Amazon Mechanical Turk Getting Started Guide

This is the Amazon Mechanical Turk Getting Started Guide. This guide provides a conceptual overview of Amazon Mechanical Turk for developers who want to write scripts or software applications using the Amazon Mechanical Turk Requester API. The major sections of this guide are described in the following table. For information on using a graphical user interface to access Amazon Mechanical Turk functionality, go to the Amazon Mechanical Turk Requester User Interface Guide.

Amazon Mechanical Turk is a web service that provides an on-demand, scalable, human workforce to complete jobs that humans can do better than computers, such as recognizing objects in photographs. For more information about this product, go to the Amazon Mechanical Turk website.

Introduction to Amazon Mechanical Turk

The following topics provide a high-level overview of the Amazon Mechanical Turk web service. After reading these topics, you should understand the basics you need to work through the examples in this guide.

Topics
- Overview of Amazon Mechanical Turk (p. 2)
- Key Amazon Mechanical Turk Concepts (p. 3)
- What's Next? (p. 3)

Overview of Amazon Mechanical Turk

Amazon Mechanical Turk provides an on-demand, scalable, human workforce to complete jobs that humans can do better than computers. Amazon Mechanical Turk software formalizes job offers to the thousands of Workers willing to do piecemeal work at their convenience. The software also retrieves work performed and compiles it for you, the Requester, who pays the Workers for satisfactory work (only). Optional qualification tests enable you to select competent Workers.

The kinds of tasks humans can complete better than computers includes finding objects in photos, writing reviews of restaurants, movies, or businesses, translating text passages into foreign languages, getting the hours of operation of the business center within a hotel, determining if a hotel is family-friendly, or telling you the most relevant search results for a given phrase.

This guide presents a very slim slice of the Amazon Mechanical Turk API. For a complete description of the entire API, go to the Amazon Mechanical Turk API Reference. For more information about using the API, go to the Amazon Mechanical Turk Developer Guide.

Features

The following list describes the features of Amazon Mechanical Turk highlighted by the tutorial in this guide.

- **On-demand workforce**—Amazon Mechanical Turk provides access to a virtual community of Workers.

- **Create jobs that Workers perform over the Internet**—Advertise your job to the thousands of Amazon Mechanical Turk Workers around the world

  You prescribe the job (HIT) that Workers complete using their computer, and pay them for their work.

- **Test and publish your jobs**—Test your applications in the Amazon Mechanical Turk sandbox

  Test your jobs in the Amazon Mechanical Turk sandbox and publish the revised jobs to the outside world.

Amazon Mechanical Turk provides SDKs and command line tools to make it easier to build solutions leveraging Amazon Mechanical Turk.
Key Amazon Mechanical Turk Concepts

This section describes the concepts and terminology you need to understand to use Amazon Mechanical Turk effectively.

Requester

A Requester is a company, organization, or person that creates and submits tasks (HITs) to Amazon Mechanical Turk for Workers to perform. As a Requester, you can use a software application to interact with Amazon Mechanical Turk to submit tasks, retrieve results, and perform other automated tasks. You can use the Requester website to check the status of your HITs, and manage your account.

Human Intelligence Task

A Human Intelligence Task (HIT) is a task that a Requester submits to Amazon Mechanical Turk for Workers to perform. A HIT represents a single, self-contained task, for example, "Identify the car color in the photo." Workers can find HITs listed on the Amazon Mechanical Turk website. For more information, go to the Amazon Mechanical Turk website.

Each HIT has a lifetime, specified by the Requester, that determines how long the HIT is available to Workers. A HIT also has an assignment duration, which is the amount of time a Worker has to complete a HIT after accepting it.

Worker

A Worker is a person who performs the tasks specified by a Requester in a HIT. Workers use the Amazon Mechanical Turk website to find and accept assignments, enter values into the question form, and submit the results. The Requester specifies how many Workers can work on a task. Amazon Mechanical Turk guarantees that a Worker can work on each task only one time.

Assignment

An assignment specifies how many people can submit completed work for your HIT. When a Worker accepts a HIT, Amazon Mechanical Turk creates an assignment to track the work to completion. The assignment belongs exclusively to the Worker and guarantees that the Worker can submit results and be eligible for a reward until the time the HIT or assignment expires.

Reward

A reward is the money you, as a Requester, pay Workers for satisfactory work they do on your HITs.

What's Next?

The next section explains how to sign up for AWS and for Amazon Mechanical Turk, and how to set up your development environment.
Setting Up Accounts and Tools

The following topics describe the tasks you need to perform before you can use Amazon Mechanical Turk.

