          "x": 714,
          "y": 578
        },
        {
          "label": "cat",
          "x": 712,
          "y": 763
        },
        {
          "label": "cat",
          "x": 397,
          "y": 814
        }
      ]
    }
  }
]
```

You may have many labels available, but only the ones that are used appear in the output.

crowd-line

A widget for drawing lines on an image. Each line is associated with a label, and output data will report the starting and ending points of each line.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a Liquid template that uses the `<crowd-line>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template. For more examples, see this GitHub repository.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-line
    name="crowdLine"
    src="{{ task.input.taskObject | grant_read_access }}"
    header="Add header here to describe the task"
    labels="['car','pedestrian','street car']"
  >
    <short-instructions>
        <p>Read the task carefully and inspect the image.</p>
        <p>Choose the appropriate label that best suits the image.</p>
        <p>Draw a line on each objects that the label applies to.</p>
    </short-instructions>

    <full-instructions>
        <p>Read the task carefully and inspect the image.</p>
        <p>Choose the appropriate label that best suits the image.
        <p>Draw a line along each object that the image applies to.
            Make sure that the line does not extend beyond the boundaries
            of the object.
        </p>
        <p>Each line is defined by a starting and ending point. Carefully
        place the starting and ending points on the boundaries of the object.</p>
    </full-instructions>

  </crowd-line>
</crowd-form>
```

Attributes

The following attributes are supported by this element.

header

Optional. The text to display above the image. This is typically a question or simple instruction for the worker.

initial-value

Optional. An array of JSON objects, each of which sets a line when the component is loaded. Each JSON object in the array contains the following properties:

- **label** – The text assigned to the line as part of the labeling task. This text must match one of the labels defined in the *labels* attribute of the `<crowd-line>` element.
- **vertices** – the `x` and `y` pixel corrdinates of the start point and end point of the line, relative to the top-left corner of the image.

```
initial-value="{
    lines: [
    {
        label: 'sideline', // label of this line annotation
        vertices:[         // an array of vertices which decide the position of the
 line
        {
            x: 84,
            y: 110
        },
        {
            x: 60,
            y: 100
        }
        ]
    },
    {
        label: 'yardline',
        vertices:[
        {
            x: 651,
            y: 498
        },
        {
            x: 862,
            y: 869
        }
```

```
        ]
     }
   ]
}"
```

Lines set via the `initial-value` property can be adjusted. Whether or not a worker answer was adjusted is tracked via an `initialValueModified` boolean in the worker answer output.

labels

Required. A JSON formatted array of strings, each of which is a label that a worker can assign to the line.

Limit: 10 labels

label-colors

Optional. An array of strings. Each string is a hexadecimal (hex) code for a label.

name

Required. The name of this widget. It's used as a key for the widget's input in the form output.

src

Required. The URL of the image on which to draw lines.

Regions

The following regions are required by this element.

full-instructions

General instructions about how to draw lines.

short-instructions

Important task-specific instructions that are displayed in a prominent place.

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form
- **Child elements**: short-instructions, full-instructions

Output

inputImageProperties

A JSON object that specifies the dimensions of the image that is being annotated by the worker. This object contains the following properties.

- **height** – The height, in pixels, of the image.
- **width** – The width, in pixels, of the image.

lines

A JSON Array containing objects with the line labels and vertices.

- **label** – The label given to a line.
- vertices – the x and y pixel corrdinates of the start point and end point of the line, relative to the top-left corner of the image.

Example : Sample Element Outputs

The following is an example of output from this element.

```
{
    "crowdLine": { //This is the name you set for the crowd-line
      "inputImageProperties": {
        "height": 1254,
        "width": 2048
      },
      "lines": [
        {
          "label": "yardline",
          "vertices": [
            {
              "x": 58,
              "y": 295
            },
            {
              "x": 1342,
              "y": 398
            }
          ]
```

```
        },
        {
          "label": "sideline",
          "vertices": [
            {
              "x": 472,
              "y": 910
            },
            {
              "x": 1480,
              "y": 600
            }
          ]
        }
      ]
    }
  }
```

crowd-modal

A small window that pops up on the display when it is opened.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of the syntax that you can use with the `<crowd-modal>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-modal
link-text = "See Examples"
link-type = "button">
Example Modal Text</crowd-modal>
```

Attributes

The following attributes are supported by this element.

link-text

The text to display for opening the modal. The default is "Click to open modal".

link-type

A string that specifies the type of trigger for the modal. The possible values are "link" (default) and "button".

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form
- **Child elements**: none

See Also

For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data
- Crowd HTML Elements Reference

crowd-polygon

A widget for drawing polygons on an image and assigning a label to the portion of the image that is enclosed in each polygon.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a Liquid template that uses the `<crowd-polygon>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
```

```
  <crowd-polygon
    name="annotatedResult"
    src="{{ task.input.taskObject | grant_read_access }}"
    header="Draw a polygon around each of the requested target(s) of interest"
    labels="['Cat', 'Dog', 'Bird']"
  >
    <full-instructions header="Polygon instructions">
      <ul>
        <li>Make the polygon tight around the object</li>
        <li>You need to select a label before starting a polygon</li>
        <li>You will need to select a label again after completing a polygon</li>
        <li>To select a polygon, you can click on its borders</li>
        <li>You can start drawing a polygon from inside another polygon</li>
        <li>You can undo and redo while you're drawing a polygon to go back and forth
 between points you've placed</li>
        <li>You are prevented from drawing lines that overlap other lines from the same
 polygon</li>
      </ul>
    </full-instructions>

    <short-instructions>
      <p>Draw a polygon around each of the requested target(s) of interest</p>
      <p>Make the polygon tight around the object</p>
    </short-instructions>
  </crowd-polygon>
</crowd-form>
```

Attributes

The following attributes are supported by this element.

header

The text to display above the image. This is typically a question or simple instruction for the worker.

labels

A JSON formatted array of strings, each of which is a label that a worker can assign to the image portion enclosed by a polygon.

name

The name of this widget. It's used as a key for the widget's input in the form output.

src

The URL of the image on which to draw polygons.

initial-value

An array of JSON objects, each of which defines a polygon to be drawn when the component is loaded. Each JSON object in the array contains the following properties.

- **label** – The text assigned to the polygon as part of the labeling task. This text must match one of the labels defined in the *labels* attribute of the <crowd-polygon> element.
- **vertices** – An array of JSON objects. Each object contains an x and y coordinate value for a point in the polygon.

Example

An `initial-value` attribute might look something like this.

```
initial-value =
  '[
     {
     "label": "dog",
     "vertices":
       [
         {
            "x": 570,
            "y": 239
         },
        ...
         {
            "x": 759,
            "y": 281
         }
       ]
     }
  ]'
```

Because this will be within an HTML element, the JSON array must be enclosed in single or double quotes. The example above uses single quotes to encapsulate the JSON and double quotes within the JSON itself. If you must mix single and double quotes inside your JSON, replace them with their HTML entity codes (`"` for double quote, `'` for single) to safely escape them.

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form
- **Child elements**: full-instructions, short-instructions

Regions

The following regions are required.

full-instructions

General instructions about how to draw polygons.

short-instructions

Important task-specific instructions that are displayed in a prominent place.

Output

The following output is supported by this element.

polygons

An array of JSON objects, each of which describes a polygon that has been created by the worker. Each JSON object in the array contains the following properties.

- **label** – The text assigned to the polygon as part of the labeling task.
- **vertices** – An array of JSON objects. Each object contains an x and y coordinate value for a point in the polygon. The top left corner of the image is 0,0.

inputImageProperties

A JSON object that specifies the dimensions of the image that is being annotated by the worker. This object contains the following properties.

- **height** – The height, in pixels, of the image.
- **width** – The width, in pixels, of the image.

Example : Sample Element Outputs

The following are samples of outputs from common use scenarios for this element.

Single Label, Single Polygon

```
{
    "annotatedResult":
    {
      "inputImageProperties": {
        "height": 853,
        "width": 1280
      },
      "polygons":
      [
        {
          "label": "dog",
          "vertices":
          [
            {
              "x": 570,
              "y": 239
            },
            {
              "x": 603,
              "y": 513
            },
            {
              "x": 823,
              "y": 645
            },
            {
              "x": 901,
              "y": 417
            },
            {
              "x": 759,
              "y": 281
            }
          ]
        }
      ]
    }
  }
```

```
]
```

Single Label, Multiple Polygons

```
[
  {
    "annotatedResult": {
      "inputImageProperties": {
        "height": 853,
        "width": 1280
      },

            },
            {
              "x": 1116,
              "y": 519
            },
            {
              "x": 1174,
              "y": 498
            },
            {
              "x": 1227,
              "y": 479
            },
            {
              "x": 1179,
              "y": 405
            },
            {
              "x": 1179,
              "y": 337
            }
          ]
        }
      ]
    }
  }
]
```

Multiple Labels, Multiple Polygons

```
[
  {
    "annotatedResult": {
      "inputImageProperties": {
        "height": 853,
```

```
        "width": 1280
      },
      "polygons": [
        {
          "label": "dog",
          "vertices": [
            {
              "x": 570,
              "y": 239
            },
            {
              "x": 603,
              "y": 513
            },
            {
              "x": 823,
              "y": 645
            },
            {
              "x": 901,
              "y": 417
            },
            {
              "x": 759,
              "y": 281
            }
          ]
        },
        {
          "label": "cat",
          "vertices": [
            {
              "x": 870,
              "y": 278
            },
            {
              "x": 908,
              "y": 446
            },
            {
              "x": 1009,
              "y": 602
            },
            {
```

```
              "x": 1116,
              "y": 519
            },
            {
              "x": 1174,
              "y": 498
            },
            {
              "x": 1227,
              "y": 479
            },
            {
              "x": 1179,
              "y": 405
            },
            {
              "x": 1179,
              "y": 337
            }
          ]
        }
      ]
    }
  }
]
```

You could have many labels available, but only the ones that are used appear in the output.

crowd-polyline

A widget for drawing polylines or lines on an image. Each polyline is associated with a label and can include two or more vertices. A polyline can intersect itself and its starting and ending points can be placed anywhere on the image.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a Liquid template that uses the `<crowd-polyline>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template. For more examples, see this GitHub repository.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-polyline
    name="crowdPolyline"
    src="{{ task.input.taskObject | grant_read_access }}"
    header="Add header here to describe the task"
    labels="['car','pedestrian','street car']"
  >
    <full-instructions>
        <p>Read the task carefully and inspect the image.</p>
        <p>Choose the appropriate label that best suits the image.</p>
        <p>Draw a polyline around the boundaries of all objects
        that the label applies to.</p>
        <p>Use the <b>Enter</b> key to complete a polyline.</p>
        <p>Make sure that the polyline fits tightly around the boundary
        of the object.</p>
    </full-instructions>

    <short-instructions>
        <p>Read the task carefully and inspect the image.</p>
        <p>Review the tool guide to learn how to use the polyline tool.</p>
        <p>Choose the appropriate label that best suits the image.</p>
        <p>To draw a polyline, select a label that applies to an object of interest
            and add a single point to the photo by clicking on that point. Continue to
            draw the polyline around the object by adding additional points
            around the object boundary.</p>
        <p>After you place the final point on the polyline, press <b>Enter</b> on your
        keyboard to complete the polyline.</p>

    </short-instructions>
  </crowd-polyline>
</crowd-form>
```

Attributes

The following attributes are supported by this element.

header

Optional. The text to display above the image. This is typically a question or simple instruction for the worker.

initial-value

Optional. An array of JSON objects, each of which sets a polyline when the component is loaded. Each JSON object in the array contains the following properties:

- **label** – The text assigned to the polyline as part of the labeling task. This text must match one of the labels defined in the *labels* attribute of the `<crowd-polyline>` element.
- **vertices** – the `x` and `y` pixel corrdinates of the vertices of a polyline, relative to the top-left corner of the image.

```
initial-value= "{
   polylines: [
   {
       label: 'sideline', // label of this line annotation
       vertices:[         // an array of vertices which decide the position of the
line
       {
           x: 84,
           y: 110
       },
       {
           x: 60,
           y: 100
       }
       ]
   },
   {
       label: 'yardline',
       vertices:[
       {
           x: 651,
           y: 498
       },
       {
           x: 862,
           y: 869
       },
```

```
        {
            x: 1000,
            y: 869
        }
        ]
    }
   ]
}"
```

Polylines set via the `initial-value` property can be adjusted. Whether or not a worker answer was adjusted is tracked via an `initialValueModified` boolean in the worker answer output.

labels

Required. A JSON formatted array of strings, each of which is a label that a worker can assign to the line.

Limit: 10 labels

label-colors

Optional. An array of strings. Each string is a hexadecimal (hex) code for a label.

name

Required. The name of this widget. It's used as a key for the widget's input in the form output.

src

Required. The URL of the image on which to draw polylines.

Regions

The following regions are required by this element.

full-instructions

General instructions about how to draw polylines.

short-instructions

Important task-specific instructions that are displayed in a prominent place.

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form
- **Child elements**: short-instructions, full-instructions

Output

inputImageProperties

A JSON object that specifies the dimensions of the image that is being annotated by the worker. This object contains the following properties.

- **height** – The height, in pixels, of the image.
- **width** – The width, in pixels, of the image.

polylines

A JSON Array containing objects with polylines' labels and vertices.

- **label** – The label given to a line.
- vertices – the x and y pixel corrdinates of the vertices of a polyline, relative to the top-left corner of the image.

Example : Sample Element Outputs

The following is an example of output from this element.

```
{
   "crowdPolyline": { //This is the name you set for the crowd-polyline
     "inputImageProperties": {
       "height": 1254,
       "width": 2048
     },
     "polylines": [
       {
         "label": "sideline",
```

```
          "vertices": [
            {
              "x": 651,
              "y": 498
            },
            {
              "x": 862,
              "y": 869
            },
            {
              "x": 1449,
              "y": 611
            }
          ]
        },
        {
          "label": "yardline",
          "vertices": [
            {
              "x": 1148,
              "y": 322
            },
            {
              "x": 1705,
              "y": 474
            },
            ,
            {
              "x": 1755,
              "y": 474
            }
          ]
        }
      ]
    }
  }
```

See Also

For more information, see the following.

crowd-radio-button

A button that can be either checked or unchecked. When radio buttons are inside a radio group, exactly one radio button in the group can be checked at any time. The following is an example of how to configure a `crowd-radio-button` element inside of a `crowd-radio-group` element.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of the syntax that you can use with the `<crowd-radio-button>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
<crowd-radio-group>
    <crowd-radio-button name="tech" value="tech">Technology</crowd-radio-button>
    <crowd-radio-button name="politics" value="politics">Politics</crowd-radio-button>
</crowd-radio-group>
</crowd-form>
```

The previous example can be seen in a custom worker task template in this GitHub example: entity recognition labeling job custom template.

Crowd HTML Element radio buttons do not support the HTML tag, `required`. To make a radio button selection required, use `<input type="radio">` elements to create radio buttons and add the `required` tag. The `name` attribute for all `<input>` elements that belong to the same group of radio buttons must be the same. For example, the following template requires the user to select a radio button in the `animal-type` group before submitting.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <p>Select an animal type:</p>
<img src="https://images.unsplash.com/photo-1537151608828-ea2b11777ee8?
ixlib=rb-1.2.1&ixid=eyJhcHBfaWQiOjEyMDd9&auto=format&fit=crop&w=1539&q=80"
 style="height: 500; width: 400;"/>
<br><br>
<div>
  <input type="radio" id="cat" name="animal-type" value="cat" required>
  <label for="cat">Cat</label>
</div>
<div>
```

```
  <input type="radio" id="dog" name="animal-type" value="dog">
  <label for="dog">Dog</label>
</div>
<div>
  <input type="radio" id="unknown" name="animal-type" value="unknown">
  <label for="unknown">Unknown</label>
</div>
    <full-instructions header="Classification Instructions">
      <p>Read the task carefully and inspect the image.</p>
      <p>Choose the appropriate label that best suits the image.</p>
    </full-instructions>
    <short-instructions>
      <p>Read the task carefully and inspect the image.</p>
      <p>Choose the appropriate label that best suits the image.</p>
    </short-instructions>
</crowd-form>
```

Attributes

The following attributes are supported by this element.

checked

A Boolean switch that, if present, displays the radio button as checked.

disabled

A Boolean switch that, if present, displays the button as disabled and prevents it from being checked.

name

A string that is used to identify the answer submitted by the worker. This value will match a key in the JSON object that specifies the answer.

> **Note**
>
> If you use the buttons outside of a crowd-radio-group element, but with the same `name` string and different `value` strings, the `name` object in the output will contain a Boolean value for each `value` string. To ensure that only one button in a group is selected, make them children of a crowd-radio-group element and use different name values.

value

A property name for the element's boolean value. If not specified, it uses "on" as the default, e.g. `{ "<name>": { "<value>": <true or false> } }`.

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-radio-group
- **Child elements**: none

Output

Outputs an object with the following pattern: `{ "<name>": { "<value>": <true or false> } }`. If you use the buttons outside of a crowd-radio-group element, but with the same `name` string and different `value` strings, the name object will contain a Boolean value for each `value` string. To ensure that only one in a group of buttons is selected, make them children of a crowd-radio-group element and use different name values.

Example Sample output of this element

```
[
  {
    "btn1": {
      "yes": true
    },
    "btn2": {
      "no": false
    }
  }
]
```

- Use Amazon SageMaker Ground Truth to Label Data
- Crowd HTML Elements Reference

crowd-radio-group

A group of radio buttons. Only one radio button within the group can be selected. Choosing one radio button clears any previously chosen radio button within the same group. For an example of a custom UI template that uses the `crowd-radio-group` element, see this entity recognition labeling job custom template.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of the syntax that you can use with the `<crowd-radio-group>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<style>
 body {
  padding-left: 20px;
  margin-bottom: 20px;
 }
 #outer-container {
     display: flex;
     justify-content: space-around;
     max-width: 900px;
     margin-left: 100px;
 }
 .left-container {
     margin-right: auto;
     padding-right: 50px;
 }
 .right-container {
     margin-left: auto;
     padding-left: 50px;
 }
 #vertical-separator {
     border: solid 1px #d5dbdb;
 }
</style>

<crowd-form>
    <div>
        <h1>Instructions</h1>
```

```
 Lorem ipsum...
    </div>
    <div>
        <h2>Background</h2>

    </div>
</crowd-form>
```

Attributes

No special attributes are supported by this element.

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form

- **Child elements**: crowd-radio-button

Output

Outputs an array of objects representing the crowd-radio-button elements within it.

Example Sample of Element Output

```
[
  {
    "btn1": {
      "yes": true
    },
    "btn2": {
      "no": false
    }
  }
]
```

See Also

For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data
- Crowd HTML Elements Reference

crowd-semantic-segmentation

A widget for segmenting an image and assigning a label to each image segment.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a Liquid template that uses the `<crowd-semantic-segmentation>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-semantic-segmentation
    name="annotatedResult"
```

```
    src="{{ task.input.taskObject | grant_read_access }}"
    header="Please label each of the requested objects in this image"
    labels="['Cat', 'Dog', 'Bird']"
  >
    <full-instructions header="Segmentation Instructions">
      <ol>
          <li><strong>Read</strong> the task carefully and inspect the image.</li>
          <li><strong>Read</strong> the options and review the examples provided to
 understand more about the labels.</li>
          <li><strong>Choose</strong> the appropriate label that best suits the
 image.</li>
      </ol>
    </full-instructions>

    <short-instructions>
      <p>Use the tools to label the requested items in the image</p>
    </short-instructions>
  </crowd-semantic-segmentation>
</crowd-form>
```

Attributes

The following attributes are supported by this element.

header

The text to display above the image. This is typically a question or simple instruction for the worker.

initial-value

A JSON object containing the color mappings of a prior semantic segmentation job and a link to the overlay image output by the prior job. Include this when you want a human worker to verify the results of a prior labeling job and adjust it if necessary.

The attribute would appear as follows:

```
  initial-value='{
    "labelMappings": {
        "Bird": {
          "color": "#ff7f0e"
        },
        "Cat": {
```

```
          "color": "#2ca02c"
        },
        "Cow": {
          "color": "#d62728"
        },
        "Dog": {
          "color": "#1f77b4"
        }
      },
    "src": {{ "S3 file URL for image" | grant_read_access }}
  }'
```

When using Ground Truth built in task types with annotation consolidation (where more than one worker labels a single image), label mappings are included in individual worker output records, however the overall result is represented as the `internal-color-map` in the consolidated results.

You can convert the `internal-color-map` to `label-mappings` in a custom template using the Liquid templating language:

```
initial-value="{
  'src' : '{{ task.input.manifestLine.label-attribute-name-from-prior-job|
 grant_read_access }}',
  'labelMappings': {
     {% for box in task.input.manifestLine.label-attribute-name-from-prior-job-
metadata.internal-color-map %}
       {% if box[1]['class-name'] != 'BACKGROUND' %}
         {{ box[1]['class-name'] | to_json }}: {
           'color': {{ box[1]['hex-color'] | to_json }}
         },
       {% endif %}
     {% endfor %}
   }
}"
```

labels

A JSON formatted array of strings, each of which is a label that a worker can assign to a segment of the image.

name

The name of this widget. It is used as a key for the widget's input in the form output.

src

The URL of the image that is to be segmented.

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form
- **Child elements**: full-instructions, short-instructions

Regions

The following regions are supported by this element.

full-instructions

General instructions about how to do image segmentation.

short-instructions

Important task-specific instructions that are displayed in a prominent place.

Output

The following output is supported by this element.

labeledImage

A JSON Object containing a Base64 encoded PNG of the labels.

labelMappings

A JSON Object containing objects with named with the segmentation labels.

- **color** – The hexadecimal value of the label's RGB color in the `labeledImage` PNG.

initialValueModified

A boolean representing whether the initial values have been modified. This is only included when the output is from an adjustment task.

inputImageProperties

A JSON object that specifies the dimensions of the image that is being annotated by the worker. This object contains the following properties.

- **height** – The height, in pixels, of the image.
- **width** – The width, in pixels, of the image.

Example : Sample Element Outputs

The following is a sample of output from this element.

```
[
  {
    "annotatedResult": {
      "inputImageProperties": {
        "height": 533,
        "width": 800
      },
      "labelMappings": {
        "<Label 2>": {
          "color": "#ff7f0e"
        },
        "<label 3>": {
          "color": "#2ca02c"
        },
        "<label 1>": {
          "color": "#1f77b4"
        }
      },
      "labeledImage": {
        "pngImageData": "<Base-64 Encoded Data>"
      }
    }
  }
]
```

- Use Amazon SageMaker Ground Truth to Label Data

- Crowd HTML Elements Reference

crowd-slider

A bar with a sliding knob that allows a worker to select a value from a range of values by moving the knob. The slider makes it a great choice for settings that reflect intensity levels, such as volume, brightness, or color saturation.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a survey template that uses the `<crowd-slider>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
<crowd-instructions link-text="View instructions" link-type="button">
  <short-summary>
    <p>Provide a brief instruction here</p>
  </short-summary>

  <detailed-instructions>
    <h3>Provide more detailed instructions here</h3>
    <p>Include additional information</p>
  </detailed-instructions>

  <positive-example>
    <p>Provide an example of a good answer here</p>
    <p>Explain why it's a good answer</p>
  </positive-example>

  <negative-example>
    <p>Provide an example of a bad answer here</p>
    <p>Explain why it's a bad answer</p>
  </negative-example>
</crowd-instructions>

<div>
  <p>What is your favorite color for a bird?</p>
  <crowd-input name="favoriteColor" placeholder="example: pink" required></crowd-input>
```

```
</div>

<div>
  <p>Check this box if you like birds</p>
  <crowd-checkbox name="likeBirds" checked="true" required></crowd-checkbox>
</div>

<div>
  <p>On a scale of 1-10, how much do you like birds?</p>
  <crowd-slider name="howMuch" min="1" max="10" step="1" pin="true" required></crowd-
slider>
</div>

<div>
  <p>Write a short essay describing your favorite bird</p>
  <crowd-text-area name="essay" rows="4" placeholder="Lorem ipsum..." required></crowd-
text-area>
</div>
</crowd-form>
```

Attributes

The following attributes are supported by this element.

disabled

A Boolean switch that, if present, displays the slider as disabled.

editable

A Boolean switch that, if present, displays an up/down button that can be chosen to select the value.

Selecting the value via the up/down button is an alternative to selecting the value by moving the knob on the slider. The knob on the slider will move synchronously with the up/down button choices.

max

A number that specifies the maximum value on the slider.

min

A number that specifies the minimum value on the slider.

name

A string that is used to identify the answer submitted by the worker. This value will match a key in the JSON object that specifies the answer.

pin

A Boolean switch that, if present, displays the current value above the knob as the knob is moved.

required

A Boolean switch that, if present, requires the worker to provide input.

secondary-progress

When used with a `crowd-slider-secondary-color` CSS attribute, the progress bar is colored to the point represented by the `secondary-progress`. For example, if this was representing the progress on a streaming video, the `value` would represent where the viewer was in the video timeline. The `secondary-progress` value would represent the point on the timeline to which the video had buffered.

step

A number that specifies the difference between selectable values on the slider.

value

A preset that becomes the default if the worker does not provide input.

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form
- **Child elements**: none

</crowd-form>
```

Attributes

This element has no attributes.

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form
- **Child elements**: crowd-tab

See Also

For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data
- Crowd HTML Elements Reference

crowd-text-area

A field for text input.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a Liquid template designed to transcribe audio clips that uses the `<crowd-text-area>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <audio controls>
      <source src="{{ task.input.taskObject | grant_read_access }}" type="audio/mpeg">
      Your browser does not support the audio element.
  </audio>
  <h3>Instructions</h3>
  <p>Transcribe the audio</p>
  <p>Ignore "umms", "hmms", "uhs" and other non-textual phrases</p>
  <crowd-text-area name="transcription" rows="4"></crowd-text-area>
</crowd-form>
```

Attributes

The following attributes are supported by this element.

allowed-pattern

A regular expression that is used with the *auto-validate* attribute to ignore non-matching characters as the worker types.

auto-focus

A Boolean switch that, if present, puts the cursor in this element on-load so that users can immediately begin typing without having to click inside the element.

auto-validate

A Boolean switch that, if present, turns on input validation. The behavior of the validator can be modified by the *error-message* and *allowed-pattern* attributes.

char-counter

A Boolean switch that, if present, puts a small text field beneath the lower-right corner of the element, displaying the number of characters inside the element.

disabled

A Boolean switch that, if present, displays the input area as disabled.

error-message

The text to be displayed below the input field, on the left side, if validation fails.

label

A string that is displayed inside a text field.

This text shrinks and rises up above a text field when the worker starts typing in the field or when the *value* attribute is set.

max-length

An integer that specifies the maximum number of characters allowed by the element. Characters typed or pasted beyond the maximum are ignored.

max-rows

An integer that specifies the maximum number of rows of text that are allowed within a crowd-text-area. Normally the element expands to accommodate new rows. If this is set, after the number of rows exceeds it, content scrolls upward out of view and a scrollbar control appears.

name

A string used to represent the element's data in the output.

placeholder

A string presented to the user as placeholder text. It disappears after the user puts something in the input area.

rows

An integer that specifies the height of the element in rows of text.

value

A preset that becomes the default if the worker does not provide input. The preset appears in a text field.

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form
- **Child elements**: none

Output

This element outputs the `name` as a property name and the element's text contents as the value. Carriage returns in the text are represented as `\n`.

Example Sample output for this element

```
[
  {
    "textInput1": "This is the text; the text that\nmakes the crowd go wild."
  }
]
```

See Also

- Use Amazon SageMaker Ground Truth to Label Data
- Crowd HTML Elements Reference

crowd-toast

A subtle notification that temporarily appears on the display. Only one crowd-toast is visible.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following is an example of a Liquid template that uses the `<crowd-toast>` element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <p>Find the official website for: <strong>{{ task.input.company }}</strong></p>
  <p>Do not give Yelp pages, LinkedIn pages, etc.</p>
  <p>Include the http:// prefix from the website</p>
  <crowd-input name="website" placeholder="http://example.com"></crowd-input>

  <crowd-toast duration="10000" opened>
    This is a message that you want users to see when opening the template. This
 message will disappear in 10 seconds.
   </crowd-toast>

</crowd-form>
```

Attributes

The following attributes are supported by this element.

duration

A number that specifies the duration, in milliseconds, that the notification appears on the screen.

text

The text to display in the notification.

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form
- **Child elements**: none

See Also

For more information, see the following.

- Use Amazon SageMaker Ground Truth to Label Data
- Crowd HTML Elements Reference

crowd-toggle-button

A button that acts as an ON/OFF switch, toggling a state.

See an interactive example of an HTML template that uses this Crowd HTML Element in CodePen.

The following example shows different ways you can use to use the `<crowd-toggle-button>` HTML element. Copy the following code and save it in a file with the extension `.html`. Open the file in any browser to preview and interact with this template.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <!--Toggle button without value-->
  <crowd-toggle-button name="toggleButtonWithoutValue"></crowd-toggle-button>

  <!--Toggle button with value-->
  <crowd-toggle-button name="toggleButtonWithValue" value="someValue"></crowd-toggle-
button>

  <!--Toggle button disabled-->
  <crowd-toggle-button name="toggleButtonDisabled" disabled></crowd-toggle-button>

  <!--Toggle button marked invalid-->
  <crowd-toggle-button name="toggleButtonInvalid" invalid></crowd-toggle-button>

  <!--Toggle button marked required-->
  <crowd-toggle-button name="toggleButtonRequired" required></crowd-toggle-button>
</crowd-form>
```

Attributes

The following attributes are supported by this element.

checked

A Boolean switch that, if present, displays the button switched to the ON position.

disabled

A Boolean switch that, if present, displays the button as disabled and prevents toggling.

invalid

When in an off position, a button using this attribute, will display in an alert color. The standard is red, but may be changed in CSS. When toggled on, the button will display in the same color as other buttons in the on position.

name

A string that is used to identify the answer submitted by the worker. This value matches a key in the JSON object that specifies the answer.

required

A Boolean switch that, if present, requires the worker to provide input.

value

A value used in the output as the property name for the element's Boolean state. Defaults to "on" if not provided.

Element Hierarchy

This element has the following parent and child elements.

- **Parent elements**: crowd-form
- **Child elements**: none

Output

This element outputs the `name` as the name of an object, containing the `value` as a property name and the element's state as Boolean value for the property. If no value for the element is specified, the property name defaults to "on."

Example Sample output for this element

```
[
  {
    "theToggler": {
      "on": true
    }
  }
]
```

Augmented AI Crowd HTML Elements

The following Crowd HTML Elements are only available for Amazon Augmented AI human workflow tasks.

Topics

crowd-textract-analyze-document

A widget to enable human review of a Amazon Textract document analysis result.

Attributes

The following attributes are supported by this element.

header

This is the text that is displayed as the header.

src

This is a link to the image to be analyzed by the worker.

initialValue

This sets initial values for attributes found in the worker UI.

The following is an example of an `initialValue` input:

```
[
            {
                "blockType": "KEY_VALUE_SET",
                "confidence": 38.43309020996094,
                "geometry": {
                    "boundingBox": {
                        "width": 0.32613086700439453,
                        "weight": 0.0942094624042511,
                        "left": 0.4833833575248718,
                        "top": 0.5227988958358765
                    },
                    "polygon": [
                        {"x": 0.123, "y": 0.345}, ...
                    ]
                }
                "id": "8c97b240-0969-4678-834a-646c95da9cf4",
                "relationships": [
                    {
                        "type": "CHILD",
                        "ids": [
                            "7ee7b7da-ee1b-428d-a567-55a3e3affa56",
                            "4d6da730-ba43-467c-a9a5-c6137ba0c472"
                        ]
                    },
                    {
                        "type": "VALUE",
                        "ids": [
                            "6ee7b7da-ee1b-428d-a567-55a3e3affa54"
                        ]
                    }
                ],
                "entityTypes": [
                    "KEY"
                ],
                "text": "Foo bar"
            },
]
```

blockTypes

This determines the kind of analysis the workers can do. Only `KEY_VALUE_SET` is currently supported.

keys

This specifies new keys and the associated text value the worker can add. The input values for `keys` can include the following elements:

- `importantFormKey` accepts strings, and is used to specify a single key.
- `importantFormKeyAliases` can be used to specify aliases that are acceptable alternatives to the keys supplied. Use this element to identify alternative spellings or presentations of your keys. This parameter accepts a list of one or more strings.

The following is an example of an input for `keys`.

```
[
      {
        importantFormKey: 'Address',
        importantFormKeyAliases: [
          'address',
          'Addr.',
          'Add.',
        ]
      },
      {
        importantFormKey: 'Last name',
        importantFormKeyAliases: ['Surname']
      }
]
```

no-key-edit

This prevents the workers from editing the keys of annotations passed through `initialValue`. This prevents workers from editing the keys that have been detected on your documents. This is required.

no-geometry-edit

This prevents workers from editing the polygons of annotations passed through `initialValue`. For example, this would prevent the worker from editing the bounding box around a given key. This is required.

Element Hierarchy

This element has the following parent and child elements.

- Parent elements – crowd-form
- Child elements – full-instructions, short-instructions

Regions

The following regions are supported by this element. You can use custom HTML and CSS code within these regions to format your instructions to workers. For example, use the `short-instructions` section to provide good and bad examples of how to complete a task.

full-instructions

General instructions about how to work with the widget.

short-instructions

Important task-specific instructions that are displayed in a prominent place.

Example of a Worker Template Using the crowd Element

An example of a worker template using this crowd element would look like the following.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
{% capture s3_uri %}http://s3.amazonaws.com/
{{ task.input.aiServiceRequest.document.s3Object.bucket }}/
{{ task.input.aiServiceRequest.document.s3Object.name }}{% endcapture %}

<crowd-form>
  <crowd-textract-analyze-document
    src="{{ s3_uri | grant_read_access }}"
    initial-value="{{ task.input.selectedAiServiceResponse.blocks }}"
    header="Review the key-value pairs listed on the right and correct them if they
 don't match the following document."
    no-key-edit
```

```
    no-geometry-edit
    keys="{{ task.input.humanLoopContext.importantFormKeys }}"
    block-types="['KEY_VALUE_SET']"
  >
    <short-instructions header="Instructions">
      <style>
        .instructions {
          white-space: pre-wrap;
        }
        .instructionsImage {
          display: inline-block;
          max-width: 100%;
        }
      </style>
      <p class='instructions'>Click on a key-value block to highlight the corresponding
 key-value pair in the document.

If it is a valid key-value pair, review the content for the value. If the content is
 incorrect, correct it.

The text of the value is incorrect, correct it.
<img class='instructionsImage' src="https://assets.crowd.aws/images/a2i-console/
correct-value-text.png" />

A wrong value is identified, correct it.
<img class='instructionsImage' src="https://assets.crowd.aws/images/a2i-console/
correct-value.png" />

If it is not a valid key-value relationship, choose No.
<img class='instructionsImage' src="https://assets.crowd.aws/images/a2i-console/not-a-
key-value-pair.png" />

If you can’t find the key in the document, choose Key not found.
<img class='instructionsImage' src="https://assets.crowd.aws/images/a2i-console/key-is-
not-found.png" />

If the content of a field is empty, choose Value is blank.
<img class='instructionsImage' src="https://assets.crowd.aws/images/a2i-console/value-
is-blank.png" />

<b>Examples</b>
Key and value are often displayed next or below to each other.

Key and value displayed in one line.
```

```
<img class='instructionsImage' src="https://assets.crowd.aws/images/a2i-console/sample-
key-value-pair-1.png" />

Key and value displayed in two lines.
<img class='instructionsImage' src="https://assets.crowd.aws/images/a2i-console/sample-
key-value-pair-2.png" />

If the content of the value has multiple lines, enter all the text without line break.
 Include all value text even if it extends beyond the highlight box.
<img class='instructionsImage' src="https://assets.crowd.aws/images/a2i-console/
multiple-lines.png" /></p>
    </short-instructions>

    <full-instructions header="Instructions"></full-instructions>
  </crowd-textract-analyze-document>
</crowd-form>
```

Output

The following is a sample of the output from this element. You can find a detailed explanation of this output in the Amazon Textract AnalyzeDocument API documentation.

```
{
  "AWS/Textract/AnalyzeDocument/Forms/V1": {
    blocks: [
      {
        "blockType": "KEY_VALUE_SET",
        "id": "8c97b240-0969-4678-834a-646c95da9cf4",
        "relationships": [
          {
            "type": "CHILD",
            "ids": ["7ee7b7da-ee1b-428d-a567-55a3e3affa56", "4d6da730-ba43-467c-a9a5-
c6137ba0c472"]
          },
          {
            "type": "VALUE",
            "ids": ["6ee7b7da-ee1b-428d-a567-55a3e3affa54"]
          }
        ],
        "entityTypes": ["KEY"],
        "text": "Foo bar baz"
      }
    ]
```

```
  }
}
```

crowd-rekognition-detect-moderation-labels

A widget to enable human review of an Amazon Rekognition image moderation result.

Attributes

The following attributes are supported by this element.

header

This is the text that is displayed as the header.

src

This is a link to the image to be analyzed by the worker.

categories

This supports `categories` as an array of strings **or** an array of objects where each object has a `name` field.

If the categories come in as objects, the following applies:

- The displayed categories are the value of the `name` field.
- The returned answer contains the **full** objects of any selected categories.

If the categories come in as strings, the following applies:

- The returned answer is an array of all the strings that were selected.

exclusion-category

By setting this attribute you create a button underneath the categories in the UI.

- When a user chooses the button, all categories are deselected and disabled.
- Choosing the button again re-enables the categories so that users can choose them.
- If you submit after choosing the button, it returns an empty array.

Element Hierarchy

This element has the following parent and child elements.

- Parent elements – crowd-form
- Child elements – full-instructions, short-instructions

AWS Regions

The following AWS Regions are supported by this element. You can use custom HTML and CSS code within these Regions to format your instructions to workers. For example, use the `short-instructions` section to provide good and bad examples of how to complete a task.

full-instructions

General instructions about how to work with the widget.

short-instructions

Important task-specific instructions that are displayed in a prominent place.

Example Worker Template with the crowd Element

An example of a worker template using the crowd element would look like the following.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
{% capture s3_uri %}http://s3.amazonaws.com/
{{ task.input.aiServiceRequest.image.s3Object.bucket }}/
{{ task.input.aiServiceRequest.image.s3Object.name }}{% endcapture %}

<crowd-form>
  <crowd-rekognition-detect-moderation-labels
    categories='[
      {% for label in task.input.selectedAiServiceResponse.moderationLabels %}
        {
          name: "{{ label.name }}",
          parentName: "{{ label.parentName }}",
        },
      {% endfor %}
    ]'
    src="{{ s3_uri | grant_read_access }}"
    header="Review the image and choose all applicable categories."
  >
```

```
    <short-instructions header="Instructions">
      <style>
        .instructions {
          white-space: pre-wrap;
        }
      </style>
      <p class='instructions'>Review the image and choose all applicable categories.
If no categories apply, choose None.

<b>Nudity</b>
Visuals depicting nude male or female person or persons

<b>Graphic Male Nudity</b>
Visuals depicting full frontal male nudity, often close ups

<b>Graphic Female Nudity</b>
Visuals depicting full frontal female nudity, often close ups

<b>Sexual Activity</b>
Visuals depicting various types of explicit sexual activities and pornography

<b>Illustrated Nudity or Sexual Activity</b>
Visuals depicting animated or drawn sexual activity, nudity or pornography

<b>Adult Toys</b>
Visuals depicting adult toys, often in a marketing context

<b>Female Swimwear or Underwear</b>
Visuals depicting female person wearing only swimwear or underwear

<b>Male Swimwear Or Underwear</b>
Visuals depicting male person wearing only swimwear or underwear

<b>Partial Nudity</b>
Visuals depicting covered up nudity, for example using hands or pose

<b>Revealing Clothes</b>
Visuals depicting revealing clothes and poses, such as deep cut dresses

<b>Graphic Violence or Gore</b>
Visuals depicting prominent blood or bloody injuries

<b>Physical Violence</b>
Visuals depicting violent physical assault, such as kicking or punching
```

```
<b>Weapon Violence</b>
Visuals depicting violence using weapons like firearms or blades, such as shooting

<b>Weapons</b>
Visuals depicting weapons like firearms and blades

<b>Self Injury</b>
Visuals depicting self-inflicted cutting on the body, typically in distinctive patterns
 using sharp objects

<b>Emaciated Bodies</b>
Visuals depicting extremely malnourished human bodies

<b>Corpses</b>
Visuals depicting human dead bodies

<b>Hanging</b>
Visuals depicting death by hanging</p>
    </short-instructions>

    <full-instructions header="Instructions"></full-instructions>
  </crowd-rekognition-detect-moderation-labels>
</crowd-form>
```

Output

The following is a sample of the output from this element. For details about this output, see Amazon Rekognition DetectModerationLabels API documentation.

```
{
  "AWS/Rekognition/DetectModerationLabels/Image/V3": {
    "ModerationLabels": [
        { name: 'Gore', parentName: 'Violence' },
        { name: 'Corpses', parentName: 'Violence' },
    ]
  }
}
```

Using Amazon Augmented AI for Human Review

When you use AI applications such as Amazon Rekognition, Amazon Textract, or your custom machine learning (ML) models, you can use Amazon Augmented AI to get human review of low-confidence predictions or random prediction samples.

What is Amazon Augmented AI?

Amazon Augmented AI (Amazon A2I) is a service that brings human review of ML predictions to all developers by removing the heavy lifting associated with building human review systems or managing large numbers of human reviewers.

Many ML applications require humans to review low-confidence predictions to ensure the results are correct. For example, extracting information from scanned mortgage application forms can require human review due to low-quality scans or poor handwriting. Building human review systems can be time-consuming and expensive because it involves implementing complex processes or *workflows*, writing custom software to manage review tasks and results, and managing large groups of reviewers.

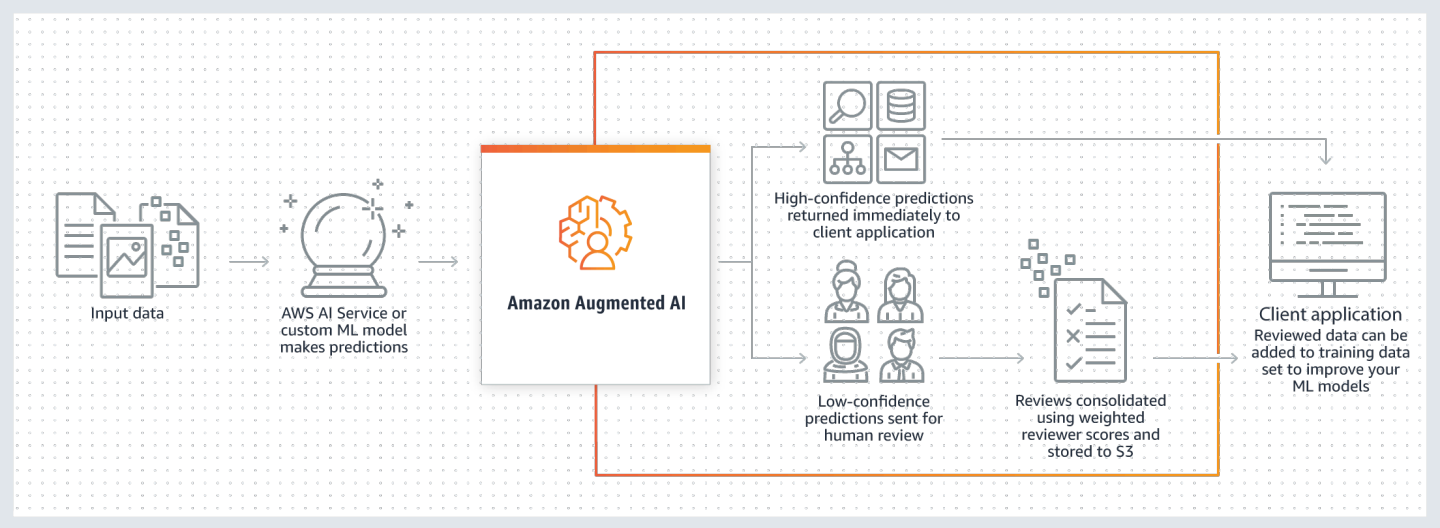
Amazon A2I streamlines building and managing human reviews for ML applications. Amazon A2I provides built-in human review workflows for common ML use cases, such as content moderation and text extraction from documents. You can also create your own workflows for ML models built on SageMaker or any other tools. Using Amazon A2I, you can allow human reviewers to step in when a model is unable to make a high-confidence prediction or to audit its predictions on an ongoing basis.

Amazon A2I Use Case Examples

The following examples demonstrate how you can use Amazon A2I to integrate a human review loop into your ML application. For each of these examples, you can find a Jupyter Notebook that demonstrates that workflow in Use Cases and Examples Using Amazon A2I.

- **Use Amazon A2I with Amazon Textract** – Have humans review important key-value pairs in single-page documents or have Amazon Textract randomly sample and send documents from your dataset to humans for review.
- **Use Amazon A2I with Amazon Rekognition** – Have humans review unsafe images for explicit adult or violent content if Amazon Rekognition returns a low-confidence score, or have Amazon Rekognition randomly sample and send images from your dataset to humans for review.

- **Use Amazon A2I to review real-time ML inferences** – Use Amazon A2I to review real-time, low-confidence inferences made by a model deployed to a SageMaker hosted endpoint and incrementally train your model using Amazon A2I output data.
- **Use Amazon A2I with Amazon Comprehend** – Have humans review Amazon Comprehend inferences about text data such as sentiment analysis, text syntax, and entity detection.
- **Use Amazon A2I with Amazon Transcribe** – Have humans review Amazon Transcribe transcriptions of video or audio files. Use the results of transcription human review loops to create a custom vocabulary and improve future transcriptions of similar video or audio content.
- **Use Amazon A2I with Amazon Translate** – Have humans review low-confidence translations returned from Amazon Translate.
- **Use Amazon A2I to review tabular data** – Use Amazon A2I to integrate a human review loop into an ML application that uses tabular data.



Topics

- Amazon A2I Output Data
- Permissions and Security in Amazon Augmented AI
- Use Amazon CloudWatch Events in Amazon Augmented AI
- Use APIs in Amazon Augmented AI

Get Started with Amazon Augmented AI

To get started using Amazon Augmented AI, review the Core Components of Amazon A2I and Prerequisites to Using Augmented AI. Then, use the following documentation to learn how to use the Amazon A2I console and API.

- Tutorial: Get Started in the Amazon A2I Console
- Tutorial: Get Started Using the Amazon A2I API

You can also get stared using the Amazon A2I API by following a Jupyter Notebook tutorial. See Use Cases and Examples Using Amazon A2I for a list of notebooks and use cases.

Core Components of Amazon A2I

Review the following terms to familiarize yourself with the core components of Amazon A2I.

Task Types

The AI/ML workflow into which you integrate Amazon A2I defines an Amazon A2I *task type*.

Amazon A2I supports:

- Two *built-in task types*: Amazon Textract key-value pair extraction and Amazon Rekognition image moderation.
- A custom task type: Use a custom task type to integrate a human review loop into *any* machine learning workflow. You can use a custom task type to integrate Amazon A2I with other AWS services like Amazon Comprehend, Amazon Transcribe, and Amazon Translate, as well as your own custom machine learning workflows. To learn more, see Use Cases and Examples Using Amazon A2I.

Select a tab in the following table to see diagrams that illustrate how Amazon A2I works with each task type. Select the task type page using the links in the preceding list to learn more about that task type.

Amazon Textract – Key-value pair extraction

This image depicts the Amazon A2I built-in workflow with Amazon Textract. On the left, the resources that are required to create an Amazon Textract human review workflow are depicted: an Amazon S3 bucket, activation conditions, a worker task template, and a work team. These resources are used to create a human review workflow, or flow definition. An arrow points right to the next step in the workflow: using Amazon Textract to configure a human loop with the human review workflow. A second arrow points right from this step to the step in which activation conditions specified in the human review workflow are met. This initiates the creation of a human loop. On the right of the image, the human loop is depicted in three steps: 1) the worker UI and tools are generated and the task is made available to workers, 2) workers review input data, and finally, 3) results are saved in Amazon S3.

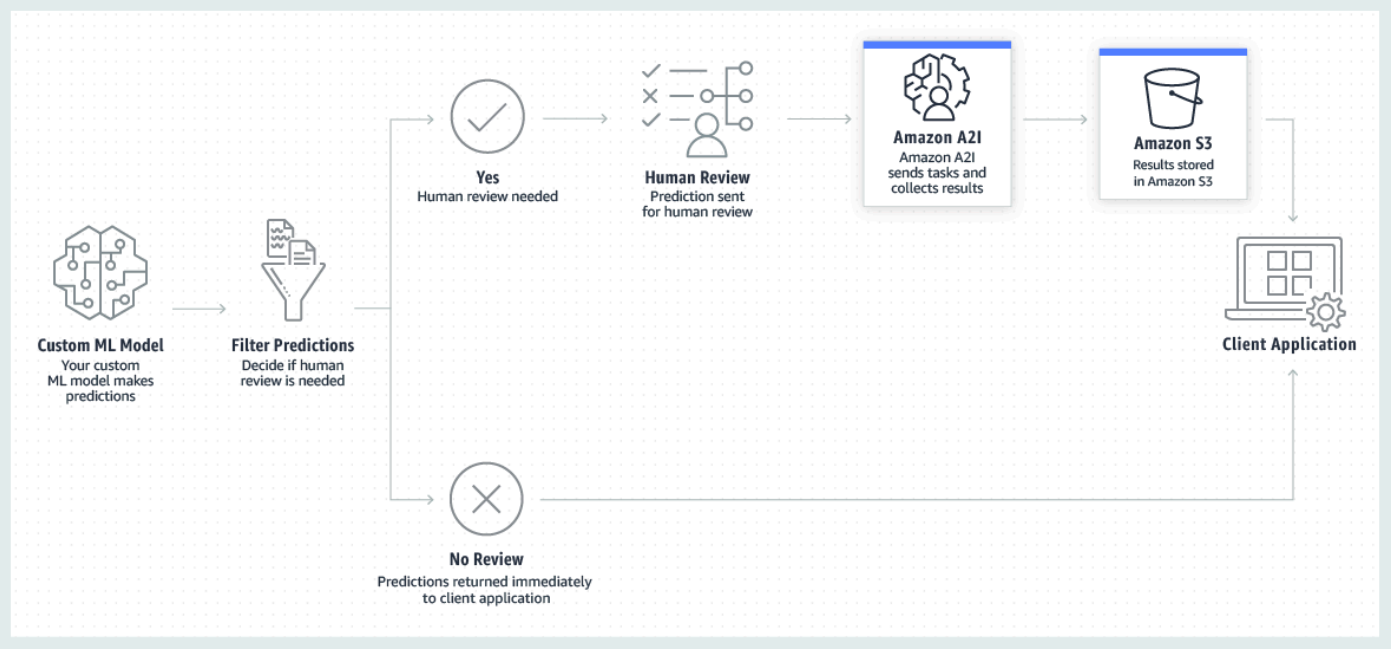
Amazon Rekognition – Image moderation

This image depicts the Amazon A2I built-in workflow with Amazon Rekognition. On the left, the resources that are required to create an Amazon Rekognition human review workflow are depicted: an Amazon S3 bucket, activation conditions, a worker task template, and a work team. These resources are used to create a human review workflow, or flow definition. An arrow points right to the next step in the workflow: using Amazon Rekognition to configure a human loop

with the human review workflow. A second arrow points right from this step to the step in which activation conditions specified in the human review workflow are met. This initiates the creation of a human loop. On the right of the image, the human loop is depicted in three steps: 1) the worker UI and tools are generated and the task is made available to workers, 2) workers review input data, and finally, 3) results are saved in Amazon S3.

Custom Task Type

The following image depicts the Amazon A2I custom workflow. A custom ML model is used to generate predictions. The client application filters these predictions using user-defined criteria and determines if a human review is required. If so, these predictions are sent to Amazon A2I for human review. Amazon A2I collects the results of human review in Amazon S3, which can access by the client application. If the filter determines that no human review is needed, predictions can be fed directly to the client application.



Human Review Workflow (Flow Definition)

You use a human review workflow to specify your human *work team*, to set up your worker UI using a *worker task template*, and to provide information about how workers should complete the review task.

For built-in task types, you also use the human review workflow to identify the conditions under which a human loop is initiated. For example, Amazon Rekognition can perform image content moderation using machine learning. You can use the human review workflow to specify that an image is sent to a human for content moderation review if Amazon Rekognition's confidence is too low.

You can use a human review workflow to create multiple human loops.

You can create a flow definition in the SageMaker console or with the SageMaker API. To learn more about both of these options, see Create a Human Review Workflow.

Work Team

A *work team* is a group of human workers to whom you send your human review tasks.

When you create a human review workflow, you specify a single work team.

Your work team can come from the Amazon Mechanical Turk workforce, a vendor-managed workforce, or your own private workforce. When you use the private workforce, you can create

multiple work teams. Each work team can be used in multiple human review workflows. To learn how to create a workforce and work teams, see Create and Manage Workforces.

Worker Task Template and Human Task UI

You use a *worker task template* to create a worker UI (a *human task UI*) for your human review tasks.

The human task UI displays your input data, such as documents or images, and instructions to workers. It also provides interactive tools that the worker uses to complete your tasks.

For built-in task types, you must use the Amazon A2I worker task template provided for that task type.

Human Loops

A *human loop* is used to create a single human review job. For each human review job, you can choose the number of workers that are sent a *task* to review a single data object. For example, if you set the number of workers per object to 3 for an image classification labeling job, three workers classify each input image. Increasing the number of workers per object can improve label accuracy.

A human loop is created using a human review workflow as follows:

- For built-in task types, the conditions specified in the human review workflow determine when the human loop is created.
- Human review tasks are sent to the work team specified in the human review workflow.
- The worker task template specified in the human review workflow is used to render the human task UI.

When do human loops get created?

When you use one of the *built-in task types*, the corresponding AWS service creates and starts a human loop on your behalf when the conditions specified in your human review workflow are met. For example:

- When you use Augmented AI with Amazon Textract, you can integrate Amazon A2I into a document review task using the API operation `AnalyzeDocument`. A human loop is created every time Amazon Textract returns inferences about key-value pairs that meet the conditions you specify in your human review workflow.

- When you use Augmented AI with Amazon Rekognition, you can integrate Amazon A2I into an image moderation task using the API operation `DetectModerationLabels`. A human loop is created every time Amazon Rekognition returns inferences about image content that meet the conditions you specify in your human review workflow.

When using a *custom task type*, you start a human loop using the Amazon Augmented AI Runtime API. When you call `StartHumanLoop` in your custom application, a task is sent to human reviewers.

To learn how to create and start a human loop, see Create and Start a Human Loop.

To generate these resources and create a human review workflow, Amazon A2I integrates multiple APIs, including the Amazon Augmented AI Runtime Model, the SageMaker APIs, and APIs associated with your task type. To learn more, see Use APIs in Amazon Augmented AI.

> **Note**
>
> AWS Region availability may differ when you use Augmented AI with other AWS services, such as Amazon Textract. Create Augmented AI resources in the same AWS Region that you use to interact with those AWS services. For AWS Region availability for all services, see the Region Table.

Prerequisites to Using Augmented AI

Amazon A2I uses resources in IAM, SageMaker, and Amazon S3 to create and run your human review workflows. You can create some of these resources in the Amazon A2I console when you create a human review workflow. To learn how, see Tutorial: Get Started in the Amazon A2I Console.

To use Amazon A2I, you need the following resources:

- One or more Amazon S3 buckets in the same AWS Region as the workflow for your input and output data. To create a bucket, follow the instructions in Create a Bucket in the *Amazon Simple Storage Service Console User Guide*.
- An IAM role with required permissions to create a human review workflow and an IAM user or role with permission to access Augmented AI. For more information, see Permissions and Security in Amazon Augmented AI.

- A public, private, or vendor workforce for your human review workflows. If you plan to use a private workforce, you need to set one up ahead of time in the same AWS Region as your Amazon A2I workflow. To learn more about these workforce types, see Create and Manage Workforces.

> **Important**
>
> To learn about the compliance programs that cover Amazon Augmented AI at this time, see AWS Services in Scope by Compliance Program. If you use Amazon Augmented AI in conjunction with other AWS services (such as Amazon Rekognition and Amazon Textract), note that Amazon Augmented AI may not be in scope for the same compliance programs as those other services. You are responsible for how you use Amazon Augmented AI, including understanding how the service processes or stores customer data and any impact on the compliance of your data environment. You should discuss your workload objectives and goals with your AWS account team; they can help you evaluate whether the service is a good fit for your proposed use case and architecture.

Tutorial: Get Started in the Amazon A2I Console

The following tutorial shows you how to get started using Amazon A2I in the Amazon A2I console.

The tutorial gives you the option to use Augmented AI with Amazon Textract for document review or Amazon Rekognition for image content review.

Prerequisites

To get started using Amazon A2I, complete the following prerequisites.

- Create an Amazon S3 bucket in the same AWS Region as the workflow for your input and output data. For example, if you are using Amazon A2I with Amazon Textract in us-east-1, create your bucket in us-east-1. To create a bucket, follow the instructions in Create a Bucket in the *Amazon Simple Storage Service Console User Guide*.
- Do one of the following:
  - If you want to complete the tutorial using Amazon Textract, download this sample document and place it in your Amazon S3 bucket.
  - If you want to complete the tutorial using Amazon Rekognition, download this image and place it in your Amazon S3 bucket.

> **Note**
>
> The Amazon A2I console is embedded in the SageMaker console.

Step 1: Create a Work Team

First, create a work team in the Amazon A2I console and add yourself as a worker so that you can preview the worker review task.

> **Important**
>
> This tutorial uses a private work team. The Amazon A2I private workforce is configured in the Ground Truth area of the SageMaker console and is shared between Amazon A2I and Ground Truth.

To create a private workforce using worker emails

1. Open the SageMaker console at https://console.aws.amazon.com/sagemaker/.
2. In the navigation pane, choose **Labeling workforces** under **Ground Truth**.
3. Choose **Private**, then choose **Create private team**.
4. Choose **Invite new workers by email**.
5. For this tutorial, enter your email and any others that you want to be able to preview the human task UI. You can paste or type a list of up to 50 email addresses, separated by commas, into the email addresses box.
6. Enter an organization name and contact email.
7. Optionally, choose an Amazon SNS topic to which to subscribe the team so workers are notified by email when new Ground Truth labeling jobs become available. Amazon SNS notifications are supported by Ground Truth and are not supported by Augmented AI. If you subscribe workers to Amazon SNS notifications, they only receive notifications about Ground Truth labeling jobs. They do not receive notifications about Augmented AI tasks.
8. Choose **Create private team**.

If you add yourself to a private work team, you receive an email from `no-reply@verificationemail.com` with login information. Use the link in this email to reset your

password and log in to your worker portal. This is where your human review tasks appear when you create a human loop.

Step 2: Create a Human Review Workflow

In this step, you create a human review workflow. Each human review workflow is created for a specific task type. This tutorial allows you to choose between the built-in task types: Amazon Rekognition and Amazon Textract.

To create a human review workflow:

1. Open the Augmented AI console at https://console.aws.amazon.com/a2i to access the **Human review workflows** page.
2. Select **Create human review workflow**.
3. In **Workflow settings**, enter a workflow **Name**, **S3 bucket**, and the **IAM role** that you created for this tutorial, with the AWS managed policy `AmazonAugmentedAIIntegratedAPIAccess` attached.
4. For **Task type**, select **Textract – Key-value pair extraction** or **Rekognition – Image moderation**.
5. Select the task type that you chose from the following table for instructions for that task type.

   Amazon Textract – Key-value pair extraction

   1. Select **Trigger a human review for specific form keys based on the form key confidence score or when specific form keys are missing**.

   2. For **Key name**, enter `Mail Address`.

   3. Set the identification confidence threshold between `0` and 99.

   4. Set the qualification confidence threshold between `0` and 99.

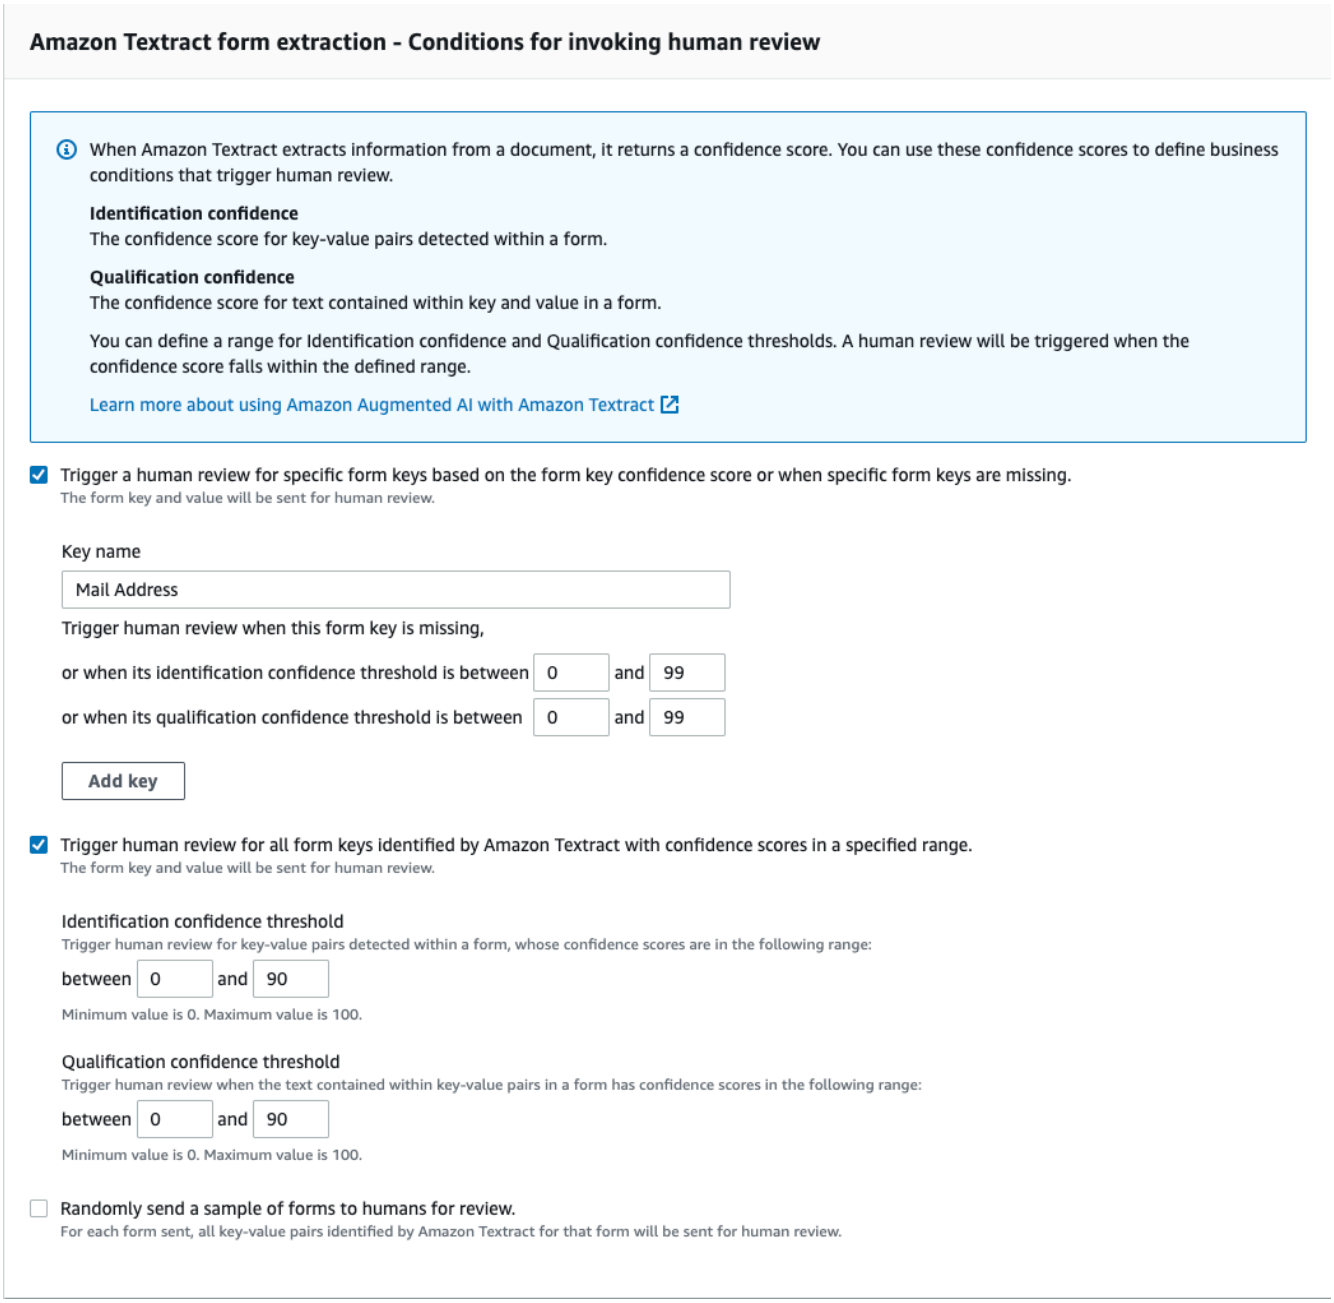
   5. Select **Trigger a human review for all form keys identified by Amazon Textract with confidence scores in a specific range**.

   6. Set the identification confidence threshold between `0` and 90.

   7. Set the qualification confidence threshold between `0` and 90.

This initiates a human review if Amazon Textract returns a confidence score that is less than 99 for `Mail Address` and its key, or if it returns a confidence score less than 90 for any key value pair detected in the document.

The following image shows the Amazon Textract form extraction - Conditions for invoking human review section of the Amazon A2I console. In the image, the check boxes for the two types of triggers explained in the proceeding paragraph are checked, and `Mail Address` is used as a **Key name** for the first trigger. The identification confidence threshold is defined using confidence scores for key-value pairs detect within the form and is set between 0 and 99. The qualification confidence threshold is defined using confidence scores for text contained within keys and values in a form and is set between 0 and 99.



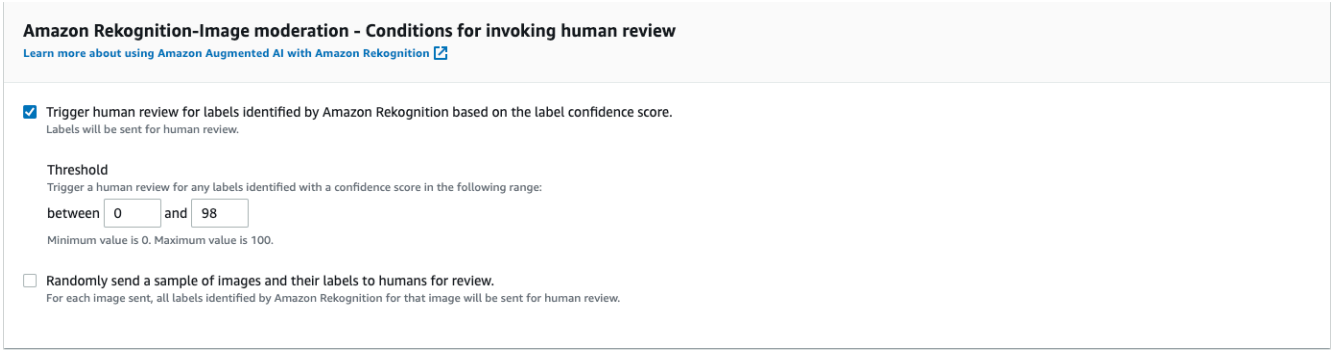
Amazon Rekognition – Image moderation

1. Select **Trigger human review for labels identified by Amazon Rekognition based on label confidence score**.

2. Set the **Threshold** between `0` and 98.

This initiates a human review if Amazon Rekognition returns a confidence score that is less than 98 for an image moderation job.

The following image shows how you can select the **Trigger human review for labels identified by Amazon Rekognition based on label confidence score** option and enter a **Threshold** between 0 and 98 in the Amazon A2I console.



6. Under **Worker task template creation**, select **Create from a default template**.
7. Enter a **Template name**.
8. In **Task description** field, enter the following text:

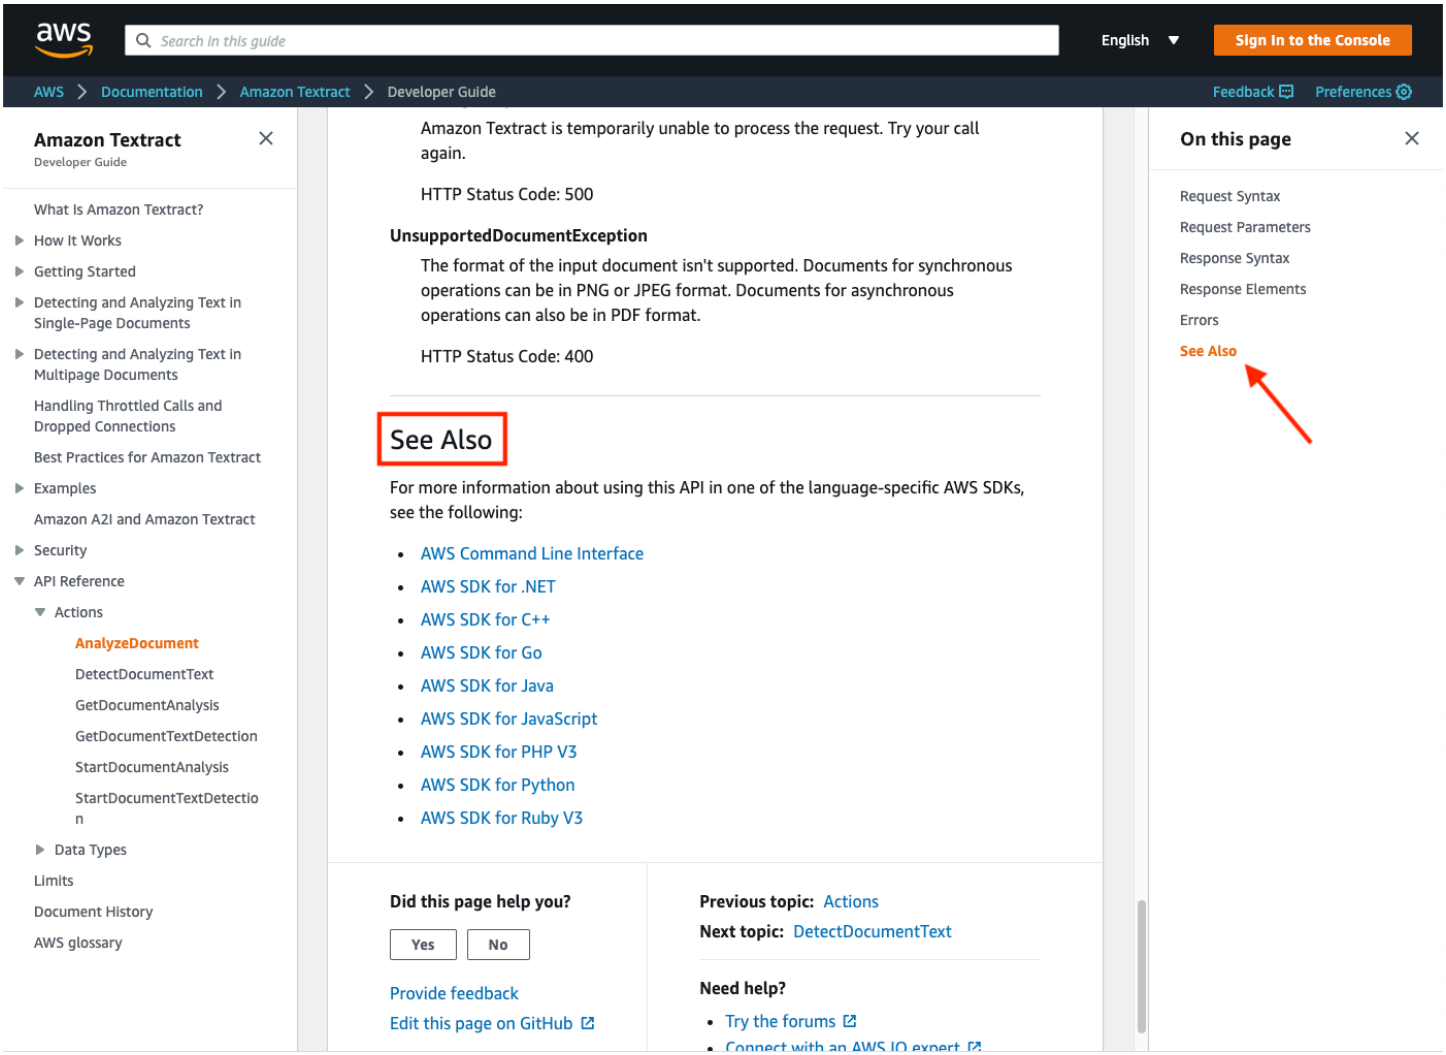
   ```
   Read the instructions carefully and complete the task.
   ```

9. Under **Workers**, select **Private**.
10. Select the private team that you created.
11. Choose **Create**.

Once your human review workflow is created, it appears in the table on the **Human review workflows** page. When the **Status** is `Active`, copy and save the Workflow ARN. You need it for the next step.

Step 3: Start a Human Loop

You must use an API operation to start a human loop. There are a variety of language-specific SDKs that you can use to interact with these API operations. To see documentation for each of these SDKs, refer to the **See Also** section in the API documentation, as shown in the following image.



For this tutorial, you use one of the following APIs:

- If you chose the Amazon Textract task type, you use the `AnalyzeDocument` operation.
- If you chose the Amazon Rekognition task type, you use the `DetectModerationLabels` operation.

You can interact with these APIs using a SageMaker notebook instance (recommended for new users) or the AWS Command Line Interface (AWS CLI). Choose one of the following to learn more about these options:

- To learn more about and set up a notebook instance, see Amazon SageMaker Notebook Instances.
- To learn more about and get started using the AWS CLI, see What Is the AWS Command Line Interface? in the *AWS Command Line Interface User Guide*.

Select your task type in the following table to see example requests for Amazon Textract and Amazon Rekognition using the AWS SDK for Python (Boto3).

Amazon Textract – Key-value pair extraction

The following example uses the AWS SDK for Python (Boto3) to call `analyze_document` in us-west-2. Replace the italicized red text with your resources. Include the `DataAttributes` parameter if you are using the Amazon Mechanical Turk workforce. For more information, see the `analyze_document` documention in the *AWS SDK for Python (Boto) API Reference*.

```
   response = client.analyze_document(
         Document={
                "S3Object": {
                    "Bucket": "AWSDOC-EXAMPLE-BUCKET",
                    "Name": "document-name.pdf"
                }
         },
         HumanLoopConfig={
            "FlowDefinitionArn":"arn:aws:sagemaker:us-west-2:111122223333:flow-
definition/flow-definition-name",
            "HumanLoopName":"human-loop-name",
            "DataAttributes" : {
                "ContentClassifiers":
["FreeOfPersonallyIdentifiableInformation","FreeOfAdultContent"]
            }
         },
         FeatureTypes=["TABLES", "FORMS"])
```

Amazon Rekognition – Image moderation

The following example uses the AWS SDK for Python (Boto3) to call `detect_moderation_labels` in us-west-2. Replace the italicized red text with your resources. Include the `DataAttributes` parameter if you are using the Amazon Mechanical Turk workforce. For more information, see the `detect_moderation_labels` documentation in the *AWS SDK for Python (Boto) API Reference*.

```
   response = client.detect_moderation_labels(
            Image={
                "S3Object":{
```

```
                    "Bucket": "AWSDOC-EXAMPLE-BUCKET",
                    "Name": "image-name.png"
                }
            },
            HumanLoopConfig={
               "FlowDefinitionArn":"arn:aws:sagemaker:us-west-2:111122223333:flow-
definition/flow-definition-name",
               "HumanLoopName":"human-loop-name",
               "DataAttributes":{
                    ContentClassifiers:
["FreeOfPersonallyIdentifiableInformation"|"FreeOfAdultContent"]
                }
             })
```

Step 4: View Human Loop Status in Console

When you start a human loop, you can view its status in the Amazon A2I console.

To view your human loop status

1. Open the Augmented AI console at https://console.aws.amazon.com/a2i to access the **Human review workflows** page.
2. Select the human review workflow that you used to start your human loop.
3. In the **Human loops** section, you can see your human loop. View its status in the **Status** column.

Step 5: Download Output Data

Your output data is stored in the Amazon S3 bucket you specified when you created a human review workflow.

To view your Amazon A2I output data

1. Open the Amazon S3 console.
2. Select the Amazon S3 bucket you specified when you created your human review workflow in step 2 of this example.
3. Starting with the folder that is named after your human review workflow, navigate to your output data by selecting the folder with the following naming convention:

```
s3://output-bucket-specified-in-human-review-workflow/human-review-workflow-
name/YYYY/MM/DD/hh/mm/ss/human-loop-name/output.json
```

4. Select `output.json` and choose **Download**.

Tutorial: Get Started Using the Amazon A2I API

This tutorial explains the API operations you can use to get started using Amazon A2I.

To use a Jupyter Notebook to run these operations, select a Jupyter Notebook from Use Cases and Examples Using Amazon A2I and use Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook to learn how to use it in a SageMaker notebook instance.

To learn more about the API operations you can use with Amazon A2I, see Use APIs in Amazon Augmented AI.

Create a Private Work Team

You can create a private work team and add yourself as a worker so that you can preview Amazon A2I.

If you are not familiar with Amazon Cognito, we recommend that you use the SageMaker console to create a private workforce and add yourself as a private worker. For instructions, see Step 1: Create a Work Team.

If you are familiar with Amazon Cognito, you can use the following instructions to create a private work team using the SageMaker API. After you create a work team, note the work team ARN (`WorkteamArn`).

To learn more about the private workforce and other available configurations, see Use a Private Workforce.

Create a private workforce

If you have not created a private workforce, you can do so using an Amazon Cognito user pool. Make sure that you have added yourself to this user pool. You can create a private work team using the AWS SDK for Python (Boto3) `create_workforce` function. For other language-specific SDKs, refer to the list in CreateWorkforce.

```
    response = client.create_workforce(
        CognitoConfig={
            "UserPool": "Pool_ID",
            "ClientId": "app-client-id"
        },
        WorkforceName="workforce-name"
    )
```

Create a private work team

After you have created a private workforce in the AWS Region to configure and start your human loop, you can create a private work team using the AWS SDK for Python (Boto3) `create_workteam` function. For other language-specific SDKs, refer to the list in `CreateWorkteam`.

```
    response = client.create_workteam(
        WorkteamName="work-team-name",
        WorkforceName= "workforce-name",
        MemberDefinitions=[
            {
                "CognitoMemberDefinition": {
                    "UserPool": "<aws-region>_ID",
                    "UserGroup": "user-group",
                    "ClientId": "app-client-id"
                },
            }
        ]
    )
```

Access your work team ARN as follows:

```
    workteamArn = response["WorkteamArn"]
```

List private work teams in your account

If you have already created a private work team, you can list all work teams in a given AWS Region in your account using the AWS SDK for Python (Boto3) `list_workteams` function. For other language-specific SDKs, refer to the list in `ListWorkteams`.

```
    response = client.list_workteams()
```

If you have numerous work teams in your account, you may want to use `MaxResults`, `SortBy`, and `NameContains` to filter your results.

Create a Human Review Workflow

You can create a human review workflow using the Amazon A2I `CreateFlowDefinition` operation. Before you create your human review workflow, you need to create a human task UI. You can do this with the `CreateHumanTaskUi` operation.

If you are using Amazon A2I with the Amazon Textract or Amazon Rekognition integrations, you can specify activation conditions using a JSON.

Create a Human Task UI

If you are creating a human review workflow to be used with Amazon Textract or Amazon Rekognition integrations, you need to use and modify pre-made worker task template. For all custom integrations, you can use your own custom worker task template. Use the following table to learn how to create a human task UI using a worker task template for the two built-in integrations. Replace the template with your own to customize this request.

Amazon Textract – Key-value pair extraction

To learn more about this template, see Custom Template Example for Amazon Textract.

```
template = r"""
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
{% capture s3_uri %}http://s3.amazonaws.com/
{{ task.input.aiServiceRequest.document.s3Object.bucket }}/
{{ task.input.aiServiceRequest.document.s3Object.name }}{% endcapture %}
<crowd-form>
  <crowd-textract-analyze-document
      src="{{ s3_uri | grant_read_access }}"
      initial-value="{{ task.input.selectedAiServiceResponse.blocks }}"
      header="Review the key-value pairs listed on the right and correct them if
 they don"t match the following document."
      no-key-edit=""
      no-geometry-edit=""
      keys="{{ task.input.humanLoopContext.importantFormKeys }}"
      block-types='["KEY_VALUE_SET"]'>
    <short-instructions header="Instructions">
```

```
        <p>Click on a key-value block to highlight the corresponding key-value pair
 in the document.
        </p><p><br></p>
        <p>If it is a valid key-value pair, review the content for the value. If the
 content is incorrect, correct it.
        </p><p><br></p>
        <p>The text of the value is incorrect, correct it.</p>
        <p><img src="https://assets.crowd.aws/images/a2i-console/correct-value-
text.png">
        </p><p><br></p>
        <p>A wrong value is identified, correct it.</p>
        <p><img src="https://assets.crowd.aws/images/a2i-console/correct-value.png">
        </p><p><br></p>
        <p>If it is not a valid key-value relationship, choose No.</p>
        <p><img src="https://assets.crowd.aws/images/a2i-console/not-a-key-value-
pair.png">
        </p><p><br></p>
        <p>If you can’t find the key in the document, choose Key not found.</p>
        <p><img src="https://assets.crowd.aws/images/a2i-console/key-is-not-
found.png">
        </p><p><br></p>
        <p>If the content of a field is empty, choose Value is blank.</p>

blank.png">
        </p><p><br></p>
        <p><strong>Examples</strong></p>
        <p>Key and value are often displayed next or below to each other.
        </p><p><br></p>
        <p>Key and value displayed in one line.</p>
        <p><img src="https://assets.crowd.aws/images/a2i-console/sample-key-value-
pair-1.png">
        </p><p><br></p>
        <p>Key and value displayed in two lines.</p>
        <p><img src="https://assets.crowd.aws/images/a2i-console/sample-key-value-
pair-2.png">
        </p><p><br></p>
        <p>If the content of the value has multiple lines, enter all the text
 without line break.
        Include all value text even if it extends beyond the highlight box.</p>
        <p><img src="https://assets.crowd.aws/images/a2i-console/multiple-
lines.png"></p>
    </short-instructions>
    <full-instructions header="Instructions"></full-instructions>
  </crowd-textract-analyze-document>
```

```
</crowd-form>
"""
```

Amazon Rekognition – Image moderation

To learn more about this template, see Custom Template Example for Amazon Rekognition.

```
template = r"""
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
{% capture s3_uri %}http://s3.amazonaws.com/
{{ task.input.aiServiceRequest.image.s3Object.bucket }}/
{{ task.input.aiServiceRequest.image.s3Object.name }}{% endcapture %}

<crowd-form>
  <crowd-rekognition-detect-moderation-labels
    categories='[
      {% for label in task.input.selectedAiServiceResponse.moderationLabels %}
        {
          name: "{{ label.name }}",
          parentName: "{{ label.parentName }}",
        },
      {% endfor %}
    ]'
    src="{{ s3_uri | grant_read_access }}"
    header="Review the image and choose all applicable categories."
  >
    <short-instructions header="Instructions">
      <style>
        .instructions {
          white-space: pre-wrap;
        }
      </style>
      <p class="instructions">Review the image and choose all applicable categories.
If no categories apply, choose None.

<b>Nudity</b>
Visuals depicting nude male or female person or persons

<b>Partial Nudity</b>
Visuals depicting covered up nudity, for example using hands or pose

<b>Revealing Clothes</b>
Visuals depicting revealing clothes and poses
```

```
<b>Physical Violence</b>
Visuals depicting violent physical assault, such as kicking or punching

<b>Weapon Violence</b>
Visuals depicting violence using weapons like firearms or blades, such as shooting

<b>Weapons</b>
Visuals depicting weapons like firearms and blades
    </short-instructions>

    <full-instructions header="Instructions"></full-instructions>
  </crowd-rekognition-detect-moderation-labels>
</crowd-form>"""
```

Custom Integration

The following is an example template that can be used in a custom integration. This template is used in this notebook, demonstrating a custom integration with Amazon Comprehend.

```
template = r"""
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
    <crowd-classifier
      name="sentiment"
      categories='["Positive", "Negative", "Neutral", "Mixed"]'
      initial-value="{{ task.input.initialValue }}"
      header="What sentiment does this text convey?"
    >
      <classification-target>
        {{ task.input.taskObject }}
      </classification-target>

      <full-instructions header="Sentiment Analysis Instructions">
        <p><strong>Positive</strong> sentiment include: joy, excitement, delight</p>
        <p><strong>Negative</strong> sentiment include: anger, sarcasm, anxiety</p>
        <p><strong>Neutral</strong>: neither positive or negative, such as stating a
 fact</p>
        <p><strong>Mixed</strong>: when the sentiment is mixed</p>
      </full-instructions>

      <short-instructions>
       Choose the primary sentiment that is expressed by the text.
```

```
      </short-instructions>
    </crowd-classifier>
</crowd-form>
"""
```

Using the template specified above, you can create a template using the AWS SDK for Python (Boto3) `create_human_task_ui` function. For other language-specific SDKs, refer to the list in `CreateHumanTaskUi`.

```
response = client.create_human_task_ui(
    HumanTaskUiName="human-task-ui-name",
    UiTemplate={
        "Content": template
    }
)
```

This response element contains the human task UI ARN. Save this as follows:

```
humanTaskUiArn = response["HumanTaskUiArn"]
```

Create JSON to specify activation conditions

For Amazon Textract and Amazon Rekognition built-in integrations, you can save activation conditions in a JSON object and use this in your `CreateFlowDefinition` request.

Next, select a tab to see example activation conditions you can use for these built-in integrations. For additional information about activation condition options, see JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI.

Amazon Textract – Key-value pair extraction

This example specifies conditions for specific keys (such as `Mail address`) in the document. If Amazon Textract's confidence falls outside of the thresholds set here, the document is sent to a human for review, with the specific keys that initiated the human loop prompted to the worker.

```
import json

humanLoopActivationConditions = json.dumps(
```

```
        {
            "Conditions": [
                {
                  "Or": [

                    {
                        "ConditionType": "ImportantFormKeyConfidenceCheck",
                        "ConditionParameters": {
                            "ImportantFormKey": "Mail address",
                            "ImportantFormKeyAliases": ["Mail Address:","Mail
address:", "Mailing Add:","Mailing Addresses"],
                            "KeyValueBlockConfidenceLessThan": 100,
                            "WordBlockConfidenceLessThan": 100
                        }
                    },
                    {
                        "ConditionType": "MissingImportantFormKey",
                        "ConditionParameters": {
                            "ImportantFormKey": "Mail address",
                            "ImportantFormKeyAliases": ["Mail Address:","Mail
address:","Mailing Add:","Mailing Addresses"]
                        }
                    },
                    {
                        "ConditionType": "ImportantFormKeyConfidenceCheck",
                        "ConditionParameters": {
                            "ImportantFormKey": "Phone Number",
                            "ImportantFormKeyAliases": ["Phone number:", "Phone
No.:", "Number:"],
                            "KeyValueBlockConfidenceLessThan": 100,
                            "WordBlockConfidenceLessThan": 100
                        }
                    },
                    {
                      "ConditionType": "ImportantFormKeyConfidenceCheck",
                      "ConditionParameters": {
                        "ImportantFormKey": "*",
                        "KeyValueBlockConfidenceLessThan": 100,
                        "WordBlockConfidenceLessThan": 100
                      }
                    },
                    {
                      "ConditionType": "ImportantFormKeyConfidenceCheck",
                      "ConditionParameters": {
```

```
                    "ImportantFormKey": "*",
                    "KeyValueBlockConfidenceGreaterThan": 0,
                    "WordBlockConfidenceGreaterThan": 0
                  }
                }
            ]
        }
            ]
        }
    )
```

Amazon Rekognition – Image moderation

The human loop activation conditions used here are tailored towards Amazon Rekognition content moderation; they are based on the confidence thresholds for the `Suggestive` and `Female Swimwear Or Underwear` moderation labels.

```
        import json

        humanLoopActivationConditions = json.dumps(
        {
            "Conditions": [
                {
                  "Or": [
                    {
                        "ConditionType": "ModerationLabelConfidenceCheck",
                        "ConditionParameters": {
                            "ModerationLabelName": "Suggestive",
                            "ConfidenceLessThan": 98
                        }
                    },
                    {
                        "ConditionType": "ModerationLabelConfidenceCheck",
                        "ConditionParameters": {
                            "ModerationLabelName": "Female Swimwear Or Underwear",
                            "ConfidenceGreaterThan": 98
                        }
                    }
                  ]
                }
            ]
        }
```

```
    )
```

Create a human review workflow

This section gives an example of the `CreateFlowDefinition` AWS SDK for Python (Boto3) request using the resources created in the previous sections. For other language-specific SDKs, refer to the list in CreateFlowDefinition. Use the tabs in the following table to see the requests to create a human review workflow for Amazon Textract and Amazon Rekognition built-in integrations.

Amazon Textract – Key-value pair extraction

If you use the built-in integration with Amazon Textract, you must specify `"AWS/Textract/AnalyzeDocument/Forms/V1"` for `"AwsManagedHumanLoopRequestSource"` in `HumanLoopRequestSource`.

```
    response = client.create_flow_definition(
        FlowDefinitionName="human-review-workflow-name",
        HumanLoopRequestSource={
            "AwsManagedHumanLoopRequestSource": "AWS/Textract/AnalyzeDocument/Forms/
V1"
        },
        HumanLoopActivationConfig={
            "HumanLoopActivationConditionsConfig": {
                "HumanLoopActivationConditions": humanLoopActivationConditions
            }
        },
        HumanLoopConfig={
            "WorkteamArn": workteamArn,
            "HumanTaskUiArn": humanTaskUiArn,
            "TaskTitle": "Document entry review",
            "TaskDescription": "Review the document and instructions. Complete the
 task",
            "TaskCount": 1,
            "TaskAvailabilityLifetimeInSeconds": 43200,
            "TaskTimeLimitInSeconds": 3600,
            "TaskKeywords": [
                "document review",
            ],
        },
```

```
        OutputConfig={
            "S3OutputPath": "s3://DOC-EXAMPLE-BUCKET/prefix/",
        },
        RoleArn="arn:aws:iam::<account-number>:role/<role-name>",
        Tags=[
            {
                "Key": "string",
                "Value": "string"
            },
        ]
    )
```

Amazon Rekognition – Image moderation

If you use the built-in integration with Amazon Rekognition, you must specify `"AWS/Rekognition/DetectModerationLabels/Image/V3"` for `"AwsManagedHumanLoopRequestSource"` in `HumanLoopRequestSource`.

```
    response = client.create_flow_definition(
        FlowDefinitionName="human-review-workflow-name",
        HumanLoopRequestSource={
            "AwsManagedHumanLoopRequestSource": "AWS/Rekognition/
DetectModerationLabels/Image/V3"
        },
        HumanLoopActivationConfig={
            "HumanLoopActivationConditionsConfig": {
                "HumanLoopActivationConditions": humanLoopActivationConditions
            }
        },
        HumanLoopConfig={
            "WorkteamArn": workteamArn,
            "HumanTaskUiArn": humanTaskUiArn,
            "TaskTitle": "Image content moderation",
            "TaskDescription": "Review the image and instructions. Complete the
 task",
            "TaskCount": 1,
            "TaskAvailabilityLifetimeInSeconds": 43200,
            "TaskTimeLimitInSeconds": 3600,
            "TaskKeywords": [
                "content moderation",
            ],
        },
```

```
        OutputConfig={
            "S3OutputPath": "s3://DOC-EXAMPLE-BUCKET/prefix/",
        },
        RoleArn="arn:aws:iam::<account-number>:role/<role-name>",
        Tags=[
            {
                "Key": "string",
                "Value": "string"
            },
        ]
    )
```

Custom Integration

If you use a custom integration, exclude the following parameters: `HumanLoopRequestSource`, `HumanLoopActivationConfig`.

```
    response = client.create_flow_definition(
        FlowDefinitionName="human-review-workflow-name",
        HumanLoopConfig={
            "WorkteamArn": workteamArn,
            "HumanTaskUiArn": humanTaskUiArn,
            "TaskTitle": "Image content moderation",
            "TaskDescription": "Review the image and instructions. Complete the
task",
            "TaskCount": 1,
            "TaskAvailabilityLifetimeInSeconds": 43200,
            "TaskTimeLimitInSeconds": 3600,
            "TaskKeywords": [
                "content moderation",
            ],
        },
        OutputConfig={
            "S3OutputPath": "s3://DOC-EXAMPLE-BUCKET/prefix/",
        },
        RoleArn="arn:aws:iam::<account-number>:role/<role-name>",
        Tags=[
            {
                "Key": "string",
                "Value": "string"
            },
        ]
```

```
    )
```

After you create a human review workflow, you can retrieve the flow definition ARN from the response:

```
humanReviewWorkflowArn = response["FlowDefinitionArn"]
```

Create a Human Loop

The API operation you use to start a human loop depends on the Amazon A2I integration you use.

- If you use the Amazon Textract built-in integration, you use the AnalyzeDocument operation.
- If you use the Amazon Rekognition built-in integration, you use the DetectModerationLabels operation.
- If you use a custom integration, you use the StartHumanLoop operation.

Select your task type in the following table to see example requests for Amazon Textract and Amazon Rekognition using the AWS SDK for Python (Boto3).

Amazon Textract – Key-value pair extraction

The following example uses the AWS SDK for Python (Boto3) to call `analyze_document` in us-west-2. Replace the italicized red text with your resources. Include the `DataAttributes` parameter if you are using the Amazon Mechanical Turk workforce. For more information, see the analyze_document documention in the *AWS SDK for Python (Boto) API Reference*.

```
   response = client.analyze_document(
         Document={"S3Object": {"Bucket": "AWSDOC-EXAMPLE-BUCKET", "Name":
 "document-name.pdf"},
         HumanLoopConfig={
            "FlowDefinitionArn":"arn:aws:sagemaker:us-west-2:111122223333:flow-
definition/flow-definition-name",
            "HumanLoopName":"human-loop-name",
            "DataAttributes" : {ContentClassifiers:
["FreeOfPersonallyIdentifiableInformation"|"FreeOfAdultContent"]}
         }
         FeatureTypes=["FORMS"]
```

```
    )
```

Human loops are only created if Amazon Textract's confidence for document analysis task meets the activation conditions you specified in your human review workflow. You can check the `response` element to determine if a human loop has been created. To see everything included in this response, see `HumanLoopActivationOutput`.

```
    if "HumanLoopArn" in analyzeDocumentResponse["HumanLoopActivationOutput"]:
        # A human loop has been started!
        print(f"A human loop has been started with ARN:
 {analyzeDocumentResponse["HumanLoopActivationOutput"]["HumanLoopArn"]}"
```

Amazon Rekognition – Image moderation

The following example uses the AWS SDK for Python (Boto3) to call `detect_moderation_labels` in us-west-2. Replace the italicized red text with your resources. Include the `DataAttributes` parameter if you are using the Amazon Mechanical Turk workforce. For more information, see the detect_moderation_labels documention in the *AWS SDK for Python (Boto) API Reference*.

```
   response = client.detect_moderation_labels(
            Image={"S3Object":{"Bucket": "AWSDOC-EXAMPLE-BUCKET", "Name": "image-
name.png"}},
            HumanLoopConfig={
               "FlowDefinitionArn":"arn:aws:sagemaker:us-west-2:111122223333:flow-
definition/flow-definition-name",
               "HumanLoopName":"human-loop-name",
               "DataAttributes":{ContentClassifiers:
["FreeOfPersonallyIdentifiableInformation"|"FreeOfAdultContent"]}
             }
    )
```

Human loops are only created if Amazon Rekognition's confidence for an image moderation task meets the activation conditions you specified in your human review workflow. You can check the `response` element to determine if a human loop has been created. To see everything included in this response, see `HumanLoopActivationOutput`.

```
    if "HumanLoopArn" in response["HumanLoopActivationOutput"]:
        # A human loop has been started!
        print(f"A human loop has been started with ARN:
 {response["HumanLoopActivationOutput"]["HumanLoopArn"]}")
```

Custom Integration

The following example uses the AWS SDK for Python (Boto3) to call `start_human_loop` in us-west-2. Replace the italicized red text with your resources. Include the `DataAttributes` parameter if you are using the Amazon Mechanical Turk workforce. For more information, see the start_human_loop documention in the *AWS SDK for Python (Boto) API Reference*.

```
   response = client.start_human_loop(
        HumanLoopName= "human-loop-name",
        FlowDefinitionArn= "arn:aws:sagemaker:us-west-2:111122223333:flow-
definition/flow-definition-name",
        HumanLoopInput={"InputContent": inputContentJson},
        DataAttributes={"ContentClassifiers":
["FreeOfPersonallyIdentifiableInformation"|"FreeOfAdultContent"]}
   )
```

This example stores input content in the variable *`inputContentJson`*. Assume that the input content contains two elements: a text blurb and sentiment (such as `Positive`, `Negative`, or `Neutral`), and it is formatted as follows:

```
    inputContent = {
        "initialValue": sentiment,
         "taskObject": blurb
     }
```

The keys `initialValue` and `taskObject` must correspond to the keys used in the liquid elements of the worker task template. Refer to the custom template in Create a Human Task UI to see an example.

To create *`inputContentJson`*, do the following:

```
    import json
```

```
inputContentJson = json.dumps(inputContent)
```

A human loop starts each time you call `start_human_loop`. To check the status of your human loop, use describe_human_loop:

```
human_loop_info = a2i.describe_human_loop(HumanLoopName="human_loop_name")
print(f"HumanLoop Status: {resp["HumanLoopStatus"]}")
print(f"HumanLoop Output Destination: {resp["HumanLoopOutput"]}")
```

Use Cases and Examples Using Amazon A2I

You can use Amazon Augmented AI to incorporate a human review into your workflow for *built-in task types*, Amazon Textract and Amazon Rekognition, or your own custom tasks using a *custom task type*.

When you create a human review workflow using one of the built-in task types, you can specify conditions, such as confidence thresholds, that initiate a human review. The service (Amazon Rekognition or Amazon Textract) creates a human loop on your behalf when these conditions are met and supplies your input data directly to Amazon A2I to send to human reviewers. To learn more about the built-in task types, use the following:

- Use Amazon Augmented AI with Amazon Textract
- Use Amazon Augmented AI with Amazon Rekognition

When you use a custom task type, you create and start a human loop using the Amazon A2I Runtime API. Use the custom task type to incorporate a human review workflow with other AWS services or your own custom ML application.

- For more details, see Use Amazon Augmented AI with Custom Task Types

The following table outlines a variety of Amazon A2I use cases that you can explore using SageMaker Jupyter Notebooks. To get started with a Jupyter Notebook, use the instructions in Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook. For more examples, see this GitHub repository.

Use Case	Description	Task Type
Use Amazon A2I with Amazon Textract	Have humans review single-page documents to review important form key-value pairs, or have Amazon Textract randomly sample and send documents from your dataset to humans for review.	Built-in
Use Amazon A2I with Amazon Rekognition	Have humans review unsafe images for explicit adult or violent content if Amazon Rekognition returns a low confidence score, or have Amazon Rekognition randomly sample and send images from your dataset to humans for review.	Built-in
Use Amazon A2I with Amazon Comprehend	Have humans review Amazon Comprehend inferences about text data such as sentiment analysis, text syntax, and entity detection.	Custom
Use Amazon A2I with Amazon Transcribe	Have humans review Amazon Transcribe transcriptions of video or audio files. Use the results of transcription human review loops to create a custom vocabulary and improve future transcrip tions of similar video or audio content.	Custom

Use Case	Description	Task Type
Use Amazon A2I with Amazon Translate	Have humans review low-confidence translations returned from Amazon Translate.	Custom
Use Amazon A2I to review real time ML inferences	Use Amazon A2I to review real-time, low-confidence inferences made by a model deployed to a SageMaker hosted endpoint and incrementally train your model using Amazon A2I output data.	Custom
Use Amazon A2I to review tabular data	Use Amazon A2I to integrate a human review loop into an ML application that uses tabular data.	Custom

- Use Amazon Augmented AI with Amazon Rekognition
- Use Amazon Augmented AI with Custom Task Types

Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook

For an end-to-end example that demonstrates how to integrate an Amazon A2I human review loop into a machine learning workflow, you can use a Jupyter Notebook from this GitHub Repository in a SageMaker notebook instance.

To use an Amazon A2I custom task type sample notebook in an Amazon SageMaker notebook instance:

1. If you do not have an active SageMaker notebook instance, create one by following the instructions in Step 1: Create an Amazon SageMaker Notebook Instance.
2. When your notebook instance is active, choose **Open JupyterLab** to the right of the notebook instance's name. It may take a few moments for JupyterLab to load.
3. Choose the

   icon to clone a GitHub repository into your workspace.
4. Enter the amazon-a2i-sample-jupyter-notebooks repository HTTPS URL.
5. Choose **CLONE**.
6. Open the notebook that you would like to run.
7. Follow the instructions in the notebook to configure your human review workflow and human loop and run the cells.
8. To avoid incurring unnecessary charges, when you are done with the demo, stop and delete your notebook instance in addition to any Amazon S3 buckets, IAM roles, and CloudWatch Events resources created during the walkthrough.

Use Amazon Augmented AI with Amazon Textract

Amazon Textract enables you to add document text detection and analysis to your applications. Amazon Augmented AI (Amazon A2I) directly integrates with Amazon Textract's `AnalyzeDocument` API operation. You can use `AnalyzeDocument` to analyze a document for relationships between detected items. When you add an Amazon A2I human review loop to an `AnalyzeDocument` request, Amazon A2I monitors the Amazon Textract results and sends a document to one or more human workers for review when the conditions specified in your flow definition are met. For example, if you want a human to review a specific key like `Full name:` and their associated input values, you can create an activation condition that starts a human review any time the `Full name:` key is detected or when the inference confidence for that key falls within a range that you specify.

The following image depicts the Amazon A2I built-in workflow with Amazon Textract. On the left, the resources that are required to create an Amazon Textract human review workflow are depicted: and Amazon S3 bucket, activation conditions, a worker task template, and a work team.

These resources are used to create a human review workflow, or flow definition. An arrow points right to the next step in the workflow: using Amazon Textract to configure a human loop with the human review workflow. A second arrow points right from this step to the step in which activation conditions specified in the human review workflow are met. This initiates the creation of a human loop. On the right of the image, the human loop is depicted in three steps: 1) the worker UI and tools are generated and the task is made available to workers,2) workers review input data, and finally, 3) results are saved in Amazon S3.

You can specify when Amazon Textract sends a task to a human worker for review when creating a human review workflow or flow definition by specifying *activation conditions*.

You can set the following activation conditions when using the Amazon Textract task type:

- Initiate a human review for specific form keys based on the form key confidence score.
- Initiate a human review when specific form keys are missing.
- Initiate human review for all form keys identified by Amazon Textract with confidence scores in a specified range.
- Randomly send a sample of forms to humans for review.

When your activation condition depends on form key confidence scores, you can use two types of prediction confidence to initiate human loops:

- **Identification confidence** – The confidence score for key-value pairs detected within a form.

- **Qualification confidence** – The confidence score for text contained within key and value in a form.

In the image in the following section, **Full Name: Jane Doe** is the key-value pair, **Full Name** is the key, and **Jane Doe** is the value.

You can set these activation conditions using the Amazon SageMaker console when you create a human review workflow, or by creating a JSON for human loop activation conditions and specifying this as input in the `HumanLoopActivationConditions` parameter of `CreateFlowDefinition` API operation. To learn how specify activation conditions in JSON format, see JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI and Use Human Loop Activation Conditions JSON Schema with Amazon Textract.

> **Note**
>
> When using Augmented AI with Amazon Textract, create Augmented AI resources in the same AWS Region you use to call `AnalyzeDocument`.

Get Started: Integrate a Human Review into an Amazon Textract Analyze Document Job

To integrate a human review into an Amazon Textract text detection and analysis job, you need to create a flow definition, and then use the Amazon Textract API to integrate that flow definition into your workflow. To learn how to create a flow definition using the SageMaker console or Augmented AI API, see the following topics:

- Create a Human Review Workflow (Console)
- Create a Human Review Workflow (API)

After you've created your flow definition, see Using Augmented AI with Amazon Textract to learn how to integrate your flow definition into your Amazon Textract task.

End-to-End Example Using Amazon Textract and Amazon A2I

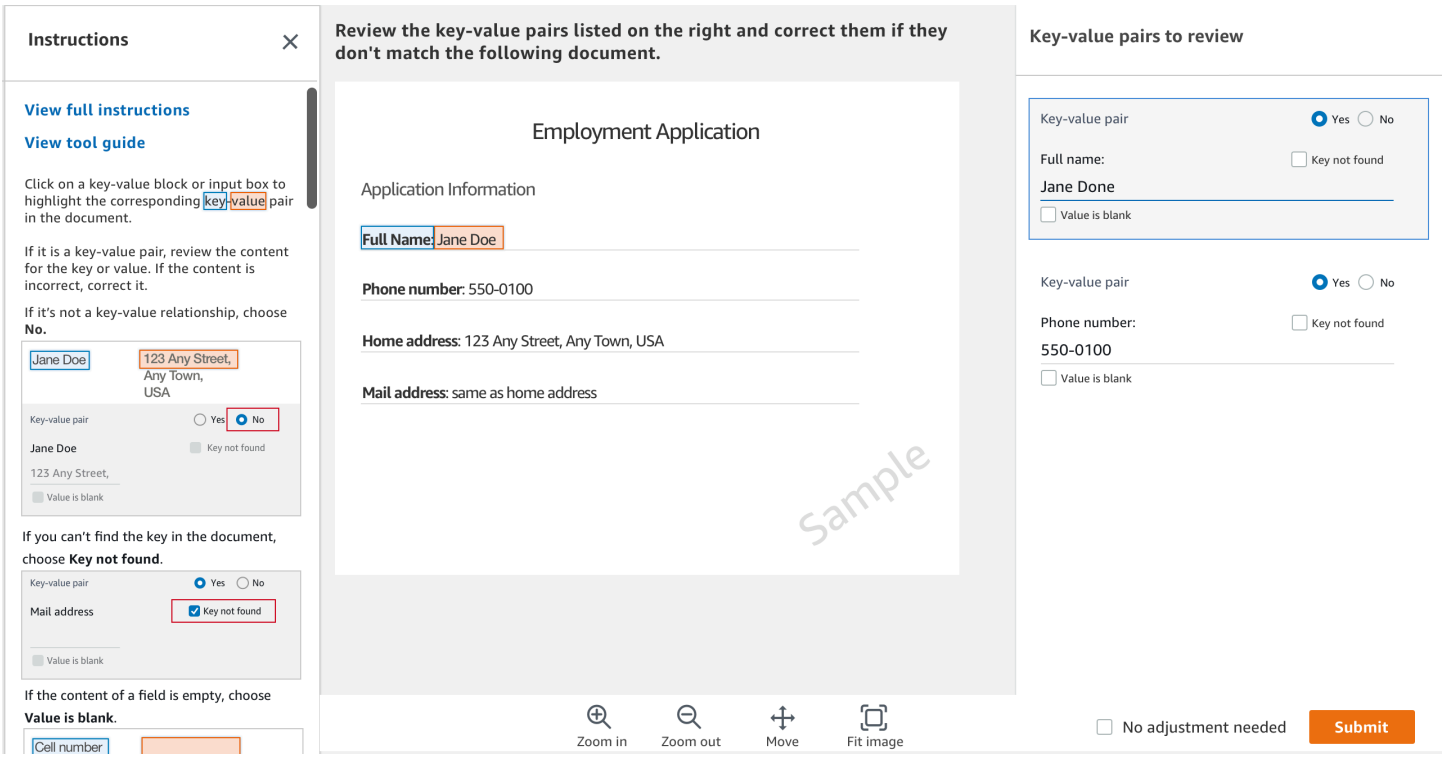
For an end-to-end example that demonstrates how to use Amazon Textract with Amazon A2I using the console, see Tutorial: Get Started in the Amazon A2I Console.

To learn how to use the Amazon A2I API to create and start a human review, you can use Amazon Augmented AI (Amazon A2I) integration with Amazon Textract's Analyze Document [Example] in a

SageMaker Notebook instance. To get started, see Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook.

A2I Textract Worker Console Preview

When they're assigned a review task in an Amazon Textract workflow, workers might see a user interface similar to the following:



You can customize this interface in the SageMaker console when you create your human review definition, or by creating and using a custom template. To learn more, see Create and Manage Worker Task Templates.

Use Amazon Augmented AI with Amazon Rekognition

Amazon Rekognition makes it easy to add image analysis to your applications. The Amazon Rekognition `DetectModerationLabels` API operation is directly integrated with Amazon A2I so that you can easily create a human loop to review unsafe images, such as explicit adult or violent content. You can use `DetectModerationLabels` to configure a human loop using a flow definition ARN. This enables Amazon A2I to analyze predictions made by Amazon Rekognition and send results to a human for review to ensure they meet the conditions set in your flow definition.

The following image depicts the Amazon A2I built-in workflow with Amazon Rekognition. On the left, the resources that are required to create an Amazon Rekognition human review workflow

are depicted: and Amazon S3 bucket, activation conditions, a worker task template, and a work team. These resources are used to create a human review workflow, or flow definition. An arrow points right to the next step in the workflow: using Amazon Rekognition to configure a human loop with the human review workflow. A second arrow points right from this step to the step in which activation conditions specified in the human review workflow are met. This initiates the creation of a human loop. On the right of the image, the human loop is depicted in three steps: 1) the worker UI and tools are generated and the task is made available to workers, 2) workers review input data, and finally, 3) results are saved in Amazon S3.

You can set the following activation conditions when using the Amazon Rekognition task type:

- Initiate human review for labels identified by Amazon Rekognition based on the label confidence score.
- Randomly send a sample of images to humans for review.

You can set these activation conditions using the Amazon SageMaker console when you create a human review workflow, or by creating a JSON for human loop activation conditions and specifying this as input in the `HumanLoopActivationConditions` parameter of the `CreateFlowDefinition` API operation. To learn how specify activation conditions in JSON format, see JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI and Use Human Loop Activation Conditions JSON Schema with Amazon Rekognition.

> **Note**
>
> When using Augmented AI with Amazon Rekognition, create Augmented AI resources in the same AWS Region you use to call `DetectModerationLabels`.

Get Started: Integrate a Human Review into an Amazon Rekognition Image Moderation Job

To integrate a human review into an Amazon Rekognition, see the following topics:

- Create a Human Review Workflow (Console)
- Create a Human Review Workflow (API)

After you've created your flow definition, see Using Augmented AI with Amazon Rekognition to learn how to integrate your flow definition into your Amazon Rekognition task.

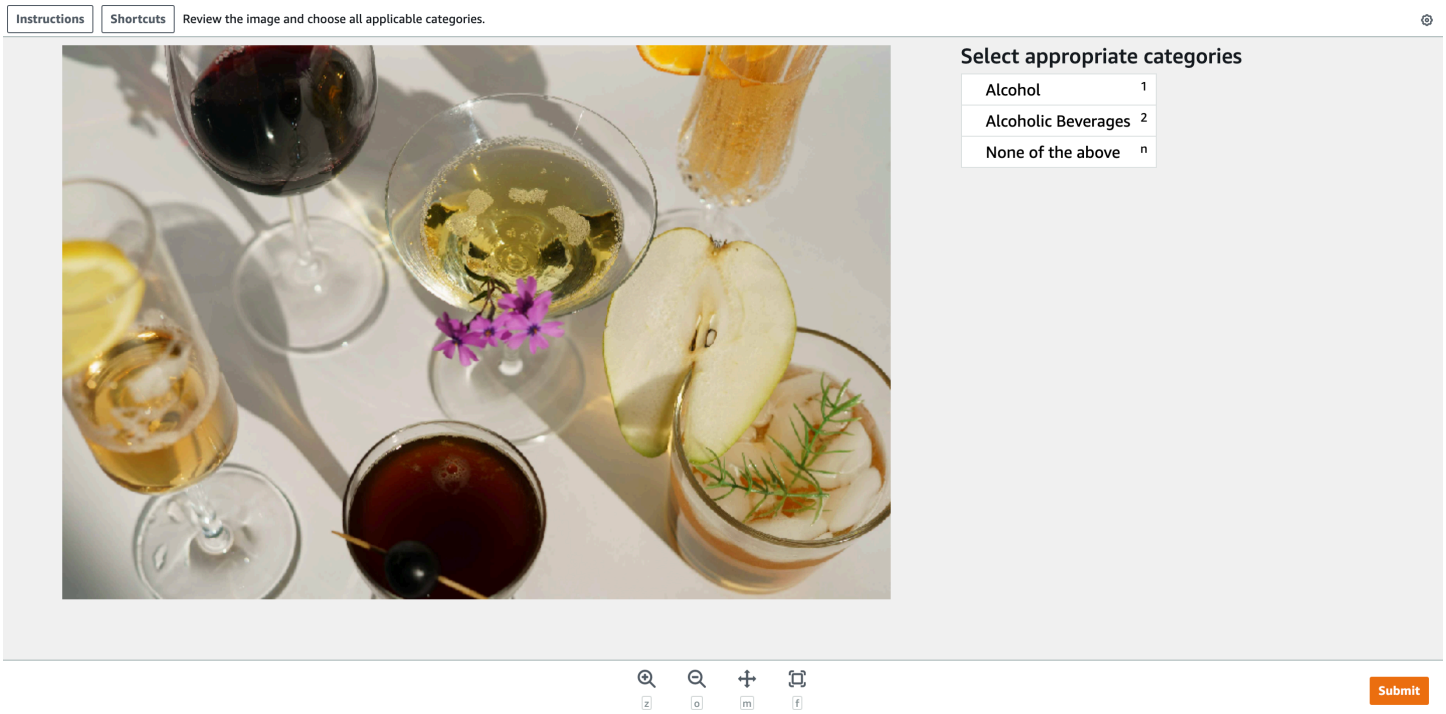
End-to-end Demo Using Amazon Rekognition and Amazon A2I

For an end-to-end example that demonstrates how to use Amazon Rekognition with Amazon A2I using the console, see Tutorial: Get Started in the Amazon A2I Console.

To learn how to use the Amazon A2I API to create and start a human review, you can use Amazon Augmented AI (Amazon A2I) integration with Amazon Rekognition [Example] in a SageMaker notebook instance. To get started, see Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook.

A2I Rekognition Worker Console Preview

When they're assigned a review task in an Amazon Rekognition workflow, workers might see a user interface similar to the following:



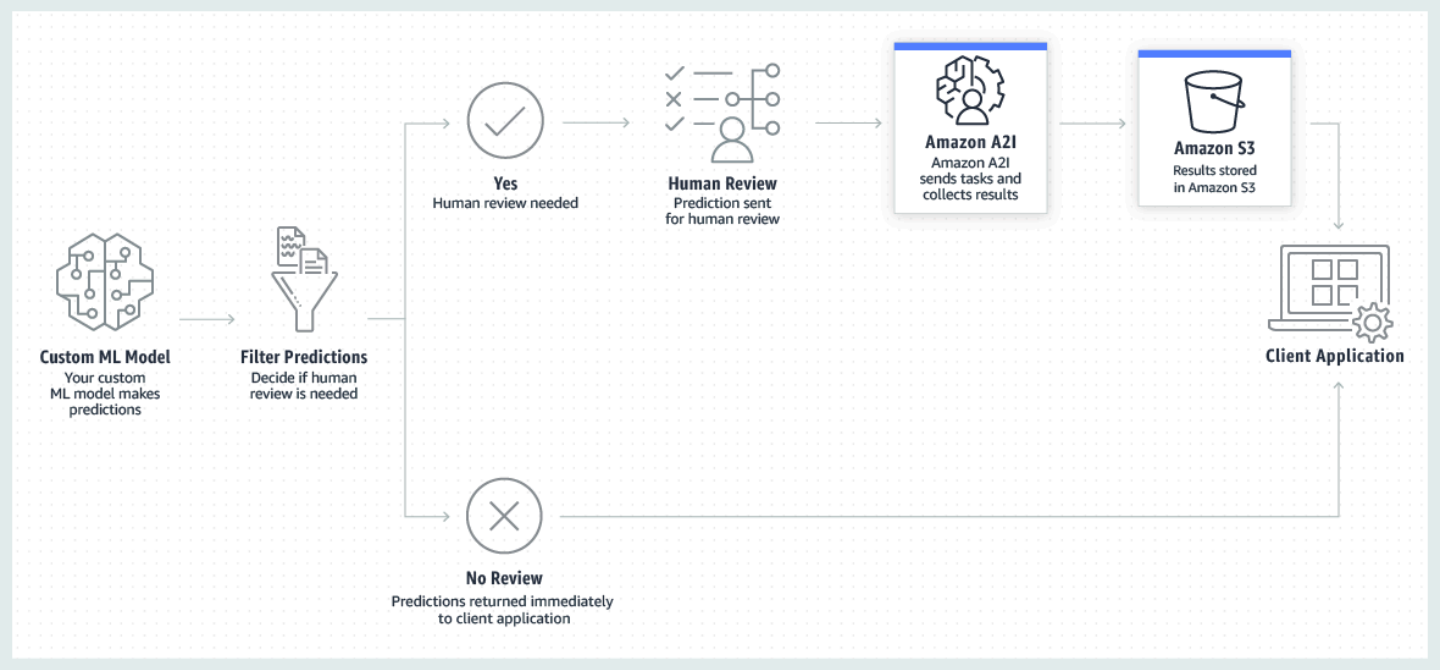
You can customize this interface in the SageMaker console when you create your human review definition, or by creating and using a custom template. To learn more, see Create and Manage Worker Task Templates.

Use Amazon Augmented AI with Custom Task Types

You can use Amazon Augmented AI (Amazon A2I) to incorporate a human review (human loop) into *any* machine learning workflow using the *custom task type*. This options gives you the most flexibility to customize the conditions under which your data objects are sent to humans for review, as well as the look and feel of your worker user interface.

When you use a custom task type, you create a custom human review workflow and specify the conditions under which a data object is sent for human review directly in your application.

The following image depicts the Amazon A2I custom workflow. A custom ML model is used to generate predictions. The client application filters these predictions using user-defined criteria and determines if a human review is required. If so, these predictions are sent to Amazon A2I for human review. Amazon A2I collects the results of human review in Amazon S3, which can access by the client application. If the filter determines that no human review is needed, predictions can be fed directly to the client application.



Use the procedures on this page to learn how to integrate Amazon A2I into any machine learning workflow using the custom task type.

Create a human loop using a flow definition, integrate it into your application, and monitor the results

1. Complete the Amazon A2I Prerequisites to Using Augmented AI. Note the following:

   - The path to the Amazon Simple Storage Service (Amazon S3) bucket or buckets where you store your input and output data.
   - The Amazon Resource Name (ARN) of an AWS Identity and Access Management (IAM) role with required permissions attached.
   - (Optional) The ARN of your private workforce, if you plan to use one.

2. Using HTML elements, create a custom worker template which Amazon A2I uses to generate your worker task UI. To learn how to create a custom template, see Create Custom Worker Task Templates.

3. Use the custom worker template from step 2 to generate a worker task template in the Amazon SageMaker console. To learn how, see Create a Worker Task Template.

   In the next step, you create a flow definition:

- If you want to create a flow definition using the SageMaker API, note the ARN of this worker task template for the next step.
- If you are creating a flow definition using the console, your template automatically appears in **Worker task template** section when you choose **Create human review workflow**.

4. When creating your flow definition, provide the path to your S3 buckets, your IAM role ARN, and your worker template.

   - To learn how to create a flow definition using the SageMaker `CreateFlowDefinition` API, see Create a Human Review Workflow (API).
   - To learn how to create a flow definition using the SageMaker console, see Create a Human Review Workflow (Console).

5. Configure your human loop using the Amazon A2I Runtime API. To learn how, see Create and Start a Human Loop.
6. To control when human reviews are initiated in your application, specify conditions under which `StartHumanLoop` is called in your application. Human loop activation conditions, such as confidence thresholds that initiate the human loop, are not available when using Amazon A2I with custom task types. Every `StartHumanLoop` invocation results in a human review.

Once you have started a human loop, you can manage and monitor your loops using the Amazon Augmented AI Runtime API and Amazon EventBridge (also known as Amazon CloudWatch Events). To learn more, see Monitor and Manage Your Human Loop.

End-to-end Tutorial Using Amazon A2I Custom Task Types

For an end-to-end examples that demonstrates how to integrate Amazon A2I into a variety of ML workflows, see the table in Use Cases and Examples Using Amazon A2I. To get started using one of these notebooks, see Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook.

Create a Human Review Workflow

Use an Amazon Augmented AI (Amazon A2I) *human review workflow*, or *flow definition*, to specify the following:

- For the Amazon Textract and Amazon Rekognition built-in task types, the conditions under which your human loop is called
- The workforce to which your tasks are sent

- The set of instructions that your workforce receives, which is called a *worker task template*
- The configuration of your worker tasks, including the number of workers that receive a task and time limits to complete tasks
- Where your output data is stored

You can create a human review workflow in the SageMaker console or using the SageMaker `CreateFlowDefinition` operation. You can build a worker task template using the console for Amazon Textract and Amazon Rekognition task types while creating your flow definition.

> **Important**
>
> Human loop activation conditions, which initiate the human loop—for example, confidence thresholds—aren't available for Amazon A2I custom task types. When using the console to create a flow definition for a custom task type, you can't specify activation conditions. When using the Amazon A2I API to create a flow definition for a custom task type, you can't set the `HumanLoopActivationConditions` attribute of the `HumanLoopActivationConditionsConfig` parameter. To control when human reviews are initiated, specify conditions under which `StartHumanLoop` is called in your custom application. In this case, every `StartHumanLoop` invocation results in a human review. For more information, see Use Amazon Augmented AI with Custom Task Types.

Prerequisites

To create a human review workflow definition, you must have completed the prerequisites described in Prerequisites to Using Augmented AI.

If you use the API to create a flow definition for any task type, or if you use a custom task type when creating a flow definition in the console, first create a worker task template. For more information, see Create and Manage Worker Task Templates.

If you want to preview your worker task template while creating a flow definition for a built-in task type in the console, ensure that you grant the role that you use to create the flow definition permission to access the Amazon S3 bucket that contains your template artifacts using a policy like the one described in Enable Worker Task Template Previews .

Topics

- Create a Human Review Workflow (Console)
- Create a Human Review Workflow (API)
- JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI

Create a Human Review Workflow (Console)

Use this procedure to create a Amazon Augmented AI (Amazon A2I) human review workflow using the SageMaker console. If you are new to Amazon A2I, we recommend that you create a private work team using people in your organization, and use this work team's ARN when creating your flow definition. To learn how to set up a private workforce and create a work team, see Create a Private Workforce (Amazon SageMaker Console). If you have already set up a private workforce, see Create a Work Team Using the SageMaker Console to learn how to add a work team to that workforce.

If you are using Amazon A2I with one of the built-in task types, you can create worker instructions using a default worker task template provided by Augmented AI while creating a human review workflow in the console. To see samples of the default templates provided by Augmented AI, see the built-in task types in Use Cases and Examples Using Amazon A2I.

