Amazon EC2 Container Registry

API Reference

API Version 2015-09-21
Welcome

Amazon Elastic Container Registry (Amazon ECR) is a managed Docker registry service. Customers can use the familiar Docker CLI to push, pull, and manage images. Amazon ECR provides a secure, scalable, and reliable registry. Amazon ECR supports private Docker repositories with resource-based permissions using IAM so that specific users or Amazon EC2 instances can access repositories and images. Developers can use the Docker CLI to author and manage images.

This document was last published on August 8, 2018.
Actions

The following actions are supported:

- BatchCheckLayerAvailability (p. 3)
- BatchDeleteImage (p. 7)
- BatchGetImage (p. 12)
- CompleteLayerUpload (p. 16)
- CreateRepository (p. 20)
- DeleteLifecyclePolicy (p. 23)
- DeleteRepository (p. 27)
- DeleteRepositoryPolicy (p. 30)
- DescribeImages (p. 34)
- DescribeRepositories (p. 39)
- GetAuthorizationToken (p. 43)
- GetDownloadUrlForLayer (p. 46)
- GetLifecyclePolicy (p. 49)
- GetLifecyclePolicyPreview (p. 53)
- GetRepositoryPolicy (p. 58)
- InitiateLayerUpload (p. 62)
- ListImages (p. 64)
- PutImage (p. 68)
- PutLifecyclePolicy (p. 72)
- SetRepositoryPolicy (p. 76)
- StartLifecyclePolicyPreview (p. 80)
- UploadLayerPart (p. 84)
BatchCheckLayerAvailability

Check the availability of multiple image layers in a specified registry and repository.

**Note**
This operation is used by the Amazon ECR proxy, and it is not intended for general use by customers for pulling and pushing images. In most cases, you should use the `docker` CLI to pull, tag, and push images.

**Request Syntax**

```json
{
    "layerDigests": [ "string" ],
    "registryId": "string",
    "repositoryName": "string"
}
```

**Request Parameters**

For information about the parameters that are common to all actions, see Common Parameters (p. 105).

The request accepts the following data in JSON format.

**layerDigests (p. 3)**

The digests of the image layers to check.

Type: Array of strings

Array Members: Minimum number of 1 item. Maximum number of 100 items.

Length Constraints: Minimum length of 0. Maximum length of 1000.

Required: Yes

**registryId (p. 3)**

The AWS account ID associated with the registry that contains the image layers to check. If you do not specify a registry, the default registry is assumed.

Type: String

Pattern: [0-9]{12}

Required: No

**repositoryName (p. 3)**

The name of the repository that is associated with the image layers to check.

Type: String

Pattern: (?:[a-z0-9]+(?:[._-][a-z0-9]+)*[/])*[a-z0-9]+(?:[._-][a-z0-9]+)*)

Required: Yes
Response Syntax

```
{
  "failures": [
    {
      "failureCode": "string",
      "failureReason": "string",
      "layerDigest": "string"
    }
  ],
  "layers": [
    {
      "layerAvailability": "string",
      "layerDigest": "string",
      "layerSize": number,
      "mediaType": "string"
    }
  ]
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**failures (p. 4)**

Any failures associated with the call.

Type: Array of LayerFailure (p. 97) objects

**layers (p. 4)**

A list of image layer objects corresponding to the image layer references in the request.

Type: Array of Layer (p. 96) objects

Errors

For information about the errors that are common to all actions, see Common Errors (p. 107).

**InvalidParameterException**

The specified parameter is invalid. Review the available parameters for the API request.

HTTP Status Code: 400

**RepositoryNotFoundException**

The specified repository could not be found. Check the spelling of the specified repository and ensure that you are performing operations on the correct registry.

HTTP Status Code: 400

**ServerException**

These errors are usually caused by a server-side issue.
HTTP Status Code: 500

Example

In the following example or examples, the Authorization header contents (AUTHPARAMS) must be replaced with an AWS Signature Version 4 signature. For more information about creating these signatures, see Signature Version 4 Signing Process in the AWS General Reference.

You only need to learn how to sign HTTP requests if you intend to manually create them. When you use the AWS Command Line Interface (AWS CLI) or one of the AWS SDKs to make requests to AWS, these tools automatically sign the requests for you with the access key that you specify when you configure the tools. When you use these tools, you don't need to learn how to sign requests yourself.

Example

This example checks the availability of an image layer in the amazonlinux repository.

Sample Request

POST / HTTP/1.1
Host: ecr.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 126
X-Amz-Target: AmazonEC2ContainerRegistry_V20150921.BatchCheckLayerAvailability
X-Amz-Date: 20161216T195733Z
User-Agent: aws-cli/1.11.22 Python/2.7.12 Darwin/16.3.0 botocore/1.4.79
Content-Type: application/x-amz-json-1.1
Authorization: AUTHPARAMS

{
  "layerDigests": [
    "sha256:8e3fa21c4cc40232e835a6761332d225c7af3235c5755f44ada2ed9d0e4ab7e8"
  ],
  "repositoryName": "amazonlinux"
}

Sample Response

HTTP/1.1 200 OK
Server: Server
Date: Fri, 16 Dec 2016 19:57:33 GMT
Content-Type: application/x-amz-json-1.1
Content-Length: 233
Connection: keep-alive
x-amzn-RequestId: e2422faf-c3c9-11e6-a3ee-63b3b5dcf3b9

{
  "failures": [],
  "layers": [
    {
      "layerAvailability": "AVAILABLE",
      "layerDigest": "sha256:8e3fa21c4cc40232e835a6761332d225c7af3235c5755f44ada2ed9d0e4ab7e8",
      "layerSize": 91768077,
      "mediaType": "application/vnd.docker.image.rootfs.diff.tar.gzip"
    }
  ]
}

- AWS SDK for Java
- AWS SDK for JavaScript
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V2
BatchDeleteImage

Deletes a list of specified images within a specified repository. Images are specified with either imageTag or imageDigest.

You can remove a tag from an image by specifying the image's tag in your request. When you remove the last tag from an image, the image is deleted from your repository.

You can completely delete an image (and all of its tags) by specifying the image's digest in your request.

Request Syntax

```json
{
    "imageIds": [
        {
            "imageDigest": "string",
            "imageTag": "string"
        }
    ],
    "registryId": "string",
    "repositoryName": "string"
}
```

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 105).

The request accepts the following data in JSON format.

**imageIds (p. 7)**

A list of image ID references that correspond to images to delete. The format of the imageIds reference is imageTag=tag or imageDigest=digest.

Type: Array of ImageIdentifier (p. 95) objects

Array Members: Minimum number of 1 item. Maximum number of 100 items.

Required: Yes

**registryId (p. 7)**

The AWS account ID associated with the registry that contains the image to delete. If you do not specify a registry, the default registry is assumed.

Type: String

Pattern: [0-9]{12}

Required: No

**repositoryName (p. 7)**

The repository that contains the image to delete.

Type: String

Pattern: (?:[a-z0-9]+(?:[._-][a-z0-9]*)+)[a-z0-9]+(?:[._-][a-z0-9]*)+}
Required: Yes

Response Syntax

```json
{
  "failures": [
    {
      "failureCode": "string",
      "failureReason": "string",
      "imageId": {
        "imageDigest": "string",
        "imageTag": "string"
      }
    }
  ],
  "imageIds": [
    {
      "imageDigest": "string",
      "imageTag": "string"
    }
  ]
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**failures (p. 8)**

Any failures associated with the call.

Type: Array of ImageFailure (p. 94) objects

**imageIds (p. 8)**

The image IDs of the deleted images.

Type: Array of ImageIdentifier (p. 95) objects

Array Members: Minimum number of 1 item. Maximum number of 100 items.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 107).

**InvalidParameterException**

The specified parameter is invalid. Review the available parameters for the API request.

HTTP Status Code: 400

**RepositoryNotFoundException**

The specified repository could not be found. Check the spelling of the specified repository and ensure that you are performing operations on the correct registry.

HTTP Status Code: 400
ServerException

These errors are usually caused by a server-side issue.

HTTP Status Code: 500

Examples

In the following example or examples, the Authorization header contents (AUTHPARAMS) must be replaced with an AWS Signature Version 4 signature. For more information about creating these signatures, see Signature Version 4 Signing Process in the AWS General Reference.

You only need to learn how to sign HTTP requests if you intend to manually create them. When you use the AWS Command Line Interface (AWS CLI) or one of the AWS SDKs to make requests to AWS, these tools automatically sign the requests for you with the access key that you specify when you configure the tools. When you use these tools, you don’t need to learn how to sign requests yourself.

Example

This example deletes an image in the ubuntu repository with the imageTag value of xenial.

Sample Request

```
POST / HTTP/1.1
Host: ecr.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 66
X-Amz-Target: AmazonEC2ContainerRegistry_V20150921.BatchDeleteImage
X-Amz-Date: 20161216T193711Z
User-Agent: aws-cli/1.11.22 Python/2.7.12 Darwin/16.3.0 botocore/1.4.79
Content-Type: application/x-amz-json-1.1
Authorization: AUTHPARAMS

{
  "repositoryName": "ubuntu",
  "imageIds": [
    {
      "imageTag": "xenial"
    }
  ]
}
```

Sample Response

```
HTTP/1.1 200 OK
Server: Server
Date: Fri, 16 Dec 2016 19:37:11 GMT
Content-Type: application/x-amz-json-1.1
Content-Length: 138
Connection: keep-alive
x-amzn-RequestId: 09cc7023-c3c7-11e6-8acf-61b7dd8abe56

{
  "failures": [],
  "imageIds": [
    {
      "imageDigest": "sha256:7a64bc9c8843b0a8c8b8a7e4715b7615e4e1b0d8ca3c7e7a76ec8250899c397a",
      "imageTag": "xenial"
    }
  ]
}
Example

This example deletes an image (and all of its tags) in the ubuntu repository with the imageDigest value of sha256:7a64bc9c8843b0a8c8b8a7e4715b7615e4e1b0d8ca3c7e7a76ec8250899c397a.

Sample Request

```plaintext
POST / HTTP/1.1
Host: ecr.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 134
X-Amz-Target: AmazonEC2ContainerRegistry_V20150921.BatchDeleteImage
X-Amz-Date: 20161216T194250Z
User-Agent: aws-cli/1.11.22 Python/2.7.12 Darwin/16.3.0 botocore/1.4.79
Content-Type: application/x-amz-json-1.1
Authorization: AUTHPARAMS

{
  "repositoryName": "ubuntu",
  "imageIds": [
    {
      "imageDigest": "sha256:7a64bc9c8843b0a8c8b8a7e4715b7615e4e1b0d8ca3c7e7a76ec8250899c397a"
    }
  ]
}
```

Sample Response

```plaintext
HTTP/1.1 200 OK
Server: Server
Date: Fri, 16 Dec 2016 19:42:50 GMT
Content-Type: application/x-amz-json-1.1
Content-Length: 248
Connection: keep-alive
x-amzn-RequestId: d441a9f6-c3c7-11e6-8acf-61b7dd8abe56

{
  "failures": [],
  "imageIds": [
    {
      "imageDigest": "sha256:7a64bc9c8843b0a8c8b8a7e4715b7615e4e1b0d8ca3c7e7a76ec8250899c397a",
      "imageTag": "xenial"
    },
    {
      "imageDigest": "sha256:7a64bc9c8843b0a8c8b8a7e4715b7615e4e1b0d8ca3c7e7a76ec8250899c397a",
      "imageTag": "latest"
    }
  ]
}
```

BatchGetImage

Gets detailed information for specified images within a specified repository. Images are specified with either imageTag or imageDigest.

Request Syntax

```json
{}

"acceptedMediaTypes": [ "string" ],
"imageIds": [ 
    
    "imageDigest": "string",
    "imageTag": "string" 
],
"registryId": "string",
"repositoryName": "string"
```

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 105).

The request accepts the following data in JSON format.

**acceptedMediaTypes (p. 12)**

The accepted media types for the request.

Valid values:
- application/vnd.docker.distribution.manifest.v1+json
- application/vnd.docker.distribution.manifest.v2+json
- application/vnd.oci.image.manifest.v1+json

Type: Array of strings

Array Members: Minimum number of 1 item. Maximum number of 100 items.

Required: No

**imageIds (p. 12)**

A list of image ID references that correspond to images to describe. The format of the imageIds reference is imageTag=tag or imageDigest=digest.

Type: Array of ImageIdentifier (p. 95) objects

Array Members: Minimum number of 1 item. Maximum number of 100 items.

Required: Yes

**registryId (p. 12)**

The AWS account ID associated with the registry that contains the images to describe. If you do not specify a registry, the default registry is assumed.

Type: String

Pattern: [0-9]{12}

Required: No
repositoryName (p. 12)

The repository that contains the images to describe.
Type: String
Pattern: (?:[a-z0-9]+(?:[._-][a-z0-9]+)*[a-z0-9]+(?:[._-][a-z0-9]+]*)*
Required: Yes

Response Syntax

```json
{
   "failures": [
      {
         "failureCode": "string",
         "failureReason": "string",
         "imageId": {
            "imageDigest": "string",
            "imageTag": "string"
         }
      }
   ],
   "images": [
      {
         "imageId": {
            "imageDigest": "string",
            "imageTag": "string"
         },
         "imageManifest": "string",
         "registryId": "string",
         "repositoryName": "string"
      }
   ]
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.
The following data is returned in JSON format by the service.

failures (p. 13)
Any failures associated with the call.
Type: Array of ImageFailure (p. 94) objects

images (p. 13)
A list of image objects corresponding to the image references in the request.
Type: Array of Image (p. 91) objects

Errors

For information about the errors that are common to all actions, see Common Errors (p. 107).
InvalidParameterException

The specified parameter is invalid. Review the available parameters for the API request.

