For more information, see [Asymmetric keys in AWS KMS](#) in the *AWS Key Management Service Developer Guide*.

Example 4: To create an asymmetric ML-DSA KMS key for signing and verification

This example creates a module-lattice digital signature algorithm (ML-DSA) key for signing and verification. The key-usage parameter is required even though `SIGN_VERIFY` is the only valid value for ML-DSA keys.

```
aws kms create-key \
    --key-spec ML_DSA_65 \
    --key-usage SIGN_VERIFY
```

Output:

```
{
    "KeyMetadata": {
        "Arn": "arn:aws:kms:us-
east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
        "AWSAccountId": "111122223333",
        "CreationDate": "2019-12-02T07:48:55-07:00",
        "Description": "",
        "Enabled": true,
        "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
        "KeyManager": "CUSTOMER",
        "KeySpec": "ML_DSA_65",
        "KeyState": "Enabled",
        "KeyUsage": "SIGN_VERIFY",
        "MultiRegion": false,
        "Origin": "AWS_KMS",
        "SigningAlgorithms": [
            "ML_DSA_SHAKE_256"
        ]
    }
```

```
}
```

For more information, see Asymmetric keys in AWS KMS in the *AWS Key Management Service Developer Guide*.

Example 5: To create an HMAC KMS key

The following `create-key` example creates a 384-bit HMAC KMS key. The `GENERATE_VERIFY_MAC` value for the `--key-usage` parameter is required even though it's the only valid value for HMAC KMS keys.

```
aws kms create-key \
    --key-spec HMAC_384 \
    --key-usage GENERATE_VERIFY_MAC
```

Output:

```
{
    "KeyMetadata": {
        "Arn": "arn:aws:kms:us-
east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
        "AWSAccountId": "111122223333",
        "CreationDate": "2022-04-05T14:04:55-07:00",
        "CustomerMasterKeySpec": "HMAC_384",
        "Description": "",
        "Enabled": true,
        "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
        "KeyManager": "CUSTOMER",
        "KeySpec": "HMAC_384",
        "KeyState": "Enabled",
        "KeyUsage": "GENERATE_VERIFY_MAC",
        "MacAlgorithms": [
            "HMAC_SHA_384"
        ],
        "MultiRegion": false,
        "Origin": "AWS_KMS"
    }
}
```

For more information, see HMAC keys in AWS KMS in the *AWS Key Management Service Developer Guide*.

Example 6: To create a multi-Region primary KMS key

The following `create-key` example creates a multi-Region primary symmetric encryption key. Because the default values for all parameters create a symmetric encryption key, only the `--multi-region` parameter is required for this KMS key. In the AWS CLI, to indicate that a Boolean parameter is true, just specify the parameter name.

```
aws kms create-key \
    --multi-region
```

Output:

```
{
    "KeyMetadata": {
        "Arn": "arn:aws:kms:us-west-2:111122223333:key/
mrk-1234abcd12ab34cd56ef12345678990ab",
        "AWSAccountId": "111122223333",
        "CreationDate": "2021-09-02T016:15:21-09:00",
        "CurrentKeyMaterialId":
 "0b7fd7ddbac6eef27907413567cad8c810e2883dc8a7534067a82ee1142fc1e6",
        "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
        "Description": "",
        "Enabled": true,
        "EncryptionAlgorithms": [
          "SYMMETRIC_DEFAULT"
        ],
        "KeyId": "mrk-1234abcd12ab34cd56ef12345678990ab",
        "KeyManager": "CUSTOMER",
        "KeySpec": "SYMMETRIC_DEFAULT",
        "KeyState": "Enabled",
        "KeyUsage": "ENCRYPT_DECRYPT",
        "MultiRegion": true,
        "MultiRegionConfiguration": {
            "MultiRegionKeyType": "PRIMARY",
            "PrimaryKey": {
                "Arn": "arn:aws:kms:us-west-2:111122223333:key/
mrk-1234abcd12ab34cd56ef12345678990ab",
                "Region": "us-west-2"
            },
            "ReplicaKeys": []
        },
        "Origin": "AWS_KMS"
```

```
    }
}
```

For more information, see Asymmetric keys in AWS KMS in the *AWS Key Management Service Developer Guide*.

Example 7: To create a KMS key for imported key material

The following `create-key` example creates a creates a KMS key with no key material. When the operation is complete, you can import your own key material into the KMS key. To create this KMS key, set the `--origin` parameter to `EXTERNAL`.

```
aws kms create-key \
    --origin EXTERNAL
```

Output:

```
{
     "KeyMetadata": {
         "Arn": "arn:aws:kms:us-
east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
         "AWSAccountId": "111122223333",
         "CreationDate": "2019-12-02T07:48:55-07:00",
         "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
         "Description": "",
         "Enabled": false,
         "EncryptionAlgorithms": [
             "SYMMETRIC_DEFAULT"
         ],
         "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
         "KeyManager": "CUSTOMER",
         "KeySpec": "SYMMETRIC_DEFAULT",
         "KeyState": "PendingImport",
         "KeyUsage": "ENCRYPT_DECRYPT",
         "MultiRegion": false,
         "Origin": "EXTERNAL"
     }
 }
```

For more information, see Importing key material in AWS KMS keys in the *AWS Key Management Service Developer Guide*.

Example 6: To create a KMS key in an AWS CloudHSM key store

The following `create-key` example creates a creates a KMS key in the specified AWS CloudHSM key store. The operation creates the KMS key and its metadata in AWS KMS and creates the key material in the AWS CloudHSM cluster associated with the custom key store. The `--custom-key-store-id` and `--origin` parameters are required.

```
aws kms create-key \
    --origin AWS_CLOUDHSM \
    --custom-key-store-id cks-1234567890abcdef0
```

Output:

```
{
    "KeyMetadata": {
        "Arn": "arn:aws:kms:us-
east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
        "AWSAccountId": "111122223333",
        "CloudHsmClusterId": "cluster-1a23b4cdefg",
        "CreationDate": "2019-12-02T07:48:55-07:00",
        "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
        "CustomKeyStoreId": "cks-1234567890abcdef0",
        "Description": "",
        "Enabled": true,
        "EncryptionAlgorithms": [
            "SYMMETRIC_DEFAULT"
        ],
        "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
        "KeyManager": "CUSTOMER",
        "KeySpec": "SYMMETRIC_DEFAULT",
        "KeyState": "Enabled",
        "KeyUsage": "ENCRYPT_DECRYPT",
        "MultiRegion": false,
        "Origin": "AWS_CLOUDHSM"
    }
}
```

For more information, see AWS CloudHSM key stores in the *AWS Key Management Service Developer Guide*.

Example 8: To create a KMS key in an external key store

The following `create-key` example creates a creates a KMS key in the specified external key store. The `--custom-key-store-id`, `--origin`, and `--xks-key-id` parameters are required in this command.

The `--xks-key-id` parameter specifies the ID of an existing symmetric encryption key in your external key manager. This key serves as the external key material for the KMS key.The value of the `--origin` parameter must be `EXTERNAL_KEY_STORE`.The `custom-key-store-id` parameter must identify an external key store that is connected to its external key store proxy.

```
aws kms create-key \
    --origin EXTERNAL_KEY_STORE \
    --custom-key-store-id cks-9876543210fedcba9 \
    --xks-key-id bb8562717f809024
```

Output:

```
{
    "KeyMetadata": {
        "Arn": "arn:aws:kms:us-
east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
        "AWSAccountId": "111122223333",
        "CreationDate": "2022-12-02T07:48:55-07:00",
        "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
        "CustomKeyStoreId": "cks-9876543210fedcba9",
        "Description": "",
        "Enabled": true,
        "EncryptionAlgorithms": [
            "SYMMETRIC_DEFAULT"
        ],
        "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
        "KeyManager": "CUSTOMER",
        "KeySpec": "SYMMETRIC_DEFAULT",
        "KeyState": "Enabled",
        "KeyUsage": "ENCRYPT_DECRYPT",
        "MultiRegion": false,
        "Origin": "EXTERNAL_KEY_STORE",
        "XksKeyConfiguration": {
            "Id": "bb8562717f809024"
        }
    }
}
```

For more information, see External key stores in the *AWS Key Management Service Developer Guide*.

- For API details, see CreateKey in *AWS CLI Command Reference*.

`decrypt`

The following code example shows how to use `decrypt`.

AWS CLI

Example 1: To decrypt an encrypted message with a symmetric KMS key (Linux and macOS)

The following `decrypt` command example demonstrates the recommended way to decrypt data with the AWS CLI. This version shows how to decrypt data under a symmetric KMS key.

Provide the ciphertext in a file.In the value of the `--ciphertext-blob` parameter, use the `fileb://` prefix, which tells the CLI to read the data from a binary file. If the file is not in the current directory, type the full path to file. For more information about reading AWS CLI parameter values from a file, see Loading AWS CLI parameters from a file <https://docs.aws.amazon.com/cli/latest/userguide/cli-usage-parameters-file.html> in the *AWS Command Line Interface User Guide* and Best Practices for Local File Parameters<https://aws.amazon.com/blogs/developer/best-practices-for-local-file-parameters/> in the *AWS Command Line Tool Blog*.Specify the KMS key to decrypt the ciphertext.The `--key-id` parameter is not required when decrypting with a symmetric KMS key. AWS KMS can get the key ID of the KMS key that was used to encrypt the data from the metadata in the ciphertext. But it's always a best practice to specify the KMS key you are using. This practice ensures that you use the KMS key that you intend, and prevents you from inadvertently decrypting a ciphertext using a KMS key you do not trust.Request the plaintext output as a text value.The `--query` parameter tells the CLI to get only the value of the `Plaintext` field from the output. The `--output` parameter returns the output as text.Base64-decode the plaintext and save it in a file.The following example pipes (|) the value of the `Plaintext` parameter to the Base64 utility, which decodes it. Then, it redirects (>) the decoded output to the `ExamplePlaintext` file.

Before running this command, replace the example key ID with a valid key ID from your AWS account.

```
aws kms decrypt \
    --ciphertext-blob fileb://ExampleEncryptedFile \
```

```
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --output text \
    --query Plaintext | base64 \
    --decode > ExamplePlaintextFile
```

This command produces no output. The output from the `decrypt` command is base64-decoded and saved in a file.

For more information, see Decrypt in the *AWS Key Management Service API Reference*.

Example 2: To decrypt an encrypted message with a symmetric KMS key (Windows command prompt)

The following example is the same as the previous one except that it uses the `certutil` utility to Base64-decode the plaintext data. This procedure requires two commands, as shown in the following examples.

Before running this command, replace the example key ID with a valid key ID from your AWS account.

```
aws kms decrypt ^
    --ciphertext-blob fileb://ExampleEncryptedFile ^
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab ^
    --output text ^
    --query Plaintext > ExamplePlaintextFile.base64
```

Run the `certutil` command.

```
certutil -decode ExamplePlaintextFile.base64 ExamplePlaintextFile
```

Output:

```
Input Length = 18
Output Length = 12
CertUtil: -decode command completed successfully.
```

For more information, see Decrypt in the *AWS Key Management Service API Reference*.

Example 3: To decrypt an encrypted message with an asymmetric KMS key (Linux and macOS)

The following `decrypt` command example shows how to decrypt data encrypted under an RSA asymmetric KMS key.

When using an asymmetric KMS key, the `encryption-algorithm` parameter, which specifies the algorithm used to encrypt the plaintext, is required.

Before running this command, replace the example key ID with a valid key ID from your AWS account.

```
aws kms decrypt \
    --ciphertext-blob fileb://ExampleEncryptedFile \
    --key-id 0987dcba-09fe-87dc-65ba-ab0987654321 \
    --encryption-algorithm RSAES_OAEP_SHA_256 \
    --output text \
    --query Plaintext | base64 \
    --decode > ExamplePlaintextFile
```

This command produces no output. The output from the `decrypt` command is base64-decoded and saved in a file.

For more information, see Asymmetric keys in AWS KMS in the *AWS Key Management Service Developer Guide*.

- For API details, see Decrypt in *AWS CLI Command Reference*.

delete-alias

The following code example shows how to use `delete-alias`.

AWS CLI

To delete an AWS KMS alias

The following `delete-alias` example deletes the alias `alias/example-alias`. The alias name must begin with alias/.

```
aws kms delete-alias \
    --alias-name alias/example-alias
```

This command produces no output. To find the alias, use the `list-aliases` command.

For more information, see Deleting an alias in the *AWS Key Management Service Developer Guide*.

- For API details, see DeleteAlias in *AWS CLI Command Reference*.

`delete-custom-key-store`

The following code example shows how to use `delete-custom-key-store`.

AWS CLI

To delete a custom key store

The following `delete-custom-key-store` example deletes the specified custom key store.

Deleting an AWS CloudHSM key store has no effect on the associated CloudHSM cluster. Deleting an external key store has no effect on the associated external key store proxy, external key manager, or external keys.

NOTE: Before you can delete a custom key store, you must schedule the deletion of all KMS keys in the custom key store and then wait for those KMS keys to be deleted. Then, you must disconnect the custom key store. For help finding the KMS keys in your custom key store, see Delete an AWS CloudHSM key store (API) in the *AWS Key Management Service Developer Guide*.

```
delete-custom-key-store \
    --custom-key-store-id cks-1234567890abcdef0
```

This command does not return any output. To verify that the custom key store is deleted, use the `describe-custom-key-stores` command.

For information about deleting an AWS CloudHSM key stores, see Deleting an AWS CloudHSM key store in the *AWS Key Management Service Developer Guide*.

For information about deleting external key stores, see Deleting an external key store in the *AWS Key Management Service Developer Guide*.

- For API details, see DeleteCustomKeyStore in *AWS CLI Command Reference*.

`delete-imported-key-material`

The following code example shows how to use `delete-imported-key-material`.

AWS CLI

To delete imported key material from a KMS key

The following `delete-imported-key-material` example deletes key material that had been imported into a KMS key.

```
aws kms delete-imported-key-material \
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
    "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
    "KeyMaterialId":
 "0b7fd7ddbac6eef27907413567cad8c810e2883dc8a7534067a82ee1142fc1e6"
}
```

For more information, see Deleting imported key material in the *AWS Key Management Service Developer Guide*.

- For API details, see DeleteImportedKeyMaterial in *AWS CLI Command Reference*.

`derive-shared-secret`

The following code example shows how to use `derive-shared-secret`.

AWS CLI

To derive a shared secret

The following `derive-shared-secret` example derives a shared secret using a key agreement algorithm.

You must use an asymmetric NIST-recommended elliptic curve (ECC) or SM2 (China Regions only) KMS key pair with a `KeyUsage` value of `KEY_AGREEMENT` to call DeriveSharedSecret.

```
aws kms derive-shared-secret \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --key-agreement-algorithm ECDH \
```

```
    --public-
key "MIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEAvH3Yj0wbkLEpUl95Cv1cJVjsVNSjwGq3tCLnzXfhVwV
```

Output:

```
{
    "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
    "SharedSecret": "MEYCIQCKZLWyTk5runarx6XiAkU9gv3lbwPO/pHa
+DXFehzdDwIhANwpsIV2g/9SPWLLsF6p/hiSskuIXMTRwqrMdVKWTMHG",
    "KeyAgreementAlgorithm": "ECDH",
    "KeyOrigin": "AWS_KMS"
}
```

For more information, see DeriveSharedSecret in the *AWS Key Management Service API Reference*.

- For API details, see DeriveSharedSecret in *AWS CLI Command Reference*.

`describe-custom-key-stores`

The following code example shows how to use `describe-custom-key-stores`.

AWS CLI

Example 1: To get details about an AWS CloudHSM key store

The following `describe-custom-key-store` example displays details about the specified AWS CloudHSM key store. The command is the same for all types of custom key stores, but the output differs with the key store type and, for an external key store, its connectivity option.

By default, this command displays information about all custom key stores in the account and Region. To display information about a particular custom key store, use the `custom-key-store-name` or `custom-key-store-id` parameter.

```
aws kms describe-custom-key-stores \
    --custom-key-store-name ExampleCloudHSMKeyStore
```

The output of this command includes useful details about the AWS CloudHSM key store including its connection state (`ConnectionState`). If the connection state is `FAILED`, the output includes a `ConnectionErrorCode` field that describes the problem.

Output:

```
{
    "CustomKeyStores": [
        {
            "CloudHsmClusterId": "cluster-1a23b4cdefg",
            "ConnectionState": "CONNECTED",
            "CreationDate": "2022-04-05T14:04:55-07:00",
            "CustomKeyStoreId": "cks-1234567890abcdef0",
            "CustomKeyStoreName": "ExampleExternalKeyStore",
            "TrustAnchorCertificate": "<certificate appears here>"
        }
    ]
}
```

For more information, see [Viewing an AWS CloudHSM key store](#) in the *AWS Key Management Service Developer Guide*.

Example 2: To get details about an external key store with public endpoint connectivity

The following `describe-custom-key-store` example displays details about the specified external key store. The command is the same for all types of custom key stores, but the output differs with the key store type and, for an external key store, its connectivity option.

By default, this command displays information about all custom key stores in the account and Region. To display information about a particular custom key store, use the `custom-key-store-name` or `custom-key-store-id` parameter.

```
aws kms describe-custom-key-stores \
    --custom-key-store-id cks-9876543210fedcba9
```

The output of this command includes useful details about the external key store including its connection state (`ConnectionState`). If the connection state is `FAILED`, the output includes a `ConnectionErrorCode` field that describes the problem.

Output:

```
{
    "CustomKeyStores": [
        {
            "CustomKeyStoreId": "cks-9876543210fedcba9",
```

```
            "CustomKeyStoreName": "ExampleXKS",
            "ConnectionState": "CONNECTED",
            "CreationDate": "2022-12-02T07:48:55-07:00",
            "CustomKeyStoreType": "EXTERNAL_KEY_STORE",
            "XksProxyConfiguration": {
                "AccessKeyId": "ABCDE12345670EXAMPLE",
                "Connectivity": "PUBLIC_ENDPOINT",
                "UriEndpoint": "https://myproxy.xks.example.com",
                "UriPath": "/example-prefix/kms/xks/v1"
            }
        }
    ]
}
```

For more information, see Viewing an external key store in the *AWS Key Management Service Developer Guide*.

Example 3: To get details about an external key store with VPC endpoint service connectivity

The following `describe-custom-key-store` example displays details about the specified external key store. The command is the same for all types of custom key stores, but the output differs with the key store type and, for an external key store, its connectivity option.

By default, this command displays information about all custom key stores in the account and Region. To display information about a particular custom key store, use the `custom-key-store-name` or `custom-key-store-id` parameter.

```
aws kms describe-custom-key-stores \
    --custom-key-store-id cks-2234567890abcdef0
```

The output of this command includes useful details about the external key store including its connection state (`ConnectionState`). If the connection state is `FAILED`, the output includes a `ConnectionErrorCode` field that describes the problem.

Output:

```
{
    "CustomKeyStores": [
        {
            "CustomKeyStoreId": "cks-3234567890abcdef0",
```

```
            "CustomKeyStoreName": "ExampleVPCExternalKeyStore",
            "ConnectionState": "CONNECTED",
            "CreationDate": "2022-12-22T07:48:55-07:00",
            "CustomKeyStoreType": "EXTERNAL_KEY_STORE",
            "XksProxyConfiguration": {
                "AccessKeyId": "ABCDE12345670EXAMPLE",
                "Connectivity": "VPC_ENDPOINT_SERVICE",
                "UriEndpoint": "https://myproxy-private.xks.example.com",
                "UriPath": "/kms/xks/v1",
                "VpcEndpointServiceName": "com.amazonaws.vpce.us-east-1.vpce-svc-
example1"
            }
        }
    ]
}
```

For more information, see Viewing an external key store in the *AWS Key Management Service Developer Guide*.

- For API details, see DescribeCustomKeyStores in *AWS CLI Command Reference*.

describe-key

The following code example shows how to use `describe-key`.

AWS CLI

Example 1: To find detailed information about a KMS key

The following `describe-key` example gets detailed information about the AWS managed key for Amazon S3 in the example account and Region. You can use this command to find details about AWS managed keys and customer managed keys.

To specify the KMS key, use the `key-id` parameter. This example uses an alias name value, but you can use a key ID, key ARN, alias name, or alias ARN in this command.

```
aws kms describe-key \
    --key-id alias/aws/s3
```

Output:

```
{
```

```
    "KeyMetadata": {
        "AWSAccountId": "846764612917",
        "KeyId": "b8a9477d-836c-491f-857e-07937918959b",
        "Arn": "arn:aws:kms:us-west-2:846764612917:key/
b8a9477d-836c-491f-857e-07937918959b",
        "CurrentKeyMaterialId":
 "0b7fd7ddbac6eef27907413567cad8c810e2883dc8a7534067a82ee1142fc1e6",
        "CreationDate": 2017-06-30T21:44:32.140000+00:00,
        "Enabled": true,
        "Description": "Default KMS key that protects my S3 objects when no other
 key is defined",
        "KeyUsage": "ENCRYPT_DECRYPT",
        "KeyState": "Enabled",
        "Origin": "AWS_KMS",
        "KeyManager": "AWS",
        "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
        "EncryptionAlgorithms": [
            "SYMMETRIC_DEFAULT"
        ]
    }
}
```

For more information, see Viewing keys in the *AWS Key Management Service Developer Guide*.

Example 2: To get details about an RSA asymmetric KMS key

The following `describe-key` example gets detailed information about an asymmetric RSA KMS key used for signing and verification.

```
aws kms describe-key \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
    "KeyMetadata": {
        "AWSAccountId": "111122223333",
        "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
        "Arn": "arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
        "CreationDate": "2019-12-02T19:47:14.861000+00:00",
        "CustomerMasterKeySpec": "RSA_2048",
```

```
        "Enabled": false,
        "Description": "",
        "KeyState": "Disabled",
        "Origin": "AWS_KMS",
        "MultiRegion": false,
        "KeyManager": "CUSTOMER",
        "KeySpec": "RSA_2048",
        "KeyUsage": "SIGN_VERIFY",
        "SigningAlgorithms": [
            "RSASSA_PKCS1_V1_5_SHA_256",
            "RSASSA_PKCS1_V1_5_SHA_384",
            "RSASSA_PKCS1_V1_5_SHA_512",
            "RSASSA_PSS_SHA_256",
            "RSASSA_PSS_SHA_384",
            "RSASSA_PSS_SHA_512"
        ]
    }
}
```

Example 3: To get details about a multi-Region replica key

The following `describe-key` example gets metadata for a multi-Region replica key. This multi-Region key is a symmetric encryption key. The output of a `describe-key` command for any multi-Region key returns information about the primary key and all of its replicas.

```
aws kms describe-key \
    --key-id arn:aws:kms:ap-northeast-1:111122223333:key/
mrk-1234abcd12ab34cd56ef1234567890ab
```

Output:

```
{
    "KeyMetadata": {
        "MultiRegion": true,
        "AWSAccountId": "111122223333",
        "Arn": "arn:aws:kms:ap-northeast-1:111122223333:key/
mrk-1234abcd12ab34cd56ef1234567890ab",
        "CreationDate": "2021-06-28T21:09:16.114000+00:00",
        "CurrentKeyMaterialId":
 "0b7fd7ddbac6eef27907413567cad8c810e2883dc8a7534067a82ee1142fc1e6",
        "Description": "",
        "Enabled": true,
```

```
        "KeyId": "mrk-1234abcd12ab34cd56ef1234567890ab",
        "KeyManager": "CUSTOMER",
        "KeyState": "Enabled",
        "KeyUsage": "ENCRYPT_DECRYPT",
        "Origin": "AWS_KMS",
        "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
        "EncryptionAlgorithms": [
            "SYMMETRIC_DEFAULT"
        ],
        "MultiRegionConfiguration": {
            "MultiRegionKeyType": "PRIMARY",
            "PrimaryKey": {
                "Arn": "arn:aws:kms:us-west-2:111122223333:key/
mrk-1234abcd12ab34cd56ef1234567890ab",
                "Region": "us-west-2"
            },
            "ReplicaKeys": [
                {
                    "Arn": "arn:aws:kms:eu-west-1:111122223333:key/
mrk-1234abcd12ab34cd56ef1234567890ab",
                    "Region": "eu-west-1"
                },
                {
                    "Arn": "arn:aws:kms:ap-northeast-1:111122223333:key/
mrk-1234abcd12ab34cd56ef1234567890ab",
                    "Region": "ap-northeast-1"
                },
                {
                    "Arn": "arn:aws:kms:sa-east-1:111122223333:key/
mrk-1234abcd12ab34cd56ef1234567890ab",
                    "Region": "sa-east-1"
                }
            ]
        }
    }
}
```

Example 4: To get details about an HMAC KMS key

The following `describe-key` example gets detailed information about an HMAC KMS key.

```
aws kms describe-key \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
    "KeyMetadata": {
        "AWSAccountId": "123456789012",
        "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
        "Arn": "arn:aws:kms:us-
west-2:123456789012:key/1234abcd-12ab-34cd-56ef-1234567890ab",
        "CreationDate": "2022-04-03T22:23:10.194000+00:00",
        "Enabled": true,
        "Description": "Test key",
        "KeyUsage": "GENERATE_VERIFY_MAC",
        "KeyState": "Enabled",
        "Origin": "AWS_KMS",
        "KeyManager": "CUSTOMER",
        "CustomerMasterKeySpec": "HMAC_256",
        "MacAlgorithms": [
            "HMAC_SHA_256"
        ],
        "MultiRegion": false
    }
}
```

- For API details, see DescribeKey in *AWS CLI Command Reference*.

`disable-key-rotation`

The following code example shows how to use `disable-key-rotation`.

AWS CLI

To disable automatic rotation of a KMS key

The following `disable-key-rotation` example disables automatic rotation of a customer managed KMS key. To reenable automatic rotation, use the `enable-key-rotation` command.

```
aws kms disable-key-rotation \
    --key-id arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab
```

This command produces no output. To verify that automatic rotation is disable for the KMS key, use the `get-key-rotation-status` command.

For more information, see Rotating keys in the *AWS Key Management Service Developer Guide*.

- For API details, see DisableKeyRotation in *AWS CLI Command Reference*.

`disable-key`

The following code example shows how to use `disable-key`.

AWS CLI

To temporarily disable a KMS key

The following `disable-key` command disables a customer managed KMS key. To re-enable the KMS key, use the `enable-key` command.

```
aws kms disable-key \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

This command produces no output.

For more information, see Enabling and Disabling Keys in the *AWS Key Management Service Developer Guide*.

- For API details, see DisableKey in *AWS CLI Command Reference*.

`disconnect-custom-key-store`

The following code example shows how to use `disconnect-custom-key-store`.

AWS CLI

To disconnect a custom key store

The following `disconnect-custom-key-store` example disconnects a custom key store from its AWS CloudHSM cluster. You might disconnect a key store to troubleshoot a problem, to update its settings, or to prevent KMS keys in the keystore from being used in cryptographic operations.

This command is the same for all custom key stores, including AWS CloudHSM key stores and external key stores.

Before running this command, replace the example custom key store ID with a valid one.

```
$ aws kms disconnect-custom-key-store \
    --custom-key-store-id cks-1234567890abcdef0
```

This command produces no output. verify that the command was effective, use the `describe-custom-key-stores` command.

For more information about disconnecting an AWS CloudHSM key store, see Connecting and disconnecting an AWS CloudHSM key store in the *AWS Key Management Service Developer Guide*.

For more information about disconnecting an external key store, see Connecting and disconnecting an external key store in the *AWS Key Management Service Developer Guide*.

- For API details, see DisconnectCustomKeyStore in *AWS CLI Command Reference*.

enable-key-rotation

The following code example shows how to use `enable-key-rotation`.

AWS CLI

To enable automatic rotation of a KMS key

The following `enable-key-rotation` example enables automatic rotation of a customer managed KMS key with a rotation period of 180 days. The KMS key will be rotated one year (approximate 365 days) from the date that this command completes and every year thereafter.

The `--key-id` parameter identifies the KMS key. This example uses a key ARN value, but you can use either the key ID or the ARN of the KMS key.The `--rotation-period-in-days` parameter specifies the number of days between each rotation date. Specify a value between 90 and 2560 days. If no value is specified, the default value is 365 days.

```
aws kms enable-key-rotation \
    --key-id arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab \
    --rotation-period-in-days 180
```

This command produces no output. To verify that the KMS key is enabled, use the `get-key-rotation-status` command.

For more information, see Rotating keys in the *AWS Key Management Service Developer Guide*.

- For API details, see EnableKeyRotation in *AWS CLI Command Reference*.

`enable-key`

The following code example shows how to use `enable-key`.

AWS CLI

To enable a KMS key

The following `enable-key` example enables a customer managed key. You can use a command like this one to enable a KMS key that you temporarily disabled by using the `disable-key` command. You can also use it to enable a KMS key that is disabled because it was scheduled for deletion and the deletion was canceled.

To specify the KMS key, use the `key-id` parameter. This example uses an key ID value, but you can use a key ID or key ARN value in this command.

Before running this command, replace the example key ID with a valid one.

```
aws kms enable-key \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

This command produces no output. To verify that the KMS key is enabled, use the `describe-key` command. See the values of the `KeyState` and `Enabled` fields in the `describe-key` output.

For more information, see Enabling and Disabling Keys in the *AWS Key Management Service Developer Guide*.

- For API details, see EnableKey in *AWS CLI Command Reference*.

`encrypt`

The following code example shows how to use `encrypt`.

AWS CLI

Example 1: To encrypt the contents of a file on Linux or MacOS

The following `encrypt` command demonstrates the recommended way to encrypt data with the AWS CLI.

```
aws kms encrypt \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --plaintext fileb://ExamplePlaintextFile \
    --output text \
    --query CiphertextBlob | base64 \
    --decode > ExampleEncryptedFile
```

The command does several things:

Uses the `--plaintext` parameter to indicate the data to encrypt. This parameter value must be base64-encoded.The value of the `plaintext` parameter must be base64-encoded, or you must use the `fileb://` prefix, which tells the AWS CLI to read binary data from the file.If the file is not in the current directory, type the full path to file. For example: `fileb:///var/tmp/ExamplePlaintextFile` or `fileb://C:\Temp\ExamplePlaintextFile`. For more information about reading AWS CLI parameter values from a file, see Loading Parameters from a File in the *AWS Command Line Interface User Guide* and Best Practices for Local File Parameters on the AWS Command Line Tool Blog.Uses the `--output` and `--query` parameters to control the command's output.These parameters extract the encrypted data, called the *ciphertext*, from the command's output.For more information about controlling output, see Controlling Command Output in the *AWS Command Line Interface User Guide*.Uses the `base64` utility to decode the extracted output into binary data.The ciphertext that is returned by a successful `encrypt` command is base64-encoded text. You must decode this text before you can use the AWS CLI to decrypt it.Saves the binary ciphertext to a file.The final part of the command (`> ExampleEncryptedFile`) saves the binary ciphertext to a file to make decryption easier. For an example command that uses the AWS CLI to decrypt data, see the decrypt examples.

Example 2: Using the AWS CLI to encrypt data on Windows

This example is the same as the previous one, except that it uses the `certutil` tool instead of `base64`. This procedure requires two commands, as shown in the following example.

```
aws kms encrypt \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --plaintext fileb://ExamplePlaintextFile \
    --output text \
    --query CiphertextBlob > C:\Temp\ExampleEncryptedFile.base64

certutil -decode C:\Temp\ExampleEncryptedFile.base64 C:\Temp\ExampleEncryptedFile
```

Example 3: Encrypting with an asymmetric KMS key

The following `encrypt` command shows how to encrypt plaintext with an asymmetric KMS key. The `--encryption-algorithm` parameter is required. As in all `encrypt` CLI commands, the `plaintext` parameter must be base64-encoded, or you must use the `fileb://` prefix, which tells the AWS CLI to read binary data from the file.

```
aws kms encrypt \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --encryption-algorithm RSAES_OAEP_SHA_256 \
    --plaintext fileb://ExamplePlaintextFile \
    --output text \
    --query CiphertextBlob | base64 \
    --decode > ExampleEncryptedFile
```

This command produces no output.

- For API details, see Encrypt in *AWS CLI Command Reference*.

`generate-data-key-pair-without-plaintext`

The following code example shows how to use `generate-data-key-pair-without-plaintext`.

AWS CLI

To generate an ECC NIST P384 asymmetric data key pair

The following `generate-data-key-pair-without-plaintext` example requests an ECC NIST P384 key pair for use outside of AWS.

The command returns a plaintext public key and a copy of the private key encrypted under the specified KMS key. It does not return a plaintext private key. You can safely store the encrypted private key with the encrypted data, and call AWS KMS to decrypt the private key when you need to use it.

To request an ECC NIST P384 asymmetric data key pair, use the `key-pair-spec` parameter with a value of `ECC_NIST_P384`.

The KMS key you specify must be a symmetric encryption KMS key, that is, a KMS key with a `KeySpec` value of `SYMMETRIC_DEFAULT`.

NOTE: The values in the output of this example are truncated for display.

```
aws kms generate-data-key-pair-without-plaintext \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --key-pair-spec ECC_NIST_P384
```

Output:

```
{
    "PrivateKeyCiphertextBlob": "AQIDAHi6LtupRpdKl2aJTzkK6FbhOtQkMlQJJH3PdtHvS/y
+hAFFxmiD134doUDzMGmfCEtcAAAHaTCCB2UGCSqGSIb3DQEHBqCCB1...",
    "PublicKey":
 "MIIBojANBgkqhkiG9w0BAQEFAAOCAY8AMIIBigKCAYEA3A3eGMyPrvSn7+LdlJE1oUoQV5HpEuHAVbdOyND
+NmYDH/mL1OSIEuLrcdZ5hrMH4pk83r40l...",
    "KeyId": "arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "KeyMaterialId":
 "0b7fd7ddbac6eef27907413567cad8c810e2883dc8a7534067a82ee1142fc1e6",
    "KeyPairSpec": "ECC_NIST_P384"
}
```

The `PublicKey` and `PrivateKeyCiphertextBlob` are returned in base64-encoded format.

For more information, see Data key pairs in the *AWS Key Management Service Developer Guide*.

- For API details, see GenerateDataKeyPairWithoutPlaintext in *AWS CLI Command Reference*.

`generate-data-key-pair`

The following code example shows how to use `generate-data-key-pair`.

AWS CLI

To generate an 2048-bit RSA asymmetric data key pair

The following `generate-data-key-pair` example requests a 2048-bit RSA asymmetric data key pair for use outside of AWS. The command returns a plaintext public key and a plaintext private key for immediate use and deletion, and a copy of the private key encrypted under the specified KMS key. You can safely store the encrypted private key with the encrypted data.

To request a 2048-bit RSA asymmetric data key pair, use the `key-pair-spec` parameter with a value of `RSA_2048`.

The KMS key you specify must be a symmetric encryption KMS key, that is, a KMS key with a `KeySpec` value of `SYMMETRIC_DEFAULT`.

NOTE: The values in the output of this example are truncated for display.

```
aws kms generate-data-key-pair \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --key-pair-spec RSA_2048
```

Output:

```
{
    "PrivateKeyCiphertextBlob": "AQIDAHi6LtupRpdKl2aJTzkK6FbhOtQkMlQJJH3PdtHvS/y
+hAFFxmiD134doUDzMGmfCEtcAAAHaTCCB2UGCSqGSIb3DQEHBqCCB1...",
    "PrivateKeyPlaintext": "MIIG/

    "PublicKey":
 "MIIBojANBgkqhkiG9w0BAQEFAAOCAY8AMIIBigKCAYEA3A3eGMyPrvSn7+LdlJE1oUoQV5HpEuHAVbdOyND
+NmYDH/mL1OSIEuLrcdZ5hrMH4pk83r40l...",
    "KeyId": "arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "KeyMaterialId":
 "0b7fd7ddbac6eef27907413567cad8c810e2883dc8a7534067a82ee1142fc1e6"
    "KeyPairSpec": "RSA_2048"
}
```

The `PublicKey`, `PrivateKeyPlaintext`, and `PrivateKeyCiphertextBlob` are returned in base64-encoded format.

For more information, see Data key pairs in the *AWS Key Management Service Developer Guide*.

- For API details, see GenerateDataKeyPair in *AWS CLI Command Reference*.

`generate-data-key-without-plaintext`

The following code example shows how to use `generate-data-key-without-plaintext`.

AWS CLI

To generate a 256-bit symmetric data key without a plaintext key

The following `generate-data-key-without-plaintext` example requests an encrypted copy of a 256-bit symmetric data key for use outside of AWS. You can call AWS KMS to decrypt the data key when you are ready to use it.

To request a 256-bit data key, use the `key-spec` parameter with a value of `AES_256`. To request a 128-bit data key, use the `key-spec` parameter with a value of `AES_128`. For all other data key lengths, use the `number-of-bytes` parameter.

The KMS key you specify must be a symmetric encryption KMS key, that is, a KMS key with a key spec value of SYMMETRIC_DEFAULT.

```
aws kms generate-data-key-without-plaintext \
    --key-id "arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab" \
    --key-spec AES_256
```

Output:

```
{
    "CiphertextBlob":
 "AQEDAHjRYf5WytIc0C857tFSnBaPn2F8DgfmThbJlGfR8P3WlwAAAH4wfAYJKoZIhvcNAQcGoG8wbQIBADBoBgkqhk
    "KeyId": "arn:aws:kms:us-
east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "KeyMaterialId":
 "0b7fd7ddbac6eef27907413567cad8c810e2883dc8a7534067a82ee1142fc1e6"
}
```

The `CiphertextBlob` (encrypted data key) is returned in base64-encoded format.

For more information, see Data keys in the *AWS Key Management Service Developer Guide*.

- For API details, see GenerateDataKeyWithoutPlaintext in *AWS CLI Command Reference*.

generate-data-key

The following code example shows how to use `generate-data-key`.

AWS CLI

Example 1: To generate a 256-bit symmetric data key

The following `generate-data-key` example requests a 256-bit symmetric data key for use outside of AWS. The command returns a plaintext data key for immediate use and deletion, and a copy of that data key encrypted under the specified KMS key. You can safely store the encrypted data key with the encrypted data.

To request a 256-bit data key, use the `key-spec` parameter with a value of `AES_256`. To request a 128-bit data key, use the `key-spec` parameter with a value of `AES_128`. For all other data key lengths, use the `number-of-bytes` parameter.

The KMS key you specify must be a symmetric encryption KMS key, that is, a KMS key with a key spec value of SYMMETRIC_DEFAULT.

```
aws kms generate-data-key \
    --key-id alias/ExampleAlias \
    --key-spec AES_256
```

Output:

```
{
    "Plaintext": "VdzKNHGzUAzJeRBVY+uUmofUGGiDzyB3+i9fVkh3piw=",
    "KeyId": "arn:aws:kms:us-
east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "KeyMaterialId":
 "0b7fd7ddbac6eef27907413567cad8c810e2883dc8a7534067a82ee1142fc1e6",

}
```

The `Plaintext` (plaintext data key) and the `CiphertextBlob` (encrypted data key) are returned in base64-encoded format.

For more information, see Data keys in the *AWS Key Management Service Developer Guide*.

Example 2: To generate a 512-bit symmetric data key

The following `generate-data-key` example requests a 512-bit symmetric data key for encryption and decryption. The command returns a plaintext data key for immediate use and deletion, and a copy of that data key encrypted under the specified KMS key. You can safely store the encrypted data key with the encrypted data.

To request a key length other than 128 or 256 bits, use the `number-of-bytes` parameter. To request a 512-bit data key, the following example uses the `number-of-bytes` parameter with a value of 64 (bytes).

The KMS key you specify must be a symmetric encryption KMS key, that is, a KMS key with a key spec value of SYMMETRIC_DEFAULT.

NOTE: The values in the output of this example are truncated for display.

```
aws kms generate-data-key \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --number-of-bytes 64
```

Output:

```
{
    "CiphertextBlob": "AQIBAHi6LtupRpdKl2aJTzkK6FbhOtQkMlQJJH3PdtHvS/y+hAEnX/
QQNmMwDfg2korNMEc8AAACaDCCAmQGCSqGSIb3DQEHBqCCAlUwggJRAgEAMIICSgYJKoZ...",
    "Plaintext": "ty8Lr0Bk6OF07M2BWt6qbFdNB
+G00ZLtf5MSEb4al3R2UKWGOp06njAwy2n72VRm2m7z/
Pm9Wpbvttz6a4lSo9hgPvKhZ5y6RTm4OovEXiVfBveyX3DQxDzRSwbKDPk/...",
    "KeyId": "arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "KeyMaterialId":
 "0b7fd7ddbac6eef27907413567cad8c810e2883dc8a7534067a82ee1142fc1e6"
}
```

The `Plaintext` (plaintext data key) and `CiphertextBlob` (encrypted data key) are returned in base64-encoded format.

For more information, see Data keys in the *AWS Key Management Service Developer Guide*.

- For API details, see GenerateDataKey in *AWS CLI Command Reference*.

`generate-mac`

The following code example shows how to use `generate-mac`.

AWS CLI

Example 1: To generate an HMAC for a message

The following `generate-mac` command generates an HMAC for a message, an HMAC KMS key, and a MAC algorithm. The algorithm must be supported by the specified HMAC KMS key.

In AWS CLI v2, the value of the `message` parameter must be Base64-encoded. Or, you can save the message in a file and use the `fileb://` prefix, which tells the AWS CLI to read binary data from the file.

Before running this command, replace the example key ID with a valid key ID from your AWS account. The key ID must represent a HMAC KMS key with a key usage of `GENERATE_VERIFY_MAC`.

```
msg=(echo 'Hello World' | base64)

aws kms generate-mac \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --message fileb://Message \
    --mac-algorithm HMAC_SHA_384
```

Output:

```
{
    "KeyId": "arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "Mac": "<HMAC_TAG>",
    "MacAlgorithm": "HMAC_SHA_384"
}
```

For more information about using HMAC KMS keys in AWS KMS, see HMAC keys in AWS KMS in the *AWS Key Management Service Developer Guide*.

Example 2: To save an HMAC in a file (Linux and macOs)

The following `generate-mac` example generates an HMAC for a short message stored in a local file. The command also gets the `Mac` property from the response, Base64-decodes it and saves it in the ExampleMac file. You can use the MAC file in a `verify-mac` command that verifies the MAC.

The `generate-mac` command requires a Base64-encoded message and a MAC algorithm that your HMAC KMS key supports. To get the MAC algorithms that your KMS key supports, use the `describe-key` command.

Before running this command, replace the example key ID with a valid key ID from your AWS account. The key ID must represent an asymmetric KMS key with a key usage of GENERATE_VERIFY_MAC.

```
echo 'hello world' | base64 > EncodedMessage

aws kms generate-mac \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --message fileb://EncodedMessage \
    --mac-algorithm HMAC_SHA_384 \
    --output text \
    --query Mac | base64 --decode > ExampleMac
```

This command produces no output. This example extracts the `Mac` property of the output and saves it in a file.

For more information about using HMAC KMS keys in AWS KMS, see HMAC keys in AWS KMS in the *AWS Key Management Service Developer Guide*.

- For API details, see GenerateMac in *AWS CLI Command Reference*.

`generate-random`

The following code example shows how to use `generate-random`.

AWS CLI

Example 1: To generate a 256-bit random byte string (Linux or macOs)

The following `generate-random` example generates a 256-bit (32-byte), base64-encoded random byte string. The example decodes the byte string and saves it in the random file.

When you run this command, you must use the `number-of-bytes` parameter to specify the length of the random value in bytes.

You don't specify a KMS key when you run this command. The random byte string is unrelated to any KMS key.

By default, AWS KMS generates the random number. However, if you specify a custom key store, the random byte string is generated in the AWS CloudHSM cluster associated with the custom key store.

This example uses the following parameters and values:

It uses the required `--number-of-bytes` parameter with a value of `32` to request a 32-byte (256-bit) string.It uses the `--output` parameter with a value of `text` to direct the AWS CLI to return the output as text, instead of JSON.It uses the `--query parameter` to extract the value of the `Plaintext` property from the response.It pipes (|) the output of the command to the `base64` utility, which decodes the extracted output.It uses the redirection operator (>) to save decoded byte string to the `ExampleRandom` file.It uses the redirection operator (>) to save the binary ciphertext to a file.

```
aws kms generate-random \
    --number-of-bytes 32 \
    --output text \
    --query Plaintext | base64 --decode > ExampleRandom
```

This command produces no output.

For more information, see GenerateRandom in the *AWS Key Management Service API Reference*.

Example 2: To generate a 256-bit random number (Windows Command Prompt)

The following example uses the `generate-random` command to generate a 256-bit (32-byte), base64-encoded random byte string. The example decodes the byte string and saves it in the random file. This example is the same as the previous example, except that it uses the `certutil` utility in Windows to base64-decode the random byte string before saving it in a file.

First, generate a base64-encoded random byte string and saves it in a temporary file, `ExampleRandom.base64`.

```
aws kms generate-random \
    --number-of-bytes 32 \
    --output text \
    --query Plaintext > ExampleRandom.base64
```

Because the output of the `generate-random` command is saved in a file, this example produces no output.

Now use the `certutil -decode` command to decode the base64-encoded byte string in the `ExampleRandom.base64` file. Then, it saves the decoded byte string in the `ExampleRandom` file.

```
certutil -decode ExampleRandom.base64 ExampleRandom
```

Output:

```
Input Length = 18
Output Length = 12
CertUtil: -decode command completed successfully.
```

For more information, see GenerateRandom in the *AWS Key Management Service API Reference*.

- For API details, see GenerateRandom in *AWS CLI Command Reference*.

`get-key-policy`

The following code example shows how to use `get-key-policy`.

AWS CLI

To copy a key policy from one KMS key to another KMS key

The following `get-key-policy` example gets the key policy from one KMS key and saves it in a text file. Then, it replaces the policy of a different KMS key using the text file as the policy input.

Because the `--policy` parameter of `put-key-policy` requires a string, you must use the `--output text` option to return the output as a text string instead of JSON.

```
aws kms get-key-policy \
    --policy-name default \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --query Policy \
    --output text > policy.txt

aws kms put-key-policy \
    --policy-name default \
    --key-id 0987dcba-09fe-87dc-65ba-ab0987654321 \
    --policy file://policy.txt
```

This command produces no output.

For more information, see PutKeyPolicy in the *AWS KMS API Reference*.

- For API details, see GetKeyPolicy in *AWS CLI Command Reference*.

`get-key-rotation-status`

The following code example shows how to use `get-key-rotation-status`.

AWS CLI

To retrieve the rotation status for a KMS key.

The following `get-key-rotation-status` example returns information about the rotation status of the specified KMS key, including whether automatic rotation is enabled, the rotation period, and the next scheduled rotation date. You can use this command on customer managed KMS keys and AWS managed KMS keys. However, all AWS managed KMS keys are automatically rotated every year.

```
aws kms get-key-rotation-status \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
    "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
    "KeyRotationEnabled": true,
    "NextRotationDate": "2024-02-14T18:14:33.587000+00:00",
    "RotationPeriodInDays": 365
}
```

For more information, see Rotating keys in the *AWS Key Management Service Developer Guide*.

- For API details, see GetKeyRotationStatus in *AWS CLI Command Reference*.

`get-parameters-for-import`

The following code example shows how to use `get-parameters-for-import`.

AWS CLI

To get the items required to import key material into a KMS key

The following `get-parameters-for-import` example gets the public key and import token that you need to import key material into a KMS key. When you use the `import-key-`

`material` command, be sure to use the import token and key material encrypted by the public key that were returned in the same `get-parameters-for-import` command. Also, the wrapping algorithm that you specify in this command must be one that you use to encrypt the key material with the public key.

To specify the KMS key, use the `key-id` parameter. This example uses an key ID, but you can use a key ID or key ARN in this command.

```
aws kms get-parameters-for-import \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --wrapping-algorithm RSAES_OAEP_SHA_256 \
    --wrapping-key-spec RSA_2048
```

Output:

```
{
    "KeyId": "arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "PublicKey": "<public key base64 encoded data>",
    "ImportToken": "<import token base64 encoded data>",
    "ParametersValidTo": 1593893322.32
}
```

For more information, see Download the public key and import token in the *AWS Key Management Service Developer Guide*.

- For API details, see GetParametersForImport in *AWS CLI Command Reference*.

`get-public-key`

The following code example shows how to use `get-public-key`.

AWS CLI

Example 1: To download the public key of an asymmetric KMS key

The following `get-public-key` example downloads the public key of an asymmetric KMS key.

In addition to returning the public key, the output includes information that you need to use the public key safely outside of AWS KMS, including the key usage and supported encryption algorithms.

```
aws kms get-public-key \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
    "KeyId": "arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "PublicKey": "jANBgkqhkiG9w0BAQEFAAOCAg8AMIICCgKCAgEAl5epvg1/
QtJhxSi2g9SDEVg8QV/...",
    "CustomerMasterKeySpec": "RSA_4096",
    "KeyUsage": "ENCRYPT_DECRYPT",
    "EncryptionAlgorithms": [
        "RSAES_OAEP_SHA_1",
        "RSAES_OAEP_SHA_256"
    ]
}
```

For more information about using asymmetric KMS keys in AWS KMS, see Asymmetric keys in AWS KMS in the *AWS Key Management Service Developer Guide*. **Example 2: To convert a public key to DER format (Linux and macOS)**

The following `get-public-key` example downloads the public key of an asymmetric KMS key and saves it in a DER file.

When you use the `get-public-key` command in the AWS CLI, it returns a DER-encoded X.509 public key that is Base64-encoded. This example gets the value of the `PublicKey` property as text. It Base64-decodes the `PublicKey` and saves it in the `public_key.der` file. The `output` parameter returns the output as text, instead of JSON. The `--query` parameter gets only the `PublicKey` property, not the properties that you need to use the public key safely outside of AWS KMS.

Before running this command, replace the example key ID with a valid key ID from your AWS account.

```
aws kms get-public-key \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --output text \
    --query PublicKey | base64 --decode > public_key.der
```

This command produces no output.

For more information about using asymmetric KMS keys in AWS KMS, see Asymmetric keys in AWS KMS in the *AWS Key Management Service Developer Guide*.

- For API details, see GetPublicKey in *AWS CLI Command Reference*.

`import-key-material`

The following code example shows how to use `import-key-material`.

AWS CLI

To import key material into a KMS key

The following `import-key-material` example uploads key material into a KMS key that was created with no key material. The key state of the KMS key must be `PendingImport`.

This command uses key material that you encrypted with the public key that the `get-parameters-for-import` command returned. It also uses the import token from the same `get-parameters-for-import` command.

The `expiration-model` parameter indicates that the key material automatically expires on the date and time specified by the `valid-to` parameter. When the key material expires, AWS KMS deletes the key material, the key state of the KMS key changes to `Pending import` and the KMS key becomes unusable. To restore the KMS key, you must reimport the same key material. To use different key material, you must create a new KMS key.

Before running this command, replace the example key ID with a valid key ID or key ARN from your AWS account.

```
aws kms import-key-material \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --encrypted-key-material fileb://EncryptedKeyMaterial.bin \
    --import-token fileb://ImportToken.bin \
    --expiration-model KEY_MATERIAL_EXPIRES \
    --valid-to 2021-09-21T19:00:00Z
```

Output:

```
{
    "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
```

```
    "KeyMaterialId":
 "0b7fd7ddbac6eef27907413567cad8c810e2883dc8a7534067a82ee1142fc1e6"
}
```

For more information about importing key material, see Importing Key Material in the *AWS Key Management Service Developer Guide*.

- For API details, see ImportKeyMaterial in *AWS CLI Command Reference*.

`list-aliases`

The following code example shows how to use `list-aliases`.

AWS CLI

Example 1: To list all aliases in an AWS account and Region

The following example uses the `list-aliases` command to list all aliases in the default Region of the AWS account. The output includes aliases associated with AWS managed KMS keys and customer managed KMS keys.

```
aws kms list-aliases
```

Output:

```
{
    "Aliases": [
        {
            "AliasArn": "arn:aws:kms:us-west-2:111122223333:alias/testKey",
            "AliasName": "alias/testKey",
            "TargetKeyId": "1234abcd-12ab-34cd-56ef-1234567890ab"
        },
        {
            "AliasArn": "arn:aws:kms:us-west-2:111122223333:alias/FinanceDept",
            "AliasName": "alias/FinanceDept",
            "TargetKeyId": "0987dcba-09fe-87dc-65ba-ab0987654321"
        },
        {
            "AliasArn": "arn:aws:kms:us-west-2:111122223333:alias/aws/dynamodb",
            "AliasName": "alias/aws/dynamodb",
            "TargetKeyId": "1a2b3c4d-5e6f-1a2b-3c4d-5e6f1a2b3c4d"
        },
```

```
        {
            "AliasArn": "arn:aws:kms:us-west-2:111122223333:alias/aws/ebs",
            "AliasName": "alias/aws/ebs",
            "TargetKeyId": "0987ab65-43cd-21ef-09ab-87654321cdef"
        },
        ...
    ]
}
```

Example 2: To list all aliases for a particular KMS key

The following example uses the `list-aliases` command and its `key-id` parameter to list all aliases that are associated with a particular KMS key.

Each alias is associated with only one KMS key, but a KMS key can have multiple aliases. This command is very useful because the AWS KMS console lists only one alias for each KMS key. To find all aliases for a KMS key, you must use the `list-aliases` command.

This example uses the key ID of the KMS key for the `--key-id` parameter, but you can use a key ID, key ARN, alias name, or alias ARN in this command.

```
aws kms list-aliases --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
    "Aliases": [
        {
            "TargetKeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
            "AliasArn": "arn:aws:kms:us-west-2:111122223333:alias/oregon-test-key",
            "AliasName": "alias/oregon-test-key"
        },
        {
            "TargetKeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
            "AliasArn": "arn:aws:kms:us-west-2:111122223333:alias/project121-test",
            "AliasName": "alias/project121-test"
        }
    ]
}
```

For more information, see Working with Aliases in the *AWS Key Management Service Developer Guide*.

- For API details, see ListAliases in *AWS CLI Command Reference*.

`list-grants`

The following code example shows how to use `list-grants`.

AWS CLI

To view the grants on an AWS KMS key

The following `list-grants` example displays all of the grants on the specified AWS managed KMS key for Amazon DynamoDB in your account. This grant allows DynamoDB to use the KMS key on your behalf to encrypt a DynamoDB table before writing it to disk. You can use a command like this one to view the grants on the AWS managed KMS keys and customer managed KMS keys in the AWS account and Region.

This command uses the `key-id` parameter with a key ID to identify the KMS key. You can use a key ID or key ARN to identify the KMS key. To get the key ID or key ARN of an AWS managed KMS key, use the `list-keys` or `list-aliases` command.

```
aws kms list-grants \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

The output shows that the grant gives Amazon DynamoDB permission to use the KMS key for cryptographic operations, and gives it permission to view details about the KMS key (`DescribeKey`) and to retire grants (`RetireGrant`). The `EncryptionContextSubset` constraint limits these permission to requests that include the specified encryption context pairs. As a result, the permissions in the grant are effective only on specified account and DynamoDB table.

```
{
    "Grants": [
        {
            "Constraints": {
                "EncryptionContextSubset": {
                    "aws:dynamodb:subscriberId": "123456789012",
                    "aws:dynamodb:tableName": "Services"
                }
            },
            "IssuingAccount": "arn:aws:iam::123456789012:root",
            "Name": "8276b9a6-6cf0-46f1-b2f0-7993a7f8c89a",
```

```
            "Operations": [
                "Decrypt",
                "Encrypt",
                "GenerateDataKey",
                "ReEncryptFrom",
                "ReEncryptTo",
                "RetireGrant",
                "DescribeKey"
            ],
            "GrantId":
 "1667b97d27cf748cf05b487217dd4179526c949d14fb3903858e25193253fe59",
            "KeyId": "arn:aws:kms:us-
west-2:123456789012:key/1234abcd-12ab-34cd-56ef-1234567890ab",
            "RetiringPrincipal": "dynamodb.us-west-2.amazonaws.com",
            "GranteePrincipal": "dynamodb.us-west-2.amazonaws.com",
            "CreationDate": "2021-05-13T18:32:45.144000+00:00"
        }
    ]
}
```

For more information, see Grants in AWS KMS in the *AWS Key Management Service Developer Guide*.

- For API details, see ListGrants in *AWS CLI Command Reference*.

`list-key-policies`

The following code example shows how to use `list-key-policies`.

AWS CLI

To get the names of key policies for a KMS key

The following `list-key-policies` example gets the names of the key policies for a customer managed key in the example account and Region. You can use this command to find the names of key policies for AWS managed keys and customer managed keys.

Because the only valid key policy name is `default`, this command is not useful.

To specify the KMS key, use the `key-id` parameter. This example uses a key ID value, but you can use a key ID or key ARN in this command.

```
aws kms list-key-policies \
```

```
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
    "PolicyNames": [
    "default"
    ]
}
```

For more information about AWS KMS key policies, see Using Key Policies in AWS KMS in the *AWS Key Management Service Developer Guide*.

- For API details, see ListKeyPolicies in *AWS CLI Command Reference*.

`list-key-rotations`

The following code example shows how to use `list-key-rotations`.

AWS CLI

To retrieve information about all completed key material rotations

The following `list-key-rotations` example lists information about all completed key material rotations for the specified KMS key.

```
aws kms list-key-rotations \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
    "Rotations": [
        {
            "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
            "RotationDate": "2024-03-02T10:11:36.564000+00:00",
            "RotationType": "AUTOMATIC"
        },
        {
            "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
            "RotationDate": "2024-04-05T15:14:47.757000+00:00",
            "RotationType": "ON_DEMAND"
```

```
        }
    ],
    "Truncated": false
}
```

For more information, see Rotating keys in the *AWS Key Management Service Developer Guide*.

- For API details, see ListKeyRotations in *AWS CLI Command Reference*.

`list-keys`

The following code example shows how to use `list-keys`.

AWS CLI

To get the KMS keys in an account and Region

The following `list-keys` example gets the KMS keys in an account and Region. This command returns both AWS managed keys and customer managed keys.

```
aws kms list-keys
```

Output:

```
{
    "Keys": [
        {
            "KeyArn": "arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
            "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab"
        },
        {
            "KeyArn": "arn:aws:kms:us-
west-2:111122223333:key/0987dcba-09fe-87dc-65ba-ab0987654321",
            "KeyId": "0987dcba-09fe-87dc-65ba-ab0987654321"
        },
        {
            "KeyArn": "arn:aws:kms:us-
east-2:111122223333:key/1a2b3c4d-5e6f-1a2b-3c4d-5e6f1a2b3c4d",
            "KeyId": "1a2b3c4d-5e6f-1a2b-3c4d-5e6f1a2b3c4d"
        }
    ]
```

```
}
```

For more information, see Viewing Keys in the *AWS Key Management Service Developer Guide*.

- For API details, see ListKeys in *AWS CLI Command Reference*.

`list-resource-tags`

The following code example shows how to use `list-resource-tags`.

AWS CLI

To get the tags on a KMS key

The following `list-resource-tags` example gets the tags for a KMS key. To add or replace resource tags on KMS keys, use the `tag-resource` command. The output shows that this KMS key has two resource tags, each of which has a key and value.

To specify the KMS key, use the `key-id` parameter. This example uses a key ID value, but you can use a key ID or key ARN in this command.

```
aws kms list-resource-tags \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
    "Tags": [
    {
        "TagKey": "Dept",
        "TagValue": "IT"
    },
    {
        "TagKey": "Purpose",
        "TagValue": "Test"
    }
    ],
    "Truncated": false
}
```

For more information about using tags in AWS KMS, see Tagging keys in the *AWS Key Management Service Developer Guide*.

- For API details, see [ListResourceTags](#) in *AWS CLI Command Reference*.

`list-retirable-grants`

The following code example shows how to use `list-retirable-grants`.

AWS CLI

To view the grants that a principal can retire

The following `list-retirable-grants` example displays all of the grants that the `ExampleAdmin` user can retire on the KMS keys in an AWS account and Region. You can use a command like this one to view the grants that any account principal can retire on KMS keys in the AWS account and Region.

The value of the required `retiring-principal` parameter must be the Amazon Resource Name (ARN) of an account, user, or role.

You cannot specify a service for the value of `retiring-principal` in this command, even though a service can be the retiring principal. To find the grants in which a particular service is the retiring principal, use the `list-grants` command.

The output shows that `ExampleAdmin` user has permission to retire grants on two different KMS keys in the account and region. In addition to the retiring principal, the account has permission to retire any grant in the account.

```
aws kms list-retirable-grants \
    --retiring-principal arn:aws:iam::111122223333:user/ExampleAdmin
```

Output:

```
{
    "Grants": [
        {
            "KeyId": "arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
            "GrantId":
 "156b69c63cb154aa21f59929ff19760717be8d9d82b99df53e18b94a15a5e88e",
            "Name": "",
            "CreationDate": 2021-01-14T20:17:36.419000+00:00,
```

```
            "GranteePrincipal": "arn:aws:iam::111122223333:user/ExampleUser",
            "RetiringPrincipal": "arn:aws:iam::111122223333:user/ExampleAdmin",
            "IssuingAccount": "arn:aws:iam::111122223333:root",
            "Operations": [
                "Encrypt"
            ],
            "Constraints": {
                "EncryptionContextSubset": {
                    "Department": "IT"
                }
            }
        },
        {
            "KeyId": "arn:aws:kms:us-
west-2:111122223333:key/0987dcba-09fe-87dc-65ba-ab0987654321",
            "GrantId":
 "8c94d1f12f5e69f440bae30eaec9570bb1fb7358824f9ddfa1aa5a0dab1a59b2",
            "Name": "",
            "CreationDate": "2021-02-02T19:49:49.638000+00:00",
            "GranteePrincipal": "arn:aws:iam::111122223333:role/ExampleRole",
            "RetiringPrincipal": "arn:aws:iam::111122223333:user/ExampleAdmin",
            "IssuingAccount": "arn:aws:iam::111122223333:root",
            "Operations": [
                "Decrypt"
            ],
            "Constraints": {
                "EncryptionContextSubset": {
                    "Department": "IT"
                }
            }
        }
    ],
    "Truncated": false
}
```

For more information, see Grants in AWS KMS in the *AWS Key Management Service Developer Guide*.

- For API details, see ListRetirableGrants in *AWS CLI Command Reference*.

`put-key-policy`

The following code example shows how to use `put-key-policy`.

AWS CLI

To change the key policy for a KMS key

The following `put-key-policy` example changes the key policy for a customer managed key.

To begin, create a key policy and save it in a local JSON file. In this example, the file is `key_policy.json`. You can also specify the key policy as a string value of the `policy` parameter.

The first statement in this key policy gives the AWS account permission to use IAM policies to control access to the KMS key. The second statement gives the `test-user` user permission to run the `describe-key` and `list-keys` commands on the KMS key.

Contents of `key_policy.json`:

```
{
    "Version":"2012-10-17",
    "Id" : "key-default-1",
    "Statement" : [
        {
            "Sid" : "Enable IAM User Permissions",
            "Effect" : "Allow",
            "Principal" : {
                "AWS" : "arn:aws:iam::111122223333:root"
            },
            "Action" : "kms:*",
            "Resource" : "*"
        },
        {
            "Sid" : "Allow Use of Key",
            "Effect" : "Allow",
            "Principal" : {
                "AWS" : "arn:aws:iam::111122223333:user/test-user"
            },
            "Action" : [
                "kms:DescribeKey",
                "kms:ListKeys"
            ],
            "Resource" : "*"
        }
    ]
}
```

To identify the KMS key, this example uses the key ID, but you can also use a key ARN. To specify the key policy, the command uses the `policy` parameter. To indicate that the policy is in a file, it uses the required `file://` prefix. This prefix is required to identify files on all supported operating systems. Finally, the command uses the `policy-name` parameter with a value of `default`. If no policy name is specified, the default value is `default`. The only valid value is `default`.

```
aws kms put-key-policy \
    --policy-name default \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --policy file://key_policy.json
```

This command does not produce any output. To verify that the command was effective, use the `get-key-policy` command. The following example command gets the key policy for the same KMS key. The `output` parameter with a value of `text` returns a text format that is easy to read.

```
aws kms get-key-policy \
    --policy-name default \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --output text
```

Output:

```
{
    "Version":"2012-10-17",
    "Id" : "key-default-1",
    "Statement" : [
        {
            "Sid" : "Enable IAM User Permissions",
            "Effect" : "Allow",
            "Principal" : {
                "AWS" : "arn:aws:iam::111122223333:root"
            },
            "Action" : "kms:*",
            "Resource" : "*"
            },
            {
            "Sid" : "Allow Use of Key",
            "Effect" : "Allow",
            "Principal" : {
```

```
                "AWS" : "arn:aws:iam::111122223333:user/test-user"
            },
            "Action" : [ "kms:Describe", "kms:List" ],
            "Resource" : "*"
        }
    ]
}
```

For more information, see Changing a Key Policy in the *AWS Key Management Service Developer Guide*.

- For API details, see PutKeyPolicy in *AWS CLI Command Reference*.

`re-encrypt`

The following code example shows how to use `re-encrypt`.

AWS CLI

Example 1: To re-encrypt an encrypted message under a different symmetric KMS key (Linux and macOS).

The following `re-encrypt` command example demonstrates the recommended way to re-encrypt data with the AWS CLI.

Provide the ciphertext in a file.In the value of the `--ciphertext-blob` parameter, use the `fileb://` prefix, which tells the CLI to read the data from a binary file. If the file is not in the current directory, type the full path to file. For more information about reading AWS CLI parameter values from a file, see Loading AWS CLI parameters from a file in the *AWS Command Line Interface User Guide* and Best Practices for Local File Parameters in the *AWS Command Line Tool Blog*.Specify the source KMS key, which decrypts the ciphertext.The `--source-key-id` parameter is not required when decrypting with symmetric encryption KMS keys. AWS KMS can get the KMS key that was used to encrypt the data from the metadata in the ciphertext blob. But it's always a best practice to specify the KMS key you are using. This practice ensures that you use the KMS key that you intend, and prevents you from inadvertently decrypting a ciphertext using a KMS key you do not trust.Specify the destination KMS key, which re-encrypts the data.The `--destination-key-id` parameter is always required. This example uses a key ARN, but you can use any valid key identifier.Request the plaintext output as a text value.The `--query` parameter tells the CLI to get only the value of the `Plaintext` field from the output. The `--output` parameter returns the output as text.Base64-decode the plaintext and save it in a file.The following example pipes (|) the value of the `Plaintext` parameter to the Base64 utility, which decodes it. Then, it redirects (>) the decoded output to the `ExamplePlaintext` file.

Before running this command, replace the example key IDs with valid key identifiers from your AWS account.

```
aws kms re-encrypt \
    --ciphertext-blob fileb://ExampleEncryptedFile \
    --source-key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --destination-key-id 0987dcba-09fe-87dc-65ba-ab0987654321 \
    --query CiphertextBlob \
    --output text | base64 --decode > ExampleReEncryptedFile
```

This command produces no output. The output from the `re-encrypt` command is base64-decoded and saved in a file.

For more information, see ReEncrypt in the *AWS Key Management Service API Reference*.

Example 2: To re-encrypt an encrypted message under a different symmetric KMS key (Windows command prompt).

The following `re-encrypt` command example is the same as the previous one except that it uses the `certutil` utility to Base64-decode the plaintext data. This procedure requires two commands, as shown in the following examples.

Before running this command, replace the example key ID with a valid key ID from your AWS account.

```
aws kms re-encrypt ^
    --ciphertext-blob fileb://ExampleEncryptedFile ^
    --source-key-id 1234abcd-12ab-34cd-56ef-1234567890ab ^
    --destination-key-id 0987dcba-09fe-87dc-65ba-ab0987654321 ^
    --query CiphertextBlob ^
    --output text > ExampleReEncryptedFile.base64
```

Then use the `certutil` utility

```
certutil -decode ExamplePlaintextFile.base64 ExamplePlaintextFile
```

Output:

```
Input Length = 18
Output Length = 12
CertUtil: -decode command completed successfully.
```

For more information, see ReEncrypt in the *AWS Key Management Service API Reference*.

- For API details, see ReEncrypt in *AWS CLI Command Reference*.

`retire-grant`

The following code example shows how to use `retire-grant`.

AWS CLI

To retire a grant on a customer master key

The following `retire-grant` example deletes a grant from a KMS key.

The following example command specifies the `grant-id` and the `key-id` parameters. The value of the `key-id` parameter must be the key ARN of the KMS key.

```
aws kms retire-grant \
    --grant-id 1234a2345b8a4e350500d432bccf8ecd6506710e1391880c4f7f7140160c9af3 \
    --key-id arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab
```

This command produces no output. To confirm that the grant was retired, use the `list-grants` command.

For more information, see Retiring and revoking grants in the *AWS Key Management Service Developer Guide*.

- For API details, see RetireGrant in *AWS CLI Command Reference*.

`revoke-grant`

The following code example shows how to use `revoke-grant`.

AWS CLI

To revoke a grant on a customer master key

The following `revoke-grant` example deletes a grant from a KMS key. The following example command specifies the `grant-id` and the `key-id` parameters. The value of the `key-id` parameter can be the key ID or key ARN of the KMS key.

```
aws kms revoke-grant \
    --grant-id 1234a2345b8a4e350500d432bccf8ecd6506710e1391880c4f7f7140160c9af3 \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

This command produces no output. To confirm that the grant was revoked, use the `list-grants` command.

For more information, see Retiring and revoking grants in the *AWS Key Management Service Developer Guide*.

- For API details, see RevokeGrant in *AWS CLI Command Reference*.

`rotate-key-on-demand`

The following code example shows how to use `rotate-key-on-demand`.

AWS CLI

To perform on-demand rotation of a KMS key

The following `rotate-key-on-demand` example immediately initiates rotation of the key material for the specified KMS key.

```
aws kms rotate-key-on-demand \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
    "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab"
}
```

For more information, see How to perform on-demand key rotation in the *AWS Key Management Service Developer Guide*.

- For API details, see RotateKeyOnDemand in *AWS CLI Command Reference*.

`schedule-key-deletion`

The following code example shows how to use `schedule-key-deletion`.

AWS CLI

To schedule the deletion of a customer managed KMS key.

The following `schedule-key-deletion` example schedules the specified customer managed KMS key to be deleted in 15 days.

The `--key-id` parameter identifies the KMS key. This example uses a key ARN value, but you can use either the key ID or the ARN of the KMS key.The `--pending-window-in-days` parameter specifies the length of the 7-30 day waiting period. By default, the waiting period is 30 days. This example specifies a value of 15, which tells AWS to permanently delete the KMS key 15 days after the command completes.

```
aws kms schedule-key-deletion \
    --key-id arn:aws:kms:us-
west-2:123456789012:key/1234abcd-12ab-34cd-56ef-1234567890ab \
    --pending-window-in-days 15
```

The response includes the key ARN, key state, waiting period (`PendingWindowInDays`), and the deletion date in Unix time. To view the deletion date in local time, use the AWS KMS console. KMS keys in the `PendingDeletion` key state cannot be used in cryptographic operations.

```
{
    "KeyId": "arn:aws:kms:us-
west-2:123456789012:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "DeletionDate": "2022-06-18T23:43:51.272000+00:00",
    "KeyState": "PendingDeletion",
    "PendingWindowInDays": 15
}
```

For more information, see Deleting keys in the *AWS Key Management Service Developer Guide*.

- For API details, see ScheduleKeyDeletion in *AWS CLI Command Reference*.

`sign`

The following code example shows how to use `sign`.

AWS CLI

Example 1: To generate a digital signature for a message

The following `sign` example generates a cryptographic signature for a short message. The output of the command includes a base-64 encoded `Signature` field that you can verify by using the `verify` command.

You must specify a message to sign and a signing algorithm that your asymmetric KMS key supports. To get the signing algorithms for your KMS key, use the `describe-key` command.

In AWS CLI v2, the value of the `message` parameter must be Base64-encoded. Or, you can save the message in a file and use the `fileb://` prefix, which tells the AWS CLI to read binary data from the file.

Before running this command, replace the example key ID with a valid key ID from your AWS account. The key ID must represent an asymmetric KMS key with a key usage of SIGN_VERIFY.

```
msg=(echo 'Hello World' | base64)

aws kms sign \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --message fileb://UnsignedMessage \
    --message-type RAW \
    --signing-algorithm RSASSA_PKCS1_V1_5_SHA_256
```

Output:

```
{
    "KeyId": "arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "Signature": "ABCDEFhpyVYyTxbafE74ccSvEJLJr3zuoV1Hfymz4qv+/
fxmxNLA7SE1SiF8lHw80fKZZ3bJ...",
    "SigningAlgorithm": "RSASSA_PKCS1_V1_5_SHA_256"
}
```

For more information about using asymmetric KMS keys in AWS KMS, see Asymmetric keys in AWS KMS in the *AWS Key Management Service Developer Guide*.

Example 2: To save a digital signature in a file (Linux and macOs)

The following `sign` example generates a cryptographic signature for a short message stored in a local file. The command also gets the `Signature` property from the response, Base64-decodes it and saves it in the ExampleSignature file. You can use the signature file in a `verify` command that verifies the signature.

The `sign` command requires a Base64-encoded message and a signing algorithm that your asymmetric KMS key supports. To get the signing algorithms that your KMS key supports, use the `describe-key` command.

Before running this command, replace the example key ID with a valid key ID from your AWS account. The key ID must represent an asymmetric KMS key with a key usage of SIGN_VERIFY.

```
echo 'hello world' | base64 > EncodedMessage

aws kms sign \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --message fileb://EncodedMessage \
    --message-type RAW \
    --signing-algorithm RSASSA_PKCS1_V1_5_SHA_256 \
    --output text \
    --query Signature | base64 --decode > ExampleSignature
```

This command produces no output. This example extracts the `Signature` property of the output and saves it in a file.

For more information about using asymmetric KMS keys in AWS KMS, see Asymmetric keys in AWS KMS in the *AWS Key Management Service Developer Guide*.

- For API details, see Sign in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add a tag to a KMS key

The following `tag-resource` example adds `"Purpose":"Test"` and `"Dept":"IT"` tags to a customer managed KMS key. You can use tags like these to label KMS keys and create categories of KMS keys for permissions and auditing.

To specify the KMS key, use the `key-id` parameter. This example uses a key ID value, but you can use a key ID or key ARN in this command.

```
aws kms tag-resource \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --tags TagKey='Purpose',TagValue='Test' TagKey='Dept',TagValue='IT'
```

This command produces no output. To view the tags on an AWS KMS KMS key, use the `list-resource-tags` command.

For more information about using tags in AWS KMS, see Tagging keys in the *AWS Key Management Service Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To delete a tag from a KMS key

The following `untag-resource` example deletes the tag with the `"Purpose"` key from a customer managed KMS key.

To specify the KMS key, use the `key-id` parameter. This example uses a key ID value, but you can use a key ID or key ARN in this command. Before running this command, replace the example key ID with a valid key ID from your AWS account.

```
aws kms untag-resource \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --tag-key 'Purpose'
```

This command produces no output. To view the tags on an AWS KMS KMS key, use the `list-resource-tags` command.

For more information about using tags in AWS KMS, see Tagging keys in the *AWS Key Management Service Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-alias`

The following code example shows how to use `update-alias`.

AWS CLI

To associate an alias with a different KMS key

The following `update-alias` example associates the alias `alias/test-key` with a different KMS key.

The `--alias-name` parameter specifies the alias. The alias name value must begin with `alias/`.The `--target-key-id` parameter specifies the KMS key to associate with the alias. You don't need to specify the current KMS key for the alias.

```
aws kms update-alias \
    --alias-name alias/test-key \
    --target-key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

This command produces no output. To find the alias, use the `list-aliases` command.

For more information, see Updating aliases in the *AWS Key Management Service Developer Guide*.

- For API details, see UpdateAlias in *AWS CLI Command Reference*.

`update-custom-key-store`

The following code example shows how to use `update-custom-key-store`.

AWS CLI

Example 1: To edit the friendly name of a custom key store

The following `update-custom-key-store` example changes the name of the custom key store. This example works for an AWS CloudHSM key store or an external key store.

Use the `custom-key-store-id` to identify the key store. Use the `new-custom-key-store-name` parameter to specify the new friendly name.

To update the friendly name of an AWS CloudHSM key store, you must first disconnect the key store, such as by using the `disconnect-custom-key-store` command. You can update the friendly name of an external key store while it is connected or disconnected. To find the connection state of your custom key store, use the `describe-custom-key-store` command.

```
aws kms update-custom-key-store \
    --custom-key-store-id cks-1234567890abcdef0 \
    --new-custom-key-store-name ExampleKeyStore
```

This command does not return any data. To verify that the command worked, use a `describe-custom-key-stores` command.

For more information about updating an AWS CloudHSM key store, see Editing AWS CloudHSM key store settings in the *AWS Key Management Service Developer Guide*.

For more information about updating an external key store, see Editing external key store properties in the *AWS Key Management Service Developer Guide*.

Example 2: To edit the kmsuser password of an AWS CloudHSM key store

The following `update-custom-key-store` example updates the value of the `kmsuser` password to the current password for the `kmsuser` in the CloudHSM cluster associated with the specified key store. This command doesn't change the `kmsuser` password it the cluster. It just tells AWS KMS the current password. If KMS doesn't have the current `kmsuser` password, it cannot connect to the AWS CloudHSM key store.

NOTE: Before updating an AWS CloudHSM key store, you must disconnect it. Use the `disconnect-custom-key-store` command. After the command completes, you can reconnect the AWS CloudHSM key store. Use the `connect-custom-key-store` command.

```
aws kms update-custom-key-store \
    --custom-key-store-id cks-1234567890abcdef0 \
    --key-store-password ExamplePassword
```

This command does not return any output. To verify that the change was effective, use a `describe-custom-key-stores` command.

For more information about updating an AWS CloudHSM key store, see Editing AWS CloudHSM key store settings in the *AWS Key Management Service Developer Guide*.

Example 3: To edit the AWS CloudHSM cluster of an AWS CloudHSM key store

The following example changes the AWS CloudHSM cluster that is associated with an AWS CloudHSM key store to a related cluster, such as a different backup of the same cluster.

NOTE: Before updating an AWS CloudHSM key store, you must disconnect it. Use the `disconnect-custom-key-store` command. After the command completes, you can reconnect the AWS CloudHSM key store. Use the `connect-custom-key-store` command.

```
aws kms update-custom-key-store \
    --custom-key-store-id cks-1234567890abcdef0 \
    --cloud-hsm-cluster-id cluster-1a23b4cdefg
```

This command does not return any output. To verify that the change was effective, use a `describe-custom-key-stores` command.

For more information about updating an AWS CloudHSM key store, see Editing AWS CloudHSM key store settings in the *AWS Key Management Service Developer Guide*.

Example 4: To edit the proxy authentication credential of an external key store

The following example updates the proxy authentication credential for your external key store. You must specify both the `raw-secret-access-key` and the `access-key-id`, even if you are changing only one of the values. You can use this feature to fix an invalid credential or to change the credential when the external key store proxy rotates it.

Establish the proxy authentication credential for AWS KMS on your external key store. Then use this command to provide the credential to AWS KMS. AWS KMS uses this credential to sign its requests to your external key store proxy.

You can update the proxy authentication credential while the external key store is connected or disconnected. To find the connection state of your custom key store, use the `describe-custom-key-store` command.

```
aws kms update-custom-key-store \
    --custom-key-store-id cks-1234567890abcdef0 \
    --xks-proxy-authentication-credential "AccessKeyId=ABCDE12345670EXAMPLE,
 RawSecretAccessKey=DXjSUawnel2fr6SKC7G25CNxTyWKE5PF9XX6H/u9pSo="
```

This command does not return any output. To verify that the change was effective, use a `describe-custom-key-stores` command.

For more information about updating an external key store, see Editing external key store properties in the *AWS Key Management Service Developer Guide*.

Example 5: To edit the proxy connectivity of an external key store

The following example changes the external key store proxy connectivity option from public endpoint connectivity to VPC endpoint service connectivity. In addition to changing the `xks-proxy-connectivity` value, you must change the `xks-proxy-uri-endpoint` value to reflect the private DNS name associated with the VPC endpoint service. You must also add an `xks-proxy-vpc-endpoint-service-name` value.

NOTE: Before updating the proxy connectivity of an external store, you must disconnect it. Use the `disconnect-custom-key-store` command. After the command completes, you can reconnect the external key store by using the `connect-custom-key-store` command.

```
aws kms update-custom-key-store \
    --custom-key-store-id cks-1234567890abcdef0 \
    --xks-proxy-connectivity VPC_ENDPOINT_SERVICE \
    --xks-proxy-uri-endpoint "https://myproxy-private.xks.example.com" \
    --xks-proxy-vpc-endpoint-service-name "com.amazonaws.vpce.us-east-1.vpce-svc-
example"
```

This command does not return any output. To verify that the change was effective, use a `describe-custom-key-stores` command.

For more information about updating an external key store, see Editing external key store properties in the *AWS Key Management Service Developer Guide*.

- For API details, see UpdateCustomKeyStore in *AWS CLI Command Reference*.

`update-key-description`

The following code example shows how to use `update-key-description`.

AWS CLI

Example 1: To add or change a description to a customer managed KMS key

The following `update-key-description` example adds a description to a customer managed KMS key. You can use the same command to change an existing description.

The `--key-id` parameter identifies the KMS key in the command. This example uses a key ARN value, but you can use either the key ID or the key ARN of the KMS key.The `--description` parameter specifies the new description. The value of this parameter replaces the current description of the KMS key, if any.

```
aws kms update-key-description \
    --key-id arn:aws:kms:us-
west-2:123456789012:key/1234abcd-12ab-34cd-56ef-1234567890ab \
    --description "IT Department test key"
```

This command produces no output. To view the description of a KMS key, use the `describe-key` command.

For more information, see UpdateKeyDescription in the *AWS Key Management Service API Reference*.

Example 2: To delete the description of a customer managed KMS key

The following `update-key-description` example deletes the description to a customer managed KMS key.

The `--key-id` parameter identifies the KMS key in the command. This example uses a key ID value, but you can use either the key ID or the key ARN of the KMS key.The `--description` parameter with an empty string value ('') deletes the existing description.

```
aws kms update-key-description \
    --key-id 0987dcba-09fe-87dc-65ba-ab0987654321 \
    --description ''
```

This command produces no output. To view the description of a KMS key, use the the describe-key command.

For more information, see UpdateKeyDescription in the *AWS Key Management Service API Reference*.

- For API details, see UpdateKeyDescription in *AWS CLI Command Reference*.

`verify-mac`

The following code example shows how to use `verify-mac`.

AWS CLI

Example 1: To verify an HMAC

The following `verify-mac` command verifies an HMAC for a particular message, HMAC KMS keys, and MAC algorithm. A value of 'true' in the MacValid value in the response indicates that the HMAC is valid.

In AWS CLI v2, the value of the `message` parameter must be Base64-encoded. Or, you can save the message in a file and use the `fileb://` prefix, which tells the AWS CLI to read binary data from the file.

The MAC that you specify cannot be base64-encoded. For help decoding the MAC that the `generate-mac` command returns, see the `generate-mac` command examples.

Before running this command, replace the example key ID with a valid key ID from your AWS account. The key ID must represent a HMAC KMS key with a key usage of `GENERATE_VERIFY_MAC`.

```
msg=(echo 'Hello World' | base64)

aws kms verify-mac \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --message fileb://Message \
    --mac-algorithm HMAC_SHA_384 \
    --mac fileb://ExampleMac
```

Output:

```
{
    "KeyId": "arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "MacValid": true,
    "MacAlgorithm": "HMAC_SHA_384"
}
```

For more information about using HMAC KMS keys in AWS KMS, see HMAC keys in AWS KMS in the *AWS Key Management Service Developer Guide*.

- For API details, see VerifyMac in *AWS CLI Command Reference*.

`verify`

The following code example shows how to use `verify`.

AWS CLI

To verify a digital signature

The following `verify` command verifies a cryptographic signature for a short, Base64-encoded message. The key ID, message, message type, and signing algorithm must be same ones that were used to sign the message.

In AWS CLI v2, the value of the `message` parameter must be Base64-encoded. Or, you can save the message in a file and use the `fileb://` prefix, which tells the AWS CLI to read binary data from the file.

The signature that you specify cannot be base64-encoded. For help decoding the signature that the `sign` command returns, see the `sign` command examples.

The output of the command includes a Boolean `SignatureValid` field that indicates that the signature was verified. If the signature validation fails, the `verify` command fails, too.

Before running this command, replace the example key ID with a valid key ID from your AWS account.

```
aws kms verify \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --message fileb://EncodedMessage \
    --message-type RAW \
    --signing-algorithm RSASSA_PKCS1_V1_5_SHA_256 \
    --signature fileb://ExampleSignature
```

Output:

```
{
    "KeyId": "arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "SignatureValid": true,
    "SigningAlgorithm": "RSASSA_PKCS1_V1_5_SHA_256"
}
```

For more information about using asymmetric KMS keys in AWS KMS, see Using asymmetric keys in the *AWS Key Management Service Developer Guide*.

- For API details, see Verify in *AWS CLI Command Reference*.

Lake Formation examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Lake Formation.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

- Actions

Actions

`add-lf-tags-to-resource`

The following code example shows how to use `add-lf-tags-to-resource`.

AWS CLI

To attach one or more LF-tags to an existing resource

The following `add-lf-tags-to-resource` example attaches given LF-tag to the table resource.

```
aws lakeformation add-lf-tags-to-resource \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "Resource": {
        "Table": {
```

```
                "CatalogId": "123456789111",
                "DatabaseName": "tpc",
                "Name": "dl_tpc_promotion"
            }
        },
        "LFTags": [{
            "CatalogId": "123456789111",
            "TagKey": "usergroup",
            "TagValues": [
                "analyst"
            ]
        }]
}
```

Output:

```
{
    "Failures": []
}
```

For more information, see Assigning LF-Tags to Data Catalog resources in the *AWS Lake Formation Developer Guide*.

- For API details, see AddLfTagsToResource in *AWS CLI Command Reference*.

`batch-grant-permissions`

The following code example shows how to use `batch-grant-permissions`.

AWS CLI

To bulk grant permissions on resources to the principals

The following `batch-grant-permissions` example bulk grants access on specified resources to the principals.

```
aws lakeformation batch-grant-permissions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
```

```
    "CatalogId": "123456789111",
    "Entries": [{
            "Id": "1",
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
developer"
            },
            "Resource": {
                "Table": {
                    "CatalogId": "123456789111",
                    "DatabaseName": "tpc",
                    "Name": "dl_tpc_promotion"
                }
            },
            "Permissions": [
                "ALL"
            ],
            "PermissionsWithGrantOption": [
                "ALL"
            ]
        },
        {
            "Id": "2",
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
developer"
            },
            "Resource": {
                "Table": {
                    "CatalogId": "123456789111",
                    "DatabaseName": "tpc",
                    "Name": "dl_tpc_customer"
                }
            },
            "Permissions": [
                "ALL"
            ],
            "PermissionsWithGrantOption": [
                "ALL"
            ]
        },
        {
            "Id": "3",
            "Principal": {
```

```
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
business-analyst"
            },
            "Resource": {
                "Table": {
                    "CatalogId": "123456789111",
                    "DatabaseName": "tpc",
                    "Name": "dl_tpc_promotion"
                }
            },
            "Permissions": [
                "ALL"
            ],
            "PermissionsWithGrantOption": [
                "ALL"
            ]
        },
        {
            "Id": "4",
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
developer"
            },
            "Resource": {
                "DataCellsFilter": {
                    "TableCatalogId": "123456789111",
                    "DatabaseName": "tpc",
                    "TableName": "dl_tpc_item",
                    "Name": "developer_item"
                }
            },
            "Permissions": [
                "SELECT"
            ],
            "PermissionsWithGrantOption": []
        }
    ]
}
```

Output:

```
{
    "Failures": []
```

```
}
```

For more information, see Granting and revoking permissions on Data Catalog resources in the *AWS Lake Formation Developer Guide*.

- For API details, see BatchGrantPermissions in *AWS CLI Command Reference*.

`batch-revoke-permissions`

The following code example shows how to use `batch-revoke-permissions`.

AWS CLI

To bulk revoke permissions on resources from the principals

The following `batch-revoke-permissions` example bulk revokes access on specified resources from the principals.

```
aws lakeformation batch-revoke-permissions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "Entries": [{
            "Id": "1",
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
developer"
            },
            "Resource": {
                "Table": {
                    "CatalogId": "123456789111",
                    "DatabaseName": "tpc",
                    "Name": "dl_tpc_promotion"
                }
            },
            "Permissions": [
                "ALL"
            ],
            "PermissionsWithGrantOption": [
                "ALL"
```

```
            ]
        },
        {
            "Id": "2",
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
business-analyst"
            },
            "Resource": {
                "Table": {
                    "CatalogId": "123456789111",
                    "DatabaseName": "tpc",
                    "Name": "dl_tpc_promotion"
                }
            },
            "Permissions": [
                "ALL"
            ],
            "PermissionsWithGrantOption": [
                "ALL"
            ]
        }
    ]
}
```

Output:

```
{
    "Failures": []
}
```

For more information, see Granting and revoking permissions on Data Catalog resources in the *AWS Lake Formation Developer Guide*.

- For API details, see BatchRevokePermissions in *AWS CLI Command Reference*.

`cancel-transaction`

The following code example shows how to use `cancel-transaction`.

AWS CLI

To cancel a transaction

The following `cancel-transaction` example cancels the transaction.

```
aws lakeformation cancel-transaction \
    --transaction-id='b014d972ca8347b89825e33c5774aec4'
```

This command produces no output.

For more information, see Reading from and writing to the data lake within transactions in the *AWS Lake Formation Developer Guide*.

- For API details, see CancelTransaction in *AWS CLI Command Reference*.

`commit-transaction`

The following code example shows how to use `commit-transaction`.

AWS CLI

To commit transaction

The following `commit-transaction` example commits the transaction.

```
aws lakeformation commit-transaction \
    --transaction-id='b014d972ca8347b89825e33c5774aec4'
```

Output:

```
{
    "TransactionStatus": "committed"
}
```

For more information, see Reading from and writing to the data lake within transactions in the *AWS Lake Formation Developer Guide*.

- For API details, see CommitTransaction in *AWS CLI Command Reference*.

`create-data-cells-filter`

The following code example shows how to use `create-data-cells-filter`.

AWS CLI

Example 1: To create data cell filter

The following `create-data-cells-filter` example creates a data cell filter to allow one to grant access to certain columns based on row condition.

```
aws lakeformation create-data-cells-filter \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "TableData": {
        "ColumnNames": ["p_channel_details", "p_start_date_sk", "p_promo_name"],
        "DatabaseName": "tpc",
        "Name": "developer_promotion",
        "RowFilter": {
            "FilterExpression": "p_promo_name='ese'"
        },
        "TableCatalogId": "123456789111",
        "TableName": "dl_tpc_promotion"
    }
}
```

This command produces no output.

For more information, see [Data filtering and cell-level security in Lake Formation]() in the *AWS Lake Formation Developer Guide*.

Example 2: To create column filter

The following `create-data-cells-filter` example creates a data filter to allow one to grant access to certain columns.

```
aws lakeformation create-data-cells-filter \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "TableData": {
```

```
        "ColumnNames": ["p_channel_details", "p_start_date_sk", "p_promo_name"],
        "DatabaseName": "tpc",
        "Name": "developer_promotion_allrows",
        "RowFilter": {
            "AllRowsWildcard": {}
        },
        "TableCatalogId": "123456789111",
        "TableName": "dl_tpc_promotion"
    }
}
```

This command produces no output.

For more information, see Data filtering and cell-level security in Lake Formation in the *AWS Lake Formation Developer Guide*.

Example 3: To create data filter with exclude columns

The following `create-data-cells-filter` example creates a data filter to allow one to grant access all except the mentioned columns.

```
aws lakeformation create-data-cells-filter \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "TableData": {
        "ColumnWildcard": {
            "ExcludedColumnNames": ["p_channel_details", "p_start_date_sk"]
        },
        "DatabaseName": "tpc",
        "Name": "developer_promotion_excludecolumn",
        "RowFilter": {
            "AllRowsWildcard": {}
        },
        "TableCatalogId": "123456789111",
        "TableName": "dl_tpc_promotion"
    }
}
```

This command produces no output.

For more information, see Data filtering and cell-level security in Lake Formation in the *AWS Lake Formation Developer Guide*.

- For API details, see CreateDataCellsFilter in *AWS CLI Command Reference*.

`create-lf-tag`

The following code example shows how to use `create-lf-tag`.

AWS CLI

To create LF-Tag

The following `create-lf-tag` example creates an LF-Tag with the specified name and values.

```
aws lakeformation create-lf-tag \
    --catalog-id '123456789111' \
    --tag-key 'usergroup' \
    --tag-values '["developer","analyst","campaign"]'
```

This command produces no output.

For more information, see Managing LF-Tags for metadata access control in the *AWS Lake Formation Developer Guide*.

- For API details, see CreateLfTag in *AWS CLI Command Reference*.

`delete-data-cells-filter`

The following code example shows how to use `delete-data-cells-filter`.

AWS CLI

To delete data cell filter

The following `delete-data-cells-filter` example deletes given data cell filter.

```
aws lakeformation delete-data-cells-filter \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "TableCatalogId": "123456789111",
    "DatabaseName": "tpc",
    "TableName": "dl_tpc_promotion",
    "Name": "developer_promotion"
}
```

This command produces no output.

For more information, see Data filtering and cell-level security in Lake Formation in the *AWS Lake Formation Developer Guide*.

- For API details, see DeleteDataCellsFilter in *AWS CLI Command Reference*.

`delete-lf-tag`

The following code example shows how to use `delete-lf-tag`.

AWS CLI

To delete LF-Tag definition

The following `delete-lf-tag` example deletes LF-Tag definition.

```
aws lakeformation delete-lf-tag \
    --catalog-id '123456789111' \
    --tag-key 'usergroup'
```

This command produces no output.

For more information, see Managing LF-Tags for metadata access control in the *AWS Lake Formation Developer Guide*.

- For API details, see DeleteLfTag in *AWS CLI Command Reference*.

`delete-objects-on-cancel`

The following code example shows how to use `delete-objects-on-cancel`.

AWS CLI

To delete object when transaction is cancelled

The following `delete-objects-on-cancel` example deletes the listed s3 object when the transaction is cancelled.

```
aws lakeformation delete-objects-on-cancel \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "012345678901",
    "DatabaseName": "tpc",
    "TableName": "dl_tpc_household_demographics_gov",
    "TransactionId": "1234d972ca8347b89825e33c5774aec4",
    "Objects": [{
        "Uri": "s3://lf-data-lake-012345678901/target/
dl_tpc_household_demographics_gov/run-unnamed-1-part-block-0-r-00000-snappy-
ff26b17504414fe88b302cd795eabd00.parquet",
        "ETag": "1234ab1fc50a316b149b4e1f21a73800"
    }]
}
```

This command produces no output.

For more information, see Reading from and writing to the data lake within transactions in the *AWS Lake Formation Developer Guide*.

- For API details, see DeleteObjectsOnCancel in *AWS CLI Command Reference*.

`deregister-resource`

The following code example shows how to use `deregister-resource`.

AWS CLI

To deregister data lake storage

The following `deregister-resource` example deregisters the resource as managed by the Lake Formation.

```
aws lakeformation deregister-resource \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "ResourceArn": "arn:aws:s3:::lf-emr-athena-result-123"
}
```

This command produces no output.

For more information, see Adding an Amazon S3 location to your data lake in the *AWS Lake Formation Developer Guide*.

- For API details, see DeregisterResource in *AWS CLI Command Reference*.

`describe-transaction`

The following code example shows how to use `describe-transaction`.

AWS CLI

To retrieve a transaction details

The following `describe-transaction` example returns the details of a single transaction.

```
aws lakeformation describe-transaction \
    --transaction-id='8cb4b1a7cc8d486fbaca9a64e7d9f5ce'
```

Output:

```
{
    "TransactionDescription": {
        "TransactionId": "12345972ca8347b89825e33c5774aec4",
        "TransactionStatus": "committed",
        "TransactionStartTime": "2022-08-10T14:29:04.046000+00:00",
        "TransactionEndTime": "2022-08-10T14:29:09.681000+00:00"
    }
}
```

For more information, see Reading from and writing to the data lake within transactions in the *AWS Lake Formation Developer Guide*.

- For API details, see DescribeTransaction in *AWS CLI Command Reference*.

`extend-transaction`

The following code example shows how to use `extend-transaction`.

AWS CLI

To extend a transaction

The following `extend-transaction` example extends the transaction.

```
aws lakeformation extend-transaction \
    --transaction-id='8cb4b1a7cc8d486fbaca9a64e7d9f5ce'
```

This command produces no output.

For more information, see Reading from and writing to the data lake within transactions in the *AWS Lake Formation Developer Guide*.

- For API details, see ExtendTransaction in *AWS CLI Command Reference*.

`get-data-lake-settings`

The following code example shows how to use `get-data-lake-settings`.

AWS CLI

To retrieve AWS Lake Formation-managed data lake settings

The following `get-data-lake-settings` example retrieves the list of data lake administrators and other data lake settings.

```
aws lakeformation get-data-lake-settings \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111"
}
```

Output:

```
{
    "DataLakeSettings": {
        "DataLakeAdmins": [{
            "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-admin"
        }],
        "CreateDatabaseDefaultPermissions": [],
        "CreateTableDefaultPermissions": [
                {
                        "Principal": {
                            "DataLakePrincipalIdentifier": "IAM_ALLOWED_PRINCIPALS"
                        },
                        "Permissions": [
                            "ALL"
                        ]
                }
        ],
        "TrustedResourceOwners": [],
        "AllowExternalDataFiltering": true,
        "ExternalDataFilteringAllowList": [{
            "DataLakePrincipalIdentifier": "123456789111"
        }],
        "AuthorizedSessionTagValueList": [
            "Amazon EMR"
        ]
    }
}
```

For more information, see Changing the default security settings for your data lake in the *AWS Lake Formation Developer Guide*.

- For API details, see GetDataLakeSettings in *AWS CLI Command Reference*.

`get-effective-permissions-for-path`

The following code example shows how to use `get-effective-permissions-for-path`.

AWS CLI

To retrieve permissions on resources located at specific path

The following `get-effective-permissions-for-path` example returns the Lake Formation permissions for a specified table or database resource located at a path in Amazon S3.

```
aws lakeformation get-effective-permissions-for-path \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "ResourceArn": "arn:aws:s3:::lf-data-lake-123456789111"
}
```

Output:

```
{
    "Permissions": [{
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
campaign-manager"
            },
            "Resource": {
                "Database": {
                    "Name": "tpc"
                }
            },
            "Permissions": [
                "DESCRIBE"
            ],
            "PermissionsWithGrantOption": []
        },
        {
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:role/EMR-
RuntimeRole"
            },
            "Resource": {
                "Database": {
                    "Name": "tpc"
                }
            },
            "Permissions": [
                "ALL"
            ],
            "PermissionsWithGrantOption": []
```

```
        },
        {
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:saml-
provider/oktaSAMLProvider:user/emr-developer"
            },
            "Resource": {
                "Database": {
                    "Name": "tpc"
                }
            },
            "Permissions": [
                "ALL",
                "DESCRIBE"
            ],
            "PermissionsWithGrantOption": []
        },
        {
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
admin"
            },
            "Resource": {
                "Database": {
                    "Name": "tpc"
                }
            },
            "Permissions": [
                "ALL",
                "ALTER",
                "CREATE_TABLE",
                "DESCRIBE",
                "DROP"
            ],
            "PermissionsWithGrantOption": [
                "ALL",
                "ALTER",
                "CREATE_TABLE",
                "DESCRIBE",
                "DROP"
            ]
        },
        {
            "Principal": {
```

```
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:role/LF-
GlueServiceRole"
            },
            "Resource": {
                "Database": {
                    "Name": "tpc"
                }
            },
            "Permissions": [
                "CREATE_TABLE"
            ],
            "PermissionsWithGrantOption": []
        }
    ],
    "NextToken":
 "E5SlJDSTZleUp6SWpvaU9UQTNORE0zTXpFeE5Ua3pJbjE5TENKbGVIQnBjbUYwYVc5dUlqcDdJbk5sWTI5dVpITWlP
}
```

For more information, see [Managing Lake Formation permissions](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [GetEffectivePermissionsForPath](#) in *AWS CLI Command Reference*.

`get-lf-tag`

The following code example shows how to use `get-lf-tag`.

AWS CLI

To retrieve LF-tag definition

The following `get-lf-tag` example retrieves LF-tag definition.

```
aws lakeformation get-lf-tag \
    --catalog-id '123456789111' \
    --tag-key 'usergroup'
```

Output:

```
{
    "CatalogId": "123456789111",
    "TagKey": "usergroup",
    "TagValues": [
```

```
            "analyst",
            "campaign",
            "developer"
        ]
}
```

For more information, see [Managing LF-Tags for metadata access control](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [GetLfTag](#) in *AWS CLI Command Reference*.

`get-query-state`

The following code example shows how to use `get-query-state`.

AWS CLI

To retrieve state of a submitted query

The following `get-query-state` example returns the state of a query previously submitted.

```
aws lakeformation get-query-state \
    --query-id='1234273f-4a62-4cda-8d98-69615ee8be9b'
```

Output:

```
{
    "State": "FINISHED"
}
```

For more information, see [Transactional data operations](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [GetQueryState](#) in *AWS CLI Command Reference*.

`get-query-statistics`

The following code example shows how to use `get-query-statistics`.

AWS CLI

To retrieve query statistics

The following `get-query-statistics` example retrieves statistics on the planning and execution of a query.

```
aws lakeformation get-query-statistics \
    --query-id='1234273f-4a62-4cda-8d98-69615ee8be9b'
```

Output:

```
{
    "ExecutionStatistics": {
        "AverageExecutionTimeMillis": 0,
        "DataScannedBytes": 0,
        "WorkUnitsExecutedCount": 0
    },
    "PlanningStatistics": {
        "EstimatedDataToScanBytes": 43235,
        "PlanningTimeMillis": 2377,
        "QueueTimeMillis": 440,
        "WorkUnitsGeneratedCount": 1
    },
    "QuerySubmissionTime": "2022-08-11T02:14:38.641870+00:00"
}
```

For more information, see Transactional data operations in the *AWS Lake Formation Developer Guide*.

- For API details, see GetQueryStatistics in *AWS CLI Command Reference*.

`get-resource-lf-tags`

The following code example shows how to use `get-resource-lf-tags`.

AWS CLI

To list LF-tags

The following `list-lf-tags` example returns list of LF-tags that the requester has permission to view.

```
aws lakeformation list-lf-tags \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "ResourceShareType": "ALL",
    "MaxResults": 2
}
```

Output:

```
{
"LFTags": [{
        "CatalogId": "123456789111",
        "TagKey": "category",
        "TagValues": [
            "private",
            "public"
        ]
    },
    {
        "CatalogId": "123456789111",
        "TagKey": "group",
        "TagValues": [
            "analyst",
            "campaign",
            "developer"
        ]
    }],
    "NextToken": "kIiwiZXhwaXJhdGlvbiI6eyJzZWNvbmRzIjoxNjYwMDY4dCI6ZmFsc2V9"
}
```

For more information, see Managing LF-Tags for metadata access control in the *AWS Lake Formation Developer Guide*.

- For API details, see GetResourceLfTags in *AWS CLI Command Reference*.

`get-table-objects`

The following code example shows how to use `get-table-objects`.

AWS CLI

To list objects of governed table

The following `get-table-objects` example returns the set of Amazon S3 objects that make up the specified governed table.

```
aws lakeformation get-table-objects \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "012345678901",
    "DatabaseName": "tpc",
    "TableName": "dl_tpc_household_demographics_gov",
    "QueryAsOfTime": "2022-08-10T15:00:00"
}
```

Output:

```
{
    "Objects": [{
        "PartitionValues": [],
        "Objects": [{
            "Uri": "s3://lf-data-lake-012345678901/target/
dl_tpc_household_demographics_gov/run-unnamed-1-part-block-0-r-00000-snappy-
ff26b17504414fe88b302cd795eabd00.parquet",
            "ETag": "12345b1fc50a316b149b4e1f21a73800",
            "Size": 43235
        }]
    }]
}
```

For more information, see Reading from and writing to the data lake within transactions in the *AWS Lake Formation Developer Guide*.

- For API details, see GetTableObjects in *AWS CLI Command Reference*.

`get-work-unit-results`

The following code example shows how to use `get-work-unit-results`.

AWS CLI

To retrieve work units of given query

The following `get-work-unit-results` example returns the work units resulting from the query.

```
aws lakeformation get-work-units \
    --query-id='1234273f-4a62-4cda-8d98-69615ee8be9b' \
    --work-unit-id '0' \
    --work-unit-token 'B2fMSdmQXe9umX8Ux8XCo4=' outfile
```

Output:

```
outfile with Blob content.
```

For more information, see Transactional data operations in the *AWS Lake Formation Developer Guide*.

- For API details, see GetWorkUnitResults in *AWS CLI Command Reference*.

`get-work-units`

The following code example shows how to use `get-work-units`.

AWS CLI

To retrieve work units

The following `get-work-units` example retrieves the work units generated by the StartQueryPlanning operation.

```
aws lakeformation get-work-units \
    --query-id='1234273f-4a62-4cda-8d98-69615ee8be9b'
```

Output:

```
{
    "WorkUnitRanges": [{
        "WorkUnitIdMax": 0,
        "WorkUnitIdMin": 0,
        "WorkUnitToken":

    }],
    "QueryId": "1234273f-4a62-4cda-8d98-69615ee8be9b"
}
```

For more information, see Transactional data operations in the *AWS Lake Formation Developer Guide*.

- For API details, see GetWorkUnits in *AWS CLI Command Reference*.

`grant-permissions`

The following code example shows how to use `grant-permissions`.

AWS CLI

Example 1: To grant permissions to the principal on resources using LF-Tags

The following `grant-permissions` example grants ALL permissions to the principal on database resource that matches the LF-Tag policy.

```
aws lakeformation grant-permissions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "Principal": {
        "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-admin"
    },
    "Resource": {
        "LFTagPolicy": {
            "CatalogId": "123456789111",
            "ResourceType": "DATABASE",
            "Expression": [{
```

```
                "TagKey": "usergroup",
                "TagValues": [
                    "analyst",
                    "developer"
                ]
            }]
        }
    },
    "Permissions": [
        "ALL"
    ],
    "PermissionsWithGrantOption": [
        "ALL"
    ]
}
```

This command produces no output.

For more information, see Granting and revoking permissions on Data Catalog resources in the *AWS Lake Formation Developer Guide*.

Example 2: To grant column level permissions to the principal

The following `grant-permissions` example grants permission to select specific column to the principal.

```
aws lakeformation grant-permissions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "Principal": {
        "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"
    },
    "Resource": {
        "TableWithColumns": {
            "CatalogId": "123456789111",
            "ColumnNames": ["p_end_date_sk"],
            "DatabaseName": "tpc",
            "Name": "dl_tpc_promotion"
```

```
        }
    },
    "Permissions": [
        "SELECT"
    ],
    "PermissionsWithGrantOption": []
}
```

This command produces no output.

For more information, see [Granting and revoking permissions on Data Catalog resources]() in the *AWS Lake Formation Developer Guide*.

Example 3: To grant table permissions to the principal

The following `grant-permissions` example grants select permission on all tables of given database to the principal.

```
aws lakeformation grant-permissions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "Principal": {
        "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"
    },
    "Resource": {
        "Table": {
            "CatalogId": "123456789111",
            "DatabaseName": "tpc",
            "TableWildcard": {}
        }
    },
    "Permissions": [
        "SELECT"
    ],
    "PermissionsWithGrantOption": []
}
```

This command produces no output.

For more information, see Granting and revoking permissions on Data Catalog resources in the *AWS Lake Formation Developer Guide*.

Example 4: To grant permissions on LF-Tags to the principal

The following `grant-permissions` example grants associate permission on LF-Tags to the principal.

```
aws lakeformation grant-permissions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "Principal": {
        "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"
    },
    "Resource": {
        "LFTag": {
            "CatalogId": "123456789111",
            "TagKey": "category",
            "TagValues": [
                "private", "public"
            ]
        }

    },
    "Permissions": [
        "ASSOCIATE"
    ],
    "PermissionsWithGrantOption": []
}
```

This command produces no output.

For more information, see Granting and revoking permissions on Data Catalog resources in the *AWS Lake Formation Developer Guide*.

Example 5: To grant permissions on data locations to the principal

The following `grant-permissions` example grants permission on data location to the principal.

```
aws lakeformation grant-permissions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "Principal": {
        "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"
    },
    "Resource": {
        "DataLocation": {
            "CatalogId": "123456789111",
            "ResourceArn": "arn:aws:s3:::lf-data-lake-123456789111"
        }
    },
    "Permissions": [
        "DATA_LOCATION_ACCESS"
    ],
    "PermissionsWithGrantOption": []
}
```

This command produces no output.

For more information, see Granting and revoking permissions on Data Catalog resources in the *AWS Lake Formation Developer Guide*.

- For API details, see GrantPermissions in *AWS CLI Command Reference*.

list-data-cells-filter

The following code example shows how to use `list-data-cells-filter`.

AWS CLI

To list data cell filters

The following `list-data-cells-filter` example list data cell filter for given table.

```
aws lakeformation list-data-cells-filter \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "MaxResults": 2,
    "Table": {
        "CatalogId": "123456789111",
        "DatabaseName": "tpc",
        "Name": "dl_tpc_promotion"
    }
}
```

Output:

```
{
    "DataCellsFilters": [{
            "TableCatalogId": "123456789111",
            "DatabaseName": "tpc",
            "TableName": "dl_tpc_promotion",
            "Name": "developer_promotion",
            "RowFilter": {
                "FilterExpression": "p_promo_name='ese'"
            },
            "ColumnNames": [
                "p_channel_details",
                "p_start_date_sk",
                "p_purpose",
                "p_promo_id",
                "p_promo_name",
                "p_end_date_sk",
                "p_discount_active"
            ]
        },
        {
            "TableCatalogId": "123456789111",
            "DatabaseName": "tpc",
            "TableName": "dl_tpc_promotion",
            "Name": "developer_promotion_allrows",
            "RowFilter": {
                "FilterExpression": "TRUE",
                "AllRowsWildcard": {}
            },
            "ColumnNames": [
                "p_channel_details",
```

```
                "p_start_date_sk",
                "p_promo_name"
            ]
        }
    ],
    "NextToken": "2MDA2MTgwNiwibmFub3MiOjE0MDAwMDAwMH19"
}
```

For more information, see Data filtering and cell-level security in Lake Formation in the *AWS Lake Formation Developer Guide*.

- For API details, see ListDataCellsFilter in *AWS CLI Command Reference*.

`list-permissions`

The following code example shows how to use `list-permissions`.

AWS CLI

Example 1: To retrieve list of principal permissions on the resource

The following `list-permissions` example returns a list of principal permissions on the database resources.

```
aws lakeformation list-permissions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "ResourceType": "DATABASE",
    "MaxResults": 2
}
```

Output:

```
{
    "PrincipalResourcePermissions": [{
        "Principal": {
            "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
campaign-manager"
```

```
        },
        "Resource": {
            "Database": {
                "CatalogId": "123456789111",
                "Name": "tpc"
            }
        },
        "Permissions": [
            "DESCRIBE"
        ],
        "PermissionsWithGrantOption": []
    }],
    "NextToken":
 "E5SlJDSTZleUp6SWpvaU9UQTNORE0zTXpFeE5Ua3pJbjE5TENKbGVIQnBjbUYwYVc5dUlqcDdJbk5sWTI5dVpITWlP
}
```

For more information, see [Managing Lake Formation permissions](#) in the *AWS Lake Formation Developer Guide*.

Example 2: To retrieve list of principal permissions on the table with data filters

The following `list-permissions` example list the permissions on the table with related data filters granted to the principal.

```
aws lakeformation list-permissions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "Resource": {
        "Table": {
            "CatalogId": "123456789111",
            "DatabaseName": "tpc",
            "Name": "dl_tpc_customer"
        }
    },
    "IncludeRelated": "TRUE",
    "MaxResults": 10
}
```

Output:

```
{
    "PrincipalResourcePermissions": [{
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:role/
Admin"
            },
            "Resource": {
                "Table": {
                    "CatalogId": "123456789111",
                    "DatabaseName": "customer",
                    "Name": "customer_invoice"
                }
            },
            "Permissions": [
                "ALL",
                "ALTER",
                "DELETE",
                "DESCRIBE",
                "DROP",
                "INSERT"
            ],
            "PermissionsWithGrantOption": [
                "ALL",
                "ALTER",
                "DELETE",
                "DESCRIBE",
                "DROP",
                "INSERT"
            ]
        },
        {
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:role/
Admin"
            },
            "Resource": {
                "TableWithColumns": {
                    "CatalogId": "123456789111",
                    "DatabaseName": "customer",
                    "Name": "customer_invoice",
                    "ColumnWildcard": {}
                }
```

```
            },
            "Permissions": [
                "SELECT"
            ],
            "PermissionsWithGrantOption": [
                "SELECT"
            ]
        },
        {
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:role/
Admin"
            },
            "Resource": {
                "DataCellsFilter": {
                    "TableCatalogId": "123456789111",
                    "DatabaseName": "customer",
                    "TableName": "customer_invoice",
                    "Name": "dl_us_customer"
                }
            },
            "Permissions": [
                "DESCRIBE",
                "SELECT",
                "DROP"
            ],
            "PermissionsWithGrantOption": []
        }
    ],
    "NextToken": "VyeUFjY291bnRQZXJtaXNzaW9ucyI6ZmFsc2V9"
}
```

For more information, see Managing Lake Formation permissions in the *AWS Lake Formation Developer Guide*.

Example 3: To retrieve list of principal permissions on the LF-Tags

The following `list-permissions` example list the permissions on the LF-Tags granted to the principal.

```
aws lakeformation list-permissions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "Resource": {
        "LFTag": {
            "CatalogId": "123456789111",
            "TagKey": "category",
            "TagValues": [
                "private"
            ]
        }
    },
    "MaxResults": 10
}
```

Output:

```
{
    "PrincipalResourcePermissions": [{
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
admin"
            },
            "Resource": {
                "LFTag": {
                    "CatalogId": "123456789111",
                    "TagKey": "category",
                    "TagValues": [
                        "*"
                    ]
                }
            },
            "Permissions": [
                "DESCRIBE"
            ],
            "PermissionsWithGrantOption": [
                "DESCRIBE"
            ]
        },
        {
            "Principal": {
```

```
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
admin"
            },
            "Resource": {
                "LFTag": {
                    "CatalogId": "123456789111",
                    "TagKey": "category",
                    "TagValues": [
                        "*"
                    ]
                }
            },
            "Permissions": [
                "ASSOCIATE"
            ],
            "PermissionsWithGrantOption": [
                "ASSOCIATE"
            ]
        }
    ],
    "NextToken": "EJwY21GMGFXOXVJanA3SW50cm1pc3Npb25zIjpmYWxzZX0="
}
```

For more information, see Managing Lake Formation permissions in the *AWS Lake Formation Developer Guide*.

- For API details, see ListPermissions in *AWS CLI Command Reference*.

list-resources

The following code example shows how to use `list-resources`.

AWS CLI

To lists the resources managed by the Lake Formation

The following `list-resources` example lists the resources matching the condition that is managed by the Lake Formation.

```
aws lakeformation list-resources \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "FilterConditionList": [{
        "Field": "ROLE_ARN",
        "ComparisonOperator": "CONTAINS",
        "StringValueList": [
            "123456789111"
        ]
    }],
    "MaxResults": 10
}
```

Output:

```
{
    "ResourceInfoList": [{
            "ResourceArn": "arn:aws:s3:::lf-data-lake-123456789111",
            "RoleArn": "arn:aws:iam::123456789111:role/LF-GlueServiceRole",
            "LastModified": "2022-07-21T02:12:46.669000+00:00"
        },
        {
            "ResourceArn": "arn:aws:s3:::lf-emr-test-123456789111",
            "RoleArn": "arn:aws:iam::123456789111:role/EMRLFS3Role",
            "LastModified": "2022-07-29T16:22:03.211000+00:00"
        }
    ]
}
```

For more information, see Managing Lake Formation permissions in the *AWS Lake Formation Developer Guide*.

- For API details, see ListResources in *AWS CLI Command Reference*.

`list-transactions`

The following code example shows how to use `list-transactions`.

AWS CLI

To list all transactions details

The following `list-transactions` example returns metadata about transactions and their status.

```
aws lakeformation list-transactions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "StatusFilter": "ALL",
    "MaxResults": 3
}
```

Output:

```
{
    "Transactions": [{
            "TransactionId": "1234569f08804cb790d950d4d0fe485e",
            "TransactionStatus": "committed",
            "TransactionStartTime": "2022-08-10T14:32:29.220000+00:00",
            "TransactionEndTime": "2022-08-10T14:32:33.751000+00:00"
        },
        {
            "TransactionId": "12345972ca8347b89825e33c5774aec4",
            "TransactionStatus": "committed",
            "TransactionStartTime": "2022-08-10T14:29:04.046000+00:00",
            "TransactionEndTime": "2022-08-10T14:29:09.681000+00:00"
        },
        {
            "TransactionId": "12345daf6cb047dbba8ad9b0414613b2",
            "TransactionStatus": "committed",
            "TransactionStartTime": "2022-08-10T13:56:51.261000+00:00",
            "TransactionEndTime": "2022-08-10T13:56:51.547000+00:00"
        }
    ],
    "NextToken": "77X1ebypsI7os+X2lhHsZLGNCDK3nNGpwRdFpicSOHgcX1/
QMoniUAKcpR3kj3ts3PVdMA=="
}
```

For more information, see Reading from and writing to the data lake within transactions in the *AWS Lake Formation Developer Guide*.

- For API details, see ListTransactions in *AWS CLI Command Reference*.

`put-data-lake-settings`

The following code example shows how to use `put-data-lake-settings`.

AWS CLI

To set AWS Lake Formation-managed data lake settings

The following `put-data-lake-settings` example sets the list of data lake administrators and other data lake settings.

```
aws lakeformation put-data-lake-settings \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "DataLakeSettings": {
        "DataLakeAdmins": [{
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
admin"
            }
        ],
        "CreateDatabaseDefaultPermissions": [],
        "CreateTableDefaultPermissions": [],
        "TrustedResourceOwners": [],
        "AllowExternalDataFiltering": true,
        "ExternalDataFilteringAllowList": [{
            "DataLakePrincipalIdentifier ": "123456789111"
        }],
        "AuthorizedSessionTagValueList": ["Amazon EMR"]
    }
}
```

This command produces no output.

For more information, see Changing the default security settings for your data lake in the *AWS Lake Formation Developer Guide*.

- For API details, see PutDataLakeSettings in *AWS CLI Command Reference*.

`register-resource`

The following code example shows how to use `register-resource`.

AWS CLI

Example 1: To register data lake storage using Service Linked Role

The following `register-resource` example registers the resource as managed by the Lake Formation using Service linked role.

```
aws lakeformation register-resource \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "ResourceArn": "arn:aws:s3:::lf-emr-athena-result-123",
    "UseServiceLinkedRole": true
}
```

This command produces no output.

For more information, see Adding an Amazon S3 location to your data lake in the *AWS Lake Formation Developer Guide*.

Example 2: To register data lake storage using custom role

The following `register-resource` example registers the resource as managed by the Lake Formation using custom role.

```
aws lakeformation register-resource \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "ResourceArn": "arn:aws:s3:::lf-emr-athena-result-123",
    "UseServiceLinkedRole": false,
    "RoleArn": "arn:aws:iam::123456789111:role/LF-GlueServiceRole"
}
```

This command produces no output.

For more information, see Adding an Amazon S3 location to your data lake in the *AWS Lake Formation Developer Guide*.

- For API details, see RegisterResource in *AWS CLI Command Reference*.

`remove-lf-tags-from-resource`

The following code example shows how to use `remove-lf-tags-from-resource`.

AWS CLI

To remove LF-Tag from a resource

The following `remove-lf-tags-from-resource` example removes the LF-Tag association with the table resource.

```
aws lakeformation remove-lf-tags-from-resource \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "Resource": {
        "Table": {
            "CatalogId": "123456789111",
            "DatabaseName": "tpc",
            "Name": "dl_tpc_promotion"
        }
    },
    "LFTags": [{
        "CatalogId": "123456789111",
        "TagKey": "usergroup",
        "TagValues": [
            "developer"
        ]
    }]
}
```

Output:

```
{
    "Failures": []
}
```

For more information, see [Assigning LF-Tags to Data Catalog resources]() in the *AWS Lake Formation Developer Guide*.

- For API details, see [RemoveLfTagsFromResource]() in *AWS CLI Command Reference*.

`revoke-permissions`

The following code example shows how to use `revoke-permissions`.

AWS CLI

To revoke permissions on resources from the principal

The following `revoke-permissions` example revoke principal access to specific table of a given database.

```
aws lakeformation revoke-permissions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "Principal": {
        "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"
    },
    "Resource": {
        "Table": {
            "CatalogId": "123456789111",
            "DatabaseName": "tpc",
            "Name": "dl_tpc_promotion"
        }
    },
    "Permissions": [
        "ALL"
    ],
    "PermissionsWithGrantOption": []
}
```

This command produces no output.

For more information, see Granting and revoking permissions on Data Catalog resources in the *AWS Lake Formation Developer Guide*.

- For API details, see RevokePermissions in *AWS CLI Command Reference*.

`search-databases-by-lf-tags`

The following code example shows how to use `search-databases-by-lf-tags`.

AWS CLI

To search on database resources by LFTags

The following `search-databases-by-lf-tags` example search on database resources matching LFTag expression.

```
aws lakeformation search-databases-by-lf-tags \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "MaxResults": 1,
    "CatalogId": "123456789111",
    "Expression": [{
        "TagKey": "usergroup",
        "TagValues": [
            "developer"
        ]
    }]
}
```

Output:

```
{
    "DatabaseList": [{
        "Database": {
            "CatalogId": "123456789111",
            "Name": "tpc"
        },
```

```
        "LFTags": [{
            "CatalogId": "123456789111",
            "TagKey": "usergroup",
            "TagValues": [
                "developer"
            ]
        }]
    }]
}
```

For more information, see Viewing the resources that a LF-Tag is assigned to in the *AWS Lake Formation Developer Guide*.

- For API details, see SearchDatabasesByLfTags in *AWS CLI Command Reference*.

`search-tables-by-lf-tags`

The following code example shows how to use `search-tables-by-lf-tags`.

AWS CLI

To search on table resources by LFTags

The following `search-tables-by-lf-tags` example search on table resources matching LFTag expression.

```
aws lakeformation search-tables-by-lf-tags \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "MaxResults": 2,
    "CatalogId": "123456789111",
    "Expression": [{
        "TagKey": "usergroup",
        "TagValues": [
            "developer"
        ]
    }]
}
```

Output:

```
{
    "NextToken": "c2VhcmNoQWxsVGFnc0luVGFibGVzIjpmYWxzZX0=",
    "TableList": [{
        "Table": {
            "CatalogId": "123456789111",
            "DatabaseName": "tpc",
            "Name": "dl_tpc_item"
        },
        "LFTagOnDatabase": [{
            "CatalogId": "123456789111",
            "TagKey": "usergroup",
            "TagValues": [
                "developer"
            ]
        }],
        "LFTagsOnTable": [{
            "CatalogId": "123456789111",
            "TagKey": "usergroup",

                    "TagValues": [
                        "developer"
                    ]
                }]
            },
            {
                "Name": "i_product_name",
                "LFTags": [{
                    "CatalogId": "123456789111",
                    "TagKey": "usergroup",
                    "TagValues": [
                        "developer"
                    ]
                }]
            }
        ]
    }]
}
```

For more information, see Viewing the resources that a LF-Tag is assigned to in the *AWS Lake Formation Developer Guide*.

- For API details, see SearchTablesByLfTags in *AWS CLI Command Reference*.

`start-query-planning`

The following code example shows how to use `start-query-planning`.

AWS CLI

To process query statement

The following `start-query-planning` example submits a request to process a query statement.

```
aws lakeformation start-query-planning \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "QueryPlanningContext": {
        "CatalogId": "012345678901",
        "DatabaseName": "tpc"
    },
    "QueryString": "select * from dl_tpc_household_demographics_gov where
 hd_income_band_sk=9"
}
```

Output:

```
{
    "QueryId": "772a273f-4a62-4cda-8d98-69615ee8be9b"
}
```

For more information, see Reading from and writing to the data lake within transactions in the *AWS Lake Formation Developer Guide*.

- For API details, see StartQueryPlanning in *AWS CLI Command Reference*.

`start-transaction`

The following code example shows how to use `start-transaction`.

AWS CLI

To start new transaction

The following `start-transaction` example starts a new transaction and returns its transaction ID.

```
aws lakeformation start-transaction \
    --transaction-type = 'READ_AND_WRITE'
```

Output:

```
{
    "TransactionId": "b014d972ca8347b89825e33c5774aec4"
}
```

For more information, see Reading from and writing to the data lake within transactions in the *AWS Lake Formation Developer Guide*.

- For API details, see StartTransaction in *AWS CLI Command Reference*.

`update-lf-tag`

The following code example shows how to use `update-lf-tag`.

AWS CLI

To update LF-Tag definition

The following `update-lf-tag` example updates LF-Tag definition.

```
aws lakeformation update-lf-tag \
    --catalog-id '123456789111' \
    --tag-key 'usergroup' \
    --tag-values-to-add '["admin"]'
```

This command produces no output.

For more information, see Managing LF-Tags for metadata access control in the *AWS Lake Formation Developer Guide*.

- For API details, see UpdateLfTag in *AWS CLI Command Reference*.

`update-table-objects`

The following code example shows how to use `update-table-objects`.

AWS CLI

To modify objects of governed table

The following `update-table-objects` example adds provided S3 objects to the specified governed table.

```
aws lakeformation update-table-objects \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "012345678901",
    "DatabaseName": "tpc",
    "TableName": "dl_tpc_household_demographics_gov",
    "TransactionId": "12347a9f75424b9b915f6ff201d2a190",
    "WriteOperations": [{
        "AddObject": {
            "Uri": "s3://lf-data-lake-012345678901/target/
dl_tpc_household_demographics_gov/run-unnamed-1-part-block-0-r-00000-snappy-
ff26b17504414fe88b302cd795eabd00.parquet",
            "ETag": "1234ab1fc50a316b149b4e1f21a73800",
            "Size": 42200
        }
    }]
}
```

This command produces no output.

For more information, see Reading from and writing to the data lake within transactions in the *AWS Lake Formation Developer Guide*.

- For API details, see UpdateTableObjects in *AWS CLI Command Reference*.

Lambda examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Lambda.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Actions

`add-layer-version-permission`

The following code example shows how to use `add-layer-version-permission`.

AWS CLI

To add permissions to a layer version

The following `add-layer-version-permission` example grants permission for the specified account to use version 1 of the layer `my-layer`.

```
aws lambda add-layer-version-permission \
    --layer-name my-layer \
    --statement-id xaccount \
    --action lambda:GetLayerVersion  \
    --principal 123456789012 \
    --version-number 1
```

Output:

```
{

    "Statement":
    {
        "Sid":"xaccount",
        "Effect":"Allow",
        "Principal":{
            "AWS":"arn:aws:iam::210987654321:root"
        },
        "Action":"lambda:GetLayerVersion",
        "Resource":"arn:aws:lambda:us-east-2:123456789012:layer:my-layer:1"
    }
}
```

For more information, see AWS Lambda Layers in the *AWS Lambda Developer Guide*.

- For API details, see AddLayerVersionPermission in *AWS CLI Command Reference*.

`add-permission`

The following code example shows how to use `add-permission`.

AWS CLI

To add permissions to an existing Lambda function

The following `add-permission` example grants the Amazon SNS service permission to invoke a function named `my-function`.

```
aws lambda add-permission \
    --function-name my-function \
    --action lambda:InvokeFunction \
    --statement-id sns \
    --principal sns.amazonaws.com
```

Output:

```
{
    "Statement":
    {
        "Sid":"sns",
        "Effect":"Allow",
        "Principal":{
            "Service":"sns.amazonaws.com"
        },
        "Action":"lambda:InvokeFunction",
        "Resource":"arn:aws:lambda:us-east-2:123456789012:function:my-function"
    }
}
```

For more information, see Using Resource-based Policies for AWS Lambda in the *AWS Lambda Developer Guide*.

- For API details, see AddPermission in *AWS CLI Command Reference*.

`create-alias`

The following code example shows how to use `create-alias`.

AWS CLI

To create an alias for a Lambda function

The following `create-alias` example creates an alias named `LIVE` that points to version 1 of the `my-function` Lambda function.

```
aws lambda create-alias \
    --function-name my-function \
    --description "alias for live version of function" \
    --function-version 1 \
    --name LIVE
```

Output:

```
{
    "FunctionVersion": "1",
    "Name": "LIVE",
    "AliasArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function:LIVE",
    "RevisionId": "873282ed-4cd3-4dc8-a069-d0c647e470c6",
    "Description": "alias for live version of function"
}
```

For more information, see Configuring AWS Lambda Function Aliases in the *AWS Lambda Developer Guide*.

- For API details, see CreateAlias in *AWS CLI Command Reference*.

`create-event-source-mapping`

The following code example shows how to use `create-event-source-mapping`.

AWS CLI

To create a mapping between an event source and an AWS Lambda function

The following `create-event-source-mapping` example creates a mapping between an SQS queue and the `my-function` Lambda function.

```
aws lambda create-event-source-mapping \
    --function-name my-function \
    --batch-size 5 \
    --event-source-arn arn:aws:sqs:us-west-2:123456789012:mySQSqueue
```

Output:

```
{
    "UUID": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
```

```
    "StateTransitionReason": "USER_INITIATED",
    "LastModified": 1569284520.333,
    "BatchSize": 5,
    "State": "Creating",
    "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function",
    "EventSourceArn": "arn:aws:sqs:us-west-2:123456789012:mySQSqueue"
}
```

For more information, see AWS Lambda Event Source Mapping in the *AWS Lambda Developer Guide*.

- For API details, see CreateEventSourceMapping in *AWS CLI Command Reference*.

`create-function`

The following code example shows how to use `create-function`.

AWS CLI

To create a Lambda function

The following `create-function` example creates a Lambda function named `my-function`.

```
aws lambda create-function \
    --function-name my-function \
    --runtime nodejs22.x \
    --zip-file fileb://my-function.zip \
    --handler my-function.handler \
    --role arn:aws:iam::123456789012:role/service-role/MyTestFunction-role-tges6bf4
```

Contents of `my-function.zip`:

```
This file is a deployment package that contains your function code and any
 dependencies.
```

Output:

```
{
    "TracingConfig": {
        "Mode": "PassThrough"
    },
```

```
    "CodeSha256": "PFn4S+er27qk+UuZSTKEQfNKG/XNn7QJs90mJgq6oH8=",
    "FunctionName": "my-function",
    "CodeSize": 308,
    "RevisionId": "873282ed-4cd3-4dc8-a069-d0c647e470c6",
    "MemorySize": 128,
    "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function",
    "Version": "$LATEST",
    "Role": "arn:aws:iam::123456789012:role/service-role/MyTestFunction-role-
zgur6bf4",
    "Timeout": 3,
    "LastModified": "2025-10-14T22:26:11.234+0000",
    "Handler": "my-function.handler",
    "Runtime": "nodejs22.x",
    "Description": ""
}
```

For more information, see Configure Lambda function memory in the *AWS Lambda Developer Guide*.

- For API details, see CreateFunction in *AWS CLI Command Reference*.

`delete-alias`

The following code example shows how to use `delete-alias`.

AWS CLI

To delete an alias of a Lambda function

The following `delete-alias` example deletes the alias named `LIVE` from the `my-function` Lambda function.

```
aws lambda delete-alias \
    --function-name my-function \
    --name LIVE
```

This command produces no output.

For more information, see Configuring AWS Lambda Function Aliases in the *AWS Lambda Developer Guide*.

- For API details, see DeleteAlias in *AWS CLI Command Reference*.

`delete-event-source-mapping`

The following code example shows how to use `delete-event-source-mapping`.

AWS CLI

To delete the mapping between an event source and an AWS Lambda function

The following `delete-event-source-mapping` example deletes the mapping between an SQS queue and the `my-function` Lambda function.

```
aws lambda delete-event-source-mapping \
    --uuid  a1b2c3d4-5678-90ab-cdef-11111EXAMPLE
```

Output:

```
{
    "UUID": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
    "StateTransitionReason": "USER_INITIATED",
    "LastModified": 1569285870.271,
    "BatchSize": 5,
    "State": "Deleting",
    "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function",
    "EventSourceArn": "arn:aws:sqs:us-west-2:123456789012:mySQSqueue"
}
```

For more information, see AWS Lambda Event Source Mapping in the *AWS Lambda Developer Guide*.

- For API details, see DeleteEventSourceMapping in *AWS CLI Command Reference*.

`delete-function-concurrency`

The following code example shows how to use `delete-function-concurrency`.

AWS CLI

To remove the reserved concurrent execution limit from a function

The following `delete-function-concurrency` example deletes the reserved concurrent execution limit from the `my-function` function.

```
aws lambda delete-function-concurrency \
```

```
    --function-name  my-function
```

This command produces no output.

For more information, see Reserving Concurrency for a Lambda Function in the *AWS Lambda Developer Guide*.

- For API details, see DeleteFunctionConcurrency in *AWS CLI Command Reference*.

`delete-function-event-invoke-config`

The following code example shows how to use `delete-function-event-invoke-config`.

AWS CLI

To delete an asynchronous invocation configuration

The following `delete-function-event-invoke-config` example deletes the asynchronous invocation configuration for the `GREEN` alias of the specified function.

```
aws lambda delete-function-event-invoke-config --function-name my-function:GREEN
```

- For API details, see DeleteFunctionEventInvokeConfig in *AWS CLI Command Reference*.

`delete-function`

The following code example shows how to use `delete-function`.

AWS CLI

Example 1: To delete a Lambda function by function name

The following `delete-function` example deletes the Lambda function named `my-function` by specifying the function's name.

```
aws lambda delete-function \
    --function-name my-function
```

This command produces no output.

Example 2: To delete a Lambda function by function ARN

The following `delete-function` example deletes the Lambda function named `my-function` by specifying the function's ARN.

```
aws lambda delete-function \
    --function-name arn:aws:lambda:us-west-2:123456789012:function:my-function
```

This command produces no output.

Example 3: To delete a Lambda function by partial function ARN

The following `delete-function` example deletes the Lambda function named `my-function` by specifying the function's partial ARN.

```
aws lambda delete-function \
    --function-name 123456789012:function:my-function
```

This command produces no output.

For more information, see AWS Lambda Function Configuration in the *AWS Lambda Developer Guide*.

- For API details, see DeleteFunction in *AWS CLI Command Reference*.

`delete-layer-version`

The following code example shows how to use `delete-layer-version`.

AWS CLI

To delete a version of a Lambda layer

The following `delete-layer-version` example deletes version 2 of the layer named `my-layer`.

```
aws lambda delete-layer-version \
    --layer-name my-layer \
    --version-number 2
```

This command produces no output.

For more information, see AWS Lambda Layers in the *AWS Lambda Developer Guide*.

- For API details, see DeleteLayerVersion in *AWS CLI Command Reference*.

`delete-provisioned-concurrency-config`

The following code example shows how to use `delete-provisioned-concurrency-config`.

AWS CLI

To delete a provisioned concurrency configuration

The following `delete-provisioned-concurrency-config` example deletes the provisioned concurrency configuration for the `GREEN` alias of the specified function.

```
aws lambda delete-provisioned-concurrency-config \
    --function-name my-function \
    --qualifier GREEN
```

- For API details, see DeleteProvisionedConcurrencyConfig in *AWS CLI Command Reference*.

`get-account-settings`

The following code example shows how to use `get-account-settings`.

AWS CLI

To retrieve details about your account in an AWS Region

The following `get-account-settings` example displays the Lambda limits and usage information for your account.

```
aws lambda get-account-settings
```

Output:

```
{
    "AccountLimit": {
       "CodeSizeUnzipped": 262144000,
       "UnreservedConcurrentExecutions": 1000,
       "ConcurrentExecutions": 1000,
       "CodeSizeZipped": 52428800,
       "TotalCodeSize": 80530636800
    },
    "AccountUsage": {
       "FunctionCount": 4,
```

```
        "TotalCodeSize": 9426
    }
}
```

For more information, see AWS Lambda Limits in the *AWS Lambda Developer Guide*.

- For API details, see GetAccountSettings in *AWS CLI Command Reference*.

get-alias

The following code example shows how to use `get-alias`.

AWS CLI

To retrieve details about a function alias

The following `get-alias` example displays details for the alias named `LIVE` on the `my-function` Lambda function.

```
aws lambda get-alias \
    --function-name my-function \
    --name LIVE
```

Output:

```
{
    "FunctionVersion": "3",
    "Name": "LIVE",
    "AliasArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function:LIVE",
    "RevisionId": "594f41fb-b85f-4c20-95c7-6ca5f2a92c93",
    "Description": "alias for live version of function"
}
```

For more information, see Configuring AWS Lambda Function Aliases in the *AWS Lambda Developer Guide*.

- For API details, see GetAlias in *AWS CLI Command Reference*.

get-event-source-mapping

The following code example shows how to use `get-event-source-mapping`.

AWS CLI

To retrieve details about an event source mapping

The following `get-event-source-mapping` example displays the details for the mapping between an SQS queue and the `my-function` Lambda function.

```
aws lambda get-event-source-mapping \
    --uuid "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE"
```

Output:

```
{
    "UUID": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
    "StateTransitionReason": "USER_INITIATED",
    "LastModified": 1569284520.333,
    "BatchSize": 5,
    "State": "Enabled",
    "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function",
    "EventSourceArn": "arn:aws:sqs:us-west-2:123456789012:mySQSqueue"
}
```

For more information, see AWS Lambda Event Source Mapping in the *AWS Lambda Developer Guide*.

- For API details, see GetEventSourceMapping in *AWS CLI Command Reference*.

`get-function-concurrency`

The following code example shows how to use `get-function-concurrency`.

AWS CLI

To view the reserved concurrency setting for a function

The following `get-function-concurrency` example retrieves the reserved concurrency setting for the specified function.

```
aws lambda get-function-concurrency \
    --function-name my-function
```

Output:

```
{
    "ReservedConcurrentExecutions": 250
}
```

- For API details, see GetFunctionConcurrency in *AWS CLI Command Reference*.

`get-function-configuration`

The following code example shows how to use `get-function-configuration`.

AWS CLI

To retrieve the version-specific settings of a Lambda function

The following `get-function-configuration` example displays the settings for version 2 of the `my-function` function.

```
aws lambda get-function-configuration \
    --function-name  my-function:2
```

Output:

```
{
    "FunctionName": "my-function",
    "LastModified": "2019-09-26T20:28:40.438+0000",
    "RevisionId": "e52502d4-9320-4688-9cd6-152a6ab7490d",
    "MemorySize": 256,
    "Version": "2",
    "Role": "arn:aws:iam::123456789012:role/service-role/my-function-role-uy3l9qyq",
    "Timeout": 3,
    "Runtime": "nodejs10.x",
    "TracingConfig": {
        "Mode": "PassThrough"
    },
    "CodeSha256": "5tT2qgzYUHaqwR716pZ2dpkn/0J1FrzJmlKidWoaCgk=",
    "Description": "",
    "VpcConfig": {
        "SubnetIds": [],
        "VpcId": "",
        "SecurityGroupIds": []
```

```
    },
    "CodeSize": 304,
    "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function:2",
    "Handler": "index.handler"
}
```

For more information, see AWS Lambda Function Configuration in the *AWS Lambda Developer Guide*.

- For API details, see GetFunctionConfiguration in *AWS CLI Command Reference*.

`get-function-event-invoke-config`

The following code example shows how to use `get-function-event-invoke-config`.

AWS CLI

To view an asynchronous invocation configuration

The following `get-function-event-invoke-config` example retrieves the asynchronous invocation configuration for the `BLUE` alias of the specified function.

```
aws lambda get-function-event-invoke-config \
    --function-name my-function:BLUE
```

Output:

```
{
    "LastModified": 1577824396.653,
    "FunctionArn": "arn:aws:lambda:us-east-2:123456789012:function:my-
function:BLUE",
    "MaximumRetryAttempts": 0,
    "MaximumEventAgeInSeconds": 3600,
    "DestinationConfig": {
        "OnSuccess": {},
        "OnFailure": {
            "Destination": "arn:aws:sqs:us-east-2:123456789012:failed-invocations"
        }
    }
}
```

- For API details, see GetFunctionEventInvokeConfig in *AWS CLI Command Reference*.

`get-function`

The following code example shows how to use `get-function`.

AWS CLI

To retrieve information about a function

The following `get-function` example displays information about the `my-function` function.

```
aws lambda get-function \
    --function-name  my-function
```

Output:

```
{
    "Concurrency": {
        "ReservedConcurrentExecutions": 100
    },
    "Code": {
        "RepositoryType": "S3",
        "Location": "https://awslambda-us-west-2-tasks.s3.us-west-2.amazonaws.com/
snapshots/123456789012/my-function..."
    },

        "LastModified": "2025-09-24T18:20:35.054+0000",
        "Runtime": "nodejs22.x",
        "Description": ""
    }
}
```

For more information, see Configure Lambda function memory in the *AWS Lambda Developer Guide*.

- For API details, see GetFunction in *AWS CLI Command Reference*.

`get-layer-version-by-arn`

The following code example shows how to use `get-layer-version-by-arn`.

AWS CLI

To retrieve information about a Lambda layer version

The following `get-layer-version-by-arn` example displays information about the layer version with the specified Amazon Resource Name (ARN).

```
aws lambda get-layer-version-by-arn \
    --arn "arn:aws:lambda:us-west-2:123456789012:layer:AWSLambda-Python311-SciPy1x:2"
```

Output:

```
{
    "LayerVersionArn": "arn:aws:lambda:us-west-2:123456789012:layer:AWSLambda-Python311-SciPy1x:2",
    "Description": "AWS Lambda SciPy layer for Python 3.11 (scipy-1.1.0, numpy-1.15.4) https://github.com/scipy/scipy/releases/tag/v1.1.0 https://github.com/numpy/numpy/releases/tag/v1.15.4",
    "CreatedDate": "2023-10-12T10:09:38.398+0000",
    "LayerArn": "arn:aws:lambda:us-west-2:123456789012:layer:AWSLambda-Python311-SciPy1x",
    "Content": {
        "CodeSize": 41784542,
        "CodeSha256": "GGmv8ocUw4cly0T8HL0Vx/f5V4RmSCGNjDIslY4VskM=",

}
```

For more information, see AWS Lambda Layers in the *AWS Lambda Developer Guide*.

- For API details, see GetLayerVersionByArn in *AWS CLI Command Reference*.

`get-layer-version-policy`

The following code example shows how to use `get-layer-version-policy`.

AWS CLI

To retrieve the permissions policy for a Lambda layer version

The following `get-layer-version-policy` example displays policy information about version 1 for the layer named `my-layer`.

```
aws lambda get-layer-version-policy \
    --layer-name my-layer \
    --version-number 1
```

Output:

```
{
    "Policy": {
        "Version":"2012-10-17",
        "Id":"default",
        "Statement":
        [
            {
                "Sid":"xaccount",
                "Effect":"Allow",
                "Principal": {"AWS":"arn:aws:iam::123456789012:root"},
                "Action":"lambda:GetLayerVersion",
                "Resource":"arn:aws:lambda:us-west-2:123456789012:layer:my-layer:1"
```

```
            }
        ]
    },
    "RevisionId": "c68f21d2-cbf0-4026-90f6-1375ee465cd0"
}
```

For more information, see [AWS Lambda Layers](#) in the *AWS Lambda Developer Guide*.

- For API details, see [GetLayerVersionPolicy](#) in *AWS CLI Command Reference*.

`get-layer-version`

The following code example shows how to use `get-layer-version`.

AWS CLI

To retrieve information about a Lambda layer version

The following `get-layer-version` example displays information for version 1 of the layer named `my-layer`.

```
aws lambda get-layer-version \
    --layer-name my-layer \
    --version-number 1
```

Output:

```
{
    "Content": {
        "Location": "https://awslambda-us-east-2-layers.s3.us-east-2.amazonaws.com/
snapshots/123456789012/my-layer-4aaa2fbb-ff77-4b0a-ad92-5b78a716a96a?
versionId=27iWyA73cCAYqyH...",
        "CodeSha256": "tv9jJO+rPbXUUXuRKi7CwHzKtLDkDRJLB3cC3Z/ouXo=",
        "CodeSize": 169
    },
    "LayerArn": "arn:aws:lambda:us-east-2:123456789012:layer:my-layer",
    "LayerVersionArn": "arn:aws:lambda:us-east-2:123456789012:layer:my-layer:1",
    "Description": "My Python layer",
    "CreatedDate": "2018-11-14T23:03:52.894+0000",
    "Version": 1,
    "LicenseInfo": "MIT",
    "CompatibleRuntimes": [
        "python3.10",
```

```
        "python3.11"
    ]
}
```

For more information, see AWS Lambda Layers in the *AWS Lambda Developer Guide*.

- For API details, see GetLayerVersion in *AWS CLI Command Reference*.

get-policy

The following code example shows how to use `get-policy`.

AWS CLI

To retrieve the resource-based IAM policy for a function, version, or alias

The following `get-policy` example displays policy information about the `my-function` Lambda function.

```
aws lambda get-policy \
    --function-name my-function
```

Output:

```
{
    "Policy": {
        "Version":"2012-10-17",
        "Id":"default",
        "Statement":
        [
            {
                "Sid":"iot-events",
                "Effect":"Allow",
                "Principal": {"Service":"iotevents.amazonaws.com"},
                "Action":"lambda:InvokeFunction",

```

For more information, see Using Resource-based Policies for AWS Lambda in the *AWS Lambda Developer Guide*.

- For API details, see GetPolicy in *AWS CLI Command Reference*.

`get-provisioned-concurrency-config`

The following code example shows how to use `get-provisioned-concurrency-config`.

AWS CLI

To view a provisioned concurrency configuration

The following `get-provisioned-concurrency-config` example displays details for the provisioned concurrency configuration for the `BLUE` alias of the specified function.

```
aws lambda get-provisioned-concurrency-config \
    --function-name my-function \
    --qualifier BLUE
```

Output:

```
{
    "RequestedProvisionedConcurrentExecutions": 100,
    "AvailableProvisionedConcurrentExecutions": 100,
    "AllocatedProvisionedConcurrentExecutions": 100,
    "Status": "READY",
    "LastModified": "2019-12-31T20:28:49+0000"
}
```

- For API details, see GetProvisionedConcurrencyConfig in *AWS CLI Command Reference*.

`invoke`

The following code example shows how to use `invoke`.

AWS CLI

Example 1: To invoke a Lambda function synchronously

The following `invoke` example invokes the `my-function` function synchronously. The `cli-binary-format` option is required if you're using AWS CLI version 2. For more information, see AWS CLI supported global command line options in the *AWS Command Line Interface User Guide*.

```
aws lambda invoke \
    --function-name my-function \
    --cli-binary-format raw-in-base64-out \
    --payload '{ "name": "Bob" }' \
    response.json
```

Output:

```
{
    "ExecutedVersion": "$LATEST",
    "StatusCode": 200
}
```

For more information, see Invoke a Lambda function synchronously in the *AWS Lambda Developer Guide*.

Example 2: To invoke a Lambda function asynchronously

The following `invoke` example invokes the `my-function` function asynchronously. The `cli-binary-format` option is required if you're using AWS CLI version 2. For more information, see AWS CLI supported global command line options in the *AWS Command Line Interface User Guide*.

```
aws lambda invoke \
    --function-name my-function \
    --invocation-type Event \
    --cli-binary-format raw-in-base64-out \
    --payload '{ "name": "Bob" }' \
    response.json
```

Output:

```
{
    "StatusCode": 202
}
```

For more information, see Invoking a Lambda function asynchronously in the *AWS Lambda Developer Guide*.

- For API details, see Invoke in *AWS CLI Command Reference*.

`list-aliases`

The following code example shows how to use `list-aliases`.

AWS CLI

To retrieve the list of aliases for a Lambda function

The following `list-aliases` example displays a list of the aliases for the `my-function` Lambda function.

```
aws lambda list-aliases \
    --function-name my-function
```

Output:

```
{
    "Aliases": [
        {
            "AliasArn": "arn:aws:lambda:us-west-2:123456789012:function:my-
function:BETA",
            "RevisionId": "a410117f-ab16-494e-8035-7e204bb7933b",
            "FunctionVersion": "2",
            "Name": "BETA",
            "Description": "alias for beta version of function"
        },
        {
            "AliasArn": "arn:aws:lambda:us-west-2:123456789012:function:my-
function:LIVE",
            "RevisionId": "21d40116-f8b1-40ba-9360-3ea284da1bb5",
            "FunctionVersion": "1",
            "Name": "LIVE",
            "Description": "alias for live version of function"
        }
    ]
}
```

For more information, see Configuring AWS Lambda Function Aliases in the *AWS Lambda Developer Guide*.

- For API details, see ListAliases in *AWS CLI Command Reference*.

`list-event-source-mappings`

The following code example shows how to use `list-event-source-mappings`.

AWS CLI

To list the event source mappings for a function

The following `list-event-source-mappings` example displays a list of the event source mappings for the `my-function` Lambda function.

```
aws lambda list-event-source-mappings \
    --function-name my-function
```

Output:

```
{
    "EventSourceMappings": [
        {
            "UUID": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
            "StateTransitionReason": "USER_INITIATED",
            "LastModified": 1569284520.333,
            "BatchSize": 5,
            "State": "Enabled",
            "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-
function",
            "EventSourceArn": "arn:aws:sqs:us-west-2:123456789012:mySQSqueue"
        }
    ]
}
```

For more information, see AWS Lambda Event Source Mapping in the *AWS Lambda Developer Guide*.

- For API details, see ListEventSourceMappings in *AWS CLI Command Reference*.

`list-function-event-invoke-configs`

The following code example shows how to use `list-function-event-invoke-configs`.

AWS CLI

To view a list of asynchronous invocation configurations

The following `list-function-event-invoke-configs` example lists the asynchronous invocation configurations for the specified function.

```
aws lambda list-function-event-invoke-configs \
    --function-name my-function
```

Output:

```
{
    "FunctionEventInvokeConfigs": [
        {
            "LastModified": 1577824406.719,
            "FunctionArn": "arn:aws:lambda:us-east-2:123456789012:function:my-
function:GREEN",
            "MaximumRetryAttempts": 2,
            "MaximumEventAgeInSeconds": 1800
        },
        {
            "LastModified": 1577824396.653,
            "FunctionArn": "arn:aws:lambda:us-east-2:123456789012:function:my-
function:BLUE",
            "MaximumRetryAttempts": 0,
            "MaximumEventAgeInSeconds": 3600
        }
    ]
}
```

- For API details, see [ListFunctionEventInvokeConfigs]() in *AWS CLI Command Reference*.

`list-functions`

The following code example shows how to use `list-functions`.

AWS CLI

To retrieve a list of Lambda functions

The following `list-functions` example displays a list of all of the functions for the current user.

```
aws lambda list-functions
```

Output:

```
{
    "Functions": [
        {
            "TracingConfig": {
                "Mode": "PassThrough"
            },

```

For more information, see Configure Lambda function memory in the *AWS Lambda Developer Guide*.

- For API details, see ListFunctions in *AWS CLI Command Reference*.

`list-layer-versions`

The following code example shows how to use `list-layer-versions`.

AWS CLI

To list the versions of an AWS Lambda layer

The following `list-layers-versions` example displays information about the versions for the layer named `my-layer`.

```
aws lambda list-layer-versions \
    --layer-name my-layer
```

Output:

```
{
    "Layers": [
        {
            "LayerVersionArn": "arn:aws:lambda:us-east-2:123456789012:layer:my-
layer:2",
            "Version": 2,
            "Description": "My layer",
            "CreatedDate": "2023-11-15T00:37:46.592+0000",
            "CompatibleRuntimes": [
                "python3.10",
                "python3.11"
            ]
        }
    ]
}
```

For more information, see AWS Lambda Layers in the *AWS Lambda Developer Guide*.

- For API details, see ListLayerVersions in *AWS CLI Command Reference*.

`list-layers`

The following code example shows how to use `list-layers`.

AWS CLI

To list the layers that are compatible with your function's runtime

The following `list-layers` example displays information about layers that are compatible with the Python 3.11 runtime.

```
aws lambda list-layers \
    --compatible-runtime python3.11
```

Output:

```
{
    "Layers": [
        {
            "LayerName": "my-layer",
            "LayerArn": "arn:aws:lambda:us-east-2:123456789012:layer:my-layer",
            "LatestMatchingVersion": {
                "LayerVersionArn": "arn:aws:lambda:us-east-2:123456789012:layer:my-
layer:2",
                "Version": 2,
                "Description": "My layer",
                "CreatedDate": "2023-11-15T00:37:46.592+0000",
                "CompatibleRuntimes": [
                    "python3.10",
                    "python3.11"
                ]
            }
        }
    ]
}
```

For more information, see AWS Lambda Layers in the *AWS Lambda Developer Guide*.

- For API details, see ListLayers in *AWS CLI Command Reference*.

`list-provisioned-concurrency-configs`

The following code example shows how to use `list-provisioned-concurrency-configs`.

AWS CLI

To get a list of provisioned concurrency configurations

The following `list-provisioned-concurrency-configs` example lists the provisioned concurrency configurations for the specified function.

```
aws lambda list-provisioned-concurrency-configs \
    --function-name my-function
```

Output:

```
{
    "ProvisionedConcurrencyConfigs": [
        {
            "FunctionArn": "arn:aws:lambda:us-east-2:123456789012:function:my-
function:GREEN",
            "RequestedProvisionedConcurrentExecutions": 100,
            "AvailableProvisionedConcurrentExecutions": 100,
            "AllocatedProvisionedConcurrentExecutions": 100,
            "Status": "READY",
            "LastModified": "2019-12-31T20:29:00+0000"
        },
        {
            "FunctionArn": "arn:aws:lambda:us-east-2:123456789012:function:my-
function:BLUE",
            "RequestedProvisionedConcurrentExecutions": 100,
            "AvailableProvisionedConcurrentExecutions": 100,
            "AllocatedProvisionedConcurrentExecutions": 100,
            "Status": "READY",
            "LastModified": "2019-12-31T20:28:49+0000"
        }
    ]
}
```

- For API details, see ListProvisionedConcurrencyConfigs in *AWS CLI Command Reference*.

`list-tags`

The following code example shows how to use `list-tags`.

AWS CLI

To retrieve the list of tags for a Lambda function

The following `list-tags` example displays the tags attached to the `my-function` Lambda function.

```
aws lambda list-tags \
    --resource arn:aws:lambda:us-west-2:123456789012:function:my-function
```

Output:

```
{
    "Tags": {
        "Category": "Web Tools",
        "Department": "Sales"
    }
}
```

For more information, see Tagging Lambda Functions in the *AWS Lambda Developer Guide*.

- For API details, see ListTags in *AWS CLI Command Reference*.

`list-versions-by-function`

The following code example shows how to use `list-versions-by-function`.

AWS CLI

To retrieve a list of versions of a function

The following `list-versions-by-function` example displays the list of versions for the `my-function` Lambda function.

```
aws lambda list-versions-by-function \
    --function-name my-function
```

Output:

```
{
    "Versions": [
        {
```

```
            "TracingConfig": {
                "Mode": "PassThrough"
            },

            "Description": "newer version"
        }
    ]
}
```

For more information, see Configuring AWS Lambda Function Aliases in the *AWS Lambda Developer Guide*.

- For API details, see ListVersionsByFunction in *AWS CLI Command Reference*.

`publish-layer-version`

The following code example shows how to use `publish-layer-version`.

AWS CLI

To create a Lambda layer version

The following `publish-layer-version` example creates a new Python library layer version. The command retrieves the layer content a file named `layer.zip` in the specified S3 bucket.

```
aws lambda publish-layer-version \
    --layer-name my-layer \
    --description "My Python layer" \
    --license-info "MIT" \
    --content S3Bucket=lambda-layers-us-west-2-123456789012,S3Key=layer.zip \
    --compatible-runtimes python3.10 python3.11
```

Output:

```
{
    "Content": {
        "Location": "https://awslambda-us-west-2-layers.s3.us-west-2.amazonaws.com/
snapshots/123456789012/my-layer-4aaa2fbb-ff77-4b0a-ad92-5b78a716a96a?
versionId=27iWyA73cCAYqyH...",
        "CodeSha256": "tv9jJO+rPbXUUXuRKi7CwHzKtLDkDRJLB3cC3Z/ouXo=",
        "CodeSize": 169
    },
    "LayerArn": "arn:aws:lambda:us-west-2:123456789012:layer:my-layer",
    "LayerVersionArn": "arn:aws:lambda:us-west-2:123456789012:layer:my-layer:1",
    "Description": "My Python layer",
    "CreatedDate": "2023-11-14T23:03:52.894+0000",
    "Version": 1,
    "LicenseInfo": "MIT",
    "CompatibleRuntimes": [
        "python3.10",
        "python3.11"
    ]
}
```

For more information, see AWS Lambda Layers in the *AWS Lambda Developer Guide*.

- For API details, see PublishLayerVersion in *AWS CLI Command Reference*.

`publish-version`

The following code example shows how to use `publish-version`.

AWS CLI

To publish a new version of a function

The following `publish-version` example publishes a new version of the `my-function` Lambda function.

```
aws lambda publish-version \
    --function-name my-function
```

Output:

```
{
    "TracingConfig": {
        "Mode": "PassThrough"
    },
    "CodeSha256": "dBG9m8SGdmlEjw/JYXlhhvCrAv5TxvXsbL/RMr0fT/I=",
    "FunctionName": "my-function",
    "CodeSize": 294,
    "RevisionId": "f31d3d39-cc63-4520-97d4-43cd44c94c20",
    "MemorySize": 128,
    "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function:3",
    "Version": "2",
    "Role": "arn:aws:iam::123456789012:role/service-role/MyTestFunction-role-
zgur6bf4",
    "Timeout": 3,
    "LastModified": "2019-09-23T18:32:33.857+0000",
    "Handler": "my-function.handler",
    "Runtime": "nodejs10.x",
    "Description": ""
}
```

For more information, see Configuring AWS Lambda Function Aliases in the *AWS Lambda Developer Guide*.

- For API details, see PublishVersion in *AWS CLI Command Reference*.

`put-function-concurrency`

The following code example shows how to use `put-function-concurrency`.

AWS CLI

To configure a reserved concurrency limit for a function

The following `put-function-concurrency` example configures 100 reserved concurrent executions for the `my-function` function.

```
aws lambda put-function-concurrency \
    --function-name  my-function  \
    --reserved-concurrent-executions 100
```

Output:

```
{
    "ReservedConcurrentExecutions": 100
}
```

For more information, see Reserving Concurrency for a Lambda Function in the *AWS Lambda Developer Guide*.

- For API details, see PutFunctionConcurrency in *AWS CLI Command Reference*.

`put-function-event-invoke-config`

The following code example shows how to use `put-function-event-invoke-config`.

AWS CLI

To configure error handling for asynchronous invocation

The following `put-function-event-invoke-config` example sets a maximum event age of one hour and disables retries for the specified function.

```
aws lambda put-function-event-invoke-config \
    --function-name my-function \
    --maximum-event-age-in-seconds 3600 \
    --maximum-retry-attempts 0
```

Output:

```
{
```

```
    "LastModified": 1573686021.479,
    "FunctionArn": "arn:aws:lambda:us-east-2:123456789012:function:my-function:
$LATEST",
    "MaximumRetryAttempts": 0,
    "MaximumEventAgeInSeconds": 3600,
    "DestinationConfig": {
        "OnSuccess": {},
        "OnFailure": {}
    }
}
```

- For API details, see [PutFunctionEventInvokeConfig]() in *AWS CLI Command Reference*.

`put-provisioned-concurrency-config`

The following code example shows how to use `put-provisioned-concurrency-config`.

AWS CLI

To allocate provisioned concurrency

The following `put-provisioned-concurrency-config` example allocates 100 provisioned concurrency for the `BLUE` alias of the specified function.

```
aws lambda put-provisioned-concurrency-config \
    --function-name my-function \
    --qualifier BLUE \
    --provisioned-concurrent-executions 100
```

Output:

```
{
    "Requested ProvisionedConcurrentExecutions": 100,
    "Allocated ProvisionedConcurrentExecutions": 0,
    "Status": "IN_PROGRESS",
    "LastModified": "2019-11-21T19:32:12+0000"
}
```

- For API details, see [PutProvisionedConcurrencyConfig]() in *AWS CLI Command Reference*.

`remove-layer-version-permission`

The following code example shows how to use `remove-layer-version-permission`.

AWS CLI

To delete layer-version permissions

The following `remove-layer-version-permission` example deletes permission for an account to configure a layer version.

```
aws lambda remove-layer-version-permission \
    --layer-name my-layer \
    --statement-id xaccount \
    --version-number 1
```

This command produces no output.

For more information, see AWS Lambda Layers in the *AWS Lambda Developer Guide*.

- For API details, see RemoveLayerVersionPermission in *AWS CLI Command Reference*.

`remove-permission`

The following code example shows how to use `remove-permission`.

AWS CLI

To remove permissions from an existing Lambda function

The following `remove-permission` example removes permission to invoke a function named `my-function`.

```
aws lambda remove-permission \
    --function-name my-function \
    --statement-id sns
```

This command produces no output.

For more information, see Using Resource-based Policies for AWS Lambda in the *AWS Lambda Developer Guide*.

- For API details, see RemovePermission in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add tags to an existing Lambda function

The following `tag-resource` example adds a tag with the key name `DEPARTMENT` and a value of `Department A` to the specified Lambda function.

```
aws lambda tag-resource \
    --resource arn:aws:lambda:us-west-2:123456789012:function:my-function \
    --tags "DEPARTMENT=Department A"
```

This command produces no output.

For more information, see Tagging Lambda Functions in the *AWS Lambda Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from an existing Lambda function

The following `untag-resource` example removes the tag with the key name `DEPARTMENT` tag from the `my-function` Lambda function.

```
aws lambda untag-resource \
    --resource arn:aws:lambda:us-west-2:123456789012:function:my-function \
    --tag-keys DEPARTMENT
```

This command produces no output.

For more information, see Tagging Lambda Functions in the *AWS Lambda Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-alias`

The following code example shows how to use `update-alias`.

AWS CLI

To update a function alias

The following `update-alias` example updates the alias named `LIVE` to point to version 3 of the `my-function` Lambda function.

```
aws lambda update-alias \
    --function-name my-function \
    --function-version 3 \
    --name LIVE
```

Output:

```
{
    "FunctionVersion": "3",
    "Name": "LIVE",
    "AliasArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function:LIVE",
    "RevisionId": "594f41fb-b85f-4c20-95c7-6ca5f2a92c93",
    "Description": "alias for live version of function"
}
```

For more information, see Configuring AWS Lambda Function Aliases in the *AWS Lambda Developer Guide*.

- For API details, see UpdateAlias in *AWS CLI Command Reference*.

`update-event-source-mapping`

The following code example shows how to use `update-event-source-mapping`.

AWS CLI

To update the mapping between an event source and an AWS Lambda function

The following `update-event-source-mapping` example updates the batch size to 8 in the specified mapping.

```
aws lambda update-event-source-mapping \
```

```
    --uuid  "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE" \
    --batch-size 8
```

Output:

```
{
    "UUID": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
    "StateTransitionReason": "USER_INITIATED",
    "LastModified": 1569284520.333,
    "BatchSize": 8,
    "State": "Updating",
    "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function",
    "EventSourceArn": "arn:aws:sqs:us-west-2:123456789012:mySQSqueue"
}
```

For more information, see AWS Lambda Event Source Mapping in the *AWS Lambda Developer Guide*.

- For API details, see UpdateEventSourceMapping in *AWS CLI Command Reference*.

`update-function-code`

The following code example shows how to use `update-function-code`.

AWS CLI

To update the code of a Lambda function

The following `update-function-code` example replaces the code of the unpublished ($LATEST) version of the `my-function` function with the contents of the specified zip file.

```
aws lambda update-function-code \
    --function-name  my-function \
    --zip-file fileb://my-function.zip
```

Output:

```
{
    "FunctionName": "my-function",
    "LastModified": "2019-09-26T20:28:40.438+0000",
    "RevisionId": "e52502d4-9320-4688-9cd6-152a6ab7490d",
    "MemorySize": 256,
```

```
    "Version": "$LATEST",
    "Role": "arn:aws:iam::123456789012:role/service-role/my-function-role-uy3l9qyq",
    "Timeout": 3,
    "Runtime": "nodejs10.x",
    "TracingConfig": {
        "Mode": "PassThrough"
    },
    "CodeSha256": "5tT2qgzYUHaqwR716pZ2dpkn/0J1FrzJmlKidWoaCgk=",
    "Description": "",
    "VpcConfig": {
        "SubnetIds": [],
        "VpcId": "",
        "SecurityGroupIds": []
    },
    "CodeSize": 304,
    "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function",
    "Handler": "index.handler"
}
```

For more information, see AWS Lambda Function Configuration in the *AWS Lambda Developer Guide*.

- For API details, see UpdateFunctionCode in *AWS CLI Command Reference*.

`update-function-configuration`

The following code example shows how to use `update-function-configuration`.

AWS CLI

To modify the configuration of a function

The following `update-function-configuration` example modifies the memory size to be 256 MB for the unpublished ($LATEST) version of the `my-function` function.

```
aws lambda update-function-configuration \
    --function-name  my-function \
    --memory-size 256
```

Output:

```
{
    "FunctionName": "my-function",
```

```
    "LastModified": "2019-09-26T20:28:40.438+0000",
    "RevisionId": "e52502d4-9320-4688-9cd6-152a6ab7490d",
    "MemorySize": 256,
    "Version": "$LATEST",
    "Role": "arn:aws:iam::123456789012:role/service-role/my-function-role-uy3l9qyq",
    "Timeout": 3,
    "Runtime": "nodejs10.x",
    "TracingConfig": {
        "Mode": "PassThrough"
    },
    "CodeSha256": "5tT2qgzYUHaqwR716pZ2dpkn/0J1FrzJmlKidWoaCgk=",
    "Description": "",
    "VpcConfig": {
        "SubnetIds": [],
        "VpcId": "",
        "SecurityGroupIds": []
    },
    "CodeSize": 304,
    "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function",
    "Handler": "index.handler"
}
```

For more information, see AWS Lambda Function Configuration in the *AWS Lambda Developer Guide*.

- For API details, see UpdateFunctionConfiguration in *AWS CLI Command Reference*.

`update-function-event-invoke-config`

The following code example shows how to use `update-function-event-invoke-config`.

AWS CLI

To update an asynchronous invocation configuration

The following `update-function-event-invoke-config` example adds an on-failure destination to the existing asynchronous invocation configuration for the specified function.

```
aws lambda update-function-event-invoke-config \
    --function-name my-function \
    --destination-config '{"OnFailure":{"Destination": "arn:aws:sqs:us-
east-2:123456789012:destination"}}'
```

Output:

```
{
    "LastModified": 1573687896.493,
    "FunctionArn": "arn:aws:lambda:us-east-2:123456789012:function:my-function:
$LATEST",
    "MaximumRetryAttempts": 0,
    "MaximumEventAgeInSeconds": 3600,
    "DestinationConfig": {
        "OnSuccess": {},
        "OnFailure": {
            "Destination": "arn:aws:sqs:us-east-2:123456789012:destination"
        }
    }
}
```

- For API details, see UpdateFunctionEventInvokeConfig in *AWS CLI Command Reference*.

License Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with License Manager.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-license-configuration`

The following code example shows how to use `create-license-configuration`.

AWS CLI

Example 1: To create a license configuration

The following `create-license-configuration` example creates a license configuration with a hard limit of 10 cores.

```
aws license-manager create-license-configuration --name my-license-configuration \
    --license-counting-type Core \
    --license-count 10 \
    --license-count-hard-limit
```

Output:

```
{
  "LicenseConfigurationArn": "arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-6eb6586f508a786a2ba41EXAMPLE1111"
}
```

Example 2: To create a license configuration

The following `create-license-configuration` example creates a license configuration with a soft limit of 100 vCPUs. It uses a rule to enable vCPU optimization.

```
aws license-manager create-license-configuration --name my-license-configuration
    --license-counting-type vCPU \
    --license-count 100 \
    --license-rules "#honorVcpuOptimization=true"
```

Output:

```
{
  "LicenseConfigurationArn": "arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-6eb6586f508a786a2ba41EXAMPLE2222"
}
```

- For API details, see CreateLicenseConfiguration in *AWS CLI Command Reference*.

`delete-license-configuration`

The following code example shows how to use `delete-license-configuration`.

AWS CLI

To delete a license configuration

The following `delete-license-configuration` example deletes the specified license configuration.

```
aws license-manager delete-license-configuration \
    --license-configuration-arn arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-6eb6586f508a786a2ba4f56c1EXAMPLE
```

This command produces no output.

- For API details, see DeleteLicenseConfiguration in *AWS CLI Command Reference*.

`get-license-configuration`

The following code example shows how to use `get-license-configuration`.

AWS CLI

To get license configuration information

The following `get-license-configuration` example displays details for the specified license configuration.

```
aws license-manager get-license-configuration \
    --license-configuration-arn arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-38b658717b87478aaa7c00883EXAMPLE
```

Output:

```
{
    "LicenseConfigurationId": "lic-38b658717b87478aaa7c00883EXAMPLE",
    "LicenseConfigurationArn": "arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-38b658717b87478aaa7c00883EXAMPLE",
    "Name": "my-license-configuration",
    "LicenseCountingType": "vCPU",
    "LicenseRules": [],
    "LicenseCountHardLimit": false,
    "ConsumedLicenses": 0,
    "Status": "AVAILABLE",
    "OwnerAccountId": "123456789012",
    "ConsumedLicenseSummaryList": [
        {
            "ResourceType": "EC2_INSTANCE",
```

```
                "ConsumedLicenses": 0
            },
            {
                "ResourceType": "EC2_HOST",
                "ConsumedLicenses": 0
            },
            {
                "ResourceType": "SYSTEMS_MANAGER_MANAGED_INSTANCE",
                "ConsumedLicenses": 0
            }
        ],
        "ManagedResourceSummaryList": [
            {
                "ResourceType": "EC2_INSTANCE",
                "AssociationCount": 0
            },
            {
                "ResourceType": "EC2_HOST",
                "AssociationCount": 0
            },
            {
                "ResourceType": "EC2_AMI",
                "AssociationCount": 2
            },
            {
                "ResourceType": "SYSTEMS_MANAGER_MANAGED_INSTANCE",
                "AssociationCount": 0
            }
        ]
}
```

- For API details, see GetLicenseConfiguration in *AWS CLI Command Reference*.

`get-service-settings`

The following code example shows how to use `get-service-settings`.

AWS CLI

To get the License Manager settings

The following `get-service-settings` example displays the service settings for License Manager in the current Region.

```
aws license-manager get-service-settings
```

The following shows example output if cross-account resource discovery is disabled.

```
{
    "OrganizationConfiguration": {
        "EnableIntegration": false
    },
    "EnableCrossAccountsDiscovery": false
}
```

The following shows example output if cross-account resource discovery is enabled.

```
{
    "S3BucketArn": "arn:aws:s3:::aws-license-manager-service-c22d6279-35c4-47c4-bb",
    "OrganizationConfiguration": {
        "EnableIntegration": true
    },
    "EnableCrossAccountsDiscovery": true
}
```

- For API details, see GetServiceSettings in *AWS CLI Command Reference*.

`list-associations-for-license-configuration`

The following code example shows how to use `list-associations-for-license-configuration`.

AWS CLI

To get associations for a license configuration

The following `list-associations-for-license-configuration` example displays detailed information for the associations of the specified license configuration.

```
aws license-manager list-associations-for-license-configuration \
    --license-configuration-arn arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-38b658717b87478aaa7c00883EXAMPLE
```

Output:

```
{
    "LicenseConfigurationAssociations": [
        {
            "ResourceArn": "arn:aws:ec2:us-west-2::image/ami-1234567890abcdef0",
            "ResourceType": "EC2_AMI",
            "ResourceOwnerId": "123456789012",
            "AssociationTime": 1568825118.617
        },
        {
            "ResourceArn": "arn:aws:ec2:us-west-2::image/ami-0abcdef1234567890",
            "ResourceType": "EC2_AMI",
            "ResourceOwnerId": "123456789012",
            "AssociationTime": 1568825118.946
        }
    ]
}
```

- For API details, see ListAssociationsForLicenseConfiguration in *AWS CLI Command Reference*.

`list-license-configurations`

The following code example shows how to use `list-license-configurations`.

AWS CLI

Example 1: To list all of your license configurations

The following `list-license-configurations` example lists all your license configurations.

```
aws license-manager list-license-configurations
```

Output:

```
{
    "LicenseConfigurations": [
        {
            "LicenseConfigurationId": "lic-6eb6586f508a786a2ba4f56c1EXAMPLE",
            "LicenseConfigurationArn": "arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-6eb6586f508a786a2ba4f56c1EXAMPLE",
            "Name": "my-license-configuration",
            "LicenseCountingType": "Core",
            "LicenseRules": [],
```

```
            "LicenseCount": 10,
            "LicenseCountHardLimit": true,
            "ConsumedLicenses": 0,
            "Status": "AVAILABLE",
            "OwnerAccountId": "123456789012",
            "ConsumedLicenseSummaryList": [
                {
                    "ResourceType": "EC2_INSTANCE",
                    "ConsumedLicenses": 0
                },
                {
                    "ResourceType": "EC2_HOST",
                    "ConsumedLicenses": 0
                },
                {
                    "ResourceType": "SYSTEMS_MANAGER_MANAGED_INSTANCE",
                    "ConsumedLicenses": 0
                }
            ],
            "ManagedResourceSummaryList": [
                {
                    "ResourceType": "EC2_INSTANCE",
                    "AssociationCount": 0
                },
                {
                    "ResourceType": "EC2_HOST",
                    "AssociationCount": 0
                },
                {
                    "ResourceType": "EC2_AMI",
                    "AssociationCount": 0
                },
                {
                    "ResourceType": "SYSTEMS_MANAGER_MANAGED_INSTANCE",
                    "AssociationCount": 0
                }
            ]
        },
        {
            ...
        }
    ]
}
```

Example 2: To list a specific license configuration

The following `list-license-configurations` example lists only the specified license configuration.

```
aws license-manager list-license-configurations \
    --license-configuration-arns arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-38b658717b87478aaa7c00883EXAMPLE
```

- For API details, see ListLicenseConfigurations in *AWS CLI Command Reference*.

`list-license-specifications-for-resource`

The following code example shows how to use `list-license-specifications-for-resource`.

AWS CLI

To list the license configurations for a resource

The following `list-license-specifications-for-resource` example lists the license configurations associated with the specified Amazon Machine Image (AMI).

```
aws license-manager list-license-specifications-for-resource \
    --resource-arn arn:aws:ec2:us-west-2::image/ami-1234567890abcdef0
```

Output:

```
{
    "LicenseConfigurationArn": "arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-38b658717b87478aaa7c00883EXAMPLE"
}
```

- For API details, see ListLicenseSpecificationsForResource in *AWS CLI Command Reference*.

`list-resource-inventory`

The following code example shows how to use `list-resource-inventory`.

AWS CLI

To list resources in the resource inventory

The following `list-resource-inventory` example lists the resources managed using Systems Manager inventory.

```
aws license-manager list-resource-inventory
```

Output:

```
{
    "ResourceInventoryList": [
        {
            "Platform": "Red Hat Enterprise Linux Server",
            "ResourceType": "EC2Instance",
            "PlatformVersion": "7.4",
            "ResourceArn": "arn:aws:ec2:us-west-2:1234567890129:instance/
i-05d3cdfb05bd36376",
            "ResourceId": "i-05d3cdfb05bd36376",
            "ResourceOwningAccountId": "1234567890129"
        },
        {
            "Platform": "Amazon Linux",
            "ResourceType": "EC2Instance",
            "PlatformVersion": "2",
            "ResourceArn": "arn:aws:ec2:us-west-2:1234567890129:instance/
i-0b1d036cfd4594808",
            "ResourceId": "i-0b1d036cfd4594808",
            "ResourceOwningAccountId": "1234567890129"
        },
        {
            "Platform": "Microsoft Windows Server 2019 Datacenter",
            "ResourceType": "EC2Instance",
            "PlatformVersion": "10.0.17763",
            "ResourceArn": "arn:aws:ec2:us-west-2:1234567890129:instance/
i-0cdb3b54a2a8246ad",
            "ResourceId": "i-0cdb3b54a2a8246ad",
            "ResourceOwningAccountId": "1234567890129"
        }
    ]
}
```

- For API details, see ListResourceInventory in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags for a license configuration

The following `list-tags-for-resource` example lists the tags for the specified license configuration.

```
aws license-manager list-tags-for-resource \
    --resource-arn arn:aws:license-manager:us-west-2:123456789012:license-configuration:lic-6eb6586f508a786a2ba4f56c1EXAMPLE
```

Output:

```
{
    "Tags": [
        {
            "Key": "project",
            "Value": "lima"
        }
    ]
}
```

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`list-usage-for-license-configuration`

The following code example shows how to use `list-usage-for-license-configuration`.

AWS CLI

To list the licenses in use for a license configuration

The following `list-usage-for-license-configuration` example lists information about the resources using licenses for the specified license configuration. For example, if the license type is vCPU, any instances consume one license per vCPU.

