Welcome to the Amazon API Gateway version 2 API Reference. For a description of Amazon API Gateway and how it works, see the API Gateway Developer Guide.
Resources

The Amazon API Gateway REST API includes the following resources.

**Topics**
- Apis (p. 2)
- Api (p. 15)
- Authorizers (p. 27)
- Authorizer (p. 36)
- Cors (p. 45)
- Deployments (p. 48)
- Deployment (p. 54)
- Integrations (p. 60)
- Integration (p. 73)
- IntegrationResponses (p. 87)
- IntegrationResponse (p. 95)
- Models (p. 103)
- Model (p. 109)
- ModelTemplate (p. 115)
- Routes (p. 118)
- Route (p. 127)
- RouteRequestParameter (p. 137)
- RouteResponses (p. 139)
- RouteResponse (p. 146)
- Stages (p. 153)
- Stage (p. 164)
- AccessLogSettings (p. 174)
- RouteSettings (p. 176)
- DomainNames (p. 179)
- DomainName (p. 187)
- ApiMappings (p. 195)
- ApiMapping (p. 201)
- Tags (p. 207)
- VPCLinks (p. 213)
- VPCLink (p. 219)

**Apis**

Represents your APIs as a collection. A collection offers a paginated view of your APIs.
URI
/v2/apis

HTTP Methods

GET

Operation ID: GetApis
Gets a collection of Api resources.

Query Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nextToken</td>
<td>String</td>
<td>False</td>
<td>The next page of elements from this collection. Not valid for the last element of the collection.</td>
</tr>
<tr>
<td>maxResults</td>
<td>String</td>
<td>False</td>
<td>The maximum number of elements to be returned for this resource.</td>
</tr>
</tbody>
</table>

Responses

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Response Model</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>200</td>
<td>Apis (p. 5)</td>
<td>Success</td>
</tr>
<tr>
<td>400</td>
<td>BadRequestException (p. 7)</td>
<td>One of the parameters in the request is invalid.</td>
</tr>
<tr>
<td>404</td>
<td>NotFoundException (p. 7)</td>
<td>The resource specified in the request was not found.</td>
</tr>
<tr>
<td>429</td>
<td>LimitExceededException (p. 7)</td>
<td>The client is sending more than the allowed number of requests per unit of time.</td>
</tr>
</tbody>
</table>

POST

Operation ID: CreateApi
Creates an Api resource.

Responses

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Response Model</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>201</td>
<td>Api (p. 6)</td>
<td>The request has succeeded and has resulted in the creation of a resource.</td>
</tr>
</tbody>
</table>
### Status Code

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Response Model</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>400</td>
<td>BadRequestException (p. 7)</td>
<td>One of the parameters in the request is invalid.</td>
</tr>
<tr>
<td>404</td>
<td>NotFoundException (p. 7)</td>
<td>The resource specified in the request was not found.</td>
</tr>
<tr>
<td>409</td>
<td>ConflictException (p. 7)</td>
<td>The resource already exists.</td>
</tr>
<tr>
<td>429</td>
<td>LimitExceededException (p. 7)</td>
<td>The client is sending more than the allowed number of requests per unit of time.</td>
</tr>
</tbody>
</table>

## PUT

**Operation ID: ImportApi**

Imports an API.

### Query Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>failOnWarnings</td>
<td>String</td>
<td>False</td>
<td>Specifies whether to rollback the API creation (true) or not (false) when a warning is encountered. The default value is false.</td>
</tr>
<tr>
<td>basepath</td>
<td>String</td>
<td>False</td>
<td>Specifies how to interpret the base path of the API during import. Valid values are ignore, prepend, and split. The default value is ignore. To learn more, see Set the OpenAPI basePath Property. Supported only for HTTP APIs.</td>
</tr>
</tbody>
</table>

### Responses

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Response Model</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>201</td>
<td>Api (p. 6)</td>
<td>The request has succeeded and has resulted in the creation of a resource.</td>
</tr>
<tr>
<td>400</td>
<td>BadRequestException (p. 7)</td>
<td>One of the parameters in the request is invalid.</td>
</tr>
<tr>
<td>404</td>
<td>NotFoundException (p. 7)</td>
<td>The resource specified in the request was not found.</td>
</tr>
</tbody>
</table>
### Status Code

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Response Model</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>409</td>
<td>ConflictException (p. 7)</td>
<td>The resource already exists.</td>
</tr>
<tr>
<td>429</td>
<td>LimitExceededException (p. 7)</td>
<td>The client is sending more than the allowed number of requests per unit of time.</td>
</tr>
</tbody>
</table>

### Schemas

#### Request Bodies

**Example POST**

```json
{
   "name": "string",
   "description": "string",
   "version": "string",
   "protocolType": enum,
   "routeSelectionExpression": "string",
   "apiKeySelectionExpression": "string",
   "disableSchemaValidation": boolean,
   "tags": {
   },
   "target": "string",
   "credentialsArn": "string",
   "routeKey": "string",
   "corsConfiguration": {
      "allowOrigins": [
      "string"
      ],
      "allowCredentials": boolean,
      "exposeHeaders": [
      "string"
      ],
      "maxAge": integer,
      "allowMethods": [
      "string"
      ],
      "allowHeaders": [
      "string"
      ]
   }
}
```

**Example PUT**

```json
{
   "body": "string"
}
```

#### Response Bodies

**Example Apis**

```json
{
}
```
"items": [
  {
    "apiId": "string",
    "name": "string",
    "description": "string",
    "version": "string",
    "protocolType": enum,
    "routeSelectionExpression": "string",
    "apiKeySelectionExpression": "string",
    "disableSchemaValidation": boolean,
    "warnings": [
      "string"
    ],
    "importInfo": [
      "string"
    ],
    "apiEndpoint": "string",
    "createdDate": "string",
    "tags": {
    },
    "corsConfiguration": {
      "allowOrigins": [
        "string"
      ],
      "allowCredentials": boolean,
      "exposeHeaders": [
        "string"
      ],
      "maxAge": integer,
      "allowMethods": [
        "string"
      ],
      "allowHeaders": [
        "string"
      ]
    }
  },
  {
    "nextToken": "string"
  }
],

Example Api

{
  "apiId": "string",
  "name": "string",
  "description": "string",
  "version": "string",
  "protocolType": enum,
  "routeSelectionExpression": "string",
  "apiKeySelectionExpression": "string",
  "disableSchemaValidation": boolean,
  "warnings": [
    "string"
  ],
  "importInfo": [
    "string"
  ],
  "apiEndpoint": "string",
  "createdDate": "string",
  "tags": {
  },
  "corsConfiguration": {
    "allowOrigins": [
    ]
  }
"string",
"allowCredentials": boolean,
"exposeHeaders": [
  "string"
],
"maxAge": integer,
"allowMethods": [
  "string"
],
"allowHeaders": [
  "string"
]
}

Example BadRequestException

{
  "message": "string"
}

Example NotFoundException

{
  "message": "string",
  "resourceType": "string"
}

Example ConflictException

{
  "message": "string"
}

Example LimitExceededException

{
  "message": "string",
  "limitType": "string"
}

Properties

Api

Represents an API.

apid

The API ID.

  Type: string
  Required: False
name

The name of the API.

Type: string
Required: True

description

The description of the API.

Type: string
Required: False

version

A version identifier for the API.

Type: string
Required: False

protocolType

The API protocol.

Type: ProtocolType (p. 14)
Required: True

routeSelectionExpression

The route selection expression for the API. For HTTP APIs, the routeSelectionExpression must be
${request.method} ${request.path}. If not provided, this will be the default for HTTP APIs. This
property is required for WebSocket APIs.

Type: string
Required: True

apiKeySelectionExpression

An API key selection expression. Supported only for WebSocket APIs. See API Key Selection Expressions.

Type: string
Required: False

disableSchemaValidation

Avoid validating models when creating a deployment. Supported only for WebSocket APIs.

Type: boolean
Required: False

warnings

The warning messages reported when failonwarnings is turned on during API import.
**importInfo**

The validation information during API import. This may include particular properties of your OpenAPI definition which are ignored during import. Supported only for HTTP APIs.

- **Type:** Array of type string
- **Required:** False

**apiEndpoint**

The URI of the API, of the form {api-id}.execute-api.{region}.amazonaws.com. The stage name is typically appended to this URI to form a complete path to a deployed API stage.

- **Type:** string
- **Required:** False
- **Format:** uri

**createdDate**

The timestamp when the API was created.

- **Type:** string
- **Required:** False
- **Format:** date-time

**tags**

A collection of tags associated with the API.

- **Type:** Tags (p. 14)
- **Required:** False

**corsConfiguration**

A CORS configuration. Supported only for HTTP APIs.

- **Type:** Cors (p. 10)
- **Required:** False

**Apis**

Represents a collection of APIs.

**items**

The elements from this collection.

- **Type:** Array of type Api (p. 7)
- **Required:** False
nextToken
The next page of elements from this collection. Not valid for the last element of the collection.

  Type: string
  Required: False

BadRequestException
The request is not valid, for example, the input is incomplete or incorrect. See the accompanying error message for details.

message
Describes the error encountered.

  Type: string
  Required: False

ConflictException
The requested operation would cause a conflict with the current state of a service resource associated with the request. Resolve the conflict before retrying this request. See the accompanying error message for details.

message
Describes the error encountered.

  Type: string
  Required: False

Cors
Represents a CORS configuration. Supported only for HTTP APIs. See Configuring CORS for more information.

allowOrigins
Represents a collection of allowed origins. Supported only for HTTP APIs.

  Type: Array of type string
  Required: False

allowCredentials
Specifies whether credentials are included in the CORS request. Supported only for HTTP APIs.

  Type: boolean
  Required: False

exposeHeaders
Represents a collection of exposed headers. Supported only for HTTP APIs.
Type: Array of type string
Required: False

maxAge

The number of seconds that the browser should cache preflight request results. Supported only for HTTP APIs.

Type: integer
Required: False

allowMethods

Represents a collection of allowed HTTP methods. Supported only for HTTP APIs.

Type: Array of type string
Required: False

allowHeaders

Represents a collection of allowed headers. Supported only for HTTP APIs.

Type: Array of type string
Required: False

CreateApiInput

Represents the input parameters for a CreateApi request.

name

The name of the API.

Type: string
Required: True

description

The description of the API.

Type: string
Required: False

version

A version identifier for the API.

Type: string
Required: False

protocolType

The API protocol.
Properties

Type: ProtocolType (p. 14)
Required: True

routeSelectionExpression

The route selection expression for the API. For HTTP APIs, the routeSelectionExpression must be
${request.method} ${request.path}. If not provided, this will be the default for HTTP APIs. This
property is required for WebSocket APIs.

Type: string
Required: False

apiKeySelectionExpression

An API key selection expression. Supported only for WebSocket APIs. See API Key Selection Expressions.

Type: string
Required: False

disableSchemaValidation

Avoid validating models when creating a deployment. Supported only for WebSocket APIs.

Type: boolean
Required: False

tags

The collection of tags. Each tag element is associated with a given resource.

Type: Tags (p. 14)
Required: False

target

This property is part of quick create. Quick create produces an API with an integration, a default
catch-all route, and a default stage which is configured to automatically deploy changes. For HTTP
integrations, specify a fully qualified URL. For Lambda integrations, specify a function ARN. The type of
the integration will be HTTP_PROXY or AWS_PROXY, respectively. Supported only for HTTP APIs.

Type: string
Required: False

credentialsArn

This property is part of quick create. It specifies the credentials required for the integration, if any. For
a Lambda integration, three options are available. To specify an IAM Role for API Gateway to assume,
use the role's Amazon Resource Name (ARN). To require that the caller's identity be passed through from
the request, specify arn:aws:iam::*:user/*. To use resource-based permissions on supported AWS
services, specify null. Currently, this property is not used for HTTP integrations. Supported only for
HTTP APIs.

Type: string
Required: False
routeKey

This property is part of quick create. If you don't specify a routeKey, a default route of \$default is created. The \$default route acts as a catch-all for any request made to your API, for a particular stage. The \$default route key can't be modified. You can add routes after creating the API, and you can update the route keys of additional routes. Supported only for HTTP APIs.

    Type: string
    Required: False

corsConfiguration

A CORS configuration. Supported only for HTTP APIs. See Configuring CORS for more information.

    Type: Cors (p. 10)
    Required: False

ImportApiInput

Represents the input to ImportAPI. Supported only for HTTP APIs.

body

The OpenAPI definition. Supported only for HTTP APIs.

    Type: string
    Required: True

LimitExceededException

A limit has been exceeded. See the accompanying error message for details.

message

Describes the error encountered.

    Type: string
    Required: False

limitType

The limit type.

    Type: string
    Required: False

NotFoundException

The resource specified in the request was not found. See the message field for more information.

message

Describes the error encountered.
Type: string
Required: False

resourceType
The resource type.

Type: string
Required: False

ProtocolType
Represents a protocol type.

WEB_SOCKET
HTTP

Tags
Represents a collection of tags associated with the resource.

key-value pairs
Type: string

],
  "allowCredentials": boolean,
  "exposeHeaders": [ 
  "string"
],
  "maxAge": integer,
  "allowMethods": [ 
  "string"
],
  "allowHeaders": [ 
  "string"
]
}

**Example BadRequestException**

```
{
  "message": "string"
}
```

**Example NotFoundException**

```
{
  "message": "string",
  "resourceType": "string"
}
```

**Example ConflictException**

```
{
  "message": "string"
}
```

**Example LimitExceededException**

```
```json
{
    "message": "string",
    "limitType": "string"
}
```

## Properties

### Api

Represents an API.

#### apiId

The API ID.

- **Type**: string
- **Required**: False

#### name

The name of the API.

- **Type**: string
- **Required**: True

#### description

The description of the API.

- **Type**: string
- **Required**: False

#### version

A version identifier for the API.

- **Type**: string
- **Required**: False

#### protocolType

The API protocol.

- **Type**: ProtocolType (p. 24)
- **Required**: True

#### routeSelectionExpression

The route selection expression for the API. For HTTP APIs, the `routeSelectionExpression` must be `${request.method} ${request.path}`. If not provided, this will be the default for HTTP APIs. This property is required for WebSocket APIs.

- **Type**: string
Properties

**Required**: True

**apiKeySelectionExpression**

An API key selection expression. Supported only for WebSocket APIs. See API Key Selection Expressions.

- **Type**: string
- **Required**: False

**disableSchemaValidation**

Avoid validating models when creating a deployment. Supported only for WebSocket APIs.

- **Type**: boolean
- **Required**: False

**warnings**

The warning messages reported when failonwarnings is turned on during API import.

- **Type**: Array of type string
- **Required**: False

**importInfo**

The validation information during API import. This may include particular properties of your OpenAPI definition which are ignored during import. Supported only for HTTP APIs.

- **Type**: Array of type string
- **Required**: False

**apiEndpoint**

The URI of the API, of the form {api-id}.execute-api.{region}.amazonaws.com. The stage name is typically appended to this URI to form a complete path to a deployed API stage.

- **Type**: string
- **Required**: False
- **Format**: uri

**createdDate**

The timestamp when the API was created.

- **Type**: string
- **Required**: False
- **Format**: date-time

**tags**

A collection of tags associated with the API.

- **Type**: Tags (p. 24)
Required: False

corsConfiguration

A CORS configuration. Supported only for HTTP APIs.

Type: Cors (p. 22)
Required: False

BadRequestException

The request is not valid, for example, the input is incomplete or incorrect. See the accompanying error message for details.

message

Describes the error encountered.

Type: string
Required: False

ConflictException

The requested operation would cause a conflict with the current state of a service resource associated with the request. Resolve the conflict before retrying this request. See the accompanying error message for details.

message

Describes the error encountered.

Type: string
Required: False

Cors

Represents a CORS configuration. Supported only for HTTP APIs. See Configuring CORS for more information.

allowOrigins

Represents a collection of allowed origins. Supported only for HTTP APIs.

Type: Array of type string
Required: False

allowCredentials

Specifies whether credentials are included in the CORS request. Supported only for HTTP APIs.

Type: boolean
Required: False
exposeHeaders
Represents a collection of exposed headers. Supported only for HTTP APIs.

  Type: Array of type string
  Required: False

maxAge
The number of seconds that the browser should cache preflight request results. Supported only for HTTP APIs.

  Type: integer
  Required: False

allowMethods
Represents a collection of allowed HTTP methods. Supported only for HTTP APIs.

  Type: Array of type string
  Required: False

allowHeaders
Represents a collection of allowed headers. Supported only for HTTP APIs.

  Type: Array of type string
  Required: False

LimitExceededException
A limit has been exceeded. See the accompanying error message for details.

message
Describes the error encountered.

  Type: string
  Required: False

limitType
The limit type.

  Type: string
  Required: False

NotFoundException
The resource specified in the request was not found. See the message field for more information.

message
Describes the error encountered.
Properties

**resourceType**
The resource type.

- **Type**: string
- **Required**: False

**ProtocolType**
Represents a protocol type.

- WEB_SOCKET
- HTTP

**ReimportApiInput**
Overwrites the configuration of an existing API using the provided definition. Supported only for HTTP APIs.

- **body**
The OpenAPI definition. Supported only for HTTP APIs.
  - **Type**: string
  - **Required**: True

**Tags**
Represents a collection of tags associated with the resource.

- **key-value pairs**
  - **Type**: string

**UpdateApiInput**
Represents the input parameters for a UpdateApi request.

- **name**
The name of the API.
  - **Type**: string
  - **Required**: False

- **description**
The description of the API.
Properties

Type: string
Required: False

version

A version identifier for the API.

Type: string
Required: False

routeSelectionExpression

The route selection expression for the API. For HTTP APIs, the routeSelectionExpression must be ${request.method} ${request.path}. If not provided, this will be the default for HTTP APIs. This property is required for WebSocket APIs.

Type: string
Required: False

apiKeySelectionExpression

An API key selection expression. Supported only for WebSocket APIs. See API Key Selection Expressions.

Type: string
Required: False

disableSchemaValidation

Avoid validating models when creating a deployment. Supported only for WebSocket APIs.

Type: boolean
Required: False

target

This property is part of quick create. For HTTP integrations, specify a fully qualified URL. For Lambda integrations, specify a function ARN. The type of the integration will be HTTP_PROXY or AWS_PROXY, respectively. The value provided updates the integration URI and integration type. You can update a quick-created target, but you can’t remove it from an API. Supported only for HTTP APIs.

Type: string
Required: False

credentialsArn

This property is part of quick create. It specifies the credentials required for the integration, if any. For a Lambda integration, three options are available. To specify an IAM Role for API Gateway to assume, use the role’s Amazon Resource Name (ARN). To require that the caller’s identity be passed through from the request, specify arn:aws:iam::*:user/* . To use resource-based permissions on supported AWS services, specify null. Currently, this property is not used for HTTP integrations. If provided, this value replaces the credentials associated with the quick create integration. Supported only for HTTP APIs.

Type: string
**RouteKey**

This property is part of quick create. If not specified, the route created using quick create is kept. Otherwise, this value replaces the route key of the quick create route. Additional routes may still be added after the API is updated. Supported only for HTTP APIs.

*Type:* string  
*Required:* False

**CorsConfiguration**

A CORS configuration. Supported only for HTTP APIs.

*Type:* Cors (p. 22)  
*Required:* False

Authorizers

Represents the collection of authorizers for an API. For Lambda (REQUEST) authorizers, see Use API Gateway Lambda Authorizers.

URI

/v2/apis/{apiId}/authorizers

HTTP Methods

GET

Operation ID: GetAuthorizers

Gets the Authorizers for an API.

Path Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiId</td>
<td>String</td>
<td>True</td>
<td>The API identifier.</td>
</tr>
</tbody>
</table>
HTTP Methods

Query Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nextToken</td>
<td>String</td>
<td>False</td>
<td>The next page of elements from this collection. Not valid for the last element of the collection.</td>
</tr>
<tr>
<td>maxResults</td>
<td>String</td>
<td>False</td>
<td>The maximum number of elements to be returned for this resource.</td>
</tr>
</tbody>
</table>

Responses

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Response Model</th>
<th>Description</th>
</tr>

<tbody>
<tr>
<td>200</td>
<td>Authorizers (p. 29)</td>
<td>Success</td>
</tr>
<tr>
<td>400</td>
<td>BadRequestException (p. 30)</td>
<td>One of the parameters in the request is invalid.</td>
</tr>
<tr>
<td>404</td>
<td>NotFoundException (p. 30)</td>
<td>The resource specified in the request was not found.</td>
</tr>
<tr>
<td>429</td>
<td>LimitExceededExceptionHandler (p. 30)</td>
<td>The client is sending more than the allowed number of requests per unit of time.</td>
</tr>
</tbody>
</table>

POST

Operation ID: CreateAuthorizer

Creates an Authorizer for an API.

Path Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiId</td>
<td>String</td>
<td>True</td>
<td>The API identifier.</td>

## Schemas

### Request Bodies

**Example POST**

