Welcome

AWS Cost Explorer Service

The Cost Explorer API allows you to programmatically query your cost and usage data. You can query for aggregated data such as total monthly costs or total daily usage. You can also query for granular data, such as the number of daily write operations for Amazon DynamoDB database tables in your production environment.

Service Endpoint

The Cost Explorer API provides the following endpoint:

- https://ce.us-east-1.amazonaws.com

For information about costs associated with the Cost Explorer API, see AWS Cost Management Pricing.

AWS Budgets

The AWS Budgets API enables you to use AWS Budgets to plan your service usage, service costs, and instance reservations. The API reference provides descriptions, syntax, and usage examples for each of the actions and data types for AWS Budgets.

Budgets provide you with a way to see the following information:

- How close your plan is to your budgeted amount or to the free tier limits
- Your usage-to-date, including how much you've used of your Reserved Instances (RIs)
- Your current estimated charges from AWS, and how much your predicted usage will accrue in charges by the end of the month
- How much of your budget has been used

AWS updates your budget status several times a day. Budgets track your unblended costs, subscriptions, refunds, and RIs. You can create the following types of budgets:

- **Cost budgets** - Plan how much you want to spend on a service.
- **Usage budgets** - Plan how much you want to use one or more services.
- **RI utilization budgets** - Define a utilization threshold, and receive alerts when your RI usage falls below that threshold. This lets you see if your RIs are unused or under-utilized.
- **RI coverage budgets** - Define a coverage threshold, and receive alerts when the number of your instance hours that are covered by RIs fall below that threshold. This lets you see how much of your instance usage is covered by a reservation.

Service Endpoint

The AWS Budgets API provides the following endpoint:

- https://budgets.amazonaws.com
For information about costs that are associated with the AWS Budgets API, see AWS Cost Management Pricing.

AWS Price List Service

AWS Price List Service API is a centralized and convenient way to programmatically query Amazon Web Services for services, products, and pricing information. The AWS Price List Service uses standardized product attributes such as Location, Storage Class, and Operating System, and provides prices at the SKU level. You can use the AWS Price List Service to build cost control and scenario planning tools, reconcile billing data, forecast future spend for budgeting purposes, and provide cost benefit analysis that compare your internal workloads with AWS.

Use GetServices without a service code to retrieve the service codes for all AWS services, then GetServices with a service code to retrieve the attribute names for that service. After you have the service code and attribute names, you can use GetAttributeValues to see what values are available for an attribute. With the service code and an attribute name and value, you can use GetProducts to find specific products that you’re interested in, such as an AmazonEC2 instance, with a Provisioned IOPS volumeType.

Service Endpoint

AWS Price List Service API provides the following two endpoints:

- https://api.pricing.us-east-1.amazonaws.com
- https://api.pricing.ap-south-1.amazonaws.com
Actions

The following actions are supported by AWS Cost Explorer Service:

- GetCostAndUsage (p. 4)
- GetDimensionValues (p. 10)
- GetReservationCoverage (p. 16)
- GetReservationPurchaseRecommendation (p. 22)
- GetReservationUtilization (p. 27)
- GetTags (p. 34)

The following actions are supported by AWS Budgets:

- CreateBudget (p. 38)
- CreateNotification (p. 42)
- CreateSubscriber (p. 45)
- DeleteBudget (p. 48)
- DeleteNotification (p. 50)
- DeleteSubscriber (p. 53)
- DescribeBudget (p. 56)
- DescribeBudgets (p. 60)
- DescribeNotificationsForBudget (p. 64)
- DescribeSubscribersForNotification (p. 68)
- UpdateBudget (p. 72)
- UpdateNotification (p. 76)
- UpdateSubscriber (p. 79)

The following actions are supported by AWS Price List Service:

- DescribeServices (p. 82)
- GetAttributeValues (p. 86)
- GetProducts (p. 90)

AWS Cost Explorer Service

The following actions are supported by AWS Cost Explorer Service:

- GetCostAndUsage (p. 4)
- GetDimensionValues (p. 10)
- GetReservationCoverage (p. 16)
- GetReservationPurchaseRecommendation (p. 22)
- GetReservationUtilization (p. 27)
- GetTags (p. 34)
GetCostAndUsage
Service: AWS Cost Explorer Service

Retrieves cost and usage metrics for your account. You can specify which cost and usage-related metric, such as BlendedCosts or UsageQuantity, that you want the request to return. You can also filter and group your data by various dimensions, such as SERVICE or AZ, in a specific time range. For a complete list of valid dimensions, see the GetDimensionValues operation. Master accounts in an organization in AWS Organizations have access to all member accounts.

Request Syntax

```
{
    "Filter": {
        "And": [
            "Expression"
        ],
        "Dimensions": {
            "Key": "string",
            "Values": [ "string" ]
        },
        "Not": "Expression",
        "Or": [
            "Expression"
        ],
        "Tags": {
            "Key": "string",
            "Values": [ "string" ]
        }
    },
    "Granularity": "string",
    "GroupBy": [
        {
            "Key": "string",
            "Type": "string"
        }
    ],
    "Metrics": [ "string" ],
    "NextPageToken": "string",
    "TimePeriod": {
        "End": "string",
        "Start": "string"
    }
}
```

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 146).

The request accepts the following data in JSON format.

Filter (p. 4)

Filters AWS costs by different dimensions. For example, you can specify SERVICE and LINKED_ACCOUNT and get the costs that are associated with that account’s usage of that service. You can nest Expression objects to define any combination of dimension filters. For more information, see Expression.

Type: Expression (p. 108) object
**Granularity (p. 4)**

Sets the AWS cost granularity to **MONTHLY** or **DAILY**. If *Granularity* isn't set, the response object doesn't include the *Granularity*, either **MONTHLY** or **DAILY**.

*Type: String*

*Valid Values: DAILY | MONTHLY*

**GroupBy (p. 4)**

You can group AWS costs using up to two different groups, either dimensions, tag keys, or both.

When you group by tag key, you get all tag values, including empty strings.

*Valid values are AZ, INSTANCE_TYPE, LEGAL_ENTITY_NAME, LINKED_ACCOUNT, OPERATION, PLATFORM, PURCHASE_TYPE, SERVICE, TAGS, TENANCY, and USAGE_TYPE.*

*Type: Array of GroupDefinition (p. 111) objects*

**Metrics (p. 4)**

Which metrics are returned in the query. For more information about blended and unblended rates, see [Why does the “blended” annotation appear on some line items in my bill?](#).

*Valid values are AmortizedCost, BlendedCost, UnblendedCost, and UsageQuantity.*

**Note**

If you return the UsageQuantity metric, the service aggregates all usage numbers without taking into account the units. For example, if you aggregate usageQuantity across all of EC2, the results aren't meaningful because EC2 compute hours and data transfer are measured in different units (for example, hours vs. GB). To get more meaningful UsageQuantity metrics, filter by UsageType or UsageTypeGroups.

*Metrics is required for GetCostAndUsage requests.*

*Type: Array of strings*

**NextPageToken (p. 4)**

The token to retrieve the next set of results. AWS provides the token when the response from a previous call has more results than the maximum page size.

*Type: String*

**TimePeriod (p. 4)**

Sets the start and end dates for retrieving AWS costs. The start date is inclusive, but the end date is exclusive. For example, if start is 2017-01-01 and end is 2017-05-01, then the cost and usage data is retrieved from 2017-01-01 up to and including 2017-04-30 but not including 2017-05-01.

*Type: DateInterval (p. 99) object*
Required: No

Response Syntax

```json
{
    "GroupDefinitions": [
        {
            "Key": "string",
            "Type": "string"
        }
    ],
    "NextPageToken": "string",
    "ResultsByTime": [
        {
            "Estimated": boolean,
            "Groups": [
                {
                    "Keys": [ "string" ],
                    "Metrics": {
                        "string": {
                            "Amount": "string",
                            "Unit": "string"
                        }
                    }
                }
            ],
            "TimePeriod": {
                "End": "string",
                "Start": "string"
            },
            "Total": {
                "string": {
                    "Amount": "string",
                    "Unit": "string"
                }
            }
        }
    ]
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**GroupDefinitions (p. 6)**

The groups that are specified by the Filter or GroupBy parameters in the request.

Type: Array of `GroupDefinition (p. 111)` objects

**NextPageToken (p. 6)**

The token for the next set of retrievable results. AWS provides the token when the response from a previous call has more results than the maximum page size.

Type: String

**ResultsByTime (p. 6)**

The time period that is covered by the results in the response.
Type: Array of ResultByTime (p. 128) objects

Errors

For information about the errors that are common to all actions, see Common Errors (p. 148).

BillExpirationException

The requested report expired. Update the date interval and try again.

HTTP Status Code: 400

DataUnavailableException

The requested data is unavailable.

HTTP Status Code: 400

InvalidNextTokenException

The pagination token is invalid. Try again without a pagination token.

HTTP Status Code: 400

LimitExceededException

You made too many calls in a short period of time. Try again later.

HTTP Status Code: 400

RequestChangedException

Your request parameters changed between pages. Try again with the old parameters or without a pagination token.

HTTP Status Code: 400

Example

The following is a sample request and response of the GetCostAndUsage operation that allows you to retrieve your Amazon S3 costs. For more complex examples, such as multi-level groupings, see Expression.

Sample Request

```
POST / HTTP/1.1
Host: ce.us-east-1.amazonaws.com
x-amz-Date: <Date>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>,
    SignedHeaders=contenttype;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,Signature=<Signature>
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: AWSInsightsIndexService.GetCostAndUsage
{
    "TimePeriod": {
        "Start": "2017-09-01",
        "End": "2017-10-01"
    },
```
"Granularity": "MONTHLY",
"Filter": {
  "Dimensions": {
    "Key": "SERVICE",
    "Values": [
      "Amazon Simple Storage Service"
    ]
  },
  "GroupBy": [
    { "Type": "DIMENSION", "Key": "SERVICE" }
  ],
  "Metrics": [ "BlendedCost", "UnblendedCost", "UsageQuantity" ]
}

Sample Response

HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
{
  "GroupDefinitions": [
    {
      "Key": "SERVICE",
      "Type": "DIMENSION"
    },
    {
      "Key": "Environment",
      "Type": "TAG"
    }
  ],
  "ResultsByTime": [
    { "Estimated": false,
      "Groups": [
        { "Keys": [
          "Amazon Simple Storage Service",
          "Environment Prod"
        ],
        "Metrics": { "BlendedCost": { "Amount": "39.1603300457", "Unit": "USD" }, "UnblendedCost": { "Amount": "39.1603300457", "Unit": "USD" }, "UsageQuantity": { "Amount": "173842.5440074444", "Unit": "N/A" } } } ]
  ]}
{  "Keys": [    "Amazon Simple Storage Service",    "Environment#Test"  ],  "Metrics": {    "BlendedCost": {      "Amount": "0.1337464807",      "Unit": "USD"    },    "UnblendedCost": {      "Amount": "0.1337464807",      "Unit": "USD"    },    "UsageQuantity": {      "Amount": "15992.0786663399",      "Unit": "N/A"    }  },  "TimePeriod": {    "End": "2017-10-01",    "Start": "2017-09-01"  },  "Total": {  }  }

GetDimensionValues
Service: AWS Cost Explorer Service

Retrieves all available filter values for a specified filter over a period of time. You can search the dimension values for an arbitrary string.

Request Syntax

```
{
    "Context": "string",
    "Dimension": "string",
    "NextPageToken": "string",
    "SearchString": "string",
    "TimePeriod": {
        "End": "string",
        "Start": "string"
    }
}
```

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 146).

The request accepts the following data in JSON format.

**Context (p. 10)**

The context for the call to GetDimensionValues. This can be RESERVATIONS or COST_AND_USAGE. The default value is COST_AND_USAGE. If the context is set to RESERVATIONS, the resulting dimension values can be used in the GetReservationUtilization operation. If the context is set to COST_AND_USAGE the resulting dimension values can be used in the GetCostAndUsage operation.

If you set the context to COST_AND_USAGE, you can use the following dimensions for searching:

- **AZ** - The Availability Zone. An example is us-east-1a.
- **DATABASE_ENGINE** - The Amazon Relational Database Service database. Examples are Aurora or MySQL.
- **INSTANCE_TYPE** - The type of EC2 instance. An example is m4.xlarge.
- **LEGAL_ENTITY_NAME** - The name of the organization that sells you AWS services, such as Amazon Web Services.
- **LINKED_ACCOUNT** - The description in the attribute map that includes the full name of the member account. The value field contains the AWS ID of the member account.
- **OPERATING_SYSTEM** - The operating system. Examples are Windows or Linux.
- **OPERATION** - The action performed. Examples include RunInstance and CreateBucket.
- **PLATFORM** - The EC2 operating system. Examples are Windows or Linux.
- **PURCHASE_TYPE** - The reservation type of the purchase to which this usage is related. Examples include On-Demand Instances and Standard Reserved Instances.
- **SERVICE** - The AWS service such as Amazon DynamoDB.
- **USAGE_TYPE** - The type of usage. An example is DataTransfer-In-Bytes. The response for the GetDimensionValues operation includes a unit attribute. Examples include GB and Hrs.
- **USAGE_TYPE_GROUP** - The grouping of common usage types. An example is EC2: CloudWatch – Alarms. The response for this operation includes a unit attribute.
• RECORD_TYPE - The different types of charges such as RI fees, usage costs, tax refunds, and credits.

If you set the context to RESERVATIONS, you can use the following dimensions for searching:
• AZ - The Availability Zone. An example is us-east-1a.
• CACHE_ENGINE - The Amazon ElastiCache operating system. Examples are Windows or Linux.
• DEPLOYMENT_OPTION - The scope of Amazon Relational Database Service deployments. Valid values are SingleAZ and MultiAZ.
• INSTANCE_TYPE - The type of EC2 instance. An example is m4.xlarge.
• LINKED_ACCOUNT - The description in the attribute map that includes the full name of the member account. The value field contains the AWS ID of the member account.
• PLATFORM - The EC2 operating system. Examples are Windows or Linux.
• REGION - The AWS Region.
• SCOPE (Utilization only) - The scope of a Reserved Instance (RI). Values are regional or a single Availability Zone.
• TAG (Coverage only) - The tags that are associated with a Reserved Instance (RI).
• TENANCY - The tenancy of a resource. Examples are shared or dedicated.

Type: String
Valid Values: COST_AND_USAGE | RESERVATIONS
Required: No

Dimension (p. 10)
The name of the dimension. Each Dimension is available for different a Context. For more information, see Context.

Type: String
Valid Values: AZ | INSTANCE_TYPE | LINKED_ACCOUNT | OPERATION | PURCHASE_TYPE | REGION | SERVICE | USAGE_TYPE | USAGE_TYPE_GROUP | RECORD_TYPE | OPERATING_SYSTEM | TENANCY | SCOPE | PLATFORM | SUBSCRIPTION_ID | LEGAL_ENTITY_NAME | DEPLOYMENT_OPTION | DATABASE_ENGINE | CACHE_ENGINE | INSTANCE_TYPE_FAMILY
Required: Yes

NextPageToken (p. 10)
The token to retrieve the next set of results. AWS provides the token when the response from a previous call has more results than the maximum page size.

Type: String
Required: No

SearchString (p. 10)
The value that you want to search the filter values for.

Type: String
Required: No

TimePeriod (p. 10)
The start and end dates for retrieving the dimension values. The start date is inclusive, but the end date is exclusive. For example, if start is 2017-01-01 and end is 2017-05-01, then the cost
and usage data is retrieved from 2017-01-01 up to and including 2017-04-30 but not including 2017-05-01.

Type: DateInterval (p. 99) object

Required: Yes

Response Syntax