```
aws license-manager list-usage-for-license-configuration \
    --license-configuration-arn arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-38b658717b87478aaa7c00883EXAMPLE
```

Output:

```
{
    "LicenseConfigurationUsageList": [
        {
            "ResourceArn": "arn:aws:ec2:us-west-2:123456789012:instance/
i-04a636d18e83cfacb",
            "ResourceType": "EC2_INSTANCE",
            "ResourceStatus": "running",
            "ResourceOwnerId": "123456789012",
            "AssociationTime": 1570892850.519,
            "ConsumedLicenses": 2
        }
    ]
}
```

- For API details, see ListUsageForLicenseConfiguration in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add a tag a license configuration

The following `tag-resource` example adds the specified tag (key name and value) to the specified license configuration.

```
aws license-manager tag-resource \
    --tags Key=project,Value=lima \
    --resource-arn arn:aws:license-manager:us-west-2:123456789012:license-
configuration:lic-6eb6586f508a786a2ba4f56c1EXAMPLE
```

This command produces no output.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a license configuration

The following `untag-resource` example removes the specified tag (key name and resource) from the specified license configuration.

```
aws license-manager untag-resource \
    --tag-keys project \
    --resource-arn arn:aws:license-manager:us-west-2:123456789012:license-
configuration:lic-6eb6586f508a786a2ba4f56c1EXAMPLE
```

This command produces no output.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-license-configuration`

The following code example shows how to use `update-license-configuration`.

AWS CLI

To update a license configuration

The following `update-license-configuration` example updates the specified license configuration to remove the hard limit.

```
aws license-manager update-license-configuration \
    --no-license-count-hard-limit \
    --license-configuration-arn arn:aws:license-manager:us-
west-2:880185128111:license-configuration:lic-6eb6586f508a786a2ba4f56c1EXAMPLE
```

This command produces no output.

The following `update-license-configuration` example updates the specified license configuration to change its status to `DISABLED`.

```
aws license-manager update-license-configuration \
    --license-configuration-status DISABLED
    --license-configuration-arn arn:aws:license-manager:us-
west-2:880185128111:license-configuration:lic-6eb6586f508a786a2ba4f56c1EXAMPLE
```

This command produces no output.

- For API details, see [UpdateLicenseConfiguration]() in *AWS CLI Command Reference*.

`update-license-specifications-for-resource`

The following code example shows how to use `update-license-specifications-for-resource`.

AWS CLI

To update the license configurations for a resource

The following `update-license-specifications-for-resource` example replaces the license configuration associated with the specified Amazon Machine Image (AMI) by removing one license configuration and adding another.

```
aws license-manager update-license-specifications-for-resource \
    --resource-arn arn:aws:ec2:us-west-2::image/ami-1234567890abcdef0 \
    --remove-license-specifications LicenseConfigurationArn=arn:aws:license-
manager:us-west-2:123456789012:license-
configuration:lic-38b658717b87478aaa7c00883EXAMPLE \
    --add-license-specifications LicenseConfigurationArn=arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-42b6deb06e5399a980d555927EXAMPLE
```

This command produces no output.

- For API details, see [UpdateLicenseSpecificationsForResource]() in *AWS CLI Command Reference*.

`update-service-settings`

The following code example shows how to use `update-service-settings`.

AWS CLI

To update the License Manager settings

The following `update-service-settings` example enables cross-account resource discovery for License Manager in the current AWS Region. The Amazon S3 bucket is the Resource Data Sync required for Systems Manager inventory.

```
aws license-manager update-service-settings \
    --organization-configuration EnableIntegration=true \
    --enable-cross-accounts-discovery \
    --s3-bucket-arn arn:aws:s3:::aws-license-manager-service-abcd1234EXAMPLE
```

This command produces no output.

- For API details, see UpdateServiceSettings in *AWS CLI Command Reference*.

Lightsail examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Lightsail.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Actions

`allocate-static-ip`

The following code example shows how to use `allocate-static-ip`.

AWS CLI

To create a static IP

The following `allocate-static-ip` example creates the specified static IP, which can be attached to an instance.

```
aws lightsail allocate-static-ip \
    --static-ip-name StaticIp-1
```

Output:

```
{
    "operations": [
        {
            "id": "b5d06d13-2f19-4683-889f-dEXAMPLEed79",
            "resourceName": "StaticIp-1",
            "resourceType": "StaticIp",
            "createdAt": 1571071325.076,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationType": "AllocateStaticIp",
            "status": "Succeeded",
            "statusChangedAt": 1571071325.274
        }
    ]
}
```

- For API details, see AllocateStaticIp in *AWS CLI Command Reference*.

`attach-disk`

The following code example shows how to use `attach-disk`.

AWS CLI

To attach a block storage disk to an instance

The following `attach-disk` example attaches disk `Disk-1` to instance `WordPress_Multisite-1` with the disk path of `/dev/xvdf`

```
aws lightsail attach-disk \
    --disk-name Disk-1 \
    --disk-path /dev/xvdf \
    --instance-name WordPress_Multisite-1
```

Output:

```
{
    "operations": [
        {
            "id": "10a08267-19ce-43be-b913-6EXAMPLE7e80",
            "resourceName": "Disk-1",
            "resourceType": "Disk",
            "createdAt": 1571071465.472,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "WordPress_Multisite-1",
            "operationType": "AttachDisk",
            "status": "Started",
            "statusChangedAt": 1571071465.472
        },
        {
            "id": "2912c477-5295-4539-88c9-bEXAMPLEd1f0",
            "resourceName": "WordPress_Multisite-1",
            "resourceType": "Instance",
            "createdAt": 1571071465.474,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "Disk-1",
            "operationType": "AttachDisk",
            "status": "Started",
            "statusChangedAt": 1571071465.474
        }
    ]
}
```

- For API details, see AttachDisk in *AWS CLI Command Reference*.

`attach-instances-to-load-balancer`

The following code example shows how to use `attach-instances-to-load-balancer`.

AWS CLI

To attach instances to a load balancer

The following `attach-instances-to-load-balancer` example attaches instances `MEAN-1`, `MEAN-2`, and `MEAN-3` to the load balancer `LoadBalancer-1`.

```
aws lightsail attach-instances-to-load-balancer \
    --instance-names {"MEAN-1","MEAN-2","MEAN-3"} \
    --load-balancer-name LoadBalancer-1
```

Output:

```
{
    "operations": [
        {
            "id": "8055d19d-abb2-40b9-b527-1EXAMPLE3c7b",
            "resourceName": "LoadBalancer-1",
            "resourceType": "LoadBalancer",
            "createdAt": 1571071699.892,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },

                "status": "Started",
                "statusChangedAt": 1571071699.901
            }
        ]
}
```

- For API details, see AttachInstancesToLoadBalancer in *AWS CLI Command Reference*.

attach-load-balancer-tls-certificate

The following code example shows how to use `attach-load-balancer-tls-certificate`.

AWS CLI

To attach a TLS certificate to a load balancer

The following `attach-load-balancer-tls-certificate` example attaches the load balancer TLS certificate `Certificate2` to the load balancer `LoadBalancer-1`.

```
aws lightsail attach-load-balancer-tls-certificate \
    --certificate-name Certificate2 \
    --load-balancer-name LoadBalancer-1
```

Output:

```
{
```

```
    "operations": [
        {
            "id": "cf1ad6e3-3cbb-4b8a-a7f2-3EXAMPLEa118",

            "resourceType": "LoadBalancerTlsCertificate",
            "createdAt": 1571072255.416,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationDetails": "LoadBalancer-1",
            "operationType": "AttachLoadBalancerTlsCertificate",
            "status": "Succeeded",
            "statusChangedAt": 1571072255.416
        }
    ]
}
```

- For API details, see AttachLoadBalancerTlsCertificate in *AWS CLI Command Reference*.

`attach-static-ip`

The following code example shows how to use `attach-static-ip`.

AWS CLI

To attach a static IP to an instance

The following `attach-static-ip` example attaches static IP `StaticIp-1` to instance `MEAN-1`.

```
aws lightsail attach-static-ip \
    --static-ip-name StaticIp-1 \
    --instance-name MEAN-1
```

Output:

```
{
    "operations": [
        {
            "id": "45e6fa13-4808-4b8d-9292-bEXAMPLE20b2",
            "resourceName": "StaticIp-1",
            "resourceType": "StaticIp",
            "createdAt": 1571072569.375,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationDetails": "MEAN-1",
            "operationType": "AttachStaticIp",
            "status": "Succeeded",
            "statusChangedAt": 1571072569.375
        },
        {
            "id": "9ee09a17-863c-4e51-8a6d-3EXAMPLE5475",
            "resourceName": "MEAN-1",
            "resourceType": "Instance",
            "createdAt": 1571072569.376,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationDetails": "StaticIp-1",
            "operationType": "AttachStaticIp",

            "statusChangedAt": 1571072569.376
        }
    ]
```

```
}
```

- For API details, see AttachStaticIp in *AWS CLI Command Reference*.

`close-instance-public-ports`

The following code example shows how to use `close-instance-public-ports`.

AWS CLI

To close firewall ports for an instance

The following `close-instance-public-ports` example closes TCP port 22 on instance `MEAN-2`.

```
aws lightsail close-instance-public-ports \
    --instance-name MEAN-2 \
    --port-info fromPort=22,protocol=TCP,toPort=22
```

Output:

```
{
    "operation": {
        "id": "4f328636-1c96-4649-ae6d-1EXAMPLEf446",
        "resourceName": "MEAN-2",
        "resourceType": "Instance",
        "createdAt": 1571072845.737,
        "location": {
            "availabilityZone": "us-west-2a",
            "regionName": "us-west-2"
        },
        "isTerminal": true,
        "operationDetails": "22/tcp",
        "operationType": "CloseInstancePublicPorts",
        "status": "Succeeded",
        "statusChangedAt": 1571072845.737
    }
}
```

- For API details, see CloseInstancePublicPorts in *AWS CLI Command Reference*.

`copy-snapshot`

The following code example shows how to use `copy-snapshot`.

AWS CLI

Example 1: To copy a snapshot within the same AWS Region

The following `copy-snapshot` example copies instance snapshot `MEAN-1-1571075291` as instance snapshot `MEAN-1-Copy` within the same AWS Region `us-west-2`.

```
aws lightsail copy-snapshot \
    --source-snapshot-name MEAN-1-1571075291 \
    --target-snapshot-name MEAN-1-Copy \
    --source-region us-west-2
```

Output:

```
{
    "operations": [
        {
            "id": "ced16fc1-f401-4556-8d82-1EXAMPLEb982",
            "resourceName": "MEAN-1-Copy",
            "resourceType": "InstanceSnapshot",
            "createdAt": 1571075581.498,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "us-west-2:MEAN-1-1571075291",
            "operationType": "CopySnapshot",
            "status": "Started",
            "statusChangedAt": 1571075581.498
        }
    ]
}
```

For more information, see Copying snapshots from one AWS Region to another in Amazon Lightsail in the *Lightsail Dev Guide*.

Example 2: To copy a snapshot from one AWS Region to another

The following `copy-snapshot` example copies instance snapshot `MEAN-1-1571075291` as instance snapshot `MEAN-1-1571075291-Copy` from AWS Region `us-west-2` to `us-east-1`.

```
aws lightsail copy-snapshot \
    --source-snapshot-name MEAN-1-1571075291 \
    --target-snapshot-name MEAN-1-1571075291-Copy \
    --source-region us-west-2 \
    --region us-east-1
```

Output:

```
{
    "operations": [
        {
            "id": "91116b79-119c-4451-b44a-dEXAMPLEd97b",
            "resourceName": "MEAN-1-1571075291-Copy",
            "resourceType": "InstanceSnapshot",
            "createdAt": 1571075695.069,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-east-1"
            },
            "isTerminal": false,
            "operationDetails": "us-west-2:MEAN-1-1571075291",
            "operationType": "CopySnapshot",
            "status": "Started",
            "statusChangedAt": 1571075695.069
        }
    ]
}
```

For more information, see Copying snapshots from one AWS Region to another in Amazon Lightsail in the *Lightsail Dev Guide*.

Example 3: To copy an automatic snapshot within the same AWS Region

The following `copy-snapshot` example copies automatic snapshot `2019-10-14` of instance `WordPress-1` as a manual snapshot `WordPress-1-10142019` in the AWS Region `us-west-2`.

```
aws lightsail copy-snapshot \
    --source-resource-name WordPress-1 \
    --restore-date 2019-10-14 \
```

```
    --target-snapshot-name WordPress-1-10142019 \
    --source-region us-west-2
```

Output:

```
{
    "operations": [
        {
            "id": "be3e6754-cd1d-48e6-ad9f-2EXAMPLE1805",
            "resourceName": "WordPress-1-10142019",
            "resourceType": "InstanceSnapshot",
            "createdAt": 1571082412.311,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "us-west-2:WordPress-1",
            "operationType": "CopySnapshot",
            "status": "Started",
            "statusChangedAt": 1571082412.311
        }
    ]
}
```

For more information, see Keeping automatic snapshots of instances or disks in Amazon Lightsail in the *Lightsail Dev Guide*.

Example 4: To copy an automatic snapshot from one AWS Region to another

The following `copy-snapshot` example copies automatic snapshot `2019-10-14` of instance `WordPress-1` as a manual snapshot `WordPress-1-10142019` from the AWS Region `us-west-2` to `us-east-1`.

```
aws lightsail copy-snapshot \
    --source-resource-name WordPress-1 \
    --restore-date 2019-10-14 \
    --target-snapshot-name WordPress-1-10142019 \
    --source-region us-west-2 \
    --region us-east-1
```

Output:

```
{
    "operations": [
        {
            "id": "dffa128b-0b07-476e-b390-bEXAMPLE3775",
            "resourceName": "WordPress-1-10142019",
            "resourceType": "InstanceSnapshot",
            "createdAt": 1571082493.422,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-east-1"
            },
            "isTerminal": false,
            "operationDetails": "us-west-2:WordPress-1",
            "operationType": "CopySnapshot",
            "status": "Started",
            "statusChangedAt": 1571082493.422
        }
    ]
}
```

For more information, see Keeping automatic snapshots of instances or disks in Amazon Lightsail in the *Lightsail Dev Guide*.

- For API details, see CopySnapshot in *AWS CLI Command Reference*.

`create-disk-from-snapshot`

The following code example shows how to use `create-disk-from-snapshot`.

AWS CLI

To create a create a disk from a disk snapshot

The following `create-disk-from-snapshot` example creates a block storage disk named `Disk-2` from the specified block storage disk snapshot. The disk is created in the specified AWS Region and Availability Zone, with 32 GB of storage space.

```
aws lightsail create-disk-from-snapshot \
    --disk-name Disk-2 \
    --disk-snapshot-name Disk-1-1566839161 \
    --availability-zone us-west-2a \
    --size-in-gb 32
```

Output:

```
{
    "operations": [
        {
            "id": "d42b605d-5ef1-4b4a-8791-7a3e8b66b5e7",
            "resourceName": "Disk-2",
            "resourceType": "Disk",
            "createdAt": 1569624941.471,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "CreateDiskFromSnapshot",
            "status": "Started",
            "statusChangedAt": 1569624941.791
        }
    ]
}
```

For more information, see Creating a block storage disk from a snapshot in Amazon Lightsail in the *Lightsail Developer Guide*.

- For API details, see CreateDiskFromSnapshot in *AWS CLI Command Reference*.

`create-disk-snapshot`

The following code example shows how to use `create-disk-snapshot`.

AWS CLI

Example 1: To create a snapshot of a disk

The following `create-disk-snapshot` example creates a snapshot named `DiskSnapshot-1` of the specified block storage disk.

```
aws lightsail create-disk-snapshot \
    --disk-name Disk-1 \
    --disk-snapshot-name DiskSnapshot-1
```

Output:

```
{
    "operations": [
        {
            "id": "fa74c6d2-03a3-4f42-a7c7-792f124d534b",
            "resourceName": "DiskSnapshot-1",
            "resourceType": "DiskSnapshot",
            "createdAt": 1569625129.739,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "Disk-1",
            "operationType": "CreateDiskSnapshot",

            "statusChangedAt": 1569625129.739
        }
    ]
}
```

Example 2: To create a snapshot of an instance's system disk

The following `create-disk-snapshot` example creates a snapshot of the specified instance's system disk.

```
aws lightsail create-disk-snapshot \
    --instance-name WordPress-1 \
```

```
    --disk-snapshot-name SystemDiskSnapshot-1
```

Output:

```
{
    "operations": [
        {
            "id": "f508cf1c-6597-42a6-a4c3-4aebd75af0d9",

        }
    ]
}
```

For more information, see Snapshots in Amazon Lightsail and Creating a snapshot of an instance root volume in Amazon Lightsail in the *Lightsail Developer Guide*.

- For API details, see CreateDiskSnapshot in *AWS CLI Command Reference*.

`create-disk`

The following code example shows how to use `create-disk`.

AWS CLI

To create a block storage disk

The following `create-disk` example creates a block storage disk `Disk-1` in the specified AWS Region and Availability Zone, with 32 GB of storage space.

```
aws lightsail create-disk \
    --disk-name Disk-1 \
    --availability-zone us-west-2a \
    --size-in-gb 32
```

Output:

```
{
    "operations": [
        {
            "id": "1c85e2ec-86ba-4697-b936-77f4d3dc013a",
            "resourceName": "Disk-1",
            "resourceType": "Disk",
            "createdAt": 1569449220.36,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "CreateDisk",
            "status": "Started",
            "statusChangedAt": 1569449220.588
        }
    ]
}
```

- For API details, see CreateDisk in *AWS CLI Command Reference*.

`create-domain-entry`

The following code example shows how to use `create-domain-entry`.

AWS CLI

To create a domain entry (DNS record)

The following `create-domain-entry` example creates a DNS record (A) for the apex of the specified domain that points to an instance's IP address.

Note: Lightsail's domain-related API operations are available in only the `us-east-1` Region. If your CLI profile is configured to use a different Region, you must include the `--region us-east-1` parameter or the command fails.

```
aws lightsail create-domain-entry \
    --region us-east-1 \
    --domain-name example.com \
    --domain-entry name=example.com,type=A,target=192.0.2.0
```

Output:

```
{
    "operation": {
        "id": "5be4494d-56f4-41fc-8730-693dcd0ef9e2",
        "resourceName": "example.com",
        "resourceType": "Domain",
        "createdAt": 1569865296.519,
        "location": {
            "availabilityZone": "all",
            "regionName": "global"
        },
        "isTerminal": true,
        "operationType": "CreateDomainEntry",
        "status": "Succeeded",
        "statusChangedAt": 1569865296.519
    }
}
```

For more information, see DNS in Amazon Lightsail and Creating a DNS zone to manage your domain's DNS records in Amazon Lightsail in the *Lightsail Developer Guide*.

- For API details, see CreateDomainEntry in *AWS CLI Command Reference*.

`create-domain`

The following code example shows how to use `create-domain`.

AWS CLI

To create a domain (DNS zone)

The following `create-domain` example creates a DNS zone for the specified domain.

Note: Lightsail's domain-related API operations are available in only the `us-east-1` Region. If your CLI profile is configured to use a different Region, you must include the `--region us-east-1` parameter or the command fails.

```
aws lightsail create-domain \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
    "operation": {
        "id": "64e522c8-9ae1-4c05-9b65-3f237324dc34",
        "resourceName": "example.com",
        "resourceType": "Domain",
        "createdAt": 1569864291.92,
        "location": {
            "availabilityZone": "all",
            "regionName": "global"
        },
        "isTerminal": true,
        "operationType": "CreateDomain",
        "status": "Succeeded",
        "statusChangedAt": 1569864292.109
    }
}
```

For more information, see DNS in Amazon Lightsail and Creating a DNS zone to manage your domain's DNS records in Amazon Lightsail in the *Lightsail Developer Guide*.

- For API details, see CreateDomain in *AWS CLI Command Reference*.

`create-instance-snapshot`

The following code example shows how to use `create-instance-snapshot`.

AWS CLI

To create a snapshot of an instance

The following `create-instance-snapshot` example creates a snapshot from the specified instance.

```
aws lightsail create-instance-snapshot \
    --instance-name WordPress-1 \
    --instance-snapshot-name WordPress-Snapshot-1
```

Output:

```
{
    "operations": [
        {
            "id": "4c3db559-9dd0-41e7-89c0-2cb88c19786f",
            "resourceName": "WordPress-Snapshot-1",
            "resourceType": "InstanceSnapshot",
            "createdAt": 1569866438.48,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "WordPress-1",
            "operationType": "CreateInstanceSnapshot",
            "status": "Started",
            "statusChangedAt": 1569866438.48
        },
        {
            "id": "c04fdc45-2981-488c-88b5-d6d2fd759a6a",
            "resourceName": "WordPress-1",

`create-instances-from-snapshot`

The following code example shows how to use `create-instances-from-snapshot`.

AWS CLI

To create an instance from a snapshot

The following `create-instances-from-snapshot` example creates an instance from the specified instance snapshot, in the specified AWS Region and Availability Zone, using the $12 USD bundle.

Note: The bundle that you specify must be equal to or greater in specifications than the bundle of the original source instance used to create the snapshot.

```
aws lightsail create-instances-from-snapshot \
    --instance-snapshot-name WordPress-1-1569866208 \
    --instance-names WordPress-2 \
    --availability-zone us-west-2a \
    --bundle-id small_3_0
```

Output:

```
{
    "operations": [
        {
            "id": "003f8271-b711-464d-b9b8-7f3806cb496e",
            "resourceName": "WordPress-2",
            "resourceType": "Instance",
            "createdAt": 1569865914.908,
```

```
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "CreateInstancesFromSnapshot",
            "status": "Started",
            "statusChangedAt": 1569865914.908
        }
    ]
}
```

- For API details, see CreateInstancesFromSnapshot in *AWS CLI Command Reference*.

`create-instances`

The following code example shows how to use `create-instances`.

AWS CLI

Example 1: To create a single instance

The following `create-instances` example creates an instance in the specified AWS Region and Availability Zone, using the WordPress blueprint, and the $5.00 USD bundle.

```
aws lightsail create-instances \
    --instance-names Instance-1 \
    --availability-zone us-west-2a \
    --blueprint-id wordpress \
    --bundle-id nano_3_0
```

Output:

```
{
    "operations": [
        {
            "id": "9a77158f-7be3-4d6d-8054-cf5ae2b720cc",
            "resourceName": "Instance-1",
            "resourceType": "Instance",
            "createdAt": 1569447986.061,
            "location": {
```

```
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "CreateInstance",
            "status": "Started",
            "statusChangedAt": 1569447986.061
        }
    ]
}
```

Example 2: To create multiple instances at one time

The following `create-instances` example creates three instances in the specified AWS Region and Availability Zone, using the WordPress blueprint, and the $5.00 USD bundle.

```
aws lightsail create-instances \
    --instance-names {"Instance1","Instance2","Instance3"} \
    --availability-zone us-west-2a \
    --blueprint-id wordpress \
    --bundle-id nano_3_0
```

Output:

```
{
    "operations": [
        {
            "id": "5492f015-9d2e-48c6-8eea-b516840e6903",
            "resourceName": "Instance1",
            "resourceType": "Instance",
            "createdAt": 1569448780.054,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "CreateInstance",
            "status": "Started",
            "statusChangedAt": 1569448780.054
        },
        {
            "id": "c58b5f46-2676-44c8-b95c-3ad375898515",
```

```
                "resourceName": "Instance2",
                "resourceType": "Instance",
                "createdAt": 1569448780.054,
                "location": {
                    "availabilityZone": "us-west-2a",
                    "regionName": "us-west-2"
                },
                "isTerminal": false,
                "operationType": "CreateInstance",
                "status": "Started",
                "statusChangedAt": 1569448780.054
            },
            {
                "id": "a5ad8006-9bee-4499-9eb7-75e42e6f5882",
                "resourceName": "Instance3",
                "resourceType": "Instance",
                "createdAt": 1569448780.054,
                "location": {
                    "availabilityZone": "us-west-2a",
                    "regionName": "us-west-2"
                },
                "isTerminal": false,
                "operationType": "CreateInstance",
                "status": "Started",
                "statusChangedAt": 1569448780.054
            }
        ]
}
```

- For API details, see CreateInstances in *AWS CLI Command Reference*.

`create-key-pair`

The following code example shows how to use `create-key-pair`.

AWS CLI

To create a key pair

The following `create-key-pair` example creates a key pair that you can use to authenticate and connect to an instance.

```
aws lightsail create-key-pair \
```

```
    --key-pair-name MyPersonalKeyPair
```

The output provides the private key base64 value that you can use to authenticate to instances that use the created key pair. **Note:** Copy and paste the private key base64 value to a safe location because you cannot retrieve it later.

```
{
    "keyPair": {
        "name": "MyPersonalKeyPair",

`create-load-balancer-tls-certificate`

The following code example shows how to use `create-load-balancer-tls-certificate`.

AWS CLI

To create a TLS certificate for a load balancer

The following `create-load-balancer-tls-certificate` example creates a TLS certificate that is attached to the specified load balancer. The certificate created applies to the specified domains. **Note:** Only two certificates can be created for a load balancer.

```
aws lightsail create-load-balancer-tls-certificate \
    --certificate-alternative-names abc.example.com \
    --certificate-domain-name example.com \
    --certificate-name MySecondCertificate \
    --load-balancer-name MyFirstLoadBalancer
```

Output:

```
{
    "operations": [
        {
            "id": "be663aed-cb46-41e2-9b23-e2f747245bd4",
            "resourceName": "MySecondCertificate",
            "resourceType": "LoadBalancerTlsCertificate",
            "createdAt": 1569867364.971,
            "location": {
```

```
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationDetails": "MyFirstLoadBalancer",
            "operationType": "CreateLoadBalancerTlsCertificate",
            "status": "Succeeded",
            "statusChangedAt": 1569867365.219
        },
        {
            "id": "f3dfa930-969e-41cc-ac7d-337178716f6d",
            "resourceName": "MyFirstLoadBalancer",
            "resourceType": "LoadBalancer",
            "createdAt": 1569867364.971,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationDetails": "MySecondCertificate",
            "operationType": "CreateLoadBalancerTlsCertificate",
            "status": "Succeeded",
            "statusChangedAt": 1569867365.219
        }
    ]
}
```

- For API details, see CreateLoadBalancerTlsCertificate in *AWS CLI Command Reference*.

`create-load-balancer`

The following code example shows how to use `create-load-balancer`.

AWS CLI

To create a load balancer

The following `create-load-balancer` example creates a load balancer with a TLS certificate. The TLS certificate applies to the specified domains, and routes traffic to instances on port 80.

```
aws lightsail create-load-balancer \
    --certificate-alternative-names www.example.com test.example.com \
    --certificate-domain-name example.com \
```

```
    --certificate-name Certificate-1 \
    --instance-port 80 \
    --load-balancer-name LoadBalancer-1
```

Output:

```
{
    "operations": [
        {
            "id": "cc7b920a-83d8-4762-a74e-9174fe1540be",
            "resourceName": "LoadBalancer-1",
            "resourceType": "LoadBalancer",
            "createdAt": 1569867169.406,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "CreateLoadBalancer",
            "status": "Started",
            "statusChangedAt": 1569867169.406
        },
        {
            "id": "658ed43b-f729-42f3-a8e4-3f8024d3c98d",
            "resourceName": "LoadBalancer-1",
            "resourceType": "LoadBalancerTlsCertificate",
            "createdAt": 1569867170.193,
            "location": {
                "availabilityZone": "all",

            },
            "isTerminal": true,
            "operationDetails": "Certificate-1",
            "operationType": "CreateLoadBalancerTlsCertificate",
            "status": "Succeeded",
            "statusChangedAt": 1569867170.54
        }
    ]
}
```

For more information, see Lightsail load balancers in the *Lightsail Developer Guide*.

- For API details, see CreateLoadBalancer in *AWS CLI Command Reference*.

`create-relational-database-from-snapshot`

The following code example shows how to use `create-relational-database-from-snapshot`.

AWS CLI

To create a managed database from a snapshot

The following `create-relational-database-from-snapshot` example creates a managed database from the specified snapshot in the specified AWS Region and Availability Zone, using the $15 USD standard database bundle. **Note:** The bundle that you specify must be equal to or greater in specifications than the bundle of the original source database used to create the snapshot.

```
aws lightsail create-relational-database-from-snapshot \
    --relational-database-snapshot-name Database-Oregon-1-1566839359 \
    --relational-database-name Database-1 \
    --availability-zone us-west-2a \
    --relational-database-bundle-id micro_1_0 \
    --no-publicly-accessible
```

Output:

```
{
    "operations": [
```

```
        {
            "id": "ad6d9193-9d5c-4ea1-97ae-8fe6de600b4c",
            "resourceName": "Database-1",
            "resourceType": "RelationalDatabase",
            "createdAt": 1569867916.938,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "CreateRelationalDatabaseFromSnapshot",
            "status": "Started",
            "statusChangedAt": 1569867918.643
        }
    ]
}
```

- For API details, see [CreateRelationalDatabaseFromSnapshot]() in *AWS CLI Command Reference*.

`create-relational-database-snapshot`

The following code example shows how to use `create-relational-database-snapshot`.

AWS CLI

To create a snapshot of a managed database

The following `create-relational-database-snapshot` example creates a snapshot of the specified managed database.

```
aws lightsail create-relational-database-snapshot \
    --relational-database-name Database1 \
    --relational-database-snapshot-name RelationalDatabaseSnapshot1
```

Output:

```
{
    "operations": [
        {
            "id": "853667fb-ea91-4c02-8d20-8fc5fd43b9eb",
            "resourceName": "RelationalDatabaseSnapshot1",
            "resourceType": "RelationalDatabaseSnapshot",
```

```
            "createdAt": 1569868074.645,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "Database1",
            "operationType": "CreateRelationalDatabaseSnapshot",

            "statusChangedAt": 1569868074.645
        },
        {
            "id": "fbafa521-3cac-4be8-9773-1c143780b239",
            "resourceName": "Database1",
            "resourceType": "RelationalDatabase",
            "createdAt": 1569868074.645,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "RelationalDatabaseSnapshot1",
            "operationType": "CreateRelationalDatabaseSnapshot",
            "status": "Started",
            "statusChangedAt": 1569868074.645
        }
    ]
}
```

- For API details, see CreateRelationalDatabaseSnapshot in *AWS CLI Command Reference*.

`create-relational-database`

The following code example shows how to use `create-relational-database`.

AWS CLI

To create a managed database

The following `create-relational-database` example creates a managed database in the specified AWS Region and Availability Zone, using the MySQL 5.6 database engine (mysql_5_6), and the $15 USD standard database bundle (micro_1_0). The managed database is pre-populated a master user name, and is not publicly accessible.

```
aws lightsail create-relational-database \
    --relational-database-name Database-1 \
    --availability-zone us-west-2a \
    --relational-database-blueprint-id mysql_5_6 \
    --relational-database-bundle-id micro_1_0 \
    --master-database-name dbmaster \
    --master-username user \
    --no-publicly-accessible
```

Output:

```
{
    "operations": [
        {
            "id": "b52bedee-73ed-4798-8d2a-9c12df89adcd",
            "resourceName": "Database-1",
            "resourceType": "RelationalDatabase",
            "createdAt": 1569450017.244,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "CreateRelationalDatabase",

            "statusChangedAt": 1569450018.637
        }
    ]
}
```

- For API details, see CreateRelationalDatabase in *AWS CLI Command Reference*.

`delete-auto-snapshot`

The following code example shows how to use `delete-auto-snapshot`.

AWS CLI

To delete an automatic snapshot

The following `delete-auto-snapshot` example deletes the automatic snapshot `2019-10-10` of instance `WordPress-1`.

```
aws lightsail delete-auto-snapshot \
    --resource-name WordPress-1 \
    --date 2019-10-10
```

Output:

```
{
    "operations": [
        {
            "id": "31c36e09-3d52-46d5-b6d8-7EXAMPLE534a",
            "resourceName": "WordPress-1",
            "resourceType": "Instance",
            "createdAt": 1571088141.501,
            "location": {
                "availabilityZone": "us-west-2",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationDetails": "DeleteAutoSnapshot-2019-10-10",
            "operationType": "DeleteAutoSnapshot",
            "status": "Succeeded"
        }
    ]
}
```

For more information, see Deleting automatic snapshots of instances or disks in Amazon Lightsail in the *Lightsail Dev Guide*.

- For API details, see DeleteAutoSnapshot in *AWS CLI Command Reference*.

`delete-disk-snapshot`

The following code example shows how to use `delete-disk-snapshot`.

AWS CLI

To delete a snapshot of a block storage disk

The following `delete-disk-snapshot` example deletes the specified snapshot of a block storage disk

```
aws lightsail delete-disk-snapshot \
```

```
    --disk-snapshot-name DiskSnapshot-1
```

Output:

```
{
    "operations": [
        {
            "id": "d1e5766d-b81e-4595-ad5d-02afbccfcd5d",
            "resourceName": "DiskSnapshot-1",
            "resourceType": "DiskSnapshot",
            "createdAt": 1569873552.79,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationType": "DeleteDiskSnapshot",
            "status": "Succeeded",
            "statusChangedAt": 1569873552.79
        }
    ]
}
```

- For API details, see DeleteDiskSnapshot in *AWS CLI Command Reference*.

`delete-disk`

The following code example shows how to use `delete-disk`.

AWS CLI

To delete a block storage disk

The following `delete-disk` example deletes the specified block storage disk.

```
aws lightsail delete-disk \
    --disk-name Disk-1
```

Output:

```
{
    "operations": [
```

```
        {
            "id": "6378c70f-4d75-4f7a-ab66-730fca0bb2fc",
            "resourceName": "Disk-1",
            "resourceType": "Disk",
            "createdAt": 1569872887.864,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationType": "DeleteDisk",
            "status": "Succeeded",
            "statusChangedAt": 1569872887.864
        }
    ]
}
```

- For API details, see DeleteDisk in *AWS CLI Command Reference*.

`delete-domain-entry`

The following code example shows how to use `delete-domain-entry`.

AWS CLI

To delete a domain entry (DNS record)

The following `delete-domain-entry` example deletes the specified domain entry from an existing domain.

Note: Lightsail's domain-related API operations are available in only the `us-east-1` Region. If your CLI profile is configured to use a different Region, you must include the `--region us-east-1` parameter or the command fails.

```
aws lightsail delete-domain-entry \
    --region us-east-1 \
    --domain-name example.com \
    --domain-entry name=123.example.com,target=192.0.2.0,type=A
```

Output:

```
{
```

```
    "operation": {
        "id": "06eacd01-d785-420e-8daa-823150c7dca1",
        "resourceName": "example.com ",
        "resourceType": "Domain",
        "createdAt": 1569874157.005,
        "location": {
            "availabilityZone": "all",
            "regionName": "global"
        },
        "isTerminal": true,
        "operationType": "DeleteDomainEntry",
        "status": "Succeeded",
        "statusChangedAt": 1569874157.005
    }
}
```

- For API details, see DeleteDomainEntry in *AWS CLI Command Reference*.

`delete-domain`

The following code example shows how to use `delete-domain`.

AWS CLI

To delete a domain (DNS zone)

The following `delete-domain` example deletes the specified domain and all of the entries in the domain (DNS records).

Note: Lightsail's domain-related API operations are available in only the `us-east-1` Region. If your CLI profile is configured to use a different Region, you must include the `--region us-east-1` parameter or the command fails.

```
aws lightsail delete-domain \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
    "operation": {
        "id": "fcef5265-5af1-4a46-a3d7-90b5e18b9b32",
```

```
            "resourceName": "example.com",
            "resourceType": "Domain",
            "createdAt": 1569873788.13,
            "location": {
                "availabilityZone": "all",
                "regionName": "global"
            },
            "isTerminal": true,
            "operationType": "DeleteDomain",
            "status": "Succeeded",
            "statusChangedAt": 1569873788.13
        }
}
```

- For API details, see DeleteDomain in *AWS CLI Command Reference*.

`delete-instance-snapshot`

The following code example shows how to use `delete-instance-snapshot`.

AWS CLI

title

The following `delete-instance-snapshot` example deletes the specified snapshot of an instance.

```
aws lightsail delete-instance-snapshot \
    --instance-snapshot-name WordPress-1-Snapshot-1
```

Output:

```
{
    "operations": [
        {
            "id": "14dad182-976a-46c6-bfd4-9480482bf0ea",
            "resourceName": "WordPress-1-Snapshot-1",
            "resourceType": "InstanceSnapshot",
            "createdAt": 1569874524.562,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
```

```
            },
            "isTerminal": true,
            "operationType": "DeleteInstanceSnapshot",
            "status": "Succeeded",
            "statusChangedAt": 1569874524.562
        }
    ]
}
```

- For API details, see DeleteInstanceSnapshot in *AWS CLI Command Reference*.

delete-instance

The following code example shows how to use `delete-instance`.

AWS CLI

To delete an instance

The following `delete-instance` example deletes the specified instance.

```
aws lightsail delete-instance \
    --instance-name WordPress-1
```

Output:

```
{
    "operations": [
        {
            "id": "d77345a3-8f80-4d2e-b47d-aaa622718df2",
            "resourceName": "Disk-1",
            "resourceType": "Disk",
            "createdAt": 1569874357.469,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "WordPress-1",
            "operationType": "DetachDisk",
            "status": "Started",
            "statusChangedAt": 1569874357.469
        },
```

```
        {
            "id": "708fa606-2bfd-4e48-a2c1-0b856585b5b1",
            "resourceName": "WordPress-1",
            "resourceType": "Instance",
            "createdAt": 1569874357.465,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "Disk-1",
            "operationType": "DetachDisk",
            "status": "Started",
            "statusChangedAt": 1569874357.465
        },
        {
            "id": "3187e823-8acb-405d-b098-fad5ceb17bec",
            "resourceName": "WordPress-1",
            "resourceType": "Instance",
            "createdAt": 1569874357.829,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationType": "DeleteInstance",
            "status": "Succeeded",
            "statusChangedAt": 1569874357.829
        }
    ]
}
```

- For API details, see DeleteInstance in *AWS CLI Command Reference*.

`delete-key-pair`

The following code example shows how to use `delete-key-pair`.

AWS CLI

To delete a key pair

The following `delete-key-pair` example deletes the specified key pair.

```
aws lightsail delete-key-pair \
    --key-pair-name MyPersonalKeyPair
```

Output:

```
{
    "operation": {
        "id": "81621463-df38-4810-b866-6e801a15abbf",
        "resourceName": "MyPersonalKeyPair",
        "resourceType": "KeyPair",
        "createdAt": 1569874626.466,
        "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
        },
        "isTerminal": true,
        "operationType": "DeleteKeyPair",
        "status": "Succeeded",
        "statusChangedAt": 1569874626.685
    }
}
```

- For API details, see DeleteKeyPair in *AWS CLI Command Reference*.

`delete-known-host-keys`

The following code example shows how to use `delete-known-host-keys`.

AWS CLI

To delete known host keys from an instance

The following `delete-known-host-keys` example deletes the known host key from the specified instance.

```
aws lightsail delete-known-host-keys \
    --instance-name Instance-1
```

Output:

```
{
```

```
    "operations": [
        {
            "id": "c61afe9c-45a4-41e6-a97e-d212364da3f5",
            "resourceName": "Instance-1",
            "resourceType": "Instance",
            "createdAt": 1569874760.201,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationType": "DeleteKnownHostKeys",
            "status": "Succeeded",
            "statusChangedAt": 1569874760.201
        }
    ]
}
```

For more information, see Troubleshooting connection issues with the Amazon Lightsail browser-based SSH or RDP client in the *Lightsail Dev Guide*.

- For API details, see DeleteKnownHostKeys in *AWS CLI Command Reference*.

`delete-load-balancer-tls-certificate`

The following code example shows how to use `delete-load-balancer-tls-certificate`.

AWS CLI

To delete a TLS certificate for a load balancer

The following `delete-load-balancer-tls-certificate` example deletes the specifie TLS certificate from the specified load balancer.

```
aws lightsail delete-load-balancer-tls-certificate \
    --load-balancer-name MyFirstLoadBalancer \
    --certificate-name MyFirstCertificate
```

Output:

```
{
    "operations": [
```

```
        {
            "id": "50bec274-e45e-4caa-8a69-b763ef636583",
            "resourceName": "MyFirstCertificate",
            "resourceType": "LoadBalancerTlsCertificate",
            "createdAt": 1569874989.48,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "DeleteLoadBalancerTlsCertificate",
            "status": "Started",
            "statusChangedAt": 1569874989.48
        },
        {
            "id": "78c58cdc-a59a-4b27-8213-500638634a8f",
            "resourceName": "MyFirstLoadBalancer",
            "resourceType": "LoadBalancer",
            "createdAt": 1569874989.48,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "DeleteLoadBalancerTlsCertificate",
            "status": "Started",
            "statusChangedAt": 1569874989.48
        }
    ]
}
```

- For API details, see DeleteLoadBalancerTlsCertificate in *AWS CLI Command Reference*.

`delete-load-balancer`

The following code example shows how to use `delete-load-balancer`.

AWS CLI

To delete a load balancer

The following `delete-load-balancer` example deletes the specified load balancer and any associated TLS certificates.

```
aws lightsail delete-load-balancer \
    --load-balancer-name MyFirstLoadBalancer
```

Output:

```
{
    "operations": [
        {
            "id": "a8c968c7-72a3-4680-a714-af8f03eea535",
            "resourceName": "MyFirstLoadBalancer",
            "resourceType": "LoadBalancer",
            "createdAt": 1569875092.125,

                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "DeleteLoadBalancerTlsCertificate",
            "status": "Started",
            "statusChangedAt": 1569875091.938
        },
        {
            "id": "cf64c060-154b-4eb4-ba57-84e2e41563d6",
            "resourceName": "MyFirstLoadBalancer",
            "resourceType": "LoadBalancer",
            "createdAt": 1569875091.94,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
```

```
            },
            "isTerminal": false,
            "operationType": "DeleteLoadBalancerTlsCertificate",
            "status": "Started",
            "statusChangedAt": 1569875091.94
        }
    ]
}
```

For more information, see title in the *guide*.

- For API details, see [DeleteLoadBalancer]() in *AWS CLI Command Reference*.

`delete-relational-database-snapshot`

The following code example shows how to use `delete-relational-database-snapshot`.

AWS CLI

To delete a snapshot of a managed database

The following `delete-relational-database-snapshot` example deletes the specified snapshot of a managed database.

```
aws lightsail delete-relational-database-snapshot \
    --relational-database-snapshot-name Database-Oregon-1-1566839359
```

Output:

```
{
    "operations": [
        {
            "id": "b99acae8-735b-4823-922f-30af580e3729",
            "resourceName": "Database-Oregon-1-1566839359",
            "resourceType": "RelationalDatabaseSnapshot",
            "createdAt": 1569875293.58,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationType": "DeleteRelationalDatabaseSnapshot",
            "status": "Succeeded",
```

```
                "statusChangedAt": 1569875293.58
            }
        ]
    }
```

- For API details, see DeleteRelationalDatabaseSnapshot in *AWS CLI Command Reference*.

`delete-relational-database`

The following code example shows how to use `delete-relational-database`.

AWS CLI

To delete a managed database

The following `delete-relational-database` example deletes the specified managed database.

```
aws lightsail delete-relational-database \
    --relational-database-name Database-1
```

Output:

```
{
    "operations": [
        {
            "id": "3b0c41c1-053d-46f0-92a3-14f76141dc86",
            "resourceName": "Database-1",
            "resourceType": "RelationalDatabase",
            "createdAt": 1569875210.999,

`detach-static-ip`

The following code example shows how to use `detach-static-ip`.

AWS CLI

To detach a static IP from an instance

The following `detach-static-ip` example detaches static IP `StaticIp-1` from any attached instance.

```
aws lightsail detach-static-ip \
    --static-ip-name StaticIp-1
```

Output:

```
{
    "operations": [
        {
            "id": "2a43d8a3-9f2d-4fe7-bdd0-eEXAMPLE3cf3",
            "resourceName": "StaticIp-1",
            "resourceType": "StaticIp",
            "createdAt": 1571088261.999,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"

            "isTerminal": true,
            "operationDetails": "MEAN-1",
            "operationType": "DetachStaticIp",
            "status": "Succeeded",
            "statusChangedAt": 1571088261.999
        },
        {
            "id": "41a7d40c-74e8-4d2e-a837-cEXAMPLEf747",
            "resourceName": "MEAN-1",
            "resourceType": "Instance",
            "createdAt": 1571088262.022,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationDetails": "StaticIp-1",
            "operationType": "DetachStaticIp",
            "status": "Succeeded",
            "statusChangedAt": 1571088262.022
        }
    ]
}
```

- For API details, see DetachStaticIp in *AWS CLI Command Reference*.

`get-active-names`

The following code example shows how to use `get-active-names`.

AWS CLI

To get active resource names

The following `get-active-names` example returns the active resource names in the configured AWS Region.

```
aws lightsail get-active-names
```

Output:

```
{
    "activeNames": [
        "WordPress-1",
        "StaticIp-1",
        "MEAN-1",
        "Plesk_Hosting_Stack_on_Ubuntu-1"
    ]
}
```

- For API details, see GetActiveNames in *AWS CLI Command Reference*.

`get-auto-snapshots`

The following code example shows how to use `get-auto-snapshots`.

AWS CLI

To get the available automatic snapshots for an instance

The following `get-auto-snapshots` example returns the available automatic snapshots for instance `WordPress-1`.

```
aws lightsail get-auto-snapshots \
    --resource-name WordPress-1
```

Output:

```
{
    "resourceName": "WordPress-1",
    "resourceType": "Instance",
    "autoSnapshots": [
        {
            "date": "2019-10-14",
            "createdAt": 1571033872.0,
            "status": "Success",
            "fromAttachedDisks": []
        },
        {
            "date": "2019-10-13",
            "createdAt": 1570947473.0,
            "status": "Success",
            "fromAttachedDisks": []
        },
        {
            "date": "2019-10-12",
            "createdAt": 1570861072.0,
            "status": "Success",
            "fromAttachedDisks": []
        },
        {
            "date": "2019-10-11",
            "createdAt": 1570774672.0,
            "status": "Success",
            "fromAttachedDisks": []
        }
    ]
}
```

For more information, see Keeping automatic snapshots of instances or disks in Amazon Lightsail in the *Lightsail Dev Guide*.

- For API details, see GetAutoSnapshots in *AWS CLI Command Reference*.

`get-blueprints`

The following code example shows how to use `get-blueprints`.

AWS CLI

To get the blueprints for new instances

The following `get-blueprints` example displays details about all of the available blueprints that can be used to create new instances in Amazon Lightsail.

```
aws lightsail get-blueprints
```

Output:

```
{
    "blueprints": [
        {
            "blueprintId": "wordpress",
            "name": "WordPress",
            "group": "wordpress",
            "type": "app",
            "description": "Bitnami, the leaders in application packaging, and
 Automattic, the experts behind WordPress, have teamed up to offer this official
 WordPress image. This image is a pre-configured, ready-to-run image for running
 WordPress on Amazon Lightsail. WordPress is the world's most popular content
 management platform. Whether it's for an enterprise or small business website, or
 a personal or corporate blog, content authors can easily create content using its
 new Gutenberg editor, and developers can extend the base platform with additional
 features. Popular plugins like Jetpack, Akismet, All in One SEO Pack, WP Mail,
 Google Analytics for WordPress, and Amazon Polly are all pre-installed in this
 image. Let's Encrypt SSL certificates are supported through an auto-configuration
 script.",

get-cloud-formation-stack-records

The following code example shows how to use `get-cloud-formation-stack-records`.

AWS CLI

To get the CloudFormation stack records and their associated stacks

The following `get-cloud-formation-stack-records` example displays details about the CloudFormation stack records and their associated stacks used to create Amazon EC2 resources from exported Amazon Lightsail snapshots.

```
aws lightsail get-cloud-formation-stack-records
```

Output:

```
{
    "cloudFormationStackRecords": [
        {
            "name": "CloudFormationStackRecord-588a4243-
e2d1-490d-8200-3a7513ecebdf",

ba28-11e9-838b-0EXAMPLE8b00",
                "service": "Aws::CloudFormation::Stack"
            }
        }
    ]
}
```

- For API details, see GetCloudFormationStackRecords in *AWS CLI Command Reference*.

`get-disk-snapshot`

The following code example shows how to use `get-disk-snapshot`.

AWS CLI

To get information about a disk snapshot

The following `get-disk-snapshot` example displays details about the disk snapshot `Disk-1-1566839161`.

```
aws lightsail get-disk-snapshot \
    --disk-snapshot-name Disk-1-1566839161
```

Output:

```
{
    "diskSnapshot": {
        "name": "Disk-1-1566839161",
        "arn": "arn:aws:lightsail:us-west-2:111122223333:DiskSnapshot/

        "isFromAutoSnapshot": false
    }
}
```

For more information, see title in the *guide*.

- For API details, see GetDiskSnapshot in *AWS CLI Command Reference*.

`get-disk-snapshots`

The following code example shows how to use `get-disk-snapshots`.

AWS CLI

To get information about all disk snapshots

The following `get-disk-snapshots` example displays details about all of the disk snapshots in the configured AWS Region.

```
aws lightsail get-disk-snapshots
```

Output:

```
{
    "diskSnapshots": [
        {
            "name": "Disk-2-1571090588",

`get-disks`

The following code example shows how to use `get-disks`.

AWS CLI

To get information about all block storage disks

The following `get-disks` example displays details about all of the disks in the configured AWS Region.

```
aws lightsail get-disks
```

Output:

```
{
    "disks": [
        {
            "name": "Disk-2",
            "arn": "arn:aws:lightsail:us-
west-2:111122223333:Disk/6a343ff8-6341-422d-86e2-bEXAMPLE16c2",

`get-domain`

The following code example shows how to use `get-domain`.

AWS CLI

To get information about a domain

The following `get-domain` example displays details about the domain `example.com`.

Note: Lightsail's domain-related API operations are available in only the `us-east-1` AWS Region. If your CLI profile is configured to use a different Region, you must include the`` --region us-east-1`` parameter or the command fails.

```
aws lightsail get-domain \
    --domain-name example.com \
    --region us-east-1
```

Output:

```
{
    "domain": {
        "name": "example.com",
        "arn":
 "arn:aws:lightsail:global:111122223333:Domain/28cda903-3f15-44b2-9baf-3EXAMPLEb304",

`get-export-snapshot-record`

The following code example shows how to use `get-export-snapshot-record`.

AWS CLI

To get the records of snapshots exported to Amazon EC2

The following `get-export-snapshot-record` example displays details about Amazon Lightsail instance or disk snapshots exported to Amazon EC2.

```
aws lightsail get-export-snapshot-records
```

Output:

```
{
    "exportSnapshotRecords": [
        {
            "name": "ExportSnapshotRecord-d2da10ce-0b3c-4ae1-ab3a-2EXAMPLEa586",

`get-instance-metric-data`

The following code example shows how to use `get-instance-metric-data`.

AWS CLI

To get metric data for an instance

The following `get-instance-metric-data` example returns the average percent of `CPUUtilization` every `7200` seconds (2 hours) between `1571342400` and `1571428800` for instance `MEAN-1`.

We recommend that you use a unix time converter to identify the start and end times.

```
aws lightsail get-instance-metric-data \
    --instance-name MEAN-1 \
```

```
    --metric-name CPUUtilization \
    --period 7200 \
    --start-time 1571342400 \
    --end-time 1571428800 \
    --unit Percent \
    --statistics Average
```

Output:

```
{
    "metricName": "CPUUtilization",
    "metricData": [
        {
            "average": 0.26113718770120725,
            "timestamp": 1571342400.0,
            "unit": "Percent"
        },
        {
            "average": 0.26861268928111953,
            "timestamp": 1571392800.0,
            "unit": "Percent"
        },
        {
            "average": 0.28187475104748777,

        },
        {
            "average": 0.2513008454658378,
            "timestamp": 1571364000.0,
            "unit": "Percent"
        },
        {
            "average": 0.26329974562758346,
            "timestamp": 1571414400.0,
            "unit": "Percent"
        },
        {
            "average": 0.2667092536656445,
            "timestamp": 1571349600.0,
            "unit": "Percent"
        }
    ]
}
```

- For API details, see GetInstanceMetricData in *AWS CLI Command Reference*.

`get-instance-port-states`

The following code example shows how to use `get-instance-port-states`.

AWS CLI

To get firewall information for an instance

The following `get-instance-port-states` example returns the firewall ports configured for instance `MEAN-1`.

```
aws lightsail get-instance-port-states \
    --instance-name MEAN-1
```

Output:

```
{
    "portStates": [
        {
            "fromPort": 80,
            "toPort": 80,
            "protocol": "tcp",
            "state": "open"
        },
        {
            "fromPort": 22,
            "toPort": 22,
            "protocol": "tcp",
            "state": "open"
        },
        {
            "fromPort": 443,
            "toPort": 443,
            "protocol": "tcp",
            "state": "open"
        }
    ]
}
```

- For API details, see GetInstancePortStates in *AWS CLI Command Reference*.

`get-instance-snapshot`

The following code example shows how to use `get-instance-snapshot`.

AWS CLI

To get information about a specified instance snapshot

The following `get-instance-snapshot` example displays details about the specified instance snapshot.

```
aws lightsail get-instance-snapshot \
    --instance-snapshot-name MEAN-1-1571419854
```

Output:

```
{
    "instanceSnapshot": {

`get-instance-snapshots`

The following code example shows how to use `get-instance-snapshots`.

AWS CLI

To get information about all of your instance snapshots

The following `get-instance-snapshots` example displays details about all of the instance snapshots in the configured AWS Region.

```
aws lightsail get-instance-snapshots
```

Output:

```
{
    "instanceSnapshots": [
        {
            "name": "MEAN-1-1571421498",
            "arn": "arn:aws:lightsail:us-west-2:111122223333:InstanceSnapshot/

        }
    ]
}
```

- For API details, see GetInstanceSnapshots in *AWS CLI Command Reference*.

`get-instance-state`

The following code example shows how to use `get-instance-state`.

AWS CLI

To get information about the state of an instance

The following `get-instance-state` example returns the state of the specified instance.

```
aws lightsail get-instance-state \
    --instance-name MEAN-1
```

Output:

```
{
    "state": {
        "code": 16,
        "name": "running"
    }
}
```

- For API details, see GetInstanceState in *AWS CLI Command Reference*.

`get-instance`

The following code example shows how to use `get-instance`.

AWS CLI

To get information about an instance

The following `get-instance` example displays details about the instance `MEAN-1`.

```
aws lightsail get-instance \
    --instance-name MEAN-1
```

Output:

```
{
    "instance": {
        "name": "MEAN-1",
        "arn": "arn:aws:lightsail:us-west-2:111122223333:Instance/bd470fc5-

`get-key-pair`

The following code example shows how to use `get-key-pair`.

AWS CLI

To get information about a key pair

The following `get-key-pair` example displays details about the specified key pair.

```
aws lightsail get-key-pair \
    --key-pair-name MyKey1
```

Output:

```
{
    "keyPair": {
        "name": "MyKey1",
        "arn": "arn:aws:lightsail:us-
west-2:111122223333:KeyPair/19a4efdf-3054-43d6-91fd-eEXAMPLE21bf",

        "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
        },
        "resourceType": "KeyPair",
        "tags": [],
        "fingerprint": "00:11:22:33:44:55:66:77:88:99:aa:bb:cc:dd:ee:ff:gg:hh:ii:jj"
    }
}
```

- For API details, see GetKeyPair in *AWS CLI Command Reference*.

`get-key-pairs`

The following code example shows how to use `get-key-pairs`.

AWS CLI

To get information about all key pairs

The following `get-key-pairs` example displays details about all of the key pairs in the configured AWS Region.

```
aws lightsail get-key-pairs
```

Output:

```
{
    "keyPairs": [
        {
            "name": "MyKey1",
            "arn": "arn:aws:lightsail:us-
west-2:111122223333:KeyPair/19a4efdf-3054-43d6-91fd-eEXAMPLE21bf",

        }
    ]
}
```

- For API details, see GetKeyPairs in *AWS CLI Command Reference*.

`get-load-balancer-tls-certificates`

The following code example shows how to use `get-load-balancer-tls-certificates`.

AWS CLI

To get information about TLS certificates for a load balancer

The following `get-load-balancer-tls-certificates` example displays details about the TLS certificates for the specified load balancer.

```
aws lightsail get-load-balancer-tls-certificates \
    --load-balancer-name LoadBalancer-1
```

Output:

```
{
    "tlsCertificates": [
        {
            "name": "example-com",
            "arn": "arn:aws:lightsail:us-

            }
        }
    ]
}
```

- For API details, see GetLoadBalancers in *AWS CLI Command Reference*.

`get-operation`

The following code example shows how to use `get-operation`.

AWS CLI

To get information about a single operation

The following `get-operation` example displays details about the specified operation.

```
aws lightsail get-operation \
    --operation-id e5700e8a-daf2-4b49-bc01-3EXAMPLE910a
```

Output:

```
{
    "operation": {
        "id": "e5700e8a-daf2-4b49-bc01-3EXAMPLE910a",
        "resourceName": "Instance-1",
        "resourceType": "Instance",
        "createdAt": 1571679872.404,
        "location": {

get-regions

The following code example shows how to use `get-regions`.

AWS CLI

To get all AWS Regions for Amazon Lightsail

The following `get-regions` example displays details about all of the AWS Regions for Amazon Lightsail.

```
aws lightsail get-regions
```

Output:

```
{
    "regions": [
        {
            "continentCode": "NA",
            "description": "This region is recommended to serve users in the eastern
 United States",
```

```
            "displayName": "Virginia",
            "name": "us-east-1",
            "availabilityZones": [],
            "relationalDatabaseAvailabilityZones": []
        },
        {
            "continentCode": "NA",
            "description": "This region is recommended to serve users in the eastern
 United States",
            "displayName": "Ohio",
            "name": "us-east-2",
            "availabilityZones": [],
            "relationalDatabaseAvailabilityZones": []
        },
        {
            "continentCode": "NA",
            "description": "This region is recommended to serve users in the
 northwestern United States, Alaska, and western Canada",
            "displayName": "Oregon",
            "name": "us-west-2",
            "availabilityZones": [],
            "relationalDatabaseAvailabilityZones": []
        },
        ...
        }
    ]
}
```

- For API details, see GetRegions in *AWS CLI Command Reference*.

`get-relational-database-blueprints`

The following code example shows how to use `get-relational-database-blueprints`.

AWS CLI

To get the blueprints for new relational databases

The following `get-relational-database-blueprints` example displays details about all of the available relational database blueprints that can be used to create new relational databases in Amazon Lightsail.

```
aws lightsail get-relational-database-blueprints
```

Output:

```
{
    "blueprints": [
        {
            "blueprintId": "mysql_5_6",
            "engine": "mysql",
            "engineVersion": "5.6.44",
            "engineDescription": "MySQL Community Edition",
            "engineVersionDescription": "MySQL 5.6.44",
            "isEngineDefault": false
        },
        {
            "blueprintId": "mysql_5_7",
            "engine": "mysql",
            "engineVersion": "5.7.26",
            "engineDescription": "MySQL Community Edition",
            "engineVersionDescription": "MySQL 5.7.26",
            "isEngineDefault": true
        },
        {
            "blueprintId": "mysql_8_0",
            "engine": "mysql",
            "engineVersion": "8.0.16",
            "engineDescription": "MySQL Community Edition",
            "engineVersionDescription": "MySQL 8.0.16",
            "isEngineDefault": false
        },
        {
            "blueprintId": "postgres_9_6",
            "engine": "postgres",
            "engineVersion": "9.6.15",
            "engineDescription": "PostgreSQL",
            "engineVersionDescription": "PostgreSQL 9.6.15-R1",
            "isEngineDefault": false
        },
        {
            "blueprintId": "postgres_10",
            "engine": "postgres",
            "engineVersion": "10.10",
            "engineDescription": "PostgreSQL",
```

```
            "engineVersionDescription": "PostgreSQL 10.10-R1",
            "isEngineDefault": false
        },
        {
            "blueprintId": "postgres_11",
            "engine": "postgres",
            "engineVersion": "11.5",
            "engineDescription": "PostgreSQL",
            "engineVersionDescription": "PostgreSQL 11.5-R1",
            "isEngineDefault": true
        }
    ]
}
```

- For API details, see GetRelationalDatabaseBlueprints in *AWS CLI Command Reference*.

`get-relational-database-bundles`

The following code example shows how to use `get-relational-database-bundles`.

AWS CLI

To get the bundles for new relational databases

The following `get-relational-database-bundles` example displays details about all of the available relational database bundles that can be used to create new relational databases in Amazon Lightsail. Note that the response does not include inactive bundles because the `--include-inactive` flag is not specified in the command. You cannot use inactive bundles to create new relational databases.

```
aws lightsail get-relational-database-bundles
```

Output:

```
{
    "bundles": [
        {
            "bundleId": "micro_2_0",
            "name": "Micro",
            "price": 15.0,
            "ramSizeInGb": 1.0,
            "diskSizeInGb": 40,
```

```
                "transferPerMonthInGb": 100,
                "cpuCount": 2,
                "isEncrypted": true,
                "isActive": true
            },
            {
                "bundleId": "micro_ha_2_0",
                "name": "Micro with High Availability",
                "price": 30.0,
                "ramSizeInGb": 1.0,
                "diskSizeInGb": 40,
                "transferPerMonthInGb": 100,
                "cpuCount": 2,
                "isEncrypted": true,
                "isActive": true
            },
            {
                "bundleId": "small_2_0",
                "name": "Small",
                "price": 30.0,
                "ramSizeInGb": 2.0,
                "diskSizeInGb": 80,
                "transferPerMonthInGb": 100,
                "cpuCount": 2,
                "isEncrypted": true,
                "isActive": true
            },
            {
                "bundleId": "small_ha_2_0",
                "name": "Small with High Availability",
                "price": 60.0,
                "ramSizeInGb": 2.0,
                "diskSizeInGb": 80,
                "transferPerMonthInGb": 100,
                "cpuCount": 2,
                "isEncrypted": true,
                "isActive": true
            },
            {
                "bundleId": "medium_2_0",
                "name": "Medium",
                "price": 60.0,
                "ramSizeInGb": 4.0,
                "diskSizeInGb": 120,
```

```
                "transferPerMonthInGb": 100,
                "cpuCount": 2,
                "isEncrypted": true,
                "isActive": true
            },
            {
                "bundleId": "medium_ha_2_0",
                "name": "Medium with High Availability",
                "price": 120.0,
                "ramSizeInGb": 4.0,
                "diskSizeInGb": 120,
                "transferPerMonthInGb": 100,
                "cpuCount": 2,
                "isEncrypted": true,
                "isActive": true
            },
            {
                "bundleId": "large_2_0",
                "name": "Large",
                "price": 115.0,
                "ramSizeInGb": 8.0,
                "diskSizeInGb": 240,
                "transferPerMonthInGb": 200,
                "cpuCount": 2,
                "isEncrypted": true,
                "isActive": true
            },
            {
                "bundleId": "large_ha_2_0",
                "name": "Large with High Availability",
                "price": 230.0,
                "ramSizeInGb": 8.0,
                "diskSizeInGb": 240,
                "transferPerMonthInGb": 200,
                "cpuCount": 2,
                "isEncrypted": true,
                "isActive": true
            }
        ]
    }
```

For more information, see Creating a database in Amazon Lightsail in the *Amazon Lightsail Developer Guide*.

- For API details, see GetRelationalDatabaseBundles in *AWS CLI Command Reference*.

`get-relational-database-events`

The following code example shows how to use `get-relational-database-events`.

AWS CLI

To get the events for a relational database

The following `get-relational-database-events` example displays details about events in the last 17 hours (1020 minutes) for the specified relational database.

```
aws lightsail get-relational-database-events \
    --relational-database-name Database-1 \
    --duration-in-minutes 1020
```

Output:

```
{
    "relationalDatabaseEvents": [
        {
            "resource": "Database-1",
            "createdAt": 1571654146.553,
            "message": "Backing up Relational Database",
            "eventCategories": [
                "backup"
            ]
        },
        {
            "resource": "Database-1",
            "createdAt": 1571654249.98,
            "message": "Finished Relational Database backup",
            "eventCategories": [
                "backup"
            ]
        }
    ]
}
```

- For API details, see GetRelationalDatabaseEvents in *AWS CLI Command Reference*.

`get-relational-database-log-events`

The following code example shows how to use `get-relational-database-log-events`.

AWS CLI

To get log events for a relational database

The following `get-relational-database-log-events` example displays details about the specified log between `1570733176` and `1571597176` for relational database `Database1`. The information returned is configured to start from `head`.

We recommend that you use a unix time converter to identify the start and end times.

```
aws lightsail get-relational-database-log-events \
    --relational-database-name Database1 \
    --log-stream-name error \
    --start-from-head \
    --start-time 1570733176 \
    --end-time 1571597176
```

Output:

```
{
    "resourceLogEvents": [
        {
            "createdAt": 1570820267.0,
            "message": "2019-10-11 18:57:47 20969 [Warning] IP address '192.0.2.0'
 could not be resolved: Name or service not known"
        },
        {
            "createdAt": 1570860974.0,
            "message": "2019-10-12 06:16:14 20969 [Warning] IP address '8192.0.2.0'
 could not be resolved: Temporary failure in name resolution"
        },
        {
            "createdAt": 1570860977.0,
            "message": "2019-10-12 06:16:17 20969 [Warning] IP address '192.0.2.0'
 could not be resolved: Temporary failure in name resolution"
        },
        {
            "createdAt": 1570860979.0,
```

```
            "message": "2019-10-12 06:16:19 20969 [Warning] IP address '192.0.2.0'
 could not be resolved: Temporary failure in name resolution"
        },
        {
            "createdAt": 1570860981.0,
            "message": "2019-10-12 06:16:21 20969 [Warning] IP address '192.0.2.0'
 could not be resolved: Temporary failure in name resolution"
        },
        {
            "createdAt": 1570860982.0,
            "message": "2019-10-12 06:16:22 20969 [Warning] IP address '192.0.2.0'
 could not be resolved: Temporary failure in name resolution"
        },
        {
            "createdAt": 1570860984.0,
            "message": "2019-10-12 06:16:24 20969 [Warning] IP address '192.0.2.0'
 could not be resolved: Temporary failure in name resolution"
        },
        {
            "createdAt": 1570860986.0,
            "message": "2019-10-12 06:16:26 20969 [Warning] IP address '192.0.2.0'
 could not be resolved: Temporary failure in name resolution"
        },
        ...
        }
    ],
    "nextBackwardToken":
 "eEXAMPLEZXJUZXh0IjoiZnRWb3F3cUpRSlQ5NndMYThxelRUZlFhR3J6c2dKWEEvM2kvajZMZzVVVWpqRDN0YjFXTj
    "nextForwardToken":
 "eEXAMPLEZXJUZXh0IjoiT09Lb0Z6ZFRJbHhaNEQ5N2tPbkkwRmwwNUxPZjFTbFFwUklQbzlSaWgvMWVXbEk4aG56VH
}
```

- For API details, see GetRelationalDatabaseLogEvents in *AWS CLI Command Reference*.

`get-relational-database-log-streams`

The following code example shows how to use `get-relational-database-log-streams`.

AWS CLI

To get the log streams for a relational database

The following `get-relational-database-log-streams` example returns all of the available log streams for the specified relational database.

```
aws lightsail get-relational-database-log-streams \
--relational-database-name Database1
```

Output:

```
{
    "logStreams": [
        "audit",
        "error",
        "general",
        "slowquery"
    ]
}
```

- For API details, see GetRelationalDatabaseLogStreams in *AWS CLI Command Reference*.

get-relational-database-master-user-password

The following code example shows how to use `get-relational-database-master-user-password`.

AWS CLI

To get the master user password for a relational database

The following `get-relational-database-master-user-password` example returns information about the master user password for the specified relational database.

```
aws lightsail get-relational-database-master-user-password \
    --relational-database-name Database-1
```

Output:

```
{
    "masterUserPassword": "VEXAMPLEec.9qvx,_t<)Wkf)kwboM,>2",
    "createdAt": 1571259453.959
}
```

- For API details, see GetRelationalDatabaseMasterUserPassword in *AWS CLI Command Reference*.

`get-relational-database-metric-data`

The following code example shows how to use `get-relational-database-metric-data`.

AWS CLI

To get metric data for a relational database

The following `get-relational-database-metric-data` example returns the count sum of the metric `DatabaseConnections` over the period of 24 hours (`86400` seconds) between `1570733176` and `1571597176` for relational database `Database1`.

We recommend that you use a unix time converter to identify the start and end times.

```
aws lightsail get-relational-database-metric-data \
    --relational-database-name Database1 \
    --metric-name DatabaseConnections \
    --period 86400 \
    --start-time 1570733176 \
    --end-time 1571597176 \
    --unit Count \
    --statistics Sum
```

Output:

```
{
    "metricName": "DatabaseConnections",
    "metricData": [
        {
            "sum": 1.0,
            "timestamp": 1571510760.0,
            "unit": "Count"
        },
        {
            "sum": 1.0,
            "timestamp": 1570733160.0,
            "unit": "Count"
        },
```

```
        {
            "sum": 1.0,
            "timestamp": 1570992360.0,
            "unit": "Count"
        },
        {
            "sum": 0.0,
            "timestamp": 1571251560.0,
            "unit": "Count"
        },
        {
            "sum": 721.0,
            "timestamp": 1570819560.0,
            "unit": "Count"
        },
        {
            "sum": 1.0,
            "timestamp": 1571078760.0,
            "unit": "Count"
        },
        {
            "sum": 2.0,
            "timestamp": 1571337960.0,
            "unit": "Count"
        },
        {
            "sum": 684.0,
            "timestamp": 1570905960.0,
            "unit": "Count"
        },
        {
            "sum": 0.0,
            "timestamp": 1571165160.0,
            "unit": "Count"
        },
        {
            "sum": 1.0,
            "timestamp": 1571424360.0,
            "unit": "Count"
        }
    ]
}
```

- For API details, see GetRelationalDatabaseMetricData in *AWS CLI Command Reference*.

`get-relational-database-parameters`

The following code example shows how to use `get-relational-database-parameters`.

AWS CLI

To get parameters for a relational database

The following `get-relational-database-parameters` example returns information about all of the available parameters for the specified relational database.

```
aws lightsail get-relational-database-parameters \
    --relational-database-name Database-1
```

Output:

```
{
    "parameters": [
        {
            "allowedValues": "0,1",
            "applyMethod": "pending-reboot",
            "applyType": "dynamic",
            "dataType": "boolean",
            "description": "Automatically set all granted roles as active after the
 user has authenticated successfully.",
            "isModifiable": true,
            "parameterName": "activate_all_roles_on_login",
            "parameterValue": "0"
        },
        {
            "allowedValues": "0,1",
            "applyMethod": "pending-reboot",
            "applyType": "static",
            "dataType": "boolean",
            "description": "Controls whether user-defined functions that have only
 an xxx symbol for the main function can be loaded",
            "isModifiable": false,
            "parameterName": "allow-suspicious-udfs"
        },
        {
            "allowedValues": "0,1",
            "applyMethod": "pending-reboot",
            "applyType": "dynamic",
```

```
                "dataType": "boolean",
                "description": "Sets the autocommit mode",
                "isModifiable": true,
                "parameterName": "autocommit"
            },
            {
                "allowedValues": "0,1",
                "applyMethod": "pending-reboot",
                "applyType": "static",
                "dataType": "boolean",
                "description": "Controls whether the server autogenerates SSL key and
 certificate files in the data directory, if they do not already exist.",
                "isModifiable": false,
                "parameterName": "auto_generate_certs"
            },
            ...
            }
    ]
}
```

For more information, see Updating database parameters in Amazon Lightsail in the *Lightsail Dev Guide*.

- For API details, see GetRelationalDatabaseParameters in *AWS CLI Command Reference*.

`get-relational-database-snapshot`

The following code example shows how to use `get-relational-database-snapshot`.

AWS CLI

To get information about a relational database snapshot

The following `get-relational-database-snapshot` example displays details about the specified relational database snapshot.

```
aws lightsail get-relational-database-snapshot \
    --relational-database-snapshot-name Database-1-1571350042
```

Output:

```
{
    "relationalDatabaseSnapshot": {
```

```
        "name": "Database-1-1571350042",
        "arn": "arn:aws:lightsail:us-

`get-static-ip`

The following code example shows how to use `get-static-ip`.

AWS CLI

To get information about a static IP

The following `get-static-ip` example displays details about the specified static IP.

```
aws lightsail get-static-ip \
    --static-ip-name StaticIp-1
```

Output:

```
{
    "staticIp": {
        "name": "StaticIp-1",
        "arn": "arn:aws:lightsail:us-
west-2:111122223333:StaticIp/2257cd76-1f0e-4ac0-82e2-2EXAMPLE23ad",
        "supportCode": "6EXAMPLE3362/192.0.2.0",
        "createdAt": 1571071325.076,
        "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
        },
        "resourceType": "StaticIp",
        "ipAddress": "192.0.2.0",
        "isAttached": false
    }
}
```

- For API details, see GetStaticIp in *AWS CLI Command Reference*.

`get-static-ips`

The following code example shows how to use `get-static-ips`.

AWS CLI

To get information about all static IPs

The following `get-static-ips` example displays details about all of the static IPs in the configured AWS Region.

```
aws lightsail get-static-ips
```

Output:

```
{
    "staticIps": [
        {
            "name": "StaticIp-1",
            "arn": "arn:aws:lightsail:us-
west-2:111122223333:StaticIp/2257cd76-1f0e-4ac0-8EXAMPLE16f9423ad",
            "supportCode": "6EXAMPLE3362/192.0.2.0",
            "createdAt": 1571071325.076,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "resourceType": "StaticIp",
            "ipAddress": "192.0.2.0",
            "isAttached": false
        },
        {
            "name": "StaticIP-2",
            "arn": "arn:aws:lightsail:us-west-2:111122223333:StaticIp/c61edb40-
e5f0-4fd6-ae7c-8EXAMPLE19f8",
            "supportCode": "6EXAMPLE3362/192.0.2.2",
            "createdAt": 1568305385.681,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "resourceType": "StaticIp",
            "ipAddress": "192.0.2.2",
            "attachedTo": "WordPress-1",
            "isAttached": true
        }
    ]
}
```

- For API details, see GetStaticIps in *AWS CLI Command Reference*.

`is-vpc-peered`

The following code example shows how to use `is-vpc-peered`.

AWS CLI

To identify if your Amazon Lightsail virtual private cloud is peered

The following `is-vpc-peered` example returns the peering status of the Amazon Lightsail virtual private cloud (VPC) for the specified AWS Region.

```
aws lightsail is-vpc-peered \
    --region us-west-2
```

Output:

```
{
    "isPeered": true
}
```

- For API details, see IsVpcPeered in *AWS CLI Command Reference*.

`open-instance-public-ports`

The following code example shows how to use `open-instance-public-ports`.

AWS CLI

To open firewall ports for an instance

The following `open-instance-public-ports` example opens TCP port 22 on the specified instance.

```
aws lightsail open-instance-public-ports \
    --instance-name MEAN-2 \
    --port-info fromPort=22,protocol=TCP,toPort=22
```

Output:

```
{
    "operation": {
```

```
        "id": "719744f0-a022-46f2-9f11-6EXAMPLE4642",
        "resourceName": "MEAN-2",
        "resourceType": "Instance",
        "createdAt": 1571072906.849,
        "location": {
            "availabilityZone": "us-west-2a",
            "regionName": "us-west-2"
        },
        "isTerminal": true,
        "operationDetails": "22/tcp",
        "operationType": "OpenInstancePublicPorts",
        "status": "Succeeded",
        "statusChangedAt": 1571072906.849
    }
}
```

- For API details, see OpenInstancePublicPorts in *AWS CLI Command Reference*.

`peer-vpc`

The following code example shows how to use `peer-vpc`.

AWS CLI

To peer the Amazon Lightsail virtual private cloud

The following `peer-vpc` example peers the Amazon Lightsail virtual private cloud (VPC) for the specified AWS Region.

```
aws lightsail peer-vpc \
    --region us-west-2
```

Output:

```
{
    "operation": {
        "id": "787e846a-54ac-497f-bce2-9EXAMPLE5d91",
        "resourceName": "vpc-0EXAMPLEa5261efb3",
        "resourceType": "PeeredVpc",
        "createdAt": 1571694233.104,
        "location": {
            "availabilityZone": "all",
```

```
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationDetails": "vpc-e2b3eb9b",
            "operationType": "PeeredVpc",

            "statusChangedAt": 1571694233.104
        }
}
```

- For API details, see PeerVpc in *AWS CLI Command Reference*.

`reboot-instance`

The following code example shows how to use `reboot-instance`.

AWS CLI

To reboot an instance

The following `reboot-instance` example reboots the specified instance.

```
aws lightsail reboot-instance \
    --instance-name MEAN-1
```

Output:

```
{
    "operations": [
        {
            "id": "2b679f1c-8b71-4bb4-8e97-8EXAMPLEed93",
            "resourceName": "MEAN-1",
            "resourceType": "Instance",
            "createdAt": 1571694445.49,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationDetails": "",
            "operationType": "RebootInstance",
            "status": "Succeeded",
```

```
                "statusChangedAt": 1571694445.49
            }
        ]
    }
```

- For API details, see RebootInstance in *AWS CLI Command Reference*.

`reboot-relational-database`

The following code example shows how to use `reboot-relational-database`.

AWS CLI

To reboot a relational database

The following `reboot-relational-database` example reboots the specified relational database.

```
aws lightsail reboot-relational-database \
    --relational-database-name Database-1
```

Output:

```
{
    "operations": [
        {
            "id": "e4c980c0-3137-496c-9c91-1EXAMPLEdec2",
            "resourceName": "Database-1",
            "resourceType": "RelationalDatabase",
            "createdAt": 1571694532.91,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "",
            "operationType": "RebootRelationalDatabase",
            "status": "Started",
            "statusChangedAt": 1571694532.91
        }
    ]
}
```

- For API details, see RebootRelationalDatabase in *AWS CLI Command Reference*.

`release-static-ip`

The following code example shows how to use `release-static-ip`.

AWS CLI

To delete a static IP

The following `release-static-ip` example deletes the specified static IP.

```
aws lightsail release-static-ip \
    --static-ip-name StaticIp-1
```

Output:

```
{
    "operations": [
        {
            "id": "e374c002-dc6d-4c7f-919f-2EXAMPLE13ce",
            "resourceName": "StaticIp-1",
            "resourceType": "StaticIp",
            "createdAt": 1571694962.003,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationType": "ReleaseStaticIp",
            "status": "Succeeded",
            "statusChangedAt": 1571694962.003
        }
    ]
}
```

- For API details, see ReleaseStaticIp in *AWS CLI Command Reference*.

`start-instance`

The following code example shows how to use `start-instance`.

AWS CLI

To start an instance

The following `start-instance` example starts the specified instance.

```
aws lightsail start-instance \
    --instance-name WordPress-1
```

Output:

```
{
    "operations": [
        {
            "id": "f88d2a93-7cea-4165-afce-2d688cb18f23",
            "resourceName": "WordPress-1",
            "resourceType": "Instance",
            "createdAt": 1571695583.463,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "StartInstance",
            "status": "Started",
            "statusChangedAt": 1571695583.463
        }
    ]
}
```

- For API details, see StartInstance in *AWS CLI Command Reference*.

`start-relational-database`

The following code example shows how to use `start-relational-database`.

AWS CLI

To start a relational database

The following `start-relational-database` example starts the specified relational database.

```
aws lightsail start-relational-database \
    --relational-database-name Database-1
```

Output:

```
{
    "operations": [
        {
            "id": "4d5294ec-a38a-4fda-9e37-aEXAMPLE0d24",
            "resourceName": "Database-1",
            "resourceType": "RelationalDatabase",
            "createdAt": 1571695998.822,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "StartRelationalDatabase",
            "status": "Started",
            "statusChangedAt": 1571695998.822
        }
    ]
}
```

- For API details, see StartRelationalDatabase in *AWS CLI Command Reference*.

`stop-instance`

The following code example shows how to use `stop-instance`.

AWS CLI

To stop an instance

The following `stop-instance` example stops the specified instance.

```
aws lightsail stop-instance \
--instance-name WordPress-1
```

Output:

```
{
    "operations": [
        {
            "id": "265357e2-2943-4d51-888a-1EXAMPLE7585",
            "resourceName": "WordPress-1",
            "resourceType": "Instance",
            "createdAt": 1571695471.134,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "StopInstance",
            "status": "Started",
            "statusChangedAt": 1571695471.134
        }
    ]
}
```

- For API details, see StopInstance in *AWS CLI Command Reference*.

`stop-relational-database`

The following code example shows how to use `stop-relational-database`.

AWS CLI

To stop a relational database

The following `stop-relational-database` example stops the specified relational database.

```
aws lightsail stop-relational-database \
    --relational-database-name Database-1
```

Output:

```
{
    "operations": [
        {
            "id": "cc559c19-4adb-41e4-b75b-5EXAMPLE4e61",
            "resourceName": "Database-1",
            "resourceType": "RelationalDatabase",
```

```
            "createdAt": 1571695526.29,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "StopRelationalDatabase",
            "status": "Started",
            "statusChangedAt": 1571695526.29
        }
    ]
}
```

- For API details, see StopRelationalDatabase in *AWS CLI Command Reference*.

`unpeer-vpc`

The following code example shows how to use `unpeer-vpc`.

AWS CLI

To unpeer the Amazon Lightsail virtual private cloud

The following `unpeer-vpc` example unpeers the Amazon Lightsail virtual private cloud (VPC) for the specified AWS Region.

```
aws lightsail unpeer-vpc \
    --region us-west-2
```

Output:

```
{
    "operation": {
        "id": "531aca64-7157-47ab-84c6-eEXAMPLEd898",
        "resourceName": "vpc-0EXAMPLEa5261efb3",
        "resourceType": "PeeredVpc",
        "createdAt": 1571694109.945,
        "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
        },
        "isTerminal": true,
```

```
            "operationDetails": "vpc-e2b3eb9b",
            "operationType": "UnpeeredVpc",
            "status": "Succeeded",
            "statusChangedAt": 1571694109.945
        }
}
```

- For API details, see UnpeerVpc in *AWS CLI Command Reference*.

Macie examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Macie.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Actions

`describe-buckets`

The following code example shows how to use `describe-buckets`.

AWS CLI

To query data about one or more S3 buckets that Amazon Macie monitors and analyzes for your account

The following `describe-buckets` example queries metadata for all S3 buckets whose names begin with amzn-s3-demo-bucket and are in the current AWS Region.

```
aws macie2 describe-buckets \
    --criteria '{"bucketName":{"prefix":"amzn-s3-demo-bucket"}}'
```

Output:

```
{
    "buckets": [
        {
            "accountId": "123456789012",
            "allowsUnencryptedObjectUploads": "FALSE",

Amazon Managed Grafana examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Managed Grafana.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

`list-workspaces`

The following code example shows how to use `list-workspaces`.

AWS CLI

To list workspaces for the account in the Region specified by the user credential

The following `list-workspaces` example lists Grafana workspaces for the account's Region.

```
aws grafana list-workspaces
```

Output:

```
{
    "workspaces": [
        {
            "authentication": {
                "providers": [
                    "AWS_SSO"
                ]
            },

Actions

`add-flow-outputs`

The following code example shows how to use `add-flow-outputs`.

AWS CLI

To add outputs to a flow

The following `add-flow-outputs` example adds outputs to the specified flow.

```
aws mediaconnect add-flow-outputs \
--flow-arn arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame \
--outputs Description='NYC
 stream',Destination=192.0.2.12,Name=NYC,Port=3333,Protocol=rtp-
fec,SmoothingLatency=100 Description='LA
 stream',Destination=203.0.113.9,Name=LA,Port=4444,Protocol=rtp-
fec,SmoothingLatency=100
```

Output:

```
{
    "Outputs": [
        {
            "Port": 3333,
            "OutputArn": "arn:aws:mediaconnect:us-
east-1:111122223333:output:2-3aBC45dEF67hiJ89-c34de5fG678h:NYC",
            "Name": "NYC",
            "Description": "NYC stream",
            "Destination": "192.0.2.12",
            "Transport": {
                "Protocol": "rtp-fec",
                "SmoothingLatency": 100
            }
        },
        {
            "Port": 4444,
            "OutputArn": "arn:aws:mediaconnect:us-
east-1:111122223333:output:2-987655dEF67hiJ89-c34de5fG678h:LA",
            "Name": "LA",
            "Description": "LA stream",
            "Destination": "203.0.113.9",
            "Transport": {
                "Protocol": "rtp-fec",
                "SmoothingLatency": 100
            }
        }
    ],
    "FlowArn": "arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame"
}
```

For more information, see Adding Outputs to a Flow in the *AWS Elemental MediaConnect User Guide*.

- For API details, see AddFlowOutputs in *AWS CLI Command Reference*.

`create-flow`

The following code example shows how to use `create-flow`.

AWS CLI

To create a flow

The following `create-flow` example creates a flow with the specified configuration.

```
aws mediaconnect create-flow \
    --availability-zone us-west-2c \
    --name ExampleFlow \
    --source Description='Example source,
 backup',IngestPort=1055,Name=BackupSource,Protocol=rtp,WhitelistCidr=10.24.34.0/23
```

Output:

```
{
    "Flow": {
        "FlowArn": "arn:aws:mediaconnect:us-
east-1:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:ExampleFlow",
        "AvailabilityZone": "us-west-2c",
        "EgressIp": "54.245.71.21",
        "Source": {
            "IngestPort": 1055,
            "SourceArn": "arn:aws:mediaconnect:us-
east-1:123456789012:source:2-3aBC45dEF67hiJ89-c34de5fG678h:BackupSource",
            "Transport": {
                "Protocol": "rtp",
                "MaxBitrate": 80000000
            },
            "Description": "Example source, backup",
            "IngestIp": "54.245.71.21",
            "WhitelistCidr": "10.24.34.0/23",
            "Name": "mySource"
        },
        "Entitlements": [],
        "Name": "ExampleFlow",
        "Outputs": [],
        "Status": "STANDBY",
        "Description": "Example source, backup"
    }
}
```

For more information, see Creating a Flow in the *AWS Elemental MediaConnect User Guide*.

- For API details, see CreateFlow in *AWS CLI Command Reference*.

`delete-flow`

The following code example shows how to use `delete-flow`.

AWS CLI

To delete a flow

The following `delete-flow` example deletes the specified flow.

```
aws mediaconnect delete-flow \
    --flow-arn arn:aws:mediaconnect:us-
east-1:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow
```

Output:

```
{
    "FlowArn": "arn:aws:mediaconnect:us-
east-1:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow",
    "Status": "DELETING"
}
```

For more information, see Deleting a Flow in the *AWS Elemental MediaConnect User Guide*.

- For API details, see DeleteFlow in *AWS CLI Command Reference*.

`describe-flow`

The following code example shows how to use `describe-flow`.

AWS CLI

To view the details of a flow

The following `describe-flow` example displays the specified flow's details, such as ARN, Availability Zone, status, source, entitlements, and outputs.

```
aws mediaconnect describe-flow \
    --flow-arn arn:aws:mediaconnect:us-
east-1:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow
```

Output:

```
{
    "Flow": {
        "EgressIp": "54.201.4.39",
        "AvailabilityZone": "us-west-2c",
        "Status": "ACTIVE",
        "FlowArn": "arn:aws:mediaconnect:us-

            "WhitelistCidr": "10.24.34.0/23"
        }
    }
}
```

For more information, see Viewing the Details of a Flow in the *AWS Elemental MediaConnect User Guide*.

- For API details, see DescribeFlow in *AWS CLI Command Reference*.

grant-flow-entitlements

The following code example shows how to use `grant-flow-entitlements`.

AWS CLI

To grant an entitlement on a flow

The following `grant-flow-entitlements` example grants an entitlement to the specified existing flow to share your content with another AWS account.

```
aws mediaconnect grant-flow-entitlements \
    --flow-arn arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame \
    --entitlements Description='For
 AnyCompany',Encryption={"Algorithm=aes128,KeyType=static-
key,RoleArn=arn:aws:iam::111122223333:role/MediaConnect-
ASM,SecretArn=arn:aws:secretsmanager:us-
west-2:111122223333:secret:mySecret1"},Name=AnyCompany_Entitlement,Subscribers=444455556666
 Description='For Example Corp',Name=ExampleCorp,Subscribers=777788889999
```

Output:

```
{
    "Entitlements": [
        {
            "Name": "AnyCompany_Entitlement",
            "EntitlementArn": "arn:aws:mediaconnect:us-
west-2:111122223333:entitlement:1-11aa22bb11aa22bb-3333cccc4444:AnyCompany_Entitlement",
            "Subscribers": [
                "444455556666"
            ],
            "Description": "For AnyCompany",
            "Encryption": {
                "SecretArn": "arn:aws:secretsmanager:us-
west-2:111122223333:secret:mySecret1",
                "Algorithm": "aes128",
                "RoleArn": "arn:aws:iam::111122223333:role/MediaConnect-ASM",
                "KeyType": "static-key"
            }
        },
        {
            "Name": "ExampleCorp",
            "EntitlementArn": "arn:aws:mediaconnect:us-
west-2:111122223333:entitlement:1-3333cccc4444dddd-1111aaaa2222:ExampleCorp",
            "Subscribers": [
                "777788889999"
            ],
            "Description": "For Example Corp"
        }
    ],
    "FlowArn": "arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame"
}
```

For more information, see Granting an Entitlement on a Flow in the *AWS Elemental MediaConnect User Guide*.

- For API details, see GrantFlowEntitlements in *AWS CLI Command Reference*.

`list-entitlements`

The following code example shows how to use `list-entitlements`.

AWS CLI

To view a list of entitlements

The following `list-entitlements` example displays a list of all entitlements that have been granted to the account.

```
aws mediaconnect list-entitlements
```

Output:

```
{
    "Entitlements": [
        {
            "EntitlementArn": "arn:aws:mediaconnect:us-
west-2:111122223333:entitlement:1-11aa22bb11aa22bb-3333cccc4444:MyEntitlement",
            "EntitlementName": "MyEntitlement"
        }
    ]
}
```

For more information, see ListEntitlements in the *AWS Elemental MediaConnect API Reference*.

- For API details, see ListEntitlements in *AWS CLI Command Reference*.

`list-flows`

The following code example shows how to use `list-flows`.

AWS CLI

To view a list of flows

The following `list-flows` example displays a list of flows.

```
aws mediaconnect list-flows
```

Output:

```
{
    "Flows": [
```

```
        {
            "Status": "STANDBY",
            "SourceType": "OWNED",
            "AvailabilityZone": "us-west-2a",
            "Description": "NYC awards show",
            "Name": "AwardsShow",
            "FlowArn": "arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow"
        },
        {
            "Status": "STANDBY",
            "SourceType": "OWNED",
            "AvailabilityZone": "us-west-2c",
            "Description": "LA basketball game",
            "Name": "BasketballGame",
            "FlowArn": "arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BasketballGame"
        }
    ]
}
```

For more information, see [Viewing a List of Flows](#) in the *AWS Elemental MediaConnect User Guide*.

- For API details, see [ListFlows](#) in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a MediaConnect resource

The following `list-tags-for-resource` example displays the tag keys and values associated with the specified MediaConnect resource.

```
aws mediaconnect list-tags-for-resource \
    --resource-arn arn:aws:mediaconnect:us-
east-1:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BasketballGame
```

Output:

```
{
    "Tags": {
        "region": "west",
        "stage": "prod"
    }
}
```

For more information, see ListTagsForResource, TagResource, UntagResource in the *AWS Elemental MediaConnect API Reference*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`remove-flow-output`

The following code example shows how to use `remove-flow-output`.

AWS CLI

To remove an output from a flow

The following `remove-flow-output` example removes an output from the specified flow.

```
aws mediaconnect remove-flow-output \
    --flow-arn arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame \
    --output-arn arn:aws:mediaconnect:us-
east-1:111122223333:output:2-3aBC45dEF67hiJ89-c34de5fG678h:NYC
```

Output:

```
{
    "FlowArn": "arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame",
    "OutputArn": "arn:aws:mediaconnect:us-
east-1:111122223333:output:2-3aBC45dEF67hiJ89-c34de5fG678h:NYC"
}
```

For more information, see Removing Outputs from a Flow in the *AWS Elemental MediaConnect User Guide*.

- For API details, see RemoveFlowOutput in *AWS CLI Command Reference*.

`revoke-flow-entitlement`

The following code example shows how to use `revoke-flow-entitlement`.

AWS CLI

To revoke an entitlement

The following `revoke-flow-entitlement` example revokes an entitlement on the specified flow.

```
aws mediaconnect revoke-flow-entitlement \
    --flow-arn arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame \
    --entitlement-arn arn:aws:mediaconnect:us-
west-2:111122223333:entitlement:1-11aa22bb11aa22bb-3333cccc4444:AnyCompany_Entitlement
```

Output:

```
{
    "FlowArn": "arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame",
    "EntitlementArn": "arn:aws:mediaconnect:us-
west-2:111122223333:entitlement:1-11aa22bb11aa22bb-3333cccc4444:AnyCompany_Entitlement"
}
```

For more information, see Revoking an Entitlement in the *AWS Elemental MediaConnect User Guide*.

- For API details, see RevokeFlowEntitlement in *AWS CLI Command Reference*.

`start-flow`

The following code example shows how to use `start-flow`.

AWS CLI

To start a flow

The following `start-flow` example starts the specified flow.

```
aws mediaconnect start-flow \
```

```
    --flow-arn arn:aws:mediaconnect:us-
east-1:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow
```

This command produces no output. Output:

```
{
    "FlowArn": "arn:aws:mediaconnect:us-
east-1:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow",
    "Status": "STARTING"
}
```

For more information, see Starting a Flow in the *AWS Elemental MediaConnect User Guide*.

- For API details, see StartFlow in *AWS CLI Command Reference*.

`stop-flow`

The following code example shows how to use `stop-flow`.

AWS CLI

To stop a flow

The following `stop-flow` example stops the specified flow.

```
aws mediaconnect stop-flow \
    --flow-arn arn:aws:mediaconnect:us-
east-1:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow
```

Output:

```
{
    "Status": "STOPPING",
    "FlowArn": "arn:aws:mediaconnect:us-
east-1:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow"
}
```

For more information, see Stopping a Flow in the *AWS Elemental MediaConnect User Guide*.

- For API details, see StopFlow in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add tags to a MediaConnect resource

The following `tag-resource` example adds a tag with a key name and value to the specified MediaConnect resource.

```
aws mediaconnect tag-resource \
    --resource-arn arn:aws:mediaconnect:us-
east-1:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BasketballGame
    --tags region=west
```

This command produces no output.

For more information, see ListTagsForResource, TagResource, UntagResource in the *AWS Elemental MediaConnect API Reference*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a MediaConnect resource

The following `untag-resource` example remove the tag with the specified key name and its associated value from a MediaConnect resource.

```
aws mediaconnect untag-resource \
    --resource-arn arn:aws:mediaconnect:us-
east-1:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BasketballGame \
    --tag-keys region
```

This command produces no output.

For more information, see ListTagsForResource, TagResource, UntagResource in the *AWS Elemental MediaConnect API Reference*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-flow-entitlement`

The following code example shows how to use `update-flow-entitlement`.

AWS CLI

To update an entitlement

The following `update-flow-entitlement` example updates the specified entitlement with a new description and subscriber.

```
aws mediaconnect update-flow-entitlement \
    --flow-arn arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame \
    --entitlement-arn arn:aws:mediaconnect:us-
west-2:111122223333:entitlement:1-11aa22bb11aa22bb-3333cccc4444:AnyCompany_Entitlement
 \
    --description 'For AnyCompany Affiliate' \
    --subscribers 777788889999
```

Output:

```
{
    "FlowArn": "arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame",
    "Entitlement": {
        "Name": "AnyCompany_Entitlement",
        "Description": "For AnyCompany Affiliate",
        "EntitlementArn": "arn:aws:mediaconnect:us-
west-2:111122223333:entitlement:1-11aa22bb11aa22bb-3333cccc4444:AnyCompany_Entitlement",
        "Encryption": {
            "KeyType": "static-key",
            "Algorithm": "aes128",
            "RoleArn": "arn:aws:iam::111122223333:role/MediaConnect-ASM",
            "SecretArn": "arn:aws:secretsmanager:us-
west-2:111122223333:secret:mySecret1"
        },
        "Subscribers": [
            "777788889999"
        ]
```

```
    }
}
```

For more information, see Updating an Entitlement in the *AWS Elemental MediaConnect User Guide*.

- For API details, see UpdateFlowEntitlement in *AWS CLI Command Reference*.

`update-flow-output`

The following code example shows how to use `update-flow-output`.

AWS CLI

To update an output on a flow

The following `update-flow-output` example update an output on the specified flow.

```
aws mediaconnect update-flow-output \
    --flow-arn arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame \
    --output-arn arn:aws:mediaconnect:us-
east-1:111122223333:output:2-3aBC45dEF67hiJ89-c34de5fG678h:NYC \
    --port 3331
```

Output:

```
{
    "FlowArn": "arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame",
    "Output": {
        "Name": "NYC",
        "Port": 3331,
        "Description": "NYC stream",
        "Transport": {
            "Protocol": "rtp-fec",
            "SmoothingLatency": 100
        },
        "OutputArn": "arn:aws:mediaconnect:us-
east-1:111122223333:output:2-3aBC45dEF67hiJ89-c34de5fG678h:NYC",
        "Destination": "192.0.2.12"
    }
```

```
}
```

For more information, see Updating Outputs on a Flow in the *AWS Elemental MediaConnect User Guide*.

- For API details, see UpdateFlowOutput in *AWS CLI Command Reference*.

`update-flow-source`

The following code example shows how to use `update-flow-source`.

AWS CLI

To update the source of an existing flow

The following `update-flow-source` example updates the source of an existing flow.

```
aws mediaconnect update-flow-source \
    --flow-arn arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow \
    --source-arn arn:aws:mediaconnect:us-
east-1:111122223333:source:3-4aBC56dEF78hiJ90-4de5fG6Hi78Jk:ShowSource \
    --description 'Friday night show' \
    --ingest-port 3344 \
    --protocol rtp-fec \
    --whitelist-cidr 10.24.34.0/23
```

Output:

```
{
    "FlowArn": "arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow",
    "Source": {
        "IngestIp": "34.210.136.56",
        "WhitelistCidr": "10.24.34.0/23",
        "Transport": {
            "Protocol": "rtp-fec"
        },
        "IngestPort": 3344,
        "Name": "ShowSource",
        "Description": "Friday night show",
        "SourceArn": "arn:aws:mediaconnect:us-
east-1:111122223333:source:3-4aBC56dEF78hiJ90-4de5fG6Hi78Jk:ShowSource"
```

```
    }
}
```

For more information, see Updating the Source of a Flow in the *AWS Elemental MediaConnect User Guide*.

- For API details, see UpdateFlowSource in *AWS CLI Command Reference*.

MediaConvert examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaConvert.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`cancel-job`

The following code example shows how to use `cancel-job`.

AWS CLI

To cancel a job that is in a queue

The following `cancel-job` example cancels the job with ID `1234567891234-abc123`. You can't cancel a job that the service has started processing.

```
aws mediaconvert cancel-job \
    --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \
    --region region-name-1 \
    --id 1234567891234-abc123
```

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

For more information, see Working with AWS Elemental MediaConvert Jobs in the *AWS Elemental MediaConvert User Guide*.

- For API details, see CancelJob in *AWS CLI Command Reference*.

`create-job-template`

The following code example shows how to use `create-job-template`.

AWS CLI

To create a job template

The following `create-job-template` example creates a job template with the transcoding settings that are specified in the file `job-template.json` that resides on your system.

```
aws mediaconvert create-job-template \
    --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \
    --region region-name-1 \
    --name JobTemplate1 \
    --cli-input-json file://~/job-template.json
```

If you create your job template JSON file by using `get-job-template` and then modifying the file, remove the `JobTemplate` object, but keep the Settings child object inside it. Also, make sure to remove the following key-value pairs: `LastUpdated`, `Arn`, `Type`, and `CreatedAt`. You can specific the category, description, name, and queue either in the JSON file or at the command line.

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

If your request is successful, the service returns the JSON specification for the job template that you created.

For more information, see Working with AWS Elemental MediaConvert Job Templates in the *AWS Elemental MediaConvert User Guide*.

- For API details, see CreateJobTemplate in *AWS CLI Command Reference*.

`create-job`

The following code example shows how to use `create-job`.

AWS CLI

To create a job

The following `create-job` example creates a transcoding job with the settings that are specified in a file `job.json` that resides on the system that you send the command from. This JSON job specification might specify each setting individually, reference a job template, or reference output presets.

```
aws mediaconvert create-job \
    --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \
    --region region-name-1 \
    --cli-input-json file://~/job.json
```

You can use the AWS Elemental MediaConvert console to generate the JSON job specification by choosing your job settings, and then choosing **Show job JSON** at the bottom of the **Job** section.

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

If your request is successful, the service returns the JSON job specification that you sent with your request.

For more information, see Working with AWS Elemental MediaConvert Jobs in the *AWS Elemental MediaConvert User Guide*.

- For API details, see CreateJob in *AWS CLI Command Reference*.

`create-preset`

The following code example shows how to use `create-preset`.

AWS CLI

To create a custom output preset

The following `create-preset` example creates a custom output preset based on the output settings that are specified in the file `preset.json`. You can specify the category, description, and name either in the JSON file or at the command line.

```
aws mediaconvert create-preset \
    --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com
    --region region-name-1 \
    --cli-input-json file://~/preset.json
```

If you create your preset JSON file by using `get-preset` and then modifying the output file, ensure that you remove the following key-value pairs: `LastUpdated`, `Arn`, `Type`, and `CreatedAt`.

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

For more information, see Working with AWS Elemental MediaConvert Output Presets in the *AWS Elemental MediaConvert User Guide*.

- For API details, see CreatePreset in *AWS CLI Command Reference*.

`create-queue`

The following code example shows how to use `create-queue`.

AWS CLI

To create a custom queue

The following `create-queue` example creates a custom transcoding queue.

```
aws mediaconvert create-queue \
    --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \
    --region region-name-1 \
    --name Queue1 \
    --description "Keep this queue empty unless job is urgent."
```

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

Output:

```
{
    "Queue": {
        "Status": "ACTIVE",
        "Name": "Queue1",
        "LastUpdated": 1518034928,
        "Arn": "arn:aws:mediaconvert:region-name-1:012345678998:queues/Queue1",
        "Type": "CUSTOM",
        "CreatedAt": 1518034928,
        "Description": "Keep this queue empty unless job is urgent."
    }
}
```

For more information, see Working with AWS Elemental MediaConvert Queues in the *AWS Elemental MediaConvert User Guide*.

- For API details, see CreateQueue in *AWS CLI Command Reference*.

`delete-job-template`

The following code example shows how to use `delete-job-template`.

AWS CLI

To delete a job template

The following `delete-job-template` example deletes the specified custom job template.

```
aws mediaconvert delete-job-template \
    --name "DASH Streaming" \
    --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

This command produces no output. Run `aws mediaconvert list-job-templates` to confirm that your template was deleted.

For more information, see Working with AWS Elemental MediaConvert Job Templates in the *AWS Elemental MediaConvert User Guide*.

- For API details, see DeleteJobTemplate in *AWS CLI Command Reference*.

`delete-preset`

The following code example shows how to use `delete-preset`.

AWS CLI

To delete a custom on-demand queue

The following `delete-preset` example deletes the specified custom preset.

```
aws mediaconvert delete-preset \
    --name SimpleMP4 \
    --endpoint-url  https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

This command produces no output. Run `aws mediaconvert list-presets` to confirm that your preset was deleted.

For more information, see Working with AWS Elemental MediaConvert Output Presets in the *AWS Elemental MediaConvert User Guide*.

- For API details, see DeletePreset in *AWS CLI Command Reference*.

`delete-queue`

The following code example shows how to use `delete-queue`.

AWS CLI

To delete a custom on-demand queue

The following `delete-queue` example deletes the specified custom on-demand queue.

You can't delete your default queue. You can't delete a reserved queue that has an active pricing plan or that contains unprocessed jobs.

```
aws mediaconvert delete-queue \
    --name Customer1 \
    --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

This command produces no output. Run `aws mediaconvert list-queues` to confirm that your queue was deleted.

For more information, see Working with AWS Elemental MediaConvert Queues in the *AWS Elemental MediaConvert User Guide*.

- For API details, see DeleteQueue in *AWS CLI Command Reference*.

`describe-endpoints`

The following code example shows how to use `describe-endpoints`.

AWS CLI

To get your account-specific endpoint

The following `describe-endpoints` example retrieves the endpoint that you need to send any other request to the service.

```
aws mediaconvert describe-endpoints
```

Output:

```
{
    "Endpoints": [
        {
            "Url": "https://abcd1234.mediaconvert.region-name-1.amazonaws.com"
        }
    ]
}
```

For more information, see Getting Started with MediaConvert Using the API in the *AWS Elemental MediaConvert API Reference*.

- For API details, see DescribeEndpoints in *AWS CLI Command Reference*.

`get-job-template`

The following code example shows how to use `get-job-template`.

AWS CLI

To get details for a job template

The following `get-job-template` example displays the JSON definition of the specified custom job template.

```
aws mediaconvert get-job-template \
    --name "DASH Streaming" \
    --endpoint-url https://abcd1234.mediaconvert.us-east-1.amazonaws.com
```

Output:

```
{
    "JobTemplate": {
        "StatusUpdateInterval": "SECONDS_60",
        "LastUpdated": 1568652998,
        "Description": "Create a DASH streaming ABR stack",
        "CreatedAt": 1568652998,
        "Priority": 0,
        "Name": "DASH Streaming",
        "Settings": {
            ...<truncatedforbrevity>...
        },
        "Arn": "arn:aws:mediaconvert:us-west-2:123456789012:jobTemplates/DASH
 Streaming",
        "Type": "CUSTOM"
    }
}
```

For more information, see Working with AWS Elemental MediaConvert Job Templates in the *AWS Elemental MediaConvert User Guide*.

- For API details, see GetJobTemplate in *AWS CLI Command Reference*.

`get-job`

The following code example shows how to use `get-job`.

AWS CLI

To get details for a particular job

The following example requests the information for the job with ID `1234567890987-1ab2c3`, which in this example ended in an error.

```
aws mediaconvert get-job \
    --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \
    --region region-name-1 \
    --id 1234567890987-1ab2c3
```

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

If your request is successful, the service returns a JSON file with job information, including job settings, any returned errors, and other job data, as follows:

```
{
    "Job": {
        "Status": "ERROR",
        "Queue": "arn:aws:mediaconvert:region-name-1:012345678998:queues/Queue1",
        "Settings": {
            ...<truncated for brevity>...
        },
        "ErrorMessage": "Unable to open input file [s3://my-input-bucket/file-
name.mp4]: [Failed probe/open: [Failed to read data: AssumeRole failed]]",
        "ErrorCode": 1434,
        "Role": "arn:aws:iam::012345678998:role/MediaConvertServiceRole",
        "Arn": "arn:aws:mediaconvert:us-
west-1:012345678998:jobs/1234567890987-1ab2c3",
        "UserMetadata": {},
        "Timing": {
            "FinishTime": 1517442131,
            "SubmitTime": 1517442103,
            "StartTime": 1517442104
        },
        "Id": "1234567890987-1ab2c3",
        "CreatedAt": 1517442103
    }
}
```

For more information, see Working with AWS Elemental MediaConvert Jobs in the *AWS Elemental MediaConvert User Guide*.

- For API details, see GetJob in *AWS CLI Command Reference*.

`get-preset`

The following code example shows how to use `get-preset`.

AWS CLI

To get details for a particular preset

The following `get-preset` example requests the JSON definition of the specified custom preset.

```
aws mediaconvert get-preset \
    --name SimpleMP4 \
    --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{
    "Preset": {
        "Description": "Creates basic MP4 file. No filtering or preproccessing.",
        "Arn": "arn:aws:mediaconvert:us-west-2:123456789012:presets/SimpleMP4",
        "LastUpdated": 1568843141,
        "Name": "SimpleMP4",
        "Settings": {
            "ContainerSettings": {
                "Mp4Settings": {
                    "FreeSpaceBox": "EXCLUDE",
                    "CslgAtom": "INCLUDE",
                    "MoovPlacement": "PROGRESSIVE_DOWNLOAD"
                },
                "Container": "MP4"
            },
            "AudioDescriptions": [
                {
                    "LanguageCodeControl": "FOLLOW_INPUT",
                    "AudioTypeControl": "FOLLOW_INPUT",
                    "CodecSettings": {
                        "AacSettings": {
                            "RawFormat": "NONE",
                            "CodecProfile": "LC",
                            "AudioDescriptionBroadcasterMix": "NORMAL",

For more information, see Working with AWS Elemental MediaConvert Output Presets in the *AWS Elemental MediaConvert User Guide*.

- For API details, see GetPreset in *AWS CLI Command Reference*.

`get-queue`

The following code example shows how to use `get-queue`.

AWS CLI

To get details for a queue

The following `get-queue` example retrieves the details of the specified custom queue.

```
aws mediaconvert get-queue \
    --name Customer1 \
    --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{
    "Queue": {
        "LastUpdated": 1526428502,
        "Type": "CUSTOM",
        "SubmittedJobsCount": 0,
        "Status": "ACTIVE",
        "PricingPlan": "ON_DEMAND",
        "CreatedAt": 1526428502,
        "ProgressingJobsCount": 0,
        "Arn": "arn:aws:mediaconvert:us-west-2:123456789012:queues/Customer1",
        "Name": "Customer1"
    }
}
```

For more information, see Working with AWS Elemental MediaConvert Queues in the *AWS Elemental MediaConvert User Guide*.

- For API details, see GetQueue in *AWS CLI Command Reference*.

`list-job-templates`

The following code example shows how to use `list-job-templates`.

AWS CLI

Example 1: To list your custom job templates

The following `list-job-templates` example lists all custom job templates in the current Region. To list the system job templates, see the next example.

```
aws mediaconvert list-job-templates \
    --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{
    "JobTemplates": [
        {
            "Description": "Create a DASH streaming ABR stack",
            "Arn": "arn:aws:mediaconvert:us-west-2:123456789012:jobTemplates/DASH
 Streaming",
            "Name": "DASH Streaming",
            "LastUpdated": 1568653007,
            "Priority": 0,
            "Settings": {
                ...<truncatedforbrevity>...
            },
            "Type": "CUSTOM",
            "StatusUpdateInterval": "SECONDS_60",
            "CreatedAt": 1568653007
        },
        {
            "Description": "Create a high-res file",
            "Arn": "arn:aws:mediaconvert:us-west-2:123456789012:jobTemplates/File",
            "Name": "File",
            "LastUpdated": 1568653007,
            "Priority": 0,
            "Settings": {
                ...<truncatedforbrevity>...
            },
```

```
            "Type": "CUSTOM",
            "StatusUpdateInterval": "SECONDS_60",
            "CreatedAt": 1568653023
        }
    ]
}
```

Example 2: To list the MediaConvert system job templates

The following `list-job-templates` example lists all system job templates.

```
aws mediaconvert list-job-templates \
    --endpoint-url https://abcd1234.mediaconvert.us-east-1.amazonaws.com \
    --list-by SYSTEM
```

Output:

```
{
    "JobTemplates": [
        {
            "CreatedAt": 1568321779,
            "Arn": "arn:aws:mediaconvert:us-east-1:123456789012:jobTemplates/System-

```

```
        },
        ...<truncatedforbrevity>...
    ]
}
```

For more information, see [Working with AWS Elemental MediaConvert Job Templates](#) in the *AWS Elemental MediaConvert User Guide*.

- For API details, see [ListJobTemplates](#) in *AWS CLI Command Reference*.

`list-jobs`

The following code example shows how to use `list-jobs`.

AWS CLI

To get details for all jobs in a region

The following example requests the information for all of your jobs in the specified region.

```
aws mediaconvert list-jobs \
    --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \
    --region region-name-1
```

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

For more information, see [Working with AWS Elemental MediaConvert Jobs](#) in the *AWS Elemental MediaConvert User Guide*.

- For API details, see [ListJobs](#) in *AWS CLI Command Reference*.

`list-presets`

The following code example shows how to use `list-presets`.

AWS CLI

Example 1: To list your custom output presets

The following `list-presets` example lists your custom output presets. To list the system presets, see the next example.

```
aws mediaconvert list-presets \
    --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{
    "Presets": [
        {
            "Name": "SimpleMP4",
            "CreatedAt": 1568841521,
            "Settings": {
                ......
            },
            "Arn": "arn:aws:mediaconvert:us-east-1:003235472598:presets/SimpleMP4",
            "Type": "CUSTOM",

            "Description": "Create a basic transport stream."
        }
    ]
}
```

Example 2: To list the system output presets

The following `list-presets` example lists the available MediaConvert system presets. To list your custom presets, see the previous example.

```
aws mediaconvert list-presets \
    --list-by SYSTEM \
    --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{
    "Presets": [
        {
            "Arn": "arn:aws:mediaconvert:us-west-2:123456789012:presets/System-

            "Type": "SYSTEM",
            "Category": "MXF",
            "Settings": {
            ...<output settings removed for brevity>...
            }
        }
    ]
}
```

For more information, see Working with AWS Elemental MediaConvert Output Presets in the *AWS Elemental MediaConvert User Guide*.

- For API details, see ListPresets in *AWS CLI Command Reference*.

`list-queues`

The following code example shows how to use `list-queues`.

AWS CLI

To list your queues

The following `list-queues` example lists all of your MediaConvert queues.

```
aws mediaconvert list-queues \
    --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{
    "Queues": [
        {
            "PricingPlan": "ON_DEMAND",
            "Type": "SYSTEM",
            "Status": "ACTIVE",
            "CreatedAt": 1503451595,
            "Name": "Default",
            "SubmittedJobsCount": 0,
            "ProgressingJobsCount": 0,
            "Arn": "arn:aws:mediaconvert:us-west-2:123456789012:queues/Default",
            "LastUpdated": 1534549158
        },
        {
            "PricingPlan": "ON_DEMAND",
            "Type": "CUSTOM",
            "Status": "ACTIVE",
            "CreatedAt": 1537460025,
            "Name": "Customer1",
            "SubmittedJobsCount": 0,
            "Description": "Jobs we run for our cusotmer.",
            "ProgressingJobsCount": 0,
            "Arn": "arn:aws:mediaconvert:us-west-2:123456789012:queues/Customer1",

            "CreatedAt": 1564066204
        }
    ]
}
```

For more information, see Working with AWS Elemental MediaConvert Queues in the *AWS Elemental MediaConvert User Guide*.

- For API details, see ListQueues in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags on a MediaConvert queue, job template, or output preset

The following `list-tags-for-resource` example lists the tags on the specified output preset.

```
aws mediaconvert list-tags-for-resource \
    --arn arn:aws:mediaconvert:us-west-2:123456789012:presets/SimpleMP4 \
    --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{
    "ResourceTags": {
        "Tags": {
            "customer": "zippyVideo"
        },
```

```
        "Arn": "arn:aws:mediaconvert:us-west-2:123456789012:presets/SimpleMP4"
    }
}
```

For more information, see Tagging AWS Elemental MediaConvert Queues, Job Templates, and Output Presets in the *AWS Elemental MediaConvert User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`update-job-template`

The following code example shows how to use `update-job-template`.

AWS CLI

To change a job template

The following `update-job-template` example replaces the JSON definition of the specified custom job template with the JSON definition in the provided file.

aws mediaconvert update-job-template --name File1 --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com --cli-input-json file://~/job-template-update.json

Contents of `job-template-update.json`:

```
{
    "Description": "A simple job template that generates a single file output.",
    "Queue": "arn:aws:mediaconvert:us-east-1:012345678998:queues/Default",

```

The system returns the JSON payload that you send with your request, even when the request results in an error. Therefore, the JSON returned is not necessarily the new definition of the job template.

Because the JSON payload can be long, you might need to scroll up to see any error messages.

For more information, see Working with AWS Elemental MediaConvert Job Templates in the *AWS Elemental MediaConvert User Guide*.

- For API details, see UpdateJobTemplate in *AWS CLI Command Reference*.

`update-preset`

The following code example shows how to use `update-preset`.

AWS CLI

To change a preset

The following `update-preset` example replaces the description for the specified preset.

```
aws mediaconvert update-preset \
--name Customer1 \
--description "New description text."
--endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

This command produces no output. Output:

```
{
    "Preset": {
        "Arn": "arn:aws:mediaconvert:us-east-1:003235472598:presets/SimpleMP4",
        "Settings": {
        ...<output settings removed for brevity>...
        },
        "Type": "CUSTOM",
        "LastUpdated": 1568938411,
        "Description": "New description text.",
        "Name": "SimpleMP4",
        "CreatedAt": 1568938240
    }
}
```

For more information, see Working with AWS Elemental MediaConvert Output Presets in the *AWS Elemental MediaConvert User Guide*.

- For API details, see UpdatePreset in *AWS CLI Command Reference*.

`update-queue`

The following code example shows how to use `update-queue`.

AWS CLI

To change a queue

The following `update-queue` example pauses the specified queue, by changing its status to `PAUSED`.

```
aws mediaconvert update-queue \
--name Customer1 \
--status PAUSED
--endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{
    "Queue": {
        "LastUpdated": 1568839845,
        "Status": "PAUSED",
        "ProgressingJobsCount": 0,
        "CreatedAt": 1526428516,
        "Arn": "arn:aws:mediaconvert:us-west-1:123456789012:queues/Customer1",
        "Name": "Customer1",
        "SubmittedJobsCount": 0,
        "PricingPlan": "ON_DEMAND",
        "Type": "CUSTOM"
    }
}
```

For more information, see Working with AWS Elemental MediaConvert Queues in the *AWS Elemental MediaConvert User Guide*.

- For API details, see UpdateQueue in *AWS CLI Command Reference*.

MediaLive examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaLive.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

`create-channel`

The following code example shows how to use `create-channel`.

AWS CLI

To create a channel

The following `create-channel` example creates a channel by passing in a JSON file that contains the parameters that you want to specify.

The channel in this example ingests an HLS PULL input that connects to a source that contains video, audio, and embedded captions. The channel creates one HLS output group with an Akamai server as the destination. The output group contains two outputs: one for the H.265 video and AAC audio, and one for the Web-VTT captions, in English only.

The JSON for this example channel includes the minimum required parameters for a channel that uses an HLS PULL input and that produces an HLS output group with Akamai as the destination. The JSON contains these main sections:

`InputAttachments`, which specifies one source for the audio, and one source for the captions. It does not specify a video selector, which means that MediaLive extracts the first video it finds in the source.`Destinations`, which contains the two IP addresses (URLs) for the single output group in this channel. These addresses require passwords.`EncoderSettings`, which contains subsections.`AudioDescriptions`, which specifies that the channel contains one audio output asset, which uses the source from InputAttachments, and produces audio in AAC format.`CaptionDescriptions`, which specifies that the channel contains one captions output asset, which uses the source from InputAttachments, and produces captions in Web-VTT format.`VideoDescriptions`, which specifies that the channel contains one video output asset, with the specified resolution.`OutputGroups`, which specifies the output groups. In this example there is one group named `Akamai`. The connection is made using HLS PUT. The output group contains two outputs. One output is for the video asset (named `Video_high`) and the audio asset (named `Audio_EN`). One output is for the captions asset (named `WebVTT_EN`).

In this example, some of the parameters contain no value or contain nested empty parameters. For example, OutputSettings for the `Video_and_audio` output contains several nested parameters that end at an empty parameter M3u8Settings. This parameter must be included, but you can omit one, several, or all its children, which means that the child will take its default value or be null.

All the parameters that apply to this example channel but that aren't specified in this file will either take the default value, be set to null, or take a unique value generated by MediaLive.

```
aws medialive create-channel \
    --cli-input-json file://channel-in-hls-out-hls-akamai.json
```

                    },
                    {
                        "CaptionDescriptionNames": [
                            "WebVTT_EN"
                        ],
                        "OutputName": "Captions-WebVTT",
                        "OutputSettings": {
                            "HlsOutputSettings": {
                                "HlsSettings": {
                                    "StandardHlsSettings": {
                                        "M3u8Settings": {}
```

```
                                    }
                                },
                                "NameModifier": "_2"
                            }
                        }
                    }
                ]
            }
        ],
        "TimecodeConfig": {
            "Source": "EMBEDDED"
        }
    }
}
```

Output:

The output repeats back the contents of the JSON file, plus the following values. All parameters are ordered alphabetically.

`ARN` for the channel. The last part of the ARN is the unique channel ID.`EgressEndpoints` is blank in this example channel because it used only for PUSH inputs. When it applies it shows the addresses on MediaLive that content is pushed to.`OutputGroups`, `Outputs`. These show all the parameters for the output group and outputs, including those that you didn't include but that are relevant to this channel. The parameters might be empty (perhaps indicating the parameter or feature is disabled in this channel configuration) or might show the default value that will apply.`LogLevel` is set to the default (DISABLED).`Tags` is set to the default (null).`PipelinesRunningCount` and `State` show the current status of the channel.

For more information, see Creating a Channel from Scratch in the *AWS Elemental MediaLive User Guide*.

- For API details, see CreateChannel in *AWS CLI Command Reference*.

`create-input`

The following code example shows how to use `create-input`.

AWS CLI

To create an input

The following `create-input` example creates an `HLS PULL` input by passing in a JSON file that contains the parameters that apply to this type of input. The JSON for this example input specifies two sources (addresses) to the input, in order to support redundancy in the ingest. These addresses require passwords.

```
aws medialive create-input \
    --cli-input-json file://input-hls-pull-news.json
```

Contents of `input-hls-pull-news.json`:

```
{
    "Name": "local_news",
    "RequestId": "cli000059",
    "Sources": [
            {
                    "Url": "https://203.0.113.13/newschannel/anytownusa.m3u8",
                    "Username": "examplecorp",
                    "PasswordParam": "/medialive/examplecorp1"
            },
       {
                    "Url": "https://198.51.100.54/fillervideos/oceanwaves.mp4",
                    "Username": "examplecorp",
                    "PasswordParam": "examplecorp2"
            }
    ],
    "Type": "URL_PULL"
}
```

Output:

The output repeats back the contents of the JSON file, plus the following values. All parameters are ordered alphabetically.

`Arn` for the input. The last part of the ARN is the unique input ID.`Attached Channels`, which is always empty for a newly created input.`Destinations`, which is empty in this example because it is used only with a PUSH input.`Id` for the input, the same as the ID in the ARN.`MediaConnectFlows`, which is empty in this example because it is used only with an input of type MediaConnect.`SecurityGroups`, which is empty in this example because it is used only with a PUSH input.`State` of this input.`Tags`, which is empty (the default for this parameter).

For more information, see Creating an Input in the *AWS Elemental MediaLive User Guide*.

- For API details, see CreateInput in *AWS CLI Command Reference*.

```

For more information, see Creating a Channel in the *AWS Elemental MediaPackage User Guide*.

- For API details, see CreateChannel in *AWS CLI Command Reference*.

`create-origin-endpoint`

The following code example shows how to use `create-origin-endpoint`.

AWS CLI

To create an origin endpoint

The following `create-origin-endpoint` command creates an origin endpoint named `cmafsports` with the package settings provided in a JSON file and specified endpoint settings.

```
aws mediapackage create-origin-endpoint \
    --channel-id sportschannel \
    --id cmafsports \
    --cmaf-package file://file/path/cmafpkg.json --description "cmaf output of
 sports" \
    --id cmaf_sports \
```

```
    --manifest-name sports_channel \
    --startover-window-seconds 300 \
    --tags region=west,media=sports \
    --time-delay-seconds 10
```

Output:

```
{
    "Arn": "arn:aws:mediapackage:us-
west-2:111222333:origin_endpoints/1dc6718be36f4f34bb9cd86bc50925e6",
    "ChannelId": "sportschannel",
    "CmafPackage": {
        "HlsManifests": [
            {
                "AdMarkers": "PASSTHROUGH",
                "Id": "cmaf_sports_endpoint",
                "IncludeIframeOnlyStream": true,
                "ManifestName": "index",
                "PlaylistType": "EVENT",
                "PlaylistWindowSeconds": 300,
                "ProgramDateTimeIntervalSeconds": 300,
                "Url": "https://c4af3793bf76b33c.mediapackage.us-
west-2.amazonaws.com/out/v1/1dc6718be36f4f34bb9cd86bc50925e6/cmaf_sports_endpoint/
index.m3u8"
            }
        ],
        "SegmentDurationSeconds": 2,
        "SegmentPrefix": "sportschannel"
    },

```

For more information, see Creating an Endpoint in the *AWS Elemental MediaPackage User Guide*.

- For API details, see CreateOriginEndpoint in *AWS CLI Command Reference*.

`delete-channel`

The following code example shows how to use `delete-channel`.

AWS CLI

To delete a channel

The following `delete-channel` command deletes the channel named `test`.

```
aws mediapackage delete-channel \
    --id test
```

This command produces no output.

For more information, see Deleting a Channel in the *AWS Elemental MediaPackage User Guide*.

- For API details, see DeleteChannel in *AWS CLI Command Reference*.

`delete-origin-endpoint`

The following code example shows how to use `delete-origin-endpoint`.

AWS CLI

To delete an origin endpoint

The following `delete-origin-endpoint` command deletes the origin endpoint named `tester2`.

```
aws mediapackage delete-origin-endpoint \
    --id tester2
```

For more information, see Deleting an Endpoint in the *AWS Elemental MediaPackage User Guide*.

- For API details, see DeleteOriginEndpoint in *AWS CLI Command Reference*.

`describe-channel`

The following code example shows how to use `describe-channel`.

AWS CLI

To describe a channel

The following `describe-channel` command displays all of the details of the channel named `test`.

```
aws mediapackage describe-channel \
    --id test
```

Output:

```
{
    "Arn": "arn:aws:mediapackage:us-
west-2:111222333:channels/584797f1740548c389a273585dd22a63",
    "HlsIngest": {
        "IngestEndpoints": [

    "Whitelist": []
}
```

For more information, see [Viewing a Single Endpoint](#) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see [DescribeOriginEndpoint](#) in *AWS CLI Command Reference*.

`list-channels`

The following code example shows how to use `list-channels`.

AWS CLI

To list all channels

The following `list-channels` command lists all of the channels that are configured on the current AWS account.

```
aws mediapackage list-channels
```

Output:

```
{
    "Channels": [
        {
            "Arn": "arn:aws:mediapackage:us-
west-2:111222333:channels/584797f1740548c389a273585dd22a63",

            "Whitelist": []
        }
    ]
}
```

For more information, see Viewing all Endpoints Associated with a Channel in the *AWS Elemental MediaPackage User Guide*.

- For API details, see ListOriginEndpoints in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags assigned to a resource

The following `list-tags-for-resource` command lists the tags that are assigned to the specified resource.

```
aws mediapackage list-tags-for-resource \
    --resource-arn arn:aws:mediapackage:us-
west-2:111222333:channels/6d345804ec3f46c9b454a91d4a80d0e0
```

Output:

```
{
    "Tags": {
        "region": "west"
    }
}
```

For more information, see Tagging Resources in AWS Elemental MediaPackage in the *AWS Elemental MediaPackage User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`rotate-ingest-endpoint-credentials`

The following code example shows how to use `rotate-ingest-endpoint-credentials`.

AWS CLI

To rotate ingest credentials

The following `rotate-ingest-endpoint-credentials` command rotates the WebDAV username and password for the specified ingest endpoint.

```
aws mediapackage rotate-ingest-endpoint-credentials \
    --id test \
    --ingest-endpoint-id 584797f1740548c389a273585dd22a63
```

Output:

```
{
    "Arn": "arn:aws:mediapackage:us-
west-2:111222333:channels/584797f1740548c389a273585dd22a63",
    "HlsIngest": {
        "IngestEndpoints": [
            {
                "Id": "584797f1740548c389a273585dd22a63",
                "Password": "webdavregeneratedpassword1",
                "Url": "https://9be9c4405c474882.mediapackage.us-
west-2.amazonaws.com/in/
v2/584797f1740548c389a273585dd22a63/584797f1740548c389a273585dd22a63/channel",
                "Username": "webdavregeneratedusername1"
            },
            {
                "Id": "7d187c8616fd455f88aaa5a9fcf74442",
                "Password": "webdavgeneratedpassword2",
                "Url": "https://7bf454c57220328d.mediapackage.us-
west-2.amazonaws.com/in/
v2/584797f1740548c389a273585dd22a63/7d187c8616fd455f88aaa5a9fcf74442/channel",
                "Username": "webdavgeneratedusername2"
            }
        ]
    },
    "Id": "test",
    "Tags": {}
}
```

For more information, see Rotating Credentials on an Input URL in the *AWS Elemental MediaPackage User Guide*.

- For API details, see RotateIngestEndpointCredentials in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add a tag to a resource

The following `tag-resource` commands adds a `region=west` key and value pair to the specified resource.

```
aws mediapackage tag-resource \
    --resource-arn arn:aws:mediapackage:us-
west-2:111222333:channels/6d345804ec3f46c9b454a91d4a80d0e0 \
    --tags region=west
```

This command produces no output.

For more information, see Tagging Resources in AWS Elemental MediaPackage in the *AWS Elemental MediaPackage User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a resource

The following `untag-resource` command removes the tag with the key `region` from the specified channel.

```
aws mediapackage untag-resource \
```

```
    --resource-arn arn:aws:mediapackage:us-
west-2:111222333:channels/6d345804ec3f46c9b454a91d4a80d0e0 \
    --tag-keys region
```

For more information, see Tagging Resources in AWS Elemental MediaPackage in the *AWS Elemental MediaPackage User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-channel`

The following code example shows how to use `update-channel`.

AWS CLI

To update a channel

The following `update-channel` command updates the channel named `sportschannel` to include the description `24x7 sports`.

```
aws mediapackage update-channel \
    --id sportschannel \
    --description "24x7 sports"
```

Output:

```
{
    "Arn": "arn:aws:mediapackage:us-
west-2:111222333:channels/6d345804ec3f46c9b454a91d4a80d0e0",
    "Description": "24x7 sports",
    "HlsIngest": {
        "IngestEndpoints": [
            {
                "Id": "6d345804ec3f46c9b454a91d4a80d0e0",

                "Username": "generatedwebdavusername2"
            }
        ]
    },
    "Id": "sportschannel",
    "Tags": {}
}
```

For more information, see Editing a Channel in the *AWS Elemental MediaPackage User Guide*.

- For API details, see UpdateChannel in *AWS CLI Command Reference*.

`update-origin-endpoint`

The following code example shows how to use `update-origin-endpoint`.

AWS CLI

To update an origin endpoint

The following `update-origin-endpoint` command updates the origin endpoint named `cmaf_sports`. It changes the time delay to `0` seconds.

```
aws mediapackage update-origin-endpoint \
    --id cmaf_sports \
    --time-delay-seconds 0
```

Output:

```
{
    "Arn": "arn:aws:mediapackage:us-
west-2:111222333:origin_endpoints/1dc6718be36f4f34bb9cd86bc50925e6",
    "ChannelId": "sportschannel",
    "CmafPackage": {
        "HlsManifests": [
            {
                "AdMarkers": "NONE",
```

```
                "Id": "cmaf_sports_endpoint",
                "IncludeIframeOnlyStream": false,
                "PlaylistType": "EVENT",
                "PlaylistWindowSeconds": 60,
                "ProgramDateTimeIntervalSeconds": 0,
                "Url": "https://c4af3793bf76b33c.mediapackage.us-
west-2.amazonaws.com/out/v1/1dc6718be36f4f34bb9cd86bc50925e6/cmaf_sports_endpoint/
index.m3u8"
            }
        ],
        "SegmentDurationSeconds": 2,
        "SegmentPrefix": "sportschannel"
    },
    "Id": "cmaf_sports",
    "ManifestName": "index",
    "StartoverWindowSeconds": 0,
    "Tags": {
        "region": "west",
        "media": "sports"
    },
    "TimeDelaySeconds": 0,
    "Url": "",
    "Whitelist": []
}
```

For more information, see Editing an Endpoint in the *AWS Elemental MediaPackage User Guide*.

- For API details, see UpdateOriginEndpoint in *AWS CLI Command Reference*.

MediaPackage VOD examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaPackage VOD.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-asset`

The following code example shows how to use `create-asset`.

AWS CLI

To create an asset

The following `create-asset` example creates an asset named `Chicken_Asset` in the current AWS account. The asset ingests the file `30sec_chicken.smil` to MediaPackage.

```
aws mediapackage-vod create-asset \
    --id chicken_asset \
    --packaging-group-id hls_chicken_gp \
    --source-role-arn arn:aws:iam::111122223333:role/EMP_Vod \
    --source-arn arn:aws:s3::111122223333:video-bucket/A/30sec_chicken.smil
```

Output:

```
{
    "Arn":"arn:aws:mediapackage-vod:us-west-2:111122223333:assets/chicken_asset",
    "Id":"chicken_asset",
    "PackagingGroupId":"hls_chicken_gp",
    "SourceArn":"arn:aws:s3::111122223333:video-bucket/A/30sec_chicken.smil",
    "SourceRoleArn":"arn:aws:iam::111122223333:role/EMP_Vod",
    "EgressEndpoints":[
        {
            "PackagingConfigurationId":"New_config_1",
            "Url":"https://c75ea2668ab49d02bca7ae10ef31c59e.egress.mediapackage-
vod.us-west-2.amazonaws.com/out/
v1/6644b55df1744261ab3732a8e5cdaf07/904b06a58c7645e08d57d40d064216ac/
f5b2e633ff4942228095d164c10074f3/index.m3u8"
        },
        {
            "PackagingConfigurationId":"new_hls",
            "Url":" https://c75ea2668ab49d02bca7ae10ef31c59e.egress.mediapackage-
vod.us-west-2.amazonaws.com/out/v1/6644b55df1744261ab3732a8e5cdaf07/
fe8f1f00a80e424cb4f8da4095835e9e/7370ec57432343af816332356d2bd5c6/string.m3u8"
        }
    ]
```

```
}
```

For more information, see Ingest an Asset in the *AWS Elemental MediaPackage User Guide*.

- For API details, see CreateAsset in *AWS CLI Command Reference*.

`create-packaging-configuration`

The following code example shows how to use `create-packaging-configuration`.

AWS CLI

To create a packaging configuration

The following `create-packaging-configuration` example creates a packaging configuration named `new_hls` in the packaging group named `hls_chicken`. This example uses a file on disk named `hls_pc.json` to provide the details.

```
aws mediapackage-vod create-packaging-configuration \
    --id new_hls \
    --packaging-group-id hls_chicken \
    --hls-package file://hls_pc.json
```

Contents of `hls_pc.json`:

```
{
    "HlsManifests":[
        {
            "AdMarkers":"NONE",
            "IncludeIframeOnlyStream":false,
            "ManifestName":"string",
            "ProgramDateTimeIntervalSeconds":60,
            "RepeatExtXKey":true,
            "StreamSelection":{
                "MaxVideoBitsPerSecond":1000,
                "MinVideoBitsPerSecond":0,
                "StreamOrder":"ORIGINAL"
            }
        }
    ],
    "SegmentDurationSeconds":6,
```

```
    "UseAudioRenditionGroup":false
}
```

Output:

```
{
    "Arn":"arn:aws:mediapackage-vod:us-west-2:111122223333:packaging-configurations/
new_hls",
    "Id":"new_hls",
    "PackagingGroupId":"hls_chicken",
    "HlsManifests":{
        "SegmentDurationSeconds":6,
        "UseAudioRenditionGroup":false,
        "HlsMarkers":[
            {
                "AdMarkers":"NONE",
                "IncludeIframeOnlyStream":false,
                "ManifestName":"string",
                "ProgramDateTimeIntervalSeconds":60,
                "RepeatExtXKey":true,
                "StreamSelection":{
                    "MaxVideoBitsPerSecond":1000,
                    "MinVideoBitsPerSecond":0,
                    "StreamOrder":"ORIGINAL"
                }
            }
        ]
    }
}
```

For more information, see Creating a Packaging Configuration in the *AWS Elemental MediaPackage User Guide*.

- For API details, see CreatePackagingConfiguration in *AWS CLI Command Reference*.

`create-packaging-group`

The following code example shows how to use `create-packaging-group`.

AWS CLI

To create a packaging group

The following `create-packaging-group` example lists all of the packaging groups that are configured in the current AWS account.

```
aws mediapackage-vod create-packaging-group \
    --id hls_chicken
```

Output:

```
{
    "Arn": "arn:aws:mediapackage-vod:us-west-2:111122223333:packaging-groups/
hls_chicken",
    "Id": "hls_chicken"
}
```

For more information, see Creating a Packaging Group in the *AWS Elemental MediaPackage User Guide*.

- For API details, see CreatePackagingGroup in *AWS CLI Command Reference*.

`delete-asset`

The following code example shows how to use `delete-asset`.

AWS CLI

To delete an asset

The following `delete-asset` example deletes the asset named `30sec_chicken`.

```
aws mediapackage-vod delete-asset \
    --id 30sec_chicken
```

This command produces no output.

For more information, see Deleting an Asset in the *AWS Elemental MediaPackage User Guide*.

- For API details, see DeleteAsset in *AWS CLI Command Reference*.

`delete-packaging-configuration`

The following code example shows how to use `delete-packaging-configuration`.

AWS CLI

To delete a packaging configuration

The following `delete-packaging-configuration` example deletes the packaging configuration named `CMAF`.

```
aws mediapackage-vod delete-packaging-configuration \
    --id CMAF
```

This command produces no output.

For more information, see Deleting a Packaging Configuration in the *AWS Elemental MediaPackage User Guide*.

- For API details, see DeletePackagingConfiguration in *AWS CLI Command Reference*.

`delete-packaging-group`

The following code example shows how to use `delete-packaging-group`.

AWS CLI

To delete a packaging group

The following `delete-packaging-group` example deletes the packaging group named `Dash_widevine`.

```
aws mediapackage-vod delete-packaging-group \
    --id Dash_widevine
```

This command produces no output.

For more information, see Deleting a Packaging Group in the *AWS Elemental MediaPackage User Guide*.

- For API details, see DeletePackagingGroup in *AWS CLI Command Reference*.

`describe-asset`

The following code example shows how to use `describe-asset`.

AWS CLI

To describe an asset

The following `describe-asset` example displays all of the details of the asset named `30sec_chicken`.

```
aws mediapackage-vod describe-asset \
    --id 30sec_chicken
```

Output:

```
{
    "Arn":"arn:aws:mediapackage-vod:us-west-2:111122223333:assets/30sec_chicken",
    "Id":"30sec_chicken",
    "PackagingGroupId":"Packaging_group_1",
    "SourceArn":"arn:aws:s3::111122223333:video-bucket/A/30sec_chicken.smil",
    "SourceRoleArn":"arn:aws:iam::111122223333:role/EMP_Vod",
    "EgressEndpoints":[
        {
            "PackagingConfigurationId":"DASH",
            "Url":"https://a5f46a44118ba3e3724ef39ef532e701.egress.mediapackage-

index.m3u8"
        }
    ]
}
```

For more information, see Viewing Asset Details in the *AWS Elemental MediaPackage User Guide*.

- For API details, see DescribeAsset in *AWS CLI Command Reference*.

`describe-packaging-configuration`

The following code example shows how to use `describe-packaging-configuration`.

AWS CLI

To describe a packaging configuration

The following `describe-packaging-configuration` example displays all of the details of the packaging configuration named DASH.

```
aws mediapackage-vod describe-packaging-configuration \
    --id DASH
```

Output:

```
{
    "Arn":"arn:aws:mediapackage-vod:us-west-2:111122223333:packaging-configurations/
DASH",
    "Id":"DASH",
    "PackagingGroupId":"Packaging_group_1",
    "DashPackage":[
        {
            "SegmentDurationSeconds":"2"
        },
        {
            "DashManifests":{
                "ManifestName":"index",
                "MinBufferTimeSeconds":"30",
                "Profile":"NONE"
            }
        }
    ]
}
```

For more information, see Viewing Packaging Configuration Details in the *AWS Elemental MediaPackage User Guide*.

- For API details, see DescribePackagingConfiguration in *AWS CLI Command Reference*.

`describe-packaging-group`

The following code example shows how to use `describe-packaging-group`.

AWS CLI

To describe a packaging group

The following `describe-packaging-group` example displays all of the details of the packaging group named `Packaging_group_1`.

```
aws mediapackage-vod describe-packaging-group \
    --id Packaging_group_1
```

Output:

```
{
    "Arn": "arn:aws:mediapackage-vod:us-west-2:111122223333:packaging-groups/
Packaging_group_1",
    "Id": "Packaging_group_1"
}
```

For more information, see Viewing Packaging Group Details in the *AWS Elemental MediaPackage User Guide*.

- For API details, see DescribePackagingGroup in *AWS CLI Command Reference*.

`list-assets`

The following code example shows how to use `list-assets`.

AWS CLI

To list all assets

The following `list-assets` example lists all of the assets that are configured in the current AWS account.

```
aws mediapackage-vod list-assets
```

Output:

```
{
    "Assets": [
        "Arn": "arn:aws:mediapackage-vod:us-
west-2:111122223333:assets/30sec_chicken",
        "Id": "30sec_chicken",
        "PackagingGroupId": "Packaging_group_1",
        "SourceArn": "arn:aws:s3::111122223333:video-bucket/A/30sec_chicken.smil",
        "SourceRoleArn": "arn:aws:iam::111122223333:role/EMP_Vod"
    ]
}
```

For more information, see Viewing Asset Details in the *AWS Elemental MediaPackage User Guide*.

- For API details, see ListAssets in *AWS CLI Command Reference*.

`list-packaging-configurations`

The following code example shows how to use `list-packaging-configurations`.

AWS CLI

To list all packaging configurations

The following `list-packaging-configurations` example lists all of the packaging configurations that are configured on the packaging group named `Packaging_group_1`.

```
aws mediapackage-vod list-packaging-configurations \
    --packaging-group-id Packaging_group_1
```

Output:

```
{
    "PackagingConfigurations":[
        {
            "Arn":"arn:aws:mediapackage-vod:us-west-2:111122223333:packaging-
configurations/CMAF",
            "Id":"CMAF",
            "PackagingGroupId":"Packaging_group_1",
            "CmafPackage":[
                {
                    "SegmentDurationSeconds":"2"
                },
```

```
                {
                    "HlsManifests":{
                        "AdMarkers":"NONE",
                        "RepeatExtXKey":"False",
                        "ManifestName":"index",
                        "ProgramDateTimeIntervalSeconds":"0",
                        "IncludeIframeOnlyStream":"False"
                    }
                }
            ]
        },
        {
            "Arn":"arn:aws:mediapackage-vod:us-west-2:111122223333:packaging-
configurations/DASH",

                },
                {
                    "HlsManifests":{
                        "AdMarkers":"NONE",
                        "RepeatExtXKey":"False",
                        "ManifestName":"index",
                        "ProgramDateTimeIntervalSeconds":"0",
                        "IncludeIframeOnlyStream":"False"
                    }
                }
            ]
        }
    ]
}
```

For more information, see Viewing Packaging Configuration Details in the *AWS Elemental MediaPackage User Guide*.

- For API details, see ListPackagingConfigurations in *AWS CLI Command Reference*.

`list-packaging-groups`

The following code example shows how to use `list-packaging-groups`.

AWS CLI

To list all packaging groups

The following `list-packaging-groups` example lists all of the packaging groups that are configured in the current AWS account.

```
aws mediapackage-vod list-packaging-groups
```

Output:

```
{
    "PackagingGroups": [
        {
            "Arn": "arn:aws:mediapackage-vod:us-west-2:111122223333:packaging-
groups/Dash_widevine",
            "Id": "Dash_widevine"
        },
        {
            "Arn": "arn:aws:mediapackage-vod:us-west-2:111122223333:packaging-
groups/Encrypted_HLS",
            "Id": "Encrypted_HLS"
        },
        {
            "Arn": "arn:aws:mediapackage-vod:us-west-2:111122223333:packaging-
groups/Packaging_group_1",
            "Id": "Packaging_group_1"
        }
    ]
}
```

For more information, see Viewing Packaging Group Details in the *AWS Elemental MediaPackage User Guide*.

- For API details, see ListPackagingGroups in *AWS CLI Command Reference*.

MediaStore Data Plane examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaStore Data Plane.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`delete-object`

The following code example shows how to use `delete-object`.

AWS CLI

To delete an object

The following `delete-object` example deletes the specified object.

```
aws mediastore-data delete-object \
    --endpoint=https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com \
    --path=/folder_name/README.md
```

This command produces no output.

For more information, see Deleting an Object in the *AWS Elemental MediaStore User Guide*.

- For API details, see DeleteObject in *AWS CLI Command Reference*.

`describe-object`

The following code example shows how to use `describe-object`.

AWS CLI

To view the headers for an object

The following `describe-object` example displays the headers for an object at the specified path.

```
aws mediastore-data describe-object \
    --endpoint https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com \
    --path events/baseball/setup.jpg
```

Output:

```
{
    "LastModified": "Fri, 19 Jul 2019 21:50:31 GMT",
    "ContentType": "image/jpeg",
    "ContentLength": "3860266",
    "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeeee4dd89ff7f555555555555da6d3"
}
```

For more information, see Viewing the Details of an Object in the *AWS Elemental MediaStore User Guide*.

- For API details, see DescribeObject in *AWS CLI Command Reference*.

`get-object`

The following code example shows how to use `get-object`.

AWS CLI

Example 1: To download an entire object

The following `get-object` example downloads the specified object.

```
aws mediastore-data get-object \
    --endpoint https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com \
    --path events/baseball/setup.jpg setup.jpg
```

Output:

```
{
```

```
    "ContentType": "image/jpeg",
    "StatusCode": 200,
    "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeeee4dd89ff7f555555555555da6d3",
    "ContentLength": "3860266",
    "LastModified": "Fri, 19 Jul 2019 21:50:31 GMT"
}
```

Example 2: To download part of an object

The following `get-object` example downloads the specified part of an object.

```
aws mediastore-data get-object \
    --endpoint https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com \
    --path events/baseball/setup.jpg setup.jpg \
    --range "bytes=0-100"
```

Output:

```
{
    "StatusCode": 206,
    "LastModified": "Fri, 19 Jul 2019 21:50:31 GMT",
    "ContentType": "image/jpeg",
    "ContentRange": "bytes 0-100/3860266",
    "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeeee4dd89ff7f555555555555da6d3",
    "ContentLength": "101"
}
```

For more information, see Downloading an Object in the *AWS Elemental MediaStore User Guide*.

- For API details, see GetObject in *AWS CLI Command Reference*.

`list-items`

The following code example shows how to use `list-items`.

AWS CLI

Example 1: To view a list of items (objects and folders) stored in a container

The following `list-items` example displays a list of items (objects and folders) stored in the specified container.

```
aws mediastore-data list-items \
```

```
    --endpoint https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com
```

Output:

```
{
    "Items": [
        {
            "Type": "OBJECT",
            "ContentLength": 3784,
            "Name": "setup.jpg",
            "ETag":
 "2aa333bbcc8d8d22d777e999c88d4aa9eeeeee4dd89ff7f555555555555da6d3",
            "ContentType": "image/jpeg",
            "LastModified": 1563571859.379
        },
        {
            "Type": "FOLDER",
            "Name": "events"
        }
    ]
}
```

Example 2: To view a list of items (objects and folders) stored in a folder

The following `list-items` example displays a list of items (objects and folders) stored in the specified folder.

```
aws mediastore-data list-items \
    --endpoint https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com \
    --path events/baseball
```

Output:

```
{
    "Items": [
        {
            "ETag":
 "2aa333bbcc8d8d22d777e999c88d4aa9eeeeee4dd89ff7f555555555555da6d3",
            "ContentType": "image/jpeg",
            "Type": "OBJECT",
            "ContentLength": 3860266,
            "LastModified": 1563573031.872,
```

```
                "Name": "setup.jpg"
            }
        ]
    }
```

For more information, see [Viewing a List of Objects](#) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [ListItems](#) in *AWS CLI Command Reference*.

`put-object`

The following code example shows how to use `put-object`.

AWS CLI

Example 1: To upload an object to a container

The following `put-object` example upload an object to the specified container.

```
aws mediastore-data put-object \
    --endpoint https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com \
    --body ReadMe.md \
    --path ReadMe.md \
    --cache-control "max-age=6, public" \
    --content-type binary/octet-stream
```

Output:

```
{
    "ContentSHA256":
 "f29bc64a9d3732b4b9035125fdb3285f5b6455778edca72414671e0ca3b2e0de",
    "StorageClass": "TEMPORAL",
    "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeeee4dd89ff7f555555555555da6d3"
}
```

Example 2: To upload an object to a folder within a container

The following `put-object` example upload an object to the specified folder within a container.

```
aws mediastore-data put-object \
    --endpoint https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com \
```

```
    --body ReadMe.md \
    --path /september-events/ReadMe.md \
    --cache-control "max-age=6, public" \
    --content-type binary/octet-stream
```

Output:

```
{
    "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeeee4dd89ff7f555555555555da6d3",
    "ContentSHA256":
 "f29bc64a9d3732b4b9035125fdb3285f5b6455778edca72414671e0ca3b2e0de",
    "StorageClass": "TEMPORAL"
}
```

For more information, see Uploading an Object in the *AWS Elemental MediaStore User Guide*.

- For API details, see PutObject in *AWS CLI Command Reference*.

MediaTailor examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaTailor.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Actions

`delete-playback-configuration`

The following code example shows how to use `delete-playback-configuration`.

AWS CLI

To delete a configuration

The following `delete-playback-configuration` deletes a configuration named `campaign_short`.

```
aws mediatailor delete-playback-configuration \
    --name campaign_short
```

This command produces no output.

For more information, see [Deleting a Configuration]() in the *AWS Elemental MediaTailor User Guide*.

- For API details, see [DeletePlaybackConfiguration]() in *AWS CLI Command Reference*.

get-playback-configuration

The following code example shows how to use `get-playback-configuration`.

AWS CLI

To describe a configuration

The following `get-playback-configuration` displays all of the details of the configuration named `west_campaign`.

```
aws mediatailor get-playback-configuration \
    --name west_campaign
```

Output:

```
{
     "AdDecisionServerUrl": "http://your.ads.url",
     "CdnConfiguration": {},
     "DashConfiguration": {
         "ManifestEndpointPrefix":

- For API details, see ListPlaybackConfigurations in *AWS CLI Command Reference*.

`put-playback-configuration`

The following code example shows how to use `put-playback-configuration`.

AWS CLI

To create a configuration

The following `put-playback-configuration` creates a configuration named `campaign_short`.

```
aws mediatailor put-playback-configuration \
    --name campaign_short \
    --ad-decision-server-url http://your.ads.url \
    --video-content-source-url http://video.bucket/index.m3u8
```

Output:

```
{
    "AdDecisionServerUrl": "http://your.ads.url",
    "CdnConfiguration": {},
    "DashConfiguration": {
         "ManifestEndpointPrefix":
 "https://13484114d38f4383bc0d6a7cb879bd00.mediatailor.us-west-2.amazonaws.com/v1/
dash/1cbfeaaecb69778e0c167d0505a2bc57da2b1754/campaign_short/",
```

```
            "MpdLocation": "EMT_DEFAULT",
            "OriginManifestType": "MULTI_PERIOD"
        },
        "HlsConfiguration": {
            "ManifestEndpointPrefix":
 "https://13484114d38f4383bc0d6a7cb879bd00.mediatailor.us-west-2.amazonaws.com/v1/
master/1cbfeaaecb69778e0c167d0505a2bc57da2b1754/campaign_short/"
        },
        "Name": "campaign_short",
        "PlaybackConfigurationArn": "arn:aws:mediatailor:us-
west-2:123456789012:playbackConfiguration/campaign_short",
        "PlaybackEndpointPrefix":
 "https://13484114d38f4383bc0d6a7cb879bd00.mediatailor.us-west-2.amazonaws.com",
        "SessionInitializationEndpointPrefix":
 "https://13484114d38f4383bc0d6a7cb879bd00.mediatailor.us-west-2.amazonaws.com/v1/

Actions

`copy-snapshot`

The following code example shows how to use `copy-snapshot`.

AWS CLI

To copy a snapshot

The following `copy-snapshot` example creates a copy of a snapshot.

```
aws memorydb copy-snapshot \
    --source-snapshot-name my-cluster-snapshot \
    --target-snapshot-name my-cluster-snapshot-copy
```

Output

```
{
    "Snapshot": {
        "Name": "my-cluster-snapshot-copy",
        "Status": "creating",
        "Source": "manual",
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:snapshot/my-cluster-
snapshot-copy",
        "ClusterConfiguration": {
            "Name": "my-cluster",
            "Description": " ",
            "NodeType": "db.r6g.large",
            "EngineVersion": "6.2",
            "MaintenanceWindow": "wed:03:00-wed:04:00",
            "Port": 6379,
            "ParameterGroupName": "default.memorydb-redis6",
            "SubnetGroupName": "my-sg",
            "VpcId": "vpc-xx2574fc",
            "SnapshotRetentionLimit": 0,
            "SnapshotWindow": "04:30-05:30",
            "NumShards": 2
        }
    }
}
```

For more information, see Copying a snapshot in the *MemoryDB User Guide*.

- For API details, see CopySnapshot in *AWS CLI Command Reference*.

`create-acl`

The following code example shows how to use `create-acl`.

AWS CLI

To create an ACL

The following `create-acl` example creates a new Access control list.

```
aws memorydb create-acl \
    --acl-name "new-acl-1" \
    --user-names "my-user"
```

Output:

```
{
    "ACL": {
        "Name": "new-acl-1",
        "Status": "creating",
        "UserNames": [
            "my-user"
        ],
        "MinimumEngineVersion": "6.2",
        "Clusters": [],
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:acl/new-acl-1"
    }
}
```

For more information, see Authenticating users with Access Control Lists in the *MemoryDB User Guide*.

- For API details, see CreateAcl in *AWS CLI Command Reference*.

`create-cluster`

The following code example shows how to use `create-cluster`.

AWS CLI

To create a cluster

The following `create-cluster` example creates a new cluster.

```
aws memorydb create-cluster \
    --cluster-name my-new-cluster \
    --node-type db.r6g.large \
    --acl-name my-acl \
    --subnet-group my-sg
```

Output:

```
{
    "Cluster": {
        "Name": "my-new-cluster",
        "Status": "creating",
        "NumberOfShards": 1,
        "AvailabilityMode": "MultiAZ",
        "ClusterEndpoint": {
            "Port": 6379
        },
        "NodeType": "db.r6g.large",
        "EngineVersion": "6.2",
        "EnginePatchVersion": "6.2.6",
        "ParameterGroupName": "default.memorydb-redis6",
        "ParameterGroupStatus": "in-sync",
        "SubnetGroupName": "my-sg",
        "TLSEnabled": true,
        "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxx:cluster/my-new-cluster",
        "SnapshotRetentionLimit": 0,
        "MaintenanceWindow": "sat:10:00-sat:11:00",
        "SnapshotWindow": "07:30-08:30",
        "ACLName": "my-acl",
        "AutoMinorVersionUpgrade": true
    }
}
```

For more information, see Managing Clusters in the *MemoryDB User Guide*.

- For API details, see CreateCluster in *AWS CLI Command Reference*.

`create-parameter-group`

The following code example shows how to use `create-parameter-group`.

AWS CLI

To create a parameter group

The following `create-parameter-group` example creates a parameter group.

```
aws memorydb create-parameter-group \
    --parameter-group-name myRedis6x \
    --family memorydb_redis6 \
    --description "my-parameter-group"
```

Output:

```
{
    "ParameterGroup": {
        "Name": "myredis6x",
        "Family": "memorydb_redis6",
        "Description": "my-parameter-group",
        "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxx:parametergroup/myredis6x"
    }
}
```

For more information, see Creating a parameter group in the *MemoryDB User Guide*.

- For API details, see CreateParameterGroup in *AWS CLI Command Reference*.

`create-snapshot`

The following code example shows how to use `create-snapshot`.

AWS CLI

To create a snapshot

The following `create-snapshot` example creates a snapshot.

```
aws memorydb create-snapshot \
    --cluster-name my-cluster \
    --snapshot-name my-cluster-snapshot
```

Output:

```
{
    "Snapshot": {
        "Name": "my-cluster-snapshot1",
        "Status": "creating",
        "Source": "manual",
        "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxx:snapshot/my-cluster-
snapshot",
        "ClusterConfiguration": {
            "Name": "my-cluster",
            "Description": "",
            "NodeType": "db.r6g.large",
            "EngineVersion": "6.2",
            "MaintenanceWindow": "wed:03:00-wed:04:00",
            "Port": 6379,
            "ParameterGroupName": "default.memorydb-redis6",
            "SubnetGroupName": "my-sg",
            "VpcId": "vpc-862xxxxc",
            "SnapshotRetentionLimit": 0,
            "SnapshotWindow": "04:30-05:30",
            "NumShards": 2
        }
    }
}
```

For more information, see Making manual snapshots in the *MemoryDB User Guide*.

- For API details, see CreateSnapshot in *AWS CLI Command Reference*.

`create-subnet-group`

The following code example shows how to use `create-subnet-group`.

AWS CLI

To create a subnet group

The following `create-subnet-group` example creates a subnet group.

```
aws memorydb create-subnet-group \
    --subnet-group-name mysubnetgroup \
    --description "my subnet group" \
```

```
    --subnet-ids subnet-5623xxxx
```

Output:

```
{
    "SubnetGroup": {
        "Name": "mysubnetgroup",
        "Description": "my subnet group",
        "VpcId": "vpc-86257xxx",
        "Subnets": [
            {
                "Identifier": "subnet-5623xxxx",
                "AvailabilityZone": {
                    "Name": "us-east-1a"
                }
            }
        ],
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:subnetgroup/mysubnetgroup"
    }
}
```

For more information, see Creating a subnet group in the *MemoryDB User Guide*.

- For API details, see CreateSubnetGroup in *AWS CLI Command Reference*.

`create-user`

The following code example shows how to use `create-user`.

AWS CLI

To create a user

The following `create-user` example creates a new user.

```
aws memorydb create-user \
    --user-name user-name-1 \
    --access-string "~objects:* ~items:* ~public:*" \
     --authentication-mode \
         Passwords="enterapasswordhere",Type=password
```

Output:

```
{
    "User": {
        "Name": "user-name-1",
        "Status": "active",
        "AccessString": "off ~objects:* ~items:* ~public:* resetchannels -@all",
        "ACLNames": [],
        "MinimumEngineVersion": "6.2",
        "Authentication": {
            "Type": "password",
            "PasswordCount": 1
        },
        "ARN": "arn:aws:memorydb:us-west-2:491658xxxxxx:user/user-name-1"
    }
}
```

For more information, see Authenticating users with Access Control Lists in the *MemoryDB User Guide*.

- For API details, see CreateUser in *AWS CLI Command Reference*.

`delete-acl`

The following code example shows how to use `delete-acl`.

AWS CLI

To delete an ACL

The following `delete-acl` example deletes an Access control list.

```
aws memorydb delete-acl \
    --acl-name "new-acl-1"
```

Output:

```
{
    "ACL": {
        "Name": "new-acl-1",
        "Status": "deleting",
        "UserNames": [
            "pat"
        ],
```

```
        "MinimumEngineVersion": "6.2",
        "Clusters": [],
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:acl/new-acl-1"
    }
}
```

For more information, see Authenticating users with Access Control Lists in the *MemoryDB User Guide*.

- For API details, see DeleteAcl in *AWS CLI Command Reference*.

delete-cluster

The following code example shows how to use `delete-cluster`.

AWS CLI

To delete a cluster

The following `delete-cluster` example deletes a cluster.

```
aws memorydb delete-cluster \
    --cluster-name my-new-cluster
```

Output:

```
{
    "Cluster": {
        "Name": "my-new-cluster",
        "Status": "deleting",
        "NumberOfShards": 1,
        "ClusterEndpoint": {
            "Address": "clustercfg.my-new-cluster.xxxxx.memorydb.us-
east-1.amazonaws.com",
            "Port": 6379
        },
        "NodeType": "db.r6g.large",
        "EngineVersion": "6.2",
        "EnginePatchVersion": "6.2.6",
        "ParameterGroupName": "default.memorydb-redis6",
        "ParameterGroupStatus": "in-sync",
        "SubnetGroupName": "my-sg",
        "TLSEnabled": true,
```

```
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:cluster/my-new-cluster",
        "SnapshotRetentionLimit": 0,
        "MaintenanceWindow": "sat:10:00-sat:11:00",
        "SnapshotWindow": "07:30-08:30",
        "AutoMinorVersionUpgrade": true
    }
}
```

For more information, see Deleting a cluster in the *MemoryDB User Guide*.

- For API details, see DeleteCluster in *AWS CLI Command Reference*.

`delete-parameter-group`

The following code example shows how to use `delete-parameter-group`.

AWS CLI

To delete a parameter group

The following `delete-parameter-group` example deletes a parameter group.

```
aws memorydb delete-parameter-group \
    --parameter-group-name myRedis6x
```

Output:

```
{
    "ParameterGroup": {
        "Name": "myredis6x",
        "Family": "memorydb_redis6",
        "Description": "my-parameter-group",
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:parametergroup/myredis6x"
    }
}
```

For more information, see Deleting a parameter group in the *MemoryDB User Guide*.

- For API details, see DeleteParameterGroup in *AWS CLI Command Reference*.

`delete-snapshot`

The following code example shows how to use `delete-snapshot`.

AWS CLI

To delete a snapshot

The following `delete-snapshot` example deletes a snapshot.

```
aws memorydb delete-snapshot \
    --snapshot-name my-cluster-snapshot
```

Output:

```
{
    "Snapshot": {
        "Name": "my-cluster-snapshot",
        "Status": "deleting",
        "Source": "manual",
        "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxx:snapshot/my-cluster-
snapshot",
        "ClusterConfiguration": {
            "Name": "my-cluster",
            "Description": "",
            "NodeType": "db.r6g.large",
            "EngineVersion": "6.2",
            "MaintenanceWindow": "wed:03:00-wed:04:00",
            "Port": 6379,
            "ParameterGroupName": "default.memorydb-redis6",
            "SubnetGroupName": "my-sg",
            "VpcId": "vpc-862xxxxc",
            "SnapshotRetentionLimit": 0,
            "SnapshotWindow": "04:30-05:30",
            "NumShards": 2
        }
    }
}
```

For more information, see Deleting a snapshot in the *MemoryDB User Guide*.

- For API details, see DeleteSnapshot in *AWS CLI Command Reference*.

`delete-subnet-group`

The following code example shows how to use `delete-subnet-group`.

AWS CLI

To delete a subnet group

The following `delete-subnet-group` example deletes a subnet.

```
aws memorydb delete-subnet-group \
    --subnet-group-name mysubnetgroup
```

Output:

```
{
    "SubnetGroup": {
        "Name": "mysubnetgroup",
        "Description": "my subnet group",
        "VpcId": "vpc-86xxxx4fc",
        "Subnets": [
            {
                "Identifier": "subnet-56xxx61b",
                "AvailabilityZone": {
                    "Name": "us-east-1a"
                }
            }
        ],
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:subnetgroup/mysubnetgroup"
    }
}
```

For more information, see Deleting a subnet group in the *MemoryDB User Guide*.

- For API details, see DeleteSubnetGroup in *AWS CLI Command Reference*.

`delete-user`

The following code example shows how to use `delete-user`.

AWS CLI

To delete a user

The following `delete-user` example deletes a user.

```
aws memorydb delete-user \
```

```
    --user-name my-user
```

Output:

```
{
    "User": {
        "Name": "my-user",
        "Status": "deleting",
        "AccessString": "on ~app::* resetchannels -@all +@read",
        "ACLNames": [
            "my-acl"
        ],
        "MinimumEngineVersion": "6.2",
        "Authentication": {
            "Type": "password",
            "PasswordCount": 1
        },
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:user/my-user"
    }
}
```

For more information, see Authenticating users with Access Control Lists in the *MemoryDB User Guide*.

- For API details, see DeleteUser in *AWS CLI Command Reference*.

`describe-acls`

The following code example shows how to use `describe-acls`.

AWS CLI

To return a list of ACLs

The following describe-acls` returns a list of ACLs.

```
aws memorydb describe-acls
```

Output:

```
{
    "ACLs": [
```

```
        {
            "Name": "open-access",
            "Status": "active",
            "UserNames": [
                "default"
            ],
            "MinimumEngineVersion": "6.2",
            "Clusters": [],
            "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:acl/open-access"
        },
        {
            "Name": my-acl",
            "Status": "active",
            "UserNames": [],
            "MinimumEngineVersion": "6.2",
            "Clusters": [
                "my-cluster"
            ],
            "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxxx:acl/my-acl"
        }
    ]
}
```

For more information, see Authenticating users with Access Control Lists in the *MemoryDB User Guide*.

- For API details, see DescribeAcls in *AWS CLI Command Reference*.

`describe-clusters`

The following code example shows how to use `describe-clusters`.

AWS CLI

To return a list of clusters

The following describe-clusters` returns a list of clusters.

```
aws memorydb describe-clusters
```

Output:

```
{
```

```
    "Clusters": [
        {
                "Name": "my-cluster",
                "Status": "available",
                "NumberOfShards": 2,
                "ClusterEndpoint": {
                    "Address": "clustercfg.my-cluster.llru6f.memorydb.us-
east-1.amazonaws.com",
                    "Port": 6379
                },
                "NodeType": "db.r6g.large",
                "EngineVersion": "6.2",
                "EnginePatchVersion": "6.2.6",
                "ParameterGroupName": "default.memorydb-redis6",
                "ParameterGroupStatus": "in-sync",
                "SecurityGroups": [
                    {
                        "SecurityGroupId": "sg-0a1434xxxxxc9fae",
                        "Status": "active"
                    }
                ],
                "SubnetGroupName": "pat-sg",
                "TLSEnabled": true,
                "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxx:cluster/my-cluster",
                "SnapshotRetentionLimit": 0,
                "MaintenanceWindow": "wed:03:00-wed:04:00",
                "SnapshotWindow": "04:30-05:30",
                "ACLName": "my-acl",
                "AutoMinorVersionUpgrade": true
        }
    ]
}
```

For more information, see Managing clusters in the *MemoryDB User Guide*.

- For API details, see DescribeClusters in *AWS CLI Command Reference*.

`describe-engine-versions`

The following code example shows how to use `describe-engine-versions`.

AWS CLI

To return a list of engine versions

The following describe-engine-versions` returns a list of engine versions.

```
aws memorydb describe-engine-versions
```

Output:

```
{
    "EngineVersions": [
        {
            "EngineVersion": "6.2",
            "EnginePatchVersion": "6.2.6",
            "ParameterGroupFamily": "memorydb_redis6"
        }
    ]
}
```

For more information, see Engine versions and upgrading in the *MemoryDB User Guide*.

- For API details, see DescribeEngineVersions in *AWS CLI Command Reference*.

`describe-events`

The following code example shows how to use `describe-events`.

AWS CLI

To return a list of events

The following describe-events` returns a list of events.

```
aws memorydb describe-events
```

Output:

```
{
    "Events": [
        {
            "SourceName": "my-cluster",
            "SourceType": "cluster",
            "Message": "Increase replica count started for replication group my-
cluster on 2022-07-22T14:09:01.440Z",
            "Date": "2022-07-22T07:09:01.443000-07:00"
```

```
        },
        {
            "SourceName": "my-user",
            "SourceType": "user",
            "Message": "Create user my-user operation completed.",
            "Date": "2022-07-22T07:00:02.975000-07:00"
        }
    ]
}
```

For more information, see Monitoring events in the *MemoryDB User Guide*.

- For API details, see DescribeEvents in *AWS CLI Command Reference*.

`describe-parameter-groups`

The following code example shows how to use `describe-parameter-groups`.

AWS CLI

To return a list of parameter groups

The following describe-parameter-groups` returns a list of parameter groups.

```
aws memorydb describe-parameter-groups
```

Output:

```
{
    "ParameterGroups": [
        {
            "Name": "default.memorydb-redis6",
            "Family": "memorydb_redis6",
            "Description": "Default parameter group for memorydb_redis6",
            "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:parametergroup/
default.memorydb-redis6"
        }
    ]
}
```

For more information, see Configuring engine parameters using parameter groups in the *MemoryDB User Guide*.

- For API details, see DescribeParameterGroups in *AWS CLI Command Reference*.

`describe-parameters`

The following code example shows how to use `describe-parameters`.

AWS CLI

To return a list of parameters

The following describe-parameters` returns a list of parameters.

```
aws memorydb describe-parameters
```

Output:

```
{
    "Parameters": [
        {
            "Name": "acllog-max-len",
            "Value": "128",
            "Description": "The maximum length of the ACL Log",
            "DataType": "integer",
            "AllowedValues": "1-10000",
            "MinimumEngineVersion": "6.2.4"
        },
        {
            "Name": "activedefrag",
            "Value": "no",
            "Description": "Enabled active memory defragmentation",
            "DataType": "string",
            "AllowedValues": "yes,no",
            "MinimumEngineVersion": "6.2.4"
        },
        {
            "Name": "active-defrag-cycle-max",
            "Value": "75",
            "Description": "Maximal effort for defrag in CPU percentage",
            "DataType": "integer",
            "AllowedValues": "1-75",
            "MinimumEngineVersion": "6.2.4"
        },
        {
```

```
            "Name": "active-defrag-cycle-min",
            "Value": "5",
            "Description": "Minimal effort for defrag in CPU percentage",
            "DataType": "integer",
            "AllowedValues": "1-75",
            "MinimumEngineVersion": "6.2.4"
        },
        {
            "Name": "active-defrag-ignore-bytes",
            "Value": "104857600",
            "Description": "Minimum amount of fragmentation waste to start active 
defrag",
            "DataType": "integer",
            "AllowedValues": "1048576-",
            "MinimumEngineVersion": "6.2.4"
        },

`describe-snapshots`

The following code example shows how to use `describe-snapshots`.

AWS CLI

To return a list of snapshots

The following describe-snapshots` returns a list of snapshots.

```
aws memorydb describe-snapshots
```

Output:

```
{
"Snapshots": [
    {
        "Name": "my-cluster-snapshot",
        "Status": "available",
        "Source": "manual",
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx2:snapshot/my-cluster-
snapshot",
        "ClusterConfiguration": {
            "Name": "my-cluster",
            "Description": " ",
            "NodeType": "db.r6g.large",
            "EngineVersion": "6.2",
            "MaintenanceWindow": "wed:03:00-wed:04:00",
            "Port": 6379,
            "ParameterGroupName": "default.memorydb-redis6",
            "SubnetGroupName": "my-sg",
            "VpcId": "vpc-862574fc",
            "SnapshotRetentionLimit": 0,
```

```
                "SnapshotWindow": "04:30-05:30",
                "NumShards": 2
            }
        }
}
```

For more information, see [Snapshot and restore]() in the *MemoryDB User Guide*.

- For API details, see [DescribeSnapshots]() in *AWS CLI Command Reference*.

`describe-subnet-groups`

The following code example shows how to use `describe-subnet-groups`.

AWS CLI

To return a list of subnet groups

The following describe-subnet-groups` returns a list of subnet groups.

```
aws memorydb describe-subnet-groups
```

Output

```
{
    "SubnetGroups": [
        {
            "Name": "my-sg",
            "Description": "pat-sg",
            "VpcId": "vpc-86xxx4fc",
            "Subnets": [
                {
                    "Identifier": "subnet-faxx84a6",
                    "AvailabilityZone": {
                        "Name": "us-east-1b"
                    }
                },
                {
                    "Identifier": "subnet-56xxf61b",
                    "AvailabilityZone": {
                        "Name": "us-east-1a"
                    }
                }
```

```
            ],
            "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxx:subnetgroup/my-sg"
        }
    ]
}
```

For more information, see [Subnets and subnet groups](#) in the *MemoryDB User Guide*.

- For API details, see [DescribeSubnetGroups](#) in *AWS CLI Command Reference*.

`describe-users`

The following code example shows how to use `describe-users`.

AWS CLI

To return a list of users

The following describe-users` returns a list of users.

```
aws memorydb describe-users
```

Output

```
{
    "Users": [
        {
            "Name": "default",
            "Status": "active",
            "AccessString": "on ~* &* +@all",
            "ACLNames": [
                "open-access"
            ],
            "MinimumEngineVersion": "6.0",
            "Authentication": {
                "Type": "no-password"
            },
            "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:user/default"
        },
        {
            "Name": "my-user",
            "Status": "active",
            "AccessString": "off ~objects:* ~items:* ~public:* resetchannels -@all",
```

```
                "ACLNames": [],
                "MinimumEngineVersion": "6.2",
                "Authentication": {
                    "Type": "password",
                    "PasswordCount": 2
                },
                "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:user/my-user"
            }
        ]
}
```

For more information, see Authenticating users with Access Control Lists in the *MemoryDB User Guide*.

- For API details, see DescribeUsers in *AWS CLI Command Reference*.

`failover-shard`

The following code example shows how to use `failover-shard`.

AWS CLI

To fail over a shard

The following failover-shard` fails over a shard.

```
aws memorydb failover-shard \
    --cluster-name my-cluster --shard-name 0001
```

Output:

```
{
    "Cluster": {
        "Name": "my-cluster",
        "Status": "available",
        "NumberOfShards": 2,
        "ClusterEndpoint": {
            "Address": "clustercfg.my-cluster.xxxxxx.memorydb.us-
east-1.amazonaws.com",
            "Port": 6379
        },
        "NodeType": "db.r6g.large",
        "EngineVersion": "6.2",
```

```
            "EnginePatchVersion": "6.2.6",
            "ParameterGroupName": "default.memorydb-redis6",
            "ParameterGroupStatus": "in-sync",
            "SecurityGroups": [
                {
                    "SecurityGroupId": "sg-0a143xxxx45c9fae",
                    "Status": "active"
                }
            ],
            "SubnetGroupName": "my-sg",
            "TLSEnabled": true,
            "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:cluster/my-cluster",
            "SnapshotRetentionLimit": 0,
            "MaintenanceWindow": "wed:03:00-wed:04:00",
            "SnapshotWindow": "04:30-05:30",
            "AutoMinorVersionUpgrade": true
        }
    }
```

For more information, see Minimizing downtime with MultiAZ in the *MemoryDB User Guide*.

- For API details, see FailoverShard in *AWS CLI Command Reference*.

`list-allowed-node-type-updates`

The following code example shows how to use `list-allowed-node-type-updates`.

AWS CLI

To return a list of allowed node type updates

The following list-allowed-node-type-updates returns a list of available node type updates.

```
aws memorydb list-allowed-node-type-updates
```

Output:

```
{
    "Cluster": {
        "Name": "my-cluster",
        "Status": "available",
        "NumberOfShards": 2,
        "ClusterEndpoint": {
```

```
            "Address": "clustercfg.my-cluster.xxxxxx.memorydb.us-
east-1.amazonaws.com",
            "Port": 6379
        },
        "NodeType": "db.r6g.large",
        "EngineVersion": "6.2",
        "EnginePatchVersion": "6.2.6",
        "ParameterGroupName": "default.memorydb-redis6",
        "ParameterGroupStatus": "in-sync",
        "SecurityGroups": [
            {
                "SecurityGroupId": "sg-0a143xxxx45c9fae",
                "Status": "active"
            }
        ],
        "SubnetGroupName": "my-sg",
        "TLSEnabled": true,
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:cluster/my-cluster",
        "SnapshotRetentionLimit": 0,
        "MaintenanceWindow": "wed:03:00-wed:04:00",
        "SnapshotWindow": "04:30-05:30",
        "AutoMinorVersionUpgrade": true
    }
}
```

For more information, see Scaling in the *MemoryDB User Guide*.

- For API details, see ListAllowedNodeTypeUpdates in *AWS CLI Command Reference*.

`list-tags`

The following code example shows how to use `list-tags`.

AWS CLI

To return a list of tags

The following list-tags returns a list of tags.

```
aws memorydb list-tags \
    --resource-arn arn:aws:memorydb:us-east-1:491658xxxxxx:cluster/my-cluster
```

Output:

```
{
    "TagList": [
        {
            "Key": "mytag",
            "Value": "myvalue"
        }
    ]
}
```

For more information, see Tagging resources in the *MemoryDB User Guide*.

- For API details, see ListTags in *AWS CLI Command Reference*.

`reset-parameter-group`

The following code example shows how to use `reset-parameter-group`.

AWS CLI

To reset a parameter group

The following reset-parameter-group` resets a parameter group.

```
aws memorydb reset-parameter-group \
    --parameter-group-name my-parameter-group \
    --all-parameters
```

Output:

```
{
    "ParameterGroup": {
        "Name": "my-parameter-group",
        "Family": "memorydb_redis6",
        "Description": "my parameter group",
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:parametergroup/my-parameter-
group"
    }
}
```

For more information, see Configuring engine parameters using parameter groups in the *MemoryDB User Guide*.

- For API details, see ResetParameterGroup in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a resource

The following tag-resource` adds a tag to a resource.

```
aws memorydb tag-resource \
    --resource-arn arn:aws:memorydb:us-east-1:491658xxxxxx:cluster/my-cluster \
    --tags Key="mykey",Value="myvalue"
```

Output:

```
{
    "TagList": [
        {
            "Key": "mytag",
            "Value": "myvalue"
        },
        {
            "Key": "mykey",
            "Value": "myvalue"
        }
    ]
}
```

For more information, see Tagging resources in the *MemoryDB User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To update an ACL

The following update-acl` updates an ACL by adding a user.