HTTP Status Code: 400

RepositoryNotFoundException

The specified repository could not be found. Check the spelling of the specified repository and ensure that you are performing operations on the correct registry.

HTTP Status Code: 400

ServerException

These errors are usually caused by a server-side issue.

HTTP Status Code: 500

Example

In the following example or examples, the Authorization header contents (AUTHPARAMS) must be replaced with an AWS Signature Version 4 signature. For more information about creating these signatures, see Signature Version 4 Signing Process in the AWS General Reference.

You only need to learn how to sign HTTP requests if you intend to manually create them. When you use the AWS Command Line Interface (AWS CLI) or one of the AWS SDKs to make requests to AWS, these tools automatically sign the requests for you with the access key that you specify when you configure the tools. When you use these tools, you don't need to learn how to sign requests yourself.

Example

This example describes an image in the amazonlinux repository with the imageTag value of latest.

Sample Request

```
POST / HTTP/1.1
Host: ecr.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 71
X-Amz-Target: AmazonEC2ContainerRegistry_V20150921.BatchGetImage
X-Amz-Date: 20161216T195356Z
User-Agent: aws-cli/1.11.22 Python/2.7.12 Darwin/16.3.0 botocore/1.4.79
Content-Type: application/x-amz-json-1.1
Authorization: AUTHPARAMS

{
  "repositoryName": "amazonlinux",
  "imageIds": [
    {
      "imageTag": "latest"
    }
  ]
}
```

Sample Response

```
HTTP/1.1 200 OK
Server: Server
```

CompleteLayerUpload

Informs Amazon ECR that the image layer upload has completed for a specified registry, repository name, and upload ID. You can optionally provide a sha256 digest of the image layer for data validation purposes.

**Note**
This operation is used by the Amazon ECR proxy, and it is not intended for general use by customers for pulling and pushing images. In most cases, you should use the docker CLI to pull, tag, and push images.

### Request Syntax

```json
{
    "layerDigests": [ "string" ],
    "registryId": "string",
    "repositoryName": "string",
    "uploadId": "string"
}
```

### Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](p. 105).

The request accepts the following data in JSON format.

**layerDigests** *(p. 16)*

The sha256 digest of the image layer.

Type: Array of strings

Array Members: Minimum number of 1 item. Maximum number of 100 items.

Pattern: `[a-zA-Z0-9-_.]+:[a-fA-F0-9]+`

Required: Yes

**registryId** *(p. 16)*

The AWS account ID associated with the registry to which to upload layers. If you do not specify a registry, the default registry is assumed.

Type: String

Pattern: `[0-9]{12}`

Required: No

**repositoryName** *(p. 16)*

The name of the repository to associate with the image layer.

Type: String

Pattern: `(?:[a-z0-9]+(?:[._-][a-z0-9]*)*+)[a-z0-9]+(?:[._-][a-z0-9]*)*`
uploadID (p. 16)

The upload ID from a previous InitiateLayerUpload (p. 62) operation to associate with the image layer.

Type: String

Pattern: \[0-9a-fA-F]{8}-[0-9a-fA-F]{4}-[0-9a-fA-F]{4}-[0-9a-fA-F]{4}-[0-9a-fA-F]{12}\]

Response Syntax

{
"layerDigest": "string",
"registryId": "string",
"repositoryName": "string",
"uploadId": "string"
}

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

layerDigest (p. 17)

The sha256 digest of the image layer.

Type: String

Pattern: [a-zA-Z0-9-._+]+:[a-fA-F0-9]+ registryId (p. 17)

The registry ID associated with the request.

Type: String

Pattern: [0-9]{12} repositoryName (p. 17)

The repository name associated with the request.

Type: String

Pattern: (?:[a-z0-9]+(?:[._-][a-z0-9]+)*[/])*[a-z0-9]+(?:[._-][a-z0-9]+)* uploadId (p. 17)

The upload ID associated with the layer.

Type: String
Pattern: [0-9a-fA-F]{8}-[0-9a-fA-F]{4}-[0-9a-fA-F]{4}-[0-9a-fA-F]{4}-[0-9a-fA-F]{12}

Errors

For information about the errors that are common to all actions, see Common Errors (p. 107).

EmptyUploadException

The specified layer upload does not contain any layer parts.

HTTP Status Code: 400

InvalidLayerException

The layer digest calculation performed by Amazon ECR upon receipt of the image layer does not match the digest specified.

HTTP Status Code: 400

InvalidParameterException

The specified parameter is invalid. Review the available parameters for the API request.

HTTP Status Code: 400

LayerAlreadyExistsException

The image layer already exists in the associated repository.

HTTP Status Code: 400

LayerPartTooSmallException

Layer parts must be at least 5 MiB in size.

HTTP Status Code: 400

RepositoryNotFoundException

The specified repository could not be found. Check the spelling of the specified repository and ensure that you are performing operations on the correct registry.

HTTP Status Code: 400

ServerException

These errors are usually caused by a server-side issue.

HTTP Status Code: 500

UploadNotFoundException

The upload could not be found, or the specified upload id is not valid for this repository.

HTTP Status Code: 400

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface
- AWS SDK for .NET
• AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java
• AWS SDK for JavaScript
• AWS SDK for PHP V3
• AWS SDK for Python
• AWS SDK for Ruby V2
CreateRepository

Creates an image repository.

Request Syntax

```
{
  "repositoryName": "string"
}
```

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 105).

The request accepts the following data in JSON format.

repositoryName (p. 20)

The name to use for the repository. The repository name may be specified on its own (such as nginx-web-app) or it can be prepended with a namespace to group the repository into a category (such as project-a/nginx-web-app).

Type: String

Pattern: (?:[a-z0-9]+(?:[._-][a-z0-9]+)+)[a-z0-9]+(?:[._-][a-z0-9]+)*

Required: Yes

Response Syntax

```
{
  "repository": {
    "createdAt": number,
    "registryId": "string",
    "repositoryArn": "string",
    "repositoryName": "string",
    "repositoryUri": "string"
  }
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

repository (p. 20)

The repository that was created.

Type: Repository (p. 103) object
Errors

For information about the errors that are common to all actions, see Common Errors (p. 107).

InvalidParameterException

The specified parameter is invalid. Review the available parameters for the API request.

HTTP Status Code: 400

LimitExceededException

The operation did not succeed because it would have exceeded a service limit for your account. For more information, see Amazon ECR Default Service Limits in the Amazon Elastic Container Registry User Guide.

HTTP Status Code: 400

RepositoryAlreadyExistsException

The specified repository already exists in the specified registry.

HTTP Status Code: 400

ServerException

These errors are usually caused by a server-side issue.

HTTP Status Code: 500

Example

In the following example or examples, the Authorization header contents (AUTHPARAMS) must be replaced with an AWS Signature Version 4 signature. For more information about creating these signatures, see Signature Version 4 Signing Process in the AWS General Reference.

You only need to learn how to sign HTTP requests if you intend to manually create them. When you use the AWS Command Line Interface (AWS CLI) or one of the AWS SDKs to make requests to AWS, these tools automatically sign the requests for you with the access key that you specify when you configure the tools. When you use these tools, you don't need to learn how to sign requests yourself.

Example

This example creates a repository called nginx-web-app inside the project-a namespace in the default registry for an account.

Sample Request

```
POST / HTTP/1.1
Host: ecr.us-east-1.amazonaws.com
Accept-Encoding: identity
Content-Length: 45
X-Amz-Target: AmazonEC2ContainerRegistry_V20150921.CreateRepository
X-Amz-Date: 20151130T203458Z
User-Agent: aws-cli/1.9.9 Python/2.7.10 Darwin/14.5.0 botocore/1.3.9
Content-Type: application/x-amz-json-1.1
Authorization: AUTHPARAMS

{
    "repositoryName": "project-a/nginx-web-app"
}
```
Sample Response

HTTP/1.1 200 OK
Server: Server
Date: Mon, 30 Nov 2015 20:34:58 GMT
Content-Type: application/x-amz-json-1.1
Content-Length: 175
Connection: keep-alive
x-amzn-RequestId: 123a4b56-7c89-01d2-3ef4-example5678f

{
  "repository": {
    "registryId": "012345678910",
    "repositoryArn": "arn:aws:ecr:us-east-1:012345678910:repository/project-a/nginx-web-app",
    "repositoryName": "project-a/nginx-web-app"
  }
}

DeleteLifecyclePolicy

Deletes the specified lifecycle policy.

Request Syntax

```json
{
   "registryId": "string",
   "repositoryName": "string"
}
```

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 105).

The request accepts the following data in JSON format.

**registryId (p. 23)**

The AWS account ID associated with the registry that contains the repository. If you do not specify a registry, the default registry is assumed.

Type: String

Pattern: [0-9]{12}

Required: No

**repositoryName (p. 23)**

The name of the repository.

Type: String

Pattern: (?:[a-z0-9]+(?:[._-][a-z0-9]+)*[/]*)*[a-z0-9]+(?:[._-][a-z0-9]+)*

Required: Yes

Response Syntax

```json
{
   "lastEvaluatedAt": number,
   "lifecyclePolicyText": "string",
   "registryId": "string",
   "repositoryName": "string"
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.
The following data is returned in JSON format by the service.

**lastEvaluatedAt (p. 23)**

The time stamp of the last time that the lifecycle policy was run.

Type: Timestamp

**lifecyclePolicyText (p. 23)**

The JSON lifecycle policy text.

Type: String

Length Constraints: Minimum length of 100. Maximum length of 10240.

**registryId (p. 23)**

The registry ID associated with the request.

Type: String

Pattern: \[0-9\]\{12\}

**repositoryName (p. 23)**

The repository name associated with the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Errors (p. 107).

**InvalidParameterException**

The specified parameter is invalid. Review the available parameters for the API request.

HTTP Status Code: 400

**LifecyclePolicyNotFoundException**

The lifecycle policy could not be found, and no policy is set to the repository.

HTTP Status Code: 400

**RepositoryNotFoundException**

The specified repository could not be found. Check the spelling of the specified repository and ensure that you are performing operations on the correct registry.

HTTP Status Code: 400

**ServerException**

These errors are usually caused by a server-side issue.

HTTP Status Code: 500
Example

In the following example or examples, the Authorization header contents (AUTHPARAMS) must be replaced with an AWS Signature Version 4 signature. For more information about creating these signatures, see Signature Version 4 Signing Process in the AWS General Reference.

You only need to learn how to sign HTTP requests if you intend to manually create them. When you use the AWS Command Line Interface (AWS CLI) or one of the AWS SDKs to make requests to AWS, these tools automatically sign the requests for you with the access key that you specify when you configure the tools. When you use these tools, you don't need to learn how to sign requests yourself.