```json
{
   "DimensionValues": [
      {
         "Attributes": {
            "string": "string"
         },
         "Value": "string"
      },
      "NextPageToken": "string",
      "ReturnSize": number,
      "TotalSize": number
   }
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**DimensionValues (p. 12)**

The filters that you used to filter your request. Some dimensions are available only for a specific context:

If you set the context to COST_AND_USAGE, you can use the following dimensions for searching:

- **AZ** - The Availability Zone. An example is us-east-1a.
- **DATABASE_ENGINE** - The Amazon Relational Database Service database. Examples are Aurora or MySQL.
- **INSTANCE_TYPE** - The type of EC2 instance. An example is m4.xlarge.
- **LEGAL_ENTITY_NAME** - The name of the organization that sells you AWS services, such as Amazon Web Services.
- **LINKED_ACCOUNT** - The description in the attribute map that includes the full name of the member account. The value field contains the AWS ID of the member account.
- **OPERATING_SYSTEM** - The operating system. Examples are Windows or Linux.
- **OPERATION** - The action performed. Examples include RunInstance and CreateBucket.
- **PLATFORM** - The EC2 operating system. Examples are Windows or Linux.
- **PURCHASE_TYPE** - The reservation type of the purchase to which this usage is related. Examples include On-Demand Instances and Standard Reserved Instances.
- **SERVICE** - The AWS service such as Amazon DynamoDB.
- **USAGE_TYPE** - The type of usage. An example is DataTransfer-In-Bytes. The response for the GetDimensionValues operation includes a unit attribute. Examples include GB and Hrs.
- **USAGE_TYPE_GROUP** - The grouping of common usage types. An example is EC2: CloudWatch – Alarms. The response for this operation includes a unit attribute.
• **RECORD_TYPE** - The different types of charges such as RI fees, usage costs, tax refunds, and credits.

If you set the context to **RESERVATIONS**, you can use the following dimensions for searching:
- **AZ** - The Availability Zone. An example is `us-east-1a`.
- **CACHE_ENGINE** - The Amazon ElastiCache operating system. Examples are Windows or Linux.
- **DEPLOYMENT_OPTION** - The scope of Amazon Relational Database Service deployments. Valid values are `SingleAZ` and `MultiAZ`.
- **INSTANCE_TYPE** - The type of EC2 instance. An example is `m4.xlarge`.
- **LINKED_ACCOUNT** - The description in the attribute map that includes the full name of the member account. The value field contains the AWS ID of the member account.
- **PLATFORM** - The EC2 operating system. Examples are Windows or Linux.
- **REGION** - The AWS Region.
- **SCOPE** (Utilization only) - The scope of a Reserved Instance (RI). Values are regional or a single Availability Zone.
- **TAG** (Coverage only) - The tags that are associated with a Reserved Instance (RI).
- **TENANCY** - The tenancy of a resource. Examples are shared or dedicated.

Type: Array of **DimensionValuesWithAttributes** objects

**NextPageToken (p. 12)**

The token for the next set of retrievable results. AWS provides the token when the response from a previous call has more results than the maximum page size.

Type: String

**ReturnSize (p. 12)**

The number of results that AWS returned at one time.

Type: Integer

**TotalSize (p. 12)**

The total number of search results.

Type: Integer

**Errors**

For information about the errors that are common to all actions, see **Common Errors (p. 148)**.

**BillExpirationException**

The requested report expired. Update the date interval and try again.

HTTP Status Code: 400

**DataUnavailableException**

The requested data is unavailable.

HTTP Status Code: 400

**InvalidNextTokenException**

The pagination token is invalid. Try again without a pagination token.

HTTP Status Code: 400
LimitExceededException

You made too many calls in a short period of time. Try again later.

HTTP Status Code: 400

RequestChangedException

Your request parameters changed between pages. Try again with the old parameters or without a pagination token.

HTTP Status Code: 400

Example

The following is a sample request and response of the GetDimensionValues operation that allows you to search for all the member accounts in an organization in AWS Organizations that have "Elastic" in their name:

Sample Request

```
POST / HTTP/1.1
Host: ce.us-east-1.amazonaws.com
x-amz-Date: <Date>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>,
    SignedHeaders=contenttype;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,Signature=<Signature>
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: AWSInsightsIndexService.GetDimensionValues
{
    "TimePeriod": {
        "Start": "2017-01-01",
        "End": "2017-05-18"
    },
    "SearchString": "Elastic",
    "Dimension": "Service"
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>

//Attributes are optional metadata that are returned depending on the dimension that you select.
{
    "DimensionValues": [
        {
            "Attributes": {},
            "Value": "Amazon ElastiCache"
        },
        {
            "Attributes": {},
            "Value": "EC2 - Other"
        }
    ]
```
"Attributes": {},
  "Value": "Amazon Elastic Compute Cloud - Compute"
},
  {
    "Attributes": {},
    "Value": "Amazon Elasticsearch Service"
  }
},
"ReturnSize": 4,
"TotalSize": 4

GetReservationCoverage
Service: AWS Cost Explorer Service

Retrieves the reservation coverage for your account. This allows you to see how much of your Amazon Elastic Compute Cloud, Amazon ElastiCache, Amazon Relational Database Service, or Amazon Redshift usage is covered by a reservation. An organization's master account can see the coverage of the associated member accounts. For any time period, you can filter data about reservation usage by the following dimensions:

- AZ
- CACHE_ENGINE
- DATABASE_ENGINE
- DEPLOYMENT_OPTION
- INSTANCE_TYPE
- LINKED_ACCOUNT
- OPERATING_SYSTEM
- PLATFORM
- REGION
- SERVICE
- TAG
- TENANCY

To determine valid values for a dimension, use the GetDimensionValues operation.

Request Syntax

```
{
  "Filter": {
    "And": [
      "Expression"
    ],
    "Dimensions": {
      "Key": "string",
      "Values": [ "string" ]
    },
    "Not": "Expression",
    "Or": [
      "Expression"
    ],
    "Tags": {
      "Key": "string",
      "Values": [ "string" ]
    }
  },
  "Granularity": "string",
  "GroupBy": [
    {
      "Key": "string",
      "Type": "string"
    }
  ],
  "NextPageToken": "string",
  "TimePeriod": {
    "End": "string",
    "Start": "string"
  }
}
```
Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 146).

The request accepts the following data in JSON format.

Filter (p. 16)

Filters utilization data by dimensions. You can filter by the following dimensions:
- AZ
- CACHE_ENGINE
- DATABASE_ENGINE
- DEPLOYMENT_OPTION
- INSTANCE_TYPE
- LINKED_ACCOUNT
- OPERATING_SYSTEM
- PLATFORM
- REGION
- SERVICE
- TAG
- TENANCY

GetReservationCoverage uses the same Expression object as the other operations, but only AND is supported among each dimension. You can nest only one level deep. If there are multiple values for a dimension, they are OR’d together.

If you don’t provide a SERVICE filter, Cost Explorer defaults to EC2.

Type: Expression (p. 108) object

Required: No

Granularity (p. 16)

The granularity of the AWS cost data for the reservation. Valid values are MONTHLY and DAILY.

If GroupBy is set, Granularity can’t be set. If Granularity isn’t set, the response object doesn’t include Granularity, either MONTHLY or DAILY.

Type: String

Valid Values: DAILY | MONTHLY

Required: No

GroupBy (p. 16)

You can group the data by the following attributes:
- AZ
- CACHE_ENGINE
- DATABASE_ENGINE
- DEPLOYMENT_OPTION
- INSTANCE_TYPE
• LINKED_ACCOUNT
• OPERATING_SYSTEM
• PLATFORM
• REGION
• TAG
• TENANCY

Type: Array of `GroupDefinition` objects
Required: No

**NextPageToken (p. 16)**

The token to retrieve the next set of results. AWS provides the token when the response from a previous call has more results than the maximum page size.

Type: String
Required: No

**TimePeriod (p. 16)**

The start and end dates of the period for which you want to retrieve data about reservation coverage. You can retrieve data for a maximum of 13 months: the last 12 months and the current month. The start date is inclusive, but the end date is exclusive. For example, if `start` is 2017-01-01 and `end` is 2017-05-01, then the cost and usage data is retrieved from 2017-01-01 up to and including 2017-04-30 but not including 2017-05-01.

Type: `DateInterval` object
Required: Yes

**Response Syntax**

```json
{
  "CoveragesByTime": [
    {
      "Groups": [
        {
          "Attributes": {
            "string" : "string"
          },
          "Coverage": {
            "CoverageHours": {
              "CoverageHoursPercentage": "string",
              "OnDemandHours": "string",
              "ReservedHours": "string",
              "TotalRunningHours": "string"
            }
          }
        }
      ],
      "TimePeriod": {   
        "End": "string",
        "Start": "string"
      },
      "Total": {
        "CoverageHours": {
          "CoverageHoursPercentage": "string",
          "OnDemandHours": "string",
          "ReservedHours": "string"
        }
      }
    }
  ]
}```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

CoveragesByTime (p. 18)

The amount of time that your reservations covered.

Type: Array of CoverageByTime (p. 97) objects

NextPageToken (p. 18)

The token for the next set of retrievable results. AWS provides the token when the response from a previous call has more results than the maximum page size.

Type: String

Total (p. 18)

The total amount of instance usage that is covered by a reservation.

Type: Coverage (p. 96) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 148).

DataUnavailableException

The requested data is unavailable.

HTTP Status Code: 400

InvalidNextTokenException

The pagination token is invalid. Try again without a pagination token.

HTTP Status Code: 400

LimitExceededException

You made too many calls in a short period of time. Try again later.

HTTP Status Code: 400
Example

The following example request for the GetReservationCoverage operation retrieves reservation coverage for all t2.nano instance types from 2017-07-01 to 2017-10-01:

Sample Request

```
POST / HTTP/1.1
Host: ce.us-east-1.amazonaws.com
x-amz-date: <Date>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>,
  SignedHeaders=contenttype;date;host;user-agent;x-amz-date;x-amzn-requestid,Signature=<Signature>
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: AWSInsightsIndexService.GetReservationCoverage
{
  "TimePeriod": {
    "Start": "2017-07-01",
    "End": "2017-10-01"
  },
  "Filter": {
    "And": [
      {"Dimensions": {
        "Key": "INSTANCE_TYPE",
        "Values": [
          "t2.nano"
        ]
      },
      {"Dimensions": {
        "Key": "REGION",
        "Values": [
          "us-east-1"
        ]
      }
    ],
    "GroupBy": [
      {"Type": "Dimension",
       "Key": "REGION"
    }
  }
}
```

Sample Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
{
  "CoveragesByTime": [
    {"Groups": [
      {"Attributes": {
        "region": "us-east-1"
      },
      {"Coverage": {
        "CoverageHours": {
```
GetReservationCoverage

"CoverageHoursPercentage": "40%",
"OnDemandHours": "40",
"ReservedHours": "40",
"TotalRunningHours": "80"
}
]
]
"TimePeriod": {
  "End": "2017-07-01",
  "Start": "2017-10-01"
},
"Total": {
  "CoverageHours": {
    "CoverageHoursPercentage": "40%",
    "OnDemandHours": "40",
    "ReservedHours": "40",
    "TotalRunningHours": "80"
  }
}
],
"Total": {
  "CoverageHours": {
    "CoverageHoursPercentage": "40%",
    "OnDemandHours": "40",
    "ReservedHours": "40",
    "TotalRunningHours": "80"
  }
}
]}

GetReservationPurchaseRecommendation

Service: AWS Cost Explorer Service

Gets recommendations for which reservations to purchase. These recommendations could help you reduce your costs. Reservations provide a discounted hourly rate (up to 75%) compared to On-Demand pricing.

AWS generates your recommendations by identifying your On-Demand usage during a specific time period and collecting your usage into categories that are eligible for a reservation. After AWS has these categories, it simulates every combination of reservations in each category of usage to identify the best number of each type of RI to purchase to maximize your estimated savings.

For example, AWS automatically aggregates your EC2 Linux, shared tenancy, and c4 family usage in the US West (Oregon) Region and recommends that you buy size-flexible regional reservations to apply to the c4 family usage. AWS recommends the smallest size instance in an instance family. This makes it easier to purchase a size-flexible RI. AWS also shows the equal number of normalized units so that you can purchase any instance size that you want. For this example, your RI recommendation would be for c4.large, because that is the smallest size instance in the c4 instance family.

Request Syntax

```
{
  "AccountId": "string",
  "AccountScope": "string",
  "LookbackPeriodInDays": "string",
  "NextPageToken": "string",
  "PageSize": number,
  "PaymentOption": "string",
  "Service": "string",
  "ServiceSpecification": {
    "EC2Specification": {
      "OfferingClass": "string"
    }
  },
  "TermInYears": "string"
}
```

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 146).

The request accepts the following data in JSON format.

**AccountId (p. 22)**

The account ID that is associated with the recommendation.

Type: String

Required: No

**AccountScope (p. 22)**

The account scope that you want recommendations for. PAYER means that AWS includes the master account and any member accounts when it calculates its recommendations. LINKED means that AWS includes only member accounts when it calculates its recommendations.

Valid values are PAYER and LINKED.
Type: String
Valid Values: PAYER | LINKED
Required: No

LookbackPeriodInDays (p. 22)
The number of previous days that you want AWS to consider when it calculates your
recommendations.
Type: String
Valid Values: SEVEN_DAYS | THIRTY_DAYS | SIXTY_DAYS
Required: No

NextPageToken (p. 22)
The pagination token that indicates the next set of results that you want to retrieve.
Type: String
Required: No

PageSize (p. 22)
The number of recommendations that you want returned in a single response object.
Type: Integer
Valid Range: Minimum value of 0.
Required: No

PaymentOption (p. 22)
The reservation purchase option that you want recommendations for.
Type: String
Valid Values: NO_UPFRONT | PARTIAL_UPFRONT | ALL_UPFRONT | LIGHT_UTILIZATION |
MEDIUM_UTILIZATION | HEAVY_UTILIZATION
Required: No

Service (p. 22)
The specific service that you want recommendations for.
Type: String
Required: Yes

ServiceSpecification (p. 22)
The hardware specifications for the service instances that you want recommendations for, such as
standard or convertible EC2 instances.
Type: ServiceSpecification (p. 129) object
Required: No
**TermInYears (p. 22)**

The reservation term that you want recommendations for.