```
aws memorydb untag-resource \
    --resource-arn arn:aws:memorydb:us-east-1:491658xxxxx:cluster/my-cluster \
    --tag-keys mykey
```

Output:

```
{
    "TagList": [
        {
            "Key": "mytag",
            "Value": "myvalue"
        }
    ]
}
```

For more information, see Tagging resources in the *MemoryDB User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-cluster`

The following code example shows how to use `update-cluster`.

AWS CLI

To update a cluster

The following update-cluster`` updates the parameter group of a cluster to my-parameter-group.

```
aws memorydb update-cluster \
    --cluster-name my-cluster \
    --parameter-group-name my-parameter-group
```

Output:

```
{
    "Cluster": {
        "Name": "my-cluster",
```

```
        "Status": "available",
        "NumberOfShards": 2,
        "AvailabilityMode": "MultiAZ",
        "ClusterEndpoint": {
            "Address": "clustercfg.my-cluster.llru6f.memorydb.us-
east-1.amazonaws.com",
            "Port": 6379
        },
        "NodeType": "db.r6g.large",
        "EngineVersion": "6.2",
        "EnginePatchVersion": "6.2.6",
        "ParameterGroupName": "my-parameter-group",
        "ParameterGroupStatus": "in-sync",
        "SecurityGroups": [
            {
                "SecurityGroupId": "sg-0a143xxxxxc9fae",
                "Status": "active"
            }
        ],
        "SubnetGroupName": "pat-sg",
        "TLSEnabled": true,
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:cluster/my-cluster",
        "SnapshotRetentionLimit": 0,
        "MaintenanceWindow": "wed:03:00-wed:04:00",
        "SnapshotWindow": "04:30-05:30",
        "ACLName": "my-acl",
        "AutoMinorVersionUpgrade": true
    }
}
```

For more information, see Modifying a cluster in the *MemoryDB User Guide*.

- For API details, see UpdateCluster in *AWS CLI Command Reference*.

`update-parameter-group`

The following code example shows how to use `update-parameter-group`.

AWS CLI

To update a parameter group

The following update-parameter-group`` updates a parameter group.

```
aws memorydb update-parameter-group \
    --parameter-group-name my-parameter-group \
    --parameter-name-values "ParameterName=activedefrag, ParameterValue=no"
```

Output:

```
{
    "ParameterGroup": {
        "Name": "my-parameter-group",
        "Family": "memorydb_redis6",
        "Description": "my parameter group",
        "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxx:parametergroup/my-parameter-
group"
    }
}
```

For more information, see Modifying a parameter group in the *MemoryDB User Guide*.

- For API details, see UpdateParameterGroup in *AWS CLI Command Reference*.

`update-subnet-group`

The following code example shows how to use `update-subnet-group`.

AWS CLI

To update a subnet group

The following update-subnet-group` updates a subnet group's subnet ID.

```
aws memorydb update-subnet-group \
    --subnet-group-name my-sg \
    --subnet-ids subnet-01f29d458f3xxxxx
```

Output:

```
{
    "SubnetGroup": {
        "Name": "my-sg-1",
        "Description": "my-sg",
        "VpcId": "vpc-09d2cfc01xxxxxxx",
        "Subnets": [
```

```
            {
                "Identifier": "subnet-01f29d458fxxxxxx",
                "AvailabilityZone": {
                    "Name": "us-east-1a"
                }
            }
        ],
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:subnetgroup/my-sg"
    }
}
```

For more information, see [Subnets and subnet groups]() in the *MemoryDB User Guide*.

- For API details, see [UpdateSubnetGroup]() in *AWS CLI Command Reference*.

`update-user`

The following code example shows how to use `update-user`.

AWS CLI

To update a user

The following `update-user` modifies a user's access string.

```
aws memorydb update-user \
    --user-name my-user \
    --access-string "off ~objects:* ~items:* ~public:* resetchannels -@all"
```

Output:

```
{
    "User": {
        "Name": "my-user",
        "Status": "modifying",
        "AccessString": "off ~objects:* ~items:* ~public:* resetchannels -@all",
        "ACLNames": [
            "myt-acl"
        ],
        "MinimumEngineVersion": "6.2",
        "Authentication": {
            "Type": "password",
            "PasswordCount": 2
```

```
        },
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:user/my-user"
    }
}
```

For more information, see Authenticating users with Access Control Lists in the *MemoryDB User Guide*.

- For API details, see UpdateUser in *AWS CLI Command Reference*.

Amazon MSK examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon MSK.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-cluster`

The following code example shows how to use `create-cluster`.

AWS CLI

To create an Amazon MSK cluster

The following `create-cluster` example creates an MSK cluster named `MessagingCluster` with three broker nodes. A JSON file named `brokernodegroupinfo.json` specifies the three subnets over which you want Amazon MSK to distribute the broker nodes. This example doesn't specify the monitoring level, so the cluster gets the `DEFAULT` level.

```
aws kafka create-cluster \
    --cluster-name "MessagingCluster" \
```

```
    --broker-node-group-info file://brokernodegroupinfo.json \
    --kafka-version "2.2.1" \
    --number-of-broker-nodes 3
```

Contents of `brokernodegroupinfo.json`:

```
{
    "InstanceType": "kafka.m5.xlarge",
    "BrokerAZDistribution": "DEFAULT",
    "ClientSubnets": [
        "subnet-0123456789111abcd",
        "subnet-0123456789222abcd",
        "subnet-0123456789333abcd"
    ]
}
```

Output:

```
{
    "ClusterArn": "arn:aws:kafka:us-west-2:123456789012:cluster/MessagingCluster/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2",
    "ClusterName": "MessagingCluster",
    "State": "CREATING"
}
```

For more information, see Create an Amazon MSK Cluster in the *Amazon Managed Streaming for Apache Kafka*.

- For API details, see CreateCluster in *AWS CLI Command Reference*.

`create-configuration`

The following code example shows how to use `create-configuration`.

AWS CLI

To create a custom Amazon MSK configuration

The following `create-configuration` example creates a custom MSK configuration with the server properties that are specified in the input file.

```
aws kafka create-configuration \
```

```
    --name "CustomConfiguration" \
    --description "Topic autocreation enabled; Apache ZooKeeper timeout 2000 ms; Log
 rolling 604800000 ms." \
    --kafka-versions "2.2.1" \
    --server-properties file://configuration.txt
```

Contents of `configuration.txt`:

```
auto.create.topics.enable = true
zookeeper.connection.timeout.ms = 2000
log.roll.ms = 604800000
```

This command produces no output. Output:

```
{
    "Arn": "arn:aws:kafka:us-west-2:123456789012:configuration/CustomConfiguration/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2",
    "CreationTime": "2019-10-09T15:26:05.548Z",
    "LatestRevision":
        {
            "CreationTime": "2019-10-09T15:26:05.548Z",
            "Description": "Topic autocreation enabled; Apache ZooKeeper timeout
 2000 ms; Log rolling 604800000 ms.",
            "Revision": 1
        },
    "Name": "CustomConfiguration"
}
```

For more information, see Amazon MSK Configuration Operations in the *Amazon Managed Streaming for Apache Kafka Developer Guide*.

- For API details, see CreateConfiguration in *AWS CLI Command Reference*.

`describe-cluster`

The following code example shows how to use `describe-cluster`.

AWS CLI

To describe a cluster

The following `describe-cluster` example describes an Amazon MSK cluster.

```
aws kafka describe-cluster \
    --cluster-arn arn:aws:kafka:us-east-1:123456789012:cluster/demo-
cluster-1/6357e0b2-0e6a-4b86-a0b4-70df934c2e31-5
```

Output:

```
{
    "ClusterInfo": {
        "BrokerNodeGroupInfo": {
            "BrokerAZDistribution": "DEFAULT",
            "ClientSubnets": [
                "subnet-cbfff283",
                "subnet-6746046b"
            ],
            "InstanceType": "kafka.m5.large",
            "SecurityGroups": [
                "sg-f839b688"
            ],
            "StorageInfo": {
                "EbsStorageInfo": {
                    "VolumeSize": 100
                }
            }
        },
        "ClusterArn": "arn:aws:kafka:us-east-1:123456789012:cluster/demo-
cluster-1/6357e0b2-0e6a-4b86-a0b4-70df934c2e31-5",
        "ClusterName": "demo-cluster-1",

            },
            "EncryptionInTransit": {
                "ClientBroker": "TLS_PLAINTEXT",
                "InCluster": true
            }
        },
        "EnhancedMonitoring": "DEFAULT",
```

```
        "OpenMonitoring": {
            "Prometheus": {
                "JmxExporter": {
                    "EnabledInBroker": false
                },
                "NodeExporter": {
                    "EnabledInBroker": false
                }
            }
        },
        "NumberOfBrokerNodes": 2,
        "State": "ACTIVE",
        "Tags": {},
        "ZookeeperConnectString": "z-2.demo-cluster-1.xuy0sb.c5.kafka.us-
east-1.amazonaws.com:2181,z-1.demo-cluster-1.xuy0sb.c5.kafka.us-
east-1.amazonaws.com:2181,z-3.demo-cluster-1.xuy0sb.c5.kafka.us-
east-1.amazonaws.com:2181"
    }
}
```

For more information, see Listing Amazon MSK Clusters in the *Amazon Managed Streaming for Apache Kafka Developer Guide*.

- For API details, see DescribeCluster in *AWS CLI Command Reference*.

`get-bootstrap-brokers`

The following code example shows how to use `get-bootstrap-brokers`.

AWS CLI

To get bootstrap brokers

The following `get-bootstrap-brokers` example retrieves the bootstrap broker information for an Amazon MSK cluster.

```
aws kafka get-bootstrap-brokers \
    --cluster-arn arn:aws:kafka:us-east-1:123456789012:cluster/demo-
cluster-1/6357e0b2-0e6a-4b86-a0b4-70df934c2e31-5
```

Output:

```
{
```

```
    "BootstrapBrokerString": "b-1.demo-cluster-1.xuy0sb.c5.kafka.us-
east-1.amazonaws.com:9092,b-2.demo-cluster-1.xuy0sb.c5.kafka.us-
east-1.amazonaws.com:9092",
    "BootstrapBrokerStringTls": "b-1.demo-cluster-1.xuy0sb.c5.kafka.us-
east-1.amazonaws.com:9094,b-2.demo-cluster-1.xuy0sb.c5.kafka.us-
east-1.amazonaws.com:9094"
}
```

For more information, see Getting the Bootstrap Brokers in the *Amazon Managed Streaming for Apache Kafka Developer Guide*.

- For API details, see GetBootstrapBrokers in *AWS CLI Command Reference*.

`list-clusters`

The following code example shows how to use `list-clusters`.

AWS CLI

To list the available clusters

The following `list-clusters` example lists the Amazon MSK clusters in your AWS account.

```
aws kafka list-clusters
```

Output:

```
{
    "ClusterInfoList": [
        {
            "BrokerNodeGroupInfo": {
                "BrokerAZDistribution": "DEFAULT",
                "ClientSubnets": [
                    "subnet-cbfff283",
                    "subnet-6746046b"
                ],
                "InstanceType": "kafka.m5.large",
                "SecurityGroups": [
                    "sg-f839b688"
                ],
                "StorageInfo": {
                    "EbsStorageInfo": {
                        "VolumeSize": 100
```

```
                    }
                }
            },
            "ClusterArn": "arn:aws:kafka:us-east-1:123456789012:cluster/demo-
cluster-1/6357e0b2-0e6a-4b86-a0b4-70df934c2e31-5",
            "ClusterName": "demo-cluster-1",
            "CreationTime": "2020-07-09T02:31:36.223000+00:00",
            "CurrentBrokerSoftwareInfo": {
                "KafkaVersion": "2.2.1"
            },
            "CurrentVersion": "K3AEGXETSR30VB",
            "EncryptionInfo": {
                "EncryptionAtRest": {
                    "DataVolumeKMSKeyId": "arn:aws:kms:us-east-1:123456789012:key/
a7ca56d5-0768-4b64-a670-339a9fbef81c"
                },
                "EncryptionInTransit": {
                    "ClientBroker": "TLS_PLAINTEXT",
                    "InCluster": true
                }
            },
            "EnhancedMonitoring": "DEFAULT",
            "OpenMonitoring": {
                "Prometheus": {
                    "JmxExporter": {
                        "EnabledInBroker": false
                    },
                    "NodeExporter": {
                        "EnabledInBroker": false
                    }
                }
            },
            "NumberOfBrokerNodes": 2,
            "State": "ACTIVE",
            "Tags": {},
            "ZookeeperConnectString": "z-2.demo-cluster-1.xuy0sb.c5.kafka.us-
east-1.amazonaws.com:2181,z-1.demo-cluster-1.xuy0sb.c5.kafka.us-
east-1.amazonaws.com:2181,z-3.demo-cluster-1.xuy0sb.c5.kafka.us-
east-1.amazonaws.com:2181"
        }
    ]
}
```

For more information, see Listing Amazon MSK Clusters in the *Amazon Managed Streaming for Apache Kafka Developer Guide*.

- For API details, see ListClusters in *AWS CLI Command Reference*.

`update-broker-storage`

The following code example shows how to use `update-broker-storage`.

AWS CLI

To update the EBS storage for brokers

The following `update-broker-storage` example updates the amount of EBS storage for all the brokers in the cluster. Amazon MSK sets the target storage amount for each broker to the amount specified in the example. You can get the current version of the cluster by describing the cluster or by listing all of the clusters.

```
aws kafka update-broker-storage \
    --cluster-arn "arn:aws:kafka:us-west-2:123456789012:cluster/MessagingCluster/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2" \
    --current-version "K21V3IB1VIZYYH" \
    --target-broker-ebs-volume-info "KafkaBrokerNodeId=ALL,VolumeSizeGB=1100"
```

The output returns an ARN for this `update-broker-storage` operation. To determine if this operation is complete, use the `describe-cluster-operation` command with this ARN as input.

```
{
    "ClusterArn": "arn:aws:kafka:us-west-2:123456789012:cluster/MessagingCluster/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2",
    "ClusterOperationArn": "arn:aws:kafka:us-west-2:123456789012:cluster-
operation/V123450123/a1b2c3d4-1234-abcd-cdef-22222EXAMPLE-2/a1b2c3d4-abcd-1234-
bcde-33333EXAMPLE"
}
```

For more information, see Update the EBS Storage for Brokers in the *Amazon Managed Streaming for Apache Kafka Developer Guide*.

- For API details, see UpdateBrokerStorage in *AWS CLI Command Reference*.

`update-cluster-configuration`

The following code example shows how to use `update-cluster-configuration`.

AWS CLI

To update the configuration of an Amazon MSK cluster

The following `update-cluster-configuration` example updates the configuration of the specified existing MSK cluster. It uses a custom MSK configuration.

```
aws kafka update-cluster-configuration \
    --cluster-arn "arn:aws:kafka:us-west-2:123456789012:cluster/MessagingCluster/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2" \
    --configuration-info file://configuration-info.json \
    --current-version "K21V3IB1VIZYYH"
```

Contents of `configuration-info.json`:

```
{
    "Arn": "arn:aws:kafka:us-west-2:123456789012:configuration/CustomConfiguration/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2",
    "Revision": 1
}
```

The output returns an ARN for this `update-cluster-configuration` operation. To determine if this operation is complete, use the `describe-cluster-operation` command with this ARN as input.

```
{
    "ClusterArn": "arn:aws:kafka:us-west-2:123456789012:cluster/MessagingCluster/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2",
    "ClusterOperationArn": "arn:aws:kafka:us-west-2:123456789012:cluster-operation/V123450123/a1b2c3d4-1234-abcd-cdef-22222EXAMPLE-2/a1b2c3d4-abcd-1234-bcde-33333EXAMPLE"
}
```

For more information, see Update the Configuration of an Amazon MSK Cluster in the *Amazon Managed Streaming for Apache Kafka Developer Guide*.

- For API details, see UpdateClusterConfiguration in *AWS CLI Command Reference*.

Network Flow Monitor examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Network Flow Monitor.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-monitor`

The following code example shows how to use `create-monitor`.

AWS CLI

To create a monitor

The following `create-monitor` example creates a monitor named demo in the specified account.

```
aws networkflowmonitor create-monitor \
    --monitor-name demo \
    --local-resources type="AWS::EC2::VPC",identifier="arn:aws:ec2:us-east-1:123456789012:vpc/vpc-03ea55eeda25adbb0"  \
    --scope-arn arn:aws:networkflowmonitor:us-east-1:123456789012:scope/e21cda79-30a0-4c12-9299-d8629d76d8cf
```

Output:

```
{
    "monitorArn": "arn:aws:networkflowmonitor:us-east-1:123456789012:monitor/demo",
    "monitorName": "demo",
    "monitorStatus": "ACTIVE",
    "tags": {}
```

```
}
```

For more information, see [Create a monitor in Network Flow Monitor]() in the *Amazon CloudWatch User Guide*.

- For API details, see [CreateMonitor]() in *AWS CLI Command Reference*.

`create-scope`

The following code example shows how to use `create-scope`.

AWS CLI

To create a scope

The following `create-scope` example creates a scope that includes a set of resources for which Network Flow Monitor will generate network traffic metrics.

```
aws networkflowmonitor create-scope \
    --targets '[{"targetIdentifier":{"targetId":
{"accountId":"123456789012"},"targetType":"ACCOUNT"},"region":"us-east-1"}]'
```

Output:

```
{
    "scopeId": "97626f8d-8a21-4b5d-813a-1a0962dd4615",
    "status": "IN_PROGRESS",
    "tags": {}
}
```

For more information, see [Components and features of Network Flow Monitor]() in the *Amazon CloudWatch User Guide*.

- For API details, see [CreateScope]() in *AWS CLI Command Reference*.

`delete-monitor`

The following code example shows how to use `delete-monitor`.

AWS CLI

To delete a monitor

The following `delete-monitor` example deletes a monitor named `demo` in the specified account.

```
aws networkflowmonitor delete-monitor \
    --monitor-name demo
```

This command produces no output.

For more information, see Delete a monitor in Network Flow Monitor in the *Amazon CloudWatch User Guide*.

- For API details, see DeleteMonitor in *AWS CLI Command Reference*.

`delete-scope`

The following code example shows how to use `delete-scope`.

AWS CLI

To delete a scope

The following `delete-scope` example deletes a specified scope.

```
aws networkflowmonitor delete-scope \
    --scope-id fdc20616-6bb4-4242-a24e-a748e65ca7ac
```

This command produces no output.

For more information, see Components and features of Network Flow Monitor in the *Amazon CloudWatch User Guide*.

- For API details, see DeleteScope in *AWS CLI Command Reference*.

`get-monitor`

The following code example shows how to use `get-monitor`.

AWS CLI

To retrieve information about a monitor

The following `get-monitor` example displays information about the monitor named demo in the specified account.

```
aws networkflowmonitor get-monitor \
    --monitor-name Demo
```

Output:

```
{
    "monitorArn": "arn:aws:networkflowmonitor:us-east-1:123456789012:monitor/Demo",
    "monitorName": "Demo",
    "monitorStatus": "ACTIVE",
    "localResources": [
        {
            "type": "AWS::EC2::VPC",
            "identifier": "arn:aws:ec2:us-east-1:123456789012:vpc/
vpc-03ea55eeda25adbb0"
        }
    ],
    "remoteResources": [],
    "createdAt": "2024-12-09T12:21:51.616000-06:00",
    "modifiedAt": "2024-12-09T12:21:55.412000-06:00",
    "tags": {}
}
```

For more information, see Components and features of Network Flow Monitor in the *Amazon CloudWatch User Guide*.

- For API details, see GetMonitor in *AWS CLI Command Reference*.

get-query-results-workload-insights-top-contributors-data

The following code example shows how to use `get-query-results-workload-insights-top-contributors-data`.

AWS CLI

To retrieve the top contributor data on workload insights

The following `get-query-results-workload-insights-top-contributors-data` example returns the data for the specified query.

```
aws networkflowmonitor get-query-results-workload-insights-top-contributors-data \
    --scope-id e21cda79-30a0-4c12-9299-d8629d76d8cf \
    --query-id cc4f4ab3-3103-33b8-80ff-d6597a0c6cea
```

Output:

```
{
    "datapoints": [
        {
            "timestamps": [
                "2024-12-09T19:00:00+00:00",
                "2024-12-09T19:05:00+00:00",
                "2024-12-09T19:10:00+00:00"
            ],
            "values": [
                259943.0,
                194856.0,
                216432.0
            ],
            "label": "use1-az6"
        }
    ],
    "unit": "Bytes"
}
```

For more information, see Evaluate network flows with workload insights in the *Amazon CloudWatch User Guide*.

- For API details, see GetQueryResultsWorkloadInsightsTopContributorsData in *AWS CLI Command Reference*.

`get-query-results-workload-insights-top-contributors`

The following code example shows how to use `get-query-results-workload-insights-top-contributors`.

AWS CLI

To retrieve the top contributors on workload insights

The following `get-query-results-workload-insights-top-contributors` example returns the data for the specified query.

```
aws networkflowmonitor get-query-results-workload-insights-top-contributors \
    --scope-id e21cda79-30a0-4c12-9299-d8629d76d8cf \
    --query-id 1fc423d3-b144-37a6-80e6-e2c7d26eea0c
```

Output:

```
{
    "topContributors": [
        {
            "accountId": "123456789012",
            "localSubnetId": "subnet-0a5b30fb95dca2c14",
            "localAz": "use1-az6",
            "localVpcId": "vpc-03ea55eeda25adbb0",
            "localRegion": "us-east-1",
            "remoteIdentifier": "",
            "value": 908443,
            "localSubnetArn": "arn:aws:ec2:us-east-1:123456789012:subnet/
subnet-0a5b30fb95dca2c14",
            "localVpcArn": "arn:aws:ec2:us-east-1:123456789012:vpc/
vpc-03ea55eeda25adbb0"
        }
    ]
}
```

For more information, see Evaluate network flows with workload insights in the *Amazon CloudWatch User Guide*.

- For API details, see GetQueryResultsWorkloadInsightsTopContributors in *AWS CLI Command Reference*.

`get-query-status-monitor-top-contributors`

The following code example shows how to use `get-query-status-monitor-top-contributors`.

AWS CLI

To retrieve the status of the query

The following `get-query-status-monitor-top-contributors` example displays the current status of the query in the specified account.

```
aws networkflowmonitor get-query-status-monitor-top-contributors \
    --monitor-name Demo \
    --query-id 5398eabd-bc40-3f5f-aba3-bcb639d3c7ca
```

Output:

```
{
    "status": "SUCCEEDED"
}
```

For more information, see Evaluate network flows with workload insights in the *Amazon CloudWatch User Guide*.

- For API details, see GetQueryStatusMonitorTopContributors in *AWS CLI Command Reference*.

`get-query-status-workload-insights-top-contributors-data`

The following code example shows how to use `get-query-status-workload-insights-top-contributors-data`.

AWS CLI

To retrieve the status of the query

The following `get-query-status-workload-insights-top-contributors-data` example displays the current status of the query in the specified account.

```
aws networkflowmonitor get-query-status-workload-insights-top-contributors-data \
    --scope-id e21cda79-30a0-4c12-9299-d8629d76d8cf \
    --query-id 4333754d-8ae1-3f29-b6b7-c36db2e7f8ac
```

Output:

```
{
    "status": "SUCCEEDED"
}
```

For more information, see Evaluate network flows with workload insights in the *Amazon CloudWatch User Guide*.

- For API details, see [GetQueryStatusWorkloadInsightsTopContributorsData]() in *AWS CLI Command Reference*.

`get-query-status-workload-insights-top-contributors`

The following code example shows how to use `get-query-status-workload-insights-top-contributors`.

AWS CLI

To retrieve the status of the query

The following `get-query-status-workload-insights-top-contributors` example displays the current status of the query in the specified account.

```
aws networkflowmonitor get-query-status-workload-insights-top-contributors \
    --scope-id e21cda79-30a0-4c12-9299-d8629d76d8cf \
    --query-id f2a87c70-3e5a-362e-8beb-4747d13d8419
```

Output:

```
{
    "status": "SUCCEEDED"
}
```

For more information, see [Evaluate network flows with workload insights]() in the *Amazon CloudWatch User Guide*.

- For API details, see [GetQueryStatusWorkloadInsightsTopContributors]() in *AWS CLI Command Reference*.

`get-scope`

The following code example shows how to use `get-scope`.

AWS CLI

To retrieve information about a scope

The following `get-scope` example displays information about a scope, such as status, tags, name and target details.

```
aws networkflowmonitor get-scope \
    --scope-id e21cda79-30a0-4c12-9299-d8629d76d8cf
```

Output:

```
{
    "scopeId": "e21cda79-30a0-4c12-9299-d8629d76d8cf",
    "status": "SUCCEEDED",
    "scopeArn": "arn:aws:networkflowmonitor:us-east-1:123456789012:scope/
e21cda79-30a0-4c12-9299-d8629d76d8cf",
    "targets": [
        {
            "targetIdentifier": {
                "targetId": {
                    "accountId": "123456789012"
                },
                "targetType": "ACCOUNT"
            },
            "region": "us-east-1"
        }
    ],
    "tags": {}
}
```

For more information, see Components and features of Network Flow Monitor in the *Amazon CloudWatch User Guide*.

- For API details, see GetScope in *AWS CLI Command Reference*.

`list-monitors`

The following code example shows how to use `list-monitors`.

AWS CLI

To retrieve a list of monitors

The following `list-monitors` example returns returns all the monitors in the specified account.

```
aws networkflowmonitor list-monitors
```

Output:

```
{
    "monitors": [
        {
            "monitorArn": "arn:aws:networkflowmonitor:us-
east-1:123456789012:monitor/Demo",
            "monitorName": "Demo",
            "monitorStatus": "ACTIVE"
        }
    ]
}
```

For more information, see Components and features of Network Flow Monitor in the *Amazon CloudWatch User Guide*.

- For API details, see ListMonitors in *AWS CLI Command Reference*.

`list-scopes`

The following code example shows how to use `list-scopes`.

AWS CLI

To retrieve a list of scopes

The following `list-scopes` example lists all scopes in the specified account.

```
aws networkflowmonitor list-scopes
```

Output:

```
{
    "scopes": [
        {
            "scopeId": "fdc20616-6bb4-4242-a24e-a748e65ca7ac",
            "status": "SUCCEEDED",
            "scopeArn": "arn:aws:networkflowmonitor:us-east-1:123456789012:scope/
fdc20616-6bb4-4242-a24e-a748e65ca7ac"
        }
    ]
```

```
}
```

For more information, see Components and features of Network Flow Monitor in the *Amazon CloudWatch User Guide*.

- For API details, see ListScopes in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags

The following `list-tags-for-resource` example returns all the tags associated with the specified resource.

```
aws networkflowmonitor list-tags-for-resource \
    --resource-arn arn:aws:networkflowmonitor:us-east-1:123456789012:monitor/Demo
```

Output:

```
{
    "tags": {
        "Value": "Production",
        "Key": "stack"
    }
}
```

For more information, see Tagging your Amazon CloudWatch resources in the *Amazon CloudWatch User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`start-query-monitor-top-contributors`

The following code example shows how to use `start-query-monitor-top-contributors`.

AWS CLI

To start a query

The following `start-query-monitor-top-contributors` example starts the query which returns a query ID to retrieve the top contributors.

```
aws networkflowmonitor start-query-monitor-top-contributors \
    --monitor-name Demo \
    --start-time 2024-12-09T19:00:00Z \
    --end-time 2024-12-09T19:15:00Z \
    --metric-name DATA_TRANSFERRED \
    --destination-category UNCLASSIFIED
```

Output:

```
{
    "queryId": "aecd3a88-0283-35b0-a17d-6e944dc8531d"
}
```

For more information, see Evaluate network flows with workload insights in the *Amazon CloudWatch User Guide*.

- For API details, see StartQueryMonitorTopContributors in *AWS CLI Command Reference*.

`start-query-workload-insights-top-contributors-data`

The following code example shows how to use `start-query-workload-insights-top-contributors-data`.

AWS CLI

To start a query

The following `start-query-workload-insights-top-contributors-data` example starts the query which returns a query ID to retrieve the top contributors.

```
aws networkflowmonitor start-query-workload-insights-top-contributors-data \
    --scope-id e21cda79-30a0-4c12-9299-d8629d76d8cf \
    --start-time 2024-12-09T19:00:00Z \
    --end-time 2024-12-09T19:15:00Z \
    --metric-name DATA_TRANSFERRED \
    --destination-category UNCLASSIFIED
```

Output:

```
{
    "queryId": "cc4f4ab3-3103-33b8-80ff-d6597a0c6cea"
}
```

For more information, see [Evaluate network flows with workload insights](#) in the *Amazon CloudWatch User Guide*.

- For API details, see [StartQueryWorkloadInsightsTopContributorsData](#) in *AWS CLI Command Reference*.

`start-query-workload-insights-top-contributors`

The following code example shows how to use `start-query-workload-insights-top-contributors`.

AWS CLI

To start a query

The following `start-query-workload-insights-top-contributors` example starts the query which returns a query ID to retrieve the top contributors.

```
aws networkflowmonitor start-query-workload-insights-top-contributors \
    --scope-id e21cda79-30a0-4c12-9299-d8629d76d8cf \
    --start-time 2024-12-09T19:00:00Z \
    --end-time 2024-12-09T19:15:00Z \
    --metric-name DATA_TRANSFERRED \
    --destination-category UNCLASSIFIED
```

Output:

```
{
    "queryId": "1fc423d3-b144-37a6-80e6-e2c7d26eea0c"
}
```

For more information, see [Evaluate network flows with workload insights](#) in the *Amazon CloudWatch User Guide*.

- For API details, see [StartQueryWorkloadInsightsTopContributors](#) in *AWS CLI Command Reference*.

`stop-query-monitor-top-contributors`

The following code example shows how to use `stop-query-monitor-top-contributors`.

AWS CLI

To stop a query

The following `stop-query-monitor-top-contributors` example stops the query in the specified account.

```
aws networkflowmonitor stop-query-monitor-top-contributors \
    --monitor-name Demo \
    --query-id aecd3a88-0283-35b0-a17d-6e944dc8531d
```

This command produces no output.

For more information, see Evaluate network flows with workload insights in the *Amazon CloudWatch User Guide*.

- For API details, see StopQueryMonitorTopContributors in *AWS CLI Command Reference*.

`stop-query-workload-insights-top-contributors-data`

The following code example shows how to use `stop-query-workload-insights-top-contributors-data`.

AWS CLI

To stop a query

The following `stop-query-workload-insights-top-contributors-data` example stops the query in the specified account.

```
aws networkflowmonitor stop-query-workload-insights-top-contributors-data \
    --scope-id e21cda79-30a0-4c12-9299-d8629d76d8cf \
    --query-id cc4f4ab3-3103-33b8-80ff-d6597a0c6cea
```

This command produces no output.

For more information, see Evaluate network flows with workload insights in the *Amazon CloudWatch User Guide*.

- For API details, see StopQueryWorkloadInsightsTopContributorsData in *AWS CLI Command Reference*.

`stop-query-workload-insights-top-contributors`

The following code example shows how to use `stop-query-workload-insights-top-contributors`.

AWS CLI

To stop a query

The following `stop-query-workload-insights-top-contributors` example stops the query in the specified account.

```
aws networkflowmonitor stop-query-workload-insights-top-contributors \
    --scope-id e21cda79-30a0-4c12-9299-d8629d76d8cf \
    --query-id 1fc423d3-b144-37a6-80e6-e2c7d26eea0c
```

This command produces no output.

For more information, see Evaluate network flows with workload insights in the *Amazon CloudWatch User Guide*.

- For API details, see StopQueryWorkloadInsightsTopContributors in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add a tag to the specified resource

The following `tag-resource` example adds a tag to the monitor in the specified account.

```
aws networkflowmonitor tag-resource \
    --resource-arn arn:aws:networkflowmonitor:us-east-1:123456789012:monitor/Demo \
    --tags Key=stack,Value=Production
```

This command produces no output.

For more information, see Tagging your Amazon CloudWatch resources in the *Amazon CloudWatch User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from the specified resource

The following `untag-resource` example removes a tag from the monitor in the specified account.

```
aws networkflowmonitor untag-resource \
    --resource-arn arn:aws:networkflowmonitor:us-east-1:123456789012:monitor/Demo \
    --tag-keys stack
```

This command produces no output.

For more information, see Tagging your Amazon CloudWatch resources in the *Amazon CloudWatch User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-monitor`

The following code example shows how to use `update-monitor`.

AWS CLI

To update an existing monitor

The following `update-monitor` example updates the monitor named `Demo` in the specified account.

```
aws networkflowmonitor update-monitor \
```

```
    --monitor-name Demo \
    --local-resources-to-add type="AWS::EC2::VPC",identifier="arn:aws:ec2:us-
east-1:123456789012:vpc/vpc-048d08dfbec623f94"
```

Output:

```
{
    "monitorArn": "arn:aws:networkflowmonitor:us-east-1:123456789012:monitor/Demo",
    "monitorName": "Demo",
    "monitorStatus": "ACTIVE",
    "tags": {
        "Value": "Production",
        "Key": "stack"
    }
}
```

For more information, see Components and features of Network Flow Monitor in the *Amazon CloudWatch User Guide*.

- For API details, see UpdateMonitor in *AWS CLI Command Reference*.

Network Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Network Manager.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`associate-customer-gateway`

The following code example shows how to use `associate-customer-gateway`.

AWS CLI

To associate a customer gateway

The following `associate-customer-gateway` example associates customer gateway `cgw-11223344556677889` in the specified global network with device `device-07f6fd08867abc123`.

```
aws networkmanager associate-customer-gateway \
    --customer-gateway-arn arn:aws:ec2:us-west-2:123456789012:customer-gateway/
cgw-11223344556677889  \
    --global-network-id global-network-01231231231231231 \
    --device-id device-07f6fd08867abc123 \
    --region us-west-2
```

Output:

```
{
    "CustomerGatewayAssociation": {
        "CustomerGatewayArn": "arn:aws:ec2:us-west-2:123456789012:customer-gateway/
cgw-11223344556677889",
        "GlobalNetworkId": "global-network-01231231231231231",
        "DeviceId": "device-07f6fd08867abc123",
        "State": "PENDING"
    }
}
```

For more information, see Customer Gateway Associations in the *Transit Gateway Network Manager Guide*.

- For API details, see AssociateCustomerGateway in *AWS CLI Command Reference*.

`associate-link`

The following code example shows how to use `associate-link`.

AWS CLI

To associate a link

The following `associate-link` example associates link `link-11112222aaaabbbb1` with device `device-07f6fd08867abc123`. The link and device are in the specified global network.

```
aws networkmanager associate-link \
    --global-network-id global-network-01231231231231231 \
    --device-id device-07f6fd08867abc123 \
    --link-id link-11112222aaaabbbb1 \
    --region us-west-2
```

Output:

```
{
    "LinkAssociation": {
        "GlobalNetworkId": "global-network-01231231231231231",
        "DeviceId": "device-07f6fd08867abc123",
        "LinkId": "link-11112222aaaabbbb1",
        "LinkAssociationState": "PENDING"
    }
}
```

For more information, see Device and Link Associations in the *Transit Gateway Network Manager Guide*.

- For API details, see AssociateLink in *AWS CLI Command Reference*.

`create-core-network`

The following code example shows how to use `create-core-network`.

AWS CLI

To create a core network

The following `create-core-network` example creates a core network using an optional description and tags within an AWS Cloud WAN global network.

```
aws networkmanager create-core-network \
    --global-network-id global-network-cdef-EXAMPLE22222 \
    --description "Main headquarters location" \
    --tags Key=Name,Value="New York City office"
```

Output:

```
{
```

```
    "CoreNetwork": {
        "GlobalNetworkId": "global-network-cdef-EXAMPLE22222",
        "CoreNetworkId": "core-network-cdef-EXAMPLE33333",
        "CoreNetworkArn": "arn:aws:networkmanager::987654321012:core-network/core-
network-cdef-EXAMPLE33333",
        "Description": "Main headquarters location",
        "CreatedAt": "2022-01-10T19:53:59+00:00",
        "State": "AVAILABLE",
        "Tags": [
            {
                "Key": "Name",
                "Value": "New York City office"
            }
        ]
    }
}
```

For more information, see Global and core networks in the *AWS Cloud WAN User Guide*.

- For API details, see CreateCoreNetwork in *AWS CLI Command Reference*.

`create-device`

The following code example shows how to use `create-device`.

AWS CLI

To create a device

The following `create-device` example creates a device in the specified global network. The device details include a description, the type, vendor, model, and serial number.

```
aws networkmanager create-device
    --global-network-id global-network-01231231231231231 \
    --description "New York office device" \
    --type "office device" \
    --vendor "anycompany" \
    --model "abcabc" \
    --serial-number "1234" \
    --region us-west-2
```

Output:

```
{
    "Device": {
        "DeviceId": "device-07f6fd08867abc123",
        "DeviceArn": "arn:aws:networkmanager::123456789012:device/global-
network-01231231231231231/device-07f6fd08867abc123",
        "GlobalNetworkId": "global-network-01231231231231231",
        "Description": "New York office device",
        "Type": "office device",
        "Vendor": "anycompany",
        "Model": "abcabc",
        "SerialNumber": "1234",
        "CreatedAt": 1575554005.0,
        "State": "PENDING"
    }
}
```

For more information, see Working with Devices in the *Transit Gateway Network Manager Guide*.

- For API details, see CreateDevice in *AWS CLI Command Reference*.

`create-global-network`

The following code example shows how to use `create-global-network`.

AWS CLI

To create a global network

The following `create-global-network` examples creates a new global network. The initial state upon creation is `PENDING`.

```
aws networkmanager create-global-network
```

Output:

```
{
    "GlobalNetwork": {
        "GlobalNetworkId": "global-network-00a77fc0f722dae74",
        "GlobalNetworkArn": "arn:aws:networkmanager::987654321012:global-network/
global-network-00a77fc0f722dae74",
        "CreatedAt": "2022-03-14T20:31:56+00:00",
```

```
            "State": "PENDING"
        }
    }
```

- For API details, see [CreateGlobalNetwork](#) in *AWS CLI Command Reference*.

`create-link`

The following code example shows how to use `create-link`.

AWS CLI

To create a link

The following `create-link` example creates a link in the specified global network. The link includes a description and details about the link type, bandwidth, and provider. The site ID indicates the site to which the link is associated.

```
aws networkmanager create-link \
    --global-network-id global-network-01231231231231231 \
    --description "VPN Link" \
    --type "broadband" \
    --bandwidth UploadSpeed=10,DownloadSpeed=20 \
    --provider "AnyCompany" \
    --site-id site-444555aaabbb11223 \
    --region us-west-2
```

Output:

```
{
    "Link": {
        "LinkId": "link-11112222aaaabbbb1",
        "LinkArn": "arn:aws:networkmanager::123456789012:link/global-
network-01231231231231231/link-11112222aaaabbbb1",
        "GlobalNetworkId": "global-network-01231231231231231",
        "SiteId": "site-444555aaabbb11223",
        "Description": "VPN Link",
        "Type": "broadband",
        "Bandwidth": {
            "UploadSpeed": 10,
            "DownloadSpeed": 20
```

```
        },
        "Provider": "AnyCompany",
        "CreatedAt": 1575555811.0,
        "State": "PENDING"
    }
}
```

For more information, see Working with Links in the *Transit Gateway Network Manager Guide*.

- For API details, see CreateLink in *AWS CLI Command Reference*.

`create-site`

The following code example shows how to use `create-site`.

AWS CLI

To create a site

The following `create-site` example creates a site in the specified global network. The site details include a description and the location information.

```
aws networkmanager create-site \
    --global-network-id global-network-01231231231231231 \
    --description  "New York head office" \
    --location Latitude=40.7128,Longitude=-74.0060 \
    --region us-west-2
```

Output:

```
{
    "Site": {
        "SiteId": "site-444555aaabbb11223",
        "SiteArn": "arn:aws:networkmanager::123456789012:site/global-
network-01231231231231231/site-444555aaabbb11223",
        "GlobalNetworkId": "global-network-01231231231231231",
        "Description": "New York head office",
        "Location": {
            "Latitude": "40.7128",
            "Longitude": "-74.0060"
        },
        "CreatedAt": 1575554300.0,
```

```
            "State": "PENDING"
        }
}
```

For more information, see [Working with Sites](#) in the *Transit Gateway Network Manager Guide*.

- For API details, see [CreateSite](#) in *AWS CLI Command Reference*.

`create-vpc-attachment`

The following code example shows how to use `create-vpc-attachment`.

AWS CLI

To create a VPC attachment

The following `create-vpc-attachment` example creates a VPC attachment with IPv6 support in a core network.

```
aws networkmanager create-vpc-attachment \
    --core-network-id core-network-0fab62fe438d94db6 \
    --vpc-arn arn:aws:ec2:us-east-1:987654321012:vpc/vpc-09f37f69e2786eeb8  \
    --subnet-arns arn:aws:ec2:us-east-1:987654321012:subnet/subnet-04ca4e010857e7bb7
 \
    --Ipv6Support=true
```

Output:

```
{
    "VpcAttachment": {
        "Attachment": {
            "CoreNetworkId": "core-network-0fab62fe438d94db6",
            "AttachmentId": "attachment-05e1da6eba87a06e6",
            "OwnerAccountId": "987654321012",
            "AttachmentType": "VPC",
            "State": "CREATING",
            "EdgeLocation": "us-east-1",
            "ResourceArn": "arn:aws:ec2:us-east-1:987654321012:vpc/
vpc-09f37f69e2786eeb8",
            "Tags": [],
            "CreatedAt": "2022-03-10T20:59:14+00:00",
            "UpdatedAt": "2022-03-10T20:59:14+00:00"
```

```
        },
        "SubnetArns": [
            "arn:aws:ec2:us-east-1:987654321012:subnet/subnet-04ca4e010857e7bb7"
        ],
        "Options": {
            "Ipv6Support": true
        }
    }
}
```

For more information, see Create an attachment in the *Cloud WAN User Guide*.

- For API details, see CreateVpcAttachment in *AWS CLI Command Reference*.

`delete-attachment`

The following code example shows how to use `delete-attachment`.

AWS CLI

To delete an attachment

The following `delete-attachment` example deletes a Connect attachment.

```
aws networkmanager delete-attachment \
    --attachment-id attachment-01feddaeae26ab68c
```

Output:

```
{
    "Attachment": {
        "CoreNetworkId": "core-network-0f4b0a9d5ee7761d1",
        "AttachmentId": "attachment-01feddaeae26ab68c",
        "OwnerAccountId": "987654321012",
        "AttachmentType": "CONNECT",
        "State": "DELETING",
        "EdgeLocation": "us-east-1",
        "ResourceArn": "arn:aws:networkmanager::987654321012:attachment/
attachment-02c3964448fedf5aa",
        "CreatedAt": "2022-03-15T19:18:41+00:00",
        "UpdatedAt": "2022-03-15T19:28:59+00:00"
    }
```

```
}
```

For more information, see Delete attachments in the *Cloud WAN User Guide*.

- For API details, see DeleteAttachment in *AWS CLI Command Reference*.

`delete-bucket-analytics-configuration`

The following code example shows how to use `delete-bucket-analytics-configuration`.

AWS CLI

To delete an analytics configuration for a bucket

The following `delete-bucket-analytics-configuration` example removes the analytics configuration for the specified bucket and ID.

```
aws s3api delete-bucket-analytics-configuration \
    --bucket amzn-s3-demo-bucket \
    --id 1
```

This command produces no output.

- For API details, see DeleteBucketAnalyticsConfiguration in *AWS CLI Command Reference*.

`delete-bucket-metrics-configuration`

The following code example shows how to use `delete-bucket-metrics-configuration`.

AWS CLI

To delete a metrics configuration for a bucket

The following `delete-bucket-metrics-configuration` example removes the metrics configuration for the specified bucket and ID.

```
aws s3api delete-bucket-metrics-configuration \
    --bucket amzn-s3-demo-bucket \
    --id 123
```

This command produces no output.

- For API details, see DeleteBucketMetricsConfiguration in *AWS CLI Command Reference*.

`delete-core-network`

The following code example shows how to use `delete-core-network`.

AWS CLI

To delete a core network

The following `delete-core-network` example deletes a core network from a Cloud WAN global network.

```
aws networkmanager delete-core-network \
    --core-network-id core-network-0fab62fe438d94db6
```

Output:

```
{
    "CoreNetwork": {
        "GlobalNetworkId": "global-network-0d59060f16a73bc41",
        "CoreNetworkId": "core-network-0fab62fe438d94db6",
        "Description": "Main headquarters location",
        "CreatedAt": "2021-12-09T18:31:11+00:00",
        "State": "DELETING",
        "Segments": [
            {
                "Name": "dev",
                "EdgeLocations": [
                    "us-east-1"
                ],
                "SharedSegments": []
            }
        ],
        "Edges": [
            {
                "EdgeLocation": "us-east-1",
                "Asn": 64512,
                "InsideCidrBlocks": []
            }
        ]
    }
```

```
}
```

For more information, see Core networks in the *Cloud WAN User Guide*.

- For API details, see DeleteCoreNetwork in *AWS CLI Command Reference*.

delete-device

The following code example shows how to use `delete-device`.

AWS CLI

To delete a device

The following `delete-device` example deletes the specified device from the specified global network.

```
aws networkmanager delete-device \
    --global-network-id global-network-01231231231231231 \
    --device-id device-07f6fd08867abc123 \
    --region us-west-2
```

Output:

```
{
    "Device": {
        "DeviceId": "device-07f6fd08867abc123",
        "DeviceArn": "arn:aws:networkmanager::123456789012:device/global-
network-01231231231231231/device-07f6fd08867abc123",
        "GlobalNetworkId": "global-network-01231231231231231",
        "Description": "New York office device",
        "Type": "office device",
        "Vendor": "anycompany",
        "Model": "abcabc",
        "SerialNumber": "1234",
        "SiteId": "site-444555aaabbb11223",
        "CreatedAt": 1575554005.0,
        "State": "DELETING"
    }
}
```

For more information, see Working with Devices in the *Transit Gateway Network Manager Guide*.

- For API details, see DeleteDevice in *AWS CLI Command Reference*.

delete-global-network

The following code example shows how to use `delete-global-network`.

AWS CLI

To delete a global network

The following `delete-global-network` example deletes a global network.

```
aws networkmanager delete-global-network \
    --global-network-id global-network-052bedddccb193b6b
```

Output:

```
{
    "GlobalNetwork": {
        "GlobalNetworkId": "global-network-052bedddccb193b6b",
        "GlobalNetworkArn": "arn:aws:networkmanager::987654321012:global-network/
global-network-052bedddccb193b6b",
        "CreatedAt": "2021-12-09T18:19:12+00:00",
        "State": "DELETING"
    }
}
```

- For API details, see DeleteGlobalNetwork in *AWS CLI Command Reference*.

delete-link

The following code example shows how to use `delete-link`.

AWS CLI

To delete a link

The following `delete-link` example deletes the specified link from the specified global network.

```
aws networkmanager delete-link \
```

```
    --global-network-id global-network-01231231231231231  \
    --link-id link-11112222aaaabbbb1 \
    --region us-west-2
```

Output:

```
{
    "Link": {
        "LinkId": "link-11112222aaaabbbb1",
        "LinkArn": "arn:aws:networkmanager::123456789012:link/global-
network-01231231231231231/link-11112222aaaabbbb1",
        "GlobalNetworkId": "global-network-01231231231231231",
        "SiteId": "site-444555aaabbb11223",
        "Description": "VPN Link",
        "Type": "broadband",
        "Bandwidth": {
            "UploadSpeed": 20,
            "DownloadSpeed": 20
        },
        "Provider": "AnyCompany",
        "CreatedAt": 1575555811.0,
        "State": "DELETING"
    }
}
```

For more information, see Working with Links in the *Transit Gateway Network Manager Guide*.

- For API details, see DeleteLink in *AWS CLI Command Reference*.

`delete-public-access-block`

The following code example shows how to use `delete-public-access-block`.

AWS CLI

To delete the block public access configuration for a bucket

The following `delete-public-access-block` example removes the block public access configuration on the specified bucket.

```
aws s3api delete-public-access-block \
    --bucket amzn-s3-demo-bucket
```

This command produces no output.

- For API details, see DeletePublicAccessBlock in *AWS CLI Command Reference*.

`delete-site`

The following code example shows how to use `delete-site`.

AWS CLI

To delete a site

The following `delete-site` example deletes the specified site (`site-444555aaabbb11223`) in the specified global network.

```
aws networkmanager delete-site \
    --global-network-id global-network-01231231231231231  \
    --site-id site-444555aaabbb11223 \
    --region us-west-2
```

Output:

```
{
    "Site": {
        "SiteId": "site-444555aaabbb11223",
        "SiteArn": "arn:aws:networkmanager::123456789012:site/global-
network-01231231231231231/site-444555aaabbb11223",
        "GlobalNetworkId": "global-network-01231231231231231",
        "Description": "New York head office",
        "Location": {
            "Latitude": "40.7128",
            "Longitude": "-74.0060"
        },
        "CreatedAt": 1575554300.0,
        "State": "DELETING"
    }
}
```

For more information, see Working with Sites in the *Transit Gateway Network Manager Guide*.

- For API details, see DeleteSite in *AWS CLI Command Reference*.

`deregister-transit-gateway`

The following code example shows how to use `deregister-transit-gateway`.

AWS CLI

To deregister a transit gateway from a global network

The following `deregister-transit-gateway` example deregisters the specified transit gateway from the specified global network.

```
aws networkmanager deregister-transit-gateway \
    --global-network-id global-network-01231231231231231 \
    --transit-gateway-arn arn:aws:ec2:us-west-2:123456789012:transit-gateway/
tgw-123abc05e04123abc \
    --region us-west-2
```

Output:

```
{
    "TransitGatewayRegistration": {
        "GlobalNetworkId": "global-network-01231231231231231",
        "TransitGatewayArn": "arn:aws:ec2:us-west-2:123456789012:transit-gateway/
tgw-123abc05e04123abc",
        "State": {
            "Code": "DELETING"
        }
    }
}
```

For more information, see Transit Gateway Registrations in the *Transit Gateway Network Manager Guide*.

- For API details, see DeregisterTransitGateway in *AWS CLI Command Reference*.

`describe-global-networks`

The following code example shows how to use `describe-global-networks`.

AWS CLI

To describe your global networks

The following `describe-global-networks` example describes all of your global networks in your account.

```
aws networkmanager describe-global-networks \
    --region us-west-2
```

Output:

```
{
    "GlobalNetworks": [
        {
            "GlobalNetworkId": "global-network-01231231231231231",
            "GlobalNetworkArn": "arn:aws:networkmanager::123456789012:global-
network/global-network-01231231231231231",
            "Description": "Company 1 global network",
            "CreatedAt": 1575553525.0,
            "State": "AVAILABLE"
        }
    ]
}
```

- For API details, see DescribeGlobalNetworks in *AWS CLI Command Reference*.

`disassociate-customer-gateway`

The following code example shows how to use `disassociate-customer-gateway`.

AWS CLI

To disassociate a customer gateway

The following `disassociate-customer-gateway` example disassociates the specified customer gateway (`cgw-11223344556677889`) from the specified global network.

```
aws networkmanager disassociate-customer-gateway \
    --global-network-id global-network-01231231231231231 \
    --customer-gateway-arn arn:aws:ec2:us-west-2:123456789012:customer-gateway/
cgw-11223344556677889 \
    --region us-west-2
```

Output:

```
{
    "CustomerGatewayAssociation": {
        "CustomerGatewayArn": "arn:aws:ec2:us-west-2:123456789012:customer-gateway/
cgw-11223344556677889",
        "GlobalNetworkId": "global-network-01231231231231231",
        "DeviceId": "device-07f6fd08867abc123",
        "State": "DELETING"
    }
}
```

For more information, see [Customer Gateway Associations]() in the *Transit Gateway Network Manager Guide*.

- For API details, see [DisassociateCustomerGateway]() in *AWS CLI Command Reference*.

`disassociate-link`

The following code example shows how to use `disassociate-link`.

AWS CLI

To disassociate a link

The following `disassociate-link` example disassociates the specified link from device `device-07f6fd08867abc123` in the specified global network.

```
aws networkmanager disassociate-link \
    --global-network-id global-network-01231231231231231 \
    --device-id device-07f6fd08867abc123 \
    --link-id link-11112222aaaabbbb1 \
    --region us-west-2
```

Output:

```
{
    "LinkAssociation": {
        "GlobalNetworkId": "global-network-01231231231231231",
        "DeviceId": "device-07f6fd08867abc123",
        "LinkId": "link-11112222aaaabbbb1",
        "LinkAssociationState": "DELETING"
    }
}
```

For more information, see Device and Link Associations in the *Transit Gateway Network Manager Guide*.

- For API details, see DisassociateLink in *AWS CLI Command Reference*.

`get-bucket-analytics-configuration`

The following code example shows how to use `get-bucket-analytics-configuration`.

AWS CLI

To retrieve the analytics configuration for a bucket with a specific ID

The following `get-bucket-analytics-configuration` example displays the analytics configuration for the specified bucket and ID.

```
aws s3api get-bucket-analytics-configuration \
    --bucket amzn-s3-demo-bucket \
    --id 1
```

Output:

```
{
    "AnalyticsConfiguration": {
        "StorageClassAnalysis": {},
        "Id": "1"
    }
}
```

- For API details, see GetBucketAnalyticsConfiguration in *AWS CLI Command Reference*.

`get-bucket-metrics-configuration`

The following code example shows how to use `get-bucket-metrics-configuration`.

AWS CLI

To retrieve the metrics configuration for a bucket with a specific ID

The following `get-bucket-metrics-configuration` example displays the metrics configuration for the specified bucket and ID.

```
aws s3api get-bucket-metrics-configuration \
    --bucket amzn-s3-demo-bucket \
    --id 123
```

Output:

```
{
    "MetricsConfiguration": {
        "Filter": {
            "Prefix": "logs"
        },
        "Id": "123"
    }
}
```

- For API details, see GetBucketMetricsConfiguration in *AWS CLI Command Reference*.

`get-customer-gateway-associations`

The following code example shows how to use `get-customer-gateway-associations`.

AWS CLI

To get your customer gateway associations

The following `get-customer-gateway-associations` example gets the customer gateway associations for the specified global network.

```
aws networkmanager get-customer-gateway-associations \
    --global-network-id global-network-01231231231231231 \
    --region us-west-2
```

Output:

```
{
    "CustomerGatewayAssociations": [
        {
            "CustomerGatewayArn": "arn:aws:ec2:us-west-2:123456789012:customer-
gateway/cgw-11223344556677889",
            "GlobalNetworkId": "global-network-01231231231231231",
            "DeviceId": "device-07f6fd08867abc123",
```

```
            "State": "AVAILABLE"
        }
    ]
}
```

- For API details, see GetCustomerGatewayAssociations in *AWS CLI Command Reference*.

`get-devices`

The following code example shows how to use `get-devices`.

AWS CLI

To get your devices

The following `get-devices` example gets the devices in the specified global network.

```
aws networkmanager get-devices \
    --global-network-id global-network-01231231231231231 \
    --region us-west-2
```

Output:

```
{
    "Devices": [
        {
            "DeviceId": "device-07f6fd08867abc123",
            "DeviceArn": "arn:aws:networkmanager::123456789012:device/global-
network-01231231231231231/device-07f6fd08867abc123",
            "GlobalNetworkId": "global-network-01231231231231231",
            "Description": "NY office device",
            "Type": "office device",
            "Vendor": "anycompany",
            "Model": "abcabc",
            "SerialNumber": "1234",
            "CreatedAt": 1575554005.0,
            "State": "AVAILABLE"
        }
    ]
}
```

- For API details, see GetDevices in *AWS CLI Command Reference*.

get-link-associations

The following code example shows how to use `get-link-associations`.

AWS CLI

To get your link associations

The following `get-link-associations` example gets the link associations in the specified global network.

```
aws networkmanager get-link-associations \
    --global-network-id global-network-01231231231231231 \
    --region us-west-2
```

Output:

```
{
    "LinkAssociations": [
        {
            "GlobalNetworkId": "global-network-01231231231231231",
            "DeviceId": "device-07f6fd08867abc123",
            "LinkId": "link-11112222aaaabbbb1",
            "LinkAssociationState": "AVAILABLE"
        }
    ]
}
```

- For API details, see [GetLinkAssociations](#) in *AWS CLI Command Reference*.

get-links

The following code example shows how to use `get-links`.

AWS CLI

To get your links

The following `get-links` example gets the links in the specified global network.

```
aws networkmanager get-links \
    --global-network-id global-network-01231231231231231 \
```

```
    --region us-west-2
```

Output:

```
{
    "Links": [
        {
            "LinkId": "link-11112222aaaabbbb1",
            "LinkArn": "arn:aws:networkmanager::123456789012:link/global-
network-01231231231231231/link-11112222aaaabbbb1",
            "GlobalNetworkId": "global-network-01231231231231231",
            "SiteId": "site-444555aaabbb11223",
            "Description": "VPN Link",
            "Type": "broadband",
            "Bandwidth": {
                "UploadSpeed": 10,
                "DownloadSpeed": 20
            },
            "Provider": "AnyCompany",
            "CreatedAt": 1575555811.0,
            "State": "AVAILABLE"
        }
    ]
}
```

- For API details, see GetLinks in *AWS CLI Command Reference*.

`get-object-retention`

The following code example shows how to use `get-object-retention`.

AWS CLI

To retrieve the object retention configuration for an object

The following `get-object-retention` example retrieves the object retention configuration for the specified object.

```
aws s3api get-object-retention \
    --bucket amzn-s3-demo-bucket-with-object-lock \
    --key doc1.rtf
```

Output:

```
{
    "Retention": {
        "Mode": "GOVERNANCE",
        "RetainUntilDate": "2025-01-01T00:00:00.000Z"
    }
}
```

- For API details, see GetObjectRetention in *AWS CLI Command Reference*.

`get-public-access-block`

The following code example shows how to use `get-public-access-block`.

AWS CLI

To set or modify the block public access configuration for a bucket

The following `get-public-access-block` example displays the block public access configuration for the specified bucket.

```
aws s3api get-public-access-block --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "PublicAccessBlockConfiguration": {
        "IgnorePublicAcls": true,
        "BlockPublicPolicy": true,
        "BlockPublicAcls": true,
        "RestrictPublicBuckets": true
    }
}
```

- For API details, see GetPublicAccessBlock in *AWS CLI Command Reference*.

`get-sites`

The following code example shows how to use `get-sites`.

AWS CLI

To get your sites

The following `get-sites` example gets the sites in the specified global network.

```
aws networkmanager get-sites \
    --global-network-id global-network-01231231231231231 \
    --region us-west-2
```

Output:

```
{
    "Sites": [
        {
            "SiteId": "site-444555aaabbb11223",
            "SiteArn": "arn:aws:networkmanager::123456789012:site/global-
network-01231231231231231/site-444555aaabbb11223",
            "GlobalNetworkId": "global-network-01231231231231231",
            "Description": "NY head office",
            "Location": {
                "Latitude": "40.7128",
                "Longitude": "-74.0060"
            },
            "CreatedAt": 1575554528.0,
            "State": "AVAILABLE"
        }
    ]
}
```

- For API details, see GetSites in *AWS CLI Command Reference*.

`get-transit-gateway-registrations`

The following code example shows how to use `get-transit-gateway-registrations`.

AWS CLI

To get your transit gateway registrations

The following `get-transit-gateway-registrations` example gets the transit gateways that are registered to the specified global network.

```
aws networkmanager get-transit-gateway-registrations \
    --global-network-id global-network-01231231231231231 \
    --region us-west-2
```

Output:

```
{
    "TransitGatewayRegistrations": [
        {
            "GlobalNetworkId": "global-network-01231231231231231",
            "TransitGatewayArn": "arn:aws:ec2:us-west-2:123456789012:transit-
gateway/tgw-123abc05e04123abc",
            "State": {
                "Code": "AVAILABLE"
            }
        }
    ]
}
```

- For API details, see GetTransitGatewayRegistrations in *AWS CLI Command Reference*.

`get-vpc-attachment`

The following code example shows how to use `get-vpc-attachment`.

AWS CLI

To get a VPC attachment

The following `get-vpc-attachment` example returns information about a VPC attachment.

```
aws networkmanager get-vpc-attachment \
    --attachment-id  attachment-03b7ea450134787da
```

Output:

```
{
    "VpcAttachment": {
        "Attachment": {
            "CoreNetworkId": "core-network-0522de1b226a5d7b3",
            "AttachmentId": "attachment-03b7ea450134787da",
```

```
                "OwnerAccountId": "987654321012",
                "AttachmentType": "VPC",
                "State": "CREATING",
                "EdgeLocation": "us-east-1",
                "ResourceArn": "arn:aws:ec2:us-east-1:987654321012:vpc/vpc-a7c4bbda",
                "Tags": [
                    {
                        "Key": "Name",
                        "Value": "DevVPC"
                    }
                ],
                "CreatedAt": "2022-03-11T17:48:58+00:00",
                "UpdatedAt": "2022-03-11T17:48:58+00:00"
            },
            "SubnetArns": [
                "arn:aws:ec2:us-east-1:987654321012:subnet/subnet-202cde6c",
                "arn:aws:ec2:us-east-1:987654321012:subnet/subnet-e5022dba",
                "arn:aws:ec2:us-east-1:987654321012:subnet/subnet-2387ae02",
                "arn:aws:ec2:us-east-1:987654321012:subnet/subnet-cda9dffc"
            ],
            "Options": {
                "Ipv6Support": false
            }
        }
    }
```

For more information, see Attachments in the *Cloud WAN User Guide*.

- For API details, see GetVpcAttachment in *AWS CLI Command Reference*.

`list-bucket-analytics-configurations`

The following code example shows how to use `list-bucket-analytics-configurations`.

AWS CLI

To retrieve a list of analytics configurations for a bucket

The following `list-bucket-analytics-configurations` retrieves a list of analytics configurations for the specified bucket.

```
aws s3api list-bucket-analytics-configurations \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "AnalyticsConfigurationList": [
        {
            "StorageClassAnalysis": {},
            "Id": "1"
        }
    ],
    "IsTruncated": false
}
```

- For API details, see ListBucketAnalyticsConfigurations in *AWS CLI Command Reference*.

`list-bucket-metrics-configurations`

The following code example shows how to use `list-bucket-metrics-configurations`.

AWS CLI

To retrieve a list of metrics configurations for a bucket

The following `list-bucket-metrics-configurations` example retrieves a list of metrics configurations for the specified bucket.

```
aws s3api list-bucket-metrics-configurations \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "IsTruncated": false,
    "MetricsConfigurationList": [
        {
            "Filter": {
                "Prefix": "logs"
            },
            "Id": "123"
        },
        {
            "Filter": {
```

```
                "Prefix": "tmp"
            },
            "Id": "234"
        }
    ]
}
```

- For API details, see ListBucketMetricsConfigurations in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags for a resource

The following `list-tags-for-resource` example lists the tags for the specified device resource (`device-07f6fd08867abc123`).

```
aws networkmanager list-tags-for-resource \
    --resource-arn arn:aws:networkmanager::123456789012:device/global-
network-01231231231231231/device-07f6fd08867abc123 \
    --region us-west-2
```

Output:

```
{
    "TagList": [
        {
            "Key": "Network",
            "Value": "Northeast"
        }
    ]
}
```

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`put-bucket-metrics-configuration`

The following code example shows how to use `put-bucket-metrics-configuration`.

AWS CLI

To set a metrics configuration for a bucket

The following `put-bucket-metrics-configuration` example sets a metric configuration with ID 123 for the specified bucket.

```
aws s3api put-bucket-metrics-configuration \
    --bucket amzn-s3-demo-bucket \
    --id 123 \
    --metrics-configuration '{"Id": "123", "Filter": {"Prefix": "logs"}}'
```

This command produces no output.

- For API details, see PutBucketMetricsConfiguration in *AWS CLI Command Reference*.

`put-object-retention`

The following code example shows how to use `put-object-retention`.

AWS CLI

To set an object retention configuration for an object

The following `put-object-retention` example sets an object retention configuration for the specified object until 2025-01-01.

```
aws s3api put-object-retention \
    --bucket amzn-s3-demo-bucket-with-object-lock \
    --key doc1.rtf \
    --retention '{ "Mode": "GOVERNANCE", "RetainUntilDate": "2025-01-01T00:00:00" }'
```

This command produces no output.

- For API details, see PutObjectRetention in *AWS CLI Command Reference*.

`put-public-access-block`

The following code example shows how to use `put-public-access-block`.

AWS CLI

To set the block public access configuration for a bucket

The following `put-public-access-block` example sets a restrictive block public access configuration for the specified bucket.

```
aws s3api put-public-access-block \
    --bucket amzn-s3-demo-bucket \
    --public-access-block-
configuration "BlockPublicAcls=true,IgnorePublicAcls=true,BlockPublicPolicy=true,RestrictPub
```

This command produces no output.

- For API details, see PutPublicAccessBlock in *AWS CLI Command Reference*.

`register-transit-gateway`

The following code example shows how to use `register-transit-gateway`.

AWS CLI

To register a transit gateway in a global network

The following `register-transit-gateway` example registers transit gateway `tgw-123abc05e04123abc` in the specified global network.

```
aws networkmanager register-transit-gateway \
    --global-network-id global-network-01231231231231231 \
    --transit-gateway-arn arn:aws:ec2:us-west-2:123456789012:transit-gateway/
tgw-123abc05e04123abc \
    --region us-west-2
```

Output:

```
{
    "TransitGatewayRegistration": {
        "GlobalNetworkId": "global-network-01231231231231231",
        "TransitGatewayArn": "arn:aws:ec2:us-west-2:123456789012:transit-gateway/
tgw-123abc05e04123abc",
        "State": {
            "Code": "PENDING"
        }
    }
}
```

For more information, see Transit Gateway Registrations in the *Transit Gateway Network Manager Guide*.

- For API details, see RegisterTransitGateway in *AWS CLI Command Reference*.

`reject-attachment`

The following code example shows how to use `reject-attachment`.

AWS CLI

To reject an attachment

The following `reject-attachment` example rejects a VPC attachment request.

```
aws networkmanager reject-attachment \
    --attachment-id  attachment-03b7ea450134787da
```

Output:

```
{
    "Attachment": {
        "CoreNetworkId": "core-network-0522de1b226a5d7b3",
        "AttachmentId": "attachment-03b7ea450134787da",
        "OwnerAccountId": "987654321012",
        "AttachmentType": "VPC",
        "State": "AVAILABLE",
        "EdgeLocation": "us-east-1",
        "ResourceArn": "arn:aws:ec2:us-east-1:987654321012:vpc/vpc-a7c4bbda",
        "CreatedAt": "2022-03-11T17:48:58+00:00",
        "UpdatedAt": "2022-03-11T17:51:25+00:00"
    }
}
```

For more information, see Attachment acceptance in the *Cloud WAN User Guide*.

- For API details, see RejectAttachment in *AWS CLI Command Reference*.

`start-route-analysis`

The following code example shows how to use `start-route-analysis`.

AWS CLI

To start route analysis

The following `start-route-analysis` example starts the analysis between a source and destination, including the optional `include-return-path`.

```
aws networkmanager start-route-analysis \
    --global-network-id global-network-00aa0aaa0b0aaa000 \
    --source TransitGatewayAttachmentArn=arn:aws:ec2:us-east-1:503089527312:transit-
gateway-attachment/tgw-attach-0d4a2d491bf68c093,IpAddress=10.0.0.0 \
    --destination TransitGatewayAttachmentArn=arn:aws:ec2:us-
west-1:503089527312:transit-gateway-attachment/tgw-
attach-002577f30bb181742,IpAddress=11.0.0.0 \
    --include-return-path
```

Output:

```
{
    "RouteAnalysis": {
        "GlobalNetworkId": "global-network-00aa0aaa0b0aaa000
        "OwnerAccountId": "1111222233333",
        "RouteAnalysisId": "a1873de1-273c-470c-1a2bc2345678",
        "StartTimestamp": 1695760154.0,
        "Status": "RUNNING",
        "Source": {
            "TransitGatewayAttachmentArn": "arn:aws:ec2:us-
east-1:111122223333:transit-gateway-attachment/tgw-attach-1234567890abcdef0,
            "TransitGatewayArn": "arn:aws:ec2:us-east-1:111122223333:transit-
gateway/tgw-abcdef01234567890",
            "IpAddress": "10.0.0.0"
        },
        "Destination": {
            "TransitGatewayAttachmentArn": "arn:aws:ec2:us-
west-1:555555555555:transit-gateway-attachment/tgw-attach-021345abcdef6789",
            "TransitGatewayArn": "arn:aws:ec2:us-west-1:111122223333:transit-
gateway/tgw-09876543210fedcba0",
            "IpAddress": "11.0.0.0"
        },
        "IncludeReturnPath": true,
        "UseMiddleboxes": false
    }
}
```

For more information, see Route Analyzer in the *AWS Global Networks for Transit Gateways User Guide*.

- For API details, see StartRouteAnalysis in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To apply tags to a resource

The following `tag-resource` example applies the tag `Network=Northeast` to the device `device-07f6fd08867abc123`.

```
aws networkmanager tag-resource \
    --resource-arn arn:aws:networkmanager::123456789012:device/global-
network-01231231231231231/device-07f6fd08867abc123 \
    --tags Key=Network,Value=Northeast \
    --region us-west-2
```

This command produces no output.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a resource

The following `untag-resource` example removes the tag with the key `Network` from the device `device-07f6fd08867abc123`.

```
aws networkmanager untag-resource \
    --resource-arn arn:aws:networkmanager::123456789012:device/global-
network-01231231231231231/device-07f6fd08867abc123 ]
    --tag-keys Network \
    --region us-west-2
```

This command produces no output.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-device`

The following code example shows how to use `update-device`.

AWS CLI

To update a device

The following `update-device` example updates device `device-07f6fd08867abc123` by specifying a site ID for the device.

```
aws networkmanager update-device \
    --global-network-id global-network-01231231231231231 \
    --device-id device-07f6fd08867abc123 \
    --site-id site-444555aaabbb11223 \
    --region us-west-2
```

Output:

```
{
    "Device": {
        "DeviceId": "device-07f6fd08867abc123",
        "DeviceArn": "arn:aws:networkmanager::123456789012:device/global-
network-01231231231231231/device-07f6fd08867abc123",
        "GlobalNetworkId": "global-network-01231231231231231",
        "Description": "NY office device",
        "Type": "Office device",
        "Vendor": "anycompany",
        "Model": "abcabc",
        "SerialNumber": "1234",
        "SiteId": "site-444555aaabbb11223",
        "CreatedAt": 1575554005.0,
        "State": "UPDATING"
    }
}
```

For more information, see Working with Devices in the *Transit Gateway Network Manager Guide*.

- For API details, see UpdateDevice in *AWS CLI Command Reference*.

`update-global-network`

The following code example shows how to use `update-global-network`.

AWS CLI

To update a global network

The following `update-global-network` example updates the description for global network `global-network-01231231231231231`.

```
aws networkmanager update-global-network \
    --global-network-id global-network-01231231231231231 \
    --description "Head offices" \
    --region us-west-2
```

Output:

```
{
    "GlobalNetwork": {
        "GlobalNetworkId": "global-network-01231231231231231",
        "GlobalNetworkArn": "arn:aws:networkmanager::123456789012:global-network/
global-network-01231231231231231",
        "Description": "Head offices",
        "CreatedAt": 1575553525.0,
        "State": "UPDATING"
    }
}
```

For more information, see Global Networks in the *Transit Gateway Network Manager Guide*.

- For API details, see UpdateGlobalNetwork in *AWS CLI Command Reference*.

`update-link`

The following code example shows how to use `update-link`.

AWS CLI

To update a link

The following `update-link` example updates the bandwidth information for link `link-11112222aaaabbbb1`.

```
aws networkmanager update-link \
    --global-network-id global-network-01231231231231231 \
    --link-id link-11112222aaaabbbb1 \
    --bandwidth  UploadSpeed=20,DownloadSpeed=20 \
    --region us-west-2
```

Output:

```
{
    "Link": {
        "LinkId": "link-11112222aaaabbbb1",
        "LinkArn": "arn:aws:networkmanager::123456789012:link/global-
network-01231231231231231/link-11112222aaaabbbb1",
        "GlobalNetworkId": "global-network-01231231231231231",
        "SiteId": "site-444555aaabbb11223",
        "Description": "VPN Link",
        "Type": "broadband",
        "Bandwidth": {
            "UploadSpeed": 20,
            "DownloadSpeed": 20
        },
        "Provider": "AnyCompany",
        "CreatedAt": 1575555811.0,
        "State": "UPDATING"
    }
}
```

For more information, see Working with Links in the *Transit Gateway Network Manager Guide*.

- For API details, see UpdateLink in *AWS CLI Command Reference*.

`update-site`

The following code example shows how to use `update-site`.

AWS CLI

To update a site

The following `update-site` example updates the description for site `site-444555aaabbb11223` in the specified global network.

```
aws networkmanager update-site \
    --global-network-id global-network-01231231231231231 \
    --site-id site-444555aaabbb11223 \
    --description "New York Office site" \
    --region us-west-2
```

Output:

```
{
    "Site": {
        "SiteId": "site-444555aaabbb11223",
        "SiteArn": "arn:aws:networkmanager::123456789012:site/global-
network-01231231231231231/site-444555aaabbb11223",
        "GlobalNetworkId": "global-network-01231231231231231",
        "Description": "New York Office site",
        "Location": {
            "Latitude": "40.7128",
            "Longitude": "-74.0060"
        },
        "CreatedAt": 1575554528.0,
        "State": "UPDATING"
    }
}
```

For more information, see Working with Sites in the *Transit Gateway Network Manager Guide*.

- For API details, see UpdateSite in *AWS CLI Command Reference*.

OpenSearch Service examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with OpenSearch Service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-elasticsearch-domain`

The following code example shows how to use `create-elasticsearch-domain`.

AWS CLI

To create an Amazon Elasticsearch Service domain

The following `create-elasticsearch-domain` command creates a new Amazon Elasticsearch Service domain within a VPC and restricts access to a single user. Amazon ES infers the VPC ID from the specified subnet and security group IDs.

```
aws es create-elasticsearch-domain \
    --domain-name vpc-cli-example \
    --elasticsearch-version 6.2 \
    --elasticsearch-cluster-
config InstanceType=m4.large.elasticsearch,InstanceCount=1 \
    --ebs-options EBSEnabled=true,VolumeType=standard,VolumeSize=10 \
    --access-policies '{"Version":"2012-10-17",        "Statement": [ { "Effect":
 "Allow", "Principal": {"AWS": "arn:aws:iam::123456789012:root" }, "Action":"es:*",
 "Resource": "arn:aws:es:us-west-1:123456789012:domain/vpc-cli-example/*" } ] }' \
    --vpc-options SubnetIds=subnet-1a2a3a4a,SecurityGroupIds=sg-2a3a4a5a
```

Output:

```
{
    "DomainStatus": {
        "ElasticsearchClusterConfig": {
            "DedicatedMasterEnabled": false,
            "InstanceCount": 1,
            "ZoneAwarenessEnabled": false,
            "InstanceType": "m4.large.elasticsearch"
        },
        "DomainId": "123456789012/vpc-cli-example",
        "CognitoOptions": {
            "Enabled": false
        },
        "VPCOptions": {
            "SubnetIds": [
                "subnet-1a2a3a4a"
            ],
```

```
                "VPCId": "vpc-3a4a5a6a",
                "SecurityGroupIds": [
                    "sg-2a3a4a5a"
                ],
                "AvailabilityZones": [
                    "us-west-1c"
                ]
            },
            "Created": true,
            "Deleted": false,
            "EBSOptions": {
                "VolumeSize": 10,
                "VolumeType": "standard",
                "EBSEnabled": true
            },
            "Processing": true,
            "DomainName": "vpc-cli-example",
            "SnapshotOptions": {
                "AutomatedSnapshotStartHour": 0
            },
            "ElasticsearchVersion": "6.2",
            "AccessPolicies": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect\":

\"}]}",
            "AdvancedOptions": {
                "rest.action.multi.allow_explicit_index": "true"
            },
            "EncryptionAtRestOptions": {
                "Enabled": false
            },
            "ARN": "arn:aws:es:us-west-1:123456789012:domain/vpc-cli-example"
    }
}
```

For more information, see Creating and Managing Amazon Elasticsearch Service Domains in the *Amazon Elasticsearch Service Developer Guide*.

- For API details, see CreateElasticsearchDomain in *AWS CLI Command Reference*.

`describe-elasticsearch-domain-config`

The following code example shows how to use `describe-elasticsearch-domain-config`.

AWS CLI

To get domain configuration details

The following `describe-elasticsearch-domain-config` example provides configuration details for a given domain, along with status information for each individual domain component.

```
aws es describe-elasticsearch-domain-config \
    --domain-name cli-example
```

Output:

```
{
    "DomainConfig": {
        "ElasticsearchVersion": {
            "Options": "7.4",
            "Status": {

`describe-elasticsearch-domain`

The following code example shows how to use `describe-elasticsearch-domain`.

AWS CLI

To get details for a single domain

The following `describe-elasticsearch-domain` example provides configuration details for a given domain.

```
aws es describe-elasticsearch-domain \
    --domain-name cli-example
```

Output:

```
{
    "DomainStatus": {
        "DomainId": "123456789012/cli-example",
        "DomainName": "cli-example",
        "ARN": "arn:aws:es:us-east-1:123456789012:domain/cli-example",
        "Created": true,
        "Deleted": false,
        "Endpoint": "search-cli-example-1a2a3a4a5a6a7a8a9a0a.us-
east-1.es.amazonaws.com",
        "Processing": false,
        "UpgradeProcessing": false,
        "ElasticsearchVersion": "7.4",
        "ElasticsearchClusterConfig": {
            "InstanceType": "c5.large.elasticsearch",
            "InstanceCount": 1,
```

```
            "DedicatedMasterEnabled": true,
            "ZoneAwarenessEnabled": false,
            "DedicatedMasterType": "c5.large.elasticsearch",
            "DedicatedMasterCount": 3,
            "WarmEnabled": true,
            "WarmType": "ultrawarm1.medium.elasticsearch",
            "WarmCount": 2
        },
        "EBSOptions": {
            "EBSEnabled": true,
            "VolumeType": "gp2",

`describe-elasticsearch-domains`

The following code example shows how to use `describe-elasticsearch-domains`.

AWS CLI

To get details for one or more domains

The following `describe-elasticsearch-domains` example provides configuration details for one or more domains.

```
aws es describe-elasticsearch-domains \
    --domain-names cli-example-1 cli-example-2
```

Output:

```
{
    "DomainStatusList": [{
            "DomainId": "123456789012/cli-example-1",
            "DomainName": "cli-example-1",
            "ARN": "arn:aws:es:us-east-1:123456789012:domain/cli-example-1",
            "Created": true,
            "Deleted": false,

`describe-reserved-elasticsearch-instances`

The following code example shows how to use `describe-reserved-elasticsearch-instances`.

AWS CLI

To view all reserved instances

The following `describe-elasticsearch-domains` example provides a summary of all instances you have reserved in a region.

```
aws es describe-reserved-elasticsearch-instances
```

Output:

```
{
    "ReservedElasticsearchInstances": [{
        "FixedPrice": 100.0,
        "ReservedElasticsearchInstanceOfferingId":
 "1a2a3a4a5-1a2a-3a4a-5a6a-1a2a3a4a5a6a",
        "ReservationName": "my-reservation",
        "PaymentOption": "PARTIAL_UPFRONT",
        "UsagePrice": 0.0,
        "ReservedElasticsearchInstanceId": "9a8a7a6a-5a4a-3a2a-1a0a-9a8a7a6a5a4a",
        "RecurringCharges": [{
            "RecurringChargeAmount": 0.603,
            "RecurringChargeFrequency": "Hourly"
        }],
        "State": "payment-pending",
        "StartTime": 1522872571.229,
        "ElasticsearchInstanceCount": 3,
        "Duration": 31536000,
        "ElasticsearchInstanceType": "m4.2xlarge.elasticsearch",
        "CurrencyCode": "USD"
    }]
}
```

For more information, see Reserved Instances in the *Amazon Elasticsearch Service Developer Guide*.

- For API details, see DescribeReservedElasticsearchInstances in *AWS CLI Command Reference*.

`list-domain-names`

The following code example shows how to use `list-domain-names`.

AWS CLI

To list all domains

The following `list-domain-names` example provides a quick summary of all domains in the region.

```
aws es list-domain-names
```

Output:

```
{
    "DomainNames": [{
            "DomainName": "cli-example-1"
        },
        {
            "DomainName": "cli-example-2"
        }
    ]
}
```

For more information, see Creating and Managing Amazon Elasticsearch Service Domains in the *Amazon Elasticsearch Service Developer Guide*.

- For API details, see ListDomainNames in *AWS CLI Command Reference*.

Organizations examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Organizations.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

`accept-handshake`

The following code example shows how to use `accept-handshake`.

AWS CLI

To accept a handshake from another account

Bill, the owner of an organization, has previously invited Juan's account to join his organization. The following example shows Juan's account accepting the handshake and thus agreeing to the invitation.

```
aws organizations accept-handshake --handshake-id h-examplehandshakeid111
```

The output shows the following:

```
{
        "Handshake": {
                "Action": "INVITE",
                "Arn": "arn:aws:organizations::111111111111:handshake/o-
exampleorgid/invite/h-examplehandshakeid111",
                "RequestedTimestamp": 1481656459.257,
                "ExpirationTimestamp": 1482952459.257,
                "Id": "h-examplehandshakeid111",
                "Parties": [
                        {
                                "Id": "o-exampleorgid",
                                "Type": "ORGANIZATION"
                        },
                        {
                                "Id": "juan@example.com",
                                "Type": "EMAIL"
                        }
                ],
                "Resources": [
                        {
                                "Resources": [
                                        {
                                                "Type": "MASTER_EMAIL",
                                                "Value": "bill@amazon.com"
                                        },
                                        {
                                                "Type": "MASTER_NAME",
                                                "Value": "Org Master Account"
                                        },
                                        {
                                                "Type": "ORGANIZATION_FEATURE_SET",
```

```
                                                    "Value": "ALL"
                                            }
                                    ],
                                    "Type": "ORGANIZATION",
                                    "Value": "o-exampleorgid"
                            },
                            {
                                    "Type": "EMAIL",
                                    "Value": "juan@example.com"
                            }
                    ],
                    "State": "ACCEPTED"
            }
}
```

- For API details, see AcceptHandshake in *AWS CLI Command Reference*.

`attach-policy`

The following code example shows how to use `attach-policy`.

AWS CLI

To attach a policy to a root, OU, or account

Example 1

The following example shows how to attach a service control policy (SCP) to an OU:

```
aws organizations attach-policy
                --policy-id p-examplepolicyid111
                --target-id ou-examplerootid111-exampleouid111
```

Example 2

The following example shows how to attach a service control policy directly to an account:

```
aws organizations attach-policy
                --policy-id p-examplepolicyid111
                --target-id 333333333333
```

- For API details, see AttachPolicy in *AWS CLI Command Reference*.

`cancel-handshake`

The following code example shows how to use `cancel-handshake`.

AWS CLI

To cancel a handshake sent from another account

Bill previously sent an invitation to Susan's account to join his organization. He changes his mind and decides to cancel the invitation before Susan accepts it. The following example shows Bill's cancellation:

```
aws organizations cancel-handshake --handshake-id h-examplehandshakeid111
```

The output includes a handshake object that shows that the state is now `CANCELED`:

```
{
        "Handshake": {
                "Id": "h-examplehandshakeid111",
                "State":"CANCELED",
                "Action": "INVITE",
                "Arn": "arn:aws:organizations::111111111111:handshake/o-
exampleorgid/invite/h-examplehandshakeid111",
                "Parties": [
                        {
                                "Id": "o-exampleorgid",
                                "Type": "ORGANIZATION"
                        },
                        {
                                "Id": "susan@example.com",
                                "Type": "EMAIL"
                        }
                ],
                "Resources": [
                        {
                                "Type": "ORGANIZATION",
                                "Value": "o-exampleorgid",
                                "Resources": [
                                        {
                                                "Type": "MASTER_EMAIL",
                                                "Value": "bill@example.com"
                                        },
```

```
                                        {
                                                "Type": "MASTER_NAME",
                                                "Value": "Master Account"
                                        },
                                        {
                                                "Type": "ORGANIZATION_FEATURE_SET",
                                                "Value": "CONSOLIDATED_BILLING"
                                        }
                                ]
                        },
                        {
                                "Type": "EMAIL",
                                "Value": "anika@example.com"
                        },
                        {
                                "Type": "NOTES",
                                "Value": "This is a request for Susan's account to
 join Bob's organization."
                        }
                ],
                "RequestedTimestamp": 1.47008383521E9,
                "ExpirationTimestamp": 1.47137983521E9
        }
}
```

- For API details, see CancelHandshake in *AWS CLI Command Reference*.

`create-account`

The following code example shows how to use `create-account`.

AWS CLI

To create a member account that is automatically part of the organization

The following example shows how to create a member account in an organization. The member account is configured with the name Production Account and the email address of susan@example.com. Organizations automatically creates an IAM role using the default name of OrganizationAccountAccessRole because the roleName parameter is not specified. Also, the setting that allows IAM users or roles with sufficient permissions to access account billing data is set to the default value of ALLOW because the IamUserAccessToBilling parameter is not specified. Organizations automatically sends Susan a "Welcome to AWS" email:

```
aws organizations create-account --email susan@example.com --account-
name "Production Account"
```

The output includes a request object that shows that the status is now `IN_PROGRESS`:

```
{
        "CreateAccountStatus": {
                "State": "IN_PROGRESS",
                "Id": "car-examplecreateaccountrequestid111"
        }
}
```

You can later query the current status of the request by providing the Id response value to the describe-create-account-status command as the value for the create-account-request-id parameter.

For more information, see Creating an AWS Account in Your Organization in the *AWS Organizations Users Guide*.

- For API details, see CreateAccount in *AWS CLI Command Reference*.

`create-organization`

The following code example shows how to use `create-organization`.

AWS CLI

Example 1: To create a new organization

Bill wants to create an organization using credentials from account 111111111111.
The following example shows that the account becomes the master account in the new organization. Because he does not specify a features set, the new organization defaults to all features enabled and service control policies are enabled on the root.

```
aws organizations create-organization
```

The output includes an organization object with details about the new organization:

```
{
        "Organization": {
```

```
                "AvailablePolicyTypes": [
                        {
                                "Status": "ENABLED",
                                "Type": "SERVICE_CONTROL_POLICY"
                        }
                ],
                "MasterAccountId": "111111111111",
                "MasterAccountArn": "arn:aws:organizations::111111111111:account/o-
exampleorgid/111111111111",
                "MasterAccountEmail": "bill@example.com",
                "FeatureSet": "ALL",
                "Id": "o-exampleorgid",
                "Arn": "arn:aws:organizations::111111111111:organization/o-
exampleorgid"
        }
}
```

Example 2: To create a new organization with only consolidated billing features enabled

The following example creates an organization that supports only the consolidated billing features:

```
aws organizations create-organization --feature-set CONSOLIDATED_BILLING
```

The output includes an organization object with details about the new organization:

```
{
        "Organization": {
                "Arn": "arn:aws:organizations::111111111111:organization/o-
exampleorgid",
                "AvailablePolicyTypes": [],
                "Id": "o-exampleorgid",
                "MasterAccountArn": "arn:aws:organizations::111111111111:account/o-
exampleorgid/111111111111",
                "MasterAccountEmail": "bill@example.com",
                "MasterAccountId": "111111111111",
                "FeatureSet": "CONSOLIDATED_BILLING"
        }
}
```

For more information, see Creating an Organization in the *AWS Organizations Users Guide*.

- For API details, see CreateOrganization in *AWS CLI Command Reference*.

`create-organizational-unit`

The following code example shows how to use `create-organizational-unit`.

AWS CLI

To create an OU in a root or parent OU

The following example shows how to create an OU that is named AccountingOU:

```
aws organizations create-organizational-unit --parent-id r-examplerootid111 --
name AccountingOU
```

The output includes an organizationalUnit object with details about the new OU:

```
{
        "OrganizationalUnit": {
                "Id": "ou-examplerootid111-exampleouid111",
                "Arn": "arn:aws:organizations::111111111111:ou/o-exampleorgid/ou-
examplerootid111-exampleouid111",
                "Name": "AccountingOU"
        }
}
```

- For API details, see CreateOrganizationalUnit in *AWS CLI Command Reference*.

`create-policy`

The following code example shows how to use `create-policy`.

AWS CLI

Example 1: To create a policy with a text source file for the JSON policy

The following example shows you how to create an service control policy (SCP) named `AllowAllS3Actions`. The policy contents are taken from a file on the local computer called `policy.json`.

```
aws organizations create-policy --content file://policy.json --
name AllowAllS3Actions, --type SERVICE_CONTROL_POLICY --description "Allows
 delegation of all S3 actions"
```

The output includes a policy object with details about the new policy:

```
{
        "Policy": {
                "Content": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect\":
\"Allow\",\"Action\":[\"s3:*\"],\"Resource\":[\"*\"]}]}",
                "PolicySummary": {
                        "Arn": "arn:aws:organizations::o-exampleorgid:policy/
service_control_policy/p-examplepolicyid111",
                        "Description": "Allows delegation of all S3 actions",
                        "Name": "AllowAllS3Actions",
                        "Type":"SERVICE_CONTROL_POLICY"
                }
        }
}
```

Example 2: To create a policy with a JSON policy as a parameter

The following example shows you how to create the same SCP, this time by embedding the policy contents as a JSON string in the parameter. The string must be escaped with backslashes before the double quotes to ensure that they are treated as literals in the parameter, which itself is surrounded by double quotes:

```
aws organizations create-policy --content "{\"Version\":\"2012-10-17\",\"Statement
\":[{\"Effect\":\"Allow\",\"Action\":[\"s3:*\"],\"Resource\":[\"*\"]}]}" --
name AllowAllS3Actions --type SERVICE_CONTROL_POLICY --description "Allows
 delegation of all S3 actions"
```

For more information about creating and using policies in your organization, see Managing Organization Policies in the *AWS Organizations User Guide*.

- For API details, see CreatePolicy in *AWS CLI Command Reference*.

`decline-handshake`

The following code example shows how to use `decline-handshake`.

AWS CLI

To decline a handshake sent from another account

The following example shows that Susan, an admin who is the owner of account 222222222222, declines an invitation to join Bill's organization. The DeclineHandshake operation returns a handshake object, showing that the state is now DECLINED:

```
aws organizations decline-handshake --handshake-id h-examplehandshakeid111
```

The output includes a handshake object that shows the new state of `DECLINED`:

```
{
        "Handshake": {
                "Id": "h-examplehandshakeid111",
                "State": "DECLINED",
                "Resources": [
                        {
                                "Type": "ORGANIZATION",
                                "Value": "o-exampleorgid",
                                "Resources": [
                                        {
                                                "Type": "MASTER_EMAIL",
                                                "Value": "bill@example.com"
                                        },
                                        {
                                                "Type": "MASTER_NAME",
                                                "Value": "Master Account"
                                        }
                                ]
                        },
                        {
                                "Type": "EMAIL",
                                "Value": "susan@example.com"
                        },
                        {
                                "Type": "NOTES",
                                "Value": "This is an invitation to Susan's account
 to join the Bill's organization."
                        }
                ],
                "Parties": [
                        {
                                "Type": "EMAIL",
                                "Id": "susan@example.com"
                        },
                        {
```

```
                                "Type": "ORGANIZATION",
                                "Id": "o-exampleorgid"
                        }
                ],
                "Action": "INVITE",
                "RequestedTimestamp": 1470684478.687,
                "ExpirationTimestamp": 1471980478.687,
                "Arn": "arn:aws:organizations::111111111111:handshake/o-
exampleorgid/invite/h-examplehandshakeid111"
        }
}
```

- For API details, see DeclineHandshake in *AWS CLI Command Reference*.

`delete-organization`

The following code example shows how to use `delete-organization`.

AWS CLI

To delete an organization

The following example shows how to delete an organization. To perform this operation, you must be an admin of the master account in the organization. The example assumes that you previously removed all the member accounts, OUs, and policies from the organization:

```
aws organizations delete-organization
```

- For API details, see DeleteOrganization in *AWS CLI Command Reference*.

`delete-organizational-unit`

The following code example shows how to use `delete-organizational-unit`.

AWS CLI

To delete an OU

The following example shows how to delete an OU. The example assumes that you previously removed all accounts and other OUs from the OU:

```
aws organizations delete-organizational-unit --organizational-unit-id ou-
examplerootid111-exampleouid111
```

- For API details, see DeleteOrganizationalUnit in *AWS CLI Command Reference*.

`delete-policy`

The following code example shows how to use `delete-policy`.

AWS CLI

To delete a policy

The following example shows how to delete a policy from an organization. The example assumes that you previously detached the policy from all entities:

```
aws organizations delete-policy --policy-id p-examplepolicyid111
```

- For API details, see DeletePolicy in *AWS CLI Command Reference*.

`describe-account`

The following code example shows how to use `describe-account`.

AWS CLI

To get the details about an account

The following example shows you how to request details about an account:

```
aws organizations describe-account --account-id 555555555555
```

The output shows an account object with the details about the account:

```
{
        "Account": {
                "Id": "555555555555",
                "Arn": "arn:aws:organizations::111111111111:account/o-
exampleorgid/555555555555",
                "Name": "Beta account",
```

```
                "Email": "anika@example.com",
                "JoinedMethod": "INVITED",
                "JoinedTimeStamp": 1481756563.134,
                "Status": "ACTIVE"
        }
}
```

- For API details, see DescribeAccount in *AWS CLI Command Reference*.

`describe-create-account-status`

The following code example shows how to use `describe-create-account-status`.

AWS CLI

To get the latest status about a request to create an account

The following example shows how to request the latest status for a previous request to create an account in an organization. The specified --request-id comes from the response of the original call to create-account. The account creation request shows by the status field that Organizations successfully completed the creation of the account.

Command:

```
aws organizations describe-create-account-status --create-account-request-id car-
examplecreateaccountrequestid111
```

Output:

```
{
  "CreateAccountStatus": {
    "State": "SUCCEEDED",
    "AccountId": "555555555555",
    "AccountName": "Beta account",
    "RequestedTimestamp": 1470684478.687,
    "CompletedTimestamp": 1470684532.472,
    "Id": "car-examplecreateaccountrequestid111"
  }
}
```

- For API details, see DescribeCreateAccountStatus in *AWS CLI Command Reference*.

`describe-handshake`

The following code example shows how to use `describe-handshake`.

AWS CLI

To get information about a handshake

The following example shows you how to request details about a handshake. The handshake ID comes either from the original call to `InviteAccountToOrganization`, or from a call to `ListHandshakesForAccount` or `ListHandshakesForOrganization`:

```
aws organizations describe-handshake --handshake-id h-examplehandshakeid111
```

The output includes a handshake object that has all the details about the requested handshake:

```
{
        "Handshake": {
                "Id": "h-examplehandshakeid111",
                "State": "OPEN",
                "Resources": [
                        {
                                "Type": "ORGANIZATION",
                                "Value": "o-exampleorgid",
                                "Resources": [
                                        {
                                                "Type": "MASTER_EMAIL",
                                                "Value": "bill@example.com"
                                        },
                                        {
                                                "Type": "MASTER_NAME",
                                                "Value": "Master Account"
                                        }
                                ]
                        },
                        {
                                "Type": "EMAIL",
                                "Value": "anika@example.com"
                        }
                ],
                "Parties": [
                        {
```

```
                                "Type": "ORGANIZATION",
                                "Id": "o-exampleorgid"
                        },
                        {
                                "Type": "EMAIL",
                                "Id": "anika@example.com"
                        }
                ],
                "Action": "INVITE",
                "RequestedTimestamp": 1470158698.046,
                "ExpirationTimestamp": 1471454698.046,
                "Arn": "arn:aws:organizations::111111111111:handshake/o-
exampleorgid/invite/h-examplehandshakeid111"
        }
}
```

- For API details, see DescribeHandshake in *AWS CLI Command Reference*.

`describe-organization`

The following code example shows how to use `describe-organization`.

AWS CLI

To get information about the current organization

The following example shows you how to request details about an organization:

```
aws organizations describe-organization
```

The output includes an organization object that has the details about the organization:

```
{
        "Organization": {
                "MasterAccountArn": "arn:aws:organizations::111111111111:account/o-
exampleorgid/111111111111",
                "MasterAccountEmail": "bill@example.com",
                "MasterAccountId": "111111111111",
                "Id": "o-exampleorgid",
                "FeatureSet": "ALL",
                "Arn": "arn:aws:organizations::111111111111:organization/o-
exampleorgid",
```

```
                "AvailablePolicyTypes": [
                        {
                                "Status": "ENABLED",
                                "Type": "SERVICE_CONTROL_POLICY"
                        }
                ]
        }
}
```

- For API details, see DescribeOrganization in *AWS CLI Command Reference*.

describe-organizational-unit

The following code example shows how to use `describe-organizational-unit`.

AWS CLI

To get information about an OU

The following `describe-organizational-unit` example requests details about an OU.

```
aws organizations describe-organizational-unit \
    --organizational-unit-id ou-examplerootid111-exampleouid111
```

Output:

```
{
    "OrganizationalUnit": {
        "Name": "Accounting Group",
        "Arn": "arn:aws:organizations::123456789012:ou/o-exampleorgid/ou-
examplerootid111-exampleouid111",
        "Id": "ou-examplerootid111-exampleouid111"
    }
}
```

- For API details, see DescribeOrganizationalUnit in *AWS CLI Command Reference*.

describe-policy

The following code example shows how to use `describe-policy`.

AWS CLI

To get information about a policy

The following example shows how to request information about a policy:

```
aws organizations describe-policy --policy-id p-examplepolicyid111
```

The output includes a policy object that contains details about the policy:

```
{
        "Policy": {
                "Content": "{\n  \"Version\": \"2012-10-17\",\n  \"Statement\": [\n
    {\n      \"Effect\": \"Allow\",\n      \"Action\": \"*\",\n      \"Resource\":
 \"*\"\n    }\n  ]\n}",
                "PolicySummary": {
                        "Arn": "arn:aws:organizations::111111111111:policy/o-
exampleorgid/service_control_policy/p-examplepolicyid111",
                        "Type": "SERVICE_CONTROL_POLICY",
                        "Id": "p-examplepolicyid111",
                        "AwsManaged": false,
                        "Name": "AllowAllS3Actions",
                        "Description": "Enables admins to delegate S3 permissions"
                }
        }
}
```

- For API details, see DescribePolicy in *AWS CLI Command Reference*.

`detach-policy`

The following code example shows how to use `detach-policy`.

AWS CLI

To detach a policy from a root, OU, or account

The following example shows how to detach a policy from an OU:

```
aws organizations  detach-policy  --target-id ou-examplerootid111-exampleouid111 --
policy-id p-examplepolicyid111
```

- For API details, see DetachPolicy in *AWS CLI Command Reference*.

`disable-policy-type`

The following code example shows how to use `disable-policy-type`.

AWS CLI

To disable a policy type in a root

The following example shows how to disable the service control policy (SCP) policy type in a root:

```
aws organizations disable-policy-type --root-id r-examplerootid111 --policy-
type SERVICE_CONTROL_POLICY
```

The output shows that the PolicyTypes response element no longer includes SERVICE_CONTROL_POLICY:

```
{
        "Root": {
                "PolicyTypes": [],
                "Name": "Root",
                "Id": "r-examplerootid111",
                "Arn": "arn:aws:organizations::111111111111:root/o-exampleorgid/r-
examplerootid111"
        }
}
```

- For API details, see DisablePolicyType in *AWS CLI Command Reference*.

`enable-all-features`

The following code example shows how to use `enable-all-features`.

AWS CLI

To enable all features in an organization

This example shows the administrator asking all the invited accounts in the organization to approve enabled all features in the organization. AWS Organizations sends an email to the address that is registered with every invited member account asking the owner to approve the change to all features by accepting the handshake that is sent. After all invited member accounts accept the handshake, the organization administrator can finalize the change to all features, and those with appropriate permissions can create policies and apply them to roots, OUs, and accounts:

```
aws organizations enable-all-features
```

The output is a handshake object that is sent to all invited member accounts for approval:

```
{
        "Handshake": {
                "Action": "ENABLE_ALL_FEATURES",
                "Arn":"arn:aws:organizations::111111111111:handshake/o-exampleorgid/
enable_all_features/h-examplehandshakeid111",
                "ExpirationTimestamp":1.483127868609E9,
                "Id":"h-examplehandshakeid111",
                "Parties": [
                        {
                                "id":"o-exampleorgid",
                                "type":"ORGANIZATION"
                        }
                ],
                "requestedTimestamp":1.481831868609E9,
                "resources": [
                        {
                                "type":"ORGANIZATION",
                                "value":"o-exampleorgid"
                        }
                ],
                "state":"REQUESTED"
        }
}
```

- For API details, see EnableAllFeatures in *AWS CLI Command Reference*.

`enable-policy-type`

The following code example shows how to use `enable-policy-type`.

AWS CLI

To enable the use of a policy type in a root

The following example shows how to enable the service control policy (SCP) policy type in a root:

```
aws organizations enable-policy-type --root-id r-examplerootid111 --policy-
type SERVICE_CONTROL_POLICY
```

The output shows a root object with a policyTypes response element showing that SCPs are now enabled:

```
{
        "Root": {
                "PolicyTypes": [
                        {
                                "Status":"ENABLED",
                                "Type":"SERVICE_CONTROL_POLICY"
                        }
                ],
                "Id": "r-examplerootid111",
                "Name": "Root",
                "Arn": "arn:aws:organizations::111111111111:root/o-exampleorgid/r-
examplerootid111"
        }
}
```

- For API details, see EnablePolicyType in *AWS CLI Command Reference*.

`invite-account-to-organization`

The following code example shows how to use `invite-account-to-organization`.

AWS CLI

To invite an account to join an organization

The following example shows the master account owned by bill@example.com inviting the account owned by juan@example.com to join an organization:

```
aws organizations invite-account-to-organization --target '{"Type": "EMAIL", "Id":
 "juan@example.com"}' --notes "This is a request for Juan's account to join Bill's
 organization."
```

The output includes a handshake structure that shows what is sent to the invited account:

```
{
        "Handshake": {
                "Action": "INVITE",
                "Arn": "arn:aws:organizations::111111111111:handshake/o-
exampleorgid/invite/h-examplehandshakeid111",
                "ExpirationTimestamp": 1482952459.257,
                "Id": "h-examplehandshakeid111",
                "Parties": [
                        {
                                "Id": "o-exampleorgid",
                                "Type": "ORGANIZATION"
                        },
                        {
                                "Id": "juan@example.com",
                                "Type": "EMAIL"
                        }
                ],
                "RequestedTimestamp": 1481656459.257,
                "Resources": [
                        {
                                "Resources": [
                                        {
                                                "Type": "MASTER_EMAIL",
                                                "Value": "bill@amazon.com"
                                        },
                                        {
                                                "Type": "MASTER_NAME",
                                                "Value": "Org Master Account"
                                        },
                                        {
                                                "Type": "ORGANIZATION_FEATURE_SET",
                                                "Value": "FULL"
                                        }
                                ],
                                "Type": "ORGANIZATION",
                                "Value": "o-exampleorgid"
                        },
```

```
                        {
                                "Type": "EMAIL",
                                "Value": "juan@example.com"
                        }
                ],
                "State": "OPEN"
        }
}
```

- For API details, see InviteAccountToOrganization in *AWS CLI Command Reference*.

`leave-organization`

The following code example shows how to use `leave-organization`.

AWS CLI

To leave an organization as a member account

The following example shows the administrator of a member account requesting to leave the organization it is currently a member of:

```
aws organizations leave-organization
```

- For API details, see LeaveOrganization in *AWS CLI Command Reference*.

`list-accounts-for-parent`

The following code example shows how to use `list-accounts-for-parent`.

AWS CLI

To retrieve a list of all of the accounts in a specified parent root or OU

The following example shows how to request a list of the accounts in an OU:

```
aws organizations list-accounts-for-parent --parent-id ou-examplerootid111-
exampleouid111
```

The output includes a list of account summary objects.

```
{
```

```
        "Accounts": [
                {
                        "Arn": "arn:aws:organizations::111111111111:account/o-
exampleorgid/333333333333",
                        "JoinedMethod": "INVITED",
                        "JoinedTimestamp": 1481835795.536,
                        "Id": "333333333333",
                        "Name": "Development Account",
                        "Email": "juan@example.com",
                        "Status": "ACTIVE"
                },
                {
                        "Arn": "arn:aws:organizations::111111111111:account/o-
exampleorgid/444444444444",
                        "JoinedMethod": "INVITED",
                        "JoinedTimestamp": 1481835812.143,
                        "Id": "444444444444",
                        "Name": "Test Account",
                        "Email": "anika@example.com",
                        "Status": "ACTIVE"
                }
        ]
}
```

- For API details, see ListAccountsForParent in *AWS CLI Command Reference*.

`list-accounts`

The following code example shows how to use `list-accounts`.

AWS CLI

To retrieve a list of all of the accounts in an organization

The following example shows you how to request a list of the accounts in an organization:

```
aws organizations list-accounts
```

The output includes a list of account summary objects.

```
{
        "Accounts": [
```

```
                {
                        "Arn": "arn:aws:organizations::111111111111:account/o-
exampleorgid/111111111111",
                        "JoinedMethod": "INVITED",
                        "JoinedTimestamp": 1481830215.45,
                        "Id": "111111111111",
                        "Name": "Master Account",
                        "Email": "bill@example.com",
                        "Status": "ACTIVE"
                },
                {
                        "Arn": "arn:aws:organizations::111111111111:account/o-
exampleorgid/222222222222",
                        "JoinedMethod": "INVITED",
                        "JoinedTimestamp": 1481835741.044,
                        "Id": "222222222222",
                        "Name": "Production Account",
                        "Email": "alice@example.com",
                        "Status": "ACTIVE"
                },
                {
                        "Arn": "arn:aws:organizations::111111111111:account/o-
exampleorgid/333333333333",
                        "JoinedMethod": "INVITED",
                        "JoinedTimestamp": 1481835795.536,
                        "Id": "333333333333",
                        "Name": "Development Account",
                        "Email": "juan@example.com",
                        "Status": "ACTIVE"
                },
                {
                        "Arn": "arn:aws:organizations::111111111111:account/o-
exampleorgid/444444444444",
                        "JoinedMethod": "INVITED",
                        "JoinedTimestamp": 1481835812.143,
                        "Id": "444444444444",
                        "Name": "Test Account",
                        "Email": "anika@example.com",
                        "Status": "ACTIVE"
                }
        ]
}
```

- For API details, see ListAccounts in *AWS CLI Command Reference*.

`list-children`

The following code example shows how to use `list-children`.

AWS CLI

To retrieve the child accounts and OUs of a parent OU or root

The following example you how to list the root or OU that contains that account 444444444444:

```
aws organizations list-children --child-type ORGANIZATIONAL_UNIT --parent-id ou-
examplerootid111-exampleouid111
```

The output shows the two child OUs that are contained by the parent:

```
{
        "Children": [
                {
                        "Id": "ou-examplerootid111-exampleouid111",
                        "Type":"ORGANIZATIONAL_UNIT"
                },
                {
                        "Id":"ou-examplerootid111-exampleouid222",
                        "Type":"ORGANIZATIONAL_UNIT"
                }
        ]
}
```

- For API details, see ListChildren in *AWS CLI Command Reference*.

`list-create-account-status`

The following code example shows how to use `list-create-account-status`.

AWS CLI

Example 1: To retrieve a list of the account creation requests made in the current organization

The following example shows how to request a list of account creation requests for an organization that have completed successfully:

```
aws organizations list-create-account-status --states SUCCEEDED
```

The output includes an array of objects with information about each request.

```
{
        "CreateAccountStatuses": [
                {
                        "AccountId": "444444444444",
                        "AccountName": "Developer Test Account",
                        "CompletedTimeStamp": 1481835812.143,
                        "Id": "car-examplecreateaccountrequestid111",
                        "RequestedTimeStamp": 1481829432.531,
                        "State": "SUCCEEDED"
                }
        ]
}
```

Example 2: To retrieve a list of the in progress account creation requests made in the current organization

The following example gets a list of in-progress account creation requests for an organization:

```
aws organizations list-create-account-status --states IN_PROGRESS
```

The output includes an array of objects with information about each request.

```
{
        "CreateAccountStatuses": [
                {
                  "State": "IN_PROGRESS",
                  "Id": "car-examplecreateaccountrequestid111",
                  "RequestedTimeStamp": 1481829432.531,
                  "AccountName": "Production Account"
                }
        ]
}
```

- For API details, see ListCreateAccountStatus in *AWS CLI Command Reference*.

`list-handshakes-for-account`

The following code example shows how to use `list-handshakes-for-account`.

AWS CLI

To retrieve a list of the handshakes sent to an account

The following example shows how to get a list of all handshakes that are associated with the account of the credentials that were used to call the operation:

```
aws organizations list-handshakes-for-account
```

The output includes a list of handshake structures with information about each handshake including its current state:

```
{
        "Handshake": {
                "Action": "INVITE",
                "Arn": "arn:aws:organizations::111111111111:handshake/o-
exampleorgid/invite/h-examplehandshakeid111",
                "ExpirationTimestamp": 1482952459.257,
                "Id": "h-examplehandshakeid111",
                "Parties": [
                        {
                                "Id": "o-exampleorgid",
                                "Type": "ORGANIZATION"
                        },
                        {
                                "Id": "juan@example.com",
                                "Type": "EMAIL"
                        }
                ],
                "RequestedTimestamp": 1481656459.257,
                "Resources": [
                        {
                                "Resources": [
                                        {
                                                "Type": "MASTER_EMAIL",
                                                "Value": "bill@amazon.com"
                                        },
                                        {
                                                "Type": "MASTER_NAME",
```

```
                                                        "Value": "Org Master Account"
                                                },
                                                {
                                                        "Type": "ORGANIZATION_FEATURE_SET",
                                                        "Value": "FULL"
                                                }
                                        ],
                                        "Type": "ORGANIZATION",
                                        "Value": "o-exampleorgid"
                                },
                                {
                                        "Type": "EMAIL",
                                        "Value": "juan@example.com"
                                }
                        ],
                        "State": "OPEN"
        }
}
```

- For API details, see ListHandshakesForAccount in *AWS CLI Command Reference*.

`list-handshakes-for-organization`

The following code example shows how to use `list-handshakes-for-organization`.

AWS CLI

To retrieve a list of the handshakes associated with an organization

The following example shows how to get a list of handshakes that are associated with the current organization:

```
aws organizations list-handshakes-for-organization
```

The output shows two handshakes. The first one is an invitation to Juan's account and shows a state of OPEN. The second is an invitation to Anika's account and shows a state of ACCEPTED:

```
{
        "Handshakes": [
                {
                        "Action": "INVITE",
```

```
                        "Arn": "arn:aws:organizations::111111111111:handshake/o-
exampleorgid/invite/h-examplehandshakeid111",
                        "ExpirationTimestamp": 1482952459.257,
                        "Id": "h-examplehandshakeid111",
                        "Parties": [
                                {
                                        "Id": "o-exampleorgid",
                                        "Type": "ORGANIZATION"
                                },
                                {
                                        "Id": "juan@example.com",
                                        "Type": "EMAIL"
                                }
                        ],
                        "RequestedTimestamp": 1481656459.257,
                        "Resources": [
                                {
                                        "Resources": [
                                                {
                                                        "Type": "MASTER_EMAIL",
                                                        "Value": "bill@amazon.com"
                                                },
                                                {
                                                        "Type": "MASTER_NAME",
                                                        "Value": "Org Master
 Account"
                                                },
                                                {
                                                        "Type":
 "ORGANIZATION_FEATURE_SET",
                                                        "Value": "FULL"
                                                }
                                        ],
                                        "Type": "ORGANIZATION",
                                        "Value": "o-exampleorgid"
                                },
                                {
                                        "Type": "EMAIL",
                                        "Value": "juan@example.com"
                                },
                                {
                                        "Type":"NOTES",
                                        "Value":"This is an invitation to Juan's
 account to join Bill's organization."
```

```
                                }
                        ],
                        "State": "OPEN"
                },
                {
                        "Action": "INVITE",

                        "RequestedTimestamp": 1.469205437427E9,
                        "Resources": [
                                {
                                        "Resources": [
                                                {
                                                        "Type":"MASTER_EMAIL",
                                                        "Value":"bill@example.com"
                                                },
                                                {
                                                        "Type":"MASTER_NAME",
                                                        "Value":"Master Account"
                                                }
                                        ],
                                        "Type":"ORGANIZATION",
                                        "Value":"o-exampleorgid"
                                },
                                {
                                        "Type":"EMAIL",
                                        "Value":"anika@example.com"
                                },
                                {
                                        "Type":"NOTES",
```

```
                                        "Value":"This is an invitation to Anika's
 account to join Bill's organization."
                                }
                        ]
                }
        ]
}
```

- For API details, see [ListHandshakesForOrganization]() in *AWS CLI Command Reference*.

`list-organizational-units-for-parent`

The following code example shows how to use `list-organizational-units-for-parent`.

AWS CLI

To retrieve a list of the OUs in a parent OU or root

The following example shows you how to get a list of OUs in a specified root:

```
aws organizations list-organizational-units-for-parent --parent-id r-
examplerootid111
```

The output shows that the specified root contains two OUs and shows details of each:

```
{
        "OrganizationalUnits": [
                {
                        "Name": "AccountingDepartment",
                        "Arn": "arn:aws:organizations::o-exampleorgid:ou/r-
examplerootid111/ou-examplerootid111-exampleouid111"
                },
                {
                        "Name": "ProductionDepartment",
                        "Arn": "arn:aws:organizations::o-exampleorgid:ou/r-
examplerootid111/ou-examplerootid111-exampleouid222"
                }
        ]
}
```

- For API details, see [ListOrganizationalUnitsForParent]() in *AWS CLI Command Reference*.

`list-parents`

The following code example shows how to use `list-parents`.

AWS CLI

To list the parent OUs or roots for an account or child OU

The following example you how to list the root or parent OU that contains that account 444444444444:

```
aws organizations list-parents --child-id 444444444444
```

The output shows that the specified account is in the OU with specified ID:

```
{
  "Parents": [
        {
          "Id": "ou-examplerootid111-exampleouid111",
          "Type": "ORGANIZATIONAL_UNIT"
        }
  ]
}
```

- For API details, see ListParents in *AWS CLI Command Reference*.

`list-policies-for-target`

The following code example shows how to use `list-policies-for-target`.

AWS CLI

To retrieve a list of the SCPs attached directly to an account

The following example shows how to get a list of all service control policies (SCPs), as specified by the Filter parameter, that are directly attached to an account:

```
aws organizations list-policies-for-target --filter SERVICE_CONTROL_POLICY --target-id 444444444444
```

The output includes a list of policy structures with summary information about the policies. The list does not include policies that apply to the account because of inheritance from its location in an OU hierarchy:

```
{
        "Policies": [
                {
                        "Type": "SERVICE_CONTROL_POLICY",
                        "Name": "AllowAllEC2Actions",
                        "AwsManaged", false,
                        "Id": "p-examplepolicyid222",
                        "Arn": "arn:aws:organizations::o-exampleorgid:policy/
service_control_policy/p-examplepolicyid222",
                        "Description": "Enables account admins to delegate
 permissions for any EC2 actions to users and roles in their accounts."
                }
        ]
}
```

- For API details, see ListPoliciesForTarget in *AWS CLI Command Reference*.

`list-policies`

The following code example shows how to use `list-policies`.

AWS CLI

To retrieve a list of all policies in an organization of a certain type

The following example shows you how to get a list of SCPs, as specified by the filter parameter:

```
aws organizations list-policies --filter SERVICE_CONTROL_POLICY
```

The output includes a list of policies with summary information:

```
{
        "Policies": [
                {
                        "Type": "SERVICE_CONTROL_POLICY",
                        "Name": "AllowAllS3Actions",
                        "AwsManaged": false,
                        "Id": "p-examplepolicyid111",
```

```
                        "Arn": "arn:aws:organizations::111111111111:policy/
service_control_policy/p-examplepolicyid111",
                        "Description": "Enables account admins to delegate
 permissions for any S3 actions to users and roles in their accounts."
                },
                {
                        "Type": "SERVICE_CONTROL_POLICY",
                        "Name": "AllowAllEC2Actions",
                        "AwsManaged": false,
                        "Id": "p-examplepolicyid222",
                        "Arn": "arn:aws:organizations::111111111111:policy/
service_control_policy/p-examplepolicyid222",
                        "Description": "Enables account admins to delegate
 permissions for any EC2 actions to users and roles in their accounts."
                },
                {
                        "AwsManaged": true,
                        "Description": "Allows access to every operation",
                        "Type": "SERVICE_CONTROL_POLICY",
                        "Id": "p-FullAWSAccess",
                        "Arn": "arn:aws:organizations::aws:policy/
service_control_policy/p-FullAWSAccess",
                        "Name": "FullAWSAccess"
                }
        ]
}
```

- For API details, see ListPolicies in *AWS CLI Command Reference*.

`list-roots`

The following code example shows how to use `list-roots`.

AWS CLI

To retrieve a list of the roots in an organization

This example shows you how to get the list of roots for an organization:

```
aws organizations list-roots
```

The output includes a list of root structures with summary information:

```
{
        "Roots": [
                {
                        "Name": "Root",
                        "Arn": "arn:aws:organizations::111111111111:root/o-
exampleorgid/r-examplerootid111",
                        "Id": "r-examplerootid111",
                        "PolicyTypes": [
                                {
                                        "Status":"ENABLED",
                                        "Type":"SERVICE_CONTROL_POLICY"
                                }
                        ]
                }
        ]
}
```

- For API details, see ListRoots in *AWS CLI Command Reference*.

`list-targets-for-policy`

The following code example shows how to use `list-targets-for-policy`.

AWS CLI

To retrieve a list of the roots, OUs, and accounts that a policy is attached to

The following example shows how to get a list of the roots, OUs, and accounts that the specified policy is attached to:

```
aws organizations list-targets-for-policy --policy-id p-FullAWSAccess
```

The output includes a list of attachment objects with summary information about the roots, OUs, and accounts the policy is attached to:

```
{
        "Targets": [
                {
                        "Arn": "arn:aws:organizations::111111111111:root/o-
exampleorgid/r-examplerootid111",
                        "Name": "Root",
```

```
                        "TargetId":"r-examplerootid111",
                        "Type":"ROOT"
                },
                {
                        "Arn": "arn:aws:organizations::111111111111:account/o-
exampleorgid/333333333333;",
                        "Name": "Developer Test Account",
                        "TargetId": "333333333333",
                        "Type": "ACCOUNT"
                },
                {
                        "Arn":"arn:aws:organizations::111111111111:ou/o-
exampleorgid/ou-examplerootid111-exampleouid111",
                        "Name":"Accounting",
                        "TargetId":"ou-examplerootid111-exampleouid111",
                        "Type":"ORGANIZATIONAL_UNIT"
                }
        ]
}
```

- For API details, see ListTargetsForPolicy in *AWS CLI Command Reference*.

`move-account`

The following code example shows how to use `move-account`.

AWS CLI

To move an account between roots or OUs

The following example shows you how to move the master account in the organization from the root to an OU:

```
aws organizations move-account --account-id 333333333333 --source-parent-id r-
examplerootid111 --destination-parent-id ou-examplerootid111-exampleouid111
```

- For API details, see MoveAccount in *AWS CLI Command Reference*.

`remove-account-from-organization`

The following code example shows how to use `remove-account-from-organization`.

AWS CLI

To remove an account from an organization as the master account

The following example shows you how to remove an account from an organization:

```
aws organizations remove-account-from-organization --account-id 333333333333
```

- For API details, see RemoveAccountFromOrganization in *AWS CLI Command Reference*.

update-organizational-unit

The following code example shows how to use `update-organizational-unit`.

AWS CLI

To rename an OU

This example shows you how to rename an OU: In this example, the OU is renamed "AccountingOU":

```
aws organizations update-organizational-unit --organizational-unit-id ou-
examplerootid111-exampleouid111 --name AccountingOU
```

The output shows the new name:

```
{
        "OrganizationalUnit": {
                "Id": "ou-examplerootid111-exampleouid111"
                "Name": "AccountingOU",
                "Arn": "arn:aws:organizations::111111111111:ou/o-exampleorgid/ou-
examplerootid111-exampleouid111""
        }
}
```

- For API details, see UpdateOrganizationalUnit in *AWS CLI Command Reference*.

update-policy

The following code example shows how to use `update-policy`.

AWS CLI

Example 1: To rename a policy

The following `update-policy` example renames a policy and gives it a new description.

```
aws organizations update-policy \
    --policy-id p-examplepolicyid111 \
    --name Renamed-Policy \
    --description "This description replaces the original."
```

The output shows the new name and description.

```
{
    "Policy": {
        "Content": "{\n  \"Version\":\"2012-10-17\",\n  \"Statement\":{\n
  \"Effect\":\"Allow\",\n    \"Action\":\"ec2:*\",\n    \"Resource\":\"*\"\n
  }\n}\n",
        "PolicySummary": {
            "Id": "p-examplepolicyid111",
            "AwsManaged": false,
            "Arn":"arn:aws:organizations::111111111111:policy/o-exampleorgid/
service_control_policy/p-examplepolicyid111",
            "Description": "This description replaces the original.",
            "Name": "Renamed-Policy",
            "Type": "SERVICE_CONTROL_POLICY"
        }
    }
}
```

Example 2: To replace a policy's JSON text content

The following example shows you how to replace the JSON text of the SCP in the previous example with a new JSON policy text string that allows S3 instead of EC2:

```
aws organizations update-policy \
    --policy-id p-examplepolicyid111 \
    --content "{\"Version\":\"2012-10-17\",\"Statement\":{\"Effect\":\"Allow\",
\"Action\":\"s3:*\",\"Resource\":\"*\"}}"
```

The output shows the new content:

```
{
    "Policy": {
        "Content": "{ \"Version\": \"2012-10-17\", \"Statement\": { \"Effect\":
 \"Allow\", \"Action\": \"s3:*\", \"Resource\": \"*\" } }",
        "PolicySummary": {
            "Arn": "arn:aws:organizations::111111111111:policy/o-exampleorgid/
service_control_policy/p-examplepolicyid111",
            "AwsManaged": false;
            "Description": "This description replaces the original.",
            "Id": "p-examplepolicyid111",
            "Name": "Renamed-Policy",
            "Type": "SERVICE_CONTROL_POLICY"
        }
    }
}
```

- For API details, see UpdatePolicy in *AWS CLI Command Reference*.

AWS Outposts examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Outposts.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Actions

`get-outpost-instance-types`

The following code example shows how to use `get-outpost-instance-types`.

AWS CLI

To get the instance types on your Outpost

The following `get-outpost-instance-types` example gets the instance types for the specified Outpost.

```
aws outposts get-outpost-instance-types \
    --outpost-id op-0ab23c4567EXAMPLE
```

Output:

```
{
    "InstanceTypes": [
        {
            "InstanceType": "c5d.large"
        },
        {
            "InstanceType": "i3en.24xlarge"
        },
        {
            "InstanceType": "m5d.large"
        },
        {
            "InstanceType": "r5d.large"
        }
    ],
    "OutpostId": "op-0ab23c4567EXAMPLE",
    "OutpostArn": "arn:aws:outposts:us-west-2:123456789012:outpost/
op-0ab23c4567EXAMPLE"
}
```

For more information, see Launch an instance on your Outpost in the *AWS Outposts User Guide*.

- For API details, see GetOutpostInstanceTypes in *AWS CLI Command Reference*.

get-outpost

The following code example shows how to use `get-outpost`.

AWS CLI

To get Outpost details

The following `get-outpost` example displays the details for the specified Outpost.

```
aws outposts get-outpost \
```

```
    --outpost-id op-0ab23c4567EXAMPLE
```

Output:

```
{
    "Outpost": {
        "OutpostId": "op-0ab23c4567EXAMPLE",
        "OwnerId": "123456789012",
        "OutpostArn": "arn:aws:outposts:us-west-2:123456789012:outpost/
op-0ab23c4567EXAMPLE",
        "SiteId": "os-0ab12c3456EXAMPLE",
        "Name": "EXAMPLE",
        "LifeCycleStatus": "ACTIVE",
        "AvailabilityZone": "us-west-2a",
        "AvailabilityZoneId": "usw2-az1",
        "Tags": {}
    }
}
```

For more information, see Working with Outposts in the *AWS Outposts User Guide*.

- For API details, see GetOutpost in *AWS CLI Command Reference*.

`list-outposts`

The following code example shows how to use `list-outposts`.

AWS CLI

To list Outposts

The following `list-outposts` example lists the Outposts in your AWS account.

```
aws outposts list-outposts
```

Output:

```
{
    "Outposts": [
        {
            "OutpostId": "op-0ab23c4567EXAMPLE",
```

```
            "OwnerId": "123456789012",
            "OutpostArn": "arn:aws:outposts:us-west-2:123456789012:outpost/
op-0ab23c4567EXAMPLE",
            "SiteId": "os-0ab12c3456EXAMPLE",
            "Name": "EXAMPLE",
            "Description": "example",
            "LifeCycleStatus": "ACTIVE",
            "AvailabilityZone": "us-west-2a",
            "AvailabilityZoneId": "usw2-az1",
            "Tags": {
                "Name": "EXAMPLE"
            }
        },
        {
            "OutpostId": "op-4fe3dc21baEXAMPLE",
            "OwnerId": "123456789012",
            "OutpostArn": "arn:aws:outposts:us-west-2:123456789012:outpost/
op-4fe3dc21baEXAMPLE",
            "SiteId": "os-0ab12c3456EXAMPLE",
            "Name": "EXAMPLE2",
            "LifeCycleStatus": "ACTIVE",
            "AvailabilityZone": "us-west-2a",
            "AvailabilityZoneId": "usw2-az1",
            "Tags": {}
        }
    ]
}
```

For more information, see Working with Outposts in the *AWS Outposts User Guide*.

- For API details, see ListOutposts in *AWS CLI Command Reference*.

`list-sites`

The following code example shows how to use `list-sites`.

AWS CLI

To list sites

The following `list-sites` example lists the available Outpost sites in your AWS account.

```
aws outposts list-sites
```

Output:

```
{
    "Sites": [
        {
            "SiteId": "os-0ab12c3456EXAMPLE",
            "AccountId": "123456789012",
            "Name": "EXAMPLE",
            "Description": "example",
            "Tags": {}
        }
    ]
}
```

For more information, see Working with Outposts in the *AWS Outposts User Guide*.

- For API details, see ListSites in *AWS CLI Command Reference*.

AWS Payment Cryptography examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Payment Cryptography.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

`create-alias`

The following code example shows how to use `create-alias`.

AWS CLI

To create an alias for a key

The following `create-alias` example creates an alias for a key.

```
aws payment-cryptography create-alias \
    --alias-name alias/sampleAlias1 \
    --key-arn arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h
```

Output:

```
{
    "Alias": {
        "AliasName": "alias/sampleAlias1",
        "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h"
    }
}
```

For more information, see About aliases in the *AWS Payment Cryptography User Guide*.

- For API details, see CreateAlias in *AWS CLI Command Reference*.

create-key

The following code example shows how to use `create-key`.

AWS CLI

To create a key

The following `create-key` example generates a 2KEY TDES key you can use to generate and verify CVV/CVV2 values.

```
aws payment-cryptography create-key \
    --exportable \
    --key-
attributes KeyAlgorithm=TDES_2KEY, KeyUsage=TR31_C0_CARD_VERIFICATION_KEY,KeyClass=SYMMETRIC
```

Output:

```
{
    "Key": {
        "CreateTimestamp": "1686800690",
```

```
        "Enabled": true,
        "Exportable": true,
        "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h",
        "KeyAttributes": {
            "KeyAlgorithm": "TDES_2KEY",
            "KeyClass": "SYMMETRIC_KEY",
            "KeyModesOfUse": {
                "Decrypt": false,
                "DeriveKey": false,
                "Encrypt": false,
                "Generate": true,
                "NoRestrictions": false,
                "Sign": false,
                "Unwrap": false,
                "Verify": true,
                "Wrap": false
            },
            "KeyUsage": "TR31_C0_CARD_VERIFICATION_KEY"
        },
        "KeyCheckValue": "F2E50F",
        "KeyCheckValueAlgorithm": "ANSI_X9_24",
        "KeyOrigin": "AWS_PAYMENT_CRYPTOGRAPHY",
        "KeyState": "CREATE_COMPLETE",
        "UsageStartTimestamp": "1686800690"
    }
}
```

For more information, see Generating keys in the *AWS Payment Cryptography User Guide*.

- For API details, see CreateKey in *AWS CLI Command Reference*.

`delete-alias`

The following code example shows how to use `delete-alias`.

AWS CLI

To delete an alias

The following `delete-alias` example deletes an alias. It does not affect the key.

```
aws payment-cryptography delete-alias \
```

```
    --alias-name alias/sampleAlias1
```

This command produces no output.

For more information, see About aliases in the *AWS Payment Cryptography User Guide*.

- For API details, see DeleteAlias in *AWS CLI Command Reference*.

`delete-key`

The following code example shows how to use `delete-key`.

AWS CLI

To delete a key

The following `delete-key` example schedules a key for deletion after 7 days, which is the default waiting period.

```
aws payment-cryptography delete-key \
    --key-identifier arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h
```

Output:

```
{
    "Key": {
        "CreateTimestamp": "1686801198",
        "DeletePendingTimestamp": "1687405998",
        "Enabled": true,
        "Exportable": true,
        "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h",
        "KeyAttributes": {
            "KeyAlgorithm": "TDES_2KEY",
            "KeyClass": "SYMMETRIC_KEY",
            "KeyModesOfUse": {
                "Decrypt": false,
                "DeriveKey": false,
                "Encrypt": false,
                "Generate": true,
                "NoRestrictions": false,
                "Sign": false,
```

```
                "Unwrap": false,
                "Verify": true,
                "Wrap": false
            },
            "KeyUsage": "TR31_C0_CARD_VERIFICATION_KEY"
        },
        "KeyCheckValue": "F2E50F",
        "KeyCheckValueAlgorithm": "ANSI_X9_24",
        "KeyOrigin": "AWS_PAYMENT_CRYPTOGRAPHY",
        "KeyState": "DELETE_PENDING",
        "UsageStartTimestamp": "1686801190"
    }
}
```

For more information, see Deleting keys in the *AWS Payment Cryptography User Guide*.

- For API details, see DeleteKey in *AWS CLI Command Reference*.

`export-key`

The following code example shows how to use `export-key`.

AWS CLI

To export a key

The following `export-key` example exports a key.

```
aws payment-cryptography export-key \
    --export-key-identifier arn:aws:payment-cryptography:us-west-2:123456789012:key/lco3w6agsk7zgu2l \
    --key-material '{"Tr34KeyBlock": { \
        "CertificateAuthorityPublicKeyIdentifier": "arn:aws:payment-cryptography:us-west-2:123456789012:key/ftobshq7pvioc5fx", \
        "ExportToken": "export-token-cu4lg26ofcziixny", \
        "KeyBlockFormat": "X9_TR34_2012", \
        "WrappingKeyCertificate": file://wrapping-key-certificate.pem }}'
```

Contents of `wrapping-key-certificate.pem`:

```
LS0tLS1CRUdJTiBDRVJUSUZJQ0FURS0tLS0tCk1JSUV2VENDQXFXZ0F3SUJBZ0lSQU1ZZS8xMXFUK2svVzlRUDJQOElV
```

Output:

```
{
    "WrappedKey": {
        "KeyMaterial":
 "308205A106092A864886F70D010702A08205923082058E020101310D300B06096086480165030402013082031F
        "WrappedKeyMaterialFormat": "TR34_KEY_BLOCK"
    }
}
```

For more information, see Export keys in the *AWS Payment Cryptography User Guide*.

- For API details, see ExportKey in *AWS CLI Command Reference*.

`get-alias`

The following code example shows how to use `get-alias`.

AWS CLI

To get an alias

The following `get-alias` example returns the ARN of the key associated with the alias.

```
aws payment-cryptography get-alias \
    --alias-name alias/sampleAlias1
```

Output:

```
{
    "Alias": {
        "AliasName": "alias/sampleAlias1",
        "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h"
    }
}
```

For more information, see About aliases in the *AWS Payment Cryptography User Guide*.

- For API details, see GetAlias in *AWS CLI Command Reference*.

`get-key`

The following code example shows how to use `get-key`.

AWS CLI

To get the metadata of a key

The following `get-key` example returns the metadata of the key associated with the alias. This operation does not return cryptographic material.

```
aws payment-cryptography get-key \
    --key-identifier alias/sampleAlias1
```

Output:

```
{
    "Key": {
        "CreateTimestamp": "1686800690",
        "DeletePendingTimestamp": "1687405998",
        "Enabled": true,
        "Exportable": true,
        "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h",
        "KeyAttributes": {
            "KeyAlgorithm": "TDES_2KEY",
            "KeyClass": "SYMMETRIC_KEY",
            "KeyModesOfUse": {
                "Decrypt": false,
                "DeriveKey": false,
                "Encrypt": false,
                "Generate": true,
                "NoRestrictions": false,
                "Sign": false,
                "Unwrap": false,
                "Verify": true,
                "Wrap": false
            },
            "KeyUsage": "TR31_C0_CARD_VERIFICATION_KEY"
        },
        "KeyCheckValue": "F2E50F",
        "KeyCheckValueAlgorithm": "ANSI_X9_24",
        "KeyOrigin": "AWS_PAYMENT_CRYPTOGRAPHY",
        "KeyState": "DELETE_PENDING",
        "UsageStartTimestamp": "1686801190"
    }
}
```

For more information, see Get keys in the *AWS Payment Cryptography User Guide*.

- For API details, see GetKey in *AWS CLI Command Reference*.

`get-parameters-for-export`

The following code example shows how to use `get-parameters-for-export`.

AWS CLI

To initialize the export process

The following `get-parameters-for-export` example generates a key pair, signs the key, and then returns the certificate and certificate root.

```
aws payment-cryptography get-parameters-for-export \
    --signing-key-algorithm RSA_2048 \
    --key-material-type TR34_KEY_BLOCK
```

Output:

```
{
    "ExportToken": "export-token-ep5cwyzune7oya53",
    "ParametersValidUntilTimestamp": "1687415640",
    "SigningKeyAlgorithm": "RSA_2048",
    "SigningKeyCertificate":

`get-parameters-for-import`

The following code example shows how to use `get-parameters-for-import`.

AWS CLI

To initialize the import process

The following `get-parameters-for-import` example generates a key pair, signs the key, and then returns the certificate and certificate root.

```
aws payment-cryptography get-parameters-for-import \
    --key-material-type TR34_KEY_BLOCK \
    --wrapping-key-algorithm RSA_2048
```

Output:

```
{
    "ImportToken": "import-token-qgmafpaa7nt2kfbb",
    "ParametersValidUntilTimestamp": "1687415640",
    "WrappingKeyAlgorithm": "RSA_2048",

`get-public-key-certificate`

The following code example shows how to use `get-public-key-certificate`.

AWS CLI

To return the public key

The following `get-public-key-certificate` example returns the public key portion of a key pair.

```
aws payment-cryptography get-public-key-certificate \
    --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h
```

Output:

```
{

For more information, see Get the public key/certificate associated with a key pair in the *AWS Payment Cryptography User Guide*.

- For API details, see GetPublicKeyCertificate in *AWS CLI Command Reference*.

`import-key`

The following code example shows how to use `import-key`.

AWS CLI

To import a TR-34 key

The following `import-key` example imports a TR-34 key.

```
aws payment-cryptography import-key \
        --key-material='{ "Tr34KeyBlock": {" \
            CertificateAuthorityPublicKeyIdentifier": "arn:aws:payment-
cryptography:us-west-2:123456789012:key/rmm5wn2q564njnjm", \
            "ImportToken": "import-token-5ott6ho5nts7bbcg", \
            "KeyBlockFormat": "X9_TR34_2012", \
            "SigningKeyCertificate": file://signing-key-certificate.pem, \
            "WrappedKeyBlock": file://wrapped-key-block.pem }}'
```

Contents of `signing-key-certificate.pem`:

```
LS0tLS1CRUdJTiBDRVJUSUZJQ0FURS0tLS0tCk1JSUV2RENDQXFTZ0F3SUJBZ0lRYWVCK25IbE1WZU1PR1ZiNjU1Q2Jz
```

Contents of `wrapped-key-block.pem`:

```
3082059806092A864886F70D010702A082058930820585020101310D300B06096086480165030402013082031606
```

Output:

```
{
    "Key": {
        "CreateTimestamp": "2023-06-09T16:56:27.621000-07:00",

    }
}
```

For more information, see Import keys in the *AWS Payment Cryptography User Guide*.

- For API details, see ImportKey in *AWS CLI Command Reference*.

`list-aliases`

The following code example shows how to use `list-aliases`.

AWS CLI

To get a list of aliases

The following `list-aliases` example shows all of the aliases in your account in this Region.

```
aws payment-cryptography list-aliases
```

Output:

```
{
    "Aliases": [
        {
            "AliasName": "alias/sampleAlias1",
            "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h"
        },
        {
```

```
            "AliasName": "alias/sampleAlias2",
            "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h"
        }
    ]
}
```

For more information, see [About aliases](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [ListAliases](#) in *AWS CLI Command Reference*.

`list-keys`

The following code example shows how to use `list-keys`.

AWS CLI

To get a list of keys

The following `list-keys` example shows all of the keys in your account in this Region.

```
aws payment-cryptography list-keys
```

Output:

```
{
    "Keys": [
    {
        "CreateTimestamp": "1666506840",
        "Enabled": false,
        "Exportable": true,
        "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h",
        "KeyAttributes": {
            "KeyAlgorithm": "TDES_3KEY",
            "KeyClass": "SYMMETRIC_KEY",
            "KeyModesOfUse": {
                "Decrypt": true,
                "DeriveKey": false,
                "Encrypt": true,
                "Generate": false,
                "NoRestrictions": false,
                "Sign": false,
```

```
                "Unwrap": true,
                "Verify": false,
                "Wrap": true
            },
            "KeyUsage": "TR31_P1_PIN_GENERATION_KEY"
        },
        "KeyCheckValue": "369D",
        "KeyCheckValueAlgorithm": "ANSI_X9_24",
        "KeyOrigin": "AWS_PAYMENT_CRYPTOGRAPHY",
        "KeyState": "CREATE_COMPLETE",
        "UsageStopTimestamp": "1666938840"
    }
    ]
}
```

For more information, see List keys in the *AWS Payment Cryptography User Guide*.

- For API details, see ListKeys in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To get the list of tags for a key

The following `list-tags-for-resource` example gets the tags for a key.

```
aws payment-cryptography list-tags-for-resource \
    --resource-arn arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h
```

Output:

```
{
    "Tags": [
        {
            "Key": "BIN",
            "Value": "20151120"
        },
        {
            "Key": "Project",
```

```
                "Value": "Production"
            }
        ]
}
```

For more information, see [Managing key tags with API operations](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

`restore-key`

The following code example shows how to use `restore-key`.

AWS CLI

To restore a key that is scheduled for deletion

The following `restore-key` example cancels the deletion of a key.

```
aws payment-cryptography restore-key \
    --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h
```

Output:

```
{
    "Key": {
        "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h",
        "KeyAttributes": {
            "KeyUsage": "TR31_V2_VISA_PIN_VERIFICATION_KEY",
            "KeyClass": "SYMMETRIC_KEY",
            "KeyAlgorithm": "TDES_3KEY",
            "KeyModesOfUse": {
                "Encrypt": false,
                "Decrypt": false,
                "Wrap": false,
                "Unwrap": false,
                "Generate": true,
                "Sign": false,
                "Verify": true,
```

```
                "DeriveKey": false,
                "NoRestrictions": false
            }
        },
        "KeyCheckValue": "",
        "KeyCheckValueAlgorithm": "ANSI_X9_24",
        "Enabled": false,
        "Exportable": true,
        "KeyState": "CREATE_COMPLETE",
        "KeyOrigin": "AWS_PAYMENT_CRYPTOGRAPHY",
        "CreateTimestamp": "1686800690",
        "UsageStopTimestamp": "1687405998"
    }
}
```

For more information, see Deleting keys in the *AWS Payment Cryptography User Guide*.

- For API details, see RestoreKey in *AWS CLI Command Reference*.

`start-key-usage`

The following code example shows how to use `start-key-usage`.

AWS CLI

To enable a key

The following `start-key-usage` example enables a key to be used.

```
aws payment-cryptography start-key-usage \
    --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h
```

Output:

```
{
    "Key": {
        "CreateTimestamp": "1686800690",
        "Enabled": true,
        "Exportable": true,
        "KeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/
alsuwfxug3pgy6xh",
        "KeyAttributes": {
```

```
                "KeyAlgorithm": "TDES_3KEY",
                "KeyClass": "SYMMETRIC_KEY",
                "KeyModesOfUse": {
                    "Decrypt": true,
                    "DeriveKey": false,
                    "Encrypt": true,
                    "Generate": false,
                    "NoRestrictions": false,
                    "Sign": false,
                    "Unwrap": true,
                    "Verify": false,
                    "Wrap": true
                },
                "KeyUsage": "TR31_P1_PIN_GENERATION_KEY"
            },
            "KeyCheckValue": "369D",
            "KeyCheckValueAlgorithm": "ANSI_X9_24",
            "KeyOrigin": "AWS_PAYMENT_CRYPTOGRAPHY",
            "KeyState": "CREATE_COMPLETE",
            "UsageStartTimestamp": "1686800690"
        }
}
```

For more information, see Enabling and disabling keys in the *AWS Payment Cryptography User Guide*.

- For API details, see StartKeyUsage in *AWS CLI Command Reference*.

stop-key-usage

The following code example shows how to use `stop-key-usage`.

AWS CLI

To disable a key

The following `stop-key-usage` example disables a key.

```
aws payment-cryptography stop-key-usage \
    --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h
```

Output:

```
{
    "Key": {
        "CreateTimestamp": "1686800690",
        "Enabled": true,
        "Exportable": true,
        "KeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/
alsuwfxug3pgy6xh",
        "KeyAttributes": {
            "KeyAlgorithm": "TDES_3KEY",
            "KeyClass": "SYMMETRIC_KEY",

        "KeyOrigin": "AWS_PAYMENT_CRYPTOGRAPHY",
        "KeyState": "CREATE_COMPLETE",
        "UsageStartTimestamp": "1686800690"
    }
}
```

For more information, see Enabling and disabling keys in the *AWS Payment Cryptography User Guide*.

- For API details, see StopKeyUsage in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a key

The following `tag-resource` example tags a key.

```
aws payment-cryptography tag-resource \
    --resource-arn arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h \
    --tags Key=sampleTag,Value=sampleValue
```

This command produces no output.

For more information, see Managing key tags in the *AWS Payment Cryptography User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a key

The following `untag-resource` example removes a tag from a key.

```
aws payment-cryptography untag-resource \
    --resource-arn arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h \
    --tag-keys sampleTag
```

This command produces no output.

For more information, see Managing key tags in the *AWS Payment Cryptography User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

update-alias

The following code example shows how to use `update-alias`.

AWS CLI

To update an alias

The following `update-alias` example associates the alias with a different key.

```
aws payment-cryptography update-alias \
    --alias-name alias/sampleAlias1 \
    --key-arn arn:aws:payment-cryptography:us-east-2:123456789012:key/
tqv5yij6wtxx64pi
```

Output:

```
{
    "Alias": {
        "AliasName": "alias/sampleAlias1",
        "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
tqv5yij6wtxx64pi "
    }
}
```

For more information, see About aliases in the *AWS Payment Cryptography User Guide*.

- For API details, see UpdateAlias in *AWS CLI Command Reference*.

AWS Payment Cryptography Data Plane examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Payment Cryptography Data Plane.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`decrypt-data`

The following code example shows how to use `decrypt-data`.

AWS CLI

To decrypt ciphertext

The following `decrypt-data` example decrypts ciphertext data using a symmetric key. For this operation, the key must have `KeyModesOfUse` set to `Decrypt` and `KeyUsage` set to `TR31_D0_SYMMETRIC_DATA_ENCRYPTION_KEY`.

```
aws payment-cryptography-data decrypt-data \
    --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h \
    --cipher-text 33612AB9D6929C3A828EB6030082B2BD \
    --decryption-attributes 'Symmetric={Mode=CBC}'
```

Output:

```
{
    "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h",
    "KeyCheckValue": "71D7AE",
    "PlainText": "31323334313233343132333431323334"
}
```

For more information, see Decrypt data in the *AWS Payment Cryptography User Guide*.

- For API details, see DecryptData in *AWS CLI Command Reference*.

`encrypt-data`

The following code example shows how to use `encrypt-data`.

AWS CLI

To encrypt data

The following `encrypt-data` example encrypts plaintext data using a symmetric key. For this operation, the key must have `KeyModesOfUse` set to `Encrypt` and `KeyUsage` set to `TR31_D0_SYMMETRIC_DATA_ENCRYPTION_KEY`.

```
aws payment-cryptography-data encrypt-data \
    --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h \
```

```
    --plain-text 31323334313233343132333431323334 \
    --encryption-attributes 'Symmetric={Mode=CBC}'
```

Output:

```
{
    "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h",
    "KeyCheckValue": "71D7AE",
    "CipherText": "33612AB9D6929C3A828EB6030082B2BD"
}
```

For more information, see Encrypt data in the *AWS Payment Cryptography User Guide*.

- For API details, see EncryptData in *AWS CLI Command Reference*.

`generate-card-validation-data`

The following code example shows how to use `generate-card-validation-data`.

AWS CLI

To generate a CVV

The following `generate-card-validation-data` example generates a CVV/CVV2.

```
aws payment-cryptography-data generate-card-validation-data \
    --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h \
    --primary-account-number=171234567890123 \
    --generation-attributes CardVerificationValue2={CardExpiryDate=0123}
```

Output:

```
{
    "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h",
    "KeyCheckValue": "CADDA1",
    "ValidationData": "801"
}
```

For more information, see Generate card data in the *AWS Payment Cryptography User Guide*.

- For API details, see GenerateCardValidationData in *AWS CLI Command Reference*.

`generate-mac`

The following code example shows how to use `generate-mac`.

AWS CLI

To generate a MAC

The following `generate-card-validation-data` example generates a Hash-Based Message Authentication Code (HMAC) for card data authentication using the algorithm HMAC_SHA256 and an HMAC encryption key. The key must have `KeyUsage` set to `TR31_M7_HMAC_KEY` and `KeyModesOfUse` to `Generate`.

```
aws payment-cryptography-data generate-mac \
    --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h \
    --message-
data "3b313038383439303031303733393431353d32343038323236303030373030303f33" \
    --generation-attributes Algorithm=HMAC_SHA256
```

Output:

```
{
    "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h,
    "KeyCheckValue": "2976E7",
    "Mac": "ED87F26E961C6D0DDB78DA5038AA2BDDEA0DCE03E5B5E96BDDD494F4A7AA470C"
}
```

For more information, see Generate MAC in the *AWS Payment Cryptography User Guide*.

- For API details, see GenerateMac in *AWS CLI Command Reference*.

`generate-pin-data`

The following code example shows how to use `generate-pin-data`.

AWS CLI

To generate a PIN

The following `generate-card-validation-data` example generate a new random PIN using the Visa PIN scheme.

```
aws payment-cryptography-data generate-pin-data \
    --generation-key-identifier arn:aws:payment-cryptography:us-
east-2:111122223333:key/37y2tsl45p5zjbh2 \
    --encryption-key-identifier arn:aws:payment-cryptography:us-
east-2:111122223333:key/ivi5ksfsuplneuyt \
    --primary-account-number 171234567890123 \
    --pin-block-format ISO_FORMAT_0 \
    --generation-attributes VisaPin={PinVerificationKeyIndex=1}
```

Output:

```
{
    "GenerationKeyArn": "arn:aws:payment-cryptography:us-
east-2:111122223333:key/37y2tsl45p5zjbh2",
    "GenerationKeyCheckValue": "7F2363",
    "EncryptionKeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/
ivi5ksfsuplneuyt",
    "EncryptionKeyCheckValue": "7CC9E2",
    "EncryptedPinBlock": "AC17DC148BDA645E",
    "PinData": {
        "VerificationValue": "5507"
    }
}
```

For more information, see Generate PIN data in the *AWS Payment Cryptography User Guide*.

- For API details, see GeneratePinData in *AWS CLI Command Reference*.

`re-encrypt-data`

The following code example shows how to use `re-encrypt-data`.

AWS CLI

To re-encrypt data with a different key

The following `re-encrypt-data` example decrypts cipher text that was encrypted using an AES symmetric key and re-encrypts it using a Derived Unique Key Per Transaction (DUKPT) key.

```
aws payment-cryptography-data re-encrypt-data \
    --incoming-key-identifier arn:aws:payment-cryptography:us-
west-2:111122223333:key/hyvv7ymboitd4vfy \
    --outgoing-key-identifier arn:aws:payment-cryptography:us-
west-2:111122223333:key/jl6ythkcvzesbxen \
    --cipher-
text 4D2B0BDBA192D5AEFEAA5B3EC28E4A65383C313FFA25140101560F75FE1B99F27192A90980AB9334
 \
    --incoming-encryption-
attributes "Dukpt={Mode=ECB,KeySerialNumber=0123456789111111}" \
    --outgoing-encryption-attributes '{"Symmetric": {"Mode": "ECB"}}'
```

Output:

```
{
    "CipherText":
 "F94959DA30EEFF0C035483C6067667CF6796E3C1AD28C2B61F9CFEB772A8DD41C0D6822931E0D3B1",
    "KeyArn": "arn:aws:payment-cryptography:us-west-2:111122223333:key/
jl6ythkcvzesbxen",
    "KeyCheckValue": "2E8CD9"
}
```

For more information, see Encrypt and decrypt data in the *AWS Payment Cryptography User Guide*.

- For API details, see ReEncryptData in *AWS CLI Command Reference*.

translate-pin-data

The following code example shows how to use `translate-pin-data`.

AWS CLI

To translate PIN data

The following `translate-pin-data` example translates a PIN from PEK TDES encryption using ISO 0 PIN block to an AES ISO 4 PIN Block using the DUKPT algorithm.

```
aws payment-cryptography-data translate-pin-data \
    --encrypted-pin-block "AC17DC148BDA645E" \
    --incoming-translation-
attributes=IsoFormat0='{PrimaryAccountNumber=171234567890123}' \
```

```
    --incoming-key-identifier arn:aws:payment-cryptography:us-
east-2:111122223333:key/ivi5ksfsuplneuyt \
    --outgoing-key-identifier arn:aws:payment-cryptography:us-
east-2:111122223333:key/4pmyquwjs3yj4vwe \
    --outgoing-translation-attributes
 IsoFormat4="{PrimaryAccountNumber=171234567890123}" \
    --outgoing-dukpt-attributes KeySerialNumber="FFFF9876543210E00008"
```

Output:

```
{
    "PinBlock": "1F4209C670E49F83E75CC72E81B787D9",
    "KeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/
ivi5ksfsuplneuyt
    "KeyCheckValue": "7CC9E2"
}
```

For more information, see Translate PIN data in the *AWS Payment Cryptography User Guide*.

- For API details, see TranslatePinData in *AWS CLI Command Reference*.

`verify-auth-request-cryptogram`

The following code example shows how to use `verify-auth-request-cryptogram`.

AWS CLI

To verify an auth request

The following `verify-auth-request-cryptogram` example verifies an Authorization Request Cryptogram (ARQC).

```
aws payment-cryptography-data verify-auth-request-cryptogram \
    --auth-request-cryptogram F6E1BD1E6037FB3E \
    --auth-response-attributes '{"ArpcMethod1": {"AuthResponseCode": "1111"}}' \
    --key-identifier arn:aws:payment-cryptography:us-west-2:111122223333:key/
pboipdfzd4mdklya \
    --major-key-derivation-mode "EMV_OPTION_A" \
    --session-key-derivation-attributes '{"EmvCommon":
 {"ApplicationTransactionCounter": "1234","PanSequenceNumber":
 "01","PrimaryAccountNumber": "471234567890123"}}' \
    --transaction-data "123456789ABCDEF"
```

Output:

```
{
    "AuthResponseValue": "D899B8C6FBF971AA",
    "KeyArn": "arn:aws:payment-cryptography:us-west-2:111122223333:key/
pboipdfzd4mdklya",
    "KeyCheckValue": "985792"
}
```

For more information, see Verify auth request (ARQC) cryptogram in the *AWS Payment Cryptography User Guide*.

- For API details, see VerifyAuthRequestCryptogram in *AWS CLI Command Reference*.

verify-card-validation-data

The following code example shows how to use `verify-card-validation-data`.

AWS CLI

To validate a CVV

The following `verify-card-validation-data` example validates a CVV/CVV2 for a PAN.

```
aws payment-cryptography-data verify-card-validation-data \
    --key-identifier arn:aws:payment-cryptography:us-east-2:111122223333:key/
tqv5yij6wtxx64pi \
    --primary-account-number=171234567890123 \
    --verification-attributes CardVerificationValue2={CardExpiryDate=0123} \
    --validation-data 801
```

Output:

```
{
    "KeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/
tqv5yij6wtxx64pi",
    "KeyCheckValue": "CADDA1"
}
```

For more information, see Verify card data in the *AWS Payment Cryptography User Guide*.

- For API details, see VerifyCardValidationData in *AWS CLI Command Reference*.

`verify-mac`

The following code example shows how to use `verify-mac`.

AWS CLI

To verify a MAC

The following `verify-mac` example verifies a Hash-Based Message Authentication Code (HMAC) for card data authentication using the algorithm HMAC_SHA256 and an HMAC encryption key.

```
aws payment-cryptography-data verify-mac \
    --key-identifier arn:aws:payment-cryptography:us-east-2:111122223333:key/qnobl5lghrzunce6 \
    --message-data "3b343038383439303031303733393431353d32343038323236303030373030303f33" \
    --verification-attributes='Algorithm=HMAC_SHA256' \
    --mac ED87F26E961C6D0DDB78DA5038AA2BDDEA0DCE03E5B5E96BDDD494F4A7AA470C
```

Output:

```
{
    "KeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/qnobl5lghrzunce6,
    "KeyCheckValue": "2976E7",
}
```

For more information, see Verify MAC in the *AWS Payment Cryptography User Guide*.

- For API details, see VerifyMac in *AWS CLI Command Reference*.

`verify-pin-data`

The following code example shows how to use `verify-pin-data`.

AWS CLI

To verify a PIN

The following `verify-pin-data` example validates a PIN for a PAN.

```
aws payment-cryptography-data verify-pin-data \
    --verification-key-identifier arn:aws:payment-cryptography:us-
east-2:111122223333:key/37y2tsl45p5zjbh2 \
    --encryption-key-identifier arn:aws:payment-cryptography:us-
east-2:111122223333:key/ivi5ksfsuplneuyt \
    --primary-account-number 171234567890123 \
    --pin-block-format ISO_FORMAT_0 \
    --verification-attributes
 VisaPin="{PinVerificationKeyIndex=1,VerificationValue=5507}" \
    --encrypted-pin-block AC17DC148BDA645E
```

Output:

```
{
    "VerificationKeyArn": "arn:aws:payment-cryptography:us-
east-2:111122223333:key/37y2tsl45p5zjbh2",
    "VerificationKeyCheckValue": "7F2363",
    "EncryptionKeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/
ivi5ksfsuplneuyt",
    "EncryptionKeyCheckValue": "7CC9E2",
}
```

For more information, see Verify PIN data in the *AWS Payment Cryptography User Guide*.

- For API details, see VerifyPinData in *AWS CLI Command Reference*.

Amazon Pinpoint examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Pinpoint.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Actions

`create-app`

The following code example shows how to use `create-app`.

AWS CLI

Example 1: To create an application

The following `create-app` example creates a new application (project).

```
aws pinpoint create-app \
    --create-application-request Name=ExampleCorp
```

Output:

```
{
    "ApplicationResponse": {
        "Arn": "arn:aws:mobiletargeting:us-
west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example",
        "Id": "810c7aab86d42fb2b56c8c966example",
        "Name": "ExampleCorp",
        "tags": {}
    }
}
```

Example 2: To create an application that is tagged

The following `create-app` example creates a new application (project) and associates a tag (key and value) with the application.

```
aws pinpoint create-app \
    --create-application-request Name=ExampleCorp,tags={"Stack"="Test"}
```

Output:

```
{
    "ApplicationResponse": {
        "Arn": "arn:aws:mobiletargeting:us-
west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example",
        "Id": "810c7aab86d42fb2b56c8c966example",
```

```
            "Name": "ExampleCorp",
            "tags": {
                "Stack": "Test"
            }
        }
    }
```

- For API details, see CreateApp in *AWS CLI Command Reference*.

`create-sms-template`

The following code example shows how to use `create-sms-template`.

AWS CLI

Creates a message template for messages that are sent through the SMS channel

The following `create-sms-template` example creates a SMS message template.

```
aws pinpoint create-sms-template \
    --template-name TestTemplate \
    --sms-template-request file://myfile.json \
    --region us-east-1
```

Contents of `myfile.json`:

```
{
    "Body": "hello\n how are you?\n food is good",
    "TemplateDescription": "Test SMS Template"
}
```

Output:

```
{
    "CreateTemplateMessageBody": {
        "Arn": "arn:aws:mobiletargeting:us-east-1:AIDACKCEVSQ6C2EXAMPLE:templates/
TestTemplate/SMS",
        "Message": "Created",
        "RequestID": "8c36b17f-a0b0-400f-ac21-29e9b62a975d"
    }
}
```

For more information, see Amazon Pinpoint message templates in the *Amazon Pinpoint User Guide*.

- For API details, see CreateSmsTemplate in *AWS CLI Command Reference*.

`delete-app`

The following code example shows how to use `delete-app`.

AWS CLI

To delete an application

The following `delete-app` example deletes an application (project).

```
aws pinpoint delete-app \
    --application-id 810c7aab86d42fb2b56c8c966example
```

Output:

```
{
    "ApplicationResponse": {
        "Arn": "arn:aws:mobiletargeting:us-
west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example",
        "Id": "810c7aab86d42fb2b56c8c966example",
        "Name": "ExampleCorp",
        "tags": {}
    }
}
```

- For API details, see DeleteApp in *AWS CLI Command Reference*.

`get-apns-channel`

The following code example shows how to use `get-apns-channel`.

AWS CLI

To retrieve information about the status and settings of the APNs channel for an application

The following `get-apns-channel` example retrieves information about the status and settings of the APNs channel for an application.

```
aws pinpoint get-apns-channel \
    --application-id 9ab1068eb0a6461c86cce7f27ce0efd7 \
    --region us-east-1
```

Output:

```
{
    "APNSChannelResponse": {
        "ApplicationId": "9ab1068eb0a6461c86cce7f27ce0efd7",
        "CreationDate": "2019-05-09T21:54:45.082Z",
        "DefaultAuthenticationMethod": "CERTIFICATE",
        "Enabled": true,
        "HasCredential": true,
        "HasTokenKey": false,
        "Id": "apns",
        "IsArchived": false,
        "LastModifiedDate": "2019-05-09T22:04:01.067Z",
        "Platform": "APNS",
        "Version": 2
    }
}
```

- For API details, see GetApnsChannel in *AWS CLI Command Reference*.

`get-app`

The following code example shows how to use `get-app`.

AWS CLI

To retrieve information about an application (project)

The following `get-app` example retrieves information about an application (project).

```
aws pinpoint get-app \
    --application-id 810c7aab86d42fb2b56c8c966example \
    --region us-east-1
```

Output:

```
{
```

```
    "ApplicationResponse": {
        "Arn": "arn:aws:mobiletargeting:us-
east-1:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example",
        "Id": "810c7aab86d42fb2b56c8c966example",
        "Name": "ExampleCorp",
        "tags": {
                "Year": "2019",
                "Stack": "Production"
            }
    }
}
```

- For API details, see GetApp in *AWS CLI Command Reference*.

`get-apps`

The following code example shows how to use `get-apps`.

AWS CLI

To retrieve information about all of your applications

The following `get-apps` example retrieves information about all of your applications (projects).

```
aws pinpoint get-apps
```

Output:

```
{
    "ApplicationsResponse": {
        "Item": [
            {
                "Arn": "arn:aws:mobiletargeting:us-
west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example",
                "Id": "810c7aab86d42fb2b56c8c966example",
                "Name": "ExampleCorp",
                "tags": {
                    "Year": "2019",
                    "Stack": "Production"
                }
            },
            {
```

```
                "Arn": "arn:aws:mobiletargeting:us-
west-2:AIDACKCEVSQ6C2EXAMPLE:apps/42d8c7eb0990a57ba1d5476a3example",
                "Id": "42d8c7eb0990a57ba1d5476a3example",
                "Name": "AnyCompany",
                "tags": {}
            },
            {
                "Arn": "arn:aws:mobiletargeting:us-
west-2:AIDACKCEVSQ6C2EXAMPLE:apps/80f5c382b638ffe5ad12376bbexample",
                "Id": "80f5c382b638ffe5ad12376bbexample",
                "Name": "ExampleCorp_Test",
                "tags": {
                    "Year": "2019",
                    "Stack": "Test"
                }
            }
        ],
        "NextToken":
 "eyJDcmVhdGlvbkRhdGUiOiIyMDE5LTA3LTE2VDE0OjM4OjUzLjkwM1oiLCJBY2NvdW50SWQiOiI1MTIzOTcxODM4N
    }
}
```

The presence of the `NextToken` response value indicates that there is more output available. Call the command again and supply that value as the `NextToken` input parameter.

- For API details, see GetApps in *AWS CLI Command Reference*.

`get-campaign`

The following code example shows how to use `get-campaign`.

AWS CLI

To retrieve information about the status, configuration, and other settings for a campaign

The following `get-campaign` example retrieves information about the status, configuration, and other settings for a campaign.

```
aws pinpoint get-campaign \
    --application-id 6e0b7591a90841d2b5d93fa11143e5a7 \
    --campaign-id a1e63c6cc0eb43ed826ffcc3cc90b30d \
    --region us-east-1
```

Output:

```
{
    "CampaignResponse": {
        "AdditionalTreatments": [],
        "ApplicationId": "6e0b7591a90841d2b5d93fa11143e5a7",

            }
        }
    }
}
```

- For API details, see GetChannels in *AWS CLI Command Reference*.

get-email-channel

The following code example shows how to use `get-email-channel`.

AWS CLI

To retrieve information about the status and settings of the Email channel for an application

The following `get-email-channel` example retrieves status and settings of the Email channel for an application.

```
aws pinpoint get-email-channel \
    --application-id 6e0b7591a90841d2b5d93fa11143e5a7 \
    --region us-east-1
```

Output:

```
{
    "EmailChannelResponse": {
        "ApplicationId": "6e0b7591a90841d2b5d93fa11143e5a7",
        "CreationDate": "2019-10-08T18:27:23.990Z",
        "Enabled": true,
        "FromAddress": "sender@example.com",
        "Id": "email",
        "Identity": "arn:aws:ses:us-east-1:AIDACKCEVSQ6C2EXAMPLE:identity/
sender@example.com",
        "IsArchived": false,
        "LastModifiedDate": "2019-10-08T18:27:23.990Z",
        "MessagesPerSecond": 1,
        "Platform": "EMAIL",
        "RoleArn": "arn:aws:iam::AIDACKCEVSQ6C2EXAMPLE:role/pinpoint-events",
        "Version": 1
    }
}
```

- For API details, see GetEmailChannel in *AWS CLI Command Reference*.

get-endpoint

The following code example shows how to use `get-endpoint`.

AWS CLI

To retrieve information about the settings and attributes of a specific endpoint for an application

The following `get-endpoint` example retrieves information about the settings and attributes of a specific endpoint for an application.

```
aws pinpoint get-endpoint \
    --application-id 611e3e3cdd47474c9c1399a505665b91 \
    --endpoint-id testendpoint \
    --region us-east-1
```

Output:

```
{
    "EndpointResponse": {
        "Address": "+11234567890",
        "ApplicationId": "611e3e3cdd47474c9c1399a505665b91",
        "Attributes": {},
        "ChannelType": "SMS",
        "CohortId": "63",
        "CreationDate": "2019-01-28T23:55:11.534Z",
        "EffectiveDate": "2021-08-06T00:04:51.763Z",
        "EndpointStatus": "ACTIVE",
        "Id": "testendpoint",
        "Location": {
            "Country": "USA"
        },
        "Metrics": {
            "SmsDelivered": 1.0
        },
        "OptOut": "ALL",
        "RequestId": "a204b1f2-7e26-48a7-9c80-b49a2143489d",
        "User": {
            "UserAttributes": {
                "Age": [
                    "24"
                ]
            },
        "UserId": "testuser"
        }
    }
```

```
}
```

- For API details, see GetEndpoint in *AWS CLI Command Reference*.

`get-gcm-channel`

The following code example shows how to use `get-gcm-channel`.

AWS CLI

To retrieve information about the status and settings of the GCM channel for an application

The following `get-gcm-channel` example retrieves information about the status and settings of the GCM channel for an application.

```
aws pinpoint get-gcm-channel \
    --application-id 6e0b7591a90841d2b5d93fa11143e5a7 \
    --region us-east-1
```

Output:

```
{
    "GCMChannelResponse": {
        "ApplicationId": "6e0b7591a90841d2b5d93fa11143e5a7",
        "CreationDate": "2019-10-08T18:28:23.182Z",
        "Enabled": true,
        "HasCredential": true,
        "Id": "gcm",
        "IsArchived": false,
        "LastModifiedDate": "2019-10-08T18:28:23.182Z",
        "Platform": "GCM",
        "Version": 1
    }
}
```

- For API details, see GetGcmChannel in *AWS CLI Command Reference*.

`get-sms-channel`

The following code example shows how to use `get-sms-channel`.

AWS CLI

To retrieve information about the status and settings of the SMS channel for an application

The following `get-sms-channel` example retrieves status and settings of the sms channel for an application.

```
aws pinpoint get-sms-channel \
    --application-id 6e0b7591a90841d2b5d93fa11143e5a7 \
    --region us-east-1
```

Output:

```
{
    "SMSChannelResponse": {
        "ApplicationId": "6e0b7591a90841d2b5d93fa11143e5a7",
        "CreationDate": "2019-10-08T18:39:18.511Z",
        "Enabled": true,
        "Id": "sms",
        "IsArchived": false,
        "LastModifiedDate": "2019-10-08T18:39:18.511Z",
        "Platform": "SMS",
        "PromotionalMessagesPerSecond": 20,
        "TransactionalMessagesPerSecond": 20,
        "Version": 1
    }
}
```

- For API details, see GetSmsChannel in *AWS CLI Command Reference*.

`get-sms-template`

The following code example shows how to use `get-sms-template`.

AWS CLI

Retrieves the content and settings of a message template for messages that are sent through the SMS channel

The following `get-sms-template` example retrieves the content and settings of a SMS message template.

```
aws pinpoint get-sms-template \
    --template-name TestTemplate \
    --region us-east-1
```

Output:

```
{
    "SMSTemplateResponse": {
        "Arn": "arn:aws:mobiletargeting:us-east-1:AIDACKCEVSQ6C2EXAMPLE:templates/
TestTemplate/SMS",
        "Body": "hello\n how are you?\n food is good",
        "CreationDate": "2023-06-20T21:37:30.124Z",
        "LastModifiedDate": "2023-06-20T21:37:30.124Z",
        "tags": {},
        "TemplateDescription": "Test SMS Template",
        "TemplateName": "TestTemplate",
        "TemplateType": "SMS",
        "Version": "1"
    }
}
```

For more information, see Amazon Pinpoint message templates in the *Amazon Pinpoint User Guide*.

- For API details, see GetSmsTemplate in *AWS CLI Command Reference*.

`get-voice-channel`

The following code example shows how to use `get-voice-channel`.

AWS CLI

To retrieve information about the status and settings of the voice channel for an application

The following `get-voice-channel` example retrieves status and settings of the voice channel for an application.

```
aws pinpoint get-voice-channel \
    --application-id 6e0b7591a90841d2b5d93fa11143e5a7 \
    --region us-east-1
```

Output:

```
{
    "VoiceChannelResponse": {
        "ApplicationId": "6e0b7591a90841d2b5d93fa11143e5a7",
        "CreationDate": "2022-04-28T00:17:03.836Z",
        "Enabled": true,
        "Id": "voice",
        "IsArchived": false,
        "LastModifiedDate": "2022-04-28T00:17:03.836Z",
        "Platform": "VOICE",
        "Version": 1
    }
}
```

- For API details, see GetVoiceChannel in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To retrieve a list of tags for a resource

The following `list-tags-for-resource` example retrieves all the tags (key names and values) that are associated with the specified resource.

```
aws pinpoint list-tags-for-resource \
    --resource-arn arn:aws:mobiletargeting:us-
west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example
```

Output:

```
{
    "TagsModel": {
        "tags": {
            "Year": "2019",
            "Stack": "Production"
        }
    }
}
```

For more information, see 'Tagging Amazon Pinpoint Resources <https://docs.aws.amazon.com/pinpoint/latest/developerguide/tagging-resources.html>'__ in the *Amazon Pinpoint Developer Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`phone-number-validate`

The following code example shows how to use `phone-number-validate`.

AWS CLI

Retrieves information about a phone number

The following `phone-number-validate` retrieves information about a phone number.

```
aws pinpoint phone-number-validate \
    --number-validate-request PhoneNumber="+12065550142" \
    --region us-east-1
```

Output:

```
{
    "NumberValidateResponse": {
        "Carrier": "ExampleCorp Mobile",
        "City": "Seattle",
        "CleansedPhoneNumberE164": "+12065550142",
        "CleansedPhoneNumberNational": "2065550142",
        "Country": "United States",
        "CountryCodeIso2": "US",
        "CountryCodeNumeric": "1",
        "OriginalPhoneNumber": "+12065550142",
        "PhoneType": "MOBILE",
        "PhoneTypeCode": 0,
        "Timezone": "America/Los_Angeles",
        "ZipCode": "98101"
    }
}
```

For more information, see Amazon Pinpoint SMS channel in the *Amazon Pinpoint User Guide*.

- For API details, see PhoneNumberValidate in *AWS CLI Command Reference*.

`send-messages`

The following code example shows how to use `send-messages`.

AWS CLI

To send SMS message using the endpoint of an application

The following `send-messages` example sends a direct message for an application with an endpoint.

```
aws pinpoint send-messages \
    --application-id 611e3e3cdd47474c9c1399a505665b91 \
    --message-request file://myfile.json \
    --region us-west-2
```

Contents of `myfile.json`:

```
{
    "MessageConfiguration": {
        "SMSMessage": {
            "Body": "hello, how are you?"
        }
    },
    "Endpoints": {
        "testendpoint": {}
    }
}
```

Output:

```
{
    "MessageResponse": {
        "ApplicationId": "611e3e3cdd47474c9c1399a505665b91",
        "EndpointResult": {
            "testendpoint": {
                "Address": "+12345678900",
                "DeliveryStatus": "SUCCESSFUL",
                "MessageId": "itnuqhai5alf1n6ahv3udc05n7hhddr6gb3lq6g0",
                "StatusCode": 200,
                "StatusMessage": "MessageId:
 itnuqhai5alf1n6ahv3udc05n7hhddr6gb3lq6g0"
```

```
            }
        },
        "RequestId": "c7e23264-04b2-4a46-b800-d24923f74753"
    }
}
```

For more information, see [Amazon Pinpoint SMS channel]() in the *Amazon Pinpoint User Guide*.

- For API details, see [SendMessages]() in *AWS CLI Command Reference*.

`send-users-messages`

The following code example shows how to use `send-users-messages`.

AWS CLI

To send SMS message for an user of an application

The following `send-users-messages` example sends a direct message for an user of an application.

```
aws pinpoint send-users-messages \
    --application-id 611e3e3cdd47474c9c1399a505665b91 \
    --send-users-message-request file://myfile.json \
    --region us-west-2
```

Contents of `myfile.json`:

```
{
    "MessageConfiguration": {
        "SMSMessage": {
            "Body": "hello, how are you?"
        }
    },
    "Users": {
        "testuser": {}
    }
}
```

Output:

```
{
```

```
    "SendUsersMessageResponse": {
        "ApplicationId": "611e3e3cdd47474c9c1399a505665b91",
        "RequestId": "e0b12cf5-2359-11e9-bb0b-d5fb91876b25",
        "Result": {
            "testuser": {
                "testuserendpoint": {
                    "DeliveryStatus": "SUCCESSFUL",
                    "MessageId": "7qu4hk5bqhda3i7i2n4pjf98qcuh8b7p45ifsmo0",
                    "StatusCode": 200,
                    "StatusMessage": "MessageId:
 7qu4hk5bqhda3i7i2n4pjf98qcuh8b7p45ifsmo0",
                    "Address": "+12345678900"
                }
            }
        }
    }
}
```

For more information, see Amazon Pinpoint SMS channel in the *Amazon Pinpoint User Guide*.

- For API details, see SendUsersMessages in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add tags to a resource

The following example adds two tags (key names and values) to a resource.

```
aws pinpoint list-tags-for-resource \
    --resource-arn arn:aws:mobiletargeting:us-
east-1:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example \
    --tags-model tags={Stack=Production,Year=2019}
```

This command produces no output.

For more information, see 'Tagging Amazon Pinpoint Resources <https://docs.aws.amazon.com/pinpoint/latest/developerguide/tagging-resources.html>'__ in the *Amazon Pinpoint Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

Example 1: To remove a tag from a resource

The following `untag-resource` example removes the specified tag (key name and value) from a resource.

```
aws pinpoint untag-resource \
    --resource-arn arn:aws:mobiletargeting:us-
west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example \
    --tag-keys Year
```

This command produces no output.

Example 2: To remove multiple tags from a resource

The following `untag-resource` example removes the specified tags (key names and values) from a resource.

```
aws pinpoint untag-resource \
    --resource-arn arn:aws:mobiletargeting:us-
east-1:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example \
    --tag-keys Year Stack
```

This command produces no output.

For more information, see 'Tagging Amazon Pinpoint Resources <https://docs.aws.amazon.com/pinpoint/latest/developerguide/tagging-resources.html>'__ in the *Amazon Pinpoint Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-sms-channel`

The following code example shows how to use `update-sms-channel`.

AWS CLI

To enable SMS channel or to update the status and settings of the SMS channel for an application.

The following `update-sms-channel` example enables SMS channel for an SMS channel for an application.

```
aws pinpoint update-sms-channel \
    --application-id 611e3e3cdd47474c9c1399a505665b91 \
    --sms-channel-request Enabled=true \
    --region us-west-2
```

Output:

```
{
    "SMSChannelResponse": {
        "ApplicationId": "611e3e3cdd47474c9c1399a505665b91",
        "CreationDate": "2019-01-28T23:25:25.224Z",
        "Enabled": true,
        "Id": "sms",
        "IsArchived": false,
        "LastModifiedDate": "2023-05-18T23:22:50.977Z",
        "Platform": "SMS",
        "PromotionalMessagesPerSecond": 20,
        "TransactionalMessagesPerSecond": 20,
        "Version": 3
    }
}
```

For more information, see Amazon Pinpoint SMS channel in the *Amazon Pinpoint User Guide*.

- For API details, see UpdateSmsChannel in *AWS CLI Command Reference*.

Amazon Polly examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Polly.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`delete-lexicon`

The following code example shows how to use `delete-lexicon`.

AWS CLI

To delete a lexicon

The following `delete-lexicon` example deletes the specified lexicon.

```
aws polly delete-lexicon \
    --name w3c
```

This command produces no output.

For more information, see Using the DeleteLexicon operation in the *Amazon Polly Developer Guide*.

- For API details, see DeleteLexicon in *AWS CLI Command Reference*.

`get-lexicon`

The following code example shows how to use `get-lexicon`.

AWS CLI

To retrieve the content of a lexicon

The following `get-lexicon` example retrieves the content of the specified pronunciation lexicon.

```
aws polly get-lexicon \
    --name w3c
```

Output:

```
{
    "Lexicon": {
        "Content": "<?xml version=\"1.0\" encoding=\"UTF-8\"?>\n<lexicon version=
\"1.0\" \n      xmlns=    \"http://www.w3.org/2005/01/pronunciation-lexicon
\"\n      xmlns:xsi=\"http://www.w3.org/2001/XMLSchema-instance\" \n
 xsi:schemaLocation=\"http://www.w3.org/2005/01/pronunciation-lexicon \n

   alphabet=\"ipa\" \n      xml:lang=\"en-US\">\n  <lexeme>\n    <grapheme>W3C</
grapheme>\n        <alias>World Wide Web Consortium</alias>\n  </lexeme>\n</lexicon>
\n",
        "Name": "w3c"
    },
    "LexiconAttributes": {
        "Alphabet": "ipa",
        "LanguageCode": "en-US",
        "LastModified": 1603908910.99,
        "LexiconArn": "arn:aws:polly:us-west-2:880185128111:lexicon/w3c",
        "LexemesCount": 1,
        "Size": 492
    }
}
```

For more information, see Using the GetLexicon operation in the *Amazon Polly Developer Guide*.

- For API details, see GetLexicon in *AWS CLI Command Reference*.

`get-speech-synthesis-task`

The following code example shows how to use `get-speech-synthesis-task`.

AWS CLI

To get information about a speech synthesis task

The following `get-speech-synthesis-task` example retrieves information about the specified speech synthesis task.