Example

This example deletes a lifecycle policy for a repository called project-a/amazon-ecs-sample in the default registry for an account.

Sample Request

```plaintext
POST / HTTP/1.1
Host: ecr.us-west-2.amazonaws.com
Accept-Encoding: identity
X-Amz-Target: AmazonEC2ContainerRegistry_V20150921.DeleteLifecyclePolicy
Content-Type: application/x-amz-json-1.1
User-Agent: aws-cli/1.11.144 Python/3.6.1 Darwin/16.6.0 botocore/1.7.2
X-Amz-Date: 20170901T223937Z
Authorization: AUTHPARAMS
Content-Length: 48
{
  "repositoryName": "project-a/amazon-ecs-sample",
}
```

Sample Response

```plaintext
HTTP/1.1 200 OK
Server: Server
Date: Fri, 01 Sep 2017 19:42:18 GMT
Content-Type: application/x-amz-json-1.1
Content-Length: 340
Connection: keep-alive
x-amzn-RequestId: 123a4b56-7c89-01d2-3ef4-example5678f
{
  "lastEvaluatedAt":1.504295007E9,
  "lifecyclePolicyText": "{\"rules\":[{\"rulePriority\":1,\"description\":\"Expire images older than 14 days\",\"selection\":{\"tagStatus\":\"untagged\",\"countType\":\"sinceImagePushed\",\"countUnit\":\"days\",\"countNumber\":14},\"action\":{\"type\":\"expire\"}}]},
  "registryId":"012345678910",
  "repositoryName":"project-a/amazon-ecs-sample"
}
```

DeleteRepository

Deletes an existing image repository. If a repository contains images, you must use the `force` option to delete it.

**Request Syntax**

```json
{
    "force": boolean,
    "registryId": "string",
    "repositoryName": "string"
}
```

**Request Parameters**

For information about the parameters that are common to all actions, see Common Parameters (p. 105).

The request accepts the following data in JSON format.

`force (p. 27)`

If a repository contains images, forces the deletion.

Type: Boolean

Required: No

`registryId (p. 27)`

The AWS account ID associated with the registry that contains the repository to delete. If you do not specify a registry, the default registry is assumed.

Type: String

Pattern: `[0-9]{12}`

Required: No

`repositoryName (p. 27)`

The name of the repository to delete.

Type: String

Pattern: `(?:[a-z0-9]+(?:[._-][a-z0-9]+)*)*[a-z0-9]+(?:[._-][a-z0-9]+)*

Required: Yes

**Response Syntax**

```json
{
    "repository": {
        "createdAt": number,
        "registryId": "string",
    }
}
```

API Version 2015-09-21
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

repository (p. 27)

The repository that was deleted.

Type: Repository (p. 103) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 107).

InvalidParameterException

The specified parameter is invalid. Review the available parameters for the API request.

HTTP Status Code: 400

RepositoryNotEmptyException

The specified repository contains images. To delete a repository that contains images, you must force the deletion with the force parameter.

HTTP Status Code: 400

RepositoryNotFoundException

The specified repository could not be found. Check the spelling of the specified repository and ensure that you are performing operations on the correct registry.

HTTP Status Code: 400

ServerException

These errors are usually caused by a server-side issue.

HTTP Status Code: 500

Example

In the following example or examples, the Authorization header contents (AUTHPARAMS) must be replaced with an AWS Signature Version 4 signature. For more information about creating these signatures, see Signature Version 4 Signing Process in the AWS General Reference.

You only need to learn how to sign HTTP requests if you intend to manually create them. When you use the AWS Command Line Interface (AWS CLI) or one of the AWS SDKs to make requests to AWS, these tools automatically sign the requests for you with the access key that you specify when you configure the tools. When you use these tools, you don’t need to learn how to sign requests yourself.
Example

This example deletes a repository named `ubuntu` in the default registry for an account.

Sample Request

```
POST / HTTP/1.1
Host: ecr.us-east-1.amazonaws.com
Accept-Encoding: identity
Content-Length: 43
X-Amz-Target: AmazonEC2ContainerRegistry_V20150921.DeleteRepository
X-Amz-Date: 20151130T201424Z
User-Agent: aws-cli/1.9.9 Python/2.7.10 Darwin/14.5.0 botocore/1.3.9
Content-Type: application/x-amz-json-1.1
Authorization: AUTHPARAMS

{
    "repositoryName": "ubuntu",
    "force": true
}
```

Sample Response

```
HTTP/1.1 200 OK
Server: Server
Date: Mon, 30 Nov 2015 20:14:24 GMT
Content-Type: application/x-amz-json-1.1
Content-Length: 141
Connection: keep-alive
x-amzn-RequestId: 123a4b56-7c89-01d2-3ef4-example5678f

{
    "repository": {
        "registryId": "012345678910",
        "repositoryArn": "arn:aws:ecr:us-east-1:012345678910:repository/ubuntu",
        "repositoryName": "ubuntu"
    }
}
```

DeleteRepositoryPolicy

Deletes the repository policy from a specified repository.

**Request Syntax**

```json
{
    "registryId": "string",
    "repositoryName": "string"
}
```

**Request Parameters**

For information about the parameters that are common to all actions, see Common Parameters (p. 105).

The request accepts the following data in JSON format.

**registryId (p. 30)**

The AWS account ID associated with the registry that contains the repository policy to delete. If you do not specify a registry, the default registry is assumed.

<table>
<thead>
<tr>
<th>Type</th>
<th>String</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pattern</td>
<td>[0-9]{12}</td>
</tr>
<tr>
<td>Required</td>
<td>No</td>
</tr>
</tbody>
</table>

**repositoryName (p. 30)**

The name of the repository that is associated with the repository policy to delete.

<table>
<thead>
<tr>
<th>Type</th>
<th>String</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pattern</td>
<td>(?:[a-z0-9]+(?:[.<em>-][a-z0-9]+)<em>[/])</em>[a-z0-9]+(?:[.</em>-][a-z0-9]+)*</td>
</tr>
<tr>
<td>Required</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Response Syntax**

```json
{
    "policyText": "string",
    "registryId": "string",
    "repositoryName": "string"
}
```

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.
policyText (p. 30)

The JSON repository policy that was deleted from the repository.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 10240.

registryId (p. 30)

The registry ID associated with the request.

Type: String

Pattern: [0-9]{12}

repositoryName (p. 30)

The repository name associated with the request.

Type: String

Pattern: (?:[a-z0-9]+(?:[._-][a-z0-9-]*)*)*[a-z0-9]+(?:[._-][a-z0-9-]*)*

Errors

For information about the errors that are common to all actions, see Common Errors (p. 107).

InvalidParameterException

The specified parameter is invalid. Review the available parameters for the API request.

HTTP Status Code: 400

RepositoryNotFoundException

The specified repository could not be found. Check the spelling of the specified repository and ensure that you are performing operations on the correct registry.

HTTP Status Code: 400

RepositoryPolicyNotFoundException

The specified repository and registry combination does not have an associated repository policy.

HTTP Status Code: 400

ServerException

These errors are usually caused by a server-side issue.

HTTP Status Code: 500

Example

In the following example or examples, the Authorization header contents (AUTHPARAMS) must be replaced with an AWS Signature Version 4 signature. For more information about creating these signatures, see Signature Version 4 Signing Process in the AWS General Reference.
You only need to learn how to sign HTTP requests if you intend to manually create them. When you use the AWS Command Line Interface (AWS CLI) or one of the AWS SDKs to make requests to AWS, these tools automatically sign the requests for you with the access key that you specify when you configure the tools. When you use these tools, you don't need to learn how to sign requests yourself.

**Example**

This example deletes the repository policy from the `ubuntu` repository.

**Sample Request**

```
POST / HTTP/1.1
Host: ecr.us-east-1.amazonaws.com
Accept-Encoding: identity
Content-Length: 28
X-Amz-Target: AmazonEC2ContainerRegistry_V20150921.DeleteRepositoryPolicy
X-Amz-Date: 20151215T003722Z
User-Agent: aws-cli/1.9.10 Python/2.7.10 Darwin/14.5.0 botocore/1.3.10
Content-Type: application/x-amz-json-1.1
Authorization: AUTHPARAMS

{
  "repositoryName": "ubuntu"
}
```

**Sample Response**

```
HTTP/1.1 200 OK
Server: Server
Date: Tue, 15 Dec 2015 00:37:22 GMT
Content-Type: application/x-amz-json-1.1

- AWS SDK for Ruby V2

API Version 2015-09-21
DescribeImages

Returns metadata about the images in a repository, including image size, image tags, and creation date.

**Note**
Beginning with Docker version 1.9, the Docker client compresses image layers before pushing them to a V2 Docker registry. The output of the `docker images` command shows the uncompressed image size, so it may return a larger image size than the image sizes returned by DescribeImages (p. 34).

Request Syntax

```
{
  "filter": {
    "tagStatus": "string"
  },
  "imageIds": [
    {
      "imageDigest": "string",
      "imageTag": "string"
    }
  ],
  "maxResults": number,
  "nextToken": "string",
  "registryId": "string",
  "repositoryName": "string"
}
```

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 105).

The request accepts the following data in JSON format.

**filter (p. 34)**

The filter key and value with which to filter your DescribeImages results.

Type: DescribeImagesFilter (p. 90) object

Required: No

**imageIds (p. 34)**

The list of image IDs for the requested repository.

Type: Array of ImageIdentifier (p. 95) objects

Array Members: Minimum number of 1 item. Maximum number of 100 items.

Required: No

**maxResults (p. 34)**

The maximum number of repository results returned by DescribeImages in paginated output. When this parameter is used, DescribeImages only returns maxResults results in a single page along with a nextToken response element. The remaining results of the initial request can be seen by sending another DescribeImages request with the returned nextToken value. This value can

API Version 2015-09-21
34
be between 1 and 100. If this parameter is not used, then DescribeImages returns up to 100 results and a nextToken value, if applicable. This option cannot be used when you specify images with imageIds.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 100.

Required: No

nextToken (p. 34)

The nextToken value returned from a previous paginated DescribeImages request where maxResults was used and the results exceeded the value of that parameter. Pagination continues from the end of the previous results that returned the nextToken value. This value is null when there are no more results to return. This option cannot be used when you specify images with imageIds.

Type: String

Required: No

registryId (p. 34)

The AWS account ID associated with the registry that contains the repository in which to describe images. If you do not specify a registry, the default registry is assumed.

Type: String

Pattern: [0-9]{12}

Required: No

repositoryName (p. 34)

A list of repositories to describe.

Type: String

Pattern: (?:[a-z0-9]+(?:[._-][a-z0-9]+)*[a-z0-9]+(?:[._-][a-z0-9]+)*

Required: Yes

Response Syntax

```json
{
    "imageDetails": [
        {
            "imageDigest": "string",
            "imagePushedAt": number,
            "imageSizeInBytes": number,
            "imageTags": [ "string" ],
            "registryId": "string",
            "repositoryName": "string"
        }
    ],
    "nextToken": "string"
}
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**imageDetails (p. 35)**

A list of ImageDetail (p. 92) objects that contain data about the image.

Type: Array of ImageDetail (p. 92) objects

**nextToken (p. 35)**

The `nextToken` value to include in a future DescribeImages request. When the results of a DescribeImages request exceed `maxResults`, this value can be used to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

Errors

For information about the errors that are common to all actions, see Common Errors (p. 107).

**ImageNotFoundException**

The image requested does not exist in the specified repository.

HTTP Status Code: 400

**InvalidParameterException**

The specified parameter is invalid. Review the available parameters for the API request.

HTTP Status Code: 400

**RepositoryNotFoundException**

The specified repository could not be found. Check the spelling of the specified repository and ensure that you are performing operations on the correct registry.

HTTP Status Code: 400

**ServerException**

These errors are usually caused by a server-side issue.

HTTP Status Code: 500

Example

In the following example or examples, the Authorization header contents (`AUTHPARAMS`) must be replaced with an AWS Signature Version 4 signature. For more information about creating these signatures, see Signature Version 4 Signing Process in the AWS General Reference.