Type: String

Valid Values: ONE_YEAR | THREE_YEARS

Required: No

**Response Syntax**

```
{
    "Metadata": {
        "GenerationTimestamp": "string",
        "RecommendationId": "string"
    },
    "NextPageToken": "string",

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response. The following data is returned in JSON format by the service.

**Metadata (p. 24)**

Information about this specific recommendation call, such as the time stamp for when Cost Explorer generated this recommendation.

Type: ReservationPurchaseRecommendationMetadata (p. 125) object

**NextPageToken (p. 24)**

The pagination token for the next set of retrievable results.

Type: String

**Recommendations (p. 24)**

Recommendations for reservations to purchase.

Type: Array of ReservationPurchaseRecommendation (p. 120) objects
Errors

For information about the errors that are common to all actions, see Common Errors (p. 148).

DataUnavailableException

The requested data is unavailable.

HTTP Status Code: 400

InvalidNextTokenException

The pagination token is invalid. Try again without a pagination token.

HTTP Status Code: 400

LimitExceeded Exception

You made too many calls in a short period of time. Try again later.

HTTP Status Code: 400

See Also

GetReservationUtilization

Service: AWS Cost Explorer Service

Retrieves the reservation utilization for your account. Master accounts in an organization have access to member accounts. You can filter data by dimensions in a time period. You can use GetDimensionValues to determine the possible dimension values. Currently, you can group only by SUBSCRIPTION_ID.

Request Syntax

```json
{
  "Filter": {
    "And": [
      "Expression"
    ],
    "Dimensions": {
      "Key": "string",
      "Values": [ "string" ]
    },
    "Not": "Expression",
    "Or": [ "Expression"
    ],
    "Tags": {
      "Key": "string",
      "Values": [ "string" ]
    }
  },
  "Granularity": "string",
  "GroupBy": [ {
    "Key": "string",
    "Type": "string"
  } ],
  "NextPageToken": "string",
  "TimePeriod": {
    "End": "string",
    "Start": "string"
  }
}
```

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 146).

The request accepts the following data in JSON format.

Filter (p. 27)

Filters utilization data by dimensions. You can filter by the following dimensions:

- AZ
- CACHE_ENGINE
- DATABASE_ENGINE
- DEPLOYMENT_OPTION
- INSTANCE_TYPE
- LINKED_ACCOUNT
GetReservationUtilization uses the same Expression object as the other operations, but only AND is supported among each dimension, and nesting is supported up to only one level deep. If there are multiple values for a dimension, they are OR'd together.

Type: Expression (p. 108) object

Required: No

Granularity (p. 27)

If GroupBy is set, Granularity can't be set. If Granularity isn't set, the response object doesn't include Granularity, either MONTHLY or DAILY. If both GroupBy and Granularity aren't set, GetReservationUtilization defaults to DAILY.

Type: String

Valid Values: DAILY | MONTHLY

Required: No

GroupBy (p. 27)

Groups only by SUBSCRIPTION_ID. Metadata is included.

Type: Array of GroupDefinition (p. 111) objects

Required: No

NextPageToken (p. 27)

The token to retrieve the next set of results. AWS provides the token when the response from a previous call has more results than the maximum page size.

Type: String

Required: No

TimePeriod (p. 27)

Sets the start and end dates for retrieving Reserved Instance (RI) utilization. The start date is inclusive, but the end date is exclusive. For example, if start is 2017-01-01 and end is 2017-05-01, then the cost and usage data is retrieved from 2017-01-01 up to and including 2017-04-30 but not including 2017-05-01.

Type: DateInterval (p. 99) object

Required: Yes

Response Syntax

```json
{
  "NextPageToken": "string",
  "Total": {
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

NextPageToken (p. 28)

The token for the next set of retrievable results. AWS provides the token when the response from a previous call has more results than the maximum page size.
Type: String

Total (p. 28)

The total amount of time that you utilized your RIs.

Type: ReservationAggregates (p. 117) object

UtilizationsByTime (p. 28)

The amount of time that you utilized your RIs.

Type: Array of UtilizationByTime (p. 131) objects

Errors

For information about the errors that are common to all actions, see Common Errors (p. 148).

DataUnavailableException

The requested data is unavailable.

HTTP Status Code: 400

InvalidNextTokenException

The pagination token is invalid. Try again without a pagination token.

HTTP Status Code: 400

LimitExceededException

You made too many calls in a short period of time. Try again later.

HTTP Status Code: 400

Example

The following is a sample request and response of the GetReservationUtilization operation that allows you to retrieve your RI utilization for all t2.nano instance types from 2017-01-01 to 2017-05-01:

Sample Request

```plaintext
POST / HTTP/1.1
Host: ce.us-east-1.amazonaws.com
x-amz-date: <Date>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>,
  SignedHeaders=contenttype;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-
  requestid,Signature=<Signature>
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: AWSInsightsIndexService.GetReservationUtilization
{
  "TimePeriod": {
    "Start": "2017-01-01",
    "End": "2017-05-01"
  },
  "Filter": {
    "Dimensions": {
```
"Key": "INSTANCE_TYPE",
"Values": [
   "t2.nano"
]
},
"GroupBy": [
   {
      "Type": "Dimension",
      "Key": "SUBSCRIPTION_ID"
   }
]
}

Sample Response

HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>

GetTags
Service: AWS Cost Explorer Service

Queries for available tag keys and tag values for a specified period. You can search the tag values for an arbitrary string.

Request Syntax

```
{
   "NextPageToken": "string",
   "SearchString": "string",
   "TagKey": "string",
   "TimePeriod": {
      "End": "string",
      "Start": "string"
   }
}
```

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 146).

The request accepts the following data in JSON format.

**NextPageToken (p. 34)**

The token to retrieve the next set of results. AWS provides the token when the response from a previous call has more results than the maximum page size.

Type: String

Required: No

**SearchString (p. 34)**

The value that you want to search for.

Type: String

Required: No

**TagKey (p. 34)**

The key of the tag that you want to return values for.

Type: String

Required: No

**TimePeriod (p. 34)**

The start and end dates for retrieving the dimension values. The start date is inclusive, but the end date is exclusive. For example, if `start` is `2017-01-01` and `end` is `2017-05-01`, then the cost and usage data is retrieved from `2017-01-01 up to and including 2017-04-30 but not including 2017-05-01`.

Type: `DateInterval (p. 99)` object

Required: Yes
Response Syntax

```
{
   "NextPageToken": "string",
   "ReturnSize": number,
   "Tags": [ "string" ],
   "TotalSize": number
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**NextPageToken (p. 35)**  
The token for the next set of retrievable results. AWS provides the token when the response from a previous call has more results than the maximum page size.

Type: String

**ReturnSize (p. 35)**  
The number of query results that AWS returns at a time.

Type: Integer

**Tags (p. 35)**  
The tags that match your request.

Type: Array of strings

**TotalSize (p. 35)**  
The total number of query results.

Type: Integer

Errors

For information about the errors that are common to all actions, see Common Errors (p. 148).

**BillExpirationException**  
The requested report expired. Update the date interval and try again.

HTTP Status Code: 400

**DataUnavailableException**  
The requested data is unavailable.

HTTP Status Code: 400

**InvalidNextTokenException**  
The pagination token is invalid. Try again without a pagination token.

HTTP Status Code: 400
**LimitExceededException**

You made too many calls in a short period of time. Try again later.

HTTP Status Code: 400

**RequestChangedException**

Your request parameters changed between pages. Try again with the old parameters or without a pagination token.

HTTP Status Code: 400

**Example**

The following example shows how to retrieve the list of tag keys using the `GetTags` operation:

**Sample Request**

```plaintext
POST / HTTP/1.1
Host: ce.us-east-1.amazonaws.com
x-amz-Date: <Date>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>,
    SignedHeaders=contenttype;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,Signature=<Signature>
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: AWSInsightsIndexService.GetTags
{
    "TimePeriod": {
        "Start": "2017-01-01",
        "End": "2017-05-18"
    },
    "TagKey": "Project",
    "SearchString": "secretProject"
}
```

**Sample Response**

```plaintext
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
{
    "ReturnSize": 2,
    "Tags": [
        "secretProject1",
        "secretProject2"
    ],
    "TotalSize": 2
}
```

AWS Budgets

The following actions are supported by AWS Budgets:

- CreateBudget (p. 38)
- CreateNotification (p. 42)
- CreateSubscriber (p. 45)
- DeleteBudget (p. 48)
- DeleteNotification (p. 50)
- DeleteSubscriber (p. 53)
- DescribeBudget (p. 56)
- DescribeBudgets (p. 60)
- DescribeNotificationsForBudget (p. 64)
- DescribeSubscribersForNotification (p. 68)
- UpdateBudget (p. 72)
- UpdateNotification (p. 76)
- UpdateSubscriber (p. 79)
**CreateBudget**

Service: AWS Budgets

Creates a budget and, if included, notifications and subscribers.

**Request Syntax**

```json
{
    "AccountId": "string",
    "Budget": {
        "BudgetLimit": {
            "Amount": "string",
            "Unit": "string"
        },
        "BudgetName": "string",
        "BudgetType": "string",
        "CalculatedSpend": {
            "ActualSpend": {
                "Amount": "string",
                "Unit": "string"
            },
            "ForecastedSpend": {
                "Amount": "string",
                "Unit": "string"
            }
        },
        "CostFilters": {
            "string": [ "string" ]
        },
        "CostTypes": {
            "IncludeCredit": boolean,
            "IncludeDiscount": boolean,
            "IncludeOtherSubscription": boolean,
            "IncludeRecurring": boolean,
            "IncludeRefund": boolean,
            "IncludeSubscription": boolean,
            "IncludeSupport": boolean,
            "IncludeTax": boolean,
            "IncludeUpfront": boolean,
            "UseAmortized": boolean,
            "UseBlended": boolean
        },
        "TimePeriod": {
            "End": number,
            "Start": number
        },
        "TimeUnit": "string"
    },
    "NotificationsWithSubscribers": [
        { "Notification": {
            "ComparisonOperator": "string",
            "NotificationType": "string",
            "Threshold": number,
            "ThresholdType": "string"
        },
        "Subscribers": [
            { "Address": "string",
              "SubscriptionType": "string"
            }
        ]
    ]
}
```
Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 146).

The request accepts the following data in JSON format.

AccountId (p. 38)

The accountId that is associated with the budget.

Type: String

Length Constraints: Fixed length of 12.

Required: Yes

Budget (p. 38)

The budget object that you want to create.

Type: Budget (p. 132) object

Required: Yes

NotificationsWithSubscribers (p. 38)

A notification that you want to associate with a budget. A budget can have up to five notifications, and each notification can have one SNS subscriber and up to 10 email subscribers. If you include notifications and subscribers in your CreateBudget call, AWS creates the notifications and subscribers for you.

Type: Array of NotificationWithSubscribers (p. 139) objects

Array Members: Maximum number of 5 items.

Required: No

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 148).

CreationLimitExceededException

You've exceeded the notification or subscriber limit.

HTTP Status Code: 400

DuplicateRecordException

The budget name already exists. Budget names must be unique within an account.

HTTP Status Code: 400
InternalErrorException

An error on the server occurred during the processing of your request. Try again later.

HTTP Status Code: 400

InvalidParameterException

An error on the client occurred. Typically, the cause is an invalid input value.

HTTP Status Code: 400

Example

The following is a sample request of the CreateBudget operation:

Sample Request

```http
POST / HTTP/1.1
Host: awsbudgets.<region>.<domain>
x-amz-date: <Date>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>,
               SignedHeaders=contenttype;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,Signature=<Signature>
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: AWSBudgetServiceGateway.CreateBudgets
{
    "AccountId": "111122223333",
    "Budget": {
        "BudgetLimit": {
            "Amount": "100",
            "Unit": "USD"
        },
        "BudgetName": "Example Budget",
        "BudgetType": "COST",
        "CostFilters": {
            "AZ": [ "us-east-1" ]
        },
        "CostTypes": {
            "IncludeCredit": true,
            "IncludeDiscount": true,
            "IncludeOtherSubscription": true,
            "IncludeRecurring": true,
            "IncludeRefund": true,
            "IncludeSubscription": true,
            "IncludeSupport": true,
            "IncludeTax": true,
            "IncludeUpfront": true,
            "UseBlended": false
        },
        "TimePeriod": {
            "Start": 1477353600,
            "End": 1477958399
        },
        "TimeUnit": "MONTHLY"
    },
    "NotificationsWithSubscribers": []
}
```
CreateBudget

"ComparisonOperator": "GREATER_THAN",
"NotificationType": "ACTUAL",
"Threshold": 80,
"ThresholdType": "PERCENTAGE"
},
"Subscribers": [
{
  "Address": "example@example.com",
  "SubscriptionType": "EMAIL"
}
]
]
]

CreateNotification

Service: AWS Budgets

Creates a notification. You must create the budget before you create the associated notification.

Request Syntax

```
{
  "AccountId": "string",
  "BudgetName": "string",
  "Notification": {
    "ComparisonOperator": "string",
    "NotificationType": "string",
    "Threshold": number,
    "ThresholdType": "string"
  },
  "Subscribers": [
    { 
      "Address": "string",
      "SubscriptionType": "string"
    }
  ]
}
```

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 146).

The request accepts the following data in JSON format.

AccountId (p. 42)

The accountId that is associated with the budget that you want to create a notification for.

Type: String

Length Constraints: Fixed length of 12.

Required: Yes

BudgetName (p. 42)

The name of the budget that you want AWS to notify you about. Budget names must be unique within an account.

Type: String

Length Constraints: Maximum length of 100.

Pattern: [^:\\]+

Required: Yes

Notification (p. 42)

The notification that you want to create.

Type: Notification (p. 137) object

Required: Yes
Subscribers (p. 42)

A list of subscribers that you want to associate with the notification. Each notification can have one SNS subscriber and up to 10 email subscribers.

Type: Array of Subscriber (p. 141) objects

Array Members: Minimum number of 1 item. Maximum number of 11 items.

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 148).

CreationLimitExceededException

You've exceeded the notification or subscriber limit.

HTTP Status Code: 400

DuplicateRecordException

The budget name already exists. Budget names must be unique within an account.

HTTP Status Code: 400

InternalErrorException

An error on the server occurred during the processing of your request. Try again later.

HTTP Status Code: 400

InvalidParameterException

An error on the client occurred. Typically, the cause is an invalid input value.

HTTP Status Code: 400

NotFoundException

We can't locate the resource that you specified.

HTTP Status Code: 400

Example

The following is a sample request of the CreateNotification operation:

Sample Request

POST / HTTP/1.1
Host: awsbudgets.<region>.<domain>
x-amz-Date: <Date>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>,
  SignedHeaders=contenttype;date:host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,Signature=<Signature>
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: AWSBudgetServiceGateway.CreateNotification
{
    "AccountId": "111122223333",
    "BudgetName": "Example Budget",
    "Notification": {
        "ComparisonOperator": "GREATER_THAN",
        "NotificationType": "ACTUAL",
        "Threshold": 80,
        "ThresholdType": "PERCENTAGE"
    },
    "Subscribers": [
        {
            "Address": "example@example.com",
            "SubscriptionType": "EMAIL"
        }
    ]
}

CreateSubscriber
Service: AWS Budgets

Creates a subscriber. You must create the associated budget and notification before you create the subscriber.

Request Syntax

{
    "AccountId": "string",
    "BudgetName": "string",
    "Notification": {
        "ComparisonOperator": "string",
        "NotificationType": "string",
        "Threshold": number,
        "ThresholdType": "string"
    },
    "Subscriber": {
        "Address": "string",
        "SubscriptionType": "string"
    }
}

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 146).

The request accepts the following data in JSON format.

AccountId (p. 45)

The accountId that is associated with the budget that you want to create a subscriber for.

Type: String

Length Constraints: Fixed length of 12.

Required: Yes

BudgetName (p. 45)

The name of the budget that you want to subscribe to. Budget names must be unique within an account.

Type: String

Length Constraints: Maximum length of 100.

Pattern: [^:\\]+  

Required: Yes

Notification (p. 45)

The notification that you want to create a subscriber for.

Type: Notification (p. 137) object

Required: Yes
**Subscriber (p. 45)**

The subscriber that you want to associate with a budget notification.

Type: Subscriber (p. 141) object

Required: Yes

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

**Errors**

For information about the errors that are common to all actions, see Common Errors (p. 148).

**CreationLimitExceededException**

You've exceeded the notification or subscriber limit.

HTTP Status Code: 400

**DuplicateRecordException**

The budget name already exists. Budget names must be unique within an account.

HTTP Status Code: 400

**InternalErrorException**

An error on the server occurred during the processing of your request. Try again later.

HTTP Status Code: 400

**InvalidParameterException**

An error on the client occurred. Typically, the cause is an invalid input value.

HTTP Status Code: 400

**NotFoundException**

We can't locate the resource that you specified.

HTTP Status Code: 400

**Example**

The following is a sample request of the CreateSubscriber operation:

**Sample Request**