```json
{
    "name": "string",
    "authorizerType": enum,
    "authorizerUri": "string",
    "authorizerCredentialsArn": "string",
    "identitySource": [
        "string"
    ],
    "identityValidationExpression": "string",
    "authorizerResultTtlInSeconds": integer,
    "jwtConfiguration": {
        "issuer": "string",
        "audience": [
            "string"
        ]
    }
}
```

### Response Bodies

**Example Authorizers**

```json
{
    "items": [
        {
            "authorizerId": "string",
            "name": "string",
            "authorizerType": enum,
            "authorizerUri": "string",
            "authorizerCredentialsArn": "string",
            "identitySource": [
                "string"
            ],
            "identityValidationExpression": "string",
            "authorizerResultTtlInSeconds": integer,
            "jwtConfiguration": {
                "issuer": "string",
                "audience": [
                    "string"
                ]
            }
        }
    ],
    "nextToken": "string"
}
```
Example Authorizer

```json
{
  "authorizerId": "string",
  "name": "string",
  "authorizerType": enum,
  "authorizerUri": "string",
  "authorizerCredentialsArn": "string",
  "identitySource": [ "string" ],
  "identityValidationExpression": "string",
  "authorizerResultTtlInSeconds": integer,
  "jwtConfiguration": {
    "issuer": "string",
    "audience": [ "string" ]
  }
}
```

Example BadRequestException

```json
{
  "message": "string"
}
```

Example NotFoundException

```json
{
  "message": "string",
  "resourceType": "string"
}
```

Example ConflictException

```json
{
  "message": "string"
}
```

Example LimitExceedededException

```json
{
  "message": "string",
  "limitType": "string"
}
```

Properties

Authorizer

Represents an authorizer.
authorizerId

The authorizer identifier.

Type: string
Required: False

name

The name of the authorizer.

Type: string
Required: True

authorType

The authorizer type. For WebSocket APIs, specify REQUEST for a Lambda function using incoming request parameters. For HTTP APIs, specify JWT to use JSON Web Tokens.

Type: AuthorizerType (p. 32)
Required: False

authorizerUri

The authorizer's Uniform Resource Identifier (URI). For REQUEST authorizers, this must be a well-formed Lambda function URI, for example, arn:aws:apigateway:us-west-2:lambda:path/2015-03-31/functions/arn:aws:lambda:us-west-2:{account_id}:function:{lambda_function_name}/invocations. In general, the URI has this form: arn:aws:apigateway:{region}:lambda:path/{service_api} , where {region} is the same as the region hosting the Lambda function, path indicates that the remaining substring in the URI should be treated as the path to the resource, including the initial /. For Lambda functions, this is usually of the form /2015-03-31/functions/[FunctionARN]/invocations. Supported only for REQUEST authorizers.

Type: string
Required: False

authorizerCredentialsArn

Specifies the required credentials as an IAM role for API Gateway to invoke the authorizer. To specify an IAM role for API Gateway to assume, use the role's Amazon Resource Name (ARN). To use resource-based permissions on the Lambda function, specify null. Supported only for REQUEST authorizers.

Type: string
Required: False

identitySource

The identity source for which authorization is requested.

For a REQUEST authorizer, this is optional. The value is a set of one or more mapping expressions of the specified request parameters. Currently, the identity source can be headers, query string parameters, stage variables, and context parameters. For example, if an Auth header and a Name query string parameter are defined as identity sources, this value is route.request.header.Auth, route.request.querystring.Name. These parameters will be used to perform runtime validation for Lambda-based authorizers by verifying all of the identity-related request parameters are present in
the request, not null, and non-empty. Only when this is true does the authorizer invoke the authorizer Lambda function. Otherwise, it returns a 401 Unauthorized response without calling the Lambda function.

For JWT, a single entry that specifies where to extract the JSON Web Token (JWT) from inbound requests. Currently only header-based and query parameter-based selections are supported, for example "$request.header.Authorization".

Type: Array of type string
Required: False

identityValidationExpression

The validation expression does not apply to the REQUEST authorizer.

Type: string
Required: False

authorizerResultTtlInSeconds

Authorizer caching is not currently supported. Don't specify this value for authorizers.

Type: integer
Required: False

jwtConfiguration

Represents the configuration of a JWT authorizer. Required for the JWT authorizer type. Supported only for HTTP APIs.

Type: JWTConfiguration (p. 35)
Required: False

AuthorizerType

The authorizer type. For WebSocket APIs, specify REQUEST for a Lambda function using incoming request parameters. For HTTP APIs, specify JWT to use JSON Web Tokens.

REQUEST
JWT

Authorizers

Represents a collection of authorizers.

items

The elements from this collection.

Type: Array of type Authorizer (p. 30)
Required: False

nextToken

The next page of elements from this collection. Not valid for the last element of the collection.
Type: string
Required: False

**BadRequestException**

The request is not valid, for example, the input is incomplete or incorrect. See the accompanying error message for details.

**message**

Describes the error encountered.

Type: string
Required: False

**ConflictException**

The requested operation would cause a conflict with the current state of a service resource associated with the request. Resolve the conflict before retrying this request. See the accompanying error message for details.

**message**

Describes the error encountered.

Type: string
Required: False

**CreateAuthorizerInput**

Represents the input parameters for a CreateAuthorizer request.

**name**

The name of the authorizer.

Type: string
Required: True

**authorizerType**

The authorizer type. For WebSocket APIs, specify **REQUEST** for a Lambda function using incoming request parameters. For HTTP APIs, specify **JWT** to use JSON Web Tokens.

Type: AuthorizerType (p. 32)
Required: True

**authorizerUri**

The authorizer's Uniform Resource Identifier (URI). For **REQUEST** authorizers, this must be a well-formed Lambda function URI, for example, `arn:aws:apigateway:us-west-2:lambda:path/2015-03-31/functions/arn:aws:lambda:us-west-2:{account_id}:function:{lambda_function_name}/invocations`. In general, the URI has this form: `arn:aws:apigateway:{region}:lambda:path/{service_api}` , where `{region}` is
the same as the region hosting the Lambda function, path indicates that the remaining substring in the URI should be treated as the path to the resource, including the initial /.

For Lambda functions, this is usually of the form /2015-03-31/functions/[FunctionARN]/invocations. Supported only for REQUEST authorizers.

**Type**: string  
**Required**: False

**authorizerCredentialsArn**

Specifies the required credentials as an IAM role for API Gateway to invoke the authorizer. To specify an IAM role for API Gateway to assume, use the role's Amazon Resource Name (ARN). To use resource-based permissions on the Lambda function, specify null. Supported only for REQUEST authorizers.

**Type**: string  
**Required**: False

**identitySource**

The identity source for which authorization is requested.

For a REQUEST authorizer, this is optional. The value is a set of one or more mapping expressions of the specified request parameters. Currently, the identity source can be headers, query string parameters, stage variables, and context parameters. For example, if an Auth header and a Name query string parameter are defined as identity sources, this value is route.request.header.Auth, route.request.querystring.Name. These parameters will be used to perform runtime validation for Lambda-based authorizers by verifying all of the identity-related request parameters are present in the request, not null, and non-empty. Only when this is true does the authorizer invoke the authorizer Lambda function. Otherwise, it returns a 401 Unauthorized response without calling the Lambda function.

For JWT, a single entry that specifies where to extract the JSON Web Token (JWT) from inbound requests. Currently only header-based and query parameter-based selections are supported, for example "$request.header.Authorization".

**Type**: Array of type string  
**Required**: True

**identityValidationExpression**

This parameter is not used.

**Type**: string  
**Required**: False

**authorizerResultTtlInSeconds**

Authorizer caching is not currently supported. Don't specify this value for authorizers.

**Type**: integer  
**Required**: False

**jwtConfiguration**

Represents the configuration of a JWT authorizer. Required for the JWT authorizer type. Supported only for HTTP APIs.
**JWTConfiguration**

Represents the configuration of a JWT authorizer. Required for the JWT authorizer type. Supported only for HTTP APIs.

**issuer**

The base domain of the identity provider that issues JSON Web Tokens. For example, an Amazon Cognito user pool has the following format: `https://cognito-idp.{region}.amazonaws.com/{userPoolId}`. Required for the JWT authorizer type. Supported only for HTTP APIs.

- **Type**: string
- **Required**: False

**audience**

A list of the intended recipients of the JWT. A valid JWT must provide an `aud` that matches at least one entry in this list. See RFC 7519. Required for the JWT authorizer type. Supported only for HTTP APIs.

- **Type**: Array of type string
- **Required**: False

**LimitExceededException**

A limit has been exceeded. See the accompanying error message for details.

**message**

Describes the error encountered.

- **Type**: string
- **Required**: False

**limitType**

The limit type.

- **Type**: string
- **Required**: False

**NotFoundException**

The resource specified in the request was not found. See the `message` field for more information.

**message**

Describes the error encountered.

- **Type**: string
Required: False

resourceType
The resource type.

Type: string
Required: False

Properties

Authorizer

Represents an authorizer.

**authorizerId**

The authorizer identifier.

- **Type:** string
- **Required:** False

**name**

The name of the authorizer.

- **Type:** string
- **Required:** True

**authorizerType**

The authorizer type. For WebSocket APIs, specify REQUEST for a Lambda function using incoming request parameters. For HTTP APIs, specify JWT to use JSON Web Tokens.

- **Type:** AuthorizerType (p. 41)
- **Required:** False

**authorizerUri**

The authorizer's Uniform Resource Identifier (URI). For REQUEST authorizers, this must be a well-formed Lambda function URI, for example, `arn:aws:apigateway:us-west-2:lambda:path/2015-03-31/functions/arn:aws:lambda:us-west-2:{account_id}:function:{lambda_function_name}/invocations`. In general, the URI has this form: `arn:aws:apigateway:{region}:lambda:path/{service_api}`, where `{region}` is the same as the region hosting the Lambda function, path indicates that the remaining substring in the URI should be treated as the path to the resource, including the initial `/`. For Lambda functions, this is usually of the form `/2015-03-31/functions/{FunctionARN}/invocations`. Supported only for REQUEST authorizers.

- **Type:** string
- **Required:** False

**authorizerCredentialsArn**

Specifies the required credentials as an IAM role for API Gateway to invoke the authorizer. To specify an IAM role for API Gateway to assume, use the role's Amazon Resource Name (ARN). To use resource-based permissions on the Lambda function, specify null. Supported only for REQUEST authorizers.

- **Type:** string
- **Required:** False
identitySource

The identity source for which authorization is requested.

For a REQUEST authorizer, this is optional. The value is a set of one or more mapping expressions of the specified request parameters. Currently, the identity source can be headers, query string parameters, stage variables, and context parameters. For example, if an Auth header and a Name query string parameter are defined as identity sources, this value is route.request.header.Auth, route.request.querystring.Name. These parameters will be used to perform runtime validation for Lambda-based authorizers by verifying all of the identity-related request parameters are present in the request, not null, and non-empty. Only when this is true does the authorizer invoke the authorizer Lambda function. Otherwise, it returns a 401 Unauthorized response without calling the Lambda function.

For JWT, a single entry that specifies where to extract the JSON Web Token (JWT) from inbound requests. Currently only header-based and query parameter-based selections are supported, for example "$request.header.Authorization".

Type: Array of type string  
Required: False

identityValidationExpression

The validation expression does not apply to the REQUEST authorizer.

Type: string  
Required: False

authorizerResultTtlInSeconds

Authorizer caching is not currently supported. Don't specify this value for authorizers.

Type: integer  
Required: False

jwtConfiguration

Represents the configuration of a JWT authorizer. Required for the JWT authorizer type. Supported only for HTTP APIs.

Type: JWTConfiguration (p. 42)  
Required: False

AuthorizerType

The authorizer type. For WebSocket APIs, specify REQUEST for a Lambda function using incoming request parameters. For HTTP APIs, specify JWT to use JSON Web Tokens.

REQUEST  
JWT

BadRequestException

The request is not valid, for example, the input is incomplete or incorrect. See the accompanying error message for details.
message

Describes the error encountered.

- **Type**: string
- **Required**: False

**ConflictException**

The requested operation would cause a conflict with the current state of a service resource associated with the request. Resolve the conflict before retrying this request. See the accompanying error message for details.

message

Describes the error encountered.

- **Type**: string
- **Required**: False

**JWTConfiguration**

Represents the configuration of a JWT authorizer. Required for the JWT authorizer type. Supported only for HTTP APIs.

**issuer**

The base domain of the identity provider that issues JSON Web Tokens. For example, an Amazon Cognito user pool has the following format: `https://cognito-idp.{region}.amazonaws.com/{userPoolId}`. Required for the JWT authorizer type. Supported only for HTTP APIs.

- **Type**: string
- **Required**: False

**audience**

A list of the intended recipients of the JWT. A valid JWT must provide an `aud` that matches at least one entry in this list. See RFC 7519. Required for the JWT authorizer type. Supported only for HTTP APIs.

- **Type**: Array of type string
- **Required**: False

**LimitExceededException**

A limit has been exceeded. See the accompanying error message for details.

message

Describes the error encountered.

- **Type**: string
- **Required**: False
**limitType**

The limit type.

- **Type:** string
- **Required:** False

**NotFoundException**

The resource specified in the request was not found. See the `message` field for more information.

**message**

Describes the error encountered.

- **Type:** string
- **Required:** False

**resourceType**

The resource type.

- **Type:** string
- **Required:** False

**UpdateAuthorizerInput**

The input parameters for an `UpdateAuthorizer` request.

**name**

The name of the authorizer.

- **Type:** string
- **Required:** False

**authorizerType**

The authorizer type. For WebSocket APIs, specify `REQUEST` for a Lambda function using incoming request parameters. For HTTP APIs, specify `JWT` to use JSON Web Tokens.

- **Type:** `AuthorizerType` (p. 41)
- **Required:** False

**authorizerUri**

The authorizer's Uniform Resource Identifier (URI). For `REQUEST` authorizers, this must be a well-formed Lambda function URI, for example, `arn:aws:apigateway:us-west-2:lambda:path/2015-03-31/functions/arn:aws:lambda:us-west-2:{account_id}:function:{lambda_function_name}/invocations`. In general, the URI has this form: `arn:aws:apigateway:{region}:lambda:path/{service_api}`, where `{region}` is the same as the region hosting the Lambda function, path indicates that the remaining substring in the URI should be treated as the path to the resource, including the initial `/`. For Lambda functions, this is usually of the form `/2015-03-31/functions/[FunctionARN]/invocations`. Supported only for `REQUEST` authorizers.
**Properties**

**Type**
- string

**Required**
- False

**authorizerCredentialsArn**

Specifies the required credentials as an IAM role for API Gateway to invoke the authorizer. To specify an IAM role for API Gateway to assume, use the role's Amazon Resource Name (ARN). To use resource-based permissions on the Lambda function, specify null.

- **Type**: string
- **Required**: False

**identitySource**

The identity source for which authorization is requested.

For a `REQUEST` authorizer, this is optional. The value is a set of one or more mapping expressions of the specified request parameters. Currently, the identity source can be headers, query string parameters, stage variables, and context parameters. For example, if an Auth header and a Name query string parameter are defined as identity sources, this value is `route.request.header.Auth, route.request.querystring.Name`. These parameters will be used to perform runtime validation for Lambda-based authorizers by verifying all of the identity-related request parameters are present in the request, not null, and non-empty. Only when this is true does the authorizer invoke the authorizer Lambda function. Otherwise, it returns a 401 Unauthorized response without calling the Lambda function.

For JWT, a single entry that specifies where to extract the JSON Web Token (JWT) from inbound requests. Currently only header-based and query parameter-based selections are supported, for example "$request.header.Authorization".

- **Type**: Array of type string
- **Required**: False

**identityValidationExpression**

This parameter is not used.

- **Type**: string
- **Required**: False

**authorizerResultTtlInSeconds**

Authorizer caching is not currently supported. Don't specify this value for authorizers.

- **Type**: integer
- **Required**: False

**jwtConfiguration**

Represents the configuration of a JWT authorizer. Required for the JWT authorizer type. Supported only for HTTP APIs.

- **Type**: JWTConfiguration (p. 42)
- **Required**: False

Cors

Represents a CORS configuration. Supported only for HTTP APIs.
URI

/v2/apis/<apiId>/cors

HTTP Methods

DELETE

Operation ID: DeleteCorsConfiguration

Deletes a CORS configuration.

Path Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiId</td>
<td>String</td>
<td>True</td>
<td>The API identifier.</td>
</tr>
</tbody>
</table>

Responses

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Response Model</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>204</td>
<td>None</td>
<td>The request has succeeded, and there is no additional content to send in the response payload body.</td>
</tr>
<tr>
<td>404</td>
<td>NotFoundException (p. 46)</td>
<td>The resource specified in the request was not found.</td>
</tr>
<tr>
<td>429</td>
<td>LimitExceeded Exception (p. 46)</td>
<td>The client is sending more than the allowed number of requests per unit of time.</td>
</tr>
</tbody>
</table>

Schemas

Response Bodies

Example NotFoundException

```json
{
    "message": "string",
    "resourceType": "string"
}
```

Example LimitExceeded Exception

```json
{
    "message": "string",
    "limitType": "string"
}
```
Properties

LimitExceededException

A limit has been exceeded. See the accompanying error message for details.

message

Describes the error encountered.

Type: string
Required: False

limitType

The limit type.

Type: string
Required: False

NotFoundException

The resource specified in the request was not found. See the message field for more information.

message

Describes the error encountered.

Type: string
Required: False

resourceType

The resource type.

Type: string
Required: False

}

Example ConflictException

{
    "message": "string"
}

Example LimitExceedededException

{
    "message": "string",
    "limitType": "string"
}

Properties

BadRequestException

The request is not valid, for example, the input is incomplete or incorrect. See the accompanying error message for details.
message
Describes the error encountered.

  Type: string
  Required: False

ConflictException
The requested operation would cause a conflict with the current state of a service resource associated with the request. Resolve the conflict before retrying this request. See the accompanying error message for details.

message
Describes the error encountered.

  Type: string
  Required: False

CreateDeploymentInput
Represents the input parameters for a CreateDeployment request.

description
The description for the deployment resource.

  Type: string
  Required: False

stageName
The name of the Stage resource for the Deployment resource to create.

  Type: string
  Required: False

Deployment
An immutable representation of an API that can be called by users. A Deployment must be associated with a Stage for it to be callable over the internet.

deploymentId
The identifier for the deployment.

  Type: string
  Required: False

description
The description for the deployment.

  Type: string
  Required: False
createdDate
The date and time when the Deployment resource was created.

- **Type**: string
- **Required**: False
- **Format**: date-time

deploymentStatus
The status of the deployment: PENDING, FAILED, or SUCCEEDED.

- **Type**: DeploymentStatus (p. 52)
- **Required**: False

deploymentStatusMessage
May contain additional feedback on the status of an API deployment.

- **Type**: string
- **Required**: False

autoDeployed
Specifies whether a deployment was automatically released.

- **Type**: boolean
- **Required**: False

**DeploymentStatus**
Represents a deployment status.

- PENDING
- FAILED
- DEPLOYED

**Deployments**
A collection resource that contains zero or more references to your existing deployments, and links that guide you on how to interact with your collection. The collection offers a paginated view of the contained deployments.

**items**
The elements from this collection.

- **Type**: Array of type Deployment (p. 51)
- **Required**: False

**nextToken**
The next page of elements from this collection. Not valid for the last element of the collection.

- **Type**: string
Required: False

LimitExceededException

A limit has been exceeded. See the accompanying error message for details.

message

Describes the error encountered.

Type: string
Required: False

limitType

The limit type.

Type: string
Required: False

NotFoundException

The resource specified in the request was not found. See the message field for more information.

message

Describes the error encountered.

Type: string
Required: False

resourceType

The resource type.

Type: string
Required: False

  "createdDate": "string",
  "deploymentStatus": enum,
  "deploymentStatusMessage": "string",
  "autoDeployed": boolean
}
```

**Example BadRequestException**

```json
{
  "message": "string"
}
```

**Example NotFoundException**

```json
{
  "message": "string",
  "resourceType": "string"
}
```

**Example ConflictException**

```json
{
  "message": "string"
}
```

**Example LimitExceededException**

```json
{
  "message": "string",
  "limitType": "string"
}
```
Properties

BadRequestException

The request is not valid, for example, the input is incomplete or incorrect. See the accompanying error message for details.

message

Describes the error encountered.