```
aws polly get-speech-synthesis-task \
    --task-id 70b61c0f-57ce-4715-a247-cae8729dcce9
```

Output:

```
{
    "SynthesisTask": {
        "TaskId": "70b61c0f-57ce-4715-a247-cae8729dcce9",
        "TaskStatus": "completed",
        "OutputUri": "https://s3.us-west-2.amazonaws.com/amzn-s3-demo-
bucket/70b61c0f-57ce-4715-a247-cae8729dcce9.mp3",
        "CreationTime": 1603911042.689,
        "RequestCharacters": 1311,
        "OutputFormat": "mp3",
        "TextType": "text",
        "VoiceId": "Joanna"
    }
}
```

For more information, see Creating long audio files in the *Amazon Polly Developer Guide*.

- For API details, see GetSpeechSynthesisTask in *AWS CLI Command Reference*.

`list-lexicons`

The following code example shows how to use `list-lexicons`.

AWS CLI

To list your lexicons

The following `list-lexicons` example lists your pronunciation lexicons.

```
aws polly list-lexicons
```

Output:

```
{
    "Lexicons": [
        {
            "Name": "w3c",
            "Attributes": {
                "Alphabet": "ipa",
                "LanguageCode": "en-US",
                "LastModified": 1603908910.99,
                "LexiconArn": "arn:aws:polly:us-east-2:123456789012:lexicon/w3c",
                "LexemesCount": 1,
                "Size": 492
```

```
            }
        }
    ]
}
```

For more information, see [Using the ListLexicons operation]() in the *Amazon Polly Developer Guide*.

- For API details, see [ListLexicons]() in *AWS CLI Command Reference*.

`list-speech-synthesis-tasks`

The following code example shows how to use `list-speech-synthesis-tasks`.

AWS CLI

To list your speech synthesis tasks

The following `list-speech-synthesis-tasks` example lists your speech synthesis tasks.

```
aws polly list-speech-synthesis-tasks
```

Output:

```
{
    "SynthesisTasks": [
        {
            "TaskId": "70b61c0f-57ce-4715-a247-cae8729dcce9",
            "TaskStatus": "completed",
            "OutputUri": "https://s3.us-west-2.amazonaws.com/amzn-s3-demo-
bucket/70b61c0f-57ce-4715-a247-cae8729dcce9.mp3",
            "CreationTime": 1603911042.689,
            "RequestCharacters": 1311,
            "OutputFormat": "mp3",
            "TextType": "text",
            "VoiceId": "Joanna"
        }
    ]
}
```

For more information, see [Creating long audio files]() in the *Amazon Polly Developer Guide*.

- For API details, see [ListSpeechSynthesisTasks]() in *AWS CLI Command Reference*.

`put-lexicon`

The following code example shows how to use `put-lexicon`.

AWS CLI

To store a lexicon

The following `put-lexicon` example stores the specified pronunciation lexicon. The `example.pls` file specifies a W3C PLS-compliant lexicon.

```
aws polly put-lexicon \
    --name w3c \
    --content file://example.pls
```

Contents of `example.pls`

```
{
    <?xml version="1.0" encoding="UTF-8"?>
    <lexicon version="1.0"
        xmlns="http://www.w3.org/2005/01/pronunciation-lexicon"
        xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
        xsi:schemaLocation="http://www.w3.org/2005/01/pronunciation-lexicon
            http://www.w3.org/TR/2007/CR-pronunciation-lexicon-20071212/pls.xsd"
        alphabet="ipa"
        xml:lang="en-US">
        <lexeme>
            <grapheme>W3C</grapheme>
            <alias>World Wide Web Consortium</alias>
        </lexeme>
    </lexicon>
}
```

This command produces no output.

For more information, see Using the PutLexicon operation in the *Amazon Polly Developer Guide*.

- For API details, see PutLexicon in *AWS CLI Command Reference*.

`start-speech-synthesis-task`

The following code example shows how to use `start-speech-synthesis-task`.

AWS CLI

To synthesize text

The following `start-speech-synthesis-task` example synthesizes the text in `text_file.txt` and stores the resulting MP3 file in the specified bucket.

```
aws polly start-speech-synthesis-task \
    --output-format mp3 \
    --output-s3-bucket-name amzn-s3-demo-bucket \
    --text  file://text_file.txt \
    --voice-id Joanna
```

Output:

```
{
    "SynthesisTask": {
        "TaskId": "70b61c0f-57ce-4715-a247-cae8729dcce9",
        "TaskStatus": "scheduled",
        "OutputUri": "https://s3.us-east-2.amazonaws.com/amzn-s3-demo-
bucket/70b61c0f-57ce-4715-a247-cae8729dcce9.mp3",
        "CreationTime": 1603911042.689,
        "RequestCharacters": 1311,
        "OutputFormat": "mp3",
        "TextType": "text",
        "VoiceId": "Joanna"
    }
}
```

For more information, see Creating long audio files in the *Amazon Polly Developer Guide*.

- For API details, see StartSpeechSynthesisTask in *AWS CLI Command Reference*.

AWS Price List examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Price List.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

`describe-services`

The following code example shows how to use `describe-services`.

AWS CLI

To retrieve service metadata

This example retrieves the metadata for the Amazon EC2 service code.

Command:

```
aws pricing describe-services --service-code AmazonEC2 --format-version aws_v1 --
max-items 1
```

Output:

```
{
  "Services": [
      {
          "ServiceCode": "AmazonEC2",
          "AttributeNames": [
              "volumeType",
              "maxIopsvolume",
              "instance",
              "instanceCapacity10xlarge",
              "locationType",

                "instanceCapacity32xlarge",
                "instanceCapacityXlarge",
                "licenseModel",
                "currentGeneration",
```

```
              "preInstalledSw",
              "location",
              "instanceCapacity24xlarge",
              "instanceCapacity9xlarge",
              "instanceCapacityMedium",
              "operation"
          ]
      }
  ],
  "FormatVersion": "aws_v1"
}
```

- For API details, see [DescribeServices](#) in *AWS CLI Command Reference*.

`get-attribute-values`

The following code example shows how to use `get-attribute-values`.

AWS CLI

To retrieve a list of attribute values

The following `get-attribute-values` example retrieves a list of values available for the given attribute.

```
aws pricing get-attribute-values \
    --service-code AmazonEC2 \
    --attribute-name volumeType \
    --max-items 2
```

Output:

```
{
    "NextToken": "eyJOZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOiAyfQ==",
    "AttributeValues": [
        {
            "Value": "Cold HDD"
        },
        {
            "Value": "General Purpose"
        }
    ]
```

```
}
```

- For API details, see GetAttributeValues in *AWS CLI Command Reference*.

`get-products`

The following code example shows how to use `get-products`.

AWS CLI

To retrieve a list of products

This example retrieves a list of products that match the given criteria.

Command:

```
aws pricing get-products --filters file://filters.json --format-version aws_v1 --
max-results 1 --service-code AmazonEC2
```

filters.json:

```
        [
  {
    "Type": "TERM_MATCH",
    "Field": "ServiceCode",
    "Value": "AmazonEC2"
  },
  {
    "Type": "TERM_MATCH",
    "Field": "volumeType",
    "Value": "Provisioned IOPS"
  }
]
```

Output:

```
{
  "FormatVersion": "aws_v1",
  "NextToken": "WGDY7ko8fQXdlaUZVdasFQ==:RVSagyIFn770XQOzdUIcO9BY6ucBG9itXAZGZF/

```

- For API details, see GetProducts in *AWS CLI Command Reference*.

AWS Private CA examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Private CA.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-certificate-authority-audit-report`

The following code example shows how to use `create-certificate-authority-audit-report`.

AWS CLI

To create a certificate authority audit report

The following `create-certificate-authority-audit-report` command creates an audit report for the private CA identified by the ARN.

```
aws acm-pca create-certificate-authority-audit-report --certificate-authority-arn arn:aws:acm-pca:us-east-1:accountid:certificate-authority/12345678-1234-1234-1234-123456789012 --s3-bucket-name your-bucket-name --audit-report-response-format JSON
```

- For API details, see CreateCertificateAuthorityAuditReport in *AWS CLI Command Reference*.

`create-certificate-authority`

The following code example shows how to use `create-certificate-authority`.

AWS CLI

To create a private certificate authority

The following `create-certificate-authority` command creates a private certificate authority in your AWS account.

```
aws acm-pca create-certificate-authority --certificate-authority-configuration
 file://C:\ca_config.txt --revocation-configuration file://C:\revoke_config.txt --
certificate-authority-type "SUBORDINATE" --idempotency-token 98256344
```

- For API details, see CreateCertificateAuthority in *AWS CLI Command Reference*.

`delete-certificate-authority`

The following code example shows how to use `delete-certificate-authority`.

AWS CLI

To delete a private certificate authority

The following `delete-certificate-authority` command deletes the certificate authority identified by the ARN.

```
aws acm-pca delete-certificate-authority --certificate-authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-authority/12345678-1234-1234-1234-123456789012
```

- For API details, see DeleteCertificateAuthority in *AWS CLI Command Reference*.

`describe-certificate-authority-audit-report`

The following code example shows how to use `describe-certificate-authority-audit-report`.

AWS CLI

To describe an audit report for a certificate authority

The following `describe-certificate-authority-audit-report` command lists information about the specified audit report for the CA identified by the ARN.

```
aws acm-pca describe-certificate-authority-audit-report --certificate-authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-authority/99999999-8888-7777-6666-555555555555 --audit-report-id 11111111-2222-3333-4444-555555555555
```

- For API details, see DescribeCertificateAuthorityAuditReport in *AWS CLI Command Reference*.

`describe-certificate-authority`

The following code example shows how to use `describe-certificate-authority`.

AWS CLI

To describe a private certificate authority

The following `describe-certificate-authority` command lists information about the private CA identified by the ARN.

```
aws acm-pca describe-certificate-authority --certificate-authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-authority/12345678-1234-1234-1234-123456789012
```

- For API details, see DescribeCertificateAuthority in *AWS CLI Command Reference*.

`get-certificate-authority-certificate`

The following code example shows how to use `get-certificate-authority-certificate`.

AWS CLI

To retrieve a certificate authority (CA) certificate

The following `get-certificate-authority-certificate` command retrieves the certificate and certificate chain for the private CA specified by the ARN.

```
aws acm-pca get-certificate-authority-certificate --certificate-
authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-
authority/12345678-1234-1234-1234-123456789012 --output text
```

- For API details, see GetCertificateAuthorityCertificate in *AWS CLI Command Reference*.

`get-certificate-authority-csr`

The following code example shows how to use `get-certificate-authority-csr`.

AWS CLI

To retrieve the certificate signing request for a certificate authority

The following `get-certificate-authority-csr` command retrieves the CSR for the private CA specified by the ARN.

```
aws acm-pca get-certificate-authority-csr --certificate-
authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-
authority/12345678-1234-1234-1234-123456789012 --output text
```

- For API details, see GetCertificateAuthorityCsr in *AWS CLI Command Reference*.

`get-certificate`

The following code example shows how to use `get-certificate`.

AWS CLI

To retrieve an issued certificate

The following `get-certificate` example retrieves a certificate from the specified private CA.

```
aws acm-pca get-certificate \
    --certificate-authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-
authority/12345678-1234-1234-1234-123456789012 \
    --certificate-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-
authority/12345678-1234-1234-1234-123456789012/
certificate/6707447683a9b7f4055627ffd55cebcc \
    --output text
```

Output:

```
-----BEGIN CERTIFICATE-----
MIIEDzCCAvegAwIBAgIRAJuJ8f6ZVYL7gG/rS3qvrZMwDQYJKoZIhvcNAQELBQAw
cTELMAkGA1UEBhMCVVMxEzARBgNVBAgMCldhc2hpbmd0b24xEDAOBgNVBAcMB1Nl
    ....certificate body truncated for brevity....
tKCSglgZZrd4FdLw1EkGm+UVXnodwMtJEQyy3oTfZjURPIyyaqskTu/KSS7YDjK0
KQNy73D6LtmdOEbAyq10XiDxqY41lvKHJ1eZrPaBmYNABxU=
-----END CERTIFICATE---- -----BEGIN CERTIFICATE-----
MIIDrzCCApegAwIBAgIRAOskdzLvcj1eShkoyEE693AwDQYJKoZIhvcNAQELBQAw
cTELMAkGA1UEBhMCVVMxEzARBgNVBAgMCldhc2hpbmd0b24xEDAOBgNVBAcMB1Nl
    ...certificate body truncated for brevity....
kdRGB6P2hpxstDOUIwAoCbhoaWwfA4ybJznf+jOQhAziNlRdKQRR8nODWpKt7H9w
dJ5nxsTk/fniJz86Ddtp6n8s82wYdkN3cVffeK72A9aTCOU=
-----END CERTIFICATE-----
```

The first part of the output is the certificate itself. The second part is the certificate chain that chains to the root CA certificate. Note that when you use the `--output text` option, a TAB character is inserted between the two certificate pieces (that is the cause of the indented text). If you intend to take this output and parse the certificates with other tools, you might need to remove the TAB character so it is processed correctly.

- For API details, see GetCertificate in *AWS CLI Command Reference*.

`import-certificate-authority-certificate`

The following code example shows how to use `import-certificate-authority-certificate`.

AWS CLI

To import your certificate authority certificate into ACM PCA

The following `import-certificate-authority-certificate` command imports the signed private CA certificate for the CA specified by the ARN into ACM PCA.

```
aws acm-pca import-certificate-authority-certificate --certificate-
authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-
authority/12345678-1234-1234-1234-123456789012 --certificate file://C:\ca_cert.pem
 --certificate-chain file://C:\ca_cert_chain.pem
```

- For API details, see ImportCertificateAuthorityCertificate in *AWS CLI Command Reference*.

`issue-certificate`

The following code example shows how to use `issue-certificate`.

AWS CLI

To issue a private certificate

The following `issue-certificate` command uses the private CA specified by the ARN to issue a private certificate.

```
aws acm-pca issue-certificate --certificate-authority-arn arn:aws:acm-pca:us-
west-2:123456789012:certificate-authority/12345678-1234-1234-1234-123456789012
 --csr file://C:\cert_1.csr --signing-algorithm "SHA256WITHRSA" --validity
 Value=365,Type="DAYS" --idempotency-token 1234
```

- For API details, see IssueCertificate in *AWS CLI Command Reference*.

`list-certificate-authorities`

The following code example shows how to use `list-certificate-authorities`.

AWS CLI

To list your private certificate authorities

The following `list-certificate-authorities` command lists information about all of the private CAs in your account.

```
aws acm-pca list-certificate-authorities --max-results 10
```

- For API details, see ListCertificateAuthorities in *AWS CLI Command Reference*.

`list-tags`

The following code example shows how to use `list-tags`.

AWS CLI

To list the tags for your certificate authority

The following `list-tags` command lists the tags associated with the private CA specified by the ARN.

```
aws acm-pca list-tags --certificate-authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-authority/123455678-1234-1234-1234-123456789012 --max-results 10
```

- For API details, see ListTags in *AWS CLI Command Reference*.

`revoke-certificate`

The following code example shows how to use `revoke-certificate`.

AWS CLI

To revoke a private certificate

The following `revoke-certificate` command revokes a private certificate from the CA identified by the ARN.

```
aws acm-pca revoke-certificate --certificate-authority-arn arn:aws:acm-pca:us-west-2:1234567890:certificate-authority/12345678-1234-1234-1234-123456789012 --certificate-serial 67:07:44:76:83:a9:b7:f4:05:56:27:ff:d5:5c:eb:cc --revocation-reason "KEY_COMPROMISE"
```

- For API details, see RevokeCertificate in *AWS CLI Command Reference*.

`tag-certificate-authority`

The following code example shows how to use `tag-certificate-authority`.

AWS CLI

To attach tags to a private certificate authority

The following `tag-certificate-authority` command attaches one or more tags to your private CA.

```
aws acm-pca tag-certificate-authority --certificate-authority-
arn arn:aws:acm-pca:us-west-2:123456789012:certificate-
authority/12345678-1234-1234-1234-123456789012 --tags Key=Admin,Value=Alice
```

- For API details, see TagCertificateAuthority in *AWS CLI Command Reference*.

`untag-certificate-authority`

The following code example shows how to use `untag-certificate-authority`.

AWS CLI

To remove one or more tags from your private certificate authority

The following `untag-certificate-authority` command removes tags from the private CA identified by the ARN.

```
aws acm-pca untag-certificate-authority --certificate-authority-
arn arn:aws:acm-pca:us-west-2:123456789012:certificate-
authority/12345678-1234-1234-1234-123456789012 --tags Key=Purpose,Value=Website
```

- For API details, see UntagCertificateAuthority in *AWS CLI Command Reference*.

`update-certificate-authority`

The following code example shows how to use `update-certificate-authority`.

AWS CLI

To update the configuration of your private certificate authority

The following `update-certificate-authority` command updates the status and configuration of the private CA identified by the ARN.

```
aws acm-pca update-certificate-authority --certificate-
authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-
authority/12345678-1234-1234-1234-1232456789012 --revocation-configuration file://C:
\revoke_config.txt --status "DISABLED"
```

- For API details, see UpdateCertificateAuthority in *AWS CLI Command Reference*.

AWS Proton examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Proton.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

- Actions

Actions

`cancel-service-instance-deployment`

The following code example shows how to use `cancel-service-instance-deployment`.

AWS CLI

To cancel a service instance deployment

The following `cancel-service-instance-deployment` example cancels a service instance deployment.

```
aws proton cancel-service-instance-deployment \
    --service-instance-name "instance-one" \
    --service-name "simple-svc"
```

Output:

```
{
    "serviceInstance": {
        "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/service-instance/instance-one",
        "createdAt": "2021-04-02T21:29:59.962000+00:00",
        "deploymentStatus": "CANCELLING",
        "environmentName": "simple-env",

        "lastDeploymentSucceededAt": "2021-04-02T21:38:00.823000+00:00",
        "name": "instance-one",
        "serviceName": "simple-svc",
        "spec": "proton: ServiceSpec\npipeline:\n my_sample_pipeline_optional_input: abc\n  my_sample_pipeline_required_input: '123'\ninstances:\n- name: my-instance\n  environment: MySimpleEnv\n  spec:\n    my_sample_service_instance_optional_input: def\n my_sample_service_instance_required_input: '456'\n- name: my-other-instance\n environment: MySimpleEnv\n  spec:\n    my_sample_service_instance_required_input: '789'\n",
        "templateMajorVersion": "1",
        "templateMinorVersion": "1",
        "templateName": "svc-simple"
    }
}
```

For more information, see Update a service instance in the *The AWS Proton Administrator Guide* or Update a service instance in the *The AWS Proton User Guide*.

- For API details, see CancelServiceInstanceDeployment in *AWS CLI Command Reference*.

`cancel-service-pipeline-deployment`

The following code example shows how to use `cancel-service-pipeline-deployment`.

AWS CLI

To cancel a service pipeline deployment

The following `cancel-service-pipeline-deployment` example cancels a service pipeline deployment.

```
aws proton cancel-service-pipeline-deployment \
    --service-name "simple-svc"
```

Output:

```
{
    "pipeline": {
        "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/pipeline",
        "createdAt": "2021-04-02T21:29:59.962000+00:00",
        "deploymentStatus": "CANCELLING",
        "lastDeploymentAttemptedAt": "2021-04-02T22:02:45.095000+00:00",
        "lastDeploymentSucceededAt": "2021-04-02T21:39:28.991000+00:00",
        "templateMajorVersion": "1",
        "templateMinorVersion": "1",
        "templateName": "svc-simple"
    }
}
```

For more information, see Update a service pipeline in the *The AWS Proton Administrator Guide* or Update a service pipeline in the *The AWS Proton User Guide*.

- For API details, see CancelServicePipelineDeployment in *AWS CLI Command Reference*.

`create-service`

The following code example shows how to use `create-service`.

AWS CLI

To create a service

The following `create-service` example creates a service with a service pipeline.

```
aws proton create-service \
    --name "MySimpleService" \
    --template-name "fargate-service" \
    --template-major-version "1" \
    --branch-name "mainline" \
    --repository-connection-arn "arn:aws:codestar-connections:region-id:account-
id:connection/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --repository-id "myorg/myapp" \
    --spec file://spec.yaml
```

Contents of `spec.yaml`:

```
proton: ServiceSpec
```

```
pipeline:
    my_sample_pipeline_required_input: "hello"
    my_sample_pipeline_optional_input: "bye"

instances:
    - name: "acme-network-dev"
        environment: "ENV_NAME"
        spec:
            my_sample_service_instance_required_input: "hi"
            my_sample_service_instance_optional_input: "ho"
```

Output:

```
{
    "service": {
        "arn": "arn:aws:proton:region-id:123456789012:service/MySimpleService",
        "createdAt": "2020-11-18T19:50:27.460000+00:00",
        "lastModifiedAt": "2020-11-18T19:50:27.460000+00:00",
        "name": "MySimpleService",
        "repositoryConnectionArn": "arn:aws:codestar-connections:region-
id:123456789012connection/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "repositoryId": "myorg/myapp",
        "status": "CREATE_IN_PROGRESS",
        "templateName": "fargate-service"
    }
}
```

For more information, see Create a service in the *The AWS Proton Administrator Guide* and Create a service in the *The AWS Proton User Guide*.

- For API details, see CreateService in *AWS CLI Command Reference*.

`delete-service`

The following code example shows how to use `delete-service`.

AWS CLI

To delete a service

The following `delete-service` example deletes a service.

```
aws proton delete-service \
    --name "simple-svc"
```

Output:

```
{
    "service": {
        "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc",
        "branchName": "mainline",
        "createdAt": "2020-11-28T22:40:50.512000+00:00",
        "description": "Edit by updating description",
        "lastModifiedAt": "2020-11-29T00:30:39.248000+00:00",
        "name": "simple-svc",
        "repositoryConnectionArn": "arn:aws:codestar-connections:region-
id:123456789012:connection/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "repositoryId": "myorg/myapp",
        "status": "DELETE_IN_PROGRESS",
        "templateName": "fargate-service"
    }
}
```

For more information, see Delete a service in the *The AWS Proton Administrator Guide*.

- For API details, see DeleteService in *AWS CLI Command Reference*.

`get-service-instance`

The following code example shows how to use `get-service-instance`.

AWS CLI

To get service instance details

The following `get-service-instance` example gets detail data for a service instance.

```
aws proton get-service-instance \
    --name "instance-one" \
    --service-name "simple-svc"
```

Output:

```
{
```

```
    "serviceInstance": {
        "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/service-
instance/instance-one",
        "createdAt": "2020-11-28T22:40:50.512000+00:00",
        "deploymentStatus": "SUCCEEDED",
        "environmentName": "simple-env",
        "lastDeploymentAttemptedAt": "2020-11-28T22:40:50.512000+00:00",
        "lastDeploymentSucceededAt": "2020-11-28T22:40:50.512000+00:00",
        "name": "instance-one",
        "serviceName": "simple-svc",
        "spec": "proton: ServiceSpec\npipeline:\n
 my_sample_pipeline_optional_input: hello world\n
 my_sample_pipeline_required_input: pipeline up\ninstances:\n- name: instance-one\n
 environment: my-simple-env\n  spec:\n    my_sample_service_instance_optional_input:
 Ola\n    my_sample_service_instance_required_input: Ciao\n",
        "templateMajorVersion": "1",
        "templateMinorVersion": "0",
        "templateName": "svc-simple"
    }
}
```

For more information, see View service data in the *The AWS Proton Administrator Guide* or View service data in the *The AWS Proton User Guide*.

- For API details, see GetServiceInstance in *AWS CLI Command Reference*.

`get-service`

The following code example shows how to use `get-service`.

AWS CLI

To get service details

The following `get-service` example gets detail data for a service.

```
aws proton get-service \
    --name "simple-svc"
```

Output:

```
{
```

```
    "service": {
        "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc",
        "branchName": "mainline",
        "createdAt": "2020-11-28T22:40:50.512000+00:00",
        "lastModifiedAt": "2020-11-28T22:44:51.207000+00:00",
        "name": "simple-svc",
        "pipeline": {
            "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/
pipeline/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "createdAt": "2020-11-28T22:40:50.512000+00:00",
            "deploymentStatus": "SUCCEEDED",
            "lastDeploymentAttemptedAt": "2020-11-28T22:40:50.512000+00:00",
            "lastDeploymentSucceededAt": "2020-11-28T22:40:50.512000+00:00",
            "spec": "proton: ServiceSpec\npipeline:\n
 my_sample_pipeline_required_input: hello\n  my_sample_pipeline_optional_input:

env\n  spec:\n    my_sample_service_instance_required_input: hi\n
 my_sample_service_instance_optional_input: ho\n",
        "status": "ACTIVE",
        "templateName": "svc-simple"
    }
}
```

For more information, see View service data in the *The AWS Proton Administrator Guide* or View service data in the *The AWS Proton User Guide*.

- For API details, see GetService in *AWS CLI Command Reference*.

list-service-instances

The following code example shows how to use `list-service-instances`.

AWS CLI

Example 1: To list all service instances

The following `list-service-instances` example lists service instances.

```
aws proton list-service-instances
```

Output:

```
{
    "serviceInstances": [
        {
            "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/
service-instance/instance-one",
            "createdAt": "2020-11-28T22:40:50.512000+00:00",
            "deploymentStatus": "SUCCEEDED",
            "environmentArn": "arn:aws:proton:region-id:123456789012:environment/
simple-env",
            "lastDeploymentAttemptedAt": "2020-11-28T22:40:50.512000+00:00",
            "lastDeploymentSucceededAt": "2020-11-28T22:40:50.512000+00:00",
            "name": "instance-one",
            "serviceName": "simple-svc",
            "templateMajorVersion": "1",
            "templateMinorVersion": "0",
            "templateName": "fargate-service"
        }
    ]
}
```

For more information, see View service instance data in the *The AWS Proton Administrator Guide* or View service instance data in the *The AWS Proton User Guide*.

Example 2: To list the specified service instance

The following `get-service-instance` example gets a service instance.

```
aws proton get-service-instance \
    --name "instance-one" \
    --service-name "simple-svc"
```

Output:

```
{
    "serviceInstance": {
        "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/service-
instance/instance-one",
        "createdAt": "2020-11-28T22:40:50.512000+00:00",
        "deploymentStatus": "SUCCEEDED",
        "environmentName": "simple-env",
        "lastDeploymentAttemptedAt": "2020-11-28T22:40:50.512000+00:00",
        "lastDeploymentSucceededAt": "2020-11-28T22:40:50.512000+00:00",
        "name": "instance-one",
        "serviceName": "simple-svc",
        "spec": "proton: ServiceSpec\npipeline:\n
 my_sample_pipeline_optional_input: hello world\n
 my_sample_pipeline_required_input: pipeline up\ninstances:\n- name: instance-one\n
 environment: my-simple-env\n  spec:\n    my_sample_service_instance_optional_input:
 Ola\n    my_sample_service_instance_required_input: Ciao\n",
        "templateMajorVersion": "1",
        "templateMinorVersion": "0",
        "templateName": "svc-simple"
    }
}
```

For more information, see View service instance data in the *The AWS Proton Administrator Guide* or View service instance data in the *The AWS Proton User Guide*.

- For API details, see ListServiceInstances in *AWS CLI Command Reference*.

`update-service-instance`

The following code example shows how to use `update-service-instance`.

AWS CLI

To update a service instance to a new minor version

The following `update-service-instance` example updates a service instance to a new minor version of its service template that adds a new instance named "my-other-instance" with a new required input.

```
aws proton update-service-instance \
    --service-name "simple-svc" \
    --spec "file://service-spec.yaml " \
```

```
    --template-major-version "1" \
    --template-minor-version "1" \
    --deployment-type "MINOR_VERSION" \
    --name "instance-one"
```

Contents of `service-spec.yaml`:

```
proton: ServiceSpec
pipeline:
    my_sample_pipeline_optional_input: "abc"
    my_sample_pipeline_required_input: "123"
instances:
    - name: "instance-one"
        environment: "simple-env"
        spec:
            my_sample_service_instance_optional_input: "def"
            my_sample_service_instance_required_input: "456"
    - name: "my-other-instance"
        environment: "simple-env"
        spec:
            my_sample_service_instance_required_input: "789"
```

Output:

```
{
    "serviceInstance": {
        "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/service-
instance/instance-one",
        "createdAt": "2021-04-02T21:29:59.962000+00:00",
        "deploymentStatus": "IN_PROGRESS",
        "environmentName": "arn:aws:proton:region-id:123456789012:environment/
simple-env",
        "lastDeploymentAttemptedAt": "2021-04-02T21:38:00.823000+00:00",
        "lastDeploymentSucceededAt": "2021-04-02T21:29:59.962000+00:00",
        "name": "instance-one",
        "serviceName": "simple-svc",
        "templateMajorVersion": "1",
        "templateMinorVersion": "0",
        "templateName": "svc-simple"
    }
}
```

For more information, see Update a service instance in the *The AWS Proton Administrator Guide* or Update a service instance in the *The AWS Proton User Guide*.

- For API details, see UpdateServiceInstance in *AWS CLI Command Reference*.

update-service-pipeline

The following code example shows how to use `update-service-pipeline`.

AWS CLI

To update a service pipeline

The following `update-service-pipeline` example updates a service pipeline to a new minor version of its service template.

```
aws proton update-service-pipeline \
    --service-name "simple-svc" \
    --spec "file://service-spec.yaml" \
    --template-major-version "1" \
    --template-minor-version "1" \
    --deployment-type "MINOR_VERSION"
```

Output:

```
{
    "pipeline": {
        "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/pipeline/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "createdAt": "2021-04-02T21:29:59.962000+00:00",
        "deploymentStatus": "IN_PROGRESS",
        "lastDeploymentAttemptedAt": "2021-04-02T21:39:28.991000+00:00",
        "lastDeploymentSucceededAt": "2021-04-02T21:29:59.962000+00:00",
        "spec": "proton: ServiceSpec\n\npipeline:\n
 my_sample_pipeline_optional_input: \"abc\"\n  my_sample_pipeline_required_input:
 \"123\"\n\ninstances:\n  - name: \"my-instance\"\n    environment: \"MySimpleEnv
\"\n    spec:\n      my_sample_service_instance_optional_input: \"def
\"\n      my_sample_service_instance_required_input: \"456\"\n  - name:
 \"my-other-instance\"\n    environment: \"MySimpleEnv\"\n    spec:\n
 my_sample_service_instance_required_input: \"789\"\n",
        "templateMajorVersion": "1",
        "templateMinorVersion": "0",
        "templateName": "svc-simple"
```

```
    }
}
```

For more information, see Update a service pipeline in the *The AWS Proton Administrator Guide* or Update a service pipeline in the *The AWS Proton User Guide*.

- For API details, see UpdateServicePipeline in *AWS CLI Command Reference*.

`update-service`

The following code example shows how to use `update-service`.

AWS CLI

To update a service

The following `update-service` example edits a service description.

```
aws proton update-service \
    --name "MySimpleService" \
    --description "Edit by updating description"
```

Output:

```
{
    "service": {
        "arn": "arn:aws:proton:region-id:123456789012:service/MySimpleService",
        "branchName": "mainline",
        "createdAt": "2021-03-12T22:39:42.318000+00:00",
        "description": "Edit by updating description",
        "lastModifiedAt": "2021-03-12T22:44:21.975000+00:00",
        "name": "MySimpleService",
        "repositoryConnectionArn": "arn:aws:codestar-connections:region-
id:123456789012:connection/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "repositoryId": "myorg/myapp",
        "status": "ACTIVE",
        "templateName": "fargate-service"
    }
}
```

For more information, see Edit a service in the *The AWS Proton Administrator Guide* or Edit a service in the *The AWS Proton User Guide*.

- For API details, see UpdateService in *AWS CLI Command Reference*.

Amazon RDS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon RDS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`add-option-to-option-group`

The following code example shows how to use `add-option-to-option-group`.

AWS CLI

To add an option to an option group

The following `add-option-to-option-group` example adds an option to the specified option group.

```
aws rds add-option-to-option-group \
    --option-group-name myoptiongroup \
    --options OptionName=OEM,Port=5500,DBSecurityGroupMemberships=default \
    --apply-immediately
```

Output:

```
{
    "OptionGroup": {
        "OptionGroupName": "myoptiongroup",
        "OptionGroupDescription": "Test Option Group",
        "EngineName": "oracle-ee",
```

```
        "MajorEngineVersion": "12.1",
        "Options": [
            {
                "OptionName": "Timezone",

            }
        ],
        "AllowsVpcAndNonVpcInstanceMemberships": false,
        "OptionGroupArn": "arn:aws:rds:us-east-1:123456789012:og:myoptiongroup"
    }
}
```

For more information, see Adding an Option to an Option Group in the *Amazon RDS User Guide*.

- For API details, see AddOptionToOptionGroup in *AWS CLI Command Reference*.

add-role-to-db-cluster

The following code example shows how to use `add-role-to-db-cluster`.

AWS CLI

To associate an AWS Identity and Access Management (IAM) role with a DB cluster

The following `add-role-to-db-cluster` example associates a role with a DB cluster.

```
aws rds add-role-to-db-cluster \
    --db-cluster-identifier mydbcluster \
    --role-arn arn:aws:iam::123456789012:role/RDSLoadFromS3
```

This command produces no output.

For more information, see Associating an IAM role with an Amazon Aurora MySQL DB cluster in the *Amazon Aurora User Guide*.

- For API details, see AddRoleToDbCluster in *AWS CLI Command Reference*.

`add-role-to-db-instance`

The following code example shows how to use `add-role-to-db-instance`.

AWS CLI

To associate an AWS Identity and Access Management (IAM) role with a DB instance

The following `add-role-to-db-instance` example adds the role to an Oracle DB instance named `test-instance`.

```
aws rds add-role-to-db-instance \
    --db-instance-identifier test-instance \
    --feature-name S3_INTEGRATION \
    --role-arn arn:aws:iam::111122223333:role/rds-s3-integration-role
```

This command produces no output.

For more information, see Prerequisites for Amazon RDS Oracle Integration with Amazon S3 in the *Amazon RDS User Guide*.

- For API details, see AddRoleToDbInstance in *AWS CLI Command Reference*.

`add-source-identifier-to-subscription`

The following code example shows how to use `add-source-identifier-to-subscription`.

AWS CLI

To add a source identifier to a subscription

The following `add-source-identifier` example adds another source identifier to an existing subscription.

```
aws rds add-source-identifier-to-subscription \
    --subscription-name my-instance-events \
```

```
    --source-identifier test-instance-repl
```

Output:

```
{
    "EventSubscription": {
        "SubscriptionCreationTime": "Tue Jul 31 23:22:01 UTC 2018",
        "CustSubscriptionId": "my-instance-events",
        "EventSubscriptionArn": "arn:aws:rds:us-east-1:123456789012:es:my-instance-
events",
        "Enabled": false,
        "Status": "modifying",
        "EventCategoriesList": [
            "backup",
            "recovery"
        ],
        "CustomerAwsId": "123456789012",
        "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:interesting-events",
        "SourceType": "db-instance",
        "SourceIdsList": [
            "test-instance",
            "test-instance-repl"
        ]
    }
}
```

- For API details, see AddSourceIdentifierToSubscription in *AWS CLI Command Reference*.

`add-tags-to-resource`

The following code example shows how to use `add-tags-to-resource`.

AWS CLI

To add tags to a resource

The following `add-tags-to-resource` example add tags to an RDS database.

```
aws rds add-tags-to-resource \
    --resource-name arn:aws:rds:us-east-1:123456789012:db:database-mysql \
    --tags "[{\"Key\": \"Name\",\"Value\": \"MyDatabase\"},{\"Key\": \"Environment
\",\"Value\": \"test\"}]"
```

This command produces no output.

For more information, see Tagging Amazon RDS Resources in the *Amazon RDS User Guide*.

- For API details, see AddTagsToResource in *AWS CLI Command Reference*.

`apply-pending-maintenance-action`

The following code example shows how to use `apply-pending-maintenance-action`.

AWS CLI

To apply pending maintenance actions

The following `apply-pending-maintenance-action` example applies the pending maintenance actions for a DB cluster.

```
aws rds apply-pending-maintenance-action \
    --resource-identifier arn:aws:rds:us-east-1:123456789012:cluster:my-db-cluster \
    --apply-action system-update \
    --opt-in-type immediate
```

Output:

```
{
    "ResourcePendingMaintenanceActions": {
        "ResourceIdentifier": "arn:aws:rds:us-east-1:123456789012:cluster:my-db-
cluster",
        "PendingMaintenanceActionDetails": [
            {
                "Action": "system-update",
                "OptInStatus": "immediate",
                "CurrentApplyDate": "2021-01-23T01:07:36.100Z",
                "Description": "Upgrade to Aurora PostgreSQL 3.3.2"
            }
        ]
    }
}
```

For more information, see Maintaining a DB instance in the *Amazon RDS User Guide* and Maintaining an Amazon Aurora DB cluster in the *Amazon Aurora User Guide*.

- For API details, see ApplyPendingMaintenanceAction in *AWS CLI Command Reference*.

`authorize-db-security-group-ingress`

The following code example shows how to use `authorize-db-security-group-ingress`.

AWS CLI

To associate an AWS Identity and Access Management (IAM) role with a DB instance

The following `authorize-db-security-group-ingress` example configures the default security group with an ingress rule for the CIDR IP range 192.0.2.0/24.

```
aws rds authorize-db-security-group-ingress \
    --db-security-group-name default \
    --cidrip 192.0.2.0/24
```

Output:

```
{
    "DBSecurityGroup": {
        "OwnerId": "123456789012",
        "DBSecurityGroupName": "default",
        "DBSecurityGroupDescription": "default",
        "EC2SecurityGroups": [],
        "IPRanges": [
            {
                "Status": "authorizing",
                "CIDRIP": "192.0.2.0/24"
            }
        ],
        "DBSecurityGroupArn": "arn:aws:rds:us-east-1:111122223333:secgrp:default"
    }
}
```

For more information, see Authorizing Network Access to a DB Security Group from an IP Range in the *Amazon RDS User Guide*.

- For API details, see AuthorizeDbSecurityGroupIngress in *AWS CLI Command Reference*.

`backtrack-db-cluster`

The following code example shows how to use `backtrack-db-cluster`.

AWS CLI

To backtrack an Aurora DB cluster

The following `backtrack-db-cluster` example backtracks the specified DB cluster sample-cluster to March 19, 2018, at 10 a.m.

```
aws rds backtrack-db-cluster --db-cluster-identifier sample-cluster --backtrack-
to 2018-03-19T10:00:00+00:00
```

This command outputs a JSON block that acknowledges the change to the RDS resource.

- For API details, see BacktrackDbCluster in *AWS CLI Command Reference*.

`cancel-export-task`

The following code example shows how to use `cancel-export-task`.

AWS CLI

To cancel a snapshot export to Amazon S3

The following `cancel-export-task` example cancels an export task in progress that is exporting a snapshot to Amazon S3.

```
aws rds cancel-export-task \
    --export-task-identifier my-s3-export-1
```

Output:

```
{
    "ExportTaskIdentifier": "my-s3-export-1",
    "SourceArn": "arn:aws:rds:us-east-1:123456789012:snapshot:publisher-final-
snapshot",
    "SnapshotTime": "2019-03-24T20:01:09.815Z",
    "S3Bucket": "amzn-s3-demo-bucket",
    "S3Prefix": "",
    "IamRoleArn": "arn:aws:iam::123456789012:role/service-role/export-snap-S3-role",
    "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/abcd0000-7bfd-4594-af38-
aabbccddeeff",
    "Status": "CANCELING",
```

```
    "PercentProgress": 0,
    "TotalExtractedDataInGB": 0
}
```

For more information, see Canceling a snapshot export task in the *Amazon RDS User Guide* or Canceling a snapshot export task in the *Amazon Aurora User Guide*.

- For API details, see CancelExportTask in *AWS CLI Command Reference*.

`copy-db-cluster-parameter-group`

The following code example shows how to use `copy-db-cluster-parameter-group`.

AWS CLI

To copy a DB cluster parameter group

The following `copy-db-cluster-parameter-group` example makes a copy of a DB cluster parameter group.

```
aws rds copy-db-cluster-parameter-group \
    --source-db-cluster-parameter-group-identifier mydbclusterpg \
    --target-db-cluster-parameter-group-identifier mydbclusterpgcopy \
    --target-db-cluster-parameter-group-description "Copy of mydbclusterpg parameter
 group"
```

Output:

```
{
    "DBClusterParameterGroup": {
        "DBClusterParameterGroupName": "mydbclusterpgcopy",
        "DBClusterParameterGroupArn": "arn:aws:rds:us-east-1:123456789012:cluster-
pg:mydbclusterpgcopy",
        "DBParameterGroupFamily": "aurora-mysql5.7",
        "Description": "Copy of mydbclusterpg parameter group"
    }
}
```

For more information, see Copying a DB Cluster Parameter Group in the *Amazon Aurora Users Guide*.

- For API details, see CopyDbClusterParameterGroup in *AWS CLI Command Reference*.

`copy-db-cluster-snapshot`

The following code example shows how to use `copy-db-cluster-snapshot`.

AWS CLI

To copy a DB cluster snapshot

The following `copy-db-cluster-snapshot` example creates a copy of a DB cluster snapshot, including its tags.

```
aws rds copy-db-cluster-snapshot \
    --source-db-cluster-snapshot-identifier arn:aws:rds:us-
east-1:123456789012:cluster-snapshot:rds:myaurora-2019-06-04-09-16
    --target-db-cluster-snapshot-identifier myclustersnapshotcopy \
    --copy-tags
```

Output:

```
{
    "DBClusterSnapshot": {
        "AvailabilityZones": [
            "us-east-1a",
            "us-east-1b",
            "us-east-1e"
        ],
        "DBClusterSnapshotIdentifier": "myclustersnapshotcopy",
        "DBClusterIdentifier": "myaurora",
        "SnapshotCreateTime": "2019-06-04T09:16:42.649Z",
        "Engine": "aurora-mysql",
        "AllocatedStorage": 0,
        "Status": "available",
        "Port": 0,
        "VpcId": "vpc-6594f31c",
        "ClusterCreateTime": "2019-04-15T14:18:42.785Z",
        "MasterUsername": "myadmin",
        "EngineVersion": "5.7.mysql_aurora.2.04.2",
        "LicenseModel": "aurora-mysql",
        "SnapshotType": "manual",
        "PercentProgress": 100,
        "StorageEncrypted": true,
        "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/AKIAIOSFODNN7EXAMPLE",
```

```
        "DBClusterSnapshotArn": "arn:aws:rds:us-east-1:123456789012:cluster-
snapshot:myclustersnapshotcopy",
        "IAMDatabaseAuthenticationEnabled": false
    }
}
```

For more information, see [Copying a Snapshot]() in the *Amazon Aurora User Guide*.

- For API details, see [CopyDbClusterSnapshot]() in *AWS CLI Command Reference*.

`copy-db-parameter-group`

The following code example shows how to use `copy-db-parameter-group`.

AWS CLI

To copy a DB cluster parameter group

The following `copy-db-parameter-group` example makes a copy of a DB parameter group.

```
aws rds copy-db-parameter-group \
    --source-db-parameter-group-identifier mydbpg \
    --target-db-parameter-group-identifier mydbpgcopy \
    --target-db-parameter-group-description "Copy of mydbpg parameter group"
```

Output:

```
{
    "DBParameterGroup": {
        "DBParameterGroupName": "mydbpgcopy",
        "DBParameterGroupArn": "arn:aws:rds:us-east-1:814387698303:pg:mydbpgcopy",
        "DBParameterGroupFamily": "mysql5.7",
        "Description": "Copy of mydbpg parameter group"
    }
}
```

For more information, see [Copying a DB Parameter Group]() in the *Amazon RDS Users Guide*.

- For API details, see [CopyDbParameterGroup]() in *AWS CLI Command Reference*.

`copy-db-snapshot`

The following code example shows how to use `copy-db-snapshot`.

AWS CLI

To copy a DB snapshot

The following `copy-db-snapshot` example creates a copy of a DB snapshot.

```
aws rds copy-db-snapshot \
    --source-db-snapshot-identifier rds:database-mysql-2019-06-06-08-38
    --target-db-snapshot-identifier mydbsnapshotcopy
```

Output:

```
{
    "DBSnapshot": {
        "VpcId": "vpc-6594f31c",
        "Status": "creating",
        "Encrypted": true,
        "SourceDBSnapshotIdentifier": "arn:aws:rds:us-
east-1:123456789012:snapshot:rds:database-mysql-2019-06-06-08-38",
        "MasterUsername": "admin",
        "Iops": 1000,
        "Port": 3306,
        "LicenseModel": "general-public-license",
        "DBSnapshotArn": "arn:aws:rds:us-
east-1:123456789012:snapshot:mydbsnapshotcopy",
        "EngineVersion": "5.6.40",
        "OptionGroupName": "default:mysql-5-6",
        "ProcessorFeatures": [],
        "Engine": "mysql",
        "StorageType": "io1",
        "DbiResourceId": "db-ZI7UJ5BLKMBYFGX7FDENCKADC4",
        "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/AKIAIOSFODNN7EXAMPLE",
        "SnapshotType": "manual",
        "IAMDatabaseAuthenticationEnabled": false,
        "SourceRegion": "us-east-1",
        "DBInstanceIdentifier": "database-mysql",
        "InstanceCreateTime": "2019-04-30T15:45:53.663Z",
        "AvailabilityZone": "us-east-1f",
        "PercentProgress": 0,
        "AllocatedStorage": 100,
        "DBSnapshotIdentifier": "mydbsnapshotcopy"
    }
}
```

For more information, see Copying a Snapshot in the *Amazon RDS User Guide*.

- For API details, see CopyDbSnapshot in *AWS CLI Command Reference*.

copy-option-group

The following code example shows how to use `copy-option-group`.

AWS CLI

To copy an option group

The following `copy-option-group` example makes a copy of an option group.

```
aws rds copy-option-group \
    --source-option-group-identifier myoptiongroup \
    --target-option-group-identifier new-option-group \
    --target-option-group-description "My option group copy"
```

Output:

```
{
    "OptionGroup": {
        "Options": [],
        "OptionGroupName": "new-option-group",
        "MajorEngineVersion": "11.2",
        "OptionGroupDescription": "My option group copy",
        "AllowsVpcAndNonVpcInstanceMemberships": true,
        "EngineName": "oracle-ee",
        "OptionGroupArn": "arn:aws:rds:us-east-1:123456789012:og:new-option-group"
    }
}
```

For more information, see Making a Copy of an Option Group in the *Amazon RDS User Guide*.

- For API details, see CopyOptionGroup in *AWS CLI Command Reference*.

create-blue-green-deployment

The following code example shows how to use `create-blue-green-deployment`.

AWS CLI

Example 1: To create a blue/green deployment for an RDS for MySQL DB instance

The following `create-blue-green-deployment` example creates a blue/green deployment for a MySQL DB instance.

```
aws rds create-blue-green-deployment \
    --blue-green-deployment-name bgd-cli-test-instance \
    --source arn:aws:rds:us-east-1:123456789012:db:my-db-instance \
    --target-engine-version 8.0 \
    --target-db-parameter-group-name mysql-80-group
```

Output:

```
{
    "BlueGreenDeployment": {
        "BlueGreenDeploymentIdentifier": "bgd-v53303651eexfake",
        "BlueGreenDeploymentName": "bgd-cli-test-instance",
        "Source": "arn:aws:rds:us-east-1:123456789012:db:my-db-instance",
        "SwitchoverDetails": [
            {
                "SourceMember": "arn:aws:rds:us-east-1:123456789012:db:my-db-
instance"
            },
            {
                "SourceMember": "arn:aws:rds:us-east-1:123456789012:db:my-db-
instance-replica-1"
            },
            {
                "SourceMember": "arn:aws:rds:us-east-1:123456789012:db:my-db-
instance-replica-2"
            },
            {
                "SourceMember": "arn:aws:rds:us-east-1:123456789012:db:my-db-
instance-replica-3"
            }
        ],
        "Tasks": [
            {
                "Name": "CREATING_READ_REPLICA_OF_SOURCE",
                "Status": "PENDING"
            },
```

```
            {
                "Name": "DB_ENGINE_VERSION_UPGRADE",
                "Status": "PENDING"
            },
            {
                "Name": "CONFIGURE_BACKUPS",
                "Status": "PENDING"
            },
            {
                "Name": "CREATING_TOPOLOGY_OF_SOURCE",
                "Status": "PENDING"
            }
        ],
        "Status": "PROVISIONING",
        "CreateTime": "2022-02-25T21:18:51.183000+00:00"
    }
}
```

For more information, see [Creating a blue/green deployment](#) in the *Amazon RDS User Guide*.

Example 2: To create a blue/green deployment for an Aurora MySQL DB cluster

The following `create-blue-green-deployment` example creates a blue/green deployment for an Aurora MySQL DB cluster.

```
aws rds create-blue-green-deployment \
    --blue-green-deployment-name my-blue-green-deployment \
    --source arn:aws:rds:us-east-1:123456789012:cluster:my-aurora-mysql-cluster \
    --target-engine-version 8.0 \
    --target-db-cluster-parameter-group-name ams-80-binlog-enabled \
    --target-db-parameter-group-name mysql-80-cluster-group
```

Output:

```
{
      "BlueGreenDeployment": {
        "BlueGreenDeploymentIdentifier": "bgd-wi89nwzglccsfake",
        "BlueGreenDeploymentName": "my-blue-green-deployment",
        "Source": "arn:aws:rds:us-east-1:123456789012:cluster:my-aurora-mysql-
cluster",
        "SwitchoverDetails": [
          {
```

```
            "SourceMember": "arn:aws:rds:us-east-1:123456789012:cluster:my-aurora-
mysql-cluster",
            "Status": "PROVISIONING"
          },
          {
            "SourceMember": "arn:aws:rds:us-east-1:123456789012:db:my-aurora-mysql-
cluster-1",
            "Status": "PROVISIONING"
          },
          {
            "SourceMember": "arn:aws:rds:us-east-1:123456789012:db:my-aurora-mysql-
cluster-2",
            "Status": "PROVISIONING"
          },
          {
            "SourceMember": "arn:aws:rds:us-east-1:123456789012:db:my-aurora-mysql-
cluster-3",
            "Status": "PROVISIONING"
          },
          {
            "SourceMember": "arn:aws:rds:us-east-1:123456789012:cluster-endpoint:my-
excluded-member-endpoint",
            "Status": "PROVISIONING"
          },
          {
            "SourceMember": "arn:aws:rds:us-east-1:123456789012:cluster-endpoint:my-
reader-endpoint",
            "Status": "PROVISIONING"
          }
        ],
        "Tasks": [
          {
            "Name": "CREATING_READ_REPLICA_OF_SOURCE",
            "Status": "PENDING"
          },
          {
            "Name": "DB_ENGINE_VERSION_UPGRADE",
            "Status": "PENDING"
          },
          {
            "Name": "CREATE_DB_INSTANCES_FOR_CLUSTER",
            "Status": "PENDING"
          },
          {
```

```
                "Name": "CREATE_CUSTOM_ENDPOINTS",
                "Status": "PENDING"
            }
        ],
        "Status": "PROVISIONING",
        "CreateTime": "2022-02-25T21:12:00.288000+00:00"
    }
}
```

For more information, see Creating a blue/green deployment in the *Amazon Aurora User Guide*.

- For API details, see CreateBlueGreenDeployment in *AWS CLI Command Reference*.

`create-db-cluster-endpoint`

The following code example shows how to use `create-db-cluster-endpoint`.

AWS CLI

To create a custom DB cluster endpoint

The following `create-db-cluster-endpoint` example creates a custom DB cluster endpoint and associate it with the specified Aurora DB cluster.

```
aws rds create-db-cluster-endpoint \
    --db-cluster-endpoint-identifier mycustomendpoint \
    --endpoint-type reader \
    --db-cluster-identifier mydbcluster \
    --static-members dbinstance1 dbinstance2
```

Output:

```
{
    "DBClusterEndpointIdentifier": "mycustomendpoint",
    "DBClusterIdentifier": "mydbcluster",
    "DBClusterEndpointResourceIdentifier": "cluster-endpoint-ANPAJ4AE5446DAEXAMPLE",
    "Endpoint": "mycustomendpoint.cluster-custom-cnpexample.us-
east-1.rds.amazonaws.com",
    "Status": "creating",
    "EndpointType": "CUSTOM",
    "CustomEndpointType": "READER",
    "StaticMembers": [
        "dbinstance1",
```

```
        "dbinstance2"
    ],
    "ExcludedMembers": [],
    "DBClusterEndpointArn": "arn:aws:rds:us-east-1:123456789012:cluster-
endpoint:mycustomendpoint"
}
```

For more information, see Amazon Aurora Connection Management in the *Amazon Aurora User Guide*.

- For API details, see CreateDbClusterEndpoint in *AWS CLI Command Reference*.

`create-db-cluster-parameter-group`

The following code example shows how to use `create-db-cluster-parameter-group`.

AWS CLI

To create a DB cluster parameter group

The following `create-db-cluster-parameter-group` example creates a DB cluster parameter group.

```
aws rds create-db-cluster-parameter-group \
    --db-cluster-parameter-group-name mydbclusterparametergroup \
    --db-parameter-group-family aurora5.6 \
    --description "My new cluster parameter group"
```

Output:

```
{
    "DBClusterParameterGroup": {
        "DBClusterParameterGroupName": "mydbclusterparametergroup",
        "DBParameterGroupFamily": "aurora5.6",
        "Description": "My new cluster parameter group",
        "DBClusterParameterGroupArn": "arn:aws:rds:us-east-1:123456789012:cluster-
pg:mydbclusterparametergroup"
    }
}
```

For more information, see Creating a DB Cluster Parameter Group in the *Amazon Aurora User Guide*.

- For API details, see CreateDbClusterParameterGroup in *AWS CLI Command Reference*.

`create-db-cluster-snapshot`

The following code example shows how to use `create-db-cluster-snapshot`.

AWS CLI

To create a DB cluster snapshot

The following `create-db-cluster-snapshot` example creates a DB cluster snapshot.

```
aws rds create-db-cluster-snapshot \
    --db-cluster-identifier mydbcluster \
    --db-cluster-snapshot-identifier mydbclustersnapshot
```

Output:

```
{
    "DBClusterSnapshot": {
        "AvailabilityZones": [
            "us-east-1a",
            "us-east-1b",
            "us-east-1e"
        ],
        "DBClusterSnapshotIdentifier": "mydbclustersnapshot",
        "DBClusterIdentifier": "mydbcluster",
        "SnapshotCreateTime": "2019-06-18T21:21:00.469Z",
        "Engine": "aurora-mysql",
        "AllocatedStorage": 1,
        "Status": "creating",
        "Port": 0,
        "VpcId": "vpc-6594f31c",
        "ClusterCreateTime": "2019-04-15T14:18:42.785Z",
        "MasterUsername": "myadmin",
        "EngineVersion": "5.7.mysql_aurora.2.04.2",
        "LicenseModel": "aurora-mysql",
        "SnapshotType": "manual",
        "PercentProgress": 0,
        "StorageEncrypted": true,
        "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/AKIAIOSFODNN7EXAMPLE",
        "DBClusterSnapshotArn": "arn:aws:rds:us-east-1:123456789012:cluster-
snapshot:mydbclustersnapshot",
```

```
            "IAMDatabaseAuthenticationEnabled": false
        }
    }
```

For more information, see [Creating a DB Cluster Snapshot]() in the *Amazon Aurora User Guide*.

- For API details, see [CreateDbClusterSnapshot]() in *AWS CLI Command Reference*.

`create-db-cluster`

The following code example shows how to use `create-db-cluster`.

AWS CLI

Example 1: To create a MySQL 5.7--compatible DB cluster

The following `create-db-cluster` example creates a MySQL 5.7-compatible DB cluster using the default engine version. Replace the sample password `secret99` with a secure password. When you use the console to create a DB cluster, Amazon RDS automatically creates the writer DB instance for your DB cluster. However, when you use the AWS CLI to create a DB cluster, you must explicitly create the writer DB instance for your DB cluster using the `create-db-instance` AWS CLI command.

```
aws rds create-db-cluster \
    --db-cluster-identifier sample-cluster \
    --engine aurora-mysql \
    --engine-version 5.7 \
    --master-username admin \
    --master-user-password secret99 \
    --db-subnet-group-name default \
    --vpc-security-group-ids sg-0b9130572daf3dc16
```

Output:

```
{
    "DBCluster": {
        "DBSubnetGroup": "default",
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sg-0b9130572daf3dc16",
                "Status": "active"
            }
```

```
        ],
        "AllocatedStorage": 1,
        "AssociatedRoles": [],
        "PreferredBackupWindow": "09:12-09:42",
        "ClusterCreateTime": "2023-02-27T23:21:33.048Z",
        "DeletionProtection": false,
        "IAMDatabaseAuthenticationEnabled": false,

east-1.rds.amazonaws.com",
        "CopyTagsToSnapshot": false
    }
}
```

Example 2: To create a PostgreSQL--compatible DB cluster

The following `create-db-cluster` example creates a PostgreSQL-compatible DB cluster using the default engine version. Replace the example password `secret99` with a secure password. When you use the console to create a DB cluster, Amazon RDS automatically creates the writer DB instance for your DB cluster. However, when you use the AWS CLI to create a DB cluster, you must explicitly create the writer DB instance for your DB cluster using the `create-db-instance` AWS CLI command.

```
aws rds create-db-cluster \
    --db-cluster-identifier sample-pg-cluster \
    --engine aurora-postgresql \
    --master-username master \
    --master-user-password secret99 \
    --db-subnet-group-name default \
    --vpc-security-group-ids sg-0b9130572daf3dc16
```

Output:

```
{
    "DBCluster": {
        "Endpoint": "sample-pg-cluster.cluster-cnpexample.us-
east-1.rds.amazonaws.com",
        "HttpEndpointEnabled": false,
        "DBClusterMembers": [],
        "EngineMode": "provisioned",
        "CopyTagsToSnapshot": false,
        "HostedZoneId": "Z2R2ITUGPM61AM",
        "IAMDatabaseAuthenticationEnabled": false,
        "AllocatedStorage": 1,
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sg-0b9130572daf3dc16",
                "Status": "active"
            }
        ],
        "DeletionProtection": false,
        "StorageEncrypted": false,
        "BackupRetentionPeriod": 1,
        "PreferredBackupWindow": "09:56-10:26",

            "us-east-1b",
            "us-east-1c"
        ],
        "ReadReplicaIdentifiers": [],
        "DBSubnetGroup": "default"
    }
}
```

For more information, see Creating an Amazon Aurora DB cluster in the *Amazon Aurora User Guide*.

- For API details, see CreateDbCluster in *AWS CLI Command Reference*.

`create-db-instance-read-replica`

The following code example shows how to use `create-db-instance-read-replica`.

AWS CLI

To create a DB instance read replica

This example creates a read replica of an existing DB instance named `test-instance`. The read replica is named `test-instance-repl`.

```
aws rds create-db-instance-read-replica \
    --db-instance-identifier test-instance-repl \
    --source-db-instance-identifier test-instance
```

Output:

```
{
    "DBInstance": {
        "IAMDatabaseAuthenticationEnabled": false,
```

```
        "MonitoringInterval": 0,
        "DBInstanceArn": "arn:aws:rds:us-east-1:123456789012:db:test-instance-repl",
        "ReadReplicaSourceDBInstanceIdentifier": "test-instance",
        "DBInstanceIdentifier": "test-instance-repl",
        ...some output truncated...
    }
}
```

- For API details, see CreateDbInstanceReadReplica in *AWS CLI Command Reference*.

`create-db-instance`

The following code example shows how to use `create-db-instance`.

AWS CLI

To create a DB instance

The following `create-db-instance` example uses the required options to launch a new DB instance.

```
aws rds create-db-instance \
    --db-instance-identifier test-mysql-instance \
    --db-instance-class db.t3.micro \
    --engine mysql \
    --master-username admin \
    --master-user-password secret99 \
    --allocated-storage 20
```

Output:

```
{
    "DBInstance": {
        "DBInstanceIdentifier": "test-mysql-instance",
        "DBInstanceClass": "db.t3.micro",
        "Engine": "mysql",
        "DBInstanceStatus": "creating",
        "MasterUsername": "admin",
        "AllocatedStorage": 20,
        "PreferredBackupWindow": "12:55-13:25",
        "BackupRetentionPeriod": 1,
        "DBSecurityGroups": [],
```

```
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sg-12345abc",
                "Status": "active"
            }
        ],
        "DBParameterGroups": [
            {
                "DBParameterGroupName": "default.mysql5.7",
                "ParameterApplyStatus": "in-sync"
            }
        ],
        "DBSubnetGroup": {
            "DBSubnetGroupName": "default",
            "DBSubnetGroupDescription": "default",

create-db-parameter-group

The following code example shows how to use `create-db-parameter-group`.

AWS CLI

To create a DB parameter group

The following `create-db-parameter-group` example creates a DB parameter group.

```
aws rds create-db-parameter-group \
    --db-parameter-group-name mydbparametergroup \
    --db-parameter-group-family MySQL5.6 \
    --description "My new parameter group"
```

Output:

```
{
    "DBParameterGroup": {
        "DBParameterGroupName": "mydbparametergroup",
        "DBParameterGroupFamily": "mysql5.6",
        "Description": "My new parameter group",
        "DBParameterGroupArn": "arn:aws:rds:us-
east-1:123456789012:pg:mydbparametergroup"
    }
}
```

For more information, see Creating a DB Parameter Group in the *Amazon RDS User Guide*.

- For API details, see CreateDBParameterGroup in *AWS CLI Command Reference*.

create-db-proxy-endpoint

The following code example shows how to use `create-db-proxy-endpoint`.

AWS CLI

To create a DB proxy endpoint for an RDS database

The following `create-db-proxy-endpoint` example creates a DB proxy endpoint.

```
aws rds create-db-proxy-endpoint \
```

```
    --db-proxy-name proxyExample \
    --db-proxy-endpoint-name "proxyep1" \
    --vpc-subnet-ids subnetgroup1 subnetgroup2
```

Output:

```
{
"DBProxyEndpoint": {
        "DBProxyEndpointName": "proxyep1",
        "DBProxyEndpointArn": "arn:aws:rds:us-east-1:123456789012:db-proxy-
endpoint:prx-endpoint-0123a01b12345c0ab",
        "DBProxyName": "proxyExample",
        "Status": "creating",
        "VpcId": "vpc-1234567",
        "VpcSecurityGroupIds": [
            "sg-1234",
            "sg-5678"
        ],
        "VpcSubnetIds": [
            "subnetgroup1",
            "subnetgroup2"
        ],
        "Endpoint": "proxyep1.endpoint.proxy-ab0cd1efghij.us-
east-1.rds.amazonaws.com",
        "CreatedDate": "2023-04-05T16:09:33.452000+00:00",
        "TargetRole": "READ_WRITE",
        "IsDefault": false
    }
}
```

For more information, see Creating a proxy endpoint in the *Amazon RDS User Guide* and Creating a proxy endpoint in the *Amazon Aurora User Guide*.

- For API details, see CreateDbProxyEndpoint in *AWS CLI Command Reference*.

`create-db-proxy`

The following code example shows how to use `create-db-proxy`.

AWS CLI

To create a DB proxy for an RDS database

The following `create-db-proxy` example creates a DB proxy.

```
aws rds create-db-proxy \
    --db-proxy-name proxyExample \
    --engine-family MYSQL \
    --auth
 Description="proxydescription1",AuthScheme="SECRETS",SecretArn="arn:aws:secretsmanager:us-
west-2:123456789123:secret:secretName-1234f",IAMAuth="DISABLED",ClientPasswordAuthType="MYSQ
 \
    --role-arn arn:aws:iam::123456789123:role/ProxyRole \
    --vpc-subnet-ids subnetgroup1 subnetgroup2
```

Output:

```
{
"DBProxy": {
        "DBProxyName": "proxyExample",
        "DBProxyArn": "arn:aws:rds:us-east-1:123456789012:db-
proxy:prx-0123a01b12345c0ab",

            "CreatedDate": "2023-04-05T16:09:33.452000+00:00",
            "UpdatedDate": "2023-04-13T01:49:38.568000+00:00"
        }
    }
```

For more information, see Creating an RDS Proxy in the *Amazon RDS User Guide* and Creating an RDS Proxy in the *Amazon Aurora User Guide*.

- For API details, see CreateDbProxy in *AWS CLI Command Reference*.

`create-db-security-group`

The following code example shows how to use `create-db-security-group`.

AWS CLI

To create an Amazon RDS DB security group

The following `create-db-security-group` command creates a new Amazon RDS DB security group:

```
aws rds create-db-security-group --db-security-group-name mysecgroup --db-security-group-description "My Test Security Group"
```

In the example, the new DB security group is named `mysecgroup` and has a description.

Output:

```
{
    "DBSecurityGroup": {
        "OwnerId": "123456789012",
        "DBSecurityGroupName": "mysecgroup",
        "DBSecurityGroupDescription": "My Test Security Group",
        "VpcId": "vpc-a1b2c3d4",
        "EC2SecurityGroups": [],
        "IPRanges": [],
        "DBSecurityGroupArn": "arn:aws:rds:us-west-2:123456789012:secgrp:mysecgroup"
    }
}
```

- For API details, see CreateDbSecurityGroup in *AWS CLI Command Reference*.

`create-db-shard-group`

The following code example shows how to use `create-db-shard-group`.

AWS CLI

Example 1: To create an Aurora PostgreSQL primary DB cluster

The following `create-db-cluster` example creates an Aurora PostgreSQL SQL primary DB cluster that's compatible with Aurora Serverless v2 and Aurora Limitless Database.

```
aws rds create-db-cluster \
    --db-cluster-identifier my-sv2-cluster \
    --engine aurora-postgresql \
    --engine-version 15.2-limitless \
    --storage-type aurora-iopt1 \
    --serverless-v2-scaling-configuration MinCapacity=2,MaxCapacity=16 \
    --enable-limitless-database \
    --master-username myuser \
    --master-user-password mypassword \
    --enable-cloudwatch-logs-exports postgresql
```

Output:

```
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "us-east-2b",
            "us-east-2c",
            "us-east-2a"
        ],
        "BackupRetentionPeriod": 1,
        "DBClusterIdentifier": "my-sv2-cluster",
        "DBClusterParameterGroup": "default.aurora-postgresql15",
        "DBSubnetGroup": "default",
        "Status": "creating",
        "Endpoint": "my-sv2-cluster.cluster-cekycexample.us-
east-2.rds.amazonaws.com",
        "ReaderEndpoint": "my-sv2-cluster.cluster-ro-cekycexample.us-
east-2.rds.amazonaws.com",
        "MultiAZ": false,
        "Engine": "aurora-postgresql",
```

```
        "EngineVersion": "15.2-limitless",
        "Port": 5432,
        "MasterUsername": "myuser",
        "PreferredBackupWindow": "06:05-06:35",
        "PreferredMaintenanceWindow": "mon:08:25-mon:08:55",
        "ReadReplicaIdentifiers": [],
        "DBClusterMembers": [],
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sg-########",
                "Status": "active"
            }
        ],
        "HostedZoneId": "Z2XHWR1EXAMPLE",
        "StorageEncrypted": false,
        "DbClusterResourceId": "cluster-XYEDT6ML6FHIXH4Q2J1EXAMPLE",
        "DBClusterArn": "arn:aws:rds:us-east-2:123456789012:cluster:my-sv2-cluster",
        "AssociatedRoles": [],
        "IAMDatabaseAuthenticationEnabled": false,
        "ClusterCreateTime": "2024-02-19T16:24:07.771000+00:00",
        "EnabledCloudwatchLogsExports": [
            "postgresql"
        ],
        "EngineMode": "provisioned",
        "DeletionProtection": false,
        "HttpEndpointEnabled": false,
        "CopyTagsToSnapshot": false,
        "CrossAccountClone": false,
        "DomainMemberships": [],
        "TagList": [],
        "StorageType": "aurora-iopt1",
        "AutoMinorVersionUpgrade": true,
        "ServerlessV2ScalingConfiguration": {
            "MinCapacity": 2.0,
            "MaxCapacity": 16.0
        },
        "NetworkType": "IPV4",
        "IOOptimizedNextAllowedModificationTime":
 "2024-03-21T16:24:07.781000+00:00",

            "MinRequiredACU": 96.0
        }
    }
```

```
}
```

Example 2: To create the primary (writer) DB instance

The following `create-db-instance` example creates an Aurora Serverless v2 primary (writer) DB instance. When you use the console to create a DB cluster, Amazon RDS automatically creates the writer DB instance for your DB cluster. However, when you use the AWS CLI to create a DB cluster, you must explicitly create the writer DB instance for your DB cluster using the `create-db-instance` AWS CLI command.

```
aws rds create-db-instance \
    --db-instance-identifier my-sv2-instance \
    --db-cluster-identifier my-sv2-cluster \
    --engine aurora-postgresql \
    --db-instance-class db.serverless
```

Output:

```
{
    "DBInstance": {
        "DBInstanceIdentifier": "my-sv2-instance",
        "DBInstanceClass": "db.serverless",
        "Engine": "aurora-postgresql",
        "DBInstanceStatus": "creating",
        "MasterUsername": "myuser",
        "AllocatedStorage": 1,

```

Example 3: To create the DB shard group

The following `create-db-shard-group` example creates a DB shard group in your Aurora PostgreSQL primary DB cluster.

```
aws rds create-db-shard-group \
    --db-shard-group-identifier my-db-shard-group \
    --db-cluster-identifier my-sv2-cluster \
    --max-acu 768
```

Output:

```
{
    "DBShardGroupResourceId": "shardgroup-a6e3a0226aa243e2ac6c7a1234567890",
    "DBShardGroupIdentifier": "my-db-shard-group",

    "MaxACU": 768.0,
    "ComputeRedundancy": 0,
    "Status": "creating",
    "PubliclyAccessible": false,
    "Endpoint": "my-sv2-cluster.limitless-cekycexample.us-east-2.rds.amazonaws.com"
}
```

For more information, see Using Aurora Serverless v2 in the *Amazon Aurora User Guide*.

- For API details, see CreateDbShardGroup in *AWS CLI Command Reference*.

`create-db-snapshot`

The following code example shows how to use `create-db-snapshot`.

AWS CLI

To create a DB snapshot

The following `create-db-snapshot` example creates a DB snapshot.

```
aws rds create-db-snapshot \
    --db-instance-identifier database-mysql \
    --db-snapshot-identifier mydbsnapshot
```

Output:

```
{
    "DBSnapshot": {
        "DBSnapshotIdentifier": "mydbsnapshot",
        "DBInstanceIdentifier": "database-mysql",
        "Engine": "mysql",
        "AllocatedStorage": 100,
        "Status": "creating",
        "Port": 3306,
        "AvailabilityZone": "us-east-1b",
        "VpcId": "vpc-6594f31c",
```

```
            "InstanceCreateTime": "2019-04-30T15:45:53.663Z",
            "MasterUsername": "admin",
            "EngineVersion": "5.6.40",
            "LicenseModel": "general-public-license",
            "SnapshotType": "manual",
            "Iops": 1000,
            "OptionGroupName": "default:mysql-5-6",
            "PercentProgress": 0,
            "StorageType": "io1",
            "Encrypted": true,
            "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/AKIAIOSFODNN7EXAMPLE",
            "DBSnapshotArn": "arn:aws:rds:us-east-1:123456789012:snapshot:mydbsnapshot",
            "IAMDatabaseAuthenticationEnabled": false,
            "ProcessorFeatures": [],
            "DbiResourceId": "db-AKIAIOSFODNN7EXAMPLE"
    }
}
```

For more information, see Creating a DB Snapshot in the *Amazon RDS User Guide*.

- For API details, see CreateDBSnapshot in *AWS CLI Command Reference*.

`create-db-subnet-group`

The following code example shows how to use `create-db-subnet-group`.

AWS CLI

To create a DB subnet group

The following `create-db-subnet-group` example creates a DB subnet group called `mysubnetgroup` using existing subnets.

```
aws rds create-db-subnet-group \
    --db-subnet-group-name mysubnetgroup \
    --db-subnet-group-description "test DB subnet group" \
    --subnet-ids
 '["subnet-0a1dc4e1a6f123456","subnet-070dd7ecb3aaaaaaa","subnet-00f5b198bc0abcdef"]'
```

Output:

```
{
    "DBSubnetGroup": {
```

```
        "DBSubnetGroupName": "mysubnetgroup",
        "DBSubnetGroupDescription": "test DB subnet group",
        "VpcId": "vpc-0f08e7610a1b2c3d4",
        "SubnetGroupStatus": "Complete",
        "Subnets": [
            {
                "SubnetIdentifier": "subnet-070dd7ecb3aaaaaaa",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2b"
                },
                "SubnetStatus": "Active"
            },
            {
                "SubnetIdentifier": "subnet-00f5b198bc0abcdef",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2d"
                },
                "SubnetStatus": "Active"
            },
            {
                "SubnetIdentifier": "subnet-0a1dc4e1a6f123456",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2b"
                },
                "SubnetStatus": "Active"
            }
        ],
        "DBSubnetGroupArn": "arn:aws:rds:us-
west-2:0123456789012:subgrp:mysubnetgroup"
    }
}
```

For more information, see Creating a DB Instance in a VPC in the *Amazon RDS User Guide*.

- For API details, see CreateDbSubnetGroup in *AWS CLI Command Reference*.

`create-event-subscription`

The following code example shows how to use `create-event-subscription`.

AWS CLI

To create an event subscription

The following `create-event-subscription` example creates a subscription for backup and recovery events for DB instances in the current AWS account. Notifications are sent to an Amazon Simple Notification Service topic, specified by `--sns-topic-arn`.

```
aws rds create-event-subscription \
    --subscription-name my-instance-events \
    --source-type db-instance \
    --event-categories '["backup","recovery"]' \
    --sns-topic-arn arn:aws:sns:us-east-1:123456789012:interesting-events
```

Output:

```
{
    "EventSubscription": {
        "Status": "creating",
        "CustSubscriptionId": "my-instance-events",
        "SubscriptionCreationTime": "Tue Jul 31 23:22:01 UTC 2018",
        "EventCategoriesList": [
            "backup",
            "recovery"
        ],
        "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:interesting-events",
        "CustomerAwsId": "123456789012",
        "EventSubscriptionArn": "arn:aws:rds:us-east-1:123456789012:es:my-instance-
events",
        "SourceType": "db-instance",
        "Enabled": true
    }
}
```

- For API details, see CreateEventSubscription in *AWS CLI Command Reference*.

`create-global-cluster`

The following code example shows how to use `create-global-cluster`.

AWS CLI

To create a global DB cluster

The following `create-global-cluster` example creates a new Aurora MySQL-compatible global DB cluster.

```
aws rds create-global-cluster \
    --global-cluster-identifier myglobalcluster \
    --engine aurora-mysql
```

Output:

```
{
    "GlobalCluster": {
        "GlobalClusterIdentifier": "myglobalcluster",
        "GlobalClusterResourceId": "cluster-f0e523bfe07aabb",
        "GlobalClusterArn": "arn:aws:rds::123456789012:global-
cluster:myglobalcluster",
        "Status": "available",
        "Engine": "aurora-mysql",
        "EngineVersion": "5.7.mysql_aurora.2.07.2",
        "StorageEncrypted": false,
        "DeletionProtection": false,
        "GlobalClusterMembers": []
    }
}
```

For more information, see Creating an Aurora global database in the *Amazon Aurora User Guide*.

- For API details, see CreateGlobalCluster in *AWS CLI Command Reference*.

`create-option-group`

The following code example shows how to use `create-option-group`.

AWS CLI

To Create an Amazon RDS option group

The following `create-option-group` command creates a new Amazon RDS option group for `Oracle Enterprise Edition` version `11.2`, is named ``MyOptionGroup` and includes a description.

```
aws rds create-option-group \
    --option-group-name MyOptionGroup \
    --engine-name oracle-ee \
    --major-engine-version 11.2 \
    --option-group-description "Oracle Database Manager Database Control"
```

Output:

```
{
    "OptionGroup": {
        "OptionGroupName": "myoptiongroup",
        "OptionGroupDescription": "Oracle Database Manager Database Control",
        "EngineName": "oracle-ee",
        "MajorEngineVersion": "11.2",
        "Options": [],
        "AllowsVpcAndNonVpcInstanceMemberships": true,
        "OptionGroupArn": "arn:aws:rds:us-west-2:123456789012:og:myoptiongroup"
    }
}
```

- For API details, see CreateOptionGroup in *AWS CLI Command Reference*.

`delete-blue-green-deployment`

The following code example shows how to use `delete-blue-green-deployment`.

AWS CLI

Example 1: To delete resources in green environment for an RDS for MySQL DB instance

The following `delete-blue-green-deployment` example deletes the resources in a green environment for an RDS for MySQL DB instance.

```
aws rds delete-blue-green-deployment \
    --blue-green-deployment-identifier bgd-v53303651eexfake \
    --delete-target
```

Output:

```
{
    "BlueGreenDeployment": {
        "BlueGreenDeploymentIdentifier": "bgd-v53303651eexfake",
        "BlueGreenDeploymentName": "bgd-cli-test-instance",
        "Source": "arn:aws:rds:us-east-1:123456789012:db:my-db-instance",
        "Target": "arn:aws:rds:us-east-1:123456789012:db:my-db-instance-green-
rkfbpe",

    }
}
```

For more information, see Deleting a blue/green deployment in the *Amazon RDS User Guide*.

Example 2: To delete resources in green environment for an Aurora MySQL DB cluster

The following `delete-blue-green-deployment` example deletes the resources in a green environment for an Aurora MySQL DB cluster.

```
aws rds delete-blue-green-deployment \
    --blue-green-deployment-identifier bgd-wi89nwzglccsfake \
    --delete-target
```

Output:

```
{
    "BlueGreenDeployment": {

    }
}
```

For more information, see Deleting a blue/green deployment in the *Amazon Aurora User Guide*.

- For API details, see DeleteBlueGreenDeployment in *AWS CLI Command Reference*.

`delete-db-cluster-endpoint`

The following code example shows how to use `delete-db-cluster-endpoint`.

AWS CLI

To delete a custom DB cluster endpoint

The following `delete-db-cluster-endpoint` example deletes the specified custom DB cluster endpoint.

```
aws rds delete-db-cluster-endpoint \
    --db-cluster-endpoint-identifier mycustomendpoint
```

Output:

```
{
    "DBClusterEndpointIdentifier": "mycustomendpoint",
    "DBClusterIdentifier": "mydbcluster",
    "DBClusterEndpointResourceIdentifier": "cluster-endpoint-ANPAJ4AE5446DAEXAMPLE",
    "Endpoint": "mycustomendpoint.cluster-custom-cnpexample.us-
east-1.rds.amazonaws.com",
    "Status": "deleting",
    "EndpointType": "CUSTOM",
    "CustomEndpointType": "READER",
    "StaticMembers": [
        "dbinstance1",
        "dbinstance2",
        "dbinstance3"
```

```
    ],
    "ExcludedMembers": [],
    "DBClusterEndpointArn": "arn:aws:rds:us-east-1:123456789012:cluster-
endpoint:mycustomendpoint"
}
```

For more information, see Amazon Aurora Connection Management in the *Amazon Aurora User Guide*.

- For API details, see DeleteDbClusterEndpoint in *AWS CLI Command Reference*.

`delete-db-cluster-parameter-group`

The following code example shows how to use `delete-db-cluster-parameter-group`.

AWS CLI

To delete a DB cluster parameter group

The following `delete-db-cluster-parameter-group` example deletes the specified DB cluster parameter group.

```
aws rds delete-db-cluster-parameter-group \
    --db-cluster-parameter-group-name mydbclusterparametergroup
```

This command produces no output.

For more information, see Working with DB Parameter Groups and DB Cluster Parameter Groups in the *Amazon Aurora User Guide*.

- For API details, see DeleteDbClusterParameterGroup in *AWS CLI Command Reference*.

`delete-db-cluster-snapshot`

The following code example shows how to use `delete-db-cluster-snapshot`.

AWS CLI

To delete a DB cluster snapshot

The following `delete-db-cluster-snapshot` example deletes the specified DB cluster snapshot.

```
aws rds delete-db-cluster-snapshot \
    --db-cluster-snapshot-identifier mydbclustersnapshot
```

Output:

```
{
    "DBClusterSnapshot": {
        "AvailabilityZones": [
            "us-east-1a",
            "us-east-1b",
            "us-east-1e"
        ],
        "DBClusterSnapshotIdentifier": "mydbclustersnapshot",
        "DBClusterIdentifier": "mydbcluster",

        "Status": "available",
        "Port": 0,
        "VpcId": "vpc-6594f31c",
        "ClusterCreateTime": "2019-04-15T14:18:42.785Z",
        "MasterUsername": "myadmin",
        "EngineVersion": "5.7.mysql_aurora.2.04.2",
        "LicenseModel": "aurora-mysql",
        "SnapshotType": "manual",
        "PercentProgress": 100,
        "StorageEncrypted": true,
        "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/AKIAIOSFODNN7EXAMPLE",
        "DBClusterSnapshotArn": "arn:aws:rds:us-east-1:123456789012:cluster-
snapshot:mydbclustersnapshot",
        "IAMDatabaseAuthenticationEnabled": false
    }
}
```

For more information, see Deleting a Snapshot in the *Amazon Aurora User Guide*.

- For API details, see DeleteDbClusterSnapshot in *AWS CLI Command Reference*.

`delete-db-cluster`

The following code example shows how to use `delete-db-cluster`.

AWS CLI

Example 1: To delete a DB instance in a DB cluster

The following `delete-db-instance` example deletes the final DB instance in a DB cluster. You can't delete a DB cluster if it contains DB instances that aren't in the **deleting** state. You can't take a final snapshot when deleting a DB instance in a DB cluster.

```
aws rds delete-db-instance \
    --db-instance-identifier database-3
```

Output:

```
{
    "DBInstance": {
        "DBInstanceIdentifier": "database-3",
        "DBInstanceClass": "db.r4.large",
        "Engine": "aurora-postgresql",
        "DBInstanceStatus": "deleting",

    ...output omitted...

    }
}
```

For more information, see Deleting a DB Instance in an Aurora DB Cluster in the *Amazon Aurora User Guide*.

Example 2: To delete a DB cluster

The following `delete-db-cluster` example deletes the DB cluster named `mycluster` and takes a final snapshot named `mycluster-final-snapshot`. The status of the DB cluster is **available** while the snapshot is being taken. To follow the progress of the deletion, use the `describe-db-clusters` CLI command.

```
aws rds delete-db-cluster \
    --db-cluster-identifier mycluster \
    --no-skip-final-snapshot \
    --final-db-snapshot-identifier mycluster-final-snapshot
```

Output:

```
{
    "DBCluster": {
        "AllocatedStorage": 20,
        "AvailabilityZones": [
            "eu-central-1b",
            "eu-central-1c",
            "eu-central-1a"
        ],
        "BackupRetentionPeriod": 7,
        "DBClusterIdentifier": "mycluster",
        "DBClusterParameterGroup": "default.aurora-postgresql10",
        "DBSubnetGroup": "default-vpc-aa11bb22",
        "Status": "available",

    ...output omitted...

    }
}
```

For more information, see Aurora Clusters with a Single DB Instance in the *Amazon Aurora User Guide*.

- For API details, see DeleteDbCluster in *AWS CLI Command Reference*.

`delete-db-instance-automated-backup`

The following code example shows how to use `delete-db-instance-automated-backup`.

AWS CLI

To delete a replicated automated backup from a Region

The following `delete-db-instance-automated-backup` example deletes the automated backup with the specified Amazon Resource Name (ARN).

```
aws rds delete-db-instance-automated-backup \
    --db-instance-automated-backups-arn "arn:aws:rds:us-west-2:123456789012:auto-backup:ab-jkib2gfq5rv7replzadausbrktni2bn4example"
```

Output:

```
{
```

```
    "DBInstanceAutomatedBackup": {
        "DBInstanceArn": "arn:aws:rds:us-east-1:123456789012:db:new-orcl-db",
        "DbiResourceId": "db-JKIB2GFQ5RV7REPLZA4EXAMPLE",
        "Region": "us-east-1",
        "DBInstanceIdentifier": "new-orcl-db",
        "RestoreWindow": {},
        "AllocatedStorage": 20,
        "Status": "deleting",
        "Port": 1521,
        "AvailabilityZone": "us-east-1b",
        "VpcId": "vpc-########",
        "InstanceCreateTime": "2020-12-04T15:28:31Z",
        "MasterUsername": "admin",
        "Engine": "oracle-se2",
        "EngineVersion": "12.1.0.2.v21",
        "LicenseModel": "bring-your-own-license",
        "OptionGroupName": "default:oracle-se2-12-1",
        "Encrypted": false,
        "StorageType": "gp2",
        "IAMDatabaseAuthenticationEnabled": false,
        "BackupRetentionPeriod": 7,
        "DBInstanceAutomatedBackupsArn": "arn:aws:rds:us-west-2:123456789012:auto-
backup:ab-jkib2gfq5rv7replzadausbrktni2bn4example"
    }
}
```

For more information, see Deleting replicated backups in the *Amazon RDS User Guide*.

- For API details, see DeleteDbInstanceAutomatedBackup in *AWS CLI Command Reference*.

`delete-db-instance`

The following code example shows how to use `delete-db-instance`.

AWS CLI

To delete a DB instance

The following `delete-db-instance` example deletes the specified DB instance after creating a final DB snapshot named `test-instance-final-snap`.

```
aws rds delete-db-instance \
    --db-instance-identifier test-instance \
```

```
    --final-db-snapshot-identifier test-instance-final-snap
```

Output:

```
{
    "DBInstance": {
        "DBInstanceIdentifier": "test-instance",
        "DBInstanceStatus": "deleting",
        ...some output truncated...
    }
}
```

- For API details, see DeleteDBInstance in *AWS CLI Command Reference*.

delete-db-parameter-group

The following code example shows how to use `delete-db-parameter-group`.

AWS CLI

To delete a DB parameter group

The following command example deletes a DB parameter group.

```
aws rds delete-db-parameter-group \
    --db-parameter-group-name mydbparametergroup
```

This command produces no output.

For more information, see Working with DB Parameter Groups in the *Amazon RDS User Guide*.

- For API details, see DeleteDBParameterGroup in *AWS CLI Command Reference*.

delete-db-proxy-endpoint

The following code example shows how to use `delete-db-proxy-endpoint`.

AWS CLI

To delete a DB proxy endpoint for an RDS database

The following `delete-db-proxy-endpoint` example deletes a DB proxy endpoint for the target database.

```
aws rds delete-db-proxy-endpoint \
    --db-proxy-endpoint-name proxyEP1
```

Output:

```
{
"DBProxyEndpoint":
    {
        "DBProxyEndpointName": "proxyEP1",
        "DBProxyEndpointArn": "arn:aws:rds:us-east-1:123456789012:db-proxy-
endpoint:prx-endpoint-0123a01b12345c0ab",
        "DBProxyName": "proxyExample",
        "Status": "deleting",
        "VpcId": "vpc-1234567",
        "VpcSecurityGroupIds": [
            "sg-1234",
            "sg-5678"
        ],
        "VpcSubnetIds": [
            "subnetgroup1",
            "subnetgroup2"
        ],
        "Endpoint": "proxyEP1.endpoint.proxy-ab0cd1efghij.us-
east-1.rds.amazonaws.com",
        "CreatedDate": "2023-04-13T01:49:38.568000+00:00",
        "TargetRole": "READ_ONLY",
        "IsDefault": false
    }
}
```

For more information, see Deleting a proxy endpoint in the *Amazon RDS User Guide* and Deleting a proxy endpoint in the *Amazon Aurora User Guide*.

- For API details, see DeleteDbProxyEndpoint in *AWS CLI Command Reference*.

delete-db-proxy

The following code example shows how to use `delete-db-proxy`.

AWS CLI

To delete a DB proxy for an RDS database

The following `delete-db-proxy` example deletes a DB proxy.

```
aws rds delete-db-proxy \
    --db-proxy-name proxyExample
```

Output:

```
{
        "DBProxy":
        {
            "DBProxyName": "proxyExample",
            "DBProxyArn": "arn:aws:rds:us-east-1:123456789012:db-
proxy:prx-0123a01b12345c0ab",
            "Status": "deleting",
            "EngineFamily": "PostgreSQL",
            "VpcId": "vpc-1234567",
            "VpcSecurityGroupIds": [
                "sg-1234",
                "sg-5678"
            ],
            "VpcSubnetIds": [
                "subnetgroup1",
                "subnetgroup2"
            ],
            "Auth": "[
                {
                "Description": "proxydescription`"
                "AuthScheme": "SECRETS",
                "SecretArn": "arn:aws:secretsmanager:us-
west-2:123456789123:secret:proxysecret1-Abcd1e",
                "IAMAuth": "DISABLED"
                } ],
            "RoleArn": "arn:aws:iam::12345678912:role/ProxyPostgreSQLRole",
            "Endpoint": "proxyExample.proxy-ab0cd1efghij.us-
east-1.rds.amazonaws.com",
            "RequireTLS": false,
            "IdleClientTimeout": 1800,
            "DebuggingLogging": false,
        "CreatedDate": "2023-04-05T16:09:33.452000+00:00",
```

```
        "UpdatedDate": "2023-04-13T01:49:38.568000+00:00"
    }
}
```

For more information, see Deleting an RDS Proxy in the *Amazon RDS User Guide* and Deleting an RDS Proxy in the *Amazon Aurora User Guide*.

- For API details, see DeleteDbProxy in *AWS CLI Command Reference*.

`delete-db-security-group`

The following code example shows how to use `delete-db-security-group`.

AWS CLI

To delete a DB security group

The following `delete-db-security-group` example deletes a DB security group named `mysecuritygroup`.

```
aws rds delete-db-security-group \
    --db-security-group-name mysecuritygroup
```

This command produces no output.

For more information, see Working with DB security groups (EC2-Classic platform) in the *Amazon RDS User Guide*.

- For API details, see DeleteDbSecurityGroup in *AWS CLI Command Reference*.

`delete-db-shard-group`

The following code example shows how to use `delete-db-shard-group`.

AWS CLI

Example 1: To delete a DB shard group unsuccessfully

The following `delete-db-shard-group` example shows the error that occurs when you try to delete a DB shard group before deleting all of your databases and schemas.

```
aws rds delete-db-shard-group \
```

```
    --db-shard-group-identifier limitless-test-shard-grp
```

Output:

```
An error occurred (InvalidDBShardGroupState) when calling the DeleteDBShardGroup
 operation: Unable to delete the DB shard group limitless-test-db-shard-group.
Delete all of your Limitless Database databases and schemas, then try again.
```

Example 2: To delete a DB shard group successfully

The following `delete-db-shard-group` example deletes a DB shard group after you've deleted all of your databases and schemas, including the `public` schema.

```
aws rds delete-db-shard-group \
    --db-shard-group-identifier limitless-test-shard-grp
```

Output:

```
{
    "DBShardGroupResourceId": "shardgroup-7bb446329da94788b3f957746example",
    "DBShardGroupIdentifier": "limitless-test-shard-grp",
    "DBClusterIdentifier": "limitless-test-cluster",
    "MaxACU": 768.0,
    "ComputeRedundancy": 0,
    "Status": "deleting",
    "PubliclyAccessible": true,
    "Endpoint": "limitless-test-cluster.limitless-cekycexample.us-
east-2.rds.amazonaws.com"
}
```

For more information, see Deleting Aurora DB clusters and DB instances in the *Amazon Aurora User Guide*.

- For API details, see DeleteDbShardGroup in *AWS CLI Command Reference*.

`delete-db-snapshot`

The following code example shows how to use `delete-db-snapshot`.

AWS CLI

To delete a DB snapshot

The following `delete-db-snapshot` example deletes the specified DB snapshot.

```
aws rds delete-db-snapshot \
    --db-snapshot-identifier mydbsnapshot
```

Output:

```
{
    "DBSnapshot": {
        "DBSnapshotIdentifier": "mydbsnapshot",
        "DBInstanceIdentifier": "database-mysql",
        "SnapshotCreateTime": "2019-06-18T22:08:40.702Z",
        "Engine": "mysql",
        "AllocatedStorage": 100,
        "Status": "deleted",
        "Port": 3306,
        "AvailabilityZone": "us-east-1b",
        "VpcId": "vpc-6594f31c",
        "InstanceCreateTime": "2019-04-30T15:45:53.663Z",
        "MasterUsername": "admin",
        "EngineVersion": "5.6.40",
        "LicenseModel": "general-public-license",
        "SnapshotType": "manual",
        "Iops": 1000,
        "OptionGroupName": "default:mysql-5-6",
        "PercentProgress": 100,
        "StorageType": "io1",
        "Encrypted": true,
        "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/AKIAIOSFODNN7EXAMPLE",
        "DBSnapshotArn": "arn:aws:rds:us-east-1:123456789012:snapshot:mydbsnapshot",
        "IAMDatabaseAuthenticationEnabled": false,
        "ProcessorFeatures": [],
        "DbiResourceId": "db-AKIAIOSFODNN7EXAMPLE"
    }
}
```

For more information, see Deleting a Snapshot in the *Amazon RDS User Guide*.

- For API details, see DeleteDbSnapshot in *AWS CLI Command Reference*.

`delete-db-subnet-group`

The following code example shows how to use `delete-db-subnet-group`.

AWS CLI

To delete a DB subnet group

The following `delete-db-subnet-group` example deletes the DB subnet group called `mysubnetgroup`.

```
aws rds delete-db-subnet-group --db-subnet-group-name mysubnetgroup
```

This command produces no output.

For more information, see Working with a DB Instance in a VPC in the *Amazon RDS User Guide*.

- For API details, see DeleteDbSubnetGroup in *AWS CLI Command Reference*.

`delete-event-subscription`

The following code example shows how to use `delete-event-subscription`.

AWS CLI

To delete an event subscription

The following `delete-event-subscription` example deletes the specified event subscription.

```
aws rds delete-event-subscription --subscription-name my-instance-events
```

Output:

```
{
    "EventSubscription": {
        "EventSubscriptionArn": "arn:aws:rds:us-east-1:123456789012:es:my-instance-
events",
        "CustomerAwsId": "123456789012",
        "Enabled": false,
        "SourceIdsList": [
            "test-instance"
        ],
        "SourceType": "db-instance",
        "EventCategoriesList": [
            "backup",
            "recovery"
```

```
        ],
        "SubscriptionCreationTime": "2018-07-31 23:22:01.893",
        "CustSubscriptionId": "my-instance-events",
        "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:interesting-events",
        "Status": "deleting"
    }
}
```

- For API details, see DeleteEventSubscription in *AWS CLI Command Reference*.

`delete-global-cluster`

The following code example shows how to use `delete-global-cluster`.

AWS CLI

To delete a global DB cluster

The following `delete-global-cluster` example deletes an Aurora MySQL-compatible global DB cluster. The output shows the cluster that you're deleting, but subsequent `describe-global-clusters` commands don't list that DB cluster.

```
aws rds delete-global-cluster \
    --global-cluster-identifier myglobalcluster
```

Output:

```
{
    "GlobalCluster": {
        "GlobalClusterIdentifier": "myglobalcluster",
        "GlobalClusterResourceId": "cluster-f0e523bfe07aabb",
        "GlobalClusterArn": "arn:aws:rds::123456789012:global-
cluster:myglobalcluster",
        "Status": "available",
        "Engine": "aurora-mysql",
        "EngineVersion": "5.7.mysql_aurora.2.07.2",
        "StorageEncrypted": false,
        "DeletionProtection": false,
        "GlobalClusterMembers": []
    }
}
```

For more information, see Deleting an Aurora global database in the *Amazon Aurora User Guide*.

- For API details, see DeleteGlobalCluster in *AWS CLI Command Reference*.

`delete-option-group`

The following code example shows how to use `delete-option-group`.

AWS CLI

To delete an option group

The following `delete-option-group` example deletes the specified option group.

```
aws rds delete-option-group \
    --option-group-name myoptiongroup
```

This command produces no output.

For more information, see Deleting an Option Group in the *Amazon RDS User Guide*.

- For API details, see DeleteOptionGroup in *AWS CLI Command Reference*.

`deregister-db-proxy-targets`

The following code example shows how to use `deregister-db-proxy-targets`.

AWS CLI

To deregister a DB proxy target from database target group

The following `deregister-db-proxy-targets` example removes the association between the proxy `proxyExample` and its target.

```
aws rds deregister-db-proxy-targets \
    --db-proxy-name proxyExample \
    --db-instance-identifiers database-1
```

This command produces no output.

For more information, see Deleting an RDS Proxy in the *Amazon RDS User Guide* and Deleting an RDS Proxy in the *Amazon Aurora User Guide*.

- For API details, see DeregisterDbProxyTargets in *AWS CLI Command Reference*.

describe-account-attributes

The following code example shows how to use `describe-account-attributes`.

AWS CLI

To describe account attributes

The following `describe-account-attributes` example retrieves the attributes for the current AWS account.

```
aws rds describe-account-attributes
```

Output:

```
{
    "AccountQuotas": [
        {
            "Max": 40,
            "Used": 4,
            "AccountQuotaName": "DBInstances"
        },
        {
            "Max": 40,
            "Used": 0,
            "AccountQuotaName": "ReservedDBInstances"
        },
        {
            "Max": 100000,
            "Used": 40,
            "AccountQuotaName": "AllocatedStorage"
        },
        {

`describe-blue-green-deployments`

The following code example shows how to use `describe-blue-green-deployments`.

AWS CLI

Example 1: To describe a blue/green deployment of an RDS DB instance after creation completes

The following `describe-blue-green-deployment` example retrieves the details of a blue/green deployment after creation completes.

```
aws rds describe-blue-green-deployments \
    --blue-green-deployment-identifier bgd-v53303651eexfake
```

Output:

```
{
    "BlueGreenDeployments": [
        {
            "BlueGreenDeploymentIdentifier": "bgd-v53303651eexfake",
            "BlueGreenDeploymentName": "bgd-cli-test-instance",
            "Source": "arn:aws:rds:us-east-1:123456789012:db:my-db-instance",
            "Target": "arn:aws:rds:us-east-1:123456789012:db:my-db-instance-green-
rkfbpe",
            "SwitchoverDetails": [
                {

`describe-certificates`

The following code example shows how to use `describe-certificates`.

AWS CLI

To describe certificates

The following `describe-certificates` example retrieves the details of the certificate associated with the user's default region.

```
aws rds describe-certificates
```

Output:

```
{
    "Certificates": [
        {
            "CertificateIdentifier": "rds-ca-ecc384-g1",
            "CertificateType": "CA",
            "Thumbprint": "2ee3dcc06e50192559b13929e73484354f23387d",
            "ValidFrom": "2021-05-24T22:06:59+00:00",
            "ValidTill": "2121-05-24T23:06:59+00:00",
            "CertificateArn": "arn:aws:rds:us-west-2::cert:rds-ca-ecc384-g1",
            "CustomerOverride": false
        },

`describe-db-cluster-backtracks`

The following code example shows how to use `describe-db-cluster-backtracks`.

AWS CLI

To describe backtracks for a DB cluster

The following `describe-db-cluster-backtracks` example retrieves details about the specified DB cluster.

```
aws rds describe-db-cluster-backtracks \
    --db-cluster-identifier mydbcluster
```

Output:

```
{
    "DBClusterBacktracks": [
        {
            "DBClusterIdentifier": "mydbcluster",
            "BacktrackIdentifier": "2f5f5294-0dd2-44c9-9f50-EXAMPLE",
            "BacktrackTo": "2021-02-12T04:59:22Z",
            "BacktrackedFrom": "2021-02-12T14:37:31.640Z",
            "BacktrackRequestCreationTime": "2021-02-12T14:36:18.819Z",
            "Status": "COMPLETED"
        },
        {
            "DBClusterIdentifier": "mydbcluster",
            "BacktrackIdentifier": "3c7a6421-af2a-4ea3-ae95-EXAMPLE",
            "BacktrackTo": "2021-02-11T22:53:46Z",
            "BacktrackedFrom": "2021-02-12T00:09:27.006Z",
            "BacktrackRequestCreationTime": "2021-02-12T00:07:53.487Z",
            "Status": "COMPLETED"
        }
    ]
}
```

For more information, see Backtracking an Aurora DB cluster in the *Amazon Aurora User Guide*.

- For API details, see DescribeDbClusterBacktracks in *AWS CLI Command Reference*.

`describe-db-cluster-endpoints`

The following code example shows how to use `describe-db-cluster-endpoints`.

AWS CLI

Example 1: To describe DB cluster endpoints

The following `describe-db-cluster-endpoints` example retrieves details for your DB cluster endpoints. The most common kinds of Aurora clusters have two endpoints. One endpoint has type `WRITER`. You can use this endpoint for all SQL statements. The other endpoint has type `READER`. You can use this endpoint only for SELECT and other read-only SQL statements.

```
aws rds describe-db-cluster-endpoints
```

Output:

```
{
    "DBClusterEndpoints": [
        {
            "DBClusterIdentifier": "my-database-1",
            "Endpoint": "my-database-1.cluster-cnpexample.us-
east-1.rds.amazonaws.com",
            "Status": "creating",
            "EndpointType": "WRITER"
        },
        {
            "DBClusterIdentifier": "my-database-1",
            "Endpoint": "my-database-1.cluster-ro-cnpexample.us-
east-1.rds.amazonaws.com",
            "Status": "creating",
            "EndpointType": "READER"
        },
        {
            "DBClusterIdentifier": "mydbcluster",
            "Endpoint": "mydbcluster.cluster-cnpexamle.us-east-1.rds.amazonaws.com",
            "Status": "available",
```

```
            "EndpointType": "WRITER"
        },
        {
            "DBClusterIdentifier": "mydbcluster",
            "Endpoint": "mydbcluster.cluster-ro-cnpexample.us-
east-1.rds.amazonaws.com",
            "Status": "available",
            "EndpointType": "READER"
        }
    ]
}
```

Example 2: To describe DB cluster endpoints of a single DB cluster

The following `describe-db-cluster-endpoints` example retrieves details for the DB cluster endpoints of a single specified DB cluster. Aurora Serverless clusters have only a single endpoint with a type of `WRITER`.

```
aws rds describe-db-cluster-endpoints \
    --db-cluster-identifier serverless-cluster
```

Output:

```
{
    "DBClusterEndpoints": [
        {
            "Status": "available",
            "Endpoint": "serverless-cluster.cluster-cnpexample.us-
east-1.rds.amazonaws.com",
            "DBClusterIdentifier": "serverless-cluster",
            "EndpointType": "WRITER"
        }
    ]
}
```

For more information, see Amazon Aurora Connection Management in the *Amazon Aurora User Guide*.

- For API details, see DescribeDbClusterEndpoints in *AWS CLI Command Reference*.

`describe-db-cluster-parameter-groups`

The following code example shows how to use `describe-db-cluster-parameter-groups`.

AWS CLI

To describe DB cluster parameter groups

The following `describe-db-cluster-parameter-groups` example retrieves details for your DB cluster parameter groups.

```
aws rds describe-db-cluster-parameter-groups
```

Output:

```
{
    "DBClusterParameterGroups": [
        {
            "DBClusterParameterGroupName": "default.aurora-mysql5.7",
            "DBParameterGroupFamily": "aurora-mysql5.7",
            "Description": "Default cluster parameter group for aurora-mysql5.7",
            "DBClusterParameterGroupArn": "arn:aws:rds:us-
east-1:123456789012:cluster-pg:default.aurora-mysql5.7"
        },
        {
            "DBClusterParameterGroupName": "default.aurora-postgresql9.6",
            "DBParameterGroupFamily": "aurora-postgresql9.6",
            "Description": "Default cluster parameter group for aurora-
postgresql9.6",
            "DBClusterParameterGroupArn": "arn:aws:rds:us-
east-1:123456789012:cluster-pg:default.aurora-postgresql9.6"
        },
        {
            "DBClusterParameterGroupName": "default.aurora5.6",
            "DBParameterGroupFamily": "aurora5.6",
            "Description": "Default cluster parameter group for aurora5.6",
            "DBClusterParameterGroupArn": "arn:aws:rds:us-
east-1:123456789012:cluster-pg:default.aurora5.6"
        },
        {
            "DBClusterParameterGroupName": "mydbclusterpg",
            "DBParameterGroupFamily": "aurora-mysql5.7",
            "Description": "My DB cluster parameter group",
```

```
            "DBClusterParameterGroupArn": "arn:aws:rds:us-
east-1:123456789012:cluster-pg:mydbclusterpg"
        },
        {
            "DBClusterParameterGroupName": "mydbclusterpgcopy",
            "DBParameterGroupFamily": "aurora-mysql5.7",
            "Description": "Copy of mydbclusterpg parameter group",
            "DBClusterParameterGroupArn": "arn:aws:rds:us-
east-1:123456789012:cluster-pg:mydbclusterpgcopy"
        }
    ]
}
```

For more information, see Working with DB Parameter Groups and DB Cluster Parameter Groups in the *Amazon Aurora User Guide*.

- For API details, see DescribeDbClusterParameterGroups in *AWS CLI Command Reference*.

`describe-db-cluster-parameters`

The following code example shows how to use `describe-db-cluster-parameters`.

AWS CLI

Example 1: To describe the parameters in a DB cluster parameter group

The following `describe-db-cluster-parameters` example retrieves details about the parameters in a DB cluster parameter group.

```
aws rds describe-db-cluster-parameters \
    --db-cluster-parameter-group-name mydbclusterpg
```

Output:

```
{
    "Parameters": [
        {
            "ParameterName": "allow-suspicious-udfs",
            "Description": "Controls whether user-defined functions that have only
 an xxx symbol for the main function can be loaded",
            "Source": "engine-default",
            "ApplyType": "static",
```

```
                "DataType": "boolean",
                "AllowedValues": "0,1",
                "IsModifiable": false,
                "ApplyMethod": "pending-reboot",
                "SupportedEngineModes": [
                    "provisioned"
                ]
            },
            {
                "ParameterName": "aurora_lab_mode",
                "ParameterValue": "0",
                "Description": "Enables new features in the Aurora engine.",
                "Source": "engine-default",
                "ApplyType": "static",
                "DataType": "boolean",
                "AllowedValues": "0,1",
                "IsModifiable": true,
                "ApplyMethod": "pending-reboot",
                "SupportedEngineModes": [
                    "provisioned"
                ]
            },
            ...some output truncated...
    ]
}
```

Example 2: To list only the parameter names in a DB cluster parameter group

The following `describe-db-cluster-parameters` example retrieves only the names of the parameters in a DB cluster parameter group.

```
aws rds describe-db-cluster-parameters \
    --db-cluster-parameter-group-name default.aurora-mysql5.7 \
    --query 'Parameters[].{ParameterName:ParameterName}'
```

Output:

```
[
    {
        "ParameterName": "allow-suspicious-udfs"
    },
    {
        "ParameterName": "aurora_binlog_read_buffer_size"
```

```
    },
    {
        "ParameterName": "aurora_binlog_replication_max_yield_seconds"
    },
    {
        "ParameterName": "aurora_binlog_use_large_read_buffer"
    },
    {
        "ParameterName": "aurora_lab_mode"
    },

    ...some output truncated...
    }
]
```

Example 3: To describe only the modifiable parameters in a DB cluster parameter group

The following `describe-db-cluster-parameters` example retrieves the names of only the parameters that you can modify in a DB cluster parameter group.

```
aws rds describe-db-cluster-parameters \
    --db-cluster-parameter-group-name default.aurora-mysql5.7 \
    --query 'Parameters[].{ParameterName:ParameterName,IsModifiable:IsModifiable} |
 [?IsModifiable == `true`]'
```

Output:

```
[
    {
        "ParameterName": "aurora_binlog_read_buffer_size",
        "IsModifiable": true
    },
    {
        "ParameterName": "aurora_binlog_replication_max_yield_seconds",
        "IsModifiable": true
    },
    {
        "ParameterName": "aurora_binlog_use_large_read_buffer",
        "IsModifiable": true
    },
    {
        "ParameterName": "aurora_lab_mode",
        "IsModifiable": true
```

```
    },

    ...some output truncated...
    }
]
```

Example 4: To describe only the modifiable Boolean parameters in a DB cluster parameter group

The following `describe-db-cluster-parameters` example retrieves the names of only the parameters that you can modify in a DB cluster parameter group and that have a Boolean data type.

```
aws rds describe-db-cluster-parameters \
    --db-cluster-parameter-group-name default.aurora-mysql5.7 \
    --query 'Parameters[].
{ParameterName:ParameterName,DataType:DataType,IsModifiable:IsModifiable} | [?
DataType == `boolean`] | [?IsModifiable == `true`]'
```

Output:

```
[
    {
        "DataType": "boolean",
        "ParameterName": "aurora_binlog_use_large_read_buffer",
        "IsModifiable": true
    },
    {
        "DataType": "boolean",
        "ParameterName": "aurora_lab_mode",
        "IsModifiable": true
    },
    {
        "DataType": "boolean",
        "ParameterName": "autocommit",
        "IsModifiable": true
    },
    {
        "DataType": "boolean",
        "ParameterName": "automatic_sp_privileges",
        "IsModifiable": true
    },
```

```
    ...some output truncated...
    }
]
```

For more information, see Working with DB Parameter Groups and DB Cluster Parameter Groups in the *Amazon Aurora User Guide*.

- For API details, see DescribeDbClusterParameters in *AWS CLI Command Reference*.

`describe-db-cluster-snapshot-attributes`

The following code example shows how to use `describe-db-cluster-snapshot-attributes`.

AWS CLI

To describe the attribute names and values for a DB cluster snapshot

The following `describe-db-cluster-snapshot-attributes` example retrieves details of the attribute names and values for the specified DB cluster snapshot.

```
aws rds describe-db-cluster-snapshot-attributes \
    --db-cluster-snapshot-identifier myclustersnapshot
```

Output:

```
{
    "DBClusterSnapshotAttributesResult": {
        "DBClusterSnapshotIdentifier": "myclustersnapshot",
        "DBClusterSnapshotAttributes": [
            {
                "AttributeName": "restore",
                "AttributeValues": [
                    "123456789012"
                ]
            }
        ]
    }
}
```

For more information, see Sharing a DB Cluster Snapshot in the *Amazon Aurora User Guide*.

- For API details, see DescribeDbClusterSnapshotAttributes in *AWS CLI Command Reference*.

`describe-db-cluster-snapshots`

The following code example shows how to use `describe-db-cluster-snapshots`.

AWS CLI

To describe a DB cluster snapshot for a DB cluster

The following `describe-db-cluster-snapshots` example retrieves the details for the DB cluster snapshots for the specified DB cluster.

```
aws rds describe-db-cluster-snapshots \
    --db-cluster-identifier mydbcluster
```

Output:

```
{
    "DBClusterSnapshots": [
        {
            "AvailabilityZones": [
                "us-east-1a",

            "EngineMode": "provisioned",
            "DeletionProtection": false,
            "HttpEndpointEnabled": false
        }
    ]
}
```

Example 2: To list certain attributes of all DB clusters

The following `describe-db-clusters` example retrieves only the `DBClusterIdentifier`, `Endpoint`, and `ReaderEndpoint` attributes of all your DB clusters in the current AWS Region.

```
aws rds describe-db-clusters \
    --query 'DBClusters[].
{DBClusterIdentifier:DBClusterIdentifier,Endpoint:Endpoint,ReaderEndpoint:ReaderEndpoint}'
```

Output:

```
[
    {
        "Endpoint": "cluster-57-2020-05-01-2270.cluster-cnpexample.us-
east-1.rds.amazonaws.com",
        "ReaderEndpoint": "cluster-57-2020-05-01-2270.cluster-ro-cnpexample.us-
east-1.rds.amazonaws.com",
        "DBClusterIdentifier": "cluster-57-2020-05-01-2270"
    },
    {
        "Endpoint": "cluster-57-2020-05-01-4615.cluster-cnpexample.us-
east-1.rds.amazonaws.com",
        "ReaderEndpoint": "cluster-57-2020-05-01-4615.cluster-ro-cnpexample.us-
east-1.rds.amazonaws.com",
        "DBClusterIdentifier": "cluster-57-2020-05-01-4615"
    },
    {
        "Endpoint": "pg2-cluster.cluster-cnpexample.us-east-1.rds.amazonaws.com",
        "ReaderEndpoint": "pg2-cluster.cluster-ro-cnpexample.us-
east-1.rds.amazonaws.com",
        "DBClusterIdentifier": "pg2-cluster"
```

```
    },
    ...output omitted...
    }
]
```

Example 3: To list DB clusters with a specific attribute

The following `describe-db-clusters` example retrieves only the `DBClusterIdentifier` and `Engine` attributes of your DB clusters that use the `aurora-postgresql` DB engine.

```
aws rds describe-db-clusters \
    --query 'DBClusters[].{DBClusterIdentifier:DBClusterIdentifier,Engine:Engine} |
 [?Engine == `aurora-postgresql`]'
```

Output:

```
[
    {
        "Engine": "aurora-postgresql",
        "DBClusterIdentifier": "pg2-cluster"
    }
]
```

For more information, see Amazon Aurora DB Clusters in the *Amazon Aurora User Guide*.

- For API details, see DescribeDbClusters in *AWS CLI Command Reference*.

`describe-db-engine-versions`

The following code example shows how to use `describe-db-engine-versions`.

AWS CLI

To describe the DB engine versions for the MySQL DB engine

The following `describe-db-engine-versions` example displays details about each of the DB engine versions for the specified DB engine.

```
aws rds describe-db-engine-versions \
    --engine mysql
```

Output:

```
{
    "DBEngineVersions": [
        {
            "Engine": "mysql",
            "EngineVersion": "5.5.46",
            "DBParameterGroupFamily": "mysql5.5",
            "DBEngineDescription": "MySQL Community Edition",
            "DBEngineVersionDescription": "MySQL 5.5.46",
            "ValidUpgradeTarget": [
                {
                    "Engine": "mysql",
                    "EngineVersion": "5.5.53",
                    "Description": "MySQL 5.5.53",
                    "AutoUpgrade": false,
                    "IsMajorVersionUpgrade": false
                },
                {
                    "Engine": "mysql",
                    "EngineVersion": "5.5.54",
                    "Description": "MySQL 5.5.54",
                    "AutoUpgrade": false,
                    "IsMajorVersionUpgrade": false
                },
                {
                    "Engine": "mysql",
                    "EngineVersion": "5.5.57",
                    "Description": "MySQL 5.5.57",
                    "AutoUpgrade": false,
                    "IsMajorVersionUpgrade": false
                },
                ...some output truncated...
            ]
        }
```

For more information, see What Is Amazon Relational Database Service (Amazon RDS)? in the *Amazon RDS User Guide*.

- For API details, see DescribeDBEngineVersions in *AWS CLI Command Reference*.

`describe-db-instance-automated-backups`

The following code example shows how to use `describe-db-instance-automated-backups`.

AWS CLI

To describe the automated backups for a DB instance

The following `describe-db-instance-automated-backups` example displays details about the automated backups for the specified DB instance. The details include replicated automated backups in other AWS Regions.

```
aws rds describe-db-instance-automated-backups \
    --db-instance-identifier new-orcl-db
```

Output:

```
{
    "DBInstanceAutomatedBackups": [
        {
            "DBInstanceArn": "arn:aws:rds:us-east-1:123456789012:db:new-orcl-db",

            "DBInstanceIdentifier": "new-orcl-db",
            "RestoreWindow": {
                "EarliestTime": "2020-12-07T21:05:20.939Z",
                "LatestTime": "2020-12-07T21:05:20.939Z"
            },
            "AllocatedStorage": 20,
            "Status": "replicating",
            "Port": 1521,
            "InstanceCreateTime": "2020-12-04T15:28:31Z",
            "MasterUsername": "admin",
            "Engine": "oracle-se2",
            "EngineVersion": "12.1.0.2.v21",
            "LicenseModel": "bring-your-own-license",
            "OptionGroupName": "default:oracle-se2-12-1",
            "Encrypted": false,
            "StorageType": "gp2",
            "IAMDatabaseAuthenticationEnabled": false,
            "BackupRetentionPeriod": 14,
            "DBInstanceAutomatedBackupsArn": "arn:aws:rds:us-
west-2:123456789012:auto-backup:ab-jkib2gfq5rv7replzadausbrktni2bn4example"
        }
    ]
}
```

For more information, see Finding information about replicated backups in the *Amazon RDS User Guide*.

- For API details, see DescribeDbInstanceAutomatedBackups in *AWS CLI Command Reference*.

`describe-db-instances`

The following code example shows how to use `describe-db-instances`.

AWS CLI

To describe a DB instance

The following `describe-db-instances` example retrieves details about the specified DB instance.

```
aws rds describe-db-instances \
    --db-instance-identifier mydbinstancecf
```

Output:

```
{
    "DBInstances": [
        {
            "DBInstanceIdentifier": "mydbinstancecf",
            "DBInstanceClass": "db.t3.small",
            "Engine": "mysql",
            "DBInstanceStatus": "available",
            "MasterUsername": "masterawsuser",
            "Endpoint": {
                "Address": "mydbinstancecf.abcexample.us-east-1.rds.amazonaws.com",
                "Port": 3306,
                "HostedZoneId": "Z2R2ITUGPM61AM"
            },
            ...some output truncated...
        }
    ]
}
```

- For API details, see DescribeDBInstances in *AWS CLI Command Reference*.

`describe-db-log-files`

The following code example shows how to use `describe-db-log-files`.

AWS CLI

To describe the log files for a DB instance

The following `describe-db-log-files` example retrieves details about the log files for the specified DB instance.

```
aws rds describe-db-log-files -\
    -db-instance-identifier test-instance
```

Output:

```
{
    "DescribeDBLogFiles": [
        {
            "Size": 0,
            "LastWritten": 1533060000000,
            "LogFileName": "error/mysql-error-running.log"
        },
        {
            "Size": 2683,
            "LastWritten": 1532994300000,
            "LogFileName": "error/mysql-error-running.log.0"
        },
        {
            "Size": 107,
            "LastWritten": 1533057300000,
            "LogFileName": "error/mysql-error-running.log.18"
        },
        {
            "Size": 13105,
            "LastWritten": 1532991000000,
            "LogFileName": "error/mysql-error-running.log.23"
        },
        {
            "Size": 0,
            "LastWritten": 1533061200000,
            "LogFileName": "error/mysql-error.log"
        },
```

```
        {
            "Size": 3519,
            "LastWritten": 1532989252000,
            "LogFileName": "mysqlUpgrade"
        }
    ]
}
```

- For API details, see [DescribeDbLogFiles]() in *AWS CLI Command Reference*.

`describe-db-parameter-groups`

The following code example shows how to use `describe-db-parameter-groups`.

AWS CLI

To describe your DB parameter group

The following `describe-db-parameter-groups` example retrieves details about your DB parameter groups.

```
aws rds describe-db-parameter-groups
```

Output:

```
{
    "DBParameterGroups": [
        {
            "DBParameterGroupName": "default.aurora-mysql5.7",
            "DBParameterGroupFamily": "aurora-mysql5.7",
            "Description": "Default parameter group for aurora-mysql5.7",
            "DBParameterGroupArn": "arn:aws:rds:us-
east-1:123456789012:pg:default.aurora-mysql5.7"
        },
        {

describe-db-parameters

The following code example shows how to use `describe-db-parameters`.

AWS CLI

To describe the parameters in a DB parameter group

The following `describe-db-parameters` example retrieves the details of the specified DB parameter group.

```
aws rds describe-db-parameters \
    --db-parameter-group-name mydbpg
```

Output:

```
{
    "Parameters": [
        {
            "ParameterName": "allow-suspicious-udfs",
            "Description": "Controls whether user-defined functions that have only
 an xxx symbol for the main function can be loaded",
```

```
                "Source": "engine-default",
                "ApplyType": "static",
                "DataType": "boolean",
                "AllowedValues": "0,1",
                "IsModifiable": false,
                "ApplyMethod": "pending-reboot"
            },
            {
                "ParameterName": "auto_generate_certs",
                "Description": "Controls whether the server autogenerates SSL key and
 certificate files in the data directory, if they do not already exist.",
                "Source": "engine-default",
                "ApplyType": "static",
                "DataType": "boolean",
                "AllowedValues": "0,1",
                "IsModifiable": false,
                "ApplyMethod": "pending-reboot"
            },
            ...some output truncated...
        ]
}
```

For more information, see Working with DB Parameter Groups in the *Amazon RDS User Guide*.

- For API details, see DescribeDBParameters in *AWS CLI Command Reference*.

`describe-db-proxies`

The following code example shows how to use `describe-db-proxies`.

AWS CLI

To describe a DB proxy for an RDS database

The following `describe-db-proxies` example returns information about DB proxies.

```
aws rds describe-db-proxies
```

Output:

```
{
    "DBProxies": [
        {
```

```
            "DBProxyName": "proxyExample1",
            "DBProxyArn": "arn:aws:rds:us-east-1:123456789012:db-
proxy:prx-0123a01b12345c0ab",

    }
}
```

For more information, see [Viewing an RDS Proxy]() in the *Amazon RDS User Guide* and [Viewing an RDS Proxy]() in the *Amazon Aurora User Guide*.

- For API details, see [DescribeDbProxyTargetGroups]() in *AWS CLI Command Reference*.

`describe-db-proxy-targets`

The following code example shows how to use `describe-db-proxy-targets`.

AWS CLI

To describe DB proxy targets

The following `describe-db-proxy-targets` example returns information about DB proxy targets.

```
aws rds describe-db-proxy-targets \
    --db-proxy-name proxyExample
```

Output:

```
{
    "Targets": [
        {
            "Endpoint": "database1.ab0cd1efghij.us-east-1.rds.amazonaws.com",
            "TrackedClusterId": "database1",
            "RdsResourceId": "database1-instance-1",
            "Port": 3306,
            "Type": "RDS_INSTANCE",
            "Role": "READ_WRITE",
            "TargetHealth": {
                "State": "UNAVAILABLE",
                "Reason": "PENDING_PROXY_CAPACITY",
                "Description": "DBProxy Target is waiting for proxy to scale to
 desired capacity"
            }
        }
    ]
}
```

For more information, see [Viewing an RDS proxy]() in the *Amazon RDS User Guide* and [Viewing an RDS proxy]() in the *Amazon Aurora User Guide*.

- For API details, see [DescribeDbProxyTargets](#) in *AWS CLI Command Reference*.

`describe-db-recommendations`

The following code example shows how to use `describe-db-recommendations`.

AWS CLI

Example 1: To list all DB recommendations

The following `describe-db-recommendations` example lists all DB recommendations in your AWS account.

```
aws rds describe-db-recommendations
```

Output:

```
{
    "DBRecommendations": [
        {
            "RecommendationId": "12ab3cde-f456-7g8h-9012-i3j45678k9lm",

Example 3: To list DB recommendations for a specified DB instance

The following `describe-db-recommendations` example lists all DB recommendations for a specified DB instance.

```
aws rds describe-db-recommendations \
    --filters Name=dbi-resource-id,Values=database-1
```

Output:

```
{
    "DBRecommendations": [
        {
            "RecommendationId": "12ab3cde-f456-7g8h-9012-i3j45678k9lm",

`describe-db-security-groups`

The following code example shows how to use `describe-db-security-groups`.

AWS CLI

To list DB security groups

The following `describe-db-security-groups` example lists DB security groups.

```
aws rds describe-db-security-groups
```

Output:

```
{
    "DBSecurityGroups": [
        {
            "OwnerId": "123456789012",
            "DBSecurityGroupName": "default",
            "DBSecurityGroupDescription": "default",
            "EC2SecurityGroups": [],
            "IPRanges": [],
            "DBSecurityGroupArn": "arn:aws:rds:us-
west-1:111122223333:secgrp:default"
        },
        {
            "OwnerId": "123456789012",
            "DBSecurityGroupName": "mysecgroup",
            "DBSecurityGroupDescription": "My Test Security Group",
            "VpcId": "vpc-1234567f",
            "EC2SecurityGroups": [],
            "IPRanges": [],
            "DBSecurityGroupArn": "arn:aws:rds:us-
west-1:111122223333:secgrp:mysecgroup"
        }
    ]
}
```

For more information, see Listing Available DB Security Groups in the *Amazon RDS User Guide*.

- For API details, see DescribeDbSecurityGroups in *AWS CLI Command Reference*.

`describe-db-shard-groups`

The following code example shows how to use `describe-db-shard-groups`.

AWS CLI

Example 1: To describe DB shard groups

The following `describe-db-shard-groups` example retrieves the details of your DB shard groups.

```
aws rds describe-db-shard-groups
```

Output:

```
{
    "DBShardGroups": [
        {
            "DBShardGroupResourceId": "shardgroup-7bb446329da94788b3f957746example",
            "DBShardGroupIdentifier": "limitless-test-shard-grp",
            "DBClusterIdentifier": "limitless-test-cluster",
            "MaxACU": 768.0,
            "ComputeRedundancy": 0,
            "Status": "available",
            "PubliclyAccessible": true,
            "Endpoint": "limitless-test-cluster.limitless-cekycexample.us-
east-2.rds.amazonaws.com"
        },
        {
            "DBShardGroupResourceId": "shardgroup-a6e3a0226aa243e2ac6c7a1234567890",
            "DBShardGroupIdentifier": "my-db-shard-group",
            "DBClusterIdentifier": "my-sv2-cluster",
            "MaxACU": 768.0,
            "ComputeRedundancy": 0,
            "Status": "available",
            "PubliclyAccessible": false,
            "Endpoint": "my-sv2-cluster.limitless-cekycexample.us-
east-2.rds.amazonaws.com"
        }
    ]
}
```

For more information, see Amazon Aurora DB Clusters in the *Amazon Aurora User Guide*.

- For API details, see DescribeDbShardGroups in *AWS CLI Command Reference*.

`describe-db-snapshot-attributes`

The following code example shows how to use `describe-db-snapshot-attributes`.

AWS CLI

To describe the attribute names and values for a DB snapshot

The following `describe-db-snapshot-attributes` example describes the attribute names and values for a DB snapshot.

```
aws rds describe-db-snapshot-attributes \
    --db-snapshot-identifier mydbsnapshot
```

Output:

```
{
    "DBSnapshotAttributesResult": {
        "DBSnapshotIdentifier": "mydbsnapshot",
        "DBSnapshotAttributes": [
            {
                "AttributeName": "restore",
                "AttributeValues": [
                    "123456789012",
                    "210987654321"
                ]
            }
        ]
    }
}
```

For more information, see Sharing a DB Snapshot in the *Amazon RDS User Guide*.

- For API details, see DescribeDbSnapshotAttributes in *AWS CLI Command Reference*.

`describe-db-snapshots`

The following code example shows how to use `describe-db-snapshots`.

AWS CLI

Example 1: To describe a DB snapshot for a DB instance

The following `describe-db-snapshots` example retrieves the details of a DB snapshot for a DB instance.

```
aws rds describe-db-snapshots \
```

```
    --db-snapshot-identifier mydbsnapshot
```

Output:

```
{
    "DBSnapshots": [
        {
            "DBSnapshotIdentifier": "mydbsnapshot",
            "DBInstanceIdentifier": "mysqldb",
            "SnapshotCreateTime": "2018-02-08T22:28:08.598Z",
            "Engine": "mysql",
            "AllocatedStorage": 20,
            "Status": "available",
            "Port": 3306,
            "AvailabilityZone": "us-east-1f",
            "VpcId": "vpc-6594f31c",
            "InstanceCreateTime": "2018-02-08T22:24:55.973Z",
            "MasterUsername": "mysqladmin",
            "EngineVersion": "5.6.37",
            "LicenseModel": "general-public-license",
            "SnapshotType": "manual",
            "OptionGroupName": "default:mysql-5-6",
            "PercentProgress": 100,
            "StorageType": "gp2",
            "Encrypted": false,
            "DBSnapshotArn": "arn:aws:rds:us-
east-1:123456789012:snapshot:mydbsnapshot",
            "IAMDatabaseAuthenticationEnabled": false,
            "ProcessorFeatures": [],
            "DbiResourceId": "db-AKIAIOSFODNN7EXAMPLE"
        }
    ]
}
```

For more information, see Creating a DB Snapshot in the *Amazon RDS User Guide*.

Example 2: To find the number of manual snapshots taken

The following `describe-db-snapshots` example uses the `length` operator in the `--query` option to return the number of manual snapshots that have been taken in a particular AWS Region.

```
aws rds describe-db-snapshots \
```

```
    --snapshot-type manual \
    --query "length(*[].{DBSnapshots:SnapshotType})" \
    --region eu-central-1
```

Output:

```
35
```

For more information, see [Creating a DB Snapshot]() in the *Amazon RDS User Guide*.

- For API details, see [DescribeDBSnapshots]() in *AWS CLI Command Reference*.

`describe-db-subnet-groups`

The following code example shows how to use `describe-db-subnet-groups`.

AWS CLI

To describe a DB subnet group

The following `describe-db-subnet-groups` example retrieves the details of the specified DB subnet group.

```
aws rds describe-db-subnet-groups
```

Output:

```
{
    "DBSubnetGroups": [
        {
            "DBSubnetGroupName": "mydbsubnetgroup",
            "DBSubnetGroupDescription": "My DB Subnet Group",
            "VpcId": "vpc-971c12ee",
            "SubnetGroupStatus": "Complete",
            "Subnets": [
                {
                    "SubnetIdentifier": "subnet-d8c8e7f4",
                    "SubnetAvailabilityZone": {
                        "Name": "us-east-1a"
                    },
                    "SubnetStatus": "Active"
                },
```

```
                {
                    "SubnetIdentifier": "subnet-718fdc7d",
                    "SubnetAvailabilityZone": {
                        "Name": "us-east-1f"
                    },
                    "SubnetStatus": "Active"
                },
                {
                    "SubnetIdentifier": "subnet-cbc8e7e7",
                    "SubnetAvailabilityZone": {
                        "Name": "us-east-1a"
                    },
                    "SubnetStatus": "Active"
                },
                {
                    "SubnetIdentifier": "subnet-0ccde220",
                    "SubnetAvailabilityZone": {
                        "Name": "us-east-1a"
                    },
                    "SubnetStatus": "Active"
                }
            ],
            "DBSubnetGroupArn": "arn:aws:rds:us-
east-1:123456789012:subgrp:mydbsubnetgroup"
        }
    ]
}
```

For more information, see Amazon Virtual Private Cloud VPCs and Amazon RDS in the *Amazon RDS User Guide*.

- For API details, see DescribeDbSubnetGroups in *AWS CLI Command Reference*.

`describe-engine-default-cluster-parameters`

The following code example shows how to use `describe-engine-default-cluster-parameters`.

AWS CLI

To describe the default engine and system parameter information for the Aurora database engine

The following `describe-engine-default-cluster-parameters` example retrieves the details of the default engine and system parameter information for Aurora DB clusters with MySQL 5.7 compatibility.

```
aws rds describe-engine-default-cluster-parameters \
    --db-parameter-group-family aurora-mysql5.7
```

Output:

```
{
    "EngineDefaults": {
        "Parameters": [
            {
                "ParameterName": "aurora_load_from_s3_role",
                "Description": "IAM role ARN used to load data from AWS S3",
                "Source": "engine-default",
                "ApplyType": "dynamic",
                "DataType": "string",
                "IsModifiable": true,
                "SupportedEngineModes": [
                    "provisioned"
                ]
            },
            ...some output truncated...
        ]
    }
}
```

For more information, see Working with DB Parameter Groups and DB Cluster Parameter Groups in the *Amazon Aurora User Guide*.

- For API details, see DescribeEngineDefaultClusterParameters in *AWS CLI Command Reference*.

`describe-engine-default-parameters`

The following code example shows how to use `describe-engine-default-parameters`.

AWS CLI

To describe the default engine and system parameter information for the database engine

The following `describe-engine-default-parameters` example retrieves details for the default engine and system parameter information for MySQL 5.7 DB instances.

```
aws rds describe-engine-default-parameters \
    --db-parameter-group-family mysql5.7
```

Output:

```
{
    "EngineDefaults": {
        "Parameters": [
            {
                "ParameterName": "allow-suspicious-udfs",
                "Description": "Controls whether user-defined functions that have
 only an xxx symbol for the main function can be loaded",
                "Source": "engine-default",
                "ApplyType": "static",
                "DataType": "boolean",
                "AllowedValues": "0,1",
                "IsModifiable": false
            },
            ...some output truncated...
        ]
    }
}
```

For more information, see Working with DB Parameter Groups in the *Amazon RDS User Guide*.

- For API details, see DescribeEngineDefaultParameters in *AWS CLI Command Reference*.

`describe-event-categories`

The following code example shows how to use `describe-event-categories`.

AWS CLI

To describe event categories

The following `describe-event-categories` example retrieves details about the event categories for all available event sources.

```
aws rds describe-event-categories
```

Output:

```
{
    "EventCategoriesMapList": [
        {
            "SourceType": "db-instance",
            "EventCategories": [
                "deletion",
                "read replica",
                "failover",
                "restoration",
                "maintenance",
                "low storage",
                "configuration change",
                "backup",
                "creation",
                "availability",
                "recovery",
                "failure",
                "backtrack",
                "notification"
            ]
        },
        {
            "SourceType": "db-security-group",
            "EventCategories": [
                "configuration change",
                "failure"
            ]
        },
        {
            "SourceType": "db-parameter-group",
            "EventCategories": [
                "configuration change"
            ]
        },
        {
            "SourceType": "db-snapshot",
            "EventCategories": [
                "deletion",
                "creation",
                "restoration",
                "notification"
            ]
```

```
        },
        {
            "SourceType": "db-cluster",
            "EventCategories": [
                "failover",
                "failure",
                "notification"
            ]
        },
        {
            "SourceType": "db-cluster-snapshot",
            "EventCategories": [
                "backup"
            ]
        }
    ]
}
```

- For API details, see DescribeEventCategories in *AWS CLI Command Reference*.

`describe-event-subscriptions`

The following code example shows how to use `describe-event-subscriptions`.

AWS CLI

To describe event subscriptions

This example describes all of the Amazon RDS event subscriptions for the current AWS account.

```
aws rds describe-event-subscriptions
```

Output:

```
{
    "EventSubscriptionsList": [
        {
            "EventCategoriesList": [
                "backup",
                "recovery"
            ],
            "Enabled": true,
```

```
            "EventSubscriptionArn": "arn:aws:rds:us-east-1:123456789012:es:my-
instance-events",
            "Status": "creating",
            "SourceType": "db-instance",
            "CustomerAwsId": "123456789012",
            "SubscriptionCreationTime": "2018-07-31 23:22:01.893",
            "CustSubscriptionId": "my-instance-events",
            "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:interesting-events"
        },
        ...some output truncated...
    ]
}
```

- For API details, see DescribeEventSubscriptions in *AWS CLI Command Reference*.

describe-events

The following code example shows how to use `describe-events`.

AWS CLI

To describe events

The following `describe-events` example retrieves details for the events that have occurred for the specified DB instance.

```
aws rds describe-events \
    --source-identifier test-instance \
    --source-type db-instance
```

Output:

```
{
    "Events": [
        {
            "SourceType": "db-instance",
            "SourceIdentifier": "test-instance",
            "EventCategories": [
                "backup"
            ],
            "Message": "Backing up DB instance",
            "Date": "2018-07-31T23:09:23.983Z",
```

```
                "SourceArn": "arn:aws:rds:us-east-1:123456789012:db:test-instance"
            },
            {
                "SourceType": "db-instance",
                "SourceIdentifier": "test-instance",
                "EventCategories": [
                    "backup"
                ],
                "Message": "Finished DB Instance backup",
                "Date": "2018-07-31T23:15:13.049Z",
                "SourceArn": "arn:aws:rds:us-east-1:123456789012:db:test-instance"
            }
        ]
}
```

- For API details, see DescribeEvents in *AWS CLI Command Reference*.

`describe-export-tasks`

The following code example shows how to use `describe-export-tasks`.

AWS CLI

To describe snapshot export tasks

The following `describe-export-tasks` example returns information about snapshot exports to Amazon S3.

```
aws rds describe-export-tasks
```

Output:

```
{
    "ExportTasks": [
        {
            "ExportTaskIdentifier": "test-snapshot-export",
            "SourceArn": "arn:aws:rds:us-west-2:123456789012:snapshot:test-
snapshot",
            "SnapshotTime": "2020-03-02T18:26:28.163Z",
            "TaskStartTime": "2020-03-02T18:57:56.896Z",
            "TaskEndTime": "2020-03-02T19:10:31.985Z",
            "S3Bucket": "amzn-s3-demo-bucket",
```

```
            "S3Prefix": "",
            "IamRoleArn": "arn:aws:iam::123456789012:role/service-role/ExportRole",
            "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/
abcd0000-7fca-4128-82f2-aabbccddeeff",
            "Status": "COMPLETE",
            "PercentProgress": 100,
            "TotalExtractedDataInGB": 0
        },
        {
            "ExportTaskIdentifier": "my-s3-export",
            "SourceArn": "arn:aws:rds:us-west-2:123456789012:snapshot:db5-snapshot-
test",
            "SnapshotTime": "2020-03-27T20:48:42.023Z",
            "S3Bucket": "amzn-s3-demo-bucket",
            "S3Prefix": "",
            "IamRoleArn": "arn:aws:iam::123456789012:role/service-role/ExportRole",
            "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/
abcd0000-7fca-4128-82f2-aabbccddeeff",
            "Status": "STARTING",
            "PercentProgress": 0,
            "TotalExtractedDataInGB": 0
        }
    ]
}
```

For more information, see Monitoring Snapshot Exports in the *Amazon RDS User Guide*.

- For API details, see DescribeExportTasks in *AWS CLI Command Reference*.

`describe-global-clusters`

The following code example shows how to use `describe-global-clusters`.

AWS CLI

To describe global DB clusters

The following `describe-global-clusters` example lists Aurora global DB clusters in the current AWS Region.

```
aws rds describe-global-clusters
```

Output:

```
{
    "GlobalClusters": [
        {
            "GlobalClusterIdentifier": "myglobalcluster",
            "GlobalClusterResourceId": "cluster-f5982077e3b5aabb",
            "GlobalClusterArn": "arn:aws:rds::123456789012:global-
cluster:myglobalcluster",
            "Status": "available",
            "Engine": "aurora-mysql",
            "EngineVersion": "5.7.mysql_aurora.2.07.2",
            "StorageEncrypted": false,
            "DeletionProtection": false,
            "GlobalClusterMembers": []
        }
    ]
}
```

For more information, see Managing an Aurora global database in the *Amazon Aurora User Guide*.

- For API details, see DescribeGlobalClusters in *AWS CLI Command Reference*.

`describe-option-group-options`

The following code example shows how to use `describe-option-group-options`.

AWS CLI

To describe all available options

The following `describe-option-group-options` example lists two options for an Oracle Database 19c instance.

```
aws rds describe-option-group-options \
    --engine-name oracle-ee \
    --major-engine-version 19 \
    --max-items 2
```

Output:

```
{
    "OptionGroupOptions": [
```

```
        {
            "Name": "APEX",
            "Description": "Oracle Application Express Runtime Environment",
            "EngineName": "oracle-ee",
            "MajorEngineVersion": "19",
            "MinimumRequiredMinorEngineVersion": "0.0.0.ru-2019-07.rur-2019-07.r1",
            "PortRequired": false,
            "OptionsDependedOn": [],
            "OptionsConflictsWith": [],
            "Persistent": false,
            "Permanent": false,
            "RequiresAutoMinorEngineVersionUpgrade": false,
            "VpcOnly": false,
            "SupportsOptionVersionDowngrade": false,
            "OptionGroupOptionSettings": [],
            "OptionGroupOptionVersions": [
                {
                    "Version": "19.1.v1",
                    "IsDefault": true
                },
                {
                    "Version": "19.2.v1",
                    "IsDefault": false
                }
            ]
        },
        {
            "Name": "APEX-DEV",
            "Description": "Oracle Application Express Development Environment",
            "EngineName": "oracle-ee",
            "MajorEngineVersion": "19",
            "MinimumRequiredMinorEngineVersion": "0.0.0.ru-2019-07.rur-2019-07.r1",
            "PortRequired": false,
            "OptionsDependedOn": [
                "APEX"
            ],

            "Persistent": false,
            "Permanent": false,
            "RequiresAutoMinorEngineVersionUpgrade": false,
            "VpcOnly": false,
            "OptionGroupOptionSettings": []
        }
    ],
```

```
    "NextToken": "eyJNYXJrZXIiOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOiAyfQ=="
}
```

For more information, see [Listing the Options and Option Settings for an Option Group]() in the *Amazon RDS User Guide*.

- For API details, see [DescribeOptionGroupOptions]() in *AWS CLI Command Reference*.

`describe-option-groups`

The following code example shows how to use `describe-option-groups`.

AWS CLI

To describe the available option groups

The following `describe-option-groups` example lists the options groups for an Oracle Database 19c instance.

```
aws rds describe-option-groups \
    --engine-name oracle-ee \
    --major-engine-version 19
```

Output:

```
{
    "OptionGroupsList": [
        {
            "OptionGroupName": "default:oracle-ee-19",
            "OptionGroupDescription": "Default option group for oracle-ee 19",
            "EngineName": "oracle-ee",
            "MajorEngineVersion": "19",
            "Options": [],
            "AllowsVpcAndNonVpcInstanceMemberships": true,
            "OptionGroupArn": "arn:aws:rds:us-west-1:111122223333:og:default:oracle-
ee-19"
        }
    ]
}
```

For more information, see [Listing the Options and Option Settings for an Option Group]() in the *Amazon RDS User Guide*.

- For API details, see DescribeOptionGroups in *AWS CLI Command Reference*.

`describe-orderable-db-instance-options`

The following code example shows how to use `describe-orderable-db-instance-options`.

AWS CLI

To describe orderable DB instance options

The following `describe-orderable-db-instance-options` example retrieves details about the orderable options for a DB instances running the MySQL DB engine.

```
aws rds describe-orderable-db-instance-options \
    --engine mysql
```

Output:

```
{
    "OrderableDBInstanceOptions": [
        {
            "MinStorageSize": 5,
            "ReadReplicaCapable": true,
            "MaxStorageSize": 6144,
            "AvailabilityZones": [
                {
                    "Name": "us-east-1a"
                },
                {
                    "Name": "us-east-1b"
                },
                {
                    "Name": "us-east-1c"
                },
                {
                    "Name": "us-east-1d"
                }
            ],
            "SupportsIops": false,
            "AvailableProcessorFeatures": [],
            "MultiAZCapable": true,
            "DBInstanceClass": "db.m1.large",
            "Vpc": true,
```

```
                "StorageType": "gp2",
                "LicenseModel": "general-public-license",
                "EngineVersion": "5.5.46",
                "SupportsStorageEncryption": false,
                "SupportsEnhancedMonitoring": true,
                "Engine": "mysql",
                "SupportsIAMDatabaseAuthentication": false,
                "SupportsPerformanceInsights": false
            }
        ]
        ...some output truncated...
}
```

- For API details, see DescribeOrderableDBInstanceOptions in *AWS CLI Command Reference*.

`describe-pending-maintenance-actions`

The following code example shows how to use `describe-pending-maintenance-actions`.

AWS CLI

To list resources with at least one pending maintenance action

The following `describe-pending-maintenance-actions` example lists the pending maintenance action for a DB instance.

```
aws rds describe-pending-maintenance-actions
```

Output:

```
{
    "PendingMaintenanceActions": [
        {
            "ResourceIdentifier": "arn:aws:rds:us-
west-2:123456789012:cluster:global-db1-cl1",
            "PendingMaintenanceActionDetails": [
                {
                    "Action": "system-update",
                    "Description": "Upgrade to Aurora PostgreSQL 2.4.2"
                }
            ]
        }
```

```
    ]
}
```

For more information, see Maintaining a DB Instance in the *Amazon RDS User Guide*.

- For API details, see DescribePendingMaintenanceActions in *AWS CLI Command Reference*.

`describe-reserved-db-instances-offerings`

The following code example shows how to use `describe-reserved-db-instances-offerings`.

AWS CLI

To describe reserved DB instance offerings

The following `describe-reserved-db-instances-offerings` example retrieves details about reserved DB instance options for `oracle`.

```
aws rds describe-reserved-db-instances-offerings \
    --product-description oracle
```

Output:

```
{
    "ReservedDBInstancesOfferings": [
        {
            "CurrencyCode": "USD",
            "UsagePrice": 0.0,
            "ProductDescription": "oracle-se2(li)",
            "ReservedDBInstancesOfferingId": "005bdee3-9ef4-4182-aa0c-58ef7cb6c2f8",
            "MultiAZ": true,
            "DBInstanceClass": "db.m4.xlarge",
            "OfferingType": "Partial Upfront",
            "RecurringCharges": [
                {

`describe-reserved-db-instances`

The following code example shows how to use `describe-reserved-db-instances`.

AWS CLI

To describe reserved DB instances

The following `describe-reserved-db-instances` example retrieves details about any reserved DB instances in the current AWS account.

```
aws rds describe-reserved-db-instances
```

Output:

```
{
    "ReservedDBInstances": [
        {
            "ReservedDBInstanceId": "myreservedinstance",
            "ReservedDBInstancesOfferingId": "12ab34cd-59af-4b2c-a660-1abcdef23456",
            "DBInstanceClass": "db.t3.micro",
            "StartTime": "2020-06-01T13:44:21.436Z",
            "Duration": 31536000,
            "FixedPrice": 0.0,
            "UsagePrice": 0.0,
            "CurrencyCode": "USD",
            "DBInstanceCount": 1,
            "ProductDescription": "sqlserver-ex(li)",
            "OfferingType": "No Upfront",
            "MultiAZ": false,
            "State": "payment-pending",
            "RecurringCharges": [
                {
                    "RecurringChargeAmount": 0.014,
                    "RecurringChargeFrequency": "Hourly"
                }
            ],
```

```
            "ReservedDBInstanceArn": "arn:aws:rds:us-
west-2:123456789012:ri:myreservedinstance",
            "LeaseId": "a1b2c3d4-6b69-4a59-be89-5e11aa446666"
        }
    ]
}
```

For more information, see Reserved DB Instances for Amazon RDS in the *Amazon RDS User Guide*.

- For API details, see DescribeReservedDbInstances in *AWS CLI Command Reference*.

`describe-source-regions`

The following code example shows how to use `describe-source-regions`.

AWS CLI

To describe source Regions

The following `describe-source-regions` example retrieves details about all source AWS Regions. It also shows that automated backups can be replicated only from US West (Oregon) to the destination AWS Region, US East (N. Virginia).

```
aws rds describe-source-regions \
    --region us-east-1
```

Output:

```
{
    "SourceRegions": [
        {
            "RegionName": "af-south-1",
            "Endpoint": "https://rds.af-south-1.amazonaws.com",
            "Status": "available",
            "SupportsDBInstanceAutomatedBackupsReplication": false
        },
        {
            "RegionName": "ap-east-1",
            "Endpoint": "https://rds.ap-east-1.amazonaws.com",
            "Status": "available",
            "SupportsDBInstanceAutomatedBackupsReplication": false
        },
```

```
        {
            "RegionName": "ap-northeast-1",
            "Endpoint": "https://rds.ap-northeast-1.amazonaws.com",
            "Status": "available",
            "SupportsDBInstanceAutomatedBackupsReplication": true
        },
        {
            "RegionName": "ap-northeast-2",
            "Endpoint": "https://rds.ap-northeast-2.amazonaws.com",
            "Status": "available",
            "SupportsDBInstanceAutomatedBackupsReplication": true
        },
        {

            "SupportsDBInstanceAutomatedBackupsReplication": true
        },
        {
            "RegionName": "us-west-2",
           "Endpoint": "https://rds.us-west-2.amazonaws.com",
            "Status": "available",
            "SupportsDBInstanceAutomatedBackupsReplication": true
        }
    ]
}
```

For more information, see Finding information about replicated backups in the *Amazon RDS User Guide*.

- For API details, see DescribeSourceRegions in *AWS CLI Command Reference*.

`describe-valid-db-instance-modifications`

The following code example shows how to use `describe-valid-db-instance-modifications`.

AWS CLI

To describe valid modifications for a DB instance

The following `describe-valid-db-instance-modifications` example retrieves details about the valid modifications for the specified DB instance.

```
aws rds describe-valid-db-instance-modifications \
    --db-instance-identifier test-instance
```

Output:

```
{
    "ValidDBInstanceModificationsMessage": {
        "ValidProcessorFeatures": [],
        "Storage": [
            {
                "StorageSize": [
                    {

```

```
                    }
                ],
                "StorageType": "magnetic"
            }
        ]
    }
}
```

- For API details, see DescribeValidDbInstanceModifications in *AWS CLI Command Reference*.

`download-db-log-file-portion`

The following code example shows how to use `download-db-log-file-portion`.

AWS CLI

Example 1: To download the latest part of a DB log file

The following `download-db-log-file-portion` example downloads only the latest part of your log file, saving it to a local file named `tail.txt`.

```
aws rds download-db-log-file-portion \
    --db-instance-identifier test-instance \
    --log-file-name log.txt \
    --output text > tail.txt
```

The saved file might contain blank lines. They appear at the end of each part of the log file while being downloaded.

Example 2: To download an entire DB log file

The following `download-db-log-file-portion` example downloads the entire log file, using the `--starting-token 0` parameter, and saves the output to a local file named `full.txt`.

```
aws rds download-db-log-file-portion \
    --db-instance-identifier test-instance \
    --log-file-name log.txt \
    --starting-token 0 \
    --output text > full.txt
```

The saved file might contain blank lines. They appear at the end of each part of the log file while being downloaded.

- For API details, see DownloadDbLogFilePortion in *AWS CLI Command Reference*.

`generate-auth-token`

The following code example shows how to use `generate-auth-token`.

AWS CLI

To generate an authentication token

The following `generate-db-auth-token` example generates an authentication token for use with IAM database authentication.

```
aws rds generate-db-auth-token \
    --hostname aurmysql-test.cdgmuqiadpid.us-west-2.rds.amazonaws.com \
    --port 3306 \
    --region us-east-1 \
    --username jane_doe
```

Output:

```
aurmysql-test.cdgmuqiadpid.us-west-2.rds.amazonaws.com:3306/?
Action=connect&DBUser=jane_doe&X-Amz-Algorithm=AWS4-HMAC-SHA256&X-Amz-
Credential=AKIAIESZCNJ3OEXAMPLE%2F20180731%2Fus-east-1%2Frds-db%2Faws4_request&X-
Amz-Date=20180731T235209Z&X-Amz-Expires=900&X-Amz-SignedHeaders=host&X-Amz-
Signature=5a8753ebEXAMPLEa2c724e5667797EXAMPLE9d6ec6e3f427191fa41aeEXAMPLE
```

- For API details, see GenerateAuthToken in *AWS CLI Command Reference*.

`generate-db-auth-token`

The following code example shows how to use `generate-db-auth-token`.

AWS CLI

To generate an IAM authentication token

The following `generate-db-auth-token` example generates IAM authentication token to connect to a database.

```
aws rds generate-db-auth-token \
    --hostname mydb.123456789012.us-east-1.rds.amazonaws.com \
    --port 3306 \
    --region us-east-1 \
    --username db_user
```

Output:

```
mydb.123456789012.us-east-1.rds.amazonaws.com:3306/?
Action=connect&DBUser=db_user&X-Amz-Algorithm=AWS4-HMAC-SHA256&X-Amz-
Credential=AKIAIEXAMPLE%2Fus-east-1%2Frds-db%2Faws4_request&X-Amz-
Date=20210123T011543Z&X-Amz-Expires=900&X-Amz-SignedHeaders=host&X-Amz-
Signature=88987EXAMPLE1EXAMPLE2EXAMPLE3EXAMPLE4EXAMPLE5EXAMPLE6
```

For more information, see Connecting to your DB instance using IAM authentication in the *Amazon RDS User Guide* and Connecting to your DB cluster using IAM authentication in the *Amazon Aurora User Guide*.

- For API details, see GenerateDbAuthToken in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags on an Amazon RDS resource

The following `list-tags-for-resource` example lists all tags on a DB instance.

```
aws rds list-tags-for-resource \
    --resource-name arn:aws:rds:us-east-1:123456789012:db:orcl1
```

Output:

```
{
    "TagList": [
        {
            "Key": "Environment",
            "Value": "test"
        },
        {
```

```
                "Key": "Name",
                "Value": "MyDatabase"
            }
        ]
}
```

For more information, see Tagging Amazon RDS Resources in the *Amazon RDS User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`modify-certificates`

The following code example shows how to use `modify-certificates`.

AWS CLI

To temporarily override the system-default SSL/TLS certificate for new DB instances

The following `modify-certificates` example temporarily overrides the system-default SSL/TLS certificate for new DB instances.

```
aws rds modify-certificates \
    --certificate-identifier rds-ca-2019
```

Output:

```
{
    "Certificate": {
        "CertificateIdentifier": "rds-ca-2019",
        "CertificateType": "CA",
        "Thumbprint": "EXAMPLE123456789012",
        "ValidFrom": "2019-09-19T18:16:53Z",
        "ValidTill": "2024-08-22T17:08:50Z",
        "CertificateArn": "arn:aws:rds:us-east-1::cert:rds-ca-2019",
        "CustomerOverride": true,
        "CustomerOverrideValidTill": "2024-08-22T17:08:50Z"
    }
}
```

For more information, see Rotating your SSL/TLS certificate in the *Amazon RDS User Guide* and Rotating your SSL/TLS certificate in the *Amazon Aurora User Guide*.

- For API details, see ModifyCertificates in *AWS CLI Command Reference*.

`modify-current-db-cluster-capacity`

The following code example shows how to use `modify-current-db-cluster-capacity`.

AWS CLI

To scale the capacity of an Aurora Serverless DB cluster

The following `modify-current-db-cluster-capacity` example scales the capacity of an Aurora Serverless DB cluster to 8.

```
aws rds modify-current-db-cluster-capacity \
    --db-cluster-identifier mydbcluster \
    --capacity 8
```

Output:

```
{
    "DBClusterIdentifier": "mydbcluster",
    "PendingCapacity": 8,
    "CurrentCapacity": 1,
    "SecondsBeforeTimeout": 300,
    "TimeoutAction": "ForceApplyCapacityChange"
}
```

For more information, see Scaling Aurora Serverless v1 DB cluster capacity manually in the *Amazon Aurora User Guide*.

- For API details, see ModifyCurrentDbClusterCapacity in *AWS CLI Command Reference*.

`modify-db-cluster-endpoint`

The following code example shows how to use `modify-db-cluster-endpoint`.

AWS CLI

To modify a custom DB cluster endpoint

The following `modify-db-cluster-endpoint` example modifies the specified custom DB cluster endpoint.

```
aws rds modify-db-cluster-endpoint \
```

```
    --db-cluster-endpoint-identifier mycustomendpoint \
    --static-members dbinstance1 dbinstance2 dbinstance3
```

Output:

```
{
    "DBClusterEndpointIdentifier": "mycustomendpoint",
    "DBClusterIdentifier": "mydbcluster",
    "DBClusterEndpointResourceIdentifier": "cluster-endpoint-ANPAJ4AE5446DAEXAMPLE",

For more information, see Amazon Aurora Connection Management in the *Amazon Aurora User Guide*.

- For API details, see ModifyDbClusterEndpoint in *AWS CLI Command Reference*.

`modify-db-cluster-parameter-group`

The following code example shows how to use `modify-db-cluster-parameter-group`.

AWS CLI

To modify parameters in a DB cluster parameter group

The following `modify-db-cluster-parameter-group` example modifies the values of parameters in a DB cluster parameter group.

```
aws rds modify-db-cluster-parameter-group \
    --db-cluster-parameter-group-name mydbclusterpg \
```

```
    --
parameters "ParameterName=server_audit_logging,ParameterValue=1,ApplyMethod=immediate"
 \

  "ParameterName=server_audit_logs_upload,ParameterValue=1,ApplyMethod=immediate"
```

Output:

```
{
    "DBClusterParameterGroupName": "mydbclusterpg"
}
```

For more information, see Working with DB parameter groups and DB cluster parameter groups in the *Amazon Aurora User Guide*.

- For API details, see ModifyDbClusterParameterGroup in *AWS CLI Command Reference*.

`modify-db-cluster-snapshot-attribute`

The following code example shows how to use `modify-db-cluster-snapshot-attribute`.

AWS CLI

To modify a DB cluster snapshot attribute

The following `modify-db-cluster-snapshot-attribute` example makes changes to the specified DB cluster snapshot attribute.

```
aws rds modify-db-cluster-snapshot-attribute \
    --db-cluster-snapshot-identifier myclustersnapshot \
    --attribute-name restore \
    --values-to-add 123456789012
```

Output:

```
{
    "DBClusterSnapshotAttributesResult": {
        "DBClusterSnapshotIdentifier": "myclustersnapshot",
        "DBClusterSnapshotAttributes": [
            {
                "AttributeName": "restore",
                "AttributeValues": [
```

```
                    "123456789012"
                ]
            }
        ]
    }
}
```

For more information, see Restoring from a DB Cluster Snapshot in the *Amazon Aurora User Guide*.

- For API details, see ModifyDbClusterSnapshotAttribute in *AWS CLI Command Reference*.

`modify-db-cluster`

The following code example shows how to use `modify-db-cluster`.

AWS CLI

Example 1: To modify a DB cluster

The following `modify-db-cluster` example changes the master user password for the DB cluster named `cluster-2` and sets the backup retention period to 14 days. The `--apply-immediately` parameter causes the changes to be made immediately, instead of waiting until the next maintenance window.

```
aws rds modify-db-cluster \
    --db-cluster-identifier cluster-2 \
    --backup-retention-period 14 \
    --master-user-password newpassword99 \
    --apply-immediately
```

Output:

```
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "eu-central-1b",
            "eu-central-1c",
            "eu-central-1a"
        ],
        "BackupRetentionPeriod": 14,
```

```

                }
            ],
            ...output omitted...
        }
}
```

For more information, see Controlling access with security groups in the *Amazon Aurora User Guide*.

- For API details, see ModifyDbCluster in *AWS CLI Command Reference*.

`modify-db-instance`

The following code example shows how to use `modify-db-instance`.

AWS CLI

Example 1: To modify a DB instance

The following `modify-db-instance` example associates an option group and a parameter group with a compatible Microsoft SQL Server DB instance. The `--apply-immediately` parameter causes the option and parameter groups to be associated immediately, instead of waiting until the next maintenance window.

```
aws rds modify-db-instance \
    --db-instance-identifier database-2 \
```

```
    --option-group-name test-se-2017 \
    --db-parameter-group-name test-sqlserver-se-2017 \
    --apply-immediately
```

Output:

```
{
    "DBInstance": {
        "DBInstanceIdentifier": "database-2",
        "DBInstanceClass": "db.r4.large",
        "Engine": "sqlserver-se",
        "DBInstanceStatus": "available",

        ...output omitted...

        "DBParameterGroups": [
            {
                "DBParameterGroupName": "test-sqlserver-se-2017",
                "ParameterApplyStatus": "applying"
            }
        ],
        "AvailabilityZone": "us-west-2d",

        ...output omitted...

        "MultiAZ": true,
        "EngineVersion": "14.00.3281.6.v1",
        "AutoMinorVersionUpgrade": false,
        "ReadReplicaDBInstanceIdentifiers": [],
        "LicenseModel": "license-included",
        "OptionGroupMemberships": [
            {
                "OptionGroupName": "test-se-2017",
                "Status": "pending-apply"
            }
        ],
        "CharacterSetName": "SQL_Latin1_General_CP1_CI_AS",
        "SecondaryAvailabilityZone": "us-west-2c",
        "PubliclyAccessible": true,
        "StorageType": "gp2",

        ...output omitted...
```

```
        "DeletionProtection": false,
        "AssociatedRoles": [],
        "MaxAllocatedStorage": 1000
    }
}
```

For more information, see [Modifying an Amazon RDS DB Instance]() in the *Amazon RDS User Guide*.

Example 2: To associate VPC security group with a DB instance

The following `modify-db-instance` example associates a specific VPC security group and removes DB security groups from a DB instance:

```
aws rds modify-db-instance \
    --db-instance-identifier dbName \
    --vpc-security-group-ids sg-ID
```

Output:

```
{
"DBInstance": {
    "DBInstanceIdentifier": "dbName",
    "DBInstanceClass": "db.t3.micro",
    "Engine": "mysql",
    "DBInstanceStatus": "available",
    "MasterUsername": "admin",
    "Endpoint": {
        "Address": "dbName.abcdefghijk.us-west-2.rds.amazonaws.com",
        "Port": 3306,
        "HostedZoneId": "ABCDEFGHIJK1234"
    },
    "AllocatedStorage": 20,
    "InstanceCreateTime": "2024-02-15T00:37:58.793000+00:00",
    "PreferredBackupWindow": "11:57-12:27",
    "BackupRetentionPeriod": 7,
    "DBSecurityGroups": [],
    "VpcSecurityGroups": [
        {
            "VpcSecurityGroupId": "sg-ID",
            "Status": "active"
        }
```

```
    ],
    ... output omitted ...
    "MultiAZ": false,
    "EngineVersion": "8.0.35",
    "AutoMinorVersionUpgrade": true,
    "ReadReplicaDBInstanceIdentifiers": [],
    "LicenseModel": "general-public-license",

    ... output omitted ...
    }
}
```

For more information, see Controlling access with security groups in the *Amazon RDS User Guide*.

- For API details, see ModifyDBInstance in *AWS CLI Command Reference*.

`modify-db-parameter-group`

The following code example shows how to use `modify-db-parameter-group`.

AWS CLI

To modify a DB parameter group

The following `modify-db-parameter-group` example changes the value of the `clr enabled` parameter in a DB parameter group. The `--apply-immediately` parameter causes the DB parameter group to be modified immediately, instead of waiting until the next maintenance window.

```
aws rds modify-db-parameter-group \
    --db-parameter-group-name test-sqlserver-se-2017 \
    --parameters "ParameterName='clr
 enabled',ParameterValue=1,ApplyMethod=immediate"
```

Output:

```
{
    "DBParameterGroupName": "test-sqlserver-se-2017"
}
```

For more information, see Modifying Parameters in a DB Parameter Group in the *Amazon RDS User Guide*.

- For API details, see ModifyDBParameterGroup in *AWS CLI Command Reference*.

`modify-db-proxy-endpoint`

The following code example shows how to use `modify-db-proxy-endpoint`.

AWS CLI

To modify a DB proxy endpoint for an RDS database

The following `modify-db-proxy-endpoint` example modifies a DB proxy endpoint `proxyEndpoint` to set the read-timeout to 65 seconds.

```
aws rds modify-db-proxy-endpoint \
    --db-proxy-endpoint-name proxyEndpoint \
    --cli-read-timeout 65
```

Output:

```
{
"DBProxyEndpoint":
    {
        "DBProxyEndpointName": "proxyEndpoint",
        "DBProxyEndpointArn": "arn:aws:rds:us-east-1:123456789012:db-proxy-
endpoint:prx-endpoint-0123a01b12345c0ab",
        "DBProxyName": "proxyExample",
        "Status": "available",
        "VpcId": "vpc-1234567",
        "VpcSecurityGroupIds": [
            "sg-1234"
        ],
        "VpcSubnetIds": [
            "subnetgroup1",
            "subnetgroup2"
        ],
        "Endpoint": "proxyEndpoint.endpoint.proxyExample-ab0cd1efghij.us-
east-1.rds.amazonaws.com",
        "CreatedDate": "2023-04-05T16:09:33.452000+00:00",
        "TargetRole": "READ_WRITE",
```

```
        "IsDefault": "false"
    }
}
```

For more information, see [Modifying a proxy endpoint](#) in the *Amazon RDS User Guide* and [Modifying a proxy endpoint](#) in the *Amazon Aurora User Guide*.

- For API details, see [ModifyDbProxyEndpoint](#) in *AWS CLI Command Reference*.

`modify-db-proxy-target-group`

The following code example shows how to use `modify-db-proxy-target-group`.

AWS CLI

To modify a DB proxy endpoints

The following `modify-db-proxy-target-group` example modifies a DB proxy target group to set the maximum connections to 80 percent and maximum idle connections to 10 percent.

```
aws rds modify-db-proxy-target-group \
    --target-group-name default \
    --db-proxy-name proxyExample \
    --connection-pool-config MaxConnectionsPercent=80,MaxIdleConnectionsPercent=10
```

Output:

```
{
"DBProxyTargetGroup":
    {
        "DBProxyName": "proxyExample",
        "TargetGroupName": "default",
        "TargetGroupArn": "arn:aws:rds:us-east-1:123456789012:target-group:prx-
tg-0123a01b12345c0ab",
        "IsDefault": true,
        "Status": "available",
        "ConnectionPoolConfig": {
            "MaxConnectionsPercent": 80,
            "MaxIdleConnectionsPercent": 10,
            "ConnectionBorrowTimeout": 120,
            "SessionPinningFilters": []
```

```
        },
        "CreatedDate": "2023-05-02T18:41:19.495000+00:00",
        "UpdatedDate": "2023-05-02T18:41:21.762000+00:00"
    }
}
```

For more information, see Modifying an RDS Proxy in the *Amazon RDS User Guide* and Modifying an RDS Proxy in the *Amazon Aurora User Guide*.

- For API details, see ModifyDbProxyTargetGroup in *AWS CLI Command Reference*.

`modify-db-proxy`

The following code example shows how to use `modify-db-proxy`.

AWS CLI

To modify a DB proxy for an RDS database

The following `modify-db-proxy` example modifies a DB proxy named `proxyExample` to require SSL for its connections.

```
aws rds modify-db-proxy \
    --db-proxy-name proxyExample \
    --require-tls
```

Output:

```
{
"DBProxy":
    {
        "DBProxyName": "proxyExample",
        "DBProxyArn": "arn:aws:rds:us-east-1:123456789012:db-
proxy:prx-0123a01b12345c0ab",

    }
}
```

For more information, see Modify an RDS Proxy in the *Amazon RDS User Guide* and Creating an RDS Proxy in the *Amazon Aurora User Guide*.

- For API details, see ModifyDbProxy in *AWS CLI Command Reference*.

`modify-db-shard-group`

The following code example shows how to use `modify-db-shard-group`.

AWS CLI

Example 1: To modify a DB shard group

The following `modify-db-shard-group` example changes the maximum capacity of a DB shard group.

```
aws rds modify-db-shard-group \
    --db-shard-group-identifier my-db-shard-group \
    --max-acu 1000
```

Output:

```
{
    "DBShardGroups": [
        {
            "DBShardGroupResourceId": "shardgroup-a6e3a0226aa243e2ac6c7a1234567890",
            "DBShardGroupIdentifier": "my-db-shard-group",
            "DBClusterIdentifier": "my-sv2-cluster",
            "MaxACU": 768.0,
            "ComputeRedundancy": 0,
            "Status": "available",
            "PubliclyAccessible": false,
            "Endpoint": "my-sv2-cluster.limitless-cekycexample.us-
east-2.rds.amazonaws.com"
        }
    ]
}
```

For more information, see Amazon Aurora DB Clusters in the *Amazon Aurora User Guide*.

Example 2: To describe your DB shard groups

The following `describe-db-shard-groups` example retrieves the details of your DB shard groups after you run the `modify-db-shard-group` command. The maximum capacity of the DB shard group `my-db-shard-group` is now 1000 Aurora capacity units (ACUs).

```
aws rds describe-db-shard-groups
```

Output:

```
{
    "DBShardGroups": [
        {
            "DBShardGroupResourceId": "shardgroup-7bb446329da94788b3f957746example",
            "DBShardGroupIdentifier": "limitless-test-shard-grp",
            "DBClusterIdentifier": "limitless-test-cluster",
            "MaxACU": 768.0,
            "ComputeRedundancy": 0,
            "Status": "available",
            "PubliclyAccessible": true,
            "Endpoint": "limitless-test-cluster.limitless-cekycexample.us-
east-2.rds.amazonaws.com"
        },
        {
```

```
            "DBShardGroupResourceId": "shardgroup-a6e3a0226aa243e2ac6c7a1234567890",
            "DBShardGroupIdentifier": "my-db-shard-group",
            "DBClusterIdentifier": "my-sv2-cluster",
            "MaxACU": 1000.0,
            "ComputeRedundancy": 0,
            "Status": "available",
            "PubliclyAccessible": false,
            "Endpoint": "my-sv2-cluster.limitless-cekycexample.us-
east-2.rds.amazonaws.com"
        }
    ]
}
```

For more information, see Amazon Aurora DB Clusters in the *Amazon Aurora User Guide*.

- For API details, see ModifyDbShardGroup in *AWS CLI Command Reference*.

`modify-db-snapshot-attribute`

The following code example shows how to use `modify-db-snapshot-attribute`.

AWS CLI

Example 1: To enable two AWS accounts to restore a DB snapshot

The following `modify-db-snapshot-attribute` example grants permission to two AWS accounts, with the identifiers `111122223333` and `444455556666`, to restore the DB snapshot named `mydbsnapshot`.

```
aws rds modify-db-snapshot-attribute \
    --db-snapshot-identifier mydbsnapshot \
    --attribute-name restore \
    --values-to-add {"111122223333","444455556666"}
```

Output:

```
{
    "DBSnapshotAttributesResult": {
        "DBSnapshotIdentifier": "mydbsnapshot",
        "DBSnapshotAttributes": [
            {
```

```
                "AttributeName": "restore",
                "AttributeValues": [
                    "111122223333",
                    "444455556666"
                ]
            }
        ]
    }
}
```

For more information, see Sharing a Snapshot in the *Amazon RDS User Guide*.

Example 2: To prevent an AWS account from restoring a DB snapshot

The following `modify-db-snapshot-attribute` example removes permission from a particular AWS account to restore the DB snapshot named `mydbsnapshot`. When specifying a single account, the account identifier can't be surrounded by quotations marks or braces.

```
aws rds modify-db-snapshot-attribute \
    --db-snapshot-identifier mydbsnapshot \
    --attribute-name restore \
    --values-to-remove 444455556666
```

Output:

```
{
    "DBSnapshotAttributesResult": {
        "DBSnapshotIdentifier": "mydbsnapshot",
        "DBSnapshotAttributes": [
            {
                "AttributeName": "restore",
                "AttributeValues": [
                    "111122223333"
                ]
            }
        ]
    }
}
```

For more information, see Sharing a Snapshot in the *Amazon RDS User Guide*.

- For API details, see ModifyDbSnapshotAttribute in *AWS CLI Command Reference*.

`modify-db-snapshot-attributes`

The following code example shows how to use `modify-db-snapshot-attributes`.

AWS CLI

To modify a DB snapshot attribute

The following `modify-db-snapshot-attribute` example permits two AWS account identifiers, `111122223333` and `444455556666`, to restore the DB snapshot named `mydbsnapshot`.

```
aws rds modify-db-snapshot-attribute \
    --db-snapshot-identifier mydbsnapshot \
    --attribute-name restore \
    --values-to-add '["111122223333","444455556666"]'
```

Output:

```
{
    "DBSnapshotAttributesResult": {
        "DBSnapshotIdentifier": "mydbsnapshot",
        "DBSnapshotAttributes": [
            {
                "AttributeName": "restore",
                "AttributeValues": [
                    "111122223333",
                    "444455556666"
                ]
            }
        ]
    }
}
```

For more information, see Sharing a Snapshot in the *Amazon RDS User Guide*.

- For API details, see ModifyDbSnapshotAttributes in *AWS CLI Command Reference*.

`modify-db-snapshot`

The following code example shows how to use `modify-db-snapshot`.

AWS CLI

To modify a DB snapshot

The following `modify-db-snapshot` example upgrades a PostgeSQL 10.6 snapshot named `db5-snapshot-upg-test` to PostgreSQL 11.7. The new DB engine version is shown after the snapshot has finished upgrading and its status is **available**.

```
aws rds modify-db-snapshot \
    --db-snapshot-identifier db5-snapshot-upg-test \
    --engine-version 11.7
```

Output:

```
{
    "DBSnapshot": {
        "DBSnapshotIdentifier": "db5-snapshot-upg-test",
        "DBInstanceIdentifier": "database-5",
        "SnapshotCreateTime": "2020-03-27T20:49:17.092Z",
        "Engine": "postgres",
        "AllocatedStorage": 20,
        "Status": "upgrading",
        "Port": 5432,
        "AvailabilityZone": "us-west-2a",
        "VpcId": "vpc-2ff27557",
        "InstanceCreateTime": "2020-03-27T19:59:04.735Z",
        "MasterUsername": "postgres",
        "EngineVersion": "10.6",
        "LicenseModel": "postgresql-license",
        "SnapshotType": "manual",
        "OptionGroupName": "default:postgres-11",
        "PercentProgress": 100,
        "StorageType": "gp2",
        "Encrypted": false,
        "DBSnapshotArn": "arn:aws:rds:us-west-2:123456789012:snapshot:db5-snapshot-
upg-test",
        "IAMDatabaseAuthenticationEnabled": false,
        "ProcessorFeatures": [],
        "DbiResourceId": "db-GJMF75LM42IL6BTFRE4UZJ5YM4"
    }
}
```

For more information, see Upgrading a PostgreSQL DB Snapshot in the *Amazon RDS User Guide*.

- For API details, see ModifyDbSnapshot in *AWS CLI Command Reference*.

`modify-db-subnet-group`

The following code example shows how to use `modify-db-subnet-group`.

AWS CLI

To modify a DB subnet group

The following `modify-db-subnet-group` example adds a subnet with the ID `subnet-08e41f9e230222222` to the DB subnet group named `mysubnetgroup`. To keep the existing subnets in the subnet group, include their IDs as values in the `--subnet-ids` option. Make sure to have subnets with at least two different Availability Zones in the DB subnet group.

```
aws rds modify-db-subnet-group \
    --db-subnet-group-name mysubnetgroup \
    --subnet-ids
 '["subnet-0a1dc4e1a6f123456","subnet-070dd7ecb3aaaaaaa","subnet-00f5b198bc0abcdef","subnet-
```

Output:

```
{
    "DBSubnetGroup": {
        "DBSubnetGroupName": "mysubnetgroup",
        "DBSubnetGroupDescription": "test DB subnet group",
        "VpcId": "vpc-0f08e7610a1b2c3d4",
        "SubnetGroupStatus": "Complete",
        "Subnets": [
            {
                "SubnetIdentifier": "subnet-08e41f9e230222222",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2a"
                },
                "SubnetStatus": "Active"
            },
            {
                "SubnetIdentifier": "subnet-070dd7ecb3aaaaaaa",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2b"
                },
                "SubnetStatus": "Active"
```

```
                },
                {
                    "SubnetIdentifier": "subnet-00f5b198bc0abcdef",
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2d"
                    },
                    "SubnetStatus": "Active"
                },
                {
                    "SubnetIdentifier": "subnet-0a1dc4e1a6f123456",
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2b"
                    },
                    "SubnetStatus": "Active"
                }
            ],
            "DBSubnetGroupArn": "arn:aws:rds:us-
west-2:534026745191:subgrp:mysubnetgroup"
        }
}
```

For more information, see Step 3: Create a DB Subnet Group in the *Amazon RDS User Guide*.

- For API details, see ModifyDbSubnetGroup in *AWS CLI Command Reference*.

`modify-event-subscription`

The following code example shows how to use `modify-event-subscription`.

AWS CLI

To modify an event subscription

The following `modify-event-subscription` example disables the specified event subscription, so that it no longer publishes notifications to the specified Amazon Simple Notification Service topic.

```
aws rds modify-event-subscription \
    --subscription-name my-instance-events \
    --no-enabled
```

Output:

```
{
    "EventSubscription": {
        "EventCategoriesList": [
            "backup",
            "recovery"
        ],
        "CustomerAwsId": "123456789012",
        "SourceType": "db-instance",
        "SubscriptionCreationTime": "Tue Jul 31 23:22:01 UTC 2018",
        "EventSubscriptionArn": "arn:aws:rds:us-east-1:123456789012:es:my-instance-
events",
        "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:interesting-events",
        "CustSubscriptionId": "my-instance-events",
        "Status": "modifying",
        "Enabled": false
    }
}
```

- For API details, see ModifyEventSubscription in *AWS CLI Command Reference*.

`modify-global-cluster`

The following code example shows how to use `modify-global-cluster`.

AWS CLI

To modify a global DB cluster

The following `modify-global-cluster` example enables deletion protection for an Aurora MySQL-compatible global DB cluster.

```
aws rds modify-global-cluster \
    --global-cluster-identifier myglobalcluster \
    --deletion-protection
```

Output:

```
{
    "GlobalCluster": {
        "GlobalClusterIdentifier": "myglobalcluster",
        "GlobalClusterResourceId": "cluster-f0e523bfe07aabb",
```

```
        "GlobalClusterArn": "arn:aws:rds::123456789012:global-
cluster:myglobalcluster",
        "Status": "available",
        "Engine": "aurora-mysql",
        "EngineVersion": "5.7.mysql_aurora.2.07.2",
        "StorageEncrypted": false,
        "DeletionProtection": true,
        "GlobalClusterMembers": []
    }
}
```

For more information, see [Managing an Aurora global database]() in the *Amazon Aurora User Guide*.

- For API details, see [ModifyGlobalCluster]() in *AWS CLI Command Reference*.

`promote-read-replica-db-cluster`

The following code example shows how to use `promote-read-replica-db-cluster`.

AWS CLI

To promote a DB cluster read replica

The following `promote-read-replica-db-cluster` example promotes the specified read replica to become a standalone DB cluster.

```
aws rds promote-read-replica-db-cluster \
    --db-cluster-identifier mydbcluster-1
```

Output:

```
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "us-east-1a",
            "us-east-1b",
            "us-east-1c"
        ],
        "BackupRetentionPeriod": 1,
        "DatabaseName": "",
```

```
        "DBClusterIdentifier": "mydbcluster-1",
        ...some output truncated...
    }
}
```

For more information, see Promoting a read replica to be a DB cluster in the *Amazon Aurora User Guide*.