To create flow definition (console)

1. Open the SageMaker console at https://console.aws.amazon.com/sagemaker/.
2. In the navigation pane, under the **Augmented AI** section, choose **Human review workflows** and then choose **Create human review workflow**.
3. In **Overview**, do the following:
    a. For **Name**, enter a unique workflow name. The name must be lowercase, unique within the AWS Region in your account, and can have up to 63 characters. Valid characters include: a-z, 0-9, and - (hyphen).
    b. For **S3 location for output**, enter the S3 bucket where you want to store the human review results. The bucket must be located in the same AWS Region as the workflow.
    c. For **IAM role**, choose the role that has the required permissions. If you choose a built-in task type and want to preview your worker template in the console, provide a role with the type of policy described in Enable Worker Task Template Previews attached.
4. For **Task type**, choose the task type that you want the human worker to perform.

5. If you chose the Amazon Rekognition or Amazon Textract task type, specify the conditions that invoke human review.

   - For Amazon Rekognition image moderation tasks, choose an inference confidence score threshold interval that initiates human review.
   - For Amazon Textract tasks, you can initiate a human review when specific form keys are missing or when form key detection confidence is low. You can also initiate a human review if, after evaluating all of the form keys in the text, confidence is lower than your required threshold for any form key. Two variables specify your confidence thresholds: **Identification confidence** and **Qualification confidence**. To learn more about these variables, see Use Amazon Augmented AI with Amazon Textract.
   - For both task types, you can randomly send a percentage of data objects (images or forms) and their labels to humans for review.

6. Configure and specify your worker task template:

   a. If you are using the Amazon Rekognition or Amazon Textract task type:

      - In the **Create template** section:

        - To create instructions for your workers using the Amazon A2I default template for Amazon Rekognition and Amazon Textract task types, choose **Build from a default template**.

          - If you choose **Build from a default template**, create your instructions under **Worker task design**:

            - Provide a **Template name** that is unique in the AWS Region you are in.
            - In the **Instructions** section, provide detailed instructions on how to complete your task. To help workers achieve greater accuracy, provide good and bad examples.
            - (Optional) In **Additional instructions**, provide your workers with additional information and instructions.

              For information on creating effective instructions, see Creating Good Worker Instructions.

        - To select a custom template that you've created, choose it from the **Template** menu and provide a **Task description** to briefly describe the task for your workers. To learn how to create a custom template, see Create a Worker Task Template.

b. If you are using the custom task type:

- In the **Worker task template** section, select your template from the list. All of the templates that you have created in the SageMaker console appear in this list. To learn how to create a template for custom task types, see Create and Manage Worker Task Templates.

7. (Optional) Preview your worker template:

   For Amazon Rekognition and Amazon Textract task types, you have the option to choose **See a sample worker task** to preview your worker task UI.

   If you are creating a flow definition for a custom task type, you can preview your worker task UI using the `RenderUiTemplate` operation. For more information, see Preview a Worker Task Template.

8. For **Workers**, choose a workforce type.
9. Choose **Create**.

Next Steps

After you've created a human review workflow, it appears in the console under **Human review workflows**. To see your flow definition's Amazon Resource Name (ARN) and configuration details, choose the workflow by selecting its name.

If you are using a built-in task type, you can use the flow definition ARN to start a human loop using that AWS service's API (for example, the Amazon Textract API). For custom task types, you can use the ARN to start a human loop using the Amazon Augmented AI Runtime API. To learn more about both options, see Create and Start a Human Loop.

Create a Human Review Workflow (API)

To create a flow definition using the SageMaker API, you use the `CreateFlowDefinition` operation. After you complete the Prerequisites to Using Augmented AI, use the following procedure to learn how to use this API operation.

For an overview of the `CreateFlowDefinition` operation, and details about each parameter, see `CreateFlowDefinition`.

To create a flow definition (API)

1. For `FlowDe#nitionName`, enter a unique name. The name must be unique within the AWS Region in your account, and can have up to 63 characters. Valid characters include: a-z, 0-9, and - (hyphen).
2. For `RoleArn`, enter the ARN of the role that you configured to grant access to your data sources.
3. For `HumanLoopConfig`, enter information about the workers and what they should see. For information about each parameter in `HumanLoopConfig`, see HumanLoopConfig.
4. (Optional) If you are using a built-in task type, provide conditions that initiate a human loop in `HumanLoopActivationCon#g`. To learn how to create the input required for the `HumanLoopActivationCon#g` parameter, see JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI. If you do not specify conditions here, when you provide a flow definition to the AWS service associated with a built-in task type (for example, Amazon Textract or Amazon Rekognition), that service sends every task to a human worker for review.

   If you are using a custom task type, `HumanLoopActivationConfig` is disabled. To learn how to control when tasks are sent to human workers using a custom task type, see Use Amazon Augmented AI with Custom Task Types.
5. (Optional) If you are using a built-in task type, specify the integration source (for example, Amazon Rekognition or Amazon Textract) in the HumanLoopRequestSource parameter.
6. For `OutputConfig`, indicate where in Amazon Simple Storage Service (Amazon S3) to store the output of the human loop.
7. (Optional) Use `Tags` to enter key-value pairs to help you categorize and organize a flow definition. Each tag consists of a key and a value, both of which you define.

Amazon Textract – Key-value pair extraction

The following is an example of a request to create an Amazon Textract human review workflow (flow definition) using the AWS SDK for Python (Boto3). You must use `'AWS/Textract/AnalyzeDocument/Forms/V1'` to create a Amazon Textract human loop. Only include `PublicWorkforceTaskPrice` if you are using the Mechanical Turk workforce.

```
sagemaker_client = boto3.client('sagemaker', aws_region)

response = sagemaker_client.create_flow_definition(
    FlowDefinitionName='ExampleFlowDefinition',
```

```
    HumanLoopRequestSource={
         'AwsManagedHumanLoopRequestSource': 'AWS/Textract/AnalyzeDocument/Forms/V1'
    },
    HumanLoopActivationConfig={
        'HumanLoopActivationConditionsConfig': {
            'HumanLoopActivationConditions': '{...}'
        }
    },
    HumanLoopConfig={
        'WorkteamArn': 'arn:aws:sagemaker:aws_region:aws_account_number:workteam/
private-crowd/workteam_name',
        'HumanTaskUiArn': 'arn:aws:sagemaker:aws_region:aws_account_number:human-
task-ui/template_name',
        'TaskTitle': 'Example task title',
        'TaskDescription': 'Example task description.',
        'TaskCount': 123,
        'TaskAvailabilityLifetimeInSeconds': 123,
        'TaskTimeLimitInSeconds': 123,
        'TaskKeywords': [
            'Keyword1','Keyword2'
        ],
        'PublicWorkforceTaskPrice': {
            'AmountInUsd': {
                'Dollars': 123,
                'Cents': 123,
                'TenthFractionsOfACent': 123
            }
        }
    },
    OutputConfig={
        'S3OutputPath': 's3://bucket/path/',
        'KmsKeyId': '1234abcd-12ab-34cd-56ef-1234567890ab'
    },
    RoleArn='arn:aws:iam::aws_account_number:role/role_name',
    Tags=[
        {
            'Key': 'KeyName',
            'Value': 'ValueName'
        },
    ]
)
```

Amazon Rekognition – Image moderation

The following is an example of a request to create an Amazon Rekognition human review workflow (flow definition) using the AWS SDK for Python (Boto3). You must use `'AWS/Rekognition/DetectModerationLabels/Image/V3'` to create an Amazon Rekognition flow definition. Only include `PublicWorkforceTaskPrice` if you are using the Mechanical Turk workforce.

```
sagemaker_client = boto3.client('sagemaker', aws_region)

response = sagemaker_client.create_flow_definition(
    FlowDefinitionName='ExampleFlowDefinition',
    HumanLoopRequestSource={
         'AwsManagedHumanLoopRequestSource': 'AWS/Rekognition/
DetectModerationLabels/Image/V3'
    },
    HumanLoopActivationConfig={
        'HumanLoopActivationConditionsConfig': {
            'HumanLoopActivationConditions': '{...}'
        }
    },
    HumanLoopConfig={
        'WorkteamArn': 'arn:aws:sagemaker:aws_region:aws_account_number:workteam/
private-crowd/workteam_name',
        'HumanTaskUiArn': 'arn:aws:sagemaker:aws_region:aws_account_number:human-
task-ui/template_name',
        'TaskTitle': 'Example task title',
        'TaskDescription': 'Example task description.',
        'TaskCount': 123,
        'TaskAvailabilityLifetimeInSeconds': 123,
        'TaskTimeLimitInSeconds': 123,
        'TaskKeywords': [
            'Keyword1','Keyword2'
        ],
        'PublicWorkforceTaskPrice': {
            'AmountInUsd': {
                'Dollars': 123,
                'Cents': 123,
                'TenthFractionsOfACent': 123
            }
        }
    },
    OutputConfig={
```

```
        'S3OutputPath': 's3://bucket/path/',
        'KmsKeyId': '1234abcd-12ab-34cd-56ef-1234567890ab'
    },
    RoleArn='arn:aws:iam::aws_account_number:role/role_name',
    Tags=[
        {
            'Key': 'KeyName',
            'Value': 'ValueName'
        },
    ]
)
```

Custom Workflow

The following is an example of a request to create a human review workflow (flow definition) for a custom integration. To create this type of human review workflow, omit `HumanLoopRequestSource` from the flow definition request. You only need to include `PublicWorkforceTaskPrice` if you are using the Mechanical Turk workforce.

```
sagemaker_client = boto3.client('sagemaker', aws_region)

response = sagemaker_client.create_flow_definition(
    FlowDefinitionName='ExampleFlowDefinition',
    HumanLoopActivationConfig={
        'HumanLoopActivationConditionsConfig': {
            'HumanLoopActivationConditions': '{...}'
        }
    },
    HumanLoopConfig={
        'WorkteamArn': 'arn:aws:sagemaker:aws_region:aws_account_number:workteam/
private-crowd/workteam_name',
        'HumanTaskUiArn': 'arn:aws:sagemaker:aws_region:aws_acount_number:human-
task-ui/template_name',
        'TaskTitle': 'Example task title',
        'TaskDescription': 'Example task description.',
        'TaskCount': 123,
        'TaskAvailabilityLifetimeInSeconds': 123,
        'TaskTimeLimitInSeconds': 123,
        'TaskKeywords': [
            'Keyword1','Keyword2'
        ],
        'PublicWorkforceTaskPrice': {
            'AmountInUsd': {
```

```
                'Dollars': 123,
                'Cents': 123,
                'TenthFractionsOfACent': 123
            }
        }
    },
    OutputConfig={
        'S3OutputPath': 's3://bucket/path/',
        'KmsKeyId': '1234abcd-12ab-34cd-56ef-1234567890ab'
    },
    RoleArn='arn:aws:iam::account_number:role/role_name',
    Tags=[
        {
            'Key': 'KeyName',
            'Value': 'ValueName'
        },
    ]
)
```

Next Steps

The return value of a successful call of the `CreateFlowDefinition` API operation is a flow definition Amazon Resource Name (ARN).

If you are using a built-in task type, you can use the flow definition ARN to start a human loop using that AWS service's API (i.e. the Amazon Textract API). For custom task types, you can use the ARN to start a human loop using the Amazon Augmented AI Runtime API. To learn more about both of these options, see Create and Start a Human Loop.

JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI

The `HumanLoopActivationConditions` is an input parameter of the `CreateFlowDefinition` API. This parameter is a JSON-formatted string. The JSON models the conditions under which a human loop is created when those conditions are evaluated against the response from an integrating AI service API (such as `Rekognition.DetectModerationLabels` or `Textract.AnalyzeDocument`). This response is referred to as an *inference*. For example, Amazon Rekognition sends an inference of a moderation label with an associated confidence score. In this example, the inference is the model's best estimate of the appropriate label for an image. For Amazon Textract, inference is made on the association between blocks of text (*key-value pairs*),

such as the association between `Name:` and `Sue` in a form as well as content within a block of text, or *word block*, such as 'Name'.

The following is the schema for the JSON. At the top level, the `HumanLoopActivationConditions` has a JSON array, `Conditions`. Each member of this array is an independent condition that, if evaluated to `true`, results in Amazon A2I creating a human loop. Each such independent condition can be a simple condition or a complex condition. A simple condition has the following attributes:

- `ConditionType`: This attribute identifies the type of condition. Each AWS AI service API that integrates with Amazon A2I defines its own set of allowed `ConditionTypes`.
  - Rekognition `DetectModerationLabels` – This API supports the `ModerationLabelConfidenceCheck` and `Sampling` `ConditionType` values.
  - Textract `AnalyzeDocument` – This API supports the `ImportantFormKeyConfidenceCheck`, `MissingImportantFormKey`, and `Sampling` `ConditionType` values.
- `ConditionParameters` – This is a JSON object that parameterizes the condition. The set of allowed attributes of this object is dependent on the value of the `ConditionType`. Each `ConditionType` defines its own set of `ConditionParameters`.

A member of the `Conditions` array can model a complex condition. This is accomplished by logically connecting simple conditions using the `And` and `Or` logical operators and nesting the underlying simple conditions. Up to two levels of nesting are supported.

```
{
    "$schema": "http://json-schema.org/draft-07/schema#",
    "definitions": {
        "Condition": {
            "type": "object",
            "properties": {
                "ConditionType": {
                    "type": "string"
                },
                "ConditionParameters": {
                    "type": "object"
                }
            },
            "required": [
                "ConditionType"
            ]
```

```
        },
        "OrConditionArray": {
            "type": "object",
            "properties": {

                    "items": {
                        "$ref": "#/definitions/ComplexCondition"
                    }
                }
            }
        },
        "ComplexCondition": {
            "anyOf": [
                {
                    "$ref": "#/definitions/Condition"
                },
                {
                    "$ref": "#/definitions/OrConditionArray"
                },
                {
                    "$ref": "#/definitions/AndConditionArray"
                }
            ]
        }
    },
    "type": "object",
    "properties": {
        "Conditions": {
            "type": "array",
            "items": {
```

```
                "$ref": "#/definitions/ComplexCondition"
            }
        }
    }
}
```

> **Note**
>
> Human loop activation conditions aren't available for human review workflows that are integrated with custom task types. The `HumanLoopActivationConditions` parameter is disabled for custom task types.

Topics

- Use Human Loop Activation Conditions JSON Schema with Amazon Textract
- Use Human Loop Activation Conditions JSON Schema with Amazon Rekognition

Use Human Loop Activation Conditions JSON Schema with Amazon Textract

When used with Amazon A2I, the `AnalyzeDocument` operation supports the following inputs in the `ConditionType` parameter:

- `ImportantFormKeyConfidenceCheck` – Use this condition to create a human loop when inference confidence is within a specified range for document form keys and word blocks. A *form key* is any word in a document that is associated with an input. The input is called a *value*. Together, form keys and values are referred to as *key-value pairs*. A *word block* refers to the words that Amazon Textract recognizes inside of a detected block of text. To learn more about Amazon Textract document blocks, see Documents and Block Objects in the *Amazon Textract Developer Guide*.
- `MissingImportantFormKey` – Use this condition to create a human loop when Amazon Textract did not identify the key or its associated aliases within the document.
- `Sampling` – Use this condition to specify a percentage of forms to send to humans for review, regardless of inference confidence scores. Use this condition to do the following:
  - Audit your ML model by randomly sampling all forms analyzed by your model and sending a specified percentage to humans for review.

- Using the `ImportantFormKeyConfidenceCheck` condition, randomly sample a percentage of the inferences that met the conditions specified in `ImportantFormKeyConfidenceCheck` to start a human loop and send only the specified percentage to humans for review.

> **Note**
>
> If you send the same request to `AnalyzeDocument` multiple times, the result of `Sampling` does not change for the inference of that input. For example, if you make an `AnalyzeDocument` request once, and `Sampling` doesn't initiate a human loop, subsequent requests to `AnalyzeDocument` with the same configuration do not initiate a human loop.

`ImportantFormKeyConfidenceCheck` Inputs and Results

The `ImportantFormKeyConfidenceCheck` `ConditionType` supports the following `ConditionParameters`:

- `ImportantFormKey` – A string representing a key in a key-value pair detected by Amazon Textract that needs to be reviewed by human workers. If the value of this parameter is the special catch-all value (*), then all keys are considered to be matched to the condition. You can use this to model the case where any key-value pair satisfying certain confidence thresholds needs human review.
- `ImportantFormKeyAliases` – An array that represents alternate spellings or logical equivalents for the important form key.
- `KeyValueBlockConfidenceEquals`
- `KeyValueBlockConfidenceLessThan`
- `KeyValueBlockConfidenceLessThanEquals`
- `KeyValueBlockConfidenceGreaterThan`
- `KeyValueBlockConfidenceGreaterThanEquals`
- `WordBlockConfidenceEquals`
- `WordBlockConfidenceLessThan`
- `WordBlockConfidenceLessThanEquals`
- `WordBlockConfidenceGreaterThan`

- `WordBlockConfidenceGreaterThanEquals`

When you use the `ImportantFormKeyConfidenceCheck` `ConditionType`, Amazon A2I sends the key-value block and word block inferences of the key-value blocks and associated aliases that you specified in `ImportantFormKey` and `ImportantFormKeyAliases` for human review.

When creating a flow definition, if you use the default worker task template that is provided in the **Human review workflows** section of the Amazon SageMaker console, key-value and block inferences sent for human review by this activation condition are included in the worker UI. If you use a custom worker task template, you need to include the `{{ task.input.selectedAiServiceResponse.blocks }}` element to include initial-value input data (inferences) from Amazon Textract. For an example of a custom template that uses this input element, see Custom Template Example for Amazon Textract.

`MissingImportantFormKey` Inputs and Results

The `MissingImportantFormKey` `ConditionType` supports the following `ConditionParameters`:

- `ImportantFormKey` – A string representing a key in a key-value pair detected by Amazon Textract that needs to be reviewed by human workers.
- `ImportantFormKeyAliases` – An array that represents alternate spellings or logical equivalents for the important form key.

When you use the `MissingImportantFormKey` `ConditionType`, if the key in `ImportantFormKey` or aliases in `ImportantFormKeyAliases` are not included in the Amazon Textract inference, that form is sent to human for review and no predicted key-value pairs are included. For example, if Amazon Textract only identified `Address` and Phone in a form, but was missing the `ImportantFormKey` `Name` (in the `MissingImportantFormKey` condition type) that form would be sent to humans for review without any of the form keys detected (`Address` and Phone).

If you use the default worker task template that is provided in the SageMaker console, a task is created asking workers to identify the key in `ImportantFormKey` and associated value. If you use a custom worker task template, you need to include the `<task.input.humanLoopContext>` custom HTML element to configure this task.

Sampling Inputs and Results

The `Sampling ConditionType` supports the `RandomSamplingPercentage ConditionParameters`. The input for `RandomSamplingPercentage` must be real number between 0.01 and 100. This number represents the percentage of data that qualifies for a human review and is sent to humans for review. If you use the `Sampling` condition without any other conditions, this number represents the percentage of all resulting inferences made by the `AnalyzeDocument` operation from a single request that is sent to humans for review.

If you specify the `Sampling` condition without any other condition type, all key-value and block inferences are sent to workers for review.

When creating a flow definition, if you use the default worker task template that is provided in the **Human review workflows** section of the SageMaker console, all key-value and block inferences sent for human review by this activation condition are included in the worker UI. If you use a custom worker task template, you need to include the `{{ task.input.selectedAiServiceResponse.blocks }}` element to include initial-value input data (inferences) from Amazon Textract. For an example of a custom template that uses this input element, see Custom Template Example for Amazon Textract.

Examples

While only one condition needs to evaluate to `true` to initiate a human loop, Amazon A2I evaluates all conditions for each object analyzed by Amazon Textract. The human reviewers are asked to review the important form keys for all the conditions that evaluated to `true`.

Example 1: Detect important form keys with confidence scores in a specified range that initiate a human loop

The following example shows a `HumanLoopActivationConditions` JSON that initiates a human loop if any one of the following three conditions is met:

- The Amazon Textract `AnalyzeDocument` API returns a key-value pair whose key is one of `Employee Name`, `Name`, or `EmployeeName`, with the confidence of the key-value block being less than 60 and the confidences of each of the word blocks making up the key and value being less than 85.
- The Amazon Textract `AnalyzeDocument` API returns a key-value pair whose key is one of `Pay Date`, `PayDate`, `DateOfPay`, or `pay-date`, with the confidence of the key-value block being less than 65 and the confidences of each of the word blocks making up the key and value being less than 85.

- The Amazon Textract `AnalyzeDocument` API returns a key-value pair whose key is one of `Gross Pay`, `GrossPay`, or `GrossAmount`, with the confidence of the key-value block being less than 60 and the confidences of each of the word blocks making up the key and value being less than 85.

```
{
    "Conditions": [
        {
            "ConditionType": "ImportantFormKeyConfidenceCheck",
            "ConditionParameters": {
                "ImportantFormKey": "Employee Name",
                "ImportantFormKeyAliases": [
                    "Name",
                    "EmployeeName"
                ],
                "KeyValueBlockConfidenceLessThan": 60,
                "WordBlockConfidenceLessThan": 85
            }
        },
        {
            "ConditionType": "ImportantFormKeyConfidenceCheck",
            "ConditionParameters": {
                "ImportantFormKey": "Pay Date",
                "ImportantFormKeyAliases": [
                    "PayDate",
                    "DateOfPay",
                    "pay-date"
                ],
                "KeyValueBlockConfidenceLessThan": 65,
                "WordBlockConfidenceLessThan": 85
            }
        },
        {
            "ConditionType": "ImportantFormKeyConfidenceCheck",
            "ConditionParameters": {
                "ImportantFormKey": "Gross Pay",
                "ImportantFormKeyAliases": [
                    "GrossPay",
                    "GrossAmount"
                ],
                "KeyValueBlockConfidenceLessThan": 60,
                "WordBlockConfidenceLessThan": 85
            }
```

```
        }
    ]
}
```

Example 2: Use `ImportantFormKeyConfidenceCheck`

In the following example, if Amazon Textract detects a key-value pair whose confidence for the key-value block is less than 60 and is less than 90 for any underlying word blocks, it creates a human loop. The human reviewers are asked to review all the form key-value pairs that matched the confidence value comparisons.

```
{
    "Conditions": [
        {
            "ConditionType": "ImportantFormKeyConfidenceCheck",
            "ConditionParameters": {
                "ImportantFormKey": "*",
                "KeyValueBlockConfidenceLessThan": 60,
                "WordBlockConfidenceLessThan": 90
            }
        }
    ]
}
```

Example 3: Use Sampling

In the following example, 5% of inferences resulting from an Amazon Textract `AnalyzeDocument` request are sent to human workers for review. All detected key-value pairs returned by Amazon Textract are sent to workers for review.

```
{
  "Conditions": [
    {
      "ConditionType": "Sampling",
      "ConditionParameters": {
        "RandomSamplingPercentage": 5
      }
    }
  ]
}
```

Example 4: Use `MissingImportantFormKey`

In the following example, if `Mailing Address` or its alias, `Mailing Address:`, is missing from keys detected by Amazon Textract, a human review is initiated. When using the default worker task template, the worker UI asks workers to identify the key `Mailing Address` or `Mailing Address:` and its associated value.

```
{
    "ConditionType": "MissingImportantFormKey",
    "ConditionParameters": {
        "ImportantFormKey": "Mailing Address",
        "ImportantFormKeyAliases": ["Mailing Address:"]
    }
}
```

Example 5: Use Sampling and `ImportantFormKeyConfidenceCheck` with the `And` operator

In this example, 5% of key-value pairs detected by Amazon Textract whose key is one of `Pay Date`, `PayDate`, `DateOfPay`, or `pay-date`, with the confidence of the key-value block less than 65 and the confidences of each of the word blocks making up the key and value less than 85, are sent to workers for review.

```
{
  "Conditions": [
    {
      "And": [
        {
          "ConditionType": "Sampling",
          "ConditionParameters": {
            "RandomSamplingPercentage": 5
          }
        },
        {
          "ConditionType": "ImportantFormKeyConfidenceCheck",
            "ConditionParameters": {
                "ImportantFormKey": "Pay Date",
                "ImportantFormKeyAliases": [
                    "PayDate",
                    "DateOfPay",
                    "pay-date"
                ],
                "KeyValueBlockConfidenceLessThan": 65,
                "WordBlockConfidenceLessThan": 85
            }
```

```
        }
      ]
    }
  ]
}
```

Example 6: Use Sampling and `ImportantFormKeyConfidenceCheck` with the And operator

Use this example to configure your human review workflow to always send low confidence inferences of a specified key-value pair for human review and sample high confidence inference of a key-value pair at a specified rate.

In the following example, a human review is initiated in one of the following ways:

- Key-value pairs detected whose key is one of `Pay Date`, `PayDate`, `DateOfPay`, or `pay-date`, with key-value and word block confidences less than 60, are sent for human review. Only the `Pay Date` form key (and its aliases) and associated values are sent to workers to review.
- 5% of key-value pairs detected whose key is one of `Pay Date`, `PayDate`, `DateOfPay`, or `pay-date`, with key-value and word block confidences greater than 90, are sent for human review. Only the `Pay Date` form key (and its aliases) and associated values are sent to workers to review.

```
{
  "Conditions": [
    {
      "Or": [
       {
          "ConditionType": "ImportantFormKeyConfidenceCheck",
            "ConditionParameters": {
                "ImportantFormKey": "Pay Date",
                "ImportantFormKeyAliases": [
                    "PayDate",
                    "DateOfPay",
                    "pay-date"
                ],
                "KeyValueBlockConfidenceLessThan": 60,
                "WordBlockConfidenceLessThan": 60
            }
        },
        {
            "And": [
```

```
                {
                    "ConditionType": "Sampling",
                    "ConditionParameters": {
                        "RandomSamplingPercentage": 5
                    }
                },
                {
                    "ConditionType": "ImportantFormKeyConfidenceCheck",
                        "ConditionParameters": {
                            "ImportantFormKey": "Pay Date",
                            "ImportantFormKeyAliases": [
                                "PayDate",
                                "DateOfPay",
                                "pay-date"
                            ],
                            "KeyValueBlockConfidenceLessThan": 90
                            "WordBlockConfidenceGreaterThan": 90
                        }
                }
            ]
        }
      ]
    }
  ]
}
```

Example 7: Use Sampling and `ImportantFormKeyConfidenceCheck` with the `Or` operator

In the following example, the Amazon Textract `AnalyzeDocument` operation returns a key-value pair whose key is one of `Pay Date`, `PayDate`, `DateOfPay`, or `pay-date`, with the confidence of the key-value block less than 65 and the confidences of each of the word blocks making up the key and value less than 85. Additionally, 5% of all other forms initiate a human loop. For each form randomly chosen, all key-value pairs detected for that form are sent to humans for review.

```
{
  "Conditions": [
    {
      "Or": [
        {
          "ConditionType": "Sampling",
          "ConditionParameters": {
            "RandomSamplingPercentage": 5
          }
```

```
        },
        {
           "ConditionType": "ImportantFormKeyConfidenceCheck",
            "ConditionParameters": {
                "ImportantFormKey": "Pay Date",
                "ImportantFormKeyAliases": [
                    "PayDate",
                    "DateOfPay",
                    "pay-date"
                ],
                "KeyValueBlockConfidenceLessThan": 65,
                "WordBlockConfidenceLessThan": 85
            }
          }
        }
      ]
    }
  ]
}
```

Use Human Loop Activation Conditions JSON Schema with Amazon Rekognition

When used with Amazon A2I, the Amazon Rekognition `DetectModerationLabels` operation supports the following inputs in the `ConditionType` parameters:

- `ModerationLabelConfidenceCheck` – Use this condition type to create a human loop when inference confidence is low for one or more specified labels.
- `Sampling` – Use this condition to specify a percentage of all inferences to send to humans for review. Use this condition to do the following:
  - Audit your ML model by randomly sampling all of your model's inferences and sending a specified percentage to humans for review.
  - Using the `ModerationLabelConfidenceCheck` condition, randomly sample a percentage of the inferences that met the conditions specified in `ModerationLabelConfidenceCheck` to start a human loop and send only the specified percentage to humans for review.

> **Note**
>
> If you send the same request to `DetectModerationLabels` multiple times, the result of `Sampling` does not change for the inference of that input. For example, if you make a

`DetectModerationLabels` request once, and `Sampling` does not initiate a human loop, subsequent requests to `DetectModerationLabels` with the same configuration don't initiate a human loop.

When creating a flow definition, if you use the default worker task template that is provided in the **Human review workflows** section of the Amazon SageMaker console, inferences sent for human review by these activation conditions are included in the worker UI when a worker opens your task. If you use a custom worker task template, you need to include the `<task.input.selectedAiServiceResponse.blocks>` custom HTML element to access these inferences. For an example of a custom template that uses this HTML element, see Custom Template Example for Amazon Rekognition.

`ModerationLabelConfidenceCheck` Inputs

For the `ModerationLabelConfidenceCheck` `ConditionType`, the following `ConditionParameters` are supported:

- `ModerationLabelName` – The exact (case-sensitive) name of a ModerationLabel detected by the Amazon Rekognition `DetectModerationLabels` operation. You can specify the special catch-all value (*) to denote any moderation label.
- `ConfidenceEquals`
- `ConfidenceLessThan`
- `ConfidenceLessThanEquals`
- `ConfidenceGreaterThan`
- `ConfidenceGreaterThanEquals`

When you use the `ModerationLabelConfidenceCheck` `ConditionType`, Amazon A2I sends label inferences for the labels that you specified in `ModerationLabelName` for human review.

Sampling Inputs

The `Sampling` `ConditionType` supports the `RandomSamplingPercentage` `ConditionParameters`. The input for the `RandomSamplingPercentage` prameter should be real number between 0.01 and 100. This number represents the percentage of inferences that qualifies for a human review that are sent to humans for review. If you use the `Sampling` condition

without any other conditions, this number represents the percentage of all inferences that result from a single `DetectModerationLabel` request that are sent to humans for review.

Examples

Example 1: Use `ModerationLabelConfidenceCheck` with the `And` operator

The following example of a `HumanLoopActivationConditions` condition initiates a human loop when one or more of the following conditions are met:

- Amazon Rekognition detects the `Graphic Male Nudity` moderation label with a confidence between 90 and 99.
- Amazon Rekognition detects the `Graphic Female Nudity` moderation label with a confidence between 80 and 99.

Note the use of the `Or` and `And` logical operators to model this logic.

Although only one of the two conditions under the `Or` operator needs to evaluate to `true` for a human loop to be created, Amazon Augmented AI evaluates all conditions. Human reviewers are asked to review the moderation labels for all the conditions that evaluated to `true`.

```
{
     "Conditions": [{
         "Or": [{
                 "And": [{
                         "ConditionType": "ModerationLabelConfidenceCheck",
                         "ConditionParameters": {
                             "ModerationLabelName": "Graphic Male Nudity",
                             "ConfidenceLessThanEquals": 99
                         }
                     },
                     {
                         "ConditionType": "ModerationLabelConfidenceCheck",
                         "ConditionParameters": {
                             "ModerationLabelName": "Graphic Male Nudity",
                             "ConfidenceGreaterThanEquals": 90
                         }
                     }
                 ]
             },
             {
```

```
                "And": [{
                        "ConditionType": "ModerationLabelConfidenceCheck",
                        "ConditionParameters": {
                            "ModerationLabelName": "Graphic Female Nudity",
                            "ConfidenceLessThanEquals": 99
                        }
                    },
                    {
                        "ConditionType": "ModerationLabelConfidenceCheck",
                        "ConditionParameters": {
                            "ModerationLabelName": "Graphic Female Nudity",
                            "ConfidenceGreaterThanEquals": 80
                        }
                    }
                ]
            }
        ]
    }]
}
```

Example 2: Use `ModerationLabelConfidenceCheck` with the catch-all value (*)

In the following example, if any moderation label with a confidence greater than or equal to 75 is detected, a human loop is initiated. Human reviewers are asked to review all moderation labels with confidence scores greater than or equal to 75.

```
{
    "Conditions": [
        {
            "ConditionType": "ModerationLabelConfidenceCheck",
            "ConditionParameters": {
                "ModerationLabelName": "*",
                "ConfidenceGreaterThanEquals": 75
            }
        }
    ]
}
```

Example 3: Use Sampling

In the following example, 5% of Amazon Rekognition inferences from a `DetectModerationLabels` request are sent to human workers. When using the default worker

task template provided in the SageMaker console, all moderation labels returned by Amazon Rekognition are sent to workers for review.

```
{
  "Conditions": [
    {
      "ConditionType": "Sampling",
      "ConditionParameters": {
        "RandomSamplingPercentage": 5
      }
    }
  ]
}
```

Example 4: Use Sampling and `ModerationLabelConfidenceCheck` with the And operator

In this example, 5% of Amazon Rekognition inferences of the `Graphic Male Nudity` moderation label with a confidence greater than 50 are sent workers for review. When using the default worker task template provided in the SageMaker console, only the inferences of the `Graphic Male Nudity` label are sent to workers for review.

```
{
  "Conditions": [
    {
      "And": [
        {
          "ConditionType": "Sampling",
          "ConditionParameters": {
            "RandomSamplingPercentage": 5
          }
        },
        {
          "ConditionType": "ModerationLabelConfidenceCheck",
          "ConditionParameters": {
            "ModerationLabelName": "Graphic Male Nudity",
            "ConfidenceGreaterThan": 50
          }
        }
      ]
    }
  ]
}
```

Example 5: Use Sampling and `ModerationLabelConfidenceCheck` with the `And` operator

Use this example to configure your human review workflow to always send low-confidence inferences of a specified label for human review and sample high-confidence inferences of a label at a specified rate.

In the following example, a human review is initiated in one of the following ways:

- Inferences for the `Graphic Male Nudity` moderation label the with confidence scores less than 60 are always sent for human review. Only the `Graphic Male Nudity` label is sent to workers to review.
- 5% of all inferences for the `Graphic Male Nudity` moderation label the with confidence scores greater than 90 are sent for human review. Only the `Graphic Male Nudity` label is sent to workers to review.

```
{
  "Conditions": [
    {
      "Or": [
        {
          "ConditionType": "ModerationLabelConfidenceCheck",
          "ConditionParameters": {
            "ModerationLabelName": "Graphic Male Nudity",
            "ConfidenceLessThan": 60
          }
        },
        {
            "And": [
                {
                    "ConditionType": "Sampling",
                    "ConditionParameters": {
                        "RandomSamplingPercentage": 5
                    }
                },
                {
                    "ConditionType": "ModerationLabelConfidenceCheck",
                    "ConditionParameters": {
                        "ModerationLabelName": "Graphic Male Nudity",
                        "ConfidenceGreaterThan": 90
                    }
                }
```

```
            ]
        }
      ]
    }
  ]
}
```

Example 6: Use Sampling and `ModerationLabelConfidenceCheck` with the `Or` operator

In the following example, a human loop is created if the Amazon Rekognition inference response contains the 'Graphic Male Nudity' label with inference confidence greater than 50. Additionally, 5% of all other inferences initiate a human loop.

```
{
  "Conditions": [
    {
      "Or": [
        {
          "ConditionType": "Sampling",
          "ConditionParameters": {
            "RandomSamplingPercentage": 5
          }
        },
        {
          "ConditionType": "ModerationLabelConfidenceCheck",
          "ConditionParameters": {
            "ModerationLabelName": "Graphic Male Nudity",
            "ConfidenceGreaterThan": 50
          }
        }
      ]
    }
  ]
}
```

Delete a Human Review Workflow

When you delete a human review workflow or you delete your AWS account while a human loop is in process, your human review workflow status changes to `Deleting`. Amazon A2I automatically stops and deletes all associated human loops if workers have not started tasks created by those human loops. If human workers are already working on a task, that task continues to be available

until it is completed or expires. As long as workers are still working on a task, your human review workflow's status is `Deleting`. If these tasks are completed, the results are stored in the Amazon S3 bucket specified in your flow definition.

Deleting a flow definition does not remove any worker answers from your S3 bucket. If the tasks are completed, but you deleted your AWS account, the results are stored in the Augmented AI service bucket for 30 days and then permanently deleted.

After all human loops have been deleted, the human review workflow is permanently deleted. When a human review workflow has been deleted, you can reuse its name to create a new human review workflow.

You might want to delete a human review workflow for any of the following reasons:

- You have sent data to a set of human reviewers and you want to delete all non-started human loops because you do not want those workers to work on those tasks any longer.
- The worker task template used to generate your worker UI does not render correctly or is not functioning as expected.

After you delete a human review workflow, the following changes occur:

- The human review workflow no longer appears on the **Human review workflows** page in the Augmented AI area of the Amazon SageMaker console.
- When you use the human review workflow name as input to the API operations `DescribeFlowDefinition` or `DeleteFlowDefinition`, Augmented AI returns a `ResourceNotFound` error.
- When you use `ListFlowDefinitions`, deleted human review workflows aren't included in the results.
- When you use the human review workflow ARN as input to the Augmented AI Runtime API operation `ListHumanLoops`, Augmented AI returns a `ResourceNotFoundException`.

Delete a Flow Definition Using the Console or the SageMaker API

You can delete a human review workflow on the **Human review workflows** page in the Augmented AI area of the SageMaker console or by using the SageMaker API.

Flow definitions can only be deleted if their status is `Active`.

Delete a human review workflow (console)

1. Navigate to the Augmented AI console at https://console.aws.amazon.com/a2i/.
2. In the navigation pane, under the **Augmented AI** section, choose **Human review workflows**.
3. Select the hyperlinked name of the human review workflow that you want to delete.
4. On the **Summary** page of your human review workflow, choose **Delete**.
5. In the dialog box asking you to confirm that you want to delete your human review workflow, choose **Delete**.

You're automatically redirected to the **Human review workflows** page. While your human review workflow is being deleted, the status **Deleting** appears in the status column for that workflow. After it's deleted, it doesn't appear in the list of workflows on this page.

Delete a human review workflow (API)

You can delete a human review workflow (flow definition) using the SageMaker DeleteFlowDefinition API operation. This API operation is supported through the AWS CLI and a variety of language specific SDKs. The following table shows example requests using SDK for Python (Boto3) and the AWS CLI to delete the human review workflow, *example-flow-definition*.

AWS SDK for Python (Boto3)

The following request example uses the SDK for Python (Boto3) to delete the human review workflow. For more information, see delete_flow_definition in the *AWS SDK for Python (Boto) API Reference*.

```
import boto3

sagemaker_client = boto3.client('sagemaker')
response = sagemaker_client.delete_flow_definition(FlowDefinitionName='example-flow-definition')
```

AWS CLI

The following request example uses the AWS CLI to delete the human review workflow. For more information, see delete-flow-definition in the *AWS CLI Command Reference*.

```
$ aws sagemaker delete-flow-definition --flow-definition-name 'example-flow-definition'
```

If the action is successful, Augmented AI sends back an HTTP 200 response with an empty HTTP body.

Create and Start a Human Loop

A *human loop* starts your human review workflow and sends data review tasks to human workers. When you use one of the Amazon A2I built-in task types, the corresponding AWS service creates and starts a human loop on your behalf when the conditions specified in your flow definition are met. If no conditions are specified in your flow definition, a human loop is created for each object. When using Amazon A2I for a custom task, a human loop starts when your application calls `StartHumanLoop`.

Use the following instructions to configure a human loop with Amazon Rekognition or Amazon Textract built-in task types and custom task types.

Prerequisites

To create and start a human loop, you must attach the `AmazonAugmentedAIFullAccess` policy to the AWS Identity and Access Management (IAM) user or role that configures or starts the human loop. This is the identity that you use to configure the human loop using `HumanLoopConfig` for built-in task types. For custom task types, this is the identity that you use to call `StartHumanLoop`.

Additionally, when using a built-in task type, your user or role must have permission to invoke API operations of the AWS service associated with your task type. For example, if you are using Amazon Rekognition with Augmented AI, you must attach permissions required to call `DetectModerationLabels`. For examples of identity-based policies you can use to grant these permissions, see Amazon Rekognition Identity-Based Policy Examples and Amazon Textract Identity-Based Policy Examples. You can also use the more general policy `AmazonAugmentedAIIntegratedAPIAccess` to grant these permissions. For more information, see Create a User With Permissions to Invoke Amazon A2I, Amazon Textract, and Amazon Rekognition API Operations.

To create and start a human loop, you need a flow definition ARN. To learn how to create a flow definition (or human review workflow), see Create a Human Review Workflow.

> **Important**
>
> Amazon A2I requires all S3 buckets that contain human loop input image data to have a CORS policy attached. To learn more about this change, see CORS Permission Requirement.

Create and Start a Human Loop for a Built-in Task Type

To start a human loop using a built-in task type, use the corresponding service's API to provide your input data and to configure the human loop. For Amazon Textract, you use the `AnalyzeDocument` API operation. For Amazon Rekognition, you use the `DetectModerationLabels` API operation. You can use the AWS CLI or a language-specific SDK to create requests using these API operations.

> **Important**
>
> When you create a human loop using a built-in task type, you can use `DataAttributes` to specify a set of `ContentClassifiers` related to the input provided to the `StartHumanLoop` operation. Use content classifiers to declare that your content is free of personally identifiable information or adult content.
> To use Amazon Mechanical Turk, ensure your data is free of personally identifiable information, including protected health information under HIPAA. Include the `FreeOfPersonallyIdentifiableInformation` content classifier. If you do not use this content classifier, SageMaker does not send your task to Mechanical Turk. If your data is free of adult content, also include the `'FreeOfAdultContent'` classifier. If you do not use these content classifiers, SageMaker may restrict the Mechanical Turk workers that can view your task.

After you start your ML job using your built-in task type's AWS service API, Amazon A2I monitors the inference results of that service. For example, when running a job with Amazon Rekognition, Amazon A2I checks the inference confidence score for each image and compares it to the confidence thresholds specified in your flow definition. If the conditions to start a human review task are satisfied, or if you didn't specify conditions in your flow definition, a human review task is sent to workers.

Create an Amazon Textract Human Loop

Amazon A2I integrates with Amazon Textract so that you can configure and start a human loop using the Amazon Textract API. To send a document file to Amazon Textract for document analysis, you use the Amazon Textract `AnalyzeDocument` API operation. To add a human loop to this document analysis job, you must configure the parameter `HumanLoopConfig`.

When you configure your human loop, the flow definition you specify in `FlowDefinitionArn` of `HumanLoopConfig` must be located in the same AWS Region as the bucket identified in `Bucket` of the `Document`parameter.

The following table shows examples of how to use this operation with the AWS CLI and AWS SDK for Python (Boto3).

AWS SDK for Python (Boto3)

The following request example uses the SDK for Python (Boto3). For more information, see analyze_document in the *AWS SDK for Python (Boto) API Reference*.

```
import boto3

textract = boto3.client('textract', aws_region)

response = textract.analyze_document(
            Document={'S3Object': {'Bucket': bucket_name, 'Name': document_name}},
            FeatureTypes=["TABLES", "FORMS"],
            HumanLoopConfig={
                'FlowDefinitionArn':
 'arn:aws:sagemaker:aws_region:aws_account_number:flow-definition/flow_def_name',
                'HumanLoopName': 'human_loop_name',
                'DataAttributes': {'ContentClassifiers':
 ['FreeOfPersonallyIdentifiableInformation','FreeOfAdultContent']}
            }
          )
```

AWS CLI

The following request example uses the AWS CLI. For more information, see analyze-document in the *AWS CLI Command Reference*.

```
$ aws textract analyze-document \
```

```
    --document '{"S3Object":{"Bucket":"bucket_name","Name":"document_name"}}' \
    --human-loop-config
 HumanLoopName="human_loop_name",FlowDefinitionArn="arn:aws:sagemaker:aws-
region:aws_account_number:flow-
definition/
flow_def_name",DataAttributes='{ContentClassifiers=["FreeOfPersonallyIdentifiableInformation
 "FreeOfAdultContent"]}' \
    --feature-types '["TABLES", "FORMS"]'
```

```
$ aws textract analyze-document \
    --document '{"S3Object":{"Bucket":"bucket_name","Name":"document_name"}}' \
    --human-loop-config \

 '{"HumanLoopName":"human_loop_name","FlowDefinitionArn":"arn:aws:sagemaker:aws_region:aws_a
definition/flow_def_name","DataAttributes": {"ContentClassifiers":
["FreeOfPersonallyIdentifiableInformation","FreeOfAdultContent"]}}' \
    --feature-types '["TABLES", "FORMS"]'
```

After you run `AnalyzeDocument` with a human loop configured, Amazon A2I monitors the results from `AnalyzeDocument` and checks it against the flow definition's activation conditions. If the Amazon Textract inference confidence score for one or more key-value pairs meets the conditions for review, Amazon A2I starts a human review loop and includes the `HumanLoopActivationOutput` object in the `AnalyzeDocument` response.

Create an Amazon Rekognition Human Loop

Amazon A2I integrates with Amazon Rekognition so that you can configure and start a human loop using the Amazon Rekognition API. To send images to Amazon Rekognition for content moderation, you use the Amazon Rekognition `DetectModerationLabels` API operation. To configure a human loop, set the `HumanLoopConfig` parameter when you configure `DetectModerationLabels`.

When you configure your human loop, the flow definition you specify in `FlowDefinitionArn` of `HumanLoopConfig` must be located in the same AWS Region as the S3 bucket identified in `Bucket` of the `Image` parameter.

The following table shows examples of how to use this operation with the AWS CLI and AWS SDK for Python (Boto3).

AWS SDK for Python (Boto3)

The following request example uses the SDK for Python (Boto3). For more information, see detect_moderation_labels in the *AWS SDK for Python (Boto) API Reference*.

```
import boto3

rekognition = boto3.client("rekognition", aws_region)

response = rekognition.detect_moderation_labels( \
        Image={'S3Object': {'Bucket': bucket_name, 'Name': image_name}}, \
        HumanLoopConfig={ \
            'HumanLoopName': 'human_loop_name', \
            'FlowDefinitionArn': , 
 "arn:aws:sagemaker:aws_region:aws_account_number:flow-definition/flow_def_name" \
            'DataAttributes': {'ContentClassifiers':
 ['FreeOfPersonallyIdentifiableInformation','FreeOfAdultContent']}
         })
```

AWS CLI

The following request example uses the AWS CLI. For more information, see detect-moderation-labels in the *AWS CLI Command Reference*.

```
$ aws rekognition detect-moderation-labels \
    --image "S3Object={Bucket='bucket_name',Name='image_name'}" \
    --human-loop-config
 HumanLoopName="human_loop_name",FlowDefinitionArn="arn:aws:sagemaker:aws_region:aws_account
definition/
flow_def_name",DataAttributes='{ContentClassifiers=["FreeOfPersonallyIdentifiableInformation
 "FreeOfAdultContent"]}'
```

```
$ aws rekognition detect-moderation-labels \
    --image "S3Object={Bucket='bucket_name',Name='image_name'}" \
    --human-loop-config \
        '{"HumanLoopName": "human_loop_name", "FlowDefinitionArn":
 "arn:aws:sagemaker:aws_region:aws_account_number:flow-
definition/flow_def_name", "DataAttributes": {"ContentClassifiers":
 ["FreeOfPersonallyIdentifiableInformation", "FreeOfAdultContent"]}}'
```

After you run `DetectModerationLabels` with a human loop configured, Amazon A2I monitors the results from `DetectModerationLabels` and checks it against the flow definition's activation conditions. If the Amazon Rekognition inference confidence score for an image meets the conditions for review, Amazon A2I starts a human review loop and includes the response element `HumanLoopActivationOutput` in the `DetectModerationLabels` response.

Create and Start a Human Loop for a Custom Task Type

To configure a human loop for a custom human review task, use the `StartHumanLoop` operation within your application. This section provides an example of a human loop request using the AWS SDK for Python (Boto3) and the AWS Command Line Interface (AWS CLI). For documentation on other language-specific SDKs that support `StartHumanLoop`, use the **See Also** section of StartHumanLoop in the Amazon Augmented AI Runtime API documentation. Refer to Use Cases and Examples Using Amazon A2I to see examples that demonstrate how to use Amazon A2I with a custom task type.

Prerequisites

To complete this procedure, you need:

- Input data formatted as a string representation of a JSON-formatted file
- The Amazon Resource Name (ARN) of your flow definition

To configure the human loop

1. For `DataAttributes`, specify a set of `ContentClassifiers` related to the input provided to the `StartHumanLoop` operation. Use content classifiers to declare that your content is free of personally identifiable information or adult content.

   To use Amazon Mechanical Turk, ensure your data is free of personally identifiable information, including protected health information under HIPAA, and include the `FreeOfPersonallyIdentifiableInformation` content classifier. If you do not use this content classifier, SageMaker does not send your task to Mechanical Turk. If your data is free of adult content, also include the `'FreeOfAdultContent'` classifier. If you do not use these content classifiers, SageMaker may restrict the Mechanical Turk workers that can view your task.
2. For `FlowDefinitionArn`, enter the Amazon Resource Name (ARN) of your flow definition.

3. For `HumanLoopInput`, enter your input data as a string representation of a JSON-formatted file. Structure your input data and custom worker task template so that your input data is properly displayed to human workers when you start your human loop. See Preview a Worker Task Template to learn how to preview your custom worker task template.
4. For `HumanLoopName`, enter a name for the human loop. The name must be unique within the Region in your account and can have up to 63 characters. Valid characters are a-z, 0-9, and - (hyphen).

To start a human loop

- To start a human loop, submit a request similar to the following examples using your preferred language-specific SDK.

AWS SDK for Python (Boto3)

The following request example uses the SDK for Python (Boto3). For more information, see Boto 3 Augmented AI Runtime in the *AWS SDK for Python (Boto) API Reference*.

```
import boto3

a2i_runtime_client = boto3.client('sagemaker-a2i-runtime')

response = a2i_runtime_client.start_human_loop(
    HumanLoopName='human_loop_name',
    FlowDefinitionArn='arn:aws:sagemaker:aws-region:xyz:flow-
definition/flow_def_name',
    HumanLoopInput={
        'InputContent': '{"InputContent": {\"prompt\":\"What is the answer?\"}}'
    },
    DataAttributes={
        'ContentClassifiers': [
            'FreeOfPersonallyIdentifiableInformation'|'FreeOfAdultContent',
        ]
    }
)
```

AWS CLI

The following request example uses the AWS CLI. For more information, see start-human-loop in the *AWS CLI Command Reference*.

```
$ aws sagemaker-a2i-runtime start-human-loop
        --flow-definition-arn 'arn:aws:sagemaker:aws_region:xyz:flow-
definition/flow_def_name' \
        --human-loop-name 'human_loop_name' \
        --human-loop-input '{"InputContent": "{\"prompt\":\"What is the answer?
\"}"}' \
        --data-attributes
 ContentClassifiers="FreeOfPersonallyIdentifiableInformation","FreeOfAdultContent" \
```

When you successfully start a human loop by invoking `StartHumanLoop` directly, the response includes a `HumanLoopARN` and a `HumanLoopActivationResults` object which is set to `NULL`. You can use this the human loop name to monitor and manage your human loop.

Next Steps:

After starting a human loop, you can manage and monitor it with the Amazon Augmented AI Runtime API and Amazon CloudWatch Events. To learn more, see Monitor and Manage Your Human Loop.

Delete a Human Loop

When you delete a human loop, the status changes to `Deleting`. When the human loop is deleted, the associated human review task is no longer available to workers. You might want to delete a human loop in one of the following circumstances:

- The worker task template used to generate your worker user interface does not render correctly or is not functioning as expected.
- A single data object was accidentally sent to workers multiple times.
- You no longer need a data object reviewed by a human.

If the status of a human loop is `InProgress`, you must stop the human loop before deleting it. When you stop a human loop, the status changes to `Stopping` while it is being stopped. When the status changes to `Stopped`, you can delete the human loop.

If human workers are already working on a task when you stop the associated human loop, that task continues to be available until it is completed or expires. As long as workers are still working on a task, your human loop's status is `Stopping`. If these tasks are completed, the results are stored in the Amazon S3 bucket URI specified in your human review workflow. If the worker leaves

the task without submitting work, it is stopped and the worker can't return to the task. If no worker has started working on the task, it is stopped immediately.

If you delete the AWS account used to create the human loop, it is stopped and deleted automatically.

Human Loop Data Retention and Deletion

When a human worker completes a human review task, the results are stored in the Amazon S3 output bucket you specified in the human review workflow used to create the human loop. Deleting or stopping a human loop does not remove any worker answers from your S3 bucket.

Additionally, Amazon A2I temporarily stores human loop input and output data internally for the following reasons:

- If you configure your human loops so that a single data object is sent to multiple workers for review, Amazon A2I does not write output data to your S3 bucket until all workers have completed the review task. Amazon A2I stores partial answers—answers from individual workers—internally so that it can write full results to your S3 bucket.
- If you report a low-quality human review result, Amazon A2I can investigate and respond to your issue.
- If you lose access to or delete the output S3 bucket specified in the human review workflow used to create a human loop, and the task has already been sent to one or more workers, Amazon A2I needs a place to temporarily store human review results.

Amazon A2I deletes this data internally 30 days after a human loop's status changes to one of the following: `Deleted`, `Stopped`, or `Completed`. In other words, data is deleted 30 days after the human loop has been completed, stopped, or deleted. Additionally, this data is deleted after 30 days if you close the AWS account used to create associated human loops.

Stop and Delete a Flow Definition Using the Console or the Amazon A2I API

You can stop and delete a human loop in the Augmented AI console or by using the SageMaker API. When the human loop has been deleted, the status changes to `Deleted`.

Delete a human loop (console)

1. Navigate to the Augmented AI console at https://console.aws.amazon.com/a2i/.
2. In the navigation pane, under the **Augmented AI** section, choose **Human review workflows**.

3. Choose the hyperlinked name of the human review workflow you used to create the human loop you want to delete.
4. In the **Human loops** section at the bottom of the page, select the human loop you want to stop and delete.
5. If the human loop status is `Completed`, `Stopped`, or `Failed`, select **Delete**.

   If the human loop **Status** is `InProgress`, select **Stop**. When the status changes to **Stopped**, select **Delete**.

Delete a human loop (API)

1. Check the status of your human loop using the Augmented AI Runtime API operation `DescribeHumanLoop`. See examples using this operation in the following table.

   AWS SDK for Python (Boto3)

   The following example uses the SDK for Python (Boto3) to describe the human loop named *`example-human-loop`*. For more information, see describe_human_loop in the *AWS SDK for Python (Boto) API Reference*.

   ```
   import boto3

   a2i_runtime_client = boto3.client('sagemaker-a2i-runtime')
   response = a2i_runtime_client.describe_human_loop(HumanLoopName='example-human-loop')
   human_loop_status = response['HumanLoopStatus']
   print(f'example-human-loop status is: {human_loop_status}')
   ```

   AWS CLI

   The following example uses the AWS CLI to describe the human loop named *`example-human-loop`*. For more information, see describe-human-loop in the *AWS CLI Command Reference*.

   ```
   $ aws sagemaker-a2i-runtime describe-human-loop --human-loop-name 'example-human-loop'
   ```

2. If the flow definition status is `Completed`, `Stopped`, or `Failed`, delete the flow definition using the Augmented AI Runtime API operation `DeleteHumanLoop`.

AWS SDK for Python (Boto3)

The following example uses the SDK for Python (Boto3) to delete the human loop named *example-human-loop*. For more information, see delete_human_loop in the *AWS SDK for Python (Boto) API Reference*.

```
import boto3

a2i_runtime_client = boto3.client('sagemaker-a2i-runtime')
response = a2i_runtime_client.delete_human_loop(HumanLoopName='example-human-loop')
```

AWS CLI

The following example uses the AWS CLI to delete the human loop named *example-human-loop*. For more information, see delete-human-loop in the *AWS CLI Command Reference*.

```
$ aws sagemaker-a2i-runtime delete-human-loop --human-loop-name 'example-human-loop'
```

If the human loop status is `InProgress`, stop the human loop using `StopHumanLoop` and then use `DeleteHumanLoop` to delete it.

AWS SDK for Python (Boto3)

The following example uses the SDK for Python (Boto3) to describe the human loop named *example-human-loop*. For more information, see stop_human_loop in the *AWS SDK for Python (Boto) API Reference*.

```
import boto3

a2i_runtime_client = boto3.client('sagemaker-a2i-runtime')
response = a2i_runtime_client.stop_human_loop(HumanLoopName='example-human-loop')
```

AWS CLI

The following example uses the AWS CLI to describe the human loop named *example-human-loop*. For more information, see stop-human-loop in the *AWS CLI Command Reference*.

```
$ aws sagemaker-a2i-runtime stop-human-loop --human-loop-name 'example-human-loop'
```

Create and Manage Worker Task Templates

You can create a task user interface for your workers by creating a *worker task template*. A worker task template is an HTML file that is used to display your input data and instructions to help workers complete your task.

For Amazon Rekognition or Amazon Textract task types, you can customize a pre-made worker task template using a graphical user interface (GUI) and avoid interacting with HTML code. For this option, use the instructions in Create a Human Review Workflow (Console) to create a human review workflow and customize your worker task template in the Amazon SageMaker console. Once you create a template using these instructions, it appears on the worker task templates page of the Augmented AI console.

If you are creating a human review workflow for a custom task type, you must create a *custom worker task template* using HTML code. For more information, see Create Custom Worker Task Templates.

If you create your template using HTML, you must use this template to generate an Amazon A2I *human task UI Amazon Resource Name (ARN)* in the Amazon A2I console. This ARN has the following format: `arn:aws:sagemaker:<aws-region>:<aws-account-number>:human-task-ui/<template-name>`. This ARN is associated with a worker task template resource that you can use in one or more human review workflows (flow definitions).

Generate a human task UI ARN using a worker task template by following the instructions found in Create a Worker Task Template or by using the `CreateHumanTaskUi` API operation.

Topics

- Create and Delete Worker Task Templates
- Create Custom Worker Task Templates

- Creating Good Worker Instructions

Create and Delete Worker Task Templates

You can use a worker template to customize the interface and instructions that your workers see when working on your tasks. Use the instructions on this page to create a worker task template in the Augmented AI area of the Amazon SageMaker console. A starter template is provided for Amazon Textract and Amazon Rekognition tasks. To learn how to customize your template using HTML crowd elements, see Create Custom Worker Task Templates.

When you create a worker template in the worker task templates page of the Augmented AI area of the SageMaker console, a worker task template ARN is generated. Use this ARN as the input to `HumanTaskUiArn` when you create a flow definition using the API operation `CreateFlowDefinition`. You can choose this template when creating a human review workflow on the human review workflows page of the console.

If you are creating a worker task template resource for an Amazon Textract or Amazon Rekognition task type, you can preview the worker UI that is generated from your template on the worker task templates console page. You must attach the policy described in Enable Worker Task Template Previews to the IAM role that you use to preview the template.

Create a Worker Task Template

You can create a worker task template using the SageMaker console and using the SageMaker API operation `CreateHumanTaskUi`.

Create a worker task template (console)

1. Open the Amazon A2I console at https://console.aws.amazon.com/a2i/.
2. Under **Amazon Augmented AI** in the left navigation pane, choose **Worker task templates**.
3. Choose **Create template**.
4. In **Template name**, enter a unique name.
5. (Optional) Enter an **IAM role** that grants Amazon A2I the permissions necessary to call services on your behalf.
6. In **Template type**, choose a template type from the dropdown list. If you are creating a template for a **Textract-form extraction** or **Rekognition-image moderation** task, choose the appropriate option.

7. Enter your custom template elements as follows:

   - If you selected the Amazon Textract or Amazon Rekognition task template, the **Template editor** autopopulates with a default template that you can customize.
   - If you are using a custom template, enter your predefined template in the editor.

8. (Optional) To complete this step, you must provide an IAM role ARN with permission to read Amazon S3 objects that get rendered on your user interface in **Step 5**.

   You can only preview your template if you are creating templates for Amazon Textract or Amazon Rekognition.

   Choose **See preview** to preview the interface and instructions that workers see. This is an interactive preview. After you complete the sample task and choose **Submit**, you see the resulting output from the task that you just performed.

   If you are creating a worker task template for a custom task type, you can preview your worker task UI using `RenderUiTemplate`. For more information, see Preview a Worker Task Template.

9. When you're satisfied with your template, choose **Create**.

After you've created your template, you can select that template when you create a human review workflow in the console. Your template also appears in the **Amazon Augmented AI** section of the SageMaker console under **Worker task templates**. Choose your template to view its ARN. Use this ARN when using the `CreateFlowDefinition` API operation .

Create a worker task template using a worker task template (API)

To generate a worker task template using the SageMaker API operation `CreateHumanTaskUi`, specify a name for your UI in `HumanTaskUiName` and input your HTML template in `Content` under `UiTemplate`. Find documentation on language-specific SDKs that support this API operation in the **See Also** section of the `CreateHumanTaskUi`.

Delete a Worker Task Template

Once you have created a worker task template, you can delete it using the SageMaker console or the SageMaker API operation `DeleteHumanTaskUi`.

When you delete a worker task template, you are not able to use human review workflows (flow definitions) created using that template to start human loops. Any human loops that have already

been created using the worker task template that you delete continue to be processed until completion and are not impacted.

Delete a worker task template (console)

1. Open the Amazon A2I console at https://console.aws.amazon.com/a2i/.
2. Under Amazon Augmented AI in the left navigation pane, choose **Worker task templates**.
3. Select the template that you want to delete.
4. Selete **Delete**.
5. A modal appears to confirm your choice. Select **Delete**.

Delete a worker task template (API)

To delete a worker task template using the SageMaker API operation `DeleteHumanTaskUi`, specify a name of your UI in `HumanTaskUiName`.

Create Custom Worker Task Templates

Crowd HTML Elements are web components that provide a number of task widgets and design elements that you can tailor to the question you want to ask. You can use these crowd elements to create a custom worker template and integrate it with an Amazon Augmented AI (Amazon A2I) human review workflow to customize the worker console and instructions.

For a list of all HTML crowd elements available to Amazon A2I users, see Crowd HTML Elements Reference. For examples of templates, see the AWS GitHub repository, which contains over 60 sample custom task templates.

Develop Templates Locally

When in the console to test how your template processes incoming data, you can test the look and feel of your template's HTML and custom elements in your browser by adding the following code to the top of your HTML file.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
```

This loads the necessary code to render the custom HTML elements. Use this code if you want to develop your template's look and feel in your preferred editor instead of in the console.

This code won't parse your variables. You might want to replace them with sample content while developing locally.

Use External Assets

Amazon Augmented AI custom templates enable you to embed external scripts and style sheets. For example, the following header embeds a `text/css` style sheet name `stylesheet` located at `https://www.example.com/my-enhancement-styles.css` into the custom template.

Example

```
<script src="https://www.example.com/my-enhancment-script.js"></script>
<link rel="stylesheet" type="text/css" href="https://www.example.com/my-enhancement-
styles.css">
```

If you encounter errors, ensure that your originating server is sending the correct MIME type and encoding headers with the assets.

For example, the MIME and encoding type for remote scripts is `application/javascript;CHARSET=UTF-8`.

The MIME and encoding type for remote stylesheets is `text/css;CHARSET=UTF-8`.

Track Your Variables

When building a custom template, you must add variables to it to represent the pieces of data that might change from task to task, or worker to worker. If you're starting with one of the sample templates, you need to make sure you're aware of the variables it already uses.

For example, for a custom template that integrates an Augmented AI human review loop with a Amazon Textract text review task, `{{ task.input.selectedAiServiceResponse.blocks }}` is used for initial-value input data. For Amazon Augmented AI (Amazon A2I) integration with Amazon Rekognition , `{{ task.input.selectedAiServiceResponse.moderationLabels }}` is used. For a custom task type, you need to determine the input parameter for your task type. Use `{{ task.input.`*`customInputValuesForStartHumanLoop`*`}}` where you specify *`customInputValuesForStartHumanLoop`*.

Custom Template Example for Amazon Textract

All custom templates begin and end with the `<crowd-form> </crowd-form>` elements. Like standard HTML `<form>` elements, all of your form code should go between these elements.

For an Amazon Textract document analysis task, use the `<crowd-textract-analyze-document>` element. It uses the following attributes:

- `src` – Specifies the URL of the image file to be annotated.
- `initialValue` – Sets initial values for attributes found in the worker UI.
- `blockTypes` (required) – Determines the kind of analysis that the workers can do. Only `KEY_VALUE_SET` is currently supported.
- `keys` (required) – Specifies new keys and the associated text value that the worker can add.
- `no-key-edit` (required) – Prevents the workers from editing the keys of annotations passed through `initialValue`.
- `no-geometry-edit` – Prevents workers from editing the polygons of annotations passed through `initialValue`.

For children of the `<crowd-textract-analyze-document>` element, you must have two Regions. You can use arbitrary HTML and CSS elements in these Regions.

- `<full-instructions>` – Instructions that are available from the **View full instructions** link in the tool. You can leave this blank, but we recommend that you provide complete instructions to get better results.
- `<short-instructions>` – A brief description of the task that appears in the tool's sidebar. You can leave this blank, but we recommend that you provide complete instructions to get better results.

An Amazon Textract template would look similar to the following.

Example

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
{% capture s3_uri %}http://s3.amazonaws.com/
{{ task.input.aiServiceRequest.document.s3Object.bucket }}/
{{ task.input.aiServiceRequest.document.s3Object.name }}{% endcapture %}

<crowd-form>
  <crowd-textract-analyze-document
    src="{{ s3_uri | grant_read_access }}"
    initial-value="{{ task.input.selectedAiServiceResponse.blocks }}"
```

```
    header="Review the key-value pairs listed on the right and correct them if they
 don't match the following document."
    no-key-edit
    no-geometry-edit
    keys="{{ task.input.humanLoopContext.importantFormKeys }}"
    block-types="['KEY_VALUE_SET']"
  >
    <short-instructions header="Instructions">
      <style>
        .instructions {
          white-space: pre-wrap;
        }
        .instructionsImage {
          display: inline-block;
          max-width: 100%;
        }
      </style>
      <p class='instructions'>Choose a key-value block to highlight the corresponding
 key-value pair in the document.

If it is a valid key-value pair, review the content for the value. If the content is
 incorrect, correct it.

The text of the value is incorrect, correct it.
<img class='instructionsImage' src="https://example-site/correct-value-text.png" />

A wrong value is identified, correct it.
<img class='instructionsImage' src="https://example-site/correct-value.png" />

If it is not a valid key-value relationship, choose No.
<img class='instructionsImage' src="https://example-site/not-a-key-value-pair.png" />

If you can’t find the key in the document, choose Key not found.
<img class='instructionsImage' src="https://example-site/key-is-not-found.png" />

If the content of a field is empty, choose Value is blank.
<img class='instructionsImage' src="https://example-site/value-is-blank.png" />

<b>Examples</b>
Key and value are often displayed next to or below to each other.

Key and value displayed in one line.
<img class='instructionsImage' src="https://example-site/sample-key-value-pair-1.png" /
>
```

```
Key and value displayed in two lines.
<img class='instructionsImage' src="https://example-site/sample-key-value-pair-2.png" /
>

If the content of the value has multiple lines, enter all the text without a line
 break. Include all value text even if it extends beyond the highlight box.
<img class='instructionsImage' src="https://assets.crowd.aws/images/a2i-console/
multiple-lines.png" /></p>
    </short-instructions>

    <full-instructions header="Instructions"></full-instructions>
  </crowd-textract-analyze-document>
</crowd-form>
```

Custom Template Example for Amazon Rekognition

All custom templates begin and end with the `<crowd-form> </crowd-form>` elements. Like standard HTML `<form>` elements, all of your form code should go between these elements. For an Amazon Rekognition custom task template, use the `<crowd-rekognition-detect-moderation-labels>` element. This element supports the following attributes:

- `categories` – An array of strings *or* an array of objects where each object has a `name` field.
  - If the categories come in as objects, the following applies:
    - The displayed categories are the value of the `name` field.
    - The returned answer contains the *full* objects of any selected categories.
  - If the categories come in as strings, the following applies:
    - The returned answer is an array of all the strings that were selected.
- `exclusion-category` – By setting this attribute, you create a button underneath the categories in the UI. When a user selects the button, all categories are deselected and disabled. If the worker selects the button again, you re-enable users to choose categories. If the worker submits the task by selecting **Submit** after you select the button, that task returns an empty array.

For children of the `<crowd-rekognition-detect-moderation-labels>` element, you must have two Regions.

- `<full-instructions>` – Instructions that are available from the **View full instructions** link in the tool. You can leave this blank, but we recommend that you provide complete instructions to get better results.
- `<short-instructions>` – Brief description of the task that appears in the tool's sidebar. You can leave this blank, but we recommend that you provide complete instructions to get better results.

A template using these elements would look similar to the following.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
{% capture s3_uri %}http://s3.amazonaws.com/
{{ task.input.aiServiceRequest.image.s3Object.bucket }}/
{{ task.input.aiServiceRequest.image.s3Object.name }}{% endcapture %}

<crowd-form>
  <crowd-rekognition-detect-moderation-labels
    categories='[
      {% for label in task.input.selectedAiServiceResponse.moderationLabels %}
        {
          name: "{{ label.name }}",
          parentName: "{{ label.parentName }}",
        },
      {% endfor %}
    ]'
    src="{{ s3_uri | grant_read_access }}"
    header="Review the image and choose all applicable categories."
  >
    <short-instructions header="Instructions">
      <style>
        .instructions {
          white-space: pre-wrap;
        }
      </style>
      <p class='instructions'>Review the image and choose all applicable categories.
If no categories apply, choose None.

<b>Nudity</b>
Visuals depicting nude male or female person or persons

<b>Graphic Male Nudity</b>
Visuals depicting full frontal male nudity, often close ups
```

```
<b>Graphic Female Nudity</b>
Visuals depicting full frontal female nudity, often close ups

<b>Sexual Activity</b>
Visuals depicting various types of explicit sexual activities and pornography

<b>Illustrated Nudity or Sexual Activity</b>
Visuals depicting animated or drawn sexual activity, nudity, or pornography

<b>Adult Toys</b>
Visuals depicting adult toys, often in a marketing context

<b>Female Swimwear or Underwear</b>
Visuals depicting female person wearing only swimwear or underwear

<b>Male Swimwear Or Underwear</b>
Visuals depicting male person wearing only swimwear or underwear

<b>Partial Nudity</b>
Visuals depicting covered up nudity, for example using hands or pose

<b>Revealing Clothes</b>
Visuals depicting revealing clothes and poses, such as deep cut dresses

<b>Graphic Violence or Gore</b>
Visuals depicting prominent blood or bloody injuries

<b>Physical Violence</b>
Visuals depicting violent physical assault, such as kicking or punching

<b>Weapon Violence</b>
Visuals depicting violence using weapons like firearms or blades, such as shooting

<b>Weapons</b>
Visuals depicting weapons like firearms and blades

</crowd-form>
```

Add Automation with Liquid

The custom template system uses Liquid for automation. *Liquid* is an open-source inline markup language. For more information and documentation, see the Liquid homepage.

In Liquid, the text between single curly braces and percent symbols is an instruction or *tag* that performs an operation like control flow or iteration. Text between double curly braces is a variable or *object* that outputs its value. The following list includes two types of liquid tags that you may find useful to automate template input data processing. If you select one of the following tag-types, you are redirected to the Liquid documentation.

- Control flow: Includes programming logic operators like `if/else`, `unless`, and `case/when`.
- Iteration: Enables you to run blocks of code repeatedly using statements like for loops.

  For example, the following code example demonstrates how you can use the Liquid `for` tag to create a `for` loop. This example loops through the `moderationLabels` returned from Amazon Rekognition and displays the `moderationLabels` attributes `name` and `parentName` for workers to review:

```
{% for label in task.input.selectedAiServiceResponse.moderationLabels %}
   {
     name: &amp;quot;{{ label.name }}&amp;quot;,
     parentName: &amp;quot;{{ label.parentName }}&amp;quot;,
   },
{% endfor %}
```

Use Variable Filters

In addition to the standard Liquid filters and actions, Amazon Augmented AI (Amazon A2I) offers additional filters. You apply filters by placing a pipe (|) character after the variable name, and then specifying a filter name. To chain filters, use the following format.

Example

```
{{ <content> | <filter> | <filter> }}
```

Autoescape and Explicit Escape

By default, inputs are HTML-escaped to prevent confusion between your variable text and HTML. You can explicitly add the `escape` filter to make it more obvious to someone reading the source of your template that escaping is being done.

escape_once

`escape_once` ensures that if you've already escaped your code, it doesn't get re-escaped again. For example, it ensures that `&` doesn't become `&`.

skip_autoescape

`skip_autoescape` is useful when your content is meant to be used as HTML. For example, you might have a few paragraphs of text and some images in the full instructions for a bounding box.

> **Note**
>
> Use `skip_autoescape` sparingly. As a best practice for templates, avoid passing in functional code or markup with `skip_autoescape` unless you are absolutely sure that you have strict control over what's being passed. If you're passing user input, you could be opening your workers up to a cross-site scripting attack.

to_json

`to_json` encodes data that you provide to JavaScript Object Notation (JSON). If you provide an object, it serializes it.

grant_read_access

`grant_read_access` takes an Amazon Simple Storage Service (Amazon S3) URI and encodes it into an HTTPS URL with a short-lived access token for that resource. This makes it possible to display photo, audio, or video objects stored in S3 buckets that are not otherwise publicly accessible to workers.

Example Example of the to_json and grant_read_access filters

Input

```
auto-escape: {{ "Have you read 'James & the Giant Peach'?" }}
explicit escape: {{ "Have you read 'James & the Giant Peach'?" | escape }}
explicit escape_once: {{ "Have you read 'James &amp; the Giant Peach'?" |
 escape_once }}
skip_autoescape: {{ "Have you read 'James & the Giant Peach'?" | skip_autoescape }}
to_json: {{ jsObject | to_json }}
grant_read_access: {{ "s3://examplebucket/myphoto.png" | grant_read_access }}
```

Example

Output

```
auto-escape: Have you read &#39;James &amp; the Giant Peach&#39;?
explicit escape: Have you read &#39;James &amp; the Giant Peach&#39;?
explicit escape_once: Have you read &#39;James &amp; the Giant Peach&#39;?
skip_autoescape: Have you read 'James & the Giant Peach'?
to_json: { "point_number": 8, "coords": [ 59, 76 ] }
grant_read_access: https://s3.amazonaws.com/examplebucket/myphoto.png?<access token and
 other params>
```

Example Example of an automated classification template.

To automate this simple text classification sample, include the Liquid tag `{{ task.input.source }}`. This example uses the crowd-classifier element.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-classifier
    name="tweetFeeling"
    categories="['positive', 'negative', 'neutral', 'cannot determine']"
    header="Which term best describes this tweet?"
  >
```

```
    <classification-target>
       {{ task.input.source }}
    </classification-target>

    <full-instructions header="Analyzing a sentiment">
      Try to determine the feeling the author
      of the tweet is trying to express.
      If none seems to match, choose "other."
    </full-instructions>

    <short-instructions>
      Pick the term that best describes the sentiment
      of the tweet.
    </short-instructions>

  </crowd-classifier>
</crowd-form>
```

Preview a Worker Task Template

To preview a custom worker task template, use the SageMaker `RenderUiTemplate` operation. You can use the `RenderUiTemplate` operation with the AWS CLI or your preferred AWS SDK. For documentation on the supported language specific SDKs for this API operation, see the `See Also` section of the `RenderUiTemplate`.

Prerequisites

To preview your worker task template, the AWS Identity and Access Management (IAM) role Amazon Resource Name (ARN), or `RoleArn`, that you use must have permission to access to the S3 objects that are used by the template. To learn how to configure your role or user see Enable Worker Task Template Previews .

To preview your worker task template using the `RenderUiTemplate` operation:

1. Provide a **`RoleArn`** of the role with required policies attached to preview your custom template.
2. In the **`Input`** parameter of **`Task`**, provide a JSON object that contains values for the variables defined in the template. These are the variables that are substituted for the `task.input.source` variable. For example, if you define a task.input.text variable in your template, you can supply the variable in the JSON object as `text: sample text`.
3. In the **`Content`** parameter of **`UiTemplate`**, insert your template.

Once you've configured `RenderUiTemplate`, use your preferred SDK or the AWS CLI to submit a request to render your template. If your request was successful, the response includes `RenderedContent`, a Liquid template that renders the HTML for the worker UI.

> **Important**
>
> To preview your template, you need an IAM role with permissions to read Amazon S3 objects that get rendered on your user interface. For a sample policy that you can attach to your IAM role to grant these permissions, see Enable Worker Task Template Previews .

Creating Good Worker Instructions

Creating good instructions for your human review jobs improves your worker's accuracy in completing their task. You can modify the default instructions that are provided in the console when creating a human review workflow, or you can use the console to create a custom worker template and include your instructions in this template. The instructions are shown to the worker on the UI page where they complete their labeling task.

Create Good Worker Instructions

There are three kinds of instructions in the Amazon Augmented AI console:

- **Task Description** – The description should provide a succinct explanation of the task.
- **Instructions** – These instructions are shown on the same webpage where workers complete a task. These instructions should provide an easy reference to show the worker the correct way to complete the task.
- **Additional Instructions** – These instructions are shown in a dialog box that appears when a worker chooses **View full instructions**. We recommend that you provide detailed instructions for completing the task, and include several examples showing edge cases and other difficult situations for labeling objects.

Add Example Images to Your Instructions

Images provide useful examples for your workers. To add a publicly accessible image to your instructions, do the following:

1. Place the cursor where the image should go in the instructions editor.

2. Choose the image icon in the editor toolbar.
3. Enter the URL of your image.

If your instruction image is in an S3 bucket that isn't publicly accessible, do the following:

- For the image URL, enter: `{{ 'https://s3.amazonaws.com/your-bucket-name/image-file-name' | grant_read_access }}`.

This renders the image URL with a short-lived, one-time access code that's appended so the worker's browser can display it. A broken image icon is displayed in the instructions editor, but previewing the tool displays the image in the rendered preview. See grant_read_access for more information about the `grand_read_access` element.

Monitor and Manage Your Human Loop

Once you've started a human review loop, you can check the results of tasks sent to the loop and manage it using the Amazon Augmented AI Runtime API. Additionally, Amazon A2I integrates with Amazon EventBridge (also known as Amazon CloudWatch Events) to alert you when a human review loop status changes to `Completed`, `Failed`, or `Stopped`. This event delivery is guaranteed at least once, which means all events created when human loops finish are successfully delivered to EventBridge.

Use the procedures below to learn how to use the Amazon A2I Runtime API to monitor and manage your human loops. See Use Amazon CloudWatch Events in Amazon Augmented AI to learn how Amazon A2I integrates with Amazon EventBridge.

To check your output data:

1. Check the results of your human loop by calling the `DescribeHumanLoop` operation. The result of this API operation contains information about the reason for and outcome of the loop activation.
2. Check the output data from your human loop in Amazon Simple Storage Service (Amazon S3). In the path to the data, *YYYY*/*MM*/*DD*/*hh*/*mm*/*ss* represents the human loop creation date with year (YYYY), month (MM), and day (DD), and the creation time with hour (hh), minute (mm), and second (ss).

```
s3://customer-output-bucket-specified-in-flow-definition/flow-definition-
name/YYYY/MM/DD/hh/mm/ss/human-loop-name/output.json
```

You can integrate this structure with AWS Glue or Amazon Athena to partition and analyze your output data. For more information, see Managing Partitions for ETL Output in AWS Glue.

To learn more about Amazon A2I output data format, see Amazon A2I Output Data.

To stop and delete your human loop:

1. Once a human loop has been started, you can stop your human loop by calling the `StopHumanLoop` operation using the `HumanLoopName`. If a human loop was successfully stopped, the server sends back an HTTP 200 response.
2. To delete a human loop for which the status equals `Failed`, `Completed`, or `Stopped`, use the `DeleteHumanLoop` operation.

To list human loops:

1. You can list all active human loops by calling the `ListHumanLoops` operation. You can filter human loops by the creation date of the loop using the `CreationTimeAfter` and `CreateTimeBefore` parameters.
2. If successful, `ListHumanLoops` returns `HumanLoopSummaries` and `NextToken` objects in the response element. `HumanLoopSummaries` contains information about a single human loop. For example, it lists a loop's status and, if applicable, its failure reason.

   Use the string returned in `NextToken` as an input in a subsequent call to `ListHumanLoops` to see the next page of human loops.

Amazon A2I Output Data

When your machine learning workflow sends Amazon A2I a data object, a *human loop* is created and human reviewers receive a *task* to review that data object. The output data from each human review task is stored in the Amazon Simple Storage Service (Amazon S3) output bucket you specify in your human review workflow. In the path to the data, *YYYY*/*MM*/*DD*/*hh*/*mm*/*ss* represents the human loop creation date with year (YYYY), month (MM), and day (DD), and the creation time with hour (hh), minute (mm), and second (ss).

```
s3://customer-output-bucket-specified-in-flow-definition/flow-definition-
name/YYYY/MM/DD/hh/mm/ss/human-loop-name/output.json
```

The content of your output data depends on the type of task type (built-in or custom) and the type of workforce you use. Your output data always includes the response from the human worker. Additionally, output data may include metadata about the human loop, the human reviewer (worker), and the data object.

Use the following sections to learn more about Amazon A2I output data format for different task types and workforces.

Output Data From Built-In Task Types

Amazon A2I built-in task types include Amazon Textract and Amazon Rekognition. In addition to human responses, the output data from one of these tasks includes details about the reason the human loop was created and information about the integrated service used to create the human loop. Use the following table to learn more about the output data schema for all built-in task types. The *value* for each of these parameters depends on the service you use with Amazon A2I. Refer to the second table in this section for more information about these service-specific values.

Parameter	Value Type	Example Values	Description
`awsManagedHumanLoopRequestSource`	String	`AWS/Rekognition/DetectModerationLabels/Image/V3` or `AWS/Textract/AnalyzeDocument/Forms/V1`	The API operation and associated AWS services that requested that Amazon A2I create the a human loop. This is the API operation you use to configure your Amazon A2I human loop.
`flowDefinitionArn`	String	`arn:aws:sagemaker:us-west-2:111122223`	The Amazon Resource Number (ARN) of the human review workflow

Parameter	Value Type	Example Values	Description
		333 :flow-definition/ *flow-definition-name*	(flow definition) used to create the human loop.

humanAnswers	List of JSON objects	<pre>{
		"answerContent":
		{
		"AWS/Rekognition/DetectModerationLabels/Image/V3": {
		"moderationLabels":
		[...]
		}
		},</pre> or <pre>{
		"answerContent": {
		"AWS/Textract/AnalyzeDocument/Forms/V1": {
		"blocks": [...]
		}
		},</pre>
			A list of JSON objects that contain worker responses in `answerContent` .
			
			This object also contains submission details and, if a private workforce was used, worker metadata. To learn more, see Track Worker Activity.
			
			For human loop output data produced from Amazon Rekognition `DetectModerationLabel` review tasks, this parameter only contains positive responses. For example, if workers select *No content*, this response is not included.

humanLoopName	String	`'human-loop-name'`	The name of the human loop.

Parameter	Value Type	Example Values	Description
`inputContent`	JSON object	`{ "aiServiceRequest": {...}, "aiServiceResponse": {...}, "humanTaskActivationConditionResults": {...}, "selectedAiServiceResponse": {...} }`	The input content the AWS service sent to Amazon A2I when it requested a human loop be created.
`aiServiceRequest`	JSON object	`{ "document": {...}, "featureTypes": [ ...], "humanLoopConfig": { ...} }` or `{ "image": {...}, "humanLoopConfig": { ...} }`	The original request sent to the AWS service integrated with Amazon A2I. For example, if you use Amazon Rekognition with Amazon A2I, this includes the request made through the API operation `DetectModerationLabels` . For Amazon Textract integrations, this includes the request made through `AnalyzeDocument` .

Parameter	Value Type	Example Values	Description

`aiServiceResponse`	JSON object	`{ "moderationLabels": [...], "moderationModelVersion": "3.0" }`
		or
		`{ "blocks": [...], "documentMetadata": {} }`
			The full response from the AWS service. This is the data that is used to determine if a human review is required. This object may contain metadata about the data object that is not shared with human reviewers.

Parameter	Value Type	Example Values	Description

`selectedAiServiceResponse`	JSON object	`{ "moderationLabels": [...], "moderationModelVersion": "3.0" }`
		or
		`{ "blocks": [...], "documentMetadata": {} }`
			The subset of the `aiServiceResponse` that matches the activation conditions in `ActivationConditions`.
			All data objects listed in `aiServiceResponse` are listed in `selectedAiServiceResponse` when inferences are randomly sampled, or all inferences initiated activation conditions.

Parameter	Value Type	Example Values	Description
humanTaskActivationConditionResults	JSON object	`{ "Conditions": [ ...] }`	A JSON object in inputContent that contains the reason a human loop was created. This includes a list of the activation conditions (Conditions) included in your human review workflow (flow definition), and the evaluation result for each condition–this result is either true or false. To learn more about activation conditions, see JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI.

Select a tab on the following table to learn about the task type–specific parameters and see an example output-data code block for each of the built-in task types.

Amazon Textract Task Type Output Data

When you use the Amazon Textract built-in integration, you see 'AWS/Textract/AnalyzeDocument/Forms/V1' as the value for awsManagedHumanLoopRequestSource in your output data.

The answerContent parameter contains a Block object that includes human responses for all blocks sent to Amazon A2I.

The `aiServiceResponse` parameter also includes a `Block` object with Amazon Textract's response to the original request sent using to `AnalyzeDocument`.

To learn more about the parameters you see in the block object, refer to Block in the *Amazon Textract Developer Guide*.

The following is an example of the output data from an Amazon A2I human review of Amazon Textract document analysis inferences.

```
{
    "awsManagedHumanLoopRequestSource": "AWS/Textract/AnalyzeDocument/Forms/V1",

                                    "Mailing Addresses"
                                ]
                            },
                            "ConditionType": "MissingImportantFormKey",
                            "EvaluationResult": false
                        }
                    ]
                }
            ]
        },
        "selectedAiServiceResponse": {
            "blocks": [...]
        }
    }
}
```

Amazon Rekognition Task Type Output Data

When you use the Amazon Textract built-in integration, you see the string `'AWS/Rekognition/DetectModerationLabels/Image/V3'` as the value for `awsManagedHumanLoopRequestSource` in your output data.

The `answerContent` parameter contains a `moderationLabels` object that contains human responses for all moderation labels sent to Amazon A2I.

The `aiServiceResponse` parameter also includes a `moderationLabels` object with Amazon Rekognition's response to the original request sent to `DetectModerationLabels`.

To learn more about the parameters you see in the block object, refer to ModerationLabel in the Amazon Rekognition Developer Guide.

The following is an example of the output data from an Amazon A2I human review of Amazon Rekognition image moderation inferences.

```
{
    "awsManagedHumanLoopRequestSource": "AWS/Rekognition/DetectModerationLabels/
Image/V3",
    "flowDefinitionArn": "arn:aws:sagemaker:us-west-2:111122223333:flow-
definition/flow-definition-name",
    "humanAnswers": [
        {
```

```
            "answerContent": {
                "AWS/Rekognition/DetectModerationLabels/Image/V3": {
                    "moderationLabels": [...]
                }
            },
            "submissionTime": "2020-09-28T19:22:35.508Z",
            "workerId": "ef7294f850a3d9d1",
            "workerMetadata": {
                "identityData": {
                    "identityProviderType": "Cognito",
                    "issuer": "https://cognito-idp.us-west-2.amazonaws.com/us-
west-2_111111",
                    "sub": "c6aa8eb7-9944-42e9-a6b9-111122223333"
                }
            }
        }
    ],
    "humanLoopName": "humnan-loop-name",
    "inputContent": {
        "aiServiceRequest": {
            "humanLoopConfig": {
                "flowDefinitionArn": "arn:aws:sagemaker:us-west-2:111122223333:flow-
definition/flow-definition-name",
                "humanLoopName": "humnan-loop-name"
            },
            "image": {
                "s3Object": {
                    "bucket": "DOC-EXAMPLE-BUCKET1",
                    "name": "example-image.jpg"
                }
            }
        },
        "aiServiceResponse": {
            "moderationLabels": [...],
            "moderationModelVersion": "3.0"
        },
        "humanTaskActivationConditionResults": {
            "Conditions": [

    }
}
```

Output Data From Custom Task Types

When you add Amazon A2I to a custom human review workflow, you see the following parameters in the output data returned from human review tasks.

Parameter	Value Type	Description
`flowDefinitionArn`	String	The Amazon Resource Number (ARN) of the human review workflow (flow

Parameter	Value Type	Description
		definition) used to create the human loop.
humanAnswers	List of JSON objects	A list of JSON objects that contain worker responses in answerContent . The value in this parameter is determined by the output received from your worker task template. If you are using a private workforce, worker metadata is included. To learn more, see Track Worker Activity.
humanLoopName	String	The name of the human loop.
inputContent	JSON Object	The input content sent to Amazon A2I in the request to StartHumanLoop .

The following is an example of output data from a custom integration with Amazon A2I and Amazon Transcribe. In this example, the inputContent consists of:

- A path to an .mp4 file in Amazon S3 and the video title
- The transcription returned from Amazon Transcribe (parsed from Amazon Transcribe output data)
- A start and end time used by the worker task template to clip the .mp4 file and show workers a relevant portion of the video

```
{
    "flowDefinitionArn": "arn:aws:sagemaker:us-west-2:111122223333:flow-
definition/flow-definition-name",
    "humanAnswers": [
        {
```

```
            "answerContent": {
                "transcription": "use lambda to turn your notebook"
            },
            "submissionTime": "2020-06-18T17:08:26.246Z",
            "workerId": "ef7294f850a3d9d1",
            "workerMetadata": {
                "identityData": {
                    "identityProviderType": "Cognito",
                    "issuer": "https://cognito-idp.us-west-2.amazonaws.com/us-
west-2_111111",
                    "sub": "c6aa8eb7-9944-42e9-a6b9-111122223333"
                }
            }

        }
    ],
    "humanLoopName": "human-loop-name",
    "inputContent": {
        "audioPath": "s3://DOC-EXAMPLE-BUCKET1/a2i_transcribe_demo/Fully-Managed
 Notebook Instances with Amazon SageMaker - a Deep Dive.mp4",
        "end_time": 950.27,
        "original_words": "but definitely use Lambda to turn your ",
        "start_time": 948.51,
        "video_title": "Fully-Managed Notebook Instances with Amazon SageMaker - a Deep
 Dive.mp4"
    }
}
```

Track Worker Activity

Amazon A2I provides information that you can use to track individual workers in task output data. To identify the worker that worked on the human review task, use the following from the output data in Amazon S3:

- The `acceptanceTime` is the time that the worker accepted the task. The format of this date and time stamp is `YYYY-MM-DDTHH:MM:SS.mmmZ` for the year (`YYYY`), month (`MM`), day (`DD`), hour (`HH`), minute (`MM`), second (`SS`), and millisecond (`mmm`). The date and time are separated by a **T**.
- The `submissionTime` is the time that the worker submitted their annotations using the **Submit** button. The format of this date and time stamp is `YYYY-MM-DDTHH:MM:SS.mmmZ` for the year (`YYYY`), month (`MM`), day (`DD`), hour (`HH`), minute (`MM`), second (`SS`), and millisecond (`mmm`). The date and time are separated by a **T**.

- `timeSpentInSeconds` reports the total time, in seconds, that a worker actively worked on that task. This metric does not include time when a worker paused or took a break.
- The `workerId` is unique to each worker.
- If you use a private workforce, in `workerMetadata`, you see the following.
  - The `identityProviderType` is the service used to manage the private workforce.
  - The `issuer` is the Amazon Cognito user pool or OpenID Connect (OIDC) Identity Provider (IdP) issuer associated with the work team assigned to this human review task.
  - A unique `sub` identifier refers to the worker. If you create a workforce using Amazon Cognito, you can retrieve details about this worker (such as the name or user name) associated with this ID using Amazon Cognito. To learn how, see Managing and Searching for User Accounts in *Amazon Cognito Developer Guide*.

The following is an example of the output you may see if you use Amazon Cognito to create a private workforce. This is identified in the `identityProviderType`.

```
"submissionTime": "2020-12-28T18:59:58.321Z",
"acceptanceTime": "2020-12-28T18:59:15.191Z",
"timeSpentInSeconds": 40.543,
"workerId": "a12b3cdefg4h5i67",
"workerMetadata": {
    "identityData": {
        "identityProviderType": "Cognito",
        "issuer": "https://cognito-idp.aws-region.amazonaws.com/aws-region_123456789",
        "sub": "aaaaaaaa-bbbb-cccc-dddd-eeeeeeeeeeee"
    }
}
```

The following is an example of the output you may see if you use your own OIDC IdP to create a private workforce:

```
"workerMetadata": {
        "identityData": {
            "identityProviderType": "Oidc",
            "issuer": "https://example-oidc-ipd.com/adfs",
            "sub": "aaaaaaaa-bbbb-cccc-dddd-eeeeeeeeeeee"
        }
}
```

To learn more about using private workforces, see Use a Private Workforce.

Permissions and Security in Amazon Augmented AI

When using Amazon Augmented AI (Amazon A2I) to create a human review workflow for your ML/AI application, you create and configure *resources* in Amazon SageMaker such as a human workforce and worker task templates. To configure and start a human loop, you either integrate Amazon A2I with other AWS services such as Amazon Textract or Amazon Rekognition, or use the Amazon Augmented AI Runtime API. To create a human review workflow and start a human loop, you must attach certain policies to your AWS Identity and Access Management (IAM) role or user. Specifically:

- When you start a human loop using image input data on or after January 12th, 2020, you must add a CORS header policy to the Amazon S3 bucket that contains your input data. See CORS Permission Requirement to learn more.
- When you create a flow definition, you need to provide a role that grants Amazon A2I permission to access Amazon S3 both for reading objects that are rendered in a human task UI and for writing the results of the human review.

  This role must also have a trust policy attached to give SageMaker permission to assume the role. This allows Amazon A2I to perform actions in accordance with permissions that you attach to the role.

  See Add Permissions to the IAM Role Used to Create a Flow Definition for example policies that you can modify and attach to the role you use to create a flow definition. These are the policies that are attached to the IAM role that is created in the **Human review workflows** section of the Amazon A2I area of the SageMaker console.
- To create and start human loops, you either use an API operation from a built-in task type (such as `DetectModerationLabel` or `AnalyzeDocument`) or the Amazon A2I Runtime API operation `StartHumanLoop` in a custom ML application. You need to attach the `AmazonAugmentedAIFullAccess` managed policy to the user that invokes these API operations to grant permission to these services to use Amazon A2I operations. To learn how, see Create a User That Can Invoke Amazon A2I API Operations.

  This policy does *not* grant permission to invoke the API operations of the AWS service associated with built-in task types. For example, `AmazonAugmentedAIFullAccess` does not grant permission to call the Amazon Rekognition `DetectModerationLabel` API operation or Amazon Textract `AnalyzeDocument` API operation. You can use the more general policy,

`AmazonAugmentedAIIntegratedAPIAccess`, to grant these permissions. For more information, see Create a User With Permissions to Invoke Amazon A2I, Amazon Textract, and Amazon Rekognition API Operations. This is a good option when you want to grant a user broad permissions to use Amazon A2I and integrated AWS services' API operations.

If you want to configure more granular permissions, see Amazon Rekognition Identity-Based Policy Examples and Amazon Textract Identity-Based Policy Examples for identity-based policies you can use to grant permission to use these individual services.

- To preview your custom worker task UI template, you need an IAM role with permissions to read Amazon S3 objects that get rendered on your user interface. See a policy example in Enable Worker Task Template Previews .

Topics

CORS Permission Requirement

Earlier in 2020, widely used browsers like Chrome and Firefox changed their default behavior for rotating images based on image metadata, referred to as EXIF data. Previously, images would always display in browsers exactly how they are stored on disk, which is typically unrotated. After the change, images now rotate according to a piece of image metadata called *orientation value*. This has important implications for the entire machine learning (ML) community. For example, if the EXIF orientation is not considered, applications that are used to annotate images may display images in unexpected orientations and result in incorrect labels.

Starting with Chrome 89, AWS can no longer automatically prevent the rotation of images because the web standards group W3C has decided that the ability to control rotation of images violates the web's Same-Origin Policy. Therefore, to ensure human workers annotate your input images in

a predictable orientation when you submit requests to create a human loop, you must add a CORS header policy to the S3 buckets that contain your input images.

> **Important**
>
> If you do not add a CORS configuration to the S3 buckets that contains your input data, human review tasks for those input data objects fail.

You can add a CORS policy to an S3 bucket that contains input data in the Amazon S3 console. To set the required CORS headers on the S3 bucket that contains your input images in the S3 console, follow the directions detailed in How do I add cross-domain resource sharing with CORS?. Use the following CORS configuration code for the buckets that host your images. If you use the Amazon S3 console to add the policy to your bucket, you must use the JSON format.

JSON

```
[{
   "AllowedHeaders": [],
   "AllowedMethods": ["GET"],
   "AllowedOrigins": ["*"],
   "ExposeHeaders": []
}]
```

XML

```
<CORSConfiguration>
 <CORSRule>
   <AllowedOrigin>*</AllowedOrigin>
   <AllowedMethod>GET</AllowedMethod>
 </CORSRule>
</CORSConfiguration>
```

Add Permissions to the IAM Role Used to Create a Flow Definition

To create a flow definition, attach the policies in this section to the role that you use when creating a human review workflow in the SageMaker console, or when using the `CreateFlowDefinition` API operation.

- If you are using the console to create a human review workflow, enter the role Amazon Resource Name (ARN) in the **IAM role** field when creating a human review workflow in the console.
- When creating a flow definition using the API, attach these policies to the role that is passed to the `RoleArn` parameter of the `CreateFlowDefinition` operation.

When you create a human review workflow (flow definition), Amazon A2I invokes Amazon S3 to complete your task. To grant Amazon A2I permission to retrieve and store your files in your Amazon S3 bucket, create the following policy and attach it to your role. For example, if the images, documents, and other files that you are sending for human review are stored in an S3 bucket named `my_input_bucket`, and if you want the human reviews to be stored in a bucket named `my_output_bucket`, create the following policy.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject"
            ],
            "Resource": [
                "arn:aws:s3:::my_input_bucket/*"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "s3:PutObject"
            ],
            "Resource": [
                "arn:aws:s3:::my_output_bucket/*"
            ]
        }
    ]
}
```

In addition, the IAM role must have the following trust policy to give SageMaker permission to assume the role. To learn more about IAM trust policies, see Resource-Based Policies section of **Policies and Permissions** in the *AWS Identity and Access Management* documentation.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "AllowSageMakerToAssumeRole",
      "Effect": "Allow",
      "Principal": {
        "Service": "sagemaker.amazonaws.com"
      },
      "Action": "sts:AssumeRole"
    }
  ]
}
```

For more information about creating and managing IAM roles and policies, see the following topics in the *AWS Identity and Access Management User Guide*:

- To create an IAM role, see Creating a Role to Delegate Permissions to an IAM User.
- To learn how to create IAM policies, see Creating IAM Policies.
- To learn how to attach an IAM policy to a role, see Adding and Removing IAM Identity Permissions.

Create a User That Can Invoke Amazon A2I API Operations

To use Amazon A2I to create and start human loops for Amazon Rekognition, Amazon Textract, or the Amazon A2I runtime API, you must use a user that has permissions to invoke Amazon A2I operations. To do this, use the IAM console to attach the `AmazonAugmentedAIFullAccess` managed policy to a new or existing user.

This policy grants permission to a user to invoke API operations from the SageMaker API for flow definition creation and management and the Amazon Augmented AI Runtime API for human loop creation and management. To learn more about these API operations, see Use APIs in Amazon Augmented AI.

`AmazonAugmentedAIFullAccess` does not grant permissions to use Amazon Rekognition or Amazon Textract API operations.

> **Note**
>
> You can also attach the `AmazonAugmentedAIFullAccess` policy to an IAM role that is used to create and start a human loop.

To provide access, add permissions to your users, groups, or roles:

- Users and groups in AWS IAM Identity Center:

  Create a permission set. Follow the instructions in Create a permission set in the *AWS IAM Identity Center User Guide*.
- Users managed in IAM through an identity provider:

  Create a role for identity federation. Follow the instructions in Creating a role for a third-party identity provider (federation) in the *IAM User Guide*.
- IAM users:
  - Create a role that your user can assume. Follow the instructions in Creating a role for an IAM user in the *IAM User Guide*.
  - (Not recommended) Attach a policy directly to a user or add a user to a user group. Follow the instructions in Adding permissions to a user (console) in the *IAM User Guide*.

For more information, see Adding and Removing IAM Identity Permissions in the *AWS Identity and Access Management User Guide*.

Create a User With Permissions to Invoke Amazon A2I, Amazon Textract, and Amazon Rekognition API Operations

To create a user that has permission to invoke the API operations used by the built-in task types (that is, `DetectModerationLables` for Amazon Rekognition and `AnalyzeDocument` for Amazon Textract) and permission to use all Amazon A2I API operations, attach the IAM managed policy, `AmazonAugmentedAIIntegratedAPIAccess`. You may want to use this policy when you want to grant broad permissions to a user using Amazon A2I with more than one task type. To learn more about these API operations, see Use APIs in Amazon Augmented AI.

> **Note**
>
> You can also attach the `AmazonAugmentedAIIntegratedAPIAccess` policy to an IAM role that is used to create and start a human loop.

To provide access, add permissions to your users, groups, or roles:

- Users and groups in AWS IAM Identity Center:

  Create a permission set. Follow the instructions in Create a permission set in the *AWS IAM Identity Center User Guide*.
- Users managed in IAM through an identity provider:

  Create a role for identity federation. Follow the instructions in Creating a role for a third-party identity provider (federation) in the *IAM User Guide*.
- IAM users:
  - Create a role that your user can assume. Follow the instructions in Creating a role for an IAM user in the *IAM User Guide*.
  - (Not recommended) Attach a policy directly to a user or add a user to a user group. Follow the instructions in Adding permissions to a user (console) in the *IAM User Guide*.

For more information, see Adding and Removing IAM Identity Permissions in the *AWS Identity and Access Management User Guide*.

Enable Worker Task Template Previews

To customize the interface and instructions that your workers see when working on your tasks, you create a worker task template. You can create the template using the `CreateHumanTaskUi` operation or the SageMaker console.

To preview your template, you need an IAM role with the following permissions to read Amazon S3 objects that get rendered on your user interface.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
```

```
            "Action": [
                "s3:GetObject"
            ],
            "Resource": [
                "arn:aws:s3:::my_input_bucket/*"
            ]
        }
    ]
}
```

For Amazon Rekognition and Amazon Textract task types, you can preview your template using the Amazon Augmented AI section of the SageMaker console. For custom task types, you preview your template by invoking the `RenderUiTemplate` operation. To preview your template, follow the instructions for your task type:

- Amazon Rekognition and Amazon Textract task types – In the SageMaker console, use the role's Amazon Resource Name (ARN) in the procedure documented in Create a Worker Task Template.
- Custom task types – In the `RenderUiTemplate` operation, use the role's ARN in the `RoleArn` parameter.

Using Amazon A2I with AWS KMS Encrypted Buckets

If you specify an AWS Key Management Service (AWS KMS) customer managed key to encrypt output data in `OutputConfig` of `CreateFlowDefinition`, you must add an IAM policy similar to the following to that key. This policy gives the IAM execution role that you use to create your human loops permission to use this key to perform all of the actions listed in `"Action"`. To learn more about these actions, see AWS KMS permissions in the AWS Key Management Service Developer Guide.

To use this policy, replace the IAM service-role ARN in `"Principal"` with the ARN of the execution role you use to create the human review workflow (flow definition). When you create a labeling job using `CreateFlowDefinition`, this is the ARN you specify for `RoleArn`. Note that you cannot provide a `KmsKeyId` when you create a flow definition in the console.

```
{
    "Sid": "AllowUseOfKmsKey",
    "Effect": "Allow",
    "Principal": {
        "AWS": "arn:aws:iam::111122223333:role/service-role/example-role"
```

```
    },
    "Action": [
        "kms:Encrypt",
        "kms:Decrypt",
        "kms:ReEncrypt*",
        "kms:GenerateDataKey*",
        "kms:DescribeKey"
    ],
    "Resource": "*"
}
```

Additional Permissions and Security Resources

- the section called “Control Access to SageMaker Resources by Using Tags”.
- the section called “SageMaker Identity-Based Policies”
- the section called “Control Creation of SageMaker Resources with Condition Keys”
- the section called “Amazon SageMaker API Permissions Reference”
- *Configure security in Amazon SageMaker*

Use Amazon CloudWatch Events in Amazon Augmented AI

Amazon Augmented AI uses Amazon CloudWatch Events to alert you when a human review loop status changes to `Completed`, `Failed`, or `Stopped`. This event delivery is guaranteed at least once, which means all events created when human loops finish are successfully delivered to CloudWatch Events (Amazon EventBridge). When a review loop changes to one of these states, Augmented AI sends an event to CloudWatch Events similar to the following.

```
{
    "version":"0",
    "id":"12345678-1111-2222-3333-12345EXAMPLE",
    "detail-type":"SageMaker A2I HumanLoop Status Change",
    "source":"aws.sagemaker",
    "account":"1111111111111",
    "time":"2019-11-14T17:49:25Z",
    "region":"us-east-1",
    "resources":["arn:aws:sagemaker:us-east-1:111111111111:human-loop/humanloop-
nov-14-1"],
    "detail":{
        "creationTime":"2019-11-14T17:37:36.740Z",
        "failureCode":null,
```

```
        "failureReason":null,
        "flowDefinitionArn":"arn:aws:sagemaker:us-east-1:111111111111:flow-definition/
flowdef-nov-12",
        "humanLoopArn":"arn:aws:sagemaker:us-east-1:111111111111:human-loop/humanloop-
nov-14-1",
        "humanLoopName":"humanloop-nov-14-1",
        "humanLoopOutput":{
            "outputS3Uri":"s3://customer-output-bucket-specified-in-flow-definition/
flowdef-nov-12/2019/11/14/17/37/36/humanloop-nov-14-1/output.json"
        },
        "humanLoopStatus":"Completed"
    }
}
```

The details in the JSON output include the following:

`creationTime`

The timestamp when Augmented AI created the human loop.

`failureCode`

A failure code denoting a specific type of failure.

`failureReason`

The reason why a human loop has failed. The failure reason is only returned when the human review loop status is `failed`.

`flowDefinitionArn`

The Amazon Resource Name (ARN) of the flow definition, or *human review workflow*.

`humanLoopArn`

The Amazon Resource Name (ARN) of the human loop.

`humanLoopName`

The name of the human loop.

`humanLoopOutput`

An object containing information about the output of the human loop.

`outputS3Uri`

The location of the Amazon S3 object where Augmented AI stores your human loop output.

`humanLoopStatus`

The status of the human loop.

Send Events from Your Human Loop to CloudWatch Events

To configure a CloudWatch Events rule to get status updates, or *events*, for your Amazon A2I human loops, use the AWS Command Line Interface (AWS CLI) `put-rule` command. When using the `put-rule` command, specify the following to receive human loop statuses:

- `\"source\":[\"aws.sagemaker\"]`
- `\"detail-type\":[\"SageMaker A2I HumanLoop Status Change\"]`

To configure a CloudWatch Events rule to watch for all status changes, use the following command and replace the placeholder text. For example, replace *"A2IHumanLoopStatusChanges"* with a unique CloudWatch Events rule name and *"arn:aws:iam::111122223333:role/MyRoleForThisRule"* with the Amazon Resource Number (ARN) of an IAM role with an events.amazonaws.com trust policy attached. Replace *region* with the AWS Region in which you want to create the rule.

```
aws events put-rule --name "A2IHumanLoopStatusChanges"
    --event-pattern "{\"source\":[\"aws.sagemaker\"],\"detail-type\":[\"SageMaker A2I
 HumanLoop Status Change\"]}"
    --role-arn "arn:aws:iam::111122223333:role/MyRoleForThisRule"
    --region "region"
```

To learn more about the `put-rule` request, see Event Patterns in CloudWatch Events in the *Amazon CloudWatch Events User Guide*.

Set Up a Target to Process Events

To process events, you need to set up a target. For example, if you want to receive an email when a human loop status changes, use a procedure in Setting Up Amazon SNS Notifications in the *Amazon CloudWatch User Guide* to set up an Amazon SNS topic and subscribe your email to it. Once you have created a topic, you can use it to create a target.

To add a target to your CloudWatch Events rule

1. Open the CloudWatch console: https://console.aws.amazon.com/cloudwatch/home

2. In the navigation pane, choose **Rules**.
3. Choose the rule to which you want to add a target.
4. Choose **Actions**, and then choose **Edit**.
5. Under **Targets**, choose **Add Target** and choose the AWS service you want to act when a human loop status change event is detected.
6. Configure your target. For instructions, see the topic for configuring a target in the AWS documentation for that service.
7. Choose **Configure details**.
8. For **Name**, enter a name and, optionally, provide details about the purpose of the rule in **Description**.
9. Make sure that the check box next to **State** is selected so that your rule is listed as **Enabled**.
10. Choose **Update rule**.

Use Human Review Output

After you receive human review results, you can analyze the results and compare them to machine learning predictions. The JSON that is stored in the Amazon S3 bucket contains both the machine learning predictions and the human review results.

More Information

Automating Amazon SageMaker with Amazon EventBridge

Use APIs in Amazon Augmented AI

You can create a human review workflow or a worker task template programmatically. The APIs you use depend on whether you are creating a Amazon Rekognition, Amazon Textract, or custom task type. This topic provides links to API reference documentation for each task type and programming task.

The following APIs can be used with Augmented AI:

Amazon Augmented AI

Use the Augmented AI API to start, stop, and delete human review loops. You can also list all human review loops and return information about human review loops in your account.

Learn more about human review loop APIs in the Amazon Augmented AI Runtime API Reference.

Amazon Rekognition

Use the **HumanLoopConfig** parameter of the `DetectModerationLabels` API to initiate a human review workflow using Amazon Rekognition.

Amazon SageMaker

Use the Amazon SageMaker API to create a `FlowDefinition`, also known as a *human review workflow*. You can also create a `HumanTaskUi` or *worker task template*.

For more information, see the `CreateFlowDefinition` or the `CreateHumanTaskUi` API documentation.

Amazon Textract

Use the **HumanLoopConfig** parameter of the AnalyzeDocument API to initiate a human review workflow using Amazon Textract.

Programmatic Tutorials

The following tutorials provide example code and step-by-step instructions for creating human review workflows and worker task templates programmatically.

- Tutorial: Get Started Using the Amazon A2I API
- Create a Human Review Workflow (API)
- Create and Start a Human Loop
- Using Amazon Augmented AI with Amazon Rekognition in the *Amazon Rekognition Developer Guide*
- Using Amazon Augmented AI with Amazon Textract AnalyzeDocument in the *Amazon Textract Developer Guide*

Prepare data

Data preparation in machine learning refers to the process of collecting, preprocessing, and organizing raw data to make it suitable for analysis and modeling. This step ensures that the data is in a format from which machine learning algorithms can effectively learn. Data preparation tasks may include handling missing values, removing outliers, scaling features, encoding categorical variables, assessing potential biases and taking steps to mitigate them, splitting data into training and testing sets, labeling, and other necessary transformations to optimize the quality and usability of the data for subsequent machine learning tasks.

Amazon SageMaker provides several built-in features for performing data preparation tasks such as cleaning, transforming, and labeling datasets before model training.

- For **low-code data preparation**, you can use Amazon SageMaker Data Wrangler to create data flows that define your ML data pre-processing and feature engineering workflows using little to no coding. Import data from sources such as Amazon S3, Amazon Redshift, or Snowflake to engineer features. You can use built-in visualizations and analyses to get insights from your data. After preparing your data, you can export the finished output to Amazon S3, Amazon SageMaker Feature Store, or SageMaker Pipelines. Data Wrangler exists within Amazon SageMaker Canvas and Amazon SageMaker Studio Classic. We recommend using it within SageMaker Canvas for the latest features. For more information about Data Wrangler within SageMaker Canvas, see the section called “Prepare data”. For information about Data Wrangler within Studio Classic, see the section called “Prepare Data with Data Wrangler”.
- For **data preparation at scale** using open-source frameworks such as Apache Spark, Apache Hive, or Presto, Amazon SageMaker Studio Classic provides a built-in integration with Amazon EMR. You can use SageMaker Studio Classic to connect or provision Amazon EMR clusters from your notebooks for petabyte-scale data processing, interactive analytics, and machine learning. For more information about using Amazon EMR from SageMaker Studio Classic, see Prepare data using Amazon EMR.

  Alternatively, you can use the Apache Spark-based serverless engine from AWS Glue interactive sessions to aggregate, transform, and prepare data from multiple sources in SageMaker Studio Classic. For more information about using AWS Glue interactive sessions within SageMaker Studio Classic, see Prepare data using AWS Glue Interactive Sessions.
- For **data preparation using SQL** in Studio, the default JupyterLab image, SageMaker distribution version 1.6 and up, includes an SQL extension. Using this SQL environment, users can connect to Amazon Redshift, Athena, and Snowflake from JupyterLab notebooks. They can explore

database schemas, write and run SQL queries, and retrieve results as pandas DataFrames for further analysis. The extension provides auto-complete, syntax highlighting, and query formatting to make writing complex SQL easier in JupyterLab notebooks. Queries can join data across multiple tables for data sampling, exploratory analysis, cleaning, feature engineering, and more. For information about the SQL extension in JupyterLab, see the section called "Prepare data with SQL in Studio".

- For **feature discovery and storage**, the Amazon SageMaker Feature Store has capabilities to search, discover, and retrieve features for model training and provides a centralized repository to store feature data in a standardized format. Storing curated features in the Feature Store allows reuse of existing features for new ML projects. The Feature Store manages the full lifecycle of features including tracking lineage, calculating statistics, and maintaining audit trails. For more information on feature data storage for your ML pipelines, refer to the Create, store, and share features section in this guide.
- For **bias detection**, you can use Amazon SageMaker Clarify to analyze your data and detect potential biases across multiple facets. For example, you can use SageMaker Clarify to detect if your training data contains imbalanced representations or labeling biases between groups such as gender, race, or age. SageMaker Clarify can help you identify these biases before training a model to avoid propagating biases into the model's predictions. For information about using SageMaker Clarify to uncover biases, refer to the the section called "Detect Pre-training Data Bias" section in this guide.
- For **data labeling**, you can use SageMaker Ground Truth to manage the data labeling workflows of your training datasets. For information about how to use Ground Truth for your labeling tasks, refer to the *Label data with a human-in-the-loop* section in this guide.

After performing exploratory data analysis and creating your data transformations steps, you can productionize your transformation code using SageMaker Processing jobs and automate your preparation workflow using Amazon SageMaker Model Building Pipelines.

For information about the SageMaker Processing API, see Amazon SageMaker processing jobs.

For information about automating your transformation steps, see SageMaker Model Building Pipelines.

Prepare ML Data with Amazon SageMaker Data Wrangler

> **Important**
>
> Amazon SageMaker Data Wrangler has been integrated into Amazon SageMaker Canvas. Within the new Data Wrangler experience in SageMaker Canvas, you can use a natural language interface to explore and transform your data in addition to the visual interface. For more information about Data Wrangler in SageMaker Canvas, see Prepare data.

Amazon SageMaker Data Wrangler (Data Wrangler) is a feature of Amazon SageMaker Studio Classic that provides an end-to-end solution to import, prepare, transform, featurize, and analyze data. You can integrate a Data Wrangler data preparation flow into your machine learning (ML) workflows to simplify and streamline data pre-processing and feature engineering using little to no coding. You can also add your own Python scripts and transformations to customize workflows.

Data Wrangler provides the following core functionalities to help you analyze and prepare data for machine learning applications.

- **Import** – Connect to and import data from Amazon Simple Storage Service (Amazon S3), Amazon Athena (Athena), Amazon Redshift, Snowflake, and Databricks.
- **Data Flow** – Create a data flow to define a series of ML data prep steps. You can use a flow to combine datasets from different data sources, identify the number and types of transformations you want to apply to datasets, and define a data prep workflow that can be integrated into an ML pipeline.
- **Transform** – Clean and transform your dataset using standard *transforms* like string, vector, and numeric data formatting tools. Featurize your data using transforms like text and date/time embedding and categorical encoding.
- **Generate Data Insights** – Automatically verify data quality and detect abnormalities in your data with Data Wrangler Data Insights and Quality Report.
- **Analyze** – Analyze features in your dataset at any point in your flow. Data Wrangler includes built-in data visualization tools like scatter plots and histograms, as well as data analysis tools like target leakage analysis and quick modeling to understand feature correlation.

- **Export** – Export your data preparation workflow to a different location. The following are example locations:
  - Amazon Simple Storage Service (Amazon S3) bucket
  - Amazon SageMaker Model Building Pipelines – Use SageMaker Pipelines to automate model deployment. You can export the data that you've transformed directly to the pipelines.
  - Amazon SageMaker Feature Store – Store the features and their data in a centralized store.
  - Python script – Store the data and their transformations in a Python script for your custom workflows.

To start using Data Wrangler, see Get Started with Data Wrangler.

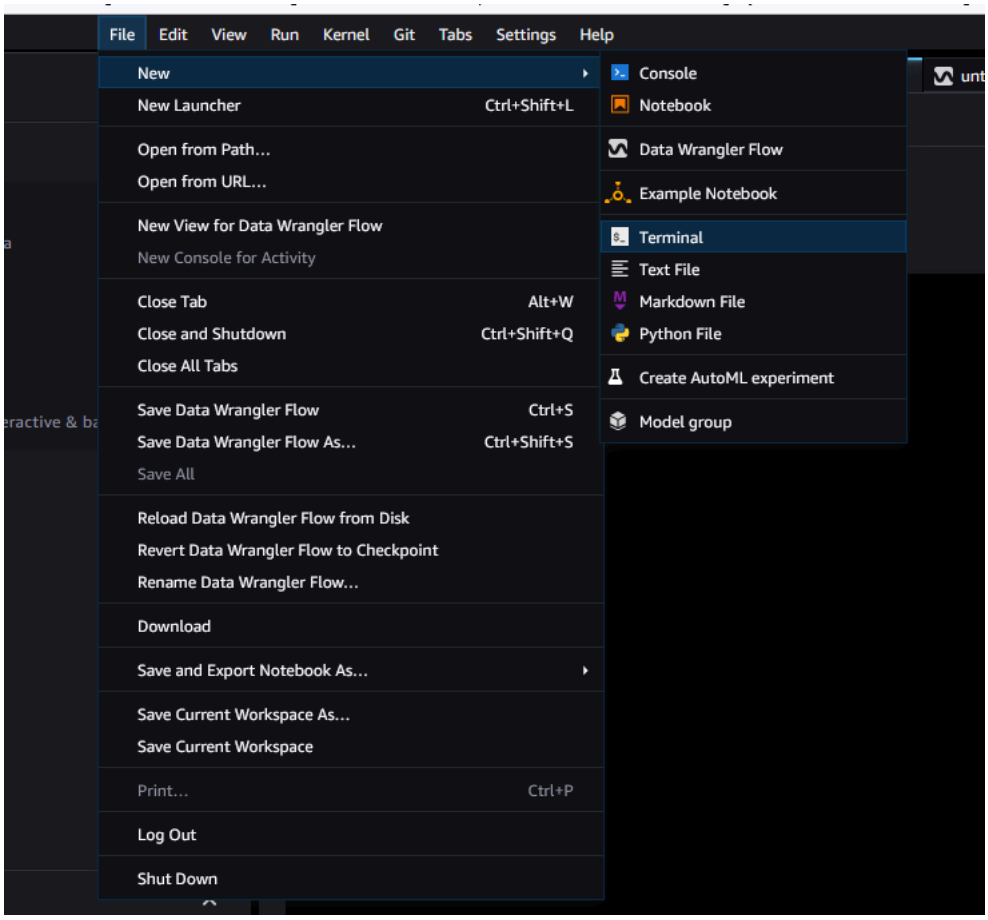
> **Important**
>
> Data Wrangler no longer supports Jupyter Lab Version 1 (JL1). To access the latest features and updates, update to Jupyter Lab Version 3. For more information about upgrading, see View and update the JupyterLab version of an application from the console.

> **Important**
>
> The information and procedures in this guide use the latest version of Amazon SageMaker Studio Classic. For information about updating Studio Classic to the latest version, see Amazon SageMaker Studio Classic UI Overview.

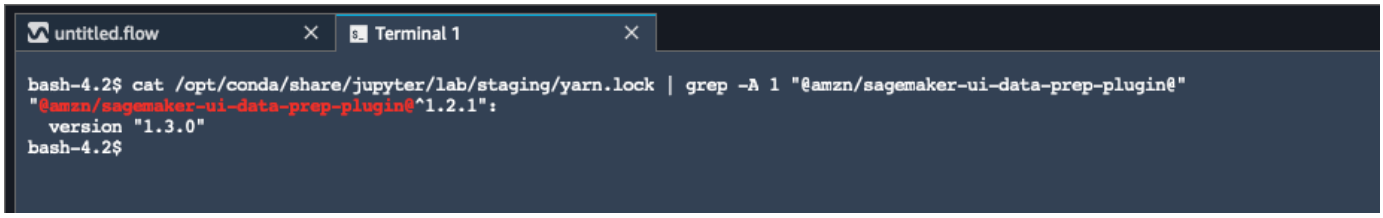
You must use Studio Classic version 1.3.0 or later. Use the following procedure to open Amazon SageMaker Studio Classic and see which version you're running.

To open Studio Classic and check its version, see the following procedure.

1. Use the steps in Prerequisites to access Data Wrangler through Amazon SageMaker Studio Classic.
2. Next to the user you want to use to launch Studio Classic, select **Launch app**.
3. Choose **Studio**.
4. After Studio Classic loads, select **File**, then **New**, and then **Terminal**.



5. Once you have launched Studio Classic, select **File**, then **New**, and then **Terminal**.
6. Enter `cat /opt/conda/share/jupyter/lab/staging/yarn.lock | grep -A 1 "@amzn/sagemaker-ui-data-prep-plugin@"` to print the version of your Studio Classic instance. You must have Studio Classic version 1.3.0 to use Snowflake.



You can update Amazon SageMaker Studio Classic from within the AWS Management Console. For more information about updating Studio Classic, see Amazon SageMaker Studio Classic UI Overview.

Topics

- Get Started with Data Wrangler

Get Started with Data Wrangler

Amazon SageMaker Data Wrangler is a feature in Amazon SageMaker Studio Classic. Use this section to learn how to access and get started using Data Wrangler. Do the following:

1. Complete each step in Prerequisites.
2. Follow the procedure in Access Data Wrangler to start using Data Wrangler.

Prerequisites

To use Data Wrangler, you must complete the following prerequisites.

1. To use Data Wrangler, you need access to an Amazon Elastic Compute Cloud (Amazon EC2) instance. For more information about the Amazon EC2 instances that you can use, see Instances. To learn how to view your quotas and, if necessary, request a quota increase, see AWS service quotas.

2. Configure the required permissions described in Security and Permissions.
3. If your organization is using a firewall that blocks internet traffic, you must have access to the following URLs:

   - `https://ui.prod-1.data-wrangler.sagemaker.aws/`
   - `https://ui.prod-2.data-wrangler.sagemaker.aws/`
   - `https://ui.prod-3.data-wrangler.sagemaker.aws/`
   - `https://ui.prod-4.data-wrangler.sagemaker.aws/`

To use Data Wrangler, you need an active Studio Classic instance. To learn how to launch a new instance, see Amazon SageMaker domain overview. When your Studio Classic instance is **Ready**, use the instructions in Access Data Wrangler.

Access Data Wrangler

The following procedure assumes you have completed the Prerequisites.

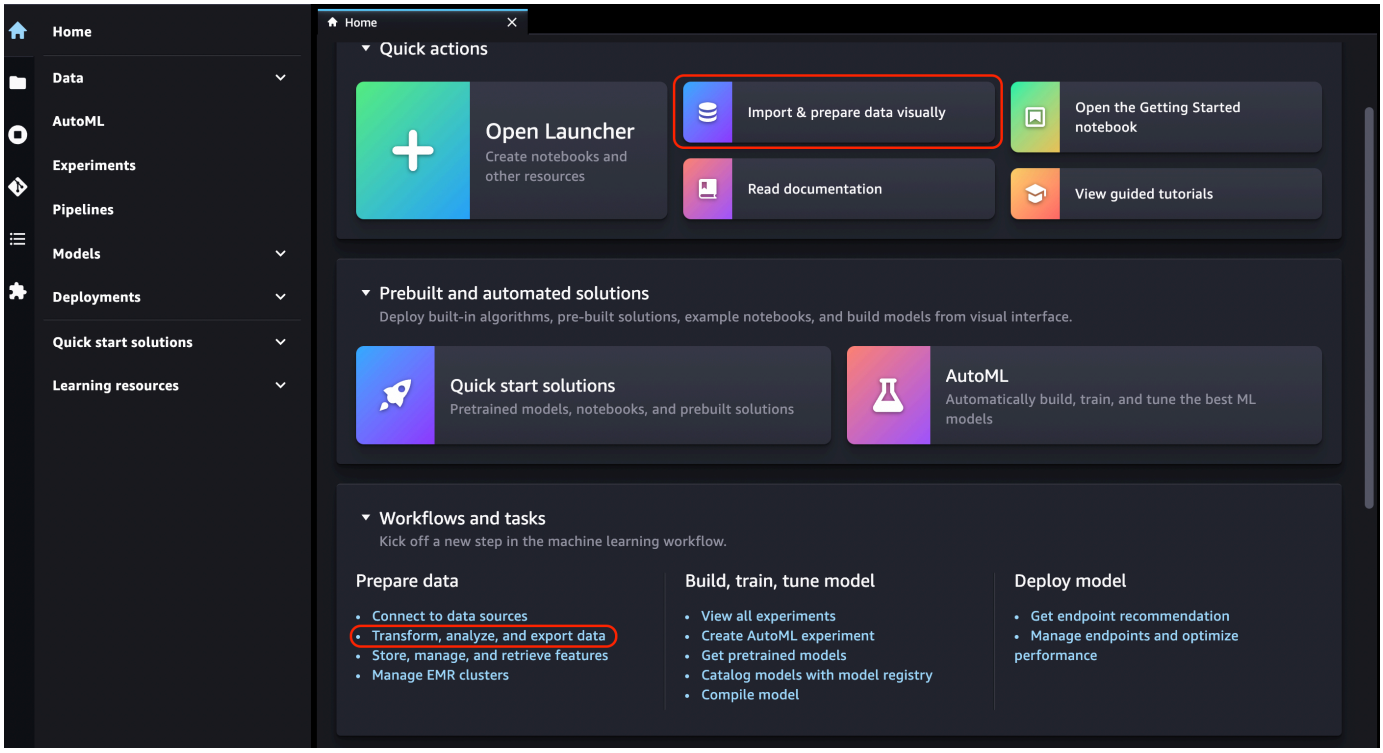
To access Data Wrangler in Studio Classic, do the following.

1. Sign in to Studio Classic. For more information, see Amazon SageMaker domain overview.
2. Choose **Studio**.
3. Choose **Launch app**.
4. From the dropdown list, select **Studio**.
5. Choose the Home icon.
6. Choose **Data**.
7. Choose **Data Wrangler**.
8. You can also create a Data Wrangler flow by doing the following.

   a. In the top navigation bar, select **File**.

   b. Select **New**.

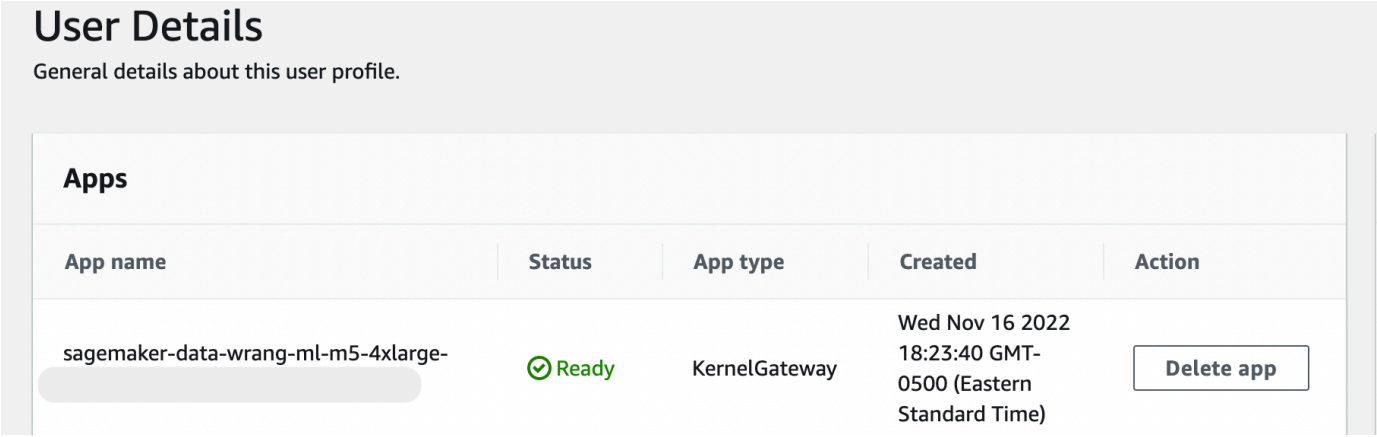
   c. Select **Data Wrangler Flow**.



9. (Optional) Rename the new directory and the .flow file.
10. When you create a new .flow file in Studio Classic, you might see a carousel that introduces you to Data Wrangler.

    This may take a few minutes.

    This messaging persists as long as the **KernelGateway** app on your **User Details** page is **Pending**. To see the status of this app, in the SageMaker console on the **Amazon SageMaker Studio Classic** page, select the name of the user you are using to access Studio Classic. On the **User Details** page, you see a **KernelGateway** app under **Apps**. Wait until this app status is **Ready** to start using Data Wrangler. This can take around 5 minutes the first time you launch Data Wrangler.



11. To get started, choose a data source and use it to import a dataset. See Import to learn more.

    When you import a dataset, it appears in your data flow. To learn more, see Create and Use a Data Wrangler Flow.

12. After you import a dataset, Data Wrangler automatically infers the type of data in each column. Choose **+** next to the **Data types** step and select **Edit data types**.

    > **Important**
    >
    > After you add transforms to the **Data types** step, you cannot bulk-update column types using **Update types**.

13. Use the data flow to add transforms and analyses. To learn more see Transform Data and Analyze and Visualize.
14. To export a complete data flow, choose **Export** and choose an export option. To learn more, see Export.
15. Finally, choose the **Components and registries** icon, and select **Data Wrangler** from the dropdown list to see all the .flow files that you've created. You can use this menu to find and move between data flows.

After you have launched Data Wrangler, you can use the following section to walk through how you might use Data Wrangler to create an ML data prep flow.

Update Data Wrangler

We recommend that you periodically update the Data Wrangler Studio Classic app to access the latest features and updates. The Data Wrangler app name starts with **sagemaker-data-wrang**. To learn how to update a Studio Classic app, see Shut down and Update Studio Classic Apps.

Demo: Data Wrangler Titanic Dataset Walkthrough

The following sections provide a walkthrough to help you get started using Data Wrangler. This walkthrough assumes that you have already followed the steps in Access Data Wrangler and have a new data flow file open that you intend to use for the demo. You may want to rename this .flow file to something similar to `titanic-demo.flow`.

This walkthrough uses the Titanic dataset. It's a modified version of the Titanic dataset that you can import into your Data Wrangler flow more easily. This data set contains the survival status, age, gender, and class (which serves as a proxy for economic status) of passengers aboard the maiden voyage of the *RMS Titanic* in 1912.

In this tutorial, you perform the following steps.

1. Do one of the following:
   - Open your Data Wrangler flow and choose **Use Sample Dataset**.
   - Upload the Titanic dataset to Amazon Simple Storage Service (Amazon S3), and then import this dataset into Data Wrangler.
2. Analyze this dataset using Data Wrangler analyses.
3. Define a data flow using Data Wrangler data transforms.
4. Export your flow to a Jupyter Notebook that you can use to create a Data Wrangler job.
5. Process your data, and kick off a SageMaker training job to train a XGBoost Binary Classifier.

Upload Dataset to S3 and Import

To get started, you can use one of the following methods to import the Titanic dataset into Data Wrangler:

- Importing the dataset directly from the Data Wrangler flow
- Uploading the dataset to Amazon S3 and then importing it into Data Wrangler

To import the dataset directly into Data Wrangler, open the flow and choose **Use Sample Dataset**.

Uploading the dataset to Amazon S3 and importing it into Data Wrangler is closer to the experience you have importing your own data. The following information tells you how to upload your dataset and import it.

Before you start importing the data into Data Wrangler, download the Titanic dataset and upload it to an Amazon S3 (Amazon S3) bucket in the AWS Region in which you want to complete this demo.

If you are a new user of Amazon S3, you can do this using drag and drop in the Amazon S3 console. To learn how, see Uploading Files and Folders by Using Drag and Drop in the Amazon Simple Storage Service User Guide.

> **Important**
>
> Upload your dataset to an S3 bucket in the same AWS Region you want to use to complete this demo.

When your dataset has been successfully uploaded to Amazon S3, you can import it into Data Wrangler.

Import the Titanic dataset to Data Wrangler

1. Choose the **Import data** button in your **Data flow** tab or choose the **Import** tab.
2. Select **Amazon S3**.
3. Use the **Import a dataset from S3** table to find the bucket to which you added the Titanic dataset. Choose the Titanic dataset CSV file to open the **Details** pane.
4. Under **Details**, the **File type** should be CSV. Check **First row is header** to specify that the first row of the dataset is a header. You can also name the dataset something more friendly, such as **`Titanic-train`**.
5. Choose the **Import** button.

When your dataset is imported into Data Wrangler, it appears in your **Data Flow** tab. You can double click on a node to enter the node detail view, which allows you to add transformations or analysis. You can use the plus icon for a quick access to the navigation. In the next section, you use this data flow to add analysis and transform steps.

Data Flow

In the data flow section, the only steps in the data flow are your recently imported dataset and a **Data type** step. After applying transformations, you can come back to this tab and see what the data flow looks like. Now, add some basic transformations under the **Prepare** and **Analyze** tabs.

Prepare and Visualize

Data Wrangler has built-in transformations and visualizations that you can use to analyze, clean, and transform your data.

The **Data** tab of the node detail view lists all built-in transformations in the right panel, which also contains an area in which you can add custom transformations. The following use case showcases how to use these transformations.

To get information that might help you with data exploration and feature engineering, create a data quality and insights report. The information from the report can help you clean and process your data. It gives you information such as the number of missing values and the number of outliers. If you have issues with your data, such as target leakage or imbalance, the insights report can bring those issues to your attention. For more information about creating a report, see Get Insights On Data and Data Quality.

Data Exploration

First, create a table summary of the data using an analysis. Do the following:

1. Choose the **+** next to the **Data type** step in your data flow and select **Add analysis**.
2. In the **Analysis** area, select **Table summary** from the dropdown list.
3. Give the table summary a **Name**.
4. Select **Preview** to preview the table that will be created.
5. Choose **Save** to save it to your data flow. It appears under **All Analyses**.

Using the statistics you see, you can make observations similar to the following about this dataset:

- Fare average (mean) is around $33, while the max is over $500. This column likely has outliers.
- This dataset uses *?* to indicate missing values. A number of columns have missing values: *cabin*, *embarked*, and *home.dest*
- The age category is missing over 250 values.

Next, clean your data using the insights gained from these stats.

Drop Unused Columns

Using the analysis from the previous section, clean up the dataset to prepare it for training. To add a new transform to your data flow, choose **+** next to the **Data type** step in your data flow and choose **Add transform**.

First, drop columns that you don't want to use for training. You can use pandas data analysis library to do this, or you can use one of the built-in transforms.

Use the following procedure to drop the unused columns.

To drop the unused columns.

1. Open the Data Wrangler flow.
2. There are two nodes in your Data Wrangler flow. Choose the **+** to the right of the **Data types** node.
3. Choose **Add transform**.
4. In the **All steps** column, choose **Add step**.
5. In the **Standard** transform list, choose **Manage Columns**. The standard transformations are ready-made, built-in transformations. Make sure that **Drop column** is selected.
6. Under **Columns to drop**, check the following column names:

    - cabin
    - ticket
    - name
    - sibsp
    - parch
    - home.dest
    - boat
    - body
7. Choose **Preview**.
8. Verify that the columns have been dropped, then choose **Add**.

To do this using pandas, follow these steps.

1. In the **All steps** column, choose **Add step**.
2. In the **Custom** transform list, choose **Custom transform**.
3. Provide a name for your transformation, and choose **Python (Pandas)** from the dropdown list.
4. Enter the following Python script in the code box.