Type: string
Required: False

ConflictException

The requested operation would cause a conflict with the current state of a service resource associated with the request. Resolve the conflict before retrying this request. See the accompanying error message for details.

message

Describes the error encountered.

Type: string
Required: False

Deployment

An immutable representation of an API that can be called by users. A Deployment must be associated with a Stage for it to be callable over the internet.

deploymentId

The identifier for the deployment.

Type: string
Required: False

description

The description for the deployment.

Type: string
Required: False

createdDate

The date and time when the Deployment resource was created.

Type: string
Required: False
Format: date-time
**deploymentStatus**

The status of the deployment: PENDING, FAILED, or SUCCEEDED.

- **Type**: DeploymentStatus (p. 58)
- **Required**: False

**deploymentStatusMessage**

May contain additional feedback on the status of an API deployment.

- **Type**: string
- **Required**: False

**autoDeployed**

Specifies whether a deployment was automatically released.

- **Type**: boolean
- **Required**: False

**DeploymentStatus**

Represents a deployment status.

- PENDING
- FAILED
- DEPLOYED

**LimitExceededException**

A limit has been exceeded. See the accompanying error message for details.

**message**

Describes the error encountered.

- **Type**: string
- **Required**: False

**limitType**

The limit type.

- **Type**: string
- **Required**: False

**NotFoundException**

The resource specified in the request was not found. See the message field for more information.

**message**

Describes the error encountered.
Type: string
Required: False

resourceType
The resource type.

Type: string
Required: False

UpdateDeploymentInput
Represents the input parameters for an UpdateDeployment request.

description
The description for the deployment resource.

Type: string
Required: False

```
Properties

BadRequestException

The request is not valid, for example, the input is incomplete or incorrect. See the accompanying error message for details.

message

Describes the error encountered.

Type: string
Required: False

ConflictException

The requested operation would cause a conflict with the current state of a service resource associated with the request. Resolve the conflict before retrying this request. See the accompanying error message for details.

message

Describes the error encountered.

Type: string
Required: False

ConnectionType

Represents a connection type.

INTERNET
VPC_LINK

ContentHandlingStrategy

Specifies how to handle response payload content type conversions. Supported only for WebSocket APIs.

CONVERT_TO_BINARY
CONVERT_TO_TEXT

CreateIntegrationInput

Represents the input parameters for a CreateIntegration request.

description

The description of the integration.

Type: string
Required: False

integrationType

The integration type of an integration. One of the following:

AWS: for integrating the route or method request with an AWS service action, including the Lambda function-invoking action. With the Lambda function-invoking action, this is referred to as the Lambda custom integration. With any other AWS service action, this is known as AWS integration. Supported only for WebSocket APIs.

AWS_PROXY: for integrating the route or method request with the Lambda function-invoking action with the client request passed through as-is. This integration is also referred to as Lambda proxy integration.

HTTP: for integrating the route or method request with an HTTP endpoint. This integration is also referred to as the HTTP custom integration. Supported only for WebSocket APIs.
HTTP_PROXY: for integrating the route or method request with an HTTP endpoint, with the client request passed through as-is. This is also referred to as HTTP proxy integration. For HTTP API private integrations, use an HTTP_PROXY integration.

MOCK: for integrating the route or method request with API Gateway as a "loopback" endpoint without invoking any backend. Supported only for WebSocket APIs.

**Type:** IntegrationType (p. 71)  
**Required:** True

**integrationMethod**  
Specifies the integration's HTTP method type.

**Type:** string  
**Required:** False

**integrationUri**  
For a Lambda integration, specify the URI of a Lambda function.
For an HTTP integration, specify a fully-qualified URL.
For an HTTP API private integration, specify the ARN of an Application Load Balancer listener, Network Load Balancer listener, or AWS Cloud Map service. If you specify the ARN of an AWS Cloud Map service, API Gateway uses DiscoverInstances to identify resources. You can use query parameters to target specific resources. To learn more, see DiscoverInstances. For private integrations, all resources must be owned by the same AWS account.

**Type:** string  
**Required:** False

**tlsConfig**  
The TLS configuration for a private integration. If you specify a TLS configuration, private integration traffic uses the HTTPS protocol. Supported only for HTTP APIs.

**Type:** TlsConfigInput (p. 73)  
**Required:** False

**credentialsArn**  
Specifies the credentials required for the integration, if any. For AWS integrations, three options are available. To specify an IAM Role for API Gateway to assume, use the role's Amazon Resource Name (ARN). To require that the caller's identity be passed through from the request, specify the string arn:aws:iam::*:user/*. To use resource-based permissions on supported AWS services, specify null.

**Type:** string  
**Required:** False

**connectionType**  
The type of the network connection to the integration endpoint. Specify INTERNET for connections through the public routable internet or VPC_LINK for private connections between API Gateway and resources in a VPC. The default value is INTERNET.

**Type:** ConnectionType (p. 64)
Properties

Required: False

connectionId

The ID of the VPC link for a private integration. Supported only for HTTP APIs.

  Type: string
  Required: False

requestParameters

A key-value map specifying request parameters that are passed from the method request to the backend. The key is an integration request parameter name and the associated value is a method request parameter value or static value that must be enclosed within single quotes and pre-encoded as required by the backend. The method request parameter value must match the pattern of method.request.{location}.{name}, where {location} is querystring, path, or header; and {name} must be a valid and unique method request parameter name. Supported only for WebSocket APIs.

  Type: IntegrationParameters (p. 71)
  Required: False

requestTemplates

Represents a map of Velocity templates that are applied on the request payload based on the value of the Content-Type header sent by the client. The content type value is the key in this map, and the template (as a String) is the value. Supported only for WebSocket APIs.

  Type: TemplateMap (p. 72)
  Required: False

templateSelectionExpression

The template selection expression for the integration.

  Type: string
  Required: False

passthroughBehavior

Specifies the pass-through behavior for incoming requests based on the Content-Type header in the request, and the available mapping templates specified as the requestTemplates property on the Integration resource. There are three valid values: WHEN_NO_MATCH, WHEN_NO_TEMPLATES, and NEVER. Supported only for WebSocket APIs.

  WHEN_NO_MATCH passes the request body for unmapped content types through to the integration backend without transformation.

  NEVER rejects unmapped content types with an HTTP 415 Unsupported Media Type response.

  WHEN_NO_TEMPLATES allows pass-through when the integration has no content types mapped to templates. However, if there is at least one content type defined, unmapped content types will be rejected with the same HTTP 415 Unsupported Media Type response.

  Type: PassthroughBehavior (p. 72)
  Required: False
contentHandlingStrategy

Supported only for WebSocket APIs. Specifies how to handle response payload content type conversions. Supported values are CONVERT_TO_BINARY and CONVERT_TO_TEXT, with the following behaviors:

CONVERT_TO_BINARY: Converts a response payload from a Base64-encoded string to the corresponding binary blob.

CONVERT_TO_TEXT: Converts a response payload from a binary blob to a Base64-encoded string.

If this property is not defined, the response payload will be passed through from the integration response to the route response or method response without modification.

Type: ContentHandlingStrategy (p. 64)
Required: False

timeoutInMillis

Custom timeout between 50 and 29,000 milliseconds for WebSocket APIs and between 50 and 30,000 milliseconds for HTTP APIs. The default timeout is 29 seconds for WebSocket APIs and 30 seconds for HTTP APIs.

Type: integer
Required: False

payloadFormatVersion

Specifies the format of the payload sent to an integration. Required for HTTP APIs.

Type: string
Required: False

Integration

Represents an integration.

integrationId

Represents the identifier of an integration.

Type: string
Required: False

description

Represents the description of an integration.

Type: string
Required: False

integrationType

The integration type of an integration. One of the following:

AWS: for integrating the route or method request with an AWS service action, including the Lambda function-invoking action. With the Lambda function-invoking action, this is referred to as the Lambda
custom integration. With any other AWS service action, this is known as AWS integration. Supported only for WebSocket APIs.

AWS_PROXY: for integrating the route or method request with the Lambda function-invoking action with the client request passed through as-is. This integration is also referred to as Lambda proxy integration.

HTTP: for integrating the route or method request with an HTTP endpoint. This integration is also referred to as the HTTP custom integration. Supported only for WebSocket APIs.

HTTP_PROXY: for integrating the route or method request with an HTTP endpoint, with the client request passed through as-is. This is also referred to as HTTP proxy integration.

MOCK: for integrating the route or method request with API Gateway as a "loopback" endpoint without invoking any backend. Supported only for WebSocket APIs.

Type: IntegrationType (p. 71)
Required: False

integrationMethod
Specifies the integration's HTTP method type.

Type: string
Required: False

integrationUri
For a Lambda integration, specify the URI of a Lambda function.
For an HTTP integration, specify a fully-qualified URL.
For an HTTP API private integration, specify the ARN of an Application Load Balancer listener, Network Load Balancer listener, or AWS Cloud Map service. If you specify the ARN of an AWS Cloud Map service, API Gateway uses DiscoverInstances to identify resources. You can use query parameters to target specific resources. To learn more, see DiscoverInstances. For private integrations, all resources must be owned by the same AWS account.

Type: string
Required: False

tlsConfig
The TLS configuration for a private integration. If you specify a TLS configuration, private integration traffic uses the HTTPS protocol. Supported only for HTTP APIs.

Type: TlsConfig (p. 72)
Required: False

credentialsArn
Specifies the credentials required for the integration, if any. For AWS integrations, three options are available. To specify an IAM Role for API Gateway to assume, use the role's Amazon Resource Name (ARN). To require that the caller's identity be passed through from the request, specify the string arn:aws:iam::*:user/*. To use resource-based permissions on supported AWS services, specify null.

Type: string
Required: False
**connectionType**

The type of the network connection to the integration endpoint. Specify `INTERNET` for connections through the public routable internet or `VPC_LINK` for private connections between API Gateway and resources in a VPC. The default value is `INTERNET`.

  * **Type:** `ConnectionType` *(p. 64)*
  * **Required:** False

**connectionId**

The ID of the VPC link for a private integration. Supported only for HTTP APIs.

  * **Type:** `string`
  * **Required:** False

**requestParameters**

A key-value map specifying request parameters that are passed from the method request to the backend. The key is an integration request parameter name and the associated value is a method request parameter value or static value that must be enclosed within single quotes and pre-encoded as required by the backend. The method request parameter value must match the pattern of `method.request.{location}.{name}`, where `{location}` is querystring, path, or header; and `{name}` must be a valid and unique method request parameter name. Supported only for WebSocket APIs.

  * **Type:** `IntegrationParameters` *(p. 71)*
  * **Required:** False

**requestTemplates**

Represents a map of Velocity templates that are applied on the request payload based on the value of the Content-Type header sent by the client. The content type value is the key in this map, and the template (as a String) is the value. Supported only for WebSocket APIs.

  * **Type:** `TemplateMap` *(p. 72)*
  * **Required:** False

**templateSelectionExpression**

The template selection expression for the integration. Supported only for WebSocket APIs.

  * **Type:** `string`
  * **Required:** False

**passthroughBehavior**

Specifies the pass-through behavior for incoming requests based on the Content-Type header in the request, and the available mapping templates specified as the `requestTemplates` property on the `Integration` resource. There are three valid values: `WHEN_NO_MATCH`, `WHEN_NO_TEMPLATES`, and `NEVER`. Supported only for WebSocket APIs.

- **WHEN_NO_MATCH** passes the request body for unmapped content types through to the integration backend without transformation.
- **NEVER** rejects unmapped content types with an HTTP 415 Unsupported Media Type response.
WHEN_NO_TEMPLATES allows pass-through when the integration has no content types mapped to templates. However, if there is at least one content type defined, unmapped content types will be rejected with the same HTTP 415 Unsupported Media Type response.

**Type:** PassthroughBehavior (p. 72)
**Required:** False

**contentHandlingStrategy**

Supported only for WebSocket APIs. Specifies how to handle response payload content type conversions. Supported values are CONVERT_TO_BINARY and CONVERT_TO_TEXT, with the following behaviors:

**CONVERT_TO_BINARY:** Converts a response payload from a Base64-encoded string to the corresponding binary blob.

**CONVERT_TO_TEXT:** Converts a response payload from a binary blob to a Base64-encoded string.

If this property is not defined, the response payload will be passed through from the integration response to the route response or method response without modification.

**Type:** ContentHandlingStrategy (p. 64)
**Required:** False

**timeoutInMillis**

Custom timeout between 50 and 29,000 milliseconds for WebSocket APIs and between 50 and 30,000 milliseconds for HTTP APIs. The default timeout is 29 seconds for WebSocket APIs and 30 seconds for HTTP APIs.

**Type:** integer
**Required:** False

**integrationResponseSelectionExpression**

The integration response selection expression for the integration. Supported only for WebSocket APIs. See Integration Response Selection Expressions.

**Type:** string
**Required:** False

**payloadFormatVersion**

Specifies the format of the payload sent to an integration. Required for HTTP APIs.

**Type:** string
**Required:** False

**apiGatewayManaged**

Specifies whether an integration is managed by API Gateway. If you created an API using quick create, the resulting integration is managed by API Gateway. You can update a managed integration, but you can't delete it.

**Type:** boolean
**Required:** False
IntegrationParameters

A key-value map specifying response parameters that are passed to the method response from the backend. The key is a method response header parameter name and the mapped value is an integration response header value, a static value enclosed within a pair of single quotes, or a JSON expression from the integration response body. The mapping key must match the pattern of method.response.header.{name}, where name is a valid and unique header name. The mapped non-static value must match the pattern of integration.response.header.{name} or integration.response.body.{JSON-expression}, where name is a valid and unique response header name and JSON-expression is a valid JSON expression without the $ prefix.

key-value pairs

Type: string

IntegrationType

Represents an API method integration type.

AWS
HTTP
MOCK
HTTP_PROXY
AWS_PROXY

Integrations

Represents a collection of integrations.

items

The elements from this collection.

Type: Array of type Integration (p. 67)
Required: False

nextToken

The next page of elements from this collection. Not valid for the last element of the collection.

Type: string
Required: False

LimitExceededException

A limit has been exceeded. See the accompanying error message for details.

message

Describes the error encountered.

Type: string
Required: False
limitType

The limit type.

  Type: string
  Required: False

NotFoundException

The resource specified in the request was not found. See the message field for more information.

message

Describes the error encountered.

  Type: string
  Required: False

resourceType

The resource type.

  Type: string
  Required: False

PassthroughBehavior

Represents passthrough behavior for an integration response. Supported only for WebSocket APIs.

  WHEN_NO_MATCH
  NEVER
  WHEN_NO_TEMPLATES

TemplateMap

A mapping of identifier keys to templates. The value is an actual template script. The key is typically a SelectionKey which is chosen based on evaluating a selection expression.

key-value pairs

  Type: string

TlsConfig

The TLS configuration for a private integration. If you specify a TLS configuration, private integration traffic uses the HTTPS protocol. Supported only for HTTP APIs.

serverNameToVerify

If you specify a server name, API Gateway uses it to verify the hostname on the integration’s certificate. The server name is also included in the TLS handshake to support Server Name Indication (SNI) or virtual hosting.

  Type: string
**Required**: False

**TlsConfigInput**

The TLS configuration for a private integration. If you specify a TLS configuration, private integration traffic uses the HTTPS protocol. Supported only for HTTP APIs.

**serverNameToVerify**

If you specify a server name, API Gateway uses it to verify the hostname on the integration's certificate. The server name is also included in the TLS handshake to support Server Name Indication (SNI) or virtual hosting.

*Type*: string  
*Required*: False

**Properties**

**BadRequestException**

The request is not valid, for example, the input is incomplete or incorrect. See the accompanying error message for details.

**message**

Describes the error encountered.

- **Type:** string
- **Required:** False

**ConflictException**

The requested operation would cause a conflict with the current state of a service resource associated with the request. Resolve the conflict before retrying this request. See the accompanying error message for details.

**message**

Describes the error encountered.

- **Type:** string
- **Required:** False

**ConnectionType**

Represents a connection type.

- INTERNET
- VPC_LINK

**ContentHandlingStrategy**

Specifies how to handle response payload content type conversions. Supported only for WebSocket APIs.

- CONVERT_TO_BINARY
- CONVERT_TO_TEXT

**Integration**

Represents an integration.
integrationId
Represents the identifier of an integration.

Type: string
Required: False

description
Represents the description of an integration.

Type: string
Required: False

integrationType
The integration type of an integration. One of the following:

AWS: for integrating the route or method request with an AWS service action, including the Lambda function-invoking action. With the Lambda function-invoking action, this is referred to as the Lambda custom integration. With any other AWS service action, this is known as AWS integration. Supported only for WebSocket APIs.

AWS_PROXY: for integrating the route or method request with the Lambda function-invoking action with the client request passed through as-is. This integration is also referred to as Lambda proxy integration.

HTTP: for integrating the route or method request with an HTTP endpoint. This integration is also referred to as the HTTP custom integration. Supported only for WebSocket APIs.

HTTP_PROXY: for integrating the route or method request with an HTTP endpoint, with the client request passed through as-is. This is also referred to as HTTP proxy integration.

MOCK: for integrating the route or method request with API Gateway as a "loopback" endpoint without invoking any backend. Supported only for WebSocket APIs.

Type: IntegrationType (p. 81)
Required: False

integrationMethod
Specifies the integration's HTTP method type.

Type: string
Required: False

integrationUri
For a Lambda integration, specify the URI of a Lambda function.
For an HTTP integration, specify a fully-qualified URL.
For an HTTP API private integration, specify the ARN of an Application Load Balancer listener, Network Load Balancer listener, or AWS Cloud Map service. If you specify the ARN of an AWS Cloud Map service, API Gateway uses DiscoverInstances to identify resources. You can use query parameters to target specific resources. To learn more, see DiscoverInstances. For private integrations, all resources must be owned by the same AWS account.

Type: string
Required: False
properties

tlsConfig

The TLS configuration for a private integration. If you specify a TLS configuration, private integration traffic uses the HTTPS protocol. Supported only for HTTP APIs.

  Type: TlsConfig (p. 82)
  Required: False

credentialsArn

Specifies the credentials required for the integration, if any. For AWS integrations, three options are available. To specify an IAM Role for API Gateway to assume, use the role’s Amazon Resource Name (ARN). To require that the caller’s identity be passed through from the request, specify the string arn:aws:iam::*:user/*. To use resource-based permissions on supported AWS services, specify null.

  Type: string
  Required: False

connectionType

The type of the network connection to the integration endpoint. Specify INTERNET for connections through the public routable internet or VPC_LINK for private connections between API Gateway and resources in a VPC. The default value is INTERNET.

  Type: ConnectionType (p. 77)
  Required: False

connectionId

The ID of the VPC link for a private integration. Supported only for HTTP APIs.

  Type: string
  Required: False

requestParameters

A key-value map specifying request parameters that are passed from the method request to the backend. The key is an integration request parameter name and the associated value is a method request parameter value or static value that must be enclosed within single quotes and pre-encoded as required by the backend. The method request parameter value must match the pattern of method.request.{location}.{name}, where {location} is querystring, path, or header; and {name} must be a valid and unique method request parameter name. Supported only for WebSocket APIs.

  Type: IntegrationParameters (p. 81)
  Required: False

requestTemplates

Represents a map of Velocity templates that are applied on the request payload based on the value of the Content-Type header sent by the client. The content type value is the key in this map, and the template (as a String) is the value. Supported only for WebSocket APIs.

  Type: TemplateMap (p. 82)
  Required: False
**templateSelectionExpression**
The template selection expression for the integration. Supported only for WebSocket APIs.

- **Type**: string
- **Required**: False

**passthroughBehavior**
Specifies the pass-through behavior for incoming requests based on the Content-Type header in the request, and the available mapping templates specified as the requestTemplates property on the Integration resource. There are three valid values: WHEN_NO_MATCH, WHEN_NO_TEMPLATES, and NEVER. Supported only for WebSocket APIs.

- **WHEN_NO_MATCH**: passes the request body for unmapped content types through to the integration backend without transformation.
- **NEVER**: rejects unmapped content types with an HTTP 415 Unsupported Media Type response.
- **WHEN_NO_TEMPLATES**: allows pass-through when the integration has no content types mapped to templates. However, if there is at least one content type defined, unmapped content types will be rejected with the same HTTP 415 Unsupported Media Type response.

- **Type**: PassthroughBehavior (p. 82)
- **Required**: False

**contentHandlingStrategy**
Supported only for WebSocket APIs. Specifies how to handle response payload content type conversions. Supported values are CONVERT_TO_BINARY and CONVERT_TO_TEXT, with the following behaviors:

- **CONVERT_TO_BINARY**: Converts a response payload from a Base64-encoded string to the corresponding binary blob.
- **CONVERT_TO_TEXT**: Converts a response payload from a binary blob to a Base64-encoded string.

If this property is not defined, the response payload will be passed through from the integration response to the route response or method response without modification.

- **Type**: ContentHandlingStrategy (p. 77)
- **Required**: False

**timeoutInMillis**
Custom timeout between 50 and 29,000 milliseconds for WebSocket APIs and between 50 and 30,000 milliseconds for HTTP APIs. The default timeout is 29 seconds for WebSocket APIs and 30 seconds for HTTP APIs.

- **Type**: integer
- **Required**: False

**integrationResponseSelectionExpression**
The integration response selection expression for the integration. Supported only for WebSocket APIs. See Integration Response Selection Expressions.

- **Type**: string
Required: False

payloadFormatVersion
Specifies the format of the payload sent to an integration. Required for HTTP APIs.

  Type: string
  Required: False

apiGatewayManaged
Specifies whether an integration is managed by API Gateway. If you created an API using quick create, the resulting integration is managed by API Gateway. You can update a managed integration, but you can't delete it.

  Type: boolean
  Required: False

IntegrationParameters
A key-value map specifying response parameters that are passed to the method response from the backend. The key is a method response header parameter name and the mapped value is an integration response header value, a static value enclosed within a pair of single quotes, or a JSON expression from the integration response body. The mapping key must match the pattern of method.response.header. (name), where name is a valid and unique header name. The mapped non-static value must match the pattern of integration.response.header.(name) or integration.response.body.(JSON-expression), where name is a valid and unique response header name and JSON-expression is a valid JSON expression without the $ prefix.

  key-value pairs
  Type: string

IntegrationType
Represents an API method integration type.

  AWS
  HTTP
  MOCK
  HTTP_PROXY
  AWS_PROXY

LimitExceededException
A limit has been exceeded. See the accompanying error message for details.

  message
  Describes the error encountered.

  Type: string
  Required: False
limitType
The limit type.

Type: string
Required: False

NotFoundException
The resource specified in the request was not found. See the message field for more information.

message
Describes the error encountered.

Type: string
Required: False

resourceType
The resource type.

Type: string
Required: False

PassthroughBehavior
Represents passthrough behavior for an integration response. Supported only for WebSocket APIs.

WHEN_NO_MATCH
NEVER
WHEN_NO_TEMPLATES

TemplateMap
A mapping of identifier keys to templates. The value is an actual template script. The key is typically a SelectionKey which is chosen based on evaluating a selection expression.

key-value pairs

Type: string

TlsConfig
The TLS configuration for a private integration. If you specify a TLS configuration, private integration traffic uses the HTTPS protocol. Supported only for HTTP APIs.

serverNameToVerify
If you specify a server name, API Gateway uses it to verify the hostname on the integration's certificate. The server name is also included in the TLS handshake to support Server Name Indication (SNI) or virtual hosting.

Type: string
Required: False
**TlsConfigInput**

The TLS configuration for a private integration. If you specify a TLS configuration, private integration traffic uses the HTTPS protocol. Supported only for HTTP APIs.

**serverNameToVerify**

If you specify a server name, API Gateway uses it to verify the hostname on the integration's certificate. The server name is also included in the TLS handshake to support Server Name Indication (SNI) or virtual hosting.

- **Type**: string
- **Required**: False

**UpdateIntegrationInput**

Represents the input parameters for an UpdateIntegration request.

**description**

The description of the integration

- **Type**: string
- **Required**: False

**integrationType**

The integration type of an integration. One of the following:

- **AWS**: for integrating the route or method request with an AWS service action, including the Lambda function-invoking action. With the Lambda function-invoking action, this is referred to as the Lambda custom integration. With any other AWS service action, this is known as AWS integration. Supported only for WebSocket APIs.

- **AWS_PROXY**: for integrating the route or method request with the Lambda function-invoking action with the client request passed through as-is. This integration is also referred to as Lambda proxy integration.

- **HTTP**: for integrating the route or method request with an HTTP endpoint. This integration is also referred to as the HTTP custom integration. Supported only for WebSocket APIs.

- **HTTP_PROXY**: for integrating the route or method request with an HTTP endpoint, with the client request passed through as-is. This is also referred to as HTTP proxy integration. For HTTP API private integrations, use an HTTP_PROXY integration.

- **MOCK**: for integrating the route or method request with API Gateway as a "loopback" endpoint without invoking any backend. Supported only for WebSocket APIs.

- **Type**: IntegrationType (p. 81)
- **Required**: False

**integrationMethod**

Specifies the integration's HTTP method type.

- **Type**: string
- **Required**: False
integrationUri

For a Lambda integration, specify the URI of a Lambda function.

For an HTTP integration, specify a fully-qualified URL.

For an HTTP API private integration, specify the ARN of an Application Load Balancer listener, Network Load Balancer listener, or AWS Cloud Map service. If you specify the ARN of an AWS Cloud Map service, API Gateway uses DiscoverInstances to identify resources. You can use query parameters to target specific resources. To learn more, see DiscoverInstances. For private integrations, all resources must be owned by the same AWS account.

  Type: string
  Required: False

tlsConfig

The TLS configuration for a private integration. If you specify a TLS configuration, private integration traffic uses the HTTPS protocol. Supported only for HTTP APIs.

  Type: TlsConfigInput (p. 83)
  Required: False

credentialsArn

Specifies the credentials required for the integration, if any. For AWS integrations, three options are available. To specify an IAM Role for API Gateway to assume, use the role's Amazon Resource Name (ARN). To require that the caller's identity be passed through from the request, specify the string arn:aws:iam:::*:user/*. To use resource-based permissions on supported AWS services, specify null.

  Type: string
  Required: False

connectionType

The type of the network connection to the integration endpoint. Specify INTERNET for connections through the public routable internet or VPC_LINK for private connections between API Gateway and resources in a VPC. The default value is INTERNET.

  Type: ConnectionType (p. 77)
  Required: False

connectionId

The ID of the VPC link for a private integration. Supported only for HTTP APIs.

  Type: string
  Required: False

requestParameters

A key-value map specifying request parameters that are passed from the method request to the backend. The key is an integration request parameter name and the associated value is a method request parameter value or static value that must be enclosed within single quotes and pre-encoded as required by the backend. The method request parameter value must match the pattern of
method.request.{location}.{name}, where {location} is querystring, path, or header; and {name} must be a valid and unique method request parameter name. Supported only for WebSocket APIs.

Type: IntegrationParameters (p. 81)
Required: False

**requestTemplates**

Represents a map of Velocity templates that are applied on the request payload based on the value of the Content-Type header sent by the client. The content type value is the key in this map, and the template (as a String) is the value. Supported only for WebSocket APIs.

Type: TemplateMap (p. 82)
Required: False

**templateSelectionExpression**

The template selection expression for the integration.

Type: string
Required: False

**passthroughBehavior**

Specifies the pass-through behavior for incoming requests based on the Content-Type header in the request, and the available mapping templates specified as the requestTemplates property on the Integration resource. There are three valid values: WHEN_NO_MATCH, WHEN_NO_TEMPLATES, and NEVER. Supported only for WebSocket APIs.

WHEN_NO_MATCH passes the request body for unmapped content types through to the integration backend without transformation.

NEVER rejects unmapped content types with an HTTP 415 Unsupported Media Type response.

WHEN_NO_TEMPLATES allows pass-through when the integration has no content types mapped to templates. However, if there is at least one content type defined, unmapped content types will be rejected with the same HTTP 415 Unsupported Media Type response.

Type: PassthroughBehavior (p. 82)
Required: False

**contentHandlingStrategy**

Supported only for WebSocket APIs. Specifies how to handle response payload content type conversions. Supported values are CONVERT_TO_BINARY and CONVERT_TO_TEXT, with the following behaviors:

CONVERT_TO_BINARY: Converts a response payload from a Base64-encoded string to the corresponding binary blob.

CONVERT_TO_TEXT: Converts a response payload from a binary blob to a Base64-encoded string.

If this property is not defined, the response payload will be passed through from the integration response to the route response or method response without modification.

Type: ContentHandlingStrategy (p. 77)
Required: False
timeoutInMillis

Custom timeout between 50 and 29,000 milliseconds for WebSocket APIs and between 50 and 30,000 milliseconds for HTTP APIs. The default timeout is 29 seconds for WebSocket APIs and 30 seconds for HTTP APIs.

Type: integer
Required: False

IntegrationResponses

Represents the collection of responses for an integration. Supported only for WebSocket APIs.

URI

/v2/apis/apiId/integrations/integrationId/integrationresponses

HTTP Methods

GET

Operation ID: GetIntegrationResponses

Gets the IntegrationResponses for an Integration.

Path Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>integrationId</td>
<td>String</td>
<td>True</td>
<td>The integration ID.</td>
</tr>
<tr>
<td>apiId</td>
<td>String</td>
<td>True</td>
<td>The API identifier.</td>
</tr>
</tbody>
</table>

Query Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nextToken</td>
<td>String</td>
<td>False</td>
<td>The next page of elements from this collection. Not valid for the last element of the collection.</td>
</tr>
<tr>
<td>maxResults</td>
<td>String</td>
<td>False</td>
<td>The maximum number of elements to be returned for this resource.</td>
</tr>
</tbody>
</table>

Responses

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Response Model</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>200</td>
<td>IntegrationResponses (p. 89)</td>
<td>Success</td>
</tr>
</tbody>
</table>
POST

Operation ID: CreateIntegrationResponse

Creates an IntegrationResponses.

Path Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiId</td>
<td>String</td>
<td>True</td>
<td>The API identifier.</td>
</tr>
<tr>
<td>integrationId</td>
<td>String</td>
<td>True</td>
<td>The integration ID.</td>
</tr>
</tbody>
</table>

Responses

<table>
<thead>
<tr>
<th>Status Code</th>

}
```

