            "provider": "OTHER",
            "roleArn": "arn:aws:iam::111122223333:role/AmazonEKSConnectorAgentRole"
        }
    }
}
```

For more information, see Connecting an external cluster in the *Amazon EKS User Guide*.

- For API details, see RegisterCluster in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

Example 1: To add the specified tags to an Amazon EKS Cluster

The following `tag-resource` example adds the specified tags to an Amazon EKS Cluster.

```
aws eks tag-resource \
    --resource-arn arn:aws:eks:us-east-2:111122223333:cluster/my-eks-cluster \
    --tag 'my-eks-cluster-test-1=test-value-1,my-eks-cluster-dev-1=dev-value-2'
```

This command produces no output.

Example 2: To add the specified tags to an Amazon EKS Node group

The following `tag-resource` example adds the specified tags to an Amazon EKS Node group.

```
aws eks tag-resource \
    --resource-arn arn:aws:eks:us-east-2:111122223333:nodegroup/my-eks-cluster/my-
eks-managed-node-group/60c71ed2-2cfb-020f-a5f4-ad32477f198c \
    --tag 'my-eks-nodegroup-test-1=test-value-1,my-eks-nodegroup-dev-1=dev-value-2'
```

This command produces no output.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

Example 1: To deletes the specified tags from an Amazon EKS Cluster

The following `untag-resource` example deletes the specified tags from an Amazon EKS Cluster.

```
aws eks untag-resource \
    --resource-arn arn:aws:eks:us-east-2:111122223333:cluster/my-eks-cluster \
    --tag-keys "my-eks-cluster-test-1" "my-eks-cluster-dev-1"
```

This command produces no output.

Example 2: To deletes the specified tags from an Amazon EKS Node group

The following `untag-resource` example deletes the specified tags from an Amazon EKS Node group.

```
aws eks untag-resource \
    --resource-arn arn:aws:eks:us-east-2:111122223333:nodegroup/my-eks-cluster/my-
eks-managed-node-group/60c71ed2-2cfb-020f-a5f4-ad32477f198c \
    --tag-keys "my-eks-nodegroup-test-1" "my-eks-nodegroup-dev-1"
```

This command produces no output.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-access-entry`

The following code example shows how to use `update-access-entry`.

AWS CLI

To update an access entry for an EKS cluster

The following `update-access-entry` updates an access entry for the EKS cluster by adding the Kubernetes group `tester`.

```
aws eks update-access-entry \
    --cluster-name eks-customer \
    --principal-arn arn:aws:iam::111122223333:role/Admin \
    --kubernetes-groups tester
```

Output:

```
{
    "accessEntry": {
        "clusterName": "eks-customer",
        "principalArn": "arn:aws:iam::111122223333:role/Admin",
        "kubernetesGroups": [
            "tester"
        ],
        "accessEntryArn": "arn:aws:eks:us-west-2:111122223333:access-entry/eks-
customer/role/111122223333/Admin/d2cb8183-d6ec-b82a-d967-eca21902a4b4",
        "createdAt": "2025-05-24T11:02:04.432000-05:00",
        "modifiedAt": "2025-05-24T17:08:01.608000-05:00",
        "tags": {},
        "username": "arn:aws:sts::111122223333:assumed-role/Admin/{{SessionName}}",
        "type": "STANDARD"
    }
}
```

For more information, see Update access entries in the *Amazon EKS User Guide*.

- For API details, see UpdateAccessEntry in *AWS CLI Command Reference*.

`update-addon`

The following code example shows how to use `update-addon`.

AWS CLI

Example 1. To update an Amazon EKS add-on with service account role ARN

The following `update-addon` example command updates an Amazon EKS add-on with service account role ARN.

```
aws eks update-addon \
    --cluster-name my-eks-cluster \
    --addon-name vpc-cni \
    --service-account-role-arn arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-
addon-vpc-cni-Role1-YfakrqOC1UTm
```

Output:

```
{
    "update": {
        "id": "c00d2de2-c2e4-3d30-929e-46b8edec2ce4",
        "status": "InProgress",
        "type": "AddonUpdate",
        "params": [
            {
                "type": "ServiceAccountRoleArn",
                "value": "arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-
addon-vpc-cni-Role1-YfakrqOC1UTm"
            }
        ],
        "updatedAt": "2024-04-12T16:04:55.614000-04:00",
        "errors": []
    }
}
```

For more information, see Managing Amazon EKS add-ons - Updating an add-on in the *Amazon EKS User Guide*.

Example 2. To update an Amazon EKS add-on with specific add-on version

The following `update-addon` example command updates an Amazon EKS add-on with specific add-on version.

```
aws eks update-addon \
    --cluster-name my-eks-cluster \
```

```
    --addon-name vpc-cni \
    --service-account-role-arn arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-
addon-vpc-cni-Role1-YfakrqOC1UTm \
    --addon-version v1.16.4-eksbuild.2
```

Output:

```
{
    "update": {
        "id": "f58dc0b0-2b18-34bd-bc6a-e4abc0011f36",
        "status": "InProgress",
        "type": "AddonUpdate",
        "params": [
            {
                "type": "AddonVersion",
                "value": "v1.16.4-eksbuild.2"
            },
            {
                "type": "ServiceAccountRoleArn",
                "value": "arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-
addon-vpc-cni-Role1-YfakrqOC1UTm"
            }
        ],
        "createdAt": "2024-04-12T16:07:16.550000-04:00",
        "errors": []
    }
}
```

For more information, see Managing Amazon EKS add-ons - Updating an add-on in the *Amazon EKS User Guide*.

Example 3. To update an Amazon EKS add-on with custom configuration values and resolve conflicts details

The following `update-addon` example command updates an Amazon EKS add-on with custom configuration values and resolve conflicts details.

```
aws eks update-addon \
    --cluster-name my-eks-cluster \
    --addon-name vpc-cni \
    --service-account-role-arn arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-
addon-vpc-cni-Role1-YfakrqOC1UTm \
    --addon-version v1.16.4-eksbuild.2 \
```

```
    --configuration-values '{"resources": {"limits":{"cpu":"100m"}, "requests":
{"cpu":"50m"}}}' \
    --resolve-conflicts PRESERVE
```

Output:

```
{
    "update": {
        "id": "cd9f2173-a8d8-3004-a90f-032f14326520",
        "status": "InProgress",
        "type": "AddonUpdate",
        "params": [
            {
                "type": "AddonVersion",
                "value": "v1.16.4-eksbuild.2"
            },
            {
                "type": "ServiceAccountRoleArn",
                "value": "arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-
addon-vpc-cni-Role1-YfakrqOC1UTm"
            },
            {
                "type": "ResolveConflicts",
                "value": "PRESERVE"
            },
            {
                "type": "ConfigurationValues",
                "value": "{\"resources\": {\"limits\":{\"cpu\":\"100m\"}, \"requests
\":{\"cpu\":\"50m\"}}}"
            }
        ],
        "createdAt": "2024-04-12T16:16:27.363000-04:00",
        "errors": []
    }
}
```

For more information, see Managing Amazon EKS add-ons - Updating an add-on in the *Amazon EKS User Guide*.

Example 4. To update an Amazon EKS add-on with custom JSON configuration values file

The following `update-addon` example command updates an Amazon EKS add-on with custom JSON configuration values and resolve conflicts details.

```
aws eks update-addon \
    --cluster-name my-eks-cluster \
    --addon-name vpc-cni \
    --service-account-role-arn arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-addon-vpc-cni-Role1-YfakrqOC1UTm \
    --addon-version v1.17.1-eksbuild.1 \
    --configuration-values 'file://configuration-values.json' \
    --resolve-conflicts PRESERVE
```

Contents of `configuration-values.json`:

```
{
    "resources": {
        "limits": {
            "cpu": "100m"
        },
        "requests": {
            "cpu": "50m"
        }
    },
    "env": {
        "AWS_VPC_K8S_CNI_LOGLEVEL": "ERROR"
    }
}
```

Output:

```
{
    "update": {
        "id": "6881a437-174f-346b-9a63-6e91763507cc",
        "status": "InProgress",
        "type": "AddonUpdate",
        "params": [
            {
                "type": "AddonVersion",
                "value": "v1.17.1-eksbuild.1"
            },
            {
                "type": "ServiceAccountRoleArn",
                "value": "arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-addon-vpc-cni-Role1-YfakrqOC1UTm"
            },
```

```
            {
                "type": "ResolveConflicts",
                "value": "PRESERVE"
            },
            {
                "type": "ConfigurationValues",
                "value": "{\n    \"resources\": {\n        \"limits\": {\n
  \"cpu\": \"100m\"\n        },\n        \"requests\": {\n            \"cpu\": \"50m
\"\n        }\n    },\n    \"env\": {\n        \"AWS_VPC_K8S_CNI_LOGLEVEL\": \"ERROR
\"\n    }\n}"
            }
        ],
        "createdAt": "2024-04-12T16:22:55.519000-04:00",
        "errors": []
    }
}
```

For more information, see Managing Amazon EKS add-ons - Updating an add-on in the *Amazon EKS User Guide*.

Example 5. To update an Amazon EKS add-on with custom YAML configuration values file

The following `update-addon` example command updates an Amazon EKS add-on with custom YAML configuration values and resolve conflicts details.

```
aws eks update-addon \
    --cluster-name my-eks-cluster \
    --addon-name vpc-cni \
    --service-account-role-arn arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-
addon-vpc-cni-Role1-YfakrqOC1UTm \
    --addon-version v1.18.0-eksbuild.1 \
    --configuration-values 'file://configuration-values.yaml' \
    --resolve-conflicts PRESERVE
```

Contents of `configuration-values.yaml`:

```
resources:
    limits:
        cpu: '100m'
    requests:
        cpu: '50m'
env:
```

```
    AWS_VPC_K8S_CNI_LOGLEVEL: 'DEBUG'
```

Output:

```
{
    "update": {
        "id": "a067a4c9-69d0-3769-ace9-d235c5b16701",
        "status": "InProgress",
        "type": "AddonUpdate",
        "params": [
            {
                "type": "AddonVersion",
                "value": "v1.18.0-eksbuild.1"
            },
            {
                "type": "ServiceAccountRoleArn",
                "value": "arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-
addon-vpc-cni-Role1-YfakrqOC1UTm"
            },
            {
                "type": "ResolveConflicts",
                "value": "PRESERVE"
            },
            {
                "type": "ConfigurationValues",
                "value": "resources:\n    limits:\n        cpu: '100m'\n
 requests:\n        cpu: '50m'\nenv:\n    AWS_VPC_K8S_CNI_LOGLEVEL: 'DEBUG'"
            }
        ],
        "createdAt": "2024-04-12T16:25:07.212000-04:00",
        "errors": []
    }
}
```

For more information, see Managing Amazon EKS add-ons - Updating an add-on in the *Amazon EKS User Guide*.

- For API details, see UpdateAddon in *AWS CLI Command Reference*.

`update-cluster-config`

The following code example shows how to use `update-cluster-config`.

AWS CLI

To update cluster endpoint access

This example command updates a cluster to disable endpoint public access and enable private endpoint access.

Command:

```
aws eks update-cluster-config --name example \
--resources-vpc-config endpointPublicAccess=false,endpointPrivateAccess=true
```

Output:

```
{
    "update": {
        "id": "ec883c93-2e9e-407c-a22f-8f6fa6e67d4f",
        "status": "InProgress",
        "type": "EndpointAccessUpdate",
        "params": [
            {
                "type": "EndpointPublicAccess",
                "value": "false"
            },
            {
                "type": "EndpointPrivateAccess",
                "value": "true"
            }
        ],
        "createdAt": 1565806986.506,
        "errors": []
    }
}
```

To enable logging for a cluster

This example command enables all cluster control plane logging types for a cluster named `example`.

Command:

```
aws eks update-cluster-config --name example \
```

```
--logging '{"clusterLogging":[{"types":
["api","audit","authenticator","controllerManager","scheduler"],"enabled":true}]}'
```

Output:

```
{
    "update": {
        "id": "7551c64b-1d27-4b1e-9f8e-c45f056eb6fd",
        "status": "InProgress",
        "type": "LoggingUpdate",
        "params": [
            {
                "type": "ClusterLogging",
                "value": "{\"clusterLogging\":[{\"types\":[\"api\",\"audit\",
\"authenticator\",\"controllerManager\",\"scheduler\"],\"enabled\":true}]}"
            }
        ],
        "createdAt": 1565807210.37,
        "errors": []
    }
}
```

- For API details, see UpdateClusterConfig in *AWS CLI Command Reference*.

`update-cluster-version`

The following code example shows how to use `update-cluster-version`.

AWS CLI

To updates an Amazon EKS cluster named `my-eks-cluster` to the specified Kubernetes version

The following `update-cluster-version` example updates an Amazon EKS cluster to the specified Kubernetes version.

```
aws eks update-cluster-version \
    --name my-eks-cluster \
    --kubernetes-version 1.27
```

Output:

```
{
    "update": {
        "id": "e4091a28-ea14-48fd-a8c7-975aeb469e8a",
        "status": "InProgress",
        "type": "VersionUpdate",
        "params": [
            {
                "type": "Version",
                "value": "1.27"
            },
            {
                "type": "PlatformVersion",
                "value": "eks.16"
            }
        ],
        "createdAt": "2024-04-12T16:56:01.082000-04:00",
        "errors": []
    }
}
```

For more information, see Updating an Amazon EKS cluster Kubernetes version in the *Amazon EKS User Guide*.

- For API details, see UpdateClusterVersion in *AWS CLI Command Reference*.

`update-kubeconfig`

The following code example shows how to use `update-kubeconfig`.

AWS CLI

Example 1: Configures your kubectl by creating or updating the kubeconfig so that you can connect to an Amazon EKS Cluster named `my-eks-cluster`

The following `update-kubeconfig` example configures your kubectl by creating or updating the kubeconfig so that you can connect to an Amazon EKS Cluster named my-eks-cluster.

```
aws eks update-kubeconfig \
    --name my-eks-cluster
```

Output:

```
Updated context arn:aws:eks:us-east-2:111122223333:cluster/my-eks-cluster in /Users/
xxx/.kube/config
```

For more information, see [Creating or updating a kubeconfig file for an Amazon EKS cluster]() in the *Amazon EKS User Guide*.

Example 2: Configures your kubectl by creating or updating the kubeconfig (with role-arn option to assume a role for cluster authentication) so that you can connect to an Amazon EKS Cluster named `my-eks-cluster`

The following `update-kubeconfig` example configures your kubectl by creating or updating the kubeconfig (with role-arn option to assume a role for cluster authentication) so that you can connect to an Amazon EKS Cluster named my-eks-cluster.

```
aws eks update-kubeconfig \
    --name my-eks-cluster \
    --role-arn arn:aws:iam::111122223333:role/eksctl-EKS-Linux-Cluster-v1-24-
cluster-ServiceRole-j1k7AfTIQtnM
```

Output:

```
Updated context arn:aws:eks:us-east-2:111122223333:cluster/my-eks-cluster in /Users/
xxx/.kube/config
```

For more information, see [Creating or updating a kubeconfig file for an Amazon EKS cluster]() in the *Amazon EKS User Guide*.

Example 3: Configures your kubectl by creating or updating the kubeconfig (with role-arn option to assume a role for cluster authentication along with custom cluster alias and user-alias) so that you can connect to an Amazon EKS Cluster named `my-eks-cluster`

The following `update-kubeconfig` example configures your kubectl by creating or updating the kubeconfig (with role-arn option to assume a role for cluster authentication along with custom cluster alias and user-alias) so that you can connect to an Amazon EKS Cluster named my-eks-cluster.

```
aws eks update-kubeconfig \
    --name my-eks-cluster \
    --role-arn arn:aws:iam::111122223333:role/eksctl-EKS-Linux-Cluster-v1-24-
cluster-ServiceRole-j1k7AfTIQtnM \
```

```
    --alias stage-eks-cluster \
    --user-alias john
```

Output:

```
Updated context stage-eks-cluster in /Users/dubaria/.kube/config
```

For more information, see [Creating or updating a kubeconfig file for an Amazon EKS cluster]() in the *Amazon EKS User Guide*.

Example 4: Print kubeconfig file entries for review and configures your kubectl so that you can connect to an Amazon EKS Cluster named `my-eks-cluster`

The following `update-kubeconfig` example configures your kubectl by creating or updating the kubeconfig (with role-arn option to assume a role for cluster authentication along with custom cluster alias and user-alias) so that you can connect to an Amazon EKS Cluster named my-eks-cluster.

```
aws eks update-kubeconfig \
    --name my-eks-cluster \
    --role-arn arn:aws:iam::111122223333:role/eksctl-EKS-Linux-Cluster-v1-24-
cluster-ServiceRole-j1k7AfTIQtnM \
    --alias stage-eks-cluster \
    --user-alias john \
    --verbose
```

Output:

```
Updated context stage-eks-cluster in /Users/dubaria/.kube/config
Entries:

context:

For more information, see Creating or updating a kubeconfig file for an Amazon EKS cluster in the *Amazon EKS User Guide*.

- For API details, see UpdateKubeconfig in *AWS CLI Command Reference*.

`update-nodegroup-config`

The following code example shows how to use `update-nodegroup-config`.

AWS CLI

Example 1: Update a managed node group to add new labels and taint to EKS worker node for an Amazon EKS cluster

The following `update-nodegroup-config` example updates a managed node group to add new labels and taint to EKS worker node for an Amazon EKS cluster.

```
aws eks update-nodegroup-config \
    --cluster-name my-eks-cluster \
    --nodegroup-name my-eks-nodegroup \
    --labels 'addOrUpdateLabels={my-eks-nodegroup-label-1=value-1,my-eks-nodegroup-
label-2=value-2}' \
    --taints 'addOrUpdateTaints=[{key=taint-key-1,value=taint-
value-1,effect=NO_EXECUTE}]'
```

Output:

```
{
    "update": {
        "id": "e66d21d3-bd8b-3ad1-a5aa-b196dc08c7c1",
        "status": "InProgress",
        "type": "ConfigUpdate",
        "params": [
            {
                "type": "LabelsToAdd",
                "value": "{\"my-eks-nodegroup-label-2\":\"value-2\",\"my-eks-
nodegroup-label-1\":\"value-1\"}"
            },
            {
                "type": "TaintsToAdd",
                "value": "[{\"effect\":\"NO_EXECUTE\",\"value\":\"taint-value-1\",
\"key\":\"taint-key-1\"}]"
            }
        ],
        "createdAt": "2024-04-08T12:05:19.161000-04:00",
        "errors": []
    }
}
```

For more information, see Updating a managed node group in the *Amazon EKS User Guide*.

Example 2: Update a managed node group to remove labels and taint for the EKS worker node for an Amazon EKS cluster

The following `update-nodegroup-config` example updates a managed node group to remove labels and taint for the EKS worker node for an Amazon EKS cluster.

```
aws eks update-nodegroup-config \
    --cluster-name my-eks-cluster \
    --nodegroup-name my-eks-nodegroup \
    --labels 'removeLabels=my-eks-nodegroup-label-1, my-eks-nodegroup-label-2' \
    --taints 'removeTaints=[{key=taint-key-1,value=taint-
value-1,effect=NO_EXECUTE}]'
```

Output:

```
{
```

```
    "update": {
        "id": "67a08692-9e59-3ace-a916-13929f44cec3",
        "status": "InProgress",
        "type": "ConfigUpdate",
        "params": [
            {
                "type": "LabelsToRemove",
                "value": "[\"my-eks-nodegroup-label-1\",\"my-eks-nodegroup-
label-2\"]"
            },
            {
                "type": "TaintsToRemove",
                "value": "[{\"effect\":\"NO_EXECUTE\",\"value\":\"taint-value-1\",
\"key\":\"taint-key-1\"}]"
            }
        ],
        "createdAt": "2024-04-08T12:17:31.817000-04:00",
        "errors": []
    }
}
```

For more information, see Updating a managed node group in the *Amazon EKS User Guide*.

Example 3: Update a managed node group to remove and add labels and taint for the EKS worker node for an Amazon EKS cluster

The following `update-nodegroup-config` example updates a managed node group to remove and add labels and taint for the EKS worker node for an Amazon EKS cluster.

```
aws eks update-nodegroup-config \
    --cluster-name my-eks-cluster \
    --nodegroup-name my-eks-nodegroup \
    --labels 'addOrUpdateLabels={my-eks-nodegroup-new-label-1=new-value-1,my-eks-
nodegroup-new-label-2=new-value-2},removeLabels=my-eks-nodegroup-label-1, my-eks-
nodegroup-label-2' \
    --taints 'addOrUpdateTaints=[{key=taint-new-key-1,value=taint-new-
value-1,effect=PREFER_NO_SCHEDULE}],removeTaints=[{key=taint-key-1,value=taint-
value-1,effect=NO_EXECUTE}]'
```

Output:

```
{
    "update": {
```

```
        "id": "4a9c8c45-6ac7-3115-be71-d6412a2339b7",
        "status": "InProgress",
        "type": "ConfigUpdate",
        "params": [
            {
                "type": "LabelsToAdd",
                "value": "{\"my-eks-nodegroup-new-label-1\":\"new-value-1\",\"my-
eks-nodegroup-new-label-2\":\"new-value-2\"}"
            },
            {
                "type": "LabelsToRemove",
                "value": "[\"my-eks-nodegroup-label-1\",\"my-eks-nodegroup-
label-2\"]"
            },
            {
                "type": "TaintsToAdd",
                "value": "[{\"effect\":\"PREFER_NO_SCHEDULE\",\"value\":\"taint-new-
value-1\",\"key\":\"taint-new-key-1\"}]"
            },
            {
                "type": "TaintsToRemove",
                "value": "[{\"effect\":\"NO_EXECUTE\",\"value\":\"taint-value-1\",
\"key\":\"taint-key-1\"}]"
            }
        ],
        "createdAt": "2024-04-08T12:30:55.486000-04:00",
        "errors": []
    }
}
```

For more information, see Updating a managed node group in the *Amazon EKS User Guide*.

Example 4: Update a managed node group to update scaling-config and update-config for the EKS worker node for an Amazon EKS cluster

The following `update-nodegroup-config` example updates a managed node group to update scaling-config and update-config for the EKS worker node for an Amazon EKS cluster.

```
aws eks update-nodegroup-config \
    --cluster-name my-eks-cluster \
    --nodegroup-name my-eks-nodegroup \
    --scaling-config minSize=1,maxSize=5,desiredSize=2 \
    --update-config maxUnavailable=2
```

Output:

```
{
    "update": {
        "id": "a977160f-59bf-3023-805d-c9826e460aea",
        "status": "InProgress",
        "type": "ConfigUpdate",
        "params": [
            {
                "type": "MinSize",
                "value": "1"
            },
            {
                "type": "MaxSize",
                "value": "5"
            },
            {
                "type": "DesiredSize",
                "value": "2"
            },
            {
                "type": "MaxUnavailable",
                "value": "2"
            }
        ],
        "createdAt": "2024-04-08T12:35:17.036000-04:00",
        "errors": []
    }
}
```

For more information, see Updating a managed node group in the *Amazon EKS User Guide*.

- For API details, see UpdateNodegroupConfig in *AWS CLI Command Reference*.

`update-nodegroup-version`

The following code example shows how to use `update-nodegroup-version`.

AWS CLI

Example 1: Update the Kubernetes version or AMI version of an Amazon EKS managed node group

The following `update-nodegroup-version` example updates the Kubernetes version or AMI version of an Amazon EKS managed node group to the latest available version for your Kubernetes cluster.

```
aws eks update-nodegroup-version \
    --cluster-name my-eks-cluster \
    --nodegroup-name my-eks-nodegroup \
    --no-force
```

Output:

```
{
    "update": {
        "id": "a94ebfc3-6bf8-307a-89e6-7dbaa36421f7",
        "status": "InProgress",
        "type": "VersionUpdate",
        "params": [
            {
                "type": "Version",
                "value": "1.26"
            },
            {
                "type": "ReleaseVersion",
                "value": "1.26.12-20240329"
            }
        ],
        "createdAt": "2024-04-08T13:16:00.724000-04:00",
        "errors": []
    }
}
```

For more information, see Updating a managed node group in the *Amazon EKS User Guide*.

Example 2: Update the Kubernetes version or AMI version of an Amazon EKS managed node group

The following `update-nodegroup-version` example updates the Kubernetes version or AMI version of an Amazon EKS managed node group to the specified AMI release version.

```
aws eks update-nodegroup-version \
    --cluster-name my-eks-cluster \
```

```
    --nodegroup-name my-eks-nodegroup \
    --kubernetes-version '1.26' \
    --release-version '1.26.12-20240307' \
    --no-force
```

Output:

```
{
    "update": {
        "id": "4db06fe1-088d-336b-bdcd-3fdb94995fb7",
        "status": "InProgress",
        "type": "VersionUpdate",
        "params": [
            {
                "type": "Version",
                "value": "1.26"
            },
            {
                "type": "ReleaseVersion",
                "value": "1.26.12-20240307"
            }
        ],
        "createdAt": "2024-04-08T13:13:58.595000-04:00",
        "errors": []
    }
}
```

For more information, see Updating a managed node group - <https://docs.aws.amazon.com/eks/latest/userguide/update-managed-node-group.html>` in the *Amazon EKS User Guide*.

- For API details, see UpdateNodegroupVersion in *AWS CLI Command Reference*.

`update-pod-identity-association`

The following code example shows how to use `update-pod-identity-association`.

AWS CLI

To update the EKS Pod Identity association

The following `update-pod-identity-association` example updates an EKS Pod Identity association by changing the associated IAM role from `arn:aws:iam::111122223333:role/`

`my-role` to `arn:aws:iam::111122223333:role/s3-role` for association ID `a-9njjin9gfghecgocd`. This API only allows updating the associated IAM role.

```
aws eks update-pod-identity-association \
    --cluster-name eks-customer \
    --association-id a-9njjin9gfghecgocd \
    --role-arn arn:aws:iam::111122223333:role/s3-role
```

Output:

```
{
    "association": {
        "clusterName": "eks-customer",
        "namespace": "default",
        "serviceAccount": "default",
        "roleArn": "arn:aws:iam::111122223333:role/s3-role",
        "associationArn": "arn:aws:eks:us-
west-2:111122223333:podidentityassociation/eks-customer/a-9njjin9gfghecgocd",
        "associationId": "a-9njjin9gfghecgocd",
        "tags": {
            "Key2": "value2",
            "Key1": "value1"
        },
        "createdAt": "2025-05-24T19:52:14.135000-05:00",
        "modifiedAt": "2025-05-25T21:01:53.120000-05:00"
    }
}
```

For more information, see Learn how EKS Pod Identity grants pods access to AWS services in the *Amazon EKS User Guide*.

- For API details, see UpdatePodIdentityAssociation in *AWS CLI Command Reference*.

Elastic Beanstalk examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Elastic Beanstalk.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`abort-environment-update`

The following code example shows how to use `abort-environment-update`.

AWS CLI

To abort a deployment

The following command aborts a running application version deployment for an environment named `my-env`:

```
aws elasticbeanstalk abort-environment-update --environment-name my-env
```

- For API details, see AbortEnvironmentUpdate in *AWS CLI Command Reference*.

`check-dns-availability`

The following code example shows how to use `check-dns-availability`.

AWS CLI

To check the availability of a CNAME

The following command checks the availability of the subdomain `my-cname.elasticbeanstalk.com`:

```
aws elasticbeanstalk check-dns-availability --cname-prefix my-cname
```

Output:

```
{
```

```
    "Available": true,
    "FullyQualifiedCNAME": "my-cname.elasticbeanstalk.com"
}
```

- For API details, see CheckDnsAvailability in *AWS CLI Command Reference*.

`create-application-version`

The following code example shows how to use `create-application-version`.

AWS CLI

To create a new application version

The following command creates a new version, "v1" of an application named "MyApp":

```
aws elasticbeanstalk create-application-version --application-name MyApp --
version-label v1 --description MyAppv1 --source-bundle S3Bucket="amzn-s3-demo-
bucket",S3Key="sample.war" --auto-create-application
```

The application will be created automatically if it does not already exist, due to the auto-create-application option. The source bundle is a .war file stored in an s3 bucket named "amzn-s3-demo-bucket" that contains the Apache Tomcat sample application.

Output:

```
{
  "ApplicationVersion": {
      "ApplicationName": "MyApp",
      "VersionLabel": "v1",
      "Description": "MyAppv1",
      "DateCreated": "2015-02-03T23:01:25.412Z",
      "DateUpdated": "2015-02-03T23:01:25.412Z",
      "SourceBundle": {
          "S3Bucket": "amzn-s3-demo-bucket",
          "S3Key": "sample.war"
      }
  }
}
```

- For API details, see CreateApplicationVersion in *AWS CLI Command Reference*.

`create-application`

The following code example shows how to use `create-application`.

AWS CLI

To create a new application

The following command creates a new application named "MyApp":

```
aws elasticbeanstalk create-application --application-name MyApp --description "my
 application"
```

The `create-application` command only configures the application's name and description. To upload source code for the application, create an initial version of the application using `create-application-version`. `create-application-version` also has an `auto-create-application` option that lets you create the application and the application version in one step.

Output:

```
{
  "Application": {
      "ApplicationName": "MyApp",
      "ConfigurationTemplates": [],
      "DateUpdated": "2015-02-12T18:32:21.181Z",
      "Description": "my application",
      "DateCreated": "2015-02-12T18:32:21.181Z"
  }
}
```

- For API details, see CreateApplication in *AWS CLI Command Reference*.

`create-configuration-template`

The following code example shows how to use `create-configuration-template`.

AWS CLI

To create a configuration template

The following command creates a configuration template named `my-app-v1` from the settings applied to an environment with the id `e-rpqsewtp2j`:

```
aws elasticbeanstalk create-configuration-template --application-name my-app --
template-name my-app-v1 --environment-id e-rpqsewtp2j
```

Output:

```
{
    "ApplicationName": "my-app",
    "TemplateName": "my-app-v1",
    "DateCreated": "2015-08-12T18:40:39Z",
    "DateUpdated": "2015-08-12T18:40:39Z",
    "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8"
}
```

- For API details, see CreateConfigurationTemplate in *AWS CLI Command Reference*.

`create-environment`

The following code example shows how to use `create-environment`.

AWS CLI

To create a new environment for an application

The following command creates a new environment for version "v1" of a java application named "my-app":

```
aws elasticbeanstalk create-environment --application-name my-app --environment-
name my-env --cname-prefix my-app --version-label v1 --solution-stack-name "64bit
 Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8"
```

Output:

```
{
  "ApplicationName": "my-app",
  "EnvironmentName": "my-env",
  "VersionLabel": "v1",
  "Status": "Launching",
```

```
  "EnvironmentId": "e-izqpassy4h",
  "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8",
  "CNAME": "my-app.elasticbeanstalk.com",
  "Health": "Grey",
  "Tier": {
      "Type": "Standard",
      "Name": "WebServer",
      "Version": " "
  },
  "DateUpdated": "2015-02-03T23:04:54.479Z",
  "DateCreated": "2015-02-03T23:04:54.479Z"
}
```

v1 is the label of an application version previously uploaded with create-application-version.

To specify a JSON file to define environment configuration options

The following `create-environment` command specifies that a JSON file with the name `myoptions.json` should be used to override values obtained from the solution stack or the configuration template:

```
aws elasticbeanstalk create-environment --environment-name sample-env --application-name sampleapp --option-settings file://myoptions.json
```

`myoptions.json` is a JSON object defining several settings:

```
[
  {
    "Namespace": "aws:elb:healthcheck",
    "OptionName": "Interval",
    "Value": "15"
  },
  {
    "Namespace": "aws:elb:healthcheck",
    "OptionName": "Timeout",
    "Value": "8"
  },
  {
    "Namespace": "aws:elb:healthcheck",
    "OptionName": "HealthyThreshold",
    "Value": "2"
  },
```

```
    {
      "Namespace": "aws:elb:healthcheck",
      "OptionName": "UnhealthyThreshold",
      "Value": "3"
    }
]
```

For more information, see Option Values in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see CreateEnvironment in *AWS CLI Command Reference*.

`create-storage-location`

The following code example shows how to use `create-storage-location`.

AWS CLI

To create a storage location

The following command creates a storage location in Amazon S3:

```
aws elasticbeanstalk create-storage-location
```

Output:

```
{
    "S3Bucket": "elasticbeanstalk-us-west-2-0123456789012"
}
```

- For API details, see CreateStorageLocation in *AWS CLI Command Reference*.

`delete-application-version`

The following code example shows how to use `delete-application-version`.

AWS CLI

To delete an application version

The following command deletes an application version named `22a0-stage-150819_182129` for an application named `my-app`:

```
aws elasticbeanstalk delete-application-version --version-label 22a0-
stage-150819_182129 --application-name my-app
```

- For API details, see DeleteApplicationVersion in *AWS CLI Command Reference*.

`delete-application`

The following code example shows how to use `delete-application`.

AWS CLI

To delete an application

The following command deletes an application named `my-app`:

```
aws elasticbeanstalk delete-application --application-name my-app
```

- For API details, see DeleteApplication in *AWS CLI Command Reference*.

`delete-configuration-template`

The following code example shows how to use `delete-configuration-template`.

AWS CLI

To delete a configuration template

The following command deletes a configuration template named `my-template` for an application named `my-app`:

```
aws elasticbeanstalk delete-configuration-template --template-name my-template --
application-name my-app
```

- For API details, see DeleteConfigurationTemplate in *AWS CLI Command Reference*.

`delete-environment-configuration`

The following code example shows how to use `delete-environment-configuration`.

AWS CLI

To delete a draft configuration

The following command deletes a draft configuration for an environment named `my-env`:

```
aws elasticbeanstalk delete-environment-configuration --environment-name my-env --
application-name my-app
```

- For API details, see DeleteEnvironmentConfiguration in *AWS CLI Command Reference*.

`describe-application-versions`

The following code example shows how to use `describe-application-versions`.

AWS CLI

To view information about an application version

The following command retrieves information about an application version labeled `v2`:

```
aws elasticbeanstalk describe-application-versions --application-name my-app --
version-label "v2"
```

Output:

```
{
    "ApplicationVersions": [
        {
            "ApplicationName": "my-app",
            "VersionLabel": "v2",
            "Description": "update cover page",
            "DateCreated": "2015-07-23T01:32:26.079Z",
            "DateUpdated": "2015-07-23T01:32:26.079Z",
            "SourceBundle": {
                "S3Bucket": "elasticbeanstalk-us-west-2-015321684451",
                "S3Key": "my-app/5026-stage-150723_224258.war"
            }
        },
      {

```

- For API details, see DescribeApplicationVersions in *AWS CLI Command Reference*.

`describe-applications`

The following code example shows how to use `describe-applications`.

AWS CLI

To view a list of applications

The following command retrieves information about applications in the current region:

```
aws elasticbeanstalk describe-applications
```

Output:

```
{
    "Applications": [
        {
            "ApplicationName": "ruby",
            "ConfigurationTemplates": [],
            "DateUpdated": "2015-08-13T21:05:44.376Z",
            "Versions": [
                "Sample Application"
            ],
            "DateCreated": "2015-08-13T21:05:44.376Z"
        },
        {
            "ApplicationName": "pythonsample",
            "Description": "Application created from the EB CLI using \"eb init\"",
            "Versions": [
                "Sample Application"
            ],
```

```
                "DateCreated": "2015-08-13T19:05:43.637Z",
                "ConfigurationTemplates": [],
                "DateUpdated": "2015-08-13T19:05:43.637Z"
            },
            {
                "ApplicationName": "nodejs-example",
                "ConfigurationTemplates": [],
                "DateUpdated": "2015-08-06T17:50:02.486Z",
                "Versions": [
                    "add elasticache",
                    "First Release"
                ],
                "DateCreated": "2015-08-06T17:50:02.486Z"
            }
        ]
}
```

- For API details, see DescribeApplications in *AWS CLI Command Reference*.

`describe-configuration-options`

The following code example shows how to use `describe-configuration-options`.

AWS CLI

To view configuration options for an environment

The following command retrieves descriptions of all available configuration options for an environment named `my-env`:

```
aws elasticbeanstalk describe-configuration-options --environment-name my-env --
application-name my-app
```

Output (abbreviated):

```
{
    "Options": [
        {
            "Name": "JVMOptions",
            "UserDefined": false,
            "DefaultValue": "Xms=256m,Xmx=256m,XX:MaxPermSize=64m,JVM Options=",
            "ChangeSeverity": "RestartApplicationServer",
```

```
                "Namespace": "aws:cloudformation:template:parameter",
                "ValueType": "KeyValueList"
            },
            {
                "Name": "Interval",
                "UserDefined": false,
                "DefaultValue": "30",
                "ChangeSeverity": "NoInterruption",
                "Namespace": "aws:elb:healthcheck",
                "MaxValue": 300,
                "MinValue": 5,
                "ValueType": "Scalar"
            },
            ...
            {
                "Name": "LowerThreshold",
                "UserDefined": false,
                "DefaultValue": "2000000",
                "ChangeSeverity": "NoInterruption",
                "Namespace": "aws:autoscaling:trigger",
                "MinValue": 0,
                "ValueType": "Scalar"
            },
            {
                "Name": "ListenerEnabled",
                "UserDefined": false,
                "DefaultValue": "true",
                "ChangeSeverity": "Unknown",
                "Namespace": "aws:elb:listener",
                "ValueType": "Boolean"
            }
        ]
}
```

Available configuration options vary per platform and configuration version. For more information about namespaces and supported options, see Option Values in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see DescribeConfigurationOptions in *AWS CLI Command Reference*.

`describe-configuration-settings`

The following code example shows how to use `describe-configuration-settings`.

AWS CLI

To view configurations settings for an environment

The following command retrieves configuration settings for an environment named `my-env`:

```
aws elasticbeanstalk describe-configuration-settings --environment-name my-env --
application-name my-app
```

Output (abbreviated):

```
{
    "ConfigurationSettings": [
        {
            "ApplicationName": "my-app",
            "EnvironmentName": "my-env",
            "Description": "Environment created from the EB CLI using \"eb create
\"",
            "DeploymentStatus": "deployed",
            "DateCreated": "2015-08-13T19:16:25Z",
            "OptionSettings": [
                {
                    "OptionName": "Availability Zones",
                    "ResourceName": "AWSEBAutoScalingGroup",
                    "Namespace": "aws:autoscaling:asg",
                    "Value": "Any"
                },
                {
                    "OptionName": "Cooldown",
                    "ResourceName": "AWSEBAutoScalingGroup",
                    "Namespace": "aws:autoscaling:asg",
                    "Value": "360"
                },
                ...
                {
                    "OptionName": "ConnectionDrainingTimeout",
                    "ResourceName": "AWSEBLoadBalancer",
                    "Namespace": "aws:elb:policies",
                    "Value": "20"
                },
                {
                    "OptionName": "ConnectionSettingIdleTimeout",
                    "ResourceName": "AWSEBLoadBalancer",
```

```
                    "Namespace": "aws:elb:policies",
                    "Value": "60"
                }
            ],
            "DateUpdated": "2015-08-13T23:30:07Z",
            "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8
 Java 8"
        }
    ]
}
```

For more information about namespaces and supported options, see Option Values in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see DescribeConfigurationSettings in *AWS CLI Command Reference*.

`describe-environment-health`

The following code example shows how to use `describe-environment-health`.

AWS CLI

To view environment health

The following command retrieves overall health information for an environment named `my-env`:

```
aws elasticbeanstalk describe-environment-health --environment-name my-env --
attribute-names All
```

Output:

```
{
    "Status": "Ready",
    "EnvironmentName": "my-env",
    "Color": "Green",
    "ApplicationMetrics": {
        "Duration": 10,
        "Latency": {
            "P99": 0.004,
            "P75": 0.002,
```

```
                "P90": 0.003,
                "P95": 0.004,
                "P85": 0.003,
                "P10": 0.001,
                "P999": 0.004,
                "P50": 0.001
            },
            "RequestCount": 45,
            "StatusCodes": {
                "Status3xx": 0,
                "Status2xx": 45,
                "Status5xx": 0,
                "Status4xx": 0
            }
        },
        "RefreshedAt": "2015-08-20T21:09:18Z",
        "HealthStatus": "Ok",
        "InstancesHealth": {
            "Info": 0,
            "Ok": 1,
            "Unknown": 0,
            "Severe": 0,
            "Warning": 0,
            "Degraded": 0,
            "NoData": 0,
            "Pending": 0
        },
        "Causes": []
}
```

Health information is only available for environments with enhanced health reporting enabled. For more information, see Enhanced Health Reporting and Monitoring in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see DescribeEnvironmentHealth in *AWS CLI Command Reference*.

`describe-environment-resources`

The following code example shows how to use `describe-environment-resources`.

AWS CLI

To view information about the AWS resources in your environment

The following command retrieves information about resources in an environment named `my-env`:

```
aws elasticbeanstalk describe-environment-resources --environment-name my-env
```

Output:

```
{
    "EnvironmentResources": {
        "EnvironmentName": "my-env",
        "AutoScalingGroups": [
            {
                "Name": "awseb-e-qu3fyyjyjs-stack-AWSEBAutoScalingGroup-
QSB2ZO88SXZT"
            }
        ],
        "Triggers": [],
        "LoadBalancers": [
            {
                "Name": "awseb-e-q-AWSEBLoa-1EEPZ0K98BIF0"
            }
        ],
        "Queues": [],
        "Instances": [
            {
                "Id": "i-0c91c786"
            }
        ],
        "LaunchConfigurations": [
            {
                "Name": "awseb-e-qu3fyyjyjs-stack-
AWSEBAutoScalingLaunchConfiguration-1UUVQIBC96TQ2"
            }
        ]
    }
}
```

- For API details, see DescribeEnvironmentResources in *AWS CLI Command Reference*.

`describe-environments`

The following code example shows how to use `describe-environments`.

AWS CLI

To view information about an environment

The following command retrieves information about an environment named `my-env`:

```
aws elasticbeanstalk describe-environments --environment-names my-env
```

Output:

```
{
    "Environments": [
        {
            "ApplicationName": "my-app",
            "EnvironmentName": "my-env",
            "VersionLabel": "7f58-stage-150812_025409",
            "Status": "Ready",
            "EnvironmentId": "e-rpqsewtp2j",
            "EndpointURL": "awseb-e-w-AWSEBLoa-1483140XB0Q4L-109QXY8121.us-
west-2.elb.amazonaws.com",

 Java 8",
            "CNAME": "my-env.elasticbeanstalk.com",
            "Health": "Green",
            "AbortableOperationInProgress": false,
            "Tier": {
                "Version": " ",
                "Type": "Standard",
                "Name": "WebServer"
            },
            "DateUpdated": "2015-08-12T18:16:55.019Z",
            "DateCreated": "2015-08-07T20:48:49.599Z"
        }
    ]
}
```

- For API details, see DescribeEnvironments in *AWS CLI Command Reference*.

`describe-events`

The following code example shows how to use `describe-events`.

AWS CLI

To view events for an environment

The following command retrieves events for an environment named `my-env`:

```
aws elasticbeanstalk describe-events --environment-name my-env
```

Output (abbreviated):

```
{
    "Events": [
        {
            "ApplicationName": "my-app",
            "EnvironmentName": "my-env",
            "Message": "Environment health has transitioned from Info to Ok.",
            "EventDate": "2015-08-20T07:06:53.535Z",
            "Severity": "INFO"
        },
        {
            "ApplicationName": "my-app",
            "EnvironmentName": "my-env",
            "Severity": "INFO",
            "RequestId": "b7f3960b-4709-11e5-ba1e-07e16200da41",
            "Message": "Environment update completed successfully.",
            "EventDate": "2015-08-20T07:06:02.049Z"
        },
        ...
        {
            "ApplicationName": "my-app",
            "EnvironmentName": "my-env",
            "Severity": "INFO",
            "RequestId": "ca8dfbf6-41ef-11e5-988b-651aa638f46b",
            "Message": "Using elasticbeanstalk-us-west-2-012445113685 as Amazon S3
 storage bucket for environment data.",
            "EventDate": "2015-08-13T19:16:27.561Z"
        },
        {
            "ApplicationName": "my-app",
            "EnvironmentName": "my-env",
            "Severity": "INFO",
            "RequestId": "cdfba8f6-41ef-11e5-988b-65638f41aa6b",
            "Message": "createEnvironment is starting.",
```

```
                "EventDate": "2015-08-13T19:16:26.581Z"
            }
        ]
}
```

- For API details, see DescribeEvents in *AWS CLI Command Reference*.

`describe-instances-health`

The following code example shows how to use `describe-instances-health`.

AWS CLI

To view environment health

The following command retrieves health information for instances in an environment named `my-env`:

```
aws elasticbeanstalk describe-instances-health --environment-name my-env --
attribute-names All
```

Output:

```
{
    "InstanceHealthList": [
        {
            "InstanceId": "i-08691cc7",
            "ApplicationMetrics": {
                "Duration": 10,
                "Latency": {
                    "P99": 0.006,
                    "P75": 0.002,
                    "P90": 0.004,
                    "P95": 0.005,
                    "P85": 0.003,
                    "P10": 0.0,
                    "P999": 0.006,

                    "Nice": 0.1
                }
            },
            "Color": "Green",
            "HealthStatus": "Ok",
            "LaunchedAt": "2015-08-13T19:17:09Z",
            "Causes": []
        }
    ],
    "RefreshedAt": "2015-08-20T21:09:08Z"
}
```

Health information is only available for environments with enhanced health reporting enabled. For more information, see Enhanced Health Reporting and Monitoring in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see DescribeInstancesHealth in *AWS CLI Command Reference*.

`list-available-solution-stacks`

The following code example shows how to use `list-available-solution-stacks`.

AWS CLI

To view solution stacks

The following command lists solution stacks for all currently available platform configurations and any that you have used in the past:

```
aws elasticbeanstalk list-available-solution-stacks
```

Output (abbreviated):

```
{
    "SolutionStacks": [
        "64bit Amazon Linux 2015.03 v2.0.0 running Node.js",
        "64bit Amazon Linux 2015.03 v2.0.0 running PHP 5.6",
        "64bit Amazon Linux 2015.03 v2.0.0 running PHP 5.5",
        "64bit Amazon Linux 2015.03 v2.0.0 running PHP 5.4",
        "64bit Amazon Linux 2015.03 v2.0.0 running Python 3.4",
        "64bit Amazon Linux 2015.03 v2.0.0 running Python 2.7",
        "64bit Amazon Linux 2015.03 v2.0.0 running Python",
        "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 2.2 (Puma)",
        "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 2.2 (Passenger Standalone)",
        "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 2.1 (Puma)",
        "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 2.1 (Passenger Standalone)",

        ]
}
```

- For API details, see ListAvailableSolutionStacks in *AWS CLI Command Reference*.

`rebuild-environment`

The following code example shows how to use `rebuild-environment`.

AWS CLI

To rebuild an environment

The following command terminates and recreates the resources in an environment named `my-env`:

```
aws elasticbeanstalk rebuild-environment --environment-name my-env
```

- For API details, see RebuildEnvironment in *AWS CLI Command Reference*.

`request-environment-info`

The following code example shows how to use `request-environment-info`.

AWS CLI

To request tailed logs

The following command requests logs from an environment named `my-env`:

```
aws elasticbeanstalk request-environment-info --environment-name my-env --info-type tail
```

After requesting logs, retrieve their location with retrieve-environment-info.

- For API details, see RequestEnvironmentInfo in *AWS CLI Command Reference*.

`restart-app-server`

The following code example shows how to use `restart-app-server`.

AWS CLI

To restart application servers

The following command restarts application servers on all instances in an environment named `my-env`:

```
aws elasticbeanstalk restart-app-server --environment-name my-env
```

- For API details, see RestartAppServer in *AWS CLI Command Reference*.

`retrieve-environment-info`

The following code example shows how to use `retrieve-environment-info`.

AWS CLI

To retrieve tailed logs

The following command retrieves a link to logs from an environment named `my-env`:

```
aws elasticbeanstalk retrieve-environment-info --environment-name my-env --info-type tail
```

Output:

```
{
    "EnvironmentInfo": [
        {
            "SampleTimestamp": "2015-08-20T22:23:17.703Z",
            "Message": "https://elasticbeanstalk-us-west-2-0123456789012.s3.amazonaws.com/resources/environments/logs/tail/e-fyqyju3yjs/i-09c1c867/TailLogs-1440109397703.out?AWSAccessKeyId=AKGPT4J56IAJ2EUBL5CQ&Expires=1440195891&Signature=n%2BEalOV6A2HIOx4Rcfb7LT16bBM%3D",
            "InfoType": "tail",
            "Ec2InstanceId": "i-09c1c867"
        }
```

```
    ]
}
```

View the link in a browser. Prior to retrieval, logs must be requested with request-environment-info.

- For API details, see RetrieveEnvironmentInfo in *AWS CLI Command Reference*.

`swap-environment-cnames`

The following code example shows how to use `swap-environment-cnames`.

AWS CLI

To swap environment CNAMES

The following command swaps the assigned subdomains of two environments:

```
aws elasticbeanstalk swap-environment-cnames --source-environment-name my-env-blue
 --destination-environment-name my-env-green
```

- For API details, see SwapEnvironmentCnames in *AWS CLI Command Reference*.

`terminate-environment`

The following code example shows how to use `terminate-environment`.

AWS CLI

To terminate an environment

The following command terminates an Elastic Beanstalk environment named `my-env`:

```
aws elasticbeanstalk terminate-environment --environment-name my-env
```

Output:

```
{
    "ApplicationName": "my-app",
    "EnvironmentName": "my-env",
    "Status": "Terminating",
```

```
    "EnvironmentId": "e-fh2eravpns",
    "EndpointURL": "awseb-e-f-AWSEBLoa-1I9XUMP4-8492WNUP202574.us-
west-2.elb.amazonaws.com",
    "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java
 8",
    "CNAME": "my-env.elasticbeanstalk.com",
    "Health": "Grey",
    "AbortableOperationInProgress": false,
    "Tier": {
        "Version": " ",
        "Type": "Standard",
        "Name": "WebServer"
    },

    "DateCreated": "2015-08-12T18:52:53.622Z"
}
```

- For API details, see TerminateEnvironment in *AWS CLI Command Reference*.

`update-application-version`

The following code example shows how to use `update-application-version`.

AWS CLI

To change an application version's description

The following command updates the description of an application version named `22a0-stage-150819_185942`:

```
aws elasticbeanstalk update-application-version --version-label 22a0-
stage-150819_185942 --application-name my-app --description "new description"
```

Output:

```
{
    "ApplicationVersion": {
        "ApplicationName": "my-app",
        "VersionLabel": "22a0-stage-150819_185942",
        "Description": "new description",
        "DateCreated": "2015-08-19T18:59:17.646Z",
        "DateUpdated": "2015-08-20T22:53:28.871Z",
```

```
        "SourceBundle": {
            "S3Bucket": "elasticbeanstalk-us-west-2-0123456789012",
            "S3Key": "my-app/22a0-stage-150819_185942.war"
        }
    }
}
```

- For API details, see UpdateApplicationVersion in *AWS CLI Command Reference*.

`update-application`

The following code example shows how to use `update-application`.

AWS CLI

To change an application's description

The following command updates the description of an application named `my-app`:

```
aws elasticbeanstalk update-application --application-name my-app --description "my
 Elastic Beanstalk application"
```

Output:

```
{
    "Application": {
        "ApplicationName": "my-app",
        "Description": "my Elastic Beanstalk application",
        "Versions": [
            "2fba-stage-150819_234450",
            "bf07-stage-150820_214945",
            "93f8",
            "fd7c-stage-150820_000431",
            "22a0-stage-150819_185942"
        ],
        "DateCreated": "2015-08-13T19:15:50.449Z",
        "ConfigurationTemplates": [],
        "DateUpdated": "2015-08-20T22:34:56.195Z"
    }
}
```

- For API details, see UpdateApplication in *AWS CLI Command Reference*.

`update-configuration-template`

The following code example shows how to use `update-configuration-template`.

AWS CLI

To update a configuration template

The following command removes the configured CloudWatch custom health metrics configuration `ConfigDocument` from a saved configuration template named `my-template`:

```
aws elasticbeanstalk update-configuration-template --template-
name my-template --application-name my-app --options-to-
remove Namespace=aws:elasticbeanstalk:healthreporting:system,OptionName=ConfigDocument
```

Output:

```
{
    "ApplicationName": "my-app",
    "TemplateName": "my-template",
    "DateCreated": "2015-08-20T22:39:31Z",
    "DateUpdated": "2015-08-20T22:43:11Z",
    "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8"
}
```

For more information about namespaces and supported options, see Option Values in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see UpdateConfigurationTemplate in *AWS CLI Command Reference*.

`update-environment`

The following code example shows how to use `update-environment`.

AWS CLI

To update an environment to a new version

The following command updates an environment named "my-env" to version "v2" of the application to which it belongs:

```
aws elasticbeanstalk update-environment --environment-name my-env --version-label v2
```

This command requires that the "my-env" environment already exists and belongs to an application that has a valid application version with the label "v2".

Output:

```
{
  "ApplicationName": "my-app",
  "EnvironmentName": "my-env",
  "VersionLabel": "v2",
  "Status": "Updating",
  "EnvironmentId": "e-szqipays4h",
  "EndpointURL": "awseb-e-i-AWSEBLoa-1RDLX6TC9VUAO-0123456789.us-
west-2.elb.amazonaws.com",
  "SolutionStackName": "64bit Amazon Linux running Tomcat 7",
  "CNAME": "my-env.elasticbeanstalk.com",
  "Health": "Grey",
  "Tier": {
      "Version": " ",
      "Type": "Standard",
      "Name": "WebServer"
  },
  "DateUpdated": "2015-02-03T23:12:29.119Z",
  "DateCreated": "2015-02-03T23:04:54.453Z"
}
```

To set an environment variable

The following command sets the value of the "PARAM1" variable in the "my-env" environment to "ParamValue":

```
aws elasticbeanstalk update-environment --environment-name my-env --option-
settings Namespace=aws:elasticbeanstalk:application:environment,OptionName=PARAM1,Value=Para
```

The `option-settings` parameter takes a namespace in addition to the name and value of the variable. Elastic Beanstalk supports several namespaces for options in addition to environment variables.

To configure option settings from a file

The following command configures several options in the `aws:elb:loadbalancer` namespace from a file:

```
aws elasticbeanstalk update-environment --environment-name my-env --option-
settings file://options.json
```

`options.json` is a JSON object defining several settings:

```
[
  {
    "Namespace": "aws:elb:healthcheck",
    "OptionName": "Interval",
    "Value": "15"
  },
  {
    "Namespace": "aws:elb:healthcheck",
    "OptionName": "Timeout",
    "Value": "8"
  },
  {
    "Namespace": "aws:elb:healthcheck",
    "OptionName": "HealthyThreshold",
    "Value": "2"
  },
  {
    "Namespace": "aws:elb:healthcheck",
    "OptionName": "UnhealthyThreshold",
    "Value": "3"
  }
]
```

Output:

```
{
    "ApplicationName": "my-app",
    "EnvironmentName": "my-env",
    "VersionLabel": "7f58-stage-150812_025409",
    "Status": "Updating",
    "EnvironmentId": "e-wtp2rpqsej",
    "EndpointURL": "awseb-e-w-AWSEBLoa-14XB83101Q4L-104QXY80921.sa-
east-1.elb.amazonaws.com",
    "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java
 8",
    "CNAME": "my-env.elasticbeanstalk.com",
    "Health": "Grey",
```

```
    "AbortableOperationInProgress": true,
    "Tier": {
        "Version": " ",
        "Type": "Standard",
        "Name": "WebServer"
    },
    "DateUpdated": "2015-08-12T18:15:23.804Z",
    "DateCreated": "2015-08-07T20:48:49.599Z"
}
```

For more information about namespaces and supported options, see Option Values in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see UpdateEnvironment in *AWS CLI Command Reference*.

`validate-configuration-settings`

The following code example shows how to use `validate-configuration-settings`.

AWS CLI

To validate configuration settings

The following command validates a CloudWatch custom metrics config document:

```
aws elasticbeanstalk validate-configuration-settings --application-name my-app --
environment-name my-env --option-settings file://options.json
```

`options.json` is a JSON document that includes one or more configuration settings to validate:

```
[
    {
        "Namespace": "aws:elasticbeanstalk:healthreporting:system",
        "OptionName": "ConfigDocument",
        "Value": "{\"CloudWatchMetrics\": {\"Environment\":
 {\"ApplicationLatencyP99.9\": null,\"InstancesSevere\": 60,
\"ApplicationLatencyP90\": 60,\"ApplicationLatencyP99\": null,
\"ApplicationLatencyP95\": 60,\"InstancesUnknown\": 60,\"ApplicationLatencyP85\":
 60,\"InstancesInfo\": null,\"ApplicationRequests2xx\": null,\"InstancesDegraded
\": null,\"InstancesWarning\": 60,\"ApplicationLatencyP50\": 60,
```

```
\"ApplicationRequestsTotal\": null,\"InstancesNoData\": null,\"InstancesPending
\": 60,\"ApplicationLatencyP10\": null,\"ApplicationRequests5xx\": null,
\"ApplicationLatencyP75\": null,\"InstancesOk\": 60,\"ApplicationRequests3xx\":
 null,\"ApplicationRequests4xx\": null},\"Instance\": {\"ApplicationLatencyP99.9\":
 null,\"ApplicationLatencyP90\": 60,\"ApplicationLatencyP99\": null,
\"ApplicationLatencyP95\": null,\"ApplicationLatencyP85\": null,\"CPUUser\": 60,
\"ApplicationRequests2xx\": null,\"CPUIdle\": null,\"ApplicationLatencyP50\":
 null,\"ApplicationRequestsTotal\": 60,\"RootFilesystemUtil\": null,
\"LoadAverage1min\": null,\"CPUIrq\": null,\"CPUNice\": 60,\"CPUIowait\": 60,
\"ApplicationLatencyP10\": null,\"LoadAverage5min\": null,\"ApplicationRequests5xx
\": null,\"ApplicationLatencyP75\": 60,\"CPUSystem\": 60,\"ApplicationRequests3xx\":
 60,\"ApplicationRequests4xx\": null,\"InstanceHealth\": null,\"CPUSoftirq\": 60}},
\"Version\": 1}"
    }
]
```

If the options that you specify are valid for the specified environment, Elastic Beanstalk returns an empty Messages array:

```
{
    "Messages": []
}
```

If validation fails, the response will include information about the error:

```
{
    "Messages": [
        {
            "OptionName": "ConfigDocumet",
            "Message": "Invalid option specification (Namespace:
 'aws:elasticbeanstalk:healthreporting:system', OptionName: 'ConfigDocumet'):
 Unknown configuration setting.",
            "Namespace": "aws:elasticbeanstalk:healthreporting:system",
            "Severity": "error"
        }
    ]
}
```

For more information about namespaces and supported options, see Option Values in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see ValidateConfigurationSettings in *AWS CLI Command Reference*.

Elastic Load Balancing - Version 1 examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Elastic Load Balancing - Version 1.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`add-tags`

The following code example shows how to use `add-tags`.

AWS CLI

To add a tag to a load balancer

This example adds tags to the specified load balancer.

Command:

```
aws elb add-tags --load-balancer-name my-load-balancer --
tags "Key=project,Value=lima" "Key=department,Value=digital-media"
```

- For API details, see AddTags in *AWS CLI Command Reference*.

`apply-security-groups-to-load-balancer`

The following code example shows how to use `apply-security-groups-to-load-balancer`.

AWS CLI

To associate a security group with a load balancer in a VPC

This example associates a security group with the specified load balancer in a VPC.

Command:

```
aws elb apply-security-groups-to-load-balancer --load-balancer-name my-load-balancer
 --security-groups sg-fc448899
```

Output:

```
{
  "SecurityGroups": [
      "sg-fc448899"
  ]
}
```

- For API details, see ApplySecurityGroupsToLoadBalancer in *AWS CLI Command Reference*.

`attach-load-balancer-to-subnets`

The following code example shows how to use `attach-load-balancer-to-subnets`.

AWS CLI

To attach subnets to a load balancer

This example adds the specified subnet to the set of configured subnets for the specified load balancer.

Command:

```
aws elb attach-load-balancer-to-subnets --load-balancer-name my-load-balancer --
subnets subnet-0ecac448
```

Output:

```
{
   "Subnets": [
       "subnet-15aaab61",
       "subnet-0ecac448"
   ]
}
```

- For API details, see AttachLoadBalancerToSubnets in *AWS CLI Command Reference*.

`configure-health-check`

The following code example shows how to use `configure-health-check`.

AWS CLI

To specify the health check settings for your backend EC2 instances

This example specifies the health check settings used to evaluate the health of your backend EC2 instances.

Command:

```
aws elb configure-health-check --load-balancer-name my-load-balancer --health-check Target=HTTP:80/png,Interval=30,UnhealthyThreshold=2,HealthyThreshold=2,Timeout=3
```

Output:

```
{
   "HealthCheck": {
       "HealthyThreshold": 2,
       "Interval": 30,
       "Target": "HTTP:80/png",
       "Timeout": 3,
       "UnhealthyThreshold": 2
   }
}
```

- For API details, see ConfigureHealthCheck in *AWS CLI Command Reference*.

`create-app-cookie-stickiness-policy`

The following code example shows how to use `create-app-cookie-stickiness-policy`.

AWS CLI

To generate a stickiness policy for your HTTPS load balancer

This example generates a stickiness policy that follows the sticky session lifetimes of the application-generated cookie.

Command:

```
aws elb create-app-cookie-stickiness-policy --load-balancer-name my-load-balancer --
policy-name my-app-cookie-policy --cookie-name my-app-cookie
```

- For API details, see [CreateAppCookieStickinessPolicy](#) in *AWS CLI Command Reference*.

`create-lb-cookie-stickiness-policy`

The following code example shows how to use `create-lb-cookie-stickiness-policy`.

AWS CLI

To generate a duration-based stickiness policy for your HTTPS load balancer

This example generates a stickiness policy with sticky session lifetimes controlled by the specified expiration period.

Command:

```
aws elb create-lb-cookie-stickiness-policy --load-balancer-name my-load-balancer --
policy-name my-duration-cookie-policy --cookie-expiration-period 60
```

- For API details, see [CreateLbCookieStickinessPolicy](#) in *AWS CLI Command Reference*.

`create-load-balancer-listeners`

The following code example shows how to use `create-load-balancer-listeners`.

AWS CLI

To create HTTP listeners for a load balancer

This example creates a listener for your load balancer at port 80 using the HTTP protocol.

Command:

```
aws elb create-load-balancer-listeners --load-balancer-name my-load-balancer --
listeners "Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80"
```

To create HTTPS listeners for a load balancer

This example creates a listener for your load balancer at port 443 using the HTTPS protocol.

Command:

```
aws elb create-load-balancer-listeners --load-balancer-name my-load-balancer --
listeners "Protocol=HTTPS,LoadBalancerPort=443,InstanceProtocol=HTTP,InstancePort=80"
```

- For API details, see CreateLoadBalancerListeners in *AWS CLI Command Reference*.

`create-load-balancer-policy`

The following code example shows how to use `create-load-balancer-policy`.

AWS CLI

To create a policy that enables Proxy Protocol on a load balancer

This example creates a policy that enables Proxy Protocol on the specified load balancer.

Command:

```
aws elb create-load-balancer-policy --load-balancer-name my-load-balancer --policy-
name my-ProxyProtocol-policy --policy-type-name ProxyProtocolPolicyType --policy-
attributes AttributeName=ProxyProtocol,AttributeValue=true
```

To create an SSL negotiation policy using the recommended security policy

This example creates an SSL negotiation policy for the specified HTTPS load balancer using the recommended security policy.

Command:

```
aws elb create-load-balancer-policy --load-balancer-name my-load-
balancer --policy-name my-SSLNegotiation-policy --policy-type-
name SSLNegotiationPolicyType --policy-attributes AttributeName=Reference-Security-
Policy,AttributeValue=ELBSecurityPolicy-2015-03
```

To create an SSL negotiation policy using a custom security policy

This example creates an SSL negotiation policy for your HTTPS load balancer using a custom security policy by enabling the protocols and the ciphers.

Command:

```
aws elb create-load-balancer-policy --load-balancer-name my-load-balancer --policy-
name my-SSLNegotiation-policy --policy-type-name SSLNegotiationPolicyType --policy-
attributes AttributeName=Protocol-SSLv3,AttributeValue=true AttributeName=Protocol-
TLSv1.1,AttributeValue=true AttributeName=DHE-RSA-AES256-
SHA256,AttributeValue=true AttributeName=Server-Defined-Cipher-
Order,AttributeValue=true
```

To create a public key policy

This example creates a public key policy.

Command:

```
aws elb create-load-balancer-policy --load-balancer-name my-load-balancer --
policy-name my-PublicKey-policy --policy-type-name PublicKeyPolicyType --policy-
attributes AttributeName=PublicKey,AttributeValue=MIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQ
+dS74kj//c6x7ROtusUaeQCTgIUkayttRDWchuqo1pHC1u
+n5xxXnBBe2ejbb2WRsKIQ5rXEeixsjFpFsojpSQKkzhVGI6mJVZBJDVKSHmswnwLBdofLhzvllpovBPTHe
+o4haAWvDBALJU0pkSI1FecPHcs2hwxf14zHoXy1e2k36A64nXW43wtfx5qcVSIxtCEOjnYRg7RPvybaGfQ
+v6Iaxb/+7J5kEvZhTFQId+bSiJImF1FSUT1W1xwzBZPUbcUkkXDj45vC2s3Z8E
+Lk7a3uZhvsQHLZnrfuWjBWGWvZ/MhZYgEXAMPLE
```

To create a backend server authentication policy

This example creates a backend server authentication policy that enables authentication on your backend instance using a public key policy.

Command:

```
aws elb create-load-balancer-policy --load-balancer-name my-
load-balancer --policy-name my-authentication-policy --policy-
type-name BackendServerAuthenticationPolicyType --policy-
attributes AttributeName=PublicKeyPolicyName,AttributeValue=my-PublicKey-policy
```

- For API details, see CreateLoadBalancerPolicy in *AWS CLI Command Reference*.

`create-load-balancer`

The following code example shows how to use `create-load-balancer`.

AWS CLI

To create an HTTP load balancer

This example creates a load balancer with an HTTP listener in a VPC.

Command:

```
aws elb create-load-balancer --load-balancer-name my-load-balancer --
listeners "Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80"
 --subnets subnet-15aaab61 --security-groups sg-a61988c3
```

Output:

```
{
    "DNSName": "my-load-balancer-1234567890.us-west-2.elb.amazonaws.com"
}
```

This example creates a load balancer with an HTTP listener in EC2-Classic.

Command:

```
aws elb create-load-balancer --load-balancer-name my-load-balancer --
listeners "Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80"
 --availability-zones us-west-2a us-west-2b
```

Output:

```
{
    "DNSName": "my-load-balancer-123456789.us-west-2.elb.amazonaws.com"
}
```

To create an HTTPS load balancer

This example creates a load balancer with an HTTPS listener in a VPC.

Command:

```
aws elb create-load-balancer --load-balancer-name my-load-balancer --
listeners "Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80" "Protoco
certificate/my-server-cert" --subnets subnet-15aaab61 --security-groups sg-a61988c3
```

Output:

```
{
    "DNSName": "my-load-balancer-1234567890.us-west-2.elb.amazonaws.com"
}
```

This example creates a load balancer with an HTTPS listener in EC2-Classic.

Command:

```
aws elb create-load-balancer --load-balancer-name my-load-balancer --
listeners "Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80" "Protoco
certificate/my-server-cert" --availability-zones us-west-2a us-west-2b
```

Output:

```
{
    "DNSName": "my-load-balancer-123456789.us-west-2.elb.amazonaws.com"
}
```

To create an internal load balancer

This example creates an internal load balancer with an HTTP listener in a VPC.

Command:

```
aws elb create-load-balancer --load-balancer-name my-load-balancer --
listeners "Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80"
 --scheme internal --subnets subnet-a85db0df --security-groups sg-a61988c3
```

Output:

```
{
    "DNSName": "internal-my-load-balancer-123456789.us-west-2.elb.amazonaws.com"
}
```

- For API details, see CreateLoadBalancer in *AWS CLI Command Reference*.

`delete-load-balancer-listeners`

The following code example shows how to use `delete-load-balancer-listeners`.

AWS CLI

To delete a listener from your load balancer

This example deletes the listener for the specified port from the specified load balancer.

Command:

```
aws elb delete-load-balancer-listeners --load-balancer-name my-load-balancer --load-balancer-ports 80
```

- For API details, see DeleteLoadBalancerListeners in *AWS CLI Command Reference*.

`delete-load-balancer-policy`

The following code example shows how to use `delete-load-balancer-policy`.

AWS CLI

To delete a policy from your load balancer

This example deletes the specified policy from the specified load balancer. The policy must not be enabled on any listener.

Command:

```
aws elb delete-load-balancer-policy --load-balancer-name my-load-balancer --policy-name my-duration-cookie-policy
```

- For API details, see DeleteLoadBalancerPolicy in *AWS CLI Command Reference*.

`delete-load-balancer`

The following code example shows how to use `delete-load-balancer`.

AWS CLI

To delete a load balancer

This example deletes the specified load balancer.

Command:

```
aws elb delete-load-balancer --load-balancer-name my-load-balancer
```

- For API details, see [DeleteLoadBalancer](#) in *AWS CLI Command Reference*.

`deregister-instances-from-load-balancer`

The following code example shows how to use `deregister-instances-from-load-balancer`.

AWS CLI

To deregister instances from a load balancer

This example deregisters the specified instance from the specified load balancer.

Command:

```
aws elb deregister-instances-from-load-balancer --load-balancer-name my-load-
balancer --instances i-d6f6fae3
```

Output:

```
{
    "Instances": [
        {
            "InstanceId": "i-207d9717"
        },
        {
            "InstanceId": "i-afefb49b"
        }
    ]
}
```

- For API details, see [DeregisterInstancesFromLoadBalancer](#) in *AWS CLI Command Reference*.

`describe-account-limits`

The following code example shows how to use `describe-account-limits`.

AWS CLI

To describe your Classic Load Balancer limits

The following `describe-account-limits` example displays details about the Classic Load Balancer limits for your AWS account.

```
aws elb describe-account-limits
```

Output:

```
{
    "Limits": [
        {
            "Name": "classic-load-balancers",
            "Max": "20"
        },
        {
            "Name": "classic-listeners",
            "Max": "100"
        },
        {
            "Name": "classic-registered-instances",
            "Max": "1000"
        }
    ]
}
```

- For API details, see DescribeAccountLimits in *AWS CLI Command Reference*.

`describe-instance-health`

The following code example shows how to use `describe-instance-health`.

AWS CLI

To describe the health of the instances for a load balancer

This example describes the health of the instances for the specified load balancer.

Command:

```
aws elb describe-instance-health --load-balancer-name my-load-balancer
```

Output:

```
{
  "InstanceStates": [
      {
          "InstanceId": "i-207d9717",
          "ReasonCode": "N/A",
          "State": "InService",
          "Description": "N/A"
      },
      {
          "InstanceId": "i-afefb49b",
          "ReasonCode": "N/A",
          "State": "InService",
          "Description": "N/A"
      }
  ]
}
```

To describe the health of an instance for a load balancer

This example describes the health of the specified instance for the specified load balancer.

Command:

```
aws elb describe-instance-health --load-balancer-name my-load-balancer --
instances i-7299c809
```

The following is an example response for an instance that is registering.

Output:

```
{
  "InstanceStates": [
      {
          "InstanceId": "i-7299c809",
          "ReasonCode": "ELB",
          "State": "OutOfService",
          "Description": "Instance registration is still in progress."
    }
  ]
}
```

The following is an example response for an unhealthy instance.

Output:

```
{
  "InstanceStates": [
      {
          "InstanceId": "i-7299c809",
          "ReasonCode": "Instance",
          "State": "OutOfService",
          "Description": "Instance has failed at least the UnhealthyThreshold number
 of health checks consecutively."
      }
  ]
}
```

- For API details, see DescribeInstanceHealth in *AWS CLI Command Reference*.

`describe-load-balancer-attributes`

The following code example shows how to use `describe-load-balancer-attributes`.

AWS CLI

To describe the attributes of a load balancer

This example describes the attributes of the specified load balancer.

Command:

```
aws elb describe-load-balancer-attributes --load-balancer-name my-load-balancer
```

Output:

```
{
  "LoadBalancerAttributes": {
      "ConnectionDraining": {
          "Enabled": false,
          "Timeout": 300
      },
      "CrossZoneLoadBalancing": {
          "Enabled": true
      },
      "ConnectionSettings": {
          "IdleTimeout": 30
```

```
      },
      "AccessLog": {
          "Enabled": false
    }
  }
}
```

- For API details, see [DescribeLoadBalancerAttributes](#) in *AWS CLI Command Reference*.

`describe-load-balancer-policies`

The following code example shows how to use `describe-load-balancer-policies`.

AWS CLI

To describe all policies associated with a load balancer

This example describes all of the policies associated with the specified load balancer.

Command:

```
aws elb describe-load-balancer-policies --load-balancer-name my-load-balancer
```

Output:

```
{
  "PolicyDescriptions": [
    {
      "PolicyAttributeDescriptions": [
        {
          "AttributeName": "ProxyProtocol",
          "AttributeValue": "true"
        }
      ],
      "PolicyName": "my-ProxyProtocol-policy",
      "PolicyTypeName": "ProxyProtocolPolicyType"
    },
    {
        "PolicyAttributeDescriptions": [
            {
                "AttributeName": "CookieName",
                "AttributeValue": "my-app-cookie"
            }
```

```
        ],
        "PolicyName": "my-app-cookie-policy",
        "PolicyTypeName": "AppCookieStickinessPolicyType"
    },
    {
      "PolicyAttributeDescriptions": [
        {
          "AttributeName": "CookieExpirationPeriod",
          "AttributeValue": "60"
        }
      ],
      "PolicyName": "my-duration-cookie-policy",
      "PolicyTypeName": "LBCookieStickinessPolicyType"
    },
    .
    .
    .
  ]
}
```

To describe a specific policy associated with a load balancer

This example describes the specified policy associated with the specified load balancer.

Command:

```
aws elb describe-load-balancer-policies --load-balancer-name my-load-balancer --
policy-name my-authentication-policy
```

Output:

```
{
  "PolicyDescriptions": [
      {
          "PolicyAttributeDescriptions": [
              {
                  "AttributeName": "PublicKeyPolicyName",
                  "AttributeValue": "my-PublicKey-policy"
              }
          ],
          "PolicyName": "my-authentication-policy",
          "PolicyTypeName": "BackendServerAuthenticationPolicyType"
      }
```

```
  ]
}
```

- For API details, see DescribeLoadBalancerPolicies in *AWS CLI Command Reference*.

`describe-load-balancer-policy-types`

The following code example shows how to use `describe-load-balancer-policy-types`.

AWS CLI

To describe the load balancer policy types defined by Elastic Load Balancing

This example describes the load balancer policy types that you can use to create policy configurations for your load balancer.

Command:

```
aws elb describe-load-balancer-policy-types
```

Output:

```
{
  "PolicyTypeDescriptions": [
      {
          "PolicyAttributeTypeDescriptions": [
              {
                  "Cardinality": "ONE",
                  "AttributeName": "ProxyProtocol",
                  "AttributeType": "Boolean"
              }
          ],
          "PolicyTypeName": "ProxyProtocolPolicyType",
          "Description": "Policy that controls whether to include the IP address and
 port of the originating request for TCP messages. This policy operates on TCP/SSL
 listeners only"
      },
      {
          "PolicyAttributeTypeDescriptions": [
              {
                  "Cardinality": "ONE",
                  "AttributeName": "PublicKey",
                  "AttributeType": "String"
```

```
            }
        ],
        "PolicyTypeName": "PublicKeyPolicyType",
        "Description": "Policy containing a list of public keys to
accept when authenticating the back-end server(s). This policy cannot be
applied directly to back-end servers or listeners but must be part of a
BackendServerAuthenticationPolicyType."
    },
    {
        "PolicyAttributeTypeDescriptions": [
            {
                "Cardinality": "ONE",
                "AttributeName": "CookieName",
                "AttributeType": "String"
            }
        ],
        "PolicyTypeName": "AppCookieStickinessPolicyType",
        "Description": "Stickiness policy with session lifetimes controlled by the
lifetime of the application-generated cookie. This policy can be associated only
with HTTP/HTTPS listeners."
    },
    {
        "PolicyAttributeTypeDescriptions": [
            {
                "Cardinality": "ZERO_OR_ONE",
                "AttributeName": "CookieExpirationPeriod",
                "AttributeType": "Long"
            }
        ],
        "PolicyTypeName": "LBCookieStickinessPolicyType",
        "Description": "Stickiness policy with session lifetimes controlled by
the browser (user-agent) or a specified expiration period. This policy can be
associated only with HTTP/HTTPS listeners."
    },
    {
        "PolicyAttributeTypeDescriptions": [
            .
            .
            .
        ],
        "PolicyTypeName": "SSLNegotiationPolicyType",
        "Description": "Listener policy that defines the ciphers and protocols
that will be accepted by the load balancer. This policy can be associated only with
HTTPS/SSL listeners."
```

```
        },
        {
            "PolicyAttributeTypeDescriptions": [
                {
                    "Cardinality": "ONE_OR_MORE",
                    "AttributeName": "PublicKeyPolicyName",
                    "AttributeType": "PolicyName"
                }
            ],
            "PolicyTypeName": "BackendServerAuthenticationPolicyType",
            "Description": "Policy that controls authentication to back-end server(s)
 and contains one or more policies, such as an instance of a PublicKeyPolicyType.
 This policy can be associated only with back-end servers that are using HTTPS/SSL."
        }
    ]
}
```

- For API details, see DescribeLoadBalancerPolicyTypes in *AWS CLI Command Reference*.

`describe-load-balancers`

The following code example shows how to use `describe-load-balancers`.

AWS CLI

To describe your load balancers

This example describes all of your load balancers.

Command:

```
aws elb describe-load-balancers
```

To describe one of your load balancers

This example describes the specified load balancer.

Command:

```
aws elb describe-load-balancers --load-balancer-name my-load-balancer
```

The following example response is for an HTTPS load balancer in a VPC.

Output:

```
{
  "LoadBalancerDescriptions": [
    {
      "Subnets": [
          "subnet-15aaab61"
      ],
      "CanonicalHostedZoneNameID": "Z3DZXE0EXAMPLE",
      "CanonicalHostedZoneName": "my-load-balancer-1234567890.us-
west-2.elb.amazonaws.com",
      "ListenerDescriptions": [
          {
              "Listener": {
                  "InstancePort": 80,
                  "LoadBalancerPort": 80,
                  "Protocol": "HTTP",
                  "InstanceProtocol": "HTTP"
              },
              "PolicyNames": []
          },
          {
              "Listener": {
                  "InstancePort": 443,
                  "SSLCertificateId": "arn:aws:iam::123456789012:server-certificate/
my-server-cert",
                  "LoadBalancerPort": 443,
                  "Protocol": "HTTPS",
                  "InstanceProtocol": "HTTPS"
              },
              "PolicyNames": [
                  "ELBSecurityPolicy-2015-03"
              ]
          }
      ],
      "HealthCheck": {
          "HealthyThreshold": 2,
          "Interval": 30,
          "Target": "HTTP:80/png",
          "Timeout": 3,
          "UnhealthyThreshold": 2
      },
      "VPCId": "vpc-a01106c2",
      "BackendServerDescriptions": [
```

```
            {
                "InstancePort": 80,
                "PolicyNames": [
                    "my-ProxyProtocol-policy"
                ]
            }
        ],
        "Instances": [
            {
                "InstanceId": "i-207d9717"
            },
            {
                "InstanceId": "i-afefb49b"
            }
        ],
        "DNSName": "my-load-balancer-1234567890.us-west-2.elb.amazonaws.com",

            "LBCookieStickinessPolicies": [
                {
                    "PolicyName": "my-duration-cookie-policy",
                    "CookieExpirationPeriod": 60
                }
            ],
            "AppCookieStickinessPolicies": [],
            "OtherPolicies": [
                "my-PublicKey-policy",
                "my-authentication-policy",
                "my-SSLNegotiation-policy",
                "my-ProxyProtocol-policy",
                "ELBSecurityPolicy-2015-03"
            ]
        },
        "LoadBalancerName": "my-load-balancer",
        "CreatedTime": "2015-03-19T03:24:02.650Z",
        "AvailabilityZones": [
            "us-west-2a"
        ],
        "Scheme": "internet-facing",
        "SourceSecurityGroup": {
            "OwnerAlias": "123456789012",
            "GroupName": "my-elb-sg"
```

```
        }
      }
    ]
  }
```

- For API details, see DescribeLoadBalancers in *AWS CLI Command Reference*.

`describe-tags`

The following code example shows how to use `describe-tags`.

AWS CLI

To describe the tags assigned to a load balancer

This example describes the tags assigned to the specified load balancer.

Command:

```
aws elb describe-tags --load-balancer-name my-load-balancer
```

Output:

```
{
  "TagDescriptions": [
      {
          "Tags": [
              {
                  "Value": "lima",
                  "Key": "project"
              },
              {
                  "Value": "digital-media",
                  "Key": "department"
              }
          ],
          "LoadBalancerName": "my-load-balancer"
      }
  ]
}
```

- For API details, see DescribeTags in *AWS CLI Command Reference*.

`detach-load-balancer-from-subnets`

The following code example shows how to use `detach-load-balancer-from-subnets`.

AWS CLI

To detach load balancers from subnets

This example detaches the specified load balancer from the specified subnet.

Command:

```
aws elb detach-load-balancer-from-subnets --load-balancer-name my-load-balancer --subnets subnet-0ecac448
```

Output:

```
{
   "Subnets": [
       "subnet-15aaab61"
   ]
}
```

- For API details, see DetachLoadBalancerFromSubnets in *AWS CLI Command Reference*.

`disable-availability-zones-for-load-balancer`

The following code example shows how to use `disable-availability-zones-for-load-balancer`.

AWS CLI

To disable Availability Zones for a load balancer

This example removes the specified Availability Zone from the set of Availability Zones for the specified load balancer.

Command:

```
aws elb disable-availability-zones-for-load-balancer --load-balancer-name my-load-balancer --availability-zones us-west-2a
```

Output:

```
{
    "AvailabilityZones": [
        "us-west-2b"
    ]
}
```

- For API details, see DisableAvailabilityZonesForLoadBalancer in *AWS CLI Command Reference*.

`enable-availability-zones-for-load-balancer`

The following code example shows how to use `enable-availability-zones-for-load-balancer`.

AWS CLI

To enable Availability Zones for a load balancer

This example adds the specified Availability Zone to the specified load balancer.

Command:

```
aws elb enable-availability-zones-for-load-balancer --load-balancer-name my-load-balancer --availability-zones us-west-2b
```

Output:

```
{
    "AvailabilityZones": [
        "us-west-2a",
        "us-west-2b"
    ]
}
```

- For API details, see EnableAvailabilityZonesForLoadBalancer in *AWS CLI Command Reference*.

`modify-load-balancer-attributes`

The following code example shows how to use `modify-load-balancer-attributes`.

AWS CLI

To modify the attributes of a load balancer

This example modifies the `CrossZoneLoadBalancing` attribute of the specified load balancer.

Command:

```
aws elb modify-load-balancer-attributes --load-balancer-name my-load-balancer --
load-balancer-attributes "{\"CrossZoneLoadBalancing\":{\"Enabled\":true}}"
```

Output:

```
{
    "LoadBalancerAttributes": {
        "CrossZoneLoadBalancing": {
            "Enabled": true
        }
    },
    "LoadBalancerName": "my-load-balancer"
}
```

This example modifies the `ConnectionDraining` attribute of the specified load balancer.

Command:

```
aws elb modify-load-balancer-attributes --load-balancer-name my-load-balancer
 --load-balancer-attributes "{\"ConnectionDraining\":{\"Enabled\":true,\"Timeout
\":300}}"
```

Output:

```
{
    "LoadBalancerAttributes": {
        "ConnectionDraining": {
            "Enabled": true,
            "Timeout": 300
        }
    },
    "LoadBalancerName": "my-load-balancer"
}
```

- For API details, see ModifyLoadBalancerAttributes in *AWS CLI Command Reference*.

`register-instances-with-load-balancer`

The following code example shows how to use `register-instances-with-load-balancer`.

AWS CLI

To register instances with a load balancer

This example registers the specified instance with the specified load balancer.

Command:

```
aws elb register-instances-with-load-balancer --load-balancer-name my-load-balancer
 --instances i-d6f6fae3
```

Output:

```
{
   "Instances": [
       {
           "InstanceId": "i-d6f6fae3"
       },
       {
           "InstanceId": "i-207d9717"
       },
       {
           "InstanceId": "i-afefb49b"
       }
   ]
}
```

- For API details, see RegisterInstancesWithLoadBalancer in *AWS CLI Command Reference*.

`remove-tags`

The following code example shows how to use `remove-tags`.

AWS CLI

To remove tags from a load balancer

This example removes a tag from the specified load balancer.

Command:

```
aws elb remove-tags --load-balancer-name my-load-balancer --tags project
```

- For API details, see RemoveTags in *AWS CLI Command Reference*.

`set-load-balancer-listener-ssl-certificate`

The following code example shows how to use `set-load-balancer-listener-ssl-certificate`.

AWS CLI

To update the SSL certificate for an HTTPS load balancer

This example replaces the existing SSL certificate for the specified HTTPS load balancer.

Command:

```
aws elb set-load-balancer-listener-ssl-certificate --load-balancer-
name my-load-balancer --load-balancer-port 443 --ssl-certificate-
id arn:aws:iam::123456789012:server-certificate/new-server-cert
```

- For API details, see SetLoadBalancerListenerSslCertificate in *AWS CLI Command Reference*.

`set-load-balancer-policies-for-backend-server`

The following code example shows how to use `set-load-balancer-policies-for-backend-server`.

AWS CLI

To replace the policies associated with a port for a backend instance

This example replaces the policies that are currently associated with the specified port.

Command:

```
aws elb set-load-balancer-policies-for-backend-server --load-balancer-name my-load-
balancer --instance-port 80 --policy-names my-ProxyProtocol-policy
```

To remove all policies that are currently associated with a port on your backend instance

This example removes all policies associated with the specified port.

Command:

```
aws elb set-load-balancer-policies-for-backend-server --load-balancer-name my-load-balancer --instance-port 80 --policy-names []
```

To confirm that the policies are removed, use the `describe-load-balancer-policies` command.

- For API details, see SetLoadBalancerPoliciesForBackendServer in *AWS CLI Command Reference*.

`set-load-balancer-policies-of-listener`

The following code example shows how to use `set-load-balancer-policies-of-listener`.

AWS CLI

To replace the policies associated with a listener

This example replaces the policies that are currently associated with the specified listener.

Command:

```
aws elb set-load-balancer-policies-of-listener --load-balancer-name my-load-balancer
 --load-balancer-port 443 --policy-names my-SSLNegotiation-policy
```

To remove all policies associated with your listener

This example removes all policies that are currently associated with the specified listener.

Command:

```
aws elb set-load-balancer-policies-of-listener --load-balancer-name my-load-balancer
 --load-balancer-port 443 --policy-names []
```

To confirm that the policies are removed from the load balancer, use the `describe-load-balancer-policies` command.

- For API details, see SetLoadBalancerPoliciesOfListener in *AWS CLI Command Reference*.

Elastic Load Balancing - Version 2 examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Elastic Load Balancing - Version 2.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`add-listener-certificates`

The following code example shows how to use `add-listener-certificates`.

AWS CLI

To add a certificate to a secure listener

This example adds the specified certificate to the specified secure listener.

Command:

```
aws elbv2 add-listener-certificates --listener-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/
f2f7dc8efc522ab2 --certificates CertificateArn=arn:aws:acm:us-
west-2:123456789012:certificate/5cc54884-f4a3-4072-80be-05b9ba72f705
```

Output:

```
{
  "Certificates": [
      {
          "CertificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/5cc54884-f4a3-4072-80be-05b9ba72f705",
          "IsDefault": false
      }
```

```
    ]
}
```

- For API details, see AddListenerCertificates in *AWS CLI Command Reference*.

`add-tags`

The following code example shows how to use `add-tags`.

AWS CLI

To add tags to a load balancer

The following `add-tags` example adds the `project` and `department` tags to the specified load balancer.

```
aws elbv2 add-tags \
    --resource-arns arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \
    --tags "Key=project,Value=lima" "Key=department,Value=digital-media"
```

- For API details, see AddTags in *AWS CLI Command Reference*.

`create-listener`

The following code example shows how to use `create-listener`.

AWS CLI

Example 1: To create an HTTP listener

The following `create-listener` example creates an HTTP listener for the specified Application Load Balancer that forwards requests to the specified target group.

```
aws elbv2 create-listener \
    --load-balancer-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \
    --protocol HTTP \
    --port 80 \
    --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

For more information, see Tutorial: Create an Application Load Balancer using the AWS CLI in the *User Guide for Application Load Balancers*.

Example 2: To create an HTTPS listener

The following `create-listener` example creates an HTTPS listener for the specified Application Load Balancer that forwards requests to the specified target group. You must specify an SSL certificate for an HTTPS listener. You can create and manage certificates using AWS Certificate Manager (ACM). Alternatively, you can create a certificate using SSL/TLS tools, get the certificate signed by a certificate authority (CA), and upload the certificate to AWS Identity and Access Management (IAM).

```
aws elbv2 create-listener \
    --load-balancer-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \
    --protocol HTTPS \
    --port 443 \
    --certificates CertificateArn=arn:aws:acm:us-
west-2:123456789012:certificate/3dcb0a41-bd72-4774-9ad9-756919c40557 \
    --ssl-policy ELBSecurityPolicy-2016-08 \
    --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

For more information, see Add an HTTPS listener in the *User Guide for Application Load Balancers*.

Example 3: To create a TCP listener

The following `create-listener` example creates a TCP listener for the specified Network Load Balancer that forwards requests to the specified target group.

```
aws elbv2 create-listener \
    --load-balancer-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/net/my-network-load-balancer/5d1b75f4f1cee11e \
    --protocol TCP \
    --port 80 \
    --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-tcp-targets/b6bba954d1361c78
```

For more information, see Tutorial: Create a Network Load Balancer using the AWS CLI in the *User Guide for Network Load Balancers*.

Example 4: To create a TLS listener

The following `create-listener` example creates a TLS listener for the specified Network Load Balancer that forwards requests to the specified target group. You must specify an SSL certificate for a TLS listener.

```
aws elbv2 create-listener \
    --load-balancer-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \
    --protocol TLS \
    --port 443 \
    --certificates CertificateArn=arn:aws:acm:us-
west-2:123456789012:certificate/3dcb0a41-bd72-4774-9ad9-756919c40557 \
    --ssl-policy ELBSecurityPolicy-2016-08 \
    --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

For more information, see TLS listeners for your Network Load Balancer in the *User Guide for Network Load Balancers*.

Example 5: To create a UDP listener

The following `create-listener` example creates a UDP listener for the specified Network Load Balancer that forwards requests to the specified target group.

```
aws elbv2 create-listener \
    --load-balancer-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/net/my-network-load-balancer/5d1b75f4f1cee11e \
    --protocol UDP \
    --port 53 \
    --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-tcp-targets/b6bba954d1361c78
```

For more information, see Tutorial: Create a Network Load Balancer using the AWS CLI in the *User Guide for Network Load Balancers*.

Example 6: To create a listener for the specified gateway and forwarding

The following `create-listener` example creates a listener for the specified Gateway Load Balancer that forwards requests to the specified target group.