Topics
- Step 1: Sign Up for an AWS Account (p. 4)
- Step 2: Create a Requester Account (p. 5)
- Step 3: Link Your AWS account to your MTurk Requester account (p. 5)
- Step 4: Create an IAM User (p. 5)
- Step 5: Set up the Developer Sandbox (p. 6)
- Step 6: Set up an AWS SDK (p. 7)
- Step 7: Prepay for Your HITs (p. 7)
- Creating a HIT Tutorial (p. 7)

Step 1: Sign Up for an AWS Account

To develop solutions using the Amazon Mechanical Turk web service, you must first sign up for an AWS account. An AWS account is an Amazon.com account that enables you to use services from AWS.

To sign up for an AWS account

1. Open https://aws.amazon.com/, and then choose Create an AWS Account.

   **Note**
   If you previously signed in to the AWS Management Console using AWS account root user credentials, choose Sign in to a different account. If you previously signed in to the console using IAM credentials, choose Sign-in using root account credentials. Then choose Create a new AWS account.

2. Follow the online instructions.

   Part of the sign-up procedure involves receiving a phone call and entering a verification code using the phone keypad.

Using your AWS account, you can view your AWS account activity and usage reports and manage your security credentials.

AWS Security Credentials

AWS uses access keys to help protect your data when you access AWS programmatically. An access key consists of two parts: an access key ID, which is similar to a user name, and a secret access key, which is similar to a password.

- Sample access key ID: AKIAIOSFODNN7EXAMPLE
- Sample secret access key: wJalrXUtnFEMI/K7MDENG/bPxsRfiCYEXAMPLEKEY

You use access keys to sign programmatic requests that you make to the Amazon Mechanical Turk API using a supported AWS SDK. You can use these access keys in both the sandbox and the production environment.
Note
Although you may use your AWS root credentials to access the Mechanical Turk API, we recommend that instead you create an IAM user and use those credentials instead. Please note that Mechanical Turk does not currently support the use of IAM role credentials.

To manage your AWS security credentials
2. Do one of the following:
   - If you signed in using your root credentials, choose Continue to Security Credentials.
   - If you signed in as an IAM user, choose Access Keys (Access Key ID and Secret Access Key).
4. In Create Access Key, choose Download Key File.
5. The private key file (rootkey.csv) is automatically downloaded by your browser. Save the private key file in a safe place.
   Important
   This is the only chance for you to save the private key file. You will need these credentials to use the Amazon Mechanical Turk API.

Step 2: Create a Requester Account

Before you can use Amazon Mechanical Turk, you must have an Amazon Mechanical Turk Requester account.

To create and register a Requester account
2. Click Create an Account.
3. Enter your email address.
4. Follow the prompts to complete your Requester account registration.
   When prompted, type your mailing address and accept the Amazon Mechanical Turk Participation Agreement.

Step 3: Link Your AWS account to your MTurk Requester account

Next, you will need to link your AWS Account to your MTurk Requester Account. This operation grants permission to your AWS Account to access your Requester account using the MTurk APIs.
2. Click Link your AWS Account and sign-in with your AWS Root user email address and password.

Step 4: Create an IAM User

With AWS Identity and Access Management (IAM) you can securely control access to AWS services and resources for your users. Creating an IAM user allows you to use these credentials to access the Amazon Mechanical Turk API instead of using your root account credentials. Please note that Mechanical Turk does not currently support the use of IAM role credentials.
Note
You use IAM credentials only to authenticate Mechanical Turk API requests. You cannot use them to log in to the Mechanical Turk Requester website.

To create an IAM user
2. Choose Get Started With IAM Users.
3. Choose Create New Users.
4. Under Enter User Names, type names for each of your users.
5. Make sure Generate an access key for each user is selected and choose Create.
7. Choose Download Credentials.
8. Your browser automatically downloads the private key file (credentials.csv). Save the private key file in a safe place.
   Important
   This is the only chance for you to save the private key file. You will need these credentials to use the Amazon Mechanical Turk API.

To set up Amazon Mechanical Turk permissions for IAM users
1. Read Overview of IAM Policies in the IAM User Guide.
2. Sign in to the IAM console at https://console.aws.amazon.com/iam/home#policies.
3. On the Policies page, choose AmazonMechanicalTurkFullAccess or AmazonMechanicalTurkReadOnly.
4. At the top of the page, choose Policy Actions and then choose Attach.
5. On the Attach Policy page, select the IAM user(s) that you want to set permissions for. Then choose Attach Policy to give those users permission to access the Mechanical Turk API.