Example NotFoundException

```json
{
    "message": "string",
    "resourceType": "string"
}
```

Example ConflictException

```json
{
    "message": "string"
}
```
Example LimitExceededException

```json
{
  "message": "string",
  "limitType": "string"
}
```

Properties

**BadRequestException**

The request is not valid, for example, the input is incomplete or incorrect. See the accompanying error message for details.

**message**

Describes the error encountered.

- **Type:** string
- **Required:** False

**ConflictException**

The requested operation would cause a conflict with the current state of a service resource associated with the request. Resolve the conflict before retrying this request. See the accompanying error message for details.

**message**

Describes the error encountered.

- **Type:** string
- **Required:** False

**ContentHandlingStrategy**

Specifies how to handle response payload content type conversions. Supported only for WebSocket APIs.

- CONVERT_TO_BINARY
- CONVERT_TO_TEXT

**CreateIntegrationResponseInput**

Represents the input parameters for a CreateIntegrationResponse request.

**integrationResponseKey**

The integration response key.

- **Type:** string
responseParameters

A key-value map specifying response parameters that are passed to the method response from the backend. The key is a method response header parameter name and the mapped value is an integration response header value, a static value enclosed within a pair of single quotes, or a JSON expression from the integration response body. The mapping key must match the pattern of method.response.header.{name}, where {name} is a valid and unique header name. The mapped non-static value must match the pattern of integration.response.header.{name} or integration.response.body.{JSON-expression}, where {name} is a valid and unique response header name and {JSON-expression} is a valid JSON expression without the $ prefix.

Type: IntegrationParameters (p. 91)
Required: False

responseTemplates

The collection of response templates for the integration response as a string-to-string map of key-value pairs. Response templates are represented as a key/value map, with a content-type as the key and a template as the value.

Type: TemplateMap (p. 94)
Required: False

templateSelectionExpression

The template selection expression for the integration response. Supported only for WebSocket APIs.

Type: string
Required: False

contentHandlingStrategy

Specifies how to handle response payload content type conversions. Supported values are CONVERT_TO_BINARY and CONVERT_TO_TEXT, with the following behaviors:

CONVERT_TO_BINARY: Converts a response payload from a Base64-encoded string to the corresponding binary blob.

CONVERT_TO_TEXT: Converts a response payload from a binary blob to a Base64-encoded string.

If this property is not defined, the response payload will be passed through from the integration response to the route response or method response without modification.

Type: ContentHandlingStrategy (p. 90)
Required: False

IntegrationParameters

A key-value map specifying response parameters that are passed to the method response from the backend. The key is a method response header parameter name and the mapped value is an integration response header value, a static value enclosed within a pair of single quotes, or a JSON expression from the integration response body. The mapping key must match the pattern of method.response.header.{name}, where name is a valid and unique header name. The mapped non-static value must match the
pattern of integration.response.header.{name} or integration.response.body.{JSON-expression}, where name is a valid and unique response header name and JSON-expression is a valid JSON expression without the $ prefix.

**key-value pairs**

**Type**: string

**IntegrationResponse**

Represents an integration response.

**integrationResponseId**

The integration response ID.

**Type**: string  
**Required**: False

**integrationResponseKey**

The integration response key.

**Type**: string  
**Required**: True

**responseParameters**

A key-value map specifying response parameters that are passed to the method response from the backend. The key is a method response header parameter name and the mapped value is an integration response header value, a static value enclosed within a pair of single quotes, or a JSON expression from the integration response body. The mapping key must match the pattern of method.response.header.{name}, where name is a valid and unique header name. The mapped non-static value must match the pattern of integration.response.header.{name} or integration.response.body.{JSON-expression}, where name is a valid and unique response header name and JSON-expression is a valid JSON expression without the $ prefix.

**Type**: IntegrationParameters (p. 91)  
**Required**: False

**responseTemplates**

The collection of response templates for the integration response as a string-to-string map of key-value pairs. Response templates are represented as a key/value map, with a content-type as the key and a template as the value.

**Type**: TemplateMap (p. 94)  
**Required**: False

**templateSelectionExpression**

The template selection expressions for the integration response.

**Type**: string
Required: False

contentHandlingStrategy

Supported only for WebSocket APIs. Specifies how to handle response payload content type conversions. Supported values are CONVERT_TO_BINARY and CONVERT_TO_TEXT, with the following behaviors:

CONVERT_TO_BINARY: Converts a response payload from a Base64-encoded string to the corresponding binary blob.

CONVERT_TO_TEXT: Converts a response payload from a binary blob to a Base64-encoded string.

If this property is not defined, the response payload will be passed through from the integration response to the route response or method response without modification.

Type: ContentHandlingStrategy (p. 90)
Required: False

IntegrationResponses

Represents a collection of integration responses.

items

The elements from this collection.

Type: Array of type IntegrationResponse (p. 92)
Required: False

nextToken

The next page of elements from this collection. Not valid for the last element of the collection.

Type: string
Required: False

LimitExceeded Exception

A limit has been exceeded. See the accompanying error message for details.

message

Describes the error encountered.

Type: string
Required: False

limitType

The limit type.

Type: string
Required: False
NotFoundException

The resource specified in the request was not found. See the message field for more information.

message

Describes the error encountered.

Type: string
Required: False

resourceType

The resource type.

Type: string
Required: False

TemplateMap

A mapping of identifier keys to templates. The value is an actual template script. The key is typically a SelectionKey which is chosen based on evaluating a selection expression.

key-value pairs

Type: string

### Status Code 429

**Response Model** LimitExceededException (p. 98)

**Description** The client is sending more than the allowed number of requests per unit of time.

### Schemas

#### Request Bodies

**Example PATCH**

```json
{
    "integrationResponseKey": "string",
    "responseParameters": {
    },
    "responseTemplates": {
    },
    "templateSelectionExpression": "string",
    "contentHandlingStrategy": enum
}
```

#### Response Bodies

**Example IntegrationResponse**

```json
{
    "integrationResponseId": "string",
    "integrationResponseKey": "string",
    "responseParameters": {
    },
    "responseTemplates": {
    },
    "templateSelectionExpression": "string",
    "contentHandlingStrategy": enum
}
```

**Example BadRequestException**

```json
{
    "message": "string"
}
```

**Example NotFoundException**

```json
{
    "message": "string",
    "resourceType": "string"
}
```

**Example ConflictException**

```json
{
    "message": "string",
    "resourceType": "string"
}
```
"message": "string"
}

Example LimitExceeded Exception

{
  "message": "string",
  "limitType": "string"
}

Properties

BadRequest Exception

The request is not valid, for example, the input is incomplete or incorrect. See the accompanying error message for details.

message

Describes the error encountered.

Type: string
Required: False

Conflict Exception

The requested operation would cause a conflict with the current state of a service resource associated with the request. Resolve the conflict before retrying this request. See the accompanying error message for details.

message

Describes the error encountered.

Type: string
Required: False

Content Handling Strategy

Specifies how to handle response payload content type conversions. Supported only for WebSocket APIs.