```
aws elbv2 create-listener \
```

```
    --load-balancer-arn arn:aws:elasticloadbalancing:us-
east-1:850631746142:loadbalancer/gwy/my-gateway-load-balancer/e0f9b3d5c7f7d3d6 \
    --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-
east-1:850631746142:targetgroup/my-glb-targets/007ca469fae3bb1615
```

Output:

```
{
    "Listeners": [
        {
            "ListenerArn": "arn:aws:elasticloadbalancing:us-
east-1:850631746142:listener/gwy/my-agw-lb-example2/e0f9b3d5c7f7d3d6/
afc127db15f925de",
            "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-
east-1:850631746142:loadbalancer/gwy/my-agw-lb-example2/e0f9b3d5c7f7d3d6",
            "DefaultActions": [
                {
                    "Type": "forward",
                    "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
east-1:850631746142:targetgroup/test-tg-agw-2/007ca469fae3bb1615",
                    "ForwardConfig": {
                        "TargetGroups": [
                            {
                                "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
east-1:850631746142:targetgroup/test-tg-agw-2/007ca469fae3bb1615"
                            }
                        ]
                    }
                }
            ]
        }
    ]
}
```

For more information, see Getting started with Gateway Load Balancers using the AWS CLI in the *User Guide for Gateway Load Balancers*.

- For API details, see CreateListener in *AWS CLI Command Reference*.

`create-load-balancer`

The following code example shows how to use `create-load-balancer`.

AWS CLI

Example 1: To create an Internet-facing load balancer

The following `create-load-balancer` example creates an Internet-facing Application Load Balancer and enables the Availability Zones for the specified subnets.

```
aws elbv2 create-load-balancer \
    --name my-load-balancer \
    --subnets subnet-b7d581c0 subnet-8360a9e7
```

Output:

```
{
    "LoadBalancers": [
        {
            "Type": "application",
            "Scheme": "internet-facing",
            "IpAddressType": "ipv4",
            "VpcId": "vpc-3ac0fb5f",
            "AvailabilityZones": [
                {
                    "ZoneName": "us-west-2a",
                    "SubnetId": "subnet-8360a9e7"
                },
                {
                    "ZoneName": "us-west-2b",
                    "SubnetId": "subnet-b7d581c0"
                }
            ],
            "CreatedTime": "2017-08-25T21:26:12.920Z",
            "CanonicalHostedZoneId": "Z2P70J7EXAMPLE",
            "DNSName": "my-load-balancer-424835706.us-west-2.elb.amazonaws.com",
            "SecurityGroups": [
                "sg-5943793c"
            ],
            "LoadBalancerName": "my-load-balancer",
            "State": {
                "Code": "provisioning"
            },
            "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188"
        }
```

```
    ]
}
```

For more information, see Tutorial: Create an Application Load Balancer using the AWS CLI in the *User Guide for Application Load Balancers*.

Example 2: To create an internal load balancer

The following `create-load-balancer` example creates an internal Application Load Balancer and enables the Availability Zones for the specified subnets.

```
aws elbv2 create-load-balancer \
    --name my-internal-load-balancer \
    --scheme internal \
    --subnets subnet-b7d581c0 subnet-8360a9e7
```

Output:

```
{
    "LoadBalancers": [
        {
            "Type": "application",
            "Scheme": "internal",
            "IpAddressType": "ipv4",
            "VpcId": "vpc-3ac0fb5f",
            "AvailabilityZones": [
                {
                    "ZoneName": "us-west-2a",
                    "SubnetId": "subnet-8360a9e7"
                },
                {
                    "ZoneName": "us-west-2b",
                    "SubnetId": "subnet-b7d581c0"
                }
            ],
            "CreatedTime": "2016-03-25T21:29:48.850Z",
            "CanonicalHostedZoneId": "Z2P70J7EXAMPLE",
            "DNSName": "internal-my-internal-load-balancer-1529930873.us-
west-2.elb.amazonaws.com",
            "SecurityGroups": [
                "sg-5943793c"
            ],
```

```
            "LoadBalancerName": "my-internal-load-balancer",
            "State": {
                "Code": "provisioning"
            },
            "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-internal-load-balancer/5b49b8d4303115c2"
        }
    ]
}
```

For more information, see [Tutorial: Create an Application Load Balancer using the AWS CLI](#) in the *User Guide for Application Load Balancers*.

Example 3: To create a Network Load Balancer

The following `create-load-balancer` example creates an Internet-facing Network Load Balancer and enables the Availability Zone for the specified subnet. It uses a subnet mapping to associate the specified Elastic IP address with the network interface used by the load balancer nodes for the Availability Zone.

```
aws elbv2 create-load-balancer \
    --name my-network-load-balancer \
    --type network \
    --subnet-mappings SubnetId=subnet-b7d581c0,AllocationId=eipalloc-64d5890a
```

Output:

```
{
    "LoadBalancers": [
        {
            "Type": "network",
            "Scheme": "internet-facing",
            "IpAddressType": "ipv4",
            "VpcId": "vpc-3ac0fb5f",
            "AvailabilityZones": [
                {
                    "LoadBalancerAddresses": [
                        {
                            "IpAddress": "35.161.207.171",
                            "AllocationId": "eipalloc-64d5890a"
                        }
                    ],
```

```
                    "ZoneName": "us-west-2b",
                    "SubnetId": "subnet-5264e837"
                }
            ],
            "CreatedTime": "2017-10-15T22:41:25.657Z",
            "CanonicalHostedZoneId": "Z2P70J7EXAMPLE",
            "DNSName": "my-network-load-balancer-5d1b75f4f1cee11e.elb.us-
west-2.amazonaws.com",
            "LoadBalancerName": "my-network-load-balancer",
            "State": {
                "Code": "provisioning"
            },
            "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/net/my-network-load-balancer/5d1b75f4f1cee11e"
        }
    ]
}
```

For more information, see Tutorial: Create a Network Load Balancer using the AWS CLI in the *User Guide for Network Load Balancers*.

Example 4: To create a Gateway Load Balancer

The following `create-load-balancer` example creates a Gateway Load Balancer and enables the Availability Zones for the specified subnets.

```
aws elbv2 create-load-balancer \
    --name my-gateway-load-balancer \
    --type gateway \
    --subnets subnet-dc83f691 subnet-a62583f9
```

Output:

```
{
    "LoadBalancers": [
        {
            "Type": "gateway",
            "VpcId": "vpc-838475fe",
            "AvailabilityZones": [
                {
                    "ZoneName": "us-east-1b",
                    "SubnetId": "subnet-a62583f9"
```

```
                },
            {
                    "ZoneName": "us-east-1a",
                    "SubnetId": "subnet-dc83f691"
                }
            ],
            "CreatedTime": "2021-07-14T19:33:43.324000+00:00",
            "LoadBalancerName": "my-gateway-load-balancer",
            "State": {
                "Code": "provisioning"
            },
            "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-
east-1:850631746142:loadbalancer/gwy/my-gateway-load-balancer/dfbb5a7d32cdee79"
        }
    ]
}
```

For more information, see Getting started with Gateway Load Balancers using the AWS CLI in the *User Guide for Gateway Load Balancers*.

- For API details, see CreateLoadBalancer in *AWS CLI Command Reference*.

`create-rule`

The following code example shows how to use `create-rule`.

AWS CLI

Example 1: To create a rule using a path condition and a forward action

The following `create-rule` example creates a rule that forwards requests to the specified target group if the URL contains the specified pattern.

```
aws elbv2 create-rule \
    --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/
my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 \
    --priority 5 \
    --conditions file://conditions-pattern.json
    --actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

Contents of `conditions-pattern.json`:

```
[
    {
        "Field": "path-pattern",
        "PathPatternConfig": {
            "Values": ["/images/*"]
        }
    }
]
```

Example 2: To create a rule using a host condition and a fixed response

The following `create-rule` example creates a rule that provides a fixed response if the hostname in the host header matches the specified hostname.

```
aws elbv2 create-rule \
    --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/
my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 \
    --priority 10 \
    --conditions file://conditions-host.json \
    --actions file://actions-fixed-response.json
```

Contents of `conditions-host.json`

```
[
  {
      "Field": "host-header",
      "HostHeaderConfig": {
          "Values": ["*.example.com"]
      }
  }
]
```

Contents of `actions-fixed-response.json`

```
[
    {
        "Type": "fixed-response",
        "FixedResponseConfig": {
            "MessageBody": "Hello world",
            "StatusCode": "200",
            "ContentType": "text/plain"
```

```
        }
    }
]
```

Example 3: To create a rule using a source IP address condition, an authenticate action, and a forward action

The following `create-rule` example creates a rule that authenticates the user if the source IP address matches the specified IP address, and forwards the request to the specified target group if authentication is successful.

```
aws elbv2 create-rule \
    --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 \
    --priority 20 \
    --conditions file://conditions-source-ip.json \
    --actions file://actions-authenticate.json
```

Contents of `conditions-source-ip.json`

```
[
    {
        "Field": "source-ip",
        "SourceIpConfig": {
            "Values": ["192.0.2.0/24", "198.51.100.10/32"]
        }
    }
]
```

Contents of `actions-authenticate.json`

```
[
    {
        "Type": "authenticate-oidc",
        "AuthenticateOidcConfig": {
            "Issuer": "https://idp-issuer.com",
            "AuthorizationEndpoint": "https://authorization-endpoint.com",
            "TokenEndpoint": "https://token-endpoint.com",
            "UserInfoEndpoint": "https://user-info-endpoint.com",
            "ClientId": "abcdefghijklmnopqrstuvwxyz123456789",
            "ClientSecret": "123456789012345678901234567890",
```

```
                "SessionCookieName": "my-cookie",
                "SessionTimeout": 3600,
                "Scope": "email",
                "AuthenticationRequestExtraParams": {
                    "display": "page",
                    "prompt": "login"
                },
                "OnUnauthenticatedRequest": "deny"
            },
            "Order": 1
        },
        {
            "Type": "forward",
            "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
east-1:880185128111:targetgroup/cli-test/642a97ecb0e0f26b",
            "Order": 2
        }
]
```

- For API details, see CreateRule in *AWS CLI Command Reference*.

`create-target-group`

The following code example shows how to use `create-target-group`.

AWS CLI

Example 1: To create a target group for an Application Load Balancer

The following `create-target-group` example creates a target group for an Application Load Balancer where you register targets by instance ID (the target type is `instance`). This target group uses the HTTP protocol, port 80, and the default health check settings for an HTTP target group.

```
aws elbv2 create-target-group \
    --name my-targets \
    --protocol HTTP \
    --port 80 \
    --target-type instance \
    --vpc-id vpc-3ac0fb5f
```

Output:

```
{
    "TargetGroups": [
        {
            "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
            "TargetGroupName": "my-targets",
            "Protocol": "HTTP",
            "Port": 80,
            "VpcId": "vpc-3ac0fb5f",
            "HealthCheckProtocol": "HTTP",
            "HealthCheckPort": "traffic-port",
            "HealthCheckEnabled": true,
            "HealthCheckIntervalSeconds": 30,
            "HealthCheckTimeoutSeconds": 5,
            "HealthyThresholdCount": 5,
            "UnhealthyThresholdCount": 2,
            "HealthCheckPath": "/",
            "Matcher": {
                "HttpCode": "200"
            },
            "TargetType": "instance",
            "ProtocolVersion": "HTTP1",
            "IpAddressType": "ipv4"
        }
    ]
}
```

For more information, see Create a target group in the *User Guide for Application Load Balancers*.

Example 2: To create a target group to route traffic from an Application Load Balancer to a Lambda function

The following `create-target-group` example creates a target group for an Application Load Balancer where the target is a Lambda function (the target type is `lambda`). Health checks are disabled for this target group by default.

```
aws elbv2 create-target-group \
    --name my-lambda-target \
    --target-type lambda
```

Output:

```
{
    "TargetGroups": [
        {
            "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-lambda-target/a3003e085dbb8ddc",
            "TargetGroupName": "my-lambda-target",
            "HealthCheckEnabled": false,
            "HealthCheckIntervalSeconds": 35,
            "HealthCheckTimeoutSeconds": 30,
            "HealthyThresholdCount": 5,
            "UnhealthyThresholdCount": 2,
            "HealthCheckPath": "/",
            "Matcher": {
                "HttpCode": "200"
            },
            "TargetType": "lambda",
            "IpAddressType": "ipv4"
        }
    ]
}
```

For more information, see Lambda functions as targets in the *User Guide for Application Load Balancers*.

Example 3: To create a target group for a Network Load Balancer

The following `create-target-group` example creates a target group for a Network Load Balancer where you register targets by IP address (the target type is `ip`). This target group uses the TCP protocol, port 80, and the default health check settings for a TCP target group.

```
aws elbv2 create-target-group \
    --name my-ip-targets \
    --protocol TCP \
    --port 80 \
    --target-type ip \
    --vpc-id vpc-3ac0fb5f
```

Output:

```
{
    "TargetGroups": [
        {
```

```
            "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-ip-targets/b6bba954d1361c78",
            "TargetGroupName": "my-ip-targets",
            "Protocol": "TCP",
            "Port": 80,
            "VpcId": "vpc-3ac0fb5f",
            "HealthCheckEnabled": true,
            "HealthCheckProtocol": "TCP",
            "HealthCheckPort": "traffic-port",
            "HealthCheckIntervalSeconds": 30,
            "HealthCheckTimeoutSeconds": 10,
            "HealthyThresholdCount": 5,
            "UnhealthyThresholdCount": 2,
            "TargetType": "ip",
            "IpAddressType": "ipv4"
        }
    ]
}
```

For more information, see Create a target group in the *User Guide for Network Load Balancers*.

Example 4: To create a target group to route traffic from a Network Load Balancer to an Application Load Balancer

The following `create-target-group` example creates a target group for a Network Load Balancer where you register an Application Load Balancer as a target (the target type is `alb`).

aws elbv2 create-target-group --name my-alb-target --protocol TCP --port 80 --target-type alb --vpc-id vpc-3ac0fb5f

Output:

```
{
    "TargetGroups": [
        {
            "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-alb-target/a3003e085dbb8ddc",
            "TargetGroupName": "my-alb-target",
            "Protocol": "TCP",
            "Port": 80,
            "VpcId": "vpc-838475fe",
            "HealthCheckProtocol": "HTTP",
            "HealthCheckPort": "traffic-port",
```

```
            "HealthCheckEnabled": true,
            "HealthCheckIntervalSeconds": 30,
            "HealthCheckTimeoutSeconds": 6,
            "HealthyThresholdCount": 5,
            "UnhealthyThresholdCount": 2,
            "HealthCheckPath": "/",
            "Matcher": {
                "HttpCode": "200-399"
            },
            "TargetType": "alb",
            "IpAddressType": "ipv4"
        }
    ]
}
```

For more information, see Create a target group with an Application Load Balancer as the target in the *User Guide for Network Load Balancers*.

Example 5: To create a target group for a Gateway Load Balancer

The following `create-target-group` example creates a target group for a Gateway Load Balancer where the target is an instance, and the target group protocol is GENEVE.

```
aws elbv2 create-target-group \
    --name my-glb-targetgroup \
    --protocol GENEVE \
    --port 6081 \
    --target-type instance \
    --vpc-id vpc-838475fe
```

Output:

```
{
    "TargetGroups": [
        {
            "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-glb-targetgroup/00c3d57eacd6f40b6f",
            "TargetGroupName": "my-glb-targetgroup",
            "Protocol": "GENEVE",
            "Port": 6081,
            "VpcId": "vpc-838475fe",
            "HealthCheckProtocol": "TCP",
```

```
                "HealthCheckPort": "80",
                "HealthCheckEnabled": true,
                "HealthCheckIntervalSeconds": 10,
                "HealthCheckTimeoutSeconds": 5,
                "HealthyThresholdCount": 5,
                "UnhealthyThresholdCount": 2,
                "TargetType": "instance"
            }
        ]
    }
```

For more information, see Create a target group <https://docs.aws.amazon.com/elasticloadbalancing/latest/gateway/create-target-group.html>`__ in the *Gateway Load Balancer User Guide*.

- For API details, see CreateTargetGroup in *AWS CLI Command Reference*.

`delete-listener`

The following code example shows how to use `delete-listener`.

AWS CLI

To delete a listener

The following `delete-listener` example deletes the specified listener.

```
aws elbv2 delete-listener \
    --listener-arn arn:aws:elasticloadbalancing:ua-west-2:123456789012:listener/app/
my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2
```

- For API details, see DeleteListener in *AWS CLI Command Reference*.

`delete-load-balancer`

The following code example shows how to use `delete-load-balancer`.

AWS CLI

To delete a load balancer

The following `delete-load-balancer` example deletes the specified load balancer.

```
aws elbv2 delete-load-balancer \
    --load-balancer-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188
```

- For API details, see DeleteLoadBalancer in *AWS CLI Command Reference*.

`delete-rule`

The following code example shows how to use `delete-rule`.

AWS CLI

To delete a rule

The following `delete-rule` example deletes the specified rule.

```
aws elbv2 delete-rule \
    --rule-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener-rule/
app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2/1291d13826f405c3
```

- For API details, see DeleteRule in *AWS CLI Command Reference*.

`delete-target-group`

The following code example shows how to use `delete-target-group`.

AWS CLI

To delete a target group

The following `delete-target-group` example deletes the specified target group.

```
aws elbv2 delete-target-group \
    --target-group-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

This command produces no output.

For more information, see Delete a load balancer in the *Application Load Balancer Guide*.

- For API details, see DeleteTargetGroup in *AWS CLI Command Reference*.

`deregister-targets`

The following code example shows how to use `deregister-targets`.

AWS CLI

Example 1: To deregister a target from a target group

The following `deregister-targets` example removes the specified instance from the specified target group.

```
aws elbv2 deregister-targets \
    --target-group-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067 \
    --targets Id=i-1234567890abcdef0
```

Example 2: To deregister a target registered using port overrides

The following `deregister-targets` example removes an instance from a target group that was registered using port overrides.

```
aws elbv2 deregister-targets \
    --target-group-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-internal-targets/3bb63f11dfb0faf9 \
    --targets Id=i-1234567890abcdef0,Port=80 Id=i-1234567890abcdef0,Port=766
```

- For API details, see DeregisterTargets in *AWS CLI Command Reference*.

`describe-account-limits`

The following code example shows how to use `describe-account-limits`.

AWS CLI

To describe your Elastic Load Balancing limits

The following `describe-account-limits` example displays the Elastic Load Balancing limits for your AWS account in the current Region.

```
aws elbv2 describe-account-limits
```

Output:

```
{
    "Limits": [
        {
            "Name": "target-groups",
            "Max": "3000"
        },
        {
            "Name": "targets-per-application-load-balancer",
            "Max": "1000"
        },
        {
            "Name": "listeners-per-application-load-balancer",
            "Max": "50"
        },
        {
            "Name": "rules-per-application-load-balancer",
            "Max": "100"
        },
        {
            "Name": "network-load-balancers",
            "Max": "50"
        },
        {
            "Name": "targets-per-network-load-balancer",
            "Max": "3000"
        },
        {
            "Name": "targets-per-availability-zone-per-network-load-balancer",
            "Max": "500"
        },
        {
            "Name": "listeners-per-network-load-balancer",
            "Max": "50"
        },
        {
            "Name": "condition-values-per-alb-rule",
            "Max": "5"
        },
        {
            "Name": "condition-wildcards-per-alb-rule",
            "Max": "5"
        },
```

```
        {
            "Name": "target-groups-per-application-load-balancer",
            "Max": "100"
        },
        {
            "Name": "target-groups-per-action-on-application-load-balancer",
            "Max": "5"
        },
        {
            "Name": "target-groups-per-action-on-network-load-balancer",
            "Max": "1"
        },
        {
            "Name": "certificates-per-application-load-balancer",
            "Max": "25"
        },
        {
            "Name": "certificates-per-network-load-balancer",
            "Max": "25"
        },
        {
            "Name": "targets-per-target-group",
            "Max": "1000"
        },
        {
            "Name": "target-id-registrations-per-application-load-balancer",
            "Max": "1000"
        },
        {
            "Name": "network-load-balancer-enis-per-vpc",
            "Max": "1200"
        },
        {
            "Name": "application-load-balancers",
            "Max": "50"
        },
        {
            "Name": "gateway-load-balancers",
            "Max": "100"
        },
        {
            "Name": "gateway-load-balancers-per-vpc",
            "Max": "100"
        },
```

```
        {
            "Name": "geneve-target-groups",
            "Max": "100"
        },
        {
            "Name": "targets-per-availability-zone-per-gateway-load-balancer",
            "Max": "300"
        }
    ]
}
```

For more information, see Quotas in the *AWS General Reference*.

- For API details, see DescribeAccountLimits in *AWS CLI Command Reference*.

`describe-listener-certificates`

The following code example shows how to use `describe-listener-certificates`.

AWS CLI

To describe the certificates for a secure listener

This example describes the certificates for the specified secure listener.

Command:

```
aws elbv2 describe-listener-certificates --listener-
arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-
balancer/50dc6c495c0c9188/f2f7dc8efc522ab2
```

Output:

```
{
  "Certificates": [
      {
          "CertificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/5cc54884-f4a3-4072-80be-05b9ba72f705",
          "IsDefault": false
      },
      {
          "CertificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/3dcb0a41-bd72-4774-9ad9-756919c40557",
```

```
            "IsDefault": false
        },
        {
            "CertificateArn": "arn:aws:acm:us-west-2:123456789012:certificate/
fe59da96-6f58-4a22-8eed-6d0d50477e1d",
            "IsDefault": true
        }
    ]
}
```

- For API details, see [DescribeListenerCertificates](#) in *AWS CLI Command Reference*.

`describe-listeners`

The following code example shows how to use `describe-listeners`.

AWS CLI

To describe a listener

This example describes the specified listener.

Command:

```
aws elbv2 describe-listeners --listener-arns arn:aws:elasticloadbalancing:us-
west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2
```

Output:

```
{
  "Listeners": [
      {
          "Port": 80,
          "Protocol": "HTTP",
          "DefaultActions": [
              {
                  "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
                  "Type": "forward"
              }
          ],
          "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
```

```
            "ListenerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2"
        }
    ]
}
```

To describe the listeners for a load balancer

This example describe the listeners for the specified load balancer.

Command:

```
aws elbv2 describe-listeners --load-balancer-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188
```

Output:

```
{
  "Listeners": [
      {
          "Port": 443,
          "Protocol": "HTTPS",
          "DefaultActions": [

```

- For API details, see [DescribeListeners](#) in *AWS CLI Command Reference*.

`describe-load-balancer-attributes`

The following code example shows how to use `describe-load-balancer-attributes`.

AWS CLI

To describe load balancer attributes

The following `describe-load-balancer-attributes` example displays the attributes of the specified load balancer.

```
aws elbv2 describe-load-balancer-attributes \
    --load-balancer-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188
```

The following example output show the attributes for an Application Load Balancer.

```
{
    "Attributes": [
        {
            "Value": "false",
            "Key": "access_logs.s3.enabled"
        },
        {
```

```
                "Value": "",
                "Key": "access_logs.s3.bucket"
            },
            {
                "Value": "",
                "Key": "access_logs.s3.prefix"
            },
            {
                "Value": "60",
                "Key": "idle_timeout.timeout_seconds"
            },
            {
                "Value": "false",
                "Key": "deletion_protection.enabled"
            },
            {
                "Value": "true",
                "Key": "routing.http2.enabled"
            }
        ]
}
```

The following example output includes the attributes for a Network Load Balancer.

```
{
    "Attributes": [
        {
            "Value": "false",
            "Key": "access_logs.s3.enabled"
        },
        {
            "Value": "",
            "Key": "access_logs.s3.bucket"
        },
        {
            "Value": "",
            "Key": "access_logs.s3.prefix"
        },
        {
            "Value": "false",
            "Key": "deletion_protection.enabled"
        },
        {
```

```
                "Value": "false",
                "Key": "load_balancing.cross_zone.enabled"
            }
        ]
}
```

- For API details, see DescribeLoadBalancerAttributes in *AWS CLI Command Reference*.

`describe-load-balancers`

The following code example shows how to use `describe-load-balancers`.

AWS CLI

To describe a load balancer

This example describes the specified load balancer.

Command:

```
aws elbv2 describe-load-balancers --load-balancer-arns arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188
```

Output:

```
{
  "LoadBalancers": [
      {
          "Type": "application",
          "Scheme": "internet-facing",
          "IpAddressType": "ipv4",
          "VpcId": "vpc-3ac0fb5f",
          "AvailabilityZones": [
              {
                  "ZoneName": "us-west-2a",
                  "SubnetId": "subnet-8360a9e7"
              },
              {
                  "ZoneName": "us-west-2b",
                  "SubnetId": "subnet-b7d581c0"
              }
```

```
            ],
            "CreatedTime": "2016-03-25T21:26:12.920Z",
            "CanonicalHostedZoneId": "Z2P70J7EXAMPLE",
            "DNSName": "my-load-balancer-424835706.us-west-2.elb.amazonaws.com",
            "SecurityGroups": [
                "sg-5943793c"
            ],
            "LoadBalancerName": "my-load-balancer",
            "State": {
                "Code": "active"
            },
            "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188"
        }
    ]
}
```

To describe all load balancers

This example describes all of your load balancers.

Command:

```
aws elbv2 describe-load-balancers
```

- For API details, see DescribeLoadBalancers in *AWS CLI Command Reference*.

`describe-rules`

The following code example shows how to use `describe-rules`.

AWS CLI

Example 1: To describe a rule

The following `describe-rules` example displays details for the specified rule.

```
aws elbv2 describe-rules \
    --rule-arns arn:aws:elasticloadbalancing:us-west-2:123456789012:listener-rule/
app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2/9683b2d02a6cabee
```

Example 2: To describe the rules for a listener

The following `describe-rules` example displays details for the rules for the specified listener. The output includes the default rule and any other rules that you've added.

```
aws elbv2 describe-rules \
    --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/
my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2
```

- For API details, see DescribeRules in *AWS CLI Command Reference*.

describe-ssl-policies

The following code example shows how to use `describe-ssl-policies`.

AWS CLI

Example 1: To list the policies used for SSL negotiation by load balancer type

The following `describe-ssl-policies` example displays the names of the polices that you can use for SSL negotiation with an Application Load Balancer. The example uses the `--query` parameter to display only the names of the policies.

```
aws elbv2 describe-ssl-policies \
    --load-balancer-type application \
    --query SslPolicies[*].Name
```

Output:

```
[
    "ELBSecurityPolicy-2016-08",
    "ELBSecurityPolicy-TLS13-1-2-2021-06",
    "ELBSecurityPolicy-TLS13-1-2-Res-2021-06",
    "ELBSecurityPolicy-TLS13-1-2-Ext1-2021-06",
    "ELBSecurityPolicy-TLS13-1-2-Ext2-2021-06",
    "ELBSecurityPolicy-TLS13-1-1-2021-06",
    "ELBSecurityPolicy-TLS13-1-0-2021-06",
    "ELBSecurityPolicy-TLS13-1-3-2021-06",
    "ELBSecurityPolicy-TLS-1-2-2017-01",
    "ELBSecurityPolicy-TLS-1-1-2017-01",
    "ELBSecurityPolicy-TLS-1-2-Ext-2018-06",
    "ELBSecurityPolicy-FS-2018-06",
    "ELBSecurityPolicy-2015-05",
```

```
    "ELBSecurityPolicy-TLS-1-0-2015-04",
    "ELBSecurityPolicy-FS-1-2-Res-2019-08",
    "ELBSecurityPolicy-FS-1-1-2019-08",
    "ELBSecurityPolicy-FS-1-2-2019-08",
    "ELBSecurityPolicy-FS-1-2-Res-2020-10"
]
```

Example 2: To list the policies that support a specific protocol

The following `describe-ssl-policies` example displays the names of the polices that support the TLS 1.3 protocol. The example uses the `--query` parameter to display only the names of the policies.

```
aws elbv2 describe-ssl-policies \
    --load-balancer-type application \
    --query SslPolicies[?contains(SslProtocols,'TLSv1.3')].Name
```

Output:

```
[
    "ELBSecurityPolicy-TLS13-1-2-2021-06",
    "ELBSecurityPolicy-TLS13-1-2-Res-2021-06",
    "ELBSecurityPolicy-TLS13-1-2-Ext1-2021-06",
    "ELBSecurityPolicy-TLS13-1-2-Ext2-2021-06",
    "ELBSecurityPolicy-TLS13-1-1-2021-06",
    "ELBSecurityPolicy-TLS13-1-0-2021-06",
    "ELBSecurityPolicy-TLS13-1-3-2021-06"
]
```

Example 3: To display the ciphers for a policy

The following `describe-ssl-policies` example displays the names of the ciphers for the specified policy. The example uses the `--query` parameter to display only the cipher names. The first cipher in the list has priority 1, and the remaining ciphers are in priority order.

```
aws elbv2 describe-ssl-policies \
    --names ELBSecurityPolicy-TLS13-1-2-2021-06 \
    --query SslPolicies[*].Ciphers[*].Name
```

Output:

```
[
    "TLS_AES_128_GCM_SHA256",
    "TLS_AES_256_GCM_SHA384",
    "TLS_CHACHA20_POLY1305_SHA256",
    "ECDHE-ECDSA-AES128-GCM-SHA256",
    "ECDHE-RSA-AES128-GCM-SHA256",
    "ECDHE-ECDSA-AES128-SHA256",
    "ECDHE-RSA-AES128-SHA256",
    "ECDHE-ECDSA-AES256-GCM-SHA384",
    "ECDHE-RSA-AES256-GCM-SHA384",
    "ECDHE-ECDSA-AES256-SHA384",
    "ECDHE-RSA-AES256-SHA384"
]
```

For more information, see Security policies in the *User Guide for Application Load Balancers*.

- For API details, see DescribeSslPolicies in *AWS CLI Command Reference*.

`describe-tags`

The following code example shows how to use `describe-tags`.

AWS CLI

To describe the tags assigned to a load balancer

This example describes the tags assigned to the specified load balancer.

Command:

```
aws elbv2 describe-tags --resource-arns arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188
```

Output:

```
{
  "TagDescriptions": [
      {
          "ResourceArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
          "Tags": [
              {
```

```
                    "Value": "lima",
                    "Key": "project"
                },
                {
                    "Value": "digital-media",
                    "Key": "department"
                }
            ]
        }
    ]
}
```

- For API details, see [DescribeTags](#) in *AWS CLI Command Reference*.

`describe-target-group-attributes`

The following code example shows how to use `describe-target-group-attributes`.

AWS CLI

To describe target group attributes

The following `describe-target-group-attributes` example displays the attributes of the specified target group.

```
aws elbv2 describe-target-group-attributes \
    --target-group-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

The output includes the attributes if the protocol is HTTP or HTTPS and the target type is `instance` or `ip`.

```
{
    "Attributes": [
        {
            "Value": "false",
            "Key": "stickiness.enabled"
        },
        {
            "Value": "300",
            "Key": "deregistration_delay.timeout_seconds"
```

```
        },
        {
            "Value": "lb_cookie",
            "Key": "stickiness.type"
        },
        {
            "Value": "86400",
            "Key": "stickiness.lb_cookie.duration_seconds"
        },
        {
            "Value": "0",
            "Key": "slow_start.duration_seconds"
        }
    ]
}
```

The following output includes the attributes if the protocol is HTTP or HTTPS and the target type is `lambda`.

```
{
    "Attributes": [
        {
            "Value": "false",
            "Key": "lambda.multi_value_headers.enabled"
        }
    ]
}
```

The following output includes the attributes if the protocol is TCP, TLS, UDP, or TCP_UDP.

```
{
    "Attributes": [
        {
            "Value": "false",
            "Key": "proxy_protocol_v2.enabled"
        },
        {
            "Value": "300",
            "Key": "deregistration_delay.timeout_seconds"
        }
    ]
}
```

- For API details, see [DescribeTargetGroupAttributes](#) in *AWS CLI Command Reference*.

`describe-target-groups`

The following code example shows how to use `describe-target-groups`.

AWS CLI

Example 1: To describe a target group

The following `describe-target-groups` example displays details for the specified target group.

```
aws elbv2 describe-target-groups \
    --target-group-arns arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

Output:

```
{
    "TargetGroups": [
        {
            "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
            "TargetGroupName": "my-targets",
            "Protocol": "HTTP",
            "Port": 80,
            "VpcId": "vpc-3ac0fb5f",
            "HealthCheckProtocol": "HTTP",
            "HealthCheckPort": "traffic-port",
            "HealthCheckEnabled": true,
            "HealthCheckIntervalSeconds": 30,
            "HealthCheckTimeoutSeconds": 5,
            "HealthyThresholdCount": 5,
            "UnhealthyThresholdCount": 2,
            "HealthCheckPath": "/",
            "Matcher": {
                "HttpCode": "200"
            },
            "LoadBalancerArns": [
                "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/
app/my-load-balancer/50dc6c495c0c9188"
```

```
            ],
            "TargetType": "instance",
            "ProtocolVersion": "HTTP1",
            "IpAddressType": "ipv4"
        }
    ]
}
```

Example 2: To describe all target groups for a load balancer

The following `describe-target-groups` example displays details for all target groups for the specified load balancer. The example uses the `--query` parameter to display only the target group names.

```
aws elbv2 describe-target-groups \
    --load-balancer-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \
    --query TargetGroups[*].TargetGroupName
```

Output:

```
[
    "my-instance-targets",
    "my-ip-targets",
    "my-lambda-target"
]
```

For more information, see Target groups in the *Application Load Balancers Guide*.

- For API details, see DescribeTargetGroups in *AWS CLI Command Reference*.

`describe-target-health`

The following code example shows how to use `describe-target-health`.

AWS CLI

Example 1: To describe the health of the targets for a target group

The following `describe-target-health` example displays health details for the targets of the specified target group. These targets are healthy.

```
aws elbv2 describe-target-health \
    --target-group-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

Output:

```
{
    "TargetHealthDescriptions": [
        {
            "HealthCheckPort": "80",
            "Target": {
                "Id": "i-ceddcd4d",
                "Port": 80
            },
            "TargetHealth": {
                "State": "healthy"
            }
        },
        {
            "HealthCheckPort": "80",
            "Target": {
                "Id": "i-0f76fade",
                "Port": 80
            },
            "TargetHealth": {
                "State": "healthy"
            }
        }
    ]
}
```

Example 2: To describe the health of a target

The following `describe-target-health` example displays health details for the specified target. This target is healthy.

```
aws elbv2 describe-target-health \
    --targets Id=i-0f76fade,Port=80 \
    --target-group-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

Output:

```
{
    "TargetHealthDescriptions": [
        {
            "HealthCheckPort": "80",
            "Target": {
                "Id": "i-0f76fade",
                "Port": 80
            },
            "TargetHealth": {
                "State": "healthy"
            }
        }
    ]
}
```

The following example output is for a target whose target group is not specified in an action for a listener. This target can't receive traffic from the load balancer.

```
{
    "TargetHealthDescriptions": [
    {
        "HealthCheckPort": "80",
        "Target": {
            "Id": "i-0f76fade",
            "Port": 80
        },
            "TargetHealth": {
                "State": "unused",
                "Reason": "Target.NotInUse",
                "Description": "Target group is not configured to receive traffic
 from the load balancer"
            }
        }
    ]
}
```

The following example output is for a target whose target group was just specified in an action for a listener. The target is still being registered.

```
{
    "TargetHealthDescriptions": [
        {
```

```
            "HealthCheckPort": "80",
            "Target": {
                "Id": "i-0f76fade",
                "Port": 80
            },
            "TargetHealth": {
                "State": "initial",
                "Reason": "Elb.RegistrationInProgress",
                "Description": "Target registration is in progress"
            }
        }
    ]
}
```

The following example output is for an unhealthy target.

```
{
    "TargetHealthDescriptions": [
        {
            "HealthCheckPort": "80",
            "Target": {
                "Id": "i-0f76fade",
                "Port": 80
            },
            "TargetHealth": {
                "State": "unhealthy",
                "Reason": "Target.Timeout",
                "Description": "Connection to target timed out"
            }
        }
    ]
}
```

The following example output is for a target that is a Lambda function and health checks are disabled.

```
{
    "TargetHealthDescriptions": [
        {
            "Target": {
                "Id": "arn:aws:lambda:us-west-2:123456789012:function:my-function",
                "AvailabilityZone": "all",
            },
```

```
            "TargetHealth": {
                "State": "unavailable",
                "Reason": "Target.HealthCheckDisabled",
                "Description": "Health checks are not enabled for this target"
            }
        }
    ]
}
```

- For API details, see DescribeTargetHealth in *AWS CLI Command Reference*.

`modify-listener`

The following code example shows how to use `modify-listener`.

AWS CLI

Example 1: To change the default action to a forward action

The following `modify-listener` example changes the default action to a `forward` action for the specified listener.

```
aws elbv2 modify-listener \
    --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/
my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 \
    --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-new-targets/2453ed029918f21f
```

Output:

```
{
    "Listeners": [
        {
            "ListenerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/
f2f7dc8efc522ab2",
            "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
            "Protocol": "HTTP",
            "Port": 80,
            "DefaultActions": [
                {
```

```
                    "Type": "forward",
                    "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-new-targets/2453ed029918f21f"
                }
            ]
        }
    ]
}
```

Example 2: To change the default action to a redirect action

The following `modify-listener` example changes the default action to a `redirect` action for the specified listener.

```
aws elbv2 modify-listener \
    --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/
my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 \
    --default-actions Type=redirect,
 RedirectConfig='{Protocol=HTTPS,StatusCode=HTTP_302}'
```

Output:

```
{
    "Listeners": [
        {
            "ListenerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/
f2f7dc8efc522ab2",
            "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
            "Protocol": "HTTP",
            "Port": 80,
            "DefaultActions": [
                {
                    "Type": "redirect",
                    "RedirectConfig": {
                        "Protocol": "HTTPS",
                        "Port": "#{port}",
                        "Host": "#{host}",
                        "Path": "/#{path}",
                        "Query": "#{query}",
                        "StatusCode": "HTTP_302",
                    }
```

```
                }
            ]
        }
    ]
}
```

Example 3: To change the server certificate

The following `modify-listener` example changes the server certificate for the specified HTTPS listener.

```
aws elbv2 modify-listener \
    --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/
my-load-balancer/50dc6c495c0c9188/0467ef3c8400ae65 \
    --certificates CertificateArn=arn:aws:iam::123456789012:server-certificate/my-
new-server-cert
```

Output:

```
{
    "Listeners": [
        {
            "ListenerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:listener/app/my-load-
balancer/50dc6c495c0c9188/0467ef3c8400ae65",
            "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
            "Protocol": "HTTPS",
            "Port": 443,
            "DefaultActions": [
                {
                    "Type": "forward",
                    "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067"
                }
            ],
            "SslPolicy": "ELBSecurityPolicy-2015-05",
            "Certificates": [
                {
                    "CertificateArn": "arn:aws:iam::123456789012:server-certificate/
my-new-server-cert"
                }
            ],
```

```
        }
    ]
}
```

For more information, see Listener rules in the *Application Load Balancers User Guide*.

- For API details, see ModifyListener in *AWS CLI Command Reference*.

`modify-load-balancer-attributes`

The following code example shows how to use `modify-load-balancer-attributes`.

AWS CLI

To enable deletion protection

This example enables deletion protection for the specified load balancer.

Command:

```
aws elbv2 modify-load-balancer-attributes --load-balancer-
arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-
balancer/50dc6c495c0c9188 --attributes Key=deletion_protection.enabled,Value=true
```

Output:

```
{
  "Attributes": [
      {
          "Value": "true",
          "Key": "deletion_protection.enabled"
      },
      {
          "Value": "false",
          "Key": "access_logs.s3.enabled"
      },
      {
          "Value": "60",
          "Key": "idle_timeout.timeout_seconds"
      },
      {
          "Value": "",
          "Key": "access_logs.s3.prefix"
```

```
        },
        {
            "Value": "",
            "Key": "access_logs.s3.bucket"
        }
    ]
}
```

To change the idle timeout

This example changes the idle timeout value for the specified load balancer.

Command:

```
aws elbv2 modify-load-balancer-attributes --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 --attributes Key=idle_timeout.timeout_seconds,Value=30
```

Output:

```
{
    "Attributes": [
        {
            "Value": "30",
            "Key": "idle_timeout.timeout_seconds"
        },
        {
            "Value": "false",
            "Key": "access_logs.s3.enabled"
        },
        {
            "Value": "",
            "Key": "access_logs.s3.prefix"
        },
        {
            "Value": "true",
            "Key": "deletion_protection.enabled"
        },
        {
            "Value": "",
            "Key": "access_logs.s3.bucket"
        }
    ]
```

```
}
```

To enable access logs

This example enables access logs for the specified load balancer. Note that the S3 bucket must exist in the same region as the load balancer and must have a policy attached that grants access to the Elastic Load Balancing service.

Command:

```
aws elbv2 modify-load-balancer-attributes --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 --attributes Key=access_logs.s3.enabled,Value=true Key=access_logs.s3.bucket,Value=my-loadbalancer-logs Key=access_logs.s3.prefix,Value=myapp
```

Output:

```
{
  "Attributes": [
      {
          "Value": "true",
          "Key": "access_logs.s3.enabled"
      },
      {
          "Value": "my-load-balancer-logs",
          "Key": "access_logs.s3.bucket"
      },
      {
          "Value": "myapp",
          "Key": "access_logs.s3.prefix"
      },
      {
          "Value": "60",
          "Key": "idle_timeout.timeout_seconds"
      },
      {
          "Value": "false",
          "Key": "deletion_protection.enabled"
      }
  ]
}
```

- For API details, see ModifyLoadBalancerAttributes in *AWS CLI Command Reference*.

modify-rule

The following code example shows how to use `modify-rule`.

AWS CLI

To modify a rule

The following `modify-rule` example updates the actions and conditions for the specified rule.

```
aws elbv2 modify-rule \
  --actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067 \
  --conditions Field=path-pattern,Values='/images/*'
  --rule-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener-rule/app/
my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2/9683b2d02a6cabee
```

Output:

```
{
    "Rules": [
        {
            "Priority": "10",
            "Conditions": [
                {
                    "Field": "path-pattern",
                    "Values": [
                        "/images/*"
                    ]
                }
            ],
            "RuleArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:listener-rule/app/my-load-balancer/50dc6c495c0c9188/
f2f7dc8efc522ab2/9683b2d02a6cabee",
            "IsDefault": false,
            "Actions": [
                {
                    "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
                    "Type": "forward"
```

```
                }
            ]
        }
    ]
}
```

- For API details, see ModifyRule in *AWS CLI Command Reference*.

`modify-target-group-attributes`

The following code example shows how to use `modify-target-group-attributes`.

AWS CLI

To modify the deregistration delay timeout

This example sets the deregistration delay timeout to the specified value for the specified target group.

Command:

```
aws elbv2 modify-target-group-attributes --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067 --attributes Key=deregistration_delay.timeout_seconds,Value=600
```

Output:

```
{
  "Attributes": [
      {
          "Value": "false",
          "Key": "stickiness.enabled"
      },
      {
          "Value": "600",
          "Key": "deregistration_delay.timeout_seconds"
      },
      {
          "Value": "lb_cookie",
          "Key": "stickiness.type"
```

```
        },
        {
            "Value": "86400",
            "Key": "stickiness.lb_cookie.duration_seconds"
        }
    ]
}
```

- For API details, see ModifyTargetGroupAttributes in *AWS CLI Command Reference*.

modify-target-group

The following code example shows how to use `modify-target-group`.

AWS CLI

To modify the health check configuration for a target group

The following `modify-target-group` example changes the configuration of the health checks used to evaluate the health of the targets for the specified target group. Note that due to the way the CLI parses commas, you must surround the range for the `--matcher` option with single quotes instead of double quotes.

```
aws elbv2 modify-target-group \
    --target-group-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-https-targets/2453ed029918f21f \
    --health-check-protocol HTTPS \
    --health-check-port 443 \
    --matcher HttpCode='200,299'
```

Output:

```
{
    "TargetGroups": [
        {
            "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-https-targets/2453ed029918f21f",
            "TargetGroupName": "my-https-targets",
            "Protocol": "HTTPS",
            "Port": 443,
            "VpcId": "vpc-3ac0fb5f",
```

```
                "HealthCheckProtocol": "HTTPS",
                "HealthCheckPort": "443",
                "HealthCheckEnabled": true,
                "HealthCheckIntervalSeconds": 30,
                "HealthCheckTimeoutSeconds": 5,
                "HealthyThresholdCount": 5,
                "UnhealthyThresholdCount": 2,
                "Matcher": {
                    "HttpCode": "200,299"
                },
                "LoadBalancerArns": [
                    "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/
app/my-load-balancer/50dc6c495c0c9188"
                ],
                "TargetType": "instance",
                "ProtocolVersion": "HTTP1",
                "IpAddressType": "ipv4"
            }
        ]
}
```

For more information, see Target groups in the *Application Load Balancers Guide*.

- For API details, see ModifyTargetGroup in *AWS CLI Command Reference*.

`register-targets`

The following code example shows how to use `register-targets`.

AWS CLI

Example 1: To register targets with a target group by instance ID

The following `register-targets` example registers the specified instances with a target group. The target group must have a target type of `instance`.

```
aws elbv2 register-targets \
    --target-group-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067 \
    --targets Id=i-1234567890abcdef0 Id=i-0abcdef1234567890
```

Example 2: To register targets with a target group using port overrides

The following `register-targets` example registers the specified instance with a target group using multiple ports. This enables you to register containers on the same instance as targets in the target group.

```
aws elbv2 register-targets \
    --target-group-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-internal-targets/3bb63f11dfb0faf9 \
    --targets Id=i-0598c7d356eba48d7,Port=80 Id=i-0598c7d356eba48d7,Port=766
```

Example 3: To register targets with a target group by IP address

The following `register-targets` example registers the specified IP addresses with a target group. The target group must have a target type of `ip`.

```
aws elbv2 register-targets \
    --target-group-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-tcp-ip-targets/8518e899d173178f \
    --targets Id=10.0.1.15 Id=10.0.1.23
```

Example 4: To register a Lambda function as a target

The following `register-targets` example registers the specified IP addresses with a target group. The target group must have a target type of `lambda`. You must grant Elastic Load Balancing permission to invoke the Lambda function.

```
aws elbv2 register-targets \
    --target-group-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-tcp-ip-targets/8518e899d173178f \
    --targets Id=arn:aws:lambda:us-west-2:123456789012:function:my-function
```

- For API details, see RegisterTargets in *AWS CLI Command Reference*.

`remove-listener-certificates`

The following code example shows how to use `remove-listener-certificates`.

AWS CLI

To remove a certificate from a secure listener

This example removes the specified certificate from the specified secure listener.

Command:

```
aws elbv2 remove-listener-certificates --listener-
arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/
app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 --
certificates CertificateArn=arn:aws:acm:us-west-2:123456789012:certificate/5cc54884-
f4a3-4072-80be-05b9ba72f705
```

- For API details, see RemoveListenerCertificates in *AWS CLI Command Reference*.

`remove-tags`

The following code example shows how to use `remove-tags`.

AWS CLI

To remove tags from a load balancer

The following `remove-tags` example removes the `project` and `department` tags from the specified load balancer.

```
aws elbv2 remove-tags \
    --resource-arns arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \
    --tag-keys project department
```

- For API details, see RemoveTags in *AWS CLI Command Reference*.

`set-ip-address-type`

The following code example shows how to use `set-ip-address-type`.

AWS CLI

To set the address type of a load balancer

This example sets the address type of the specified load balancer to `dualstack`. The load balancer subnets must have associated IPv6 CIDR blocks.

Command:

```
aws elbv2 set-ip-address-type --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 --ip-address-type dualstack
```

Output:

```
{
    "IpAddressType": "dualstack"
}
```

- For API details, see SetIpAddressType in *AWS CLI Command Reference*.

`set-rule-priorities`

The following code example shows how to use `set-rule-priorities`.

AWS CLI

To set the rule priority

This example sets the priority of the specified rule.

Command:

```
aws elbv2 set-rule-priorities --rule-priorities RuleArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:listener-rule/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2/1291d13826f405c3,Priority=5
```

Output:

```
{
  "Rules": [
      {
          "Priority": "5",
          "Conditions": [
              {
                  "Field": "path-pattern",
                  "Values": [
                      "/img/*"
                  ]
```

```
                }
            ],
            "RuleArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:listener-
rule/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2/1291d13826f405c3",
            "IsDefault": false,
            "Actions": [
                {
                    "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
                    "Type": "forward"
                }
            ]
        }
    ]
}
```

- For API details, see SetRulePriorities in *AWS CLI Command Reference*.

`set-security-groups`

The following code example shows how to use `set-security-groups`.

AWS CLI

To associate a security group with a load balancer

This example associates the specified security group with the specified load balancer.

Command:

```
aws elbv2 set-security-groups --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 --security-groups sg-5943793c
```

Output:

```
{
  "SecurityGroupIds": [
      "sg-5943793c"
  ]
}
```

- For API details, see SetSecurityGroups in *AWS CLI Command Reference*.

`set-subnets`

The following code example shows how to use `set-subnets`.

AWS CLI

To enable Availability Zones for a load balancer

This example enables the Availability Zone for the specified subnet for the specified load balancer.

Command:

```
aws elbv2 set-subnets --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 --subnets subnet-8360a9e7 subnet-b7d581c0
```

Output:

```
{
  "AvailabilityZones": [
      {
          "SubnetId": "subnet-8360a9e7",
          "ZoneName": "us-west-2a"
      },
      {
          "SubnetId": "subnet-b7d581c0",
          "ZoneName": "us-west-2b"
      }
  ]
}
```

- For API details, see SetSubnets in *AWS CLI Command Reference*.

ElastiCache examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with ElastiCache.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`add-tags-to-resource`

The following code example shows how to use `add-tags-to-resource`.

AWS CLI

To add tags to a resource

The following `add-tags-to-resource` example adds up to 10 tags, key-value pairs, to a cluster or snapshot resource.

```
aws elasticache add-tags-to-resource \
    --resource-name "arn:aws:elasticache:us-east-1:1234567890:cluster:my-mem-cluster" \
    --tags '{"20150202":15, "ElastiCache":"Service"}'
```

Output:

```
{
    "TagList": [
        {
            "Value": "20150202",
            "Key": "APIVersion"
        },
        {
            "Value": "ElastiCache",
            "Key": "Service"
        }
    ]
}
```

For more information, see Monitoring Costs with Cost Allocation Tags in the *Elasticache User Guide*.

- For API details, see AddTagsToResource in *AWS CLI Command Reference*.

`authorize-cache-security-group-ingress`

The following code example shows how to use `authorize-cache-security-group-ingress`.

AWS CLI

To authorize cache security group for ingress

The following `authorize-cache-security-group-ingress` example allows network ingress to a cache security group.

```
aws elasticache authorize-cache-security-group-ingress \
     --cache-security-group-name  "my-sec-grp" \
     --ec2-security-group-name "my-ec2-sec-grp" \
     --ec2-security-group-owner-id "1234567890"
```

The command produces no output.

For more information, see Self-Service Updates in Amazon ElastiCache in the *Elasticache User Guide*.

- For API details, see AuthorizeCacheSecurityGroupIngress in *AWS CLI Command Reference*.

`batch-apply-update-action`

The following code example shows how to use `batch-apply-update-action`.

AWS CLI

To apply a service update

The following `batch-apply-update-action` example applies a service update to a Redis cluster.

```
aws elasticache batch-apply-update-action \
    --service-update-name elc-xxxxx406-xxx \
    --replication-group-ids test-cluster
```

Output:

```
{
    "ProcessedUpdateActions": [
        {
            "ReplicationGroupId": "pat-cluster",
            "ServiceUpdateName": "elc-xxxxx406-xxx",
            "UpdateActionStatus": "waiting-to-start"
        }
    ],
    "UnprocessedUpdateActions": []
}
```

For more information, see Self-Service Updates in Amazon ElastiCache in the *Elasticache User Guide*.

- For API details, see BatchApplyUpdateAction in *AWS CLI Command Reference*.

`batch-stop-update-action`

The following code example shows how to use `batch-stop-update-action`.

AWS CLI

To stop a service update

The following `batch-stop-update-action` example applies a service update to a Redis cluster.

```
aws elasticache batch-stop-update-action \
    --service-update-name elc-xxxxx406-xxx \
    --replication-group-ids test-cluster
```

Output:

```
{
    "ProcessedUpdateActions": [
        {
            "ReplicationGroupId": "pat-cluster",
            "ServiceUpdateName": "elc-xxxxx406-xxx",
            "UpdateActionStatus": "stopping"
        }
```

```
    ],
    "UnprocessedUpdateActions": []
}
```

For more information, see Self-Service Updates in Amazon ElastiCache in the *Elasticache User Guide*.

- For API details, see BatchStopUpdateAction in *AWS CLI Command Reference*.

`copy-snapshot`

The following code example shows how to use `copy-snapshot`.

AWS CLI

To copy a snapshot

The following `copy-snapshot` example makes a copy of an existing snapshot.

```
aws elasticache copy-snapshot \
    --source-snapshot-name "my-snapshot" \
    --target-snapshot-name "my-snapshot-copy"
```

Output:

```
{
    "Snapshot":{
        "Engine": "redis",
        "CacheParameterGroupName": "default.redis3.2",
        "VpcId": "vpc-3820329f3",
        "CacheClusterId": "my-redis4",
        "SnapshotRetentionLimit": 7,
        "NumCacheNodes": 1,
        "SnapshotName": "my-snapshot-copy",
        "CacheClusterCreateTime": "2016-12-21T22:24:04.955Z",
        "AutoMinorVersionUpgrade": true,
        "PreferredAvailabilityZone": "us-east-1c",
        "SnapshotStatus": "creating",
        "SnapshotSource": "manual",
        "SnapshotWindow": "07:00-08:00",
        "EngineVersion": "3.2.4",
        "NodeSnapshots": [
```

```
            {
                "CacheSize": "3 MB",
                "SnapshotCreateTime": "2016-12-28T07:00:52Z",
                "CacheNodeId": "0001",
                "CacheNodeCreateTime": "2016-12-21T22:24:04.955Z"
            }
        ],
        "CacheSubnetGroupName": "default",
        "Port": 6379,
        "PreferredMaintenanceWindow": "tue:09:30-tue:10:30",
        "CacheNodeType": "cache.m3.large"
    }
}
```

For more information, see Exporting a Backup in the *Elasticache User Guide*.

- For API details, see CopySnapshot in *AWS CLI Command Reference*.

`create-cache-cluster`

The following code example shows how to use `create-cache-cluster`.

AWS CLI

To create a cache cluster

The following `create-cache-cluster` example creates a cache cluster using the Redis engine.

```
aws elasticache create-cache-cluster \
    --cache-cluster-id "cluster-test" \
    --engine redis \
    --cache-node-type cache.m5.large \
    --num-cache-nodes 1
```

Output:

```
{
    "CacheCluster": {
        "CacheClusterId": "cluster-test",
        "ClientDownloadLandingPage": "https://console.aws.amazon.com/elasticache/
home#client-download:",
```

```
        "CacheNodeType": "cache.m5.large",
        "Engine": "redis",
        "EngineVersion": "5.0.5",
        "CacheClusterStatus": "creating",
        "NumCacheNodes": 1,
        "PreferredMaintenanceWindow": "sat:13:00-sat:14:00",
        "PendingModifiedValues": {},
        "CacheSecurityGroups": [],
        "CacheParameterGroup": {
            "CacheParameterGroupName": "default.redis5.0",
            "ParameterApplyStatus": "in-sync",
            "CacheNodeIdsToReboot": []
        },
        "CacheSubnetGroupName": "default",
        "AutoMinorVersionUpgrade": true,
        "SnapshotRetentionLimit": 0,
        "SnapshotWindow": "06:30-07:30",
        "TransitEncryptionEnabled": false,
        "AtRestEncryptionEnabled": false
    }
}
```

For more information, see Creating a Cluster in the *Elasticache User Guide*.

- For API details, see CreateCacheCluster in *AWS CLI Command Reference*.

`create-cache-parameter-group`

The following code example shows how to use `create-cache-parameter-group`.

AWS CLI

To create a cache parameter group

The following `create-cache-parameter-group` example creates a new Amazon ElastiCache cache parameter group.

```
aws elasticache create-cache-parameter-group \
    --cache-parameter-group-family "redis5.0" \
    --cache-parameter-group-name "mygroup" \
    --description "mygroup"
```

Output:

```
{
    "CacheParameterGroup": {
        "CacheParameterGroupName": "mygroup",
        "CacheParameterGroupFamily": "redis5.0",
        "Description": "my group"
    }
}
```

For more information, see Creating a Parameter Group in the *Elasticache User Guide*.

- For API details, see CreateCacheParameterGroup in *AWS CLI Command Reference*.

`create-cache-subnet-group`

The following code example shows how to use `create-cache-subnet-group`.

AWS CLI

To create a cache subnet group

The following `create-cache-subnet-group` example creates a new cache subnet group.

```
aws elasticache create-cache-subnet-group \
    --cache-subnet-group-name "mygroup" \
    --cache-subnet-group-description "my subnet group" \
    --subnet-ids "subnet-xxxxec4f"
```

Output:

```
{
    "CacheSubnetGroup": {
        "CacheSubnetGroupName": "mygroup",
        "CacheSubnetGroupDescription": "my subnet group",
        "VpcId": "vpc-a3e97cdb",
        "Subnets": [
            {
                "SubnetIdentifier": "subnet-xxxxec4f",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2d"
                }
            }
        ]
```

```
    }
}
```

For more information, see [Creating a Cache Subnet Group](#) in the *Elasticache User Guide*.

- For API details, see [CreateCacheSubnetGroup](#) in *AWS CLI Command Reference*.

`create-global-replication-group`

The following code example shows how to use `create-global-replication-group`.

AWS CLI

To create a global replication group

The following `create-global-replication-group` example creates a new global replication group.

```
aws elasticache create-global-replication-group \
    --global-replication-group-id-suffix my-global-replication-group \
    --primary-replication-group-id my-primary-cluster
```

Output:

```
{
    "GlobalReplicationGroup": {
        "GlobalReplicationGroupId": "sgaui-my-global-replication-group",
        "GlobalReplicationGroupDescription": " ",
        "Status": "creating",
        "CacheNodeType": "cache.r5.large",
        "Engine": "redis",
        "EngineVersion": "5.0.6",
        "Members": [
            {
                "ReplicationGroupId": "my-primary-cluster",
                "ReplicationGroupRegion": "us-west-2",
                "Role": "PRIMARY",
                "AutomaticFailover": "enabled",
                "Status": "associating"
            }
        ],
        "ClusterEnabled": true,
        "GlobalNodeGroups": [
```

```
                {
                    "GlobalNodeGroupId": "sgaui-my-global-replication-group-0001",
                    "Slots": "0-16383"
                }
            ],
            "AuthTokenEnabled": false,
            "TransitEncryptionEnabled": false,
            "AtRestEncryptionEnabled": false
    }
}
```

For more information, see Replication Across AWS Regions Using Global Datastore in the *Elasticache User Guide*.

- For API details, see CreateGlobalReplicationGroup in *AWS CLI Command Reference*.

`create-replication-group`

The following code example shows how to use `create-replication-group`.

AWS CLI

To create a replication group

The following `create-replication-group` example creates a Redis (cluster mode disabled) or a Redis (cluster mode enabled) replication group. This operation is valid for Redis only.

```
aws elasticache create-replication-group \
    --replication-group-id "mygroup" \
    --replication-group-description "my group" \
    --engine "redis" \
    --cache-node-type "cache.m5.large"
```

Output:

```
{
    "ReplicationGroup": {
        "ReplicationGroupId": "mygroup",
        "Description": "my group",
        "Status": "creating",
        "PendingModifiedValues": {},
        "MemberClusters": [
```

```
                "mygroup-001"
            ],
            "AutomaticFailover": "disabled",
            "SnapshotRetentionLimit": 0,
            "SnapshotWindow": "06:00-07:00",
            "ClusterEnabled": false,
            "CacheNodeType": "cache.m5.large",
            "TransitEncryptionEnabled": false,
            "AtRestEncryptionEnabled": false
        }
}
```

For more information, see Creating a Redis Replication Group in the *Elasticache User Guide*.

- For API details, see CreateReplicationGroup in *AWS CLI Command Reference*.

`create-snapshot`

The following code example shows how to use `create-snapshot`.

AWS CLI

To create a snapshot

The following `create-snapshot` example creates a snapshot using the Redis engine.

```
aws elasticache create-snapshot \
    --snapshot-name mysnapshot \
    --cache-cluster-id cluster-test
```

Output:

```
{
    "Snapshot": {
        "SnapshotName": "mysnapshot",
        "CacheClusterId": "cluster-test",
        "SnapshotStatus": "creating",
        "SnapshotSource": "manual",
        "CacheNodeType": "cache.m5.large",
        "Engine": "redis",
        "EngineVersion": "5.0.5",
        "NumCacheNodes": 1,
        "PreferredAvailabilityZone": "us-west-2b",
```

```
        "CacheClusterCreateTime": "2020-03-19T03:12:01.483Z",
        "PreferredMaintenanceWindow": "sat:13:00-sat:14:00",
        "Port": 6379,
        "CacheParameterGroupName": "default.redis5.0",
        "CacheSubnetGroupName": "default",
        "VpcId": "vpc-a3e97cdb",
        "AutoMinorVersionUpgrade": true,
        "SnapshotRetentionLimit": 0,
        "SnapshotWindow": "06:30-07:30",
        "NodeSnapshots": [
            {
                "CacheNodeId": "0001",
                "CacheSize": "",
                "CacheNodeCreateTime": "2020-03-19T03:12:01.483Z"
            }
        ]
    }
}
```

For more information, see Backup and Restore for ElastiCache for Redis in the *Elasticache User Guide*.

- For API details, see CreateSnapshot in *AWS CLI Command Reference*.

`create-user-group`

The following code example shows how to use `create-user-group`.

AWS CLI

To create a user group

The following `create-user-group` example creates a new user group.

```
aws elasticache create-user-group \
    --user-group-id myusergroup \
    --engine redis \
    --user-ids default
```

Output:

```
{
    "UserGroupId": "myusergroup",
```

```
    "Status": "creating",
    "Engine": "redis",
    "UserIds": [
        "default"
    ],
    "ReplicationGroups": [],
    "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:usergroup:myusergroup"
}
```

For more information, see Authenticating Users with Role-Based Access Control (RBAC) in the *Elasticache User Guide*.

- For API details, see CreateUserGroup in *AWS CLI Command Reference*.

`create-user`

The following code example shows how to use `create-user`.

AWS CLI

To create a user

The following `create-user` example creates a new user.

```
aws elasticache create-user \
    --user-id user1 \
    --user-name myUser \
    --passwords mYnuUzrpAxXw2rdzx \
    --engine redis \
    --access-string "on ~app::* -@all +@read"
```

Output:

```
{
    "UserId": "user2",
    "UserName": "myUser",
    "Status": "active",
    "Engine": "redis",
    "AccessString": "on ~app::* -@all +@read +@hash +@bitmap +@geo -setbit -bitfield
 -hset -hsetnx -hmset -hincrby -hincrbyfloat -hdel -bitop -geoadd -georadius -
georadiusbymember",
    "UserGroupIds": [],
    "Authentication": {
```

```
        "Type": "password",
        "PasswordCount": 1
    },
    "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:user2"
}
```

For more information, see Authenticating Users with Role-Based Access Control (RBAC) in the *Elasticache User Guide*.

- For API details, see CreateUser in *AWS CLI Command Reference*.

decrease-node-groups-in-global-replication-group

The following code example shows how to use `decrease-node-groups-in-global-replication-group`.

AWS CLI

To decrease the number of node groups in a global replication group

The following `decrease-node-groups-in-global-replication-group` decreases the node group count using the Redis engine.

```
aws elasticache decrease-node-groups-in-global-replication-group \
    --global-replication-group-id sgaui-test \
    --node-group-count 1 \
    --apply-immediately \
    --global-node-groups-to-retain sgaui-test-0003
```

Output:

```
{
    "GlobalReplicationGroup":
    {
        "GlobalReplicationGroupId": "sgaui-test",
        "GlobalReplicationGroupDescription": "test",
        "Status": "modifying",
        "CacheNodeType": "cache.r5.large",
        "Engine": "redis",
        "EngineVersion": "5.0.6",
        "Members": [
            {
```

```
                "ReplicationGroupId": "test-2",
                "ReplicationGroupRegion": "us-east-1",
                "Role": "SECONDARY",
                "AutomaticFailover": "enabled",
                "Status": "associated"
            },
            {
                "ReplicationGroupId": "test-1",
                "ReplicationGroupRegion": "us-west-2",
                "Role": "PRIMARY",
                "AutomaticFailover": "enabled",
                "Status": "associated"
            }
        ],
        "ClusterEnabled": true,
        "GlobalNodeGroups": [
            {
                "GlobalNodeGroupId": "sgaui-test-0001",
                "Slots": "0-449,1816-5461"
            },
            {
                "GlobalNodeGroupId": "sgaui-test-0002",
                "Slots": "6827-10922"
            },
            {
                "GlobalNodeGroupId": "sgaui-test-0003",
                "Slots": "10923-14052,15418-16383"
            },

- For API details, see DecreaseNodeGroupsInGlobalReplicationGroup in *AWS CLI Command Reference*.

`decrease-replica-count`

The following code example shows how to use `decrease-replica-count`.

AWS CLI

To decrease replica count

The following `decrease-replica-count` example dynamically decreases the number of replicas in a Redis (cluster mode disabled) replication group or the number of replica nodes in one or more node groups (shards) of a Redis (cluster mode enabled) replication group. This operation is performed with no cluster downtime.

```
aws elasticache decrease-replica-count \
    --replication-group-id my-cluster \
    --apply-immediately  \
    --new-replica-count 2
```

Output:

```
{
    "ReplicationGroup": {
        "ReplicationGroupId": "my-cluster",
        "Description": " ",
        "Status": "modifying",
        "PendingModifiedValues": {},
        "MemberClusters": [
            "myrepliace",
            "my-cluster-001",
            "my-cluster-002",
            "my-cluster-003"
        ],
        "NodeGroups": [
            {
                "NodeGroupId": "0001",
                "Status": "modifying",
                "PrimaryEndpoint": {
                    "Address": "my-cluster.xxxxx.ng.0001.usw2.cache.amazonaws.com",

```

For more information, see Changing the Number of Replicas in the *Elasticache User Guide*.

- For API details, see DecreaseReplicaCount in *AWS CLI Command Reference*.

`delete-cache-cluster`

The following code example shows how to use `delete-cache-cluster`.

AWS CLI

To delete a cache cluster

The following `delete-cache-cluster` example deletes the specified previously provisioned cluster. The command deletes all associated cache nodes, node endpoints. and the cluster itself. When you receive a successful response from this operation, Amazon ElastiCache immediately begins deleting the cluster; you can't cancel or revert this operation.

This operation is not valid for the following:

Redis (cluster mode enabled) clustersA cluster that is the last read replica of a replication groupA node group (shard) that has Multi-AZ mode enabledA cluster from a Redis (cluster mode enabled) replication groupA cluster that is not in the available state

```
aws elasticache delete-cache-cluster \
    --cache-cluster-id "my-cluster-002"
```

Output:

```
{
    "CacheCluster": {
        "CacheClusterId": "my-cluster-002",
        "ClientDownloadLandingPage": "https://console.aws.amazon.com/elasticache/
home#client-download:",
        "CacheNodeType": "cache.r5.xlarge",
        "Engine": "redis",
        "EngineVersion": "5.0.5",
        "CacheClusterStatus": "deleting",
        "NumCacheNodes": 1,
        "PreferredAvailabilityZone": "us-west-2a",
        "CacheClusterCreateTime": "2019-11-26T03:35:04.546Z",
        "PreferredMaintenanceWindow": "mon:04:05-mon:05:05",
        "PendingModifiedValues": {},
        "NotificationConfiguration": {
            "TopicArn": "arn:aws:sns:us-west-x:xxxxxxx4152:My_Topic",
            "TopicStatus": "active"
        },
        "CacheSecurityGroups": [],
        "CacheParameterGroup": {
            "CacheParameterGroupName": "mygroup",
            "ParameterApplyStatus": "in-sync",
            "CacheNodeIdsToReboot": []
        },
        "CacheSubnetGroupName": "kxkxk",
        "AutoMinorVersionUpgrade": true,
        "SecurityGroups": [
            {
                "SecurityGroupId": "sg-xxxxxxxxxx9836",
                "Status": "active"
            },
            {
                "SecurityGroupId": "sg-xxxxxxxxxxxx7b",
                "Status": "active"
            }
        ],
        "ReplicationGroupId": "my-cluster",
        "SnapshotRetentionLimit": 0,
        "SnapshotWindow": "07:30-08:30",
        "TransitEncryptionEnabled": false,
        "AtRestEncryptionEnabled": false
    }
```

```
}
```

For more information, see Deleting a Cluster in the *Elasticache User Guide*.

- For API details, see DeleteCacheCluster in *AWS CLI Command Reference*.

`delete-cache-parameter-group`

The following code example shows how to use `delete-cache-parameter-group`.

AWS CLI

To delete a cache parameter group

The following `delete-cache-parameter-group` example deletes the specified cache parameter group. You can't delete a cache parameter group if it's associated with any cache clusters.

```
aws elasticache delete-cache-parameter-group \
    --cache-parameter-group-name myparamgroup
```

This command produces no output.

For more information, see Deleting a Parameter Group in the *Elasticache User Guide*.

- For API details, see DeleteCacheParameterGroup in *AWS CLI Command Reference*.

`delete-cache-subnet-group`

The following code example shows how to use `delete-cache-subnet-group`.

AWS CLI

To delete a cache subnet group

The following `delete-cache-subnet-group` example deletes the specified cache subnet group. You can't delete a cache subnet group if it's associated with any clusters.

```
aws elasticache delete-cache-subnet-group \
    --cache-subnet-group-name "mygroup"
```

This command produces no output.

For more information, see Deleting a Subnet Group in the *Elasticache User Guide*.

- For API details, see DeleteCacheSubnetGroup in *AWS CLI Command Reference*.

`delete-global-replication-group`

The following code example shows how to use `delete-global-replication-group`.

AWS CLI

To delete a global replication group

The following `delete-global-replication-group` example deletes a new global replication group.

```
aws elasticache delete-global-replication-group \
    --global-replication-group-id my-global-replication-group \
    --retain-primary-replication-group
```

Output:

```
{
    "GlobalReplicationGroup": {
        "GlobalReplicationGroupId": "sgaui-my-grg",
        "GlobalReplicationGroupDescription": "my-grg",
        "Status": "deleting",
        "CacheNodeType": "cache.r5.large",
        "Engine": "redis",
        "EngineVersion": "5.0.6",
        "Members": [
            {
                "ReplicationGroupId": "my-cluster-grg",
                "ReplicationGroupRegion": "us-west-2",
                "Role": "PRIMARY",
                "AutomaticFailover": "enabled",
                "Status": "associated"
            }
        ],
        "ClusterEnabled": false,
        "AuthTokenEnabled": false,
        "TransitEncryptionEnabled": false,
        "AtRestEncryptionEnabled": false
    }
```

```
}
```

For more information, see Replication Across AWS Regions Using Global Datastore in the *Elasticache User Guide*.

- For API details, see DeleteGlobalReplicationGroup in *AWS CLI Command Reference*.

`delete-replication-group`

The following code example shows how to use `delete-replication-group`.

AWS CLI

To delete a replication group

The following `delete-replication-group` example deletes an existing replication group. By default, this operation deletes the entire replication group, including the primary/primaries and all of the read replicas. If the replication group has only one primary, you can optionally delete only the read replicas, while retaining the primary by setting RetainPrimaryCluster=true .

When you receive a successful response from this operation, Amazon ElastiCache immediately begins deleting the selected resources; you cannot cancel or revert this operation. Valid for Redis only.

```
aws elasticache delete-replication-group \
    --replication-group-id "mygroup"
```

Output:

```
{
     "ReplicationGroup": {
         "ReplicationGroupId": "mygroup",
         "Description": "my group",
         "Status": "deleting",
         "PendingModifiedValues": {},
         "AutomaticFailover": "disabled",
         "SnapshotRetentionLimit": 0,
         "SnapshotWindow": "06:00-07:00",
         "TransitEncryptionEnabled": false,
         "AtRestEncryptionEnabled": false
     }
```

```
}
```

- For API details, see DeleteReplicationGroup in *AWS CLI Command Reference*.

`delete-snapshot`

The following code example shows how to use `delete-snapshot`.

AWS CLI

To delete a snapshot

The following `delete-snapshot` example deleted a snapshot using the Redis engine.

```
aws elasticache delete-snapshot \
    --snapshot-name mysnapshot
```

Output:

```
{
    "Snapshot": {
        "SnapshotName": "my-cluster-snapshot",
        "ReplicationGroupId": "mycluster",
        "ReplicationGroupDescription": "mycluster",

            }
        ]
    }
}
```

For more information, see Backup and Restore for ElastiCache for Redis in the *Elasticache User Guide*.

- For API details, see DeleteSnapshot in *AWS CLI Command Reference*.

`delete-user-group`

The following code example shows how to use `delete-user-group`.

AWS CLI

To delete a user group

The following `delete-user-group` example deletes a user group.

```
aws elasticache delete-user-group \
    --user-group-id myusergroup
```

Output:

```
{
    "UserGroupId": "myusergroup",
    "Status": "deleting",
    "Engine": "redis",
    "UserIds": [
        "default"
    ],
    "ReplicationGroups": [],
    "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:usergroup:myusergroup"
}
```

For more information, see Authenticating Users with Role-Based Access Control (RBAC) in the *Elasticache User Guide*.

- For API details, see DeleteUserGroup in *AWS CLI Command Reference*.

`delete-user`

The following code example shows how to use `delete-user`.

AWS CLI

To delete a user

The following `delete-user` example deletes a user.

```
aws elasticache delete-user \
    --user-id user2
```

Output:

```
{
    "UserId": "user1",
    "UserName": "myUser",
    "Status": "deleting",
    "Engine": "redis",
    "AccessString": "on ~* +@all",
    "UserGroupIds": [
        "myusergroup"
    ],
    "Authentication": {
        "Type": "password",
        "PasswordCount": 1
    },
    "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:user1"
}
```

For more information, see [Authenticating Users with Role-Based Access Control (RBAC)]() in the *Elasticache User Guide*.

- For API details, see [DeleteUser]() in *AWS CLI Command Reference*.

`describe-cache-clusters`

The following code example shows how to use `describe-cache-clusters`.

AWS CLI

To describe a cache cluster

The following `describe-cache-clusters` example describes a cache cluster.

```
aws elasticache describe-cache-clusters
```

Output:

```
{
    "CacheClusters": [
    {
            "CacheClusterId": "my-cluster-003",
            "ClientDownloadLandingPage": "https://console.aws.amazon.com/

`describe-cache-engine-versions`

The following code example shows how to use `describe-cache-engine-versions`.

AWS CLI

To describe a cache engine version

The following `describe-cache-engine-versions` example returns a list of the available cache engines and their versions.

```
aws elasticache describe-cache-engine-versions \
    --engine "Redis"
```

Output:

```
{
    "CacheEngineVersions": [
        {
            "Engine": "redis",
            "EngineVersion": "2.6.13",
            "CacheParameterGroupFamily": "redis2.6",
            "CacheEngineDescription": "Redis",
            "CacheEngineVersionDescription": "redis version 2.6.13"
        },
        {
            "Engine": "redis",
            "EngineVersion": "2.8.19",
            "CacheParameterGroupFamily": "redis2.8",
            "CacheEngineDescription": "Redis",
            "CacheEngineVersionDescription": "redis version 2.8.19"
```

```
        },
        {
            "Engine": "redis",
            "EngineVersion": "2.8.21",
            "CacheParameterGroupFamily": "redis2.8",
            "CacheEngineDescription": "Redis",
            "CacheEngineVersionDescription": "redis version 2.8.21"
        },
        {
            "Engine": "redis",

```

```
                "CacheParameterGroupFamily": "redis5.0",
                "CacheEngineDescription": "Redis",
                "CacheEngineVersionDescription": "redis version 5.0.5"
            }
        ]
}
```

- For API details, see DescribeCacheEngineVersions in *AWS CLI Command Reference*.

`describe-cache-parameter-groups`

The following code example shows how to use `describe-cache-parameter-groups`.

AWS CLI

To describe a cache parameter group

The following `describe-cache-parameter-groups` example returns a list of cache parameter group descriptions.

```
aws elasticache describe-cache-parameter-groups \
    --cache-parameter-group-name "mygroup"
```

Output:

```
{
    "CacheParameterGroups": [
        {
            "CacheParameterGroupName": "mygroup",
            "CacheParameterGroupFamily": "redis5.0",
            "Description": " "
        }
    ]
}
```

For more information, see Configuring Engine Parameters Using Parameter Groups in the *Elasticache User Guide*.

- For API details, see DescribeCacheParameterGroups in *AWS CLI Command Reference*.

`describe-cache-parameters`

The following code example shows how to use `describe-cache-parameters`.

AWS CLI

To describe cache parameters

The following "describe-cache-parameters" example returns the detailed parameter list for the specified cache parameter group.

```
aws elasticache describe-cache-parameters \
    --cache-parameter-group-name "myparamgroup"
```

Output:

```
{
    "Parameters": [

For more information, see Parameter Management in the *Elasticache User Guide*.

- For API details, see DescribeCacheParameters in *AWS CLI Command Reference*.

`describe-cache-subnet-groups`

The following code example shows how to use `describe-cache-subnet-groups`.

AWS CLI

To describe cache subnet groups

The following `describe-cache-subnet-groups` example returns a list of subnet groups.

```
aws elasticache describe-cache-subnet-groups
```

Output:

```
{
    "CacheSubnetGroups": [
        {
            "CacheSubnetGroupName": "default",
            "CacheSubnetGroupDescription": "Default CacheSubnetGroup",
            "VpcId": "vpc-a3e97cdb",
            "Subnets": [
                {

For more information, see Subnets and Subnet Groups in the *Elasticache User Guide* or Subnets and Subnet Groups in the *ElastiCache for Memcached User Guide*.

- For API details, see DescribeCacheSubnetGroups in *AWS CLI Command Reference*.

`describe-engine-default-parameters`

The following code example shows how to use `describe-engine-default-parameters`.

AWS CLI

To describe engine default parameters

The following `describe-engine-default-parameters` example returns the default engine and system parameter information for the specified cache engine.

```
aws elasticache describe-engine-default-parameters \
    --cache-parameter-group-family "redis5.0"
```

Output:

```
{
    "EngineDefaults": {
        "Parameters": [
```

```
            {

            },
            {
                "ParameterName": "zset-max-ziplist-value",
                "ParameterValue": "64",
```

```
                "Description": "The threshold of biggest sorted set entries in order
 for the dataset to be compressed.",
                "Source": "system",
                "DataType": "integer",
                "AllowedValues": "0-",
                "IsModifiable": true,
                "MinimumEngineVersion": "5.0.0",
                "ChangeType": "immediate"
            }
        ]
    }
}
```

- For API details, see DescribeEngineDefaultParameters in *AWS CLI Command Reference*.

`describe-events`

The following code example shows how to use `describe-events`.

AWS CLI

To describe events of a replication group

The following `describe-events` example returns a list of events for a replication group.

```
aws elasticache describe-events \
    --source-identifier test-cluster \
    --source-type replication-group
```

Output:

```
{
    "Events": [
        {
            "SourceIdentifier": "test-cluster",
            "SourceType": "replication-group",
            "Message": "Automatic failover has been turned on for replication group
 test-cluster",
            "Date": "2020-03-18T23:51:34.457Z"
        },
        {
            "SourceIdentifier": "test-cluster",
            "SourceType": "replication-group",
```

```
            "Message": "Replication group test-cluster created",
            "Date": "2020-03-18T23:50:31.378Z"
        }
    ]
}
```

For more information, see [Monitoring Events](#) in the *Elasticache User Guide*.

- For API details, see [DescribeEvents](#) in *AWS CLI Command Reference*.

`describe-global-replication-groups`

The following code example shows how to use `describe-global-replication-groups`.

AWS CLI

To describe global replication groups

The following `describe-global-replication-groups` example returns details of a Global datastore.

```
aws elasticache describe-global-replication-groups \
    --global-replication-group-id my-grg
```

Output:

```
{
    "GlobalReplicationGroups": [
        {
            "GlobalReplicationGroupId": "my-grg",
            "GlobalReplicationGroupDescription": "my-grg",
            "Status": "creating",
            "CacheNodeType": "cache.r5.large",
            "Engine": "redis",
            "EngineVersion": "5.0.6",
            "ClusterEnabled": false,
            "AuthTokenEnabled": false,
            "TransitEncryptionEnabled": false,
            "AtRestEncryptionEnabled": false
        }
    ]
}
```

For more information, see Replication Across AWS Regions Using Global Datastore in the *Elasticache User Guide*.

- For API details, see DescribeGlobalReplicationGroups in *AWS CLI Command Reference*.

`describe-replication-groups`

The following code example shows how to use `describe-replication-groups`.

AWS CLI

To return a list of replication group details

The following `describe-replication-groups` example returns the replication groups.

```
aws elasticache describe-replication-groups
```

Output:

```
{
    "ReplicationGroups": [
        {
            "ReplicationGroupId": "my-cluster",
            "Description": "mycluster",

`describe-reserved-cache-nodes-offerings`

The following code example shows how to use `describe-reserved-cache-nodes-offerings`.

AWS CLI

To describe reserved-cache-nodes-offerings

The following `describe-reserved-cache-nodes-offerings` example returns details of a reserved-cache-node options.

```
aws elasticache describe-reserved-cache-nodes-offerings
```

Output:

```
{
    "ReservedCacheNodesOfferings": [
        {
            "ReservedCacheNodesOfferingId": "01ce0a19-a476-41cb-8aee-48eacbcdc8e5",
            "CacheNodeType": "cache.t3.small",

            "OfferingType": "Heavy Utilization",
            "RecurringCharges": [
                {
                    "RecurringChargeAmount": 0.25,
                    "RecurringChargeFrequency": "Hourly"
                }
            ]
        },
```

```
        ...

    ]
}
```

For more information, see Getting Info About Reserved Node Offerings in the *Elasticache Redis User Guide* or Getting Info About Reserved Node Offerings in the *Elasticache Memcached User Guide*.

- For API details, see DescribeReservedCacheNodesOfferings in *AWS CLI Command Reference*.

`describe-reserved-cache-nodes`

The following code example shows how to use `describe-reserved-cache-nodes`.

AWS CLI

To describe reserved cache nodes

The following `describe-reserved-cache-nodes` example returns information about reserved cache nodes for this account, or about the specified reserved cache node.

aws elasticache describe-reserved-cache-nodes

Output:

```
{
    "ReservedCacheNodes": [
        {
            "ReservedCacheNodeId": "mynode",
            "ReservedCacheNodesOfferingId": "xxxxxxxxx-xxxxx-xxxxx-xxxx-xxxxxxxx71",
            "CacheNodeType": "cache.t3.small",
            "StartTime": "2019-12-06T02:50:44.003Z",
            "Duration": 31536000,
            "FixedPrice": 0.0,
            "UsagePrice": 0.0,
            "CacheNodeCount": 1,
            "ProductDescription": "redis",
            "OfferingType": "No Upfront",
            "State": "payment-pending",
            "RecurringCharges": [
                {
```

```
                    "RecurringChargeAmount": 0.023,
                    "RecurringChargeFrequency": "Hourly"
                }
            ],
            "ReservationARN": "arn:aws:elasticache:us-
west-2:xxxxxxxxxxxx52:reserved-instance:mynode"
        }
    ]
}
```

For more information, see [Managing Costs with Reserved Nodes](#) in the *Elasticache User Guide*.

- For API details, see [DescribeReservedCacheNodes](#) in *AWS CLI Command Reference*.

`describe-service-updates`

The following code example shows how to use `describe-service-updates`.

AWS CLI

To describe service updates

The following `describe-service-updates` example returns details about service updates.

```
aws elasticache describe-service-updates
```

Output:

```
{
     "ServiceUpdates": [
         {
             "ServiceUpdateName": "elc-xxxxxxxx7-001",
             "ServiceUpdateReleaseDate": "2019-10-09T16:00:00Z",
             "ServiceUpdateEndDate": "2020-02-09T15:59:59Z",
             "ServiceUpdateSeverity": "important",

             "ServiceUpdateDescription": "Upgrades to improve the security,
 reliability, and operational performance of your ElastiCache nodes",
             "ServiceUpdateType": "security-update",
             "Engine": "redis, memcached",
             "EngineVersion": "redis 2.6.13 and onwards, memcached 1.4.5 and
 onwards",
```

```
                "AutoUpdateAfterRecommendedApplyByDate": false,
                "EstimatedUpdateTime": "30 minutes per node"
            },
            {
                "ServiceUpdateName": "elc-xxxxxxxx4-001",
                "ServiceUpdateReleaseDate": "2019-06-11T15:00:00Z",
                "ServiceUpdateEndDate": "2019-10-01T09:24:00Z",
                "ServiceUpdateSeverity": "important",
                "ServiceUpdateRecommendedApplyByDate": "2019-07-11T14:59:59Z",
                "ServiceUpdateStatus": "expired",
                "ServiceUpdateDescription": "Upgrades to improve the security,
 reliability, and operational performance of your ElastiCache nodes",
                "ServiceUpdateType": "security-update",
                "Engine": "redis",
                "EngineVersion": "redis 3.2.6, redis 4.0 and onwards",
                "AutoUpdateAfterRecommendedApplyByDate": false,
                "EstimatedUpdateTime": "30 minutes per node"
            }
        ]
 }
```

- For API details, see DescribeServiceUpdates in *AWS CLI Command Reference*.

`describe-snapshots`

The following code example shows how to use `describe-snapshots`.

AWS CLI

To describe snapshots

The following "describe-snapshots" example returns information about your cluster or replication group snapshots.

```
aws elasticache describe-snapshots
```

Output:

```
{
    "Snapshots": [
        {
            "SnapshotName": "automatic.my-cluster2-002-2019-12-05-06-38",
```

```
            "CacheClusterId": "my-cluster2-002",
            "SnapshotStatus": "available",

`describe-update-actions`

The following code example shows how to use `describe-update-actions`.

AWS CLI

To describe update actions

The following `describe-update-actions` example returns details of update actions.

```
aws elasticache describe-update-actions
```

Output:

```
{
    "UpdateActions": [
        {
            "ReplicationGroupId": "mycluster",
            "ServiceUpdateName": "elc-20191007-001",

        }
    ]
}
```

For more information, see Self-Service Updates in Amazon ElastiCache in the *Elasticache User Guide*.

- For API details, see DescribeUpdateActions in *AWS CLI Command Reference*.

`describe-user-groups`

The following code example shows how to use `describe-user-groups`.

AWS CLI

To describe user-groups

The following `describe-user-groups` example returns a list of user groups.

```
aws elasticache describe-user-groups
```

Output:

```
{
    "UserGroups": [
        {
            "UserGroupId": "myusergroup",
            "Status": "active",
            "Engine": "redis",
            "UserIds": [
                "default"
            ],
            "ReplicationGroups": [],
            "ARN": "arn:aws:elasticache:us-
west-2:xxxxxxxxxx52:usergroup:myusergroup"
        }
    ]
}
```

For more information, see Authenticating Users with Role-Based Access Control (RBAC) in the *Elasticache User Guide*.

- For API details, see DescribeUserGroups in *AWS CLI Command Reference*.

`describe-users`

The following code example shows how to use `describe-users`.

AWS CLI

To describe users

The following `describe-users` example returns a list of users.

```
aws elasticache describe-users
```

Output:

```
{
    "Users": [
        {
            "UserId": "default",
            "UserName": "default",
            "Status": "active",
            "Engine": "redis",
            "AccessString": "on ~* +@all",
            "UserGroupIds": [
                "myusergroup"
            ],
            "Authentication": {
                "Type": "no-password"
            },
            "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:default"
        },
        {
            "UserId": "user1",
            "UserName": "myUser",
            "Status": "active",
            "Engine": "redis",
            "AccessString": "on ~* +@all",
            "UserGroupIds": [],
            "Authentication": {
                "Type": "password",
                "PasswordCount": 1
            },
            "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:user1"
        },
        {
            "UserId": "user2",
            "UserName": "myUser",
            "Status": "active",
```

```
            "Engine": "redis",
            "AccessString": "on ~app::* -@all +@read +@hash +@bitmap +@geo -setbit -
bitfield -hset -hsetnx -hmset -hincrby -hincrbyfloat -hdel -bitop -geoadd -georadius
 -georadiusbymember",
            "UserGroupIds": [],
            "Authentication": {
                "Type": "password",
                "PasswordCount": 1
            },
            "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:user2"
        }
    ]
}
```

For more information, see Authenticating Users with Role-Based Access Control (RBAC) in the *Elasticache User Guide*.

- For API details, see DescribeUsers in *AWS CLI Command Reference*.

`disassociate-global-replication-group`

The following code example shows how to use `disassociate-global-replication-group`.

AWS CLI

To diassociate a secondary cluster from a global replication group

The following `disassociate-global-replication-group` example removes a secondary cluster from a Global datastore

```
aws elasticache disassociate-global-replication-group \
    --global-replication-group-id my-grg \
    --replication-group-id my-cluster-grg-secondary \
    --replication-group-region us-east-1
```

Output:

```
{
    "GlobalReplicationGroup": {
        "GlobalReplicationGroupId": "my-grg",
        "GlobalReplicationGroupDescription": "my-grg",
```

```
        "Status": "modifying",
        "CacheNodeType": "cache.r5.large",
        "Engine": "redis",
        "EngineVersion": "5.0.6",
        "Members": [
            {
                "ReplicationGroupId": "my-cluster-grg-secondary",
                "ReplicationGroupRegion": "us-east-1",
                "Role": "SECONDARY",
                "AutomaticFailover": "enabled",
                "Status": "associated"
            },
            {
                "ReplicationGroupId": "my-cluster-grg",
                "ReplicationGroupRegion": "us-west-2",
                "Role": "PRIMARY",
                "AutomaticFailover": "enabled",
                "Status": "associated"
            }
        ],
        "ClusterEnabled": false,
        "AuthTokenEnabled": false,
        "TransitEncryptionEnabled": false,
        "AtRestEncryptionEnabled": false
    }
}
```

For more information, see Replication Across AWS Regions Using Global Datastore in the *Elasticache User Guide*.

- For API details, see DisassociateGlobalReplicationGroup in *AWS CLI Command Reference*.

`increase-node-groups-in-global-replication-group`

The following code example shows how to use `increase-node-groups-in-global-replication-group`.

AWS CLI

To increase the number of node groups in a global replication group

The following `increase-node-groups-in-global-replication-group` increases the node group count using the Redis engine.

```
aws elasticache increase-node-groups-in-global-replication-group \
    --global-replication-group-id sgaui-pat-test-4 \
    --node-group-count 6 \
    --apply-immediately
```

Output:

```
{
    "GlobalReplicationGroup": {
        "GlobalReplicationGroupId": "sgaui-test-4",
        "GlobalReplicationGroupDescription": "test-4",
        "Status": "modifying",
        "CacheNodeType": "cache.r5.large",
        "Engine": "redis",
        "EngineVersion": "5.0.6",
        "Members": [
            {
                "ReplicationGroupId": "my-cluster-b",
                "ReplicationGroupRegion": "us-east-1",
                "Role": "SECONDARY",
                "AutomaticFailover": "enabled",
                "Status": "associated"
            },
            {
                "ReplicationGroupId": "my-cluster-a",
                "ReplicationGroupRegion": "us-west-2",
                "Role": "PRIMARY",
                "AutomaticFailover": "enabled",
                "Status": "associated"
            }
        ],
        "ClusterEnabled": true,
        "GlobalNodeGroups": [
            {
                "GlobalNodeGroupId": "sgaui-test-4-0001",
                "Slots": "0-234,2420-5461"
            },
            {
                "GlobalNodeGroupId": "sgaui-test-4-0002",
                "Slots": "5462-5904,6997-9830"
            },
            {
                "GlobalNodeGroupId": "sgaui-test-4-0003",
```

```
                "Slots": "10923-11190,13375-16383"
            },
            {
                "GlobalNodeGroupId": "sgaui-test-4-0004",
                "Slots": "235-2419,5905-6996"
            },
            {
                "GlobalNodeGroupId": "sgaui-test-4-0005",
                "Slots": "9831-10922,11191-13374"
            }
        ],
        "AuthTokenEnabled": false,
        "TransitEncryptionEnabled": false,
        "AtRestEncryptionEnabled": false
    }
}
```

For more information, see Replication Across AWS Regions Using Global Datastore in the *Elasticache User Guide*.

- For API details, see IncreaseNodeGroupsInGlobalReplicationGroup in *AWS CLI Command Reference*.

`increase-replica-count`

The following code example shows how to use `increase-replica-count`.

AWS CLI

To increase replica count

The following `increase-replica-count` example does one of two things. It can dynamically increase the number of replicas in a Redis (cluster mode disabled) replication group. Or it can dynamically increase the number of replica nodes in one or more node groups (shards) of a Redis (cluster mode enabled) replication group. This operation is performed with no cluster downtime.