```
POST / HTTP/1.1
Host: awsbudgets.<region>.<domain>
X-Amz-Date: <Date>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>,
    SignedHeaders=contenttype;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,Signature=<Signature>
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.1
```
See Also

DeleteBudget
Service: AWS Budgets

Deletes a budget. You can delete your budget at any time.

**Important**
Deleting a budget also deletes the notifications and subscribers that are associated with that budget.

**Request Syntax**

```json
{
    "AccountId": "string",
    "BudgetName": "string"
}
```

**Request Parameters**

For information about the parameters that are common to all actions, see Common Parameters (p. 146).

The request accepts the following data in JSON format.

**AccountId (p. 48)**

The `AccountId` that is associated with the budget that you want to delete.

Type: String

Length Constraints: Fixed length of 12.

Required: Yes

**BudgetName (p. 48)**

The name of the budget that you want to delete.

Type: String

Length Constraints: Maximum length of 100.

Pattern: `[^:\\]+`

Required: Yes

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

**Errors**

For information about the errors that are common to all actions, see Common Errors (p. 148).

**InternalErrorException**

An error on the server occurred during the processing of your request. Try again later.

HTTP Status Code: 400
InvalidParameterException

An error on the client occurred. Typically, the cause is an invalid input value.

HTTP Status Code: 400

NotFoundException

We can't locate the resource that you specified.

HTTP Status Code: 400

Example

The following is a sample request of the DeleteBudget operation:

Sample Request

```plaintext
POST / HTTP/1.1
Host: awsbudgets.<region>.<domain>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>,
               SignedHeaders=contenttype;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid;Signature=<Signature>
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: AWSBudgetServiceGateway.DeleteBudget
{
    "AccountId": "111122223333",
    "BudgetName": "Example Budget"
}
```

DeleteNotification
Service: AWS Budgets

Deletes a notification.

**Important**
Deleting a notification also deletes the subscribers that are associated with the notification.

**Request Syntax**

```
{
    "AccountId": "string",
    "BudgetName": "string",
    "Notification": {
        "ComparisonOperator": "string",
        "NotificationType": "string",
        "Threshold": number,
        "ThresholdType": "string"
    }
}
```

**Request Parameters**

For information about the parameters that are common to all actions, see Common Parameters (p. 146).

The request accepts the following data in JSON format.

**AccountId (p. 50)**

The accountId that is associated with the budget whose notification you want to delete.

Type: String

Length Constraints: Fixed length of 12.

Required: Yes

**BudgetName (p. 50)**

The name of the budget whose notification you want to delete.

Type: String

Length Constraints: Maximum length of 100.

Pattern: [^:\\]+

Required: Yes

**Notification (p. 50)**

The notification that you want to delete.

Type: Notification (p. 137) object

Required: Yes

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.
Errors
For information about the errors that are common to all actions, see Common Errors (p. 148).

InternalErrorException
An error on the server occurred during the processing of your request. Try again later.

HTTP Status Code: 400

InvalidParameterException
An error on the client occurred. Typically, the cause is an invalid input value.

HTTP Status Code: 400

NotFoundException
We can’t locate the resource that you specified.

HTTP Status Code: 400

Example
The following is a sample request of the DeleteNotification operation:

Sample Request

```
POST / HTTP/1.1
Host: awsbudgets.<region>.<domain>
x-amz-Date: <Date>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>,
               SignedHeaders=contenttype;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-
               requestid,Signature=<Signature>
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: AWSBudgetServiceGateway.DeleteNotification
{
    "AccountId": "111122223333",
    "BudgetName": "Example Budget",
    "Notification": {
        "ComparisonOperator": "GREATER_THAN",
        "NotificationType": "ACTUAL",
        "Threshold": 80,
        "ThresholdType": "PERCENTAGE"
    }
}
```

DeleteSubscriber
Service: AWS Budgets

Deletes a subscriber.

**Important**
Deleting the last subscriber to a notification also deletes the notification.

**Request Syntax**

```json
{
  "AccountId": "string",
  "BudgetName": "string",
  "Notification": {
    "ComparisonOperator": "string",
    "NotificationType": "string",
    "Threshold": number,
    "ThresholdType": "string"
  },
  "Subscriber": {
    "Address": "string",
    "SubscriptionType": "string"
  }
}
```

**Request Parameters**

For information about the parameters that are common to all actions, see Common Parameters (p. 146).

The request accepts the following data in JSON format.

**AccountId (p. 53)**

The accountId that is associated with the budget whose subscriber you want to delete.

Type: String

Length Constraints: Fixed length of 12.

Required: Yes

**BudgetName (p. 53)**

The name of the budget whose subscriber you want to delete.

Type: String

Length Constraints: Maximum length of 100.

Pattern: [^:\\]+

Required: Yes

**Notification (p. 53)**

The notification whose subscriber you want to delete.

Type: Notification (p. 137) object

Required: Yes
Subscriber (p. 53)

The subscriber that you want to delete.

Type: Subscriber (p. 141) object

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 148).

InternalErrorException

An error on the server occurred during the processing of your request. Try again later.

HTTP Status Code: 400

InvalidParameterException

An error on the client occurred. Typically, the cause is an invalid input value.

HTTP Status Code: 400

NotFoundException

We can't locate the resource that you specified.

HTTP Status Code: 400

Example

The following is a sample request of the DeleteSubscriber operation:

Sample Request

```plaintext
POST / HTTP/1.1
Host: awsbudgets.<region>.<domain>
x-amz-Date: <Date>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>,
   SignedHeaders=contenttype;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-
   requestid,Signature=<Signature>
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: AWSBudgetServiceGateway.DeleteSubscriber
{
   "AccountId": "111122223333",
   "BudgetName": "Example Budget",
   "Notification": {
      "ComparisonOperator": "GREATER_THAN",
      "NotificationType": "ACTUAL",
      "Threshold": 80,
      "ThresholdType": "PERCENTAGE"
}```

DescribeBudget
Service: AWS Budgets
Describes a budget.

Request Syntax

```
{
    "AccountId": "string",
    "BudgetName": "string"
}
```

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 146).

The request accepts the following data in JSON format.

AccountId (p. 56)

The accountId that is associated with the budget that you want a description of.

Type: String
Length Constraints: Fixed length of 12.
Required: Yes

BudgetName (p. 56)

The name of the budget that you want a description of.

Type: String
Length Constraints: Maximum length of 100.
Pattern: [^:\\]+
Required: Yes

Response Syntax

```
{

    "Budget": {
        "BudgetLimit": {
            "Amount": "string",
            "Unit": "string"
        },
        "BudgetName": "string",
        "BudgetType": "string",
        "CalculatedSpend": {
            "ActualSpend": {
                "Amount": "string",
                "Unit": "string"
            },
            "ForecastedSpend": {

```

56
"Amount": "string",
"Unit": "string"
}
,
"CostFilters": {
   "string": [ "string" ]
},
"CostTypes": {
   "IncludeCredit": boolean,
   "IncludeDiscount": boolean,
   "IncludeOtherSubscription": boolean,
   "IncludeRecurring": boolean,
   "IncludeRefund": boolean,
   "IncludeSubscription": boolean,
   "IncludeSupport": boolean,
   "IncludeTax": boolean,
   "IncludeUpfront": boolean,
   "UseAmortized": boolean,
   "UseBlended": boolean
},
"TimePeriod": {
   "End": number,
   "Start": number
},
"TimeUnit": "string"
}

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**Budget (p. 56)**

The description of the budget.

Type: Budget (p. 132) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 148).

**InternalErrorException**

An error on the server occurred during the processing of your request. Try again later.

HTTP Status Code: 400

**InvalidParameterException**

An error on the client occurred. Typically, the cause is an invalid input value.

HTTP Status Code: 400

**NotFoundException**

We can't locate the resource that you specified.

HTTP Status Code: 400
Example

The following is a sample request and response of the DescribeBudget operation:

Sample Request

```plaintext
POST / HTTP/1.1
Host: awsbudgets.<region>.<domain>
x-amz-date: <Date>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>,
    SignedHeaders=contenttype;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-
    requestid,Signature=<Signature>
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: AWSBudgetServiceGateway.DescribeBudget
{
    "AccountId": "111122223333",
    "BudgetName": "Example Budget"
}
```

Sample Response

```json
{
    "Budget": {
        "BudgetLimit": {
            "Amount": "100",
            "Unit": "USD"
        },

DescribeBudgets
Service: AWS Budgets
Lists the budgets that are associated with an account.

Request Syntax

```
{
   "AccountId": "string",
   "MaxResults": number,
   "NextToken": "string"
}
```

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 146).

The request accepts the following data in JSON format.

**AccountId (p. 60)**

The accountId that is associated with the budgets that you want descriptions of.

Type: String

Length Constraints: Fixed length of 12.

Required: Yes

**MaxResults (p. 60)**

Optional integer. Specifies the maximum number of results to return in a response.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 100.

Required: No

**NextToken (p. 60)**

The pagination token that you include in your request to indicate the next set of results that you want to retrieve.

Type: String

Required: No

Response Syntax

```
{
   "Budgets": [
   {
      "BudgetLimit": {
         "Amount": "string",
         "Unit": "string"
      },
      "BudgetName": "string",
      "BudgetType": "string"
   }
   ]
}
```
DescribeBudgets

"CalculatedSpend": {
  "ActualSpend": {
    "Amount": "string",
    "Unit": "string"
  },
  "ForecastedSpend": {
    "Amount": "string",
    "Unit": "string"
  }
},
"CostFilters": {
  "string": [ "string" ]
},
"CostTypes": {
  "IncludeCredit": boolean,
  "IncludeDiscount": boolean,
  "IncludeOtherSubscription": boolean,
  "IncludeRecurring": boolean,
  "IncludeRefund": boolean,
  "IncludeSubscription": boolean,
  "IncludeSupport": boolean,
  "IncludeTax": boolean,
  "IncludeUpfront": boolean,
  "UseAmortized": boolean,
  "UseBlended": boolean
},
"TimePeriod": {
  "End": number,
  "Start": number
},
"TimeUnit": "string"

"NextToken": "string"

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

Budgets (p. 60)

A list of budgets.

Type: Array of Budget (p. 132) objects

NextToken (p. 60)

The pagination token in the service response that indicates the next set of results that you can retrieve.

Type: String

Errors

For information about the errors that are common to all actions, see Common Errors (p. 148).

ExpiredNextTokenException

The pagination token expired.
HTTP Status Code: 400

**InternalErrorException**

An error on the server occurred during the processing of your request. Try again later.

HTTP Status Code: 400

**InvalidNextTokenException**

The pagination token is invalid.

HTTP Status Code: 400

**InvalidParameterException**

An error on the client occurred. Typically, the cause is an invalid input value.

HTTP Status Code: 400

**NotFoundException**

We can't locate the resource that you specified.

HTTP Status Code: 400

**Example**

The following is a sample request and response of the DescribeBudgets operation:

**Sample Request**

```
POST / HTTP/1.1
Host: awsbudgets.<region>.<domain>
x-amz-Date: <Date>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>,
    SignedHeaders=contenttype;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-
    requestid,Signature=<Signature>
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: AWSBudgetServiceGateway.DescribeBudgets
{
    "AccountId": "111122223333",
    "MaxResults": 20
}
```

**Sample Response**

```
{
    "Budgets": [
        {
            "BudgetLimit": {
                "Amount": "100",
                "Unit": "USD"
            },
            "BudgetName": "Example Budget",
            "BudgetType": "COST",
            "CalculatedSpend": {
                "ActualSpend": {
                    "Amount": "50",
                    "Unit": "USD"
                },
```

```
"Unit": "USD"
},
"ForecastedSpend": {
   "Amount": "100",
   "Unit": "USD"
}
},
"CostFilters": {
   "AZ": [ "us-east-1" ]
},
"CostTypes": {
   "IncludeCredit": true,
   "IncludeDiscount": true,
   "IncludeOtherSubscription": true,
   "IncludeRecurring": true,
   "IncludeRefund": true,
   "IncludeSubscription": true,
   "IncludeSupport": true,
   "IncludeTax": true,
   "IncludeUpfront": true,
   "UseBlended": false
},
"TimePeriod": {
   "Start": 1477353600,
   "End": 1477958399
},
"TimeUnit": "MONTHLY"
},
"NextToken": "exampleTokenString"

DescribeNotificationsForBudget

Service: AWS Budgets

Lists the notifications that are associated with a budget.

Request Syntax

```
{
   "AccountId": "string",
   "BudgetName": "string",
   "MaxResults": number,
   "NextToken": "string"
}
```

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 146).

The request accepts the following data in JSON format.

**AccountId (p. 64)**

The `accountId` that is associated with the budget whose notifications you want descriptions of.

Type: String

Length Constraints: Fixed length of 12.

Required: Yes

**BudgetName (p. 64)**

The name of the budget whose notifications you want descriptions of.

Type: String

Length Constraints: Maximum length of 100.

Pattern: `[^:\\]+`

Required: Yes

**MaxResults (p. 64)**

Optional integer. Specifies the maximum number of results to return in a response.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 100.