CONVERT_TO_BINARY
CONVERT_TO_TEXT

Integration Parameters

A key-value map specifying response parameters that are passed to the method response from the backend. The key is a method response header parameter name and the mapped value is an integration response header value, a static value enclosed within a pair of single quotes, or a JSON expression from the integration response body. The mapping key must match the pattern of method.response.header.{name}, where name is a valid and unique header name. The mapped non-static value must match the
pattern of integration.response.header.{name} or integration.response.body.{JSON-expression}, where
name is a valid and unique response header name and JSON-expression is a valid JSON expression
without the $ prefix.

**key-value pairs**

*Type:* string

**IntegrationResponse**

Represents an integration response.

**integrationResponseId**

The integration response ID.

*Type:* string
*Required:* False

**integrationResponseKey**

The integration response key.

*Type:* string
*Required:* True

**responseParameters**

A key-value map specifying response parameters that are passed to the method response from the
backend. The key is a method response header parameter name and the mapped value is an integration
response header value, a static value enclosed within a pair of single quotes, or a JSON expression from
the integration response body. The mapping key must match the pattern of method.response.header.
{name}, where name is a valid and unique header name. The mapped non-static value must match the
pattern of integration.response.header.{name} or integration.response.body.{JSON-expression}, where
name is a valid and unique response header name and JSON-expression is a valid JSON expression
without the $ prefix.

*Type:* IntegrationParameters (p. 98)
*Required:* False

**responseTemplates**

The collection of response templates for the integration response as a string-to-string map of key-value
pairs. Response templates are represented as a key/value map, with a content-type as the key and a
template as the value.

*Type:* TemplateMap (p. 101)
*Required:* False

**templateSelectionExpression**

The template selection expressions for the integration response.

*Type:* string
Properties

Required: False

**contentHandlingStrategy**

Supported only for WebSocket APIs. Specifies how to handle response payload content type conversions. Supported values are `CONVERT_TO_BINARY` and `CONVERT_TO_TEXT`, with the following behaviors:

- **CONVERT_TO_BINARY**: Converts a response payload from a Base64-encoded string to the corresponding binary blob.
- **CONVERT_TO_TEXT**: Converts a response payload from a binary blob to a Base64-encoded string.

If this property is not defined, the response payload will be passed through from the integration response to the route response or method response without modification.

- **Type**: ContentHandlingStrategy (p. 98)
- **Required**: False

**LimitExceededException**

A limit has been exceeded. See the accompanying error message for details.

**message**

Describes the error encountered.

- **Type**: string
- **Required**: False

**limitType**

The limit type.

- **Type**: string
- **Required**: False

**NotFoundException**

The resource specified in the request was not found. See the message field for more information.

**message**

Describes the error encountered.

- **Type**: string
- **Required**: False

**resourceType**

The resource type.

- **Type**: string
- **Required**: False
**TemplateMap**

A mapping of identifier keys to templates. The value is an actual template script. The key is typically a `SelectionKey` which is chosen based on evaluating a selection expression.

**key-value pairs**

*Type:* string

**UpdateIntegrationResponseInput**

Represents the input parameters for an `UpdateIntegrationResponse` request.

**integrationResponseKey**

The integration response key.

*Type:* string

*Required:* False

**responseParameters**

A key-value map specifying response parameters that are passed to the method response from the backend. The key is a method response header parameter name and the mapped value is an integration response header value, a static value enclosed within a pair of single quotes, or a JSON expression from the integration response body. The mapping key must match the pattern of `method.response.header.{name}` , where name is a valid and unique header name. The mapped non-static value must match the pattern of `integration.response.header.{name}` or `integration.response.body.{JSON-expression}` , where `{name}` is a valid and unique response header name and `{JSON-expression}` is a valid JSON expression without the $ prefix.

*Type:* `IntegrationParameters` (p. 98)

*Required:* False

**responseTemplates**

The collection of response templates for the integration response as a string-to-string map of key-value pairs. Response templates are represented as a key/value map, with a content-type as the key and a template as the value.

*Type:* `TemplateMap` (p. 101)

*Required:* False

**templateSelectionExpression**

The template selection expression for the integration response. Supported only for WebSocket APIs.

*Type:* string

*Required:* False

**contentHandlingStrategy**

Supported only for WebSocket APIs. Specifies how to handle response payload content type conversions. Supported values are `CONVERT_TO_BINARY` and `CONVERT_TO_TEXT`, with the following behaviors:
CONVERT_TO_BINARY: Converts a response payload from a Base64-encoded string to the corresponding binary blob.

CONVERT_TO_TEXT: Converts a response payload from a binary blob to a Base64-encoded string.

If this property is not defined, the response payload will be passed through from the integration response to the route response or method response without modification.

Type: ContentHandlingStrategy (p. 98)
Required: False

<td>The client is sending more than the allowed number of requests per unit of time.</td>
</tr>
</tbody>
</table>

### POST

**Operation ID: CreateModel**

Creates a Model for an API.

**Path Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apiId</td>
<td>String</td>
<td>True</td>
<td>The API identifier.</td>
</tr>
</tbody>
</table>

**Responses**

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Response Model</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>201</td>
<td>Model (p. 105)</td>
<td>The request has succeeded and has resulted in the creation of a resource.</td>
</tr>
<tr>
<td>400</td>
<td>BadRequestException (p. 105)</td>
<td>One of the parameters in the request is invalid.</td>
</tr>
<tr>
<td>404</td>
<td>NotFoundException (p. 105)</td>
<td>The resource specified in the request was not found.</td>
</tr>
<tr>
<td>409</td>
<td>ConflictException (p. 105)</td>
<td>The resource already exists.</td>
</tr>
<tr>
<td>429</td>
<td>LimitExceededException (p. 105)</td>
<td>The client is sending more than the allowed number of requests per unit of time.</td>
</tr>
</tbody>
</table>

### Schemas

**Request Bodies**

**Example POST**

```
{
   "name": "string",
   "description": "string",
   "schema": "string",
```

104
"contentType": "string"
}

Response Bodies

Example Models

{
   "items": [
      {
         "modelId": "string",
         "name": "string",
         "description": "string",
         "schema": "string",
         "contentType": "string"
      }
   ],
   "nextToken": "string"
}

Example Model

{
   "modelId": "string",
   "name": "string",
   "description": "string",
   "schema": "string",
   "contentType": "string"
}

Example BadRequestException

{
   "message": "string"
}

Example NotFoundException

{
   "message": "string",
   "resourceType": "string"
}

Example ConflictException

{
   "message": "string"
}

Example LimitExceedededException

{
   "message": "string",
   "limitType": "string"}
Properties

BadRequestException

The request is not valid, for example, the input is incomplete or incorrect. See the accompanying error message for details.

message

Describes the error encountered.

Type: string
Required: False

ConflictException

The requested operation would cause a conflict with the current state of a service resource associated with the request. Resolve the conflict before retrying this request. See the accompanying error message for details.

message

Describes the error encountered.

Type: string
Required: False

CreateModelInput

Represents the input parameters for a CreateModel request.

name

The name of the model. Must be alphanumeric.

Type: string
Required: True

description

The description of the model.

Type: string
Required: False

schema

The schema for the model. For application/json models, this should be JSON schema draft 4 model.

Type: string
Required: True
contentType
The content-type for the model, for example, "application/json".

   Type: string
   Required: False

LimitExceededException
A limit has been exceeded. See the accompanying error message for details.

message
Describes the error encountered.

   Type: string
   Required: False

limitType
The limit type.

   Type: string
   Required: False

Model
Represents a data model for an API. Supported only for WebSocket APIs. See Create Models and Mapping Templates for Request and Response Mappings.

modelId
The model identifier.

   Type: string
   Required: False

name
The name of the model. Must be alphanumeric.

   Type: string
   Required: True

description
The description of the model.

   Type: string
   Required: False

schema
The schema for the model. For application/json models, this should be JSON schema draft 4 model.
contentType

The content-type for the model, for example, "application/json".

- **Type**: string
- **Required**: False

**Models**

Represents a collection of data models. See Create Models and Mapping Templates for Request and Response Mappings.

- **items**
  - The elements from this collection.
  - **Type**: Array of type Model (p. 107)
  - **Required**: False

- **nextToken**
  - The next page of elements from this collection. Not valid for the last element of the collection.
  - **Type**: string
  - **Required**: False

**NotFoundException**

The resource specified in the request was not found. See the message field for more information.

- **message**
  - Describes the error encountered.
  - **Type**: string
  - **Required**: False

- **resourceType**
  - The resource type.
  - **Type**: string
  - **Required**: False

## Schemas

### Request Bodies

**Example PATCH**

```json
{
  "name": "string",
  "description": "string",
  "schema": "string",
  "contentType": "string"
}
```

### Response Bodies

**Example Model**

```json
{
  "modelId": "string",
  "name": "string",
  "description": "string",
  "schema": "string",
  "contentType": "string"
}
```

**Example BadRequestException**

```json
{
  "message": "string"
}
```

**Example NotFoundException**

```json
{
  "message": "string",
  "resourceType": "string"
}
```
Example ConflictException

```json
{
   "message": "string"
}
```

Example LimitExceededException

```json
{
   "message": "string",
   "limitType": "string"
}
```

**Properties**

**BadRequestException**

The request is not valid, for example, the input is incomplete or incorrect. See the accompanying error message for details.

- **message**
  Describes the error encountered.

  - **Type:** string
  - **Required:** False

**ConflictException**

The requested operation would cause a conflict with the current state of a service resource associated with the request. Resolve the conflict before retrying this request. See the accompanying error message for details.

- **message**
  Describes the error encountered.

  - **Type:** string
  - **Required:** False

**LimitExceededException**

A limit has been exceeded. See the accompanying error message for details.

- **message**
  Describes the error encountered.

  - **Type:** string
  - **Required:** False
limitType

The limit type.

  Type: string
  Required: False

Model

Represents a data model for an API. Supported only for WebSocket APIs. See Create Models and Mapping Templates for Request and Response Mappings.

modelId

The model identifier.

  Type: string
  Required: False

name

The name of the model. Must be alphanumeric.

  Type: string
  Required: True

description

The description of the model.

  Type: string
  Required: False

schema

The schema for the model. For application/json models, this should be JSON schema draft 4 model.

  Type: string
  Required: False

contentType

The content-type for the model, for example, "application/json".

  Type: string
  Required: False

NotFoundException

The resource specified in the request was not found. See the message field for more information.

message

Describes the error encountered.
resourceType

The resource type.

Type: string
Required: False

UpdateModelInput

Represents the input parameters for an UpdateModel request. Supported only for WebSocket APIs.

name

The name of the model.

Type: string
Required: False

description

The description of the model.

Type: string
Required: False

schema

The schema for the model. For application/json models, this should be JSON schema draft 4 model.

Type: string
Required: False

contentType

The content-type for the model, for example, "application/json".

Type: string
Required: False

GetModel

- AWS Command Line Interface
- AWS SDK for .NET
- AWS SDK for C++
ModelTemplate

Represents a model template. Supported only for WebSocket APIs.

URI

/v2/apis/{apiId}/models/{modelId}/template

HTTP Methods

GET

Operation ID: GetModelTemplate
Gets a model template.

**Path Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>modelId</td>
<td>String</td>
<td>True</td>
<td>The model ID.</td>
</tr>
<tr>
<td>apiId</td>
<td>String</td>
<td>True</td>
<td>The API identifier.</td>
</tr>
</tbody>
</table>

**Responses**

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Response Model</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>200</td>
<td>Template (p. 116)</td>
<td>Success</td>
</tr>
<tr>
<td>404</td>
<td>NotFoundException (p. 116)</td>
<td>The resource specified in the request was not found.</td>
</tr>
<tr>
<td>429</td>
<td>LimitExceededException (p. 116)</td>
<td>The client is sending more than the allowed number of requests per unit of time.</td>
</tr>
</tbody>
</table>

**Schemas**

**Response Bodies**

**Example Template**

```json
{
   "value": "string"
}
```

**Example NotFoundException**

```json
{
   "message": "string",
   "resourceType": "string"
}
```

**Example LimitExceededException**

```json
{
   "message": "string",
   "limitType": "string"
}
```

**Properties**

**LimitExceededException**

A limit has been exceeded. See the accompanying error message for details.
message
Describes the error encountered.
  Type: string
  Required: False

limitType
The limit type.
  Type: string
  Required: False

NotFoundException
The resource specified in the request was not found. See the message field for more information.
message
Describes the error encountered.
  Type: string
  Required: False

resourceType
The resource type.
  Type: string
  Required: False

Template
Represents a template.
value
The template value.
  Type: string
  Required: False

**Schemas**

**Request Bodies**

**Example POST**

```json
{
    "routeKey": "string",
    "authorizationType": enum,
    "authorizerId": "string",
```
"authorizationScopes": [ "string" ],
"apiKeyRequired": boolean,
"requestParameters": { },
"requestModels": { },
"modelSelectionExpression": "string",
"target": "string",
"operationName": "string",
"routeResponseSelectionExpression": "string"
}

Response Bodies

Example Routes

{ "items": [ {
   "routeId": "string",
   "routeKey": "string",
   "authorizationType": enum,
   "authorizerId": "string",
   "authorizationScopes": [ "string" ],
   "apiKeyRequired": boolean,
   "requestParameters": { },
   "requestModels": { },
   "modelSelectionExpression": "string",
   "target": "string",
   "operationName": "string",
   "routeResponseSelectionExpression": "string",
   "apiGatewayManaged": boolean
   },
   "nextToken": "string"
]}

Example Route

{ "routeId": "string",
 "routeKey": "string",
 "authorizationType": enum,
 "authorizerId": "string",
 "authorizationScopes": [ "string" ],
 "apiKeyRequired": boolean,
 "requestParameters": { },
 "requestModels": { },
 "modelSelectionExpression": "string",
 "target": "string",
 "operationName": "string",
 "routeResponseSelectionExpression": "string" }
"apiGatewayManaged": boolean

Example BadRequestException

{  "message": "string"
}

Example NotFoundException

{  "message": "string",
  "resourceType": "string"
}

Example ConflictException

{  "message": "string"
}

Example LimitExceedededException

{  "message": "string",
  "limitType": "string"
}

Properties

AuthorizationType

The authorization type. For WebSocket APIs, valid values are NONE for open access, AWS_IAM for using AWS IAM permissions, and CUSTOM for using a Lambda authorizer. For HTTP APIs, valid values are NONE for open access, or JWT for using JSON Web Tokens.

NONE
AWS_IAM
CUSTOM
JWT

BadRequestException

The request is not valid, for example, the input is incomplete or incorrect. See the accompanying error message for details.

message

Describes the error encountered.

Type: string
**ConflictException**

The requested operation would cause a conflict with the current state of a service resource associated with the request. Resolve the conflict before retrying this request. See the accompanying error message for details.

**message**

Describes the error encountered.

- **Type**: string
- **Required**: False

**CreateRouteInput**

Represents the input parameters for a CreateRoute request.

**routeKey**

The route key for the route.

- **Type**: string
- **Required**: True

**authorizationType**

The authorization type for the route. For WebSocket APIs, valid values are `NONE` for open access, `AWS_IAM` for using AWS IAM permissions, and `CUSTOM` for using a Lambda authorizer. For HTTP APIs, valid values are `NONE` for open access, or `JWT` for using JSON Web Tokens.

- **Type**: AuthorizationType (p. 121)
- **Required**: False

**authorizerId**

The identifier of the Authorizer resource to be associated with this route. The authorizer identifier is generated by API Gateway when you created the authorizer.

- **Type**: string
- **Required**: False

**authorizationScopes**

The authorization scopes supported by this route.

- **Type**: Array of type string
- **Required**: False

**apiKeyRequired**

Specifies whether an API key is required for the route. Supported only for WebSocket APIs.
Properties

Type: boolean
Required: False

**requestParameters**
The request parameters for the route. Supported only for WebSocket APIs.

Type: RouteParameters (p. 126)
Required: False

**requestModels**
The request models for the route. Supported only for WebSocket APIs.

Type: RouteModels (p. 126)
Required: False

**modelSelectionExpression**
The model selection expression for the route. Supported only for WebSocket APIs.

Type: string
Required: False

**target**
The target for the route.

Type: string
Required: False

**operationName**
The operation name for the route.

Type: string
Required: False

**routeResponseSelectionExpression**
The route response selection expression for the route. Supported only for WebSocket APIs.

Type: string
Required: False

**LimitExceeded Exception**
A limit has been exceeded. See the accompanying error message for details.

**message**
Describes the error encountered.

Type: string
Required: False

limitType
The limit type.
  Type: string
  Required: False

NotFoundException
The resource specified in the request was not found. See the message field for more information.

message
Describes the error encountered.
  Type: string
  Required: False

resourceType
The resource type.
  Type: string
  Required: False

ParameterConstraints
Validation constraints imposed on parameters of a request (path, query string, headers).

required
Whether or not the parameter is required.
  Type: boolean
  Required: False

Route
Represents a route.

routeId
The route ID.
  Type: string
  Required: False

routeKey
The route key for the route.
  Type: string
Properties

Required: True

authorizationType
The authorization type for the route. For WebSocket APIs, valid values are NONE for open access, AWS_IAM for using AWS IAM permissions, and CUSTOM for using a Lambda authorizer. For HTTP APIs, valid values are NONE for open access, or JWT for using JSON Web Tokens.

Type: AuthorizationType (p. 121)
Required: False

authorizerId
The identifier of the Authorizer resource to be associated with this route. The authorizer identifier is generated by API Gateway when you created the authorizer.

Type: string
Required: False

authorizationScopes
A list of authorization scopes configured on a route. The scopes are used with a JWT authorizer to authorize the method invocation. The authorization works by matching the route scopes against the scopes parsed from the access token in the incoming request. The method invocation is authorized if any route scope matches a claimed scope in the access token. Otherwise, the invocation is not authorized. When the route scope is configured, the client must provide an access token instead of an identity token for authorization purposes.

Type: Array of type string
Required: False

apiKeyRequired
Specifies whether an API key is required for this route. Supported only for WebSocket APIs.

Type: boolean
Required: False

requestParameters
The request parameters for the route. Supported only for WebSocket APIs.

Type: RouteParameters (p. 126)
Required: False

requestModels
The request models for the route. Supported only for WebSocket APIs.

Type: RouteModels (p. 126)
Required: False

modelSelectionExpression
The model selection expression for the route. Supported only for WebSocket APIs.
Properties

Type: string
Required: False

target
The target for the route.

Type: string
Required: False

operationName
The operation name for the route.

Type: string
Required: False

routeResponseSelectionExpression
The route response selection expression for the route. Supported only for WebSocket APIs.

Type: string
Required: False

apiGatewayManaged
Specifies whether a route is managed by API Gateway. If you created an API using quick create, the $default route is managed by API Gateway. You can't modify the $default route key.

Type: boolean
Required: False

RouteModels
The route models.

key-value pairs

Type: string

RouteParameters
The route parameters.

key-value pairs

Type: object

Routes
Represents a collection of routes.
items

The elements from this collection.

Type: Array of type Route (p. 124)
Required: False

nextToken

The next page of elements from this collection. Not valid for the last element of the collection.

Type: string
Required: False

**Schemas**

**Request Bodies**

**Example PATCH**

```json
{
  "routeKey": "string",
  "authorizationType": enum,
  "authorizerId": "string",
  "authorizationScopes": [
    "string"
  ],
  "apiKeyRequired": boolean,
}  
```
"requestParameters": { },
"requestModels": { },
"modelSelectionExpression": "string",
"target": "string",
"operationName": "string",
"routeResponseSelectionExpression": "string"
}

Response Bodies

Example Route

{
  "routeId": "string",
  "routeKey": "string",
  "authorizationType": enum,
  "authorizerId": "string",
  "authorizationScopes": [
    "string"
  ],
  "apiKeyRequired": boolean,
  "requestParameters": { },
  "requestModels": { },
  "modelSelectionExpression": "string",
  "target": "string",
  "operationName": "string",
  "routeResponseSelectionExpression": "string",
  "apiGatewayManaged": boolean
}

Example BadRequestException

{
  "message": "string"
}

Example NotFoundException

{
  "message": "string",
  "resourceType": "string"
}

Example ConflictException

{
  "message": "string"
}

Example LimitExceedededException

{
"message": "string",
"limitType": "string"
}

Properties

AuthorizationType

The authorization type. For WebSocket APIs, valid values are NONE for open access, AWS_IAM for using AWS IAM permissions, and CUSTOM for using a Lambda authorizer. For HTTP APIs, valid values are NONE for open access, or JWT for using JSON Web Tokens.