```
aws elasticache increase-replica-count \
    --replication-group-id "my-cluster" \
    --apply-immediately \
    --new-replica-count 3
```

Output:

```
{
     "ReplicationGroup": {
         "ReplicationGroupId": "my-cluster",
         "Description": " ",
         "Status": "modifying",
         "PendingModifiedValues": {},
         "MemberClusters": [
             "my-cluster-001",
             "my-cluster-002",
             "my-cluster-003",
             "my-cluster-004"
         ],
         "NodeGroups": [
             {
                 "NodeGroupId": "0001",
                 "Status": "modifying",
                 "PrimaryEndpoint": {
                     "Address": "my-
cluster.xxxxxih.ng.0001.usw2.cache.amazonaws.com",

                         "CurrentRole": "replica"
                     }
                 ]
             }
         ],
         "AutomaticFailover": "disabled",
         "SnapshotRetentionLimit": 0,
         "SnapshotWindow": "07:30-08:30",
         "ClusterEnabled": false,
         "CacheNodeType": "cache.r5.xlarge",
         "TransitEncryptionEnabled": false,
         "AtRestEncryptionEnabled": false
     }
 }
```

For more information, see Increasing the Number of Replicas in a Shard in the *Elasticache User Guide*.

- For API details, see IncreaseReplicaCount in *AWS CLI Command Reference*.

`list-allowed-node-type-modifications`

The following code example shows how to use `list-allowed-node-type-modifications`.

AWS CLI

To list the allowed node modifications

The following `list-allowed-node-type-modifications` example lists all the available node types that you can scale your Redis cluster's or replication group's current node type to.

```
aws elasticache list-allowed-node-type-modifications \
    --replication-group-id "my-replication-group"
```

Output:

```
{
```

```
    "ScaleUpModifications": [
        "cache.m5.12xlarge",
        "cache.m5.24xlarge",
        "cache.m5.4xlarge",
        "cache.r5.12xlarge",
        "cache.r5.24xlarge",
        "cache.r5.2xlarge",

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a resource

The following `list-tags-for-resource` example lists tags for a resource.

```
aws elasticache list-tags-for-resource \
    --resource-name "arn:aws:elasticache:us-east-1:123456789012:cluster:my-cluster"
```

Output:

```
{
    "TagList": [
        {
            "Key": "Project",
            "Value": "querySpeedUp"
        },
        {
            "Key": "Environment",
            "Value": "PROD"
        }
    ]
}
```

For more information, see Listing Tags Using the AWS CLI in the *Elasticache User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`modify-cache-cluster`

The following code example shows how to use `modify-cache-cluster`.

AWS CLI

To modify cache clusters

The following `modify-cache-cluster` example modifies the settings for the specified cluster.

```
aws elasticache modify-cache-cluster \
    --cache-cluster-id "my-cluster" \
    --num-cache-nodes 1
```

Output:

```
{
    "CacheCluster": {
        "CacheClusterId": "my-cluster",
```

```
        "ClientDownloadLandingPage": "https://console.aws.amazon.com/elasticache/
home#client-download:",

        "AtRestEncryptionEnabled": false
    }
}
```

For more information, see Modifying an ElastiCache Cluster in the *Elasticache User Guide*.

- For API details, see ModifyCacheCluster in *AWS CLI Command Reference*.

`modify-cache-parameter-group`

The following code example shows how to use `modify-cache-parameter-group`.

AWS CLI

To modify a cache parameter group

The following `modify-cache-parameter-group` example modifies the parameters of the specified cache parameter group.

```
aws elasticache modify-cache-parameter-group \
    --cache-parameter-group-name "mygroup" \
```

```
    --parameter-name-values "ParameterName=activedefrag, ParameterValue=no"
```

Output:

```
{
    "CacheParameterGroupName": "mygroup"
}
```

For more information, see Modifying a Parameter Group in the *Elasticache User Guide*.

- For API details, see ModifyCacheParameterGroup in *AWS CLI Command Reference*.

`modify-cache-subnet-group`

The following code example shows how to use `modify-cache-subnet-group`.

AWS CLI

To modify a cache subnet group

The following `modify-cache-subnet-group` example modifies the specified cache subnet group.

```
aws elasticache modify-cache-subnet-group \
    --cache-subnet-group-name kxkxk \
    --cache-subnet-group-description "mygroup"
```

Output:

```
{
    "CacheSubnetGroup": {
        "CacheSubnetGroupName": "kxkxk",
        "CacheSubnetGroupDescription": "mygroup",
        "VpcId": "vpc-xxxxcdb",
        "Subnets": [
            {
                "SubnetIdentifier": "subnet-xxxxbff",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2a"
                }
            }
        ]
```

```
    }
}
```

For more information, see Modifying a Subnet Group in the *Elasticache User Guide*.

- For API details, see ModifyCacheSubnetGroup in *AWS CLI Command Reference*.

modify-global-replication-group

The following code example shows how to use `modify-global-replication-group`.

AWS CLI

To modify a global replication group

The following `modify-global-replication-group` modifies the properties of a global replication group, in this case disabling automatic failover, using the Redis engine.

```
aws elasticache modify-global-replication-group \
    --global-replication-group-id sgaui-pat-group \
    --apply-immediately \
    --no-automatic-failover-enabled
```

Output

```
{
    "GlobalReplicationGroup": {
        "GlobalReplicationGroupId": "sgaui-test-group",
        "GlobalReplicationGroupDescription": " ",
        "Status": "modifying",
        "CacheNodeType": "cache.r5.large",
        "Engine": "redis",
        "EngineVersion": "5.0.6",
        "ClusterEnabled": false,
        "AuthTokenEnabled": false,
        "TransitEncryptionEnabled": false,
        "AtRestEncryptionEnabled": false
    }
}
```

For more information, see Replication Across AWS Regions Using Global Datastore in the *Elasticache User Guide*.

- For API details, see ModifyGlobalReplicationGroup in *AWS CLI Command Reference*.

`modify-replication-group-shard-configuration`

The following code example shows how to use `modify-replication-group-shard-configuration`.

AWS CLI

To modify a replication group shard configuration

The following `modify-replication-group-shard-configuration` decreases the node group count using the Redis engine.

```
aws elasticache modify-replication-group-shard-configuration \
    --replication-group-id mycluster \
    --node-group-count 3 \
    --apply-immediately \
    --node-groups-to-remove 0002
```

Output

```
{
    "ReplicationGroup": {
        "ReplicationGroupId": "mycluster",
        "Description": "mycluster",
        "GlobalReplicationGroupInfo": {},

modify-replication-group

The following code example shows how to use `modify-replication-group`.

AWS CLI

To modify a replication group

The following `modify-replication-group` disables Multi-AZ using the Redis engine.

```
aws elasticache modify-replication-group \
    --replication-group-id test-cluster \
    --no-multi-az-enabled \
```

```
    --apply-immediately
```

Output

```
{
    "ReplicationGroup": {
        "ReplicationGroupId": "test-cluster",
        "Description": "test-cluster",
        "GlobalReplicationGroupInfo": {
            "GlobalReplicationGroupId": "sgaui-pat-group",
            "GlobalReplicationGroupMemberRole": "PRIMARY"
        },

        "CacheNodeType": "cache.r5.large",
        "TransitEncryptionEnabled": false,
        "AtRestEncryptionEnabled": false
    }
}
```

For more information, see Modifying a Replication Group in the *Elasticache User Guide*.

- For API details, see ModifyReplicationGroup in *AWS CLI Command Reference*.

`modify-user-group`

The following code example shows how to use `modify-user-group`.

AWS CLI

To modify a user group

The following `modify-user-group` example adds a user to the user group.

```
aws elasticache modify-user-group \
    --user-group-id myusergroup \
    --user-ids-to-add user1
```

Output:

```
{
    "UserGroupId": "myusergroup",
    "Status": "modifying",
    "Engine": "redis",
    "UserIds": [
        "default"
    ],
    "PendingChanges": {
        "UserIdsToAdd": [
            "user1"
        ]
    },
    "ReplicationGroups": [],
    "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:usergroup:myusergroup"
}
```

For more information, see Authenticating Users with Role-Based Access Control (RBAC) in the *Elasticache User Guide*.

- For API details, see ModifyUserGroup in *AWS CLI Command Reference*.

`modify-user`

The following code example shows how to use `modify-user`.

AWS CLI

To modify a user

The following `modify-user` example modifies a user's access string.

```
aws elasticache modify-user \
    --user-id user2 \
    --append-access-string "on ~* +@all"
```

Output:

```
{
    "UserId": "user2",
    "UserName": "myUser",
    "Status": "modifying",
    "Engine": "redis",
    "AccessString": "on ~* +@all",
    "UserGroupIds": [],
    "Authentication": {
        "Type": "password",
        "PasswordCount": 1
    },
    "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:user2"
}
```

For more information, see Authenticating Users with Role-Based Access Control (RBAC) in the *Elasticache User Guide*.

- For API details, see ModifyUser in *AWS CLI Command Reference*.

`purchase-reserved-cache-nodes-offering`

The following code example shows how to use `purchase-reserved-cache-nodes-offering`.

AWS CLI

To purchase a reserved-cache-node-offering

The following `purchase-reserved-cache-nodes-offering` example allows you to purchase a reserved cache node offering.

```
aws elasticache purchase-reserved-cache-nodes-offering \
```

```
    --reserved-cache-nodes-offering-id xxxxxxx-4da5-4b90-b92d-929fbd7abed2
```

Output

```
{
    "ReservedCacheNode": {
        "ReservedCacheNodeId": "ri-2020-06-30-17-59-40-474",
        "ReservedCacheNodesOfferingId": "xxxxxxx-4da5-4b90-b92d-929fbd7abed2",
        "CacheNodeType": "cache.m3.2xlarge",
        "StartTime": "2020-06-30T17:59:40.474000+00:00",
        "Duration": 31536000,
        "FixedPrice": 1772.0,
        "UsagePrice": 0.0,
        "CacheNodeCount": 1,
        "ProductDescription": "redis",
        "OfferingType": "Heavy Utilization",
        "State": "payment-pending",
        "RecurringCharges": [
            {
                "RecurringChargeAmount": 0.25,
                "RecurringChargeFrequency": "Hourly"
            }
        ]
    }
}
```

For more information, see Getting Info About Reserved Node Offerings in the *Elasticache Redis User Guide* or Getting Info About Reserved Node Offerings in the *Elasticache Memcached User Guide*.

- For API details, see PurchaseReservedCacheNodesOffering in *AWS CLI Command Reference*.

`reboot-cache-cluster`

The following code example shows how to use `reboot-cache-cluster`.

AWS CLI

To reboot a cache cluster

The following `reboot-cache-cluster` example reboots some, or all, of the cache nodes within a provisioned cluster. This operation applies any modified cache parameter groups to the cluster. The reboot operation takes place as soon as possible, and results in a momentary outage to the cluster. During the reboot, the cluster status is set to `REBOOTING`.

```
aws elasticache reboot-cache-cluster \
    --cache-cluster-id "my-cluster-001" \
    --cache-node-ids-to-reboot "0001"
```

Output:

```
{
    "CacheCluster": {
        "CacheClusterId": "my-cluster-001",
        "ClientDownloadLandingPage": "https://console.aws.amazon.com/elasticache/
home#client-download:",
        "CacheNodeType": "cache.r5.xlarge",
        "Engine": "redis",
        "EngineVersion": "5.0.5",
        "CacheClusterStatus": "rebooting cache cluster nodes",
        "NumCacheNodes": 1,
        "PreferredAvailabilityZone": "us-west-2a",
        "CacheClusterCreateTime": "2019-11-26T03:35:04.546Z",
        "PreferredMaintenanceWindow": "mon:04:05-mon:05:05",
        "PendingModifiedValues": {},
        "NotificationConfiguration": {
            "TopicArn": "arn:aws:sns:us-west-2:xxxxxxxxxx152:My_Topic",
            "TopicStatus": "active"
        },
        "CacheSecurityGroups": [],
        "CacheParameterGroup": {
            "CacheParameterGroupName": "mygroup",
            "ParameterApplyStatus": "in-sync",
            "CacheNodeIdsToReboot": []
        },
        "CacheSubnetGroupName": "kxkxk",
        "AutoMinorVersionUpgrade": true,
        "SecurityGroups": [
            {
                "SecurityGroupId": "sg-xxxxxxxxxxxxx836",
                "Status": "active"
            },
            {
                "SecurityGroupId": "sg-xxxxxxxx7b",
                "Status": "active"
```

```
            }
        ],
        "ReplicationGroupId": "my-cluster",
        "SnapshotRetentionLimit": 0,
        "SnapshotWindow": "07:30-08:30",
        "TransitEncryptionEnabled": false,
        "AtRestEncryptionEnabled": false
    }
}
```

For more information, see Rebooting a Cluster <https://docs.aws.amazon.com/AmazonElastiCache/latest/red-ug/Clusters.Rebooting.html in the *Elasticache User Guide*.

- For API details, see RebootCacheCluster in *AWS CLI Command Reference*.

`reset-cache-parameter-group`

The following code example shows how to use `reset-cache-parameter-group`.

AWS CLI

To reset a cache parameter group

The following `reset-cache-parameter-group` example modifies the parameters of a cache parameter group to the engine or system default value. You can reset specific parameters by submitting a list of parameter names. To reset the entire cache parameter group, specify the `--reset-all-parameters` and `--cache-parameter-group-name` parameters.

```
aws elasticache reset-cache-parameter-group \
    --cache-parameter-group-name "mygroup" \
    --reset-all-parameters
```

Output:

```
{
    "CacheParameterGroupName": "mygroup"
}
```

- For API details, see ResetCacheParameterGroup in *AWS CLI Command Reference*.

`start-migration`

The following code example shows how to use `start-migration`.

AWS CLI

To start a migration

The following `start-migration` migrates your data from self-hosted Redis on Amazon EC2 to Amazon ElastiCache, using the Redis engine.

```
aws elasticache start-migration \
   --replication-group-id test \
   --customer-node-endpoint-
list "Address='test.g2xbih.ng.0001.usw2.cache.amazonaws.com',Port=6379"
```

Output

```
{
    "ReplicationGroup": {
        "ReplicationGroupId": "test",
        "Description": "test",
        "GlobalReplicationGroupInfo": {},
        "Status": "modifying",
        "PendingModifiedValues": {},
        "MemberClusters": [
            "test-001",
            "test-002",
            "test-003"
        ],
        "NodeGroups": [
            {
                "NodeGroupId": "0001",
                "Status": "available",
                "PrimaryEndpoint": {
                    "Address": "test.g2xbih.ng.0001.usw2.cache.amazonaws.com",

```

```
        "AtRestEncryptionEnabled": false
    }
}
```

For more information, see [Online Migration to ElastiCache](#) in the *Elasticache User Guide*.

- For API details, see [StartMigration](#) in *AWS CLI Command Reference*.

`test-failover`

The following code example shows how to use `test-failover`.

AWS CLI

To test failover of a node group

The following `test-failover` example tests automatic failover on the specified node group (called a shard in the console) in a replication group (called a cluster in the console).

```
aws elasticache test-failover /
    --replication-group-id "mycluster" /
    --node-group-id "0001"
```

Output:

```
{
    "ReplicationGroup": {
        "ReplicationGroupId": "mycluster",
        "Description": "My Cluster",
        "Status": "available",
        "PendingModifiedValues": {},
        "MemberClusters": [
            "mycluster-0001-001",
            "mycluster-0001-002",
            "mycluster-0001-003",
            "mycluster-0002-001",
            "mycluster-0002-002",
            "mycluster-0002-003",
            "mycluster-0003-001",
            "mycluster-0003-002",
            "mycluster-0003-003"
        ],
        "NodeGroups": [
```

```
            {
                "NodeGroupId": "0001",
                "Status": "available",

```

- For API details, see TestFailover in *AWS CLI Command Reference*.

MediaStore examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaStore.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-container`

The following code example shows how to use `create-container`.

AWS CLI

To create a container

The following `create-container` example creates a new, empty container.

```
aws mediastore create-container --container-name ExampleContainer
```

Output:

```
{
    "Container": {
        "AccessLoggingEnabled": false,
        "CreationTime": 1563557265,
        "Name": "ExampleContainer",
        "Status": "CREATING",
        "ARN": "arn:aws:mediastore:us-west-2:111122223333:container/
ExampleContainer"
    }
}
```

For more information, see Creating a Container in the *AWS Elemental MediaStore User Guide*.

- For API details, see CreateContainer in *AWS CLI Command Reference*.

`delete-container-policy`

The following code example shows how to use `delete-container-policy`.

AWS CLI

To delete a container policy

The following `delete-container-policy` example deletes the policy that is assigned to the specified container. When the policy is deleted, AWS Elemental MediaStore automatically assigns the default policy to the container.

```
aws mediastore delete-container-policy \
    --container-name LiveEvents
```

This command produces no output.

For more information, see DeleteContainerPolicy in the *AWS Elemental MediaStore API reference*.

- For API details, see DeleteContainerPolicy in *AWS CLI Command Reference*.

`delete-container`

The following code example shows how to use `delete-container`.

AWS CLI

To delete a container

The following `delete-container` example deletes the specified container. You can delete a container only if it has no objects.

```
aws mediastore delete-container \
    --container-name=ExampleLiveDemo
```

This command produces no output.

For more information, see Deleting a Container in the *AWS Elemental MediaStore User Guide*.

- For API details, see DeleteContainer in *AWS CLI Command Reference*.

delete-cors-policy

The following code example shows how to use `delete-cors-policy`.

AWS CLI

To delete a CORS policy

The following `delete-cors-policy` example deletes the cross-origin resource sharing (CORS) policy that is assigned to the specified container.

```
aws mediastore delete-cors-policy \
    --container-name ExampleContainer
```

This command produces no output.

For more information, see Deleting a CORS Policy in the *AWS Elemental MediaStore User Guide*.

- For API details, see DeleteCorsPolicy in *AWS CLI Command Reference*.

delete-lifecycle-policy

The following code example shows how to use `delete-lifecycle-policy`.

AWS CLI

To delete an object lifecycle policy

The following `delete-lifecycle-policy` example deletes the object lifecycle policy attached to the specified container. This change can take up to 20 minutes to take effect.

```
aws mediastore delete-lifecycle-policy \
    --container-name LiveEvents
```

This command produces no output.

For more information, see Deleting an Object Lifecycle Policy in the *AWS Elemental MediaStore User Guide*.

- For API details, see DeleteLifecyclePolicy in *AWS CLI Command Reference*.

`describe-container`

The following code example shows how to use `describe-container`.

AWS CLI

To view the details of a container

The following `describe-container` example displays the details of the specified container.

```
aws mediastore describe-container \
    --container-name ExampleContainer
```

Output:

```
{
    "Container": {
        "CreationTime": 1563558086,
        "AccessLoggingEnabled": false,
        "ARN": "arn:aws:mediastore:us-west-2:111122223333:container/
ExampleContainer",
        "Status": "ACTIVE",
        "Name": "ExampleContainer",
        "Endpoint": "https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com"
    }
}
```

For more information, see Viewing the Details for a Container in the *AWS Elemental MediaStore User Guide*.

- For API details, see DescribeContainer in *AWS CLI Command Reference*.

`describe-object`

The following code example shows how to use `describe-object`.

AWS CLI

To view a list of objects and folders in a specific container

The following `describe-object` example displays items (objects and folders) stored in a specific container.

```
aws mediastore-data describe-object \
    --endpoint https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com \
    --path /folder_name/file1234.jpg
```

Output:

```
{
    "ContentType": "image/jpeg",
    "LastModified": "Fri, 19 Jul 2019 21:32:20 GMT",
    "ContentLength": "2307346",
    "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeeee4dd89ff7f555555555555da6d3"
}
```

For more information, see Viewing the Details of an Object in the *AWS Elemental MediaStore User Guide*.

- For API details, see DescribeObject in *AWS CLI Command Reference*.

`get-container-policy`

The following code example shows how to use `get-container-policy`.

AWS CLI

To view a container policy

The following `get-container-policy` example displays the resource-based policy of the specified container.

```
aws mediastore get-container-policy \
    --container-name ExampleLiveDemo
```

Output:

```
{
    "Policy": {
        "Version":"2012-10-17",
        "Statement": [
            {
                "Sid": "PublicReadOverHttps",
                "Effect": "Allow",
                "Principal": {
```

```
                    "AWS": "arn:aws:iam::111122223333:root"
                },
                "Action": [
                    "mediastore:GetObject",
                    "mediastore:DescribeObject"
                ],
                "Resource": "arn:aws:mediastore:us-west-2:111122223333:container/
ExampleLiveDemo/",
                "Condition": {
                    "Bool": {
                        "aws:SecureTransport": "true"
                    }
                }
            }
        ]
    }
}
```

For more information, see Viewing a Container Policy in the *AWS Elemental MediaStore User Guide*.

- For API details, see GetContainerPolicy in *AWS CLI Command Reference*.

get-cors-policy

The following code example shows how to use `get-cors-policy`.

AWS CLI

To view a CORS policy

The following `get-cors-policy` example displays the cross-origin resource sharing (CORS) policy that is assigned to the specified container.

```
aws mediastore get-cors-policy \
    --container-name ExampleContainer \
    --region us-west-2
```

Output:

```
{
    "CorsPolicy": [
        {
```

```
                "AllowedMethods": [
                    "GET",
                    "HEAD"
                ],
                "MaxAgeSeconds": 3000,
                "AllowedOrigins": [
                    ""
                ],
                "AllowedHeaders": [
                    ""
                ]
            }
        ]
}
```

For more information, see Viewing a CORS Policy in the *AWS Elemental MediaStore User Guide*.

- For API details, see GetCorsPolicy in *AWS CLI Command Reference*.

`get-lifecycle-policy`

The following code example shows how to use `get-lifecycle-policy`.

AWS CLI

To view an object lifecycle policy

The following `get-lifecycle-policy` example displays the object lifecycle policy attached to the specified container.

```
aws mediastore get-lifecycle-policy \
    --container-name LiveEvents
```

Output:

```
{
    "LifecyclePolicy": {
        "rules": [
            {
                "definition": {
                    "path": [
                        {
                            "prefix": "Football/"
```

```
                            },
                            {
                                "prefix": "Baseball/"
                            }
                        ],
                        "days_since_create": [
                            {
                                "numeric": [
                                    ">",
                                    28
                                ]
                            }
                        ]
                    },
                    "action": "EXPIRE"
                }
            ]
        }
}
```

For more information, see Viewing an Object Lifecycle Policy in the *AWS Elemental MediaStore User Guide*.

- For API details, see GetLifecyclePolicy in *AWS CLI Command Reference*.

`get-object`

The following code example shows how to use `get-object`.

AWS CLI

To download an object

The following `get-object` example download an object to the specified endpoint.

```
aws mediastore-data get-object \
    --endpoint https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com \
    --path=/folder_name/README.md README.md
```

Output:

```
{
    "ContentLength": "2307346",
```

```
    "ContentType": "image/jpeg",
    "LastModified": "Fri, 19 Jul 2019 21:32:20 GMT",
    "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeeee4dd89ff7f555555555555da6d3",
    "StatusCode": 200
}
```

To download part of an object

The following `get-object` example downloads a portion an object to the specified endpoint.

```
aws mediastore-data get-object \
    --endpoint https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com \
    --path /folder_name/README.md \
    --range="bytes=0-100" README2.md
```

Output:

```
{
    "StatusCode": 206,
    "ContentRange": "bytes 0-100/2307346",
    "ContentLength": "101",
    "LastModified": "Fri, 19 Jul 2019 21:32:20 GMT",
    "ContentType": "image/jpeg",
    "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeeee4dd89ff7f555555555555da6d3"
}
```

For more information, see Downloading an Object in the *AWS Elemental MediaStore User Guide*.

- For API details, see GetObject in *AWS CLI Command Reference*.

`list-containers`

The following code example shows how to use `list-containers`.

AWS CLI

To view a list of containers

The following `list-containers` example displays a list of all containers that are associated with your account.

```
aws mediastore list-containers
```

Output:

```
{
    "Containers": [
        {
            "CreationTime": 1505317931,
            "Endpoint": "https://aaabbbcccdddee.data.mediastore.us-
west-2.amazonaws.com",
            "Status": "ACTIVE",
            "ARN": "arn:aws:mediastore:us-west-2:111122223333:container/
ExampleLiveDemo",
            "AccessLoggingEnabled": false,
            "Name": "ExampleLiveDemo"
        },
        {
            "CreationTime": 1506528818,
            "Endpoint": "https://fffggghhhiiijj.data.mediastore.us-
west-2.amazonaws.com",
            "Status": "ACTIVE",
            "ARN": "arn:aws:mediastore:us-west-2:111122223333:container/
ExampleContainer",
            "AccessLoggingEnabled": false,
            "Name": "ExampleContainer"
        }
    ]
}
```

For more information, see Viewing a List of Containers in the *AWS Elemental MediaStore User Guide*.

- For API details, see ListContainers in *AWS CLI Command Reference*.

`list-items`

The following code example shows how to use `list-items`.

AWS CLI

Example 1: To view a list of objects and folders in a specific container

The following `list-items` example displays items (objects and folders) stored in the specified container.

```
aws mediastore-data list-items \
    --endpoint https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com
```

Output:

```
{
    "Items": [
        {
            "ContentType": "image/jpeg",
            "LastModified": 1563571859.379,
            "Name": "filename.jpg",
            "Type": "OBJECT",
            "ETag":
 "543ab21abcd1a234ab123456a1a2b12345ab12abc12a1234abc1a2bc12345a12",
            "ContentLength": 3784
        },
        {
            "Type": "FOLDER",
            "Name": "ExampleLiveDemo"
        }
    ]
}
```

Example 2: To view a list of objects and folders in a specific folder

The following `list-items` example displays items (objects and folders) stored in a specific folder.

```
aws mediastore-data list-items \
    --endpoint https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com
```

Output:

```
{
    "Items": [
        {
            "ContentType": "image/jpeg",
            "LastModified": 1563571859.379,
            "Name": "filename.jpg",
            "Type": "OBJECT",
            "ETag":
 "543ab21abcd1a234ab123456a1a2b12345ab12abc12a1234abc1a2bc12345a12",
```

```
                "ContentLength": 3784
            },
            {
                "Type": "FOLDER",
                "Name": "ExampleLiveDemo"
            }
        ]
}
```

For more information, see Viewing a List of Objects in the *AWS Elemental MediaStore User Guide*.

- For API details, see ListItems in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a container

The following `list-tags-for-resource` example displays the tag keys and values assigned to the specified container.

```
aws mediastore list-tags-for-resource \
    --resource arn:aws:mediastore:us-west-2:1213456789012:container/ExampleContainer
```

Output:

```
{
    "Tags": [
        {
            "Value": "Test",
            "Key": "Environment"
        },
        {
            "Value": "West",
            "Key": "Region"
        }
    ]
}
```

For more information, see ListTagsForResource in the *AWS Elemental MediaStore API Reference*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

put-container-policy

The following code example shows how to use `put-container-policy`.

AWS CLI

To edit a container policy

The following `put-container-policy` example assigns a different policy to the specified container. In this example, the updated policy is defined in a file named `LiveEventsContainerPolicy.json`.

```
aws mediastore put-container-policy \
    --container-name LiveEvents \
    --policy file://LiveEventsContainerPolicy.json
```

This command produces no output.

For more information, see Editing a Container Policy in the *AWS Elemental MediaStore User Guide*.

- For API details, see PutContainerPolicy in *AWS CLI Command Reference*.

put-cors-policy

The following code example shows how to use `put-cors-policy`.

AWS CLI

Example 1: To add a CORS policy

The following `put-cors-policy` example adds a cross-origin resource sharing (CORS) policy to the specified container. The contents of the CORS policy are in the file named `corsPolicy.json`.

```
aws mediastore put-cors-policy \
    --container-name ExampleContainer \
```

```
    --cors-policy file://corsPolicy.json
```

This command produces no output.

For more information, see Adding a CORS Policy to a Container in the *AWS Elemental MediaStore User Guide*.

Example 2: To edit a CORS policy

The following `put-cors-policy` example updates the cross-origin resource sharing (CORS) policy that is assigned to the specified container. The contents of the updated CORS policy are in the file named `corsPolicy2.json`.

For more information, see Editing a CORS Policy in the *AWS Elemental MediaStore User Guide*.

- For API details, see PutCorsPolicy in *AWS CLI Command Reference*.

`put-lifecycle-policy`

The following code example shows how to use `put-lifecycle-policy`.

AWS CLI

To create an object lifecycle policy

The following `put-lifecycle-policy` example attaches an object lifecycle policy to the specified container. This enables you to specify how long the service should store objects in your container. MediaStore deletes objects in the container once they reach their expiration date, as indicated in the policy, which is in the file named `LiveEventsLifecyclePolicy.json`.

```
aws mediastore put-lifecycle-policy \
    --container-name ExampleContainer \
    --lifecycle-policy file://ExampleLifecyclePolicy.json
```

This command produces no output.

For more information, see Adding an Object Lifecycle Policy to a Container in the *AWS Elemental MediaStore User Guide*.

- For API details, see PutLifecyclePolicy in *AWS CLI Command Reference*.

`put-object`

The following code example shows how to use `put-object`.

AWS CLI

To upload an object

The following `put-object` example uploads an object to the specified container. You can specify a folder path where the object will be saved within the container. If the folder already exists, AWS Elemental MediaStore stores the object in the folder. If the folder doesn't exist, the service creates it, and then stores the object in the folder.

```
aws mediastore-data put-object \
    --endpoint https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com \
    --body README.md \
    --path /folder_name/README.md \
    --cache-control "max-age=6, public" \
    --content-type binary/octet-stream
```

Output:

```
{
    "ContentSHA256":
 "74b5fdb517f423ed750ef214c44adfe2be36e37d861eafe9c842cbe1bf387a9d",
    "StorageClass": "TEMPORAL",
    "ETag": "af3e4731af032167a106015d1f2fe934e68b32ed1aa297a9e325f5c64979277b"
}
```

For more information, see Uploading an Object in the *AWS Elemental MediaStore User Guide*.

- For API details, see PutObject in *AWS CLI Command Reference*.

`start-access-logging`

The following code example shows how to use `start-access-logging`.

AWS CLI

To enable access logging on a container

The following `start-access-logging` example enable access logging on the specified container.

```
aws mediastore start-access-logging \
    --container-name LiveEvents
```

This command produces no output.

For more information, see Enabling Access Logging for a Container in the *AWS Elemental MediaStore User Guide*.

- For API details, see StartAccessLogging in *AWS CLI Command Reference*.

`stop-access-logging`

The following code example shows how to use `stop-access-logging`.

AWS CLI

To disable access logging on a container

The following `stop-access-logging` example disables access logging on the specified container.

```
aws mediastore stop-access-logging \
    --container-name LiveEvents
```

This command produces no output.

For more information, see Disabling Access Logging for a Container in the *AWS Elemental MediaStore User Guide*.

- For API details, see StopAccessLogging in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add tags to a container

The following `tag-resource` example adds tag keys and values to the specified container.

```
aws mediastore tag-resource \
    --resource arn:aws:mediastore:us-west-2:123456789012:container/ExampleContainer
 \
    --tags '[{"Key": "Region", "Value": "West"}, {"Key": "Environment", "Value":
 "Test"}]'
```

This command produces no output.

For more information, see TagResource in the *AWS Elemental MediaStore API Reference*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a container

The following `untag-resource` example removes the specified tag key and its associated value from a container.

```
aws mediastore untag-resource \
    --resource arn:aws:mediastore:us-west-2:123456789012:container/ExampleContainer
 \
    --tag-keys Region
```

This command produces no output.

For more information, see UntagResource in the *AWS Elemental MediaStore API Reference.*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

Amazon EMR examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EMR.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`add-instance-fleet`

The following code example shows how to use `add-instance-fleet`.

AWS CLI

To add a task instance fleet to a cluster

This example adds a new task instance fleet to the cluster specified.

Command:

```
aws emr add-instance-fleet --cluster-id 'j-12ABCDEFGHI34JK' --instance-fleet
 InstanceFleetType=TASK,TargetSpotCapacity=1,LaunchSpecifications={SpotSpecification='{Timeo
```

Output:

```
{
   "ClusterId": "j-12ABCDEFGHI34JK",
   "InstanceFleetId": "if-23ABCDEFGHI45JJ"
}
```

- For API details, see AddInstanceFleet in *AWS CLI Command Reference*.

`add-steps`

The following code example shows how to use `add-steps`.

AWS CLI

1. To add Custom JAR steps to a cluster

Command:

```
aws emr add-steps --cluster-id j-XXXXXXXX --steps
 Type=CUSTOM_JAR,Name=CustomJAR,ActionOnFailure=CONTINUE,Jar=s3://amzn-s3-demo-
bucket/mytest.jar,Args=arg1,arg2,arg3
 Type=CUSTOM_JAR,Name=CustomJAR,ActionOnFailure=CONTINUE,Jar=s3://amzn-s3-demo-
bucket/mytest.jar,MainClass=mymainclass,Args=arg1,arg2,arg3
```

Required parameters:

```
Jar
```

Optional parameters:

```
Type, Name, ActionOnFailure, Args
```

Output:

```
{
    "StepIds":[
        "s-XXXXXXXX",
        "s-YYYYYYYY"
    ]
}
```

2. To add Streaming steps to a cluster

Command:

```
aws emr add-steps --cluster-id j-XXXXXXXX --steps Type=STREAMING,Name='Streaming
 Program',ActionOnFailure=CONTINUE,Args=[-files,s3://elasticmapreduce/samples/
wordcount/wordSplitter.py,-mapper,wordSplitter.py,-reducer,aggregate,-input,s3://
elasticmapreduce/samples/wordcount/input,-output,s3://amzn-s3-demo-bucket/wordcount/
output]
```

Required parameters:

```
Type, Args
```

Optional parameters:

```
Name, ActionOnFailure
```

JSON equivalent (contents of step.json):

```
 [
  {
    "Name": "JSON Streaming Step",
    "Args": ["-files","s3://elasticmapreduce/samples/wordcount/wordSplitter.py","-
mapper","wordSplitter.py","-reducer","aggregate","-input","s3://elasticmapreduce/
samples/wordcount/input","-output","s3://amzn-s3-demo-bucket/wordcount/output"],
    "ActionOnFailure": "CONTINUE",
    "Type": "STREAMING"
  }
]
```

NOTE: JSON arguments must include options and values as their own items in the list.

Command (using step.json):

```
aws emr add-steps --cluster-id j-XXXXXXXX --steps file://./step.json
```

Output:

```
{
    "StepIds":[
        "s-XXXXXXXX",
        "s-YYYYYYYY"
    ]
}
```

3. To add a Streaming step with multiple files to a cluster (JSON only)

JSON (multiplefiles.json):

```
[
  {
     "Name": "JSON Streaming Step",
     "Type": "STREAMING",
     "ActionOnFailure": "CONTINUE",
```

```
      "Args": [
          "-files",
          "s3://amzn-s3-demo-bucket/mapper.py,s3://amzn-s3-demo-bucket/reducer.py",
          "-mapper",
          "mapper.py",
          "-reducer",
          "reducer.py",
          "-input",
          "s3://amzn-s3-demo-bucket/input",
          "-output",
          "s3://amzn-s3-demo-bucket/output"]
  }
]
```

Command:

```
aws emr add-steps --cluster-id j-XXXXXXXX  --steps file://./multiplefiles.json
```

Required parameters:

```
Type, Args
```

Optional parameters:

```
Name, ActionOnFailure
```

Output:

```
{
    "StepIds":[
        "s-XXXXXXXX",
    ]
}
```

4. To add Hive steps to a cluster

Command:

```
aws emr add-steps --cluster-id j-XXXXXXXX --steps Type=HIVE,Name='Hive
 program',ActionOnFailure=CONTINUE,Args=[-f,s3://amzn-s3-demo-bucket/
```

```
myhivescript.q,-d,INPUT=s3://amzn-s3-demo-bucket/myhiveinput,-d,OUTPUT=s3://
amzn-s3-demo-bucket/myhiveoutput,arg1,arg2] Type=HIVE,Name='Hive
 steps',ActionOnFailure=TERMINATE_CLUSTER,Args=[-f,s3://elasticmapreduce/samples/
hive-ads/libs/model-build.q,-d,INPUT=s3://elasticmapreduce/samples/hive-ads/tables,-
d,OUTPUT=s3://amzn-s3-demo-bucket/hive-ads/output/2014-04-18/11-07-32,-d,LIBS=s3://
elasticmapreduce/samples/hive-ads/libs]
```

Required parameters:

```
Type, Args
```

Optional parameters:

```
Name, ActionOnFailure
```

Output:

```
{
    "StepIds":[
        "s-XXXXXXXX",
        "s-YYYYYYYY"
    ]
}
```

5. To add Pig steps to a cluster

Command:

```
aws emr add-steps --cluster-id j-XXXXXXXX --steps Type=PIG,Name='Pig
 program',ActionOnFailure=CONTINUE,Args=[-f,s3://amzn-s3-demo-bucket/
mypigscript.pig,-p,INPUT=s3://amzn-s3-demo-bucket/mypiginput,-p,OUTPUT=s3://
amzn-s3-demo-bucket/mypigoutput,arg1,arg2] Type=PIG,Name='Pig program',Args=[-
f,s3://elasticmapreduce/samples/pig-apache/do-reports2.pig,-p,INPUT=s3://
elasticmapreduce/samples/pig-apache/input,-p,OUTPUT=s3://amzn-s3-demo-bucket/pig-
apache/output,arg1,arg2]
```

Required parameters:

```
Type, Args
```

Optional parameters:

```
Name, ActionOnFailure
```

Output:

```
{
    "StepIds":[
        "s-XXXXXXXX",
        "s-YYYYYYYY"
    ]
}
```

6. To add Impala steps to a cluster

Command:

```
aws emr add-steps --cluster-id j-XXXXXXXX --steps Type=IMPALA,Name='Impala
 program',ActionOnFailure=CONTINUE,Args=--impala-script,s3://myimpala/input,--
console-output-path,s3://myimpala/output
```

Required parameters:

```
Type, Args
```

Optional parameters:

```
Name, ActionOnFailure
```

Output:

```
{
    "StepIds":[
        "s-XXXXXXXX",
        "s-YYYYYYYY"
    ]
}
```

- For API details, see AddSteps in *AWS CLI Command Reference*.

`add-tags`

The following code example shows how to use `add-tags`.

AWS CLI

1. To add tags to a cluster

Command:

```
aws emr add-tags --resource-id j-xxxxxxx --tags name="John Doe" age=29 sex=male
 address="123 East NW Seattle"
```

Output:

```
None
```

2. To list tags of a cluster

--Command:

```
aws emr describe-cluster --cluster-id j-XXXXXXYY --query Cluster.Tags
```

Output:

```
[
    {
        "Value": "male",
        "Key": "sex"
    },
    {
        "Value": "123 East NW Seattle",
        "Key": "address"
    },
    {
        "Value": "John Doe",
        "Key": "name"
    },
    {
        "Value": "29",
        "Key": "age"
```

```
    }
]
```

- For API details, see AddTags in *AWS CLI Command Reference*.

`create-cluster-examples`

The following code example shows how to use `create-cluster-examples`.

AWS CLI

Most of the following examples assume that you specified your Amazon EMR service role and Amazon EC2 instance profile. If you have not done this, you must specify each required IAM role or use the `--use-default-roles` parameter when creating your cluster. For more information about specifying IAM roles, see Configure IAM Roles for Amazon EMR Permissions to AWS Services in the *Amazon EMR Management Guide*.

Example 1: To create a cluster

The following `create-cluster` example creates a simple EMR cluster.

```
aws emr create-cluster \
    --release-label emr-5.14.0 \
    --instance-type m4.large \
    --instance-count 2
```

This command produces no output.

Example 2: To create an Amazon EMR cluster with default ServiceRole and InstanceProfile roles

The following `create-cluster` example creates an Amazon EMR cluster that uses the `--instance-groups` configuration.

```
aws emr create-cluster \
    --release-label emr-5.14.0 \
    --service-role EMR_DefaultRole \
    --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
```

Example 3: To create an Amazon EMR cluster that uses an instance fleet

The following `create-cluster` example creates an Amazon EMR cluster that uses the `--instance-fleets` configuration, specifying two instance types for each fleet and two EC2 Subnets.

```
aws emr create-cluster \
    --release-label emr-5.14.0 \
    --service-role EMR_DefaultRole \
    --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole,SubnetIds=['subnet-
ab12345c','subnet-de67890f'] \
    --instance-fleets
 InstanceFleetType=MASTER,TargetOnDemandCapacity=1,InstanceTypeConfigs=['{InstanceType=m4.la
 InstanceFleetType=CORE,TargetSpotCapacity=11,InstanceTypeConfigs=['{InstanceType=m4.large,B
```

Example 4: To create a cluster with default roles

The following `create-cluster` example uses the `--use-default-roles` parameter to specify the default service role and instance profile.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
    --use-default-roles \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
 \
    --auto-terminate
```

Example 5: To create a cluster and specify the applications to install

The following `create-cluster` example uses the `--applications` parameter to specify the applications that Amazon EMR installs. This example installs Hadoop, Hive and Pig.

```
aws emr create-cluster \
    --applications Name=Hadoop Name=Hive Name=Pig \
    --release-label emr-5.9.0 \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
 \
    --auto-terminate
```

Example 6: To create a cluster that includes Spark

The following example installs Spark.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
    --applications Name=Spark \
    --ec2-attributes KeyName=myKey \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
 \
    --auto-terminate
```

Example 7: To specify a custom AMI to use for cluster instances

The following `create-cluster` example creates a cluster instance based on the Amazon Linux AMI with ID `ami-a518e6df`.

```
aws emr create-cluster \
    --name "Cluster with My Custom AMI" \
    --custom-ami-id ami-a518e6df \
    --ebs-root-volume-size 20 \
    --release-label emr-5.9.0 \
    --use-default-roles \
    --instance-count 2 \
    --instance-type m4.large
```

Example 8: To customize application configurations

The following examples use the `--configurations` parameter to specify a JSON configuration file that contains application customizations for Hadoop. For more information, see Configuring Applications in the *Amazon EMR Release Guide*.

Contents of `configurations.json`:

```
[
    {
       "Classification": "mapred-site",
       "Properties": {
           "mapred.tasktracker.map.tasks.maximum": 2
       }
    },
    {
```

```
            "Classification": "hadoop-env",
            "Properties": {},
            "Configurations": [
                {
                    "Classification": "export",
                    "Properties": {
                        "HADOOP_DATANODE_HEAPSIZE": 2048,
                        "HADOOP_NAMENODE_OPTS": "-XX:GCTimeRatio=19"
                    }
                }
            ]
        }
]
```

The following example references `configurations.json` as a local file.

```
aws emr create-cluster \
    --configurations file://configurations.json \
    --release-label emr-5.9.0 \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
 \
    --auto-terminate
```

The following example references `configurations.json` as a file in Amazon S3.

```
aws emr create-cluster \
    --configurations https://s3.amazonaws.com/amzn-s3-demo-bucket/
configurations.json \
    --release-label emr-5.9.0 \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
 \
    --auto-terminate
```

Example 9: To create a cluster with master, core, and task instance groups

The following `create-cluster` example uses `--instance-groups` to specify the type and number of EC2 instances to use for master, core, and task instance groups.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
```

```
    --instance-
groups Name=Master,InstanceGroupType=MASTER,InstanceType=m4.large,InstanceCount=1 Name=Core,
```

Example 10: To specify that a cluster should terminate after completing all steps

The following `create-cluster` example uses `--auto-terminate` to specify that the cluster should shut down automatically after completing all steps.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
  InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
    --auto-terminate
```

Example 11: To specify cluster configuration details such as the Amazon EC2 key pair, network configuration, and security groups

The following `create-cluster` example creates a cluster with the Amazon EC2 key pair named `myKey` and a customized instance profile named `myProfile`. Key pairs are used to authorize SSH connections to cluster nodes, most often the master node. For more information, see Use an Amazon EC2 Key Pair for SSH Credentials in the *Amazon EMR Management Guide*.

```
aws emr create-cluster \
    --ec2-attributes KeyName=myKey,InstanceProfile=myProfile \
    --release-label emr-5.9.0 \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
 \
    --auto-terminate
```

The following example creates a cluster in an Amazon VPC subnet.

```
aws emr create-cluster \
    --ec2-attributes SubnetId=subnet-xxxxx \
    --release-label emr-5.9.0 \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
 \
    --auto-terminate
```

The following example creates a cluster in the `us-east-1b` availability zone.

```
aws emr create-cluster \
    --ec2-attributes AvailabilityZone=us-east-1b \
    --release-label emr-5.9.0 \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
```

The following example creates a cluster and specifies only the Amazon EMR-managed security groups.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
    --service-role myServiceRole \
    --ec2-attributes InstanceProfile=myRole,EmrManagedMasterSecurityGroup=sg-
master1,EmrManagedSlaveSecurityGroup=sg-slave1 \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
```

The following example creates a cluster and specifies only additional Amazon EC2 security groups.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
    --service-role myServiceRole \
    --ec2-attributes InstanceProfile=myRole,AdditionalMasterSecurityGroups=[sg-
addMaster1,sg-addMaster2,sg-addMaster3,sg-
addMaster4],AdditionalSlaveSecurityGroups=[sg-addSlave1,sg-addSlave2,sg-
addSlave3,sg-addSlave4] \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
```

The following example creates a cluster and specifies the EMR-Managed security groups, as well as additional security groups.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
    --service-role myServiceRole \
    --ec2-attributes InstanceProfile=myRole,EmrManagedMasterSecurityGroup=sg-
master1,EmrManagedSlaveSecurityGroup=sg-slave1,AdditionalMasterSecurityGroups=[sg-
addMaster1,sg-addMaster2,sg-addMaster3,sg-
addMaster4],AdditionalSlaveSecurityGroups=[sg-addSlave1,sg-addSlave2,sg-
addSlave3,sg-addSlave4] \
```

```
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
```

The following example creates a cluster in a VPC private subnet and use a specific Amazon EC2 security group to enable Amazon EMR service access, which is required for clusters in private subnets.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
    --service-role myServiceRole \
    --ec2-attributes InstanceProfile=myRole,ServiceAccessSecurityGroup=sg-service-
access,EmrManagedMasterSecurityGroup=sg-master,EmrManagedSlaveSecurityGroup=sg-slave
 \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
```

The following example specifies security group configuration parameters using a JSON file named `ec2_attributes.json` that is stored locally. NOTE: JSON arguments must include options and values as their own items in the list.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
    --service-role myServiceRole \
    --ec2-attributes file://ec2_attributes.json  \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
```

Contents of `ec2_attributes.json`:

```
[
    {
        "SubnetId": "subnet-xxxxx",
        "KeyName": "myKey",
        "InstanceProfile":"myRole",
        "EmrManagedMasterSecurityGroup": "sg-master1",
        "EmrManagedSlaveSecurityGroup": "sg-slave1",
        "ServiceAccessSecurityGroup": "sg-service-access",
        "AdditionalMasterSecurityGroups": ["sg-addMaster1","sg-addMaster2","sg-
addMaster3","sg-addMaster4"],
        "AdditionalSlaveSecurityGroups": ["sg-addSlave1","sg-addSlave2","sg-
addSlave3","sg-addSlave4"]
```

```
    }
]
```

Example 12: To enable debugging and specify a log URI

The following `create-cluster` example uses the `--enable-debugging` parameter, which allows you to view log files more easily using the debugging tool in the Amazon EMR console. The `--log-uri` parameter is required with `--enable-debugging`.

```
aws emr create-cluster \
    --enable-debugging \
    --log-uri s3://amzn-s3-demo-bucket/myLog \
    --release-label emr-5.9.0 \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
 \
    --auto-terminate
```

Example 13: To add tags when creating a cluster

Tags are key-value pairs that help you identify and manage clusters. The following `create-cluster` example uses the `--tags` parameter to create three tags for a cluster, one with the key name `name` and the value `Shirley Rodriguez`, a second with the key name `age` and the value `29`, and a third tag with the key name `department` and the value `Analytics`.

```
aws emr create-cluster \
    --tags name="Shirley Rodriguez" age=29 department="Analytics" \
    --release-label emr-5.32.0 \
    --instance-type m5.xlarge \
    --instance-count 3 \
    --use-default-roles
```

The following example lists the tags applied to a cluster.

```
aws emr describe-cluster \
    --cluster-id j-XXXXXXYY \
    --query Cluster.Tags
```

Example 14: To use a security configuration that enables encryption and other security features

The following `create-cluster` example uses the `--security-configuration` parameter to specify a security configuration for an EMR cluster. You can use security configurations with Amazon EMR version 4.8.0 or later.

```
aws emr create-cluster \
    --instance-type m4.large \
    --release-label emr-5.9.0 \
    --security-configuration mySecurityConfiguration
```

Example 15: To create a cluster with additional EBS storage volumes configured for the instance groups

When specifying additional EBS volumes, the following arguments are required: `VolumeType`, `SizeInGB` if `EbsBlockDeviceConfigs` is specified.

The following `create-cluster` example creates a cluster with multiple EBS volumes attached to EC2 instances in the core instance group.

```
aws emr create-cluster \
    --release-label emr-5.9.0  \
    --use-default-roles \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=d2.xlarge
 'InstanceGroupType=CORE,InstanceCount=2,InstanceType=d2.xlarge,EbsConfiguration={EbsOptimiz
{VolumeSpecification={VolumeType=io1,SizeInGB=100,Iops=100},VolumesPerInstance=4}]}'
 \
    --auto-terminate
```

The following example creates a cluster with multiple EBS volumes attached to EC2 instances in the master instance group.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
    --use-default-roles \
    --instance-groups 'InstanceGroupType=MASTER, InstanceCount=1,
 InstanceType=d2.xlarge, EbsConfiguration={EbsOptimized=true,
 EbsBlockDeviceConfigs=[{VolumeSpecification={VolumeType=io1, SizeInGB=100,
 Iops=100}},
{VolumeSpecification={VolumeType=standard,SizeInGB=50},VolumesPerInstance=3}]}' InstanceGrou
 \
    --auto-terminate
```

Example 16: To create a cluster with an automatic scaling policy

You can attach automatic scaling policies to core and task instance groups using Amazon EMR version 4.0 and later. The automatic scaling policy dynamically adds and removes EC2 instances in response to an Amazon CloudWatch metric. For more information, see Using Automatic Scaling in Amazon EMR <https://docs.aws.amazon.com/emr/latest/ManagementGuide/emr-automatic-scaling.html>`_ in the *Amazon EMR Management Guide*.

When attaching an automatic scaling policy, you must also specify the default role for automatic scaling using `--auto-scaling-role EMR_AutoScaling_DefaultRole`.

The following `create-cluster` example specifies the automatic scaling policy for the `CORE` instance group using the `AutoScalingPolicy` argument with an embedded JSON structure, which specifies the scaling policy configuration. Instance groups with an embedded JSON structure must have the entire collection of arguments enclosed in single quotes. Using single quotes is optional for instance groups without an embedded JSON structure.

```
aws emr create-cluster
    --release-label emr-5.9.0 \
    --use-default-roles --auto-scaling-role EMR_AutoScaling_DefaultRole \
    --instance-
groups InstanceGroupType=MASTER,InstanceType=d2.xlarge,InstanceCount=1
 'InstanceGroupType=CORE,InstanceType=d2.xlarge,InstanceCount=2,AutoScalingPolicy={Constrain
```

The following example uses a JSON file, `instancegroupconfig.json`, to specify the configuration of all instance groups in a cluster. The JSON file specifies the automatic scaling policy configuration for the core instance group.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
    --service-role EMR_DefaultRole \
    --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
    --instance-groups file://myfolder/instancegroupconfig.json \
    --auto-scaling-role EMR_AutoScaling_DefaultRole
```

Contents of `instancegroupconfig.json`:

```
[
    {
        "InstanceCount": 1,
        "Name": "MyMasterIG",
```

```
       "InstanceGroupType": "MASTER",
       "InstanceType": "m4.large"
   },
   {
       "InstanceCount": 2,
       "Name": "MyCoreIG",
       "InstanceGroupType": "CORE",
       "InstanceType": "m4.large",
       "AutoScalingPolicy": {
           "Constraints": {
               "MinCapacity": 2,
               "MaxCapacity": 10
           },
           "Rules": [
               {
                   "Name": "Default-scale-out",
                   "Description": "Replicates the default scale-out rule in the 
console for YARN memory.",
                   "Action": {
                       "SimpleScalingPolicyConfiguration": {
                           "AdjustmentType": "CHANGE_IN_CAPACITY",
                           "ScalingAdjustment": 1,
                           "CoolDown": 300
                       }
                   },
                   "Trigger": {
                       "CloudWatchAlarmDefinition": {
                           "ComparisonOperator": "LESS_THAN",
                           "EvaluationPeriods": 1,
                           "MetricName": "YARNMemoryAvailablePercentage",
                           "Namespace": "AWS/ElasticMapReduce",
                           "Period": 300,
                           "Threshold": 15,
                           "Statistic": "AVERAGE",
                           "Unit": "PERCENT",
                           "Dimensions": [
                               {
                                   "Key": "JobFlowId",
                                   "Value": "${emr.clusterId}"
                               }
                           ]
                       }
                   }
               }
```

```
            ]
        }
    }
]
```

Example 17: Add custom JAR steps when creating a cluster

The following `create-cluster` example adds steps by specifying a JAR file stored in Amazon S3. Steps submit work to a cluster. The main function defined in the JAR file executes after EC2 instances are provisioned, any bootstrap actions have executed, and applications are installed. The steps are specified using `Type=CUSTOM_JAR`.

Custom JAR steps require the `Jar=` parameter, which specifies the path and file name of the JAR. Optional parameters are `Type`, `Name`, `ActionOnFailure`, `Args`, and `MainClass`. If main class is not specified, the JAR file should specify `Main-Class` in its manifest file.

```
aws emr create-cluster \
    --steps Type=CUSTOM_JAR,Name=CustomJAR,ActionOnFailure=CONTINUE,Jar=s3://amzn-
s3-demo-bucket/
mytest.jar,Args=arg1,arg2,arg3 Type=CUSTOM_JAR,Name=CustomJAR,ActionOnFailure=CONTINUE,Jar=s
amzn-s3-demo-bucket/mytest.jar,MainClass=mymainclass,Args=arg1,arg2,arg3  \
    --release-label emr-5.3.1 \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
 \
    --auto-terminate
```

Example 18: To add streaming steps when creating a cluster

The following `create-cluster` examples add a streaming step to a cluster that terminates after all steps run. Streaming steps require parameters `Type` and `Args`. Streaming steps optional parameters are `Name` and `ActionOnFailure`.

The following example specifies the step inline.

```
aws emr create-cluster \
    --steps Type=STREAMING,Name='Streaming Program',ActionOnFailure=CONTINUE,Args=[-
files,s3://elasticmapreduce/samples/wordcount/wordSplitter.py,-
mapper,wordSplitter.py,-reducer,aggregate,-input,s3://elasticmapreduce/samples/
wordcount/input,-output,s3://amzn-s3-demo-bucket/wordcount/output] \
    --release-label emr-5.3.1 \
```

```
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
 \
    --auto-terminate
```

The following example uses a locally stored JSON configuration file named `multiplefiles.json`. The JSON configuration specifies multiple files. To specify multiple files within a step, you must use a JSON configuration file to specify the step. JSON arguments must include options and values as their own items in the list.

```
aws emr create-cluster \
    --steps file://./multiplefiles.json \
    --release-label emr-5.9.0  \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
 \
    --auto-terminate
```

Contents of `multiplefiles.json`:

```
[
    {
        "Name": "JSON Streaming Step",
        "Args": [
            "-files",
            "s3://elasticmapreduce/samples/wordcount/wordSplitter.py",
            "-mapper",
            "wordSplitter.py",
            "-reducer",
            "aggregate",
            "-input",
            "s3://elasticmapreduce/samples/wordcount/input",
            "-output",
            "s3://amzn-s3-demo-bucket/wordcount/output"
        ],
        "ActionOnFailure": "CONTINUE",
        "Type": "STREAMING"
    }
]
```

Example 19: To add Hive steps when creating a cluster

The following example add Hive steps when creating a cluster. Hive steps require parameters `Type` and `Args`. Hive steps optional parameters are `Name` and `ActionOnFailure`.

```
aws emr create-cluster \
    --steps Type=HIVE,Name='Hive
 program',ActionOnFailure=CONTINUE,ActionOnFailure=TERMINATE_CLUSTER,Args=[-
f,s3://elasticmapreduce/samples/hive-ads/libs/model-build.q,-d,INPUT=s3://
elasticmapreduce/samples/hive-ads/tables,-d,OUTPUT=s3://amzn-s3-demo-bucket/hive-
ads/output/2014-04-18/11-07-32,-d,LIBS=s3://elasticmapreduce/samples/hive-ads/libs]
 \
    --applications Name=Hive \
    --release-label emr-5.3.1 \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
```

Example 20: To add Pig steps when creating a cluster

The following example adds Pig steps when creating a cluster. Pig steps required parameters are `Type` and `Args`. Pig steps optional parameters are `Name` and `ActionOnFailure`.

```
aws emr create-cluster \
    --steps Type=PIG,Name='Pig program',ActionOnFailure=CONTINUE,Args=[-f,s3://
elasticmapreduce/samples/pig-apache/do-reports2.pig,-p,INPUT=s3://elasticmapreduce/
samples/pig-apache/input,-p,OUTPUT=s3://amzn-s3-demo-bucket/pig-apache/output] \
    --applications Name=Pig \
    --release-label emr-5.3.1 \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
```

Example 21: To add bootstrap actions

The following `create-cluster` example runs two bootstrap actions defined as scripts that are stored in Amazon S3.

```
aws emr create-cluster \
    --bootstrap-actions Path=s3://amzn-s3-demo-bucket/
myscript1,Name=BootstrapAction1,Args=[arg1,arg2] Path=s3://amzn-s3-demo-bucket/
myscript2,Name=BootstrapAction2,Args=[arg1,arg2] \
    --release-label emr-5.3.1 \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
 \
```

```
    --auto-terminate
```

Example 22: To enable EMRFS consistent view and customize the RetryCount and RetryPeriod settings

The following `create-cluster` example specifies the retry count and retry period for EMRFS consistent view. The `Consistent=true` argument is required.

```
aws emr create-cluster \
    --instance-type m4.large \
    --release-label emr-5.9.0 \
    --emrfs Consistent=true,RetryCount=6,RetryPeriod=30
```

The following example specifies the same EMRFS configuration as the previous example, using a locally stored JSON configuration file named `emrfsconfig.json`.

```
aws emr create-cluster \
    --instance-type m4.large \
    --release-label emr-5.9.0 \
    --emrfs file://emrfsconfig.json
```

Contents of `emrfsconfig.json`:

```
{
    "Consistent": true,
    "RetryCount": 6,
    "RetryPeriod": 30
}
```

Example 23: To create a cluster with Kerberos configured

The following `create-cluster` examples create a cluster using a security configuration with Kerberos enabled, and establishes Kerberos parameters for the cluster using `--kerberos-attributes`.

The following command specifies Kerberos attributes for the cluster inline.

```
aws emr create-cluster \
    --instance-type m3.xlarge \
    --release-label emr-5.10.0 \
    --service-role EMR_DefaultRole \
```

```
    --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
    --security-configuration mySecurityConfiguration \
    --kerberos-
attributes Realm=EC2.INTERNAL,KdcAdminPassword=123,CrossRealmTrustPrincipalPassword=123
```

The following command specifies the same attributes, but references a locally stored JSON file named `kerberos_attributes.json`. In this example, the file is saved in the same directory where you run the command. You can also reference a configuration file saved in Amazon S3.

```
aws emr create-cluster \
    --instance-type m3.xlarge \
    --release-label emr-5.10.0 \
    --service-role EMR_DefaultRole \
    --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
    --security-configuration mySecurityConfiguration \
    --kerberos-attributes file://kerberos_attributes.json
```

Contents of `kerberos_attributes.json`:

```
{
    "Realm": "EC2.INTERNAL",
    "KdcAdminPassword": "123",
    "CrossRealmTrustPrincipalPassword": "123",
}
```

The following `create-cluster` example creates an Amazon EMR cluster that uses the `--instance-groups` configuration and has a managed scaling policy.

```
aws emr create-cluster \
    --release-label emr-5.30.0 \
    --service-role EMR_DefaultRole \
    --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
    --managed-scaling-policy
 ComputeLimits='{MinimumCapacityUnits=2,MaximumCapacityUnits=4,UnitType=Instances}'
```

The following `create-cluster` example creates an Amazon EMR cluster that uses the "--log-encryption-kms-key-id" to define KMS key ID utilized for Log encryption.

```
aws emr create-cluster \
```

```
    --release-label emr-5.30.0 \
    --log-uri s3://amzn-s3-demo-bucket/myLog \
    --log-encryption-kms-key-id arn:aws:kms:us-east-1:110302272565:key/
dd559181-283e-45d7-99d1-66da348c4d33 \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
```

The following `create-cluster` example creates an Amazon EMR cluster that uses the "--placement-group-configs" configuration to place master nodes in a high-availability (HA) cluster within an EC2 placement group using SPREAD placement strategy.

```
aws emr create-cluster \
    --release-label emr-5.30.0 \
    --service-role EMR_DefaultRole \
    --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=3,InstanceType=m4.largeInstanceGroupType=CORE,
 \
    --placement-group-configs InstanceRole=MASTER
```

The following `create-cluster` example creates an Amazon EMR cluster that uses the "--auto-termination-policy" configuration to place an automatic idle termination threshold for the cluster.

```
aws emr create-cluster \
    --release-label emr-5.34.0 \
    --service-role EMR_DefaultRole \
    --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
 \
    --auto-termination-policy IdleTimeout=100
```

The following `create-cluster` example creates an Amazon EMR cluster that uses the "--os-release-label" to define an Amazon Linux release for cluster launch

```
aws emr create-cluster \
    --release-label emr-6.6.0 \
    --os-release-label 2.0.20220406.1 \
    --service-role EMR_DefaultRole \
    --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
```

```
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
```

Example 24: To specify an EBS root volume attributes: size, iops and throughput for cluster instances created with EMR releases 6.15.0 and later

The following `create-cluster` example creates an Amazon EMR cluster that uses root volume attributes to configure root volumes specifications for the EC2 instances.

```
aws emr create-cluster \
    --name "Cluster with My Custom AMI" \
    --custom-ami-id ami-a518e6df \
    --ebs-root-volume-size 20 \
    --ebs-root-volume-iops 3000 \
    --ebs-root-volume-throughput 125 \
    --release-label emr-6.15.0 \
    --use-default-roles \
    --instance-count 2 \
    --instance-type m4.large
```

- For API details, see CreateClusterExamples in *AWS CLI Command Reference*.

`create-default-roles`

The following code example shows how to use `create-default-roles`.

AWS CLI

1. To create the default IAM role for EC2

Command:

```
aws emr create-default-roles
```

Output:

```
If the role already exists then the command returns nothing.

If the role does not exist then the output will be:

[
    {
```

```
        "RolePolicy": {
            "Version":"2012-10-17",
            "Statement": [
                {
                    "Action": [
                        "cloudwatch:*",
                        "dynamodb:*",
                        "ec2:Describe*",
                        "elasticmapreduce:Describe*",
                        "elasticmapreduce:ListBootstrapActions",
                        "elasticmapreduce:ListClusters",
                        "elasticmapreduce:ListInstanceGroups",
                        "elasticmapreduce:ListInstances",

            "RoleName": "EMR_DefaultRole",
            "Path": "/",
            "Arn": "arn:aws:iam::176430881729:role/EMR_DefaultRole"
        }
    }
]
```

- For API details, see CreateDefaultRoles in *AWS CLI Command Reference*.

`create-security-configuration`

The following code example shows how to use `create-security-configuration`.

AWS CLI

1. To create a security configuration with in-transit encryption enabled with PEM for certificate provider, and at-rest encryption enabled with SSE-S3 for S3 encryption and AWS-KMS for local disk key provider

Command:

```
 aws emr create-security-configuration --name MySecurityConfig --security-
configuration '{
        "EncryptionConfiguration": {
                "EnableInTransitEncryption" : true,
                "EnableAtRestEncryption" : true,
                "InTransitEncryptionConfiguration" : {
                        "TLSCertificateConfiguration" : {
                                "CertificateProviderType" : "PEM",
                                "S3Object" : "s3://mycertstore/artifacts/
MyCerts.zip"
                        }
                },
                "AtRestEncryptionConfiguration" : {
                        "S3EncryptionConfiguration" : {
                                "EncryptionMode" : "SSE-S3"
                        },
                        "LocalDiskEncryptionConfiguration" : {
                                "EncryptionKeyProviderType" : "AwsKms",
                                "AwsKmsKey" : "arn:aws:kms:us-
east-1:123456789012:key/12345678-1234-1234-1234-123456789012"
                        }
                }
        }
}'
```

Output:

```
{
"CreationDateTime": 1474070889.129,
"Name": "MySecurityConfig"
}
```

JSON equivalent (contents of security_configuration.json):

```
{
    "EncryptionConfiguration": {
        "EnableInTransitEncryption": true,
        "EnableAtRestEncryption": true,
        "InTransitEncryptionConfiguration": {
            "TLSCertificateConfiguration": {
                "CertificateProviderType": "PEM",
                "S3Object": "s3://mycertstore/artifacts/MyCerts.zip"
            }
        },
        "AtRestEncryptionConfiguration": {
            "S3EncryptionConfiguration": {
                "EncryptionMode": "SSE-S3"
            },
            "LocalDiskEncryptionConfiguration": {
                "EncryptionKeyProviderType": "AwsKms",
                "AwsKmsKey": "arn:aws:kms:us-
east-1:123456789012:key/12345678-1234-1234-1234-123456789012"
            }
        }
    }
}
```

Command (using security_configuration.json):

```
aws emr create-security-configuration --name "MySecurityConfig" --security-
configuration file://./security_configuration.json
```

Output:

```
{
"CreationDateTime": 1474070889.129,
"Name": "MySecurityConfig"
}
```

2. To create a security configuration with Kerberos enabled using cluster-dedicated KDC and cross-realm trust

Command:

```
 aws emr create-security-configuration --name MySecurityConfig --security-
configuration '{
     "AuthenticationConfiguration": {
         "KerberosConfiguration": {
             "Provider": "ClusterDedicatedKdc",
             "ClusterDedicatedKdcConfiguration": {
                 "TicketLifetimeInHours": 24,
                 "CrossRealmTrustConfiguration": {
                   "Realm": "AD.DOMAIN.COM",
                   "Domain": "ad.domain.com",
                   "AdminServer": "ad.domain.com",
                   "KdcServer": "ad.domain.com"
                 }
             }
         }
     }
}'
```

Output:

```
{
"CreationDateTime": 1490225558.982,
"Name": "MySecurityConfig"
}
```

JSON equivalent (contents of security_configuration.json):

```
{
    "AuthenticationConfiguration": {
        "KerberosConfiguration": {
            "Provider": "ClusterDedicatedKdc",
            "ClusterDedicatedKdcConfiguration": {
                "TicketLifetimeInHours": 24,
                "CrossRealmTrustConfiguration": {
                    "Realm": "AD.DOMAIN.COM",

                }
            }
        }
    }
```

```
}
```

Command (using security_configuration.json):

```
aws emr create-security-configuration --name "MySecurityConfig" --security-
configuration file://./security_configuration.json
```

Output:

```
{
"CreationDateTime": 1490225558.982,
"Name": "MySecurityConfig"
}
```

- For API details, see CreateSecurityConfiguration in *AWS CLI Command Reference*.

`delete-security-configuration`

The following code example shows how to use `delete-security-configuration`.

AWS CLI

To delete a security configuration in the current region

Command:

```
aws emr delete-security-configuration --name MySecurityConfig
```

Output:

```
None
```

- For API details, see DeleteSecurityConfiguration in *AWS CLI Command Reference*.

`describe-cluster`

The following code example shows how to use `describe-cluster`.

AWS CLI

Command:

```
aws emr describe-cluster --cluster-id j-XXXXXXXX
```

Output:

```
For release-label based uniform instance groups cluster:

        {
            "Cluster": {
                "Status": {

    }
}
```

- For API details, see DescribeCluster in *AWS CLI Command Reference*.

`describe-step`

The following code example shows how to use `describe-step`.

AWS CLI

The following command describes a step with the step ID `s-3LZC0QUT43AM` in a cluster with the cluster ID `j-3SD91U2E1L2QX`:

```
aws emr describe-step --cluster-id j-3SD91U2E1L2QX --step-id s-3LZC0QUT43AM
```

Output:

```
{
    "Step": {
        "Status": {
            "Timeline": {
                "EndDateTime": 1433200470.481,
                "CreationDateTime": 1433199926.597,
                "StartDateTime": 1433200404.959
            },
            "State": "COMPLETED",
            "StateChangeReason": {}
        },
        "Config": {
            "Args": [
                "s3://us-west-2.elasticmapreduce/libs/hive/hive-script",
                "--base-path",
                "s3://us-west-2.elasticmapreduce/libs/hive/",
                "--install-hive",
                "--hive-versions",
                "0.13.1"
            ],
            "Jar": "s3://us-west-2.elasticmapreduce/libs/script-runner/script-
runner.jar",
            "Properties": {}
        },
        "Id": "s-3LZC0QUT43AM",
        "ActionOnFailure": "TERMINATE_CLUSTER",
        "Name": "Setup hive"
    }
}
```

- For API details, see DescribeStep in *AWS CLI Command Reference*.

`get`

The following code example shows how to use `get`.

AWS CLI

The following downloads the `hadoop-examples.jar` archive from the master instance in a cluster with the cluster ID `j-3SD91U2E1L2QX`:

```
aws emr get --cluster-id j-3SD91U2E1L2QX --key-pair-file ~/.ssh/mykey.pem --src /
home/hadoop-examples.jar --dest ~
```

- For API details, see Get in *AWS CLI Command Reference*.

`list-clusters`

The following code example shows how to use `list-clusters`.

AWS CLI

The following command lists all active EMR clusters in the current region:

```
aws emr list-clusters --active
```

Output:

```
{
    "Clusters": [
        {
            "Status": {
                "Timeline": {
                    "ReadyDateTime": 1433200405.353,
                    "CreationDateTime": 1433199926.596
                },
                "State": "WAITING",
                "StateChangeReason": {
                    "Message": "Waiting after step completed"
                }
```

```
            },
            "NormalizedInstanceHours": 6,
            "Id": "j-3SD91U2E1L2QX",
            "Name": "my-cluster"
        }
    ]
}
```

- For API details, see ListClusters in *AWS CLI Command Reference*.

`list-instance-fleets`

The following code example shows how to use `list-instance-fleets`.

AWS CLI

To get configuration details of instance fleets in a cluster

This example lists the details of instance fleets in the cluster specified.

Command:

```
list-instance-fleets --cluster-id 'j-12ABCDEFGHI34JK'
```

Output:

```
{
  "InstanceFleets": [
      {
          "Status": {
              "Timeline": {
                  "ReadyDateTime": 1488759094.637,
                  "CreationDateTime": 1488758719.817
              },
              "State": "RUNNING",
              "StateChangeReason": {
                  "Message": ""
              }
          },
          "ProvisionedSpotCapacity": 6,
          "Name": "CORE",
          "InstanceFleetType": "CORE",
```

```
          "LaunchSpecifications": {
              "SpotSpecification": {
                  "TimeoutDurationMinutes": 60,
                  "TimeoutAction": "TERMINATE_CLUSTER"
              }
          },
          "ProvisionedOnDemandCapacity": 2,
          "InstanceTypeSpecifications": [
              {
                  "BidPrice": "0.5",
                  "InstanceType": "m3.xlarge",
                  "WeightedCapacity": 2
              }
          ],
          "Id": "if-1ABC2DEFGHIJ3"
      },
      {
          "Status": {
              "Timeline": {
                  "ReadyDateTime": 1488759058.598,
                  "CreationDateTime": 1488758719.811
              },
              "State": "RUNNING",
              "StateChangeReason": {
                  "Message": ""
              }
          },
          "ProvisionedSpotCapacity": 0,
          "Name": "MASTER",
          "InstanceFleetType": "MASTER",
          "ProvisionedOnDemandCapacity": 1,
          "InstanceTypeSpecifications": [
              {
                  "BidPriceAsPercentageOfOnDemandPrice": 100.0,
                  "InstanceType": "m3.xlarge",
                  "WeightedCapacity": 1
              }
          ],
         "Id": "if-2ABC4DEFGHIJ4"
      }
  ]
}
```

- For API details, see ListInstanceFleets in *AWS CLI Command Reference*.

`list-instances`

The following code example shows how to use `list-instances`.

AWS CLI

The following command lists all of the instances in a cluster with the cluster ID `j-3C6XNQ39VR9WL`:

```
aws emr list-instances --cluster-id j-3C6XNQ39VR9WL
```

Output:

```
For a uniform instance group based cluster
  {
    "Instances": [
         {
            "Status": {
                "Timeline": {
                    "ReadyDateTime": 1433200400.03,
                    "CreationDateTime": 1433199960.152
                },
                "State": "RUNNING",
                "StateChangeReason": {}
            },
            "Ec2InstanceId": "i-f19ecfee",
            "PublicDnsName": "ec2-52-52-41-150.us-west-2.compute.amazonaws.com",
            "PrivateDnsName": "ip-172-21-11-216.us-west-2.compute.internal",
            "PublicIpAddress": "52.52.41.150",
            "Id": "ci-3NNHQUQ2TWB6Y",
            "PrivateIpAddress": "172.21.11.216"
        },
        {
            "Status": {
                "Timeline": {
                    "ReadyDateTime": 1433200400.031,
                    "CreationDateTime": 1433199949.102
                },
                "State": "RUNNING",
                "StateChangeReason": {}
            },
            "Ec2InstanceId": "i-1feee4c2",
            "PublicDnsName": "ec2-52-63-246-32.us-west-2.compute.amazonaws.com",
```

```
            "PrivateDnsName": "ip-172-31-24-130.us-west-2.compute.internal",
            "PublicIpAddress": "52.63.246.32",
            "Id": "ci-GAOCMKNKDCV7",
            "PrivateIpAddress": "172.21.11.215"
        },
        {
            "Status": {
                "Timeline": {
                    "ReadyDateTime": 1433200400.031,
                    "CreationDateTime": 1433199949.102
                },
                "State": "RUNNING",
                "StateChangeReason": {}
            },
            "Ec2InstanceId": "i-15cfeee3",
            "PublicDnsName": "ec2-52-25-246-63.us-west-2.compute.amazonaws.com",
            "PrivateDnsName": "ip-172-31-24-129.us-west-2.compute.internal",
            "PublicIpAddress": "52.25.246.63",
            "Id": "ci-2W3TDFFB47UAD",
            "PrivateIpAddress": "172.21.11.214"
        }
    ]
  }

For a fleet based cluster:
   {
      "Instances": [
          {
              "Status": {
                  "Timeline": {
                      "ReadyDateTime": 1487810810.878,
                      "CreationDateTime": 1487810588.367,
                      "EndDateTime": 1488022990.924
                  },
                  "State": "TERMINATED",
                  "StateChangeReason": {
                      "Message": "Instance was terminated."
                  }
              },
              "Ec2InstanceId": "i-xxxxx",
              "InstanceFleetId": "if-xxxxx",
              "EbsVolumes": [],
              "PublicDnsName": "ec2-xx-xxx-xxx-xxx.compute-1.amazonaws.com",
```

```
                "InstanceType": "m3.xlarge",
                "PrivateDnsName": "ip-xx-xx-xxx-xx.ec2.internal",
                "Market": "SPOT",
                "PublicIpAddress": "xx.xx.xxx.xxx",
                "Id": "ci-xxxxx",
                "PrivateIpAddress": "10.47.191.80"
            }
        ]
    }
```

- For API details, see ListInstances in *AWS CLI Command Reference*.

`list-security-configurations`

The following code example shows how to use `list-security-configurations`.

AWS CLI

To list security configurations in the current region

Command:

```
aws emr list-security-configurations
```

Output:

```
{
    "SecurityConfigurations": [
        {
            "CreationDateTime": 1473889697.417,
            "Name": "MySecurityConfig-1"
        },
        {
            "CreationDateTime": 1473889697.417,
            "Name": "MySecurityConfig-2"
        }
    ]
}
```

- For API details, see ListSecurityConfigurations in *AWS CLI Command Reference*.

`list-steps`

The following code example shows how to use `list-steps`.

AWS CLI

The following command lists all of the steps in a cluster with the cluster ID `j-3SD91U2E1L2QX`:

```
aws emr list-steps --cluster-id j-3SD91U2E1L2QX
```

- For API details, see ListSteps in *AWS CLI Command Reference*.

`modify-cluster-attributes`

The following code example shows how to use `modify-cluster-attributes`.

AWS CLI

The following command sets the visibility of an EMR cluster with the ID `j-301CDNY0J5XM4` to all users:

```
aws emr modify-cluster-attributes --cluster-id j-301CDNY0J5XM4 --visible-to-all-
users
```

- For API details, see ModifyClusterAttributes in *AWS CLI Command Reference*.

`modify-instance-fleet`

The following code example shows how to use `modify-instance-fleet`.

AWS CLI

To change the target capacites of an instance fleet

This example changes the On-Demand and Spot target capacities to 1 for the instance fleet specified.

Command:

```
aws emr modify-instance-fleet --cluster-id 'j-12ABCDEFGHI34JK' --instance-fleet
 InstanceFleetId='if-2ABC4DEFGHIJ4',TargetOnDemandCapacity=1,TargetSpotCapacity=1
```

- For API details, see ModifyInstanceFleet in *AWS CLI Command Reference*.

`put`

The following code example shows how to use `put`.

AWS CLI

The following command uploads a file named `healthcheck.sh` to the master instance in a cluster with the cluster ID `j-3SD91U2E1L2QX`:

```
aws emr put --cluster-id j-3SD91U2E1L2QX --key-pair-file ~/.ssh/mykey.pem --src ~/
scripts/healthcheck.sh --dest /home/hadoop/bin/healthcheck.sh
```

- For API details, see Put in *AWS CLI Command Reference*.

`remove-tags`

The following code example shows how to use `remove-tags`.

AWS CLI

The following command removes a tag with the key `prod` from a cluster with the cluster ID `j-3SD91U2E1L2QX`:

```
aws emr remove-tags --resource-id j-3SD91U2E1L2QX --tag-keys prod
```

- For API details, see RemoveTags in *AWS CLI Command Reference*.

`schedule-hbase-backup`

The following code example shows how to use `schedule-hbase-backup`.

AWS CLI

Note: This command can only be used with HBase on AMI version 2.x and 3.x

1. To schedule a full HBase backup >>>>>>> 06ab6d6e13564b5733d75abaf3b599f93cf39a23

Command:

```
aws emr schedule-hbase-backup --cluster-id j-XXXXXXYY --type full --dir
s3://amzn-s3-demo-bucket/backup --interval 10 --unit hours --start-time
2014-04-21T05:26:10Z --consistent
```

Output:

```
None
```

2. To schedule an incremental HBase backup

Command:

```
aws emr schedule-hbase-backup --cluster-id j-XXXXXXYY --type incremental
 --dir s3://amzn-s3-demo-bucket/backup --interval 30 --unit minutes --start-time
2014-04-21T05:26:10Z --consistent
```

Output:

```
None
```

- For API details, see ScheduleHbaseBackup in *AWS CLI Command Reference*.

`socks`

The following code example shows how to use `socks`.

AWS CLI

The following command opens a socks connection with the master instance in a cluster with the cluster ID `j-3SD91U2E1L2QX`:

```
aws emr socks --cluster-id j-3SD91U2E1L2QX --key-pair-file ~/.ssh/mykey.pem
```

The key pair file option takes a local path to a private key file.

- For API details, see Socks in *AWS CLI Command Reference*.

`ssh`

The following code example shows how to use `ssh`.

AWS CLI

The following command opens an ssh connection with the master instance in a cluster with the cluster ID `j-3SD91U2E1L2QX`:

```
aws emr ssh --cluster-id j-3SD91U2E1L2QX --key-pair-file ~/.ssh/mykey.pem
```

The key pair file option takes a local path to a private key file.

Output:

```
ssh -o StrictHostKeyChecking=no -o ServerAliveInterval=10 -i /home/local/user/.ssh/
mykey.pem hadoop@ec2-52-52-41-150.us-west-2.compute.amazonaws.com
Warning: Permanently added 'ec2-52-52-41-150.us-
west-2.compute.amazonaws.com,52.52.41.150' (ECDSA) to the list of known hosts.

--------------------------------------------------------------------------------

Welcome to Amazon Elastic MapReduce running Hadoop and Amazon Linux.

Hadoop is installed in /home/hadoop. Log files are in /mnt/var/log/hadoop. Check
/mnt/var/log/hadoop/steps for diagnosing step failures.

The Hadoop UI can be accessed via the following commands:

  ResourceManager    lynx http://ip-172-21-11-216:9026/
  NameNode           lynx http://ip-172-21-11-216:9101/

--------------------------------------------------------------------------------

[hadoop@ip-172-31-16-216 ~]$
```

- For API details, see Ssh in *AWS CLI Command Reference*.

Amazon EMR on EKS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EMR on EKS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`update-role-trust-policy`

The following code example shows how to use `update-role-trust-policy`.

AWS CLI

To update the trust policy of an IAM Role to be used with Amazon EMR on EKS

This example command updates the trust policy of a role named **example_iam_role** such that it can be used with Amazon EMR on EKS with **example_namespace** namespace from an EKS cluster named **example_cluster**.

Command:

```
aws emr-containers update-role-trust-policy \
    --cluster example_cluster \
    --namespace example_namespace \
    --role-name example_iam_role
```

Output:

```
If the trust policy has already been updated, then the output will be:
Trust policy statement already exists for role example_iam_role. No
changes were made!

If the trust policy has not been updated yet, then the output will be:
```

```
Successfully updated trust policy of role example_iam_role.
```

- For API details, see UpdateRoleTrustPolicy in *AWS CLI Command Reference*.

EventBridge examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with EventBridge.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`delete-rule`

The following code example shows how to use `delete-rule`.

AWS CLI

To delete a CloudWatch Events rule

This example deletes the rule named EC2InstanceStateChanges:

```
aws events delete-rule --name "EC2InstanceStateChanges"
```

- For API details, see DeleteRule in *AWS CLI Command Reference*.

`describe-rule`

The following code example shows how to use `describe-rule`.

AWS CLI

To display information about a CloudWatch Events rule

This example displays information about the rule named DailyLambdaFunction:

```
aws events describe-rule --name "DailyLambdaFunction"
```

- For API details, see DescribeRule in *AWS CLI Command Reference*.

`disable-rule`

The following code example shows how to use `disable-rule`.

AWS CLI

To disable a CloudWatch Events rule

This example disables the rule named DailyLambdaFunction. The rule is not deleted:

```
aws events disable-rule --name "DailyLambdaFunction"
```

- For API details, see DisableRule in *AWS CLI Command Reference*.

`enable-rule`

The following code example shows how to use `enable-rule`.

AWS CLI

To enable a CloudWatch Events rule

This example enables the rule named DailyLambdaFunction, which had been previously disabled:

```
aws events enable-rule --name "DailyLambdaFunction"
```

- For API details, see EnableRule in *AWS CLI Command Reference*.

`list-rule-names-by-target`

The following code example shows how to use `list-rule-names-by-target`.

AWS CLI

To display all the rules that have a specified target

This example displays all rules that have the Lambda function named "MyFunctionName" as the target:

```
aws events list-rule-names-by-target --target-arn "arn:aws:lambda:us-east-1:123456789012:function:MyFunctionName"
```

- For API details, see ListRuleNamesByTarget in *AWS CLI Command Reference*.

`list-rules`

The following code example shows how to use `list-rules`.

AWS CLI

To display a list of all CloudWatch Events rules

This example displays all CloudWatch Events rules in the region:

```
aws events list-rules
```

To display a list of CloudWatch Events rules beginning with a certain string.

This example displays all CloudWatch Events rules in the region that have a name starting with "Daily":

```
aws events list-rules --name-prefix "Daily"
```

- For API details, see ListRules in *AWS CLI Command Reference*.

`list-targets-by-rule`

The following code example shows how to use `list-targets-by-rule`.

AWS CLI

To display all the targets for a CloudWatch Events rule

This example displays all the targets of the rule named DailyLambdaFunction:

```
aws events list-targets-by-rule --rule  "DailyLambdaFunction"
```

- For API details, see ListTargetsByRule in *AWS CLI Command Reference*.

`put-events`

The following code example shows how to use `put-events`.

AWS CLI

To send a custom event to CloudWatch Events

This example sends a custom event to CloudWatch Events. The event is contained within the putevents.json file:

```
aws events put-events --entries file://putevents.json
```

Here are the contents of the putevents.json file:

```
[
  {
    "Source": "com.mycompany.myapp",
    "Detail": "{ \"key1\": \"value1\", \"key2\": \"value2\" }",
    "Resources": [
      "resource1",
      "resource2"
    ],
    "DetailType": "myDetailType"
  },
  {
    "Source": "com.mycompany.myapp",
    "Detail": "{ \"key1\": \"value3\", \"key2\": \"value4\" }",
    "Resources": [
      "resource1",
      "resource2"
    ],
    "DetailType": "myDetailType"
   }
]
```

- For API details, see PutEvents in *AWS CLI Command Reference*.

`put-rule`

The following code example shows how to use `put-rule`.

AWS CLI

To create CloudWatch Events rules

This example creates a rule that triggers every day at 9:00am (UTC). If you use put-targets to add a Lambda function as a target of this rule, you could run the Lambda function every day at the specified time:

```
aws events put-rule --name "DailyLambdaFunction" --schedule-expression "cron(0 9 *
 * ? *)"
```

This example creates a rule that triggers when any EC2 instance in the region changes state:

```
aws events put-rule --name "EC2InstanceStateChanges" --event-pattern "{\"source\":
[\"aws.ec2\"],\"detail-type\":[\"EC2 Instance State-change Notification\"]}"  --
role-arn "arn:aws:iam::123456789012:role/MyRoleForThisRule"
```

This example creates a rule that triggers when any EC2 instance in the region is stopped or terminated:

```
aws events put-rule --name "EC2InstanceStateChangeStopOrTerminate" --event-
pattern "{\"source\":[\"aws.ec2\"],\"detail-type\":[\"EC2 Instance State-change
 Notification\"],\"detail\":{\"state\":[\"stopped\",\"terminated\"]}}" --role-
arn "arn:aws:iam::123456789012:role/MyRoleForThisRule"
```

- For API details, see PutRule in *AWS CLI Command Reference*.

`put-targets`

The following code example shows how to use `put-targets`.

AWS CLI

To add targets for CloudWatch Events rules

This example adds a Lambda function as the target of a rule:

```
aws events put-targets --rule DailyLambdaFunction --targets
 "Id"="1","Arn"="arn:aws:lambda:us-east-1:123456789012:function:MyFunctionName"
```

This example sets an Amazon Kinesis stream as the target, so that events caught by this rule are relayed to the stream:

```
aws events put-targets --rule EC2InstanceStateChanges --targets
 "Id"="1","Arn"="arn:aws:kinesis:us-east-1:123456789012:stream/
MyStream","RoleArn"="arn:aws:iam::123456789012:role/MyRoleForThisRule"
```

This example sets two Amazon Kinesis streams as targets for one rule:

```
aws events put-targets --rule DailyLambdaFunction --targets
 "Id"="Target1","Arn"="arn:aws:kinesis:us-east-1:379642911888:stream/
MyStream1","RoleArn"="arn:aws:iam::379642911888:role/ MyRoleToAccessLambda"
  "Id"="Target2"," Arn"="arn:aws:kinesis:us-east-1:379642911888:stream/
MyStream2","RoleArn"="arn:aws:iam::379642911888:role/MyRoleToAccessLambda"
```

- For API details, see PutTargets in *AWS CLI Command Reference*.

`remove-targets`

The following code example shows how to use `remove-targets`.

AWS CLI

To remove a target for an event

This example removes the Amazon Kinesis stream named MyStream1 from being a target of the rule DailyLambdaFunction. When DailyLambdaFunction was created, this stream was set as a target with an ID of Target1:

```
aws events remove-targets --rule "DailyLambdaFunction" --ids "Target1"
```

- For API details, see RemoveTargets in *AWS CLI Command Reference*.

`test-event-pattern`

The following code example shows how to use `test-event-pattern`.

AWS CLI

To check whether an event pattern matches a specified event

This example tests whether the pattern "source:com.mycompany.myapp" matches the specified event. In this example, the output would be "true":

```
aws events test-event-pattern --event-pattern "{\"source\":[\"com.mycompany.myapp
\"]}" --event "{\"id\":\"1\",\"source\":\"com.mycompany.myapp\",\"detail-type\":
\"myDetailType\",\"account\":\"123456789012\",\"region\":\"us-east-1\",\"time\":
\"2017-04-11T20:11:04Z\"}"
```

- For API details, see TestEventPattern in *AWS CLI Command Reference*.

EventBridge Pipes examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with EventBridge Pipes.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Actions

`create-pipe`

The following code example shows how to use `create-pipe`.

AWS CLI

To Create a pipe

The following `create-pipe` example creates a Pipe named `Demo_Pipe` with SQS as the source and CloudWatch Log Group as the target for the Pipe.

```
aws pipes create-pipe \
    --name Demo_Pipe \
    --desired-state RUNNING \
    --role-arn arn:aws:iam::123456789012:role/service-role/
Amazon_EventBridge_Pipe_Demo_Pipe_28b3aa4f \
    --source arn:aws:sqs:us-east-1:123456789012:Demo_Queue \
    --target arn:aws:logs:us-east-1:123456789012:log-group:/aws/pipes/Demo_LogGroup
```

Output:

```
{
    "Arn": "arn:aws:pipes:us-east-1:123456789012:pipe/Demo_Pipe",
    "Name": "Demo_Pipe",
    "DesiredState": "RUNNING",
    "CurrentState": "CREATING",
    "CreationTime": "2024-10-08T12:33:59-05:00",
    "LastModifiedTime": "2024-10-08T12:33:59.684839-05:00"
}
```

For more information, see Amazon EventBridge Pipes concepts in the *Amazon EventBridge User Guide*.

- For API details, see CreatePipe in *AWS CLI Command Reference*.

`delete-pipe`

The following code example shows how to use `delete-pipe`.

AWS CLI

To delete an existing pipe

The following `delete-pipe` example deletes a Pipe named `Demo_Pipe` in the specified account.

```
aws pipes delete-pipe \
    --name Demo_Pipe
```

Output:

```
{
```

```
    "Arn": "arn:aws:pipes:us-east-1:123456789012:pipe/Demo_Pipe",
    "Name": "Demo_Pipe",
    "DesiredState": "STOPPED",
    "CurrentState": "DELETING",
    "CreationTime": "2024-10-08T09:29:10-05:00",
    "LastModifiedTime": "2024-10-08T11:57:22-05:00"
}
```

For more information, see Amazon EventBridge Pipes concepts in the *Amazon EventBridge User Guide*.

- For API details, see DeletePipe in *AWS CLI Command Reference*.

`describe-pipe`

The following code example shows how to use `describe-pipe`.

AWS CLI

To retrieve information about a Pipe

The following `describe-pipe` example displays information about the Pipe `Demo_Pipe` in the specified account.

```
aws pipes describe-pipe \
    --name Demo_Pipe
```

Output:

```
{
    "Arn": "arn:aws:pipes:us-east-1:123456789012:pipe/Demo_Pipe",
    "Name": "Demo_Pipe",
    "DesiredState": "RUNNING",
    "CurrentState": "RUNNING",
    "StateReason": "User initiated",
    "Source": "arn:aws:sqs:us-east-1:123456789012:Demo_Queue",
    "SourceParameters": {
        "SqsQueueParameters": {
            "BatchSize": 1
        }
    },
    "EnrichmentParameters": {},
```

```
    "Target": "arn:aws:logs:us-east-1:123456789012:log-group:/aws/pipes/
Demo_LogGroup",
    "TargetParameters": {},
    "RoleArn": "arn:aws:iam::123456789012:role/service-role/
Amazon_EventBridge_Pipe_Demo_Pipe_28b3aa4f",
    "Tags": {},
    "CreationTime": "2024-10-08T09:29:10-05:00",
    "LastModifiedTime": "2024-10-08T10:23:47-05:00",
    "LogConfiguration": {
        "CloudwatchLogsLogDestination": {
            "LogGroupArn": "arn:aws:logs:us-east-1:123456789012:log-group:/aws/
vendedlogs/pipes/Demo_Pipe"
        },
        "Level": "ERROR"
    }
}
```

For more information, see Amazon EventBridge Pipes concepts in the *Amazon EventBridge User Guide*.