Required: No

**NextToken (p. 64)**

The pagination token that you include in your request to indicate the next set of results that you want to retrieve.

Type: String

Required: No
Response Syntax

```json
{
    "NextToken": "string",
    "Notifications": [
        {
            "ComparisonOperator": "string",
            "NotificationType": "string",
            "Threshold": number,
            "ThresholdType": "string"
        }
    ]
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**NextToken (p. 65)**

The pagination token in the service response that indicates the next set of results that you can retrieve.

Type: String

**Notifications (p. 65)**

A list of notifications that are associated with a budget.

Type: Array of Notification (p. 137) objects

Errors

For information about the errors that are common to all actions, see Common Errors (p. 148).

**ExpiredNextTokenException**

The pagination token expired.

HTTP Status Code: 400

**InternalErrorException**

An error on the server occurred during the processing of your request. Try again later.

HTTP Status Code: 400

**InvalidNextTokenException**

The pagination token is invalid.

HTTP Status Code: 400

**InvalidParameterException**

An error on the client occurred. Typically, the cause is an invalid input value.

HTTP Status Code: 400
NotFoundException

We can't locate the resource that you specified.

HTTP Status Code: 400

Example

The following is a sample request and response of the DescribeNotificationsForBudget operation:

Sample Request

```plaintext
POST / HTTP/1.1
Host: awsbudgets.<region>.<domain>
x-amz-Date: <Date>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>,
SignedHeaders=contenttype;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,Signature=<Signature>
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: AWSBudgetServiceGateway.DescribeNotificationsForBudget
{
    "AccountId": "111122223333",
    "BudgetName": "Example Budget",
    "MaxResults": 5
}
```

Sample Response

```json
{
    "NextToken": "exampleTokenString",
    "Notifications": [
        {
            "ComparisonOperator": "GREATER_THAN",
            "NotificationType": "ACTUAL",
            "Threshold": 80,
            "ThresholdType": "PERCENTAGE"
        }
    ]
}
```

DescribeSubscribersForNotification
Service: AWS Budgets

Lists the subscribers that are associated with a notification.

Request Syntax

```json
{
    "AccountId": "string",
    "BudgetName": "string",
    "MaxResults": number,
    "NextToken": "string",
    "Notification": {
        "ComparisonOperator": "string",
        "NotificationType": "string",
        "Threshold": number,
        "ThresholdType": "string"
    }
}
```

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 146).

The request accepts the following data in JSON format.

AccountId (p. 68)

The accountId that is associated with the budget whose subscribers you want descriptions of.

Type: String

Length Constraints: Fixed length of 12.

Required: Yes

BudgetName (p. 68)

The name of the budget whose subscribers you want descriptions of.

Type: String

Length Constraints: Maximum length of 100.

Pattern: [^:\\]+

Required: Yes

MaxResults (p. 68)

Optional integer. Specifies the maximum number of results to return in a response.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 100.

Required: No

NextToken (p. 68)

The pagination token that you include in your request to indicate the next set of results that you want to retrieve.
DescribeSubscribersForNotification

Type: String
Required: No

**Notification (p. 68)**

The notification whose subscribers you want to list.

Type: Notification (p. 137) object
Required: Yes

**Response Syntax**

```json
{
    "NextToken": "string",
    "Subscribers": [
        {
            "Address": "string",
            "SubscriptionType": "string"
        }
    ]
}
```

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**NextToken (p. 69)**

The pagination token in the service response that indicates the next set of results that you can retrieve.

Type: String

**Subscribers (p. 69)**

A list of subscribers that are associated with a notification.

Type: Array of Subscriber (p. 141) objects
Array Members: Minimum number of 1 item. Maximum number of 11 items.

**Errors**

For information about the errors that are common to all actions, see Common Errors (p. 148).

**ExpiredNextTokenException**

The pagination token expired.

HTTP Status Code: 400

**InternalErrorException**

An error on the server occurred during the processing of your request. Try again later.
HTTP Status Code: 400
InvalidNextTokenException
The pagination token is invalid.

HTTP Status Code: 400
InvalidParameterException
An error on the client occurred. Typically, the cause is an invalid input value.

HTTP Status Code: 400
NotFoundException
We can't locate the resource that you specified.

HTTP Status Code: 400

Example

The following is a sample request and response of the DescribeSubscribersForNotification operation:

Sample Request

```
POST / HTTP/1.1
Host: awsbudgets.<region>.<domain>
x-amz-Date: <Date>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>,
  SignedHeaders=contenttype;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid;Signature=<Signature>
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: AWSBudgetServiceGateway.DescribeSubscribersForNotification
{
  "AccountId": "111122223333",
  "BudgetName": "Example Budget",
  "MaxResults": 5,
  "Notification": {
    "ComparisonOperator": "GREATER_THAN",
    "NotificationType": "ACTUAL",
    "Threshold": 80,
    "ThresholdType": "PERCENTAGE"
  }
}
```

Sample Response

```
{
  "NextToken": "string",
  "Subscribers": [
    {
      "Address": "example@example.com",
      "SubscriptionType": "EMAIL"
    }
  ]
}
```

UpdateBudget
Service: AWS Budgets

Updates a budget. You can change every part of a budget except for the `budgetName` and the `calculatedSpend`. When you modify a budget, the `calculatedSpend` drops to zero until AWS has new usage data to use for forecasting.

**Request Syntax**

```json
{
   "AccountId": "string",
   "NewBudget": {
      "BudgetLimit": {
         "Amount": "string",
         "Unit": "string"
      },
      "BudgetName": "string",
      "BudgetType": "string",
      "CalculatedSpend": {
         "ActualSpend": {
            "Amount": "string",
            "Unit": "string"
         },
         "ForecastedSpend": {
            "Amount": "string",
            "Unit": "string"
         }
      },
      "CostFilters": {
         "string": [ "string" ]
      },
      "CostTypes": {
         "IncludeCredit": boolean,
         "IncludeDiscount": boolean,
         "IncludeOtherSubscription": boolean,
         "IncludeRecurring": boolean,
         "IncludeRefund": boolean,
         "IncludeSubscription": boolean,
         "IncludeSupport": boolean,
         "IncludeTax": boolean,
         "IncludeUpfront": boolean,
         "UseAmortized": boolean,
         "UseBlended": boolean
      },
      "TimePeriod": {
         "End": number,
         "Start": number
      },
      "TimeUnit": "string"
   }
}
```

**Request Parameters**

For information about the parameters that are common to all actions, see Common Parameters (p. 146).

The request accepts the following data in JSON format.

**AccountId (p. 72)**

The `accountId` that is associated with the budget that you want to update.
Type: String
Length Constraints: Fixed length of 12.
Required: Yes

**NewBudget (p. 72)**

The budget that you want to update your budget to.
Type: Budget (p. 132) object
Required: Yes

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

**Errors**

For information about the errors that are common to all actions, see Common Errors (p. 148).

**InternalErrorException**

An error on the server occurred during the processing of your request. Try again later.

HTTP Status Code: 400

**InvalidParameterException**

An error on the client occurred. Typically, the cause is an invalid input value.

HTTP Status Code: 400

**NotFoundException**

We can't locate the resource that you specified.

HTTP Status Code: 400

**Example**

The following is a sample request and response of the `UpdateBudget` operation:

**Sample Request**

```
POST / HTTP/1.1
Host: awsbudgets.<region>.<domain>
x-amz-Date: <Date>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>,
    SignedHeaders=contenttype;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-
    requestid,Signature=<Signature>
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: AWSBudgetServiceGateway.UpdateBudget
{
    "AccountId": "111122223333",
    "NewBudget": {
```

UpdateNotification
Service: AWS Budgets

Updates a notification.

Request Syntax

```json
{
  "AccountId": "string",
  "BudgetName": "string",
  "NewNotification": {
    "ComparisonOperator": "string",
    "NotificationType": "string",
    "Threshold": number,
    "ThresholdType": "string"
  },
  "OldNotification": {
    "ComparisonOperator": "string",
    "NotificationType": "string",
    "Threshold": number,
    "ThresholdType": "string"
  }
}
```

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 146).

The request accepts the following data in JSON format.

**AccountId (p. 76)**

The `accountId` that is associated with the budget whose notification you want to update.

Type: String

Length Constraints: Fixed length of 12.

Required: Yes

**BudgetName (p. 76)**

The name of the budget whose notification you want to update.

Type: String

Length Constraints: Maximum length of 100.

Pattern: `[\^:\\]+`

Required: Yes

**NewNotification (p. 76)**

The updated notification to be associated with a budget.

Type: `Notification (p. 137)` object

Required: Yes
OldNotification (p. 76)

The previous notification that is associated with a budget.

Type: Notification (p. 137) object

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 148).

DuplicateRecordException

The budget name already exists. Budget names must be unique within an account.

HTTP Status Code: 400

InternalErrorException

An error on the server occurred during the processing of your request. Try again later.

HTTP Status Code: 400

InvalidParameterException

An error on the client occurred. Typically, the cause is an invalid input value.

HTTP Status Code: 400

NotFoundException

We can't locate the resource that you specified.

HTTP Status Code: 400

Example

The following is a sample request of the UpdateNotification operation:

Sample Request

```
POST / HTTP/1.1
Host: awsbudgets.<region>.<domain>
x-amz-Date: <Date>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>,
    SignedHeaders=contenttype;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-
requestid,Signature=<Signature>
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: AWSBudgetServiceGateway.UpdateNotification
{
    "AccountId": "111122223333",
    "BudgetName": "Example Budget",
```
"NewNotification": {
    "ComparisonOperator": "GREATER_THAN",
    "NotificationType": "ACTUAL",
    "Threshold": 80,
    "ThresholdType": "PERCENTAGE"
  }
},
"OldNotification": {
    "ComparisonOperator": "GREATER_THAN",
    "NotificationType": "ACTUAL",
    "Threshold": 80,
    "ThresholdType": "PERCENTAGE"
  }
}

UpdateSubscriber

Service: AWS Budgets

Updates a subscriber.

Request Syntax

```
{
    "AccountId": "string",
    "BudgetName": "string",
    "NewSubscriber": {
        "Address": "string",
        "SubscriptionType": "string"
    },
    "Notification": {
        "ComparisonOperator": "string",
        "NotificationType": "string",
        "Threshold": number,
        "ThresholdType": "string"
    },
    "OldSubscriber": {
        "Address": "string",
        "SubscriptionType": "string"
    }
}
```

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 146).

The request accepts the following data in JSON format.

**AccountId (p. 79)**

The `accountId` that is associated with the budget whose subscriber you want to update.

Type: String

Length Constraints: Fixed length of 12.

Required: Yes

**BudgetName (p. 79)**

The name of the budget whose subscriber you want to update.

Type: String

Length Constraints: Maximum length of 100.

Pattern: `[^:\\]+`

Required: Yes

**NewSubscriber (p. 79)**

The updated subscriber that is associated with a budget notification.

Type: `Subscriber (p. 141)` object

Required: Yes
**Notification (p. 79)**

The notification whose subscriber you want to update.

Type: Notification (p. 137) object

Required: Yes

**OldSubscriber (p. 79)**

The previous subscriber that is associated with a budget notification.

Type: Subscriber (p. 141) object

Required: Yes

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

**Errors**

For information about the errors that are common to all actions, see Common Errors (p. 148).

**DuplicateRecordException**

The budget name already exists. Budget names must be unique within an account.

HTTP Status Code: 400

**InternalErrorException**

An error on the server occurred during the processing of your request. Try again later.

HTTP Status Code: 400

**InvalidParameterException**

An error on the client occurred. Typically, the cause is an invalid input value.

HTTP Status Code: 400

**NotFoundException**

We can't locate the resource that you specified.

HTTP Status Code: 400

**Example**

The following is a sample request of the UpdateSubscriber operation:

**Sample Request**

```
POST / HTTP/1.1
Host: awsbudgets.<region>.<domain>
x-amz-Date: <Date>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>,
               SignedHeaders=contenttype;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-
               requestid,Signature=<Signature>
```
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: AWSBudgetServiceGateway.UpdateSubscriber
{
    "AccountId": "111122223333",
    "BudgetName": "Example Budget",
    "Notification": {
        "ComparisonOperator": "GREATER_THAN",
        "NotificationType": "ACTUAL",
        "Threshold": 80,
        "ThresholdType": "PERCENTAGE"
    },
    "OldSubscriber": {
        "Address": "example@example.com",
        "SubscriptionType": "EMAIL"
    },
    "NewSubscriber": {
        "Address": "example2@example.com",
        "SubscriptionType": "EMAIL"
    }
}

AWS Price List Service

The following actions are supported by AWS Price List Service:

- DescribeServices (p. 82)
- GetAttributeValues (p. 86)
- GetProducts (p. 90)
DescribeServices

Service: AWS Price List Service

Returns the metadata for one service or a list of the metadata for all services. Use this without a service code to get the service codes for all services. Use it with a service code, such as AmazonEC2, to get information specific to that service, such as the attribute names available for that service. For example, some of the attribute names available for EC2 are `volumeType`, `maxIopsVolume`, `operation`, `locationType`, and `instanceCapacity10xlarge`.

Request Syntax

```json
{
   "FormatVersion": "string",
   "MaxResults": number,
   "NextToken": "string",
   "ServiceCode": "string"
}
```

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 146).

The request accepts the following data in JSON format.

**FormatVersion (p. 82)**

The format version that you want the response to be in.

Valid values are: `aws_v1`

Type: String

Required: No

**MaxResults (p. 82)**

The maximum number of results that you want returned in the response.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 100.

Required: No

**NextToken (p. 82)**

The pagination token that indicates the next set of results that you want to retrieve.

Type: String

Required: No

**ServiceCode (p. 82)**

The code for the service whose information you want to retrieve, such as `AmazonEC2`. You can use the `ServiceCode` to filter the results in a `GetProducts` call. To retrieve a list of all services, leave this blank.

Type: String

Required: No
Response Syntax

```
{
  "FormatVersion": "string",
  "NextToken": "string",
  "Services": [
    {
      "AttributeNames": [ "string" ],
      "ServiceCode": "string"
    }
  ]
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**FormatVersion (p. 83)**

The format version of the response. For example, `aws_v1`.

Type: String

**NextToken (p. 83)**

The pagination token for the next set of retrievable results.

Type: String

**Services (p. 83)**

The service metadata for the service or services in the response.

Type: Array of Service (p. 145) objects

Errors

For information about the errors that are common to all actions, see Common Errors (p. 148).

**ExpiredNextTokenException**

The pagination token expired. Try again without a pagination token.

HTTP Status Code: 400

**InternalErrorException**

An error on the server occurred during the processing of your request. Try again later.

HTTP Status Code: 400

**InvalidNextTokenException**

The pagination token is invalid. Try again without a pagination token.

HTTP Status Code: 400

**InvalidParameterException**

One or more parameters had an invalid value.
HTTP Status Code: 400

NotFoundException

The requested resource can't be found.

HTTP Status Code: 400

Example

The following is a sample request and response of the GetService operation.