NONE
AWS_IAM
CUSTOM
JWT

BadRequestException

The request is not valid, for example, the input is incomplete or incorrect. See the accompanying error message for details.

message

Describes the error encountered.

Type: string
Required: False

ConflictException

The requested operation would cause a conflict with the current state of a service resource associated with the request. Resolve the conflict before retrying this request. See the accompanying error message for details.

message

Describes the error encountered.

Type: string
Required: False

LimitExceededException

A limit has been exceeded. See the accompanying error message for details.

message

Describes the error encountered.

Type: string
Required: False
limitType
The limit type.
  Type: string
  Required: False

NotFoundException
The resource specified in the request was not found. See the message field for more information.

message
Describes the error encountered.
  Type: string
  Required: False

resourceType
The resource type.
  Type: string
  Required: False

ParameterConstraints
Validation constraints imposed on parameters of a request (path, query string, headers).

required
Whether or not the parameter is required.
  Type: boolean
  Required: False

Route
Represents a route.

routeId
The route ID.
  Type: string
  Required: False

routeKey
The route key for the route.
  Type: string
  Required: True
authorizationType

The authorization type for the route. For WebSocket APIs, valid values are `NONE` for open access, `AWS_IAM` for using AWS IAM permissions, and `CUSTOM` for using a Lambda authorizer. For HTTP APIs, valid values are `NONE` for open access, or `JWT` for using JSON Web Tokens.

- **Type**: `AuthorizationType` (p. 131)
- **Required**: False

authorizerId

The identifier of the `Authorizer` resource to be associated with this route. The authorizer identifier is generated by API Gateway when you created the authorizer.

- **Type**: `string`
- **Required**: False

authorizationScopes

A list of authorization scopes configured on a route. The scopes are used with a `JWT` authorizer to authorize the method invocation. The authorization works by matching the route scopes against the scopes parsed from the access token in the incoming request. The method invocation is authorized if any route scope matches a claimed scope in the access token. Otherwise, the invocation is not authorized. When the route scope is configured, the client must provide an access token instead of an identity token for authorization purposes.

- **Type**: `Array of type string`
- **Required**: False

apiKeyRequired

Specifies whether an API key is required for this route. Supported only for WebSocket APIs.

- **Type**: `boolean`
- **Required**: False

requestParameters

The request parameters for the route. Supported only for WebSocket APIs.

- **Type**: `RouteParameters` (p. 134)
- **Required**: False

requestModels

The request models for the route. Supported only for WebSocket APIs.

- **Type**: `RouteModels` (p. 134)
- **Required**: False

modelSelectionExpression

The model selection expression for the route. Supported only for WebSocket APIs.

- **Type**: `string`
- **Required**: False
target

The target for the route.

Type: string
Required: False

operationName

The operation name for the route.

Type: string
Required: False

routeResponseSelectionExpression

The route response selection expression for the route. Supported only for WebSocket APIs.

Type: string
Required: False

apiGatewayManaged

Specifies whether a route is managed by API Gateway. If you created an API using quick create, the 
$default$ route is managed by API Gateway. You can't modify the $default$ route key.

Type: boolean
Required: False

RouteModels

The route models.

key-value pairs

Type: string

RouteParameters

The route parameters.

key-value pairs

Type: object

UpdateRouteInput

Represents the input parameters for an UpdateRoute request.

routeKey

The route key for the route.

Type: string
Required: False
authorizationType

The authorization type for the route. For WebSocket APIs, valid values are NONE for open access, AWS_IAM for using AWS IAM permissions, and CUSTOM for using a Lambda authorizer. For HTTP APIs, valid values are NONE for open access, or JWT for using JSON Web Tokens.

Type: AuthorizationType (p. 131)
Required: False

authorizerId

The identifier of the Authorizer resource to be associated with this route. The authorizer identifier is generated by API Gateway when you created the authorizer.

Type: string
Required: False

authorizationScopes

The authorization scopes supported by this route.

Type: Array of type string
Required: False

apiKeyRequired

Specifies whether an API key is required for the route. Supported only for WebSocket APIs.

Type: boolean
Required: False

requestParameters

The request parameters for the route. Supported only for WebSocket APIs.

Type: RouteParameters (p. 134)
Required: False

requestModels

The request models for the route. Supported only for WebSocket APIs.

Type: RouteModels (p. 134)
Required: False

modelSelectionExpression

The model selection expression for the route. Supported only for WebSocket APIs.

Type: string
Required: False

target

The target for the route.

</tbody>
</table>
Schemas

Response Bodies

Example NotFoundException

```json
{
  "message": "string",
  "resourceType": "string"
}
```

Example LimitExceededException

```json
{
  "message": "string",
  "limitType": "string"
}
```

Properties

LimitExceededException

A limit has been exceeded. See the accompanying error message for details.

- **message**
  Describes the error encountered.
  - **Type:** string
    - **Required:** False

limitType

The limit type.

- **Type:** string
  - **Required:** False

NotFoundException

The resource specified in the request was not found. See the message field for more information.

- **message**
  Describes the error encountered.
  - **Type:** string
    - **Required:** False

resourceType

The resource type.

- **Type:** string
  - **Required:** False

</tbody>
</table>
Schemas

Request Bodies

Example POST

```json
{
    "routeResponseKey": "string",
    "responseParameters": {},
    "responseModels": {},
    "modelSelectionExpression": "string"
}
```

Response Bodies

Example RouteResponses

```json
{
    "items": [
        {
            "routeResponseId": "string",
            "routeResponseKey": "string",
            "responseParameters": {},
            "responseModels": {},
            "modelSelectionExpression": "string"
        }
    ],
    "nextToken": "string"
}
```

Example RouteResponse

```json
{
    "routeResponseId": "string",
    "routeResponseKey": "string",
    "responseParameters": {},
    "responseModels": {},
    "modelSelectionExpression": "string"
}
```

Example BadRequestException

```json
{
    "message": "string"
}
```

Example NotFoundException

```json
{
    "message": "string",
```
Properties

BadRequestException
The request is not valid, for example, the input is incomplete or incorrect. See the accompanying error message for details.

**message**
Describes the error encountered.

- **Type:** string
- **Required:** False

ConflictException
The requested operation would cause a conflict with the current state of a service resource associated with the request. Resolve the conflict before retrying this request. See the accompanying error message for details.

**message**
Describes the error encountered.

- **Type:** string
- **Required:** False

CreateRouteResponseInput
Represents the input parameters for a CreateRouteResponse request.

**routeResponseKey**
The route response key.

- **Type:** string
- **Required:** True
responseParameters

The route response parameters.

**Type**: RouteParameters (p. 144)

**Required**: False

responseModels

The response models for the route response.

**Type**: RouteModels (p. 144)

**Required**: False

modelSelectionExpression

The model selection expression for the route response. Supported only for WebSocket APIs.

**Type**: string

**Required**: False

**LimitExceededException**

A limit has been exceeded. See the accompanying error message for details.

**message**

Describes the error encountered.

**Type**: string

**Required**: False

**limitType**

The limit type.

**Type**: string

**Required**: False

**NotFoundException**

The resource specified in the request was not found. See the **message** field for more information.

**message**

Describes the error encountered.

**Type**: string

**Required**: False

**resourceType**

The resource type.

**Type**: string
Required: False

ParameterConstraints
Validation constraints imposed on parameters of a request (path, query string, headers).

required
Whether or not the parameter is required.

Type: boolean
Required: False

RouteModels
The route models.

key-value pairs
Type: string

RouteParameters
The route parameters.

key-value pairs
Type: object

RouteResponse
Represents a route response.

routeResponseId
Represents the identifier of a route response.

Type: string
Required: False

routeResponseKey
Represents the route response key of a route response.

Type: string
Required: True

responseParameters
Represents the response parameters of a route response.

Type: RouteParameters (p. 144)
Required: False
responseModels

Represents the response models of a route response.

  Type: RouteModels (p. 144)
  Required: False

modelSelectionExpression

Represents the model selection expression of a route response. Supported only for WebSocket APIs.

  Type: string
  Required: False

RouteResponses

Represents a collection of route responses.

items

The elements from this collection.

  Type: Array of type RouteResponse (p. 144)
  Required: False

nextToken

The next page of elements from this collection. Not valid for the last element of the collection.

  Type: string
  Required: False

Status Code | Response Model | Description
---|---|---
429 | LimitExceededException (p. 149) | The client is sending more than the allowed number of requests per unit of time.

## Schemas

### Request Bodies

**Example PATCH**

```json
{
  "routeResponseKey": "string",
  "responseParameters": {
  },
  "responseModels": {
  },
  "modelSelectionExpression": "string"
}
```

### Response Bodies

**Example RouteResponse**

```json
{
  "routeResponseId": "string",
  "routeResponseKey": "string",
  "responseParameters": {
  },
  "responseModels": {
  },
  "modelSelectionExpression": "string"
}
```

**Example BadRequestException**

```json
{
  "message": "string"
}
```

**Example NotFoundException**

```json
{
  "message": "string",
  "resourceType": "string"
}
```

**Example ConflictException**

```json
{
  "message": "string"
}
```
Example LimitExceededException

```
{
    "message": "string",
    "limitType": "string"
}
```

Properties

**BadRequestException**

The request is not valid, for example, the input is incomplete or incorrect. See the accompanying error message for details.

*message*

Describes the error encountered.

*Type:* string  
*Required:* False

**ConflictException**

The requested operation would cause a conflict with the current state of a service resource associated with the request. Resolve the conflict before retrying this request. See the accompanying error message for details.

*message*

Describes the error encountered.

*Type:* string  
*Required:* False

**LimitExceededException**

A limit has been exceeded. See the accompanying error message for details.

*message*

Describes the error encountered.

*Type:* string  
*Required:* False

*limitType*

The limit type.

*Type:* string  
*Required:* False
**NotFoundException**

The resource specified in the request was not found. See the `message` field for more information.

`message`

Describes the error encountered.

Type: string  
Required: False

`resourceType`

The resource type.

Type: string  
Required: False

**ParameterConstraints**

Validation constraints imposed on parameters of a request (path, query string, headers).

`required`

Whether or not the parameter is required.

Type: boolean  
Required: False

**RouteModels**

The route models.

`key-value pairs`

Type: string

**RouteParameters**

The route parameters.

`key-value pairs`

Type: object

**RouteResponse**

Represents a route response.

`routeResponseId`

Represents the identifier of a route response.
**Properties**

- **Type**: `string`  
  **Required**: `False`

- **routeResponseKey**
  Represents the route response key of a route response.
  
  - **Type**: `string`  
    **Required**: `True`

- **responseParameters**
  Represents the response parameters of a route response.
  
  - **Type**: `RouteParameters (p. 150)`  
    **Required**: `False`

- **responseModels**
  Represents the response models of a route response.
  
  - **Type**: `RouteModels (p. 150)`  
    **Required**: `False`

- **modelSelectionExpression**
  Represents the model selection expression of a route response. Supported only for WebSocket APIs.
  
  - **Type**: `string`  
    **Required**: `False`

**UpdateRouteResponseInput**

Represents the input parameters for an `UpdateRouteResponse` request.

- **routeResponseKey**
  The route response key.
  
  - **Type**: `string`  
    **Required**: `False`

- **responseParameters**
  The route response parameters.
  
  - **Type**: `RouteParameters (p. 150)`  
    **Required**: `False`

- **responseModels**
  The response models for the route response.
  
  - **Type**: `RouteModels (p. 150)`
**Required:** False

**modelSelectionExpression**

The model selection expression for the route response. Supported only for WebSocket APIs.

*Type:* string

*Required:* False

Request Bodies

Example POST

```json
{
    "stageName": "string",
    "description": "string",
    "deploymentId": "string",
    "clientCertificateId": "string",
    "defaultRouteSettings": {
        "detailedMetricsEnabled": boolean,
        "loggingLevel": enum,
        "dataTraceEnabled": boolean,
        "throttlingBurstLimit": integer,
        "throttlingRateLimit": number
    },
    "stageDescription": "string"
}
```
Response Bodies

Example Stages

```json
{
  "items": [
    {
      "stageName": "string",
      "description": "string",
      "deploymentId": "string",
      "clientCertificateId": "string",
      "defaultRouteSettings": {
        "detailedMetricsEnabled": boolean,
        "loggingLevel": enum,
        "dataTraceEnabled": boolean,
        "throttlingBurstLimit": integer,
        "throttlingRateLimit": number
      },
      "routeSettings": {
      },
      "stageVariables": {
      },
      "accessLogSettings": {
        "format": "string",
        "destinationArn": "string"
      },
      "autoDeploy": boolean,
      "lastDeploymentStatusMessage": "string",
      "createdDate": "string",
      "lastUpdatedDate": "string",
      "tags": {
      },
      "apiGatewayManaged": boolean
    }
  ],
  "nextToken": "string"
}
```

Example Stage

```json
{
  "stageName": "string",
  "description": "string",
  "deploymentId": "string",
  "clientCertificateId": "string",
  "defaultRouteSettings": {
    "detailedMetricsEnabled": boolean,
    "loggingLevel": enum,
    "dataTraceEnabled": boolean,
    "throttlingBurstLimit": integer,
    "throttlingRateLimit": number
  },
  "routeSettings": {
  },
  "stageVariables": {
  },
  "accessLogSettings": {
    "format": "string",
    "destinationArn": "string"
  },
  "autoDeploy": boolean,
  "lastDeploymentStatusMessage": "string",
  "createdDate": "string",
  "lastUpdatedDate": "string",
  "tags": {
  },
  "apiGatewayManaged": boolean
}
```
Properties

AccessLogSettings

Settings for logging access in a stage.

format

A single line format of the access logs of data, as specified by selected $context variables. The format must include at least $context.requestId.
**destinationArn**

The ARN of the CloudWatch Logs log group to receive access logs.

- **Type**: string
- **Required**: False

**BadRequestException**

The request is not valid, for example, the input is incomplete or incorrect. See the accompanying error message for details.

- **message**
  - Describes the error encountered.
  - **Type**: string
  - **Required**: False

**ConflictException**

The requested operation would cause a conflict with the current state of a service resource associated with the request. Resolve the conflict before retrying this request. See the accompanying error message for details.

- **message**
  - Describes the error encountered.
  - **Type**: string
  - **Required**: False

**CreateStageInput**

Represents the input parameters for a CreateStage request.

- **stageName**
  - The name of the stage.
  - **Type**: string
  - **Required**: True

- **description**
  - The description for the API stage.
  - **Type**: string
  - **Required**: False
**deploymentId**

The deployment identifier of the API stage.

- **Type**: string
- **Required**: False

**clientCertificateId**

The identifier of a client certificate for a stage. Supported only for WebSocket APIs.

- **Type**: string
- **Required**: False

**defaultRouteSettings**

The default route settings for the stage.

- **Type**: RouteSettings (p. 159)
- **Required**: False

**routeSettings**

Route settings for the stage, by routeKey.

- **Type**: RouteSettingsMap (p. 160)
- **Required**: False

**stageVariables**

A map that defines the stage variables for a stage. Variable names can have alphanumeric and underscore characters, and the values must match [A-Za-z0-9-._~:/?#&=,]+.

- **Type**: StageVariablesMap (p. 162)
- **Required**: False

**accessLogSettings**

Settings for logging access in this stage.

- **Type**: AccessLogSettings (p. 156)
- **Required**: False

**tags**

The collection of tags. Each tag element is associated with a given resource.

- **Type**: Tags (p. 163)
- **Required**: False

**autoDeploy**

Specifies whether updates to an API automatically trigger a new deployment. The default value is false.

- **Type**: boolean
Required: False

LimitExceededException
A limit has been exceeded. See the accompanying error message for details.

message
Describes the error encountered.

  Type: string
  Required: False

limitType
The limit type.

  Type: string
  Required: False

LoggingLevel
The logging level.

  ERROR
  INFO
  OFF

NotFoundException
The resource specified in the request was not found. See the message field for more information.

message
Describes the error encountered.

  Type: string
  Required: False

resourceType
The resource type.

  Type: string
  Required: False

RouteSettings
Represents a collection of route settings.

detailedMetricsEnabled
Specifies whether detailed metrics are enabled.
Properties

**Type**: boolean  
**Required**: False

**loggingLevel**

Specifies the logging level for this route: **INFO**, **ERROR**, or **OFF**. This property affects the log entries pushed to Amazon CloudWatch Logs. Supported only for WebSocket APIs.

Type: **LoggingLevel**  
Required: False

**dataTraceEnabled**

Specifies whether (**true**) or not (**false**) data trace logging is enabled for this route. This property affects the log entries pushed to Amazon CloudWatch Logs. Supported only for WebSocket APIs.

Type: boolean  
Required: False

**throttlingBurstLimit**

Specifies the throttling burst limit.

Type: integer  
Required: False  
Format: int32

**throttlingRateLimit**

Specifies the throttling rate limit.

Type: number  
Required: False  
Format: double

**RouteSettingsMap**

The route settings map.

**key-value pairs**

Type: object

**Stage**

Represents an API stage.

**stageName**

The name of the stage.

Type: string  
Required: True
description

The description of the stage.

Type: string
Required: False

deploymentId

The identifier of the Deployment that the Stage is associated with. Can't be updated if autoDeploy is enabled.

Type: string
Required: False

clientCertificateId

The identifier of a client certificate for a Stage. Supported only for WebSocket APIs.

Type: string
Required: False

defaultRouteSettings

Default route settings for the stage.

Type: RouteSettings (p. 159)
Required: False

routeSettings

Route settings for the stage, by routeKey.

Type: RouteSettingsMap (p. 160)
Required: False

stageVariables

A map that defines the stage variables for a stage resource. Variable names can have alphanumeric and underscore characters, and the values must match [A-Za-z0-9-_.~/?#&=,]+.

Type: StageVariablesMap (p. 162)
Required: False

accessLogSettings

Settings for logging access in this stage.

Type: AccessLogSettings (p. 156)
Required: False

autoDeploy

Specifies whether updates to an API automatically trigger a new deployment. The default value is false.
Properties

lastDeploymentStatusMessage

Describes the status of the last deployment of a stage. Supported only for stages with autoDeploy enabled.

Type: string
Required: False

createdDate

The timestamp when the stage was created.

Type: string
Required: False
Format: date-time

lastUpdatedDate

The timestamp when the stage was last updated.

Type: string
Required: False
Format: date-time

tags

The collection of tags. Each tag element is associated with a given resource.

Type: Tags (p. 163)
Required: False

apiGatewayManaged

Specifies whether a stage is managed by API Gateway. If you created an API using quick create, the $default stage is managed by API Gateway. You can't modify the $default stage.

Type: boolean
Required: False

StageVariablesMap

The stage variable map.

key-value pairs

Type: string

Stages

A collection of Stage resources that are associated with the ApiKey resource.
items

The elements from this collection.

Type: Array of type Stage (p. 160)
Required: False

nextToken

The next page of elements from this collection. Not valid for the last element of the collection.

Type: string
Required: False

Tags

Represents a collection of tags associated with the resource.

key-value pairs

Type: string

Stage

Represents an API stage.