- For API details, see DescribePipe in *AWS CLI Command Reference*.

`list-pipes`

The following code example shows how to use `list-pipes`.

AWS CLI

To retrieve a list of Pipes

The following `list-pipes` example shows all the pipes in the specified account.

```
aws pipes list-pipes
```

Output:

```
{
    "Pipes": [
        {
            "Name": "Demo_Pipe",
            "Arn": "arn:aws:pipes:us-east-1:123456789012:pipe/Demo_Pipe",
            "DesiredState": "RUNNING",
            "CurrentState": "RUNNING",
```

```
            "StateReason": "User initiated",
            "CreationTime": "2024-10-08T09:29:10-05:00",
            "LastModifiedTime": "2024-10-08T10:23:47-05:00",
            "Source": "arn:aws:sqs:us-east-1:123456789012:Demo_Queue",
            "Target": "arn:aws:logs:us-east-1:123456789012:log-group:/aws/pipes/
Demo_LogGroup"
        }
    ]
}
```

For more information, see Amazon EventBridge Pipes concepts in the *Amazon EventBridge User Guide*.

- For API details, see ListPipes in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags associated with an existing pipe

The following `list-tags-for-resource` example lists all the tags associated with a pipe named `Demo_Pipe` in the specified account.

```
aws pipes list-tags-for-resource \
    --resource-arn arn:aws:pipes:us-east-1:123456789012:pipe/Demo_Pipe
```

Output:

```
{
    "tags": {
        "stack": "Production",
        "team": "DevOps"
    }
}
```

For more information, see Amazon EventBridge Pipes concepts in the *Amazon EventBridge User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`start-pipe`

The following code example shows how to use `start-pipe`.

AWS CLI

To start an existing pipe

The following `start-pipe` example starts a Pipe named `Demo_Pipe` in the specified account.

```
aws pipes start-pipe \
    --name Demo_Pipe
```

Output:

```
{
    "Arn": "arn:aws:pipes:us-east-1:123456789012:pipe/Demo_Pipe",
    "Name": "Demo_Pipe",
    "DesiredState": "RUNNING",
    "CurrentState": "STARTING",
    "CreationTime": "2024-10-08T09:29:10-05:00",
    "LastModifiedTime": "2024-10-08T10:17:24-05:00"
}
```

For more information, see Starting or stopping an Amazon EventBridge pipe in the *Amazon EventBridge User Guide*.

- For API details, see StartPipe in *AWS CLI Command Reference*.

`stop-pipe`

The following code example shows how to use `stop-pipe`.

AWS CLI

To stop an existing pipe

The following `stop-pipe` example stops a Pipe named `Demo_Pipe` in the specified account.

```
aws pipes stop-pipe \
    --name Demo_Pipe
```

Output:

```
{
    "Arn": "arn:aws:pipes:us-east-1:123456789012:pipe/Demo_Pipe",
    "Name": "Demo_Pipe",
    "DesiredState": "STOPPED",
    "CurrentState": "STOPPING",
    "CreationTime": "2024-10-08T09:29:10-05:00",
    "LastModifiedTime": "2024-10-08T09:29:49-05:00"
}
```

For more information, see Starting or stopping an Amazon EventBridge pipe in the *Amazon EventBridge User Guide*.

- For API details, see StopPipe in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To Tag an existing pipe

The following `tag-resource` example tags a Pipe named `Demo_Pipe`. If the command succeeds, no output is returned.

```
aws pipes tag-resource \
    --resource-arn arn:aws:pipes:us-east-1:123456789012:pipe/Demo_Pipe \
    --tags stack=Production
```

For more information, see Amazon EventBridge Pipes concepts in the *Amazon EventBridge User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a Tag from an existing pipe

The following `untag-resource` example removes a tag with the key `stack` from the Pipe named `Demo_Pipe`. If the command succeeds, no output is returned.

```
aws pipes untag-resource \
    --resource-arn arn:aws:pipes:us-east-1:123456789012:pipe/Demo_Pipe \
    --tags stack
```

For more information, see Amazon EventBridge Pipes concepts in the *Amazon EventBridge User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

update-pipe

The following code example shows how to use `update-pipe`.

AWS CLI

To update an existing pipe

The following `update-pipe` example updates the Pipe named `Demo_Pipe` by adding a CloudWatch Log configuration parameter, enure to update the execution role of the pipe so that it has the correct permissions for Log destination.

```
aws pipes update-pipe \
    --name Demo_Pipe \
    --desired-state RUNNING \
    --log-configuration CloudwatchLogsLogDestination={LogGroupArn=arn:aws:logs:us-east-1:123456789012:log-group:/aws/vendedlogs/pipes/Demo_Pipe},Level=TRACE \
    --role-arn arn:aws:iam::123456789012:role/service-role/Amazon_EventBridge_Pipe_Demo_Pipe_28b3aa4f
```

Output:

```
{
    "Arn": "arn:aws:pipes:us-east-1:123456789012:pipe/Demo_Pipe",
    "Name": "Demo_Pipe",
    "DesiredState": "RUNNING",
    "CurrentState": "UPDATING",
    "CreationTime": "2024-10-08T09:29:10-05:00",
    "LastModifiedTime": "2024-10-08T11:35:48-05:00"
```

```
}
```

For more information, see Amazon EventBridge Pipes concepts in the *Amazon EventBridge User Guide*.

- For API details, see UpdatePipe in *AWS CLI Command Reference*.

Firewall Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Firewall Manager.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`associate-admin-account`

The following code example shows how to use `associate-admin-account`.

AWS CLI

To set the Firewall Manager administrator account

The following `associate-admin-account` example sets the administrator account for Firewall Manager.

```
aws fms associate-admin-account \
    --admin-account 123456789012
```

This command produces no output.

For more information, see Set the AWS Firewall Manager Administrator Account in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see AssociateAdminAccount in *AWS CLI Command Reference*.

`delete-notification-channel`

The following code example shows how to use `delete-notification-channel`.

AWS CLI

To remove the SNS topic information for Firewall Manager logs

The following `delete-notification-channel` example removes the SNS topic information.

```
aws fms delete-notification-channel
```

This command produces no output.

For more information, see Configure Amazon SNS Notifications and Amazon CloudWatch Alarms in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see DeleteNotificationChannel in *AWS CLI Command Reference*.

`delete-policy`

The following code example shows how to use `delete-policy`.

AWS CLI

To delete a Firewall Manager policy

The following `delete-policy` example removes the policy with the specified ID, along with all of its resources.

```
aws fms delete-policy \
    --policy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --delete-all-policy-resources
```

This command produces no output.

For more information, see Working with AWS Firewall Manager Policies in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see DeletePolicy in *AWS CLI Command Reference*.

`disassociate-admin-account`

The following code example shows how to use `disassociate-admin-account`.

AWS CLI

To remove the Firewall Manager administrator account

The following `disassociate-admin-account` example removes the current administrator account association from Firewall Manager.

```
aws fms disassociate-admin-account
```

This command produces no output.

For more information, see Set the AWS Firewall Manager Administrator Account in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see DisassociateAdminAccount in *AWS CLI Command Reference*.

`get-admin-account`

The following code example shows how to use `get-admin-account`.

AWS CLI

To retrieve the Firewall Manager administrator account

The following `get-admin-account` example retrieves the administrator account.

```
aws fms get-admin-account
```

Output:

```
{
    "AdminAccount": "123456789012",
    "RoleStatus": "READY"
}
```

For more information, see AWS Firewall Manager Prerequisites in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see GetAdminAccount in *AWS CLI Command Reference*.

get-compliance-detail

The following code example shows how to use `get-compliance-detail`.

AWS CLI

To retrieve the compliance information for an account

The following `get-compliance-detail` example retrieves compliance information for the specified policy and member account.

```
aws fms get-compliance-detail \
    --policy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --member-account 123456789012
```

Output:

```
{
    "PolicyComplianceDetail": {
    "EvaluationLimitExceeded": false,
    "IssueInfoMap": {},
    "MemberAccount": "123456789012",
    "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "PolicyOwner": "123456789012",
    "Violators": []
}
```

For more information, see Viewing Resource Compliance with a Policy in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see GetComplianceDetail in *AWS CLI Command Reference*.

get-notification-channel

The following code example shows how to use `get-notification-channel`.

AWS CLI

To retrieve the SNS topic information for Firewall Manager logs

The following `get-notification-channel` example retrieves the SNS topic information.

```
aws fms get-notification-channel
```

Output:

```
{
    "SnsTopicArn": "arn:aws:sns:us-west-2:123456789012:us-west-2-fms",
    "SnsRoleName": "arn:aws:iam::123456789012:role/aws-service-role/
fms.amazonaws.com/AWSServiceRoleForFMS"
}
```

For more information, see Configure Amazon SNS Notifications and Amazon CloudWatch Alarms in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see GetNotificationChannel in *AWS CLI Command Reference*.

`get-policy`

The following code example shows how to use `get-policy`.

AWS CLI

To retrieve a Firewall Manager policy

The following `get-policy` example retrieves the policy with the specified ID.

```
aws fms get-policy \
    --policy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "Policy": {
        "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "PolicyName": "test",
        "PolicyUpdateToken": "1:p+2RpKR4wPFx7mcrL1UOQQ==",
        "SecurityServicePolicyData": {
            "Type": "SECURITY_GROUPS_COMMON",
            "ManagedServiceData": "{\"type\":\"SECURITY_GROUPS_COMMON\",
\"revertManualSecurityGroupChanges\":true,\"exclusiveResourceSecurityGroupManagement
\":false,\"securityGroups\":[{\"id\":\"sg-045c43ccc9724e63e\"}]}"
```

```
        },
        "ResourceType": "AWS::EC2::Instance",
        "ResourceTags": [],
        "ExcludeResourceTags": false,
        "RemediationEnabled": false
    },
    "PolicyArn": "arn:aws:fms:us-west-2:123456789012:policy/d1ac59b8-938e-42b3-
b2e0-7c620422ddc2"
}
```

For more information, see Working with AWS Firewall Manager Policies in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see GetPolicy in *AWS CLI Command Reference*.

`list-compliance-status`

The following code example shows how to use `list-compliance-status`.

AWS CLI

To retrieve the policy compliance information for member accounts

The following `list-compliance-status` example retrieves member account compliance information for the specified policy.

```
aws fms list-compliance-status \
    --policy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "PolicyComplianceStatusList": [
        {
            "PolicyOwner": "123456789012",
            "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "PolicyName": "test",
            "MemberAccount": "123456789012",
            "EvaluationResults": [
                {
                    "ComplianceStatus": "COMPLIANT",
                    "ViolatorCount": 0,
```

```
                    "EvaluationLimitExceeded": false
                },
                {
                    "ComplianceStatus": "NON_COMPLIANT",
                    "ViolatorCount": 2,
                    "EvaluationLimitExceeded": false
                }
            ],
            "LastUpdated": 1576283774.0,
            "IssueInfoMap": {}
        }
    ]
}
```

For more information, see Viewing Resource Compliance with a Policy in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see ListComplianceStatus in *AWS CLI Command Reference*.

`list-member-accounts`

The following code example shows how to use `list-member-accounts`.

AWS CLI

To retrieve the member accounts in the organization

The following `list-member-accounts` example lists all of the member accounts that are in the Firewall Manager administrator's organization.

```
aws fms list-member-accounts
```

Output:

```
{
    "MemberAccounts": [
        "222222222222",
        "333333333333",
        "444444444444"
    ]
}
```

For more information, see AWS Firewall Manager in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see ListMemberAccounts in *AWS CLI Command Reference*.

`list-policies`

The following code example shows how to use `list-policies`.

AWS CLI

To retrieve all Firewall Manager policies

The following `list-policies` example retrieves the list of policies for the account. In this example, the output is limited to two results per request. Each call returns a `NextToken` that can be used as the value for the `--starting-token` parameter in the next `list-policies` call to get the next set of results for the list.

```
aws fms list-policies \
    --max-items 2
```

Output:

```
{
    "PolicyList": [
        {
            "PolicyArn": "arn:aws:fms:us-west-2:123456789012:policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "PolicyName": "test",
            "ResourceType": "AWS::EC2::Instance",
            "SecurityServiceType": "SECURITY_GROUPS_COMMON",
            "RemediationEnabled": false
        },
        {
            "PolicyArn": "arn:aws:fms:us-west-2:123456789012:policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "PolicyId": "457c9b21-fc94-406c-ae63-21217395ba72",
            "PolicyName": "test",
            "ResourceType": "AWS::EC2::Instance",
            "SecurityServiceType": "SECURITY_GROUPS_COMMON",
            "RemediationEnabled": false
```

```
        }
    ],
    "NextToken": "eyJOZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOiAyfQ=="
}
```

For more information, see Working with AWS Firewall Manager Policies in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see ListPolicies in *AWS CLI Command Reference*.

`put-notification-channel`

The following code example shows how to use `put-notification-channel`.

AWS CLI

To set the SNS topic information for Firewall Manager logs

The following `put-notification-channel` example sets the SNS topic information.

```
aws fms put-notification-channel \
    --sns-topic-arn arn:aws:sns:us-west-2:123456789012:us-west-2-fms \
    --sns-role-name arn:aws:iam::123456789012:role/aws-service-role/
fms.amazonaws.com/AWSServiceRoleForFMS
```

This command produces no output.

For more information, see Configure Amazon SNS Notifications and Amazon CloudWatch Alarms in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see PutNotificationChannel in *AWS CLI Command Reference*.

`put-policy`

The following code example shows how to use `put-policy`.

AWS CLI

To create a Firewall Manager policy

The following `put-policy` example creates a Firewall Manager security group policy.

```
aws fms put-policy \
```

```
    --cli-input-json file://policy.json
```

Contents of `policy.json`:

```
{
    "Policy": {
        "PolicyName": "test",
        "SecurityServicePolicyData": {
            "Type": "SECURITY_GROUPS_USAGE_AUDIT",
            "ManagedServiceData": "{\"type\":\"SECURITY_GROUPS_USAGE_AUDIT\",
\"deleteUnusedSecurityGroups\":false,\"coalesceRedundantSecurityGroups\":true}"
        },
        "ResourceType": "AWS::EC2::SecurityGroup",
        "ResourceTags": [],
        "ExcludeResourceTags": false,
        "RemediationEnabled": false
    },
    "TagList": [
        {
            "Key": "foo",
            "Value": "foo"
        }
    ]
}
```

Output:

```
{
    "Policy": {
        "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "PolicyName": "test",
        "PolicyUpdateToken": "1:X9QGexP7HASDlsFp+G31Iw==",
        "SecurityServicePolicyData": {
            "Type": "SECURITY_GROUPS_USAGE_AUDIT",
            "ManagedServiceData": "{\"type\":\"SECURITY_GROUPS_USAGE_AUDIT\",
\"deleteUnusedSecurityGroups\":false,\"coalesceRedundantSecurityGroups\":true,
\"optionalDelayForUnusedInMinutes\":null}"
        },
        "ResourceType": "AWS::EC2::SecurityGroup",
        "ResourceTags": [],
        "ExcludeResourceTags": false,
        "RemediationEnabled": false
    },
```

```
    "PolicyArn": "arn:aws:fms:us-west-2:123456789012:policy/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Working with AWS Firewall Manager Policies in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see PutPolicy in *AWS CLI Command Reference*.

AWS FIS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS FIS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

`create-experiment-template`

The following code example shows how to use `create-experiment-template`.

AWS CLI

To create an experiment template

The following `create-experiment-template` example creates an experiment template in your AWS FIS account.

```
aws fis create-experiment-template \
    --cli-input-json file://myfile.json
```

Contents of `myfile.json`:

```
{
    "description": "experimentTemplate",
    "stopConditions": [
        {
            "source": "aws:cloudwatch:alarm",
            "value": "arn:aws:cloudwatch:us-west-2:123456789012:alarm:alarmName"
        }
    ],
    "targets": {
        "Instances-Target-1": {
            "resourceType": "aws:ec2:instance",
            "resourceArns": [
                "arn:aws:ec2:us-west-2:123456789012:instance/i-12a3b4c56d78e9012"
            ],
            "selectionMode": "ALL"
        }
    },
    "actions": {
        "reboot": {
            "actionId": "aws:ec2:reboot-instances",
            "description": "reboot",
            "parameters": {},
            "targets": {
                "Instances": "Instances-Target-1"
            }
        }
    },
    "roleArn": "arn:aws:iam::123456789012:role/myRole"
}
```

Output:

```
{
    "experimentTemplate": {
        "id": "ABCDE1fgHIJkLmNop",
        "description": "experimentTemplate",
        "targets": {
            "Instances-Target-1": {
                "resourceType": "aws:ec2:instance",
                "resourceArns": [
                    "arn:aws:ec2:us-west-2:123456789012:instance/
i-12a3b4c56d78e9012"
                ],
```

```
                "selectionMode": "ALL"
            }
        },
        "actions": {
            "reboot": {
                "actionId": "aws:ec2:reboot-instances",
                "description": "reboot",
                "parameters": {},
                "targets": {
                    "Instances": "Instances-Target-1"
                }
            }
        },
        "stopConditions": [
            {
                "source": "aws:cloudwatch:alarm",
                "value": "arn:aws:cloudwatch:us-west-2:123456789012:alarm:alarmName"
            }
        ],
        "creationTime": 1616434850.659,
        "lastUpdateTime": 1616434850.659,
        "roleArn": "arn:aws:iam::123456789012:role/myRole",
        "tags": {}
    }
}
```

For more information, see Create an experiment template in the *AWS Fault Injection Simulator User Guide*.

- For API details, see CreateExperimentTemplate in *AWS CLI Command Reference*.

`delete-experiment-template`

The following code example shows how to use `delete-experiment-template`.

AWS CLI

To delete an experiment template

The following `delete-experiment-template` example deletes the specified experiment template.

```
aws fis delete-experiment-template \
```

```
    --id ABCDE1fgHIJkLmNop
```

Output:

```
{
    "experimentTemplate": {
        "id": "ABCDE1fgHIJkLmNop",
        "description": "myExperimentTemplate",
        "targets": {
            "Instances-Target-1": {
                "resourceType": "aws:ec2:instance",
                "resourceArns": [
                    "arn:aws:ec2:us-west-2:123456789012:instance/
i-12a3b4c56d78e9012"
                ],
                "selectionMode": "ALL"
            }
        },
        "actions": {
            "testaction": {
                "actionId": "aws:ec2:stop-instances",
                "parameters": {},
                "targets": {
                    "Instances": "Instances-Target-1"
                }
            }
        },
        "stopConditions": [
            {
                "source": "none"
            }
        ],
        "creationTime": 1616017191.124,
        "lastUpdateTime": 1616017859.607,
        "roleArn": "arn:aws:iam::123456789012:role/FISRole"
    }
}
```

For more information, see Delete an experiment template in the *AWS Fault Injection Simulator User Guide*.

- For API details, see DeleteExperimentTemplate in *AWS CLI Command Reference*.

`get-action`

The following code example shows how to use `get-action`.

AWS CLI

To get action details

The following `get-action` example gets the details of the specified action.

```
aws fis get-action \
    --id aws:ec2:stop-instances
```

Output:

```
{
    "action": {
        "id": "aws:ec2:stop-instances",
        "description": "Stop the specified EC2 instances.",
        "parameters": {
            "startInstancesAfterDuration": {
                "description": "The time to wait before restarting the instances
 (ISO 8601 duration).",
                "required": false
            }
        },
        "targets": {
            "Instances": {
                "resourceType": "aws:ec2:instance"
            }
        },
        "tags": {}
    }
}
```

For more information, see Actions in the *AWS Fault Injection Simulator User Guide*.

- For API details, see GetAction in *AWS CLI Command Reference*.

`get-experiment-template`

The following code example shows how to use `get-experiment-template`.

AWS CLI

To get experiment template details

The following `get-experiment-template` example gets the details of the specified experiment template.

```
aws fis get-experiment-template \
    --id ABCDE1fgHIJkLmNop
```

Output:

```
{
    "experimentTemplate": {
        "id": "ABCDE1fgHIJkLmNop",
        "description": "myExperimentTemplate",
        "targets": {
            "Instances-Target-1": {
                "resourceType": "aws:ec2:instance",
                "resourceArns": [
                    "arn:aws:ec2:us-west-2:123456789012:instance/
i-12a3b4c56d78e9012"
                ],
                "selectionMode": "ALL"
            }
        },
        "actions": {
            "testaction": {
                "actionId": "aws:ec2:stop-instances",
                "parameters": {},
                "targets": {
                    "Instances": "Instances-Target-1"
                }
            }
        },
        "stopConditions": [
            {
                "source": "none"
            }
        ],
        "creationTime": 1616017191.124,
        "lastUpdateTime": 1616017331.51,
        "roleArn": "arn:aws:iam::123456789012:role/FISRole",
```

```
        "tags": {
        "key: "value"
        }
    }
}
```

For more information, see [Experiment templates]() in the *AWS Fault Injection Simulator User Guide*.

- For API details, see [GetExperimentTemplate]() in *AWS CLI Command Reference*.

`get-experiment`

The following code example shows how to use `get-experiment`.

AWS CLI

To get experiment details

The following `get-experiment` example gets the details of the specified experiment.

```
aws fis get-experiment \
    --id ABC12DeFGhI3jKLMNOP
```

Output:

```
{
    "experiment": {
        "id": "ABC12DeFGhI3jKLMNOP",
        "experimentTemplateId": "ABCDE1fgHIJkLmNop",
        "roleArn": "arn:aws:iam::123456789012:role/myRole",
        "state": {
            "status": "completed",
            "reason": "Experiment completed."
        },
        "targets": {
            "Instances-Target-1": {
                "resourceType": "aws:ec2:instance",
                "resourceArns": [
                    "arn:aws:ec2:us-west-2:123456789012:instance/
i-12a3b4c56d78e9012"
                ],
                "selectionMode": "ALL"
```

```
            }
        },
        "actions": {
            "reboot": {
                "actionId": "aws:ec2:reboot-instances",
                "parameters": {},
                "targets": {
                    "Instances": "Instances-Target-1"
                },
                "state": {
                    "status": "completed",
                    "reason": "Action was completed."
                }
            }
        },
        "stopConditions": [
            {
                "source": "none"
            }
        ],
        "creationTime": 1616432509.662,
        "startTime": 1616432509.962,
        "endTime": 1616432522.307,
        "tags": {}
    }
}
```

For more information, see Experiments for AWS FIS in the *AWS Fault Injection Simulator User Guide*.

- For API details, see GetExperiment in *AWS CLI Command Reference*.

`list-actions`

The following code example shows how to use `list-actions`.

AWS CLI

To list actions

The following `list-actions` example lists the available actions.

```
aws fis list-actions
```

Output:

```
{
    "actions": [
        {
            "id": "aws:ec2:reboot-instances",
            "description": "Reboot the specified EC2 instances.",
            "targets": {
                "Instances": {
                    "resourceType": "aws:ec2:instance"
                }
            },
            "tags": {}
        },
        {
            "id": "aws:ec2:stop-instances",
            "description": "Stop the specified EC2 instances.",
            "targets": {
                "Instances": {
                    "resourceType": "aws:ec2:instance"
                }
            },
            "tags": {}
        },
        {
            "id": "aws:ec2:terminate-instances",
            "description": "Terminate the specified EC2 instances.",
            "targets": {
                "Instances": {
                    "resourceType": "aws:ec2:instance"
                }
            },
            "tags": {}
        },
        {
            "id": "aws:ecs:drain-container-instances",
            "description": "Drain percentage of underlying EC2 instances on an ECS
 cluster.",
            "targets": {
                "Clusters": {
                    "resourceType": "aws:ecs:cluster"
                }
            },
            "tags": {}
```

```
        },
        {
            "id": "aws:eks:terminate-nodegroup-instances",
            "description": "Terminates a percentage of the underlying EC2 instances
 in an EKS cluster.",
            "targets": {
                "Nodegroups": {
                    "resourceType": "aws:eks:nodegroup"
                }
            },
            "tags": {}
        },
        {
            "id": "aws:fis:inject-api-internal-error",
            "description": "Cause an AWS service to return internal error responses
 for specific callers and operations.",
            "targets": {
                "Roles": {
                    "resourceType": "aws:iam:role"
                }
            },

                }
            },
            "tags": {}
        },
        {
            "id": "aws:ssm:send-command",
            "description": "Run the specified SSM document.",
            "targets": {
                "Instances": {
                    "resourceType": "aws:ec2:instance"
                }
            },
            "tags": {}
        }
    ]
}
```

For more information, see Actions in the *AWS Fault Injection Simulator User Guide*.

- For API details, see ListActions in *AWS CLI Command Reference*.

`list-experiment-templates`

The following code example shows how to use `list-experiment-templates`.

AWS CLI

To list experiment templates

The following `list-experiment-templates` example lists the experiment templates in your AWS account.

```
aws fis list-experiment-templates
```

Output:

```
{
    "experimentTemplates": [
        {
            "id": "ABCDE1fgHIJkLmNop",
            "description": "myExperimentTemplate",
            "creationTime": 1616017191.124,
            "lastUpdateTime": 1616017191.124,
            "tags": {
                "key": "value"
            }
        }
    ]
}
```

For more information, see Experiment templates in the *AWS Fault Injection Simulator User Guide*.

- For API details, see ListExperimentTemplates in *AWS CLI Command Reference*.

`list-experiments`

The following code example shows how to use `list-experiments`.

AWS CLI

To list experiments

The following `list-experiments` example lists the experiments in your AWS account.

```
aws fis list-experiments
```

Output:

```
{
    "experiments": [
        {
            "id": "ABCdeF1GHiJkLM23NO",
            "experimentTemplateId": "ABCDE1fgHIJkLmNop",
            "state": {
                "status": "running",
                "reason": "Experiment is running."
            },
            "creationTime": 1616017341.197,
            "tags": {
            "key": "value"
            }
        }
    ]
}
```

For more information, see Experiments in the *AWS Fault Injection Simulator User Guide*.

- For API details, see ListExperiments in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a resource

The following `list-tags-for-resource` example lists the tags for the specified resource.

```
aws fis list-tags-for-resource \
    --resource-arn arn:aws:fis:us-west-2:123456789012:experiment/ABC12DeFGhI3jKLMNOP
```

Output:

```
{
    "tags": {
```

```
            "key1": "value1",
            "key2": "value2"
        }
    }
```

For more information, see Tag your AWS FIS resources in the *AWS Fault Injection Simulator User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`start-experiment`

The following code example shows how to use `start-experiment`.

AWS CLI

To start an experiment

The following `start-experiment` example starts the specified experiment.

```
aws fis start-experiment \
    --experiment-template-id ABCDE1fgHIJkLmNop
```

Output:

```
{
    "experiment": {
        "id": "ABC12DeFGhI3jKLMNOP",
        "experimentTemplateId": "ABCDE1fgHIJkLmNop",
        "roleArn": "arn:aws:iam::123456789012:role/myRole",
        "state": {
            "status": "initiating",
            "reason": "Experiment is initiating."
        },
        "targets": {
            "Instances-Target-1": {
                "resourceType": "aws:ec2:instance",
                "resourceArns": [
                    "arn:aws:ec2:us-west-2:123456789012:instance/

For more information, see Experiments for AWS FIS in the *AWS Fault Injection Simulator User Guide*.

- For API details, see StartExperiment in *AWS CLI Command Reference*.

stop-experiment

The following code example shows how to use `stop-experiment`.

AWS CLI

To stop an experiment

The following `stop-experiment` example stops the specified experiment from running.

```
aws fis stop-experiment \
    --id ABC12DeFGhI3jKLMNOP
```

Output:

```
{
    "experiment": {
        "id": "ABC12DeFGhI3jKLMNOP",
        "experimentTemplateId": "ABCDE1fgHIJkLmNop",
        "roleArn": "arn:aws:iam::123456789012:role/myRole",
        "state": {
            "status": "stopping",
            "reason": "Stopping Experiment."
        },
        "targets": {
            "Instances-Target-1": {
                "resourceType": "aws:ec2:instance",
                "resourceArns": [
                    "arn:aws:ec2:us-west-2:123456789012:instance/
i-12a3b4c56d78e9012"
                ],
                "selectionMode": "ALL"
            }
        },
        "actions": {
            "reboot": {
                "actionId": "aws:ec2:reboot-instances",
                "parameters": {},
                "targets": {
                    "Instances": "Instances-Target-1"
                },
                "startAfter": [
                    "wait"
                ],
                "state": {
                    "status": "pending",
                    "reason": "Initial state."
                }
            },
            "wait": {
                "actionId": "aws:fis:wait",
                "parameters": {
                    "duration": "PT5M"
                },
                "state": {
                    "status": "running",
                    "reason": ""
```

```
                }
            }
        },
        "stopConditions": [
            {
                "source": "none"
            }
        ],
        "creationTime": 1616432680.927,
        "startTime": 1616432681.177,
        "tags": {}
    }
}
```

For more information, see Experiments for AWS FIS in the *AWS Fault Injection Simulator User Guide*.

- For API details, see StopExperiment in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a resource

The following `tag-resource` example tags the specified resource.

```
aws fis tag-resource \
    --resource-arn arn:aws:fis:us-west-2:123456789012:experiment/ABC12DeFGhI3jKLMNOP
 \
    --tags key1=value1,key2=value2
```

This command produces no output.

For more information, see Tag your AWS FIS resources in the *AWS Fault Injection Simulator User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To untag a resource

The following `untag-resource` example removes the tags from the specified resource.

```
aws fis untag-resource \
    --resource-arn arn:aws:fis:us-west-2:123456789012:experiment/ABC12DeFGhI3jKLMNOP
```

This command produces no output.

For more information, see Tag your AWS FIS resources in the *AWS Fault Injection Simulator User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-experiment-template`

The following code example shows how to use `update-experiment-template`.

AWS CLI

To update an experiment template

The following `update-experiment-template` example updates the description of the specified experiment template.

```
aws fis update-experiment-template \
    --id ABCDE1fgHIJkLmNop \
    ---description myExperimentTemplate
```

Output:

```
{
    "experimentTemplate": {
        "id": "ABCDE1fgHIJkLmNop",
        "description": "myExperimentTemplate",
        "targets": {
            "Instances-Target-1": {
```

```
                "resourceType": "aws:ec2:instance",
                "resourceArns": [
                    "arn:aws:ec2:us-west-2:123456789012:instance/
i-12a3b4c56d78e9012"
                ],
                "selectionMode": "ALL"
            }
        },
        "actions": {
            "testaction": {
                "actionId": "aws:ec2:stop-instances",
                "parameters": {},
                "targets": {
                    "Instances": "Instances-Target-1"
                }
            }
        },
        "stopConditions": [
            {
                "source": "none"
            }
        ],
        "creationTime": 1616017191.124,
        "lastUpdateTime": 1616017859.607,
        "roleArn": "arn:aws:iam::123456789012:role/FISRole",
        "tags": {
            "key": "value"
        }
    }
}
```

For more information, see Update an experiment template in the *AWS Fault Injection Simulator User Guide*.

- For API details, see UpdateExperimentTemplate in *AWS CLI Command Reference*.

Amazon GameLift Servers examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon GameLift Servers.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-build`

The following code example shows how to use `create-build`.

AWS CLI

Example1: To create a game build from files in an S3 bucket

The following `create-build` example creates a custom game build resource. It uses zipped files that are stored in an S3 location in an AWS account that you control. This example assumes that you've already created an IAM role that gives Amazon GameLift permission to access the S3 location. Since the request does not specify an operating system, the new build resource defaults to WINDOWS_2012.

```
aws gamelift create-build \
    --storage-location file://storage-loc.json \
    --name MegaFrogRaceServer.NA \
    --build-version 12345.678
```

Contents of `storage-loc.json`:

```
{
    "Bucket":"MegaFrogRaceServer_NA_build_files"
    "Key":"MegaFrogRaceServer_build_123.zip"
    "RoleArn":"arn:aws:iam::123456789012:role/gamelift"
}
```

Output:

```
{
    "Build": {
        "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111",
```

```
        "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "CreationTime": 1496708916.18,
        "Name": "MegaFrogRaceServer.NA",
        "OperatingSystem": "WINDOWS_2012",
        "SizeOnDisk": 479303,
        "Status": "INITIALIZED",
        "Version": "12345.678"
    },
    "StorageLocation": {
        "Bucket": "MegaFrogRaceServer_NA_build_files",
        "Key": "MegaFrogRaceServer_build_123.zip"
    }
}
```

Example2: To create a game build resource for manually uploading files to GameLift

The following `create-build` example creates a new build resource. It also gets a storage location and temporary credentials that allow you to manually upload your game build to the GameLift location in Amazon S3. Once you've successfully uploaded your build, the GameLift service validates the build and updates the new build's status.

```
aws gamelift create-build \
    --name MegaFrogRaceServer.NA \
    --build-version 12345.678 \
    --operating-system AMAZON_LINUX
```

Output:

```
{
    "Build": {
        "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111",
        "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "CreationTime": 1496708916.18,
        "Name": "MegaFrogRaceServer.NA",
        "OperatingSystem": "AMAZON_LINUX",
        "SizeOnDisk": 0,
        "Status": "INITIALIZED",
        "Version": "12345.678"
    },
    "StorageLocation": {
        "Bucket": "gamelift-builds-us-west-2",
```

```
        "Key": "123456789012/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    },
    "UploadCredentials": {
        "AccessKeyId": "AKIAIOSFODNN7EXAMPLE",
        "SecretAccessKey": "wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY",
        "SessionToken": "AgoGb3JpZ2luENz...EXAMPLETOKEN=="
    }
}
```

For more information, see Upload a Custom Server Build to GameLift in the *Amazon GameLift Developer Guide*.

- For API details, see CreateBuild in *AWS CLI Command Reference*.

`create-fleet`

The following code example shows how to use `create-fleet`.

AWS CLI

Example 1: To create a basic Linux fleet

The following `create-fleet` example creates a minimally configured fleet of on-demand Linux instances to host a custom server build. You can complete the configuration by using `update-fleet`.

```
aws gamelift create-fleet \
    --name MegaFrogRaceServer.NA.v2 \
    --description 'Hosts for v2 North America' \
    --build-id build-1111aaaa-22bb-33cc-44dd-5555eeee66ff \
    --certificate-configuration 'CertificateType=GENERATED' \
    --ec2-instance-type c4.large \
    --fleet-type ON_DEMAND \
    --runtime-configuration 'ServerProcesses=[{LaunchPath=/local/game/release-na/
MegaFrogRace_Server.exe,ConcurrentExecutions=1}]'
```

Output:

```
{
    "FleetAttributes": {
        "BuildId": "build-1111aaaa-22bb-33cc-44dd-5555eeee66ff",
        "CertificateConfiguration": {
```

```
            "CertificateType": "GENERATED"
        },
        "CreationTime": 1496365885.44,
        "Description": "Hosts for v2 North America",
        "FleetArn": "arn:aws:gamelift:us-west-2:444455556666:fleet/
fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
        "FleetId": "fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
        "FleetType": "ON_DEMAND",
        "InstanceType": "c4.large",
        "MetricGroups": ["default"],
        "Name": "MegaFrogRace.NA.v2",
        "NewGameSessionProtectionPolicy": "NoProtection",
        "OperatingSystem": "AMAZON_LINUX",
        "ServerLaunchPath": "/local/game/release-na/MegaFrogRace_Server.exe",
        "Status": "NEW"
    }
}
```

Example 2: To create a basic Windows fleet

The following `create-fleet` example creates a minimally configured fleet of spot Windows instances to host a custom server build. You can complete the configuration by using `update-fleet`.

```
aws gamelift create-fleet \
    --name MegaFrogRace.NA.v2 \
    --description 'Hosts for v2 North America' \
    --build-id build-2222aaaa-33bb-44cc-55dd-6666eeee77ff  \
    --certificate-configuration 'CertificateType=GENERATED' \
    --ec2-instance-type c4.large \
    --fleet-type SPOT \
    --runtime-configuration 'ServerProcesses=[{LaunchPath=C:\game
\Bin64.Release.Dedicated\MegaFrogRace_Server.exe,ConcurrentExecutions=1}]'
```

Output:

```
{
    "FleetAttributes": {
        "BuildId": "build-2222aaaa-33bb-44cc-55dd-6666eeee77ff",
        "CertificateConfiguration": {
            "CertificateType": "GENERATED"
        },
```

```
        "CreationTime": 1496365885.44,
        "Description": "Hosts for v2 North America",
        "FleetArn": "arn:aws:gamelift:us-west-2:444455556666:fleet/
fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
        "FleetId": "fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
        "FleetType": "SPOT",
        "InstanceType": "c4.large",
        "MetricGroups": ["default"],
        "Name": "MegaFrogRace.NA.v2",
        "NewGameSessionProtectionPolicy": "NoProtection",
        "OperatingSystem": "WINDOWS_2012",
        "ServerLaunchPath": "C:\game\Bin64.Release.Dedicated
\MegaFrogRace_Server.exe",
        "Status": "NEW"
    }
}
```

Example 3: To create a fully configured fleet

The following `create-fleet` example creates a fleet of Spot Windows instances for a custom server build, with most commonly used configuration settings provided.

```
aws gamelift create-fleet \
    --name MegaFrogRace.NA.v2 \
    --description 'Hosts for v2 North America' \
    --build-id build-2222aaaa-33bb-44cc-55dd-6666eeee77ff \
    --certificate-configuration 'CertificateType=GENERATED' \
    --ec2-instance-type c4.large \
    --ec2-inbound-permissions
 'FromPort=33435,ToPort=33435,IpRange=10.24.34.0/23,Protocol=UDP' \
    --fleet-type SPOT \
    --new-game-session-protection-policy FullProtection \
    --runtime-configuration file://runtime-config.json \
    --metric-groups default \
    --instance-role-arn 'arn:aws:iam::444455556666:role/GameLiftS3Access'
```

Contents of `runtime-config.json`:

```
GameSessionActivationTimeoutSeconds=300,
 MaxConcurrentGameSessionActivations=2,
 ServerProcesses=[
   {LaunchPath=C:\game\Bin64.Release.Dedicated\MegaFrogRace_Server.exe,Parameters=-
debug,ConcurrentExecutions=1},
```

```
   {LaunchPath=C:\game\Bin64.Release.Dedicated
\MegaFrogRace_Server.exe,ConcurrentExecutions=1}]
```

Output:

```
{
    "FleetAttributes": {
        "InstanceRoleArn": "arn:aws:iam::444455556666:role/GameLiftS3Access",
        "Status": "NEW",
        "InstanceType": "c4.large",
        "FleetArn": "arn:aws:gamelift:us-west-2:444455556666:fleet/
fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
        "FleetId": "fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
        "Description": "Hosts for v2 North America",
        "FleetType": "SPOT",
        "OperatingSystem": "WINDOWS_2012",
        "Name": "MegaFrogRace.NA.v2",
        "CreationTime": 1569309011.11,
        "MetricGroups": [
            "default"
        ],
        "BuildId": "build-2222aaaa-33bb-44cc-55dd-6666eeee77ff",
        "ServerLaunchParameters": "abc",
        "ServerLaunchPath": "C:\\game\\Bin64.Release.Dedicated\
\MegaFrogRace_Server.exe",
        "NewGameSessionProtectionPolicy": "FullProtection",
        "CertificateConfiguration": {
            "CertificateType": "GENERATED"
        }
    }
}
```

Example 4: To create a Realtime Servers fleet

The following `create-fleet` example creates a fleet of Spot instances with a Realtime configuration script that has been uploaded to Amazon GameLift. All Realtime servers are deployed onto Linux machines. For the purposes of this example, assume that the uploaded Realtime script includes multiple script files, with the `Init()` function located in the script file called `MainScript.js`. As shown, this file is identified as the launch script in the runtime configuration.

```
aws gamelift create-fleet \
```

```
    --name MegaFrogRace.NA.realtime \
    --description 'Mega Frog Race Realtime fleet' \
    --script-id script-1111aaaa-22bb-33cc-44dd-5555eeee66ff \
    --ec2-instance-type c4.large \
    --fleet-type SPOT \
    --certificate-configuration 'CertificateType=GENERATED' --runtime-configuration
 'ServerProcesses=[{LaunchPath=/local/game/MainScript.js,Parameters=+map
 Winter444,ConcurrentExecutions=5}]'
```

Output:

```
{
    "FleetAttributes": {
        "FleetId": "fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
        "Status": "NEW",
        "CreationTime": 1569310745.212,
        "InstanceType": "c4.large",
        "NewGameSessionProtectionPolicy": "NoProtection",
        "CertificateConfiguration": {
            "CertificateType": "GENERATED"
        },
        "Name": "MegaFrogRace.NA.realtime",
        "ScriptId": "script-1111aaaa-22bb-33cc-44dd-5555eeee66ff",
        "FleetArn": "arn:aws:gamelift:us-west-2:444455556666:fleet/
fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
        "FleetType": "SPOT",
        "MetricGroups": [
            "default"
        ],
        "Description": "Mega Frog Race Realtime fleet",
        "OperatingSystem": "AMAZON_LINUX"
    }
}
```

- For API details, see CreateFleet in *AWS CLI Command Reference*.

`create-game-session-queue`

The following code example shows how to use `create-game-session-queue`.

AWS CLI

Example1: To set up an ordered game session queue

The following `create-game-session-queue` example creates a new game session queue with destinations in two regions. It also configures the queue so that game session requests time out after waiting 10 minutes for placement. Since no latency policies are defined, GameLift attempts to place all game sessions with the first destination listed.

```
aws gamelift create-game-session-queue \
    --name MegaFrogRaceServer-NA \
    --destinations file://destinations.json \
    --timeout-in-seconds 600
```

Contents of `destinations.json`:

```
{
    "Destinations": [
        {"DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" },
        {"DestinationArn": "arn:aws:gamelift:us-west-1::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222" }
    ]
}
```

Output:

```
{
    "GameSessionQueues": [
        {
            "Name": "MegaFrogRaceServer-NA",
            "GameSessionQueueArn": "arn:aws:gamelift:us-
west-2:123456789012:gamesessionqueue/MegaFrogRaceServer-NA",
            "TimeoutInSeconds": 600,
            "Destinations": [
                {"DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"},
                {"DestinationArn": "arn:aws:gamelift:us-west-1::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"}
            ]
        }
    ]
}
```

Example2: To set up a game session queue with player latency policies

The following `create-game-session-queue` example creates a new game session queue with two player latency policies. The first policy sets a 100ms latency cap that is enforced during the first minute of a game session placement attempt. The second policy raises the latency cap to 200ms until the placement request times out at 3 minutes.

```
aws gamelift create-game-session-queue \
    --name MegaFrogRaceServer-NA \
    --destinations file://destinations.json \
    --player-latency-policies file://latency-policies.json \
    --timeout-in-seconds 180
```

Contents of `destinations.json`:

```
{
    "Destinations": [
        { "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" },
        { "DestinationArn": "arn:aws:gamelift:us-east-1::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222" }
    ]
}
```

Contents of `latency-policies.json`:

```
{
    "PlayerLatencyPolicies": [
        {"MaximumIndividualPlayerLatencyMilliseconds": 200},
        {"MaximumIndividualPlayerLatencyMilliseconds": 100, "PolicyDurationSeconds":
 60}
    ]
}
```

Output:

```
{
    "GameSessionQueue": {
        "Name": "MegaFrogRaceServer-NA",
        "GameSessionQueueArn": "arn:aws:gamelift:us-
west-2:111122223333:gamesessionqueue/MegaFrogRaceServer-NA",
        "TimeoutInSeconds": 600,
        "PlayerLatencyPolicies": [
```

```
            {
                "MaximumIndividualPlayerLatencyMilliseconds": 100,
                "PolicyDurationSeconds": 60
            },
            {
                "MaximumIndividualPlayerLatencyMilliseconds": 200
            }
        ]
        "Destinations": [
            {"DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"},
            {"DestinationArn": "arn:aws:gamelift:us-east-1::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"}
        ],
    }
}
```

For more information, see Create a Queue in the *Amazon GameLift Developer Guide*.

- For API details, see CreateGameSessionQueue in *AWS CLI Command Reference*.

`delete-build`

The following code example shows how to use `delete-build`.

AWS CLI

To delete a custom game build

The following `delete-build` example removes a build from your Amazon GameLift account. After the build is deleted, you cannot use it to create new fleets. This operation cannot be undone.

```
aws gamelift delete-build \
   --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

- For API details, see DeleteBuild in *AWS CLI Command Reference*.

`delete-fleet`

The following code example shows how to use `delete-fleet`.

AWS CLI

To delete a fleet that is no longer in use

The following `delete-fleet` example removes a fleet that has been scaled down to zero instances. If the fleet capacity is greater than zero, the request fails with an HTTP 400 error.

```
aws gamelift delete-fleet \
   --fleet-id fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Manage GameLift Fleets in the *Amazon GameLift Developer Guide*.

- For API details, see DeleteFleet in *AWS CLI Command Reference*.

`delete-game-session-queue`

The following code example shows how to use `delete-game-session-queue`.

AWS CLI

To delete a game session queue

The following `delete-game-session-queue` example deletes a specified game session queue.

```
aws gamelift delete-game-session-queue \
    --name MegaFrogRace-NA
```

This command produces no output.

- For API details, see DeleteGameSessionQueue in *AWS CLI Command Reference*.

`describe-build`

The following code example shows how to use `describe-build`.

AWS CLI

To get information on a custom game build

The following `describe-build` example retrieves properties for a game server build resource.

```
aws gamelift describe-build \
    --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "Build": {
        "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111",
        "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "CreationTime": 1496708916.18,
        "Name": "My_Game_Server_Build_One",
        "OperatingSystem": "AMAZON_LINUX",
        "SizeOnDisk": 1304924,
        "Status": "READY",
        "Version": "12345.678"
    }
}
```

For more information, see Upload a Custom Server Build to GameLift in the *Amazon GameLift Developer Guide*.

- For API details, see DescribeBuild in *AWS CLI Command Reference*.

`describe-ec2-instance-limits`

The following code example shows how to use `describe-ec2-instance-limits`.

AWS CLI

To retrieve service limits for an EC2 instance type

The following `describe-ec2-instance-limits` example displays the maximum allowed instances and current instances in use for the specified EC2 instance type in the current Region. The result indicates that only five of the allowed twenty instances are being used.

```
aws gamelift describe-ec2-instance-limits \
    --ec2-instance-type m5.large
```

Output:

```
{
    "EC2InstanceLimits": [
        {
            "EC2InstanceType": ""m5.large",
            "CurrentInstances": 5,
            "InstanceLimit": 20
        }
    ]
}
```

For more information, see [Choose Computing Resources](#) in the *Amazon GameLift Developer Guide*.

- For API details, see [DescribeEc2InstanceLimits](#) in *AWS CLI Command Reference*.

`describe-fleet-attributes`

The following code example shows how to use `describe-fleet-attributes`.

AWS CLI

Example1: To view attributes for a list of fleets

The following `describe-fleet-attributes` example retrieves fleet attributes for two specified fleets. As shown, the requested fleets are deployed with the same build, one for On-Demand instances and one for Spot instances, with some minor configuration differences.

```
aws gamelift describe-fleet-attributes \
    --fleet-ids arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111 fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "FleetAttributes": [
        {
            "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "FleetArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111",
            "FleetType": "ON_DEMAND",
            "InstanceType": "c4.large",
            "Description": "On-demand hosts for v2 North America",
```

```
            "Name": "MegaFrogRaceServer.NA.v2-od",
            "CreationTime": 1568836191.995,
            "Status": "ACTIVE",
            "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-
cdef-EXAMPLE33333",
            "ServerLaunchPath": "C:\\game\\MegaFrogRace_Server.exe",
            "ServerLaunchParameters": "+gamelift_start_server",
            "NewGameSessionProtectionPolicy": "NoProtection",
            "OperatingSystem": "WINDOWS_2012",
            "MetricGroups": [
                "default"
            ],
            "CertificateConfiguration": {
                "CertificateType": "DISABLED"
            }
        },
        {
            "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "FleetArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222",
            "FleetType": "SPOT",
            "InstanceType": "c4.large",
            "Description": "On-demand hosts for v2 North America",
            "Name": "MegaFrogRaceServer.NA.v2-spot",
            "CreationTime": 1568838275.379,
            "Status": "ACTIVATING",
            "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-
cdef-EXAMPLE33333",
            "ServerLaunchPath": "C:\\game\\MegaFrogRace_Server.exe",
            "NewGameSessionProtectionPolicy": "NoProtection",
            "OperatingSystem": "WINDOWS_2012",
                "MetricGroups": [
                "default"
            ],
            "CertificateConfiguration": {
                "CertificateType": "GENERATED"
            }
        }
    ]
}
```

Example2: To request attributes for all fleets

The following `describe-fleet-attributes` returns fleet attributes for all fleets with any status. This example illustrates the use of pagination parameters to return one fleet at a time.

```
aws gamelift describe-fleet-attributes \
    --limit 1
```

Output:

```
{
    "FleetAttributes": [
        {
            "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "FleetArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222",
            "FleetType": "SPOT",
            "InstanceType": "c4.large",
            "Description": "On-demand hosts for v2 North America",
            "Name": "MegaFrogRaceServer.NA.v2-spot",
            "CreationTime": 1568838275.379,
            "Status": "ACTIVATING",
            "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-
cdef-EXAMPLE33333",
            "ServerLaunchPath": "C:\\game\\MegaFrogRace_Server.exe",
            "NewGameSessionProtectionPolicy": "NoProtection",
            "OperatingSystem": "WINDOWS_2012",
            "MetricGroups": [
                "default"
            ],
            "CertificateConfiguration": {
                "CertificateType": "GENERATED"
            }
        }
    ],
    "NextToken":
 "eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTZmMS
}
```

The output includes a `NextToken` value that you can use when you call the command a second time. Pass the value to the `--next-token` parameter to specify where to pick up the output. The following command returns the second result in the output.

```
aws gamelift describe-fleet-attributes \
    --limit 1 \
    --next-
token eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZT
```

Repeat until the response doesn't include a `NextToken` value.

For more information, see [Setting Up GameLift Fleets]() in the *Amazon GameLift Developer Guide*.

- For API details, see [DescribeFleetAttributes]() in *AWS CLI Command Reference*.

`describe-fleet-capacity`

The following code example shows how to use `describe-fleet-capacity`.

AWS CLI

To view capacity status for a list of fleets

The following `describe-fleet-capacity` example retrieves current capacity for two specified fleets.

```
aws gamelift describe-fleet-capacity \
    --fleet-ids arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111 fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "FleetCapacity": [
        {
            "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "InstanceType": "c5.large",
            "InstanceCounts": {
                "DESIRED": 10,
                "MINIMUM": 1,
                "MAXIMUM": 20,
                "PENDING": 0,
```

```
                    "ACTIVE": 10,
                    "IDLE": 3,
                    "TERMINATING": 0
                }
            },
            {
                "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
                "InstanceType": "c5.large",
                "InstanceCounts": {
                    "DESIRED": 13,
                    "MINIMUM": 1,
                    "MAXIMUM": 20,
                    "PENDING": 0,
                    "ACTIVE": 15,
                    "IDLE": 2,
                    "TERMINATING": 2
                }
            }

    ]
}
```

For more information, see GameLift Metrics for Fleets in the *Amazon GameLift Developer Guide*.

- For API details, see DescribeFleetCapacity in *AWS CLI Command Reference*.

`describe-fleet-events`

The following code example shows how to use `describe-fleet-events`.

AWS CLI

To request events for a specified time span

The following `describe-fleet-events` example displays details of all fleet-related events that occurred during the specified time span.

```
aws gamelift describe-fleet-events \
    --fleet-id arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --start-time 1579647600 \
    --end-time 1579649400 \
    --limit 5
```

Output:

```
{
    "Events": [
        {
            "EventId": "a37b6892-5d07-4d3b-8b47-80244ecf66b9",
            "ResourceId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "EventCode": "FLEET_STATE_ACTIVE",
            "Message": "Fleet fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 changed
 state to ACTIVE",
            "EventTime": 1579649342.191
        },
        {
            "EventId": "67da4ec9-92a3-4d95-886a-5d6772c24063",
            "ResourceId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",

For more information, see [Debug GameLift Fleet Issues](#) in the *Amazon GameLift Developer Guide*.

- For API details, see [DescribeFleetEvents](#) in *AWS CLI Command Reference*.

`describe-fleet-port-settings`

The following code example shows how to use `describe-fleet-port-settings`.

AWS CLI

To view inbound connection permissions for a fleet

The following `describe-fleet-port-settings` example retrieves connection settings for a specified fleet.

```
aws gamelift describe-fleet-port-settings \
    --fleet-id arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "InboundPermissions": [
        {
            "FromPort": 33400,
            "ToPort": 33500,
            "IpRange": "0.0.0.0/0",
            "Protocol": "UDP"
        },
        {
            "FromPort": 1900,
            "ToPort": 2000,
            "IpRange": "0.0.0.0/0",
            "Protocol": "TCP"
        }
    ]
}
```

For more information, see Setting Up GameLift Fleets in the *Amazon GameLift Developer Guide*.

- For API details, see DescribeFleetPortSettings in *AWS CLI Command Reference*.

`describe-fleet-utilization`

The following code example shows how to use `describe-fleet-utilization`.

AWS CLI

Example1: To view usage data for a list of fleets

The following `describe-fleet-utilization` example retrieves current usage information for one specified fleet.

```
aws gamelift describe-fleet-utilization \
    --fleet-ids arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "FleetUtilization": [
        {
        "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "ActiveServerProcessCount": 100,
        "ActiveGameSessionCount": 62,
        "CurrentPlayerSessionCount": 329,
        "MaximumPlayerSessionCount": 1000
        }
    ]
}
```

Example2: To request usage data for all fleets

The following `describe-fleet-utilization` returns fleet usage data for all fleets with any status. This example uses pagination parameters to return data for two fleets at a time.

```
aws gamelift describe-fleet-utilization \
    --limit 2
```

Output:

```
{
    "FleetUtilization": [
        {
            "FleetId": "fleet-1111aaaa-22bb-33cc-44dd-5555eeee66ff",
            "ActiveServerProcessCount": 100,
            "ActiveGameSessionCount": 13,
            "CurrentPlayerSessionCount": 98,
            "MaximumPlayerSessionCount": 1000
        },
        {
            "FleetId": "fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
            "ActiveServerProcessCount": 100,
            "ActiveGameSessionCount": 62,
            "CurrentPlayerSessionCount": 329,
            "MaximumPlayerSessionCount": 1000
        }
    ],
    "NextToken":
  "eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTZmMS
```

```
}
```

Call the command a second time, passing the `NextToken` value as the argument to the `--next-token` parameter to see the next two results.

```
aws gamelift describe-fleet-utilization \
    --limit 2 \
    --next-
token eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZT
```

Repeat until the response no longer includes a `NextToken` value in the output.

For more information, see GameLift Metrics for Fleets in the *Amazon GameLift Developer Guide*.

- For API details, see DescribeFleetUtilization in *AWS CLI Command Reference*.

`describe-game-session-queues`

The following code example shows how to use `describe-game-session-queues`.

AWS CLI

To view game session queues

The following `describe-game-session-queues` example retrieves properties for two specified queues.

```
aws gamelift describe-game-session-queues \
    --names MegaFrogRace-NA MegaFrogRace-EU
```

Output:

```
{
    "GameSessionQueues": [{
            "Destinations": [{
                    "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
                },
                {
                    "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
```

```
                }
            ],
            "Name": "MegaFrogRace-NA",
            "TimeoutInSeconds": 600,
            "GameSessionQueueArn": "arn:aws:gamelift:us-west-2::gamesessionqueue/
MegaFrogRace-NA",
            "PlayerLatencyPolicies": [{
                    "MaximumIndividualPlayerLatencyMilliseconds": 200
                },
                {
                    "MaximumIndividualPlayerLatencyMilliseconds": 100,
                    "PolicyDurationSeconds": 60
                }
            ],
            "FilterConfiguration": {
                "AllowedLocations": ["us-west-2", "ap-south-1", "us-east-1"]
            },
            "PriorityConfiguration": {
                "PriorityOrder": ["LOCATION", "FLEET_TYPE", "DESTINATION"],
                "LocationOrder": ["us-west-2", "ap-south-1", "us-east-1"]
            }
        },
        {
            "Destinations": [{
                "DestinationArn": "arn:aws:gamelift:eu-west-3::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
            }],
            "Name": "MegaFrogRace-EU",
            "TimeoutInSeconds": 600,
            "GameSessionQueueArn": "arn:aws:gamelift:us-west-2::gamesessionqueue/
MegaFrogRace-EU"
        }
    ]
}
```

For more information, see Using Multi-Region Queues in the *Amazon GameLift Developer Guide*.

- For API details, see DescribeGameSessionQueues in *AWS CLI Command Reference*.

`describe-runtime-configuration`

The following code example shows how to use `describe-runtime-configuration`.

AWS CLI

To request the runtime configuration for a fleet

The following `describe-runtime-configuration` example retrieves details about the current runtime configuration for a specified fleet.

```
aws gamelift describe-runtime-configuration \
    --fleet-id fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "RuntimeConfiguration": {
        "ServerProcesses": [
            {
                "LaunchPath": "C:\game\Bin64.Release.Dedicated
\MegaFrogRace_Server.exe",
                "Parameters": "+gamelift_start_server",
                "ConcurrentExecutions": 3
            },
            {
                "LaunchPath": "C:\game\Bin64.Release.Dedicated
\MegaFrogRace_Server.exe",
                "Parameters": "+gamelift_start_server +debug",
                "ConcurrentExecutions": 1
            }
        ],
        "MaxConcurrentGameSessionActivations": 2147483647,
        "GameSessionActivationTimeoutSeconds": 300
    }
}
```

For more information, see Run Multiple Processes on a Fleet in the *Amazon GameLift Developer Guide*.

- For API details, see DescribeRuntimeConfiguration in *AWS CLI Command Reference*.

`list-builds`

The following code example shows how to use `list-builds`.

AWS CLI

Example1: To get a list of custom game builds

The following `list-builds` example retrieves properties for all game server builds in the current Region. The sample request illustrates how to use the pagination parameters, `Limit` and `NextToken`, to retrieve the results in sequential sets. The first command retrieves the first two builds. Because there are more than two available, the response includes a `NextToken` to indicate that more results are available.

```
aws gamelift list-builds \
    --limit 2
```

Output:

```
{
    "Builds": [
        {
            "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111",
            "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "CreationTime": 1495664528.723,
            "Name": "My_Game_Server_Build_One",
            "OperatingSystem": "WINDOWS_2012",
            "SizeOnDisk": 8567781,
            "Status": "READY",
            "Version": "12345.678"
        },
        {
            "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222",
            "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "CreationTime": 1495528748.555,
            "Name": "My_Game_Server_Build_Two",
            "OperatingSystem": "AMAZON_LINUX_2",
            "SizeOnDisk": 8567781,
            "Status": "FAILED",
            "Version": "23456.789"
        }
    ],
    "NextToken":
 "eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTZmMS
```

```
}
```

You can then call the command again with the `--next-token` parameter as follows to see the next two builds.

```
aws gamelift list-builds \
    --limit 2
    --next-
token eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZT
```

Repeat until the response doesn't include a `NextToken` value.

Example2: To get a list of custom game builds in failure status

The following `list-builds` example retrieves properties for all game server builds in the current region that currently have status FAILED.

```
aws gamelift list-builds \
    --status FAILED
```

Output:

```
{
    "Builds": [
        {
            "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222",
            "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "CreationTime": 1495528748.555,
            "Name": "My_Game_Server_Build_Two",
            "OperatingSystem": "AMAZON_LINUX_2",
            "SizeOnDisk": 8567781,
            "Status": "FAILED",
            "Version": "23456.789"
        }
    ]
}
```

- For API details, see ListBuilds in *AWS CLI Command Reference*.

`list-fleets`

The following code example shows how to use `list-fleets`.

AWS CLI

Example1: To get a list of all fleets in a Region

The following `list-fleets` example displays the fleet IDs of all fleets in the current Region. This example uses pagination parameters to retrieve two fleet IDs at a time. The response includes a `next-token` attribute, which indicates that there are more results to retrieve.

```
aws gamelift list-fleets \
    --limit 2
```

Output:

```
{
    "FleetIds": [
        "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
    ],
    "NextToken":
 "eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTZmMS
}
```

You can pass the `NextToken` value from the previous response in the next command, as shown here to get the next two results.

```
aws gamelift list-fleets \
    --limit 2 \
    --next-
token eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC00NDRlZj
```

Example2: To get a list of all fleets in a Region with a specific build or script

The following `list-builds` example retrieves the IDs of fleets that are deployed with the specified game build. If you're working with Realtime Servers, you can provide a script ID in place of a build ID. Because this example does not specify the limit parameter, the results can include up to 16 fleet IDs.

```
aws gamelift list-fleets \
    --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "FleetIds": [
        "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
        "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE44444"
    ]
}
```

- For API details, see ListFleets in *AWS CLI Command Reference*.

`request-upload-credentials`

The following code example shows how to use `request-upload-credentials`.

AWS CLI

To refresh access credentials for uploading a build

The following `create-build` example obtains new, valid access credentials for uploading a GameLift build file to an Amazon S3 location. Credentials have a limited life span. You get the build ID from the response to the original `CreateBuild` request.

```
aws gamelift request-upload-credentials \
    --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "StorageLocation": {
        "Bucket": "gamelift-builds-us-west-2",
        "Key": "123456789012/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    },
    "UploadCredentials": {
        "AccessKeyId": "AKIAIOSFODNN7EXAMPLE",
        "SecretAccessKey": "wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY",
        "SessionToken": "AgoGb3JpZ2luENz...EXAMPLETOKEN=="
```

```
    }
}
```

For more information, see Upload a Custom Server Build to GameLift in the *Amazon GameLift Developer Guide*.

- For API details, see RequestUploadCredentials in *AWS CLI Command Reference*.

`start-fleet-actions`

The following code example shows how to use `start-fleet-actions`.

AWS CLI

To restart fleet automatic scaling activity

The following `start-fleet-actions` example resumes the use of all scaling policies that are defined for the specified fleet but were stopped by calling``stop-fleet-actions``. After starting, the scaling policies immediately begin tracking their respective metrics.

```
aws gamelift start-fleet-actions \
    --fleet-id fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --actions AUTO_SCALING
```

This command produces no output.

- For API details, see StartFleetActions in *AWS CLI Command Reference*.

`stop-fleet-actions`

The following code example shows how to use `stop-fleet-actions`.

AWS CLI

To stop a fleet's automatic scaling activity

The following `stop-fleet-actions` example stops the use of all scaling policies that are defined for the specified fleet. After the policies are suspended, fleet capacity remains at the same active instance count unless you adjust it manually.

```
aws gamelift start-fleet-actions \
```

```
    --fleet-id fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --actions AUTO_SCALING
```

This command produces no output.

- For API details, see StopFleetActions in *AWS CLI Command Reference*.

update-build

The following code example shows how to use `update-build`.

AWS CLI

To update a custom game build

The following `update-build` example changes the name and version information that is associated with a specified build resource. The returned build object verifies that the changes were made successfully.

```
aws gamelift update-build \
    --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --name MegaFrogRaceServer.NA.east \
    --build-version 12345.east
```

Output:

```
{
    "Build": {
        "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111",
        "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "CreationTime": 1496708916.18,
        "Name": "MegaFrogRaceServer.NA.east",
        "OperatingSystem": "AMAZON_LINUX_2",
        "SizeOnDisk": 1304924,
        "Status": "READY",
        "Version": "12345.east"
    }
}
```

For more information, see Update Your Build Files in the *Amazon GameLift Developer Guide*.

- For API details, see UpdateBuild in *AWS CLI Command Reference*.

`update-game-session-queue`

The following code example shows how to use `update-game-session-queue`.

AWS CLI

To update a game session queue configuration

The following `update-game-session-queue` example adds a new destination and updates the player latency policies for an existing game session queue.

```
aws gamelift update-game-session-queue \
    --name MegaFrogRace-NA \
    --destinations file://destinations.json \
    --player-latency-policies file://latency-policies.json
```

Contents of `destinations.json`:

```
{
    "Destinations": [
        {"DestinationArn": "arn:aws:gamelift:us-west-2::fleet/
fleet-1a2b3c4d-5e6f-7a8b-9c0d-1e2f3a4b5c6d"},
        {"DestinationArn": "arn:aws:gamelift:us-east-1::fleet/
fleet-5c6d3c4d-5e6f-7a8b-9c0d-1e2f3a4b5a2b"},
        {"DestinationArn": "arn:aws:gamelift:us-east-1::alias/
alias-11aa22bb-3c4d-5e6f-000a-1111aaaa22bb"}
    ]
}
```

Contents of `latency-policies.json`:

```
{
    "PlayerLatencyPolicies": [
        {"MaximumIndividualPlayerLatencyMilliseconds": 200},
        {"MaximumIndividualPlayerLatencyMilliseconds": 150, "PolicyDurationSeconds":
 120},
        {"MaximumIndividualPlayerLatencyMilliseconds": 100, "PolicyDurationSeconds":
 120}
    ]
```

```
}
```

Output:

```
{
    "GameSessionQueue": {
        "Destinations": [
            {"DestinationArn": "arn:aws:gamelift:us-west-2::fleet/
fleet-1a2b3c4d-5e6f-7a8b-9c0d-1e2f3a4b5c6d"},
            {"DestinationArn": "arn:aws:gamelift:us-east-1::fleet/
fleet-5c6d3c4d-5e6f-7a8b-9c0d-1e2f3a4b5a2b"},
            {"DestinationArn": "arn:aws:gamelift:us-east-1::alias/
alias-11aa22bb-3c4d-5e6f-000a-1111aaaa22bb"}
        ],
        "GameSessionQueueArn": "arn:aws:gamelift:us-
west-2:111122223333:gamesessionqueue/MegaFrogRace-NA",
        "Name": "MegaFrogRace-NA",
        "TimeoutInSeconds": 600,
        "PlayerLatencyPolicies": [
            {"MaximumIndividualPlayerLatencyMilliseconds": 200},
            {"MaximumIndividualPlayerLatencyMilliseconds": 150,
 "PolicyDurationSeconds": 120},
            {"MaximumIndividualPlayerLatencyMilliseconds": 100,
 "PolicyDurationSeconds": 120}
        ]
    }
}
```

For more information, see Using Multi-Region Queues in the *Amazon GameLift Developer Guide*.

- For API details, see UpdateGameSessionQueue in *AWS CLI Command Reference*.

`upload-build`

The following code example shows how to use `upload-build`.

AWS CLI

Example1: To upload a Linux game server build

The following `upload-build` example uploads Linux game server build files from a file directory to the GameLift service and creates a build resource.

```
aws gamelift upload-build \
    --name MegaFrogRaceServer.NA \
    --build-version 2.0.1 \
    --build-root ~/MegaFrogRace_Server/release-na \
    --operating-system AMAZON_LINUX_2
    --server-sdk-version 4.0.2
```

Output:

```
Uploading ~/MegaFrogRace_Server/release-na:  16.0 KiB / 74.6 KiB (21.45%)
Uploading ~/MegaFrogRace_Server/release-na:  32.0 KiB / 74.6 KiB (42.89%)
Uploading ~/MegaFrogRace_Server/release-na:  48.0 KiB / 74.6 KiB (64.34%)
Uploading ~/MegaFrogRace_Server/release-na:  64.0 KiB / 74.6 KiB (85.79%)
Uploading ~/MegaFrogRace_Server/release-na:  74.6 KiB / 74.6 KiB (100.00%)
Successfully uploaded ~/MegaFrogRace_Server/release-na to AWS GameLift
Build ID: build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Example2: To upload a Windows game server build

The following `upload-build` example uploads Windows game server build files from a directory to the GameLift service and creates a build record.

```
aws gamelift upload-build \
    --name MegaFrogRaceServer.NA \
    --build-version 2.0.1 \
    --build-root C:\MegaFrogRace_Server\release-na \
    --operating-system WINDOWS_2012
    --server-sdk-version 4.0.2
```

Output:

```
Uploading C:\MegaFrogRace_Server\release-na:  16.0 KiB / 74.6 KiB (21.45%)
Uploading C:\MegaFrogRace_Server\release-na:  32.0 KiB / 74.6 KiB (42.89%)
Uploading C:\MegaFrogRace_Server\release-na:  48.0 KiB / 74.6 KiB (64.34%)
Uploading C:\MegaFrogRace_Server\release-na:  64.0 KiB / 74.6 KiB (85.79%)
Uploading C:\MegaFrogRace_Server\release-na:  74.6 KiB / 74.6 KiB (100.00%)
Successfully uploaded C:\MegaFrogRace_Server\release-na to AWS GameLift
Build ID: build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

For more information, see Upload a Custom Server Build to GameLift in the *Amazon GameLift Developer Guide*.

- For API details, see UploadBuild in *AWS CLI Command Reference*.

Amazon Glacier examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Glacier.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`abort-multipart-upload`

The following code example shows how to use `abort-multipart-upload`.

AWS CLI

The following command deletes an in-progress multipart upload to a vault named `my-vault`:

```
aws glacier abort-multipart-upload --account-id - --vault-name my-vault
 --upload-id 19gaRezEXAMPLES6Ry5YYdqthHOC_kGRCT03L9yetr220UmPtBYKk-
OssZtLqyFu7sY1_lR7vgFuJV6NtcV5zpsJ
```

This command does not produce any output. Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account. The upload ID is returned by the `aws glacier initiate-multipart-upload` command and can also be obtained by using `aws glacier list-multipart-uploads`.

For more information on multipart uploads to Amazon Glacier using the AWS CLI, see Using Amazon Glacier in the *AWS CLI User Guide*.

- For API details, see AbortMultipartUpload in *AWS CLI Command Reference*.

`abort-vault-lock`

The following code example shows how to use `abort-vault-lock`.

AWS CLI

To abort an in-progress vault lock process

The following `abort-vault-lock` example deletes a vault lock policy from the specified vault and resets the lock state of the vault lock to unlocked.

```
aws glacier abort-vault-lock \
    --account-id - \
    --vault-name MyVaultName
```

This command produces no output.

For more information, see Abort Vault Lock (DELETE lock-policy) in the *Amazon Glacier API Developer Guide*.

- For API details, see AbortVaultLock in *AWS CLI Command Reference*.

`add-tags-to-vault`

The following code example shows how to use `add-tags-to-vault`.

AWS CLI

The following command adds two tags to a vault named `my-vault`:

```
aws glacier add-tags-to-vault --account-id - --vault-name my-vault --
tags id=1234,date=july2015
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see AddTagsToVault in *AWS CLI Command Reference*.

`complete-multipart-upload`

The following code example shows how to use `complete-multipart-upload`.

AWS CLI

The following command completes multipart upload for a 3 MiB archive:

```
aws glacier complete-multipart-upload --archive-size 3145728 --
checksum 9628195fcdbcbbe76cdde456d4646fa7de5f219fb39823836d81f0cc0e18aa67
 --upload-id 19gaRezEXAMPLES6Ry5YYdqthHOC_kGRCT03L9yetr220UmPtBYKk-
OssZtLqyFu7sY1_lR7vgFuJV6NtcV5zpsJ --account-id - --vault-name my-vault
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

The upload ID is returned by the `aws glacier initiate-multipart-upload` command and can also be obtained by using `aws glacier list-multipart-uploads`. The checksum parameter takes a SHA-256 tree hash of the archive in hexadecimal.

For more information on multipart uploads to Amazon Glacier using the AWS CLI, including instructions on calculating a tree hash, see Using Amazon Glacier in the *AWS CLI User Guide*.

- For API details, see CompleteMultipartUpload in *AWS CLI Command Reference*.

`complete-vault-lock`

The following code example shows how to use `complete-vault-lock`.

AWS CLI

To complete an in-progress vault lock process

The following `complete-vault-lock` example completes the in-progress locking progress for the specified vault and sets the lock state of the vault lock to `Locked`. You get the value for the `lock-id` parameter when you run `initiate-lock-process`.

```
aws glacier complete-vault-lock \
    --account-id - \
    --vault-name MyVaultName \
    --lock-id 9QZgEXAMPLEPhvL6xEXAMPLE
```

This command produces no output.

For more information, see Complete Vault Lock (POST lockId) in the *Amazon Glacier API Developer Guide*.

- For API details, see CompleteVaultLock in *AWS CLI Command Reference*.

`create-vault`

The following code example shows how to use `create-vault`.

AWS CLI

The following command creates a new vault named `my-vault`:

```
aws glacier create-vault --vault-name my-vault --account-id -
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see CreateVault in *AWS CLI Command Reference*.

`delete-archive`

The following code example shows how to use `delete-archive`.

AWS CLI

To delete an archive from a vault

The following `delete-archive` example removes the specified archive from `example_vault`.

```
aws glacier delete-archive \
    --account-id 111122223333  \
    --vault-name example_vault \
    --archive-id Sc0u9ZP8yaWkmh-XGlIvAVprtLhaLCGnNwNl5I5x9HqPIkX5mjc0DrId3Ln-
Gi_k2HzmlIDZUz117KSdVMdMXLuFWi9PJUitxWO73edQ43eTlMWkH0pd9zVSAuV_XXZBVhKhyGhJ7w
```

This command produces no output.

- For API details, see DeleteArchive in *AWS CLI Command Reference*.

`delete-vault-access-policy`

The following code example shows how to use `delete-vault-access-policy`.

AWS CLI

To remove the access policy of a vault

The following `delete-vault-access-policy` example removes the access policy for the specified vault.

```
aws glacier delete-vault-access-policy \
    --account-id 111122223333 \
    --vault-name example_vault
```

This command produces no output.

- For API details, see DeleteVaultAccessPolicy in *AWS CLI Command Reference*.

`delete-vault-notifications`

The following code example shows how to use `delete-vault-notifications`.

AWS CLI

To remove the SNS notifications for a vault

The following `delete-vault-notifications` example removes notifications sent by Amazon Simple Notification Service (Amazon SNS) for the specified vault.

```
aws glacier delete-vault-notifications \
    --account-id 111122223333 \
    --vault-name example_vault
```

This command produces no output.

- For API details, see DeleteVaultNotifications in *AWS CLI Command Reference*.

`delete-vault`

The following code example shows how to use `delete-vault`.

AWS CLI

The following command deletes a vault named `my-vault`:

```
aws glacier delete-vault --vault-name my-vault --account-id -
```

This command does not produce any output. Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see DeleteVault in *AWS CLI Command Reference*.

describe-job

The following code example shows how to use `describe-job`.

AWS CLI

The following command retrieves information about an inventory retrieval job on a vault named `my-vault`:

```
aws glacier describe-job --account-id - --vault-name my-
vault --job-id zbxcm3Z_3z5UkoroF7SuZKrxgGoDc3RloGduS7Eg-
RO47Yc6FxsdGBgf_Q2DK5Ejh18CnTS5XW4_XqlNHS61dsO4CnMW
```

Output:

```
{
    "InventoryRetrievalParameters": {
        "Format": "JSON"
    },
    "VaultARN": "arn:aws:glacier:us-west-2:0123456789012:vaults/my-vault",
    "Completed": false,
    "JobId": "zbxcm3Z_3z5UkoroF7SuZKrxgGoDc3RloGduS7Eg-
RO47Yc6FxsdGBgf_Q2DK5Ejh18CnTS5XW4_XqlNHS61dsO4CnMW",
    "Action": "InventoryRetrieval",
    "CreationDate": "2015-07-17T20:23:41.616Z",
    "StatusCode": "InProgress"
}
```

The job ID can be found in the output of `aws glacier initiate-job` and `aws glacier list-jobs`. Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see DescribeJob in *AWS CLI Command Reference*.

`describe-vault`

The following code example shows how to use `describe-vault`.

AWS CLI

The following command retrieves data about a vault named `my-vault`:

```
aws glacier describe-vault --vault-name my-vault --account-id -
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see DescribeVault in *AWS CLI Command Reference*.

`get-data-retrieval-policy`

The following code example shows how to use `get-data-retrieval-policy`.

AWS CLI

The following command gets the data retrieval policy for the in-use account:

```
aws glacier get-data-retrieval-policy --account-id -
```

Output:

```
{
    "Policy": {
        "Rules": [
            {
                "BytesPerHour": 10737418240,
                "Strategy": "BytesPerHour"
            }
        ]
    }
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see GetDataRetrievalPolicy in *AWS CLI Command Reference*.

`get-job-output`

The following code example shows how to use `get-job-output`.

AWS CLI

The following command saves the output from a vault inventory job to a file in the current directory named `output.json`:

```
aws glacier get-job-output --account-id - --vault-name my-
vault --job-id zbxcm3Z_3z5UkoroF7SuZKrxgGoDc3RloGduS7Eg-
RO47Yc6FxsdGBgf_Q2DK5Ejh18CnTS5XW4_XqlNHS61dsO4CnMW output.json
```

The `job-id` is available in the output of `aws glacier list-jobs`. Note that the output file name is a positional argument that is not prefixed by an option name. Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

Output:

```
{
    "status": 200,
    "acceptRanges": "bytes",
    "contentType": "application/json"
}
```

`output.json`:

```
{"VaultARN":"arn:aws:glacier:us-west-2:0123456789012:vaults/
my-vault","InventoryDate":"2015-04-07T00:26:18Z","ArchiveList":
[{"ArchiveId":"kKB7ymWJVpPSwhGP6ycSOAekp9ZYe_--zM_mw6k76ZFGEIWQX-
ybtRDvc2VkPSDtfKmQrj0IRQLSGsNuDp-
AJVlu2ccmDSyDUmZwKbwbpAdGATGDiB3hHO0bjbGehXTcApVud_wyDw","ArchiveDescription":"multipart
 upload
 test","CreationDate":"2015-04-06T22:24:34Z","Size":3145728,"SHA256TreeHash":"9628195fcdbcbb
```

- For API details, see GetJobOutput in *AWS CLI Command Reference*.

`get-vault-access-policy`

The following code example shows how to use `get-vault-access-policy`.

AWS CLI

To retrieve the access policy of a vault

The following `get-vault-access-policy` example retrieves the access policy for the specified vault.

```
aws glacier get-vault-access-policy \
    --account-id 111122223333 \
    --vault-name example_vault
```

Output:

```
{
    "policy": {
        "Policy": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect
\":\"Allow\",\"Principal\":{\"AWS\":\"arn:aws:iam::444455556666:root
\"},\"Action\":\"glacier:ListJobs\",\"Resource\":\"arn:aws:glacier:us-
east-1:111122223333:vaults/example_vault\"},{\"Effect\":\"Allow\",\"Principal\":
{\"AWS\":\"arn:aws:iam::444455556666:root\"},\"Action\":\"glacier:UploadArchive\",
\"Resource\":\"arn:aws:glacier:us-east-1:111122223333:vaults/example_vault\"}]}"
    }
}
```

- For API details, see GetVaultAccessPolicy in *AWS CLI Command Reference*.

`get-vault-lock`

The following code example shows how to use `get-vault-lock`.

AWS CLI

To get the details of a vault lock

The following `get-vault-lock` example retrieved the details about the lock for the specified vault.

```
aws glacier get-vault-lock \
    --account-id - \
    --vault-name MyVaultName
```

Output:

```
{
    "Policy": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Sid\":\"Define-vault-lock\",\"Effect\":\"Deny\",\"Principal\":{\"AWS\":\"arn:aws:iam::999999999999:root\"},\"Action\":\"glacier:DeleteArchive\",\"Resource\":\"arn:aws:glacier:us-west-2:99999999999:vaults/MyVaultName\",\"Condition\":{\"NumericLessThanEquals\":{\"glacier:ArchiveAgeinDays\":\"365\"}}}]}",
    "State": "Locked",
    "CreationDate": "2019-07-29T22:25:28.640Z"
}
```

For more information, see Get Vault Lock (GET lock-policy) in the *Amazon Glacier API Developer Guide*.

- For API details, see GetVaultLock in *AWS CLI Command Reference*.

`get-vault-notifications`

The following code example shows how to use `get-vault-notifications`.

AWS CLI

The following command gets a description of the notification configuration for a vault named `my-vault`:

```
aws glacier get-vault-notifications --account-id - --vault-name my-vault
```

Output:

```
{
    "vaultNotificationConfig": {
        "Events": [
            "InventoryRetrievalCompleted",
            "ArchiveRetrievalCompleted"
        ],
        "SNSTopic": "arn:aws:sns:us-west-2:0123456789012:my-vault"
    }
}
```

If no notifications have been configured for the vault, an error is returned. Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see GetVaultNotifications in *AWS CLI Command Reference*.

`initiate-job`

The following code example shows how to use `initiate-job`.

AWS CLI

The following command initiates a job to get an inventory of the vault `my-vault`:

```
aws glacier initiate-job --account-id - --vault-name my-vault --job-parameters
 '{"Type": "inventory-retrieval"}'
```

Output:

```
{
    "location": "/0123456789012/vaults/my-vault/jobs/
zbxcm3Z_3z5UkoroF7SuZKrxgGoDc3RloGduS7Eg-
RO47Yc6FxsdGBgf_Q2DK5Ejh18CnTS5XW4_XqlNHS61dsO4CnMW",
    "jobId": "zbxcm3Z_3z5UkoroF7SuZKrxgGoDc3RloGduS7Eg-
RO47Yc6FxsdGBgf_Q2DK5Ejh18CnTS5XW4_XqlNHS61dsO4CnMW"
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

The following command initiates a job to retrieve an archive from the vault `my-vault`:

```
aws glacier initiate-job --account-id - --vault-name my-vault --job-
parameters file://job-archive-retrieval.json
```

`job-archive-retrieval.json` is a JSON file in the local folder that specifies the type of job, archive ID, and some optional parameters:

```
{
  "Type": "archive-retrieval",
  "ArchiveId": "kKB7ymWJVpPSwhGP6ycSOAekp9ZYe_--zM_mw6k76ZFGEIWQX-
ybtRDvc2VkPSDtfKmQrj0IRQLSGsNuDp-
AJVlu2ccmDSyDUmZwKbwbpAdGATGDiB3hHO0bjbGehXTcApVud_wyDw",
```

```
  "Description": "Retrieve archive on 2015-07-17",
  "SNSTopic": "arn:aws:sns:us-west-2:0123456789012:my-topic"
}
```

Archive IDs are available in the output of `aws glacier upload-archive` and `aws glacier get-job-output`.

Output:

```
{
    "location": "/011685312445/vaults/mwunderl/jobs/l7IL5-
EkXyEY9Ws95fClzIbk2O5uLYaFdAYOi-
azsX_Z8V6NH4yERHzars8wTKYQMX6nBDI9cMNHzyZJO59-8N9aHWav",
    "jobId": "l7IL5-EkXy2O5uLYaFdAYOiEY9Ws95fClzIbk-
azsX_Z8V6NH4yERHzars8wTKYQMX6nBDI9cMNHzyZJO59-8N9aHWav"
}
```

See Initiate Job in the *Amazon Glacier API Reference* for details on the job parameters format.

- For API details, see InitiateJob in *AWS CLI Command Reference*.

initiate-multipart-upload

The following code example shows how to use `initiate-multipart-upload`.

AWS CLI

The following command initiates a multipart upload to a vault named `my-vault` with a part size of 1 MiB (1024 x 1024 bytes) per file:

```
aws glacier initiate-multipart-upload --account-id - --part-size 1048576 --vault-
name my-vault --archive-description "multipart upload test"
```

The archive description parameter is optional. Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

This command outputs an upload ID when successful. Use the upload ID when uploading each part of your archive with `aws glacier upload-multipart-part`. For more information on multipart uploads to Amazon Glacier using the AWS CLI, see Using Amazon Glacier in the *AWS CLI User Guide*.

- For API details, see InitiateMultipartUpload in *AWS CLI Command Reference*.

`initiate-vault-lock`

The following code example shows how to use `initiate-vault-lock`.

AWS CLI

To initiate the vault locking process

The following `initiate-vault-lock` example installs a vault lock policy on the specified vault and sets the lock state of the vault lock to `InProgress`. You must complete the process by calling `complete-vault-lock` within 24 hours to set the state of the vault lock to `Locked`.

```
aws glacier initiate-vault-lock \
    --account-id - \
    --vault-name MyVaultName \
    --policy file://vault_lock_policy.json
```

Contents of `vault_lock_policy.json`:

```
{"Policy":"{\"Version\":\"2012-10-17\",\"Statement\":[{\"Sid\":\"Define-vault-
lock\",\"Effect\":\"Deny\",\"Principal\":{\"AWS\":\"arn:aws:iam::999999999999:root
\"},\"Action\":\"glacier:DeleteArchive\",\"Resource\":\"arn:aws:glacier:us-
west-2:999999999999:vaults/examplevault\",\"Condition\":{\"NumericLessThanEquals\":
{\"glacier:ArchiveAgeinDays\":\"365\"}}}]}"}
```

The output is the vault lock ID that you can use to complete the vault lock process.

```
{
    "lockId": "9QZgEXAMPLEPhvL6xEXAMPLE"
}
```

For more information, see Initiate Vault Lock (POST lock-policy) in the *Amazon Glacier API Developer Guide*.

- For API details, see InitiateVaultLock in *AWS CLI Command Reference*.

`list-jobs`

The following code example shows how to use `list-jobs`.

AWS CLI

The following command lists in-progress and recently completed jobs for a vault named `my-vault`:

```
aws glacier list-jobs --account-id - --vault-name my-vault
```

Output:

```
{
    "JobList": [
        {
            "VaultARN": "arn:aws:glacier:us-west-2:0123456789012:vaults/my-vault",
            "RetrievalByteRange": "0-3145727",
            "SNSTopic": "arn:aws:sns:us-west-2:0123456789012:my-vault",
            "Completed": false,
            "SHA256TreeHash":
 "9628195fcdbcbbe76cdde932d4646fa7de5f219fb39823836d81f0cc0e18aa67",
            "JobId": "l7IL5-EkXyEY9Ws95fClzIbk2O5uLYaFdAYOi-
azsX_Z8V6NH4yERHzars8wTKYQMX6nBDI9cMNHzyZJO59-8N9aHWav",
            "ArchiveId": "kKB7ymWJVpPSwhGP6ycSOAekp9ZYe_--zM_mw6k76ZFGEIWQX-
ybtRDvc2VkPSDtfKmQrj0IRQLSGsNuDp-
AJVlu2ccmDSyDUmZwKbwbpAdGATGDiB3hHO0bjbGehXTcApVud_wyDw",
            "JobDescription": "Retrieve archive on 2015-07-17",
            "ArchiveSizeInBytes": 3145728,
            "Action": "ArchiveRetrieval",
            "ArchiveSHA256TreeHash":
 "9628195fcdbcbbe76cdde932d4646fa7de5f219fb39823836d81f0cc0e18aa67",
            "CreationDate": "2015-07-17T21:16:13.840Z",
            "StatusCode": "InProgress"
        },
        {
            "InventoryRetrievalParameters": {
                "Format": "JSON"
            },
            "VaultARN": "arn:aws:glacier:us-west-2:0123456789012:vaults/my-vault",
            "Completed": false,
            "JobId": "zbxcm3Z_3z5UkoroF7SuZKrxgGoDc3RloGduS7Eg-
RO47Yc6FxsdGBgf_Q2DK5Ejh18CnTS5XW4_XqlNHS61dsO4CnMW",
            "Action": "InventoryRetrieval",
            "CreationDate": "2015-07-17T20:23:41.616Z",
            "StatusCode": ""InProgress""
        }
```

```
    ]
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see ListJobs in *AWS CLI Command Reference*.

`list-multipart-uploads`

The following code example shows how to use `list-multipart-uploads`.

AWS CLI

The following command shows all of the in-progress multipart uploads for a vault named `my-vault`:

```
aws glacier list-multipart-uploads --account-id - --vault-name my-vault
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

For more information on multipart uploads to Amazon Glacier using the AWS CLI, see Using Amazon Glacier in the *AWS CLI User Guide*.

- For API details, see ListMultipartUploads in *AWS CLI Command Reference*.

`list-parts`

The following code example shows how to use `list-parts`.

AWS CLI

The following command lists the uploaded parts for a multipart upload to a vault named `my-vault`:

```
aws glacier list-parts --account-id - --vault-name my-vault --upload-id "SYZi7qnL-
YGqGwAm8Kn3BLP2ElNCvnB-5961R09CSaPmPwkYGHOqeN_nX3-Vhnd2yF0KfB5FkmbnBU9GubbdrCs8ut-D"
```

Output:

```
{
    "MultipartUploadId": "SYZi7qnL-
YGqGwAm8Kn3BLP2ElNCvnB-5961R09CSaPmPwkYGHOqeN_nX3-Vhnd2yF0KfB5FkmbnBU9GubbdrCs8ut-
D",
    "Parts": [
        {
            "RangeInBytes": "0-1048575",
            "SHA256TreeHash":
 "e1f2a7cd6e047350f69b9f8cfa60fa606fe2f02802097a9a026360a7edc1f553"
        },
        {
            "RangeInBytes": "1048576-2097151",
            "SHA256TreeHash":
 "43cf3061fb95796aed99a11a6aa3cd8f839eed15e655ab0a597126210636aee6"
        }
    ],
    "VaultARN": "arn:aws:glacier:us-west-2:0123456789012:vaults/my-vault",
    "CreationDate": "2015-07-18T00:05:23.830Z",
    "PartSizeInBytes": 1048576
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

For more information on multipart uploads to Amazon Glacier using the AWS CLI, see Using Amazon Glacier in the *AWS CLI User Guide*.

- For API details, see ListParts in *AWS CLI Command Reference*.

`list-provisioned-capacity`

The following code example shows how to use `list-provisioned-capacity`.

AWS CLI

To retrieve the provisioned capacity units

The following `list-provisioned-capacity` example retrieves details for any provisioned capacity units for the specified account.

```
aws glacier list-provisioned-capacity \
    --account-id 111122223333
```

Output:

```
{
    "ProvisionedCapacityList": [
        {
            "CapacityId": "HpASAuvfRFiVDbOjMfEIcr8K",
            "ExpirationDate": "2020-03-18T19:59:24.000Z",
            "StartDate": "2020-02-18T19:59:24.912Z"
        }
    ]
}
```

- For API details, see ListProvisionedCapacity in *AWS CLI Command Reference*.

`list-tags-for-vault`

The following code example shows how to use `list-tags-for-vault`.

AWS CLI

The following command lists the tags applied to a vault named `my-vault`:

```
aws glacier list-tags-for-vault --account-id - --vault-name my-vault
```

Output:

```
{
    "Tags": {
        "date": "july2015",
        "id": "1234"
    }
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see ListTagsForVault in *AWS CLI Command Reference*.

`list-vaults`

The following code example shows how to use `list-vaults`.

AWS CLI

The following command lists the vaults in the default account and region:

```
aws glacier list-vaults --account-id -
```

Output:

```
{
    "VaultList": [
        {
            "SizeInBytes": 3178496,
            "VaultARN": "arn:aws:glacier:us-west-2:0123456789012:vaults/my-vault",
            "LastInventoryDate": "2015-04-07T00:26:19.028Z",
            "VaultName": "my-vault",
            "NumberOfArchives": 1,
            "CreationDate": "2015-04-06T21:23:45.708Z"
        }
    ]
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see ListVaults in *AWS CLI Command Reference*.

`purchase-provisioned-capacity`

The following code example shows how to use `purchase-provisioned-capacity`.

AWS CLI

To purchase a provisioned capacity unit

The following `purchase-provisioned-capacity` example purchases a provisioned capacity unit.

```
aws glacier purchase-provisioned-capacity \
    --account-id 111122223333
```

Output:

```
{
    "capacityId": "HpASAuvfRFiVDbOjMfEIcr8K"
}
```

- For API details, see PurchaseProvisionedCapacity in *AWS CLI Command Reference*.

`remove-tags-from-vault`

The following code example shows how to use `remove-tags-from-vault`.