You only need to learn how to sign HTTP requests if you intend to manually create them. When you use the AWS Command Line Interface (AWS CLI) or one of the AWS SDKs to make requests to AWS, these tools automatically sign the requests for you with the access key that you specify when you configure the tools. When you use these tools, you don't need to learn how to sign requests yourself.
### Example

This example describes the images in a repository named `ubuntu` in the default account. Note that the image with the digest `sha256:7a64bc9c8843b0a8c8b8a7e4715b7615e4e1b0d8ca3c7e7a76ec8250899c397a` is tagged as latest and xenial.

### Sample Request

```
POST / HTTP/1.1
Host: ecr.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 28
X-Amz-Target: AmazonEC2ContainerRegistry_V20150921.DescribeImages
X-Amz-Date: 20161216T193133Z
User-Agent: aws-cli/1.11.22 Python/2.7.12 Darwin/16.3.0 botocore/1.4.79
Content-Type: application/x-amz-json-1.1

DescribeRepositories

Describes image repositories in a registry.

Request Syntax

```json
{
   "maxResults": number,
   "nextToken": "string",
   "registryId": "string",
   "repositoryNames": [ "string" ]
}
```

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 105).

The request accepts the following data in JSON format.

maxResults (p. 39)

The maximum number of repository results returned by DescribeRepositories in paginated output. When this parameter is used, DescribeRepositories only returns maxResults results in a single page along with a nextToken response element. The remaining results of the initial request can be seen by sending another DescribeRepositories request with the returned nextToken value. This value can be between 1 and 100. If this parameter is not used, then DescribeRepositories returns up to 100 results and a nextToken value, if applicable. This option cannot be used when you specify repositories with repositoryNames.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 100.

Required: No

nextToken (p. 39)

The nextToken value returned from a previous paginated DescribeRepositories request where maxResults was used and the results exceeded the value of that parameter. Pagination continues from the end of the previous results that returned the nextToken value. This value is null when there are no more results to return. This option cannot be used when you specify repositories with repositoryNames.

Note

This token should be treated as an opaque identifier that is only used to retrieve the next items in a list and not for other programmatic purposes.

Type: String

Required: No

registryId (p. 39)

The AWS account ID associated with the registry that contains the repositories to be described. If you do not specify a registry, the default registry is assumed.

Type: String
Response Syntax

```json
{
  "nextToken": "string",
  "repositories": [
    {
      "createdAt": number,
      "registryId": "string",
      "repositoryArn": "string",
      "repositoryName": "string",
      "repositoryUri": "string"
    }
  ]
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**nextToken (p. 40)**

The `nextToken` value to include in a future `DescribeRepositories` request. When the results of a `DescribeRepositories` request exceed `maxResults`, this value can be used to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

**repositories (p. 40)**

A list of repository objects corresponding to valid repositories.

Type: Array of `Repository (p. 103)` objects

Errors

For information about the errors that are common to all actions, see `Common Errors (p. 107)`.
InvalidParameterException

The specified parameter is invalid. Review the available parameters for the API request.

HTTP Status Code: 400

RepositoryNotFoundException

The specified repository could not be found. Check the spelling of the specified repository and ensure that you are performing operations on the correct registry.

HTTP Status Code: 400

ServerException

These errors are usually caused by a server-side issue.

HTTP Status Code: 500

Example

In the following example or examples, the Authorization header contents (AUTHPARAMS) must be replaced with an AWS Signature Version 4 signature. For more information about creating these signatures, see Signature Version 4 Signing Process in the AWS General Reference.

You only need to learn how to sign HTTP requests if you intend to manually create them. When you use the AWS Command Line Interface (AWS CLI) or one of the AWS SDKs to make requests to AWS, these tools automatically sign the requests for you with the access key that you specify when you configure the tools. When you use these tools, you don't need to learn how to sign requests yourself.

Example

This example describes the repositories in the default registry for an account.

Sample Request

```plaintext
POST / HTTP/1.1
Host: ecr.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 2
X-Amz-Target: AmazonEC2ContainerRegistry_V20150921.DescribeRepositories
X-Amz-Date: 20161216T200121Z

GetAuthorizationToken

Retrieves a token that is valid for a specified registry for 12 hours. This command allows you to use the docker CLI to push and pull images with Amazon ECR. If you do not specify a registry, the default registry is assumed.

The authorizationToken returned for each registry specified is a base64 encoded string that can be decoded and used in a docker login command to authenticate to a registry. The AWS CLI offers an aws ecr get-login command that simplifies the login process.

Request Syntax

```json
{
  "registryIds": [ "string" ]
}
```

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 105).

The request accepts the following data in JSON format.

registryIds (p. 43)

A list of AWS account IDs that are associated with the registries for which to get authorization tokens. If you do not specify a registry, the default registry is assumed.

Type: Array of strings

Array Members: Minimum number of 1 item. Maximum number of 10 items.

Pattern: \[0-9]{12}\]

Required: No

Response Syntax

```json
{
  "authorizationData": [
    {
      "authorizationToken": "string",
      "expiresAt": number,
      "proxyEndpoint": "string"
    }
  ]
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.
authorizationData (p. 43)

A list of authorization token data objects that correspond to the registryIds values in the request.

Type: Array of AuthorizationData (p. 89) objects

Errors

For information about the errors that are common to all actions, see Common Errors (p. 107).

InvalidParameterException

The specified parameter is invalid. Review the available parameters for the API request.

HTTP Status Code: 400

ServerException

These errors are usually caused by a server-side issue.

HTTP Status Code: 500

Example

In the following example or examples, the Authorization header contents (AUTHPARAMS) must be replaced with an AWS Signature Version 4 signature. For more information about creating these signatures, see Signature Version 4 Signing Process in the AWS General Reference.

You only need to learn how to sign HTTP requests if you intend to manually create them. When you use the AWS Command Line Interface (AWS CLI) or one of the AWS SDKs to make requests to AWS, these tools automatically sign the requests for you with the access key that you specify when you configure the tools. When you use these tools, you don't need to learn how to sign requests yourself.

Example

This example gets an authorization token for your default registry.

Sample Request

POST / HTTP/1.1
Host: ecr.us-east-1.amazonaws.com
Accept-Encoding: identity
Content-Length: 2
X-Amz-Target: AmazonEC2ContainerRegistry_V20150921.GetAuthorizationToken
X-Amz-Date: 20151129T221940Z
User-Agent: aws-cli/1.9.9 Python/2.7.10 Darwin/14.5.0 botocore/1.3.9
Content-Type: application/x-amz-json-1.1
Authorization: AUTHPARAMS

{}

Sample Response

HTTP/1.1 200 OK
Server: Server
Date: Sun, 29 Nov 2015 22:19:39 GMT

GetDownloadUrlForLayer

Retrieves the pre-signed Amazon S3 download URL corresponding to an image layer. You can only get URLs for image layers that are referenced in an image.

**Note**
This operation is used by the Amazon ECR proxy, and it is not intended for general use by customers for pulling and pushing images. In most cases, you should use the `docker` CLI to pull, tag, and push images.

**Request Syntax**

```json
{
    "layerDigest": "string",
    "registryId": "string",
    "repositoryName": "string"
}
```

**Request Parameters**

For information about the parameters that are common to all actions, see Common Parameters (p. 105).

The request accepts the following data in JSON format.

**layerDigest** (p. 46)

The digest of the image layer to download.

Type: String

Pattern: `[a-zA-Z0-9-_+.]+:[a-fA-F0-9]+`

Required: Yes

**registryId** (p. 46)

The AWS account ID associated with the registry that contains the image layer to download. If you do not specify a registry, the default registry is assumed.

Type: String

Pattern: `[0-9]{12}`

Required: No

**repositoryName** (p. 46)

The name of the repository that is associated with the image layer to download.

Type: String

Required: Yes
Response Syntax

```
{
  "downloadUrl": "string",
  "layerDigest": "string"
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**downloadUrl (p. 47)**

The pre-signed Amazon S3 download URL for the requested layer.

Type: String

**layerDigest (p. 47)**

The digest of the image layer to download.

Type: String

Pattern: [a-zA-Z0-9-_+.]+:[a-fA-F0-9]+  

Errors

For information about the errors that are common to all actions, see Common Errors (p. 107).

**InvalidParameterException**

The specified parameter is invalid. Review the available parameters for the API request.

HTTP Status Code: 400

**LayerInaccessibleException**

The specified layer is not available because it is not associated with an image. Unassociated image layers may be cleaned up at any time.

HTTP Status Code: 400

**LayersNotFoundException**

The specified layers could not be found, or the specified layer is not valid for this repository.

HTTP Status Code: 400

**RepositoryNotFoundException**

The specified repository could not be found. Check the spelling of the specified repository and ensure that you are performing operations on the correct registry.

HTTP Status Code: 400

**ServerException**

These errors are usually caused by a server-side issue.
HTTP Status Code: 500

GetLifecyclePolicy

Retrieves the specified lifecycle policy.

Request Syntax

```json
{
   "registryId": "string",
   "repositoryName": "string"
}
```

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 105).

The request accepts the following data in JSON format.

**registryId (p. 49)**

The AWS account ID associated with the registry that contains the repository. If you do not specify a registry, the default registry is assumed.

Type: String

Pattern: [0-9]{12}

Required: No

**repositoryName (p. 49)**

The name of the repository.

Type: String

Pattern: (?:[a-z0-9]+(?:[._-][a-z0-9]+)*[a-z0-9]+(?:[._-][a-z0-9]+)*)

Required: Yes

Response Syntax

```json
{
   "lastEvaluatedAt": number,
   "lifecyclePolicyText": "string",
   "registryId": "string",
   "repositoryName": "string"
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.
The following data is returned in JSON format by the service.

**lastEvaluatedAt (p. 49)**

The time stamp of the last time that the lifecycle policy was run.

Type: Timestamp

**lifecyclePolicyText (p. 49)**

The JSON lifecycle policy text.

Type: String

Length Constraints: Minimum length of 100. Maximum length of 10240.

**registryId (p. 49)**

The registry ID associated with the request.

Type: String

Pattern: `[0-9]{12}`

**repositoryName (p. 49)**

The repository name associated with the request.

Type: String

Pattern: `(?:[a-z0-9]+(?:[._-][a-z0-9]+])*[a-z0-9]+(?:[._-][a-z0-9]+)*)`

---

**Errors**

For information about the errors that are common to all actions, see Common Errors (p. 107).

**InvalidParameterException**

The specified parameter is invalid. Review the available parameters for the API request.

HTTP Status Code: 400

**LifecyclePolicyNotFoundException**

The lifecycle policy could not be found, and no policy is set to the repository.

HTTP Status Code: 400

**RepositoryNotFoundException**

The specified repository could not be found. Check the spelling of the specified repository and ensure that you are performing operations on the correct registry.

HTTP Status Code: 400

**ServerException**

These errors are usually caused by a server-side issue.

HTTP Status Code: 500
Example

In the following example or examples, the Authorization header contents (AUTHPARAMS) must be replaced with an AWS Signature Version 4 signature. For more information about creating these signatures, see Signature Version 4 Signing Process in the AWS General Reference.

You only need to learn how to sign HTTP requests if you intend to manually create them. When you use the AWS Command Line Interface (AWS CLI) or one of the AWS SDKs to make requests to AWS, these tools automatically sign the requests for you with the access key that you specify when you configure the tools. When you use these tools, you don't need to learn how to sign requests yourself.

Example

This example retrieves the lifecycle policy for a repository called project-a/amazon-ecs-sample in the default registry for an account.

Sample Request

```
POST / HTTP/1.1
Host: ecr.us-west-2.amazonaws.com
Accept-Encoding: identity
X-Amz-Target: AmazonEC2ContainerRegistry_V20150921.GetLifecyclePolicy
Content-Type: application/x-amz-json-1.1
User-Agent: aws-cli/1.11.144 Python/3.6.1 Darwin/16.6.0 botocore/1.7.2
X-Amz-Date: 20170901T210647Z
Authorization: AUTHPARAMS
Content-Length: 48

{  
  "repositoryName": "project-a/amazon-ecs-sample"
}
```

Sample Response

```
HTTP/1.1 200 OK
Server: Server
Date: Fri, 01 Sep 2017 21:06:48 GMT
Content-Type: application/x-amz-json-1.1
Content-Length: 372
Connection: keep-alive
x-amzn-RequestId: 123a4b56-7c89-01d2-3ef4-example5678f

{
  "lastEvaluatedAt":1.504295007E9,
  "lifecyclePolicyText":"{"rules":[{"rulePriority":1,"description":"Expire images older than 14 days"},"selection":{"tagStatus":"untagged","countType":"sinceImagePushed","countUnit":"days","countNumber":14},"action":{"type":"expire"}]}",
  "registryId":"012345678910",
  "repositoryName":"project-a/amazon-ecs-sample"
}
```

GetLifecyclePolicyPreview

Retrieves the results of the specified lifecycle policy preview request.