URI

/v2/apis/{apiId}/stages/{stageName}

HTTP Methods

GET

Operation ID: GetStage

Gets a Stage.

Path Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stageName</td>
<td>String</td>
<td>True</td>
<td>The stage name. Stage names can only contain alphanumeric characters, hyphens, and underscores. Maximum length is 128 characters.</td>
</tr>
<tr>
<td>apiId</td>
<td>String</td>
<td>True</td>
<td>The API identifier.</td>
</tr>
</tbody>
</table>

Responses

<table>

<tbody>
<tr>
<td>200</td>
<td>Stage (p. 166)</td>
<td>Success</td>
</tr>
<tr>
<td>404</td>
<td>NotFoundException (p. 167)</td>
<td>The resource specified in the request was not found.</td>
</tr>
<tr>
<td>429</td>
<td>LimitExceededException (p. 167)</td>
<td>The client is sending more than the allowed number of requests per unit of time.</td>
</tr>
</tbody>
</table>

DELETE

Operation ID: DeleteStage

Deletes a Stage.
### PATCH

Operation ID: UpdateStage

Updates a Stage.

#### Path Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stageName</td>
<td>String</td>
<td>True</td>
<td>The stage name. Stage names can only contain alphanumeric characters, hyphens, and underscores. Maximum length is 128 characters.</td>
</tr>
<tr>
<td>apiId</td>
<td>String</td>
<td>True</td>
<td>The API identifier.</td>

</table>
### Schemas

#### Request Bodies

**Example PATCH**

```json
{
    "description": "string",
    "deploymentId": "string",
    "clientCertificateId": "string",
    "defaultRouteSettings": {
        "detailedMetricsEnabled": boolean,
        "loggingLevel": enum,
        "dataTraceEnabled": boolean,
        "throttlingBurstLimit": integer,
        "throttlingRateLimit": number
    },
    "routeSettings": {
    },
    "stageVariables": {
    },
    "accessLogSettings": {
        "format": "string",
        "destinationArn": "string"
    },
    "autoDeploy": boolean
}
```

#### Response Bodies

**Example Stage**

```json
{
    "stageName": "string",
    "description": "string",
    "deploymentId": "string",
    "clientCertificateId": "string",
    "defaultRouteSettings": {
        "detailedMetricsEnabled": boolean,
        "loggingLevel": enum,
        "dataTraceEnabled": boolean,
        "throttlingBurstLimit": integer,
        "throttlingRateLimit": number
    },
}
```
Properties

AccessLogSettings

Settings for logging access in a stage.

format

A single line format of the access logs of data, as specified by selected $context variables. The format must include at least $context.requestid.

Type: string
Required: False
**destinationArn**

The ARN of the CloudWatch Logs log group to receive access logs.

- **Type**: string
- **Required**: False

**BadRequestException**

The request is not valid, for example, the input is incomplete or incorrect. See the accompanying error message for details.

- **message**
  
  Describes the error encountered.

  - **Type**: string
  - **Required**: False

**ConflictException**

The requested operation would cause a conflict with the current state of a service resource associated with the request. Resolve the conflict before retrying this request. See the accompanying error message for details.

- **message**
  
  Describes the error encountered.

  - **Type**: string
  - **Required**: False

**LimitExceededException**

A limit has been exceeded. See the accompanying error message for details.

- **message**
  
  Describes the error encountered.

  - **Type**: string
  - **Required**: False

- **limitType**
  
  The limit type.

  - **Type**: string
  - **Required**: False

**LoggingLevel**

The logging level.
ERROR
INFO
OFF

**NotFoundException**

The resource specified in the request was not found. See the `message` field for more information.

**message**

Describes the error encountered.

- **Type:** string
- **Required:** False

**resourceType**

The resource type.

- **Type:** string
- **Required:** False

**RouteSettings**

Represents a collection of route settings.

**detailedMetricsEnabled**

Specifies whether detailed metrics are enabled.

- **Type:** boolean
- **Required:** False

**loggingLevel**

Specifies the logging level for this route: `INFO`, `ERROR`, or `OFF`. This property affects the log entries pushed to Amazon CloudWatch Logs. Supported only for WebSocket APIs.

- **Type:** `LoggingLevel` (p. 168)
- **Required:** False

**dataTraceEnabled**

Specifies whether (`true`) or not (`false`) data trace logging is enabled for this route. This property affects the log entries pushed to Amazon CloudWatch Logs. Supported only for WebSocket APIs.

- **Type:** boolean
- **Required:** False

**throttlingBurstLimit**

Specifies the throttling burst limit.

- **Type:** integer
- **Required:** False
**throttlingRateLimit**

Specifies the throttling rate limit.

- **Type:** number
- **Required:** False
- **Format:** double

**RouteSettingsMap**

The route settings map.

**key-value pairs**

- **Type:** object

**Stage**

Represents an API stage.

**stageName**

The name of the stage.

- **Type:** string
  - **Required:** True

**description**

The description of the stage.

- **Type:** string
  - **Required:** False

**deploymentId**

The identifier of the Deployment that the Stage is associated with. Can't be updated if `autoDeploy` is enabled.

- **Type:** string
  - **Required:** False

**clientCertificateId**

The identifier of a client certificate for a Stage. Supported only for WebSocket APIs.

- **Type:** string
  - **Required:** False

**defaultRouteSettings**

Default route settings for the stage.
Properties

Type: RouteSettings (p. 169)
Required: False

routeSettings
Route settings for the stage, by routeKey.

Type: RouteSettingsMap (p. 170)
Required: False

stageVariables
A map that defines the stage variables for a stage resource. Variable names can have alphanumeric and underscore characters, and the values must match [A-Za-z0-9-_:~/?#&=,]+.

Type: StageVariablesMap (p. 172)
Required: False

accessLogSettings
Settings for logging access in this stage.

Type: AccessLogSettings (p. 167)
Required: False

autoDeploy
Specifies whether updates to an API automatically trigger a new deployment. The default value is false.

Type: boolean
Required: False

lastDeploymentStatusMessage
Describes the status of the last deployment of a stage. Supported only for stages with autoDeploy enabled.

Type: string
Required: False

createdDate
The timestamp when the stage was created.

Type: string
Required: False
Format: date-time

lastUpdatedDate
The timestamp when the stage was last updated.

Type: string
Required: False
Format: date-time
tags

The collection of tags. Each tag element is associated with a given resource.

Type: Tags (p. 172)
Required: False

apiGatewayManaged

Specifies whether a stage is managed by API Gateway. If you created an API using quick create, the $default stage is managed by API Gateway. You can't modify the $default stage.

Type: boolean
Required: False

StageVariablesMap

The stage variable map.

key-value pairs

Type: string

Tags

Represents a collection of tags associated with the resource.

key-value pairs

Type: string

UpdateStageInput

Represents the input parameters for an UpdateStage request.

description

The description for the API stage.

Type: string
Required: False

deploymentId

The deployment identifier for the API stage. Can't be updated if autoDeploy is enabled.

Type: string
Required: False

clientCertificateId

The identifier of a client certificate for a Stage.
**defaultRouteSettings**

The default route settings for the stage.

- **Type**: RouteSettings (p. 169)
- **Required**: False

**routeSettings**

Route settings for the stage.

- **Type**: RouteSettingsMap (p. 170)
- **Required**: False

**stageVariables**

A map that defines the stage variables for a Stage. Variable names can have alphanumeric and underscore characters, and the values must match [A-Za-z0-9-_:~/?&=,]+.

- **Type**: StageVariablesMap (p. 172)
- **Required**: False

**accessLogSettings**

Settings for logging access in this stage.

- **Type**: AccessLogSettings (p. 167)
- **Required**: False

**autoDeploy**

Specifies whether updates to an API automatically trigger a new deployment. The default value is `false`.

- **Type**: boolean
- **Required**: False

AccessLogSettings

Represents the access log settings for a stage.

**URI**

`/v2/apis/<apiId>/stages/<stageName>/accesslogsettings`

**HTTP Methods**

DELETE

Operation ID: DeleteAccessLogSettings

Deletes the AccessLogSettings for a Stage. To disable access logging for a Stage, delete its AccessLogSettings.
### Path Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stageName</td>
<td>String</td>
<td>True</td>
<td>The stage name. Stage names can only contain alphanumeric characters, hyphens, and underscores. Maximum length is 128 characters.</td>
</tr>
<tr>
<td>apiId</td>
<td>String</td>
<td>True</td>
<td>The API identifier.</td>
</tr>
</tbody>

### Schemas

#### Response Bodies

**Example NotFoundException**

```json
{
  "message": "string",
  "resourceType": "string"
}
```

**Example LimitExceededException**

```json
{
  "message": "string",
  "limitType": "string"
}
```

#### Properties

**LimitExceededException**

A limit has been exceeded. See the accompanying error message for details.
message
Describes the error encountered.

Type: string
Required: False

limitType
The limit type.

Type: string
Required: False

NotFoundException
The resource specified in the request was not found. See the message field for more information.

message
Describes the error encountered.

Type: string
Required: False

resourceType
The resource type.

Type: string
Required: False

Example LimitExceededException

```json
{
   "message": "string",
   "limitType": "string"
}
```

Properties

LimitExceededException

A limit has been exceeded. See the accompanying error message for details.

message

Describes the error encountered.

- **Type**: string
- **Required**: False

limitType

The limit type.

- **Type**: string
- **Required**: False

NotFoundException

The resource specified in the request was not found. See the message field for more information.

message

Describes the error encountered.

- **Type**: string
- **Required**: False

resourceType

The resource type.

- **Type**: string
- **Required**: False

          "securityPolicy": enum,
          "domainNameStatus": enum,
          "domainNameStatusMessage": "string"
        }
      ],
      "apiMappingSelectionExpression": "string",
      "tags": {
      }
    }
  ],
  "nextToken": "string"
}
```

Example DomainName

```json
{
  "domainName": "string",
  "domainNameConfigurations": [
    {
      "endpointType": enum,
      "certificateName": "string",
      "certificateArn": "string",
      "apiGatewayDomainName": "string",
      "hostedZoneId": "string",
      "certificateUploadDate": "string",
      "securityPolicy": enum,
      "domainNameStatus": enum,
      "domainNameStatusMessage": "string"
    }
  ],
  "apiMappingSelectionExpression": "string",
  "tags": {
  }
}
```

Example BadRequestException

```json
{
  "message": "string"
}
```
Example AccessDeniedException

```json
{
    "message": "string"
}
```

Example NotFoundException

```json
{
    "message": "string",
    "resourceType": "string"
}
```

Example ConflictException

```json
{
    "message": "string"
}
```

Example LimitExceedededException

```json
{
    "message": "string",
    "limitType": "string"
}
```

Properties

AccessDeniedException

**message**

*Type:* string  
*Required:* False

BadRequestException

The request is not valid, for example, the input is incomplete or incorrect. See the accompanying error message for details.

**message**

Describes the error encountered.

*Type:* string  
*Required:* False

ConflictException

The requested operation would cause a conflict with the current state of a service resource associated with the request. Resolve the conflict before retrying this request. See the accompanying error message for details.
message
Describes the error encountered.

  Type: string
  Required: False

CreateDomainNameInput
Represents the input parameters for a CreateDomainName request.

domainName
The domain name.

  Type: string
  Required: True

domainNameConfigurations
The domain name configurations.

  Type: Array of type DomainNameConfiguration (p. 184)
  Required: False

tags
The collection of tags associated with a domain name.

  Type: Tags (p. 186)
  Required: False

DomainName
Represents a domain name.

domainName
The name of the DomainName resource.

  Type: string
  Required: True

domainNameConfigurations
The domain name configurations.

  Type: Array of type DomainNameConfiguration (p. 184)
  Required: False

apiMappingSelectionExpression
The API mapping selection expression.

  Type: string
**Required**: False

**tags**
The collection of tags associated with a domain name.

*Type*: Tags (p. 186)  
*Required*: False

**DomainNameConfiguration**
The domain name configuration.

**endpointType**
The endpoint type.

*Type*: EndpointType (p. 186)  
*Required*: False

**certificateName**
The user-friendly name of the certificate that will be used by the edge-optimized endpoint for this domain name.

*Type*: string  
*Required*: False

**certificateArn**
An AWS-managed certificate that will be used by the edge-optimized endpoint for this domain name. AWS Certificate Manager is the only supported source.

*Type*: string  
*Required*: False

**apiGatewayDomainName**
A domain name for the API.

*Type*: string  
*Required*: False

**hostedZoneId**
The Amazon Route 53 Hosted Zone ID of the endpoint.

*Type*: string  
*Required*: False

**certificateUploadDate**
The timestamp when the certificate that was used by edge-optimized endpoint for this domain name was uploaded.
**Properties**

**Type**: string  
**Required**: False  
**Format**: date-time

**securityPolicy**

The Transport Layer Security (TLS) version of the security policy for this domain name. The valid values are **TLS_1_0** and **TLS_1_2**.

**Type**: SecurityPolicy (p. 186)  
**Required**: False

**domainNameStatus**

The status of the domain name migration. The valid values are **AVAILABLE** and **UPDATING**. If the status is **UPDATING**, the domain cannot be modified further until the existing operation is complete. If it is **AVAILABLE**, the domain can be updated.

**Type**: DomainNameStatus (p. 185)  
**Required**: False

**domainNameStatusMessage**

An optional text message containing detailed information about status of the domain name migration.

**Type**: string  
**Required**: False

**DomainNameStatus**

The status of the domain name migration. The valid values are **AVAILABLE** and **UPDATING**. If the status is **UPDATING**, the domain cannot be modified further until the existing operation is complete. If it is **AVAILABLE**, the domain can be updated.

**AVAILABLE**  
**UPDATING**

**DomainNames**

Represents a collection of domain names.

**items**

The elements from this collection.

**Type**: Array of type DomainName (p. 183)  
**Required**: False

**nextToken**

The next page of elements from this collection. Not valid for the last element of the collection.

**Type**: string  
**Required**: False
**EndpointType**

Represents an endpoint type.

- REGIONAL
- EDGE

**LimitExceededexception**

A limit has been exceeded. See the accompanying error message for details.

**message**

Describes the error encountered.

- **Type**: string
- **Required**: False

**limitType**

The limit type.

- **Type**: string
- **Required**: False

**NotFoundException**

The resource specified in the request was not found. See the message field for more information.

**message**

Describes the error encountered.

- **Type**: string
- **Required**: False

**resourceType**

The resource type.

- **Type**: string
- **Required**: False

**SecurityPolicy**

The Transport Layer Security (TLS) version of the security policy for this domain name. The valid values are TLS_1_0 and TLS_1_2.

- TLS_1_0
- TLS_1_2

**Tags**

Represents a collection of tags associated with the resource.
key-value pairs

DomainName

Represents a domain name. See Set up Custom Domain Name for an API in API Gateway.

URI

/v2/dominanames/domainName

HTTP Methods

GET

Operation ID: GetDomainName
Gets a domain name.

### Path Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>domainName</td>
<td>String</td>
<td>True</td>
<td>The domain name.</td>
</tr>
</tbody>
</table>

### Responses

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Response Model</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>200</td>
<td>DomainName (p. 189)</td>
<td>Success</td>
</tr>
<tr>
<td>404</td>
<td>NotFoundException (p. 190)</td>
<td>The resource specified in the request was not found.</td>
</tr>
<tr>
<td>429</td>
<td>LimitExceededException (p. 190)</td>
<td>The client is sending more than the allowed number of requests per unit of time.</td>
</tr>
</tbody>
</table>

### DELETE

Operation ID: DeleteDomainName

Deletes a domain name.

### Path Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>domainName</td>
<td>String</td>
<td>True</td>
<td>The domain name.</td>
</tr>
</tbody>
</table>

### Responses

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Response Model</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>204</td>
<td>None</td>
<td>The request has succeeded, and there is no additional content to send in the response payload body.</td>
</tr>
<tr>
<td>404</td>
<td>NotFoundException (p. 190)</td>
<td>The resource specified in the request was not found.</td>
</tr>
<tr>
<td>429</td>
<td>LimitExceededException (p. 190)</td>
<td>The client is sending more than the allowed number of requests per unit of time.</td>
</tr>
</tbody>
</table>

### PATCH

Operation ID: UpdateDomainName

Updates a domain name.
Path Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>domainName</td>
<td>String</td>
<td>True</td>
<td>The domain name.</td>
</tr>
</tbody>
</table>

Responses

<table>
<thead>
<tr>
<th>Status Code</th>

Schemas

Request Bodies

Example PATCH

```json
{
  "domainNameConfigurations": [
    {
      "endpointType": enum,
      "certificateName": "string",
      "certificateArn": "string",
      "apiGatewayDomainName": "string",
      "hostedZoneId": "string",
      "certificateUploadDate": "string",
      "securityPolicy": enum,
      "domainNameStatus": enum,
      "domainNameStatusMessage": "string"
    }
  ]
}
```

Response Bodies

Example DomainName

```json
{
  "domainName": "string",
  "domainNameConfigurations": [
    {
      "endpointType": enum,
```
Properties

BadRequestException

The request is not valid, for example, the input is incomplete or incorrect. See the accompanying error message for details.

message

Describes the error encountered.

Type: string
Required: False
ConflictException
The requested operation would cause a conflict with the current state of a service resource associated with the request. Resolve the conflict before retrying this request. See the accompanying error message for details.

message
Describes the error encountered.

  Type: string
  Required: False

DomainName
Represents a domain name.

domainName
The name of the DomainName resource.

  Type: string
  Required: True

domainNameConfigurations
The domain name configurations.

  Type: Array of type DomainNameConfiguration (p. 191)
  Required: False

apiMappingSelectionExpression
The API mapping selection expression.

  Type: string
  Required: False

tags
The collection of tags associated with a domain name.

  Type: Tags (p. 194)
  Required: False

DomainNameConfiguration
The domain name configuration.

endpointType
The endpoint type.

  Type: EndpointType (p. 193)
Properties

**Required**: False

**certificateName**
The user-friendly name of the certificate that will be used by the edge-optimized endpoint for this domain name.

  * **Type**: string
  * **Required**: False

**certificateArn**
An AWS-managed certificate that will be used by the edge-optimized endpoint for this domain name. AWS Certificate Manager is the only supported source.

  * **Type**: string
  * **Required**: False

**apiGatewayDomainName**
A domain name for the API.

  * **Type**: string
  * **Required**: False

**hostedZoneId**
The Amazon Route 53 Hosted Zone ID of the endpoint.

  * **Type**: string
  * **Required**: False

**certificateUploadDate**
The timestamp when the certificate that was used by edge-optimized endpoint for this domain name was uploaded.

  * **Type**: string
  * **Required**: False
  * **Format**: date-time

**securityPolicy**
The Transport Layer Security (TLS) version of the security policy for this domain name. The valid values are TLS_1_0 and TLS_1_2.

  * **Type**: SecurityPolicy (p. 194)
  * **Required**: False

**domainNameStatus**
The status of the domain name migration. The valid values are AVAILABLE and UPDATING. If the status is UPDATING, the domain cannot be modified further until the existing operation is complete. If it is AVAILABLE, the domain can be updated.
Type: DomainNameStatus (p. 193)
Required: False

domainNameStatusMessage
An optional text message containing detailed information about status of the domain name migration.

Type: string
Required: False

DomainNameStatus
The status of the domain name migration. The valid values are AVAILABLE and UPDATING. If the status is UPDATING, the domain cannot be modified further until the existing operation is complete. If it is AVAILABLE, the domain can be updated.

AVAILABLE
UPDATING

EndpointType
 Represents an endpoint type.

REGIONAL
EDGE

LimitExceeded Exception
A limit has been exceeded. See the accompanying error message for details.

message
Describes the error encountered.

Type: string
Required: False

limitType
The limit type.

Type: string
Required: False

NotFoundException
The resource specified in the request was not found. See the message field for more information.

message
Describes the error encountered.
resourceType

The resource type.

Type: string
Required: False

SecurityPolicy

The Transport Layer Security (TLS) version of the security policy for this domain name. The valid values are TLS_1_0 and TLS_1_2.

- TLS_1_0
- TLS_1_2

Tags

Represents a collection of tags associated with the resource.

key-value pairs

Type: string

UpdateDomainNameInput

Represents the input parameters for an UpdateDomainName request.

domainNameConfigurations

The domain name configurations.

Type: Array of type DomainNameConfiguration (p. 191)
Required: False

ApiMappings

Represents a collection of API mappings.

URI

/v2/domainnames/{domainName}/apimappings

HTTP Methods

GET

Operation ID: GetApiMappings

Gets API mappings.
Path Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>domainName</td>
<td>String</td>
<td>True</td>
<td>The domain name.</td>
</tr>
</tbody>
</table>

Query Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nextToken</td>
<td>String</td>
<td>False</td>
<td>The next page of elements from this collection. Not valid for the last element of the collection.</td>
</tr>
<tr>
<td>maxResults</td>
<td>String</td>
<td>False</td>
<td>The maximum number of elements to be returned for this resource.</td>
</tr>
</tbody>
</table>

Responses

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Response Model</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>200</td>
<td>ApiMappings (p. 197)</td>
<td>Success</td>
</tr>
<tr>
<td>400</td>
<td>BadRequestException (p. 197)</td>
<td>One of the parameters in the request is invalid.</td>
</tr>
<tr>
<td>404</td>
<td>NotFoundException (p. 198)</td>
<td>The resource specified in the request was not found.</td>
</tr>
<tr>
<td>429</td>
<td>LimitExceededException (p. 198)</td>
<td>The client is sending more than the allowed number of requests per unit of time.</td>
</tr>
</tbody>
</table>

POST

Operation ID: CreateApiMapping

Creates an API mapping.

Path Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>domainName</td>
<td>String</td>
<td>True</td>
<td>The domain name.</td>

}
```

Example LimitExceedededException

```json
{
    "message": "string",
    "limitType": "string"
}
```

Properties

ApiMapping

Represents an API mapping.

apiMappingId

The API mapping identifier.