```
cols = ['name', 'ticket', 'cabin', 'sibsp', 'parch', 'home.dest','boat', 'body']
df = df.drop(cols, axis=1)
```

5. Choose **Preview** to preview the change, and then choose **Add** to add the transformation.

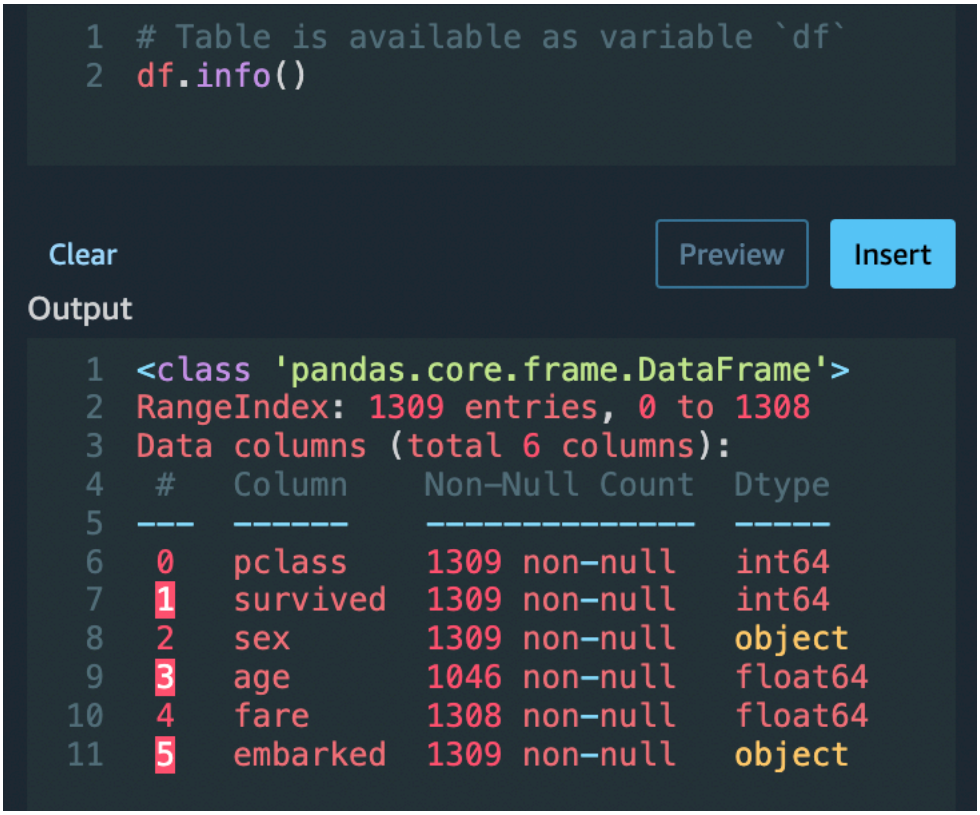
Clean up Missing Values

Now, clean up missing values. You can do this with the **Handling missing values** transform group.

A number of columns have missing values. Of the remaining columns, *age* and *fare* contain missing values. Inspect this using a **Custom Transform**.

Using the **Python (Pandas)** option, use the following to quickly review the number of entries in each column:

```
df.info()
```



To drop rows with missing values in the *age* category, do the following:

1. Choose **Handle missing**.
2. Choose **Drop missing** for the **Transformer**.
3. Choose *age* for the **Input column**.
4. Choose **Preview** to see the new data frame, and then choose **Add** to add the transform to your flow.
5. Repeat the same process for *fare*.

You can use `df.info()` in the **Custom transform** section to confirm that all rows now have 1,045 values.

Custom Pandas: Encode

Try flat encoding using Pandas. Encoding categorical data is the process of creating a numerical representation for categories. For example, if your categories are `Dog` and `Cat`, you may encode this information into two vectors: `[1,0]` to represent `Dog`, and `[0,1]` to represent `Cat`.

1. In the **Custom Transform** section, choose **Python (Pandas)** from the dropdown list.

2. Enter the following in the code box.

```
import pandas as pd

dummies = []
cols = ['pclass','sex','embarked']
for col in cols:
    dummies.append(pd.get_dummies(df[col]))

encoded = pd.concat(dummies, axis=1)

df = pd.concat((df, encoded),axis=1)
```

3. Choose **Preview** to preview the change. The encoded version of each column is added to the dataset.
4. Choose **Add** to add the transformation.

Custom SQL: SELECT Columns

Now, select the columns you want to keep using SQL. For this demo, select the columns listed in the following SELECT statement. Because *survived* is your target column for training, put that column first.

1. In the **Custom Transform** section, select **SQL (PySpark SQL)** from the dropdown list.
2. Enter the following in the code box.

```
SELECT survived, age, fare, 1, 2, 3, female, male, C, Q, S FROM df;
```

3. Choose **Preview** to preview the change. The columns listed in your SELECT statement are the only remaining columns.
4. Choose **Add** to add the transformation.

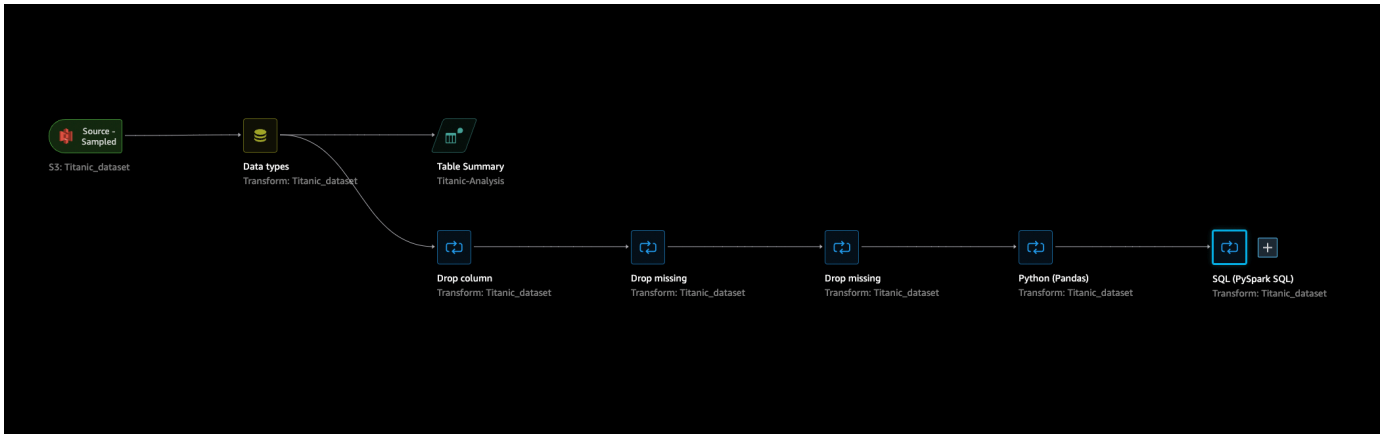
Export to a Data Wrangler Notebook

When you've finished creating a data flow, you have a number of export options. The following section explains how to export to a Data Wrangler job notebook. A Data Wrangler job is used to process your data using the steps defined in your data flow. To learn more about all export options, see Export.

Export to Data Wrangler Job Notebook

When you export your data flow using a **Data Wrangler job**, the process automatically creates a Jupyter Notebook. This notebook automatically opens in your Studio Classic instance and is configured to run a SageMaker processing job to run your Data Wrangler data flow, which is referred to as a Data Wrangler job.

1. Save your data flow. Select **File** and then select **Save Data Wrangler Flow**.
2. Back to the **Data Flow** tab, select the last step in your data flow (SQL), then choose the **+** to open the navigation.
3. Choose **Export**, and **Amazon S3 (via Jupyter Notebook)**. This opens a Jupyter Notebook.



4. Choose any **Python 3 (Data Science)** kernel for the **Kernel**.
5. When the kernel starts, run the cells in the notebook book until **Kick off SageMaker Training Job (Optional)**.
6. Optionally, you can run the cells in **Kick off SageMaker Training Job (Optional)** if you want to create a SageMaker training job to train an XGBoost classifier. You can find the cost to run a SageMaker training job in Amazon SageMaker Pricing.

   Alternatively, you can add the code blocks found in Training XGBoost Classifier to the notebook and run them to use the XGBoost open source library to train an XGBoost classifier.
7. Uncomment and run the cell under **Cleanup** and run it to revert the SageMaker Python SDK to its original version.

You can monitor your Data Wrangler job status in the SageMaker console in the **Processing** tab. Additionally, you can monitor your Data Wrangler job using Amazon CloudWatch. For additional information, see Monitor Amazon SageMaker Processing Jobs with CloudWatch Logs and Metrics.

If you kicked off a training job, you can monitor its status using the SageMaker console under **Training jobs** in the **Training section**.

Training XGBoost Classifier

You can train an XGBoost Binary Classifier using either a Jupyter notebook or a Amazon SageMaker Autopilot. You can use Autopilot to automatically train and tune models on the data that you've transformed directly from your Data Wrangler flow. For information about Autopilot, see Automatically Train Models on Your Data Flow.

In the same notebook that kicked off the Data Wrangler job, you can pull the data and train an XGBoost Binary Classifier using the prepared data with minimal data preparation.

1. First, upgrade necessary modules using `pip` and remove the _SUCCESS file (this last file is problematic when using `awswrangler`).

```
! pip install --upgrade awscli awswrangler boto sklearn
! aws s3 rm {output_path} --recursive  --exclude "*" --include "*_SUCCESS*"
```

2. Read the data from Amazon S3. You can use `awswrangler` to recursively read all the CSV files in the S3 prefix. The data is then split into features and labels. The label is the first column of the dataframe.

```
import awswrangler as wr

df = wr.s3.read_csv(path=output_path, dataset=True)
X, y = df.iloc[:,:-1],df.iloc[:,-1]
```

   - Finally, create DMatrices (the XGBoost primitive structure for data) and do cross-validation using the XGBoost binary classification.

```
import xgboost as xgb

dmatrix = xgb.DMatrix(data=X, label=y)

params = {"objective":"binary:logistic",'learning_rate': 0.1, 'max_depth': 5,
 'alpha': 10}

xgb.cv(
    dtrain=dmatrix,
    params=params,
```

```
    nfold=3,
    num_boost_round=50,
    early_stopping_rounds=10,
    metrics="rmse",
    as_pandas=True,
    seed=123)
```

Shut down Data Wrangler

When you are finished using Data Wrangler, we recommend that you shut down the instance it runs on to avoid incurring additional charges. To learn how to shut down the Data Wrangler app and associated instance, see Shut Down Data Wrangler.

Import

You can use Amazon SageMaker Data Wrangler to import data from the following *data sources*: Amazon Simple Storage Service (Amazon S3), Amazon Athena, Amazon Redshift, and Snowflake. The dataset that you import can include up to 1000 columns.

Topics

- Import data from Amazon S3
- Import data from Athena
- Import data from Amazon Redshift
- Import data from Amazon EMR
- Import data from Databricks (JDBC)
- Import data from Salesforce Data Cloud
- Import data from Snowflake
- Import Data From Software as a Service (SaaS) Platforms
- Imported Data Storage

Some data sources allow you to add multiple *data connections*:

- You can connect to multiple Amazon Redshift clusters. Each cluster becomes a data source.
- You can query any Athena database in your account to import data from that database.

When you import a dataset from a data source, it appears in your data flow. Data Wrangler automatically infers the data type of each column in your dataset. To modify these types, select the **Data types** step and select **Edit data types**.

When you import data from Athena or Amazon Redshift, the imported data is automatically stored in the default SageMaker S3 bucket for the AWS Region in which you are using Studio Classic. Additionally, Athena stores data you preview in Data Wrangler in this bucket. To learn more, see Imported Data Storage.

> **Important**
>
> The default Amazon S3 bucket may not have the least permissive security settings, such as bucket policy and server-side encryption (SSE). We strongly recommend that you Add a Bucket Policy To Restrict Access to Datasets Imported to Data Wrangler.

> **Important**
>
> In addition, if you use the managed policy for SageMaker, we strongly recommend that you scope it down to the most restrictive policy that allows you to perform your use case. For more information, see Grant an IAM Role Permission to Use Data Wrangler.

All data sources except for Amazon Simple Storage Service (Amazon S3) require you to specify a SQL query to import your data. For each query, you must specify the following:

- **Data catalog**
- **Database**
- **Table**

You can specify the name of the database or the data catalog in either the drop down menus or within the query. The following are example queries:

- `select * from example-data-catalog-name.example-database-name.example-table-name` – The query doesn't use anything specified in the dropdown menus of the user-interface (UI) to run. It queries `example-table-name` within `example-database-name` within `example-data-catalog-name`.

- `select * from example-database-name.example-table-name` – The query uses the data catalog that you've specified in the **Data catalog** dropdown menu to run. It queries `example-table-name` within `example-database-name` within the data catalog that you've specified.
- `select * from example-table-name` – The query requires you to select fields for both the **Data catalog** and **Database name** dropdown menus. It queries `example-table-name` within the data catalog within the database and data catalog that you've specified.

The link between Data Wrangler and the data source is a *connection*. You use the connection to import data from your data source.

There are the following types of connections:

- Direct
- Cataloged

Data Wrangler always has access to the most recent data in a direct connection. If the data in the data source has been updated, you can use the connection to import the data. For example, if someone adds a file to one of your Amazon S3 buckets, you can import the file.

A cataloged connection is the result of a data transfer. The data in the cataloged connection doesn't necessarily have the most recent data. For example, you might set up a data transfer between Salesforce and Amazon S3. If there's an update to the Salesforce data, you must transfer the data again. You can automate the process of transferring data. For more information about data transfers, see Import Data From Software as a Service (SaaS) Platforms.

Import data from Amazon S3

You can use Amazon Simple Storage Service (Amazon S3) to store and retrieve any amount of data, at any time, from anywhere on the web. You can accomplish these tasks using the AWS Management Console, which is a simple and intuitive web interface, and the Amazon S3 API. If you've stored your dataset locally, we recommend that you add it to an S3 bucket for import into Data Wrangler. To learn how, see Uploading an object to a bucket in the Amazon Simple Storage Service User Guide.

Data Wrangler uses S3 Select to allow you to preview your Amazon S3 files in Data Wrangler. You incur standard charges for each file preview. To learn more about pricing, see the **Requests & data retrievals** tab on Amazon S3 pricing.

Important

If you plan to export a data flow and launch a Data Wrangler job, ingest data into a SageMaker feature store, or create a SageMaker pipeline, be aware that these integrations require Amazon S3 input data to be located in the same AWS region.

Important

If you're importing a CSV file, make sure it meets the following requirements:

- A record in your dataset can't be longer than one line.
- A backslash, `\`, is the only valid escape character.
- Your dataset must use one of the following delimiters:
  - Comma – `,`
  - Colon – `:`
  - Semicolon – `;`
  - Pipe – `|`
  - Tab – `[TAB]`

To save space, you can import compressed CSV files.

Data Wrangler gives you the ability to either import the entire dataset or sample a portion of it. For Amazon S3, it provides the following sampling options:

- None – Import the entire dataset.
- First K – Sample the first K rows of the dataset, where K is an integer that you specify.
- Randomized – Takes a random sample of a size that you specify.
- Stratified – Takes a stratified random sample. A stratified sample preserves the ratio of values in a column.

After you've imported your data, you can also use the sampling transformer to take one or more samples from your entire dataset. For more information about the sampling transformer, see Sampling.

You can use one of the following resource identifiers to import your data:

- An Amazon S3 URI that uses an Amazon S3 bucket or Amazon S3 access point
- An Amazon S3 access point alias
- An Amazon Resource Name (ARN) that uses an Amazon S3 access point or Amazon S3 bucket

Amazon S3 access points are named network endpoints that are attached to the buckets. Each access point has distinct permissions and network controls that you can configure. For more information about access points, see Managing data access with Amazon S3 access points.

> **Important**
>
> If you're using an Amazon Resource Name (ARN) to import your data, it must be for a resource located in the same AWS Region that you're using to access Amazon SageMaker Studio Classic.

You can import either a single file or multiple files as a dataset. You can use the multifile import operation when you have a dataset that is partitioned into separate files. It takes all of the files from an Amazon S3 directory and imports them as a single dataset. For information on the types of files that you can import and how to import them, see the following sections.

Single File Import

You can import single files in the following formats:

- Comma Separated Values (CSV)
- Parquet
- Javascript Object Notation (JSON)
- Optimized Row Columnar (ORC)
- Image – Data Wrangler uses OpenCV to import images. For more information about supported image formats, see Image file reading and writing.

For files formatted in JSON, Data Wrangler supports both JSON lines (.jsonl) and JSON documents (.json). When you preview your data, it automatically shows the JSON in tabular format. For nested JSON documents that are larger than 5 MB, Data Wrangler shows the schema for the structure and the arrays as values in the dataset. Use the **Flatten structured** and

Explode array operators to display the nested values in tabular format. For more information, see Unnest JSON Data and Explode Array.

When you choose a dataset, you can rename it, specify the file type, and identify the first row as a header.

You can import a dataset that you've partitioned into multiple files in an Amazon S3 bucket in a single import step.

To import a dataset into Data Wrangler from a single file that you've stored in Amazon S3:

1. If you are not currently on the **Import** tab, choose **Import**.
2. Under **Available**, choose **Amazon S3**.
3. From the **Import tabular, image, or time-series data from S3**, do one of the following:
   - Choose an Amazon S3 bucket from the tabular view and navigate to the file that you're importing.
   - For **S3 source**, specify an Amazon S3 bucket or an Amazon S3 URI and select **Go**. The Amazon S3 URIs can be in one of the following formats:
     - `s3://DOC-EXAMPLE-BUCKET/example-prefix/example-file`
     - *example-access-point*-*aqfqprnstn7aefdfbarligizwgyfouse1a*-s3alias/datasets/*example-file*
     - `s3://arn:aws:s3:AWS-Region:111122223333:accesspoint/example-prefix/example-file`
4. Choose the dataset to open the **Import settings** pane.
5. If your CSV file has a header, select the checkbox next to **Add header to table**.
6. Use the **Preview** table to preview your dataset. This table shows up to 100 rows.
7. In the **Details** pane, verify or change the **Name** and **File Type** for your dataset. If you add a **Name** that contains spaces, these spaces are replaced with underscores when your dataset is imported.
8. Specify the sampling configuration that you'd like to use.
9. Choose **Import**.

Multifile Import

The following are the requirements for importing multiple files:

- The files must be in the same folder of your Amazon S3 bucket.
- The files must either share the same header or have no header.

Each file must be in one of the following formats:

- CSV
- Parquet
- Optimized Row Columnar (ORC)
- Image – Data Wrangler uses OpenCV to import images. For more information about supported image formats, see Image file reading and writing.

Use the following procedure to import multiple files.

To import a dataset into Data Wrangler from multiple files that you've stored in an Amazon S3 directory

1. If you are not currently on the **Import** tab, choose **Import**.
2. Under **Available**, choose **Amazon S3**.
3. From the **Import tabular, image, or time-series data from S3**, do one of the following:
   - Choose an Amazon S3 bucket from the tabular view and navigate to the folder containing the files that you're importing.
   - For **S3 source**, specify the Amazon S3 bucket or an Amazon S3 URI with your files and select **Go**. The following are valid URIs:
     - `s3://DOC-EXAMPLE-BUCKET/example-prefix/example-prefix`
     - `example-access-point-aqfqprnstn7aefdfbarligizwgyfouse1a-s3alias/example-prefix/`
     - `s3://arn:aws:s3:AWS-Region:111122223333:accesspoint/example-prefix`
4. Select the folder containing the files that you want to import. Each file must be in one of the supported formats. Your files must be the same data type.
5. If your folder contains CSV files with headers, select the checkbox next to **First row is header**.

6. If your files are nested within other folders, select the checkbox next to **Include nested directories**.
7. (Optional) Choose **Add filename column** add a column to the dataset that shows the filename for each observation.
8. (Optional) By default, Data Wrangler doesn't show you a preview of a folder. You can activate previewing by choosing the blue **Preview off** button. A preview shows the first 10 rows of the first 10 files in the folder.
9. In the **Details** pane, verify or change the **Name** and **File Type** for your dataset. If you add a **Name** that contains spaces, these spaces are replaced with underscores when your dataset is imported.
10. Specify the sampling configuration that you'd like to use.
11. Choose **Import dataset**.

You can also use parameters to import a subset of files that match a pattern. Parameters help you more selectively pick the files that you're importing. To start using parameters, edit the data source and apply them to the path that you're using to import the data. For more information, see Reusing Data Flows for Different Datasets.

Import data from Athena

Use Amazon Athena to import your data from Amazon Simple Storage Service (Amazon S3) into Data Wrangler. In Athena, you write standard SQL queries to select the data that you're importing from Amazon S3. For more information, see What is Amazon Athena?

You can use the AWS Management Console to set up Amazon Athena. You must create at least one database in Athena before you start running queries. For more information about getting started with Athena, see Getting started.

Athena is directly integrated with Data Wrangler. You can write Athena queries without having to leave the Data Wrangler UI.

In addition to writing simple Athena queries in Data Wrangler, you can also use:

- Athena workgroups for query result management. For more information about workgroups, see Managing query results.
- Lifecycle configurations for setting data retention periods. For more information about data retention, see Setting data retention periods.

Query Athena within Data Wrangler

> **Note**
>
> Data Wrangler does not support federated queries.

If you use AWS Lake Formation with Athena, make sure your Lake Formation IAM permissions do not override IAM permissions for the database `sagemaker_data_wrangler`.

Data Wrangler gives you the ability to either import the entire dataset or sample a portion of it. For Athena, it provides the following sampling options:

- None – Import the entire dataset.
- First K – Sample the first K rows of the dataset, where K is an integer that you specify.
- Randomized – Takes a random sample of a size that you specify.
- Stratified – Takes a stratified random sample. A stratified sample preserves the ratio of values in a column.

The following procedure shows how to import a dataset from Athena into Data Wrangler.

To import a dataset into Data Wrangler from Athena

1. Sign into Amazon SageMaker Console.
2. Choose **Studio**.
3. Choose **Launch app**.
4. From the dropdown list, select **Studio**.
5. Choose the Home icon.
6. Choose **Data**.
7. Choose **Data Wrangler**.
8. Choose **Import data**.
9. Under **Available**, choose **Amazon Athena**.
10. For **Data Catalog**, choose a data catalog.
11. Use the **Database** dropdown list to select the database that you want to query. When you select a database, you can preview all tables in your database using the **Tables** listed under **Details**.

12. (Optional) Choose **Advanced configuration**.

    a. Choose a **Workgroup**.

    b. If your workgroup hasn't enforced the Amazon S3 output location or if you don't use a workgroup, specify a value for **Amazon S3 location of query results**.

    c. (Optional) For **Data retention period**, select the checkbox to set a data retention period and specify the number of days to store the data before it's deleted.

    d. (Optional) By default, Data Wrangler saves the connection. You can choose to deselect the checkbox and not save the connection.

13. For **Sampling**, choose a sampling method. Choose **None** to turn off sampling.

14. Enter your query in the query editor and use the **Run** button to run the query. After a successful query, you can preview your result under the editor.

    Note

    Salesforce data uses the `timestamptz` type. If you're querying the timestamp column that you've imported to Athena from Salesforce, cast the data in the column to the `timestamp` type. The following query casts the timestamp column to the correct type.

    ```
    # cast column timestamptz_col as timestamp type, and name it as
     timestamp_col
    select cast(timestamptz_col as timestamp) as timestamp_col from table
    ```

15. To import the results of your query, select **Import**.

After you complete the preceding procedure, the dataset that you've queried and imported appears in the Data Wrangler flow.

By default, Data Wrangler saves the connection settings as a new connection. When you import your data, the query that you've already specified appears as a new connection. The saved connections store information about the Athena workgroups and Amazon S3 buckets that you're using. When you're connecting to the data source again, you can choose the saved connection.

Managing query results

Data Wrangler supports using Athena workgroups to manage the query results within an AWS account. You can specify an Amazon S3 output location for each workgroup. You can also specify whether the output of the query can go to different Amazon S3 locations. For more information, see Using Workgroups to Control Query Access and Costs.

Your workgroup might be configured to enforce the Amazon S3 query output location. You can't change the output location of the query results for those workgroups.

If you don't use a workgroup or specify an output location for your queries, Data Wrangler uses the default Amazon S3 bucket in the same AWS Region in which your Studio Classic instance is located to store Athena query results. It creates temporary tables in this database to move the query output to this Amazon S3 bucket. It deletes these tables after data has been imported; however the database, `sagemaker_data_wrangler`, persists. To learn more, see Imported Data Storage.

To use Athena workgroups, set up the IAM policy that gives access to workgroups. If you're using a `SageMaker-Execution-Role`, we recommend adding the policy to the role. For more information about IAM policies for workgroups, see IAM policies for accessing workgroups. For example workgroup policies, see Workgroup example policies.

Setting data retention periods

Data Wrangler automatically sets a data retention period for the query results. The results are deleted after the length of the retention period. For example, the default retention period is five days. The results of the query are deleted after five days. This configuration is designed to help you clean up data that you're no longer using. Cleaning up your data prevents unauthorized users from gaining access. It also helps control the costs of storing your data on Amazon S3.

If you don't set a retention period, the Amazon S3 lifecycle configuration determines the duration that the objects are stored. The data retention policy that you've specified for the lifecycle configuration removes any query results that are older than the lifecycle configuration that you've specified. For more information, see Setting lifecycle configuration on a bucket.

Data Wrangler uses Amazon S3 lifecycle configurations to manage data retention and expiration. You must give your Amazon SageMaker Studio Classic IAM execution role permissions to manage bucket lifecycle configurations. Use the following procedure to give permissions.

To give permissions to manage the lifecycle configuration do the following.

1. Sign in to the AWS Management Console and open the IAM console at https://console.aws.amazon.com/iam/.
2. Choose **Roles**.
3. In the search bar, specify the Amazon SageMaker execution role that Amazon SageMaker Studio Classic is using.
4. Choose the role.
5. Choose **Add permissions**.
6. Choose **Create inline policy**.
7. For **Service**, specify **S3** and choose it.
8. Under the **Read** section, choose **GetLifecycleConfiguration**.
9. Under the **Write** section, choose **PutLifecycleConfiguration**.
10. For **Resources**, choose **Specific**.
11. For **Actions**, select the arrow icon next to **Permissions management**.
12. Choose **PutResourcePolicy**.
13. For **Resources**, choose **Specific**.
14. Choose the checkbox next to **Any in this account**.
15. Choose **Review policy**.
16. For **Name**, specify a name.
17. Choose **Create policy**.

Import data from Amazon Redshift

Amazon Redshift is a fully managed, petabyte-scale data warehouse service in the cloud. The first step to create a data warehouse is to launch a set of nodes, called an Amazon Redshift cluster. After you provision your cluster, you can upload your dataset and then perform data analysis queries.

You can connect to and query one or more Amazon Redshift clusters in Data Wrangler. To use this import option, you must create at least one cluster in Amazon Redshift. To learn how, see Getting started with Amazon Redshift.

You can output the results of your Amazon Redshift query in one of the following locations:

- The default Amazon S3 bucket

- An Amazon S3 output location that you specify

You can either import the entire dataset or sample a portion of it. For Amazon Redshift, it provides the following sampling options:

- None – Import the entire dataset.
- First K – Sample the first K rows of the dataset, where K is an integer that you specify.
- Randomized – Takes a random sample of a size that you specify.
- Stratified – Takes a stratified random sample. A stratified sample preserves the ratio of values in a column.

The default Amazon S3 bucket is in the same AWS Region in which your Studio Classic instance is located to store Amazon Redshift query results. For more information, see Imported Data Storage.

For either the default Amazon S3 bucket or the bucket that you specify, you have the following encryption options:

- The default AWS service-side encryption with an Amazon S3 managed key (SSE-S3)
- An AWS Key Management Service (AWS KMS) key that you specify

An AWS KMS key is an encryption key that you create and manage. For more information on KMS keys, see AWS Key Management Service.

You can specify an AWS KMS key using either the key ARN or the ARN of your AWS account.

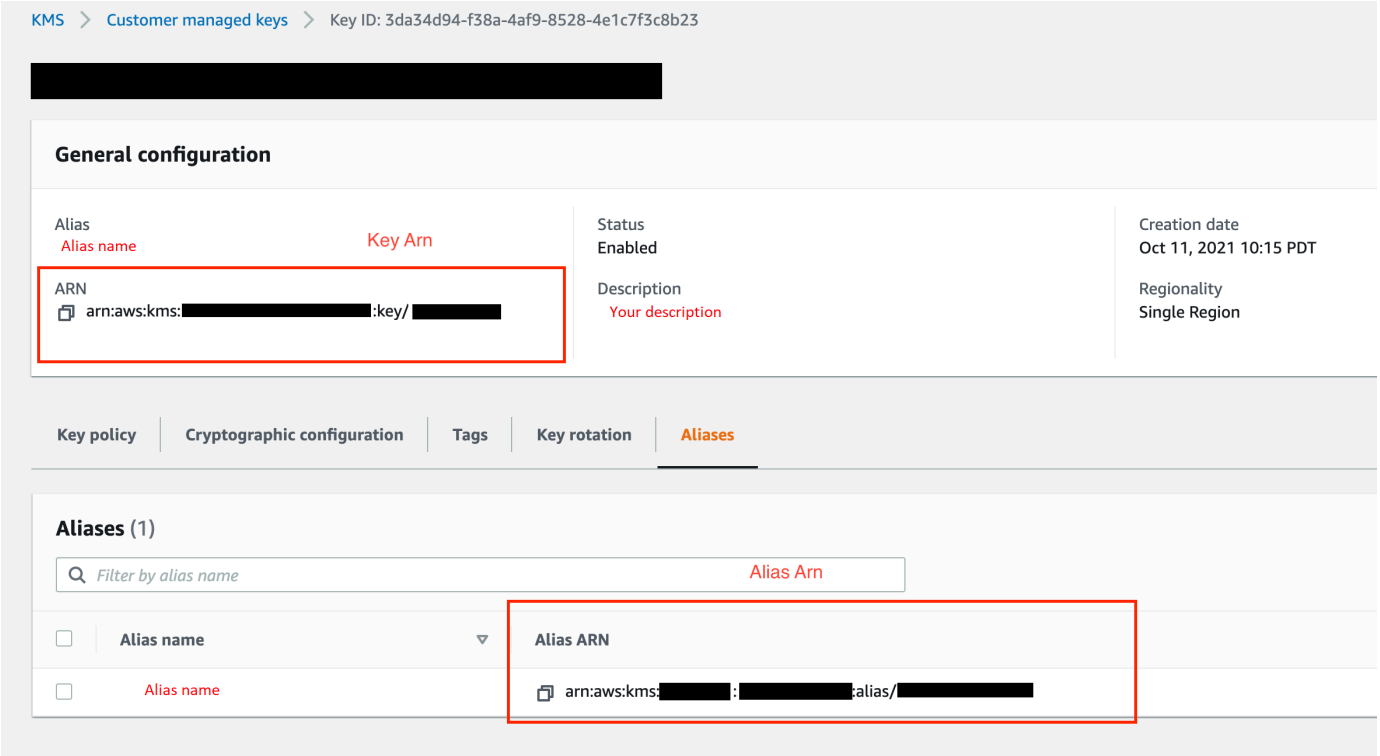
If you use the IAM managed policy, `AmazonSageMakerFullAccess`, to grant a role permission to use Data Wrangler in Studio Classic, your **Database User** name must have the prefix `sagemaker_access`.

Use the following procedures to learn how to add a new cluster.

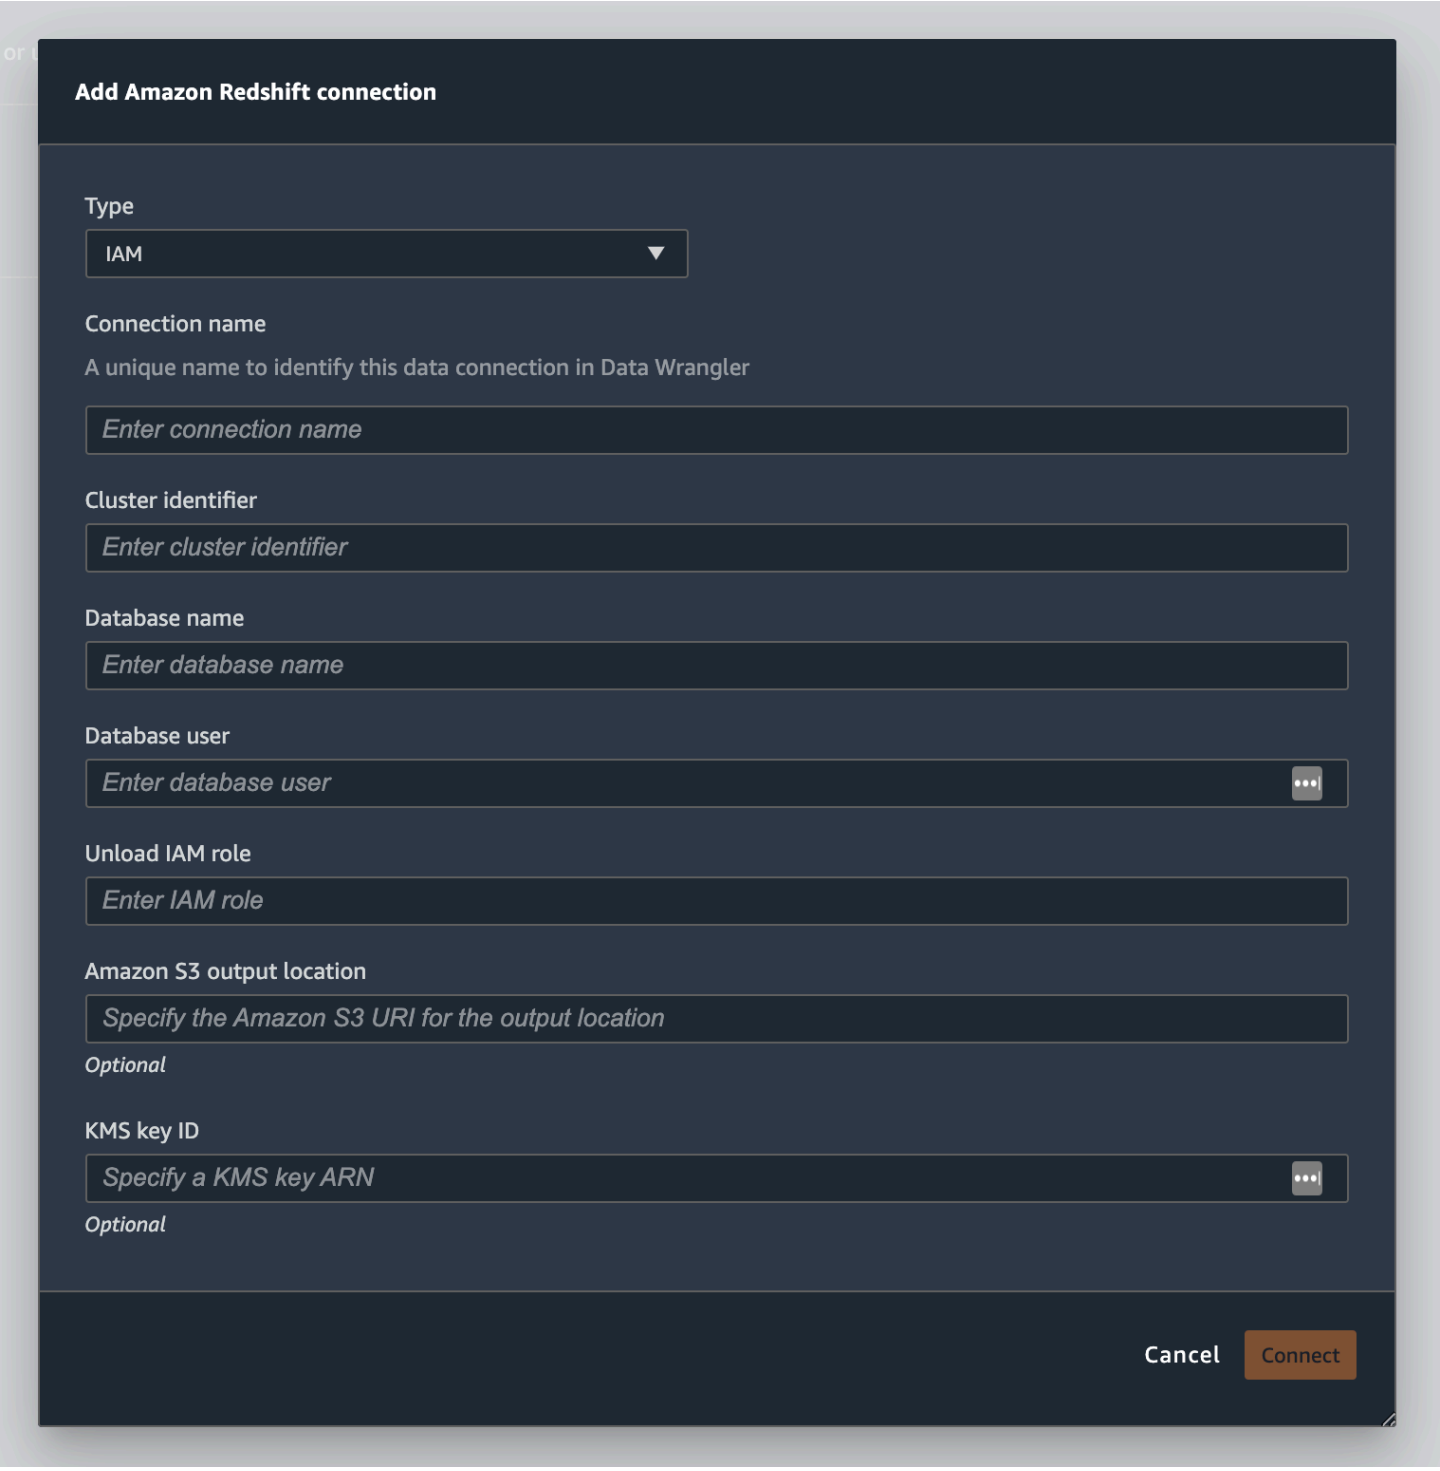
> **Note**
>
> Data Wrangler uses the Amazon Redshift Data API with temporary credentials. To learn more about this API, refer to Using the Amazon Redshift Data API in the Amazon Redshift Management Guide.

To connect to a Amazon Redshift cluster

1. Sign into Amazon SageMaker Console.
2. Choose **Studio**.
3. Choose **Launch app**.
4. From the dropdown list, select **Studio**.
5. Choose the Home icon.
6. Choose **Data**.
7. Choose **Data Wrangler**.
8. Choose **Import data**.
9. Under **Available**, choose **Amazon Athena**.
10. Choose **Amazon Redshift**.
11. Choose **Temporary credentials (IAM)** for **Type**.
12. Enter a **Connection Name**. This is a name used by Data Wrangler to identify this connection.
13. Enter the **Cluster Identifier** to specify to which cluster you want to connect. Note: Enter only the cluster identifier and not the full endpoint of the Amazon Redshift cluster.
14. Enter the **Database Name** of the database to which you want to connect.
15. Enter a **Database User** to identify the user you want to use to connect to the database.
16. For **UNLOAD IAM Role**, enter the IAM role ARN of the role that the Amazon Redshift cluster should assume to move and write data to Amazon S3. For more information about this role, see Authorizing Amazon Redshift to access other AWS services on your behalf in the Amazon Redshift Management Guide.
17. Choose **Connect**.
18. (Optional) For **Amazon S3 output location**, specify the S3 URI to store the query results.
19. (Optional) For **KMS key ID**, specify the ARN of the AWS KMS key or alias. The following image shows you where you can find either key in the AWS Management Console.



The following image shows all the fields from the preceding procedure.



After your connection is successfully established, it appears as a data source under **Data Import**. Select this data source to query your database and import data.

To query and import data from Amazon Redshift

1. Select the connection that you want to query from **Data Sources**.

2. Select a **Schema**. To learn more about Amazon Redshift Schemas, see Schemas in the Amazon Redshift Database Developer Guide.
3. (Optional) Under **Advanced configuration**, specify the **Sampling** method that you'd like to use.
4. Enter your query in the query editor and choose **Run** to run the query. After a successful query, you can preview your result under the editor.
5. Select **Import dataset** to import the dataset that has been queried.
6. Enter a **Dataset name**. If you add a **Dataset name** that contains spaces, these spaces are replaced with underscores when your dataset is imported.
7. Choose **Add**.

To edit a dataset, do the following.

1. Navigate to your Data Wrangler flow.
2. Choose the + next to **Source - Sampled**.
3. Change the data that you're importing.
4. Choose **Apply**

Import data from Amazon EMR

You can use Amazon EMR as a data source for your Amazon SageMaker Data Wrangler flow. Amazon EMR is a managed cluster platform that you can use process and analyze large amounts of data. For more information about Amazon EMR, see What is Amazon EMR?. To import a dataset from EMR, you connect to it and query it.

> ⚠ **Important**
>
> You must meet the following prerequisites to connect to an Amazon EMR cluster:
>
> **Prerequisites**
>
> - **Network configurations**
>   - You have an Amazon VPC in the Region that you're using to launch Amazon SageMaker Studio Classic and Amazon EMR.

- Both Amazon EMR and Amazon SageMaker Studio Classic must be launched in private subnets. They can be in the same subnet or in different ones.
- Amazon SageMaker Studio Classic must be in VPC-only mode.

  For more information about creating a VPC, see Create a VPC.

  For more information about creating a VPC, see Connect SageMaker Studio Classic Notebooks in a VPC to External Resources.
- The Amazon EMR clusters that you're running must be in the same Amazon VPC.
- The Amazon EMR clusters and the Amazon VPC must be in the same AWS account.
- Your Amazon EMR clusters are running Hive or Presto.
  - Hive clusters must allow inbound traffic from Studio Classic security groups on port 10000.
  - Presto clusters must allow inbound traffic from Studio Classic security groups on port 8889.

  > **Note**
  >
  > The port number is different for Amazon EMR clusters using IAM roles. Navigate to the end of the prerequisites section for more information.

- **SageMaker Studio Classic**
  - Amazon SageMaker Studio Classic must run Jupyter Lab Version 3. For information about updating the Jupyter Lab Version, see View and update the JupyterLab version of an application from the console.
  - Amazon SageMaker Studio Classic has an IAM role that controls user access. The default IAM role that you're using to run Amazon SageMaker Studio Classic doesn't have policies that can give you access to Amazon EMR clusters. You must attach the policy granting permissions to the IAM role. For more information, see Configure the discoverability of Amazon EMR clusters (for administrators).
  - The IAM role must also have the following policy attached `secretsmanager:PutResourcePolicy`.
  - If you're using a Studio Classic domain that you've already created, make sure that its `AppNetworkAccessType` is in VPC-only mode. For information about updating a domain to use VPC-only mode, see Shut down and Update SageMaker Studio Classic.

- **Amazon EMR clusters**
  - You must have Hive or Presto installed on your cluster.
  - The Amazon EMR release must be version 5.5.0 or later.

    > **Note**
    >
    > Amazon EMR supports auto termination. Auto termination stops idle clusters from running and prevents you from incurring costs. The following are the releases that support auto termination:
    >
    > - For 6.x releases, version 6.1.0 or later.
    > - For 5.x releases, version 5.30.0 or later.

- **Amazon EMR clusters using IAM runtime roles**
  - Use the following pages to set up IAM runtime roles for the Amazon EMR cluster. You must enable in-transit encryption when you're using runtime roles:
    - Prerequisites for launching an Amazon EMR cluster with a runtime role
    - Launch an Amazon EMR cluster with role-based access control
  - You must Lake Formation as a governance tool for the data within your databases. You must also use external data filtering for access control.
    - For more information about Lake Formation, see What is AWS Lake Formation?
    - For more information about integrating Lake Formation into Amazon EMR, see Integrating third-party services with Lake Formation.
  - The version of your cluster must be 6.9.0 or later.
  - Access to AWS Secrets Manager. For more information about Secrets Manager see What is AWS Secrets Manager?
  - Hive clusters must allow inbound traffic from Studio Classic security groups on port 10000.

An Amazon VPC is a virtual network that is logically isolated from other networks on the AWS cloud. Amazon SageMaker Studio Classic and your Amazon EMR cluster only exist within the Amazon VPC.

~~Use the following procedure to launch Amazon SageMaker Studio Classic in an Amazon VPC.~~

To launch Studio Classic within a VPC, do the following.

1. Navigate to the SageMaker console at https://console.aws.amazon.com/sagemaker/.
2. Choose **Launch SageMaker Studio Classic**.
3. Choose **Standard setup**.
4. For **Default execution role**, choose the IAM role to set up Studio Classic.
5. Choose the VPC where you've launched the Amazon EMR clusters.
6. For **Subnet**, choose a private subnet.
7. For **Security group(s)**, specify the security groups that you're using to control between your VPC.
8. Choose **VPC Only**.
9. (Optional) AWS uses a default encryption key. You can specify an AWS Key Management Service key to encrypt your data.
10. Choose **Next**.
11. Under **Studio settings**, choose the configurations that are best suited to you.
12. Choose **Next** to skip the SageMaker Canvas settings.
13. Choose **Next** to skip the RStudio settings.

If you don't have an Amazon EMR cluster ready, you can use the following procedure to create one. For more information about Amazon EMR, see What is Amazon EMR?

To create a cluster, do the following.

1. Navigate to the AWS Management Console.
2. In the search bar, specify **`Amazon EMR`**.
3. Choose **Create cluster**.
4. For **Cluster name**, specify the name of your cluster.
5. For **Release**, select the release version of the cluster.

> **Note**
>
> Amazon EMR supports auto termination for the following releases:
>
> - For 6.x releases, releases 6.1.0 or later

- For 5.x releases, releases 5.30.0 or later

Auto termination stops idle clusters from running and prevents you from incurring costs.

6. (Optional) For **Applications**, choose **Presto**.
7. Choose the application that you're running on the cluster.
8. Under **Networking**, for **Hardware configuration**, specify the hardware configuration settings.

Important

For **Networking**, choose the VPC that is running Amazon SageMaker Studio Classic and choose a private subnet.

9. Under **Security and access**, specify the security settings.
10. Choose **Create**.

For a tutorial about creating an Amazon EMR cluster, see Getting started with Amazon EMR. For information about best practices for configuring a cluster, see Considerations and best practices.

Note

For security best practices, Data Wrangler can only connect to VPCs on private subnets. You can't connect to the master node unless you use AWS Systems Manager for your Amazon EMR instances. For more information, see Securing access to EMR clusters using AWS Systems Manager.

You can currently use the following methods to access an Amazon EMR cluster:

- No authentication
- Lightweight Directory Access Protocol (LDAP)
- IAM (Runtime role)

Not using authentication or using LDAP can require you to create multiple clusters and Amazon EC2 instance profiles. If you're an administrator, you might need to provide groups of users with

different levels of access to the data. These methods can result in administrative overhead that makes it more difficult to manage your users.

We recommend using an IAM runtime role that gives multiple users the ability to connect to the same Amazon EMR cluster. A runtime role is an IAM role that you can assign to a user who is connecting to an Amazon EMR cluster. You can configure the runtime IAM role to have permissions that are specific to each group of users.

Use the following sections to create a Presto or Hive Amazon EMR cluster with LDAP activated.

Presto

> **Important**
>
> To use AWS Glue as a metastore for Presto tables, select **Use** for **Presto table metadata** to store the results of your Amazon EMR queries in a AWS Glue data catalog when you're launching an EMR cluster. Storing the query results in a AWS Glue data catalog can save you from incurring charges.
> To query large datasets on Amazon EMR clusters, you must add the following properties to the Presto configuration file on your Amazon EMR clusters:
>
> ```
> [{"classification":"presto-config","properties":{
> "http-server.max-request-header-size":"5MB",
> "http-server.max-response-header-size":"5MB"}}]
> ```
>
> You can also modify the configuration settings when you launch the Amazon EMR cluster.
> The configuration file for your Amazon EMR cluster is located under the following path: `/etc/presto/conf/config.properties`.

Use the following procedure to create a Presto cluster with LDAP activated.

To create a cluster, do the following.

1. Navigate to the AWS Management Console.
2. In the search bar, specify **`Amazon EMR`**.

3. Choose **Create cluster**.
4. For **Cluster name**, specify the name of your cluster.
5. For **Release**, select the release version of the cluster.

> **Note**
>
> Amazon EMR supports auto termination for the following releases:
>
> - For 6.x releases, releases 6.1.0 or later
> - For 5.x releases, releases 5.30.0 or later
>
> Auto termination stops idle clusters from running and prevent you from incurring costs.

6. Choose the application that you're running on the cluster.
7. Under **Networking**, for **Hardware configuration**, specify the hardware configuration settings.

> **Important**
>
> For **Networking**, choose the VPC that is running Amazon SageMaker Studio Classic and choose a private subnet.

8. Under **Security and access**, specify the security settings.
9. Choose **Create**.

Hive

> **Important**
>
> To use AWS Glue as a metastore for Hive tables, select **Use** for **Hive table metadata** to store the results of your Amazon EMR queries in a AWS Glue data catalog when you're launching an EMR cluster. Storing the query results in a AWS Glue data catalog can save you from incurring charges.
> To be able to query large datasets on Amazon EMR clusters, add the following properties to Hive configuration file on your Amazon EMR clusters:

```
[{"classification":"hive-site", "properties"
:{"hive.resultset.use.unique.column.names":"false"}}]
```

You can also modify the configuration settings when you launch the Amazon EMR cluster.
The configuration file for your Amazon EMR cluster is located under the following path: `/etc/hive/conf/hive-site.xml`. You can specify the following property and restart the cluster:

```
<property>
    <name>hive.resultset.use.unique.column.names</name>
    <value>false</value>
</property>
```

Use the following procedure to create a Hive cluster with LDAP activated.

To create a Hive cluster with LDAP activated, do the following.

1. Navigate to the AWS Management Console.
2. In the search bar, specify **`Amazon EMR`**.
3. Choose **Create cluster**.
4. Choose **Go to advanced options**.
5. For **Release**, select an Amazon EMR release version.
6. The **Hive** configuration option is selected by default. Make sure the **Hive** option has a checkbox next to it.
7. (Optional) You can also select **Presto** as a configuration option to activate both Hive and Presto on your cluster.
8. (Optional) Select **Use for Hive table metadata** to store the results of your Amazon EMR queries in a AWS Glue data catalog. Storing the query results in a AWS Glue catalog can save you from incurring charges. For more information, see Using the AWS Glue Data Catalog as the metastore for Hive.

> **Note**
>
> Storing the query results in a data catalog requires Amazon EMR version 5.8.0 or later.

9. Under **Enter configuration**, specify the following JSON:

```
[
  {
    "classification": "hive-site",
    "properties": {
      "hive.server2.authentication.ldap.baseDN": "dc=example,dc=org",
      "hive.server2.authentication": "LDAP",
      "hive.server2.authentication.ldap.url": "ldap://ldap-server-dns-name:389"
    }
  }
]
```

> **Note**
>
> As a security best practice, we recommend enabling SSL for HiveServer by adding a few properties in the preceding hive-site JSON. For more information, see Enable SSL on HiveServer2.

10. Specify the remaining cluster settings and create a cluster.

Use the following sections to use LDAP authentication for Amazon EMR clusters that you've already created.

LDAP for Presto

Using LDAP on a cluster running Presto requires access to the Presto coordinator through HTTPS. Do the following to provide access:

- Activate access on port 636
- Enable SSL for the Presto coordinator

Use the following template to configure Presto:

```
- Classification: presto-config
    ConfigurationProperties:
       http-server.authentication.type: 'PASSWORD'
       http-server.https.enabled: 'true'
       http-server.https.port: '8889'
       http-server.http.port: '8899'
       node-scheduler.include-coordinator: 'true'
       http-server.https.keystore.path: '/path/to/keystore/path/for/presto'
       http-server.https.keystore.key: 'keystore-key-password'
       discovery.uri: 'http://master-node-dns-name:8899'
- Classification: presto-password-authenticator
    ConfigurationProperties:
       password-authenticator.name: 'ldap'
       ldap.url: !Sub 'ldaps://ldap-server-dns-name:636'
       ldap.user-bind-pattern: "uid=${USER},dc=example,dc=org"
       internal-communication.authentication.ldap.user: "ldap-user-name"
       internal-communication.authentication.ldap.password: "ldap-password"
```

For information about setting up LDAP in Presto, see the following resources:

- LDAP Authentication
- Using LDAP Authentication for Presto on Amazon EMR

> **Note**
>
> As a security best practice, we recommend enabling SSL for Presto. For more information, see Secure Internal Communication.

LDAP for Hive

To use LDAP for Hive for a cluster that you've created, use the following procedure Reconfigure an instance group in the console.

You're specifying the name of the cluster to which you're connecting.

```
[
  {
    "classification": "hive-site",
    "properties": {
      "hive.server2.authentication.ldap.baseDN": "dc=example,dc=org",
      "hive.server2.authentication": "LDAP",
      "hive.server2.authentication.ldap.url": "ldap://ldap-server-dns-name:389"
    }
  }
]
```

Use the following procedure to import data from a cluster.

To import data from a cluster, do the following.

1. Open a Data Wrangler flow.
2. Choose **Create Connection**.
3. Choose **Amazon EMR**.
4. Do one of the following.
   - (Optional) For **Secrets ARN**, specify the Amazon Resource Number (ARN) of the database within the cluster. Secrets provide additional security. For more information about secrets, see What is AWS Secrets Manager? For information about creating a secret for your cluster, see Creating a AWS Secrets Manager secret for your cluster.

     > **Important**
     >
     > You must specify a secret if you're using an IAM runtime role for authentication.

   - From the dropdown table, choose a cluster.
5. Choose **Next**.
6. For **Select an endpoint for *example-cluster-name* cluster**, choose a query engine.
7. (Optional) Select **Save connection**.
8. Choose **Next, select login** and choose one of the following:
   - No authentication

- LDAP
- IAM

9. For **Login into *`example-cluster-name`* cluster**, specify the **Username** and **Password** for the cluster.
10. Choose **Connect**.
11. In the query editor specify a SQL query.
12. Choose **Run**.
13. Choose **Import**.

Creating a AWS Secrets Manager secret for your cluster

If you're using an IAM runtime role to access your Amazon EMR cluster, you must store the credentials that you're using to access the Amazon EMR as a Secrets Manager secret. You store all the credentials that you use to access the cluster within the secret.

You must store the following information in the secret:

- JDBC endpoint – `jdbc:hive2://`
- DNS name – The DNS name of your Amazon EMR cluster. It's either the endpoint for the primary node or the hostname.
- Port – 8446

You can also store the following additional information within the secret:

- IAM role – The IAM role that you're using to access the cluster. Data Wrangler uses your SageMaker execution role by default.
- Truststore path – By default, Data Wrangler creates a truststore path for you. You can also use your own truststore path. For more information about truststore paths, see In-transit encryption in HiveServer2.
- Truststore password – By default, Data Wrangler creates a truststore password for you. You can also use your own truststore path. For more information about truststore paths, see In-transit encryption in HiveServer2.

Use the following procedure to store the credentials within a Secrets Manager secret.

To store your credentials as a secret, do the following.

1. Navigate to the AWS Management Console.
2. In the search bar, specify Secrets Manager.
3. Choose **AWS Secrets Manager**.
4. Choose **Store a new secret**.
5. For **Secret type**, choose **Other type of secret**.
6. Under **Key/value** pairs, select **Plaintext**.
7. For clusters running Hive, you can use the following template for IAM authentication.

```
{"jdbcURL": ""
 "iam_auth": {"endpoint": "jdbc:hive2://", #required
               "dns": "ip-xx-x-xxx-xxx.ec2.internal", #required
               "port": "10000", #required
             "cluster_id": "j-xxxxxxxxx", #required
             "iam_role": "arn:aws:iam::xxxxxxxx:role/xxxxxxxxxxxx", #optional
             "truststore_path": "/etc/alternatives/jre/lib/security/cacerts",
 #optional
             "truststore_password": "changeit" #optional

             }}
```

> **Note**
>
> After you import your data, you apply transformations to them. You then export the data that you've transformed to a specific location. If you're using a Jupyter notebook to export your transformed data to Amazon S3, you must use the truststore path specified in the preceding example.

A Secrets Manager secret stores the JDBC URL of the Amazon EMR cluster as a secret. Using a secret is more secure than directly entering in your credentials.

Use the following procedure to store the JDBC URL as a secret.

To store the JDBC URL as a secret, do the following.

1. Navigate to the AWS Management Console.
2. In the search bar, specify Secrets Manager.
3. Choose **AWS Secrets Manager**.
4. Choose **Store a new secret**.
5. For **Secret type**, choose **Other type of secret**.
6. For **Key/value pairs**, specify `jdbcURL` as the key and a valid JDBC URL as the value.

   The format of a valid JDBC URL depends on whether you use authentication and whether you use Hive or Presto as the query engine. The following list shows the valid JBDC URL formats for the different possible configurations.

   - Hive, no authentication – `jdbc:hive2://`*`emr-cluster-master-public`*`-dns:10000/;`
   - Hive, LDAP authentication – `jdbc:hive2://`*`emr-cluster-master-public-dns-name`*`:10000/;AuthMech=3;UID=david;PWD=welcome123;`
   - For Hive with SSL enabled, the JDBC URL format depends on whether you use a Java Keystore File for the TLS configuration. The Java Keystore File helps verify the identity of the master node of the Amazon EMR cluster. To use a Java Keystore File, generate it on an EMR cluster and upload it to Data Wrangler. To generate a file, use the following command on the Amazon EMR cluster, `keytool -genkey -alias hive -keyalg RSA -keysize 1024 -keystore hive.jks`. For information about running commands on an Amazon EMR cluster, see Securing access to EMR clusters using AWS Systems Manager. To upload a file, choose the upward arrow on the left-hand navigation of the Data Wrangler UI.

     The following are the valid JDBC URL formats for Hive with SSL enabled:

     - Without a Java Keystore File – `jdbc:hive2://`*`emr-cluster-master-public-dns`*`:10000/;AuthMech=3;UID=`*`user-name`*`;PWD=`*`password`*`;SSL=1;AllowSelfSignedCerts=1;`
     - With a Java Keystore File – `jdbc:hive2://`*`emr-cluster-master-public-dns`*`:10000/;AuthMech=3;UID=`*`user-name`*`;PWD=`*`password`*`;SSL=1;SSLKeyStore=/home/sagemaker-user/data/`*`Java-keystore-file-name`*`;SSLKeyStorePwd=`*`Java-keystore-file-passsword`*`;`
   - Presto, no authentication – jdbc:presto://*`emr-cluster-master-public-dns`*:8889/;
   - For Presto with LDAP authentication and SSL enabled, the JDBC URL format depends on whether you use a Java Keystore File for the TLS configuration. The Java Keystore File helps verify the identity of the master node of the Amazon EMR cluster. To use a Java Keystore

File, generate it on an EMR cluster and upload it to Data Wrangler. To upload a file, choose the upward arrow on the left-hand navigation of the Data Wrangler UI. For information about creating a Java Keystore File for Presto, see Java Keystore File for TLS. For information about running commands on an Amazon EMR cluster, see Securing access to EMR clusters using AWS Systems Manager.

- Without a Java Keystore File – `jdbc:presto://emr-cluster-master-public-dns:8889/;SSL=1;AuthenticationType=LDAP Authentication;UID=user-name;PWD=password;AllowSelfSignedServerCert=1;AllowHostNameCNMismatch=1;`
- With a Java Keystore File – `jdbc:presto://emr-cluster-master-public-dns:8889/;SSL=1;AuthenticationType=LDAP Authentication;SSLTrustStorePath=/home/sagemaker-user/data/Java-keystore-file-name;SSLTrustStorePwd=Java-keystore-file-passsword;UID=user-name;PWD=password;`

Throughout the process of importing data from an Amazon EMR cluster, you might run into issues. For information about troubleshooting them, see Troubleshooting issues with Amazon EMR.

Import data from Databricks (JDBC)

You can use Databricks as a data source for your Amazon SageMaker Data Wrangler flow. To import a dataset from Databricks, use the JDBC (Java Database Connectivity) import functionality to access to your Databricks database. After you access the database, specify a SQL query to get the data and import it.

We assume that you have a running Databricks cluster and that you've configured your JDBC driver to it. For more information, see the following Databricks documentation pages:

- JDBC driver
- JDBC configuration and connection parameters
- Authentication parameters

Data Wrangler stores your JDBC URL in AWS Secrets Manager. You must give your Amazon SageMaker Studio Classic IAM execution role permissions to use Secrets Manager. Use the following procedure to give permissions.

To give permissions to Secrets Manager, do the following.

1. Sign in to the AWS Management Console and open the IAM console at https://console.aws.amazon.com/iam/.
2. Choose **Roles**.
3. In the search bar, specify the Amazon SageMaker execution role that Amazon SageMaker Studio Classic is using.
4. Choose the role.
5. Choose **Add permissions**.
6. Choose **Create inline policy**.
7. For **Service**, specify **Secrets Manager** and choose it.
8. For **Actions**, select the arrow icon next to **Permissions management**.
9. Choose **PutResourcePolicy**.
10. For **Resources**, choose **Specific**.
11. Choose the checkbox next to **Any in this account**.
12. Choose **Review policy**.
13. For **Name**, specify a name.
14. Choose **Create policy**.

You can use partitions to import your data more quickly. Partitions give Data Wrangler the ability to process the data in parallel. By default, Data Wrangler uses 2 partitions. For most use cases, 2 partitions give you near-optimal data processing speeds.

If you choose to specify more than 2 partitions, you can also specify a column to partition the data. The type of the values in the column must be numeric or date.

We recommend using partitions only if you understand the structure of the data and how it's processed.

You can either import the entire dataset or sample a portion of it. For a Databricks database, it provides the following sampling options:

- None – Import the entire dataset.
- First K – Sample the first K rows of the dataset, where K is an integer that you specify.
- Randomized – Takes a random sample of a size that you specify.
- Stratified – Takes a stratified random sample. A stratified sample preserves the ratio of values in a column.

Use the following procedure to import your data from a Databricks database.

To import data from Databricks, do the following.

1. Sign into Amazon SageMaker Console.
2. Choose **Studio**.
3. Choose **Launch app**.
4. From the dropdown list, select **Studio**.
5. From the **Import data** tab of your Data Wrangler flow, choose **Databricks**.
6. Specify the following fields:

   - **Dataset name** – A name that you want to use for the dataset in your Data Wrangler flow.
   - **Driver** – **com.simba.spark.jdbc.Driver**.
   - **JDBC URL** – The URL of the Databricks database. The URL formatting can vary between Databricks instances. For information about finding the URL and the specifying the parameters within it, see JDBC configuration and connection parameters. The following is an example of how a URL can be formatted: jdbc:spark://aws-sagemaker-datawrangler.cloud.databricks.com:443/default;transportMode=http;ssl=1;httpPath=sql/protocolv1/o/3122619508517275/0909-200301-cut318;AuthMech=3;UID=*token*;PWD=*personal-access-token*.

     > **Note**
     >
     > You can specify a secret ARN that contains the JDBC URL instead of specifying the JDBC URL itself. The secret must contain a key-value pair with the following format: `jdbcURL:`*`JDBC-URL`*. For more information, see What is Secrets Manager?.

7. Specify a SQL SELECT statement.

   > **Note**
   >
   > Data Wrangler doesn't support Common Table Expressions (CTE) or temporary tables within a query.

8. For **Sampling**, choose a sampling method.
9. Choose **Run**.

10. (Optional) For the **PREVIEW**, choose the gear to open the **Partition settings**.
    The gear for the additional settings is located to the far right of the **PREVIEW** title.

    - Specify the number of partitions. You can partition by column if you specify the number of partitions:

      - **Enter number of partitions** – Specify a value greater than 2.
      - (Optional) **Partition by column** – Specify the following fields. You can only partition by a column if you've specified a value for **Enter number of partitions**.
        - **Select column** – Select the column that you're using for the data partition. The data type of the column must be numeric or date.
        - **Upper bound** – From the values in the column that you've specified, the upper bound is the value that you're using in the partition. The value that you specify doesn't change the data that you're importing. It only affects the speed of the import. For the best performance, specify an upper bound that's close to the column's maximum.
        - **Lower bound** – From the values in the column that you've specified, the lower bound is the value that you're using in the partition. The value that you specify doesn't change the data that you're importing. It only affects the speed of the import. For the best performance, specify a lower bound that's close to the column's minimum.
11. Choose **Import**.

Import data from Salesforce Data Cloud

You can use Salesforce Data Cloud as a data source in Amazon SageMaker Data Wrangler to prepare the data in your Salesforce Data Cloud for machine learning.

With Salesforce Data Cloud as a data source in Data Wrangler, you can quickly connect to your Salesforce data without writing a single line of code. You can join your Salesforce data with data from any other data source in Data Wrangler.

After you connect to the data cloud, you can do the following:

- Visualize your data with built-in visualizations
- Understand data and identify potential errors and extreme values
- Transform data with more than 300 built-in transformations
- Export the data that you've transformed

Topics

Administrator setup

> **Important**
>
> Before you get started, make sure that your users are running Amazon SageMaker Studio Classic version 1.3.0 or later. For information about checking the version of Studio Classic and updating it, see Prepare ML Data with Amazon SageMaker Data Wrangler.

When you're setting up access to Salesforce Data Cloud, you must complete the following tasks:

- Getting your Salesforce Domain URL. Salesforce also refers to the Domain URL as your org's URL.
- Getting OAuth credentials from Salesforce.
- Getting the authorization URL and token URL for your Salesforce Domain.
- Creating a AWS Secrets Manager secret with the OAuth configuration.
- Creating a lifecycle configuration that Data Wrangler uses to read the credentials from the secret.
- Giving Data Wrangler permissions to read the secret.

After you perform the preceding tasks, your users can log into the Salesforce Data Cloud using OAuth.

> **Note**
>
> Your users might run into issues after you've set everything up. For information about troubleshooting, see Troubleshooting with Salesforce.

Use the following procedure to get the Domain URL.

1. Navigate to the Salesforce login page.

2. For **Quick find**, specify **My Domain**.
3. Copy the value of **Current My Domain URL** to a text file.
4. Add `https://` to the beginning of the URL.

After you get the Salesforce Domain URL, you can use the following procedure to get the login credentials from Salesforce and allow Data Wrangler to access your Salesforce data.

To get the log in credentials from Salesforce and provide access to Data Wrangler, do the following.

1. Navigate to your Salesforce Domain URL and log into your account.
2. Choose the gear icon.
3. In the search bar that appears, specify **App Manager**.
4. Select **New Connected App**.
5. Specify the following fields:
   - Connected App Name – You can specify any name, but we recommend choosing a name that includes Data Wrangler. For example, you can specify **Salesforce Data Cloud Data Wrangler Integration**.
   - API name – Use the default value.
   - Contact Email – Specify your email address.
   - Under **API heading (Enable OAuth Settings)**, select the checkbox to activate OAuth settings.
   - For **Callback URL** specify the Amazon SageMaker Studio Classic URL. To get the URL for Studio Classic, access it from the AWS Management Console and copy the URL.
6. Under **Selected OAuth Scopes**, move the following from the **Available OAuth Scopes** to **Selected OAuth Scopes**:
   - Manage user data via APIs (`api`)
   - Perform requests at any time (`refresh_token`, `offline_access`)
   - Perform ANSI SQL queries on Salesforce Data Cloud data (`cdp_query_api`)
   - Manage Salesforce Customer Data Platform profile data (`cdp_profile_api`)
7. Choose **Save**. After you save your changes, Salesforce opens a new page.
8. Choose **Continue**
9. Navigate to **Consumer Key and Secret**.

10. Choose **Manage Consumer Details**. Salesforce redirects you to a new page where you might have to pass two-factor authentication.
11.
> **Important**
>
> Copy the Consumer Key and Consumer Secret to a text editor. You need this information to connect the data cloud to Data Wrangler.

12. Navigate back to **Manage Connected Apps**.
13. Navigate to **Connected App Name** and the name of your application.
14. Choose **Manage**.
    a. Select **Edit Policies**.
    b. Change **IP Relaxation** to **Relax IP restrictions**.
    c. Choose **Save**.

After you provide access to your Salesforce Data Cloud, you need to provide permissions for your users. Use the following procedure to provide them with permissions.

To provide your users with permissions, do the following.

1. Navigate to the setup home page.
2. On the left-hand navigation, search for **Users** and choose the **Users** menu item.
3. Choose the hyperlink with your user name.
4. Navigate to **Permission Set Assignments**.
5. Choose **Edit Assignments**.
6. Add the following permissions:
    - **Customer Data Platform Admin**
    - **Customer Data Platform Data Aware Specialist**
7. Choose **Save**.

After you get the information for your Salesforce Domain, you must get the authorization URL and the token URL for the AWS Secrets Manager secret that you're creating.

Use the following procedure to get the authorization URL and the token URL.

To get the authorization URL and token URL

1. Navigate to your Salesforce Domain URL.
2. Use one of the following methods to get the URLs. If you are on a Linux distribution with `curl` and `jq` installed, we recommend using the method that only works on Linux.
   - (Linux only) Specify the following command in your terminal.

     ```
     curl salesforce-domain-URL/.well-known/openid-configuration | \
     jq '. | { authorization_url: .authorization_endpoint,
      token_url: .token_endpoint }' | \
     jq '.  += { identity_provider: "SALESFORCE", client_id: "example-client-id",
      client_secret: "example-client-secret" }'
     ```

   - a. Navigate to *example-org-URL/.well-known/openid-configuration* in your browser.

     b. Copy the `authorization_endpoint` and `token_endpoint` to a text editor.

     c. Create the following JSON object:

     ```
     {
       "identity_provider": "SALESFORCE",
       "authorization_url": "example-authorization-endpoint",
       "token_url": "example-token-endpoint",
       "client_id": "example-consumer-key",
       "client_secret": "example-consumer-secret"
     }
     ```

After you create the OAuth configuration object, you can create a AWS Secrets Manager secret that stores it. Use the following procedure to create the secret.

To create a secret, do the following.

1. Navigate to the AWS Secrets Manager console.
2. Choose **Store a secret**.
3. Select **Other type of secret**.
4. Under **Key/value** pairs select **Plaintext**.

5. Replace the empty JSON with the following configuration settings.

```
{
  "identity_provider": "SALESFORCE",
  "authorization_url": "example-authorization-endpoint",
  "token_url": "example-token-endpoint",
  "client_id": "example-consumer-key",
  "client_secret": "example-consumer-secret"
}
```

6. Choose **Next**.
7. For **Secret Name**, specify the name of the secret.
8. Under **Tags**, choose **Add**.
   - For the **Key**, specify **sagemaker:partner**. For **Value**, we recommend specifying a value that might be useful for your use case. However, you can specify anything.

> **Important**
>
> You must create the key. You can't import your data from Salesforce if you don't create it.

9. Choose **Next**.
10. Choose **Store**.
11. Choose the secret you've created.
12. Make a note of the following fields:
    - The Amazon Resource Number (ARN) of the secret
    - The name of the secret

After you've created the secret, you must add permissions for Data Wrangler to read the secret. Use the following procedure to add permissions.

To add read permissions for Data Wrangler, do the following.

1. Navigate to the Amazon SageMaker console.
2. Choose **domains**.

3. Choose the domain that you're using to access Data Wrangler.
4. Choose your **User Profile**.
5. Under **Details**, find the **Execution role**. Its ARN is in the following format: `arn:aws:iam::111122223333:role/example-role`. Make a note of the SageMaker execution role. Within the ARN, it's everything after `role/`.
6. Navigate to the IAM console.
7. In the **Search IAM** search bar, specify the name of the SageMaker execution role.
8. Choose the role.
9. Choose **Add permissions**.
10. Choose **Create inline policy**.
11. Choose the JSON tab.
12. Specify the following policy within the editor.

```
{
 "Version": "2012-10-17",
 "Statement": [
     {
         "Effect": "Allow",
         "Action": [
             "secretsmanager:GetSecretValue",
             "secretsmanager:PutSecretValue"
         ],
         "Resource": "arn:aws:secretsmanager:*:*:secret:*",
         "Condition": {
             "ForAnyValue:StringLike": {
                 "aws:ResourceTag/sagemaker:partner": "*"
             }
         }
     },
     {
         "Effect": "Allow",
         "Action": [
             "secretsmanager:UpdateSecret"
         ],
         "Resource": "arn:aws:secretsmanager:*:*:secret:AmazonSageMaker-*"
     }
 ]
}
```

13. Choose **Review Policy**.
14. For **Name**, specify a name.
15. Choose **Create policy**.

After you've given Data Wrangler permissions to read the secret, you must add a Lifecycle Configuration that uses your Secrets Manager secret to your Amazon SageMaker Studio Classic user profile.

Use the following procedure to create a lifecycle configuration and add it to the Studio Classic profile.

To create a lifecycle configuration and add it to the Studio Classic profile, do the following.

1. Navigate to the Amazon SageMaker console.
2. Choose **domains**.
3. Choose the domain that you're using to access Data Wrangler.
4. Choose your **User Profile**.
5. If you see the following applications, delete them:
   - KernelGateway
   - JupyterKernel

   > **Note**
   >
   > Deleting the applications updates Studio Classic. It can take a while for the updates to happen.
6. While you're waiting for updates to happen, choose **Lifecycle configurations**.
7. Make sure the page you're on says **Studio Classic Lifecycle configurations**.
8. Choose **Create configuration**.
9. Make sure **Jupyter server app** has been selected.
10. Choose **Next**.
11. For **Name**, specify a name for the configuration.

12. For **Scripts**, specify the following script:

```
#!/bin/bash
set -eux

cat > ~/.sfgenie_identity_provider_oauth_config <<EOL
{
    "secret_arn": "secrets-arn-containing-salesforce-credentials"
}
EOL
```

13. Choose **Submit**.
14. On the left hand navigation, choose **domains**.
15. Choose your domain.
16. Choose **Environment**.
17. Under **Lifecycle configurations for personal Studio Classic apps**, choose **Attach**.
18. Select **Existing configuration**.
19. Under **Studio Classic Lifecycle configurations** select the lifecycle configuration that you've created.
20. Choose **Attach to domain**.
21. Select the checkbox next to the lifecycle configuration that you've attached.
22. Select **Set as default**.

You might run into issues when you set up your lifecycle configuration. For information about debugging them, see Debug lifecycle configurations.

Data Scientist Guide

Use the following to connect Salesforce Data Cloud and access your data in Data Wrangler.

> **Important**
>
> Your administrator needs to use the information in the preceding sections to set up Salesforce Data Cloud. If you're running into issues, contact them for troubleshooting help.

To open Studio Classic and check its version, see the following procedure.

1. Use the steps in Prerequisites to access Data Wrangler through Amazon SageMaker Studio Classic.
2. Next to the user you want to use to launch Studio Classic, select **Launch app**.
3. Choose **Studio**.

To create a dataset in Data Wrangler with data from the Salesforce Data Cloud

1. Sign into Amazon SageMaker Console.
2. Choose **Studio**.
3. Choose **Launch app**.
4. From the dropdown list, select **Studio**.
5. Choose the Home icon.
6. Choose **Data**.
7. Choose **Data Wrangler**.
8. Choose **Import data**.
9. Under **Available**, choose **Salesforce Data Cloud**.
10. For **Connection name**, specify a name for your connection to the Salesforce Data Cloud.
11. For **Org URL**, specify the organization URL in your Salesforce account. You can get the URL from your administrator.s
12. Choose **Connect**.
13. Specify your credentials to log into Salesforce.

You can begin creating a dataset using data from Salesforce Data Cloud after you've connected to it.

After you select a table, you can write queries and run them. The output of your query shows under **Query results**.

After you have settled on the output of your query, you can then import the output of your query into a Data Wrangler flow to perform data transformations.

After you've created a dataset, navigate to the **Data flow** screen to start transforming your data.

Import data from Snowflake

You can use Snowflake as a data source in SageMaker Data Wrangler to prepare data in Snowflake for machine learning.

With Snowflake as a data source in Data Wrangler, you can quickly connect to Snowflake without writing a single line of code. You can join your data in Snowflake with data from any other data source in Data Wrangler.

Once connected, you can interactively query data stored in Snowflake, transform data with more than 300 preconfigured data transformations, understand data and identify potential errors and extreme values with a set of robust preconfigured visualization templates, quickly identify inconsistencies in your data preparation workflow, and diagnose issues before models are deployed into production. Finally, you can export your data preparation workflow to Amazon S3 for use with other SageMaker features such as Amazon SageMaker Autopilot, Amazon SageMaker Feature Store and Amazon SageMaker Model Building Pipelines.

You can encrypt the output of your queries using an AWS Key Management Service key that you've created. For more information about AWS KMS, see AWS Key Management Service.

Administrator Guide

> **Important**
>
> To learn more about granular access control and best practices, see Security Access Control.

This section is for Snowflake administrators who are setting up access to Snowflake from within SageMaker Data Wrangler.

Important

You are responsible for managing and monitoring the access control within Snowflake. Data Wrangler does not add a layer of access control with respect to Snowflake. Access control includes the following:

- The data that a user accesses
- (Optional) The storage integration that provides Snowflake the ability to write query results to an Amazon S3 bucket
- The queries that a user can run

(Optional) Configure Snowflake Data Import Permissions

By default, Data Wrangler queries the data in Snowflake without creating a copy of it in an Amazon S3 location. Use the following information if you're configuring a storage integration with Snowflake. Your users can use a storage integration to store their query results in an Amazon S3 location.

Your users might have different levels of access of sensitive data. For optimal data security, provide each user with their own storage integration. Each storage integration should have its own data governance policy.

This feature is currently not available in the opt-in Regions.

Snowflake requires the following permissions on an S3 bucket and directory to be able to access files in the directory:

- `s3:GetObject`
- `s3:GetObjectVersion`
- `s3:ListBucket`
- `s3:ListObjects`
- `s3:GetBucketLocation`

Create an IAM policy

You must create an IAM policy to configure access permissions for Snowflake to load and unload data from an Amazon S3 bucket.

The following is the JSON policy document that you use to create the policy:

```
# Example policy for S3 write access
# This needs to be updated
{
"Version": "2012-10-17",
"Statement": [
  {
    "Effect": "Allow",
    "Action": [
        "s3:PutObject",
        "s3:GetObject",
        "s3:GetObjectVersion",
        "s3:DeleteObject",
        "s3:DeleteObjectVersion"
    ],
    "Resource": "arn:aws:s3:::bucket/prefix/*"
  },
  {
    "Effect": "Allow",
    "Action": [
        "s3:ListBucket"
    ],
    "Resource": "arn:aws:s3:::bucket/",
    "Condition": {
        "StringLike": {
            "s3:prefix": ["prefix/*"]
        }
    }
  }
 ]
}
```

For information and procedures about creating policies with policy documents, see Creating IAM policies.

For documentation that provides an overview of using IAM permissions with Snowflake, see the following resources:

- What is IAM?

- Create the IAM Role in AWS
- Create a Cloud Storage Integration in Snowflake
- Retrieve the AWS IAM User for your Snowflake Account
- Grant the IAM User Permissions to Access Bucket.

To grant the data scientist's Snowflake role usage permission to the storage integration, you must run `GRANT USAGE ON INTEGRATION integration_name TO snowflake_role;`.

- `integration_name` is the name of your storage integration.
- `snowflake_role` is the name of the default Snowflake role given to the data scientist user.

Setting up Snowflake OAuth Access

Instead of having your users directly enter their credentials into Data Wrangler, you can have them use an identity provider to access Snowflake. The following are links to the Snowflake documentation for the identity providers that Data Wrangler supports.

- Azure AD
- Okta
- Ping Federate

Use the documentation from the preceding links to set up access to your identity provider. The information and procedures in this section help you understand how to properly use the documentation to access Snowflake within Data Wrangler.

Your identity provider needs to recognize Data Wrangler as an application. Use the following procedure to register Data Wrangler as an application within the identity provider:

1. Select the configuration that starts the process of registering Data Wrangler as an application.
2. Provide the users within the identity provider access to Data Wrangler.
3. Turn on OAuth client authentication by storing the client credentials as an AWS Secrets Manager secret.
4. Specify a redirect URL using the following format: https://*domain-ID*.studio.*AWS Region*.sagemaker.aws/jupyter/default/lab

> **Important**
>
> You're specifying the Amazon SageMaker domain ID and AWS Region that you're using to run Data Wrangler.

> **Important**
>
> You must register a URL for each Amazon SageMaker domain and AWS Region where you're running Data Wrangler. Users from a domain and AWS Region that don't have redirect URLs set up for them won't be able to authenticate with the identity provider to access the Snowflake connection.

5. Make sure that the authorization code and refresh token grant types are allowed for the Data Wrangler application.

Within your identity provider, you must set up a server that sends OAuth tokens to Data Wrangler at the user level. The server sends the tokens with Snowflake as the audience.

Snowflake uses the concept of roles that are distinct role the IAM roles used in AWS. You must configure the identity provider to use any role to use the default role associated with the Snowflake account. For example, if a user has `systems administrator` as the default role in their Snowflake profile, the connection from Data Wrangler to Snowflake uses `systems administrator` as the role.

Use the following procedure to set up the server.

To set up the server, do the following. You're working within Snowflake for all steps except the last one.

1. Start setting up the server or API.
2. Configure the authorization server to use the authorization code and refresh token grant types.
3. Specify the lifetime of the access token.
4. Set the refresh token idle timeout. The idle timeout is the time that the refresh token expires if it's not used.

> **Note**
>
> If you're scheduling jobs in Data Wrangler, we recommend making the idle timeout time greater than the frequency of the processing job. Otherwise, some processing jobs might fail because the refresh token expired before they could run. When the refresh token expires, the user must re-authenticate by accessing the connection that they've made to Snowflake through Data Wrangler.

5. Specify `session:role-any` as the new scope.

> **Note**
>
> For Azure AD, copy the unique identifier for the scope. Data Wrangler requires you to provide it with the identifier.

6.

> **Important**
>
> Within the External OAuth Security Integration for Snowflake, enable `external_oauth_any_role_mode`.

> **Important**
>
> Data Wrangler doesn't support rotating refresh tokens. Using rotating refresh tokens might result in access failures or users needing to log in frequently.

> **Important**
>
> If the refresh token expires, your users must reauthenticate by accessing the connection that they've made to Snowflake through Data Wrangler.

After you've set up the OAuth provider, you provide Data Wrangler with the information it needs to connect to the provider. You can use the documentation from your identity provider to get values for the following fields:

- Token URL – The URL of the token that the identity provider sends to Data Wrangler.
- Authorization URL – The URL of the authorization server of the identity provider.
- Client ID – The ID of the identity provider.
- Client secret – The secret that only the authorization server or API recognizes.
- (Azure AD only) The OAuth scope credentials that you've copied.

You store the fields and values in a AWS Secrets Manager secret and add it to the Amazon SageMaker Studio Classic lifecycle configuration that you're using for Data Wrangler. A Lifecycle Configuration is a shell script. Use it to make the Amazon Resource Name (ARN) of the secret accessible to Data Wrangler. For information about creating secrets see Move hardcoded secrets to AWS Secrets Manager. For information about using lifecycle configurations in Studio Classic, see Use lifecycle configurations with Amazon SageMaker Studio Classic.

Important

Before you create a Secrets Manager secret, make sure that the SageMaker execution role that you're using for Amazon SageMaker Studio Classic has permissions to create and update secrets in Secrets Manager. For more information about adding permissions, see Example: Permission to create secrets.

For Okta and Ping Federate, the following is the format of the secret:

```
{
    "token_url":"https://identityprovider.com/oauth2/example-portion-of-URL-path/v2/
token",
    "client_id":"example-client-id",
    "client_secret":"example-client-secret",
    "identity_provider":"OKTA"|"PING_FEDERATE",
    "authorization_url":"https://identityprovider.com/oauth2/example-portion-of-URL-
path/v2/authorize"
}
```

For Azure AD, the following is the format of the secret:

```
{
    "token_url":"https://identityprovider.com/oauth2/example-portion-of-URL-path/v2/
token",
    "client_id":"example-client-id",
    "client_secret":"example-client-secret",
    "identity_provider":"AZURE_AD",
    "authorization_url":"https://identityprovider.com/oauth2/example-portion-of-URL-
path/v2/authorize",
    "datasource_oauth_scope":"api://appuri/session:role-any)"
}
```

You must have a lifecycle configuration that uses the Secrets Manager secret that you've created. You can either create the lifecycle configuration or modify one that has already been created. The configuration must use the following script.

```
#!/bin/bash

set -eux

## Script Body

cat > ~/.snowflake_identity_provider_oauth_config <<EOL
{
    "secret_arn": "example-secret-arn"
}
EOL
```

For information about setting up lifecycle configurations, see Create and associate a lifecycle configuration. When you're going through the process of setting up, do the following:

- Set the application type of the configuration to `Jupyter Server`.
- Attach the configuration to the Amazon SageMaker domain that has your users.
- Have the configuration run by default. It must run every time a user logs into Studio Classic. Otherwise, the credentials saved in the configuration won't be available to your users when they're using Data Wrangler.
- The lifecycle configuration creates a file with the name, `snowflake_identity_provider_oauth_config` in the user's home folder. The file contains

the Secrets Manager secret. Make sure that it's in the user's home folder every time the Jupyter Server's instance is initialized.

Private Connectivity between Data Wrangler and Snowflake via AWS PrivateLink

This section explains how to use AWS PrivateLink to establish a private connection between Data Wrangler and Snowflake. The steps are explained in the following sections.

Create a VPC

If you do not have a VPC set up, then follow the Create a new VPC instructions to create one.

Once you have a chosen VPC you would like to use for establishing a private connection, provide the following credentials to your Snowflake Administrator to enable AWS PrivateLink:

- VPC ID
- AWS Account ID
- Your corresponding account URL you use to access Snowflake

> **Important**
>
> As described in Snowflake's documentation, enabling your Snowflake account can take up to two business days.

Set up Snowflake AWS PrivateLink Integration

After AWS PrivateLink is activated, retrieve the AWS PrivateLink configuration for your Region by running the following command in a Snowflake worksheet. Log into your Snowflake console and enter the following under **Worksheets**: `select SYSTEM$GET_PRIVATELINK_CONFIG();`

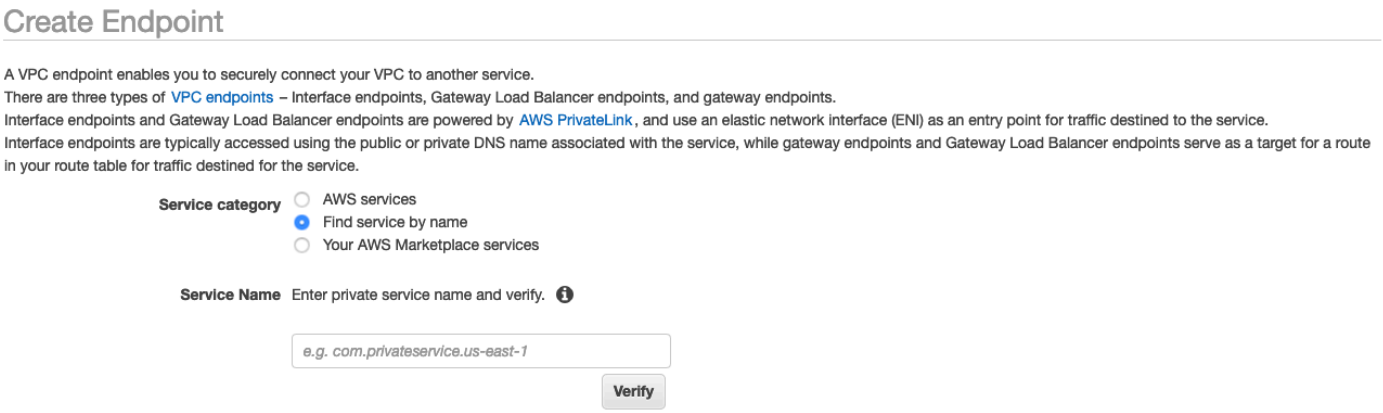
1. Retrieve the values for the following: `privatelink-account-name`, `privatelink_ocsp-url`, `privatelink-account-url`, and `privatelink_ocsp-url` from the resulting JSON object. Examples of each value are shown in the following snippet. Store these values for later use.

```
privatelink-account-name: xxxxxxxx.region.privatelink
privatelink-vpce-id: com.amazonaws.vpce.region.vpce-svc-xxxxxxxxxxxxxxxxx
```

```
privatelink-account-url: xxxxxxxx.region.privatelink.snowflakecomputing.com
privatelink_ocsp-url: ocsp.xxxxxxxx.region.privatelink.snowflakecomputing.com
```

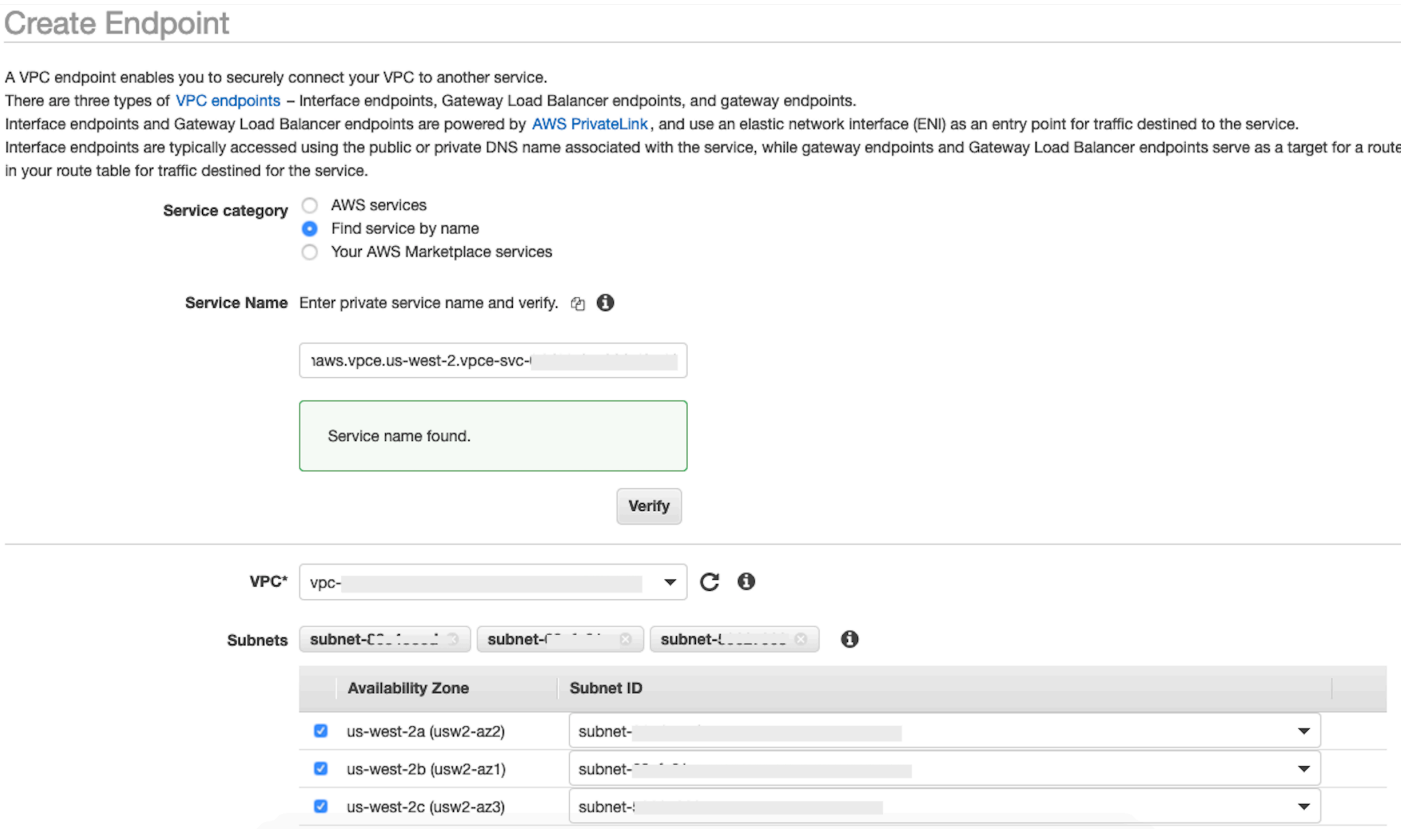
2. Switch to your AWS Console and navigate to the VPC menu.
3. From the left side panel, choose the **Endpoints** link to navigate to the **VPC Endpoints** setup.

   Once there, choose **Create Endpoint**.
4. Select the radio button for **Find service by name**, as shown in the following screenshot.



5. In the **Service Name** field, paste in the value for `privatelink-vpce-id` that you retrieved in the preceding step and choose **Verify**.

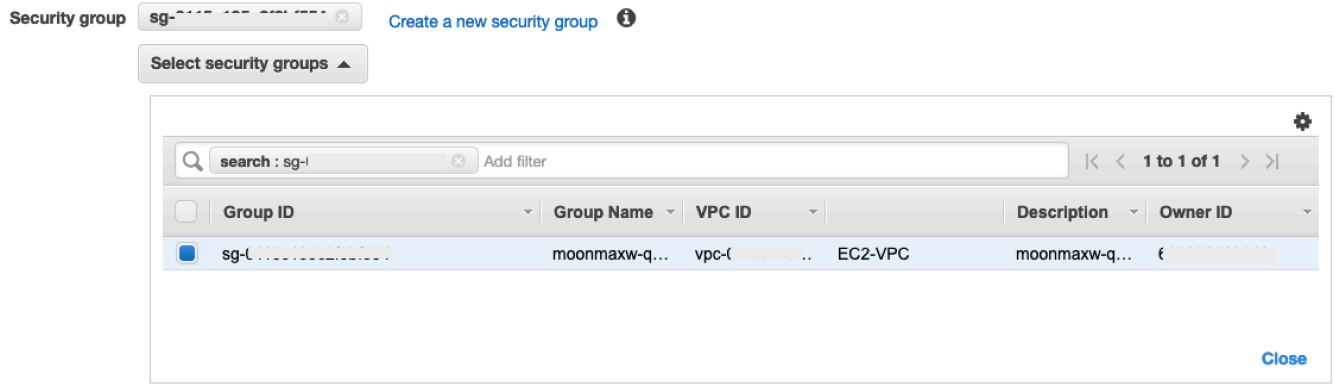
   If the connection is successful, a green alert saying **Service name found** appears on your screen and the **VPC** and **Subnet** options automatically expand, as shown in the following screenshot. Depending on your targeted Region, your resulting screen may show another AWS Region name.



6. Select the same VPC ID that you sent to Snowflake from the **VPC** dropdown list.
7. If you have not yet created a subnet, then perform the following set of instructions on creating a subnet.
8. Select **Subnets** from the **VPC** dropdown list. Then select **Create subnet** and follow the prompts to create a subset in your VPC. Ensure you select the VPC ID you sent Snowflake.
9. Under **Security Group Configuration**, select **Create New Security Group** to open the default **Security Group** screen in a new tab. In this new tab, select t**Create Security Group**.
10. Provide a name for the new security group (such as `datawrangler-doc-snowflake-privatelink-connection`) and a description. Be sure to select the VPC ID you have used in previous steps.
11. Add two rules to allow traffic from within your VPC to this VPC endpoint.

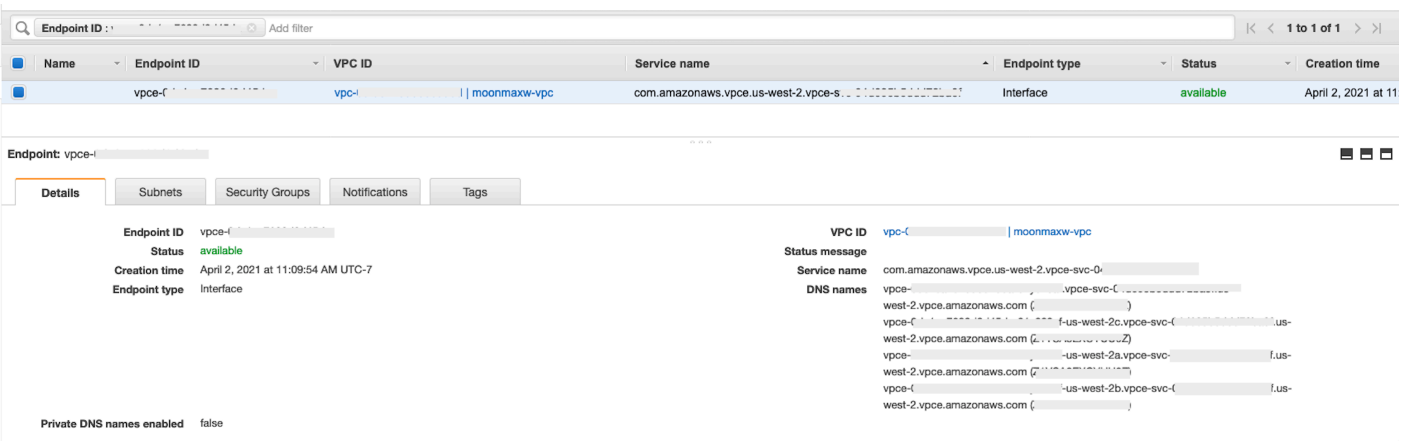
    Navigate to your VPC under **Your VPCs** in a separate tab, and retrieve your CIDR block for your VPC. Then choose **Add Rule** in the **Inbound Rules** section. Select HTTPS for the type, leave the **Source** as **Custom** in the form, and paste in the value retrieved from the preceding `describe-vpcs` call (such as `10.0.0.0/16`).
12. Choose **Create Security Group**. Retrieve the **Security Group ID** from the newly created security group (such as `sg-xxxxxxxxxxxxxxxxx`).

13In the **VPC Endpoint** configuration screen, remove the default security group. Paste in the security group ID in the search field and select the checkbox.



14Select **Create Endpoint**.

15If the endpoint creation is successful, you see a page that has a link to your VPC endpoint configuration, specified by the VPC ID. Select the link to view the configuration in full.



Retrieve the topmost record in the DNS names list. This can be differentiated from other DNS names because it only includes the Region name (such as `us-west-2`), and no Availability Zone letter notation (such as `us-west-2a`). Store this information for later use.

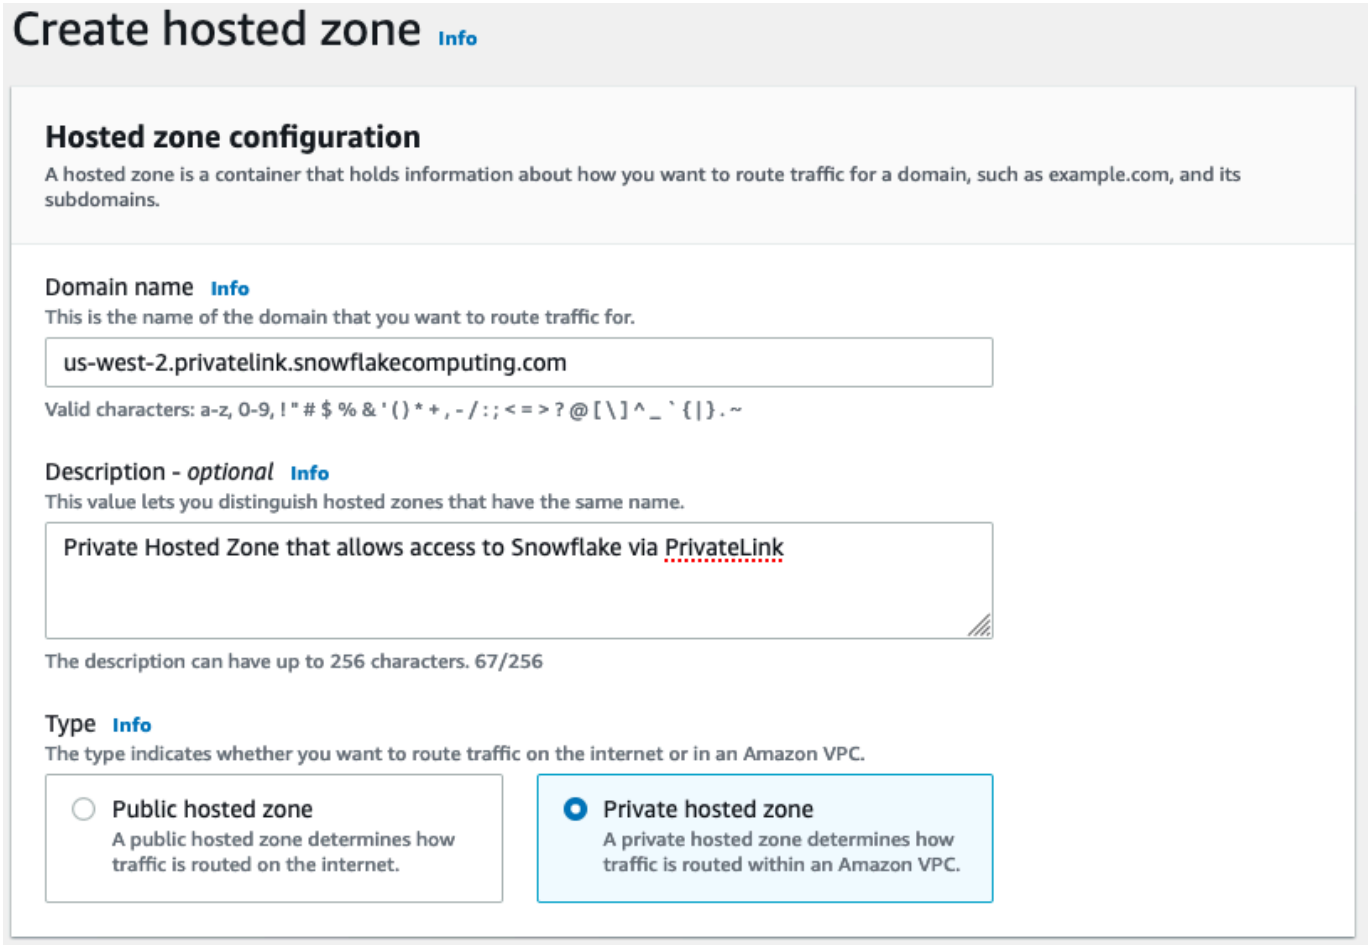
Configure DNS for Snowflake Endpoints in your VPC

This section explains how to configure DNS for Snowflake endpoints in your VPC. This allows your VPC to resolve requests to the Snowflake AWS PrivateLink endpoint.

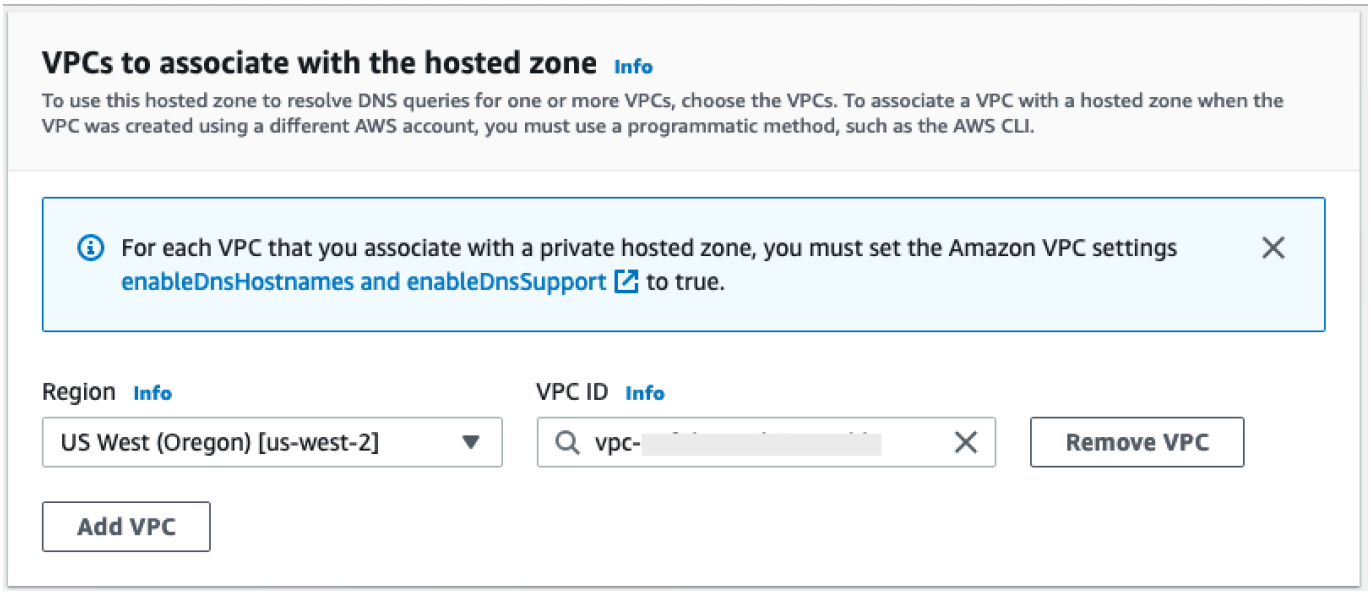
1. Navigate to the Route 53 menu within your AWS console.
2. Select the **Hosted Zones** option (if necessary, expand the left-hand menu to find this option).
3. Choose **Create Hosted Zone**.

a. In the **Domain name** field, reference the value that was stored for `privatelink-account-url` in the preceding steps. In this field, your Snowflake account ID is removed from the DNS name and only uses the value starting with the Region identifier. A **Resource Record Set** is also created later for the subdomain, such as, `region.privatelink.snowflakecomputing.com`.

b. Select the radio button for **Private Hosted Zone** in the **Type** section. Your Region code may not be `us-west-2`. Reference the DNS name returned to you by Snowflake.



c. In the **VPCs to associate with the hosted zone** section, select the Region in which your VPC is located and the VPC ID used in previous steps.



d. Choose **Create hosted zone**.

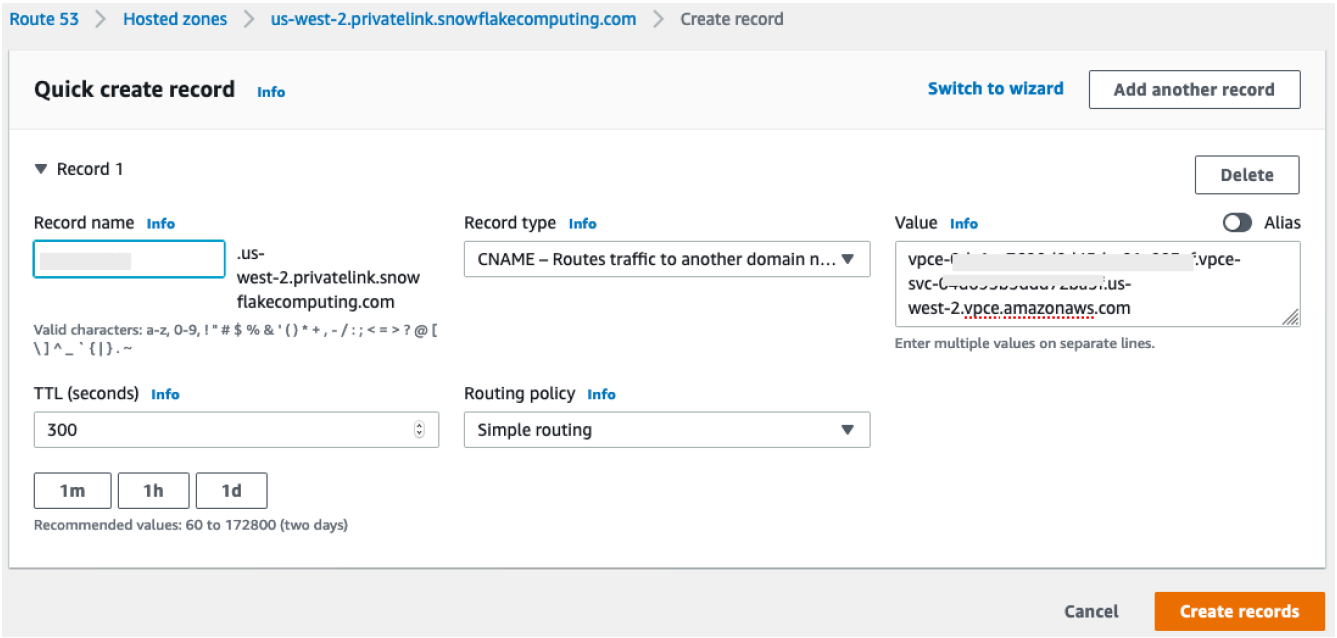
4. Next, create two records, one for `privatelink-account-url` and one for `privatelink_ocsp-url`.

   - In the **Hosted Zone** menu, choose **Create Record Set**.

     a. Under **Record name**, enter your Snowflake Account ID only (the first 8 characters in `privatelink-account-url`).

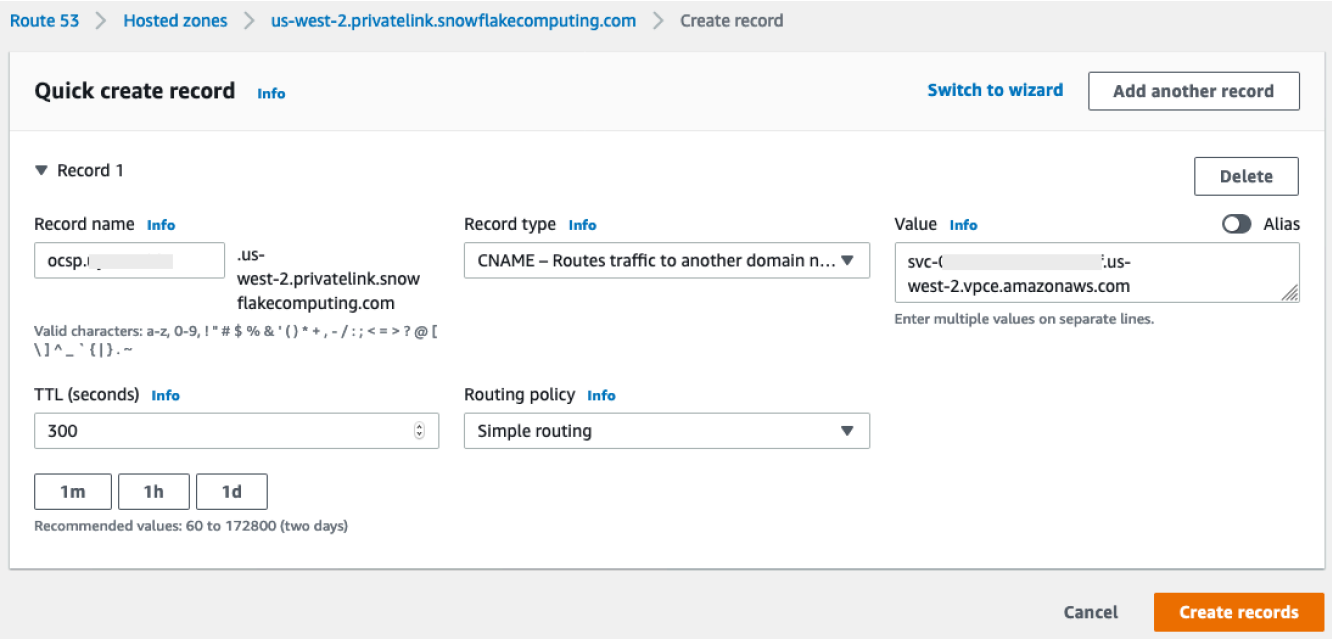
     b. Under **Record type**, select **CNAME**.

     c. Under **Value**, enter the DNS name for the regional VPC endpoint you retrieved in the last step of the *Set up the Snowflake AWS PrivateLink Integration* section.



d. Choose **Create records**.

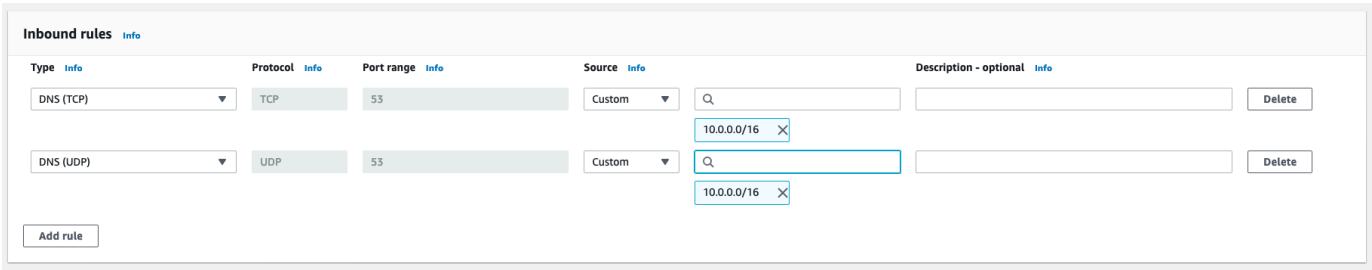
e. Repeat the preceding steps for the OCSP record we notated as `privatelink-ocsp-url`, starting with `ocsp` through the 8-character Snowflake ID for the record name (such as `ocsp.xxxxxxxx`).



Configure Route 53 Resolver Inbound Endpoint for your VPC

This section explains how to configure Route 53 resolvers inbound endpoints for your VPC.

1. Navigate to the Route 53 menu within your AWS console.
   - In the left hand panel in the **Security** section, select the **Security Groups** option.
2. Choose **Create Security Group**.
   - Provide a name for your security group (such as `datawranger-doc-route53-resolver-sg`) and a description.
   - Select the VPC ID used in previous steps.
   - Create rules that allow for DNS over UDP and TCP from within the VPC CIDR block.



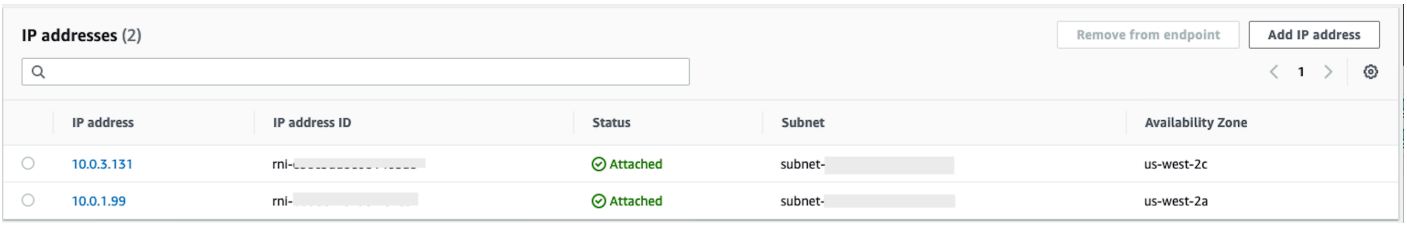
- Choose **Create Security Group**. Note the **Security Group ID** because adds a rule to allow traffic to the VPC endpoint security group.

3. Navigate to the Route 53 menu within your AWS console.
   - In the **Resolver** section, select the **Inbound Endpoint** option.
4. Choose **Create Inbound Endpoint**.
   - Provide an endpoint name.
   - From the **VPC in the Region** dropdown list, select the VPC ID you have used in all previous steps.
   - In the **Security group for this endpoint** dropdown list, select the security group ID from Step 2 in this section.

   - In the **IP Address** section, select an Availability Zones, select a subnet, and leave the radio selector for **Use an IP address that is selected automatically** selected for each IP address.

- Choose **Submit**.

5. Select the **Inbound endpoint** after it has been created.
6. Once the inbound endpoint is created, note the two IP addresses for the resolvers.



SageMaker VPC Endpoints

This section explains how to create VPC endpoints for the following: Amazon SageMaker Studio Classic, SageMaker Notebooks, the SageMaker API, SageMaker Runtime Runtime, and Amazon SageMaker Feature Store Runtime.

Create a security group that is applied to all endpoints.

1. Navigate to the EC2 menu in the AWS Console.
2. In the **Network & Security** section, select the **Security groups** option.
3. Choose **Create security group**.
4. Provide a security group name and description (such as `datawrangler-doc-sagemaker-vpce-sg`). A rule is added later to allow traffic over HTTPS from SageMaker to this group.

Creating the endpoints

1. Navigate to the VPC menu in the AWS console.
2. Select the **Endpoints** option.
3. Choose **Create Endpoint**.
4. Search for the service by entering its name in the **Search** field.
5. From the **VPC** dropdown list, select the VPC in which your Snowflake AWS PrivateLink connection exists.
6. In the **Subnets** section, select the subnets which have access to the Snowflake PrivateLink connection.
7. Leave the **Enable DNS Name** checkbox selected.
8. In the **Security Groups** section, select the security group you created in the preceding section.
9. Choose **Create Endpoint**.

Configure Studio Classic and Data Wrangler

This section explains how to configure Studio Classic and Data Wrangler.

1. Configure the security group.
   a. Navigate to the Amazon EC2 menu in the AWS Console.
   b. Select the **Security Groups** option in the **Network & Security** section.
   c. Choose **Create Security Group**.
   d. Provide a name and description for your security group (such as `datawrangler-doc-sagemaker-studio`).
   e. Create the following inbound rules.
      - The HTTPS connection to the security group you provisioned for the Snowflake PrivateLink connection you created in the *Set up the Snowflake PrivateLink Integration* step.
      - The HTTP connection to the security group you provisioned for the Snowflake PrivateLink connection you created in the *Set up the Snowflake PrivateLink Integration step*.
      - The UDP and TCP for DNS (port 53) to Route 53 Resolver Inbound Endpoint security group you create in step 2 of *Configure Route 53 Resolver Inbound Endpoint for your VPC*.
   f. Choose **Create Security Group** button in the lower right hand corner.
2. Configure Studio Classic.
   - Navigate to the SageMaker menu in the AWS console.
   - From the left hand console, Select the **SageMaker Studio Classic** option.
   - If you do not have any domains configured, the **Get Started** menu is present.
   - Select the **Standard Setup** option from the **Get Started** menu.
   - Under **Authentication method**, select **AWS Identity and Access Management (IAM)**.
   - From the **Permissions** menu, you can create a new role or use a pre-existing role, depending on your use case.
     - If you choose **Create a new role**, you are presented the option to provide an S3 bucket name, and a policy is generated for you.
     - If you already have a role created with permissions for the S3 buckets to which you require access, select the role from the dropdown list. This role should have the `AmazonSageMakerFullAccess` policy attached to it.
   - Select the **Network and Storage** dropdown list to configure the VPC, security, and subnets SageMaker uses.

- Under **VPC**, select the VPC in which your Snowflake PrivateLink connection exists.
- Under **Subnet(s)**, select the subnets which have access to the Snowflake PrivateLink connection.
- Under **Network Access for Studio Classic**, select **VPC Only**.
- Under **Security Group(s)**, select the security group you created in step 1.
- Choose **Submit**.

3. Edit the SageMaker security group.
   - Create the following inbound rules:
     - Port 2049 to the inbound and outbound NFS Security Groups created automatically by SageMaker in step 2 (the security group names contain the Studio Classic domain ID).
     - Access to all TCP ports to itself (required for SageMaker for VPC Only).
4. Edit the VPC Endpoint Security Groups:
   - Navigate to the Amazon EC2 menu in the AWS console.
   - Locate the security group you created in a preceding step.
   - Add an inbound rule allowing for HTTPS traffic from the security group created in step 1.
5. Create a user profile.
   - From the **SageMaker Studio Classic Control Panel** , choose **Add User**.
   - Provide a user name.
   - For the **Execution Role**, choose to create a new role or to use a pre-existing role.
     - If you choose **Create a new role**, you are presented the option to provide an Amazon S3 bucket name, and a policy is generated for you.
     - If you already have a role created with permissions to the Amazon S3 buckets to which you require access, select the role from the dropdown list. This role should have the `AmazonSageMakerFullAccess` policy attached to it.
   - Choose **Submit**.
6. Create a data flow (follow the data scientist guide outlined in a preceding section).
   - When adding a Snowflake connection, enter the value of `privatelink-account-name` (from the *Set up Snowflake PrivateLink Integration* step) into the **Snowflake account name (alphanumeric)** field, instead of the plain Snowflake account name. Everything else is left unchanged.

Provide information to the data scientist

Provide the data scientist with the information that they need to access Snowflake from Amazon SageMaker Data Wrangler.

> **Important**
>
> Your users need to run Amazon SageMaker Studio Classic version 1.3.0 or later. For information about checking the version of Studio Classic and updating it, see Prepare ML Data with Amazon SageMaker Data Wrangler.

1. To allow your data scientist to access Snowflake from SageMaker Data Wrangler, provide them with one of the following:

   - For Basic Authentication, a Snowflake account name, user name, and password.
   - For OAuth, a user name and password in the identity provider.
   - For ARN, the Secrets Manager secret Amazon Resource Name (ARN).
   - A secret created with AWS Secrets Manager and the ARN of the secret. Use the following procedure below to create the secret for Snowflake if you choose this option.

     > **Important**
     >
     > If your data scientists use the **Snowflake Credentials (User name and Password)** option to connect to Snowflake, you can use Secrets Manager to store the credentials in a secret. Secrets Manager rotates secrets as part of a best practice security plan. The secret created in Secrets Manager is only accessible with the Studio Classic role configured when you set up a Studio Classic user profile. This requires you to add this permission, `secretsmanager:PutResourcePolicy`, to the policy that is attached to your Studio Classic role.
     > We strongly recommend that you scope the role policy to use different roles for different groups of Studio Classic users. You can add additional resource-based permissions for the Secrets Manager secrets. See Manage Secret Policy for condition keys you can use.
     > For information about creating a secret, see Create a secret. You're charged for the secrets that you create.

2. (Optional) Provide the data scientist with the name of the storage integration that you created using the following procedure Create a Cloud Storage Integration in Snowflake. This is the name of the new integration and is called `integration_name` in the `CREATE INTEGRATION` SQL command you ran, which is shown in the following snippet:

```
CREATE STORAGE INTEGRATION integration_name
TYPE = EXTERNAL_STAGE
STORAGE_PROVIDER = S3
ENABLED = TRUE
STORAGE_AWS_ROLE_ARN = 'iam_role'
[ STORAGE_AWS_OBJECT_ACL = 'bucket-owner-full-control' ]
STORAGE_ALLOWED_LOCATIONS = ('s3://bucket/path/', 's3://bucket/path/')
[ STORAGE_BLOCKED_LOCATIONS = ('s3://bucket/path/', 's3://bucket/path/') ]
```

Data Scientist Guide

Use the following to connect Snowflake and access your data in Data Wrangler.

> **Important**
>
> Your administrator needs to use the information in the preceding sections to set up Snowflake. If you're running into issues, contact them for troubleshooting help.

You can connect to Snowflake in one of the following ways:

- Specifying your Snowflake credentials (account name, user name, and password) in Data Wrangler.
- Providing an Amazon Resource Name (ARN) of a secret containing the credentials.
- Using an open standard for access delegation (OAuth) provider that connects to Snowflake. Your administrator can give you access to one of the following OAuth providers:
  - Azure AD
  - Okta
  - Ping Federate

Talk to your administrator about the method that you need to use to connect to Snowflake.

The following sections have information about how you can connect to Snowflake using the preceding methods.

Specifying your Snowflake Credentials

To import a dataset into Data Wrangler from Snowflake using your credentials

1. Sign into Amazon SageMaker Console.
2. Choose **Studio**.
3. Choose **Launch app**.
4. From the dropdown list, select **Studio**.
5. Choose the Home icon.
6. Choose **Data**.
7. Choose **Data Wrangler**.
8. Choose **Import data**.
9. Under **Available**, choose **Snowflake**.
10. For **Connection name**, specify a name that uniquely identifies the connection.
11. For **Authentication method**, choose **Basic Username-Password**.
12. For **Snowflake account name (alphanumeric)**, specify the full name of the Snowflake account.
13. For **Username**, specify the username that you use to access the Snowflake account.
14. For **Password**, specify the password associated with the username.
15. (Optional) For **Advanced settings**. specify the following:
    - **Role** – A role within Snowflake. Some roles have access to different datasets. If you don't specify a role, Data Wrangler uses the default role in your Snowflake account.
    - **Storage integration** – When you specify and run a query, Data Wrangler creates a temporary copy of the query results in memory. To store a permanent copy of the query results, specify the Amazon S3 location for the storage integration. Your administrator provided you with the S3 URI.
    - **KMS key ID** – A KMS key that you've created. You can specify its ARN to encrypt the output of the Snowflake query. Otherwise, Data Wrangler uses the default encryption.
16. Choose **Connect**.

Providing an Amazon Resource Name (ARN)

To import a dataset into Data Wrangler from Snowflake using an ARN

1. Sign into Amazon SageMaker Console.
2. Choose **Studio**.
3. Choose **Launch app**.
4. From the dropdown list, select **Studio**.
5. Choose the Home icon.
6. Choose **Data**.
7. Choose **Data Wrangler**.
8. Choose **Import data**.
9. Under **Available**, choose **Snowflake**.
10. For **Connection name**, specify a name that uniquely identifies the connection.
11. For **Authentication method**, choose **ARN**.
12. **Secrets Manager ARN** – The ARN of the AWS Secrets Manager secret used to store the credentials used to connect to Snowflake.
13. (Optional) For **Advanced settings**. specify the following:
    - **Role** – A role within Snowflake. Some roles have access to different datasets. If you don't specify a role, Data Wrangler uses the default role in your Snowflake account.
    - **Storage integration** – When you specify and run a query, Data Wrangler creates a temporary copy of the query results in memory. To store a permanent copy of the query results, specify the Amazon S3 location for the storage integration. Your administrator provided you with the S3 URI.
    - **KMS key ID** – A KMS key that you've created. You can specify its ARN to encrypt the output of the Snowflake query. Otherwise, Data Wrangler uses the default encryption.
14. Choose **Connect**.

Using an OAuth Connection

> **Important**
>
> Your administrator customized your Studio Classic environment to provide the functionality you're using to use an OAuth connection. You might need to restart the Jupyter server application to use the functionality.
> Use the following procedure to update the Jupyter server application.
>
> 1. Within Studio Classic, choose **File**
> 2. Choose **Shut down**.
> 3. Choose **Shut down server**.
> 4. Close the tab or window that you're using to access Studio Classic.
> 5. From the Amazon SageMaker console, open Studio Classic.

To import a dataset into Data Wrangler from Snowflake using your credentials

1. Sign into Amazon SageMaker Console.
2. Choose **Studio**.
3. Choose **Launch app**.
4. From the dropdown list, select **Studio**.
5. Choose the Home icon.
6. Choose **Data**.
7. Choose **Data Wrangler**.
8. Choose **Import data**.
9. Under **Available**, choose **Snowflake**.
10. For **Connection name**, specify a name that uniquely identifies the connection.
11. For **Authentication method**, choose **OAuth**.
12. (Optional) For **Advanced settings**. specify the following:

    - **Role** – A role within Snowflake. Some roles have access to different datasets. If you don't specify a role, Data Wrangler uses the default role in your Snowflake account.
    - **Storage integration** – When you specify and run a query, Data Wrangler creates a temporary copy of the query results in memory. To store a permanent copy of the query

results, specify the Amazon S3 location for the storage integration. Your administrator provided you with the S3 URI.

- **KMS key ID** – A KMS key that you've created. You can specify its ARN to encrypt the output of the Snowflake query. Otherwise, Data Wrangler uses the default encryption.

13. Choose **Connect**.

You can begin the process of importing your data from Snowflake after you've connected to it.

Within Data Wrangler, you can view your data warehouses, databases, and schemas, along with the eye icon with which you can preview your table. After you select the **Preview Table** icon, the schema preview of that table is generated. You must select a warehouse before you can preview a table.

> **Important**
>
> If you're importing a dataset with columns of type `TIMESTAMP_TZ` or `TIMESTAMP_LTZ`, add `::string` to the column names of your query. For more information, see How To: Unload TIMESTAMP_TZ and TIMESTAMP_LTZ data to a Parquet file.

After you select a data warehouse, database and schema, you can now write queries and run them. The output of your query shows under **Query results**.

After you have settled on the output of your query, you can then import the output of your query into a Data Wrangler flow to perform data transformations.

After you've imported your data, navigate to your Data Wrangler flow and start adding transformations to it. For a list of available transforms, see Transform Data.

Import Data From Software as a Service (SaaS) Platforms

You can use Data Wrangler to import data from more than forty software as a service (SaaS) platforms. To import your data from your SaaS platform, you or your administrator must use Amazon AppFlow to transfer the data from the platform to Amazon S3 or Amazon Redshift. For more information about Amazon AppFlow, see What is Amazon AppFlow? If you don't need to use Amazon Redshift, we recommend transferring the data to Amazon S3 for a simpler process.

Data Wrangler supports transferring data from the following SaaS platforms:

- Amplitude
- Asana
- Braintree
- CircleCI
- DocuSign Monitor
- Delighted
- Domo
- Datadog
- Dynatrace
- Facebook Ads
- Facebook Page Insights
- Google Ads
- Google Analytics 4
- Google Calendar
- Google Search Console
- GitHub
- GitLab
- Infor Nexus
- Instagram Ads
- Intercom
- JDBC (Sync)
- Jira Cloud
- LinkedIn Ads
- Mailchimp
- Marketo
- Microsoft Dynamics 365
- Microsoft Teams
- Mixpanel
- Okta
- Oracle HCM

- Paypal Checkout
- Pendo
- Salesforce
- Salesforce Marketing Cloud
- Salesforce Pardot
- SAP OData
- SendGrid
- ServiceNow
- Singular
- Slack
- Smartsheet
- Snapchat Ads
- Stripe
- Trend Micro
- Typeform
- Veeva
- WooCommerce
- Zendesk
- Zendesk Chat
- Zendesk Sell
- Zendesk Sunshine
- Zoho CRM
- Zoom Meetings

The preceding list has links to more information about setting up your data source. You or your administrator can refer to the preceding links after you've read the following information.

When you navigate to the **Import** tab of your Data Wrangler flow, you see data sources under the following sections:

- **Available**
- **Set up data sources**

You can connect to data sources under **Available** without needing additional configuration. You can choose the data source and import your data.

Data sources under **Set up data sources**, require you or your administrator to use Amazon AppFlow to transfer the data from the SaaS platform to Amazon S3 or Amazon Redshift. For information about performing a transfer, see Using Amazon AppFlow to transfer your data.

After you perform the data transfer, the SaaS platform appears as a data source under **Available**. You can choose it and import the data that you've transferred into Data Wrangler. The data that you've transferred appears as tables that you can query.

Using Amazon AppFlow to transfer your data

Amazon AppFlow is a platform that you can use to transfer data from your SaaS platform to Amazon S3 or Amazon Redshift without having to write any code. To perform a data transfer, you use the AWS Management Console.

> **Important**
>
> You must make sure you've set up the permissions to perform a data transfer. For more information, see Amazon AppFlow Permissions.

After you've added permissions, you can transfer the data. Within Amazon AppFlow, you create a *flow* to transfer the data. A flow is a series of configurations. You can use it to specify whether you're running the data transfer on a schedule or whether you're partitioning the data into separate files. After you've configured the flow, you run it to transfer the data.

For information about creating a flow, see Creating flows in Amazon AppFlow. For information about running a flow, see Activate an Amazon AppFlow flow.

After the data has been transferred, use the following procedure to access the data in Data Wrangler.

> **Important**
>
> Before you try to access your data, make sure your IAM role has the following policy:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "glue:SearchTables",
            "Resource": [
                "arn:aws:glue:*:*:table/*/*",
                "arn:aws:glue:*:*:database/*",
                "arn:aws:glue:*:*:catalog"
            ]
        }
    ]
}
```

By default, the IAM role that you use to access Data Wrangler is the `SageMakerExecutionRole`. For more information about adding policies, see Adding IAM identity permissions (console).

To connect to a data source, do the following.

1. Sign into Amazon SageMaker Console.
2. Choose **Studio**.
3. Choose **Launch app**.
4. From the dropdown list, select **Studio**.
5. Choose the Home icon.
6. Choose **Data**.
7. Choose **Data Wrangler**.
8. Choose **Import data**.
9. Under **Available**, choose the data source.
10. For the **Name** field, specify the name of the connection.
11. (Optional) Choose **Advanced configuration**.
    a. Choose a **Workgroup**.
    b. If your workgroup hasn't enforced the Amazon S3 output location or if you don't use a workgroup, specify a value for **Amazon S3 location of query results**.

c. (Optional) For **Data retention period**, select the checkbox to set a data retention period and specify the number of days to store the data before it's deleted.

d. (Optional) By default, Data Wrangler saves the connection. You can choose to deselect the checkbox and not save the connection.

12. Choose **Connect**.
13. Specify a query.

> **Note**
>
> To help you specify a query, you can choose a table on the left-hand navigation panel. Data Wrangler shows the table name and a preview of the table. Choose the icon next to the table name to copy the name. You can use the table name in the query.

14. Choose **Run**.
15. Choose **Import query**.
16. For **Dataset name**, specify the name of the dataset.
17. Choose **Add**.

When you navigate to the **Import data** screen, you can see the connection that you've created. You can use the connection to import more data.

Imported Data Storage

> **Important**
>
> We strongly recommend that you follow the best practices around protecting your Amazon S3 bucket by following Security best practices.

When you query data from Amazon Athena or Amazon Redshift, the queried dataset is automatically stored in Amazon S3. Data is stored in the default SageMaker S3 bucket for the AWS Region in which you are using Studio Classic.

Default S3 buckets have the following naming convention: `sagemaker-`*`region`*`-`*`account number`*. For example, if your account number is 111122223333 and you are using Studio Classic in `us-east-1`, your imported datasets are stored in `sagemaker-us-east-1-111122223333`.

Data Wrangler flows depend on this Amazon S3 dataset location, so you should not modify this dataset in Amazon S3 while you are using a dependent flow. If you do modify this S3 location, and you want to continue using your data flow, you must remove all objects in `trained_parameters` in your .flow file. To do this, download the .flow file from Studio Classic and for each instance of `trained_parameters`, delete all entries. When you are done, `trained_parameters` should be an empty JSON object:

```
"trained_parameters": {}
```

When you export and use your data flow to process your data, the .flow file you export refers to this dataset in Amazon S3. Use the following sections to learn more.

Amazon Redshift Import Storage

Data Wrangler stores the datasets that result from your query in a Parquet file in your default SageMaker S3 bucket.

This file is stored under the following prefix (directory): redshift/*uuid*/data/, where *uuid* is a unique identifier that gets created for each query.

For example, if your default bucket is `sagemaker-us-east-1-111122223333`, a single dataset queried from Amazon Redshift is located in s3://sagemaker-us-east-1-111122223333/redshift/*uuid*/data/.

Amazon Athena Import Storage

When you query an Athena database and import a dataset, Data Wrangler stores the dataset, as well as a subset of that dataset, or *preview files*, in Amazon S3.

The dataset you import by selecting **Import dataset** is stored in Parquet format in Amazon S3.

Preview files are written in CSV format when you select **Run** on the Athena import screen, and contain up to 100 rows from your queried dataset.

The dataset you query is located under the prefix (directory): athena/*uuid*/data/, where *uuid* is a unique identifier that gets created for each query.

For example, if your default bucket is `sagemaker-us-east-1-111122223333`, a single dataset queried from Athena is located in `s3://sagemaker-us-east-1-111122223333/athena/`*uuid*/data/*example_dataset.parquet*.

The subset of the dataset that is stored to preview dataframes in Data Wrangler is stored under the prefix: athena/.

Create and Use a Data Wrangler Flow

Use an Amazon SageMaker Data Wrangler flow, or a *data flow*, to create and modify a data preparation pipeline. The data flow connects the datasets, transformations, and analyses, or *steps*, you create and can be used to define your pipeline.

Instances

When you create a Data Wrangler flow in Amazon SageMaker Studio Classic, Data Wrangler uses an Amazon EC2 instance to run the analyses and transformations in your flow. By default, Data Wrangler uses the m5.4xlarge instance. m5 instances are general purpose instances that provide a balance between compute and memory. You can use m5 instances for a variety of compute workloads.

Data Wrangler also gives you the option of using r5 instances. r5 instances are designed to deliver fast performance that processes large datasets in memory.

We recommend that you choose an instance that is best optimized around your workloads. For example, the r5.8xlarge might have a higher price than the m5.4xlarge, but the r5.8xlarge might be better optimized for your workloads. With better optimized instances, you can run your data flows in less time at lower cost.

The following table shows the instances that you can use to run your Data Wrangler flow.

Standard Instances	vCPU	Memory
ml.m5.4xlarge	16	64 GiB
ml.m5.8xlarge	32	128 GiB
ml.m5.16xlarge	64	256 GiB
ml.m5.24xlarge	96	384 GiB
r5.4xlarge	16	128 GiB
r5.8xlarge	32	256 GiB

Standard Instances	vCPU	Memory
r5.24xlarge	96	768 GiB

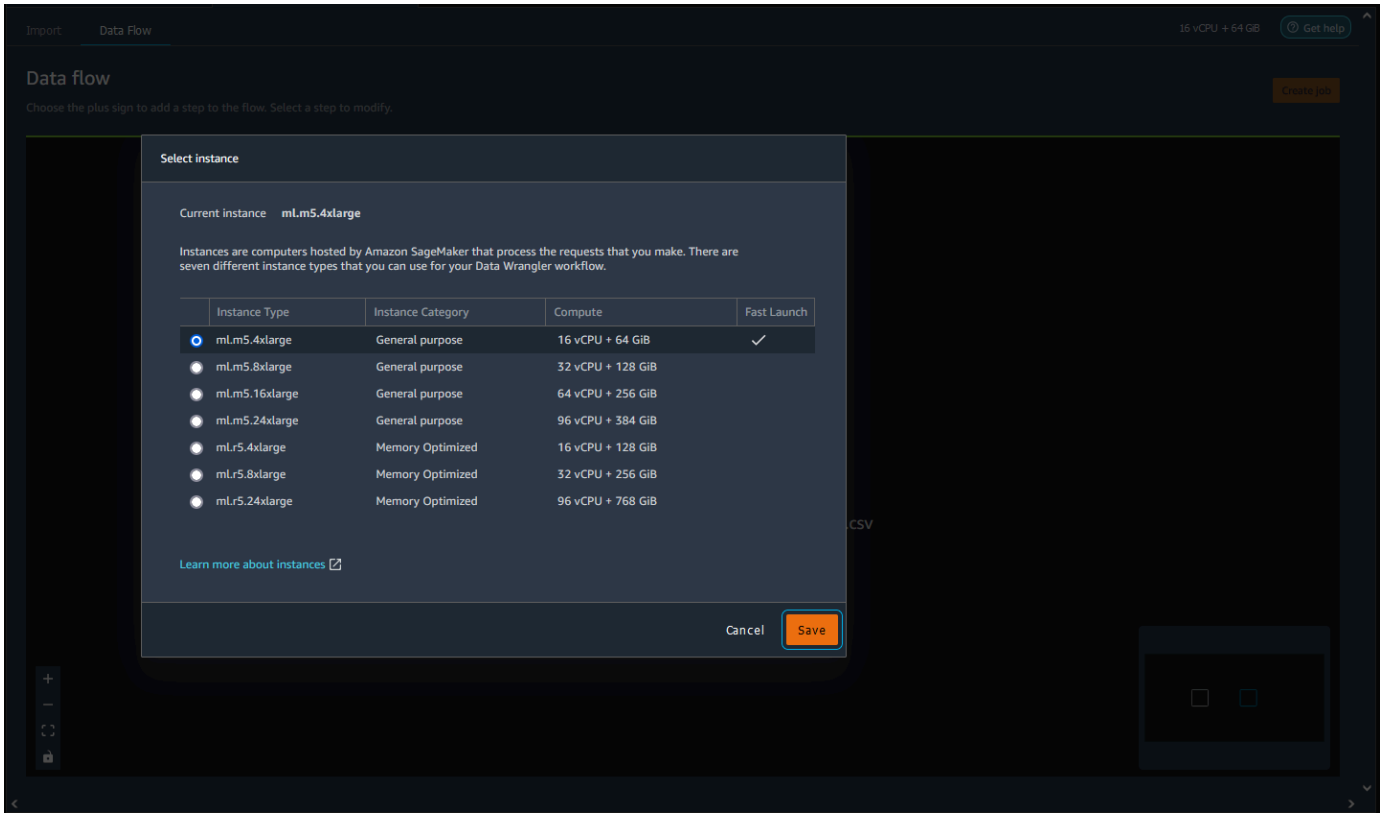
For more information about r5 instances, see Amazon EC2 R5 Instances. For more information about m5 instances, see Amazon EC2 M5 Instances.

Each Data Wrangler flow has an Amazon EC2 instance associated with it. You might have multiple flows that are associated with a single instance.

For each flow file, you can seamlessly switch the instance type. If you switch the instance type, the instance that you used to run the flow continues to run.

To switch the instance type of your flow, do the following.

1. Choose the home icon,
   
   .
2. Navigate to the instance that you're using and choose it.
3. Choose the instance type that you want to use.

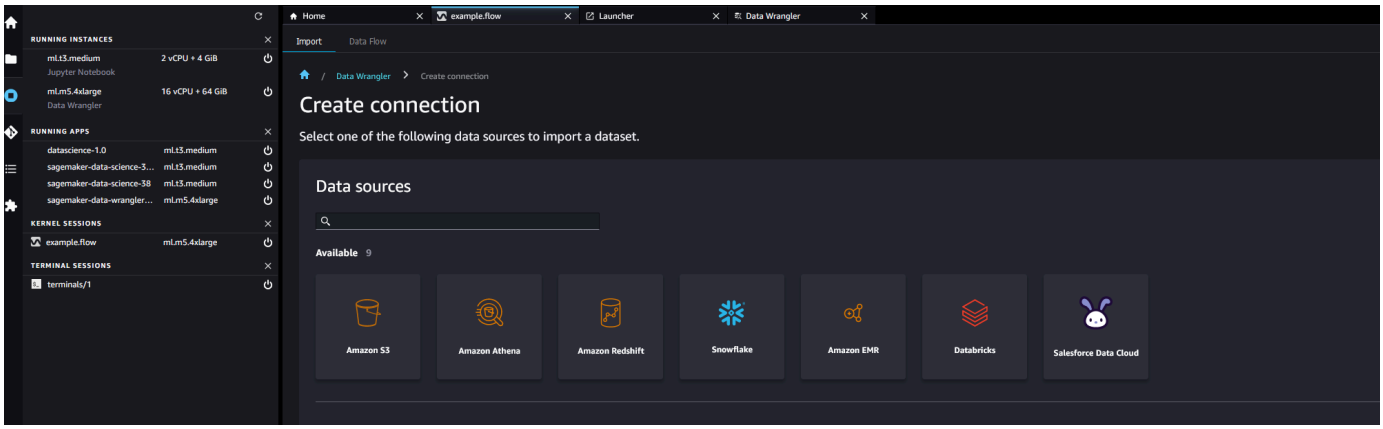


4. Choose **Save**.

You are charged for all running instances. To avoid incurring additional charges, shut down the instances that you aren't using manually. To shut down an instance that is running, use the following procedure.

To shut down a running instance.

1. Choose the instance icon. The following image shows you where to select the **RUNNING INSTANCES** icon.



2. Choose **Shut down** next to the instance that you want to shut down.

If you shut down an instance used to run a flow, you temporarily can't access the flow. If you get an error while attempting to open the flow running an instance you previously shut down, wait for 5 minutes and try opening it again.

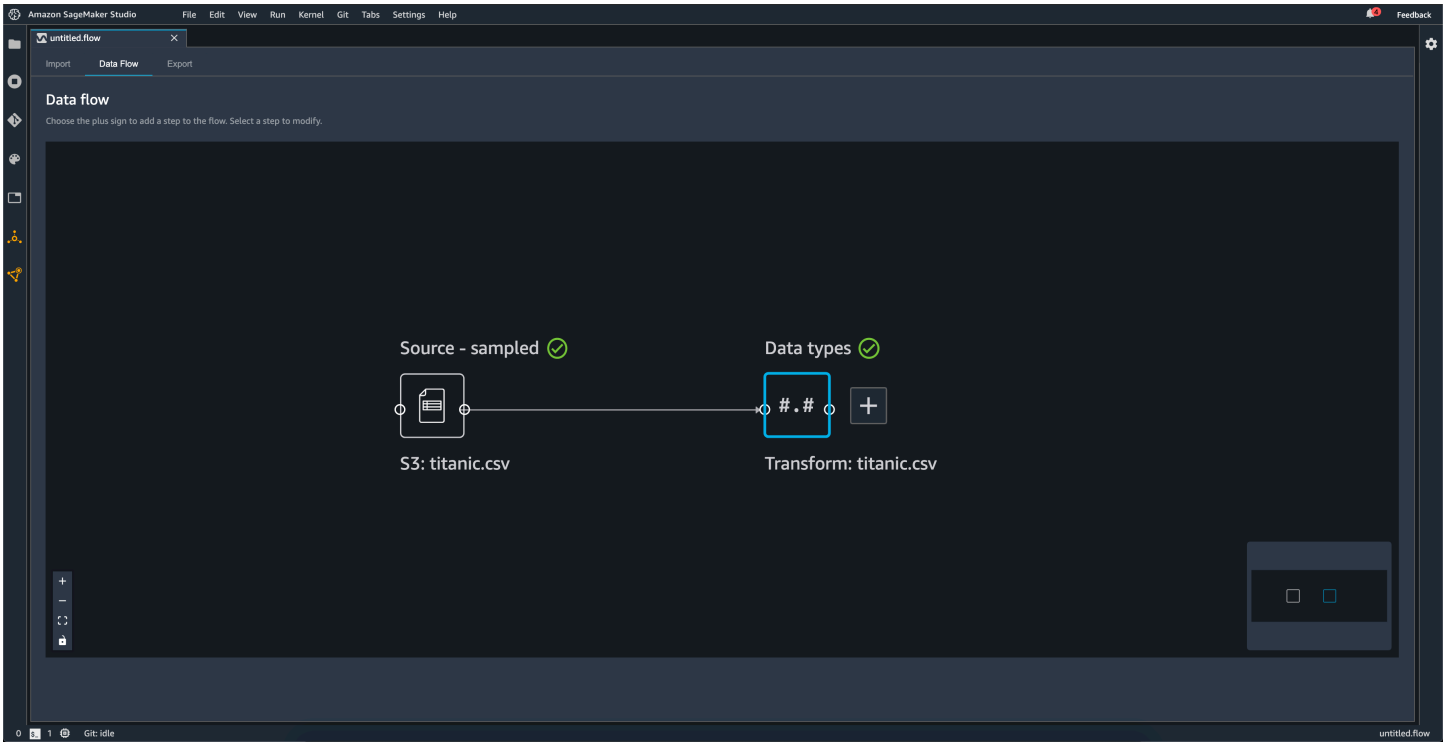
When you export your data flow to a location such as Amazon Simple Storage Service or Amazon SageMaker Feature Store, Data Wrangler runs an Amazon SageMaker processing job. You can use one of the following instances for the processing job. For more information on exporting your data, see Export.

Standard Instances	vCPU	Memory
ml.m5.4xlarge	16	64 GiB
ml.m5.12xlarge	48	192 GiB
ml.m5.24xlarge	96	384 GiB

For more information about the cost per hour for using the available instance types, see SageMaker Pricing.

The Data Flow UI

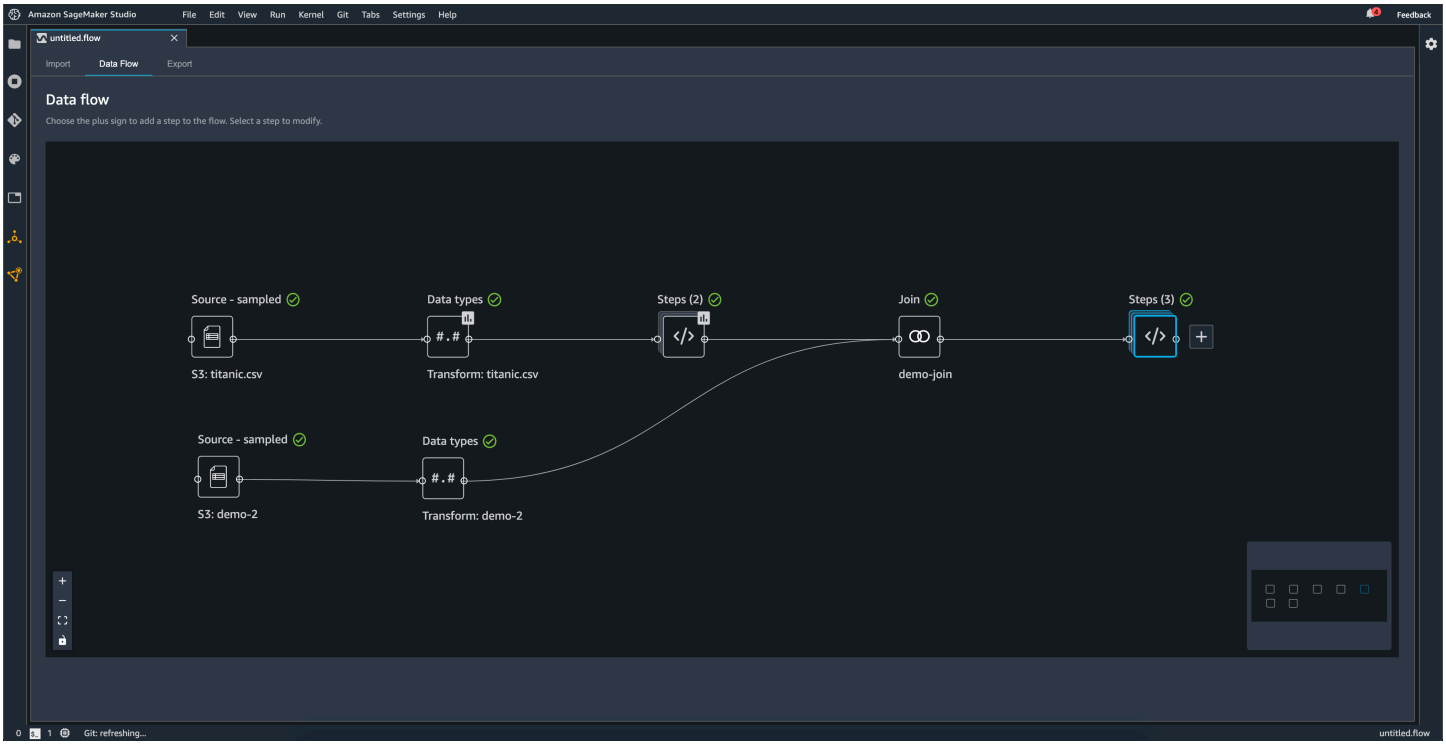
When you import a dataset, the original dataset appears on the data flow and is named **Source**. If you turned on sampling when you imported your data, this dataset is named **Source - sampled**. Data Wrangler automatically infers the types of each column in your dataset and creates a new dataframe named **Data types**. You can select this frame to update the inferred data types. You see results similar to those shown in the following image after you upload a single dataset:



Each time you add a transform step, you create a new dataframe. When multiple transform steps (other than **Join** or **Concatenate**) are added to the same dataset, they are stacked.

Join and **Concatenate** create standalone steps that contain the new joined or concatenated dataset.

The following diagram shows a data flow with a join between two datasets, as well as two stacks of steps. The first stack (**Steps (2)**) adds two transforms to the type inferred in the **Data types** dataset. The *downstream* stack, or the stack to the right, adds transforms to the dataset resulting from a join named **demo-join**.



The small, gray box in the bottom right corner of the data flow provides an overview of number of stacks and steps in the flow and the layout of the flow. The lighter box inside the gray box indicates the steps that are within the UI view. You can use this box to see sections of your data flow that fall outside of the UI view. Use the fit screen icon (⛶) to fit all steps and datasets into your UI view.

The bottom left navigation bar includes icons that you can use to zoom in (+) and out (—) of your data flow and resize the data flow to fit the screen (⛶). Use the lock icon (🔒) to lock and unlock the location of each step on the screen.

Add a Step to Your Data Flow

Select **+** next to any dataset or previously added step and then select one of the following options:

- **Edit data types** (For a **Data types** step only): If you have not added any transforms to a **Data types** step, you can select **Edit data types** to update the data types Data Wrangler inferred when importing your dataset.
- **Add transform**: Adds a new transform step. See Transform Data to learn more about the data transformations you can add.
- **Add analysis**: Adds an analysis. You can use this option to analyze your data at any point in the data flow. When you add one or more analyses to a step, an analysis icon () appears on that step. See Analyze and Visualize to learn more about the analyses you can add.
- **Join**: Joins two datasets and adds the resulting dataset to the data flow. To learn more, see Join Datasets.
- **Concatenate**: Concatenates two datasets and adds the resulting dataset to the data flow. To learn more, see Concatenate Datasets.

Delete a Step from Your Data Flow

To delete a step, select the step and select **Delete**. If the node is a node that has a single input, you delete only the step that you select. Deleting a step that has a single input doesn't delete the steps that follow it. If you're deleting a step for a source, join, or concatenate node, all the steps that follow it are also deleted.

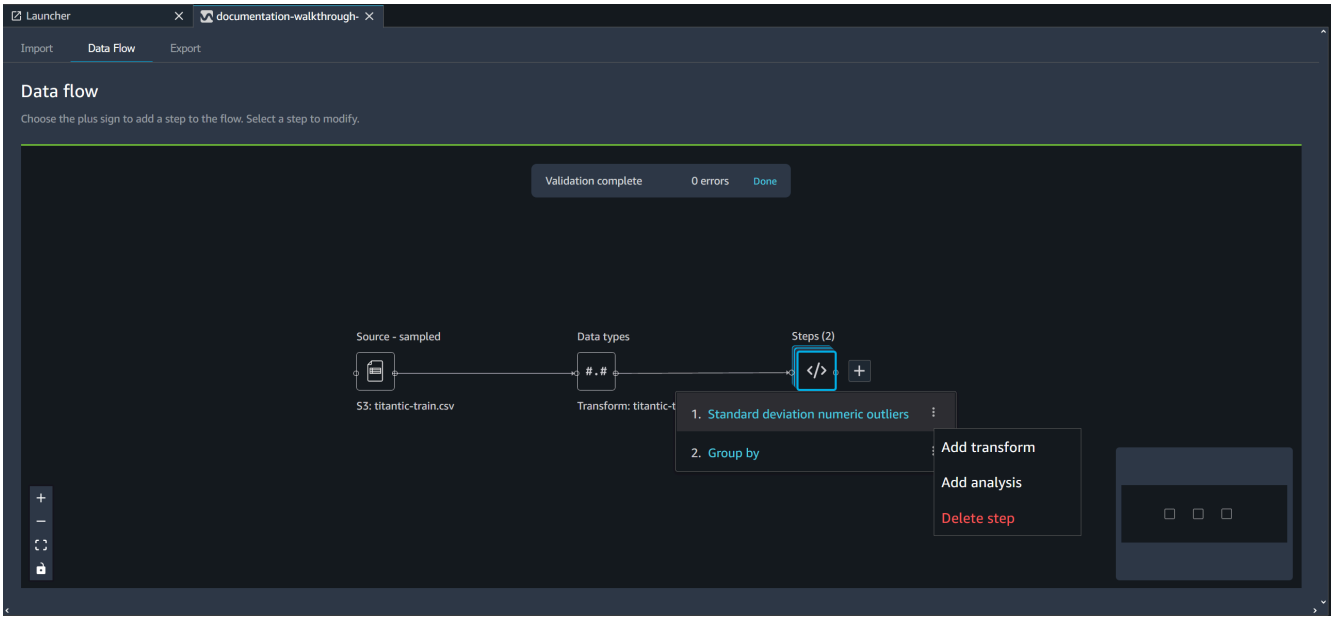
To delete a step from a stack of steps, select the stack and then select the step you want to delete.

You can use one of the following procedures to delete a step without deleting the downstream steps.

Delete a step in the Data Wrangler flow

> You can delete an individual step for nodes in your data flow that have a single input. You can't delete individual steps for source, join, and concatenate nodes.
>
> Use the following procedure to delete a step in the Data Wrangler flow.

1. Choose the group of steps that has the step that you're deleting.
2. Choose the icon next to the step.
3. Choose **Delete step**.

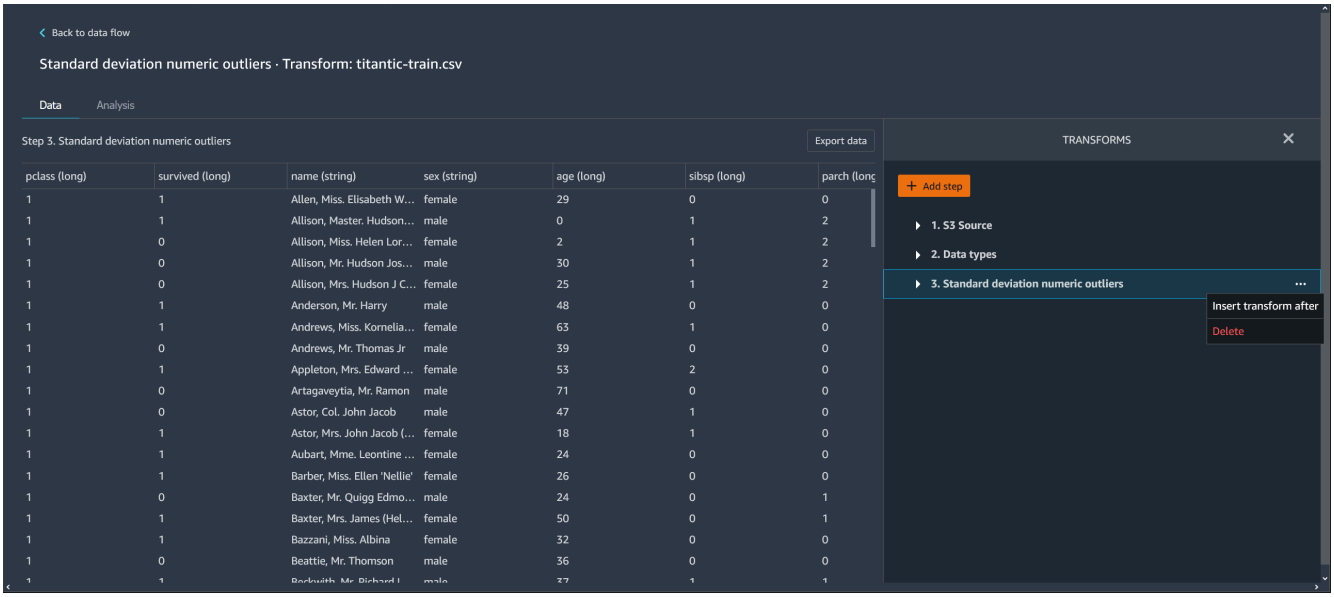


Delete a step in the table view

Use the following procedure to delete a step in the table view.

You can delete an individual step for nodes in your data flow that have a single input. You can't delete individual steps for source, join, and concatenate nodes.

1. Choose the step and open the table view for the step.
2. Move your cursor over the step so the ellipsis icon appears.
3. Choose the icon next to the step.
4. Choose **Delete**.



Edit a Step in Your Data Wrangler Flow

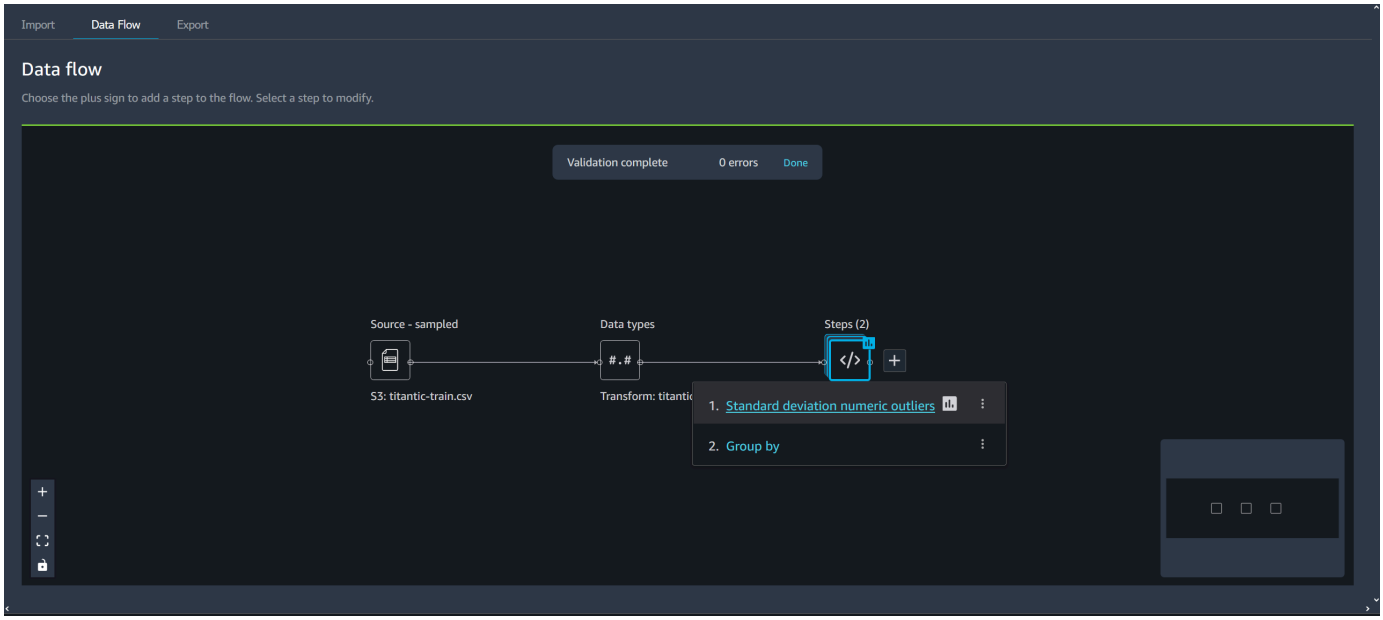
You can edit each step that you've added in your Data Wrangler flow. By editing steps, you can change the transformations or the data types of the columns. You can edit the steps to make changes with which you can perform better analyses.

There are many ways that you can edit a step. Some examples include changing the imputation method or changing the threshold for considering a value to be an outlier.

Use the following procedure to edit a step.

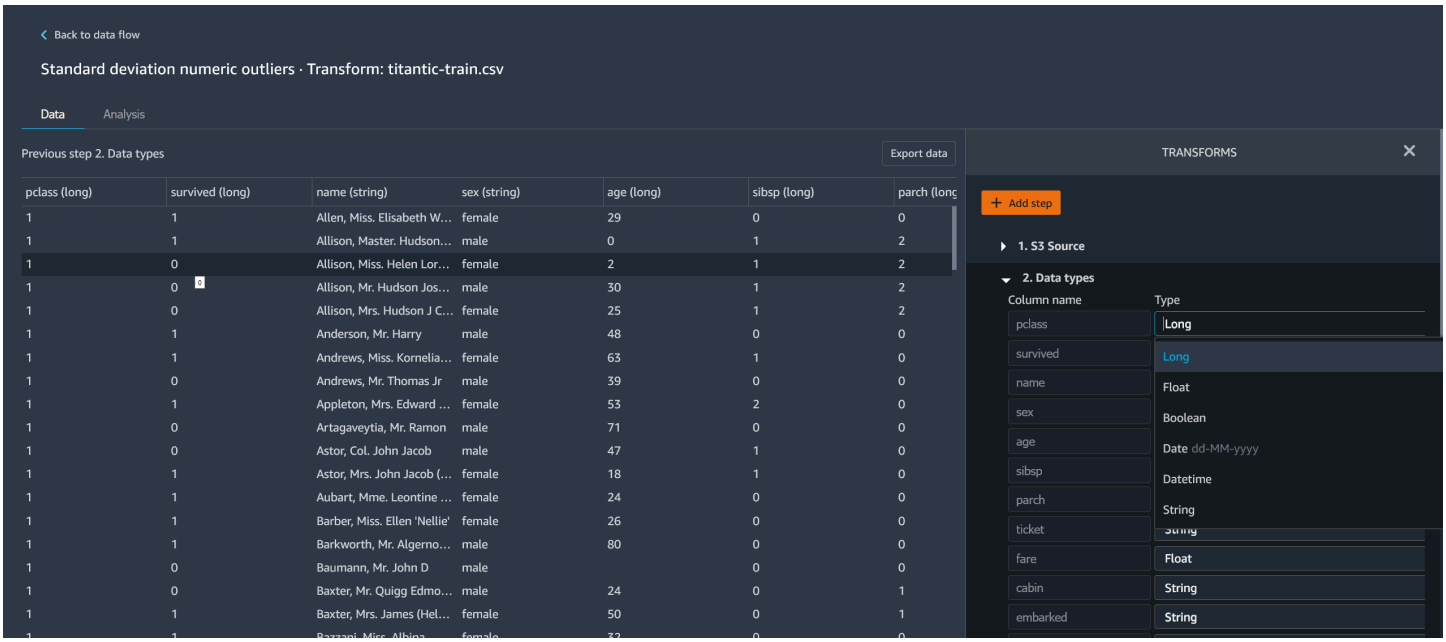
To edit a step, do the following.

1. Choose a step in the Data Wrangler flow to open the table view.



2. Choose a step in the data flow.
3. Edit the step.

The following image shows an example of editing a step.



> **Note**
>
> You can use the shared spaces within your Amazon SageMaker domain to work collaboratively on your Data Wrangler flows. Within a shared space, you and your

collaborators can edit a flow file in real-time. However, neither you nor your collaborators can see the changes in real-time. When anyone makes a change to the Data Wrangler flow, they must save it immediately. When someone saves a file, a collaborator won't be able to see it unless the close the file and reopen it. Any changes that aren't saved by one person are overwritten by the person who saved their changes.

Get Insights On Data and Data Quality

Use the **Data Quality and Insights Report** to perform an analysis of the data that you've imported into Data Wrangler. We recommend that you create the report after you import your dataset. You can use the report to help you clean and process your data. It gives you information such as the number of missing values and the number of outliers. If you have issues with your data, such as target leakage or imbalance, the insights report can bring those issues to your attention.

Use the following procedure to create a Data Quality and Insights report. It assumes that you've already imported a dataset into your Data Wrangler flow.

To create a Data Quality and Insights report

1. Choose a **+** next to a node in your Data Wrangler flow.
2. Select **Get data insights**.
3. For **Analysis name**, specify a name for the insights report.
4. (Optional) For **Target column**, specify the target column.
5. For **Problem type**, specify **Regression** or **Classification**.
6. For **Data size**, specify one of the following:

   - **50 K** – Uses the first 50000 rows of the dataset that you've imported to create the report.
   - **Entire dataset** – Uses the entire dataset that you've imported to create the report.

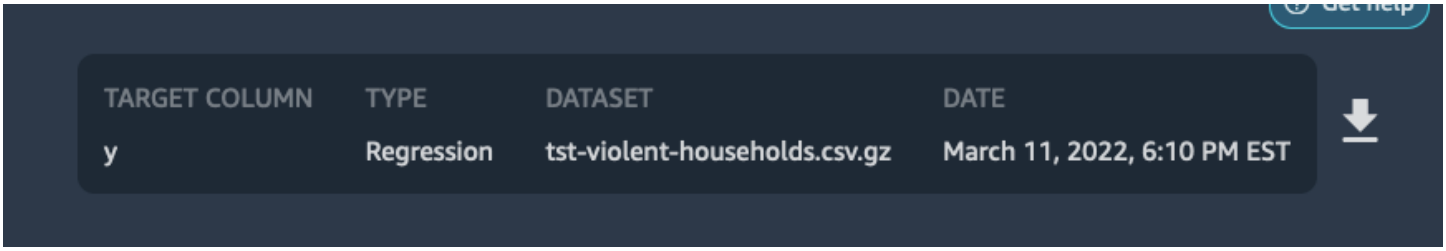
> **Note**
>
> Creating a Data Quality and Insights report on the entire dataset uses an Amazon SageMaker processing job. A SageMaker processing job provisions the additional compute resources required to get insights for all of your data. For more information about SageMaker processing jobs, see Process data.

7. Choose **Create**.

The following topics show the sections of the report:

Topics

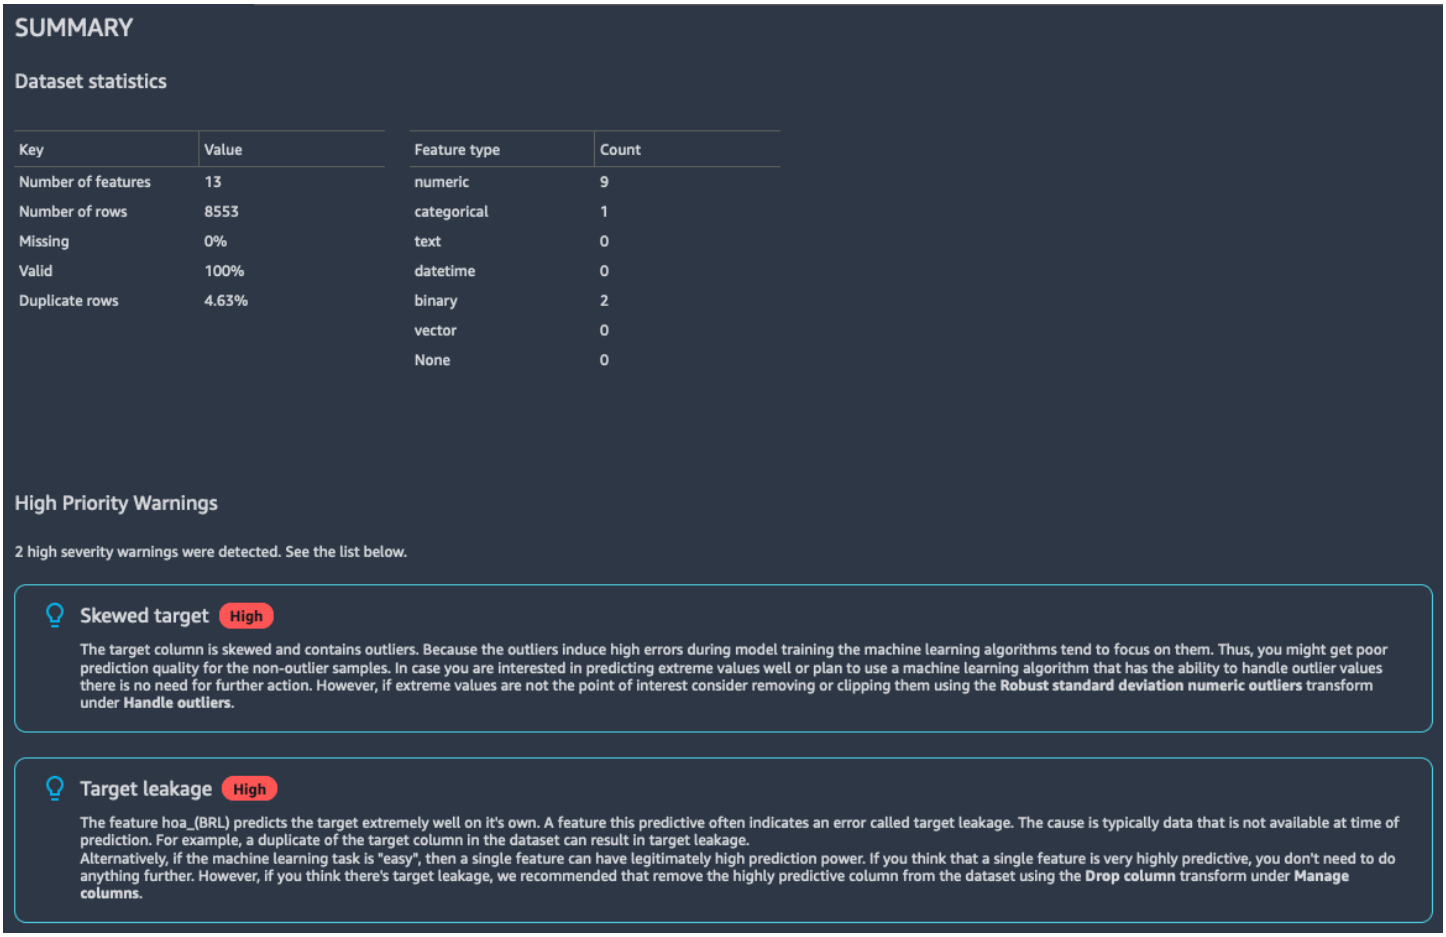
You can either download the report or view it online. To download the report, choose the download button at the top right corner of the screen. The following image shows the button.



Summary

The insights report has a brief summary of the data that includes general information such as missing values, invalid values, feature types, outlier counts, and more. It can also include high severity warnings that point to probable issues with the data. We recommend that you investigate the warnings.

The following is an example of a report summary.

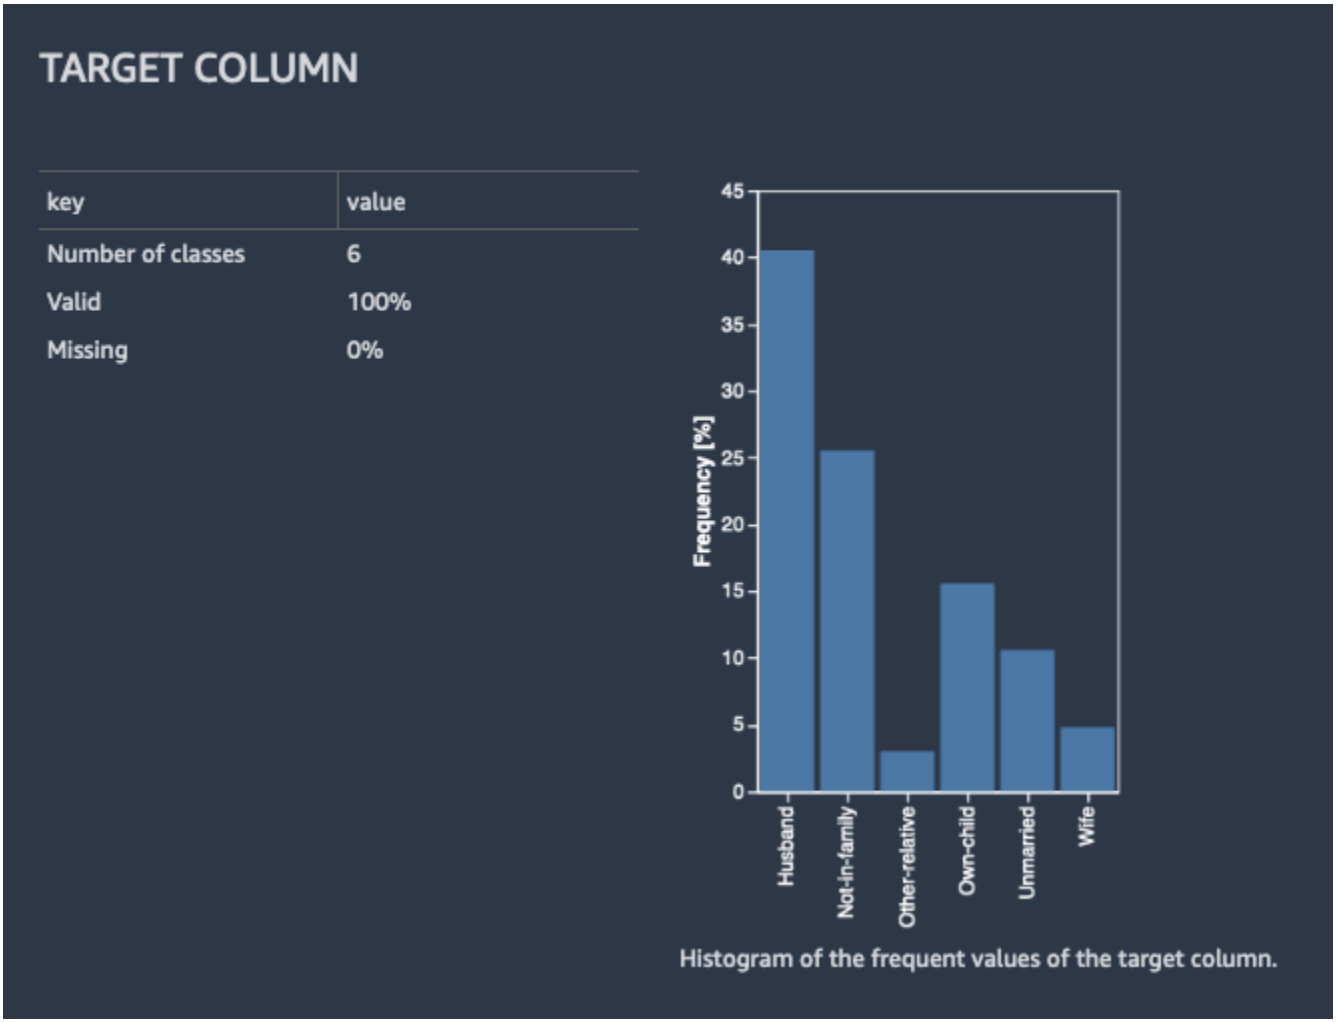


Target column

When you create the data quality and insights report, Data Wrangler gives you the option to select a target column. A target column is a column that you're trying to predict. When you choose a target column, Data Wrangler automatically creates a target column analysis. It also ranks the features in the order of their predictive power. When you select a target column, you must specify whether you're trying to solve a regression or a classification problem.

For classification, Data Wrangler shows a table and a histogram of the most common classes. A class is a category. It also presents observations, or rows, with a missing or invalid target value.

The following image shows an example target column analysis for a classification problem.

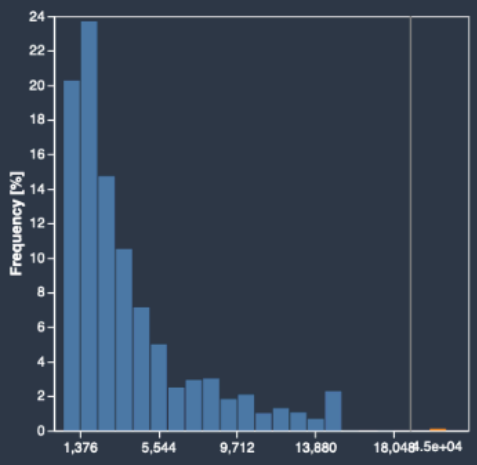


For regression, Data Wrangler shows a histogram of all the values in the target column. It also presents observations, or rows, with a missing, invalid, or outlier target value.

The following image shows an example target column analysis for a regression problem.

TARGET COLUMN

key	value
Valid	100%
Missing	0%
Outliers	0.103%
Min	450
Max	4.5e+04
Mean	3.9e+03
Median	2.66e+03
Skew	1.84
Kurtosis	4.62
Number of unique	1195



Histogram of the target column. The orange bars contain outliers and the value below them is the outliers average.

See below several samples with outlier target values.

city	area	rooms	bathroom	parking spaces	floor	animal	furniture	hoa (R$)	rent amount (R$)	property tax (R$)	fire insurance (R$)	total (R$)
São Paulo	700	4	7	8	-	acept	not furnished	0	45000	8750	677	54430
São Paulo	350	3	3	3	-	acept	not furnished	0	30000	560	451	31010
São Paulo	486	8	4	6	-	acept	not furnished	0	25000	2200	376	27580
São Paulo	80	2	1	1	1	acept	not furnished	875	24000	0	305	25180
São Paulo	900	3	4	8	-	acept	not furnished	0	20000	3813	301	24110

Quick model

The **Quick model** provides an estimate of the expected predicted quality of a model that you train on your data.

Data Wrangler splits your data into training and validation folds. It uses 80% of the samples for training and 20% of the values for validation. For classification, the sample is stratified split. For a stratified split, each data partition has the same ratio of labels. For classification problems, it's important to have the same ratio of labels between the training and classification folds. Data Wrangler trains the XGBoost model with the default hyperparameters. It applies early stopping on the validation data and performs minimal feature preprocessing.

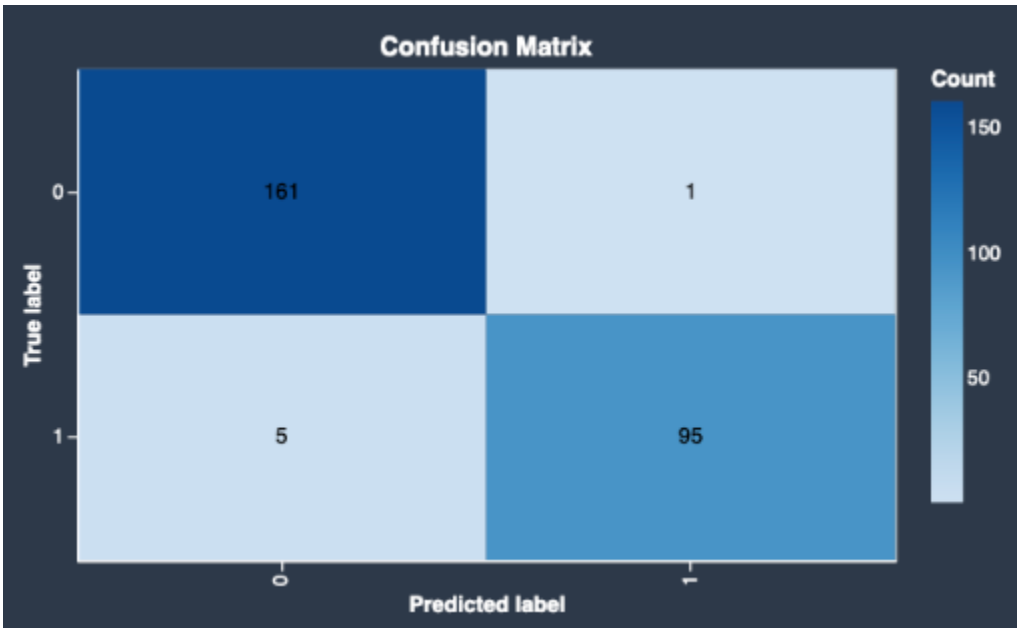
For classification models, Data Wrangler returns both a model summary and a confusion matrix.

The following is an example of a classification model summary. To learn more about the information that it returns, see Definitions.

Metric	Validation scores	Train scores
Accuracy	0.977	0.992
Balanced accuracy	0.972	0.99
ROC-AUC	0.995	1
F1	0.969	0.99
Precision	0.99	0.997
Recall	0.95	0.983

class	precision	recall	f1-score	support
0	0.9698795180722891	0.9938271604938271	0.9817073170731707	162.0
1	0.9895833333333334	0.95	0.9693877551020408	100.0

The following is an example of a confusion matrix that the quick model returns.



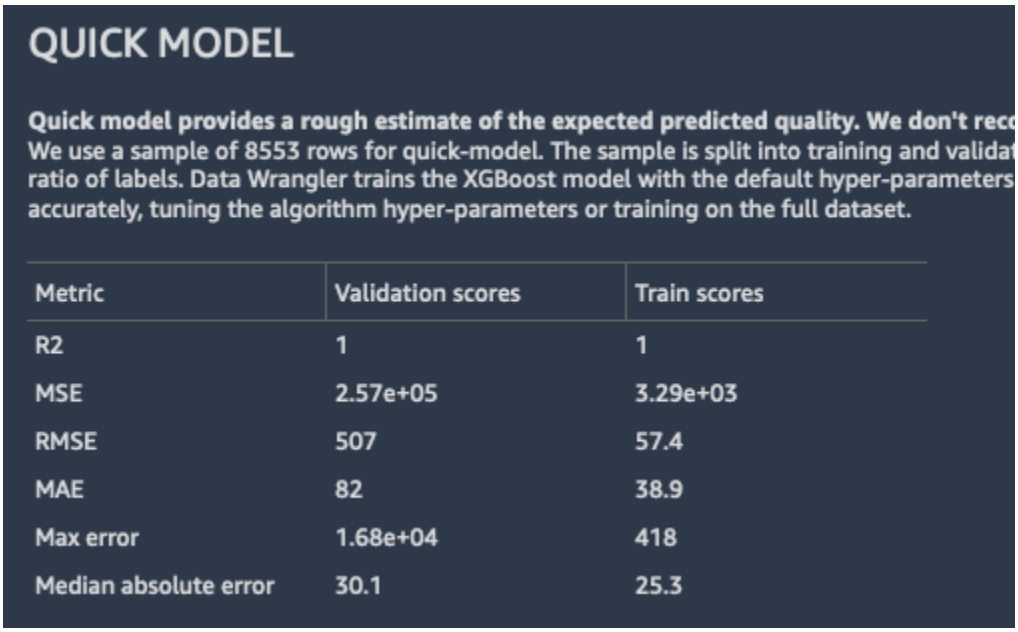
A confusion matrix gives you the following information:

- The number of times the predicted label matches the true label.
- The number of times the predicted label doesn't match the true label.

The true label represents an actual observation in your data. For example, if you're using a model to detect fraudulent transactions, the true label represents a transaction that is actually fraudulent or non-fraudulent. The predicted label represents the label that your model assigns to the data.

You can use the confusion matrix to see how well the model predicts the presence or the absence of a condition. If you're predicting fraudulent transactions, you can use the confusion matrix to get a sense of both the sensitivity and the specificity of the model. The sensitivity refers to the model's ability to detect fraudulent transactions. The specificity refers to the model's ability to avoid detecting non-fraudulent transactions as fraudulent.

The following is an example of the quick model outputs for a regression problem.



QUICK MODEL

Quick model provides a rough estimate of the expected predicted quality. We don't rec
We use a sample of 8553 rows for quick-model. The sample is split into training and valida
ratio of labels. Data Wrangler trains the XGBoost model with the default hyper-parameters
accurately, tuning the algorithm hyper-parameters or training on the full dataset.

Metric	Validation scores	Train scores
R2	1	1
MSE	2.57e+05	3.29e+03
RMSE	507	57.4
MAE	82	38.9
Max error	1.68e+04	418
Median absolute error	30.1	25.3

Feature summary

When you specify a target column, Data Wrangler orders the features by their prediction power. Prediction power is measured on the data after it was split into 80% training and 20% validation folds. Data Wrangler fits a model for each feature separately on the training fold. It applies minimal feature preprocessing and measures prediction performance on the validation data.

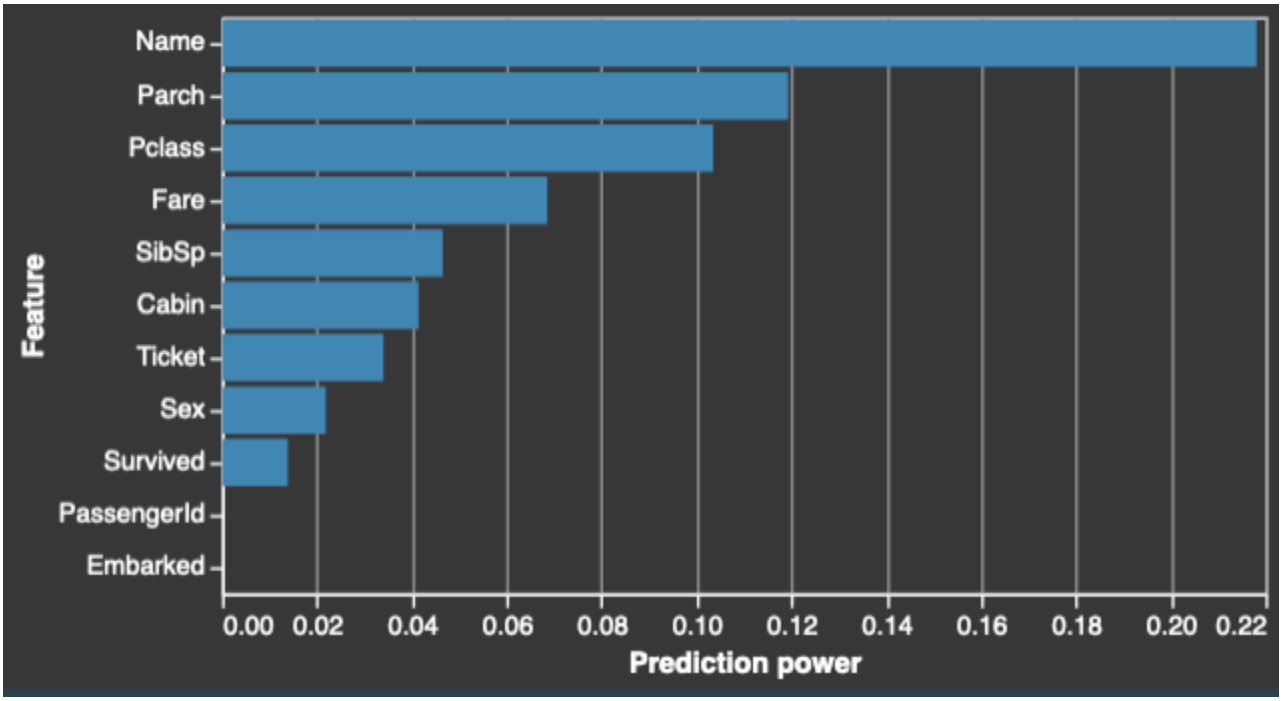
It normalizes the scores to the range [0,1]. Higher prediction scores indicate columns that are more useful for predicting the target on their own. Lower scores point to columns that aren’t predictive of the target column.

It’s uncommon for a column that isn’t predictive on its own to be predictive when it’s used in tandem with other columns. You can confidently use the prediction scores to determine whether a feature in your dataset is predictive.

A low score usually indicates the feature is redundant. A score of 1 implies perfect predictive abilities, which often indicates target leakage. Target leakage usually happens when the dataset contains a column that isn't available at the prediction time. For example, it could be a duplicate of the target column.

The following are examples of the table and the histogram that show the prediction value of each feature.

Feature	Prediction power	Type	Valid	Missing	Outliers	#Warnings
Name	0.274276	text	100.0%	0.0%		0
Pclass	0.154638	numeric	100.0%	0.0%	0.0%	0
SibSp	0.141675	numeric	100.0%	0.0%	3.22%	0
Parch	0.127353	numeric	100.0%	0.0%	1.4%	0
Cabin	0.112283	text	25.91%	74.09%		0
Ticket	0.0869433	numeric	72.97%	0.0%	3.07%	0
Fare	0.0625847	numeric	100.0%	0.0%	2.52%	0
Embarked	0.00600914	categorical	99.72%	0.28%		0
Survived	0.00434197	binary	100.0%	0.0%		0
PassengerId	0	numeric	100.0%	0.0%	0.0%	0
Sex	0	binary	100.0%	0.0%		0



Samples

Data Wrangler provides information about whether your samples are anomalous or if there are duplicates in your dataset.

Data Wrangler detects anomalous samples using the *isolation forest algorithm*. The isolation forest associates an anomaly score with each sample (row) of the dataset. Low anomaly scores indicate anomalous samples. High scores are associated with non-anomalous samples. Samples with a negative anomaly score are usually considered anomalous and samples with positive anomaly score are considered non-anomalous.

When you look at a sample that might be anomalous, we recommend that you pay attention to unusual values. For example, you might have anomalous values that result from errors in gathering and processing the data. The following is an example of the most anomalous samples according to the Data Wrangler's implementation of the isolation forest algorithm. We recommend using domain knowledge and business logic when you examine the anomalous samples.

Data Wrangler detects duplicate rows and calculates the ratio of duplicate rows in your data. Some data sources could include valid duplicates. Other data sources could have duplicates that point to problems in data collection. Duplicate samples that result from faulty data collection could interfere with machine learning processes that rely on splitting the data into independent training and validation folds.

The following are elements of the insights report that can be impacted by duplicated samples:

- Quick model
- Prediction power estimation
- Automatic hyperparameter tuning

You can remove duplicate samples from the dataset using the **Drop duplicates** transform under **Manage rows**. Data Wrangler shows you the most frequently duplicated rows.

Definitions

The following are definitions for the technical terms that are used in the data insights report.

Feature types

The following are the definitions for each of the feature types:

- **Numeric** – Numeric values can be either floats or integers, such as age or income. The machine learning models assume that numeric values are ordered and a distance is defined over them. For example, 3 is closer to 4 than to 10 and 3 < 4 < 10.
- Categorical – The column entries belong to a set of unique values, which is usually much smaller than the number of entries in the column. For example, a column of length 100 could contain the unique values `Dog`, `Cat`, and `Mouse`. The values could be numeric, text, or a combination of both. `Horse`, `House`, 8, `Love`, and `3.1` would all be valid values and could be found in the same categorical column. The machine learning model does not assume order or distance on the values of categorical features, as opposed to numeric features, even when all the values are numbers.
- **Binary** – Binary features are a special categorical feature type in which the cardinality of the set of unique values is 2.
- **Text** – A text column contains many non-numeric unique values. In extreme cases, all the elements of the column are unique. In an extreme case, no two entries are the same.
- **Datetime** – A datetime column contains information about the date or time. It can have information about both the date and time.

Feature statistics

The following are definitions for each of the feature statistics:

- **Prediction power** – Prediction power measures how useful the column is in predicting the target.
- **Outliers** (in numeric columns) – Data Wrangler detects outliers using two statistics that are robust to outliers: median and robust standard deviation (RSTD). RSTD is derived by clipping the feature values to the range [5 percentile, 95 percentile] and calculating the standard deviation of the clipped vector. All values larger than median + 5 * RSTD or smaller than median - 5 * RSTD are considered to be outliers.
- **Skew** (in numeric columns) – Skew measures the symmetry of the distribution and is defined as the third moment of the distribution divided by the third power of the standard deviation. The skewness of the normal distribution or any other symmetric distribution is zero. Positive values imply that the right tail of the distribution is longer than the left tail. Negative values imply that the left tail of the distribution is longer than the right tail. As a rule of thumb, a distribution is considered skewed when the absolute value of the skew is larger than 3.
- **Kurtosis** (in numeric columns) – Pearson's kurtosis measures the heaviness of the tail of the distribution. It's defined as the fourth moment of the distribution divided by the square of the second moment. The kurtosis of the normal distribution is 3. Kurtosis values lower than 3 imply that the distribution is concentrated around the mean and the tails are lighter than the tails of the normal distribution. Kurtosis values higher than 3 imply heavier tails or outliers.
- **Missing values** – Null-like objects, empty strings and strings composed of only white spaces are considered missing.
- **Valid values for numeric features or regression target** – All values that you can cast to finite floats are valid. Missing values are not valid.
- **Valid values for categorical, binary, or text features, or for classification target** – All values that are not missing are valid.
- **Datetime features** – All values that you can cast to a datetime object are valid. Missing values are not valid.
- **Invalid values** – Values that are either missing or you can't properly cast. For example, in a numeric column, you can't cast the string `"six"` or a null value.

Quick model metrics for regression

The following are the definitions for the quick model metrics:

- R2 or coefficient of determination) – R2 is the proportion of the variation in the target that is predicted by the model. R2 is in the range of [-infty, 1]. 1 is the score of the model that

predicts the target perfectly and 0 is the score of the trivial model that always predicts the target mean.

- MSE or mean squared error – MSE is in the range [0, infty]. 0 is the score of the model that predicts the target perfectly.
- MAE or mean absolute error – MAE is in the range [0, infty] where 0 is the score of the model that predicts the target perfectly.
- RMSE or root mean square error – RMSE is in the range [0, infty] where 0 is the score of the model that predicts the target perfectly.
- Max error – The maximum absolute value of the error over the dataset. Max error is in the range [0, infty]. 0 is the score of the model that predicts the target perfectly.
- Median absolute error – Median absolute error is in the range [0, infty]. 0 is the score of the model that predicts the target perfectly.

Quick model metrics for classification

The following are the definitions for the quick model metrics:

- **Accuracy** – Accuracy is the ratio of samples that are predicted accurately. Accuracy is in the range [0, 1]. 0 is the score of the model that predicts all samples incorrectly and 1 is the score of the perfect model.
- **Balanced accuracy** – Balanced accuracy is the ratio of samples that are predicted accurately when the class weights are adjusted to balance the data. All classes are given the same importance, regardless of their frequency. Balanced accuracy is in the range [0, 1]. 0 is the score of the model that predicts all samples wrong. 1 is the score of the perfect model.
- **AUC (binary classification)** – This is the area under the receiver operating characteristic curve. AUC is in the range [0, 1] where a random model returns a score of 0.5 and the perfect model returns a score of 1.
- **AUC (OVR)** – For multiclass classification, this is the area under the receiver operating characteristic curve calculated separately for each label using one versus rest. Data Wrangler reports the average of the areas. AUC is in the range [0, 1] where a random model returns a score of 0.5 and the perfect model returns a score of 1.
- **Precision** – Precision is defined for a specific class. Precision is the fraction of true positives out of all the instances that the model classified as that class. Precision is in the range [0, 1]. 1 is the score of the model that has no false positives for the class. For binary classification, Data Wrangler reports the precision of the positive class.

- **Recall** – Recall is defined for a specific class. Recall is the fraction of the relevant class instances that are successfully retrieved. Recall is in the range [0, 1]. 1 is the score of the model that classifies all the instances of the class correctly. For binary classification, Data Wrangler reports the recall of the positive class.
- **F1** – F1 is defined for a specific class. It's the harmonic mean of the precision and recall. F1 is in the range [0, 1]. 1 is the score of the perfect model. For binary classification, Data Wrangler reports the F1 for classes with positive values.

Textual patterns

Patterns describe the textual format of a string using an easy to read format. The following are examples of textual patterns:

- "{digits:4-7}" describes a sequence of digits that have a length between 4 and 7.
- "{alnum:5}" describes an alpha-numeric string with a length of exactly 5.

Data Wrangler infers the patterns by looking at samples of non-empty strings from your data. It can describe many of the commonly used patterns. The **confidence** expressed as a percentage indicates how much of the data is estimated to match the pattern. Using the textual pattern, you can see which rows in your data you need to correct or drop.

The following describes the patterns that Data Wrangler can recognize:

Pattern	Textual Format
{alnum}	Alphanumeric strings
{any}	Any string of word characters
{digits}	A sequence of digits
{lower}	A lowercase word
{mixed}	A mixed-case word
{name}	A word beginning with a capital letter
{upper}	An uppercase word

Pattern	Textual Format
{whitespace}	whitespace characters

A word character is either an underscore or a character that might appear in a word in any language. For example, the strings 'Hello_word' and 'écoute' both consist of word characters. 'H' and 'é' are both examples of word characters.

Automatically Train Models on Your Data Flow

You can use Amazon SageMaker Autopilot to automatically train, tune, and deploy models on the data that you've transformed in your data flow. Amazon SageMaker Autopilot can go through several algorithms and use the one that works best with your data. For more information about Amazon SageMaker Autopilot, see SageMaker Autopilot.

When you train and tune a model, Data Wrangler exports your data to an Amazon S3 location where Amazon SageMaker Autopilot can access it.

You can prepare and deploy a model by choosing a node in your Data Wrangler flow and choosing **Export and Train** in the data preview. You can use this method to view your dataset before you choose to train a model on it.

You can also train and deploy a model directly from your data flow.

The following procedure prepares and deploys a model from the data flow. For Data Wrangler flows with multi-row transforms, you can't use the transforms from the Data Wrangler flow when you're deploying the model. You can use the following procedure to process the data before you use it to perform inference.

To train and deploy a model directly from your data flow, do the following.

1. Choose the **+** next to the node containing the training data.
2. Choose **Train model**.
3. (Optional) Specify a AWS KMS key or ID. For more information about creating and controlling cryptographic keys to protect your data, see AWS Key Management Service.
4. Choose **Export and train**.

5. After Amazon SageMaker Autopilot trains the model on the data that Data Wrangler exported, specify a name for **Experiment name**.
6. Under **Input data**, choose **Preview** to verify that Data Wrangler properly exported your data to Amazon SageMaker Autopilot.
7. For **Target**, choose the target column.
8. (Optional) For **S3 location** under **Output data**, specify an Amazon S3 location other than the default location.
9. Choose **Next: Training method**.
10. Choose a training method. For more information, see Training modes.
11. (Optional) For **Auto deploy endpoint**, specify a name for the endpoint.
12. For **Deployment option**, choose a deployment method. You can choose to deploy with or without the transformations that you've made to your data.

> **Important**
>
> You can't deploy an Amazon SageMaker Autopilot model with the transformations that you've made in your Data Wrangler flow. For more information about those transformations, see Export to an Inference Endpoint.

13. Choose **Next: Review and create**.
14. Choose **Create experiment**.

For more information about model training and deployment, see Create a regression or classification job for tabular data using the AutoML API. Autopilot shows you analyses about the best model's performance. For more information about model performance, see View an Autopilot Model Performance Report.

Transform Data

Amazon SageMaker Data Wrangler provides numerous ML data transforms to streamline cleaning, transforming, and featurizing your data. When you add a transform, it adds a step to the data flow. Each transform you add modifies your dataset and produces a new dataframe. All subsequent transforms apply to the resulting dataframe.

Data Wrangler includes built-in transforms, which you can use to transform columns without any code. You can also add custom transformations using PySpark, Python (User-Defined Function),

pandas, and PySpark SQL. Some transforms operate in place, while others create a new output column in your dataset.

You can apply transforms to multiple columns at once. For example, you can delete multiple columns in a single step.

You can apply the **Process numeric** and **Handle missing** transforms only to a single column.

Use this page to learn more about these built-in and custom transforms.

Transform UI

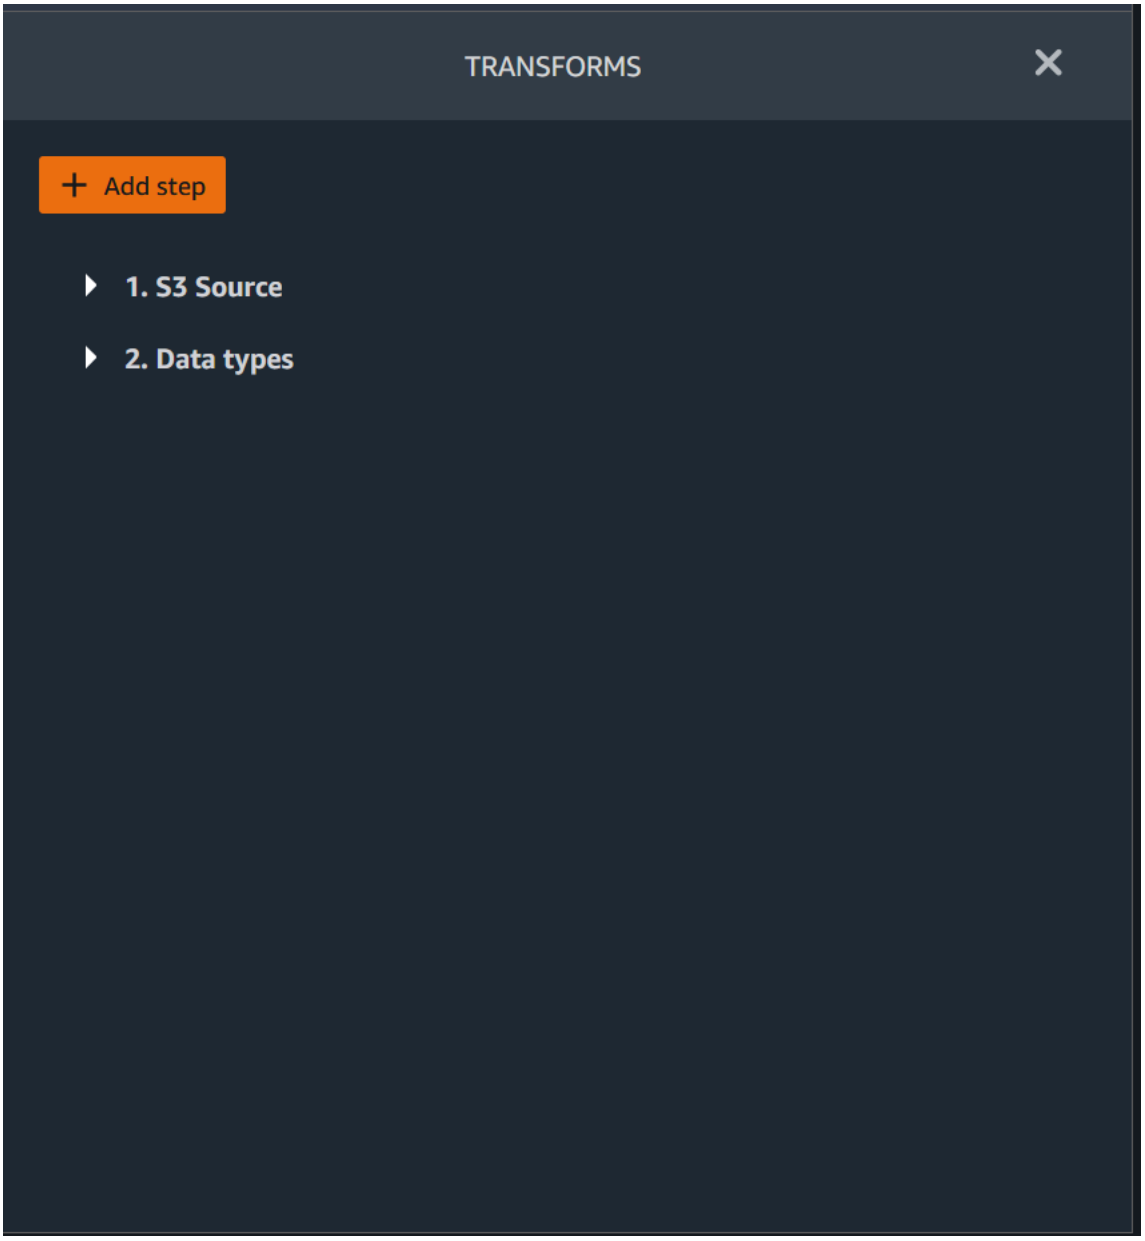
Most of the built-in transforms are located in the **Prepare** tab of the Data Wrangler UI. You can access the join and concatenate transforms through the data flow view. Use the following table to preview these two views.

Transform

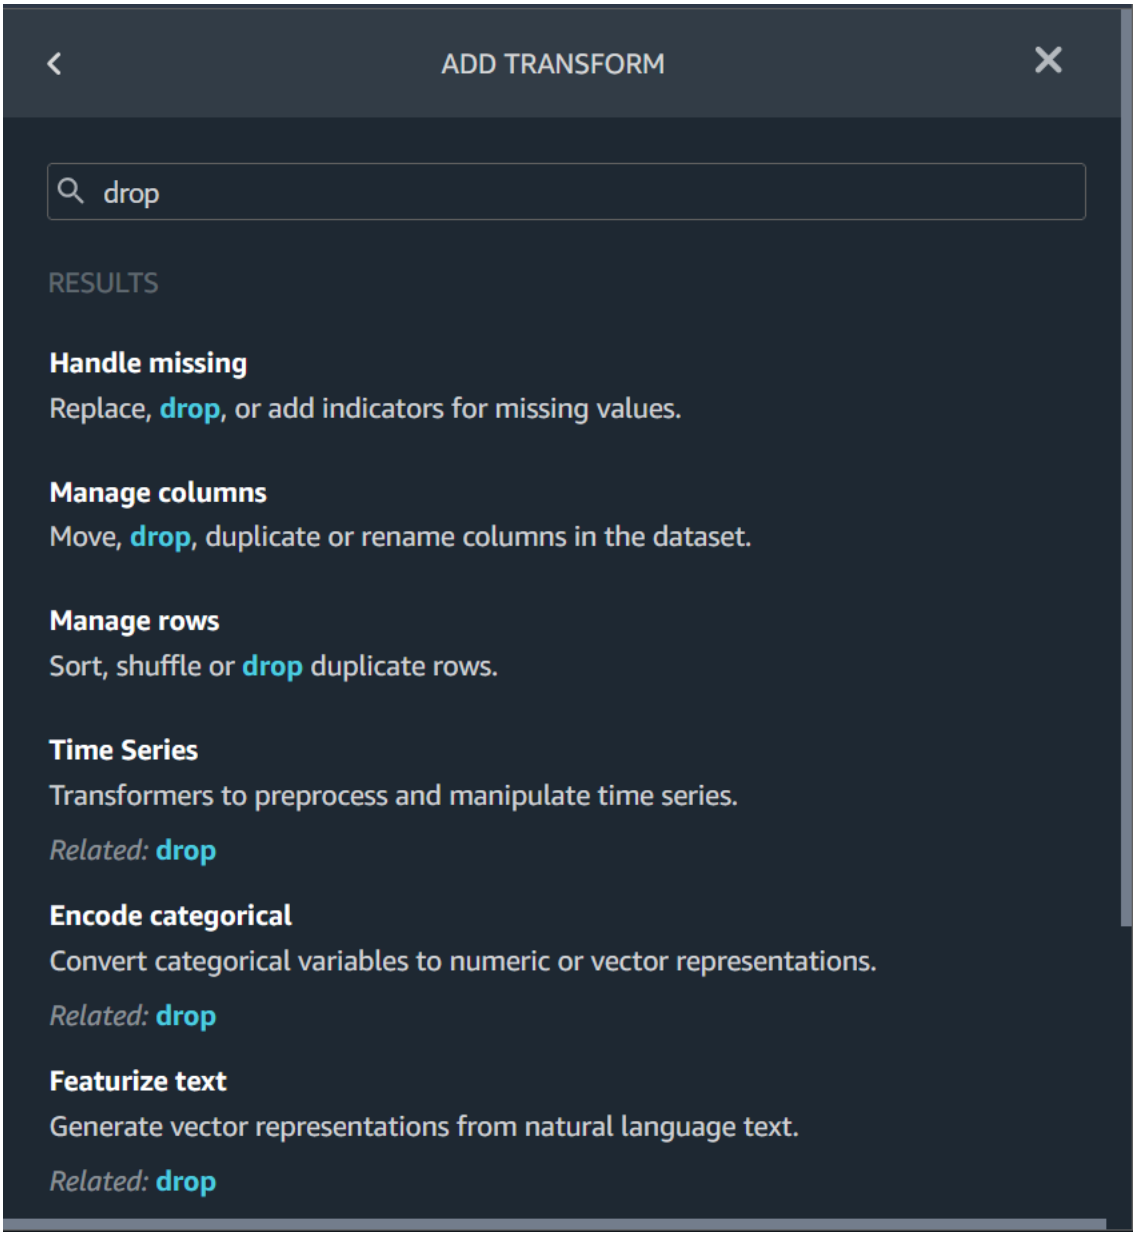
You can add a transform to any step in your data flow. Use the following procedure to add a transform to your data flow.

To add a step to your data flow, do the following.

1. Choose the **+** next to the step in the data flow.
2. Choose **Add transform**.
3. Choose **Add step**.

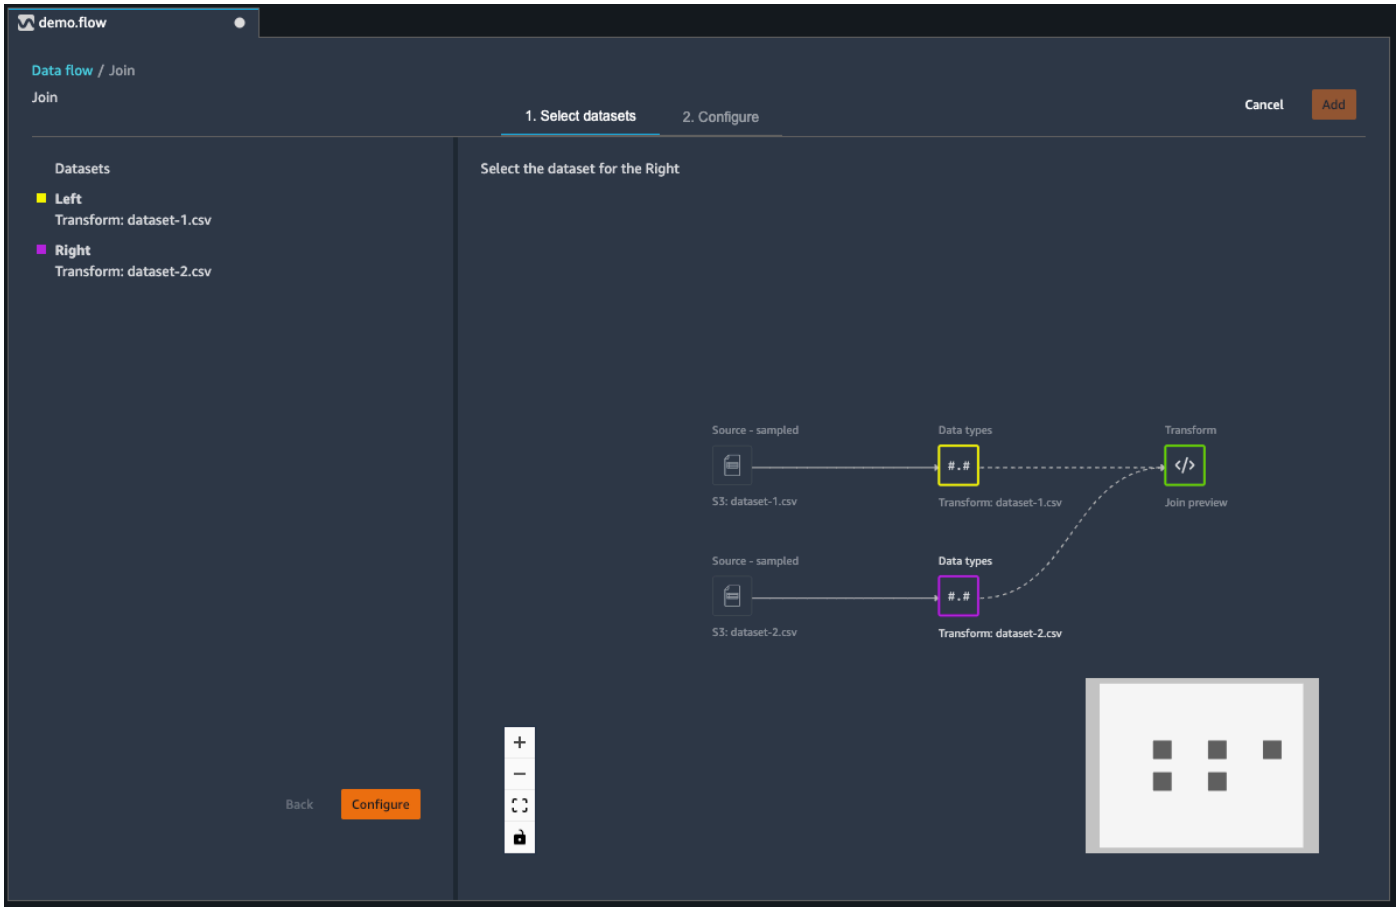


4. Choose a transform.
5. (Optional) You can search for the transform that you want to use. Data Wrangler highlights the query in the results.

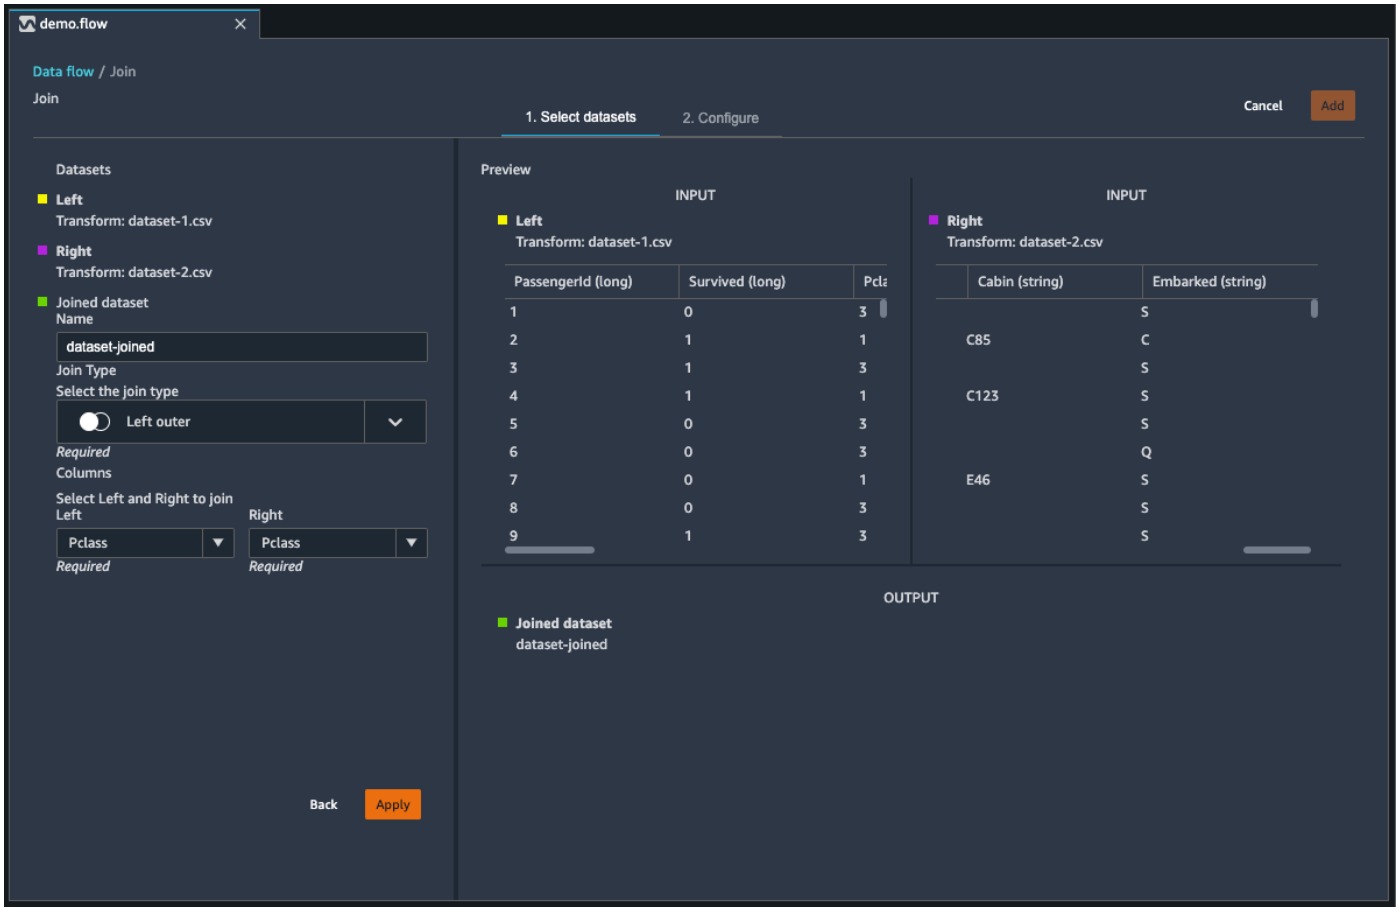


Join View

To join two datasets, select the first dataset in your data flow and choose **Join**. When you choose **Join**, you see results similar to those shown in the following image. Your left and right datasets are displayed in the left panel. The main panel displays your data flow, with the newly joined dataset added.



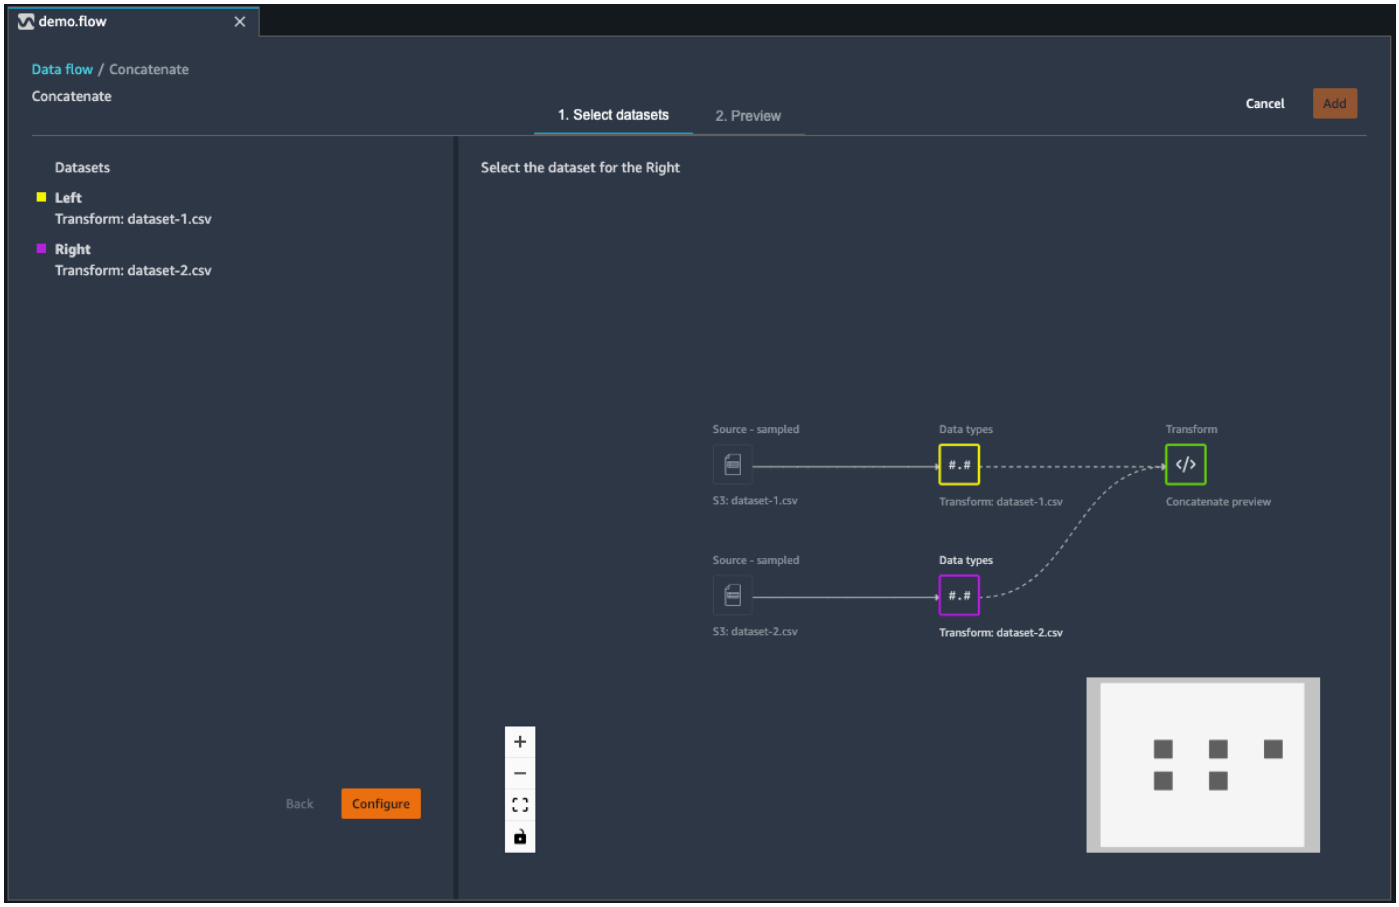
When you choose **Configure** to configure your join, you see results similar to those shown in the following image. Your join configuration is displayed in the left panel. You can use this panel to choose the joined dataset name, join type, and columns to join. The main panel displays three tables. The top two tables display the left and right datasets on the left and right respectively. Under this table, you can preview the joined dataset.



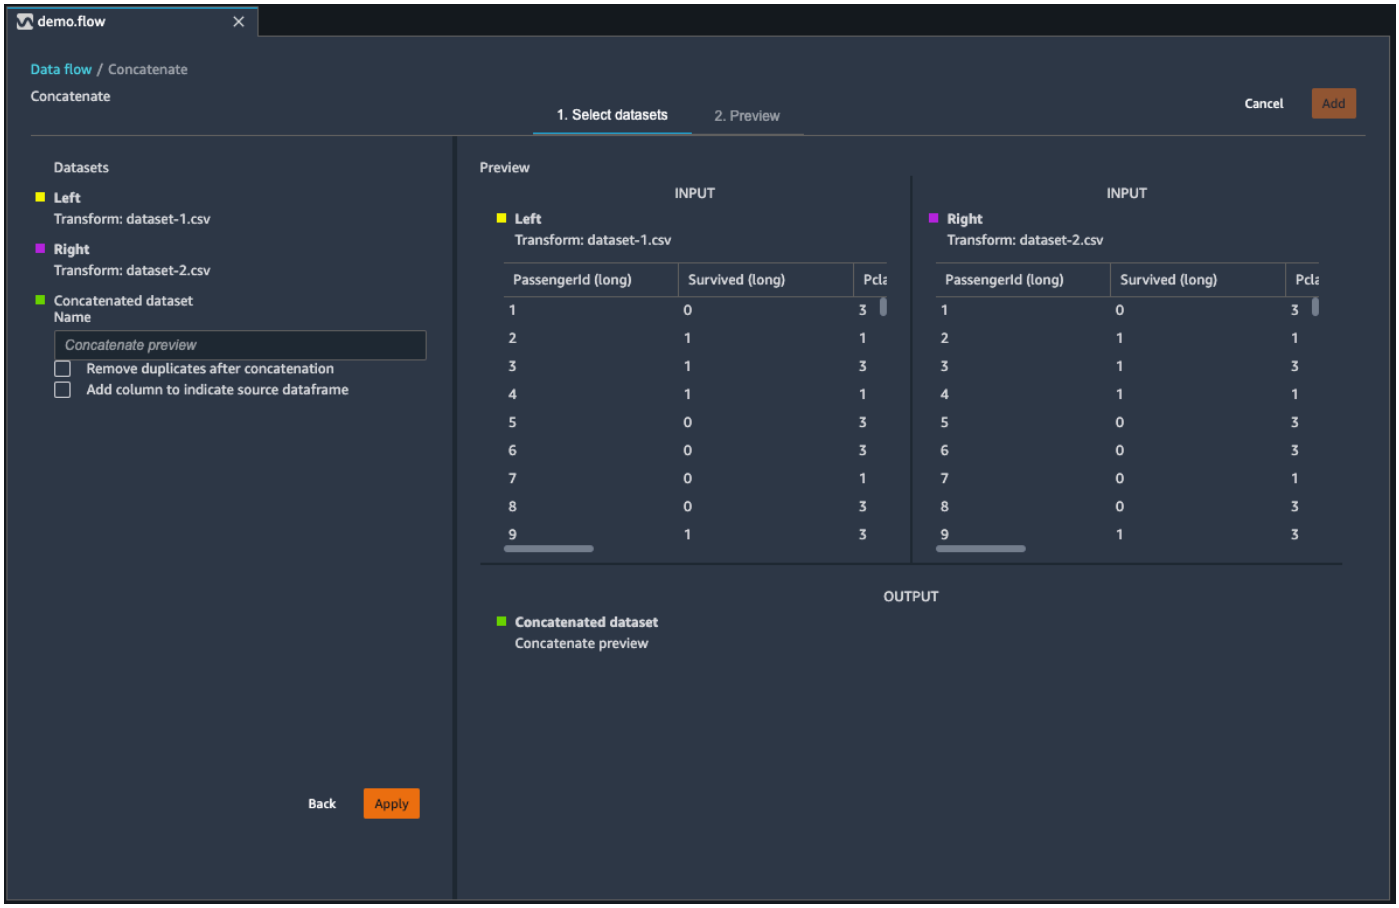
See Join Datasets to learn more.

Concatenate View

To concatenate two datasets, you select the first dataset in your data flow and choose **Concatenate**. When you select **Concatenate**, you see results similar to those shown in the following image. Your left and right datasets are displayed in the left panel. The main panel displays your data flow, with the newly concatenated dataset added.



When you choose **Configure** to configure your concatenation, you see results similar to those shown in the following image. Your concatenate configuration displays in the left panel. You can use this panel to choose the concatenated dataset's name, and choose to remove duplicates after concatenation and add columns to indicate the source dataframe. The main panel displays three tables. The top two tables display the left and right datasets on the left and right respectively. Under this table, you can preview the concatenated dataset.



See Concatenate Datasets to learn more.

Join Datasets

You join dataframes directly in your data flow. When you join two datasets, the resulting joined dataset appears in your flow. The following join types are supported by Data Wrangler.

- **Left Outer** – Include all rows from the left table. If the value for the column joined on a left table row does not match any right table row values, that row contains null values for all right table columns in the joined table.
- **Left Anti** – Include rows from the left table that do not contain values in the right table for the joined column.
- **Left semi** – Include a single row from the left table for all identical rows that satisfy the criteria in the join statement. This excludes duplicate rows from the left table that match the criteria of the join.

- **Right Outer** – Include all rows from the right table. If the value for the joined column in a right table row does not match any left table row values, that row contains null values for all left table columns in the joined table.
- **Inner** – Include rows from left and right tables that contain matching values in the joined column.
- **Full Outer** – Include all rows from the left and right tables. If the row value for the joined column in either table does not match, separate rows are created in the joined table. If a row doesn't contain a value for a column in the joined table, null is inserted for that column.
- **Cartesian Cross** – Include rows which combine each row from the first table with each row from the second table. This is a Cartesian product of rows from tables in the join. The result of this product is the size of the left table times the size of the right table. Therefore, we recommend caution in using this join between very large datasets.

Use the following procedure to join two dataframes.

1. Select **+** next to the left dataframe that you want to join. The first dataframe you select is always the left table in your join.
2. Choose **Join**.
3. Select the right dataframe. The second dataframe you select is always the right table in your join.
4. Choose **Configure** to configure your join.
5. Give your joined dataset a name using the **Name** field.
6. Select a **Join type**.
7. Select a column from the left and right tables to join.
8. Choose **Apply** to preview the joined dataset on the right.
9. To add the joined table to your data flow, choose **Add**.

Concatenate Datasets

Concatenate two datasets:

1. Choose **+** next to the left dataframe that you want to concatenate. The first dataframe you select is always the left table in your concatenate.
2. Choose **Concatenate**.

3. Select the right dataframe. The second dataframe you select is always the right table in your concatenate.
4. Choose **Configure** to configure your concatenate.
5. Give your concatenated dataset a name using the **Name** field.
6. (Optional) Select the checkbox next to **Remove duplicates after concatenation** to remove duplicate columns.
7. (Optional) Select the checkbox next to **Add column to indicate source dataframe** if, for each column in the new dataset, you want to add an indicator of the column's source.
8. Choose **Apply** to preview the new dataset.
9. Choose **Add** to add the new dataset to your data flow.

Balance Data

You can balance the data for datasets with an underrepresented category. Balancing a dataset can help you create better models for binary classification.

> **Note**
>
> You can't balance datasets containing column vectors.

You can use the **Balance data** operation to balance your data using one of the following operators:

- *Random oversampling* – Randomly duplicates samples in the minority category. For example, if you're trying to detect fraud, you might only have cases of fraud in 10% of your data. For an equal proportion of fraudulent and non-fraudulent cases, this operator randomly duplicates fraud cases within the dataset 8 times.
- *Random undersampling* – Roughly equivalent to random oversampling. Randomly removes samples from the overrepresented category to get the proportion of samples that you desire.
- *Synthetic Minority Oversampling Technique (SMOTE)* – Uses samples from the underrepresented category to interpolate new synthetic minority samples. For more information about SMOTE, see the following description.

You can use all transforms for datasets containing both numeric and non-numeric features. SMOTE interpolates values by using neighboring samples. Data Wrangler uses the R-squared distance

to determine the neighborhood to interpolate the additional samples. Data Wrangler only uses numeric features to calculate the distances between samples in the underrepresented group.

For two real samples in the underrepresented group, Data Wrangler interpolates the numeric features by using a weighted average. It randomly assigns weights to those samples in the range of [0, 1]. For numeric features, Data Wrangler interpolates samples using a weighted average of the samples. For samples A and B, Data Wrangler could randomly assign a weight of 0.7 to A and 0.3 to B. The interpolated sample has a value of 0.7A + 0.3B.

Data Wrangler interpolates non-numeric features by copying from either of the interpolated real samples. It copies the samples with a probability that it randomly assigns to each sample. For samples A and B, it can assign probabilities 0.8 to A and 0.2 to B. For the probabilities it assigned, it copies A 80% of the time.

Custom Transforms

The **Custom Transforms** group allows you to use Python (User-Defined Function), PySpark, pandas, or PySpark (SQL) to define custom transformations. For all three options, you use the variable `df` to access the dataframe to which you want to apply the transform. To apply your custom code to your dataframe, assign the dataframe with the transformations that you've made to the `df` variable. If you're not using Python (User-Defined Function), you don't need to include a return statement. Choose **Preview** to preview the result of the custom transform. Choose **Add** to add the custom transform to your list of **Previous steps**.