**Request Syntax**

```json
{
  "filter": {
    "tagStatus": "string",
    "imageIds": [
      {
        "imageDigest": "string",
        "imageTag": "string"
      }
    ],
    "maxResults": number,
    "nextToken": "string",
    "registryId": "string",
    "repositoryName": "string"
  }
}
```

**Request Parameters**

For information about the parameters that are common to all actions, see Common Parameters (p. 105).

The request accepts the following data in JSON format.

**filter (p. 53)**

An optional parameter that filters results based on image tag status and all tags, if tagged.

Type: LifecyclePolicyPreviewFilter (p. 98) object

Required: No

**imageIds (p. 53)**

The list of imageIds to be included.

Type: Array of ImageIdentifier (p. 95) objects

Array Members: Minimum number of 1 item. Maximum number of 100 items.

Required: No

**maxResults (p. 53)**

The maximum number of repository results returned by GetLifecyclePolicyPreviewRequest in paginated output. When this parameter is used, GetLifecyclePolicyPreviewRequest only returns maxResults results in a single page along with a nextToken response element. The remaining results of the initial request can be seen by sending another GetLifecyclePolicyPreviewRequest request with the returned nextToken value. This value can be between 1 and 100. If this parameter is not used, then GetLifecyclePolicyPreviewRequest returns up to 100 results and a nextToken value, if
applicable. This option cannot be used when you specify images with `imageIds`.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 100.

Required: No

nextToken (p. 53)

The `nextToken` value returned from a previous paginated `GetLifecyclePolicyPreviewRequest` request where `maxResults` was used and the results exceeded the value of that parameter. Pagination continues from the end of the previous results that returned the `nextToken` value. This value is `null` when there are no more results to return. This option cannot be used when you specify images with `imageIds`.

Type: String

Required: No

registryId (p. 53)

The AWS account ID associated with the registry that contains the repository. If you do not specify a registry, the default registry is assumed.

Type: String

Pattern: `[0-9]{12}`

Required: No

repositoryName (p. 53)

The name of the repository.

Type: String

Pattern: `(?:[a-z0-9]+(?:[._-][a-z0-9]+)*/)*[a-z0-9]+(?:[._-][a-z0-9]+)*`

Required: Yes

Response Syntax

```
{
  "lifecyclePolicyText": "string",
  "nextToken": "string",
  "previewResults": [
    {
      "action": {
        "type": "string"
      },
      "appliedRulePriority": number,
      "imageDigest": "string",
      "imagePushedAt": number,
      "imageTags": [ "string" ]
    }
  ],
  "registryId": "string",
  "repositoryName": "string",
```

API Version 2015-09-21
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**lifecyclePolicyText (p. 54)**

The JSON lifecycle policy text.

Type: String

Length Constraints: Minimum length of 100. Maximum length of 10240.

**nextToken (p. 54)**

The nextToken value to include in a future GetLifecyclePolicyPreview request. When the results of a GetLifecyclePolicyPreview request exceed maxResults, this value can be used to retrieve the next page of results. This value is null when there are no more results to return.

Type: String

**previewResults (p. 54)**

The results of the lifecycle policy preview request.

Type: Array of LifecyclePolicyPreviewResult (p. 99) objects

**registryId (p. 54)**

The registry ID associated with the request.

Type: String

Pattern: [0-9]{12}

**repositoryName (p. 54)**

The repository name associated with the request.

Type: String

Pattern: (?:[a-z0-9]+(?:[._-][a-z0-9]+)*[a-z0-9]+(?:[._-][a-z0-9]+)*

**status (p. 54)**

The status of the lifecycle policy preview request.

Type: String

Valid Values: IN_PROGRESS | COMPLETE | EXPIRED | FAILED

**summary (p. 54)**

The list of images that is returned as a result of the action.

Type: LifecyclePolicyPreviewSummary (p. 100) object
Errors

For information about the errors that are common to all actions, see Common Errors (p. 107).

InvalidParameterException

The specified parameter is invalid. Review the available parameters for the API request.

HTTP Status Code: 400

LifecyclePolicyPreviewNotFoundException

There is no dry run for this repository.

HTTP Status Code: 400

RepositoryNotFoundException

The specified repository could not be found. Check the spelling of the specified repository and ensure that you are performing operations on the correct registry.

HTTP Status Code: 400

ServerException

These errors are usually caused by a server-side issue.

HTTP Status Code: 500

Example

In the following example or examples, the Authorization header contents (AUTHPARAMS) must be replaced with an AWS Signature Version 4 signature. For more information about creating these signatures, see Signature Version 4 Signing Process in the AWS General Reference.

You only need to learn how to sign HTTP requests if you intend to manually create them. When you use the AWS Command Line Interface (AWS CLI) or one of the AWS SDKs to make requests to AWS, these tools automatically sign the requests for you with the access key that you specify when you configure the tools. When you use these tools, you don’t need to learn how to sign requests yourself.

Example

This example retrieves the result of a lifecycle policy preview for a repository called project-a/amazon-ecs-sample in the default registry for an account.

Sample Request

```plaintext
POST / HTTP/1.1
Host: ecr.us-west-2.amazonaws.com
Accept-Encoding: identity
X-Amz-Target: AmazonEC2ContainerRegistry_V20150921.GetLifecyclePolicyPreview
Content-Type: application/x-amz-json-1.1
User-Agent: aws-cli/1.11.144 Python/3.6.1 Darwin/16.6.0 botocore/1.7.2
X-Amz-Date: 20170901T222304Z
Authorization: AUTHPARAMS
Content-Length: 48

{
    "repositoryName": "project-a/amazon-ecs-sample"
}
```
Sample Response

```
HTTP/1.1 200 OK
Server: Server
Date: Fri, 01 Sep 2017 22:23:06 GMT
Content-Type: application/x-amz-json-1.1
Content-Length: 640
Connection: keep-alive
x-amzn-RequestId: 123a4b56-7c89-01d2-3ef4-example5678f
{
   "lifecyclePolicyText":"{\n      "rules": [\n         {\n            "rulePriority": 1,
            "description": "Expire images older than 14 days",
            "selection": {\n               "tagStatus": "untagged",
               "countType": "sinceImagePushed",
               "countUnit": "days",
               "countNumber": 14
            },
            "action": {\n               "type": "expire"
            }
         }
      ]
   }
}
```

GetRepositoryPolicy

Retrieves the repository policy for a specified repository.

**Request Syntax**

```
{
   "registryId": "string",
   "repositoryName": "string"
}
```

**Request Parameters**

For information about the parameters that are common to all actions, see Common Parameters (p. 105).

The request accepts the following data in JSON format.

**registryId (p. 58)**

The AWS account ID associated with the registry that contains the repository. If you do not specify a registry, the default registry is assumed.

Type: String

Pattern: [0-9]{12}

Required: No

**repositoryName (p. 58)**

The name of the repository with the policy to retrieve.

Type: String

Pattern: (?:[a-z0-9]+(?!:[._-][a-z0-9]+)+)*[a-z0-9]+(?!:[._-][a-z0-9]+)+

Required: Yes

**Response Syntax**

```
{
   "policyText": "string",
   "registryId": "string",
   "repositoryName": "string"
}
```

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.
**policyText (p. 58)**

The JSON repository policy text associated with the repository.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 10240.

**registryId (p. 58)**

The registry ID associated with the request.

Type: String

Pattern: [0-9]{12}

**repositoryName (p. 58)**

The repository name associated with the request.

Type: String

Pattern: (?:[a-z0-9]+(?:[._-][a-z0-9]+)*)*[a-z0-9]+(?:[._-][a-z0-9]+)*

**Errors**

For information about the errors that are common to all actions, see Common Errors (p. 107).

**InvalidParameterException**

The specified parameter is invalid. Review the available parameters for the API request.

HTTP Status Code: 400

**RepositoryNotFoundException**

The specified repository could not be found. Check the spelling of the specified repository and ensure that you are performing operations on the correct registry.

HTTP Status Code: 400

**RepositoryPolicyNotFoundException**

The specified repository and registry combination does not have an associated repository policy.

HTTP Status Code: 400

**ServerException**

These errors are usually caused by a server-side issue.

HTTP Status Code: 500

**Example**

In the following example or examples, the Authorization header contents (AUTHPARAMS) must be replaced with an AWS Signature Version 4 signature. For more information about creating these signatures, see Signature Version 4 Signing Process in the AWS General Reference.
You only need to learn how to sign HTTP requests if you intend to manually create them. When you use the AWS Command Line Interface (AWS CLI) or one of the AWS SDKs to make requests to AWS, these tools automatically sign the requests for you with the access key that you specify when you configure the tools. When you use these tools, you don’t need to learn how to sign requests yourself.

**Example**

This example gets the repository policy for the `ubuntu` repository.

**Sample Request**

```plaintext
POST / HTTP/1.1
Host: ecr.us-east-1.amazonaws.com
Accept-Encoding: identity
Content-Length: 28
X-Amz-Target: AmazonEC2ContainerRegistry_V20150921.GetRepositoryPolicy
X-Amz-Date: 20151215T002404Z
User-Agent: aws-cli/1.9.10 Python/2.7.10 Darwin/14.5.0 botocore/1.3.10
Content-Type: application/x-amz-json-1.1
Authorization: AUTHPARAMS

{
  "repositoryName": "ubuntu"
}
```

**Sample Response**

```plaintext
HTTP/1.1 200 OK
Server: Server
Date: Tue, 15 Dec 2015 00:24:04 GMT
Content-Type: application/x-amz-json-1.1
Content-Length: 301
Connection: keep-alive
x-amzn-RequestId: 25da0b72-a2c2-11e5-8543-ebda6fb1393b

{
  "policyText": "{\n  "Version": "2012-10-17",\n  "Statement": [ {\n    "Sid": "AllowPull",
    "Effect": "Allow",
    "Principal": "*",
    "Action": [ "ecr:BatchGetImage", "ecr:GetDownloadUrlForLayer" ]\n  } ]\n},
  "registryId": "012345678910",
  "repositoryName": "ubuntu"
}
```

InitiateLayerUpload

Notify Amazon ECR that you intend to upload an image layer.

**Note**
This operation is used by the Amazon ECR proxy, and it is not intended for general use by customers for pulling and pushing images. In most cases, you should use the `docker` CLI to pull, tag, and push images.

### Request Syntax

```json
{
    "registryId": "string",
    "repositoryName": "string"
}
```

### Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 105).

The request accepts the following data in JSON format.

**registryId (p. 62)**

The AWS account ID associated with the registry to which you intend to upload layers. If you do not specify a registry, the default registry is assumed.

Type: String

Pattern: `[0-9]{12}`

Required: No

**repositoryName (p. 62)**

The name of the repository to which you intend to upload layers.

Type: String

Pattern: `(?:[a-z0-9]+(?:[._-][a-z0-9]+)*[a-z0-9]+(?:[._-][a-z0-9]+)*)`\[1\]`\[[a-z0-9]+(?:[._-][a-z0-9]+)\]`\[2\]

Required: Yes

### Response Syntax

```json
{
    "partSize": number,
    "uploadId": "string"
}
```

### Response Elements

If the action is successful, the service sends back an HTTP 200 response.
The following data is returned in JSON format by the service.

`partSize (p. 62)`

The size, in bytes, that Amazon ECR expects future layer part uploads to be.

Type: Long

Valid Range: Minimum value of 0.

`uploadId (p. 62)`

The upload ID for the layer upload. This parameter is passed to further `UploadLayerPart (p. 84)` and `CompleteLayerUpload (p. 16)` operations.