Sample Request

POST / HTTP/1.1
Host: api.pricing.<region>.<domain>
x-amz-Date: <Date>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>,
SignedHeaders=contenttype;date;host;user-agent;x-amz-date;x-amz-target;x-amz-
requestid;Signature=<Signature>
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: AWSPriceListService.DescribeServices
{
    "ServiceCode": "AmazonEC2",
    "FormatVersion": "aws_v1",
    "NextToken": null,
    "MaxResults": 1
}

Sample Response

HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
{
    "FormatVersion": "aws_v1",
    "NextToken": "abcdefg123",
    "Services": [
        {
            "AttributeNames": [
                "volumeType",
                "max1opsvolume",
                "instanceCapacity10xlarge",
                "locationType",
                "operation"
            ],
            "ServiceCode": "AmazonEC2"
        }
    ]
}

GetAttributeValues

Service: AWS Price List Service

Returns a list of attribute values. Attributes are similar to the details in a Price List API offer file. For a list of available attributes, see Offer File Definitions in the AWS Billing and Cost Management User Guide.

Request Syntax

```json
{
    "AttributeName": "string",
    "MaxResults": number,
    "NextToken": "string",
    "ServiceCode": "string"
}
```

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 146).

The request accepts the following data in JSON format.

AttributeName (p. 86)

The name of the attribute that you want to retrieve the values for, such as `volumeType`.

Type: String

Required: Yes

MaxResults (p. 86)

The maximum number of results to return in response.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 100.

Required: No

NextToken (p. 86)

The pagination token that indicates the next set of results that you want to retrieve.

Type: String

Required: No

ServiceCode (p. 86)

The service code for the service whose attributes you want to retrieve. For example, if you want to retrieve an EC2 attribute, use `AmazonEC2`.

Type: String

Required: Yes

Response Syntax

```json
{

```
"AttributeValues": [  
  {  
   "Value": "string"  
  }  
],  
"NextToken": "string"  
}

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

AttributeValues (p. 86)

The list of values for an attribute. For example, Throughput Optimized HDD and Provisioned IOPS are two available values for the AmazonEC2 volumeType.

Type: Array of AttributeValue (p. 143) objects

NextToken (p. 86)

The pagination token that indicates the next set of results to retrieve.

Type: String

Errors

For information about the errors that are common to all actions, see Common Errors (p. 148).

ExpiredNextTokenException

The pagination token expired. Try again without a pagination token.

HTTP Status Code: 400

InternalErrorException

An error on the server occurred during the processing of your request. Try again later.

HTTP Status Code: 400

InvalidNextTokenException

The pagination token is invalid. Try again without a pagination token.

HTTP Status Code: 400

InvalidParameterException

One or more parameters had an invalid value.

HTTP Status Code: 400

NotFoundException

The requested resource can't be found.

HTTP Status Code: 400
Example

The following is a sample request and response of the GetAttributeValues operation.

Sample Request

POST / HTTP/1.1
Host: api.pricing.<region>.<domain>
x-amz-Date: <Date>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>,
  SignedHeaders=contenttype;date;host;user-agent;x-amz-date;x-amz-target;x-amzn-requestid,Signature=<Signature>
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: AWSPriceListService.GetAttributeValues
{
  "ServiceCode": "AmazonEC2",
  "AttributeName": "volumeType",
  "NextToken": null,
  "MaxResults": 2
}

Sample Response

HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
{
  "AttributeValues": [
    {
      "Value": "Throughput Optimized HDD"
    },
    {
      "Value": "Provisioned IOPS"
    }
  ],
  "NextToken": "GpgauTGIY1LGezuc15LV0w==:7GzYJ0nw0DBTJ2J66EcTiINe60iuXWqTrqioJZQadBnDVgHFzI1en4BUQnPCLpseBk9RQQAwAFYd6fZ/9/cTw9GldnPOHN98+FdmJP7wKU3QQpQ8Mq5K0eBkiAsAqvAQuYdL0dkL7tHwPtE5iCEByAmp9gHC/yBu1vAQsf7R3VAnn4MSjJdv3woSwqASS11BVB6tgW78YL22KhssoItM/jWw+aP6Jqtq4mlx/ct6DWA1+xLPwHU/CbketimPFPxyqHF3/UUXdw=="
}

GetProducts

Service: AWS Price List Service

Returns a list of all products that match the filter criteria.

Request Syntax

```json
{
  "Filters": [
    {
      "Field": "string",
      "Type": "string",
      "Value": "string"
    }
  ],
  "FormatVersion": "string",
  "MaxResults": number,
  "NextToken": "string",
  "ServiceCode": "string"
}
```

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 146).

The request accepts the following data in JSON format.

**Filters (p. 90)**

The list of filters that limit the returned products. only products that match all filters are returned.

Type: Array of Filter (p. 144) objects

Required: No

**FormatVersion (p. 90)**

The format version that you want the response to be in.

Valid values are: aws_v1

Type: String

Required: No

**MaxResults (p. 90)**

The maximum number of results to return in the response.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 100.

Required: No

**NextToken (p. 90)**

The pagination token that indicates the next set of results that you want to retrieve.

Type: String
Required: No

**ServiceCode (p. 90)**

The code for the service whose products you want to retrieve.

Type: String

Required: No

**Response Syntax**

```
{
    "FormatVersion": "string",
    "NextToken": "string",
    "PriceList": [ "string" ]
}
```

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**FormatVersion (p. 91)**

The format version of the response. For example, aws_v1.

Type: String

**NextToken (p. 91)**

The pagination token that indicates the next set of results to retrieve.

Type: String

**PriceList (p. 91)**

The list of products that match your filters. The list contains both the product metadata and the price information.

Type: Array of strings

**Errors**

For information about the errors that are common to all actions, see [Common Errors (p. 148)](#).

**ExpiredNextTokenException**

The pagination token expired. Try again without a pagination token.

HTTP Status Code: 400

**InternalErrorException**

An error on the server occurred during the processing of your request. Try again later.

HTTP Status Code: 400

**InvalidNextTokenException**

The pagination token is invalid. Try again without a pagination token.
HTTP Status Code: 400
**InvalidParameterException**

One or more parameters had an invalid value.

HTTP Status Code: 400
**NotFoundException**

The requested resource can’t be found.

HTTP Status Code: 400

**Example**

The following is a sample request and response of the GetProducts operation.

**Sample Request**

```plaintext
POST / HTTP/1.1
Host: api.pricing.<region>.<domain>
x-amz-Date: <Date>
Authorization: AWS4-HMAC-SHA256 Credential=<Credential>,
SignedHeaders=content-type;date;host;user-agent;x-amz-date;x-amzn-requestid;Signature=<Signature>
User-Agent: <UserAgentString>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Connection: Keep-Alive
X-Amz-Target: AWSPriceListService.GetProducts
{
  "Filters": [
    {
      "Type": "TERM_MATCH",
      "Field": "ServiceCode",
      "Value": "AmazonEC2"
    },
    {
      "Type": "TERM_MATCH",
      "Field": "volumeType",
      "Value": "Provisioned IOPS"
    }
  ],
  "FormatVersion": "aws_v1",
  "NextToken": null,
  "MaxResults": 1
}
```

**Sample Response**

```plaintext
HTTP/1.1 200 OK
x-amzn-RequestId: <RequestId>
Content-Type: application/x-amz-json-1.1
Content-Length: <PayloadSizeBytes>
Date: <Date>
{
  "FormatVersion": "aws_v1",
  "NextToken": "57r3UcqRjDujbzWfHF7Ciw==:ywSmZsD3mtQPQ5Xo8IMkYybSj+vat+kGmmMFq+99DGMjIoJz7LunVeamiIOqthdW5O2a7YKojC0+2YdJmuNL2QvNhXs

Data Types

The following data types are supported by AWS Cost Explorer Service:

- Coverage (p. 96)
- CoverageByTime (p. 97)
- CoverageHours (p. 98)
- DateInterval (p. 99)
- DimensionValues (p. 100)
- DimensionValuesWithAttributes (p. 101)
- EC2InstanceDetails (p. 102)
- EC2Specification (p. 104)
- ElastiCacheInstanceDetails (p. 105)
- ESInstanceDetails (p. 107)
- Expression (p. 108)
- Group (p. 110)
- GroupDefinition (p. 111)
- InstanceDetails (p. 112)
- MetricValue (p. 113)
- RDSInstanceDetails (p. 114)
- RedshiftInstanceDetails (p. 116)
- ReservationAggregates (p. 117)
- ReservationCoverageGroup (p. 119)
- ReservationPurchaseRecommendation (p. 120)
- ReservationPurchaseRecommendationDetail (p. 122)
- ReservationPurchaseRecommendationMetadata (p. 125)
- ReservationPurchaseRecommendationSummary (p. 126)
- ReservationUtilizationGroup (p. 127)
- ResultByTime (p. 128)
- ServiceSpecification (p. 129)
- TagValues (p. 130)
- UtilizationByTime (p. 131)

The following data types are supported by AWS Budgets:

- Budget (p. 132)
- CalculatedSpend (p. 134)
- CostTypes (p. 135)
- Notification (p. 137)
- NotificationWithSubscribers (p. 139)
- Spend (p. 140)
- Subscriber (p. 141)
- TimePeriod (p. 142)
The following data types are supported by AWS Price List Service:

- AttributeValue (p. 143)
- Filter (p. 144)
- Service (p. 145)

AWS Cost Explorer Service

The following data types are supported by AWS Cost Explorer Service:

- Coverage (p. 96)
- CoverageByTime (p. 97)
- CoverageHours (p. 98)
- DateInterval (p. 99)
- DimensionValues (p. 100)
- DimensionValuesWithAttributes (p. 101)
- EC2InstanceDetails (p. 102)
- EC2Specification (p. 104)
- ElastiCacheInstanceDetails (p. 105)
- ESInstanceDetails (p. 107)
- Expression (p. 108)
- Group (p. 110)
- GroupDefinition (p. 111)
- InstanceDetails (p. 112)
- MetricValue (p. 113)
- RDSInstanceDetails (p. 114)
- RedshiftInstanceDetails (p. 116)
- ReservationAggregates (p. 117)
- ReservationCoverageGroup (p. 119)
- ReservationPurchaseRecommendation (p. 120)
- ReservationPurchaseRecommendationDetail (p. 122)
- ReservationPurchaseRecommendationMetadata (p. 125)
- ReservationPurchaseRecommendationSummary (p. 126)
- ReservationUtilizationGroup (p. 127)
- ResultByTime (p. 128)
- ServiceSpecification (p. 129)
- TagValues (p. 130)
- UtilizationByTime (p. 131)
Coverage
Service: AWS Cost Explorer Service

The amount of instance usage that a reservation covered.

Contents

CoverageHours

The amount of instance usage that a reservation covered, in hours.

Type: CoverageHours (p. 98) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
CoverageByTime

Service: AWS Cost Explorer Service

Reservation coverage for a specified period, in hours.

Contents

Groups

The groups of instances that are covered by a reservation.

Type: Array of ReservationCoverageGroup (p. 119) objects

Required: No

TimePeriod

The period over which this coverage was used.

Type: DateInterval (p. 99) object

Required: No

Total

The total reservation coverage, in hours.

Type: Coverage (p. 96) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
**CoverageHours**

Service: AWS Cost Explorer Service

How long a running instance either used a reservation or was On-Demand.

**Contents**

**CoverageHoursPercentage**

The percentage of instance hours that are covered by a reservation.

Type: String

Required: No

**OnDemandHours**

The number of instance running hours that are covered by On-Demand Instances.

Type: String

Required: No

**ReservedHours**

The number of instance running hours that are covered by reservations.

Type: String

Required: No

**TotalRunningHours**

The total instance usage, in hours.

Type: String

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
**DateInterval**

Service: AWS Cost Explorer Service

The time period that you want the usage and costs for.

**Contents**

**End**

The end of the time period that you want the usage and costs for. The end date is exclusive. For example, if `<end>` is `2017-05-01`, AWS retrieves cost and usage data from the start date up to, but not including, `2017-05-01`.

Type: String

Pattern: `\d{4}-\d{2}-\d{2}`

Required: Yes

**Start**

The beginning of the time period that you want the usage and costs for. The start date is inclusive. For example, if `<start>` is `2017-01-01`, AWS retrieves cost and usage data starting at `2017-01-01` up to the end date.

Type: String

Pattern: `\d{4}-\d{2}-\d{2}`

Required: Yes

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
DimensionValues

Service: AWS Cost Explorer Service

The metadata that you can use to filter and group your results. You can use GetDimensionValues to find specific values.

Contents

Key

The names of the metadata types that you can use to filter and group your results. For example, AZ returns a list of Availability Zones.

Type: String

Valid Values: AZ | INSTANCE_TYPE | LINKED_ACCOUNT | OPERATION | PURCHASE_TYPE | REGION | SERVICE | USAGE_TYPE | USAGE_TYPE_GROUP | RECORD_TYPE | OPERATING_SYSTEM | TENANCY | SCOPE | PLATFORM | SUBSCRIPTION_ID | LEGAL_ENTITY_NAME | DEPLOYMENT_OPTION | DATABASE_ENGINE | CACHE_ENGINE | INSTANCE_TYPE_FAMILY

Required: No

Values

The metadata values that you can use to filter and group your results. You can use GetDimensionValues to find specific values.

Type: Array of strings

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
**DimensionValuesWithAttributes**

Service: AWS Cost Explorer Service

The metadata of a specific type that you can use to filter and group your results. You can use GetDimensionValues to find specific values.

**Contents**

**Attributes**

- The attribute that applies to a specific Dimension.
- Type: String to string map
- Required: No

**Value**

- The value of a dimension with a specific attribute.
- Type: String
- Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
**EC2InstanceDetails**

Service: AWS Cost Explorer Service

Details about the EC2 instances that AWS recommends that you purchase.

**Contents**

**AvailabilityZone**

The Availability Zone of the recommended reservation.

Type: String

Required: No

**CurrentGeneration**

Whether the recommendation is for a current generation instance.

Type: Boolean

Required: No

**Family**

The instance family of the recommended reservation.

Type: String

Required: No

**InstanceType**

The type of instance that AWS recommends.

Type: String

Required: No

**Platform**

The platform of the recommended reservation. The platform is the specific combination of operating system, license model, and software on an instance.

Type: String

Required: No

**Region**

The AWS Region of the recommended reservation.

Type: String

Required: No

**SizeFlexEligible**

Whether the recommended reservation is size flexible.

Type: Boolean

Required: No
Tenancy

Whether the recommended reservation is dedicated or shared.

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
EC2Specification

Service: AWS Cost Explorer Service

The EC2 hardware specifications that you want AWS to provide recommendations for.

Contents

OfferingClass

Whether you want a recommendation for standard or convertible reservations.

Type: String

Valid Values: STANDARD | CONVERTIBLE

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
ElastiCacheInstanceDetails
Service: AWS Cost Explorer Service

Details about the ElastiCache instances that AWS recommends that you purchase.

Contents

CurrentGeneration
Whether the recommendation is for a current generation instance.
Type: Boolean
Required: No

Family
The instance family of the recommended reservation.
Type: String
Required: No

NodeType
The type of node that AWS recommends.
Type: String
Required: No

ProductDescription
The description of the recommended reservation.
Type: String
Required: No

Region
The AWS Region of the recommended reservation.
Type: String
Required: No

SizeFlexEligible
Whether the recommended reservation is size flexible.
Type: Boolean
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
• AWS SDK for Ruby V2
ESInstanceDetails
Service: AWS Cost Explorer Service
Details about the ES instances that AWS recommends that you purchase.

Contents

CurrentGeneration
Whether the recommendation is for a current generation instance.
Type: Boolean
Required: No

InstanceClass
The class of instance that AWS recommends.
Type: String
Required: No

InstanceSize
The size of instance that AWS recommends.
Type: String
Required: No

Region
The AWS Region of the recommended reservation.
Type: String
Required: No

SizeFlexEligible
Whether the recommended reservation is size flexible.
Type: Boolean
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
Expression
Service: AWS Cost Explorer Service

Use Expression to filter by cost or by usage. There are two patterns:

- Simple dimension values - You can set the dimension name and values for the filters that you plan to use. For example, you can filter for INSTANCE_TYPE==m4.xlarge OR INSTANCE_TYPE==c4.large. The Expression for that looks like this:

  ```json
  { "Dimensions": { "Key": "INSTANCE_TYPE", "Values": [ "m4.xlarge", "c4.large" ] } }
  ```

  The list of dimension values are OR'd together to retrieve cost or usage data. You can create Expression and DimensionValues objects using either with* methods or set* methods in multiple lines.

- Compound dimension values with logical operations - You can use multiple Expression types and the logical operators AND/OR/NOT to create a list of one or more Expression objects. This allows you to filter on more advanced options. For example, you can filter on ((INSTANCE_TYPE == m4.large OR INSTANCE_TYPE == m3.large) OR (TAG.Type == Type1)) AND (USAGE_TYPE != DataTransfer). The Expression for that looks like this:

  ```json
  { "And": [ { "Or": [ { "Dimensions": { "Key": "INSTANCE_TYPE", "Values": [ "m4.x.large", "c4.large" ] } }, { "Tags": { "Key": "TagName", "Values": [ "Value1" ] } } ], { "Not": { "Dimensions": { "Key": "USAGE_TYPE", "Values": [ "DataTransfer" ] } } } ] }
  ```

  **Note**

  Because each Expression can have only one operator, the service returns an error if more than one is specified. The following example shows an Expression object that creates an error.

  ```json
  { "And": [ ... ], "DimensionValues": { "Dimension": "USAGE_TYPE", "Values": [ "DataTransfer" ] } }
  ```

Contents

And

Return results that match both Dimension objects.

Type: Array of Expression (p. 108) objects

Required: No

Dimensions

The specific Dimension to use for Expression.

Type: DimensionValues (p. 100) object

Required: No

Not

Return results that don't match a Dimension object.

Type: Expression (p. 108) object

Required: No
Or

Return results that match either Dimension object.

Type: Array of Expression (p. 108) objects

Required: No

Tags

The specific Tag to use for Expression.

Type: TagValues (p. 130) object

Required: No

See Also

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
**Group**
Service: AWS Cost Explorer Service

One level of grouped data within the results.

**Contents**

**Keys**
- The keys that are included in this group.
  - Type: Array of strings
  - Required: No

**Metrics**
- The metrics that are included in this group.
  - Type: String to MetricValue (p. 113) object map
  - Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
**GroupDefinition**

Service: AWS Cost Explorer Service

Represents a group when you specify a group by criteria, or in the response to a query with a specific grouping.

**Contents**

**Key**

The string that represents a key for a specified group.

Type: String

Required: No

**Type**

The string that represents the type of group.

Type: String

Valid Values: DIMENSION | TAG

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
InstanceDetails
Service: AWS Cost Explorer Service

Details about the instances that AWS recommends that you purchase.

Contents

EC2InstanceDetails
The EC2 instances that AWS recommends that you purchase.
Type: EC2InstanceDetails (p. 102) object
Required: No

ElastiCacheInstanceDetails
The ElastiCache instances that AWS recommends that you purchase.
Type: ElastiCacheInstanceDetails (p. 105) object
Required: No

ESInstanceDetails
The Amazon ES instances that AWS recommends that you purchase.
Type: ESInstanceDetails (p. 107) object
Required: No

RDSInstanceDetails
The RDS instances that AWS recommends that you purchase.
Type: RDSInstanceDetails (p. 114) object
Required: No

RedshiftInstanceDetails
The Amazon Redshift instances that AWS recommends that you purchase.
Type: RedshiftInstanceDetails (p. 116) object
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
MetricValue
Service: AWS Cost Explorer Service
The aggregated value for a metric.

Contents

Amount
The actual number that represents the metric.
Type: String
Required: No

Unit
The unit that the metric is given in.
Type: String
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
RDSInstanceDetails
Service: AWS Cost Explorer Service
Details about the RDS instances that AWS recommends that you purchase.

Contents

CurrentGeneration
Whether the recommendation is for a current generation instance.
Type: Boolean
Required: No

DatabaseEdition
The database edition that the recommended reservation supports.
Type: String
Required: No

DatabaseEngine
The database engine that the recommended reservation supports.
Type: String
Required: No

DeploymentOption
Whether the recommendation is for a reservation in a single Availability Zone or a reservation with a backup in a second Availability Zone.
Type: String
Required: No

Family
The instance family of the recommended reservation.
Type: String
Required: No

InstanceType
The type of instance that AWS recommends.
Type: String
Required: No

LicenseModel
The license model that the recommended reservation supports.
Type: String
Required: No
Region

The AWS Region of the recommended reservation.

Type: String
Required: No

SizeFlexEligible

Whether the recommended reservation is size flexible.

Type: Boolean
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
RedshiftInstanceDetails
Service: AWS Cost Explorer Service
Details about the Amazon Redshift instances that AWS recommends that you purchase.

Contents

CurrentGeneration
Whether the recommendation is for a current generation instance.
Type: Boolean
Required: No

Family
The instance family of the recommended reservation.
Type: String
Required: No

NodeType
The type of node that AWS recommends.
Type: String
Required: No

Region
The AWS Region of the recommended reservation.
Type: String
Required: No

SizeFlexEligible
Whether the recommended reservation is size flexible.
Type: Boolean
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:
- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
ReservationAggregates
Service: AWS Cost Explorer Service

The aggregated numbers for your Reserved Instance (RI) usage.

Contents

AmortizedRecurringFee
The monthly cost of your RI, amortized over the RI period.
Type: String
Required: No

AmortizedUpfrontFee
The upfront cost of your RI, amortized over the RI period.
Type: String
Required: No

NetRISavings
How much you saved due to purchasing and utilizing RIs. AWS calculates this by subtracting TotalAmortizedFee from OnDemandCostOfRIHoursUsed.
Type: String
Required: No

OnDemandCostOfRIHoursUsed
How much your RIs would cost if charged On-Demand rates.
Type: String
Required: No

PurchasedHours
How many RI hours that you purchased.
Type: String
Required: No

TotalActualHours
The total number of RI hours that you used.
Type: String
Required: No

TotalAmortizedFee
The total cost of your RI, amortized over the RI period.
Type: String
Required: No
TotalPotentialRISavings
How much you could save if you use your entire reservation.
Type: String
Required: No

UnusedHours
The number of RI hours that you didn't use.
Type: String
Required: No

UtilizationPercentage
The percentage of RI time that you used.
Type: String
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:
- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
ReservationCoverageGroup
Service: AWS Cost Explorer Service
A group of reservations that share a set of attributes.

Contents

Attributes
The attributes for this group of reservations.
Type: String to string map
Required: No

Coverage
How much instance usage this group of reservations covered.
Type: Coverage (p. 96) object
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
ReservationPurchaseRecommendation
Service: AWS Cost Explorer Service

A specific reservation that AWS recommends for purchase.

Contents

AccountScope

The account scope that AWS recommends that you purchase this instance for. For example, you can purchase this reservation for an entire organization in AWS Organizations.

Type: String

Valid Values: PAYER | LINKED

Required: No

LookbackPeriodInDays

How many days of previous usage that AWS considers when making this recommendation.

Type: String

Valid Values: SEVEN_DAYS | THIRTY_DAYS | SIXTY_DAYS

Required: No

PaymentOption

The payment option for the reservation. For example, AllUpfront or NoUpfront.

Type: String

Valid Values: NO_UPFRONT | PARTIAL_UPFRONT | ALL_UPFRONT | LIGHT_UTILIZATION | MEDIUM_UTILIZATION | HEAVY_UTILIZATION

Required: No

RecommendationDetails

Details about the recommended purchases.

Type: Array of ReservationPurchaseRecommendationDetail (p. 122) objects

Required: No

RecommendationSummary

A summary about the recommended purchase.

Type: ReservationPurchaseRecommendationSummary (p. 126) object

Required: No

ServiceSpecification

Hardware specifications for the service that you want recommendations for.

Type: ServiceSpecification (p. 129) object

Required: No
**TermInYears**

The term of the reservation that you want recommendations for, in years.

Type: String

Valid Values: **ONE_YEAR**  |  **THREE_YEARS**

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
ReservationPurchaseRecommendationDetail
Service: AWS Cost Explorer Service
Details about your recommended reservation purchase.

Contents

**AverageNormalizedUnitsUsedPerHour**
- The average number of normalized units that you used in an hour during the historical period. AWS uses this to calculate your recommended reservation purchases.
- Type: String
- Required: No

**AverageNumberOfInstancesUsedPerHour**
- The average number of instances that you used in an hour during the historical period. AWS uses this to calculate your recommended reservation purchases.
- Type: String
- Required: No

**AverageUtilization**
- The average utilization of your instances. AWS uses this to calculate your recommended reservation purchases.
- Type: String
- Required: No

**CurrencyCode**
- The currency code that AWS used to calculate the costs for this instance.
- Type: String
- Required: No

**EstimatedBreakEvenInMonths**
- How long AWS estimates that it takes for this instance to start saving you money, in months.
- Type: String
- Required: No

**EstimatedMonthlyOnDemandCost**
- How much AWS estimates that you spend on On-Demand Instances in a month.
- Type: String
- Required: No

**EstimatedMonthlySavingsAmount**
- How much AWS estimates that this specific recommendation could save you in a month.
- Type: String
- Required: No
**EstimatedMonthlySavingsPercentage**

How much AWS estimates that this specific recommendation could save you in a month, as a percentage of your overall costs.

Type: String

Required: No

**EstimatedReservationCostForLookbackPeriod**

How much AWS estimates that you would have spent for all usage during the specified historical period if you had had a reservation.

Type: String

Required: No

**InstanceDetails**

Details about the instances that AWS recommends that you purchase.

Type: [InstanceDetails](p. 112) object

Required: No

**MaximumNormalizedUnitsUsedPerHour**

The maximum number of normalized units that you used in an hour during the historical period. AWS uses this to calculate your recommended reservation purchases.

Type: String

Required: No

**MaximumNumberOfInstancesUsedPerHour**

The maximum number of instances that you used in an hour during the historical period. AWS uses this to calculate your recommended reservation purchases.

Type: String

Required: No

**MinimumNormalizedUnitsUsedPerHour**

The minimum number of hours that you used in an hour during the historical period. AWS uses this to calculate your recommended reservation purchases.

Type: String

Required: No

**MinimumNumberOfInstancesUsedPerHour**

The minimum number of instances that you used in an hour during the historical period. AWS uses this to calculate your recommended reservation purchases.

Type: String

Required: No

**RecommendedNormalizedUnitsToPurchase**

The number of normalized units that AWS recommends that you purchase.

Type: String
Required: No

**RecommendedNumberOfInstancesToPurchase**

The number of instances that AWS recommends that you purchase.

Type: String

Required: No

**RecurringStandardMonthlyCost**

How much purchasing this instance costs you on a monthly basis.

Type: String

Required: No

**UpfrontCost**

How much purchasing this instance costs you upfront.

Type: String

Required: No

**See Also**

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
ReservationPurchaseRecommendationMetadata
Service: AWS Cost Explorer Service

Information about this specific recommendation, such as the time stamp for when AWS made a specific recommendation.

Contents

GenerationTimestamp

The time stamp for when AWS made this recommendation.

Type: String

Required: No

RecommendationId

The ID for this specific recommendation.

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
ReservationPurchaseRecommendationSummary

Service: AWS Cost Explorer Service

A summary about this recommendation, such as the currency code, the amount that AWS estimates that you could save, and the total amount of reservation to purchase.

Contents

CurrencyCode

The currency code used for this recommendation.

Type: String

Required: No

TotalEstimatedMonthlySavingsAmount

The total amount that AWS estimates that this recommendation could save you in a month.

Type: String

Required: No

TotalEstimatedMonthlySavingsPercentage

The total amount that AWS estimates that this recommendation could save you in a month, as a percentage of your costs.

Type: String

Required: No

See Also

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
ReservationUtilizationGroup
Service: AWS Cost Explorer Service

A group of Reserved Instances (RIs) that share a set of attributes.

Contents

Attributes
The attributes for this group of RIs.
Type: String to string map
Required: No

Key
The key for a specific RI attribute.
Type: String
Required: No

Utilization
How much you used this group of RIs.
Type: ReservationAggregates (p. 117) object
Required: No

Value
The value of a specific RI attribute.
Type: String
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
ResultByTime
Service: AWS Cost Explorer Service

The result that is associated with a time period.

Contents

Estimated
Whether this result is estimated.
Type: Boolean
Required: No

Groups
The groups that are included in this time period.
Type: Array of Group (p. 110) objects
Required: No

TimePeriod
The time period covered by a result.
Type: DateInterval (p. 99) object
Required: No

Total
The total amount of cost or usage accrued during the time period.
Type: String to MetricValue (p. 113) object map
Required: No

See Also

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
ServiceSpecification
Service: AWS Cost Explorer Service

Hardware specifications for the service that you want recommendations for.

Contents

EC2Specification

The EC2 hardware specifications that you want AWS to provide recommendations for.

Type: EC2Specification (p. 104) object

Required: No

See Also

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
TagValues
Service: AWS Cost Explorer Service
The values that are available for a tag.

Contents

Key
The key for a tag.
Type: String
Required: No

Values
The specific value of a tag.
Type: Array of strings
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
UtilizationByTime
Service: AWS Cost Explorer Service

The amount of utilization, in hours.

Contents

Groups

The groups that are included in this utilization result.
Type: Array of ReservationUtilizationGroup (p. 127) objects
Required: No

TimePeriod

The period of time over which this utilization was used.
Type: DateInterval (p. 99) object
Required: No

Total

The total number of RI hours that were used.
Type: ReservationAggregates (p. 117) object
Required: No

See Also

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2

AWS Budgets

The following data types are supported by AWS Budgets:

- Budget (p. 132)
- CalculatedSpend (p. 134)
- CostTypes (p. 135)
- Notification (p. 137)
- NotificationWithSubscribers (p. 139)
- Spend (p. 140)
- Subscriber (p. 141)
- TimePeriod (p. 142)
Budget
Service: AWS Budgets

Represents the output of the CreateBudget operation. The content consists of the detailed metadata and data file information, and the current status of the budget object.

This is the ARN pattern for a budget:

arn:aws:budgetservice::AccountId:budget/budgetName

Contents

BudgetLimit

The total amount of cost, usage, RI utilization, or RI coverage that you want to track with your budget.

BudgetLimit is required for cost or usage budgets, but optional for RI utilization or coverage budgets. RI utilization or coverage budgets default to 100, which is the only valid value for RI utilization or coverage budgets.