You can import the popular libraries with an `import` statement in the custom transform code block, such as the following:

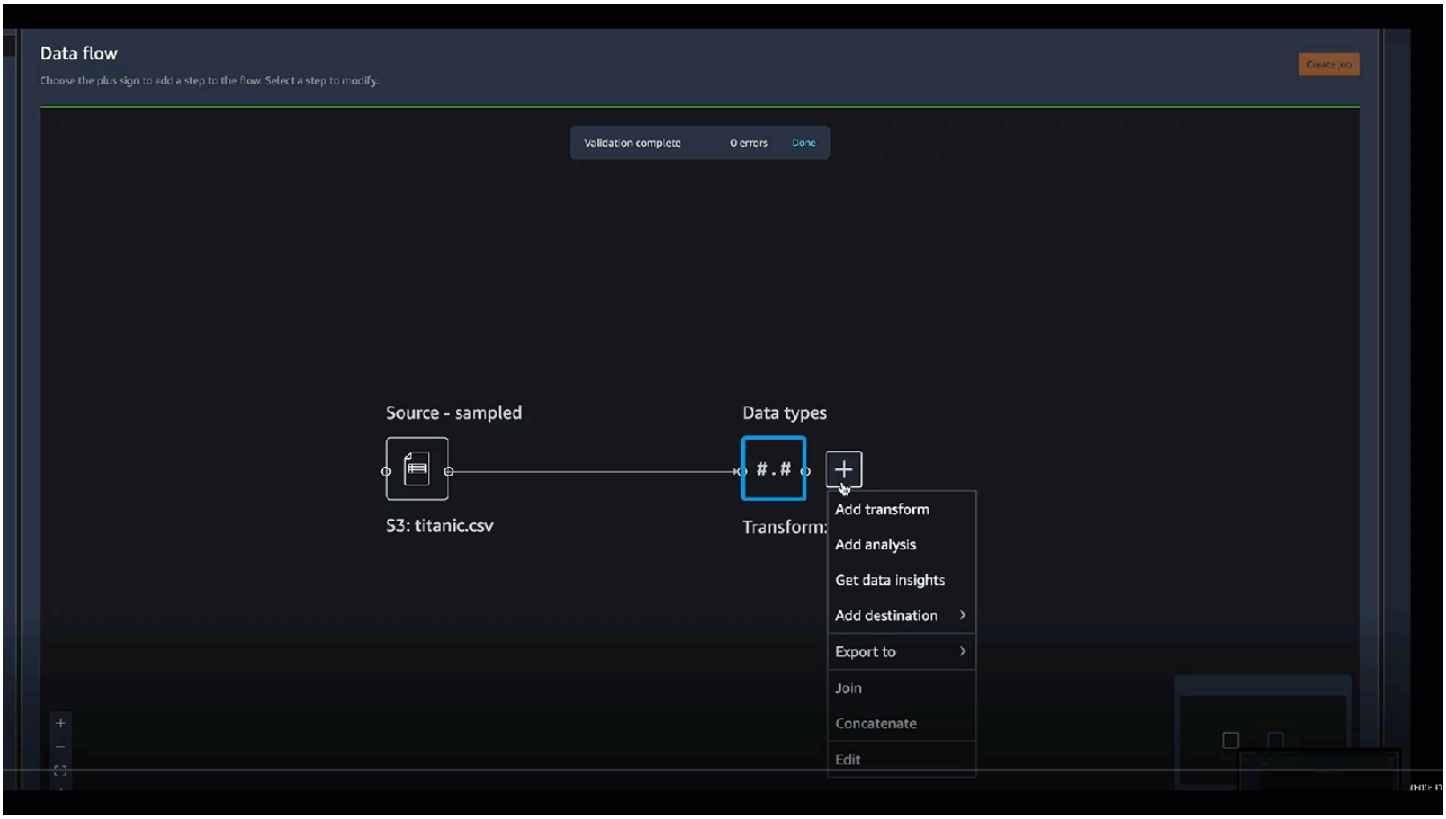
- NumPy version 1.19.0
- scikit-learn version 0.23.2
- SciPy version 1.5.4
- pandas version 1.0.3
- PySpark version 3.0.0

> **Important**
>
> **Custom transform** doesn't support columns with spaces or special characters in the name. We recommend that you specify column names that only have alphanumeric characters and underscores. You can use the **Rename column** transform in the **Manage columns**

transform group to remove spaces from a column's name. You can also add a **Python (Pandas) Custom transform** similar to the following to remove spaces from multiple columns in a single step. This example changes columns named `A column` and `B column` to `A_column` and `B_column` respectively.

```
df.rename(columns={"A column": "A_column", "B column": "B_column"})
```

If you include print statements in the code block, the result appears when you select **Preview**. You can resize the custom code transformer panel. Resizing the panel provides more space to write code. The following image shows the resizing of the panel.



The following sections provide additional context and examples for writing custom transform code.

Python (User-Defined Function)

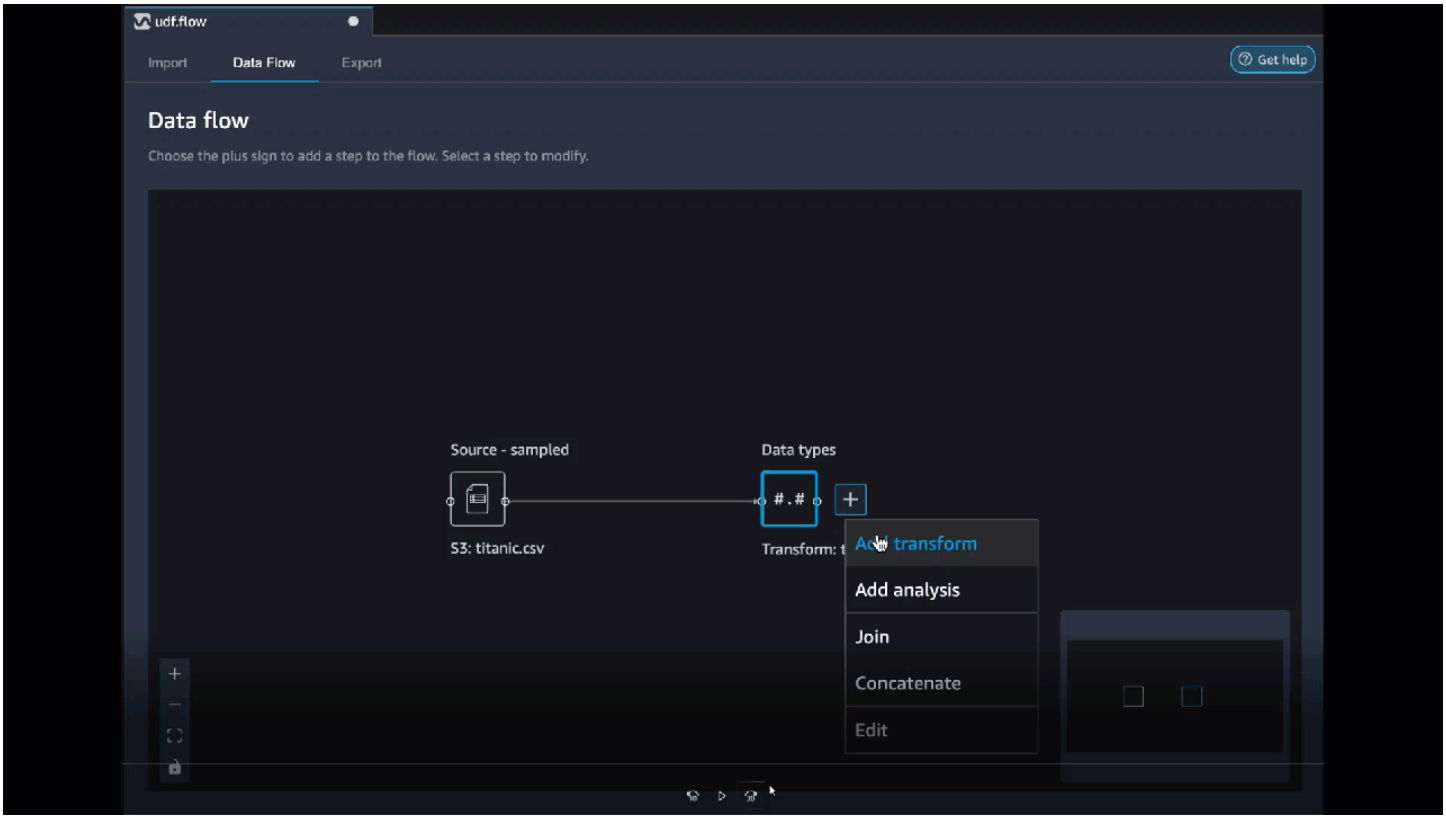
The Python function gives you the ability to write custom transformations without needing to know Apache Spark or pandas. Data Wrangler is optimized to run your custom code quickly. You get similar performance using custom Python code and an Apache Spark plugin.

To use the Python (User-Defined Function) code block, you specify the following:

- **Input column** – The input column where you're applying the transform.
- **Mode** – The scripting mode, either pandas or Python.
- **Return type** – The data type of the value that you're returning.

Using the pandas mode gives better performance. The Python mode makes it easier for you to write transformations by using pure Python functions.

The following video shows an example of how to use custom code to create a transformation. It uses the Titanic dataset to create a column with the person's salutation.



PySpark

The following example extracts date and time from a timestamp.

```
from pyspark.sql.functions import from_unixtime, to_date, date_format
df = df.withColumn('DATE_TIME', from_unixtime('TIMESTAMP'))
df = df.withColumn( 'EVENT_DATE', to_date('DATE_TIME')).withColumn(
'EVENT_TIME', date_format('DATE_TIME', 'HH:mm:ss'))
```

pandas

The following example provides an overview of the dataframe to which you are adding transforms.

```
df.info()
```

PySpark (SQL)

The following example creates a new dataframe with four columns: *name*, *fare*, *pclass*, *survived*.

```
SELECT name, fare, pclass, survived FROM df
```

If you don't know how to use PySpark, you can use custom code snippets to help you get started.

Data Wrangler has a searchable collection of code snippets. You can use to code snippets to perform tasks such as dropping columns, grouping by columns, or modelling.

To use a code snippet, choose **Search example snippets** and specify a query in the search bar. The text you specify in the query doesn't have to match the name of the code snippet exactly.

The following example shows a **Drop duplicate rows** code snippet that can delete rows with similar data in your dataset. You can find the code snippet by searching for one of the following:

- Duplicates
- Identical
- Remove

The following snippet has comments to help you understand the changes that you need to make. For most snippets, you must specify the column names of your dataset in the code.

```
# Specify the subset of columns
# all rows having identical values in these columns will be dropped

subset = ["col1", "col2", "col3"]
df = df.dropDuplicates(subset)

# to drop the full-duplicate rows run
# df = df.dropDuplicates()
```

To use a snippet, copy and paste its content into the **Custom transform** field. You can copy and paste multiple code snippets into the custom transform field.

Custom Formula

Use **Custom formula** to define a new column using a Spark SQL expression to query data in the current dataframe. The query must use the conventions of Spark SQL expressions.

> **Important**
>
> **Custom formula** doesn't support columns with spaces or special characters in the name. We recommend that you specify column names that only have alphanumeric characters and underscores. You can use the **Rename column** transform in the **Manage columns** transform group to remove spaces from a column's name. You can also add a **Python (Pandas) Custom transform** similar to the following to remove spaces from multiple columns in a single step. This example changes columns named `A column` and `B column` to `A_column` and `B_column` respectively.
>
> ```
> df.rename(columns={"A column": "A_column", "B column": "B_column"})
> ```

You can use this transform to perform operations on columns, referencing the columns by name. For example, assuming the current dataframe contains columns named *col_a* and *col_b*, you can use the following operation to produce an **Output column** that is the product of these two columns with the following code:

```
col_a * col_b
```

Other common operations include the following, assuming a dataframe contains `col_a` and `col_b` columns:

- Concatenate two columns: `concat(col_a, col_b)`
- Add two columns: `col_a + col_b`
- Subtract two columns: `col_a - col_b`
- Divide two columns: `col_a / col_b`
- Take the absolute value of a column: `abs(col_a)`

For more information, see the Spark documentation on selecting data.

Reduce Dimensionality within a Dataset

Reduce the dimensionality in your data by using Principal Component Analysis (PCA). The dimensionality of your dataset corresponds to the number of features. When you use dimensionality reduction in Data Wrangler, you get a new set of features called components. Each component accounts for some variability in the data.

The first component accounts for the largest amount of variation in the data. The second component accounts for the second largest amount of variation in the data, and so on.

You can use dimensionality reduction to reduce the size of the data sets that you use to train models. Instead of using the features in your dataset, you can use the principal components instead.

To perform PCA, Data Wrangler creates axes for your data. An axis is an affine combination of columns in your dataset. The first principal component is the value on the axis that has the largest amount of variance. The second principal component is the value on the axis that has the second largest amount of variance. The nth principal component is the value on the axis that has the nth largest amount of variance.

You can configure the number of principal components that Data Wrangler returns. You can either specify the number of principal components directly or you can specify the variance threshold percentage. Each principal component explains an amount of variance in the data. For example, you might have a principal component with a value of 0.5. The component would explain 50% of the variation in the data. When you specify a variance threshold percentage, Data Wrangler returns the smallest number of components that meet the percentage that you specify.

The following are example principal components with the amount of variance that they explain in the data.

- Component 1 – 0.5
- Component 2 – 0.45
- Component 3 – 0.05

If you specify a variance threshold percentage of 94 or 95, Data Wrangler returns Component 1 and Component 2. If you specify a variance threshold percentage of 96, Data Wrangler returns all three principal components.

You can use the following procedure to run PCA on your dataset.

To run PCA on your dataset, do the following.

1. Open your Data Wrangler data flow.
2. Choose the **+**, and select **Add transform**.
3. Choose **Add step**.
4. Choose **Dimensionality Reduction**.
5. For **Input Columns**, choose the features that you're reducing into the principal components.
6. (Optional) For **Number of principal components**, choose the number of principal components that Data Wrangler returns in your dataset. If specify a value for the field, you can't specify a value for **Variance threshold percentage**.
7. (Optional) For **Variance threshold percentage**, specify the percentage of variation in the data that you want explained by the principal components. Data Wrangler uses the default value of 95 if you don't specify a value for the variance threshold. You can't specify a variance threshold percentage if you've specified a value for **Number of principal components**.
8. (Optional) Deselect **Center** to not use the mean of the columns as the center of the data. By default, Data Wrangler centers the data with the mean before scaling.
9. (Optional) Deselect **Scale** to not scale the data with the unit standard deviation.
10. (Optional) Choose **Columns** to output the components to separate columns. Choose **Vector** to output the components as a single vector.
11. (Optional) For **Output column**, specify a name for an output column. If you're outputting the components to separate columns, the name that you specify is a prefix. If you're outputting the components to a vector, the name that you specify is the name of the vector column.
12. (Optional) Select **Keep input columns**. We don't recommend selecting this option if you plan on only using the principal components to train your model.
13. Choose **Preview**.
14. Choose **Add**.

Encode Categorical

Categorical data is usually composed of a finite number of categories, where each category is represented with a string. For example, if you have a table of customer data, a column that indicates the country a person lives in is categorical. The categories would be *Afghanistan*, *Albania*,

Algeria, and so on. Categorical data can be *nominal* or *ordinal*. Ordinal categories have an inherent order, and nominal categories do not. The highest degree obtained (*High school*, *Bachelors*, *Masters*, and so on) is an example of ordinal categories.

Encoding categorical data is the process of creating a numerical representation for categories. For example, if your categories are *Dog* and *Cat*, you may encode this information into two vectors, `[1,0]` to represent *Dog*, and `[0,1]` to represent *Cat*.

When you encode ordinal categories, you may need to translate the natural order of categories into your encoding. For example, you can represent the highest degree obtained with the following map: `{"High school": 1, "Bachelors": 2, "Masters":3}`.

Use categorical encoding to encode categorical data that is in string format into arrays of integers.

The Data Wrangler categorical encoders create encodings for all categories that exist in a column at the time the step is defined. If new categories have been added to a column when you start a Data Wrangler job to process your dataset at time *t*, and this column was the input for a Data Wrangler categorical encoding transform at time *t*-1, these new categories are considered *missing* in the Data Wrangler job. The option you select for **Invalid handling strategy** is applied to these missing values. Examples of when this can occur are:

- When you use a .flow file to create a Data Wrangler job to process a dataset that was updated after the creation of the data flow. For example, you may use a data flow to regularly process sales data each month. If that sales data is updated weekly, new categories may be introduced into columns for which an encode categorical step is defined.
- When you select **Sampling** when you import your dataset, some categories may be left out of the sample.

In these situations, these new categories are considered missing values in the Data Wrangler job.

You can choose from and configure an *ordinal* and a *one-hot encode*. Use the following sections to learn more about these options.

Both transforms create a new column named **Output column name**. You specify the output format of this column with **Output style**:

- Select **Vector** to produce a single column with a sparse vector.
- Select **Columns** to create a column for every category with an indicator variable for whether the text in the original column contains a value that is equal to that category.

Ordinal Encode

Select **Ordinal encode** to encode categories into an integer between 0 and the total number of categories in the **Input column** you select.

Invalid handing strategy: Select a method to handle invalid or missing values.

- Choose **Skip** if you want to omit the rows with missing values.
- Choose **Keep** to retain missing values as the last category.
- Choose **Error** if you want Data Wrangler to throw an error if missing values are encountered in the **Input column**.
- Choose **Replace with NaN** to replace missing with NaN. This option is recommended if your ML algorithm can handle missing values. Otherwise, the first three options in this list may produce better results.

One-Hot Encode

Select **One-hot encode** for **Transform** to use one-hot encoding. Configure this transform using the following:

- **Drop last category**: If `True`, the last category does not have a corresponding index in the one-hot encoding. When missing values are possible, a missing category is always the last one and setting this to `True` means that a missing value results in an all zero vector.
- **Invalid handing strategy**: Select a method to handle invalid or missing values.
  - Choose **Skip** if you want to omit the rows with missing values.
  - Choose **Keep** to retain missing values as the last category.
  - Choose **Error** if you want Data Wrangler to throw an error if missing values are encountered in the **Input column**.
- **Is input ordinal encoded**: Select this option if the input vector contains ordinal encoded data. This option requires that input data contain non-negative integers. If **True**, input *i* is encoded as a vector with a non-zero in the *i*th location.

Similarity encode

Use similarity encoding when you have the following:

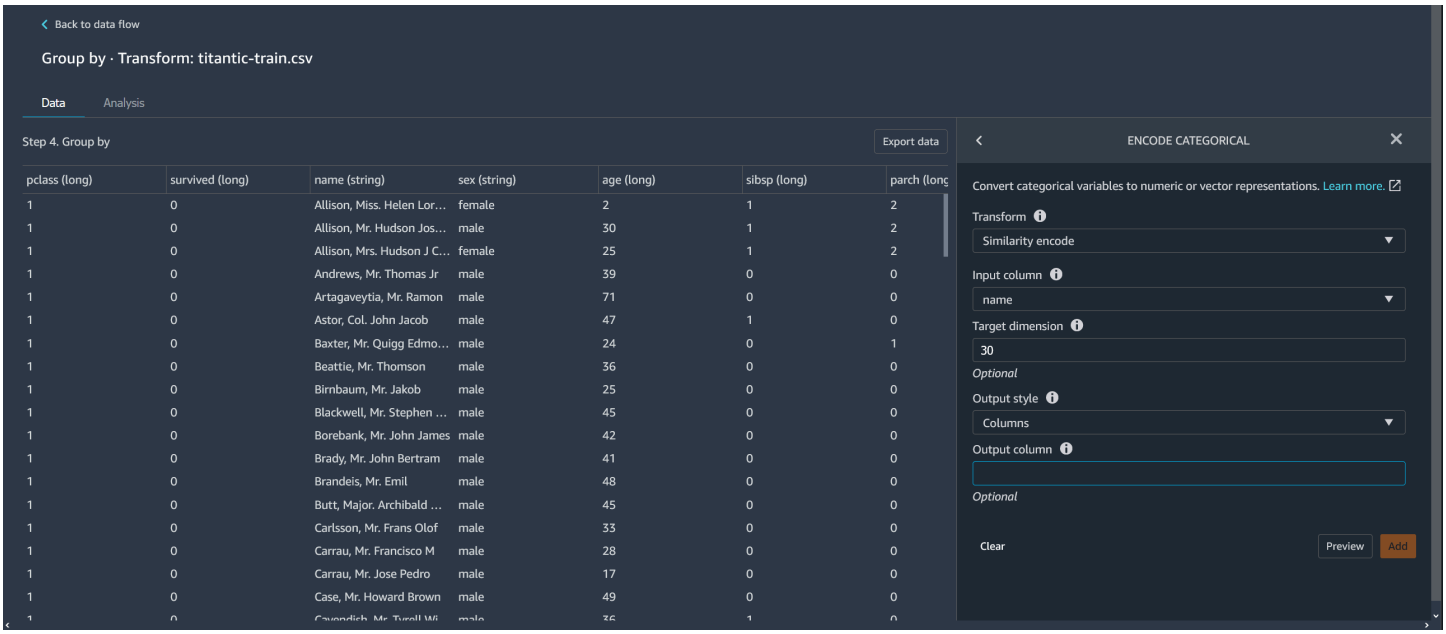
- A large number of categorical variables

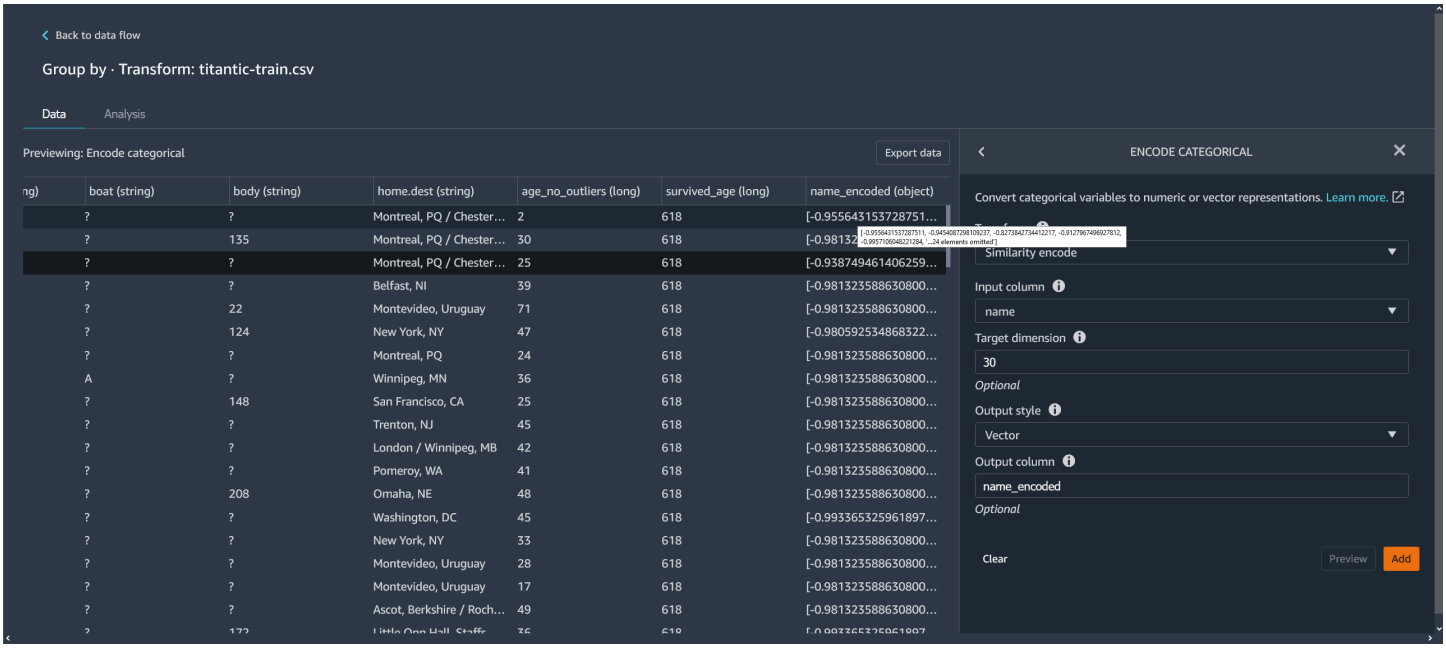
- Noisy data

The similarity encoder creates embeddings for columns with categorical data. An embedding is a mapping of discrete objects, such as words, to vectors of real numbers. It encodes similar strings to vectors containing similar values. For example, it creates very similar encodings for "California" and "Calfornia".

Data Wrangler converts each category in your dataset into a set of tokens using a 3-gram tokenizer. It converts the tokens into an embedding using min-hash encoding.

The following example shows how the similarity encoder creates vectors from strings.





The similarity encodings that Data Wrangler creates:

- Have low dimensionality
- Are scalable to a large number of categories
- Are robust and resistant to noise

For the preceding reasons, similarity encoding is more versatile than one-hot encoding.

To add the similarity encoding transform to your dataset, use the following procedure.

To use similarity encoding, do the following.

1. Sign in to the Amazon SageMaker Console.
2. Choose **Open Studio Classic**.
3. Choose **Launch app**.
4. Choose **Studio**.
5. Specify your data flow.
6. Choose a step with a transformation.
7. Choose **Add step**.
8. Choose **Encode categorical**.
9. Specify the following:

- **Transform** – **Similarity encode**
- **Input column** – The column containing the categorical data that you're encoding.
- **Target dimension** – (Optional) The dimension of the categorical embedding vector. The default value is 30. We recommend using a larger target dimension if you have a large dataset with many categories.
- **Output style** – Choose **Vector** for a single vector with all of the encoded values. Choose **Column** to have the encoded values in separate columns.
- **Output column** – (Optional) The name of the output column for a vector encoded output. For a column-encoded output, this is the prefix of the column names followed by listed number.

Featurize Text

Use the **Featurize Text** transform group to inspect string-typed columns and use text embedding to featurize these columns.

This feature group contains two features, *Character statistics* and *Vectorize*. Use the following sections to learn more about these transforms. For both options, the **Input column** must contain text data (string type).

Character Statistics

Use **Character statistics** to generate statistics for each row in a column containing text data.

This transform computes the following ratios and counts for each row, and creates a new column to report the result. The new column is named using the input column name as a prefix and a suffix that is specific to the ratio or count.

- **Number of words**: The total number of words in that row. The suffix for this output column is `-stats_word_count`.
- **Number of characters**: The total number of characters in that row. The suffix for this output column is `-stats_char_count`.
- **Ratio of upper**: The number of uppercase characters, from A to Z, divided by all characters in the column. The suffix for this output column is `-stats_capital_ratio`.
- **Ratio of lower**: The number of lowercase characters, from a to z, divided by all characters in the column. The suffix for this output column is `-stats_lower_ratio`.

- **Ratio of digits**: The ratio of digits in a single row over the sum of digits in the input column. The suffix for this output column is `-stats_digit_ratio`.
- **Special characters ratio**: The ratio of non-alphanumeric (characters like #$&%:@) characters to over the sum of all characters in the input column. The suffix for this output column is `-stats_special_ratio`.

Vectorize

Text embedding involves mapping words or phrases from a vocabulary to vectors of real numbers. Use the Data Wrangler text embedding transform to tokenize and vectorize text data into term frequency–inverse document frequency (TF-IDF) vectors.

When TF-IDF is calculated for a column of text data, each word in each sentence is converted to a real number that represents its semantic importance. Higher numbers are associated with less frequent words, which tend to be more meaningful.

When you define a **Vectorize** transform step, Data Wrangler uses the data in your dataset to define the count vectorizer and TF-IDF methods . Running a Data Wrangler job uses these same methods.

You configure this transform using the following:

- **Output column name**: This transform creates a new column with the text embedding. Use this field to specify a name for this output column.
- **Tokenizer**: A tokenizer converts the sentence into a list of words, or *tokens*.

  Choose **Standard** to use a tokenizer that splits by white space and converts each word to lowercase. For example, `"Good dog"` is tokenized to `["good","dog"]`.

  Choose **Custom** to use a customized tokenizer. If you choose **Custom**, you can use the following fields to configure the tokenizer:
  - **Minimum token length**: The minimum length, in characters, for a token to be valid. Defaults to `1`. For example, if you specify `3` for minimum token length, words like `a, at, in` are dropped from the tokenized sentence.
  - **Should regex split on gaps**: If selected, **regex** splits on gaps. Otherwise, it matches tokens. Defaults to `True`.
  - **Regex pattern**: Regex pattern that defines the tokenization process. Defaults to `' \\ s+'`.
  - **To lowercase**: If chosen, Data Wrangler converts all characters to lowercase before tokenization. Defaults to `True`.

To learn more, see the Spark documentation on Tokenizer.

- **Vectorizer**: The vectorizer converts the list of tokens into a sparse numeric vector. Each token corresponds to an index in the vector and a non-zero indicates the existence of the token in the input sentence. You can choose from two vectorizer options, *Count* and *Hashing*.
  - **Count vectorize** allows customizations that filter infrequent or too common tokens. **Count vectorize parameters** include the following:
    - **Minimum term frequency**: In each row, terms (tokens) with smaller frequency are filtered. If you specify an integer, this is an absolute threshold (inclusive). If you specify a fraction between 0 (inclusive) and 1, the threshold is relative to the total term count. Defaults to 1.
    - **Minimum document frequency**: Minimum number of rows in which a term (token) must appear to be included. If you specify an integer, this is an absolute threshold (inclusive). If you specify a fraction between 0 (inclusive) and 1, the threshold is relative to the total term count. Defaults to 1.
    - **Maximum document frequency**: Maximum number of documents (rows) in which a term (token) can appear to be included. If you specify an integer, this is an absolute threshold (inclusive). If you specify a fraction between 0 (inclusive) and 1, the threshold is relative to the total term count. Defaults to `0.999`.
    - **Maximum vocabulary size**: Maximum size of the vocabulary. The vocabulary is made up of all terms (tokens) in all rows of the column. Defaults to 262144.
    - **Binary outputs**: If selected, the vector outputs do not include the number of appearances of a term in a document, but rather are a binary indicator of its appearance. Defaults to `False`.

    To learn more about this option, see the Spark documentation on CountVectorizer.
  - **Hashing** is computationally faster. **Hash vectorize parameters** includes the following:
    - **Number of features during hashing**: A hash vectorizer maps tokens to a vector index according to their hash value. This feature determines the number of possible hash values. Large values result in fewer collisions between hash values but a higher dimension output vector.

    To learn more about this option, see the Spark documentation on FeatureHasher
- **Apply IDF** applies an IDF transformation, which multiplies the term frequency with the standard inverse document frequency used for TF-IDF embedding. **IDF parameters** include the following:
  - **Minimum document frequency** : Minimum number of documents (rows) in which a term (token) must appear to be included. If **count_vectorize** is the chosen vectorizer, we

recommend that you keep the default value and only modify the **min_doc_freq** field in **Count vectorize parameters**. Defaults to 5.

- **Output format**:The output format of each row.
  - Select **Vector** to produce a single column with a sparse vector.
  - Select **Flattened** to create a column for every category with an indicator variable for whether the text in the original column contains a value that is equal to that category. You can only choose flattened when **Vectorizer** is set as **Count vectorizer**.

Transform Time Series

In Data Wrangler, you can transform time series data. The values in a time series dataset are indexed to specific time. For example, a dataset that shows the number of customers in a store for each hour in a day is a time series dataset. The following table shows an example of a time series dataset.

Hourly number of customers in a store

Number of customers	Time (hour)
4	09:00
10	10:00
14	11:00
25	12:00
20	13:00
18	14:00

For the preceding table, the **Number of Customers** column contains the time series data. The time series data is indexed on the hourly data in the **Time (hour)** column.

You might need to perform a series of transformations on your data to get it in a format that you can use for your analysis. Use the **Time series** transform group to transform your time series data. For more information about the transformations that you can perform, see the following sections.

Topics

- Group by a Time Series
- Resample Time Series Data
- Handle Missing Time Series Data
- Validate the Timestamp of Your Time Series Data
- Standardizing the Length of the Time Series
- Extract Features from Your Time Series Data
- Use Lagged Features from Your Time Series Data
- Create a Datetime Range In Your Time Series
- Use a Rolling Window In Your Time Series

Group by a Time Series

You can use the group by operation to group time series data for specific values in a column.

For example, you have the following table that tracks the average daily electricity usage in a household.

Average daily household electricity usage

Household ID	Daily timestamp	Electricity usage (kWh)	Number of household occupants
household_0	1/1/2020	30	2
household_0	1/2/2020	40	2
household_0	1/4/2020	35	3
household_1	1/2/2020	45	3
household_1	1/3/2020	55	4

If you choose to group by ID, you get the following table.

Electricity usage grouped by household ID

Household ID	Electricity usage series (kWh)	Number of household occupants series
household_0	[30, 40, 35]	[2, 2, 3]
household_1	[45, 55]	[3, 4]

Each entry in the time series sequence is ordered by the corresponding timestamp. The first element of the sequence corresponds to the first timestamp of the series. For `household_0`, `30` is the first value of the **Electricity Usage Series**. The value of `30` corresponds to the first timestamp of `1/1/2020`.

You can include the starting timestamp and ending timestamp. The following table shows how that information appears.

Electricity usage grouped by household ID

Household ID	Electricity usage series (kWh)	Number of household occupants series	Start_time	End_time
household_0	[30, 40, 35]	[2, 2, 3]	1/1/2020	1/4/2020
household_1	[45, 55]	[3, 4]	1/2/2020	1/3/2020

You can use the following procedure to group by a time series column.

1. Open your Data Wrangler data flow.
2. If you haven't imported your dataset, import it under the **Import data** tab.
3. In your data flow, under **Data types**, choose the **+**, and select **Add transform**.
4. Choose **Add step**.
5. Choose **Time Series**.
6. Under **Transform**, choose **Group by**.
7. Specify a column in **Group by this column**.
8. For **Apply to columns**, specify a value.

9. Choose **Preview** to generate a preview of the transform.
10. Choose **Add** to add the transform to the Data Wrangler data flow.

Resample Time Series Data

Time series data usually has observations that aren't taken at regular intervals. For example, a dataset could have some observations that are recorded hourly and other observations that are recorded every two hours.

Many analyses, such as forecasting algorithms, require the observations to be taken at regular intervals. Resampling gives you the ability to establish regular intervals for the observations in your dataset.

You can either upsample or downsample a time series. Downsampling increases the interval between observations in the dataset. For example, if you downsample observations that are taken either every hour or every two hours, each observation in your dataset is taken every two hours. The hourly observations are aggregated into a single value using an aggregation method such as the mean or median.

Upsampling reduces the interval between observations in the dataset. For example, if you upsample observations that are taken every two hours into hourly observations, you can use an interpolation method to infer hourly observations from the ones that have been taken every two hours. For information on interpolation methods, see pandas.DataFrame.interpolate.

You can resample both numeric and non-numeric data.

Use the **Resample** operation to resample your time series data. If you have multiple time series in your dataset, Data Wrangler standardizes the time interval for each time series.

The following table shows an example of downsampling time series data by using the mean as the aggregation method. The data is downsampled from every two hours to every hour.

Hourly temperature readings over a day before downsampling

Timestamp	Temperature (Celsius)
12:00	30
1:00	32

Timestamp	Temperature (Celsius)
2:00	35
3:00	32
4:00	30

Temperature readings downsampled to every two hours

Timestamp	Temperature (Celsius)
12:00	30
2:00	33.5
4:00	35

You can use the following procedure to resample time series data.

1. Open your Data Wrangler data flow.
2. If you haven't imported your dataset, import it under the **Import data** tab.
3. In your data flow, under **Data types**, choose the **+**, and select **Add transform**.
4. Choose **Add step**.
5. Choose **Resample**.
6. For **Timestamp**, choose the timestamp column.
7. For **Frequency unit**, specify the frequency that you're resampling.
8. (Optional) Specify a value for **Frequency quantity**.
9. Configure the transform by specifying the remaining fields.
10. Choose **Preview** to generate a preview of the transform.
11. Choose **Add** to add the transform to the Data Wrangler data flow.

Handle Missing Time Series Data

If you have missing values in your dataset, you can do one of the following:

- For datasets that have multiple time series, drop the time series that have missing values that are greater than a threshold that you specify.
- Impute the missing values in a time series by using other values in the time series.

Imputing a missing value involves replacing the data by either specifying a value or by using an inferential method. The following are the methods that you can use for imputation:

- Constant value – Replace all the missing data in your dataset with a value that you specify.
- Most common value – Replace all the missing data with the value that has the highest frequency in the dataset.
- Forward fill – Use a forward fill to replace the missing values with the non-missing value that precedes the missing values. For the sequence: [2, 4, 7, NaN, NaN, NaN, 8], all of the missing values are replaced with 7. The sequence that results from using a forward fill is [2, 4, 7, 7, 7, 7, 8].
- Backward fill – Use a backward fill to replace the missing values with the non-missing value that follows the missing values. For the sequence: [2, 4, 7, NaN, NaN, NaN, 8], all of the missing values are replaced with 8. The sequence that results from using a backward fill is [2, 4, 7, 8, 8, 8, 8].
- Interpolate – Uses an interpolation function to impute the missing values. For more information on the functions that you can use for interpolation, see pandas.DataFrame.interpolate.

Some of the imputation methods might not be able to impute of all the missing value in your dataset. For example, a **Forward fill** can't impute a missing value that appears at the beginning of the time series. You can impute the values by using either a forward fill or a backward fill.

You can either impute missing values within a cell or within a column.

The following example shows how values are imputed within a cell.

Electricity usage with missing values

Household ID	Electricity usage series (kWh)
household_0	[30, 40, 35, NaN, NaN]
household_1	[45, NaN, 55]

Electricity usage with values imputed using a forward fill

Household ID	Electricity usage series (kWh)
household_0	[30, 40, 35, 35, 35]
household_1	[45, 45, 55]

The following example shows how values are imputed within a column.

Average daily household electricity usage with missing values

Household ID	Electricity usage (kWh)
household_0	30
household_0	40
household_0	NaN
household_1	NaN
household_1	NaN

Average daily household electricity usage with values imputed using a forward fill

Household ID	Electricity usage (kWh)
household_0	30
household_0	40
household_0	40
household_1	40
household_1	40

You can use the following procedure to handle missing values.

1. Open your Data Wrangler data flow.
2. If you haven't imported your dataset, import it under the **Import data** tab.
3. In your data flow, under **Data types**, choose the **+**, and select **Add transform**.
4. Choose **Add step**.
5. Choose **Handle missing**.
6. For **Time series input type**, choose whether you want to handle missing values inside of a cell or along a column.
7. For **Impute missing values for this column**, specify the column that has the missing values.
8. For **Method for imputing values**, select a method.
9. Configure the transform by specifying the remaining fields.
10. Choose **Preview** to generate a preview of the transform.
11. If you have missing values, you can specify a method for imputing them under **Method for imputing values**.
12. Choose **Add** to add the transform to the Data Wrangler data flow.

Validate the Timestamp of Your Time Series Data

You might have time stamp data that is invalid. You can use the **Validate time stamp** function to determine whether the timestamps in your dataset are valid. Your timestamp can be invalid for one or more of the following reasons:

- Your timestamp column has missing values.
- The values in your timestamp column are not formatted correctly.

If you have invalid timestamps in your dataset, you can't perform your analysis successfully. You can use Data Wrangler to identify invalid timestamps and understand where you need to clean your data.

The time series validation works in one of the two ways:

You can configure Data Wrangler to do one of the following if it encounters missing values in your dataset:

- Drop the rows that have the missing or invalid values.

- Identify the rows that have the missing or invalid values.
- Throw an error if it finds any missing or invalid values in your dataset.

You can validate the timestamps on columns that either have the `timestamp` type or the `string` type. If the column has the `string` type, Data Wrangler converts the type of the column to `timestamp` and performs the validation.

You can use the following procedure to validate the timestamps in your dataset.

1. Open your Data Wrangler data flow.
2. If you haven't imported your dataset, import it under the **Import data** tab.
3. In your data flow, under **Data types**, choose the **+**, and select **Add transform**.
4. Choose **Add step**.
5. Choose **Validate timestamps**.
6. For **Timestamp Column**, choose the timestamp column.
7. For **Policy**, choose whether you want to handle missing timestamps.
8. (Optional) For **Output column**, specify a name for the output column.
9. If the date time column is formatted for the string type, choose **Cast to datetime**.
10. Choose **Preview** to generate a preview of the transform.
11. Choose **Add** to add the transform to the Data Wrangler data flow.

Standardizing the Length of the Time Series

If you have time series data stored as arrays, you can standardize each time series to the same length. Standardizing the length of the time series array might make it easier for you to perform your analysis on the data.

You can standardize your time series for data transformations that require the length of your data to be fixed.

Many ML algorithms require you to flatten your time series data before you use them. Flattening time series data is separating each value of the time series into its own column in a dataset. The number of columns in a dataset can't change, so the lengths of the time series need to be standardized between you flatten each array into a set of features.

Each time series is set to the length that you specify as a quantile or percentile of the time series set. For example, you can have three sequences that have the following lengths:

- 3
- 4
- 5

You can set the length of all of the sequences as the length of the sequence that has the 50th percentile length.

Time series arrays that are shorter than the length you've specified have missing values added. The following is an example format of standardizing the time series to a longer length: [2, 4, 5, NaN, NaN, NaN].

You can use different approaches to handle the missing values. For information on those approaches, see Handle Missing Time Series Data.

The time series arrays that are longer than the length that you specify are truncated.

You can use the following procedure to standardize the length of the time series.

1. Open your Data Wrangler data flow.
2. If you haven't imported your dataset, import it under the **Import data** tab.
3. In your data flow, under **Data types**, choose the **+**, and select **Add transform**.
4. Choose **Add step**.
5. Choose **Standardize length**.
6. For **Standardize the time series length for the column**, choose a column.
7. (Optional) For **Output column**, specify a name for the output column. If you don't specify a name, the transform is done in place.
8. If the datetime column is formatted for the string type, choose **Cast to datetime**.
9. Choose **Cutoff quantile** and specify a quantile to set the length of the sequence.
10. Choose **Flatten the output** to output the values of the time series into separate columns.
11. Choose **Preview** to generate a preview of the transform.
12. Choose **Add** to add the transform to the Data Wrangler data flow.

Extract Features from Your Time Series Data

If you're running a classification or a regression algorithm on your time series data, we recommend extracting features from the time series before running the algorithm. Extracting features might improve the performance of your algorithm.

Use the following options to choose how you want to extract features from your data:

- Use **Minimal subset** to specify extracting 8 features that you know are useful in downstream analyses. You can use a minimal subset when you need to perform computations quickly. You can also use it when your ML algorithm has a high risk of overfitting and you want to provide it with fewer features.
- Use **Efficient subset** to specify extracting the most features possible without extracting features that are computationally intensive in your analyses.
- Use **All features** to specify extracting all features from the tune series.
- Use **Manual subset** to choose a list of features that you think explain the variation in your data well.

Use the following the procedure to extract features from your time series data.

1. Open your Data Wrangler data flow.
2. If you haven't imported your dataset, import it under the **Import data** tab.
3. In your data flow, under **Data types**, choose the **+**, and select **Add transform**.
4. Choose **Add step**.
5. Choose **Extract features**.
6. For **Extract features for this column**, choose a column.
7. (Optional) Select **Flatten** to output the features into separate columns.
8. For **Strategy**, choose a strategy to extract the features.
9. Choose **Preview** to generate a preview of the transform.
10. Choose **Add** to add the transform to the Data Wrangler data flow.

Use Lagged Features from Your Time Series Data

For many use cases, the best way to predict the future behavior of your time series is to use its most recent behavior.

The most common uses of lagged features are the following:

- Collecting a handful of past values. For example, for time, t + 1, you collect t, t - 1, t - 2, and t - 3.
- Collecting values that correspond to seasonal behavior in the data. For example, to predict the occupancy in a restaurant at 1:00 PM, you might want to use the features from 1:00 PM on the previous day. Using the features from 12:00 PM or 11:00 AM on the same day might not be as predictive as using the features from previous days.

1. Open your Data Wrangler data flow.
2. If you haven't imported your dataset, import it under the **Import data** tab.
3. In your data flow, under **Data types**, choose the **+**, and select **Add transform**.
4. Choose **Add step**.
5. Choose **Lag features**.
6. For **Generate lag features for this column**, choose a column.
7. For **Timestamp Column**, choose the column containing the timestamps.
8. For **Lag**, specify the duration of the lag.
9. (Optional) Configure the output using one of the following options:
    - **Include the entire lag window**
    - **Flatten the output**
    - **Drop rows without history**
10. Choose **Preview** to generate a preview of the transform.
11. Choose **Add** to add the transform to the Data Wrangler data flow.

Create a Datetime Range In Your Time Series

You might have time series data that don't have timestamps. If you know that the observations were taken at regular intervals, you can generate timestamps for the time series in a separate column. To generate timestamps, you specify the value for the start timestamp and the frequency of the timestamps.

For example, you might have the following time series data for the number of customers at a restaurant.

Time series data on the number of customers at a restaurant

Number of customers
10
14
24
40
30
20

If you know that the restaurant opened at 5:00 PM and that the observations are taken hourly, you can add a timestamp column that corresponds to the time series data. You can see the timestamp column in the following table.

Time series data on the number of customers at a restaurant

Number of customers	Timestamp
10	1:00 PM
14	2:00 PM
24	3:00 PM
40	4:00 PM
30	5:00 PM
20	6:00 PM

Use the following procedure to add a datetime range to your data.

1. Open your Data Wrangler data flow.
2. If you haven't imported your dataset, import it under the **Import data** tab.

3. In your data flow, under **Data types**, choose the **+**, and select **Add transform**.
4. Choose **Add step**.
5. Choose **Datetime range**.
6. For **Frequency type**, choose the unit used to measure the frequency of the timestamps.
7. For **Starting timestamp**, specify the start timestamp.
8. For **Output column**, specify a name for the output column.
9. (Optional) Configure the output using the remaining fields.
10. Choose **Preview** to generate a preview of the transform.
11. Choose **Add** to add the transform to the Data Wrangler data flow.

Use a Rolling Window In Your Time Series

You can extract features over a time period. For example, for time, *t*, and a time window length of 3, and for the row that indicates the *t*th timestamp, we append the features that are extracted from the time series at times *t* - 3, *t* -2, and *t* - 1. For information on extracting features, see Extract Features from Your Time Series Data.

You can use the following procedure to extract features over a time period.

1. Open your Data Wrangler data flow.
2. If you haven't imported your dataset, import it under the **Import data** tab.
3. In your data flow, under **Data types**, choose the **+**, and select **Add transform**.
4. Choose **Add step**.
5. Choose **Rolling window features**.
6. For **Generate rolling window features for this column**, choose a column.
7. For **Timestamp Column**, choose the column containing the timestamps.
8. (Optional) For **Output Column**, specify the name of the output column.
9. For **Window size**, specify the window size.
10. For **Strategy**, choose the extraction strategy.
11. Choose **Preview** to generate a preview of the transform.
12. Choose **Add** to add the transform to the Data Wrangler data flow.

Featurize Datetime

Use **Featurize date/time** to create a vector embedding representing a datetime field. To use this transform, your datetime data must be in one of the following formats:

- Strings describing datetime: For example, `"January 1st, 2020, 12:44pm"`.
- A Unix timestamp: A Unix timestamp describes the number of seconds, milliseconds, microseconds, or nanoseconds from 1/1/1970.

You can choose to **Infer datetime format** and provide a **Datetime format**. If you provide a datetime format, you must use the codes described in the Python documentation. The options you select for these two configurations have implications for the speed of the operation and the final results.

- The most manual and computationally fastest option is to specify a **Datetime format** and select **No** for **Infer datetime format**.
- To reduce manual labor, you can choose **Infer datetime format** and not specify a datetime format. It is also a computationally fast operation; however, the first datetime format encountered in the input column is assumed to be the format for the entire column. If there are other formats in the column, these values are NaN in the final output. Inferring the datetime format can give you unparsed strings.
- If you don't specify a format and select **No** for **Infer datetime format**, you get the most robust results. All the valid datetime strings are parsed. However, this operation can be an order of magnitude slower than the first two options in this list.

When you use this transform, you specify an **Input column** which contains datetime data in one of the formats listed above. The transform creates an output column named **Output column name**. The format of the output column depends on your configuration using the following:

- **Vector**: Outputs a single column as a vector.
- **Columns**: Creates a new column for every feature. For example, if the output contains a year, month, and day, three separate columns are created for year, month, and day.

Additionally, you must choose an **Embedding mode**. For linear models and deep networks, we recommend choosing **cyclic**. For tree-based algorithms, we recommend choosing **ordinal**.

Format String

The **Format string** transforms contain standard string formatting operations. For example, you can use these operations to remove special characters, normalize string lengths, and update string casing.

This feature group contains the following transforms. All transforms return copies of the strings in the **Input column** and add the result to a new, output column.

Name	Function
Left pad	Left-pad the string with a given **Fill character** to the given **width**. If the string is longer than **width**, the return value is shortened to **width** characters.
Right pad	Right-pad the string with a given **Fill character** to the given **width**. If the string is longer than **width**, the return value is shortened to **width** characters.
Center (pad on either side)	Center-pad the string (add padding on both sides of the string) with a given **Fill character** to the given **width**. If the string is longer than **width**, the return value is shortened to **width** characters.
Prepend zeros	Left-fill a numeric string with zeros, up to a given **width**. If the string is longer than **width**, the return value is shortened to **width** characters.
Strip left and right	Returns a copy of the string with the leading and trailing characters removed.
Strip characters from left	Returns a copy of the string with leading characters removed.

Name	Function
Strip characters from right	Returns a copy of the string with trailing characters removed.
Lower case	Convert all letters in text to lowercase.
Upper case	Convert all letters in text to uppercase.
Capitalize	Capitalize the first letter in each sentence.
Swap case	Converts all uppercase characters to lowercase and all lowercase characters to uppercase characters of the given string, and returns it.
Add prefix or suffix	Adds a prefix and a suffix the string column. You must specify at least one of **Prefix** and **Suffix**.
Remove symbols	Removes given symbols from a string. All listed characters are removed. Defaults to white space.

Handle Outliers

Machine learning models are sensitive to the distribution and range of your feature values. Outliers, or rare values, can negatively impact model accuracy and lead to longer training times. Use this feature group to detect and update outliers in your dataset.

When you define a **Handle outliers** transform step, the statistics used to detect outliers are generated on the data available in Data Wrangler when defining this step. These same statistics are used when running a Data Wrangler job.

Use the following sections to learn more about the transforms this group contains. You specify an **Output name** and each of these transforms produces an output column with the resulting data.

Robust standard deviation numeric outliers

This transform detects and fixes outliers in numeric features using statistics that are robust to outliers.

You must define an **Upper quantile** and a **Lower quantile** for the statistics used to calculate outliers. You must also specify the number of **Standard deviations** from which a value must vary from the mean to be considered an outlier. For example, if you specify 3 for **Standard deviations**, a value must fall more than 3 standard deviations from the mean to be considered an outlier.

The **Fix method** is the method used to handle outliers when they are detected. You can choose from the following:

- **Clip**: Use this option to clip the outliers to the corresponding outlier detection bound.
- **Remove**: Use this option to remove rows with outliers from the dataframe.
- **Invalidate**: Use this option to replace outliers with invalid values.

Standard Deviation Numeric Outliers

This transform detects and fixes outliers in numeric features using the mean and standard deviation.

You specify the number of **Standard deviations** a value must vary from the mean to be considered an outlier. For example, if you specify 3 for **Standard deviations**, a value must fall more than 3 standard deviations from the mean to be considered an outlier.

The **Fix method** is the method used to handle outliers when they are detected. You can choose from the following:

- **Clip**: Use this option to clip the outliers to the corresponding outlier detection bound.
- **Remove**: Use this option to remove rows with outliers from the dataframe.
- **Invalidate**: Use this option to replace outliers with invalid values.

Quantile Numeric Outliers

Use this transform to detect and fix outliers in numeric features using quantiles. You can define an **Upper quantile** and a **Lower quantile**. All values that fall above the upper quantile or below the lower quantile are considered outliers.

The **Fix method** is the method used to handle outliers when they are detected. You can choose from the following:

- **Clip**: Use this option to clip the outliers to the corresponding outlier detection bound.

- **Remove**: Use this option to remove rows with outliers from the dataframe.
- **Invalidate**: Use this option to replace outliers with invalid values.

Min-Max Numeric Outliers

This transform detects and fixes outliers in numeric features using upper and lower thresholds. Use this method if you know threshold values that demark outliers.

You specify a **Upper threshold** and a **Lower threshold**, and if values fall above or below those thresholds respectively, they are considered outliers.

The **Fix method** is the method used to handle outliers when they are detected. You can choose from the following:

- **Clip**: Use this option to clip the outliers to the corresponding outlier detection bound.
- **Remove**: Use this option to remove rows with outliers from the dataframe.
- **Invalidate**: Use this option to replace outliers with invalid values.

Replace Rare

When you use the **Replace rare** transform, you specify a threshold and Data Wrangler finds all values that meet that threshold and replaces them with a string that you specify. For example, you may want to use this transform to categorize all outliers in a column into an "Others" category.

- **Replacement string**: The string with which to replace outliers.
- **Absolute threshold**: A category is rare if the number of instances is less than or equal to this absolute threshold.
- **Fraction threshold**: A category is rare if the number of instances is less than or equal to this fraction threshold multiplied by the number of rows.
- **Max common categories**: Maximum not-rare categories that remain after the operation. If the threshold does not filter enough categories, those with the top number of appearances are classified as not rare. If set to 0 (default), there is no hard limit to the number of categories.

Handle Missing Values

Missing values are a common occurrence in machine learning datasets. In some situations, it is appropriate to impute missing data with a calculated value, such as an average or categorically

common value. You can process missing values using the **Handle missing values** transform group. This group contains the following transforms.

Fill Missing

Use the **Fill missing** transform to replace missing values with a **Fill value** you define.

Impute Missing

Use the **Impute missing** transform to create a new column that contains imputed values where missing values were found in input categorical and numerical data. The configuration depends on your data type.

For numeric data, choose an imputing strategy, the strategy used to determine the new value to impute. You can choose to impute the mean or the median over the values that are present in your dataset. Data Wrangler uses the value that it computes to impute the missing values.

For categorical data, Data Wrangler imputes missing values using the most frequent value in the column. To impute a custom string, use the **Fill missing** transform instead.

Add Indicator for Missing

Use the **Add indicator for missing** transform to create a new indicator column, which contains a Boolean `"false"` if a row contains a value, and `"true"` if a row contains a missing value.

Drop Missing

Use the **Drop missing** option to drop rows that contain missing values from the **Input column**.

Manage Columns

You can use the following transforms to quickly update and manage columns in your dataset:

Name	Function
Drop Column	Delete a column.
Duplicate Column	Duplicate a column.
Rename Column	Rename a column.
Move Column	Move a column's location in the dataset. Choose to move your column to the start or

Name	Function
	end of the dataset, before or after a reference column, or to a specific index.

Manage Rows

Use this transform group to quickly perform sort and shuffle operations on rows. This group contains the following:

- **Sort**: Sort the entire dataframe by a given column. Select the check box next to **Ascending order** for this option; otherwise, deselect the check box and descending order is used for the sort.
- **Shuffle**: Randomly shuffle all rows in the dataset.

Manage Vectors

Use this transform group to combine or flatten vector columns. This group contains the following transforms.

- **Assemble**: Use this transform to combine Spark vectors and numeric data into a single column. For example, you can combine three columns: two containing numeric data and one containing vectors. Add all the columns you want to combine in **Input columns** and specify a **Output column name** for the combined data.
- **Flatten**: Use this transform to flatten a single column containing vector data. The input column must contain PySpark vectors or array-like objects. You can control the number of columns created by specifying a **Method to detect number of outputs**. For example, if you select **Length of first vector**, the number of elements in the first valid vector or array found in the column determines the number of output columns that are created. All other input vectors with too many items are truncated. Inputs with too few items are filled with NaNs.

  You also specify an **Output prefix**, which is used as the prefix for each output column.

Process Numeric

Use the **Process Numeric** feature group to process numeric data. Each scalar in this group is defined using the Spark library. The following scalars are supported:

- **Standard Scaler**: Standardize the input column by subtracting the mean from each value and scaling to unit variance. To learn more, see the Spark documentation for StandardScaler.
- **Robust Scaler**: Scale the input column using statistics that are robust to outliers. To learn more, see the Spark documentation for RobustScaler.
- **Min Max Scaler**: Transform the input column by scaling each feature to a given range. To learn more, see the Spark documentation for MinMaxScaler.
- **Max Absolute Scaler**: Scale the input column by dividing each value by the maximum absolute value. To learn more, see the Spark documentation for MaxAbsScaler.

Sampling

After you've imported your data, you can use the **Sampling** transformer to take one or more samples of it. When you use the sampling transformer, Data Wrangler samples your original dataset.

You can choose one of the following sample methods:

- **Limit**: Samples the dataset starting from the first row up to the limit that you specify.
- **Randomized**: Takes a random sample of a size that you specify.
- **Stratified**: Takes a stratified random sample.

You can stratify a randomized sample to make sure that it represents the original distribution of the dataset.

You might be performing data preparation for multiple use cases. For each use case, you can take a different sample and apply a different set of transformations.

The following procedure describes the process of creating a random sample.

To take a random sample from your data.

1. Choose the **+** to the right of the dataset that you've imported. The name of your dataset is located below the **+**.
2. Choose **Add transform**.
3. Choose **Sampling**.
4. For **Sampling method**, choose the sampling method.

5. For **Approximate sample size**, choose the approximate number of observations that you want in your sample.
6. (Optional) Specify an integer for **Random seed** to create a reproducible sample.

The following procedure describes the process of creating a stratified sample.

To take a stratified sample from your data.

1. Choose the **+** to the right of the dataset that you've imported. The name of your dataset is located below the **+**.
2. Choose **Add transform**.
3. Choose **Sampling**.
4. For **Sampling method**, choose the sampling method.
5. For **Approximate sample size**, choose the approximate number of observations that you want in your sample.
6. For **Stratify column**, specify the name of the column that you want to stratify on.
7. (Optional) Specify an integer for **Random seed** to create a reproducible sample.

Search and Edit

Use this section to search for and edit specific patterns within strings. For example, you can find and update strings within sentences or documents, split strings by delimiters, and find occurrences of specific strings.

The following transforms are supported under **Search and edit**. All transforms return copies of the strings in the **Input column** and add the result to a new output column.

Name	Function
Find substring	Returns the index of the first occurrence of the **Substring** for which you searched , You can start and end the search at **Start** and **End** respectively.
Find substring (from right)	Returns the index of the last occurrence of the **Substring** for which you searched. You

Name	Function
	can start and end the search at **Start** and **End** respectively.
Matches prefix	Returns a Boolean value if the string contains a given **Pattern**. A pattern can be a character sequence or regular expression. Optionally, you can make the pattern case sensitive.
Find all occurrences	Returns an array with all occurrences of a given pattern. A pattern can be a character sequence or regular expression.
Extract using regex	Returns a string that matches a given Regex pattern.
Extract between delimiters	Returns a string with all characters found between **Left delimiter** and **Right delimiter**.
Extract from position	Returns a string, starting from **Start position** in the input string, that contains all characters up to the start position plus **Length**.
Find and replace substring	Returns a string with all matches of a given **Pattern** (regular expression) replaced by **Replacement string**.
Replace between delimiters	Returns a string with the substring found between the first appearance of a **Left delimiter** and the last appearance of a **Right delimiter** replaced by **Replacement string**. If no match is found, nothing is replaced.

Name	Function
Replace from position	Returns a string with the substring between **Start position** and **Start position** plus **Length** replaced by **Replacement string**. If **Start position** plus **Length** is greater than the length of the replacement string, the output contains **...**.
Convert regex to missing	Converts a string to None if invalid and returns the result. Validity is defined with a regular expression in **Pattern**.
Split string by delimiter	Returns an array of strings from the input string, split by **Delimiter**, with up to **Max number of splits** (optional). The delimiter defaults to white space.

Split data

Use the **Split data** transform to split your dataset into two or three datasets. For example, you can split your dataset into a dataset used to train your model and a dataset used to test it. You can determine the proportion of the dataset that goes into each split. For example, if you're splitting one dataset into two datasets, the training dataset can have 80% of the data while the testing dataset has 20%.

Splitting your data into three datasets gives you the ability to create training, validation, and test datasets. You can see how well the model performs on the test dataset by dropping the target column.

Your use case determines how much of the original dataset each of your datasets get and the method you use to split the data. For example, you might want to use a stratified split to make sure that the distribution of the observations in the target column are the same across datasets. You can use the following split transforms:

- Randomized split — Each split is a random, non-overlapping sample of the original dataset. For larger datasets, using a randomized split might be computationally expensive and take longer than an ordered split.

- Ordered split – Splits the dataset based on the sequential order of the observations. For example, for an 80/20 train-test split, the first observations that make up 80% of the dataset go to the training dataset. The last 20% of the observations go to the testing dataset. Ordered splits are effective in keeping the existing order of the data between splits.
- Stratified split – Splits the dataset to make sure that the number of observations in the input column have proportional representation. For an input column that has the observations 1, 1, 1, 1, 1, 1, 2, 2, 2, 2, 2, 2, 2, 2, 3, 3, 3, 3, 3, 3, 3, an 80/20 split on the column would mean that approximately 80% of the 1s, 80% of the 2s, and 80% of the 3s go to the training set. About 20% of each type of observation go to the testing set.
- Split by key – Avoids data with the same key occurring in more than one split. For example, if you have a dataset with the column 'customer_id' and you're using it as a key, no customer id is in more than one split.

After you split the data, you can apply additional transformations to each dataset. For most use cases, they aren't necessary.

Data Wrangler calculates the proportions of the splits for performance. You can choose an error threshold to set the accuracy of the splits. Lower error thresholds more accurately reflect the proportions that you specify for the splits. If you set a higher error threshold, you get better performance, but lower accuracy.

For perfectly split data, set the error threshold to 0. You can specify a threshold between 0 and 1 for better performance. If you specify a value greater than 1, Data Wrangler interprets that value as 1.

If you have 10000 rows in your dataset and you specify an 80/20 split with an error of 0.001, you would get observations approximating one of the following results:

- 8010 observations in the training set and 1990 in the testing set
- 7990 observations in the training set and 2010 in the testing set

The number of observations for the testing set in the preceding example is in the interval between 8010 and 7990.

By default, Data Wrangler uses a random seed to make the splits reproducible. You can specify a different value for the seed to create a different reproducible split.

Randomized split

Use the following procedure to perform a randomized split on your dataset.

To split your dataset randomly, do the following

1. Choose the **+** next to the node containing the dataset that you're splitting.
2. Choose **Add transform**.
3. Choose **Split data**.
4. (Optional) For **Splits**, specify the names and proportions of each split. The proportions must sum to 1.
5. (Optional) Choose the **+** to create an additional split.
   - Specify the names and proportions of all the splits. The proportions must sum to 1.
6. (Optional) Specify a value for **Error threshold** other than the default value.
7. (Optional) Specify a value for **Random seed**.
8. Choose **Preview**.
9. Choose **Add**.

Ordered split

Use the following procedure to perform an ordered split on your dataset.

To make an ordered split in your dataset, do the following.

1. Choose the **+** next to the node containing the dataset that you're splitting.
2. Choose **Add transform**.
3. For **Transform**, choose **Ordered split**.
4. Choose **Split data**.
5. (Optional) For **Splits**, specify the names and proportions of each split. The proportions must sum to 1.
6. (Optional) Choose the **+** to create an additional split.
   - Specify the names and proportions of all the splits. The proportions must sum to 1.
7. (Optional) Specify a value for **Error threshold** other than the default value.

8. (Optional) For **Input column**, specify a column with numeric values. Uses the values of the columns to infer which records are in each split. The smaller values are in one split with the larger values in the other splits.
9. (Optional) Select **Handle duplicates** to add noise to duplicate values and create a dataset of entirely unique values.
10. (Optional) Specify a value for **Random seed**.
11. Choose **Preview**.
12. Choose **Add**.

Stratified split

Use the following procedure to perform a stratified split on your dataset.

To make a stratified split in your dataset, do the following.

1. Choose the **+** next to the node containing the dataset that you're splitting.
2. Choose **Add transform**.
3. Choose **Split data**.
4. For **Transform**, choose **Stratified split**.
5. (Optional) For **Splits**, specify the names and proportions of each split. The proportions must sum to 1.
6. (Optional) Choose the **+** to create an additional split.
    - Specify the names and proportions of all the splits. The proportions must sum to 1.
7. For **Input column**, specify a column with up to 100 unique values. Data Wrangler can't stratify a column with more than 100 unique values.
8. (Optional) Specify a value for **Error threshold** other than the default value.
9. (Optional) Specify a value for **Random seed** to specify a different seed.
10. Choose **Preview**.
11. Choose **Add**.

Split by column keys

Use the following procedure to split by the column keys in your dataset.

To split by the column keys in your dataset, do the following.

1. Choose the **+** next to the node containing the dataset that you're splitting.
2. Choose **Add transform**.
3. Choose **Split data**.
4. For **Transform**, choose **Split by key**.
5. (Optional) For **Splits**, specify the names and proportions of each split. The proportions must sum to 1.
6. (Optional) Choose the **+** to create an additional split.
    - Specify the names and proportions of all the splits. The proportions must sum to 1.
7. For **Key columns**, specify the columns with values that you don't want to appear in both datasets.
8. (Optional) Specify a value for **Error threshold** other than the default value.
9. Choose **Preview**.
10. Choose **Add**.

Parse Value as Type

Use this transform to cast a column to a new type. The supported Data Wrangler data types are:

- Long
- Float
- Boolean
- Date, in the format dd-MM-yyyy, representing day, month, and year respectively.
- String

Validate String

Use the **Validate string** transforms to create a new column that indicates that a row of text data meets a specified condition. For example, you can use a **Validate string** transform to verify that a string only contains lowercase characters. The following transforms are supported under **Validate string**.

The following transforms are included in this transform group. If a transform outputs a Boolean value, `True` is represented with a `1` and `False` is represented with a `0`.

Name	Function
String length	Returns `True` if a string length equals specified length. Otherwise, returns `False`.
Starts with	Returns `True` if a string starts will a specified prefix. Otherwise, returns `False`.
Ends with	Returns `True` if a string length equals specified length. Otherwise, returns `False`.
Is alphanumeric	Returns `True` if a string only contains numbers and letters. Otherwise, returns `False`.
Is alpha (letters)	Returns `True` if a string only contains letters. Otherwise, returns `False`.
Is digit	Returns `True` if a string only contains digits. Otherwise, returns `False`.
Is space	Returns `True` if a string only contains numbers and letters. Otherwise, returns `False`.
Is title	Returns `True` if a string contains any white spaces. Otherwise, returns `False`.
Is lowercase	Returns `True` if a string only contains lower case letters. Otherwise, returns `False`.
Is uppercase	Returns `True` if a string only contains upper case letters. Otherwise, returns `False`.
Is numeric	Returns `True` if a string only contains numbers. Otherwise, returns `False`.

Name	Function
Is decimal	Returns `True` if a string only contains decimal numbers. Otherwise, returns `False`.

Unnest JSON Data

If you have a .csv file, you might have values in your dataset that are JSON strings. Similarly, you might have nested data in columns of either a Parquet file or a JSON document.

Use the **Flatten structured** operator to separate the first level keys into separate columns. A first level key is a key that isn't nested within a value.

For example, you might have a dataset that has a *person* column with demographic information on each person stored as JSON strings. A JSON string might look like the following.

```
"{"seq": 1,"name": {"first": "Nathaniel","last": "Ferguson"},"age": 59,"city":
"Posbotno","state": "WV"}"
```

The **Flatten structured** operator converts the following first level keys into additional columns in your dataset:

- seq
- name
- age
- city
- state

Data Wrangler puts the values of the keys as values under the columns. The following shows the column names and values of the JSON.

```
seq, name,                                  age, city, state
1, {"first": "Nathaniel","last": "Ferguson"}, 59, Posbotno, WV
```

For each value in your dataset containing JSON, the **Flatten structured** operator creates columns for the first-level keys. To create columns for nested keys, call the operator again. For the preceding example, calling the operator creates the columns:

- name_first
- name_last

The following example shows the dataset that results from calling the operation again.

```
seq, name,                                    age, city, state, name_first, name_last
1, {"first": "Nathaniel","last": "Ferguson"}, 59, Posbotno, WV, Nathaniel, Ferguson
```

Choose **Keys to flatten on** to specify the first-level keys that want to extract as separate columns. If you don't specify any keys, Data Wrangler extracts all the keys by default.

Explode Array

Use **Explode array** to expand the values of the array into separate output rows. For example, the operation can take each value in the array, [[1, 2, 3,], [4, 5, 6], [7, 8, 9]] and create a new column with the following rows:

```
[1, 2, 3]
[4, 5, 6]
[7, 8, 9]
```

Data Wrangler names the new column, input_column_name_flatten.

You can call the **Explode array** operation multiple times to get the nested values of the array into separate output columns. The following example shows the result of calling the operation multiple times on a dataset with a nested array.

Putting the values of a nested array into separate columns

id	array	id	array_items	id	array_items_items
1	[[cat, dog], [bat, frog]]	1	[cat, dog]	1	cat
2	[[rose, petunia], [lily, daisy]]	1	[bat, frog]	1	dog
		2	[rose, petunia]	1	bat
		2	[lily, daisy]	1	frog
			2	2	rose
			2	2	petunia
			2	2	lily
			2	2	daisy

Transform Image Data

Use Data Wrangler to import and transform the images that you're using for your machine learning (ML) pipelines. After you've prepared your image data, you can export it from your Data Wrangler flow to your ML pipeline.

You can use the information provided here to familiarize yourself with importing and transforming image data in Data Wrangler. Data Wrangler uses OpenCV to import images. For more information about supported image formats, see Image file reading and writing.

After you've familiarized yourself with the concepts of transforming your image data, go through the following tutorial, Prepare image data with Amazon SageMaker Data Wrangler.

The following industries and use cases are examples where applying machine learning to transformed image data can be useful:

- Manufacturing – Identifying defects in items from the assembly line
- Food – Identifying spoiled or rotten food
- Medicine – Identifying lesions in tissues

When you work with image data in Data Wrangler, you go through the following process:

1. Import – Select the images by choosing the directory containing them in your Amazon S3 bucket.
2. Transform – Use the built-in transformations to prepare the images for your machine learning pipeline.
3. Export – Export the images that you've transformed to a location that can be accessed from the pipeline.

Use the following procedure to import your image data.

To import your image data

1. Navigate to the **Create connection** page.
2. Choose **Amazon S3**.
3. Specify the Amazon S3 file path that contains the image data.
4. For **File type**, choose **Image**.
5. (Optional) Choose **Import nested directories** to import images from multiple Amazon S3 paths.
6. Choose **Import**.

Data Wrangler uses the open-source imgaug library for its built-in image transformations. You can use the following built-in transformations:

- **ResizeImage**
- **EnhanceImage**
- **CorruptImage**
- **SplitImage**
- **DropCorruptedImages**

- **DropImageDuplicates**
- **Brightness**
- **ColorChannels**
- **Grayscale**
- **Rotate**

Use the following procedure to transform your images without writing code.

To transform the image data without writing code

1. From your Data Wrangler flow, choose the **+** next to the node representing the images that you've imported.
2. Choose **Add transform**.
3. Choose **Add step**.
4. Choose the transform and configure it.
5. Choose **Preview**.
6. Choose **Add**.

In addition to using the transformations that Data Wrangler provides, you can also use your own custom code snippets. For more information about using custom code snippets, see Custom Transforms. You can import the OpenCV and imgaug libraries within your code snippets and use the transforms associated with them. The following is an example of a code snippet that detects edges within the images.

```
# A table with your image data is stored in the `df` variable
import cv2
import numpy as np
from pyspark.sql.functions import column

from sagemaker_dataprep.compute.operators.transforms.image.constants import
 DEFAULT_IMAGE_COLUMN, IMAGE_COLUMN_TYPE
from sagemaker_dataprep.compute.operators.transforms.image.decorators import
 BasicImageOperationDecorator, PandasUDFOperationDecorator

@BasicImageOperationDecorator
```

```
def my_transform(image: np.ndarray) -> np.ndarray:
  # To use the code snippet on your image data, modify the following lines within the
 function
    HYST_THRLD_1, HYST_THRLD_2 = 100, 200
    edges = cv2.Canny(image,HYST_THRLD_1,HYST_THRLD_2)
    return edges

@PandasUDFOperationDecorator(IMAGE_COLUMN_TYPE)
def custom_image_udf(image_row):
    return my_transform(image_row)

df = df.withColumn(DEFAULT_IMAGE_COLUMN,
 custom_image_udf(column(DEFAULT_IMAGE_COLUMN)))
```

When apply transformations in your Data Wrangler flow, Data Wrangler only applies them to a sample of the images in your dataset. To optimize your experience with the application, Data Wrangler doesn't apply the transforms to all of your images.

To apply the transformations to all of your images, export your Data Wrangler flow to an Amazon S3 location. You can use the images that you've exported in your training or inference pipelines. Use a destination node or a Jupyter Notebook to export your data. You can access either method for exporting your data from the Data Wrangler flow. For information about using these methods, see Export to Amazon S3.

Filter data

Use Data Wrangler to filter the data in your columns. When you filter the data in a column, you specify the following fields:

- **Column name** – The name of the column that you're using to filter the data.
- **Condition** – The type of filter that you're applying to values in the column.
- **Value** – The value or category in the column to which you're applying the filter.

You can filter on the following conditions:

- **=** – Returns values that match the value or category that you specify.
- **!=** – Returns values that don't match the value or category that you specify.

- **>=** – For **Long** or **Float** data, filters for values that are greater than or equal to the value that you specify.
- **<=** – For **Long** or **Float** data, filters for values that are less than or equal to the value that you specify.
- **>** – For **Long** or **Float** data, filters for values that are greater than the value that you specify.
- **<** – For **Long** or **Float** data, filters for values that are less than the value that you specify.

For a column that has the categories, `male` and `female`, you can filter out all the `male` values. You could also filter for all the `female` values. Because there are only `male` and `female` values in the column, the filter returns a column that only has `female` values.

You can also add multiple filters. The filters can be applied across multiple columns or the same column. For example, if you're creating a column that only has values within a certain range, you add two different filters. One filter specifies that the column must have values greater than the value that you provide. The other filter specifies that the column must have values less than the value that you provide.

Use the following procedure to add the filter transform to your data.

To filter your data

1. From your Data Wrangler flow, choose the **+** next to the node with the data that you're filtering.
2. Choose **Add transform**.
3. Choose **Add step**.
4. Choose **Filter data**.
5. Specify the following fields:
   - **Column name** – The column that you're filtering.
   - **Condition** – The condition of the filter.
   - **Value** – The value or category in the column to which you're applying the filter.
6. (Optional) Choose **+** following the filter that you've created.
7. Configure the filter.
8. Choose **Preview**.
9. Choose **Add**.

Map Columns for Amazon Personalize

Data Wrangler integrates with Amazon Personalize, a fully managed machine learning service that generates item recommendations and user segments. You can use the **Map columns for Amazon Personalize** transform to get your data into a format that Amazon Personalize can interpret. For more information about the transforms specific to Amazon Personalize, see Importing data using Amazon SageMaker Data Wrangler. For more information about Amazon Personalize see What is Amazon Personalize?

Analyze and Visualize

Amazon SageMaker Data Wrangler includes built-in analyses that help you generate visualizations and data analyses in a few clicks. You can also create custom analyses using your own code.

You add an analysis to a dataframe by selecting a step in your data flow, and then choosing **Add analysis**. To access an analysis you've created, select the step that contains the analysis, and select the analysis.

All analyses are generated using 100,000 rows of your dataset.

You can add the following analysis to a dataframe:

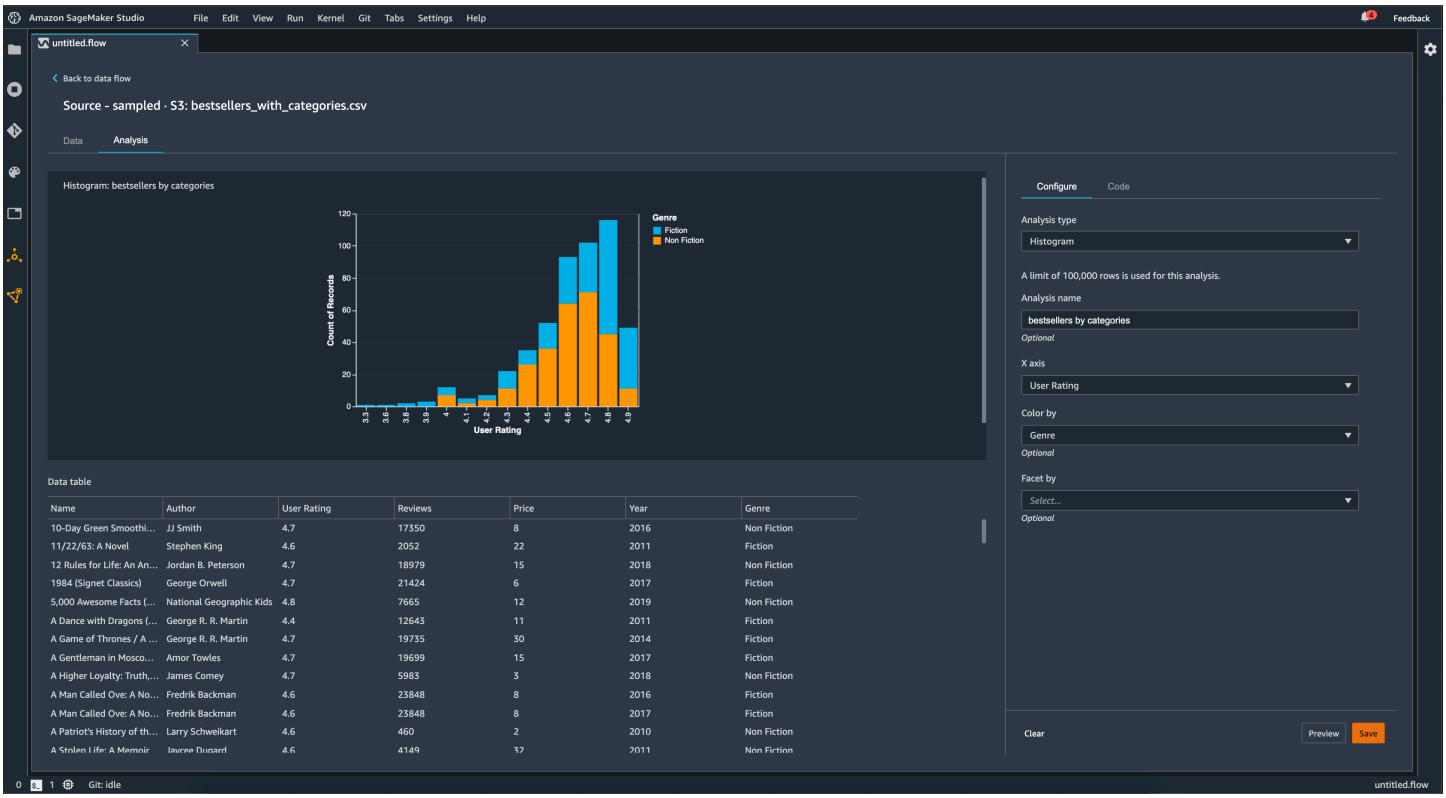
- Data visualizations, including histograms and scatter plots.
- A quick summary of your dataset, including number of entries, minimum and maximum values (for numeric data), and most and least frequent categories (for categorical data).
- A quick model of the dataset, which can be used to generate an importance score for each feature.
- A target leakage report, which you can use to determine if one or more features are strongly correlated with your target feature.
- A custom visualization using your own code.

Use the following sections to learn more about these options.

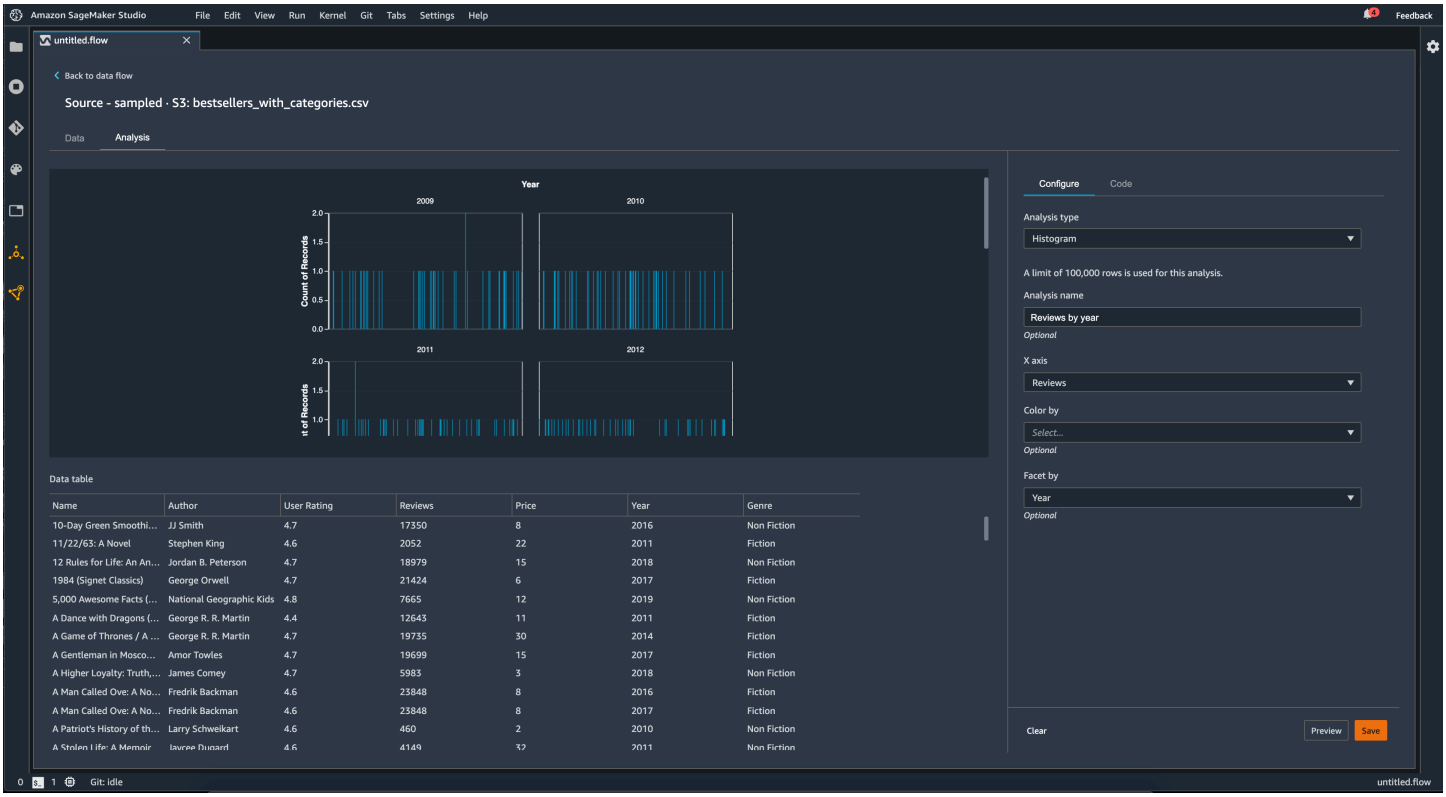
Histogram

Use histograms to see the counts of feature values for a specific feature. You can inspect the relationships between features using the **Color by** option. For example, the following histogram

charts the distribution of user ratings of the best-selling books on Amazon from 2009–2019, colored by genre.



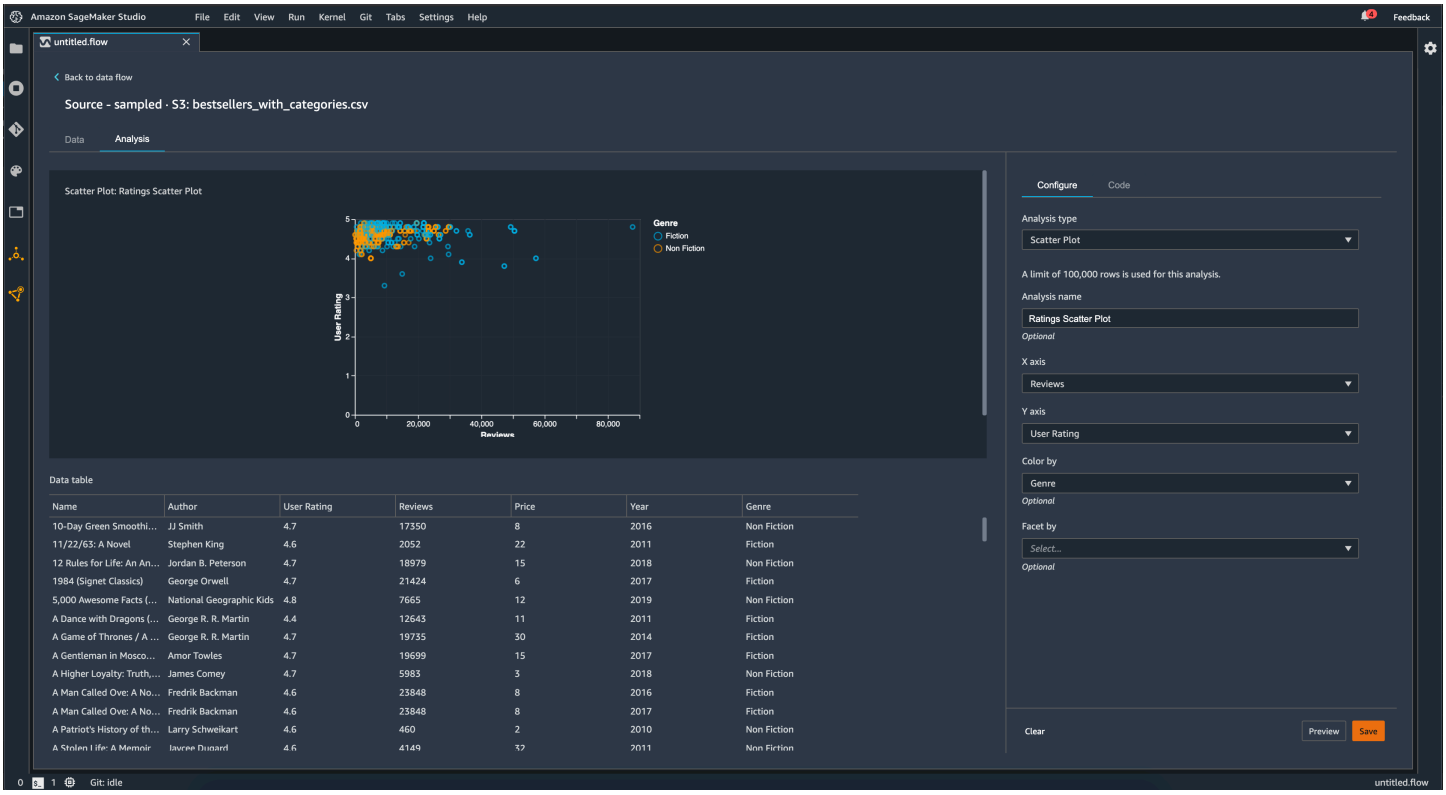
You can use the **Facet by** feature to create histograms of one column, for each value in another column. For example, the following diagram shows histograms of user reviews of best-selling books on Amazon if faceted by year.



Scatter Plot

Use the **Scatter Plot** feature to inspect the relationship between features. To create a scatter plot, select a feature to plot on the **X axis** and the **Y axis**. Both of these columns must be numeric typed columns.

You can color scatter plots by an additional column. For example, the following example shows a scatter plot comparing the number of reviews against user ratings of top-selling books on Amazon between 2009 and 2019. The scatter plot is colored by book genre.



Additionally, you can facet scatter plots by features. For example, the following image shows an example of the same review versus user rating scatter plot, faceted by year.

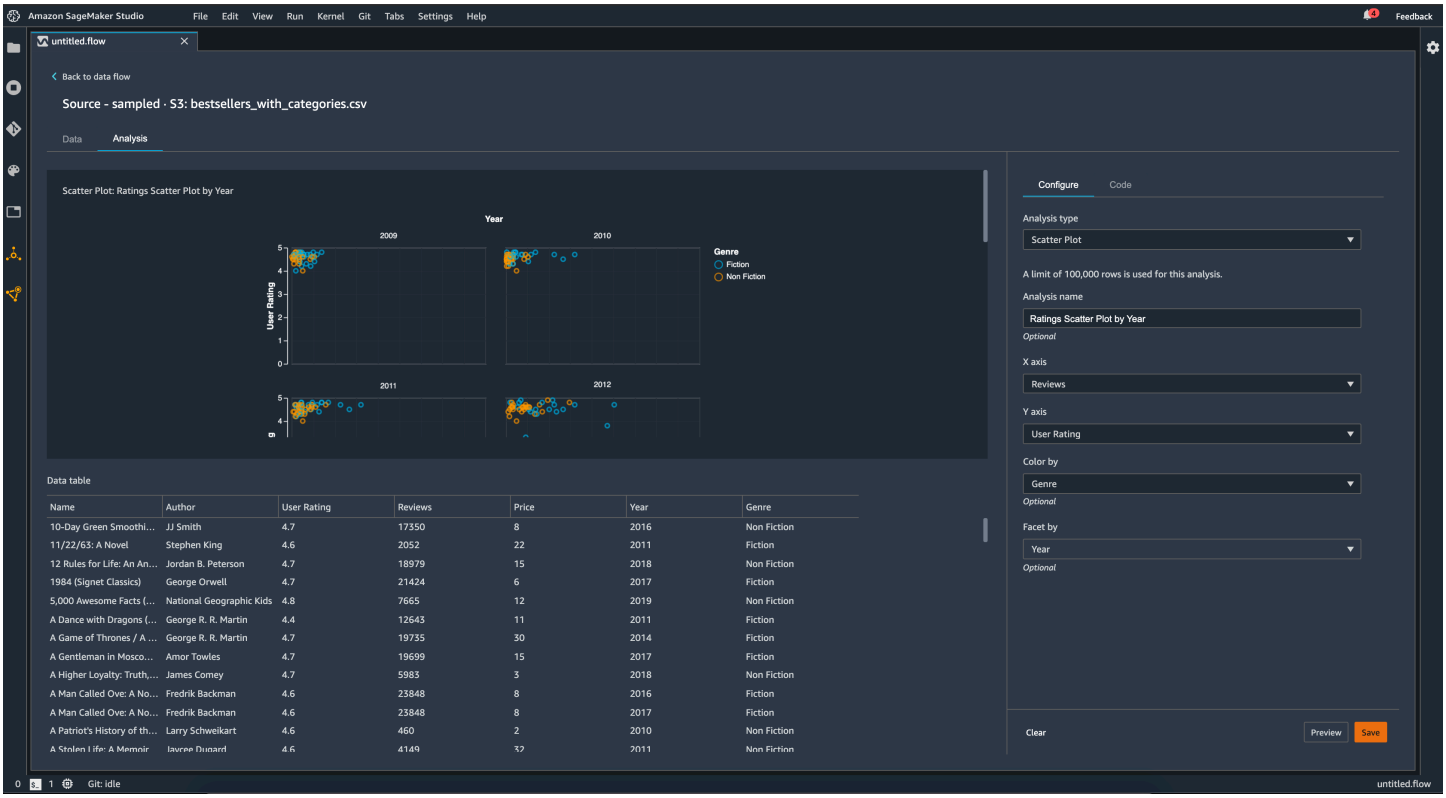


Table Summary

Use the **Table Summary** analysis to quickly summarize your data.

For columns with numerical data, including log and float data, a table summary reports the number of entries (count), minimum (min), maximum (max), mean, and standard deviation (stddev) for each column.

For columns with non-numerical data, including columns with string, Boolean, or date/time data, a table summary reports the number of entries (count), least frequent value (min), and most frequent value (max).

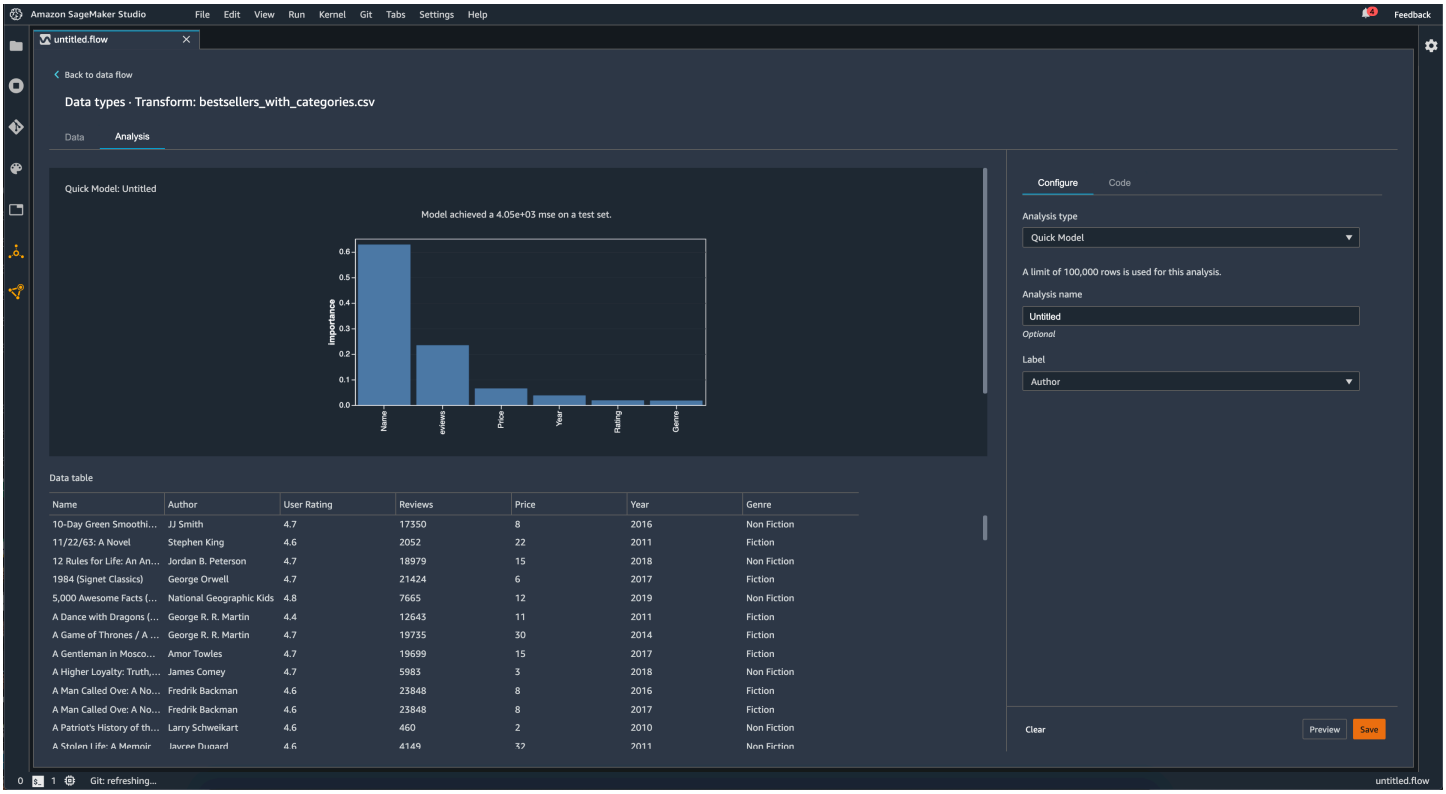
Quick Model

Use the **Quick Model** visualization to quickly evaluate your data and produce importance scores for each feature. A feature importance score score indicates how useful a feature is at predicting a target label. The feature importance score is between [0, 1] and a higher number indicates that the feature is more important to the whole dataset. On the top of the quick model chart, there is a model score. A classification problem shows an F1 score. A regression problem has a mean squared error (MSE) score.

When you create a quick model chart, you select a dataset you want evaluated, and a target label against which you want feature importance to be compared. Data Wrangler does the following:

- Infers the data types for the target label and each feature in the dataset selected.
- Determines the problem type. Based on the number of distinct values in the label column, Data Wrangler determines if this is a regression or classification problem type. Data Wrangler sets a categorical threshold to 100. If there are more than 100 distinct values in the label column, Data Wrangler classifies it as a regression problem; otherwise, it is classified as a classification problem.
- Pre-processes features and label data for training. The algorithm used requires encoding features to vector type and encoding labels to double type.
- Trains a random forest algorithm with 70% of data. Spark's RandomForestRegressor is used to train a model for regression problems. The RandomForestClassifier is used to train a model for classification problems.
- Evaluates a random forest model with the remaining 30% of data. Data Wrangler evaluates classification models using an F1 score and evaluates regression models using an MSE score.
- Calculates feature importance for each feature using the Gini importance method.

The following image shows the user interface for the quick model feature.



Target Leakage

Target leakage occurs when there is data in a machine learning training dataset that is strongly correlated with the target label, but is not available in real-world data. For example, you may have a column in your dataset that serves as a proxy for the column you want to predict with your model.

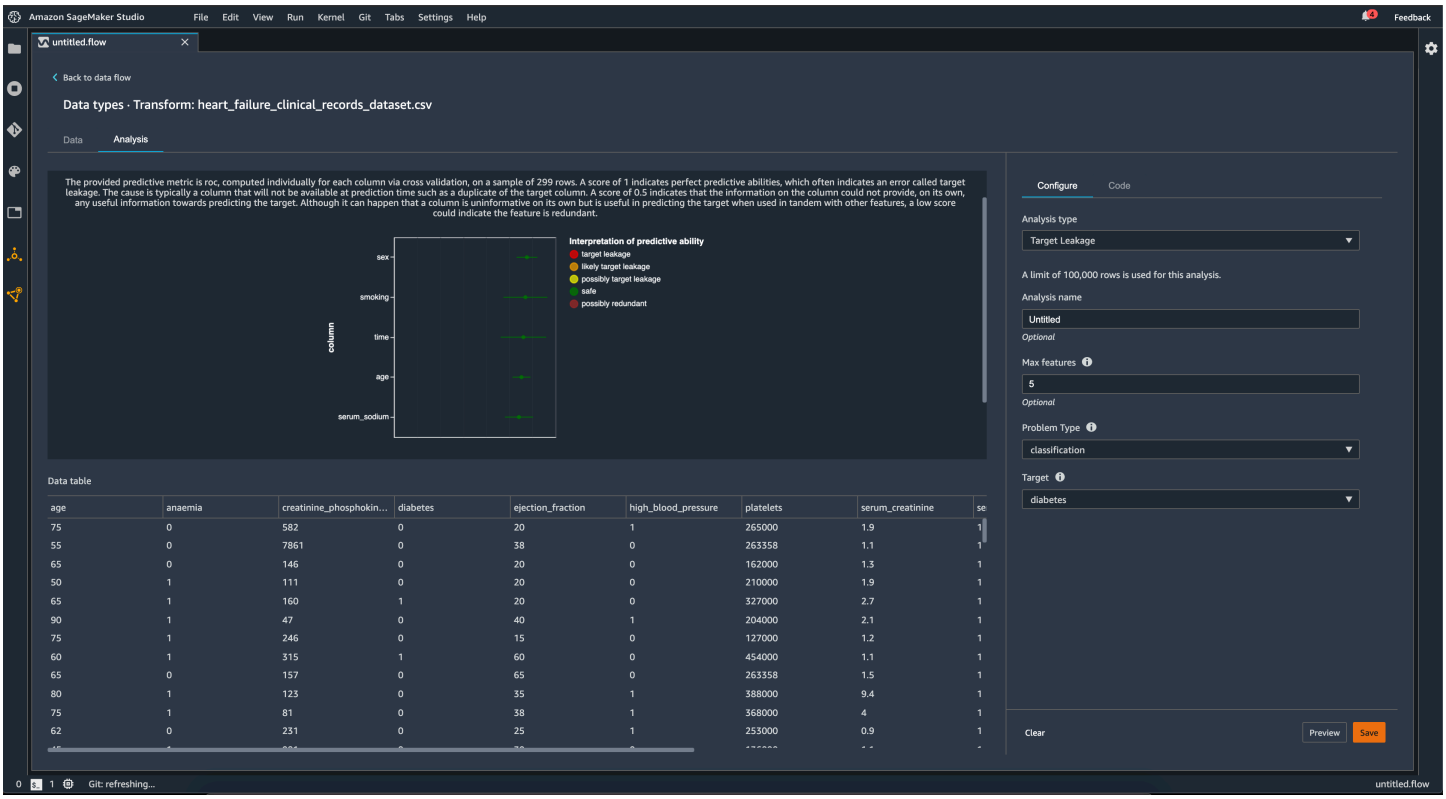
When you use the **Target Leakage** analysis, you specify the following:

- **Target**: This is the feature about which you want your ML model to be able to make predictions.
- **Problem type**: This is the ML problem type on which you are working. Problem type can either be **classification** or **regression**.
- (Optional) **Max features**: This is the maximum number of features to present in the visualization, which shows features ranked by their risk of being target leakage.

For classification, the target leakage analysis uses the area under the receiver operating characteristic, or AUC - ROC curve for each column, up to **Max features**. For regression, it uses a coefficient of determination, or R2 metric.

The AUC - ROC curve provides a predictive metric, computed individually for each column using cross-validation, on a sample of up to around 1000 rows. A score of 1 indicates perfect predictive abilities, which often indicates target leakage. A score of 0.5 or lower indicates that the information on the column could not provide, on its own, any useful information towards predicting the target. Although it can happen that a column is uninformative on its own but is useful in predicting the target when used in tandem with other features, a low score could indicate the feature is redundant.

For example, the following image shows a target leakage report for a diabetes classification problem, that is, predicting if a person has diabetes or not. An AUC - ROC curve is used to calculate the predictive ability of five features, and all are determined to be safe from target leakage.



Multicollinearity

Multicollinearity is a circumstance where two or more predictor variables are related to each other. The predictor variables are the features in your dataset that you're using to predict a target variable. When you have multicollinearity, the predictor variables are not only predictive of the target variable, but also predictive of each other.

You can use the **Variance Inflation Factor (VIF)**, **Principal Component Analysis (PCA)**, or **Lasso feature selection** as measures for the multicollinearity in your data. For more information, see the following.

Variance Inflation Factor (VIF)

The Variance Inflation Factor (VIF) is a measure of collinearity among variable pairs. Data Wrangler returns a VIF score as a measure of how closely the variables are related to each other. A VIF score is a positive number that is greater than or equal to 1.

A score of 1 means that the variable is uncorrelated with the other variables. Scores greater than 1 indicate higher correlation.

Theoretically, you can have a VIF score with a value of infinity. Data Wrangler clips high scores to 50. If you have a VIF score greater than 50, Data Wrangler sets the score to 50.

You can use the following guidelines to interpret your VIF scores:

- A VIF score less than or equal to 5 indicates that the variables are moderately correlated with the other variables.
- A VIF score greater than or equal to 5 indicates that the variables are highly correlated with the other variables.

Principle Component Analysis (PCA)

Principal Component Analysis (PCA) measures the variance of the data along different directions in the feature space. The feature space consists of all the predictor variables that you use to predict the target variable in your dataset.

For example, if you're trying to predict who survived on the *RMS Titanic* after it hit an iceberg, your feature space can include the passengers' age, gender, and the fare that they paid.

From the feature space, PCA generates an ordered list of variances. These variances are also known as singular values. The values in the list of variances are greater than or equal to 0. We can use them to determine how much multicollinearity there is in our data.

When the numbers are roughly uniform, the data has very few instances of multicollinearity. When there is a lot of variability among the values, we have many instances of multicollinearity. Before it performs PCA, Data Wrangler normalizes each feature to have a mean of 0 and a standard deviation of 1.

> **Note**
>
> PCA in this circumstance can also be referred to as Singular Value Decomposition (SVD).

Lasso feature selection

Lasso feature selection uses the L1 regularization technique to only include the most predictive features in your dataset.

For both classification and regression, the regularization technique generates a coefficient for each feature. The absolute value of the coefficient provides an importance score for the feature. A higher importance score indicates that it is more predictive of the target variable. A common feature selection method is to use all the features that have a non-zero lasso coefficient.

Detect Anomalies In Time Series Data

You can use the anomaly detection visualization to see outliers in your time series data. To understand what determines an anomaly, you need to understand that we decompose the time series into a predicted term and an error term. We treat the seasonality and trend of the time series as the predicted term. We treat the residuals as the error term.

For the error term, you specify a threshold as the number of standard of deviations the residual can be away from the mean for it to be considered an anomaly. For example, you can specify a threshold as being 3 standard deviations. Any residual greater than 3 standard deviations away from the mean is an anomaly.

You can use the following procedure to perform an **Anomaly detection** analysis.

1. Open your Data Wrangler data flow.
2. In your data flow, under **Data types**, choose the **+**, and select **Add analysis**.
3. For **Analysis type**, choose **Time Series**.
4. For **Visualization**, choose **Anomaly detection**.
5. For **Anomaly threshold**, choose the threshold that a value is considered an anomaly.
6. Choose **Preview** to generate a preview of the analysis.
7. Choose **Add** to add the transform to the Data Wrangler data flow.

Seasonal Trend Decomposition In Time Series Data

You can determine whether there's seasonality in your time series data by using the Seasonal Trend Decomposition visualization. We use the STL (Seasonal Trend decomposition using LOESS) method to perform the decomposition. We decompose the time series into its seasonal, trend, and residual components. The trend reflects the long term progression of the series. The seasonal component is a signal that recurs in a time period. After removing the trend and the seasonal components from the time series, you have the residual.

You can use the following procedure to perform a **Seasonal-Trend decomposition** analysis.

1. Open your Data Wrangler data flow.
2. In your data flow, under **Data types**, choose the **+**, and select **Add analysis**.
3. For **Analysis type**, choose **Time Series**.
4. For **Visualization**, choose **Seasonal-Trend decomposition**.
5. For **Anomaly threshold**, choose the threshold that a value is considered an anomaly.
6. Choose **Preview** to generate a preview of the analysis.
7. Choose **Add** to add the transform to the Data Wrangler data flow.

Bias Report

You can use the bias report in Data Wrangler to uncover potential biases in your data. To generate a bias report, you must specify the target column, or **Label**, that you want to predict and a **Facet**, or the column that you want to inspect for biases.

Label: The feature about which you want a model to make predictions. For example, if you are predicting customer conversion, you may select a column containing data on whether or not a customer has placed an order. You must also specify whether this feature is a label or a threshold. If you specify a label, you must specify what a *positive outcome* looks like in your data. In the customer conversion example, a positive outcome may be a 1 in the orders column, representing the positive outcome of a customer placing an order within the last three months. If you specify a threshold, you must specify a lower bound defining a positive outcome. For example, if your customer orders columns contains the number of orders placed in the last year, you may want to specify 1.

Facet: The column that you want to inspect for biases. For example, if you are trying to predict customer conversion, your facet may be the age of the customer. You may choose this facet

because you believe that your data is biased toward a certain age group. You must identify whether the facet is measured as a value or threshold. For example, if you wanted to inspect one or more specific ages, you select **Value** and specify those ages. If you want to look at an age group, you select **Threshold** and specify the threshold of ages you want to inspect.

After you select your feature and label, you select the types of bias metrics you want to calculate.

To learn more, see Generate reports for bias in pre-training data.

Create Custom Visualizations

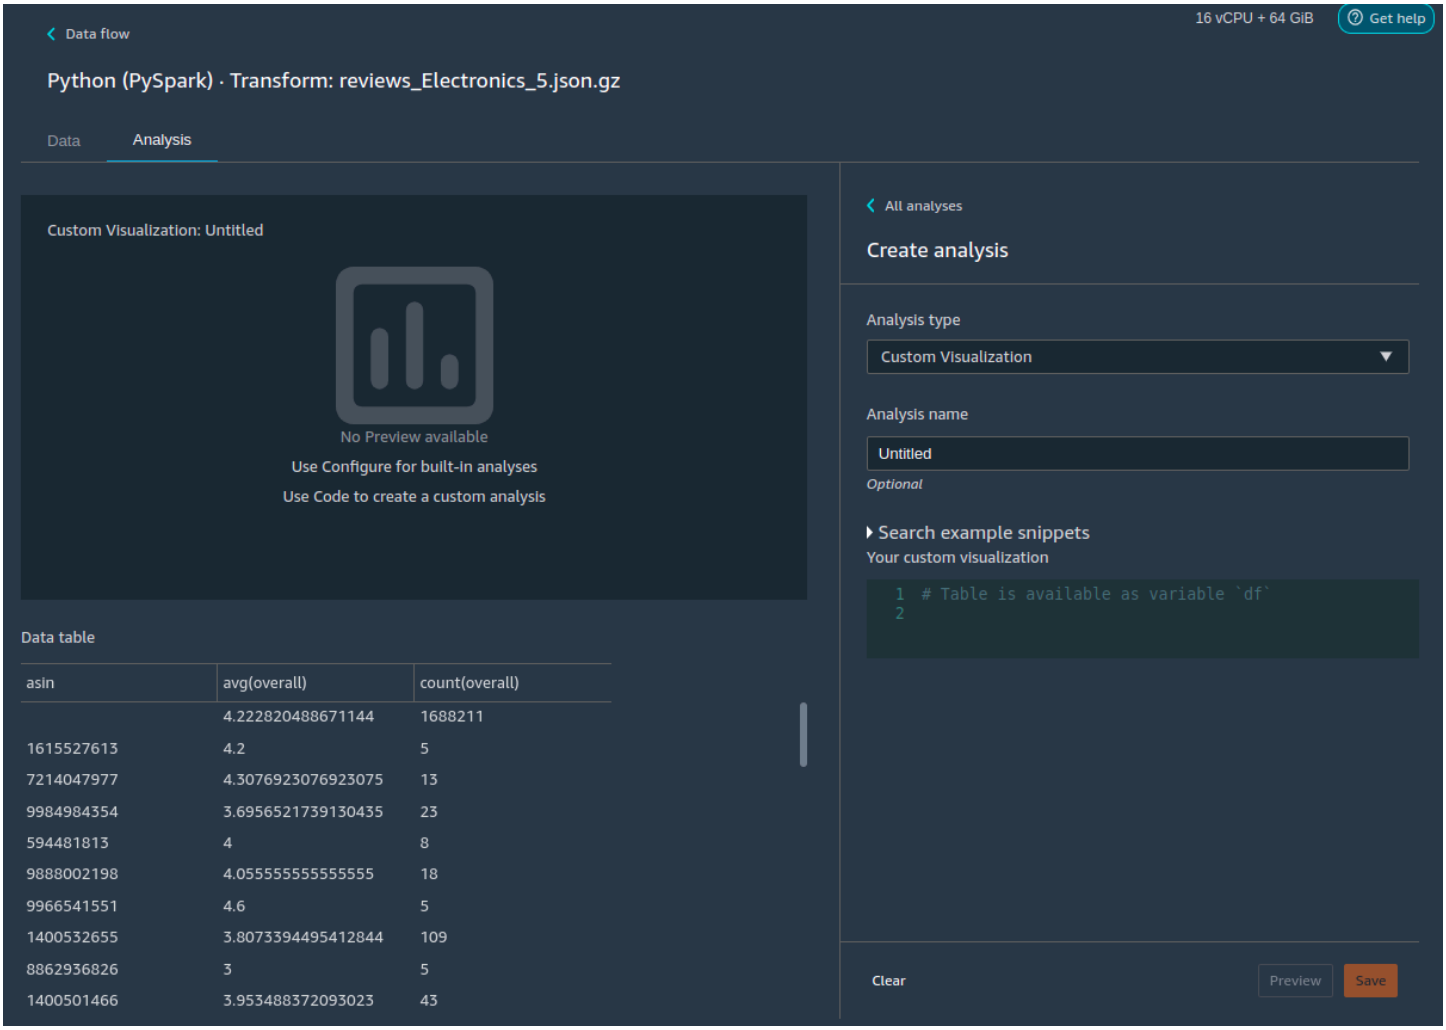
You can add an analysis to your Data Wrangler flow to create a custom visualization. Your dataset, with all the transformations you've applied, is available as a Pandas DataFrame. Data Wrangler uses the `df` variable to store the dataframe. You access the dataframe by calling the variable.

You must provide the output variable, `chart`, to store an Altair output chart. For example, you can use the following code block to create a custom histogram using the Titanic dataset.

```
import altair as alt
df = df.iloc[:30]
df = df.rename(columns={"Age": "value"})
df = df.assign(count=df.groupby('value').value.transform('count'))
df = df[["value", "count"]]
base = alt.Chart(df)
bar = base.mark_bar().encode(x=alt.X('value', bin=True, axis=None), y=alt.Y('count'))
rule = base.mark_rule(color='red').encode(
    x='mean(value):Q',
    size=alt.value(5))
chart = bar + rule
```

To create a custom visualization:

1. Next to the node containing the transformation that you'd like to visualize, choose the **+**.
2. Choose **Add analysis**.
3. For **Analysis type**, choose **Custom Visualization**.
4. For **Analysis name**, specify a name.
5. Enter your code in the code box.
6. Choose **Preview** to preview your visualization.
7. Choose **Save** to add your visualization.



If you don't know how to use the Altair visualization package in Python, you can use custom code snippets to help you get started.

Data Wrangler has a searchable collection of visualization snippets. To use a visualization snippet, choose **Search example snippets** and specify a query in the search bar.

The following example uses the **Binned scatterplot** code snippet. It plots a histogram for 2 dimensions.

The snippets have comments to help you understand the changes that you need to make to the code. You usually need to specify the column names of your dataset in the code.

```
import altair as alt

# Specify the number of top rows for plotting
```

```
rows_number = 1000
df = df.head(rows_number)
# You can also choose bottom rows or randomly sampled rows
# df = df.tail(rows_number)
# df = df.sample(rows_number)

chart = (
    alt.Chart(df)
    .mark_circle()
    .encode(
        # Specify the column names for binning and number of bins for X and Y axis
        x=alt.X("col1:Q", bin=alt.Bin(maxbins=20)),
        y=alt.Y("col2:Q", bin=alt.Bin(maxbins=20)),
        size="count()",
    )
)

# :Q specifies that label column has quantitative type.
# For more details on Altair typing refer to
# https://altair-viz.github.io/user_guide/encoding.html#encoding-data-types
```

Reusing Data Flows for Different Datasets

For Amazon Simple Storage Service (Amazon S3) data sources, you can create and use parameters. A parameter is a variable that you've saved in your Data Wrangler flow. Its value can be any portion of the data source's Amazon S3 path. Use parameters to quickly change the data that you're importing into a Data Wrangler flow or exporting to a processing job. You can also use parameters to select and import a specific subset of your data.

After you created a Data Wrangler flow, you might have trained a model on the data that you've transformed. For datasets that have the same schema, you can use parameters to apply the same transformations on a different dataset and train a different model. You can use the new datasets to perform inference with your model or you could be using them to retrain your model.

In general, parameters have the following attributes:

- Name – The name you specify for the parameter
- Type – The type of value that the parameter represents
- Default value – The value of the parameter when you don't specify a new value

> **Note**
>
> Datetime parameters have a time range attribute that they use as the default value.

Data Wrangler uses curly braces, `{{}}`, to indicate that a parameter is being used in the Amazon S3 path. For example, you can have a URL such as `s3://DOC-EXAMPLE-BUCKET1/{{example_parameter_name}}/example-dataset.csv`.

You create a parameter when you're editing the Amazon S3 data source that you've imported. You can set any portion of the file path to a parameter value. You can set the parameter value to either a value or a pattern. The following are the available parameter value types in the Data Wrangler flow:

- Number
- String
- Pattern
- Datetime

> **Note**
>
> You can't create a pattern parameter or a datetime parameter for the name of the bucket in the Amazon S3 path.

You must set a number as the default value of a number parameter. You can change the value of the parameter to a different number when you're editing a parameter or when you're launching a processing job. For example, in the S3 path, `s3://DOC-EXAMPLE-BUCKET/example-prefix/example-file-1.csv`, you can create a number parameter named `number_parameter` in the place of 1. Your S3 path now appears as `s3://DOC-EXAMPLE-BUCKET/example-prefix/example-file-{{number_parameter}}.csv`. The path continues to point to the `example-file-1.csv` dataset until you change the value of the parameter. If you change the value of `number_parameter` to 2 the path is now `s3://DOC-EXAMPLE-BUCKET/example-prefix/example-file-2.csv`. You can import `example-file-2.csv` into Data Wrangler if you've uploaded the file to that Amazon S3 location.

A string parameter stores a string as its default value. For example, in the S3 path, `s3://DOC-EXAMPLE-BUCKET/example-prefix/example-file-1.csv`, you can create a string parameter named `string_parameter` in the place of the filename, `example-file-1.csv`. The path now appears as `s3://DOC-EXAMPLE-BUCKET/example-prefix/{{string_parameter}}`. It continues to match `s3://DOC-EXAMPLE-BUCKET/example-prefix/example-file-1.csv`, until you change the value of the parameter.

Instead of specifying the filename as a string parameter, you can create a string parameter using the entire Amazon S3 path. You can specify a dataset from any Amazon S3 location in the string parameter.

A pattern parameter stores a regular expression (Python REGEX) string as its default value. You can use a pattern parameter to import multiple data files at the same time. To import more than one object at a time, specify a parameter value that matches the Amazon S3 objects that you're importing.

You can also create a pattern parameter for the following datasets:

- s3://DOC-EXAMPLE-BUCKET1/example-prefix/example-file-1.csv
- s3://DOC-EXAMPLE-BUCKET1/example-prefix/example-file-2.csv
- s3://DOC-EXAMPLE-BUCKET1/example-prefix/example-file-10.csv
- s3://DOC-EXAMPLE-BUCKET/example-prefix/example-file-0123.csv

For `s3://DOC-EXAMPLE-BUCKET1/example-prefix/example-file-1.csv`, you can create a pattern parameter in the place of 1, and set the default value of the parameter to `\d+`. The `\d+` REGEX string matches any one or more decimal digits. If you create a pattern parameter named `pattern_parameter`, your S3 path appears as `s3://DOC-EXAMPLE-BUCKET1/example-prefix/example-file-{{pattern_parameter}}.csv`.

You can also use pattern parameters to match all CSV objects within your bucket. To match all objects in a bucket, create a pattern parameter with the default value of `.*` and set the path to `s3://DOC-EXAMPLE-BUCKET/{{pattern_parameter}}.csv`. The `.*` character matches any string character in the path.

The `s3://DOC-EXAMPLE-BUCKET/{{pattern_parameter}}.csv` path can match the following datasets.

- `example-file-1.csv`

- `other-example-file.csv`
- `example-file-a.csv`

A datetime parameter stores the format with the following information:

- A format for parsing strings inside an Amazon S3 path.
- A relative time range to limit the datetime values that match

For example, in the Amazon S3 file path, `s3://DOC-EXAMPLE-BUCKET/2020/01/01/example-dataset.csv`, 2020/01/01 represents a datetime in the format of `year/month/day`. You can set the parameter's time range to an interval such as `1 years` or `24 hours`. An interval of `1 years` matches all S3 paths with datetimes that fall between the current time and the time exactly a year before the current time. The current time is the time when you start exporting the transformations that you've made to the data. For more information about exporting data, see Export. If the current date is 2022/01/01 and the time range is `1 years`, the S3 path matches datasets such as the following:

- s3://DOC-EXAMPLE-BUCKET/2021/01/01/example-dataset.csv
- s3://DOC-EXAMPLE-BUCKET/2021/06/30/example-dataset.csv
- s3://DOC-EXAMPLE-BUCKET/2021/12/31/example-dataset.csv

The datetime values within a relative time range change as time passes. The S3 paths that fall within the relative time range might also differ.

For the Amazon S3 file path, `s3://DOC-EXAMPLE-BUCKET1/20200101/example-dataset.csv`, `20220101` is an example of a path that can become a datetime parameter.

To view a table of all parameters that you've created in Data Wrangler flow, choose the `{{}}` to the right of the text box containing the Amazon S3 path. If you no longer need a parameter that you've created, you can edit or delete. To edit or delete a parameter, choose icons to the right of the parameter.

> **Important**
>
> Before you delete a parameter, make sure that you haven't used it anywhere in your Data Wrangler flow. Deleted parameters that are still within the flow cause errors.

You can create parameters for any step of your Data Wrangler flow. You can edit or delete any parameter that you create. If you're applying transformations to data that is no longer relevant to your use case, you can modify the values of parameters. Modifying the values of the parameters changes the data that you're importing.

The following sections provide additional examples and general guidance on using parameters. You can use the sections to understand the parameters that work best for you.

> **Note**
>
> The following sections contain procedures that use the Data Wrangler interface to override the parameters and create a processing job.
> You can also override the parameters by using the following procedures.
>
> To export your Data Wrangler flow and override the value of a parameter, do the following.
>
> 1. Choose the **+** next to the node that you want to export.
> 2. Choose **Export to**.
> 3. Choose the location where you're exporting the data.
> 4. Under `parameter_overrides`, specify different values for the parameters that you've created.
> 5. Run the Jupyter Notebook.

Applying a Data Wrangler flow to files using patterns

You can use parameters to apply transformations in your Data Wrangler flow to different files that match a pattern in the Amazon S3 URI path. This helps you specify the files in your S3 bucket that you want to transform with high specificity. For example, you might have a dataset with the path `s3://DOC-EXAMPLE-BUCKET1/example-prefix-0/example-prefix-1/example-prefix-2/example-dataset.csv`. Different datasets named `example-dataset.csv` are stored under many different example prefixes. The prefixes might also be numbered sequentially. You can create patterns for the numbers in the Amazon S3 URI. Pattern parameters use REGEX to select any number of files that match the pattern of the expression. The following are REGEX patterns that might be useful:

- `.*` – Matches zero or more of any character, except newline characters
- `.+` – Matches one or more of any character, excluding newline characters

- `\d+` – Matches one or more of any decimal digit
- `\w+` – Matches one or more of any alphanumeric character
- `[abc-_]{2,4}` – Matches a string two, three, or four characters composed of the set of characters provided within a set of brackets
- `abc|def` – Matches one string or another. For example, the operation matches either `abc` or `def`

You can replace each number in the following paths with a single parameter that has a value of `\d+`.

- `s3://DOC-EXAMPLE-BUCKET1/example-prefix-3/example-prefix-4/example-prefix-5/example-dataset.csv`
- `s3://DOC-EXAMPLE-BUCKET1/example-prefix-8/example-prefix-12/example-prefix-13/example-dataset.csv`
- `s3://DOC-EXAMPLE-BUCKET1/example-prefix-4/example-prefix-9/example-prefix-137/example-dataset.csv`

The following procedure creates a pattern parameter for a dataset with the path `s3://DOC-EXAMPLE-BUCKET1/example-prefix-0/example-prefix-1/example-prefix-2/example-dataset.csv`.

To create a pattern parameter, do the following.

1. Next to the dataset that you've imported, choose **Edit dataset**.
2. Highlight the `0` in `example-prefix-0`.
3. Specify values for the following fields:
   - **Name** – A name for parameter
   - **Type** – **Pattern**
   - **Value** – **\d+** a regular expression that corresponds to one or more digits
4. Choose **Create**.
5. Replace the 1 and the 2 in S3 URI path with the parameter. The path should have the following format: `s3://DOC-EXAMPLE-BUCKET1/example-prefix-{{example_parameter_name}}/example-prefix-{{example_parameter_name}}/example-prefix-{{example_parameter_name}}/example-dataset.csv`

The following is a general procedure for creating a pattern parameter.

1. Navigate to your Data Wrangler flow.
2. Next to the dataset that you've imported, choose **Edit dataset**.
3. Highlight the portion of the URI that you're using as the value of the pattern parameter.
4. Choose **Create custom parameter**.
5. Specify values for the following fields:
   - **Name** – A name for parameter
   - **Type** – **Pattern**
   - **Value** – A regular expression containing the pattern that you'd like to store.
6. Choose **Create**.

Applying a Data Wrangler flow to files using numeric values

You can use parameters to apply transformations in your Data Wrangler flow to different files that have similar paths. For example, you might have a dataset with the path `s3://DOC-EXAMPLE-BUCKET1/example-prefix-0/example-prefix-1/example-prefix-2/example-dataset.csv`.

You might have the transformations from your Data Wrangler flow that you've applied to datasets under `example-prefix-1`. You might want to apply the same transformations to `example-dataset.csv` that falls under `example-prefix-10` or `example-prefix-20`.

You can create a parameter that stores the value 1. If you want to apply the transformations to different datasets, you can create processing jobs that replace the value of the parameter with a different value. The parameter acts as a placeholder for you to change when you want to apply the transformations from your Data Wrangler flow to new data. You can override the value of the parameter when you create a Data Wrangler processing job to apply the transformations in your Data Wrangler flow to different datasets.

Use the following procedure to create numeric parameters for `s3://DOC-EXAMPLE-BUCKET1/example-prefix-0/example-prefix-1/example-prefix-2/example-dataset.csv`.

To create parameters for the preceding S3 URI path, do the following.

1. Navigate to your Data Wrangler flow.
2. Next to the dataset that you've imported, choose **Edit dataset**.

3. Highlight the number in an example prefix of `example-prefix-number`.
4. Choose **Create custom parameter**.
5. For **Name**, specify a name for the parameter.
6. For **Type**, choose **Integer**.
7. For **Value**, specify the number.
8. Create parameters for the remaining numbers by repeating the procedure.

After you've created the parameters, apply the transforms to your dataset and create a destination node for them. For more information about destination nodes, see Export.