Type: String

Pattern: `[0-9a-fA-F]{8}-[0-9a-fA-F]{4}-[0-9a-fA-F]{4}-[0-9a-fA-F]{4}-[0-9a-fA-F]{12}`

**Errors**

For information about the errors that are common to all actions, see [Common Errors (p. 107)](#).

**InvalidParameterException**

The specified parameter is invalid. Review the available parameters for the API request.

HTTP Status Code: 400

**RepositoryNotFoundException**

The specified repository could not be found. Check the spelling of the specified repository and ensure that you are performing operations on the correct registry.

HTTP Status Code: 400

**ServerException**

These errors are usually caused by a server-side issue.

HTTP Status Code: 500

- AWS SDK for JavaScript
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V2
ListImages

Lists all the image IDs for a given repository.

You can filter images based on whether or not they are tagged by setting the tagStatus parameter to TAGGED or UNTAGGED. For example, you can filter your results to return only UNTAGGED images and then pipe that result to a BatchDeleteImage (p. 7) operation to delete them. Or, you can filter your results to return only TAGGED images to list all of the tags in your repository.

Request Syntax

```json
{
    "filter": {
        "tagStatus": "string"
    },
    "maxResults": number,
    "nextToken": "string",
    "registryId": "string",
    "repositoryName": "string"
}
```

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 105).

The request accepts the following data in JSON format.

filter (p. 64)

The filter key and value with which to filter your ListImages results.

Type: ListImagesFilter (p. 102) object

Required: No

maxResults (p. 64)

The maximum number of image results returned by ListImages in paginated output. When this parameter is used, ListImages only returns maxResults results in a single page along with a nextToken response element. The remaining results of the initial request can be seen by sending another ListImages request with the returned nextToken value. This value can be between 1 and 100. If this parameter is not used, then ListImages returns up to 100 results and a nextToken value, if applicable.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 100.

Required: No

nextToken (p. 64)

The nextToken value returned from a previous paginated ListImages request where maxResults was used and the results exceeded the value of that parameter. Pagination continues from the end of the previous results that returned the nextToken value. This value is null when there are no more results to return.
Note
This token should be treated as an opaque identifier that is only used to retrieve the next items in a list and not for other programmatic purposes.

Type: String
Required: No

registryId (p. 64)
The AWS account ID associated with the registry that contains the repository in which to list images. If you do not specify a registry, the default registry is assumed.

Type: String
Pattern: [0-9]{12}
Required: No

repositoryName (p. 64)
The repository with image IDs to be listed.

Type: String
Pattern: (?:[a-z0-9]+(?:[._-][a-z0-9]+)*)*[a-z0-9]+(?:[._-][a-z0-9]+)*
Required: Yes

Response Syntax

```
{
  "imageIds": [
    {
      "imageDigest": "string",
      "imageTag": "string"
    }
  ],
  "nextToken": "string"
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.
The following data is returned in JSON format by the service.

imagelds (p. 65)
The list of image IDs for the requested repository.
Type: Array of Imageldentifier (p. 95) objects

Array Members: Minimum number of 1 item. Maximum number of 100 items.

nextToken (p. 65)
The nextToken value to include in a future ListImages request. When the results of a ListImages request exceed maxResults, this value can be used to retrieve the next page of results. This value is null when there are no more results to return.
Type: String

Errors

For information about the errors that are common to all actions, see Common Errors (p. 107).

InvalidParameterException

The specified parameter is invalid. Review the available parameters for the API request.

HTTP Status Code: 400

RepositoryNotFoundException

The specified repository could not be found. Check the spelling of the specified repository and ensure that you are performing operations on the correct registry.

HTTP Status Code: 400

ServerException

These errors are usually caused by a server-side issue.

HTTP Status Code: 500

Example

In the following example or examples, the Authorization header contents (AUTHPARAMS) must be replaced with an AWS Signature Version 4 signature. For more information about creating these signatures, see Signature Version 4 Signing Process in the AWS General Reference.

You only need to learn how to sign HTTP requests if you intend to manually create them. When you use the AWS Command Line Interface (AWS CLI) or one of the AWS SDKs to make requests to AWS, these tools automatically sign the requests for you with the access key that you specify when you configure the tools. When you use these tools, you don't need to learn how to sign requests yourself.

Example

This example lists all of the images in the amazonlinux repository.

Sample Request

```
POST / HTTP/1.1
Host: ecr.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 33
X-Amz-Target: AmazonEC2ContainerRegistry_V20150921.ListImages
X-Amz-Date: 20161216T200542Z
User-Agent: aws-cli/1.11.22 Python/2.7.12 Darwin/16.3.0 botocore/1.4.79
Content-Type: application/x-amz-json-1.1
Authorization: AWUTHPARAMS

{
  "repositoryName": "amazonlinux"
}
```

Sample Response

```
HTTP/1.1 200 OK
```

- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V2
PutImage

Creates or updates the image manifest and tags associated with an image.

**Note**
This operation is used by the Amazon ECR proxy, and it is not intended for general use by customers for pulling and pushing images. In most cases, you should use the `docker` CLI to pull, tag, and push images.

**Request Syntax**

```json
{
  "imageManifest": "string",
  "imageTag": "string",
  "registryId": "string",
  "repositoryName": "string"
}
```

**Request Parameters**

For information about the parameters that are common to all actions, see Common Parameters (p. 105).

The request accepts the following data in JSON format.

**imageManifest (p. 68)**

The image manifest corresponding to the image to be uploaded.

Type: String

Required: Yes

**imageTag (p. 68)**

The tag to associate with the image. This parameter is required for images that use the Docker Image Manifest V2 Schema 2 or OCI formats.

Type: String

Required: No

**registryId (p. 68)**

The AWS account ID associated with the registry that contains the repository in which to put the image. If you do not specify a registry, the default registry is assumed.

Type: String

Pattern: [0-9]{12}

Required: No

**repositoryName (p. 68)**

The name of the repository in which to put the image.

Type: String

Response Syntax

```
{
  "image": {
    "imageId": {
      "imageDigest": "string",
      "imageTag": "string"
    },
    "imageManifest": "string",
    "registryId": "string",
    "repositoryName": "string"
  }
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

image (p. 69)

Details of the image uploaded.

Type: Image (p. 91) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 107).

ImageAlreadyExistsException

The specified image has already been pushed, and there were no changes to the manifest or image tag after the last push.

HTTP Status Code: 400

InvalidParameterException

The specified parameter is invalid. Review the available parameters for the API request.

HTTP Status Code: 400

LayersNotFoundException

The specified layers could not be found, or the specified layer is not valid for this repository.

HTTP Status Code: 400

LimitExceededException

The operation did not succeed because it would have exceeded a service limit for your account. For more information, see Amazon ECR Default Service Limits in the Amazon Elastic Container Registry User Guide.
HTTP Status Code: 400
**RepositoryNotFoundException**
The specified repository could not be found. Check the spelling of the specified repository and ensure that you are performing operations on the correct registry.

HTTP Status Code: 400
**ServerException**
These errors are usually caused by a server-side issue.

HTTP Status Code: 500

Example

In the following example or examples, the Authorization header contents (**AUTHPARAMS**) must be replaced with an AWS Signature Version 4 signature. For more information about creating these signatures, see Signature Version 4 Signing Process in the AWS General Reference.

You only need to learn how to sign HTTP requests if you intend to manually create them. When you use the AWS Command Line Interface (AWS CLI) or one of the AWS SDKs to make requests to AWS, these tools automatically sign the requests for you with the access key that you specify when you configure the tools. When you use these tools, you don't need to learn how to sign requests yourself.

Example

This example puts an image to the `amazonlinux` repository with the tag `2016.09`.

Sample Request

```
POST / HTTP/1.1
Host: ecr.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 653
X-Amz-Target: AmazonEC2ContainerRegistry_V20150921.PutImage
X-Amz-Date: 20161216T201255Z
User-Agent: aws-cli/1.11.22 Python/2.7.12 Darwin/16.3.0 botocore/1.4.79
Content-Type: application/x-amz-json-1.1
Authorization: AUTHPARAMS

{
   "imageManifest": "{  "schemaVersion": 2,
      "mediaType": "application/vnd.docker.distribution.manifest.v2+json",
      "config": {
         "mediaType": "application/vnd.docker.container.image.v1+json",
         "size": 1486,
         "digest": "sha256:5b52b314511a611975c2c695d920acdf8ae890fe0f0b7d018d1f1b64"
      }
    },
   "layers": [
      {
         "mediaType": "application/vnd.docker.image.rootfs.diff.tar.gzip",
         "size": 91768077,
         "digest": "sha256:8e3fa31c4cc420323e835a6761332d225c7af3335c5755f44ada2ed9de4ab7e8"
      }
    ],
   "repositoryName": "amazonlinux",
   "imageTag": "2016.09"
}
```

Sample Response

```
HTTP/1.1 200 OK
Server: Server
Date: Fri, 16 Dec 2016 20:12:56 GMT
```

PutLifecyclePolicy

Creates or updates a lifecycle policy. For information about lifecycle policy syntax, see Lifecycle Policy Template.

**Request Syntax**

```json
{
    "lifecyclePolicyText": "string",
    "registryId": "string",
    "repositoryName": "string"
}
```

**Request Parameters**

For information about the parameters that are common to all actions, see Common Parameters (p. 105).

The request accepts the following data in JSON format.

- **lifecyclePolicyText (p. 72)**
  - The JSON repository policy text to apply to the repository.
  - Type: String
  - Length Constraints: Minimum length of 100. Maximum length of 10240.
  - Required: Yes

- **registryId (p. 72)**
  - The AWS account ID associated with the registry that contains the repository. If you do not specify a registry, the default registry is assumed.
  - Type: String
  - Pattern: `[0-9]{12}`
  - Required: No

- **repositoryName (p. 72)**
  - The name of the repository to receive the policy.
  - Type: String
  - Required: Yes

**Response Syntax**

```json
{
    "lifecyclePolicyText": "string",
    "registryId": "string",
    "repositoryName": "string"
}
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**lifecyclePolicyText (p. 72)**

The JSON repository policy text.

Type: String

Length Constraints: Minimum length of 100. Maximum length of 10240.

**registryId (p. 72)**

The registry ID associated with the request.

Type: String

Pattern: [0-9]{12}

**repositoryName (p. 72)**

The repository name associated with the request.

Type: String

Pattern: (?i:[a-z0-9]+(?:[._-][a-z0-9]+)*[a-z0-9]+(?i:[._-][a-z0-9]+)+)*

Errors

For information about the errors that are common to all actions, see Common Errors (p. 107).

**InvalidParameterException**

The specified parameter is invalid. Review the available parameters for the API request.

HTTP Status Code: 400

**RepositoryNotFoundException**

The specified repository could not be found. Check the spelling of the specified repository and ensure that you are performing operations on the correct registry.

HTTP Status Code: 400

**ServerException**

These errors are usually caused by a server-side issue.

HTTP Status Code: 500

Example

In the following example or examples, the Authorization header contents (AUTHPARAMS) must be replaced with an AWS Signature Version 4 signature. For more information about creating these signatures, see Signature Version 4 Signing Process in the AWS General Reference.
You only need to learn how to sign HTTP requests if you intend to manually create them. When you use the AWS Command Line Interface (AWS CLI) or one of the AWS SDKs to make requests to AWS, these tools automatically sign the requests for you with the access key that you specify when you configure the tools. When you use these tools, you don't need to learn how to sign requests yourself.

Example

This example creates a lifecycle policy to expire images older than 14 days for a repository called project-a/amazon-ecs-sample in the default registry for an account.

Sample Request

```
POST / HTTP/1.1
Host: ecr.us-west-2.amazonaws.com
Accept-Encoding: identity
X-Amz-Target: AmazonEC2ContainerRegistry_V20150921.PutLifecyclePolicy
Content-Type: application/x-amz-json-1.1
User-Agent: aws-cli/1.11.144 Python/3.6.1 Darwin/16.6.0 botocore/1.7.2
X-Amz-Date: 20170901T194217Z
Authorization: AUTHPARAMS
Content-Length: 535
{
    "repositoryName": "project-a/amazon-ecs-sample",
    "lifecyclePolicyText": "{\n        "rules": [{\n            "rulePriority": 1,
            "description": "Expire images older than 14 days",
            "selection": {
                "tagStatus": "untagged",
                "countType": "sinceImagePushed",
                "countUnit": "days",
                "countNumber": 14
            },
            "action": {
                "type": "expire"
            }
        }]
    }
}
```

Sample Response