- For API details, see PromoteReadReplicaDbCluster in *AWS CLI Command Reference*.

`promote-read-replica`

The following code example shows how to use `promote-read-replica`.

AWS CLI

To promote a read replica

The following `promote-read-replica` example promotes the specified read replica to become a standalone DB instance.

```
aws rds promote-read-replica \
    --db-instance-identifier test-instance-repl
```

Output:

```
{
    "DBInstance": {
        "DBInstanceArn": "arn:aws:rds:us-east-1:123456789012:db:test-instance-repl",
        "StorageType": "standard",
        "ReadReplicaSourceDBInstanceIdentifier": "test-instance",
        "DBInstanceStatus": "modifying",
        ...some output truncated...
    }
}
```

- For API details, see PromoteReadReplica in *AWS CLI Command Reference*.

`purchase-reserved-db-instance`

The following code example shows how to use `purchase-reserved-db-instance`.

AWS CLI

To purchase a reserved DB instance offering

The following `purchase-reserved-db-instances-offering` example purchases a reserved DB instance offering. The `reserved-db-instances-offering-id` must be a valid offering ID, as returned by the `describe-reserved-db-instances-offering` command.

aws rds purchase-reserved-db-instances-offering --reserved-db-instances-offering-id 438012d3-4a52-4cc7-b2e3-8dff72e0e706

- For API details, see [PurchaseReservedDbInstance](#) in *AWS CLI Command Reference*.

`purchase-reserved-db-instances-offerings`

The following code example shows how to use `purchase-reserved-db-instances-offerings`.

AWS CLI

Example 1: To find a reserved DB instance to purchase

The following `describe-reserved-db-instances-offerings` example lists the available reserved MySQL DB instances with the db.t2.micro instance class and a duration of one year. The offering ID is required for purchasing a reserved DB instance.

```
aws rds describe-reserved-db-instances-offerings \
    --product-description mysql \
    --db-instance-class db.t2.micro \
    --duration 1
```

Output:

```
{
    "ReservedDBInstancesOfferings": [
        {
            "ReservedDBInstancesOfferingId": "8ba30be1-b9ec-447f-8f23-6114e3f4c7b4",
            "DBInstanceClass": "db.t2.micro",
            "Duration": 31536000,
            "FixedPrice": 51.0,
            "UsagePrice": 0.0,
```

```
                "CurrencyCode": "USD",
                "ProductDescription": "mysql",
                "OfferingType": "Partial Upfront",
                "MultiAZ": false,
                "RecurringCharges": [
                    {
                        "RecurringChargeAmount": 0.006,
                        "RecurringChargeFrequency": "Hourly"
                    }
                ]
            },
        ... some output truncated ...
        ]
}
```

For more information, see Reserved DB Instances for Amazon RDS in the *Amazon RDS User Guide*.

Example 2: To purchase a reserved DB instance

The following `purchase-reserved-db-instances-offering` example shows how to buy the reserved DB instance offering from the previous example.

aws rds purchase-reserved-db-instances-offering --reserved-db-instances-offering-id 8ba30be1-b9ec-447f-8f23-6114e3f4c7b4

Output:

```
{
    "ReservedDBInstance": {
        "ReservedDBInstanceId": "ri-2020-06-29-16-54-57-670",
        "ReservedDBInstancesOfferingId": "8ba30be1-b9ec-447f-8f23-6114e3f4c7b4",
        "DBInstanceClass": "db.t2.micro",
        "StartTime": "2020-06-29T16:54:57.670Z",
        "Duration": 31536000,
        "FixedPrice": 51.0,
        "UsagePrice": 0.0,
        "CurrencyCode": "USD",
        "DBInstanceCount": 1,
        "ProductDescription": "mysql",
        "OfferingType": "Partial Upfront",
        "MultiAZ": false,
        "State": "payment-pending",
```

```
        "RecurringCharges": [
            {
                "RecurringChargeAmount": 0.006,
                "RecurringChargeFrequency": "Hourly"
            }
        ],
        "ReservedDBInstanceArn": "arn:aws:rds:us-
west-2:123456789012:ri:ri-2020-06-29-16-54-57-670"
    }
}
```

For more information, see Reserved DB Instances for Amazon RDS in the *Amazon RDS User Guide*.

- For API details, see PurchaseReservedDbInstancesOfferings in *AWS CLI Command Reference*.

`reboot-db-instance`

The following code example shows how to use `reboot-db-instance`.

AWS CLI

To reboot a DB instance

The following `reboot-db-instance` example starts a reboot of the specified DB instance.

```
aws rds reboot-db-instance \
    --db-instance-identifier test-mysql-instance
```

Output:

```
{
    "DBInstance": {
        "DBInstanceIdentifier": "test-mysql-instance",
        "DBInstanceClass": "db.t3.micro",
        "Engine": "mysql",
        "DBInstanceStatus": "rebooting",
        "MasterUsername": "admin",
        "Endpoint": {
            "Address": "test-mysql-instance.############.us-
west-2.rds.amazonaws.com",
            "Port": 3306,
```

```
                "HostedZoneId": "Z1PVIF0EXAMPLE"
            },

        ... output omitted...

        }
}
```

For more information, see [Rebooting a DB Instance](#) in the *Amazon RDS User Guide*.

- For API details, see [RebootDBInstance](#) in *AWS CLI Command Reference*.

`reboot-db-shard-group`

The following code example shows how to use `reboot-db-shard-group`.

AWS CLI

Example 1: To reboot a DB shard group

The following `reboot-db-shard-group` example reboots a DB shard group.

```
aws rds reboot-db-shard-group \
    --db-shard-group-identifier my-db-shard-group
```

Output:

```
{
    "DBShardGroups": [
        {
            "DBShardGroupResourceId": "shardgroup-a6e3a0226aa243e2ac6c7a1234567890",
            "DBShardGroupIdentifier": "my-db-shard-group",
            "DBClusterIdentifier": "my-sv2-cluster",
            "MaxACU": 1000.0,
            "ComputeRedundancy": 0,
            "Status": "available",
            "PubliclyAccessible": false,
            "Endpoint": "my-sv2-cluster.limitless-cekycexample.us-
east-2.rds.amazonaws.com"
        }
    ]
}
```

For more information, see Rebooting an Amazon Aurora DB cluster or Amazon Aurora DB instance in the *Amazon Aurora User Guide*.

Example 2: To describe your DB shard groups

The following `describe-db-shard-groups` example retrieves the details of your DB shard groups after you run the `reboot-db-shard-group` command. The DB shard group `my-db-shard-group` is now rebooting.

```
aws rds describe-db-shard-groups
```

Output:

```
{
    "DBShardGroups": [
        {
            "DBShardGroupResourceId": "shardgroup-7bb446329da94788b3f957746example",
            "DBShardGroupIdentifier": "limitless-test-shard-grp",
            "DBClusterIdentifier": "limitless-test-cluster",
            "MaxACU": 768.0,
            "ComputeRedundancy": 0,
            "Status": "available",
            "PubliclyAccessible": true,
            "Endpoint": "limitless-test-cluster.limitless-cekycexample.us-
east-2.rds.amazonaws.com"
        },
        {
            "DBShardGroupResourceId": "shardgroup-a6e3a0226aa243e2ac6c7a1234567890",
            "DBShardGroupIdentifier": "my-db-shard-group",
            "DBClusterIdentifier": "my-sv2-cluster",
            "MaxACU": 1000.0,
            "ComputeRedundancy": 0,
            "Status": "rebooting",
            "PubliclyAccessible": false,
            "Endpoint": "my-sv2-cluster.limitless-cekycexample.us-
east-2.rds.amazonaws.com"
        }
    ]
}
```

For more information, see Rebooting an Amazon Aurora DB cluster or Amazon Aurora DB instance in the *Amazon Aurora User Guide*.

- For API details, see RebootDbShardGroup in *AWS CLI Command Reference*.

`register-db-proxy-targets`

The following code example shows how to use `register-db-proxy-targets`.

AWS CLI

To register a DB proxy with a database

The following `register-db-proxy-targets` example creates the association between a database and a proxy.

```
aws rds register-db-proxy-targets \
    --db-proxy-name proxyExample \
    --db-cluster-identifiers database-5
```

Output:

```
{
    "DBProxyTargets": [
        {
            "RdsResourceId": "database-5",
            "Port": 3306,
            "Type": "TRACKED_CLUSTER",
            "TargetHealth": {
                "State": "REGISTERING"
            }
        },
        {
            "Endpoint": "database-5instance-1.ab0cd1efghij.us-
east-1.rds.amazonaws.com",
            "RdsResourceId": "database-5",
            "Port": 3306,
            "Type": "RDS_INSTANCE",
            "TargetHealth": {
                "State": "REGISTERING"
            }
        }
    ]
}
```

For more information, see Creating an RDS proxy in the *Amazon RDS User Guide* and Creating an RDS proxy in the *Amazon Aurora User Guide*.

- For API details, see RegisterDbProxyTargets in *AWS CLI Command Reference*.

`remove-from-global-cluster`

The following code example shows how to use `remove-from-global-cluster`.

AWS CLI

To detach an Aurora secondary cluster from an Aurora global database cluster

The following `remove-from-global-cluster` example detaches an Aurora secondary cluster from an Aurora global database cluster. The cluster changes from being read-only to a standalone cluster with read-write capability.

```
aws rds remove-from-global-cluster \
    --region us-west-2 \
    --global-cluster-identifier myglobalcluster \
    --db-cluster-identifier arn:aws:rds:us-west-2:123456789012:cluster:DB-1
```

Output:

```
{
    "GlobalCluster": {
        "GlobalClusterIdentifier": "myglobalcluster",
        "GlobalClusterResourceId": "cluster-abc123def456gh",
        "GlobalClusterArn": "arn:aws:rds::123456789012:global-
cluster:myglobalcluster",
        "Status": "available",
        "Engine": "aurora-postgresql",
        "EngineVersion": "10.11",
        "StorageEncrypted": true,
        "DeletionProtection": false,
        "GlobalClusterMembers": [
            {
                "DBClusterArn": "arn:aws:rds:us-east-1:123456789012:cluster:js-
global-cluster",
                "Readers": [
                    "arn:aws:rds:us-west-2:123456789012:cluster:DB-1"
                ],
                "IsWriter": true
```

```
                },
                {
                    "DBClusterArn": "arn:aws:rds:us-west-2:123456789012:cluster:DB-1",
                    "Readers": [],
                    "IsWriter": false,
                    "GlobalWriteForwardingStatus": "disabled"
                }
            ]
        }
}
```

For more information, see Removing a cluster from an Amazon Aurora global database in the *Amazon Aurora User Guide*.

- For API details, see RemoveFromGlobalCluster in *AWS CLI Command Reference*.

`remove-option-from-option-group`

The following code example shows how to use `remove-option-from-option-group`.

AWS CLI

To delete an option from an option group

The following `remove-option-from-option-group` example removes the `OEM` option from `myoptiongroup`.

```
aws rds remove-option-from-option-group \
    --option-group-name myoptiongroup \
    --options OEM \
    --apply-immediately
```

Output:

```
{
    "OptionGroup": {
        "OptionGroupName": "myoptiongroup",
        "OptionGroupDescription": "Test",
        "EngineName": "oracle-ee",
        "MajorEngineVersion": "19",
        "Options": [],
        "AllowsVpcAndNonVpcInstanceMemberships": true,
        "OptionGroupArn": "arn:aws:rds:us-east-1:123456789012:og:myoptiongroup"
```

```
    }
}
```

For more information, see Removing an Option from an Option Group in the *Amazon Aurora User Guide*.

- For API details, see RemoveOptionFromOptionGroup in *AWS CLI Command Reference*.

`remove-role-from-db-cluster`

The following code example shows how to use `remove-role-from-db-cluster`.

AWS CLI

To disassociate an AWS Identity and Access Management (IAM) role from a DB cluster

The following `remove-role-from-db-cluster` example removes a role from a DB cluster.

```
aws rds remove-role-from-db-cluster \
    --db-cluster-identifier mydbcluster \
    --role-arn arn:aws:iam::123456789012:role/RDSLoadFromS3
```

This command produces no output.

For more information, see Associating an IAM role with an Amazon Aurora MySQL DB cluster in the *Amazon Aurora User Guide*.

- For API details, see RemoveRoleFromDbCluster in *AWS CLI Command Reference*.

`remove-role-from-db-instance`

The following code example shows how to use `remove-role-from-db-instance`.

AWS CLI

To disassociate an AWS Identity and Access Management (IAM) role from a DB instance

The following `remove-role-from-db-instance` example removes the role named `rds-s3-integration-role` from an Oracle DB instance named `test-instance`.

```
aws rds remove-role-from-db-instance \
    --db-instance-identifier test-instance \
    --feature-name S3_INTEGRATION \
```

```
    --role-arn arn:aws:iam::111122223333:role/rds-s3-integration-role
```

This command produces no output.

For more information, see Disabling RDS SQL Server Integration with S3 in the *Amazon RDS User Guide*.

- For API details, see RemoveRoleFromDbInstance in *AWS CLI Command Reference*.

`remove-source-identifier-from-subscription`

The following code example shows how to use `remove-source-identifier-from-subscription`.

AWS CLI

To remove a source identifier from a subscription

The following `remove-source-identifier` example removes the specified source identifier from an existing subscription.

```
aws rds remove-source-identifier-from-subscription \
    --subscription-name my-instance-events \
    --source-identifier test-instance-repl
```

Output:

```
{
    "EventSubscription": {
        "EventSubscriptionArn": "arn:aws:rds:us-east-1:123456789012:es:my-instance-
events",
        "SubscriptionCreationTime": "Tue Jul 31 23:22:01 UTC 2018",
        "EventCategoriesList": [
            "backup",
            "recovery"
        ],
        "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:interesting-events",
        "Status": "modifying",
        "CustSubscriptionId": "my-instance-events",
        "CustomerAwsId": "123456789012",
        "SourceIdsList": [
            "test-instance"
        ],
```

```
        "SourceType": "db-instance",
        "Enabled": false
    }
}
```

- For API details, see RemoveSourceIdentifierFromSubscription in *AWS CLI Command Reference*.

`remove-tags-from-resource`

The following code example shows how to use `remove-tags-from-resource`.

AWS CLI

To remove tags from a resource

The following `remove-tags-from-resource` example removes tags from a resource.

```
aws rds remove-tags-from-resource \
    --resource-name arn:aws:rds:us-east-1:123456789012:db:mydbinstance \
    --tag-keys Name Environment
```

This command produces no output.

For more information, see Tagging Amazon RDS resources in the *Amazon RDS User Guide* and Tagging Amazon RDS resources in the *Amazon Aurora User Guide*.

- For API details, see RemoveTagsFromResource in *AWS CLI Command Reference*.

`reset-db-cluster-parameter-group`

The following code example shows how to use `reset-db-cluster-parameter-group`.

AWS CLI

Example 1: To reset all parameters to their default values

The following `reset-db-cluster-parameter-group` example resets all parameter values in a customer-created DB cluster parameter group to their default values.

```
aws rds reset-db-cluster-parameter-group \
    --db-cluster-parameter-group-name mydbclpg \
    --reset-all-parameters
```

Output:

```
{
    "DBClusterParameterGroupName": "mydbclpg"
}
```

For more information, see [Working with DB parameter groups and DB cluster parameter groups](#) in the *Amazon Aurora User Guide*.

Example 2: To reset specific parameters to their default values

The following `reset-db-cluster-parameter-group` example resets the parameter values for specific parameters to their default values in a customer-created DB cluster parameter group.

```
aws rds reset-db-cluster-parameter-group \
    --db-cluster-parameter-group-name mydbclpgy \
    --parameters "ParameterName=max_connections,ApplyMethod=immediate" \
                 "ParameterName=max_allowed_packet,ApplyMethod=immediate"
```

Output:

```
{
    "DBClusterParameterGroupName": "mydbclpg"
}
```

For more information, see [Working with DB parameter groups and DB cluster parameter groups](#) in the *Amazon Aurora User Guide*.

- For API details, see [ResetDbClusterParameterGroup](#) in *AWS CLI Command Reference*.

`reset-db-parameter-group`

The following code example shows how to use `reset-db-parameter-group`.

AWS CLI

Example 1: To reset all parameters to their default values

The following `reset-db-parameter-group` example resets all parameter values in a customer-created DB parameter group to their default values.

```
aws rds reset-db-parameter-group \
    --db-parameter-group-name mypg \
    --reset-all-parameters
```

Output:

```
{
    "DBParameterGroupName": "mypg"
}
```

For more information, see Working with DB parameter groups in the *Amazon RDS User Guide* and Working with DB parameter groups and DB cluster parameter groups in the *Amazon Aurora User Guide*.

Example 2: To reset specific parameters to their default values

The following `reset-db-parameter-group` example resets the parameter values for specific parameters to their default values in a customer-created DB parameter group.

```
aws rds reset-db-parameter-group \
    --db-parameter-group-name mypg \
    --parameters "ParameterName=max_connections,ApplyMethod=immediate" \
                 "ParameterName=max_allowed_packet,ApplyMethod=immediate"
```

Output:

```
{
    "DBParameterGroupName": "mypg"
}
```

For more information, see Working with DB parameter groups in the *Amazon RDS User Guide* and Working with DB parameter groups and DB cluster parameter groups in the *Amazon Aurora User Guide*.

- For API details, see ResetDbParameterGroup in *AWS CLI Command Reference*.

`restore-db-cluster-from-s3`

The following code example shows how to use `restore-db-cluster-from-s3`.

AWS CLI

To restore an Amazon Aurora DB cluster from Amazon S3

The following `restore-db-cluster-from-s3` example restores an Amazon Aurora MySQL version 5.7-compatible DB cluster from a MySQL 5.7 DB backup file in Amazon S3.

```
aws rds restore-db-cluster-from-s3 \
    --db-cluster-identifier cluster-s3-restore \
    --engine aurora-mysql \
    --master-username admin \
    --master-user-password mypassword \
    --s3-bucket-name amzn-s3-demo-bucket \
    --s3-prefix test-backup \
    --s3-ingestion-role-arn arn:aws:iam::123456789012:role/service-role/TestBackup \
    --source-engine mysql \
    --source-engine-version 5.7.28
```

Output:

```
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "us-west-2c",

For more information, see Migrating Data from MySQL by Using an Amazon S3 Bucket in the *Amazon Aurora User Guide*.

- For API details, see RestoreDbClusterFromS3 in *AWS CLI Command Reference*.

`restore-db-cluster-from-snapshot`

The following code example shows how to use `restore-db-cluster-from-snapshot`.

AWS CLI

To restore a DB cluster from a snapshot

The following `restore-db-cluster-from-snapshot` restores an Aurora PostgreSQL DB cluster compatible with PostgreSQL version 10.7 from a DB cluster snapshot named `test-instance-snapshot`.

```
aws rds restore-db-cluster-from-snapshot \
    --db-cluster-identifier newdbcluster \
    --snapshot-identifier test-instance-snapshot \
    --engine aurora-postgresql \
    --engine-version 10.7
```

Output:

```
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "us-west-2c",

        "DomainMemberships": []
    }
}
```

For more information, see Restoring from a DB Cluster Snapshot in the *Amazon Aurora User Guide*.

- For API details, see RestoreDbClusterFromSnapshot in *AWS CLI Command Reference*.

`restore-db-cluster-to-point-in-time`

The following code example shows how to use `restore-db-cluster-to-point-in-time`.

AWS CLI

To restore a DB cluster to a specified time

The following `restore-db-cluster-to-point-in-time` example restores the DB cluster named `database-4` to the latest possible time. Using `copy-on-write` as the restore type restores the new DB cluster as a clone of the source DB cluster.

```
aws rds restore-db-cluster-to-point-in-time \
    --source-db-cluster-identifier database-4 \
    --db-cluster-identifier sample-cluster-clone \
    --restore-type copy-on-write \
    --use-latest-restorable-time
```

Output:

```
{
```

```
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "us-west-2c",
            "us-west-2a",
            "us-west-2b"
        ],
        "BackupRetentionPeriod": 7,
        "DatabaseName": "",
        "DBClusterIdentifier": "sample-cluster-clone",
        "DBClusterParameterGroup": "default.aurora-postgresql10",
        "DBSubnetGroup": "default",
        "Status": "creating",
        "Endpoint": "sample-cluster-clone.cluster-############.us-
west-2.rds.amazonaws.com",
        "ReaderEndpoint": "sample-cluster-clone.cluster-ro-############.us-
west-2.rds.amazonaws.com",
        "MultiAZ": false,
        "Engine": "aurora-postgresql",
        "EngineVersion": "10.7",
        "Port": 5432,
        "MasterUsername": "postgres",
        "PreferredBackupWindow": "09:33-10:03",
        "PreferredMaintenanceWindow": "sun:12:22-sun:12:52",

        "CrossAccountClone": false
    }
}
```

For more information, see [Restoring a DB Cluster to a Specified Time]() in the *Amazon Aurora User Guide*.

- For API details, see [RestoreDbClusterToPointInTime]() in *AWS CLI Command Reference*.

`restore-db-instance-from-db-snapshot`

The following code example shows how to use `restore-db-instance-from-db-snapshot`.

AWS CLI

To restore a DB instance from a DB snapshot

The following `restore-db-instance-from-db-snapshot` example creates a new DB instance named `db7-new-instance` with the `db.t3.small` DB instance class from the specified DB snapshot. The source DB instance from which the snapshot was taken uses a deprecated DB instance class, so you can't upgrade it.

```
aws rds restore-db-instance-from-db-snapshot \
    --db-instance-identifier db7-new-instance \
    --db-snapshot-identifier db7-test-snapshot \
    --db-instance-class db.t3.small
```

Output:

```
{
    "DBInstance": {
        "DBInstanceIdentifier": "db7-new-instance",
        "DBInstanceClass": "db.t3.small",
        "Engine": "mysql",
        "DBInstanceStatus": "creating",

        ...output omitted...
```

```
        "PreferredMaintenanceWindow": "mon:07:37-mon:08:07",
        "PendingModifiedValues": {},
        "MultiAZ": false,
        "EngineVersion": "5.7.22",
        "AutoMinorVersionUpgrade": true,
        "ReadReplicaDBInstanceIdentifiers": [],
        "LicenseModel": "general-public-license",

        ...output omitted...

        "DBInstanceArn": "arn:aws:rds:us-west-2:123456789012:db:db7-new-instance",
        "IAMDatabaseAuthenticationEnabled": false,
        "PerformanceInsightsEnabled": false,
        "DeletionProtection": false,
        "AssociatedRoles": []
    }
}
```

For more information, see Restoring from a DB Snapshot in the *Amazon RDS User Guide*.

- For API details, see RestoreDbInstanceFromDbSnapshot in *AWS CLI Command Reference*.

`restore-db-instance-from-s3`

The following code example shows how to use `restore-db-instance-from-s3`.

AWS CLI

To restore a DB instance from a backup in Amazon S3

The following `restore-db-instance-from-s3` example creates a new DB instance named `restored-test-instance` from an existing backup in the `my-backups` S3 bucket.

```
aws rds restore-db-instance-from-s3 \
    --db-instance-identifier restored-test-instance \
    --allocated-storage 250 --db-instance-class db.m4.large --engine mysql \
    --master-username master --master-user-password secret99 \
    --s3-bucket-name my-backups --s3-ingestion-role-
arn arn:aws:iam::123456789012:role/my-role \
    --source-engine mysql --source-engine-version 5.6.27
```

- For API details, see RestoreDbInstanceFromS3 in *AWS CLI Command Reference*.

`restore-db-instance-to-point-in-time`

The following code example shows how to use `restore-db-instance-to-point-in-time`.

AWS CLI

Example 1: To restore a DB instance to a point in time

The following `restore-db-instance-to-point-in-time` example restores `test-instance` to a new DB instance named `restored-test-instance`, as of the specified time.

```
aws rds restore-db-instance-to-point-in-time \
    --source-db-instance-identifier test-instance \
    --target-db-instance restored-test-instance \
    --restore-time 2018-07-30T23:45:00.000Z
```

Output:

```
{
    "DBInstance": {
        "AllocatedStorage": 20,
        "DBInstanceArn": "arn:aws:rds:us-east-1:123456789012:db:restored-test-
instance",
        "DBInstanceStatus": "creating",
        "DBInstanceIdentifier": "restored-test-instance",
        ...some output omitted...
    }
}
```

For more information, see Restoring a DB instance to a specified time in the *Amazon RDS User Guide*.

Example 2: To restore a DB instance to a specified time from a replicated backup

The following `restore-db-instance-to-point-in-time` example restores an Oracle DB instance to the specified time from a replicated automated backup.

```
aws rds restore-db-instance-to-point-in-time \
    --source-db-instance-automated-backups-arn "arn:aws:rds:us-
west-2:123456789012:auto-backup:ab-jkib2gfq5rv7replzadausbrktni2bn4example" \
    --target-db-instance-identifier myorclinstance-from-replicated-backup \
```

```
    --restore-time 2020-12-08T18:45:00.000Z
```

Output:

```
{
    "DBInstance": {
        "DBInstanceIdentifier": "myorclinstance-from-replicated-backup",
        "DBInstanceClass": "db.t3.micro",
        "Engine": "oracle-se2",
        "DBInstanceStatus": "creating",
        "MasterUsername": "admin",
        "DBName": "ORCL",
        "AllocatedStorage": 20,
        "PreferredBackupWindow": "07:45-08:15",
        "BackupRetentionPeriod": 14,
        ... some output omitted ...
        "DbiResourceId": "db-KGLXG75BGVIWKQT7NQ4EXAMPLE",
        "CACertificateIdentifier": "rds-ca-2019",
        "DomainMemberships": [],
        "CopyTagsToSnapshot": false,
        "MonitoringInterval": 0,
        "DBInstanceArn": "arn:aws:rds:us-west-2:123456789012:db:myorclinstance-from-
replicated-backup",
        "IAMDatabaseAuthenticationEnabled": false,
        "PerformanceInsightsEnabled": false,
        "DeletionProtection": false,
        "AssociatedRoles": [],
        "TagList": []
    }
}
```

For more information, see Restoring to a specified time from a replicated backup in the *Amazon RDS User Guide*.

- For API details, see RestoreDbInstanceToPointInTime in *AWS CLI Command Reference*.

`start-activity-stream`

The following code example shows how to use `start-activity-stream`.

AWS CLI

To start a database activity stream

The following `start-activity-stream` example starts an asynchronous activity stream to monitor an Aurora cluster named my-pg-cluster.

```
aws rds start-activity-stream \
    --region us-east-1 \
    --mode async \
    --kms-key-id arn:aws:kms:us-east-1:1234567890123:key/a12c345d-6ef7-890g-
h123-456i789jk0l1 \
    --resource-arn arn:aws:rds:us-east-1:1234567890123:cluster:my-pg-cluster \
    --apply-immediately
```

Output:

```
{
    "KmsKeyId": "arn:aws:kms:us-east-1:1234567890123:key/a12c345d-6ef7-890g-
h123-456i789jk0l1",
    "KinesisStreamName": "aws-rds-das-cluster-0ABCDEFGHI1JKLM2NOPQ3R4S",
    "Status": "starting",
    "Mode": "async",
    "ApplyImmediately": true
}
```

For more information, see Starting a database activity stream in the *Amazon Aurora User Guide*.

- For API details, see StartActivityStream in *AWS CLI Command Reference*.

`start-db-cluster`

The following code example shows how to use `start-db-cluster`.

AWS CLI

To start a DB cluster

The following `start-db-cluster` example starts a DB cluster and its DB instances.

```
aws rds start-db-cluster \
    --db-cluster-identifier mydbcluster
```

Output:

```
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "us-east-1a",
            "us-east-1e",
            "us-east-1b"
        ],
        "BackupRetentionPeriod": 1,
        "DatabaseName": "mydb",
        "DBClusterIdentifier": "mydbcluster",
        ...some output truncated...
    }
}
```

For more information, see Stopping and starting an Amazon Aurora DB cluster in the *Amazon Aurora User Guide*.

- For API details, see StartDbCluster in *AWS CLI Command Reference*.

`start-db-instance-automated-backups-replication`

The following code example shows how to use `start-db-instance-automated-backups-replication`.

AWS CLI

To enable cross-Region automated backups

The following `start-db-instance-automated-backups-replication` example replicates automated backups from a DB instance in the US East (N. Virginia) Region to US West (Oregon). The backup retention period is 14 days.

```
aws rds start-db-instance-automated-backups-replication \
    --region us-west-2 \
    --source-db-instance-arn "arn:aws:rds:us-east-1:123456789012:db:new-orcl-db" \
    --backup-retention-period 14
```

Output:

```
{
```

```
    "DBInstanceAutomatedBackup": {
        "DBInstanceArn": "arn:aws:rds:us-east-1:123456789012:db:new-orcl-db",
        "DbiResourceId": "db-JKIB2GFQ5RV7REPLZA4EXAMPLE",
        "Region": "us-east-1",
        "DBInstanceIdentifier": "new-orcl-db",
        "RestoreWindow": {},
        "AllocatedStorage": 20,
        "Status": "pending",
        "Port": 1521,
        "InstanceCreateTime": "2020-12-04T15:28:31Z",
        "MasterUsername": "admin",
        "Engine": "oracle-se2",
        "EngineVersion": "12.1.0.2.v21",
        "LicenseModel": "bring-your-own-license",
        "OptionGroupName": "default:oracle-se2-12-1",
        "Encrypted": false,
        "StorageType": "gp2",
        "IAMDatabaseAuthenticationEnabled": false,
        "BackupRetentionPeriod": 14,
        "DBInstanceAutomatedBackupsArn": "arn:aws:rds:us-west-2:123456789012:auto-
backup:ab-jkib2gfq5rv7replzadausbrktni2bn4example"
    }
}
```

For more information, see Enabling cross-Region automated backups in the *Amazon RDS User Guide*.

- For API details, see StartDbInstanceAutomatedBackupsReplication in *AWS CLI Command Reference*.

`start-db-instance`

The following code example shows how to use `start-db-instance`.

AWS CLI

To start a DB instance

The following `start-db-instance` example starts the specified DB instance.

```
aws rds start-db-instance \
    --db-instance-identifier test-instance
```

Output:

```
{
    "DBInstance": {
        "DBInstanceStatus": "starting",
        ...some output truncated...
    }
}
```

- For API details, see [StartDbInstance](#) in *AWS CLI Command Reference*.

`start-export-task`

The following code example shows how to use `start-export-task`.

AWS CLI

To export a snapshot to Amazon S3

The following `start-export-task` example exports a DB snapshot named `db5-snapshot-test` to the Amazon S3 bucket named `amzn-s3-demo-bucket`.

```
aws rds start-export-task \
    --export-task-identifier my-s3-export \
    --source-arn arn:aws:rds:us-west-2:123456789012:snapshot:db5-snapshot-test \
    --s3-bucket-name amzn-s3-demo-bucket \
    --iam-role-arn arn:aws:iam::123456789012:role/service-role/ExportRole \
    --kms-key-id arn:aws:kms:us-west-2:123456789012:key/abcd0000-7fca-4128-82f2-
aabbccddeeff
```

Output:

```
{
    "ExportTaskIdentifier": "my-s3-export",
    "SourceArn": "arn:aws:rds:us-west-2:123456789012:snapshot:db5-snapshot-test",
    "SnapshotTime": "2020-03-27T20:48:42.023Z",
    "S3Bucket": "amzn-s3-demo-bucket",
    "IamRoleArn": "arn:aws:iam::123456789012:role/service-role/ExportRole",
    "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/abcd0000-7fca-4128-82f2-
aabbccddeeff",
    "Status": "STARTING",
```

```
    "PercentProgress": 0,
    "TotalExtractedDataInGB": 0
}
```

For more information, see Exporting a Snapshot to an Amazon S3 Bucket in the *Amazon RDS User Guide*.

- For API details, see StartExportTask in *AWS CLI Command Reference*.

stop-activity-stream

The following code example shows how to use `stop-activity-stream`.

AWS CLI

To stop a database activity stream

The following `stop-activity-stream` example stops an activity stream in an Aurora cluster named my-pg-cluster.

```
aws rds stop-activity-stream \
    --region us-east-1 \
    --resource-arn arn:aws:rds:us-east-1:1234567890123:cluster:my-pg-cluster \
    --apply-immediately
```

Output:

```
{
    "KmsKeyId": "arn:aws:kms:us-east-1:1234567890123:key/a12c345d-6ef7-890g-
h123-456i789jk0l1",
    "KinesisStreamName": "aws-rds-das-cluster-0ABCDEFGHI1JKLM2NOPQ3R4S",
    "Status": "stopping"
}
```

For more information, see Stopping an activity stream in the *Amazon Aurora User Guide*.

- For API details, see StopActivityStream in *AWS CLI Command Reference*.

stop-db-cluster

The following code example shows how to use `stop-db-cluster`.

AWS CLI

To stop a DB cluster

The following `stop-db-cluster` example stops a DB cluster and its DB instances.

```
aws rds stop-db-cluster \
    --db-cluster-identifier mydbcluster
```

Output:

```
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "us-east-1a",
            "us-east-1e",
            "us-east-1b"
        ],
        "BackupRetentionPeriod": 1,
        "DatabaseName": "mydb",
        "DBClusterIdentifier": "mydbcluster",
        ...some output truncated...
    }
}
```

For more information, see Stopping and starting an Amazon Aurora DB cluster in the *Amazon Aurora User Guide*.

- For API details, see StopDbCluster in *AWS CLI Command Reference*.

`stop-db-instance-automated-backups-replication`

The following code example shows how to use `stop-db-instance-automated-backups-replication`.

AWS CLI

To stop replicating automated backups

The following `stop-db-instance-automated-backups-replication` ends replication of automated backups to the US West (Oregon) Region. Replicated backups are retained according to the set backup retention period.

```
aws rds stop-db-instance-automated-backups-replication \
    --region us-west-2 \
    --source-db-instance-arn "arn:aws:rds:us-east-1:123456789012:db:new-orcl-db"
```

Output:

```
{
    "DBInstanceAutomatedBackup": {
        "DBInstanceArn": "arn:aws:rds:us-east-1:123456789012:db:new-orcl-db",
        "DbiResourceId": "db-JKIB2GFQ5RV7REPLZA4EXAMPLE",
        "Region": "us-east-1",
        "DBInstanceIdentifier": "new-orcl-db",
        "RestoreWindow": {
            "EarliestTime": "2020-12-04T23:13:21.030Z",
            "LatestTime": "2020-12-07T19:59:57Z"
        },
        "AllocatedStorage": 20,
        "Status": "replicating",
        "Port": 1521,
        "InstanceCreateTime": "2020-12-04T15:28:31Z",
        "MasterUsername": "admin",
        "Engine": "oracle-se2",
        "EngineVersion": "12.1.0.2.v21",
        "LicenseModel": "bring-your-own-license",
        "OptionGroupName": "default:oracle-se2-12-1",
        "Encrypted": false,
        "StorageType": "gp2",
        "IAMDatabaseAuthenticationEnabled": false,
        "BackupRetentionPeriod": 7,
        "DBInstanceAutomatedBackupsArn": "arn:aws:rds:us-west-2:123456789012:auto-
backup:ab-jkib2gfq5rv7replzadausbrktni2bn4example"
    }
}
```

For more information, see Stopping automated backup replication in the *Amazon RDS User Guide*.

- For API details, see StopDbInstanceAutomatedBackupsReplication in *AWS CLI Command Reference*.

`stop-db-instance`

The following code example shows how to use `stop-db-instance`.

AWS CLI

To stop a DB instance

The following `stop-db-instance` example stops the specified DB instance.

```
aws rds stop-db-instance \
    --db-instance-identifier test-instance
```

Output:

```
{
    "DBInstance": {
        "DBInstanceStatus": "stopping",
        ...some output truncated...
    }
}
```

- For API details, see StopDbInstance in *AWS CLI Command Reference*.

`switchover-blue-green-deployment`

The following code example shows how to use `switchover-blue-green-deployment`.

AWS CLI

Example 1: To switch a blue/green deployment for an RDS DB instance

The following `switchover-blue-green-deployment` example promotes the specified green environment as the new production environment.

```
aws rds switchover-blue-green-deployment \
    --blue-green-deployment-identifier bgd-wi89nwzglccsfake \
    --switchover-timeout 300
```

Output:

```
{
    "BlueGreenDeployment": {
        "BlueGreenDeploymentIdentifier": "bgd-v53303651eexfake",
        "BlueGreenDeploymentName": "bgd-cli-test-instance",
        "Source": "arn:aws:rds:us-east-1:123456789012:db:my-db-instance",
        "Target": "arn:aws:rds:us-east-1:123456789012:db:my-db-instance-green-
blhi1e",
        "SwitchoverDetails": [
            {
                "SourceMember": "arn:aws:rds:us-east-1:123456789012:db:my-db-
instance",

        "CreateTime": "2022-02-25T22:33:22.225000+00:00"
    }
}
```

For more information, see Switching a blue/green deployment in the *Amazon RDS User Guide*.

Example 2: To promote a blue/green deployment for an Aurora MySQL DB cluster

The following `switchover-blue-green-deployment` example promotes the specified green environment as the new production environment.

```
aws rds switchover-blue-green-deployment \
    --blue-green-deployment-identifier bgd-wi89nwzglccsfake \
    --switchover-timeout 300
```

Output:

```
{
    "BlueGreenDeployment": {

- For API details, see SwitchoverBlueGreenDeployment in *AWS CLI Command Reference*.

Amazon RDS Data Service examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon RDS Data Service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`batch-execute-statement`

The following code example shows how to use `batch-execute-statement`.

AWS CLI

To execute a batch SQL statement

The following `batch-execute-statement` example executes a batch SQL statement over an array of data with a parameter set.

```
aws rds-data batch-execute-statement \
    --resource-arn "arn:aws:rds:us-west-2:123456789012:cluster:mydbcluster" \
    --database "mydb" \
    --secret-arn "arn:aws:secretsmanager:us-west-2:123456789012:secret:mysecret" \
    --sql "insert into mytable values (:id, :val)" \
    --parameter-sets "[[{\"name\": \"id\", \"value\": {\"longValue\": 1}},{\"name\":
 \"val\", \"value\": {\"stringValue\": \"ValueOne\"}}],
        [{\"name\": \"id\", \"value\": {\"longValue\": 2}},{\"name\": \"val\",
 \"value\": {\"stringValue\": \"ValueTwo\"}}],
        [{\"name\": \"id\", \"value\": {\"longValue\": 3}},{\"name\": \"val\",
 \"value\": {\"stringValue\": \"ValueThree\"}}]]"
```

This command produces no output.

For more information, see Using the Data API for Aurora Serverless in the *Amazon RDS User Guide*.

- For API details, see BatchExecuteStatement in *AWS CLI Command Reference*.

`begin-transaction`

The following code example shows how to use `begin-transaction`.

AWS CLI

To start a SQL transaction

The following `begin-transaction` example starts a SQL transaction.

```
aws rds-data begin-transaction \
```

```
    --resource-arn "arn:aws:rds:us-west-2:123456789012:cluster:mydbcluster" \
    --database "mydb" \
    --secret-arn "arn:aws:secretsmanager:us-west-2:123456789012:secret:mysecret"
```

Output:

```
{
    "transactionId": "ABC1234567890xyz"
}
```

For more information, see Using the Data API for Aurora Serverless in the *Amazon RDS User Guide*.

- For API details, see BeginTransaction in *AWS CLI Command Reference*.

`commit-transaction`

The following code example shows how to use `commit-transaction`.

AWS CLI

To commit a SQL transaction

The following `commit-transaction` example ends the specified SQL transaction and commits the changes that you made as part of it.

```
aws rds-data commit-transaction \
    --resource-arn "arn:aws:rds:us-west-2:123456789012:cluster:mydbcluster" \
    --secret-arn "arn:aws:secretsmanager:us-west-2:123456789012:secret:mysecret" \
    --transaction-id "ABC1234567890xyz"
```

Output:

```
{
    "transactionStatus": "Transaction Committed"
}
```

For more information, see Using the Data API for Aurora Serverless in the *Amazon RDS User Guide*.

- For API details, see CommitTransaction in *AWS CLI Command Reference*.

`execute-statement`

The following code example shows how to use `execute-statement`.

AWS CLI

Example 1: To execute a SQL statement that is part of a transaction

The following `execute-statement` example runs a SQL statement that is part of a transaction.

```
aws rds-data execute-statement \
    --resource-arn "arn:aws:rds:us-west-2:123456789012:cluster:mydbcluster" \
    --database "mydb" \
    --secret-arn "arn:aws:secretsmanager:us-west-2:123456789012:secret:mysecret" \
    --sql "update mytable set quantity=5 where id=201" \
    --transaction-id "ABC1234567890xyz"
```

Output:

```
{
    "numberOfRecordsUpdated": 1
}
```

Example 2: To execute a SQL statement with parameters

The following `execute-statement` example runs a SQL statement with parameters.

```
aws rds-data execute-statement \
    --resource-arn "arn:aws:rds:us-east-1:123456789012:cluster:mydbcluster" \
    --database "mydb" \
    --secret-arn "arn:aws:secretsmanager:us-east-1:123456789012:secret:mysecret" \
    --sql "insert into mytable values (:id, :val)" \
    --parameters "[{\"name\": \"id\", \"value\": {\"longValue\": 1}},{\"name\":
 \"val\", \"value\": {\"stringValue\": \"value1\"}}]"
```

Output:

```
{
    "numberOfRecordsUpdated": 1
```

```
}
```

For more information, see Using the Data API for Aurora Serverless in the *Amazon RDS User Guide*.

- For API details, see ExecuteStatement in *AWS CLI Command Reference*.

`rollback-transaction`

The following code example shows how to use `rollback-transaction`.

AWS CLI

To roll back a SQL transaction

The following `rollback-transaction` example rolls back the specified SQL transaction.

```
aws rds-data rollback-transaction \
    --resource-arn "arn:aws:rds:us-west-2:123456789012:cluster:mydbcluster" \
    --secret-arn "arn:aws:secretsmanager:us-west-2:123456789012:secret:mysecret" \
    --transaction-id "ABC1234567890xyz"
```

Output:

```
{
    "transactionStatus": "Rollback Complete"
}
```

For more information, see Using the Data API for Aurora Serverless in the *Amazon RDS User Guide*.

- For API details, see RollbackTransaction in *AWS CLI Command Reference*.

Amazon RDS Performance Insights examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon RDS Performance Insights.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-performance-analysis-report`

The following code example shows how to use `create-performance-analysis-report`.

AWS CLI

To create a performance analysis report

The following `create-performance-analysis-report` example creates a performance analysis report with the start time `1682969503` and end time `1682979503` for the database `db-abcdefg123456789`.

```
aws pi create-performance-analysis-report \
    --service-type RDS \
    --identifier db-abcdefg123456789 \
    --start-time 1682969503 \
    --end-time 1682979503
```

Output:

```
{
    "AnalysisReportId": "report-0234d3ed98e28fb17"
}
```

For more information about creating performance analysis reports, see Creating a performance analysis report in Performance Insights in the *Amazon RDS User Guide* and Creating a performance analysis report in Performance Insights in the *Amazon Aurora User Guide*.

- For API details, see CreatePerformanceAnalysisReport in *AWS CLI Command Reference*.

`delete-performance-analysis-report`

The following code example shows how to use `delete-performance-analysis-report`.

AWS CLI

To delete a performance analysis report

The following `delete-performance-analysis-report` example deletes the performance analysis report with the report ID `report-0d99cc91c4422ee61`.

```
aws pi delete-performance-analysis-report \
    --service-type RDS \
    --identifier db-abcdefg123456789 \
    --analysis-report-id report-0d99cc91c4422ee61
```

This command produces no output.

For more information about deleting performance analysis reports, see Deleting a performance analysis report in Performance Insights in the *Amazon RDS User Guide* and Deleting a performance analysis report in Performance Insights in the *Amazon Aurora User Guide*.

- For API details, see DeletePerformanceAnalysisReport in *AWS CLI Command Reference*.

`describe-dimension-keys`

The following code example shows how to use `describe-dimension-keys`.

AWS CLI

Example 1: To describe dimension keys

This example requests the names of all wait events. The data is summarized by event name, and the aggregate values of those events over the specified time period.

Command:

```
aws pi describe-dimension-keys --service-type RDS --identifier db-
LKCGOBK26374TPTDFXOIWVCPPM --start-time 1527026400 --end-time 1527080400 --
metric db.load.avg --group-by '{"Group":"db.wait_event"}'
```

Output:

```
{
    "AlignedEndTime": 1.5270804E9,
    "AlignedStartTime": 1.5270264E9,
    "Keys": [
```

```
        {
            "Dimensions": {"db.wait_event.name": "wait/synch/mutex/innodb/
aurora_lock_thread_slot_futex"},
            "Total": 0.05906906851195666
        },
        {
            "Dimensions": {"db.wait_event.name": "wait/io/aurora_redo_log_flush"},
            "Total": 0.015824722186149193
        },
        {
            "Dimensions": {"db.wait_event.name": "CPU"},
            "Total": 0.008014396230265477
        },
        {
            "Dimensions": {"db.wait_event.name": "wait/io/
aurora_respond_to_client"},
            "Total": 0.0036361612526204477
        },
        {
            "Dimensions": {"db.wait_event.name": "wait/io/table/sql/handler"},
            "Total": 0.0019108398419382965
        },
        {
            "Dimensions": {"db.wait_event.name": "wait/synch/cond/mysys/
my_thread_var::suspend"},
            "Total": 8.533847837782684E-4
        },
        {
            "Dimensions": {"db.wait_event.name": "wait/io/file/csv/data"},
            "Total": 6.864181956477376E-4
        },
        {
            "Dimensions": {"db.wait_event.name": "Unknown"},
            "Total": 3.895887056379051E-4
        },
        {
            "Dimensions": {"db.wait_event.name": "wait/synch/mutex/sql/
FILE_AS_TABLE::LOCK_shim_lists"},
            "Total": 3.710368625122906E-5
        },
        {
            "Dimensions": {"db.wait_event.name": "wait/lock/table/sql/handler"},
            "Total": 0
        }
```

```
    ]
}
```

Example 2: To find the SQL ID for statements contributing the most to DB load

The following `describe-dimension-keys` requests the SQL statement and SQL ID for the 10 statements that contributed the most to DB load.

```
aws pi describe-dimension-keys \
    --service-type RDS \
    --identifier db-abcdefg123456789 \
    --start-time 2023-05-01T00:00:00Z \
    --end-time 2023-05-01T01:00:00Z \
    --metric db.load.avg \
    --group-by '{"Group": "db.sql", "Dimensions": ["db.sql.id",
 "db.sql.statement"],"Limit": 10}'
```

Output:

```
{
    "AlignedEndTime": 1.5270804E9,
    "AlignedStartTime": 1.5270264E9,
    "Identifier": "db-abcdefg123456789",
    "MetricList": [
        {
            "Keys": [
                {
                    "Dimensions": {"db.sql.id": "AKIAIOSFODNN7EXAMPLE",
 "db.sql.statement": "SELECT * FROM customers WHERE customer_id = 123"},
                    "Total": 25.5,"Partitions": [12.3, 13.2]
                }
            ]
        }
    ]
}
```

For more information about dimensions in Performance Insights, see Database load in the *Amazon RDS User Guide* and Database load in the *Amazon Aurora User Guide*.

- For API details, see DescribeDimensionKeys in *AWS CLI Command Reference*.

`get-dimension-key-details`

The following code example shows how to use `get-dimension-key-details`.

AWS CLI

To get details for a specified dimension group for a DB instance

The following `get-dimension-key-details` example retrieves the full text of a SQL statement for DB instance `db-10BCD2EFGHIJ3KL4M5NO6PQRS5`. The `--group` is `db.sql`, and the `--group-identifier` is `db.sql.id`. In this example, `example-sql-id` represents a SQL ID retrieved by using the `get-resource-metrics` or `describe-dimension-keys` operations. In this example, the dimensions details are available. Thus, Performance Insights retrieves the full text of the SQL statement, without truncating it.

```
aws pi get-dimension-key-details \
    --service-type RDS \
    --identifier db-10BCD2EFGHIJ3KL4M5NO6PQRS5 \
    --group db.sql \
    --group-identifier example-sql-id \
    --requested-dimensions statement
```

Output:

```
{
    "Dimensions":[
        {
            "Value": "SELECT e.last_name, d.department_name FROM employees e,
 departments d WHERE e.department_id=d.department_id",
            "Dimension": "db.sql.statement",
            "Status": "AVAILABLE"
        },
    ...
    ]
}
```

For more information about dimensions in Performance Insights, see Database load in the *Amazon RDS User Guide* and Database load in the *Amazon Aurora User Guide*.

- For API details, see GetDimensionKeyDetails in *AWS CLI Command Reference*.

`get-performance-analysis-report`

The following code example shows how to use `get-performance-analysis-report`.

AWS CLI

To get a performance analysis report

The following `get-performance-analysis-report` example gets the performance analysis report for the database `db-abcdefg123456789` with the report ID `report-0d99cc91c4422ee61`. The response provides the report status, ID, time details, and insights.

```
aws pi get-performance-analysis-report \
    --service-type RDS \
    --identifier db-abcdefg123456789 \
    --analysis-report-id report-0d99cc91c4422ee61
```

Output:

```
{
    "AnalysisReport": {
        "Status": "Succeeded",
        "ServiceType": "RDS",
        "Identifier": "db-abcdefg123456789",
        "StartTime": 1680583486.584,
        "AnalysisReportId": "report-0d99cc91c4422ee61",
        "EndTime": 1680587086.584,
        "CreateTime": 1680587087.139,
        "Insights": [
            ... (Condensed for space)
       ]
    }
}
```

For more information about performance analysis reports, see Analyzing database performance for a period of time in the *Amazon RDS User Guide* and Analyzing database performance for a period of time in the *Amazon Aurora User Guide*.

- For API details, see GetPerformanceAnalysisReport in *AWS CLI Command Reference*.

`get-resource-metadata`

The following code example shows how to use `get-resource-metadata`.

AWS CLI

To get resource metadata for a database

The following `get-resource-metadata` example gets the resource metadata for the database `db-abcdefg123456789`. The response shows that SQL digest statistics are enabled.

```
aws pi get-resource-metadata \
    --service-type RDS \
    --identifier db-abcdefg123456789
```

Output:

```
{
    "Identifier": "db-abcdefg123456789",
    "Features":{
        "SQL_DIGEST_STATISTICS":{
            "Status": "ENABLED"
        }
    }
}
```

For more information about SQL statistics for Performance Insights, see SQL statistics for Performance Insights in the *Amazon RDS User Guide* and SQL statistics for Performance Insights in the *Amazon Aurora User Guide*.

- For API details, see GetResourceMetadata in *AWS CLI Command Reference*.

`get-resource-metrics`

The following code example shows how to use `get-resource-metrics`.

AWS CLI

To get resource metrics

This example requests data points for the *db.wait_event* dimension group, and for the *db.wait_event.name* dimension within that group. In the response, the relevant data points are grouped by the requested dimension (*db.wait_event.name*).

Command:

```
aws pi get-resource-metrics --service-type RDS --identifier db-
LKCGOBK26374TPTDFXOIWVCPPM --start-time 1527026400 --end-time 1527080400 --period-
in-seconds 300 --metric db.load.avg --metric-queries file://metric-queries.json
```

The arguments for `--metric-queries` are stored in a JSON file, `metric-queries.json`. Here are the contents of that file:

```
[
    {
        "Metric": "db.load.avg",
        "GroupBy": {
            "Group":"db.wait_event"
        }
    }
]
```

Output:

```
{
    "AlignedEndTime": 1.5270804E9,
    "AlignedStartTime": 1.5270264E9,
    "Identifier": "db-LKCGOBK26374TPTDFXOIWVCPPM",
    "MetricList": [
        {
            "Key": {
                "Metric": "db.load.avg"
            },
            "DataPoints": [
                {
                    "Timestamp": 1527026700.0,
                    "Value": 1.3533333333333333
                },
                {
                    "Timestamp": 1527027000.0,
                    "Value": 0.88
                },
```

```
                <...remaining output omitted...>
            ]
        },
        {
            "Key": {
                "Metric": "db.load.avg",
                "Dimensions": {
                    "db.wait_event.name": "wait/synch/mutex/innodb/
aurora_lock_thread_slot_futex"
                }
            },
            "DataPoints": [
                {
                    "Timestamp": 1527026700.0,
                    "Value": 0.8566666666666667
                },
                {
                    "Timestamp": 1527027000.0,
                    "Value": 0.8633333333333333
                },
                <...remaining output omitted...>
            ],
        },
            <...remaining output omitted...>
    ]
}
```

- For API details, see GetResourceMetrics in *AWS CLI Command Reference*.

`list-available-resource-dimensions`

The following code example shows how to use `list-available-resource-dimensions`.

AWS CLI

To list the dimensions that can be queried for a metric type on a DB instance

The following `list-available-resource-dimensions` example lists the `db.load` metrics you can query for the database `db-abcdefg123456789`.

```
aws pi list-available-resource-dimensions \
    --service-type RDS \
```

```
    --identifier db-abcdefg123456789 \
    --metrics db.load
```

Output:

```
{
    "MetricDimensions": [
        {
            "Metric": "db.load",
            "Groups": [
                {
                    "Group": "db.user",
                    "Dimensions": [
                        {
                            "Identifier": "db.user.id"
                        },
                        {
                            "Identifier": "db.user.name"
                        }
                    ]
                },
                {
                    "Group": "db.sql_tokenized",
                    "Dimensions": [
                        {
                            "Identifier": "db.sql_tokenized.id"
                        },
                        {
                            "Identifier": "db.sql_tokenized.db_id"
                        },
                        {
                            "Identifier": "db.sql_tokenized.statement"
                        }
                    ]
                },
                ...
            ]
        }
    ]
}
```

For more information about dimensions in Performance Insights, see Database load in the *Amazon RDS User Guide* and Database load in the *Amazon Aurora User Guide*.

- For API details, see ListAvailableResourceDimensions in *AWS CLI Command Reference*.

`list-available-resource-metrics`

The following code example shows how to use `list-available-resource-metrics`.

AWS CLI

To list the metrics that can be queried for a metric type on a DB instance

The following `list-available-resource-metrics` example lists the `db.load` metrics you can query for the database `db-abcdefg123456789`.

```
aws pi list-available-resource-metrics \
    --service-type RDS \
    --identifier db-abcdefg123456789 \
    --metric-types "os" "db"
```

Output:

```
{
    "Metrics": [
        {
            "Description": "The number of virtual CPUs for the DB instance",
            "Metric": "os.general.numVCPUs",
            "Unit": "vCPUs"
        },
        ......,
        {
            "Description": "Time spent reading data file blocks by backends in this
 instance",
            "Metric": "db.IO.read_latency",
            "Unit": "Milliseconds per block"
        },
        ......
    ]
}
```

For more information about metrics in Performance Insights, see Database load in the *Amazon RDS User Guide* and Database load in the *Amazon Aurora User Guide*.

- For API details, see ListAvailableResourceMetrics in *AWS CLI Command Reference*.

`list-performance-analysis-reports`

The following code example shows how to use `list-performance-analysis-reports`.

AWS CLI

To list performance analysis reports for a database

The following `list-performance-analysis-reports` example lists performance analysis reports for the database `db-abcdefg123456789`. The response lists all the reports with the report ID, status, and time period details.

```
aws pi list-performance-analysis-reports \
    --service-type RDS \
    --identifier db-abcdefg123456789
```

Output:

```
{
    "AnalysisReports": [
        {
            "Status": "Succeeded",
            "EndTime": 1680587086.584,
            "CreateTime": 1680587087.139,
            "StartTime": 1680583486.584,
            "AnalysisReportId": "report-0d99cc91c4422ee61"
        },
        {
            "Status": "Succeeded",
            "EndTime": 1681491137.914,
            "CreateTime": 1681491145.973,
            "StartTime": 1681487537.914,
            "AnalysisReportId": "report-002633115cc002233"
        },
        {
            "Status": "Succeeded",
            "EndTime": 1681493499.849,
            "CreateTime": 1681493507.762,
            "StartTime": 1681489899.849,
            "AnalysisReportId": "report-043b1e006b47246f9"
        },
        {
```

```
                "Status": "InProgress",
                "EndTime": 1682979503.0,
                "CreateTime": 1682979618.994,
                "StartTime": 1682969503.0,
                "AnalysisReportId": "report-01ad15f9b88bcbd56"
            }
        ]
}
```

For more information about performance analysis reports, see Analyzing database performance for a period of time in the *Amazon RDS User Guide* and Analyzing database performance for a period of time in the *Amazon Aurora User Guide*.

- For API details, see ListPerformanceAnalysisReports in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a performance analysis report

The following `list-tags-for-resource` example lists tags for a performance analysis report with the report ID `report-0d99cc91c4422ee61`.

```
aws pi list-tags-for-resource \
    --service-type RDS \
    --resource-arn arn:aws:pi:us-west-2:123456789012:perf-reports/RDS/db-abcdefg123456789/report-0d99cc91c4422ee61
```

Output:

```
{
    "Tags": [
        {
            "Value": "test-tag",
            "Key": "name"
        }
    ]
}
```

For more information about tagging performance analysis reports, see Adding tags to a performance analysis report in Performance Insights in the *Amazon RDS User Guide* and Adding tags to a performance analysis report in Performance Insights in the *Amazon Aurora User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add a tag to a performance analysis report

The following `tag-resource` example adds the tag key `name` with the tag value `test-tag` to a performance analysis report with the report ID `report-0d99cc91c4422ee61`.

```
aws pi tag-resource \
    --service-type RDS \
    --resource-arn arn:aws:pi:us-west-2:123456789012:perf-reports/RDS/db-abcdefg123456789/report-0d99cc91c4422ee61 \
    --tags Key=name,Value=test-tag
```

This command produces no output.

For more information about tagging performance analysis reports, see Adding tags to a performance analysis report in Performance Insights in the *Amazon RDS User Guide* and Adding tags to a performance analysis report in Performance Insights in the *Amazon Aurora User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To delete a tag for a performance analysis report

The following `untag-resource` example deletes the tag `name` for a performance analysis report with the report ID `report-0d99cc91c4422ee61`.

```
aws pi untag-resource \
    --service-type RDS \
    --resource-arn arn:aws:pi:us-west-2:123456789012:perf-reports/RDS/db-
abcdefg123456789/report-0d99cc91c4422ee61 \
    --tag-keys name
```

This command produces no output.

For more information about tagging performance analysis reports, see Adding tags to a performance analysis report in Performance Insights in the *Amazon RDS User Guide* and Adding tags to a performance analysis report in Performance Insights in the *Amazon Aurora User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

Amazon Redshift examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Redshift.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Actions

`accept-reserved-node-exchange`

The following code example shows how to use `accept-reserved-node-exchange`.

AWS CLI

To accept reserved node exchange

The following `accept-reserved-node-exchange` example accepts exchange of a DC1 reserved node for a DC2 reserved node.

```
aws redshift accept-reserved-node-exchange /
    --reserved-node-id 12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE /
    --target-reserved-node-offering-id 12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE
```

Output:

```
{
    "ExchangedReservedNode": {
        "ReservedNodeId": "12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE",
        "ReservedNodeOfferingId": "12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE",
        "NodeType": "dc2.large",
        "StartTime": "2019-12-06T21:17:26Z",
        "Duration": 31536000,
        "FixedPrice": 0.0,
        "UsagePrice": 0.0,
        "CurrencyCode": "USD",
        "NodeCount": 1,
        "State": "exchanging",
        "OfferingType": "All Upfront",
        "RecurringCharges": [
            {
                "RecurringChargeAmount": 0.0,
                "RecurringChargeFrequency": "Hourly"
            }
        ],
        "ReservedNodeOfferingType": "Regular"
    }
}
```

For more information, see Upgrading Reserved Nodes With the AWS CLI in the *Amazon Redshift Cluster Management Guide*.

- For API details, see AcceptReservedNodeExchange in *AWS CLI Command Reference*.

`authorize-cluster-security-group-ingress`

The following code example shows how to use `authorize-cluster-security-group-ingress`.

AWS CLI

Authorizing Access to an EC2 Security GroupThis example authorizes access to a named Amazon EC2 security group.Command:

```
aws redshift authorize-cluster-security-group-ingress --cluster-security-group-name
 mysecuritygroup --ec2-security-group-name myec2securitygroup --ec2-security-group-
owner-id 123445677890
```

Authorizing Access to a CIDR rangeThis example authorizes access to a CIDR range.Command:

```
aws redshift authorize-cluster-security-group-ingress --cluster-security-group-name
 mysecuritygroup --cidrip 192.168.100.100/32
```

- For API details, see AuthorizeClusterSecurityGroupIngress in *AWS CLI Command Reference*.

`authorize-snapshot-access`

The following code example shows how to use `authorize-snapshot-access`.

AWS CLI

Authorize an AWS Account to Restore a SnapshotThis example authorizes the AWS account `444455556666` to restore the snapshot `my-snapshot-id`. By default, the output is in JSON format.Command:

```
aws redshift authorize-snapshot-access --snapshot-id my-snapshot-id --account-with-
restore-access 444455556666
```

Result:

```
{
   "Snapshot": {
      "Status": "available",
      "SnapshotCreateTime": "2013-07-17T22:04:18.947Z",
      "EstimatedSecondsToCompletion": 0,
      "AvailabilityZone": "us-east-1a",
      "ClusterVersion": "1.0",
      "MasterUsername": "adminuser",
      "Encrypted": false,
```

```
        "OwnerAccount": "111122223333",
        "BackupProgressInMegabytes": 11.0,
        "ElapsedTimeInSeconds": 0,
        "DBName": "dev",
        "CurrentBackupRateInMegabytesPerSecond: 0.1534,
        "ClusterCreateTime": "2013-01-22T21:59:29.559Z",
        "ActualIncrementalBackupSizeInMegabytes"; 11.0,
        "SnapshotType": "manual",
        "NodeType": "dw.hs1.xlarge",
        "ClusterIdentifier": "mycluster",
        "TotalBackupSizeInMegabytes": 20.0,
        "Port": 5439,
        "NumberOfNodes": 2,
        "SnapshotIdentifier": "my-snapshot-id"
    }
}
```

- For API details, see AuthorizeSnapshotAccess in *AWS CLI Command Reference*.

`batch-delete-cluster-snapshots`

The following code example shows how to use `batch-delete-cluster-snapshots`.

AWS CLI

To delete a set of cluster snapshots

The following `batch-delete-cluster-snapshots` example deletes a set of manual cluster snapshots.

```
aws redshift batch-delete-cluster-snapshots \
        --
identifiers SnapshotIdentifier=mycluster-2019-11-06-14-12 SnapshotIdentifier=mycluster-2019-
```

Output:

```
{
    "Resources": [
        "mycluster-2019-11-06-14-12",
        "mycluster-2019-11-06-14-20"
    ]
```

```
}
```

For more information, see Amazon Redshift Snapshots in the *Amazon Redshift Cluster Management Guide*.

- For API details, see BatchDeleteClusterSnapshots in *AWS CLI Command Reference*.

`batch-modify-cluster-snapshots`

The following code example shows how to use `batch-modify-cluster-snapshots`.

AWS CLI

To modify a set of cluster snapshots

The following `batch-modify-cluster-snapshots` example modifies the settings for a set of cluster snapshots.

```
aws redshift batch-modify-cluster-snapshots \
    --snapshot-identifier-list mycluster-2019-11-06-16-31 mycluster-2019-11-06-16-32
 \
    --manual-snapshot-retention-period 30
```

Output:

```
{
    "Resources": [
        "mycluster-2019-11-06-16-31",
        "mycluster-2019-11-06-16-32"
    ],
    "Errors": [],
    "ResponseMetadata": {
        "RequestId": "12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE",
        "HTTPStatusCode": 200,
        "HTTPHeaders": {
                "x-amzn-requestid": "12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE,
                "content-type": "text/xml",
                "content-length": "480",
                "date": "Sat, 07 Dec 2019 00:36:09 GMT",
                "connection": "keep-alive"
        },
        "RetryAttempts": 0
```

```
    }
}
```

For more information, see Amazon Redshift Snapshots in the *Amazon Redshift Cluster Management Guide*.

- For API details, see BatchModifyClusterSnapshots in *AWS CLI Command Reference*.

`cancel-resize`

The following code example shows how to use `cancel-resize`.

AWS CLI

To cancel resize of a cluster

The following `cancel-resize` example cancels a classic resize operation for a cluster.

```
aws redshift cancel-resize \
    --cluster-identifier mycluster
```

Output:

```
{
    "TargetNodeType": "dc2.large",
    "TargetNumberOfNodes": 2,
    "TargetClusterType": "multi-node",
    "Status": "CANCELLING",
    "ResizeType": "ClassicResize",
    "TargetEncryptionType": "NONE"
}
```

For more information, see Resizing Clusters in Amazon Redshift in the *Amazon Redshift Cluster Management Guide*.

- For API details, see CancelResize in *AWS CLI Command Reference*.

`copy-cluster-snapshot`

The following code example shows how to use `copy-cluster-snapshot`.

AWS CLI

Get a Description of All Cluster VersionsThis example returns a description of all cluster versions. By default, the output is in JSON format.Command:

```
aws redshift copy-cluster-snapshot --source-snapshot-identifier
 cm:examplecluster-2013-01-22-19-27-58 --target-snapshot-identifier my-saved-
snapshot-copy
```

Result:

```
{
   "Snapshot": {
      "Status": "available",
      "SnapshotCreateTime": "2013-01-22T19:27:58.931Z",
      "AvailabilityZone": "us-east-1c",
      "ClusterVersion": "1.0",
      "MasterUsername": "adminuser",
      "DBName": "dev",
      "ClusterCreateTime": "2013-01-22T19:23:59.368Z",
      "SnapshotType": "manual",
      "NodeType": "dw.hs1.xlarge",
      "ClusterIdentifier": "examplecluster",
      "Port": 5439,
      "NumberOfNodes": "2",
      "SnapshotIdentifier": "my-saved-snapshot-copy"
   },
   "ResponseMetadata": {
      "RequestId": "3b279691-64e3-11e2-bec0-17624ad140dd"
   }
}
```

- For API details, see CopyClusterSnapshot in *AWS CLI Command Reference*.

`create-cluster-parameter-group`

The following code example shows how to use `create-cluster-parameter-group`.

AWS CLI

Create a Cluster Parameter GroupThis example creates a new cluster parameter group.Command:

```
aws redshift create-cluster-parameter-group --parameter-group-name
 myclusterparametergroup --parameter-group-family redshift-1.0 --description "My
 first cluster parameter group"
```

Result:

```
{
   "ClusterParameterGroup": {
      "ParameterGroupFamily": "redshift-1.0",
      "Description": "My first cluster parameter group",
      "ParameterGroupName": "myclusterparametergroup"
   },
   "ResponseMetadata": {
      "RequestId": "739448f0-64cc-11e2-8f7d-3b939af52818"
   }
}
```

- For API details, see CreateClusterParameterGroup in *AWS CLI Command Reference*.

`create-cluster-security-group`

The following code example shows how to use `create-cluster-security-group`.

AWS CLI

Creating a Cluster Security GroupThis example creates a new cluster security group. By default, the output is in JSON format.Command:

```
aws redshift create-cluster-security-group --cluster-security-group-name
 mysecuritygroup --description "This is my cluster security group"
```

Result:

```
{
   "create_cluster_security_group_response": {
      "create_cluster_security_group_result": {
         "cluster_security_group": {
            "description": "This is my cluster security group",
            "owner_id": "300454760768",
            "cluster_security_group_name": "mysecuritygroup",
            "ec2_security_groups": \[],
```

```
                "ip_ranges": \[]
            }
        },
        "response_metadata": {
            "request_id": "5df486a0-343a-11e2-b0d8-d15d0ef48549"
        }
    }
}
```

You can also obtain the same information in text format using the `--output text` option.Command:

`--output text` option.Command:

option.Command:

```
aws redshift create-cluster-security-group --cluster-security-group-name
 mysecuritygroup --description "This is my cluster security group" --output text
```

Result:

```
This is my cluster security group   300454760768    mysecuritygroup
a0c0bfab-343a-11e2-95d2-c3dc9fe8ab57
```

- For API details, see CreateClusterSecurityGroup in *AWS CLI Command Reference*.

`create-cluster-snapshot`

The following code example shows how to use `create-cluster-snapshot`.

AWS CLI

Create a Cluster SnapshotThis example creates a new cluster snapshot. By default, the output is in JSON format.Command:

```
aws redshift create-cluster-snapshot --cluster-identifier mycluster --snapshot-
identifier my-snapshot-id
```

Result:

```
{
```

```
    "Snapshot": {
        "Status": "creating",
        "SnapshotCreateTime": "2013-01-22T22:20:33.548Z",
        "AvailabilityZone": "us-east-1a",
        "ClusterVersion": "1.0",
        "MasterUsername": "adminuser",
        "DBName": "dev",
        "ClusterCreateTime": "2013-01-22T21:59:29.559Z",
        "SnapshotType": "manual",
        "NodeType": "dw.hs1.xlarge",
        "ClusterIdentifier": "mycluster",
        "Port": 5439,
        "NumberOfNodes": "2",
        "SnapshotIdentifier": "my-snapshot-id"
    },
    "ResponseMetadata": {
        "RequestId": "f024d1a5-64e1-11e2-88c5-53eb05787dfb"
    }
}
```

- For API details, see CreateClusterSnapshot in *AWS CLI Command Reference*.

`create-cluster-subnet-group`

The following code example shows how to use `create-cluster-subnet-group`.

AWS CLI

Create a Cluster Subnet GroupThis example creates a new cluster subnet group.Command:

```
aws redshift create-cluster-subnet-group --cluster-subnet-group-name mysubnetgroup
 --description "My subnet group" --subnet-ids subnet-763fdd1c
```

Result:

```
{
    "ClusterSubnetGroup": {
        "Subnets": [
            {
                "SubnetStatus": "Active",
                "SubnetIdentifier": "subnet-763fdd1c",
                "SubnetAvailabilityZone": {
```

```
                "Name": "us-east-1a"
            }
         } ],
      "VpcId": "vpc-7e3fdd14",
      "SubnetGroupStatus": "Complete",
      "Description": "My subnet group",
      "ClusterSubnetGroupName": "mysubnetgroup"
   },
   "ResponseMetadata": {
      "RequestId": "500b8ce2-698f-11e2-9790-fd67517fb6fd"
   }
}
```

- For API details, see CreateClusterSubnetGroup in *AWS CLI Command Reference*.

`create-cluster`

The following code example shows how to use `create-cluster`.

AWS CLI

Create a Cluster with Minimal ParametersThis example creates a cluster with the minimal set of parameters. By default, the output is in JSON format.Command:

```
aws redshift create-cluster --node-type dw.hs1.xlarge --number-of-nodes 2 --master-
username adminuser --master-user-password TopSecret1 --cluster-identifier mycluster
```

Result:

```
{
   "Cluster": {
      "NodeType": "dw.hs1.xlarge",
      "ClusterVersion": "1.0",
      "PubliclyAccessible": "true",
      "MasterUsername": "adminuser",
      "ClusterParameterGroups": [
         {
            "ParameterApplyStatus": "in-sync",
            "ParameterGroupName": "default.redshift-1.0"
         } ],
      "ClusterSecurityGroups": [
         {
```

```
             "Status": "active",
             "ClusterSecurityGroupName": "default"
          } ],
       "AllowVersionUpgrade": true,
       "VpcSecurityGroups": \[],
       "PreferredMaintenanceWindow": "sat:03:30-sat:04:00",
       "AutomatedSnapshotRetentionPeriod": 1,
       "ClusterStatus": "creating",
       "ClusterIdentifier": "mycluster",
       "DBName": "dev",
       "NumberOfNodes": 2,
       "PendingModifiedValues": {
          "MasterUserPassword": "\****"
       }
    },
    "ResponseMetadata": {
       "RequestId": "7cf4bcfc-64dd-11e2-bea9-49e0ce183f07"
    }
}
```

- For API details, see CreateCluster in *AWS CLI Command Reference*.

`create-event-subscription`

The following code example shows how to use `create-event-subscription`.

AWS CLI

To create a notification subscription for an event

The following `create-event-subscription` example creates an event notification subscription.

```
aws redshift create-event-subscription \
    --subscription-name mysubscription \
    --sns-topic-arn arn:aws:sns:us-west-2:123456789012:MySNStopic \
    --source-type cluster \
    --source-ids mycluster
```

Output:

```
{
```

```
        "EventSubscription": {
        "CustomerAwsId": "123456789012",
        "CustSubscriptionId": "mysubscription",
        "SnsTopicArn": "arn:aws:sns:us-west-2:123456789012:MySNStopic",
        "Status": "active",
        "SubscriptionCreationTime": "2019-12-09T20:05:19.365Z",
        "SourceType": "cluster",
        "SourceIdsList": [
            "mycluster"
        ],
        "EventCategoriesList": [],
        "Severity": "INFO",
        "Enabled": true,
        "Tags": []
    }
}
```

For more information, see Subscribing to Amazon Redshift Event Notifications in the *Amazon Redshift Cluster Management Guide*.

- For API details, see CreateEventSubscription in *AWS CLI Command Reference*.

`create-hsm-client-certificate`

The following code example shows how to use `create-hsm-client-certificate`.

AWS CLI

To create an HSM client certificate

The following `create-hsm-client-certificate` example generates an HSM client certificate that a cluster can use to connect to an HSM.

```
aws redshift create-hsm-client-certificate \
    --hsm-client-certificate-identifier myhsmclientcert
```

Output:

```
{
    "HsmClientCertificate": {
        "HsmClientCertificateIdentifier": "myhsmclientcert",
        "HsmClientCertificatePublicKey": "-----BEGIN CERTIFICATE-----
```

    }
}
```

For more information, see [Amazon Redshift API Permissions Reference]() in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [CreateHsmClientCertificate]() in *AWS CLI Command Reference*.

`create-hsm-configuration`

The following code example shows how to use `create-hsm-configuration`.

AWS CLI

To create an HSM configuration

The following `create-hsm-configuration` example creates the specified HSM configuration that contains information required by a cluster to store and use database encryption keys in a hardware security module (HSM).

```
aws redshift create-hsm-configuration /
    --hsm-configuration-identifier myhsmconnection
    --description "My HSM connection"
    --hsm-ip-address 192.0.2.09
    --hsm-partition-name myhsmpartition /
    --hsm-partition-password A1b2c3d4 /
    --hsm-server-public-certificate myhsmclientcert
```

Output:

```
{
    "HsmConfiguration": {
        "HsmConfigurationIdentifier": "myhsmconnection",
        "Description": "My HSM connection",
        "HsmIpAddress": "192.0.2.09",
        "HsmPartitionName": "myhsmpartition",
        "Tags": []
    }
}
```

- For API details, see CreateHsmConfiguration in *AWS CLI Command Reference*.

`create-snapshot-copy-grant`

The following code example shows how to use `create-snapshot-copy-grant`.

AWS CLI

To create a snapshot copy grant

The following `create-snapshot-copy-grant` example creates a snapshot copy grant and encrypts copied snapshots in a destination AWS Region.

```
aws redshift create-snapshot-copy-grant \
    --snapshot-copy-grant-name mysnapshotcopygrantname
```

Output:

```
{
    "SnapshotCopyGrant": {
        "SnapshotCopyGrantName": "mysnapshotcopygrantname",
        "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/
bPxRfih3yCo8nvbEXAMPLEKEY",
        "Tags": []
    }
}
```

For more information, see Amazon Redshift Database Encryption in the *Amazon Redshift Cluster Management Guide*.

- For API details, see CreateSnapshotCopyGrant in *AWS CLI Command Reference*.

`create-snapshot-schedule`

The following code example shows how to use `create-snapshot-schedule`.

AWS CLI

To create snapshot schedule

The following `create-snapshot-schedule` example creates a snapshot schedule with the specified description and a rate of every 12 hours.

```
aws redshift create-snapshot-schedule \
    --schedule-definitions "rate(12 hours)" \
    --schedule-identifier mysnapshotschedule \
    --schedule-description "My schedule description"
```

Output:

```
{
    "ScheduleDefinitions": [
        "rate(12 hours)"
    ],
    "ScheduleIdentifier": "mysnapshotschedule",
    "ScheduleDescription": "My schedule description",
    "Tags": []
}
```

For more information, see Automated Snapshot Schedules in the *Amazon Redshift Cluster Management Guide*.

- For API details, see CreateSnapshotSchedule in *AWS CLI Command Reference*.

`create-tags`

The following code example shows how to use `create-tags`.

AWS CLI

To create tags for a cluster

The following `create-tags` example adds the specified tag key/value pair to the specified cluster.

```
aws redshift create-tags \
    --resource-name arn:aws:redshift:us-west-2:123456789012:cluster:mycluster \
    --tags "Key"="mytags","Value"="tag1"
```

This command does not produce any output.

For more information, see Tagging Resources in Amazon Redshift in the *Amazon Redshift Cluster Management Guide*.

- For API details, see CreateTags in *AWS CLI Command Reference*.

`delete-cluster-parameter-group`

The following code example shows how to use `delete-cluster-parameter-group`.

AWS CLI

Delete a Cluster Parameter GroupThis example deletes a cluster parameter group.Command:

```
aws redshift delete-cluster-parameter-group --parameter-group-name
 myclusterparametergroup
```

- For API details, see DeleteClusterParameterGroup in *AWS CLI Command Reference*.

`delete-cluster-security-group`

The following code example shows how to use `delete-cluster-security-group`.

AWS CLI

Delete a Cluster Security GroupThis example deletes a cluster security group.Command:

```
aws redshift delete-cluster-security-group --cluster-security-group-name
 mysecuritygroup
```

- For API details, see DeleteClusterSecurityGroup in *AWS CLI Command Reference*.

`delete-cluster-snapshot`

The following code example shows how to use `delete-cluster-snapshot`.

AWS CLI

Delete a Cluster SnapshotThis example deletes a cluster snapshot.Command:

```
aws redshift delete-cluster-snapshot --snapshot-identifier my-snapshot-id
```

- For API details, see DeleteClusterSnapshot in *AWS CLI Command Reference*.

`delete-cluster-subnet-group`

The following code example shows how to use `delete-cluster-subnet-group`.

AWS CLI

Delete a Cluster subnet GroupThis example deletes a cluster subnet group.Command:

```
aws redshift delete-cluster-subnet-group --cluster-subnet-group-name mysubnetgroup
```

Result:

```
{
   "ResponseMetadata": {
      "RequestId": "253fbffd-6993-11e2-bc3a-47431073908a"
   }
}
```

- For API details, see DeleteClusterSubnetGroup in *AWS CLI Command Reference*.

`delete-cluster`

The following code example shows how to use `delete-cluster`.

AWS CLI

Delete a Cluster with No Final Cluster SnapshotThis example deletes a cluster, forcing data deletion so no final cluster snapshot is created.Command:

```
aws redshift delete-cluster --cluster-identifier mycluster --skip-final-cluster-
snapshot
```

Delete a Cluster, Allowing a Final Cluster SnapshotThis example deletes a cluster, but specifies a final cluster snapshot.Command:

```
aws redshift delete-cluster --cluster-identifier mycluster --final-cluster-snapshot-
identifier myfinalsnapshot
```

- For API details, see DeleteCluster in *AWS CLI Command Reference*.

`delete-event-subscription`

The following code example shows how to use `delete-event-subscription`.

AWS CLI

To delete event subscription

The following `delete-event-subscription` example deletes the specified event notification subscription.

```
aws redshift delete-event-subscription \
    --subscription-name mysubscription
```

This command does not produce any output.

For more information, see Subscribing to Amazon Redshift Event Notifications in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DeleteEventSubscription in *AWS CLI Command Reference*.

`delete-hsm-client-certificate`

The following code example shows how to use `delete-hsm-client-certificate`.

AWS CLI

To delete HSM client certificate

The following `delete-hsm-client-certificate` example deletes an HSM client certificate.

```
aws redshift delete-hsm-client-certificate \
    --hsm-client-certificate-identifier myhsmclientcert
```

This command does not produce any output.

For more information, see Amazon Redshift API Permissions Reference in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DeleteHsmClientCertificate in *AWS CLI Command Reference*.

delete-hsm-configuration

The following code example shows how to use `delete-hsm-configuration`.

AWS CLI

To delete an HSM configuration

The following `delete-hsm-configuration` example deletes the specified HSM configuration from the current AWS account.

```
aws redshift delete-hsm-configuration /
    --hsm-configuration-identifier myhsmconnection
```

This command does not produce any output.

- For API details, see DeleteHsmConfiguration in *AWS CLI Command Reference*.

delete-scheduled-action

The following code example shows how to use `delete-scheduled-action`.

AWS CLI

To delete scheduled action

The following `delete-scheduled-action` example deletes the specified scheduled action.

```
aws redshift delete-scheduled-action \
```

```
    --scheduled-action-name myscheduledaction
```

This command does not produce any output.

- For API details, see DeleteScheduledAction in *AWS CLI Command Reference*.

`delete-snapshot-copy-grant`

The following code example shows how to use `delete-snapshot-copy-grant`.

AWS CLI

To delete snapshot copy grant

The following `delete-snapshot-copy-grant` example deletes the specified snapshot copy grant.

```
aws redshift delete-snapshot-copy-grant \
    --snapshot-copy-grant-name mysnapshotcopygrantname
```

This command does not produce any output.

For more information, see Amazon Redshift Database Encryption in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DeleteSnapshotCopyGrant in *AWS CLI Command Reference*.

`delete-snapshot-schedule`

The following code example shows how to use `delete-snapshot-schedule`.

AWS CLI

To delete snapshot schedule

The following `delete-snapshot-schedule` example deletes the specified snapshot schedule. You must disassociate clusters before deleting the schedule.

```
aws redshift delete-snapshot-schedule \
    --schedule-identifier mysnapshotschedule
```

This command does not produce any output.

For more information, see [Automated Snapshot Schedules]() in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [DeleteSnapshotSchedule]() in *AWS CLI Command Reference*.

`delete-tags`

The following code example shows how to use `delete-tags`.

AWS CLI

To delete tags from a cluster

The following `delete-tags` example deletes the tags with the specified key names from the specified cluster.

```
aws redshift delete-tags \
    --resource-name arn:aws:redshift:us-west-2:123456789012:cluster:mycluster \
    --tag-keys "clustertagkey" "clustertagvalue"
```

This command does not produce any output.

For more information, see [Tagging Resources in Amazon Redshift]() in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [DeleteTags]() in *AWS CLI Command Reference*.

`describe-account-attributes`

The following code example shows how to use `describe-account-attributes`.

AWS CLI

To describe attributes of an AWS account

The following `describe-account-attributes` example displays the attributes attached to the calling AWS account.

```
aws redshift describe-account-attributes
```

Output:

```
{
    "AccountAttributes": [
        {
            "AttributeName": "max-defer-maintenance-duration",
            "AttributeValues": [
                {
                    "AttributeValue": "45"
                }
            ]
        }
    ]
}
```

- For API details, see DescribeAccountAttributes in *AWS CLI Command Reference*.

`describe-cluster-db-revisions`

The following code example shows how to use `describe-cluster-db-revisions`.

AWS CLI

To describe DB revisions for a cluster

The following `describe-cluster-db-revisions` example displays the details of an array of `ClusterDbRevision` objects for the specified cluster.

```
aws redshift describe-cluster-db-revisions \
    --cluster-identifier mycluster
```

Output:

```
{
    "ClusterDbRevisions": [
        {
            "ClusterIdentifier": "mycluster",
            "CurrentDatabaseRevision": "11420",
            "DatabaseRevisionReleaseDate": "2019-11-22T16:43:49.597Z",
            "RevisionTargets": []
        }
    ]
```

```
}
```

- For API details, see DescribeClusterDbRevisions in *AWS CLI Command Reference*.

`describe-cluster-parameter-groups`

The following code example shows how to use `describe-cluster-parameter-groups`.

AWS CLI

Get a Description of All Cluster Parameter GroupsThis example returns a description of all cluster parameter groups for the account, with column headers. By default, the output is in JSON format.Command:

```
aws redshift describe-cluster-parameter-groups
```

Result:

```
{
   "ParameterGroups": [
      {
         "ParameterGroupFamily": "redshift-1.0",
         "Description": "My first cluster parameter group",
         "ParameterGroupName": "myclusterparametergroup"
      } ],
   "ResponseMetadata": {
      "RequestId": "8ceb8f6f-64cc-11e2-bea9-49e0ce183f07"
   }
}
```

You can also obtain the same information in text format using the `--output text` option.Command:

`--output text` option.Command:

option.Command:

```
aws redshift describe-cluster-parameter-groups --output text
```

Result:

```
redshift-1.0        My first cluster parameter group        myclusterparametergroup
RESPONSEMETADATA    9e665a36-64cc-11e2-8f7d-3b939af52818
```

- For API details, see DescribeClusterParameterGroups in *AWS CLI Command Reference*.

`describe-cluster-parameters`

The following code example shows how to use `describe-cluster-parameters`.

AWS CLI

Retrieve the Parameters for a Specified Cluster Parameter GroupThis example retrieves the parameters for the named parameter group. By default, the output is in JSON format.Command:

```
aws redshift describe-cluster-parameters --parameter-group-name
 myclusterparametergroup
```

Result:

```
{
   "Parameters": [
      {
         "Description": "Sets the display format for date and time values.",
         "DataType": "string",
         "IsModifiable": true,
         "Source": "engine-default",
         "ParameterValue": "ISO, MDY",
         "ParameterName": "datestyle"
      },
      {
         "Description": "Sets the number of digits displayed for floating-point
 values",
         "DataType": "integer",
         "IsModifiable": true,
         "AllowedValues": "-15-2",
         "Source": "engine-default",
         "ParameterValue": "0",
         "ParameterName": "extra_float_digits"
      },
      (...remaining output omitted...)
```

```
    ]
}
```

You can also obtain the same information in text format using the `--output text` option.Command:

`--output text` option.Command:

option.Command:

```
aws redshift describe-cluster-parameters --parameter-group-name
 myclusterparametergroup --output text
```

Result:

```
RESPONSEMETADATA    cdac40aa-64cc-11e2-9e70-918437dd236d
Sets the display format for date and time values.   string  True    engine-default

```

- For API details, see [DescribeClusterParameters](#) in *AWS CLI Command Reference*.

`describe-cluster-security-groups`

The following code example shows how to use `describe-cluster-security-groups`.

AWS CLI

Get a Description of All Cluster Security GroupsThis example returns a description of all cluster security groups for the account. By default, the output is in JSON format.Command:

```
aws redshift describe-cluster-security-groups
```

Result:

```
{
   "ClusterSecurityGroups": [
      {
         "OwnerId": "100447751468",
         "Description": "default",
         "ClusterSecurityGroupName": "default",
         "EC2SecurityGroups": \[],
         "IPRanges": [
            {
               "Status": "authorized",
               "CIDRIP": "0.0.0.0/0"
            }
         ]
      },
      {
         "OwnerId": "100447751468",
         "Description": "This is my cluster security group",
         "ClusterSecurityGroupName": "mysecuritygroup",
         "EC2SecurityGroups": \[],
         "IPRanges": \[]
      },
      (...remaining output omitted...)
   ]
}
```

- For API details, see DescribeClusterSecurityGroups in *AWS CLI Command Reference*.

`describe-cluster-snapshots`

The following code example shows how to use `describe-cluster-snapshots`.

AWS CLI

Get a Description of All Cluster SnapshotsThis example returns a description of all cluster snapshots for the account. By default, the output is in JSON format.Command:

```
aws redshift describe-cluster-snapshots
```

Result:

```
{
   "Snapshots": [
      {
         "Status": "available",
         "SnapshotCreateTime": "2013-07-17T22:02:22.852Z",

         } ]
      }
      (...remaining output omitted...)
```

- For API details, see DescribeClusterSnapshots in *AWS CLI Command Reference*.

`describe-cluster-subnet-groups`

The following code example shows how to use `describe-cluster-subnet-groups`.

AWS CLI

Get a Description of All Cluster Subnet GroupsThis example returns a description of all cluster subnet groups. By default, the output is in JSON format.Command:

```
aws redshift describe-cluster-subnet-groups
```

Result:

```
{
   "ClusterSubnetGroups": [
      {
         "Subnets": [
            {
               "SubnetStatus": "Active",
               "SubnetIdentifier": "subnet-763fdd1c",
               "SubnetAvailabilityZone": {
                  "Name": "us-east-1a"
               }
            }
         ],
         "VpcId": "vpc-7e3fdd14",
         "SubnetGroupStatus": "Complete",
```

```
            "Description": "My subnet group",
            "ClusterSubnetGroupName": "mysubnetgroup"
         }
      ],
      "ResponseMetadata": {
         "RequestId": "37fa8c89-6990-11e2-8f75-ab4018764c77"
      }
}
```

- For API details, see DescribeClusterSubnetGroups in *AWS CLI Command Reference*.

`describe-cluster-tracks`

The following code example shows how to use `describe-cluster-tracks`.

AWS CLI

To describe cluster tracks

The following `describe-cluster-tracks` example displays details of the available maintenance tracks.

```
aws redshift describe-cluster-tracks \
    --maintenance-track-name current
```

Output:

```
{
    "MaintenanceTracks": [
        {
            "MaintenanceTrackName": "current",
            "DatabaseVersion": "1.0.11420",
            "UpdateTargets": [
                {
                    "MaintenanceTrackName": "preview_features",
                    "DatabaseVersion": "1.0.11746",
                    "SupportedOperations": [
                        {
                            "OperationName": "restore-from-cluster-snapshot"
                        }
                    ]
                },
```

```
                {
                    "MaintenanceTrackName": "trailing",
                    "DatabaseVersion": "1.0.11116",
                    "SupportedOperations": [
                        {
                            "OperationName": "restore-from-cluster-snapshot"
                        },
                        {
                            "OperationName": "modify-cluster"
                        }
                    ]
                }
            ]
        }
    ]
}
```

For more information, see Choosing Cluster Maintenance Tracks in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DescribeClusterTracks in *AWS CLI Command Reference*.

`describe-cluster-versions`

The following code example shows how to use `describe-cluster-versions`.

AWS CLI

Get a Description of All Cluster VersionsThis example returns a description of all cluster versions. By default, the output is in JSON format.Command:

```
aws redshift describe-cluster-versions
```

Result:

```
{
   "ClusterVersions": [
      {
      "ClusterVersion": "1.0",
      "Description": "Initial release",
      "ClusterParameterGroupFamily": "redshift-1.0"
      } ],
```

```
   "ResponseMetadata": {
      "RequestId": "16a53de3-64cc-11e2-bec0-17624ad140dd"
   }
}
```

- For API details, see DescribeClusterVersions in *AWS CLI Command Reference*.

`describe-clusters`

The following code example shows how to use `describe-clusters`.

AWS CLI

Get a Description of All ClustersThis example returns a description of all clusters for the account. By default, the output is in JSON format.Command:

```
aws redshift describe-clusters
```

Result:

```
{
   "Clusters": [
   {
      "NodeType": "dw.hs1.xlarge",
      "Endpoint": {
         "Port": 5439,
         "Address": "mycluster.coqoarplqhsn.us-east-1.redshift.amazonaws.com"
      },
      "ClusterVersion": "1.0",
      "PubliclyAccessible": "true",
      "MasterUsername": "adminuser",
      "ClusterParameterGroups": [
         {
            "ParameterApplyStatus": "in-sync",
            "ParameterGroupName": "default.redshift-1.0"
         } ],
      "ClusterSecurityGroups": [
         {
            "Status": "active",
            "ClusterSecurityGroupName": "default"
         } ],
      "AllowVersionUpgrade": true,
```

```
         "VpcSecurityGroups": \[],
         "AvailabilityZone": "us-east-1a",
         "ClusterCreateTime": "2013-01-22T21:59:29.559Z",
         "PreferredMaintenanceWindow": "sat:03:30-sat:04:00",
         "AutomatedSnapshotRetentionPeriod": 1,
         "ClusterStatus": "available",
         "ClusterIdentifier": "mycluster",
         "DBName": "dev",
         "NumberOfNodes": 2,
         "PendingModifiedValues": {}
      } ],
      "ResponseMetadata": {
         "RequestId": "65b71cac-64df-11e2-8f5b-e90bd6c77476"
      }
}
```

You can also obtain the same information in text format using the `--output text` option.Command:

`--output text` option.Command:

option.Command:

```
aws redshift describe-clusters --output text
```

Result:

```

```

- For API details, see DescribeClusters in *AWS CLI Command Reference*.

`describe-default-cluster-parameters`

The following code example shows how to use `describe-default-cluster-parameters`.

AWS CLI

Get a Description of Default Cluster ParametersThis example returns a description of the default cluster parameters for the `redshift-1.0` family. By default, the output is in JSON format.Command:

```
aws redshift describe-default-cluster-parameters --parameter-group-family
 redshift-1.0
```

Result:

```
{
   "DefaultClusterParameters": {
   "ParameterGroupFamily": "redshift-1.0",
   "Parameters": [
      {
         "Description": "Sets the display format for date and time values.",
         "DataType": "string",
         "IsModifiable": true,
         "Source": "engine-default",
         "ParameterValue": "ISO, MDY",
         "ParameterName": "datestyle"
      },
      {
         "Description": "Sets the number of digits displayed for floating-point
 values",
         "DataType": "integer",
         "IsModifiable": true,
         "AllowedValues": "-15-2",
         "Source": "engine-default",
         "ParameterValue": "0",
         "ParameterName": "extra_float_digits"
      },
      (...remaining output omitted...)
      ]
   }
}
```

To see a list of valid parameter group families, use the `describe-cluster-parameter-groups` command.

`describe-cluster-parameter-groups` command.

command.

- For API details, see [DescribeDefaultClusterParameters]() in *AWS CLI Command Reference*.

`describe-event-categories`

The following code example shows how to use `describe-event-categories`.

AWS CLI

To describe event categories for a cluster

The following `describe-event-categories` example displays details for the event categories for a cluster.

```
aws redshift describe-event-categories \
    --source-type cluster
```

Output:

```
{
    "EventCategoriesMapList": [
        {
            "SourceType": "cluster",
            "Events": [
                {
                    "EventId": "REDSHIFT-EVENT-2000",
                    "EventCategories": [
                        "management"
                    ],
                    "EventDescription": "Cluster <cluster name> created at <time in
 UTC>.",
                    "Severity": "INFO"
                },
                {
                    "EventId": "REDSHIFT-EVENT-2001",
                    "EventCategories": [
                        "management"
                    ],
                    "EventDescription": "Cluster <cluster name> deleted at <time in
 UTC>.",
                    "Severity": "INFO"
```

```
                },
                {
                    "EventId": "REDSHIFT-EVENT-3625",
                    "EventCategories": [
                        "monitoring"
                    ],
                    "EventDescription": "The cluster <cluster name> can't be resumed
 with its previous elastic network interface <ENI id>. We will allocate a new
 elastic network interface and associate it with the cluster node.",
                    "Severity": "INFO"
                }
            ]
        }
    ]
}
```

- For API details, see [DescribeEventCategories](#) in *AWS CLI Command Reference*.

`describe-event-subscriptions`

The following code example shows how to use `describe-event-subscriptions`.

AWS CLI

To describe event subscriptions

The following `describe-event-subscriptions` example displays event notification subscriptions for the specified subscription.

```
aws redshift describe-event-subscriptions \
    --subscription-name mysubscription
```

Output:

```
{
    "EventSubscriptionsList": [
        {
            "CustomerAwsId": "123456789012",
            "CustSubscriptionId": "mysubscription",
            "SnsTopicArn": "arn:aws:sns:us-west-2:123456789012:MySNStopic",
            "Status": "active",
```

```
                "SubscriptionCreationTime": "2019-12-09T21:50:21.332Z",
                "SourceIdsList": [],
                "EventCategoriesList": [
                    "management"
                ],
                "Severity": "ERROR",
                "Enabled": true,
                "Tags": []
            }
        ]
}
```

For more information, see [Subscribing to Amazon Redshift Event Notifications](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [DescribeEventSubscriptions](#) in *AWS CLI Command Reference*.

`describe-events`

The following code example shows how to use `describe-events`.

AWS CLI

Describe All Eventsthis example returns all events. By default, the output is in JSON format.Command:

```
aws redshift describe-events
```

Result:

```
{
   "Events": [
      {
      "Date": "2013-01-22T19:17:03.640Z",
      "SourceIdentifier": "myclusterparametergroup",
      "Message": "Cluster parameter group myclusterparametergroup has been
 created.",
      "SourceType": "cluster-parameter-group"
      } ],
   "ResponseMetadata": {
      "RequestId": "9f056111-64c9-11e2-9390-ff04f2c1e638"
   }
```

```
}
```

You can also obtain the same information in text format using the `--output text` option.Command:

`--output text` option.Command:

option.Command:

```
aws redshift describe-events --output text
```

Result:

```

```

- For API details, see DescribeEvents in *AWS CLI Command Reference*.

`describe-hsm-client-certificates`

The following code example shows how to use `describe-hsm-client-certificates`.

AWS CLI

To describe HSM client certificates

The following `describe-hsm-client-certificates` example displays details for the specified HSM client certificate.

```
aws redshift describe-hsm-client-certificates \
    --hsm-client-certificate-identifier myhsmclientcert
```

Output:

```
{
    "HsmClientCertificates": [
        {
        "HsmClientCertificateIdentifier": "myhsmclientcert",
        "HsmClientCertificatePublicKey": "-----BEGIN CERTIFICATE-----\

```

For more information, see [Amazon Redshift API Permissions Reference](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [DescribeHsmClientCertificates](#) in *AWS CLI Command Reference*.

`describe-hsm-configurations`

The following code example shows how to use `describe-hsm-configurations`.

AWS CLI

To describe HSM configurations

The following `describe-hsm-configurations` example displays details for the available HSM configurations for the calling AWS account.

```
aws redshift describe-hsm-configurations /
    --hsm-configuration-identifier myhsmconnection
```

Output:

```
{
    "HsmConfigurations": [
```

```
        {
            "HsmConfigurationIdentifier": "myhsmconnection",
            "Description": "My HSM connection",
            "HsmIpAddress": "192.0.2.09",
            "HsmPartitionName": "myhsmpartition",
            "Tags": []
        }
    ]
}
```

- For API details, see DescribeHsmConfigurations in *AWS CLI Command Reference*.

`describe-logging-status`

The following code example shows how to use `describe-logging-status`.

AWS CLI

To describe logging status for a cluster

The following `describe-logging-status` example displays whether information, such as queries and connection attempts, is being logged for a cluster.

```
aws redshift describe-logging-status \
    --cluster-identifier mycluster
```

Output:

```
{
    "LoggingEnabled": false
}
```

For more information, see Database Audit Logging in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DescribeLoggingStatus in *AWS CLI Command Reference*.

`describe-node-configuration-options`

The following code example shows how to use `describe-node-configuration-options`.

AWS CLI

To describe node configuration options

The following `describe-node-configuration-options` example displays the properties of possible node configurations such as node type, number of nodes, and disk usage for the specified cluster snapshot.

```
aws redshift describe-node-configuration-options \
    --action-type restore-cluster \
    --snapshot-identifier rs:mycluster-2019-12-09-16-42-43
```

Output:

```
{
    "NodeConfigurationOptionList": [
        {
            "NodeType": "dc2.large",
            "NumberOfNodes": 2,
            "EstimatedDiskUtilizationPercent": 19.61
        },
        {
            "NodeType": "dc2.large",
            "NumberOfNodes": 4,
            "EstimatedDiskUtilizationPercent": 9.96
        },
        {
            "NodeType": "ds2.xlarge",
            "NumberOfNodes": 2,
            "EstimatedDiskUtilizationPercent": 1.53
        },
        {
            "NodeType": "ds2.xlarge",
            "NumberOfNodes": 4,
            "EstimatedDiskUtilizationPercent": 0.78
        }
    ]
}
```

For more information, see Purchasing Amazon Redshift Reserved Nodes in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DescribeNodeConfigurationOptions in *AWS CLI Command Reference*.

`describe-orderable-cluster-options`

The following code example shows how to use `describe-orderable-cluster-options`.

AWS CLI

Describing All Orderable Cluster OptionsThis example returns descriptions of all orderable cluster options. By default, the output is in JSON format.Command:

```
aws redshift describe-orderable-cluster-options
```

Result:

```
{
   "OrderableClusterOptions": [
      {
         "NodeType": "dw.hs1.8xlarge",
         "AvailabilityZones": [
            { "Name": "us-east-1a" },
            { "Name": "us-east-1b" },
            { "Name": "us-east-1c" } ],
         "ClusterVersion": "1.0",
         "ClusterType": "multi-node"
      },
      {
         "NodeType": "dw.hs1.xlarge",
         "AvailabilityZones": [
            { "Name": "us-east-1a" },
            { "Name": "us-east-1b" },
            { "Name": "us-east-1c" } ],
         "ClusterVersion": "1.0",
         "ClusterType": "multi-node"
      },
      {
      "NodeType": "dw.hs1.xlarge",
      "AvailabilityZones": [
         { "Name": "us-east-1a" },
         { "Name": "us-east-1b" },
         { "Name": "us-east-1c" } ],
      "ClusterVersion": "1.0",
      "ClusterType": "single-node"
      } ],
   "ResponseMetadata": {
```

```
        "RequestId": "f6000035-64cb-11e2-9135-ff82df53a51a"
    }
}
```

You can also obtain the same information in text format using the `--output text` option.Command:

`--output text` option.Command:

```

- For API details, see DescribeOrderableClusterOptions in *AWS CLI Command Reference*.

`describe-reserved-node-offerings`

The following code example shows how to use `describe-reserved-node-offerings`.

AWS CLI

Describe Reserved Node OfferingsThis example shows all of the reserved node offerings that are available for purchase.Command:

```
aws redshift describe-reserved-node-offerings
```

Result:

```
{
   "ReservedNodeOfferings": [
      {
         "OfferingType": "Heavy Utilization",
         "FixedPrice": "",
         "NodeType": "dw.hs1.xlarge",
         "UsagePrice": "",
         "RecurringCharges": [
            {
               "RecurringChargeAmount": "",
               "RecurringChargeFrequency": "Hourly"
            } ],
         "Duration": 31536000,
         "ReservedNodeOfferingId": "ceb6a579-cf4c-4343-be8b-d832c45ab51c"
      },
      {
         "OfferingType": "Heavy Utilization",
         "FixedPrice": "",
         "NodeType": "dw.hs1.8xlarge",
         "UsagePrice": "",
         "RecurringCharges": [
            {
            "RecurringChargeAmount": "",
            "RecurringChargeFrequency": "Hourly"
            } ],
         "Duration": 31536000,
         "ReservedNodeOfferingId": "e5a2ff3b-352d-4a9c-ad7d-373c4cab5dd2"
      },
      ...remaining output omitted...
   ],
   "ResponseMetadata": {
      "RequestId": "8b1a1a43-75ff-11e2-9666-e142fe91ddd1"
   }
}
```

If you want to purchase a reserved node offering, you can call `purchase-reserved-node-offering` using a valid *ReservedNodeOfferingId*.

`purchase-reserved-node-offering` using a valid *ReservedNodeOfferingId*.

using a valid *ReservedNodeOfferingId*.

ReservedNodeOfferingId.

.

- For API details, see DescribeReservedNodeOfferings in *AWS CLI Command Reference*.

`describe-reserved-nodes`

The following code example shows how to use `describe-reserved-nodes`.

AWS CLI

Describe Reserved NodesThis example shows a reserved node offering that has been purchased.Command:

```
aws redshift describe-reserved-nodes
```

Result:

```
{
   "ResponseMetadata": {
      "RequestId": "bc29ce2e-7600-11e2-9949-4b361e7420b7"
   },
   "ReservedNodes": [
      {
         "OfferingType": "Heavy Utilization",
         "FixedPrice": "",

         "ReservedNodeId": "1ba8e2e3-bc01-4d65-b35d-a4a3e931547e",
         "UsagePrice": "",
         "RecurringCharges": [
            {
               "RecurringChargeAmount": "",
               "RecurringChargeFrequency": "Hourly"
            } ],
         "NodeCount": 1,
         "State": "payment-pending",
         "StartTime": "2013-02-13T17:08:39.051Z",
         "Duration": 31536000,
         "ReservedNodeOfferingId": "ceb6a579-cf4c-4343-be8b-d832c45ab51c"
      }
   ]
```

```
}
```

- For API details, see DescribeReservedNodes in *AWS CLI Command Reference*.

`describe-resize`

The following code example shows how to use `describe-resize`.

AWS CLI

Describe ResizeThis example describes the latest resize of a cluster. The request was for 3 nodes of type `dw.hs1.8xlarge`.Command:

```
aws redshift describe-resize --cluster-identifier mycluster
```

Result:

```
{
   "Status": "NONE",
   "TargetClusterType": "multi-node",
   "TargetNodeType": "dw.hs1.8xlarge",
   "ResponseMetadata": {
      "RequestId": "9f52b0b4-7733-11e2-aa9b-318b2909bd27"
   },
   "TargetNumberOfNodes": "3"
}
```

- For API details, see DescribeResize in *AWS CLI Command Reference*.

`describe-scheduled-actions`

The following code example shows how to use `describe-scheduled-actions`.

AWS CLI

To describe scheduled actions

The following `describe-scheduled-actions` example displays details for any currently scheduled actions.

```
aws redshift describe-scheduled-actions
```

Output:

```
{
    "ScheduledActions": [
        {
            "ScheduledActionName": "resizecluster",
            "TargetAction": {
                "ResizeCluster": {
                    "ClusterIdentifier": "mycluster",
                    "NumberOfNodes": 4,
                    "Classic": false
                }
            },
            "Schedule": "at(2019-12-10T00:07:00)",
            "IamRole": "arn:aws:iam::123456789012:role/myRedshiftRole",
            "State": "ACTIVE",
            "NextInvocations": [
                "2019-12-10T00:07:00Z"
            ]
        }
    ]
}
```

- For API details, see DescribeScheduledActions in *AWS CLI Command Reference*.

`describe-snapshot-copy-grants`

The following code example shows how to use `describe-snapshot-copy-grants`.

AWS CLI

To describe snapshot copy grants

The following `describe-snapshot-copy-grants` example displays details for the specified cluster snapshot copy grant.

```
aws redshift describe-snapshot-copy-grants \
    --snapshot-copy-grant-name mysnapshotcopygrantname
```

Output:

```
{
```

```
    "SnapshotCopyGrants": [
        {
            "SnapshotCopyGrantName": "mysnapshotcopygrantname",
            "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/
bPxRfih3yCo8nvbEXAMPLEKEY",
            "Tags": []
        }
    ]
}
```

For more information, see Amazon Redshift Database Encryption in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DescribeSnapshotCopyGrants in *AWS CLI Command Reference*.

`describe-snapshot-schedules`

The following code example shows how to use `describe-snapshot-schedules`.

AWS CLI

To describe snapshot schedules

The following `describe-snapshot-schedules` example displays details for the specified cluster snapshot schedule.

```
aws redshift describe-snapshot-schedules \
    --cluster-identifier mycluster \
    --schedule-identifier mysnapshotschedule
```

Output:

```
{
    "SnapshotSchedules": [
        {
            "ScheduleDefinitions": [
                "rate(12 hours)"
            ],
            "ScheduleIdentifier": "mysnapshotschedule",
            "ScheduleDescription": "My schedule description",
            "Tags": [],
            "AssociatedClusterCount": 1,
            "AssociatedClusters": [
```

```
                    {
                        "ClusterIdentifier": "mycluster",
                        "ScheduleAssociationState": "ACTIVE"
                    }
                ]
            }
        ]
}
```

For more information, see Automated Snapshot Schedules in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DescribeSnapshotSchedules in *AWS CLI Command Reference*.

`describe-storage`

The following code example shows how to use `describe-storage`.

AWS CLI

To describe storage

The following `describe-storage` example displays details about the backup storage and provisional storage sizes for the account.

```
aws redshift describe-storage
```

Output:

```
{
    "TotalBackupSizeInMegaBytes": 193149.0,
    "TotalProvisionedStorageInMegaBytes": 655360.0
}
```

For more information, see Managing Snapshot Storage in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DescribeStorage in *AWS CLI Command Reference*.

`describe-table-restore-status`

The following code example shows how to use `describe-table-restore-status`.

AWS CLI

To describe status of table restore requests from a cluster snapshot

The following `describe-table-restore-status` example displays details for table restore requests made for the specified cluster.

```
aws redshift describe-table-restore-status /
    --cluster-identifier mycluster
```

Output:

```
{
    "TableRestoreStatusDetails": [
        {
            "TableRestoreRequestId": "z1116630-0e80-46f4-ba86-bd9670411ebd",
            "Status": "IN_PROGRESS",
            "RequestTime": "2019-12-27T18:22:12.257Z",
            "ClusterIdentifier": "mycluster",
            "SnapshotIdentifier": "mysnapshotid",
            "SourceDatabaseName": "dev",
            "SourceSchemaName": "public",
            "SourceTableName": "mytable",
            "TargetDatabaseName": "dev",
            "TargetSchemaName": "public",
            "NewTableName": "mytable-clone"
        }
    ]
}
```

For more information, see Restoring a Table from a Snapshot in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DescribeTableRestoreStatus in *AWS CLI Command Reference*.

`describe-tags`

The following code example shows how to use `describe-tags`.

AWS CLI

To describe tags

The following `describe-tags` example displays the resources the specified cluster associated with the specified tag names and values.

```
aws redshift describe-tags \
    --resource-name arn:aws:redshift:us-west-2:123456789012:cluster:mycluster \
    --tag-keys clustertagkey \
    --tag-values clustertagvalue
```

Output:

```
{
    "TaggedResources": [
                    {
            "Tag": {
                "Key": "clustertagkey",
                "Value": "clustertagvalue"
            },
            "ResourceName": "arn:aws:redshift:us-
west-2:123456789012:cluster:mycluster",
            "ResourceType": "cluster"
        }
    ]
}
```

For more information, see Tagging Resources in Amazon Redshift in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DescribeTags in *AWS CLI Command Reference*.

`disable-snapshot-copy`

The following code example shows how to use `disable-snapshot-copy`.

AWS CLI

To disable snapshot copy for a cluster

The following `disable-snapshot-copy` example disables the automatic copy of a snapshot for the specified cluster.

```
aws redshift disable-snapshot-copy \
    --cluster-identifier mycluster
```

Output:

```
{
    "Cluster": {
        "ClusterIdentifier": "mycluster",
        "NodeType": "dc2.large",
        "ClusterStatus": "available",

    }
}
```

For more information, see Copying Snapshots to Another AWS Region in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DisableSnapshotCopy in *AWS CLI Command Reference*.

`enable-snapshot-copy`

The following code example shows how to use `enable-snapshot-copy`.

AWS CLI

To enable snapshot copy for a cluster

The following `enable-snapshot-copy` example enables the automatic copy of a snapshot for the specified cluster.

```
aws redshift enable-snapshot-copy \
    --cluster-identifier mycluster \
    --destination-region us-west-1
```

Output:

```
{
    "Cluster": {
        "ClusterIdentifier": "mycluster",
        "NodeType": "dc2.large",
        "ClusterStatus": "available",
        "ClusterAvailabilityStatus": "Available",
        "MasterUsername": "adminuser",
        "DBName": "dev",
        "Endpoint": {
            "Address": "mycluster.cmeaswqeuae.us-west-2.redshift.amazonaws.com",
            "Port": 5439
        },
        "ClusterCreateTime": "2019-12-05T18:44:36.991Z",

        "NextMaintenanceWindowStartTime": "2019-12-14T16:00:00Z"
    }
}
```

For more information, see Copying Snapshots to Another AWS Region in the *Amazon Redshift Cluster Management Guide*.

- For API details, see EnableSnapshotCopy in *AWS CLI Command Reference*.

`get-cluster-credentials`

The following code example shows how to use `get-cluster-credentials`.

AWS CLI

To get cluster credentials for an AWS account

The following `get-cluster-credentials` example retrieves temporary credentials that enable access to an Amazon Redshift database.

```
aws redshift get-cluster-credentials \
    --db-user adminuser --db-name dev \
```

```
    --cluster-identifier mycluster
```

Output:

```
{
    "DbUser": "IAM:adminuser",
    "DbPassword": "AMAFUyyuros/QjxPTtgzcsuQsqzIasdzJEN04aCtWDzXx1O9d6UmpkBtvEeqFly/
EXAMPLE==",
    "Expiration": "2019-12-10T17:25:05.770Z"
}
```

For more information, see Generating IAM Database Credentials Using the Amazon Redshift CLI or API in the *Amazon Redshift Cluster Management Guide*.

- For API details, see GetClusterCredentials in *AWS CLI Command Reference*.

`get-reserved-node-exchange-offerings`

The following code example shows how to use `get-reserved-node-exchange-offerings`.

AWS CLI

To get reserved node exchange offerings

The following `get-reserved-node-exchange-offerings` example retrieves an array of `DC2 ReservedNodeOfferings` that match the specified DC1 reserved node.

```
aws redshift get-reserved-node-exchange-offerings \
    --reserved-node-id 12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE
```

Output:

```
{
    "ReservedNodeOfferings": [
        {
            "ReservedNodeOfferingId": "12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE",
            "NodeType": "dc2.large",
            "Duration": 31536000,
            "FixedPrice": 0.0,
            "UsagePrice": 0.0,
            "CurrencyCode": "USD",
            "OfferingType": "All Upfront",
```

```
                "RecurringCharges": [
                    {
                        "RecurringChargeAmount": 0.0,
                        "RecurringChargeFrequency": "Hourly"
                    }
                ],
                "ReservedNodeOfferingType": "Regular"
            }
        ]
    }
```

For more information, see [Upgrading Reserved Nodes With the AWS CLI]() in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [GetReservedNodeExchangeOfferings]() in *AWS CLI Command Reference*.

`modify-cluster-iam-roles`

The following code example shows how to use `modify-cluster-iam-roles`.

AWS CLI

To modify the IAM role for a cluster

The following `modify-cluster-iam-roles` example removes the specified AWS IAM role from the specified cluster.

```
aws redshift modify-cluster-iam-roles \
    --cluster-identifier mycluster \
    --remove-iam-roles arn:aws:iam::123456789012:role/myRedshiftRole
```

Output:

```
{
    "Cluster": {
        "ClusterIdentifier": "mycluster",
        "NodeType": "dc2.large",
        "ClusterStatus": "available",
        "ClusterAvailabilityStatus": "Available",
        "MasterUsername": "adminuser",
        "DBName": "dev",
        "Endpoint": {
            "Address": "mycluster.cmeaswqeuae.us-west-2.redshift.amazonaws.com",
```

```
            "Port": 5439
        },

        "NextMaintenanceWindowStartTime": "2019-12-14T16:00:00Z"
    }
}
```

For more information, see Using Identity-Based Policies (IAM Policies) for Amazon Redshift in the *Amazon Redshift Cluster Management Guide*.

- For API details, see ModifyClusterIamRoles in *AWS CLI Command Reference*.

`modify-cluster-maintenance`

The following code example shows how to use `modify-cluster-maintenance`.

AWS CLI

To modify cluster maintenance

The following `modify-cluster-maintenance` example defers the maintenance of the specified cluster by 30 days.

```
aws redshift modify-cluster-maintenance \
    --cluster-identifier mycluster \
    --defer-maintenance \
    --defer-maintenance-duration 30
```

Output:

```
{
    "Cluster": {
        "ClusterIdentifier": "mycluster",
        "NodeType": "dc2.large",
        "ClusterStatus": "available",
        "ClusterAvailabilityStatus": "Available",
        "MasterUsername": "adminuser",
        "DBName": "dev",
        "Endpoint": {
            "Address": "mycluster.cmeaswqeuae.us-west-2.redshift.amazonaws.com",
            "Port": 5439
```

```
        },
        "ClusterCreateTime": "2019-12-05T18:44:36.991Z",
        "AutomatedSnapshotRetentionPeriod": 3,
        "ManualSnapshotRetentionPeriod": -1,
        "ClusterSecurityGroups": [],
        "VpcSecurityGroups": [
            {

`modify-cluster-parameter-group`

The following code example shows how to use `modify-cluster-parameter-group`.

AWS CLI

Modify a parameter in a parameter group

The following `modify-cluster-parameter-group` example modifies the *wlm_json_configuration* parameter for workload management. It accepts the parameters from a file that contains the JSON contents shown below.

```
aws redshift modify-cluster-parameter-group \
    --parameter-group-name myclusterparametergroup \
    --parameters file://modify_pg.json
```

Contents of `modify_pg.json`:

```
[
    {
        "ParameterName": "wlm_json_configuration",
        "ParameterValue": "[{\"user_group\":\"example_user_group1\",\"query_group\":
 \"example_query_group1\", \"query_concurrency\":7},{\"query_concurrency\":5}]"
```

```
    }
]
```

Output:

```
{
   "ParameterGroupStatus": "Your parameter group has been updated but changes won't
 get applied until you reboot the associated Clusters.",
   "ParameterGroupName": "myclusterparametergroup",
   "ResponseMetadata": {
      "RequestId": "09974cc0-64cd-11e2-bea9-49e0ce183f07"
   }
}
```

- For API details, see [ModifyClusterParameterGroup](#) in *AWS CLI Command Reference*.

`modify-cluster-snapshot-schedule`

The following code example shows how to use `modify-cluster-snapshot-schedule`.

AWS CLI

To modify cluster snapshot schedule

The following `modify-cluster-snapshot-schedule` example removes the specified snapshot schedule from the specified cluster.

```
aws redshift modify-cluster-snapshot-schedule \
    --cluster-identifier mycluster \
    --schedule-identifier mysnapshotschedule \
    --disassociate-schedule
```

This command does not produce any output.

For more information, see [Automated Snapshot Schedules](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [ModifyClusterSnapshotSchedule](#) in *AWS CLI Command Reference*.

`modify-cluster-snapshot`

The following code example shows how to use `modify-cluster-snapshot`.

AWS CLI

To modify cluster snapshot

The following `modify-cluster-snapshot` example sets the manual retention period setting for the specified cluster snapshot to value of 10 days.

```
aws redshift modify-cluster-snapshot \
    --snapshot-identifier mycluster-2019-11-06-16-32 \
    --manual-snapshot-retention-period 10
```

Output:

```
{
    "Snapshot": {
        "SnapshotIdentifier": "mycluster-2019-11-06-16-32",
        "ClusterIdentifier": "mycluster",
        "SnapshotCreateTime": "2019-12-07T00:34:05.633Z",
        "Status": "available",
        "Port": 5439,
        "AvailabilityZone": "us-west-2f",

    }
}
```

For more information, see Amazon Redshift Snapshots in the *Amazon Redshift Cluster Management Guide*.

- For API details, see ModifyClusterSnapshot in *AWS CLI Command Reference*.

`modify-cluster-subnet-group`

The following code example shows how to use `modify-cluster-subnet-group`.

AWS CLI

Modify the Subnets in a Cluster Subnet GroupThis example shows how to modify the list of subnets in a cache subnet group. By default, the output is in JSON format.Command:

```
aws redshift modify-cluster-subnet-group --cluster-subnet-group-name mysubnetgroup
 --subnet-ids subnet-763fdd1 subnet-ac830e9
```

Result:

```
{
   "ClusterSubnetGroup":
   {
      "Subnets": [
         {
            "SubnetStatus": "Active",
            "SubnetIdentifier": "subnet-763fdd1c",
            "SubnetAvailabilityZone":
               { "Name": "us-east-1a" }
         },
         {
            "SubnetStatus": "Active",
            "SubnetIdentifier": "subnet-ac830e9",
            "SubnetAvailabilityZone":
```

```
                { "Name": "us-east-1b" }
            } ],
        "VpcId": "vpc-7e3fdd14",
        "SubnetGroupStatus": "Complete",
        "Description": "My subnet group",
        "ClusterSubnetGroupName": "mysubnetgroup"
    },
    "ResponseMetadata": {
        "RequestId": "8da93e89-8372-f936-93a8-873918938197a"
    }
}
```

- For API details, see ModifyClusterSubnetGroup in *AWS CLI Command Reference*.

`modify-cluster`

The following code example shows how to use `modify-cluster`.

AWS CLI

Associate a Security Group with a ClusterThis example shows how to associate a cluster security group with the specified cluster.Command:

```
aws redshift modify-cluster --cluster-identifier mycluster --cluster-security-groups
 mysecuritygroup
```

Modify the Maintenance Window for a ClusterThis shows how to change the weekly preferred maintenance window for a cluster to be the minimum four hour window starting Sundays at 11:15 PM, and ending Mondays at 3:15 AM.Command:

```
aws redshift modify-cluster --cluster-identifier mycluster --preferred-maintenance-
window Sun:23:15-Mon:03:15
```

Change the Master Password for the ClusterThis example shows how to change the master password for a cluster.Command:

```
aws redshift modify-cluster --cluster-identifier mycluster --master-user-password
 A1b2c3d4
```

- For API details, see ModifyCluster in *AWS CLI Command Reference*.

`modify-event-subscription`

The following code example shows how to use `modify-event-subscription`.

AWS CLI

To modify event subscription

The following `modify-event-subscription` example disables the specified event notification subscription.

```
aws redshift modify-event-subscription \
    --subscription-name mysubscription \
    --no-enabled
```

Output:

```
{
    "EventSubscription": {
        "CustomerAwsId": "123456789012",
        "CustSubscriptionId": "mysubscription",
        "SnsTopicArn": "arn:aws:sns:us-west-2:123456789012:MySNStopic",
        "Status": "active",
        "SubscriptionCreationTime": "2019-12-09T21:50:21.332Z",
        "SourceIdsList": [],
        "EventCategoriesList": [
            "management"
        ],
        "Severity": "ERROR",
        "Enabled": false,
        "Tags": []
    }
}
```

For more information, see Subscribing to Amazon Redshift Event Notifications in the *Amazon Redshift Cluster Management Guide*.

- For API details, see ModifyEventSubscription in *AWS CLI Command Reference*.

`modify-scheduled-action`

The following code example shows how to use `modify-scheduled-action`.

AWS CLI

To modify scheduled action

The following `modify-scheduled-action` example adds a description to the specified existing scheduled action.

```
aws redshift modify-scheduled-action \
    --scheduled-action-name myscheduledaction \
    --scheduled-action-description "My scheduled action"
```

Output:

```
{
    "ScheduledActionName": "myscheduledaction",
    "TargetAction": {
        "ResizeCluster": {
            "ClusterIdentifier": "mycluster",
            "NumberOfNodes": 2,
            "Classic": false
        }
    },
    "Schedule": "at(2019-12-25T00:00:00)",
    "IamRole": "arn:aws:iam::123456789012:role/myRedshiftRole",
    "ScheduledActionDescription": "My scheduled action",
    "State": "ACTIVE",
    "NextInvocations": [
        "2019-12-25T00:00:00Z"
    ]
}
```

- For API details, see ModifyScheduledAction in *AWS CLI Command Reference*.

`modify-snapshot-copy-retention-period`

The following code example shows how to use `modify-snapshot-copy-retention-period`.

AWS CLI

To modify snapshot copy retention period

The following `modify-snapshot-copy-retention-period` example modifies the number of days to retain snapshots for the specified cluster in the destination AWS Region after they are copied from the source AWS Region.

```
aws redshift modify-snapshot-copy-retention-period \
    --cluster-identifier mycluster \
    --retention-period 15
```

Output:

```
{
    "Cluster": {
        "ClusterIdentifier": "mycluster",
        "NodeType": "dc2.large",
        "ClusterStatus": "available",
        "ClusterAvailabilityStatus": "Available",
        "MasterUsername": "adminuser",
        "DBName": "dev",
        "Endpoint": {
            "Address": "mycluster.cmeaswqeuae.us-west-2.redshift.amazonaws.com",
            "Port": 5439
        },
        "ClusterCreateTime": "2019-12-05T18:44:36.991Z",

                }
            ],
            "NextMaintenanceWindowStartTime": "2020-01-11T16:00:00Z"
        }
}
```

For more information, see Snapshot Schedule Format in the *Amazon Redshift Cluster Management Guide*.

- For API details, see ModifySnapshotCopyRetentionPeriod in *AWS CLI Command Reference*.

`modify-snapshot-schedule`

The following code example shows how to use `modify-snapshot-schedule`.

AWS CLI

To modify snapshot schedule

The following `modify-snapshot-schedule` example modifies the rate of the specified snapshot schedule to every 10 hours.

```
aws redshift modify-snapshot-schedule \
    --schedule-identifier mysnapshotschedule \
    --schedule-definitions "rate(10 hours)"
```

Output:

```
{
    "ScheduleDefinitions": [
        "rate(10 hours)"
    ],
    "ScheduleIdentifier": "mysnapshotschedule",
    "ScheduleDescription": "My schedule description",
    "Tags": []
}
```

For more information, see Snapshot Schedule Format in the *Amazon Redshift Cluster Management Guide*.

- For API details, see ModifySnapshotSchedule in *AWS CLI Command Reference*.

`purchase-reserved-node-offering`

The following code example shows how to use `purchase-reserved-node-offering`.

AWS CLI

Purchase a Reserved NodeThis example shows how to purchase a reserved node offering. The `reserved-node-offering-id` is obtained by calling `describe-reserved-node-offerings`.Command:

```
aws redshift purchase-reserved-node-offering --reserved-node-offering-id ceb6a579-
cf4c-4343-be8b-d832c45ab51c
```

Result:

```
{
   "ReservedNode": {
      "OfferingType": "Heavy Utilization",
      "FixedPrice": "",
      "NodeType": "dw.hs1.xlarge",
      "ReservedNodeId": "1ba8e2e3-bc01-4d65-b35d-a4a3e931547e",
      "UsagePrice": "",
      "RecurringCharges": [
         {
            "RecurringChargeAmount": "",
            "RecurringChargeFrequency": "Hourly"
         }
      ],
      "NodeCount": 1,
      "State": "payment-pending",
      "StartTime": "2013-02-13T17:08:39.051Z",
      "Duration": 31536000,
      "ReservedNodeOfferingId": "ceb6a579-cf4c-4343-be8b-d832c45ab51c"
   },
   "ResponseMetadata": {
      "RequestId": "01bda7bf-7600-11e2-b605-2568d7396e7f"
   }
}
```

- For API details, see PurchaseReservedNodeOffering in *AWS CLI Command Reference*.

`reboot-cluster`

The following code example shows how to use `reboot-cluster`.

AWS CLI

Reboot a ClusterThis example reboots a cluster. By default, the output is in JSON format.Command:

```
aws redshift reboot-cluster --cluster-identifier mycluster
```

Result:

```
{
   "Cluster": {
```

```
        "NodeType": "dw.hs1.xlarge",
        "Endpoint": {
           "Port": 5439,
           "Address": "mycluster.coqoarplqhsn.us-east-1.redshift.amazonaws.com"
        },
        "ClusterVersion": "1.0",
        "PubliclyAccessible": "true",
        "MasterUsername": "adminuser",
        "ClusterParameterGroups": [
           {
           "ParameterApplyStatus": "in-sync",
           "ParameterGroupName": "default.redshift-1.0"
           }
        ],
        "ClusterSecurityGroups": [
           {
           "Status": "active",
           "ClusterSecurityGroupName": "default"
           }
        ],
        "AllowVersionUpgrade": true,
        "VpcSecurityGroups": \[],
        "AvailabilityZone": "us-east-1a",
        "ClusterCreateTime": "2013-01-22T21:59:29.559Z",
        "PreferredMaintenanceWindow": "sun:23:15-mon:03:15",
        "AutomatedSnapshotRetentionPeriod": 1,
        "ClusterStatus": "rebooting",
        "ClusterIdentifier": "mycluster",
        "DBName": "dev",
        "NumberOfNodes": 2,
        "PendingModifiedValues": {}
     },
     "ResponseMetadata": {
        "RequestId": "61c8b564-64e8-11e2-8f7d-3b939af52818"
     }
  }
```

- For API details, see RebootCluster in *AWS CLI Command Reference*.

`reset-cluster-parameter-group`

The following code example shows how to use `reset-cluster-parameter-group`.

AWS CLI

Reset Parameters in a Parameter GroupThis example shows how to reset all of the parameters in a parameter group.Command:

```
aws redshift reset-cluster-parameter-group --parameter-group-name
 myclusterparametergroup --reset-all-parameters
```

- For API details, see ResetClusterParameterGroup in *AWS CLI Command Reference*.

`resize-cluster`

The following code example shows how to use `resize-cluster`.

AWS CLI

To resize cluster

The following `resize-cluster` example resizes the specified cluster.

```
aws redshift resize-cluster \
    --cluster-identifier mycluster \
    --cluster-type multi-node \
    --node-type dc2.large \
    --number-of-nodes 6 \
    --classic
```

Output:

```
{
    "Cluster": {
        "ClusterIdentifier": "mycluster",
        "NodeType": "dc2.large",
        "ClusterStatus": "resizing",
        "ClusterAvailabilityStatus": "Modifying",
        "MasterUsername": "adminuser",
        "DBName": "dev",
        "Endpoint": {
            "Address": "mycluster.cmeaswqeuae.us-west-2.redshift.amazonaws.com",
            "Port": 5439
        },
        "ClusterCreateTime": "2019-12-05T18:44:36.991Z",
```

```
        "AutomatedSnapshotRetentionPeriod": 3,
        "ManualSnapshotRetentionPeriod": -1,
        "ClusterSecurityGroups": [],
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sh-a1a123ab",
                "Status": "active"
            }
        ],
        "ClusterParameterGroups": [
            {
                "ParameterGroupName": "default.redshift-1.0",
                "ParameterApplyStatus": "in-sync"
            }
        ],
        "ClusterSubnetGroupName": "default",
        "VpcId": "vpc-a1abc1a1",
        "AvailabilityZone": "us-west-2f",
        "PreferredMaintenanceWindow": "sat:16:00-sat:16:30",
        "PendingModifiedValues": {

For more information, see Resizing a Cluster in the *Amazon Redshift Cluster Management Guide*.

- For API details, see ResizeCluster in *AWS CLI Command Reference*.

`restore-from-cluster-snapshot`

The following code example shows how to use `restore-from-cluster-snapshot`.

AWS CLI

Restore a Cluster From a SnapshotThis example restores a cluster from a snapshot.Command:

```
aws redshift restore-from-cluster-snapshot --cluster-identifier mycluster-clone --
snapshot-identifier my-snapshot-id
```

Result:

```
{
   "Cluster": {
      "NodeType": "dw.hs1.xlarge",
      "ClusterVersion": "1.0",
      "PubliclyAccessible": "true",
      "MasterUsername": "adminuser",
      "ClusterParameterGroups": [
         {
         "ParameterApplyStatus": "in-sync",
         "ParameterGroupName": "default.redshift-1.0"
         }
```

```
        ],
        "ClusterSecurityGroups": [
           {
           "Status": "active",
           "ClusterSecurityGroupName": "default"
           }
        ],
        "AllowVersionUpgrade": true,
        "VpcSecurityGroups": \[],
        "PreferredMaintenanceWindow": "sun:23:15-mon:03:15",
        "AutomatedSnapshotRetentionPeriod": 1,
        "ClusterStatus": "creating",
        "ClusterIdentifier": "mycluster-clone",
        "DBName": "dev",
        "NumberOfNodes": 2,
        "PendingModifiedValues": {}
     },
     "ResponseMetadata": {
        "RequestId": "77fd512b-64e3-11e2-8f5b-e90bd6c77476"
     }
}
```

- For API details, see RestoreFromClusterSnapshot in *AWS CLI Command Reference*.

`restore-table-from-cluster-snapshot`

The following code example shows how to use `restore-table-from-cluster-snapshot`.

AWS CLI

To restore table from a cluster snapshot

The following `restore-table-from-cluster-snapshot` example creates a new table from the specified table in the specified cluster snapshot.

```
aws redshift restore-table-from-cluster-snapshot /
    --cluster-identifier mycluster /
    --snapshot-identifier mycluster-2019-11-19-16-17 /
    --source-database-name dev /
    --source-schema-name public /
    --source-table-name mytable /
    --target-database-name dev /
    --target-schema-name public /
```

```
    --new-table-name mytable-clone
```

Output:

```
{
    "TableRestoreStatus": {
        "TableRestoreRequestId": "a123a12b-abc1-1a1a-a123-a1234ab12345",
        "Status": "PENDING",
        "RequestTime": "2019-12-20T00:20:16.402Z",
        "ClusterIdentifier": "mycluster",
        "SnapshotIdentifier": "mycluster-2019-11-19-16-17",
        "SourceDatabaseName": "dev",
        "SourceSchemaName": "public",
        "SourceTableName": "mytable",
        "TargetDatabaseName": "dev",
        "TargetSchemaName": "public",
        "NewTableName": "mytable-clone"
    }
}
```

For more information, see Restoring a Table from a Snapshot in the *Amazon Redshift Cluster Management Guide*.

- For API details, see RestoreTableFromClusterSnapshot in *AWS CLI Command Reference*.

`revoke-cluster-security-group-ingress`

The following code example shows how to use `revoke-cluster-security-group-ingress`.

AWS CLI

Revoke Access from an EC2 Security GroupThis example revokes access to a named Amazon EC2 security group.Command:

```
aws redshift revoke-cluster-security-group-ingress --cluster-security-group-name
 mysecuritygroup --ec2-security-group-name myec2securitygroup --ec2-security-group-
owner-id 123445677890
```

Revoking Access to a CIDR rangeThis example revokes access to a CIDR range.Command:

```
aws redshift revoke-cluster-security-group-ingress --cluster-security-group-name
 mysecuritygroup --cidrip 192.168.100.100/32
```

- For API details, see RevokeClusterSecurityGroupIngress in *AWS CLI Command Reference*.

`revoke-snapshot-access`

The following code example shows how to use `revoke-snapshot-access`.

AWS CLI

Revoke the Authorization of an AWS Account to Restore a SnapshotThis example revokes the authorization of the AWS account `444455556666` to restore the snapshot `my-snapshot-id`. By default, the output is in JSON format.Command:

```
aws redshift revoke-snapshot-access --snapshot-id my-snapshot-id --account-with-restore-access 444455556666
```

Result:

```
{
   "Snapshot": {
      "Status": "available",
      "SnapshotCreateTime": "2013-07-17T22:04:18.947Z",
      "EstimatedSecondsToCompletion": 0,
      "AvailabilityZone": "us-east-1a",
      "ClusterVersion": "1.0",
      "MasterUsername": "adminuser",
      "Encrypted": false,
      "OwnerAccount": "111122223333",
      "BackupProgressInMegabytes": 11.0,
      "ElapsedTimeInSeconds": 0,
      "DBName": "dev",
      "CurrentBackupRateInMegabytesPerSecond: 0.1534,
      "ClusterCreateTime": "2013-01-22T21:59:29.559Z",
      "ActualIncrementalBackupSizeInMegabytes"; 11.0,
      "SnapshotType": "manual",
      "NodeType": "dw.hs1.xlarge",
      "ClusterIdentifier": "mycluster",
      "TotalBackupSizeInMegabytes": 20.0,
      "Port": 5439,
      "NumberOfNodes": 2,
      "SnapshotIdentifier": "my-snapshot-id"
   }
}
```

- For API details, see RevokeSnapshotAccess in *AWS CLI Command Reference*.

`rotate-encryption-key`

The following code example shows how to use `rotate-encryption-key`.

AWS CLI

To rotate encryption key for a cluster

The following `rotate-encryption-key` example rotates the encryption key for the specified cluster.

```
aws redshift rotate-encryption-key \
    --cluster-identifier mycluster
```

Output:

```
{
    "Cluster": {
        "ClusterIdentifier": "mycluster",
        "NodeType": "dc2.large",
        "ClusterStatus": "rotating-keys",
        "ClusterAvailabilityStatus": "Modifying",
        "MasterUsername": "adminuser",
        "DBName": "dev",
        "Endpoint": {
            "Address": "mycluster.cmeaswqeuae.us-west-2.redshift.amazonaws.com",
            "Port": 5439
        },

        "EnhancedVpcRouting": false,
        "IamRoles": [
            {
                "IamRoleArn": "arn:aws:iam::123456789012:role/myRedshiftRole",
                "ApplyStatus": "in-sync"
            }
        ],
        "MaintenanceTrackName": "current",
        "DeferredMaintenanceWindows": [],
        "NextMaintenanceWindowStartTime": "2019-12-14T16:00:00Z"
    }
}
```

For more information, see Amazon Redshift Database Encryption in the *Amazon Redshift Cluster Management Guide*.

- For API details, see RotateEncryptionKey in *AWS CLI Command Reference*.

Amazon Rekognition examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Rekognition.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`compare-faces`

The following code example shows how to use `compare-faces`.

For more information, see Comparing faces in images.

AWS CLI

To compare faces in two images

The following `compare-faces` command compares faces in two images stored in an Amazon S3 bucket.

```
aws rekognition compare-faces \
    --source-image '{"S3Object":{"Bucket":"MyImageS3Bucket","Name":"source.jpg"}}' \
    --target-image '{"S3Object":{"Bucket":"MyImageS3Bucket","Name":"target.jpg"}}'
```

Output:

```
{
    "UnmatchedFaces": [],
    "FaceMatches": [
        {
            "Face": {
                "BoundingBox": {

        },
```

```
            "Confidence": 100.0
        }
}
```

For more information, see Comparing Faces in Images in the *Amazon Rekognition Developer Guide*.

- For API details, see CompareFaces in *AWS CLI Command Reference*.

`create-collection`

The following code example shows how to use `create-collection`.

For more information, see Creating a collection.

AWS CLI

To create a collection

The following `create-collection` command creates a collection with the specified name.

```
aws rekognition create-collection \
    --collection-id "MyCollection"
```

Output:

```
{
    "CollectionArn": "aws:rekognition:us-west-2:123456789012:collection/
MyCollection",
    "FaceModelVersion": "4.0",
    "StatusCode": 200
}
```

For more information, see Creating a Collection in the *Amazon Rekognition Developer Guide*.

- For API details, see CreateCollection in *AWS CLI Command Reference*.

`create-stream-processor`

The following code example shows how to use `create-stream-processor`.

AWS CLI

To create a new stream processor

The following `create-stream-processor` example creates a new stream processor with the specified configuration.

```
aws rekognition create-stream-processor --name my-stream-processor\
    --input '{"KinesisVideoStream":{"Arn":"arn:aws:kinesisvideo:us-
west-2:123456789012:stream/macwebcam/1530559711205"}}'\
    --stream-processor-output '{"KinesisDataStream":{"Arn":"arn:aws:kinesis:us-
west-2:123456789012:stream/AmazonRekognitionRekStream"}}'\
    --role-arn arn:aws:iam::123456789012:role/AmazonRekognitionDetect\
    --settings '{"FaceSearch":
{"CollectionId":"MyCollection","FaceMatchThreshold":85.5}}'
```

Output:

```
{
    "StreamProcessorArn": "arn:aws:rekognition:us-
west-2:123456789012:streamprocessor/my-stream-processor"
}
```

For more information, see Working with Streaming Videos in the *Amazon Rekognition Developer Guide*.

- For API details, see CreateStreamProcessor in *AWS CLI Command Reference*.

`delete-collection`

The following code example shows how to use `delete-collection`.

For more information, see Deleting a collection.

AWS CLI

To delete a collection

The following `delete-collection` command deletes the specified collection.

```
aws rekognition delete-collection \
    --collection-id MyCollection
```

Output:

```
{
    "StatusCode": 200
}
```

For more information, see Deleting a Collection in the *Amazon Rekognition Developer Guide*.

- For API details, see DeleteCollection in *AWS CLI Command Reference*.

`delete-faces`

The following code example shows how to use `delete-faces`.

For more information, see Deleting faces from a collection.

AWS CLI

To delete faces from a collection

The following `delete-faces` command deletes the specified face from a collection.

```
aws rekognition delete-faces \
    --collection-id MyCollection
    --face-ids '["0040279c-0178-436e-b70a-e61b074e96b0"]'
```

Output:

```
{
    "DeletedFaces": [
        "0040279c-0178-436e-b70a-e61b074e96b0"
    ]
}
```

For more information, see Deleting Faces from a Collection in the *Amazon Rekognition Developer Guide*.

- For API details, see DeleteFaces in *AWS CLI Command Reference*.

`delete-stream-processor`

The following code example shows how to use `delete-stream-processor`.

AWS CLI

To delete a stream processor

The following `delete-stream-processor` command deletes the specified stream processor.

```
aws rekognition delete-stream-processor \
    --name my-stream-processor
```

This command produces no output.

For more information, see Working with Streaming Videos in the *Amazon Rekognition Developer Guide*.

- For API details, see DeleteStreamProcessor in *AWS CLI Command Reference*.

`describe-collection`

The following code example shows how to use `describe-collection`.

For more information, see Describing a collection.

AWS CLI

To describe a collection

The following `describe-collection` example displays the details about the specified collection.

```
aws rekognition describe-collection \
    --collection-id MyCollection
```

Output:

```
{
    "FaceCount": 200,
    "CreationTimestamp": 1569444828.274,
    "CollectionARN": "arn:aws:rekognition:us-west-2:123456789012:collection/
MyCollection",
    "FaceModelVersion": "4.0"
}
```

For more information, see Describing a Collection in the *Amazon Rekognition Developer Guide*.

- For API details, see DescribeCollection in *AWS CLI Command Reference*.

describe-stream-processor

The following code example shows how to use `describe-stream-processor`.

AWS CLI

To get information about a stream processor

The following `describe-stream-processor` command displays details about the specified stream processor.

```
aws rekognition describe-stream-processor \
    --name my-stream-processor
```

Output:

```
{
    "Status": "STOPPED",
    "Name": "my-stream-processor",
    "LastUpdateTimestamp": 1532449292.712,
    "Settings": {
        "FaceSearch": {
            "FaceMatchThreshold": 80.0,
            "CollectionId": "my-collection"
        }
    },
    "RoleArn": "arn:aws:iam::123456789012:role/AmazonRekognitionDetectStream",
    "StreamProcessorArn": "arn:aws:rekognition:us-
west-2:123456789012:streamprocessor/my-stream-processpr",
    "Output": {
        "KinesisDataStream": {
            "Arn": "arn:aws:kinesis:us-west-2:123456789012:stream/
AmazonRekognitionRekStream"
        }
    },
    "Input": {
        "KinesisVideoStream": {
            "Arn": "arn:aws:kinesisvideo:us-west-2:123456789012:stream/

        }
    },
```

```
    "CreationTimestamp": 1532449292.712
}
```

For more information, see Working with Streaming Videos in the *Amazon Rekognition Developer Guide*.

- For API details, see DescribeStreamProcessor in *AWS CLI Command Reference*.

`detect-faces`

The following code example shows how to use `detect-faces`.

For more information, see Detecting faces in an image.

AWS CLI

To detect faces in an image

The following `detect-faces` command detects faces in the specified image stored in an Amazon S3 bucket.

```
aws rekognition detect-faces \
    --image '{"S3Object":{"Bucket":"MyImageS3Bucket","Name":"MyFriend.jpg"}}' \
    --attributes "ALL"
```

Output:

```
{
    "FaceDetails": [
        {
            "Confidence": 100.0,
            "Eyeglasses": {

For more information, see Detecting Faces in an Image in the *Amazon Rekognition Developer Guide*.

- For API details, see DetectFaces in *AWS CLI Command Reference*.

`detect-labels`

The following code example shows how to use `detect-labels`.

For more information, see Detecting labels in an image.

AWS CLI

To detect a label in an image

The following `detect-labels` example detects scenes and objects in an image stored in an Amazon S3 bucket.

```
aws rekognition detect-labels \
    --image '{"S3Object":{"Bucket":"bucket","Name":"image"}}'
```

Output:

```
{
    "Labels": [
        {
            "Instances": [],
            "Confidence": 99.15271759033203,

For more information, see Detecting Labels in an Image in the *Amazon Rekognition Developer Guide*.

- For API details, see DetectLabels in *AWS CLI Command Reference*.

`detect-moderation-labels`

The following code example shows how to use `detect-moderation-labels`.

For more information, see Detecting inappropriate images.

AWS CLI

To detect unsafe content in an image

The following `detect-moderation-labels` command detects unsafe content in the specified image stored in an Amazon S3 bucket.

```
aws rekognition detect-moderation-labels \
    --image "S3Object={Bucket=MyImageS3Bucket,Name=gun.jpg}"
```

Output:

```
{
    "ModerationModelVersion": "3.0",
    "ModerationLabels": [
        {
            "Confidence": 97.29618072509766,
```

```
                "ParentName": "Violence",
                "Name": "Weapon Violence"
            },
            {
                "Confidence": 97.29618072509766,
                "ParentName": "",
                "Name": "Violence"
            }
        ]
}
```

For more information, see [Detecting Unsafe Images](#) in the *Amazon Rekognition Developer Guide*.

- For API details, see [DetectModerationLabels](#) in *AWS CLI Command Reference*.

`detect-text`

The following code example shows how to use `detect-text`.

For more information, see [Detecting text in an image](#).

AWS CLI

To detect text in an image

The following `detect-text` command detects text in the specified image.

```
aws rekognition detect-text \
    --image '{"S3Object":{"Bucket":"MyImageS3Bucket","Name":"ExamplePicture.jpg"}}'
```

Output:

```
{
    "TextDetections": [
        {
            "Geometry": {

`get-celebrity-info`

The following code example shows how to use `get-celebrity-info`.

AWS CLI

To get information about a celebrity

The following `get-celebrity-info` command displays information about the specified celebrity. The `id` parameter comes from a previous call to `recognize-celebrities`.

```
aws rekognition get-celebrity-info --id nnnnnnn
```

Output:

```
{
    "Name": "Celeb A",
    "Urls": [
        "www.imdb.com/name/aaaaaaaaa"
    ]
}
```

For more information, see Getting Information About a Celebrity in the *Amazon Rekognition Developer Guide*.

- For API details, see GetCelebrityInfo in *AWS CLI Command Reference*.

`get-celebrity-recognition`

The following code example shows how to use `get-celebrity-recognition`.

AWS CLI

To get the results of a celebrity recognition operation

The following `get-celebrity-recognition` command displays the results of a celebrity recognition operation that you started previously by calling `start-celebrity-recognition`.

```
aws rekognition get-celebrity-recognition  \
    --job-id 1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef
```

Output:

`get-person-tracking`

The following code example shows how to use `get-person-tracking`.

AWS CLI

To get the results of a people pathing operation

The following `get-person-tracking` command displays the results of a people pathing operation that you started previously by calling `start-person-tracking`.

```
aws rekognition get-person-tracking  \
    --job-id 1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef
```

Output:

```
{
    "Persons": [
        {
            "Timestamp": 500,
            "Person": {
                "BoundingBox": {
                    "Width": 0.4151041805744171,
                    "Top": 0.07870370149612427,
                    "Left": 0.0,
                    "Height": 0.9212962985038757
                },
                "Index": 0
            }
```

```
        },
        {
            "Timestamp": 567,
            "Person": {
                "BoundingBox": {
                    "Width": 0.4755208194255829,

```

For more information, see People Pathing in the *Amazon Rekognition Developer Guide*.

- For API details, see GetPersonTracking in *AWS CLI Command Reference*.

`index-faces`

The following code example shows how to use `index-faces`.

For more information, see Adding faces to a collection.

AWS CLI

To add faces to a collection

The following `index-faces` command adds the faces found in an image to the specified collection.

```
aws rekognition index-faces \
    --image '{"S3Object":{"Bucket":"MyVideoS3Bucket","Name":"MyPicture.jpg"}}' \
    --collection-id MyCollection \
    --max-faces 1 \
    --quality-filter "AUTO" \
    --detection-attributes "ALL" \
    --external-image-id "MyPicture.jpg"
```

Output:

```
{
    "FaceRecords": [
        {
            "FaceDetail": {

`list-collections`

The following code example shows how to use `list-collections`.

For more information, see Listing collections.

AWS CLI

To list the available collections

The following `list-collections` command lists the available collections in the AWS account.

```
aws rekognition list-collections
```

Output:

```
{
    "FaceModelVersions": [
        "2.0",
        "3.0",
        "3.0",
        "3.0",
        "4.0",
        "1.0",
        "3.0",
        "4.0",
        "4.0",
        "4.0"
    ],
    "CollectionIds": [
```

```
            "MyCollection1",
            "MyCollection2",
            "MyCollection3",
            "MyCollection4",
            "MyCollection5",
            "MyCollection6",
            "MyCollection7",
            "MyCollection8",
            "MyCollection9",
            "MyCollection10"
        ]
}
```

For more information, see Listing Collections in the *Amazon Rekognition Developer Guide*.

- For API details, see ListCollections in *AWS CLI Command Reference*.

`list-faces`

The following code example shows how to use `list-faces`.

For more information, see Listing faces in a collection.

AWS CLI

To list the faces in a collection

The following `list-faces` command lists the faces in the specified collection.

```
aws rekognition list-faces \
    --collection-id MyCollection
```

Output:

```
{
    "FaceModelVersion": "3.0",
    "Faces": [
        {

`list-stream-processors`

The following code example shows how to use `list-stream-processors`.

AWS CLI

To list the stream processors in your account

The following `list-stream-processors` command lists the stream processors in your account and the state of each.

```
aws rekognition list-stream-processors
```

Output:

```
{
    "StreamProcessors": [
        {
            "Status": "STOPPED",
            "Name": "my-stream-processor"
        }
    ]
}
```

For more information, see Working with Streaming Videos in the *Amazon Rekognition Developer Guide*.

- For API details, see ListStreamProcessors in *AWS CLI Command Reference*.

`recognize-celebrities`

The following code example shows how to use `recognize-celebrities`.

For more information, see Recognizing celebrities in an image.

AWS CLI

To recognize celebrities in an image

The following `recognize-celebrities` command recognizes celebrities in the specified image stored in an Amazon S3 bucket.:

```
aws rekognition recognize-celebrities \
    --image "S3Object={Bucket=MyImageS3Bucket,Name=moviestars.jpg}"
```

Output:

```
{
    "UnrecognizedFaces": [
        {
```

```

For more information, see Recognizing Celebrities in an Image in the *Amazon Rekognition Developer Guide*.

- For API details, see RecognizeCelebrities in *AWS CLI Command Reference*.

`search-faces-by-image`

The following code example shows how to use `search-faces-by-image`.

For more information, see Searching for a face (image).

AWS CLI

To search for faces in a collection that match the largest face in an image.

The following `search-faces-by-image` command searches for faces in a collection that match the largest face in the specified image.:

```
aws rekognition search-faces-by-image \
    --image '{"S3Object":{"Bucket":"MyImageS3Bucket","Name":"ExamplePerson.jpg"}}' \
    --collection-id MyFaceImageCollection

`search-faces`

The following code example shows how to use `search-faces`.

For more information, see Searching for a face (face ID).

AWS CLI

To search for faces in a collection that match a face ID.

The following `search-faces` command searches for faces in a collection that match the specified face ID.

```
aws rekognition search-faces \
    --face-id 8d3cfc70-4ba8-4b36-9644-90fba29c2dac \
    --collection-id MyCollection
```

Output:

```
{
    "SearchedFaceId": "8d3cfc70-4ba8-4b36-9644-90fba29c2dac",
    "FaceModelVersion": "3.0",

```

For more information, see Searching for a Face Using Its Face ID in the *Amazon Rekognition Developer Guide*.

- For API details, see SearchFaces in *AWS CLI Command Reference*.

`start-celebrity-recognition`

The following code example shows how to use `start-celebrity-recognition`.

AWS CLI

To start the recognition of celebrities in a stored video

The following `start-celebrity-recognition` command starts a job to look for celebrities in the specified video file stored in an Amazon S3 bucket.

```
aws rekognition start-celebrity-recognition \
    --video "S3Object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}"
```

Output:

```
{
    "JobId": "1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef"
}
```

For more information, see Recognizing Celebrities in a Stored Video in the *Amazon Rekognition Developer Guide*.

- For API details, see StartCelebrityRecognition in *AWS CLI Command Reference*.

`start-content-moderation`

The following code example shows how to use `start-content-moderation`.

AWS CLI

To start the recognition of unsafe content in a stored video

The following `start-content-moderation` command starts a job to detect unsafe content in the specified video file stored in an Amazon S3 bucket.

```
aws rekognition start-content-moderation \
    --video "S3Object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}"
```

Output:

```
{
    "JobId": "1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef"
}
```

For more information, see Detecting Unsafe Stored Videos in the *Amazon Rekognition Developer Guide*.

- For API details, see StartContentModeration in *AWS CLI Command Reference*.

`start-face-detection`

The following code example shows how to use `start-face-detection`.

AWS CLI

To detect faces in a video

The following `start-face-detection` command starts a job to detect faces in the specified video file stored in an Amazon S3 bucket.

```
aws rekognition start-face-detection
    --video "S3Object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}"
```

Output:

```
{
    "JobId": "1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef"
}
```

For more information, see Detecting Faces in a Stored Video in the *Amazon Rekognition Developer Guide*.

- For API details, see StartFaceDetection in *AWS CLI Command Reference*.

`start-face-search`

The following code example shows how to use `start-face-search`.

AWS CLI

To search for faces in a collection that match faces detected in a video

The following `start-face-search` command starts a job to search for faces in a collection that match faces detected in the specified video file in an Amazon S3 bucket.

```
aws rekognition start-face-search \
    --video "S3Object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}" \
    --collection-id collection
```

Output:

```
{
    "JobId": "1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef"
}
```

For more information, see Searching Stored Videos for Faces in the *Amazon Rekognition Developer Guide*.

- For API details, see StartFaceSearch in *AWS CLI Command Reference*.

`start-label-detection`

The following code example shows how to use `start-label-detection`.

AWS CLI

To detect objects and scenes in a video

The following `start-label-detection` command starts a job to detect objects and scenes in the specified video file stored in an Amazon S3 bucket.

```
aws rekognition start-label-detection \
    --video "S3Object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}"
```

Output:

```
{
    "JobId": "1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef"
}
```

For more information, see Detecting Labels in a Video in the *Amazon Rekognition Developer Guide*.

- For API details, see StartLabelDetection in *AWS CLI Command Reference*.

`start-person-tracking`

The following code example shows how to use `start-person-tracking`.

AWS CLI

To start the pathing of people in a stored video

The following `start-person-tracking` command starts a job to track the paths that people take in the specified video fiel stored in an Amazon S3 bucket.:

```
aws rekognition start-person-tracking \
    --video "S3Object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}"
```

Output:

```
{
    "JobId": "1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef"
```

```
}
```

For more information, see People Pathing in the *Amazon Rekognition Developer Guide*.

- For API details, see StartPersonTracking in *AWS CLI Command Reference*.

`start-stream-processor`

The following code example shows how to use `start-stream-processor`.

AWS CLI

To start a stream processor

The following `start-stream-processor` command starts the specified video stream processor.

```
aws rekognition start-stream-processor \
    --name my-stream-processor
```

This command produces no output.

For more information, see Working with Streaming Videos in the *Amazon Rekognition Developer Guide*.

- For API details, see StartStreamProcessor in *AWS CLI Command Reference*.

`stop-stream-processor`

The following code example shows how to use `stop-stream-processor`.

AWS CLI

To stop a running stream processor

The following `stop-stream-processor` command stops the specified running stream processor.

```
aws rekognition stop-stream-processor \
    --name my-stream-processor
```

This command produces no output.

For more information, see Working with Streaming Videos in the *Amazon Rekognition Developer Guide*.

- For API details, see StopStreamProcessor in *AWS CLI Command Reference*.

AWS RAM examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS RAM.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

`accept-resource-share-invitation`

The following code example shows how to use `accept-resource-share-invitation`.

AWS CLI

To accept a resource share invitation

The following `accept-resource-share-invitation` example accepts the specified resource share invitation. Principals in the invited account can immediately start using the resources in the share.

```
aws ram accept-resource-share-invitation \
    --resource-share-invitation-arn arn:aws:ram:us-west-2:111111111111:resource-share-invitation/1e3477be-4a95-46b4-bbe0-c4001EXAMPLE
```

Output:

```
{
    "resourceShareInvitation": {
        "resourceShareInvitationArn": "arn:aws:ram:us-west-2:111111111111:resource-
share-invitation/1e3477be-4a95-46b4-bbe0-c4001EXAMPLE",
        "resourceShareName": "MyLicenseShare",
        "resourceShareArn": "arn:aws:ram:us-west-2:111111111111:resource-
share/27d09b4b-5e12-41d1-a4f2-19dedEXAMPLE",
        "senderAccountId": "111111111111",
        "receiverAccountId": "222222222222",
        "invitationTimestamp": "2021-09-22T15:07:35.620000-07:00",
        "status": "ACCEPTED"
    }
}
```

- For API details, see AcceptResourceShareInvitation in *AWS CLI Command Reference*.

`associate-resource-share-permission`

The following code example shows how to use `associate-resource-share-permission`.

AWS CLI

To associate a RAM managed permission with a resource share

The following `associate-resource-share-permission` example replaces the existing managed permission for the relevant resource type with the specified managed permission. Access to all resources of the relevant resource type is governed by the new permission.

```
aws ram associate-resource-share-permission \
    --permission-arn arn:aws:ram::aws:permission/
AWSRAMPermissionGlueDatabaseReadWrite \
    --replace \
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-
share/27d09b4b-5e12-41d1-a4f2-19dedEXAMPLE
```

Output:

```
{
    "returnValue": true
}
```

- For API details, see AssociateResourceSharePermission in *AWS CLI Command Reference*.

`associate-resource-share`

The following code example shows how to use `associate-resource-share`.

AWS CLI

Example 1: To associate a resource with a resource share

The following `associate-resource-share` example adds a license configuration to the specified resource share.

```
aws ram associate-resource-share \
    --resource-share arn:aws:ram:us-west-2:123456789012:resource-share/27d09b4b-5e12-41d1-a4f2-19dedEXAMPLE \
    --resource-arns arn:aws:license-manager:us-west-2:123456789012:license-configuration:lic-36be0485f5ae379cc74cf8e92EXAMPLE
```

Output:

```
{
    "resourceShareAssociations": [
        {
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/27d09b4b-5e12-41d1-a4f2-19dedEXAMPLE",
            "associatedEntity": "arn:aws:license-manager:us-west-2:123456789012:license-configuration:lic-36be0485f5ae379cc74cf8e92EXAMPLE",
            "associationType": "RESOURCE",
            "status": "ASSOCIATING",
            "external": false
        }
    ]
}
```

Example 2: To associate a principal with a resource share

The following `associate-resource-share` example grants access for the specified resource share to all accounts in the specified organizational unit.

```
aws ram associate-resource-share \
```

```
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-
share/27d09b4b-5e12-41d1-a4f2-19dedEXAMPLE \
    --principals arn:aws:organizations::123456789012:ou/o-63bEXAMPLE/ou-46xi-
rEXAMPLE
```

Output:

```
{
    "resourceShareAssociations": [
        {
            "status": "ASSOCIATING",
            "associationType": "PRINCIPAL",
            "associatedEntity": "arn:aws:organizations::123456789012:ou/
o-63bEXAMPLE/ou-46xi-rEXAMPLE",
            "external": false,
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/27d09b4b-5e12-41d1-a4f2-19dedEXAMPLE"
        }
    ]
}
```

- For API details, see AssociateResourceShare in *AWS CLI Command Reference*.

`create-resource-share`

The following code example shows how to use `create-resource-share`.

AWS CLI

Example 1: To create a resource share

The following `create-resource-share` example creates an empty resource share with the specified name. You must separately add resources, principals, and permissions to the share.

```
aws ram create-resource-share \
    --name MyNewResourceShare
```

Output:

```
{
    "resourceShare": {
```

```
        "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/4476c27d-8feb-4b21-afe9-7de23EXAMPLE",
        "name": "MyNewResourceShare",
        "owningAccountId": "123456789012",
        "allowExternalPrincipals": true,
        "status": "ACTIVE",
        "creationTime": 1634586271.302,
        "lastUpdatedTime": 1634586271.302
    }
}
```

Example 2: To create a resource share with AWS accounts as principals

The following `create-resource-share` example creates a resource share and grants access to the specified AWS account (222222222222). If the specified principals are not part of the same AWS Organization, then invitations are sent and must be accepted before access is granted.

```
aws ram create-resource-share \
    --name MyNewResourceShare \
    --principals 222222222222
```

Example 3: To create a resource share restricted to your AWS Organization

The following `create-resource-share` example creates a resource share that is restricted to accounts in the AWS Organization that your account is a member of, and adds the specified OU as a principal. All accounts in that OU can use the resources in the resource share.

```
aws ram create-resource-share \
    --name MyNewResourceShare \
    --no-allow-external-principals \
    --principals arn:aws:organizations::123456789012:ou/o-63bEXAMPLE/ou-46xi-
rEXAMPLE
```

Output:

```
{
    "resourceShare": {
        "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/7be8694e-095c-41ca-9ce8-7be4aEXAMPLE",
```

```
            "name": "MyNewResourceShare",
            "owningAccountId": "123456789012",
            "allowExternalPrincipals": false,
            "status": "ACTIVE",
            "creationTime": 1634587042.49,
            "lastUpdatedTime": 1634587042.49
        }
}
```

- For API details, see [CreateResourceShare](#) in *AWS CLI Command Reference*.

`delete-resource-share`

The following code example shows how to use `delete-resource-share`.

AWS CLI

To delete a resource share

The following `delete-resource-share` example deletes the specified resource share.

```
aws ram delete-resource-share \
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE
```

The following output indicates success:

```
{
    "returnValue": true
}
```

- For API details, see [DeleteResourceShare](#) in *AWS CLI Command Reference*.

`disassociate-resource-share-permission`

The following code example shows how to use `disassociate-resource-share-permission`.

AWS CLI

To remove a RAM managed permission for a resource type from a resource share

The following `disassociate-resource-share-permission` example removes the RAM managed permission for Glue databases from the specified resource share.

```
aws ram disassociate-resource-share-permission \
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-
share/27d09b4b-5e12-41d1-a4f2-19dedEXAMPLE \
    --permission-arn arn:aws:ram::aws:permission/
AWSRAMPermissionGlueDatabaseReadWrite
```

Output:

```
{
    "returnValue": true
}
```

- For API details, see DisassociateResourceSharePermission in *AWS CLI Command Reference*.

`disassociate-resource-share`

The following code example shows how to use `disassociate-resource-share`.

AWS CLI

To remove a resource from a resource share

The following `disassociate-resource-share` example removes the specified resource, in this case a VPC subnet, from the specified resource share. Any principals with access to the resource share can no longer perform operations on that resource.

```
aws ram disassociate-resource-share \
    --resource-arns arn:aws:ec2:us-west-2:123456789012:subnet/
subnet-0250c25a1fEXAMPLE \
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-
b505-7e2a-420d-6f5d3EXAMPLE
```

Output:

```
{
    "resourceShareAssociations": [
```

```
        "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE",
        "associatedEntity": "arn:aws:ec2:us-west-2:123456789012:subnet/
subnet-0250c25a1fEXAMPLE",
        "associationType": "RESOURCE",
        "status": "DISASSOCIATING",
        "external": false
    ]
}
```

- For API details, see DisassociateResourceShare in *AWS CLI Command Reference*.

`enable-sharing-with-aws-organization`

The following code example shows how to use `enable-sharing-with-aws-organization`.

AWS CLI

To enable resource sharing across AWS Organizations

The following `enable-sharing-with-aws-organization` example enables resource sharing across your organization and organizational units.

```
aws ram enable-sharing-with-aws-organization
```

The following output indicates success.

```
{
    "returnValue": true
}
```

- For API details, see EnableSharingWithAwsOrganization in *AWS CLI Command Reference*.

`get-permission`

The following code example shows how to use `get-permission`.

AWS CLI

To retrieve the details for a RAM managed permission

The following `get-permission` example displays the details for the default version of the specified RAM managed permission.

```
aws ram get-permission \
    --permission-arn arn:aws:ram::aws:permission/
AWSRAMPermissionGlueTableReadWriteForDatabase
```

Output:

```
{
    "permission": {
        "arn": "arn:aws:ram::aws:permission/
AWSRAMPermissionGlueTableReadWriteForDatabase",
        "version": "2",
        "defaultVersion": true,
        "name": "AWSRAMPermissionGlueTableReadWriteForDatabase",
        "resourceType": "glue:Database",
        "permission": "{\"Effect\":\"Allow\",\"Action\":[\"glue:GetTable
\", \"glue:UpdateTable\", \"glue:DeleteTable\", \"glue:BatchDeleteTable\",
 \"glue:BatchDeleteTableVersion\", \"glue:GetTableVersion\", \"glue:GetTableVersions
\", \"glue:GetPartition\", \"glue:GetPartitions\", \"glue:BatchGetPartition\",
 \"glue:BatchCreatePartition\", \"glue:CreatePartition\", \"glue:UpdatePartition
\", \"glue:BatchDeletePartition\", \"glue:DeletePartition\", \"glue:GetTables\",
 \"glue:SearchTables\"]}",
        "creationTime": 1624912434.431,
        "lastUpdatedTime": 1624912434.431,
        "isResourceTypeDefault": false
    }
}
```

- For API details, see GetPermission in *AWS CLI Command Reference*.

get-resource-policies

The following code example shows how to use `get-resource-policies`.

AWS CLI

To get the policies for a resource

The following `get-resource-policies` example displays the resource-based permission policies for the specified resource associated with a resource share.

```
aws ram get-resource-policies \
    --resource-arns arn:aws:ec2:us-west-2:123456789012:subnet/
subnet-0250c25a1fEXAMPLE
```

Output:

```
{
    "policies": [
         "{\"Version\":\"2008-10-17\",\"Statement\":[{\"Sid\":\"RamStatement1\",
\"Effect\":\"Allow\",\"Principal\":{\"AWS\":[]},\"Action\":[\"ec2:RunInstances
\",\"ec2:CreateNetworkInterface\",\"ec2:DescribeSubnets\"],\"Resource\":
\"arn:aws:ec2:us-west-2:123456789012:subnet/subnet-0250c25a1fEXAMPLE\"}]}"
    ]
}
```

- For API details, see GetResourcePolicies in *AWS CLI Command Reference*.

`get-resource-share-associations`

The following code example shows how to use `get-resource-share-associations`.

AWS CLI

Example 1: To list all resource associations for all resource types

The following `get-resource-share-associations` example lists the resource associations for all resource types across all of your resource shares.

```
aws ram get-resource-share-associations \
    --association-type RESOURCE
```

Output:

```
{
    "resourceShareAssociations": [
        {
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE",
            "associatedEntity": "arn:aws:ec2:us-west-2:123456789012:subnet/
subnet-0250c25a1fEXAMPLE",
```

```
            "resourceShareName": "MySubnetShare",
            "associationType": "RESOURCE",
            "status": "ASSOCIATED",
            "creationTime": 1565303590.973,
            "lastUpdatedTime": 1565303591.695,
            "external": false
        },
        {
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/8167bdfe-4480-4a01-8632-315e0EXAMPLE",
            "associatedEntity": "arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-36be0485f5ae379cc74cf8e92EXAMPLE",
            "resourceShareName": "MyLicenseShare",
            "associationType": "RESOURCE",
            "status": "ASSOCIATED",
            "creationTime": 1632342958.457,
            "lastUpdatedTime": 1632342958.907,
            "external": false
        }
    ]
}
```

Example 2: To list principal associations for a resource share

The following `get-resource-share-associations` example lists only the principal associations for only the specified resource share.

```
aws ram get-resource-share-associations \
   --resource-share-arns arn:aws:ram:us-west-2:123456789012:resource-
share/7be8694e-095c-41ca-9ce8-7be4aEXAMPLE \
   --association-type PRINCIPAL
```

Output:

```
{
    "resourceShareAssociations": [
        {
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/7be8694e-095c-41ca-9ce8-7be4aEXAMPLE",
            "resourceShareName": "MyNewResourceShare",
            "associatedEntity": "arn:aws:organizations::123456789012:ou/
o-63bEXAMPLE/ou-46xi-rEXAMPLE",
```

```
                "associationType": "PRINCIPAL",
                "status": "ASSOCIATED",
                "creationTime": 1634587042.49,
                "lastUpdatedTime": 1634587044.291,
                "external": false
            }
        ]
}
```

- For API details, see GetResourceShareAssociations in *AWS CLI Command Reference*.

get-resource-share-invitations

The following code example shows how to use `get-resource-share-invitations`.

AWS CLI

To list your resource share invitations

The following `get-resource-share-invitations` example lists your current resource share invitations.

```
aws ram get-resource-share-invitations
```

Output:

```
{
    "resourceShareInvitations": [
        {
            "resourceShareInvitationArn": "arn:aws:ram:us-
west2-1:111111111111:resource-share-invitation/32b639f0-14b8-7e8f-55ea-
e6117EXAMPLE",
            "resourceShareName": "project-resource-share",
            "resourceShareArn": "arn:aws:ram:us-west-2:111111111111:resource-share/
fcb639f0-1449-4744-35bc-a983fEXAMPLE",
            "senderAccountId": "111111111111",
            "receiverAccountId": "222222222222",
            "invitationTimestamp": 1565312166.258,
            "status": "PENDING"
        }
    ]
```

```
}
```

- For API details, see GetResourceShareInvitations in *AWS CLI Command Reference*.

`get-resource-shares`

The following code example shows how to use `get-resource-shares`.

AWS CLI

Example 1: To list resource shares you own and share with others

The following `get-resource-shares` example lists the resource shares that created and are sharing with others.

```
aws ram get-resource-shares \
    --resource-owner SELF
```

Output:

```
{
    "resourceShares": [
        {
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/3ab63985-99d9-1cd2-7d24-75e93EXAMPLE",
            "name": "my-resource-share",
            "owningAccountId": "123456789012",
            "allowExternalPrincipals": false,
            "status": "ACTIVE",
            "tags": [
                {
                    "key": "project",
                    "value": "lima"
                }
            ]
            "creationTime": 1565295733.282,
            "lastUpdatedTime": 1565295733.282
        },
        {
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE",
```

```
                "name": "my-resource-share",
                "owningAccountId": "123456789012",
                "allowExternalPrincipals": true,
                "status": "ACTIVE",
                "creationTime": 1565295733.282,
                "lastUpdatedTime": 1565295733.282
            }
        ]
}
```

Example 2: To list resource shares owned by others and shared with you

The following `get-resource-shares` example lists the resource shares that others created and shared with you. In this example, there are none.

```
aws ram get-resource-shares \
    --resource-owner OTHER-ACCOUNTS
```

Output:

```
{
    "resourceShares": []
}
```

- For API details, see GetResourceShares in *AWS CLI Command Reference*.

`list-pending-invitation-resources`

The following code example shows how to use `list-pending-invitation-resources`.

AWS CLI

To list the resources that are available in a pending resource share

The following `list-pending-invitation-resources` example lists all of the resources that are in the resource share associated with the specified invitation.

```
aws ram list-pending-invitation-resources \
    --resource-share-invitation-arn arn:aws:ram:us-west-2:123456789012:resource-
share-invitation/1e3477be-4a95-46b4-bbe0-c4001EXAMPLE
```

Output:

```
{
   "resources": [
        {
            "arn": "arn:aws:ec2:us-west-2:123456789012:subnet/
subnet-04a555b0e6EXAMPLE",
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/7be8694e-095c-41ca-9ce8-7be4aEXAMPLE",
            "creationTime": 1634676051.269,
            "lastUpdatedTime": 1634676052.07,
            "status": "AVAILABLE",
            "type": "ec2:Subnet"
        },
        {
            "arn": "arn:aws:license-manager:us-west-2:123456789012:license-
configuration:lic-36be0485f5ae379cc74cf8e92EXAMPLE",
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE",
            "creationTime": 1624912434.431,
            "lastUpdatedTime": 1624912434.431,
            "status": "AVAILABLE",
            "type": "license-manager:LicenseConfiguration"
      }
   ]
}
```

- For API details, see ListPendingInvitationResources in *AWS CLI Command Reference*.

`list-permissions`

The following code example shows how to use `list-permissions`.

AWS CLI

To list the available RAM managed permissions

The following `list-permissions` example lists all of the RAM managed permissions available for only the AWS Glue database resource type.

```
aws ram list-permissions \
    --resource-type glue:Database
```

Output:

```
{
    "permissions": [
        {
            "arn": "arn:aws:ram::aws:permission/
AWSRAMDefaultPermissionGlueDatabase",
            "version": "1",
            "defaultVersion": true,
            "name": "AWSRAMDefaultPermissionGlueDatabase",
            "resourceType": "glue:Database",
            "creationTime": 1592007820.935,
            "lastUpdatedTime": 1592007820.935,
            "isResourceTypeDefault": true
        },
        {
            "arn": "arn:aws:ram::aws:permission/
AWSRAMPermissionGlueAllTablesReadWriteForDatabase",
            "version": "2",
            "defaultVersion": true,
            "name": "AWSRAMPermissionGlueAllTablesReadWriteForDatabase",
            "resourceType": "glue:Database",
            "creationTime": 1624912413.323,
            "lastUpdatedTime": 1624912413.323,
            "isResourceTypeDefault": false
        },
        {
            "arn": "arn:aws:ram::aws:permission/
AWSRAMPermissionGlueDatabaseReadWrite",
            "version": "2",
            "defaultVersion": true,
            "name": "AWSRAMPermissionGlueDatabaseReadWrite",
            "resourceType": "glue:Database",
            "creationTime": 1624912417.4,
            "lastUpdatedTime": 1624912417.4,
            "isResourceTypeDefault": false
        },
        {
            "arn": "arn:aws:ram::aws:permission/
AWSRAMPermissionGlueTableReadWriteForDatabase",
            "version": "2",
            "defaultVersion": true,
            "name": "AWSRAMPermissionGlueTableReadWriteForDatabase",
            "resourceType": "glue:Database",
```

```
            "creationTime": 1624912434.431,
            "lastUpdatedTime": 1624912434.431,
            "isResourceTypeDefault": false
        }
    ]
}
```

The following `list-permissions` example displays the available RAM managed permissions for all resource types.

```
aws ram list-permissions
```

Output:

```
{
    "permissions": [
        {
            "arn": "arn:aws:ram::aws:permission/
AWSRAMBlankEndEntityCertificateAPICSRPassthroughIssuanceCertificateAuthority",
            "version": "1",
            "defaultVersion": true,
            "name":
 "AWSRAMBlankEndEntityCertificateAPICSRPassthroughIssuanceCertificateAuthority",
            "resourceType": "acm-pca:CertificateAuthority",
            "creationTime": 1623264861.085,
            "lastUpdatedTime": 1623264861.085,
            "isResourceTypeDefault": false
        },
        {
            "arn": "arn:aws:ram::aws:permission/AWSRAMDefaultPermissionAppMesh",
            "version": "1",
            "defaultVersion": true,
            "name": "AWSRAMDefaultPermissionAppMesh",
            "resourceType": "appmesh:Mesh",
            "creationTime": 1589307188.584,
            "lastUpdatedTime": 1589307188.584,
            "isResourceTypeDefault": true
        },
        ...TRUNCATED FOR BREVITY...
        {
            "arn": "arn:aws:ram::aws:permission/
AWSRAMSubordinateCACertificatePathLen0IssuanceCertificateAuthority",
            "version": "1",
```

```
                "defaultVersion": true,
                "name":
 "AWSRAMSubordinateCACertificatePathLen0IssuanceCertificateAuthority",
                "resourceType": "acm-pca:CertificateAuthority",
                "creationTime": 1623264876.75,
                "lastUpdatedTime": 1623264876.75,
                "isResourceTypeDefault": false
            }
        ]
}
```

- For API details, see ListPermissions in *AWS CLI Command Reference*.

`list-principals`

The following code example shows how to use `list-principals`.

AWS CLI

To list principals with access to a resource

The following `list-principals` example displays a list of the principals that can access resources of the specified type through any resource shares.

```
aws ram list-principals \
    --resource-type ec2:Subnet
```

Output:

```
{
    "principals": [
        {
            "id": "arn:aws:organizations::123456789012:ou/o-gx7EXAMPLE/ou-29c5-
zEXAMPLE",
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE",
            "creationTime": 1565298209.737,
            "lastUpdatedTime": 1565298211.019,
            "external": false
        }
    ]
}
```

- For API details, see [ListPrincipals](#) in *AWS CLI Command Reference*.

`list-resource-share-permissions`

The following code example shows how to use `list-resource-share-permissions`.

AWS CLI

To list all of the RAM managed permissions currently attached to a resource share

The following `list-resource-share-permissions` example lists all of the RAM managed permissions that are attached to the specified resource share.

```
aws ram list-resource-share-permissions \
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-
share/27d09b4b-5e12-41d1-a4f2-19dedEXAMPLE
```

Output:

```
{
    "permissions": [
        {
            "arn": "arn:aws:ram::aws:permission/
AWSRAMDefaultPermissionLicenseConfiguration",
            "version": "1",
            "resourceType": "license-manager:LicenseConfiguration",
            "status": "ASSOCIATED",
            "lastUpdatedTime": 1632342984.234
        },
        {
            "arn": "arn:aws:ram::aws:permission/
AWSRAMPermissionGlueDatabaseReadWrite",
            "version": "2",
            "resourceType": "glue:Database",
            "status": "ASSOCIATED",
            "lastUpdatedTime": 1632512462.297
        }
    ]
}
```

- For API details, see [ListResourceSharePermissions](#) in *AWS CLI Command Reference*.

`list-resource-types`

The following code example shows how to use `list-resource-types`.

AWS CLI

To list the resource types that are supported by AWS RAM

The following `list-resource-types` example lists all of the resource types currently supported by AWS RAM.