Use the following procedure to apply the transformations from your Data Wrangler flow to a different time range. It assumes that you've created a destination node for the transformations in your flow.

To change the value of a numeric parameter in a Data Wrangler processing job, do the following.

1. From your Data Wrangler flow, choose **Create job**
2. Select only the destination node that contains the transformations to the dataset containing the datetime parameters.
3. Choose **Configure job**.
4. Choose **Parameters**.
5. Choose the name of a parameter that you've created.
6. Change the value of the parameter.
7. Repeat the procedure for the other parameters.
8. Choose **Run**.

Applying a Data Wrangler flow to files using strings

You can use parameters to apply transformations in your Data Wrangler flow to different files that have similar paths. For example, you might have a dataset with the path `s3://DOC-EXAMPLE-BUCKET1/example-prefix/example-dataset.csv`.

You might have transformations from your Data Wrangler flow that you've applied to datasets under `example-prefix`. You might want to apply the same transformations to `example-dataset.csv` under `another-example-prefix` or `example-prefix-20`.

You can create a parameter that stores the value `example-prefix`. If you want to apply the transformations to different datasets, you can create processing jobs that replace the value of the parameter with a different value. The parameter acts as a placeholder for you to change when you want to apply the transformations from your Data Wrangler flow to new data. You can override the value of the parameter when you create a Data Wrangler processing job to apply the transformations in your Data Wrangler flow to different datasets.

Use the following procedure to create a string parameter for `s3://DOC-EXAMPLE-BUCKET1/example-prefix/example-dataset.csv`.

To create a parameter for the preceding S3 URI path, do the following.

1. Navigate to your Data Wrangler flow.
2. Next to the dataset that you've imported, choose **Edit dataset**.
3. Highlight the example prefix, `example-prefix`.
4. Choose **Create custom parameter**.
5. For **Name**, specify a name for the parameter.
6. For **Type**, choose **String**.
7. For **Value**, specify the prefix.

After you've created the parameter, apply the transforms to your dataset and create a destination node for them. For more information about destination nodes, see Export.

Use the following procedure to apply the transformations from your Data Wrangler flow to a different time range. It assumes that you've created a destination node for the transformations in your flow.

To change the value of a numeric parameter in a Data Wrangler processing job, do the following:

1. From your Data Wrangler flow, choose **Create job**
2. Select only the destination node that contains the transformations to the dataset containing the datetime parameters.
3. Choose **Configure job**.
4. Choose **Parameters**.
5. Choose the name of a parameter that you've created.
6. Change the value of the parameter.

7. Repeat the procedure for the other parameters.
8. Choose **Run**.

Applying a Data Wrangler flow to different datetime ranges

Use datetime parameters to apply transformations in your Data Wrangler flow to different time ranges. Highlight the portion of the Amazon S3 URI that has a timestamp and create a parameter for it. When you create a parameter, you specify a time range from the current time to a time in the past. For example, you might have an Amazon S3 URI that looks like the following: `s3://DOC-EXAMPLE-BUCKET1/example-prefix/2022/05/15/example-dataset.csv`. You can save `2022/05/15` as a datetime parameter. If you specify a year as the time range, the time range includes the moment that you run the processing job containing the datetime parameter and the time exactly one year ago. If the moment you're running the processing job is September 6th, 2022 or `2022/09/06`, the time ranges can include the following:

- `s3://DOC-EXAMPLE-BUCKET1/example-prefix/2022/03/15/example-dataset.csv`
- `s3://DOC-EXAMPLE-BUCKET1/example-prefix/2022/01/08/example-dataset.csv`
- `s3://DOC-EXAMPLE-BUCKET1/example-prefix/2022/07/31/example-dataset.csv`
- `s3://DOC-EXAMPLE-BUCKET1/example-prefix/2021/09/07/example-dataset.csv`

The transformations in the Data Wrangler flow apply to all of the preceding prefixes. Changing the value of the parameter in the processing job doesn't change the value of the parameter in the Data Wrangler flow. To apply the transformations to datasets within a different time range, do the following:

1. Create a destination node containing all the transformations that you'd like to use.
2. Create a Data Wrangler job.
3. Configure the job to use a different time range for the parameter. Changing the value of the parameter in the processing job doesn't change the value of the parameter in the Data Wrangler flow.

For more information about destination nodes and Data Wrangler jobs, see Export.

The following procedure creates a datetime parameter for the Amazon S3 path: `s3://DOC-EXAMPLE-BUCKET1/example-prefix/2022/05/15/example-dataset.csv`.

To create a datetime parameter for the preceding S3 URI path, do the following.

1. Navigate to your Data Wrangler flow.
2. Next to the dataset that you've imported, choose **Edit dataset**.
3. Highlight the portion of the URI that you're using as the value of the datetime parameter.
4. Choose **Create custom parameter**.
5. For **Name**, specify a name for the parameter.
6. For **Type**, choose **Datetime**.

   > **Note**
   >
   > By default, Data Wrangler selects **Predefined**, which provides a dropdown menu for you to select a date format. However, the timestamp format that you're using might not be available. Instead of using **Predefined** as the default option, you can choose **Custom** and specify the timestamp format manually.

7. For **Date format**, open the dropdown menu following **Predefined** and choose **yyyy/MM/dd**. The format, **yyyy/MM/dd,** corresponds to the year/month/day of the timestamp.
8. For **Timezone**, choose a time zone.

   > **Note**
   >
   > The data that you're analyzing might have time stamps taken in a different time zone from your time zone. Make sure that the time zone that you select matches the time zone of the data.

9. For **Time range**, specify the time range for the parameter.
10. (Optional) Enter a description to describe how you're using the parameter.
11. Choose **Create**.

After you've created the datetime parameters, apply the transforms to your dataset and create a destination node for them. For more information about destination nodes, see Export.

Use the following procedure to apply the transformations from your Data Wrangler flow to a different time range. It assumes that you've created a destination node for the transformations in your flow.

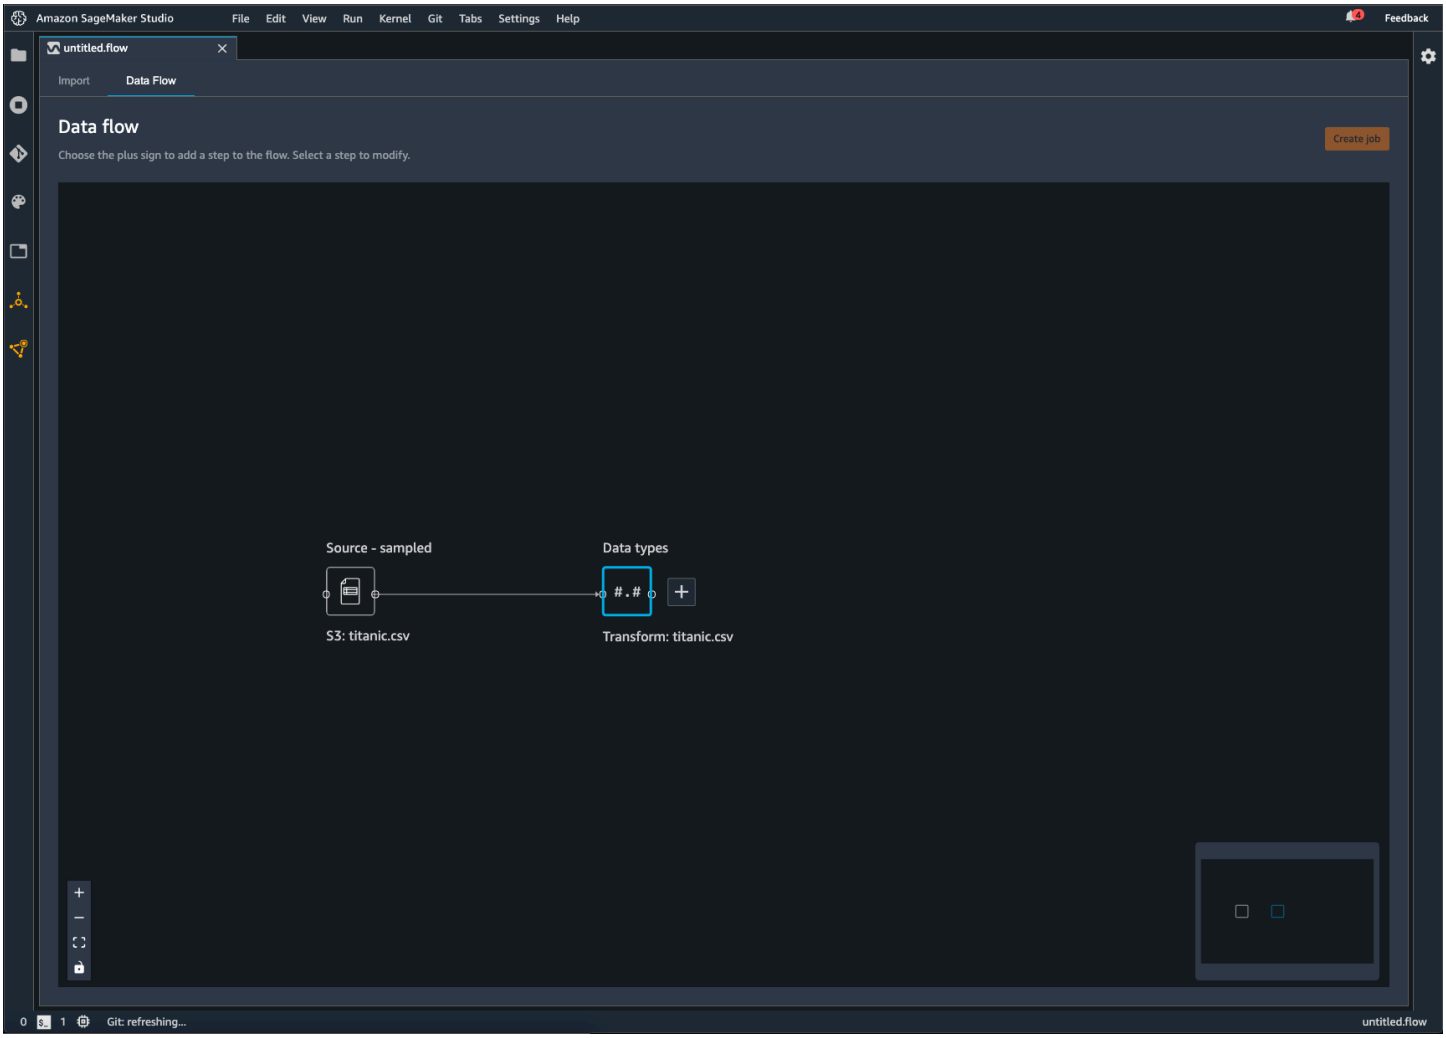
To change the value of a datetime parameter in a Data Wrangler processing job, do the following:

1. From your Data Wrangler flow, choose **Create job**
2. Select only the destination node that contains the transformations to the dataset containing the datetime parameters.
3. Choose **Configure job**.
4. Choose **Parameters**.
5. Choose the name of the datetime parameter that you've created.
6. For **Time range**, change the time range for the datasets.
7. Choose **Run**.

Export

In your Data Wrangler flow, you can export some or all of the transformations that you've made to your data processing pipelines.

A *Data Wrangler flow* is the series of data preparation steps that you've performed on your data. In your data preparation, you perform one or more transformations to your data. Each transformation is done using a transform step. The flow has a series of nodes that represent the import of your data and the transformations that you've performed. For an example of nodes, see the following image.



The preceding image shows a Data Wrangler flow with two nodes. The **Source - sampled** node shows the data source from which you've imported your data. The **Data types** node indicates that Data Wrangler has performed a transformation to convert the dataset into a usable format.

Each transformation that you add to the Data Wrangler flow appears as an additional node. For information on the transforms that you can add, see Transform Data. The following image shows a Data Wrangler flow that has a **Rename-column** node to change the name of a column in a dataset.

You can export your data transformations to the following:

- Amazon S3
- SageMaker Pipelines
- Amazon SageMaker Feature Store
- Python Code

Important

We recommend that you use the IAM `AmazonSageMakerFullAccess` managed policy to grant AWS permission to use Data Wrangler. If you don't use the managed policy, you can use an IAM policy that gives Data Wrangler access to an Amazon S3 bucket. For more information on the policy, see Security and Permissions.

When you export your data flow, you're charged for the AWS resources that you use. You can use cost allocation tags to organize and manage the costs of those resources. You create these tags for your user-profile and Data Wrangler automatically applies them to the resources used to export the data flow. For more information, see Using Cost Allocation Tags.

Export to Amazon S3

Data Wrangler gives you the ability to export your data to a location within an Amazon S3 bucket. You can specify the location using one of the following methods:

- Destination node – Where Data Wrangler stores the data after it has processed it.
- Export to – Exports the data resulting from a transformation to Amazon S3.
- Export data – For small datasets, can quickly export the data that you've transformed.

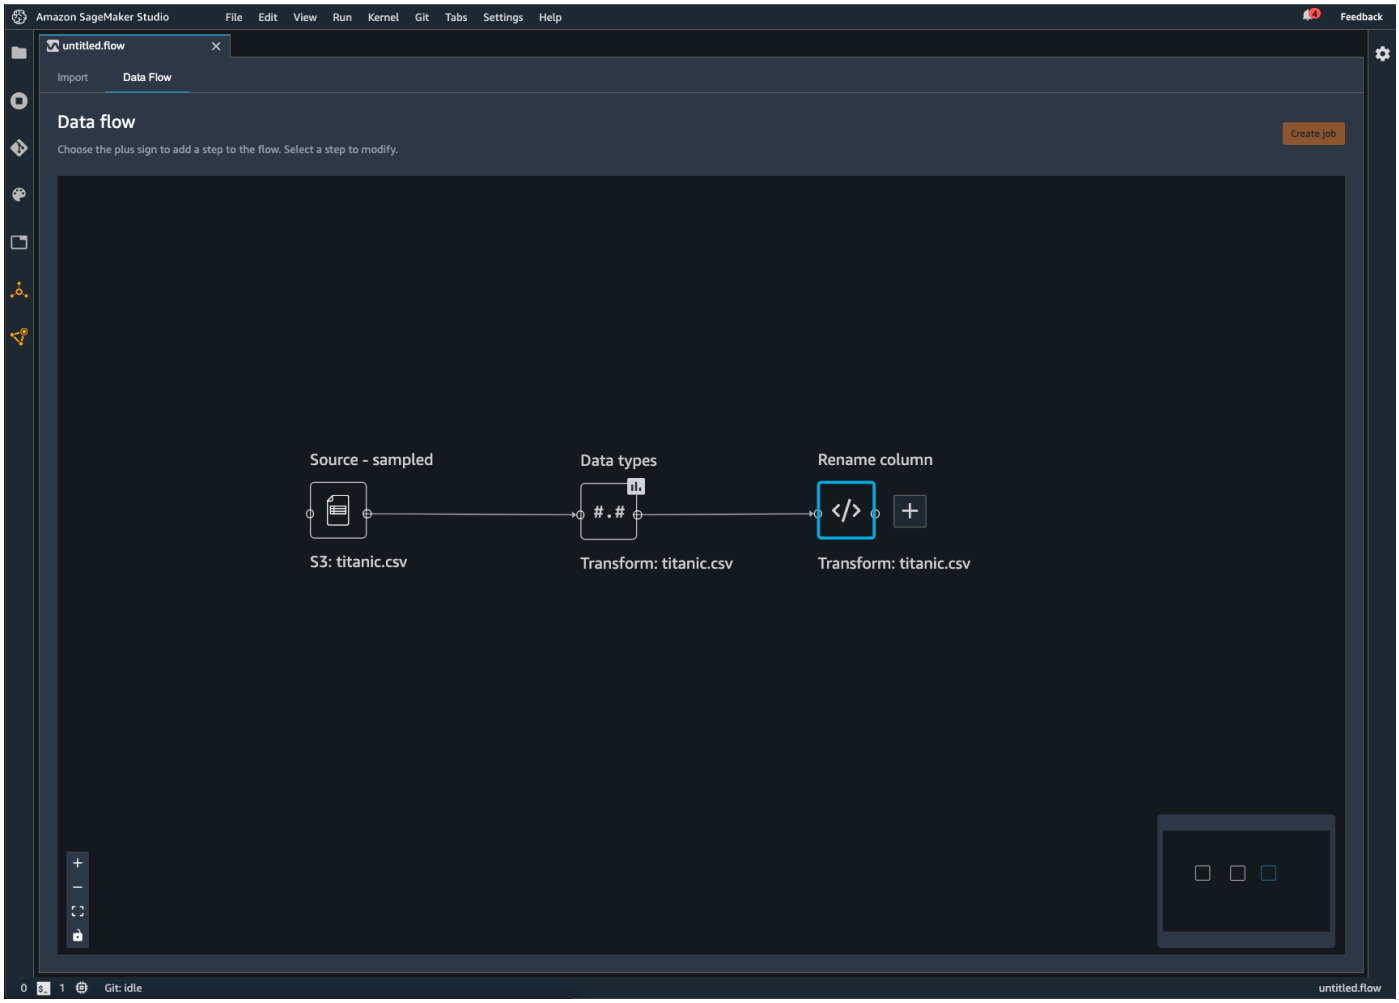
Use the following sections to learn more about each of these methods.

Destination Node

If you want to output a series of data processing steps that you've performed to Amazon S3, you create a destination node. A *destination node* tells Data Wrangler where to store the data after you've processed it. After you create a destination node, you create a processing job to output the data. A *processing job* is an Amazon SageMaker processing job. When you're using a destination node, it runs the computational resources needed to output the data that you've transformed to Amazon S3.

You can use a destination node to export some of the transformations or all of the transformations that you've made in your Data Wrangler flow.

You can use multiple destination nodes to export different transformations or sets of transformations. The following example shows two destination nodes in a single Data Wrangler flow.



You can use the following procedure to create destination nodes and export them to an Amazon S3 bucket.

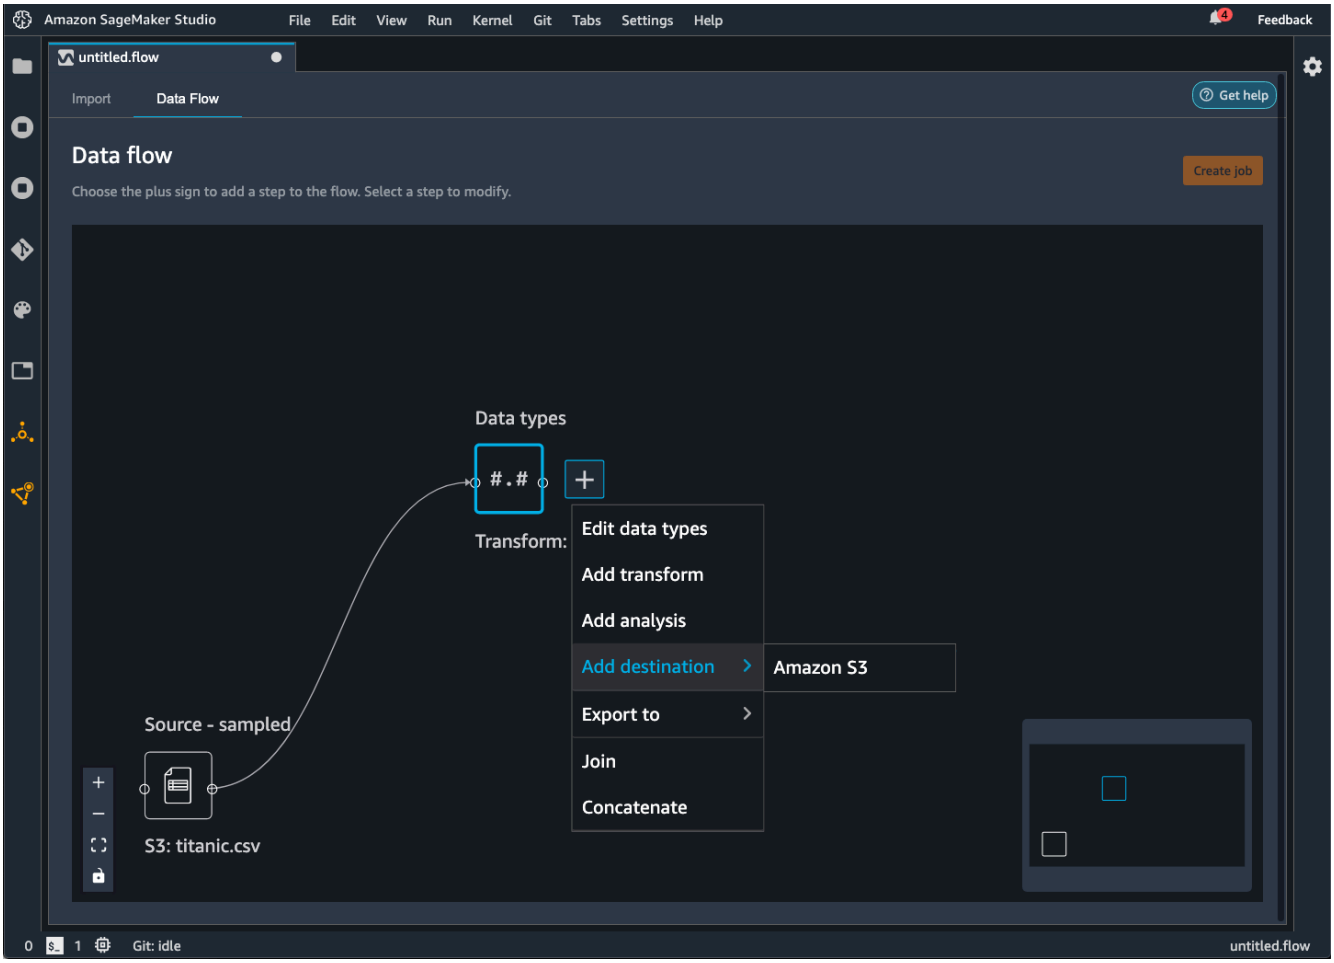
To export your data flow, you create destination nodes and a Data Wrangler job to export the data. Creating a Data Wrangler job starts a SageMaker processing job to export your flow. You can choose the destination nodes that you want to export after you've created them.

> **Note**
>
> You can choose **Create job** in the Data Wrangler flow to view the instructions to use a processing job.

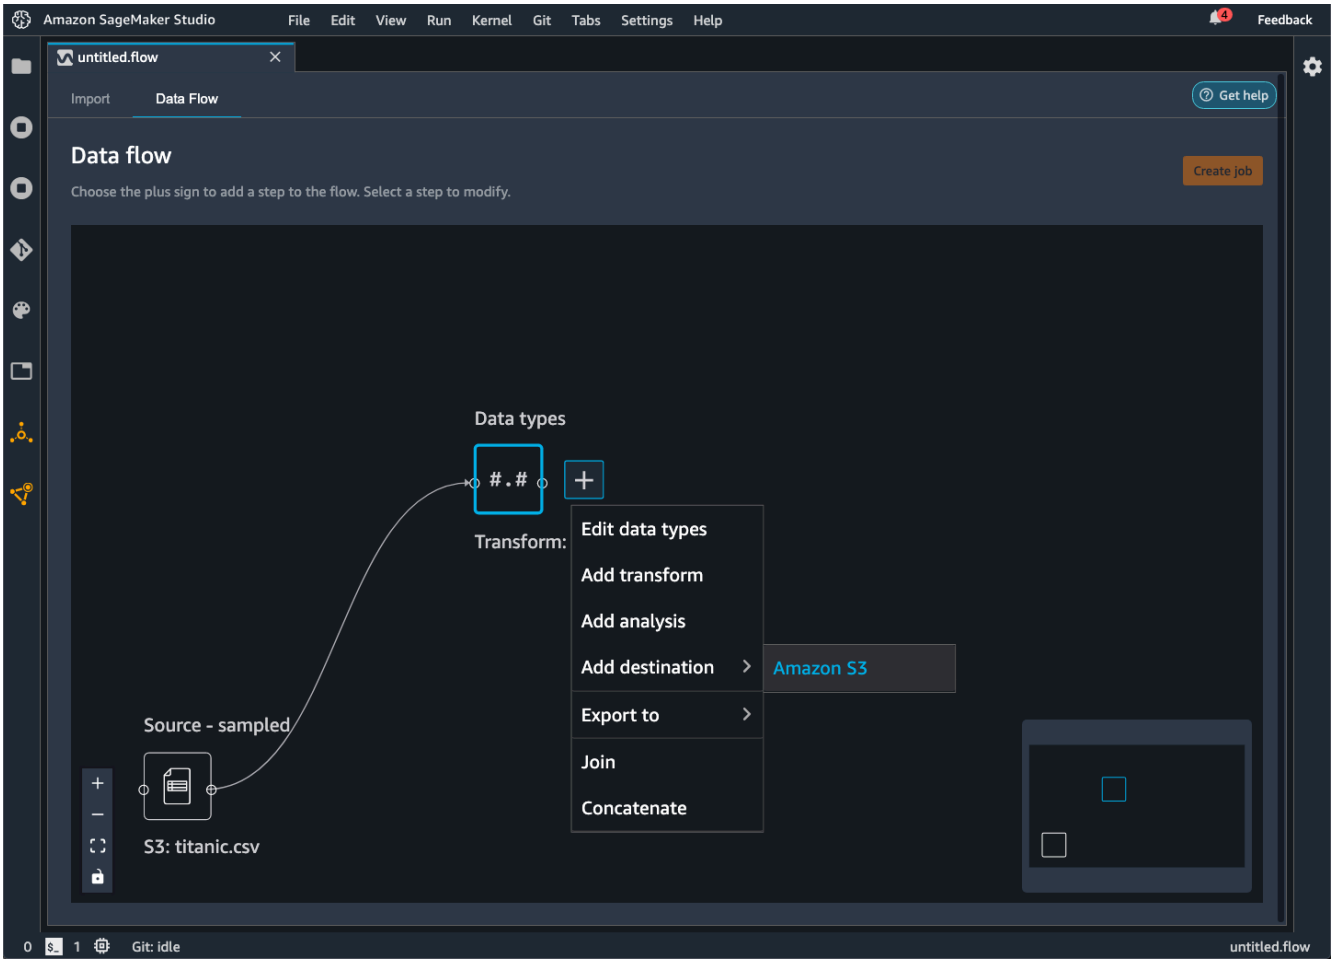
Use the following procedure to create destination nodes.

1. Choose the **+** next to the nodes that represent the transformations that you want to export.

2. Choose **Add destination**.



3. Choose **Amazon S3**.



4. Specify the following fields.

   - **Dataset name** – The name that you specify for the dataset that you're exporting.
   - **File type** – The format of the file that you're exporting.
   - **Delimiter** (CSV and Parquet files only) – The value used to separate other values.
   - **Compression** (CSV and Parquet files only) – The compression method used to reduce the file size. You can use the following compression methods:
     - bzip2
     - deflate
     - gzip
   - (Optional) **Amazon S3 location** – The S3 location that you're using to output the files.
   - (Optional) **Number of partitions** – The number of datasets that you're writing as the output of the processing job.

- (Optional) **Partition by column** – Writes all data with the same unique value from the column.
- (Optional) **Inference Parameters** – Selecting **Generate inference artifact** applies all of the transformations you've used in the Data Wrangler flow to data coming into your inference pipeline. The model in your pipeline makes predictions on the transformed data.

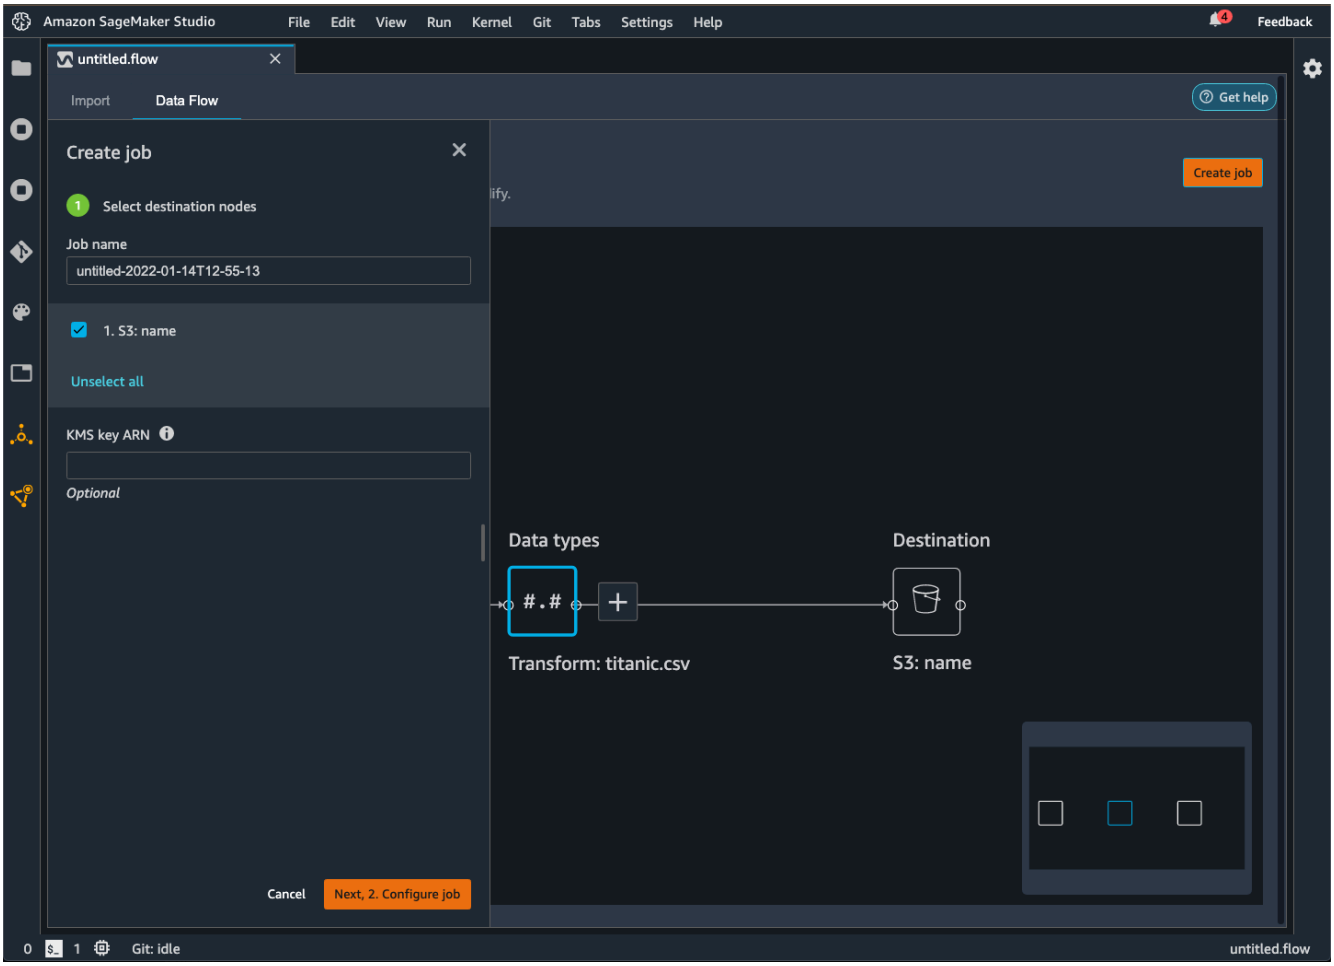
5. Choose **Add destination**.

Use the following procedure to create a processing job.

Create a job from the **Data flow** page and choose the destination nodes that you want to export.

> **Note**
>
> You can choose **Create job** in the Data Wrangler flow to view the instructions for creating a processing job.

1. Choose **Create job**. The following image shows the pane that appears after you select **Create job**.



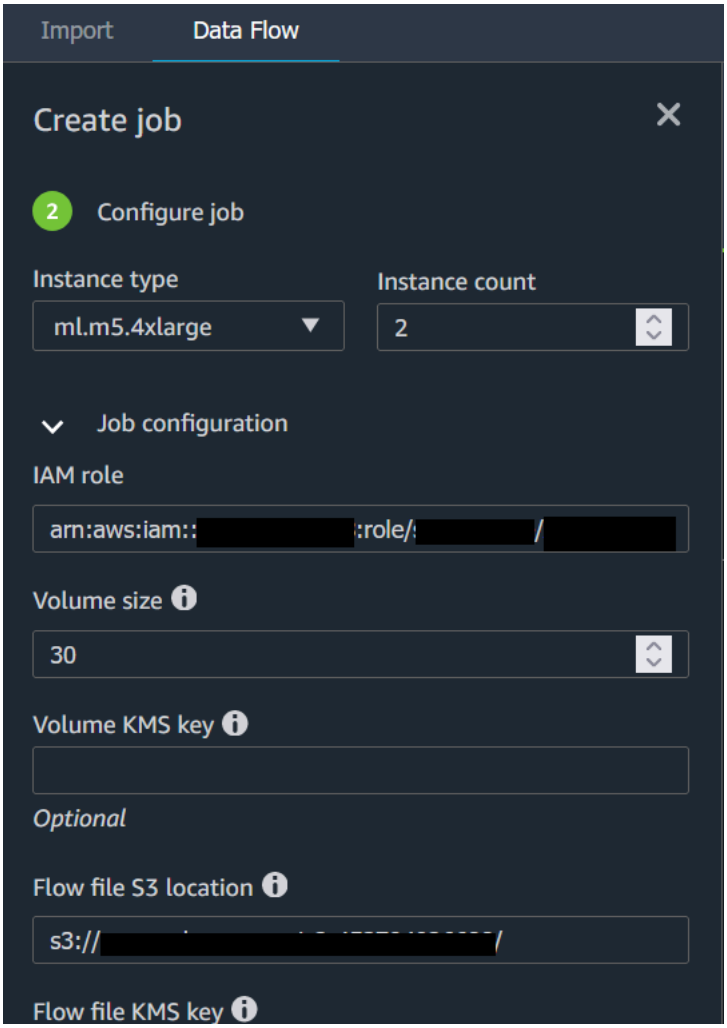
2. For **Job name**, specify the name of the export job.
3. Choose the destination nodes that you want to export.
4. (Optional) Specify a AWS KMS key ARN. A AWS KMS key is a cryptographic key that you can use to protect your data. For more information about AWS KMS keys, see AWS Key Management Service.
5. (Optional) Under **Trained parameters**. choose **Refit** if you've done the following:

   - Sampled your dataset
   - Applied a transform that uses your data to create a new column in the dataset

   For more information about refitting the transformations you've made to an entire dataset, see Refit Transforms to The Entire Dataset and Export Them.

> **Note**
>
> For image data, Data Wrangler exports the transformations that you've made to all of the images. Refitting the transformations isn't applicable to your use case.

6. Choose **Configure job**. The following image shows the **Configure job** page.



7. (Optional) Configure the Data Wrangler job. You can make the following configurations:

   - **Job configuration**
   - **Spark memory configuration**
   - **Network configuration**
   - **Tags**
   - **Parameters**

- **Associate Schedules**

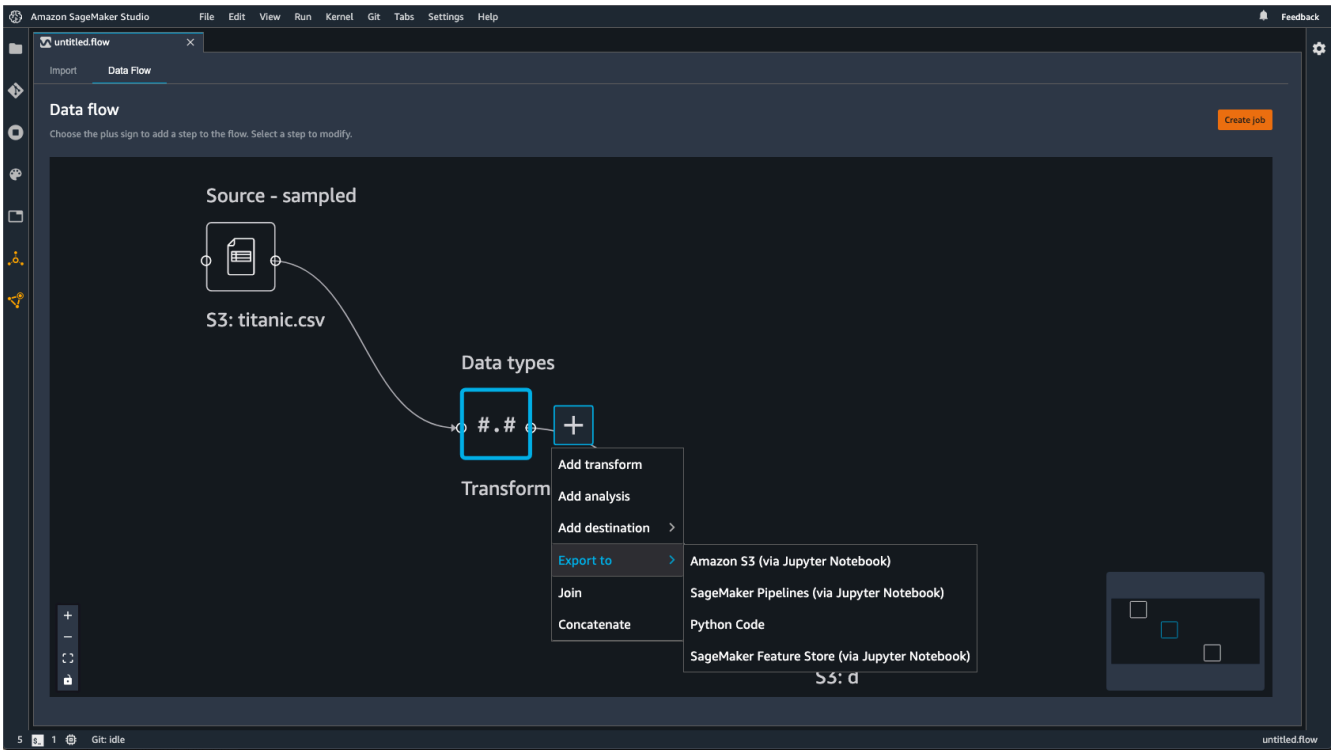
8. Choose **Run**.

Export to

As an alternative to using a destination node, you can use the **Export to** option to export your Data Wrangler flow to Amazon S3 using a Jupyter notebook. You can choose any data node in your Data Wrangler flow and export it. Exporting the data node exports the transformation that the node represents and the transformations that precede it.

Use the following procedure to generate a Jupyter notebook and run it to export your Data Wrangler flow to Amazon S3.

1. Choose the **+** next to the node that you want to export.
2. Choose **Export to**.
3. Choose **Amazon S3 (via Jupyter Notebook)**.
4. Run the Jupyter notebook.



When you run the notebook, it exports your data flow (.flow file) in the same AWS Region as the Data Wrangler flow.

The notebook provides options that you can use to configure the processing job and the data that it outputs.

> **Important**
>
> We provide you with job configurations to configure the output of your data. For the partitioning and driver memory options, we strongly recommend that you don't specify a configuration unless you already have knowledge about them.

Under **Job Configurations**, you can configure the following:

- `output_content_type` – The content type of the output file. Uses CSV as the default format, but you can specify `Parquet`.
- `delimiter` – The character used to separate values in the dataset when writing to a CSV file.
- `compression` – If set, compresses the output file. Uses gzip as the default compression format.
- `num_partitions` – The number of partitions or files that Data Wrangler writes as the output.
- `partition_by` – The names of the columns that you use to partition the output.

To change the output file format from CSV to Parquet, change the value from `"CSV"` to `"Parquet"`. For the rest of the preceding fields, uncomment the lines containing the fields that you want to specify.

Under **(Optional) Configure Spark Cluster Driver Memory** you can configure Spark properties for the job, such as the Spark driver memory, in the `config` dictionary.

The following shows the `config` dictionary.

```
config = json.dumps({
    "Classification": "spark-defaults",
    "Properties": {
        "spark.driver.memory": f"{driver_memory_in_mb}m",
    }
})
```

To apply the configuration to the processing job, uncomment the following lines:

```
# data_sources.append(ProcessingInput(
#     source=config_s3_uri,
#     destination="/opt/ml/processing/input/conf",
#     input_name="spark-config",
#     s3_data_type="S3Prefix",
#     s3_input_mode="File",
#     s3_data_distribution_type="FullyReplicated"
# ))
```

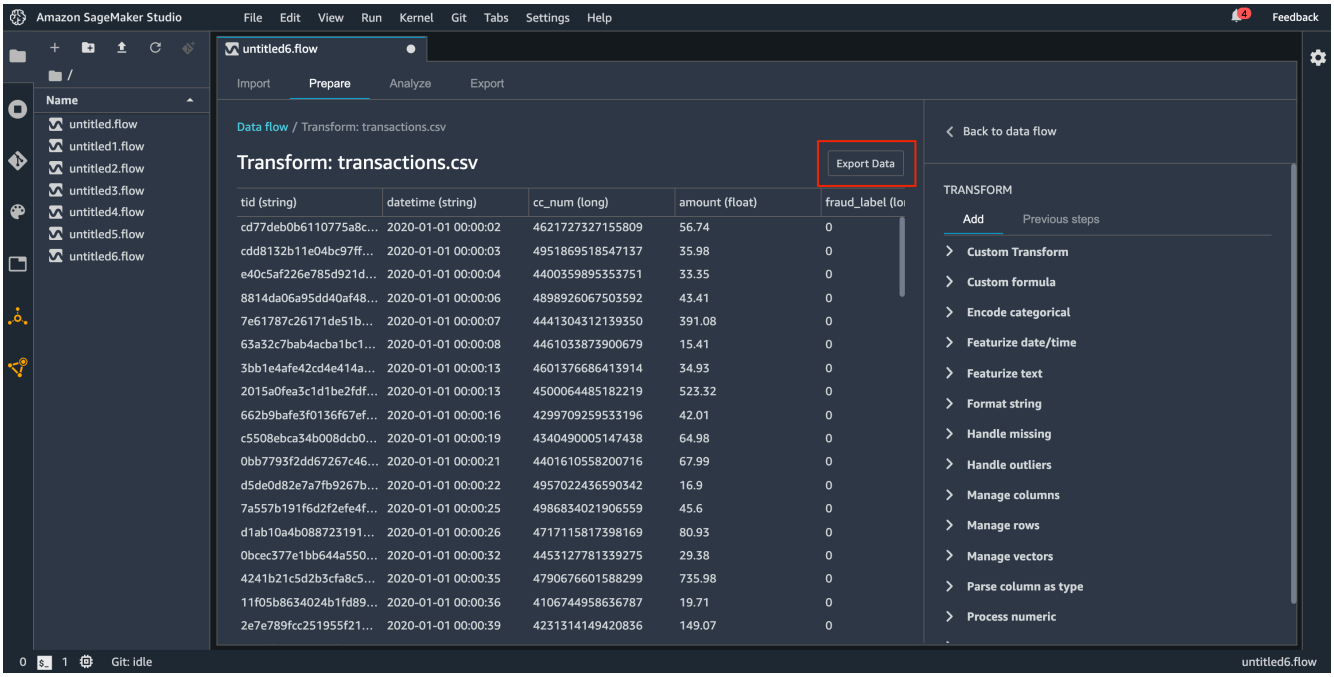
Export data

If you have a transformation on a small dataset that you want to export quickly, you can use the **Export data** method. When you start choose **Export data**, Data Wrangler works synchronously to export the data that you've transformed to Amazon S3. You can't use Data Wrangler until either it finishes exporting your data or you cancel the operation.

For information on using the **Export data** method in your Data Wrangler flow, see the following procedure.

To use the **Export data** method:

1. Choose a node in your Data Wrangler flow by opening (double-clicking on) it.



2. Configure how you want to export the data.
3. Choose **Export data**.

When you export your data flow to an Amazon S3 bucket, Data Wrangler stores a copy of the flow file in the S3 bucket. It stores the flow file under the *data_wrangler_flows* prefix. If you use the default Amazon S3 bucket to store your flow files, it uses the following naming convention: `sagemaker-region-account number`. For example, if your account number is 111122223333 and you are using Studio Classic in us-east-1, your imported datasets are stored in `sagemaker-us-east-1-111122223333`. In this example, your .flow files created in us-east-1 are stored in `s3://sagemaker-region-account number/data_wrangler_flows/`.

Export to SageMaker Pipelines

When you want to build and deploy large-scale machine learning (ML) workflows, you can use SageMaker Pipelines to create workflows that manage and deploy SageMaker jobs. With SageMaker Pipelines, you can build workflows that manage your SageMaker data preparation, model training, and model deployment jobs. You can use the first-party algorithms that SageMaker offers by using SageMaker Pipelines. For more information on SageMaker Pipelines, see SageMaker Pipelines.

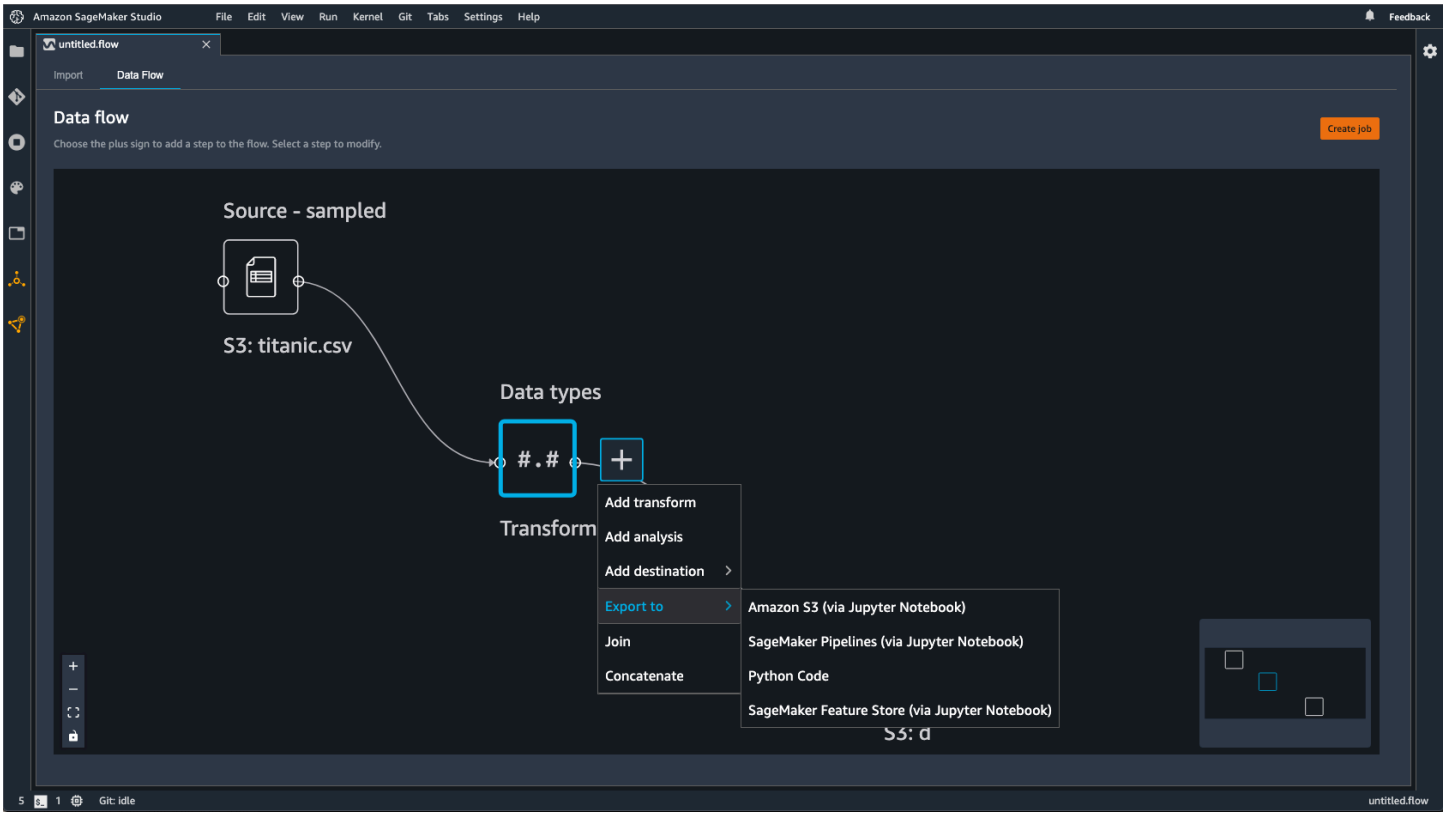
When you export one or more steps from your data flow to SageMaker Pipelines, Data Wrangler creates a Jupyter notebook that you can use to define, instantiate, run, and manage a pipeline.

Use a Jupyter Notebook to Create a Pipeline

Use the following procedure to create a Jupyter notebook to export your Data Wrangler flow to SageMaker Pipelines.

Use the following procedure to generate a Jupyter notebook and run it to export your Data Wrangler flow to SageMaker Pipelines.

1. Choose the **+** next to the node that you want to export.
2. Choose **Export to**.
3. Choose **SageMaker Pipelines (via Jupyter Notebook)**.
4. Run the Jupyter notebook.



You can use the Jupyter notebook that Data Wrangler produces to define a pipeline. The pipeline includes the data processing steps that are defined by your Data Wrangler flow.

You can add additional steps to your pipeline by adding steps to the `steps` list in the following code in the notebook:

```
pipeline = Pipeline(
```

```
    name=pipeline_name,
    parameters=[instance_type, instance_count],
    steps=[step_process], #Add more steps to this list to run in your Pipeline
)
```

For more information on defining pipelines, see Define SageMaker Pipeline.

Export to an Inference Endpoint

Use your Data Wrangler flow to process data at the time of inference by creating a SageMaker serial inference pipeline from your Data Wrangler flow. An inference pipeline is a series of steps that results in a trained model making predictions on new data. A serial inference pipeline within Data Wrangler transforms the raw data and provides it to the machine learning model for a prediction. You create, run, and manage the inference pipeline from a Jupyter notebook within Studio Classic. For more information about accessing the notebook, see Use a Jupyter Notebook to create an inference endpoint.

Within the notebook, you can either train a machine learning model or specify one that you've already trained. You can either use Amazon SageMaker Autopilot or XGBoost to train the model using the data that you've transformed in your Data Wrangler flow.

The pipeline provides the ability to perform either batch or real-time inference. You can also add the Data Wrangler flow to SageMaker Model Registry. For more information about hosting models, see Host multiple models in one container behind one endpoint.

Important

You can't export your Data Wrangler flow to an inference endpoint if it has the following transformations:

- Join
- Concatenate
- Group by

If you must use the preceding transforms to prepare your data, use the following procedure.

To prepare your data for inference with unsupported transforms

1. Create a Data Wrangler flow.

2. Apply the preceding transforms that aren't supported.
3. Export the data to an Amazon S3 bucket.
4. Create a separate Data Wrangler flow.
5. Import the data that you've exported from the preceding flow.
6. Apply the remaining transforms.
7. Create a serial inference pipeline using the Jupyter notebook that we provide.

For information about exporting your data to an Amazon S3 bucket see Export to Amazon S3. For information about opening the Jupyter notebook used to create the serial inference pipeline, see Use a Jupyter Notebook to create an inference endpoint.

Data Wrangler ignores transforms that remove data at the time of inference. For example, Data Wrangler ignores the Handle Missing Values transform if you use the **Drop missing** configuration.

If you've refit transforms to your entire dataset, the transforms carry over to your inference pipeline. For example, if you used the median value to impute missing values, the median value from refitting the transform is applied to your inference requests. You can either refit the transforms from your Data Wrangler flow when you're using the Jupyter notebook or when you're exporting your data to an inference pipeline. For information about refitting transforms, see Refit Transforms to The Entire Dataset and Export Them.

The serial inference pipeline supports the following data types for the input and output strings. Each data type has a set of requirements.

Supported datatypes

- `text/csv` – the datatype for CSV strings
  - The string can't have a header.
  - Features used for the inference pipeline must be in the same order as features in the training dataset.
  - There must be a comma delimiter between features.
  - Records must be delimited by a newline character.

  The following is an example of a validly formatted CSV string that you can provide in an inference request.

```
abc,0.0,"Doe, John",12345\ndef,1.1,"Doe, Jane",67890
```

- `application/json` – the datatype for JSON strings
  - The features used in the dataset for the inference pipeline must be in the same order as the features in the training dataset.
  - The data must have a specific schema. You define schema as a single `instances` object that has a set of `features`. Each `features` object represents an observation.

  The following is an example of a validly formatted JSON string that you can provide in an inference request.

```
{
    "instances": [
        {
            "features": ["abc", 0.0, "Doe, John", 12345]
        },
        {
            "features": ["def", 1.1, "Doe, Jane", 67890]
        }
    ]
}
```

Use a Jupyter Notebook to create an inference endpoint

Use the following procedure to export your Data Wrangler flow to create an inference pipeline.

To create an inference pipeline using a Jupyter notebook, do the following.

1. Choose the **+** next to the node that you want to export.
2. Choose **Export to**.
3. Choose **SageMaker Inference Pipeline (via Jupyter Notebook)**.
4. Run the Jupyter notebook.

When you run the Jupyter notebook, it creates an inference flow artifact. An inference flow artifact is a Data Wrangler flow file with additional metadata used to create the serial inference pipeline. The node that you're exporting encompasses all of the transforms from the preceding nodes.

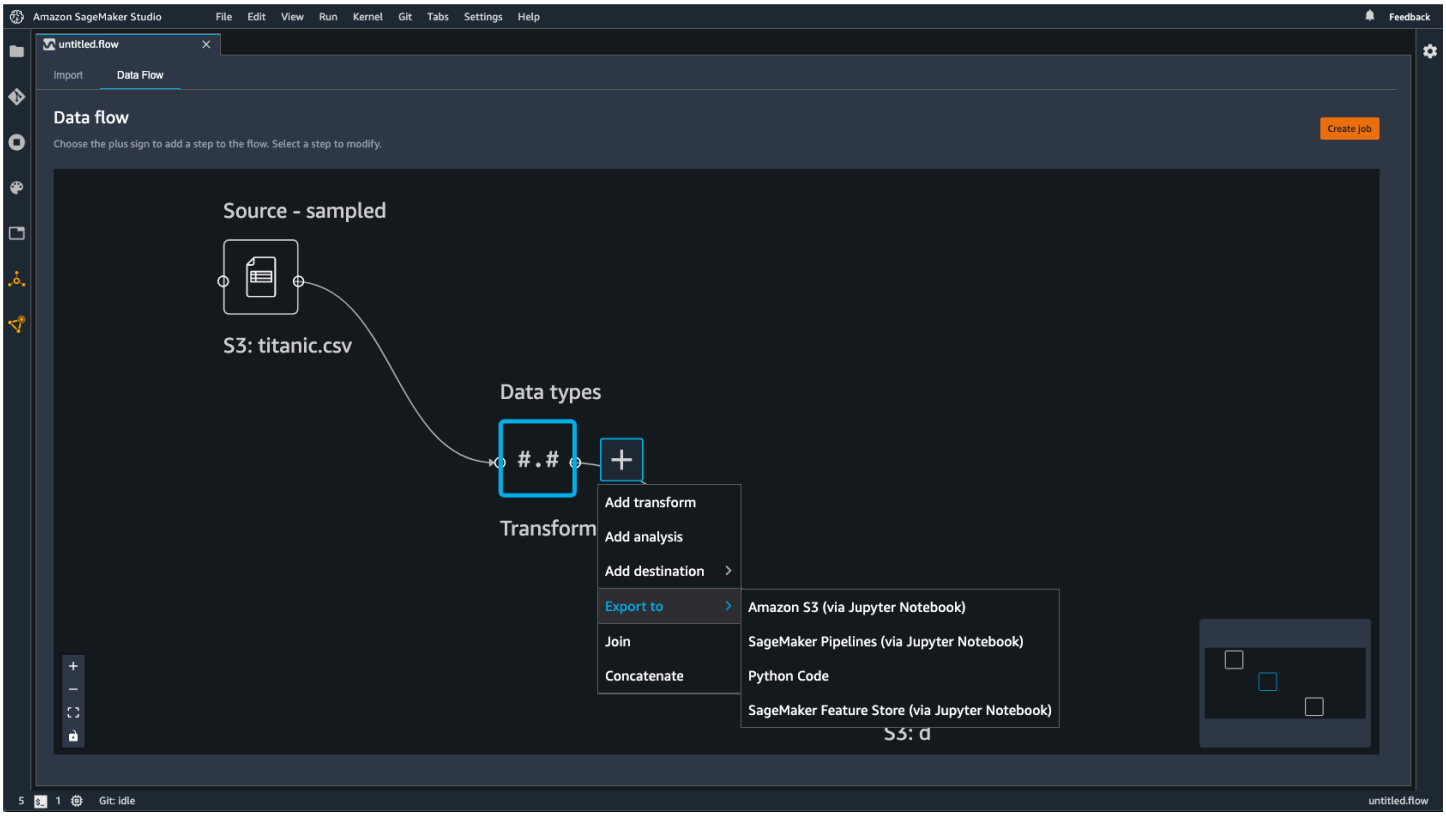
> **Important**
>
> Data Wrangler needs the inference flow artifact to run the inference pipeline. You can't use your own flow file as the artifact. You must create it by using the preceding procedure.

Export to Python Code

To export all steps in your data flow to a Python file that you can manually integrate into any data processing workflow, use the following procedure.

Use the following procedure to generate a Jupyter notebook and run it to export your Data Wrangler flow to Python Code.

1. Choose the **+** next to the node that you want to export.
2. Choose **Export to**.
3. Choose **Python Code**.
4. Run the Jupyter notebook.



You might need to configure the Python script to make it run in your pipeline. For example, if you're running a Spark environment, make sure that you are running the script from an environment that has permission to access AWS resources.

Export to Amazon SageMaker Feature Store

You can use Data Wrangler to export features you've created to Amazon SageMaker Feature Store. A feature is a column in your dataset. Feature Store is a centralized store for features and their associated metadata. You can use Feature Store to create, share, and manage curated data for machine learning (ML) development. Centralized stores make your data more discoverable and reusable. For more information about Feature Store, see Amazon SageMaker Feature Store.

A core concept in Feature Store is a feature group. A feature group is a collection of features, their records (observations), and associated metadata. It's similar to a table in a database.

You can use Data Wrangler to do one of the following:

- Update an existing feature group with new records. A record is an observation in the dataset.
- Create a new feature group from a node in your Data Wrangler flow. Data Wrangler adds the observations from your datasets as records in your feature group.

If you're updating an existing feature group, your dataset's schema must match the schema of the feature group. All the records in the feature group are replaced with the observations in your dataset.

You can use either a Jupyter notebook or a destination node to update your feature group with the observations in the dataset.

If your feature groups with the Iceberg table format have a custom offline store encryption key, make sure you grant the IAM that you're using for the Amazon SageMaker Processing job permissions to use it. At a minimum, you must grant it permissions to encrypt the data that you're writing to Amazon S3. To grant the permissions, give the IAM role the ability to use the GenerateDataKey. For more information about granting IAM roles permissions to use AWS KMS keys see https://docs.aws.amazon.com/kms/latest/developerguide/key-policies.html

Destination Node

If you want to output a series of data processing steps that you've performed to a feature group, you can create a destination node. When you create and run a destination node, Data Wrangler updates a feature group with your data. You can also create a new feature group from the destination node UI. After you create a destination node, you create a processing job to output the data. A processing job is an Amazon SageMaker processing job. When you're using a destination node, it runs the computational resources needed to output the data that you've transformed to the feature group.

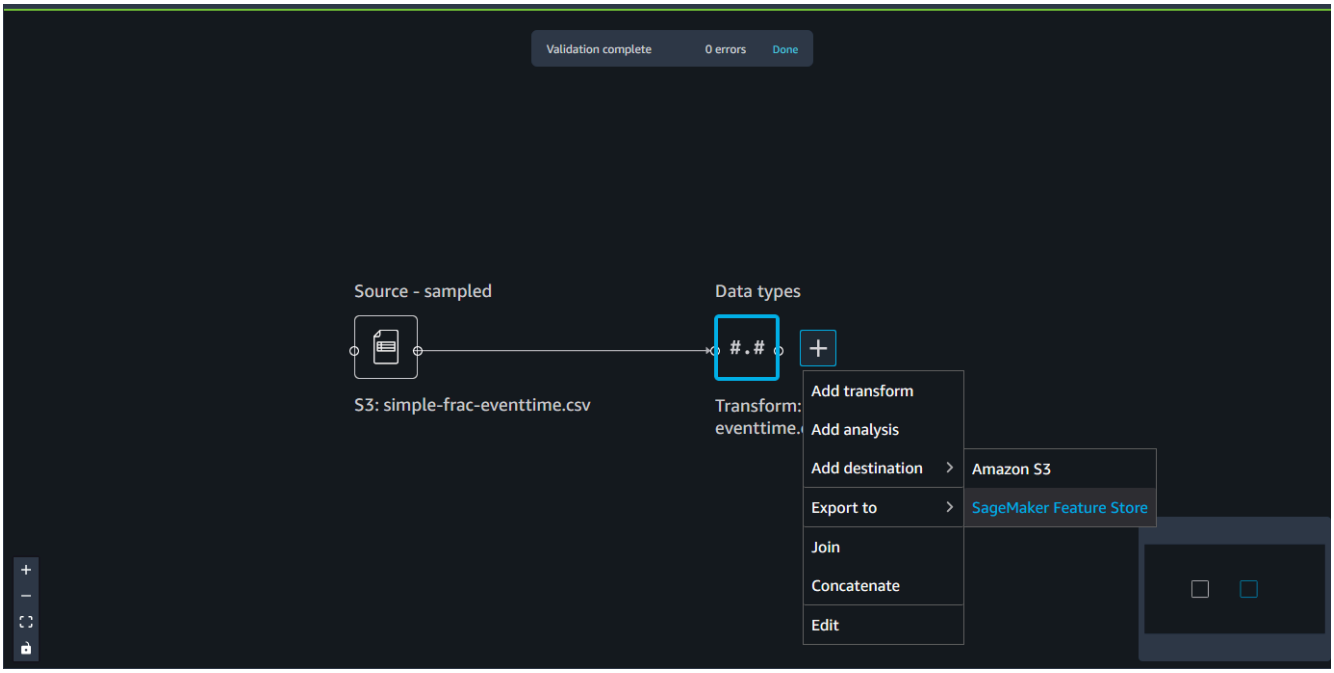
You can use a destination node to export some of the transformations or all of the transformations that you've made in your Data Wrangler flow.

Use the following procedure to create a destination node to update a feature group with the observations from your dataset.

To update a feature group using a destination node, do the following.

> **Note**
>
> You can choose **Create job** in the Data Wrangler flow to view the instructions for using a processing job to update the feature group.

1. Choose the **+** symbol next to the node containing the dataset that you'd like to export.
2. Under **Add destination**, choose **SageMaker Feature Store**.



3. Choose (double-click) the feature group. Data Wrangler checks whether the schema of the feature group matches the schema of the data that you're using to update the feature group.
4. (Optional) Select **Export to offline store only** for feature groups that have both an online store and an offline store. This option only updates the offline store with observations from your dataset.
5. After Data Wrangler validates the schema of your dataset, choose **Add**.

Use the following procedure to create a new feature group with data from your dataset.

You can store your feature group in one of the following ways:

- Online – Low-latency, high-availability cache for a feature group that provides real-time lookup of records. The online store allows quick access to the latest value for a record in a feature group.
- Offline – Stores data for your feature group in an Amazon S3 bucket. You can store your data offline when you don't need low-latency (sub-second) reads. You can use an offline store for features used in data exploration, model training, and batch inference.
- Both online and offline – Stores your data in both an online store and an offline store.

To create a feature group using a destination node, do the following.

1. Choose the **+** symbol next to the node containing the dataset that you'd like to export.
2. Under **Add destination**, choose **SageMaker Feature Store**.
3. Choose **Create Feature Group**.
4. In the following dialog box, if your dataset doesn't have an event time column, select **Create "EventTime" column**.
5. Choose **Next**.
6. Choose **Copy JSON Schema**. When you create a feature group, you paste the schema into the feature definitions.
7. Choose **Create**.
8. For **Feature group name**, specify a name for your feature group.
9. For **Description (optional)**, specify a description to make your feature group more discoverable.
10. To create a feature group for an online store, do the following.
    a. Select **Enable storage online**.
    b. For **Online store encryption key**, specify an AWS managed encryption key or an encryption key of your own.
11. To create a feature group for an offline store, do the following.
    a. Select **Enable storage offline**. Specify values for the following fields:
        - **S3 bucket name** – The name of the Amazon S3 bucket that stores the feature group.
        - (Optional) **Dataset directory name** – The Amazon S3 prefix that you're using to store the feature group.
        - **IAM Role ARN** – The IAM role that has access to Feature Store.
        - **Table Format** – Table format of your offline store. You can specify **Glue** or **Iceberg**. **Glue** is the default format.
        - **Offline store encryption key** – By default, Feature Store uses an AWS Key Management Service managed key, but you can use the field to specify a key of your own.
    b. Specify values for the following fields:
        - **S3 bucket name** – The name of the bucket storing the feature group.

- **(Optional) Dataset directory name** – The Amazon S3 prefix that you're using to store the feature group.
- **IAM Role ARN** – The IAM role that has access to feature store.
- **Offline store encryption key** – By default, Feature Store uses an AWS managed key, but you can use the field to specify a key of your own.

12. Choose **Continue**.
13. Choose **JSON**.
14. Remove the placeholder brackets in the window.
15. Paste the JSON text from Step 6.
16. Choose **Continue**.
17. For **RECORD IDENTIFIER FEATURE NAME**, choose the column in your dataset that has unique identifiers for each record in your dataset.
18. For **EVENT TIME FEATURE NAME**, choose the column with the timestamp values.
19. Choose **Continue**.
20. (Optional) Add tags to make your feature group more discoverable.
21. Choose **Continue**.
22. Choose **Create feature group**.
23. Navigate back to your Data Wrangler flow and choose the refresh icon next to the **Feature Group** search bar.

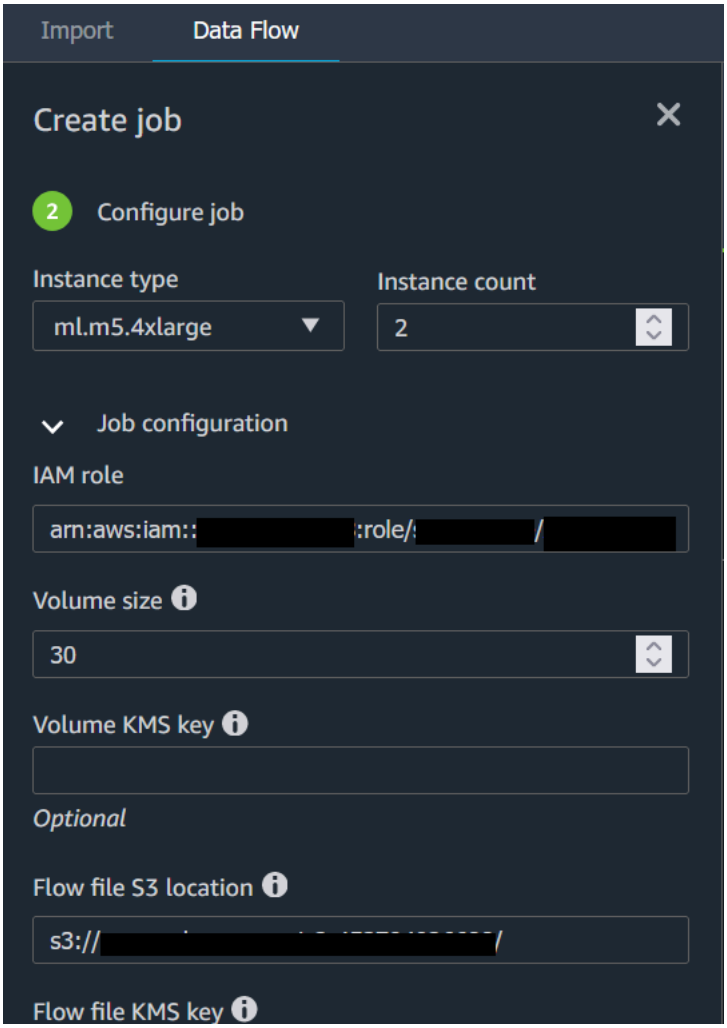
> **Note**
>
> If you've already created a destination node for a feature group within a flow, you can't create another destination node for the same feature group. If you want to create another destination node for the same feature group, you must create another flow file.

Use the following procedure to create a Data Wrangler job.

Create a job from the **Data flow** page and choose the destination nodes that you want to export.

1. Choose **Create job**. The following image shows the pane that appears after you select **Create job**.

2. For **Job name**, specify the name of the export job.
3. Choose the destination nodes that you want to export.
4. (Optional) For **Output KMS Key**, specify an ARN, ID, or alias of an AWS KMS key. A KMS key is a cryptographic key. You can use the key to encrypt the output data from the job. For more information about AWS KMS keys, see AWS Key Management Service.
5. The following image shows the **Configure job** page with the **Job configuration** tab open.



(Optional) Under **Trained parameters**. choose **Refit** if you've done the following:

- Sampled your dataset
- Applied a transform that uses your data to create a new column in the dataset

For more information about refitting the transformations you've made to an entire dataset, see Refit Transforms to The Entire Dataset and Export Them.

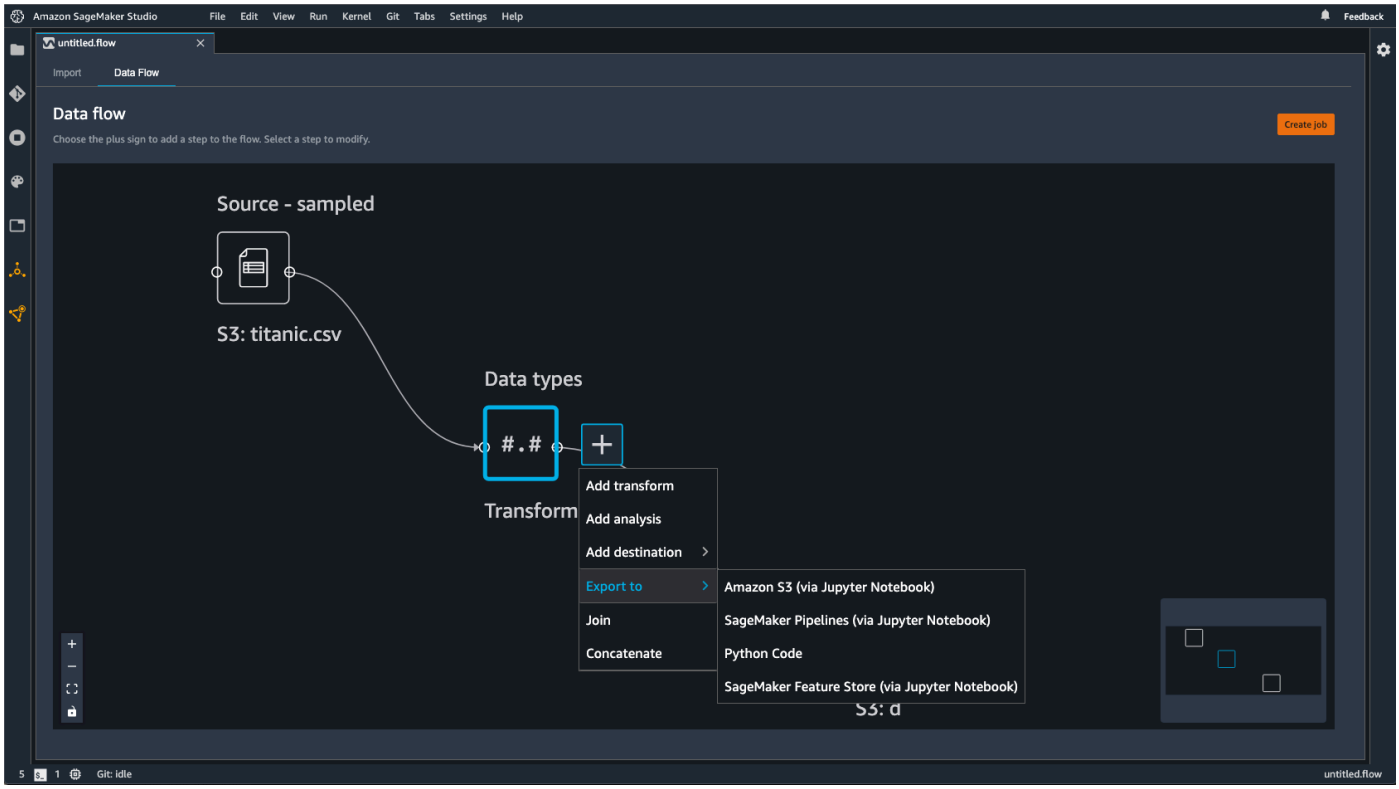
6. Choose **Configure job**.
7. (Optional) Configure the Data Wrangler job. You can make the following configurations:
   - **Job configuration**
   - **Spark memory configuration**
   - **Network configuration**
   - **Tags**
   - **Parameters**
   - **Associate Schedules**
8. Choose **Run**.

Jupyter notebook

Use the following procedure to a Jupyter notebook to export to Amazon SageMaker Feature Store.

Use the following procedure to generate a Jupyter notebook and run it to export your Data Wrangler flow to Feature Store.

1. Choose the **+** next to the node that you want to export.
2. Choose **Export to**.
3. Choose **Amazon SageMaker Feature Store (via Jupyter Notebook)**.
4. Run the Jupyter notebook.



Running a Jupyter notebook runs a Data Wrangler job. Running a Data Wrangler job starts a SageMaker processing job. The processing job ingests the flow into an online and offline feature store.

> **Important**
>
> The IAM role you use to run this notebook must have the following AWS managed policies attached: `AmazonSageMakerFullAccess` and `AmazonSageMakerFeatureStoreAccess`.

You only need to enable one online or offline feature store when you create a feature group. You can also enable both. To disable online store creation, set `EnableOnlineStore` to `False`:

```
# Online Store Configuration
online_store_config = {
    "EnableOnlineStore": False
}
```

The notebook uses the column names and types of the dataframe you export to create a feature group schema, which is used to create a feature group. A feature group is a group of features defined in the feature store to describe a record. The feature group defines the schema and features contained in the feature group. A feature group definition is composed of a list of features, a record identifier feature name, an event time feature name, and configurations for its online store and offline store.

Each feature in a feature group can have one of the following types: *String*, *Fractional*, or *Integral*. If a column in your exported dataframe is not one of these types, it defaults to `String`.

The following is an example of a feature group schema.

```
column_schema = [
    {
        "name": "Height",
        "type": "long"
    },
    {
        "name": "Input",
        "type": "string"
    },
    {
        "name": "Output",
        "type": "string"
    },
    {
        "name": "Sum",
        "type": "string"
    },
    {
        "name": "Time",
        "type": "string"
    }
]
```

Additionally, you must specify a record identifier name and event time feature name:

- The *record identifier name* is the name of the feature whose value uniquely identifies a record defined in the feature store. Only the latest record per identifier value is stored in the online store. The record identifier feature name must be one of feature definitions' names.

- The *event time feature name* is the name of the feature that stores the `EventTime` of a record in a feature group. An `EventTime` is a point in time when a new event occurs that corresponds to the creation or update of a record in a feature. All records in the feature group must have a corresponding `EventTime`.

The notebook uses these configurations to create a feature group, process your data at scale, and then ingest the processed data into your online and offline feature stores. To learn more, see Data Sources and Ingestion.

The notebook uses these configurations to create a feature group, process your data at scale, and then ingest the processed data into your online and offline feature stores. To learn more, see Data Sources and Ingestion.

Refit Transforms to The Entire Dataset and Export Them

When you import data, Data Wrangler uses a sample of the data to apply the encodings. By default, Data Wrangler uses the first 50,000 rows as a sample, but you can import the entire dataset or use a different sampling method. For more information, see Import.

The following transformations use your data to create a column in the dataset:

- Encode Categorical
- Featurize Text
- Handle Outliers
- Handle Missing Values

If you used sampling to import your data, the preceding transforms only use the data from the sample to create the column. The transform might not have used all of the relevant data. For example, if you use the **Encode Categorical** transform, there might have been a category in the entire dataset that wasn't present in the sample.

You can either use a destination node or a Jupyter notebook to refit the transformations to the entire dataset. When Data Wrangler exports the transformations in the flow, it creates a SageMaker processing job. When the processing job finishes, Data Wrangler saves the following files in either the default Amazon S3 location or an S3 location that you specify:

- The Data Wrangler flow file that specifies the transformations that are refit to the dataset

- The dataset with the refit transformations applied to it

You can open a Data Wrangler flow file within Data Wrangler and apply the transformations to a different dataset. For example, if you've applied the transformations to a training dataset, you can open and use the Data Wrangler flow file to apply the transformations to a dataset used for inference.

For a information about using destination nodes to refit transforms and export see the following pages:

- Export to Amazon S3
- Export to Amazon SageMaker Feature Store

Use the following procedure to run a Jupyter notebook to refit the transformations and export the data.

To run a Jupyter notebook and to refit the transformations and export your Data Wrangler flow, do the following.

1. Choose the **+** next to the node that you want to export.
2. Choose **Export to**.
3. Choose the location to which you're exporting the data.
4. For the `refit_trained_params` object, set `refit` to `True`.
5. For the `output_flow` field, specify the name of the output flow file with the refit transformations.
6. Run the Jupyter notebook.

Create a Schedule to Automatically Process New Data

If you're processing data periodically, you can create a schedule to run the processing job automatically. For example, you can create a schedule that runs a processing job automatically when you get new data. For more information about processing jobs, see Export to Amazon S3 and Export to Amazon SageMaker Feature Store.

When you create a job you must specify an IAM role that has permissions to create the job. By default, the IAM role that you use to access Data Wrangler is the `SageMakerExecutionRole`.

The following permissions allow Data Wrangler to access EventBridge and allow EventBridge to run processing jobs:

- Add the following AWS Managed policy to the Amazon SageMaker Studio Classic execution role that provides Data Wrangler with permissions to use EventBridge:

```
arn:aws:iam::aws:policy/AmazonEventBridgeFullAccess
```

  For more information about the policy, see AWS managed policies for EventBridge.

- Add the following policy to the IAM role that you specify when you create a job in Data Wrangler:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "sagemaker:StartPipelineExecution",
            "Resource": "arn:aws:sagemaker:Region:AWS-account-id:pipeline/data-
wrangler-*"
        }
    ]
}
```

  If you're using the default IAM role, you add the preceding policy to the Amazon SageMaker Studio Classic execution role.

  Add the following trust policy to the role to allow EventBridge to assume it.

```
{
    "Effect": "Allow",
    "Principal": {
        "Service": "events.amazonaws.com"
    },
    "Action": "sts:AssumeRole"
}
```

Important

When you create a schedule, Data Wrangler creates an `eventRule` in EventBridge. You incur charges for both the event rules that you create and the instances used to run the processing job.
For information about EventBridge pricing, see Amazon EventBridge pricing. For information about processing job pricing, see Amazon SageMaker Pricing.

You can set a schedule using one of the following methods:

- CRON expressions

  Note

  Data Wrangler doesn't support the following expressions:

  - LW#
  - Abbreviations for days
  - Abbreviations for months

- RATE expressions
- Recurring – Set an hourly or daily interval to run the job.
- Specific time – Set specific days and times to run the job.

The following sections provide procedures on creating jobs.

CRON

Use the following procedure to create a schedule with a CRON expression.

To specify a schedule with a CRON expression, do the following.

1. Open your Data Wrangler flow.
2. Choose **Create job**.

3. (Optional) For **Output KMS key**, specify an AWS KMS key to configure the output of the job.
4. Choose **Next, 2. Configure job**.
5. Select **Associate Schedules**.
6. Choose **Create a new schedule**.
7. For **Schedule Name**, specify the name of the schedule.
8. For **Run Frequency**, choose **CRON**.
9. Specify a valid CRON expression.
10. Choose **Create**.
11. (Optional) Choose **Add another schedule** to run the job on an additional schedule.

> **Note**
>
> You can associate a maximum of two schedules. The schedules are independent and don't affect each other unless the times overlap.

12. Choose one of the following:
    - **Schedule and run now** – Data Wrangler the job runs immediately and subsequently runs on the schedules.
    - **Schedule only** – Data Wrangler the job only runs on the schedules that you specify.
13. Choose **Run**

RATE

Use the following procedure to create a schedule with a RATE expression.

To specify a schedule with a RATE expression, do the following.

1. Open your Data Wrangler flow.
2. Choose **Create job**.
3. (Optional) For **Output KMS key**, specify an AWS KMS key to configure the output of the job.
4. Choose **Next, 2. Configure job**.
5. Select **Associate Schedules**.

6. Choose **Create a new schedule**.
7. For **Schedule Name**, specify the name of the schedule.
8. For **Run Frequency**, choose **Rate**.
9. For **Value**, specify an integer.
10. For **Unit**, select one of the following:

    - **Minutes**
    - **Hours**
    - **Days**
11. Choose **Create**.
12. (Optional) Choose **Add another schedule** to run the job on an additional schedule.

    > **Note**
    >
    > You can associate a maximum of two schedules. The schedules are independent and don't affect each other unless the times overlap.
13. Choose one of the following:

    - **Schedule and run now** – Data Wrangler the job runs immediately and subsequently runs on the schedules.
    - **Schedule only** – Data Wrangler the job only runs on the schedules that you specify.
14. Choose **Run**

Recurring

Use the following procedure to create a schedule that runs a job on a recurring basis.

To specify a schedule with a CRON expression, do the following.

1. Open your Data Wrangler flow.
2. Choose **Create job**.
3. (Optional) For **Output KMS key**, specify an AWS KMS key to configure the output of the job.
4. Choose **Next, 2. Configure job**.
5. Select **Associate Schedules**.

6. Choose **Create a new schedule**.
7. For **Schedule Name**, specify the name of the schedule.
8. For **Run Frequency**, make sure **Recurring** is selected by default.
9. For **Every x hours**, specify the hourly frequency that the job runs during the day. Valid values are integers in the inclusive range of **1** and **23**.
10. For **On days**, select one of the following options:

    - **Every Day**
    - **Weekends**
    - **Weekdays**
    - **Select Days**

    - (Optional) If you've selected **Select Days**, choose the days of the week to run the job.

    > **Note**
    >
    > The schedule resets every day. If you schedule a job to run every five hours, it runs at the following times during the day:
    >
    > - 00:00
    > - 05:00
    > - 10:00
    > - 15:00
    > - 20:00

11. Choose **Create**.
12. (Optional) Choose **Add another schedule** to run the job on an additional schedule.

    > **Note**
    >
    > You can associate a maximum of two schedules. The schedules are independent and don't affect each other unless the times overlap.

13. Choose one of the following:

- **Schedule and run now** – Data Wrangler the job runs immediately and subsequently runs on the schedules.
- **Schedule only** – Data Wrangler the job only runs on the schedules that you specify.

14. Choose **Run**

Specific time

Use the following procedure to create a schedule that runs a job at specific times.

To specify a schedule with a CRON expression, do the following.

1. Open your Data Wrangler flow.
2. Choose **Create job**.
3. (Optional) For **Output KMS key**, specify an AWS KMS key to configure the output of the job.
4. Choose **Next, 2. Configure job**.
5. Select **Associate Schedules**.
6. Choose **Create a new schedule**.
7. For **Schedule Name**, specify the name of the schedule.
8. Choose **Create**.
9. (Optional) Choose **Add another schedule** to run the job on an additional schedule.

> **Note**
>
> You can associate a maximum of two schedules. The schedules are independent and don't affect each other unless the times overlap.

10. Choose one of the following:
    - **Schedule and run now** – Data Wrangler the job runs immediately and subsequently runs on the schedules.
    - **Schedule only** – Data Wrangler the job only runs on the schedules that you specify.
11. Choose **Run**

You can use Amazon SageMaker Studio Classic view the jobs that are scheduled to run. Your processing jobs run within SageMaker Pipelines. Each processing job has its own pipeline. It runs as a processing step within the pipeline. You can view the schedules that you've created within a pipeline. For information about viewing a pipeline, see View a Pipeline.

Use the following procedure to view the jobs that you've scheduled.

To view the jobs you've scheduled, do the following.

1. Open Amazon SageMaker Studio Classic.
2. Open SageMaker Pipelines
3. View the pipelines for the jobs that you've created.

   The pipeline running the job uses the job name as a prefix. For example, if you've created a job named `housing-data-feature-enginnering`, the name of the pipeline is `data-wrangler-housing-data-feature-engineering`.
4. Choose the pipeline containing your job.
5. View the status of the pipelines. Pipelines with a **Status** of **Succeeded** have run the processing job successfully.

To stop the processing job from running, do the following:

To stop a processing job from running, delete the event rule that specifies the schedule. Deleting an event rule stops all the jobs associated with the schedule from running. For information about deleting a rule, see Disabling or deleting an Amazon EventBridge rule.

You can stop and delete the pipelines associated with the schedules as well. For information about stopping a pipeline, see StopPipelineExecution. For information about deleting a pipeline, see DeletePipeline.

Use an Interactive Data Preparation Widget in an Amazon SageMaker Studio Classic Notebook to Get Data Insights

Use the Data Wrangler data preparation widget to interact with your data, get visualizations, explore actionable insights, and fix data quality issues.

You can access the data preparation widget from an Amazon SageMaker Studio Classic notebook. For each column, the widget creates a visualization that helps you better understand its distribution. If a column has data quality issues, a warning appears in its header.

To see the data quality issues, select the column header showing the warning. You can use the information that you get from the insights and the visualizations to apply the widget's built-in transformations to help you fix the issues.

For example, the widget might detect that you have a column that only has one unique value and show you a warning. The warning provides the option to drop the column from the dataset.

Getting started with running the widget

Use the following information to help you get started with running a notebook.

Open a notebook in Amazon SageMaker Studio Classic. For information about opening a notebook, see Create or Open an Amazon SageMaker Studio Classic Notebook.

Important

To run the widget, the notebook must use one of the following images:

- Python 3 (Data Science) with Python 3.7
- Python 3 (Data Science 2.0) with Python 3.8
- Python 3 (Data Science 3.0) with Python 3.10
- SparkAnalytics 1.0
- SparkAnalytics 2.0

For more information about images, see Available Amazon SageMaker Images.

Use the following code to import the data preparation widget and pandas. The widget uses pandas dataframes to analyze your data.

```
import pandas as pd
import sagemaker_datawrangler
```

The following example code loads a file into the dataframe called `df`.

```
df = pd.read_csv("example-dataset.csv")
```

You can use a dataset in any format that you can load as a pandas dataframe object. For more information about pandas formats, see IO tools (text, CSV, HDF5, …).

The following cell runs the `df` variable to start the widget.

```
df
```

The top of the dataframe has the following options:

- **View the Pandas table** – Switches between the interactive visualization and a pandas table.
- **Use all of the rows in your dataset to compute the insights. Using the entire dataset might increase the time it takes to generate the insights.** – If you don't select the option, Data Wrangler computes the insights for the first 10,000 rows of the dataset.

The dataframe shows the first 1000 rows of the dataset. Each column header has a stacked bar chart that shows the column's characteristics. It shows the proportion of valid values, invalid values, and missing values. You can hover over the different portions of the stacked bar chart to get the calculated percentages.

Each column has a visualization in the header. The following shows the types of visualizations the columns can have:

- Categorical – Bar chart
- Numeric – Histogram
- Datetime – Bar chart
- Text – Bar chart

For each visualization, the data preparation widget highlights outliers in orange.

When you choose a column, it opens a side panel. The side panel shows you the **Insights** tab. The pane provides a count for the following types of values:

- Invalid values – Values whose type doesn't match the column type.
- Missing values – Values that are missing, such as `NaN` or `None`.
- Valid values – Values that are neither missing nor invalid.

For numeric columns, the **Insights** tab shows the following summary statistics:

- Minimum – The smallest value.
- Maximum – The largest value.
- Mean – The mean of the values.
- Mode – The value that appears most frequently.
- Standard deviation – The standard deviation of the values.

For categorical columns, the **Insights** tab shows the following summary statistics:

- Unique values – The number of unique values in the column.
- Top – The value that appears most frequently.

The columns that have warning icons in their headers have data quality issues. Choosing a column opens a **Data quality** tab that you can use to find transforms to help you fix the issue. A warning has one of the following severity levels:

- Low – Issues that might not affect your analysis, but can be useful to fix.
- Medium – Issues that are likely to affect your analysis, but are likely not critical to fix.
- High – Severe issues that we strongly recommend fixing.

> **Note**
>
> The widget sorts the column to show the values that have data quality issues at the top of the dataframe. It also highlights the values that are causing the issues. The color of the highlighting corresponds to the severity level.

Under **SUGGESTED TRANSFORMS**, you can choose a transform to fix the data quality issue. The widget can offer multiple transforms that can fix the issue. It can offer recommendations for the transforms that are best suited to the problem. You can move your cursor over the transform to get more information about it.

To apply a transform to the dataset, choose **Apply and export code**. The transform modifies the dataset and updates the visualization with modified values. The code for the transform appears in

the following cell of the notebook. If you apply additional transforms to the dataset, the widget appends the transforms to the cell. You can use the code that the widget generates to do the following:

- Customize it to better fit your needs.
- Use it in your own workflows.

You can reproduce all the transforms you've made by rerunning all of the cells in the notebook.

The widget can provide insights and warnings for the target column. The target column is the column that you're trying to predict. Use the following procedure to get target column insights.

To get target column insights, do the following.

1. Choose the column that you're using as the target column.
2. Choose **Select as target column**.
3. Choose the problem type. The widget's insights and warnings are tailored to the problem types. The following are the problem types:
   - **Classification** – The target column has categorical data.
   - **Regression** – The target column has numeric data.
4. Choose **Run**.
5. (Optional) Under **Target Column Insights**, choose one of the suggested transforms.

Reference for the insights and transforms in the widget

For feature columns (columns that aren't the target column), you can get the following insights to warn you about issues with your dataset.

- **Missing values** – The column has missing values such as `None`, `NaN` (not a number), or `NaT` (not a timestamp). Many machine learning algorithms don’t support missing values in the input data. Filling them in or dropping the rows with missing data is therefore a crucial data preparation step. If you see the missing values warning, you can use one of the following transforms to correct the issue.
  - **Drop missing** – Drops rows with missing values. We recommend dropping rows when the percentage of rows with missing data is small and imputing the missing values isn't appropriate.

  - **Replace with new value** – Replaces textual missing values with `Other`. You can change `Other` to a different value in the output code. Replaces numeric missing values with 0.
  - **Replace with mean** – Replaces missing values with the mean of the column.
  - **Replace with median** – Replaces missing values with the median of the column.
  - **Drop column** – Drops the column with missing values from the dataset. We recommend dropping the entire column when there's a high percentage of rows with missing data.
- **Disguised missing values** – The column has disguised missing values. A disguised missing value is a value that isn't explicitly encoded as a missing value. For example, instead of using a `NaN` to indicate a missing value, the value could be `Placeholder`. You can use one of the following transforms to handle the missing values:
  - **Drop missing** – Drops rows with missing values
  - **Replace with new value** – Replaces textual missing values with `Other`. You can change `Other` to a different value in the output code. Replaces numeric missing values with 0.
- **Constant column** – The column only has one value. It therefore has no predictive power. We strongly recommend using the **Drop column** transform to drop the column from the dataset.
- **ID column** – The column has no repeating values. All of the values in the column are unique. They might be either IDs or database keys. Without additional information, the column has no predictive power. We strongly recommend using the **Drop column** transform to drop the column from the dataset.
- **High cardinality** – The column has a high percentage of unique values. High cardinality limits the predictive power of categorical columns. Examine the importance of the column in your analysis and consider using the **Drop column** transform to drop it.

For the target column, you can get the following insights to warn you about issues with your dataset. You can use the suggested transformation provided with the warning to correct the issue.

- **Mixed data types in target (Regression)** – There are some non-numeric values in the target column. There might be data entry errors. We recommend removing the rows that have the values that can't be converted.
- **Frequent label** – Certain values in the target column appear more frequently than what would be normal in the context of regression. There might be an error in data collection or processing. A frequently appearing category might indicate that either the value is used as a default value or that it’s a placeholder for missing values. We recommend using the **Replace with new value** transform to replace the missing values with `Other`.

- **Too few instances per class** – The target column has categories that appear rarely. Some of the categories don't have enough rows for the target column to be useful. You can use one of the following transforms:
  - **Drop rare target** – Drops unique values with fewer than ten observations. For example, drops the value `cat` if it appears nine times in the column.
  - **Replace rare target** – Replaces categories that appear rarely in the dataset with the value `Other`.
- **Classes too imbalanced (multi-class classification)** – There are categories in the dataset that appear much more frequently than the other categories. The class imbalance might affect prediction accuracy. For the most accurate predictions possible, we recommend updating the dataset with rows that have the categories that currently appear less frequently.
- **Large amount of classes/too many classes** – There's a large number of classes in the target column. Having many classes might result in longer training times or poor predictive quality. We recommend doing one of the following:
  - Grouping some of the categories into their own category. For example, if six categories are closely related, we recommend using a single category for them.
  - Using an ML algorithm that's resilient to multiple categories.

Security and Permissions

When you query data from Athena or Amazon Redshift, the queried dataset is automatically stored in the default SageMaker S3 bucket for the AWS Region in which you are using Studio Classic. Additionally, when you export a Jupyter Notebook from Amazon SageMaker Data Wrangler and run it, your data flows, or .flow files, are saved to the same default bucket, under the prefix *data_wrangler_flows*.

For high-level security needs, you can configure a bucket policy that restricts the AWS roles that have access to this default SageMaker S3 bucket. Use the following section to add this type of policy to an S3 bucket. To follow the instructions on this page, use the AWS Command Line Interface (AWS CLI). To learn how, see Configuring the AWS CLI in the IAM User Guide.

Additionally, you need to grant each IAM role that uses Data Wrangler permissions to access required resources. If you do not require granular permissions for the IAM role you use to access Data Wrangler, you can add the IAM managed policy, `AmazonSageMakerFullAccess`, to an IAM role that you use to create your Studio Classic user. This policy grants you full permission to use

Data Wrangler. If you require more granular permissions, refer to the section, Grant an IAM Role Permission to Use Data Wrangler.

Add a Bucket Policy To Restrict Access to Datasets Imported to Data Wrangler

You can add a policy to the S3 bucket that contains your Data Wrangler resources using an Amazon S3 bucket policy. Resources that Data Wrangler uploads to your default SageMaker S3 bucket in the AWS Region you are using Studio Classic in include the following:

- Queried Amazon Redshift results. These are stored under the *redshift/* prefix.
- Queried Athena results. These are stored under the *athena/* prefix.
- The .flow files uploaded to Amazon S3 when you run an exported Jupyter Notebook Data Wrangler produces. These are stored under the *data_wrangler_flows/* prefix.

Use the following procedure to create an S3 bucket policy that you can add to restrict IAM role access to that bucket. To learn how to add a policy to an S3 bucket, see How do I add an S3 Bucket policy?.

To set up a bucket policy on the S3 bucket that stores your Data Wrangler resources:

1. Configure one or more IAM roles that you want to be able to access Data Wrangler.
2. Open a command prompt or shell. For each role that you create, replace *role-name* with the name of the role and run the following:

   ```
   $ aws iam get-role --role-name role-name
   ```

   In the response, you see a `RoleId` string which begins with `AROA`. Copy this string.
3. Add the following policy to the SageMaker default bucket in the AWS Region in which you are using Data Wrangler. Replace *region* with the AWS Region in which the bucket is located, and *account-id* with your AWS account ID. Replace `userId`s starting with *AROAEXAMPLEID* with the IDs of an AWS roles to which you want to grant permission to use Data Wrangler.

   ```
   {
     "Version": "2012-10-17",
     "Statement": [
       {
         "Effect": "Deny",
         "Principal": "*",
   ```

```
      "Action": "s3:*",
      "Resource": [
        "arn:aws:s3:::sagemaker-region-account-id/data_wrangler_flows/",
        "arn:aws:s3:::sagemaker-region-account-id/data_wrangler_flows/*",
        "arn:aws:s3:::sagemaker-region-account-id/athena",
        "arn:aws:s3:::sagemaker-region-account-id/athena/*",
        "arn:aws:s3:::sagemaker-region-account-id/redshift",
        "arn:aws:s3:::sagemaker-region-account-id/redshift/*"

      ],
      "Condition": {
        "StringNotLike": {
          "aws:userId": [
            "AROAEXAMPLEID_1:*",
            "AROAEXAMPLEID_2:*"
          ]
        }
      }
    }
  ]
}
```

Create an Allowlist for Data Wrangler

Whenever a user starts running Data Wrangler from the Amazon SageMaker Studio Classic user interface, they make call to the SageMaker application programming interface (API) to create a Data Wrangler application.

Your organization might not provide your users with permissions to make those API calls by default. To provide permissions, you must create and attach a policy to the user's IAM roles using the following policy template: Data Wrangler Allow List Example.

> **Note**
>
> The preceding policy example only gives your users access to the Data Wrangler application.

For information about creating a policy, see Creating policies on the JSON tab. When you're creating a policy, copy and paste the JSON policy from Data Wrangler Allow List Example in the **JSON** tab.

Important

Delete any IAM policies that prevent users from running the following operations:

- CreateApp
- DescribeApp

If you don't delete the policies, your users could still be affected by them.

After you've creating the policy using the template, attach it to the IAM roles of your users. For information about attaching a policy, see Adding IAM identity permissions (console).

Grant an IAM Role Permission to Use Data Wrangler

You can grant an IAM role permission to use Data Wrangler with the general IAM managed policy, `AmazonSageMakerFullAccess`. This is a general policy that includes permissions required to use all SageMaker services. This policy grants an IAM role full access to Data Wrangler. You should be aware of the following when using `AmazonSageMakerFullAccess` to grant access to Data Wrangler:

- If you import data from Amazon Redshift, the **Database User** name must have the prefix `sagemaker_access`.
- This managed policy only grants permission to access buckets with one of the following in the name: `SageMaker`, `SageMaker`, `sagemaker`, or `aws-glue`. If want to use Data Wrangler to import from an S3 bucket without these phrases in the name, refer to the last section on this page to learn how to grant permission to an IAM entity to access your S3 buckets.

If you have high-security needs, you can attach the policies in this section to an IAM entity to grant permissions required to use Data Wrangler.

If you have datasets in Amazon Redshift or Athena that an IAM role needs to import from Data Wrangler, you must add a policy to that entity to access these resources. The following policies are the most restrictive policies you can use to give an IAM role permission to import data from Amazon Redshift and Athena.

To learn how to attach a custom policy to an IAM role, refer to Managing IAM policies in the IAM User Guide.

Policy example to grant access to an Athena dataset import

The following policy assumes that the IAM role has permission to access the underlying S3 bucket where data is stored through a separate IAM policy.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "athena:ListDataCatalogs",
                "athena:ListDatabases",
                "athena:ListTableMetadata",
                "athena:GetQueryExecution",
                "athena:GetQueryResults",
                "athena:StartQueryExecution",
                "athena:StopQueryExecution"
            ],
            "Resource": [
                "*"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "glue:CreateTable"
            ],
            "Resource": [
                "arn:aws:glue:*:*:table/*/sagemaker_tmp_*",
                "arn:aws:glue:*:*:table/sagemaker_featurestore/*",
                "arn:aws:glue:*:*:catalog",
                "arn:aws:glue:*:*:database/*"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "glue:DeleteTable"
            ],
            "Resource": [
                "arn:aws:glue:*:*:table/*/sagemaker_tmp_*",
                "arn:aws:glue:*:*:catalog",
                "arn:aws:glue:*:*:database/*"
```

```
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "glue:GetDatabases",
                "glue:GetTable",
                "glue:GetTables"
            ],
            "Resource": [
                "arn:aws:glue:*:*:table/*",
                "arn:aws:glue:*:*:catalog",
                "arn:aws:glue:*:*:database/*"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "glue:CreateDatabase",
                "glue:GetDatabase"
            ],
            "Resource": [
                "arn:aws:glue:*:*:catalog",
                "arn:aws:glue:*:*:database/sagemaker_featurestore",
                "arn:aws:glue:*:*:database/sagemaker_processing",
                "arn:aws:glue:*:*:database/default",
                "arn:aws:glue:*:*:database/sagemaker_data_wrangler"
            ]
        }
    ]
}
```

Policy example to grant access to an Amazon Redshift dataset import

The following policy grants permission to set up an Amazon Redshift connection to Data Wrangler using database users that have the prefix `sagemaker_access` in the name. To grant permission to connect using additional database users, add additional entries under `"Resources"` in the following policy. The following policy assumes that the IAM role has permission to access the underlying S3 bucket where data is stored through a separate IAM policy, if applicable.

```
{
    "Version": "2012-10-17",
    "Statement": [
```

```
        {
            "Effect": "Allow",
            "Action": [
                "redshift-data:ExecuteStatement",
                "redshift-data:DescribeStatement",
                "redshift-data:CancelStatement",
                "redshift-data:GetStatementResult",
                "redshift-data:ListSchemas",
                "redshift-data:ListTables"
            ],
            "Resource": [
                "*"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "redshift:GetClusterCredentials"
            ],
            "Resource": [
                "arn:aws:redshift:*:*:dbuser:*/sagemaker_access*",
                "arn:aws:redshift:*:*:dbname:*"
            ]
        }
    ]
}
```

Policy to grant access to an S3 bucket

If your dataset is stored in Amazon S3, you can grant an IAM role permission to access this bucket with a policy similar to the following. This example grants programmatic read-write access to the bucket named *test*.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": ["s3:ListBucket"],
      "Resource": ["arn:aws:s3:::test"]
    },
    {
      "Effect": "Allow",
```

```
      "Action": [
        "s3:PutObject",
        "s3:GetObject",
        "s3:DeleteObject"
      ],
      "Resource": ["arn:aws:s3:::test/*"]
    }
  ]
}
```

To import data from Athena and Amazon Redshift, you must grant an IAM role permission to access the following prefixes under the default Amazon S3 bucket in the AWS Region Data Wrangler in which is being used: `athena/`, `redshift/`. If a default Amazon S3 bucket does not already exist in the AWS Region, you must also give the IAM role permission to create a bucket in this region.

Additionally, if you want the IAM role to be able to use the Amazon SageMaker Feature Store, SageMaker Pipelines, and Data Wrangler job export options, you must grant access to the prefix `data_wrangler_flows/` in this bucket.

Data Wrangler uses the `athena/` and `redshift/` prefixes to store preview files and imported datasets. To learn more, see Imported Data Storage.

Data Wrangler uses the `data_wrangler_flows/` prefix to store .flow files when you run a Jupyter Notebook exported from Data Wrangler. To learn more, see Export.

Use a policy similar to the following to grant the permissions described in the preceding paragraphs.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject",
                "s3:PutObject"
            ],
            "Resource": [
                "arn:aws:s3:::sagemaker-region-account-id/data_wrangler_flows/",
                "arn:aws:s3:::sagemaker-region-account-id/data_wrangler_flows/*",
                "arn:aws:s3:::sagemaker-region-account-id/athena",
```

```
                "arn:aws:s3:::sagemaker-region-account-id/athena/*",
                "arn:aws:s3:::sagemaker-region-account-id/redshift",
                "arn:aws:s3:::sagemaker-region-account-id/redshift/*"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "s3:CreateBucket",
                "s3:ListBucket"
            ],
            "Resource": "arn:aws:s3:::sagemaker-region-account-id"
        },
        {
            "Effect": "Allow",
            "Action": [
                "s3:ListAllMyBuckets",
                "s3:GetBucketLocation"
            ],
            "Resource": "*"
        }
    ]
}
```

You can also access data in your Amazon S3 bucket from another AWS account by specifying the Amazon S3 bucket URI. To do this, the IAM policy that grants access to the Amazon S3 bucket in the other account should use a policy similar to the following example, where `BucketFolder` is the specific directory in the user's bucket `UserBucket`. This policy should be added to the user granting access to their bucket for another user.

```
{
   "Version": "2012-10-17",
   "Statement": [
       {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject",
                "s3:PutObject",
                "s3:PutObjectAcl"
            ],
            "Resource": "arn:aws:s3:::UserBucket/BucketFolder/*"
            },
                {
```

```
                "Effect": "Allow",
                "Action": [
                    "s3:ListBucket"
                ],
                "Resource": "arn:aws:s3:::UserBucket",
                "Condition": {
                "StringLike": {
                    "s3:prefix": [
                    "BucketFolder/*"
                    ]
                }
            }
        }
    ]
}
```

The user that is accessing the bucket (not the bucket owner) must add a policy similar to the following example to their user. Note that `AccountX` and `TestUser` below refers to the bucket owner and their user respectively.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::AccountX:user/TestUser"
            },
            "Action": [
                "s3:GetObject",
                "s3:PutObject",
                "s3:PutObjectAcl"
            ],
            "Resource": [
                "arn:aws:s3:::UserBucket/BucketFolder/*"
            ]
        },
        {
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::AccountX:user/TestUser"
            },
            "Action": [
```

```
                "s3:ListBucket"
            ],
            "Resource": [
                "arn:aws:s3:::UserBucket"
            ]
        }
    ]
}
```

Policy example to grant access to use SageMaker Studio

Use a policy like to the following to create an IAM execution role that can be used to set up a Studio Classic instance.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "sagemaker:CreatePresignedDomainUrl",
                "sagemaker:DescribeDomain",
                "sagemaker:ListDomains",
                "sagemaker:DescribeUserProfile",
                "sagemaker:ListUserProfiles",
                "sagemaker:*App",
                "sagemaker:ListApps"
            ],
            "Resource": "*"
        }
    ]
}
```

Snowflake and Data Wrangler

All permissions for AWS resources are managed via your IAM role attached to your Studio Classic instance. The Snowflake administrator manages Snowflake-specific permissions, as they can grant granular permissions and privileges to each Snowflake user. This includes databases, schemas, tables, warehouses, and storage integration objects. You must ensure that the correct permissions are set up outside of Data Wrangler.

Note that the Snowflake `COPY INTO Amazon S3` command moves data from Snowflake to Amazon S3 over the public internet by default, but data in transit is secured using SSL. Data at rest in Amazon S3 is encrypted with SSE-KMS using the default AWS KMS key.

With respect to Snowflake credentials storage, Data Wrangler does not store customer credentials. Data Wrangler uses Secrets Manager to store the credentials in a secret and rotates secrets as part of a best practice security plan. The Snowflake or Studio Classic administrator needs to ensure that the data scientist's Studio Classic execution role is granted permission to perform `GetSecretValue` on the secret storing the credentials. If already attached to the Studio Classic execution role, the `AmazonSageMakerFullAccess` policy has the necessary permissions to read secrets created by Data Wrangler and secrets created by following the naming and tagging convention in the instructions above. Secrets that do not follow the conventions must be separately granted access. We recommend using Secrets Manager to prevent sharing credentials over unsecured channels; however, note that a logged-in user can retrieve the plain-text password by launching a terminal or Python notebook in Studio Classic and then invoking API calls from the Secrets Manager API.

Data Encryption with AWS KMS

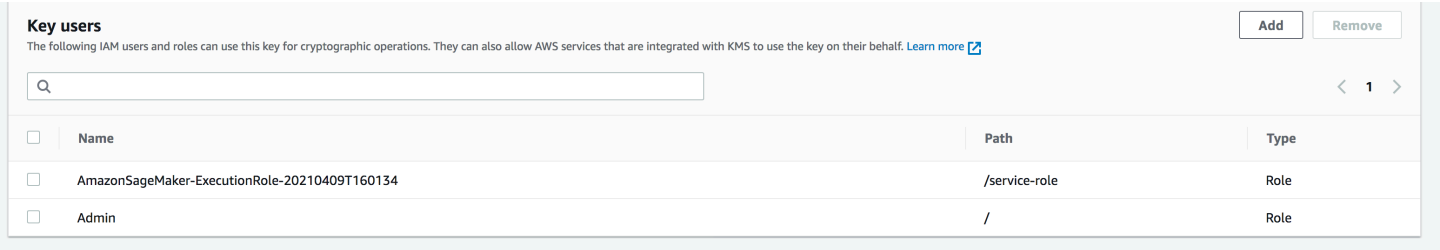
Within Data Wrangler, you can decrypt encrypted files and add them to your Data Wrangler flow. You can also encrypt the output of the transforms using either a default AWS KMS key or one that you provide.

You can import files if they have the following:

- server-side encryption
- SSE-KMS as the encryption type

To decrypt the file and import to a Data Wrangler flow, you must add the SageMaker Studio Classic user that you're using as a key user.

The following screenshot shows a Studio Classic user role added as a key user. See IAM Roles to access users under the left panel to make this change.



Amazon S3 customer managed key setup for Data Wrangler imported data storage

By default, Data Wrangler uses Amazon S3 buckets that have the following naming convention: `sagemaker-region-account number`. For example, if your account number is `111122223333` and you are using Studio Classic in us-east-1, your imported datasets are stored with the following naming convention: `sagemaker-us-east-1-111122223333`.

The following instructions explain how to set up a customer managed key for your default Amazon S3 bucket.

1. To enable server-side encryption and setup a customer managed key for your default S3 bucket, see Using KMS Encryption.
2. After following step 1, navigate to AWS KMS in your AWS Management Console. Find the customer managed key you selected in step 1 of the previous step and add the Studio Classic role as the key user. To do this, follow the instructions in Allows key users to use a customer managed key.

Encrypting the Data That You Export

You can encrypt the data that you export using one of the following methods:

- Specifying that your Amazon S3 bucket has object use SSE-KMS encryption.
- Specifying an AWS KMS key to encrypt the data that you export from Data Wrangler.

On the **Export data** page, specify a value for the **AWS KMS key ID or ARN**.

For more information on using AWS KMS keys, see Protecting Data Using Server-Side Encryption with AWS KMS keys Stored in AWSAWS Key Management Service (SSE-KMS) .

Amazon AppFlow Permissions

When you're performing a transfer, you must specify an IAM role that has permissions to perform the transfer. You can use the same IAM role that has permissions to use Data Wrangler. By default, the IAM role that you use to access Data Wrangler is the `SageMakerExecutionRole`.

The IAM role must have the following permissions:

- Permissions to Amazon AppFlow
- Permissions to the AWS Glue Data Catalog

- Permissions for AWS Glue to discover the data sources that are available

When you run a transfer, Amazon AppFlow stores metadata from the transfer in the AWS Glue Data Catalog. Data Wrangler uses the metadata from the catalog to determine whether it's available for you to query and import.

To add permissions to Amazon AppFlow, add the `AmazonAppFlowFullAccess` AWS managed policy to the IAM role. For more information about adding policies, see Adding or removing IAM identity permissions.

If you're transferring data to Amazon S3, you must also attach the following policy.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "VisualEditor0",
      "Effect": "Allow",
      "Action": [
        "s3:GetBucketTagging",
        "s3:ListBucketVersions",
        "s3:CreateBucket",
        "s3:ListBucket",
        "s3:GetBucketPolicy",
        "s3:PutEncryptionConfiguration",
        "s3:GetEncryptionConfiguration",
        "s3:PutBucketTagging",
        "s3:GetObjectTagging",
        "s3:GetBucketOwnershipControls",
        "s3:PutObjectTagging",
        "s3:DeleteObject",
        "s3:DeleteBucket",
        "s3:DeleteObjectTagging",
        "s3:GetBucketPublicAccessBlock",
        "s3:GetBucketPolicyStatus",
        "s3:PutBucketPublicAccessBlock",
        "s3:PutAccountPublicAccessBlock",
        "s3:ListAccessPoints",
        "s3:PutBucketOwnershipControls",
        "s3:PutObjectVersionTagging",
        "s3:DeleteObjectVersionTagging",
```

```
        "s3:GetBucketVersioning",
        "s3:GetBucketAcl",
        "s3:PutObject",
        "s3:GetObject",
        "s3:GetAccountPublicAccessBlock",
        "s3:ListAllMyBuckets",
        "s3:GetAnalyticsConfiguration",
        "s3:GetBucketLocation"
      ],
      "Resource": "*"
    }
  ]
}
```

To add AWS Glue permissions, add the `AWSGlueConsoleFullAccess` managed policy to the IAM role. For more information about AWS Glue permissions with Amazon AppFlow, see [link-to-appflow-page].

Amazon AppFlow needs to access AWS Glue and Data Wrangler for you to import the data that you've transferred. To grant Amazon AppFlow access, add the following trust policy to the IAM role.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::123456789012:root",
                "Service": [
                    "appflow.amazonaws.com"
                ]
            },
            "Action": "sts:AssumeRole"
        }
    ]
}
```

To display the Amazon AppFlow data in Data Wrangler, add the following policy to the IAM role:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "glue:SearchTables",
            "Resource": [
                "arn:aws:glue:*:*:table/*/*",
                "arn:aws:glue:*:*:database/*",
                "arn:aws:glue:*:*:catalog"
            ]
        }
    ]
}
```

Using Lifecycle Configurations in Data Wrangler

You might have an Amazon EC2 instance that is configured to run Kernel Gateway applications, but not the Data Wrangler application. Kernel Gateway applications provide access to the environment and the kernels that you use to run Studio Classic notebooks and terminals. The Data Wrangler application is the UI application that runs Data Wrangler. Amazon EC2 instances that aren't Data Wrangler instances require a modification to their lifecycle configurations to run Data Wrangler. Lifecycle configurations are shell scripts that automate the customization of your Amazon SageMaker Studio Classic environment.

For more information about lifecycle configurations, see Use lifecycle configurations with Amazon SageMaker Studio Classic.

The default lifecycle configuration for your instance doesn't support using Data Wrangler. You can make the following modifications to the default configuration to use Data Wrangler with your instance.

```
#!/bin/bash
set -eux
STATUS=$(
python3 -c "import sagemaker_dataprep"
echo $?
)
if [ "$STATUS" -eq 0 ]; then
echo 'Instance is of Type Data Wrangler'
else
```

```
echo 'Instance is not of Type Data Wrangler'

# Replace this with the URL of your git repository
export REPOSITORY_URL="https://github.com/aws-samples/sagemaker-studio-lifecycle-
config-examples.git"

git -C /root clone $REPOSTIORY_URL

fi
```

You can save the script as `lifecycle_configuration.sh`.

You attach the lifecycle configuration to your Studio Classic domain or user profile. For more information about creating and attaching a lifecycle configuration, see Create and associate a lifecycle configuration.

The following instructions show you how to attach a lifecycle configuration to a Studio Classic domain or user profile.

You might run into errors when you're creating or attaching a lifecycle configuration. For information about debugging lifecycle configuration errors, KernelGateway app failure.

Release Notes

Data Wrangler is regularly updated with new features and bug fixes. To upgrade the version of Data Wrangler you are using in Studio Classic, follow the instructions in Shut down and Update Studio Classic Apps.

Release Notes
8/31/2023 New functionality: You can now create a Data Quality and Insights report on your entire dataset. For more information, see Get Insights On Data and Data Quality.
5/20/2023 New functionality:

Release Notes

You can now import your data from Salesforce Data Cloud. For more information, see Import data from Salesforce Data Cloud.

4/18/2023

New functionality:

You can now get your data in a format that Amazon Personalize can interpret. For more information, see Map Columns for Amazon Personalize.

3/1/2023

New functionality:

You can now use Hive to import your data from Amazon EMR. For more information, see Import data from Amazon EMR.

12/10/2022

New functionality:

You can now export your Data Wrangler flow to an inference endpoint. For more information, see Export to an Inference Endpoint.

New functionality:

You can now use an interactive notebook widget for data preparation. For more information, see Use an Interactive Data Preparation Widget in an Amazon SageMaker Studio Classic Notebook to Get Data Insights.

New functionality:

You can now import data from SaaS platforms. For more information, see Import Data From Software as a Service (SaaS) Platforms.

10/12/2022

New functionality:

Release Notes

You can now reuse data flows for different data sets. For more information, see Reusing Data Flows for Different Datasets.

10/05/2022

New functionality:

You can now use Principal Component Analysis (PCA) as a transform. For more information, see Reduce Dimensionality within a Dataset.

10/05/2022

New functionality:

You can now refit parameters in your Data Wrangler flow. For more information, see Export.

10/03/2022

New functionality:

You can now deploy models from your Data Wrangler flow. For more information, see Automatically Train Models on Your Data Flow.

9/20/2022

New functionality:

You can now set data retention periods in Athena. For more information, see Import data from Athena.

6/9/2022

New functionality:

You can now use Amazon SageMaker Autopilot to train a model directly from your Data Wrangler flow. For more information, see Automatically Train Models on Your Data Flow.

5/6/2022

New functionality:

Release Notes

You can now use additional m5 and r5 instances. For more information, see Instances.

4/27/2022

New functionalities:

- You can now get a data quality report. For more information, see Get Insights On Data and Data Quality
- You can now perform random sampling and stratified sampling. For more information, see Sampling.

4/1/2022

New functionality:

You can now use Databricks as a data source. For more information, see Import data from Databricks (JDBC).

2/2/2022

New functionalities:

- You can now export using destination nodes. For more information, see Export
- You can import ORC and JSON files. For more information about file types, see Import.
- Data Wrangler now supports using the SMOTE transform. For more information, see Balance Data.
- Data Wrangler now supports similarity encoding for categorical data. For more information, see Similarity encode.
- Data Wrangler now supports unnesting JSON data. For more information, see Unnest JSON Data.
- Data Wrangler now supports expanding the values of an array into separate columns. For more information, see Explode Array.
- Data Wrangler now supports reaching out to the service team when you're having issues. For more information, see Troubleshoot.

Release Notes

- Data Wrangler supports editing and deleting steps in your data flow. For more information, see Delete a Step from Your Data Flow and Edit a Step in Your Data Wrangler Flow.
- You can now perform transformations on multiple columns. For more information, see Transform Data.
- Data Wrangler now supports cost allocation tags. For more information, see Using Cost Allocation Tags.

10/16/2021

New functionality:

Data Wrangler now supports Athena workgroups. For more information, see Import data from Athena.

10/6/2021

New functionality:

Data Wrangler now supports transforming time series data. For more information, see Transform Time Series.

7/15/2021

New functionalities:

- Snowflake and Data Wrangler is now supported. You can use Snowflake as a data source in Data Wrangler.
- Added support for custom field delimiter in CSV. Now comma, colon, semicolon, pipe (|) and Tab are supported.
- Now you can export results directly to Amazon S3.
- Added a few new multicollinearity analyzers: Variance Inflation Factors, Principal Component Analysis and Lasso feature selection.

Enhancements:

- The analyze charts can no longer be could be packed with overlapping labels.

Release Notes

Bug Fixes:

- One-hot encoder handles empty string gracefully.
- Fixed crashes that occured when a dataframe column name contained dots.

4/26/2021

Enhancements:

- Added support for distributed processing Jobs. You can use multiple instances when running a processing job.
- Data Wrangler Processing job now automatically coalesces small outputs when estimated result size is less than 1 gigabytes.
- Feature Store Notebook: Improved feature store ingestion performance
- Data Wrangler Processing jobs now use 1.x as the authoritative container tag for future releases.

Bug Fixes:

- Fixed rendering issues for faceted histogram.
- Fixed **Export to Processing Job** to support vector type columns.
- Fixed `Extract using regex` operator to return the first captured group if one or more exists in the regular expression or regex.

2/8/2021

New Functionalities:

- Data Wrangler Flows supports multiple instances.
- Updated Export to Data Wrangler Job Notebook to use SageMaker SDK 2.20.0.
- Updated Export to Pipeline Notebook to use SageMaker SDK 2.20.0.
- Updated Export to Pipeline Notebook to add XGBoost training example as an optional step.

Enhancements:

Release Notes

- To improve performance, importing CSV files that contain multiple lines in a single field is no longer supported.

Bug Fixes:

- Fixed type inference issue in Quick model.
- Fixed the bias metric bug in bias reports.
- Fixed the Featurize text transform to work with columns with missing values.
- Fixed Histogram and Scatter plot built-in visualizations to work with datasets that contain array-like columns.
- Athena query now re-runs if the query execution ID has expired.

Troubleshoot

If an issue arises when using Amazon SageMaker Data Wrangler, we recommend you do the following:

- If an error message is provided, read the message and resolve the issue it reports if possible.
- Make sure the IAM role of your Studio Classic user has the required permissions to perform the action. For more information, see Security and Permissions.
- If the issue occurs when you are trying to import from another AWS service, such as Amazon Redshift or Athena, make sure that you have configured the necessary permissions and resources to perform the data import. For more information, see Import.
- If you're still having issues, choose **Get help** at the top right of your screen to reach out to the Data Wrangler team. For more information, see the following images.

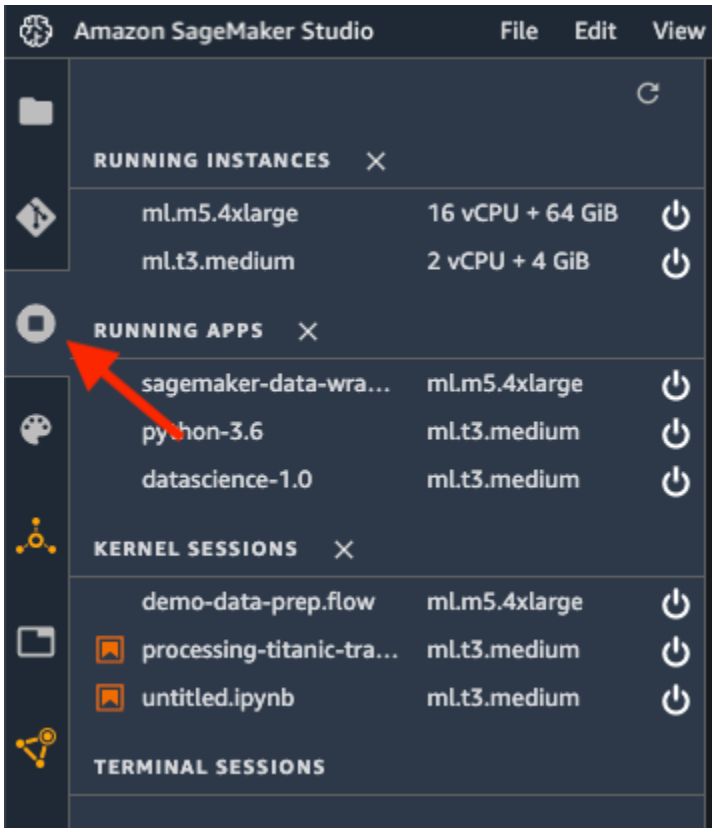
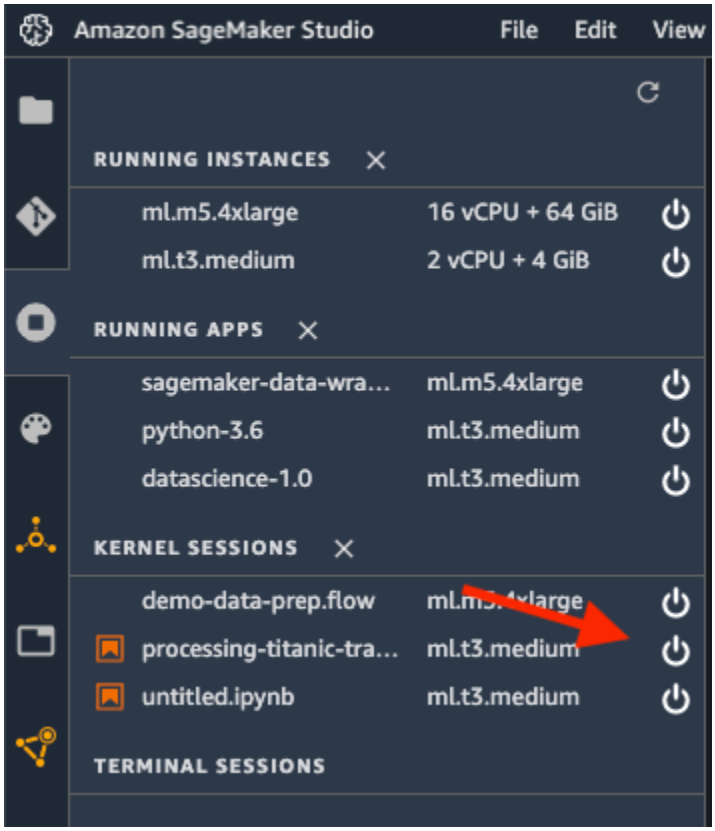
As a last resort, you can try restarting the kernel on which Data Wrangler is running.

1. Save and exit the .flow file for which you want to restart the kernel.
2. Select the **Running Terminals and Kernels** icon, as shown in the following image.



3. Select the **Stop** icon to the right of the .flow file for which you want to terminate the kernel, as shown in the following image.



4. Refresh the browser.
5. Reopen the .flow file on which you were working.

Troubleshooting issues with Amazon EMR

Use the following information to help you troubleshoot errors that might come up when you're using Amazon EMR.

- Connection failure – If the connection fails with the following message `The IP address of the EMR cluster isn't private error message`, your Amazon EMR cluster might not have been launched in a private subnet. As a security best practice, Data Wrangler only supports connecting to private Amazon EMR clusters. Choose a private EC2 subnet you launch an EMR cluster.
- Connection hanging and timing out – The issue is most likely due to a network connectivity issue. After you start connecting to the cluster, the screen doesn't refresh. After about 2 minutes, you might see the following error `JdbcAddConnectionError: An error occurred when trying to connect to presto: xxx: Connect to xxx failed: Connection timed out (Connection timed out) will display on top of the screen.`.

The errors might have two root causes:

- The Amazon EMR and Amazon SageMaker Studio Classic are in different VPCs. We recommend launching both Amazon EMR and Studio Classic in the same VPC. You can also use VPC peering. For more information, see What is VPC peering?.
- The Amazon EMR master security group lacks the inbound traffic rule for the security group of Amazon SageMaker Studio Classic on the port used for Presto. To resolve the issue, allow inbound traffic on port 8889.

- Connection fails due to the connection type being misconfigured – You might see the following error message: `Data Wrangler couldn't create a connection to {connection_source} successfully. Try connecting to {connection_source} again. For more information, see Troubleshoot. If you're still experiencing issues, contact support.`

  Check the authentication method. The authentication method that you've specified in Data Wrangler should match the authentication method that you're using on the cluster.

- You don't have HDFS permissions for LDAP authentication – Use the following guidance to resolve the issue Set up HDFS Permissions using Linux Credentials. You can log into the cluster using the following commands:

```
hdfs dfs -mkdir /user/USERNAME
hdfs dfs -chown USERNAME:USERNAME /user/USERNAME
```

- LDAP authentication missing connection key error – You might see the following error message: `Data Wrangler couldn't connect to EMR hive successfully. JDBC connection is missing required connection key(s): PWD`.

  For LDAP authentication, you must specify both a username and a password. The JDBC URL stored in Secrets Manager is missing property `PWD`.

- When you're troubleshooting the LDAP configuration: We recommend making sure that the LDAP authenticator (LDAP server) is correctly configured to connect to the Amazon EMR cluster. Use the `ldapwhoami` command to help you resolve the configuration issue. The following are example commands that you can run:
  - For LDAPS – `ldapwhoami -x -H ldaps://ldap-server`
  - For LDAP – `ldapwhoami -x -H ldap://ldap-server`

Either command should return `Anonymous` if you've configured the authenticator successfully.

Troubleshooting with Salesforce

Lifecycle configuration error

When your user opens Studio Classic for the first time, they might get an error saying that there's something wrong with their lifecycle configuration. Use Amazon CloudWatch to access the logs written by your lifecycle configuration script. For more information about debugging lifecycle configurations, see Debug lifecycle configurations.

If you aren't able to debug the error, you can create the configuration file manually. You must create the file every time you delete or restart the Jupyter server. Use the following procedure to create the file manually.

To create a configuration file

1. Navigate to Studio Classic.
2. Choose **File**, then **New**, then **Terminal**.
3. Create `.sfgenie_identity_provider_oauth_config`.
4. Open the file in a text editor.
5. Add a JSON object containing the Amazon Resource Name (ARN) of the Secrets Manager secret to the file. You can use the following template to create the object.