```
HTTP/1.1 200 OK
Server: Server
Date: Fri, 01 Sep 2017 19:42:18 GMT
Content-Type: application/x-amz-json-1.1
Content-Length: 340
Connection: keep-alive
x-amzn-RequestId: 123a4b56-7c89-01d2-3ef4-example5678f
{
    "lifecyclePolicyText": "{\n        "rules": [{\n            "rulePriority": 1,
            "description": "Expire images older than 14 days",
            "selection": {"tagStatus": "untagged", "countType": "sinceImagePushed", "countUnit": "days", "countNumber": 14},
            "action": {"type": "expire"}
        }]
    }
    "registryId": "012345678910",
    "repositoryName": "project-a/amazon-ecs-sample"
}
```

SetRepositoryPolicy

Applies a repository policy on a specified repository to control access permissions.

**Request Syntax**

```
{
  "force": boolean,
  "policyText": "string",
  "registryId": "string",
  "repositoryName": "string"
}
```

**Request Parameters**

For information about the parameters that are common to all actions, see Common Parameters (p. 105).

The request accepts the following data in JSON format.

**force (p. 76)**

If the policy you are attempting to set on a repository policy would prevent you from setting another policy in the future, you must force the `SetRepositoryPolicy (p. 76)` operation. This is intended to prevent accidental repository lock outs.

Type: Boolean

Required: No

**policyText (p. 76)**

The JSON repository policy text to apply to the repository.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 10240.

Required: Yes

**registryId (p. 76)**

The AWS account ID associated with the registry that contains the repository. If you do not specify a registry, the default registry is assumed.

Type: String

Pattern: \[0-9\]{12}

Required: No

**repositoryName (p. 76)**

The name of the repository to receive the policy.

Type: String

Response Syntax

Required: Yes

```json
{
  "policyText": "string",
  "registryId": "string",
  "repositoryName": "string"
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**policyText (p. 77)**

The JSON repository policy text applied to the repository.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 10240.

**registryId (p. 77)**

The registry ID associated with the request.

Type: String

Pattern: [0-9]{12}

**repositoryName (p. 77)**

The repository name associated with the request.

Type: String

Pattern: (?:[a-z0-9]+(?:[._-][a-z0-9]+)*[a-z0-9]+(?:[._-][a-z0-9]+)*

Errors

For information about the errors that are common to all actions, see Common Errors (p. 107).

**InvalidParameterException**

The specified parameter is invalid. Review the available parameters for the API request.

HTTP Status Code: 400

**RepositoryNotFoundException**

The specified repository could not be found. Check the spelling of the specified repository and ensure that you are performing operations on the correct registry.

HTTP Status Code: 400
Server Exception

These errors are usually caused by a server-side issue.

HTTP Status Code: 500

Example

In the following example or examples, the Authorization header contents (AUTHPARAMS) must be replaced with an AWS Signature Version 4 signature. For more information about creating these signatures, see Signature Version 4 Signing Process in the AWS General Reference.

You only need to learn how to sign HTTP requests if you intend to manually create them. When you use the AWS Command Line Interface (AWS CLI) or one of the AWS SDKs to make requests to AWS, these tools automatically sign the requests for you with the access key that you specify when you configure the tools. When you use these tools, you don’t need to learn how to sign requests yourself.

Example

The following example sets a repository policy on the ubuntu repository that allows all AWS accounts to pull from it.

Sample Request

POST / HTTP/1.1
Host: ecr.us-east-1.amazonaws.com
Accept-Encoding: identity
Content-Length: 223
X-Amz-Target: AmazonEC2ContainerRegistry_V20150921.SetRepositoryPolicy
X-Amz-Date: 20151214T235302Z
User-Agent: aws-cli/1.9.10 Python/2.7.10 Darwin/14.5.0 botocore/1.3.10
Content-Type: application/x-amz-json-1.1
Authorization: AWUTHPARAMS

{
  "policyText": "{"Version":"2012-10-17","Statement": [{"Sid":"AllowPull","Effect":"Allow","Action": ["ecr:BatchGetImage","ecr:GetDownloadUrlForLayer"],"Principal": "*"}]
  }
  "repositoryName": "ubuntu"
}

Sample Response

HTTP/1.1 200 OK
Server: Server
Date: Mon, 14 Dec 2015 23:53:02 GMT
Content-Type: application/x-amz-json-1.1
Content-Length: 301
Connection: keep-alive
x-amzn-RequestId: cfc3ead9-a2bd-11e5-91c7-7126cb670c2b

{
  "policyText": "{\\"Version\\":\\"2012-10-17\\",\\"Statement\\": [{\\"Sid\\":\\"AllowPull\\",\\"Effect\\":\\"Allow\\",\\"Action\\": [\\"ecr:BatchGetImage\\",\\"ecr:GetDownloadUrlForLayer\\"],\\"Principal\\":\\"\\*\\"}],\\"repositoryName\\":\\"ubuntu\\"
  }
}

StartLifecyclePolicyPreview

Starts a preview of the specified lifecycle policy. This allows you to see the results before creating the lifecycle policy.

Request Syntax

```
{
   "lifecyclePolicyText": "string",
   "registryId": "string",
   "repositoryName": "string"
}
```

Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](p. 105).

The request accepts the following data in JSON format.

**lifecyclePolicyText (p. 80)**

The policy to be evaluated against. If you do not specify a policy, the current policy for the repository is used.

Type: String

Length Constraints: Minimum length of 100. Maximum length of 10240.

Required: No

**registryId (p. 80)**

The AWS account ID associated with the registry that contains the repository. If you do not specify a registry, the default registry is assumed.

Type: String

Pattern: [0-9]{12}

Required: No

**repositoryName (p. 80)**

The name of the repository to be evaluated.

Type: String

Pattern: (?:[a-z0-9]+(?:[._-][a-z0-9]+)*)*[a-z0-9]+(?:[._-][a-z0-9]+)*

Required: Yes

Response Syntax

```
{
```

API Version 2015-09-21
80
Response Elements

If the action is successful, the service sends back an HTTP 200 response. The following data is returned in JSON format by the service.

**lifecyclePolicyText (p. 80)**

The JSON repository policy text.

Type: String

Length Constraints: Minimum length of 100. Maximum length of 10240.

**registryId (p. 80)**

The registry ID associated with the request.

Type: String

Pattern: [0-9]{12}

**repositoryName (p. 80)**

The repository name associated with the request.

Type: String

Pattern: (?:[a-z0-9]+(?:[._-][a-z0-9]+)*[a-z0-9]+(?:[._-][a-z0-9]+)*)

**status (p. 80)**

The status of the lifecycle policy preview request.

Type: String

Valid Values: IN_PROGRESS | COMPLETE | EXPIRED | FAILED

Errors

For information about the errors that are common to all actions, see Common Errors (p. 107).

**InvalidParameterException**

The specified parameter is invalid. Review the available parameters for the API request.

HTTP Status Code: 400

**LifecyclePolicyNotFoundException**

The lifecycle policy could not be found, and no policy is set to the repository.

HTTP Status Code: 400
**LifecyclePolicyPreviewInProgressException**

The previous lifecycle policy preview request has not completed. Please try again later.

HTTP Status Code: 400

**RepositoryNotFoundException**

The specified repository could not be found. Check the spelling of the specified repository and ensure that you are performing operations on the correct registry.

HTTP Status Code: 400

**ServerException**

These errors are usually caused by a server-side issue.

HTTP Status Code: 500

---

**Example**

In the following example or examples, the Authorization header contents (AUTHPARAMS) must be replaced with an AWS Signature Version 4 signature. For more information about creating these signatures, see Signature Version 4 Signing Process in the AWS General Reference.

You only need to learn how to sign HTTP requests if you intend to manually create them. When you use the AWS Command Line Interface (AWS CLI) or one of the AWS SDKs to make requests to AWS, these tools automatically sign the requests for you with the access key that you specify when you configure the tools. When you use these tools, you don't need to learn how to sign requests yourself.

**Example**

This example creates a lifecycle policy preview to expire images older than 14 days for a repository called project-a/amazon-ecs-sample in the default registry for an account.

**Sample Request**

```bash
POST / HTTP/1.1
Host: ecr.us-west-2.amazonaws.com
Accept-Encoding: identity
X-Amz-Target: AmazonEC2ContainerRegistry_V20150921.StartLifecyclePolicyPreview
Content-Type: application/x-amz-json-1.1
User-Agent: aws-cli/1.11.144 Python/3.6.1 Darwin/16.6.0 botocore/1.7.2
X-Amz-Date: 20170901T221604Z
Authorization: AUTHPARAMS
Content-Length: 535

{
    "repositoryName": "project-a/amazon-ecs-sample",
    "lifecyclePolicyText": "{
        "rules": [
            {
                "rulePriority": 1,
                "description": "Expire images older than 14 days",
                "selection": {
                    "tagStatus": "untagged",
                    "countType": "sinceImagePushed",
                    "countUnit": "days",
                    "countNumber": 14
                },
                "action": {
                    "type": "expire"
                }
            }
        ]
    }
}
```

**Sample Response**

```
HTTP/1.1 200 OK
```

---

UploadLayerPart

Uploads an image layer part to Amazon ECR.

**Note**
This operation is used by the Amazon ECR proxy, and it is not intended for general use by customers for pulling and pushing images. In most cases, you should use the `docker` CLI to pull, tag, and push images.

**Request Syntax**

```json
{
  "layerPartBlob": blob,
  "partFirstByte": number,
  "partLastByte": number,
  "registryId": "string",
  "repositoryName": "string",
  "uploadId": "string"
}
```

**Request Parameters**

For information about the parameters that are common to all actions, see [Common Parameters](p. 105).

The request accepts the following data in JSON format.

- **layerPartBlob** *(p. 84)*
  - The base64-encoded layer part payload.
  - Type: Base64-encoded binary data object
  - Required: Yes

- **partFirstByte** *(p. 84)*
  - The integer value of the first byte of the layer part.
  - Type: Long
  - Valid Range: Minimum value of 0.
  - Required: Yes

- **partLastByte** *(p. 84)*
  - The integer value of the last byte of the layer part.
  - Type: Long
  - Valid Range: Minimum value of 0.
  - Required: Yes

- **registryId** *(p. 84)*
  - The AWS account ID associated with the registry to which you are uploading layer parts. If you do not specify a registry, the default registry is assumed.
  - Type: String
Pattern: \[0-9\]{12}

Required: No

**repositoryName (p. 84)**

The name of the repository to which you are uploading layer parts.

Type: String

Pattern: \(?:[a-z0-9]+(?:\.[._-][a-z0-9]+)*/)*[a-z0-9]+(?:\.[._-][a-z0-9]+)*)

Required: Yes

**uploadId (p. 84)**

The upload ID from a previous *InitiateLayerUpload (p. 62)* operation to associate with the layer part upload.

Type: String

Pattern: \[0-9a-fA-F\]{8}-\[0-9a-fA-F\]{4}-\[0-9a-fA-F\]{4}-\[0-9a-fA-F\]{4}-\[0-9a-fA-F\]{12}

Required: Yes

---

**Response Syntax**

```
{
  "lastByteReceived": number,
  "registryId": "string",
  "repositoryName": "string",
  "uploadId": "string"
}
```

---

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**lastByteReceived (p. 85)**

The integer value of the last byte received in the request.

Type: Long

Valid Range: Minimum value of 0.

**registryId (p. 85)**

The registry ID associated with the request.

Type: String

**repositoryName (p. 85)**

The repository name associated with the request.
Errors

For information about the errors that are common to all actions, see Common Errors (p. 107).

InvalidLayerPartException

The layer part size is not valid, or the first byte specified is not consecutive to the last byte of a previous layer part upload.

HTTP Status Code: 400

InvalidParameterException

The specified parameter is invalid. Review the available parameters for the API request.

HTTP Status Code: 400

LimitExceededException

The operation did not succeed because it would have exceeded a service limit for your account. For more information, see Amazon ECR Default Service Limits in the Amazon Elastic Container Registry User Guide.