What is supported?

<table>
<thead>
<tr>
<th>Feature</th>
<th>Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>API authentication using IAM credentials</td>
<td>Yes</td>
</tr>
<tr>
<td>Website authentication using IAM credentials</td>
<td>No</td>
</tr>
<tr>
<td>Action-level permissions for IAM users</td>
<td>Yes</td>
</tr>
<tr>
<td>Resource-level permissions for IAM users</td>
<td>No</td>
</tr>
<tr>
<td>Tag-based permissions for IAM users</td>
<td>No</td>
</tr>
<tr>
<td>Authentication using temporary credentials (roles or groups)</td>
<td>No</td>
</tr>
<tr>
<td>Authentication using federated user credentials</td>
<td>No</td>
</tr>
</tbody>
</table>

Step 5: Set up the Developer Sandbox

You should test your HITs in the Amazon Mechanical Turk sandbox testing environment to make sure they work as expected before publishing your HITs in the Mechanical Turk marketplace. The sandbox provides a testing environment where you can publish and work on HITs to try them out before
Step 6: Set up an AWS SDK

The MTurk API can be accessed using the following AWS SDKs: Python/Boto (Boto3), Javascript (NodeJS or Browser), Java, .NET, Go, Ruby, PHP or C++.

Configure the AWS SDK to use the 'us-east-1' region. This is the region in which the MTurk API is available. Then connect to the MTurk Developer Sandbox and check your account balance (the Sandbox should always return a balance of $10,000). To connect to the MTurk Developer Sandbox, set the API endpoint in your SDK to https://mturk-requester-sandbox.us-east-1.amazonaws.com. You can find examples here.

Step 7: Prepay for Your HITs

Before you use the production version of Amazon Mechanical Turk you need to prepay for the HITs you create. Otherwise, you can't post your HITs to Workers.

To post your HITs to Workers, you must have money in your Prepaid Hit Balance to prepay for all of your HITs. You can use a credit or debit card or debit card to prepay for the HITs.

For instructions on how to prepay for your HITs, go to the Requester website.

Creating a HIT Tutorial

The Creating a HIT (p. 8) tutorial in the next section takes you step-by-step through using Amazon Mechanical Turk to create a HIT.
Creating a HIT

In the previous section, you set up your AWS account and installed the programming tools you need to use Amazon Mechanical Turk. The following topics describe how to write, test, publish, and manage a Human Intelligence Task (HIT).

Topics
- Workflow (p. 8)

Workflow

The following procedure gives you an overview of creating, testing, publishing, and managing a HIT.

Workflow for Requesters

1. Define your HIT.
   Construct your question in one of the Question and Answer Data Structure. The Question parameter accepts a XML string or HTML string.

2. Create HIT.
   Build a new HIT with the CreateHIT operation or CreateHITwithHITType operation.
   Provide Title, Description, Keywords, and Question Details as outlined in the documentation.
   For code samples demonstrating how to use the Amazon Mechanical Turk Requester API, go to AWSLabs on Github.
   For language-specific support about using Amazon Mechanical Turk Requester API go to AWS SDKs.

3. Test your HIT.
   Publish your HIT on the Amazon Mechanical Turk Developer Sandbox. The Amazon Mechanical Turk Developer Sandbox is a simulated environment that allows you to view your HIT as it would appear to Workers.
   For more information about the Amazon Mechanical Turk Developer Sandbox and how to use it, go to the Amazon Mechanical Turk Developer Sandbox.

4. Publish your HIT on the Amazon Mechanical Turk production system.
   This step makes your HIT available to Workers.

5. Workers accept your HIT and complete the assignment.
   You can view the status of your HITs with AWS Shell or the AWS CLI.

6. Process the assignment results.
   When a Worker completes an assignment, you can view the results, output the results to a file, and accept or reject the work. Accepting the work means that you agree to pay the Worker.
   Use List Assignments for a HIT to get results once Workers have completed the Assignment. Then you can process the results with the ApproveAssignment operation and RejectAssignment operation.
<table>
<thead>
<tr>
<th>7</th>
<th>Manage your HIT.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>You can extend the completion time for your HIT, expire the HIT early, add additional assignments, modify the HIT properties, or block Workers whose work does not meet your standards.</td>
</tr>
</tbody>
</table>
Implementing Amazon Mechanical Turk

The following topics describe information and additional resources you can use to implement a project using Amazon Mechanical Turk.