AWS CLI

The following command removes a tag with the key `date` from a vault named `my-vault`:

```
aws glacier remove-tags-from-vault --account-id - --vault-name my-vault --tag-keys date
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see RemoveTagsFromVault in *AWS CLI Command Reference*.

`set-data-retrieval-policy`

The following code example shows how to use `set-data-retrieval-policy`.

AWS CLI

The following command configures a data retrieval policy for the in-use account:

```
aws glacier set-data-retrieval-policy --account-id - --policy file://data-retrieval-policy.json
```

`data-retrieval-policy.json` is a JSON file in the current folder that specifies a data retrieval policy:

```
{
  "Rules":[
     {
```

```
            "Strategy":"BytesPerHour",
            "BytesPerHour":10737418240
        }
    ]
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

The following command sets the data retrieval policy to `FreeTier` using inline JSON:

```
aws glacier set-data-retrieval-policy --account-id - --policy '{"Rules":
[{"Strategy":"FreeTier"}]}'
```

See Set Data Retrieval Policy in the *Amazon Glacier API Reference* for details on the policy format.

- For API details, see SetDataRetrievalPolicy in *AWS CLI Command Reference*.

`set-vault-access-policy`

The following code example shows how to use `set-vault-access-policy`.

AWS CLI

To set the access policy of a vault

The following `set-vault-access-policy` example attaches a permission policy to the specified vault.

```
aws glacier set-vault-access-policy \
    --account-id 111122223333 \
    --vault-name example_vault
    --policy '{"Policy": "{\"Version\":\"2012-10-17\",\"Statement\":
[{\"Effect\":\"Allow\",\"Principal\":{\"AWS\":\"arn:aws:iam::444455556666:root
\"},\"Action\":\"glacier:ListJobs\",\"Resource\":\"arn:aws:glacier:us-
east-1:111122223333:vaults/example_vault\"},{\"Effect\":\"Allow\",\"Principal\":
{\"AWS\":\"arn:aws:iam::444455556666:root\"},\"Action\":\"glacier:UploadArchive\",
\"Resource\":\"arn:aws:glacier:us-east-1:111122223333:vaults/example_vault\"}]}"}'
```

This command produces no output.

- For API details, see SetVaultAccessPolicy in *AWS CLI Command Reference*.

`set-vault-notifications`

The following code example shows how to use `set-vault-notifications`.

AWS CLI

The following command configures SNS notifications for a vault named `my-vault`:

```
aws glacier set-vault-notifications --account-id - --vault-name my-vault --vault-notification-config file://notificationconfig.json
```

`notificationconfig.json` is a JSON file in the current folder that specifies an SNS topic and the events to publish:

```
{
  "SNSTopic": "arn:aws:sns:us-west-2:0123456789012:my-vault",
  "Events": ["ArchiveRetrievalCompleted", "InventoryRetrievalCompleted"]
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see SetVaultNotifications in *AWS CLI Command Reference*.

`upload-archive`

The following code example shows how to use `upload-archive`.

AWS CLI

The following command uploads an archive in the current folder named `archive.zip` to a vault named `my-vault`:

```
aws glacier upload-archive --account-id - --vault-name my-vault --body archive.zip
```

Output:

```
{
```

```
    "archiveId": "kKB7ymWJVpPSwhGP6ycSOAekp9ZYe_--zM_mw6k76ZFGEIWQX-
ybtRDvc2VkPSDtfKmQrj0IRQLSGsNuDp-
AJVlu2ccmDSyDUmZwKbwbpAdGATGDiB3hHO0bjbGehXTcApVud_wyDw",
    "checksum": "969fb39823836d81f0cc028195fcdbcbbe76cdde932d4646fa7de5f21e18aa67",
    "location": "/0123456789012/vaults/my-vault/archives/
kKB7ymWJVpPSwhGP6ycSOAekp9ZYe_--zM_mw6k76ZFGEIWQX-ybtRDvc2VkPSDtfKmQrj0IRQLSGsNuDp-
AJVlu2ccmDSyDUmZwKbwbpAdGATGDiB3hHO0bjbGehXTcApVud_wyDw"
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

To retrieve an uploaded archive, initiate a retrieval job with the aws glacier initiate-job command.

- For API details, see UploadArchive in *AWS CLI Command Reference*.

`upload-multipart-part`

The following code example shows how to use `upload-multipart-part`.

AWS CLI

The following command uploads the first 1 MiB (1024 x 1024 bytes) part of an archive:

```
aws glacier upload-multipart-part --body part1 --range 'bytes
 0-1048575/*' --account-id - --vault-name my-vault --upload-
id 19gaRezEXAMPLES6Ry5YYdqthHOC_kGRCT03L9yetr220UmPtBYKk-
OssZtLqyFu7sY1_lR7vgFuJV6NtcV5zpsJ
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

The body parameter takes a path to a part file on the local filesystem. The range parameter takes an HTTP content range indicating the bytes that the part occupies in the completed archive. The upload ID is returned by the `aws glacier initiate-multipart-upload` command and can also be obtained by using `aws glacier list-multipart-uploads`.

For more information on multipart uploads to Amazon Glacier using the AWS CLI, see Using Amazon Glacier in the *AWS CLI User Guide*.

- For API details, see [UploadMultipartPart](#) in *AWS CLI Command Reference*.

Global Accelerator examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Global Accelerator.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

`add-custom-routing-endpoints`

The following code example shows how to use `add-custom-routing-endpoints`.

AWS CLI

To add a VPC subnet endpoint to an endpoint group for a custom routing accelerator

The following `add-custom-routing-endpoints` example adds a VPC subnet endpoint to an endpoint group for a custom routing accelerator.

```
aws globalaccelerator add-custom-routing-endpoints \
    --endpoint-group-
arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/4321abcd \
    --endpoint-configurations "EndpointId=subnet-1234567890abcdef0"
```

Output:

```
{
    "EndpointDescriptions": [
```

```
        {
            "EndpointId": "subnet-1234567890abcdef0"
        }
    ],
    
 "EndpointGroupArn":"arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/4321abcd"
}
```

For more information, see VPC subnet endpoints for custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see AddCustomRoutingEndpoints in *AWS CLI Command Reference*.

`advertise-byoip-cidr`

The following code example shows how to use `advertise-byoip-cidr`.

AWS CLI

To advertise an address range

The following `advertise-byoip-cidr` example requests AWS to advertise an address range that you've provisioned for use with your AWS resources.

```
aws globalaccelerator advertise-byoip-cidr \
    --cidr 198.51.100.0/24
```

Output:

```
{
    "ByoipCidr": {
        "Cidr": "198.51.100.0/24",
        "State": "PENDING_ADVERTISING"
    }
}
```

For more information, see Bring Your Own IP Address in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see AdvertiseByoipCidr in *AWS CLI Command Reference*.

`allow-custom-routing-traffic`

The following code example shows how to use `allow-custom-routing-traffic`.

AWS CLI

To allow traffic to specific Amazon EC2 instance destinations in a VPC subnet for a custom routing accelerator

The following `allow-custom-routing-traffic` example specifies that traffic is allowed to certain Amazon EC2 instance (destination) IP addresses and ports for a VPC subnet endpoint in a custom routing accelerator can receive traffic.

```
aws globalaccelerator allow-custom-routing-traffic \
    --endpoint-group-
arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/ab88888example \
    --endpoint-id subnet-abcd123example \
    --destination-addresses "172.31.200.6" "172.31.200.7" \
    --destination-ports 80 81
```

This command produces no output.

For more information, see VPC subnet endpoints for custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see AllowCustomRoutingTraffic in *AWS CLI Command Reference*.

`create-accelerator`

The following code example shows how to use `create-accelerator`.

AWS CLI

To create an accelerator

The following `create-accelerator` example creates an accelerator with two tags with two BYOIP static IP addresses. You must specify the `US-West-2 (Oregon)` Region to create or update an accelerator.

```
aws globalaccelerator create-accelerator \
```

```
    --name ExampleAccelerator \
    --tags Key="Name",Value="Example Name" Key="Project",Value="Example Project" \
    --ip-addresses 192.0.2.250 198.51.100.52
```

Output:

```
{
    "Accelerator": {
        "AcceleratorArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh",
        "IpAddressType": "IPV4",
        "Name": "ExampleAccelerator",
        "Enabled": true,
        "Status": "IN_PROGRESS",
        "IpSets": [
            {
                "IpAddresses": [
                    "192.0.2.250",
                    "198.51.100.52"
                ],
                "IpFamily": "IPv4"
            }
        ],
        "DnsName":"a1234567890abcdef.awsglobalaccelerator.com",
        "CreatedTime": 1542394847.0,
        "LastModifiedTime": 1542394847.0
    }
}
```

For more information, see Accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see CreateAccelerator in *AWS CLI Command Reference*.

`create-custom-routing-accelerator`

The following code example shows how to use `create-custom-routing-accelerator`.

AWS CLI

To create a custom routing accelerator

The following `create-custom-routing-accelerator` example creates a custom routing accelerator with the tags `Name` and `Project`.

```
aws globalaccelerator create-custom-routing-accelerator \
    --name ExampleCustomRoutingAccelerator \
    --tags Key="Name",Value="Example Name" Key="Project",Value="Example Project" \
    --ip-addresses 192.0.2.250 198.51.100.52
```

Output:

```
{
    "Accelerator": {
        "AcceleratorArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh",
        "IpAddressType": "IPV4",
        "Name": "ExampleCustomRoutingAccelerator",
        "Enabled": true,
        "Status": "IN_PROGRESS",
        "IpSets": [
            {
                "IpAddresses": [
                    "192.0.2.250",
                    "198.51.100.52"
                ],
                "IpFamily": "IPv4"
            }
        ],
        "DnsName":"a1234567890abcdef.awsglobalaccelerator.com",
        "CreatedTime": 1542394847.0,
        "LastModifiedTime": 1542394847.0
    }
}
```

For more information, see Custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see CreateCustomRoutingAccelerator in *AWS CLI Command Reference*.

`create-custom-routing-endpoint-group`

The following code example shows how to use `create-custom-routing-endpoint-group`.

AWS CLI

To create an endpoint group for a custom routing accelerator

The following `create-custom-routing-endpoint-group` example creates an endpoint group for a custom routing accelerator.

```
aws globalaccelerator create-custom-routing-endpoint-group \
    --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz \
    --endpoint-group-region us-east-2 \
    --destination-configurations "FromPort=80,ToPort=81,Protocols=TCP,UDP"
```

Output:

```
{
    "EndpointGroup": {
        "EndpointGroupArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/4321abcd",
        "EndpointGroupRegion": "us-east-2",
        "DestinationDescriptions": [
            {
                "FromPort": 80,
                "ToPort": 81,
                "Protocols": [
                    "TCP",
                    "UDP"
                ]
            }
        ],
        "EndpointDescriptions": []
    }
}
```

For more information, see Endpoint groups for custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see CreateCustomRoutingEndpointGroup in *AWS CLI Command Reference*.

`create-custom-routing-listener`

The following code example shows how to use `create-custom-routing-listener`.

AWS CLI

To create a listener for a custom routing accelerator

The following `create-custom-routing-listener` example creates a listener with a port range from 5000 to 10000 for a custom routing accelerator.

```
aws globalaccelerator create-custom-routing-listener \
    --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh \
    --port-ranges FromPort=5000,ToPort=10000
```

Output:

```
{
    "Listener": {
        "PortRange": [
            "FromPort": 5000,
            "ToPort": 10000
        ],
        "ListenerArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/0123vxyz"
    }
}
```

For more information, see Listeners for custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see CreateCustomRoutingListener in *AWS CLI Command Reference*.

`create-endpoint-group`

The following code example shows how to use `create-endpoint-group`.

AWS CLI

To create an endpoint group

The following `create-endpoint-group` example creates an endpoint group with one endpoint.

```
aws globalaccelerator create-endpoint-group \
    --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh/listener/0123vxyz \
    --endpoint-group-region us-east-1 \
    --endpoint-configurations EndpointId=i-1234567890abcdef0,Weight=128
```

Output:

```
{
    "EndpointGroup": {
        "TrafficDialPercentage": 100.0,
        "EndpointDescriptions": [
            {
                "Weight": 128,
                "EndpointId": "i-1234567890abcdef0"
            }
        ],
        "EndpointGroupArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/098765zyxwvu",
        "EndpointGroupRegion": "us-east-1"
    }
}
```

For more information, see Endpoint groups in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see CreateEndpointGroup in *AWS CLI Command Reference*.

`create-listener`

The following code example shows how to use `create-listener`.

AWS CLI

To create a listener

The following `create-listener` example creates a listener with two ports.

```
aws globalaccelerator create-listener \
    --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh \
```

```
    --port-ranges FromPort=80,ToPort=80 FromPort=81,ToPort=81 \
    --protocol TCP
```

Output:

```
{
    "Listener": {
        "PortRanges": [
            {
                "ToPort": 80,
                "FromPort": 80
            },
            {
                "ToPort": 81,
                "FromPort": 81
            }
        ],
        "ClientAffinity": "NONE",
        "Protocol": "TCP",
        "ListenerArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/0123vxyz"
    }
}
```

For more information, see Listeners in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see CreateListener in *AWS CLI Command Reference*.

`deny-custom-routing-traffic`

The following code example shows how to use `deny-custom-routing-traffic`.

AWS CLI

To specify a destination address that cannot receive traffic in a custom routing accelerator

The following `deny-custom-routing-traffic` example specifies destination address or addresses in a subnet endpoint that cannot receive traffic for a custom routing accelerator. To specify more than one destination address, separate the addresses with a space. There's no response for a successful deny-custom-routing-traffic call.

```
aws globalaccelerator deny-custom-routing-traffic \
    --endpoint-group-
arn "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/ab88888example" \
    --endpoint-id "subnet-abcd123example" \
    --destination-addresses "198.51.100.52"
```

This command produces no output.

For more information, see VPC subnet endpoints for custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see DenyCustomRoutingTraffic in *AWS CLI Command Reference*.

`deprovision-byoip-cidr`

The following code example shows how to use `deprovision-byoip-cidr`.

AWS CLI

To deprovision an address range

The following `deprovision-byoip-cidr` example releases the specified address range that you provisioned to use with your AWS resources.

```
aws globalaccelerator deprovision-byoip-cidr \
    --cidr "198.51.100.0/24"
```

Output:

```
{
    "ByoipCidr": {
        "Cidr": "198.51.100.0/24",
        "State": "PENDING_DEPROVISIONING"
    }
}
```

For more information, see Bring your own IP address in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see DeprovisionByoipCidr in *AWS CLI Command Reference*.

`describe-accelerator-attributes`

The following code example shows how to use `describe-accelerator-attributes`.

AWS CLI

To describe an accelerator's attributes

The following `describe-accelerator-attributes` example retrieves the attribute details for an accelerator.

```
aws globalaccelerator describe-accelerator-attributes \
    --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

Output:

```
{
    "AcceleratorAttributes": {
        "FlowLogsEnabled": true
        "FlowLogsS3Bucket": flowlogs-abc
        "FlowLogsS3Prefix": bucketprefix-abc
    }
}
```

For more information, see Accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see DescribeAcceleratorAttributes in *AWS CLI Command Reference*.

`describe-accelerator`

The following code example shows how to use `describe-accelerator`.

AWS CLI

To describe an accelerator

The following `describe-accelerator` example retrieves the details about the specified accelerator.

```
aws globalaccelerator describe-accelerator \
```

```
    --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

Output:

```
{
    "Accelerator": {
        "AcceleratorArn":
 "arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh",
        "IpAddressType": "IPV4",
        "Name": "ExampleAccelerator",
        "Enabled": true,
        "Status": "IN_PROGRESS",
        "IpSets": [
            {
                "IpAddresses": [
                    "192.0.2.250",
                    "198.51.100.52"
                ],
                "IpFamily": "IPv4"
            }
        ],
        "DnsName":"a1234567890abcdef.awsglobalaccelerator.com",
        "CreatedTime": 1542394847,
        "LastModifiedTime": 1542395013
    }
}
```

For more information, see Accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see DescribeAccelerator in *AWS CLI Command Reference*.

`describe-custom-routing-accelerator-attributes`

The following code example shows how to use `describe-custom-routing-accelerator-attributes`.

AWS CLI

To describe a custom routing accelerator's attributes

The following `describe-custom-routing-accelerator-attributes` example describes the attributes for a custom routing accelerator.

```
aws globalaccelerator describe-custom-routing-accelerator-attributes \
   --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

Output:

```
{
    "AcceleratorAttributes": {
    "FlowLogsEnabled": false
    }
}
```

For more information, see Custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see DescribeCustomRoutingAcceleratorAttributes in *AWS CLI Command Reference*.

`describe-custom-routing-accelerator`

The following code example shows how to use `describe-custom-routing-accelerator`.

AWS CLI

To describe a custom routing accelerator

The following `describe-custom-routing-accelerator` example retrieves the details about the specified custom routing accelerator.

```
aws globalaccelerator describe-custom-routing-accelerator \
    --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

Output:

```
{
    "Accelerator": {
```

```
        "AcceleratorArn":
 "arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh",
        "IpAddressType": "IPV4",
        "Name": "ExampleCustomRoutingAccelerator",
        "Enabled": true,
        "Status": "IN_PROGRESS",
        "IpSets": [
            {
                "IpAddresses": [
                    "192.0.2.250",
                    "198.51.100.52"
                ],
                "IpFamily": "IPv4"
            }
        ],
        "DnsName":"a1234567890abcdef.awsglobalaccelerator.com",
        "CreatedTime": 1542394847,
        "LastModifiedTime": 1542395013
    }
}
```

For more information, see Custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see DescribeCustomRoutingAccelerator in *AWS CLI Command Reference*.

`describe-custom-routing-endpoint-group`

The following code example shows how to use `describe-custom-routing-endpoint-group`.

AWS CLI

To describe an endpoint group for a custom routing accelerator

The following `describe-custom-routing-endpoint-group` example describes an endpoint group for a custom routing accelerator.

```
aws globalaccelerator describe-custom-routing-endpoint-group \
    --endpoint-group-
arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/6789vxyz/endpoint-group/ab88888example
```

Output:

```
{
    "EndpointGroup": {
        "EndpointGroupArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/6789vxyz/endpoint-group/ab88888example",
        "EndpointGroupRegion": "us-east-2",
        "DestinationDescriptions": [
            {
                "FromPort": 5000,
                "ToPort": 10000,
                "Protocols": [
                    "UDP"
                ]
            }
        ],
        "EndpointDescriptions": [
            {
                "EndpointId": "subnet-1234567890abcdef0"
            }
        ]
    }
}
```

For more information, see Endpoint groups for custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see DescribeCustomRoutingEndpointGroup in *AWS CLI Command Reference*.

`describe-custom-routing-listener`

The following code example shows how to use `describe-custom-routing-listener`.

AWS CLI

To describe a listener for a custom routing accelerator

The following `describe-custom-routing-listener` example describes a listener for a custom routing accelerator.

```
aws globalaccelerator describe-custom-routing-listener \
```

```
    --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh/listener/abcdef1234
```

Output:

```
{
    "Listener": {
        "PortRanges": [
            "FromPort": 5000,
            "ToPort": 10000
        ],
        "ListenerArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/abcdef1234"
    }
}
```

For more information, see Listeners for custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see DescribeCustomRoutingListener in *AWS CLI Command Reference*.

`describe-endpoint-group`

The following code example shows how to use `describe-endpoint-group`.

AWS CLI

To describe an endpoint group

The following `describe-endpoint-group` example retrieves details about an endpoint group with the following endpoints: an Amazon EC2 instance, an ALB, and an NLB.

```
aws globalaccelerator describe-endpoint-group \
    --endpoint-group-
arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/6789vxyz-vxyz-6789-vxyz-6789lmnopqrs/endpoint-group/
ab88888example
```

Output:

```
{
```

```
    "EndpointGroup": {
        "TrafficDialPercentage": 100.0,
        "EndpointDescriptions": [
        {
            "Weight": 128,
            "EndpointId": "i-1234567890abcdef0"
        },
        {
            "Weight": 128,
            "EndpointId": "arn:aws:elasticloadbalancing:us-
east-1:000123456789:loadbalancer/app/ALBTesting/alb01234567890xyz"
        },
        {
            "Weight": 128,
            "EndpointId": "arn:aws:elasticloadbalancing:us-
east-1:000123456789:loadbalancer/net/NLBTesting/alb01234567890qrs"
        }
        ],
        "EndpointGroupArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/6789vxyz-vxyz-6789-vxyz-6789lmnopqrs/endpoint-
group/4321abcd-abcd-4321-abcd-4321abcdefg",
        "EndpointGroupRegion": "us-east-1"
    }
}
```

For more information, see Endpoint groups in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see DescribeEndpointGroup in *AWS CLI Command Reference*.

`describe-listener`

The following code example shows how to use `describe-listener`.

AWS CLI

To describe a listener

The following `describe-listener` example describes a listener.

```
aws globalaccelerator describe-listener \
```

```
    --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234
```

Output:

```
{
    "Listener": {
        "ListenerArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/abcdef1234",
        "PortRanges": [
            {
                "FromPort": 80,
                "ToPort": 80
            }
        ],
        "Protocol": "TCP",
        "ClientAffinity": "NONE"
    }
}
```

For more information, see Listeners in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see DescribeListener in *AWS CLI Command Reference*.

`list-accelerators`

The following code example shows how to use `list-accelerators`.

AWS CLI

To list your accelerators

The following `list-accelerators` example lists the accelerators in your AWS account. This account has two accelerators.

```
aws globalaccelerator list-accelerators
```

Output:

```
{
```

```
    "Accelerators": [
        {
            "AcceleratorArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/5555abcd-abcd-5555-
abcd-5555EXAMPLE1",
            "Name": "TestAccelerator",
            "IpAddressType": "IPV4",
            "Enabled": true,
            "IpSets": [
                {
                    "IpFamily": "IPv4",
                    "IpAddresses": [
                        "192.0.2.250",
                        "198.51.100.52"
                    ]
                }
            ],
            "DnsName": "5a5a5a5a5a5a5a5a.awsglobalaccelerator.com",
            "Status": "DEPLOYED",
            "CreatedTime": 1552424416.0,
            "LastModifiedTime": 1569375641.0
        },
        {
            "AcceleratorArn":
 "arn:aws:globalaccelerator::888888888888:accelerator/8888abcd-abcd-8888-
abcd-8888EXAMPLE2",
            "Name": "ExampleAccelerator",
            "IpAddressType": "IPV4",
            "Enabled": true,
            "IpSets": [
                {
                    "IpFamily": "IPv4",
                    "IpAddresses": [
                        "192.0.2.100",
                        "198.51.100.10"
                    ]
                }
            ],
            "DnsName": "6a6a6a6a6a6a6a.awsglobalaccelerator.com",
            "Status": "DEPLOYED",
            "CreatedTime": 1575585564.0,
            "LastModifiedTime": 1579809243.0
        },
    ]
```

```
}
```

For more information, see [Accelerators in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [ListAccelerators](#) in *AWS CLI Command Reference*.

`list-byoip-cidr`

The following code example shows how to use `list-byoip-cidr`.

AWS CLI

To list your address ranges

The following `list-byoip-cidr` example list the bring your own IP address (BYOIP) address ranges that you've provisioned for use with Global Accelerator.

```
aws globalaccelerator list-byoip-cidrs
```

Output:

```
{
    "ByoipCidrs": [
        {
            "Cidr": "198.51.100.0/24",
            "State": "READY"
        }
        {
            "Cidr": "203.0.113.25/24",
            "State": "READY"
        }
    ]
}
```

For more information, see [Bring your own IP address in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [ListByoipCidr](#) in *AWS CLI Command Reference*.

`list-custom-routing-accelerators`

The following code example shows how to use `list-custom-routing-accelerators`.

AWS CLI

To list your custom routing accelerators

The following `list-custom-routing-accelerators` example lists the custom routing accelerators in an AWS account.

```
aws globalaccelerator list-custom-routing-accelerators
```

Output:

```
{
    "Accelerators": [
        {
            "AcceleratorArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/5555abcd-abcd-5555-
abcd-5555EXAMPLE1",
            "Name": "TestCustomRoutingAccelerator",
            "IpAddressType": "IPV4",
            "Enabled": true,
            "IpSets": [
                {
                    "IpFamily": "IPv4",
                    "IpAddresses": [
                        "192.0.2.250",
                        "198.51.100.52"
                    ]
                }
            ],
            "DnsName": "5a5a5a5a5a5a5a5a.awsglobalaccelerator.com",
            "Status": "DEPLOYED",
            "CreatedTime": 1552424416.0,
            "LastModifiedTime": 1569375641.0
        },
        {
            "AcceleratorArn":
 "arn:aws:globalaccelerator::888888888888:accelerator/8888abcd-abcd-8888-
abcd-8888EXAMPLE2",
            "Name": "ExampleCustomRoutingAccelerator",
```

```
                "IpAddressType": "IPV4",
                "Enabled": true,
                "IpSets": [
                    {
                        "IpFamily": "IPv4",
                        "IpAddresses": [
                            "192.0.2.100",
                            "198.51.100.10"
                        ]
                    }
                ],
                "DnsName": "6a6a6a6a6a6a6a.awsglobalaccelerator.com",
                "Status": "DEPLOYED",
                "CreatedTime": 1575585564.0,
                "LastModifiedTime": 1579809243.0
        },
    ]
}
```

For more information, see Custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see ListCustomRoutingAccelerators in *AWS CLI Command Reference*.

`list-custom-routing-endpoint-groups`

The following code example shows how to use `list-custom-routing-endpoint-groups`.

AWS CLI

To list endpoint groups for a listener in a custom routing accelerator

The following `list-custom-routing-endpoint-groups` example lists the endpoint groups for a listener in a custom routing accelerator.

```
aws globalaccelerator list-custom-routing-endpoint-groups \
    --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh/listener/abcdef1234
```

Output:

```
{
```

```
    "EndpointGroups": [
        {
            "EndpointGroupArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/abcdef1234/endpoint-group/ab88888example",
            "EndpointGroupRegion": "eu-central-1",
            "DestinationDescriptions": [
                {
                    "FromPort": 80,
                    "ToPort": 80,
                    "Protocols": [
                        "TCP",
                        "UDP"
                    ]
                }
            ]
            "EndpointDescriptions": [
                {
                    "EndpointId": "subnet-abcd123example"
                }
            ]
        }
    ]
}
```

For more information, see Endpoint groups for custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see ListCustomRoutingEndpointGroups in *AWS CLI Command Reference*.

`list-custom-routing-listeners`

The following code example shows how to use `list-custom-routing-listeners`.

AWS CLI

To list listeners for custom routing accelerators

The following `list-custom-routing-listeners` example lists the listeners for a custom routing accelerator.

```
aws globalaccelerator list-custom-routing-listeners \
```

```
    --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

Output:

```
{
    "Listeners": [
        {
            "ListenerArn": 
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/abcdef1234",
            "PortRanges": [
                {
                    "FromPort": 5000,
                    "ToPort": 10000
                }
            ],
            "Protocol": "TCP"
        }
    ]
}
```

For more information, see Listeners for custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see ListCustomRoutingListeners in *AWS CLI Command Reference*.

`list-custom-routing-port-mappings-by-destination`

The following code example shows how to use `list-custom-routing-port-mappings-by-destination`.

AWS CLI

To list the port mappings for a specific custom routing accelerator destination

The following `list-custom-routing-port-mappings-by-destination` example provides the port mappings for a specific destination EC2 server (at the destination address) for a custom routing accelerator.

```
aws globalaccelerator list-custom-routing-port-mappings-by-destination \
```

```
    --endpoint-id subnet-abcd123example \
    --destination-address 198.51.100.52
```

Output:

```
{
    "DestinationPortMappings": [
        {
            "AcceleratorArn":
 "arn:aws:globalaccelerator::402092451327:accelerator/24ea29b8-
d750-4489-8919-3095f3c4b0a7",
                "AcceleratorSocketAddresses": [
                    {
                        "IpAddress": "192.0.2.250",
                        "Port": 65514
                    },
                    {
                        "IpAddress": "192.10.100.99",
                        "Port": 65514
                    }
                ],
                "EndpointGroupArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/ab88888example",
                "EndpointId": "subnet-abcd123example",
                "EndpointGroupRegion": "us-west-2",
                "DestinationSocketAddress": {
                    "IpAddress": "198.51.100.52",
                    "Port": 80
                },
                "IpAddressType": "IPv4",
                "DestinationTrafficState": "ALLOW"
        }
    ]
}
```

For more information, see How custom routing accelerators work in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see ListCustomRoutingPortMappingsByDestination in *AWS CLI Command Reference*.

`list-custom-routing-port-mappings`

The following code example shows how to use `list-custom-routing-port-mappings`.

AWS CLI

To list the port mappings in a custom routing accelerator

The following `list-custom-routing-port-mappings` example provides a partial list of the port mappings in a custom routing accelerator.

```
aws globalaccelerator list-custom-routing-port-mappings \
    --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh
```

Output:

```
{
    "PortMappings": [
        {
            "AcceleratorPort": 40480,
            "EndpointGroupArn":

```

For more information, see [How custom routing accelerators work in AWS Global Accelerator](https://docs.aws.amazon.com/global-accelerator/latest/dg/about-custom-routing-how-it-works.html) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [ListCustomRoutingPortMappings](https://awscli.amazonaws.com/v2/documentation/api/latest/reference/globalaccelerator/list-custom-routing-port-mappings.html) in *AWS CLI Command Reference*.

`list-endpoint-groups`

The following code example shows how to use `list-endpoint-groups`.

AWS CLI

To list endpoint groups

The following `list-endpoint-groups` example lists the endpoint groups for a listener. This listener has two endpoint groups.

```
aws globalaccelerator --region us-west-2 list-endpoint-groups \
    --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh/listener/abcdef1234
```

Output:

```
{
    "EndpointGroups": [
        {
            "EndpointGroupArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/abcdef1234/endpoint-group/ab88888example",
            "EndpointGroupRegion": "eu-central-1",
            "EndpointDescriptions": [],
            "TrafficDialPercentage": 100.0,
```

```
            "HealthCheckPort": 80,
            "HealthCheckProtocol": "TCP",
            "HealthCheckIntervalSeconds": 30,
            "ThresholdCount": 3
        }
        {
            "EndpointGroupArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/abcdef1234/endpoint-group/ab99999example",
            "EndpointGroupRegion": "us-east-1",
            "EndpointDescriptions": [],
            "TrafficDialPercentage": 50.0,
            "HealthCheckPort": 80,
            "HealthCheckProtocol": "TCP",
            "HealthCheckIntervalSeconds": 30,
            "ThresholdCount": 3
        }
    ]
}
```

For more information, see Endpoint Groups in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see ListEndpointGroups in *AWS CLI Command Reference*.

`list-listeners`

The following code example shows how to use `list-listeners`.

AWS CLI

To list listeners

The following `list-listeners` example lists the listeners for an accelerator.

```
aws globalaccelerator list-listeners \
    --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh
```

Output:

```
{
```

```
    "Listeners": [
        {
            "ListenerArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/abcdef1234",
            "PortRanges": [
                {
                    "FromPort": 80,
                    "ToPort": 80
                }
            ],
            "Protocol": "TCP",
            "ClientAffinity": "NONE"
        }
    ]
}
```

For more information, see Listeners in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see ListListeners in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for an accelerator

The following `list-tags-for-resource` example lists the tags for a specific accelerator.

```
aws globalaccelerator list-tags-for-resource \
    --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh
```

Output:

```
{
    "Tags": [
        {
            "Key": "Project",
            "Value": "A123456"
```

```
        }
    ]
}
```

For more information, see Tagging in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`provision-byoip-cidr`

The following code example shows how to use `provision-byoip-cidr`.

AWS CLI

To provision an address range

The following `provision-byoip-cidr` example provisions the specified address range to use with your AWS resources.

```
aws globalaccelerator provision-byoip-cidr \
    --cidr 192.0.2.250/24 \
    --cidr-authorization-context Message="$text_message",Signature="$signed_message"
```

Output:

```
{
    "ByoipCidr": {
        "Cidr": "192.0.2.250/24",
        "State": "PENDING_PROVISIONING"
    }
}
```

For more information, see Bring your own IP address in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see ProvisionByoipCidr in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To tag an accelerator

The following `tag-resource` example adds tags Name and Project to an accelerator, along with corresponding values for each.

```
aws globalaccelerator tag-resource \
    --resource-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh \
    --tags Key="Name",Value="Example Name" Key="Project",Value="Example Project"
```

This command produces no output.

For more information, see Tagging in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from an accelerator

The following `untag-resource` example removes the tags Name and Project from an accelerator.

```
aws globalaccelerator untag-resource \
    --resource-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh \
    --tag-keys Key="Name" Key="Project"
```

This command produces no output.

For more information, see Tagging in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-accelerator-attributes`

The following code example shows how to use `update-accelerator-attributes`.

AWS CLI

To update an accelerator's attributes

The following `update-accelerator-attributes` example updates an accelerator to enable flow logs. You must specify the `US-West-2 (Oregon)` Region to create or update accelerator attributes.

```
aws globalaccelerator update-accelerator-attributes \
    --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh \
    --flow-logs-enabled \
    --flow-logs-s3-bucket flowlogs-abc \
    --flow-logs-s3-prefix bucketprefix-abc
```

Output:

```
{
    "AcceleratorAttributes": {
        "FlowLogsEnabled": true
        "FlowLogsS3Bucket": flowlogs-abc
        "FlowLogsS3Prefix": bucketprefix-abc
    }
}
```

For more information, see Accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see UpdateAcceleratorAttributes in *AWS CLI Command Reference*.

`update-accelerator`

The following code example shows how to use `update-accelerator`.

AWS CLI

To update an accelerator

The following `update-accelerator` example modifies an accelerator to change the accelerator name to `ExampleAcceleratorNew`. You must specify the `US-West-2 (Oregon)` Region to create or update accelerators.

```
aws globalaccelerator update-accelerator \
    --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh \
    --name ExampleAcceleratorNew
```

Output:

```
{
    "Accelerator": {
        "AcceleratorArn":
 "arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh",
        "IpAddressType": "IPV4",
        "Name": "ExampleAcceleratorNew",
        "Enabled": true,
        "Status": "IN_PROGRESS",
        "IpSets": [
            {
                "IpAddresses": [
                    "192.0.2.250",
                    "198.51.100.52"
                ],
                "IpFamily": "IPv4"
            }
        ],
        "DnsName":"a1234567890abcdef.awsglobalaccelerator.com",
        "CreatedTime": 1232394847,
        "LastModifiedTime": 1232395654
    }
}
```

For more information, see Accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see UpdateAccelerator in *AWS CLI Command Reference*.

`update-custom-routing-accelerator-attributes`

The following code example shows how to use `update-custom-routing-accelerator-attributes`.

AWS CLI

To update a custom routing accelerator's attributes

The following `update-custom-routing-accelerator-attributes` example updates a custom routing accelerator to enable flow logs.

```
aws globalaccelerator update-custom-routing-accelerator-attributes \
    --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh \
    --flow-logs-enabled \
    --flow-logs-s3-bucket flowlogs-abc \
    --flow-logs-s3-prefix bucketprefix-abc
```

Output:

```
{
    "AcceleratorAttributes": {
        "FlowLogsEnabled": true
        "FlowLogsS3Bucket": flowlogs-abc
        "FlowLogsS3Prefix": bucketprefix-abc
    }
}
```

For more information, see Custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see UpdateCustomRoutingAcceleratorAttributes in *AWS CLI Command Reference*.

`update-custom-routing-accelerator`

The following code example shows how to use `update-custom-routing-accelerator`.

AWS CLI

To update a custom routing accelerator

The following `update-custom-routing-accelerator` example modifies a custom routing accelerator to change the accelerator name.

```
aws globalaccelerator --region us-west-2 update-custom-routing-accelerator \
    --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh \
    --name ExampleCustomRoutingAcceleratorNew
```

Output:

```
{
    "Accelerator": {
        "AcceleratorArn":
 "arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh",
        "IpAddressType": "IPV4",
        "Name": "ExampleCustomRoutingAcceleratorNew",
        "Enabled": true,
        "Status": "IN_PROGRESS",
        "IpSets": [
            {
                "IpAddresses": [
                    "192.0.2.250",
                    "198.51.100.52"
                ],
                "IpFamily": "IPv4"
            }
        ],
        "DnsName":"a1234567890abcdef.awsglobalaccelerator.com",
        "CreatedTime": 1232394847,
        "LastModifiedTime": 1232395654
    }
}
```

For more information, see Custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see UpdateCustomRoutingAccelerator in *AWS CLI Command Reference*.

`update-custom-routing-listener`

The following code example shows how to use `update-custom-routing-listener`.

AWS CLI

To update a listener for a custom routing accelerator

The following `update-custom-routing-listener` example updates a listener to change the port range.

```
aws globalaccelerator update-custom-routing-listener \
    --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz \
    --port-ranges FromPort=10000,ToPort=20000
```

Output:

```
{
    "Listener": {
        "ListenerArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz
        "PortRanges": [
            {
                "FromPort": 10000,
                "ToPort": 20000
            }
        ],
        "Protocol": "TCP"
    }
}
```

For more information, see Listeners for custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see UpdateCustomRoutingListener in *AWS CLI Command Reference*.

`update-endpoint-group`

The following code example shows how to use `update-endpoint-group`.

AWS CLI

To update an endpoint group

The following `update-endpoint-group` example adds three endpoints to an endpoint group: an Elastic IP address, an ALB, and an NLB.

```
aws globalaccelerator update-endpoint-group \
    --endpoint-group-
arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/6789vxyz-vxyz-6789-vxyz-6789lmnopqrs/endpoint-group/
ab88888example \
    --endpoint-configurations \
        EndpointId=eipalloc-eip01234567890abc,Weight=128 \
        EndpointId=arn:aws:elasticloadbalancing:us-east-1:000123456789:loadbalancer/
app/ALBTesting/alb01234567890xyz,Weight=128 \
        EndpointId=arn:aws:elasticloadbalancing:us-east-1:000123456789:loadbalancer/
net/NLBTesting/alb01234567890qrs,Weight=128
```

Output:

```
{
    "EndpointGroup": {
        "TrafficDialPercentage": 100,
        "EndpointDescriptions": [
            {
                "Weight": 128,
                "EndpointId": "eip01234567890abc"
            },
            {
                "Weight": 128,
                "EndpointId": "arn:aws:elasticloadbalancing:us-
east-1:000123456789:loadbalancer/app/ALBTesting/alb01234567890xyz"
            },
            {
                "Weight": 128,
                "EndpointId": "arn:aws:elasticloadbalancing:us-
east-1:000123456789:loadbalancer/net/NLBTesting/alb01234567890qrs"
            }
        ],
        "EndpointGroupArn":
 "arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/6789vxyz-vxyz-6789-vxyz-6789lmnopqrs/endpoint-
group/4321abcd-abcd-4321-abcd-4321abcdefg",
        "EndpointGroupRegion": "us-east-1"
    }
```

```
}
```

For more information, see Endpoint groups in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see UpdateEndpointGroup in *AWS CLI Command Reference*.

`update-listener`

The following code example shows how to use `update-listener`.

AWS CLI

To update a listener

The following `update-listener` example updates a listener to change the port to 100.

```
aws globalaccelerator update-listener \
    --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh/listener/0123vxyz \
    --port-ranges FromPort=100,ToPort=100
```

Output:

```
{
    "Listener": {
        "ListenerArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/0123vxyz
        "PortRanges": [
            {
                "FromPort": 100,
                "ToPort": 100
            }
        ],
        "Protocol": "TCP",
        "ClientAffinity": "NONE"
    }
}
```

For more information, see Listeners in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see UpdateListener in *AWS CLI Command Reference*.

`withdraw-byoip-cidr`

The following code example shows how to use `withdraw-byoip-cidr`.

AWS CLI

To withdraw an address range

The following `withdraw-byoip-cidr` example withdraws an address range from AWS Global Accelerator that you previously advertised for use with your AWS resources.

```
aws globalaccelerator withdraw-byoip-cidr \
    --cidr 192.0.2.250/24
```

Output:

```
{
    "ByoipCidr": {
        "Cidr": "192.0.2.250/24",
        "State": "PENDING_WITHDRAWING"
    }
}
```

For more information, see Bring your own IP address in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see WithdrawByoipCidr in *AWS CLI Command Reference*.

AWS Glue examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Glue.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

batch-stop-job-run

The following code example shows how to use `batch-stop-job-run`.

AWS CLI

To stop job runs

The following `batch-stop-job-run` example stops a job runs.

```
aws glue batch-stop-job-run \
    --job-name "my-testing-job" \
    --job-run-id jr_852f1de1f29fb62e0ba4166c33970803935d87f14f96cfdee5089d5274a61d3f
```

Output:

```
{
    "SuccessfulSubmissions": [
        {
            "JobName": "my-testing-job",
            "JobRunId": 
 "jr_852f1de1f29fb62e0ba4166c33970803935d87f14f96cfdee5089d5274a61d3f"
        }
    ],
    "Errors": [],
    "ResponseMetadata": {
        "RequestId": "66bd6b90-01db-44ab-95b9-6aeff0e73d88",
        "HTTPStatusCode": 200,
        "HTTPHeaders": {
            "date": "Fri, 16 Oct 2020 20:54:51 GMT",
            "content-type": "application/x-amz-json-1.1",
            "content-length": "148",
            "connection": "keep-alive",
            "x-amzn-requestid": "66bd6b90-01db-44ab-95b9-6aeff0e73d88"
        },
        "RetryAttempts": 0
```

```
    }
}
```

For more information, see Job Runs in the *AWS Glue Developer Guide*.

- For API details, see BatchStopJobRun in *AWS CLI Command Reference*.

`create-connection`

The following code example shows how to use `create-connection`.

AWS CLI

To create a connection for AWS Glue data stores

The following `create-connection` example creates a connection in the AWS Glue Data Catalog that provides connection information for a Kafka data store.

```
aws glue create-connection \
    --connection-input '{ \
        "Name":"conn-kafka-custom", \
        "Description":"kafka connection with ssl to custom kafka", \
        "ConnectionType":"KAFKA",  \
        "ConnectionProperties":{  \
            "KAFKA_BOOTSTRAP_SERVERS":"<Kafka-broker-server-url>:<SSL-Port>", \
            "KAFKA_SSL_ENABLED":"true", \
            "KAFKA_CUSTOM_CERT": "s3://bucket/prefix/cert-file.pem" \
        }, \
        "PhysicalConnectionRequirements":{ \
            "SubnetId":"subnet-1234", \
            "SecurityGroupIdList":["sg-1234"], \
            "AvailabilityZone":"us-east-1a"} \
    }' \
    --region us-east-1
    --endpoint https://glue.us-east-1.amazonaws.com
```

This command produces no output.

For more information, see Defining Connections in the AWS Glue Data Catalog in the *AWS Glue Developer Guide*.

- For API details, see CreateConnection in *AWS CLI Command Reference*.

`create-database`

The following code example shows how to use `create-database`.

AWS CLI

To create a database

The following `create-database` example creates a database in the AWS Glue Data Catalog.

```
aws glue create-database \
    --database-input "{\"Name\":\"tempdb\"}" \
    --profile my_profile \
    --endpoint https://glue.us-east-1.amazonaws.com
```

This command produces no output.

For more information, see Defining a Database in Your Data Catalog in the *AWS Glue Developer Guide*.

- For API details, see CreateDatabase in *AWS CLI Command Reference*.

`create-job`

The following code example shows how to use `create-job`.

AWS CLI

To create a job to transform data

The following `create-job` example creates a streaming job that runs a script stored in S3.

```
aws glue create-job \
    --name my-testing-job \
    --role AWSGlueServiceRoleDefault \
    --command '{ \
        "Name": "gluestreaming", \
        "ScriptLocation": "s3://amzn-s3-demo-bucket/folder/" \
    }' \
    --region us-east-1 \
    --output json \
    --default-arguments '{ \
```

```
        "--job-language":"scala", \
        "--class":"GlueApp" \
    }' \
    --profile my-profile \
    --endpoint https://glue.us-east-1.amazonaws.com
```

Contents of `test_script.scala`:

```
import com.amazonaws.services.glue.ChoiceOption
import com.amazonaws.services.glue.GlueContext
import com.amazonaws.services.glue.MappingSpec
import com.amazonaws.services.glue.ResolveSpec
import com.amazonaws.services.glue.errors.CallSite
import com.amazonaws.services.glue.util.GlueArgParser
import com.amazonaws.services.glue.util.Job
import com.amazonaws.services.glue.util.JsonOptions
import org.apache.spark.SparkContext
import scala.collection.JavaConverters._

object GlueApp {
    def main(sysArgs: Array[String]) {
        val spark: SparkContext = new SparkContext()
        val glueContext: GlueContext = new GlueContext(spark)
        // @params: [JOB_NAME]
        val args = GlueArgParser.getResolvedOptions(sysArgs,
 Seq("JOB_NAME").toArray)
        Job.init(args("JOB_NAME"), glueContext, args.asJava)
        // @type: DataSource
        // @args: [database = "tempdb", table_name = "s3-source", transformation_ctx
 = "datasource0"]
        // @return: datasource0
        // @inputs: []
        val datasource0 = glueContext.getCatalogSource(database = "tempdb",
 tableName = "s3-source", redshiftTmpDir = "", transformationContext =
 "datasource0").getDynamicFrame()
        // @type: ApplyMapping
        // @args: [mapping = [("sensorid", "int", "sensorid", "int"),
 ("currenttemperature", "int", "currenttemperature", "int"), ("status", "string",
 "status", "string")], transformation_ctx = "applymapping1"]
        // @return: applymapping1
        // @inputs: [frame = datasource0]
        val applymapping1 = datasource0.applyMapping(mappings = Seq(("sensorid",
 "int", "sensorid", "int"), ("currenttemperature", "int", "currenttemperature",
```

```
 "int"), ("status", "string", "status", "string")), caseSensitive = false,
 transformationContext = "applymapping1")
        // @type: SelectFields
        // @args: [paths = ["sensorid", "currenttemperature", "status"],
 transformation_ctx = "selectfields2"]
        // @return: selectfields2
        // @inputs: [frame = applymapping1]
        val selectfields2 = applymapping1.selectFields(paths = Seq("sensorid",
 "currenttemperature", "status"), transformationContext = "selectfields2")
        // @type: ResolveChoice
        // @args: [choice = "MATCH_CATALOG", database = "tempdb", table_name = "my-
s3-sink", transformation_ctx = "resolvechoice3"]
        // @return: resolvechoice3
        // @inputs: [frame = selectfields2]
        val resolvechoice3 = selectfields2.resolveChoice(choiceOption =
 Some(ChoiceOption("MATCH_CATALOG")), database = Some("tempdb"), tableName =
 Some("my-s3-sink"), transformationContext = "resolvechoice3")
        // @type: DataSink
        // @args: [database = "tempdb", table_name = "my-s3-sink",
 transformation_ctx = "datasink4"]
        // @return: datasink4
        // @inputs: [frame = resolvechoice3]
        val datasink4 = glueContext.getCatalogSink(database = "tempdb",
 tableName = "my-s3-sink", redshiftTmpDir = "", transformationContext =
 "datasink4").writeDynamicFrame(resolvechoice3)
        Job.commit()
    }
}
```

Output:

```
{
    "Name": "my-testing-job"
}
```

For more information, see Authoring Jobs in AWS Glue in the *AWS Glue Developer Guide*.

- For API details, see CreateJob in *AWS CLI Command Reference*.

`create-table`

The following code example shows how to use `create-table`.

AWS CLI

Example 1: To create a table for a Kinesis data stream

The following `create-table` example creates a table in the AWS Glue Data Catalog that describes a Kinesis data stream.

```
aws glue create-table \
    --database-name tempdb \
    --table-input  '{"Name":"test-kinesis-input", "StorageDescriptor":{ \
            "Columns":[ \
                {"Name":"sensorid", "Type":"int"}, \
                {"Name":"currenttemperature", "Type":"int"}, \
                {"Name":"status", "Type":"string"}
            ], \
            "Location":"my-testing-stream", \
            "Parameters":{ \
                "typeOfData":"kinesis","streamName":"my-testing-stream", \
                "kinesisUrl":"https://kinesis.us-east-1.amazonaws.com" \
            }, \
            "SerdeInfo":{ \
                "SerializationLibrary":"org.openx.data.jsonserde.JsonSerDe"} \
        }, \
        "Parameters":{ \
            "classification":"json"} \
        }' \
    --profile my-profile \
    --endpoint https://glue.us-east-1.amazonaws.com
```

This command produces no output.

For more information, see Defining Tables in the AWS Glue Data Catalog in the *AWS Glue Developer Guide*.

Example 2: To create a table for a Kafka data store

The following `create-table` example creates a table in the AWS Glue Data Catalog that describes a Kafka data store.

```
aws glue create-table \
    --database-name tempdb \
    --table-input  '{"Name":"test-kafka-input", "StorageDescriptor":{ \
            "Columns":[ \
```

```
                {"Name":"sensorid", "Type":"int"}, \
                {"Name":"currenttemperature", "Type":"int"}, \
                {"Name":"status", "Type":"string"}
            ], \
            "Location":"glue-topic", \
            "Parameters":{ \
                "typeOfData":"kafka","topicName":"glue-topic", \
                "connectionName":"my-kafka-connection"
            }, \
            "SerdeInfo":{ \
                "SerializationLibrary":"org.apache.hadoop.hive.serde2.OpenCSVSerde"}
 \
        }, \
        "Parameters":{ \
            "separatorChar":","} \
        }' \
    --profile my-profile \
    --endpoint https://glue.us-east-1.amazonaws.com
```

This command produces no output.

For more information, see Defining Tables in the AWS Glue Data Catalog in the *AWS Glue Developer Guide*.

Example 3: To create a table for a AWS S3 data store

The following `create-table` example creates a table in the AWS Glue Data Catalog that describes a AWS Simple Storage Service (AWS S3) data store.

```
aws glue create-table \
    --database-name tempdb \
    --table-input  '{"Name":"s3-output", "StorageDescriptor":{ \
            "Columns":[ \
                {"Name":"s1", "Type":"string"}, \
                {"Name":"s2", "Type":"int"}, \
                {"Name":"s3", "Type":"string"}
            ], \
            "Location":"s3://bucket-path/", \
            "SerdeInfo":{ \
                "SerializationLibrary":"org.openx.data.jsonserde.JsonSerDe"} \
        }, \
        "Parameters":{ \
            "classification":"json"} \
```

```
        }' \
    --profile my-profile \
    --endpoint https://glue.us-east-1.amazonaws.com
```

This command produces no output.

For more information, see Defining Tables in the AWS Glue Data Catalog in the *AWS Glue Developer Guide*.

- For API details, see CreateTable in *AWS CLI Command Reference*.

`delete-job`

The following code example shows how to use `delete-job`.

AWS CLI

To delete a job

The following `delete-job` example deletes a job that is no longer needed.

```
aws glue delete-job \
    --job-name my-testing-job
```

Output:

```
{
    "JobName": "my-testing-job"
}
```

For more information, see Working with Jobs on the AWS Glue Console in the *AWS Glue Developer Guide*.

- For API details, see DeleteJob in *AWS CLI Command Reference*.

`get-databases`

The following code example shows how to use `get-databases`.

AWS CLI

To list the definitions of some or all of the databases in the AWS Glue Data Catalog

The following `get-databases` example returns information about the databases in the Data Catalog.

```
aws glue get-databases
```

Output:

```
{
    "DatabaseList": [
        {
            "Name": "default",
            "Description": "Default Hive database",

get-job

The following code example shows how to use `get-job`.

AWS CLI

To retrieve information about a job

The following `get-job` example retrieves information about a job.

```
aws glue get-job \
    --job-name my-testing-job
```

Output:

```
{
    "Job": {
        "Name": "my-testing-job",
        "Role": "Glue_DefaultRole",
        "CreatedOn": 1602805698.167,
        "LastModifiedOn": 1602805698.167,
        "ExecutionProperty": {
            "MaxConcurrentRuns": 1
        },
```

```
        "Command": {
            "Name": "gluestreaming",
            "ScriptLocation": "s3://janetst-bucket-01/Scripts/test_script.scala",
            "PythonVersion": "2"
        },
        "DefaultArguments": {
            "--class": "GlueApp",
            "--job-language": "scala"
        },
        "MaxRetries": 0,
        "AllocatedCapacity": 10,
        "MaxCapacity": 10.0,
        "GlueVersion": "1.0"
    }
}
```

For more information, see Jobs in the *AWS Glue Developer Guide*.

- For API details, see GetJob in *AWS CLI Command Reference*.

`get-plan`

The following code example shows how to use `get-plan`.

AWS CLI

To get the generated code for mapping data from source tables to target tables

The following `get-plan` retrieves the generated code for mapping columns from the data source to the data target.

```
aws glue get-plan --mapping '[ \
    { \
        "SourcePath":"sensorid", \
        "SourceTable":"anything", \
        "SourceType":"int", \
        "TargetPath":"sensorid", \
        "TargetTable":"anything", \
        "TargetType":"int" \
    }, \
    { \
        "SourcePath":"currenttemperature", \
        "SourceTable":"anything", \
```

```
        "SourceType":"int", \
        "TargetPath":"currenttemperature", \
        "TargetTable":"anything", \
        "TargetType":"int" \
    }, \
    { \
        "SourcePath":"status", \
        "SourceTable":"anything", \
        "SourceType":"string", \
        "TargetPath":"status", \
        "TargetTable":"anything", \
        "TargetType":"string" \
    }]' \
    --source '{ \
        "DatabaseName":"tempdb", \
        "TableName":"s3-source" \
    }' \
    --sinks '[ \
        { \
            "DatabaseName":"tempdb", \
            "TableName":"my-s3-sink" \
        }]'
    --language "scala"
    --endpoint https://glue.us-east-1.amazonaws.com
    --output "text"
```

Output:

```
import com.amazonaws.services.glue.ChoiceOption
import com.amazonaws.services.glue.GlueContext
import com.amazonaws.services.glue.MappingSpec
import com.amazonaws.services.glue.ResolveSpec
import com.amazonaws.services.glue.errors.CallSite
import com.amazonaws.services.glue.util.GlueArgParser
import com.amazonaws.services.glue.util.Job
import com.amazonaws.services.glue.util.JsonOptions
import org.apache.spark.SparkContext
import scala.collection.JavaConverters._

object GlueApp {
  def main(sysArgs: Array[String]) {
    val spark: SparkContext = new SparkContext()
    val glueContext: GlueContext = new GlueContext(spark)
```

```
    // @params: [JOB_NAME]
    val args = GlueArgParser.getResolvedOptions(sysArgs, Seq("JOB_NAME").toArray)
    Job.init(args("JOB_NAME"), glueContext, args.asJava)
    // @type: DataSource
    // @args: [database = "tempdb", table_name = "s3-source", transformation_ctx =
 "datasource0"]
    // @return: datasource0
    // @inputs: []
    val datasource0 = glueContext.getCatalogSource(database = "tempdb",
 tableName = "s3-source", redshiftTmpDir = "", transformationContext =
 "datasource0").getDynamicFrame()
    // @type: ApplyMapping
    // @args: [mapping = [("sensorid", "int", "sensorid", "int"),
 ("currenttemperature", "int", "currenttemperature", "int"), ("status", "string",
 "status", "string")], transformation_ctx = "applymapping1"]
    // @return: applymapping1
    // @inputs: [frame = datasource0]
    val applymapping1 = datasource0.applyMapping(mappings = Seq(("sensorid",
 "int", "sensorid", "int"), ("currenttemperature", "int", "currenttemperature",
 "int"), ("status", "string", "status", "string")), caseSensitive = false,
 transformationContext = "applymapping1")
    // @type: SelectFields
    // @args: [paths = ["sensorid", "currenttemperature", "status"],
 transformation_ctx = "selectfields2"]
    // @return: selectfields2
    // @inputs: [frame = applymapping1]
    val selectfields2 = applymapping1.selectFields(paths = Seq("sensorid",
 "currenttemperature", "status"), transformationContext = "selectfields2")
    // @type: ResolveChoice
    // @args: [choice = "MATCH_CATALOG", database = "tempdb", table_name = "my-s3-
sink", transformation_ctx = "resolvechoice3"]
    // @return: resolvechoice3
    // @inputs: [frame = selectfields2]
    val resolvechoice3 = selectfields2.resolveChoice(choiceOption =
 Some(ChoiceOption("MATCH_CATALOG")), database = Some("tempdb"), tableName =
 Some("my-s3-sink"), transformationContext = "resolvechoice3")
    // @type: DataSink
    // @args: [database = "tempdb", table_name = "my-s3-sink", transformation_ctx =
 "datasink4"]
    // @return: datasink4
    // @inputs: [frame = resolvechoice3]
    val datasink4 = glueContext.getCatalogSink(database = "tempdb",
 tableName = "my-s3-sink", redshiftTmpDir = "", transformationContext =
 "datasink4").writeDynamicFrame(resolvechoice3)
```

```
    Job.commit()
  }
}
```

For more information, see Editing Scripts in AWS Glue in the *AWS Glue Developer Guide*.

- For API details, see GetPlan in *AWS CLI Command Reference*.

`get-tables`

The following code example shows how to use `get-tables`.

AWS CLI

To list the definitions of some or all of the tables in the specified database

The following `get-tables` example returns information about the tables in the specified database.

```
aws glue get-tables --database-name 'tempdb'
```

Output:

```
{
    "TableList": [
        {
            "Name": "my-s3-sink",
            "DatabaseName": "tempdb",

            }
        ]
}
```

For more information, see Defining Tables in the AWS Glue Data Catalog in the *AWS Glue Developer Guide*.

- For API details, see GetTables in *AWS CLI Command Reference*.

`start-crawler`

The following code example shows how to use `start-crawler`.

AWS CLI

To start a crawler

The following `start-crawler` example starts a crawler.

```
aws glue start-crawler --name my-crawler
```

Output:

```
None
```

For more information, see Defining Crawlers in the *AWS Glue Developer Guide*.

- For API details, see StartCrawler in *AWS CLI Command Reference*.

`start-job-run`

The following code example shows how to use `start-job-run`.

AWS CLI

To start running a job

The following `start-job-run` example starts a job.

```
aws glue start-job-run \
    --job-name my-job
```

Output:

```
{
    "JobRunId":
 "jr_22208b1f44eb5376a60569d4b21dd20fcb8621e1a366b4e7b2494af764b82ded"
}
```

For more information, see Authoring Jobs in the *AWS Glue Developer Guide*.

- For API details, see StartJobRun in *AWS CLI Command Reference*.

GuardDuty examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with GuardDuty.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`accept-invitation`

The following code example shows how to use `accept-invitation`.

AWS CLI

To accept an invitation to become a GuardDuty member account in the current region

The following `accept-invitation` example shows how to accept an invitation to become a GuardDuty member account in the current region.

```
aws guardduty accept-invitation  \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --master-id 123456789111 \
    --invitation-id d6b94fb03a66ff665f7db8764example
```

This command produces no output.

For more information, see Managing GuardDuty accounts by invitation in the GuardDuty User Guide.

- For API details, see AcceptInvitation in *AWS CLI Command Reference*.

`archive-findings`

The following code example shows how to use `archive-findings`.

AWS CLI

To archive findings in the current region

This `archive-findings` example shows how to archive findings in the current region.

```
aws guardduty archive-findings \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --finding-ids d6b94fb03a66ff665f7db8764example 3eb970e0de00c16ec14e6910fexample
```

This command produces no output.

For more information, see Creating suppression rules in the *GuardDuty User Guide*.

- For API details, see ArchiveFindings in *AWS CLI Command Reference*.

`create-detector`

The following code example shows how to use `create-detector`.

AWS CLI

To enable GuardDuty in the current region

This example shows how to create a new detector, which enables GuardDuty, in the current region.:

```
aws guardduty create-detector \
    --enable
```

Output:

```
{
    "DetectorId": "b6b992d6d2f48e64bc59180bfexample"
}
```

For more information, see Enable Amazon GuardDuty in the *GuardDuty User Guide*.

- For API details, see CreateDetector in *AWS CLI Command Reference*.

`create-filter`

The following code example shows how to use `create-filter`.

AWS CLI

Example 1: To create a new filter in the current region

The following `create-filter` example creates a filter that matches all Portscan findings for instance created from a specific image. This does not suppress those findings.

```
aws guardduty create-filter \
    --detector-id b6b992d6d2f48e64bc59180bfexample \
    --name myFilterExample \
    --finding-criteria '{"Criterion": {"type": {"Eq": ["Recon:EC2/
Portscan"]},"resource.instanceDetails.imageId": {"Eq": ["ami-0a7a207083example"]}}}'
```

Output:

```
{
    "Name": "myFilterExample"
}
```

For more information, see Filtering GuardDuty findings in the *GuardDuty User Guide*.

Example 2: To create a new filter and suppress findings in the current region

The following `create-filter` example creates a filter that matches all Portscan findings for instance created from a specific image. This filter archives those findings so that they do not appear in your current findings.

```
aws guardduty create-filter \
    --detector-id b6b992d6d2f48e64bc59180bfexample \
    --action ARCHIVE \
    --name myFilterSecondExample \
    --finding-criteria '{"Criterion": {"type": {"Eq": ["Recon:EC2/
Portscan"]},"resource.instanceDetails.imageId": {"Eq": ["ami-0a7a207083example"]}}}'
```

Output:

```
{
    "Name": "myFilterSecondExample"
}
```

For more information, see Filtering GuardDuty findings in the *GuardDuty User Guide*.

- For API details, see CreateFilter in *AWS CLI Command Reference*.

`create-ip-set`

The following code example shows how to use `create-ip-set`.

AWS CLI

To create and activate a trusted IP set

The following `create-ip-set` example creates and activates a trusted IP set in the current Region.

```
aws guardduty create-ip-set \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --name new-ip-set-example \
    --format TXT \
    --location s3://amzn-s3-demo-bucket/customtrustlist.csv \
    --activate
```

Output:

```
{
    "IpSetId": "d4b94fc952d6912b8f3060768example"
}
```

For more information, see [Working with Trusted IP Lists and Threat Lists](#) in the *GuardDuty User Guide*.

- For API details, see [CreateIpSet](#) in *AWS CLI Command Reference*.

`create-members`

The following code example shows how to use `create-members`.

AWS CLI

To associate a new member with your GuardDuty master account in the current region.

This example shows how to associate member accounts to be managed by the current account as the GuardDuty master.

```
aws guardduty create-members
    --detector-id b6b992d6d2f48e64bc59180bfexample \
    --account-details AccountId=111122223333,Email=first
+member@example.com AccountId=111111111111 ,Email=another+member@example.com
```

Output:

```
{
   "UnprocessedAccounts": []
}
```

For more information, see [Managing multiple accounts](#) in the GuardDuty User Guide.

- For API details, see [CreateMembers](#) in *AWS CLI Command Reference*.

`create-publishing-destination`

The following code example shows how to use `create-publishing-destination`.

AWS CLI

To create a publishing destination to export GuardDuty findings in the current region to.

The following `create-publishing-destination` example shows how to set up a publishing destination to export current (not archived) GuardDuty findings to keep track of historical findings data.

```
aws guardduty create-publishing-destination \
    --detector-id b6b992d6d2f48e64bc59180bfexample \
    --destination-type S3 \
    --destination-properties 'DestinationArn=arn:aws:s3:::amzn-s3-demo-
bucket,KmsKeyArn=arn:aws:kms:us-west-1:111122223333:key/84cee9c5-dea1-401a-ab6d-
e1de7example'
```

Output:

```
{
    "DestinationId": "46b99823849e1bbc242dfbe3cexample"
}
```

For more information, see Exporting generated GuardDuty findings to Amazon S3 buckets in the *GuardDuty User Guide*.

- For API details, see CreatePublishingDestination in *AWS CLI Command Reference*.

`create-sample-findings`

The following code example shows how to use `create-sample-findings`.

AWS CLI

To create sample GuardDuty findings in the current region.

This example shows how to create a sample finding of the provided types.

```
aws guardduty create-sample-findings \
    --detector-id b6b992d6d2f48e64bc59180bfexample \
    --finding-types UnauthorizedAccess:EC2/TorClient UnauthorizedAccess:EC2/TorRelay
```

This command produces no output.

For more information, see Sample findings in the *GuardDuty User Guide*.

- For API details, see CreateSampleFindings in *AWS CLI Command Reference*.

`create-threat-intel-set`

The following code example shows how to use `create-threat-intel-set`.

AWS CLI

To create and activate a new threat intel set

The following `create-threat-intel-set` example creates and activates a threat intel set in the current Region.

```
aws guardduty create-threat-intel-set \
    --detector-id b6b992d6d2f48e64bc59180bfexample \
    --name myThreatSet-example \
    --format TXT \
    --location s3://amzn-s3-demo-bucket/threatlist.csv \
    --activate
```

Output:

```
{
    "ThreatIntelSetId": "20b9a4691aeb33506b808878cexample"
}
```

For more information, see Working with Trusted IP Lists and Threat Lists in the *GuardDuty User Guide*.

- For API details, see CreateThreatIntelSet in *AWS CLI Command Reference*.

`decline-invitations`

The following code example shows how to use `decline-invitations`.

AWS CLI

To decline an invitation to have Guardduty managed by another account in the current region.

This example shows how to decline a membership invitation.

```
aws guardduty decline-invitations \
```

```
    --account-ids 111122223333
```

Output:

```
{
    "UnprocessedAccounts": []
}
```

For more information, see Managing GuardDuty accounts by invitation in the GuardDuty User Guide.

- For API details, see DeclineInvitations in *AWS CLI Command Reference*.

`delete-detector`

The following code example shows how to use `delete-detector`.

AWS CLI

To delete a detector, and disable GuardDuty, in the current region.

This example shows how to delete a detector, if successful, this will disable GuardDuty in the region associated with that detector.

```
aws guardduty delete-detector \
    --detector-id b6b992d6d2f48e64bc59180bfexample
```

This command produces no output.

For more information, see Suspending or disabling GuardDuty in the *GuardDuty User Guide*.

- For API details, see DeleteDetector in *AWS CLI Command Reference*.

`delete-filter`

The following code example shows how to use `delete-filter`.

AWS CLI

To delete an existing filter in the current region

This example shows how to create delete a filter.

```
aws guardduty delete-filter \
    --detector-id b6b992d6d2f48e64bc59180bfexample \
    --filter-name byebyeFilter
```

This command produces no output.

For more information, see Filtering findings in the GuardDuty User Guide.

- For API details, see DeleteFilter in *AWS CLI Command Reference*.

`disable-organization-admin-account`

The following code example shows how to use `disable-organization-admin-account`.

AWS CLI

To remove an account as the delegated administrator for GuardDuty within your organization

This example shows how to remove an account as the delegated administrator for GuardDuty.

```
aws guardduty disable-organization-admin-account \
    --admin-account-id 111122223333
```

This command produces no output.

For more information, see Managing accounts with AWS organizations in the *GuardDuty User Guide*.

- For API details, see DisableOrganizationAdminAccount in *AWS CLI Command Reference*.

`disassociate-from-master-account`

The following code example shows how to use `disassociate-from-master-account`.

AWS CLI

To disassociate from your current administrator account in the current region

The following `disassociate-from-master-account` example disassociates your account from the current GuardDuty administrator account in the current AWS region.

```
aws guardduty disassociate-from-master-account \
    --detector-id d4b040365221be2b54a6264dcexample
```

This command produces no output.

For more information, see Understanding the relationship between GuardDuty administrator account and member accounts in the *GuardDuty User Guide*.

- For API details, see DisassociateFromMasterAccount in *AWS CLI Command Reference*.

get-detector

The following code example shows how to use `get-detector`.

AWS CLI

To retrieve details of a specific detector

The following `get-detector` example displays the configurations details of the specified detector.

```
aws guardduty get-detector \
    --detector-id 12abc34d567e8fa901bc2d34eexample
```

Output:

```
{
    "Status": "ENABLED",
    "ServiceRole": "arn:aws:iam::111122223333:role/aws-service-role/
guardduty.amazonaws.com/AWSServiceRoleForAmazonGuardDuty",
    "Tags": {},
    "FindingPublishingFrequency": "SIX_HOURS",
    "UpdatedAt": "2018-11-07T03:24:22.938Z",
    "CreatedAt": "2017-12-22T22:51:31.940Z"
}
```

For more information, see Concepts and Terminology in the GuardDuty User Guide.

- For API details, see GetDetector in *AWS CLI Command Reference*.

get-findings

The following code example shows how to use `get-findings`.

AWS CLI

Example 1: To retrieve the details of a specific finding

The following `get-findings` example retrieves the full JSON finding details of the specified finding.

```
aws guardduty get-findings \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --finding-id 1ab92989eaf0e742df4a014d5example
```

Output:

```
{
    "Findings": [
        {
            "Resource": {
                "ResourceType": "AccessKey",
                "AccessKeyDetails": {
                    "UserName": "testuser",
                    "UserType": "IAMUser",

            "AccountId": "111122223333"
        }
    ]
}
```

For more information, see Findings in the GuardDuty User Guide.

- For API details, see GetFindings in *AWS CLI Command Reference*.

`get-ip-set`

The following code example shows how to use `get-ip-set`.

AWS CLI

To list get details on a specified trusted IP set

The following `get-ip-set` example shows the status and details of the specified trusted IP set.

```
aws guardduty get-ip-set \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --ip-set-id d4b94fc952d6912b8f3060768example
```

Output:

```
{
    "Status": "ACTIVE",
    "Location": "s3://amzn-s3-demo-bucket.s3-us-west-2.amazonaws.com/
customlist.csv",
    "Tags": {},
    "Format": "TXT",
    "Name": "test-ip-set-example"
}
```

For more information, see Working with Trusted IP Lists and Threat Lists in the *GuardDuty User Guide*.

- For API details, see GetIpSet in *AWS CLI Command Reference*.

`get-master-account`

The following code example shows how to use `get-master-account`.

AWS CLI

To retrieve details about your master account in the current region

The following `get-master-account` example displays the status and details of the master account associated with your detector in the current region.

```
aws guardduty get-master-account \
```

```
    --detector-id 12abc34d567e8fa901bc2d34eexample
```

Output:

```
{
    "Master": {
        "InvitationId": "04b94d9704854a73f94e061e8example",
        "InvitedAt": "2020-06-09T22:23:04.970Z",
        "RelationshipStatus": "Enabled",
        "AccountId": "111122223333"
    }
}
```

For more information, see Understanding the relationship between GuardDuty administrator account and member account in the *GuardDuty User Guide*.

- For API details, see GetMasterAccount in *AWS CLI Command Reference*.

`list-detectors`

The following code example shows how to use `list-detectors`.

AWS CLI

To list the available detectors in the current region

The following `list-detectors` example lists the available detectors in your current AWS region.

```
aws guardduty list-detectors
```

Output:

```
{
    "DetectorIds": [
        "12abc34d567e8fa901bc2d34eexample"
    ]
}
```

For more information, see Concepts and Terminology in the GuardDuty User Guide.

- For API details, see ListDetectors in *AWS CLI Command Reference*.

`list-findings`

The following code example shows how to use `list-findings`.

AWS CLI

Example 1: To list all findings for the current region

The following `list-findings` example displays a list of all findingIds for the current region sorted by severity from highest to lowest.

```
aws guardduty list-findings \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --sort-criteria '{"AttributeName": "severity","OrderBy":"DESC"}'
```

Output:

```
{
    "FindingIds": [
        "04b8ab50fd29c64fc771b232dexample",
        "5ab8ab50fd21373735c826d3aexample",
        "90b93de7aba69107f05bbe60bexample",
        ...
    ]
}
```

For more information, see Findings in the GuardDuty User Guide.

Example 2: To list findings for the current region matching a specific finding criteria

The following `list-findings` example displays a list of all findingIds that match a specified finding type.

```
aws guardduty list-findings \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --finding-criteria  '{"Criterion":{"type": {"Eq":["UnauthorizedAccess:EC2/
SSHBruteForce"]}}}'
```

Output:

```
{
    "FindingIds": [
```

```
        "90b93de7aba69107f05bbe60bexample",
        "6eb9430d7023d30774d6f05e3example",
        "2eb91a2d060ac9a21963a5848example",
        "44b8ab50fd2b0039a9e48f570example",
        "9eb8ab4cd2b7e5b66ba4f5e96example",
        "e0b8ab3a38e9b0312cc390ceeexample"
    ]
}
```

For more information, see Findings in the GuardDuty User Guide.

Example 3: To list findings for the current region matching a specific set of finding criteria defined within a JSON file

The following `list-findings` example displays a list of all findingIds that are not archived, and involve the IAM user named "testuser", as specified in a JSON file.

```
aws guardduty list-findings \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --finding-criteria  file://myfile.json
```

Contents of `myfile.json`:

```
{"Criterion": {
    "resource.accessKeyDetails.userName":{
                "Eq":[
                    "testuser"
                    ]
                },
    "service.archived": {
                "Eq": [
                    "false"
                ]
            }
        }
}
```

Output:

```
{
    "FindingIds": [
        "1ab92989eaf0e742df4a014d5example"
```

```
    ]
}
```

For more information, see Findings in the GuardDuty User Guide.

- For API details, see ListFindings in *AWS CLI Command Reference*.

`list-invitations`

The following code example shows how to use `list-invitations`.

AWS CLI

To list details on your invitations to become a member account in the current region

The following `list-invitations` example lists details and statuses on your invitations to become a GuardDuty member account in the current region.

```
aws guardduty list-invitations
```

Output:

```
{
    "Invitations": [
        {
            "InvitationId": "d6b94fb03a66ff665f7db8764example",
            "InvitedAt": "2020-06-10T17:56:38.221Z",
            "RelationshipStatus": "Invited",
            "AccountId": "123456789111"
        }
    ]
}
```

For more information, see Managing GuardDuty Accounts by Invitation in the GuardDuty User Guide.

- For API details, see ListInvitations in *AWS CLI Command Reference*.

`list-ip-sets`

The following code example shows how to use `list-ip-sets`.

AWS CLI

To list trusted IP sets in the current region

The following `list-ip-sets` example lists the trusted IP sets in your current AWS region.

```
aws guardduty list-ip-sets \
    --detector-id 12abc34d567e8fa901bc2d34eexample
```

Output:

```
{
    "IpSetIds": [
        "d4b94fc952d6912b8f3060768example"
    ]
}
```

For more information, see Working with Trusted IP Lists and Threat Lists in the GuardDuty User Guide.

- For API details, see ListIpSets in *AWS CLI Command Reference*.

`list-members`

The following code example shows how to use `list-members`.

AWS CLI

Example 1: To list only current members in the current Region

The following `list-members` example lists and provides details of only current member accounts associated with the GuardDuty administrator account, in the current region.

```
aws guardduty list-members \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --only-associated="true"
```

Output:

```
{
    "Members": [
        {
```

```
                "RelationshipStatus": "Enabled",
                "InvitedAt": "2020-06-09T22:49:00.910Z",
                "MasterId": "111122223333",
                "DetectorId": "7ab8b2f61b256c87f793f6a86example",
                "UpdatedAt": "2020-06-09T23:08:22.512Z",
                "Email": "your+member@example.com",
                "AccountId": "123456789012"
            }
        ]
}
```

For more information, see Understanding the relationship between GuardDuty administrator account and member accounts in the *GuardDuty User Guide*.

Example 2: To list all the members in the current Region

The following `list-members` example lists and provides details of all the member accounts, including those who have been disassociated or have not yet accepted the invite from the GuardDuty administrator, in the current region.

```
aws guardduty list-members \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --only-associated="false"
```

Output:

```
{
    "Members": [
        {
            "RelationshipStatus": "Enabled",
            "InvitedAt": "2020-06-09T22:49:00.910Z",
            "MasterId": "111122223333",
            "DetectorId": "7ab8b2f61b256c87f793f6a86example",
            "UpdatedAt": "2020-06-09T23:08:22.512Z",
            "Email": "your+other+member@example.com",
            "AccountId": "555555555555"
        }
    ]
}
```

For more information, see Understanding the relationship between GuardDuty administrator account and member accounts in the *GuardDuty User Guide*.

- For API details, see ListMembers in *AWS CLI Command Reference*.

`update-detector`

The following code example shows how to use `update-detector`.

AWS CLI

Example 1: To enable runtime monitoring in GuardDuty

The following `update-detector` example enables runtime monitoring without additional configuration.

```
aws guardduty update-detector \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --features 'Name=RUNTIME_MONITORING,Status=ENABLED'
```

This command produces no output.

For more information, see Runtime monitoring in the *GuardDuty User Guide*.

Example 2: To enable runtime monitoring with additional configuration

The following `update-detector` example enables runtime monitoring with additional configuration for EC2, ECS Fargate, and EKS.

```
aws guardduty update-detector \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --features
 'Name=RUNTIME_MONITORING,Status=ENABLED,AdditionalConfiguration=[{Name=EC2_AGENT_MANAGEMENT
{Name=ECS_FARGATE_AGENT_MANAGEMENT,Status=ENABLED},
{Name=EKS_ADDON_MANAGEMENT,Status=ENABLED}]'
```

This command produces no output.

For more information, see Runtime monitoring in the *GuardDuty User Guide*.

- For API details, see UpdateDetector in *AWS CLI Command Reference*.

`update-ip-set`

The following code example shows how to use `update-ip-set`.

AWS CLI

To update a trusted IP set

The following `update-ip-set` example shows how to update the details of a trusted IP set.

```
aws guardduty update-ip-set \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --ip-set-id d4b94fc952d6912b8f3060768example \
    --location https://amzn-s3-demo-bucket.s3-us-west-2.amazonaws.com/
customtrustlist2.csv
```

This command produces no output.

For more information, see Working with Trusted IP Lists and Threat Lists in the *GuardDuty User Guide*.

- For API details, see UpdateIpSet in *AWS CLI Command Reference*.

AWS Health examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Health.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`describe-affected-entities`

The following code example shows how to use `describe-affected-entities`.

AWS CLI

To list the entities that are affected by a specified AWS Health event

The following `describe-affected-entities` example lists the entities that are affected by the specified AWS Health event. This event is a billing notification for the AWS account.

```
aws health describe-affected-entities \
    --filter "eventArns=arn:aws:health:global::event/BILLING/
AWS_BILLING_NOTIFICATION/AWS_BILLING_NOTIFICATION_6ce1d874-e995-40e2-99cd-
EXAMPLE11145" \
    --region us-east-1
```

Output:

```
{
    "entities": [
        {
            "entityArn": "arn:aws:health:global:123456789012:entity/
EXAMPLEimSMoULmWHpb",
            "eventArn": "arn:aws:health:global::event/BILLING/
AWS_BILLING_NOTIFICATION/AWS_BILLING_NOTIFICATION_6ce1d874-e995-40e2-99cd-
EXAMPLE11145",
            "entityValue": "AWS_ACCOUNT",
            "awsAccountId": "123456789012",
            "lastUpdatedTime": 1588356454.08
        }
    ]
}
```

For more information, see Event log in the *AWS Health User Guide*.

- For API details, see DescribeAffectedEntities in *AWS CLI Command Reference*.

`describe-event-details`

The following code example shows how to use `describe-event-details`.

AWS CLI

To list information about an AWS Health event

The following `describe-event-details` example lists information about the specified AWS Health event.

```
aws health describe-event-details \
```

```
    --event-arns "arn:aws:health:us-east-1::event/EC2/AWS_EC2_OPERATIONAL_ISSUE/
AWS_EC2_OPERATIONAL_ISSUE_VKTXI_EXAMPLE111" \
    --region us-east-1
```

Output:

```
{
    "successfulSet": [
        {
            "event": {
                "arn": "arn:aws:health:us-east-1::event/EC2/
AWS_EC2_OPERATIONAL_ISSUE/AWS_EC2_OPERATIONAL_ISSUE_VKTXI_EXAMPLE111",
                "service": "EC2",
                "eventTypeCode": "AWS_EC2_OPERATIONAL_ISSUE",
                "eventTypeCategory": "issue",
                "region": "us-east-1",
                "startTime": 1587462325.096,
                "endTime": 1587464204.774,
                "lastUpdatedTime": 1587464204.865,
                "statusCode": "closed"
            },
            "eventDescription": {
                "latestDescription": "[RESOLVED] Increased API Error Rates and
 Latencies\n\n[02:45 AM PDT] We are investigating increased API error rates and
 latencies in the US-EAST-1 Region.\n\n[03:16 AM PDT] Between 2:10 AM and 2:59 AM
 PDT we experienced increased API error rates and latencies in the US-EAST-1 Region.
 The issue has been resolved and the service is operating normally."
            }
        }
    ],
    "failedSet": []
}
```

For more information, see Event details pane in the *AWS Health User Guide*.

- For API details, see DescribeEventDetails in *AWS CLI Command Reference*.

`describe-events`

The following code example shows how to use `describe-events`.

AWS CLI

Example 1: To list AWS Health events

The following `describe-events` example lists recent AWS Health events.

```
aws health describe-events \
    --region us-east-1
```

Output:

```
{
    "events": [
        {
            "arn": "arn:aws:health:us-west-1::event/ECS/AWS_ECS_OPERATIONAL_ISSUE/

For more information, see Getting started with the AWS Personal Health Dashboard in the *AWS Health User Guide*.

Example 2: To list AWS Health events by service and event status code

The following `describe-events` example lists AWS Health events for Amazon Elastic Compute Cloud (Amazon EC2) where the event status is closed.

```
aws health describe-events \
    --filter "services=EC2,eventStatusCodes=closed"
```

Output:

```
{
    "events": [
        {
            "arn": "arn:aws:health:us-east-1::event/EC2/AWS_EC2_OPERATIONAL_ISSUE/

            "service": "EC2",
            "eventTypeCode": "AWS_EC2_OPERATIONAL_ISSUE",
            "eventTypeCategory": "issue",
            "region": "ap-southeast-2",
            "startTime": 1583881487.483,
            "endTime": 1583885056.785,
            "lastUpdatedTime": 1583885057.052,
            "statusCode": "closed",
            "eventScopeCode": "PUBLIC"
        }
    ]
}
```

For more information, see Getting started with the AWS Personal Health Dashboard in the *AWS Health User Guide*.

- For API details, see DescribeEvents in *AWS CLI Command Reference*.

HealthImaging examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with HealthImaging.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`copy-image-set`

The following code example shows how to use `copy-image-set`.

AWS CLI

Example 1: To copy an image set without a destination.

The following `copy-image-set` example makes a duplicate copy of an image set without a destination.

```
aws medical-imaging copy-image-set \
    --datastore-id 12345678901234567890123456789012 \
    --source-image-set-id ea92b0d8838c72a3f25d00d13616f87e \
    --copy-image-set-information '{"sourceImageSet": {"latestVersionId": "1" } }'
```

Output:

```
{
    "destinationImageSetProperties": {
        "latestVersionId": "2",
        "imageSetWorkflowStatus": "COPYING",
        "updatedAt": 1680042357.432,
        "imageSetId": "b9a06fef182a5f992842f77f8e0868e5",
        "imageSetState": "LOCKED",
        "createdAt": 1680042357.432
    },
    "sourceImageSetProperties": {
        "latestVersionId": "1",
        "imageSetWorkflowStatus": "COPYING_WITH_READ_ONLY_ACCESS",
        "updatedAt": 1680042357.432,
        "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
        "imageSetState": "LOCKED",
```

```
        "createdAt": 1680027126.436
    },
    "datastoreId": "12345678901234567890123456789012"
}
```

Example 2: To copy an image set with a destination.

The following `copy-image-set` example makes a duplicate copy of an image set with a destination.

```
aws medical-imaging copy-image-set \
    --datastore-id 12345678901234567890123456789012 \
    --source-image-set-id ea92b0d8838c72a3f25d00d13616f87e \
    --copy-image-set-information '{"sourceImageSet": {"latestVersionId": "1" },
 "destinationImageSet": { "imageSetId": "b9a06fef182a5f992842f77f8e0868e5",
 "latestVersionId": "1"} }'
```

Output:

```
{
    "destinationImageSetProperties": {
        "latestVersionId": "2",
        "imageSetWorkflowStatus": "COPYING",
        "updatedAt": 1680042505.135,
        "imageSetId": "b9a06fef182a5f992842f77f8e0868e5",
        "imageSetState": "LOCKED",
        "createdAt": 1680042357.432
    },
    "sourceImageSetProperties": {
        "latestVersionId": "1",
        "imageSetWorkflowStatus": "COPYING_WITH_READ_ONLY_ACCESS",
        "updatedAt": 1680042505.135,
        "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
        "imageSetState": "LOCKED",
        "createdAt": 1680027126.436
    },
    "datastoreId": "12345678901234567890123456789012"
}
```

Example 3: To copy a subset of instances from a source image set to a destination image set.

The following `copy-image-set` example copies one DICOM instance from the source image set to the destination image set. The force parameter is provided to override inconsistencies in the Patient, Study, and Series level attributes.

```
aws medical-imaging copy-image-set \
    --datastore-id 12345678901234567890123456789012 \
    --source-image-set-id ea92b0d8838c72a3f25d00d13616f87e \
    --copy-image-set-information '{"sourceImageSet": {"latestVersionId":
 "1","DICOMCopies": {"copiableAttributes": "{\"SchemaVersion\":\"1.1\",\"Study\":
{\"Series\":{\"1.3.6.1.4.1.5962.99.1.3673257865.2104868982.1369432891697.3666.0\":
{\"Instances\":
{\"1.3.6.1.4.1.5962.99.1.3673257865.2104868982.1369432891697.3669.0\":
{}}}}}}"}},"destinationImageSet": {"imageSetId":
 "b9eb50d8ee682eb9fcf4acbf92f62bb7","latestVersionId": "1"}}' \
    --force
```

Output:

```
{
    "destinationImageSetProperties": {
        "latestVersionId": "2",
        "imageSetWorkflowStatus": "COPYING",
        "updatedAt": 1680042505.135,
        "imageSetId": "b9eb50d8ee682eb9fcf4acbf92f62bb7",
        "imageSetState": "LOCKED",
        "createdAt": 1680042357.432
    },
    "sourceImageSetProperties": {
        "latestVersionId": "1",
        "imageSetWorkflowStatus": "COPYING_WITH_READ_ONLY_ACCESS",
        "updatedAt": 1680042505.135,
        "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
        "imageSetState": "LOCKED",
        "createdAt": 1680027126.436
    },
    "datastoreId": "12345678901234567890123456789012"
}
```

For more information, see Copying an image set in the *AWS HealthImaging Developer Guide*.

- For API details, see CopyImageSet in *AWS CLI Command Reference*.

`create-datastore`

The following code example shows how to use `create-datastore`.

AWS CLI

Example 1: To create a data store

The following `create-datastore` code example creates a data store with the name `my-datastore`. When you create a datastore without specifying a `--lossless-storage-format`, AWS HealthImaging defaults to HTJ2K (High Throughput JPEG 2000).

```
aws medical-imaging create-datastore \
    --datastore-name "my-datastore"
```

Output:

```
{
    "datastoreId": "12345678901234567890123456789012",
    "datastoreStatus": "CREATING"
}
```

Example 2: To create a data store with JPEG 2000 Lossless storage format

A data store configured with JPEG 2000 Lossless storage format will transcode and persist lossless image frames in JPEG 2000 format. Image frames can then be retrieved in JPEG 2000 Lossless without transcoding. The following `create-datastore` code example creates a data store configured for JPEG 2000 Lossless storage format with the name `my-datastore`.

```
aws medical-imaging create-datastore \
    --datastore-name "my-datastore" \
    --lossless-storage-format JPEG_2000_LOSSLESS
```

Output:

```
{
    "datastoreId": "12345678901234567890123456789012",
    "datastoreStatus": "CREATING"
}
```

For more information, see Creating a data store in the *AWS HealthImaging Developer Guide*.

- For API details, see CreateDatastore in *AWS CLI Command Reference*.

`delete-datastore`

The following code example shows how to use `delete-datastore`.

AWS CLI

To delete a data store

The following `delete-datastore` code example deletes a data store.

```
aws medical-imaging delete-datastore \
    --datastore-id "12345678901234567890123456789012"
```

Output:

```
{
    "datastoreId": "12345678901234567890123456789012",
    "datastoreStatus": "DELETING"
}
```

For more information, see Deleting a data store in the *AWS HealthImaging Developer Guide*.

- For API details, see DeleteDatastore in *AWS CLI Command Reference*.

`delete-image-set`

The following code example shows how to use `delete-image-set`.

AWS CLI

To delete an image set

The following `delete-image-set` code example deletes an image set.

```
aws medical-imaging delete-image-set \
    --datastore-id 12345678901234567890123456789012 \
    --image-set-id ea92b0d8838c72a3f25d00d13616f87e
```

Output:

```
{
    "imageSetWorkflowStatus": "DELETING",
    "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
    "imageSetState": "LOCKED",
    "datastoreId": "12345678901234567890123456789012"
}
```

For more information, see Deleting an image set in the *AWS HealthImaging Developer Guide*.

- For API details, see DeleteImageSet in *AWS CLI Command Reference*.

`get-datastore`

The following code example shows how to use `get-datastore`.

AWS CLI

Example 1: To get a data store's properties

The following `get-datastore` code example gets a data store's properties.

```
aws medical-imaging get-datastore \
    --datastore-id 12345678901234567890123456789012
```

Output:

```
{
    "datastoreProperties": {
        "datastoreId": "12345678901234567890123456789012",
        "datastoreName": "TestDatastore123",
        "datastoreStatus": "ACTIVE",
        "losslessStorageFormat": "HTJ2K"
        "datastoreArn": "arn:aws:medical-imaging:us-
east-1:123456789012:datastore/12345678901234567890123456789012",
        "createdAt": "2022-11-15T23:33:09.643000+00:00",
        "updatedAt": "2022-11-15T23:33:09.643000+00:00"
    }
}
```

Example 2: To get data store's properties configured for JPEG2000

The following `get-datastore` code example gets a data store's properties for a data store configured for JPEG 2000 Lossless storage format.

```
aws medical-imaging get-datastore \
    --datastore-id 12345678901234567890123456789012
```

Output:

```
{
    "datastoreProperties": {
        "datastoreId": "12345678901234567890123456789012",
        "datastoreName": "TestDatastore123",
        "datastoreStatus": "ACTIVE",
        "losslessStorageFormat": "JPEG_2000_LOSSLESS",
        "datastoreArn": "arn:aws:medical-imaging:us-
east-1:123456789012:datastore/12345678901234567890123456789012",
        "createdAt": "2022-11-15T23:33:09.643000+00:00",
        "updatedAt": "2022-11-15T23:33:09.643000+00:00"
    }
}
```

For more information, see Getting data store properties in the *AWS HealthImaging Developer Guide*.

- For API details, see GetDatastore in *AWS CLI Command Reference*.

`get-dicom-import-job`

The following code example shows how to use `get-dicom-import-job`.

AWS CLI

To get a dicom import job's properties

The following `get-dicom-import-job` code example gets a dicom import job's properties.

```
aws medical-imaging get-dicom-import-job \
    --datastore-id "12345678901234567890123456789012" \
    --job-id "09876543210987654321098765432109"
```

Output:

```
{
    "jobProperties": {
        "jobId": "09876543210987654321098765432109",
        "jobName": "my-job",
        "jobStatus": "COMPLETED",
        "datastoreId": "12345678901234567890123456789012",
        "dataAccessRoleArn": "arn:aws:iam::123456789012:role/
ImportJobDataAccessRole",
        "endedAt": "2022-08-12T11:29:42.285000+00:00",
        "submittedAt": "2022-08-12T11:28:11.152000+00:00",
        "inputS3Uri": "s3://medical-imaging-dicom-input/dicom_input/",
        "outputS3Uri": "s3://medical-imaging-output/
job_output/12345678901234567890123456789012-
DicomImport-09876543210987654321098765432109/"
    }
}
```

For more information, see Getting import job properties in the *AWS HealthImaging Developer Guide*.

- For API details, see GetDICOMImportJob in *AWS CLI Command Reference*.

`get-image-frame`

The following code example shows how to use `get-image-frame`.

AWS CLI

To get image set pixel data

The following `get-image-frame` code example gets an image frame.

```
aws medical-imaging get-image-frame \
    --datastore-id "12345678901234567890123456789012" \
    --image-set-id "98765412345612345678907890789012" \
    --image-frame-information imageFrameId=3abf5d5d7ae72f80a0ec81b2c0de3ef4 \
    imageframe.jph
```

Note: This code example does not include output because the GetImageFrame action returns a stream of pixel data to the imageframe.jph file. For information about decoding and viewing image frames, see HTJ2K decoding libraries.