```
{
  "secret_arn": "example-secret-ARN"
}
```

6. Save your changes to the file.

Unable to access Salesforce Data Cloud from the Data Wrangler flow

After your user chooses **Salesforce Data Cloud** from your Data Wrangler flow, they might get an error indicating the prerequisites to set up the connection haven't been met. It might be caused by following errors:

- The Salesforce secret in Secrets Manager hasn't been created.

- The Salesforce secret in Secrets Manager has been created, but it's missing the Salesforce tag.
- The Salesforce secret in Secrets Manager has been created in the wrong AWS Region. For example, your user won't be able to access the Salesforce Data Cloud in `ca-central-1` because you've created the secret in `us-east-1`. You can either replicate the secret to `ca-central-1` or create a new secret with the same credentials in `ca-central-1`. For information about replicating secrets, see Replicate an AWS Secrets Manager secret to other AWS Regions.
- The policy that your users are using to access Amazon SageMaker Studio Classic are missing permissions for AWS Secrets Manager
- There's a typo in the Secrets Manager ARN of the JSON object that you've specified through your lifecycle configuration.
- There's a typo in the Secrets Manager secret containing your Salesforce OAuth configuration

Blank page showing `redirect_uri_mismatch`

After your users choose **Save and Connect**, they might get redirected to a page that shows `redirect_uri_mismatch`. The callback URI that you've registered in your Salesforce Connected App settings is either missing or incorrect.

Use the following URL to check that your Studio Classic URL is correctly registered in your Salesforce org's Connected App settings: `https://EXAMPLE_SALESFORCE_ORG/lightning/setup/NavigationMenus/home/`. For more information about using the connected app settings, navigate to the following URL: `https://EXAMPLE_SALESFORCE_ORG/lightning/setup/NavigationMenus/home/`.

> **Note**
>
> It takes roughly ten minutes to propagate the URI within Salesforce's systems.

Shared spaces

Shared spaces doesn't currently work with the Salesforce Data Cloud integration. You can either delete the shared spaces in the Amazon SageMaker domain that you intend to use, or you can use another domain that doesn't have shared spaces set up.

OAuth Redirect Error

Your users should be able to import their data from the Salesforce Data Cloud after they choose **Connect**. If they're running into an error, we recommend asking them to do the following:

- Tell them to be patient – When they get redirected back to Amazon SageMaker Studio Classic, it can take up to a minute to complete the authentication process. While they're getting redirected, we recommend telling them to avoid interacting with the browser. For example, they shouldn't close the browser tab, switch to another tab, or interact with the Data Wrangler flow. Interacting with the browser might remove the authorization code required to connect to the data cloud.
- Have your users reconnect to the data cloud – There are transient issues that can cause a connection to the Salesforce Data Cloud to fail. Have your users create a new Data Wrangler flow and try connecting to the Salesforce Data Cloud again.
- Make sure your users close all other tabs with Amazon SageMaker Studio Classic – Having Studio Classic open in multiple tabs can cause the Salesforce Data Cloud connection to fail. Make sure your users only have one Studio Classic tab open.
- Multiple users accessing Studio Classic at the same time – Only one user should access an Amazon SageMaker domain at a time. If multiple users access the same domain, the connection that a user is trying to create to the Salesforce Data Cloud might fail.

Updating both Data Wrangler and Studio Classic might also fix their error. For information about updating Data Wrangler, see Update Data Wrangler. For information about updating Studio Classic, see Shut down and Update SageMaker Studio Classic.

If none of the preceding troubleshooting steps work, you might find an error message from Salesforce with a corresponding description embedded in the Studio Classic URL. The following is an example of a message you could find: `error=invalid_client_id&error_description=client%20identifier%20invalid`.

You can look at the error message in the URL and try to address the issues it presents. If the error message or description is unclear, we recommend searching the Salesforce Knowledge Base. If searching the knowledge base doesn't work, you can reach out to the Salesforce help desk for more assistance.

Data Wrangler takes a long time to load

When your users are getting redirected back to Data Wrangler from the Salesforce Data Cloud, they might experience long load times.

If this is the user's first time using Data Wrangler or they've deleted the kernel, it might take about 5 minutes to provision the new Amazon EC2 instance to use Data Wrangler.

If this isn't the user's first time using Data Wrangler and they haven't deleted the kernel, you can ask them to refresh the page or close as many browser tabs as possible.

If none of the preceding interventions work, have them set up a new connection to the Salesforce Data Cloud.

User fails to export their data with an `Invalid batch Id` error

When your user exports the transformations that they've made to their Salesforce data, the SageMaker processing job that Data Wrangler uses on the backend might fail. The Salesforce Data Cloud might be temporarily unavailable or there could be a caching issue.

To address the issue, we recommend having your users go back to the step where they're importing the data and changing the order of the columns that they're querying . For example, they can change the following query:

```
SELECT col_A, col_B FROM table
```

To the following query:

```
SELECT col_B, col_A FROM table
```

After they've changed the order of the columns and made sure that the subsequent transformations they've made are still valid, they can start exporting their data again.

Users can't export a very large dataset

If your users imported a very large dataset from the Salesforce Data Cloud, they might not be able to export the transformations that they've made. A large dataset might have too many rows, or it can result from a complex query.

We recommend having your users take the following actions:

- Simplifying their SQL query

- Sampling their data

The following are some strategies that they can use to simplify their queries:

- Specify column names instead of using the * operator
- Finding a subset of the data that they'd like to import instead of using a larger subset
- Minimizing joins between very large datasets

They can use sampling to reduce the number of rows in their dataset. For information about sampling methods, your users can refer to Sampling.

Users can't export data due to invalid refresh token

Data Wrangler uses a JDBC driver to integrate with the Salesforce Data Cloud. The method for authentication is OAuth. For OAuth, the refresh token and the access token are two different pieces of data that are used to authorize access to resources within your Salesforce Data Cloud.

The access token, or core token, is what allows you to access your Salesforce data and run queries directly through Data Wrangler. It's short lived and designed to expire quickly. To maintain access to your Salesforce data, Data Wrangler uses the refresh token to get a new access token from Salesforce.

You might have set the refresh to expire too quickly to get a new access token for your users. You might have to revisit your refresh token policy to make sure that it can accommodate queries that take a long time to run for your users. For information about configuring your refresh token policy, see `https://EXAMPLE_SALESFORCE_ORG_URL/lightning/setup/ConnectedApplication/home/`.

Queries failing or tables not loading

Salesforce experiences service outages. Even if you've configured everything correctly, your users might not be able to import their data for periods of time.

Service outages can happen for maintenance reasons. We recommend checking in the following day to see if the issue has been resolved.

If you're experiencing issues for more than a day, we recommend contacting Salesforce's help desk for further assistance. For information about contacting Salesforce, see How would you like to contact Salesforce?

`OAUTH_APP_BLOCKED` during Studio Classic redirect

When your user gets redirected back to Amazon SageMaker Studio Classic, they might notice the query parameter `error=OAUTH_APP_BLOCKED` within the URL. They're might be experiencing a transient issue that should resolve itself within a day.

It's possible that you've blocked their access to the Connected App as well. For information about resolving the issue, see `https://EXAMPLE_SALESFORCE_ORG_URL/lightning/setup/ConnectedApplication/home/`.

`OAUTH_APP_DENIED` during Studio Classic redirect

When your user gets redirected back to Amazon SageMaker Studio Classic, they might notice the query parameter `error=OAUTH_APP_ACCESS_DENIED` within the URL. You haven't given their profile type permissions to access the `Connected App` associated with Data Wrangler.

To resolve their access issue, navigate to `https://EXAMPLE_SALESFORCE_ORG_URL/lightning/setup/ManageUsers/home/` and check whether the user is assigned to the correct profile.

Increase Amazon EC2 Instance Limit

You might see the following error message when you're using Data Wrangler: `The following instance type is not available: ml.m5.4xlarge. Try selecting a different instance below.`

The message can indicate that you need to select a different instance type, but it can also indicate that you don't have enough Amazon EC2 instances to successfully run Data Wrangler on your workflow. You can increase the number of instances by using the following procedure.

To increase the number of instances, do the following.

1. Open the AWS Management Console.
2. In the search bar, specify **`Services Quotas`**.
3. Choose **Service Quotas**.
4. Choose **AWS services**.
5. In the search bar, specify **`Amazon SageMaker`**.
6. Choose **Amazon SageMaker**.

7. Under **Service quotas**, specify **`Studio KernelGateway Apps running on ml.m5.4xlarge` instance**.

   > **Note**
   >
   > ml.m5.4xlarge is the default instance type for Data Wrangler. You can use other instance types and request quota increases for them. For more information, see Instances.

8. Select **Studio KernelGateway Apps running on `ml.m5.4xlarge` instance**.
9. Choose **Request quota increase**.
10. For **Change quota value**, specify a value greater than **Applied quota value**.
11. Choose **Request**.

If your request is approved, AWS sends a notification to the email address associated with your account. You can also check the status of your request by choosing **Quota request history** on the **Service Quotas** page. Processed requests have a **Status** of **Closed**.

Update Data Wrangler

To update Data Wrangler to the latest release, first shut down the corresponding KernelGateway app from the Amazon SageMaker Studio Classic control panel. After the KernelGateway app is shut down, restart it by opening a new or existing Data Wrangler flow in Studio Classic. When you open a new or existing Data Wrangler flow, the kernel that starts contains the latest version of Data Wrangler.

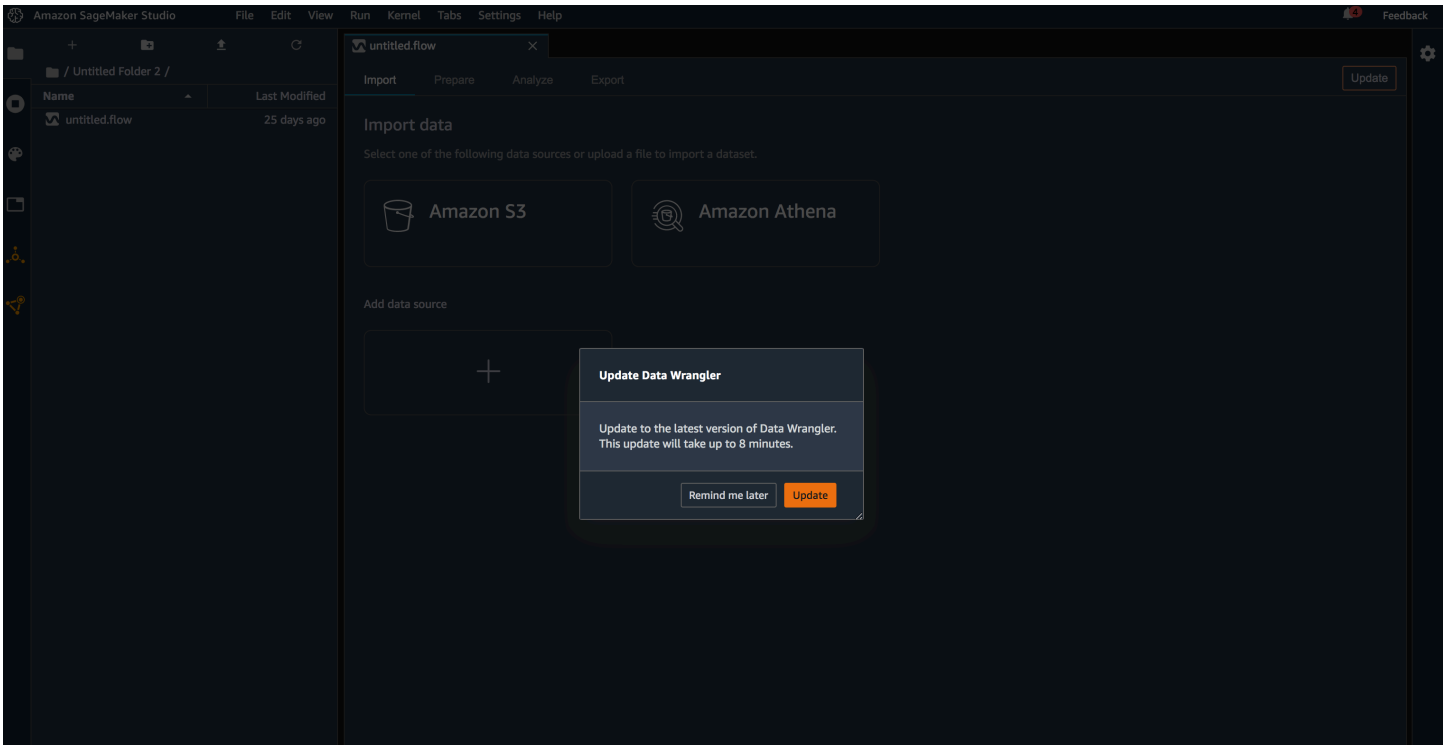
Update your Studio Classic and Data Wrangler instance

1. Navigate to your SageMaker Console.
2. Choose SageMaker and then Studio Classic.
3. Choose your user name.
4. Under **Apps**, in the row displaying the **App name**, choose **Delete app** for the app that starts with `sagemaker-data-wrang`, and for the JupyterServer app.
5. Choose **Yes, delete app**.
6. Type `delete` in the confirmation box.
7. Choose **Delete**.

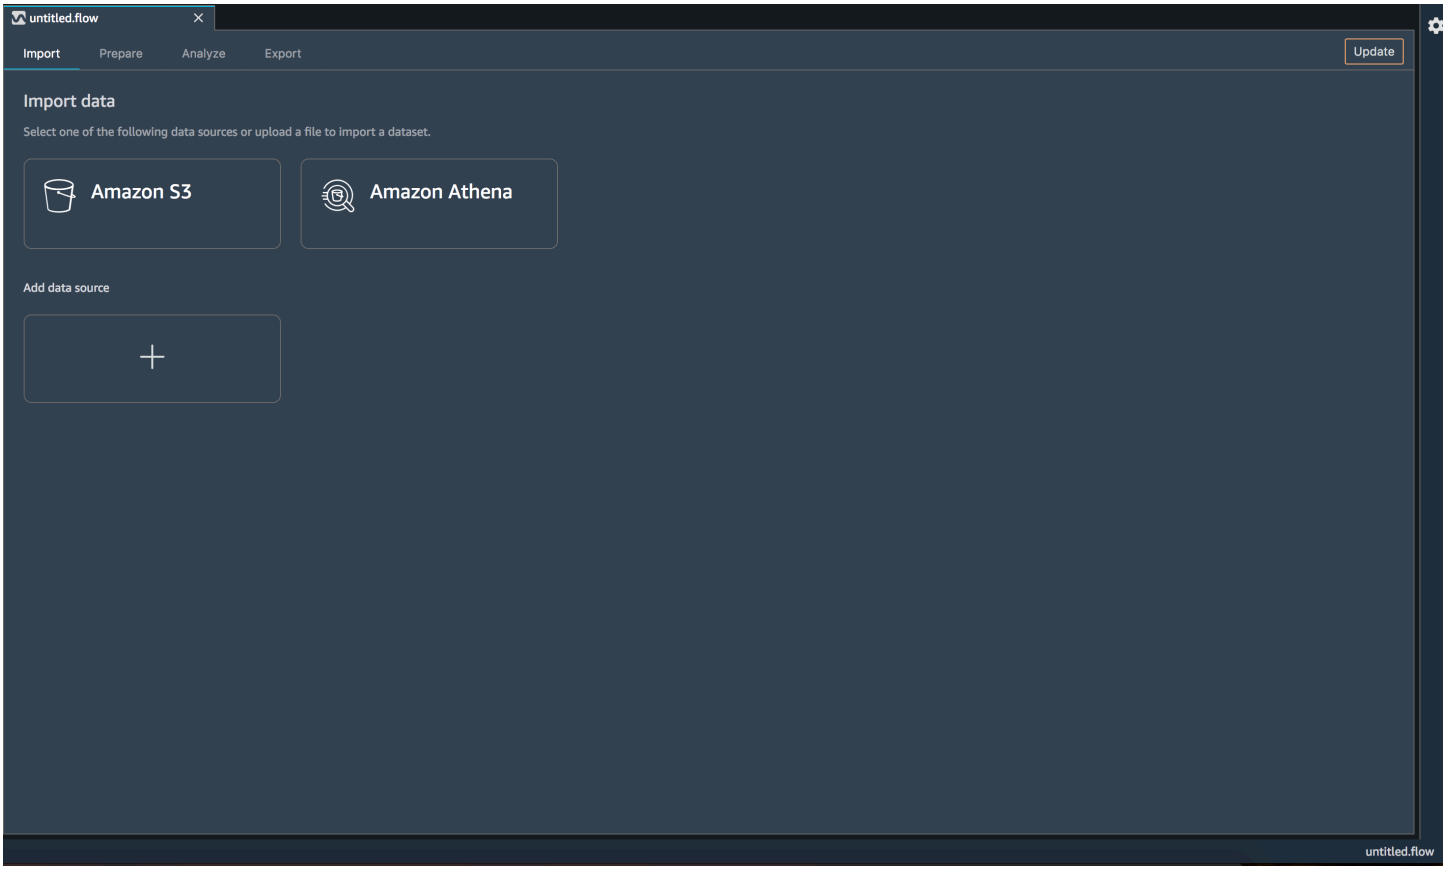
8. Reopen your Studio Classic instance. When you begin to create a Data Wrangler flow, your instance now uses the latest version of Data Wrangler.

Alternatively, if you are using a Data Wrangler application version that is not the latest version, and you have an existing Data Wrangler flow open, you are prompted to update your Data Wrangler application version in the Studio Classic UI. The following screenshot shows this prompt.

> **Important**
>
> This updates the Data Wrangler kernel gateway app only. You still need to shut down the JupyterServer app in your user account. To do this, follow the preceding steps.



You can also choose **Remind me later**, in which case an **Update** button appears in the top-right corner of the screen.



Shut Down Data Wrangler

When you are not using Data Wrangler, it is important to shut down the instance on which it runs to avoid incurring additional fees.

To avoid losing work, save your data flow before shutting Data Wrangler down. To save your data flow in Studio Classic, choose **File** and then choose **Save Data Wrangler Flow**. Data Wrangler automatically saves your data flow every 60 seconds.

To shut down the Data Wrangler instance in Studio Classic

1. In Studio Classic, select the **Running Instances and Kernels** icon (
   
).
2. Under **RUNNING APPS** is the **sagemaker-data-wrangler-1.0** app. Select the shutdown icon next to this app (
   
).

Data Wrangler runs on an ml.m5.4xlarge instance. This instance disappears from **RUNNING INSTANCES** when you shut down the Data Wrangler app.

> **Important**
>
> If you open Data Wrangler again, an Amazon EC2 instance starts running the application and you will be charged for the compute. In addition to compute, you are also charged for the storage that you use. For example, you're charged for any Amazon S3 buckets that you're using with Data Wrangler.
>
> If you find that you're still getting charged for Data Wrangler after shutting down your applications, there's a Jupyter extension that you can use to automatically shut down idle sessions. For information about the extension, see SageMaker-Studio-Autoshutdown-Extension.

After you shut down the Data Wrangler app, it has to restart the next time you open a Data Wrangler flow file. This can take a few minutes.

Prepare Data at Scale with Studio Classic using Amazon EMR or AWS Glue

Amazon SageMaker Studio Classic provides data scientists, machine learning (ML) engineers, and general practitioners with tools to perform data analytics and data preparation at scale. Analyzing, transforming, and preparing large amounts of data is a foundational step of any data science and ML workflow. SageMaker Studio Classic comes with built-in integration of Amazon EMR and AWS Glue Interactive Sessions to handle your large-scale interactive data preparation and machine learning workflows, all within your Studio Classic notebook.

Amazon EMR is a managed big data platform with resources to help you run petabyte-scale distributed data processing jobs using open-source analytics frameworks on AWS such as Apache Spark, Apache Hive, Presto, HBase, Flink, and Hudi among others. Data engineers and data scientists use Amazon EMR for a wide variety of use cases, including big data analytics, what-if analyses, real-time analytics, and data preparation for machine learning. With Studio Classic integration with Amazon EMR, you can create, browse, discover, and connect to Amazon EMR clusters without leaving your Studio Classic notebook. You can also monitor and debug your Spark workloads with one-click access to the Spark UI from within the notebook. You should consider

Amazon EMR for your data preparation workloads if you want maximum control over hardware and software versions, containers, and big data processing applications.

AWS Glue Interactive Sessions is a serverless service that you can enlist to collect, transform, cleanse, and prepare data for storage in your data lakes and data pipelines. AWS Glue Interactive Sessions provides an on-demand, serverless Apache Spark runtime environment that you can initialize in seconds on a dedicated Data Processing Unit (DPU) without having to worry about provisioning and managing complex compute cluster infrastructure. After initialization, you can quickly browse the AWS Glue data catalog, run large queries, access data governed by AWS Lake Formation, and interactively analyze and prepare data using Spark, right in your Studio Classic notebook. You can then use the prepared data to train, tune, and deploy models using the purpose-built ML tools within SageMaker Studio Classic. You should consider AWS Glue Interactive Sessions for your data preparation workloads when you want a serverless Spark service with moderate control of configurability and flexibility.

Content

Prepare data using Amazon EMR

Amazon SageMaker Studio Classic comes with built-in integration of Amazon EMR, with which data scientists and data engineers can perform petabyte-scale interactive data preparation and machine learning (ML) right from their Studio Classic notebook. Within a notebook, they can discover and connect to existing Amazon EMR clusters, then interactively explore, visualize, and prepare large-scale data for machine learning using Apache Spark, Apache Hive, Presto. Additionally, users can access Spark UI with a single click to monitor their Spark jobs from their Studio Classic notebooks.

Administrators can use the AWS Service Catalog to define AWS CloudFormation templates of Amazon EMR clusters accessible to Studio Classic users. Data scientists can then choose a predefined template to self-provision an Amazon EMR cluster directly from Amazon SageMaker Studio Classic notebooks. Administrators can further parameterize the templates to let users choose aspects of the cluster to match their workloads within predefined values. For example, a data scientist or data engineer may want to specify the number of core nodes of the cluster up to a predetermined maximum value, or select the instance type of a node from a dropdown menu.

- If you are an administrator, make sure that you have enabled communication between Amazon SageMaker Studio Classic notebooks and Amazon EMR clusters. For instructions, see the Configure networking (for administrators) section. Once this communication is enabled, you have the option to:
  - Define cluster templates in AWS Service Catalog and ensure the availability of these templates through Studio Classic's notebooks: Configure Amazon EMR templates in AWS Service Catalog (for administrators).
  - Configure the discoverability of existing Amazon EMR clusters directly from Studio Classic's notebooks: Configure the discoverability of Amazon EMR clusters (for administrators).
- If you are a data scientist or data engineer looking to self-provision an Amazon EMR cluster, see Launch an Amazon EMR cluster from Studio Classic.
- If you are a data scientist or data engineer looking to discover and connect to existing Amazon EMR clusters from Studio Classic, see Use Amazon EMR clusters from Studio Classic notebooks.

List of topics

Configure networking (for administrators)

This section provides information about how administrators can configure their network to allow communication between Amazon SageMaker Studio Classic notebooks and an Amazon EMR cluster.

The networking instructions vary based on whether SageMaker Studio Classic and Amazon EMR are deployed within a private Amazon Virtual Private Cloud (VPC) or communicate over the internet.

By default, SageMaker Studio Classic runs in an AWS managed VPC with internet access. When using an internet connection, Studio Classic accesses AWS resources, such as Amazon S3 buckets,

over the internet. However, if you have security requirements to control access to your data and job containers, we recommend that you configure SageMaker Studio Classic and Amazon EMR so that your data and containers aren't accessible over the internet. To control access to your resources or run SageMaker Studio Classic without public internet access, you can specify the `VPC only` network access type when you onboard to Amazon SageMaker domain. In this scenario, SageMaker Studio Classic establishes connections with other AWS services via private VPC endpoints. For information about configuring SageMaker Studio Classic in `VPC only` mode, see Connect SageMaker Studio Classic notebooks in a VPC to external resources..

The first two sections describe how to ensure communication between SageMaker Studio Classic and an Amazon EMR cluster in VPCs without public internet access. The last section covers how to ensure communication between SageMaker Studio Classic and Amazon EMR using an internet connection. Prior to connecting SageMaker Studio Classic and Amazon EMR without internet access, make sure to establish endpoints for Amazon Simple Storage Service (data storage), Amazon CloudWatch (logging and monitoring), and Amazon SageMaker Runtime (fine-grained role-based access control (RBAC)).

- If your Amazon SageMaker Studio Classic and Amazon EMR cluster are set up in different VPCs in the same AWS account or in different accounts, see Studio Classic and Amazon EMR are deployed in separate VPCs.
- If your Amazon SageMaker Studio Classic and Amazon EMR cluster are set up in the same VPC, see Amazon SageMaker Studio Classic and Amazon EMR are in the same VPC.
- If you chose to connect Amazon SageMaker Studio Classic and Amazon EMR cluster over public internet, see Amazon SageMaker Studio Classic and Amazon EMR communicate over public internet.

Studio Classic and Amazon EMR are deployed in separate VPCs

To allow communication between SageMaker Studio Classic and an Amazon EMR cluster when they are deployed in different VPCs:

1. Start by connecting your VPCs through a VPC peering connection.
2. Update your routing tables in each VPC to route the network traffic between Studio Classic subnets and Amazon EMR subnets both ways.
3. Configure your security groups to allow inbound and outbound traffic.

The steps are similar, regardless of whether Amazon SageMaker Studio Classic and the Amazon EMR cluster are deployed within the same AWS account (Single account use case) or different AWS accounts (Cross accounts use case).

1. **VPC peering**

   Create a VPC peering connection to facilitate the networking between the two VPCs (SageMaker Studio Classic and Amazon EMR).

   a. From your SageMaker Studio Classic account, on the VPC dashboard, choose **Peering connections**, then **Create peering connection**.

   b. Create your request to peer the Studio Classic VPC within the Amazon EMR VPC. When requesting peering in another AWS account, choose **Another account** in **Select another VPC to peer with**.

      For cross accounts peering, the administrator must accept the request from the Amazon EMR account.

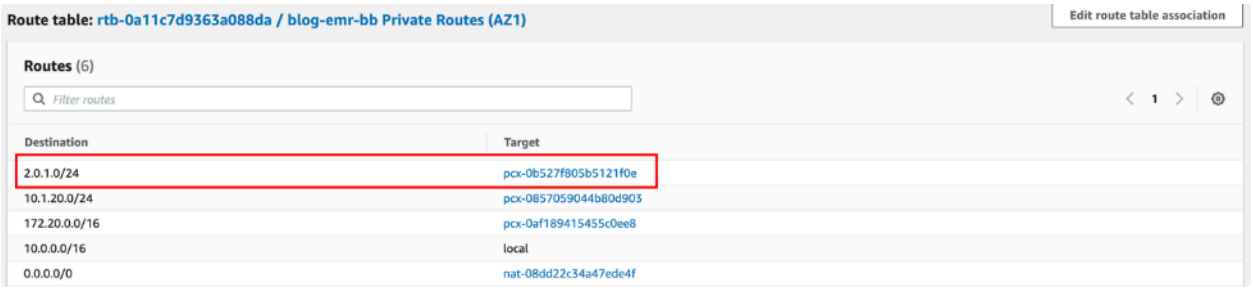
      When peering private subnets, you should enable private IP DNS resolution at the VPC peering connection level.

2. **Routing tables**

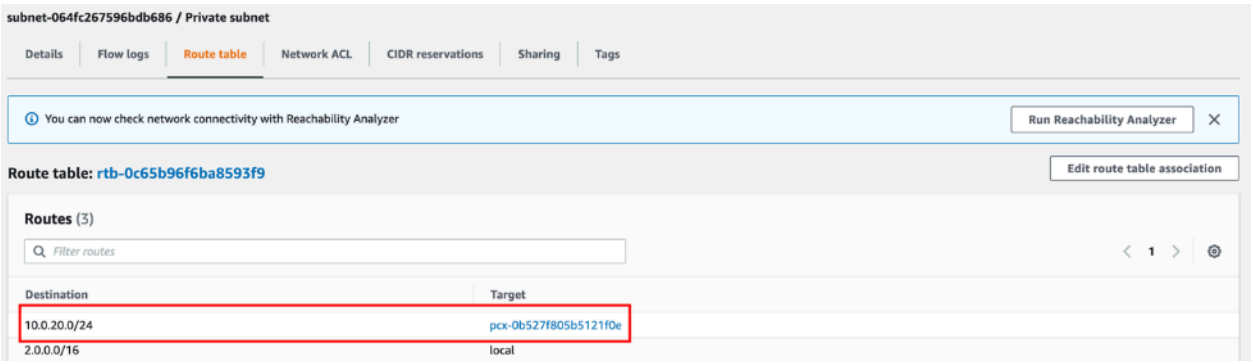
   Send the network traffic between SageMaker Studio Classic subnets and Amazon EMR subnets both ways.

   After you establish the peering connection, the administrator (on each account for cross-account access) can add routes to the private subnet route tables to route the traffic between the notebooks and the cluster subnets. You can define those routes by going to the **Route Tables** section of each VPC in the VPC dashboard.

   The following illustration of the route table of a Studio Classic VPCsubnet shows an example of an outbound route from the Studio Classic account to the Amazon EMR VPC IP range (here `2.0.1.0/24`) through the peering connection.



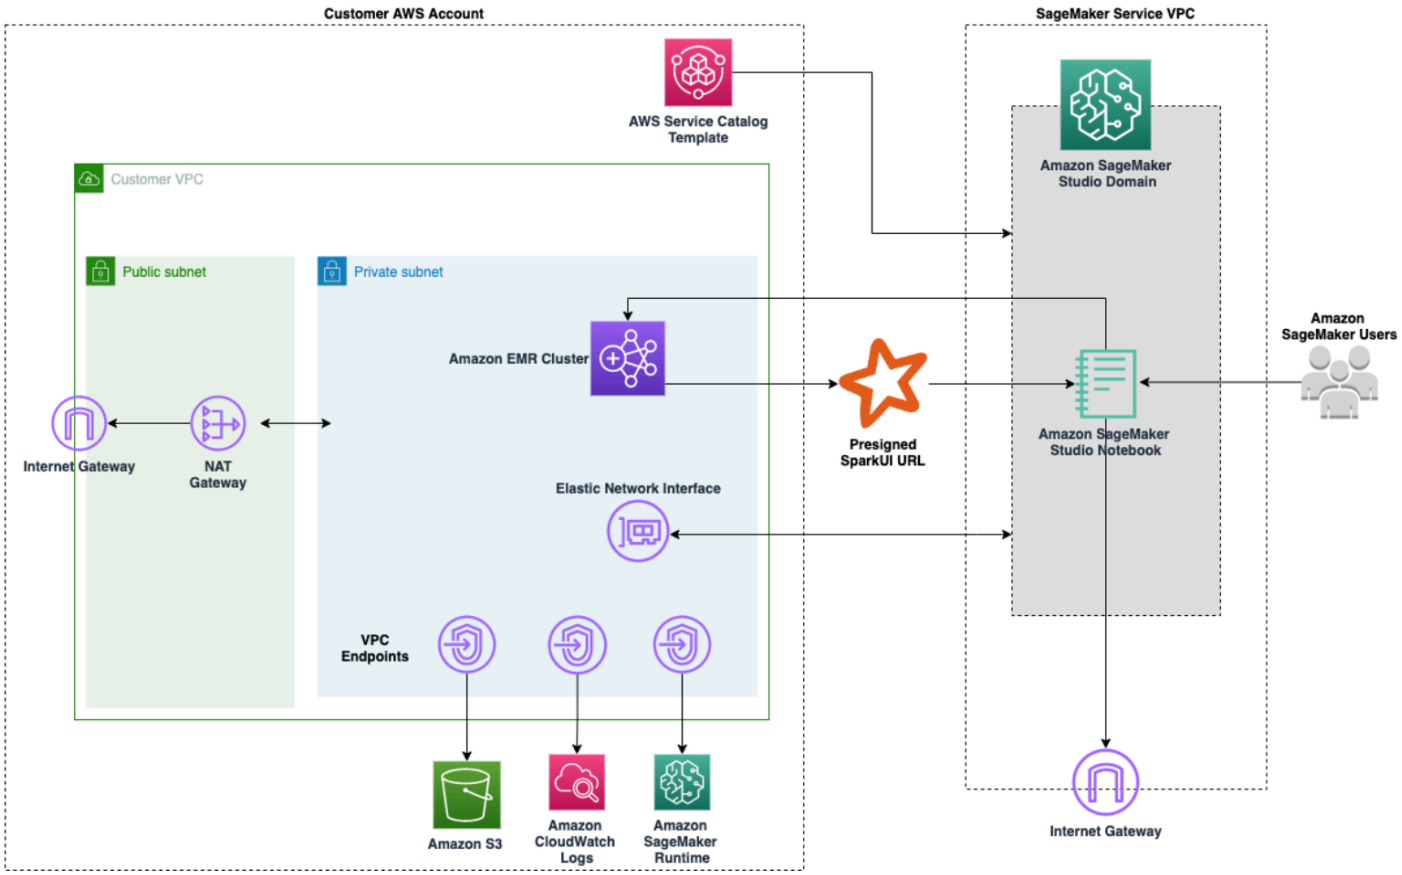
The following illustration of a route table of an Amazon EMR VPC subnet shows an example of return routes from the Amazon EMR VPC to Studio Classic VPC IP range (here `10.0.20.0/24`) through the peering connection.



3. **Security groups**

   Lastly, the security group of your Studio Classic domain must allow outbound traffic, and the security group of the Amazon EMR primary node must allow inbound traffic on *Apache Livy*, *Hive*, or *Presto* TCP ports (respectively 8998, `10000`, and 8889) from the Studio Classic instance security group. Apache Livy is a service that enables interaction with a Amazon EMR cluster over a REST interface.

The following image shows an example of an Amazon VPC setup that enables SageMaker Studio Classic notebooks to provision Amazon EMR clusters from AWS CloudFormation templates and then connect to an Amazon EMR cluster within the same AWS account. The diagram provides an additional illustration of the required endpoints for a direct connection to various AWS services, such as Amazon S3 or Amazon CloudWatch, when the VPCs have no internet access. Alternatively, a NAT gateway must be used to allow instances in private subnets of multiple VPCs to share a single public IP address provided by the internet gateway when accessing the internet.



Amazon SageMaker Studio Classic and Amazon EMR are in the same VPC

If Amazon SageMaker Studio Classic and the cluster are in different subnets, add routes to each private subnet route table to route the traffic between the notebooks and the cluster subnets. You can define those routes by going to the **Route Tables** section of each VPC in the VPC dashboard. If you deployed Amazon SageMaker Studio Classic and an Amazon EMR cluster in the same VPC and the same subnet, you do not need to route the traffic between the notebooks and the cluster.

Whether or not you needed to update your routing tables, the security group of your Studio Classic domain must allow outbound traffic, and the security group of the Amazon EMR primary node must allow inbound traffic on *Apache Livy*, *Hive*,or *Presto* TCP ports (respectively 8998, `10000`, and 8889) from the Studio Classic instance security group. Apache Livy is a service that enables interaction with a Amazon EMR cluster over a REST interface.

Amazon SageMaker Studio Classic and Amazon EMR communicate over public internet

By default, SageMaker Studio Classic provides a network interface that allows communication with the internet through an internet gateway in the VPC associated with the SageMaker domain. If you

choose to connect to Amazon EMR through the public internet, your Amazon EMR cluster needs to accept inbound traffic on *Apache Livy*, *Hive*,or *Presto* TCP ports (respectively 8998, 10000, and 8889) from its internet gateway. Apache Livy is a service that enables interaction with an Amazon EMR cluster over a REST interface.

Keep in mind that any port on which you allow inbound traffic represents a potential security vulnerability. Carefully review custom security groups to ensure that you minimize vulnerabilities. For more information, see Control network traffic with security groups.

Alternatively, see Walkthroughs and whitepapers for a detailed walkthrough of how to enable Kerberos on Amazon EMR, set the cluster in a private subnet, and access the cluster using a Network Load Balancer (NLB) to expose only specific ports, which are access-controlled via security groups.

> **Note**
>
> When connecting to your Apache Livy endpoint through the public internet, we recommend that you secure communications between Amazon SageMaker Studio Classic and your Amazon EMR cluster using TLS.
> For information on setting up HTTPS with Apache Livy, see Enabling HTTPS with Apache Livy. For information on setting an Amazon EMR cluster with transit encryption enabled, see Providing certificates for encrypting data in transit with Amazon EMR encryption. Additionally, you need to configure Studio Classic to access your certificate key as specified in Connect to an Amazon EMR cluster over HTTPS.

Create an Amazon EMR cluster from Studio Classic notebooks

Administrators can use AWS Service Catalog to define AWS CloudFormation templates of Amazon EMR clusters as products of a portfolio, then make them available to selected users. Using the Service Catalog, administrators can fully control the organizational, security, and networking setup of Amazon EMR clusters. Data scientists and data engineers can then view, select, and customize those templates for their specific workloads to create on-demand Amazon EMR clusters directly from their SageMaker Studio Classic notebooks. This can be done without manually setting up complex configurations. Users can also terminate Amazon EMR clusters from Studio Classic notebooks after use.

- If you are an administrator looking to configure AWS CloudFormation templates as AWS Service Catalog products so users can create Amazon EMR clusters from Studio Classic, see Configure Amazon EMR templates in AWS Service Catalog (for administrators).
- If you are a data scientist or data engineer looking to self-provision an Amazon EMR cluster to process data at scale using open-source frameworks such as Apache Spark, Apache Hive, or Presto, see Launch an Amazon EMR cluster from Studio Classic.
- If you are looking to discover and connect to existing Amazon EMR clusters from Studio Classic, see Use Amazon EMR clusters from Studio Classic notebooks.

Topics

- Configure Amazon EMR templates in AWS Service Catalog (for administrators)
- Launch an Amazon EMR cluster from Studio Classic

Configure Amazon EMR templates in AWS Service Catalog (for administrators)

This section provides details about how administrators can configure an AWS Service Catalog product so users can independently self-provision Amazon EMR clusters from Amazon SageMaker Studio Classic notebooks. Additionally, administrators can configure the Amazon EMR cluster templates in a way so end-users can customize various aspects of the cluster to suit their specific requirements. For example, the administrator can define a list of permissible instance types from which users can choose when creating cluster.

This topic assumes that you are familiar with the creation of portfolios and products in AWS Service Catalog as well as Amazon EMR, and AWS CloudFormation.

> **Note**
>
> You can refer to the AWS CloudFormation templates in aws-samples/sagemaker-studio-emr GitHub repository as examples of CloudFormation stacks to deploy IAM roles, Amazon VPCs, a sandbox Studio Classic domain, a user profile, as well as a CloudFormation template to launch an Amazon EMR cluster. Several options are available depending on your authentication method between Studio Classic and the Amazon EMR cluster. In these examples, a parent CloudFormation template passes the SageMaker VPC ID, security group, and subnet ID parameters to the CloudFormation template of an Amazon EMR cluster.

You can access various examples of CloudFormation Amazon EMR templates in the nested repository sagemaker-studio-emr/cloudformation/emr_servicecatalog_templates and further choose from a single account deployment to cross accounts.
For more information about the authentication methods available when connecting to an Amazon EMR cluster, see Use Amazon EMR clusters from Studio Classic notebooks.

To simplify the creation of Amazon EMR clusters, administrators can register the CloudFormation template of an Amazon EMR cluster as a product in the portfolio of the AWS Service Catalog. Then they associate the Service Catalog portfolio with the Studio Classic execution role to ensure the availability of the template in Studio Classic. Furthermore, to make sure that data scientists can discover those templates, provision Amazon EMR clusters, and connect to Amazon EMR clusters from their Studio Classic notebooks, administrators need to set the proper access permissions.

The following list provides the additional settings that administrators need to apply to a baseline CloudFormation stack to enable Studio Classic to access the Service Catalog products and provision Amazon EMR clusters. Those settings must be applied at multiple levels:

- In the Service Catalog portfolio
- In the Service Catalog product
- In the CloudFormation Amazon EMR template declared as the Service Catalog product

Finally, administrators must assign the required permissions to both the Studio Classic execution role accessing the clusters and the account where Amazon EMR is deployed, based on whether Studio Classic and Amazon EMR are in the same or different AWS accounts.

- Pre-requisites: **Networking and authentication requirements**

  As a prerequisite, ensure that you have reviewed the networking and security requirements in Configure networking (for administrators) and that you have created a baseline CloudFormation stack supporting the authentication method of your choice. You can find examples of CloudFormation templates in aws-samples/sagemaker-studio-emr.
- **In your Service Catalog portfolio:**

  Add the following section to your portfolio CloudFormation template (see the example in YAML format) to associate your portfolio with the Studio Classic execution role accessing your cluster.

```
SageMakerStudioEMRProductPortfolioPrincipalAssociation:
```

```
    Type: AWS::ServiceCatalog::PortfolioPrincipalAssociation
    Properties:
      PrincipalARN: SageMakerExecutionRole.Arn
      PortfolioId: SageMakerStudioEMRProductPortfolio ID
      PrincipalType: IAM
```

- **In your Service Catalog product:**

  Add the following tag key `"sagemaker:studio-visibility:emr"` and set to the value `"true"` (here in YAML) to the Service Catalog product referencing the Amazon EMR template resource. This ensures the visibility of the template in Studio Classic .

```
SMStudioEMRNoAuthProduct:
    Type: AWS::ServiceCatalog::CloudFormationProduct
    Properties:
      Owner: AWS
      Name: SageMaker Studio Domain No Auth EMR
      ProvisioningArtifactParameters:
        - Name: SageMaker Studio Domain No Auth EMR
          Description: Provisions a SageMaker domain and No Auth EMR Cluster
          Info:
            LoadTemplateFromURL: Link to your CloudFormation template. For example,
 https://aws-ml-blog.s3.amazonaws.com/artifacts/astra-m4-sagemaker/end-to-end/CFN-
EMR-NoStudioNoAuthTemplate-v3.yaml
      Tags:
        - Key: "sagemaker:studio-visibility:emr"
          Value: "true"
```

- **In the CloudFormation template of the Amazon EMR cluster** within your Service Catalog product:

  Add the following mandatory stack parameters as a placeholder. This section is populated with the Studio Classic project name and identifier used by the user when provisioning a cluster from Studio Classic.

```
SageMakerProjectName:
Type: String
Description: Name of the project

SageMakerProjectId:
Type: String
Description: Service generated Id of the project.
```

Administrators can specify `Default` and `AllowedValues` to include choices in the parameters section of a template, letting users input or select custom values when creating a cluster. The following example illustrates additional input parameters that administrators can set when creating an Amazon EMR template.

```
"Parameters": {
    "EmrClusterName": {
      "Type": "String",
      "Description": "EMR cluster Name."
    },
    "MasterInstanceType": {
      "Type": "String",
      "Description": "Instance type of the EMR master node.",
      "Default": "m5.xlarge",
      "AllowedValues": [
        "m5.xlarge",
        "m5.2xlarge",
        "m5.4xlarge"
      ]
    },
    "CoreInstanceType": {
      "Type": "String",
      "Description": "Instance type of the EMR core nodes.",
      "Default": "m5.xlarge",
      "AllowedValues": [
        "m5.xlarge",
        "m5.2xlarge",
        "m5.4xlarge",
        "m3.medium",
        "m3.large",
        "m3.xlarge",
        "m3.2xlarge"
      ]
    },
    "CoreInstanceCount": {
      "Type": "String",
      "Description": "Number of core instances in the EMR cluster.",
      "Default": "2",
      "AllowedValues": [
        "2",
        "5",
        "10"
```

```
      ]
    },
    "EmrReleaseVersion": {
      "Type": "String",
      "Description": "The release version of EMR to launch.",
      "Default": "emr-5.33.1",
      "AllowedValues": [
        "emr-5.33.1",
        "emr-6.4.0"
      ]
    }
  }
```

- Last, attach the required IAM policies to enable the visibility of CloudFormation Amazon EMR templates and the self-provisioning of Amazon EMR clusters from the Studio Classic notebooks. The role to which you must add those policies depends on whether Studio Classic and Amazon EMR are deployed in the same account (single account) or in different accounts (cross accounts).
  - If your Amazon EMR cluster is deployed in the same AWS account as the Studio Classic account, refer to the *Single Account* tab.
  - If your Amazon EMR cluster is deployed in a different AWS account than the Studio Classic account, refer to the *Cross Accounts* tab.

  For more information on cross-account access using roles, see Cross account resource access in IAM or Cross-account policy evaluation logic.

  Single account

  Attach the following permissions to the Studio Classic execution role accessing your cluster.

  The following list provides a breakdown of the permissions required.

  - `AllowEMRTemplateDiscovery` allows the discoverability for Amazon EMR templates.
  - `AllowSagemakerProjectManagement` enables the creation of SageMaker projects. In Studio Classic, access to the AWS Service Catalog is granted through Projects.
  - `AllowClusterDetailsDiscovery` and `AllowClusterDiscovery` allow the discovery and connection to Amazon EMR clusters.
  - `AllowPresignedUrl` allows the creation of pre-signed URLs to access Spark UI.

  The following is a comprehensive JSON that includes these permissions.

  ```
  {
  ```

```
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AllowPresignedUrl",
            "Effect": "Allow",
            "Action": [
                "elasticmapreduce:DescribeCluster",
                "elasticmapreduce:ListInstanceGroups",
                "elasticmapreduce:CreatePersistentAppUI",
                "elasticmapreduce:DescribePersistentAppUI",
                "elasticmapreduce:GetPersistentAppUIPresignedURL",
                "elasticmapreduce:GetOnClusterAppUIPresignedURL"
            ],
            "Resource": [
                "arn:aws:elasticmapreduce:studio-region:studio-account:cluster/*"
            ]
        },
        {
            "Sid": "AllowClusterDetailsDiscovery",
            "Effect": "Allow",
            "Action": [
                "elasticmapreduce:DescribeCluster",
                "elasticmapreduce:ListInstances",
                "elasticmapreduce:ListInstanceGroups",
                "elasticmapreduce:DescribeSecurityConfiguration"
            ],
            "Resource": [
                "arn:aws:elasticmapreduce:studio-region:studio-account:cluster/*"
            ]
        },
        {
            "Sid": "AllowClusterDiscovery",
            "Effect": "Allow",
            "Action": [
                "elasticmapreduce:ListClusters"
            ],
            "Resource": "*"
        },
        {
            "Sid": "AllowEMRTemplateDiscovery",
            "Effect": "Allow",
            "Action": [
              "servicecatalog:SearchProducts"
            ],
```

```
            "Resource": "*"
        },
        {
            "Sid": "AllowSagemakerProjectManagement",
            "Effect": "Allow",
            "Action": [
                "sagemaker:CreateProject",
                "sagemaker:DeleteProject"
            ],
            "Resource": "arn:aws:sagemaker:studio-region:studio-account:project/*"
        },
    ]
}
```

Cross accounts

If your Amazon EMR clusters and Studio Classic are deployed in separate AWS accounts, you configure the permissions in multiple steps.

- On the *trusting account* (the account in which Amazon EMR is deployed), create a custom IAM role (referred to as `ASSUMABLE-ROLE` in this page) with the following permissions and trust relationship.

  For information about creating a role on an AWS account, see Creating an IAM role (console).

  1. Add an IAM policy defining the following permissions.
     - `AllowClusterDetailsDiscovery` and `AllowClusterDiscovery` to allow the discovery and connection to Amazon EMR clusters.
     - `AllowPresignedUrl` to allow the creation of pre-signed URLs to access Spark UI.

     The following is a comprehensive JSON that includes these permissions.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AllowPresignedUrl",
            "Effect": "Allow",
            "Action": [
                "elasticmapreduce:DescribeCluster",
                "elasticmapreduce:ListInstanceGroups",
```

```
                "elasticmapreduce:CreatePersistentAppUI",
                "elasticmapreduce:DescribePersistentAppUI",
                "elasticmapreduce:GetPersistentAppUIPresignedURL",
                "elasticmapreduce:GetOnClusterAppUIPresignedURL"
            ],
            "Resource": [
                "arn:aws:elasticmapreduce:emr-region:emr-account:cluster/*"
            ]
        },
        {
            "Sid": "AllowClusterDetailsDiscovery",
            "Effect": "Allow",
            "Action": [
               "elasticmapreduce:DescribeCluster",
               "elasticmapreduce:ListInstances",
               "elasticmapreduce:ListInstanceGroups",
               "elasticmapreduce:DescribeSecurityConfiguration"
            ],
            "Resource": [
                "arn:aws:elasticmapreduce:emr-region:emr-account:cluster/*"
            ]
        },
        {
            "Sid": "AllowClusterDiscovery",
            "Effect": "Allow",
            "Action": [
                "elasticmapreduce:ListClusters"
            ],
            "Resource": "*"
        }
    ]
}
```

2. To grant the *trusted account* (the account in which Studio Classic is deployed) the permission to assume a role in the *trusting account*, include the following trust relationship.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
```

```
        "AWS": "arn:aws:iam::studio-account:root"
      },
      "Action": "sts:AssumeRole"
    }
  ]
}
```

- On the *trusted account* (the account in which Studio Classic is deployed), add the following permissions and trust relationship to the Studio Classic execution role.

  1. Add an IAM policy defining the following permissions.

     - `AllowSagemakerProjectManagement` to allow the creation of SageMaker projects. In Studio Classic, access to the AWS Service Catalog is granted through Projects.
     - `AllowEMRTemplateDiscovery` to allow the discoverability of Amazon EMR templates.

     The following is a comprehensive JSON that includes these permissions.

```
{
  "Version": "2012-10-17",
  "Statement": [
  {
            "Sid": "AllowSagemakerProjectManagement",
            "Effect": "Allow",
            "Action": [
                "sagemaker:CreateProject",
                "sagemaker:DeleteProject"
            ],
            "Resource": "arn:aws:sagemaker:::project/*"
   },
   {
            "Sid": "AllowEMRTemplateDiscovery",
            "Effect": "Allow",
            "Action": [
              "servicecatalog:SearchProducts"
            ],
            "Resource": "*"
   }
    ]
}
```

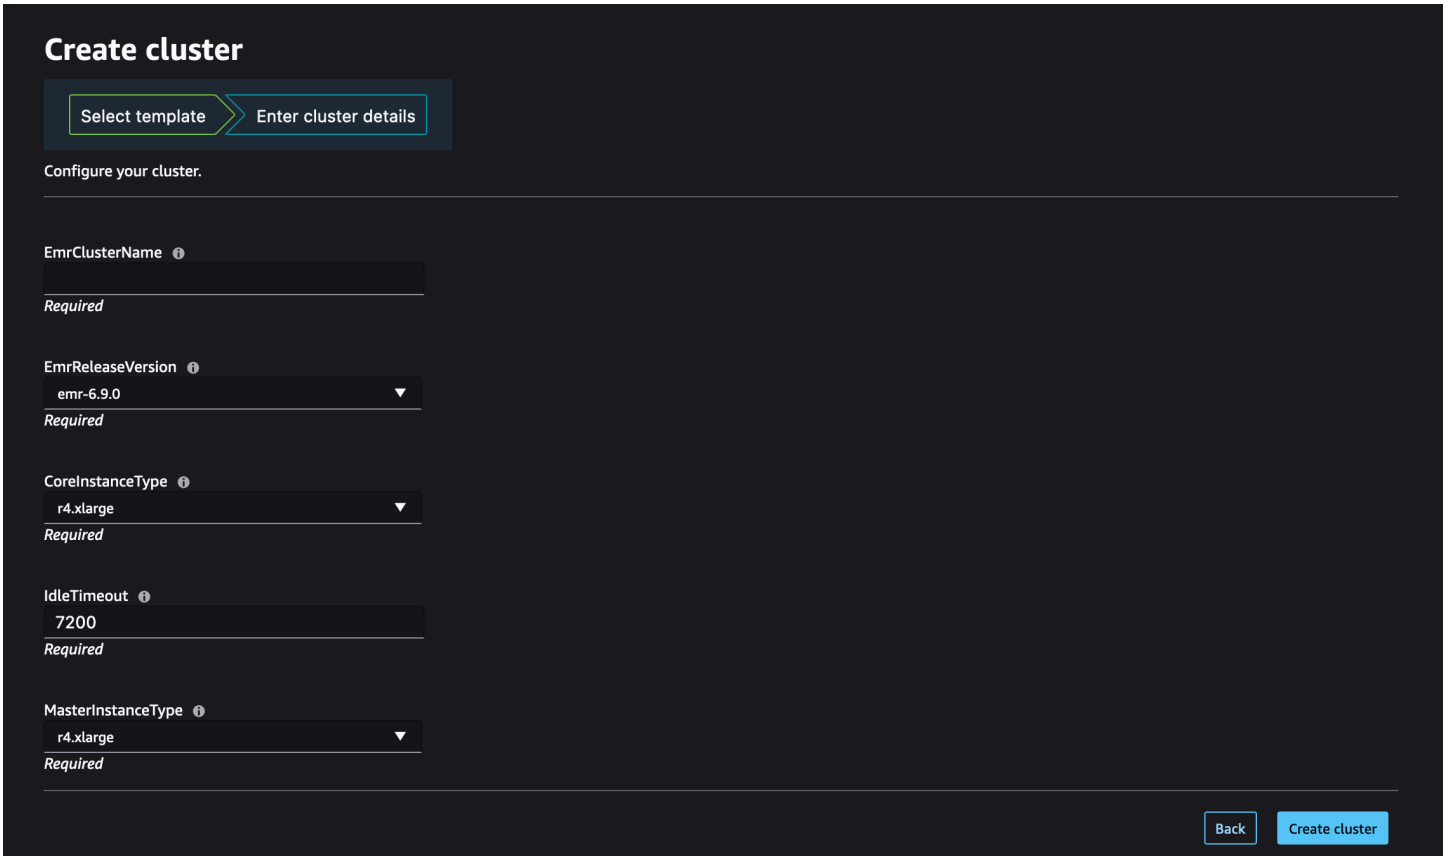
2. To grant the Studio Classic execution role the permission to assume the ASSUMABLE-ROLE in the *trusting account*, include the following trust relationship.

```
{
  "Version": "2012-10-17",
  "Statement": [
  {
            "Sid": "AllowRoleAssumptionForCrossAccountDiscovery",
            "Effect": "Allow",
            "Action": "sts:AssumeRole",
            "Resource":  ["arn:aws:iam::emr-account:role/ASSUMABLE-ROLE" ]
  }]
  }
```

- Last, see Additional Configuration for cross accounts use cases (for administrators) to learn how to provide the ARN of the ASSUMABLE-ROLE to the Studio Classic execution role. The ARN is loaded by the Studio Classic Jupyter server at launch. The Studio Classic execution role assumes that cross-account role to discover and connect to Amazon EMR clusters in the *trusting account*.

Once the CloudFormation templates are available in Amazon SageMaker Studio Classic, data scientists can use them to self-provision Amazon EMR clusters. Each of the `"Parameters"` specified in the template becomes an input box in the cluster creation form of Studio Classic, with the corresponding `"AllowedValues"` appearing in a dropdown menu.

The following illustration shows the dynamic form assembled from a CloudFormation Amazon EMR template to create an Amazon EMR cluster in SageMaker Studio Classic.



Visit Launch an Amazon EMR cluster from Studio Classic to learn about how to launch a cluster from Studio Classic using those Amazon EMR templates.

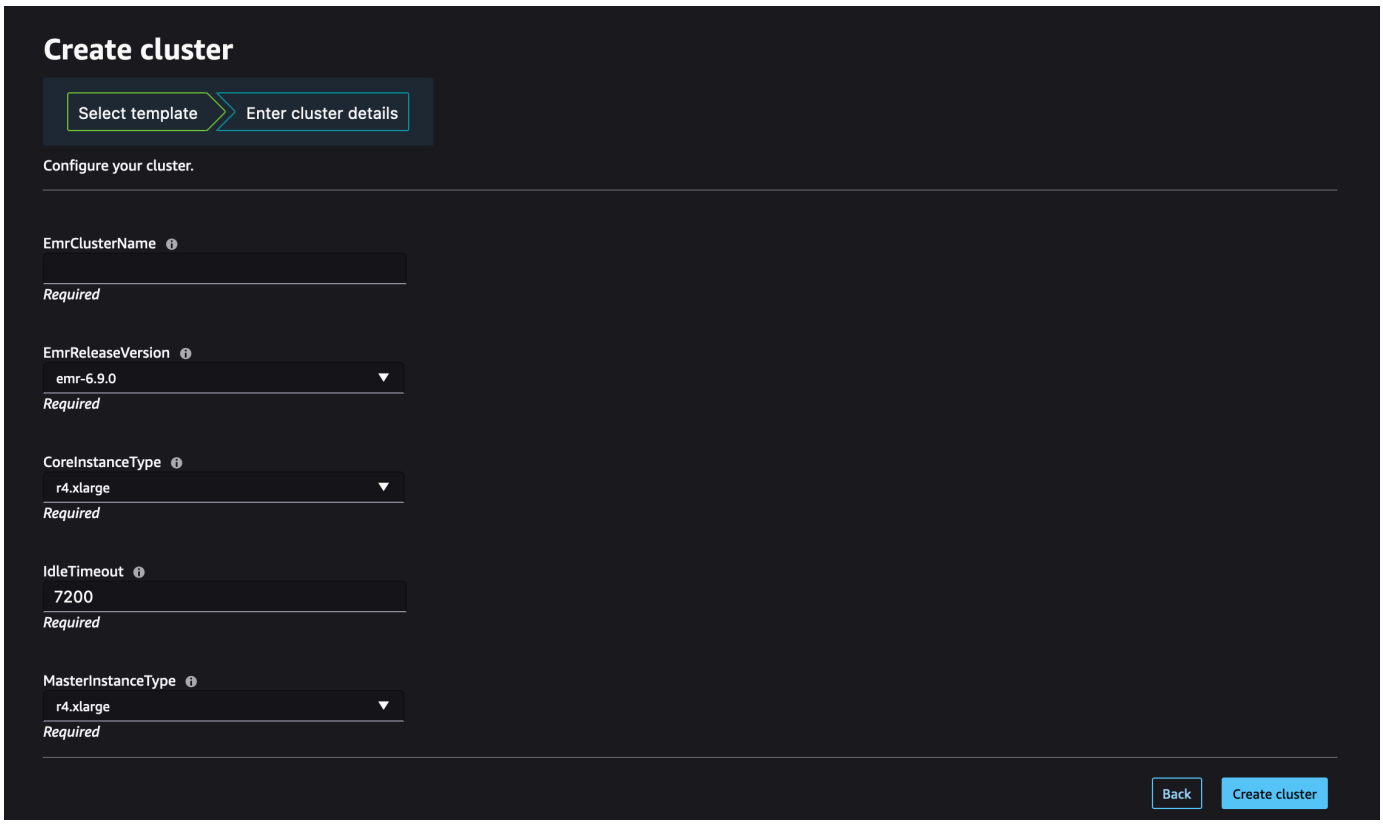
Launch an Amazon EMR cluster from Studio Classic

Data scientists and data engineers can self-provision Amazon EMR clusters from Studio Classic using AWS CloudFormation templates configured by their administrators. If you are an administrator looking to configure CloudFormation templates as AWS Service Catalog products so users can create Amazon EMR clusters from Studio Classic, see Configure Amazon EMR templates in AWS Service Catalog (for administrators).

To provision a new Amazon EMR cluster from Studio Classic:

1. Select the **Home**
   ()
   icon in the Studio Classic UI's left-side panel, then select the **Data** node in the navigation menu. Navigate down to the **Clusters** node. This opens up a page listing the Amazon EMR clusters that you can access from SageMaker Studio Classic.

2. Choose **Create cluster**. This opens up a page, in the main working area, listing the cluster templates available to you.
3. Select a cluster configuration template by choosing a template name. The selection of a template activates the **Select template** button. Choose **Select template**. This opens up a cluster creation form.
4. Enter the cluster's details, such as a cluster name and any specific configurable parameter set by your administrator, then choose **Create cluster**. The creation of the cluster might take a couple of minutes.



Once the cluster is provisioned, the Studio Classic UI displays a *The cluster has been successfully created* message.

To connect to your cluster, see Use Amazon EMR clusters from Studio Classic notebooks

Use Amazon EMR clusters from Studio Classic notebooks

In this section, you learn about how to discover, connect to, or terminate an Amazon EMR cluster from SageMaker Studio Classic notebooks.

- If you are an administrator, see Configure the discoverability of Amazon EMR clusters (for administrators) to configure the discoverability of Amazon EMR clusters from SageMaker Studio Classic notebooks.
- If you are a data scientist or data engineer looking to discover Amazon EMR clusters from your Studio Classic notebooks, see Discover Amazon EMR clusters from SageMaker Studio Classic.
- If you are a data scientist or data engineer looking to connect to existing Amazon EMR clusters from your Studio Classic notebooks, see Connect to an Amazon EMR cluster from SageMaker Studio Classic.

When connecting to your Amazon EMR cluster from SageMaker Studio Classic, you can authenticate to your cluster with Kerberos, Lightweight Directory Access Protocol (LDAP), or use runtime IAM role authentication. Your authentication method depends on your cluster configuration. You can refer to this example Access Apache Livy using a Network Load Balancer on a Kerberos-enabled Amazon EMR cluster to set up an Amazon EMR cluster that uses Kerberos. Alternatively, you can look at the CloudFormation example templates using Kerberos or LDAP in the aws-samples/sagemaker-studio-emr GitHub repository.

Find the list of available connection commands to an Amazon EMR cluster per authentication method in Enter the connection command to an Amazon EMR cluster manually to connect to your Amazon EMR cluster.

Supported images and kernels to connect to an Amazon EMR cluster from SageMaker Studio Classic

SageMaker Studio Classic provides built-in support to connect to Amazon EMR clusters in the following images and kernels:

- DataScience – Python 3 kernel
- DataScience 2.0 – Python 3 kernel
- DataScience 3.0 – Python 3 kernel
- SparkAnalytics 1.0 – SparkMagic and PySpark kernels
- SparkAnalytics 2.0 – SparkMagic and PySpark kernels
- SparkMagic – SparkMagic and PySpark kernels
- PyTorch 1.8 – Python 3 kernels
- TensorFlow 2.6 – Python 3 kernel
- TensorFlow 2.11 – Python 3 kernel

Those images and kernels come with sagemaker-studio-analytics-extension, a notebook extension that enables connection to a remote Spark (Amazon EMR) cluster via the SparkMagic library using Apache Livy.

To connect to Amazon EMR clusters using another built-in image or your own image, follow the instructions in Bring your own image.

Bring your own image

To bring your own image in SageMaker Studio Classic and allow your notebooks to connect to Amazon EMR clusters, install the following sagemaker-studio-analytics-extension extension to your kernel. It supports connecting SageMaker Studio Classic notebooks to Spark(Amazon EMR) clusters through the SparkMagic library.

```
pip install sparkmagic
pip install sagemaker-studio-sparkmagic-lib
pip install sagemaker-studio-analytics-extension
```

Additionally, to connect to Amazon EMR with Kerberos authentication, you must install the kinit client. Depending on your OS, the command to install the kinit client can vary. To bring an Ubuntu (Debian based) image, use the `apt-get install -y -qq krb5-user` command.

For more information on bringing your own image in SageMaker Studio Classic, see Bring your own SageMaker image.

Configure the discoverability of Amazon EMR clusters (for administrators)

This section provides details about how administrators can configure the discoverability of existing Amazon EMR clusters from SageMaker Studio Classic. The clusters can be deployed in the same AWS account as Studio Classic (*Single Account* tab) or in separate accounts (*Cross Accounts* tab).

Single Account

Attach the following permissions to the SageMaker Studio Classic execution role accessing your cluster.

The following list provides a breakdown of the permissions required.

- `AllowSagemakerProjectManagement` enables the creation of SageMaker projects. In Studio Classic, access to the AWS Service Catalog is granted through Projects.

- `AllowClusterDetailsDiscovery` and `AllowClusterDiscovery` allow the discovery and connection to Amazon EMR clusters.
- `AllowPresignedUrl` allows the creation of pre-signed URLs to access Spark UI.

The following is a comprehensive JSON that includes these permissions.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AllowPresignedUrl",
            "Effect": "Allow",
            "Action": [
                "elasticmapreduce:DescribeCluster",
                "elasticmapreduce:ListInstanceGroups",
                "elasticmapreduce:CreatePersistentAppUI",
                "elasticmapreduce:DescribePersistentAppUI",
                "elasticmapreduce:GetPersistentAppUIPresignedURL",
                "elasticmapreduce:GetOnClusterAppUIPresignedURL"
            ],
            "Resource": [
                "arn:aws:elasticmapreduce:region:account-id:cluster/*"
            ]
        },
        {
            "Sid": "AllowClusterDetailsDiscovery",
            "Effect": "Allow",
            "Action": [
               "elasticmapreduce:DescribeCluster",
               "elasticmapreduce:ListInstances",
               "elasticmapreduce:ListInstanceGroups",
               "elasticmapreduce:DescribeSecurityConfiguration"
            ],
            "Resource": [
                "arn:aws:elasticmapreduce:region:account-id:cluster/*"
            ]
        },
        {
            "Sid": "AllowClusterDiscovery",
            "Effect": "Allow",
            "Action": [
                "elasticmapreduce:ListClusters"
```

```
            ],
            "Resource": "*"
        },
        {
            "Sid": "AllowSagemakerProjectManagement",
            "Effect": "Allow",
            "Action": [
                "sagemaker:CreateProject",
                "sagemaker:DeleteProject"
            ],
            "Resource": "arn:aws:sagemaker:region:account-id:project/*"
        }
    ]
}
```

Cross Accounts

If your Amazon EMR clusters and SageMaker Studio Classic are deployed in separate AWS accounts, you configure the permissions in multiple steps.

- On the *trusting account* (the account in which Amazon EMR is deployed), create a custom IAM role (referred to as `ASSUMABLE-ROLE` in this page) with the following permissions and trust relationship.

  For information about creating a role on an AWS account, see Creating an IAM role (console).

  1. Add a policy defining the following permissions.
     - `AllowClusterDetailsDiscovery` and `AllowClusterDiscovery` to allow the discovery and connection to Amazon EMR clusters.
     - `AllowPresignedUrl` to allow the creation of pre-signed URLs to access Spark UI.

     The following is a comprehensive JSON that includes these permissions.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AllowPresignedUrl",
            "Effect": "Allow",
            "Action": [
                "elasticmapreduce:DescribeCluster",
                "elasticmapreduce:ListInstanceGroups",
```

```
                "elasticmapreduce:CreatePersistentAppUI",
                "elasticmapreduce:DescribePersistentAppUI",
                "elasticmapreduce:GetPersistentAppUIPresignedURL",
                "elasticmapreduce:GetOnClusterAppUIPresignedURL"
            ],
            "Resource": [
                "arn:aws:elasticmapreduce:emr-region:emr-account:cluster/*"
            ]
        },
        {
            "Sid": "AllowClusterDetailsDiscovery",
            "Effect": "Allow",
            "Action": [
               "elasticmapreduce:DescribeCluster",
               "elasticmapreduce:ListInstances",
               "elasticmapreduce:ListInstanceGroups",
               "elasticmapreduce:DescribeSecurityConfiguration"
            ],
            "Resource": [
                "arn:aws:elasticmapreduce:emr-region:emr-account:cluster/*"
            ]
        },
        {
            "Sid": "AllowClusterDiscovery",
            "Effect": "Allow",
            "Action": [
                "elasticmapreduce:ListClusters"
            ],
            "Resource": "*"
        }
    ]
}
```

2. To grant the *trusted account* (the account in which SageMaker Studio Classic's account is deployed) the permission to assume a role in the *trusting account*, add the following trust relationship.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
```

```
        "AWS": "arn:aws:iam::studio-account:root"
      },
      "Action": "sts:AssumeRole"
    }
  ]
}
```

- On the *trusted account* (the account in which SageMaker Studio Classic is deployed), add the following trust relationship to the Studio Classic execution role.

```
{
  "Version": "2012-10-17",
  "Statement": [
  {
            "Sid": "AllowRoleAssumptionForCrossAccountDiscovery",
            "Effect": "Allow",
            "Action": "sts:AssumeRole",
            "Resource":  ["arn:aws:iam::emr-account:role/ASSUMABLE-ROLE" ]
  }]
}
```

- Last, see Additional Configuration for cross accounts use cases (for administrators) to learn how to provide the ARN of the `ASSUMABLE-ROLE` to the Studio Classic execution role. The ARN is loaded by the Studio Classic Jupyter server at launch. The Studio Classic execution role assumes that cross-account role to discover and connect to Amazon EMR clusters in the *trusting account*.

Visit Discover Amazon EMR clusters from SageMaker Studio Classic to learn about how to discover and connect to Amazon EMR clusters from Studio Classic notebooks.

Discover Amazon EMR clusters from SageMaker Studio Classic

Data scientists and data engineers can discover, connect to, and manage Amazon EMR clusters from Amazon SageMaker Studio Classic. The Amazon EMR clusters may be in the same AWS account as Amazon SageMaker Studio Classic or in a different AWS account.

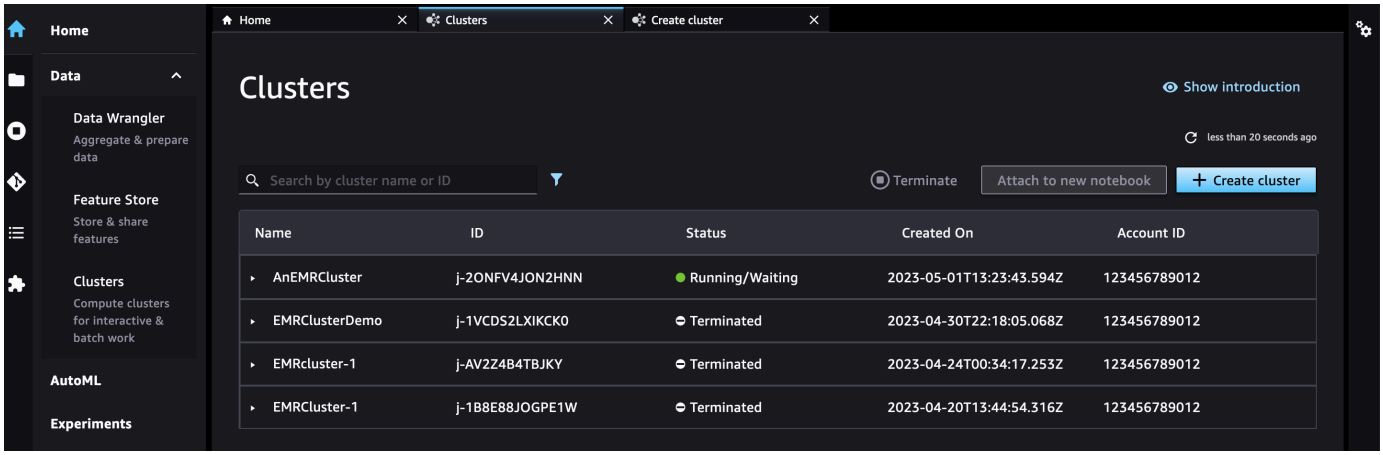
If your administrator configured the cross accounts discovery of Amazon EMR clusters, you can see a consolidated list of clusters in the AWS account used by SageMaker Studio Classic as well as in the remote accounts.

If you are an administrator looking to set up the discoverability of Amazon EMR clusters from SageMaker Studio Classic, see Configure the discoverability of Amazon EMR clusters (for administrators).

To view the list of available Amazon EMR clusters from SageMaker Studio Classic:

1. Select the **Home** () icon in Studio Classic UI's left-side panel, then select the **Data** node in the navigation menu.
2. Navigate down to the **Clusters** node. This opens up a page listing the Amazon EMR clusters that you can access from SageMaker Studio Classic.

   The list displays the status of each cluster. A cluster status can be **Starting**, **Bootstrapping**, **Running/Walking**, **Terminating**, **Terminated**, and **Terminated with error**. You can filter clusters by status by selecting the filter icon. The following image shows an example of a list of clusters.



3. To connect to a particular **Running/Walking** cluster, see Connect to an Amazon EMR cluster from SageMaker Studio Classic.

Connect to an Amazon EMR cluster from SageMaker Studio Classic

This section explains how you can connect to an Amazon EMR cluster from a Studio Classic notebook when you use any of the supported kernels.

Connect to an Amazon EMR cluster automatically

To connect to your cluster using the Studio Classic UI, you can either initiate a connection from the list of clusters accessed in Discover Amazon EMR clusters from SageMaker Studio Classic, or from a notebook in SageMaker Studio Classic.

To connect to a particular cluster from your list of clusters

1. Choose the name of the cluster in your list. This activates the **Attach to new notebook** button.
2. Choose **Attach to new notebook**. This opens up the images and kernels selection box.
3. Select your image and kernel, then choose **Select**. For a list of supported images, see Supported images and kernels to connect to an Amazon EMR cluster from SageMaker Studio Classic or refer to Bring your own image.
4. If the cluster you select does not use Kerberos, LDAP, or runtime role authentication, Studio Classic prompts you to select the credential type. Choose from **Http basic authentication** or **No credentials**, then enter your credentials, if applicable. A connection command populates the first cell of your notebook and initiates the connection with the Amazon EMR cluster.

   Once the connection succeeds, a message confirms the connection and the start of the Spark application.

Alternatively, you can connect to a cluster from a notebook.

1. Choose **Cluster** at the top of your notebook.

   Cluster is only visible when you use a kernel from Supported images and kernels to connect to an Amazon EMR cluster from SageMaker Studio Classic or from Bring your own image. If you cannot see **Cluster** at the top of your notebook, ensure that your administrator has configured the discoverability of your clusters and switch to a supported kernel.

   This opens up a list of available clusters.
2. Select the cluster to which you want to connect, then choose **Connect**.
3. If you configured your Amazon EMR clusters to support runtime IAM roles and your administrator preloaded your roles in an execution role configuration JSON, you can select

your Amazon EMR access role from the **Amazon EMR execution role** drop down menu. If your roles are not preloaded, Studio Classic uses your Studio Classic execution role by default. For information about using runtime roles with Amazon EMR, see Connect to an Amazon EMR cluster from Studio Classic using runtime IAM roles. When you connect to a cluster, Studio Classic adds a code block to an active cell to establish the connection.

Otherwise, if the cluster you choose does not use Kerberos, LDAP, or runtime role authentication, Studio Classic prompts you to select the credential type. You can choose **HTTP basic authentication** or **No credential**.

4. An active cell populates and runs. This cell contains the connection command to connect to your Amazon EMR cluster.

   Once the connection succeeds, a message confirm the connection and the start of the Spark application.

Enter the connection command to an Amazon EMR cluster manually

You can manually connect to your Amazon EMR cluster from a Studio Classic notebook whether or not your Studio Classic application and cluster reside in the same AWS account.

For each of the following authentication types, use the specified command to manually connect to your cluster from your Studio Classic notebook.

- **Kerberos**

  Append the `--assumable-role-arn` argument if you need cross-account Amazon EMR access. Append the `--verify-certificate` argument if you connect to your cluster with HTTPS.

```
%load_ext sagemaker_studio_analytics_extension.magics
%sm_analytics emr connect --cluster-id cluster_id \
--auth-type Kerberos --language python
[--assumable-role-arn EMR_access_role_ARN ]
[--verify-certificate /home/user/certificateKey.pem]
```

- **LDAP**

  Append the `--assumable-role-arn` argument if you need cross-account Amazon EMR access. Append the `--verify-certificate` argument if you connect to your cluster with HTTPS.

```
%load_ext sagemaker_studio_analytics_extension.magics
```

```
%sm_analytics emr connect --cluster-id cluster_id \
--auth-type Basic_Access --language python
[--assumable-role-arn EMR_access_role_ARN ]
[--verify-certificate /home/user/certificateKey.pem]
```

- **NoAuth**

  Append the `--assumable-role-arn` argument if you need cross-account Amazon EMR access. Append the `--verify-certificate` argument if you connect to your cluster with HTTPS.

```
%load_ext sagemaker_studio_analytics_extension.magics
%sm_analytics emr connect --cluster-id cluster_id \
--auth-type None --language python
[--assumable-role-arn EMR_access_role_ARN ]
[--verify-certificate /home/user/certificateKey.pem]
```

- **Runtime IAM roles**

  Append the `--assumable-role-arn` argument if you need cross-account Amazon EMR access. Append the `--verify-certificate` argument if you connect to your cluster with HTTPS.

  For more information on connecting to an Amazon EMR cluster using runtime IAM roles, see Connect to an Amazon EMR cluster from Studio Classic using runtime IAM roles.

```
%load_ext sagemaker_studio_analytics_extension.magics
%sm_analytics emr connect --cluster-id cluster_id \
--auth-type Basic_Access \
--emr-execution-role-arn arn:aws:iam::studio_account_id:role/emr-execution-role-name
[--assumable-role-arn EMR_access_role_ARN]
[--verify-certificate /home/user/certificateKey.pem]
```

Connect to an Amazon EMR cluster over HTTPS

If you have configured your Amazon EMR cluster with transit encryption enabled and Apache Livy server for HTTPS and would like Studio Classic to communicate with Amazon EMR using HTTPS, you need to configure Studio Classic to access your certificate key.

For self-signed or local Certificate Authority (CA) signed certificates, you can do this in two steps:

1. Download the PEM file of your certificate to your local file system using one of the following options:

- Jupyter's built-in file upload function.
- A notebook cell.
- A lifecycle configuration (LCC) script.

  For information on how to use an LCC script, see Customize a Notebook Instance Using a Lifecycle Configuration Script

2. Enable the validation of the certificate by providing the path to your certificate in the `--verify-certificate` argument of your connection command.

```
%sm_analytics emr connect --cluster-id cluster_id \
    --verify-certificate /home/user/certificateKey.pem ...
```

For public CA issued certificates, set the certificate validation by setting the `--verify-certificate` parameter as `true`.

Alternatively, you can disable the certificate validation by setting the `--verify-certificate` parameter as `false`.

You can find the list of available connection commands to an Amazon EMR cluster in Enter the connection command to an Amazon EMR cluster manually.

Connect to an Amazon EMR cluster from Studio Classic using runtime IAM roles

When you connect to an Amazon EMR cluster from your Amazon SageMaker Studio Classic notebook, you can visually browse a list of IAM roles, known as runtime roles, and select one on the fly. Subsequently, all your Apache Spark, Apache Hive, or Presto jobs created from your Studio Classic notebook access only the data and resources permitted by policies attached to the runtime role. Also, when data is accessed from data lakes managed with AWS Lake Formation, you can enforce table-level and column-level access using policies attached to the runtime role.

With this capability, you and your teammates can connect to the same cluster, each using a runtime role scoped with permissions matching your individual level of access to data. Your sessions are also isolated from one another on the shared cluster. With this ability to control fine-grained access to data on the same shared cluster, you can simplify provisioning of Amazon EMR clusters, reducing operational overhead and saving costs.

To try out this new feature, see Apply fine-grained data access controls with AWS Lake Formation and Amazon EMR from Amazon SageMaker Studio Classic . This blog post helps you set up a demo

environment where you can try using preconfigured runtime roles to connect to Amazon EMR clusters.

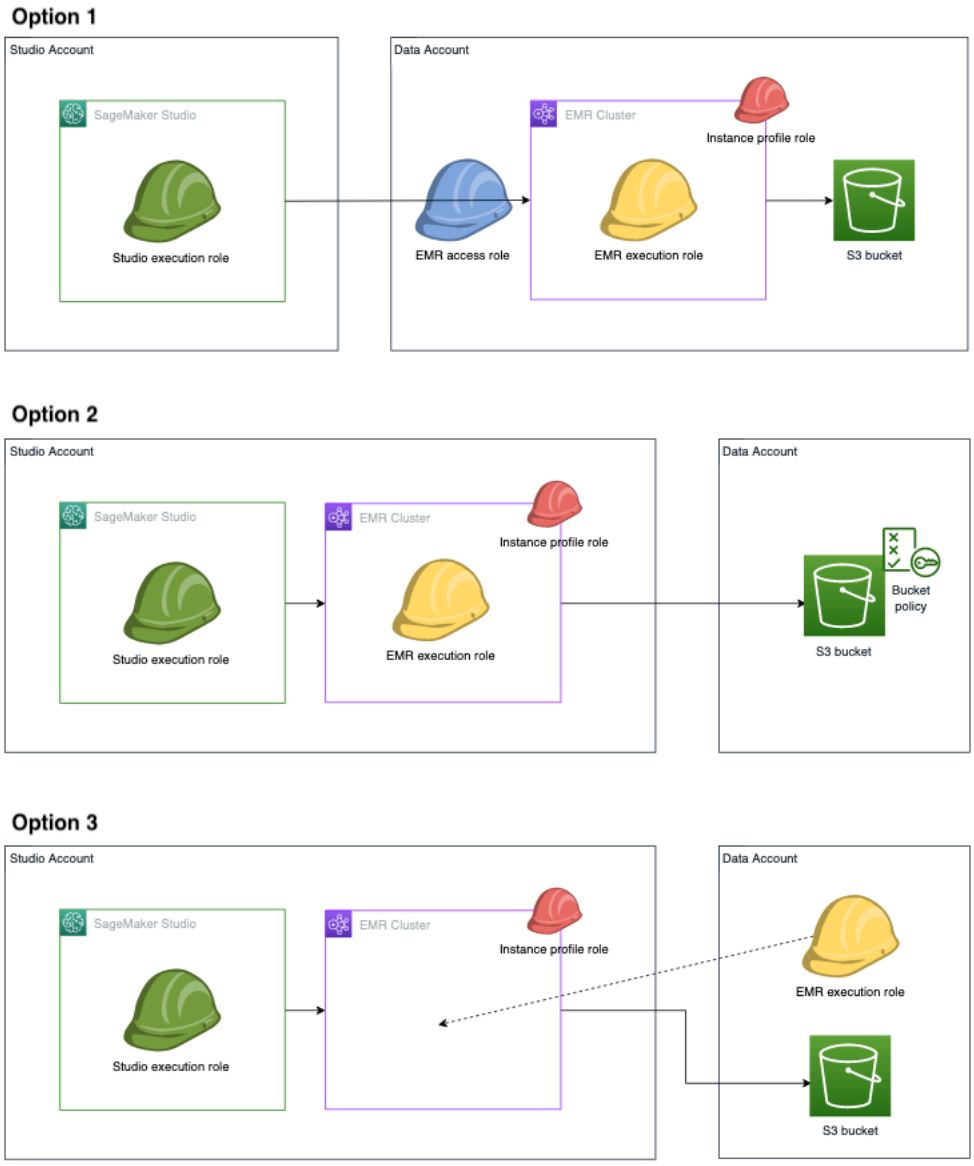
Prerequisites

Before you get started, make sure you meet the following prerequisites:

- Use Amazon EMR version 6.9 or above.
- Use JupyterLab version 3 in the Studio Classic Jupyter server application configuration. This version supports Studio Classic connection to Amazon EMR clusters using runtime roles.
- Allow the use of runtime roles in your cluster's security configuration. For more information, see Runtime roles for Amazon EMR steps.
- Create a notebook with any of the kernels listed in Use Amazon EMR clusters from Studio Classic notebooks.
- Make sure you review the instructions in Set up Studio Classic to use runtime IAM roles to configure runtime roles with Studio Classic.

Cross-account connection scenarios

Runtime role authentication supports a variety of cross-account connection scenarios when your data resides outside of your Studio Classic account. The following image shows three different ways you can assign your Amazon EMR cluster, data, and even Amazon EMR execution role between your Studio Classic and data accounts:



In option 1, your Amazon EMR cluster and Amazon EMR execution role are in a separate data account from your Studio Classic account. You define a separate Amazon EMR access role permission policy which grants permission to your Studio Classic execution role to assume the Amazon EMR access role. The Amazon EMR access role then calls the Amazon EMR API `GetClusterSessionCredentials` on behalf of your Studio Classic execution role, giving you access to the cluster.

In option 2, your Amazon EMR cluster and Amazon EMR execution role are in your Studio Classic account. Your Studio Classic execution role has permission to use the Amazon EMR API `GetClusterSessionCredentials` to gain access to your cluster. To access the Amazon S3

bucket, give the Amazon EMR execution role cross-account Amazon S3 bucket access permissions — you grant these permissions within your Amazon S3 bucket policy.

In option 3, your Amazon EMR clusters are in your Studio Classic account, and the Amazon EMR execution role is in the data account. Your Studio Classic execution role has permission to use the Amazon EMR API `GetClusterSessionCredentials` to gain access to your cluster. Add the Amazon EMR execution role into the execution role configuration JSON. Then you can select the role in the UI when you choose your cluster. For details about how to set up your execution role configuration JSON file, see Preload your execution roles into Studio Classic.

Set up Studio Classic to use runtime IAM roles

To establish runtime role authentication for your Amazon EMR clusters, configure the required IAM policies, network, and usability enhancements. Your setup depends on whether you handle any cross-account arrangements if your Amazon EMR clusters, Amazon EMR execution role, or both, reside outside of your Amazon SageMaker Studio Classic account. The following discussion guides you through the policies to install, how to configure the network to allow traffic between cross-accounts, and the local configuration file to set up to automate your Amazon EMR connection.

Configure runtime role authentication when your Amazon EMR cluster and Studio Classic are in the same account

If your Amazon EMR cluster resides in your Studio Classic account, add the basic policy to connect to your Amazon EMR cluster and set permissions to call the Amazon EMR API `GetClusterSessionCredentials`, which gives you access to the cluster. Complete the following steps to add necessary permissions to your Studio Classic execution policy:

1. Add the required IAM policy to connect to Amazon EMR clusters. For details, see Discover Amazon EMR clusters from SageMaker Studio Classic.
2. Grant permission to call the Amazon EMR API `GetClusterSessionCredentials` when you pass one or more permitted Amazon EMR execution roles specified in the policy.
3. (Optional) Grant permission to pass IAM roles that follow any user-defined naming conventions.
4. (Optional) Grant permission to access Amazon EMR clusters that are tagged with specific user-defined strings.
5. If you don't want to manually call the Amazon EMR connection command, install a SageMaker configuration file in your local Amazon EFS and select the role to use when you select your Amazon EMR cluster. For details about how to preload your IAM roles, see Preload your execution roles into Studio Classic.

The following example policy permits Amazon EMR execution roles belonging to the modeling and training groups to call `GetClusterSessionCredentials`. In addition, the policyholder can access Amazon EMR clusters tagged with the strings `modeling` or `training`.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "VisualEditor0",
            "Effect": "Allow",
            "Action": "elasticmapreduce:GetClusterSessionCredentials",
            "Resource": "*",
            "Condition": {
                "StringLike": {
                    "elasticmapreduce:ExecutionRoleArn": [
                        "arn:aws:iam::123456780910:role/emr-execution-role-ml-
modeling*",
                        "arn:aws:iam::123456780910:role/emr-execution-role-ml-
training*"
                    ],
                    "elasticmapreduce:ResourceTag/group": [
                        "*modeling*",
                        "*training*"
                    ]
                }
            }
        }
    ]
}
```

Configure runtime role authentication when your cluster and Studio Classic are in different accounts

If your Amazon EMR cluster is not in your Studio Classic account, allow your Studio Classic execution role to assume the cross-account Amazon EMR access role so you can connect to the cluster. Complete the following steps to set up your cross-account configuration:

1. Create your Studio Classic execution role permission policy so that the execution role can assume the Amazon EMR access role. The following policy is an example:

```
{
    "Version": "2012-10-17",
```

```
    "Statement": [
        {
            "Sid": "AllowAssumeCrossAccountEMRAccessRole",
            "Effect": "Allow",
            "Action": "sts:AssumeRole",
            "Resource": "arn:aws:iam::emr_account_id:role/emr-access-role-name"
        }
    ]
}
```

2. Create the trust policy to specify which Studio Classic account IDs are trusted to assume the Amazon EMR access role. The following policy is an example:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "AllowCrossAccountSageMakerExecutionRoleToAssumeThisRole",
      "Effect": "Allow",
      "Principal": {
        "AWS": "arn:aws:iam::studio_account_id:role/studio_execution_role"
      },
      "Action": "sts:AssumeRole"
    }
}
```

3. Create the Amazon EMR access role permission policy, which grants the Amazon EMR execution role the needed permissions to carry out the intended tasks on the cluster. Configure the Amazon EMR access role to call the API `GetClusterSessionCredentials` with the Amazon EMR execution roles specified in the access role permission policy. The following policy is an example:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AllowCallingEmrGetClusterSessionCredentialsAPI",
            "Effect": "Allow",
            "Action": "elasticmapreduce:GetClusterSessionCredentials",
            "Resource": "",
            "Condition": {
                "StringLike": {
```

```
                    "elasticmapreduce:ExecutionRoleArn": [
                        "arn:aws:iam::emr_account_id:role/emr-execution-role-name"
                    ]
                }
            }
        }
    ]
}
```

4. Set up the cross-account network so that traffic can move back and forth between your accounts. For guided instruction, see *Set up the network* in the blog post Create and manage Amazon EMR Clusters from SageMaker Studio Classic to run interactive Spark and ML workloads – Part 2. The steps in the blog post help you complete the following tasks:
   a. VPC-peer your Studio Classic account and your Amazon EMR account to establish a connection.
   b. Manually add routes to the private subnet route tables in both accounts. This permits creation and connection of Amazon EMR clusters from the Studio Classic account to the remote account's private subnet.
   c. Set up the security group attached to your Studio Classic domain to allow outbound traffic and the security group of the Amazon EMR primary node to allow inbound TCP traffic from the Studio Classic instance security group.
5. If you don't want to manually call the Amazon EMR connection command, install a SageMaker configuration file in your local Amazon EFS so you can select the role to use when you choose your Amazon EMR cluster. For details about how to preload your IAM roles, see Preload your execution roles into Studio Classic.

Configure Lake Formation access

When you access data from data lakes managed by AWS Lake Formation, you can enforce table-level and column-level access using policies attached to your runtime role. To configure permission for Lake Formation access, see Integrate Amazon EMR with AWS Lake Formation.

Preload your execution roles into Studio Classic

If you don't want to manually call the Amazon EMR connection command, you can install a SageMaker configuration file in your local Amazon EFS so you can select the execution role to use when you choose your Amazon EMR cluster.

To write a configuration file for the Amazon EMR execution roles, associate a Use lifecycle configurations with Amazon SageMaker Studio Classic (LCC) to the Jupyter server application. Alternatively, you can write or update the configuration file and restart the Jupyter server with the command: `restart-jupyter-server`.

The following snippet is an example LCC bash script you can apply if your Studio Classic application and cluster are in the same account:

```
#!/bin/bash

set -eux

FILE_DIRECTORY="/home/sagemaker-user/.sagemaker-analytics-configuration-DO_NOT_DELETE"
FILE_NAME="emr-configurations-DO_NOT_DELETE.json"
FILE="$FILE_DIRECTORY/$FILE_NAME"

mkdir -p $FILE_DIRECTORY

cat << 'EOF' > "$FILE"
{
    "emr-execution-role-arns":
    {
      "123456789012": [
          "arn:aws:iam::123456789012:role/emr-execution-role-1",
          "arn:aws:iam::123456789012:role/emr-execution-role-2"
      ]
    }
}
EOF
```

If your Studio Classic application and clusters are in different accounts, specify the Amazon EMR access roles that can use the cluster. In the following example policy, *123456789012* is the ARN for the Amazon EMR cluster account, and *212121212121* and *434343434343* are the ARNs for the permitted Amazon EMR access roles.

```
#!/bin/bash

set -eux

FILE_DIRECTORY="/home/sagemaker-user/.sagemaker-analytics-configuration-DO_NOT_DELETE"
FILE_NAME="emr-configurations-DO_NOT_DELETE.json"
FILE="$FILE_DIRECTORY/$FILE_NAME"
```

```
mkdir -p $FILE_DIRECTORY

cat << 'EOF' > "$FILE"
{
    "emr-execution-role-arns":
    {
      "123456789012": [
          "arn:aws:iam::212121212121:role/emr-execution-role-1",
          "arn:aws:iam::434343434343:role/emr-execution-role-2"
      ]
    }
}
EOF

# add your cross-account EMR access role
FILE_DIRECTORY="/home/sagemaker-user/.cross-account-configuration-DO_NOT_DELETE"
FILE_NAME="emr-discovery-iam-role-arns-DO_NOT_DELETE.json"
FILE="$FILE_DIRECTORY/$FILE_NAME"

mkdir -p $FILE_DIRECTORY

cat << 'EOF' > "$FILE"
{
    "123456789012": "arn:aws:iam::123456789012:role/cross-account-emr-access-role"
}
EOF
```

Terminate an Amazon EMR cluster from Studio Classic

The following procedure shows how to terminate an Amazon EMR cluster from a Studio Classic notebook.

To terminate a cluster in a `Running` state, navigate to the list of available Amazon EMR clusters.

1. In SageMaker Studio Classic, select the **Home** () icon in Studio Classic UI's left-side panel, then select the **Data** node in the navigation menu.
2. Navigate down to the **Clusters** node. This opens up a page listing the Amazon EMR clusters that you can access from SageMaker Studio Classic.

3. Select the name of the cluster that you want to terminate, then choose **Terminate**.
4. This opens up a confirmation window informing you that any pending work or data on your cluster will be lost permanently after termination. Confirm by choosing **Terminate** again.

Access Spark UI from Studio Classic

The following sections give instructions for accessing the Spark UI from SageMaker Studio Classic notebooks. The Spark UI allows you to monitor and debug your Spark Jobs submitted to run on Amazon EMR from Studio Classic notebooks. SSH tunneling and presigned URLs are two ways for accessing the Spark UI.

Set up SSH tunneling for Spark UI access

To set up SSH tunneling to access the Spark UI, follow one of the two options in this section.

Options for setting up SSH tunneling:

- Option 1: Set up an SSH tunnel to the master node using local port forwarding
- Option 2, part 1: Set up an SSH tunnel to the master node using dynamic port forwarding

  Option 2, part 2: Configure proxy settings to view websites hosted on the master node

For information about viewing web interfaces hosted on Amazon EMR clusters, see View web interfaces hosted on Amazon EMR Clusters. You can also visit your Amazon EMR console to get access to the Spark UI.

> **Note**
>
> You can set up an SSH tunnel even if presigned URLs are not available to you.

Presigned URLs

To create one-click URLs that can access Spark UI on Amazon EMR from SageMaker Studio Classic notebooks, you must enable the following IAM permissions. Choose the option that applies to you:

- **For Amazon EMR clusters that are in the same account as the SageMaker Studio Classic notebook: Add the following permissions to the SageMaker Studio Classic IAM execution role.**

- **For Amazon EMR clusters that are in a different account (not SageMaker Studio Classic notebook): Add the following permissions to the cross-account role that you created for Discover Amazon EMR clusters from SageMaker Studio Classic.**

> **Note**
>
> You can access presigned URLs from the console in the following regions:
>
> - US East (N. Virginia) Region
> - US West (N. California) Region
> - Canada (Central) Region
> - Europe (Frankfurt) Region
> - Europe (Stockholm) Region
> - Europe (Ireland) Region
> - Europe (London) Region
> - Europe (Paris) Region
> - Asia Pacific (Tokyo) Region
> - Asia Pacific (Seoul) Region
> - Asia Pacific (Sydney) Region
> - Asia Pacific (Mumbai) Region
> - Asia Pacific (Singapore) Region
> - South America (São Paulo)

The following policy gives access to presigned URLs for your execution role.

```
{
            "Sid": "AllowPresignedUrl",
            "Effect": "Allow",
            "Action": [
                "elasticmapreduce:DescribeCluster",
                "elasticmapreduce:ListInstanceGroups",
                "elasticmapreduce:CreatePersistentAppUI",
                "elasticmapreduce:DescribePersistentAppUI",
                "elasticmapreduce:GetPersistentAppUIPresignedURL",
                "elasticmapreduce:GetOnClusterAppUIPresignedURL"
```

```
            ],
            "Resource": [
                "arn:aws:elasticmapreduce:region:account-id:cluster/*"
            ]
}
```

Walkthroughs and whitepapers

The following blogs use a case study of sentiment prediction for a movie review to illustrate the process of executing a complete machine learning workflow. This includes data preparation, monitoring Spark jobs, and training and deploying a ML model to get predictions directly from your Studio Classic notebook.

- Create and manage Amazon EMR clusters from SageMaker Studio Classic to run interactive Spark and ML workloads.
- To extend the use case to a cross-account configuration where SageMaker Studio Classic and your Amazon EMR cluster are deployed in separete AWS accounts, see Create and manage Amazon EMR clusters from SageMaker Studio Classic to run interactive Spark and ML workloads - Part 2.

See also:

- A walkthrough of the configuration of Access Apache Livy using a Network Load Balancer on a Kerberos-enabled Amazon EMR cluster.
- AWS whitepapers for SageMaker Studio Classic best practices.

Additional Configuration for cross accounts use cases (for administrators)

To enable cluster discovery across accounts, administrators need to provide the ARN of a cross-account IAM role to the execution role of SageMaker Studio Classic. SageMaker Studio Classic's execution role assumes that remote role to discover and connect to Amazon EMR clusters in the *trusting account*. The ARN of this role is loaded by the Studio Classic's Jupyter server at launch.

You can specify this information in two ways.

- Write this remote role in a file named `emr-discovery-iam-role-arns-DO_NOT_DELETE.json` placed in the directory `.cross-account-configuration-`

DO_NOT_DELETE in your home directory located in the Amazon EFS storage volume used by SageMaker Studio Classic.

- Alternatively, you can automate this process by using Lifecycle Configuration (LCC) scripts. You can attach the LCC to your domain or a specific user profile. The LCC script that you use must be a JupyterServer configuration. For more information on how to create an LCC script, see Use Lifecycle Configurations with Studio Classic.

The following is an example LCC script. To modify the script, replace ASSUMABLE-ROLE and emr-account with your role name and remote account ID, respectively. The number of cross accounts is limited to five.

```
# This script creates the file that informs SageMaker Studio Classic that the role
 "arn:aws:iam::emr-account:role/ASSUMABLE-ROLE" in remote account "emr-account" must be
 assumed to list and describe Amazon EMR clusters in the remote account.

#!/bin/bash

set -eux

FILE_DIRECTORY="/home/sagemaker-user/.cross-account-configuration-DO_NOT_DELETE"
FILE_NAME="emr-discovery-iam-role-arns-DO_NOT_DELETE.json"
FILE="$FILE_DIRECTORY/$FILE_NAME"

mkdir -p $FILE_DIRECTORY

cat > "$FILE" <<- "EOF"
{
  emr-cross-account1: "arn:aws:iam::emr-cross-account1:role/ASSUMABLE-ROLE",
  emr-cross-account2: "arn:aws:iam::emr-cross-account2:role/ASSUMABLE-ROLE"
}
EOF
```

After the LCC runs and the files are written, the server reads the file /home/sagemaker-user/.cross-account-configuration-DO_NOT_DELETE/emr-discovery-iam-role-arns-DO_NOT_DELETE.json and stores the cross-account ARN.

Troubleshooting

The following are common errors that might occur while connecting or using Amazon EMR clusters from Studio Classic notebooks.

Troubleshoot Livy connections hanging or failing

The following are Livy connectivity issues that might occur while using Amazon EMR clusters from Studio Classic notebooks.

- **Your Amazon EMR cluster encountered an out-of-memory error.**

  A possible reason for a Livy connection via `sparkmagic` hanging or failing is if your Amazon EMR cluster encountered an out-of-memory error.

  By default, the Java configuration parameter of the Apache Spark driver, `spark.driver.defaultJavaOptions`, is set to `-XX:OnOutOfMemoryError='kill -9 %p'`. This means that the default action taken when the driver program encounters an `OutOfMemoryError` is to terminate the driver program by sending a SIGKILL signal. When the Apache Spark driver is terminated, any Livy connection via `sparkmagic` that depends on that driver hangs or fails. This is because the Spark driver is responsible for managing the Spark application's resources, including task scheduling and execution. Without the driver, the Spark application cannot function, and any attempts to interact with it fails.

  If you suspect that your Spark cluster is experiencing memory issues, you can check Amazon EMR logs. Containers killed due to out-of-memory errors typically exit with a code of `137`. In such cases, you need to restart the Spark application and establish a new Livy connection to resume interaction with the Spark cluster.

  You can refer to the knowledge base article How do I resolve the error "Container killed by YARN for exceeding memory limits" in Spark on Amazon EMR? on AWS re:Post to learn about various strategies and parameters that can be used to address an out-of-memory issue.

  We recommend reviewing the Amazon EMR Best Practices Guides for best practices and tuning guidance on running Apache Spark workloads on your Amazon EMR clusters.

- **Your Livy session times out when connecting to an Amazon EMR cluster for the first time.**

  When you initially connect to an Amazon EMR cluster using sagemaker-studio-analytics-extension, which enables connection to a remote Spark (Amazon EMR) cluster via the SparkMagic library using Apache Livy, you may encounter a connection timeout error:

  ```
  An error was encountered: Session 0 did not start up in 60 seconds.
  ```

  If your Amazon EMR cluster requires the initialization of a Spark application upon establishing a connection, there is an increased chance of seeing connection timeout errors.

To reduce the chances of getting timeouts when connecting to an Amazon EMR cluster using Livy through the analytics extension, `sagemaker-studio-analytics-extension` version `0.0.19` and later override the default server session timeout to `120` seconds instead of `sparkmagic`'s default of `60` seconds.

We recommend upgrading your extension `0.0.18` and sooner by running the following upgrade command.

```
pip install --upgrade sagemaker-studio-analytics-extension
```

Note that when providing a custom timeout configuration in `sparkmagic`, `sagemaker-studio-analytics-extension` honors this override. However, setting the session timeout to `60` seconds automatically triggers the default server session timeout of `120` seconds in `sagemaker-studio-analytics-extension`.

Prepare data using AWS Glue Interactive Sessions

AWS Glue Interactive Sessions is an on-demand, serverless, Apache Spark runtime environment that data scientists and engineers can use to rapidly build, test, and run data preparation and analytics applications.

You can initiate an AWS Glue interactive session by starting a SageMaker Studio Classic notebook. When creating your Studio Classic notebook, choose the built-in `Glue PySpark` or `Glue Spark` kernel. This automatically starts an interactive, serverless Spark session. You do not need to provision or manage any compute cluster or infrastructure. After initialization, you can explore the AWS Glue Data Catalog, execute complex queries, and interactively analyze and prepare data using Spark within your Studio Classic notebook. You can then use the prepared data to build, train, tune, and deploy models using the purpose-built ML tools within SageMaker Studio Classic.

Before starting your AWS Glue interactive session in SageMaker Studio Classic, you need to set the appropriate roles and policies. Additionally, you may need to provide access to additional resources, such as a storage Amazon S3 bucket, which might require additional policies. For more information about required and additional IAM policies, see Permissions for AWS Glue Interactive Sessions in SageMaker Studio Classic.

SageMaker Studio Classic provides a default configuration for your AWS Glue interactive session, however, you can use AWS Glue's full catalog of Jupyter magic commands to further customize

your environment. For information about the default and additional Jupyter magics that you can use in your AWS Glue interactive session, see Configure your AWS Glue interactive session in SageMaker Studio Classic.

The supported images and kernels for connecting to a AWS Glue interactive session are as follows:

- Images: SparkAnalytics 1.0, SparkAnalytics 2.0
- Kernel: Glue Python [PySpark and Ray] and Glue Spark

Prerequisites:

The SparkAnalytics image that you select to launch your AWS Glue session in Studio Classic is a combination of two frameworks - the SparkMagic framework (used with Amazon EMR), and AWS Glue. For this reason, the prerequisites for both frameworks apply. However, you do not have to set up the Amazon EMR cluster if you only plan to use AWS Glue Interactive Sessions. Before you start your first AWS Glue interactive session in Studio Classic, complete the following:

- Complete the prerequisites required to use the SparkMagic image. For a list of the prerequisites, see the Prerequisites section in Prepare Data at Scale with Studio Classic Notebooks.
- Create an execution role with permissions for both AWS Glue and SageMaker Studio Classic. Add the managed policy `AwsGlueSessionUserRestrictedServiceRole`, and create a custom policy that includes permissions `sts:GetCallerIdentity`, `iam:GetRole`, and `IAM:Passrole`. For instructions about how to create the necessary permissions, see Permissions for AWS Glue Interactive Sessions in SageMaker Studio Classic.
- Create a SageMaker domain with the execution role you created. For instructions about how to create a domain, see Setting up.

Get Started with AWS Glue Interactive Sessions

In this guide, you learn how to initiate an AWS Glue interactive session in SageMaker Studio Classic, and manage your environment with Jupyter magics.

Permissions for AWS Glue Interactive Sessions in SageMaker Studio Classic

This section lists the required policies to run AWS Glue interactive sessions in Studio Classic and explains how to set them up. In particular, it details how to:

- Attach the `AwsGlueSessionUserRestrictedServiceRole` managed policy to your SageMaker execution role.
- Create an inline custom policy on your SageMaker execution role.
- Modify the trust relationship of your SageMaker execution role.

To attach the `AwsGlueSessionUserRestrictedServiceRole` managed policy to your execution role

1. Open the IAM console.
2. Select **Roles** in the left-side panel.
3. Find your Studio Classic execution role. Choose the role name to access the role summary page.
4. Under the **Permissions** tab, select **Attach policies** from the **Add Permissions** dropdown menu.
5. Select the checkbox next to the managed policy `AwsGlueSessionUserRestrictedServiceRole`.
6. Choose **Attach policies**.

   The summary page shows your newly-added managed policies.

To create the inline custom policy on your execution role

1. Select **Create inline policy** in the **Add Permissions** dropdown menu.
2. Select the **JSON** tab.
3. Copy and paste in the following policy.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "unique_statement_id",

            "Effect": "Allow",
            "Action": [
  "iam:GetRole",
                "iam:PassRole",
                "sts:GetCallerIdentity"
```

```
            ],
            "Resource": "*"
        }
    ]
}
```

4. Choose **Review policy**.
5. Enter a **Name** and choose **Create policy**.

   The summary page shows your newly-added custom policy.

To modify the trust relationship of your execution role

1. Select the **Trust relationships** tab.
2. Chose **Edit trust policy**.
3. Copy and paste in the following policy.

```
{
"Version": "2012-10-17",
"Statement": [
    {
        "Effect": "Allow",
        "Principal": {
            "Service": [
                "glue.amazonaws.com",
                "sagemaker.amazonaws.com"
            ]
        },
        "Action": "sts:AssumeRole"
    }
]
}
```

4. Choose **Update policy**.

You can add additional roles and policies if you need to access other AWS resources. For a description of the additional roles and policies you can include, see Interactive sessions with IAM in the AWS Glue documentation.

Tag propagation

Tags are commonly used to track and allocate costs, control access to your session, isolate your resources, and more. To learn about adding metadata to your AWS resources using tagging, or for details on common use cases, see Additional information.

You can enable the automatic propagation of AWS tags to new AWS Glue interactive sessions created from within the Studio Classic UI. When an AWS Glue interactive session is created from SageMaker Studio Classic, any user-defined tags attached to the user profile or shared space are carried over to the new AWS Glue interactive session. Additionally, SageMaker Studio Classic automatically adds two AWS-generated internal tags ((`sagemaker:user-profile-arn` and `sagemaker:domain-arn`) or (`sagemaker:shared-space-arn` and `sagemaker:domain-arn`)) to new AWS Glue interactive sessions created from the Studio Classic UI. You can use these tags to aggregate costs across individual domains, user profiles, or spaces.

Enable tag propagation

To enable the automatic propagation of tags to new AWS Glue interactive sessions, set the following permissions for your SageMaker execution role and the IAM role associated with your AWS Glue session:

> **Note**
>
> By default, the role associated with the AWS Glue interactive session is the same as the SageMaker execution role. You can specify a different execution role for the AWS Glue interactive session by using the `%iam_role` magic command. For information on the available Jupyter magic commands to configure AWS Glue interactive sessions, see Configure your AWS Glue interactive session in SageMaker Studio Classic.

- *On your SageMaker execution role*: Create a new inline policy, and paste the following JSON file. The policy grants the execution role permission to describe (`DescribeUserProfile`, `DescribeSpace`, `DescribeDomain`) and list the tags (`ListTag`) set on the user profiles, shared spaces, and SageMaker domain.

```
{
    "Effect": "Allow",
    "Action": [
        "sagemaker:ListTags"
```

```
    ],
    "Resource": [
        "arn:aws:sagemaker:*:*:user-profile/*",
        "arn:aws:sagemaker:*:*:space/*"
    ]
},
{
    "Effect": "Allow",
    "Action": [
        "sagemaker:DescribeUserProfile"
    ],
    "Resource": [
        "arn:aws:sagemaker:*:*:user-profile/*"
    ]
},
{
    "Effect": "Allow",
    "Action": [
        "sagemaker:DescribeSpace"
    ],
    "Resource": [
        "arn:aws:sagemaker:*:*:space/*"
    ]
}
{
    "Effect": "Allow",
    "Action": [
        "sagemaker:DescribeDomain"
    ],
    "Resource": [
        "arn:aws:sagemaker:*:*:domain/*"
    ]
}
```

- *On the IAM role of your AWS Glue session*: Create a new inline policy, and paste the following JSON file. The policy grants your role permission to attach tags (`TagResource`) to your session, or retrieve its list of tags (`GetTags`).

```
{
    "Effect": "Allow",
    "Action": [
        "glue:TagResource",
        "glue:GetTags"
```

```
    ],
    "Resource": [
        "arn:aws:glue:*:*:session/*"
    ]
}
```

Note

- Failures occurring while applying those permissions do not prevent the creation of AWS Glue interactive sessions. You can find details about the reason of the failure in SageMaker Studio Classic CloudWatch logs.
- You must restart the kernel of your AWS Glue interactive session to propagate the update of a tag's value.

It is important to note the following points:

- Once a tag is attached to a session, it cannot be removed by propagation.

  You can remove tags from an AWS Glue interactive session directly through the AWS CLI, the AWS Glue API, or the https://console.aws.amazon.com/sagemaker/. For example, using the AWS CLI, you can remove a tag by providing the session's ARN and the tag keys you want to remove as follows:

  ```
  aws glue untag-resource \
  --resource-arn arn:aws:glue:region:account-id:session:session-name \
  --tags-to-remove tag-key1,tag-key2
  ```

- SageMaker Studio Classic adds two AWS-generated internal tags ((`sagemaker:user-profile-arn` and `sagemaker:domain-arn`) or (`sagemaker:shared-space-arn` and `sagemaker:domain-arn`)) to new AWS Glue interactive sessions created from the Studio Classic UI. Those tags count against the limit of 50 tags set on all AWS resources. Both `sagemaker:user-profile-arn` and `sagemaker:shared-space-arn` contain the domain ID to which they belong.
- Tags keys starting with `aws:`, `AWS:`, or any combination of upper and lowercase letters as a prefix for keys are not propagated and are reserved for AWS use.

Additional information

For more information on tagging, refer to the following resources.

- To learn about adding metadata to your AWS resources with tagging, see Tagging AWS resources.
- For information on tracking costs using tags, see Cost analysis in SageMaker Studio Classic Administration Best Practices.
- For information on controlling access to AWS Glue based on tag keys, see ABAC with AWS Glue.

Launch your AWS Glue interactive session on SageMaker Studio Classic

After you create the roles, policies, and SageMaker domain, you can launch your AWS Glue interactive session in SageMaker Studio Classic.

To launch AWS Glue in SageMaker Studio Classic

1. Create a SageMaker domain. For instructions on how to create a new domain, see Amazon SageMaker domain overview.
2. Sign in to the SageMaker console at https://console.aws.amazon.com/sagemaker/.
3. Select **Control Panel** in the left-side panel.
4. In the **Launch App** dropdown menu next to the user name, select **Studio**.
5. In the Jupyter view, choose **File**, then **New**, then **Notebook**.
6. In the **Image** dropdown menu, select **SparkAnalytics 1.0** or **SparkAnalytics 2.0**. In the **kernel** dropdown menu, select **Glue Spark** or **Glue Python [PySpark and Ray]**. Choose **Select**.
7. (optional) Use Jupyter magics to customize your environment. For more information about Jupyter magics, see Configure your AWS Glue interactive session in SageMaker Studio Classic.
8. Start writing your Spark data processing scripts.

Configure your AWS Glue interactive session in SageMaker Studio Classic

> **Note**
>
> All magic configurations are carried over to subsequent sessions for the lifetime of the AWS Glue kernel.

You can use Jupyter magics in your AWS Glue interactive session to modify your session and configuration parameters. Magics are short commands prefixed with % at the start of Jupyter cells that provide a quick and easy way to help you control your environment. In your AWS Glue interactive session, the following magics are set for you by default:

Magic	Default value
`%glue_version`	3.0
`%iam_role`	*execution role attached to your SageMaker domain*
`%region`	your region

You can use magics to further customize your environment. For example, if you want to change the number of workers allocated to your job from the default five to 10, you can specify `%number_of_workers 10`. If you want to configure your session to stop after 10 minutes of idle time instead of the default 2880, you can specify `%idle_timeout 10`.

All of the Jupyter magics currently available in AWS Glue are also available in SageMaker Studio Classic. For the complete list of AWS Glue magics available, see Configuring AWS Glue interactive sessions for Jupyter and AWS Glue Studio Classic notebooks.

AWS Glue Interactive Session Pricing

When you use AWS Glue Interactive Sessions on SageMaker Studio Classic notebooks, you are charged separately for resource usage on AWS Glue and Studio Classic notebooks.

AWS charges for AWS Glue Interactive Sessions based on how long the session is active and the number of Data Processing Units (DPU) used. You are charged an hourly rate for the number of DPUs used to run your workloads, billed in increments of one second. AWS Glue Interactive Sessions assigns a default of five DPUs and requires a minimum of two DPUs. There is also a one-minute minimum billing duration for each interactive session. To see the AWS Glue rates and pricing examples, or to estimate your costs using the AWS Pricing Calculator, see AWS Glue pricing .

Your SageMaker Studio Classic notebook runs on an Amazon EC2 instance and you are charged for the instance type you choose, based on the duration of use. Studio Classic assigns you a default EC2 instance type of `ml-t3-medium` when you select the `SparkAnalytics` image and associated

kernel. You can change the instance type for of your Studio Classic notebook to suit your workload. For information about SageMaker Studio Classic pricing, see Amazon SageMaker Pricing.

Prepare data with SQL in Studio

Amazon SageMaker Studio provides a built-in SQL extension with which data scientists can perform tasks such as sampling, exploratory analysis, and feature engineering in their JupyterLab notebooks. Using AWS Glue connections as a centralized repository for data source metadata, the extension provides an SQL environment that data scientists can use to browse data catalogs, explore their data, author complex SQL queries, and further process the results in Python.

This section walks through configuring the built-in SQL extension in Studio. It describes the capabilities enabled by the SQL integration and provides instructions for running SQL queries in JupyterLab notebooks.

To enable SQL data analysis, administrators first need to configure AWS Glue connections to select data sources. These connections allow data scientists to seamlessly access authorized datasets from within JupyterLab. With access set up, JupyterLab users can:

- View and browse pre-configured data sources.
- Search, filter, and inspect database information elements such as tables, schemas, and columns.
- Auto-generate the connection parameters to a data source.
- Create complex SQL queries using the syntax-highlighting, auto-completion, and SQL formatting features of the extension's SQL editor.
- Run SQL statements from JupyterLab notebook cells.
- Retrieve the results of SQL queries as pandas DataFrames for further processing, visualization, and other machine learning tasks.

You can access the extension by choosing the

icon in the navigation pane of your JupyterLab application in Studio. Hovering over the icon displays its *Data Discovery* tool tip.

Important

- The JupyterLab image in SageMaker Studio contains the SQL extension by default, starting with SageMaker Distribution 1.6. The extension works with Python and SparkMagic kernels only.
- The extension's user interface for exploring connections and data is only available in JupyterLab within Studio. It is compatible with Amazon Redshift, Amazon Athena, and Snowflake.

- If you are an administrator looking to configure connections to data sources for the SQL extension, follow these steps:
  - Enable the network communication between your Studio domain and the data sources to which you want to connect in the section called "Configure networking (for administrators)".
  - Once this communication is enabled, create the AWS Glue connections to your data sources, and then grant the execution role of your SageMaker domain or user profiles the required permissions in the section called "Create data sources connections (for administrators)".
- If you are a data scientist looking to browse and query your data sources using the SQL extension, ensure that your administrator has configured the connections to your data sources, then follow these steps:
  - Create a private space to launch your JupyterLab application in Studio using the SageMaker distribution image version 1.6 or higher.
  - If you are a user of the SageMaker distribution image version 1.6, load the SQL extension in a JupyterLab notebook by running `%load_ext amazon_sagemaker_sql_magic` in a notebook cell.

    For users of SageMaker distribution image versions 1.7 and later, no action is needed, the SQL extension loads automatically.
  - Familiarize yourself with the capabilities of the SQL extension in the section called "Features overview and usage".

Analyze data in Amazon S3 using SQL in JupyterLab notebooks

Users can analyze data stored in Amazon S3 by running SQL queries from JupyterLab notebooks using the SQL extension. This takes advantage of the integration between the JupyterLab extension and Athena.

This section walks you through the steps to load data from Amazon S3 into Athena and then query that data from JupyterLab using the SQL extension. You will create an Athena data source and AWS Glue crawler to index your Amazon S3 data, configure the proper IAM permissions to enable JupyterLab access to Athena, and connect JupyterLab to Athena to query the data. Following those few steps, you will be able to analyze Amazon S3 data using the SQL extension in JupyterLab notebooks.

Prerequisites

- Sign in to the AWS Management Console using an AWS Identity and Access Management (IAM) user account with admin permissions. For information on how to sign up for an AWS account and create a user with administrative access, see the section called "Amazon SageMaker Prerequisites".
- Have a SageMaker domain and user profile to access SageMaker Studio. For information on how to set a SageMaker environment, see the section called "Quick setup".
- Have an Amazon S3 bucket and folder to store Athena query results, using the same AWS Region and account as your SageMaker environment. For information on how to create a bucket in Amazon S3, see Creating a bucket in the Amazon S3 documentation. You will configure this bucket and folder to be your query output location.

To access and query your data in Amazon S3:

- Step 1: Set up an Athena data source and AWS Glue crawler for your Amazon S3 data
- Step 2: Grant Studio the permissions to access Athena

- Step 3: Enable Athena default connection in JupyterLab
- Step 4: Query data in Amazon S3 from JupyterLab notebooks using the SQL extension

Step 1: Set up an Athena data source and AWS Glue crawler for your Amazon S3 data

Follow these steps to index your data in Amazon S3 and create tables in Athena.

> **Note**
>
> To avoid collisions between table names from different Amazon S3 locations, create a separate data source and crawler for each location. Each data source creates a table named after the folder that contain them unless prefixed.

1. Configure a query result location
   a. Go to the Athena console: https://console.aws.amazon.com/athena/.
   b. From the left menu, choose **Workgroups**.
   c. Follow the link for the `primary` workgroup and choose **Edit**.
   d. In the **Query result configuration** section, enter the Amazon S3 path for your output directory and then choose **Save changes**.
2. Create an Athena data source for your Amazon S3 data
   a. From the left menu in the Athena console, choose **Data sources** and then **Create Data Source**.
   b. Choose **S3 - AWS Glue Data Catalog** and then **Next**.
   c. Leave the default **AWS Glue Data Catalog in this account**, choose **Create a crawler in AWS Glue** and then **Create in AWS Glue**. This opens the AWS Glue console.
3. Use AWS Glue to crawl your data source
   a. Enter a name and a description for your new crawler and then choose **Next**.
   b. Under **Data Sources**, choose **Add a data source**.

i. If the Amazon Amazon S3 bucket containing your data is in a different AWS account than your SageMaker environment, choose **In a different account** for the **Location of the S3 data**.

ii. Enter the path to your dataset in Amazon S3. For example:

```
s3://dsoaws/nyc-taxi-orig-cleaned-split-parquet-per-year-multiple-files/
ride-info/year=2019/
```

iii. Keep all other default values and then choose **Add an Amazon S3 data source**. You should see a new Amazon S3 data source in the data sources table.

iv. Choose **Next**.

c. Configure the IAM role for the crawler to access your data.