**Topics**
- Interfaces (p. 10)
- Considerations (p. 10)
- Common Use Scenarios (p. 11)
- Coding Resources (p. 12)
- Advanced Functionality (p. 13)
- Reference Resources (p. 13)

In the Creating a HIT (p. 8) tutorial you learned how to complete basic Amazon Mechanical Turk tasks. If you didn't use the tutorial, you can learn how to complete basic and advanced Amazon Mechanical Turk tasks using the *Amazon Mechanical Turk Developer Guide* and by looking at code samples. For more information, go to *Amazon Mechanical Turk Developer Guide* and *Amazon Mechanical Turk Sample Code and Libraries*, respectively.

**Interfaces**

Amazon Mechanical Turk offers the following interfaces:

- Command line
- API
- Requester user interface

The Amazon Mechanical Turk command line interface (CLI) makes it easy to use most of the Amazon Mechanical Turk functionality. When you wish to have a hands-on approach to using Amazon Mechanical Turk and have a relatively small number of assignments and results, the CLI is a good choice. For more information, go to *Amazon Mechanical Turk Command Line Tool Reference*.

When the number of assignments you have or the number of results you have is large, the Amazon Mechanical Turk API is a good choice. The API exercises all of Amazon Mechanical Turk's functionality and enables you to integrate Amazon Mechanical Turk functions programmatically. For more information, go to *Amazon Mechanical Turk Developer Guide*.

If you have a very large number of similar HITs, consider using the Requester user interface. It merges one question template with lots of question data to create many similar HITs. For more information, go to *Amazon Mechanical Turk Requester User Interface*.

**Considerations**

Creating a successful HIT involves more than programming. There is a certain art involved, for example, in pricing a HIT correctly, laying out the question correctly, breaking down the task into HITs, and
minimizing the Worker's time spent with the HIT. For that reason, we created a best practices guide that
gives detailed instructions about creating an effective HIT.

Some of the HITs you create require the Workers to have special skills. You might, for example, publish a
HIT that asks for a translation. Whenever you have a HIT that requires specialized skills, we recommend
that you qualify the Workers. Only those who pass the test receive the opportunity to work on your HITs.
For more information, go to CreateHIT and read about the QualificationRequirement parameter.

Once a Worker becomes qualified, you can grant them qualification status so that they no longer
need to complete a qualification test before working on your HITs. For more information, go to
AssignQualification.

Considerations for Writing a HIT

This guide presented a HIT for you to use. When you have to create your own, there are several things
you should consider:

• What is the problem you are trying to solve?

  What questions do you want the Workers to answer? What is the best way to present the task to
  Workers? You need this information when you write the description and question for your HIT. You
  should be familiar with the format to create your question or task. For more information, go to the
  Amazon Mechanical Turk Developer Guide.

• How much do you want to pay Workers?

  You need to specify a reward for your HIT. Setting too low a reward discourages Workers from working
  on your HITs. You need to determine what a fair price is for the work you're asking the Workers to do.
  The best way is to look at similar tasks advertised on the Amazon Mechanical Turk website. For more
  information, go to the Amazon Mechanical Turk website.

• How many responses do you want?

  This is the number of assignments for your HIT. Sometimes you want only one answer per HIT. When
  the answer is controversial, however, you might like to get multiple answers (and thus use multiple
  assignments) per HIT and reach an answer by consensus.

• How much time do you want to allow to complete the task?

  Giving a Worker too long a time potentially delays getting results. Making the duration too short
  frustrates Workers.

Common Use Scenarios

This section describes some of the ways you can use Amazon Mechanical Turk.

Photo and Video Processing

Amazon Mechanical Turk is well-suited for processing images. In the past, companies have used
Mechanical Turk to:

• Tag objects found in an image for easier searching and advertising targeting
• Select from a set of images the best picture to represent a product
• Audit user-uploaded images for inappropriate content
• Classify objects found in satellite imagery
Data Verification and Clean-up

Companies with large online catalogs use Amazon Mechanical Turk to identify duplicate entries and verify item details. Examples include:

- De-duplication of yellow pages directory listings
- Identification of duplicate products in an online product catalog
- Verification of restaurant details, such as the phone number or hours of operation

Information Gathering

The Amazon Mechanical Turk workforce enables you to gather information, such as:

- Allowing people to ask questions from a computer or mobile device about any topic and have Workers return results to those questions
- Filling out survey data on a variety of topics
- Writing reviews, descriptions and blog entries for websites
- Finding specific fields or data elements in large legal and government documents

Data Processing

Use Amazon Mechanical Turk to process data, for example:

- Podcast editing and transcription
- Human powered translation services
- Search engine rating

Coding Resources

To help you code your applications, we provide the following resources:

- **Developer Resources page**—Click the Developer tab on the Requester website located at https://requester.mturk.com/ to get to the Developer Resources page, which has links to sample code, documentation, the sandbox, and other helpful information.
- **Sample Code and Libraries**—You can use code samples as a means of understanding how to implement the Amazon Mechanical Turk API. For more information, go to Amazon Mechanical Turk Sample Code and Libraries.
- **Customer Forum**—We recommend you look at the Amazon Mechanical Turk Forum to get an idea of what other users are doing and to benefit from the questions they've asked.

The forum can help you understand what you can and can't do with Amazon Mechanical Turk. The forum also serves as a place for you to ask questions that other users or Amazon representatives might answer. You can use the forum to report issues with the service, the API, or the documentation. For more information, go to Amazon Mechanical Turk Discussion Forums.
Advanced Functionality

The tutorial in this guide showed how to accomplish the basic tasks of creating, testing, and publishing your HITs. The Amazon Mechanical Turk API, however, offers advanced functionality, which the following table summarizes. For more information, go to the Amazon Mechanical Turk Developer Guide.

<table>
<thead>
<tr>
<th>Functionality</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Review the work submitted by Workers</td>
<td>You reward work well done by paying the Worker. If work is not done well, you can elect not to pay the Worker and block them from future assignments.</td>
</tr>
<tr>
<td>Give bonuses</td>
<td>You might like to give a bonus to a Worker that does especially good work. This gives the Worker incentive to work on one of your other HITs. By rewarding Workers, you can create a small group of qualified people who you know do good work. They, in turn, will prioritize your HITs over others so that Workers complete your HITs in a timely manner. For more information about awarding bonuses, go to SendBonus.</td>
</tr>
<tr>
<td>Review results programmatically</td>
<td>Reviewing the results manually is an option when the number of assignments is small. As the number of assignments grows, reviewing results programmatically becomes more practical. The Amazon Mechanical Turk API enables you to do that. For more information, go to ListReviewableHITs.</td>
</tr>
<tr>
<td>Delete a HIT</td>
<td>There are times when the results, although accurate, are unexpected and unusable by you. In that case, you have to delete the HIT, revise, and recreate it. For more information, go to DeleteHIT.</td>
</tr>
<tr>
<td>Update HIT properties</td>
<td>You can use API operations and the command line tools to update HIT properties, such as Title, Description, Reward, and Keywords. For more information, go to UpdateHITTypeOfHIT.</td>
</tr>
<tr>
<td>Extend or eliminate HITs</td>
<td>You can also use the API operations to extend the completion time for a HIT, expire a HIT early, or add additional assignments. For more information, go to CreateAdditionalAssignmentsForHIT and DeleteHIT.</td>
</tr>
<tr>
<td>Communicate with Workers</td>
<td>You can use NotifyWorkers to send emails to specified Workers.</td>
</tr>
<tr>
<td>Return the amount of money in your account that you use to pay Workers</td>
<td>Before you can publish Amazon Mechanical Turk HITs, your account must contain the money required to pay for all of the assignments. You can programmatically access the amount of money in your account using GetAccountBalance.</td>
</tr>
<tr>
<td>Create your own qualifications for Workers</td>
<td>We recommend that you use qualification tests when completing your HITs requires specialized skills. You can create your own qualification tests using CreateQualificationType.</td>
</tr>
</tbody>
</table>

Reference Resources

The following list shows additional resources you can use to further your understanding of Amazon Mechanical Turk.

- Learn the pricing for Amazon Mechanical Turk.

For more information, go to Amazon Mechanical Turk Pricing.
• When you have questions about developing with Amazon Mechanical Turk visit the customer forum to
get your questions answered.

A wide variety of questions have already been answered in the forum. If your question has not
been answered, ask it and wait for a fellow developer or Amazon representative to help. For more
information, go to Amazon Mechanical Turk Developer Forums.

• The Service Health Dashboard shows you the status of the Amazon Mechanical Turk web service.

The dashboard shows you whether Amazon Mechanical Turk (and all other AWS web services) are
functioning properly. For more information, go to Service Health Dashboard.

• The Amazon Mechanical Turk Developer Guide provides a detailed discussion of the service.

For more information, go to Amazon Mechanical Turk Developer Guide.

• The HIT page shows the Amazon Mechanical Turk HITs available to work on.

For more information, go to the HIT page.