HTTP Status Code: 400

RepositoryNotFoundException

The specified repository could not be found. Check the spelling of the specified repository and ensure that you are performing operations on the correct registry.

HTTP Status Code: 400

ServerException

These errors are usually caused by a server-side issue.

HTTP Status Code: 500

UploadNotFoundException

The upload could not be found, or the specified upload id is not valid for this repository.

HTTP Status Code: 400

Data Types

The Amazon EC2 Container Registry API contains several data types that various actions use. This section describes each data type in detail.

**Note**
The order of each element in a data type structure is not guaranteed. Applications should not assume a particular order.

The following data types are supported:

- AuthorizationData (p. 89)
- DescribeImagesFilter (p. 90)
- Image (p. 91)
- ImageDetail (p. 92)
- ImageFailure (p. 94)
- ImageIdentifier (p. 95)
- Layer (p. 96)
- LayerFailure (p. 97)
- LifecyclePolicyPreviewFilter (p. 98)
- LifecyclePolicyPreviewResult (p. 99)
- LifecyclePolicyPreviewSummary (p. 100)
- LifecyclePolicyRuleAction (p. 101)
- ListImagesFilter (p. 102)
- Repository (p. 103)
AuthorizationData

An object representing authorization data for an Amazon ECR registry.

Contents

authorizationToken

A base64-encoded string that contains authorization data for the specified Amazon ECR registry. When the string is decoded, it is presented in the format user:password for private registry authentication using `docker login`.

Type: String

Pattern: ^\S+$

Required: No

expiresAt

The Unix time in seconds and milliseconds when the authorization token expires. Authorization tokens are valid for 12 hours.

Type: Timestamp

Required: No

proxyEndpoint

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
DescribeImagesFilter

An object representing a filter on a DescribeImages (p. 34) operation.

Contents

tagStatus

The tag status with which to filter your DescribeImages (p. 34) results. You can filter results based on whether they are TAGGED or UNTAGGED.

Type: String

Valid Values:  TAGGED | UNTAGGED

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

• AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java
• AWS SDK for Ruby V2
Image

An object representing an Amazon ECR image.

Contents

imageId

An object containing the image tag and image digest associated with an image.

Type: ImageIdentifier (p. 95) object

Required: No

imageManifest

The image manifest associated with the image.

Type: String

Required: No

registryId

The AWS account ID associated with the registry containing the image.

Type: String

Pattern: [0-9]{12}

Required: No

repositoryName

The name of the repository associated with the image.

Type: String

Pattern: (?:[a-z0-9]+(?:[._-][a-z0-9]+)*[a-z0-9]+(?:[._-][a-z0-9]+)*)\

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
ImageDetail

An object that describes an image returned by a DescribeImages (p. 34) operation.

Contents

imageDigest
  The sha256 digest of the image manifest.
  Type: String
  Required: No

imagePushedAt
  The date and time, expressed in standard JavaScript date format, at which the current image was pushed to the repository.
  Type: Timestamp
  Required: No

imageSizeInBytes
  The size, in bytes, of the image in the repository.

  Note
  Beginning with Docker version 1.9, the Docker client compresses image layers before pushing them to a V2 Docker registry. The output of the docker images command shows the uncompressed image size, so it may return a larger image size than the image sizes returned by DescribeImages (p. 34).
  Type: Long
  Required: No

imageTags
  The list of tags associated with this image.
  Type: Array of strings
  Required: No

registryId
  The AWS account ID associated with the registry to which this image belongs.
  Type: String
  Pattern: [0-9]{12}
  Required: No

repositoryName
  The name of the repository to which this image belongs.
  Type: String
  Pattern: (?i)[a-z0-9]+(?:[._-][a-z0-9]+)*[a-z0-9]+(?:[._-][a-z0-9]+)*
See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
ImageFailure

An object representing an Amazon ECR image failure.

Contents

failureCode

The code associated with the failure.

Type: String

Valid Values: InvalidImageDigest | InvalidImageTag | ImageTagDoesNotMatchDigest | ImageNotFound | MissingDigestAndTag

Required: No

failureReason

The reason for the failure.

Type: String

Required: No

imageId

The image ID associated with the failure.

Type: ImageIdentifier (p. 95) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
ImageIdentifier

An object with identifying information for an Amazon ECR image.

Contents

imageDigest

The sha256 digest of the image manifest.

Type: String
Required: No

imageTag

The tag used for the image.

Type: String
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
Layer

An object representing an Amazon ECR image layer.

Contents

layerAvailability

The availability status of the image layer.

Type: String

Valid Values: AVAILABLE | UNAVAILABLE

Required: No

layerDigest

The sha256 digest of the image layer.

Type: String

Pattern: [a-zA-Z0-9-_.]+:[a-fA-F0-9]+

Required: No

layerSize

The size, in bytes, of the image layer.

Type: Long

Required: No

mediaType

The media type of the layer, such as application/vnd.docker.image.rootfs.diff.tar.gzip or application/vnd.oci.image.layer.v1.tar+gzip.

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
LayerFailure

An object representing an Amazon ECR image layer failure.

Contents

failureCode

The failure code associated with the failure.
Type: String
Valid Values: InvalidLayerDigest | MissingLayerDigest
Required: No

failureReason

The reason for the failure.
Type: String
Required: No

layerDigest

The layer digest associated with the failure.
Type: String
Length Constraints: Minimum length of 0. Maximum length of 1000.
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
LifecyclePolicyPreviewFilter

The filter for the lifecycle policy preview.

Contents

tagStatus

The tag status of the image.

Type: String

Valid Values: TAGGED | UNTAGGED

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
LifecyclePolicyPreviewResult

The result of the lifecycle policy preview.

Contents

action

The type of action to be taken.

Type: LifecyclePolicyRuleAction (p. 101) object

Required: No

appliedRulePriority

The priority of the applied rule.

Type: Integer

Valid Range: Minimum value of 1.

Required: No

imageDigest

The sha256 digest of the image manifest.

Type: String

Required: No

imagePushedAt

The date and time, expressed in standard JavaScript date format, at which the current image was pushed to the repository.

Type: Timestamp

Required: No

imageTags

The list of tags associated with this image.

Type: Array of strings

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
LifecyclePolicyPreviewSummary

The summary of the lifecycle policy preview request.

Contents

expiringImageTotalCount

The number of expiring images.

Type: Integer

Valid Range: Minimum value of 0.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
LifecyclePolicyRuleAction

The type of action to be taken.

Contents

type

The type of action to be taken.

Type: String

Valid Values: EXPIRE

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
ListImagesFilter

An object representing a filter on a ListImages (p. 64) operation.

Contents

tagStatus

The tag status with which to filter your ListImages (p. 64) results. You can filter results based on whether they are TAGGED or UNTAGGED.

Type: String

Valid Values:  TAGGED  |  UNTAGGED

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
Repository

An object representing a repository.

Contents

createdAt

The date and time, in JavaScript date format, when the repository was created.

Type: Timestamp

Required: No

registryId

The AWS account ID associated with the registry that contains the repository.

Type: String

Pattern: \[0-9\]{12}

Required: No

repositoryArn

The Amazon Resource Name (ARN) that identifies the repository. The ARN contains the arn:aws:ecr namespace, followed by the region of the repository, AWS account ID of the repository owner, repository namespace, and repository name. For example, arn:aws:ecr:region:012345678910:repository/test.

Type: String

Required: No

repositoryName

The name of the repository.

Type: String

Pattern: (?:[a-z0-9]+(?:[._-][a-z0-9]+)+)+[a-z0-9]+(?:[._-][a-z0-9]+)*

Required: No

repositoryUri

The URI for the repository. You can use this URI for Docker push or pull operations.

Type: String

Required: No

Common Parameters

The following list contains the parameters that all actions use for signing Signature Version 4 requests with a query string. Any action-specific parameters are listed in the topic for that action. For more information about Signature Version 4, see Signature Version 4 Signing Process in the Amazon Web Services General Reference.

**Action**

The action to be performed.

- **Type:** string
- **Required:** Yes

**Version**

The API version that the request is written for, expressed in the format YYYY-MM-DD.

- **Type:** string
- **Required:** Yes

**X-Amz-Algorithm**

The hash algorithm that you used to create the request signature.

- 
  - **Condition:** Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.
  - **Type:** string
  - **Valid Values:** AWS4-HMAC-SHA256
  - **Required:** Conditional

**X-Amz-Credential**

The credential scope value, which is a string that includes your access key, the date, the region you are targeting, the service you are requesting, and a termination string (“aws4_request”). The value is expressed in the following format: access_key/YYYYMMDD/region/service/aws4_request.

For more information, see Task 2: Create a String to Sign for Signature Version 4 in the Amazon Web Services General Reference.

- 
  - **Condition:** Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.
  - **Type:** string
  - **Required:** Conditional

**X-Amz-Date**

The date that is used to create the signature. The format must be ISO 8601 basic format (YYYYMMDD'T'HHMMSS'Z'). For example, the following date time is a valid X-Amz-Date value: 20120325T120000Z.

- 
  - **Condition:** X-Amz-Date is optional for all requests; it can be used to override the date used for signing requests. If the Date header is specified in the ISO 8601 basic format, X-Amz-Date is
not required. When X-Amz-Date is used, it always overrides the value of the Date header. For more information, see Handling Dates in Signature Version 4 in the Amazon Web Services General Reference.

Type: string
Required: Conditional

**X-Amz-Security-Token**

The temporary security token that was obtained through a call to AWS Security Token Service (AWS STS). For a list of services that support temporary security credentials from AWS Security Token Service, go to AWS Services That Work with IAM in the IAM User Guide.

Condition: If you're using temporary security credentials from the AWS Security Token Service, you must include the security token.

Type: string
Required: Conditional

**X-Amz-Signature**

Specifies the hex-encoded signature that was calculated from the string to sign and the derived signing key.

Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.

Type: string
Required: Conditional

**X-Amz-SignedHeaders**

Specifies all the HTTP headers that were included as part of the canonical request. For more information about specifying signed headers, see Task 1: Create a Canonical Request For Signature Version 4 in the Amazon Web Services General Reference.

Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.

Type: string
Required: Conditional
Common Errors

This section lists the errors common to the API actions of all AWS services. For errors specific to an API action for this service, see the topic for that API action.

**AccessDeniedException**

You do not have sufficient access to perform this action.

HTTP Status Code: 400

**IncompleteSignature**

The request signature does not conform to AWS standards.

HTTP Status Code: 400

**InternalFailure**

The request processing has failed because of an unknown error, exception or failure.

HTTP Status Code: 500

**InvalidAction**

The action or operation requested is invalid. Verify that the action is typed correctly.

HTTP Status Code: 400

**InvalidClientTokenId**

The X.509 certificate or AWS access key ID provided does not exist in our records.

HTTP Status Code: 403

**InvalidParameterCombination**

Parameters that must not be used together were used together.

HTTP Status Code: 400

**InvalidParameterValue**

An invalid or out-of-range value was supplied for the input parameter.

HTTP Status Code: 400

**InvalidQueryParameter**

The AWS query string is malformed or does not adhere to AWS standards.

HTTP Status Code: 400

**MalformedQueryString**

The query string contains a syntax error.

HTTP Status Code: 404

**MissingAction**

The request is missing an action or a required parameter.

HTTP Status Code: 400
MissingAuthenticationToken

The request must contain either a valid (registered) AWS access key ID or X.509 certificate.

HTTP Status Code: 403

MissingParameter

A required parameter for the specified action is not supplied.

HTTP Status Code: 400

OptInRequired

The AWS access key ID needs a subscription for the service.

HTTP Status Code: 403

RequestExpired

The request reached the service more than 15 minutes after the date stamp on the request or more than 15 minutes after the request expiration date (such as for pre-signed URLs), or the date stamp on the request is more than 15 minutes in the future.

HTTP Status Code: 400

ServiceUnavailable

The request has failed due to a temporary failure of the server.

HTTP Status Code: 503

ThrottlingException

The request was denied due to request throttling.

HTTP Status Code: 400

ValidationException

The input fails to satisfy the constraints specified by an AWS service.

HTTP Status Code: 400