```
aws ram list-resource-types
```

Output:

```
{
    "resourceTypes": [
        {
            "resourceType": "route53resolver:FirewallRuleGroup",
            "serviceName": "route53resolver"
        },
        {
            "resourceType": "ec2:LocalGatewayRouteTable",
            "serviceName": "ec2"
        },
        ...OUTPUT TRUNCATED FOR BREVITY...
        {
            "resourceType": "ec2:Subnet",
            "serviceName": "ec2"
        },
        {
            "resourceType": "ec2:TransitGatewayMulticastDomain",
            "serviceName": "ec2"
        }
    ]
}
```

- For API details, see ListResourceTypes in *AWS CLI Command Reference*.

`list-resources`

The following code example shows how to use `list-resources`.

AWS CLI

To list the resources associated with a resource share

The following `list-resources` example lists all resources in the specified resource share that are of the specified resource type.

```
aws ram list-resources \
    --resource-type ec2:Subnet \
    --resource-owner SELF \
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE
```

Output:

```
{
    "resources": [
        {
            "arn": "aarn:aws:ec2:us-west-2:123456789012:subnet/subnet-0250c25a1f4e15235",
            "type": "ec2:Subnet",
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE",
            "creationTime": 1565301545.023,
            "lastUpdatedTime": 1565301545.947
        }
    ]
}
```

- For API details, see ListResources in *AWS CLI Command Reference*.

`promote-resource-share-created-from-policy`

The following code example shows how to use `promote-resource-share-created-from-policy`.

AWS CLI

To promote a resource-policy based resource share to full functionality in AWS RAM

The following `promote-resource-share-created-from-policy` example takes a resource share that you created implicitly by attaching a resource-based policy, and converts it to be fully functional with the AWS RAM console and its CLI and API operations.

```
aws ram promote-resource-share-created-from-policy \
    --resource-share-arn arn:aws:ram:us-east-1:123456789012:resource-
share/91fa8429-2d06-4032-909a-90909EXAMPLE
```

Output:

```
{
    "returnValue": true
}
```

- For API details, see PromoteResourceShareCreatedFromPolicy in *AWS CLI Command Reference*.

`reject-resource-share-invitation`

The following code example shows how to use `reject-resource-share-invitation`.

AWS CLI

To reject a resource share invitation

The following `reject-resource-share-invitation` example rejects the specified resource share invitation.

```
aws ram reject-resource-share-invitation \
    --resource-share-invitation-arn arn:aws:ram:us-west-2:111111111111:resource-
share-invitation/32b639f0-14b8-7e8f-55ea-e6117EXAMPLE
```

Output:

```
"resourceShareInvitations": [
    {
        "resourceShareInvitationArn": "arn:aws:ram:us-west2-1:111111111111:resource-
share-invitation/32b639f0-14b8-7e8f-55ea-e6117EXAMPLE",
        "resourceShareName": "project-resource-share",
```

```
        "resourceShareArn": "arn:aws:ram:us-west-2:111111111111:resource-share/
fcb639f0-1449-4744-35bc-a983fEXAMPLE",
        "senderAccountId": "111111111111",
        "receiverAccountId": "222222222222",
        "invitationTimestamp": 1565319592.463,
        "status": "REJECTED"
    }
]
```

- For API details, see RejectResourceShareInvitation in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add tags to a resource share

The following `tag-resource` example adds a tag key `project` and associated value `lima` to the specified resource share.

```
aws ram tag-resource \
    --tags key=project,value=lima \
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-
b505-7e2a-420d-6f5d3EXAMPLE
```

This command produces no output.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a resource share

The following `untag-resource` example removes the `project` tag key and associated value from the specified resource share.

```
aws ram untag-resource \
    --tag-keys project \
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-
b505-7e2a-420d-6f5d3EXAMPLE
```

This command produces no output.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-resource-share`

The following code example shows how to use `update-resource-share`.

AWS CLI

To update a resource share

The following `update-resource-share` example changes the specified resource share to allow external principals that are not in an AWS Organization.

```
aws ram update-resource-share \
    --allow-external-principals \
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-
b505-7e2a-420d-6f5d3EXAMPLE
```

Output:

```
{
    "resourceShare": {
        "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE",
        "name": "my-resource-share",
        "owningAccountId": "123456789012",
        "allowExternalPrincipals": true,
        "status": "ACTIVE",
        "creationTime": 1565295733.282,
        "lastUpdatedTime": 1565303080.023
    }
}
```

- For API details, see UpdateResourceShare in *AWS CLI Command Reference*.

Resource Explorer examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Resource Explorer.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`associate-default-view`

The following code example shows how to use `associate-default-view`.

AWS CLI

To set a Resource Explorer view as the default for its AWS Region

The following `associate-default-view` example sets a view, as specified by its ARN, to be the default view for the AWS Region in which you call the operation.

```
aws resource-explorer-2 associate-default-view \
    --view-arn arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-Main-View/
EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111
```

Output:

```
{
    "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-Main-
View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111"
}
```

For more information, see Setting a default view in an AWS Region in the *AWS Resource Explorer Users Guide*.

- For API details, see AssociateDefaultView in *AWS CLI Command Reference*.

`batch-get-view`

The following code example shows how to use `batch-get-view`.

AWS CLI

To retrieve details about multiple Resource Explorer views

The following `batch-get-view` example displays the details about two views specified by their ARNs. Use spaces to separate the multiple ARNs in the --view-arn parameter.

```
aws resource-explorer-2 batch-get-view \
    --view-arns arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-EC2-Only-
View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222, \
                arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-Main-
View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111
```

Output:

```
{
    "Views": [
        {
            "Filters": {
                "FilterString": "service:ec2"
            },
            "IncludedProperties": [
                {
                    "Name": "tags"
                }
            ],
            "LastUpdatedAt": "2022-07-13T21:33:45.249000+00:00",
            "Owner": "123456789012",
            "Scope": "arn:aws:iam::123456789012:root",
            "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-
EC2-Only-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222"
        },
        {
            "Filters": {
                "FilterString": ""
            },
            "IncludedProperties": [
```

```
                {
                    "Name": "tags"
                }
            ],
            "LastUpdatedAt": "2022-07-13T20:34:11.314000+00:00",
            "Owner": "123456789012",
            "Scope": "arn:aws:iam::123456789012:root",
            "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-
Main-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111"
        }
    ]
    "Errors": []
}
```

For more information about views, see About Resource Explorer views in the *AWS Resource Explorer Users Guide*.

- For API details, see BatchGetView in *AWS CLI Command Reference*.

`create-index`

The following code example shows how to use `create-index`.

AWS CLI

To turn on Resource Explorer in an AWS Region by creating an index

The following `create-index` example creates a local index in the AWS Region in which the operation is called. The AWS CLI automatically generates a random `client-token` parameter value and includes it in the call to AWS if you don't specify a value.

```
aws resource-explorer-2 create-index \
    --region us-east-1
```

Output:

```
{
    "Arn": "arn:aws:resource-explorer-2:us-east-1:123456789012:index/EXAMPLE8-90ab-
cdef-fedc-EXAMPLE22222c",
    "CreatedAt": "2022-11-01T20:00:59.149Z",
    "State": "CREATING"
}
```

After you create a local index, you can convert it into the aggregator index for the account by running the update-index-type command.

For more information, see Turning on Resource Explorer in an AWS Region to index your resources in the *AWS Resource Explorer Users Guide*.

- For API details, see CreateIndex in *AWS CLI Command Reference*.

`create-view`

The following code example shows how to use `create-view`.

AWS CLI

Example 1: To create an unfiltered view for the index in an AWS Region

The following `create-view` example creates a view in the specified AWS Region that returns all results in the Region without any filtering. The view includes the optional Tags field on returned results. Because this view is created in the Region that contains the aggregator index, it can include results from all Regions in the account that contain a Resource Explorer index.

```
aws resource-explorer-2 create-view \
    --view-name My-Main-View \
    --included-properties Name=tags \
    --region us-east-1
```

Output:

```
{
    "View": {
        "Filters": {
            "FilterString": ""
        },
        "IncludedProperties": [
            {
                "Name": "tags"
            }
        ],
        "LastUpdatedAt": "2022-07-13T20:34:11.314000+00:00",
        "Owner": "123456789012",
        "Scope": "arn:aws:iam::123456789012:root",
```

```
        "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-Main-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111"
    }
}
```

Example 2: To create a view that returns only resources associated with Amazon EC2

The following `create-view` creates a view in AWS Region `us-east-1` that returns only those resources in the Region that are associated with the Amazon EC2 service. The view includes the optional `Tags` field on returned results. Because this view is created in the Region that contains the aggregator index, it can include results from all Regions in the account that contain a Resource Explorer index.

```
aws resource-explorer-2 create-view \
    --view-name My-EC2-Only-View \
    --included-properties Name=tags \
    --filters FilterString="service:ec2" \
    --region us-east-1
```

Output:

```
{
    "View": {
        "Filters": {
            "FilterString": "service:ec2"
        },
        "IncludedProperties": [
            {
                "Name":"tags"
            }
        ],
        "LastUpdatedAt": "2022-07-13T21:35:09.059Z",
        "Owner": "123456789012",
        "Scope": "arn:aws:iam::123456789012:root",
        "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-EC2-Only-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222"
    }
}
```

For more information, see Creating views for search in the *AWS Resource Explorer Users Guide*.

- For API details, see CreateView in *AWS CLI Command Reference*.

`delete-index`

The following code example shows how to use `delete-index`.

AWS CLI

To turn off Resource Explorer in an AWS Region by deleting its index

The following `delete-index` example deletes the specified Resource Explorer index in the AWS Region in which you make the request.

```
aws resource-explorer-2 delete-index \
    --arn arn:aws:resource-explorer-2:us-west-2:123456789012:index/EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222 \
    --region us-west-2
```

Output:

```
{
    "Arn": "arn:aws:resource-explorer-2:us-west-2:123456789012:index/EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222",
    "State": "DELETING"
}
```

For more information about deleting an index, see Turning off AWS Resource Explorer in an AWS Region in the *AWS Resource Explorer Users Guide*.

- For API details, see DeleteIndex in *AWS CLI Command Reference*.

`delete-view`

The following code example shows how to use `delete-view`.

AWS CLI

To delete a Resource Explorer view

The following `delete-view` example deletes a view specified by its ARN.

```
aws resource-explorer-2 delete-view \
    --view-arn arn:aws:resource-explorer-2:us-east-1:123456789012:view/EC2-Only-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111
```

Output:

```
{
    "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/EC2-Only-
View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111"
}
```

For more information, see Deleting views in the *AWS Resource Explorer Users Guide*.

- For API details, see DeleteView in *AWS CLI Command Reference*.

`disassociate-default-view`

The following code example shows how to use `disassociate-default-view`.

AWS CLI

To remove the default Resource Explorer view for an AWS Region

The following `disassociate-default-view` removes the default Resource Explorer view for the AWS Region in which you call the operation. After performing this operation, all search operations in the Region must explicitly specify a view or the operation fails.

```
aws resource-explorer-2 disassociate-default-view
```

This command produces no output.

For more information, see Setting a default view in an AWS Region in the *AWS Resource Explorer Users Guide*.

- For API details, see DisassociateDefaultView in *AWS CLI Command Reference*.

`get-default-view`

The following code example shows how to use `get-default-view`.

AWS CLI

To retrieve the Resource Explorer view that is the default view for its AWS Region

The following `get-default-view` example retrieves the ARN of the view that is the default for the AWS Region in which you call the operation.

```
aws resource-explorer-2 get-default-view
```

Output:

```
{
    "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/default-
view/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111"
}
```

For more information, see Setting a default view in an AWS Region in the *AWS Resource Explorer Users Guide*.

- For API details, see GetDefaultView in *AWS CLI Command Reference*.

`get-index`

The following code example shows how to use `get-index`.

AWS CLI

Example 1: To retrieve the details for a Resource Explorer aggregator index

The following `get-index` example displays the details for the Resource Explorer index in the specified AWS Region. Because the specified Region contains the aggregator index for the account, the output lists the Regions that replicate data into this Region's index.

```
aws resource-explorer-2 get-index \
    --region us-east-1
```

Output:

```
{
    "Arn": "arn:aws:resource-explorer-2:us-east-1:123456789012:index/EXAMPLE8-90ab-
cdef-fedc-EXAMPLE11111",
    "CreatedAt": "2022-07-12T18:59:10.503000+00:00",
    "LastUpdatedAt": "2022-07-13T18:41:58.799000+00:00",
    "ReplicatingFrom": [
        "ap-south-1",
        "us-west-2"
    ],
    "State": "ACTIVE",
```

```
    "Tags": {},
    "Type": "AGGREGATOR"
}
```

Example 2: To retrieve the details for a Resource Explorer local index

The following `get-index` example displays the details for the Resource Explorer index in the specified AWS Region. Because the specified Region contains a local index, the output lists the Region to which it replicates data from this Region's index.

```
aws resource-explorer-2 get-index \
    --region us-west-2
```

Output:

```
{
    "Arn": "arn:aws:resource-explorer-2:us-west-2:123456789012:index/EXAMPLE8-90ab-
cdef-fedc-EXAMPLE22222",
    "CreatedAt": "2022-07-12T18:59:10.503000+00:00",
    "LastUpdatedAt": "2022-07-13T18:41:58.799000+00:00",
    "ReplicatingTo": [
        "us-west-2"
    ],
    "State": "ACTIVE",
    "Tags": {},
    "Type": "LOCAL"
}
```

For more information about indexes, see Checking which AWS Regions have Resource Explorer turned on in the *AWS Resource Explorer Users Guide*.

- For API details, see GetIndex in *AWS CLI Command Reference*.

`get-view`

The following code example shows how to use `get-view`.

AWS CLI

To retrieve details about a Resource Explorer view

The following `get-view` example displays the details about a view specified by its ARN.

```
aws resource-explorer-2 get-view \
    --view-arn arn:aws:resource-explorer-2:us-east-1:123456789012:view/EC2-Only-
View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111
```

Output:

```
{
  "Tags" : {},
  "View" : {
        "Filters" : {
            "FilterString" : "service:ec2"
        },
        "IncludedProperties" : [
            {
                "Name" : "tags"
            }
        ],
        "LastUpdatedAt" : "2022-07-13T21:33:45.249Z",
        "Owner" : "123456789012",
        "Scope" : "arn:aws:iam::123456789012:root",
        "ViewArn" : "arn:aws:resource-explorer-2:us-east-1:123456789012:view/EC2-
Only-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111"
  }
}
```

For more information about views, see About Resource Explorer views in the *AWS Resource Explorer Users Guide*.

- For API details, see GetView in *AWS CLI Command Reference*.

`list-indexes`

The following code example shows how to use `list-indexes`.

AWS CLI

To list the AWS Regions where Resource Explorer has indexes

The following `list-indexes` example lists the indexes for all Regions where Resource Explorer has an index. The response specifies the type of each index, its AWS Region, and its ARN.

```
aws resource-explorer-2 list-indexes
```

Output:

```
{
    "Indexes": [
        {
            "Arn": "arn:aws:resource-explorer-2:us-west-2:123456789012:index/
EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111",
            "Region": "us-west-2",
            "Type": "AGGREGATOR"
        },
        {
            "Arn": "arn:aws:resource-explorer-2:us-east-1:123456789012:index/
EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222",
            "Region": "us-east-1",
            "Type": "LOCAL"
        },
        {
            "Arn": "arn:aws:resource-explorer-2:us-east-2:123456789012:index/
EXAMPLE8-90ab-cdef-fedc-EXAMPLE33333",
            "Region": "us-east-2",
            "Type": "LOCAL"
        },
        {
            "Arn": "arn:aws:resource-explorer-2:us-west-1:123456789012:index/
EXAMPLE8-90ab-cdef-fedc-EXAMPLE44444",
            "Region": "us-west-1",
            "Type": "LOCAL"
        }
    ]
}
```

For more information about indexes, see Checking which AWS Regions have Resource Explorer turned on in the *AWS Resource Explorer Users Guide*.

- For API details, see ListIndexes in *AWS CLI Command Reference*.

`list-supported-resource-types`

The following code example shows how to use `list-supported-resource-types`.

AWS CLI

To list the AWS Regions where Resource Explorer has indexes

The following `list-supported-resource-types` example lists all of the resource types currently supported by &AREXlong;. The example response includes a `NextToken` value, which indicates that there is more output available to retrieve with additional calls.

```
aws resource-explorer-2 list-supported-resource-types \
    --max-items 10
```

Output:

```
{
    "ResourceTypes": [
        {
            "ResourceType": "cloudfront:cache-policy",
            "Service": "cloudfront"
        },
        {
            "ResourceType": "cloudfront:distribution",
            "Service": "cloudfront"
        },
        {
            "ResourceType": "cloudfront:function",
            "Service": "cloudfront"
        },
        {
            "ResourceType": "cloudfront:origin-access-identity",
            "Service": "cloudfront"
        },
        {
            "ResourceType": "cloudfront:origin-request-policy",
            "Service": "cloudfront"
        },
        {
            "ResourceType": "cloudfront:realtime-log-config",
            "Service": "cloudfront"
        },
        {
            "ResourceType": "cloudfront:response-headers-policy",
            "Service": "cloudfront"
        },
        {
            "ResourceType": "cloudwatch:alarm",
            "Service": "cloudwatch"
        },
```

```
        {
            "ResourceType": "cloudwatch:dashboard",
            "Service": "cloudwatch"
        },
        {
            "ResourceType": "cloudwatch:insight-rule",
            "Service": "cloudwatch"
        }
    ],
    "NextToken": "eyJOZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOiAxMH0="
}
```

To get the next part of the output, call the operation again, and pass the previous call's `NextToken` response value as the value for `--starting-token`. Repeat until `NextToken` is absent from the response.

```
aws resource-explorer-2 list-supported-resource-types \
    --max-items 10  \
    --starting-
token eyJOZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOiAxMH0=
```

Output:

```
{
    "ResourceTypes": [
        {
            "ResourceType": "cloudwatch:metric-stream",
            "Service": "cloudwatch"
        },
        {
            "ResourceType": "dynamodb:table",
            "Service": "dynamodb"
        },
        {
            "ResourceType": "ec2:capacity-reservation",
            "Service": "ec2"
        },
        {
            "ResourceType": "ec2:capacity-reservation-fleet",
            "Service": "ec2"
        },
        {
```

```
            "ResourceType": "ec2:client-vpn-endpoint",
            "Service": "ec2"
        },
        {
            "ResourceType": "ec2:customer-gateway",
            "Service": "ec2"
        },
        {
            "ResourceType": "ec2:dedicated-host",
            "Service": "ec2"
        },
        {
            "ResourceType": "ec2:dhcp-options",
            "Service": "ec2"
        },
        {
            "ResourceType": "ec2:egress-only-internet-gateway",
            "Service": "ec2"
        },
        {
            "ResourceType": "ec2:elastic-gpu",
            "Service": "ec2"
        }
    ],
    "NextToken": "eyJOZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOiAyMH0="
}
```

For more information about indexes, see Checking which AWS Regions have Resource Explorer turned on in the *AWS Resource Explorer Users Guide*.

- For API details, see ListSupportedResourceTypes in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags attached to a Resource Explorer view or index

The following `list-tags-for-resource` example lists the tag key and value pairs attached to view with the specified ARN. You must call the operation from the AWS Region that contains the resource.

```
aws resource-explorer-2 list-tags-for-resource \
    --resource-arn arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-View/
EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111
```

Output:

```
{
    "Tags": {
        "application": "MainCorpApp",
        "department": "1234"
    }
}
```

For more information about tagging views, see Tagging views for access control in the *AWS Resource Explorer Users Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`list-views`

The following code example shows how to use `list-views`.

AWS CLI

To list the Resource Explorer views available in an AWS Region

The following `list-views` example lists all of the views available in the Region in which you invoke the operation.

```
aws resource-explorer-2 list-views
```

Output:

```
{
    "Views": [
        "arn:aws:resource-explorer-2:us-east-1:123456789012:view/EC2-Only-View/
EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111",
        "arn:aws:resource-explorer-2:us-east-1:123456789012:view/Default-All-
Resources-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222",
        "arn:aws:resource-explorer-2:us-east-1:123456789012:view/Production-Only-
View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE33333"
    ]
```

```
}
```

For more information about views, see About Resource Explorer views in the *AWS Resource Explorer Users Guide*.

- For API details, see ListViews in *AWS CLI Command Reference*.

search

The following code example shows how to use `search`.

AWS CLI

Example 1: To search using the default view

The following `search` example displays all resources in the specified that are associated with the service. The search uses the default view for the Region. The example response includes a `NextToken` value, which indicates that there is more output available to retrieve with additional calls.

```
aws resource-explorer-2 search \
    --query-string "service:iam"
```

Output:

```
{
    "Count": {
        "Complete": true,
        "TotalResources": 55
    },
    "NextToken":
 "AG9VOEF1KLEXAMPLEOhJHVwo5chEXAMPLER5XiEpNrgsEXAMPLE...b0CmOFOryHEXAMPLE",
    "Resources": [{
        "Arn": "arn:aws:iam::123456789012:policy/service-role/Some-Policy-For-A-
Service-Role",
        "LastReportedAt": "2022-07-21T12:34:42Z",
        "OwningAccountId": "123456789012",
        "Properties": [],
        "Region": "global",
        "ResourceType": "iam:policy",
        "Service": "iam"
    }, {
```

```
        "Arn": "arn:aws:iam::123456789012:policy/service-role/Another-Policy-For-A-Service-Role",
        "LastReportedAt": "2022-07-21T12:34:42Z",
        "OwningAccountId": "123456789012",
        "Properties": [],
        "Region": "global",
        "ResourceType": "iam:policy",
        "Service": "iam"
    }, {
       ... TRUNCATED FOR BREVITY ...
    }],
    "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/my-default-view/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111"
}
```

Example 2: To search using a specified view

The following `search` example search displays all resources ("*") in the specified AWS Region that are visible through the specified view. The results include only resources associated with Amazon EC2 because of the filters attached to the view.

```
aws resource-explorer-2 search \
    -- query-string "*" \
    -- view-arn arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-EC2-view/EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222
```

Output:

```
HTTP/1.1 200 OK
Date: Tue, 01 Nov 2022 20:00:59 GMT
Content-Type: application/json
Content-Length: <PayloadSizeBytes>

    {
        "Count": {
            "Complete": true,
            "TotalResources": 67
        },
        "Resources": [{
            "Arn": "arn:aws:ec2:us-east-1:123456789012:network-acl/acl-1a2b3c4d",
            "LastReportedAt": "2022-07-21T18:52:02Z",
            "OwningAccountId": "123456789012",
            "Properties": [{
```

```
                "Data": [{
                    "Key": "Department",
                    "Value": "AppDevelopment"
                }, {
                    "Key": "Environment",
                    "Value": "Production"
                }],
                "LastReportedAt": "2021-11-15T14:48:29Z",
                "Name": "tags"
            }],
            "Region": "us-east-1",
            "ResourceType": "ec2:network-acl",
            "Service": "ec2"
        }, {
            "Arn": "arn:aws:ec2:us-east-1:123456789012:subnet/subnet-1a2b3c4d",
            "LastReportedAt": "2022-07-21T21:22:23Z",
            "OwningAccountId": "123456789012",
            "Properties": [{
                "Data": [{
                    "Key": "Department",
                    "Value": "AppDevelopment"
                }, {
                    "Key": "Environment",
                    "Value": "Production"
                }],
                "LastReportedAt": "2021-07-29T19:02:39Z",
                "Name": "tags"
            }],
            "Region": "us-east-1",
            "ResourceType": "ec2:subnet",
            "Service": "ec2"
        }, {

            "LastReportedAt": "2022-07-21T06:08:53Z",
            "OwningAccountId": "123456789012",
            "Properties": [{
                "Data": [{
                    "Key": "Department",
                    "Value": "AppDevelopment"
                }, {
                    "Key": "Environment",
                    "Value": "Production"
                }],
                "LastReportedAt": "2021-11-15T15:11:05Z",
```

```
                "Name": "tags"
            }],
            "Region": "us-east-1",
            "ResourceType": "ec2:dhcpoptions",
            "Service": "ec2"
        }, {
            ... TRUNCATED FOR BREVITY ...
        }],
        "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-EC2-
view/EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222"
    }
```

For more information, see Using AWS Resource Explorer to search for resources in the *AWS Resource Explorer Users Guide*.

- For API details, see Search in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a Resource Explorer view

The following `tag-resource` example adds the tag key "environment" with the value "production" to the view with the specified ARN.

```
aws resource-explorer-2 tag-resource \
    --resource-arn arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-View//
EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111 \
    --tags environment=production
```

This command produces no output.

For more information, see Tagging views for access control in the *AWS Resource Explorer Users Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a Resource Explorer view

The following `untag-resource` example removes any tag with the key name "environment" from the view with the specified ARN.

```
aws resource-explorer-2 untag-resource \
    --resource-arn arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-View//
EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111 \
    --tag-keys environment
```

This command produces no output.

For more information, see Tagging views for access control in the *AWS Resource Explorer Users Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-index-type`

The following code example shows how to use `update-index-type`.

AWS CLI

To change the type of a Resource Explorer index

The following `update-index-type` example converts the specified index from type `local` to type `aggregator` to turn on the ability to search for resources across all AWS Regions in the account. You must send the request to the AWS Region that contains the index you want to update.

```
aws resource-explorer-2 update-index-type \
    --arn arn:aws:resource-explorer-2:us-east-1:123456789012:index/EXAMPLE8-90ab-
cdef-fedc-EXAMPLE11111 \
    --type aggregator \
    --region us-east-1
```

Output:

```
{
```

```
    "Arn":"arn:aws:resource-explorer-2:us-east-1:123456789012:index/EXAMPLE8-90ab-
cdef-fedc-EXAMPLE11111",
    "LastUpdatedAt":"2022-07-13T18:41:58.799Z",
    "State":"updating",
    "Type":"aggregator"
}
```

For more information about changing an index's type, see Turning on cross-Region search by creating an aggregator index in the *AWS Resource Explorer Users Guide*.

- For API details, see UpdateIndexType in *AWS CLI Command Reference*.

`update-view`

The following code example shows how to use `update-view`.

AWS CLI

Example 1: To update the IncludedProperties field for a Resource Explorer view

The following `update-view` example updates the specified view by adding ``` `tags` ``` to the optional ``` `IncludedProperties` ```. After running this operation, search operations that use this view include information about the tags attached to the resources that appear in the results.

```
aws resource-explorer-2 update-view \
    --included-properties Name=tags \
    --view-arn arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-View/
EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222
```

Output:

```
{
    "View": {
        "Filters": {
            "FilterString": ""
        },
        "IncludedProperties": [
            {
                "Name": "tags"
            }
```

```
        ],
        "LastUpdatedAt": "2022-07-19T17:41:21.710000+00:00",
        "Owner": "123456789012",
        "Scope": "arn:aws:iam::123456789012:root",
        "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-EC2-
Only-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111"
    }
}
```

Example 2: To update the filters attached to a view

The following `update-view` example updates the specified view to use a filter that limits results to only resource types that are associated with the Amazon EC2 service.

```
aws resource-explorer-2 update-view \
    --filters FilterString="service:ec2" \
    --view-arn arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-View/
EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222
```

Output:

```
{
    "View": {
    "Filters": {
        "FilterString": "service:ec2"
    },
    "IncludedProperties": [],
    "LastUpdatedAt": "2022-07-19T17:41:21.710000+00:00",
        "Owner": "123456789012",
        "Scope": "arn:aws:iam::123456789012:root",
        "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-View/
EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222"
    }
}
```

For more information about views, see About Resource Explorer views in the *AWS Resource Explorer Users Guide*.

- For API details, see UpdateView in *AWS CLI Command Reference*.

Resource Groups examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Resource Groups.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Actions

`create-group`

The following code example shows how to use `create-group`.

AWS CLI

Example 1: To create a tag-based resource group

The following `create-group` example creates a tag-based resource group of Amazon EC2 instances in the current region. It's based on a query for resources that are tagged with the key `Name`, and the value `WebServers`. The group name is `tbq-WebServer`. The query is in a separate JSON file that is passed to the command.

```
aws resource-groups create-group \
    --name tbq-WebServer \
    --resource-query file://query.json
```

Contents of `query.json`:

```
{
    "Type": "TAG_FILTERS_1_0",
    "Query": "{\"ResourceTypeFilters\":[\"AWS::EC2::Instance\"],\"TagFilters\":
[{\"Key\":\"Name\", \"Values\":[\"WebServers\"]}]}"
}
```

Output:

```
{
    "Group": {
        "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/tbq-
WebServer",
        "Name": "tbq-WebServer"
    },
    "ResourceQuery": {
        "Type": "TAG_FILTERS_1_0",
        "Query": "{\"ResourceTypeFilters\":[\"AWS::EC2::Instance\"],\"TagFilters\":
[{\"Key\":\"Name\", \"Values\":[\"WebServers\"]}]}"
    }
}
```

Example 2: To create a CloudFormation stack-based resource group

The following `create-group` example creates an AWS CloudFormation stack-based resource group named `sampleCFNstackgroup`. The query includes all resources in the specified CloudFormation stack that are supported by AWS Resource Groups.

```
aws resource-groups create-group \
    --name cbq-CFNstackgroup \
    --resource-query file://query.json
```

Contents of `query.json`:

```
{
    "Type": "CLOUDFORMATION_STACK_1_0",
    "Query": "{\"ResourceTypeFilters\":[\"AWS::AllSupported\"],\"StackIdentifier
\":\"arn:aws:cloudformation:us-west-2:123456789012:stack/MyCFNStack/1415z9z0-
z39z-11z8-97z5-500z212zz6fz\"}"
}
```

Output:

```
{
    "Group": {
        "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/cbq-
CFNstackgroup",
        "Name": "cbq-CFNstackgroup"
    },
```

```
    "ResourceQuery": {
        "Type": "CLOUDFORMATION_STACK_1_0",
        "Query": "{\"ResourceTypeFilters\":[\"AWS::AllSupported\"],\"StackIdentifier
\":\"arn:aws:cloudformation:us-east-2:123456789012:stack/MyCFNStack/1415z9z0-
z39z-11z8-97z5-500z212zz6fz\"}"}'
    }
}
```

For more information, see Create Groups in the *AWS Resource Groups User Guide*.

- For API details, see CreateGroup in *AWS CLI Command Reference*.

`delete-group`

The following code example shows how to use `delete-group`.

AWS CLI

To update the description for a resource group

The following `delete-group` example updates the specified resource group.

```
aws resource-groups delete-group \
    --group-name tbq-WebServer
```

Output:

```
{
    "Group": {
        "GroupArn": "arn:aws:resource-groups:us-west-2:1234567890:group/tbq-
WebServer",
        "Name": "tbq-WebServer"
    }
}
```

For more information, see Delete Groups in the *AWS Resource Groups User Guide*.

- For API details, see DeleteGroup in *AWS CLI Command Reference*.

`get-group-query`

The following code example shows how to use `get-group-query`.

AWS CLI

To get the query attached to a resource group

The following `get-group-query` example displays query attached to the specified resource group.

```
aws resource-groups get-group-query \
    --group-name tbq-WebServer
```

Output:

```
{
    "GroupQuery": {
        "GroupName": "tbq-WebServer",
        "ResourceQuery": {
            "Type": "TAG_FILTERS_1_0",
            "Query": "{\"ResourceTypeFilters\":[\"AWS::EC2::Instance\"],\"TagFilters
\":[{\"Key\":\"Name\", \"Values\":[\"WebServers\"]}]}"
        }
    }
}
```

- For API details, see GetGroupQuery in *AWS CLI Command Reference*.

`get-group`

The following code example shows how to use `get-group`.

AWS CLI

To get information about a resource group

The following `get-group` example displays details about the specified resource group. To get the query attached to the group, use `get-group-query`.

```
aws resource-groups get-group \
    --group-name tbq-WebServer
```

Output:

```
{
    "Group": {
        "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/tbq-
WebServer",
        "Name": "tbq-WebServer",
        "Description": "A tag-based query resource group of WebServers."
    }
}
```

- For API details, see GetGroup in *AWS CLI Command Reference*.

`get-tags`

The following code example shows how to use `get-tags`.

AWS CLI

To retrieve the tags attached to a resource group

The following `get-tags` example displays the tag key and value pairs attached to the specified resource group (the group itself, not its members).

```
aws resource-groups get-tags \
    --arn arn:aws:resource-groups:us-west-2:123456789012:group/tbq-WebServer
```

Output:

```
{
    "Arn": "arn:aws:resource-groups:us-west-2:123456789012:group/tbq-WebServer",
    "Tags": {
        "QueryType": "tags",
        "QueryResources": "ec2-instances"
    }
}
```

- For API details, see GetTags in *AWS CLI Command Reference*.

`list-group-resources`

The following code example shows how to use `list-group-resources`.

AWS CLI

To list all of the resources in a resource group

Example 1: The following `list-resource-groups` example lists all of the resources that are part of the specified resource group.

```
aws resource-groups list-group-resources \
    --group-name tbq-WebServer
```

Output:

```
{
    "ResourceIdentifiers": [
        {
            "ResourceArn": "arn:aws:ec2:us-west-2:123456789012:instance/
i-09f77fa38c12345ab",
            "ResourceType": "AWS::EC2::Instance"
        }
    ]
}
```

Example 2: The following example lists all of the resources in the group that also have a 'resource-type' of the 'AWS::EC2::Instance'. :

aws resource-groups list-group-resources --group-name tbq-WebServer --filters Name=resource-type,Values=AWS::EC2::Instance

- For API details, see ListGroupResources in *AWS CLI Command Reference*.

`list-groups`

The following code example shows how to use `list-groups`.

AWS CLI

To list the available resource groups

The following `list-groups` example displays a list of all of the resource groups.

```
aws resource-groups list-groups
```

Output:

```
{
    "GroupIdentifiers": [
        {
            "GroupName": "tbq-WebServer",
            "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/tbq-
WebServer3"
        },
        {
            "GroupName": "cbq-CFNStackQuery",
            "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/cbq-
CFNStackQuery"
        }
    ],
    "Groups": [
        {
            "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/tbq-
WebServer",
            "Name": "tbq-WebServer"
        },
        {
            "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/cbq-
CFNStackQuery",
            "Name": "cbq-CFNStackQuery"
        }
    ]
}
```

- For API details, see ListGroups in *AWS CLI Command Reference*.

`list-resource-groups`

The following code example shows how to use `list-resource-groups`.

AWS CLI

To list all of the resources in a resource group

The following `list-resource-groups` example lists all of the resources that are part of the specified resource group.

```
aws resource-groups list-group-resources \
```

```
    --group-name tbq-WebServer
```

Output:

```
{
    "ResourceIdentifiers": [
        {
            "ResourceArn": "arn:aws:ec2:us-west-2:123456789012:instance/
i-09f77fa38c12345ab",
            "ResourceType": "AWS::EC2::Instance"
        }
    ]
}
```

- For API details, see ListResourceGroups in *AWS CLI Command Reference*.

`put-group-configuration`

The following code example shows how to use `put-group-configuration`.

AWS CLI

To attach a service configuration to a resource group

Example 1: The following `put-group-configuration` example specifies that the resource group is to contain only Amazon EC2 capacity reservations for instances in the `C5` or `M5` families.

```
aws resource-groups put-group-configuration \
    --group MyTestGroup \
    --configuration file://config.json
```

Contents of `config.json`:

```
[
    {
        "Type": "AWS::EC2::HostManagement",
        "Parameters": [
            {
                "Name": "allowed-host-families",
                "Values": [ "c5", "m5" ]
```

```
            },
                {
                    "Name": "any-host-based-license-configuration",
                    "Values": [ "true" ]
                }
        ]
    },
    {
        "Type": "AWS::ResourceGroups::Generic",
        "Parameters": [
            {
                "Name": "allowed-resource-types",
                "Values": [ "AWS::EC2::Host" ]
            },
            {
                "Name": "deletion-protection",
                "Values": [ "UNLESS_EMPTY" ]
            }
        ]
    }
]
```

This command produces no output if successful.

For more information, see Service configurations for resource groups in the *Resource Groups API Reference Guide*.

- For API details, see PutGroupConfiguration in *AWS CLI Command Reference*.

`search-resources`

The following code example shows how to use `search-resources`.

AWS CLI

To find resources that match a query

The following `search-resources` example retrieves a list of all AWS resources that match the specified query.

```
aws resource-groups search-resources \
    --resource-query file://query.json
```

Contents of `query.json`:

```
{
    "Type": "TAG_FILTERS_1_0",
    "Query": "{\"ResourceTypeFilters\":[\"AWS::EC2::Instance\"],\"TagFilters\":
[{\"Key\":\"Patch Group\", \"Values\":[\"Dev\"]}]}"
}
```

Output:

```
{
    "ResourceIdentifiers": [
        {
            "ResourceArn": "arn:aws:ec2:us-west-2:123456789012:instance/
i-01a23bc45d67890ef",
            "ResourceType": "AWS::EC2::Instance"
        }
    ]
}
```

- For API details, see SearchResources in *AWS CLI Command Reference*.

`tag`

The following code example shows how to use `tag`.

AWS CLI

To attach a tag to a resource group

The following `tag` example attaches the specified tag key and value pairs to the specified resource group (the group itself, not its members).

```
aws resource-groups tag \
    --tags QueryType=tags,QueryResources=ec2-instances \
    --arn arn:aws:resource-groups:us-west-2:128716708097:group/tbq-WebServer
```

Output:

```
{
    "Arn": "arn:aws:resource-groups:us-west-2:128716708097:group/tbq-WebServer",
```

```
    "Tags": {
        "QueryType": "tags",
        "QueryResources": "ec2-instances"
    }
}
```

For more information, see Manage tags in the *AWS Resource Groups User Guide*.

- For API details, see Tag in *AWS CLI Command Reference*.

`untag`

The following code example shows how to use `untag`.

AWS CLI

To remove tags from a resource group

The following `untags` example removes any tag with the specified key from the resource group itself, not its members.

```
aws resource-groups untag \
    --arn arn:aws:resource-groups:us-west-2:123456789012:group/tbq-WebServer \
    --keys QueryType
```

Output:

```
{
    "Arn": "arn:aws:resource-groups:us-west-2:123456789012:group/tbq-WebServer",
    "Keys": [
        "QueryType"
    ]
}
```

For more information, see Manage tags in the *AWS Resource Groups User Guide*.

- For API details, see Untag in *AWS CLI Command Reference*.

`update-group-query`

The following code example shows how to use `update-group-query`.

AWS CLI

Example 1: To update the query for a tag-based resource group

The following `update-group-query` example updates the query attached to the specified tag-based resource group.

```
aws resource-groups update-group-query \
    --group-name tbq-WebServer \
    --resource-query '{"Type":"TAG_FILTERS_1_0", "Query":"{\"ResourceTypeFilters\":
[\"AWS::EC2::Instance\"],\"TagFilters\":[{\"Key\":\"Name\", \"Values\":[\"WebServers
\"]}]}"}'
```

Output:

```
{
    "Group": {
        "GroupArn": "arn:aws:resource-groups:us-east-2:123456789012:group/tbq-
WebServer",
        "Name": "tbq-WebServer"
    },
    "ResourceQuery": {
        "Type": "TAG_FILTERS_1_0",
        "Query": "{\"ResourceTypeFilters\":[\"AWS::EC2::Instance\"],\"TagFilters\":
[{\"Key\":\"Name\", \"Values\":[\"WebServers\"]}]}"
    }
}
```

For more information, see Update Groups in the *AWS Resource Groups User Guide*.

Example 2: To update the query for a CloudFormation stack-based resource group

The following `update-group-query` example updates the query attached to the specified AWS CloudFormation stack-based resource group.

```
aws resource-groups update-group-query \
    --group-name cbq-CFNstackgroup \
    --resource-query '{"Type": "CLOUDFORMATION_STACK_1_0", "Query":
 "{\"ResourceTypeFilters\":[\"AWS::AllSupported\"],\"StackIdentifier\":
\"arn:aws:cloudformation:us-west-2:123456789012:stack/MyCFNStack/1415z9z0-
z39z-11z8-97z5-500z212zz6fz\"}"}'
```

Output:

```
{
    "Group": {
        "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/cbq-
CFNstackgroup",
        "Name": "cbq-CFNstackgroup"
    },
    "ResourceQuery": {
        "Type": "CLOUDFORMATION_STACK_1_0",
        "Query": "{\"ResourceTypeFilters\":[\"AWS::AllSupported\"],\"StackIdentifier
\":\"arn:aws:cloudformation:us-west-2:123456789012:stack/MyCFNStack/1415z9z0-
z39z-11z8-97z5-500z212zz6fz\"}"
    }
}
```

For more information, see Update Groups in the *AWS Resource Groups User Guide*.

- For API details, see UpdateGroupQuery in *AWS CLI Command Reference*.

`update-group`

The following code example shows how to use `update-group`.

AWS CLI

To update the description for a resource group

The following `update-group` example updates the description for the specified resource group.

```
aws resource-groups update-group \
    --group-name tbq-WebServer \
    --description "Resource group for all web server resources."
```

Output:

```
{
    "Group": {
        "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/tbq-
WebServer",
        "Name": "tbq-WebServer"
        "Description": "Resource group for all web server resources."
```

```
    }
}
```

For more information, see Update Groups in the *AWS Resource Groups User Guide*.

- For API details, see UpdateGroup in *AWS CLI Command Reference*.

Resource Groups Tagging API examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Resource Groups Tagging API.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

- Actions

Actions

`get-resources`

The following code example shows how to use `get-resources`.

AWS CLI

To get a list of tagged resources

The following `get-resources` example displays a list of resources in the account that are tagged with the specified key name and value.

```
aws resourcegroupstaggingapi get-resources \
    --tag-filters Key=Environment,Values=Production \
    --tags-per-page 100
```

Output:

```
{
```

```
    "ResourceTagMappingList": [
        {
            "ResourceARN": " arn:aws:inspector:us-west-2:123456789012:target/0-
nvgVhaxX/template/0-7sbz2Kz0",
            "Tags": [
                {
                    "Key": "Environment",
                    "Value": "Production"
                }
            ]
        }
    ]
}
```

For more information, see GetResources in the *Resource Groups Tagging API Reference*.

- For API details, see GetResources in *AWS CLI Command Reference*.

`get-tag-keys`

The following code example shows how to use `get-tag-keys`.

AWS CLI

To get a list of all tag keys

The following `get-tag-keys` example retrieves the list of all tag key names used by resources in the account.

```
aws resourcegroupstaggingapi get-tag-keys
```

Output:

```
{
    "TagKeys": [
        "Environment",
        "CostCenter",
        "Department"
    ]
}
```

For more information, see GetTagKeys in the *Resource Groups Tagging API Reference*.

- For API details, see GetTagKeys in *AWS CLI Command Reference*.

`get-tag-values`

The following code example shows how to use `get-tag-values`.

AWS CLI

To get a list of all tag values

The following `get-tag-values` example displays all of the values used for the specified key for all resources in the

```
aws resourcegroupstaggingapi get-tag-values \
    --key=Environment
```

Output:

```
{
    "TagValues": [
        "Alpha",
        "Gamma",
        "Production"
    ]
}
```

For more information, see GetTagValues in the *Resource Groups Tagging API Reference*.

- For API details, see GetTagValues in *AWS CLI Command Reference*.

`tag-resources`

The following code example shows how to use `tag-resources`.

AWS CLI

To attach a tag to a resource

The following `tag-resources` example tags the specified resource with a key name and value.

```
aws resourcegroupstaggingapi tag-resources \
    --resource-arn-list arn:aws:s3:::MyProductionBucket \
```

```
    --tags Environment=Production,CostCenter=1234
```

Output:

```
{
    "FailedResourcesMap": {}
}
```

For more information, see TagResources in the *Resource Groups Tagging API Reference*.

- For API details, see TagResources in *AWS CLI Command Reference*.

`untag-resources`

The following code example shows how to use `untag-resources`.

AWS CLI

To remove a tag from a resource

The following `untag-resources` example removes the specified tag keys and any associated values from the specified resource.

```
aws resourcegroupstaggingapi untag-resources \
    --resource-arn-list arn:aws:s3:::amzn-s3-demo-bucket \
    --tag-keys Environment CostCenter
```

Output:

```
{
    "FailedResourcesMap": {}
}
```

For more information, see UntagResources in the *Resource Groups Tagging API Reference*.

- For API details, see UntagResources in *AWS CLI Command Reference*.

Route 53 examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Route 53.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

`change-resource-record-sets`

The following code example shows how to use `change-resource-record-sets`.

AWS CLI

To create, update, or delete a resource record set

The following `change-resource-record-sets` command creates a resource record set using the `hosted-zone-id` `Z1R8UBAEXAMPLE` and the JSON-formatted configuration in the file `C:\awscli\route53\change-resource-record-sets.json`:

```
aws route53 change-resource-record-sets --hosted-zone-id Z1R8UBAEXAMPLE --change-batch file://C:\awscli\route53\change-resource-record-sets.json
```

For more information, see POST ChangeResourceRecordSets in the *Amazon Route 53 API Reference*.

The configuration in the JSON file depends on the kind of resource record set you want to create:

  "Comment": "optional comment about the changes in this change batch request",
  "Changes": [
    {
      "Action": "CREATE"|"DELETE"|"UPSERT",
      "ResourceRecordSet": {
        "Name": "DNS domain name",
        "Type": "SOA"|"A"|"TXT"|"NS"|"CNAME"|"MX"|"PTR"|"SRV"|"SPF"|"AAAA",
        "SetIdentifier": "unique description for this resource record set",
        "Failover": "PRIMARY" | "SECONDARY",
        "AliasTarget": {
          "HostedZoneId": "hosted zone ID for your CloudFront distribution, Amazon
 S3 bucket, Elastic Load Balancing load balancer, or Amazon Route 53 hosted zone",
          "DNSName": "DNS domain name for your CloudFront distribution, Amazon S3
 bucket, Elastic Load Balancing load balancer, or another resource record set in
 this hosted zone",
          "EvaluateTargetHealth": true|false
        },
        "HealthCheckId": "optional ID of an Amazon Route 53 health check"
      }
    },
    {...}
  ]
}
```

- For API details, see ChangeResourceRecordSets in *AWS CLI Command Reference*.

`change-tags-for-resource`

The following code example shows how to use `change-tags-for-resource`.

AWS CLI

The following command adds a tag named `owner` to a healthcheck resource specified by ID:

```
aws route53 change-tags-for-resource --resource-type healthcheck --resource-
id 6233434j-18c1-34433-ba8e-3443434 --add-tags Key=owner,Value=myboss
```

The following command removes a tag named `owner` from a hosted zone resource specified by ID:

```
aws route53 change-tags-for-resource --resource-type hostedzone --resource-id Z1523434445 --remove-tag-keys owner
```

- For API details, see ChangeTagsForResource in *AWS CLI Command Reference*.

`create-health-check`

The following code example shows how to use `create-health-check`.

AWS CLI

To create a health check

The following `create-health-check` command creates a health check using the caller reference `2014-04-01-18:47` and the JSON-formatted configuration in the file `C:\awscli\route53\create-health-check.json`:

```
aws route53 create-health-check --caller-reference 2014-04-01-18:47 --health-check-config file://C:\awscli\route53\create-health-check.json
```

JSON syntax:

```
{
  "IPAddress": "IP address of the endpoint to check",
  "Port": port on the endpoint to check--required when Type is "TCP",
  "Type": "HTTP"|"HTTPS"|"HTTP_STR_MATCH"|"HTTPS_STR_MATCH"|"TCP",
  "ResourcePath": "path of the file that you want Amazon Route 53 to request--all Types except TCP",
  "FullyQualifiedDomainName": "domain name of the endpoint to check--all Types except TCP",
  "SearchString": "if Type is HTTP_STR_MATCH or HTTPS_STR_MATCH, the string to search for in the response body from the specified resource",
  "RequestInterval": 10 | 30,
  "FailureThreshold": integer between 1 and 10
}
```

To add the health check to a Route 53 resource record set, use the `change-resource-record-sets` command.

For more information, see Amazon Route 53 Health Checks and DNS Failover in the *Amazon Route 53 Developer Guide*.

- For API details, see CreateHealthCheck in *AWS CLI Command Reference*.

`create-hosted-zone`

The following code example shows how to use `create-hosted-zone`.

AWS CLI

To create a hosted zone

The following `create-hosted-zone` command adds a hosted zone named `example.com` using the caller reference `2014-04-01-18:47`. The optional comment includes a space, so it must be enclosed in quotation marks:

```
aws route53 create-hosted-zone --name example.com --caller-
reference 2014-04-01-18:47 --hosted-zone-config Comment="command-line version"
```

For more information, see Working with Hosted Zones in the *Amazon Route 53 Developer Guide*.

- For API details, see CreateHostedZone in *AWS CLI Command Reference*.

`delete-health-check`

The following code example shows how to use `delete-health-check`.

AWS CLI

To delete a health check

The following `delete-health-check` command deletes the health check with a `health-check-id` of `e75b48d9-547a-4c3d-88a5-ae4002397608`:

```
aws route53 delete-health-check --health-check-id e75b48d9-547a-4c3d-88a5-
ae4002397608
```

- For API details, see DeleteHealthCheck in *AWS CLI Command Reference*.

`delete-hosted-zone`

The following code example shows how to use `delete-hosted-zone`.

AWS CLI

To delete a hosted zone

The following `delete-hosted-zone` command deletes the hosted zone with an `id` of `Z36KTIQEXAMPLE`:

```
aws route53 delete-hosted-zone --id Z36KTIQEXAMPLE
```

- For API details, see DeleteHostedZone in *AWS CLI Command Reference*.

`get-change`

The following code example shows how to use `get-change`.

AWS CLI

To get the status of a change to resource record sets

The following `get-change` command gets the status and other information about the `change-resource-record-sets` request that has an `Id` of `/change/CWPIK4URU2I5S`:

```
aws route53 get-change --id /change/CWPIK4URU2I5S
```

- For API details, see GetChange in *AWS CLI Command Reference*.

`get-health-check`

The following code example shows how to use `get-health-check`.

AWS CLI

To get information about a health check

The following `get-health-check` command gets information about the health check that has a `health-check-id` of `02ec8401-9879-4259-91fa-04e66d094674`:

```
aws route53 get-health-check --health-check-id 02ec8401-9879-4259-91fa-04e66d094674
```

- For API details, see GetHealthCheck in *AWS CLI Command Reference*.

`get-hosted-zone`

The following code example shows how to use `get-hosted-zone`.

AWS CLI

To get information about a hosted zone

The following `get-hosted-zone` command gets information about the hosted zone with an `id` of `Z1R8UBAEXAMPLE`:

```
aws route53 get-hosted-zone --id Z1R8UBAEXAMPLE
```

- For API details, see GetHostedZone in *AWS CLI Command Reference*.

`list-health-checks`

The following code example shows how to use `list-health-checks`.

AWS CLI

To list the health checks associated with the current AWS account

The following `list-health-checks` command lists detailed information about the first 100 health checks that are associated with the current AWS account.:

```
aws route53 list-health-checks
```

If you have more than 100 health checks, or if you want to list them in groups smaller than 100, include the `--maxitems` parameter. For example, to list health checks one at a time, use the following command:

```
aws route53 list-health-checks --max-items 1
```

To view the next health check, take the value of `NextToken` from the response to the previous command, and include it in the `--starting-token` parameter, for example:

```
aws route53 list-health-checks --max-items 1 --starting-token Z3M3LMPEXAMPLE
```

- For API details, see ListHealthChecks in *AWS CLI Command Reference*.

`list-hosted-zones-by-name`

The following code example shows how to use `list-hosted-zones-by-name`.

AWS CLI

The following command lists up to 100 hosted zones ordered by domain name:

```
aws route53 list-hosted-zones-by-name
```

Output:

```
{
  "HostedZones": [
      {
          "ResourceRecordSetCount": 2,
          "CallerReference": "test20150527-2",
          "Config": {
              "Comment": "test2",
              "PrivateZone": false
          },
          "Id": "/hostedzone/Z119WBBTVP5WFX",
          "Name": "2.example.com."
      },
      {
          "ResourceRecordSetCount": 2,
          "CallerReference": "test20150527-1",
          "Config": {
              "Comment": "test",
              "PrivateZone": false
          },
          "Id": "/hostedzone/Z3P5QSUBK4POTI",
          "Name": "www.example.com."
      }
  ],
```

```
  "IsTruncated": false,
  "MaxItems": "100"
}
```

The following command lists hosted zones ordered by name, beginning with `www.example.com`:

```
aws route53 list-hosted-zones-by-name --dns-name www.example.com
```

Output:

```
{
  "HostedZones": [
      {
          "ResourceRecordSetCount": 2,
          "CallerReference": "mwunderl20150527-1",
          "Config": {
              "Comment": "test",
              "PrivateZone": false
          },
          "Id": "/hostedzone/Z3P5QSUBK4POTI",
          "Name": "www.example.com."
      }
  ],
  "DNSName": "www.example.com",
  "IsTruncated": false,
  "MaxItems": "100"
}
```

- For API details, see ListHostedZonesByName in *AWS CLI Command Reference*.

`list-hosted-zones`

The following code example shows how to use `list-hosted-zones`.

AWS CLI

To list the hosted zones associated with the current AWS account

The following `list-hosted-zones` command lists summary information about the first 100 hosted zones that are associated with the current AWS account.:

```
aws route53 list-hosted-zones
```

If you have more than 100 hosted zones, or if you want to list them in groups smaller than 100, include the `--max-items` parameter. For example, to list hosted zones one at a time, use the following command:

```
aws route53 list-hosted-zones --max-items 1
```

To view information about the next hosted zone, take the value of `NextToken` from the response to the previous command, and include it in the `--starting-token` parameter, for example:

```
aws route53 list-hosted-zones --max-items 1 --starting-token Z3M3LMPEXAMPLE
```

- For API details, see ListHostedZones in *AWS CLI Command Reference*.

`list-query-logging-configs`

The following code example shows how to use `list-query-logging-configs`.

AWS CLI

To list query logging configurations

The following `list-query-logging-configs` example lists information about the first 100 query logging configurations in your AWS account, for the hosted zone `Z1OX3WQEXAMPLE`.

```
aws route53 list-query-logging-configs \
    --hosted-zone-id Z1OX3WQEXAMPLE
```

Output:

```
{
    "QueryLoggingConfigs": [
        {
            "Id": "964ff34e-ae03-4f06-80a2-9683cexample",
            "HostedZoneId": "Z1OX3WQEXAMPLE",
            "CloudWatchLogsLogGroupArn": "arn:aws:logs:us-east-1:111122223333:log-
group:/aws/route53/example.com:*"
```

```
        }
    ]
}
```

For more information, see [Logging DNS queries](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [ListQueryLoggingConfigs](#) in *AWS CLI Command Reference*.

`list-resource-record-sets`

The following code example shows how to use `list-resource-record-sets`.

AWS CLI

To list the resource record sets in a hosted zone

The following `list-resource-record-sets` command lists summary information about the first 100 resource record sets in a specified hosted zone.:

```
aws route53 list-resource-record-sets --hosted-zone-id Z2LD58HEXAMPLE
```

If the hosted zone contains more than 100 resource record sets, or if you want to list them in groups smaller than 100, include the `--maxitems` parameter. For example, to list resource record sets one at a time, use the following command:

```
aws route53 list-resource-record-sets --hosted-zone-id Z2LD58HEXAMPLE --max-items 1
```

To view information about the next resource record set in the hosted zone, take the value of `NextToken` from the response to the previous command, and include it in the `--starting-token` parameter, for example:

```
aws route53 list-resource-record-sets --hosted-zone-id Z2LD58HEXAMPLE --max-items 1
 --starting-token Z3M3LMPEXAMPLE
```

To view all the resource record sets of a particular name, use the `--query` parameter to filter them out. For example:

```
aws route53 list-resource-record-sets --hosted-zone-id Z2LD58HEXAMPLE --
query "ResourceRecordSets[?Name == 'example.domain.']"
```

- For API details, see ListResourceRecordSets in *AWS CLI Command Reference*.

Route 53 domain registration examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Route 53 domain registration.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`check-domain-availability`

The following code example shows how to use `check-domain-availability`.

AWS CLI

To determine whether you can register a domain name with Route 53

The following `check-domain-availability` command returns information about whether the domain name `example.com` is available to be registered using Route 53.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains check-domain-availability \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
```

```
    "Availability": "UNAVAILABLE"
}
```

Route 53 supports a large number of top-level domains (TLDs), such as `.com` and `.jp`, but we don't support all available TLDs. If you check the availability of a domain and Route 53 doesn't support the TLD, `check-domain-availability` returns the following message.

```
An error occurred (UnsupportedTLD) when calling the CheckDomainAvailability
 operation: <top-level domain> tld is not supported.
```

For a list of the TLDs that you can use when registering a domain with Route 53, see Domains That You Can Register with Amazon Route 53 in the *Amazon Route 53 Developer Guide*. For more information about registering domains with Amazon Route 53, see Registering a New Domain in the *Amazon Route 53 Developer Guide*.

- For API details, see CheckDomainAvailability in *AWS CLI Command Reference*.

`check-domain-transferability`

The following code example shows how to use `check-domain-transferability`.

AWS CLI

To determine whether a domain can be transferred to Route 53

The following `check-domain-transferability` command returns information about whether you can transfer the domain name `example.com` to Route 53.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains check-domain-transferability \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
    "Transferability": {
        "Transferable": "UNTRANSFERABLE"
```

```
    }
}
```

For more information, see Transferring Registration for a Domain to Amazon Route 53 in the *Amazon Route 53 Developer Guide*.

- For API details, see CheckDomainTransferability in *AWS CLI Command Reference*.

`delete-tags-for-domain`

The following code example shows how to use `delete-tags-for-domain`.

AWS CLI

To delete tags for a domain

The following `delete-tags-for-domain` command deletes three tags from the specified domain. Note that you specify only the tag key, not the tag value.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains delete-tags-for-domain \
    --region us-east-1 \
    --domain-name example.com \
    --tags-to-delete accounting-key hr-key engineering-key
```

This command produces no output.

To confirm that the tags were deleted, you can run list-tags-for-domain . For more information, see Tagging Amazon Route 53 Resources in the *Amazon Route 53 Developer Guide*.

- For API details, see DeleteTagsForDomain in *AWS CLI Command Reference*.

`disable-domain-auto-renew`

The following code example shows how to use `disable-domain-auto-renew`.

AWS CLI

To disable automatic renewal of a domain

The following `disable-domain-auto-renew` command configures Route 53 to *not* automatically renew the domain `example.com` before registration for the domain expires.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains disable-domain-auto-renew \
    --region us-east-1 \
    --domain-name example.com
```

This command produces no output.

To confirm that the setting was changed, you can run get-domain-detail . If automatic renewal is disabled, the value of `AutoRenew` is `False`. For more information about automatic renewal, see Renewing Registration for a Domain <https://docs.aws.amazon.com/Route53/latest/DeveloperGuide/domain-renew.html in the *Amazon Route 53 Developer Guide*.

- For API details, see DisableDomainAutoRenew in *AWS CLI Command Reference*.

`disable-domain-transfer-lock`

The following code example shows how to use `disable-domain-transfer-lock`.

AWS CLI

To disable the transfer lock on a domain

The following `disable-domain-transfer-lock` command removes the transfer lock on the domain `example.com` so that the domain can be transferred to another registrar. This command changes the `clientTransferProhibited` status.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains disable-domain-transfer-lock \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
```

```
    "OperationId": "3f28e0ac-126a-4113-9048-cc930example"
}
```

To confirm that the transfer lock has been changed, you can run get-domain-detail . When the transfer lock is disabled, the value of `StatusList` does *not* include `clientTransferProhibited`.

For more information about the transfer process, see Transferring a Domain from Amazon Route 53 to Another Registrar in the *Amazon Route 53 Developer Guide*.

- For API details, see DisableDomainTransferLock in *AWS CLI Command Reference*.

enable-domain-auto-renew

The following code example shows how to use `enable-domain-auto-renew`.

AWS CLI

To enable automatic renewal of a domain

The following `enable-domain-auto-renew` command configures Route 53 to automatically renew the domain `example.com` before registration for the domain expires.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains enable-domain-auto-renew \
    --region us-east-1 \
    --domain-name example.com
```

This command produces no output. To confirm that the setting was changed, you can run get-domain-detail . If automatic renewal is enabled, the value of `AutoRenew` is `True`.

For more information about automatic renewal, see Renewing Registration for a Domain <https://docs.aws.amazon.com/Route53/latest/DeveloperGuide/domain-renew.html in the *Amazon Route 53 Developer Guide*.

- For API details, see EnableDomainAutoRenew in *AWS CLI Command Reference*.

enable-domain-transfer-lock

The following code example shows how to use `enable-domain-transfer-lock`.

AWS CLI

To enable the transfer lock on a domain

The following `enable-domain-transfer-lock` command locks the specified domain so that it can't be transferred to another registrar. This command changes the `clientTransferProhibited` status.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains enable-domain-transfer-lock \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
    "OperationId": "3f28e0ac-126a-4113-9048-cc930example"
}
```

To confirm that the transfer lock has been changed, you can run get-domain-detail . When the transfer lock is enabled, the value of `StatusList` includes `clientTransferProhibited`.

For more information about the transfer process, see Transferring a Domain from Amazon Route 53 to Another Registrar in the *Amazon Route 53 Developer Guide*.

- For API details, see EnableDomainTransferLock in *AWS CLI Command Reference*.

`get-contact-reachability-status`

The following code example shows how to use `get-contact-reachability-status`.

AWS CLI

To determine whether the registrant contact has responded to a confirmation email

The following `get-contact-reachability-status` command returns information about whether the registrant contact for the specified domain has responded to a confirmation email.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains get-contact-reachability-status \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
    "domainName": "example.com",
    "status": "DONE"
}
```

For more information, see Resending Authorization and Confirmation Emails in the *Amazon Route 53 Developer Guide*.

- For API details, see GetContactReachabilityStatus in *AWS CLI Command Reference*.

`get-domain-detail`

The following code example shows how to use `get-domain-detail`.

AWS CLI

To get detailed information about a specified domain

The following `get-domain-detail` command displays detailed information about the specified domain.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains get-domain-detail \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
    "DomainName": "example.com",
    "Nameservers": [
        {
            "Name": "ns-2048.awsdns-64.com",
            "GlueIps": []
```

```
        },
        {
            "Name": "ns-2049.awsdns-65.net",
            "GlueIps": []
        },
        {
            "Name": "ns-2050.awsdns-66.org",
            "GlueIps": []
        },
        {
            "Name": "ns-2051.awsdns-67.co.uk",
            "GlueIps": []
        }
    ],
    "AutoRenew": true,
    "AdminContact": {
        "FirstName": "Saanvi",
        "LastName": "Sarkar",
        "ContactType": "COMPANY",
        "OrganizationName": "Example",
        "AddressLine1": "123 Main Street",
        "City": "Anytown",
        "State": "WA",
        "CountryCode": "US",
        "ZipCode": "98101",
        "PhoneNumber": "+1.8005551212",
        "Email": "ssarkar@example.com",
        "ExtraParams": []
    },
    "RegistrantContact": {
        "FirstName": "Alejandro",
        "LastName": "Rosalez",

    "ExpirationDate": 1602787689.0,
    "StatusList": [
        "clientTransferProhibited"
    ]
}
```

- For API details, see GetDomainDetail in *AWS CLI Command Reference*.

get-domain-suggestions

The following code example shows how to use `get-domain-suggestions`.

AWS CLI

To get a list of suggested domain names

The following `get-domain-suggestions` command displays a list of suggested domain names based on the domain name `example.com`. The response includes only domain names that are available. This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains get-domain-suggestions \
    --region us-east-1 \
    --domain-name example.com \
    --suggestion-count 10 \
    --only-available
```

Output:

```
{
    "SuggestionsList": [
        {
            "DomainName": "egzaampal.com",
            "Availability": "AVAILABLE"
        },
        {
            "DomainName": "examplelaw.com",
            "Availability": "AVAILABLE"
        },
        {
            "DomainName": "examplehouse.net",
            "Availability": "AVAILABLE"
        },
        {
            "DomainName": "homeexample.net",
            "Availability": "AVAILABLE"
        },
        {
            "DomainName": "examplelist.com",
            "Availability": "AVAILABLE"
       },
        {
            "DomainName": "examplenews.net",
            "Availability": "AVAILABLE"
        },
        {
            "DomainName": "officeexample.com",
            "Availability": "AVAILABLE"
        },
        {
            "DomainName": "exampleworld.com",
            "Availability": "AVAILABLE"
        },
        {
```

```
                "DomainName": "exampleart.com",
                "Availability": "AVAILABLE"
            }
        ]
}
```

- For API details, see GetDomainSuggestions in *AWS CLI Command Reference*.

`get-operation-detail`

The following code example shows how to use `get-operation-detail`.

AWS CLI

To get the current status of an operation

Some domain registration operations operate asynchronously and return a response before they finish. These operations return an operation ID that you can use to get the current status. The following `get-operation-detail` command returns the status of the specified operation.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains get-operation-detail \
    --region us-east-1 \
    --operation-id edbd8d63-7fe7-4343-9bc5-54033example
```

Output:

```
{
    "OperationId": "edbd8d63-7fe7-4343-9bc5-54033example",
    "Status": "SUCCESSFUL",
    "DomainName": "example.com",
    "Type": "DOMAIN_LOCK",
    "SubmittedDate": 1573749367.864
}
```

- For API details, see GetOperationDetail in *AWS CLI Command Reference*.

`list-domains`

The following code example shows how to use `list-domains`.

AWS CLI

To list the domains that are registered with the current AWS account

The following `list-domains` command lists summary information about the domains that are registered with the current AWS account.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains list-domains
    --region us-east-1
```

Output:

```
{
    "Domains": [
        {
            "DomainName": "example.com",
            "AutoRenew": true,
            "TransferLock": true,
            "Expiry": 1602712345.0
        },
        {
            "DomainName": "example.net",
            "AutoRenew": true,
            "TransferLock": true,
            "Expiry": 1602723456.0
        },
        {
            "DomainName": "example.org",
            "AutoRenew": true,
            "TransferLock": true,
            "Expiry": 1602734567.0
        }
    ]
}
```

- For API details, see ListDomains in *AWS CLI Command Reference*.

`list-operations`

The following code example shows how to use `list-operations`.

AWS CLI

To list the status of operations that return an operation ID

Some domain registration operations run asynchronously and return a response before they finish. These operations return an operation ID that you can use to get the current status. The following `list-operations` command lists summary information, including the status, about the current domain-registration operations.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains list-operations
    --region us-east-1
```

Output:

```
{
    "Operations": [
        {
            "OperationId": "aab9822f-1da0-4bf3-8a15-fd4e0example",
            "Status": "SUCCESSFUL",
            "Type": "DOMAIN_LOCK",
            "SubmittedDate": 1455321739.986
        },
        {
            "OperationId": "c24379ed-76be-42f8-bdad-9379bexample",
            "Status": "SUCCESSFUL",
            "Type": "UPDATE_NAMESERVER",
            "SubmittedDate": 1468960475.109
        },
        {
            "OperationId": "f47e1297-ef9e-4c2b-ae1e-a5fcbexample",
            "Status": "SUCCESSFUL",
            "Type": "RENEW_DOMAIN",
            "SubmittedDate": 1473561835.943
        },
        {
            "OperationId": "75584f23-b15f-459e-aed7-dc6f5example",
```

```
                "Status": "SUCCESSFUL",
                "Type": "UPDATE_DOMAIN_CONTACT",
                "SubmittedDate": 1547501003.41
            }
        ]
}
```

The output includes all the operations that return an operation ID and that you have performed on all the domains that you have ever registered using the current AWS account. If you want to get only the operations that you submitted after a specified date, you can include the `submitted-since` parameter and specify a date in Unix format and Coordinated Universal Time (UTC). The following command gets the status of all operations that were submitted after 12:00 am UTC on January 1, 2020.

```
aws route53domains list-operations \
    --submitted-since 1577836800
```

- For API details, see ListOperations in *AWS CLI Command Reference*.

`list-tags-for-domain`

The following code example shows how to use `list-tags-for-domain`.

AWS CLI

To list tags for a domain

The following `list-tags-for-domain` command lists the tags that are currently associated with the specified domain.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains list-tags-for-domain \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
    "TagList": [
```

```
        {
            "Key": "key1",
            "Value": "value1"
        },
        {
            "Key": "key2",
            "Value": "value2"
        }
    ]
}
```

For more information, see Tagging Amazon Route 53 Resources in the *Amazon Route 53 Developer Guide*.

- For API details, see ListTagsForDomain in *AWS CLI Command Reference*.

`register-domain`

The following code example shows how to use `register-domain`.

AWS CLI

To register a domain

The following `register-domain` command registers a domain, retrieving all parameter values from a JSON-formatted file.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains register-domain \
    --region us-east-1 \
    --cli-input-json file://register-domain.json
```

Contents of `register-domain.json`:

```
{
    "DomainName": "example.com",
    "DurationInYears": 1,
    "AutoRenew": true,
    "AdminContact": {
        "FirstName": "Martha",
```

```
        "LastName": "Rivera",
        "ContactType": "PERSON",
        "OrganizationName": "Example",
        "AddressLine1": "1 Main Street",
        "City": "Anytown",
        "State": "WA",
        "CountryCode": "US",
        "ZipCode": "98101",
        "PhoneNumber": "+1.8005551212",
        "Email": "mrivera@example.com"
    },
    "RegistrantContact": {
        "FirstName": "Li",
        "LastName": "Juan",
        "ContactType": "PERSON",
        "OrganizationName": "Example",
        "AddressLine1": "1 Main Street",
        "City": "Anytown",
        "State": "WA",
        "CountryCode": "US",
        "ZipCode": "98101",
        "PhoneNumber": "+1.8005551212",
        "Email": "ljuan@example.com"
    },
    "TechContact": {
        "FirstName": "Mateo",
        "LastName": "Jackson",
        "ContactType": "PERSON",
        "OrganizationName": "Example",
        "AddressLine1": "1 Main Street",
        "City": "Anytown",
        "State": "WA",
        "CountryCode": "US",
        "ZipCode": "98101",
        "PhoneNumber": "+1.8005551212",
        "Email": "mjackson@example.com"
    },
    "PrivacyProtectAdminContact": true,
    "PrivacyProtectRegistrantContact": true,
    "PrivacyProtectTechContact": true
}
```

Output:

```
{
    "OperationId": "b114c44a-9330-47d1-a6e8-a0b11example"
}
```

To confirm that the operation succeeded, you can run `get-operation-detail`. For more information, see get-operation-detail .

For more information, see Registering a New Domain in the *Amazon Route 53 Developer Guide*.

For information about which top-level domains (TLDs) require values for `ExtraParams` and what the valid values are, see ExtraParam in the *Amazon Route 53 API Reference*.

- For API details, see RegisterDomain in *AWS CLI Command Reference*.

`renew-domain`

The following code example shows how to use `renew-domain`.

AWS CLI

To renew a domain

The following `renew-domain` command renews the specified domain for five years. To get the value for `current-expiry-year`, use the `get-domain-detail` command, and convert the value of `ExpirationDate` from Unix format.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains renew-domain \
    --region us-east-1 \
    --domain-name example.com \
    --duration-in-years 5 \
    --current-expiry-year 2020
```

Output:

```
{
    "OperationId": "3f28e0ac-126a-4113-9048-cc930example"
}
```

To confirm that the operation succeeded, you can run `get-operation-detail`. For more information, see get-operation-detail.

The registry for each top-level domain (TLD), such as .com or .org, controls the maximum number of years that you can renew a domain for. To get the maximum renewal period for your domain, see the "Registration and Renewal Period" section for your TLD in Domains That You Can Register with Amazon Route 53 in the *Amazon Route 53 Developer Guide*.

For more information, see Renewing Registration for a Domain in the *Amazon Route 53 Developer Guide*.

- For API details, see RenewDomain in *AWS CLI Command Reference*.

`resend-contact-reachability-email`

The following code example shows how to use `resend-contact-reachability-email`.

AWS CLI

To resend the confirmation email to the current email address for the registrant contact

The following `resend-contact-reachability-email` command resends the confirmation email to the current email address for the registrant contact for the example.com domain.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains resend-contact-reachability-email \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
    "domainName": "example.com",
    "emailAddress": "moliveira@example.com",
    "isAlreadyVerified": true
}
```

If the value of `isAlreadyVerified` is `true`, as in this example, the registrant contact has already confirmed that the specified email address is reachable.

For more information, see Resending Authorization and Confirmation Emails in the *Amazon Route 53 Developer Guide*.

- For API details, see ResendContactReachabilityEmail in *AWS CLI Command Reference*.

`retrieve-domain-auth-code`

The following code example shows how to use `retrieve-domain-auth-code`.

AWS CLI

To get the authorization code for a domain so you can transfer the domain to another registrar

The following `retrieve-domain-auth-code` command gets the current authorization code for the example.com domain. You give this value to another domain registrar when you want to transfer the domain to that registrar.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains retrieve-domain-auth-code \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
    "AuthCode": ")o!v3dJeXampLe"
}
```

For more information, see Transferring a Domain from Amazon Route 53 to Another Registrar in the *Amazon Route 53 Developer Guide*.

- For API details, see RetrieveDomainAuthCode in *AWS CLI Command Reference*.

`transfer-domain`

The following code example shows how to use `transfer-domain`.

AWS CLI

To transfer a domain to Amazon Route 53

The following `transfer-domain` command transfers a domain to Route 53, with the parameters provided by the JSON-formatted file `C:\temp\transfer-domain.json`.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains transfer-domain \
    --region us-east-1 \
    --cli-input-json file://C:\temp\transfer-domain.json
```

Contents of `transfer-domain.json`:

```
{
    "DomainName": "example.com",
    "DurationInYears": 1,
    "Nameservers": [
        {
            "Name": "ns-2048.awsdns-64.com"
        },
        {
            "Name": "ns-2049.awsdns-65.net"
        },
        {
            "Name": "ns-2050.awsdns-66.org"
        },
        {
            "Name": "ns-2051.awsdns-67.co.uk"
        }
    ],
    "AuthCode": ")o!v3dJeXampLe",
    "AutoRenew": true,

```
{
    "OperationId": "b114c44a-9330-47d1-a6e8-a0b11example"
}
```

To confirm that the operation succeeded, you can run `get-operation-detail`. For more information, see get-operation-detail .

For more information, see Transferring Registration for a Domain to Amazon Route 53 in the *Amazon Route 53 Developer Guide*.

- For API details, see TransferDomain in *AWS CLI Command Reference*.

`update-domain-contact-privacy`

The following code example shows how to use `update-domain-contact-privacy`.

AWS CLI

To update the privacy settings for the contacts for a domain

The following `update-domain-contact-privacy` command turns off privacy protection for the administrative contact for the example.com domain. This command runs only in the `us-east-1` Region.

If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains update-domain-contact-privacy \
    --region us-east-1 \
    --domain-name example.com \
    --no-admin-privacy
```

Output:

```
{
    "OperationId": "b3a219e9-d801-4244-b533-b7256example"
}
```

To confirm that the operation succeeded, you can run `get-operation-detail`. For more information, see get-operation-detail .

For more information, see Enabling or Disabling Privacy Protection for Contact Information for a Domain in the *Amazon Route 53 Developer Guide*.

- For API details, see UpdateDomainContactPrivacy in *AWS CLI Command Reference*.

`update-domain-contact`

The following code example shows how to use `update-domain-contact`.

AWS CLI

To update the contact information for a domain

The following `update-domain-contact` command updates the contact information for a domain, getting the parameters from the JSON-formatted file `C:\temp\update-domain-contact.json`.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains update-domain-contact \
    --region us-east-1 \
    --cli-input-json file://C:\temp\update-domain-contact.json
```

Contents of `update-domain-contact.json`:

```
{
    "AdminContact": {
        "AddressLine1": "101 Main Street",
        "AddressLine2": "Suite 1a",
        "City": "Seattle",
        "ContactType": "COMPANY",
        "CountryCode": "US",
        "Email": "w.xiulan@example.com",
        "FirstName": "Wang",
        "LastName": "Xiulan",
        "OrganizationName": "Example",
        "PhoneNumber": "+1.8005551212",
        "State": "WA",
        "ZipCode": "98101"
    },
    "DomainName": "example.com",
    "RegistrantContact": {
        "AddressLine1": "101 Main Street",
        "AddressLine2": "Suite 1a",
        "City": "Seattle",
        "ContactType": "COMPANY",
```

```
        "CountryCode": "US",
        "Email": "w.xiulan@example.com",
        "FirstName": "Wang",
        "LastName": "Xiulan",
        "OrganizationName": "Example",
        "PhoneNumber": "+1.8005551212",
        "State": "WA",
        "ZipCode": "98101"
    },
    "TechContact": {
        "AddressLine1": "101 Main Street",
        "AddressLine2": "Suite 1a",
        "City": "Seattle",
        "ContactType": "COMPANY",
        "CountryCode": "US",
        "Email": "w.xiulan@example.com",
        "FirstName": "Wang",
        "LastName": "Xiulan",
        "OrganizationName": "Example",
        "PhoneNumber": "+1.8005551212",
        "State": "WA",
        "ZipCode": "98101"
    }
}
```

Output:

```
{
    "OperationId": "b3a219e9-d801-4244-b533-b7256example"
}
```

To confirm that the operation succeeded, you can run get-domain-detail . For more information, see Updating Contact Information for a Domain in the *Amazon Route 53 Developer Guide*.

- For API details, see UpdateDomainContact in *AWS CLI Command Reference*.

`update-domain-nameservers`

The following code example shows how to use `update-domain-nameservers`.

AWS CLI

To update the name servers for a domain

The following `update-domain-nameservers` command updates the name servers for a domain.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains update-domain-nameservers \
    --region us-east-1 \
    --domain-name example.com \
    --
nameservers Name=ns-1.awsdns-01.org Name=ns-2.awsdns-02.co.uk Name=ns-3.awsdns-03.net Name=n
```

Output:

```
{
    "OperationId": "f1691ec4-0e7a-489e-82e0-b19d3example"
}
```

To confirm that the operation succeeded, you can run get-domain-detail .

For more information, see Adding or Changing Name Servers and Glue Records for a Domain in the *Amazon Route 53 Developer Guide*.

- For API details, see UpdateDomainNameservers in *AWS CLI Command Reference*.

`update-tags-for-domain`

The following code example shows how to use `update-tags-for-domain`.

AWS CLI

To add or update tags for a domain

The following `update-tags-for-domain` command adds or updates two keys and the corresponding values for the example.com domain. To update the value for a key, just include the key and the new value. You can add or update tags in only one domain at a time.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains update-tags-for-domain \
```

```
    --region us-east-1 \
    --domain-name example.com \
    --tags-to-update "Key=key1,Value=value1" "Key=key2,Value=value2"
```

This command produces no output. To confirm that the tags were added or updated, you can run list-tags-for-domain .

For more information, see Tagging Amazon Route 53 Resources in the *Amazon Route 53 Developer Guide*.

- For API details, see UpdateTagsForDomain in *AWS CLI Command Reference*.

`view-billing`

The following code example shows how to use `view-billing`.

AWS CLI

To get billing information for domain registration charges for the current AWS account

The following `view-billing` command returns all the domain-related billing records for the current account for the period from January 1, 2018 (1514764800 in Unix time) and midnight on December 31, 2019 (1577836800 in Unix time).

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains view-billing \
    --region us-east-1 \
    --start-time 1514764800 \
    --end-time 1577836800
```

Output:

```
{
    "BillingRecords": [
        {
            "DomainName": "example.com",
            "Operation": "RENEW_DOMAIN",
            "InvoiceId": "149962827",
            "BillDate": 1536618063.181,
```

```
                "Price": 12.0
            },
            {
                "DomainName": "example.com",
                "Operation": "RENEW_DOMAIN",
                "InvoiceId": "290913289",
                "BillDate": 1568162630.884,
                "Price": 12.0
            }
        ]
    }
```

For more information, see ViewBilling in the *Amazon Route 53 API Reference*.

- For API details, see ViewBilling in *AWS CLI Command Reference*.

Route 53 Profiles examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Route 53 Profiles.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Actions

`associate-profile`

The following code example shows how to use `associate-profile`.

AWS CLI

To associate a Profile

The following `associate-profile` example associates a Profile to a VPC.

```
aws route53profiles associate-profile \
    --name test-association \
    --profile-id rp-4987774726example \
    --resource-id vpc-0af3b96b3example
```

Output:

```
{
    "ProfileAssociation": {
        "CreationTime": 1710851336.527,
        "Id": "rpassoc-489ce212fexample",
        "ModificationTime": 1710851336.527,
        "Name": "test-association",
        "OwnerId": "123456789012",
        "ProfileId": "rp-4987774726example",
        "ResourceId": "vpc-0af3b96b3example",
        "Status": "CREATING",
        "StatusMessage": "Creating Profile Association"
    }
}
```

For more information, see Using Profiles in the *Amazon Route 53 Developer Guide*.

- For API details, see AssociateProfile in *AWS CLI Command Reference*.

`associate-resource-to-profile`

The following code example shows how to use `associate-resource-to-profile`.

AWS CLI

To associate a resource to a Profile

The following `associate-resource-to-profile` example associates a DNS Firewall rule group with the priority of 102 to a Profile.

```
aws route53profiles associate-resource-to-profile \
    --name test-resource-association \
    --profile-id rp-4987774726example \
    --resource-arn arn:aws:route53resolver:us-east-1:123456789012:firewall-rule-
group/rslvr-frg-cfe7f72example \
    --resource-properties "{\"priority\": 102}"
```

Output:

```
{
    "ProfileResourceAssociation": {
        "CreationTime": 1710851216.613,
        "Id": "rpr-001913120a7example",
        "ModificationTime": 1710851216.613,
        "Name": "test-resource-association",
        "OwnerId": "123456789012",
        "ProfileId": "rp-4987774726example",
        "ResourceArn": "arn:aws:route53resolver:us-east-1:123456789012:firewall-
rule-group/rslvr-frg-cfe7f72example",
        "ResourceProperties": "{\"priority\":102}",
        "ResourceType": "FIREWALL_RULE_GROUP",
        "Status": "UPDATING",
        "StatusMessage": "Updating the Profile to DNS Firewall rule group
 association"
    }
}
```

- For API details, see AssociateResourceToProfile in *AWS CLI Command Reference*.

`create-profile`

The following code example shows how to use `create-profile`.

AWS CLI

To create a Profile

The following `create-profile` example creates a Profile.

```
aws route53profiles create-profile \
    --name test
```

Output:

```
{
    "Profile": {
        "Arn": "arn:aws:route53profiles:us-east-1:123456789012:profile/
rp-6ffe47d5example",
```

```
        "ClientToken": "2ca1a304-32b3-4f5f-bc4c-EXAMPLE11111",
        "CreationTime": 1710850903.578,
        "Id": "rp-6ffe47d5example",
        "ModificationTime": 1710850903.578,
        "Name": "test",
        "OwnerId": "123456789012",
        "ShareStatus": "NOT_SHARED",
        "Status": "COMPLETE",
        "StatusMessage": "Created Profile"
    }
}
```

- For API details, see CreateProfile in *AWS CLI Command Reference*.

`delete-profile`

The following code example shows how to use `delete-profile`.

AWS CLI

To delete a Profile

The following `delete-profile` example deletes a Profile.

```
aws route53profiles delete-profile \
    --profile-id rp-6ffe47d5example
```

Output:

```
{
    "Profile": {
        "Arn": "arn:aws:route53profiles:us-east-1:123456789012:profile/
rp-6ffe47d5example",
        "ClientToken": "0a15fec0-05d9-4f78-bec0-EXAMPLE11111",
        "CreationTime": 1710850903.578,
        "Id": "rp-6ffe47d5example",
        "ModificationTime": 1710850903.578,
        "Name": "test",
        "OwnerId": "123456789012",
        "ShareStatus": "NOT_SHARED",
        "Status": "DELETED",
        "StatusMessage": "Deleted Profile"
```

```
    }
}
```

- For API details, see DeleteProfile in *AWS CLI Command Reference*.

disassociate-profile

The following code example shows how to use `disassociate-profile`.

AWS CLI

To disassociate a Profile

The following `disassociate-profile` example disassociates a Profile from a VPC.

```
aws route53profiles disassociate-profile \
    --profile-id rp-4987774726example \
    --resource-id vpc-0af3b96b3example
```

Output:

```
{
    "ProfileAssociation": {
        "CreationTime": 1710851336.527,
        "Id": "rpassoc-489ce212fexample",
        "ModificationTime": 1710851401.362,
        "Name": "test-association",
        "OwnerId": "123456789012",
        "ProfileId": "rp-4987774726example",
        "ResourceId": "vpc-0af3b96b3example",
        "Status": "DELETING",
        "StatusMessage": "Deleting Profile Association"
    }
}
```

- For API details, see DisassociateProfile in *AWS CLI Command Reference*.

disassociate-resource-from-profile

The following code example shows how to use `disassociate-resource-from-profile`.

AWS CLI

To disassociate a resource from Profile

The following `disassociate-resource-from-profile` example disassociates a DNS Firewall rule group from a Profile.

```
aws route53profiles disassociate-resource-from-profile \
    --profile-id rp-4987774726example \
    --resource-arn arn:aws:route53resolver:us-east-1:123456789012:firewall-rule-group/rslvr-frg-cfe7f72example
```

Output:

```
{
    "ProfileResourceAssociation": {
        "CreationTime": 1710851216.613,
        "Id": "rpr-001913120a7example",
        "ModificationTime": 1710852624.36,
        "Name": "test-resource-association",
        "OwnerId": "123456789012",
        "ProfileId": "rp-4987774726example",
        "ResourceArn": "arn:aws:route53resolver:us-east-1:123456789012:firewall-rule-group/rslvr-frg-cfe7f72example",
        "ResourceProperties": "{\"priority\":105}",
        "ResourceType": "FIREWALL_RULE_GROUP",
        "Status": "DELETING",
        "StatusMessage": "Deleting the Profile to DNS Firewall rule group association"
    }
}
```

- For API details, see DisassociateResourceFromProfile in *AWS CLI Command Reference*.

`get-profile-association`

The following code example shows how to use `get-profile-association`.

AWS CLI

To get information about a Profile association

The following `get-profile-association` returns information about the specified Profile association.

```
aws route53profiles get-profile-association \
    --profile-association-id rpassoc-489ce212fexample
```

Output:

```
{
    "ProfileAssociation": {
        "CreationTime": 1709338817.148,
        "Id": "rrpassoc-489ce212fexample",
        "ModificationTime": 1709338974.772,
        "Name": "test-association",
        "OwnerId": "123456789012",
        "ProfileId": "rp-4987774726example",
        "ResourceId": "vpc-0af3b96b3example",
        "Status": "COMPLETE",
        "StatusMessage": "Created Profile Association"
    }
}
```

- For API details, see GetProfileAssociation in *AWS CLI Command Reference*.

get-profile-resource-association

The following code example shows how to use `get-profile-resource-association`.

AWS CLI

To get information about a resource associated to a Profile

The following `get-profile-resource-association` returns information about the specified resource association to a Profile.

```
aws route53profiles get-profile-resource-association \
    --profile-resource-association-id rpr-001913120a7example
```

Output:

```
{
```

```
    "ProfileResourceAssociation": {
        "CreationTime": 1710851216.613,
        "Id": "rpr-001913120a7example",
        "ModificationTime": 1710852303.798,
        "Name": "test-resource-association",
        "OwnerId": "123456789012",
        "ProfileId": "rp-4987774726example",
        "ResourceArn": "arn:aws:route53resolver:us-east-1:123456789012:firewall-
rule-group/rslvr-frg-cfe7f72example",
        "ResourceProperties": "{\"priority\":105}",
        "ResourceType": "FIREWALL_RULE_GROUP",
        "Status": "COMPLETE",
        "StatusMessage": "Completed creation of Profile to DNS Firewall rule group
 association"
    }
}
```

- For API details, see GetProfileResourceAssociation in *AWS CLI Command Reference*.

`get-profile`

The following code example shows how to use `get-profile`.

AWS CLI

To get information about a Profile

The following `get-profile` returns information about the specified Profile.

```
aws route53profiles get-profile \
    --profile-id rp-4987774726example
```

Output:

```
{
    "Profile": {
        "Arn": "arn:aws:route53profiles:us-east-1:123456789012:profile/
rp-4987774726example",
        "ClientToken": "0cbc5ae7-4921-4204-bea9-EXAMPLE11111",
        "CreationTime": 1710851044.288,
        "Id": "rp-4987774726example",
        "ModificationTime": 1710851044.288,
```

```
        "Name": "test",
        "OwnerId": "123456789012",
        "ShareStatus": "NOT_SHARED",
        "Status": "COMPLETE",
        "StatusMessage": "Created Profile"
    }
}
```

- For API details, see [GetProfile](#) in *AWS CLI Command Reference*.

`list-profile-associations`

The following code example shows how to use `list-profile-associations`.

AWS CLI

To list Profile associations

The following `list-profile-associations` lists the Profile associations in your AWS account.

```
aws route53profiles list-profile-associations
```

Output:

```
{
    "ProfileAssociations": [
        {
            "CreationTime": 1709338817.148,
            "Id": "rpassoc-489ce212fexample",
            "ModificationTime": 1709338974.772,
            "Name": "test-association",
            "OwnerId": "123456789012",
            "ProfileId": "rp-4987774726example",
            "ResourceId": "vpc-0af3b96b3example",
            "Status": "COMPLETE",
            "StatusMessage": "Created Profile Association"
        }
    ]
}
```

- For API details, see [ListProfileAssociations](#) in *AWS CLI Command Reference*.

`list-profile-resource-associations`

The following code example shows how to use `list-profile-resource-associations`.

AWS CLI

To list Profile resource associations

The following `list-profile-resource-associations` list the Profile resource associations for the specified Profile.

```
aws route53profiles list-profile-resource-associations \
    --profile-id rp-4987774726example
```

Output:

```
{
     "ProfileResourceAssociations": [
         {
             "CreationTime": 1710851216.613,
             "Id": "rpr-001913120a7example",
             "ModificationTime": 1710851216.613,
             "Name": "test-resource-association",
             "OwnerId": "123456789012",
             "ProfileId": "rp-4987774726example",
             "ResourceArn": "arn:aws:route53resolver:us-
east-1:123456789012:firewall-rule-group/rslvr-frg-cfe7f72example",
             "ResourceProperties": "{\"priority\":102}",
             "ResourceType": "FIREWALL_RULE_GROUP",
             "Status": "COMPLETE",
             "StatusMessage": "Completed creation of Profile to DNS Firewall rule
 group association"
         }
     ]
 }
```

- For API details, see ListProfileResourceAssociations in *AWS CLI Command Reference*.

`list-profiles`

The following code example shows how to use `list-profiles`.

AWS CLI

To list Profiles

The following `list-profiles` lists the Profiles in your AWS account and displays additional information about them.

```
aws route53profiles list-profiles
```

Output:

```
{
     "ProfileSummaries": [
         {
             "Arn": "arn:aws:route53profiles:us-east-1:123456789012:profile/
rp-4987774726example",
             "Id": "rp-4987774726example",
             "Name": "test",
             "ShareStatus": "NOT_SHARED"
         }
     ]
 }
```

- For API details, see ListProfiles in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a resource

The following `list-tags-for-resource` lists tags for the specified resource.

```
aws route53profiles list-tags-for-resource \
    --resource-arn arn:aws:route53profiles:us-east-1:123456789012:profile/
rp-4987774726example
```

Output:

```
{
    "Tags": {
        "my-key-2": "my-value-2",
        "my-key-1": "my-value-1"
    }
}
```

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`update-profile-resource-association`

The following code example shows how to use `update-profile-resource-association`.

AWS CLI

To update a resource associated to a Profile

The following `update-profile-resource-association` updates a priority of a DNS Firewall rule group that is associated to the Profile.

```
aws route53profiles update-profile-resource-association \
    --profile-resource-association-id rpr-001913120a7example \
    --resource-properties "{\"priority\": 105}"
```

Output:

```
{
    "ProfileResourceAssociation": {
        "CreationTime": 1710851216.613,
        "Id": "rpr-001913120a7example",
        "ModificationTime": 1710852303.798,
        "Name": "test-resource-association",
        "OwnerId": "123456789012",
        "ProfileId": "rp-4987774726example",
        "ResourceArn": "arn:aws:route53resolver:us-east-1:123456789012:firewall-
rule-group/rslvr-frg-cfe7f72example",
        "ResourceProperties": "{\"priority\":105}",
        "ResourceType": "FIREWALL_RULE_GROUP",
        "Status": "UPDATING",
        "StatusMessage": "Updating the Profile to DNS Firewall rule group
 association"
```

```
    }
}
```

- For API details, see UpdateProfileResourceAssociation in *AWS CLI Command Reference*.

Route 53 Resolver examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Route 53 Resolver.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`associate-firewall-rule-group`

The following code example shows how to use `associate-firewall-rule-group`.

AWS CLI

To associate a firewall rule group with a VPC

The following `associate-firewall-rule-group` example associates a DNS Firewall rule group with an Amazon VPC.

```
aws route53resolver associate-firewall-rule-group \
    --name test-association \
    --firewall-rule-group-id rslvr-frg-47f93271fexample \
    --vpc-id vpc-31e92222 \
    --priority 101
```

Output:

```
{
    "FirewallRuleGroupAssociation": {
        "Id": "rslvr-frgassoc-57e8873d7example",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-group-
association/rslvr-frgassoc-57e8873d7example",
        "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
        "VpcId": "vpc-31e92222",
        "Name": "test-association",
        "Priority": 101,
        "MutationProtection": "DISABLED",
        "Status": "UPDATING",
        "StatusMessage": "Creating Firewall Rule Group Association",
        "CreatorRequestId": "2ca1a304-32b3-4f5f-bc4c-EXAMPLE11111",
        "CreationTime": "2021-05-25T21:47:48.755768Z",
        "ModificationTime": "2021-05-25T21:47:48.755768Z"
    }
}
```

For more information, see Managing associations between your VPC and Route 53 Resolver DNS Firewall rule groups in the *Amazon Route 53 Developer Guide*.

- For API details, see AssociateFirewallRuleGroup in *AWS CLI Command Reference*.

`associate-resolver-endpoint-ip-address`

The following code example shows how to use `associate-resolver-endpoint-ip-address`.

AWS CLI

To associate another IP address with a Resolver endpoint

The following `associate-resolver-endpoint-ip-address` example associates another IP address with an inbound Resolver endpoint. If you specify only a subnet ID and omit the IP address from the `--ip-address` parameter, Resolver chooses an IP address for you from among the available IP addresses in the specified subnet.

```
aws route53resolver associate-resolver-endpoint-ip-address \
    --resolver-endpoint-id rslvr-in-497098ad5example \
    --ip-address="SubnetId=subnet-12d8exam,Ip=192.0.2.118"
```

Output:

```
{
    "ResolverEndpoint": {
        "Id": "rslvr-in-497098ad5example",
        "CreatorRequestId": "AWSConsole.25.0123456789",
        "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-endpoint/
rslvr-in-497098ad5example",
        "Name": "my-inbound-endpoint",
        "SecurityGroupIds": [
            "sg-05cd7b25d6example"
        ],
        "Direction": "INBOUND",
        "IpAddressCount": 3,
        "HostVPCId": "vpc-304bexam",
        "Status": "UPDATING",
        "StatusMessage": "Updating the Resolver Endpoint",
        "CreationTime": "2020-01-02T23:25:45.538Z",
        "ModificationTime": "2020-01-02T23:25:45.538Z"
    }
}
```

For more information, see Values That You Specify When You Create or Edit Inbound Endpoints in the *Amazon Route 53 Developer Guide*.

- For API details, see AssociateResolverEndpointIpAddress in *AWS CLI Command Reference*.

`associate-resolver-rule`

The following code example shows how to use `associate-resolver-rule`.

AWS CLI

To associate a Resolver rule with a VPC

The following `associate-resolver-rule` example associates a Resolver rule with an Amazon VPC. After you run the command, Resolver starts to forward DNS queries to your network based on the settings in the rule, such as the domain name of the queries that are forwarded.

```
aws route53resolver associate-resolver-rule \
    --name my-resolver-rule-association \
    --resolver-rule-id rslvr-rr-42b60677c0example \
    --vpc-id vpc-304bexam
```

Output:

```
{
    "ResolverRuleAssociation": {
        "Id": "rslvr-rrassoc-d61cbb2c8bexample",
        "ResolverRuleId": "rslvr-rr-42b60677c0example",
        "Name": "my-resolver-rule-association",
        "VPCId": "vpc-304bexam",
        "Status": "CREATING",
        "StatusMessage": "[Trace id: 1-5dc5a8fa-ec2cc480d2ef07617example] Creating
 the association."
    }
}
```

For more information, see Forwarding Outbound DNS Queries to Your Network in the *Amazon Route 53 Developer Guide*.

- For API details, see AssociateResolverRule in *AWS CLI Command Reference*.

`create-firewall-domain-list`

The following code example shows how to use `create-firewall-domain-list`.

AWS CLI

To create a Route 53 Resolver DNS Firewall domain list

The following `create-firewall-domain-list` example creates a Route 53 Resolver DNS Firewall domain list, named test, in your AWS account.

```
aws route53resolver create-firewall-domain-list \
    --creator-request-id my-request-id \
    --name test
```

Output:

```
{
    "FirewallDomainList": {
        "Id": "rslvr-fdl-d61cbb2cbexample",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-domain-list/
rslvr-fdl-d61cbb2cbexample",
```

```
        "Name": "test",
        "DomainCount": 0,
        "Status": "COMPLETE",
        "StatusMessage": "Created Firewall Domain List",
        "CreatorRequestId": "my-request-id",
        "CreationTime": "2021-05-25T15:55:51.115365Z",
        "ModificationTime": "2021-05-25T15:55:51.115365Z"
    }
}
```

For more information, see Managing your own domain lists in the *Amazon Route 53 Developer Guide*.

- For API details, see CreateFirewallDomainList in *AWS CLI Command Reference*.

`create-firewall-rule-group`

The following code example shows how to use `create-firewall-rule-group`.

AWS CLI

To create a Firewall rule group

The following `create-firewall-rule-group` example creates a DNS Firewall rule group.

```
aws route53resolver create-firewall-rule-group \
    --creator-request-id my-request-id \
    --name test
```

Output:

```
{
    "FirewallRuleGroup": {
        "Id": "rslvr-frg-47f93271fexample",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-group/
rslvr-frg-47f93271fexample",
        "Name": "test",
        "RuleCount": 0,
        "Status": "COMPLETE",
        "StatusMessage": "Created Firewall Rule Group",
        "OwnerId": "123456789012",
        "CreatorRequestId": "my-request-id",
```

```
        "ShareStatus": "NOT_SHARED",
        "CreationTime": "2021-05-25T18:59:26.490017Z",
        "ModificationTime": "2021-05-25T18:59:26.490017Z"
    }
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the *Amazon Route 53 Developer Guide*.

- For API details, see CreateFirewallRuleGroup in *AWS CLI Command Reference*.

`create-firewall-rule`

The following code example shows how to use `create-firewall-rule`.

AWS CLI

To create a firewall rule

The following `create-firewall-rule` example creates a firewall rule in a DNS Firewall rule for domains listed in a DNS Firewall domain list.

```
aws route53resolver create-firewall-rule \
    --name allow-rule \
    --firewall-rule-group-id rslvr-frg-47f93271fexample \
    --firewall-domain-list-id rslvr-fdl-9e956e9ffexample \
    --priority 101 \
    --action ALLOW
```

Output:

```
{
    "FirewallRule": {
        "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
        "FirewallDomainListId": "rslvr-fdl-9e956e9ffexample",
        "Name": "allow-rule",
        "Priority": 101,
        "Action": "ALLOW",
        "CreatorRequestId": "d81e3fb7-020b-415e-939f-EXAMPLE11111",
        "CreationTime": "2021-05-25T21:44:00.346093Z",
        "ModificationTime": "2021-05-25T21:44:00.346093Z"
```

```
    }
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the *Amazon Route 53 Developer Guide*.

- For API details, see CreateFirewallRule in *AWS CLI Command Reference*.

`create-resolver-endpoint`

The following code example shows how to use `create-resolver-endpoint`.

AWS CLI

To create an inbound Resolver endpoint

The following `create-resolver-endpoint` example creates an inbound Resolver endpoint. You can use the same command to create both inbound and outbound endpoints.

aws route53resolver create-resolver-endpoint --name my-inbound-endpoint --creator-request-id 2020-01-01-18:47 --security-group-ids "sg-f62bexam" --direction INBOUND --ip-addresses SubnetId=subnet-ba47exam,Ip=192.0.2.255 SubnetId=subnet-12d8exam,Ip=192.0.2.254

Output:

```
{
    "ResolverEndpoint": {
        "Id": "rslvr-in-f9ab8a03f1example",
        "CreatorRequestId": "2020-01-01-18:47",
        "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-endpoint/
rslvr-in-f9ab8a03f1example",
        "Name": "my-inbound-endpoint",
        "SecurityGroupIds": [
            "sg-f62bexam"
        ],
        "Direction": "INBOUND",
        "IpAddressCount": 2,
        "HostVPCId": "vpc-304examp",
        "Status": "CREATING",
        "StatusMessage": "[Trace id: 1-5dc1ff84-f3477826e4a190025example] Creating
 the Resolver Endpoint",
        "CreationTime": "2020-01-01T23:02:29.583Z",
```

```
        "ModificationTime": "2020-01-01T23:02:29.583Z"
    }
}
```

To create an outbound Resolver endpoint

The following `create-resolver-endpoint` example creates an outbound resolver endpoint using the values in the JSON-formatted document `create-outbound-resolver-endpoint.json`.

```
aws route53resolver create-resolver-endpoint \
    --cli-input-json file://c:\temp\create-outbound-resolver-endpoint.json
```

Contents of `create-outbound-resolver-endpoint.json`:

```
{
   "CreatorRequestId": "2020-01-01-18:47",
   "Direction": "OUTBOUND",
   "IpAddresses": [
      {
         "Ip": "192.0.2.255",
         "SubnetId": "subnet-ba47exam"
      },
      {
         "Ip": "192.0.2.254",
         "SubnetId": "subnet-12d8exam"
      }
   ],
   "Name": "my-outbound-endpoint",
   "SecurityGroupIds": [ "sg-05cd7b25d6example" ],
   "Tags": [
      {
         "Key": "my-key-name",
         "Value": "my-key-value"
      }
   ]
}
```

For more information, see Resolving DNS Queries Between VPCs and Your Network in the *Amazon Route 53 Developer Guide*.

- For API details, see CreateResolverEndpoint in *AWS CLI Command Reference*.

`create-resolver-rule`

The following code example shows how to use `create-resolver-rule`.

AWS CLI

To create a Resolver rule

The following `create-resolver-rule` example creates a Resolver forwarding rule. The rule uses the outbound endpoint rslvr-out-d5e5920e37example to forward DNS queries for `example.com` to the IP addresses 10.24.8.75 and 10.24.8.156.

```
aws route53resolver create-resolver-rule \
    --creator-request-id 2020-01-02-18:47 \
    --domain-name example.com \
    --name my-rule \
    --resolver-endpoint-id rslvr-out-d5e5920e37example \
    --rule-type FORWARD \
    --target-ips "Ip=10.24.8.75" "Ip=10.24.8.156"
```

Output:

```
{
    "ResolverRule": {
        "Status": "COMPLETE",
        "RuleType": "FORWARD",
        "ResolverEndpointId": "rslvr-out-d5e5920e37example",
        "Name": "my-rule",
        "DomainName": "example.com.",
        "CreationTime": "2022-05-10T21:35:30.923187Z",
        "TargetIps": [
            {
                "Ip": "10.24.8.75",
                "Port": 53
            },
            {
                "Ip": "10.24.8.156",
                "Port": 53
            }
        ],
        "CreatorRequestId": "2022-05-10-16:33",
        "ModificationTime": "2022-05-10T21:35:30.923187Z",
```

```
        "ShareStatus": "NOT_SHARED",
        "Arn": "arn:aws:route53resolver:us-east-1:111117012054:resolver-rule/rslvr-
rr-b1e0b905e93611111",
        "OwnerId": "111111111111",
        "Id": "rslvr-rr-rslvr-rr-b1e0b905e93611111",
        "StatusMessage": "[Trace id: 1-22222222-3e56afcc71a3724664f22e24]
 Successfully created Resolver Rule."
    }
}
```

- For API details, see CreateResolverRule in *AWS CLI Command Reference*.

`delete-firewall-domain-list`

The following code example shows how to use `delete-firewall-domain-list`.

AWS CLI

To delete a Route 53 Resolver DNS Firewall domain list

The following `delete-firewall-domain-list` example deletes a Route 53 Resolver DNS Firewall domain list, named test, in your AWS account.

```
aws route53resolver delete-firewall-domain-list \
    --firewall-domain-list-id rslvr-fdl-9e956e9ffexample
```

Output:

```
{
    "FirewallDomainList": {
        "Id": "rslvr-fdl-9e956e9ffexample",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-domain-list/
rslvr-fdl-9e956e9ffexample",
        "Name": "test",
        "DomainCount": 6,
        "Status": "DELETING",
        "StatusMessage": "Deleting the Firewall Domain List",
        "CreatorRequestId": "my-request-id",
        "CreationTime": "2021-05-25T15:55:51.115365Z",
        "ModificationTime": "2021-05-25T18:58:05.588024Z"
    }
```

```
}
```

For more information, see Managing your own domain lists in the *Amazon Route 53 Developer Guide*.

- For API details, see DeleteFirewallDomainList in *AWS CLI Command Reference*.

`delete-firewall-rule-group`

The following code example shows how to use `delete-firewall-rule-group`.

AWS CLI

To delete a firewall rule group

The following `delete-firewall-rule-group` example deletes a firewall rule group.

```
aws route53resolver delete-firewall-rule-group \
    --firewall-rule-group-id rslvr-frg-47f93271fexample
```

Output:

```
{
    "FirewallRuleGroup": {
        "Id": "rslvr-frg-47f93271fexample",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-group/
rslvr-frg-47f93271fexample",
        "Name": "test",
        "RuleCount": 0,
        "Status": "UPDATING",
        "StatusMessage": "Updating Firewall Rule Group",
        "OwnerId": "123456789012",
        "CreatorRequestId": "my-request-id",
        "ShareStatus": "NOT_SHARED",
        "CreationTime": "2021-05-25T18:59:26.490017Z",
        "ModificationTime": "2021-05-25T21:51:53.028688Z"
    }
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the *Amazon Route 53 Developer Guide*.

- For API details, see DeleteFirewallRuleGroup in *AWS CLI Command Reference*.

`delete-firewall-rule`

The following code example shows how to use `delete-firewall-rule`.

AWS CLI

To delete a firewall rule

The following `delete-firewall-rule` example deletes a specified firewall rule.

```
aws route53resolver delete-firewall-rule \
    --firewall-rule-group-id rslvr-frg-47f93271fexample \
    --firewall-domain-list-id rslvr-fdl-9e956e9ffexample
```

Output:

```
{
    "FirewallRule": {
        "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
        "FirewallDomainListId": "rslvr-fdl-9e956e9ffexample",
        "Name": "allow-rule",
        "Priority": 102,
        "Action": "ALLOW",
        "CreatorRequestId": "d81e3fb7-020b-415e-939f-EXAMPLE11111",
        "CreationTime": "2021-05-25T21:44:00.346093Z",
        "ModificationTime": "2021-05-25T21:45:59.611600Z"
    }
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the *Amazon Route 53 Developer Guide*.

- For API details, see DeleteFirewallRule in *AWS CLI Command Reference*.

`delete-resolver-endpoint`

The following code example shows how to use `delete-resolver-endpoint`.

AWS CLI

To delete a Resolver endpoint

The following `delete-resolver-endpoint` example deletes the specified endpoint.

Important If you delete an inbound endpoint, DNS queries from your network are no longer forwarded to Resolver in the VPC that you specified in the endpoint. If you delete an outbound endpoint, Resolver stops forwarding DNS queries from your VPC to your network for rules that specify the deleted outbound endpoint.

```
aws route53resolver delete-resolver-endpoint \
    --resolver-endpoint-id rslvr-in-497098ad59example
```

Output:

```
{
    "ResolverEndpoint": {
        "Id": "rslvr-in-497098ad59example",
        "CreatorRequestId": "AWSConsole.25.157290example",
        "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-endpoint/
rslvr-in-497098ad59example",
        "Name": "my-inbound-endpoint",
        "SecurityGroupIds": [
            "sg-05cd7b25d6example"
        ],
        "Direction": "INBOUND",
        "IpAddressCount": 5,
        "HostVPCId": "vpc-304bexam",
        "Status": "DELETING",
        "StatusMessage": "[Trace id: 1-5dc5b658-811b5be0922bbc382example] Deleting
 ResolverEndpoint.",
        "CreationTime": "2020-01-01T23:25:45.538Z",
        "ModificationTime": "2020-01-02T23:25:45.538Z"
    }
}
```

- For API details, see DeleteResolverEndpoint in *AWS CLI Command Reference*.

`delete-resolver-rule`

The following code example shows how to use `delete-resolver-rule`.

AWS CLI

To delete a Resolver rule

The following `delete-resolver-rule` example deletes the specified rule.

Note If a rule is associated with any VPCs, you must first disassociate the rule from the VPCs before you can delete it.

```
aws route53resolver delete-resolver-rule \
    --resolver-rule-id rslvr-rr-5b3809426bexample
```

Output:

```
{
    "ResolverRule": {
        "Id": "rslvr-rr-5b3809426bexample",
        "CreatorRequestId": "2020-01-03-18:47",
        "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-rule/rslvr-
rr-5b3809426bexample",
        "DomainName": "zenith.example.com.",
        "Status": "DELETING",
        "StatusMessage": "[Trace id: 1-5dc5e05b-602e67b052cb74f05example] Deleting
 Resolver Rule.",
        "RuleType": "FORWARD",
        "Name": "my-resolver-rule",
        "TargetIps": [
            {
                "Ip": "192.0.2.50",
                "Port": 53
            }
        ],
        "ResolverEndpointId": "rslvr-out-d5e5920e3example",
        "OwnerId": "111122223333",
        "ShareStatus": "NOT_SHARED"
    }
}
```

- For API details, see DeleteResolverRule in *AWS CLI Command Reference*.

`disassociate-firewall-rule-group`

The following code example shows how to use `disassociate-firewall-rule-group`.

AWS CLI

To disassociate a firewall rule group from a VPC

The following `disassociate-firewall-rule-group` example disassociates a DNS Firewall rule group from an Amazon VPC.

```
aws route53resolver disassociate-firewall-rule-group \
    --firewall-rule-group-association-id rslvr-frgassoc-57e8873d7example
```

Output:

```
{
    "FirewallRuleGroupAssociation": {
        "Id": "rslvr-frgassoc-57e8873d7example",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-group-
association/rslvr-frgassoc-57e8873d7example",
        "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
        "VpcId": "vpc-31e92222",
        "Name": "test-association",
        "Priority": 103,
        "MutationProtection": "DISABLED",
        "Status": "DELETING",
        "StatusMessage": "Deleting the Firewall Rule Group Association",
        "CreatorRequestId": "2ca1a304-32b3-4f5f-bc4c-EXAMPLE11111",
        "CreationTime": "2021-05-25T21:47:48.755768Z",
        "ModificationTime": "2021-05-25T21:51:02.377887Z"
    }
}
```

For more information, see Managing associations between your VPC and Route 53 Resolver DNS Firewall rule groups in the *Amazon Route 53 Developer Guide*.

- For API details, see DisassociateFirewallRuleGroup in *AWS CLI Command Reference*.

`disassociate-resolver-endpoint-ip-address`

The following code example shows how to use `disassociate-resolver-endpoint-ip-address`.

AWS CLI

To disassociate an IP address from a Resolver endpoint

The following `disassociate-resolver-endpoint-ip-address` example removes an IP address from a specified Resolver inbound or outbound endpoint.

Note An endpoint must have at least two IP addresses. If an endpoint currently has only two IP addresses and you want to replace one address with another address, you must first use associate-resolver-endpoint-ip-address to associate the new IP address. Then you can disassociate one of the original IP addresses from the endpoint.

```
aws route53resolver disassociate-resolver-endpoint-ip-address \
    --resolver-endpoint-id rslvr-in-f9ab8a03f1example \
    --ip-address="SubnetId=subnet-12d8a459,Ip=172.31.40.121"
```

Output:

```
{
    "ResolverEndpoint": {
        "Id": "rslvr-in-f9ab8a03f1example",
        "CreatorRequestId": "2020-01-01-18:47",
        "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-endpoint/
rslvr-in-f9ab8a03f1example",
        "Name": "my-inbound-endpoint",
        "SecurityGroupIds": [
            "sg-f62bexam"
        ],
        "Direction": "INBOUND",
        "IpAddressCount": 3,
        "HostVPCId": "vpc-304bexam",
        "Status": "UPDATING",
        "StatusMessage": "Updating the Resolver Endpoint",
        "CreationTime": "2020-01-01T23:02:29.583Z",
        "ModificationTime": "2020-01-05T23:02:29.583Z"
    }
}
```

- For API details, see DisassociateResolverEndpointIpAddress in *AWS CLI Command Reference*.

`disassociate-resolver-rule`

The following code example shows how to use `disassociate-resolver-rule`.

AWS CLI

To disassociate a Resolver rule from an Amazon VPC

The following `disassociate-resolver-rule` example removes the association between the specified Resolver rule and the specified VPC. You can disassociate a rule from a VPC in the following circumstances:

For DNS queries that originate in this VPC, you want Resolver to stop forwarding queries to your network for the domain name that is specified in the rule.You want to delete the forwarding rule. If a rule is currently associated with one or more VPCs, you must disassociate the rule from all VPCs before you can delete it.

```
aws route53resolver disassociate-resolver-rule \
    --resolver-rule-id rslvr-rr-4955cb98ceexample \
    --vpc-id vpc-304bexam
```

Output:

```
{
    "ResolverRuleAssociation": {
        "Id": "rslvr-rrassoc-322f4e8b9cexample",
        "ResolverRuleId": "rslvr-rr-4955cb98ceexample",
        "Name": "my-resolver-rule-association",
        "VPCId": "vpc-304bexam",
        "Status": "DELETING",
        "StatusMessage": "[Trace id: 1-5dc5ffa2-a26c38004c1f94006example] Deleting
 Association"
    }
}
```

- For API details, see DisassociateResolverRule in *AWS CLI Command Reference*.

`get-firewall-config`

The following code example shows how to use `get-firewall-config`.

AWS CLI

To get a firewall config for a VPC

The following `get-firewall-config` example retrieves the DNS Firewall behavior for the specified VPC.

```
aws route53resolver get-firewall-config \
```

```
    --resource-id vpc-31e92222
```

Output:

```
{
    "FirewallConfig": {
        "Id": "rslvr-fc-86016850cexample",
        "ResourceId": "vpc-31e9222",
        "OwnerId": "123456789012",
        "FirewallFailOpen": "DISABLED"
    }
}
```

For more information, see DNS Firewall VPC configuration in the *Amazon Route 53 Developer Guide*.

- For API details, see GetFirewallConfig in *AWS CLI Command Reference*.

`get-firewall-domain-list`

The following code example shows how to use `get-firewall-domain-list`.

AWS CLI

To get a Route 53 Resolver DNS Firewall domain list

The following `get-firewall-domain-list` example retrieves the domain list with the ID you specify.

```
aws route53resolver get-firewall-domain-list \
    --firewall-domain-list-id rslvr-fdl-42b60677cexample
```

Output:

```
{
    "FirewallDomainList": {
        "Id": "rslvr-fdl-9e956e9ffexample",
        "Arn": "arn:aws:route53resolver:us-west-2:123457689012:firewall-domain-list/
rslvr-fdl-42b60677cexample",
        "Name": "test",
```

```
        "DomainCount": 0,
        "Status": "COMPLETE",
        "StatusMessage": "Created Firewall Domain List",
        "CreatorRequestId": "my-request-id",
        "CreationTime": "2021-05-25T15:55:51.115365Z",
        "ModificationTime": "2021-05-25T15:55:51.115365Z"
    }
}
```

For more information, see Managing your own domain lists in the *Amazon Route 53 Developer Guide*.

- For API details, see GetFirewallDomainList in *AWS CLI Command Reference*.

`get-firewall-rule-group-association`

The following code example shows how to use `get-firewall-rule-group-association`.

AWS CLI

To get a firewall rule group association

The following `get-firewall-rule-group-association` example retrieves a firewall rule group association.

```
aws route53resolver get-firewall-rule-group-association \
    --firewall-rule-group-association-id rslvr-frgassoc-57e8873d7example
```

Output:

```
{
    "FirewallRuleGroupAssociation": {
        "Id": "rslvr-frgassoc-57e8873d7example",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-group-
association/rslvr-frgassoc-57e8873d7example",
        "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
        "VpcId": "vpc-31e92222",
        "Name": "test-association",
        "Priority": 101,
        "MutationProtection": "DISABLED",
        "Status": "COMPLETE",
        "StatusMessage": "Finished rule group association update",
```

```
        "CreatorRequestId": "2ca1a304-32b3-4f5f-bc4c-EXAMPLE11111",
        "CreationTime": "2021-05-25T21:47:48.755768Z",
        "ModificationTime": "2021-05-25T21:47:48.755768Z"
    }
}
```

For more information, see Managing associations between your VPC and Route 53 Resolver DNS Firewall rule groups in the *Amazon Route 53 Developer Guide*.

- For API details, see GetFirewallRuleGroupAssociation in *AWS CLI Command Reference*.

`get-firewall-rule-group-policy`

The following code example shows how to use `get-firewall-rule-group-policy`.

AWS CLI

To get an AWS IAM policy

The following `get-firewall-rule-group-policy` example gets the AWS Identity and Access Management (AWS IAM) policy for sharing the specified rule group.

```
aws route53resolver get-firewall-rule-group-policy \
    --arn arn:aws:route53resolver:us-west-2:AWS_ACCOUNT_ID:firewall-rule-group/
rslvr-frg-47f93271fexample
```

Output:

```
{
    "FirewallRuleGroupPolicy": "{\"Version\":\"2012-10-17\",
\"Statement\":[{\"Sid\":\"test\",\"Effect\":\"Allow\",\"Principal
\":{\"AWS\":\"arn:aws:iam::AWS_ACCOUNT_ID:root\"},\"Action\":
[\"route53resolver:GetFirewallRuleGroup\",\"route53resolver:ListFirewallRuleGroups
\"],\"Resource\":\"arn:aws:route53resolver:us-east-1:AWS_ACCOUNT_ID:firewall-rule-
group/rslvr-frg-47f93271fexample\"}]}"
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the *Amazon Route 53 Developer Guide*.

- For API details, see GetFirewallRuleGroupPolicy in *AWS CLI Command Reference*.

`get-firewall-rule-group`

The following code example shows how to use `get-firewall-rule-group`.

AWS CLI

To get a Firewall rule group

The following `get-firewall-rule-group` example retrieves information about a DNS Firewall rule group with the ID you provide.

```
aws route53resolver get-firewall-rule-group \
    --firewall-rule-group-id rslvr-frg-47f93271fexample
```

Output:

```
{
    "FirewallRuleGroup": {
        "Id": "rslvr-frg-47f93271fexample",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-group/
rslvr-frg-47f93271fexample",
        "Name": "test",
        "RuleCount": 0,
        "Status": "COMPLETE",
        "StatusMessage": "Created Firewall Rule Group",
        "OwnerId": "123456789012",
        "CreatorRequestId": "my-request-id",
        "ShareStatus": "NOT_SHARED",
        "CreationTime": "2021-05-25T18:59:26.490017Z",
        "ModificationTime": "2021-05-25T18:59:26.490017Z"
    }
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the *Amazon Route 53 Developer Guide*.

- For API details, see GetFirewallRuleGroup in *AWS CLI Command Reference*.

`get-resolver-endpoint`

The following code example shows how to use `get-resolver-endpoint`.

AWS CLI

To get information about a Resolver endpoint

The following `get-resolver-endpoint` example displays details for the outbound specified endpoint. You can use `get-resolver-endpoint` for both inbound and outbound endpoints by specifying the applicable endpoint ID.

```
aws route53resolver get-resolver-endpoint \
    --resolver-endpoint-id rslvr-out-d5e5920e37example
```

Output:

```
{
    "ResolverEndpoint": {
        "Id": "rslvr-out-d5e5920e37example",
        "CreatorRequestId": "2020-01-01-18:47",
        "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-endpoint/
rslvr-out-d5e5920e37example",
        "Name": "my-outbound-endpoint",
        "SecurityGroupIds": [
            "sg-05cd7b25d6example"
        ],
        "Direction": "OUTBOUND",
        "IpAddressCount": 2,
        "HostVPCId": "vpc-304bexam",
        "Status": "OPERATIONAL",
        "StatusMessage": "This Resolver Endpoint is operational.",
        "CreationTime": "2020-01-01T23:50:50.979Z",
        "ModificationTime": "2020-01-02T23:50:50.979Z"
    }
}
```

For more information, see Values That You Specify When You Create or Edit Inbound Endpoints in the *Amazon Route 53 Developer Guide*.

- For API details, see GetResolverEndpoint in *AWS CLI Command Reference*.

`get-resolver-rule-association`

The following code example shows how to use `get-resolver-rule-association`.

AWS CLI

To get information about the association between a Resolver rule and a VPC

The following `get-resolver-rule-association` example displays details about the association between a specified Resolver rule and a VPC. You associate a resolver rule and a VPC using associate-resolver-rule.

```
aws route53resolver get-resolver-rule-association \
    --resolver-rule-association-id rslvr-rrassoc-d61cbb2c8bexample
```

Output:

```
{
    "ResolverRuleAssociation": {
        "Id": "rslvr-rrassoc-d61cbb2c8bexample",
        "ResolverRuleId": "rslvr-rr-42b60677c0example",
        "Name": "my-resolver-rule-association",
        "VPCId": "vpc-304bexam",
        "Status": "COMPLETE",
        "StatusMessage": ""
    }
}
```

- For API details, see GetResolverRuleAssociation in *AWS CLI Command Reference*.

`get-resolver-rule`

The following code example shows how to use `get-resolver-rule`.

AWS CLI

To get information about a Resolver rule

The following `get-resolver-rule` example displays details about the specified Resolver rule, such as the domain name that the rule forwards DNS queries for and the ID of the outbound resolver endpoint that the rule is associated with.

```
aws route53resolver get-resolver-rule \
    --resolver-rule-id rslvr-rr-42b60677c0example
```

Output:

```
{
    "ResolverRule": {
        "Id": "rslvr-rr-42b60677c0example",
        "CreatorRequestId": "2020-01-01-18:47",
        "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-rule/rslvr-
rr-42b60677c0example",
        "DomainName": "example.com.",
        "Status": "COMPLETE",
        "StatusMessage": "[Trace id: 1-5dc4b177-ff1d9d001a0f80005example]
 Successfully created Resolver Rule.",
        "RuleType": "FORWARD",
        "Name": "my-rule",
        "TargetIps": [
            {
                "Ip": "192.0.2.45",
                "Port": 53
            }
        ],
        "ResolverEndpointId": "rslvr-out-d5e5920e37example",
        "OwnerId": "111122223333",
        "ShareStatus": "NOT_SHARED"
    }
}
```

For more information, see Values That You Specify When You Create or Edit Rules in the *Amazon Route 53 Developer Guide*.

- For API details, see GetResolverRule in *AWS CLI Command Reference*.

`import-firewall-domains`

The following code example shows how to use `import-firewall-domains`.

AWS CLI

To import domains into a domain list

The following `import-firewall-domains` example imports a set of domains from a file into a DNS Firewall domain list that you specify.

```
aws route53resolver import-firewall-domains \
```

```
    --firewall-domain-list-id rslvr-fdl-d61cbb2cbexample \
    --operation REPLACE \
    --domain-file-url s3://PATH/TO/YOUR/FILE
```

Output:

```
{
    "Id": "rslvr-fdl-d61cbb2cbexample",
    "Name": "test",
    "Status": "IMPORTING",
    "StatusMessage": "Importing domains from provided file."
}
```

For more information, see Managing your own domain lists in the *Amazon Route 53 Developer Guide*.

- For API details, see ImportFirewallDomains in *AWS CLI Command Reference*.

`list-firewall-configs`

The following code example shows how to use `list-firewall-configs`.

AWS CLI

To list firewall configs

The following `list-firewall-configs` example lists your DNS Firewall configurations.

```
aws route53resolver list-firewall-configs
```

Output:

```
{
    "FirewallConfigs": [
        {
            "Id": "rslvr-fc-86016850cexample",
            "ResourceId": "vpc-31e92222",
            "OwnerId": "123456789012",
            "FirewallFailOpen": "DISABLED"
        }
    ]
}
```

For more information, see DNS Firewall VPC configuration in the *Amazon Route 53 Developer Guide*.

- For API details, see ListFirewallConfigs in *AWS CLI Command Reference*.

`list-firewall-domain-lists`

The following code example shows how to use `list-firewall-domain-lists`.

AWS CLI

To list all of Route 53 Resolver DNS Firewall domain lists

The following `list-firewall-domain-lists` example lists all the domain lists.

```
aws route53resolver list-firewall-domain-lists
```

Output:

```
{
    "FirewallDomainLists": [
        {
            "Id": "rslvr-fdl-2c46f2ecfexample",
            "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-domain-
list/rslvr-fdl-2c46f2ecfexample",
            "Name": "AWSManagedDomainsMalwareDomainList",
            "CreatorRequestId": "AWSManagedDomainsMalwareDomainList",
            "ManagedOwnerName": "Route 53 Resolver DNS Firewall"
        },
        {
            "Id": "rslvr-fdl-aa970e9e1example",
            "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-domain-
list/rslvr-fdl-aa970e9e1example",
            "Name": "AWSManagedDomainsBotnetCommandandControl",
            "CreatorRequestId": "AWSManagedDomainsBotnetCommandandControl",
            "ManagedOwnerName": "Route 53 Resolver DNS Firewall"
        },
        {
            "Id": "rslvr-fdl-42b60677cexample",
            "Arn": "arn:aws:route53resolver:us-west-2:123456789111:firewall-domain-
list/rslvr-fdl-42b60677cexample",
            "Name": "test",
            "CreatorRequestId": "my-request-id"
```

```
        }
    ]
}
```

For more information, see Route 53 Resolver DNS Firewall domain lists in the *Amazon Route 53 Developer Guide*.

- For API details, see ListFirewallDomainLists in *AWS CLI Command Reference*.

`list-firewall-domains`

The following code example shows how to use `list-firewall-domains`.

AWS CLI

To list domains in a domain list

The following `list-firewall-domains` example lists the domains in a DNS Firewall domain list that you specify.

```
aws route53resolver list-firewall-domains \
    --firewall-domain-list-id rslvr-fdl-d61cbb2cbexample
```

Output:

```
{
    "Domains": [
        "test1.com.",
        "test2.com.",
        "test3.com."
    ]
}
```

For more information, see Managing your own domain lists in the *Amazon Route 53 Developer Guide*.

- For API details, see ListFirewallDomains in *AWS CLI Command Reference*.

`list-firewall-rule-group-associations`

The following code example shows how to use `list-firewall-rule-group-associations`.

AWS CLI

To list DNS Firewall rule group associations

The following `list-firewall-rule-group-associations` example lists your DNS Firewall rule group associations with Amazon VPCs.

```
aws route53resolver list-firewall-rule-group-associations
```

Output:

```
{
    "FirewallRuleGroupAssociations": [
        {
            "Id": "rslvr-frgassoc-57e8873d7example",
            "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-group-association/rslvr-frgassoc-57e8873d7example",
            "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
            "VpcId": "vpc-31e92222",
            "Name": "test-association",
            "Priority": 101,
            "MutationProtection": "DISABLED",
            "Status": "UPDATING",
            "StatusMessage": "Creating Firewall Rule Group Association",
            "CreatorRequestId": "2ca1a304-32b3-4f5f-bc4c-EXAMPLE11111",
            "CreationTime": "2021-05-25T21:47:48.755768Z",
            "ModificationTime": "2021-05-25T21:47:48.755768Z"
        }
    ]
}
```

For more information, see Managing associations between your VPC and Route 53 Resolver DNS Firewall rule group in the *Amazon Route 53 Developer Guide*.

- For API details, see ListFirewallRuleGroupAssociations in *AWS CLI Command Reference*.

`list-firewall-rule-groups`

The following code example shows how to use `list-firewall-rule-groups`.

AWS CLI

To get a list of your Firewall rule groups

The following `list-firewall-rule-groups` example lists your DNS Firewall rule groups.

```
aws route53resolver list-firewall-rule-groups
```

Output:

```
{
    "FirewallRuleGroups": [
        {
            "Id": "rslvr-frg-47f93271fexample",
            "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-
group/rslvr-frg-47f93271fexample",
            "Name": "test",
            "OwnerId": "123456789012",
            "CreatorRequestId": "my-request-id",
            "ShareStatus": "NOT_SHARED"
        }
    ]
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the *Amazon Route 53 Developer Guide*.

- For API details, see ListFirewallRuleGroups in *AWS CLI Command Reference*.

`list-firewall-rules`

The following code example shows how to use `list-firewall-rules`.

AWS CLI

To list firewall rules

The following `list-firewall-rules` example list all of your DNS Firewall rules within a firewall rule group.

```
aws route53resolver list-firewall-rules \
    --firewall-rule-group-id rslvr-frg-47f93271fexample
```

Output:

```
{
```

```
    "FirewallRules": [
        {
            "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
            "FirewallDomainListId": "rslvr-fdl-9e956e9ffexample",
            "Name": "allow-rule",
            "Priority": 101,
            "Action": "ALLOW",
            "CreatorRequestId": "d81e3fb7-020b-415e-939f-EXAMPLE11111",
            "CreationTime": "2021-05-25T21:44:00.346093Z",
            "ModificationTime": "2021-05-25T21:44:00.346093Z"
        }
    ]
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the *Amazon Route 53 Developer Guide*.

- For API details, see ListFirewallRules in *AWS CLI Command Reference*.

`list-resolver-endpoint-ip-addresses`

The following code example shows how to use `list-resolver-endpoint-ip-addresses`.

AWS CLI

To list IP addresses for a specified inbound or outbound endpoint

The following `list-resolver-endpoint-ip-addresses` example lists information about the IP addresses that are associated with the inbound endpoint `rslvr-in-f9ab8a03f1example`. You can also use `list-resolver-endpoint-ip-addresses` for outbound endpoints by specifying the applicable endpoint ID.

```
aws route53resolver list-resolver-endpoint-ip-addresses \
    --resolver-endpoint-id rslvr-in-f9ab8a03f1example
```

Output:

```
{
    "MaxResults": 10,
    "IpAddresses": [
        {
            "IpId": "rni-1de60cdbfeexample",
```

```
                "SubnetId": "subnet-ba47exam",
                "Ip": "192.0.2.44",
                "Status": "ATTACHED",
                "StatusMessage": "This IP address is operational.",
                "CreationTime": "2020-01-03T23:02:29.587Z",
                "ModificationTime": "2020-01-03T23:03:05.555Z"
            },
            {
                "IpId": "rni-aac7085e38example",
                "SubnetId": "subnet-12d8exam",
                "Ip": "192.0.2.45",
                "Status": "ATTACHED",
                "StatusMessage": "This IP address is operational.",
                "CreationTime": "2020-01-03T23:02:29.593Z",
                "ModificationTime": "2020-01-03T23:02:55.060Z"
            }
        ]
}
```

For more information about the values in the output, see Values That You Specify When You Create or Edit Inbound Endpoints, and Values That You Specify When You Create or Edit Outbound Endpoints, both in the *Amazon Route 53 Developer Guide*.

- For API details, see ListResolverEndpointIpAddresses in *AWS CLI Command Reference*.

`list-resolver-endpoints`

The following code example shows how to use `list-resolver-endpoints`.

AWS CLI

To list Resolver endpoints in an AWS Region

The following `list-resolver-endpoints` example lists the inbound and outbound Resolver endpoints that exist in the current account.

```
aws route53resolver list-resolver-endpoints
```

Output:

```
{
    "MaxResults": 10,
```

```
    "ResolverEndpoints": [
        {
            "Id": "rslvr-in-497098ad59example",
            "CreatorRequestId": "2020-01-01-18:47",
            "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-
endpoint/rslvr-in-497098ad59example",
            "Name": "my-inbound-endpoint",
            "SecurityGroupIds": [
                "sg-05cd7b25d6example"
            ],
            "Direction": "INBOUND",
            "IpAddressCount": 2,
            "HostVPCId": "vpc-304bexam",
            "Status": "OPERATIONAL",
            "StatusMessage": "This Resolver Endpoint is operational.",
            "CreationTime": "2020-01-01T23:25:45.538Z",
            "ModificationTime": "2020-01-01T23:25:45.538Z"
        },
        {
            "Id": "rslvr-out-d5e5920e37example",
            "CreatorRequestId": "2020-01-01-18:48",
            "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-
endpoint/rslvr-out-d5e5920e37example",
            "Name": "my-outbound-endpoint",
            "SecurityGroupIds": [
                "sg-05cd7b25d6example"
            ],
            "Direction": "OUTBOUND",
            "IpAddressCount": 2,
            "HostVPCId": "vpc-304bexam",
            "Status": "OPERATIONAL",
            "StatusMessage": "This Resolver Endpoint is operational.",
            "CreationTime": "2020-01-01T23:50:50.979Z",
            "ModificationTime": "2020-01-01T23:50:50.979Z"
        }
    ]
}
```

- For API details, see ListResolverEndpoints in *AWS CLI Command Reference*.

`list-resolver-rule-associations`

The following code example shows how to use `list-resolver-rule-associations`.

AWS CLI

To list associations between Resolver rules and VPCs

The following `list-resolver-rule-associations` example lists the associations between resolver rules and VPCs in the current AWS account.

```
aws route53resolver list-resolver-rule-associations
```

Output:

```
{
    "MaxResults": 30,
    "ResolverRuleAssociations": [
        {
            "Id": "rslvr-autodefined-assoc-vpc-304bexam-internet-resolver",
            "ResolverRuleId": "rslvr-autodefined-rr-internet-resolver",
            "Name": "System Rule Association",
            "VPCId": "vpc-304bexam",
            "Status": "COMPLETE",
            "StatusMessage": ""
        },
        {
            "Id": "rslvr-rrassoc-d61cbb2c8bexample",
            "ResolverRuleId": "rslvr-rr-42b60677c0example",
            "Name": "my-resolver-rule-association",
            "VPCId": "vpc-304bexam",
            "Status": "COMPLETE",
            "StatusMessage": ""
        }
    ]
}
```

For more information, see How Route 53 Resolver Forwards DNS Queries from Your VPCs to Your Network in the *Amazon Route 53 Developer Guide*.

- For API details, see ListResolverRuleAssociations in *AWS CLI Command Reference*.

`list-resolver-rules`

The following code example shows how to use `list-resolver-rules`.

AWS CLI

To list Resolver rules

The following `list-resolver-rules` example lists all the Resolver rules in the current AWS account.

```
aws route53resolver list-resolver-rules
```

Output:

```
{
    "MaxResults": 30,
    "ResolverRules": [
        {
            "Id": "rslvr-autodefined-rr-internet-resolver",
            "CreatorRequestId": "",
            "Arn": "arn:aws:route53resolver:us-west-2::autodefined-rule/rslvr-
autodefined-rr-internet-resolver",
            "DomainName": ".",
            "Status": "COMPLETE",
            "RuleType": "RECURSIVE",
            "Name": "Internet Resolver",
            "OwnerId": "Route 53 Resolver",
            "ShareStatus": "NOT_SHARED"
        },
        {
            "Id": "rslvr-rr-42b60677c0example",
            "CreatorRequestId": "2020-01-01-18:47",
            "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-rule/
rslvr-rr-42b60677c0bc4e299",
            "DomainName": "example.com.",
            "Status": "COMPLETE",
            "StatusMessage": "[Trace id: 1-5dc4b177-ff1d9d001a0f80005example]
 Successfully created Resolver Rule.",
            "RuleType": "FORWARD",
            "Name": "my-rule",
            "TargetIps": [
                {
                    "Ip": "192.0.2.45",
                    "Port": 53
                }
            ],
```

```
                "ResolverEndpointId": "rslvr-out-d5e5920e37example",
                "OwnerId": "111122223333",
                "ShareStatus": "NOT_SHARED"
            }
        ]
}
```

For more information, see How Route 53 Resolver Forwards DNS Queries from Your VPCs to Your Network in the *Amazon Route 53 Developer Guide*.

- For API details, see ListResolverRules in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags for a Resolver resource

The following `list-tags-for-resource` example lists the tags that are assigned to the specified Resolver rule.

```
aws route53resolver list-tags-for-resource \
    --resource-arn "arn:aws:route53resolver:us-west-2:111122223333:resolver-rule/
rslvr-rr-42b60677c0example"
```

Output:

```
{
    "Tags": [
        {
            "Key": "my-key-1",
            "Value": "my-value-1"
        },
        {
            "Key": "my-key-2",
            "Value": "my-value-2"
        }
    ]
}
```

For information about using tags for cost allocation, see Using Cost Allocation Tags in the *AWS Billing and Cost Management User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

put-firewall-rule-group-policy

The following code example shows how to use `put-firewall-rule-group-policy`.

AWS CLI

To attach an AWS IAM policy to share a Firewall rule group policy

The following `put-firewall-rule-group-policy` example attaches an AWS Identity and Access Management (AWS IAM) policy for sharing the rule group.

```
aws route53resolver put-firewall-rule-group-policy \
    --firewall-rule-group-policy "{\"Version\":\"2012-10-17\",
\"Statement\":[{\"Sid\":\"test\",\"Effect\":\"Allow\",\"Principal
\":{\"AWS\":\"arn:aws:iam::AWS_ACCOUNT_ID:root\"},\"Action\":
[\"route53resolver:GetFirewallRuleGroup\",\"route53resolver:ListFirewallRuleGroups
\"],\"Resource\":\"arn:aws:route53resolver:us-east-1:AWS_ACCOUNT_ID:firewall-rule-
group/rslvr-frg-47f93271fexample\"}]}"
```

Output:

```
{
    "ReturnValue": true
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the *Amazon Route 53 Developer Guide*.

- For API details, see PutFirewallRuleGroupPolicy in *AWS CLI Command Reference*.

put-resolver-rule-policy

The following code example shows how to use `put-resolver-rule-policy`.

AWS CLI

To share a Resolver rule with another AWS account

The following `put-resolver-rule-policy` example specifies a Resolver rule that you want to share with another AWS account, the account that you want to share the rule with, and the rule-related operations that you want the account to be able to perform on the rules.

Note You must run this command using credentials from the same account that created the rule.

```
aws route53resolver put-resolver-rule-policy \
    --region us-east-1 \
    --arn "arn:aws:route53resolver:us-east-1:111122223333:resolver-rule/rslvr-rr-42b60677c0example" \
    --resolver-rule-policy "{\"Version\": \"2012-10-17\", \
        \"Statement\": [ { \
        \"Effect\" : \"Allow\", \
        \"Principal\" : {\"AWS\" : \"444455556666\" }, \
        \"Action\" : [ \
            \"route53resolver:GetResolverRule\", \
            \"route53resolver:AssociateResolverRule\", \
            \"route53resolver:DisassociateResolverRule\", \
            \"route53resolver:ListResolverRules\", \
            \"route53resolver:ListResolverRuleAssociations\" ], \
        \"Resource\" : [ \"arn:aws:route53resolver:us-east-1:111122223333:resolver-rule/rslvr-rr-42b60677c0example\" ] } ] }"
```

Output:

```
{
    "ReturnValue": true
}
```

After you run `put-resolver-rule-policy`, you can run the following two Resource Access Manager (RAM) commands. You must use the account that you want to share the rule with:

`get-resource-share-invitations` returns the value `resourceShareInvitationArn`. You need this value to accept the invitation to use the shared rule.`accept-resource-share-invitation` accepts the invitation to use the shared rule.

For more information, see the following documentation:

get-resource-share-invitationsaccept-resource-share-invitationsSharing Forwarding Rules with Other AWS Accounts and Using Shared Rules in the *Amazon Route 53 Developer Guide*

- For API details, see PutResolverRulePolicy in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To associate tags with a Resolver resource

The following `tag-resource` example associates two tag key/value pairs with the specified Resolver rule.

```
aws route53resolver tag-resource \
    --resource-arn "arn:aws:route53resolver:us-west-2:111122223333:resolver-rule/
rslvr-rr-42b60677c0example" \
    --tags "Key=my-key-1,Value=my-value-1" "Key=my-key-2,Value=my-value-2"
```

This command produces no output.

For information about using tags for cost allocation, see Using Cost Allocation Tags in the *AWS Billing and Cost Management User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a Resolver resource

The following `untag-resource` example removes two tags from the specified Resolver rule.

```
aws route53resolver untag-resource \
    --resource-arn "arn:aws:route53resolver:us-west-2:111122223333:resolver-rule/
rslvr-rr-42b60677c0example" \
    --tag-keys my-key-1 my-key-2
```

This command produces no output. To confirm that the tags were removed, you can use list-tags-for-resource.

For information about using tags for cost allocation, see Using Cost Allocation Tags in the *AWS Billing and Cost Management User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

update-firewall-config

The following code example shows how to use `update-firewall-config`.

AWS CLI

To update a firewall config

The following `update-firewall-config` example updates DNS Firewall configuration.

```
aws route53resolver update-firewall-config \
    --resource-id vpc-31e92222 \
    --firewall-fail-open DISABLED
```

Output:

```
{
    "FirewallConfig": {
        "Id": "rslvr-fc-86016850cexample",
        "ResourceId": "vpc-31e92222",
        "OwnerId": "123456789012",
        "FirewallFailOpen": "DISABLED"
    }
}
```

For more information, see DNS Firewall VPC configuration in the *Amazon Route 53 Developer Guide*.

- For API details, see UpdateFirewallConfig in *AWS CLI Command Reference*.

update-firewall-domains

The following code example shows how to use `update-firewall-domains`.

AWS CLI

To update a domain list

The following `update-firewall-domains` example adds the domains to a domain list with the ID you provide.

```
aws route53resolver update-firewall-domains \
    --firewall-domain-list-id rslvr-fdl-42b60677cexampleb \
    --operation ADD \
    --domains test1.com test2.com test3.com
```

Output:

```
{
    "Id": "rslvr-fdl-42b60677cexample",
    "Name": "test",
    "Status": "UPDATING",
    "StatusMessage": "Updating the Firewall Domain List"
}
```

For more information, see Managing your own domain lists in the *Amazon Route 53 Developer Guide*.

- For API details, see UpdateFirewallDomains in *AWS CLI Command Reference*.

`update-firewall-rule-group-association`

The following code example shows how to use `update-firewall-rule-group-association`.

AWS CLI

To update a firewall rule group association

The following `update-firewall-rule-group-association` example updates a firewall rule group association.

```
aws route53resolver update-firewall-rule-group-association \
    --firewall-rule-group-association-id rslvr-frgassoc-57e8873d7example \
    --priority 103
```

Output:

```
{
```

```
    "FirewallRuleGroupAssociation": {
        "Id": "rslvr-frgassoc-57e8873d7example",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-group-
association/rslvr-frgassoc-57e8873d7example",
        "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
        "VpcId": "vpc-31e92222",
        "Name": "test-association",
        "Priority": 103,
        "MutationProtection": "DISABLED",
        "Status": "UPDATING",
        "StatusMessage": "Updating the Firewall Rule Group Association Attributes",
        "CreatorRequestId": "2ca1a304-32b3-4f5f-bc4c-EXAMPLE11111",
        "CreationTime": "2021-05-25T21:47:48.755768Z",
        "ModificationTime": "2021-05-25T21:50:09.272569Z"
    }
}
```

For more information, see Managing associations between your VPC and Route 53 Resolver DNS Firewall rule group in the *Amazon Route 53 Developer Guide*.

- For API details, see UpdateFirewallRuleGroupAssociation in *AWS CLI Command Reference*.

`update-firewall-rule`

The following code example shows how to use `update-firewall-rule`.

AWS CLI

To update a firewall rule

The following `update-firewall-rule` example updates a firewall rule with the parameters you specify.

```
aws route53resolver update-firewall-rule \
    --firewall-rule-group-id rslvr-frg-47f93271fexample \
    --firewall-domain-list-id rslvr-fdl-9e956e9ffexample \
    --priority 102
```

Output:

```
{
    "FirewallRule": {
```

```
        "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
        "FirewallDomainListId": "rslvr-fdl-9e956e9ffexample",
        "Name": "allow-rule",
        "Priority": 102,
        "Action": "ALLOW",
        "CreatorRequestId": "d81e3fb7-020b-415e-939f-EXAMPLE11111",
        "CreationTime": "2021-05-25T21:44:00.346093Z",
        "ModificationTime": "2021-05-25T21:45:59.611600Z"
    }
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the *Amazon Route 53 Developer Guide*.

- For API details, see UpdateFirewallRule in *AWS CLI Command Reference*.

`update-resolver-endpoint`

The following code example shows how to use `update-resolver-endpoint`.

AWS CLI

To update the name of a Resolver endpoint

The following `update-resolver-endpoint` example updates the name of a Resolver endpoint. Updating other values isn't supported.

```
aws route53resolver update-resolver-endpoint \
    --resolver-endpoint-id rslvr-in-b5d45e32bdc445f09 \
    --name my-renamed-inbound-endpoint
```

Output:

```
{
    "ResolverEndpoint": {
        "Id": "rslvr-in-b5d45e32bdexample",
        "CreatorRequestId": "2020-01-02-18:48",
        "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-endpoint/
rslvr-in-b5d45e32bdexample",
        "Name": "my-renamed-inbound-endpoint",
        "SecurityGroupIds": [
            "sg-f62bexam"
```

```
        ],
        "Direction": "INBOUND",
        "IpAddressCount": 2,
        "HostVPCId": "vpc-304bexam",
        "Status": "OPERATIONAL",
        "StatusMessage": "This Resolver Endpoint is operational.",
        "CreationTime": "2020-01-01T18:33:59.265Z",
        "ModificationTime": "2020-01-08T18:33:59.265Z"
    }
}
```

- For API details, see UpdateResolverEndpoint in *AWS CLI Command Reference*.

`update-resolver-rule`

The following code example shows how to use `update-resolver-rule`.

AWS CLI

Example 1: To update settings Resolver endpoint

The following `update-resolver-rule` example updates the name of the rule, the IP addresses on your on-premises network that DNS queries are forwarded to, and the ID of the outbound Resolver endpoint that you're using to forward queries to your network.

Note Existing values for `TargetIps` are overwritten, so you must specify all the IP addresses that you want the rule to have after the update.

```
aws route53resolver update-resolver-rule \
    --resolver-rule-id rslvr-rr-1247fa64f3example \
    --config Name="my-2nd-rule",TargetIps=[{Ip=192.0.2.45,Port=53},
{Ip=192.0.2.46,Port=53}],ResolverEndpointId=rslvr-out-7b89ed0d25example
```

Output:

```
{
    "ResolverRule": {
        "Id": "rslvr-rr-1247fa64f3example",
        "CreatorRequestId": "2020-01-02-18:47",
        "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-rule/rslvr-
rr-1247fa64f3example",
```

```
        "DomainName": "www.example.com.",
        "Status": "COMPLETE",
        "StatusMessage": "[Trace id: 1-5dcc90b9-8a8ee860aba1ebd89example]
 Successfully updated Resolver Rule.",
        "RuleType": "FORWARD",
        "Name": "my-2nd-rule",
        "TargetIps": [
            {
                "Ip": "192.0.2.45",
                "Port": 53
            },
            {
                "Ip": "192.0.2.46",
                "Port": 53
            }
        ],
        "ResolverEndpointId": "rslvr-out-7b89ed0d25example",
        "OwnerId": "111122223333",
        "ShareStatus": "NOT_SHARED"
    }
}
```

Example 2: To update settings Resolver endpoint using a file for ``config`` settings

You can alternatively include the `config` settings in a JSON file and then specify that file when you call `update-resolver-rule`.

```
aws route53resolver update-resolver-rule \
    --resolver-rule-id rslvr-rr-1247fa64f3example \
    --config file://c:\temp\update-resolver-rule.json
```

Contents of `update-resolver-rule.json`.

```
{
    "Name": "my-2nd-rule",
    "TargetIps": [
        {
            "Ip": "192.0.2.45",
            "Port": 53
        },
        {
            "Ip": "192.0.2.46",
            "Port": 53
```

```
        }
    ],
    "ResolverEndpointId": "rslvr-out-7b89ed0d25example"
}
```

For more information, see Values That You Specify When You Create or Edit Rules in the *Amazon Route 53 Developer Guide*.

- For API details, see UpdateResolverRule in *AWS CLI Command Reference*.

Amazon S3 examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon S3.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`abort-multipart-upload`

The following code example shows how to use `abort-multipart-upload`.

AWS CLI

To abort the specified multipart upload

The following `abort-multipart-upload` command aborts a multipart upload for the key `multipart/01` in the bucket `amzn-s3-demo-bucket`.

```
aws s3api abort-multipart-upload \
    --bucket amzn-s3-demo-bucket \
    --key multipart/01 \
```

```
    --upload-
id dfRtDYU0WWCCcH43C3WFbkRONycyCpTJJvxu2i5GYkZljF.Yxwh6XG7WfS2vC4to6HiV6Yjlx.cph0gtNBtJ8P3UR
```

The upload ID required by this command is output by `create-multipart-upload` and can also be retrieved with `list-multipart-uploads`.

- For API details, see [AbortMultipartUpload](#) in *AWS CLI Command Reference*.

`complete-multipart-upload`

The following code example shows how to use `complete-multipart-upload`.

AWS CLI

The following command completes a multipart upload for the key `multipart/01` in the bucket `amzn-s3-demo-bucket`:

```
aws s3api complete-multipart-upload --multipart-upload file://
mpustruct --bucket amzn-s3-demo-bucket --key 'multipart/01' --upload-
id dfRtDYU0WWCCcH43C3WFbkRONycyCpTJJvxu2i5GYkZljF.Yxwh6XG7WfS2vC4to6HiV6Yjlx.cph0gtNBtJ8P3UR
```

The upload ID required by this command is output by `create-multipart-upload` and can also be retrieved with `list-multipart-uploads`.

The multipart upload option in the above command takes a JSON structure that describes the parts of the multipart upload that should be reassembled into the complete file. In this example, the `file://` prefix is used to load the JSON structure from a file in the local folder named `mpustruct`.

mpustruct:

```
{
  "Parts": [
    {
      "ETag": "e868e0f4719e394144ef36531ee6824c",
      "PartNumber": 1
    },
    {
      "ETag": "6bb2b12753d66fe86da4998aa33fffb0",
      "PartNumber": 2
    },
    {
```

```
            "ETag": "d0a0112e841abec9c9ec83406f0159c8",
            "PartNumber": 3
        }
    ]
}
```

The ETag value for each part is upload is output each time you upload a part using the `upload-part` command and can also be retrieved by calling `list-parts` or calculated by taking the MD5 checksum of each part.

Output:

```
{
    "ETag": "\"3944a9f7a4faab7f78788ff6210f63f0-3\"",
    "Bucket": "amzn-s3-demo-bucket",
    "Location": "https://amzn-s3-demo-bucket.s3.amazonaws.com/multipart%2F01",
    "Key": "multipart/01"
}
```

- For API details, see CompleteMultipartUpload in *AWS CLI Command Reference*.

`copy-object`

The following code example shows how to use `copy-object`.

AWS CLI

The following command copies an object from `bucket-1` to `bucket-2`:

```
aws s3api copy-object --copy-source bucket-1/test.txt --key test.txt --
bucket bucket-2
```

Output:

```
{
    "CopyObjectResult": {
        "LastModified": "2015-11-10T01:07:25.000Z",
        "ETag": "\"589c8b79c230a6ecd5a7e1d040a9a030\""
    },
    "VersionId": "YdnYvTCVDqRRFA.NFJjy36p0hxifMlkA"
}
```

- For API details, see CopyObject in *AWS CLI Command Reference*.

cp

The following code example shows how to use `cp`.

AWS CLI

Example 1: Copying a local file to S3

The following `cp` command copies a single file to a specified bucket and key:

```
aws s3 cp test.txt s3://amzn-s3-demo-bucket/test2.txt
```

Output:

```
upload: test.txt to s3://amzn-s3-demo-bucket/test2.txt
```

Example 2: Copying a local file to S3 with an expiration date

The following `cp` command copies a single file to a specified bucket and key that expires at the specified ISO 8601 timestamp:

```
aws s3 cp test.txt s3://amzn-s3-demo-bucket/test2.txt \
    --expires 2014-10-01T20:30:00Z
```

Output:

```
upload: test.txt to s3://amzn-s3-demo-bucket/test2.txt
```

Example 3: Copying a file from S3 to S3

The following `cp` command copies a single s3 object to a specified bucket and key:

```
aws s3 cp s3://amzn-s3-demo-bucket/test.txt s3://amzn-s3-demo-bucket/test2.txt
```

Output:

```
copy: s3://amzn-s3-demo-bucket/test.txt to s3://amzn-s3-demo-bucket/test2.txt
```

Example 4: Copying an S3 object to a local file

The following `cp` command copies a single object to a specified file locally:

```
aws s3 cp s3://amzn-s3-demo-bucket/test.txt test2.txt
```

Output:

```
download: s3://amzn-s3-demo-bucket/test.txt to test2.txt
```

Example 5: Copying an S3 object from one bucket to another

The following `cp` command copies a single object to a specified bucket while retaining its original name:

```
aws s3 cp s3://amzn-s3-demo-bucket/test.txt s3://amzn-s3-demo-bucket2/
```

Output:

```
copy: s3://amzn-s3-demo-bucket/test.txt to s3://amzn-s3-demo-bucket2/test.txt
```

Example 6: Recursively copying S3 objects to a local directory

When passed with the parameter `--recursive`, the following `cp` command recursively copies all objects under a specified prefix and bucket to a specified directory. In this example, the bucket `amzn-s3-demo-bucket` has the objects `test1.txt` and `test2.txt`:

```
aws s3 cp s3://amzn-s3-demo-bucket . \
    --recursive
```

Output:

```
download: s3://amzn-s3-demo-bucket/test1.txt to test1.txt
download: s3://amzn-s3-demo-bucket/test2.txt to test2.txt
```

Example 7: Recursively copying local files to S3

When passed with the parameter `--recursive`, the following `cp` command recursively copies all files under a specified directory to a specified bucket and prefix while excluding some files by using an `--exclude` parameter. In this example, the directory `myDir` has the files `test1.txt` and `test2.jpg`:

```
aws s3 cp myDir s3://amzn-s3-demo-bucket/ \
    --recursive \
    --exclude "*.jpg"
```

Output:

```
upload: myDir/test1.txt to s3://amzn-s3-demo-bucket/test1.txt
```

Example 8: Recursively copying S3 objects to another bucket

When passed with the parameter `--recursive`, the following `cp` command recursively copies all objects under a specified bucket to another bucket while excluding some objects by using an `--exclude` parameter. In this example, the bucket `amzn-s3-demo-bucket` has the objects `test1.txt` and `another/test1.txt`:

```
aws s3 cp s3://amzn-s3-demo-bucket/ s3://amzn-s3-demo-bucket2/ \
    --recursive \
    --exclude "another/*"
```

Output:

```
copy: s3://amzn-s3-demo-bucket/test1.txt to s3://amzn-s3-demo-bucket2/test1.txt
```

You can combine `--exclude` and `--include` options to copy only objects that match a pattern, excluding all others:

```
aws s3 cp s3://amzn-s3-demo-bucket/logs/ s3://amzn-s3-demo-bucket2/logs/ \
    --recursive \
    --exclude "*" \
    --include "*.log"
```

Output:

```
copy: s3://amzn-s3-demo-bucket/logs/test/test.log to s3://amzn-s3-demo-bucket2/logs/
test/test.log
```

```
copy: s3://amzn-s3-demo-bucket/logs/test3.log to s3://amzn-s3-demo-bucket2/logs/
test3.log
```

Example 9: Setting the Access Control List (ACL) while copying an S3 object

The following `cp` command copies a single object to a specified bucket and key while setting the ACL to `public-read-write`:

```
aws s3 cp s3://amzn-s3-demo-bucket/test.txt s3://amzn-s3-demo-bucket/test2.txt \
    --acl public-read-write
```

Output:

```
copy: s3://amzn-s3-demo-bucket/test.txt to s3://amzn-s3-demo-bucket/test2.txt
```

Note that if you're using the `--acl` option, ensure that any associated IAM policies include the `"s3:PutObjectAcl"` action:

```
aws iam get-user-policy \
    --user-name myuser \
    --policy-name mypolicy
```

Output:

```
{
    "UserName": "myuser",
    "PolicyName": "mypolicy",
    "PolicyDocument": {
        "Version":"2012-10-17",
        "Statement": [
            {
                "Action": [
                    "s3:PutObject",
                    "s3:PutObjectAcl"
                ],
                "Resource": [
                    "arn:aws:s3:::amzn-s3-demo-bucket/*"
                ],
                "Effect": "Allow",
                "Sid": "Stmt1234567891234"
            }
```

```
        ]
    }
}
```

Example 10: Granting permissions for an S3 object

The following `cp` command illustrates the use of the `--grants` option to grant read access to all users identified by URI and full control to a specific user identified by their Canonical ID:

```
aws s3 cp file.txt s3://amzn-s3-demo-bucket/ --grants read=uri=http://
acs.amazonaws.com/groups/global/
AllUsers full=id=79a59df900b949e55d96a1e698fbacedfd6e09d98eacf8f8d5218e7cd47ef2be
```

Output:

```
upload: file.txt to s3://amzn-s3-demo-bucket/file.txt
```

Example 11: Uploading a local file stream to S3

PowerShell may alter the encoding of or add a CRLF to piped input.

The following `cp` command uploads a local file stream from standard input to a specified bucket and key:

```
aws s3 cp - s3://amzn-s3-demo-bucket/stream.txt
```

Example 12: Uploading a local file stream that is larger than 50GB to S3

The following `cp` command uploads a 51GB local file stream from standard input to a specified bucket and key. The `--expected-size` option must be provided, or the upload may fail when it reaches the default part limit of 10,000:

```
aws s3 cp - s3://amzn-s3-demo-bucket/stream.txt --expected-size 54760833024
```

Example 13: Downloading an S3 object as a local file stream

PowerShell may alter the encoding of or add a CRLF to piped or redirected output.

The following `cp` command downloads an S3 object locally as a stream to standard output. Downloading as a stream is not currently compatible with the `--recursive` parameter:

```
aws s3 cp s3://amzn-s3-demo-bucket/stream.txt -
```

Example 14: Uploading to an S3 access point

The following `cp` command uploads a single file (`mydoc.txt`) to the access point (`myaccesspoint`) at the key (`mykey`):

```
aws s3 cp mydoc.txt s3://arn:aws:s3:us-west-2:123456789012:accesspoint/
myaccesspoint/mykey
```

Output:

```
upload: mydoc.txt to s3://arn:aws:s3:us-west-2:123456789012:accesspoint/
myaccesspoint/mykey
```

Example 15: Downloading from an S3 access point

The following `cp` command downloads a single object (`mykey`) from the access point (`myaccesspoint`) to the local file (`mydoc.txt`):

```
aws s3 cp s3://arn:aws:s3:us-west-2:123456789012:accesspoint/myaccesspoint/
mykey mydoc.txt
```

Output:

```
download: s3://arn:aws:s3:us-west-2:123456789012:accesspoint/myaccesspoint/mykey to
 mydoc.txt
```

- For API details, see Cp in *AWS CLI Command Reference*.

`create-bucket`

The following code example shows how to use `create-bucket`.

AWS CLI

Example 1: To create a bucket

The following `create-bucket` example creates a bucket named `amzn-s3-demo-bucket`:

```
aws s3api create-bucket \
    --bucket amzn-s3-demo-bucket \
    --region us-east-1
```

Output:

```
{
    "Location": "/amzn-s3-demo-bucket"
}
```

For more information, see Creating a bucket in the *Amazon S3 User Guide*.

Example 2: To create a bucket with owner enforced

The following `create-bucket` example creates a bucket named `amzn-s3-demo-bucket` that uses the bucket owner enforced setting for S3 Object Ownership.

```
aws s3api create-bucket \
    --bucket amzn-s3-demo-bucket \
    --region us-east-1 \
    --object-ownership BucketOwnerEnforced
```

Output:

```
{
    "Location": "/amzn-s3-demo-bucket"
}
```

For more information, see Controlling ownership of objects and disabling ACLs in the *Amazon S3 User Guide*.

Example 3: To create a bucket outside of the ``us-east-1`` region

The following `create-bucket` example creates a bucket named `amzn-s3-demo-bucket` in the `eu-west-1` region. Regions outside of `us-east-1` require the appropriate `LocationConstraint` to be specified in order to create the bucket in the desired region.

```
aws s3api create-bucket \
    --bucket amzn-s3-demo-bucket \
    --region eu-west-1 \
```

```
    --create-bucket-configuration LocationConstraint=eu-west-1
```

Output:

```
{
    "Location": "http://amzn-s3-demo-bucket.s3.amazonaws.com/"
}
```

For more information, see Creating a bucket in the *Amazon S3 User Guide*.

- For API details, see CreateBucket in *AWS CLI Command Reference*.

`create-multipart-upload`

The following code example shows how to use `create-multipart-upload`.

AWS CLI

The following command creates a multipart upload in the bucket `amzn-s3-demo-bucket` with the key `multipart/01`:

```
aws s3api create-multipart-upload --bucket amzn-s3-demo-bucket --key 'multipart/01'
```

Output:

```
{
    "Bucket": "amzn-s3-demo-bucket",
    "UploadId":
 "dfRtDYU0WWCCcH43C3WFbkRONycyCpTJJvxu2i5GYkZljF.Yxwh6XG7WfS2vC4to6HiV6Yjlx.cph0gtNBtJ8P3URC
    "Key": "multipart/01"
}
```

The completed file will be named `01` in a folder called `multipart` in the bucket `amzn-s3-demo-bucket`. Save the upload ID, key and bucket name for use with the `upload-part` command.

- For API details, see CreateMultipartUpload in *AWS CLI Command Reference*.

`delete-bucket-analytics-configuration`

The following code example shows how to use `delete-bucket-analytics-configuration`.

AWS CLI

To delete an analytics configuration for a bucket

The following `delete-bucket-analytics-configuration` example removes the analytics configuration for the specified bucket and ID.

```
aws s3api delete-bucket-analytics-configuration \
    --bucket amzn-s3-demo-bucket \
    --id 1
```

This command produces no output.

- For API details, see DeleteBucketAnalyticsConfiguration in *AWS CLI Command Reference*.

`delete-bucket-cors`

The following code example shows how to use `delete-bucket-cors`.

AWS CLI

The following command deletes a Cross-Origin Resource Sharing configuration from a bucket named `amzn-s3-demo-bucket`:

```
aws s3api delete-bucket-cors --bucket amzn-s3-demo-bucket
```

- For API details, see DeleteBucketCors in *AWS CLI Command Reference*.

`delete-bucket-encryption`

The following code example shows how to use `delete-bucket-encryption`.

AWS CLI

To delete the server-side encryption configuration of a bucket

The following `delete-bucket-encryption` example deletes the server-side encryption configuration of the specified bucket.

```
aws s3api delete-bucket-encryption \
```

```
    --bucket amzn-s3-demo-bucket
```

This command produces no output.

- For API details, see [DeleteBucketEncryption](#) in *AWS CLI Command Reference*.

`delete-bucket-intelligent-tiering-configuration`

The following code example shows how to use `delete-bucket-intelligent-tiering-configuration`.

AWS CLI

To remove an S3 Intelligent-Tiering configuration on a bucket

The following `delete-bucket-intelligent-tiering-configuration` example removes an S3 Intelligent-Tiering configuration, named ExampleConfig, on a bucket.

```
aws s3api delete-bucket-intelligent-tiering-configuration \
    --bucket amzn-s3-demo-bucket \
    --id ExampleConfig
```

This command produces no output.

For more information, see [Using S3 Intelligent-Tiering](#) in the *Amazon S3 User Guide*.

- For API details, see [DeleteBucketIntelligentTieringConfiguration](#) in *AWS CLI Command Reference*.

`delete-bucket-inventory-configuration`

The following code example shows how to use `delete-bucket-inventory-configuration`.

AWS CLI

To delete the inventory configuration of a bucket

The following `delete-bucket-inventory-configuration` example deletes the inventory configuration with ID 1 for the specified bucket.

```
aws s3api delete-bucket-inventory-configuration \
    --bucket amzn-s3-demo-bucket \
```

```
    --id 1
```

This command produces no output.

- For API details, see DeleteBucketInventoryConfiguration in *AWS CLI Command Reference*.

`delete-bucket-lifecycle`

The following code example shows how to use `delete-bucket-lifecycle`.

AWS CLI

The following command deletes a lifecycle configuration from a bucket named `amzn-s3-demo-bucket`:

```
aws s3api delete-bucket-lifecycle --bucket amzn-s3-demo-bucket
```

- For API details, see DeleteBucketLifecycle in *AWS CLI Command Reference*.

`delete-bucket-metrics-configuration`

The following code example shows how to use `delete-bucket-metrics-configuration`.

AWS CLI

To delete a metrics configuration for a bucket

The following `delete-bucket-metrics-configuration` example removes the metrics configuration for the specified bucket and ID.

```
aws s3api delete-bucket-metrics-configuration \
    --bucket amzn-s3-demo-bucket \
    --id 123
```

This command produces no output.

- For API details, see DeleteBucketMetricsConfiguration in *AWS CLI Command Reference*.

`delete-bucket-ownership-controls`

The following code example shows how to use `delete-bucket-ownership-controls`.

AWS CLI

To remove the bucket ownership settings of a bucket

The following `delete-bucket-ownership-controls` example removes the bucket ownership settings of a bucket.

```
aws s3api delete-bucket-ownership-controls \
    --bucket amzn-s3-demo-bucket
```

This command produces no output.

For more information, see Setting Object Ownership on an existing bucket in the *Amazon S3 User Guide*.

- For API details, see DeleteBucketOwnershipControls in *AWS CLI Command Reference*.

`delete-bucket-policy`

The following code example shows how to use `delete-bucket-policy`.

AWS CLI

The following command deletes a bucket policy from a bucket named `amzn-s3-demo-bucket`:

```
aws s3api delete-bucket-policy --bucket amzn-s3-demo-bucket
```

- For API details, see DeleteBucketPolicy in *AWS CLI Command Reference*.

`delete-bucket-replication`

The following code example shows how to use `delete-bucket-replication`.

AWS CLI

The following command deletes a replication configuration from a bucket named `amzn-s3-demo-bucket`:

```
aws s3api delete-bucket-replication --bucket amzn-s3-demo-bucket
```

- For API details, see DeleteBucketReplication in *AWS CLI Command Reference*.

`delete-bucket-tagging`

The following code example shows how to use `delete-bucket-tagging`.

AWS CLI

The following command deletes a tagging configuration from a bucket named `amzn-s3-demo-bucket`:

```
aws s3api delete-bucket-tagging --bucket amzn-s3-demo-bucket
```

- For API details, see DeleteBucketTagging in *AWS CLI Command Reference*.

`delete-bucket-website`

The following code example shows how to use `delete-bucket-website`.

AWS CLI

The following command deletes a website configuration from a bucket named `amzn-s3-demo-bucket`:

```
aws s3api delete-bucket-website --bucket amzn-s3-demo-bucket
```

- For API details, see DeleteBucketWebsite in *AWS CLI Command Reference*.

`delete-bucket`

The following code example shows how to use `delete-bucket`.

AWS CLI

The following command deletes a bucket named `amzn-s3-demo-bucket`:

```
aws s3api delete-bucket --bucket amzn-s3-demo-bucket --region us-east-1
```

- For API details, see DeleteBucket in *AWS CLI Command Reference*.

`delete-object-tagging`

The following code example shows how to use `delete-object-tagging`.

AWS CLI

To delete the tag sets of an object

The following `delete-object-tagging` example deletes the tag with the specified key from the object `doc1.rtf`.

```
aws s3api delete-object-tagging \
    --bucket amzn-s3-demo-bucket \
    --key doc1.rtf
```

This command produces no output.

- For API details, see DeleteObjectTagging in *AWS CLI Command Reference*.

`delete-object`

The following code example shows how to use `delete-object`.

AWS CLI

The following command deletes an object named `test.txt` from a bucket named `amzn-s3-demo-bucket`:

```
aws s3api delete-object --bucket amzn-s3-demo-bucket --key test.txt
```

If bucket versioning is enabled, the output will contain the version ID of the delete marker:

```
{
  "VersionId": "9_gKg5vG56F.TTEUdwkxGpJ3tNDlWlGq",
  "DeleteMarker": true
}
```

For more information about deleting objects, see Deleting Objects in the *Amazon S3 Developer Guide*.

- For API details, see DeleteObject in *AWS CLI Command Reference*.

`delete-objects`

The following code example shows how to use `delete-objects`.

AWS CLI

The following command deletes an object from a bucket named `amzn-s3-demo-bucket`:

```
aws s3api delete-objects --bucket amzn-s3-demo-bucket --delete file://delete.json
```

`delete.json` is a JSON document in the current directory that specifies the object to delete:

```
{
  "Objects": [
    {
      "Key": "test1.txt"
    }
  ],
  "Quiet": false
}
```

Output:

```
{
    "Deleted": [
        {
            "DeleteMarkerVersionId": "mYAT5Mc6F7aeUL8SS7FAAqUPO1koHwzU",
            "Key": "test1.txt",
            "DeleteMarker": true
        }
    ]
}
```

- For API details, see DeleteObjects in *AWS CLI Command Reference*.

`delete-public-access-block`

The following code example shows how to use `delete-public-access-block`.

AWS CLI

To delete the block public access configuration for a bucket

The following `delete-public-access-block` example removes the block public access configuration on the specified bucket.

```
aws s3api delete-public-access-block \
    --bucket amzn-s3-demo-bucket
```

This command produces no output.

- For API details, see DeletePublicAccessBlock in *AWS CLI Command Reference*.

get-bucket-accelerate-configuration

The following code example shows how to use `get-bucket-accelerate-configuration`.

AWS CLI

To retrieve the accelerate configuration of a bucket

The following `get-bucket-accelerate-configuration` example retrieves the accelerate configuration for the specified bucket.

```
aws s3api get-bucket-accelerate-configuration \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "Status": "Enabled"
}
```

- For API details, see GetBucketAccelerateConfiguration in *AWS CLI Command Reference*.

get-bucket-acl

The following code example shows how to use `get-bucket-acl`.

AWS CLI

The following command retrieves the access control list for a bucket named `amzn-s3-demo-bucket`:

```
aws s3api get-bucket-acl --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "Owner": {
        "DisplayName": "my-username",
        "ID": "7009a8971cd538e11f6b6606438875e7c86c5b672f46db45460ddcd087d36c32"
    },
    "Grants": [
        {
            "Grantee": {
                "DisplayName": "my-username",
                "ID":
 "7009a8971cd538e11f6b6606438875e7c86c5b672f46db45460ddcd087d36c32"
            },
            "Permission": "FULL_CONTROL"
        }
    ]
}
```

- For API details, see GetBucketAcl in *AWS CLI Command Reference*.

`get-bucket-analytics-configuration`

The following code example shows how to use `get-bucket-analytics-configuration`.

AWS CLI

To retrieve the analytics configuration for a bucket with a specific ID

The following `get-bucket-analytics-configuration` example displays the analytics configuration for the specified bucket and ID.

```
aws s3api get-bucket-analytics-configuration \
    --bucket amzn-s3-demo-bucket \
    --id 1
```

Output:

```
{
```

```
    "AnalyticsConfiguration": {
        "StorageClassAnalysis": {},
        "Id": "1"
    }
}
```

- For API details, see GetBucketAnalyticsConfiguration in *AWS CLI Command Reference*.

get-bucket-cors

The following code example shows how to use `get-bucket-cors`.

AWS CLI

The following command retrieves the Cross-Origin Resource Sharing configuration for a bucket named `amzn-s3-demo-bucket`:

```
aws s3api get-bucket-cors --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "CORSRules": [
        {
            "AllowedHeaders": [
                "*"
            ],
            "ExposeHeaders": [
                "x-amz-server-side-encryption"
            ],
            "AllowedMethods": [
                "PUT",
                "POST",
                "DELETE"
            ],
            "MaxAgeSeconds": 3000,
            "AllowedOrigins": [
                "http://www.example.com"
            ]
        },
        {
            "AllowedHeaders": [
```

```
                "Authorization"
            ],
            "MaxAgeSeconds": 3000,
            "AllowedMethods": [
                "GET"
            ],
            "AllowedOrigins": [
                "*"
            ]
        }
    ]
}
```

- For API details, see GetBucketCors in *AWS CLI Command Reference*.

`get-bucket-encryption`

The following code example shows how to use `get-bucket-encryption`.

AWS CLI

To retrieve the server-side encryption configuration for a bucket

The following `get-bucket-encryption` example retrieves the server-side encryption configuration for the bucket `amzn-s3-demo-bucket`.

```
aws s3api get-bucket-encryption \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "ServerSideEncryptionConfiguration": {
        "Rules": [
            {
                "ApplyServerSideEncryptionByDefault": {
                    "SSEAlgorithm": "AES256"
                }
            }
        ]
    }
}
```

- For API details, see GetBucketEncryption in *AWS CLI Command Reference*.

`get-bucket-intelligent-tiering-configuration`

The following code example shows how to use `get-bucket-intelligent-tiering-configuration`.

AWS CLI

To retrieve an S3 Intelligent-Tiering configuration on a bucket

The following `get-bucket-intelligent-tiering-configuration` example retrieves an S3 Intelligent-Tiering configuration, named ExampleConfig, on a bucket.

```
aws s3api get-bucket-intelligent-tiering-configuration \
    --bucket amzn-s3-demo-bucket \
    --id ExampleConfig
```

Output:

```
{
    "IntelligentTieringConfiguration": {
        "Id": "ExampleConfig2",
        "Filter": {
            "Prefix": "images"
        },
        "Status": "Enabled",
        "Tierings": [
            {
                "Days": 90,
                "AccessTier": "ARCHIVE_ACCESS"
            },
            {
                "Days": 180,
                "AccessTier": "DEEP_ARCHIVE_ACCESS"
            }
        ]
    }
}
```

For more information, see Using S3 Intelligent-Tiering in the *Amazon S3 User Guide*.

- For API details, see GetBucketIntelligentTieringConfiguration in *AWS CLI Command Reference*.

`get-bucket-inventory-configuration`

The following code example shows how to use `get-bucket-inventory-configuration`.

AWS CLI

To retrieve the inventory configuration for a bucket

The following `get-bucket-inventory-configuration` example retrieves the inventory configuration for the specified bucket with ID 1.

```
aws s3api get-bucket-inventory-configuration \
    --bucket amzn-s3-demo-bucket \
    --id 1
```

Output:

```
{
    "InventoryConfiguration": {
        "IsEnabled": true,
        "Destination": {
            "S3BucketDestination": {
                "Format": "ORC",
                "Bucket": "arn:aws:s3:::amzn-s3-demo-bucket",
                "AccountId": "123456789012"
            }
        },
        "IncludedObjectVersions": "Current",
        "Id": "1",
        "Schedule": {
            "Frequency": "Weekly"
        }
    }
}
```

- For API details, see GetBucketInventoryConfiguration in *AWS CLI Command Reference*.

`get-bucket-lifecycle-configuration`

The following code example shows how to use `get-bucket-lifecycle-configuration`.

AWS CLI

The following command retrieves the lifecycle configuration for a bucket named `amzn-s3-demo-bucket`:

```
aws s3api get-bucket-lifecycle-configuration --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "Rules": [
        {
            "ID": "Move rotated logs to Glacier",
            "Prefix": "rotated/",
            "Status": "Enabled",
            "Transitions": [
                {
                    "Date": "2015-11-10T00:00:00.000Z",
                    "StorageClass": "GLACIER"
                }
            ]
        },
        {
            "Status": "Enabled",
            "Prefix": "",
            "NoncurrentVersionTransitions": [
                {
                    "NoncurrentDays": 0,
                    "StorageClass": "GLACIER"
                }
            ],
            "ID": "Move old versions to Glacier"
        }
    ]
}
```

- For API details, see GetBucketLifecycleConfiguration in *AWS CLI Command Reference*.

`get-bucket-lifecycle`

The following code example shows how to use `get-bucket-lifecycle`.

AWS CLI

The following command retrieves the lifecycle configuration for a bucket named `amzn-s3-demo-bucket`:

```
aws s3api get-bucket-lifecycle --bucket amzn-s3-demo-bucket
```

Output:

```
{
  "Rules": [
    {
      "ID": "Move to Glacier after sixty days (objects in logs/2015/)",
      "Prefix": "logs/2015/",
      "Status": "Enabled",
      "Transition": {
        "Days": 60,
        "StorageClass": "GLACIER"
      }
    },
    {
      "Expiration": {
        "Date": "2016-01-01T00:00:00.000Z"
      },
      "ID": "Delete 2014 logs in 2016.",
      "Prefix": "logs/2014/",
      "Status": "Enabled"
    }
  ]
}
```

- For API details, see GetBucketLifecycle in *AWS CLI Command Reference*.

`get-bucket-location`

The following code example shows how to use `get-bucket-location`.

AWS CLI

The following command retrieves the location constraint for a bucket named `amzn-s3-demo-bucket`, if a constraint exists:

```
aws s3api get-bucket-location --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "LocationConstraint": "us-west-2"
}
```

- For API details, see GetBucketLocation in *AWS CLI Command Reference*.

`get-bucket-logging`

The following code example shows how to use `get-bucket-logging`.

AWS CLI

To retrieve the logging status for a bucket

The following `get-bucket-logging` example retrieves the logging status for the specified bucket.