For more information, see Getting image set pixel data in the *AWS HealthImaging Developer Guide*.

- For API details, see GetImageFrame in *AWS CLI Command Reference*.

`get-image-set-metadata`

The following code example shows how to use `get-image-set-metadata`.

AWS CLI

Example 1: To get image set metadata without version

The following `get-image-set-metadata` code example gets metadata for an image set without specifying a version.

Note: `outfile` is a required parameter

```
aws medical-imaging get-image-set-metadata \
    --datastore-id 12345678901234567890123456789012 \
    --image-set-id ea92b0d8838c72a3f25d00d13616f87e \
    studymetadata.json.gz
```

The returned metadata is compressed with gzip and stored in the studymetadata.json.gz file. To view the contents of the returned JSON object, you must first decompress it.

Output:

```
{
    "contentType": "application/json",
    "contentEncoding": "gzip"
}
```

Example 2: To get image set metadata with version

The following `get-image-set-metadata` code example gets metadata for an image set with a specified version.

Note: `outfile` is a required parameter

```
aws medical-imaging get-image-set-metadata \
```

```
    --datastore-id 12345678901234567890123456789012 \
    --image-set-id ea92b0d8838c72a3f25d00d13616f87e \
    --version-id 1 \
    studymetadata.json.gz
```

The returned metadata is compressed with gzip and stored in the studymetadata.json.gz file. To view the contents of the returned JSON object, you must first decompress it.

Output:

```
{
    "contentType": "application/json",
    "contentEncoding": "gzip"
}
```

For more information, see Getting image set metadata in the *AWS HealthImaging Developer Guide*.

- For API details, see GetImageSetMetadata in *AWS CLI Command Reference*.

`get-image-set`

The following code example shows how to use `get-image-set`.

AWS CLI

To get image set properties

The following `get-image-set` code example gets the properties for an image set.

```
aws medical-imaging get-image-set \
    --datastore-id 12345678901234567890123456789012 \
    --image-set-id 18f88ac7870584f58d56256646b4d92b \
    --version-id 1
```

Output:

```
{
    "versionId": "1",
    "imageSetWorkflowStatus": "COPIED",
    "updatedAt": 1680027253.471,
```

```
    "imageSetId": "18f88ac7870584f58d56256646b4d92b",
    "imageSetState": "ACTIVE",
    "createdAt": 1679592510.753,
    "datastoreId": "12345678901234567890123456789012"
}
```

For more information, see Getting image set properties in the *AWS HealthImaging Developer Guide*.

- For API details, see GetImageSet in *AWS CLI Command Reference*.

`list-datastores`

The following code example shows how to use `list-datastores`.

AWS CLI

To list data stores

The following `list-datastores` code example lists available data stores.

```
aws medical-imaging list-datastores
```

Output:

```
{
    "datastoreSummaries": [
        {
            "datastoreId": "12345678901234567890123456789012",
            "datastoreName": "TestDatastore123",
            "datastoreStatus": "ACTIVE",
            "datastoreArn": "arn:aws:medical-imaging:us-
east-1:123456789012:datastore/12345678901234567890123456789012",
            "createdAt": "2022-11-15T23:33:09.643000+00:00",
            "updatedAt": "2022-11-15T23:33:09.643000+00:00"
        }
    ]
}
```

For more information, see Listing data stores in the *AWS HealthImaging Developer Guide*.

- For API details, see ListDatastores in *AWS CLI Command Reference*.

`list-dicom-import-jobs`

The following code example shows how to use `list-dicom-import-jobs`.

AWS CLI

To list dicom import jobs

The following `list-dicom-import-jobs` code example lists dicom import jobs.

```
aws medical-imaging list-dicom-import-jobs \
    --datastore-id "12345678901234567890123456789012"
```

Output:

```
{
    "jobSummaries": [
        {
            "jobId": "09876543210987654321098765432109",
            "jobName": "my-job",
            "jobStatus": "COMPLETED",
            "datastoreId": "12345678901234567890123456789012",
            "dataAccessRoleArn": "arn:aws:iam::123456789012:role/
ImportJobDataAccessRole",
            "endedAt": "2022-08-12T11:21:56.504000+00:00",
            "submittedAt": "2022-08-12T11:20:21.734000+00:00"
        }
    ]
}
```

For more information, see Listing import jobs in the *AWS HealthImaging Developer Guide*.

- For API details, see ListDICOMImportJobs in *AWS CLI Command Reference*.

`list-image-set-versions`

The following code example shows how to use `list-image-set-versions`.

AWS CLI

To list image set versions

The following `list-image-set-versions` code example lists the version history for an image set.

```
aws medical-imaging list-image-set-versions \
    --datastore-id 12345678901234567890123456789012 \
    --image-set-id ea92b0d8838c72a3f25d00d13616f87e
```

Output:

```
{
    "imageSetPropertiesList": [
        {
            "ImageSetWorkflowStatus": "UPDATED",
            "versionId": "4",
            "updatedAt": 1680029436.304,
            "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
            "imageSetState": "ACTIVE",
            "createdAt": 1680027126.436
        },
        {
            "ImageSetWorkflowStatus": "UPDATED",
            "versionId": "3",
            "updatedAt": 1680029163.325,
            "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
            "imageSetState": "ACTIVE",
            "createdAt": 1680027126.436
        },
        {
            "ImageSetWorkflowStatus": "COPY_FAILED",
            "versionId": "2",
            "updatedAt": 1680027455.944,
            "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
            "imageSetState": "ACTIVE",
            "message": "INVALID_REQUEST:  Series of SourceImageSet and
 DestinationImageSet don't match.",
            "createdAt": 1680027126.436
        },
        {
            "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
            "imageSetState": "ACTIVE",
            "versionId": "1",
            "ImageSetWorkflowStatus": "COPIED",
            "createdAt": 1680027126.436
```

```
        }
    ]
}
```

For more information, see Listing image set versions in the *AWS HealthImaging Developer Guide*.

- For API details, see ListImageSetVersions in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

Example 1: To list resource tags for a data store

The following `list-tags-for-resource` code example lists tags for a data store.

```
aws medical-imaging list-tags-for-resource \
    --resource-arn "arn:aws:medical-imaging:us-
east-1:123456789012:datastore/12345678901234567890123456789012"
```

Output:

```
{
    "tags":{
        "Deployment":"Development"
    }
}
```

Example 2: To list resource tags for an image set

The following `list-tags-for-resource` code example lists tags for an image set.

```
aws medical-imaging list-tags-for-resource \
    --resource-arn "arn:aws:medical-imaging:us-
east-1:123456789012:datastore/12345678901234567890123456789012/
imageset/18f88ac7870584f58d56256646b4d92b"
```

Output:

```
{
```

```
    "tags":{
        "Deployment":"Development"
    }
}
```

For more information, see Tagging resources with AWS HealthImaging in the *AWS HealthImaging Developer Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`search-image-sets`

The following code example shows how to use `search-image-sets`.

AWS CLI

Example 1: To search image sets with an EQUAL operator

The following `search-image-sets` code example uses the EQUAL operator to search image sets based on a specific value.

```
aws medical-imaging search-image-sets \
    --datastore-id 12345678901234567890123456789012 \
    --search-criteria file://search-criteria.json
```

Contents of `search-criteria.json`

```
{
    "filters": [{
        "values": [{"DICOMPatientId" : "SUBJECT08701"}],
        "operator": "EQUAL"
    }]
}
```

Output:

```
{
    "imageSetsMetadataSummaries": [{
        "imageSetId": "09876543210987654321098765432109",
        "createdAt": "2022-12-06T21:40:59.429000+00:00",
        "version": 1,
```

```
        "DICOMTags": {
            "DICOMStudyId": "2011201407",
            "DICOMStudyDate": "19991122",
             "DICOMPatientSex": "F",
             "DICOMStudyInstanceUID": "1.2.840.99999999.84710745.943275268089",
             "DICOMPatientBirthDate": "19201120",
             "DICOMStudyDescription": "UNKNOWN",
             "DICOMPatientId": "SUBJECT08701",
             "DICOMPatientName": "Melissa844 Huel628",
             "DICOMNumberOfStudyRelatedInstances": 1,
             "DICOMStudyTime": "140728",
             "DICOMNumberOfStudyRelatedSeries": 1
            },
        "updatedAt": "2022-12-06T21:40:59.429000+00:00"
    }]
}
```

Example 2: To search image sets with a BETWEEN operator using DICOMStudyDate and DICOMStudyTime

The following `search-image-sets` code example searches for image sets with DICOM Studies generated between January 1, 1990 (12:00 AM) and January 1, 2023 (12:00 AM).

Note: DICOMStudyTime is optional. If it is not present, 12:00 AM (start of the day) is the time value for the dates provided for filtering.

```
aws medical-imaging search-image-sets \
    --datastore-id 12345678901234567890123456789012 \
    --search-criteria file://search-criteria.json
```

Contents of `search-criteria.json`

```
{
    "filters": [{
        "values": [{
            "DICOMStudyDateAndTime": {
                "DICOMStudyDate": "19900101",
                "DICOMStudyTime": "000000"
            }
        },
        {
            "DICOMStudyDateAndTime": {
```

```
                "DICOMStudyDate": "20230101",
                "DICOMStudyTime": "000000"
            }
        }],
        "operator": "BETWEEN"
    }]
}
```

Output:

```
{
    "imageSetsMetadataSummaries": [{
        "imageSetId": "09876543210987654321098765432109",
        "createdAt": "2022-12-06T21:40:59.429000+00:00",
        "version": 1,
        "DICOMTags": {
            "DICOMStudyId": "2011201407",
            "DICOMStudyDate": "19991122",
            "DICOMPatientSex": "F",
            "DICOMStudyInstanceUID": "1.2.840.99999999.84710745.943275268089",
            "DICOMPatientBirthDate": "19201120",
            "DICOMStudyDescription": "UNKNOWN",
            "DICOMPatientId": "SUBJECT08701",
            "DICOMPatientName": "Melissa844 Huel628",
            "DICOMNumberOfStudyRelatedInstances": 1,
            "DICOMStudyTime": "140728",
            "DICOMNumberOfStudyRelatedSeries": 1
        },
        "updatedAt": "2022-12-06T21:40:59.429000+00:00"
    }]
}
```

Example 3: To search image sets with a BETWEEN operator using createdAt (time studies were previously persisted)

The following `search-image-sets` code example searches for image sets with DICOM Studies persisted in HealthImaging between the time ranges in UTC time zone.

Note: Provide createdAt in example format ("1985-04-12T23:20:50.52Z").

```
aws medical-imaging search-image-sets \
    --datastore-id 12345678901234567890123456789012 \
```

```
    --search-criteria  file://search-criteria.json
```

Contents of `search-criteria.json`

```
{
    "filters": [{
        "values": [{
            "createdAt": "1985-04-12T23:20:50.52Z"
        },
        {
            "createdAt": "2022-04-12T23:20:50.52Z"
        }],
        "operator": "BETWEEN"
    }]
}
```

Output:

```
{
    "imageSetsMetadataSummaries": [{
        "imageSetId": "09876543210987654321098765432109",
        "createdAt": "2022-12-06T21:40:59.429000+00:00",
        "version": 1,
        "DICOMTags": {
            "DICOMStudyId": "2011201407",
            "DICOMStudyDate": "19991122",
            "DICOMPatientSex": "F",
            "DICOMStudyInstanceUID": "1.2.840.99999999.84710745.943275268089",
            "DICOMPatientBirthDate": "19201120",
            "DICOMStudyDescription": "UNKNOWN",
            "DICOMPatientId": "SUBJECT08701",
            "DICOMPatientName": "Melissa844 Huel628",
            "DICOMNumberOfStudyRelatedInstances": 1,
            "DICOMStudyTime": "140728",
            "DICOMNumberOfStudyRelatedSeries": 1
        },
        "lastUpdatedAt": "2022-12-06T21:40:59.429000+00:00"
    }]
}
```

Example 4: To search image sets with an EQUAL operator on DICOMSeriesInstanceUID and BETWEEN on updatedAt and sort response in ASC order on updatedAt field

The following `search-image-sets` code example searches for image sets with an EQUAL operator on DICOMSeriesInstanceUID and BETWEEN on updatedAt and sort response in ASC order on updatedAt field.

Note: Provide updatedAt in example format ("1985-04-12T23:20:50.52Z").

```
aws medical-imaging search-image-sets \
    --datastore-id 12345678901234567890123456789012 \
    --search-criteria  file://search-criteria.json
```

Contents of `search-criteria.json`

```
{
    "filters": [{
        "values": [{
            "updatedAt": "2024-03-11T15:00:05.074000-07:00"
        }, {
            "updatedAt": "2024-03-11T16:00:05.074000-07:00"
        }],
        "operator": "BETWEEN"
    }, {
        "values": [{
            "DICOMSeriesInstanceUID": "1.2.840.99999999.84710745.943275268089"
        }],
        "operator": "EQUAL"
    }],
    "sort": {
        "sortField": "updatedAt",
        "sortOrder": "ASC"
    }
}
```

Output:

```
{
    "imageSetsMetadataSummaries": [{
        "imageSetId": "09876543210987654321098765432109",
        "createdAt": "2022-12-06T21:40:59.429000+00:00",
        "version": 1,

```

For more information, see Searching image sets in the *AWS HealthImaging Developer Guide*.

- For API details, see SearchImageSets in *AWS CLI Command Reference*.

`start-dicom-import-job`

The following code example shows how to use `start-dicom-import-job`.

AWS CLI

To start a dicom import job

The following `start-dicom-import-job` code example starts a dicom import job.

```
aws medical-imaging start-dicom-import-job \
    --job-name "my-job" \
    --datastore-id "12345678901234567890123456789012" \
    --input-s3-uri "s3://medical-imaging-dicom-input/dicom_input/" \
    --output-s3-uri "s3://medical-imaging-output/job_output/" \
    --data-access-role-arn "arn:aws:iam::123456789012:role/ImportJobDataAccessRole"
```

Output:

```
{
    "datastoreId": "12345678901234567890123456789012",
    "jobId": "09876543210987654321098765432109",
    "jobStatus": "SUBMITTED",
    "submittedAt": "2022-08-12T11:28:11.152000+00:00"
```

```
}
```

For more information, see [Starting an import job](#) in the *AWS HealthImaging Developer Guide*.

- For API details, see [StartDICOMImportJob](#) in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

Example 1: To tag a data store

The following `tag-resource` code examples tags a data store.

```
aws medical-imaging tag-resource \
  --resource-arn "arn:aws:medical-imaging:us-
east-1:123456789012:datastore/12345678901234567890123456789012" \
  --tags '{"Deployment":"Development"}'
```

This command produces no output.

Example 2: To tag an image set

The following `tag-resource` code examples tags an image set.

```
aws medical-imaging tag-resource \
    --resource-arn "arn:aws:medical-imaging:us-
east-1:123456789012:datastore/12345678901234567890123456789012/
imageset/18f88ac7870584f58d56256646b4d92b" \
    --tags '{"Deployment":"Development"}'
```

This command produces no output.

For more information, see [Tagging resources with AWS HealthImaging](#) in the *AWS HealthImaging Developer Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

Example 1: To untag a data store

The following `untag-resource` code example untags a data store.

```
aws medical-imaging untag-resource \
    --resource-arn "arn:aws:medical-imaging:us-east-1:123456789012:datastore/12345678901234567890123456789012" \
    --tag-keys '["Deployment"]'
```

This command produces no output.

Example 2: To untag an image set

The following `untag-resource` code example untags an image set.

```
aws medical-imaging untag-resource \
    --resource-arn "arn:aws:medical-imaging:us-east-1:123456789012:datastore/12345678901234567890123456789012/imageset/18f88ac7870584f58d56256646b4d92b" \
    --tag-keys '["Deployment"]'
```

This command produces no output.

For more information, see Tagging resources with AWS HealthImaging in the *AWS HealthImaging Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-image-set-metadata`

The following code example shows how to use `update-image-set-metadata`.

AWS CLI

Example 1: To insert or update an attribute in image set metadata

The following `update-image-set-metadata` example inserts or updates an attribute in image set metadata.

```
aws medical-imaging update-image-set-metadata \
    --datastore-id 12345678901234567890123456789012 \
    --image-set-id ea92b0d8838c72a3f25d00d13616f87e \
    --latest-version-id 1 \
    --cli-binary-format raw-in-base64-out \
    --update-image-set-metadata-updates file://metadata-updates.json
```

Contents of `metadata-updates.json`

```
{
    "DICOMUpdates": {
        "updatableAttributes": "{\"SchemaVersion\":1.1,\"Patient\":{\"DICOM\":
{\"PatientName\":\"MX^MX\"}}}"
    }
}
```

Output:

```
{
    "latestVersionId": "2",
    "imageSetWorkflowStatus": "UPDATING",
    "updatedAt": 1680042257.908,
    "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
    "imageSetState": "LOCKED",
    "createdAt": 1680027126.436,
    "datastoreId": "12345678901234567890123456789012"
}
```

Example 2: To remove an attribute from image set metadata

The following `update-image-set-metadata` example removes an attribute from image set metadata.

```
aws medical-imaging update-image-set-metadata \
    --datastore-id 12345678901234567890123456789012 \
    --image-set-id ea92b0d8838c72a3f25d00d13616f87e \
    --latest-version-id 1 \
    --cli-binary-format raw-in-base64-out \
    --update-image-set-metadata-updates file://metadata-updates.json
```

Contents of `metadata-updates.json`

```
{
    "DICOMUpdates": {
        "removableAttributes": "{\"SchemaVersion\":1.1,\"Study\":{\"DICOM\":
{\"StudyDescription\":\"CHEST\"}}}"
    }
}
```

Output:

```
{
    "latestVersionId": "2",
    "imageSetWorkflowStatus": "UPDATING",
    "updatedAt": 1680042257.908,
    "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
    "imageSetState": "LOCKED",
    "createdAt": 1680027126.436,
    "datastoreId": "12345678901234567890123456789012"
}
```

Example 3: To remove an instance from image set metadata

The following `update-image-set-metadata` example removes an instance from image set metadata.

```
aws medical-imaging update-image-set-metadata \
    --datastore-id 12345678901234567890123456789012 \
    --image-set-id ea92b0d8838c72a3f25d00d13616f87e \
    --latest-version-id 1 \
    --cli-binary-format raw-in-base64-out \
    --update-image-set-metadata-updates file://metadata-updates.json \
    --force
```

Contents of `metadata-updates.json`

```
{
    "DICOMUpdates": {
        "removableAttributes": "{\"SchemaVersion\": 1.1,\"Study\": {\"Series
\": {\"1.1.1.1.1.1.12345.123456789012.123.12345678901234.1\": {\"Instances\":
 {\"1.1.1.1.1.1.12345.123456789012.123.12345678901234.1\": {}}}}}}}"
    }
}
```

Output:

```
{
    "latestVersionId": "2",
    "imageSetWorkflowStatus": "UPDATING",
    "updatedAt": 1680042257.908,
    "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
    "imageSetState": "LOCKED",
    "createdAt": 1680027126.436,
    "datastoreId": "12345678901234567890123456789012"
}
```

Example 4: To revert an image set to a previous version

The following `update-image-set-metadata` example shows how to revert an image set to a prior version. CopyImageSet and UpdateImageSetMetadata actions create new versions of image sets.

```
aws medical-imaging update-image-set-metadata \
    --datastore-id 12345678901234567890123456789012 \
    --image-set-id 53d5fdb05ca4d46ac7ca64b06545c66e \
    --latest-version-id 3 \
    --cli-binary-format raw-in-base64-out \
    --update-image-set-metadata-updates '{"revertToVersionId": "1"}'
```

Output:

```
{
    "datastoreId": "12345678901234567890123456789012",
    "imageSetId": "53d5fdb05ca4d46ac7ca64b06545c66e",
    "latestVersionId": "4",
    "imageSetState": "LOCKED",
    "imageSetWorkflowStatus": "UPDATING",
    "createdAt": 1680027126.436,
    "updatedAt": 1680042257.908
}
```

Example 5: To add a private DICOM data element to an instance

The following `update-image-set-metadata` example shows how to add a private element to a specified instance within an image set. The DICOM standard permits private data elements for communication of information that cannot be contained in standard data elements. You can create, update, and delete private data elements with the UpdateImageSetMetadata action.

```
aws medical-imaging update-image-set-metadata \
    --datastore-id 12345678901234567890123456789012 \
    --image-set-id 53d5fdb05ca4d46ac7ca64b06545c66e \
    --latest-version-id 1 \
    --cli-binary-format raw-in-base64-out \
    --force \
    --update-image-set-metadata-updates file://metadata-updates.json
```

Contents of `metadata-updates.json`

```
{
    "DICOMUpdates": {
        "updatableAttributes": "{\"SchemaVersion\": 1.1,\"Study\": {\"Series
\": {\"1.1.1.1.1.1.12345.123456789012.123.12345678901234.1\": {\"Instances
\": {\"1.1.1.1.1.1.12345.123456789012.123.12345678901234.1\": {\"DICOM\":
 {\"001910F9\": \"97\"},\"DICOMVRs\": {\"001910F9\": \"DS\"}}}}}}}"
    }
}
```

Output:

```
{
    "latestVersionId": "2",
    "imageSetWorkflowStatus": "UPDATING",
    "updatedAt": 1680042257.908,
    "imageSetId": "53d5fdb05ca4d46ac7ca64b06545c66e",
    "imageSetState": "LOCKED",
    "createdAt": 1680027126.436,
    "datastoreId": "12345678901234567890123456789012"
}
```

Example 6: To update a private DICOM data element to an instance

The following `update-image-set-metadata` example shows how to update the value of a private data element belonging to an instance within an image set.

```
aws medical-imaging update-image-set-metadata \
    --datastore-id 12345678901234567890123456789012 \
    --image-set-id 53d5fdb05ca4d46ac7ca64b06545c66e \
```

```
    --latest-version-id 1 \
    --cli-binary-format raw-in-base64-out \
    --force \
    --update-image-set-metadata-updates file://metadata-updates.json
```

Contents of `metadata-updates.json`

```
{
    "DICOMUpdates": {
        "updatableAttributes": "{\"SchemaVersion\": 1.1,\"Study\": {\"Series
\": {\"1.1.1.1.1.1.12345.123456789012.123.12345678901234.1\": {\"Instances
\": {\"1.1.1.1.1.1.12345.123456789012.123.12345678901234.1\": {\"DICOM\":
 {\"00091001\": \"GE_GENESIS_DD\"}}}}}}}"
    }
}
```

Output:

```
{
    "latestVersionId": "2",
    "imageSetWorkflowStatus": "UPDATING",
    "updatedAt": 1680042257.908,
    "imageSetId": "53d5fdb05ca4d46ac7ca64b06545c66e",
    "imageSetState": "LOCKED",
    "createdAt": 1680027126.436,
    "datastoreId": "12345678901234567890123456789012"
}
```

Example 7: To update a SOPInstanceUID with the force parameter

The following `update-image-set-metadata` example shows how to update a SOPInstanceUID, using the force parameter to override the DICOM metadata constraints.

```
aws medical-imaging update-image-set-metadata \
        --datastore-id 12345678901234567890123456789012 \
        --image-set-id 53d5fdb05ca4d46ac7ca64b06545c66e \
        --latest-version-id 1 \
        --cli-binary-format raw-in-base64-out \
        --force \
        --update-image-set-metadata-updates file://metadata-updates.json
```

Contents of `metadata-updates.json`

```
{
    "DICOMUpdates": {
        "updatableAttributes": "{\"SchemaVersion\":1.1,\"Study\":{\"Series\":
{\"1.3.6.1.4.1.5962.99.1.3633258862.2104868982.1369432891697.3656.0\":{\"Instances
\":{\"1.3.6.1.4.1.5962.99.1.3633258862.2104868982.1369432891697.3659.0\":{\"DICOM\":
{\"SOPInstanceUID\":
\"1.3.6.1.4.1.5962.99.1.3633258862.2104868982.1369432891697.3659.9\"}}}}}}}"
    }
}
```

Output:

```
{
    "latestVersionId": "2",
    "imageSetWorkflowStatus": "UPDATING",
    "updatedAt": 1680042257.908,
    "imageSetId": "53d5fdb05ca4d46ac7ca64b06545c66e",
    "imageSetState": "LOCKED",
    "createdAt": 1680027126.436,
    "datastoreId": "12345678901234567890123456789012"
}
```

For more information, see Updating image set metadata in the *AWS HealthImaging Developer Guide*.

- For API details, see UpdateImageSetMetadata in *AWS CLI Command Reference*.

HealthLake examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with HealthLake.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-fhir-datastore`

The following code example shows how to use `create-fhir-datastore`.

AWS CLI

Example 1: Create a SigV4-enabled HealthLake data store

The following `create-fhir-datastore` example demonstrates how to create a new data store in AWS HealthLake.

```
aws healthlake create-fhir-datastore \
    --datastore-type-version R4 \
    --datastore-name "FhirTestDatastore"
```

Output:

```
{
    "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/(Data
 store ID)/r4/",
    "DatastoreArn": "arn:aws:healthlake:us-east-1:(AWS Account ID):datastore/(Data
 store ID)",
    "DatastoreStatus": "CREATING",
    "DatastoreId": "(Data store ID)"
}
```

Example 2: Create a SMART on FHIR-enabled HealthLake data store

The following `create-fhir-datastore` example demonstrates how to create a new SMART on FHIR-enabled data store in AWS HealthLake.

```
aws healthlake create-fhir-datastore \
    --datastore-name "your-data-store-name" \
    --datastore-type-version R4 \
    --preload-data-config PreloadDataType="SYNTHEA" \
    --sse-configuration '{ "KmsEncryptionConfig": {  "CmkType":
 "CUSTOMER_MANAGED_KMS_KEY", "KmsKeyId": "arn:aws:kms:us-east-1:your-account-id:key/
your-key-id" } }' \
    --identity-provider-configuration  file://identity_provider_configuration.json
```

Contents of `identity_provider_configuration.json`:

```
{
    "AuthorizationStrategy": "SMART_ON_FHIR_V1",
    "FineGrainedAuthorizationEnabled": true,
    "IdpLambdaArn": "arn:aws:lambda:your-region:your-account-id:function:your-
lambda-name",
    "Metadata": "{\"issuer\":\"https://ehr.example.com\", \"jwks_uri\":\"https://
ehr.example.com/.well-known/jwks.json\",\"authorization_endpoint\":\"https://
ehr.example.com/auth/authorize\",\"token_endpoint\":\"https://ehr.token.com/auth/
token\",\"token_endpoint_auth_methods_supported\":[\"client_secret_basic\",\"foo\"],
\"grant_types_supported\":[\"client_credential\",\"foo\"],\"registration_endpoint\":
\"https://ehr.example.com/auth/register\",\"scopes_supported\":[\"openId\",\"profile
\",\"launch\"],\"response_types_supported\":[\"code\"],\"management_endpoint\":
\"https://ehr.example.com/user/manage\",\"introspection_endpoint\":\"https://
ehr.example.com/user/introspect\",\"revocation_endpoint\":\"https://ehr.example.com/
user/revoke\",\"code_challenge_methods_supported\":[\"S256\"],\"capabilities\":
[\"launch-ehr\",\"sso-openid-connect\",\"client-public\"]}"
}
```

Output:

```
{
    "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/(Data
 store ID)/r4/",
    "DatastoreArn": "arn:aws:healthlake:us-east-1:(AWS Account ID):datastore/(Data
 store ID)",
    "DatastoreStatus": "CREATING",
    "DatastoreId": "(Data store ID)"
}
```

For more information, see Creating and monitoring a FHIR data store in the *AWS HealthLake Developer Guide*.

- For API details, see CreateFHIRDatastore in *AWS CLI Command Reference*.

`delete-fhir-datastore`

The following code example shows how to use `delete-fhir-datastore`.

AWS CLI

To delete a FHIR data store

The following `delete-fhir-datastore` example demonstrates how to delete a data store and all of its contents in AWS HealthLake.

```
aws healthlake delete-fhir-datastore \
    --datastore-id (Data store ID)
```

Output:

```
{
    "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/(Data
 store ID)/r4/",
    "DatastoreArn": "arn:aws:healthlake:us-east-1:(AWS Account ID):datastore/(Data
 store ID)",
    "DatastoreStatus": "DELETING",
    "DatastoreId": "(Data store ID)"
}
```

For more information, see Creating and monitoring a FHIR data store <https://docs.aws.amazon.com/healthlake/latest/devguide/working-with-FHIR-healthlake.html> in the *AWS HealthLake Developer Guide*.

- For API details, see DeleteFHIRDatastore in *AWS CLI Command Reference*.

`describe-fhir-datastore`

The following code example shows how to use `describe-fhir-datastore`.

AWS CLI

To describe a FHIR data store

The following `describe-fhir-datastore` example demonstrates how to find the properties of a data store in AWS HealthLake.

```
aws healthlake describe-fhir-datastore \
    --datastore-id "1f2f459836ac6c513ce899f9e4f66a59"
```

Output:

```
{
    "DatastoreProperties": {
```

```
        "PreloadDataConfig": {
            "PreloadDataType": "SYNTHEA"
        },
        "SseConfiguration": {
            "KmsEncryptionConfig": {
                "CmkType": "CUSTOMER_MANAGED_KMS_KEY",
                "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
            }
        },
        "DatastoreName": "Demo",
        "DatastoreArn": "arn:aws:healthlake:us-east-1:<AWS Account ID>:datastore/
<Data store ID>",
        "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/
<Data store ID>/r4/",
        "DatastoreStatus": "ACTIVE",
        "DatastoreTypeVersion": "R4",
        "CreatedAt": 1603761064.881,
        "DatastoreId": "<Data store ID>",
        "IdentityProviderConfiguration": {
            "AuthorizationStrategy": "AWS_AUTH",
            "FineGrainedAuthorizationEnabled": false
        }
    }
}
```

For more information, see Creating and monitoring a FHIR data stores in the *AWS HealthLake Developer Guide*.

- For API details, see DescribeFHIRDatastore in *AWS CLI Command Reference*.

describe-fhir-export-job

The following code example shows how to use `describe-fhir-export-job`.

AWS CLI

To describe a FHIR export job

The following `describe-fhir-export-job` example shows how to find the properties of a FHIR export job in AWS HealthLake.

```
aws healthlake describe-fhir-export-job \
```

```
    --datastore-id (Data store ID) \
    --job-id 9b9a51943afaedd0a8c0c26c49135a31
```

Output:

```
{
    "ExportJobProperties": {
        "DataAccessRoleArn": "arn:aws:iam::(AWS Account ID):role/(Role Name)",
        "JobStatus": "IN_PROGRESS",
        "JobId": "9009813e9d69ba7cf79bcb3468780f16",
        "SubmitTime": "2024-11-20T11:31:46.672000-05:00",
        "EndTime": "2024-11-20T11:34:01.636000-05:00",
        "OutputDataConfig": {
            "S3Configuration": {
            "S3Uri": "s3://(Bucket Name)/(Prefix Name)/",
            "KmsKeyId": "arn:aws:kms:us-east-1:012345678910:key/d330e7fc-b56c-4216-

        }

        },
        "DatastoreId": "(Data store ID)"
    }
}
```

For more information, see Exporting files from a FHIR data store in the *AWS HealthLake Developer Guide*.

- For API details, see DescribeFHIRExportJob in *AWS CLI Command Reference*.

describe-fhir-import-job

The following code example shows how to use `describe-fhir-import-job`.

AWS CLI

To describe a FHIR import job

The following `describe-fhir-import-job` example shows how to learn the properties of a FHIR import job using AWS HealthLake.

```
aws healthlake describe-fhir-import-job \
    --datastore-id (Data store ID) \
```

```
    --job-id c145fbb27b192af392f8ce6e7838e34f
```

Output:

```
{
    "ImportJobProperties": {
    "InputDataConfig": {
        "S3Uri": "s3://(Bucket Name)/(Prefix Name)/"
        { "arrayitem2": 2 }
    },
    "DataAccessRoleArn": "arn:aws:iam::(AWS Account ID):role/(Role Name)",
    "JobStatus": "COMPLETED",
    "JobId": "c145fbb27b192af392f8ce6e7838e34f",
    "SubmitTime": 1606272542.161,
    "EndTime": 1606272609.497,
    "DatastoreId": "(Data store ID)"
    }
}
```

For more information, see Importing files to a FHIR data store in the *AWS HealthLake Developer Guide*.

- For API details, see DescribeFHIRImportJob in *AWS CLI Command Reference*.

`list-fhir-datastores`

The following code example shows how to use `list-fhir-datastores`.

AWS CLI

To list FHIR data stores

The following `list-fhir-datastores` example shows to how to use the command and how users can filter results based on data store status in AWS HealthLake.

```
aws healthlake list-fhir-datastores \
    --filter DatastoreStatus=ACTIVE
```

Output:

```
{
    "DatastorePropertiesList": [
```

```
    {
        "PreloadDataConfig": {
            "PreloadDataType": "SYNTHEA"
        },
        "SseConfiguration": {
            "KmsEncryptionConfig": {
                "CmkType": "CUSTOMER_MANAGED_KMS_KEY",
                "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
            }
        },
        "DatastoreName": "Demo",
        "DatastoreArn": "arn:aws:healthlake:us-east-1:<AWS Account ID>:datastore/
<Data store ID>",
        "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/
<Data store ID>/r4/",
        "DatastoreStatus": "ACTIVE",
        "DatastoreTypeVersion": "R4",
        "CreatedAt": 1603761064.881,
        "DatastoreId": "<Data store ID>",
        "IdentityProviderConfiguration": {
            "AuthorizationStrategy": "AWS_AUTH",
            "FineGrainedAuthorizationEnabled": false
        }
    }
    ]
}
```

For more information, see Creating and monitoring a FHIR data store in the *AWS HealthLake Developer Guide*.

- For API details, see ListFHIRDatastores in *AWS CLI Command Reference*.

`list-fhir-export-jobs`

The following code example shows how to use `list-fhir-export-jobs`.

AWS CLI

To list all FHIR export jobs

The following `list-fhir-export-jobs` example shows how to use the command to view a list of export jobs associated with an account.

```
aws healthlake list-fhir-export-jobs \
    --datastore-id (Data store ID) \
    --submitted-before (DATE like 2024-10-13T19:00:00Z)\
    --submitted-after (DATE like 2020-10-13T19:00:00Z )\
    --job-name "FHIR-EXPORT" \
    --job-status SUBMITTED  \
    --max-results (Integer between 1 and 500)
```

Output:

```
{
    "ExportJobPropertiesList": [
        {
            "ExportJobProperties": {
                "OutputDataConfig": {
                    "S3Uri": "s3://(Bucket Name)/(Prefix Name)/",
                    "S3Configuration": {
                        "S3Uri": "s3://(Bucket Name)/(Prefix Name)/",
                        "KmsKeyId": "(KmsKey Id)"
                    }
                },
                "DataAccessRoleArn": "arn:aws:iam::(AWS Account ID):role/(Role
 Name)",
                "JobStatus": "COMPLETED",
                "JobId": "c145fbb27b192af392f8ce6e7838e34f",
                "JobName": "FHIR-EXPORT",
                "SubmitTime": "2024-11-20T11:31:46.672000-05:00",
                "EndTime": "2024-11-20T11:34:01.636000-05:00",
                "DatastoreId": "(Data store ID)"
            }
        }
    ]
}
```

For more information, see Exporting files from a FHIR data store in the AWS HealthLake Developer Guide.

- For API details, see ListFHIRExportJobs in *AWS CLI Command Reference*.

`list-fhir-import-jobs`

The following code example shows how to use `list-fhir-import-jobs`.

AWS CLI

To list all FHIR import jobs

The following `list-fhir-import-jobs` example shows how to use the command to view a list of all import jobs associated with an account.

```
aws healthlake list-fhir-import-jobs \
    --datastore-id (Data store ID) \
    --submitted-before (DATE like 2024-10-13T19:00:00Z) \
    --submitted-after (DATE like 2020-10-13T19:00:00Z ) \
    --job-name "FHIR-IMPORT" \
    --job-status SUBMITTED  \
    -max-results (Integer between 1 and 500)
```

Output:

```
{
    "ImportJobPropertiesList": [
        {
            "JobId": "c0fddbf76f238297632d4aebdbfc9ddf",
            "JobStatus": "COMPLETED",
            "SubmitTime": "2024-11-20T10:08:46.813000-05:00",
            "EndTime": "2024-11-20T10:10:09.093000-05:00",
            "DatastoreId": "(Data store ID)",
            "InputDataConfig": {
                "S3Uri": "s3://(Bucket Name)/(Prefix Name)/"
            },
            "JobOutputDataConfig": {
                "S3Configuration": {
                    "S3Uri": "s3://(Bucket Name)/
import/6407b9ae4c2def3cb6f1a46a0c599ec0-FHIR_IMPORT-
c0fddbf76f238297632d4aebdbfc9ddf/",
                    "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/b7f645cb-
e564-4981-8672-9e012d1ff1a0"
                }
            },
            "JobProgressReport": {
                "TotalNumberOfScannedFiles": 1,
                "TotalSizeOfScannedFilesInMB": 0.001798,
                "TotalNumberOfImportedFiles": 1,
                "TotalNumberOfResourcesScanned": 1,
                "TotalNumberOfResourcesImported": 1,
```

```
                "TotalNumberOfResourcesWithCustomerError": 0,
                "TotalNumberOfFilesReadWithCustomerError": 0,
                "Throughput": 0.0
            },
            "DataAccessRoleArn": "arn:aws:iam::(AWS Account ID):role/(Role Name)"
        }
    ]
}
```

For more information, see Importing files to FHIR data store in the AWS HealthLake Developer Guide.

- For API details, see ListFHIRImportJobs in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a data store

The following `list-tags-for-resource` example lists the tags associated with the specified data store.:

```
aws healthlake list-tags-for-resource \
    --resource-arn "arn:aws:healthlake:us-east-1:123456789012:datastore/
fhir/0725c83f4307f263e16fd56b6d8ebdbe"
```

Output:

```
{
    "tags": {
        "key": "value",
        "key1": "value1"
    }
}
```

For more information, see Tagging resources in AWS HealthLake in the AWS HealthLake Developer Guide.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`start-fhir-export-job`

The following code example shows how to use `start-fhir-export-job`.

AWS CLI

To start a FHIR export job

The following `start-fhir-export-job` example shows how to start a FHIR export job using AWS HealthLake.

```
aws healthlake start-fhir-export-job \
    --output-data-config '{"S3Configuration": {"S3Uri":"s3://(Bucket Name)/(Prefix
 Name)/","KmsKeyId":"arn:aws:kms:us-east-1:012345678910:key/d330e7fc-b56c-4216-a250-
f4c43ef46e83"}}' \
    --datastore-id (Data store ID) \
    --data-access-role-arn arn:aws:iam::(AWS Account ID):role/(Role Name)
```

Output:

```
{
    "DatastoreId": "(Data store ID)",
    "JobStatus": "SUBMITTED",
    "JobId": "9b9a51943afaedd0a8c0c26c49135a31"
}
```

For more information, see Exporting files from a FHIR data store in the *AWS HealthLake Developer Guide*.

- For API details, see StartFHIRExportJob in *AWS CLI Command Reference*.

`start-fhir-import-job`

The following code example shows how to use `start-fhir-import-job`.

AWS CLI

To start a FHIR import job

The following `start-fhir-import-job` example shows how to start a FHIR import job using AWS HealthLake.

```
aws healthlake start-fhir-import-job \
    --input-data-config S3Uri="s3://(Bucket Name)/(Prefix Name)/" \
    --job-output-data-config '{"S3Configuration": {"S3Uri":"s3://(Bucket Name)/
(Prefix Name)/","KmsKeyId":"arn:aws:kms:us-east-1:012345678910:key/d330e7fc-
b56c-4216-a250-f4c43ef46e83"}}' \
    --datastore-id (Data store ID) \
    --data-access-role-arn "arn:aws:iam::(AWS Account ID):role/(Role Name)"
```

Output:

```
{
    "DatastoreId": "(Data store ID)",
    "JobStatus": "SUBMITTED",
    "JobId": "c145fbb27b192af392f8ce6e7838e34f"
}
```

For more information, see Importing files to a FHIR data store in the *AWS HealthLake Developer Guide*.

- For API details, see StartFHIRImportJob in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add a tag to data store

The following `tag-resource` example shows how to add a tag to a data store.

```
aws healthlake tag-resource \
    --resource-arn "arn:aws:healthlake:us-east-1:123456789012:datastore/
fhir/0725c83f4307f263e16fd56b6d8ebdbe" \
    --tags '[{"Key": "key1", "Value": "value1"}]'
```

This command produces no output.

For more information, see Adding a tag to a data store in the *AWS HealthLake Developer Guide.*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a data store.

The following `untag-resource` example shows how to remove tags from a data store.

```
aws healthlake untag-resource \
    --resource-arn "arn:aws:healthlake:us-east-1:123456789012:datastore/fhir/
b91723d65c6fdeb1d26543a49d2ed1fa" \
    --tag-keys '["key1"]'
```

This command produces no output.

For more information, see Removing tags from a data store in the *AWS HealthLake Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

HealthOmics examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with HealthOmics.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`abort-multipart-read-set-upload`

The following code example shows how to use `abort-multipart-read-set-upload`.

AWS CLI

To stop a multipart read set upload

The following `abort-multipart-read-set-upload` example stops a multipart read set upload into your HealthOmics sequence store.

```
aws omics abort-multipart-read-set-upload \
    --sequence-store-id 0123456789 \
    --upload-id 1122334455
```

This command produces no output.

For more information, see Direct upload to a sequence store in the *AWS HealthOmics User Guide*.

- For API details, see AbortMultipartReadSetUpload in *AWS CLI Command Reference*.

`accept-share`

The following code example shows how to use `accept-share`.

AWS CLI

To accept a share of analytics store data

The following `accept-share` example accepts a share of HealthOmics analytics store data.

```
aws omics accept-share \
    ----share-id "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a"
```

Output:

```
{
    "status": "ACTIVATING"
}
```

For more information, see Cross-account sharing in the *AWS HealthOmics User Guide*.

- For API details, see AcceptShare in *AWS CLI Command Reference*.

`batch-delete-read-set`

The following code example shows how to use `batch-delete-read-set`.

AWS CLI

To delete multiple read sets

The following `batch-delete-read-set` example deletes two read sets.

```
aws omics batch-delete-read-set \
    --sequence-store-id 1234567890 \
    --ids 1234567890 0123456789
```

If there is an error deleting any of the specified read sets, the service returns an error list.

```
{
    "errors": [
        {
            "code": "",
            "id": "0123456789",
            "message": "The specified readset does not exist."
        }
    ]
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see BatchDeleteReadSet in *AWS CLI Command Reference*.

`cancel-annotation-import-job`

The following code example shows how to use `cancel-annotation-import-job`.

AWS CLI

To cancel an annotation import job

The following `cancel-annotation-import-job` example cancels an annotation import job with ID `04f57618-xmpl-4fd0-9349-e5a85aefb997`.

```
aws omics cancel-annotation-import-job \
```

```
    --job-id 04f57618-xmpl-4fd0-9349-e5a85aefb997
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see CancelAnnotationImportJob in *AWS CLI Command Reference*.

`cancel-run`

The following code example shows how to use `cancel-run`.

AWS CLI

To cancel a run

The following `cancel-run` example cancels a run with ID `1234567`.

```
aws omics cancel-run \
    --id 1234567
```

For more information, see Run lifecycle in a workflow in the *AWS HealthOmics User Guide*.

- For API details, see CancelRun in *AWS CLI Command Reference*.

`cancel-variant-import-job`

The following code example shows how to use `cancel-variant-import-job`.

AWS CLI

To cancel a variant import job

The following `cancel-variant-import-job` example cancels a variant import job with ID `69cb65d6-xmpl-4a4a-9025-4565794b684e`.

```
aws omics cancel-variant-import-job \
    --job-id 69cb65d6-xmpl-4a4a-9025-4565794b684e
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see CancelVariantImportJob in *AWS CLI Command Reference*.

`complete-multipart-read-set-upload`

The following code example shows how to use `complete-multipart-read-set-upload`.

AWS CLI

To conclude a multipart upload once you have uploaded all of the components.

The following `complete-multipart-read-set-upload` example concludes a multipart upload into a sequence store once all of the components have been uploaded.

```
aws omics complete-multipart-read-set-upload \
    --sequence-store-id 0123456789 \
    --upload-id 1122334455 \
    --parts '[{"checksum":"gaCBQMe+rpCFZxLpoP6gydBoXaKKDA/
Vobh5zBDb4W4=","partNumber":1,"partSource":"SOURCE1"}]'
```

Output:

```
{
    "readSetId": "0000000001"
    "readSetId": "0000000002"
    "readSetId": "0000000003"
}
```

For more information, see Direct upload to a sequence store in the *AWS HealthOmics User Guide*.

- For API details, see CompleteMultipartReadSetUpload in *AWS CLI Command Reference*.

`create-annotation-store-version`

The following code example shows how to use `create-annotation-store-version`.

AWS CLI

To create a new version of an annotation store

The following `create-annotation-store-version` example creates a new version of an annotation store.

```
aws omics create-annotation-store-version \
```

```
    --name my_annotation_store \
    --version-name my_version
```

Output:

```
{
    "creationTime": "2023-07-21T17:15:49.251040+00:00",
    "id": "3b93cdef69d2",
    "name": "my_annotation_store",
    "reference": {
        "referenceArn": "arn:aws:omics:us-
west-2:555555555555:referenceStore/6505293348/reference/5987565360"
    },
    "status": "CREATING",
    "versionName": "my_version"
}
```

For more information, see Creating new versions of annotation stores in the *AWS HealthOmics User Guide*.

- For API details, see CreateAnnotationStoreVersion in *AWS CLI Command Reference*.

`create-annotation-store`

The following code example shows how to use `create-annotation-store`.

AWS CLI

Example 1: To create a VCF annotation store

The following `create-annotation-store` example creates a VCF format annotation store.

```
aws omics create-annotation-store \
    --name my_ann_store \
    --store-format VCF \
    --reference referenceArn=arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890
```

Output:

```
{
```

```
    "creationTime": "2022-11-23T22:48:39.226492Z",
    "id": "0a91xmplc71f",
    "name": "my_ann_store",
    "reference": {
        "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890"
    },
    "status": "CREATING",
    "storeFormat": "VCF"
}
```

Example 2: To create a TSV annotation store

The following `create-annotation-store` example creates a TSV format annotation store.

```
aws omics create-annotation-store \
    --name tsv_ann_store \
    --store-format TSV \
    --reference referenceArn=arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890 \
    --store-options file://tsv-store-options.json
```

`tsv-store-options.json` configures format options for annotations.

```
{
    "tsvStoreOptions": {
        "annotationType": "CHR_START_END_ZERO_BASE",
        "formatToHeader": {
            "CHR": "chromosome",
            "START": "start",
            "END": "end"
        },
        "schema": [
            {
                "chromosome": "STRING"
            },
            {
                "start": "LONG"
            },
            {
                "end": "LONG"
            },
            {
```

```
                "name": "STRING"
            }
        ]
    }
}
```

Output:

```
{
    "creationTime": "2022-11-30T01:28:08.525586Z",
    "id": "861cxmpl96b0",
    "name": "tsv_ann_store",
    "reference": {
        "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890"
    },
    "status": "CREATING",
    "storeFormat": "TSV",
    "storeOptions": {
        "tsvStoreOptions": {
            "annotationType": "CHR_START_END_ZERO_BASE",
            "formatToHeader": {
                "CHR": "chromosome",
                "END": "end",
                "START": "start"
            },
            "schema": [
                {
                    "chromosome": "STRING"
                },
                {
                    "start": "LONG"
                },
                {
                    "end": "LONG"
                },
                {
                    "name": "STRING"
                }
            ]
        }
    }
}
```

For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see CreateAnnotationStore in *AWS CLI Command Reference*.

`create-multipart-read-set-upload`

The following code example shows how to use `create-multipart-read-set-upload`.

AWS CLI

To begin a multipart read set upload.

The following `create-multipart-read-set-upload` example initiates a multipart read set upload.

```
aws omics create-multipart-read-set-upload \
    --sequence-store-id 0123456789 \
    --name HG00146 \
    --source-file-type FASTQ \
    --subject-id mySubject\
    --sample-id mySample\
    --description "FASTQ for HG00146"\
    --generated-from "1000 Genomes"
```

Output:

```
{
    "creationTime": "2022-07-13T23:25:20Z",
    "description": "FASTQ for HG00146",
    "generatedFrom": "1000 Genomes",
    "name": "HG00146",
    "sampleId": "mySample",
    "sequenceStoreId": "0123456789",
    "sourceFileType": "FASTQ",
    "subjectId": "mySubject",
    "uploadId": "1122334455"
}
```

For more information, see Direct upload to a sequence store in the *AWS HealthOmics User Guide*.

- For API details, see CreateMultipartReadSetUpload in *AWS CLI Command Reference*.

`create-reference-store`

The following code example shows how to use `create-reference-store`.

AWS CLI

To create a reference store

The following `create-reference-store` example creates a reference store `my-ref-store`.

```
aws omics create-reference-store \
    --name my-ref-store
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:referenceStore/1234567890",
    "creationTime": "2022-11-22T22:13:25.947Z",
    "id": "1234567890",
    "name": "my-ref-store"
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see CreateReferenceStore in *AWS CLI Command Reference*.

`create-run-group`

The following code example shows how to use `create-run-group`.

AWS CLI

To create a run group

The following `create-run-group` example creates a run group named `cram-converter`.

```
aws omics create-run-group \
    --name cram-converter \
    --max-cpus 20 \
    --max-gpus 10 \
    --max-duration 600 \
    --max-runs 5
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:runGroup/1234567",
    "id": "1234567",
    "tags": {}
}
```

For more information, see Creating run groups in the *AWS HealthOmics User Guide*.

- For API details, see CreateRunGroup in *AWS CLI Command Reference*.

`create-sequence-store`

The following code example shows how to use `create-sequence-store`.

AWS CLI

To create a sequence store

The following `create-sequence-store` example creates a sequence store.

```
aws omics create-sequence-store \
    --name my-seq-store
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:sequenceStore/1234567890",
    "creationTime": "2022-11-23T01:24:33.629Z",
    "id": "1234567890",
    "name": "my-seq-store"
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see CreateSequenceStore in *AWS CLI Command Reference*.

`create-share`

The following code example shows how to use `create-share`.

AWS CLI

To create a share of a HealthOmics analytics store

The following `create-share` example shows how to create a share of a HealthOmics analytics store that can be accepted by a subscriber outside the account.

```
aws omics create-share \
    --resource-arn "arn:aws:omics:us-west-2:555555555555:variantStore/
omics_dev_var_store" \
    --principal-subscriber "123456789012" \
    --name "my_Share-123"
```

Output:

```
{
    "shareId": "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a",
    "name": "my_Share-123",
    "status": "PENDING"
}
```

For more information, see Cross-acount sharing in the *AWS HealthOmics User Guide*.

- For API details, see CreateShare in *AWS CLI Command Reference*.

`create-variant-store`

The following code example shows how to use `create-variant-store`.

AWS CLI

To create a variant store

The following `create-variant-store` example creates a variant store named `my_var_store`.

```
aws omics create-variant-store \
    --name my_var_store \
    --reference referenceArn=arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890
```

Output:

```
{
    "creationTime": "2022-11-23T22:09:07.534499Z",
    "id": "02dexmplcfdd",
    "name": "my_var_store",
    "reference": {
        "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890"
    },
    "status": "CREATING"
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see CreateVariantStore in *AWS CLI Command Reference*.

`create-workflow`

The following code example shows how to use `create-workflow`.

AWS CLI

To create a workflow

The following `create-workflow` example creates a WDL workflow.

```
aws omics create-workflow \
    --name cram-converter \
    --engine WDL \
    --definition-zip fileb://workflow-crambam.zip \
    --parameter-template file://workflow-params.json
```

`workflow-crambam.zip` is a ZIP archive containing a workflow definition. `workflow-params.json` defines runtime parameters for the workflow.

```
{
    "ref_fasta" : {
        "description": "Reference genome fasta file",
        "optional": false
    },
    "ref_fasta_index" : {
        "description": "Index of the reference genome fasta file",
```

```
        "optional": false
    },
    "ref_dict" : {
        "description": "dictionary file for 'ref_fasta'",
        "optional": false
    },
    "input_cram" : {
        "description": "The Cram file to convert to BAM",
        "optional": false
    },
    "sample_name" : {
        "description": "The name of the input sample, used to name the output BAM",
        "optional": false
    }
}
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:workflow/1234567",
    "id": "1234567",
    "status": "CREATING",
    "tags": {}
}
```

For more information, see Creating private workflows in the *AWS HealthOmics User Guide*.

- For API details, see CreateWorkflow in *AWS CLI Command Reference*.

`delete-annotation-store-versions`

The following code example shows how to use `delete-annotation-store-versions`.

AWS CLI

To delete an annotation store version

The following `delete-annotation-store-versions` example deletes an annotation store version.

```
aws omics delete-annotation-store-versions \
    --name my_annotation_store \
```

```
    --versions my_version
```

Output:

```
{
    "errors": []
}
```

For more information, see Creating new versions of annotation stores in the *AWS HealthOmics User Guide*.

- For API details, see DeleteAnnotationStoreVersions in *AWS CLI Command Reference*.

`delete-annotation-store`

The following code example shows how to use `delete-annotation-store`.

AWS CLI

To delete an annotation store

The following `delete-annotation-store` example deletes an annotation store named `my_vcf_store`.

```
aws omics delete-annotation-store \
    --name my_vcf_store
```

Output:

```
{
    "status": "DELETING"
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see DeleteAnnotationStore in *AWS CLI Command Reference*.

`delete-reference-store`

The following code example shows how to use `delete-reference-store`.

AWS CLI

To delete a reference store

The following `delete-reference-store` example deletes a reference store with ID `1234567890`.

```
aws omics delete-reference-store \
    --id 1234567890
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see DeleteReferenceStore in *AWS CLI Command Reference*.

`delete-reference`

The following code example shows how to use `delete-reference`.

AWS CLI

To delete a reference

The following `delete-reference` example deletes a reference.

```
aws omics delete-reference \
    --reference-store-id 1234567890 \
    --id 1234567890
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see DeleteReference in *AWS CLI Command Reference*.

`delete-run-group`

The following code example shows how to use `delete-run-group`.

AWS CLI

To delete a run group

The following `delete-run-group` example deletes a run group with ID `1234567`.

```
aws omics delete-run-group \
    --id 1234567
```

For more information, see Deleting runs and run groups in the *AWS HealthOmics User Guide*.

- For API details, see DeleteRunGroup in *AWS CLI Command Reference*.

`delete-run`

The following code example shows how to use `delete-run`.

AWS CLI

To delete a workflow run

The following `delete-run` example deletes a run with ID `1234567`.

```
aws omics delete-run \
    --id 1234567
```

For more information, see Deleting runs and run groups in the *AWS HealthOmics User Guide*.

- For API details, see DeleteRun in *AWS CLI Command Reference*.

`delete-sequence-store`

The following code example shows how to use `delete-sequence-store`.

AWS CLI

To delete a sequence store

The following `delete-sequence-store` example deletes a sequence store with ID `1234567890`.

```
aws omics delete-sequence-store \
    --id 1234567890
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see DeleteSequenceStore in *AWS CLI Command Reference*.

`delete-share`

The following code example shows how to use `delete-share`.

AWS CLI

To delete a share of HealthOmics analytics data

The following `delete-share` example deletes a cross-account share of analytics data.

```
aws omics delete-share \
    --share-id "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a"
```

Output:

```
{
    "status": "DELETING"
}
```

For more information, see Cross-account sharing in the *AWS HealthOmics User Guide*.

- For API details, see DeleteShare in *AWS CLI Command Reference*.

`delete-variant-store`

The following code example shows how to use `delete-variant-store`.

AWS CLI

To delete a variant store

The following `delete-variant-store` example deletes a variant store named `my_var_store`.

```
aws omics delete-variant-store \
    --name my_var_store
```

Output:

```
{
    "status": "DELETING"
```

```
}
```

For more information, see [Omics Analytics]() in the *Amazon Omics Developer Guide*.

- For API details, see [DeleteVariantStore]() in *AWS CLI Command Reference*.

delete-workflow

The following code example shows how to use `delete-workflow`.

AWS CLI

To delete a workflow

The following `delete-workflow` example deletes a workflow with ID `1234567`.

```
aws omics delete-workflow \
    --id 1234567
```

For more information, see [Delete a private workflow]() in the *AWS HealthOmics User Guide*.

- For API details, see [DeleteWorkflow]() in *AWS CLI Command Reference*.

get-annotation-import-job

The following code example shows how to use `get-annotation-import-job`.

AWS CLI

To view an annotation import job

The following `get-annotation-import-job` example gets details about an annotation import job.

```
aws omics get-annotation-import-job \
    --job-id 984162c7-xmpl-4d23-ab47-286f7950bfbf
```

Output:

```
{
    "creationTime": "2022-11-30T01:40:11.017746Z",
```

```
    "destinationName": "tsv_ann_store",
    "id": "984162c7-xmpl-4d23-ab47-286f7950bfbf",
    "items": [
        {
            "jobStatus": "COMPLETED",
            "source": "s3://omics-artifacts-01d6xmpl4e72dd32/targetedregions.bed.gz"
        }
    ],
    "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W8O1XMPL7QZ",
    "runLeftNormalization": false,
    "status": "COMPLETED",
    "updateTime": "2022-11-30T01:42:39.134009Z"
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see GetAnnotationImportJob in *AWS CLI Command Reference*.

`get-annotation-store-version`

The following code example shows how to use `get-annotation-store-version`.

AWS CLI

To retrieve the metadata for an annotation store version

The following `get-annotation-store-version` example retrieves the metadata for the requested annotation store version.

```
aws omics get-annotation-store-version \
    --name my_annotation_store \
    --version-name my_version
```

Output:

```
{
    "storeId": "4934045d1c6d",
    "id": "2a3f4a44aa7b",
    "status": "ACTIVE",
    "versionArn": "arn:aws:omics:us-west-2:555555555555:annotationStore/
my_annotation_store/version/my_version",
```

```
    "name": "my_annotation_store",
    "versionName": "my_version",
    "creationTime": "2023-07-21T17:15:49.251040+00:00",
    "updateTime": "2023-07-21T17:15:56.434223+00:00",
    "statusMessage": "",
    "versionSizeBytes": 0
}
```

For more information, see [Creating new versions of annotation stores]() in the *AWS HealthOmics User Guide*.

- For API details, see [GetAnnotationStoreVersion]() in *AWS CLI Command Reference*.

get-annotation-store

The following code example shows how to use `get-annotation-store`.

AWS CLI

To view an annotation store

The following `get-annotation-store` example gets details about an annotation store named `my_ann_store`.

```
aws omics get-annotation-store \
    --name my_ann_store
```

Output:

```
{
    "creationTime": "2022-11-23T22:48:39.226492Z",
    "id": "0a91xmplc71f",
    "name": "my_ann_store",
    "reference": {
        "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890"
    },
    "status": "CREATING",
    "storeArn": "arn:aws:omics:us-west-2:123456789012:annotationStore/my_ann_store",
    "storeFormat": "VCF",
    "storeSizeBytes": 0,
    "tags": {}
```

```
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see GetAnnotationStore in *AWS CLI Command Reference*.

`get-read-set-activation-job`

The following code example shows how to use `get-read-set-activation-job`.

AWS CLI

To view a read set activation job

The following `get-read-set-activation-job` example gets details about a read set activation job.

```
aws omics get-read-set-activation-job \
    --sequence-store-id 1234567890 \
    --id 1234567890
```

Output:

```
{
    "completionTime": "2022-12-06T22:33:42.828Z",
    "creationTime": "2022-12-06T22:32:45.213Z",
    "id": "1234567890",
    "sequenceStoreId": "1234567890",
    "sources": [
        {
            "readSetId": "1234567890",
            "status": "FINISHED",
            "statusMessage": "No activation needed as read set is already in
 ACTIVATING or ACTIVE state."
        }
    ],
    "status": "COMPLETED",
    "statusMessage": "The job completed successfully."
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see GetReadSetActivationJob in *AWS CLI Command Reference*.

get-read-set-export-job

The following code example shows how to use `get-read-set-export-job`.

AWS CLI

To view a read set export job

The following `get-read-set-export-job` example gets details about a read set export job.

```
aws omics get-read-set-export-job \
    --sequence-store-id 1234567890 \
    --id 1234567890
```

Output:

```
{
    "completionTime": "2022-12-06T22:39:14.491Z",
    "creationTime": "2022-12-06T22:37:18.612Z",
    "destination": "s3://omics-artifacts-01d6xmpl4e72dd32/read-set-export/",
    "id": "1234567890",
    "sequenceStoreId": "1234567890",
    "status": "COMPLETED",
    "statusMessage": "The job is submitted and will start soon."
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see GetReadSetExportJob in *AWS CLI Command Reference*.

get-read-set-import-job

The following code example shows how to use `get-read-set-import-job`.

AWS CLI

To view a read set import job

The following `get-read-set-import-job` example gets details about a read set import job.

```
aws omics get-read-set-import-job \
    --sequence-store-id 1234567890 \
    --id 1234567890
```

Output:

```
{
    "creationTime": "2022-11-23T01:36:38.158Z",
    "id": "1234567890",

                "aws:omics:subjectId": "cram-subject"
            }
        }
    ],
    "status": "IN_PROGRESS",
    "statusMessage": "The job is currently in progress."
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see GetReadSetImportJob in *AWS CLI Command Reference*.

`get-read-set-metadata`

The following code example shows how to use `get-read-set-metadata`.

AWS CLI

To view a read set

The following `get-read-set-metadata` example gets details about a read set's files.

```
aws omics get-read-set-metadata \
    --sequence-store-id 1234567890 \
    --id 1234567890
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:sequenceStore/1234567890/
readSet/1234567890",
    "creationTime": "2022-11-23T21:55:00.515Z",
    "fileType": "FASTQ",
    "files": {
        "source1": {
            "contentLength": 310054739,
            "partSize": 104857600,
            "totalParts": 3
        },
        "source2": {
            "contentLength": 307846621,
            "partSize": 104857600,
            "totalParts": 3
        }
    },
    "id": "1234567890",
    "name": "HG00146",
    "referenceArn": "arn:aws:omics:us-west-2:123456789012:referenceStore/1234567890/

    "sequenceInformation": {
        "alignment": "UNALIGNED",
        "totalBaseCount": 677717384,
        "totalReadCount": 8917334
    },
    "sequenceStoreId": "1234567890",
    "status": "ACTIVE",
    "subjectId": "fastq-subject"
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see GetReadSetMetadata in *AWS CLI Command Reference*.

`get-read-set`

The following code example shows how to use `get-read-set`.

AWS CLI

To download a read set

The following `get-read-set` example downloads part 3 of a read set as `1234567890.3.bam`.

```
aws omics get-read-set \
    --sequence-store-id 1234567890 \
    --id 1234567890 \
    --part-number 3  1234567890.3.bam
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see GetReadSet in *AWS CLI Command Reference*.

`get-reference-import-job`

The following code example shows how to use `get-reference-import-job`.

AWS CLI

To view a reference import job

The following `get-reference-import-job` example example gets details about a reference import job.

```
aws omics get-reference-import-job \
    --reference-store-id 1234567890 \
    --id 1234567890
```

Output:

```
{
    "creationTime": "2022-11-22T22:25:41.124Z",
    "id": "1234567890",
    "referenceStoreId": "1234567890",
    "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W8O1XMPL7QZ",
```

```
    "sources": [
        {
            "name": "assembly-38",
            "sourceFile": "s3://omics-artifacts-01d6xmpl4e72dd32/
Homo_sapiens_assembly38.fasta",
            "status": "IN_PROGRESS",
            "statusMessage": "The source job is currently in progress."
        }
    ],
    "status": "IN_PROGRESS",
    "statusMessage": "The job is currently in progress."
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see GetReferenceImportJob in *AWS CLI Command Reference*.

`get-reference-metadata`

The following code example shows how to use `get-reference-metadata`.

AWS CLI

To view a reference

The following `get-reference-metadata` example gets details about a reference.

```
aws omics get-reference-metadata \
    --reference-store-id 1234567890 \
    --id 1234567890
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:referenceStore/1234567890/
reference/1234567890",
    "creationTime": "2022-11-22T22:27:09.033Z",
    "files": {
        "index": {
            "contentLength": 160928,
            "partSize": 104857600,
            "totalParts": 1
```

```
        },
        "source": {
            "contentLength": 3249912778,
            "partSize": 104857600,
            "totalParts": 31
        }
    },
    "id": "1234567890",
    "md5": "7ff134953dcca8c8997453bbb80b6b5e",
    "name": "assembly-38",
    "referenceStoreId": "1234567890",
    "status": "ACTIVE",
    "updateTime": "2022-11-22T22:27:09.033Z"
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see GetReferenceMetadata in *AWS CLI Command Reference*.

`get-reference-store`

The following code example shows how to use `get-reference-store`.

AWS CLI

To view a reference store

The following `get-reference-store` example gets details about a reference store.

```
aws omics get-reference-store \
    --id 1234567890
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:referenceStore/1234567890",
    "creationTime": "2022-09-23T23:27:20.364Z",
    "id": "1234567890",
    "name": "my-rstore-0"
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see GetReferenceStore in *AWS CLI Command Reference*.

`get-reference`

The following code example shows how to use `get-reference`.

AWS CLI

To download a genome reference

The following `get-reference` example downloads part 1 of a genome as `hg38.1.fa`.

```
aws omics get-reference \
    --reference-store-id 1234567890 \
    --id 1234567890 \
    --part-number 1 hg38.1.fa
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see GetReference in *AWS CLI Command Reference*.

`get-run-group`

The following code example shows how to use `get-run-group`.

AWS CLI

To view a run group

The following `get-run-group` example gets details about a run group.

```
aws omics get-run-group \
    --id 1234567
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:runGroup/1234567",
    "creationTime": "2022-12-01T00:58:42.915219Z",
    "id": "1234567",
```

```
    "maxCpus": 20,
    "maxDuration": 600,
    "name": "cram-convert",
    "tags": {}
}
```

For more information, see Creating run groups in the *AWS HealthOmics User Guide*.

- For API details, see GetRunGroup in *AWS CLI Command Reference*.

`get-run-task`

The following code example shows how to use `get-run-task`.

AWS CLI

To view a task

The following `get-run-task` example gets details about a workflow task.

```
aws omics get-run-task \
    --id 1234567 \
    --task-id 1234567
```

Output:

```
{
    "cpus": 1,
    "creationTime": "2022-11-30T23:13:00.718651Z",
    "logStream": "arn:aws:logs:us-west-2:123456789012:log-group:/aws/omics/
WorkflowLog:log-stream:run/1234567/task/1234567",
    "memory": 15,
    "name": "CramToBamTask",
    "startTime": "2022-11-30T23:17:47.016Z",
    "status": "COMPLETED",
    "stopTime": "2022-11-30T23:18:21.503Z",
    "taskId": "1234567"
}
```

For more information, see Task lifecycle in a HealthOmics run in the *AWS HealthOmics User Guide*.

- For API details, see GetRunTask in *AWS CLI Command Reference*.

`get-run`

The following code example shows how to use `get-run`.

AWS CLI

To view a workflow run

The following `get-run` example gets details about a workflow run.

```
aws omics get-run \
    --id 1234567
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:run/1234567",

    "workflowType": "PRIVATE"
}
```

For more information, see Run lifecycle in a workflow in the *AWS HealthOmics User Guide*.

- For API details, see GetRun in *AWS CLI Command Reference*.

`get-sequence-store`

The following code example shows how to use `get-sequence-store`.

AWS CLI

To view a sequence store

The following `get-sequence-store` example gets details about a sequence store with ID `1234567890`.

```
aws omics get-sequence-store \
    --id 1234567890
```

Output:

```
{
    "arn": "arn:aws:omics:us-east-1:123456789012:sequenceStore/1234567890",
    "creationTime": "2022-11-23T19:55:48.376Z",
    "id": "1234567890",
    "name": "my-seq-store"
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see GetSequenceStore in *AWS CLI Command Reference*.

`get-share`

The following code example shows how to use `get-share`.

AWS CLI

To retrieves the metadata about a share of a HealthOmics analytics data

The following `get-share` example retrieves the metadata for a cross-account share of analytics data.

```
aws omics get-share \
    --share-id "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a"
```

Output:

```
{
    "share": {
        "shareId": "495c21bedc889d07d0ab69d710a6841e-
dd75ab7a1a9c384fa848b5bd8e5a7e0a",
        "name": "my_Share-123",
        "resourceArn": "arn:aws:omics:us-west-2:555555555555:variantStore/
omics_dev_var_store",
        "principalSubscriber": "123456789012",
        "ownerId": "555555555555",
        "status": "PENDING"
    }
}
```

For more information, see Cross-account sharing in the *AWS HealthOmics User Guide*.

- For API details, see GetShare in *AWS CLI Command Reference*.

`get-variant-import-job`

The following code example shows how to use `get-variant-import-job`.

AWS CLI

To view a variant import job

The following `get-variant-import-job` example gets details about a variant import job.

```
aws omics get-variant-import-job \
    --job-id edd7b8ce-xmpl-47e2-bc99-258cac95a508
```

Output:

```
{
    "creationTime": "2022-11-23T22:42:50.037812Z",
    "destinationName": "my_var_store",
    "id": "edd7b8ce-xmpl-47e2-bc99-258cac95a508",
    "items": [
        {
            "jobStatus": "IN_PROGRESS",
            "source": "s3://omics-artifacts-01d6xmpl4e72dd32/
Homo_sapiens_assembly38.known_indels.vcf.gz"
        }
    ],
    "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W8O1XMPL7QZ",
    "runLeftNormalization": false,

    "updateTime": "2022-11-23T22:43:05.898309Z"
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see GetVariantImportJob in *AWS CLI Command Reference*.

`get-variant-store`

The following code example shows how to use `get-variant-store`.

AWS CLI

To view a variant store

The following `get-variant-store` example gets details about a variant store.

```
aws omics get-variant-store \
    --name my_var_store
```

Output:

```
{
    "creationTime": "2022-11-23T22:09:07.534499Z",
    "id": "02dexmplcfdd",
    "name": "my_var_store",
    "reference": {
        "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890"
    },
    "status": "CREATING",
    "storeArn": "arn:aws:omics:us-west-2:123456789012:variantStore/my_var_store",
    "storeSizeBytes": 0,
    "tags": {},

}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see GetVariantStore in *AWS CLI Command Reference*.

`get-workflow`

The following code example shows how to use `get-workflow`.

AWS CLI

To view a workflow

The following `get-workflow` example gets details about a workflow with ID 1234567.

```
aws omics get-workflow \
    --id 1234567
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:workflow/1234567",
    "creationTime": "2022-11-30T22:33:16.225368Z",
    "digest":

    "engine": "WDL",
    "id": "1234567",
    "main": "workflow-crambam.wdl",
    "name": "cram-converter",
```

```
    "parameterTemplate": {
        "ref_dict": {
            "description": "dictionary file for 'ref_fasta'"
        },
        "ref_fasta_index": {
            "description": "Index of the reference genome fasta file"
        },
        "ref_fasta": {
            "description": "Reference genome fasta file"
        },
        "input_cram": {
            "description": "The Cram file to convert to BAM"
        },
        "sample_name": {
            "description": "The name of the input sample, used to name the output
 BAM"
        }
    },
    "status": "ACTIVE",
    "statusMessage": "workflow-crambam.wdl\n    workflow CramToBamFlow\n
 call CramToBamTask\n        call ValidateSamFile\n    task CramToBamTask\n    task
 ValidateSamFile\n",
    "tags": {},
    "type": "PRIVATE"
}
```

For more information, see Creating private workflows in the *AWS HealthOmics User Guide*.

- For API details, see GetWorkflow in *AWS CLI Command Reference*.

`list-annotation-import-jobs`

The following code example shows how to use `list-annotation-import-jobs`.

AWS CLI

To get a list of annotation import jobs

The following `list-annotation-import-jobs` gets a list of annotation import jobs.

```
aws omics list-annotation-import-jobs
```

Output:

```
{
    "annotationImportJobs": [
        {
            "creationTime": "2022-11-30T01:39:41.478294Z",
            "destinationName": "gff_ann_store",
            "id": "18a9e792-xmpl-4869-a105-e5b602900444",
            "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-
serviceRole-W8O1XMPL7QZ",
            "runLeftNormalization": false,
            "status": "COMPLETED",
            "updateTime": "2022-11-30T01:47:09.145178Z"
        },
        {
            "creationTime": "2022-11-30T00:45:58.007838Z",
            "destinationName": "my_ann_store",
            "id": "4e9eafc8-xmpl-431e-a0b2-3bda27cb600a",
            "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-
serviceRole-W8O1XMPL7QZ",
            "runLeftNormalization": false,
            "status": "FAILED",
            "updateTime": "2022-11-30T00:47:01.706325Z"
        }
    ]
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see ListAnnotationImportJobs in *AWS CLI Command Reference*.

`list-annotation-store-versions`

The following code example shows how to use `list-annotation-store-versions`.

AWS CLI

To list all the versions of an annotation store.

The following `list-annotation-store-versions` example lists all versions that exist of an annotation store.

```
aws omics list-annotation-store-versions \
    --name my_annotation_store
```

Output:

```
{
    "annotationStoreVersions": [
        {
        "storeId": "4934045d1c6d",
        "id": "2a3f4a44aa7b",
        "status": "CREATING",
        "versionArn": "arn:aws:omics:us-west-2:555555555555:annotationStore/
my_annotation_store/version/my_version_2",
        "name": "my_annotation_store",
        "versionName": "my_version_2",
        "creation Time": "2023-07-21T17:20:59.380043+00:00",
        "versionSizeBytes": 0
},
{
     "storeId": "4934045d1c6d",
     "id": "4934045d1c6d",
     "status": "ACTIVE",
     "versionArn": "arn:aws:omics:us-west-2:555555555555:annotationStore/
my_annotation_store/version/my_version_1",
     "name": "my_annotation_store",
     "versionName": "my_version_1",
     "creationTime": "2023-07-21T17:15:49.251040+00:00",
     "updateTime": "2023-07-21T17:15:56.434223+00:00",
     "statusMessage": "",
     "versionSizeBytes": 0
     }

}
```

For more information, see Creating new versions of annotation stores in the *AWS HealthOmics User Guide*.

- For API details, see ListAnnotationStoreVersions in *AWS CLI Command Reference*.

`list-annotation-stores`

The following code example shows how to use `list-annotation-stores`.

AWS CLI

To get a list of annotation stores

The following `list-annotation-stores` example gets a list of annotation stores.

```
aws omics list-annotation-stores
```

Output:

```
{
    "annotationStores": [
        {
            "creationTime": "2022-11-23T22:48:39.226492Z",
            "id": "0a91xmplc71f",
            "name": "my_ann_store",
            "reference": {
                "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890"
            },
            "status": "ACTIVE",
            "statusMessage": "",
            "storeArn": "arn:aws:omics:us-west-2:123456789012:annotationStore/
my_ann_store",
            "storeFormat": "VCF",
            "storeSizeBytes": 0,
            "updateTime": "2022-11-23T22:53:27.372840Z"
        }
    ]
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see ListAnnotationStores in *AWS CLI Command Reference*.

`list-multipart-read-set-uploads`

The following code example shows how to use `list-multipart-read-set-uploads`.

AWS CLI

To list all multipart read set uploads and their statuses.

The following `list-multipart-read-set-uploads` example lists all multipart read set uploads and their statuses.

```
aws omics list-multipart-read-set-uploads \
    --sequence-store-id 0123456789
```

Output:

```
{
"uploads":
    [
        {
           "sequenceStoreId": "0123456789",
           "uploadId": "8749584421",
           "sourceFileType": "FASTQ",
            "subjectId": "mySubject",
            "sampleId": "mySample",
            "generatedFrom": "1000 Genomes",
            "name": "HG00146",
            "description": "FASTQ for HG00146",
            "creationTime": "2023-11-29T19:22:51.349298+00:00"
        },
        {
            "sequenceStoreId": "0123456789",
            "uploadId": "5290538638",
            "sourceFileType": "BAM",
            "subjectId": "mySubject",
            "sampleId": "mySample",
            "generatedFrom": "1000 Genomes",
            "referenceArn": "arn:aws:omics:us-
west-2:845448930428:referenceStore/8168613728/reference/2190697383",
            "name": "HG00146",
            "description": "BAM for HG00146",
            "creationTime": "2023-11-29T19:23:33.116516+00:00"
        },
        {
            "sequenceStoreId": "0123456789",
            "uploadId": "4174220862",
            "sourceFileType": "BAM",
            "subjectId": "mySubject",
            "sampleId": "mySample",
            "generatedFrom": "1000 Genomes",
            "referenceArn": "arn:aws:omics:us-
west-2:845448930428:referenceStore/8168613728/reference/2190697383",
            "name": "HG00147",
            "description": "BAM for HG00147",
```

```
                "creationTime": "2023-11-29T19:23:47.007866+00:00"
            }
        ]
}
```

For more information, see [Direct upload to a sequence store](#) in the *AWS HealthOmics User Guide*.

- For API details, see [ListMultipartReadSetUploads](#) in *AWS CLI Command Reference*.

`list-read-set-activation-jobs`

The following code example shows how to use `list-read-set-activation-jobs`.

AWS CLI

To get a list of read set activation jobs

The following `list-read-set-activation-jobs` example gets a list of activation jobs for a sequence store with id `1234567890`.

```
aws omics list-read-set-activation-jobs \
    --sequence-store-id 1234567890
```

Output:

```
{
    "activationJobs": [
        {
            "completionTime": "2022-12-06T22:33:42.828Z",
            "creationTime": "2022-12-06T22:32:45.213Z",
            "id": "1234567890",
            "sequenceStoreId": "1234567890",
            "status": "COMPLETED"
        },
        {
            "creationTime": "2022-12-06T22:35:10.100Z",
            "id": "1234567890",
            "sequenceStoreId": "1234567890",
            "status": "IN_PROGRESS"
        }
    ]
```

```
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see ListReadSetActivationJobs in *AWS CLI Command Reference*.

`list-read-set-export-jobs`

The following code example shows how to use `list-read-set-export-jobs`.

AWS CLI

To gets a list of read set export jobs

The following `list-read-set-export-jobs` example gets a list of export jobs for a sequence store with id `1234567890`.

```
aws omics list-read-set-export-jobs \
    --sequence-store-id 1234567890
```

Output:

```
{
    "exportJobs": [
        {
            "completionTime": "2022-12-06T22:39:14.491Z",
            "creationTime": "2022-12-06T22:37:18.612Z",
            "destination": "s3://omics-artifacts-01d6xmpl4e72dd32/read-set-export/",
            "id": "1234567890",
            "sequenceStoreId": "1234567890",
            "status": "COMPLETED"
        },
        {
            "creationTime": "2022-12-06T22:38:04.871Z",
            "destination": "s3://omics-artifacts-01d6xmpl4e72dd32/read-set-export/",
            "id": "1234567890",
            "sequenceStoreId": "1234567890",
            "status": "IN_PROGRESS"
        }
    ]
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see ListReadSetExportJobs in *AWS CLI Command Reference*.

`list-read-set-import-jobs`

The following code example shows how to use `list-read-set-import-jobs`.

AWS CLI

To get a list of read set import jobs

The following `list-read-set-import-jobs` example gets a list of import jobs for a sequence store with id 1234567890.

```
aws omics list-read-set-import-jobs \
    --sequence-store-id 1234567890
```

Output:

```
{
    "importJobs": [
        {
            "completionTime": "2022-11-29T18:17:49.244Z",
            "creationTime": "2022-11-29T17:32:47.700Z",
            "id": "1234567890",
            "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-
serviceRole-W8O1XMPL7QZ",
            "sequenceStoreId": "1234567890",
            "status": "COMPLETED"
        },
        {
            "completionTime": "2022-11-23T22:01:34.090Z",
            "creationTime": "2022-11-23T21:52:43.289Z",
            "id": "1234567890",
            "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-
serviceRole-W8O1XMPL7QZ",
            "sequenceStoreId": "1234567890",
            "status": "COMPLETED_WITH_FAILURES"
        }
    ]
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see ListReadSetImportJobs in *AWS CLI Command Reference*.

`list-read-set-upload-parts`

The following code example shows how to use `list-read-set-upload-parts`.

AWS CLI

To list all parts in a requested multipart upload for a sequence store.

The following `list-read-set-upload-parts` example list all parts in a requested multipart upload for a sequence store.

```
aws omics list-read-set-upload-parts \
    --sequence-store-id 0123456789 \
    --upload-id 1122334455 \
    --part-source SOURCE1
```

Output:

```
{
    "parts": [
        {
            "partNumber": 1,
            "partSize": 94371840,
            "file": "SOURCE1",
            "checksum":
 "984979b9928ae8d8622286c4a9cd8e99d964a22d59ed0f5722e1733eb280e635",
            "lastUpdatedTime": "2023-02-02T20:14:47.533000+00:00"
        }
        {
            "partNumber": 2,
            "partSize": 10471840,
            "file": "SOURCE1",
            "checksum":
 "984979b9928ae8d8622286c4a9cd8e99d964a22d59ed0f5722e1733eb280e635",
            "lastUpdatedTime": "2023-02-02T20:14:47.533000+00:00"
        }
      ]
```

```
}
```

For more information, see Direct upload to a sequence store in the *AWS HealthOmics User Guide*.

- For API details, see ListReadSetUploadParts in *AWS CLI Command Reference*.

`list-read-sets`

The following code example shows how to use `list-read-sets`.

AWS CLI

To get a list of read sets

The following `list-read-sets` example gets a list of read sets for a sequence store with id `1234567890`.

```
aws omics list-read-sets \
    --sequence-store-id 1234567890
```

Output:

```
{
    "readSets": [
        {
            "arn": "arn:aws:omics:us-west-2:123456789012:sequenceStore/1234567890/
readSet/1234567890",
            "creationTime": "2022-11-23T21:55:00.515Z",
            "fileType": "FASTQ",
            "id": "1234567890",
            "name": "HG00146",
            "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890",
            "sampleId": "fastq-sample",
            "sequenceStoreId": "1234567890",
            "status": "ACTIVE",
            "subjectId": "fastq-subject"
        }
    ]
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see ListReadSets in *AWS CLI Command Reference*.

`list-reference-import-jobs`

The following code example shows how to use `list-reference-import-jobs`.

AWS CLI

To get a list of reference import jobs

The following `list-reference-import-jobs` example gets a list of reference import jobs for a reference store with id `1234567890`.

```
aws omics list-reference-import-jobs \
    --reference-store-id 1234567890
```

Output:

```
{
    "importJobs": [
        {
            "completionTime": "2022-11-23T19:54:58.204Z",
            "creationTime": "2022-11-23T19:53:20.729Z",
            "id": "1234567890",
            "referenceStoreId": "1234567890",
            "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-
serviceRole-W8O1XMPL7QZ",
            "status": "COMPLETED"
        },
        {
            "creationTime": "2022-11-23T20:34:03.250Z",
            "id": "1234567890",
            "referenceStoreId": "1234567890",
            "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-
serviceRole-W8O1XMPL7QZ",
            "status": "IN_PROGRESS"
        }
    ]
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see ListReferenceImportJobs in *AWS CLI Command Reference*.

`list-reference-stores`

The following code example shows how to use `list-reference-stores`.

AWS CLI

To get a list of reference stores

The following `list-reference-stores` example gets a list of reference stores.

```
aws omics list-reference-stores
```

Output:

```
{
    "referenceStores": [
        {
            "arn": "arn:aws:omics:us-west-2:123456789012:referenceStore/1234567890",
            "creationTime": "2022-11-22T22:13:25.947Z",
            "id": "1234567890",
            "name": "my-ref-store"
        }
    ]
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see ListReferenceStores in *AWS CLI Command Reference*.

`list-references`

The following code example shows how to use `list-references`.

AWS CLI

To get a list of references

The following `list-references` example gets a list of genome references for a reference store with id `1234567890`.

```
aws omics list-references \
    --reference-store-id 1234567890
```

Output:

```
{
    "references": [
        {
            "arn": "arn:aws:omics:us-west-2:123456789012:referenceStore/1234567890/
reference/1234567890",
            "creationTime": "2022-11-22T22:27:09.033Z",
            "id": "1234567890",
            "md5": "7ff134953dcca8c8997453bbb80b6b5e",
            "name": "assembly-38",
            "referenceStoreId": "1234567890",
            "status": "ACTIVE",
            "updateTime": "2022-11-22T22:27:09.033Z"
        }
    ]
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see ListReferences in *AWS CLI Command Reference*.

`list-run-groups`

The following code example shows how to use `list-run-groups`.

AWS CLI

To get a list of run groups

The following `list-run-groups` example gets a list of run groups.

```
aws omics list-run-groups
```

Output:

```
{
    "items": [
        {
```

```
                "arn": "arn:aws:omics:us-west-2:123456789012:runGroup/1234567",
                "creationTime": "2022-12-01T00:58:42.915219Z",
                "id": "1234567",
                "maxCpus": 20,
                "maxDuration": 600,
                "name": "cram-convert"
            }
        ]
    }
```

For more information, see [Creating run groups](#) in the *AWS HealthOmics User Guide*.

- For API details, see [ListRunGroups](#) in *AWS CLI Command Reference*.

`list-run-tasks`

The following code example shows how to use `list-run-tasks`.

AWS CLI

To get a list of tasks

The following `list-run-tasks` example gets a list of tasks for a workflow run.

```
aws omics list-run-tasks \
    --id 1234567
```

Output:

```
{
    "items": [
        {
            "cpus": 1,
            "creationTime": "2022-11-30T23:13:00.718651Z",
            "memory": 15,
            "name": "CramToBamTask",
            "startTime": "2022-11-30T23:17:47.016Z",
            "status": "COMPLETED",
            "stopTime": "2022-11-30T23:18:21.503Z",
            "taskId": "1234567"
        },
        {
            "cpus": 1,
```

```
                "creationTime": "2022-11-30T23:18:32.315606Z",
                "memory": 4,
                "name": "ValidateSamFile",
                "startTime": "2022-11-30T23:23:40.165Z",
                "status": "COMPLETED",
                "stopTime": "2022-11-30T23:24:14.766Z",
                "taskId": "1234567"
            }
        ]
    }
```

For more information, see Task lifecycle in a HealthOmics run in the *AWS HealthOmics User Guide*.

- For API details, see ListRunTasks in *AWS CLI Command Reference*.

`list-runs`

The following code example shows how to use `list-runs`.

AWS CLI

To get a list of workflow runs

The following `list-runs` example gets a list of workflow runs.

```
aws omics list-runs
```

Output:

```
{
    "items": [
        {
            "arn": "arn:aws:omics:us-west-2:123456789012:run/1234567",
            "creationTime": "2022-12-02T23:20:01.202074Z",
            "id": "1234567",

            "storageCapacity": 10,
            "workflowId": "1234567"
        },
        {
            "arn": "arn:aws:omics:us-west-2:123456789012:run/1234567",
            "creationTime": "2022-12-05T17:57:08.444817Z",
            "id": "1234567",
            "name": "cram-to-bam",
            "status": "STARTING",
            "workflowId": "1234567"
        }
    ]
}
```

For more information, see Run lifecycle in a workflow in the *AWS HealthOmics User Guide*.

- For API details, see ListRuns in *AWS CLI Command Reference*.

`list-sequence-stores`

The following code example shows how to use `list-sequence-stores`.

AWS CLI

To get a list of sequence stores

The following `list-sequence-stores` example gets a list of sequence stores.

```
aws omics list-sequence-stores
```

Output:

```
{
```

```
    "sequenceStores": [
        {
            "arn": "arn:aws:omics:us-west-2:123456789012:sequenceStore/1234567890",
            "creationTime": "2022-11-23T01:24:33.629Z",
            "id": "1234567890",
            "name": "my-seq-store"
        }
    ]
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see ListSequenceStores in *AWS CLI Command Reference*.

`list-shares`

The following code example shows how to use `list-shares`.

AWS CLI

To list the available shares of a HealthOmics analytics data

The following `list-shares` example lists all shares that have been created for a resource-owner.

```
aws omics list-shares \
    --resource-owner SELF
```

Output:

```
{
    "shares": [
        {
            "shareId": "595c1cbd-a008-4eca-a887-954d30c91c6e",
            "name": "myShare",
            "resourceArn": "arn:aws:omics:us-west-2:555555555555:variantStore/
store_1",
            "principalSubscriber": "123456789012",
            "ownerId": "555555555555",
            "status": "PENDING"
        }
        {
            "shareId": "39b65d0d-4368-4a19-9814-b0e31d73c10a",
```

```
            "name": "myShare3456",
            "resourceArn": "arn:aws:omics:us-west-2:555555555555:variantStore/
store_2",
            "principalSubscriber": "123456789012",
            "ownerId": "555555555555",
            "status": "ACTIVE"
        },
        {
            "shareId": "203152f5-eef9-459d-a4e0-a691668d44ef",
            "name": "myShare4",
            "resourceArn": "arn:aws:omics:us-west-2:555555555555:variantStore/
store_3",
            "principalSubscriber": "123456789012",
            "ownerId": "555555555555",
            "status": "ACTIVE"
        }
    ]
}
```

For more information, see Cross-account sharing in the *AWS HealthOmics User Guide*.

- For API details, see ListShares in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To get a list of tags

The following `list-tags-for-resource` example gets a list of tags for a workflow with id `1234567`.

```
aws omics list-tags-for-resource \
    --resource-arn arn:aws:omics:us-west-2:123456789012:workflow/1234567
```

Output:

```
{
    "tags": {
        "department": "analytics"
```

```
    }
}
```

For more information, see [Tagging resources in Amazon Omics](#) in the *Amazon Omics Developer Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

`list-variant-import-jobs`

The following code example shows how to use `list-variant-import-jobs`.

AWS CLI

To get a list of variant import jobs

The following `list-variant-import-jobs` example gets a list of variant import jobs.

```
aws omics list-variant-import-jobs
```

Output:

```
{
    "variantImportJobs": [
        {
            "creationTime": "2022-11-23T22:47:02.514002Z",
            "destinationName": "my_var_store",
            "id": "69cb65d6-xmpl-4a4a-9025-4565794b684e",
            "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-
serviceRole-W8O1XMPL7QZ",
            "runLeftNormalization": false,
            "status": "COMPLETED",
            "updateTime": "2022-11-23T22:49:17.976597Z"
        },
        {
            "creationTime": "2022-11-23T22:42:50.037812Z",
            "destinationName": "my_var_store",
            "id": "edd7b8ce-xmpl-47e2-bc99-258cac95a508",
            "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-
serviceRole-W8O1XMPL7QZ",
            "runLeftNormalization": false,
            "status": "COMPLETED",
            "updateTime": "2022-11-23T22:45:26.009880Z"
```

```
        }
    ]
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see ListVariantImportJobs in *AWS CLI Command Reference*.

`list-variant-stores`

The following code example shows how to use `list-variant-stores`.

AWS CLI

To get a list of variant stores

The following `list-variant-stores` example gets a list of variant stores.

```
aws omics list-variant-stores
```

Output:

```
{
    "variantStores": [
        {
            "creationTime": "2022-11-23T22:09:07.534499Z",
            "id": "02dexmplcfdd",
            "name": "my_var_store",
            "reference": {
                "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890"
            },
            "status": "CREATING",
            "storeArn": "arn:aws:omics:us-west-2:123456789012:variantStore/
my_var_store",
            "storeSizeBytes": 0,
            "updateTime": "2022-11-23T22:09:24.931711Z"
        },
        {
            "creationTime": "2022-09-23T23:00:09.140265Z",
            "id": "8777xmpl1a24",
            "name": "myvstore0",
            "status": "ACTIVE",
```

```
            "storeArn": "arn:aws:omics:us-west-2:123456789012:variantStore/
myvstore0",
            "storeSizeBytes": 0,
            "updateTime": "2022-09-23T23:03:26.013220Z"
        }
    ]
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see ListVariantStores in *AWS CLI Command Reference*.

`list-workflows`

The following code example shows how to use `list-workflows`.