Type: string
Required: False

apiMappingKey

The API mapping key.

Type: string
Required: False

apiId

The API identifier.

Type: string
Required: True

stage

The API stage.
**Type**: string  
**Required**: True

### ApiMappings

Represents a collection of ApiMappings resources.

**items**

The elements from this collection.

**Type**: Array of type ApiMapping (p. 198)  
**Required**: False

### nextToken

The next page of elements from this collection. Not valid for the last element of the collection.

**Type**: string  
**Required**: False

### BadRequestException

The request is not valid, for example, the input is incomplete or incorrect. See the accompanying error message for details.

**message**

Describes the error encountered.

**Type**: string  
**Required**: False

### ConflictException

The requested operation would cause a conflict with the current state of a service resource associated with the request. Resolve the conflict before retrying this request. See the accompanying error message for details.

**message**

Describes the error encountered.

**Type**: string  
**Required**: False

### CreateApiMappingInput

Represents the input parameters for a CreateApiMapping request.

**apiMappingKey**

The API mapping key.
**apiId**

The API identifier.

Type: string

Required: True

**stage**

The API stage.

Type: string

Required: True

**LimitExceededException**

A limit has been exceeded. See the accompanying error message for details.

**message**

Describes the error encountered.

Type: string

Required: False

**limitType**

The limit type.

Type: string

Required: False

**NotFoundException**

The resource specified in the request was not found. See the `message` field for more information.

**message**

Describes the error encountered.

Type: string

Required: False

**resourceType**

The resource type.

Type: string

Required: False

Properties

ApiMapping

Represents an API mapping.

apiMappingId

The API mapping identifier.

Type: string
Required: False
apiMappingKey
The API mapping key.

Type: string
Required: False

apilId
The API identifier.

Type: string
Required: True

stage
The API stage.

Type: string
Required: True

BadRequestException
The request is not valid, for example, the input is incomplete or incorrect. See the accompanying error message for details.

message
Describes the error encountered.

Type: string
Required: False

ConflictException
The requested operation would cause a conflict with the current state of a service resource associated with the request. Resolve the conflict before retrying this request. See the accompanying error message for details.

message
Describes the error encountered.

Type: string
Required: False

LimitExceededException
A limit has been exceeded. See the accompanying error message for details.

message
Describes the error encountered.

Type: string
Required: False
limitType

The limit type.

   Type: string
   Required: False

NotFoundException

The resource specified in the request was not found. See the message field for more information.

message

Describes the error encountered.

   Type: string
   Required: False

resourceType

The resource type.

   Type: string
   Required: False

UpdateApiMappingInput

Represents the input parameters for an UpdateApiMapping request.

apiMappingKey

The API mapping key.

   Type: string
   Required: False

apiId

The API identifier.

   Type: string
   Required: False

stage

The API stage.

   Type: string
   Required: False

Tags

Represents a collection of tags associated with the resource.

URI

/v2/tags/resource-arn
HTTP Methods

GET

Operation ID: GetTags

Gets a collection of Tag resources.

Path Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resource-arn</td>
<td>String</td>
<td>True</td>
<td>The resource ARN for the tag.</td>
</tr>
</tbody>
</table>

Responses

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Response Model</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>200</td>
<td>Tags (p. 210)</td>
<td>Success</td>
</tr>
<tr>
<td>400</td>
<td>BadRequestException (p. 210)</td>
<td>One of the parameters in the request is invalid.</td>
</tr>
<tr>
<td>404</td>
<td>NotFoundException (p. 210)</td>
<td>The resource specified in the request was not found.</td>
</tr>
<tr>
<td>429</td>
<td>LimitExceededException (p. 210)</td>
<td>The client is sending more than the allowed number of requests per unit of time.</td>
</tr>
</tbody>
</table>

POST

Operation ID: TagResource

Creates a new Tag resource to represent a tag.

Path Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resource-arn</td>
<td>String</td>
<td>True</td>
<td>The resource ARN for the tag.</td>
</tr>
</tbody>
</table>

Responses

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Response Model</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>201</td>
<td>None</td>
<td>The request has succeeded and has resulted in the creation of a resource.</td>
</tr>
</tbody>
</table>
## DELETE

**Operation ID:** UntagResource

Deletes a Tag.

### Path Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resource-arn</td>
<td>String</td>
<td>True</td>
<td>The resource ARN for the tag.</td>
</tr>
</tbody>
</table>

### Query Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UntagResourceInput</td>
<td>String</td>
<td>True</td>
<td>Represents the input parameters for an UntagResource request.</td>
</tr>
</tbody>
</table>

### Responses

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Response Model</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>204</td>
<td>None</td>
<td>The request has succeeded, and there is no additional content to send in the response payload body.</td>
</tr>
<tr>
<td>400</td>
<td>BadRequestException (p. 210)</td>
<td>One of the parameters in the request is invalid.</td>
</tr>
<tr>
<td>404</td>
<td>NotFoundException (p. 210)</td>
<td>The resource specified in the request was not found.</td>
</tr>
<tr>
<td>429</td>
<td>LimitExceededException (p. 210)</td>
<td>The client is sending more than the allowed number of requests per unit of time.</td>
</tr>
</tbody>
</table>
Schemas

Request Bodies

Example POST

```json
{
  "tags": {
  
  }
}
```

Response Bodies

Example Tags

```json
{
}
```

Example BadRequestException

```json
{
  "message": "string"
}
```

Example NotFoundException

```json
{
  "message": "string",
  "resourceType": "string"
}
```

Example ConflictException

```json
{
  "message": "string"
}
```

Example LimitExceeded Exception

```json
{
  "message": "string",
  "limitType": "string"
}
```

Properties

BadRequestException

The request is not valid, for example, the input is incomplete or incorrect. See the accompanying error message for details.
message
Describes the error encountered.

  Type: string
  Required: False

ConflicException
The requested operation would cause a conflict with the current state of a service resource associated with the request. Resolve the conflict before retrying this request. See the accompanying error message for details.

message
Describes the error encountered.

  Type: string
  Required: False

LimitExceededException
A limit has been exceeded. See the accompanying error message for details.

message
Describes the error encountered.

  Type: string
  Required: False

limitType
The limit type.

  Type: string
  Required: False

NotFoundException
The resource specified in the request was not found. See the message field for more information.

message
Describes the error encountered.

  Type: string
  Required: False

resourceType
The resource type.

  Type: string
TagResourceInput

Represents the input parameters for a TagResource request.

tags

The collection of tags. Each tag element is associated with a given resource.

- **Type**: Tags (p. 212)
- **Required**: False

Tags

Represents a collection of tags associated with the resource.

- **key-value pairs**

  - **Type**: string

VPCLinks

Represents your VPC links as a collection. A collection offers a paginated view of your VPC links.

URI

/v2/vpclinks

HTTP Methods

GET

Operation ID: GetVpcLinks

Gets a collection of VPC links.

Query Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nextToken</td>
<td>String</td>
<td>False</td>
<td>The next page of elements from this collection. Not valid for the last element of the collection.</td>
</tr>
<tr>
<td>maxResults</td>
<td>String</td>
<td>False</td>
<td>The maximum number of elements to be returned for this resource.</td>
</tr>
</tbody>
</table>

Responses

Schemas

Request Bodies

Example POST

```json
{
    "name": "string",
    "subnetIds": [
        "string"
    ],
    "securityGroupIds": [
        "string"
    ],
    "tags": {
    }
}
```

Response Bodies

Example VpcLinks

```json
{
    "items": [
        {
            "vpcLinkId": "string",
            "name": "string",
            "subnetIds": ["string"
        }
    ]
}
```
### Example VpcLink

```json
{
  "vpcLinkId": "string",
  "name": "string",
  "subnetIds": [
    "string"
  ],
  "securityGroupIds": [
    "string"
  ],
  "tags": {
  },
  "createdDate": "string",
  "vpcLinkStatus": enum,
  "vpcLinkStatusMessage": "string",
  "vpcLinkVersion": enum
}
```

### Example BadRequestException

```json
{
  "message": "string"
}
```

### Example LimitExceededException

```json
{
  "message": "string",
  "limitType": "string"
}
```

## Properties

### BadRequestException

The request is not valid, for example, the input is incomplete or incorrect. See the accompanying error message for details.

**message**

Describes the error encountered.
**CreateVpcLinkInput**

Represents the input parameters for a `CreateVpcLink` request.

**name**

The name of the VPC link.

- **Type:** string
- **Required:** True

**subnetIds**

A list of subnet IDs to include in the VPC link.

- **Type:** Array of type string
- **Required:** True

**securityGroupIds**

A list of security group IDs for the VPC link.

- **Type:** Array of type string
- **Required:** False

**tags**

A list of tags.

- **Type:** Tags (p. 217)
- **Required:** False

**LimitExceededException**

A limit has been exceeded. See the accompanying error message for details.

**message**

Describes the error encountered.

- **Type:** string
- **Required:** False

**limitType**

The limit type.

- **Type:** string
- **Required:** False
Tags

Represents a collection of tags associated with the resource.

**key-value pairs**

*Type: string*

VpcLink

Represents a VPC link.

vpcLinkId

The ID of the VPC link.

*Type: string*

*Required: True*

name

The name of the VPC link.

*Type: string*

*Required: True*

subnetIds

A list of subnet IDs to include in the VPC link.

*Type: Array of type string*

*Required: True*

securityGroupIds

A list of security group IDs for the VPC link.

*Type: Array of type string*

*Required: True*

tags

Tags for the VPC link.

*Type: Tags (p. 217)*

*Required: False*

createdDate

The timestamp when the VPC link was created.

*Type: string*

*Required: False*

*Format: date-time*
vpcLinkStatus
The status of the VPC link.
   Type: VpcLinkStatus (p. 218)
   Required: False

vpcLinkStatusMessage
A message summarizing the cause of the status of the VPC link.
   Type: string
   Required: False

vpcLinkVersion
The version of the VPC link.
   Type: VpcLinkVersion (p. 218)
   Required: False

VpcLinkStatus
The status of the VPC link.
   PENDING
   AVAILABLE
   DELETING
   DELETING
   FAILED
   INACTIVE

VpcLinkVersion
The version of the VPC link.
   V2

VpcLinks
Represent a collection of VPCLinks.

items
A collection of VPC links.
   Type: Array of type VpcLink (p. 217)
   Required: False

nextToken
The next page of elements from this collection. Not valid for the last element of the collection.
   Type: string
Required: False

### Properties

#### BadRequestException

The request is not valid, for example, the input is incomplete or incorrect. See the accompanying error message for details.

- **message**
  - Describes the error encountered.
  - **Type:** string
  - **Required:** False

#### LimitExceededException

A limit has been exceeded. See the accompanying error message for details.

- **message**
  - Describes the error encountered.
  - **Type:** string
  - **Required:** False

- **limitType**
  - The limit type.
  - **Type:** string
  - **Required:** False

#### NotFoundException

The resource specified in the request was not found. See the `message` field for more information.

- **message**
  - Describes the error encountered.
  - **Type:** string
  - **Required:** False
resourceType
The resource type.
   Type: string
   Required: False

Tags
Represents a collection of tags associated with the resource.

key-value pairs
   Type: string

UpdateVpcLinkInput
Represents the input parameters for an UpdateVpcLink request.

name
The name of the VPC link.
   Type: string
   Required: False

VpcLink
Represents a VPC link.

vpcLinkId
The ID of the VPC link.
   Type: string
   Required: True

dependencies
The name of the VPC link.
   Type: string
   Required: True

subnetIds
A list of subnet IDs to include in the VPC link.
   Type: Array of type string
   Required: True

securityGroupIds
A list of security group IDs for the VPC link.
**Type:** Array of type string

**Required:** True

**tags**

Tags for the VPC link.

**Type:** Tags (p. 223)

**Required:** False

**createdDate**

The timestamp when the VPC link was created.

**Type:** string

**Required:** False

**Format:** date-time

**vpcLinkStatus**

The status of the VPC link.

**Type:** VpcLinkStatus (p. 224)

**Required:** False

**vpcLinkStatusMessage**

A message summarizing the cause of the status of the VPC link.

**Type:** string

**Required:** False

**vpcLinkVersion**

The version of the VPC link.

**Type:** VpcLinkVersion (p. 224)

**Required:** False

**VpcLinkStatus**

The status of the VPC link.

- PENDING
- AVAILABLE
- DELETING
- FAILED
- INACTIVE

**VpcLinkVersion**

The version of the VPC link.

Operations

The Amazon API Gateway REST API includes the following operations.

- **CreateApi** (p. 3)
  Creates an API resource.
- **CreateApiMapping** (p. 196)
  Creates an API mapping.
- **CreateAuthorizer** (p. 28)
  Creates an Authorizer for an API.
- **CreateDeployment** (p. 49)
  Creates a Deployment for an API.
- **CreateDomainName** (p. 180)
  Creates a domain name.
- **CreateIntegration** (p. 61)
  Creates an Integration.
- **CreateIntegrationResponse** (p. 88)
  Creates an IntegrationResponses.
- **CreateModel** (p. 104)
  Creates a Model for an API.
- **CreateRoute** (p. 119)
  Creates a Route for an API.
- **CreateRouteResponse** (p. 140)
  Creates a RouteResponse for a Route.
- **CreateStage** (p. 154)
  Creates a Stage for an API.
- **CreateVpcLink** (p. 214)
  Creates a VPC link.
- **DeleteAccessLogSettings** (p. 174)
  Deletes the AccessLogSettings for a Stage. To disable access logging for a Stage, delete its AccessLogSettings.
- **DeleteApi** (p. 17)
  Deletes an API resource.
- **DeleteApiMapping** (p. 202)
  Deletes an API mapping.
- **DeleteAuthorizer** (p. 37)
  Deletes an Authorizer.
• **DeleteCorsConfiguration (p. 46)**
  Deletes a CORS configuration.

• **DeleteDeployment (p. 55)**
  Deletes a Deployment.

• **DeleteDomainName (p. 188)**
  Deletes a domain name.

• **DeleteIntegration (p. 74)**
  Deletes an Integration.

• **DeleteIntegrationResponse (p. 95)**
  Deletes an IntegrationResponses.

• **DeleteModel (p. 110)**
  Deletes a Model.

• **DeleteRoute (p. 128)**
  Deletes a Route.

• **DeleteRouteRequestParameter (p. 137)**
  Deletes a route request parameter.

• **DeleteRouteResponse (p. 146)**
  Deletes a RouteResponse.

• **DeleteRouteSettings (p. 177)**
  Deletes the RouteSettings for a stage.

• **DeleteStage (p. 164)**
  Deletes a Stage.

• **DeleteVpcLink (p. 220)**
  Deletes a VPC link.

• **GetApi (p. 15)**
  Gets an Api resource.

• **GetApiMapping (p. 201)**
  Gets an API mapping.

• **GetApiMappings (p. 195)**
  Gets API mappings.

• **GetApis (p. 3)**
  Gets a collection of Api resources.

• **GetAuthorizer (p. 37)**
  Gets an Authorizer.

• **GetAuthorizers (p. 27)**
  Gets the Authorizers for an API.

• **GetDeployment (p. 54)**
Gets a Deployment.
• GetDeployments (p. 48)

Gets the Deployments for an API.
• GetDomainName (p. 187)

Gets a domain name.
• GetDomainNames (p. 179)

Gets the domain names for an AWS account.
• GetIntegration (p. 74)

Gets an Integration.
• GetIntegrationResponse (p. 95)

Gets an IntegrationResponses.
• GetIntegrationResponses (p. 87)

Gets the IntegrationResponses for an Integration.
• GetIntegrations (p. 60)

Gets the Integrations for an API.
• GetModel (p. 109)

Gets a Model.
• GetModels (p. 103)

Gets the Models for an API.
• GetModelTemplate (p. 115)

Gets a model template.
• GetRoute (p. 128)

Gets a Route.
• GetRouteResponse (p. 146)

Gets a RouteResponse.
• GetRouteResponses (p. 139)

Gets the RouteResponses for a Route.
• GetRoutes (p. 118)

Gets the Routes for an API.
• GetStage (p. 164)

Gets a Stage.
• GetStages (p. 153)

Gets the Stages for an API.
• GetTags (p. 208)

Gets a collection of Tag resources.
• GetVpcLink (p. 219)

Gets a VPC link.
• GetVpcLinks (p. 213)
  Gets a collection of VPC links.
• ImportApi (p. 4)
  Imports an API.
• ReimportApi (p. 16)
  Puts an Api resource.
• TagResource (p. 208)
  Creates a new Tag resource to represent a tag.
• UntagResource (p. 209)
  Deletes a Tag.
• UpdateApi (p. 17)
  Updates an Api resource.
• UpdateApiMapping (p. 203)
  The API mapping.
• UpdateAuthorizer (p. 38)
  Updates an Authorizer.
• UpdateDeployment (p. 55)
  Updates a Deployment.
• UpdateDomainName (p. 188)
  Updates a domain name.
• UpdateIntegration (p. 75)
  Updates an Integration.
• UpdateIntegrationResponse (p. 96)
  Updates an IntegrationResponses.
• UpdateModel (p. 110)
  Updates a Model.
• UpdateRoute (p. 129)
  Updates a Route.
• UpdateRouteResponse (p. 147)
  Updates a RouteResponse.
• UpdateStage (p. 165)
  Updates a Stage.
• UpdateVpcLink (p. 220)
  Updates a VPC link.
Document History for the API Gateway v2 API Reference

The following table describes the documentation for this release of the Amazon API Gateway v2 API Reference.

- **API version**: v2
- **Latest documentation update**: March 12, 2020