```
aws s3api get-bucket-logging \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "LoggingEnabled": {
        "TargetPrefix": "",
        "TargetBucket": "amzn-s3-demo-bucket-logs"
          }
}
```

- For API details, see GetBucketLogging in *AWS CLI Command Reference*.

`get-bucket-metrics-configuration`

The following code example shows how to use `get-bucket-metrics-configuration`.

AWS CLI

To retrieve the metrics configuration for a bucket with a specific ID

The following `get-bucket-metrics-configuration` example displays the metrics configuration for the specified bucket and ID.

```
aws s3api get-bucket-metrics-configuration \
    --bucket amzn-s3-demo-bucket \
    --id 123
```

Output:

```
{
    "MetricsConfiguration": {
        "Filter": {
            "Prefix": "logs"
        },
        "Id": "123"
    }
}
```

- For API details, see GetBucketMetricsConfiguration in *AWS CLI Command Reference*.

`get-bucket-notification-configuration`

The following code example shows how to use `get-bucket-notification-configuration`.

AWS CLI

The following command retrieves the notification configuration for a bucket named `amzn-s3-demo-bucket`:

```
aws s3api get-bucket-notification-configuration --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "TopicConfigurations": [
        {
```

```
                "Id": "YmQzMmEwM2EjZWVlI0NGItNzVtZjI1MC00ZjgyLWZDBiZWNl",
                "TopicArn": "arn:aws:sns:us-west-2:123456789012:my-notification-topic",
                "Events": [
                    "s3:ObjectCreated:*"
                ]
            }
        ]
    }
```

- For API details, see GetBucketNotificationConfiguration in *AWS CLI Command Reference*.

get-bucket-notification

The following code example shows how to use `get-bucket-notification`.

AWS CLI

The following command retrieves the notification configuration for a bucket named `amzn-s3-demo-bucket`:

```
aws s3api get-bucket-notification --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "TopicConfiguration": {
        "Topic": "arn:aws:sns:us-west-2:123456789012:my-notification-topic",
        "Id": "YmQzMmEwM2EjZWVlI0NGItNzVtZjI1MC00ZjgyLWZDBiZWNl",
        "Event": "s3:ObjectCreated:*",
        "Events": [
            "s3:ObjectCreated:*"
        ]
    }
}
```

- For API details, see GetBucketNotification in *AWS CLI Command Reference*.

get-bucket-ownership-controls

The following code example shows how to use `get-bucket-ownership-controls`.

AWS CLI

To retrieve the bucket ownership settings of a bucket

The following `get-bucket-ownership-controls` example retrieves the bucket ownership settings of a bucket.

```
aws s3api get-bucket-ownership-controls \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "OwnershipControls": {
        "Rules": [
            {
                "ObjectOwnership": "BucketOwnerEnforced"
            }
        ]
    }
}
```

For more information, see Viewing the Object Ownership setting for an S3 bucket in the *Amazon S3 User Guide*.

- For API details, see GetBucketOwnershipControls in *AWS CLI Command Reference*.

`get-bucket-policy-status`

The following code example shows how to use `get-bucket-policy-status`.

AWS CLI

To retrieve the policy status for a bucket indicating whether the bucket is public

The following `get-bucket-policy-status` example retrieves the policy status for the bucket `amzn-s3-demo-bucket`.

```
aws s3api get-bucket-policy-status \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "PolicyStatus": {
        "IsPublic": false
    }
}
```

- For API details, see GetBucketPolicyStatus in *AWS CLI Command Reference*.

`get-bucket-policy`

The following code example shows how to use `get-bucket-policy`.

AWS CLI

The following command retrieves the bucket policy for a bucket named `amzn-s3-demo-bucket`:

```
aws s3api get-bucket-policy --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "Policy": "{\"Version\":\"2008-10-17\",\"Statement\":[{\"Sid\":\"\",\"Effect
\":\"Allow\",\"Principal\":\"*\",\"Action\":\"s3:GetObject\",\"Resource\":
\"arn:aws:s3:::amzn-s3-demo-bucket/*\"},{\"Sid\":\"\",\"Effect\":\"Deny\",
\"Principal\":\"*\",\"Action\":\"s3:GetObject\",\"Resource\":\"arn:aws:s3:::amzn-s3-
demo-bucket/secret/*\"}]}"
}
```

Get and put a bucket policyThe following example shows how you can download an Amazon S3 bucket policy, make modifications to the file, and then use `put-bucket-policy` to apply the modified bucket policy. To download the bucket policy to a file, you can run:

```
aws s3api get-bucket-policy --bucket amzn-s3-demo-bucket --query Policy --output
 text > policy.json
```

You can then modify the `policy.json` file as needed. Finally you can apply this modified policy back to the S3 bucket by running:

`policy.json` file as needed. Finally you can apply this modified policy back to the S3 bucket by running:

file as needed. Finally you can apply this modified policy back to the S3 bucket by running:

```
aws s3api put-bucket-policy --bucket amzn-s3-demo-bucket --policy file://policy.json
```

- For API details, see GetBucketPolicy in *AWS CLI Command Reference*.

`get-bucket-replication`

The following code example shows how to use `get-bucket-replication`.

AWS CLI

The following command retrieves the replication configuration for a bucket named `amzn-s3-demo-bucket`:

```
aws s3api get-bucket-replication --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "ReplicationConfiguration": {
        "Rules": [
            {
                "Status": "Enabled",
                "Prefix": "",
                "Destination": {
                    "Bucket": "arn:aws:s3:::amzn-s3-demo-bucket-backup",
                    "StorageClass": "STANDARD"
                },
                "ID": "ZmUwNzE4ZmQ4tMjVhOS00MTlkLOGI4NDkzZTIWJjNTUtYTA1"
            }
        ],
        "Role": "arn:aws:iam::123456789012:role/s3-replication-role"
    }
}
```

- For API details, see GetBucketReplication in *AWS CLI Command Reference*.

`get-bucket-request-payment`

The following code example shows how to use `get-bucket-request-payment`.

AWS CLI

To retrieve the request payment configuration for a bucket

The following `get-bucket-request-payment` example retrieves the requester pays configuration for the specified bucket.

```
aws s3api get-bucket-request-payment \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "Payer": "BucketOwner"
}
```

- For API details, see GetBucketRequestPayment in *AWS CLI Command Reference*.

`get-bucket-tagging`

The following code example shows how to use `get-bucket-tagging`.

AWS CLI

The following command retrieves the tagging configuration for a bucket named `amzn-s3-demo-bucket`:

```
aws s3api get-bucket-tagging --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "TagSet": [
        {
            "Value": "marketing",
            "Key": "organization"
        }
    ]
```

```
}
```

- For API details, see GetBucketTagging in *AWS CLI Command Reference*.

`get-bucket-versioning`

The following code example shows how to use `get-bucket-versioning`.

AWS CLI

The following command retrieves the versioning configuration for a bucket named `amzn-s3-demo-bucket`:

```
aws s3api get-bucket-versioning --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "Status": "Enabled"
}
```

- For API details, see GetBucketVersioning in *AWS CLI Command Reference*.

`get-bucket-website`

The following code example shows how to use `get-bucket-website`.

AWS CLI

The following command retrieves the static website configuration for a bucket named `amzn-s3-demo-bucket`:

```
aws s3api get-bucket-website --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "IndexDocument": {
        "Suffix": "index.html"
    },
```

```
    "ErrorDocument": {
        "Key": "error.html"
    }
}
```

- For API details, see GetBucketWebsite in *AWS CLI Command Reference*.

`get-object-acl`

The following code example shows how to use `get-object-acl`.

AWS CLI

The following command retrieves the access control list for an object in a bucket named `amzn-s3-demo-bucket`:

```
aws s3api get-object-acl --bucket amzn-s3-demo-bucket --key index.html
```

Output:

```
{
    "Owner": {
        "DisplayName": "my-username",
        "ID": "7009a8971cd538e11f6b6606438875e7c86c5b672f46db45460ddcd087d36c32"
    },
    "Grants": [
        {
            "Grantee": {
                "DisplayName": "my-username",
                "ID":
 "7009a8971cd538e11f6b6606438875e7c86c5b672f46db45460ddcd087d36c32"
            },
            "Permission": "FULL_CONTROL"
        },
        {
            "Grantee": {
                "URI": "http://acs.amazonaws.com/groups/global/AllUsers"
            },
            "Permission": "READ"
        }
    ]
}
```

- For API details, see GetObjectAcl in *AWS CLI Command Reference*.

`get-object-attributes`

The following code example shows how to use `get-object-attributes`.

AWS CLI

To retrieves metadata from an object without returning the object itself

The following `get-object-attributes` example retrieves metadata from the object `doc1.rtf`.

```
aws s3api get-object-attributes \
    --bucket amzn-s3-demo-bucket \
    --key doc1.rtf \
    --object-attributes "StorageClass" "ETag" "ObjectSize"
```

Output:

```
{
    "LastModified": "2022-03-15T19:37:31+00:00",
    "VersionId": "IuCPjXTDzHNfldAuitVBIKJpF2p1fg4P",
    "ETag": "b662d79adeb7c8d787ea7eafb9ef6207",
    "StorageClass": "STANDARD",
    "ObjectSize": 405
}
```

For more information, see GetObjectAttributes in the Amazon S3 API Reference.

- For API details, see GetObjectAttributes in *AWS CLI Command Reference*.

`get-object-legal-hold`

The following code example shows how to use `get-object-legal-hold`.

AWS CLI

Retrieves the Legal Hold status of an object

The following `get-object-legal-hold` example retrieves the Legal Hold status for the specified object.

```
aws s3api get-object-legal-hold \
    --bucket amzn-s3-demo-bucket-with-object-lock \
    --key doc1.rtf
```

Output:

```
{
    "LegalHold": {
        "Status": "ON"
    }
}
```

- For API details, see GetObjectLegalHold in *AWS CLI Command Reference*.

`get-object-lock-configuration`

The following code example shows how to use `get-object-lock-configuration`.

AWS CLI

To retrieve an object lock configuration for a bucket

The following `get-object-lock-configuration` example retrieves the object lock configuration for the specified bucket.

```
aws s3api get-object-lock-configuration \
    --bucket amzn-s3-demo-bucket-with-object-lock
```

Output:

```
{
    "ObjectLockConfiguration": {
        "ObjectLockEnabled": "Enabled",
        "Rule": {
            "DefaultRetention": {
                "Mode": "COMPLIANCE",
                "Days": 50
            }
        }
    }
}
```

- For API details, see GetObjectLockConfiguration in *AWS CLI Command Reference*.

`get-object-retention`

The following code example shows how to use `get-object-retention`.

AWS CLI

To retrieve the object retention configuration for an object

The following `get-object-retention` example retrieves the object retention configuration for the specified object.

```
aws s3api get-object-retention \
    --bucket amzn-s3-demo-bucket-with-object-lock \
    --key doc1.rtf
```

Output:

```
{
    "Retention": {
        "Mode": "GOVERNANCE",
        "RetainUntilDate": "2025-01-01T00:00:00.000Z"
    }
}
```

- For API details, see GetObjectRetention in *AWS CLI Command Reference*.

`get-object-tagging`

The following code example shows how to use `get-object-tagging`.

AWS CLI

To retrieve the tags attached to an object

The following `get-object-tagging` example retrieves the values for the specified key from the specified object.

```
aws s3api get-object-tagging \
```

```
    --bucket amzn-s3-demo-bucket \
    --key doc1.rtf
```

Output:

```
{
    "TagSet": [
        {
            "Value": "confidential",
            "Key": "designation"
        }
    ]
}
```

The following `get-object-tagging` example tries to retrieve the tag sets of the object `doc2.rtf`, which has no tags.

```
aws s3api get-object-tagging \
    --bucket amzn-s3-demo-bucket \
    --key doc2.rtf
```

Output:

```
{
    "TagSet": []
}
```

The following `get-object-tagging` example retrieves the tag sets of the object `doc3.rtf`, which has multiple tags.

```
aws s3api get-object-tagging \
    --bucket amzn-s3-demo-bucket \
    --key doc3.rtf
```

Output:

```
{
    "TagSet": [
        {
            "Value": "confidential",
```

```
            "Key": "designation"
        },
        {
            "Value": "finance",
            "Key": "department"
        },
        {
            "Value": "payroll",
            "Key": "team"
        }
    ]
}
```

- For API details, see GetObjectTagging in *AWS CLI Command Reference*.

`get-object-torrent`

The following code example shows how to use `get-object-torrent`.

AWS CLI

The following command creates a torrent for an object in a bucket named `amzn-s3-demo-bucket`:

```
aws s3api get-object-torrent --bucket amzn-s3-demo-bucket --key large-video-
file.mp4 large-video-file.torrent
```

The torrent file is saved locally in the current folder. Note that the output filename (`large-video-file.torrent`) is specified without an option name and must be the last argument in the command.

- For API details, see GetObjectTorrent in *AWS CLI Command Reference*.

`get-object`

The following code example shows how to use `get-object`.

AWS CLI

The following example uses the `get-object` command to download an object from Amazon S3:

```
aws s3api get-object --bucket text-content --key dir/
my_images.tar.bz2 my_images.tar.bz2
```

Note that the outfile parameter is specified without an option name such as "--outfile". The name of the output file must be the last parameter in the command.

The example below demonstrates the use of `--range` to download a specific byte range from an object. Note the byte ranges needs to be prefixed with "bytes=":

```
aws s3api get-object --bucket text-content --key dir/my_data --
range bytes=8888-9999 my_data_range
```

For more information about retrieving objects, see Getting Objects in the *Amazon S3 Developer Guide*.

- For API details, see GetObject in *AWS CLI Command Reference*.

`get-public-access-block`

The following code example shows how to use `get-public-access-block`.

AWS CLI

To set or modify the block public access configuration for a bucket

The following `get-public-access-block` example displays the block public access configuration for the specified bucket.

```
aws s3api get-public-access-block \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "PublicAccessBlockConfiguration": {
        "IgnorePublicAcls": true,
        "BlockPublicPolicy": true,
        "BlockPublicAcls": true,
        "RestrictPublicBuckets": true
    }
}
```

- For API details, see GetPublicAccessBlock in *AWS CLI Command Reference*.

`head-bucket`

The following code example shows how to use `head-bucket`.

AWS CLI

The following command verifies access to a bucket named `amzn-s3-demo-bucket`:

```
aws s3api head-bucket --bucket amzn-s3-demo-bucket
```

If the bucket exists and you have access to it, no output is returned. Otherwise, an error message will be shown. For example:

```
A client error (404) occurred when calling the HeadBucket operation: Not Found
```

- For API details, see HeadBucket in *AWS CLI Command Reference*.

`head-object`

The following code example shows how to use `head-object`.

AWS CLI

The following command retrieves metadata for an object in a bucket named `amzn-s3-demo-bucket`:

```
aws s3api head-object --bucket amzn-s3-demo-bucket --key index.html
```

Output:

```
{
    "AcceptRanges": "bytes",
    "ContentType": "text/html",
    "LastModified": "Thu, 16 Apr 2015 18:19:14 GMT",
    "ContentLength": 77,
    "VersionId": "null",
    "ETag": "\"30a6ec7e1a9ad79c203d05a589c8b400\"",
    "Metadata": {}
```

```
}
```

- For API details, see HeadObject in *AWS CLI Command Reference*.

`list-bucket-analytics-configurations`

The following code example shows how to use `list-bucket-analytics-configurations`.

AWS CLI

To retrieve a list of analytics configurations for a bucket

The following `list-bucket-analytics-configurations` retrieves a list of analytics configurations for the specified bucket.

```
aws s3api list-bucket-analytics-configurations \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "AnalyticsConfigurationList": [
        {
            "StorageClassAnalysis": {},
            "Id": "1"
        }
    ],
    "IsTruncated": false
}
```

- For API details, see ListBucketAnalyticsConfigurations in *AWS CLI Command Reference*.

`list-bucket-intelligent-tiering-configurations`

The following code example shows how to use `list-bucket-intelligent-tiering-configurations`.

AWS CLI

To retrieve all S3 Intelligent-Tiering configurations on a bucket

The following `list-bucket-intelligent-tiering-configurations` example retrieves all S3 Intelligent-Tiering configuration on a bucket.

```
aws s3api list-bucket-intelligent-tiering-configurations \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "IsTruncated": false,
    "IntelligentTieringConfigurationList": [
        {
            "Id": "ExampleConfig",
            "Filter": {
                "Prefix": "images"
            },
            "Status": "Enabled",
            "Tierings": [
                {
                    "Days": 90,
                    "AccessTier": "ARCHIVE_ACCESS"
                },
                {
                    "Days": 180,
                    "AccessTier": "DEEP_ARCHIVE_ACCESS"
                }
            ]
        },
        {
            "Id": "ExampleConfig2",
            "Status": "Disabled",
            "Tierings": [
                {
                    "Days": 730,
                    "AccessTier": "ARCHIVE_ACCESS"
                }
            ]
        },
        {
            "Id": "ExampleConfig3",
            "Filter": {
                "Tag": {
                    "Key": "documents",
```

```
                    "Value": "taxes"
                }
            },
            "Status": "Enabled",
            "Tierings": [
                {
                    "Days": 90,
                    "AccessTier": "ARCHIVE_ACCESS"
                },
                {
                    "Days": 365,
                    "AccessTier": "DEEP_ARCHIVE_ACCESS"
                }
            ]
        }
    ]
}
```

For more information, see [Using S3 Intelligent-Tiering]() in the *Amazon S3 User Guide*.

- For API details, see [ListBucketIntelligentTieringConfigurations]() in *AWS CLI Command Reference*.

`list-bucket-inventory-configurations`

The following code example shows how to use `list-bucket-inventory-configurations`.

AWS CLI

To retrieve a list of inventory configurations for a bucket

The following `list-bucket-inventory-configurations` example lists the inventory configurations for the specified bucket.

```
aws s3api list-bucket-inventory-configurations \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "InventoryConfigurationList": [
```

```
        {
            "IsEnabled": true,
            "Destination": {
                "S3BucketDestination": {
                    "Format": "ORC",
                    "Bucket": "arn:aws:s3:::amzn-s3-demo-bucket",
                    "AccountId": "123456789012"
                }
            },
            "IncludedObjectVersions": "Current",
            "Id": "1",
            "Schedule": {
                "Frequency": "Weekly"
            }
        },
        {
            "IsEnabled": true,
            "Destination": {
                "S3BucketDestination": {
                    "Format": "CSV",
                    "Bucket": "arn:aws:s3:::amzn-s3-demo-bucket",
                    "AccountId": "123456789012"
                }
            },
            "IncludedObjectVersions": "Current",
            "Id": "2",
            "Schedule": {
                "Frequency": "Daily"
            }
        }
    ],
    "IsTruncated": false
}
```

- For API details, see ListBucketInventoryConfigurations in *AWS CLI Command Reference*.

`list-bucket-metrics-configurations`

The following code example shows how to use `list-bucket-metrics-configurations`.

AWS CLI

To retrieve a list of metrics configurations for a bucket

The following `list-bucket-metrics-configurations` example retrieves a list of metrics configurations for the specified bucket.

```
aws s3api list-bucket-metrics-configurations \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "IsTruncated": false,
    "MetricsConfigurationList": [
        {
            "Filter": {
                "Prefix": "logs"
            },
            "Id": "123"
        },
        {
            "Filter": {
                "Prefix": "tmp"
            },
            "Id": "234"
        }
    ]
}
```

- For API details, see ListBucketMetricsConfigurations in *AWS CLI Command Reference*.

`list-buckets`

The following code example shows how to use `list-buckets`.

AWS CLI

The following command uses the `list-buckets` command to display the names of all your Amazon S3 buckets (across all regions):

```
aws s3api list-buckets --query "Buckets[].Name"
```

The query option filters the output of `list-buckets` down to only the bucket names.

For more information about buckets, see Working with Amazon S3 Buckets in the *Amazon S3 Developer Guide*.

- For API details, see ListBuckets in *AWS CLI Command Reference*.

`list-multipart-uploads`

The following code example shows how to use `list-multipart-uploads`.

AWS CLI

The following command lists all of the active multipart uploads for a bucket named `amzn-s3-demo-bucket`:

```
aws s3api list-multipart-uploads --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "Uploads": [
        {
            "Initiator": {
                "DisplayName": "username",
                "ID": "arn:aws:iam::0123456789012:user/username"
            },
            "Initiated": "2015-06-02T18:01:30.000Z",
            "UploadId":
 "dfRtDYU0WWCCcH43C3WFbkRONycyCpTJJvxu2i5GYkZljF.Yxwh6XG7WfS2vC4to6HiV6Yjlx.cph0gtNBtJ8P3URC
            "StorageClass": "STANDARD",
            "Key": "multipart/01",
            "Owner": {
                "DisplayName": "aws-account-name",
                "ID":
 "100719349fc3b6dcd7c820a124bf7aecd408092c3d7b51b38494939801fc248b"
            }
        }
    ],
    "CommonPrefixes": []
}
```

In progress multipart uploads incur storage costs in Amazon S3. Complete or abort an active multipart upload to remove its parts from your account.

- For API details, see ListMultipartUploads in *AWS CLI Command Reference*.

`list-object-versions`

The following code example shows how to use `list-object-versions`.

AWS CLI

The following command retrieves version information for an object in a bucket named `amzn-s3-demo-bucket`:

```
aws s3api list-object-versions --bucket amzn-s3-demo-bucket --prefix index.html
```

Output:

```
{
    "DeleteMarkers": [
        {
            "Owner": {
                "DisplayName": "my-username",
                "ID":
 "7009a8971cd660687538875e7c86c5b672fe116bd438f46db45460ddcd036c32"
            },
            "IsLatest": true,
            "VersionId": "B2VsEK5saUNNHKcOAJj7hIE86RozToyq",
            "Key": "index.html",
            "LastModified": "2015-11-10T00:57:03.000Z"
        },
        {
            "Owner": {
                "DisplayName": "my-username",
                "ID":
 "7009a8971cd660687538875e7c86c5b672fe116bd438f46db45460ddcd036c32"
            },
            "IsLatest": false,
            "VersionId": ".FLQEZscLIcfxSq.jsFJ.szUkmng2Yw6",
            "Key": "index.html",
            "LastModified": "2015-11-09T23:32:20.000Z"
        }
    ],
    "Versions": [
        {
```

```
            "LastModified": "2015-11-10T00:20:11.000Z",
            "VersionId": "Rb_l2T8UHDkFEwCgJjhlgPOZC0qJ.vpD",
            "ETag": "\"0622528de826c0df5db1258a23b80be5\"",
            "StorageClass": "STANDARD",
            "Key": "index.html",
            "Owner": {

            },
            "IsLatest": false,
            "Size": 38
        },
        {
            "LastModified": "2015-11-09T22:50:50.000Z",
            "VersionId": "null",
            "ETag": "\"d1f45267a863c8392e07d24dd592f1b9\"",
            "StorageClass": "STANDARD",
            "Key": "index.html",
            "Owner": {
                "DisplayName": "my-username",
                "ID":
 "7009a8971cd660687538875e7c86c5b672fe116bd438f46db45460ddcd036c32"
            },
            "IsLatest": false,
            "Size": 533823
        }
    ]
}
```

- For API details, see ListObjectVersions in *AWS CLI Command Reference*.

`list-objects-v2`

The following code example shows how to use `list-objects-v2`.

AWS CLI

To get a list of objects in a bucket

The following `list-objects-v2` example lists the objects in the specified bucket.

```
aws s3api list-objects-v2 \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{

            }
        ]
}
```

- For API details, see ListObjectsV2 in *AWS CLI Command Reference*.

`list-objects`

The following code example shows how to use `list-objects`.

AWS CLI

The following example uses the `list-objects` command to display the names of all the objects in the specified bucket:

```
aws s3api list-objects --bucket text-content --query 'Contents[].{Key: Key, Size:
 Size}'
```

The example uses the `--query` argument to filter the output of `list-objects` down to the key value and size for each object

For more information about objects, see Working with Amazon S3 Objects in the *Amazon S3 Developer Guide*.

- For API details, see ListObjects in *AWS CLI Command Reference*.

`list-parts`

The following code example shows how to use `list-parts`.

AWS CLI

The following command lists all of the parts that have been uploaded for a multipart upload with key `multipart/01` in the bucket `amzn-s3-demo-bucket`:

```
aws s3api list-parts --bucket amzn-s3-demo-bucket --key 'multipart/01' --upload-
id dfRtDYU0WWCCcH43C3WFbkRONycyCpTJJvxu2i5GYkZljF.Yxwh6XG7WfS2vC4to6HiV6Yjlx.cph0gtNBtJ8P3UR
```

Output:

```
{
    "Owner": {
        "DisplayName": "aws-account-name",
        "ID": "100719349fc3b6dcd7c820a124bf7aecd408092c3d7b51b38494939801fc248b"
    },
    "Initiator": {
        "DisplayName": "username",
        "ID": "arn:aws:iam::0123456789012:user/username"
    },
    "Parts": [
        {
            "LastModified": "2015-06-02T18:07:35.000Z",
            "PartNumber": 1,
            "ETag": "\"e868e0f4719e394144ef36531ee6824c\"",
            "Size": 5242880
        },
        {
            "LastModified": "2015-06-02T18:07:42.000Z",

            "Size": 5242880
        }
    ],
    "StorageClass": "STANDARD"
}
```

- For API details, see ListParts in *AWS CLI Command Reference*.

`ls`

The following code example shows how to use `ls`.

AWS CLI

Example 1: Listing all user owned buckets

The following `ls` command lists all of the bucket owned by the user. In this example, the user owns the buckets `amzn-s3-demo-bucket` and `amzn-s3-demo-bucket2`. The timestamp is the date the bucket was created, shown in your machine's time zone. This date can change when making changes to your bucket, such as editing its bucket policy. Note if `s3://` is used for the path argument `<S3Uri>`, it will list all of the buckets as well.

```
aws s3 ls
```

Output:

```
2013-07-11 17:08:50 amzn-s3-demo-bucket
2013-07-24 14:55:44 amzn-s3-demo-bucket2
```

Example 2: Listing all prefixes and objects in a bucket

The following `ls` command lists objects and common prefixes under a specified bucket and prefix. In this example, the user owns the bucket `amzn-s3-demo-bucket` with the objects `test.txt` and `somePrefix/test.txt`. The `LastWriteTime` and `Length` are arbitrary. Note that since the `ls` command has no interaction with the local filesystem, the `s3://` URI scheme is not required to resolve ambiguity and may be omitted.

```
aws s3 ls s3://amzn-s3-demo-bucket
```

Output:

```
                           PRE somePrefix/
2013-07-25 17:06:27         88 test.txt
```

Example 3: Listing all prefixes and objects in a specific bucket and prefix

The following `ls` command lists objects and common prefixes under a specified bucket and prefix. However, there are no objects nor common prefixes under the specified bucket and prefix.

```
aws s3 ls s3://amzn-s3-demo-bucket/noExistPrefix
```

Output:

```
None
```

Example 4: Recursively listing all prefixes and objects in a bucket

The following `ls` command will recursively list objects in a bucket. Rather than showing PRE `dirname/` in the output, all the content in a bucket will be listed in order.

```
aws s3 ls s3://amzn-s3-demo-bucket \
    --recursive
```

Output:

```
2013-09-02 21:37:53         10 a.txt
2013-09-02 21:37:53    2863288 foo.zip
2013-09-02 21:32:57         23 foo/bar/.baz/a
2013-09-02 21:32:58         41 foo/bar/.baz/b
2013-09-02 21:32:57        281 foo/bar/.baz/c
2013-09-02 21:32:57         73 foo/bar/.baz/d
2013-09-02 21:32:57        452 foo/bar/.baz/e
2013-09-02 21:32:57        896 foo/bar/.baz/hooks/bar
2013-09-02 21:32:57        189 foo/bar/.baz/hooks/foo
2013-09-02 21:32:57        398 z.txt
```

Example 5: Summarizing all prefixes and objects in a bucket

The following `ls` command demonstrates the same command using the --human-readable and --summarize options. --human-readable displays file size in Bytes/MiB/KiB/GiB/TiB/PiB/EiB. --summarize displays the total number of objects and total size at the end of the result listing:

```
aws s3 ls s3://amzn-s3-demo-bucket \
    --recursive \
    --human-readable \
    --summarize
```

Output:

```
2013-09-02 21:37:53   10 Bytes a.txt
2013-09-02 21:37:53  2.9 MiB foo.zip
2013-09-02 21:32:57   23 Bytes foo/bar/.baz/a
2013-09-02 21:32:58   41 Bytes foo/bar/.baz/b
2013-09-02 21:32:57  281 Bytes foo/bar/.baz/c
```

```
2013-09-02 21:32:57   73 Bytes foo/bar/.baz/d
2013-09-02 21:32:57  452 Bytes foo/bar/.baz/e
2013-09-02 21:32:57  896 Bytes foo/bar/.baz/hooks/bar
2013-09-02 21:32:57  189 Bytes foo/bar/.baz/hooks/foo
2013-09-02 21:32:57  398 Bytes z.txt

Total Objects: 10
   Total Size: 2.9 MiB
```

Example 6: Listing from an S3 access point

The following `ls` command list objects from access point (`myaccesspoint`):

```
aws s3 ls s3://arn:aws:s3:us-west-2:123456789012:accesspoint/myaccesspoint/
```

Output:

```
                           PRE somePrefix/
2013-07-25 17:06:27         88 test.txt
```

- For API details, see Ls in *AWS CLI Command Reference*.

`mb`

The following code example shows how to use `mb`.

AWS CLI

Example 1: Create a bucket

The following `mb` command creates a bucket. In this example, the user makes the bucket `amzn-s3-demo-bucket`. The bucket is created in the region specified in the user's configuration file:

```
aws s3 mb s3://amzn-s3-demo-bucket
```

Output:

```
make_bucket: s3://amzn-s3-demo-bucket
```

Example 2: Create a bucket in the specified region

The following `mb` command creates a bucket in a region specified by the `--region` parameter. In this example, the user makes the bucket `amzn-s3-demo-bucket` in the region `us-west-1`:

```
aws s3 mb s3://amzn-s3-demo-bucket \
    --region us-west-1
```

Output:

```
make_bucket: s3://amzn-s3-demo-bucket
```

Example 3: Create a bucket with specified tags

The following `mb` command creates a bucket with specified tags using the `--tags` parameter. In this example, the user makes the bucket `amzn-s3-demo-bucket` with two tags with keys `Key1` and `Key2`, respectively.

```
aws s3 mb s3://amzn-s3-demo-bucket \
    --tags Key1 Value1 \
    --tags Key2 Value2
```

Output:

```
make_bucket: s3://amzn-s3-demo-bucket
```

- For API details, see Mb in *AWS CLI Command Reference*.

`mv`

The following code example shows how to use `mv`.

AWS CLI

Example 1: Move a local file to the specified bucket

The following `mv` command moves a single file to a specified bucket and key.

```
aws s3 mv test.txt s3://amzn-s3-demo-bucket/test2.txt
```

Output:

```
move: test.txt to s3://amzn-s3-demo-bucket/test2.txt
```

Example 2: Move an object to the specified bucket and key

The following `mv` command moves a single s3 object to a specified bucket and key.

```
aws s3 mv s3://amzn-s3-demo-bucket/test.txt s3://amzn-s3-demo-bucket/test2.txt
```

Output:

```
move: s3://amzn-s3-demo-bucket/test.txt to s3://amzn-s3-demo-bucket/test2.txt
```

Example 3: Move an S3 object to the local directory

The following `mv` command moves a single object to a specified file locally.

```
aws s3 mv s3://amzn-s3-demo-bucket/test.txt test2.txt
```

Output:

```
move: s3://amzn-s3-demo-bucket/test.txt to test2.txt
```

Example 4: Move an object with it's original name to the specified bucket

The following `mv` command moves a single object to a specified bucket while retaining its original name:

```
aws s3 mv s3://amzn-s3-demo-bucket/test.txt s3://amzn-s3-demo-bucket2/
```

Output:

```
move: s3://amzn-s3-demo-bucket/test.txt to s3://amzn-s3-demo-bucket2/test.txt
```

Example 5: Move all objects and prefixes in a bucket to the local directory

When passed with the parameter `--recursive`, the following `mv` command recursively moves all objects under a specified prefix and bucket to a specified directory. In this example, the bucket `amzn-s3-demo-bucket` has the objects `test1.txt` and `test2.txt`.

```
aws s3 mv s3://amzn-s3-demo-bucket . \
    --recursive
```

Output:

```
move: s3://amzn-s3-demo-bucket/test1.txt to test1.txt
move: s3://amzn-s3-demo-bucket/test2.txt to test2.txt
```

Example 6: Move all objects and prefixes in a bucket to the local directory, except ``.jpg`` files

When passed with the parameter `--recursive`, the following `mv` command recursively moves all files under a specified directory to a specified bucket and prefix while excluding some files by using an `--exclude` parameter. In this example, the directory `myDir` has the files `test1.txt` and `test2.jpg`.

```
aws s3 mv myDir s3://amzn-s3-demo-bucket/ \
    --recursive \
    --exclude "*.jpg"
```

Output:

```
move: myDir/test1.txt to s3://amzn-s3-demo-bucket2/test1.txt
```

Example 7: Move all objects and prefixes in a bucket to the local directory, except specified prefix

When passed with the parameter `--recursive`, the following `mv` command recursively moves all objects under a specified bucket to another bucket while excluding some objects by using an `--exclude` parameter. In this example, the bucket `amzn-s3-demo-bucket` has the objects `test1.txt` and `another/test1.txt`.

```
aws s3 mv s3://amzn-s3-demo-bucket/ s3://amzn-s3-demo-bucket2/ \
    --recursive \
    --exclude "amzn-s3-demo-bucket/another/*"
```

Output:

```
move: s3://amzn-s3-demo-bucket/test1.txt to s3://amzn-s3-demo-bucket2/test1.txt
```

Example 8: Move an object to the specified bucket and set the ACL

The following `mv` command moves a single object to a specified bucket and key while setting the ACL to `public-read-write`.

```
aws s3 mv s3://amzn-s3-demo-bucket/test.txt s3://amzn-s3-demo-bucket/test2.txt \
    --acl public-read-write
```

Output:

```
move: s3://amzn-s3-demo-bucket/test.txt to s3://amzn-s3-demo-bucket/test2.txt
```

Example 9: Move a local file to the specified bucket and grant permissions

The following `mv` command illustrates the use of the `--grants` option to grant read access to all users and full control to a specific user identified by their email address.

```
aws s3 mv file.txt s3://amzn-s3-demo-bucket/ \
    --grants read=uri=http://acs.amazonaws.com/groups/global/
AllUsers full=emailaddress=user@example.com
```

Output:

```
move: file.txt to s3://amzn-s3-demo-bucket/file.txt
```

Example 10: Move a file to an S3 access point

The following `mv` command moves a single file named `mydoc.txt` to the access point named `myaccesspoint` at the key named `mykey`.

```
aws s3 mv mydoc.txt s3://arn:aws:s3:us-west-2:123456789012:accesspoint/
myaccesspoint/mykey
```

Output:

```
move: mydoc.txt to s3://arn:aws:s3:us-west-2:123456789012:accesspoint/myaccesspoint/
mykey
```

- For API details, see Mv in *AWS CLI Command Reference*.

`presign`

The following code example shows how to use `presign`.

AWS CLI

Example 1: To create a pre-signed URL with the default one hour lifetime that links to an object in an S3 bucket

The following `presign` command generates a pre-signed URL for a specified bucket and key that is valid for one hour.

```
aws s3 presign s3://amzn-s3-demo-bucket/test2.txt
```

Output:

```
https://amzn-s3-demo-bucket.s3.us-west-2.amazonaws.com/key?X-Amz-Algorithm=AWS4-
HMAC-SHA256&X-Amz-Credential=AKIAEXAMPLE123456789%2F20210621%2Fus-
west-2%2Fs3%2Faws4_request&X-Amz-Date=20210621T041609Z&X-Amz-Expires=3600&X-Amz-
SignedHeaders=host&X-Amz-
Signature=EXAMBLE1234494d5fba3fed607f98018e1dfc62e2529ae96d844123456
```

Example 2: To create a pre-signed URL with a custom lifetime that links to an object in an S3 bucket

The following `presign` command generates a pre-signed URL for a specified bucket and key that is valid for one week.

```
aws s3 presign s3://amzn-s3-demo-bucket/test2.txt \
    --expires-in 604800
```

Output:

```
https://amzn-s3-demo-bucket.s3.us-west-2.amazonaws.com/key?X-Amz-Algorithm=AWS4-
HMAC-SHA256&X-Amz-Credential=AKIAEXAMPLE123456789%2F20210621%2Fus-
west-2%2Fs3%2Faws4_request&X-Amz-Date=20210621T041609Z&X-Amz-Expires=604800&X-Amz-
SignedHeaders=host&X-Amz-
Signature=EXAMBLE1234494d5fba3fed607f98018e1dfc62e2529ae96d844123456
```

For more information, see Share an Object with Others in the *S3 Developer Guide* guide.

- For API details, see Presign in *AWS CLI Command Reference*.

put-bucket-accelerate-configuration

The following code example shows how to use `put-bucket-accelerate-configuration`.

AWS CLI

To set the accelerate configuration of a bucket

The following `put-bucket-accelerate-configuration` example enables the accelerate configuration for the specified bucket.

```
aws s3api put-bucket-accelerate-configuration \
    --bucket amzn-s3-demo-bucket \
    --accelerate-configuration Status=Enabled
```

This command produces no output.

- For API details, see PutBucketAccelerateConfiguration in *AWS CLI Command Reference*.

put-bucket-acl

The following code example shows how to use `put-bucket-acl`.

AWS CLI

This example grants `full control` to two AWS users (*user1@example.com* and *user2@example.com*) and `read` permission to everyone:

```
aws s3api put-bucket-acl --bucket amzn-s3-demo-bucket --grant-full-
control emailaddress=user1@example.com,emailaddress=user2@example.com --grant-
read uri=http://acs.amazonaws.com/groups/global/AllUsers
```

See http://docs.aws.amazon.com/AmazonS3/latest/API/RESTBucketPUTacl.html for details on custom ACLs (the s3api ACL commands, such as `put-bucket-acl`, use the same shorthand argument notation).

- For API details, see PutBucketAcl in *AWS CLI Command Reference*.

`put-bucket-analytics-configuration`

The following code example shows how to use `put-bucket-analytics-configuration`.

AWS CLI

To sets an analytics configuration for the bucket

The following `put-bucket-analytics-configuration` example configures analytics for the specified bucket.

```
aws s3api put-bucket-analytics-configuration \
    --bucket amzn-s3-demo-bucket --id 1 \
    --analytics-configuration '{"Id": "1","StorageClassAnalysis": {}}'
```

This command produces no output.

- For API details, see PutBucketAnalyticsConfiguration in *AWS CLI Command Reference*.

`put-bucket-cors`

The following code example shows how to use `put-bucket-cors`.

AWS CLI

The following example enables `PUT`, `POST`, and `DELETE` requests from *www.example.com*, and enables `GET` requests from any domain:

```
aws s3api put-bucket-cors --bucket amzn-s3-demo-bucket --cors-configuration file://
cors.json

cors.json:
{
  "CORSRules": [
    {
      "AllowedOrigins": ["http://www.example.com"],
      "AllowedHeaders": ["*"],
      "AllowedMethods": ["PUT", "POST", "DELETE"],
      "MaxAgeSeconds": 3000,
      "ExposeHeaders": ["x-amz-server-side-encryption"]
    },
    {
```

```
        "AllowedOrigins": ["*"],
        "AllowedHeaders": ["Authorization"],
        "AllowedMethods": ["GET"],
        "MaxAgeSeconds": 3000
      }
    ]
  }
```

- For API details, see PutBucketCors in *AWS CLI Command Reference*.

put-bucket-encryption

The following code example shows how to use `put-bucket-encryption`.

AWS CLI

To configure server-side encryption for a bucket

The following `put-bucket-encryption` example sets AES256 encryption as the default for the specified bucket.

```
aws s3api put-bucket-encryption \
    --bucket amzn-s3-demo-bucket \
    --server-side-encryption-configuration '{"Rules":
 [{"ApplyServerSideEncryptionByDefault": {"SSEAlgorithm": "AES256"}}]}'
```

This command produces no output.

- For API details, see PutBucketEncryption in *AWS CLI Command Reference*.

put-bucket-intelligent-tiering-configuration

The following code example shows how to use `put-bucket-intelligent-tiering-configuration`.

AWS CLI

To update an S3 Intelligent-Tiering configuration on a bucket

The following `put-bucket-intelligent-tiering-configuration` example updates an S3 Intelligent-Tiering configuration, named ExampleConfig, on a bucket. The configuration will transition objects that have not been accessed under the prefix images to Archive Access after 90 days and Deep Archive Access after 180 days.

```
aws s3api put-bucket-intelligent-tiering-configuration \
    --bucket amzn-s3-demo-bucket \
    --id "ExampleConfig" \
    --intelligent-tiering-configuration file://intelligent-tiering-
configuration.json
```

Contents of `intelligent-tiering-configuration.json`:

```
{
    "Id": "ExampleConfig",
    "Status": "Enabled",
    "Filter": {
        "Prefix": "images"
        },
    "Tierings": [
        {
            "Days": 90,
            "AccessTier": "ARCHIVE_ACCESS"
        },
        {
            "Days": 180,
            "AccessTier": "DEEP_ARCHIVE_ACCESS"
        }
    ]
}
```

This command produces no output.

For more information, see Setting Object Ownership on an existing bucket in the *Amazon S3 User Guide*.

- For API details, see PutBucketIntelligentTieringConfiguration in *AWS CLI Command Reference*.

put-bucket-inventory-configuration

The following code example shows how to use `put-bucket-inventory-configuration`.

AWS CLI

Example 1: To set an inventory configuration for a bucket

The following `put-bucket-inventory-configuration` example sets a weekly ORC-formatted inventory report for the bucket `amzn-s3-demo-bucket`.

```
aws s3api put-bucket-inventory-configuration \
    --bucket amzn-s3-demo-bucket \
    --id 1 \
    --inventory-configuration '{"Destination": { "S3BucketDestination":
 { "AccountId": "123456789012", "Bucket": "arn:aws:s3:::amzn-s3-demo-bucket",
 "Format": "ORC" }}, "IsEnabled": true, "Id": "1", "IncludedObjectVersions":
 "Current", "Schedule": { "Frequency": "Weekly" }}'
```

This command produces no output.

Example 2: To set an inventory configuration for a bucket

The following `put-bucket-inventory-configuration` example sets a daily CSV-formatted inventory report for the bucket `amzn-s3-demo-bucket`.

```
aws s3api put-bucket-inventory-configuration \
    --bucket amzn-s3-demo-bucket \
    --id 2 \
    --inventory-configuration '{"Destination": { "S3BucketDestination":
 { "AccountId": "123456789012", "Bucket": "arn:aws:s3:::amzn-s3-demo-bucket",
 "Format": "CSV" }}, "IsEnabled": true, "Id": "2", "IncludedObjectVersions":
 "Current", "Schedule": { "Frequency": "Daily" }}'
```

This command produces no output.

- For API details, see PutBucketInventoryConfiguration in *AWS CLI Command Reference*.

`put-bucket-lifecycle-configuration`

The following code example shows how to use `put-bucket-lifecycle-configuration`.

AWS CLI

The following command applies a lifecycle configuration to a bucket named `amzn-s3-demo-bucket`:

```
aws s3api put-bucket-lifecycle-configuration --bucket amzn-s3-demo-bucket --
lifecycle-configuration  file://lifecycle.json
```

The file `lifecycle.json` is a JSON document in the current folder that specifies two rules:

```
{
    "Rules": [
        {
            "ID": "Move rotated logs to Glacier",
            "Prefix": "rotated/",
            "Status": "Enabled",
            "Transitions": [
                {
                    "Date": "2015-11-10T00:00:00.000Z",
                    "StorageClass": "GLACIER"
                }
            ]
        },
        {
            "Status": "Enabled",
            "Prefix": "",
            "NoncurrentVersionTransitions": [
                {
                    "NoncurrentDays": 2,
                    "StorageClass": "GLACIER"
                }
            ],
            "ID": "Move old versions to Glacier"
        }
    ]
}
```

The first rule moves files with the prefix `rotated` to Glacier on the specified date. The second rule moves old object versions to Glacier when they are no longer current. For information on acceptable timestamp formats, see Specifying Parameter Values in the *AWS CLI User Guide*.

- For API details, see PutBucketLifecycleConfiguration in *AWS CLI Command Reference*.

`put-bucket-lifecycle`

The following code example shows how to use `put-bucket-lifecycle`.

AWS CLI

The following command applies a lifecycle configuration to the bucket `amzn-s3-demo-bucket`:

```
aws s3api put-bucket-lifecycle --bucket amzn-s3-demo-bucket --lifecycle-configuration file://lifecycle.json
```

The file `lifecycle.json` is a JSON document in the current folder that specifies two rules:

```
{
  "Rules": [
    {
      "ID": "Move to Glacier after sixty days (objects in logs/2015/)",
      "Prefix": "logs/2015/",
      "Status": "Enabled",
      "Transition": {
        "Days": 60,
        "StorageClass": "GLACIER"
      }
    },
    {
      "Expiration": {
        "Date": "2016-01-01T00:00:00.000Z"
      },
      "ID": "Delete 2014 logs in 2016.",
      "Prefix": "logs/2014/",
      "Status": "Enabled"
    }
  ]
}
```

The first rule moves files to Amazon Glacier after sixty days. The second rule deletes files from Amazon S3 on the specified date. For information on acceptable timestamp formats, see Specifying Parameter Values in the *AWS CLI User Guide*.

Each rule in the above example specifies a policy (`Transition` or `Expiration`) and file prefix (folder name) to which it applies. You can also create a rule that applies to an entire bucket by specifying a blank prefix:

```
{
  "Rules": [
    {
      "ID": "Move to Glacier after sixty days (all objects in bucket)",
      "Prefix": "",
      "Status": "Enabled",
```

```
        "Transition": {
          "Days": 60,
          "StorageClass": "GLACIER"
        }
      }
    ]
}
```

- For API details, see PutBucketLifecycle in *AWS CLI Command Reference*.

`put-bucket-logging`

The following code example shows how to use `put-bucket-logging`.

AWS CLI

Example 1: To set bucket policy logging

The following `put-bucket-logging` example sets the logging policy for *amzn-s3-demo-bucket*. First, grant the logging service principal permission in your bucket policy using the `put-bucket-policy` command.

```
aws s3api put-bucket-policy \
    --bucket amzn-s3-demo-bucket \
    --policy file://policy.json
```

Contents of `policy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "S3ServerAccessLogsPolicy",
            "Effect": "Allow",
            "Principal": {"Service": "logging.s3.amazonaws.com"},
            "Action": "s3:PutObject",
            "Resource": "arn:aws:s3:::amzn-s3-demo-bucket/Logs/*",
            "Condition": {
                "ArnLike": {"aws:SourceARN": "arn:aws:s3:::SOURCE-BUCKET-NAME"},
                "StringEquals": {"aws:SourceAccount": "SOURCE-AWS-ACCOUNT-ID"}
            }
```

```
        }
    ]
}
```

To apply the logging policy, use `put-bucket-logging`.

```
aws s3api put-bucket-logging \
    --bucket amzn-s3-demo-bucket \
    --bucket-logging-status file://logging.json
```

Contents of `logging.json`:

```
{
     "LoggingEnabled": {
         "TargetBucket": "amzn-s3-demo-bucket",
         "TargetPrefix": "Logs/"
     }
 }
```

The `put-bucket-policy` command is required to grant `s3:PutObject` permissions to the logging service principal.

For more information, see Amazon S3 Server Access Logging in the *Amazon S3 User Guide*.

Example 2: To set a bucket policy for logging access to only a single user

The following `put-bucket-logging` example sets the logging policy for *amzn-s3-demo-bucket*. The AWS user *bob@example.com* will have full control over the log files, and no one else has any access. First, grant S3 permission with `put-bucket-acl`.

```
aws s3api put-bucket-acl \
    --bucket amzn-s3-demo-bucket \
    --grant-write URI=http://acs.amazonaws.com/groups/s3/LogDelivery \
    --grant-read-acp URI=http://acs.amazonaws.com/groups/s3/LogDelivery
```

Then apply the logging policy using `put-bucket-logging`.

```
aws s3api put-bucket-logging \
    --bucket amzn-s3-demo-bucket \
```

```
    --bucket-logging-status file://logging.json
```

Contents of `logging.json`:

```
{
    "LoggingEnabled": {
        "TargetBucket": "amzn-s3-demo-bucket",
        "TargetPrefix": "amzn-s3-demo-bucket-logs/",
        "TargetGrants": [
            {
                "Grantee": {
                    "Type": "AmazonCustomerByEmail",
                    "EmailAddress": "bob@example.com"
                },
                "Permission": "FULL_CONTROL"
            }
        ]
    }
}
```

the `put-bucket-acl` command is required to grant S3's log delivery system the necessary permissions (write and read-acp permissions).

For more information, see Amazon S3 Server Access Logging in the *Amazon S3 Developer Guide*.

- For API details, see PutBucketLogging in *AWS CLI Command Reference*.

`put-bucket-metrics-configuration`

The following code example shows how to use `put-bucket-metrics-configuration`.

AWS CLI

To set a metrics configuration for a bucket

The following `put-bucket-metrics-configuration` example sets a metric configuration with ID 123 for the specified bucket.

```
aws s3api put-bucket-metrics-configuration \
    --bucket amzn-s3-demo-bucket \
    --id 123 \
    --metrics-configuration '{"Id": "123", "Filter": {"Prefix": "logs"}}'
```

This command produces no output.

- For API details, see PutBucketMetricsConfiguration in *AWS CLI Command Reference*.

`put-bucket-notification-configuration`

The following code example shows how to use `put-bucket-notification-configuration`.

AWS CLI

To enable the specified notifications to a bucket

The following `put-bucket-notification-configuration` example applies a notification configuration to a bucket named `amzn-s3-demo-bucket`. The file `notification.json` is a JSON document in the current folder that specifies an SNS topic and an event type to monitor.

```
aws s3api put-bucket-notification-configuration \
    --bucket amzn-s3-demo-bucket \
    --notification-configuration file://notification.json
```

Contents of `notification.json`:

```
{
    "TopicConfigurations": [
        {
            "TopicArn": "arn:aws:sns:us-west-2:123456789012:s3-notification-topic",
            "Events": [
                "s3:ObjectCreated:*"
            ]
        }
    ]
}
```

The SNS topic must have an IAM policy attached to it that allows Amazon S3 to publish to it.

```
{
    "Version":"2012-10-17",
    "Id": "example-ID",
    "Statement": [
        {
            "Sid": "example-statement-ID",
```

```
                "Effect": "Allow",
                "Principal": {
                    "Service": "s3.amazonaws.com"
                },
                "Action": [
                    "SNS:Publish"
                ],
                "Resource": "arn:aws:sns:us-west-2:123456789012::s3-notification-topic",
                "Condition": {
                    "ArnLike": {
                        "aws:SourceArn": "arn:aws:s3:*:*:amzn-s3-demo-bucket"
                    }
                }
            }
        ]
}
```

- For API details, see PutBucketNotificationConfiguration in *AWS CLI Command Reference*.

put-bucket-notification

The following code example shows how to use `put-bucket-notification`.

AWS CLI

The applies a notification configuration to a bucket named `amzn-s3-demo-bucket`:

```
aws s3api put-bucket-notification --bucket amzn-s3-demo-bucket --notification-configuration file://notification.json
```

The file `notification.json` is a JSON document in the current folder that specifies an SNS topic and an event type to monitor:

```
{
  "TopicConfiguration": {
    "Event": "s3:ObjectCreated:*",
    "Topic": "arn:aws:sns:us-west-2:123456789012:s3-notification-topic"
  }
}
```

The SNS topic must have an IAM policy attached to it that allows Amazon S3 to publish to it:

```
{
 "Version":"2012-10-17",
 "Id": "example-ID",
 "Statement": [
  {
   "Sid": "example-statement-ID",
   "Effect": "Allow",
   "Principal": {
     "Service": "s3.amazonaws.com"
   },
   "Action": [
    "SNS:Publish"
   ],
   "Resource": "arn:aws:sns:us-west-2:123456789012:amzn-s3-demo-bucket",
   "Condition": {
      "ArnLike": {
      "aws:SourceArn": "arn:aws:s3:*:*:amzn-s3-demo-bucket"
    }
   }
  }
 ]
}
```

- For API details, see [PutBucketNotification](#) in *AWS CLI Command Reference*.

`put-bucket-ownership-controls`

The following code example shows how to use `put-bucket-ownership-controls`.

AWS CLI

To update the bucket ownership settings of a bucket

The following `put-bucket-ownership-controls` example updates the bucket ownership settings of a bucket.

```
aws s3api put-bucket-ownership-controls \
    --bucket amzn-s3-demo-bucket \
    --ownership-controls="Rules=[{ObjectOwnership=BucketOwnerEnforced}]"
```

This command produces no output.

For more information, see Setting Object Ownership on an existing bucket in the *Amazon S3 User Guide*.

- For API details, see PutBucketOwnershipControls in *AWS CLI Command Reference*.

`put-bucket-policy`

The following code example shows how to use `put-bucket-policy`.

AWS CLI

This example allows all users to retrieve any object in *amzn-s3-demo-bucket* except those in the *MySecretFolder*. It also grants `put` and `delete` permission to the root user of the AWS account `1234-5678-9012`:

```
aws s3api put-bucket-policy --bucket amzn-s3-demo-bucket --policy file://policy.json

policy.json:
{
   "Statement": [
      {
         "Effect": "Allow",
         "Principal": "*",
         "Action": "s3:GetObject",
         "Resource": "arn:aws:s3:::amzn-s3-demo-bucket/*"
      },
      {
         "Effect": "Deny",
         "Principal": "*",
         "Action": "s3:GetObject",
         "Resource": "arn:aws:s3:::amzn-s3-demo-bucket/MySecretFolder/*"
      },
      {
         "Effect": "Allow",
         "Principal": {
            "AWS": "arn:aws:iam::123456789012:root"
         },
         "Action": [
            "s3:DeleteObject",
            "s3:PutObject"
         ],
         "Resource": "arn:aws:s3:::amzn-s3-demo-bucket/*"
      }
```

```
    ]
}
```

- For API details, see PutBucketPolicy in *AWS CLI Command Reference*.

`put-bucket-replication`

The following code example shows how to use `put-bucket-replication`.

AWS CLI

To configure replication for an S3 bucket

The following `put-bucket-replication` example applies a replication configuration to the specified S3 bucket.

```
aws s3api put-bucket-replication \
    --bucket amzn-s3-demo-bucket1 \
    --replication-configuration file://replication.json
```

Contents of `replication.json`:

```
{
    "Role": "arn:aws:iam::123456789012:role/s3-replication-role",
    "Rules": [
        {
            "Status": "Enabled",
            "Priority": 1,
            "DeleteMarkerReplication": { "Status": "Disabled" },
            "Filter" : { "Prefix": ""},
            "Destination": {
                "Bucket": "arn:aws:s3:::amzn-s3-demo-bucket2"
            }
        }
    ]
}
```

The destination bucket must have versioning enabled. The specified role must have permission to write to the destination bucket and have a trust relationship that allows Amazon S3 to assume the role.

Example role permission policy:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetReplicationConfiguration",
                "s3:ListBucket"
            ],
            "Resource": [
                "arn:aws:s3:::amzn-s3-demo-bucket1"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObjectVersion",
                "s3:GetObjectVersionAcl",
                "s3:GetObjectVersionTagging"
            ],
            "Resource": [
                "arn:aws:s3:::amzn-s3-demo-bucket1/*"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "s3:ReplicateObject",
                "s3:ReplicateDelete",
                "s3:ReplicateTags"
            ],
            "Resource": "arn:aws:s3:::amzn-s3-demo-bucket2/*"
        }
    ]
}
```

Example trust relationship policy:

```
{
    "Version":"2012-10-17",
    "Statement": [
```

```
        {
            "Effect": "Allow",
            "Principal": {
                "Service": "s3.amazonaws.com"
            },
            "Action": "sts:AssumeRole"
        }
    ]
}
```

This command produces no output.

For more information, see This is the topic title in the *Amazon Simple Storage Service Console User Guide*.

- For API details, see PutBucketReplication in *AWS CLI Command Reference*.

`put-bucket-request-payment`

The following code example shows how to use `put-bucket-request-payment`.

AWS CLI

Example 1: To enable ``requester pays`` configuration for a bucket

The following `put-bucket-request-payment` example enables `requester pays` for the specified bucket.

```
aws s3api put-bucket-request-payment \
    --bucket amzn-s3-demo-bucket \
    --request-payment-configuration '{"Payer":"Requester"}'
```

This command produces no output.

Example 2: To disable ``requester pays`` configuration for a bucket

The following `put-bucket-request-payment` example disables `requester pays` for the specified bucket.

```
aws s3api put-bucket-request-payment \
    --bucket amzn-s3-demo-bucket \
    --request-payment-configuration '{"Payer":"BucketOwner"}'
```

This command produces no output.

- For API details, see PutBucketRequestPayment in *AWS CLI Command Reference*.

`put-bucket-tagging`

The following code example shows how to use `put-bucket-tagging`.

AWS CLI

The following command applies a tagging configuration to a bucket named `amzn-s3-demo-bucket`:

```
aws s3api put-bucket-tagging --bucket amzn-s3-demo-bucket --tagging file://
tagging.json
```

The file `tagging.json` is a JSON document in the current folder that specifies tags:

```
{
   "TagSet": [
     {
       "Key": "organization",
       "Value": "marketing"
     }
   ]
}
```

Or apply a tagging configuration to `amzn-s3-demo-bucket` directly from the command line:

```
aws s3api put-bucket-tagging --bucket amzn-s3-demo-bucket --tagging
 'TagSet=[{Key=organization,Value=marketing}]'
```

- For API details, see PutBucketTagging in *AWS CLI Command Reference*.

`put-bucket-versioning`

The following code example shows how to use `put-bucket-versioning`.

AWS CLI

The following command enables versioning on a bucket named `amzn-s3-demo-bucket`:

```
aws s3api put-bucket-versioning --bucket amzn-s3-demo-bucket --versioning-
configuration Status=Enabled
```

The following command enables versioning, and uses an mfa code

```
aws s3api put-bucket-versioning --bucket amzn-s3-demo-bucket --versioning-
configuration Status=Enabled --mfa "SERIAL 123456"
```

- For API details, see PutBucketVersioning in *AWS CLI Command Reference*.

put-bucket-website

The following code example shows how to use `put-bucket-website`.

AWS CLI

The applies a static website configuration to a bucket named `amzn-s3-demo-bucket`:

```
aws s3api put-bucket-website --bucket amzn-s3-demo-bucket --website-
configuration file://website.json
```

The file `website.json` is a JSON document in the current folder that specifies index and error pages for the website:

```
{
    "IndexDocument": {
        "Suffix": "index.html"
    },
    "ErrorDocument": {
        "Key": "error.html"
    }
}
```

- For API details, see PutBucketWebsite in *AWS CLI Command Reference*.

put-object-acl

The following code example shows how to use `put-object-acl`.

AWS CLI

The following command grants `full control` to two AWS users (*user1@example.com* and *user2@example.com*) and `read` permission to everyone:

```
aws s3api put-object-acl --bucket amzn-s3-demo-bucket --key file.txt --grant-full-
control emailaddress=user1@example.com,emailaddress=user2@example.com --grant-
read uri=http://acs.amazonaws.com/groups/global/AllUsers
```

See http://docs.aws.amazon.com/AmazonS3/latest/API/RESTBucketPUTacl.html for details on custom ACLs (the s3api ACL commands, such as `put-object-acl`, use the same shorthand argument notation).

- For API details, see PutObjectAcl in *AWS CLI Command Reference*.

`put-object-legal-hold`

The following code example shows how to use `put-object-legal-hold`.

AWS CLI

To apply a Legal Hold to an object

The following `put-object-legal-hold` example sets a Legal Hold on the object `doc1.rtf`.

```
aws s3api put-object-legal-hold \
    --bucket amzn-s3-demo-bucket-with-object-lock \
    --key doc1.rtf \
    --legal-hold Status=ON
```

This command produces no output.

- For API details, see PutObjectLegalHold in *AWS CLI Command Reference*.

`put-object-lock-configuration`

The following code example shows how to use `put-object-lock-configuration`.

AWS CLI

To set an object lock configuration on a bucket

The following `put-object-lock-configuration` example sets a 50-day object lock on the specified bucket.

```
aws s3api put-object-lock-configuration \
    --bucket amzn-s3-demo-bucket-with-object-lock \
    --object-lock-configuration '{ "ObjectLockEnabled": "Enabled", "Rule":
 { "DefaultRetention": { "Mode": "COMPLIANCE", "Days": 50 }}}'
```

This command produces no output.

- For API details, see PutObjectLockConfiguration in *AWS CLI Command Reference*.

`put-object-retention`

The following code example shows how to use `put-object-retention`.

AWS CLI

To set an object retention configuration for an object

The following `put-object-retention` example sets an object retention configuration for the specified object until 2025-01-01.

```
aws s3api put-object-retention \
    --bucket amzn-s3-demo-bucket-with-object-lock \
    --key doc1.rtf \
    --retention '{ "Mode": "GOVERNANCE", "RetainUntilDate": "2025-01-01T00:00:00" }'
```

This command produces no output.

- For API details, see PutObjectRetention in *AWS CLI Command Reference*.

`put-object-tagging`

The following code example shows how to use `put-object-tagging`.

AWS CLI

To set a tag on an object

The following `put-object-tagging` example sets a tag with the key `designation` and the value `confidential` on the specified object.

```
aws s3api put-object-tagging \
    --bucket amzn-s3-demo-bucket \
    --key doc1.rtf \
    --tagging '{"TagSet": [{ "Key": "designation", "Value": "confidential" }]}'
```

This command produces no output.

The following `put-object-tagging` example sets multiple tags sets on the specified object.

```
aws s3api put-object-tagging \
    --bucket amzn-s3-demo-bucket-example \
    --key doc3.rtf \
    --tagging '{"TagSet": [{ "Key": "designation", "Value": "confidential" },
 { "Key": "department", "Value": "finance" }, { "Key": "team", "Value":
 "payroll" } ]}'
```

This command produces no output.

- For API details, see PutObjectTagging in *AWS CLI Command Reference*.

`put-object`

The following code example shows how to use `put-object`.

AWS CLI

Example 1: Upload an object to Amazon S3

The following `put-object` command example uploads an object to Amazon S3.

```
aws s3api put-object \
    --bucket amzn-s3-demo-bucket \
    --key my-dir/MySampleImage.png \
    --body MySampleImage.png
```

For more information about uploading objects, see Uploading Objects < http://docs.aws.amazon.com/AmazonS3/latest/dev/UploadingObjects.html> in the *Amazon S3 Developer Guide*.

Example 2: Upload a video file to Amazon S3

The following `put-object` command example uploads a video file.

```
aws s3api put-object \
    --bucket amzn-s3-demo-bucket \
    --key my-dir/big-video-file.mp4 \
    --body /media/videos/f-sharp-3-data-services.mp4
```

For more information about uploading objects, see Uploading Objects < http://docs.aws.amazon.com/AmazonS3/latest/dev/UploadingObjects.html> in the *Amazon S3 Developer Guide*.

- For API details, see PutObject in *AWS CLI Command Reference*.

`put-public-access-block`

The following code example shows how to use `put-public-access-block`.

AWS CLI

To set the block public access configuration for a bucket

The following `put-public-access-block` example sets a restrictive block public access configuration for the specified bucket.

```
aws s3api put-public-access-block \
    --bucket amzn-s3-demo-bucket \
    --public-access-block-
configuration "BlockPublicAcls=true,IgnorePublicAcls=true,BlockPublicPolicy=true,RestrictPub
```

This command produces no output.

- For API details, see PutPublicAccessBlock in *AWS CLI Command Reference*.

`rb`

The following code example shows how to use `rb`.

AWS CLI

Example 1: Delete a bucket

The following `rb` command removes a bucket. In this example, the user's bucket is `amzn-s3-demo-bucket`. Note that the bucket must be empty in order to remove:

```
aws s3 rb s3://amzn-s3-demo-bucket
```

Output:

```
remove_bucket: amzn-s3-demo-bucket
```

Example 2: Force delete a bucket

The following `rb` command uses the `--force` parameter to first remove all of the objects in the bucket and then remove the bucket itself. In this example, the user's bucket is `amzn-s3-demo-bucket` and the objects in `amzn-s3-demo-bucket` are `test1.txt` and `test2.txt`:

```
aws s3 rb s3://amzn-s3-demo-bucket \
    --force
```

Output:

```
delete: s3://amzn-s3-demo-bucket/test1.txt
delete: s3://amzn-s3-demo-bucket/test2.txt
remove_bucket: amzn-s3-demo-bucket
```

- For API details, see Rb in *AWS CLI Command Reference*.

`restore-object`

The following code example shows how to use `restore-object`.

AWS CLI

To create a restore request for an object

The following `restore-object` example restores the specified Amazon S3 Glacier object for the bucket `my-glacier-bucket` for 10 days.

```
aws s3api restore-object \
    --bucket my-glacier-bucket \
    --key doc1.rtf \
    --restore-request Days=10
```

This command produces no output.

- For API details, see RestoreObject in *AWS CLI Command Reference*.

`rm`

The following code example shows how to use `rm`.

AWS CLI

Example 1: Delete an S3 object

The following `rm` command deletes a single s3 object:

```
aws s3 rm s3://amzn-s3-demo-bucket/test2.txt
```

Output:

```
delete: s3://amzn-s3-demo-bucket/test2.txt
```

Example 2: Delete all contents in a bucket

The following `rm` command recursively deletes all objects under a specified bucket and prefix when passed with the parameter `--recursive`. In this example, the bucket `amzn-s3-demo-bucket` contains the objects `test1.txt` and `test2.txt`:

```
aws s3 rm s3://amzn-s3-demo-bucket \
    --recursive
```

Output:

```
delete: s3://amzn-s3-demo-bucket/test1.txt
delete: s3://amzn-s3-demo-bucket/test2.txt
```

Example 3: Delete all contents in a bucket, except ``.jpg`` files

The following `rm` command recursively deletes all objects under a specified bucket and prefix when passed with the parameter `--recursive` while excluding some objects by using an `--exclude` parameter. In this example, the bucket `amzn-s3-demo-bucket` has the objects `test1.txt` and `test2.jpg`:

```
aws s3 rm s3://amzn-s3-demo-bucket/ \
```

```
    --recursive \
    --exclude "*.jpg"
```

Output:

```
delete: s3://amzn-s3-demo-bucket/test1.txt
```

Example 4: Delete all contents in a bucket, except objects under the specified prefix

The following `rm` command recursively deletes all objects under a specified bucket and prefix when passed with the parameter `--recursive` while excluding all objects under a particular prefix by using an `--exclude` parameter. In this example, the bucket `amzn-s3-demo-bucket` has the objects `test1.txt` and `another/test.txt`:

```
aws s3 rm s3://amzn-s3-demo-bucket/ \
    --recursive \
    --exclude "another/*"
```

Output:

```
delete: s3://amzn-s3-demo-bucket/test1.txt
```

Example 5: Delete an object from an S3 access point

The following `rm` command deletes a single object (`mykey`) from the access point (`myaccesspoint`). :: The following `rm` command deletes a single object (`mykey`) from the access point (`myaccesspoint`).

```
aws s3 rm s3://arn:aws:s3:us-west-2:123456789012:accesspoint/myaccesspoint/mykey
```

Output:

```
delete: s3://arn:aws:s3:us-west-2:123456789012:accesspoint/myaccesspoint/mykey
```

- For API details, see Rm in *AWS CLI Command Reference*.

`select-object-content`

The following code example shows how to use `select-object-content`.

AWS CLI

To filter the contents of an Amazon S3 object based on an SQL statement

The following `select-object-content` example filters the object `my-data-file.csv` with the specified SQL statement and sends output to a file.

```
aws s3api select-object-content \
    --bucket amzn-s3-demo-bucket \
    --key my-data-file.csv \
    --expression "select * from s3object limit 100" \
    --expression-type 'SQL' \
    --input-serialization '{"CSV": {}, "CompressionType": "NONE"}' \
    --output-serialization '{"CSV": {}}' "output.csv"
```

This command produces no output.

- For API details, see SelectObjectContent in *AWS CLI Command Reference*.

sync

The following code example shows how to use `sync`.

AWS CLI

Example 1: Sync all local objects to the specified bucket

The following `sync` command syncs objects from a local directory to the specified prefix and bucket by uploading the local files to S3. A local file will require uploading if the size of the local file is different than the size of the S3 object, the last modified time of the local file is newer than the last modified time of the S3 object, or the local file does not exist under the specified bucket and prefix. In this example, the user syncs the bucket `amzn-s3-demo-bucket` to the local current directory. The local current directory contains the files `test.txt` and `test2.txt`. The bucket `amzn-s3-demo-bucket` contains no objects.

```
aws s3 sync . s3://amzn-s3-demo-bucket
```

Output:

```
upload: test.txt to s3://amzn-s3-demo-bucket/test.txt
```

```
upload: test2.txt to s3://amzn-s3-demo-bucket/test2.txt
```

Example 2: Sync all S3 objects from the specified S3 bucket to another bucket

The following `sync` command syncs objects under a specified prefix and bucket to objects under another specified prefix and bucket by copying S3 objects. An S3 object will require copying if the sizes of the two S3 objects differ, the last modified time of the source is newer than the last modified time of the destination, or the S3 object does not exist under the specified bucket and prefix destination.

In this example, the user syncs the bucket `amzn-s3-demo-bucket` to the bucket `amzn-s3-demo-bucket2`. The bucket `amzn-s3-demo-bucket` contains the objects `test.txt` and `test2.txt`. The bucket `amzn-s3-demo-bucket2` contains no objects:

```
aws s3 sync s3://amzn-s3-demo-bucket s3://amzn-s3-demo-bucket2
```

Output:

```
copy: s3://amzn-s3-demo-bucket/test.txt to s3://amzn-s3-demo-bucket2/test.txt
copy: s3://amzn-s3-demo-bucket/test2.txt to s3://amzn-s3-demo-bucket2/test2.txt
```

Example 3: Sync all S3 objects from the specified S3 bucket to the local directory

The following `sync` command syncs files from the specified S3 bucket to the local directory by downloading S3 objects. An S3 object will require downloading if the size of the S3 object differs from the size of the local file, the last modified time of the S3 object is newer than the last modified time of the local file, or the S3 object does not exist in the local directory. Take note that when objects are downloaded from S3, the last modified time of the local file is changed to the last modified time of the S3 object. In this example, the user syncs the bucket `amzn-s3-demo-bucket` to the current local directory. The bucket `amzn-s3-demo-bucket` contains the objects `test.txt` and `test2.txt`. The current local directory has no files:

```
aws s3 sync s3://amzn-s3-demo-bucket .
```

Output:

```
download: s3://amzn-s3-demo-bucket/test.txt to test.txt
download: s3://amzn-s3-demo-bucket/test2.txt to test2.txt
```

Example 4: Sync all local objects to the specified bucket and delete all files that do not match

The following `sync` command syncs objects under a specified prefix and bucket to files in a local directory by uploading the local files to S3. Because of the `--delete` parameter, any files existing under the specified prefix and bucket but not existing in the local directory will be deleted. In this example, the user syncs the bucket `amzn-s3-demo-bucket` to the local current directory. The local current directory contains the files `test.txt` and `test2.txt`. The bucket `amzn-s3-demo-bucket` contains the object `test3.txt`:

```
aws s3 sync . s3://amzn-s3-demo-bucket \
    --delete
```

Output:

```
upload: test.txt to s3://amzn-s3-demo-bucket/test.txt
upload: test2.txt to s3://amzn-s3-demo-bucket/test2.txt
delete: s3://amzn-s3-demo-bucket/test3.txt
```

Example 5: Sync all local objects to the specified bucket except ``.jpg`` files

The following `sync` command syncs objects under a specified prefix and bucket to files in a local directory by uploading the local files to S3. Because of the `--exclude` parameter, all files matching the pattern existing both in S3 and locally will be excluded from the sync. In this example, the user syncs the bucket `amzn-s3-demo-bucket` to the local current directory. The local current directory contains the files `test.jpg` and `test2.txt`. The bucket `amzn-s3-demo-bucket` contains the object `test.jpg` of a different size than the local `test.jpg`:

```
aws s3 sync . s3://amzn-s3-demo-bucket \
    --exclude "*.jpg"
```

Output:

```
upload: test2.txt to s3://amzn-s3-demo-bucket/test2.txt
```

Example 6: Sync all local objects to the specified bucket except specified directory files

The following `sync` command syncs files under a local directory to objects under a specified prefix and bucket by downloading S3 objects. This example uses the `--exclude` parameter flag to exclude a specified directory and S3 prefix from the `sync` command. In this example, the user syncs the local current directory to the bucket `amzn-s3-demo-bucket`. The local current directory contains the files `test.txt` and `another/test2.txt`. The bucket `amzn-s3-demo-bucket` contains the objects `another/test5.txt` and `test1.txt`:

```
aws s3 sync s3://amzn-s3-demo-bucket/ . \
    --exclude "*another/*"
```

Output:

```
download: s3://amzn-s3-demo-bucket/test1.txt to test1.txt
```

Example 7: Sync all objects between buckets in different regions

The following `sync` command syncs files between two buckets in different regions:

```
aws s3 sync s3://my-us-west-2-bucket s3://my-us-east-1-bucket \
    --source-region us-west-2 \
    --region us-east-1
```

Output:

```
download: s3://my-us-west-2-bucket/test1.txt to s3://my-us-east-1-bucket/test1.txt
```

Example 8: Sync to an S3 access point

The following `sync` command syncs the current directory to the access point (`myaccesspoint`):

```
aws s3 sync . s3://arn:aws:s3:us-west-2:123456789012:accesspoint/myaccesspoint/
```

Output:

```
upload: test.txt to s3://arn:aws:s3:us-west-2:123456789012:accesspoint/
myaccesspoint/test.txt
upload: test2.txt to s3://arn:aws:s3:us-west-2:123456789012:accesspoint/
myaccesspoint/test2.txt
```

- For API details, see Sync in *AWS CLI Command Reference*.

upload-part-copy

The following code example shows how to use `upload-part-copy`.

AWS CLI

To upload part of an object by copying data from an existing object as the data source

The following `upload-part-copy` example uploads a part by copying data from an existing object as a data source.

```
aws s3api upload-part-copy \
    --bucket amzn-s3-demo-bucket \
    --key "Map_Data_June.mp4" \
    --copy-source "amzn-s3-demo-bucket/copy_of_Map_Data_June.mp4" \
    --part-number 1 \
    --upload-
id "bq0tdE1CDpWQYRPLHuNG50xAT6pA5D.m_RiBy0ggOH6b13pVRY7QjvLlf75iFdJqp_2wztk5hvpUM2SesXgrzbeh
```

Output:

```
{
    "CopyPartResult": {
        "LastModified": "2019-12-13T23:16:03.000Z",
        "ETag": "\"711470fc377698c393d94aed6305e245\""
    }
}
```

- For API details, see UploadPartCopy in *AWS CLI Command Reference*.

upload-part

The following code example shows how to use `upload-part`.

AWS CLI

The following command uploads the first part in a multipart upload initiated with the `create-multipart-upload` command:

```
aws s3api upload-part --bucket amzn-s3-demo-bucket --key
 'multipart/01' --part-number 1 --body part01 --upload-id
  "dfRtDYU0WWCCcH43C3WFbkRONycyCpTJJvxu2i5GYkZljF.Yxwh6XG7WfS2vC4to6HiV6Yjlx.cph0gtNBtJ8P3UR
```

The body option takes the name or path of a local file for upload (do not use the file:// prefix). The minimum part size is 5 MB. Upload ID is returned by `create-multipart-upload` and can also be retrieved with `list-multipart-uploads`. Bucket and key are specified when you create the multipart upload.

Output:

```
{
    "ETag": "\"e868e0f4719e394144ef36531ee6824c\""
}
```

Save the ETag value of each part for later. They are required to complete the multipart upload.

- For API details, see UploadPart in *AWS CLI Command Reference*.

`website`

The following code example shows how to use `website`.

AWS CLI

Configure an S3 bucket as a static website

The following command configures a bucket named `amzn-s3-demo-bucket` as a static website. The index document option specifies the file in `amzn-s3-demo-bucket` that visitors will be directed to when they navigate to the website URL. In this case, the bucket is in the us-west-2 region, so the site would appear at `http://amzn-s3-demo-bucket.s3-website-us-west-2.amazonaws.com`.

All files in the bucket that appear on the static site must be configured to allow visitors to open them. File permissions are configured separately from the bucket website configuration.

```
aws s3 website s3://amzn-s3-demo-bucket/ \
    --index-document index.html \
    --error-document error.html
```

For information on hosting a static website in Amazon S3, see Hosting a Static Website in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see Website in *AWS CLI Command Reference*.

Amazon S3 Control examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon S3 Control.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Actions

`create-access-point`

The following code example shows how to use `create-access-point`.

AWS CLI

To create an access point

The following `create-access-point` example creates an access point named `finance-ap` for the bucket `business-records` in account 123456789012. Before running this example, replace the access point name, bucket name, and account number with appropriate values for your use case.

```
aws s3control create-access-point \
    --account-id 123456789012 \
    --bucket business-records \
    --name finance-ap
```

This command produces no output.

For more information, see Creating Access Points in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see CreateAccessPoint in *AWS CLI Command Reference*.

`create-job`

The following code example shows how to use `create-job`.

AWS CLI

To create an Amazon S3 batch operations job

The following `create-job` example creates an Amazon S3 batch operations job to tag objects as `confidential`` in the bucket ``employee-records`.

```
aws s3control create-job \
    --account-id 123456789012 \
    --operation '{"S3PutObjectTagging": { "TagSet": [{"Key":"confidential",
 "Value":"true"}] }}' \
    --report '{"Bucket":"arn:aws:s3:::employee-records-logs","Prefix":"batch-op-
create-job",
 "Format":"Report_CSV_20180820","Enabled":true,"ReportScope":"AllTasks"}' \
    --manifest '{"Spec":{"Format":"S3BatchOperations_CSV_20180820","Fields":
["Bucket","Key"]},"Location":{"ObjectArn":"arn:aws:s3:::employee-records-logs/inv-
report/7a6a9be4-072c-407e-85a2-
ec3e982f773e.csv","ETag":"69f52a4e9f797e987155d9c8f5880897"}}' \
    --priority 42 \
    --role-arn arn:aws:iam::123456789012:role/S3BatchJobRole
```

Output:

```
{
    "JobId": "93735294-df46-44d5-8638-6356f335324e"
}
```

- For API details, see CreateJob in *AWS CLI Command Reference*.

`delete-access-point-policy`

The following code example shows how to use `delete-access-point-policy`.

AWS CLI

To delete an access point policy

The following `delete-access-point-policy` example deletes the access point policy from the access point named `finance-ap` in account 123456789012. Before running this example, replace the access point name and account number with appropriate values for your use case.

```
aws s3control delete-access-point-policy \
    --account-id 123456789012 \
    --name finance-ap
```

This command produces no output.

For more information, see Managing Data Access with Amazon S3 Access Points in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see DeleteAccessPointPolicy in *AWS CLI Command Reference*.

`delete-access-point`

The following code example shows how to use `delete-access-point`.

AWS CLI

To delete an access point

The following `delete-access-point` example deletes an access point named `finance-ap` in account 123456789012. Before running this example, replace the access point name and account number with appropriate values for your use case.

```
aws s3control delete-access-point \
    --account-id 123456789012 \
    --name finance-ap
```

This command produces no output.

For more information, see Managing Data Access with Amazon S3 Access Points in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see DeleteAccessPoint in *AWS CLI Command Reference*.

`delete-public-access-block`

The following code example shows how to use `delete-public-access-block`.

AWS CLI

To delete block public access settings for an account

The following `delete-public-access-block` example deletes block public access settings for the specified account.

```
aws s3control delete-public-access-block \
    --account-id 123456789012
```

This command produces no output.

- For API details, see DeletePublicAccessBlock in *AWS CLI Command Reference*.

`describe-job`

The following code example shows how to use `describe-job`.

AWS CLI

To describe an Amazon S3 batch operations job

The following `describe-job` provides configuration parameters and status for the specified batch operations job.

```
aws s3control describe-job \
    --account-id 123456789012 \
    --job-id 93735294-df46-44d5-8638-6356f335324e
```

Output:

```
{
    "Job": {
        "TerminationDate": "2019-10-03T21:49:53.944Z",
        "JobId": "93735294-df46-44d5-8638-6356f335324e",
        "FailureReasons": [],
        "Manifest": {
            "Spec": {
```

```
                "Fields": [
                    "Bucket",
                    "Key"
                ],
                "Format": "S3BatchOperations_CSV_20180820"
            },
            "Location": {
                "ETag": "69f52a4e9f797e987155d9c8f5880897",
                "ObjectArn": "arn:aws:s3:::employee-records-logs/inv-
report/7a6a9be4-072c-407e-85a2-ec3e982f773e.csv"
            }
        },
        "Operation": {
            "S3PutObjectTagging": {
                "TagSet": [
                    {
                        "Value": "true",
                        "Key": "confidential"
                    }
                ]
            }
        },
        "RoleArn": "arn:aws:iam::123456789012:role/S3BatchJobRole",
        "ProgressSummary": {
            "TotalNumberOfTasks": 8,
            "NumberOfTasksFailed": 0,
            "NumberOfTasksSucceeded": 8
        },
        "Priority": 42,
        "Report": {
            "ReportScope": "AllTasks",
            "Format": "Report_CSV_20180820",
            "Enabled": true,
            "Prefix": "batch-op-create-job",
            "Bucket": "arn:aws:s3:::employee-records-logs"
        },
        "JobArn": "arn:aws:s3:us-west-2:123456789012:job/93735294-
df46-44d5-8638-6356f335324e",
        "CreationTime": "2019-10-03T21:48:48.048Z",
        "Status": "Complete"
    }
}
```

- For API details, see DescribeJob in *AWS CLI Command Reference*.

`get-access-point-policy-status`

The following code example shows how to use `get-access-point-policy-status`.

AWS CLI

To retrieve the access point policy status

The following `get-access-point-policy-status` example retrieves the access point policy status for the access point named `finance-ap` in account 123456789012. The access point policy status indicates whether the access point's policy allows public access. Before running this example, replace the access point name and account number with appropriate values for your use case.

```
aws s3control get-access-point-policy-status \
    --account-id 123456789012 \
    --name finance-ap
```

Output:

```
{
    "PolicyStatus": {
        "IsPublic": false
    }
}
```

For more information about when an access point policy is considered public, see The Meaning of "Public" in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see GetAccessPointPolicyStatus in *AWS CLI Command Reference*.

`get-access-point-policy`

The following code example shows how to use `get-access-point-policy`.

AWS CLI

To retrieve an access point policy

The following `get-access-point-policy` example retrieves the access point policy from the access point named `finance-ap` in account 123456789012. Before running this example, replace the access point name and account number with appropriate values for your use case.

```
aws s3control get-access-point-policy \
    --account-id 123456789012 \
    --name finance-ap
```

Output:

```
{
    "Policy": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect\":\"Allow
\",\"Principal\":{\"AWS\":\"arn:aws:iam::123456789012:role/Admin\"},\"Action\":
\"s3:GetObject\",\"Resource\":\"arn:aws:s3:us-west-2:123456789012:accesspoint/
finance-ap/object/records/*\"}]}"
}
```

For more information, see Managing Data Access with Amazon S3 Access Points in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see GetAccessPointPolicy in *AWS CLI Command Reference*.

`get-access-point`

The following code example shows how to use `get-access-point`.

AWS CLI

To retrieve access point configuration details

The following `get-access-point` example retrieves the configuration details for the access point named `finance-ap` in account 123456789012. Before running this example, replace the access point name and account number with appropriate values for your use case.

```
aws s3control get-access-point \
    --account-id 123456789012 \
    --name finance-ap
```

Output:

```
{
    "Name": "finance-ap",
    "Bucket": "business-records",
    "NetworkOrigin": "Internet",
    "PublicAccessBlockConfiguration": {
```

```
        "BlockPublicAcls": false,
        "IgnorePublicAcls": false,
        "BlockPublicPolicy": false,
        "RestrictPublicBuckets": false
    },
    "CreationDate": "2020-01-01T00:00:00Z"
}
```

For more information, see Managing Data Access with Amazon S3 Access Points in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see GetAccessPoint in *AWS CLI Command Reference*.

`get-multi-region-access-point-routes`

The following code example shows how to use `get-multi-region-access-point-routes`.

AWS CLI

To query the current Multi-Region Access Point route configuration

The following `get-multi-region-access-point-routes` example returns the current routing configuration for the specified Multi-Region Access Point.

```
aws s3control get-multi-region-access-point-routes \
    --region Region \
    --account-id 111122223333 \
    --mrap MultiRegionAccessPoint_ARN
```

Output:

```
{
    "Mrap": "arn:aws:s3::111122223333:accesspoint/0000000000000.mrap",
    "Routes": [
        {
            "Bucket": "amzn-s3-demo-bucket1",
            "Region": "ap-southeast-2",
            "TrafficDialPercentage": 100
        },
        {
            "Bucket": "amzn-s3-demo-bucket2",
            "Region": "us-west-1",
```

```
                "TrafficDialPercentage": 0
            }
        ]
}
```

- For API details, see GetMultiRegionAccessPointRoutes in *AWS CLI Command Reference*.

`get-public-access-block`

The following code example shows how to use `get-public-access-block`.

AWS CLI

To list public block access settings for an account

The following `get-public-access-block` example displays the block public access settings for the specified account.

```
aws s3control get-public-access-block \
    --account-id 123456789012
```

Output:

```
{
   "PublicAccessBlockConfiguration": {
      "BlockPublicPolicy": true,
      "RestrictPublicBuckets": true,
      "IgnorePublicAcls": true,
      "BlockPublicAcls": true
   }
}
```

- For API details, see GetPublicAccessBlock in *AWS CLI Command Reference*.

`list-access-points`

The following code example shows how to use `list-access-points`.

AWS CLI

Example 1: To retrieve a list of all access points for an account

The following `list-access-points` example displays a list of all access points attached to buckets owned by account 123456789012.

```
aws s3control list-access-points \
    --account-id 123456789012
```

Output:

```
{
    "AccessPointList": [
        {
            "Name": "finance-ap",
            "NetworkOrigin": "Internet",
            "Bucket": "business-records"
        },
        {
            "Name": "managers-ap",
            "NetworkOrigin": "Internet",
            "Bucket": "business-records"
        },
        {
            "Name": "private-network-ap",
            "NetworkOrigin": "VPC",
            "VpcConfiguration": {
                "VpcId": "1a2b3c"
            },
            "Bucket": "business-records"
        },
        {
            "Name": "customer-ap",
            "NetworkOrigin": "Internet",
            "Bucket": "external-docs"
        },
        {
            "Name": "public-ap",
            "NetworkOrigin": "Internet",
            "Bucket": "external-docs"
        }
    ]
}
```

Example 2: To retrieve a list of all access points for a bucket

The following `list-access-points` example retrieves a list of all access points attached to the bucket `external-docs` owned by account 123456789012.

```
aws s3control list-access-points \
    --account-id 123456789012 \
    --bucket external-docs
```

Output:

```
{
    "AccessPointList": [
        {
            "Name": "customer-ap",
            "NetworkOrigin": "Internet",
            "Bucket": "external-docs"
        },
        {
            "Name": "public-ap",
            "NetworkOrigin": "Internet",
            "Bucket": "external-docs"
        }
    ]
}
```

For more information, see Managing Data Access with Amazon S3 Access Points in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see ListAccessPoints in *AWS CLI Command Reference*.

`list-jobs`

The following code example shows how to use `list-jobs`.

AWS CLI

To list an accounts Amazon S3 batch operations jobs

The following `list-jobs` example lists all recent batch operations jobs for the specified account.

```
aws s3control list-jobs \
```

```
    --account-id 123456789012
```

Output:

```
{
    "Jobs": [
        {
            "Operation": "S3PutObjectTagging",
            "ProgressSummary": {
                "NumberOfTasksFailed": 0,
                "NumberOfTasksSucceeded": 8,
                "TotalNumberOfTasks": 8
            },
            "CreationTime": "2019-10-03T21:48:48.048Z",
            "Status": "Complete",
            "JobId": "93735294-df46-44d5-8638-6356f335324e",
            "Priority": 42
        },
        {
            "Operation": "S3PutObjectTagging",
            "ProgressSummary": {
                "NumberOfTasksFailed": 0,
                "NumberOfTasksSucceeded": 0,
                "TotalNumberOfTasks": 0
            },
            "CreationTime": "2019-10-03T21:46:07.084Z",
            "Status": "Failed",
            "JobId": "3f3c7619-02d3-4779-97f6-1d98dd313108",
            "Priority": 42
        },
    ]
}
```

- For API details, see ListJobs in *AWS CLI Command Reference*.

`put-access-point-policy`

The following code example shows how to use `put-access-point-policy`.

AWS CLI

To set an access point policy

The following `put-access-point-policy` example places the specified access point policy for the access point `finance-ap` in account 123456789012. If the access point `finance-ap` already has a policy, this command replaces the existing policy with the one specified in this command. Before running this example, replace the account number, access point name, and policy statements with appropriate values for your use case.

```
aws s3control put-access-point-policy \
    --account-id 123456789012 \
    --name finance-ap \
    --policy file://ap-policy.json
```

Contents of `ap-policy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::123456789012:user/Alice"
            },
            "Action": "s3:GetObject",
            "Resource": "arn:aws:s3:us-west-2:123456789012:accesspoint/finance-ap/
object/Alice/*"
        }
    ]
}
```

This command produces no output.

For more information, see Managing Data Access with Amazon S3 Access Points in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see PutAccessPointPolicy in *AWS CLI Command Reference*.

`put-public-access-block`

The following code example shows how to use `put-public-access-block`.

AWS CLI

To edit block public access settings for an account

The following `put-public-access-block` example toggles all block public access settings to `true` for the specified account.

```
aws s3control put-public-access-block \
    --account-id 123456789012 \
    --public-access-block-configuration '{"BlockPublicAcls": true,
 "IgnorePublicAcls": true, "BlockPublicPolicy": true, "RestrictPublicBuckets":
 true}'
```

This command produces no output.

- For API details, see PutPublicAccessBlock in *AWS CLI Command Reference*.

submit-multi-region-access-point-routes

The following code example shows how to use `submit-multi-region-access-point-routes`.

AWS CLI

To update your Multi-Region Access Point routing configuration

The following `submit-multi-region-access-point-routes` example updates the routing statuses of `amzn-s3-demo-bucket1` and `amzn-s3-demo-bucket2` in the `ap-southeast-2` Region for your Multi-Region Access Point.

```
aws s3control submit-multi-region-access-point-routes \
    --region ap-southeast-2 \
    --account-id 111122223333 \
    --mrap MultiRegionAccessPoint_ARN \
    --route-updates Bucket=amzn-s3-demo-
bucket1,TrafficDialPercentage=100 Bucket=amzn-s3-demo-
bucket2,TrafficDialPercentage=0
```

This command produces no output.

- For API details, see SubmitMultiRegionAccessPointRoutes in *AWS CLI Command Reference*.

update-job-priority

The following code example shows how to use `update-job-priority`.

AWS CLI

To update the job priority of an Amazon S3 batch operations job

The following `update-job-priority` example updates the specified job to a new priority.

```
aws s3control update-job-priority \
    --account-id 123456789012 \
    --job-id 8d9a18fe-c303-4d39-8ccc-860d372da386 \
    --priority 52
```

Output:

```
{
    "JobId": "8d9a18fe-c303-4d39-8ccc-860d372da386",
    "Priority": 52
}
```

- For API details, see UpdateJobPriority in *AWS CLI Command Reference*.

`update-job-status`

The following code example shows how to use `update-job-status`.

AWS CLI

To update the status of an Amazon S3 batch operations job

The following `update-job-status` example cancels the specified job which is awaiting approval.

```
aws s3control update-job-status \
    --account-id 123456789012 \
    --job-id 8d9a18fe-c303-4d39-8ccc-860d372da386 \
    --requested-job-status Cancelled
```

Output:

```
{
    "Status": "Cancelled",
```

```
    "JobId": "8d9a18fe-c303-4d39-8ccc-860d372da386"
}
```

The following `update-job-status` example confirms and runs the specified which is awaiting approval.

```
aws s3control update-job-status \
    --account-id 123456789012 \
    --job-id 5782949f-3301-4fb3-be34-8d5bab54dbca \
    --requested-job-status Ready

Output::

{
    "Status": "Ready",
    "JobId": "5782949f-3301-4fb3-
be34-8d5bab54dbca"
}
```

The following `update-job-status` example cancels the specified job which is running.

```
 aws s3control update-job-status \
    --account-id 123456789012 \
    --job-id 5782949f-3301-4fb3-be34-8d5bab54dbca \
    --requested-job-status Cancelled

Output::
{
         "Status": "Cancelling",
         "JobId": "5782949f-3301-4fb3-be34-8d5bab54dbca"
}
```

- For API details, see UpdateJobStatus in *AWS CLI Command Reference*.

Secrets Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Secrets Manager.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`batch-get-secret-value`

The following code example shows how to use `batch-get-secret-value`.

AWS CLI

Example 1: To retrieve the secret value for a group of secrets listed by name

The following `batch-get-secret-value` example gets the secret value secrets for three secrets.

```
aws secretsmanager batch-get-secret-value \
    --secret-id-list MySecret1 MySecret2 MySecret3
```

Output:

```
{
    "SecretValues": [
        {
            "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MySecret1-
a1b2c3",
            "Name": "MySecret1",
            "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLEaaaaa",
            "SecretString": "{\"username\":\"diego_ramirez\",\"password\":\"EXAMPLE-
PASSWORD\",\"engine\":\"mysql\",\"host\":\"secretsmanagertutorial.cluster.us-
west-2.rds.amazonaws.com\",\"port\":3306,\"dbClusterIdentifier\":
\"secretsmanagertutorial\"}",
            "VersionStages": [
                "AWSCURRENT"
            ],
            "CreatedDate": "1523477145.729"
        },
        {
```

```
            "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MySecret2-
a1b2c3",
            "Name": "MySecret2",
            "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLEbbbbb",
            "SecretString": "{\"username\":\"akua_mansa\",\"password\":\"EXAMPLE-
PASSWORD\"",
            "VersionStages": [
                "AWSCURRENT"
            ],
            "CreatedDate": "1673477781.275"
        },
        {
            "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MySecret3-
a1b2c3",
            "Name": "MySecret3",
            "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLEccccc",
            "SecretString": "{\"username\":\"jie_liu\",\"password\":\"EXAMPLE-
PASSWORD\"",
            "VersionStages": [
                "AWSCURRENT"
            ],
            "CreatedDate": "1373477721.124"
        }
    ],
    "Errors": []
}
```

For more information, see Retrieve a group of secrets in a batch in the *AWS Secrets Manager User Guide*.

Example 2: To retrieve the secret value for a group of secrets selected by filter

The following `batch-get-secret-value` example gets the secret value secrets in your account that have `MySecret` in the name. Filtering by name is case sensitive.

```
aws secretsmanager batch-get-secret-value \
    --filters Key="name",Values="MySecret"
```

Output:

```
{
    "SecretValues": [
        {
```

```
            "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MySecret1-
a1b2c3",
            "Name": "MySecret1",
            "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLEaaaaa",
            "SecretString": "{\"username\":\"diego_ramirez\",\"password\":\"EXAMPLE-
PASSWORD\",\"engine\":\"mysql\",\"host\":\"secretsmanagertutorial.cluster.us-
west-2.rds.amazonaws.com\",\"port\":3306,\"dbClusterIdentifier\":
\"secretsmanagertutorial\"}",
            "VersionStages": [
                "AWSCURRENT"
            ],
            "CreatedDate": "1523477145.729"
        },
        {
            "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MySecret2-
a1b2c3",
            "Name": "MySecret2",
            "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLEbbbbb",
            "SecretString": "{\"username\":\"akua_mansa\",\"password\":\"EXAMPLE-
PASSWORD\"",
            "VersionStages": [
                "AWSCURRENT"
            ],
            "CreatedDate": "1673477781.275"
        },
        {
            "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MySecret3-
a1b2c3",
            "Name": "MySecret3",
            "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLEccccc",
            "SecretString": "{\"username\":\"jie_liu\",\"password\":\"EXAMPLE-
PASSWORD\"",
            "VersionStages": [
                "AWSCURRENT"
            ],
            "CreatedDate": "1373477721.124"
        }
    ],
    "Errors": []
}
```

For more information, see Retrieve a group of secrets in a batch in the *AWS Secrets Manager User Guide*.

- For API details, see BatchGetSecretValue in *AWS CLI Command Reference*.

`cancel-rotate-secret`

The following code example shows how to use `cancel-rotate-secret`.

AWS CLI

To turn off automatic rotation for a secret

The following `cancel-rotate-secret` example turns off automatic rotation for a secret. To resume rotation, call `rotate-secret`.

```
aws secretsmanager cancel-rotate-secret \
    --secret-id MyTestSecret
```

Output:

```
{
  "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-a1b2c3",
  "Name": "MyTestSecret"
}
```

For more information, see Rotate a secret in the *Secrets Manager User Guide*.

- For API details, see CancelRotateSecret in *AWS CLI Command Reference*.

`create-secret`

The following code example shows how to use `create-secret`.

AWS CLI

Example 1: To create a secret from credentials in a JSON file

The following `create-secret` example creates a secret from credentials in a file. For more information, see Loading AWS CLI parameters from a file in the *AWS CLI User Guide*.

```
aws secretsmanager create-secret \
    --name MyTestSecret \
```

```
    --secret-string file://mycreds.json
```

Contents of `mycreds.json`:

```
{
  "engine": "mysql",
  "username": "saanvis",
  "password": "EXAMPLE-PASSWORD",
  "host": "my-database-endpoint.us-west-2.rds.amazonaws.com",
  "dbname": "myDatabase",
  "port": "3306"
}
```

Output:

```
{
  "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-a1b2c3",
  "Name": "MyTestSecret",
  "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Create a secret in the *Secrets Manager User Guide*.

Example 2: To create a secret

The following `create-secret` example creates a secret with two key-value pairs. When you enter commands in a command shell, there is a risk of the command history being accessed or utilities having access to your command parameters. This is a concern if the command includes the value of a secret. For more information, see Mitigate the risks of using command-line tools to store secrets in the *Secrets Manager User Guide*.

```
aws secretsmanager create-secret \
    --name MyTestSecret \
    --description "My test secret created with the CLI." \
    --secret-string "{\"user\":\"diegor\",\"password\":\"EXAMPLE-PASSWORD\"}"
```

Output:

```
{
  "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-a1b2c3",
```

```
  "Name": "MyTestSecret",
  "VersionId": "EXAMPLE1-90ab-cdef-fedc-ba987EXAMPLE"
}
```

For more information, see Create a secret in the *Secrets Manager User Guide*.

- For API details, see CreateSecret in *AWS CLI Command Reference*.

`delete-resource-policy`

The following code example shows how to use `delete-resource-policy`.

AWS CLI

To delete the resource-based policy attached to a secret

The following `delete-resource-policy` example deletes the resource-based policy attached to a secret.

```
aws secretsmanager delete-resource-policy \
    --secret-id MyTestSecret
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret"
}
```

For more information, see Authentication and access control in the *Secrets Manager User Guide*.

- For API details, see DeleteResourcePolicy in *AWS CLI Command Reference*.

`delete-secret`

The following code example shows how to use `delete-secret`.

AWS CLI

Example 1: To delete a secret

The following `delete-secret` example deletes a secret. You can recover the secret with `restore-secret` until the date and time in the `DeletionDate` response field. To delete a secret that is replicated to other regions, first remove its replicas with `remove-regions-from-replication`, and then call `delete-secret`.

```
aws secretsmanager delete-secret \
    --secret-id MyTestSecret \
    --recovery-window-in-days 7
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret",
    "DeletionDate": 1524085349.095
}
```

For more information, see Delete a secret in the *Secrets Manager User Guide*.

Example 2: To delete a secret immediately

The following `delete-secret` example deletes a secret immediately without a recovery window. You can't recover this secret.

```
aws secretsmanager delete-secret \
    --secret-id MyTestSecret \
    --force-delete-without-recovery
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret",
    "DeletionDate": 1508750180.309
}
```

For more information, see Delete a secret in the *Secrets Manager User Guide*.

- For API details, see [DeleteSecret](#) in *AWS CLI Command Reference*.

`describe-secret`

The following code example shows how to use `describe-secret`.

AWS CLI

To retrieve the details of a secret

The following `describe-secret` example shows the details of a secret.

```
aws secretsmanager describe-secret \
    --secret-id MyTestSecret
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
Ca8JGt",
    "Name": "MyTestSecret",
    "Description": "My test secret",
    "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/EXAMPLE1-90ab-cdef-fedc-
ba987EXAMPLE",

                "Region": "eu-west-3",
                "KmsKeyId": "alias/aws/secretsmanager",
                "Status": "InSync",
                "StatusMessage": "Replication succeeded"
            }
        ]
}
```

For more information, see Secret in the *Secrets Manager User Guide*.

- For API details, see DescribeSecret in *AWS CLI Command Reference*.

`get-random-password`

The following code example shows how to use `get-random-password`.

AWS CLI

To generate a random password

The following `get-random-password` example generates a random password 20 characters long that includes at least one uppercase letter, lowercase letter, number, and punctuation.

```
aws secretsmanager get-random-password \
    --require-each-included-type \
```

```
    --password-length 20
```

Output:

```
{
    "RandomPassword": "EXAMPLE-PASSWORD"
}
```

For more information, see Create and manage secrets in the *Secrets Manager User Guide*.

- For API details, see GetRandomPassword in *AWS CLI Command Reference*.

`get-resource-policy`

The following code example shows how to use `get-resource-policy`.

AWS CLI

To retrieve the resource-based policy attached to a secret

The following `get-resource-policy` example retrieves the resource-based policy attached to a secret.

```
aws secretsmanager get-resource-policy \
    --secret-id MyTestSecret
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret",
    "ResourcePolicy": "{\n\"Version\":\"2012-10-17\",\n\"Statement\":[{\n\"Effect\":
\"Allow\",\n
    \"Principal\":{\n\"AWS\":\"arn:aws:iam::123456789012:root\"\n},\n\"Action\":
    \"secretsmanager:GetSecretValue\",\n\"Resource\":\"*\"\n}]\n}"
}
```

For more information, see Authentication and access control in the *Secrets Manager User Guide*.

- For API details, see GetResourcePolicy in *AWS CLI Command Reference*.

`get-secret-value`

The following code example shows how to use `get-secret-value`.

AWS CLI

Example 1: To retrieve the encrypted secret value of a secret

The following `get-secret-value` example gets the current secret value.

```
aws secretsmanager get-secret-value \
    --secret-id MyTestSecret
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret",
    "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "SecretString": "{\"user\":\"diegor\",\"password\":\"EXAMPLE-PASSWORD\"}",
    "VersionStages": [
        "AWSCURRENT"
    ],
    "CreatedDate": 1523477145.713
}
```

For more information, see Retrieve a secret in the *Secrets Manager User Guide*.

Example 2: To retrieve the previous secret value

The following `get-secret-value` example gets the previous secret value.:

```
aws secretsmanager get-secret-value \
    --secret-id MyTestSecret
    --version-stage AWSPREVIOUS
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
```

```
    "Name": "MyTestSecret",
    "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "SecretString": "{\"user\":\"diegor\",\"password\":\"PREVIOUS-EXAMPLE-PASSWORD
\"}",
    "VersionStages": [
        "AWSPREVIOUS"
    ],
    "CreatedDate": 1523477145.713
}
```

For more information, see Retrieve a secret in the *Secrets Manager User Guide*.

- For API details, see GetSecretValue in *AWS CLI Command Reference*.

`list-secret-version-ids`

The following code example shows how to use `list-secret-version-ids`.

AWS CLI

To list all of the secret versions associated with a secret

The following `list-secret-version-ids` example gets a list of all of the versions of a secret.

```
aws secretsmanager list-secret-version-ids \
    --secret-id MyTestSecret
```

Output:

```
{
  "Versions": [
    {
        "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "VersionStages": [
            "AWSPREVIOUS"
        ],
        "LastAccessedDate": 1523477145.713,
        "CreatedDate": 1523477145.713
    },
    {
        "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
```

```
            "VersionStages": [
                "AWSCURRENT"
            ],
            "LastAccessedDate": 1523477145.713,
            "CreatedDate": 1523486221.391
        },
        {
            "CreatedDate": 1.51197446236E9,
            "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333;"
        }
        ],
        "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
        "Name": "MyTestSecret"
}
```

For more information, see Version in the *Secrets Manager User Guide*.

- For API details, see ListSecretVersionIds in *AWS CLI Command Reference*.

`list-secrets`

The following code example shows how to use `list-secrets`.

AWS CLI

Example 1: To list the secrets in your account

The following `list-secrets` example gets a list of the secrets in your account.

```
aws secretsmanager list-secrets
```

Output:

```
{
    "SecretList": [
        {
            "ARN": "arn:aws:secretsmanager:us-
west-2:123456789012:secret:MyTestSecret-a1b2c3",
            "Name": "MyTestSecret",
            "LastChangedDate": 1523477145.729,
            "SecretVersionsToStages": {
```

```
                "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111": [
                    "AWSCURRENT"
                ]
            }
        },
        {
            "ARN": "arn:aws:secretsmanager:us-
west-2:123456789012:secret:AnotherSecret-d4e5f6",
            "Name": "AnotherSecret",
            "LastChangedDate": 1523482025.685,
            "SecretVersionsToStages": {
                "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222": [
                    "AWSCURRENT"
                ]
            }
        }
    ]
}
```

For more information, see Find a secret in the *Secrets Manager User Guide*.

Example 2: To filter the list of secrets in your account

The following `list-secrets` example gets a list of the secrets in your account that have `Test` in the name. Filtering by name is case sensitive.

```
aws secretsmanager list-secrets \
    --filter Key="name",Values="Test"
```

Output:

```
{
    "SecretList": [
        {
            "ARN": "arn:aws:secretsmanager:us-
west-2:123456789012:secret:MyTestSecret-a1b2c3",
            "Name": "MyTestSecret",
            "LastChangedDate": 1523477145.729,
            "SecretVersionsToStages": {
                "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111": [
                    "AWSCURRENT"
                ]
```

```
            }
        }
    ]
}
```

For more information, see Find a secret in the *Secrets Manager User Guide*.

Example 3: To list the secrets in your account managed by another service

The following `list-secrets` example returns the secrets in your account that are managed by Amazon RDS.

```
aws secretsmanager list-secrets \
    --filter Key="owning-service",Values="rds"
```

Output:

```
{
    "SecretList": [
        {
            "Name": "rds!cluster-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Tags": [
                {
                    "Value": "arn:aws:rds:us-
west-2:123456789012:cluster:database-1",
                    "Key": "aws:rds:primaryDBClusterArn"
                },
                {
                    "Value": "rds",
                    "Key": "aws:secretsmanager:owningService"
                }
            ],
            "RotationRules": {
                "AutomaticallyAfterDays": 1
            },
            "LastChangedDate": 1673477781.275,
            "LastRotatedDate": 1673477781.26,
            "SecretVersionsToStages": {
                "a1b2c3d4-5678-90ab-cdef-EXAMPLEaaaaa": [
                    "AWSPREVIOUS"
                ],
                "a1b2c3d4-5678-90ab-cdef-EXAMPLEbbbbb": [
                    "AWSCURRENT",
```

```
                        "AWSPENDING"
                    ]
                },
                "OwningService": "rds",
                "RotationEnabled": true,
                "CreatedDate": 1673467300.7,
                "LastAccessedDate": 1673395200.0,
                "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:rds!
cluster-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111-a1b2c3",
                "Description": "Secret associated with primary RDS DB cluster:
 arn:aws:rds:us-west-2:123456789012:cluster:database-1"
            }
        ]
}
```

For more information, see Secrets managed by other services in the *Secrets Manager User Guide*.

- For API details, see ListSecrets in *AWS CLI Command Reference*.

`put-resource-policy`

The following code example shows how to use `put-resource-policy`.

AWS CLI

To add a resource-based policy to a secret

The following `put-resource-policy` example adds a permissions policy to a secret, checking first that the policy does not provide broad access to the secret. The policy is read from a file. For more information, see Loading AWS CLI parameters from a file in the *AWS CLI User Guide*.

```
aws secretsmanager put-resource-policy \
    --secret-id MyTestSecret \
    --resource-policy file://mypolicy.json \
    --block-public-policy
```

Contents of `mypolicy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
```

```
                "Effect": "Allow",
                "Principal": {
                    "AWS": "arn:aws:iam::123456789012:role/MyRole"
                },
                "Action": "secretsmanager:GetSecretValue",
                "Resource": "*"
            }
        ]
    }
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret"
}
```

For more information, see Attach a permissions policy to a secret in the *Secrets Manager User Guide*.

- For API details, see PutResourcePolicy in *AWS CLI Command Reference*.

`put-secret-value`

The following code example shows how to use `put-secret-value`.

AWS CLI

Example 1: To store a new secret value in a secret

The following `put-secret-value` example creates a new version of a secret with two key-value pairs.

```
aws secretsmanager put-secret-value \
    --secret-id MyTestSecret \
    --secret-string "{\"user\":\"diegor\",\"password\":\"EXAMPLE-PASSWORD\"}"
```

Output:

```
{
```

```
    "ARN": "arn:aws:secretsmanager:us-
west-2:123456789012:secret:MyTestSecret-1a2b3c",
    "Name": "MyTestSecret",
    "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "VersionStages": [
        "AWSCURRENT"
    ]
}
```

For more information, see Modify a secret in the *Secrets Manager User Guide*.

Example 2: To store a new secret value from credentials in a JSON file

The following `put-secret-value` example creates a new version of a secret from credentials in a file. For more information, see Loading AWS CLI parameters from a file in the *AWS CLI User Guide*.

```
aws secretsmanager put-secret-value \
    --secret-id MyTestSecret \
    --secret-string file://mycreds.json
```

Contents of `mycreds.json`:

```
{
  "engine": "mysql",
  "username": "saanvis",
  "password": "EXAMPLE-PASSWORD",
  "host": "my-database-endpoint.us-west-2.rds.amazonaws.com",
  "dbname": "myDatabase",
  "port": "3306"
}
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret",
    "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "VersionStages": [
        "AWSCURRENT"
    ]
```

```
}
```

For more information, see Modify a secret in the *Secrets Manager User Guide*.

- For API details, see PutSecretValue in *AWS CLI Command Reference*.

`remove-regions-from-replication`

The following code example shows how to use `remove-regions-from-replication`.

AWS CLI

To delete a replica secret

The following `remove-regions-from-replication` example deletes a replica secret in eu-west-3. To delete a primary secret that is replicated to other regions, first delete the replicas and then call `delete-secret`.

```
aws secretsmanager remove-regions-from-replication \
    --secret-id MyTestSecret \
    --remove-replica-regions eu-west-3
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-
west-2:123456789012:secret:MyTestSecret-1a2b3c",
    "ReplicationStatus": []
}
```

For more information, see Delete a replica secret in the *Secrets Manager User Guide*.

- For API details, see RemoveRegionsFromReplication in *AWS CLI Command Reference*.

`replicate-secret-to-regions`

The following code example shows how to use `replicate-secret-to-regions`.

AWS CLI

To replicate a secret to another region

The following `replicate-secret-to-regions` example replicates a secret to eu-west-3. The replica is encrypted with the AWS managed key `aws/secretsmanager`.

```
aws secretsmanager replicate-secret-to-regions \
    --secret-id MyTestSecret \
    --add-replica-regions Region=eu-west-3
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-
west-2:123456789012:secret:MyTestSecret-1a2b3c",
    "ReplicationStatus": [
        {
            "Region": "eu-west-3",
            "KmsKeyId": "alias/aws/secretsmanager",
            "Status": "InProgress"
        }
    ]
}
```

For more information, see Replicate a secret to another Region in the *Secrets Manager User Guide*.

- For API details, see ReplicateSecretToRegions in *AWS CLI Command Reference*.

`restore-secret`

The following code example shows how to use `restore-secret`.

AWS CLI

To restore a previously deleted secret

The following `restore-secret` example restores a secret that was previously scheduled for deletion.

```
aws secretsmanager restore-secret \
    --secret-id MyTestSecret
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret"
}
```

For more information, see Delete a secret in the *Secrets Manager User Guide*.

- For API details, see RestoreSecret in *AWS CLI Command Reference*.

`rotate-secret`

The following code example shows how to use `rotate-secret`.

AWS CLI

Example 1: To configure and start automatic rotation for a secret

The following `rotate-secret` example configures and starts automatic rotation for a secret. Secrets Manager rotates the secret once immediately, and then every eight hours in a two hour window. The output shows the `VersionId` of the new secret version created by rotation.

```
aws secretsmanager rotate-secret \
    --secret-id MyTestDatabaseSecret \
    --rotation-lambda-arn arn:aws:lambda:us-
west-2:1234566789012:function:SecretsManagerTestRotationLambda \
    --rotation-rules "{\"ScheduleExpression\": \"cron(0 8/8 * * ? *)\", \"Duration
\": \"2h\"}"
```

Output:

```
{
    "ARN": "aws:arn:secretsmanager:us-
west-2:123456789012:secret:MyTestDatabaseSecret-a1b2c3",
    "Name": "MyTestDatabaseSecret",
    "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Rotate secrets in the *Secrets Manager User Guide*.

Example 2: To configure and start automatic rotation on a rotation interval

The following `rotate-secret` example configures and starts automatic rotation for a secret. Secrets Manager rotates the secret once immediately, and then every 10 days. The output shows the `VersionId` of the new secret version created by rotation.

```
aws secretsmanager rotate-secret \
    --secret-id MyTestDatabaseSecret \
    --rotation-lambda-arn arn:aws:lambda:us-
west-2:1234566789012:function:SecretsManagerTestRotationLambda \
    --rotation-rules "{\"ScheduleExpression\": \"rate(10 days)\"}"
```

Output:

```
{
    "ARN": "aws:arn:secretsmanager:us-
west-2:123456789012:secret:MyTestDatabaseSecret-a1b2c3",
    "Name": "MyTestDatabaseSecret",
    "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Rotate secrets in the *Secrets Manager User Guide*.

Example 3: To rotate a secret immediately

The following `rotate-secret` example starts an immediate rotation. The output shows the `VersionId` of the new secret version created by rotation. The secret must already have rotation configured.

```
aws secretsmanager rotate-secret \
    --secret-id MyTestDatabaseSecret
```

Output:

```
{
    "ARN": "aws:arn:secretsmanager:us-
west-2:123456789012:secret:MyTestDatabaseSecret-a1b2c3",
    "Name": "MyTestDatabaseSecret",
    "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Rotate secrets in the *Secrets Manager User Guide*.

- For API details, see RotateSecret in *AWS CLI Command Reference*.

`stop-replication-to-replica`

The following code example shows how to use `stop-replication-to-replica`.

AWS CLI

To promote a replica secret to a primary

The following `stop-replication-to-replica` example removes the link between a replica secret to the primary. The replica secret is promoted to a primary secret in the replica region. You must call `stop-replication-to-replica` from within the replica region.

```
aws secretsmanager stop-replication-to-replica \
    --secret-id MyTestSecret
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3"
}
```

For more information, see Promote a replica secret in the *Secrets Manager User Guide*.

- For API details, see StopReplicationToReplica in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

Example 1: To add a tag to a secret

The following example shows how to attach a tag with shorthand syntax.

```
aws secretsmanager tag-resource \
    --secret-id MyTestSecret \
```

```
    --tags Key=FirstTag,Value=FirstValue
```

This command produces no output.

For more information, see Tag your secrets in the *Secrets Manager User Guide*.

Example 2: To add multiple tags to a secret

The following `tag-resource` example attaches two key-value tags to a secret.

```
aws secretsmanager tag-resource \
    --secret-id MyTestSecret \
    --tags '[{"Key": "FirstTag", "Value": "FirstValue"}, {"Key": "SecondTag",
 "Value": "SecondValue"}]'
```

This command produces no output.

For more information, see Tag secrets in the *Secrets Manager User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a secret

The following `untag-resource` example removes two tags from a secret. For each tag, both key and value are removed.

```
aws secretsmanager untag-resource \
    --secret-id MyTestSecret \
    --tag-keys '[ "FirstTag", "SecondTag"]'
```

This command produces no output.

For more information, see Tag secrets in the *Secrets Manager User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-secret-version-stage`

The following code example shows how to use `update-secret-version-stage`.

AWS CLI

Example 1: To revert a secret to the previous version

The following `update-secret-version-stage` example moves the AWSCURRENT staging label to the previous version of a secret, which reverts the secret to the previous version. To find the ID for the previous version, use `list-secret-version-ids`. For this example, the version with the AWSCURRENT label is a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 and the version with the AWSPREVIOUS label is a1b2c3d4-5678-90ab-cdef-EXAMPLE22222. In this example, you move the AWSCURRENT label from version 11111 to 22222. Because the AWSCURRENT label is removed from a version, `update-secret-version-stage` automatically moves the AWSPREVIOUS label to that version (11111). The effect is that the AWSCURRENT and AWSPREVIOUS versions are swapped.

```
aws secretsmanager update-secret-version-stage \
    --secret-id MyTestSecret \
    --version-stage AWSCURRENT \
    --move-to-version-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222 \
    --remove-from-version-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret"
}
```

For more information, see Version in the *Secrets Manager User Guide*.

Example 2: To add a staging label attached to a version of a secret

The following `update-secret-version-stage` example adds a staging label to a version of a secret. You can review the results by running `list-secret-version-ids` and viewing the `VersionStages` response field for the affected version.

```
aws secretsmanager update-secret-version-stage \
```

```
    --secret-id MyTestSecret \
    --version-stage STAGINGLABEL1 \
    --move-to-version-id EXAMPLE1-90ab-cdef-fedc-ba987EXAMPLE
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret"
}
```

For more information, see Version in the *Secrets Manager User Guide*.

Example 3: To delete a staging label attached to a version of a secret

The following `update-secret-version-stage` example deletes a staging label that is attached to a version of a secret. You can review the results by running `list-secret-version-ids` and viewing the `VersionStages` response field for the affected version.

```
aws secretsmanager update-secret-version-stage \
    --secret-id MyTestSecret \
    --version-stage STAGINGLABEL1 \
    --remove-from-version-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret"
}
```

For more information, see Version in the *Secrets Manager User Guide*.

- For API details, see UpdateSecretVersionStage in *AWS CLI Command Reference*.

`update-secret`

The following code example shows how to use `update-secret`.

AWS CLI

Example 1: To update the description of a secret

The following `update-secret` example updates the description of a secret.

```
aws secretsmanager update-secret \
    --secret-id MyTestSecret \
    --description "This is a new description for the secret."
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret"
}
```

For more information, see Modify a secret in the *Secrets Manager User Guide*.

Example 2: To update the encryption key associated with a secret

The following `update-secret` example updates the KMS key used to encrypt the secret value. The KMS key must be in the same region as the secret.

```
aws secretsmanager update-secret \
    --secret-id MyTestSecret \
    --kms-key-id arn:aws:kms:us-west-2:123456789012:key/EXAMPLE1-90ab-cdef-fedc-
ba987EXAMPLE
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret"
}
```

For more information, see Modify a secret in the *Secrets Manager User Guide*.

- For API details, see UpdateSecret in *AWS CLI Command Reference*.

`validate-resource-policy`

The following code example shows how to use `validate-resource-policy`.

AWS CLI

To validate a resource policy

The following `validate-resource-policy` example checks that a resource policy doesn't grant broad access to a secret. The policy is read from a file on disk. For more information, see Loading AWS CLI parameters from a file in the *AWS CLI User Guide*.

```
aws secretsmanager validate-resource-policy \
    --resource-policy file://mypolicy.json
```

Contents of `mypolicy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::123456789012:role/MyRole"
            },
            "Action": "secretsmanager:GetSecretValue",
            "Resource": "*"
        }
    ]
}
```

Output:

```
{
    "PolicyValidationPassed": true,
    "ValidationErrors": []
}
```

For more information, see Permissions reference for Secrets Manager in the *Secrets Manager User Guide*.

- For API details, see ValidateResourcePolicy in *AWS CLI Command Reference*.

Security Hub CSPM examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Security Hub CSPM.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`accept-administrator-invitation`

The following code example shows how to use `accept-administrator-invitation`.

AWS CLI

To accept an invitation from an administrator account

The following `accept-administrator-invitation` example accepts the specified invitation from the specified administrator account.

```
aws securityhub accept-invitation \
    --administrator-id 123456789012 \
    --invitation-id 7ab938c5d52d7904ad09f9e7c20cc4eb
```

This command produces no output.

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see AcceptAdministratorInvitation in *AWS CLI Command Reference*.

`accept-invitation`

The following code example shows how to use `accept-invitation`.

AWS CLI

To accept an invitation from an administrator account

The following `accept-invitation` example accepts the specified invitation from the specified administrator account.

```
aws securityhub accept-invitation \
    --master-id 123456789012 \
    --invitation-id 7ab938c5d52d7904ad09f9e7c20cc4eb
```

This command produces no output.

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see AcceptInvitation in *AWS CLI Command Reference*.

`batch-delete-automation-rules`

The following code example shows how to use `batch-delete-automation-rules`.

AWS CLI

To delete automation rules

The following `batch-delete-automation-rules` example deletes the specified automation rule. You can delete one or more rules with a single command. Only the Security Hub administrator account can run this command.

```
aws securityhub batch-delete-automation-rules \
    --automation-rules-arns '["arn:aws:securityhub:us-
east-1:123456789012:automation-rule/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"]'
```

Output:

```
{
    "ProcessedAutomationRules": [
        "arn:aws:securityhub:us-east-1:123456789012:automation-rule/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

```
    ],
    "UnprocessedAutomationRules": []
}
```

For more information, see Deleting automation rules in the *AWS Security Hub User Guide*.

- For API details, see BatchDeleteAutomationRules in *AWS CLI Command Reference*.

`batch-disable-standards`

The following code example shows how to use `batch-disable-standards`.

AWS CLI

To disable a standard

The following `batch-disable-standards` example disables the standard associated with the specified subscription ARN.

```
aws securityhub batch-disable-standards \
    --standards-subscription-arns "arn:aws:securityhub:us-
west-1:123456789012:subscription/pci-dss/v/3.2.1"
```

Output:

```
{
    "StandardsSubscriptions": [
        {
            "StandardsArn": "arn:aws:securityhub:eu-central-1::standards/pci-dss/
v/3.2.1",
            "StandardsInput": { },
            "StandardsStatus": "DELETING",
            "StandardsSubscriptionArn": "arn:aws:securityhub:us-
west-1:123456789012:subscription/pci-dss/v/3.2.1"
        }
    ]
}
```

For more information, see Disabling or enabling a security standard in the *AWS Security Hub User Guide*.

- For API details, see BatchDisableStandards in *AWS CLI Command Reference*.

`batch-enable-standards`

The following code example shows how to use `batch-enable-standards`.

AWS CLI

To enable a standard

The following `batch-enable-standards` example enables the PCI DSS standard for the requesting account.

```
aws securityhub batch-enable-standards \
    --standards-subscription-requests '{"StandardsArn":"arn:aws:securityhub:us-
west-1::standards/pci-dss/v/3.2.1"}'
```

Output:

```
{
    "StandardsSubscriptions": [
        {
            "StandardsArn": "arn:aws:securityhub:us-west-1::standards/pci-dss/
v/3.2.1",
            "StandardsInput": { },
            "StandardsStatus": "PENDING",
            "StandardsSubscriptionArn": "arn:aws:securityhub:us-
west-1:123456789012:subscription/pci-dss/v/3.2.1"
        }
    ]
}
```

For more information, see Disabling or enabling a security standard in the *AWS Security Hub User Guide*.

- For API details, see BatchEnableStandards in *AWS CLI Command Reference*.

`batch-get-automation-rules`

The following code example shows how to use `batch-get-automation-rules`.

AWS CLI

To get details for automation rules

The following `batch-get-automation-rules` example gets details for the specified automation rule. You can get details for one or more automation rules with a single command.

```
aws securityhub batch-get-automation-rules \
    --automation-rules-arns '["arn:aws:securityhub:us-
east-1:123456789012:automation-rule/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"]'
```

Output:

```
{
    "Rules": [
        {
            "RuleArn": "arn:aws:securityhub:us-east-1:123456789012:automation-rule/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "RuleStatus": "ENABLED",
            "RuleOrder": 1,
            "RuleName": "Suppress informational findings",
            "Description": "Suppress GuardDuty findings with Informational
 severity",
            "IsTerminal": false,
            "Criteria": {
                "ProductName": [
                    {
                        "Value": "GuardDuty",
                        "Comparison": "EQUALS"
                    }
                ],
                "SeverityLabel": [
                    {
                        "Value": "INFORMATIONAL",
                        "Comparison": "EQUALS"
                    }
                ],
                "WorkflowStatus": [
                    {
                        "Value": "NEW",
                        "Comparison": "EQUALS"
                    }
                ],
                "RecordState": [
                    {
                        "Value": "ACTIVE",
                        "Comparison": "EQUALS"
```

```
                    }
                ]
            },
            "Actions": [
                {
                    "Type": "FINDING_FIELDS_UPDATE",
                    "FindingFieldsUpdate": {
                        "Note": {
                            "Text": "Automatically suppress GuardDuty findings with
 Informational severity",
                            "UpdatedBy": "sechub-automation"
                        },
                        "Workflow": {
                            "Status": "SUPPRESSED"
                        }
                    }
                }
            ],
            "CreatedAt": "2023-05-31T17:56:14.837000+00:00",
            "UpdatedAt": "2023-05-31T17:59:38.466000+00:00",
            "CreatedBy": "arn:aws:iam::123456789012:role/Admin"
        }
    ],
    "UnprocessedAutomationRules": []
}
```

For more information, see Viewing automation rules in the *AWS Security Hub User Guide*.

- For API details, see BatchGetAutomationRules in *AWS CLI Command Reference*.

`batch-get-configuration-policy-associations`

The following code example shows how to use `batch-get-configuration-policy-associations`.

AWS CLI

To get configuration association details for a batch of targets

The following `batch-get-configuration-policy-associations` example retrieves association details for the specified targets. You can provide account IDs, organizational unit IDs, or the root ID for the target.

```
aws securityhub batch-get-configuration-policy-associations \
    --target '{"OrganizationalUnitId": "ou-6hi7-8j91kl2m"}'
```

Output:

```
{
    "ConfigurationPolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
    "TargetId": "ou-6hi7-8j91kl2m",
    "TargetType": "ORGANIZATIONAL_UNIT",
    "AssociationType": "APPLIED",
    "UpdatedAt": "2023-09-26T21:13:01.816000+00:00",
    "AssociationStatus": "SUCCESS",
    "AssociationStatusMessage": "Association applied successfully on this target."
}
```

For more information, see Viewing Security Hub configuration policies in the *AWS Security Hub User Guide*.

- For API details, see BatchGetConfigurationPolicyAssociations in *AWS CLI Command Reference*.

`batch-get-security-controls`

The following code example shows how to use `batch-get-security-controls`.

AWS CLI

To get security control details

The following `batch-get-security-controls` example gets details for the security controls ACM.1 and IAM.1 in the current AWS account and AWS Region.

```
aws securityhub batch-get-security-controls \
    --security-control-ids '["ACM.1", "IAM.1"]'
```

Output:

```
{
    "SecurityControls": [
        {
            "SecurityControlId": "ACM.1",
            "SecurityControlArn": "arn:aws:securityhub:us-
east-2:123456789012:security-control/ACM.1",
```

```
            "Title": "Imported and ACM-issued certificates should be renewed after a
 specified time period",
            "Description": "This control checks whether an AWS Certificate Manager
 (ACM) certificate is renewed within the specified time period. It checks both
 imported certificates and certificates provided by ACM. The control fails if the
 certificate isn't renewed within the specified time period. Unless you provide a
 custom parameter value for the renewal period, Security Hub uses a default value of
 30 days.",
            "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/
ACM.1/remediation",
            "SeverityRating": "MEDIUM",
            "SecurityControlStatus": "ENABLED"
            "UpdateStatus": "READY",
            "Parameters": {
                "daysToExpiration": {
                    "ValueType": CUSTOM,
                    "Value": {
                        "Integer": 15
                    }
                }
            },
            "LastUpdateReason": "Updated control parameter"
        },
        {
            "SecurityControlId": "IAM.1",
            "SecurityControlArn": "arn:aws:securityhub:us-
east-2:123456789012:security-control/IAM.1",
            "Title": "IAM policies should not allow full \"*\" administrative
 privileges",
            "Description": "This AWS control checks whether the default version of
 AWS Identity and Access Management (IAM) policies (also known as customer managed
 policies) do not have administrator access with a statement that has \"Effect\":
 \"Allow\" with \"Action\": \"*\" over \"Resource\": \"*\". It only checks for
 the Customer Managed Policies that you created, but not inline and AWS Managed
 Policies.",
            "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/
IAM.1/remediation",
            "SeverityRating": "HIGH",
            "SecurityControlStatus": "ENABLED"
            "UpdateStatus": "READY",
            "Parameters": {}
        }
    ]
```

```
}
```

For more information, see Viewing details for a control in the *AWS Security Hub User Guide*.

- For API details, see BatchGetSecurityControls in *AWS CLI Command Reference*.

`batch-get-standards-control-associations`

The following code example shows how to use `batch-get-standards-control-associations`.

AWS CLI

To get the enablement status of a control

The following `batch-get-standards-control-associations` example identifies whether the specified controls are enabled in the specified standards.

```
aws securityhub batch-get-standards-control-associations \
    --standards-control-association-ids '[{"SecurityControlId":
 "Config.1","StandardsArn": "arn:aws:securityhub:us-east-1:123456789012:ruleset/cis-
aws-foundations-benchmark/v/1.2.0"}, {"SecurityControlId": "IAM.6","StandardsArn":
 "arn:aws:securityhub:us-east-1:123456789012:standards/aws-foundational-security-
best-practices/v/1.0.0"}]'
```

Output:

```
{
    "StandardsControlAssociationDetails": [
        {
            "StandardsArn": "arn:aws:securityhub:::ruleset/cis-aws-foundations-
benchmark/v/1.2.0",
            "SecurityControlId": "Config.1",
            "SecurityControlArn": "arn:aws:securityhub:us-
east-1:068873283051:security-control/Config.1",
            "AssociationStatus": "ENABLED",
            "RelatedRequirements": [
                "CIS AWS Foundations 2.5"
            ],
            "UpdatedAt": "2022-10-27T16:07:12.960000+00:00",
            "StandardsControlTitle": "Ensure AWS Config is enabled",
```

```
            "StandardsControlDescription": "AWS Config is a web service that
 performs configuration management of supported AWS resources within your account
 and delivers log files to you. The recorded information includes the configuration
 item (AWS resource), relationships between configuration items (AWS resources), and
 any configuration changes between resources. It is recommended to enable AWS Config
 in all regions.",
            "StandardsControlArns": [
                "arn:aws:securityhub:us-east-1:068873283051:control/cis-aws-
foundations-benchmark/v/1.2.0/2.5"
            ]
        },

            "RelatedRequirements": [],
            "UpdatedAt": "2022-11-22T21:30:35.080000+00:00",
            "UpdatedReason": "test",
            "StandardsControlTitle": "Hardware MFA should be enabled for the root
 user",
            "StandardsControlDescription": "This AWS control checks whether your AWS
 account is enabled to use a hardware multi-factor authentication (MFA) device to
 sign in with root user credentials.",
            "StandardsControlArns": [
                "arn:aws:securityhub:us-east-1:068873283051:control/aws-
foundational-security-best-practices/v/1.0.0/IAM.6"
            ]
        }
    ]
}
```

For more information, see Enabling and disabling controls in specific standards in the *AWS Security Hub User Guide*.

- For API details, see BatchGetStandardsControlAssociations in *AWS CLI Command Reference*.

`batch-import-findings`

The following code example shows how to use `batch-import-findings`.

AWS CLI

To update a finding

The following `batch-import-findings` example updates a finding.

```
aws securityhub batch-import-findings \
     --findings '
        [{
            "AwsAccountId": "123456789012",
            "CreatedAt": "2020-05-27T17:05:54.832Z",
            "Description": "Vulnerability in a CloudTrail trail",
            "FindingProviderFields": {
                "Severity": {
                    "Label": "LOW",
                    "Original": "10"
                },
                "Types": [
                    "Software and Configuration Checks/Vulnerabilities/CVE"
                ]
            },
            "GeneratorId": "TestGeneratorId",
            "Id": "Id1",
            "ProductArn": "arn:aws:securityhub:us-
west-1:123456789012:product/123456789012/default",
            "Resources": [
                {
                    "Id": "arn:aws:cloudtrail:us-west-1:123456789012:trail/
TrailName",
                    "Partition": "aws",
                    "Region": "us-west-1",
                    "Type": "AwsCloudTrailTrail"
                }
            ],
            "SchemaVersion": "2018-10-08",
            "Title": "CloudTrail trail vulnerability",
            "UpdatedAt": "2020-06-02T16:05:54.832Z"
        }]'
```

Output:

```
{
    "FailedCount": 0,
```

```
    "SuccessCount": 1,
    "FailedFindings": []
}
```

For more information, see Using BatchImportFindings to create and update findings in the *AWS Security Hub User Guide*.

- For API details, see BatchImportFindings in *AWS CLI Command Reference*.

`batch-update-automation-rules`

The following code example shows how to use `batch-update-automation-rules`.

AWS CLI

To update automation rules

The following `batch-update-automation-rules` example updates the specified automation rule. You can update one or more rules with a single command. Only the Security Hub administrator account can run this command.

```
aws securityhub batch-update-automation-rules \
    --update-automation-rules-request-items '[ \
        { \
            "Actions": [{ \
                "Type": "FINDING_FIELDS_UPDATE", \
                "FindingFieldsUpdate": { \
                    "Note": { \
                        "Text": "Known issue that is a risk", \
                        "UpdatedBy": "sechub-automation" \
                    }, \
                    "Workflow": { \
                        "Status": "NEW" \
                    } \
                } \
            }], \
            "Criteria": { \
                "SeverityLabel": [{ \
                    "Value": "LOW", \
                    "Comparison": "EQUALS" \
                }] \
            }, \
```

```
            "RuleArn": "arn:aws:securityhub:us-east-1:123456789012:automation-rule/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111", \
            "RuleOrder": 1, \
            "RuleStatus": "DISABLED" \
        } \
    ]'
```

Output:

```
{
    "ProcessedAutomationRules": [
        "arn:aws:securityhub:us-east-1:123456789012:automation-rule/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    ],
    "UnprocessedAutomationRules": []
}
```

For more information, see Editing automation rules in the *AWS Security Hub User Guide*.

- For API details, see BatchUpdateAutomationRules in *AWS CLI Command Reference*.

`batch-update-findings`

The following code example shows how to use `batch-update-findings`.

AWS CLI

Example 1: To update a finding

The following `batch-update-findings` example updates two findings to add a note, change the severity label, and resolve it.

```
aws securityhub batch-update-findings \
    --finding-identifiers '[{"Id": "arn:aws:securityhub:us-
west-1:123456789012:subscription/pci-dss/v/3.2.1/PCI.Lambda.2/finding/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111", "ProductArn": "arn:aws:securityhub:us-
west-1::product/aws/securityhub"}, {"Id": "arn:aws:securityhub:us-
west-1:123456789012:subscription/pci-dss/v/3.2.1/PCI.Lambda.2/finding/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222", "ProductArn": "arn:aws:securityhub:us-
west-1::product/aws/securityhub"}]' \
    --note '{"Text": "Known issue that is not a risk.", "UpdatedBy": "user1"}' \
    --severity '{"Label": "LOW"}' \
```

```
    --workflow '{"Status": "RESOLVED"}'
```

Output:

```
{
    "ProcessedFindings": [
        {
            "Id": "arn:aws:securityhub:us-west-1:123456789012:subscription/pci-dss/
v/3.2.1/PCI.Lambda.2/finding/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "ProductArn": "arn:aws:securityhub:us-west-1::product/aws/securityhub"
        },
        {
            "Id": "arn:aws:securityhub:us-west-1:123456789012:subscription/pci-dss/
v/3.2.1/PCI.Lambda.2/finding/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "ProductArn": "arn:aws:securityhub:us-west-1::product/aws/securityhub"
        }
    ],
    "UnprocessedFindings": []
}
```

For more information, see Using BatchUpdateFindings to update a finding in the *AWS Security Hub User Guide*.

Example 2: To update a finding using shorthand syntax

The following `batch-update-findings` example updates two findings to add a note, change the severity label, and resolve it using shorthand syntax.

```
aws securityhub batch-update-findings \
    --finding-identifiers Id="arn:aws:securityhub:us-
west-1:123456789012:subscription/pci-dss/v/3.2.1/PCI.Lambda.2/finding/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",ProductArn="arn:aws:securityhub:us-
west-1::product/aws/securityhub" Id="arn:aws:securityhub:us-
west-1:123456789012:subscription/pci-dss/v/3.2.1/PCI.Lambda.2/finding/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",ProductArn="arn:aws:securityhub:us-
west-1::product/aws/securityhub" \
    --note Text="Known issue that is not a risk.",UpdatedBy="user1" \
    --severity Label="LOW" \
    --workflow Status="RESOLVED"
```

Output:

```
{
    "ProcessedFindings": [
        {
            "Id": "arn:aws:securityhub:us-west-1:123456789012:subscription/pci-dss/
v/3.2.1/PCI.Lambda.2/finding/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "ProductArn": "arn:aws:securityhub:us-west-1::product/aws/securityhub"
        },
        {
            "Id": "arn:aws:securityhub:us-west-1:123456789012:subscription/pci-dss/
v/3.2.1/PCI.Lambda.2/finding/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "ProductArn": "arn:aws:securityhub:us-west-1::product/aws/securityhub"
        }
    ],
    "UnprocessedFindings": []
}
```

For more information, see Using BatchUpdateFindings to update a finding in the *AWS Security Hub User Guide*.

- For API details, see BatchUpdateFindings in *AWS CLI Command Reference*.

`batch-update-standards-control-associations`

The following code example shows how to use `batch-update-standards-control-associations`.

AWS CLI

To update the enablement status of a control in enabled standards

The following `batch-update-standards-control-associations` example disables CloudTrail.1 in the specified standards.

```
aws securityhub batch-update-standards-control-associations \
    --standards-control-association-updates '[{"SecurityControlId": "CloudTrail.1",
 "StandardsArn": "arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/
v/1.2.0", "AssociationStatus": "DISABLED", "UpdatedReason": "Not applicable
 to environment"}, {"SecurityControlId": "CloudTrail.1", "StandardsArn":
 "arn:aws:securityhub:::standards/cis-aws-foundations-benchmark/v/1.4.0",
 "AssociationStatus": "DISABLED", "UpdatedReason": "Not applicable to
 environment"}]'
```

This command produces no output when successful.

For more information, see Enabling and disabling controls in specific standards and Enabling and disabling controls in all standards in the *AWS Security Hub User Guide*.

- For API details, see BatchUpdateStandardsControlAssociations in *AWS CLI Command Reference*.

`create-action-target`

The following code example shows how to use `create-action-target`.

AWS CLI

To create a custom action

The following `create-action-target` example creates a custom action. It provides the name, description, and identifier for the action.

```
aws securityhub create-action-target \
    --name "Send to remediation" \
    --description "Action to send the finding for remediation tracking" \
    --id "Remediation"
```

Output:

```
{
    "ActionTargetArn": "arn:aws:securityhub:us-west-1:123456789012:action/custom/
Remediation"
}
```

For more information, see Creating a custom action and associating it with a CloudWatch Events rule in the *AWS Security Hub User Guide*.

- For API details, see CreateActionTarget in *AWS CLI Command Reference*.

`create-automation-rule`

The following code example shows how to use `create-automation-rule`.

AWS CLI

To create an automation rule

The following `create-automation-rule` example creates an automation rule in the current AWS account and AWS Region. Security Hub filters your findings based on the specified criteria and applies the actions to matching findings. Only the Security Hub administrator account can run this command.

```
aws securityhub create-automation-rule \
    --actions '[{ \
        "Type": "FINDING_FIELDS_UPDATE", \
        "FindingFieldsUpdate": { \
            "Severity": { \
                "Label": "HIGH" \
            }, \
            "Note": { \
                "Text": "Known issue that is a risk. Updated by automation rules", \
                "UpdatedBy": "sechub-automation" \
            } \
        } \
    }]' \
    --criteria '{ \
        "SeverityLabel": [{ \
            "Value": "INFORMATIONAL", \
            "Comparison": "EQUALS" \
        }] \
    }' \
    --description "A sample rule" \
    --no-is-terminal \
    --rule-name "sample rule" \
    --rule-order 1 \
    --rule-status "ENABLED"
```

Output:

```
{
    "RuleArn": "arn:aws:securityhub:us-east-1:123456789012:automation-rule/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Creating automation rules in the *AWS Security Hub User Guide*.

- For API details, see [CreateAutomationRule]() in *AWS CLI Command Reference*.

`create-configuration-policy`

The following code example shows how to use `create-configuration-policy`.

AWS CLI

To create a configuration policy

The following `create-configuration-policy` example creates a configuration policy with the specified settings.

```
aws securityhub create-configuration-policy \
    --name "SampleConfigurationPolicy" \
    --description "SampleDescription" \
    --configuration-policy '{"SecurityHub": {"ServiceEnabled":
 true, "EnabledStandardIdentifiers": ["arn:aws:securityhub:eu-
central-1::standards/aws-foundational-security-best-practices/
v/1.0.0","arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/
v/1.2.0"],"SecurityControlsConfiguration":{"DisabledSecurityControlIdentifiers":
 ["CloudTrail.2"], "SecurityControlCustomParameters": [{"SecurityControlId":
 "ACM.1", "Parameters": {"daysToExpiration": {"ValueType": "CUSTOM", "Value":
 {"Integer": 15}}}}]}}}' \
    --tags '{"Environment": "Prod"}'
```

Output:

```
{
    "Arn": "arn:aws:securityhub:eu-central-1:123456789012:configuration-policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Name": "SampleConfigurationPolicy",
    "Description": "SampleDescription",
    "UpdatedAt": "2023-11-28T20:28:04.494000+00:00",
    "CreatedAt": "2023-11-28T20:28:04.494000+00:00",
    "ConfigurationPolicy": {
        "SecurityHub": {
            "ServiceEnabled": true,
            "EnabledStandardIdentifiers": [
                "arn:aws:securityhub:eu-central-1::standards/aws-foundational-
security-best-practices/v/1.0.0",
```

```
                "arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/
v/1.2.0"
            ],
            "SecurityControlsConfiguration": {
                "DisabledSecurityControlIdentifiers": [
                    "CloudTrail.2"
                ],
                "SecurityControlCustomParameters": [
                    {
                        "SecurityControlId": "ACM.1",
                        "Parameters": {
                            "daysToExpiration": {
                                "ValueType": "CUSTOM",
                                "Value": {
                                    "Integer": 15
                                }
                            }
                        }
                    }
                ]
            }
        }
    }
}
```

For more information, see Creating and associating Security Hub configuration policies in the *AWS Security Hub User Guide*.

- For API details, see CreateConfigurationPolicy in *AWS CLI Command Reference*.

`create-finding-aggregator`

The following code example shows how to use `create-finding-aggregator`.

AWS CLI

To enable finding aggregation

The following `create-finding-aggregator` example configures finding aggregation. It is run from US East (Virginia), which designates US East (Virginia) as the aggregation Region. It indicates to only link specified Regions, and to not automatically link new Regions. It selects US West (N. California) and US West (Oregon) as the linked Regions.

```
aws securityhub create-finding-aggregator \
    --region us-east-1 \
    --region-linking-mode SPECIFIED_REGIONS \
    --regions us-west-1,us-west-2
```

Output:

```
{
    "FindingAggregatorArn": "arn:aws:securityhub:us-east-1:222222222222:finding-
aggregator/123e4567-e89b-12d3-a456-426652340000",
    "FindingAggregationRegion": "us-east-1",
    "RegionLinkingMode": "SPECIFIED_REGIONS",
    "Regions": "us-west-1,us-west-2"
}
```

For more information, see Enabling finding aggregation in the *AWS Security Hub User Guide*.

- For API details, see CreateFindingAggregator in *AWS CLI Command Reference*.

`create-insight`

The following code example shows how to use `create-insight`.

AWS CLI

To create a custom insight

The following `create-insight` example creates a custom insight named Critical role findings that returns critical findings that are related to AWS roles.

```
aws securityhub create-insight \
    --filters '{"ResourceType": [{ "Comparison": "EQUALS", "Value": "AwsIamRole"}],
 "SeverityLabel": [{"Comparison": "EQUALS", "Value": "CRITICAL"}]}' \
    --group-by-attribute "ResourceId" \
    --name "Critical role findings"
```

Output:

```
{
    "InsightArn": "arn:aws:securityhub:us-west-1:123456789012:insight/123456789012/
custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

```
}
```

For more information, see Managing custom insights in the *AWS Security Hub User Guide*.

- For API details, see CreateInsight in *AWS CLI Command Reference*.

`create-members`

The following code example shows how to use `create-members`.

AWS CLI

To add accounts as member accounts

The following `create-members` example adds two accounts as member accounts to the requesting administrator account.

```
aws securityhub create-members \
    --account-details '[{"AccountId": "123456789111"}, {"AccountId":
 "123456789222"}]'
```

Output:

```
{
    "UnprocessedAccounts": []
}
```

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see CreateMembers in *AWS CLI Command Reference*.

`decline-invitations`

The following code example shows how to use `decline-invitations`.

AWS CLI

To decline an invitation to be a member account

The following `decline-invitations` example declines an invitation to be a member account of the specified administrator account. The member account is the requesting account.

```
aws securityhub decline-invitations \
    --account-ids "123456789012"
```

Output:

```
{
    "UnprocessedAccounts": []
}
```

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see DeclineInvitations in *AWS CLI Command Reference*.

`delete-action-target`

The following code example shows how to use `delete-action-target`.

AWS CLI

To delete a custom action

The following `delete-action-target` example deletes the custom action identified by the specified ARN.

```
aws securityhub delete-action-target \
    --action-target-arn "arn:aws:securityhub:us-west-1:123456789012:action/custom/
Remediation"
```

Output:

```
{
    "ActionTargetArn": "arn:aws:securityhub:us-west-1:123456789012:action/custom/
Remediation"
}
```

For more information, see Creating a custom action and associating it with a CloudWatch Events rule in the *AWS Security Hub User Guide*.

- For API details, see DeleteActionTarget in *AWS CLI Command Reference*.

`delete-configuration-policy`

The following code example shows how to use `delete-configuration-policy`.

AWS CLI

To delete a configuration policy

The following `delete-configuration-policy` example deletes the specified configuration policy.

```
aws securityhub delete-configuration-policy \
    --identifier "arn:aws:securityhub:eu-central-1:123456789012:configuration-policy/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Deleting and disassociating Security Hub configuration policies in the *AWS Security Hub User Guide*.

- For API details, see DeleteConfigurationPolicy in *AWS CLI Command Reference*.

`delete-finding-aggregator`

The following code example shows how to use `delete-finding-aggregator`.

AWS CLI

To stop finding aggregation

The following `delete-finding-aggregator` example stops finding aggregation. It is run from US East (Virginia), which is the aggregation Region.

```
aws securityhub delete-finding-aggregator \
    --region us-east-1 \
    --finding-aggregator-arn arn:aws:securityhub:us-east-1:222222222222:finding-aggregator/123e4567-e89b-12d3-a456-426652340000
```

This command produces no output.

For more information, see Stopping finding aggregation in the *AWS Security Hub User Guide*.

- For API details, see DeleteFindingAggregator in *AWS CLI Command Reference*.

`delete-insight`

The following code example shows how to use `delete-insight`.

AWS CLI

To delete a custom insight

The following `delete-insight` example deletes the custom insight with the specified ARN.

```
aws securityhub delete-insight \
    --insight-arn "arn:aws:securityhub:us-west-1:123456789012:insight/123456789012/
custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
   "InsightArn": "arn:aws:securityhub:eu-
central-1:123456789012:insight/123456789012/custom/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111"
}
```

For more information, see Managing custom insights in the *AWS Security Hub User Guide*.

- For API details, see DeleteInsight in *AWS CLI Command Reference*.

`delete-invitations`

The following code example shows how to use `delete-invitations`.

AWS CLI

To delete an invitation to be a member account

The following `delete-invitations` example deletes an invitation to be a member account for the specified administrator account. The member account is the requesting account.

```
aws securityhub delete-invitations \
```

```
    --account-ids "123456789012"
```

Output:

```
{
    "UnprocessedAccounts": []
}
```

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see DeleteInvitations in *AWS CLI Command Reference*.

`delete-members`

The following code example shows how to use `delete-members`.

AWS CLI

To delete member accounts

The following `delete-members` example deletes the specified member accounts from the requesting administrator account.

```
aws securityhub delete-members \
    --account-ids "123456789111" "123456789222"
```

Output:

```
{
    "UnprocessedAccounts": []
}
```

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see DeleteMembers in *AWS CLI Command Reference*.

`describe-action-targets`

The following code example shows how to use `describe-action-targets`.

AWS CLI

To retrieve details about custom actions

The following `describe-action-targets` example retrieves information about the custom action identified by the specified ARN.

```
aws securityhub describe-action-targets \
    --action-target-arns "arn:aws:securityhub:us-west-1:123456789012:action/custom/
Remediation"
```

Output:

```
{
    "ActionTargets": [
        {
            "ActionTargetArn": "arn:aws:securityhub:us-west-1:123456789012:action/
custom/Remediation",
            "Description": "Action to send the finding for remediation tracking",
            "Name": "Send to remediation"
        }
    ]
}
```

For more information, see Creating a custom action and associating it with a CloudWatch Events rule in the *AWS Security Hub User Guide*.

- For API details, see DescribeActionTargets in *AWS CLI Command Reference*.

`describe-hub`

The following code example shows how to use `describe-hub`.

AWS CLI

To get information about a hub resource

The following `describe-hub` example returns the subscription date and other configuration settings for the specified hub resource. The hub resource is identified by its ARN.

```
aws securityhub describe-hub \
```

```
    --hub-arn "arn:aws:securityhub:us-west-1:123456789012:hub/default"
```

Output:

```
{
    "HubArn": "arn:aws:securityhub:us-west-1:123456789012:hub/default",
    "SubscribedAt": "2019-11-19T23:15:10.046Z",
    "AutoEnableControls": true,
    "ControlFindingGenerator": "SECURITY_CONTROL"
}
```

For more information, see AWS::SecurityHub::Hub in the *AWS CloudFormation User Guide*.

- For API details, see DescribeHub in *AWS CLI Command Reference*.

`describe-organization-configuration`

The following code example shows how to use `describe-organization-configuration`.

AWS CLI

To view how Security Hub is configured for an organization

The following `describe-organization-configuration` example returns information about the way an organization is configured in Security Hub. In this example, the organization uses central configuration. Only the Security Hub administrator account can run this command.

```
aws securityhub describe-organization-configuration
```

Output:

```
{
    "AutoEnable": false,
    "MemberAccountLimitReached": false,
    "AutoEnableStandards": "NONE",
    "OrganizationConfiguration": {
        "ConfigurationType": "LOCAL",
        "Status": "ENABLED",
        "StatusMessage": "Central configuration has been enabled successfully"
    }
```

```
}
```

For more information, see [Managing accounts with AWS Organizations]() in the *AWS Security Hub User Guide*.

- For API details, see [DescribeOrganizationConfiguration]() in *AWS CLI Command Reference*.

`describe-products`

The following code example shows how to use `describe-products`.

AWS CLI

To return information about available product integrations

The following `describe-products` example returns the available product integrations one at a time.

```
aws securityhub describe-products \
    --max-results 1
```

Output:

```
{
    "NextToken": "U2FsdGVkX18vvPlOqb7RDrWRWVFBJI46MOIAb+nZmRJmR15NoRi2gm13sdQEn3O/

        }
    ]
}
```

For more information, see Managing product integrations in the *AWS Security Hub User Guide*.

- For API details, see DescribeProducts in *AWS CLI Command Reference*.

`describe-standards-controls`

The following code example shows how to use `describe-standards-controls`.

AWS CLI

To request the list of controls in an enabled standard

The following `describe-standards-controls` example requests the list of controls in the requester account's subscription to the PCI DSS standard. The request returns two controls at a time.

```
aws securityhub describe-standards-controls \
    --standards-subscription-arn "arn:aws:securityhub:us-
west-1:123456789012:subscription/pci-dss/v/3.2.1" \
    --max-results 2
```

Output:

```
{
    "Controls": [
        {
            "StandardsControlArn": "arn:aws:securityhub:us-
west-1:123456789012:control/pci-dss/v/3.2.1/PCI.AutoScaling.1",

```

For more information, see Viewing details for controls in the *AWS Security Hub User Guide*.

- For API details, see DescribeStandardsControls in *AWS CLI Command Reference*.

`describe-standards`

The following code example shows how to use `describe-standards`.

AWS CLI

To return a list of available standards

The following `describe-standards` example returns the list of available standards.

```
aws securityhub describe-standards
```

Output:

```
{
    "Standards": [
        {
            "StandardsArn": "arn:aws:securityhub:us-west-1::standards/aws-
foundational-security-best-practices/v/1.0.0",
            "Name": "AWS Foundational Security Best Practices v1.0.0",
            "Description": "The AWS Foundational Security Best Practices standard
 is a set of automated security checks that detect when AWS accounts and deployed
 resources do not align to security best practices. The standard is defined by AWS
 security experts. This curated set of controls helps improve your security posture
 in AWS, and cover AWS's most popular and foundational services.",
            "EnabledByDefault": true
        },
        {
            "StandardsArn": "arn:aws:securityhub:::ruleset/cis-aws-foundations-
benchmark/v/1.2.0",
            "Name": "CIS AWS Foundations Benchmark v1.2.0",
```

```
            "Description": "The Center for Internet Security (CIS) AWS Foundations
 Benchmark v1.2.0 is a set of security configuration best practices for AWS. This
 Security Hub standard automatically checks for your compliance readiness against a
 subset of CIS requirements.",
            "EnabledByDefault": true
        },
        {
            "StandardsArn": "arn:aws:securityhub:us-west-1::standards/pci-dss/
v/3.2.1",
            "Name": "PCI DSS v3.2.1",
            "Description": "The Payment Card Industry Data Security Standard (PCI
 DSS) v3.2.1 is an information security standard for entities that store, process,
 and/or transmit cardholder data. This Security Hub standard automatically checks
 for your compliance readiness against a subset of PCI DSS requirements.",
            "EnabledByDefault": false
        }
    ]
}
```

For more information, see Security standards in AWS Security Hub in the *AWS Security Hub User Guide*.

- For API details, see DescribeStandards in *AWS CLI Command Reference*.

`disable-import-findings-for-product`

The following code example shows how to use `disable-import-findings-for-product`.

AWS CLI

To stop receiving findings from a product integration

The following `disable-import-findings-for-product` example disables the flow of findings for the specified subscription to a product integration.

```
aws securityhub disable-import-findings-for-product \
    --product-subscription-arn "arn:aws:securityhub:us-west-1:123456789012:product-subscription/crowdstrike/crowdstrike-falcon"
```

This command produces no output.

For more information, see Managing product integrations in the *AWS Security Hub User Guide*.

- For API details, see DisableImportFindingsForProduct in *AWS CLI Command Reference*.

`disable-organization-admin-account`

The following code example shows how to use `disable-organization-admin-account`.

AWS CLI

To remove a Security Hub administrator account

The following `disable-organization-admin-account` example revokes the specified account's assignment as a Security Hub administrator account for AWS Organizations.

```
aws securityhub disable-organization-admin-account \
    --admin-account-id 777788889999
```

This command produces no output.

For more information, see Designating a Security Hub administrator account in the *AWS Security Hub User Guide*.

- For API details, see DisableOrganizationAdminAccount in *AWS CLI Command Reference*.

`disable-security-hub`

The following code example shows how to use `disable-security-hub`.

AWS CLI

To disable AWS Security Hub

The following `disable-security-hub` example disables AWS Security Hub for the requesting account.

```
aws securityhub disable-security-hub
```

This command produces no output.

For more information, see Disabling AWS Security Hub in the *AWS Security Hub User Guide*.

- For API details, see DisableSecurityHub in *AWS CLI Command Reference*.

`disassociate-from-administrator-account`

The following code example shows how to use `disassociate-from-administrator-account`.

AWS CLI

To disassociate from an administrator account

The following `disassociate-from-administrator-account` example disassociates the requesting account from its current administrator account.

```
aws securityhub disassociate-from-administrator-account
```

This command produces no output.

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see DisassociateFromAdministratorAccount in *AWS CLI Command Reference*.

`disassociate-from-master-account`

The following code example shows how to use `disassociate-from-master-account`.

AWS CLI

To disassociate from an administrator account

The following `disassociate-from-master-account` example disassociates the requesting account from its current administrator account.

```
aws securityhub disassociate-from-master-account
```

This command produces no output.

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see DisassociateFromMasterAccount in *AWS CLI Command Reference*.

`disassociate-members`

The following code example shows how to use `disassociate-members`.

AWS CLI

To disassociate member accounts

The following `disassociate-members` example disassociates the specified member accounts from the requesting administrator account.

```
aws securityhub disassociate-members  \
    --account-ids "123456789111" "123456789222"
```

This command produces no output.

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see DisassociateMembers in *AWS CLI Command Reference*.

`enable-import-findings-for-product`

The following code example shows how to use `enable-import-findings-for-product`.

AWS CLI

To start receiving findings from a product integration

The following `enable-import-findings-for-product` example enables the flow of findings from the specified product integration.

```
aws securityhub enable-import-findings-for-product \
    --product-arn "arn:aws:securityhub:us-east-1:123456789333:product/crowdstrike/
crowdstrike-falcon"
```

Output:

```
{
    "ProductSubscriptionArn": "arn:aws:securityhub:us-east-1:123456789012:product-
subscription/crowdstrike/crowdstrike-falcon"
```

```
}
```

For more information, see Managing product integrations in the *AWS Security Hub User Guide*.

- For API details, see EnableImportFindingsForProduct in *AWS CLI Command Reference*.

`enable-organization-admin-account`

The following code example shows how to use `enable-organization-admin-account`.

AWS CLI

To designate an organization account as a Security Hub administrator account

The following `enable-organization-admin-account` example designates the specified account as a Security Hub administrator account.

```
aws securityhub enable-organization-admin-account \
    --admin-account-id 777788889999
```

This command produces no output.

For more information, see Designating a Security Hub administrator account in the *AWS Security Hub User Guide*.

- For API details, see EnableOrganizationAdminAccount in *AWS CLI Command Reference*.

`enable-security-hub`

The following code example shows how to use `enable-security-hub`.

AWS CLI

To enable AWS Security Hub

The following `enable-security-hub` example enables AWS Security Hub for the requesting account. It configures Security Hub to enable the default standards. For the hub resource, it assigns the value `Security` to the tag `Department`.

```
aws securityhub enable-security-hub \
```

```
    --enable-default-standards \
    --tags '{"Department": "Security"}'
```

This command produces no output.

For more information, see Enabling Security Hub in the *AWS Security Hub User Guide*.

- For API details, see EnableSecurityHub in *AWS CLI Command Reference*.

get-administrator-account

The following code example shows how to use `get-administrator-account`.

AWS CLI

To retrieve information about an administrator account

The following `get-administrator-account` example retrieves information about the administrator account for the requesting account.

```
aws securityhub get-administrator-account
```

Output:

```
{
   "Master": {
      "AccountId": "123456789012",
      "InvitationId": "7ab938c5d52d7904ad09f9e7c20cc4eb",
      "InvitedAt": 2020-06-01T20:21:18.042000+00:00,
      "MemberStatus": "ASSOCIATED"
   }
}
```

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see GetAdministratorAccount in *AWS CLI Command Reference*.

get-configuration-policy-association

The following code example shows how to use `get-configuration-policy-association`.

AWS CLI

To get configuration association details for a target

The following `get-configuration-policy-association` example retrieves association details for the specified target. You can provide an account ID, organizational unit ID, or the root ID for the target.

```
aws securityhub get-configuration-policy-association \
    --target '{"OrganizationalUnitId": "ou-6hi7-8j91kl2m"}'
```

Output:

```
{
    "ConfigurationPolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
    "TargetId": "ou-6hi7-8j91kl2m",
    "TargetType": "ORGANIZATIONAL_UNIT",
    "AssociationType": "APPLIED",
    "UpdatedAt": "2023-09-26T21:13:01.816000+00:00",
    "AssociationStatus": "SUCCESS",
    "AssociationStatusMessage": "Association applied successfully on this target."
}
```

For more information, see Viewing Security Hub configuration policies in the *AWS Security Hub User Guide*.

- For API details, see GetConfigurationPolicyAssociation in *AWS CLI Command Reference*.

`get-configuration-policy`

The following code example shows how to use `get-configuration-policy`.

AWS CLI

To view configuration policy details

The following `get-configuration-policy` example retrieves details about the specified configuration policy.

```
aws securityhub get-configuration-policy \
   --identifier "arn:aws:securityhub:eu-central-1:123456789012:configuration-policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "Arn": "arn:aws:securityhub:eu-central-1:123456789012:configuration-policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Id": "ce5ed1e7-9639-4e2f-9313-fa87fcef944b",
    "Name": "SampleConfigurationPolicy",
    "Description": "SampleDescription",
    "UpdatedAt": "2023-11-28T20:28:04.494000+00:00",
    "CreatedAt": "2023-11-28T20:28:04.494000+00:00",
    "ConfigurationPolicy": {
        "SecurityHub": {
            "ServiceEnabled": true,
            "EnabledStandardIdentifiers": [
                "arn:aws:securityhub:eu-central-1::standards/aws-foundational-
security-best-practices/v/1.0.0",
                "arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/
v/1.2.0"
            ],
            "SecurityControlsConfiguration": {
                "DisabledSecurityControlIdentifiers": [
                    "CloudTrail.2"
                ],
                "SecurityControlCustomParameters": [
                    {
                        "SecurityControlId": "ACM.1",
                        "Parameters": {
                            "daysToExpiration": {
                                "ValueType": "CUSTOM",
                                "Value": {
                                    "Integer": 15
                                }
                            }
                        }
                    }
                ]
            }
        }
    }
}
```

For more information, see [Viewing Security Hub configuration policies](#) in the *AWS Security Hub User Guide*.

- For API details, see GetConfigurationPolicy in *AWS CLI Command Reference*.

`get-enabled-standards`

The following code example shows how to use `get-enabled-standards`.

AWS CLI

To retrieve information about an enabled standard

The following `get-enabled-standards` example retrieves information about the PCI DSS standard.

```
aws securityhub get-enabled-standards \
    --standards-subscription-arn "arn:aws:securityhub:us-
west-1:123456789012:subscription/pci-dss/v/3.2.1"
```

Output:

```
{
    "StandardsSubscriptions": [
        {
            "StandardsArn": "arn:aws:securityhub:us-west-1::standards/pci-dss/
v/3.2.1",
            "StandardsInput": { },
            "StandardsStatus": "READY",
            "StandardsSubscriptionArn": "arn:aws:securityhub:us-
west-1:123456789012:subscription/pci-dss/v/3.2.1"
        }
    ]
}
```

For more information, see Security standards in AWS Security Hub in the *AWS Security Hub User Guide*.

- For API details, see GetEnabledStandards in *AWS CLI Command Reference*.

`get-finding-aggregator`

The following code example shows how to use `get-finding-aggregator`.

AWS CLI

To retrieve the current finding aggregation configuration

The following `get-finding-aggregator` example retrieves the current finding aggregation configuration.

```
aws securityhub get-finding-aggregator \
    --finding-aggregator-arn arn:aws:securityhub:us-east-1:222222222222:finding-aggregator/123e4567-e89b-12d3-a456-426652340000
```

Output:

```
{
    "FindingAggregatorArn": "arn:aws:securityhub:us-east-1:222222222222:finding-aggregator/123e4567-e89b-12d3-a456-426652340000",
    "FindingAggregationRegion": "us-east-1",
    "RegionLinkingMode": "SPECIFIED_REGIONS",
    "Regions": "us-west-1,us-west-2"
}
```

For more information, see Viewing the current finding aggregation configuration in the *AWS Security Hub User Guide*.

- For API details, see GetFindingAggregator in *AWS CLI Command Reference*.

`get-finding-history`

The following code example shows how to use `get-finding-history`.

AWS CLI

To get finding history

The following `get-finding-history` example gets up to the last 90 days of history for the specified finding. In this example, the results are limited to two records of finding history.

```
aws securityhub get-finding-history \
    --finding-identifier Id="arn:aws:securityhub:us-east-1:123456789012:security-control/S3.17/finding/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",ProductArn="arn:aws:securityhub:us-east-1::product/aws/securityhub"
```

Output:

```
{
    "Records": [
        {
            "FindingIdentifier": {
                "Id": "arn:aws:securityhub:us-east-1:123456789012:security-control/

`get-findings`

The following code example shows how to use `get-findings`.

AWS CLI

Example 1: To return findings generated for a specific standard

The following `get-findings` example returns findings for the PCI DSS standard.

```
aws securityhub get-findings \
    --filters '{"GeneratorId":[{"Value": "pci-dss","Comparison":"PREFIX"}]}' \
    --max-items 1
```

Output:

```
{
    "Findings": [
        {
```

```
            "SchemaVersion": "2018-10-08",
            "Id": "arn:aws:securityhub:eu-central-1:123456789012:subscription/pci-

`get-insight-results`

The following code example shows how to use `get-insight-results`.

AWS CLI

To retrieve the results for an insight

The following `get-insight-results` example returns the list of insight results for the insight with the specified ARN.

```
aws securityhub get-insight-results \
    --insight-arn "arn:aws:securityhub:us-west-1:123456789012:insight/123456789012/
custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "InsightResults": {
        "GroupByAttribute": "ResourceId",
        "InsightArn": "arn:aws:securityhub:us-
west-1:123456789012:insight/123456789012/custom/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
```

```
            "ResultValues": [
                {
                    "Count": 10,
                    "GroupByAttributeValue": "AWS::::Account:123456789111"
                },
                {
                    "Count": 3,
                    "GroupByAttributeValue": "AWS::::Account:123456789222"
                }
            ]
        }
    }
```

For more information, see Viewing and taking action on insight results and findings in the *AWS Security Hub User Guide*.

- For API details, see GetInsightResults in *AWS CLI Command Reference*.

`get-insights`

The following code example shows how to use `get-insights`.

AWS CLI

To retrieve details about an insight

The following `get-insights` example retrieves the configuration details for the insight with the specified ARN.

```
aws securityhub get-insights \
    --insight-arns "arn:aws:securityhub:us-west-1:123456789012:insight/123456789012/
custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "Insights": [
        {
            "Filters": {
               "ResourceType": [
                    {
                        "Comparison": "EQUALS",
```

```
                        "Value": "AwsIamRole"
                    }
                ],
                "SeverityLabel": [
                    {
                        "Comparison": "EQUALS",
                        "Value": "CRITICAL"
                    }
                ],
            },
            "GroupByAttribute": "ResourceId",
            "InsightArn": "arn:aws:securityhub:us-
west-1:123456789012:insight/123456789012/custom/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
            "Name": "Critical role findings"
        }
    ]
}
```

For more information, see Insights in AWS Security Hub in the *AWS Security Hub User Guide*.

- For API details, see GetInsights in *AWS CLI Command Reference*.

`get-invitations-count`

The following code example shows how to use `get-invitations-count`.

AWS CLI

To retrieve the number of invitations that were not accepted

The following `get-invitations-count` example retrieves the number of invitations that the requesting account declined or did not respond to.

```
aws securityhub get-invitations-count
```

Output:

```
{
  "InvitationsCount": 3
}
```

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see GetInvitationsCount in *AWS CLI Command Reference*.

`get-master-account`

The following code example shows how to use `get-master-account`.

AWS CLI

To retrieve information about an administrator account

The following `get-master-account` example retrieves information about the administrator account for the requesting account.

```
aws securityhub get-master-account
```

Output:

```
{
   "Master": {
      "AccountId": "123456789012",
      "InvitationId": "7ab938c5d52d7904ad09f9e7c20cc4eb",
      "InvitedAt": 2020-06-01T20:21:18.042000+00:00,
      "MemberStatus": "ASSOCIATED"
   }
}
```

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see GetMasterAccount in *AWS CLI Command Reference*.

`get-members`

The following code example shows how to use `get-members`.

AWS CLI

To retrieve information about selected member accounts

The following `get-members` example retrieves information about the specified member accounts.

```
aws securityhub get-members \
    --account-ids "444455556666" "777788889999"
```

Output:

```
{

- For API details, see GetMembers in *AWS CLI Command Reference*.

`get-security-control-definition`

The following code example shows how to use `get-security-control-definition`.

AWS CLI

To get security control definition details

The following `get-security-control-definition` example retrieves definition details for a Security Hub security control. Details include the control title, description, Region availability, parameters, and other information.

```
aws securityhub get-security-control-definition \
    --security-control-id ACM.1
```

Output:

```
{
    "SecurityControlDefinition": {
        "SecurityControlId": "ACM.1",
        "Title": "Imported and ACM-issued certificates should be renewed after a
 specified time period",
        "Description": "This control checks whether an AWS Certificate Manager
 (ACM) certificate is renewed within the specified time period. It checks both
 imported certificates and certificates provided by ACM. The control fails if the
 certificate isn't renewed within the specified time period. Unless you provide a
 custom parameter value for the renewal period, Security Hub uses a default value of
 30 days.",
        "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/ACM.1/
remediation",
        "SeverityRating": "MEDIUM",
        "CurrentRegionAvailability": "AVAILABLE",
        "ParameterDefinitions": {
            "daysToExpiration": {
                "Description": "Number of days within which the ACM certificate must
 be renewed",
                "ConfigurationOptions": {
                    "Integer": {
                        "DefaultValue": 30,
                        "Min": 14,
                        "Max": 365
                    }
                }
            }
        }
    }
}
```

For more information, see Custom control parameters in the *AWS Security Hub User Guide*.

- For API details, see GetSecurityControlDefinition in *AWS CLI Command Reference*.

`invite-members`

The following code example shows how to use `invite-members`.

AWS CLI

To send invitations to member accounts

The following `invite-members` example sends invitations to the specified member accounts.

```
aws securityhub invite-members \
    --account-ids "123456789111" "123456789222"
```

Output:

```
{
    "UnprocessedAccounts": []
}
```

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see InviteMembers in *AWS CLI Command Reference*.

`list-automation-rules`

The following code example shows how to use `list-automation-rules`.

AWS CLI

To view a list of automation rules

The following `list-automation-rules` example lists the automation rules for an AWS account. Only the Security Hub administrator account can run this command.

```
aws securityhub list-automation-rules \
    --max-results 3 \
    --next-token NULL
```

Output:

```
{
```

```
    "AutomationRulesMetadata": [
        {
            "RuleArn": "arn:aws:securityhub:us-east-1:123456789012:automation-rule/

        }
    ]
}
```

For more information, see Viewing automation rules in the *AWS Security Hub User Guide*.

- For API details, see ListAutomationRules in *AWS CLI Command Reference*.

`list-configuration-policies`

The following code example shows how to use `list-configuration-policies`.

AWS CLI

To list configuration policy summaries

The following `list-configuration-policies` example lists a summary of configuration policies for the organization.

```
aws securityhub list-configuration-policies \
    --max-items 3
```

Output:

```
{
    "ConfigurationPolicySummaries": [
        {
            "Arn": "arn:aws:securityhub:eu-central-1:123456789012:configuration-
policy/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",

            "UpdatedAt": "2023-11-28T19:26:25.207000+00:00",
            "ServiceEnabled": true
        },
        {
            "Arn": "arn:aws:securityhub:eu-central-1:123456789012:configuration-
policy/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "Name": "SampleConfigurationPolicy3",
            "Description": "SampleDescription3",
            "UpdatedAt": "2023-11-28T20:28:04.494000+00:00",
```

```
            "ServiceEnabled": true
        }
}
```

For more information, see [Viewing Security Hub configuration policies]() in the *AWS Security Hub User Guide*.

- For API details, see [ListConfigurationPolicies]() in *AWS CLI Command Reference*.

`list-configuration-policy-associations`

The following code example shows how to use `list-configuration-policy-associations`.

AWS CLI

To list configuration associations

The following `list-configuration-policy-associations` example lists a summary of configuration associations for the organization. The response include associations with configuration policies and self-managed behavior.

```
aws securityhub list-configuration-policy-associations \
    --filters '{"AssociationType": "APPLIED"}' \
    --max-items 4
```

Output:

```
{
    "ConfigurationPolicyAssociationSummaries": [
        {
            "ConfigurationPolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "TargetId": "r-1ab2",
            "TargetType": "ROOT",
            "AssociationType": "APPLIED",
            "UpdatedAt": "2023-11-28T19:26:49.417000+00:00",
            "AssociationStatus": "FAILED",
            "AssociationStatusMessage": "Policy association failed because 2
 organizational units or accounts under this root failed."
        },
        {
            "ConfigurationPolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "TargetId": "ou-1ab2-c3de4f5g",
            "TargetType": "ORGANIZATIONAL_UNIT",
```

```
            "AssociationType": "APPLIED",
            "UpdatedAt": "2023-09-26T21:14:05.283000+00:00",
            "AssociationStatus": "FAILED",
            "AssociationStatusMessage": "One or more children under this target
 failed association."
        },
        {
            "ConfigurationPolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "TargetId": "ou-6hi7-8j91kl2m",
            "TargetType": "ORGANIZATIONAL_UNIT",
            "AssociationType": "APPLIED",
            "UpdatedAt": "2023-09-26T21:13:01.816000+00:00",
            "AssociationStatus": "SUCCESS",
            "AssociationStatusMessage": "Association applied successfully on this
 target."
        },
        {
            "ConfigurationPolicyId": "SELF_MANAGED_SECURITY_HUB",
            "TargetId": "111122223333",
            "TargetType": "ACCOUNT",
            "AssociationType": "APPLIED",
            "UpdatedAt": "2023-11-28T22:01:26.409000+00:00",
            "AssociationStatus": "SUCCESS"
    }
}
```

For more information, see Viewing configuration policy status and details in the *AWS Security Hub User Guide*.

- For API details, see ListConfigurationPolicyAssociations in *AWS CLI Command Reference*.

`list-enabled-products-for-import`

The following code example shows how to use `list-enabled-products-for-import`.

AWS CLI

To return the list of enabled product integrations

The following `list-enabled-products-for-import` example returns the list of subscription ARNS for the currently enabled product integrations.

```
aws securityhub list-enabled-products-for-import
```

Output:

```
{
    "ProductSubscriptions": [ "arn:aws:securityhub:us-west-1:123456789012:product-subscription/crowdstrike/crowdstrike-falcon", "arn:aws:securityhub:us-west-1:123456789012:product-subscription/aws/securityhub" ]
}
```

For more information, see Managing product integrations in the *AWS Security Hub User Guide*.

- For API details, see ListEnabledProductsForImport in *AWS CLI Command Reference*.

`list-finding-aggregators`

The following code example shows how to use `list-finding-aggregators`.

AWS CLI

To list the available widgets

The following `list-finding-aggregators` example returns the ARN of the finding aggregation configuration.

```
aws securityhub list-finding-aggregators
```

Output:

```
{
    "FindingAggregatorArn": "arn:aws:securityhub:us-east-1:222222222222:finding-aggregator/123e4567-e89b-12d3-a456-426652340000"
}
```

For more information, see Viewing the current finding aggregation configuration in the *AWS Security Hub User Guide*.

- For API details, see ListFindingAggregators in *AWS CLI Command Reference*.

`list-invitations`

The following code example shows how to use `list-invitations`.

AWS CLI

To display a list of invitations

The following `list-invitations` example retrieves the list of invitations sent to the requesting account.

```
aws securityhub list-invitations
```

Output:

```
{
    "Invitations": [
        {
            "AccountId": "123456789012",
            "InvitationId": "7ab938c5d52d7904ad09f9e7c20cc4eb",
            "InvitedAt": 2020-06-01T20:21:18.042000+00:00,
            "MemberStatus": "ASSOCIATED"
        }
    ],
}
```

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see ListInvitations in *AWS CLI Command Reference*.

`list-members`

The following code example shows how to use `list-members`.

AWS CLI

To retrieve a list of member accounts

The following `list-members` example returns the list of member accounts for the requesting administrator account.

```
aws securityhub list-members
```

Output:

```
{
    "Members": [
        {
            "AccountId": "123456789111",
            "AdministratorId": "123456789012",
            "InvitedAt": 2020-06-01T20:15:15.289000+00:00,
            "MasterId": "123456789012",
            "MemberStatus": "ASSOCIATED",
            "UpdatedAt": 2020-06-01T20:15:15.289000+00:00
        },
        {
            "AccountId": "123456789222",
            "AdministratorId": "123456789012",
            "InvitedAt": 2020-06-01T20:15:15.289000+00:00,
            "MasterId": "123456789012",
            "MemberStatus": "ASSOCIATED",
            "UpdatedAt": 2020-06-01T20:15:15.289000+00:00
        }
    ],
}
```

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see ListMembers in *AWS CLI Command Reference*.

`list-organization-admin-accounts`

The following code example shows how to use `list-organization-admin-accounts`.

AWS CLI

To list the designated Security Hub administrator accounts

The following `list-organization-admin-accounts` example lists the Security Hub administrator accounts for an organization.

