What Is AWS Auto Scaling?

AWS Auto Scaling enables you to configure automatic scaling for the scalable AWS resources for your application in a matter of minutes. AWS Auto Scaling uses the Auto Scaling and Application Auto Scaling services to configure scaling policies for your scalable AWS resources.

For more information about the benefits of this service, see AWS Auto Scaling.

Scalable Resources

Use AWS Auto Scaling to automatically scale the following resources for your applications:

- Aurora DB clusters
- Auto Scaling groups
- DynamoDB global secondary indexes
- DynamoDB tables
- ECS services
- Spot Fleet requests

How AWS Auto Scaling Works

With AWS Auto Scaling, you create a scaling plan with a set of instructions used to configure dynamic scaling for the scalable resources in your application. AWS Auto Scaling creates target tracking scaling policies for the scalable resources in your scaling plan. Target tracking scaling policies adjust the capacity of your scalable resource as required to maintain resource utilization at the target value that you specified. For more information, see Target Tracking Scaling Policies in the Application Auto Scaling User Guide.

You can create one scaling plan per application source (a CloudFormation stack or a set of tags). You can add each scalable resource to one scaling plan. If you have already configured scaling policies for a scalable resource in your application, AWS Auto Scaling keeps the existing scaling policies instead of creating additional scaling policies for the resource.

How to Get Started

To get started, create a scaling plan. For more information, see Getting Started with AWS Auto Scaling (p. 2).
Getting Started with AWS Auto Scaling

This tutorial provides a hands-on introduction to AWS Auto Scaling through the AWS Management Console, a web-based interface. To create your first scaling plan, complete the following steps.

Tasks
- Requirements (p. 2)
- Step 1: Search for Your Scalable Resources (p. 2)
- Step 2: Configure Your Scaling Plan (p. 3)
- Step 3: Create Your Scaling Plan (p. 3)
- Step 4: Delete Your Scaling Plan (Optional) (p. 3)

Requirements

AWS Auto Scaling uses an application source to discover the AWS resources that power your application. You can use a AWS CloudFormation stack or a set of tags as an application source. You need the name of your CloudFormation stack or a set of tags before you can create a scaling plan.

You can create one scaling plan per application source and add each scalable resource to one scaling plan.

Step 1: Search for Your Scalable Resources

Use one of the following procedures to specify the application source for your scalable resources.

To specify a CloudFormation stack as the application source
2. Select Search by CloudFormation stack.
3. Select your AWS CloudFormation stack and choose Next.

To specify a set of tags as the application source
2. Select Search by tag.
3. For each tag, select a tag key from Key and tag values from Value. To add tags, choose Add another row. To remove tags, choose Remove.
4. When you are finished specifying tags, choose Next.
Step 2: Configure Your Scaling Plan

On the Configure scaling plan page, for Scaling plan details, Name, type a name for your scaling plan. For each type of scalable resource, select a strategy. To omit a type of scalable resource from your scaling plan, clear Include in scaling plan. When you are finished, choose Next.

Step 3: Create Your Scaling Plan

On the Review and create page, choose Create scaling plan.

Step 4: Delete Your Scaling Plan (Optional)

When you are finished with a scaling plan, you can delete it. Deleting a scaling plan deletes the target tracking policies that AWS Auto Scaling created on your behalf. Deleting a scaling plan does not delete your AWS CloudFormation stack or the scalable resources.

To delete a scaling plan

2. On the Scaling plans page, select the scaling plan and choose Delete.
3. When prompted for confirmation, choose Delete.
Authentication and Access Control for AWS Auto Scaling

By default, IAM users don't have permission to create or modify AWS resources. To grant IAM users permission to create or modify AWS resources, you must create policies using AWS Identity and Access Management (IAM). IAM policies grant permissions to specific resources and API actions. You attach an IAM policy to the IAM users or groups that require the permissions it grants. For more information, see Access Management in the IAM User Guide.

AWS Auto Scaling Actions

You can specify any and all AWS Auto Scaling actions in an IAM policy. Use the following prefix with the name of the action: autoscaling-plans: . For example:

```
"Action": "autoscaling-plans:DescribeScalingPlans"
```

You can also use wildcards. For example, use autoscaling-plans:* to specify all AWS Auto Scaling actions.

```
"Action": "autoscaling-plans:*"
```

Use Describe* to specify all actions whose names start with Describe.

```
"Action": "autoscaling-plans:Describe*"
```

For a list of actions, see AWS Auto Scaling Actions.

AWS Auto Scaling Resources

When writing an IAM policy to control access to AWS Auto Scaling actions, you must use "*" as the resource. There are no supported Amazon Resource Names (ARNs) for AWS Auto Scaling resources.

AWS Auto Scaling Keys

For a list of context keys supported by each AWS service and a list of AWS-wide policy keys, see AWS Service Actions and Condition Context Keys and Global and IAM Condition Context Keys in the IAM User Guide.

Example Policies

To create a scaling plan, users must have permission to use the actions in the following example policy.
Example Policies

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "autoscaling-plans:*",
                "cloudwatch:PutMetricAlarm",
                "cloudwatch:DeleteAlarms",
                "cloudwatch:DescribeAlarms",
                "cloudformation:ListStackResources"
            ],
            "Resource": "*"
        }
    ]
}
```

Users must have additional permissions for each type of scalable resource they must add to a scaling plan.

**Auto Scaling groups**

- `autoscaling:UpdateAutoScalingGroups`
- `autoscaling:DescribeAutoScalingGroups`
- `autoscaling:PutScalingPolicy`
- `autoscaling:DescribePolicies`
- `autoscaling:DeletePolicy`

**Resource types other than Auto Scaling groups**

- `application-autoscaling:RegisterScalableTarget`
- `application-autoscaling:DescribeScalableTargets`
- `application-autoscaling:DeregisterScalableTarget`
- `application-autoscaling:PutScalingPolicy`
- `application-autoscaling:DescribeScalingPolicies`
- `application-autoscaling:DeleteScalingPolicy`
- `iam:CreateServiceLinkedRole`

**ECS services**

- `ecs:DescribeServices`
- `ecs:UpdateServices`

**Spot Fleet requests**

- `ec2:DescribeSpotFleetRequests`
- `ec2:ModifySpotFleetRequest`

**DynamoDB tables or global indexes**

- `dynamodb:DescribeTable`
- `dynamodb:UpdateTable`
Aurora DB clusters

- rds:AddTagsToResource
- rds:CreateDBInstance
- rds:DeleteDBInstance
- rds:DescribeDBClusters
- rds:DescribeDBInstances
AWS Auto Scaling Limits

Your AWS account has the following limits related to AWS Auto Scaling. To request a limit increase, use the Auto Scaling Limits form.

- Scaling plans: 100
- Target tracking configurations per instruction: 10
- Target tracking configurations per scaling plan: 500
Document History

The following table describes important additions to the documentation for AWS Auto Scaling.

<table>
<thead>
<tr>
<th>Change</th>
<th>Description</th>
<th>Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tags as an application source</td>
<td>This release adds support for specifying a set of tags as an application source.</td>
<td>April 23, 2018</td>
</tr>
<tr>
<td>New service</td>
<td>Initial release of AWS Auto Scaling</td>
<td>January 16, 2018</td>
</tr>