AWS CLI

To get a list of workflows

The following `list-workflows` example gets a list of workflows.

```
aws omics list-workflows
```

Output:

```
{
    "items": [
        {
            "arn": "arn:aws:omics:us-west-2:123456789012:workflow/1234567",
            "creationTime": "2022-09-23T23:08:22.041227Z",
            "digest": "nSCNo/qMWFxmplXpUdokXJnwgneOaxyyc2YOxVxrJTE=",
            "id": "1234567",
            "name": "my-wkflow-0",
            "status": "ACTIVE",
            "type": "PRIVATE"
        },
        {
            "arn": "arn:aws:omics:us-west-2:123456789012:workflow/1234567",
            "creationTime": "2022-11-30T22:33:16.225368Z",
            "digest":
 "sha256:c54bxmpl742dcc26f7fa1f10e37550ddd8f251f418277c0a58e895b801ed28cf",
            "id": "1234567",
```

```
                "name": "cram-converter",
                "status": "ACTIVE",
                "type": "PRIVATE"
            }
        ]
    }
```

For more information, see [Creating private workflows](#) in the *AWS HealthOmics User Guide*.

- For API details, see [ListWorkflows](#) in *AWS CLI Command Reference*.

`start-annotation-import-job`

The following code example shows how to use `start-annotation-import-job`.

AWS CLI

To import annotations

The following `start-annotation-import-job` example imports annotations from Amazon S3.

```
aws omics start-annotation-import-job \
    --destination-name tsv_ann_store \
    --no-run-left-normalization \
    --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W8O1XMPL7QZ \
    --items source=s3://omics-artifacts-01d6xmpl4e72dd32/targetedregions.bed.gz
```

Output:

```
{
    "jobId": "984162c7-xmpl-4d23-ab47-286f7950bfbf"
}
```

For more information, see [Omics Analytics](#) in the *Amazon Omics Developer Guide*.

- For API details, see [StartAnnotationImportJob](#) in *AWS CLI Command Reference*.

`start-read-set-activation-job`

The following code example shows how to use `start-read-set-activation-job`.

AWS CLI

To activate an archived read set

The following `start-read-set-activation-job` example activates two read sets.

```
aws omics start-read-set-activation-job \
    --sequence-store-id 1234567890 \
    --sources readSetId=1234567890 readSetId=1234567890
```

Output:

```
{
    "creationTime": "2022-12-06T22:35:10.100Z",
    "id": "1234567890",
    "sequenceStoreId": "1234567890",
    "status": "SUBMITTED"
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see StartReadSetActivationJob in *AWS CLI Command Reference*.

`start-read-set-export-job`

The following code example shows how to use `start-read-set-export-job`.

AWS CLI

To export a read set

The following `start-read-set-export-job` example exports two read sets to Amazon S3.

```
   aws omics start-read-set-export-job \
       --sequence-store-id 1234567890 \
       --sources readSetId=1234567890 readSetId=1234567890 \
       --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W8O1XMPL7QZ
\
       --destination s3://omics-artifacts-01d6xmpl4e72dd32/read-set-export/
```

Output:

```
{
    "creationTime": "2022-12-06T22:37:18.612Z",
    "destination": "s3://omics-artifacts-01d6xmpl4e72dd32/read-set-export/",
    "id": "1234567890",
    "sequenceStoreId": "1234567890",
    "status": "SUBMITTED"
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see StartReadSetExportJob in *AWS CLI Command Reference*.

`start-read-set-import-job`

The following code example shows how to use `start-read-set-import-job`.

AWS CLI

To import a read set

The following `start-read-set-import-job` example imports a read set.

```
aws omics start-read-set-import-job \
    --sequence-store-id 1234567890 \
    --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W8O1XMPL7QZ \
    --sources file://readset-sources.json
```

readset-sources.json is a JSON document with the following content.

```
[
    {
        "sourceFiles":
        {
            "source1": "s3://omics-artifacts-01d6xmpl4e72dd32/
HG00100.chrom20.ILLUMINA.bwa.GBR.low_coverage.20101123.bam"
        },
        "sourceFileType": "BAM",
        "subjectId": "bam-subject",
        "sampleId": "bam-sample",
        "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890",
```

```
            "name": "HG00100"
        }
]
```

Output:

```
{
    "creationTime": "2022-11-23T01:36:38.158Z",
    "id": "1234567890",
    "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W8O1XMPL7QZ",
    "sequenceStoreId": "1234567890",
    "status": "SUBMITTED"
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see StartReadSetImportJob in *AWS CLI Command Reference*.

`start-reference-import-job`

The following code example shows how to use `start-reference-import-job`.

AWS CLI

To import a reference genome

The following `start-reference-import-job` example imports a reference genome from Amazon S3.

```
aws omics start-reference-import-job \
    --reference-store-id 1234567890 \
    --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W8O1XMPL7QZ \
    --sources sourceFile=s3://omics-artifacts-01d6xmpl4e72dd32/
Homo_sapiens_assembly38.fasta,name=assembly-38
```

Output:

```
{
    "creationTime": "2022-11-22T22:25:41.124Z",
    "id": "1234567890",
```

```
    "referenceStoreId": "1234567890",
    "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W8O1XMPL7QZ",
    "status": "SUBMITTED"
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see StartReferenceImportJob in *AWS CLI Command Reference*.

`start-run`

The following code example shows how to use `start-run`.

AWS CLI

To run a workflow

The following `start-run` example runs a workflow with ID 1234567.

```
aws omics start-run \
    --workflow-id 1234567 \
    --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W8O1XMPL7QZ \
    --name 'cram-to-bam' \
    --output-uri s3://omics-artifacts-01d6xmpl4e72dd32/workflow-output/ \
    --run-group-id 1234567 \
    --priority 1 \
    --storage-capacity 10 \
    --log-level ALL \
    --parameters file://workflow-inputs.json
```

workflow-inputs.json is a JSON document with the following content.

```
{
    "sample_name": "NA12878",
    "input_cram": "s3://omics-artifacts-01d6xmpl4e72dd32/NA12878.cram",
    "ref_dict": "s3://omics-artifacts-01d6xmpl4e72dd32/
Homo_sapiens_assembly38.dict",
    "ref_fasta": "s3://omics-artifacts-01d6xmpl4e72dd32/
Homo_sapiens_assembly38.fasta",
    "ref_fasta_index": "omics-artifacts-01d6xmpl4e72dd32/
Homo_sapiens_assembly38.fasta.fai"
```

```
}
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:run/1234567",
    "id": "1234567",
    "status": "PENDING",
    "tags": {}
}
```

For more information, see Starting a run in the *AWS HealthOmics User Guide*.

To load source files from Amazon Omics

You can also load source files from Amazon Omics storage, by using service-specific URIs. The following example workflow-inputs.json file uses Amazon Omics URIs for read set and reference genome sources.

```
{
    "sample_name": "NA12878",
    "input_cram": "omics://123456789012.storage.us-west-2.amazonaws.com/1234567890/
readSet/1234567890/source1",
    "ref_dict": "s3://omics-artifacts-01d6xmpl4e72dd32/
Homo_sapiens_assembly38.dict",
    "ref_fasta": "omics://123456789012.storage.us-west-2.amazonaws.com/1234567890/
reference/1234567890",
    "ref_fasta_index": "omics://123456789012.storage.us-
west-2.amazonaws.com/1234567890/reference/1234567890/index"
}
```

- For API details, see StartRun in *AWS CLI Command Reference*.

`start-variant-import-job`

The following code example shows how to use `start-variant-import-job`.

AWS CLI

To import a variant file

The following `start-variant-import-job` example imports a VCF format variant file.

```
aws omics start-variant-import-job \
    --destination-name my_var_store \
    --no-run-left-normalization  \
    --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W8O1XMPL7QZ \
    --items source=s3://omics-artifacts-01d6xmpl4e72dd32/
Homo_sapiens_assembly38.known_indels.vcf.gz
```

Output:

```
{
    "jobId": "edd7b8ce-xmpl-47e2-bc99-258cac95a508"
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see StartVariantImportJob in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a resource

The following `tag-resource` example adds a `department` tag to a workflow with id `1234567`.

```
aws omics tag-resource \
    --resource-arn arn:aws:omics:us-west-2:123456789012:workflow/1234567 \
    --tags department=analytics
```

For more information, see Tagging resources in Amazon Omics in the *Amazon Omics Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a resource

The following `untag-resource` example removes the `department` tag from a workflow.

```
aws omics untag-resource \
    --resource-arn arn:aws:omics:us-west-2:123456789012:workflow/1234567 \
    --tag-keys department
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-annotation-store`

The following code example shows how to use `update-annotation-store`.

AWS CLI

To update an annotation store

The following `update-annotation-store` example updates the description of an annotation store named `my_vcf_store`.

```
aws omics update-annotation-store \
    --name my_vcf_store \
    --description "VCF annotation store"
```

Output:

```
{
    "creationTime": "2022-12-05T18:00:56.101860Z",
    "description": "VCF annotation store",
    "id": "bd6axmpl2444",
    "name": "my_vcf_store",
    "reference": {
        "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890"
    },
    "status": "ACTIVE",
    "storeFormat": "VCF",
```

```
    "updateTime": "2022-12-05T18:13:16.100051Z"
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see UpdateAnnotationStore in *AWS CLI Command Reference*.

update-run-group

The following code example shows how to use `update-run-group`.

AWS CLI

To update a run group

The following `update-run-group` example updates the settings of a run group with id `1234567`.

```
aws omics update-run-group \
    --id 1234567 \
    --max-cpus 10
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:runGroup/1234567",
    "creationTime": "2022-12-01T00:58:42.915219Z",
    "id": "1234567",
    "maxCpus": 10,
    "maxDuration": 600,
    "name": "cram-convert",
    "tags": {}
}
```

For more information, see Omics Workflows in the *Amazon Omics Developer Guide*.

- For API details, see UpdateRunGroup in *AWS CLI Command Reference*.

update-variant-store

The following code example shows how to use `update-variant-store`.

AWS CLI

To update a variant store

The following `update-variant-store` example updates the description of a variant store named `my_var_store`.

```
aws omics update-variant-store \
    --name my_var_store \
    --description "variant store"
```

Output:

```
{
    "creationTime": "2022-11-23T22:09:07.534499Z",
    "description": "variant store",
    "id": "02dexmplcfdd",
    "name": "my_var_store",
    "reference": {
        "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890"
    },
    "status": "ACTIVE",
    "updateTime": "2022-12-05T18:23:37.686402Z"
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see UpdateVariantStore in *AWS CLI Command Reference*.

`update-workflow`

The following code example shows how to use `update-workflow`.

AWS CLI

To update a workflow

The following `update-workflow` example updates the description of a workflow with ID `1234567`.

```
aws omics update-workflow \
```

```
    --id 1234567 \
    --description "copy workflow"
```

For more information, see [Creating or updating a workflow](#) in the *AWS HealthOmics User Guide*.

- For API details, see [UpdateWorkflow](#) in *AWS CLI Command Reference*.

`upload-read-set-part`

The following code example shows how to use `upload-read-set-part`.

AWS CLI

To upload a read set part.

The following `upload-read-set-part` example uploads a specified part of a read set.

```
aws omics upload-read-set-part \
    --sequence-store-id 0123456789 \
    --upload-id 1122334455 \
    --part-source SOURCE1 \
    --part-number 1 \
    --payload /path/to/file/read_1_part_1.fastq.gz
```

Output:

```
{
    "checksum": "984979b9928ae8d8622286c4a9cd8e99d964a22d59ed0f5722e1733eb280e635"
}
```

For more information, see [Direct upload to a sequence store](#) in the *AWS HealthOmics User Guide*.

- For API details, see [UploadReadSetPart](#) in *AWS CLI Command Reference*.

IAM examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with IAM.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`add-client-id-to-open-id-connect-provider`

The following code example shows how to use `add-client-id-to-open-id-connect-provider`.

AWS CLI

To add a client ID (audience) to an Open-ID Connect (OIDC) provider

The following `add-client-id-to-open-id-connect-provider` command adds the client ID `my-application-ID` to the OIDC provider named `server.example.com`.

```
aws iam add-client-id-to-open-id-connect-provider \
    --client-id my-application-ID \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
server.example.com
```

This command produces no output.

To create an OIDC provider, use the `create-open-id-connect-provider` command.

For more information, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

- For API details, see AddClientIdToOpenIdConnectProvider in *AWS CLI Command Reference*.

`add-role-to-instance-profile`

The following code example shows how to use `add-role-to-instance-profile`.

AWS CLI

To add a role to an instance profile

The following `add-role-to-instance-profile` command adds the role named `S3Access` to the instance profile named `Webserver`.

```
aws iam add-role-to-instance-profile \
    --role-name S3Access \
    --instance-profile-name Webserver
```

This command produces no output.

To create an instance profile, use the `create-instance-profile` command.

For more information, see Using an IAM role to grant permissions to applications running on Amazon EC2 instances in the *AWS IAM User Guide*.

- For API details, see AddRoleToInstanceProfile in *AWS CLI Command Reference*.

`add-user-to-group`

The following code example shows how to use `add-user-to-group`.

AWS CLI

To add a user to an IAM group

The following `add-user-to-group` command adds an IAM user named Bob to the IAM group named `Admins`.

```
aws iam add-user-to-group \
    --user-name Bob \
    --group-name Admins
```

This command produces no output.

For more information, see Adding and removing users in an IAM user group in the *AWS IAM User Guide*.

- For API details, see AddUserToGroup in *AWS CLI Command Reference*.

`attach-group-policy`

The following code example shows how to use `attach-group-policy`.

AWS CLI

To attach a managed policy to an IAM group

The following `attach-group-policy` command attaches the AWS managed policy named `ReadOnlyAccess` to the IAM group named `Finance`.

```
aws iam attach-group-policy \
    --policy-arn arn:aws:iam::aws:policy/ReadOnlyAccess \
    --group-name Finance
```

This command produces no output.

For more information, see Managed policies and inline policies in the *AWS IAM User Guide*.

- For API details, see AttachGroupPolicy in *AWS CLI Command Reference*.

`attach-role-policy`

The following code example shows how to use `attach-role-policy`.

AWS CLI

To attach a managed policy to an IAM role

The following `attach-role-policy` command attaches the AWS managed policy named `ReadOnlyAccess` to the IAM role named `ReadOnlyRole`.

```
aws iam attach-role-policy \
    --policy-arn arn:aws:iam::aws:policy/ReadOnlyAccess \
    --role-name ReadOnlyRole
```

This command produces no output.

For more information, see Managed policies and inline policies in the *AWS IAM User Guide*.

- For API details, see AttachRolePolicy in *AWS CLI Command Reference*.

`attach-user-policy`

The following code example shows how to use `attach-user-policy`.

AWS CLI

To attach a managed policy to an IAM user

The following `attach-user-policy` command attaches the AWS managed policy named `AdministratorAccess` to the IAM user named `Alice`.

```
aws iam attach-user-policy \
    --policy-arn arn:aws:iam::aws:policy/AdministratorAccess \
    --user-name Alice
```

This command produces no output.

For more information, see Managed policies and inline policies in the *AWS IAM User Guide*.

- For API details, see AttachUserPolicy in *AWS CLI Command Reference*.

`change-password`

The following code example shows how to use `change-password`.

AWS CLI

To change the password for your IAM user

To change the password for your IAM user, we recommend using the `--cli-input-json` parameter to pass a JSON file that contains your old and new passwords. Using this method, you can use strong passwords with non-alphanumeric characters. It can be difficult to use passwords with non-alphanumeric characters when you pass them as command line parameters. To use the `--cli-input-json` parameter, start by using the `change-password` command with the `--generate-cli-skeleton` parameter, as in the following example.

```
aws iam change-password \
    --generate-cli-skeleton > change-password.json
```

The previous command creates a JSON file called change-password.json that you can use to fill in your old and new passwords. For example, the file might look like the following.

```
{
    "OldPassword": "3s0K_;xh4~8XXI",
    "NewPassword": "]35d/{pB9Fo9wJ"
```

```
}
```

Next, to change your password, use the `change-password` command again, this time passing the `--cli-input-json` parameter to specify your JSON file. The following `change-password` command uses the `--cli-input-json` parameter with a JSON file called change-password.json.

```
aws iam change-password \
    --cli-input-json file://change-password.json
```

This command produces no output.

This command can be called by IAM users only. If this command is called using AWS account (root) credentials, the command returns an `InvalidUserType` error.

For more information, see How an IAM user changes their own password in the *AWS IAM User Guide*.

- For API details, see ChangePassword in *AWS CLI Command Reference*.

`create-access-key`

The following code example shows how to use `create-access-key`.

AWS CLI

To create an access key for an IAM user

The following `create-access-key` command creates an access key (access key ID and secret access key) for the IAM user named Bob.

```
aws iam create-access-key \
    --user-name Bob
```

Output:

```
{
    "AccessKey": {
        "UserName": "Bob",
        "Status": "Active",
        "CreateDate": "2015-03-09T18:39:23.411Z",
```

```
        "SecretAccessKey": "wJalrXUtnFEMI/K7MDENG/bPxRfiCYzEXAMPLEKEY",
        "AccessKeyId": "AKIAIOSFODNN7EXAMPLE"
    }
}
```

Store the secret access key in a secure location. If it is lost, it cannot be recovered, and you must create a new access key.

For more information, see Managing access keys for IAM users in the *AWS IAM User Guide*.

- For API details, see CreateAccessKey in *AWS CLI Command Reference*.

`create-account-alias`

The following code example shows how to use `create-account-alias`.

AWS CLI

To create an account alias

The following `create-account-alias` command creates the alias `examplecorp` for your AWS account.

```
aws iam create-account-alias \
    --account-alias examplecorp
```

This command produces no output.

For more information, see Your AWS account ID and its alias in the *AWS IAM User Guide*.

- For API details, see CreateAccountAlias in *AWS CLI Command Reference*.

`create-group`

The following code example shows how to use `create-group`.

AWS CLI

To create an IAM group

The following `create-group` command creates an IAM group named `Admins`.

```
aws iam create-group \
```

```
    --group-name Admins
```

Output:

```
{
    "Group": {
        "Path": "/",
        "CreateDate": "2015-03-09T20:30:24.940Z",
        "GroupId": "AIDGPMS9RO4H3FEXAMPLE",
        "Arn": "arn:aws:iam::123456789012:group/Admins",
        "GroupName": "Admins"
    }
}
```

For more information, see Creating IAM user groups in the *AWS IAM User Guide*.

- For API details, see CreateGroup in *AWS CLI Command Reference*.

`create-instance-profile`

The following code example shows how to use `create-instance-profile`.

AWS CLI

To create an instance profile

The following `create-instance-profile` command creates an instance profile named `Webserver`.

```
aws iam create-instance-profile \
    --instance-profile-name Webserver
```

Output:

```
{
    "InstanceProfile": {
        "InstanceProfileId": "AIPAJMBYC7DLSPEXAMPLE",
        "Roles": [],
        "CreateDate": "2015-03-09T20:33:19.626Z",
        "InstanceProfileName": "Webserver",
        "Path": "/",
        "Arn": "arn:aws:iam::123456789012:instance-profile/Webserver"
```

```
    }
}
```

To add a role to an instance profile, use the `add-role-to-instance-profile` command.

For more information, see Using an IAM role to grant permissions to applications running on Amazon EC2 instances in the *AWS IAM User Guide*.

- For API details, see CreateInstanceProfile in *AWS CLI Command Reference*.

`create-login-profile`

The following code example shows how to use `create-login-profile`.

AWS CLI

To create a password for an IAM user

To create a password for an IAM user, we recommend using the `--cli-input-json` parameter to pass a JSON file that contains the password. Using this method, you can create a strong password with non-alphanumeric characters. It can be difficult to create a password with non-alphanumeric characters when you pass it as a command line parameter.

To use the `--cli-input-json` parameter, start by using the `create-login-profile` command with the `--generate-cli-skeleton` parameter, as in the following example.

```
aws iam create-login-profile \
    --generate-cli-skeleton > create-login-profile.json
```

The previous command creates a JSON file called create-login-profile.json that you can use to fill in the information for a subsequent `create-login-profile` command. For example:

```
{
    "UserName": "Bob",
    "Password": "&1-3a6u:RA0djs",
    "PasswordResetRequired": true
}
```

Next, to create a password for an IAM user, use the `create-login-profile` command again, this time passing the `--cli-input-json` parameter to specify your JSON file. The following `create-login-profile` command uses the `--cli-input-json` parameter with a JSON file called create-login-profile.json.

```
aws iam create-login-profile \
    --cli-input-json file://create-login-profile.json
```

Output:

```
{
    "LoginProfile": {
        "UserName": "Bob",
        "CreateDate": "2015-03-10T20:55:40.274Z",
        "PasswordResetRequired": true
    }
}
```

If the new password violates the account password policy, the command returns a `PasswordPolicyViolation` error.

To change the password for a user that already has one, use `update-login-profile`. To set a password policy for the account, use the `update-account-password-policy` command.

If the account password policy allows them to, IAM users can change their own passwords using the `change-password` command.

For more information, see Managing passwords for IAM users in the *AWS IAM User Guide*.

- For API details, see CreateLoginProfile in *AWS CLI Command Reference*.

`create-open-id-connect-provider`

The following code example shows how to use `create-open-id-connect-provider`.

AWS CLI

To create an OpenID Connect (OIDC) provider

To create an OpenID Connect (OIDC) provider, we recommend using the `--cli-input-json` parameter to pass a JSON file that contains the required parameters. When you create an OIDC provider, you must pass the URL of the provider, and the URL must begin with `https://`. It can be difficult to pass the URL as a command line parameter, because the colon (:) and forward slash (/) characters have special meaning in some command line environments. Using the `--cli-input-json` parameter gets around this limitation.

To use the `--cli-input-json` parameter, start by using the `create-open-id-connect-provider` command with the `--generate-cli-skeleton` parameter, as in the following example.

```
aws iam create-open-id-connect-provider \
    --generate-cli-skeleton > create-open-id-connect-provider.json
```

The previous command creates a JSON file called create-open-id-connect-provider.json that you can use to fill in the information for a subsequent `create-open-id-connect-provider` command. For example:

```
{
    "Url": "https://server.example.com",
    "ClientIDList": [
        "example-application-ID"
    ],
    "ThumbprintList": [
        "c3768084dfb3d2b68b7897bf5f565da8eEXAMPLE"
    ]
}
```

Next, to create the OpenID Connect (OIDC) provider, use the `create-open-id-connect-provider` command again, this time passing the `--cli-input-json` parameter to specify your JSON file. The following `create-open-id-connect-provider` command uses the `--cli-input-json` parameter with a JSON file called create-open-id-connect-provider.json.

```
aws iam create-open-id-connect-provider \
    --cli-input-json file://create-open-id-connect-provider.json
```

Output:

```
{
    "OpenIDConnectProviderArn": "arn:aws:iam::123456789012:oidc-provider/
server.example.com"
}
```

For more information about OIDC providers, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

For more information about obtaining thumbprints for an OIDC provider, see Obtaining the thumbprint for an OpenID Connect Identity Provider in the *AWS IAM User Guide*.

- For API details, see CreateOpenIdConnectProvider in *AWS CLI Command Reference*.

`create-policy-version`

The following code example shows how to use `create-policy-version`.

AWS CLI

To create a new version of a managed policy

This example creates a new `v2` version of the IAM policy whose ARN is `arn:aws:iam::123456789012:policy/MyPolicy` and makes it the default version.

```
aws iam create-policy-version \
    --policy-arn arn:aws:iam::123456789012:policy/MyPolicy \
    --policy-document file://NewPolicyVersion.json \
    --set-as-default
```

Output:

```
{
    "PolicyVersion": {
        "CreateDate": "2015-06-16T18:56:03.721Z",
        "VersionId": "v2",
        "IsDefaultVersion": true
    }
}
```

For more information, see Versioning IAM policies in the *AWS IAM User Guide*.

- For API details, see CreatePolicyVersion in *AWS CLI Command Reference*.

`create-policy`

The following code example shows how to use `create-policy`.

AWS CLI

Example 1: To create a customer managed policy

The following command creates a customer managed policy named `my-policy`. The file `policy.json` is a JSON document in the current folder that grants read only access to the `shared` folder in an Amazon S3 bucket named `amzn-s3-demo-bucket`.

```
aws iam create-policy \
    --policy-name my-policy \
    --policy-document file://policy.json
```

Contents of policy.json:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:Get*",
                "s3:List*"
            ],
            "Resource": [
                "arn:aws:s3:::amzn-s3-demo-bucket/shared/*"
            ]
        }
    ]
}
```

Output:

```
{
    "Policy": {
        "PolicyName": "my-policy",
        "CreateDate": "2015-06-01T19:31:18.620Z",
        "AttachmentCount": 0,
        "IsAttachable": true,
        "PolicyId": "ZXR6A36LTYANPAI7NJ5UV",
        "DefaultVersionId": "v1",
        "Path": "/",
        "Arn": "arn:aws:iam::0123456789012:policy/my-policy",
```

```
        "UpdateDate": "2015-06-01T19:31:18.620Z"
    }
}
```

For more information on using files as input for string parameters, see [Specify parameter values for the AWS CLI]() in the *AWS CLI User Guide*.

Example 2: To create a customer managed policy with a description

The following command creates a customer managed policy named `my-policy` with an immutable description.

The file `policy.json` is a JSON document in the current folder that grants access to all Put, List, and Get actions for an Amazon S3 bucket named `amzn-s3-demo-bucket`.

```
aws iam create-policy \
    --policy-name my-policy \
    --policy-document file://policy.json \
    --description "This policy grants access to all Put, Get, and List actions for
 amzn-s3-demo-bucket"
```

Contents of policy.json:

```
{
   "Version":"2012-10-17",
   "Statement": [
       {
           "Effect": "Allow",
           "Action": [
                "s3:ListBucket*",
                "s3:PutBucket*",
                "s3:GetBucket*"
            ],
            "Resource": [
                "arn:aws:s3:::amzn-s3-demo-bucket"
            ]
        }
    ]
}
```

Output:

```
{
    "Policy": {
        "PolicyName": "my-policy",
        "PolicyId": "ANPAWGSUGIDPEXAMPLE",
        "Arn": "arn:aws:iam::123456789012:policy/my-policy",
        "Path": "/",
        "DefaultVersionId": "v1",
        "AttachmentCount": 0,
        "PermissionsBoundaryUsageCount": 0,
        "IsAttachable": true,
        "CreateDate": "2023-05-24T22:38:47+00:00",
        "UpdateDate": "2023-05-24T22:38:47+00:00"
    }
}
```

For more information on Idenity-based Policies, see Identity-based policies and resource-based policies in the *AWS IAM User Guide*.

Example 3: To create a customer managed policy with tags

The following command creates a customer managed policy named `my-policy` with tags. This example uses the `--tags` parameter with the following JSON-formatted tags: `'{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location", "Value": "Seattle"}'`. Alternatively, the `--tags` parameter can be used with tags in the shorthand format: `'Key=Department,Value=Accounting Key=Location,Value=Seattle'`.

The file `policy.json` is a JSON document in the current folder that grants access to all Put, List, and Get actions for an Amazon S3 bucket named `amzn-s3-demo-bucket`.

```
aws iam create-policy \
    --policy-name my-policy \
    --policy-document file://policy.json \
    --tags '{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location",
 "Value": "Seattle"}'
```

Contents of policy.json:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
```

```
            "Effect": "Allow",
            "Action": [
                "s3:ListBucket*",
                "s3:PutBucket*",
                "s3:GetBucket*"
            ],
            "Resource": [
                "arn:aws:s3:::amzn-s3-demo-bucket"
            ]
        }
    ]
}
```

Output:

```
{
    "Policy": {
        "PolicyName": "my-policy",
        "PolicyId": "ANPAWGSUGIDPEXAMPLE",
        "Arn": "arn:aws:iam::12345678012:policy/my-policy",
        "Path": "/",
        "DefaultVersionId": "v1",
        "AttachmentCount": 0,
        "PermissionsBoundaryUsageCount": 0,
        "IsAttachable": true,
        "CreateDate": "2023-05-24T23:16:39+00:00",
        "UpdateDate": "2023-05-24T23:16:39+00:00",
        "Tags": [
            {
                "Key": "Department",
                "Value": "Accounting"
            },
                "Key": "Location",
                "Value": "Seattle"
            {
        ]
    }
}
```

For more information on Tagging policies, see Tagging customer managed policies in the *AWS IAM User Guide*.

- For API details, see CreatePolicy in *AWS CLI Command Reference*.

`create-role`

The following code example shows how to use `create-role`.

AWS CLI

Example 1: To create an IAM role

The following `create-role` command creates a role named `Test-Role` and attaches a trust policy to it.

```
aws iam create-role \
    --role-name Test-Role \
    --assume-role-policy-document file://Test-Role-Trust-Policy.json
```

Output:

```
{
    "Role": {
        "AssumeRolePolicyDocument": "<URL-encoded-JSON>",
        "RoleId": "AKIAIOSFODNN7EXAMPLE",
        "CreateDate": "2013-06-07T20:43:32.821Z",
        "RoleName": "Test-Role",
        "Path": "/",
        "Arn": "arn:aws:iam::123456789012:role/Test-Role"
    }
}
```

The trust policy is defined as a JSON document in the *Test-Role-Trust-Policy.json* file. (The file name and extension do not have significance.) The trust policy must specify a principal.

To attach a permissions policy to a role, use the `put-role-policy` command.

For more information, see Creating IAM roles in the *AWS IAM User Guide*.

Example 2: To create an IAM role with specified maximum session duration

The following `create-role` command creates a role named `Test-Role` and sets a maximum session duration of 7200 seconds (2 hours).

```
aws iam create-role \
```

```
    --role-name Test-Role \
    --assume-role-policy-document file://Test-Role-Trust-Policy.json \
    --max-session-duration 7200
```

Output:

```
{
    "Role": {
        "Path": "/",
        "RoleName": "Test-Role",
        "RoleId": "AKIAIOSFODNN7EXAMPLE",
        "Arn": "arn:aws:iam::12345678012:role/Test-Role",
        "CreateDate": "2023-05-24T23:50:25+00:00",
        "AssumeRolePolicyDocument": {
            "Version":"2012-10-17",
            "Statement": [
                {
                    "Sid": "Statement1",
                    "Effect": "Allow",
                    "Principal": {
                        "AWS": "arn:aws:iam::12345678012:root"
                    },
                    "Action": "sts:AssumeRole"
                }
            ]
        }
    }
}
```

For more information, see Modifying a role maximum session duration (AWS API) in the *AWS IAM User Guide*.

Example 3: To create an IAM Role with tags

The following command creates an IAM Role `Test-Role` with tags. This example uses the `--tags` parameter flag with the following JSON-formatted tags: `'{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location", "Value": "Seattle"}'`. Alternatively, the `--tags` flag can be used with tags in the shorthand format: `'Key=Department,Value=Accounting Key=Location,Value=Seattle'`.

```
aws iam create-role \
```

```
    --role-name Test-Role \
    --assume-role-policy-document file://Test-Role-Trust-Policy.json \
    --tags '{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location",
 "Value": "Seattle"}'
```

Output:

```
{
    "Role": {
        "Path": "/",
        "RoleName": "Test-Role",
        "RoleId": "AKIAIOSFODNN7EXAMPLE",
        "Arn": "arn:aws:iam::123456789012:role/Test-Role",
        "CreateDate": "2023-05-25T23:29:41+00:00",
        "AssumeRolePolicyDocument": {
            "Version":"2012-10-17",
            "Statement": [
                {
                    "Sid": "Statement1",
                    "Effect": "Allow",
                    "Principal": {
                        "AWS": "arn:aws:iam::123456789012:root"
                    },
                    "Action": "sts:AssumeRole"
                }
            ]
        },
        "Tags": [
            {
                "Key": "Department",
                "Value": "Accounting"
            },
            {
                "Key": "Location",
                "Value": "Seattle"
            }
        ]
    }
}
```

For more information, see Tagging IAM roles in the *AWS IAM User Guide*.

- For API details, see CreateRole in *AWS CLI Command Reference*.

`create-saml-provider`

The following code example shows how to use `create-saml-provider`.

AWS CLI

To create a SAML provider

This example creates a new SAML provider in IAM named `MySAMLProvider`. It is described by the SAML metadata document found in the file `SAMLMetaData.xml`.

```
aws iam create-saml-provider \
    --saml-metadata-document file://SAMLMetaData.xml \
    --name MySAMLProvider
```

Output:

```
{
    "SAMLProviderArn": "arn:aws:iam::123456789012:saml-provider/MySAMLProvider"
}
```

For more information, see Creating IAM SAML identity providers in the *AWS IAM User Guide*.

- For API details, see CreateSAMLProvider in *AWS CLI Command Reference*.

`create-service-linked-role`

The following code example shows how to use `create-service-linked-role`.

AWS CLI

To create a service-linked role

The following `create-service-linked-role` example creates a service-linked role for the specified AWS service and attaches the specified description.

```
aws iam create-service-linked-role \
    --aws-service-name lex.amazonaws.com \
    --description "My service-linked role to support Lex"
```

Output:

```
{
    "Role": {
        "Path": "/aws-service-role/lex.amazonaws.com/",
        "RoleName": "AWSServiceRoleForLexBots",
        "RoleId": "AROA1234567890EXAMPLE",
        "Arn": "arn:aws:iam::1234567890:role/aws-service-role/lex.amazonaws.com/
AWSServiceRoleForLexBots",
        "CreateDate": "2019-04-17T20:34:14+00:00",
        "AssumeRolePolicyDocument": {
            "Version":"2012-10-17",
            "Statement": [
                {
                    "Action": [
                        "sts:AssumeRole"
                    ],
                    "Effect": "Allow",
                    "Principal": {
                        "Service": [
                            "lex.amazonaws.com"
                        ]
                    }
                }
            ]
        }
    }
}
```

For more information, see Using service-linked roles in the *AWS IAM User Guide*.

- For API details, see CreateServiceLinkedRole in *AWS CLI Command Reference*.

`create-service-specific-credential`

The following code example shows how to use `create-service-specific-credential`.

AWS CLI

Create a set of service-specific credentials for a user

The following `create-service-specific-credential` example creates a username and password that can be used to access only the configured service.

```
aws iam create-service-specific-credential \
```

```
    --user-name sofia \
    --service-name codecommit.amazonaws.com
```

Output:

```
{
    "ServiceSpecificCredential": {
        "CreateDate": "2019-04-18T20:45:36+00:00",
        "ServiceName": "codecommit.amazonaws.com",
        "ServiceUserName": "sofia-at-123456789012",
        "ServicePassword": "k1zPZM6uVxMQ3oxqgoYlNuJPyRTZ1vREs76zTQE3eJk=",
        "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",
        "UserName": "sofia",
        "Status": "Active"
    }
}
```

For more information, see Create Git credentials for HTTPS connections to CodeCommit in the *AWS CodeCommit User Guide*.

- For API details, see CreateServiceSpecificCredential in *AWS CLI Command Reference*.

`create-user`

The following code example shows how to use `create-user`.

AWS CLI

Example 1: To create an IAM user

The following `create-user` command creates an IAM user named Bob in the current account.

```
aws iam create-user \
    --user-name Bob
```

Output:

```
{
    "User": {
        "UserName": "Bob",
        "Path": "/",
```

```
        "CreateDate": "2023-06-08T03:20:41.270Z",
        "UserId": "AIDAIOSFODNN7EXAMPLE",
        "Arn": "arn:aws:iam::123456789012:user/Bob"
    }
}
```

For more information, see Creating an IAM user in your AWS account in the *AWS IAM User Guide*.

Example 2: To create an IAM user at a specified path

The following `create-user` command creates an IAM user named Bob at the specified path.

```
aws iam create-user \
    --user-name Bob \
    --path /division_abc/subdivision_xyz/
```

Output:

```
{
    "User": {
        "Path": "/division_abc/subdivision_xyz/",
        "UserName": "Bob",
        "UserId": "AIDAIOSFODNN7EXAMPLE",
        "Arn": "arn:aws:iam::12345678012:user/division_abc/subdivision_xyz/Bob",
        "CreateDate": "2023-05-24T18:20:17+00:00"
    }
}
```

For more information, see IAM identifiers in the *AWS IAM User Guide*.

Example 3: To Create an IAM User with tags

The following `create-user` command creates an IAM user named Bob with tags. This example uses the `--tags` parameter flag with the following JSON-formatted tags: `'{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location", "Value": "Seattle"}'`. Alternatively, the `--tags` flag can be used with tags in the shorthand format: `'Key=Department,Value=Accounting Key=Location,Value=Seattle'`.

```
aws iam create-user \
    --user-name Bob \
```

```
    --tags '{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location", 
"Value": "Seattle"}'
```

Output:

```
{
    "User": {
        "Path": "/",
        "UserName": "Bob",
        "UserId": "AIDAIOSFODNN7EXAMPLE",
        "Arn": "arn:aws:iam::12345678012:user/Bob",
        "CreateDate": "2023-05-25T17:14:21+00:00",
        "Tags": [
            {
                "Key": "Department",
                "Value": "Accounting"
            },
            {
                "Key": "Location",
                "Value": "Seattle"
            }
        ]
    }
}
```

For more information, see Tagging IAM users in the *AWS IAM User Guide*.

Example 3: To create an IAM user with a set permissions boundary

The following `create-user` command creates an IAM user named Bob with the permissions boundary of AmazonS3FullAccess.

```
aws iam create-user \
    --user-name Bob \
    --permissions-boundary arn:aws:iam::aws:policy/AmazonS3FullAccess
```

Output:

```
{
    "User": {
        "Path": "/",
        "UserName": "Bob",
```

```
        "UserId": "AIDAIOSFODNN7EXAMPLE",
        "Arn": "arn:aws:iam::12345678012:user/Bob",
        "CreateDate": "2023-05-24T17:50:53+00:00",
        "PermissionsBoundary": {
        "PermissionsBoundaryType": "Policy",
        "PermissionsBoundaryArn": "arn:aws:iam::aws:policy/AmazonS3FullAccess"
        }
    }
}
```

For more information, see Permissions boundaries for IAM entities in the *AWS IAM User Guide*.

- For API details, see CreateUser in *AWS CLI Command Reference*.

`create-virtual-mfa-device`

The following code example shows how to use `create-virtual-mfa-device`.

AWS CLI

To create a virtual MFA device

This example creates a new virtual MFA device called `BobsMFADevice`. It creates a file that contains bootstrap information called `QRCode.png` and places it in the `C:/` directory. The bootstrap method used in this example is `QRCodePNG`.

```
aws iam create-virtual-mfa-device \
    --virtual-mfa-device-name BobsMFADevice \
    --outfile C:/QRCode.png \
    --bootstrap-method QRCodePNG
```

Output:

```
{
    "VirtualMFADevice": {
        "SerialNumber": "arn:aws:iam::210987654321:mfa/BobsMFADevice"
}
```

For more information, see Using multi-factor authentication (MFA) in AWS in the *AWS IAM User Guide*.

- For API details, see CreateVirtualMfaDevice in *AWS CLI Command Reference*.

`deactivate-mfa-device`

The following code example shows how to use `deactivate-mfa-device`.

AWS CLI

To deactivate an MFA device

This command deactivates the virtual MFA device with the ARN `arn:aws:iam::210987654321:mfa/BobsMFADevice` that is associated with the user Bob.

```
aws iam deactivate-mfa-device \
    --user-name Bob \
    --serial-number arn:aws:iam::210987654321:mfa/BobsMFADevice
```

This command produces no output.

For more information, see Using multi-factor authentication (MFA) in AWS in the *AWS IAM User Guide*.

- For API details, see DeactivateMfaDevice in *AWS CLI Command Reference*.

`decode-authorization-message`

The following code example shows how to use `decode-authorization-message`.

AWS CLI

To decode a authorization failure message

The following `decode-authorization-message` example decodes the message returned by the EC2 console when attempting to launch an instance without the required permissions.

```
aws sts decode-authorization-message \
    --encoded-message lxzA8VEjEvu-s0TTt3PgYCXik9YakOqsrFJGRZR98xNcyWAxwRq14xIvd-
npzbgTevuufCTbjeBAaDARg9cbTK1rJbg3awM33o-Vy3ebPErE2-
mWR9hVYdvX-0zKgVOWF9pWjZaJSMqxB-aLXo-I_8TTvBq88x8IFPbMArNdpu0IjxDjzf22PF3SOE3XvIQ-
_PEO0aUqHCCcsSrFtvxm6yQD1nbm6VTIVrfa0Bzy8lsoMo7SjIaJ2r5vph6SY5vCCwg6o2JKe3hIHTa8zRrDbZSFMkcX
Xx9AYAAIr6bhcis7C__bZh4dlAAWooHFGKgfoJcWGwgdzgbu9hWyVvKTpeot5hsb8qANYjJRCPXTKpi6PZfdijIkwb6g
```

The output is formatted as a single-line string of JSON text that you can parse with any JSON text processor.

```
{
    "DecodedMessage": "{\"allowed\":false,\"explicitDeny\":false,\"matchedStatements
\":{\"items\":[]},\"failures\":{\"items\":[]},\"context\":{\"principal
\":{\"id\":\"AIDAV3ZUEFP6J7GY7O6LO\",\"name\":\"chain-user\",\"arn\":
\"arn:aws:iam::403299380220:user/chain-user\"},\"action\":\"ec2:RunInstances\",
\"resource\":\"arn:aws:ec2:us-east-2:403299380220:instance/*\",\"conditions\":
{\"items\":[{\"key\":\"ec2:InstanceMarketType\",\"values\":{\"items\":[{\"value

\":\"us-east-2\"}]}},{\"key\":\"aws:ARN\",\"values\":{\"items\":[{\"value\":
\"arn:aws:ec2:us-east-2:403299380220:instance/*\"}]}}]}}}"
}
```

For more information, see How can I decode an authorization failure message after receiving an "UnauthorizedOperation" error during an EC2 instance launch? in *AWS re:Post*.

- For API details, see DecodeAuthorizationMessage in *AWS CLI Command Reference*.

`delete-access-key`

The following code example shows how to use `delete-access-key`.

AWS CLI

To delete an access key for an IAM user

The following `delete-access-key` command deletes the specified access key (access key ID and secret access key) for the IAM user named Bob.

```
aws iam delete-access-key \
    --access-key-id AKIDPMS9RO4H3FEXAMPLE \
```

```
    --user-name Bob
```

This command produces no output.

To list the access keys defined for an IAM user, use the `list-access-keys` command.

For more information, see Managing access keys for IAM users in the *AWS IAM User Guide*.

- For API details, see DeleteAccessKey in *AWS CLI Command Reference*.

`delete-account-alias`

The following code example shows how to use `delete-account-alias`.

AWS CLI

To delete an account alias

The following `delete-account-alias` command removes the alias `mycompany` for the current account.

```
aws iam delete-account-alias \
    --account-alias mycompany
```

This command produces no output.

For more information, see Your AWS account ID and its alias in the *AWS IAM User Guide*.

- For API details, see DeleteAccountAlias in *AWS CLI Command Reference*.

`delete-account-password-policy`

The following code example shows how to use `delete-account-password-policy`.

AWS CLI

To delete the current account password policy

The following `delete-account-password-policy` command removes the password policy for the current account.

```
aws iam delete-account-password-policy
```

This command produces no output.

For more information, see Setting an account password policy for IAM users in the *AWS IAM User Guide*.

- For API details, see DeleteAccountPasswordPolicy in *AWS CLI Command Reference*.

`delete-group-policy`

The following code example shows how to use `delete-group-policy`.

AWS CLI

To delete a policy from an IAM group

The following `delete-group-policy` command deletes the policy named `ExamplePolicy` from the group named `Admins`.

```
aws iam delete-group-policy \
    --group-name Admins \
    --policy-name ExamplePolicy
```

This command produces no output.

To see the policies attached to a group, use the `list-group-policies` command.

For more information, see Managing IAM policies in the *AWS IAM User Guide*.

- For API details, see DeleteGroupPolicy in *AWS CLI Command Reference*.

`delete-group`

The following code example shows how to use `delete-group`.

AWS CLI

To delete an IAM group

The following `delete-group` command deletes an IAM group named `MyTestGroup`.

```
aws iam delete-group \
    --group-name MyTestGroup
```

This command produces no output.

For more information, see Deleting an IAM user group in the *AWS IAM User Guide*.

- For API details, see DeleteGroup in *AWS CLI Command Reference*.

delete-instance-profile

The following code example shows how to use `delete-instance-profile`.

AWS CLI

To delete an instance profile

The following `delete-instance-profile` command deletes the instance profile named `ExampleInstanceProfile`.

```
aws iam delete-instance-profile \
    --instance-profile-name ExampleInstanceProfile
```

This command produces no output.

For more information, see Using instance profiles in the *AWS IAM User Guide*.

- For API details, see DeleteInstanceProfile in *AWS CLI Command Reference*.

delete-login-profile

The following code example shows how to use `delete-login-profile`.

AWS CLI

To delete a password for an IAM user

The following `delete-login-profile` command deletes the password for the IAM user named Bob.

```
aws iam delete-login-profile \
    --user-name Bob
```

This command produces no output.

For more information, see Managing passwords for IAM users in the *AWS IAM User Guide*.

- For API details, see DeleteLoginProfile in *AWS CLI Command Reference*.

`delete-open-id-connect-provider`

The following code example shows how to use `delete-open-id-connect-provider`.

AWS CLI

To delete an IAM OpenID Connect identity provider

This example deletes the IAM OIDC provider that connects to the provider `example.oidcprovider.com`.

```
aws iam delete-open-id-connect-provider \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
example.oidcprovider.com
```

This command produces no output.

For more information, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

- For API details, see DeleteOpenIdConnectProvider in *AWS CLI Command Reference*.

`delete-policy-version`

The following code example shows how to use `delete-policy-version`.

AWS CLI

To delete a version of a managed policy

This example deletes the version identified as `v2` from the policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`.

```
aws iam delete-policy-version \
    --policy-arn arn:aws:iam::123456789012:policy/MyPolicy \
    --version-id v2
```

This command produces no output.

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see DeletePolicyVersion in *AWS CLI Command Reference*.

`delete-policy`

The following code example shows how to use `delete-policy`.

AWS CLI

To delete an IAM policy

This example deletes the policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`.

```
aws iam delete-policy \
    --policy-arn arn:aws:iam::123456789012:policy/MySamplePolicy
```

This command produces no output.

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see DeletePolicy in *AWS CLI Command Reference*.

`delete-role-permissions-boundary`

The following code example shows how to use `delete-role-permissions-boundary`.

AWS CLI

To delete a permissions boundary from an IAM role

The following `delete-role-permissions-boundary` example deletes the permissions boundary for the specified IAM role. To apply a permissions boundary to a role, use the `put-role-permissions-boundary` command.

```
aws iam delete-role-permissions-boundary \
    --role-name lambda-application-role
```

This command produces no output.

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see DeleteRolePermissionsBoundary in *AWS CLI Command Reference*.

`delete-role-policy`

The following code example shows how to use `delete-role-policy`.

AWS CLI

To remove a policy from an IAM role

The following `delete-role-policy` command removes the policy named `ExamplePolicy` from the role named `Test-Role`.

```
aws iam delete-role-policy \
    --role-name Test-Role \
    --policy-name ExamplePolicy
```

This command produces no output.

For more information, see Modifying a role in the *AWS IAM User Guide*.

- For API details, see DeleteRolePolicy in *AWS CLI Command Reference*.

`delete-role`

The following code example shows how to use `delete-role`.

AWS CLI

To delete an IAM role

The following `delete-role` command removes the role named `Test-Role`.

```
aws iam delete-role \
    --role-name Test-Role
```

This command produces no output.

Before you can delete a role, you must remove the role from any instance profile (`remove-role-from-instance-profile`), detach any managed policies (`detach-role-policy`) and delete any inline policies that are attached to the role (`delete-role-policy`).

For more information, see Creating IAM roles and Using instance profiles in the *AWS IAM User Guide*.

- For API details, see DeleteRole in *AWS CLI Command Reference*.

`delete-saml-provider`

The following code example shows how to use `delete-saml-provider`.

AWS CLI

To delete a SAML provider

This example deletes the IAM SAML 2.0 provider whose ARN is `arn:aws:iam::123456789012:saml-provider/SAMLADFSProvider`.

```
aws iam delete-saml-provider \
--saml-provider-arn arn:aws:iam::123456789012:saml-provider/SAMLADFSProvider
```

This command produces no output.

For more information, see Creating IAM SAML identity providers in the *AWS IAM User Guide*.

- For API details, see DeleteSAMLProvider in *AWS CLI Command Reference*.

`delete-server-certificate`

The following code example shows how to use `delete-server-certificate`.

AWS CLI

To delete a server certificate from your AWS account

The following `delete-server-certificate` command removes the specified server certificate from your AWS account.

```
aws iam delete-server-certificate \
    --server-certificate-name myUpdatedServerCertificate
```

This command produces no output.

To list the server certificates available in your AWS account, use the `list-server-certificates` command.

For more information, see Managing server certificates in IAM in the *AWS IAM User Guide*.

- For API details, see DeleteServerCertificate in *AWS CLI Command Reference*.

`delete-service-linked-role`

The following code example shows how to use `delete-service-linked-role`.

AWS CLI

To delete a service-linked role

The following `delete-service-linked-role` example deletes the specified service-linked role that you no longer need. The deletion happens asynchronously. You can check the status of the deletion and confirm when it is done by using the `get-service-linked-role-deletion-status` command.

```
aws iam delete-service-linked-role \
    --role-name AWSServiceRoleForLexBots
```

Output:

```
{
    "DeletionTaskId": "task/aws-service-role/lex.amazonaws.com/
AWSServiceRoleForLexBots/1a2b3c4d-1234-abcd-7890-abcdeEXAMPLE"
}
```

For more information, see Using service-linked roles in the *AWS IAM User Guide*.

- For API details, see DeleteServiceLinkedRole in *AWS CLI Command Reference*.

`delete-service-specific-credential`

The following code example shows how to use `delete-service-specific-credential`.

AWS CLI

Example 1: Delete a service-specific credential for the requesting user

The following `delete-service-specific-credential` example deletes the specified service-specific credential for the user making the request. The `service-specific-credential-id` is provided when you create the credential and you can retrieve it by using the `list-service-specific-credentials` command.

```
aws iam delete-service-specific-credential \
    --service-specific-credential-id ACCAEXAMPLE123EXAMPLE
```

This command produces no output.

Example 2: Delete a service-specific credential for a specified user

The following `delete-service-specific-credential` example deletes the specified service-specific credential for the specified user. The `service-specific-credential-id` is provided when you create the credential and you can retrieve it by using the `list-service-specific-credentials` command.

```
aws iam delete-service-specific-credential \
    --user-name sofia \
    --service-specific-credential-id ACCAEXAMPLE123EXAMPLE
```

This command produces no output.

For more information, see Create Git credentials for HTTPS connections to CodeCommit in the *AWS CodeCommit User Guide*.

- For API details, see DeleteServiceSpecificCredential in *AWS CLI Command Reference*.

`delete-signing-certificate`

The following code example shows how to use `delete-signing-certificate`.

AWS CLI

To delete a signing certificate for an IAM user

The following `delete-signing-certificate` command deletes the specified signing certificate for the IAM user named Bob.

```
aws iam delete-signing-certificate \
    --user-name Bob \
    --certificate-id TA7SMP42TDN5Z26OBPJE7EXAMPLE
```

This command produces no output.

To get the ID for a signing certificate, use the `list-signing-certificates` command.

For more information, see Manage signing certificates in the *Amazon EC2 User Guide*.

- For API details, see DeleteSigningCertificate in *AWS CLI Command Reference*.

`delete-ssh-public-key`

The following code example shows how to use `delete-ssh-public-key`.

AWS CLI

To delete an SSH public keys attached to an IAM user

The following `delete-ssh-public-key` command deletes the specified SSH public key attached to the IAM user `sofia`.

```
aws iam delete-ssh-public-key \
    --user-name sofia \
    --ssh-public-key-id APKA123456789EXAMPLE
```

This command produces no output.

For more information, see Use SSH keys and SSH with CodeCommit in the *AWS IAM User Guide*.

- For API details, see DeleteSshPublicKey in *AWS CLI Command Reference*.

`delete-user-permissions-boundary`

The following code example shows how to use `delete-user-permissions-boundary`.

AWS CLI

To delete a permissions boundary from an IAM user

The following `delete-user-permissions-boundary` example deletes the permissions boundary attached to the IAM user named `intern`. To apply a permissions boundary to a user, use the `put-user-permissions-boundary` command.

```
aws iam delete-user-permissions-boundary \
    --user-name intern
```

This command produces no output.

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see DeleteUserPermissionsBoundary in *AWS CLI Command Reference*.

`delete-user-policy`

The following code example shows how to use `delete-user-policy`.

AWS CLI

To remove a policy from an IAM user

The following `delete-user-policy` command removes the specified policy from the IAM user named Bob.

```
aws iam delete-user-policy \
    --user-name Bob \
    --policy-name ExamplePolicy
```

This command produces no output.

To get a list of policies for an IAM user, use the `list-user-policies` command.

For more information, see Creating an IAM user in your AWS account in the *AWS IAM User Guide*.

- For API details, see DeleteUserPolicy in *AWS CLI Command Reference*.

`delete-user`

The following code example shows how to use `delete-user`.

AWS CLI

To delete an IAM user

The following `delete-user` command removes the IAM user named Bob from the current account.

```
aws iam delete-user \
    --user-name Bob
```

This command produces no output.

For more information, see Deleting an IAM user in the *AWS IAM User Guide*.

- For API details, see DeleteUser in *AWS CLI Command Reference*.

`delete-virtual-mfa-device`

The following code example shows how to use `delete-virtual-mfa-device`.

AWS CLI

To remove a virtual MFA device

The following `delete-virtual-mfa-device` command removes the specified MFA device from the current account.

```
aws iam delete-virtual-mfa-device \
    --serial-number arn:aws:iam::123456789012:mfa/MFATest
```

This command produces no output.

For more information, see Deactivating MFA devices in the *AWS IAM User Guide*.

- For API details, see DeleteVirtualMfaDevice in *AWS CLI Command Reference*.

`detach-group-policy`

The following code example shows how to use `detach-group-policy`.

AWS CLI

To detach a policy from a group

This example removes the managed policy with the ARN `arn:aws:iam::123456789012:policy/TesterAccessPolicy` from the group called `Testers`.

```
aws iam detach-group-policy \
    --group-name Testers \
    --policy-arn arn:aws:iam::123456789012:policy/TesterAccessPolicy
```

This command produces no output.

For more information, see Managing IAM user groups in the *AWS IAM User Guide*.

- For API details, see DetachGroupPolicy in *AWS CLI Command Reference*.

`detach-role-policy`

The following code example shows how to use `detach-role-policy`.

AWS CLI

To detach a policy from a role

This example removes the managed policy with the ARN `arn:aws:iam::123456789012:policy/FederatedTesterAccessPolicy` from the role called `FedTesterRole`.

```
aws iam detach-role-policy \
    --role-name FedTesterRole \
    --policy-arn arn:aws:iam::123456789012:policy/FederatedTesterAccessPolicy
```

This command produces no output.

For more information, see Modifying a role in the *AWS IAM User Guide*.

- For API details, see DetachRolePolicy in *AWS CLI Command Reference*.

`detach-user-policy`

The following code example shows how to use `detach-user-policy`.

AWS CLI

To detach a policy from a user

This example removes the managed policy with the ARN `arn:aws:iam::123456789012:policy/TesterPolicy` from the user Bob.

```
aws iam detach-user-policy \
    --user-name Bob \
    --policy-arn arn:aws:iam::123456789012:policy/TesterPolicy
```

This command produces no output.

For more information, see Changing permissions for an IAM user in the *AWS IAM User Guide*.

- For API details, see DetachUserPolicy in *AWS CLI Command Reference*.

`disable-organizations-root-credentials-management`

The following code example shows how to use `disable-organizations-root-credentials-management`.

AWS CLI

To disable the RootCredentialsManagement feature in your organization

The following `disable-organizations-root-credentials-management` command disables the management of privileged root user credentials across member accounts in your organization.

```
aws iam disable-organizations-root-credentials-management
```

Output:

```
{
    "EnabledFeatures": [
        "RootSessions"
    ]
    "OrganizationId": "o-aa111bb222"
}
```

For more information, see Centralize root access for member accounts in the *AWS IAM User Guide*.g

- For API details, see DisableOrganizationsRootCredentialsManagement in *AWS CLI Command Reference*.

`disable-organizations-root-sessions`

The following code example shows how to use `disable-organizations-root-sessions`.

AWS CLI

To disable the RootSessions feature in your organization

The following `disable-organizations-root-sessions` command disables root user sessions for privileged tasks across member accounts in your organization.

```
aws iam disable-organizations-root-sessions
```

Output:

```
{
    "EnabledFeatures": [
        "RootCredentialsManagement"
    ]
    "OrganizationId": "o-aa111bb222"
}
```

For more information, see Centralize root access for member accounts in the *AWS IAM User Guide*.

- For API details, see DisableOrganizationsRootSessions in *AWS CLI Command Reference*.

`enable-mfa-device`

The following code example shows how to use `enable-mfa-device`.

AWS CLI

To enable an MFA device

After you use the `create-virtual-mfa-device` command to create a new virtual MFA device, you can assign the MFA device to a user. The following `enable-mfa-device` example assigns the MFA device with the serial number `arn:aws:iam::210987654321:mfa/BobsMFADevice` to the user Bob. The command also synchronizes the device with AWS by including the first two codes in sequence from the virtual MFA device.

```
aws iam enable-mfa-device \
    --user-name Bob \
    --serial-number arn:aws:iam::210987654321:mfa/BobsMFADevice \
    --authentication-code1 123456 \
    --authentication-code2 789012
```

This command produces no output.

For more information, see Enabling a virtual multi-factor authentication (MFA) device in the *AWS IAM User Guide*.

- For API details, see EnableMfaDevice in *AWS CLI Command Reference*.

`enable-organizations-root-credentials-management`

The following code example shows how to use `enable-organizations-root-credentials-management`.

AWS CLI

To enable the RootCredentialsManagement feature in your organization

The following `enable-organizations-root-credentials-management` command enables the management of privileged root user credentials across member accounts in your organization.

```
aws iam enable-organizations-root-credentials-management
```

Output:

```
{
    "EnabledFeatures": [
        "RootCredentialsManagement"
    ]
    "OrganizationId": "o-aa111bb222"
}
```

For more information, see Centralize root access for member accounts in the *AWS IAM User Guide*.

- For API details, see EnableOrganizationsRootCredentialsManagement in *AWS CLI Command Reference*.

`enable-organizations-root-sessions`

The following code example shows how to use `enable-organizations-root-sessions`.

AWS CLI

To enable the RootSessions feature in your organization

The following `enable-organizations-root-sessions` command allows the management account or delegated administrator to perform privileged tasks on member accounts in your organization.

```
aws iam enable-organizations-root-sessions
```

Output:

```
{
    "EnabledFeatures": [
        "RootSessions"
    ]
    "OrganizationId": "o-aa111bb222"
}
```

For more information, see Centralize root access for member accounts in the *AWS IAM User Guide*.

- For API details, see EnableOrganizationsRootSessions in *AWS CLI Command Reference*.

`generate-credential-report`

The following code example shows how to use `generate-credential-report`.

AWS CLI

To generate a credential report

The following example attempts to generate a credential report for the AWS account.

```
aws iam generate-credential-report
```

Output:

```
{
    "State":  "STARTED",
    "Description": "No report exists. Starting a new report generation task"
}
```

For more information, see Getting credential reports for your AWS account in the *AWS IAM User Guide*.

- For API details, see GenerateCredentialReport in *AWS CLI Command Reference*.

`generate-organizations-access-report`

The following code example shows how to use `generate-organizations-access-report`.

AWS CLI

Example 1: To generate an access report for a root in an organization

The following `generate-organizations-access-report` example starts a background job to create an access report for the specified root in an organization. You can display the report after it's created by running the `get-organizations-access-report` command.

```
aws iam generate-organizations-access-report \
    --entity-path o-4fxmplt198/r-c3xb
```

Output:

```
{
    "JobId": "a8b6c06f-aaa4-8xmp-28bc-81da71836359"
}
```

Example 2: To generate an access report for an account in an organization

The following `generate-organizations-access-report` example starts a background job to create an access report for account ID 123456789012 in the organization `o-4fxmplt198`. You can display the report after it's created by running the `get-organizations-access-report` command.

```
aws iam generate-organizations-access-report \
    --entity-path o-4fxmplt198/r-c3xb/123456789012
```

Output:

```
{
    "JobId": "14b6c071-75f6-2xmp-fb77-faf6fb4201d2"
}
```

Example 3: To generate an access report for an account in an organizational unit in an organization

The following `generate-organizations-access-report` example starts a background job to create an access report for account ID `234567890123` in organizational unit `ou-c3xb-lmu7j2yg` in the organization `o-4fxmplt198`. You can display the report after it's created by running the `get-organizations-access-report` command.

```
aws iam generate-organizations-access-report \
    --entity-path o-4fxmplt198/r-c3xb/ou-c3xb-lmu7j2yg/234567890123
```

Output:

```
{
    "JobId": "2eb6c2e6-0xmp-ec04-1425-c937916a64af"
}
```

To get details about roots and organizational units in your organization, use the `organizations list-roots` and `organizations list-organizational-units-for-parent` commands.

For more information, see Refining permissions in AWS using last accessed information in the *AWS IAM User Guide*.

- For API details, see GenerateOrganizationsAccessReport in *AWS CLI Command Reference*.

`generate-service-last-accessed-details`

The following code example shows how to use `generate-service-last-accessed-details`.

AWS CLI

Example 1: To generate a service access report for a custom policy

The following `generate-service-last-accessed-details` example starts a background job to generate a report that lists the services accessed by IAM users and other entities with a custom policy named `intern-boundary`. You can display the report after it is created by running the `get-service-last-accessed-details` command.

```
aws iam generate-service-last-accessed-details \
```

```
    --arn arn:aws:iam::123456789012:policy/intern-boundary
```

Output:

```
{
    "JobId": "2eb6c2b8-7b4c-3xmp-3c13-03b72c8cdfdc"
}
```

Example 2: To generate a service access report for the AWS managed AdministratorAccess policy

The following `generate-service-last-accessed-details` example starts a background job to generate a report that lists the services accessed by IAM users and other entities with the AWS managed `AdministratorAccess` policy. You can display the report after it is created by running the `get-service-last-accessed-details` command.

```
aws iam generate-service-last-accessed-details \
    --arn arn:aws:iam::aws:policy/AdministratorAccess
```

Output:

```
{
    "JobId": "78b6c2ba-d09e-6xmp-7039-ecde30b26916"
}
```

For more information, see Refining permissions in AWS using last accessed information in the *AWS IAM User Guide*.

- For API details, see GenerateServiceLastAccessedDetails in *AWS CLI Command Reference*.

`get-access-key-last-used`

The following code example shows how to use `get-access-key-last-used`.

AWS CLI

To retrieve information about when the specified access key was last used

The following example retrieves information about when the access key `ABCDEXAMPLE` was last used.

```
aws iam get-access-key-last-used \
    --access-key-id ABCDEXAMPLE
```

Output:

```
{
    "UserName":  "Bob",
    "AccessKeyLastUsed": {
        "Region": "us-east-1",
        "ServiceName": "iam",
        "LastUsedDate": "2015-06-16T22:45:00Z"
    }
}
```

For more information, see Managing access keys for IAM users in the *AWS IAM User Guide*.

- For API details, see GetAccessKeyLastUsed in *AWS CLI Command Reference*.

`get-account-authorization-details`

The following code example shows how to use `get-account-authorization-details`.

AWS CLI

To list an AWS account's IAM users, groups, roles, and policies

The following `get-account-authorization-details` command returns information about all IAM users, groups, roles, and policies in the AWS account.

```
aws iam get-account-authorization-details
```

Output:

```
{
    "RoleDetailList": [
        {
            "AssumeRolePolicyDocument": {
                "Version":"2012-10-17",
                "Statement": [
                    {
                        "Sid": "",
                        "Effect": "Allow",
```

```
                        "Principal": {
                            "Service": "ec2.amazonaws.com"
                        },
                        "Action": "sts:AssumeRole"
                    }
                ]
            },
            "RoleId": "AROA1234567890EXAMPLE",
            "CreateDate": "2014-07-30T17:09:20Z",
            "InstanceProfileList": [
                {
                    "InstanceProfileId": "AIPA1234567890EXAMPLE",
                    "Roles": [
                        {
                            "AssumeRolePolicyDocument": {
                                "Version":"2012-10-17",
                                "Statement": [
                                    {
                                        "Sid": "",
                                        "Effect": "Allow",
                                        "Principal": {
                                            "Service": "ec2.amazonaws.com"
                                        },
                                        "Action": "sts:AssumeRole"
                                    }
                                ]
                            },
                            "RoleId": "AROA1234567890EXAMPLE",
                            "CreateDate": "2014-07-30T17:09:20Z",
                            "RoleName": "EC2role",
                            "Path": "/",
                            "Arn": "arn:aws:iam::123456789012:role/EC2role"
                        }
                    ],
                    "CreateDate": "2014-07-30T17:09:20Z",

    "IsTruncated": true
}
```

For more information, see AWS security audit guidelines in the *AWS IAM User Guide*.

- For API details, see GetAccountAuthorizationDetails in *AWS CLI Command Reference*.

`get-account-password-policy`

The following code example shows how to use `get-account-password-policy`.

AWS CLI

To see the current account password policy

The following `get-account-password-policy` command displays details about the password policy for the current account.

```
aws iam get-account-password-policy
```

Output:

```
{
    "PasswordPolicy": {
        "AllowUsersToChangePassword": false,
        "RequireLowercaseCharacters": false,
```

```
            "RequireUppercaseCharacters": false,
            "MinimumPasswordLength": 8,
            "RequireNumbers": true,
            "RequireSymbols": true
        }
}
```

If no password policy is defined for the account, the command returns a `NoSuchEntity` error.

For more information, see Setting an account password policy for IAM users in the *AWS IAM User Guide*.

- For API details, see GetAccountPasswordPolicy in *AWS CLI Command Reference*.

`get-account-summary`

The following code example shows how to use `get-account-summary`.

AWS CLI

To get information about IAM entity usage and IAM quotas in the current account

The following `get-account-summary` command returns information about the current IAM entity usage and current IAM entity quotas in the account.

```
aws iam get-account-summary
```

Output:

```
{
    "SummaryMap": {
        "UsersQuota": 5000,
        "GroupsQuota": 100,
        "InstanceProfiles": 6,
        "SigningCertificatesPerUserQuota": 2,
        "AccountAccessKeysPresent": 0,
        "RolesQuota": 250,
        "RolePolicySizeQuota": 10240,
        "AccountSigningCertificatesPresent": 0,
        "Users": 27,
        "ServerCertificatesQuota": 20,
        "ServerCertificates": 0,
```

```
        "AssumeRolePolicySizeQuota": 2048,
        "Groups": 7,
        "MFADevicesInUse": 1,
        "Roles": 3,
        "AccountMFAEnabled": 1,
        "MFADevices": 3,
        "GroupsPerUserQuota": 10,
        "GroupPolicySizeQuota": 5120,
        "InstanceProfilesQuota": 100,
        "AccessKeysPerUserQuota": 2,
        "Providers": 0,
        "UserPolicySizeQuota": 2048
    }
}
```

For more information about entity limitations, see IAM and AWS STS quotas in the *AWS IAM User Guide*.

- For API details, see GetAccountSummary in *AWS CLI Command Reference*.

`get-context-keys-for-custom-policy`

The following code example shows how to use `get-context-keys-for-custom-policy`.

AWS CLI

Example 1: To list the context keys referenced by one or more custom JSON policies provided as a parameter on the command line

The following `get-context-keys-for-custom-policy` command parses each supplied policy and lists the context keys used by those policies. Use this command to identify which context key values you must supply to successfully use the policy simulator commands `simulate-custom-policy` and `simulate-custom-policy`. You can also retrieve the list of context keys used by all policies associated by an IAM user or role by using the `get-context-keys-for-custom-policy` command. Parameter values that begin with `file://` instruct the command to read the file and use the contents as the value for the parameter instead of the file name itself.

```
aws iam get-context-keys-for-custom-policy \
    --policy-input-list '{"Version":"2012-10-17",       "Statement":
{"Effect":"Allow","Action":"dynamodb:*","Resource":"arn:aws:dynamodb:us-
```

```
west-2:123456789012:table/${aws:username}","Condition":{"DateGreaterThan":
{"aws:CurrentTime":"2015-08-16T12:00:00Z"}}}}'
```

Output:

```
{
    "ContextKeyNames": [
        "aws:username",
        "aws:CurrentTime"
    ]
}
```

Example 2: To list the context keys referenced by one or more custom JSON policies provided as a file input

The following `get-context-keys-for-custom-policy` command is the same as the previous example, except that the policies are provided in a file instead of as a parameter. Because the command expects a JSON list of strings, and not a list of JSON structures, the file must be structured as follows, although you can collapse it into one one.

```
[
    "Policy1",
    "Policy2"
]
```

So for example, a file that contains the policy from the previous example must look like the following. You must escape each embedded double-quote inside the policy string by preceding it with a backslash ''.

```
[ "{\"Version\": \"2012-10-17\", \"Statement\": {\"Effect\": \"Allow\", \"Action
\": \"dynamodb:*\", \"Resource\": \"arn:aws:dynamodb:us-west-2:128716708097:table/
${aws:username}\", \"Condition\": {\"DateGreaterThan\": {\"aws:CurrentTime\":
 \"2015-08-16T12:00:00Z\"}}}}" ]
```

This file can then be submitted to the following command.

```
aws iam get-context-keys-for-custom-policy \
    --policy-input-list file://policyfile.json
```

Output:

```
{
    "ContextKeyNames": [
        "aws:username",
        "aws:CurrentTime"
    ]
}
```

For more information, see Using the IAM Policy Simulator (AWS CLI and AWS API) in the *AWS IAM User Guide*.

- For API details, see GetContextKeysForCustomPolicy in *AWS CLI Command Reference*.

`get-context-keys-for-principal-policy`

The following code example shows how to use `get-context-keys-for-principal-policy`.

AWS CLI

To list the context keys referenced by all policies associated with an IAM principal

The following `get-context-keys-for-principal-policy` command retrieves all policies that are attached to the user `saanvi` and any groups she is a member of. It then parses each and lists the context keys used by those policies. Use this command to identify which context key values you must supply to successfully use the `simulate-custom-policy` and `simulate-principal-policy` commands. You can also retrieve the list of context keys used by an arbitrary JSON policy by using the `get-context-keys-for-custom-policy` command.

```
aws iam get-context-keys-for-principal-policy \
   --policy-source-arn arn:aws:iam::123456789012:user/saanvi
```

Output:

```
{
    "ContextKeyNames": [
        "aws:username",
        "aws:CurrentTime"
    ]
}
```

For more information, see Using the IAM Policy Simulator (AWS CLI and AWS API) in the *AWS IAM User Guide*.

- For API details, see GetContextKeysForPrincipalPolicy in *AWS CLI Command Reference*.

`get-credential-report`

The following code example shows how to use `get-credential-report`.

AWS CLI

To get a credential report

This example opens the returned report and outputs it to the pipeline as an array of text lines.

```
aws iam get-credential-report
```

Output:

```
{
    "GeneratedTime":  "2015-06-17T19:11:50Z",
    "ReportFormat": "text/csv"
}
```

For more information, see Getting credential reports for your AWS account in the *AWS IAM User Guide*.

- For API details, see GetCredentialReport in *AWS CLI Command Reference*.

`get-group-policy`

The following code example shows how to use `get-group-policy`.

AWS CLI

To get information about a policy attached to an IAM group

The following `get-group-policy` command gets information about the specified policy attached to the group named `Test-Group`.

```
aws iam get-group-policy \
    --group-name Test-Group \
```

```
    --policy-name S3-ReadOnly-Policy
```

Output:

```
{
    "GroupName": "Test-Group",
    "PolicyDocument": {
        "Statement": [
            {
                "Action": [
                    "s3:Get*",
                    "s3:List*"
                ],
                "Resource": "*",
                "Effect": "Allow"
            }
        ]
    },
    "PolicyName": "S3-ReadOnly-Policy"
}
```

For more information, see Managing IAM policies in the *AWS IAM User Guide*.

- For API details, see GetGroupPolicy in *AWS CLI Command Reference*.

`get-group`

The following code example shows how to use `get-group`.

AWS CLI

To get an IAM group

This example returns details about the IAM group `Admins`.

```
aws iam get-group \
    --group-name Admins
```

Output:

```
{
    "Group": {
        "Path": "/",
```

```
            "CreateDate": "2015-06-16T19:41:48Z",
            "GroupId": "AIDGPMS9RO4H3FEXAMPLE",
            "Arn": "arn:aws:iam::123456789012:group/Admins",
            "GroupName": "Admins"
        },
        "Users": []
    }
```

For more information, see IAM Identities (users, user groups, and roles) in the *AWS IAM User Guide*.

- For API details, see GetGroup in *AWS CLI Command Reference*.

`get-instance-profile`

The following code example shows how to use `get-instance-profile`.

AWS CLI

To get information about an instance profile

The following `get-instance-profile` command gets information about the instance profile named `ExampleInstanceProfile`.

```
aws iam get-instance-profile \
    --instance-profile-name ExampleInstanceProfile
```

Output:

```
{
    "InstanceProfile": {
        "InstanceProfileId": "AID2MAB8DPLSRHEXAMPLE",
        "Roles": [
            {
                "AssumeRolePolicyDocument": "<URL-encoded-JSON>",
                "RoleId": "AIDGPMS9RO4H3FEXAMPLE",
                "CreateDate": "2013-01-09T06:33:26Z",
                "RoleName": "Test-Role",
                "Path": "/",
                "Arn": "arn:aws:iam::336924118301:role/Test-Role"
            }
        ],
        "CreateDate": "2013-06-12T23:52:02Z",
```

```
        "InstanceProfileName": "ExampleInstanceProfile",
        "Path": "/",
        "Arn": "arn:aws:iam::336924118301:instance-profile/ExampleInstanceProfile"
    }
}
```

For more information, see Using instance profiles in the *AWS IAM User Guide*.

- For API details, see GetInstanceProfile in *AWS CLI Command Reference*.

`get-login-profile`

The following code example shows how to use `get-login-profile`.

AWS CLI

To get password information for an IAM user

The following `get-login-profile` command gets information about the password for the IAM user named Bob.

```
aws iam get-login-profile \
    --user-name Bob
```

Output:

```
{
    "LoginProfile": {
        "UserName": "Bob",
        "CreateDate": "2012-09-21T23:03:39Z"
    }
}
```

The `get-login-profile` command can be used to verify that an IAM user has a password. The command returns a `NoSuchEntity` error if no password is defined for the user.

You cannot view a password using this command. If the password is lost, you can reset the password (`update-login-profile`) for the user. Alternatively, you can delete the login profile (`delete-login-profile`) for the user and then create a new one (`create-login-profile`).

For more information, see Managing passwords for IAM users in the *AWS IAM User Guide*.

- For API details, see GetLoginProfile in *AWS CLI Command Reference*.

`get-mfa-device`

The following code example shows how to use `get-mfa-device`.

AWS CLI

To retrieve information about a FIDO security key

The following `get-mfa-device` command example retrieves information about the specified FIDO security key.

```
aws iam get-mfa-device \
    --serial-number arn:aws:iam::123456789012:u2f/user/alice/fidokeyname-EXAMPLEBN5FHTECLFG7EXAMPLE
```

Output:

```
{
    "UserName": "alice",
    "SerialNumber": "arn:aws:iam::123456789012:u2f/user/alice/fidokeyname-EXAMPLEBN5FHTECLFG7EXAMPLE",
    "EnableDate": "2023-09-19T01:49:18+00:00",
    "Certifications": {
        "FIDO": "L1"
    }
}
```

For more information, see Using multi-factor authentication (MFA) in AWS in the *AWS IAM User Guide*.

- For API details, see GetMfaDevice in *AWS CLI Command Reference*.

`get-open-id-connect-provider`

The following code example shows how to use `get-open-id-connect-provider`.

AWS CLI

To return information about the specified OpenID Connect provider

This example returns details about the OpenID Connect provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/server.example.com`.

```
aws iam get-open-id-connect-provider \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
server.example.com
```

Output:

```
{
    "Url": "server.example.com"
        "CreateDate": "2015-06-16T19:41:48Z",
        "ThumbprintList": [
        "12345abcdefghijk67890lmnopqrst987example"
        ],
        "ClientIDList": [
        "example-application-ID"
        ]
}
```

For more information, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

- For API details, see GetOpenIdConnectProvider in *AWS CLI Command Reference*.

`get-organizations-access-report`

The following code example shows how to use `get-organizations-access-report`.

AWS CLI

To retrieve an access report

The following `get-organizations-access-report` example displays a previously generated access report for an AWS Organizations entity. To generate a report, use the `generate-organizations-access-report` command.

```
aws iam get-organizations-access-report \
    --job-id a8b6c06f-aaa4-8xmp-28bc-81da71836359
```

Output:

```
{
    "JobStatus": "COMPLETED",
    "JobCreationDate": "2019-09-30T06:53:36.187Z",
    "JobCompletionDate": "2019-09-30T06:53:37.547Z",
    "NumberOfServicesAccessible": 188,
    "NumberOfServicesNotAccessed": 171,
    "AccessDetails": [
        {
            "ServiceName": "Alexa for Business",
            "ServiceNamespace": "a4b",
            "TotalAuthenticatedEntities": 0
        },
        ...
}
```

For more information, see Refining permissions in AWS using last accessed information in the *AWS IAM User Guide*.

- For API details, see GetOrganizationsAccessReport in *AWS CLI Command Reference*.

`get-policy-version`

The following code example shows how to use `get-policy-version`.

AWS CLI

To retrieve information about the specified version of the specified managed policy

This example returns the policy document for the v2 version of the policy whose ARN is `arn:aws:iam::123456789012:policy/MyManagedPolicy`.

```
aws iam get-policy-version \
    --policy-arn arn:aws:iam::123456789012:policy/MyPolicy \
    --version-id v2
```

Output:

```
{
    "PolicyVersion": {
        "Document": {
            "Version":"2012-10-17",
            "Statement": [
```

```
                {
                    "Effect": "Allow",
                    "Action": "iam:*",
                    "Resource": "*"
                }
            ]
        },
        "VersionId": "v2",
        "IsDefaultVersion": true,
        "CreateDate": "2023-04-11T00:22:54+00:00"
    }
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see GetPolicyVersion in *AWS CLI Command Reference*.

`get-policy`

The following code example shows how to use `get-policy`.

AWS CLI

To retrieve information about the specified managed policy

This example returns details about the managed policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`.

```
aws iam get-policy \
    --policy-arn arn:aws:iam::123456789012:policy/MySamplePolicy
```

Output:

```
{
    "Policy": {
        "PolicyName": "MySamplePolicy",
        "CreateDate": "2015-06-17T19:23;32Z",
        "AttachmentCount": 0,
        "IsAttachable": true,
        "PolicyId": "Z27SI6FQMGNQ2EXAMPLE1",
        "DefaultVersionId": "v1",
        "Path": "/",
```

```
        "Arn": "arn:aws:iam::123456789012:policy/MySamplePolicy",
        "UpdateDate": "2015-06-17T19:23:32Z"
    }
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see GetPolicy in *AWS CLI Command Reference*.

`get-role-policy`

The following code example shows how to use `get-role-policy`.

AWS CLI

To get information about a policy attached to an IAM role

The following `get-role-policy` command gets information about the specified policy attached to the role named `Test-Role`.

```
aws iam get-role-policy \
    --role-name Test-Role \
    --policy-name ExamplePolicy
```

Output:

```
{
  "RoleName": "Test-Role",
  "PolicyDocument": {
      "Statement": [
          {
              "Action": [
                  "s3:ListBucket",
                  "s3:Put*",
                  "s3:Get*",
                  "s3:*MultipartUpload*"
              ],
              "Resource": "*",
              "Effect": "Allow",
              "Sid": "1"
          }
      ]
```

```
    }
    "PolicyName": "ExamplePolicy"
}
```

For more information, see Creating IAM roles in the *AWS IAM User Guide*.

- For API details, see GetRolePolicy in *AWS CLI Command Reference*.

get-role

The following code example shows how to use `get-role`.

AWS CLI

To get information about an IAM role

The following `get-role` command gets information about the role named `Test-Role`.

```
aws iam get-role \
    --role-name Test-Role
```

Output:

```
{
    "Role": {
        "Description": "Test Role",
        "AssumeRolePolicyDocument":"<URL-encoded-JSON>",
        "MaxSessionDuration": 3600,
        "RoleId": "AROA1234567890EXAMPLE",
        "CreateDate": "2019-11-13T16:45:56Z",
        "RoleName": "Test-Role",
        "Path": "/",
        "RoleLastUsed": {
            "Region": "us-east-1",
            "LastUsedDate": "2019-11-13T17:14:00Z"
        },
        "Arn": "arn:aws:iam::123456789012:role/Test-Role"
    }
}
```

The command displays the trust policy attached to the role. To list the permissions policies attached to a role, use the `list-role-policies` command.

For more information, see Creating IAM roles in the *AWS IAM User Guide*.

- For API details, see GetRole in *AWS CLI Command Reference*.

`get-saml-provider`

The following code example shows how to use `get-saml-provider`.

AWS CLI

To retrieve the SAML provider metadocument

This example retrieves the details about the SAML 2.0 provider whose ARM is `arn:aws:iam::123456789012:saml-provider/SAMLADFS`. The response includes the metadata document that you got from the identity provider to create the AWS SAML provider entity as well as the creation and expiration dates.

```
aws iam get-saml-provider \
    --saml-provider-arn arn:aws:iam::123456789012:saml-provider/SAMLADFS
```

Output:

```
{
    "SAMLMetadataDocument": "...SAMLMetadataDocument-XML...",
    "CreateDate": "2017-03-06T22:29:46+00:00",
    "ValidUntil": "2117-03-06T22:29:46.433000+00:00",
    "Tags": [
        {
            "Key": "DeptID",
            "Value": "123456"
        },
        {
            "Key": "Department",
            "Value": "Accounting"
        }
    ]
}
```

For more information, see Creating IAM SAML identity providers in the *AWS IAM User Guide*.

- For API details, see GetSamlProvider in *AWS CLI Command Reference*.

`get-server-certificate`

The following code example shows how to use `get-server-certificate`.

AWS CLI

To get details about a server certificate in your AWS account

The following `get-server-certificate` command retrieves all of the details about the specified server certificate in your AWS account.

```
aws iam get-server-certificate \
    --server-certificate-name myUpdatedServerCertificate
```

Output:

```
{
    "ServerCertificate": {
        "ServerCertificateMetadata": {
            "Path": "/",
            "ServerCertificateName": "myUpdatedServerCertificate",
            "ServerCertificateId": "ASCAEXAMPLE123EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:server-certificate/
myUpdatedServerCertificate",
            "UploadDate": "2019-04-22T21:13:44+00:00",
            "Expiration": "2019-10-15T22:23:16+00:00"
        },
        "CertificateBody": "-----BEGIN CERTIFICATE-----

    }
}
```

To list the server certificates available in your AWS account, use the `list-server-certificates` command.

For more information, see Managing server certificates in IAM in the *AWS IAM User Guide*.

- For API details, see GetServerCertificate in *AWS CLI Command Reference*.

`get-service-last-accessed-details-with-entities`

The following code example shows how to use `get-service-last-accessed-details-with-entities`.

AWS CLI

To retrieve a service access report with details for a service

The following `get-service-last-accessed-details-with-entities` example retrieves a report that contains details about IAM users and other entities that accessed the specified service. To generate a report, use the `generate-service-last-accessed-details` command. To get a list of services accessed with namespaces, use `get-service-last-accessed-details`.

```
aws iam get-service-last-accessed-details-with-entities \
    --job-id 78b6c2ba-d09e-6xmp-7039-ecde30b26916 \
    --service-namespace lambda
```

Output:

```
{
    "JobStatus": "COMPLETED",
    "JobCreationDate": "2019-10-01T03:55:41.756Z",
    "JobCompletionDate": "2019-10-01T03:55:42.533Z",
    "EntityDetailsList": [
        {
            "EntityInfo": {
                "Arn": "arn:aws:iam::123456789012:user/admin",
                "Name": "admin",
                "Type": "USER",
                "Id": "AIDAIO2XMPLENQEXAMPLE",
                "Path": "/"
            },
            "LastAuthenticated": "2019-09-30T23:02:00Z"
        },
        {
            "EntityInfo": {
                "Arn": "arn:aws:iam::123456789012:user/developer",
                "Name": "developer",
                "Type": "USER",
                "Id": "AIDAIBEYXMPL2YEXAMPLE",
                "Path": "/"
            },
            "LastAuthenticated": "2019-09-16T19:34:00Z"
        }
    ]
}
```

For more information, see Refining permissions in AWS using last accessed information in the *AWS IAM User Guide*.

- For API details, see GetServiceLastAccessedDetailsWithEntities in *AWS CLI Command Reference*.

`get-service-last-accessed-details`

The following code example shows how to use `get-service-last-accessed-details`.

AWS CLI

To retrieve a service access report

The following `get-service-last-accessed-details` example retrieves a previously generated report that lists the services accessed by IAM entities. To generate a report, use the `generate-service-last-accessed-details` command.

```
aws iam get-service-last-accessed-details \
    --job-id 2eb6c2b8-7b4c-3xmp-3c13-03b72c8cdfdc
```

Output:

```
{
    "JobStatus": "COMPLETED",
    "JobCreationDate": "2019-10-01T03:50:35.929Z",
    "ServicesLastAccessed": [
        ...
        {
            "ServiceName": "AWS Lambda",
            "LastAuthenticated": "2019-09-30T23:02:00Z",
            "ServiceNamespace": "lambda",
            "LastAuthenticatedEntity": "arn:aws:iam::123456789012:user/admin",
            "TotalAuthenticatedEntities": 6
        },
    ]
}
```

For more information, see Refining permissions in AWS using last accessed information in the *AWS IAM User Guide*.

- For API details, see GetServiceLastAccessedDetails in *AWS CLI Command Reference*.

`get-service-linked-role-deletion-status`

The following code example shows how to use `get-service-linked-role-deletion-status`.

AWS CLI

To check the status of a request to delete a service-linked role

The following `get-service-linked-role-deletion-status` example displays the status of a previously request to delete a service-linked role. The delete operation occurs asynchronously. When you make the request, you get a `DeletionTaskId` value that you provide as a parameter for this command.

```
aws iam get-service-linked-role-deletion-status \
    --deletion-task-id task/aws-service-role/lex.amazonaws.com/
AWSServiceRoleForLexBots/1a2b3c4d-1234-abcd-7890-abcdeEXAMPLE
```

Output:

```
{
"Status": "SUCCEEDED"
}
```

For more information, see [Using service-linked roles](#) in the *AWS IAM User Guide*.

- For API details, see [GetServiceLinkedRoleDeletionStatus](#) in *AWS CLI Command Reference*.

`get-ssh-public-key`

The following code example shows how to use `get-ssh-public-key`.

AWS CLI

Example 1: To retrieve an SSH public key attached to an IAM user in SSH encoded form

The following `get-ssh-public-key` command retrieves the specified SSH public key from the IAM user `sofia`. The output is in SSH encoding.

```
aws iam get-ssh-public-key \
    --user-name sofia \
    --ssh-public-key-id APKA123456789EXAMPLE \
    --encoding SSH
```

Output:

```
{
    "SSHPublicKey": {
        "UserName": "sofia",
        "SSHPublicKeyId": "APKA123456789EXAMPLE",
        "Fingerprint": "12:34:56:78:90:ab:cd:ef:12:34:56:78:90:ab:cd:ef",
        "SSHPublicKeyBody": "ssh-rsa <<long encoded SSH string>>",
        "Status": "Inactive",
        "UploadDate": "2019-04-18T17:04:49+00:00"
    }
```

```
}
```

Example 2: To retrieve an SSH public key attached to an IAM user in PEM encoded form

The following `get-ssh-public-key` command retrieves the specified SSH public key from the IAM user `sofia`. The output is in PEM encoding.

```
aws iam get-ssh-public-key \
    --user-name sofia \
    --ssh-public-key-id APKA123456789EXAMPLE \
    --encoding PEM
```

Output:

```
{
    "SSHPublicKey": {
        "UserName": "sofia",
        "SSHPublicKeyId": "APKA123456789EXAMPLE",
        "Fingerprint": "12:34:56:78:90:ab:cd:ef:12:34:56:78:90:ab:cd:ef",
        "SSHPublicKeyBody": ""-----BEGIN PUBLIC KEY-----\n<<long encoded PEM
 string>>\n-----END PUBLIC KEY-----\n"",
        "Status": "Inactive",
        "UploadDate": "2019-04-18T17:04:49+00:00"
    }
}
```

For more information, see Use SSH keys and SSH with CodeCommit in the *AWS IAM User Guide*.

- For API details, see GetSshPublicKey in *AWS CLI Command Reference*.

`get-user-policy`

The following code example shows how to use `get-user-policy`.

AWS CLI

To list policy details for an IAM user

The following `get-user-policy` command lists the details of the specified policy that is attached to the IAM user named Bob.

```
aws iam get-user-policy \
```

```
    --user-name Bob \
    --policy-name ExamplePolicy
```

Output:

```
{
    "UserName": "Bob",
    "PolicyName": "ExamplePolicy",
    "PolicyDocument": {
        "Version":"2012-10-17",
        "Statement": [
            {
                "Action": "*",
                "Resource": "*",
                "Effect": "Allow"
            }
        ]
    }
}
```

To get a list of policies for an IAM user, use the `list-user-policies` command.

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see GetUserPolicy in *AWS CLI Command Reference*.

`get-user`

The following code example shows how to use `get-user`.

AWS CLI

To get information about an IAM user

The following `get-user` command gets information about the IAM user named `Paulo`.

```
aws iam get-user \
    --user-name Paulo
```

Output:

```
{
    "User": {
```

```
        "UserName": "Paulo",
        "Path": "/",
        "CreateDate": "2019-09-21T23:03:13Z",
        "UserId": "AIDA123456789EXAMPLE",
        "Arn": "arn:aws:iam::123456789012:user/Paulo"
    }
}
```

For more information, see Managing IAM users in the *AWS IAM User Guide*.

- For API details, see GetUser in *AWS CLI Command Reference*.

`list-access-keys`

The following code example shows how to use `list-access-keys`.

AWS CLI

To list the access key IDs for an IAM user

The following `list-access-keys` command lists the access keys IDs for the IAM user named Bob.

```
aws iam list-access-keys \
    --user-name Bob
```

Output:

```
{
    "AccessKeyMetadata": [
        {
            "UserName": "Bob",
            "Status": "Active",
            "CreateDate": "2013-06-04T18:17:34Z",
            "AccessKeyId": "AKIAIOSFODNN7EXAMPLE"
        },
        {
            "UserName": "Bob",
            "Status": "Inactive",
            "CreateDate": "2013-06-06T20:42:26Z",
            "AccessKeyId": "AKIAI44QH8DHBEXAMPLE"
        }
    ]
```

```
}
```

You cannot list the secret access keys for IAM users. If the secret access keys are lost, you must create new access keys using the `create-access-keys` command.

For more information, see Managing access keys for IAM users in the *AWS IAM User Guide*.

- For API details, see ListAccessKeys in *AWS CLI Command Reference*.

list-account-aliases

The following code example shows how to use `list-account-aliases`.

AWS CLI

To list account aliases

The following `list-account-aliases` command lists the aliases for the current account.

```
aws iam list-account-aliases
```

Output:

```
{
    "AccountAliases": [
    "mycompany"
    ]
}
```

For more information, see Your AWS account ID and its alias in the *AWS IAM User Guide*.

- For API details, see ListAccountAliases in *AWS CLI Command Reference*.

list-attached-group-policies

The following code example shows how to use `list-attached-group-policies`.

AWS CLI

To list all managed policies that are attached to the specified group

This example returns the names and ARNs of the managed policies that are attached to the IAM group named `Admins` in the AWS account.

```
aws iam list-attached-group-policies \
    --group-name Admins
```

Output:

```
{
    "AttachedPolicies": [
        {
            "PolicyName": "AdministratorAccess",
            "PolicyArn": "arn:aws:iam::aws:policy/AdministratorAccess"
        },
        {
            "PolicyName": "SecurityAudit",
            "PolicyArn": "arn:aws:iam::aws:policy/SecurityAudit"
        }
    ],
    "IsTruncated": false
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see ListAttachedGroupPolicies in *AWS CLI Command Reference*.

`list-attached-role-policies`

The following code example shows how to use `list-attached-role-policies`.

AWS CLI

To list all managed policies that are attached to the specified role

This command returns the names and ARNs of the managed policies attached to the IAM role named `SecurityAuditRole` in the AWS account.