Type: Spend (p. 140) object

Required: No

BudgetName

The name of a budget. The name must be unique within accounts. The : and \ characters are not allowed in BudgetName.

Type: String

Length Constraints: Maximum length of 100.

Pattern: [^:\\]+

Required: Yes

BudgetType

Whether this budget tracks monetary costs, usage, RI utilization, or RI coverage.

Type: String

Valid Values: USAGE | COST | RI_UTILIZATION | RI_COVERAGE

Required: Yes

CalculatedSpend

The actual and forecasted cost or usage that the budget tracks.

Type: CalculatedSpend (p. 134) object

Required: No

CostFilters

The cost filters, such as service or region, that are applied to a budget.

Type: String to array of strings map

Required: No
**CostTypes**

The types of costs that are included in this COST budget.

 USAGE, RI_UTILIZATION, and RI_COVERAGE budgets do not have CostTypes.

Type: `CostTypes (p. 135)` object

Required: No

**TimePeriod**

The period of time that is covered by a budget. The period has a start date and an end date. The start date must come before the end date. The end date must come before 06/15/87 00:00 UTC.

If you create your budget and don't specify a start date, AWS defaults to the start of your chosen time period (DAILY, MONTHLY, QUARTERLY, or ANNUALLY). For example, if you created your budget on January 24, 2018, chose DAILY, and didn't set a start date, AWS set your start date to 01/24/18 00:00 UTC. If you chose MONTHLY, AWS set your start date to 01/01/18 00:00 UTC. If you didn't specify an end date, AWS set your end date to 06/15/87 00:00 UTC. The defaults are the same for the AWS Billing and Cost Management console and the API.

You can change either date with the UpdateBudget operation.

After the end date, AWS deletes the budget and all associated notifications and subscribers.

Type: `TimePeriod (p. 142)` object

Required: No

**TimeUnit**

The length of time until a budget resets the actual and forecasted spend. DAILY is available only for RI_UTILIZATION and RI_COVERAGE budgets.

Type: String

Valid Values: DAILY | MONTHLY | QUARTERLY | ANNUALLY

Required: Yes

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
**CalculatedSpend**

Service: AWS Budgets

The spend objects that are associated with this budget. The `actualSpend` tracks how much you've used, cost, usage, or RI units, and the `forecastsedSpend` tracks how much you are predicted to spend if your current usage remains steady.

For example, if it is the 20th of the month and you have spent 50 dollars on Amazon EC2, your `actualSpend` is 50 USD, and your `forecastedSpend` is 75 USD.

**Contents**

**ActualSpend**

The amount of cost, usage, or RI units that you have used.

Type: Spend (p. 140) object

Required: Yes

**ForecastedSpend**

The amount of cost, usage, or RI units that you are forecasted to use.

Type: Spend (p. 140) object

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
CostTypes
Service: AWS Budgets

The types of cost that are included in a COST budget, such as tax and subscriptions.

USAGE, RI_UTILIZATION, and RI_COVERAGE budgets do not have CostTypes.

Contents

IncludeCredit
   Specifies whether a budget includes credits.
   The default value is true.
   Type: Boolean
   Required: No

IncludeDiscount
   Specifies whether a budget includes discounts.
   The default value is true.
   Type: Boolean
   Required: No

IncludeOtherSubscription
   Specifies whether a budget includes non-RI subscription costs.
   The default value is true.
   Type: Boolean
   Required: No

IncludeRecurring
   Specifies whether a budget includes recurring fees such as monthly RI fees.
   The default value is true.
   Type: Boolean
   Required: No

IncludeRefund
   Specifies whether a budget includes refunds.
   The default value is true.
   Type: Boolean
   Required: No

IncludeSubscription
   Specifies whether a budget includes subscriptions.
   The default value is true.

Type: Boolean
Required: No

**IncludeSupport**

Specifies whether a budget includes support subscription fees.

The default value is `true`.

Type: Boolean
Required: No

**IncludeTax**

Specifies whether a budget includes taxes.

The default value is `true`.

Type: Boolean
Required: No

**IncludeUpfront**

Specifies whether a budget includes upfront RI costs.

The default value is `true`.

Type: Boolean
Required: No

**UseAmortized**

Specifies whether a budget uses the amortized rate.

The default value is `false`.

Type: Boolean
Required: No

**UseBlended**

Specifies whether a budget uses a blended rate.

The default value is `false`.

Type: Boolean
Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
Notification
Service: AWS Budgets

A notification that is associated with a budget. A budget can have up to five notifications.

Each notification must have at least one subscriber. A notification can have one SNS subscriber and up to 10 email subscribers, for a total of 11 subscribers.

For example, if you have a budget for 200 dollars and you want to be notified when you go over 160 dollars, create a notification with the following parameters:

- A notificationType of ACTUAL
- A comparisonOperator of GREATER_THAN
- A notification threshold of 80

Contents

ComparisonOperator

The comparison that is used for this notification.

Type: String

Valid Values: GREATER_THAN | LESS_THAN | EQUAL_TO

Required: Yes

NotificationType

Whether the notification is for how much you have spent (ACTUAL) or for how much you are forecasted to spend (FORECASTED).

Type: String

Valid Values: ACTUAL | FORECASTED

Required: Yes

Threshold

The threshold that is associated with a notification. Thresholds are always a percentage.

Type: Double

Valid Range: Minimum value of 0.1. Maximum value of 1000000000.

Required: Yes

ThresholdType

The type of threshold for a notification. For ACTUAL thresholds, AWS notifies you when you go over the threshold. For FORECASTED thresholds, AWS notifies you when you are forecasted to go over the threshold.

Type: String

Valid Values: PERCENTAGE | ABSOLUTE_VALUE

Required: No
See Also

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
NotificationWithSubscribers
Service: AWS Budgets

A notification with subscribers. A notification can have one SNS subscriber and up to 10 email subscribers, for a total of 11 subscribers.

Contents

Notification

The notification that is associated with a budget.

Type: Notification (p. 137) object

Required: Yes

Subscribers

A list of subscribers who are subscribed to this notification.

Type: Array of Subscriber (p. 141) objects

Array Members: Minimum number of 1 item. Maximum number of 11 items.

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
Spend

Service: AWS Budgets

The amount of cost or usage that is measured for a budget.

For example, a Spend for 3 GB of S3 usage would have the following parameters:

- An Amount of 3
- A unit of GB

Contents

Amount

The cost or usage amount that is associated with a budget forecast, actual spend, or budget threshold.

Type: String

Pattern: [0-9]+(?:\.[0-9]+)?

Required: Yes

Unit

The unit of measurement that is used for the budget forecast, actual spend, or budget threshold, such as dollars or GB.

Type: String

Length Constraints: Minimum length of 1.

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
Subscriber
Service: AWS Budgets

The subscriber to a budget notification. The subscriber consists of a subscription type and either an Amazon SNS topic or an email address.

For example, an email subscriber would have the following parameters:

- A subscriptionType of EMAIL
- An address of example@example.com

Contents

Address

The address that AWS sends budget notifications to, either an SNS topic or an email.

Type: String

Length Constraints: Minimum length of 1.

Required: Yes

SubscriptionType

The type of notification that AWS sends to a subscriber.

Type: String

Valid Values: SNS | EMAIL

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
AWS Cost Explorer Service Cost Management APIs

TimePeriod

Service: AWS Budgets

The period of time that is covered by a budget. The period has a start date and an end date. The start date must come before the end date. There are no restrictions on the end date.

Contents

End

The end date for a budget. If you didn't specify an end date, AWS set your end date to 06/15/87 00:00 UTC. The defaults are the same for the AWS Billing and Cost Management console and the API.

After the end date, AWS deletes the budget and all associated notifications and subscribers. You can change your end date with the UpdateBudget operation.

Type: Timestamp

Required: No

Start

The start date for a budget. If you created your budget and didn't specify a start date, AWS defaults to the start of your chosen time period (DAILY, MONTHLY, QUARTERLY, or ANNUALLY). For example, if you created your budget on January 24, 2018, chose DAILY, and didn't set a start date, AWS set your start date to 01/24/18 00:00 UTC. If you chose MONTHLY, AWS set your start date to 01/01/18 00:00 UTC. The defaults are the same for the AWS Billing and Cost Management console and the API.

You can change your start date with the UpdateBudget operation.

Type: Timestamp

Required: No

- AWS SDK for Ruby V2

AWS Price List Service

The following data types are supported by AWS Price List Service:

- AttributeValue (p. 143)
- Filter (p. 144)
- Service (p. 145)
AttributeValue

Service: AWS Price List Service

The values of a given attribute, such as Throughput Optimized HDD or Provisioned IOPS for the Amazon EC2 volumeType attribute.

Contents

Value

The specific value of an attributeName.

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
Filter
Service: AWS Price List Service

The constraints that you want all returned products to match.

Contents

Field
The product metadata field that you want to filter on. You can filter by just the service code to see all products for a specific service, filter by just the attribute name to see a specific attribute for multiple services, or use both a service code and an attribute name to retrieve only products that match both fields.

Valid values include: ServiceCode, and all attribute names

For example, you can filter by the AmazonEC2 service code and the volumeType attribute name to get the prices for only Amazon EC2 volumes.

Type: String
Required: Yes

Type
The type of filter that you want to use.

Valid values are: TERM_MATCH. TERM_MATCH returns only products that match both the given filter field and the given value.

Type: String
Required: Yes

Value
The service code or attribute value that you want to filter by. If you are filtering by service code this is the actual service code, such as AmazonEC2. If you are filtering by attribute name, this is the attribute value that you want the returned products to match, such as a Provisioned IOPS volume.

Type: String
Required: Yes

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
Service
Service: AWS Price List Service

The metadata for a service, such as the service code and available attribute names.

Contents

AttributeNames
The attributes that are available for this service.
Type: Array of strings
Required: No

ServiceCode
The code for the AWS service.
Type: String
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V2
Common Parameters

The following list contains the parameters that all actions use for signing Signature Version 4 requests with a query string. Any action-specific parameters are listed in the topic for that action. For more information about Signature Version 4, see Signature Version 4 Signing Process in the Amazon Web Services General Reference.

**Action**
- The action to be performed.
  - Type: string
  - Required: Yes

**Version**
- The API version that the request is written for, expressed in the format YYYY-MM-DD.
  - Type: string
  - Required: Yes

**X-Amz-Algorithm**
- The hash algorithm that you used to create the request signature.
  - Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.
  - Type: string
  - Valid Values: AWS4-HMAC-SHA256
  - Required: Conditional

**X-Amz-Credential**
- The credential scope value, which is a string that includes your access key, the date, the region you are targeting, the service you are requesting, and a termination string (“aws4_request”). The value is expressed in the following format: access_key/YYYYMMDD/region/service/aws4_request.
  - Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.
  - Type: string
  - Required: Conditional

**X-Amz-Date**
- The date that is used to create the signature. The format must be ISO 8601 basic format (YYYYMMDD'T'HHMMSS'Z'). For example, the following date time is a valid X-Amz-Date value: 20120325T120000Z.
  - Condition: X-Amz-Date is optional for all requests; it can be used to override the date used for signing requests. If the Date header is specified in the ISO 8601 basic format, X-Amz-Date is
X-Amz-Date

Not required. When X-Amz-Date is used, it always overrides the value of the Date header. For more information, see Handling Dates in Signature Version 4 in the Amazon Web Services General Reference.

Type: string
Required: Conditional

X-Amz-Security-Token

The temporary security token that was obtained through a call to AWS Security Token Service (AWS STS). For a list of services that support temporary security credentials from AWS Security Token Service, go to AWS Services That Work with IAM in the IAM User Guide.

Condition: If you're using temporary security credentials from the AWS Security Token Service, you must include the security token.

Type: string
Required: Conditional

X-Amz-Signature

Specifies the hex-encoded signature that was calculated from the string to sign and the derived signing key.

Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.

Type: string
Required: Conditional

X-Amz-SignedHeaders

Specifies all the HTTP headers that were included as part of the canonical request. For more information about specifying signed headers, see Task 1: Create a Canonical Request For Signature Version 4 in the Amazon Web Services General Reference.

Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.

Type: string
Required: Conditional
Common Errors

This section lists the errors common to the API actions of all AWS services. For errors specific to an API action for this service, see the topic for that API action.

**AccessDeniedException**
- You do not have sufficient access to perform this action.
  - HTTP Status Code: 400

**IncompleteSignature**
- The request signature does not conform to AWS standards.
  - HTTP Status Code: 400

**InternalFailure**
- The request processing has failed because of an unknown error, exception or failure.
  - HTTP Status Code: 500

**InvalidAction**
- The action or operation requested is invalid. Verify that the action is typed correctly.
  - HTTP Status Code: 400

**InvalidClientTokenId**
- The X.509 certificate or AWS access key ID provided does not exist in our records.
  - HTTP Status Code: 403

**InvalidParameterCombination**
- Parameters that must not be used together were used together.
  - HTTP Status Code: 400

**InvalidParameterValue**
- An invalid or out-of-range value was supplied for the input parameter.
  - HTTP Status Code: 400

**InvalidQueryParameter**
- The AWS query string is malformed or does not adhere to AWS standards.
  - HTTP Status Code: 400

**MalformedQueryString**
- The query string contains a syntax error.
  - HTTP Status Code: 404

**MissingAction**
- The request is missing an action or a required parameter.
  - HTTP Status Code: 400
MISSINGAUTHENTICATIONTOKEN

The request must contain either a valid (registered) AWS access key ID or X.509 certificate.

HTTP Status Code: 403

MISSINGPARAMETER

A required parameter for the specified action is not supplied.

HTTP Status Code: 400

OPTINREQUIRED

The AWS access key ID needs a subscription for the service.

HTTP Status Code: 403

REQUESTEXPIRED

The request reached the service more than 15 minutes after the date stamp on the request or more
than 15 minutes after the request expiration date (such as for pre-signed URLs), or the date stamp
on the request is more than 15 minutes in the future.

HTTP Status Code: 400

SERVICEUNAVAILABLE

The request has failed due to a temporary failure of the server.

HTTP Status Code: 503

THROTTLINGEXCEPTION

The request was denied due to request throttling.

HTTP Status Code: 400

VALIDATIONERROR

The input fails to satisfy the constraints specified by an AWS service.

HTTP Status Code: 400