```
aws securityhub list-organization-admin-accounts
```

Output:

```
{
```

```
    AdminAccounts": [
        { "AccountId": "777788889999" },
        { "Status": "ENABLED" }
    ]
}
```

For more information, see [Designating a Security Hub administrator account]() in the *AWS Security Hub User Guide*.

- For API details, see [ListOrganizationAdminAccounts]() in *AWS CLI Command Reference*.

`list-security-control-definitions`

The following code example shows how to use `list-security-control-definitions`.

AWS CLI

Example 1: To list all available security controls

The following `list-security-control-definitions` example lists the available security controls across all Security Hub standards. This example limits the results to three controls.

```
aws securityhub list-security-control-definitions \
    --max-items 3
```

Output:

```
{
    "SecurityControlDefinitions": [
        {
            "SecurityControlId": "ACM.1",
            "Title": "Imported and ACM-issued certificates should be renewed after a
 specified time period",
            "Description": "This control checks whether an AWS Certificate Manager
 (ACM) certificate is renewed within the specified time period. It checks both
 imported certificates and certificates provided by ACM. The control fails if the
 certificate isn't renewed within the specified time period. Unless you provide a
 custom parameter value for the renewal period, Security Hub uses a default value of
 30 days.",
            "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/
ACM.1/remediation",
            "SeverityRating": "MEDIUM",
            "CurrentRegionAvailability": "AVAILABLE",
```

```
            "CustomizableProperties": [
                "Parameters"
            ]
        },
        {
            "SecurityControlId": "ACM.2",
            "Title": "RSA certificates managed by ACM should use a key length of at
 least 2,048 bits",
            "Description": "This control checks whether RSA certificates managed by
 AWS Certificate Manager use a key length of at least 2,048 bits. The control fails
 if the key length is smaller than 2,048 bits.",
            "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/
ACM.2/remediation",
            "SeverityRating": "HIGH",
            "CurrentRegionAvailability": "AVAILABLE",
            "CustomizableProperties": []
        },
        {
            "SecurityControlId": "APIGateway.1",
            "Title": "API Gateway REST and WebSocket API execution logging should be
 enabled",
            "Description": "This control checks whether all stages of an Amazon
 API Gateway REST or WebSocket API have logging enabled. The control fails if
 the 'loggingLevel' isn't 'ERROR' or 'INFO' for all stages of the API. Unless you
 provide custom parameter values to indicate that a specific log type should be
 enabled, Security Hub produces a passed finding if the logging level is either
 'ERROR' or 'INFO'.",
            "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/
APIGateway.1/remediation",
            "SeverityRating": "MEDIUM",
            "CurrentRegionAvailability": "AVAILABLE",
            "CustomizableProperties": [
                "Parameters"
            ]
        }
    ],
    "NextToken": "U2FsdGVkX1/UprCPzxVbkDeHikDXbDxfgJZ1w2RG1XWsFPTMTIQPVE0m/

+NYawjocVBeos6xzn/8qnbF9IuwGg=="
}
```

For more information, see Viewing details for a standard in the *AWS Security Hub User Guide*.

Example 2: To list available security controls for a specific standard

The following `list-security-control-definitions` example lists the available security controls for the CIS AWS Foundations Benchmark v1.4.0. This example limits the results to three controls.

```
aws securityhub list-security-control-definitions \
    --standards-arn "arn:aws:securityhub:us-east-1::standards/cis-aws-foundations-benchmark/v/1.4.0" \
    --max-items 3
```

Output:

```
{
    "SecurityControlDefinitions": [
        {
            "SecurityControlId": "CloudTrail.1",
            "Title": "CloudTrail should be enabled and configured with at least one
 multi-Region trail that includes read and write management events",
            "Description": "This AWS control checks that there is at least one
 multi-region AWS CloudTrail trail includes read and write management events.",
            "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/
CloudTrail.1/remediation",
            "SeverityRating": "HIGH",
            "CurrentRegionAvailability": "AVAILABLE",
            "CustomizableProperties": []
        },
        {
            "SecurityControlId": "CloudTrail.2",
            "Title": "CloudTrail should have encryption at-rest enabled",
            "Description": "This AWS control checks whether AWS CloudTrail is
 configured to use the server side encryption (SSE) AWS Key Management Service (AWS
 KMS) customer master key (CMK) encryption. The check will pass if the KmsKeyId is
 defined.",
            "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/
CloudTrail.2/remediation",
            "SeverityRating": "MEDIUM",
            "CurrentRegionAvailability": "AVAILABLE",
            "CustomizableProperties": []
        },
        {
            "SecurityControlId": "CloudTrail.4",
            "Title": "CloudTrail log file validation should be enabled",
            "Description": "This AWS control checks whether CloudTrail log file
 validation is enabled.",
```

```
            "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/
CloudTrail.4/remediation",
            "SeverityRating": "MEDIUM",

- For API details, see [ListSecurityControlDefinitions](#) in *AWS CLI Command Reference*.

`list-standards-control-associations`

The following code example shows how to use `list-standards-control-associations`.

AWS CLI

To get the enablement status of a control in each enabled standard

The following `list-standards-control-associations` example lists the enablement status of CloudTrail.1 in each enabled standard.

```
aws securityhub list-standards-control-associations \
    --security-control-id CloudTrail.1
```

Output:

```
{
    "StandardsControlAssociationSummaries": [
        {
            "StandardsArn": "arn:aws:securityhub:us-east-2::standards/nist-800-53/

For more information, see Enabling and disabling controls in specific standards in the *AWS Security Hub User Guide*.

- For API details, see ListStandardsControlAssociations in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To retrieve the tags assigned to a resource

The following `list-tags-for-resource` example returns the tags assigned to the specified hub resource.

```
aws securityhub list-tags-for-resource \
    --resource-arn "arn:aws:securityhub:us-west-1:123456789012:hub/default"
```

Output:

```
{
    "Tags": {
        "Department" : "Operations",
        "Area" : "USMidwest"
    }
}
```

For more information, see AWS::SecurityHub::Hub in the *AWS CloudFormation User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`start-configuration-policy-association`

The following code example shows how to use `start-configuration-policy-association`.

AWS CLI

Example 1: To associate a configuration policy

The following `start-configuration-policy-association` example associates the specified configuration policy with the specified organizational unit. A configuration may be associated with a target account, organizational unit, or the root.

```
aws securityhub start-configuration-policy-association \
```

```
    --configuration-policy-identifier "arn:aws:securityhub:eu-
central-1:123456789012:configuration-policy/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333" \
    --target '{"OrganizationalUnitId": "ou-6hi7-8j91kl2m"}'
```

Output:

```
{
    "ConfigurationPolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
    "TargetId": "ou-6hi7-8j91kl2m",
    "TargetType": "ORGANIZATIONAL_UNIT",
    "AssociationType": "APPLIED",
    "UpdatedAt": "2023-11-29T17:40:52.468000+00:00",
    "AssociationStatus": "PENDING"
}
```

For more information, see Creating and associating Security Hub configuration policies in the *AWS Security Hub User Guide*.

Example 2: To associate a self-managed configuration

The following `start-configuration-policy-association` example associates a self-managed configuration with the specified account.

```
aws securityhub start-configuration-policy-association \
    --configuration-policy-identifier "SELF_MANAGED_SECURITY_HUB" \
    --target '{"OrganizationalUnitId": "123456789012"}'
```

Output:

```
{
    "ConfigurationPolicyId": "SELF_MANAGED_SECURITY_HUB",
    "TargetId": "123456789012",
    "TargetType": "ACCOUNT",
    "AssociationType": "APPLIED",
    "UpdatedAt": "2023-11-29T17:40:52.468000+00:00",
    "AssociationStatus": "PENDING"
}
```

For more information, see Creating and associating Security Hub configuration policies in the *AWS Security Hub User Guide*.

- For API details, see StartConfigurationPolicyAssociation in *AWS CLI Command Reference*.

`start-configuration-policy-disassociation`

The following code example shows how to use `start-configuration-policy-disassociation`.

AWS CLI

Example 1: To disassociate a configuration policy

The following `start-configuration-policy-disassociation` example disassociates a configuration policy from the specified organizational unit. A configuration may be disassociated from a target account, organizational unit, or the root.

```
aws securityhub start-configuration-policy-disassociation \
    --configuration-policy-identifier "arn:aws:securityhub:eu-
central-1:123456789012:configuration-policy/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333" \
    --target '{"OrganizationalUnitId": "ou-6hi7-8j91kl2m"}'
```

This command produces no output.

For more information, see Disassociating a configuration from accounts and OUs in the *AWS Security Hub User Guide*.

Example 2: To disassociate a self-managed configuration

The following `start-configuration-policy-disassociation` example disassociates a self-managed configuration from the specified account.

```
aws securityhub start-configuration-policy-disassociation \
    --configuration-policy-identifier "SELF_MANAGED_SECURITY_HUB" \
    --target '{"AccountId": "123456789012"}'
```

This command produces no output.

For more information, see Disassociating a configuration from accounts and OUs in the *AWS Security Hub User Guide*.

- For API details, see StartConfigurationPolicyDisassociation in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To assign a tag to a resource

The following `tag-resource` example assigns values for the Department and Area tags to the specified hub resource.

```
aws securityhub tag-resource \
    --resource-arn "arn:aws:securityhub:us-west-1:123456789012:hub/default" \
    --tags '{"Department":"Operations", "Area":"USMidwest"}'
```

This command produces no output.

For more information, see AWS::SecurityHub::Hub in the *AWS CloudFormation User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag value from a resource

The following `untag-resource` example removes the Department tag from the specified hub resource.

```
aws securityhub untag-resource \
    --resource-arn "arn:aws:securityhub:us-west-1:123456789012:hub/default" \
    --tag-keys "Department"
```

This command produces no output.

For more information, see AWS::SecurityHub::Hub in the *AWS CloudFormation User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-action-target`

The following code example shows how to use `update-action-target`.

AWS CLI

To update a custom action

The following `update-action-target` example updates the name of the custom action identified by the specified ARN.

```
aws securityhub update-action-target \
    --action-target-arn "arn:aws:securityhub:us-west-1:123456789012:action/custom/
Remediation" \
    --name "Send to remediation"
```

This command produces no output.

For more information, see [Creating a custom action and associating it with a CloudWatch Events rule](#) in the *AWS Security Hub User Guide*.

- For API details, see [UpdateActionTarget](#) in *AWS CLI Command Reference*.

`update-configuration-policy`

The following code example shows how to use `update-configuration-policy`.

AWS CLI

To update a configuration policy

The following `update-configuration-policy` example updates an existing configuration policy to use the specified settings.

```
aws securityhub update-configuration-policy \
    --identifier "arn:aws:securityhub:eu-central-1:508236694226:configuration-
policy/09f37766-57d8-4ede-9d33-5d8b0fecf70e" \
    --name "SampleConfigurationPolicyUpdated" \
    --description "SampleDescriptionUpdated" \
    --configuration-policy '{"SecurityHub": {"ServiceEnabled":
 true, "EnabledStandardIdentifiers": ["arn:aws:securityhub:eu-
central-1::standards/aws-foundational-security-best-practices/
```

```
v/1.0.0","arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/
v/1.2.0"],"SecurityControlsConfiguration":{"DisabledSecurityControlIdentifiers":
 ["CloudWatch.1"], "SecurityControlCustomParameters": [{"SecurityControlId":
 "ACM.1", "Parameters": {"daysToExpiration": {"ValueType": "CUSTOM", "Value":
 {"Integer": 21}}}}]}}}' \
    --updated-reason "Disabling CloudWatch.1 and changing parameter value"
```

Output:

```
{
    "Arn": "arn:aws:securityhub:eu-central-1:123456789012:configuration-policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",

    "CreatedAt": "2023-11-28T20:28:04.494000+00:00",
    "ConfigurationPolicy": {
        "SecurityHub": {
            "ServiceEnabled": true,
            "EnabledStandardIdentifiers": [
                "arn:aws:securityhub:eu-central-1::standards/aws-foundational-
security-best-practices/v/1.0.0",
                "arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/
v/1.2.0"
            ],
            "SecurityControlsConfiguration": {
                "DisabledSecurityControlIdentifiers": [
                    "CloudWatch.1"
                ],
                "SecurityControlCustomParameters": [
                    {
                        "SecurityControlId": "ACM.1",
                        "Parameters": {
                            "daysToExpiration": {
                                "ValueType": "CUSTOM",
                                "Value": {
                                    "Integer": 21
                                }
                            }
                        }
                    }
                ]
```

```
                }
            }
        }
    }
```

For more information, see Updating Security Hub configuration policies in the *AWS Security Hub User Guide*.

- For API details, see UpdateConfigurationPolicy in *AWS CLI Command Reference*.

`update-finding-aggregator`

The following code example shows how to use `update-finding-aggregator`.

AWS CLI

To update the current finding aggregation configuration

The following `update-finding-aggregator` example changes the finding aggregation configuration to link from selected Regions. It is run from US East (Virginia), which is the aggregation Region. It selects US West (N. California) and US West (Oregon) as the linked Regions.

```
aws securityhub update-finding-aggregator \
    --region us-east-1 \
    --finding-aggregator-arn arn:aws:securityhub:us-east-1:222222222222:finding-aggregator/123e4567-e89b-12d3-a456-426652340000 \
    --region-linking-mode SPECIFIED_REGIONS \
    --regions us-west-1,us-west-2
```

This command produces no output.

For more information, see Updating the finding aggregation configuration in the *AWS Security Hub User Guide*.

- For API details, see UpdateFindingAggregator in *AWS CLI Command Reference*.

`update-insight`

The following code example shows how to use `update-insight`.

AWS CLI

Example 1: To change the filter for a custom insight

The following `update-insight` example changes the filters for a custom insight. The updated insight looks for findings with a high severity that are related to AWS roles.

```
aws securityhub update-insight \
    --insight-arn "arn:aws:securityhub:us-west-1:123456789012:insight/123456789012/
custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --filters '{"ResourceType": [{ "Comparison": "EQUALS", "Value": "AwsIamRole"}],
 "SeverityLabel": [{"Comparison": "EQUALS", "Value": "HIGH"}]}' \
    --name "High severity role findings"
```

Example 2: To change the grouping attribute for a custom insight

The following `update-insight` example changes the grouping attribute for the custom insight with the specified ARN. The new grouping attribute is the resource ID.

```
aws securityhub update-insight \
    --insight-arn "arn:aws:securityhub:us-west-1:123456789012:insight/123456789012/
custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --group-by-attribute "ResourceId" \
    --name "Critical role findings"
```

Output:

```
{
    "Insights": [
        {
            "InsightArn": "arn:aws:securityhub:us-
west-1:123456789012:insight/123456789012/custom/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
            "Name": "Critical role findings",
            "Filters": {
                "SeverityLabel": [
                    {
                        "Value": "CRITICAL",
                        "Comparison": "EQUALS"
                    }
                ],
                "ResourceType": [
```

```
                        {
                            "Value": "AwsIamRole",
                            "Comparison": "EQUALS"
                        }
                    ]
                },
                "GroupByAttribute": "ResourceId"
            }
        ]
}
```

For more information, see [Managing custom insights]() in the *AWS Security Hub User Guide*.

- For API details, see [UpdateInsight]() in *AWS CLI Command Reference*.

`update-organization-configuration`

The following code example shows how to use `update-organization-configuration`.

AWS CLI

To update how Security Hub is configured for an organization

The following `update-organization-configuration` example specifies that Security Hub should use central configuration to configure an organization. After running this command, the delegated Security Hub administrator can create and manage configuration policies to configure the organization. The delegated administrator can also use this command to switch from central to local configuration. If local configuration is the configuration type, the delegated administrator can choose whether to automatically enable Security Hub and default security standards in new organization accounts.

```
aws securityhub update-organization-configuration \
    --no-auto-enable \
    --organization-configuration '{"ConfigurationType": "CENTRAL"}'
```

This command produces no output.

For more information, see [Managing accounts with AWS Organizations]() in the *AWS Security Hub User Guide*.

- For API details, see [UpdateOrganizationConfiguration]() in *AWS CLI Command Reference*.

`update-security-control`

The following code example shows how to use `update-security-control`.

AWS CLI

To update security control properties

The following `update-security-control` example specifies custom values for a Security Hub security control parameter.

```
aws securityhub update-security-control \
    --security-control-id ACM.1 \
    --parameters '{"daysToExpiration": {"ValueType": "CUSTOM", "Value": {"Integer": 15}}}' \
    --last-update-reason "Internal compliance requirement"
```

This command produces no output.

For more information, see Custom control parameters in the *AWS Security Hub User Guide*.

- For API details, see UpdateSecurityControl in *AWS CLI Command Reference*.

`update-security-hub-configuration`

The following code example shows how to use `update-security-hub-configuration`.

AWS CLI

To update Security Hub configuration

The following `update-security-hub-configuration` example configures Security Hub to automatically enable new controls for enabled standards.

```
aws securityhub update-security-hub-configuration \
    --auto-enable-controls
```

This command produces no output.

For more information, see Enabling new controls automatically in the *AWS Security Hub User Guide*.

- For API details, see UpdateSecurityHubConfiguration in *AWS CLI Command Reference*.

`update-standards-control`

The following code example shows how to use `update-standards-control`.

AWS CLI

Example 1: To disable a control

The following `update-standards-control` example disables the PCI.AutoScaling.1 control.

```
aws securityhub update-standards-control \
    --standards-control-arn "arn:aws:securityhub:us-west-1:123456789012:control/pci-dss/v/3.2.1/PCI.AutoScaling.1" \
    --control-status "DISABLED" \
    --disabled-reason "Not applicable for my service"
```

This command produces no output.

Example 2: To enable a control

The following `update-standards-control` example enables the PCI.AutoScaling.1 control.

```
aws securityhub update-standards-control \
    --standards-control-arn "arn:aws:securityhub:us-west-1:123456789012:control/pci-dss/v/3.2.1/PCI.AutoScaling.1" \
    --control-status "ENABLED"
```

This command produces no output.

For more information, see Disabling and enabling individual controls in the *AWS Security Hub User Guide*.

- For API details, see UpdateStandardsControl in *AWS CLI Command Reference*.

Security Lake examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Security Lake.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-aws-log-source`

The following code example shows how to use `create-aws-log-source`.

AWS CLI

To add a natively supported Amazon Web Service as an Amazon Security Lake source

The following `create-aws-logsource` example adds VPC Flow Logs as a Security Lake source in the designated accounts and Regions.

```
aws securitylake create-aws-log-source \
    --sources '[{"regions": ["us-east-1"], "accounts": ["123456789012"],
 "sourceName": "SH_FINDINGS", "sourceVersion": "2.0"}]'
```

Output:

```
{
    "failed": [
        "123456789012"
    ]
}
```

For more information, see Adding an AWS service as a source in the *Amazon Security Lake User Guide*.

- For API details, see CreateAwsLogSource in *AWS CLI Command Reference*.

`create-custom-log-source`

The following code example shows how to use `create-custom-log-source`.

AWS CLI

To add a custom source as an Amazon Security Lake source

The following `create-custom-logsource` example adds a custom source as a Security Lake source in the designated log provider account and the designated Region.

```
aws securitylake create-custom-log-source \
    --source-name "VPC_FLOW" \
    --event-classes '["DNS_ACTIVITY", "NETWORK_ACTIVITY"]' \
    --configuration '{"crawlerConfiguration": {"roleArn": "arn:aws:glue:eu-
west-2:123456789012:crawler/E1WG1ZNPRXT0D4"},"providerIdentity": {"principal":
 "029189416600","externalId": "123456789012"}}' --region "us-east-1"
```

Output:

```
{
    "customLogSource": {
        "attributes": {
            "crawlerArn": "arn:aws:glue:eu-west-2:123456789012:crawler/
E1WG1ZNPRXT0D4",
            "databaseArn": "arn:aws:glue:eu-west-2:123456789012:database/
E1WG1ZNPRXT0D4",
            "tableArn": "arn:aws:glue:eu-west-2:123456789012:table/E1WG1ZNPRXT0D4"
        },
        "provider": {
            "location": "amzn-s3-demo-bucket--usw2-az1--x-s3",
            "roleArn": "arn:aws:iam::123456789012:role/AmazonSecurityLake-Provider-
testCustom2-eu-west-2"
        },
        "sourceName": "testCustom2"
        "sourceVersion": "2.0"
    }
}
```

For more information, see Adding a custom source in the *Amazon Security Lake User Guide*.

- For API details, see CreateCustomLogSource in *AWS CLI Command Reference*.

`create-data-lake-exception-subscription`

The following code example shows how to use `create-data-lake-exception-subscription`.

AWS CLI

To send notifications of Security Lake exceptions

The following `create-data-lake-exception-subscription` example sends notifications of Security Lake exceptions to the specified account through SMS delivery. The exception message remains for the specified time period.

```
aws securitylake create-data-lake-exception-subscription \
    --notification-endpoint "123456789012" \
    --exception-time-to-live 30 \
    --subscription-protocol "sms"
```

This command produces no output.

For more information, see Troubleshooting Amazon Security Lake in the *Amazon Security Lake User Guide*.

- For API details, see CreateDataLakeExceptionSubscription in *AWS CLI Command Reference*.

`create-data-lake-organization-configuration`

The following code example shows how to use `create-data-lake-organization-configuration`.

AWS CLI

To configure Security Lake in new organization accounts

The following `create-data-lake-organization-configuration` example enables Security Lake and the collection of the specified source events and logs in new organization accounts.

```
aws securitylake create-data-lake-organization-configuration \
    --auto-enable-new-account '[{"region":"us-east-1","sources":
[{"sourceName":"SH_FINDINGS","sourceVersion": "1.0"}]}]'
```

This command produces no output.

For more information, see Managing multiple accounts with AWS Organizations in the *Amazon Security Lake User Guide*.

- For API details, see CreateDataLakeOrganizationConfiguration in *AWS CLI Command Reference*.

`create-data-lake`

The following code example shows how to use `create-data-lake`.

AWS CLI

Example 1: To configure your data lake in multiple Regions

The following `create-data-lake` example enables Amazon Security Lake in multiple AWS Regions and configures your data lake.

```
aws securitylake create-data-lake \
    --configurations '[{"encryptionConfiguration":
 {"kmsKeyId":"S3_MANAGED_KEY"},"region":"us-east-1","lifecycleConfiguration":
 {"expiration":{"days":365},"transitions":
[{"days":60,"storageClass":"ONEZONE_IA"}]}}, {"encryptionConfiguration":
 {"kmsKeyId":"S3_MANAGED_KEY"},"region":"us-east-2","lifecycleConfiguration":
 {"expiration":{"days":365},"transitions":
[{"days":60,"storageClass":"ONEZONE_IA"}]}}]' \
    --meta-store-manager-role-arn "arn:aws:iam:us-east-1:123456789012:role/service-
role/AmazonSecurityLakeMetaStoreManager"
```

Output:

```
{
    "dataLakes": [
        {
            "createStatus": "COMPLETED",
            "dataLakeArn": "arn:aws:securitylake:us-east-1:522481757177:data-lake/
default",
            "encryptionConfiguration": {
                "kmsKeyId": "S3_MANAGED_KEY"
            },
            "lifecycleConfiguration": {
                "expiration": {
                    "days": 365
                },
                "transitions": [
                    {
```

```
                        "days": 60,
                        "storageClass": "ONEZONE_IA"
                    }
                ]
            },
            "region": "us-east-1",
            "replicationConfiguration": {
                "regions": [
                    "ap-northeast-3"
                ],
                "roleArn": "arn:aws:securitylake:ap-northeast-3:522481757177:data-
lake/default"
            },
            "s3BucketArn": "arn:aws:s3:::aws-security-data-lake-us-east-1-
gnevt6s8z7bzby8oi3uiaysbr8v2ml",
            "updateStatus": {
                "exception": {},
                "requestId": "f20a6450-d24a-4f87-a6be-1d4c075a59c2",
                "status": "INITIALIZED"
            }
        },
        {
            "createStatus": "COMPLETED",
            "dataLakeArn": "arn:aws:securitylake:us-east-2:522481757177:data-lake/
default",
            "encryptionConfiguration": {
                "kmsKeyId": "S3_MANAGED_KEY"
            },
            "lifecycleConfiguration": {
                "expiration": {
                    "days": 365
                },
                "transitions": [
                    {
                        "days": 60,
                        "storageClass": "ONEZONE_IA"
                    }
                ]
            },
            "region": "us-east-2",
            "replicationConfiguration": {
                "regions": [
                    "ap-northeast-3"
                ],
```

```
                "roleArn": "arn:aws:securitylake:ap-northeast-3:522481757177:data-
lake/default"
            },
            "s3BucketArn": "arn:aws:s3:::aws-security-data-lake-us-east-2-
cehuifzl5rwmhm6m62h7zhvtseogr9",
            "updateStatus": {
                "exception": {},
                "requestId": "f20a6450-d24a-4f87-a6be-1d4c075a59c2",
                "status": "INITIALIZED"
            }
        }
    ]
}
```

For more information, see Getting started with Amazon Security Lake in the *Amazon Security Lake User Guide*.

Example 2: To configure your data lake in a single Region

The following `create-data-lake` example enables Amazon Security Lake in a single AWS Region and configures your data lake.

```
aws securitylake create-data-lake \
    --configurations '[{"encryptionConfiguration":
 {"kmsKeyId":"1234abcd-12ab-34cd-56ef-1234567890ab"},"region":"us-
east-2","lifecycleConfiguration": {"expiration":{"days":500},"transitions":
[{"days":30,"storageClass":"GLACIER"}]}}]' \
    --meta-store-manager-role-arn "arn:aws:iam:us-east-1:123456789012:role/service-
role/AmazonSecurityLakeMetaStoreManager"
```

Output:

```
{
    "dataLakes": [
        {
            "createStatus": "COMPLETED",
            "dataLakeArn": "arn:aws:securitylake:us-east-2:522481757177:data-lake/
default",
            "encryptionConfiguration": {
                "kmsKeyId": "1234abcd-12ab-34cd-56ef-1234567890ab"
            },
            "lifecycleConfiguration": {
                "expiration": {
```

```
                    "days": 500
                },
                "transitions": [
                    {
                        "days": 30,
                        "storageClass": "GLACIER"
                    }
                ]
            },
            "region": "us-east-2",
            "replicationConfiguration": {
                "regions": [
                    "ap-northeast-3"
                ],
                "roleArn": "arn:aws:securitylake:ap-northeast-3:522481757177:data-
lake/default"
            },
            "s3BucketArn": "arn:aws:s3:::aws-security-data-lake-us-east-2-
cehuifzl5rwmhm6m62h7zhvtseogr9",
            "updateStatus": {
                "exception": {},
                "requestId": "77702a53-dcbf-493e-b8ef-518e362f3003",
                "status": "INITIALIZED"
            }
        }
    ]
}
```

For more information, see Getting started with Amazon Security Lake in the *Amazon Security Lake User Guide*.

- For API details, see CreateDataLake in *AWS CLI Command Reference*.

`create-subscriber-notification`

The following code example shows how to use `create-subscriber-notification`.

AWS CLI

To create a subscriber notification

The following `create-subscriber-notification` example shows how to specify subscriber notification to create a notification when new data is written to the data lake.

```
aws securitylake create-subscriber-notification \
    --subscriber-id "12345ab8-1a34-1c34-1bd4-12345ab9012" \
    --configuration '{"httpsNotificationConfiguration":
 {"targetRoleArn":"arn:aws:iam::XXX:role/service-role/RoleName",
 "endpoint":"https://account-management.$3.$2.securitylake.aws.dev/v1/datalake"}}'
```

Output:

```
{
    "subscriberEndpoint": [
        "https://account-management.$3.$2.securitylake.aws.dev/v1/datalake"
    ]
}
```

For more information, see Subscriber management in the *Amazon Security Lake User Guide*.

- For API details, see CreateSubscriberNotification in *AWS CLI Command Reference*.

`create-subscriber`

The following code example shows how to use `create-subscriber`.

AWS CLI

Example 1: To create a subscriber with data access

The following `create-subscriber` example creates a subscriber in Security Lake with access to data in the current AWS Region for the specified subscriber identity for an AWS source.

```
aws securitylake create-subscriber \
    --access-types "S3" \
    --sources '[{"awsLogSource": {"sourceName": "VPC_FLOW","sourceVersion":
 "2.0"}}]' \
    --subscriber-name 'opensearch-s3' \
    --subscriber-identity '{"principal": "029189416600","externalId":
 "123456789012"}'
```

Output:

```
{
```

```
    "subscriber": {
        "accessTypes": [
            "S3"
        ],
        "createdAt": "2024-07-17T19:08:26.787000+00:00",
        "roleArn": "arn:aws:iam::773172568199:role/AmazonSecurityLake-896f218b-
cfba-40be-a255-8b49a65d0407",
        "s3BucketArn": "arn:aws:s3:::aws-security-data-lake-us-east-1-
um632ufwpvxkyz0bc5hkb64atycnf3",
        "sources": [
            {
                "awsLogSource": {
                    "sourceName": "VPC_FLOW",
                    "sourceVersion": "2.0"
                }
            }
        ],
        "subscriberArn": "arn:aws:securitylake:us-
east-1:773172568199:subscriber/896f218b-cfba-40be-a255-8b49a65d0407",
        "subscriberId": "896f218b-cfba-40be-a255-8b49a65d0407",
        "subscriberIdentity": {
            "externalId": "123456789012",
            "principal": "029189416600"
        },
        "subscriberName": "opensearch-s3",
        "subscriberStatus": "ACTIVE",
        "updatedAt": "2024-07-17T19:08:27.133000+00:00"
    }
}
```

For more information, see Creating a subscriber with data access in the *Amazon Security Lake User Guide*.

Example 2: To create a subscriber with query access

The following `create-subscriber` example creates a subscriber in Security Lake with query access in the current AWS Region for the specified subscriber identity.

```
aws securitylake create-subscriber \
    --access-types "LAKEFORMATION" \
    --sources '[{"awsLogSource": {"sourceName": "VPC_FLOW","sourceVersion":
 "2.0"}}]' \
    --subscriber-name 'opensearch-s3' \
```

```
    --subscriber-identity '{"principal": "029189416600","externalId": 
"123456789012"}'
```

Output:

```
{
    "subscriber": {
        "accessTypes": [
            "LAKEFORMATION"
        ],
        "createdAt": "2024-07-18T01:05:55.853000+00:00",
        "resourceShareArn": "arn:aws:ram:us-east-1:123456789012:resource-
share/8c31da49-c224-4f1e-bb12-37ab756d6d8a",
        "resourceShareName": "LakeFormation-V2-NAMENAMENA-123456789012",
        "sources": [
            {
                "awsLogSource": {
                    "sourceName": "VPC_FLOW",
                    "sourceVersion": "2.0"
                }
            }
        ],
        "subscriberArn": "arn:aws:securitylake:us-east-1:123456789012:subscriber/
e762aabb-ce3d-4585-beab-63474597845d",
        "subscriberId": "e762aabb-ce3d-4585-beab-63474597845d",
        "subscriberIdentity": {
            "externalId": "123456789012",
            "principal": "029189416600"
        },
        "subscriberName": "opensearch-s3",
        "subscriberStatus": "ACTIVE",
        "updatedAt": "2024-07-18T01:05:58.393000+00:00"
    }
}
```

For more information, see Creating a subscriber with query access in the *Amazon Security Lake User Guide*.

- For API details, see CreateSubscriber in *AWS CLI Command Reference*.

delete-aws-log-source

The following code example shows how to use `delete-aws-log-source`.

AWS CLI

To remove a natively-supported AWS service.

The following `delete-aws-logsource` example deletes VPC Flow Logs as a Security Lake source in the designated accounts and Regions.

```
aws securitylake delete-aws-log-source \
    --sources '[{"regions": ["us-east-1"], "accounts": ["123456789012"],
 "sourceName": "SH_FINDINGS", "sourceVersion": "2.0"}]'
```

Output:

```
{
    "failed": [
        "123456789012"
    ]
}
```

For more information, see Removing an AWS service as a source in the *Amazon Security Lake User Guide*.

- For API details, see DeleteAwsLogSource in *AWS CLI Command Reference*.

`delete-custom-log-source`

The following code example shows how to use `delete-custom-log-source`.

AWS CLI

To remove a custom source.

The following `delete-custom-logsource` example deletes a custom source in the designated log provider account in the designated Region.

```
aws securitylake delete-custom-log-source \
    --source-name "CustomSourceName"
```

This command produces no output.

For more information, see Deleting a custom source in the *Amazon Security Lake User Guide*.

- For API details, see DeleteCustomLogSource in *AWS CLI Command Reference*.

`delete-data-lake-organization-configuration`

The following code example shows how to use `delete-data-lake-organization-configuration`.

AWS CLI

To stop automatic source collection in member accounts

The following `delete-data-lake-organization-configuration` example stops the automatic collection of AWS Security Hub findings from new member accounts that join the organization. Only the delegated Security Lake administrator can run this command. It prevents new member accounts from automatically contributing data to the data lake.

```
aws securitylake delete-data-lake-organization-configuration \
    --auto-enable-new-account '[{"region":"us-east-1","sources":
[{"sourceName":"SH_FINDINGS"}]}]'
```

This command produces no output.

For more information, see Managing multiple accounts with AWS Organizations in the *Amazon Security Lake User Guide*.

- For API details, see DeleteDataLakeOrganizationConfiguration in *AWS CLI Command Reference*.

`delete-data-lake`

The following code example shows how to use `delete-data-lake`.

AWS CLI

To disable your data lake

The following `delete-data-lake` example disables your data lake in the specified AWS Regions. In the specified Regions, sources no longer contribute data to the data lake. For a Security Lake deployment utilizing AWS Organizations, only the delegated Security Lake administrator for the organization can disable Security Lake for accounts in the organization.

```
aws securitylake delete-data-lake \
    --regions "ap-northeast-1" "eu-central-1"
```

This command produces no output.

For more information, see Disabling Amazon Security Lake in the *Amazon Security Lake User Guide*.

- For API details, see DeleteDataLake in *AWS CLI Command Reference*.

`delete-subscriber-notification`

The following code example shows how to use `delete-subscriber-notification`.

AWS CLI

To delete a subscriber notification

The following `delete-subscriber-notification` example shows how to delete the subscriber notification for specific Security Lake subscriber.

```
aws securitylake delete-subscriber-notification \
    --subscriber-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Subscriber management in the *Amazon Security Lake User Guide*.

- For API details, see DeleteSubscriberNotification in *AWS CLI Command Reference*.

`delete-subscriber`

The following code example shows how to use `delete-subscriber`.

AWS CLI

To delete a subscriber

The following `delete-subscriber` example shows how to remove a subscriber if you no longer want a subscriber to consume data from Security Lake.

```
aws securitylake delete-subscriber \
```

```
    --subscriber-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Subscriber management in the *Amazon Security Lake User Guide*.

- For API details, see DeleteSubscriber in *AWS CLI Command Reference*.

get-data-lake-exception-subscription

The following code example shows how to use `get-data-lake-exception-subscription`.

AWS CLI

To get details about an exception subscription

The following `get-data-lake-exception-subscription` example provides details about a Security Lake exception subscription. In this example, the user of the specified AWS account is notified of errors through SMS delivery. The exception message remains in the account for the specified time period. An exception subscription notifies a Security Lake user about an error through the requester's preferred protocol.

```
aws securitylake get-data-lake-exception-subscription
```

Output:

```
{
    "exceptionTimeToLive": 30,
    "notificationEndpoint": "123456789012",
    "subscriptionProtocol": "sms"
}
```

For more information, see Troubleshooting data lake status in the *Amazon Security Lake User Guide*.

- For API details, see GetDataLakeExceptionSubscription in *AWS CLI Command Reference*.

get-data-lake-organization-configuration

The following code example shows how to use `get-data-lake-organization-configuration`.

AWS CLI

To get details about the configuration for new organization accounts

The following `get-data-lake-organization-configuration` example retrieves details about the source logs that new organization accounts will send after onboarding to Amazon Security Lake.

```
aws securitylake get-data-lake-organization-configuration
```

Output:

```
{
    "autoEnableNewAccount": [
        {
            "region": "us-east-1",
            "sources": [
                {
                    "sourceName": "VPC_FLOW",
                    "sourceVersion": "1.0"
                },
                {
                    "sourceName": "ROUTE53",
                    "sourceVersion": "1.0"
                },
                {
                    "sourceName": "SH_FINDINGS",
                    "sourceVersion": "1.0"
                }
            ]
        }
    ]
}
```

For more information, see Managing multiple accounts with AWS Organizations in the *Amazon Security Lake User Guide*.

- For API details, see GetDataLakeOrganizationConfiguration in *AWS CLI Command Reference*.

`get-data-lake-sources`

The following code example shows how to use `get-data-lake-sources`.

AWS CLI

To get the status of log collection

The following `get-data-lake-sources` example gets a snapshot of log collection for the specified account in the current AWS Region. The account has Amazon Security Lake enabled.

```
aws securitylake get-data-lake-sources \
    --accounts "123456789012"
```

Output:

```
{
    "dataLakeSources": [
        {
            "account": "123456789012",
            "sourceName": "SH_FINDINGS",
            "sourceStatuses": [
                {
                    "resource": "vpc-1234567890abcdef0",
                    "status": "COLLECTING"
                }
            ]
        },
        {
            "account": "123456789012",
            "sourceName": "VPC_FLOW",
            "sourceStatuses": [
                {
                    "resource": "vpc-1234567890abcdef0",
                    "status": "NOT_COLLECTING"
                }
            ]
        },
        {
            "account": "123456789012",
            "sourceName": "LAMBDA_EXECUTION",
            "sourceStatuses": [
                {
                    "resource": "vpc-1234567890abcdef0",
                    "status": "COLLECTING"
                }
            ]
```

```
        },
        {
            "account": "123456789012",
            "sourceName": "ROUTE53",
            "sourceStatuses": [
                {
                    "resource": "vpc-1234567890abcdef0",
                    "status": "COLLECTING"
                }
            ]
        },
        {
            "account": "123456789012",
            "sourceName": "CLOUD_TRAIL_MGMT",
            "sourceStatuses": [
                {
                    "resource": "vpc-1234567890abcdef0",
                    "status": "COLLECTING"
                }
            ]
        }
    ],
    "dataLakeArn": null
}
```

For more information, see Collecting data from AWS services in the *Amazon Security Lake User Guide*.

- For API details, see GetDataLakeSources in *AWS CLI Command Reference*.

`get-subscriber`

The following code example shows how to use `get-subscriber`.

AWS CLI

To retrieve the subscription information

The following `get-subscriber` example retrieves the subscription information for the specified Security Lake subscriber.

```
aws securitylake get-subscriber \
    --subscriber-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "subscriber": {
        "accessTypes": [
            "LAKEFORMATION"
        ],
        "createdAt": "2024-04-19T15:19:44.421803+00:00",
        "resourceShareArn": "arn:aws:ram:eu-west-2:123456789012:resource-share/

```

For more information, see Subscriber management in the *Amazon Security Lake User Guide*.

- For API details, see GetSubscriber in *AWS CLI Command Reference*.

`list-data-lake-exceptions`

The following code example shows how to use `list-data-lake-exceptions`.

AWS CLI

To list the issues affecting your data lake

The following `list-data-lake-exceptions` example lists the issues that are affecting your data lake in the last 14 days in the specified AWS Regions.

```
aws securitylake list-data-lake-exceptions \
    --regions "us-east-1" "eu-west-3"
```

Output:

```
{
    "exceptions": [
        {
            "exception": "The account does not have the required role permissions.
 Update your role permissions to use the new data source version.",
            "region": "us-east-1",
            "timestamp": "2024-02-29T12:24:15.641725+00:00"
        },
        {
            "exception": "The account does not have the required role permissions.
 Update your role permissions to use the new data source version.",
            "region": "eu-west-3",
            "timestamp": "2024-02-29T12:24:15.641725+00:00"
        }
    ]
}
```

For more information, see Troubleshooting Amazon Security Lake in the *Amazon Security Lake User Guide*.

- For API details, see ListDataLakeExceptions in *AWS CLI Command Reference*.

list-data-lakes

The following code example shows how to use `list-data-lakes`.

AWS CLI

To list the Security Lake configuration object

The following `list-data-lakes` example lists the Amazon Security Lake configuration object for the specified AWS Region. You can use this command to determine whether Security Lake is enabled in a specified Region or Regions.

```
aws securitylake list-data-lakes \
    --regions "us-east-1"
```

Output:

```
{
    "dataLakes": [
        {
            "createStatus": "COMPLETED",
            "dataLakeArn": "arn:aws:securitylake:us-east-1:123456789012:data-lake/
default",
            "encryptionConfiguration": {
                "kmsKeyId": "S3_MANAGED_KEY"
            },
            "lifecycleConfiguration": {
                "expiration": {
                    "days": 365
                },
                "transitions": [
                    {
                        "days": 60,
                        "storageClass": "ONEZONE_IA"
                    }
                ]
            },
            "region": "us-east-1",
```

```
            "replicationConfiguration": {
                "regions": [
                    "ap-northeast-3"
                ],
                "roleArn": "arn:aws:securitylake:ap-northeast-3:123456789012:data-
lake/default"
            },
            "s3BucketArn": "arn:aws:s3:::aws-security-data-lake-us-
east-1-1234567890abcdef0",
            "updateStatus": {
                "exception": {
                    "code": "software.amazon.awssdk.services.s3.model.S3Exception",
                    "reason": ""
                },
                "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
                "status": "FAILED"
            }
        }
    ]
}
```

For more information, see Checking Region status in the *Amazon Security Lake User Guide*.

- For API details, see ListDataLakes in *AWS CLI Command Reference*.

`list-log-sources`

The following code example shows how to use `list-log-sources`.

AWS CLI

To retrieve the Amazon Security Lake log sources

The following `list-log-sources` example lists the Amazon Security Lake log sources in a specified account.

```
aws securitylake list-log-sources \
    --accounts "123456789012"
```

Output:

```
{
    "account": "123456789012",
```

```
    "region": "xy-region-1",
    "sources": [
        {
               "awsLogSource": {
                "sourceName": "VPC_FLOW",
                "sourceVersion": "2.0"
            }
        },
        {
            "awsLogSource": {
                "sourceName": "SH_FINDINGS",
                "sourceVersion": "2.0"
            }
        }
    ]
}
```

For more information, see Source management in the *Amazon Security Lake User Guide*.

- For API details, see ListLogSources in *AWS CLI Command Reference*.

`list-subscribers`

The following code example shows how to use `list-subscribers`.

AWS CLI

To retrieve the Amazon Security Lake subscribers

The following `list-subscribers` example lists all the Amazon Security Lake subscribers in a specific account.

```
aws securitylake list-subscribers
```

Output:

```
{
    "subscribers": [
        {
            "accessTypes": [
                "S3"
            ],
            "createdAt": "2024-06-04T15:02:28.921000+00:00",
```

```
            "roleArn": "arn:aws:iam::123456789012:role/AmazonSecurityLake-
E1WG1ZNPRXT0D4",
            "s3BucketArn": "amzn-s3-demo-bucket--usw2-az1--x-s3",
            "sources": [
                {
                    "awsLogSource": {
                        "sourceName": "CLOUD_TRAIL_MGMT",
                        "sourceVersion": "2.0"
                    }
                },
                {
                    "awsLogSource": {
                        "sourceName": "LAMBDA_EXECUTION",
                        "sourceVersion": "1.0"
                    }
                },
                {
                    "customLogSource": {
                        "attributes": {
                            "crawlerArn": "arn:aws:glue:eu-

Queue",
            "subscriberId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "subscriberIdentity": {
                "externalId": "ext123456789012",
                "principal": "123456789012"
```

```
            },
            "subscriberName": "Test",
            "subscriberStatus": "ACTIVE",
            "updatedAt": "2024-06-04T15:02:35.617000+00:00"
        }
    ]
}
```

For more information, see [Subscriber management](#) in the *Amazon Security Lake User Guide*.

- For API details, see [ListSubscribers](#) in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for an existing resource

The following `list-tags-for-resource` example lists tags for the specified Amazon Security Lake subscriber. In this example, the Owner tag key doesn't have an associated tag value. You can use this operation to list tags for other existing Security Lake resources as well.

```
aws securitylake list-tags-for-resource \
    --resource-arn "arn:aws:securitylake:us-
east-1:123456789012:subscriber/1234abcd-12ab-34cd-56ef-1234567890ab"
```

Output:

```
{
    "tags": [
        {
            "key": "Environment",
            "value": "Cloud"
        },
        {
            "key": "CostCenter",
            "value": "12345"
        },
        {
```

```
                "key": "Owner",
                "value": ""
            }
        ]
}
```

For more information, see Tagging Amazon Security Lake resources in the *Amazon Security Lake User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`register-data-lake-delegated-administrator`

The following code example shows how to use `register-data-lake-delegated-administrator`.

AWS CLI

To designate the delegated administratore

The following `register-data-lake-delegated-administrator` example designates the specified AWS account as the delegated Amazon Security Lake administrator.

```
aws securitylake register-data-lake-delegated-administrator \
    --account-id 123456789012
```

This command produces no output.

For more information, see Managing multiple accounts with AWS Organizations in the *Amazon Security Lake User Guide*.

- For API details, see RegisterDataLakeDelegatedAdministrator in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add tags to an existing resource

The following `tag-resource` example add tags to an existing subscriber resource. To create a new resource and add one or more tags to it, don't use this operation. Instead, use the appropriate Create operation for the the type of resource that you want to create.

```
aws securitylake tag-resource \
    --resource-arn "arn:aws:securitylake:us-
east-1:123456789012:subscriber/1234abcd-12ab-34cd-56ef-1234567890ab" \
    --tags key=Environment,value=Cloud
```

This command produces no output.

For more information, see Tagging Amazon Security Lake resources in the *Amazon Security Lake User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from an existing resource

The following `untag-resource` example removes the specified tags from an existing subscriber resource.

```
aws securitylake untag-resource \
    --resource-arn "arn:aws:securitylake:us-
east-1:123456789012:subscriber/1234abcd-12ab-34cd-56ef-1234567890ab" \
    --tags Environment Owner
```

This command produces no output.

For more information, see Tagging Amazon Security Lake resources in the *Amazon Security Lake User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-data-lake-exception-subscription`

The following code example shows how to use `update-data-lake-exception-subscription`.

AWS CLI

To update notification subscription for Security Lake exceptions

The following `update-data-lake-exception-subscription` example updates the notification subscription that notifies users of Security Lake exceptions.

```
aws securitylake update-data-lake-exception-subscription \
    --notification-endpoint "123456789012" \
    --exception-time-to-live 30 \
    --subscription-protocol "email"
```

This command produces no output.

For more information, see Troubleshooting Amazon Security Lake in the *Amazon Security Lake User Guide*.

- For API details, see UpdateDataLakeExceptionSubscription in *AWS CLI Command Reference*.

`update-data-lake`

The following code example shows how to use `update-data-lake`.

AWS CLI

Example 1: To update your data lake settings

The following `update-data-lake` example updates the settings of your Amazon Security Lake data lake. You can use this operation to specify data encryption, storage, and rollup Region settings.

```
aws securitylake update-data-lake \
    --configurations '[{"encryptionConfiguration":
 {"kmsKeyId":"S3_MANAGED_KEY"},"region":"us-east-1","lifecycleConfiguration":
 {"expiration":{"days":365},"transitions":
[{"days":60,"storageClass":"ONEZONE_IA"}]}}, {"encryptionConfiguration":
 {"kmsKeyId":"S3_MANAGED_KEY"},"region":"us-east-2","lifecycleConfiguration":
 {"expiration":{"days":365},"transitions":
[{"days":60,"storageClass":"ONEZONE_IA"}]}}]' \
    --meta-store-manager-role-arn "arn:aws:iam:us-east-1:123456789012:role/service-
role/AmazonSecurityLakeMetaStoreManager"
```

Output:

```
{
    "dataLakes": [
        {
            "createStatus": "COMPLETED",
            "dataLakeArn": "arn:aws:securitylake:us-east-1:522481757177:data-lake/
default",
            "encryptionConfiguration": {
                "kmsKeyId": "S3_MANAGED_KEY"
            },
            "lifecycleConfiguration": {
                "expiration": {
                    "days": 365
                },
                "transitions": [
                    {
                        "days": 60,
                        "storageClass": "ONEZONE_IA"
                    }
                ]
            },
            "region": "us-east-1",
            "replicationConfiguration": {
                "regions": [
                    "ap-northeast-3"
                ],
                "roleArn": "arn:aws:securitylake:ap-northeast-3:522481757177:data-
lake/default"
            },

                    }
                ]
            },
            "region": "us-east-2",
            "replicationConfiguration": {
                "regions": [
                    "ap-northeast-3"
                ],
                "roleArn": "arn:aws:securitylake:ap-northeast-3:522481757177:data-
lake/default"
            },
            "s3BucketArn": "arn:aws:s3:::aws-security-data-lake-us-east-2-
cehuifzl5rwmhm6m62h7zhvtseogr9",
            "updateStatus": {
                "exception": {},
                "requestId": "f20a6450-d24a-4f87-a6be-1d4c075a59c2",
                "status": "INITIALIZED"
            }
        }
    ]
}
```

For more information, see Getting started with Amazon Security Lake in the *Amazon Security Lake User Guide*.

Example 2: To configure your data lake in a single Region

The following `create-data-lake` example enables Amazon Security Lake in a single AWS Region and configures your data lake.

```
aws securitylake create-data-lake \
    --configurations '[{"encryptionConfiguration":
 {"kmsKeyId":"1234abcd-12ab-34cd-56ef-1234567890ab"},"region":"us-
```

```
east-2","lifecycleConfiguration": {"expiration":{"days":500},"transitions":
[{"days":30,"storageClass":"GLACIER"}]}}]' \
    --meta-store-manager-role-arn "arn:aws:iam:us-east-1:123456789012:role/service-
role/AmazonSecurityLakeMetaStoreManager"
```

Output:

```
{
    "dataLakes": [
        {
            "createStatus": "COMPLETED",
            "dataLakeArn": "arn:aws:securitylake:us-east-2:522481757177:data-lake/
default",
            "encryptionConfiguration": {
                "kmsKeyId": "1234abcd-12ab-34cd-56ef-1234567890ab"
            },
            "lifecycleConfiguration": {
                "expiration": {
                    "days": 500
                },
                "transitions": [
                    {
                        "days": 30,
                        "storageClass": "GLACIER"
                    }
                ]
            },
            "region": "us-east-2",
            "replicationConfiguration": {
                "regions": [
                    "ap-northeast-3"
                ],
                "roleArn": "arn:aws:securitylake:ap-northeast-3:522481757177:data-
lake/default"
            },
            "s3BucketArn": "arn:aws:s3:::aws-security-data-lake-us-east-2-
cehuifzl5rwmhm6m62h7zhvtseogr9",
            "updateStatus": {
                "exception": {},
                "requestId": "77702a53-dcbf-493e-b8ef-518e362f3003",
                "status": "INITIALIZED"
            }
        }
```

```
    ]
}
```

For more information, see [Getting started with Amazon Security Lake](#) in the *Amazon Security Lake User Guide*.

- For API details, see [UpdateDataLake](#) in *AWS CLI Command Reference*.

`update-subscriber-notification`

The following code example shows how to use `update-subscriber-notification`.

AWS CLI

To update a subscriber notification

The following `update-subscriber-notification` example shows how you can update the notification method for a subscriber.

```
aws securitylake update-subscriber-notification \
    --subscriber-id "12345ab8-1a34-1c34-1bd4-12345ab9012" \
    --configuration '{"httpsNotificationConfiguration":
 {"targetRoleArn":"arn:aws:iam::XXX:role/service-role/RoleName",
 "endpoint":"https://account-management.$3.$2.securitylake.aws.dev/v1/datalake"}}'
```

Output:

```
{
    "subscriberEndpoint": [
        "https://account-management.$3.$2.securitylake.aws.dev/v1/datalake"
    ]
}
```

For more information, see [Subscriber management](#) in the *Amazon Security Lake User Guide*.

- For API details, see [UpdateSubscriberNotification](#) in *AWS CLI Command Reference*.

`update-subscriber`

The following code example shows how to use `update-subscriber`.

AWS CLI

To update an Amazon Security Lake subscriber.

The following `update-subscriber` example updates the security lake data access sources for a specific Security Lake subscriber.

```
aws securitylake update-subscriber \
    --subscriber-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "subscriber": {
        "accessTypes": [
            "LAKEFORMATION"
        ],
        "createdAt": "2024-04-19T15:19:44.421803+00:00",

}
```

For more information, see Subscriber management in the *Amazon Security Lake User Guide*.

- For API details, see UpdateSubscriber in *AWS CLI Command Reference*.

AWS Serverless Application Repository examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Serverless Application Repository.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`put-application-policy`

The following code example shows how to use `put-application-policy`.

AWS CLI

Example 1: To share an application publicly

The following `put-application-policy` shares an application publicly, so anyone can find and deploy your application in the AWS Serverless Application Repository.

```
aws serverlessrepo put-application-policy \
    --application-id arn:aws:serverlessrepo:us-east-1:123456789012:applications/my-test-application \
    --statements Principals='*',Actions=Deploy
```

Output:

```
{
    "Statements": [
        {
            "Actions": [
                "Deploy"
            ],
            "Principals": [
                ""
```

```
            ],
            "StatementId": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE"
        }
    ]
}
```

Example 2: To share an application privately

The following `put-application-policy` shares an application privately, so only specific AWS accounts can find and deploy your application in the AWS Serverless Application Repository.

```
aws serverlessrepo put-application-policy \
    --application-id arn:aws:serverlessrepo:us-east-1:123456789012:applications/my-
test-application \
    --statements Principals=111111111111,222222222222,Actions=Deploy
```

Output:

```
{
    "Statements": [
        {
            "Actions": [
                "Deploy"
            ],
            "Principals": [
                "111111111111",
                "222222222222"
            ],
            "StatementId": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE"
        }
    ]
}
```

For more information, see Sharing an Application Through the Console in the *AWS Serverless Application Repository Developer Guide*

- For API details, see PutApplicationPolicy in *AWS CLI Command Reference*.

Service Catalog examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Service Catalog.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`accept-portfolio-share`

The following code example shows how to use `accept-portfolio-share`.

AWS CLI

To accept a portfolio share

The following `accept-portfolio-share` example accepts an offer, made by another user, to share the specified portfolio.

```
aws servicecatalog accept-portfolio-share \
    --portfolio-id port-2s6wuabcdefghijk
```

This command produces no output.

- For API details, see AcceptPortfolioShare in *AWS CLI Command Reference*.

`associate-principal-with-portfolio`

The following code example shows how to use `associate-principal-with-portfolio`.

AWS CLI

To associate a principal with a portfolio

The following `associate-principal-with-portfolio` example associates a user with the specified portfolio.

```
aws servicecatalog associate-principal-with-portfolio \
    --portfolio-id port-2s6abcdefwdh4 \
    --principal-arn arn:aws:iam::123456789012:user/usertest \
    --principal-type IAM
```

This command produces no output.

- For API details, see AssociatePrincipalWithPortfolio in *AWS CLI Command Reference*.

`associate-product-with-portfolio`

The following code example shows how to use `associate-product-with-portfolio`.

AWS CLI

To associate a product with a portfolio

The following `associate-product-with-portfolio` example associates the given product with the specified portfolio.

```
aws servicecatalog associate-product-with-portfolio
     --product-id prod-3p5abcdef3oyk
     --portfolio-id port-2s6abcdef5wdh4
```

This command produces no output.

- For API details, see AssociateProductWithPortfolio in *AWS CLI Command Reference*.

`associate-tag-option-with-resource`

The following code example shows how to use `associate-tag-option-with-resource`.

AWS CLI

To associate a TagOption with a resource

The following `associate-tag-option-with-resource` example associates the specified TagOption with the specified resource.

```
aws servicecatalog associate-tag-option-with-resource \
    --resource-id port-2s6abcdq5wdh4 \
```

```
    --tag-option-id tag-p3abc2pkpz5qc
```

This command produces no output.

- For API details, see AssociateTagOptionWithResource in *AWS CLI Command Reference*.

`copy-product`

The following code example shows how to use `copy-product`.

AWS CLI

To copy a product

The following `copy-product` example makes a copy of the specified product, using a JSON file to pass parameters.

```
aws servicecatalog copy-product --cli-input-json file://copy-product-input.json
```

Contents of `copy-product-input.json`:

```
{
    "SourceProductArn": "arn:aws:catalog:us-west-2:123456789012:product/prod-
tcabcd3syn2xy",
    "TargetProductName": "copy-of-myproduct",
    "CopyOptions": [
        "CopyTags"
    ]
}
```

Output:

```
{
    "CopyProductToken": "copyproduct-abc5defgjkdji"
}
```

- For API details, see CopyProduct in *AWS CLI Command Reference*.

`create-portfolio-share`

The following code example shows how to use `create-portfolio-share`.

AWS CLI

To share a portfolio with an account

The following `create-portfolio-share` example shares the specified portfolio with the specified account.

```
aws servicecatalog create-portfolio-share \
    --portfolio-id port-2s6abcdef5wdh4 \
    --account-id 794123456789
```

This command produces no output.

- For API details, see CreatePortfolioShare in *AWS CLI Command Reference*.

`create-portfolio`

The following code example shows how to use `create-portfolio`.

AWS CLI

To create a portfolio

The following `create-portfolio` example creates a portfolio.

```
aws servicecatalog create-portfolio  \
    --provider-name my-provider \
    --display-name my-portfolio
```

Output:

```
{
    "PortfolioDetail": {
        "ProviderName": "my-provider",
        "DisplayName": "my-portfolio",
        "CreatedTime": 1571337221.555,
        "ARN": "arn:aws:catalog:us-east-2:123456789012:portfolio/
port-2s6xmplq5wdh4",
        "Id": "port-2s6xmplq5wdh4"
    }
}
```

- For API details, see CreatePortfolio in *AWS CLI Command Reference*.

`create-product`

The following code example shows how to use `create-product`.

AWS CLI

To create a product

The following `create-product` example creates a product, using a JSON file to pass parameters.

```
aws servicecatalog create-product \
    --cli-input-json file://create-product-input.json
```

Contents of `create-product-input.json`:

```
{
    "AcceptLanguage": "en",
    "Name": "test-product",
    "Owner": "test-owner",
    "Description": "test-description",

}
```

- For API details, see CreateProduct in *AWS CLI Command Reference*.

`create-provisioning-artifact`

The following code example shows how to use `create-provisioning-artifact`.

AWS CLI

To create a provisioning artifact

The following `create-provisioning-artifact` example creates a provisioning artifact, using a JSON file to pass parameters.

```
aws servicecatalog create-provisioning-artifact \
   --cli-input-json file://create-provisioning-artifact-input.json
```

Contents of `create-provisioning-artifact-input.json`:

```
{
    "ProductId": "prod-nfi2abcdefghi",
    "Parameters": {
        "Name": "test-provisioning-artifact",
        "Description": "test description",
        "Info": {
            "LoadTemplateFromURL": "https://s3-us-west-1.amazonaws.com/
cloudformation-templates-us-west-1/my-cfn-template.template"
        },
        "Type": "CLOUD_FORMATION_TEMPLATE"
    }
}
```

Output:

```
{
    "Info": {
        "TemplateUrl": "https://s3-us-west-1.amazonaws.com/cloudformation-templates-
us-west-1/my-cfn-template.template"
    },
    "Status": "CREATING",
    "ProvisioningArtifactDetail": {
        "Id": "pa-bb4abcdefwnaio",
        "Name": "test-provisioning-artifact",
        "Description": "test description",
        "Active": true,
        "Type": "CLOUD_FORMATION_TEMPLATE",
        "CreatedTime": 1576022545.0
    }
}
```

- For API details, see CreateProvisioningArtifact in *AWS CLI Command Reference*.

`create-tag-option`

The following code example shows how to use `create-tag-option`.

AWS CLI

To create a TagOption

The following `create-tag-option` example creates a TagOption.

```
aws servicecatalog create-tag-option
    --key 1234
    --value name
```

Output:

```
{
    "TagOptionDetail": {
    "Id": "tag-iabcdn4fzjjms",
    "Value": "name",
    "Active": true,
    "Key": "1234"
    }
}
```

- For API details, see CreateTagOption in *AWS CLI Command Reference*.

`delete-portfolio-share`

The following code example shows how to use `delete-portfolio-share`.

AWS CLI

To stop sharing a portfolio with an account

The following `delete-portfolio-share` example stops sharing the portfolio with the specified account.

```
aws servicecatalog delete-portfolio-share \
    --portfolio-id port-2s6abcdq5wdh4 \
```

```
    --account-id 123456789012
```

This command produces no output.

- For API details, see DeletePortfolioShare in *AWS CLI Command Reference*.

`delete-portfolio`

The following code example shows how to use `delete-portfolio`.

AWS CLI

To delete a portfolio

The following `delete-portfolio` example deletes the specified portfolio.

```
aws servicecatalog delete-portfolio \
    --id port-abcdlx4gox4do
```

This command produces no output.

- For API details, see DeletePortfolio in *AWS CLI Command Reference*.

`delete-product`

The following code example shows how to use `delete-product`.

AWS CLI

To delete a product

The following `delete-product` example deletes the specified product.

```
aws servicecatalog delete-product \
    --id prod-abcdcek6yhbxi
```

This command produces no output.

- For API details, see DeleteProduct in *AWS CLI Command Reference*.

`delete-provisioning-artifact`

The following code example shows how to use `delete-provisioning-artifact`.

AWS CLI

To delete a provisioning artifact

The following `delete-provisioning-artifact` example deletes the specified provisioning artifact.

```
aws servicecatalog delete-provisioning-artifact \
    --product-id prod-abc2uebuplcpw \
    --provisioning-artifact-id pa-pqabcddii7ouc
```

This command produces no output.

- For API details, see DeleteProvisioningArtifact in *AWS CLI Command Reference*.

`delete-tag-option`

The following code example shows how to use `delete-tag-option`.

AWS CLI

To delete a TagOption

The following `delete-tag-option` example deletes the specified TagOption.

```
aws servicecatalog delete-tag-option \
    --id tag-iabcdn4fzjjms
```

This command produces no output.

- For API details, see DeleteTagOption in *AWS CLI Command Reference*.

`describe-copy-product-status`

The following code example shows how to use `describe-copy-product-status`.

AWS CLI

To describe the status of the copy product operation

The following `describe-copy-product-status` example displays the current status of the specified asynchronous copy product operation.

```
aws servicecatalog describe-copy-product-status \
    --copy-product-token copyproduct-znn5tf5abcd3w
```

Output:

```
{
    "CopyProductStatus": "SUCCEEDED",
    "TargetProductId": "prod-os6hog7abcdt2"
}
```

- For API details, see DescribeCopyProductStatus in *AWS CLI Command Reference*.

`describe-portfolio`

The following code example shows how to use `describe-portfolio`.

AWS CLI

To describe a portfolio

The following `describe-portfolio` example displays details for the specified portfolio.

```
aws servicecatalog describe-portfolio \
    --id port-2s6abcdq5wdh4
```

Output:

```
{
    "TagOptions": [],
    "PortfolioDetail": {
        "ARN": "arn:aws:catalog:us-west-2:687558541234:portfolio/
port-2s6abcdq5wdh4",
        "Id": "port-2s6wuzyq5wdh4",
        "CreatedTime": 1571337221.555,
        "DisplayName": "my-portfolio",
        "ProviderName": "my-provider"
    },
    "Tags": []
}
```

- For API details, see DescribePortfolio in *AWS CLI Command Reference*.

`describe-product-as-admin`

The following code example shows how to use `describe-product-as-admin`.

AWS CLI

To describe a product as an administrator

The following `describe-product-as-admin` example displays details for the specified product using administrator privileges.

```
aws servicecatalog describe-product-as-admin \
    --id prod-abcdcek6yhbxi
```

Output:

```
{
    "TagOptions": [],
    "ProductViewDetail": {
        "ProductARN": "arn:aws:catalog:us-west-2:687558542028:product/prod-
abcdcek6yhbxi",
        "ProductViewSummary": {
            "SupportEmail": "test@amazon.com",
            "Type": "CLOUD_FORMATION_TEMPLATE",
            "Distributor": "test-distributor",
            "ShortDescription": "test-description",
            "Owner": "test-owner",
            "Id": "prodview-wi3l2j4abc6vc",
            "SupportDescription": "test-support",
            "ProductId": "prod-abcdcek6yhbxi",
            "HasDefaultPath": false,
            "Name": "test-product3",
            "SupportUrl": "https://aws.amazon.com"
        },
        "CreatedTime": 1577136715.0,
        "Status": "CREATED"
    },
    "ProvisioningArtifactSummaries": [
        {
            "CreatedTime": 1577136715.0,
```

```
                "Description": "test-version-description",
                "ProvisioningArtifactMetadata": {
                    "SourceProvisioningArtifactId": "pa-abcdxkkiv5fcm"
                },
                "Name": "test-version-name-3",
                "Id": "pa-abcdxkkiv5fcm"
            }
        ],
        "Tags": [
            {
                "Value": "iad",
                "Key": "region"
            }
        ]
}
```

- For API details, see DescribeProductAsAdmin in *AWS CLI Command Reference*.

`describe-provisioned-product`

The following code example shows how to use `describe-provisioned-product`.

AWS CLI

To describe a provisioned product

The following `describe-provisioned-product` example displays details for the specified provisioned product.

```
aws servicecatalog describe-provisioned-product \
    --id pp-dpom27bm4abcd
```

Output:

```
{
    "ProvisionedProductDetail": {
        "Status": "ERROR",
        "CreatedTime": 1577222793.358,

        "Type": "CFN_STACK",
        "Name": "mytestppname3"
    },
    "CloudWatchDashboards": []
}
```

- For API details, see DescribeProvisionedProduct in *AWS CLI Command Reference*.

`describe-provisioning-artifact`

The following code example shows how to use `describe-provisioning-artifact`.

AWS CLI

To describe a provisioning artifact

The following `describe-provisioning-artifact` example displays details for the specified provisioning artifact.

```
aws servicecatalog describe-provisioning-artifact \
    --provisioning-artifact-id pa-pcz347abcdcfm \
    --product-id prod-abcdfz3syn2rg
```

Output:

```
{
    "Info": {
        "TemplateUrl": "https://awsdocs.s3.amazonaws.com/servicecatalog/
myexampledevelopment-environment.template"
    },
    "ProvisioningArtifactDetail": {
        "Id": "pa-pcz347abcdcfm",
        "Active": true,
        "Type": "CLOUD_FORMATION_TEMPLATE",
        "Description": "updated description",
        "CreatedTime": 1562097906.0,
```

```
            "Name": "updated name"
        },
        "Status": "AVAILABLE"
}
```

- For API details, see DescribeProvisioningArtifact in *AWS CLI Command Reference*.

`describe-tag-option`

The following code example shows how to use `describe-tag-option`.

AWS CLI

To describe a TagOption

The following `describe-tag-option` example displays details for the specified TagOption.

```
aws servicecatalog describe-tag-option \
    --id tag-p3tej2abcd5qc
```

Output:

```
{
    "TagOptionDetail": {
        "Active": true,
        "Id": "tag-p3tej2abcd5qc",
        "Value": "value-3",
        "Key": "1234"
    }
}
```

- For API details, see DescribeTagOption in *AWS CLI Command Reference*.

`disassociate-principal-from-portfolio`

The following code example shows how to use `disassociate-principal-from-portfolio`.

AWS CLI

To disassociate a principal from a portfolio

The following `disassociate-principal-from-portfolio` example disassociates the specified principal from the portfolio.

```
aws servicecatalog disassociate-principal-from-portfolio \
    --portfolio-id port-2s6abcdq5wdh4 \
    --principal-arn arn:aws:iam::123456789012:group/myendusers
```

This command produces no output.

- For API details, see DisassociatePrincipalFromPortfolio in *AWS CLI Command Reference*.

`disassociate-product-from-portfolio`

The following code example shows how to use `disassociate-product-from-portfolio`.

AWS CLI

To disassociate a product from a portfolio

The following `disassociate-product-from-portfolio` example disassociates the specified product from the portfolio.

```
aws servicecatalog disassociate-product-from-portfolio \
    --product-id prod-3p5abcdmu3oyk \
    --portfolio-id port-2s6abcdq5wdh4
```

This command produces no output.

- For API details, see DisassociateProductFromPortfolio in *AWS CLI Command Reference*.

`disassociate-tag-option-from-resource`

The following code example shows how to use `disassociate-tag-option-from-resource`.

AWS CLI

To disassociate a TagOption from a resource

The following `disassociate-tag-option-from-resource` example disassociates the specified `TagOption` from the resource.

```
aws servicecatalog disassociate-tag-option-from-resource \
     --resource-id port-2s6abcdq5wdh4 \
     --tag-option-id tag-p3abc2pkpz5qc
```

This command produces no output.

- For API details, see DisassociateTagOptionFromResource in *AWS CLI Command Reference*.

`list-accepted-portfolio-shares`

The following code example shows how to use `list-accepted-portfolio-shares`.

AWS CLI

To list accepted portfolio shares

The following `list-accepted-portfolio-shares` example lists all portfolios for which sharing was accepted by this account, including only the default Service Catalog portfolios.

```
aws servicecatalog list-accepted-portfolio-shares \
    --portfolio-share-type "AWS_SERVICECATALOG"
```

Output:

```
{
    "PortfolioDetails": [
        {
            "ARN": "arn:aws:catalog:us-west-2:123456789012:portfolio/port-
d2abcd5dpkuma",
            "Description": "AWS Service Catalog Reference blueprints for often-used
 AWS services such as EC2, S3, RDS, VPC and EMR.",
            "CreatedTime": 1574456190.687,
            "ProviderName": "AWS Service Catalog",
            "DisplayName": "Reference Architectures",
            "Id": "port-d2abcd5dpkuma"
        },
        {
            "ARN": "arn:aws:catalog:us-west-2:123456789012:portfolio/port-
abcdefaua7zpu",
            "Description": "AWS well-architected blueprints for high reliability
 applications.",
            "CreatedTime": 1574461496.092,
```

```
                "ProviderName": "AWS Service Catalog",
                "DisplayName": "High Reliability Architectures",
                "Id": "port-abcdefaua7zpu"
            }
        ]
    }
```

- For API details, see ListAcceptedPortfolioShares in *AWS CLI Command Reference*.

list-portfolio-access

The following code example shows how to use `list-portfolio-access`.

AWS CLI

To list accounts with access to a portfolio

The following `list-portfolio-access` example lists the AWS accounts that have access to the specified portfolio.

```
aws servicecatalog list-portfolio-access \
    --portfolio-id port-2s6abcdq5wdh4
```

Output:

```
{
    "AccountIds": [
        "123456789012"
    ]
}
```

- For API details, see ListPortfolioAccess in *AWS CLI Command Reference*.

list-portfolios-for-product

The following code example shows how to use `list-portfolios-for-product`.

AWS CLI

To list portfolios associated with a product

The following `list-portfolios-for-product` example lists the portfolios associated with the specified product.

```
aws servicecatalog list-portfolios-for-product \
    --product-id prod-abcdfz3syn2rg
```

Output:

```
{
    "PortfolioDetails": [
        {
            "CreatedTime": 1571337221.555,
            "Id": "port-2s6abcdq5wdh4",
            "ARN": "arn:aws:catalog:us-west-2:123456789012:portfolio/
port-2s6abcdq5wdh4",
            "DisplayName": "my-portfolio",
            "ProviderName": "my-provider"
        },
        {
            "CreatedTime": 1559665256.348,
            "Id": "port-5abcd3e5st4ei",
            "ARN": "arn:aws:catalog:us-west-2:123456789012:portfolio/
port-5abcd3e5st4ei",
            "DisplayName": "test",
            "ProviderName": "provider-name"
        }
    ]
}
```

- For API details, see ListPortfoliosForProduct in *AWS CLI Command Reference*.

`list-portfolios`

The following code example shows how to use `list-portfolios`.

AWS CLI

To list portfolios

The following `list-portfolios` example lists the Service Catalog portfolios in the current Region.

```
aws servicecatalog list-portfolios
```

Output:

```
{
    "PortfolioDetails": [
        {
           "CreatedTime": 1559665256.348,
           "ARN": "arn:aws:catalog:us-east-2:123456789012:portfolio/
port-5pzcxmplst4ei",
           "DisplayName": "my-portfolio",
           "Id": "port-5pzcxmplst4ei",
           "ProviderName": "my-user"
        }
    ]
}
```

- For API details, see ListPortfolios in *AWS CLI Command Reference*.

`list-principals-for-portfolio`

The following code example shows how to use `list-principals-for-portfolio`.

AWS CLI

To list all principals for a portfolio

The following `list-principals-for-portfolio` example lists all principals for the specified portfolio.

```
aws servicecatalog list-principals-for-portfolio \
    --portfolio-id port-2s6abcdq5wdh4
```

Output:

```
{
    "Principals": [
        {
            "PrincipalARN": "arn:aws:iam::123456789012:user/usertest",
            "PrincipalType": "IAM"
        }
```

```
    ]
}
```

- For API details, see ListPrincipalsForPortfolio in *AWS CLI Command Reference*.

`list-provisioning-artifacts`

The following code example shows how to use `list-provisioning-artifacts`.

AWS CLI

To list all provisioning artifacts for a product

The following `list-provisioning-artifacts` example lists all provisioning artifacts for the specified product.

```
aws servicecatalog list-provisioning-artifacts \
    --product-id prod-nfi2abcdefgcpw
```

Output:

```
{
    "ProvisioningArtifactDetails": [
        {
            "Id": "pa-abcdef54ipm6z",
            "Description": "test-version-description",
            "Type": "CLOUD_FORMATION_TEMPLATE",
            "CreatedTime": 1576021147.0,
            "Active": true,
            "Name": "test-version-name"
        },
        {
            "Id": "pa-bb4zyxwwnaio",
            "Description": "test description",
            "Type": "CLOUD_FORMATION_TEMPLATE",
            "CreatedTime": 1576022545.0,
            "Active": true,
            "Name": "test-provisioning-artifact-2"
        }
    ]
}
```

- For API details, see ListProvisioningArtifacts in *AWS CLI Command Reference*.

`list-resources-for-tag-option`

The following code example shows how to use `list-resources-for-tag-option`.

AWS CLI

To list resources associated to a TagOption

The following `list-resources-for-tag-option` example lists the resources associated with the specified `TagOption`.

```
aws servicecatalog list-resources-for-tag-option \
    --tag-option-id tag-p3tej2abcd5qc
```

Output:

```
{
    "ResourceDetails": [
        {
            "ARN": "arn:aws:catalog:us-west-2:123456789012:product/prod-
abcdfz3syn2rg",
            "Name": "my product",
            "Description": "description",
            "CreatedTime": 1562097906.0,
            "Id": "prod-abcdfz3syn2rg"
        }
    ]
}
```

- For API details, see ListResourcesForTagOption in *AWS CLI Command Reference*.

`list-tag-options`

The following code example shows how to use `list-tag-options`.

AWS CLI

The following `list-tag-options` example lists all values for `TagOptions`.

```
aws servicecatalog list-tag-options
```

Output:

```
{
    "TagOptionDetails": [
        {
            "Value": "newvalue",
            "Active": true,
            "Id": "tag-iabcdn4fzjjms",
            "Key": "1234"
        },
        {
            "Value": "value1",
            "Active": true,
            "Id": "tag-e3abcdvmwvrzy",
            "Key": "key"
        }
    ]
}
```

- For API details, see ListTagOptions in *AWS CLI Command Reference*.

`provision-product`

The following code example shows how to use `provision-product`.

AWS CLI

To provision a product

The following `provision-product` example provisions the specified product using the specified provisioning artifact.

```
aws servicecatalog provision-product \
    --product-id prod-abcdfz3syn2rg \
    --provisioning-artifact-id pa-abc347pcsccfm \
    --provisioned-product-name "mytestppname3"
```

Output:

```
{
    "RecordDetail": {
        "RecordId": "rec-tfuawdabcdege",
        "CreatedTime": 1577222793.362,
        "ProvisionedProductId": "pp-abcd27bm4mldq",
        "PathId": "lpv2-abcdg3jp6t5k6",
        "RecordErrors": [],
        "ProductId": "prod-abcdfz3syn2rg",
        "UpdatedTime": 1577222793.362,
        "RecordType": "PROVISION_PRODUCT",
        "ProvisionedProductName": "mytestppname3",
        "ProvisioningArtifactId": "pa-pcz347abcdcfm",
        "RecordTags": [],
        "Status": "CREATED",
        "ProvisionedProductType": "CFN_STACK"
    }
}
```

- For API details, see ProvisionProduct in *AWS CLI Command Reference*.

`reject-portfolio-share`

The following code example shows how to use `reject-portfolio-share`.

AWS CLI

To reject a portfolio share

The following `reject-portfolio-share` example rejects the portfolio share for the given portfolio.

```
aws servicecatalog reject-portfolio-share \
    --portfolio-id port-2s6wuabcdefghijk
```

This command produces no output.

- For API details, see RejectPortfolioShare in *AWS CLI Command Reference*.

`scan-provisioned-products`

The following code example shows how to use `scan-provisioned-products`.

AWS CLI

To list all available provisioned products

The following `scan-provisioned-products` example lists available provisioned products.

```
aws servicecatalog scan-provisioned-products
```

Output:

```
{
    "ProvisionedProducts": [
        {
            "Status": "ERROR",
            "Arn": "arn:aws:servicecatalog:us-west-2:123456789012:stack/
mytestppname3/pp-abcd27bm4mldq",
            "StatusMessage": "AmazonCloudFormationException  Parameters: [KeyName]
 must have values (Service: AmazonCloudFormation; Status Code: 400; Error Code:
 ValidationError; Request ID: 5528602a-a9ef-427c-825c-f82c31b814f5)",
            "Id": "pp-abcd27bm4mldq",
            "Type": "CFN_STACK",
            "IdempotencyToken": "527c5358-2a1a-4b9e-b1b9-7293b0ddff42",
            "CreatedTime": 1577222793.358,
            "Name": "mytestppname3",
            "LastRecordId": "rec-tfuawdabcdxge"
        }
    ]
}
```

- For API details, see ScanProvisionedProducts in *AWS CLI Command Reference*.

`search-products-as-admin`

The following code example shows how to use `search-products-as-admin`.

AWS CLI

To search products with administrator privileges

The following `search-products-as-admin` example searches for products with admin privileges, using a portfolio ID as a filter.

```
aws servicecatalog search-products-as-admin \
    --portfolio-id port-5abcd3e5st4ei
```

Output:

```
{
    "ProductViewDetails": [
        {
            "ProductViewSummary": {
                "Name": "my product",
                "Owner": "owner name",
                "Type": "CLOUD_FORMATION_TEMPLATE",
                "ProductId": "prod-abcdfz3syn2rg",
                "HasDefaultPath": false,
                "Id": "prodview-abcdmyuzv2dlu",
                "ShortDescription": "description"
            },
            "ProductARN": "arn:aws:catalog:us-west-2:123456789012:product/prod-
abcdfz3syn2rg",
            "CreatedTime": 1562097906.0,
            "Status": "CREATED"
        }
    ]
}
```

- For API details, see SearchProductsAsAdmin in *AWS CLI Command Reference*.

`search-provisioned-products`

The following code example shows how to use `search-provisioned-products`.

AWS CLI

To search provisioned products

The following `search-provisioned-products` example searches for provisioned products matching the specified product ID, using a JSON file to pass parameters.

```
aws servicecatalog search-provisioned-products \
    --cli-input-json file://search-provisioned-products-input.json
```

Contents of `search-provisioned-products-input.json`:

```
{
    "Filters": {
        "SearchQuery": [
            "prod-tcjvfz3syn2rg"
        ]
    }
}
```

Output:

```
{
    "ProvisionedProducts": [
        {
            "ProvisioningArtifactId": "pa-pcz347abcdcfm",
            "Name": "mytestppname3",
            "CreatedTime": 1577222793.358,
            "Id": "pp-abcd27bm4mldq",
            "Status": "ERROR",
            "UserArn": "arn:aws:iam::123456789012:user/cliuser",
            "StatusMessage": "AmazonCloudFormationException  Parameters: [KeyName]
 must have values (Service: AmazonCloudFormation; Status Code: 400; Error Code:
 ValidationError; Request ID: 5528602a-a9ef-427c-825c-f82c31b814f5)",

            "ProductId": "prod-abcdfz3syn2rg"
        }
    ],
    "TotalResultsCount": 1
}
```

- For API details, see SearchProvisionedProducts in *AWS CLI Command Reference*.

update-portfolio

The following code example shows how to use `update-portfolio`.

AWS CLI

To update a portfolio

The following `update-portfolio` example updates the name of the specified portfolio.

```
aws servicecatalog update-portfolio \
    --id port-5abcd3e5st4ei \
    --display-name "New portfolio name"
```

Output:

```
{
    "PortfolioDetail": {
```

```
        "DisplayName": "New portfolio name",
        "ProviderName": "provider",
        "ARN": "arn:aws:catalog:us-west-2:123456789012:portfolio/
port-5abcd3e5st4ei",
        "Id": "port-5abcd3e5st4ei",
        "CreatedTime": 1559665256.348
    },
    "Tags": []
}
```

- For API details, see UpdatePortfolio in *AWS CLI Command Reference*.

`update-product`

The following code example shows how to use `update-product`.

AWS CLI

To update a product

The following `update-product` example updates the name and owner of the specified product.

```
aws servicecatalog update-product \
    --id prod-os6abc7drqlt2 \
    --name "New product name" \
    --owner "Updated product owner"
```

Output:

```
{
    "Tags": [
        {
            "Value": "iad",
            "Key": "region"
        }
    ],
    "ProductViewDetail": {
        "ProductViewSummary": {
            "Owner": "Updated product owner",
            "ProductId": "prod-os6abc7drqlt2",
            "Distributor": "test-distributor",
```

```
                "SupportUrl": "https://aws.amazon.com",
                "Name": "New product name",
                "ShortDescription": "test-description",
                "HasDefaultPath": false,
                "Id": "prodview-6abcdgrfhvidy",
                "SupportDescription": "test-support",
                "SupportEmail": "test@amazon.com",
                "Type": "CLOUD_FORMATION_TEMPLATE"
            },
            "Status": "CREATED",
            "ProductARN": "arn:aws:catalog:us-west-2:123456789012:product/prod-
os6abc7drqlt2",
            "CreatedTime": 1577136255.0
        }
}
```

- For API details, see UpdateProduct in *AWS CLI Command Reference*.

`update-provisioning-artifact`

The following code example shows how to use `update-provisioning-artifact`.

AWS CLI

To update a provisioning artifact

The following `update-provisioning-artifact` example updates the name and description of the specified provisioning artifact, using a JSON file to pass parameters.

```
aws servicecatalog update-provisioning-artifact \
    --cli-input-json file://update-provisioning-artifact-input.json
```

Contents of `update-provisioning-artifact-input.json`:

```
{
    "ProductId": "prod-abcdfz3syn2rg",
    "ProvisioningArtifactId": "pa-pcz347abcdcfm",
    "Name": "updated name",
    "Description": "updated description"
}
```

Output:

```
{
    "Info": {
        "TemplateUrl": "https://awsdocs.s3.amazonaws.com/servicecatalog/
myexampledevelopment-environment.template"
    },
    "Status": "AVAILABLE",
    "ProvisioningArtifactDetail": {
        "Active": true,
        "Description": "updated description",
        "Id": "pa-pcz347abcdcfm",
        "Name": "updated name",
        "Type": "CLOUD_FORMATION_TEMPLATE",
        "CreatedTime": 1562097906.0
    }
}
```

- For API details, see UpdateProvisioningArtifact in *AWS CLI Command Reference*.

`update-tag-option`

The following code example shows how to use `update-tag-option`.

AWS CLI

To update a TagOption

The following `update-tag-option` example updates the value of a `TagOption`, using the specified JSON file.

```
aws servicecatalog update-tag-option --cli-input-json file://update-tag-option-
input.json
```

Contents of `update-tag-option-input.json`:

```
{
    "Id": "tag-iabcdn4fzjjms",
    "Value": "newvalue",
    "Active": true
}
```

Output:

```
{
    "TagOptionDetail": {
        "Value": "newvalue",
        "Key": "1234",
        "Active": true,
        "Id": "tag-iabcdn4fzjjms"
    }
}
```

- For API details, see UpdateTagOption in *AWS CLI Command Reference*.

Service Quotas examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Service Quotas.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`get-aws-default-service-quota`

The following code example shows how to use `get-aws-default-service-quota`.

AWS CLI

To describe a default service quota

The following `get-aws-default-service-quota` example displays details for the specified quota.

```
aws service-quotas get-aws-default-service-quota \
    --service-code ec2 \
```

```
    --quota-code L-1216C47A
```

Output:

```
{
    "Quota": {
        "ServiceCode": "ec2",
        "ServiceName": "Amazon Elastic Compute Cloud (Amazon EC2)",
        "QuotaArn": "arn:aws:servicequotas:us-east-2::ec2/L-1216C47A",
        "QuotaCode": "L-1216C47A",
        "QuotaName": "Running On-Demand Standard (A, C, D, H, I, M, R, T, Z)
 instances",
        "Value": 5.0,
        "Unit": "None",
        "Adjustable": true,
        "GlobalQuota": false,
        "UsageMetric": {
            "MetricNamespace": "AWS/Usage",
            "MetricName": "ResourceCount",
            "MetricDimensions": {
                "Class": "Standard/OnDemand",
                "Resource": "vCPU",
                "Service": "EC2",
                "Type": "Resource"
            },
            "MetricStatisticRecommendation": "Maximum"
        }
    }
}
```

- For API details, see GetAwsDefaultServiceQuota in *AWS CLI Command Reference*.

`get-requested-service-quota-change`

The following code example shows how to use `get-requested-service-quota-change`.

AWS CLI

To describe a service quota increase request

The following `get-requested-service-quota-change` example describes the specified quota increase request.

```
aws service-quotas get-requested-service-quota-change \
    --request-id d187537d15254312a9609aa51bbf7624u7W49tPO
```

Output:

```
{
    "RequestedQuota": {
        "Id": "d187537d15254312a9609aa51bbf7624u7W49tPO",
        "CaseId": "6780195351",
        "ServiceCode": "ec2",
        "ServiceName": "Amazon Elastic Compute Cloud (Amazon EC2)",
        "QuotaCode": "L-20F13EBD",
        "QuotaName": "Running Dedicated c5n Hosts",
        "DesiredValue": 2.0,
        "Status": "CASE_OPENED",
        "Created": 1580446904.067,
        "LastUpdated": 1580446953.265,
        "Requester": "{\"accountId\":\"123456789012\",\"callerArn\":
\"arn:aws:iam::123456789012:root\"}",
        "QuotaArn": "arn:aws:servicequotas:us-east-2:123456789012:ec2/L-20F13EBD",
        "GlobalQuota": false,
        "Unit": "None"
    }
}
```

- For API details, see GetRequestedServiceQuotaChange in *AWS CLI Command Reference*.

`get-service-quota`

The following code example shows how to use `get-service-quota`.

AWS CLI

To describe a service quota

The following `get-service-quota` example displays details about the specified quota.

```
aws service-quotas get-service-quota \
    --service-code ec2 \
    --quota-code L-1216C47A
```

Output:

```
{
    "Quota": {
        "ServiceCode": "ec2",
        "ServiceName": "Amazon Elastic Compute Cloud (Amazon EC2)",
        "QuotaArn": "arn:aws:servicequotas:us-east-2:123456789012:ec2/L-1216C47A",
        "QuotaCode": "L-1216C47A",
        "QuotaName": "Running On-Demand Standard (A, C, D, H, I, M, R, T, Z)
 instances",
        "Value": 1920.0,
        "Unit": "None",
        "Adjustable": true,
        "GlobalQuota": false,
        "UsageMetric": {
            "MetricNamespace": "AWS/Usage",
            "MetricName": "ResourceCount",
            "MetricDimensions": {
                "Class": "Standard/OnDemand",
                "Resource": "vCPU",
                "Service": "EC2",
                "Type": "Resource"
            },
            "MetricStatisticRecommendation": "Maximum"
        }
    }
}
```

- For API details, see GetServiceQuota in *AWS CLI Command Reference*.

`list-aws-default-service-quotas`

The following code example shows how to use `list-aws-default-service-quotas`.

AWS CLI

To list the default quotas for a service

The following `list-aws-default-service-quotas` example lists the default values for the quotas for the specified service.

```
aws service-quotas list-aws-default-service-quotas \
```

```
    --service-code xray
```

Output:

```
{
    "Quotas": [
        {
            "ServiceCode": "xray",
            "ServiceName": "AWS X-Ray",
            "QuotaArn": "arn:aws:servicequotas:us-west-2::xray/L-C6B6F05D",
            "QuotaCode": "L-C6B6F05D",
            "QuotaName": "Indexed annotations per trace",
            "Value": 50.0,
            "Unit": "None",
            "Adjustable": false,
            "GlobalQuota": false
        },
        {
            "ServiceCode": "xray",
            "ServiceName": "AWS X-Ray",
            "QuotaArn": "arn:aws:servicequotas:us-west-2::xray/L-D781C0FD",
            "QuotaCode": "L-D781C0FD",
            "QuotaName": "Segment document size",
            "Value": 64.0,
            "Unit": "Kilobytes",
            "Adjustable": false,
            "GlobalQuota": false
        },
        {
            "ServiceCode": "xray",
            "ServiceName": "AWS X-Ray",
            "QuotaArn": "arn:aws:servicequotas:us-west-2::xray/L-998BFF16",
            "QuotaCode": "L-998BFF16",
            "QuotaName": "Trace and service graph retention in days",
            "Value": 30.0,
            "Unit": "None",
            "Adjustable": false,
            "GlobalQuota": false
        }
    ]
}
```

- For API details, see ListAwsDefaultServiceQuotas in *AWS CLI Command Reference*.

`list-requested-service-quota-change-history-by-quota`

The following code example shows how to use `list-requested-service-quota-change-history-by-quota`.

AWS CLI

To list your quota increase requests

The following `list-requested-service-quota-change-history-by-quota` example lists the quota increase requests for the specified quota.

```
aws service-quotas list-requested-service-quota-change-history-by-quota \
    --service-code ec2 \
    --quota-code L-20F13EBD
```

Output:

```
{
    "RequestedQuotas": [
        {
            "Id": "d187537d15254312a9609aa51bbf7624u7W49tPO",
            "CaseId": "6780195351",
            "ServiceCode": "ec2",
            "ServiceName": "Amazon Elastic Compute Cloud (Amazon EC2)",
            "QuotaCode": "L-20F13EBD",
            "QuotaName": "Running Dedicated c5n Hosts",
            "DesiredValue": 2.0,
            "Status": "CASE_OPENED",
            "Created": 1580446904.067,
            "LastUpdated": 1580446953.265,
            "Requester": "{\"accountId\":\"123456789012\",\"callerArn\":
\"arn:aws:iam::123456789012:root\"}",
            "QuotaArn": "arn:aws:servicequotas:us-east-2:123456789012:ec2/
L-20F13EBD",
            "GlobalQuota": false,
            "Unit": "None"
        }
    ]
}
```

- For API details, see ListRequestedServiceQuotaChangeHistoryByQuota in *AWS CLI Command Reference*.

`list-requested-service-quota-change-history`

The following code example shows how to use `list-requested-service-quota-change-history`.

AWS CLI

To list your quota increase requests

The following `list-requested-service-quota-change-history` example lists the quota increase requests for the specified service.

```
aws service-quotas list-requested-service-quota-change-history \
    --service-code ec2
```

Output:

```
{
    "RequestedQuotas": [
        {
            "Id": "d187537d15254312a9609aa51bbf7624u7W49tPO",
            "CaseId": "6780195351",
            "ServiceCode": "ec2",
            "ServiceName": "Amazon Elastic Compute Cloud (Amazon EC2)",
            "QuotaCode": "L-20F13EBD",
            "QuotaName": "Running Dedicated c5n Hosts",
            "DesiredValue": 2.0,
            "Status": "CASE_OPENED",
            "Created": 1580446904.067,
            "LastUpdated": 1580446953.265,
            "Requester": "{\"accountId\":\"123456789012\",\"callerArn\":
\"arn:aws:iam::123456789012:root\"}",
            "QuotaArn": "arn:aws:servicequotas:us-east-2:123456789012:ec2/
L-20F13EBD",
            "GlobalQuota": false,
            "Unit": "None"
        }
    ]
}
```

- For API details, see ListRequestedServiceQuotaChangeHistory in *AWS CLI Command Reference*.

`list-service-quotas`

The following code example shows how to use `list-service-quotas`.

AWS CLI

To list the quotas for a service

The following `list-service-quotas` example displays details about the quotas for AWS CloudFormation.

```
aws service-quotas list-service-quotas \
    --service-code cloudformation
```

Output:

```
{
    "Quotas": [
        {
            "ServiceCode": "cloudformation",
            "ServiceName": "AWS CloudFormation",
            "QuotaArn": "arn:aws:servicequotas:us-
east-2:123456789012:cloudformation/L-87D14FB7",
            "QuotaCode": "L-87D14FB7",
            "QuotaName": "Output count in CloudFormation template",
            "Value": 60.0,
            "Unit": "None",
            "Adjustable": false,
            "GlobalQuota": false
        },
        {
            "ServiceCode": "cloudformation",
            "ServiceName": "AWS CloudFormation",
            "QuotaArn": "arn:aws:servicequotas:us-
east-2:123456789012:cloudformation/L-0485CB21",
            "QuotaCode": "L-0485CB21",
            "QuotaName": "Stack count",
            "Value": 200.0,
            "Unit": "None",
            "Adjustable": true,
            "GlobalQuota": false
        }
    ]
```

```
}
```

- For API details, see ListServiceQuotas in *AWS CLI Command Reference*.

`list-services`

The following code example shows how to use `list-services`.

AWS CLI

To list the available services

The following command lists the services that are available in Service Quotas.

```
aws service-quotas list-services
```

Output:

```
{
    "Services": [
        {
            "ServiceCode": "AWSCloudMap",
            "ServiceName": "AWS Cloud Map"
        },
        {
            "ServiceCode": "access-analyzer",
            "ServiceName": "Access Analyzer"
        },
        {
            "ServiceCode": "acm",
            "ServiceName": "AWS Certificate Manager (ACM)"
        },

        ...truncated...

        {
            "ServiceCode": "xray",
            "ServiceName": "AWS X-Ray"
        }
    ]
}
```

You can add the `--query` parameter to filter the display to the information that you are interested in. The following example displays only the service codes.

```
aws service-quotas list-services \
    --query Services[*].ServiceCode
```

Output:

```
[
    "AWSCloudMap",
    "access-analyzer",
    "acm",
    "acm-pca",
    "amplify",
    "apigateway",
    "application-autoscaling",
        ...truncated...
    "xray"
]
```

- For API details, see ListServices in *AWS CLI Command Reference*.

`request-service-quota-increase`

The following code example shows how to use `request-service-quota-increase`.

AWS CLI

To request a service quota increase

The following `request-service-quota-increase` example requests an increase in the specified service quota.

```
aws service-quotas request-service-quota-increase \
    --service-code ec2 \
    --quota-code L-20F13EBD \
    --desired-value 2
```

Output:

```
{
```

```
    "RequestedQuota": {
        "Id": "d187537d15254312a9609aa51bbf7624u7W49tPO",
        "ServiceCode": "ec2",
        "ServiceName": "Amazon Elastic Compute Cloud (Amazon EC2)",
        "QuotaCode": "L-20F13EBD",
        "QuotaName": "Running Dedicated c5n Hosts",
        "DesiredValue": 2.0,
        "Status": "PENDING",
        "Created": 1580446904.067,
        "Requester": "{\"accountId\":\"123456789012\",\"callerArn\":
\"arn:aws:iam::123456789012:root\"}",
        "QuotaArn": "arn:aws:servicequotas:us-east-2:123456789012:ec2/L-20F13EBD",
        "GlobalQuota": false,
        "Unit": "None"
    }
}
```

- For API details, see RequestServiceQuotaIncrease in *AWS CLI Command Reference*.

Amazon SES examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon SES.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`delete-identity`

The following code example shows how to use `delete-identity`.

AWS CLI

To delete an identity

The following example uses the `delete-identity` command to delete an identity from the list of identities verified with Amazon SES:

```
aws ses delete-identity --identity user@example.com
```

For more information about verified identities, see Verifying Email Addresses and Domains in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see DeleteIdentity in *AWS CLI Command Reference*.

`get-identity-dkim-attributes`

The following code example shows how to use `get-identity-dkim-attributes`.

AWS CLI

To get the Amazon SES Easy DKIM attributes for a list of identities

The following example uses the `get-identity-dkim-attributes` command to retrieve the Amazon SES Easy DKIM attributes for a list of identities:

```
aws ses get-identity-dkim-attributes --identities "example.com" "user@example.com"
```

Output:

```
{
   "DkimAttributes": {
       "example.com": {
           "DkimTokens": [
               "EXAMPLEjcs5xoyqytjsotsijas7236gr",
               "EXAMPLEjr76cvoc6mysspnioorxsn6ep",
               "EXAMPLEkbmkqkhlm2lyz77ppkulerm4k"
           ],
           "DkimEnabled": true,
           "DkimVerificationStatus": "Success"
       },
       "user@example.com": {
           "DkimEnabled": false,
```

```
            "DkimVerificationStatus": "NotStarted"
        }
    }
}
```

If you call this command with an identity that you have never submitted for verification, that identity won't appear in the output.

For more information about Easy DKIM, see Easy DKIM in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see GetIdentityDkimAttributes in *AWS CLI Command Reference*.

`get-identity-notification-attributes`

The following code example shows how to use `get-identity-notification-attributes`.

AWS CLI

To get the Amazon SES notification attributes for a list of identities

The following example uses the `get-identity-notification-attributes` command to retrieve the Amazon SES notification attributes for a list of identities:

```
aws ses get-identity-notification-attributes --
identities "user1@example.com" "user2@example.com"
```

Output:

```
{
   "NotificationAttributes": {
       "user1@example.com": {
           "ForwardingEnabled": false,
           "ComplaintTopic": "arn:aws:sns:us-east-1:EXAMPLE65304:MyTopic",
           "BounceTopic": "arn:aws:sns:us-east-1:EXAMPLE65304:MyTopic",
           "DeliveryTopic": "arn:aws:sns:us-east-1:EXAMPLE65304:MyTopic"
       },
       "user2@example.com": {
           "ForwardingEnabled": true
       }
   }
}
```

This command returns the status of email feedback forwarding and, if applicable, the Amazon Resource Names (ARNs) of the Amazon SNS topics that bounce, complaint, and delivery notifications are sent to.

If you call this command with an identity that you have never submitted for verification, that identity won't appear in the output.

For more information about notifications, see Using Notifications With Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see GetIdentityNotificationAttributes in *AWS CLI Command Reference*.

`get-identity-verification-attributes`

The following code example shows how to use `get-identity-verification-attributes`.

AWS CLI

To get the Amazon SES verification status for a list of identities

The following example uses the `get-identity-verification-attributes` command to retrieve the Amazon SES verification status for a list of identities:

```
aws ses get-identity-verification-attributes --
identities "user1@example.com" "user2@example.com"
```

Output:

```
{
   "VerificationAttributes": {
       "user1@example.com": {
           "VerificationStatus": "Success"
       },
       "user2@example.com": {
           "VerificationStatus": "Pending"
       }
   }
}
```

If you call this command with an identity that you have never submitted for verification, that identity won't appear in the output.

For more information about verified identities, see Verifying Email Addresses and Domains in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see GetIdentityVerificationAttributes in *AWS CLI Command Reference*.

`get-send-quota`

The following code example shows how to use `get-send-quota`.

AWS CLI

To get your Amazon SES sending limits

The following example uses the `get-send-quota` command to return your Amazon SES sending limits:

```
aws ses get-send-quota
```

Output:

```
{
   "Max24HourSend": 200.0,
   "SentLast24Hours": 1.0,
   "MaxSendRate": 1.0
}
```

Max24HourSend is your sending quota, which is the maximum number of emails that you can send in a 24-hour period. The sending quota reflects a rolling time period. Every time you try to send an email, Amazon SES checks how many emails you sent in the previous 24 hours. As long as the total number of emails that you have sent is less than your quota, your send request will be accepted and your email will be sent.

SentLast24Hours is the number of emails that you have sent in the previous 24 hours.

MaxSendRate is the maximum number of emails that you can send per second.

Note that sending limits are based on recipients rather than on messages. For example, an email that has 10 recipients counts as 10 against your sending quota.

For more information, see Managing Your Amazon SES Sending Limits in the *Amazon Simple Email Service Developer Guide*.

- For API details, see GetSendQuota in *AWS CLI Command Reference*.

`get-send-statistics`

The following code example shows how to use `get-send-statistics`.

AWS CLI

To get your Amazon SES sending statistics

The following example uses the `get-send-statistics` command to return your Amazon SES sending statistics

```
aws ses get-send-statistics
```

Output:

```
{
   "SendDataPoints": [
       {
           "Complaints": 0,
           "Timestamp": "2013-06-12T19:32:00Z",
           "DeliveryAttempts": 2,
           "Bounces": 0,
           "Rejects": 0
       },
       {
           "Complaints": 0,
           "Timestamp": "2013-06-12T00:47:00Z",
           "DeliveryAttempts": 1,
           "Bounces": 0,
           "Rejects": 0
       }
   ]
}
```

The result is a list of data points, representing the last two weeks of sending activity. Each data point in the list contains statistics for a 15-minute interval.

In this example, there are only two data points because the only emails that the user sent in the last two weeks fell within two 15-minute intervals.

For more information, see Monitoring Your Amazon SES Usage Statistics in the *Amazon Simple Email Service Developer Guide*.

- For API details, see GetSendStatistics in *AWS CLI Command Reference*.

`list-identities`

The following code example shows how to use `list-identities`.

AWS CLI

To list all identities (email addresses and domains) for a specific AWS account

The following example uses the `list-identities` command to list all identities that have been submitted for verification with Amazon SES:

```
aws ses list-identities
```

Output:

```
{
    "Identities": [
      "user@example.com",
      "example.com"
    ]
}
```

The list that is returned contains all identities regardless of verification status (verified, pending verification, failure, etc.).

In this example, email addresses *and* domains are returned because we did not specify the identity-type parameter.

For more information about verification, see Verifying Email Addresses and Domains in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see ListIdentities in *AWS CLI Command Reference*.

`send-email`

The following code example shows how to use `send-email`.

AWS CLI

To send a formatted email using Amazon SES

The following example uses the `send-email` command to send a formatted email:

```
aws ses send-email --from sender@example.com --destination file://destination.json
 --message file://message.json
```

Output:

```
{
   "MessageId": "EXAMPLEf3a5efcd1-51adec81-d2a4-4e3f-9fe2-5d85c1b23783-000000"
}
```

The destination and the message are JSON data structures saved in .json files in the current directory. These files are as follows:

`destination.json`:

```
{
  "ToAddresses":  ["recipient1@example.com", "recipient2@example.com"],
  "CcAddresses":  ["recipient3@example.com"],
  "BccAddresses": []
}
```

`message.json`:

```
{
   "Subject": {
       "Data": "Test email sent using the AWS CLI",
       "Charset": "UTF-8"
   },
   "Body": {
       "Text": {
           "Data": "This is the message body in text format.",
           "Charset": "UTF-8"
       },
       "Html": {
           "Data": "This message body contains HTML formatting. It can, for example,
 contain links like this one: <a class=\"ulink\" href=\"http://docs.aws.amazon.com/
ses/latest/DeveloperGuide\" target=\"_blank\">Amazon SES Developer Guide</a>.",
           "Charset": "UTF-8"
       }
   }
```

```
}
```

Replace the sender and recipient email addresses with the ones you want to use. Note that the sender's email address must be verified with Amazon SES. Until you are granted production access to Amazon SES, you must also verify the email address of each recipient unless the recipient is the Amazon SES mailbox simulator. For more information on verification, see Verifying Email Addresses and Domains in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

The Message ID in the output indicates that the call to send-email was successful.

If you don't receive the email, check your Junk box.

For more information on sending formatted email, see Sending Formatted Email Using the Amazon SES API in the *Amazon Simple Email Service Developer Guide*.

- For API details, see SendEmail in *AWS CLI Command Reference*.

`send-raw-email`

The following code example shows how to use `send-raw-email`.

AWS CLI

To send a raw email using Amazon SES

The following example uses the `send-raw-email` command to send an email with a TXT attachment:

```
aws ses send-raw-email --raw-message file://message.json
```

Output:

```
{
   "MessageId": "EXAMPLEf3f73d99b-c63fb06f-d263-41f8-a0fb-d0dc67d56c07-000000"
}
```

The raw message is a JSON data structure saved in a file named `message.json` in the current directory. It contains the following:

```
{
```

```
   "Data": "From: sender@example.com\nTo: recipient@example.com\nSubject: Test email
 sent using the AWS CLI (contains an attachment)\nMIME-Version: 1.0\nContent-type:
 Multipart/Mixed; boundary=\"NextPart\"\n\n--NextPart\nContent-Type: text/plain
\n\nThis is the message body.\n\n--NextPart\nContent-Type: text/plain;\nContent-
Disposition: attachment; filename=\"attachment.txt\"\n\nThis is the text in the
 attachment.\n\n--NextPart--"
}
```

As you can see, "Data" is one long string that contains the entire raw email content in MIME format, including an attachment called attachment.txt.

Replace sender@example.com and recipient@example.com with the addresses you want to use. Note that the sender's email address must be verified with Amazon SES. Until you are granted production access to Amazon SES, you must also verify the email address of the recipient unless the recipient is the Amazon SES mailbox simulator. For more information on verification, see Verifying Email Addresses and Domains in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

The Message ID in the output indicates that the call to send-raw-email was successful.

If you don't receive the email, check your Junk box.

For more information on sending raw email, see Sending Raw Email Using the Amazon SES API in the *Amazon Simple Email Service Developer Guide*.

- For API details, see SendRawEmail in *AWS CLI Command Reference*.

`set-identity-dkim-enabled`

The following code example shows how to use `set-identity-dkim-enabled`.

AWS CLI

To enable or disable Easy DKIM for an Amazon SES verified identity

The following example uses the `set-identity-dkim-enabled` command to disable DKIM for a verified email address:

```
aws ses set-identity-dkim-enabled --identity user@example.com --no-dkim-enabled
```

For more information about Easy DKIM, see Easy DKIM in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see SetIdentityDkimEnabled in *AWS CLI Command Reference*.

`set-identity-feedback-forwarding-enabled`

The following code example shows how to use `set-identity-feedback-forwarding-enabled`.

AWS CLI

To enable or disable bounce and complaint email feedback forwarding for an Amazon SES verified identity

The following example uses the `set-identity-feedback-forwarding-enabled` command to enable a verified email address to receive bounce and complaint notifications by email:

```
aws ses set-identity-feedback-forwarding-enabled --identity user@example.com --
forwarding-enabled
```

You are required to receive bounce and complaint notifications via either Amazon SNS or email feedback forwarding, so you can only disable email feedback forwarding if you select an Amazon SNS topic for both bounce and complaint notifications.

For more information about notifications, see Using Notifications With Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see SetIdentityFeedbackForwardingEnabled in *AWS CLI Command Reference*.

`set-identity-notification-topic`

The following code example shows how to use `set-identity-notification-topic`.

AWS CLI

To set the Amazon SNS topic to which Amazon SES will publish bounce, complaint, and/or delivery notifications for a verified identity

The following example uses the `set-identity-notification-topic` command to specify the Amazon SNS topic to which a verified email address will receive bounce notifications:

```
aws ses set-identity-notification-topic --identity user@example.com --notification-
type Bounce --sns-topic arn:aws:sns:us-east-1:EXAMPLE65304:MyTopic
```

For more information about notifications, see Using Notifications With Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see SetIdentityNotificationTopic in *AWS CLI Command Reference*.

`verify-domain-dkim`

The following code example shows how to use `verify-domain-dkim`.

AWS CLI

To generate a verified domain's DKIM tokens for DKIM signing with Amazon SES

The following example uses the `verify-domain-dkim` command to generate DKIM tokens for a domain that has been verified with Amazon SES:

```
aws ses verify-domain-dkim --domain example.com
```

Output:

```
{
   "DkimTokens": [
       "EXAMPLEq76owjnks3lnluwg65scbemvw",
       "EXAMPLEi3dnsj67hstzaj673klariwx2",
       "EXAMPLEwfbtcukvimehexktmdtaz6naj"
   ]
}
```

To set up DKIM, you must use the returned DKIM tokens to update your domain's DNS settings with CNAME records that point to DKIM public keys hosted by Amazon SES. For more information, see Easy DKIM in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see VerifyDomainDkim in *AWS CLI Command Reference*.

`verify-domain-identity`

The following code example shows how to use `verify-domain-identity`.

AWS CLI

To verify a domain with Amazon SES

The following example uses the `verify-domain-identity` command to verify a domain:

```
aws ses verify-domain-identity --domain example.com
```

Output:

```
{
   "VerificationToken": "eoEmxw+YaYhb3h3iVJHuXMJXqeu1q1/wwmvjuEXAMPLE"
}
```

To complete domain verification, you must add a TXT record with the returned verification token to your domain's DNS settings. For more information, see Verifying Domains in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see VerifyDomainIdentity in *AWS CLI Command Reference*.

`verify-email-identity`

The following code example shows how to use `verify-email-identity`.

AWS CLI

To verify an email address with Amazon SES

The following example uses the `verify-email-identity` command to verify an email address:

```
aws ses verify-email-identity --email-address user@example.com
```

Before you can send an email using Amazon SES, you must verify the address or domain that you are sending the email from to prove that you own it. If you do not have production access yet, you also need to verify any email addresses that you send emails to except for email addresses provided by the Amazon SES mailbox simulator.

After verify-email-identity is called, the email address will receive a verification email. The user must click on the link in the email to complete the verification process.

For more information, see Verifying Email Addresses in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see VerifyEmailIdentity in *AWS CLI Command Reference*.

Shield examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Shield.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Actions

`associate-drt-log-bucket`

The following code example shows how to use `associate-drt-log-bucket`.

AWS CLI

To authorize the DRT to access an Amazon S3 bucket

The following `associate-drt-log-bucket` example creates an association between the DRT and the specified S3 bucket. This permits the DRT to access the bucket on behalf of the account.:

```
aws shield associate-drt-log-bucket \
    --log-bucket flow-logs-for-website-lb
```

This command produces no output.

For more information, see Authorize the DDoS Response Team in the *AWS Shield Advanced Developer Guide*.

- For API details, see AssociateDrtLogBucket in *AWS CLI Command Reference*.

`associate-drt-role`

The following code example shows how to use `associate-drt-role`.

AWS CLI

To authorize the DRT to mitigate potential attacks on your behalf

The following `associate-drt-role` example creates an association between the DRT and the specified role. The DRT can use the role to access and manage the account.

```
aws shield associate-drt-role \
    --role-arn arn:aws:iam::123456789012:role/service-role/DrtRole
```

This command produces no output.

For more information, see Authorize the DDoS Response Team in the *AWS Shield Advanced Developer Guide*.

- For API details, see AssociateDrtRole in *AWS CLI Command Reference*.

`create-protection`

The following code example shows how to use `create-protection`.

AWS CLI

To enable AWS Shield Advanced protection for a single AWS resource

The following `create-protection` example enables Shield Advanced protection for the specified AWS CloudFront distribution.

```
aws shield create-protection \
    --name "Protection for CloudFront distribution" \
    --resource-arn arn:aws:cloudfront::123456789012:distribution/E198WC25FXOWY8
```

Output:

```
{
    "ProtectionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Specify Your Resources to Protect in the *AWS Shield Advanced Developer Guide*.

- For API details, see CreateProtection in *AWS CLI Command Reference*.

`create-subscription`

The following code example shows how to use `create-subscription`.

AWS CLI

To enable AWS Shield Advanced protection for an account

The following `create-subscription` example enables Shield Advanced protection for the account.

```
aws shield create-subscription
```

This command produces no output.

For more information, see Getting Started with AWS Shield Advanced in the *AWS Shield Advanced Developer Guide*.

- For API details, see CreateSubscription in *AWS CLI Command Reference*.

`delete-protection`

The following code example shows how to use `delete-protection`.

AWS CLI

To remove AWS Shield Advanced protection from an AWS resource

The following `delete-protection` example removes the specified AWS Shield Advanced protection.

```
aws shield delete-protection \
    --protection-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Removing AWS Shield Advanced from an AWS Resource in the *AWS Shield Advanced Developer Guide*.

- For API details, see DeleteProtection in *AWS CLI Command Reference*.

`describe-attack`

The following code example shows how to use `describe-attack`.

AWS CLI

To retrieve a detailed description of an attack

The following `describe-attack` example displays details about the DDoS attack with the specified attack ID. You can obtain attack IDs by running the `list-attacks` command.

```
aws shield describe-attack --attack-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "Attack": {
        "AttackId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",

```

For more information, see Reviewing DDoS Incidents in the *AWS Shield Advanced Developer Guide*.

- For API details, see DescribeAttack in *AWS CLI Command Reference*.

`describe-drt-access`

The following code example shows how to use `describe-drt-access`.

AWS CLI

To retrieve a description of the authorizations the DRT has to mitigate attacks on your behalf

The following `describe-drt-access` example retrieves the role and S3 bucket authorizations that the DRT has, which allow it to respond to potential attacks on your behalf.

```
aws shield describe-drt-access
```

Output:

```
{
    "RoleArn": "arn:aws:iam::123456789012:role/service-role/DrtRole",
    "LogBucketList": [
        "flow-logs-for-website-lb"
    ]
```

```
}
```

For more information, see Authorize the DDoS Response Team in the *AWS Shield Advanced Developer Guide*.

- For API details, see DescribeDrtAccess in *AWS CLI Command Reference*.

`describe-emergency-contact-settings`

The following code example shows how to use `describe-emergency-contact-settings`.

AWS CLI

To retrieve emergency e-mail addresses that you have on file with the DRT

The following `describe-emergency-contact-settings` example retrieves the e-mail addresses that are on file with the DRT for the account. These are the addresses the DRT should contact when it's responding to a suspected attack.

```
aws shield describe-emergency-contact-settings
```

Output:

```
{
    "EmergencyContactList": [
        {
            "EmailAddress": "ops@example.com"
        },
        {
            "EmailAddress": "ddos-notifications@example.com"
       }
    ]
}
```

For more information, see How AWS Shield Works<https://docs.aws.amazon.com/waf/latest/developerguide/ddos-overview.html> in the *AWS Shield Advanced Developer Guide*.

- For API details, see DescribeEmergencyContactSettings in *AWS CLI Command Reference*.

`describe-protection`

The following code example shows how to use `describe-protection`.

AWS CLI

To retrieve the details for an AWS Shield Advanced protection

The following `describe-protection` example displays details about the Shield Advanced protection with the specified ID. You can obtain protection IDs by running the `list-protections` command.

```
aws shield describe-protection \
    --protection-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "Protection": {
        "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Name": "1.2.3.4",
        "ResourceArn": "arn:aws:ec2:us-west-2:123456789012:eip-allocation/
eipalloc-0ac1537af40742a6d"
    }
}
```

For more information, see Specify Your Resources to Protect in the *AWS Shield Advanced Developer Guide*.

- For API details, see DescribeProtection in *AWS CLI Command Reference*.

`describe-subscription`

The following code example shows how to use `describe-subscription`.

AWS CLI

To retrieve the details of the AWS Shield Advanced protection for the account

The following `describe-subscription` example displays details about the Shield Advanced protection provided for the account.:

```
aws shield describe-subscription
```

Output:

```
{
    "Subscription": {
        "StartTime": 1534368978.0,
        "EndTime": 1597613778.0,

        "AutoRenew": "ENABLED",
        "Limits": [
            {
                "Type": "GLOBAL_ACCELERATOR",
                "Max": 1000
            },
            {
                "Type": "ROUTE53_HOSTED_ZONE",
                "Max": 1000
            },
            {
                "Type": "CF_DISTRIBUTION",
                "Max": 1000
            },
            {
                "Type": "ELB_LOAD_BALANCER",
                "Max": 1000
            },
            {
                "Type": "EC2_ELASTIC_IP_ALLOCATION",
                "Max": 1000
            }
        ]
    }
}
```

For more information, see How AWS Shield Works in the *AWS Shield Advanced Developer Guide*.

- For API details, see DescribeSubscription in *AWS CLI Command Reference*.

disassociate-drt-log-bucket

The following code example shows how to use `disassociate-drt-log-bucket`.

AWS CLI

To remove the authorization for DRT to access an Amazon S3 bucket on your behalf

The following `disassociate-drt-log-bucket` example removes the association between the DRT and the specified S3 bucket. After this command completes, the DRT can no longer access the bucket on behalf of the account.

```
aws shield disassociate-drt-log-bucket \
    --log-bucket flow-logs-for-website-lb
```

This command produces no output.

For more information, see Authorize the DDoS Response Team in the *AWS Shield Advanced Developer Guide*.

- For API details, see DisassociateDrtLogBucket in *AWS CLI Command Reference*.

`disassociate-drt-role`

The following code example shows how to use `disassociate-drt-role`.

AWS CLI

To remove the authorization for DRT to mitigate potential attacks on your behalf

The following `disassociate-drt-role` example removes the association between the DRT and the account. After this call, the DRT can no longer access or manage your account.

```
aws shield disassociate-drt-role
```

This command produces no output.

For more information, see Authorize the DDoS Response Team in the *AWS Shield Advanced Developer Guide*.

- For API details, see DisassociateDrtRole in *AWS CLI Command Reference*.

`get-subscription-state`

The following code example shows how to use `get-subscription-state`.

AWS CLI

To retrieve the current state of the account's AWS Shield Advanced subscription

The following `get-subscription-state` example retrieves the state of the Shield Advanced protection for the account.

```
aws shield get-subscription-state
```

Output:

```
{
    "SubscriptionState": "ACTIVE"
}
```

For more information, see How AWS Shield Works in the *AWS Shield Advanced Developer Guide*.

- For API details, see GetSubscriptionState in *AWS CLI Command Reference*.

`list-attacks`

The following code example shows how to use `list-attacks`.

AWS CLI

To retrieve attack summaries from AWS Shield Advanced

The following `list-attacks` example retrieves summaries of attacks for the specified AWS CloudFront distribution during the specified time period. The response includes attack IDs that you can provide to the `describe-attack` command for detailed information on an attack.

```
aws shield list-attacks \
    --resource-arns arn:aws:cloudfront::12345678910:distribution/E1PXMP22ZVFAOR \
    --start-time FromInclusive=1529280000,ToExclusive=1529300000
```

Output:

```
{
    "AttackSummaries": [
        {
            "AttackId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "ResourceArn": "arn:aws:cloudfront::123456789012:distribution/
E1PXMP22ZVFAOR",
            "StartTime": 1529280000.0,
            "EndTime": 1529449200.0,
```

```
                "AttackVectors": [
                    {
                        "VectorType": "SYN_FLOOD"
                    }
                ]
            }
        ]
}
```

For more information, see [Reviewing DDoS Incidents](#) in the *AWS Shield Advanced Developer Guide*.

- For API details, see [ListAttacks](#) in *AWS CLI Command Reference*.

`list-protections`

The following code example shows how to use `list-protections`.

AWS CLI

To retrieve protection summaries from AWS Shield Advanced

The following `list-protections` example retrieves summaries of the protections that are enabled for the account.

```
aws shield list-protections
```

Output:

```
{
    "Protections": [
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Name": "Protection for CloudFront distribution",
            "ResourceArn": "arn:aws:cloudfront::123456789012:distribution/
E198WC25FXOWY8"
        }
    ]
}
```

For more information, see [Specify Your Resources to Protect](#) in the *AWS Shield Advanced Developer Guide*.

- For API details, see ListProtections in *AWS CLI Command Reference*.

`update-emergency-contact-settings`

The following code example shows how to use `update-emergency-contact-settings`.

AWS CLI

To define the emergency e-mail addresses that are on file with the DRT

The following `update-emergency-contact-settings` example defines two e-mail addresses that the DRT should contact when it's responding to a suspected attack.

```
aws shield update-emergency-contact-settings \
        --emergency-contact-list EmailAddress=ops@example.com EmailAddress=ddos-
notifications@example.com
```

This command produces no output.

For more information, see How AWS Shield Works in the *AWS Shield Advanced Developer Guide*.

- For API details, see UpdateEmergencyContactSettings in *AWS CLI Command Reference*.

`update-subscription`

The following code example shows how to use `update-subscription`.

AWS CLI

To modify the account's AWS Shield Advanced subscription

The following `update-subscription` example enables auto-renewal of the AWS Shield Advanced subscription for the account.

```
aws shield update-subscription \
    --auto-renew ENABLED
```

This command produces no output.

For more information, see How AWS Shield Works in the *AWS Shield Advanced Developer Guide*.

- For API details, see UpdateSubscription in *AWS CLI Command Reference*.

Signer examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Signer.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Actions

`cancel-signing-profile`

The following code example shows how to use `cancel-signing-profile`.

AWS CLI

To delete a signing profile

The following `cancel-signing-profile` example removes an existing signing profile from AWS Signer.

```
aws signer cancel-signing-profile \
    --profile-name MyProfile1
```

This command produces no output.

- For API details, see CancelSigningProfile in *AWS CLI Command Reference*.

`describe-signing-job`

The following code example shows how to use `describe-signing-job`.

AWS CLI

To display details about a signing job

The following `describe-signing-job` example displays details about the specified signing job.

```
aws signer describe-signing-job \
    --job-id 2065c468-73e2-4385-a6c9-0123456789abc
```

Output:

```
{
    "status": "Succeeded",
    "completedAt": 1568412037,
    "platformId": "AmazonFreeRTOS-Default",
    "signingMaterial": {
        "certificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc"
    },

        }
    },
    "requestedBy": "arn:aws:iam::123456789012:user/maria",
    "createdAt": 1568412036
}
```

- For API details, see DescribeSigningJob in *AWS CLI Command Reference*.

`get-signing-platform`

The following code example shows how to use `get-signing-platform`.

AWS CLI

To display details about a signing platform

The following `get-signing-platform` example displays details about the specified signing platform.

```
aws signer get-signing-platform \
    --platform-id AmazonFreeRTOS-TI-CC3220SF
```

Output:

```
{
    "category": "AWS",
    "displayName": "Amazon FreeRTOS SHA1-RSA CC3220SF-Format",
    "target": "SHA1-RSA-TISHA1",
    "platformId": "AmazonFreeRTOS-TI-CC3220SF",
    "signingConfiguration": {
        "encryptionAlgorithmOptions": {
            "defaultValue": "RSA",
            "allowedValues": [
                "RSA"
            ]
        },
        "hashAlgorithmOptions": {
            "defaultValue": "SHA1",
            "allowedValues": [
                "SHA1"
            ]
        }
    },
    "maxSizeInMB": 16,
    "partner": "AmazonFreeRTOS",
    "signingImageFormat": {
        "defaultFormat": "JSONEmbedded",
        "supportedFormats": [
            "JSONEmbedded"
        ]
    }
}
```

- For API details, see GetSigningPlatform in *AWS CLI Command Reference*.

`get-signing-profile`

The following code example shows how to use `get-signing-profile`.

AWS CLI

To display details about a signing profile

The following `get-signing-profile` example displays details about the specified signing profile.

```
aws signer get-signing-profile \
    --profile-name MyProfile3
```

Output:

```
{
    "platformId": "AmazonFreeRTOS-TI-CC3220SF",
    "profileName": "MyProfile3",
    "status": "Active",
    "signingMaterial": {
        "certificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc"
    }
}
```

- For API details, see GetSigningProfile in *AWS CLI Command Reference*.

`list-signing-jobs`

The following code example shows how to use `list-signing-jobs`.

AWS CLI

To list all signing jobs

The following `list-signing-jobs` example displays details about all signing jobs for the account.

```
aws signer list-signing-jobs
```

In this example, two jobs are returned, one successful, and one failed.

```
{
    "jobs": [
        {
            "status": "Succeeded",
            "signingMaterial": {
                "certificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc"
            },
            "jobId": "2065c468-73e2-4385-a6c9-0123456789abc",
            "source": {
                "s3": {
                    "version": "PNyFaUTgsQh5ZdMCcoCe6pT1gOpgB_M4",
                    "bucketName": "signer-source",
                    "key": "MyCode.rb"
                }
            },
            "signedObject": {
                "s3": {
                    "bucketName": "signer-destination",
                    "key": "signed-2065c468-73e2-4385-a6c9-0123456789abc"
                }
            },
            "createdAt": 1568412036
        },
        {
            "status": "Failed",
            "source": {
                "s3": {
                    "version": "PNyFaUTgsQh5ZdMCcoCe6pT1gOpgB_M4",
                    "bucketName": "signer-source",
                    "key": "MyOtherCode.rb"
                }
            },
            "signingMaterial": {
                "certificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc"
            },
            "createdAt": 1568402690,
            "jobId": "74d9825e-22fc-4a0d-b962-0123456789abc"
        }
    ]
```

```
}
```

- For API details, see ListSigningJobs in *AWS CLI Command Reference*.

`list-signing-platforms`

The following code example shows how to use `list-signing-platforms`.

AWS CLI

To list all signing platforms

The following `list-signing-platforms` example displays details about all available signing platforms.

```
aws signer list-signing-platforms
```

Output:

```
{
    "platforms": [
        {
            "category": "AWS",
            "displayName": "AWS IoT Device Management SHA256-ECDSA ",
            "target": "SHA256-ECDSA",
            "platformId": "AWSIoTDeviceManagement-SHA256-ECDSA",
            "signingConfiguration": {
                "encryptionAlgorithmOptions": {
                    "defaultValue": "ECDSA",
                    "allowedValues": [
                        "ECDSA"
                    ]
                },
                "hashAlgorithmOptions": {
                    "defaultValue": "SHA256",
                    "allowedValues": [
                        "SHA256"
                    ]
                }
            },
            "maxSizeInMB": 2048,
            "partner": "AWSIoTDeviceManagement",
```

```
            "signingImageFormat": {
                "defaultFormat": "JSONDetached",
                "supportedFormats": [
                    "JSONDetached"
                ]
            }
        },
        {
            "category": "AWS",
            "displayName": "Amazon FreeRTOS SHA1-RSA CC3220SF-Format",
            "target": "SHA1-RSA-TISHA1",
            "platformId": "AmazonFreeRTOS-TI-CC3220SF",
            "signingConfiguration": {
                "encryptionAlgorithmOptions": {
                    "defaultValue": "RSA",
                    "allowedValues": [
                        "RSA"
                    ]
                },
                "hashAlgorithmOptions": {
                    "defaultValue": "SHA1",
                    "allowedValues": [
                        "SHA1"
                    ]
                }
            },
            "maxSizeInMB": 16,
            "partner": "AmazonFreeRTOS",
            "signingImageFormat": {
                "defaultFormat": "JSONEmbedded",
                "supportedFormats": [
                    "JSONEmbedded"
                ]
            }
        },
        {
            "category": "AWS",
            "displayName": "Amazon FreeRTOS SHA256-ECDSA",
            "target": "SHA256-ECDSA",
            "platformId": "AmazonFreeRTOS-Default",
            "signingConfiguration": {
                "encryptionAlgorithmOptions": {
                    "defaultValue": "ECDSA",
                    "allowedValues": [
```

```
                        "ECDSA"
                    ]
                },
                "hashAlgorithmOptions": {
                    "defaultValue": "SHA256",
                    "allowedValues": [
                        "SHA256"
                    ]
                }
            },
            "maxSizeInMB": 16,
            "partner": "AmazonFreeRTOS",
            "signingImageFormat": {
                "defaultFormat": "JSONEmbedded",
                "supportedFormats": [
                    "JSONEmbedded"
                ]
            }
        }
    ]
}
```

- For API details, see ListSigningPlatforms in *AWS CLI Command Reference*.

list-signing-profiles

The following code example shows how to use `list-signing-profiles`.

AWS CLI

To list all signing profiles

The following `list-signing-profiles` example displays details about all signing profiles for the account.

```
aws signer list-signing-profiles
```

Output:

```
{
    "profiles": [
        {
```

```
            "platformId": "AmazonFreeRTOS-TI-CC3220SF",
            "profileName": "MyProfile4",
            "status": "Active",
            "signingMaterial": {
                "certificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc"
            }
        },
        {
            "platformId": "AWSIoTDeviceManagement-SHA256-ECDSA",
            "profileName": "MyProfile5",
            "status": "Active",
            "signingMaterial": {
                "certificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc"
            }
        }
    ]
}
```

- For API details, see ListSigningProfiles in *AWS CLI Command Reference*.

`put-signing-profile`

The following code example shows how to use `put-signing-profile`.

AWS CLI

To create a signing profile

The following `put-signing-profile` example creates a signing profile using the specified certificate and platform.

```
aws signer put-signing-profile \
    --profile-name MyProfile6 \
    --signing-material certificateArn=arn:aws:acm:us-
west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc \
    --platform AmazonFreeRTOS-TI-CC3220SF
```

Output:

```
{
```

```
    "arn": "arn:aws:signer:us-west-2:123456789012:/signing-profiles/MyProfile6"
}
```

- For API details, see PutSigningProfile in *AWS CLI Command Reference*.

`start-signing-job`

The following code example shows how to use `start-signing-job`.

AWS CLI

To start a signing job

The following `start-signing-job` example starts a signing job on the code found at the specified source. It uses the specified profile to do the signing and places the signed code in the specified destination.

```
aws signer start-signing-job \
    --source 's3={bucketName=signer-
source,key=MyCode.rb,version=PNyFaUTgsQh5ZdMCcoCe6pT1gOpgB_M4}' \
    --destination 's3={bucketName=signer-destination,prefix=signed-}' \
    --profile-name MyProfile7
```

The output is the ID of the signing job.

```
{
    "jobId": "2065c468-73e2-4385-a6c9-0123456789abc"
}
```

- For API details, see StartSigningJob in *AWS CLI Command Reference*.

Snowball Edge examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Snowball Edge.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

`get-snowball-usage`

The following code example shows how to use `get-snowball-usage`.

AWS CLI

To get information about the Snowball service limit for your account

The following `get-snowball-usage` example displays information about the Snowball service limit for your account, and also the number of Snowballs your account has in use.

```
aws snowball get-snowball-usage
```

Output:

```
{
    "SnowballLimit": 1,
    "SnowballsInUse": 0
}
```

FOR more information, see AWS Snowball Edge Limits in the *AWS Snowball Developer Guide*.

- For API details, see GetSnowballUsage in *AWS CLI Command Reference*.

`list-jobs`

The following code example shows how to use `list-jobs`.

AWS CLI

To list the current Snowball jobs in your account

The following `list-jobs` example displays an array of `JobListEntry` objects. In this example, a single job is listed.

```
aws snowball list-jobs
```

Output:

```
{
    "JobListEntries": [
        {
            "CreationDate": 2016-09-27T14:50Z,
             "Description": "Important Photos 2016-08-11",
             "IsMaster": TRUE,
             "JobId": "ABCd1e324fe-022f-488e-a98b-3b0566063db1",
             "JobState": "Complete",
             "JobType": "IMPORT",
             "SnowballType": "EDGE"
        }
   ]
}
```

For more information, see Jobs for AWS Snowball Edge devices in the *AWS Snowball Developer Guide*.

- For API details, see ListJobs in *AWS CLI Command Reference*.

Amazon SNS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon SNS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Actions

`add-permission`

The following code example shows how to use `add-permission`.

AWS CLI

To add a permission to a topic

The following `add-permission` example adds the permission for AWS account `987654321098` to use the `Publish` action with the specified topic under AWS account `123456789012`.

```
aws sns add-permission \
    --topic-arn arn:aws:sns:us-west-2:123456789012:MyTopic \
    --label Publish-Permission \
    --aws-account-id 987654321098 \
    --action-name Publish
```

This command produces no output.

- For API details, see AddPermission in *AWS CLI Command Reference*.

`check-if-phone-number-is-opted-out`

The following code example shows how to use `check-if-phone-number-is-opted-out`.

AWS CLI

To check SMS message opt-out for a phone number

The following `check-if-phone-number-is-opted-out` example checks whether the specified phone number is opted out of receiving SMS messages from the current AWS account.

```
aws sns check-if-phone-number-is-opted-out \
    --phone-number +1555550100
```

Output:

```
{
    "isOptedOut": false
```

```
}
```

- For API details, see [CheckIfPhoneNumberIsOptedOut]() in *AWS CLI Command Reference*.

`confirm-subscription`

The following code example shows how to use `confirm-subscription`.

AWS CLI

To confirm a subscription

The following `confirm-subscription` command completes the confirmation process started when you subscribed to an SNS topic named `my-topic`. The --token parameter comes from the confirmation message sent to the notification endpoint specified in the subscribe call.

```
aws sns confirm-subscription \
    --topic-arn arn:aws:sns:us-west-2:123456789012:my-topic \
    --
token 2336412f37fb687f5d51e6e241d7700ae02f7124d8268910b858cb4db727ceeb2474bb937929d3bdd7ce5d
```

Output:

```
{
    "SubscriptionArn": "arn:aws:sns:us-west-2:123456789012:my-
topic:8a21d249-4329-4871-acc6-7be709c6ea7f"
}
```

- For API details, see [ConfirmSubscription]() in *AWS CLI Command Reference*.

`create-platform-application`

The following code example shows how to use `create-platform-application`.

AWS CLI

To create a platform application

The following `create-platform-application` example creates a Google Firebase platform application using the specified platform credential.

```
aws sns create-platform-application \
    --name MyApplication \
    --platform GCM \
    --attributes PlatformCredential=EXAMPLEabcd12345jklm67890stuv12345bcdef
```

Output:

```
{
    "PlatformApplicationArn": "arn:aws:sns:us-west-2:123456789012:app/GCM/
MyApplication"
}
```

- For API details, see CreatePlatformApplication in *AWS CLI Command Reference*.

`create-topic`

The following code example shows how to use `create-topic`.

AWS CLI

To create an SNS topic

The following `create-topic` example creates an SNS topic named `my-topic`.

```
aws sns create-topic \
    --name my-topic
```

Output:

```
{
    "ResponseMetadata": {
        "RequestId": "1469e8d7-1642-564e-b85d-a19b4b341f83"
    },
    "TopicArn": "arn:aws:sns:us-west-2:123456789012:my-topic"
}
```

For more information, see Using the AWS Command Line Interface with Amazon SQS and Amazon SNS in the *AWS Command Line Interface User Guide*.

- For API details, see CreateTopic in *AWS CLI Command Reference*.

`delete-endpoint`

The following code example shows how to use `delete-endpoint`.

AWS CLI

To delete a platform application endpoint

The following `delete-endpoint` example deletes the specified platform application endpoint.

```
aws sns delete-endpoint \
    --endpoint-arn arn:aws:sns:us-west-2:123456789012:endpoint/GCM/
MyApplication/12345678-abcd-9012-efgh-345678901234
```

This command produces no output.

- For API details, see [DeleteEndpoint](#) in *AWS CLI Command Reference*.

`delete-platform-application`

The following code example shows how to use `delete-platform-application`.

AWS CLI

To delete a platform application

The following `delete-platform-application` example deletes the specified platform application.

```
aws sns delete-platform-application \
    --platform-application-arn arn:aws:sns:us-west-2:123456789012:app/ADM/
MyApplication
```

This command produces no output.

- For API details, see [DeletePlatformApplication](#) in *AWS CLI Command Reference*.

`delete-topic`

The following code example shows how to use `delete-topic`.

AWS CLI

To delete an SNS topic

The following `delete-topic` example deletes the specified SNS topic.

```
aws sns delete-topic \
    --topic-arn "arn:aws:sns:us-west-2:123456789012:my-topic"
```

This command produces no output.

- For API details, see DeleteTopic in *AWS CLI Command Reference*.

`get-endpoint-attributes`

The following code example shows how to use `get-endpoint-attributes`.

AWS CLI

To list platform application endpoint attributes

The following `get-endpoint-attributes` example lists the attributes for the specified platform application endpoint.

```
aws sns get-endpoint-attributes \
    --endpoint-arn arn:aws:sns:us-west-2:123456789012:endpoint/GCM/
MyApplication/12345678-abcd-9012-efgh-345678901234
```

Output:

```
{
    "Attributes": {
        "Enabled": "true",
        "Token": "EXAMPLE12345..."
    }
}
```

- For API details, see GetEndpointAttributes in *AWS CLI Command Reference*.

`get-platform-application-attributes`

The following code example shows how to use `get-platform-application-attributes`.

AWS CLI

To list the platform application attributes

The following `get-platform-application-attributes` example lists the attributes for the specified platform application.

```
aws sns get-platform-application-attributes \
    --platform-application-arn arn:aws:sns:us-west-2:123456789012:app/MPNS/
MyApplication
```

Output:

```
{
    "Attributes": {
        "Enabled": "true",
        "SuccessFeedbackSampleRate": "100"
    }
}
```

- For API details, see GetPlatformApplicationAttributes in *AWS CLI Command Reference*.

`get-sms-attributes`

The following code example shows how to use `get-sms-attributes`.

AWS CLI

To list the default SMS message attributes

The following `get-sms-attributes` example lists the default attributes for sending SMS messages.

```
aws sns get-sms-attributes
```

Output:

```
{
    "attributes": {
        "DefaultSenderID": "MyName"
    }
```

```
}
```

- For API details, see GetSMSAttributes in *AWS CLI Command Reference*.

`get-subscription-attributes`

The following code example shows how to use `get-subscription-attributes`.

AWS CLI

To retrieve subscription attributes for a topic

The following `get-subscription-attributes` displays the attributes of the specified subscription. You can get the `subscription-arn` from the output of the `list-subscriptions` command.

```
aws sns get-subscription-attributes \
    --subscription-arn "arn:aws:sns:us-west-2:123456789012:my-
topic:8a21d249-4329-4871-acc6-7be709c6ea7f"
```

Output:

```
{
    "Attributes": {
        "Endpoint": "my-email@example.com",
        "Protocol": "email",
        "RawMessageDelivery": "false",
        "ConfirmationWasAuthenticated": "false",
        "Owner": "123456789012",
        "SubscriptionArn": "arn:aws:sns:us-west-2:123456789012:my-
topic:8a21d249-4329-4871-acc6-7be709c6ea7f",
        "TopicArn": "arn:aws:sns:us-west-2:123456789012:my-topic"
    }
}
```

- For API details, see GetSubscriptionAttributes in *AWS CLI Command Reference*.

`get-topic-attributes`

The following code example shows how to use `get-topic-attributes`.

AWS CLI

To retrieve the attributes of a topic

The following `get-topic-attributes` example displays the attributes for the specified topic.

```
aws sns get-topic-attributes \
    --topic-arn "arn:aws:sns:us-west-2:123456789012:my-topic"
```

Output:

```
{
    "Attributes": {
        "SubscriptionsConfirmed": "1",
        "DisplayName": "my-topic",
        "SubscriptionsDeleted": "0",
        "EffectiveDeliveryPolicy": "{\"http\":{\"defaultHealthyRetryPolicy\":
{\"minDelayTarget\":20,\"maxDelayTarget\":20,\"numRetries\":3,\"numMaxDelayRetries
\":0,\"numNoDelayRetries\":0,\"numMinDelayRetries\":0,\"backoffFunction\":\"linear
\"},\"disableSubscriptionOverrides\":false}}",
        "Owner": "123456789012",
        "Policy": "{\"Version\":\"2008-10-17\",\"Id\":\"__default_policy_ID\",
\"Statement\":[{\"Sid\":\"__default_statement_ID\",\"Effect\":\"Allow\",\"Principal
\":{\"AWS\":\"*\"},\"Action\":[\"SNS:Subscribe\",\"SNS:ListSubscriptionsByTopic
\",\"SNS:DeleteTopic\",\"SNS:GetTopicAttributes\",\"SNS:Publish\",
\"SNS:RemovePermission\",\"SNS:AddPermission\",\"SNS:SetTopicAttributes\"],
\"Resource\":\"arn:aws:sns:us-west-2:123456789012:my-topic\",\"Condition\":
{\"StringEquals\":{\"AWS:SourceOwner\":\"0123456789012\"}}}]}",
        "TopicArn": "arn:aws:sns:us-west-2:123456789012:my-topic",
        "SubscriptionsPending": "0"
    }
}
```

- For API details, see GetTopicAttributes in *AWS CLI Command Reference*.

`list-endpoints-by-platform-application`

The following code example shows how to use `list-endpoints-by-platform-application`.

AWS CLI

To list the endpoints for a platform application

The following `list-endpoints-by-platform-application` example lists the endpoints and endpoint attributes for the specified platform application.

```
aws sns list-endpoints-by-platform-application \
    --platform-application-arn arn:aws:sns:us-west-2:123456789012:app/GCM/
MyApplication
```

Output:

```
{
    "Endpoints": [
        {
            "Attributes": {
                "Token": "EXAMPLE12345...,
                "Enabled": "true"
            },
            "EndpointArn": "arn:aws:sns:us-west-2:123456789012:endpoint/GCM/
MyApplication/12345678-abcd-9012-efgh-345678901234"
        }
    ]
}
```

- For API details, see ListEndpointsByPlatformApplication in *AWS CLI Command Reference*.

`list-phone-numbers-opted-out`

The following code example shows how to use `list-phone-numbers-opted-out`.

AWS CLI

To list SMS message opt-outs

The following `list-phone-numbers-opted-out` example lists the phone numbers opted out of receiving SMS messages.

```
aws sns list-phone-numbers-opted-out
```

Output:

```
{
    "phoneNumbers": [
```

```
        "+15555550100"
    ]
}
```

- For API details, see ListPhoneNumbersOptedOut in *AWS CLI Command Reference*.

`list-platform-applications`

The following code example shows how to use `list-platform-applications`.

AWS CLI

To list platform applications

The following `list-platform-applications` example lists the platform applications for ADM and MPNS.

```
aws sns list-platform-applications
```

Output:

```
{
    "PlatformApplications": [
        {
            "PlatformApplicationArn": "arn:aws:sns:us-west-2:123456789012:app/ADM/
MyApplication",
            "Attributes": {
                "SuccessFeedbackSampleRate": "100",
                "Enabled": "true"
            }
        },
        {
            "PlatformApplicationArn": "arn:aws:sns:us-west-2:123456789012:app/MPNS/
MyOtherApplication",
            "Attributes": {
                "SuccessFeedbackSampleRate": "100",
                "Enabled": "true"
            }
        }
    ]
}
```

- For API details, see ListPlatformApplications in *AWS CLI Command Reference*.

`list-subscriptions-by-topic`

The following code example shows how to use `list-subscriptions-by-topic`.

AWS CLI

To list the subscriptions associated with a topic

The following `list-subscriptions-by-topic` retrieves a list of SNS subscriptions associated with the specified topic.

```
aws sns list-subscriptions-by-topic \
    --topic-arn "arn:aws:sns:us-west-2:123456789012:my-topic"
```

Output:

```
{
    "Subscriptions": [
        {
            "Owner": "123456789012",
            "Endpoint": "my-email@example.com",
            "Protocol": "email",
            "TopicArn": "arn:aws:sns:us-west-2:123456789012:my-topic",
            "SubscriptionArn": "arn:aws:sns:us-west-2:123456789012:my-
topic:8a21d249-4329-4871-acc6-7be709c6ea7f"
        }
    ]
}
```

- For API details, see ListSubscriptionsByTopic in *AWS CLI Command Reference*.

`list-subscriptions`

The following code example shows how to use `list-subscriptions`.

AWS CLI

To list your SNS subscriptions

The following `list-subscriptions` example displays a list of the SNS subscriptions in your AWS account.

```
aws sns list-subscriptions
```

Output:

```
{
    "Subscriptions": [
        {
            "Owner": "123456789012",
            "Endpoint": "my-email@example.com",
            "Protocol": "email",
            "TopicArn": "arn:aws:sns:us-west-2:123456789012:my-topic",
            "SubscriptionArn": "arn:aws:sns:us-west-2:123456789012:my-
topic:8a21d249-4329-4871-acc6-7be709c6ea7f"
        }
    ]
}
```

- For API details, see ListSubscriptions in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a topic

The following `list-tags-for-resource` example lists the tags for the specified Amazon SNS topic.

```
aws sns list-tags-for-resource \
    --resource-arn arn:aws:sns:us-west-2:123456789012:MyTopic
```

Output:

```
{
    "Tags": [
        {
```

```
                "Key": "Team",
                "Value": "Alpha"
            }
        ]
    }
```

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`list-topics`

The following code example shows how to use `list-topics`.

AWS CLI

To list your SNS topics

The following `list-topics` example lists all of SNS topics in your AWS account.

```
aws sns list-topics
```

Output:

```
{
    "Topics": [
        {
            "TopicArn": "arn:aws:sns:us-west-2:123456789012:my-topic"
        }
    ]
}
```

- For API details, see ListTopics in *AWS CLI Command Reference*.

`opt-in-phone-number`

The following code example shows how to use `opt-in-phone-number`.

AWS CLI

To opt-in for SMS messages

The following `opt-in-phone-number` example opts the specified phone number into receiving SMS messages.

```
aws sns opt-in-phone-number \
    --phone-number +15555550100
```

This command produces no output.

- For API details, see OptInPhoneNumber in *AWS CLI Command Reference*.

`publish`

The following code example shows how to use `publish`.

AWS CLI

Example 1: To publish a message to a topic

The following `publish` example publishes the specified message to the specified SNS topic. The message comes from a text file, which enables you to include line breaks.

```
aws sns publish \
    --topic-arn "arn:aws:sns:us-west-2:123456789012:my-topic" \
    --message file://message.txt
```

Contents of `message.txt`:

```
Hello World
Second Line
```

Output:

```
{
    "MessageId": "123a45b6-7890-12c3-45d6-111122223333"
}
```

Example 2: To publish an SMS message to a phone number

The following `publish` example publishes the message `Hello world!` to the phone number `+1-555-555-0100`.

```
aws sns publish \
    --message "Hello world!" \
```

```
    --phone-number +1-555-555-0100
```

Output:

```
{
    "MessageId": "123a45b6-7890-12c3-45d6-333322221111"
}
```

- For API details, see Publish in *AWS CLI Command Reference*.

`put-data-protection-policy`

The following code example shows how to use `put-data-protection-policy`.

AWS CLI

To set data protection policy

Example 1: To deny publishers from publishing messages with CreditCardNumber

The following `put-data-protection-policy` example denies publishers from publishing messages with CreditCardNumber.

```
aws sns put-data-protection-policy \
    --resource-arn arn:aws:sns:us-east-1:123456789012:mytopic \
    --data-protection-policy "{\"Name\":\"data_protection_policy\",\"Description
\":\"Example data protection policy\",\"Version\":\"2021-06-01\",\"Statement
\":[{\"DataDirection\":\"Inbound\",\"Principal\":[\"*\"],\"DataIdentifier\":
[\"arn:aws:dataprotection::aws:data-identifier/CreditCardNumber\"],\"Operation\":
{\"Deny\":{}}}]}"
```

This command produces no output.

Example 2: To load parameters from a file

The following `put-data-protection-policy` loads parameters from a file.

```
aws sns put-data-protection-policy \
    --resource-arn arn:aws:sns:us-west-2:123456789012:MyTopic \
    --data-protection-policy file://policy.json
```

This command produces no output.

- For API details, see PutDataProtectionPolicy in *AWS CLI Command Reference*.

`remove-permission`

The following code example shows how to use `remove-permission`.

AWS CLI

To remove a permission from a topic

The following `remove-permission` example removes the permission `Publish-Permission` from the specified topic.

```
aws sns remove-permission \
    --topic-arn arn:aws:sns:us-west-2:123456789012:MyTopic \
    --label Publish-Permission
```

This command produces no output.

- For API details, see RemovePermission in *AWS CLI Command Reference*.

`set-endpoint-attributes`

The following code example shows how to use `set-endpoint-attributes`.

AWS CLI

To set endpoint attributes

The following `set-endpoint-attributes` example disables the specified platform application endpoint.

```
aws sns set-endpoint-attributes \
    --endpoint-arn arn:aws:sns:us-west-2:123456789012:endpoint/GCM/
MyApplication/12345678-abcd-9012-efgh-345678901234 \
    --attributes Enabled=false
```

Output:

```
{
    "Attributes": {
        "Enabled": "false",
```

```
        "Token": "EXAMPLE12345..."
    }
}
```

- For API details, see SetEndpointAttributes in *AWS CLI Command Reference*.

`set-platform-application-attributes`

The following code example shows how to use `set-platform-application-attributes`.

AWS CLI

To set platform application attributes

The following `set-platform-application-attributes` example sets the `EventDeliveryFailure` attribute for the specified platform application to the ARN of the specified Amazon SNS topic.

```
aws sns set-platform-application-attributes \
    --platform-application-arn arn:aws:sns:us-west-2:123456789012:app/GCM/
MyApplication \
    --attributes EventDeliveryFailure=arn:aws:sns:us-
west-2:123456789012:AnotherTopic
```

This command produces no output.

- For API details, see SetPlatformApplicationAttributes in *AWS CLI Command Reference*.

`set-sms-attributes`

The following code example shows how to use `set-sms-attributes`.

AWS CLI

To set SMS message attributes

The following `set-sms-attributes` example sets the default sender ID for SMS messages to `MyName`.

```
aws sns set-sms-attributes \
    --attributes DefaultSenderID=MyName
```

This command produces no output.

- For API details, see SetSMSAttributes in *AWS CLI Command Reference*.

`set-subscription-attributes`

The following code example shows how to use `set-subscription-attributes`.

AWS CLI

To set subscription attributes

The following `set-subscription-attributes` example sets the `RawMessageDelivery` attribute to an SQS subscription.

```
aws sns set-subscription-attributes \
    --subscription-arn arn:aws:sns:us-
east-1:123456789012:mytopic:f248de18-2cf6-578c-8592-b6f1eaa877dc \
    --attribute-name RawMessageDelivery \
    --attribute-value true
```

This command produces no output.

The following `set-subscription-attributes` example sets a `FilterPolicy` attribute to an SQS subscription.

```
aws sns set-subscription-attributes \
    --subscription-arn arn:aws:sns:us-
east-1:123456789012:mytopic:f248de18-2cf6-578c-8592-b6f1eaa877dc \
    --attribute-name FilterPolicy \
    --attribute-value "{ \"anyMandatoryKey\": [\"any\", \"of\", \"these\"] }"
```

This command produces no output.

The following `set-subscription-attributes` example removes the `FilterPolicy` attribute from an SQS subscription.

```
aws sns set-subscription-attributes \
    --subscription-arn arn:aws:sns:us-
east-1:123456789012:mytopic:f248de18-2cf6-578c-8592-b6f1eaa877dc \
    --attribute-name FilterPolicy \
```

```
    --attribute-value "{}"
```

This command produces no output.

- For API details, see SetSubscriptionAttributes in *AWS CLI Command Reference*.

`set-topic-attributes`

The following code example shows how to use `set-topic-attributes`.

AWS CLI

To set an attribute for a topic

The following `set-topic-attributes` example sets the `DisplayName` attribute for the specified topic.

```
aws sns set-topic-attributes \
    --topic-arn arn:aws:sns:us-west-2:123456789012:MyTopic \
    --attribute-name DisplayName \
    --attribute-value MyTopicDisplayName
```

This command produces no output.

- For API details, see SetTopicAttributes in *AWS CLI Command Reference*.

`subscribe`

The following code example shows how to use `subscribe`.

AWS CLI

To subscribe to a topic

The following `subscribe` command subscribes an email address to the specified topic.

```
aws sns subscribe \
    --topic-arn arn:aws:sns:us-west-2:123456789012:my-topic \
    --protocol email \
    --notification-endpoint my-email@example.com
```

Output:

```
{
    "SubscriptionArn": "pending confirmation"
}
```

- For API details, see Subscribe in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add a tag to a topic

The following `tag-resource` example adds a metadata tag to the specified Amazon SNS topic.

```
aws sns tag-resource \
    --resource-arn arn:aws:sns:us-west-2:123456789012:MyTopic \
    --tags Key=Team,Value=Alpha
```

This command produces no output.

- For API details, see TagResource in *AWS CLI Command Reference*.

`unsubscribe`

The following code example shows how to use `unsubscribe`.

AWS CLI

To unsubscribe from a topic

The following `unsubscribe` example deletes the specified subscription from a topic.

```
aws sns unsubscribe \
    --subscription-arn arn:aws:sns:us-west-2:0123456789012:my-
topic:8a21d249-4329-4871-acc6-7be709c6ea7f
```

This command produces no output.

- For API details, see Unsubscribe in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a topic

The following `untag-resource` example removes any tags with the specified keys from the specified Amazon SNS topic.

```
aws sns untag-resource \
    --resource-arn arn:aws:sns:us-west-2:123456789012:MyTopic \
    --tag-keys Team
```

This command produces no output.

- For API details, see UntagResource in *AWS CLI Command Reference*.

Scenarios

Create a platform endpoint for push notifications

The following code example shows how to create a platform endpoint for Amazon SNS push notifications.

AWS CLI

To create a platform application endpoint

The following `create-platform-endpoint` example creates an endpoint for the specified platform application using the specified token.

```
aws sns create-platform-endpoint \
    --platform-application-arn arn:aws:sns:us-west-2:123456789012:app/GCM/
MyApplication \
    --token EXAMPLE12345...
```

Output:

```
{
      "EndpointArn": "arn:aws:sns:us-west-2:1234567890:endpoint/GCM/
MyApplication/12345678-abcd-9012-efgh-345678901234"
```

```
}
```

Amazon SQS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon SQS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`add-permission`

The following code example shows how to use `add-permission`.

AWS CLI

To add a permission to a queue

This example enables the specified AWS account to send messages to the specified queue.

Command:

```
aws sqs add-permission --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/
MyQueue --label SendMessagesFromMyQueue --aws-account-ids 12345EXAMPLE --
actions SendMessage
```

Output:

```
None.
```

- For API details, see AddPermission in *AWS CLI Command Reference*.

`cancel-message-move-task`

The following code example shows how to use `cancel-message-move-task`.

AWS CLI

To cancel a message move task

The following `cancel-message-move-task` example cancels the specified message move task.

```
aws sqs cancel-message-move-task \
    --task-handle AQEB6nR4...HzlvZQ==
```

Output:

```
{
    "ApproximateNumberOfMessagesMoved": 102
}
```

For more information, see Amazon SQS API permissions: Actions and resource reference in the *Developer Guide*.

- For API details, see CancelMessageMoveTask in *AWS CLI Command Reference*.

`change-message-visibility-batch`

The following code example shows how to use `change-message-visibility-batch`.

AWS CLI

To change multiple messages' timeout visibilities as a batch

This example changes the 2 specified messages' timeout visibilities to 10 hours (10 hours * 60 minutes * 60 seconds).

Command:

```
aws sqs change-message-visibility-batch --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue --entries file://change-message-visibility-batch.json
```

Input file (change-message-visibility-batch.json):

```
[
  {
    "Id": "FirstMessage",
        "ReceiptHandle": "AQEBhz2q...Jf3kaw==",
        "VisibilityTimeout": 36000
  },
  {
    "Id": "SecondMessage",
        "ReceiptHandle": "AQEBkTUH...HifSnw==",
        "VisibilityTimeout": 36000
  }
]
```

Output:

```
{
  "Successful": [
    {
      "Id": "SecondMessage"
    },
    {
      "Id": "FirstMessage"
    }
  ]
}
```

- For API details, see ChangeMessageVisibilityBatch in *AWS CLI Command Reference*.

`change-message-visibility`

The following code example shows how to use `change-message-visibility`.

AWS CLI

To change a message's timeout visibility

This example changes the specified message's timeout visibility to 10 hours (10 hours * 60 minutes * 60 seconds).

Command:

```
aws sqs change-message-visibility --queue-url https://sqs.us-
east-1.amazonaws.com/80398EXAMPLE/MyQueue --receipt-handle AQEBTpyI...t6HyQg== --
visibility-timeout 36000
```

Output:

```
None.
```

- For API details, see ChangeMessageVisibility in *AWS CLI Command Reference*.

`create-queue`

The following code example shows how to use `create-queue`.

AWS CLI

To create a queue

This example creates a queue with the specified name, sets the message retention period to 3 days (3 days * 24 hours * 60 minutes * 60 seconds), and sets the queue's dead letter queue to the specified queue with a maximum receive count of 1,000 messages.

Command:

```
aws sqs create-queue --queue-name MyQueue --attributes file://create-queue.json
```

Input file (create-queue.json):

```
{
  "RedrivePolicy": "{\"deadLetterTargetArn\":\"arn:aws:sqs:us-
east-1:80398EXAMPLE:MyDeadLetterQueue\",\"maxReceiveCount\":\"1000\"}",
  "MessageRetentionPeriod": "259200"
}
```

Output:

```
{
  "QueueUrl": "https://queue.amazonaws.com/80398EXAMPLE/MyQueue"
}
```

- For API details, see CreateQueue in *AWS CLI Command Reference*.

`delete-message-batch`

The following code example shows how to use `delete-message-batch`.

AWS CLI

To delete multiple messages as a batch

This example deletes the specified messages.

Command:

```
aws sqs delete-message-batch --queue-url https://sqs.us-
east-1.amazonaws.com/80398EXAMPLE/MyQueue --entries file://delete-message-batch.json
```

Input file (delete-message-batch.json):

```
[
  {
        "Id": "FirstMessage",
        "ReceiptHandle": "AQEB1mgl...Z4GuLw=="
  },
  {
    "Id": "SecondMessage",
        "ReceiptHandle": "AQEBLsYM...VQubAA=="
  }
]
```

Output:

```
{
  "Successful": [
    {
      "Id": "FirstMessage"
    },
    {
      "Id": "SecondMessage"
    }
  ]
}
```

- For API details, see DeleteMessageBatch in *AWS CLI Command Reference*.

`delete-message`

The following code example shows how to use `delete-message`.

AWS CLI

To delete a message

This example deletes the specified message.

Command:

```
aws sqs delete-message --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/
MyQueue --receipt-handle AQEBRXTo...q2doVA==
```

Output:

```
None.
```

- For API details, see DeleteMessage in *AWS CLI Command Reference*.

`delete-queue`

The following code example shows how to use `delete-queue`.

AWS CLI

To delete a queue

This example deletes the specified queue.

Command:

```
aws sqs delete-queue --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/
MyNewerQueue
```

Output:

```
None.
```

- For API details, see DeleteQueue in *AWS CLI Command Reference*.

`get-queue-attributes`

The following code example shows how to use `get-queue-attributes`.

AWS CLI

To get a queue's attributes

This example gets all of the specified queue's attributes.

Command:

```
aws sqs get-queue-attributes --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue --attribute-names All
```

Output:

```
{
  "Attributes": {
    "ApproximateNumberOfMessagesNotVisible": "0",
    "RedrivePolicy": "{\"deadLetterTargetArn\":\"arn:aws:sqs:us-
east-1:80398EXAMPLE:MyDeadLetterQueue\",\"maxReceiveCount\":1000}",
    "MessageRetentionPeriod": "345600",
    "ApproximateNumberOfMessagesDelayed": "0",
    "MaximumMessageSize": "262144",
    "CreatedTimestamp": "1442426968",
    "ApproximateNumberOfMessages": "0",
    "ReceiveMessageWaitTimeSeconds": "0",
    "DelaySeconds": "0",
    "VisibilityTimeout": "30",
    "LastModifiedTimestamp": "1442426968",
    "QueueArn": "arn:aws:sqs:us-east-1:80398EXAMPLE:MyNewQueue"
  }
}
```

This example gets only the specified queue's maximum message size and visibility timeout attributes.

Command:

```
aws sqs get-queue-attributes --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyNewQueue --attribute-names MaximumMessageSize VisibilityTimeout
```

Output:

```
{
  "Attributes": {
    "VisibilityTimeout": "30",
    "MaximumMessageSize": "262144"
  }
}
```

- For API details, see GetQueueAttributes in *AWS CLI Command Reference*.

`get-queue-url`

The following code example shows how to use `get-queue-url`.

AWS CLI

To get a queue URL

This example gets the specified queue's URL.

Command:

```
aws sqs get-queue-url --queue-name MyQueue
```

Output:

```
{
  "QueueUrl": "https://queue.amazonaws.com/80398EXAMPLE/MyQueue"
}
```

- For API details, see GetQueueUrl in *AWS CLI Command Reference*.

`list-dead-letter-source-queues`

The following code example shows how to use `list-dead-letter-source-queues`.

AWS CLI

To list dead letter source queues

This example lists the queues that are associated with the specified dead letter source queue.

Command:

```
aws sqs list-dead-letter-source-queues --queue-url https://sqs.us-
east-1.amazonaws.com/80398EXAMPLE/MyDeadLetterQueue
```

Output:

```
{
  "queueUrls": [
    "https://queue.amazonaws.com/80398EXAMPLE/MyQueue",
    "https://queue.amazonaws.com/80398EXAMPLE/MyOtherQueue"
  ]
}
```

- For API details, see ListDeadLetterSourceQueues in *AWS CLI Command Reference*.

`list-message-move-tasks`

The following code example shows how to use `list-message-move-tasks`.

AWS CLI

To list the message move tasks

The following `list-message-move-tasks` example lists the 2 most recent message move tasks in the specified queue.

```
aws sqs list-message-move-tasks \
    --source-arn arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue \
    --max-results 2
```

Output:

```
{
    "Results": [
        {
            "TaskHandle": "AQEB6nR4...HzlvZQ==",
            "Status": "RUNNING",
            "SourceArn": "arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue1",
            "DestinationArn": "arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue2",
            "MaxNumberOfMessagesPerSecond": 50,
```

```
                "ApproximateNumberOfMessagesMoved": 203,
                "ApproximateNumberOfMessagesToMove": 30,
                "StartedTimestamp": 1442428276921
            },

            {
                "Status": "COMPLETED",
                "SourceArn": "arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue1",
                "DestinationArn": "arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue2",
                "ApproximateNumberOfMessagesMoved": 29,
                "ApproximateNumberOfMessagesToMove": 0,
                "StartedTimestamp": 1342428272093
            }
        ]
}
```

For more information, see Amazon SQS API permissions: Actions and resource reference in the *Developer Guide*.

- For API details, see ListMessageMoveTasks in *AWS CLI Command Reference*.

`list-queue-tags`

The following code example shows how to use `list-queue-tags`.

AWS CLI

To list all cost allocation tags for a queue

The following `list-queue-tags` example displays all of the cost allocation tags associated with the specified queue.

```
aws sqs list-queue-tags \
    --queue-url https://sqs.us-west-2.amazonaws.com/123456789012/MyQueue
```

Output:

```
{
    "Tags": {
        "Team": "Alpha"
    }
}
```

For more information, see Listing Cost Allocation Tags in the *Amazon Simple Queue Service Developer Guide*.

- For API details, see ListQueueTags in *AWS CLI Command Reference*.

`list-queues`

The following code example shows how to use `list-queues`.

AWS CLI

To list queues

This example lists all queues.

Command:

```
aws sqs list-queues
```

Output:

```
{
  "QueueUrls": [
    "https://queue.amazonaws.com/80398EXAMPLE/MyDeadLetterQueue",
    "https://queue.amazonaws.com/80398EXAMPLE/MyQueue",
    "https://queue.amazonaws.com/80398EXAMPLE/MyOtherQueue",
    "https://queue.amazonaws.com/80398EXAMPLE/TestQueue1",
        "https://queue.amazonaws.com/80398EXAMPLE/TestQueue2"
  ]
}
```

This example lists only queues that start with "My".

Command:

```
aws sqs list-queues --queue-name-prefix My
```

Output:

```
{
  "QueueUrls": [
```

```
    "https://queue.amazonaws.com/80398EXAMPLE/MyDeadLetterQueue",
    "https://queue.amazonaws.com/80398EXAMPLE/MyQueue",
    "https://queue.amazonaws.com/80398EXAMPLE/MyOtherQueue"
  ]
}
```

- For API details, see ListQueues in *AWS CLI Command Reference*.

`purge-queue`

The following code example shows how to use `purge-queue`.

AWS CLI

To purge a queue

This example deletes all messages in the specified queue.

Command:

```
aws sqs purge-queue --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/
MyNewQueue
```

Output:

```
None.
```

- For API details, see PurgeQueue in *AWS CLI Command Reference*.

`receive-message`

The following code example shows how to use `receive-message`.

AWS CLI

To receive a message

This example receives up to 10 available messages, returning all available attributes.

Command:

```
aws sqs receive-message --queue-url https://sqs.us-
east-1.amazonaws.com/80398EXAMPLE/MyQueue --attribute-names All --message-attribute-
names All --max-number-of-messages 10
```

Output:

```
{
  "Messages": [
    {
      "Body": "My first message.",
      "ReceiptHandle": "AQEBzbVv...fqNzFw==",
      "MD5OfBody": "1000f835...a35411fa",
      "MD5OfMessageAttributes": "9424c491...26bc3ae7",
      "MessageId": "d6790f8d-d575-4f01-bc51-40122EXAMPLE",
      "Attributes": {
        "ApproximateFirstReceiveTimestamp": "1442428276921",
        "SenderId": "AIDAIAZKMSNQ7TEXAMPLE",
        "ApproximateReceiveCount": "5",
        "SentTimestamp": "1442428276921"
      },
      "MessageAttributes": {
        "PostalCode": {
          "DataType": "String",
          "StringValue": "ABC123"
        },
        "City": {
          "DataType": "String",
          "StringValue": "Any City"
        }
      }
    }
  ]
}
```

This example receives the next available message, returning only the SenderId and SentTimestamp attributes as well as the PostalCode message attribute.

Command:

```
aws sqs receive-message --queue-url https://sqs.us-
east-1.amazonaws.com/80398EXAMPLE/MyQueue --attribute-names SenderId SentTimestamp
 --message-attribute-names PostalCode
```

Output:

```
{
  "Messages": [
    {
      "Body": "My first message.",
      "ReceiptHandle": "AQEB6nR4...HzlvZQ==",
      "MD5OfBody": "1000f835...a35411fa",
      "MD5OfMessageAttributes": "b8e89563...e088e74f",
      "MessageId": "d6790f8d-d575-4f01-bc51-40122EXAMPLE",
      "Attributes": {
        "SenderId": "AIDAIAZKMSNQ7TEXAMPLE",
        "SentTimestamp": "1442428276921"
      },
      "MessageAttributes": {
        "PostalCode": {
          "DataType": "String",
          "StringValue": "ABC123"
        }
      }
    }
  ]
}
```

- For API details, see ReceiveMessage in *AWS CLI Command Reference*.

`remove-permission`

The following code example shows how to use `remove-permission`.

AWS CLI

To remove a permission

This example removes the permission with the specified label from the specified queue.

Command:

```
aws sqs remove-permission --queue-url https://sqs.us-
east-1.amazonaws.com/80398EXAMPLE/MyQueue --label SendMessagesFromMyQueue
```

Output:

```
None.
```

- For API details, see [RemovePermission](#) in *AWS CLI Command Reference*.

`send-message-batch`

The following code example shows how to use `send-message-batch`.

AWS CLI

To send multiple messages as a batch

This example sends 2 messages with the specified message bodies, delay periods, and message attributes, to the specified queue.

Command:

```
aws sqs send-message-batch --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue --entries file://send-message-batch.json
```

Input file (send-message-batch.json):

```
[
  {
    "Id": "FuelReport-0001-2015-09-16T140731Z",
        "MessageBody": "Fuel report for account 0001 on 2015-09-16 at 02:07:31 PM.",
        "DelaySeconds": 10,
        "MessageAttributes": {
          "SellerName": {
            "DataType": "String",
                "StringValue": "Example Store"
      },
          "City": {
        "DataType": "String",
        "StringValue": "Any City"
      },
          "Region": {
            "DataType": "String",
                "StringValue": "WA"
      },
          "PostalCode": {
```

```
            "DataType": "String",
                "StringValue": "99065"
          },
          "PricePerGallon": {
            "DataType": "Number",
                "StringValue": "1.99"
      }
        }
  },
  {
    "Id": "FuelReport-0002-2015-09-16T140930Z",
        "MessageBody": "Fuel report for account 0002 on 2015-09-16 at 02:09:30 PM.",
        "DelaySeconds": 10,
        "MessageAttributes": {
          "SellerName": {
            "DataType": "String",
                "StringValue": "Example Fuels"
      },
          "City": {
        "DataType": "String",
        "StringValue": "North Town"
      },
          "Region": {
            "DataType": "String",
                "StringValue": "WA"
      },
          "PostalCode": {
            "DataType": "String",
                "StringValue": "99123"
          },
          "PricePerGallon": {
            "DataType": "Number",
                "StringValue": "1.87"
      }
        }
  }
]
```

Output:

```
{
  "Successful": [
    {
```

```
      "MD5OfMessageBody": "203c4a38...7943237e",
      "MD5OfMessageAttributes": "10809b55...baf283ef",
      "Id": "FuelReport-0001-2015-09-16T140731Z",
      "MessageId": "d175070c-d6b8-4101-861d-adeb3EXAMPLE"
    },
    {
      "MD5OfMessageBody": "2cf0159a...c1980595",
      "MD5OfMessageAttributes": "55623928...ae354a25",
      "Id": "FuelReport-0002-2015-09-16T140930Z",
      "MessageId": "f9b7d55d-0570-413e-b9c5-a9264EXAMPLE"
    }
  ]
}
```

- For API details, see SendMessageBatch in *AWS CLI Command Reference*.

`send-message`

The following code example shows how to use `send-message`.

AWS CLI

To send a message

This example sends a message with the specified message body, delay period, and message attributes, to the specified queue.

Command:

```
aws sqs send-message --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/
MyQueue --message-body "Information about the largest city in Any Region." --delay-
seconds 10 --message-attributes file://send-message.json
```

Input file (send-message.json):

```
{
  "City": {
    "DataType": "String",
    "StringValue": "Any City"
  },
  "Greeting": {
    "DataType": "Binary",
    "BinaryValue": "Hello, World!"
```

```
  },
  "Population": {
    "DataType": "Number",
    "StringValue": "1250800"
  }
}
```

Output:

```
{
  "MD5OfMessageBody": "51b0a325...39163aa0",
  "MD5OfMessageAttributes": "00484c68...59e48f06",
  "MessageId": "da68f62c-0c07-4bee-bf5f-7e856EXAMPLE"
}
```

- For API details, see SendMessage in *AWS CLI Command Reference*.

`set-queue-attributes`

The following code example shows how to use `set-queue-attributes`.

AWS CLI

To set queue attributes

This example sets the specified queue to a delivery delay of 10 seconds, a maximum message size of 128 KB (128 KB * 1,024 bytes), a message retention period of 3 days (3 days * 24 hours * 60 minutes * 60 seconds), a receive message wait time of 20 seconds, and a default visibility timeout of 60 seconds. This example also associates the specified dead letter queue with a maximum receive count of 1,000 messages.

Command:

```
aws sqs set-queue-attributes --queue-url https://sqs.us-
east-1.amazonaws.com/80398EXAMPLE/MyNewQueue --attributes file://set-queue-
attributes.json
```

Input file (set-queue-attributes.json):

```
{
  "DelaySeconds": "10",
```

```
  "MaximumMessageSize": "131072",
  "MessageRetentionPeriod": "259200",
  "ReceiveMessageWaitTimeSeconds": "20",
  "RedrivePolicy": "{\"deadLetterTargetArn\":\"arn:aws:sqs:us-
east-1:80398EXAMPLE:MyDeadLetterQueue\",\"maxReceiveCount\":\"1000\"}",
  "VisibilityTimeout": "60"
}
```

Output:

```
None.
```

- For API details, see SetQueueAttributes in *AWS CLI Command Reference*.

`start-message-move-task`

The following code example shows how to use `start-message-move-task`.

AWS CLI

*Example 1: *To start a message move task**

The following `start-message-move-task` example starts a message move task to redrive messages from the specified dead-letter queue to the source queue.

```
aws sqs start-message-move-task \
    --source-arn arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue
```

Output:

```
{
    "TaskHandle": "AQEB6nR4...HzlvZQ=="
}
```

For more information, see This is the topic title in the *Name of your guide*.

*Example 2: *To start a message move task with a maximum rate**

The following `start-message-move-task` example starts a message move task to redrive messages from the specified dead-letter queue to the specified destination queue at a maximum rate of 50 messages per second.

```
aws sqs start-message-move-task \
    --source-arn arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue1 \
    --destination-arn arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue2 \
    --max-number-of-messages-per-second 50
```

Output:

```
{
    "TaskHandle": "AQEB6nR4...HzlvZQ=="
}
```

For more information, see Amazon SQS API permissions: Actions and resource reference in the *Developer Guide*.

- For API details, see StartMessageMoveTask in *AWS CLI Command Reference*.

tag-queue

The following code example shows how to use `tag-queue`.

AWS CLI

To add cost allocation tags to a queue

The following `tag-queue` example adds a cost allocation tag to the specified Amazon SQS queue.

```
aws sqs tag-queue \
    --queue-url https://sqs.us-west-2.amazonaws.com/123456789012/MyQueue \
    --tags Priority=Highest
```

This command produces no output.

For more information, see Adding Cost Allocation Tags in the *Amazon Simple Queue Service Developer Guide*.

- For API details, see TagQueue in *AWS CLI Command Reference*.

untag-queue

The following code example shows how to use `untag-queue`.

AWS CLI

To remove cost allocation tags from a queue

The following `untag-queue` example removes a cost allocation tag from the specified Amazon SQS queue.

```
aws sqs untag-queue \
    --queue-url https://sqs.us-west-2.amazonaws.com/123456789012/MyQueue \
    --tag-keys "Priority"
```

This command produces no output.

For more information, see Adding Cost Allocation Tags in the *Amazon Simple Queue Service Developer Guide*.

- For API details, see UntagQueue in *AWS CLI Command Reference*.

Storage Gateway examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Storage Gateway.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Actions

`describe-gateway-information`

The following code example shows how to use `describe-gateway-information`.

AWS CLI

To describe a gateway

The following `describe-gateway-information` command returns metadata about the specified gateway. To specify which gateway to describe, use the Amazon Resource Name (ARN) of the gateway in the command.

This examples specifies a gateway with the id `sgw-12A3456B` in account `123456789012`:

```
aws storagegateway describe-gateway-information --gateway-
arn "arn:aws:storagegateway:us-west-2:123456789012:gateway/sgw-12A3456B"
```

This command outputs a JSON block that contains metadata about about the gateway such as its name, network interfaces, configured time zone, and the state (whether the gateway is running or not).

- For API details, see DescribeGatewayInformation in *AWS CLI Command Reference*.

list-file-shares

The following code example shows how to use `list-file-shares`.

AWS CLI

To list file shares

The following `command-name` example lists the available widgets in your AWS account.

```
aws storagegateway list-file-shares \
    --gateway-arn arn:aws:storagegateway:us-east-1:209870788375:gateway/sgw-FB02E292
```

Output:

```
{
    "FileShareInfoList": [
        {
            "FileShareType": "NFS",
            "FileShareARN": "arn:aws:storagegateway:us-east-1:111122223333:share/
share-2FA12345",
            "FileShareId": "share-2FA12345",
            "FileShareStatus": "AVAILABLE",
            "GatewayARN": "arn:aws:storagegateway:us-east-1:111122223333:gateway/
sgw-FB0AAAAA"
        }
```

```
    ],
    "Marker": null
}
```

For more information, see ListFileShares in the *AWS Storage Gateway Service API Reference*.

- For API details, see ListFileShares in *AWS CLI Command Reference*.

`list-gateways`

The following code example shows how to use `list-gateways`.

AWS CLI

To list gateways for an account

The following `list-gateways` command lists all the gateways defined for an account:

```
aws storagegateway list-gateways
```

This command outputs a JSON block that contains a list of gateway Amazon Resource Names (ARNs).

- For API details, see ListGateways in *AWS CLI Command Reference*.

`list-volumes`

The following code example shows how to use `list-volumes`.

AWS CLI

To list the volumes configured for a gateway

The following `list-volumes` command returns a list of volumes configured for the specified gateway. To specify which gateway to describe, use the Amazon Resource Name (ARN) of the gateway in the command.

This examples specifies a gateway with the id `sgw-12A3456B` in account `123456789012`:

```
aws storagegateway list-volumes --gateway-arn "arn:aws:storagegateway:us-
west-2:123456789012:gateway/sgw-12A3456B"
```

This command outputs a JSON block that a list of volumes that includes the type and ARN for each volume.

- For API details, see ListVolumes in *AWS CLI Command Reference*.

`refresh-cache`

The following code example shows how to use `refresh-cache`.

AWS CLI

To refresh the file share cache

The following `refresh-cache` example refreshes the cache for the specified file share.

```
aws storagegateway refresh-cache \
    --file-share-arn arn:aws:storagegateway:us-east-1:111122223333:share/
share-2FA12345
```

Output:

```
{
    "FileShareARN": "arn:aws:storagegateway:us-east-1:111122223333:share/
share-2FA12345",
    "NotificationId": "4954d4b1-abcd-ef01-1234-97950a7d3483"
}
```

For more information, see ListFileShares in the *AWS Storage Gateway Service API Reference*.

- For API details, see RefreshCache in *AWS CLI Command Reference*.

AWS STS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS STS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

`assume-role-with-saml`

The following code example shows how to use `assume-role-with-saml`.

AWS CLI

To get short-term credentials for a role authenticated with SAML

The following `assume-role-with-saml` command retrieves a set of short-term credentials for the IAM role `TestSaml`. The request in this example is authenticated by using the SAML assertion supplied by your identity provider when you authenticate to it.

```
aws sts assume-role-with-saml \
    --role-arn arn:aws:iam::123456789012:role/TestSaml \
    --principal-arn arn:aws:iam::123456789012:saml-provider/SAML-test \
    --saml-
assertion "VERYLONGENCODEDASSERTIONEXAMPLExzYW1sOkF1ZGllbmNlPmJsYW5rPC9zYW1sOkF1ZGllbmNlPjwv