> **Note**
>
> Each role is scoped down to the data source you specify. When reusing a role, edit the JSON policy to add any new resource you want to grant access to or create a new role for this data source.

i. Choose **Create new IAM role**.

ii. Enter a name for the role and then choose **Next**.

4. Create or select a database for your tables

a. If you do not have an existing database in Athena, choose **Add database** and then **Create a new database**.

b. Back to your previous crawler creation tab, in **Output configuration**, choose the **Refresh** button. You should now see your newly created database in the list.

c. Select your database, add an optional prefix in **Table name prefix** and then choose **Next**.

> **Note**
>
> For the previous example where your data is located at `s3://dsoaws/nyc-taxi-orig-cleaned-split-parquet-per-year-multiple-files/ride-info/year=2019/`, adding the prefix `taxi-ride-` will create a table named

`taxi-ride-year_2019`. Adding a prefix helps prevent table name collisions when multiple data locations have identically named folders.

5. Choose **Create crawler**.
6. Run your crawler to index your data. Wait for the crawler run to reach a `Completed` status, which may take a few minutes.

To ensure that a new table was created, go to the left menu in AWS Glue and choose **Databases** then **Tables**. You should now see a new table containing your data.

Step 2: Grant Studio the permissions to access Athena

In the following steps you grant the execution role of your user profile permissions to access Athena.

1. Retrieve the ARN of the execution role associated with your user profile
   a. Go to the SageMaker console at https://console.aws.amazon.com/sagemaker/ and choose **Domains** in the left menu.
   b. Follow the name for your domain name.
   c. In the **User profiles** list, follow the name for your user profile.
   d. On the **User details** page, copy the ARN of the execution role.
2. Update the policy of your execution role
   a. Find your AWS region and account ID at the top right of the SageMaker console. Use these values and your database name to update the placeholders in the following JSON policy in a text editor.

```
{
 "Version": "2012-10-17",
 "Statement": [
  {
   "Sid": "GetS3AndDataSourcesMetadata",
   "Effect": "Allow",
   "Action": [
    "glue:GetDatabases",
    "glue:GetSchema",
    "glue:GetTables",
    "s3:ListBucket",
```

```
        "s3:GetObject",
        "s3:GetBucketLocation",
        "glue:GetDatabase",
        "glue:GetTable",
        "glue:ListSchemas",
        "glue:GetPartitions"
       ],
       "Resource": [
        "arn:aws:s3:::*",
        "arn:aws:glue:region:account-id:catalog",
        "arn:aws:glue:region:account-id:database/db-name"
       ]
      },
      {
       "Sid": "ExecuteAthenaQueries",
       "Effect": "Allow",
       "Action": [
        "athena:ListDataCatalogs",
        "athena:ListDatabases",
        "athena:ListTableMetadata",
        "athena:StartQueryExecution",
        "athena:GetQueryExecution",
        "athena:RunQuery",
        "athena:StartSession",
        "athena:GetQueryResults",
        "athena:ListWorkGroups",
        "s3:ListMultipartUploadParts",
        "s3:ListBucket",
        "s3:GetBucketLocation",
        "athena:GetDataCatalog",
        "s3:AbortMultipartUpload",
        "s3:GetObject",
        "s3:PutObject",
        "athena:GetWorkGroup"
       ],
       "Resource": [
        "arn:aws:s3:::*"
       ]
      },
      {
       "Sid": "GetGlueConnectionsAndSecrets",
       "Effect": "Allow",
       "Action": [
        "glue:GetConnections",
```

```
    "glue:GetConnection"
   ],
   "Resource": [
    "*"
   ]
  }
 ]
}
```

b. Go to the IAM console: https://console.aws.amazon.com/iam/ and choose **Roles** in the left menu.

c. Search for your role by role name.

> **Note**
>
> You can retrieve an execution role name from its Amazon Resource Name (ARN) by splitting the ARN on `'/'` and taking the last element. For example, in the following example of an ARN `arn:aws:iam::112233445566:role/SageMakerStudio-SQLExtension-ExecutionRole`, the name of the execution role is `SageMakerStudio-SQLExtension-ExecutionRole`.

d. Follow the link for your role.

e. In the **Permissions** tab, choose **Add permissions** then **Create inline policy**.

f. Choose the `JSON` format in the **Policy editor** section.

g. Copy the policy above and then choose **Next**. Ensure that you have replaced all the `account-id`, `region-name`, and `db-name` with their values.

h. Enter a name for your policy and then choose **Create policy**.

Step 3: Enable Athena default connection in JupyterLab

In the following steps, you enable a `default-athena-connection` in your JupyterLab application. The default Athena connection allows running SQL queries in Athena directly from JupyterLab, without needing to manually create a connection.

To enable the default Athena connection

1. Go to the SageMaker console at https://console.aws.amazon.com/sagemaker/ and choose **Studio** in the left menu. Using your domain and user profile, launch Studio.

2. Choose the JupyterLab application.
3. If you have not created a space for your JupyterLab application, choose **Create a JupyterLab space**. Enter a name for the space, keep the space as **Private**, and then choose **Create space**. Run your space using the latest version of the SageMaker Distribution image.

   Otherwise, choose **Run space** on your space to launch a JupyterLab application.
4. Enable Athena default connection:

   a. In your JupyterLab application, navigate to the **Settings** menu in the top navigation bar and open the **Settings Editor** menu.

   b. Choose **Data Discovery**.

   c. Check the box for **Enable default Athena connection**.

   d. In your JupyterLab application, choose the

   

   icon in the left navigation pane to open the SQL extension.

   e. Choose the **Refresh** button at the bottom of the data discovery panel. You should see a `default-athena-connection` in the list of connections.

Step 4: Query data in Amazon S3 from JupyterLab notebooks using the SQL extension

You are ready to query your data using SQL in your JupyterLab notebooks.

1. Open the connection `default-athena-connection` and then **AWSDataCatalog**.
2. Navigate to your database and choose the three dots icon

   ( )

   on its right. Select **Query in notebook**.

   This automatically populates a notebook cell in JupyterLab with the relevant `%%sm_sql` magic command to connect to the data source. It also adds a sample SQL statement to help you start querying right away.

   > **Note**
   >
   > Ensure to load the extension in the top cell before you run an SQL query.

You can further refine the SQL query using the auto-complete and highlighting features of the extension. See the section called “SQL editor” for more information on using the SQL extension SQL editor.

SQL extension features and usage

This section details the various features of the JupyterLab SQL extension in Studio, and provides instructions on how to use them. Before you can use the SQL extension to access and query data from your JupyterLab notebooks, an administrator must first configure the connection to your data sources. For information on how administrators can create connections to data sources, see the section called “Create data sources connections (for administrators)”.

> **Note**
>
> To use the SQL extension, your JupyterLab application must run on a SageMaker distribution image version 1.6 or higher. These SageMaker images have the extension pre-installed.

The extension provides two components to help you access, discover, query, and analyze data from pre-configured data sources.

- Use the *user interface* of the SQL extension to discover and explore your data sources. The UI capabilities can be further divided into the following subcategories.
  - With the **data exploration** UI element, you can browse your data sources and explore their tables, columns, and metadata. For details on the data exploration features of the SQL extension, see the section called “Data browser”.
  - The **connection caching** element caches connections for quick access. For details on connection caching in the SQL extension, see the section called “Connection caching”.
- Use the *SQL Editor and Executor* to write, edit, and run SQL queries against connected data sources.
  - With the **SQL editor** element, you can write, format, and validate SQL statements within the notebooks of your JupyterLab application in Studio. For details on the SQL editor features, see the section called “SQL editor”.

- With the **SQL execution** element, you can run your SQL queries and visualize their results from the notebooks of your JupyterLab application in Studio. For details on the SQL execution capabilities, see the section called “SQL execution”.

SQL extension data browser

To open the SQL extension user interface (UI), choose the

icon in the navigation pane of your JupyterLab application in Studio. The left panel data discovery view expands and displays all pre-configured data store connections to Amazon Athena, Amazon Redshift, and Snowflake.

From there, you can:

- Expand a specific connection to explore its databases, schemas, tables or views, and columns.
- Search for a specific connection using the search box in the SQL extension UI. The search returns any databases, schemas, tables, or views that partially match the string you enter.

> **Note**
>
> If Athena is already set up in your AWS account, you can enable a `default-athena-connection` in your JupyterLab application. This allows you to run Athena queries without needing to manually create the connection. To enable the default Athena connection:
>
> 1. Check with your administrator that your execution role has the required permissions to access Athena and the AWS Glue catalog. For details on the permissions required, see Configure an AWS Glue connection for Athena
> 2. In your JupyterLab application, navigate to the **Settings** menu in the top navigation bar and open the **Settings Editor** menu.
> 3. Choose **Data Discovery**.
> 4. Check the box for **Enable default Athena connection**.
> 5. You can update the default `primary` WorkGroup if needed.

To query a database, schema, or table in a JupyterLab notebook, from a given connection in the SQL extension pane:

- Choose the three dots icon
  ( )
  on the right side of any database, schema, or table.
- Select **Query in notebook** from the menu.

  This automatically populates a notebook cell in JupyterLab with the relevant `%%sm_sql` magic command to connect to the data source. It also adds a sample SQL statement to help you start querying right away. You can further refine the SQL query using the auto-complete and highlighting features of the extension. See the section called “SQL editor” for more information on using the SQL extension SQL editor.

At the table level, the three dots icon provides the additional option to choose to **Preview** a table's metadata.

The JupyterLab notebook cell content below shows an example of what is automatically generated when selecting the **Query in notebook** menu on a `redshift-connection` data source in the SQL extension pane.

```
%%sm_sql --metastore-id redshift-connection --metastore-type GLUE_CONNECTION

-- Query to list tables from schema 'dev.public'
SHOW TABLES
FROM
  SCHEMA "dev"."public"
```

Use the *less than* symbol
()
at the top of the SQL extension pane to clear the search box or return to the list of your connections.

> **Note**
>
> The extension caches your exploration results for fast access. If the cached results are outdated or a connection is missing from your list, you can manually refresh the cache

by choosing the **Refresh** button at the bottom of the SQL extension panel. For more information on connection caching, see the section called “Connection caching”.

SQL editor

The SQL extension provides magic commands that enable the SQL editor functionalities within your JupyterLab notebook cells.

If you are a user of the SageMaker distribution image version 1.6, you must load the SQL extension magic library by running `%load_ext amazon_sagemaker_sql_magic` in a JupyterLab notebook. This turns on SQL editing features.

For users of SageMaker distribution image versions 1.7 and later, no action is needed, the SQL extension loads automatically.

Once the extension is loaded, add the `%%sm_sql` magic command at the beginning of a cell to activate the following capabilities of the SQL editor.

- **Connection-selection dropdown**: Upon adding an `%%sm_sql` magic command to a cell, a dropdown menu appears at the top of the cell with your available data source connections. Select a connection to automatically fill in the parameters needed to query that data source. The following is an example of an `%%sm_sql` magic command string generated by selecting the connection named `connection-name`.

  ```
  %%sm_sql --metastore-type GLUE_CONNECTION --metastore-id connection-name
  ```

  Use the SQL editor's features below to build your SQL queries, then run the query by running the cell. For more information on the SQL execution capabilities, see the section called “SQL execution”.
- **Query result dropdown**: You can specify how to render query results by selecting a result type from the dropdown menu next to your connection-selection dropdown menu. Choose between the following two alternatives:
  - **Cell Output**: (default) This option displays the result of your query in the notebook cell output area.
  - **Pandas Dataframe**: This option populates a pandas DataFrame with the query results. An extra input box lets you name the DataFrame when you choose this option.

- **SQL syntax highlight**: The cell automatically visually distinguishes SQL keywords, clauses, operators, and more by color and styling. This makes SQL code easier to read and understand. Keywords such as `SELECT`, `FROM`, `WHERE`, and built-in functions such as `SUM` and `COUNT`, or clauses such as `GROUP BY` and more are highlighted in a different color and bold style.
- **SQL formatting**: You can apply consistent indents, capitalization, spacing, and line breaks to group or separate SQL statements and clauses in one of the following ways. This makes SQL code easier to read and understand.
  - Right-click on the SQL cell and choose **Format SQL**.
  - When the SQL cell is in focus, use the *ALT + F* shortcut on Windows or *Option + F* on MacOS.
- **SQL auto-completion**: The extension provides automatic suggestions and completion of SQL keywords, functions, table names, column names, and more as you type. As you start typing an SQL keyword such as `SELECT` or `WHERE`, the extension displays a pop-up with suggestions to auto-complete the rest of the word. For example, when typing table or column names, it suggests matching table and column names defined in the database schema.

> **Important**
>
> To enable SQL auto-completion in JupyterLab notebooks, users of the SageMaker distribution image version 1.6 must run the following `npm install -g vscode-jsonrpc sql-language-server` command in a terminal. After the installation completes, restart the JupyterLab server by running `restart-jupyter-server`. For users of SageMaker distribution image versions 1.7 and later, no action is needed.

The cell offers two methods for auto-completing recognized SQL keywords:

- Explicit invocation (recommended): Choose the **Tab** key to initiate the context-aware suggestion menu, then choose **Enter** to accept the suggested item.
- Continuous hinting: The cell automatically suggests completions as you type.

> **Note**
>
> - Auto-completion is only triggered if the SQL keywords are in uppercase. For instance, entering `SEL` prompts for `SELECT`, but typing `sel` does not.

- The first time you connect to a data source, SQL auto-completion indexes the data source's metadata. This indexing process may take some time to complete depending on the size of your databases.

SQL execution

When a cell with the `%%sm_sql` magic command runs, the SQL extension engine runs the cell's SQL query against the data source defined in the magic command parameters.

Run `%%sm_sql?` to view details about the magic command's parameters and supported formats.

The following sections illustrate the most frequently used cell magic command parameters to run SQL queries inside JupyterLab notebooks.

In particular, you learn about:

- The required parameters to create a simple connection in the section called "Create a simple connection".
- The parameter that saves your query results in a pandas DataFrame in the section called "Save results in a DataFrame".
- How to override or add to connection properties defined by your administrator in the section called "Override connection properties".
- How to the section called "Provide dynamic values in SQL queries".

Important

To use Snowflake, users of the SageMaker distribution image version 1.6 must install the Snowflake Python dependency by running the following `micromamba install snowflake-connector-python -c conda-forge` command in a terminal of their JupyterLab application. Restart the JupyterLab server by running `restart-jupyter-server` in the terminal after the installation is complete.
For SageMaker distribution image versions 1.7 and later, the Snowflake dependency is pre-installed. No action is needed.

Create a simple magic command connection string

If your administrator has configured the connections to your data sources, follow these steps to easily create a connection string in a notebook cell:

1. Open a notebook cell that uses `%%sm_sql`.
2. Select a pre-configured connection to your desired data source from the connection dropdown menu above the cell.
3. This will automatically populate the parameters needed to query that data source.

Alternatively, you can specify connection properties inline in the cell.

Choosing a connection from the dropdown menu inserts the following two parameters into the default magic command string. The parameters contain the connection information your administrator configured.

- `--metastore-id`: The name of the connection object that holds your connection parameters.
- `--metastore-type`: The type of meta-store corresponding to `--metastore-id`. The SQL extension uses AWS Glue connections as a connection meta-store. This value is automatically set to `GLUE_CONNECTION`.

For example, the connection string to a pre-configured Amazon Athena data store looks like the following:

```
%%sm_sql --metastore-id athena-connection-name --metastore-type GLUE_CONNECTION
```

Save SQL query results in a pandas DataFrame

You can store the results of your SQL query in a pandas DataFrame. The easiest way to output query results to a DataFrame is to use the the section called “SQL editor” query-result dropdown and choose the **Pandas dataframe** option.

Alternatively, you can add the parameter `--output '{"format": "DATAFRAME", "dataframe_name": "dataframe_name"}'` to your connection string.

For example, the following query extracts details of customers with the highest balance from the `Customer` table in Snowflake's `TPCH_SF1` database, using both pandas and SQL:

- In this example, we extract all the data from the customer table and save then in a DataFrame named `all_customer_data`.

```
%%sm_sql --output '{"format": "DATAFRAME", "dataframe_name": "all_customer_data"}' --
metastore-id snowflake-connection-name --metastore-type GLUE_CONNECTION
SELECT * FROM SNOWFLAKE_SAMPLE_DATA.TPCH_SF1.CUSTOMER
```

```
Saved results to all_customer_data
```

- Next, we extract the details of the highest account balance from the DataFrame.

```
all_customer_data.loc[all_customer_data['C_ACCTBAL'].idxmax()].values
```

```
array([61453, 'Customer#000061453', 'RxNgWcyl5RZD4qOYnyT3', 15,
'25-819-925-1077', Decimal('9999.99'), 'BUILDING','es. carefully regular requests
 among the blithely pending requests boost slyly alo'],
dtype=object)
```

Override connection properties

Your administrator's predefined connection definitions may not have the exact parameters you need to connect to a specific data store. You can add or override parameters in the connection string by using the `--connection-properties` argument.

The arguments are applied in the following order of precedence:

1. Overridden connection properties provided as inline arguments.
2. Connection properties present in the AWS Secrets Manager.
3. Connection properties in the AWS Glue connection.

If the same connection property is present in all three (command line argument, Secrets Manager, and connection), the value provided in the command line argument takes precedence.

For more information on the available connection properties per data source, see the the section called “Connection parameters”.

The following example illustrates a connection property argument that sets the schema name for Amazon Athena.

```
%%sm_sql --connection-properties '{"schema_name": "athena-db-name"}' --metastore-
id athena-connection-name --metastore-type GLUE_CONNECTION
```

Use query parameters to provide dynamic values in SQL queries

Query parameters can be used to provide dynamic values in SQL queries.

In the following example, we pass a query parameter to the `WHERE` clause of the query.

```
# How to use '--query-parameters' with ATHENA as a data store
%%sm_sql --metastore-id athena-connection-name --metastore-type GLUE_CONNECTION --
query-parameters '{"parameters":{"name_var": "John Smith"}}'
SELECT * FROM my_db.my_schema.my_table WHERE name = (%(name_var)s);
```

SQL extension connection caching

The SQL extension extension defaults to caching connections to prevent the creation of multiple connections for the same set of connection properties. The cached connections can be managed using the `%sm_sql_manage` magic command.

Create cached connections

You can create cached connections by specifying a connection name in the `--connection-name` parameter of your connection string. This is particularly useful when multiple connection properties are overridden for a specific use case, and there's a need to reuse the same properties without retyping them.

For example, the code below saves an Athena connection with an overridden schema connection property using the name `--connection-name my_athena_conn_with_schema`, and then reuses it in another cell:

```
%%sm_sql --connection-name my_athena_conn_with_schema --connection-properties
 '{"schema_name": "sm-sql-private-beta-db"}' --metastore-id sm-sql-private-beta-athena-
connection --metastore-type GLUE_CONNECTION
SELECT * FROM "covid_table" LIMIT 2
```

```
%%sm_sql --connection-name my_athena_conn_with_schema
SELECT * FROM "covid_table" LIMIT 2
```

List cached connections

You can list your cached connections by running the following command:

```
%sm_sql_manage --list-cached-connections
```

Clear cached connections

To clear all cached connections, run the following command:

```
%sm_sql_manage --clear-cached-connections
```

Disable cached connections

To disable connection caching, run the following command:

```
%sm_sql_manage --set-connection-reuse False
```

Configure networking (for administrators)

This section provides information about how administrators can configure their network to allow communication between Amazon SageMaker Studio and Amazon Redshift or Amazon Athena.

The networking instructions vary based on whether the Studio domain and the data store are deployed within a private Amazon Virtual Private Cloud (VPC) or communicate over the internet.

By default, Studio runs in an AWS managed VPC with internet access. When using an internet connection, Studio accesses AWS resources, such as Amazon S3 buckets, over the internet. However, if you have security requirements to control access to your data and job containers, we recommend that you configure Studio and your data store (Amazon Redshift or Athena) so that your data and containers aren't accessible over the internet. To control access to your resources or run Studio without public internet access, you can specify the `VPC only` network access type when you onboard to Amazon SageMaker domain. In this scenario, Studio establishes connections with other AWS services via private VPC endpoints. For information about configuring Studio in `VPC only` mode, see Connect Studio to external resources in a VPC.

> **Note**
>
> To connect to Snowflake, the VPC of the Studio domain must have internet access.

The first two sections describe how to ensure communication between your Studio domain and your data store in VPCs without public internet access. The last section covers how to ensure communication between Studio and your data store using an internet connection. Prior to connecting Studio and your data store without internet access, make sure to establish endpoints for Amazon Simple Storage Service, Amazon Redshift or Athena, SageMaker, and for Amazon CloudWatch and AWS CloudTrail (logging and monitoring).

- If Studio and the data store are in different VPCs, either in the same AWS account or in separate accounts, see Studio and the data store are deployed in separate VPCs.
- If Studio and the data store are in the same VPC, see Studio and the data store are deployed in the same VPC.
- If you chose to connect Studio and the data store over the public internet, see Studio and the data store communicate over public internet.

Studio and the data store are deployed in separate VPCs

To allow communication between Studio and a data store deployed in different VPCs:

1. Start by connecting your VPCs through a VPC peering connection.
2. Update the routing tables in each VPC to allow bidirectional network traffic between Studio subnets and the data store subnets.
3. Configure your security groups to allow inbound and outbound traffic.

The configuration steps are the same whether Studio and the data store are deployed in a single AWS account or across different AWS accounts.

1. **VPC peering**

   Create a VPC peering connection to facilitate the networking between the two VPCs (Studio and the data store).

   a. From the Studio account, on the VPC dashboard, choose **Peering connections**, then **Create peering connection**.

   b. Create your request to peer the Studio VPC with the data store VPC. When requesting peering in another AWS account, choose **Another account** in **Select another VPC to peer with**.

For cross-account peering, the administrator must accept the request from the SQL engine account.

When peering private subnets, you should enable private IP DNS resolution at the VPC peering connection level.

2. **Routing tables**

   Configure the routing to allow network traffic between Studio and data store VPC subnets in both directions.

   After you establish the peering connection, the administrator (on each account for cross account access) can add routes to the private subnet route tables to route the traffic between Studio and the data store VPCs' subnets. You can define those routes by going to the **Route Tables** section of each VPC in the VPC dashboard.

3. **Security groups**

   Lastly, the security group of Studio's domain VPC must allow outbound traffic, and the security group of the data store's VPC must allow inbound traffic on your data store port from Studio's VPC security group.

Studio and the data store are deployed in the same VPC

If Studio and the data store are in different private subnets in the same VPC, add routes in each private subnet's route table. The routes should allow traffic to flow between the Studio subnets and the data store subnets. You can define those routes by going to the **Route Tables** section of each VPC in the VPC dashboard. If you deployed Studio and the data store in the same VPC and the same subnet, you do not need to route the traffic.

Regardless of any routing table updates, the security group of Studio's domain VPC must allow outbound traffic, and the security group of the data store's VPC must allow inbound traffic on its port from Studio's VPC security group.

Studio and the data store communicate over public internet

By default, Studio provides a network interface that allows communication with the internet through an internet gateway in the VPC associated with the Studio domain. If you choose to connect to your data store through the public internet, your data store needs to accept inbound traffic on its port.

A NAT gateway must be used to allow instances in private subnets of multiple VPCs to share a single public IP address provided by the internet gateway when accessing the internet.

> **Note**
>
> Each port opened for inbound traffic represents a potential security risk. Carefully review custom security groups to ensure that you minimize vulnerabilities.

Configure the SQL extension connection to data sources (for administrators)

The JupyterLab SQL extension in Amazon SageMaker Studio uses AWS Glue connections to interact with data sources.

Before data scientists can explore and query data in JupyterLab notebooks using the SQL extension, administrators must first set up AWS Glue connections to the data sources. A connection stores the credentials and parameters needed to connect to a data source. Administrators must then grant the IAM permissions required for Studio's execution role to access the data sources.

Before creating connections, administrators need to ensure their network allows communication between Studio and their data sources. For information on how administrators can set up networking, see the section called “Configure networking (for administrators)”.

This section details how to configure and create an AWS Glue connection. It then provides the IAM permissions required by the execution role used by the JupyterLab application in Amazon SageMaker Studio. This allows the application to access the data source through the connection.

> **Important**
>
> Amazon SageMaker Assets integrates Amazon DataZone with Studio. It includes a SageMaker blueprint that administrators can use to create Studio environments from Amazon DataZone projects within an Amazon DataZone domain.
> Users of a JupyterLab application launched from a Studio domain created with the SageMaker blueprint can automatically access AWS Glue connections to data assets in their Amazon DataZone catalog when using the SQL extension. This lets them query those data sources without manually creating connections.

Topics

Configure AWS Glue connections

To configure data sources for use with the SQL extension, administrators need to create an AWS Glue connection for each data source. These connections store the configuration details that allow accessing and interacting with the data source.

To create these connections:

- First, create a JSON file that defines the connection properties for each data source. The JSON file includes details such as the data source identifier, access credentials, and other relevant configuration parameters to access the data sources through the AWS Glue connections.
- Then use the AWS Command Line Interface (AWS CLI) to create the AWS Glue connection, passing the JSON file as a parameter. The AWS CLI command reads the connection details from the JSON file and establishes the appropriate connection.

> **Note**
>
> The SQL extension supports creating connections using the AWS CLI only.

Before creating AWS Glue connections, ensure that you complete the following steps:

- Install and configure the AWS Command Line Interface (AWS CLI). For more information about how to install and configure the AWS CLI, see About AWS CLI version 2. Ensure that the access keys and tokens of the IAM user or role used to configure the AWS CLI have the required permissions to create AWS Glue connections. Add a policy that allows the `glue:CreateConnection` action otherwise.
- Understand how to use AWS Secrets Manager. We recommend that you use Secrets Manager to provide connection credentials and any other sensitive information for your data store. For more information on using Secrets Manager to store credentials, see Storing connection credentials in AWS Secrets Manager.

Create a connection definition JSON file

To create an AWS Glue connection definition file, create a JSON file to define the connection details on the machine where you have installed and configured the AWS CLI. For this example, name the file `sagemaker-sql-connection.json`.

The connection definition file should follow the following general format:

- **Name** is the name for the connection.
- **Description** is a textual description of the connection.
- **ConnectionType** is the type of connection. Choose `REDSHIFT`, `ATHENA`, or `SNOWFLAKE`.
- **ConnectionProperties** is a map of key-value pairs for the connection properties, such as the ARN of your AWS secret, or the name of your database.

```
{
    "ConnectionInput": {
        "Name": <GLUE_CONNECTION_NAME>,
        "Description": <GLUE_CONNECTION_DESCRIPTION>,
        "ConnectionType": "REDSHIFT | ATHENA | SNOWFLAKE",
        "ConnectionProperties": {
            "PythonProperties": "{\"aws_secret_arn\": <SECRET_ARN>, \"database\":
 <...>}"
        }
    }
}
```

Note

- The properties within the `ConnectionProperties` key consist of stringified key-value pairs. Escape any double quotes used in the keys or values with a backslash (\) character.
- All properties available in Secrets Manager can also be directly provided through `PythonProperties`. However, it is not recommended to include sensitive fields such as passwords in `PythonProperties`. Instead, the preferred approach is to use Secrets Manager.

Connection definition files specific to different data stores can be found in the following sections.

The connection definition files for each data source contain the specific properties and configuration required to connect to those data stores from the SQL extension. Refer to the appropriate section for details on defining connections to that source.

- To create an AWS Glue connection for Amazon Redshift, see the sample definition file in the section called "Configure an AWS Glue connection for Amazon Redshift".
- To create an AWS Glue connection for Amazon Athena, see the sample definition file in the section called "Configure an AWS Glue connection for Athena".
- To create an AWS Glue connection for Snowflake, see the sample definition file in the section called "Configure an AWS Glue connection for Snowflake".

Configure an AWS Glue connection for Amazon Redshift

This section provides details on the secret and connection properties in JSON definition files that are specific to Amazon Redshift. Before creating your connection configuration file, we recommend storing your Amazon Redshift access credentials as a secret in Secrets Manager. Alternatively, you can generate temporary database credentials based on permissions granted through an AWS Identity and Access Management (IAM) permissions policy to manage the access that your users have to your Amazon Redshift database. For more information, see Using IAM authentication to generate database user credentials.

Create a secret for Amazon Redshift access credentials

To store Amazon Redshift information in AWS Secrets Manager

1. From the AWS console, navigate to Secrets Manager.
2. Choose **Store a new secret**.
3. Under **Secret type**, choose **Credentials for Amazon Redshift**.
4. Enter the administrator username and password configured when launching the Amazon Redshift cluster.
5. Select the Amazon Redshift cluster associated with the secrets.
6. Name your secret.
7. The remaining settings can be left at their default values for initial secret creation, or customized if required.
8. Create the secret and retrieve its ARN.

Configure an AWS Glue connection for Amazon Redshift

The SQL extension connects to data sources using custom AWS Glue connections. For general information on creating AWS Glue connections to connect a data source, see the section called "Data sources connection setup". The following example is a sample AWS Glue connection definition for connecting to Amazon Redshift.

Before creating a new connection, keep these recommendations in mind:

- The properties within the `PythonProperties` key consist of stringified key-value pairs. Escape any double quotes used in the keys or values with a backslash (\) character.
- In the connection definition file, enter the name and description of the connection, replace the ARN of the secret in `aws_secret_arn` with the ARN of the secret previously created.
- Ensure that the database declared by its name in the connection definition above matches the cluster database. You can verify this by going to the cluster details page on Amazon Redshift console, and verifying the database name under **Database configurations** in **Properties** section.
- For additional parameters, see the list of connection properties supported by Amazon Redshift in the section called "Amazon Redshift connection parameters".

> **Note**
>
> - By default, the SQL extension connector for Python runs all queries in a transaction, unless the `auto_commit` in connection properties is set to `true`.
> - You can add all connection parameters, including the `database` name, to a secret.

```
{
  "ConnectionInput": {
      "Name": "Redshift connection name",
      "Description": "Redshift connection description",
      "ConnectionType": "REDSHIFT",
      "ConnectionProperties": {
          "PythonProperties":"{\"aws_secret_arn\":
 \"arn:aws:secretsmanager:region:account_id:secret:secret_name\", \"database\":
\"database_name\", \"database_metadata_current_db_only\": false}"
      }
  }
}
```

Once your definition file is updated, follow the steps in the section called "Create a AWS Glue connection" to create your AWS Glue connection.

Configure an AWS Glue connection for Athena

This section provides details on the connection properties in JSON definition files that are specific to Athena.

Configure an AWS Glue connection for Athena

The SQL extension connects to data sources using custom AWS Glue connections. For general information on creating AWS Glue connections to connect a data source, see the section called "Data sources connection setup". The following example is a sample AWS Glue connection definition for connecting to Athena.

Before creating a new connection, keep these recommendations in mind:

- The properties within the `ConnectionProperties` key consist of stringified key-value pairs. Escape any double quotes used in the keys or values with a backslash (\) character.
- In the connection definition file, enter the name and description of the connection, replace the `catalog_name` with the name of your catalog, `s3_staging_dir` with the Amazon S3 URI (Uniform Resource Identifier) of your output directory in your Amazon S3 bucket, and the `region_name` with the region of your Amazon S3 bucket.
- For additional parameters, refer to the list of connection properties supported by Athena in the section called "Athena connection parameters".

> **Note**
>
> - You can add all connection parameters, including the `catalog_name` or `s3_staging_dir`, to a secret.
> - If you specify a `workgroup`, you don't need to specify `s3_staging_dir`.

```
{
    "ConnectionInput": {
        "Name": "Athena connection name",
        "Description": "Athena connection description",
        "ConnectionType": "ATHENA",
        "ConnectionProperties": {
```

```
            "PythonProperties": "{\"catalog_name\": \"catalog_name\",\"s3_staging_dir
\": \"s3://bucket_name_in_same_region/output_query_results_dir/\", \"region_name\":
 \"region\"}"
        }
    }
}
```

Once your definition file is updated, follow the steps in the section called "Create a AWS Glue connection" to create your AWS Glue connection.

Configure an AWS Glue connection for Snowflake

This section provides details on the secret and connection properties in JSON definition files that are specific to Snowflake. Before creating your connection configuration file, we recommend storing your Snowflake access credentials as a secret in Secrets Manager.

Create a secret for Snowflake access credentials

To store Amazon Redshift information in Secrets Manager

1. From the AWS console, navigate to Secrets Manager.
2. Choose **Store a new secret**.
3. Under **Secret type**, choose **Other type of secret**.
4. In the key-value pair, choose **Plaintext**, and then copy the following JSON content. Replace the `user`, `password`, and `account` by their values.

   ```
   {
       "user":"snowflake_user",
       "password":"snowflake_password",
       "account":"account_id"
   }
   ```

5. Name the secret.
6. The remaining settings can be left at their default values for initial secret creation, or customized if required.
7. Create the secret and retrieve its ARN.

Configure an AWS Glue connection for Snowflake

The SQL extension connects to data sources using custom AWS Glue connections. For general information on creating AWS Glue connections to connect a data source, see the section called "Data sources connection setup". The following example is a sample AWS Glue connection definition for connecting to Snowflake.

Before creating a new connection, keep these recommendations in mind:

- The properties within the `ConnectionProperties` key consist of stringified key-value pairs. Escape any double quotes used in the keys or values with a backslash (\) character.
- In the connection definition file, enter the name and description of the connection, then replace the ARN of the secret in `aws_secret_arn` with the ARN of the secret previously created, and your account ID in `account`.
- For additional parameters, refer to the list of connection properties supported by Snowflake in the section called "Snowflake connection parameters".

> **Note**
>
> You can add all connection parameters, including the `account`, to a secret.

```
{
    "ConnectionInput": {
        "Name": "Snowflake connection name",
        "Description": "Snowflake connection description",
        "ConnectionType": "SNOWFLAKE",
        "ConnectionProperties": {
            "PythonProperties":  "{\"aws_secret_arn\":
 \"arn:aws:secretsmanager:region:account_id:secret:secret_name\", \"account\":
\"account_id\"}"}"
        }
    }
}
```

Once your definition file is updated, follow the steps in the section called "Create a AWS Glue connection" to create your AWS Glue connection.

Create AWS Glue connections

To create an AWS Glue connection through the AWS CLI, use your connection definition file and run this AWS CLI command. Replace the `region` placeholder with your AWS Region name and provide the local path to your definition file.

> **Note**
>
> The path to your configuration definition file must be preceded by `file://`.

```
aws --region region glue create-connection --cli-input-json file://path_to_file/
sagemaker-sql-connection.json
```

Verify that the AWS Glue connection was created by running the following command and check for your connection name.

```
aws --region region glue get-connections
```

Alternatively, you can update an existing AWS Glue connection as follows:

- Modify the AWS Glue connection definition file as required.
- Run the following command to update the connection.

```
aws --region region glue update-connection --name glue_connection_name --cli-input-
json file://path_to_file/sagemaker-sql-connection.json
```

Set up the IAM permissions to access the data sources

To give the SageMaker execution role used by your JupyterLab application in Studio access to a data source through an AWS Glue connection, attach the following inline policy to the role.

To view the permissions for each data store or authentication method, see the relevant sections below.

> **Note**
>
> We recommend limiting your policy's permissions to only the resources and actions required.

To scope down policies and grant least privilege access, replace wildcard `"Resource": ["*"]` in your policy with specific ARNs for the exact resources needing access. For more information about how to control access to your resources, see the section called “Fine-tune AWS resource access with granular ARN permissions”.

All connection types

Note

We strongly recommend scoping down this policy to only the actions and resources required.

}
}
```

Fine-tune AWS resource access with granular ARN permissions

For finer-grained control over access to your AWS resources, replace the wildcard resource `"Resource": ["*"]` in your policies with the specific Amazon Resource Names (ARNs) of only those resources that require access. Using the exact ARNs rather than a wildcard restricts access to the intended resources.

- **Use specific Amazon S3 bucket ARNs**

  For example `"arn:aws:s3:::bucket-name"` or `"arn:aws:s3:::bucket-name/*"` for bucket-level or object-level operations.

  For information about all resource types in Amazon S3, see Resource types defined by Amazon S3.
- **Use specific AWS Glue database ARNs**

  For example `"arn:aws:glue:region:account-id:catalog"` or `"arn:aws:glue:region:account-id:database/db-name"`. For information about all resource types in AWS Glue, see Resource types defined by AWS Glue.
- **Use specific Athena workgroup ARNs**

  For example `"arn:aws:athena:region:account-id:workgroup/workgroup-name"`. For information about all resource types in Athena, see Resource types defined by Athena.
- **Use specific AWS Secrets Manager secret ARNs**

  For example `"arn:aws:secretsmanager:region:account-id:secret:secret-name"`. For information about all resource types in AWS Secrets Manager, see Resource types defined by AWS Secrets Manager
- **Use specific Amazon Redshift cluster ARNs**

For example "arn:aws:redshift:region:account-id:cluster:cluster-name". For information about resource types in Amazon Redshift, see Resource types defined by Amazon Redshift. For information about all resource types in Redshift Serverless, see Resource types defined by Redshift Serverless.

Frequently asked questions

The following FAQs answer common general questions.

Q: Where do I find the logs for the SQL extension?

A: The SQL extension writes its log in the general log file of your JupyterLab application in Studio. You can find those logs at `/var/log/apps/app_container.log`.

Q: I am getting an error: "UsageError: Cell magic `%%sm_sql` not found."

A: Create a new cell and load the extension again using `%load_ext amazon_sagemaker_sql_magic`.

Q: How do I list the various parameters of my `%%sm_sql` command?

A: Use `%%sm_sql?` to get the help content of the command.

Q: I cannot see the data discovery view on the right side panel.

A: Ensure that your space uses a SageMaker distribution image version 1.6 or higher. These SageMaker images come pre-installed with the extension.

If you updated the image of your JupyterLab application space in Studio, refresh your browser.

Q: The right panel does not accurately reflect the AWS Glue connections configured.

A: Try refreshing the right panel using the **Refresh** button in the bottom right corner of the SQL extension UI in your notebook.

Q: SQL statements do not run as expected or run incorrectly.

A: Try clearing the cached connections by running the following magic command `%sm_sql_manage --clear-cached-connections`.

Q: I am getting an error: "Actual statement count 2 did not match the desired statement count 1."

A: The SQL extension only supports running one SQL query at a time.

Snowflake FAQs

The following FAQs answer common general questions for users of the SQL extension using Snowflake as their data source.

Q: I am getting an error: "No active warehouse selected in the current session." Select an active warehouse with the 'use warehouse' command.

A: This can happen if the default warehouse for a user is not selected. Run the command `USE WAREHOUSE` *`warehouse_name`* for each session.

Q: I am getting an error: "object '*foo*' does not exist or not authorized."

A: Ensure that your Snowflake user has access to the given object.

Connection parameters

The following lists detail the supported Python properties for AWS Glue connections per data store.

Amazon Redshift connection parameters

The following Python connection parameters are supported by AWS Glue connections to Amazon Redshift.

Key	Type	Description	Constraints	Required
`auto_create`	Type: `boolean`	Indicates whether the user should be created if they do not exist. Defaults to `false`.	`true`, `false`	No

Key	Type	Description	Constraints	Required
aws_secret_arn	Type: string	The ARN of the secret used to retrieve the additional parameters for the connection.	Valid ARN	No
cluster_identifier	Type: string - maxLength: 63	The cluster identifier of the Amazon Redshift cluster.	^(?!.*—)[a-z][a-z0-9-]{0,61}[a-z0-9]$	No
database	Type: string - maxLength: 127	The name of the database to connect to.		No
database_metadata_current_db_only	Type: boolean	Indicates if the application supports multi-database datashare catalogs. Defaults to true to indicate that the application does not support multi-database datashare catalogs for backwards compatibility.	true, false	No

Key	Type	Description	Constraints	Required
db_groups	Type: string	A comma-separated list of existing database group names that the db_user joins for the current session.		No
db_user	Type: string	The user ID to use with Amazon Redshift.		No
host	Type: string - maxLength: 256	The hostname of the Amazon Redshift cluster.		No
iam	Type: boolean	Flag to enable or disable IAM based authentication for a connection. Defaults to false.	true, false	No

Key	Type	Description	Constraints	Required
`iam_disable_cache`	Type: `boolean`	This option specifies whether the IAM credentials are cached. Defaults to `true`. This improves performance when requests to the API gateway are throttled.	`true`, `false`	No
`max_prepared_statements`	Type: `integer`	The maximum number of prepared statements that can be open at once.		No

Key	Type	Description	Constraints	Required
`numeric_to_float`	Decimal to float	Specifies if `NUMERIC` datatype values will be converted from decimal. By default `NUMERIC` values are received as `decimal.Decimal` Python objects. Enabling this option is not recommended for use cases which prefer the most precision as results may be rounded. Please reference the Python documentation on `decimal.Decimal` to understand the tradeoffs between `decimal.Decimal` and `float` before enabling this option. Defaults to `false`.	`true`, `false`	No

Key	Type	Description	Constraints	Required
`port`	Type: `integer`	The port number of the Amazon Redshift cluster.	Range 1150-65535	No
`profile`	Type: `string` - maxLength: 256	The name of the profile containin g the credentials and setting used by the AWS CLI.		No
`region`	Type: `string`	The AWS Region where the cluster is located.	Valid AWS Region	No
`serverles s_acct_id`	Type: `string` - maxLength: 256	The AWS account ID that is associate d with the Amazon Redshift serverless resource.		No
`serverles s_work_gr oup`	Type: `string` - maxLength: 256	The name of the work group for the Amazon Redshift serverless endpoint.		No
`ssl`	Type: `boolean`	`true` if SSL is enabled.	`true`, `false`	No

Key	Type	Description	Constraints	Required
`ssl_mode`	Type: enum[`verify-ca` , `verify-full` , null])	The security of the connection to Amazon Redshift. `verify-ca` (SSL must be used and the server certificate must be verified.) and `verify-full` (SSL must be used. The server certificate must be verified and the server hostname must match the hostname attribute on the certificate.) are supported. For more information, see Configuring security options for connections in Amazon Redshift documentation. Defaults to `verify-ca` .	`verify-ca` , `verify-full`	No

Key	Type	Description	Constraints	Required
`timeout`	Type: `integer`	The number of seconds before the connectio n to the server times out.	0	No

Athena connection parameters

The following Python connection parameters are supported by AWS Glue connections to Athena.

Key	Type	Description	Constraints	Required
`aws_acces s_key_id`	Type: `string` - maxLength: 256	Specifies an AWS access key associated with an IAM account. We recommend storing this information in the `aws_secre t` .	Length 16-128	No
`aws_secre t_access_ key`	Type: `string` - maxLength: 256	Secret part of an AWS access key. We recommend storing this information in the `aws_secre t` .		No
`aws_secre t_arn`	Type: `string`	The ARN of the secret used to retrieve the additional	Valid ARN	No

Key	Type	Description	Constraints	Required
		parameters for the connection.		
`catalog_name`	Type: `string` - maxLength: 256	The catalog that contains the databases and the tables that are accessed with the driver. For information about catalogs, see DataCatalog.		No
`duration_seconds`	Type: `number`	The duration, in seconds, of the role session. This setting can have a value from 1 hour to 12 hours. By default the duration is set to 3600 seconds (1 hour).	Range from 900 seconds (15 minutes) up to the maximum session duration setting for the role	No
`encryption_option`	Type: enum[`SSE_S3`, `SSE_KMS`, `CSE_KMS`, null])	Encryption at rest for Amazon S3. See the *Encryption at rest* section in Athena guide.	`SSE_S3`, `SSE_KMS`, `CSE_KMS`	No
`kms_key`	Type: `string` - maxLength: 256	AWS KMS key if using `CSE_KMS` in `encryption_option` .		No

Key	Type	Description	Constraints	Required
`poll_interval`	Type: `number`	Interval in seconds to poll the status of query results in Athena.		No
`profile_name`	Type: `string` - maxLength: 256	The name of the AWS configuration profile whose credentials should be used to authenticate the request to Athena.		No
`region_name`	Type: `string`	The AWS Region where queries are run.	Valid AWS Region	No
`result_reuse_enable`	Type: `boolean`	Enable the reuse of previous query result.	`true`, `false`	No
`result_reuse_minutes`	Type: `integer`	Specifies, in minutes, the maximum age of a previous query result that Athena should consider for reuse. The default is 60.	>= 1	No

Key	Type	Description	Constraints	Required
role_arn	Type: string	Role to be used for running queries.	Valid ARN	No
schema_name	Type: string - maxLength: 256	Name of the default schema to use for the database.		No
s3_staging_dir	Type: string - maxLength: 1024	The location in Amazon S3 where the query results are stored.		Either s3_staging_dir or work_group is required
work_group	Type: string	The workgroup in which queries will run. For information about workgroups, see WorkGroup.	^[a-zA-Z0-9._-]{1,128}$	Either s3_staging_dir or work_group is required

Snowflake connection parameters

The following Python connection parameters are supported by AWS Glue connections to Snowflake.

Snowflake connection parameters

Key	Type	Description	Constraints	Required
account	Type: string - maxLength: 256	The Snowflake account identifier. The account identifier does		Yes

Key	Type	Description	Constraints	Required
		not include the `snowflakecomputing.com` suffix.		
`arrow_number_to_decimal`	Type: `boolean`	False by default, which means that NUMBER column values are returned as double-precision floating point numbers (`float64`). Set this to True to return DECIMAL column values as decimal numbers (`decimal.Decimal`) when calling the `fetch_pandas_all()` and `fetch_pandas_batches()` methods.	`true`, `false`	No

Key	Type	Description	Constraints	Required
`autocommit`	Type: `boolean`	Defaults to `false`, which honors the Snowflake parameter `AUTOCOMMIT`. Set to `true` or `false` to enable or disable the `autocommit` mode in the session, respectively.	`true`, `false`	No
`aws_secret_arn`	Type: `string`	The ARN of the secret used to retrieve the additional parameters for the connection.	Valid ARN	No
`client_prefetch_threads`	Type: `integer`	The number of threads used to download the result sets (4 by default). Increasing the value improves the fetch performance but requires more memory.		No

Key	Type	Description	Constraints	Required
`database`	Type: `string` - maxLength: 256	The name of the default database to use.		No
`login_timeout`	Type: `integer`	The timeout in seconds for the login request. Defaults to 60 seconds. The login request gives up after the timeout length if the HTTP response is not `success`.		No
`network_timeout`	Type: `integer`	The timeout in seconds for all other operations. Defaults to none (infinite). A general request gives up after the timeout length if the HTTP response is not `success`.		No

Key	Type	Description	Constraints	Required
`paramstyle`	Type: `string` - maxLength: 256	Placeholder syntaxes used for parameter substitution when executing SQL queries from Python code. Defaults to `pyformat` for client side binding. Specify `qmark` or `numeric` to change the bind variable formats for server side binding.		No
`role`	Type: `string` - maxLength: 256	The name of the default role to use.		No
`schema`	Type: `string` - maxLength: 256	The name of the default schema to use for the database.		No

Key	Type	Description	Constraints	Required
`timezone`	Type: `string` - maxLength: 128	None by default, which honors the Snowflake parameter `TIMEZONE`. Set to a valid time zone (such as `America/Los_Angeles`) to set the session time zone.	Timezone in a format similar to `America/Los_Angeles`	No
`validate_default_parameters`	Type: `boolean`	Set to `true` to raise an exception if the specified database, schema, or warehouse doesn't exist. Defaults to `false`.		No
`warehouse`	Type: `string` - maxLength: 256	The name of the default warehouse to use.		No

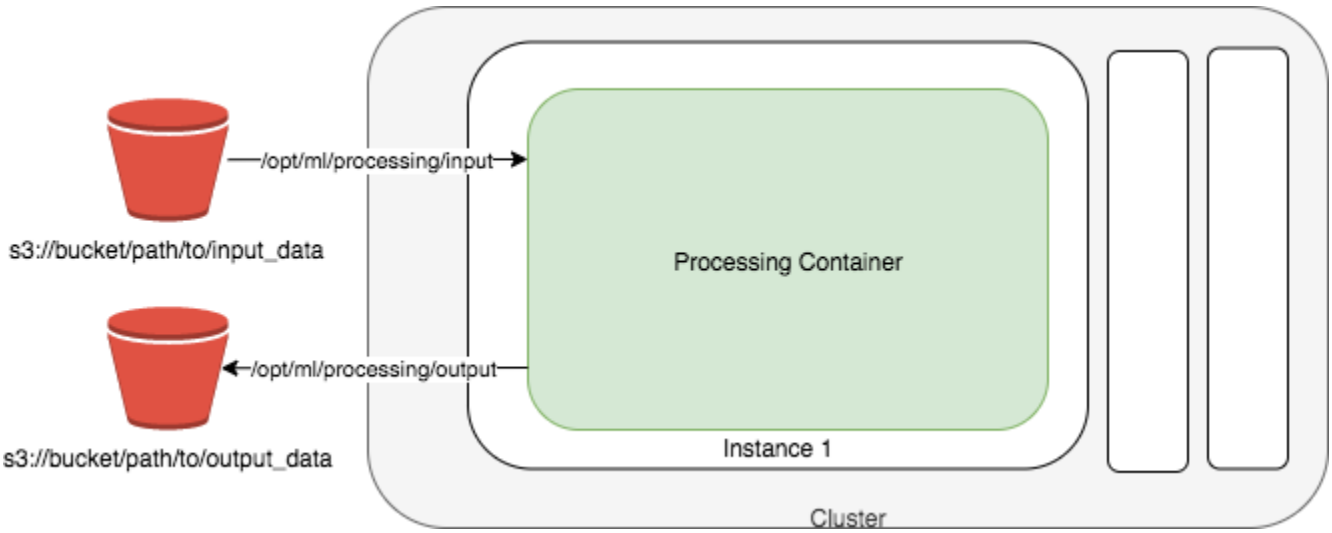
Process data

SageMaker Processing refers to SageMaker's capabilities to run data pre and post processing, feature engineering, and model evaluation tasks on SageMaker's fully-managed infrastructure. These tasks are executed as processing jobs. Using SageMaker Processing API, data scientists can run scripts and notebooks to process, transform, and analyze datasets to prepare them for machine learning. When combined with the other critical machine learning tasks provided by SageMaker, such as training and hosting, Processing provides you with the benefits of a fully managed machine learning environment, including all the security and compliance support built into SageMaker. You have the flexibility to use the built-in data processing containers or to bring your own containers for custom processing logic and then submit jobs to run on SageMaker managed infrastructure.

> **Note**
>
> You can create a processing job programmatically by calling the CreateProcessingJob API action in any language supported by SageMaker or by using the AWS CLI. For information on how this API action translates into a function in the language of your choice, see the See Also section of CreateProcessingJob and choose an SDK. As an example, for Python users, refer to the Amazon SageMaker Processing section of SageMaker Python SDK. Alternatively, see the full request syntax of create_processing_job in the AWS SDK for Python (Boto3).

The following diagram shows how Amazon SageMaker spins up a Processing job. Amazon SageMaker takes your script, copies your data from Amazon Simple Storage Service (Amazon S3), and then pulls a processing container. The underlying infrastructure for a Processing job is fully managed by Amazon SageMaker. After you submit a processing job, SageMaker launches the compute instances, processes and analyzes the input data, and releases the resources upon completion. The output of the Processing job is stored in the Amazon S3 bucket you specified.

> **Note**
>
> Your input data must be stored in an Amazon S3 bucket. Alternatively, you can use Amazon Athena or Amazon Redshift as input sources.



Tip

To learn best practices for distributed computing of machine learning (ML) training and processing jobs in general, see Distributed computing with SageMaker best practices.

Use Amazon SageMaker Processing Sample Notebooks

We provide two sample Jupyter notebooks that show how to perform data preprocessing, model evaluation, or both.

For a sample notebook that shows how to run scikit-learn scripts to perform data preprocessing and model training and evaluation with the SageMaker Python SDK for Processing, see scikit-learn Processing. This notebook also shows how to use your own custom container to run processing workloads with your Python libraries and other specific dependencies.

For a sample notebook that shows how to use Amazon SageMaker Processing to perform distributed data preprocessing with Spark, see Distributed Processing (Spark). This notebook also shows how to train a regression model using XGBoost on the preprocessed dataset.

For instructions on how to create and access Jupyter notebook instances that you can use to run these samples in SageMaker, see Amazon SageMaker Notebook Instances. After you have created a notebook instance and opened it, choose the **SageMaker Examples** tab to see a list of all the SageMaker samples. To open a notebook, choose its **Use** tab and choose **Create copy**.

Monitor Amazon SageMaker Processing Jobs with CloudWatch Logs and Metrics

Amazon SageMaker Processing provides Amazon CloudWatch logs and metrics to monitor processing jobs. CloudWatch provides CPU, GPU, memory, GPU memory, and disk metrics, and event logging. For more information, see Monitor Amazon SageMaker with Amazon CloudWatch and Log Amazon SageMaker Events with Amazon CloudWatch.

Data Processing with Apache Spark

Apache Spark is a unified analytics engine for large-scale data processing. Amazon SageMaker provides prebuilt Docker images that include Apache Spark and other dependencies needed to run distributed data processing jobs. With the Amazon SageMaker Python SDK, you can easily apply data transformations and extract features (feature engineering) using the Spark framework. For information about using the SageMaker Python SDK to run Spark processing jobs, see Data Processing with Spark in the Amazon SageMaker Python SDK.

A code repository that contains the source code and Dockerfiles for the Spark images is available on GitHub.

Running a Spark Processing Job

You can use the `sagemaker.spark.PySparkProcessor` or `sagemaker.spark.SparkJarProcessor` class to run your Spark application inside of a processing job. Note you can set MaxRuntimeInSeconds to a maximum runtime limit of 5 days. With respect to execution time, and number of instances used, simple spark workloads see a near linear relationship between the number of instances vs. time to completion.

The following code example shows how to run a processing job that invokes your PySpark script `preprocess.py`.

```
from sagemaker.spark.processing import PySparkProcessor

spark_processor = PySparkProcessor(
    base_job_name="spark-preprocessor",
    framework_version="2.4",
    role=role,
    instance_count=2,
```

```
    instance_type="ml.m5.xlarge",
    max_runtime_in_seconds=1200,
)

spark_processor.run(
    submit_app="preprocess.py",
    arguments=['s3_input_bucket', bucket,
               's3_input_key_prefix', input_prefix,
               's3_output_bucket', bucket,
               's3_output_key_prefix', output_prefix]
)
```

For an in-depth look, see the Distributed Data Processing with Apache Spark and SageMaker Processing example notebook.

If you are not using the Amazon SageMaker Python SDK and one of its Processor classes to retrieve the pre-built images, you can retrieve these images yourself. The SageMaker prebuilt Docker images are stored in Amazon Elastic Container Registry (Amazon ECR). For a complete list of the available pre-built Docker images, see the available images document.

To learn more about using the SageMaker Python SDK with Processing containers, see Amazon SageMaker Python SDK.

Data Processing with scikit-learn

For a sample notebook that shows how to run scikit-learn scripts using a Docker image provided and maintained by SageMaker to preprocess data and evaluate models, see scikit-learn Processing. To use this notebook, you need to install the SageMaker Python SDK for Processing.

This notebook runs a processing job using `SKLearnProcessor` class from the the SageMaker Python SDK to run a scikit-learn script that you provide. The script preprocesses data, trains a model using a SageMaker training job, and then runs a processing job to evaluate the trained model. The processing job estimates how the model is expected to perform in production.

To learn more about using the SageMaker Python SDK with Processing containers, see the SageMaker Python SDK. For a complete list of pre-built Docker images available for processing jobs, see Docker Registry Paths and Example Code.

The following code example shows how the notebook uses `SKLearnProcessor` to run your own scikit-learn script using a Docker image provided and maintained by SageMaker, instead of your own Docker image.

```
from sagemaker.sklearn.processing import SKLearnProcessor
from sagemaker.processing import ProcessingInput, ProcessingOutput

sklearn_processor = SKLearnProcessor(framework_version='0.20.0',
                                     role=role,
                                     instance_type='ml.m5.xlarge',
                                     instance_count=1)

sklearn_processor.run(code='preprocessing.py',
                      inputs=[ProcessingInput(
                        source='s3://path/to/my/input-data.csv',
                        destination='/opt/ml/processing/input')],
                      outputs=[ProcessingOutput(source='/opt/ml/processing/output/
train'),
                               ProcessingOutput(source='/opt/ml/processing/output/
validation'),
                               ProcessingOutput(source='/opt/ml/processing/output/
test')]
                     )
```

To process data in parallel using Scikit-Learn on Amazon SageMaker Processing, you can shard input objects by S3 key by setting `s3_data_distribution_type='ShardedByS3Key'` inside a `ProcessingInput` so that each instance receives about the same number of input objects.

Data Processing with Framework Processors

A `FrameworkProcessor` can run Processing jobs with a specified machine learning framework, providing you with an Amazon SageMaker–managed container for whichever machine learning framework you choose. `FrameworkProcessor` provides premade containers for the following machine learning frameworks: Hugging Face, MXNet, PyTorch, TensorFlow, and XGBoost.

The `FrameworkProcessor` class also provides you with customization over the container configuration. The `FrameworkProcessor` class supports specifying a source directory `source_dir` for your processing scripts and dependencies. With this capability, you can give the processor access to multiple scripts in a directory instead of only specifying one script. `FrameworkProcessor` also supports including a `requirements.txt` file in the `source_dir` for customizing the Python libraries to install in the container.

For more information on the `FrameworkProcessor` class and its methods and parameters, see FrameworkProcessor in the *Amazon SageMaker Python SDK*.

To see examples of using a `FrameworkProcessor` for each of the supported machine learning frameworks, see the following topics.

Topics

Hugging Face Framework Processor

Hugging Face is an open-source provider of natural language processing (NLP) models. The `HuggingFaceProcessor` in the Amazon SageMaker Python SDK provides you with the ability to run processing jobs with Hugging Face scripts. When you use the `HuggingFaceProcessor`, you can leverage an Amazon-built Docker container with a managed Hugging Face environment so that you don't need to bring your own container.

The following code example shows how you can use the `HuggingFaceProcessor` to run your Processing job using a Docker image provided and maintained by SageMaker. Note that when you run the job, you can specify a directory containing your scripts and dependencies in the `source_dir` argument, and you can have a `requirements.txt` file located inside your `source_dir` directory that specifies the dependencies for your processing script(s). SageMaker Processing installs the dependencies in `requirements.txt` in the container for you.

```
from sagemaker.huggingface import HuggingFaceProcessor
from sagemaker.processing import ProcessingInput, ProcessingOutput
from sagemaker import get_execution_role

#Initialize the HuggingFaceProcessor
hfp = HuggingFaceProcessor(
    role=get_execution_role(),
    instance_count=1,
    instance_type='ml.g4dn.xlarge',
    transformers_version='4.4.2',
    pytorch_version='1.6.0',
    base_job_name='frameworkprocessor-hf'
)
```

```
#Run the processing job
hfp.run(
    code='processing-script.py',
    source_dir='scripts',
    inputs=[
        ProcessingInput(
            input_name='data',
            source=f's3://{BUCKET}/{S3_INPUT_PATH}',
            destination='/opt/ml/processing/input/data/'
        )
    ],
    outputs=[
        ProcessingOutput(output_name='train', source='/opt/ml/processing/output/
train/', destination=f's3://{BUCKET}/{S3_OUTPUT_PATH}'),
        ProcessingOutput(output_name='test', source='/opt/ml/processing/output/test/',
 destination=f's3://{BUCKET}/{S3_OUTPUT_PATH}'),
        ProcessingOutput(output_name='val', source='/opt/ml/processing/output/val/',
 destination=f's3://{BUCKET}/{S3_OUTPUT_PATH}')
    ]
)
```

If you have a `requirements.txt` file, it should be a list of libraries you want to install in the container. The path for `source_dir` can be a relative, absolute, or Amazon S3 URI path. However, if you use an Amazon S3 URI, then it must point to a tar.gz file. You can have multiple scripts in the directory you specify for `source_dir`. To learn more about the `HuggingFaceProcessor` class, see Hugging Face Estimator in the *Amazon SageMaker Python SDK*.

MXNet Framework Processor

Apache MXNet is an open-source deep learning framework commonly used for training and deploying neural networks. The `MXNetProcessor` in the Amazon SageMaker Python SDK provides you with the ability to run processing jobs with MXNet scripts. When you use the `MXNetProcessor`, you can leverage an Amazon-built Docker container with a managed MXNet environment so that you don't need to bring your own container.

The following code example shows how you can use the `MXNetProcessor` to run your Processing job using a Docker image provided and maintained by SageMaker. Note that when you run the job, you can specify a directory containing your scripts and dependencies in the `source_dir` argument, and you can have a `requirements.txt` file located inside your `source_dir` directory

that specifies the dependencies for your processing script(s). SageMaker Processing installs the dependencies in `requirements.txt` in the container for you.

```
from sagemaker.mxnet import MXNetProcessor
from sagemaker.processing import ProcessingInput, ProcessingOutput
from sagemaker import get_execution_role

#Initialize the MXNetProcessor
mxp = MXNetProcessor(
    framework_version='1.8.0',
    py_version='py37',
    role=get_execution_role(),
    instance_count=1,
    instance_type='ml.c5.xlarge',
    base_job_name='frameworkprocessor-mxnet'
)

#Run the processing job
mxp.run(
    code='processing-script.py',
    source_dir='scripts',
    inputs=[
        ProcessingInput(
            input_name='data',
            source=f's3://{BUCKET}/{S3_INPUT_PATH}',
            destination='/opt/ml/processing/input/data/'
        )
    ],
    outputs=[
        ProcessingOutput(
            output_name='processed_data',
            source='/opt/ml/processing/output/',
            destination=f's3://{BUCKET}/{S3_OUTPUT_PATH}'
        )
    ]
)
```

If you have a `requirements.txt` file, it should be a list of libraries you want to install in the container. The path for `source_dir` can be a relative, absolute, or Amazon S3 URI path. However, if you use an Amazon S3 URI, then it must point to a tar.gz file. You can have multiple scripts in the directory you specify for `source_dir`. To learn more about the `MXNetProcessor` class, see MXNet Estimator in the *Amazon SageMaker Python SDK*.

PyTorch Framework Processor

PyTorch is an open-source machine learning framework. The `PyTorchProcessor` in the Amazon SageMaker Python SDK provides you with the ability to run processing jobs with PyTorch scripts. When you use the `PyTorchProcessor`, you can leverage an Amazon-built Docker container with a managed PyTorch environment so that you don't need to bring your own container.

The following code example shows how you can use the `PyTorchProcessor` to run your Processing job using a Docker image provided and maintained by SageMaker. Note that when you run the job, you can specify a directory containing your scripts and dependencies in the `source_dir` argument, and you can have a `requirements.txt` file located inside your `source_dir` directory that specifies the dependencies for your processing script(s). SageMaker Processing installs the dependencies in `requirements.txt` in the container for you.

For the PyTorch versions supported by SageMaker, see the available Deep Learning Container images.

```
from sagemaker.pytorch.processing import PyTorchProcessor
from sagemaker.processing import ProcessingInput, ProcessingOutput
from sagemaker import get_execution_role

#Initialize the PyTorchProcessor
pytorch_processor = PyTorchProcessor(
    framework_version='1.8',
    role=get_execution_role(),
    instance_type='ml.m5.xlarge',
    instance_count=1,
    base_job_name='frameworkprocessor-PT'
)

#Run the processing job
pytorch_processor.run(
    code='processing-script.py',
    source_dir='scripts',
    inputs=[
        ProcessingInput(
            input_name='data',
            source=f's3://{BUCKET}/{S3_INPUT_PATH}',
            destination='/opt/ml/processing/input'
        )
    ],
    outputs=[
```

```
        ProcessingOutput(output_name='data_structured', source='/opt/ml/processing/tmp/
data_structured', destination=f's3://{BUCKET}/{S3_OUTPUT_PATH}'),
        ProcessingOutput(output_name='train', source='/opt/ml/processing/output/train',
 destination=f's3://{BUCKET}/{S3_OUTPUT_PATH}'),
        ProcessingOutput(output_name='validation', source='/opt/ml/processing/output/
val', destination=f's3://{BUCKET}/{S3_OUTPUT_PATH}'),
        ProcessingOutput(output_name='test', source='/opt/ml/processing/output/test',
 destination=f's3://{BUCKET}/{S3_OUTPUT_PATH}'),
        ProcessingOutput(output_name='logs', source='/opt/ml/processing/logs',
 destination=f's3://{BUCKET}/{S3_OUTPUT_PATH}')
    ]
)
```

If you have a `requirements.txt` file, it should be a list of libraries you want to install in the container. The path for `source_dir` can be a relative, absolute, or Amazon S3 URI path. However, if you use an Amazon S3 URI, then it must point to a tar.gz file. You can have multiple scripts in the directory you specify for `source_dir`. To learn more about the `PyTorchProcessor` class, see PyTorch Estimator in the *Amazon SageMaker Python SDK*.

TensorFlow Framework Processor

TensorFlow is an open-source machine learning and artificial intelligence library. The `TensorFlowProcessor` in the Amazon SageMaker Python SDK provides you with the ability to run processing jobs with TensorFlow scripts. When you use the `TensorFlowProcessor`, you can leverage an Amazon-built Docker container with a managed TensorFlow environment so that you don't need to bring your own container.

The following code example shows how you can use the `TensorFlowProcessor` to run your Processing job using a Docker image provided and maintained by SageMaker. Note that when you run the job, you can specify a directory containing your scripts and dependencies in the `source_dir` argument, and you can have a `requirements.txt` file located inside your `source_dir` directory that specifies the dependencies for your processing script(s). SageMaker Processing installs the dependencies in `requirements.txt` in the container for you.

```
from sagemaker.tensorflow import TensorFlowProcessor
from sagemaker.processing import ProcessingInput, ProcessingOutput
from sagemaker import get_execution_role

#Initialize the TensorFlowProcessor
tp = TensorFlowProcessor(
    framework_version='2.3',
```

```
    role=get_execution_role(),
    instance_type='ml.m5.xlarge',
    instance_count=1,
    base_job_name='frameworkprocessor-TF',
    py_version='py37'
)

#Run the processing job
tp.run(
    code='processing-script.py',
    source_dir='scripts',
    inputs=[
        ProcessingInput(
            input_name='data',
            source=f's3://{BUCKET}/{S3_INPUT_PATH}',
            destination='/opt/ml/processing/input/data'
        ),
        ProcessingInput(
            input_name='model',
            source=f's3://{BUCKET}/{S3_PATH_TO_MODEL}',
            destination='/opt/ml/processing/input/model'
        )
    ],
    outputs=[
        ProcessingOutput(
            output_name='predictions',
            source='/opt/ml/processing/output',
            destination=f's3://{BUCKET}/{S3_OUTPUT_PATH}'
        )
    ]
)
```

If you have a `requirements.txt` file, it should be a list of libraries you want to install in the container. The path for `source_dir` can be a relative, absolute, or Amazon S3 URI path. However, if you use an Amazon S3 URI, then it must point to a tar.gz file. You can have multiple scripts in the directory you specify for `source_dir`. To learn more about the `TensorFlowProcessor` class, see TensorFlow Estimator in the *Amazon SageMaker Python SDK*.

XGBoost Framework Processor

XGBoost is an open-source machine learning framework. The `XGBoostProcessor` in the Amazon SageMaker Python SDK provides you with the ability to run processing jobs with XGBoost scripts.

When you use the XGBoostProcessor, you can leverage an Amazon-built Docker container with a managed XGBoost environment so that you don't need to bring your own container.

The following code example shows how you can use the `XGBoostProcessor` to run your Processing job using a Docker image provided and maintained by SageMaker. Note that when you run the job, you can specify a directory containing your scripts and dependencies in the `source_dir` argument, and you can have a `requirements.txt` file located inside your `source_dir` directory that specifies the dependencies for your processing script(s). SageMaker Processing installs the dependencies in `requirements.txt` in the container for you.

```
from sagemaker.xgboost import XGBoostProcessor
from sagemaker.processing import ProcessingInput, ProcessingOutput
from sagemaker import get_execution_role

#Initialize the XGBoostProcessor
xgb = XGBoostProcessor(
    framework_version='1.2-2',
    role=get_execution_role(),
    instance_type='ml.m5.xlarge',
    instance_count=1,
    base_job_name='frameworkprocessor-XGB',
)

#Run the processing job
xgb.run(
    code='processing-script.py',
    source_dir='scripts',
    inputs=[
        ProcessingInput(
            input_name='data',
            source=f's3://{BUCKET}/{S3_INPUT_PATH}',
            destination='/opt/ml/processing/input/data'
        )
    ],
    outputs=[
        ProcessingOutput(
            output_name='processed_data',
            source='/opt/ml/processing/output/',
            destination=f's3://{BUCKET}/{S3_OUTPUT_PATH}'
        )
    ]
)
```

If you have a `requirements.txt` file, it should be a list of libraries you want to install in the container. The path for `source_dir` can be a relative, absolute, or Amazon S3 URI path. However, if you use an Amazon S3 URI, then it must point to a tar.gz file. You can have multiple scripts in the directory you specify for `source_dir`. To learn more about the `XGBoostProcessor` class, see XGBoost Estimator in the *Amazon SageMaker Python SDK*.

Use Your Own Processing Code

You can install libraries to run your scripts in your own processing container or, in a more advanced scenario, you can build your own processing container that satisfies the contract to run in Amazon SageMaker. For more information about containers in SageMaker, see Use Docker containers to build models. For a formal specification that defines the contract for an Amazon SageMaker Processing container, see Build Your Own Processing Container (Advanced Scenario).

Topics

- Run Scripts with Your Own Processing Container
- Build Your Own Processing Container (Advanced Scenario)

Run Scripts with Your Own Processing Container

You can use scikit-learn scripts to preprocess data and evaluate your models. To see how to run scikit-learn scripts to perform these tasks, see the scikit-learn Processing sample notebook. This notebook uses the `ScriptProcessor` class from the Amazon SageMaker Python SDK for Processing.

The following example shows a general workflow for using a `ScriptProcessor` class with your own processing container. The workflow shows how to create your own image, build your container, and use a `ScriptProcessor` class to run a Python preprocessing script with the container. The processing job processes your input data and saves the processed data in Amazon Simple Storage Service (Amazon S3).

Before using the following examples, you need to have your own input data and a Python script prepared to process your data. For an end-to-end, guided example of this process, refer back to the scikit-learn Processing sample notebook.

1. Create a Docker directory and add the Dockerfile used to create the processing container. Install pandas and scikit-learn into it. (You could also install your own dependencies with a similar `RUN` command.)

```
mkdir docker

%%writefile docker/Dockerfile

FROM python:3.7-slim-buster

RUN pip3 install pandas==0.25.3 scikit-learn==0.21.3
ENV PYTHONUNBUFFERED=TRUE

ENTRYPOINT ["python3"]
```

2. Build the container using the docker command, create an Amazon Elastic Container Registry (Amazon ECR) repository, and push the image to Amazon ECR.

```
import boto3

account_id = boto3.client('sts').get_caller_identity().get('Account')
region = boto3.Session().region_name
ecr_repository = 'sagemaker-processing-container'
tag = ':latest'
processing_repository_uri = '{}.dkr.ecr.{}.amazonaws.com/{}'.format(account_id,
 region, ecr_repository + tag)

# Create ECR repository and push docker image
!docker build -t $ecr_repository docker
!aws ecr get-login-password --region {region} | docker login --username AWS --
password-stdin {account_id}.dkr.ecr.{region}.amazonaws.com
!aws ecr create-repository --repository-name $ecr_repository
!docker tag {ecr_repository + tag} $processing_repository_uri
!docker push $processing_repository_uri
```

3. Set up the `ScriptProcessor` from the SageMaker Python SDK to run the script. Replace *`image_uri`* with the URI for the image you created, and replace *`role_arn`* with the ARN for an AWS Identity and Access Management role that has access to your target Amazon S3 bucket.

```
from sagemaker.processing import ScriptProcessor, ProcessingInput, ProcessingOutput

script_processor = ScriptProcessor(command=['python3'],
                image_uri='image_uri',
                role='role_arn',
                instance_count=1,
```

```
                instance_type='ml.m5.xlarge')
```

4. Run the script. Replace *preprocessing.py* with the name of your own Python processing script, and replace *s3://path/to/my/input-data.csv* with the Amazon S3 path to your input data.

```
script_processor.run(code='preprocessing.py',
                     inputs=[ProcessingInput(
                        source='s3://path/to/my/input-data.csv',
                        destination='/opt/ml/processing/input')],
                     outputs=[ProcessingOutput(source='/opt/ml/processing/output/
train'),
                              ProcessingOutput(source='/opt/ml/processing/output/
validation'),
                              ProcessingOutput(source='/opt/ml/processing/output/
test')])
```

You can use the same procedure with any other library or system dependencies. You can also use existing Docker images. This includes images that you run on other platforms such as Kubernetes.

Build Your Own Processing Container (Advanced Scenario)

You can provide Amazon SageMaker Processing with a Docker image that has your own code and dependencies to run your data processing, feature engineering, and model evaluation workloads.

The following example of a Dockerfile builds a container with the Python libraries scikit-learn and pandas, which you can run as a processing job.

```
FROM python:3.7-slim-buster

# Install scikit-learn and pandas
RUN pip3 install pandas==0.25.3 scikit-learn==0.21.3

# Add a Python script and configure Docker to run it
ADD processing_script.py /
ENTRYPOINT ["python3", "/processing_script.py"]
```

For an example of a processing script, see Get started with SageMaker Processing.

Build and push this Docker image to an Amazon Elastic Container Registry (Amazon ECR) repository and ensure that your SageMaker IAM role can pull the image from Amazon ECR. Then you can run this image on Amazon SageMaker Processing.

How Amazon SageMaker Processing Runs Your Processing Container Image

Amazon SageMaker Processing runs your processing container image in a similar way as the following command, where `AppSpecification.ImageUri` is the Amazon ECR image URI that you specify in a `CreateProcessingJob` operation.

```
docker run [AppSpecification.ImageUri]
```

This command runs the `ENTRYPOINT` command configured in your Docker image.

You can also override the entrypoint command in the image or give command-line arguments to your entrypoint command using the `AppSpecification.ContainerEntrypoint` and `AppSpecification.ContainerArgument` parameters in your `CreateProcessingJob` request. Specifying these parameters configures Amazon SageMaker Processing to run the container similar to the way that the following command does.

```
docker run --entry-point [AppSpecification.ContainerEntrypoint]
[AppSpecification.ImageUri] [AppSpecification.ContainerArguments]
```

For example, if you specify the `ContainerEntrypoint` to be `[python3, -v, /processing_script.py]` in your `CreateProcessingJob` request, and `ContainerArguments` to be `[data-format, csv]`, Amazon SageMaker Processing runs your container with the following command.

```
python3 -v /processing_script.py data-format csv
```

When building your processing container, consider the following details:

- Amazon SageMaker Processing decides whether the job completes or fails depending on the exit code of the command run. A processing job completes if all of the processing containers exit successfully with an exit code of 0, and fails if any of the containers exits with a non-zero exit code.
- Amazon SageMaker Processing lets you override the processing container's entrypoint and set command-line arguments just like you can with the Docker API. Docker images can also configure

the entrypoint and command-line arguments using the ENTRYPOINT and CMD instructions. The way CreateProcessingJob's ContainerEntrypoint and ContainerArgument parameters configure a Docker image's entrypoint and arguments mirrors how Docker overrides the entrypoint and arguments through the Docker API:

- If neither ContainerEntrypoint nor ContainerArguments are provided, Processing uses the default ENTRYPOINT or CMD in the image.
- If ContainerEntrypoint is provided, but not ContainerArguments, Processing runs the image with the given entrypoint, and ignores the ENTRYPOINT and CMD in the image.
- If ContainerArguments is provided, but not ContainerEntrypoint, Processing runs the image with the default ENTRYPOINT in the image and with the provided arguments.
- If both ContainerEntrypoint and ContainerArguments are provided, Processing runs the image with the given entrypoint and arguments, and ignores the ENTRYPOINT and CMD in the image.

- You must use the exec form of the ENTRYPOINT instruction in your Dockerfile (ENTRYPOINT ["executable", "param1", "param2"]) instead of the shell form (ENTRYPOINT command param1 param2). This lets your processing container receive SIGINT and SIGKILL signals, which Processing uses to stop processing jobs with the StopProcessingJob API.
- /opt/ml and all its subdirectories are reserved by SageMaker. When building your Processing Docker image, don't place any data required by your processing container in these directories.
- If you plan to use GPU devices, make sure that your containers are nvidia-docker compatible. Include only the CUDA toolkit in containers. Don't bundle NVIDIA drivers with the image. For more information about nvidia-docker, see NVIDIA/nvidia-docker.

How Amazon SageMaker Processing Configures Input and Output For Your Processing Container

When you create a processing job using the CreateProcessingJob operation, you can specify multiple ProcessingInput and ProcessingOutput. values.

You use the ProcessingInput parameter to specify an Amazon Simple Storage Service (Amazon S3) URI to download data from, and a path in your processing container to download the data to. The ProcessingOutput parameter configures a path in your processing container from which to upload data, and where in Amazon S3 to upload that data to. For both ProcessingInput and ProcessingOutput, the path in the processing container must begin with /opt/ml/processing/ .

For example, you might create a processing job with one `ProcessingInput` parameter that downloads data from `s3://your-data-bucket/path/to/input/csv/data` into `/opt/ml/processing/csv` in your processing container, and a `ProcessingOutput` parameter that uploads data from `/opt/ml/processing/processed_csv` to `s3://your-data-bucket/path/to/output/csv/data`. Your processing job would read the input data, and write output data to `/opt/ml/processing/processed_csv`. Then it uploads the data written to this path to the specified Amazon S3 output location.

> **Important**
>
> Symbolic links (symlinks) can not be used to upload output data to Amazon S3. Symlinks are not followed when uploading output data.

How Amazon SageMaker Processing Provides Logs and Metrics for Your Processing Container

When your processing container writes to `stdout` or `stderr`, Amazon SageMaker Processing saves the output from each processing container and puts it in Amazon CloudWatch logs. For information about logging, see Log Amazon SageMaker Events with Amazon CloudWatch.

Amazon SageMaker Processing also provides CloudWatch metrics for each instance running your processing container. For information about metrics, see Monitor Amazon SageMaker with Amazon CloudWatch.

How Amazon SageMaker Processing Configures Your Processing Container

Amazon SageMaker Processing provides configuration information to your processing container through environment variables and two JSON files—`/opt/ml/config/processingjobconfig.json` and `/opt/ml/config/resourceconfig.json`— at predefined locations in the container.

When a processing job starts, it uses the environment variables that you specified with the `Environment` map in the `CreateProcessingJob` request. The `/opt/ml/config/processingjobconfig.json` file contains information about the hostnames of your processing containers, and is also specified in the `CreateProcessingJob` request.

The following example shows the format of the `/opt/ml/config/processingjobconfig.json` file.

```
{
    "ProcessingJobArn": "<processing_job_arn>",
    "ProcessingJobName": "<processing_job_name>",
    "AppSpecification": {
        "ImageUri": "<image_uri>",
        "ContainerEntrypoint": null,
        "ContainerArguments": null
    },
    "Environment": {
        "KEY": "VALUE"
    },
    "ProcessingInputs": [
        {
            "InputName": "input-1",
            "S3Input": {
                "LocalPath": "/opt/ml/processing/input/dataset",
                "S3Uri": "<s3_uri>",
                "S3DataDistributionType": "FullyReplicated",
                "S3DataType": "S3Prefix",
                "S3InputMode": "File",
                "S3CompressionType": "None",
                "S3DownloadMode": "StartOfJob"
            }
        }
    ],
    "ProcessingOutputConfig": {
        "Outputs": [
            {
                "OutputName": "output-1",
                "S3Output": {
                    "LocalPath": "/opt/ml/processing/output/dataset",
                    "S3Uri": "<s3_uri>",
                    "S3UploadMode": "EndOfJob"
                }
            }
        ],
        "KmsKeyId": null
    },
    "ProcessingResources": {
        "ClusterConfig": {
            "InstanceCount": 1,
            "InstanceType": "ml.m5.xlarge",
            "VolumeSizeInGB": 30,
```

```
            "VolumeKmsKeyId": null
        }
    },
    "RoleArn": "<IAM role>",
    "StoppingCondition": {
        "MaxRuntimeInSeconds": 86400
    }
}
```

The `/opt/ml/config/resourceconfig.json` file contains information about the hostnames of your processing containers. Use the following hostnames when creating or running distributed processing code.

```
{
  "current_host": "algo-1",
  "hosts": ["algo-1","algo-2","algo-3"]
}
```

Don't use the information about hostnames contained in `/etc/hostname` or `/etc/hosts` because it might be inaccurate.

Hostname information might not be immediately available to the processing container. We recommend adding a retry policy on hostname resolution operations as nodes become available in the cluster.

Save and Access Metadata Information About Your Processing Job

To save metadata from the processing container after exiting it, containers can write UTF-8 encoded text to the `/opt/ml/output/message` file. After the processing job enters any terminal status (`"Completed"`, `"Stopped"`, or `"Failed"`), the `"ExitMessage"` field in `DescribeProcessingJob` contains the first 1 KB of this file. Access that initial part of file with a call to `DescribeProcessingJob`, which returns it through the `ExitMessage` parameter. For failed processing jobs, you can use this field to communicate information about why the processing container failed.

> **Important**
>
> Don't write sensitive data to the `/opt/ml/output/message` file.

If the data in this file isn't UTF-8 encoded, the job fails and returns a `ClientError`. If multiple containers exit with an `ExitMessage`, the content of the `ExitMessage` from each processing container is concatenated, then truncated to 1 KB.

Run Your Processing Container Using the SageMaker Python SDK

You can use the SageMaker Python SDK to run your own processing image by using the `Processor` class. The following example shows how to run your own processing container with one input from Amazon Simple Storage Service (Amazon S3) and one output to Amazon S3.

```
from sagemaker.processing import Processor, ProcessingInput, ProcessingOutput

processor = Processor(image_uri='<your_ecr_image_uri>',
                      role=role,
                      instance_count=1,
                      instance_type="ml.m5.xlarge")

processor.run(inputs=[ProcessingInput(
                         source='<s3_uri or local path>',
                         destination='/opt/ml/processing/input_data')],
                     outputs=[ProcessingOutput(
                         source='/opt/ml/processing/processed_data',
                         destination='<s3_uri>')],
                     )
```

Instead of building your processing code into your processing image, you can provide a `ScriptProcessor` with your image and the command that you want to run, along with the code that you want to run inside that container. For an example, see Run Scripts with Your Own Processing Container.

You can also use the scikit-learn image that Amazon SageMaker Processing provides through `SKLearnProcessor` to run scikit-learn scripts. For an example, see Data Processing with scikit-learn.

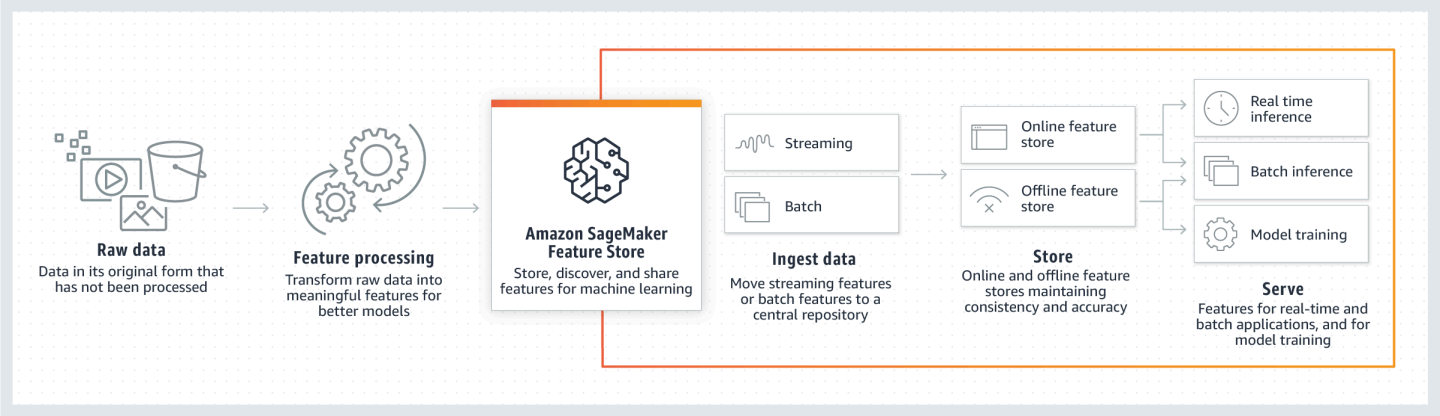
Create, store, and share features with Amazon SageMaker Feature Store

The machine learning (ML) development process includes extracting raw data, transforming it into *features* (meaningful inputs for your ML model), and then storing those features in a serviceable way for data exploration, ML training, and ML inference. Amazon SageMaker Feature Store simplifies how you create, store, share, and manage features. This is done by providing feature store options and reducing repetitive data processing and curation work.

Among other things, with Feature Store you can:

- Simplify feature processing, storing, retrieving, and sharing features for ML development across accounts or in an organization.
- Track your feature processing code development, apply your feature processor to the raw data, and ingest your features into Feature Store in a consistent way. This reduces training-serving skew, a common issue in ML where the difference between performance during training and serving can impact the accuracy of your ML model.
- Store your features and associated metadata in feature groups, so features can be easily discovered and reused. Feature groups are mutable and can evolve their schema after creation.
- Create feature groups that can be configured to include an online or offline store, or both, to manage your features and automate how features are stored for your ML tasks.
  - The online store retains only the latest records for your features. This is primarily designed for supporting real-time predictions that need low millisecond latency reads and high throughput writes.
  - The offline store keeps all records for your features as a historical database. This is primarily intended for data exploration, model training, and batch predictions.

The following diagram shows how you can use Feature Store as part of your ML pipeline. Once you read in your raw data, you can use Feature Store to transform the raw data into features and ingest them into your feature group. The features can be ingested via streaming or batches to the feature group's online and offline stores. The features can then be served for data exploration, model training, and real-time or batch inference.



How Feature Store works

In Feature Store, features are stored in a collection called a *feature group*. You can visualize a feature group as a table in which each column is a feature, with a unique identifier for each row. In principle, a feature group is composed of features and values specific to each feature. A `Record` is a collection of values for features that correspond to a unique `RecordIdentifier`. Altogether, a `FeatureGroup` is a group of features defined in your `FeatureStore` to describe a `Record`.

You can use Feature Store in the following modes:

- **Online** – In online mode, features are read with low latency (milliseconds) reads and used for high throughput predictions. This mode requires a feature group to be stored in an online store.
- **Offline** – In offline mode, large streams of data are fed to an offline store, which can be used for training and batch inference. This mode requires a feature group to be stored in an offline store. The offline store uses your S3 bucket for storage and can also fetch data using Athena queries.
- **Online and Offline** – This includes both online and offline modes.

You can ingest data into feature groups in Feature Store in two ways: streaming or in batches. When you ingest data through streaming, a collection of records are pushed to Feature Store by calling a synchronous `PutRecord` API call. This API enables you to maintain the latest feature values in Feature Store and to push new feature values as soon an update is detected.

Alternatively, Feature Store can process and ingest data in batches. You can author features using Amazon SageMaker Data Wrangler, create feature groups in Feature Store and ingest features in batches using a SageMaker Processing job with a notebook exported from Data Wrangler. This mode allows for batch ingestion into the offline store. It also supports ingestion into the online store if the feature group is configured for both online and offline use.

Create feature groups

To ingest features into Feature Store, you must first define the feature group and the feature definitions (feature name and data type) for all features that belong to the feature group. After they are created, feature groups are mutable and can evolve their schema. Feature group names are unique within an AWS Region and AWS account. When creating a feature group, you can also create the metadata for the feature group, such as a short description, storage configuration, features for identifying each record, and the event time, as well as tags to store information such as the author, data source, version, and more.

> **Important**
>
> `FeatureGroup` names or associated metadata such as description or tags should not contain any personal identifiable information (PII) or confidential information.

Find, discover, and share features

After you create a feature group in Feature Store, other authorized users of the feature store can share and discover it. Users can browse through a list of all feature groups in Feature Store or discover existing feature groups by searching by feature group name, description, record identifier name, creation date, and tags.

Real-time inference for features stored in the online store

With Feature Store, you can enrich your features stored in the online store in real time with data from a streaming source (clean stream data from another application) and serve the features with low millisecond latency for real-time inference.

You can also perform joins across different `FeatureGroups` for real-time inference by querying two different `FeatureGroups` in the client application.

Offline store for model training and batch inference

Feature Store provides offline storage for feature values in your S3 bucket. Your data is stored in your S3 bucket using a prefixing scheme based on event time. The offline store is an append-only store, enabling Feature Store to maintain a historical record of all feature values. Data is stored in the offline store in Parquet format for optimized storage and query access.

You can query, explore, and visualize features using Data Wrangler from the console. Feature Store supports combining data to produce, train, validate, and test data sets, and allows you to extract data at different points in time.

Feature data ingestion

Feature generation pipelines can be created to process large batches (1 million rows of data or more) or small batches, and to write feature data to the offline or online store. Streaming sources such as Amazon Managed Streaming for Apache Kafka or Amazon Kinesis can also be used as data sources from which features are extracted and directly fed to the online store for training, inference, or feature creation.

You can push records to Feature Store by calling the synchronous `PutRecord` API call. Since this is a synchronous API call, it allows small batches of updates to be pushed in a single API call. This enables you to maintain high freshness of the feature values and publish values as soon as an update is detected. These are also called *streaming features*.

When feature data is ingested and updated, Feature Store stores historical data for all features in the offline store. For batch ingest, you can pull feature values from your S3 bucket or use Athena to query. You can also use Data Wrangler to process and engineer new features that can then be exported to a chosen S3 bucket to be accessed by Feature Store. For batch ingestion, you can configure a processing job to batch ingest your data into Feature Store, or you can pull feature values from your S3 bucket using Athena.

To remove a `Record` from your online store, use the `DeleteRecord` API call. This will also add the deleted record to the offline store.

Resilience in Feature Store

Feature Store is distributed across multiple Availability Zones (AZs). An AZ is an isolated location within an AWS Region. If some AZs fail, Feature Store can use other AZs. For more information about AZs, see Resilience in Amazon SageMaker.

Get started with Amazon SageMaker Feature Store

The following topics give information about using Amazon SageMaker Feature Store. First learn the Feature Store concepts, then how to manage permissions to use Feature Store, how to create and use feature groups using Studio Classic, Jupyter or JupyterLab notebook, how to use Feature Store

using the User Interface through the console, and how to delete feature groups using the console and AWS SDK for Python (Boto3).

The instructions on using Feature Store through the console depends on if you have enabled Studio or Studio Classic as your default experience. For information on accessing Studio Classic, see Launch Studio Classic Using the Amazon SageMaker Console.

Topics

Feature Store concepts

We list common terms used in Amazon SageMaker Feature Store, followed by example diagrams to visualize a few concepts:

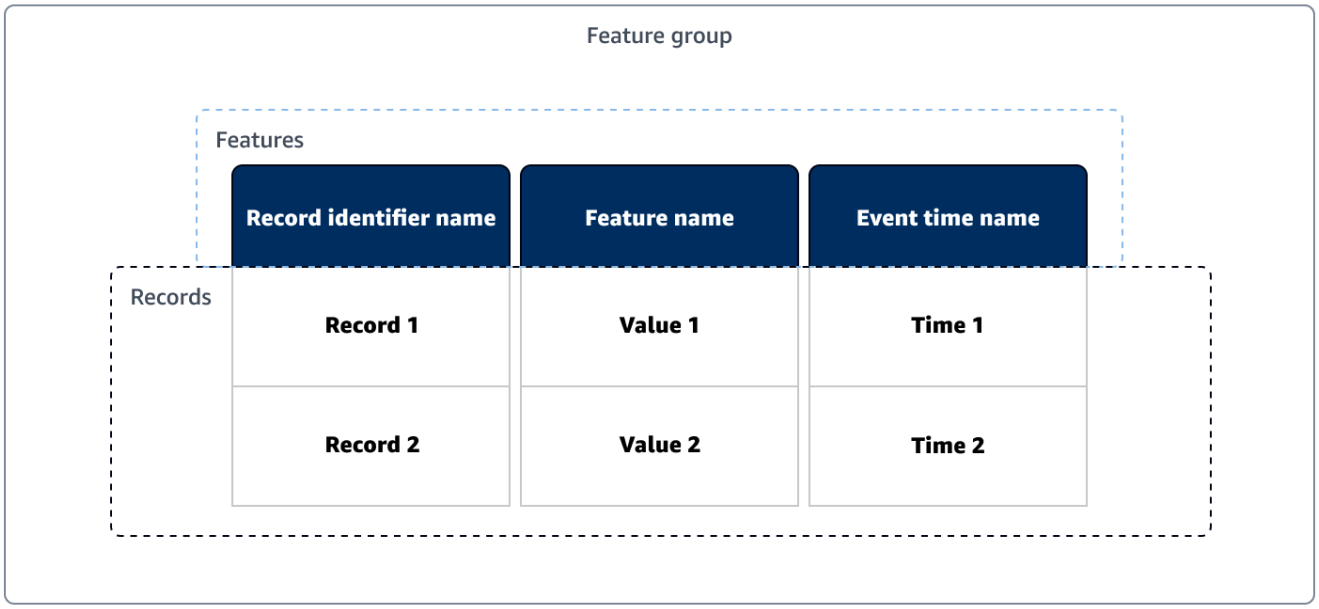
- **Feature Store**: Storage and data management layer for machine learning (ML) features. Serves as the single source of truth to store, retrieve, remove, track, share, discover, and control access to features. In the following example diagram, the Feature Store is a store for your feature groups, which contains your ML data, and provides additional services.
- **Online store**: Low latency, high availability store for a feature group that enables real-time lookup of records. The online store allows quick access to the latest record via the `GetRecord` API.
- **Offline store**: Stores historical data in your Amazon S3 bucket. The offline store is used when low (sub-second) latency reads are not needed. For example, the offline store can be used when you want to store and serve features for exploration, model training, and batch inference.
- **Feature group**: The main resource of Feature Store that contains the data and metadata used for training or predicting with a ML model. A feature group is a logical grouping of features used to describe records. In the following example diagram, a feature group contains your ML data.
- **Feature**: A property that is used as one of the inputs to train or predict using your ML model. In the Feature Store API a feature is an attribute of a record. In the following example diagram, a feature describes a column in your ML data table.

- **Feature definition**: Consists of a name and one of the data types: integral, string or fractional. A feature group contains a list of feature definitions. For more information on Feature Store data types, see Data types.
- **Record**: Collection of values for features for a single record identifier. A combination of record identifier and event time values uniquely identify a record within a feature group. In the following example diagram, a record is a row in your ML data table.
- **Record identifier name**: The record identifier name is the name of the feature that identifies the records. It must refer to one of the names of a feature defined in the feature group's feature definitions. Each feature group is defined with a record identifier name.
- **Event time**: Timestamp that you provide corresponding to when the record event occurred. All records in a feature group must have a corresponding event time. The online store only contains the record corresponding to the latest event time, whereas the offline store contains all historic records. For more information on event time formats, see Data types.
- **Ingestion**: Adding new records to a feature group. Ingestion is typically achieved via the `PutRecord` API.

Topics

Concepts overview diagram

The following example diagram conceptualizes a few Feature Store concepts:



The Feature Store contains your feature groups and a feature group contains your ML data. In the example diagram, the original feature group contains a data table that has three features (each describing a column) and two records (rows).

- A feature's definition describes the feature name and data type of the feature values that are associated with records.
- A record contains the feature values and is uniquely identified by its record identifier and must include the event time.

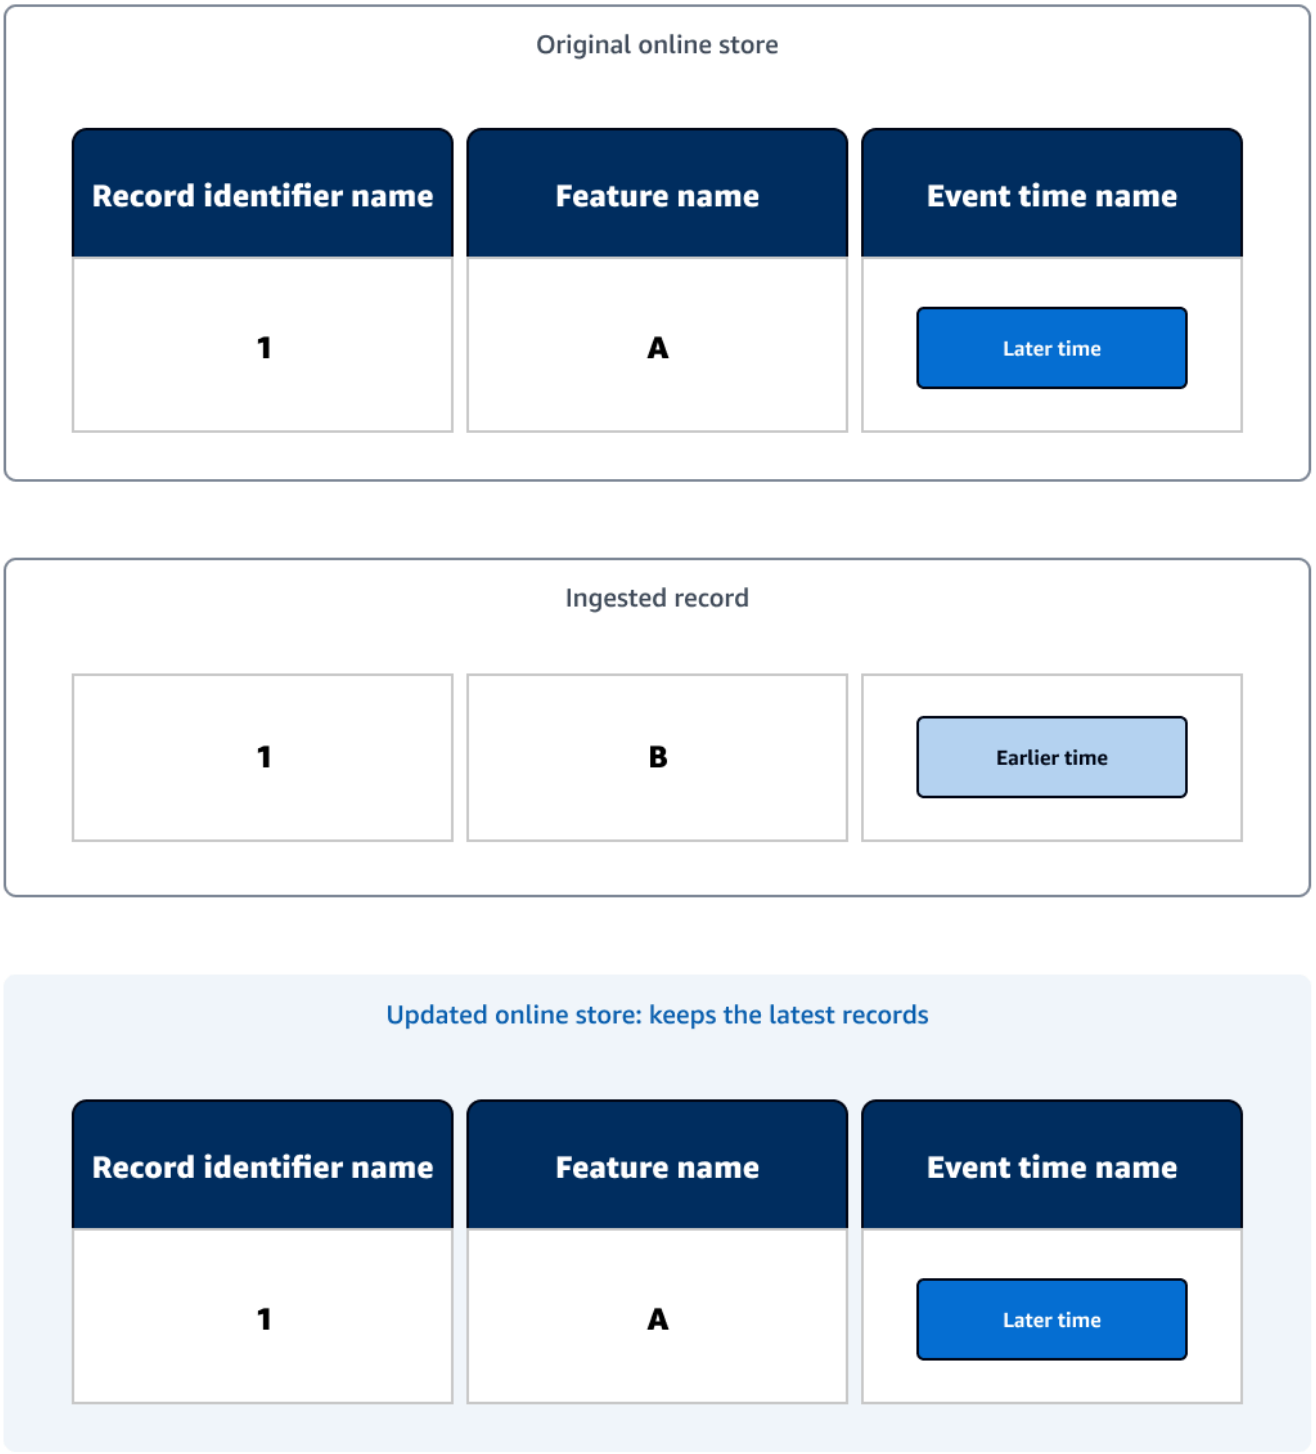
Ingestion diagrams

Ingestion is the action of adding a record or records to an existing feature group. The online and offline stores are updated differently for different storage use cases.

Ingestion to the online store example

The online store acts as a real-time look-up of records and only keeps the most up-to-date records. Once a record is ingested into an existing online store, the updated online store will only keep the record with the latest event time.

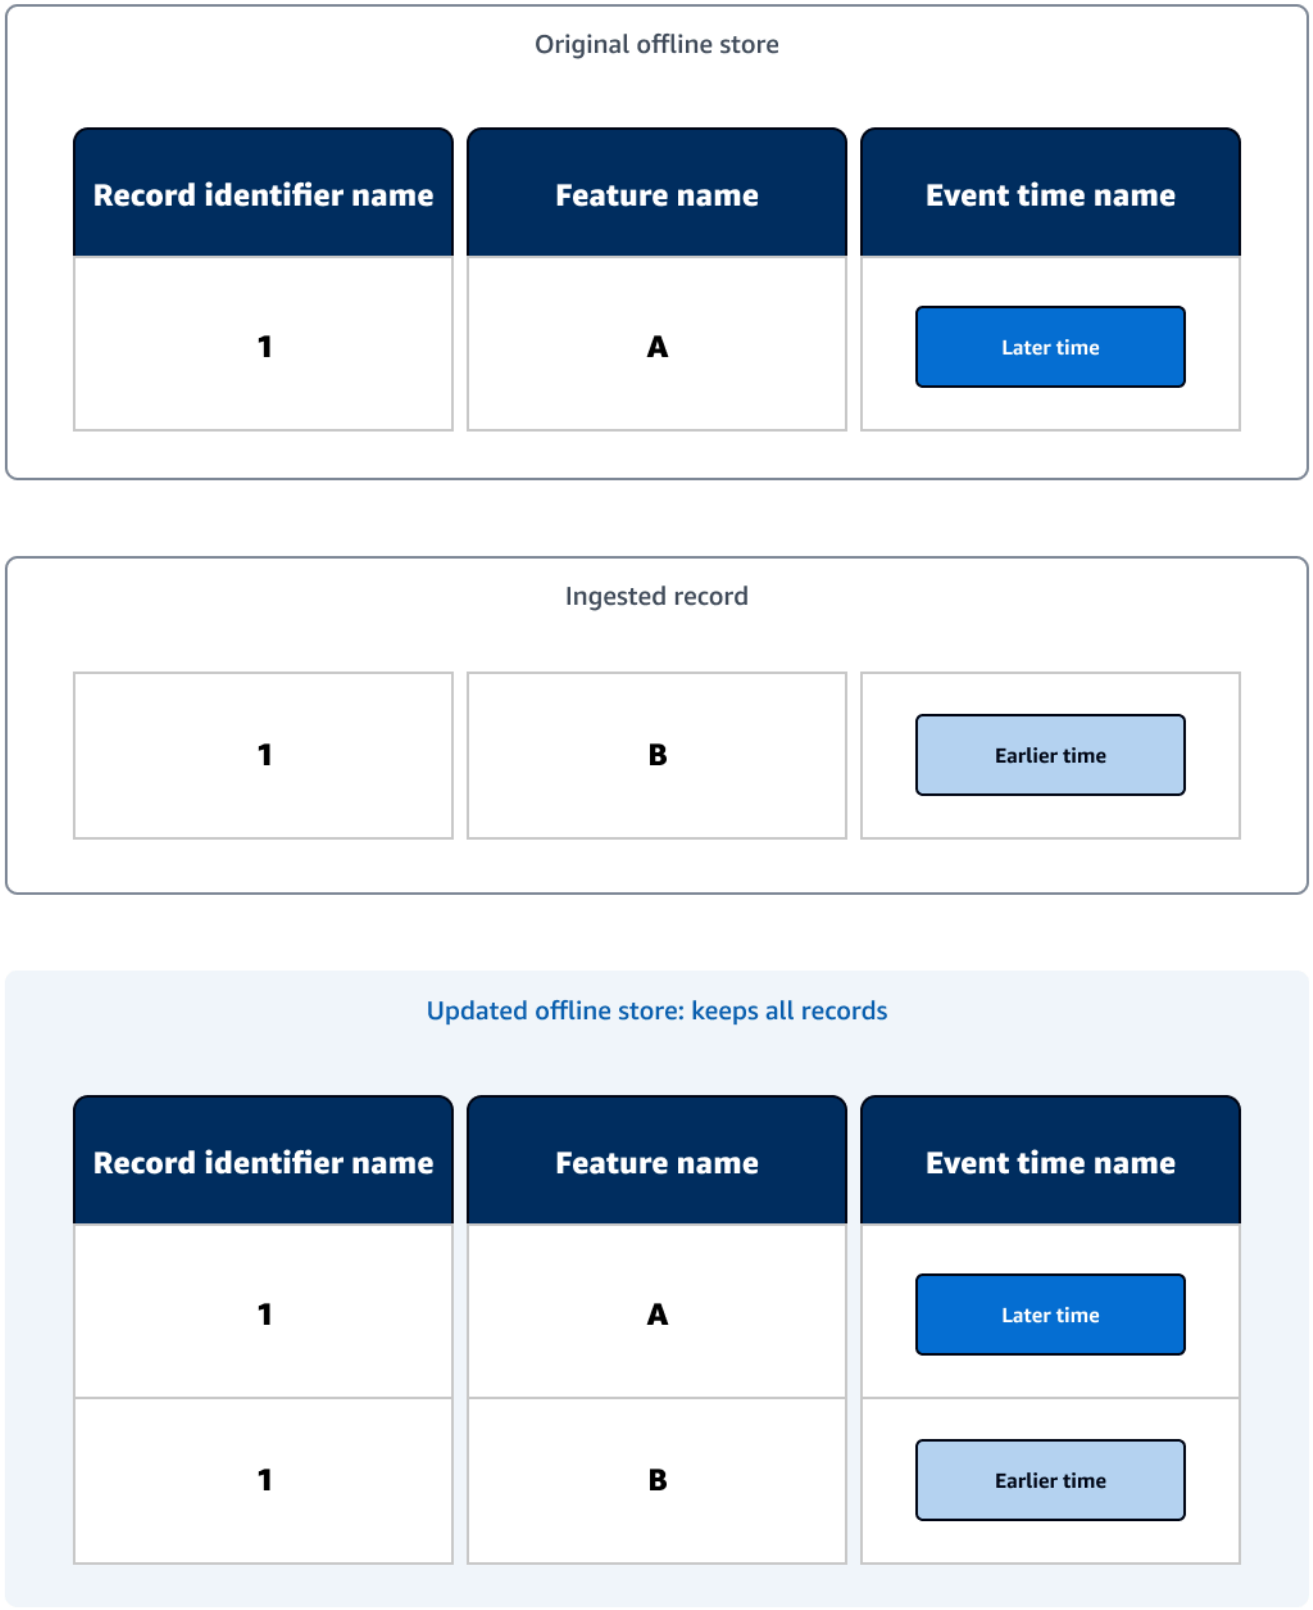
In the following example diagram, the original online store contains a ML data table with one record. A record is ingested with the same record identifier name as the original record, and the ingested record has an earlier event time than the original record. As the updated online store only keeps the record with the latest event time, the updated online store contains the original record.



Ingestion to the offline store example

The offline store acts as a historical look-up of records and keeps all records. After a new record is ingested into an existing offline store, the updated offline store will keep the new record.

In the following example diagram, the original offline store contains a ML data table with one record. A record is ingested with the same record identifier name as the original record, and the ingested record has an event time earlier than the original record. As the updated offline store keeps all of the records, the updated offline store contains both records.



Original offline store
Record identifier name
Feature name
Event time name
1
A
Later time
Ingested record
1
B
Earlier time
Updated offline store: keeps all records
Record identifier name
Feature name
Event time name
1
A
Later time
1
B
Earlier time

Adding policies to your IAM role

To get started with Amazon SageMaker Feature Store you must have a role and add the required policy to your role, `AmazonSageMakerFeatureStoreAccess`. The following is a walkthrough on how to view the policies attached to a role and how to add a policy to your role. For information on how to create a role, see SageMaker Roles. For information on how to get your execution role, see Get execution role.

1. Open the IAM console at https://console.aws.amazon.com/iam/.
2. In the navigation pane on the left of the IAM console, choose **Roles**.
3. In the search bar enter the role you are using for Amazon SageMaker Feature Store.

   For examples on how to find your execution role ARN for a notebook within SageMaker, see Get execution role. The role is at the end of the execution role ARN.
4. After you enter the role in the search bar, choose the role.

   Under **Permissions policies** you can view the policies attached to the role.
5. After you choose the role, choose **Add permissions**, then choose **Attach policies**.
6. In the search bar under **Other permissions policies** enter `AmazonSageMakerFeatureStoreAccess` and press enter. If the policy does not show, you may already have the policy attached, listed under your **Current permissions policies**.
7. After you press enter, select the **check box** next to the policy and then choose **Add permissions**.
8. After you have attached the policy to your role, the policy will appear under **Permissions policies** for your IAM role.

Use Feature Store with SDK for Python (Boto3)

The feature group is the main Feature Store resource that contains your machine learning (ML) data and metadata stored in Amazon SageMaker Feature Store. A feature group is a logical grouping of features and records. A feature group's definition is composed of a configurations for its online and offline store and a list of feature definitions that are used to describe the values of your records. The feature definitions must include a record identifier name and an event time name. For more information on feature store concepts, see Feature Store concepts.

Prior to using a feature store you typically load your dataset, run transformations, and set up your features for ingestion. This process has a lot of variation and is highly dependent on your data. The example code in the following topics refer to the Introduction to Feature Store and Fraud Detection with Amazon SageMaker Feature Store example notebooks, respectively. Both use the AWS SDK for Python (Boto3). For more Feature Store examples and resources, see Amazon SageMaker Feature Store resources.

Feature Store supports the following feature types: `String`, `Fractional` (IEEE 64-bit floating point value), and `Integral` (Int64 - 64 bit signed integral value). The default type is set to `String`. This means that, if a column in your dataset is not of a `float` or `long` feature type, it defaults to `String` in your feature store.

You may use a schema to describe your data's columns and data types. You pass this schema into `FeatureDefinitions`, a required parameter for a `FeatureGroup`. You can use the SDK for Python (Boto3), which has automatic data type detection when you use the `load_feature_definitions` function.

The default behavior when a new feature record is added with an already existing record ID is as follows. In the offline store, the new record will be appended. In the online store, if the event time of the new record is less than the existing event time then nothing will happen, but if the event time of the new record is greater than or equal to the existing event time, the record will be overwritten.

When you create a new feature group you can choose one of the following table formats:

- AWS Glue (Default)
- Apache Iceberg

Ingesting data, especially when streaming, can result in a large number of small files deposited into the offline store. This can negatively impact query performance due the higher number of file operations required. To avoid potential performance issues, use the Apache Iceberg table format when creating new feature groups. With Iceberg you can compact the small data files into fewer large files in the partition, resulting in significantly faster queries. This compaction operation is concurrent and does not affect ongoing read and write operations on the feature group. If you choose the Iceberg option when creating new feature groups, Amazon SageMaker Feature Store will create the Iceberg tables using Parquet file format, and register the tables with the AWS Glue Data Catalog.

- Fraud detection with Feature Store example notebook

Introduction to Feature Store example notebook

> **Important**
>
> Custom IAM policies that allow Amazon SageMaker Studio or Amazon SageMaker Studio Classic to create Amazon SageMaker resources must also grant permissions to add tags to those resources. The permission to add tags to resources is required because Studio and Studio Classic automatically tag any resources they create. If an IAM policy allows Studio and Studio Classic to create resources but does not allow tagging, "AccessDenied" errors can occur when trying to create resources. For more information, see Provide Permissions for Tagging SageMaker Resources.
> AWS Managed Policies for Amazon SageMaker that give permissions to create SageMaker resources already include permissions to add tags while creating those resources.

The example code on this page refers to the Introduction to Feature Store example notebook. We recommend that you run this notebook in Studio Classic, notebook instances, or JupyterLab because the code in this guide is conceptual and not fully functional if copied.

Use the following to clone the aws/amazon-sagemaker-examples GitHub repository, containing the example notebook:

- **For Studio Classic**

Launch Studio Classic. You can open Studio Classic if Studio or Studio Classic is enabled as your default experience. For instructions on how to open Studio Classic, see Launch Studio Classic Using the Amazon SageMaker Console.

Clone the aws/amazon-sagemaker-examples GitHub repository to Studio Classic by following the steps in Clone a Git Repository in SageMaker Studio Classic.

- **For Amazon SageMaker notebook instances**

  Launch SageMaker notebook instance by following the instructions in Access Notebook Instances.

  Check if the examples are already in your notebooks by following the instructions in Example Notebooks. If not, follow the instructions in Add a Git Repository to Your Amazon SageMaker Account.

Now that you have the SageMaker example notebooks, navigate to the `amazon-sagemaker-examples/sagemaker-featurestore` directory and open the Introduction to Feature Store example notebook.

Step 1: Set up your SageMaker session

To start using Feature Store, create a SageMaker session. Then, set up the Amazon Simple Storage Service (Amazon S3) bucket that you want to use for your features. The Amazon S3 bucket is your offline store. The following code uses the SageMaker default bucket and adds a custom prefix to it.

> **Note**
>
> The role that you use to run the notebook must have the following managed policies attached to it: `AmazonS3FullAccess` and `AmazonSageMakerFeatureStoreAccess`. For information about adding policies to your IAM role, see Adding policies to your IAM role.

```
# SageMaker Python SDK version 2.x is required
import sagemaker
import sys
```

```
import boto3
```

```
import pandas as pd
import numpy as np
import io
from sagemaker.session import Session
from sagemaker import get_execution_role

prefix = 'sagemaker-featurestore-introduction'
role = get_execution_role()

sagemaker_session = sagemaker.Session()
region = sagemaker_session.boto_region_name
s3_bucket_name = sagemaker_session.default_bucket()
```

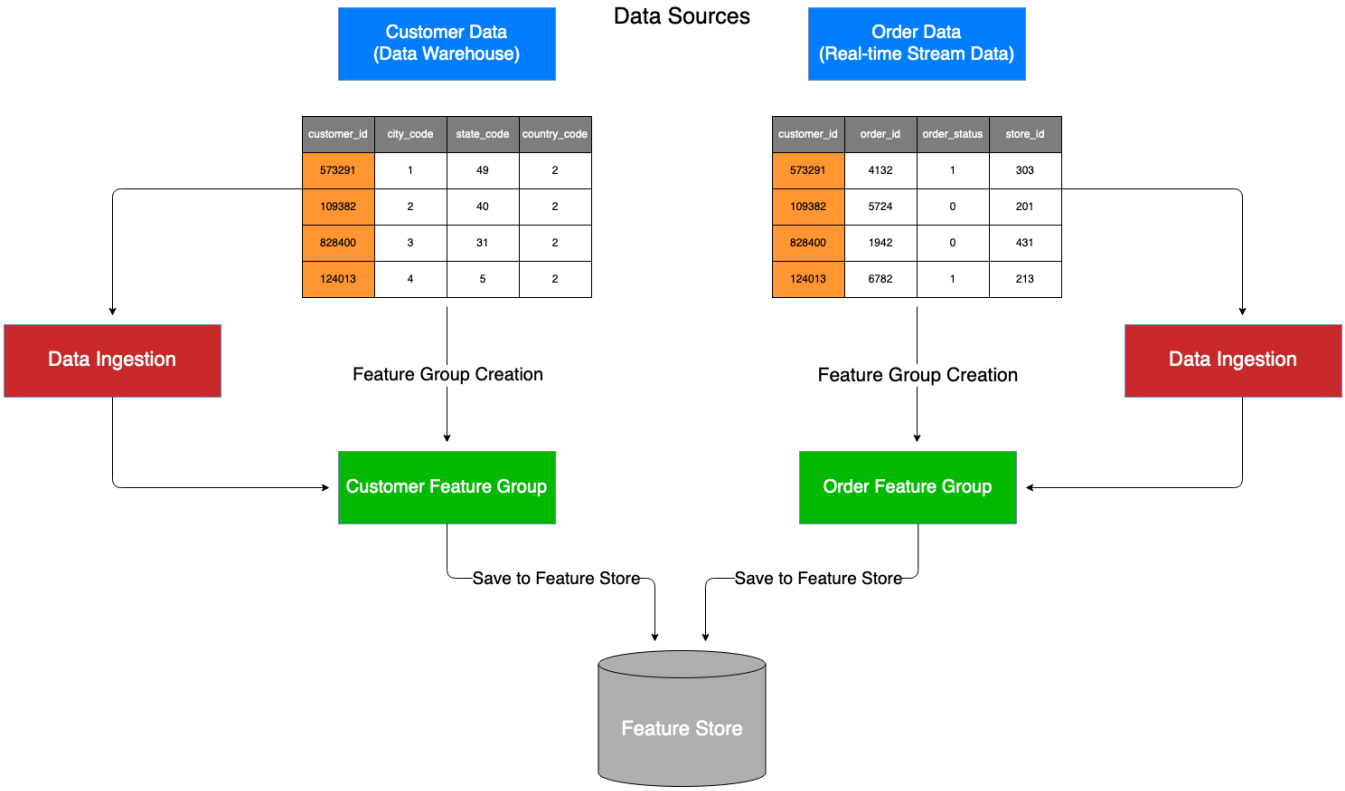
Step 2: Inspect your data

In this notebook example, we ingest synthetic data from the GitHub repository that hosts the full notebook.

```
customer_data = pd.read_csv("data/feature_store_introduction_customer.csv")
orders_data = pd.read_csv("data/feature_store_introduction_orders.csv")

print(customer_data.head())
print(orders_data.head())
```

The following diagram illustrates the steps that data goes through before Feature Store ingests it. In this notebook, we illustrate the use case where you have data from multiple sources and want to store them independently in a Feature Store. Our example considers data from a data warehouse (customer data), and data from a real-time streaming service (order data).



Step 3: Create feature groups

We first start by creating feature group names for customer_data and orders_data. Following this, we create two feature groups, one for `customer_data` and another for `orders_data`:

```
import time
from time import strftime, gmtime
customers_feature_group_name = 'customers-feature-group-' + strftime('%d-%H-%M-%S',
 gmtime())
orders_feature_group_name = 'orders-feature-group-' + strftime('%d-%H-%M-%S', gmtime())
```

Instantiate a `FeatureGroup` object for `customers_data` and `orders_data`:

```
from sagemaker.feature_store.feature_group import FeatureGroup

customers_feature_group = FeatureGroup(
    name=customers_feature_group_name, sagemaker_session=sagemaker_session
)
orders_feature_group = FeatureGroup(
    name=orders_feature_group_name, sagemaker_session=sagemaker_session
```

```
)
```

```
import time
current_time_sec = int(round(time.time()))
record_identifier_feature_name = "customer_id"
```

Append `EventTime` feature to your data frame. This parameter is required, and timestamps each data point:

```
customer_data["EventTime"] = pd.Series([current_time_sec]*len(customer_data),
 dtype="float64")
orders_data["EventTime"] = pd.Series([current_time_sec]*len(orders_data),
 dtype="float64")
```

Load feature definitions to your feature group:

```
customers_feature_group.load_feature_definitions(data_frame=customer_data)
orders_feature_group.load_feature_definitions(data_frame=orders_data)
```

The following calls `create` to create two feature groups, `customers_feature_group` and `orders_feature_group`, respectively:

```
customers_feature_group.create(
    s3_uri=f"s3://{s3_bucket_name}/{prefix}",
    record_identifier_name=record_identifier_feature_name,
    event_time_feature_name="EventTime",
    role_arn=role,
    enable_online_store=True
)

orders_feature_group.create(
    s3_uri=f"s3://{s3_bucket_name}/{prefix}",
    record_identifier_name=record_identifier_feature_name,
    event_time_feature_name="EventTime",
    role_arn=role,
    enable_online_store=True
)
```

To confirm that your feature group was created, we display it by using `DescribeFeatureGroup` and `ListFeatureGroups` APIs:

```
customers_feature_group.describe()
```

```
orders_feature_group.describe()
```

```
sagemaker_session.boto_session.client('sagemaker',
 region_name=region).list_feature_groups() # We use the boto client to list
 FeatureGroups
```

Step 4: Ingest data into a feature group

After feature groups are created, we can put data into them. If you're using the SageMaker AWS SDK for Python (Boto3), use the `ingest` API call. If you're using SDK for Python (Boto3), then use the `PutRecord` API. It will take less than 1 minute to ingest data both of these options. This example uses the SageMaker SDK for Python (Boto3), so it uses the `ingest` API call:

```
def check_feature_group_status(feature_group):
    status = feature_group.describe().get("FeatureGroupStatus")
    while status == "Creating":
        print("Waiting for Feature Group to be Created")
        time.sleep(5)
        status = feature_group.describe().get("FeatureGroupStatus")
    print(f"FeatureGroup {feature_group.name} successfully created.")

check_feature_group_status(customers_feature_group)
check_feature_group_status(orders_feature_group)
```

```
customers_feature_group.ingest(
    data_frame=customer_data, max_workers=3, wait=True
)
```

```
orders_feature_group.ingest(
    data_frame=orders_data, max_workers=3, wait=True
)
```

Using an arbitrary customer record id, 573291 we use `get_record` to check that the data has been ingested into the feature group.

```
customer_id = 573291
```

```
sample_record = sagemaker_session.boto_session.client('sagemaker-featurestore-runtime',
 region_name=region).get_record(FeatureGroupName=customers_feature_group_name,
 RecordIdentifierValueAsString=str(customer_id))
```

```
print(sample_record)
```