```
aws iam list-attached-role-policies \
    --role-name SecurityAuditRole
```

Output:

```
{
    "AttachedPolicies": [
        {
```

```
                "PolicyName": "SecurityAudit",
                "PolicyArn": "arn:aws:iam::aws:policy/SecurityAudit"
            }
        ],
        "IsTruncated": false
    }
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see ListAttachedRolePolicies in *AWS CLI Command Reference*.

list-attached-user-policies

The following code example shows how to use `list-attached-user-policies`.

AWS CLI

To list all managed policies that are attached to the specified user

This command returns the names and ARNs of the managed policies for the IAM user named Bob in the AWS account.

```
aws iam list-attached-user-policies \
    --user-name Bob
```

Output:

```
{
    "AttachedPolicies": [
        {
            "PolicyName": "AdministratorAccess",
            "PolicyArn": "arn:aws:iam::aws:policy/AdministratorAccess"
        },
        {
            "PolicyName": "SecurityAudit",
            "PolicyArn": "arn:aws:iam::aws:policy/SecurityAudit"
        }
    ],
    "IsTruncated": false
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see ListAttachedUserPolicies in *AWS CLI Command Reference*.

`list-entities-for-policy`

The following code example shows how to use `list-entities-for-policy`.

AWS CLI

To list all users, groups, and roles that the specified managed policy is attached to

This example returns a list of IAM groups, roles, and users who have the policy `arn:aws:iam::123456789012:policy/TestPolicy` attached.

```
aws iam list-entities-for-policy \
    --policy-arn arn:aws:iam::123456789012:policy/TestPolicy
```

Output:

```
{
    "PolicyGroups": [
        {
            "GroupName": "Admins",
            "GroupId": "AGPACKCEVSQ6C2EXAMPLE"
        }
    ],
    "PolicyUsers": [
        {
            "UserName": "Alice",
            "UserId": "AIDACKCEVSQ6C2EXAMPLE"
        }
    ],
    "PolicyRoles": [
        {
            "RoleName": "DevRole",
            "RoleId": "AROADBQP57FF2AEXAMPLE"
        }
    ],
    "IsTruncated": false
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see ListEntitiesForPolicy in *AWS CLI Command Reference*.

`list-group-policies`

The following code example shows how to use `list-group-policies`.

AWS CLI

To list all inline policies that are attached to the specified group

The following `list-group-policies` command lists the names of inline policies that are attached to the IAM group named `Admins` in the current account.

```
aws iam list-group-policies \
    --group-name Admins
```

Output:

```
{
    "PolicyNames": [
        "AdminRoot",
        "ExamplePolicy"
    ]
}
```

For more information, see Managing IAM policies in the *AWS IAM User Guide*.

- For API details, see ListGroupPolicies in *AWS CLI Command Reference*.

`list-groups-for-user`

The following code example shows how to use `list-groups-for-user`.

AWS CLI

To list the groups that an IAM user belongs to

The following `list-groups-for-user` command displays the groups that the IAM user named Bob belongs to.

```
aws iam list-groups-for-user \
    --user-name Bob
```

Output:

```
{
    "Groups": [
        {
            "Path": "/",
            "CreateDate": "2013-05-06T01:18:08Z",
            "GroupId": "AKIAIOSFODNN7EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:group/Admin",
            "GroupName": "Admin"
        },
        {
            "Path": "/",
            "CreateDate": "2013-05-06T01:37:28Z",
            "GroupId": "AKIAI44QH8DHBEXAMPLE",
            "Arn": "arn:aws:iam::123456789012:group/s3-Users",
            "GroupName": "s3-Users"
        }
    ]
}
```

For more information, see Managing IAM user groups in the *AWS IAM User Guide*.

- For API details, see ListGroupsForUser in *AWS CLI Command Reference*.

`list-groups`

The following code example shows how to use `list-groups`.

AWS CLI

To list the IAM groups for the current account

The following `list-groups` command lists the IAM groups in the current account.

```
aws iam list-groups
```

Output:

```
{
    "Groups": [
        {
            "Path": "/",
            "CreateDate": "2013-06-04T20:27:27.972Z",
```

```
            "GroupId": "AIDACKCEVSQ6C2EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:group/Admins",
            "GroupName": "Admins"
        },
        {
            "Path": "/",
            "CreateDate": "2013-04-16T20:30:42Z",
            "GroupId": "AIDGPMS9RO4H3FEXAMPLE",
            "Arn": "arn:aws:iam::123456789012:group/S3-Admins",
            "GroupName": "S3-Admins"
        }
    ]
}
```

For more information, see Managing IAM user groups in the *AWS IAM User Guide*.

- For API details, see ListGroups in *AWS CLI Command Reference*.

`list-instance-profile-tags`

The following code example shows how to use `list-instance-profile-tags`.

AWS CLI

To list the tags attached to an instance profile

The following `list-instance-profile-tags` command retrieves the list of tags associated with the specified instance profile.

```
aws iam list-instance-profile-tags \
    --instance-profile-name deployment-role
```

Output:

```
{
    "Tags": [
        {
            "Key": "DeptID",
            "Value": "123456"
        },
        {
            "Key": "Department",
            "Value": "Accounting"
```

```
        }
    ]
}
```

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see ListInstanceProfileTags in *AWS CLI Command Reference*.

`list-instance-profiles-for-role`

The following code example shows how to use `list-instance-profiles-for-role`.

AWS CLI

To list the instance profiles for an IAM role

The following `list-instance-profiles-for-role` command lists the instance profiles that are associated with the role `Test-Role`.

```
aws iam list-instance-profiles-for-role \
    --role-name Test-Role
```

Output:

```
{
    "InstanceProfiles": [
        {
            "InstanceProfileId": "AIDGPMS9RO4H3FEXAMPLE",
            "Roles": [
                {
                    "AssumeRolePolicyDocument": "<URL-encoded-JSON>",
                    "RoleId": "AIDACKCEVSQ6C2EXAMPLE",
                    "CreateDate": "2013-06-07T20:42:15Z",
                    "RoleName": "Test-Role",
                    "Path": "/",
                    "Arn": "arn:aws:iam::123456789012:role/Test-Role"
                }
            ],
            "CreateDate": "2013-06-07T21:05:24Z",
            "InstanceProfileName": "ExampleInstanceProfile",
            "Path": "/",
            "Arn": "arn:aws:iam::123456789012:instance-profile/
ExampleInstanceProfile"
```

```
        }
    ]
}
```

For more information, see Using instance profiles in the *AWS IAM User Guide*.

- For API details, see ListInstanceProfilesForRole in *AWS CLI Command Reference*.

`list-instance-profiles`

The following code example shows how to use `list-instance-profiles`.

AWS CLI

To lists the instance profiles for the account

The following `list-instance-profiles` command lists the instance profiles that are associated with the current account.

```
aws iam list-instance-profiles
```

Output:

```
{
    "InstanceProfiles": [
        {
            "Path": "/",
            "InstanceProfileName": "example-dev-role",
            "InstanceProfileId": "AIPAIXEU4NUHUPEXAMPLE",
            "Arn": "arn:aws:iam::123456789012:instance-profile/example-dev-role",
            "CreateDate": "2023-09-21T18:17:41+00:00",
            "Roles": [
                {
                    "Path": "/",
                    "RoleName": "example-dev-role",
                    "RoleId": "AROAJ52OTH4H7LEXAMPLE",
                    "Arn": "arn:aws:iam::123456789012:role/example-dev-role",
                    "CreateDate": "2023-09-21T18:17:40+00:00",
                    "AssumeRolePolicyDocument": {
                        "Version":"2012-10-17",
                        "Statement": [
                            {
                                "Effect": "Allow",
```

```
                                "Principal": {
                                    "Service": "ec2.amazonaws.com"
                                },
                                "Action": "sts:AssumeRole"
                            }
                        ]
                    }
                }
            ]
        },
        {
            "Path": "/",
            "InstanceProfileName": "example-s3-role",
            "InstanceProfileId": "AIPAJVJVNRIQFREXAMPLE",
            "Arn": "arn:aws:iam::123456789012:instance-profile/example-s3-role",
            "CreateDate": "2023-09-21T18:18:50+00:00",
            "Roles": [
                {
                    "Path": "/",
                    "RoleName": "example-s3-role",
                    "RoleId": "AROAINUBC5O7XLEXAMPLE",
                    "Arn": "arn:aws:iam::123456789012:role/example-s3-role",
                    "CreateDate": "2023-09-21T18:18:49+00:00",
                    "AssumeRolePolicyDocument": {
                        "Version":"2012-10-17",
                        "Statement": [
                            {
                                "Effect": "Allow",
                                "Principal": {
                                    "Service": "ec2.amazonaws.com"
                                },
                                "Action": "sts:AssumeRole"
                            }
                        ]
                    }
                }
            ]
        }
    ]
}
```

For more information, see Using instance profiles in the *AWS IAM User Guide*.

- For API details, see ListInstanceProfiles in *AWS CLI Command Reference*.

`list-mfa-device-tags`

The following code example shows how to use `list-mfa-device-tags`.

AWS CLI

To list the tags attached to an MFA device

The following `list-mfa-device-tags` command retrieves the list of tags associated with the specified MFA device.

```
aws iam list-mfa-device-tags \
    --serial-number arn:aws:iam::123456789012:mfa/alice
```

Output:

```
{
    "Tags": [
        {
            "Key": "DeptID",
            "Value": "123456"
        },
        {
            "Key": "Department",
            "Value": "Accounting"
        }
    ]
}
```

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see ListMfaDeviceTags in *AWS CLI Command Reference*.

`list-mfa-devices`

The following code example shows how to use `list-mfa-devices`.

AWS CLI

To list all MFA devices for a specified user

This example returns details about the MFA device assigned to the IAM user Bob.

```
aws iam list-mfa-devices \
    --user-name Bob
```

Output:

```
{
    "MFADevices": [
        {
            "UserName": "Bob",
            "SerialNumber": "arn:aws:iam::123456789012:mfa/Bob",
            "EnableDate": "2019-10-28T20:37:09+00:00"
        },
        {
            "UserName": "Bob",
            "SerialNumber": "GAKT12345678",
            "EnableDate": "2023-02-18T21:44:42+00:00"
        },
        {
            "UserName": "Bob",
            "SerialNumber": "arn:aws:iam::123456789012:u2f/user/Bob/
fidosecuritykey1-7XNL7NFNLZ123456789EXAMPLE",
            "EnableDate": "2023-09-19T02:25:35+00:00"
        },
        {
            "UserName": "Bob",
            "SerialNumber": "arn:aws:iam::123456789012:u2f/user/Bob/
fidosecuritykey2-VDRQTDBBN5123456789EXAMPLE",
            "EnableDate": "2023-09-19T01:49:18+00:00"
        }
    ]
}
```

For more information, see Using multi-factor authentication (MFA) in AWS in the *AWS IAM User Guide*.

- For API details, see ListMfaDevices in *AWS CLI Command Reference*.

`list-open-id-connect-provider-tags`

The following code example shows how to use `list-open-id-connect-provider-tags`.

AWS CLI

To list the tags attached to an OpenID Connect (OIDC)-compatible identity provider

The following `list-open-id-connect-provider-tags` command retrieves the list of tags associated with the specified OIDC identity provider.

```
aws iam list-open-id-connect-provider-tags \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
server.example.com
```

Output:

```
{
    "Tags": [
        {
            "Key": "DeptID",
            "Value": "123456"
        },
        {
            "Key": "Department",
            "Value": "Accounting"
        }
    ]
}
```

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see ListOpenIdConnectProviderTags in *AWS CLI Command Reference*.

`list-open-id-connect-providers`

The following code example shows how to use `list-open-id-connect-providers`.

AWS CLI

To list information about the OpenID Connect providers in the AWS account

This example returns a list of ARNS of all the OpenID Connect providers that are defined in the current AWS account.

```
aws iam list-open-id-connect-providers
```

Output:

```
{
    "OpenIDConnectProviderList": [
        {
            "Arn": "arn:aws:iam::123456789012:oidc-provider/
example.oidcprovider.com"
        }
    ]
}
```

For more information, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

- For API details, see ListOpenIdConnectProviders in *AWS CLI Command Reference*.

`list-organizations-features`

The following code example shows how to use `list-organizations-features`.

AWS CLI

To list the centralized root access features enabled for your organization

The following `list-organizations-features` command lists the centralized root access features enabled for your organization.

```
aws iam list-organizations-features
```

Output:

```
{
    "EnabledFeatures": [
        "RootCredentialsManagement",
        "RootSessions"
    ]
    "OrganizationId": "o-aa111bb222"
}
```

For more information, see Centrally manage root access for member accounts in the *AWS IAM User Guide*.

- For API details, see ListOrganizationsFeatures in *AWS CLI Command Reference*.

`list-policies-granting-service-access`

The following code example shows how to use `list-policies-granting-service-access`.

AWS CLI

To list the policies that grant a principal access to the specified service

The following `list-policies-granting-service-access` example retrieves the list of policies that grant the IAM user `sofia` access to AWS CodeCommit service.

```
aws iam list-policies-granting-service-access \
    --arn arn:aws:iam::123456789012:user/sofia \
    --service-namespaces codecommit
```

Output:

```
{
    "PoliciesGrantingServiceAccess": [
        {
            "ServiceNamespace": "codecommit",
            "Policies": [
                {
                    "PolicyName": "Grant-Sofia-Access-To-CodeCommit",
                    "PolicyType": "INLINE",
                    "EntityType": "USER",
                    "EntityName": "sofia"
                }
            ]
        }
    ],
    "IsTruncated": false
}
```

For more information, see Using IAM with CodeCommit: Git credentials, SSH keys, and AWS access keys in the *AWS IAM User Guide*.

- For API details, see ListPoliciesGrantingServiceAccess in *AWS CLI Command Reference*.

`list-policies`

The following code example shows how to use `list-policies`.

AWS CLI

To list managed policies that are available to your AWS account

This example returns a collection of the first two managed policies available in the current AWS account.

```
aws iam list-policies \
    --max-items 3
```

Output:

```
{
    "Policies": [
        {
            "PolicyName": "AWSCloudTrailAccessPolicy",
            "PolicyId": "ANPAXQE2B5PJ7YEXAMPLE",
            "Arn": "arn:aws:iam::123456789012:policy/AWSCloudTrailAccessPolicy",
            "Path": "/",
            "DefaultVersionId": "v1",
            "AttachmentCount": 0,
            "PermissionsBoundaryUsageCount": 0,
            "IsAttachable": true,
            "CreateDate": "2019-09-04T17:43:42+00:00",
            "UpdateDate": "2019-09-04T17:43:42+00:00"
        },
        {
            "PolicyName": "AdministratorAccess",
            "PolicyId": "ANPAIWMBCKSKIEE64ZLYK",
            "Arn": "arn:aws:iam::aws:policy/AdministratorAccess",
            "Path": "/",
            "DefaultVersionId": "v1",
            "AttachmentCount": 6,
            "PermissionsBoundaryUsageCount": 0,
            "IsAttachable": true,
            "CreateDate": "2015-02-06T18:39:46+00:00",
            "UpdateDate": "2015-02-06T18:39:46+00:00"
        },
        {
```

```
            "PolicyName": "PowerUserAccess",
            "PolicyId": "ANPAJYRXTHIB4FOVS3ZXS",
            "Arn": "arn:aws:iam::aws:policy/PowerUserAccess",
            "Path": "/",
            "DefaultVersionId": "v5",
            "AttachmentCount": 1,
            "PermissionsBoundaryUsageCount": 0,
            "IsAttachable": true,
            "CreateDate": "2015-02-06T18:39:47+00:00",
            "UpdateDate": "2023-07-06T22:04:00+00:00"
        }
    ],
    "NextToken": "EXAMPLErZXIiOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOiA4fQ=="
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see ListPolicies in *AWS CLI Command Reference*.

`list-policy-tags`

The following code example shows how to use `list-policy-tags`.

AWS CLI

To list the tags attached to a managed policy

The following `list-policy-tags` command retrieves the list of tags associated with the specified managed policy.

```
aws iam list-policy-tags \
    --policy-arn arn:aws:iam::123456789012:policy/billing-access
```

Output:

```
{
    "Tags": [
        {
            "Key": "DeptID",
            "Value": "123456"
        },
        {
            "Key": "Department",
```

```
                "Value": "Accounting"
            }
        ]
}
```

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see ListPolicyTags in *AWS CLI Command Reference*.

`list-policy-versions`

The following code example shows how to use `list-policy-versions`.

AWS CLI

To list information about the versions of the specified managed policy

This example returns the list of available versions of the policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`.

```
aws iam list-policy-versions \
    --policy-arn arn:aws:iam::123456789012:policy/MySamplePolicy
```

Output:

```
{
    "IsTruncated": false,
    "Versions": [
        {
        "VersionId": "v2",
        "IsDefaultVersion": true,
        "CreateDate": "2015-06-02T23:19:44Z"
        },
        {
        "VersionId": "v1",
        "IsDefaultVersion": false,
        "CreateDate": "2015-06-02T22:30:47Z"
        }
    ]
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see ListPolicyVersions in *AWS CLI Command Reference*.

`list-role-policies`

The following code example shows how to use `list-role-policies`.

AWS CLI

To list the policies attached to an IAM role

The following `list-role-policies` command lists the names of the permissions policies for the specified IAM role.

```
aws iam list-role-policies \
    --role-name Test-Role
```

Output:

```
{
    "PolicyNames": [
        "ExamplePolicy"
    ]
}
```

To see the trust policy attached to a role, use the `get-role` command. To see the details of a permissions policy, use the `get-role-policy` command.

For more information, see Creating IAM roles in the *AWS IAM User Guide*.

- For API details, see ListRolePolicies in *AWS CLI Command Reference*.

`list-role-tags`

The following code example shows how to use `list-role-tags`.

AWS CLI

To list the tags attached to a role

The following `list-role-tags` command retrieves the list of tags associated with the specified role.

```
aws iam list-role-tags \
    --role-name production-role
```

Output:

```
{
    "Tags": [
        {
            "Key": "Department",
            "Value": "Accounting"
        },
        {
            "Key": "DeptID",
            "Value": "12345"
        }
    ],
    "IsTruncated": false
}
```

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see ListRoleTags in *AWS CLI Command Reference*.

`list-roles`

The following code example shows how to use `list-roles`.

AWS CLI

To list IAM roles for the current account

The following `list-roles` command lists IAM roles for the current account.

```
aws iam list-roles
```

Output:

```
{
    "Roles": [
        {
            "Path": "/",
            "RoleName": "ExampleRole",
```

```
            "RoleId": "AROAJ52OTH4H7LEXAMPLE",
            "Arn": "arn:aws:iam::123456789012:role/ExampleRole",
            "CreateDate": "2017-09-12T19:23:36+00:00",
            "AssumeRolePolicyDocument": {
                "Version":"2012-10-17",
                "Statement": [
                    {
                        "Sid": "",
                        "Effect": "Allow",
                        "Principal": {
                            "Service": "ec2.amazonaws.com"
                        },
                        "Action": "sts:AssumeRole"
                    }
                ]
            },
            "MaxSessionDuration": 3600
        },
        {
            "Path": "/example_path/",
            "RoleName": "ExampleRoleWithPath",
            "RoleId": "AROAI4QRP7UFT7EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:role/example_path/
ExampleRoleWithPath",
            "CreateDate": "2023-09-21T20:29:38+00:00",
            "AssumeRolePolicyDocument": {
                "Version":"2012-10-17",
                "Statement": [
                    {
                        "Sid": "",
                        "Effect": "Allow",
                        "Principal": {
                            "Service": "ec2.amazonaws.com"
                        },
                        "Action": "sts:AssumeRole"
                    }
                ]
            },
            "MaxSessionDuration": 3600
        }
    ]
}
```

For more information, see Creating IAM roles in the *AWS IAM User Guide*.

- For API details, see ListRoles in *AWS CLI Command Reference*.

`list-saml-provider-tags`

The following code example shows how to use `list-saml-provider-tags`.

AWS CLI

To list the tags attached to a SAML provider

The following `list-saml-provider-tags` command retrieves the list of tags associated with the specified SAML provider.

```
aws iam list-saml-provider-tags \
    --saml-provider-arn arn:aws:iam::123456789012:saml-provider/ADFS
```

Output:

```
{
    "Tags": [
        {
            "Key": "DeptID",
            "Value": "123456"
        },
        {
            "Key": "Department",
            "Value": "Accounting"
        }
    ]
}
```

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see ListSamlProviderTags in *AWS CLI Command Reference*.

`list-saml-providers`

The following code example shows how to use `list-saml-providers`.

AWS CLI

To list the SAML providers in the AWS account

This example retrieves the list of SAML 2.0 providers created in the current AWS account.

```
aws iam list-saml-providers
```

Output:

```
{
    "SAMLProviderList": [
        {
            "Arn": "arn:aws:iam::123456789012:saml-provider/SAML-ADFS",
            "ValidUntil": "2015-06-05T22:45:14Z",
            "CreateDate": "2015-06-05T22:45:14Z"
        }
    ]
}
```

For more information, see Creating IAM SAML identity providers in the *AWS IAM User Guide*.

- For API details, see ListSAMLProviders in *AWS CLI Command Reference*.

`list-server-certificate-tags`

The following code example shows how to use `list-server-certificate-tags`.

AWS CLI

To list the tags attached to a server certificate

The following `list-server-certificate-tags` command retrieves the list of tags associated with the specified server certificate.

```
aws iam list-server-certificate-tags \
    --server-certificate-name ExampleCertificate
```

Output:

```
{
    "Tags": [
```

```
        {
            "Key": "DeptID",
            "Value": "123456"
        },
        {
            "Key": "Department",
            "Value": "Accounting"
        }
    ]
}
```

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see ListServerCertificateTags in *AWS CLI Command Reference*.

`list-server-certificates`

The following code example shows how to use `list-server-certificates`.

AWS CLI

To list the server certificates in your AWS account

The following `list-server-certificates` command lists all of the server certificates stored and available for use in your AWS account.

```
aws iam list-server-certificates
```

Output:

```
{
    "ServerCertificateMetadataList": [
        {
            "Path": "/",
            "ServerCertificateName": "myUpdatedServerCertificate",
            "ServerCertificateId": "ASCAEXAMPLE123EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:server-certificate/
myUpdatedServerCertificate",
            "UploadDate": "2019-04-22T21:13:44+00:00",
            "Expiration": "2019-10-15T22:23:16+00:00"
        },
        {
            "Path": "/cloudfront/",
```

```
            "ServerCertificateName": "MyTestCert",
            "ServerCertificateId": "ASCAEXAMPLE456EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:server-certificate/Org1/Org2/
MyTestCert",
            "UploadDate": "2015-04-21T18:14:16+00:00",
            "Expiration": "2018-01-14T17:52:36+00:00"
        }
    ]
}
```

For more information, see Managing server certificates in IAM in the *AWS IAM User Guide*.

- For API details, see ListServerCertificates in *AWS CLI Command Reference*.

`list-service-specific-credential`

The following code example shows how to use `list-service-specific-credential`.

AWS CLI

Example 1: List the service-specific credentials for a user

The following `list-service-specific-credentials` example displays all service-specific credentials assigned to the specified user. Passwords are not included in the response.

```
aws iam list-service-specific-credentials \
    --user-name sofia
```

Output:

```
{
    "ServiceSpecificCredential": {
        "CreateDate": "2019-04-18T20:45:36+00:00",
        "ServiceName": "codecommit.amazonaws.com",
        "ServiceUserName": "sofia-at-123456789012",
        "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",
        "UserName": "sofia",
        "Status": "Active"
    }
}
```

Example 2: List the service-specific credentials for a user filtered to a specified service

The following `list-service-specific-credentials` example displays the service-specific credentials assigned to the user making the request. The list is filtered to include only those credentials for the specified service. Passwords are not included in the response.

```
aws iam list-service-specific-credentials \
    --service-name codecommit.amazonaws.com
```

Output:

```
{
    "ServiceSpecificCredential": {
        "CreateDate": "2019-04-18T20:45:36+00:00",
        "ServiceName": "codecommit.amazonaws.com",
        "ServiceUserName": "sofia-at-123456789012",
        "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",
        "UserName": "sofia",
        "Status": "Active"
    }
}
```

For more information, see Create Git credentials for HTTPS connections to CodeCommit in the *AWS CodeCommit User Guide*.

- For API details, see ListServiceSpecificCredential in *AWS CLI Command Reference*.

`list-service-specific-credentials`

The following code example shows how to use `list-service-specific-credentials`.

AWS CLI

To retrieve a list of credentials

The following `list-service-specific-credentials` example lists the credentials generated for HTTPS access to AWS CodeCommit repositories for a user named `developer`.

```
aws iam list-service-specific-credentials \
    --user-name developer \
    --service-name codecommit.amazonaws.com
```

Output:

```
{
    "ServiceSpecificCredentials": [
        {
            "UserName": "developer",
            "Status": "Inactive",
            "ServiceUserName": "developer-at-123456789012",
            "CreateDate": "2019-10-01T04:31:41Z",
            "ServiceSpecificCredentialId": "ACCAQFODXMPL4YFHP7DZE",
            "ServiceName": "codecommit.amazonaws.com"
        },
        {
            "UserName": "developer",
            "Status": "Active",
            "ServiceUserName": "developer+1-at-123456789012",
            "CreateDate": "2019-10-01T04:31:45Z",
            "ServiceSpecificCredentialId": "ACCAQFOXMPL6VW57M7AJP",
            "ServiceName": "codecommit.amazonaws.com"
        }
    ]
}
```

For more information, see Create Git credentials for HTTPS connections to CodeCommit in the *AWS CodeCommit User Guide*.

- For API details, see ListServiceSpecificCredentials in *AWS CLI Command Reference*.

`list-signing-certificates`

The following code example shows how to use `list-signing-certificates`.

AWS CLI

To list the signing certificates for an IAM user

The following `list-signing-certificates` command lists the signing certificates for the IAM user named Bob.

```
aws iam list-signing-certificates \
    --user-name Bob
```

Output:

```
{
    "Certificates": [
        {
            "UserName": "Bob",
            "Status": "Inactive",
            "CertificateBody": "-----BEGIN CERTIFICATE-----<certificate-body>-----
END CERTIFICATE-----",
            "CertificateId": "TA7SMP42TDN5Z26OBPJE7EXAMPLE",
            "UploadDate": "2013-06-06T21:40:08Z"
        }
    ]
}
```

For more information, see Manage signing certificates in the *Amazon EC2 User Guide*.

- For API details, see ListSigningCertificates in *AWS CLI Command Reference*.

`list-ssh-public-keys`

The following code example shows how to use `list-ssh-public-keys`.

AWS CLI

To list the SSH public keys attached to an IAM user

The following `list-ssh-public-keys` example lists the SSH public keys attached to the IAM user `sofia`.

```
aws iam list-ssh-public-keys \
    --user-name sofia
```

Output:

```
{
    "SSHPublicKeys": [
        {
            "UserName": "sofia",
            "SSHPublicKeyId": "APKA1234567890EXAMPLE",
            "Status": "Inactive",
            "UploadDate": "2019-04-18T17:04:49+00:00"
        }
```

```
    ]
}
```

For more information, see Use SSH keys and SSH with CodeCommit in the *AWS IAM User Guide*

- For API details, see ListSshPublicKeys in *AWS CLI Command Reference*.

`list-user-policies`

The following code example shows how to use `list-user-policies`.

AWS CLI

To list policies for an IAM user

The following `list-user-policies` command lists the policies that are attached to the IAM user named Bob.

```
aws iam list-user-policies \
    --user-name Bob
```

Output:

```
{
    "PolicyNames": [
        "ExamplePolicy",
        "TestPolicy"
    ]
}
```

For more information, see Creating an IAM user in your AWS account in the *AWS IAM User Guide*.

- For API details, see ListUserPolicies in *AWS CLI Command Reference*.

`list-user-tags`

The following code example shows how to use `list-user-tags`.

AWS CLI

To list the tags attached to a user

The following `list-user-tags` command retrieves the list of tags associated with the specified IAM user.

```
aws iam list-user-tags \
    --user-name alice
```

Output:

```
{
    "Tags": [
        {
            "Key": "Department",
            "Value": "Accounting"
        },
        {
            "Key": "DeptID",
            "Value": "12345"
        }
    ],
    "IsTruncated": false
}
```

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see ListUserTags in *AWS CLI Command Reference*.

`list-users`

The following code example shows how to use `list-users`.

AWS CLI

To list IAM users

The following `list-users` command lists the IAM users in the current account.

```
aws iam list-users
```

Output:

```
{
```

```
    "Users": [
        {
            "UserName": "Adele",
            "Path": "/",
            "CreateDate": "2013-03-07T05:14:48Z",
            "UserId": "AKIAI44QH8DHBEXAMPLE",
            "Arn": "arn:aws:iam::123456789012:user/Adele"
        },
        {
            "UserName": "Bob",
            "Path": "/",
            "CreateDate": "2012-09-21T23:03:13Z",
            "UserId": "AKIAIOSFODNN7EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:user/Bob"
        }
    ]
}
```

For more information, see Listing IAM users in the *AWS IAM User Guide*.

- For API details, see ListUsers in *AWS CLI Command Reference*.

`list-virtual-mfa-devices`

The following code example shows how to use `list-virtual-mfa-devices`.

AWS CLI

To list virtual MFA devices

The following `list-virtual-mfa-devices` command lists the virtual MFA devices that have been configured for the current account.

```
aws iam list-virtual-mfa-devices
```

Output:

```
{
    "VirtualMFADevices": [
        {
            "SerialNumber": "arn:aws:iam::123456789012:mfa/ExampleMFADevice"
        },
```

```
            {
                "SerialNumber": "arn:aws:iam::123456789012:mfa/Fred"
            }
        ]
}
```

For more information, see Enabling a virtual multi-factor authentication (MFA) device in the *AWS IAM User Guide*.

- For API details, see ListVirtualMfaDevices in *AWS CLI Command Reference*.

`put-group-policy`

The following code example shows how to use `put-group-policy`.

AWS CLI

To add a policy to a group

The following `put-group-policy` command adds a policy to the IAM group named `Admins`.

```
aws iam put-group-policy \
    --group-name Admins \
    --policy-document file://AdminPolicy.json \
    --policy-name AdminRoot
```

This command produces no output.

The policy is defined as a JSON document in the *AdminPolicy.json* file. (The file name and extension do not have significance.)

For more information, see Managing IAM policies in the *AWS IAM User Guide*.

- For API details, see PutGroupPolicy in *AWS CLI Command Reference*.

`put-role-permissions-boundary`

The following code example shows how to use `put-role-permissions-boundary`.

AWS CLI

Example 1: To apply a permissions boundary based on a custom policy to an IAM role

The following `put-role-permissions-boundary` example applies the custom policy named `intern-boundary` as the permissions boundary for the specified IAM role.

```
aws iam put-role-permissions-boundary \
    --permissions-boundary arn:aws:iam::123456789012:policy/intern-boundary \
    --role-name lambda-application-role
```

This command produces no output.

Example 2: To apply a permissions boundary based on an AWS managed policy to an IAM role

The following `put-role-permissions-boundary` example applies the AWS managed `PowerUserAccess` policy as the permissions boundary for the specified IAM role.

```
aws iam put-role-permissions-boundary \
    --permissions-boundary arn:aws:iam::aws:policy/PowerUserAccess \
    --role-name x-account-admin
```

This command produces no output.

For more information, see Modifying a role in the *AWS IAM User Guide*.

- For API details, see PutRolePermissionsBoundary in *AWS CLI Command Reference*.

`put-role-policy`

The following code example shows how to use `put-role-policy`.

AWS CLI

To attach a permissions policy to an IAM role

The following `put-role-policy` command adds a permissions policy to the role named `Test-Role`.

```
aws iam put-role-policy \
    --role-name Test-Role \
    --policy-name ExamplePolicy \
    --policy-document file://AdminPolicy.json
```

This command produces no output.

The policy is defined as a JSON document in the *AdminPolicy.json* file. (The file name and extension do not have significance.)

To attach a trust policy to a role, use the `update-assume-role-policy` command.

For more information, see [Modifying a role]() in the *AWS IAM User Guide*.

- For API details, see [PutRolePolicy]() in *AWS CLI Command Reference*.

`put-user-permissions-boundary`

The following code example shows how to use `put-user-permissions-boundary`.

AWS CLI

Example 1: To apply a permissions boundary based on a custom policy to an IAM user

The following `put-user-permissions-boundary` example applies a custom policy named `intern-boundary` as the permissions boundary for the specified IAM user.

```
aws iam put-user-permissions-boundary \
    --permissions-boundary arn:aws:iam::123456789012:policy/intern-boundary \
    --user-name intern
```

This command produces no output.

Example 2: To apply a permissions boundary based on an AWS managed policy to an IAM user

The following `put-user-permissions-boundary` example applies the AWS managed pollicy named `PowerUserAccess` as the permissions boundary for the specified IAM user.

```
aws iam put-user-permissions-boundary \
    --permissions-boundary arn:aws:iam::aws:policy/PowerUserAccess \
    --user-name developer
```

This command produces no output.

For more information, see [Adding and removing IAM identity permissions]() in the *AWS IAM User Guide*.

- For API details, see [PutUserPermissionsBoundary]() in *AWS CLI Command Reference*.

`put-user-policy`

The following code example shows how to use `put-user-policy`.

AWS CLI

To attach a policy to an IAM user

The following `put-user-policy` command attaches a policy to the IAM user named Bob.

```
aws iam put-user-policy \
    --user-name Bob \
    --policy-name ExamplePolicy \
    --policy-document file://AdminPolicy.json
```

This command produces no output.

The policy is defined as a JSON document in the *AdminPolicy.json* file. (The file name and extension do not have significance.)

For more information, see Adding and removing IAM identity permissions in the *AWS IAM User Guide*.

- For API details, see PutUserPolicy in *AWS CLI Command Reference*.

`remove-client-id-from-open-id-connect-provider`

The following code example shows how to use `remove-client-id-from-open-id-connect-provider`.

AWS CLI

To remove the specified client ID from the list of client IDs registered for the specified IAM OpenID Connect provider

This example removes the client ID `My-TestApp-3` from the list of client IDs associated with the IAM OIDC provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com`.

```
aws iam remove-client-id-from-open-id-connect-provider
    --client-id My-TestApp-3 \
```

```
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
example.oidcprovider.com
```

This command produces no output.

For more information, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

- For API details, see RemoveClientIdFromOpenIdConnectProvider in *AWS CLI Command Reference*.

`remove-role-from-instance-profile`

The following code example shows how to use `remove-role-from-instance-profile`.

AWS CLI

To remove a role from an instance profile

The following `remove-role-from-instance-profile` command removes the role named `Test-Role` from the instance profile named `ExampleInstanceProfile`.

```
aws iam remove-role-from-instance-profile \
    --instance-profile-name ExampleInstanceProfile \
    --role-name Test-Role
```

For more information, see Using instance profiles in the *AWS IAM User Guide*.

- For API details, see RemoveRoleFromInstanceProfile in *AWS CLI Command Reference*.

`remove-user-from-group`

The following code example shows how to use `remove-user-from-group`.

AWS CLI

To remove a user from an IAM group

The following `remove-user-from-group` command removes the user named `Bob` from the IAM group named `Admins`.

```
aws iam remove-user-from-group \
```

```
    --user-name Bob \
    --group-name Admins
```

This command produces no output.

For more information, see Adding and removing users in an IAM user group in the *AWS IAM User Guide*.

- For API details, see RemoveUserFromGroup in *AWS CLI Command Reference*.

`reset-service-specific-credential`

The following code example shows how to use `reset-service-specific-credential`.

AWS CLI

Example 1: Reset the password for a service-specific credential attached to the user making the request

The following `reset-service-specific-credential` example generates a new cryptographically strong password for the specified service-specific credential attached to the user making the request.

```
aws iam reset-service-specific-credential \
    --service-specific-credential-id ACCAEXAMPLE123EXAMPLE
```

Output:

```
{
    "ServiceSpecificCredential": {
        "CreateDate": "2019-04-18T20:45:36+00:00",
        "ServiceName": "codecommit.amazonaws.com",
        "ServiceUserName": "sofia-at-123456789012",
        "ServicePassword": "+oaFsNk7tLco+C/obP9GhhcOzGcKOayTmE3LnAmAmH4=",
        "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",
        "UserName": "sofia",
        "Status": "Active"
    }
}
```

Example 2: Reset the password for a service-specific credential attached to a specified user

The following `reset-service-specific-credential` example generates a new cryptographically strong password for a service-specific credential attached to the specified user.

```
aws iam reset-service-specific-credential \
    --user-name sofia \
    --service-specific-credential-id ACCAEXAMPLE123EXAMPLE
```

Output:

```
{
    "ServiceSpecificCredential": {
        "CreateDate": "2019-04-18T20:45:36+00:00",
        "ServiceName": "codecommit.amazonaws.com",
        "ServiceUserName": "sofia-at-123456789012",
        "ServicePassword": "+oaFsNk7tLco+C/obP9GhhcOzGcKOayTmE3LnAmAmH4=",
        "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",
        "UserName": "sofia",
        "Status": "Active"
    }
}
```

For more information, see Create Git credentials for HTTPS connections to CodeCommit in the *AWS CodeCommit User Guide*.

- For API details, see ResetServiceSpecificCredential in *AWS CLI Command Reference*.

`resync-mfa-device`

The following code example shows how to use `resync-mfa-device`.

AWS CLI

To synchronize an MFA device

The following `resync-mfa-device` example synchronizes the MFA device that is associated with the IAM user Bob and whose ARN is `arn:aws:iam::123456789012:mfa/BobsMFADevice` with an authenticator program that provided the two authentication codes.

```
aws iam resync-mfa-device \
    --user-name Bob \
    --serial-number arn:aws:iam::210987654321:mfa/BobsMFADevice \
```

```
    --authentication-code1 123456 \
    --authentication-code2 987654
```

This command produces no output.

For more information, see Using multi-factor authentication (MFA) in AWS in the *AWS IAM User Guide*.

- For API details, see ResyncMfaDevice in *AWS CLI Command Reference*.

`set-default-policy-version`

The following code example shows how to use `set-default-policy-version`.

AWS CLI

To set the specified version of the specified policy as the policy's default version.

This example sets the `v2` version of the policy whose ARN is `arn:aws:iam::123456789012:policy/MyPolicy` as the default active version.

```
aws iam set-default-policy-version \
    --policy-arn arn:aws:iam::123456789012:policy/MyPolicy \
    --version-id v2
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see SetDefaultPolicyVersion in *AWS CLI Command Reference*.

`set-security-token-service-preferences`

The following code example shows how to use `set-security-token-service-preferences`.

AWS CLI

To set the global endpoint token version

The following `set-security-token-service-preferences` example configures Amazon STS to use version 2 tokens when you authenticate against the global endpoint.

```
aws iam set-security-token-service-preferences \
    --global-endpoint-token-version v2Token
```

This command produces no output.

For more information, see Managing AWS STS in an AWS Region in the *AWS IAM User Guide*.

- For API details, see SetSecurityTokenServicePreferences in *AWS CLI Command Reference*.

`simulate-custom-policy`

The following code example shows how to use `simulate-custom-policy`.

AWS CLI

Example 1: To simulate the effects of all IAM policies associated with an IAM user or role

The following `simulate-custom-policy` shows how to provide both the policy and define variable values and simulate an API call to see if it is allowed or denied. The following example shows a policy that enables database access only after a specified date and time. The simulation succeeds because the simulated actions and the specified `aws:CurrentTime` variable all match the requirements of the policy.

```
aws iam simulate-custom-policy \
    --policy-input-list '{"Version":"2012-10-17",       "Statement":
{"Effect":"Allow","Action":"dynamodb:*","Resource":"*","Condition":
{"DateGreaterThan":{"aws:CurrentTime":"2018-08-16T12:00:00Z"}}}}' \
    --action-names dynamodb:CreateBackup \
    --context-
entries "ContextKeyName='aws:CurrentTime',ContextKeyValues='2019-04-25T11:00:00Z',ContextKey
```

Output:

```
{
    "EvaluationResults": [
        {
            "EvalActionName": "dynamodb:CreateBackup",
            "EvalResourceName": "*",
            "EvalDecision": "allowed",
            "MatchedStatements": [
                {
                    "SourcePolicyId": "PolicyInputList.1",
                    "StartPosition": {
                        "Line": 1,
                        "Column": 38
```

```
                    },
                    "EndPosition": {
                        "Line": 1,
                        "Column": 167
                    }
                }
            ],
            "MissingContextValues": []
        }
    ]
}
```

Example 2: To simulate a command that is prohibited by the policy

The following `simulate-custom-policy` example shows the results of simulating a command that is prohibited by the policy. In this example, the provided date is before that required by the policy's condition.

```
aws iam simulate-custom-policy \
    --policy-input-list '{"Version":"2012-10-17",       "Statement":
{"Effect":"Allow","Action":"dynamodb:*","Resource":"*","Condition":
{"DateGreaterThan":{"aws:CurrentTime":"2018-08-16T12:00:00Z"}}}}' \
    --action-names dynamodb:CreateBackup \
    --context-
entries "ContextKeyName='aws:CurrentTime',ContextKeyValues='2014-04-25T11:00:00Z',ContextKey
```

Output:

```
{
    "EvaluationResults": [
        {
            "EvalActionName": "dynamodb:CreateBackup",
            "EvalResourceName": "*",
            "EvalDecision": "implicitDeny",
            "MatchedStatements": [],
            "MissingContextValues": []
        }
    ]
}
```

For more information, see Testing IAM policies with the IAM policy simulator in the *AWS IAM User Guide*.

- For API details, see SimulateCustomPolicy in *AWS CLI Command Reference*.

`simulate-principal-policy`

The following code example shows how to use `simulate-principal-policy`.

AWS CLI

Example 1: To simulate the effects of an arbitrary IAM policy

The following `simulate-principal-policy` shows how to simulate a user calling an API action and determining whether the policies associated with that user allow or deny the action. In the following example, the user has a policy that allows only the `codecommit:ListRepositories` action.

```
aws iam simulate-principal-policy \
    --policy-source-arn arn:aws:iam::123456789012:user/alejandro \
    --action-names codecommit:ListRepositories
```

Output:

```
{
    "EvaluationResults": [
        {
            "EvalActionName": "codecommit:ListRepositories",
            "EvalResourceName": "*",
            "EvalDecision": "allowed",
            "MatchedStatements": [
                {
                    "SourcePolicyId": "Grant-Access-To-CodeCommit-ListRepo",
                    "StartPosition": {
                        "Line": 3,
                        "Column": 19
                    },
                    "EndPosition": {
                        "Line": 9,
                        "Column": 10
                    }
                }
            ],
            "MissingContextValues": []
```

```
        }
    ]
}
```

Example 2: To simulate the effects of a prohibited command

The following `simulate-custom-policy` example shows the results of simulating a command that is prohibited by one of the user's policies. In the following example, the user has a policy that permits access to a DynamoDB database only after a certain date and time. The simulation has the user attempting to access the database with an `aws:CurrentTime` value that is earlier than the policy's condition permits.

```
aws iam simulate-principal-policy \
    --policy-source-arn arn:aws:iam::123456789012:user/alejandro \
    --action-names dynamodb:CreateBackup \
    --context-
entries "ContextKeyName='aws:CurrentTime',ContextKeyValues='2018-04-25T11:00:00Z',ContextKey
```

Output:

```
{
    "EvaluationResults": [
        {
            "EvalActionName": "dynamodb:CreateBackup",
            "EvalResourceName": "*",
            "EvalDecision": "implicitDeny",
            "MatchedStatements": [],
            "MissingContextValues": []
        }
    ]
}
```

For more information, see Testing IAM policies with the IAM policy simulator in the *AWS IAM User Guide*.

- For API details, see SimulatePrincipalPolicy in *AWS CLI Command Reference*.

`tag-instance-profile`

The following code example shows how to use `tag-instance-profile`.

AWS CLI

To add a tag to an instance profile

The following `tag-instance-profile` command adds a tag with a Department name to the specified instance profile.

```
aws iam tag-instance-profile \
    --instance-profile-name deployment-role \
    --tags '[{"Key": "Department", "Value": "Accounting"}]'
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see TagInstanceProfile in *AWS CLI Command Reference*.

`tag-mfa-device`

The following code example shows how to use `tag-mfa-device`.

AWS CLI

To add a tag to an MFA device

The following `tag-mfa-device` command adds a tag with a Department name to the specified MFA device.

```
aws iam tag-mfa-device \
    --serial-number arn:aws:iam::123456789012:mfa/alice \
    --tags '[{"Key": "Department", "Value": "Accounting"}]'
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see TagMfaDevice in *AWS CLI Command Reference*.

`tag-open-id-connect-provider`

The following code example shows how to use `tag-open-id-connect-provider`.

AWS CLI

To add a tag to an OpenID Connect (OIDC)-compatible identity provider

The following `tag-open-id-connect-provider` command adds a tag with a Department name to the specified OIDC identity provider.

```
aws iam tag-open-id-connect-provider \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
server.example.com \
    --tags '[{"Key": "Department", "Value": "Accounting"}]'
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see TagOpenIdConnectProvider in *AWS CLI Command Reference*.

`tag-policy`

The following code example shows how to use `tag-policy`.

AWS CLI

To add a tag to a customer managed policy

The following `tag-policy` command adds a tag with a Department name to the specified customer managed policy.

```
aws iam tag-policy \
    --policy-arn arn:aws:iam::123456789012:policy/billing-access \
    --tags '[{"Key": "Department", "Value": "Accounting"}]'
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see TagPolicy in *AWS CLI Command Reference*.

`tag-role`

The following code example shows how to use `tag-role`.

AWS CLI

To add a tag to a role

The following `tag-role` command adds a tag with a Department name to the specified role.

```
aws iam tag-role --role-name my-role \
    --tags '{"Key": "Department", "Value": "Accounting"}'
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see TagRole in *AWS CLI Command Reference*.

`tag-saml-provider`

The following code example shows how to use `tag-saml-provider`.

AWS CLI

To add a tag to a SAML provider

The following `tag-saml-provider` command adds a tag with a Department name to the specified SAML provider.

```
aws iam tag-saml-provider \
    --saml-provider-arn arn:aws:iam::123456789012:saml-provider/ADFS \
    --tags '[{"Key": "Department", "Value": "Accounting"}]'
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see TagSamlProvider in *AWS CLI Command Reference*.

`tag-server-certificate`

The following code example shows how to use `tag-server-certificate`.

AWS CLI

To add a tag to a server certificate

The following `tag-saml-provider` command adds a tag with a Department name to the specified sever certificate.

```
aws iam tag-server-certificate \
    --server-certificate-name ExampleCertificate \
    --tags '[{"Key": "Department", "Value": "Accounting"}]'
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see TagServerCertificate in *AWS CLI Command Reference*.

`tag-user`

The following code example shows how to use `tag-user`.

AWS CLI

To add a tag to a user

The following `tag-user` command adds a tag with the associated Department to the specified user.

```
aws iam tag-user \
    --user-name alice \
    --tags '{"Key": "Department", "Value": "Accounting"}'
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see TagUser in *AWS CLI Command Reference*.

`untag-instance-profile`

The following code example shows how to use `untag-instance-profile`.

AWS CLI

To remove a tag from an instance profile

The following `untag-instance-profile` command removes any tag with the key name 'Department' from the specified instance profile.

```
aws iam untag-instance-profile \
    --instance-profile-name deployment-role \
    --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see UntagInstanceProfile in *AWS CLI Command Reference*.

`untag-mfa-device`

The following code example shows how to use `untag-mfa-device`.

AWS CLI

To remove a tag from an MFA device

The following `untag-mfa-device` command removes any tag with the key name 'Department' from the specified MFA device.

```
aws iam untag-mfa-device \
    --serial-number arn:aws:iam::123456789012:mfa/alice \
    --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see UntagMfaDevice in *AWS CLI Command Reference*.

`untag-open-id-connect-provider`

The following code example shows how to use `untag-open-id-connect-provider`.

AWS CLI

To remove a tag from an OIDC identity provider

The following `untag-open-id-connect-provider` command removes any tag with the key name 'Department' from the specified OIDC identity provider.

```
aws iam untag-open-id-connect-provider \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
server.example.com \
    --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see UntagOpenIdConnectProvider in *AWS CLI Command Reference*.

`untag-policy`

The following code example shows how to use `untag-policy`.

AWS CLI

To remove a tag from a customer managed policy

The following `untag-policy` command removes any tag with the key name 'Department' from the specified customer managed policy.

```
aws iam untag-policy \
    --policy-arn arn:aws:iam::452925170507:policy/billing-access \
    --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see UntagPolicy in *AWS CLI Command Reference*.

`untag-role`

The following code example shows how to use `untag-role`.

AWS CLI

To remove a tag from a role

The following `untag-role` command removes any tag with the key name 'Department' from the specified role.

```
aws iam untag-role \
    --role-name my-role \
    --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see UntagRole in *AWS CLI Command Reference*.

untag-saml-provider

The following code example shows how to use `untag-saml-provider`.

AWS CLI

To remove a tag from a SAML provider

The following `untag-saml-provider` command removes any tag with the key name 'Department' from the specified instance profile.

```
aws iam untag-saml-provider \
    --saml-provider-arn arn:aws:iam::123456789012:saml-provider/ADFS \
    --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see UntagSamlProvider in *AWS CLI Command Reference*.

untag-server-certificate

The following code example shows how to use `untag-server-certificate`.

AWS CLI

To remove a tag from a server certificate

The following `untag-server-certificate` command removes any tag with the key name 'Department' from the specified server certificate.

```
aws iam untag-server-certificate \
    --server-certificate-name ExampleCertificate \
    --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see UntagServerCertificate in *AWS CLI Command Reference*.

`untag-user`

The following code example shows how to use `untag-user`.

AWS CLI

To remove a tag from a user

The following `untag-user` command removes any tag with the key name 'Department' from the specified user.

```
aws iam untag-user \
    --user-name alice \
    --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see UntagUser in *AWS CLI Command Reference*.

`update-access-key`

The following code example shows how to use `update-access-key`.

AWS CLI

To activate or deactivate an access key for an IAM user

The following `update-access-key` command deactivates the specified access key (access key ID and secret access key) for the IAM user named `Bob`.

```
aws iam update-access-key \
    --access-key-id AKIAIOSFODNN7EXAMPLE \
    --status Inactive \
    --user-name Bob
```

This command produces no output.

Deactivating the key means that it cannot be used for programmatic access to AWS. However, the key is still available and can be reactivated.

For more information, see Managing access keys for IAM users in the *AWS IAM User Guide*.

- For API details, see UpdateAccessKey in *AWS CLI Command Reference*.

update-account-password-policy

The following code example shows how to use `update-account-password-policy`.

AWS CLI

To set or change the current account password policy

The following `update-account-password-policy` command sets the password policy to require a minimum length of eight characters and to require one or more numbers in the password.

```
aws iam update-account-password-policy \
    --minimum-password-length 8 \
    --require-numbers
```

This command produces no output.

Changes to an account's password policy affect any new passwords that are created for IAM users in the account. Password policy changes do not affect existing passwords.

For more information, see Setting an account password policy for IAM users in the *AWS IAM User Guide*.

- For API details, see UpdateAccountPasswordPolicy in *AWS CLI Command Reference*.

`update-assume-role-policy`

The following code example shows how to use `update-assume-role-policy`.

AWS CLI

To update the trust policy for an IAM role

The following `update-assume-role-policy` command updates the trust policy for the role named `Test-Role`.

```
aws iam update-assume-role-policy \
    --role-name Test-Role \
    --policy-document file://Test-Role-Trust-Policy.json
```

This command produces no output.

The trust policy is defined as a JSON document in the *Test-Role-Trust-Policy.json* file. (The file name and extension do not have significance.) The trust policy must specify a principal.

To update the permissions policy for a role, use the `put-role-policy` command.

For more information, see Creating IAM roles in the *AWS IAM User Guide*.

- For API details, see UpdateAssumeRolePolicy in *AWS CLI Command Reference*.

`update-group`

The following code example shows how to use `update-group`.

AWS CLI

To rename an IAM group

The following `update-group` command changes the name of the IAM group `Test` to `Test-1`.

```
aws iam update-group \
    --group-name Test \
    --new-group-name Test-1
```

This command produces no output.

For more information, see Renaming an IAM user group in the *AWS IAM User Guide*.

- For API details, see UpdateGroup in *AWS CLI Command Reference*.

`update-login-profile`

The following code example shows how to use `update-login-profile`.

AWS CLI

To update the password for an IAM user

The following `update-login-profile` command creates a new password for the IAM user named Bob.

```
aws iam update-login-profile \
    --user-name Bob \
    --password <password>
```

This command produces no output.

To set a password policy for the account, use the `update-account-password-policy` command. If the new password violates the account password policy, the command returns a `PasswordPolicyViolation` error.

If the account password policy allows them to, IAM users can change their own passwords using the `change-password` command.

Store the password in a secure place. If the password is lost, it cannot be recovered, and you must create a new one using the `create-login-profile` command.

For more information, see Managing passwords for IAM users in the *AWS IAM User Guide*.

- For API details, see UpdateLoginProfile in *AWS CLI Command Reference*.

`update-open-id-connect-provider-thumbprint`

The following code example shows how to use `update-open-id-connect-provider-thumbprint`.

AWS CLI

To replace the existing list of server certificate thumbprints with a new list

This example updates the certificate thumbprint list for the OIDC provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com` to use a new thumbprint.

```
aws iam update-open-id-connect-provider-thumbprint \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
example.oidcprovider.com \
    --thumbprint-list 7359755EXAMPLEabc3060bce3EXAMPLEec4542a3
```

This command produces no output.

For more information, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

- For API details, see UpdateOpenIdConnectProviderThumbprint in *AWS CLI Command Reference*.

`update-role-description`

The following code example shows how to use `update-role-description`.

AWS CLI

To change an IAM role's description

The following `update-role` command changes the description of the IAM role `production-role` to `Main production role`.

```
aws iam update-role-description \
    --role-name production-role \
    --description 'Main production role'
```

Output:

```
{
    "Role": {
        "Path": "/",
        "RoleName": "production-role",
        "RoleId": "AROA1234567890EXAMPLE",
        "Arn": "arn:aws:iam::123456789012:role/production-role",
```

```
        "CreateDate": "2017-12-06T17:16:37+00:00",
        "AssumeRolePolicyDocument": {
            "Version":"2012-10-17",
            "Statement": [
                {
                    "Effect": "Allow",
                    "Principal": {
                        "AWS": "arn:aws:iam::123456789012:root"
                    },
                    "Action": "sts:AssumeRole",
                    "Condition": {}
                }
            ]
        },
        "Description": "Main production role"
    }
}
```

For more information, see Modifying a role in the *AWS IAM User Guide*.

- For API details, see UpdateRoleDescription in *AWS CLI Command Reference*.

`update-role`

The following code example shows how to use `update-role`.

AWS CLI

To change an IAM role's description or session duration

The following `update-role` command changes the description of the IAM role `production-role` to `Main production role` and sets the maximum session duration to 12 hours.

```
aws iam update-role \
    --role-name production-role \
    --description 'Main production role' \
    --max-session-duration 43200
```

This command produces no output.

For more information, see Modifying a role in the *AWS IAM User Guide*.

- For API details, see UpdateRole in *AWS CLI Command Reference*.

`update-saml-provider`

The following code example shows how to use `update-saml-provider`.

AWS CLI

To update the metadata document for an existing SAML provider

This example updates the SAML provider in IAM whose ARN is `arn:aws:iam::123456789012:saml-provider/SAMLADFS` with a new SAML metadata document from the file `SAMLMetaData.xml`.

```
aws iam update-saml-provider \
    --saml-metadata-document file://SAMLMetaData.xml \
    --saml-provider-arn arn:aws:iam::123456789012:saml-provider/SAMLADFS
```

Output:

```
{
    "SAMLProviderArn": "arn:aws:iam::123456789012:saml-provider/SAMLADFS"
}
```

For more information, see Creating IAM SAML identity providers in the *AWS IAM User Guide*.

- For API details, see UpdateSamlProvider in *AWS CLI Command Reference*.

`update-server-certificate`

The following code example shows how to use `update-server-certificate`.

AWS CLI

To change the path or name of a server certificate in your AWS account

The following `update-server-certificate` command changes the name of the certificate from `myServerCertificate` to `myUpdatedServerCertificate`. It also changes the path to `/cloudfront/` so that it can be accessed by the Amazon CloudFront service. This command produces no output. You can see the results of the update by running the `list-server-certificates` command.

```
aws-iam update-server-certificate \
```

```
    --server-certificate-name myServerCertificate \
    --new-server-certificate-name myUpdatedServerCertificate \
    --new-path /cloudfront/
```

This command produces no output.

For more information, see Managing server certificates in IAM in the *AWS IAM User Guide*.

- For API details, see UpdateServerCertificate in *AWS CLI Command Reference*.

`update-service-specific-credential`

The following code example shows how to use `update-service-specific-credential`.

AWS CLI

Example 1: To update the status of the requesting user's service-specific credential

The following `update-service-specific-credential` example changes the status for the specified credential for the user making the request to `Inactive`.

```
aws iam update-service-specific-credential \
    --service-specific-credential-id ACCAEXAMPLE123EXAMPLE \
    --status Inactive
```

This command produces no output.

Example 2: To update the status of a specified user's service-specific credential

The following `update-service-specific-credential` example changes the status for the credential of the specified user to Inactive.

```
aws iam update-service-specific-credential \
    --user-name sofia \
    --service-specific-credential-id ACCAEXAMPLE123EXAMPLE \
    --status Inactive
```

This command produces no output.

For more information, see Create Git Credentials for HTTPS Connections to CodeCommit in the *AWS CodeCommit User Guide*

- For API details, see UpdateServiceSpecificCredential in *AWS CLI Command Reference*.

`update-signing-certificate`

The following code example shows how to use `update-signing-certificate`.

AWS CLI

To activate or deactivate a signing certificate for an IAM user

The following `update-signing-certificate` command deactivates the specified signing certificate for the IAM user named Bob.

```
aws iam update-signing-certificate \
    --certificate-id TA7SMP42TDN5Z26OBPJE7EXAMPLE \
    --status Inactive \
    --user-name Bob
```

To get the ID for a signing certificate, use the `list-signing-certificates` command.

For more information, see Manage signing certificates in the *Amazon EC2 User Guide*.

- For API details, see UpdateSigningCertificate in *AWS CLI Command Reference*.

`update-ssh-public-key`

The following code example shows how to use `update-ssh-public-key`.

AWS CLI

To change the status of an SSH public key

The following `update-ssh-public-key` command changes the status of the specified public key to `Inactive`.

```
aws iam update-ssh-public-key \
    --user-name sofia \
    --ssh-public-key-id APKA1234567890EXAMPLE \
    --status Inactive
```

This command produces no output.

For more information, see Use SSH keys and SSH with CodeCommit in the *AWS IAM User Guide*.

- For API details, see UpdateSshPublicKey in *AWS CLI Command Reference*.

`update-user`

The following code example shows how to use `update-user`.

AWS CLI

To change an IAM user's name

The following `update-user` command changes the name of the IAM user `Bob` to `Robert`.

```
aws iam update-user \
    --user-name Bob \
    --new-user-name Robert
```

This command produces no output.

For more information, see Renaming an IAM user group in the *AWS IAM User Guide*.

- For API details, see UpdateUser in *AWS CLI Command Reference*.

`upload-server-certificate`

The following code example shows how to use `upload-server-certificate`.

AWS CLI

To upload a server certificate to your AWS account

The following **upload-server-certificate** command uploads a server certificate to your AWS account. In this example, the certificate is in the file `public_key_cert_file.pem`, the associated private key is in the file `my_private_key.pem`, and the the certificate chain provided by the certificate authority (CA) is in the `my_certificate_chain_file.pem` file. When the file has finished uploading, it is available under the name *myServerCertificate*. Parameters that begin with `file://` tells the command to read the contents of the file and use that as the parameter value instead of the file name itself.

```
aws iam upload-server-certificate \
    --server-certificate-name myServerCertificate \
    --certificate-body file://public_key_cert_file.pem \
    --private-key file://my_private_key.pem \
    --certificate-chain file://my_certificate_chain_file.pem
```

Output:

```
{
    "ServerCertificateMetadata": {
        "Path": "/",
        "ServerCertificateName": "myServerCertificate",
        "ServerCertificateId": "ASCAEXAMPLE123EXAMPLE",
        "Arn": "arn:aws:iam::1234567989012:server-certificate/myServerCertificate",
        "UploadDate": "2019-04-22T21:13:44+00:00",
        "Expiration": "2019-10-15T22:23:16+00:00"
    }
}
```

For more information, see Creating, Uploading, and Deleting Server Certificates in the *Using IAM* guide.

- For API details, see UploadServerCertificate in *AWS CLI Command Reference*.

`upload-signing-certificate`

The following code example shows how to use `upload-signing-certificate`.

AWS CLI

To upload a signing certificate for an IAM user

The following `upload-signing-certificate` command uploads a signing certificate for the IAM user named Bob.

```
aws iam upload-signing-certificate \
    --user-name Bob \
    --certificate-body file://certificate.pem
```

Output:

```
{
    "Certificate": {
        "UserName": "Bob",
        "Status": "Active",
        "CertificateBody": "-----BEGIN CERTIFICATE-----<certificate-body>-----END
 CERTIFICATE-----",
        "CertificateId": "TA7SMP42TDN5Z26OBPJE7EXAMPLE",
```

```
        "UploadDate": "2013-06-06T21:40:08.121Z"
    }
}
```

The certificate is in a file named *certificate.pem* in PEM format.

For more information, see Creating and Uploading a User Signing Certificate in the *Using IAM* guide.

- For API details, see UploadSigningCertificate in *AWS CLI Command Reference*.

`upload-ssh-public-key`

The following code example shows how to use `upload-ssh-public-key`.

AWS CLI

To upload an SSH public key and associate it with a user

The following `upload-ssh-public-key` command uploads the public key found in the file `sshkey.pub` and attaches it to the user `sofia`.

```
aws iam upload-ssh-public-key \
    --user-name sofia \
    --ssh-public-key-body file://sshkey.pub
```

Output:

```
{
    "SSHPublicKey": {
        "UserName": "sofia",
        "SSHPublicKeyId": "APKA1234567890EXAMPLE",
        "Fingerprint": "12:34:56:78:90:ab:cd:ef:12:34:56:78:90:ab:cd:ef",
        "SSHPublicKeyBody": "ssh-rsa <<long string generated by ssh-keygen
 command>>",
        "Status": "Active",
        "UploadDate": "2019-04-18T17:04:49+00:00"
    }
}
```

For more information about how to generate keys in a format suitable for this command, see SSH and Linux, macOS, or Unix: Set up the public and private keys for Git and CodeCommit or SSH and Windows: Set up the public and private keys for Git and CodeCommit in the *AWS CodeCommit User Guide*.

- For API details, see UploadSshPublicKey in *AWS CLI Command Reference*.

IAM Access Analyzer examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with IAM Access Analyzer.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`apply-archive-rule`

The following code example shows how to use `apply-archive-rule`.

AWS CLI

To apply an archive rule to existing findings that meet the archive rule criteria

The following `apply-archive-rule` example applies an archive rule to existing findings that meet the archive rule criteria.

```
aws accessanalyzer apply-archive-rule \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
UnusedAccess-ConsoleAnalyzer-organization \
    --rule-name MyArchiveRule
```

This command produces no output.

For more information, see Archive rules in the *AWS IAM User Guide*.

- For API details, see ApplyArchiveRule in *AWS CLI Command Reference*.

`cancel-policy-generation`

The following code example shows how to use `cancel-policy-generation`.

AWS CLI

To cancel the requested policy generation

The following `cancel-policy-generation` example cancels the requested policy generation job id.

```
aws accessanalyzer cancel-policy-generation \
    --job-id 923a56b0-ebb8-4e80-8a3c-a11ccfbcd6f2
```

This command produces no output.

For more information, see IAM Access Analyzer policy generation in the *AWS IAM User Guide*.

- For API details, see CancelPolicyGeneration in *AWS CLI Command Reference*.

`check-access-not-granted`

The following code example shows how to use `check-access-not-granted`.

AWS CLI

To check whether the specified access isn't allowed by a policy

The following `check-access-not-granted` example checks whether the specified access isn't allowed by a policy.

```
aws accessanalyzer check-access-not-granted \
    --policy-document file://myfile.json \
    --access actions="s3:DeleteBucket","s3:GetBucketLocation" \
    --policy-type IDENTITY_POLICY
```

Contents of `myfile.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
```

```
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject",
                "s3:ListBucket"
            ],
            "Resource": [
                "arn:aws:s3:::amzn-s3-demo-bucket",
                "arn:aws:s3:::amzn-s3-demo-bucket/*"
            ]
        }
    ]
}
```

Output:

```
{
    "result": "PASS",
    "message": "The policy document does not grant access to perform one or more of
 the listed actions."
}
```

For more information, see Previewing access with IAM Access Analyzer APIs in the *AWS IAM User Guide*.

- For API details, see CheckAccessNotGranted in *AWS CLI Command Reference*.

`check-no-new-access`

The following code example shows how to use `check-no-new-access`.

AWS CLI

To check whether new access is allowed for an updated policy when compared to the existing policy

The following `check-no-new-access` example checks whether new access is allowed for an updated policy when compared to the existing policy.

```
aws accessanalyzer check-no-new-access \
    --existing-policy-document file://existing-policy.json \
    --new-policy-document file://new-policy.json \
```

```
    --policy-type IDENTITY_POLICY
```

Contents of `existing-policy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject",
                "s3:ListBucket"
            ],
            "Resource": [
                "arn:aws:s3:::amzn-s3-demo-bucket",
                "arn:aws:s3:::amzn-s3-demo-bucket/*"
            ]
        }
    ]
}
```

Contents of `new-policy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject",
                "s3:GetObjectAcl",
                "s3:ListBucket"
            ],
            "Resource": [
                "arn:aws:s3:::amzn-s3-demo-bucket",
                "arn:aws:s3:::amzn-s3-demo-bucket/*"
            ]
        }
    ]
}
```

Output:

```
{
    "result": "FAIL",
    "message": "The modified permissions grant new access compared to your existing
 policy.",
    "reasons": [
        {
            "description": "New access in the statement with index: 0.",
            "statementIndex": 0
        }
    ]
}
```

For more information, see Previewing access with IAM Access Analyzer APIs in the *AWS IAM User Guide*.

- For API details, see CheckNoNewAccess in *AWS CLI Command Reference*.

`check-no-public-access`

The following code example shows how to use `check-no-public-access`.

AWS CLI

To check whether a resource policy can grant public access to the specified resource type

The following `check-no-public-access` example checks whether a resource policy can grant public access to the specified resource type.

```
aws accessanalyzer check-no-public-access \
    --policy-document file://check-no-public-access-myfile.json \
    --resource-type AWS::S3::Bucket
```

Contents of `myfile.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "CheckNoPublicAccess",
            "Effect": "Allow",
            "Principal": { "AWS": "arn:aws:iam::111122223333:user/JohnDoe" },
            "Action": [
```

```
                "s3:GetObject"
            ]
        }
    ]
}
```

Output:

```
{
    "result": "PASS",
    "message": "The resource policy does not grant public access for the given
 resource type."
}
```

For more information, see Previewing access with IAM Access Analyzer APIs in the *AWS IAM User Guide*.

- For API details, see CheckNoPublicAccess in *AWS CLI Command Reference*.

`create-access-preview`

The following code example shows how to use `create-access-preview`.

AWS CLI

To create an access preview that allows you to preview IAM Access Analyzer findings for your resource before deploying resource permissions

The following `create-access-preview` example creates an access preview that allows you to preview IAM Access Analyzer findings for your resource before deploying resource permissions in your AWS account.

```
aws accessanalyzer create-access-preview \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account \
    --configurations file://myfile.json
```

Contents of `myfile.json`:

```
{
    "arn:aws:s3:::amzn-s3-demo-bucket": {
```

```
        "s3Bucket": {
            "bucketPolicy": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect
\":\"Allow\",\"Principal\":{\"AWS\":[\"arn:aws:iam::111122223333:root\"]},\"Action
\":[\"s3:PutObject\",\"s3:PutObjectAcl\"],\"Resource\":\"arn:aws:s3:::amzn-s3-demo-
bucket/*\"}]}",
            "bucketPublicAccessBlock": {
                "ignorePublicAcls": true,
                "restrictPublicBuckets": true
            },
            "bucketAclGrants": [
                {
                    "grantee": {
                        "id":
 "79a59df900b949e55d96a1e698fbacedfd6e09d98eacf8f8d5218e7cd47ef2be"
                    },
                    "permission": "READ"
                }
            ]
        }
    }
}
```

Output:

```
{
    "id": "3c65eb13-6ef9-4629-8919-a32043619e6b"
}
```

For more information, see Previewing access with IAM Access Analyzer APIs in the *AWS IAM User Guide*.

- For API details, see CreateAccessPreview in *AWS CLI Command Reference*.

`create-analyzer`

The following code example shows how to use `create-analyzer`.

AWS CLI

To create an analyzer

The following `create-analyzer` example creates an analyzer in your AWS account.

```
aws accessanalyzer create-analyzer \
    --analyzer-name example \
    --type ACCOUNT
```

Output:

```
{
    "arn": "arn:aws:access-analyzer:us-east-2:111122223333:analyzer/example"
}
```

For more information, see Getting started with AWS Identity and Access Management Access Analyzer findings in the *AWS IAM User Guide*.

- For API details, see CreateAnalyzer in *AWS CLI Command Reference*.

`create-archive-rule`

The following code example shows how to use `create-archive-rule`.

AWS CLI

To create an archive rule for the specified analyzer

The following `create-archive-rule` example creates an archive rule for the specified analyzer in your AWS account.

```
aws accessanalyzer create-archive-rule \
    --analyzer-name UnusedAccess-ConsoleAnalyzer-organization \
    --rule-name MyRule \
    --filter '{"resource": {"contains": ["Cognito"]}, "resourceType": {"eq":
 ["AWS::IAM::Role"]}}'
```

This command produces no output.

For more information, see Archive rules in the *AWS IAM User Guide*.

- For API details, see CreateArchiveRule in *AWS CLI Command Reference*.

`delete-analyzer`

The following code example shows how to use `delete-analyzer`.

AWS CLI

To delete the specified analyzer

The following `delete-analyzer` example deletes the specified analyzer in your AWS account.

```
aws accessanalyzer delete-analyzer \
    --analyzer-name example
```

This command produces no output.

For more information, see Archive rules in the *AWS IAM User Guide*.

- For API details, see DeleteAnalyzer in *AWS CLI Command Reference*.

`delete-archive-rule`

The following code example shows how to use `delete-archive-rule`.

AWS CLI

To delete the specified archive rule

The following `delete-archive-rule` example deletes the specified archive rule in your AWS account.

```
aws accessanalyzer delete-archive-rule \
    --analyzer-name UnusedAccess-ConsoleAnalyzer-organization \
    --rule-name MyRule
```

This command produces no output.

For more information, see Archive rules in the *AWS IAM User Guide*.

- For API details, see DeleteArchiveRule in *AWS CLI Command Reference*.

`get-access-preview`

The following code example shows how to use `get-access-preview`.

AWS CLI

To retrieves information about an access preview for the specified analyzer

The following `get-access-preview` example retrieves information about an access preview for the specified analyzer in your AWS account.

```
aws accessanalyzer get-access-preview \
    --access-preview-id 3c65eb13-6ef9-4629-8919-a32043619e6b \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account
```

Output:

```
{
    "accessPreview": {
        "id": "3c65eb13-6ef9-4629-8919-a32043619e6b",
        "analyzerArn": "arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account",
        "configurations": {
            "arn:aws:s3:::amzn-s3-demo-bucket": {
                "s3Bucket": {
                    "bucketPolicy": "{\"Version\":\"2012-10-17\",\"Statement\":
[{\"Effect\":\"Allow\",\"Principal\":{\"AWS\":[\"arn:aws:iam::111122223333:root\"]},
\"Action\":[\"s3:PutObject\",\"s3:PutObjectAcl\"],\"Resource\":\"arn:aws:s3:::amzn-
s3-demo-bucket/*\"}]}",
                    "bucketAclGrants": [
                        {
                            "permission": "READ",
                            "grantee": {
                                "id":
 "79a59df900b949e55d96a1e698fbacedfd6e09d98eacf8f8d5218e7cd47ef2be"
                            }
                        }
                    ],
                    "bucketPublicAccessBlock": {
                        "ignorePublicAcls": true,
                        "restrictPublicBuckets": true
                    }
                }
            }
        },
        "createdAt": "2024-02-17T00:18:44+00:00",
        "status": "COMPLETED"
    }
}
```

For more information, see Previewing access with IAM Access Analyzer APIs in the *AWS IAM User Guide*.

- For API details, see GetAccessPreview in *AWS CLI Command Reference*.

`get-analyzed-resource`

The following code example shows how to use `get-analyzed-resource`.

AWS CLI

To retrieve information about a resource that was analyzed

The following `get-analyzed-resource` example retrieves information about a resource that was analyzed in your AWS account.

```
aws accessanalyzer get-analyzed-resource \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account \
    --resource-arn arn:aws:s3:::amzn-s3-demo-bucket
```

Output:

```
{
    "resource": {
        "analyzedAt": "2024-02-15T18:01:53.002000+00:00",
        "isPublic": false,
        "resourceArn": "arn:aws:s3:::amzn-s3-demo-bucket",
        "resourceOwnerAccount": "111122223333",
        "resourceType": "AWS::S3::Bucket"
    }
}
```

For more information, see Using AWS Identity and Access Management Access Analyzer in the *AWS IAM User Guide*.

- For API details, see GetAnalyzedResource in *AWS CLI Command Reference*.

`get-analyzer`

The following code example shows how to use `get-analyzer`.

AWS CLI

To retrieve information about the specified analyzer

The following `get-analyzer` example retrieves information about the specified analyzer in your AWS account.

```
aws accessanalyzer get-analyzer \
    --analyzer-name ConsoleAnalyzer-account
```

Output:

```
{
    "analyzer": {
        "arn": "arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account",
        "createdAt": "2019-12-03T07:28:17+00:00",
        "lastResourceAnalyzed": "arn:aws:sns:us-west-2:111122223333:config-topic",
        "lastResourceAnalyzedAt": "2024-02-15T18:01:53.003000+00:00",
        "name": "ConsoleAnalyzer-account",
        "status": "ACTIVE",
        "tags": {
            "auto-delete": "no"
        },
        "type": "ACCOUNT"
    }
}
```

For more information, see Using AWS Identity and Access Management Access Analyzer in the *AWS IAM User Guide*.

- For API details, see GetAnalyzer in *AWS CLI Command Reference*.

`get-archive-rule`

The following code example shows how to use `get-archive-rule`.

AWS CLI

To retrieve information about an archive rule

The following `get-archive-rule` example retrieves information about an archive rule in your AWS account.

```
aws accessanalyzer get-archive-rule \
    --analyzer-name UnusedAccess-ConsoleAnalyzer-organization \
    --rule-name MyArchiveRule
```

Output:

```
{
    "archiveRule": {
        "createdAt": "2024-02-15T00:49:27+00:00",
        "filter": {
            "resource": {
                "contains": [
                    "Cognito"
                ]
            },
            "resourceType": {
                "eq": [
                    "AWS::IAM::Role"
                ]
            }
        },
        "ruleName": "MyArchiveRule",
        "updatedAt": "2024-02-15T00:49:27+00:00"
    }
}
```

For more information, see Archive rules in the *AWS IAM User Guide*.

- For API details, see GetArchiveRule in *AWS CLI Command Reference*.

get-finding-v2

The following code example shows how to use `get-finding-v2`.

AWS CLI

To retrieve information about the specified finding

The following `get-finding-v2` example etrieves information about the specified finding in your AWS account.

```
aws accessanalyzer get-finding-v2 \
```

```
    --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-organization \
    --id 0910eedb-381e-4e95-adda-0d25c19e6e90
```

Output:

```
{
    "findingDetails": [
        {
            "externalAccessDetails": {
                "action": [
                    "sts:AssumeRoleWithWebIdentity"
                ],
                "condition": {
                    "cognito-identity.amazonaws.com:aud": "us-
west-2:EXAMPLE0-0000-0000-0000-000000000000"
                },
                "isPublic": false,
                "principal": {
                    "Federated": "cognito-identity.amazonaws.com"
                }
            }
        }
    ],
    "resource": "arn:aws:iam::111122223333:role/Cognito_testpoolAuth_Role",
    "status": "ACTIVE",
    "error": null,
    "createdAt": "2021-02-26T21:17:50.905000+00:00",
    "resourceType": "AWS::IAM::Role",
    "findingType": "ExternalAccess",
    "resourceOwnerAccount": "111122223333",
    "analyzedAt": "2024-02-16T18:17:47.888000+00:00",
    "id": "0910eedb-381e-4e95-adda-0d25c19e6e90",
    "updatedAt": "2021-02-26T21:17:50.905000+00:00"
}
```

For more information, see Reviewing findings in the *AWS IAM User Guide*.

- For API details, see GetFindingV2 in *AWS CLI Command Reference*.

`get-finding`

The following code example shows how to use `get-finding`.

AWS CLI

To retrieve information about the specified finding

The following `get-finding` example etrieves information about the specified finding in your AWS account.

```
aws accessanalyzer get-finding \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-organization \
    --id 0910eedb-381e-4e95-adda-0d25c19e6e90
```

Output:

```
{
    "finding": {
        "id": "0910eedb-381e-4e95-adda-0d25c19e6e90",
        "principal": {
            "Federated": "cognito-identity.amazonaws.com"
        },
        "action": [
            "sts:AssumeRoleWithWebIdentity"
        ],
        "resource": "arn:aws:iam::111122223333:role/Cognito_testpoolAuth_Role",
        "isPublic": false,
        "resourceType": "AWS::IAM::Role",
        "condition": {
            "cognito-identity.amazonaws.com:aud": "us-
west-2:EXAMPLE0-0000-0000-0000-000000000000"
        },
        "createdAt": "2021-02-26T21:17:50.905000+00:00",
        "analyzedAt": "2024-02-16T18:17:47.888000+00:00",
        "updatedAt": "2021-02-26T21:17:50.905000+00:00",
        "status": "ACTIVE",
        "resourceOwnerAccount": "111122223333"
    }
}
```

For more information, see Reviewing findings in the *AWS IAM User Guide*.

- For API details, see GetFinding in *AWS CLI Command Reference*.

`get-generated-policy`

The following code example shows how to use `get-generated-policy`.

AWS CLI

To retrieve the policy that was generated using the `StartPolicyGeneration` API

The following `get-generated-policy` example retrieves the policy that was generated using the StartPolicyGeneration API in your AWS account.

```
aws accessanalyzer get-generated-policy \
    --job-id c557dc4a-0338-4489-95dd-739014860ff9
```

Output:

```
{
    "generatedPolicyResult": {
        "generatedPolicies": [
            {
                "policy": "{\"Version\":\"2012-10-17\",\"Statement\":
[{\"Sid\":\"SupportedServiceSid0\",\"Effect\":\"Allow\",\"Action\":
[\"access-analyzer:GetAnalyzer\",\"access-analyzer:ListAnalyzers\",
\"access-analyzer:ListArchiveRules\",\"access-analyzer:ListFindings
\",\"cloudtrail:DescribeTrails\",\"cloudtrail:GetEventDataStore\",
\"cloudtrail:GetEventSelectors\",\"cloudtrail:GetInsightSelectors
\",\"cloudtrail:GetTrailStatus\",\"cloudtrail:ListChannels\",
\"cloudtrail:ListEventDataStores\",\"cloudtrail:ListQueries\",\"cloudtrail:ListTags
\",\"cloudtrail:LookupEvents\",\"ec2:DescribeRegions\",\"iam:GetAccountSummary
\",\"iam:GetOpenIDConnectProvider\",\"iam:GetRole\",\"iam:ListAccessKeys\",
\"iam:ListAccountAliases\",\"iam:ListOpenIDConnectProviders\",\"iam:ListRoles
\",\"iam:ListSAMLProviders\",\"kms:ListAliases\",\"s3:GetBucketLocation\",
\"s3:ListAllMyBuckets\"],\"Resource\":\"*\"}]}"
            }
        ],
        "properties": {
            "cloudTrailProperties": {
                "endTime": "2024-02-14T22:44:40+00:00",
                "startTime": "2024-02-13T00:30:00+00:00",
                "trailProperties": [
                    {
                        "allRegions": true,
```

```
                        "cloudTrailArn": "arn:aws:cloudtrail:us-
west-2:111122223333:trail/my-trail",
                        "regions": []
                    }
                ]
            },
            "isComplete": false,
            "principalArn": "arn:aws:iam::111122223333:role/Admin"
        }
    },
    "jobDetails": {
        "completedOn": "2024-02-14T22:47:01+00:00",
        "jobId": "c557dc4a-0338-4489-95dd-739014860ff9",
        "startedOn": "2024-02-14T22:44:41+00:00",
        "status": "SUCCEEDED"
    }
}
```

For more information, see IAM Access Analyzer policy generation in the *AWS IAM User Guide*.

- For API details, see GetGeneratedPolicy in *AWS CLI Command Reference*.

`list-access-preview-findings`

The following code example shows how to use `list-access-preview-findings`.

AWS CLI

To retrieve a list of access preview findings generated by the specified access preview

The following `list-access-preview-findings` example retrieves a list of access preview findings generated by the specified access preview in your AWS account.

```
aws accessanalyzer list-access-preview-findings \
    --access-preview-id 3c65eb13-6ef9-4629-8919-a32043619e6b \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account
```

Output:

```
{
    "findings": [
```

```
        {
            "id": "e22fc158-1c87-4c32-9464-e7f405ce8d74",
            "principal": {
                "AWS": "111122223333"
            },
            "action": [
                "s3:PutObject",
                "s3:PutObjectAcl"
            ],
            "condition": {},
            "resource": "arn:aws:s3:::amzn-s3-demo-bucket",
            "isPublic": false,
            "resourceType": "AWS::S3::Bucket",
            "createdAt": "2024-02-17T00:18:46+00:00",
            "changeType": "NEW",
            "status": "ACTIVE",
            "resourceOwnerAccount": "111122223333",
            "sources": [
                {
                    "type": "POLICY"
                }
            ]
        }
    ]
}
```

For more information, see Previewing access with IAM Access Analyzer APIs in the *AWS IAM User Guide*.

- For API details, see ListAccessPreviewFindings in *AWS CLI Command Reference*.

`list-access-previews`

The following code example shows how to use `list-access-previews`.

AWS CLI

To retrieve a list of access previews for the specified analyzer

The following `list-access-previews` example retrieves a list of access previews for the specified analyzer in your AWS account.

```
aws accessanalyzer list-access-previews \
```

```
    --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account
```

Output:

```
{
    "accessPreviews": [
        {
            "id": "3c65eb13-6ef9-4629-8919-a32043619e6b",
            "analyzerArn": "arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account",
            "createdAt": "2024-02-17T00:18:44+00:00",
            "status": "COMPLETED"
        }
    ]
}
```

For more information, see Previewing access with IAM Access Analyzer APIs in the *AWS IAM User Guide*.

- For API details, see ListAccessPreviews in *AWS CLI Command Reference*.

`list-analyzed-resources`

The following code example shows how to use `list-analyzed-resources`.

AWS CLI

To list the available widgets

The following `list-analyzed-resources` example lists the available widgets in your AWS account.

```
aws accessanalyzer list-analyzed-resources \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account \
    --resource-type AWS::IAM::Role
```

Output:

```
{
    "analyzedResources": [
```

```
        {
            "resourceArn": "arn:aws:sns:us-west-2:111122223333:Validation-Email",
            "resourceOwnerAccount": "111122223333",
            "resourceType": "AWS::SNS::Topic"
        },
        {
            "resourceArn": "arn:aws:sns:us-west-2:111122223333:admin-alerts",
            "resourceOwnerAccount": "111122223333",
            "resourceType": "AWS::SNS::Topic"
        },
        {
            "resourceArn": "arn:aws:sns:us-west-2:111122223333:config-topic",
            "resourceOwnerAccount": "111122223333",
            "resourceType": "AWS::SNS::Topic"
        },
        {
            "resourceArn": "arn:aws:sns:us-west-2:111122223333:inspector-topic",
            "resourceOwnerAccount": "111122223333",
            "resourceType": "AWS::SNS::Topic"
        }
    ]
}
```

For more information, see Using AWS Identity and Access Management Access Analyzer in the *AWS IAM User Guide*.

- For API details, see ListAnalyzedResources in *AWS CLI Command Reference*.

`list-analyzers`

The following code example shows how to use `list-analyzers`.

AWS CLI

To retrieve a list of analyzers

The following `list-analyzers` example retrieves a list of analyzers in your AWS account.

```
aws accessanalyzer list-analyzers
```

Output:

```
{
```

```
    "analyzers": [
        {
            "arn": "arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
UnusedAccess-ConsoleAnalyzer-organization",
            "createdAt": "2024-02-15T00:46:40+00:00",
            "name": "UnusedAccess-ConsoleAnalyzer-organization",
            "status": "ACTIVE",
            "tags": {
                "auto-delete": "no"
            },
            "type": "ORGANIZATION_UNUSED_ACCESS"
        },
        {
            "arn": "arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-organization",
            "createdAt": "2020-04-25T07:43:28+00:00",
            "lastResourceAnalyzed": "arn:aws:s3:::amzn-s3-demo-bucket",
            "lastResourceAnalyzedAt": "2024-02-15T21:51:56.517000+00:00",
            "name": "ConsoleAnalyzer-organization",
            "status": "ACTIVE",
            "tags": {
                "auto-delete": "no"
            },
            "type": "ORGANIZATION"
        },
        {
            "arn": "arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account",
            "createdAt": "2019-12-03T07:28:17+00:00",
            "lastResourceAnalyzed": "arn:aws:sns:us-west-2:111122223333:config-
topic",

            "name": "ConsoleAnalyzer-account",
            "status": "ACTIVE",
            "tags": {
                "auto-delete": "no"
            },
            "type": "ACCOUNT"
        }
    ]
}
```

For more information, see Using AWS Identity and Access Management Access Analyzer in the *AWS IAM User Guide*.

- For API details, see ListAnalyzers in *AWS CLI Command Reference*.

`list-archive-rules`

The following code example shows how to use `list-archive-rules`.

AWS CLI

To retrieve a list of archive rules created for the specified analyzer

The following `list-archive-rules` example retrieves a list of archive rules created for the specified analyzer in your AWS account.

```
aws accessanalyzer list-archive-rules \
    --analyzer-name UnusedAccess-ConsoleAnalyzer-organization
```

Output:

```
{
    "archiveRules": [
        {
            "createdAt": "2024-02-15T00:49:27+00:00",
            "filter": {
                "resource": {
                    "contains": [
                        "Cognito"
                    ]
                },
                "resourceType": {
                    "eq": [
                        "AWS::IAM::Role"
                    ]
                }
            },
            "ruleName": "MyArchiveRule",
            "updatedAt": "2024-02-15T00:49:27+00:00"
        },
        {
            "createdAt": "2024-02-15T23:27:45+00:00",
            "filter": {
```

```
                "findingType": {
                    "eq": [
                        "UnusedIAMUserAccessKey"
                    ]
                }
            },
            "ruleName": "ArchiveRule-56125a39-e517-4ff8-afb1-ef06f58db612",
            "updatedAt": "2024-02-15T23:27:45+00:00"
        }
    ]
}
```

For more information, see [Using AWS Identity and Access Management Access Analyzer](#) in the *AWS IAM User Guide*.

- For API details, see [ListArchiveRules](#) in *AWS CLI Command Reference*.

`list-findings-v2`

The following code example shows how to use `list-findings-v2`.

AWS CLI

To retrieve a list of findings generated by the specified analyzer

The following `list-findings-v2` example retrieves a list of findings generated by the specified analyzer in your AWS account. This example filters the results to include only IAM roles whose name contains `Cognito`.

```
aws accessanalyzer list-findings-v2 \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account \
    --filter '{"resource": {"contains": ["Cognito"]}, "resourceType": {"eq":
 ["AWS::IAM::Role"]}}'
```

Output:

```
{
    "findings": [
        {
            "analyzedAt": "2024-02-16T18:17:47.888000+00:00",
            "createdAt": "2021-02-26T21:17:24.710000+00:00",
```

```
            "id": "597f3bc2-3adc-4c18-9879-5c4b23485e46",
            "resource": "arn:aws:iam::111122223333:role/
Cognito_testpoolUnauth_Role",
            "resourceType": "AWS::IAM::Role",
            "resourceOwnerAccount": "111122223333",
            "status": "ACTIVE",
            "updatedAt": "2021-02-26T21:17:24.710000+00:00",
            "findingType": "ExternalAccess"
        },
        {
            "analyzedAt": "2024-02-16T18:17:47.888000+00:00",
            "createdAt": "2021-02-26T21:17:50.905000+00:00",
            "id": "ce0e221a-85b9-4d52-91ff-d7678075442f",
            "resource": "arn:aws:iam::111122223333:role/Cognito_testpoolAuth_Role",
            "resourceType": "AWS::IAM::Role",
            "resourceOwnerAccount": "111122223333",
            "status": "ACTIVE",
            "updatedAt": "2021-02-26T21:17:50.905000+00:00",
            "findingType": "ExternalAccess"
        }
    ]
}
```

For more information, see Using AWS Identity and Access Management Access Analyzer in the *AWS IAM User Guide*.

- For API details, see ListFindingsV2 in *AWS CLI Command Reference*.

`list-findings`

The following code example shows how to use `list-findings`.

AWS CLI

To retrieve a list of findings generated by the specified analyzer

The following `list-findings` example retrieves a list of findings generated by the specified analyzer in your AWS account. This example filters the results to include only IAM roles whose name contains `Cognito`.

```
aws accessanalyzer list-findings \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account \
```

```
    --filter '{"resource": {"contains": ["Cognito"]}, "resourceType": {"eq": 
["AWS::IAM::Role"]}}'
```

Output:

```
{
    "findings": [
        {
            "id": "597f3bc2-3adc-4c18-9879-5c4b23485e46",
            "principal": {
                "Federated": "cognito-identity.amazonaws.com"
            },
            "action": [
                "sts:AssumeRoleWithWebIdentity"
            ],
            "resource": "arn:aws:iam::111122223333:role/
Cognito_testpoolUnauth_Role",
            "isPublic": false,
            "resourceType": "AWS::IAM::Role",
            "condition": {
                "cognito-identity.amazonaws.com:aud": "us-

            "updatedAt": "2021-02-26T21:17:50.905000+00:00",
            "status": "ACTIVE",
            "resourceOwnerAccount": "111122223333"
        }
    ]
}
```

For more information, see Using AWS Identity and Access Management Access Analyzer in the *AWS IAM User Guide*.

- For API details, see ListFindings in *AWS CLI Command Reference*.

`list-policy-generations`

The following code example shows how to use `list-policy-generations`.

AWS CLI

To list all of the policy generations requested in the last seven days

The following `list-policy-generations` example lists all of the policy generations requested in the last seven days in your AWS account.

```
aws accessanalyzer list-policy-generations
```

Output:

```
{
    "policyGenerations": [
        {
            "completedOn": "2024-02-14T23:43:38+00:00",
            "jobId": "923a56b0-ebb8-4e80-8a3c-a11ccfbcd6f2",
            "principalArn": "arn:aws:iam::111122223333:role/Admin",
            "startedOn": "2024-02-14T23:43:02+00:00",
            "status": "CANCELED"
        },
        {
            "completedOn": "2024-02-14T22:47:01+00:00",
            "jobId": "c557dc4a-0338-4489-95dd-739014860ff9",
```

```
                "principalArn": "arn:aws:iam::111122223333:role/Admin",
                "startedOn": "2024-02-14T22:44:41+00:00",
                "status": "SUCCEEDED"
            }
        ]
}
```

For more information, see IAM Access Analyzer policy generation in the *AWS IAM User Guide*.

- For API details, see ListPolicyGenerations in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To retrieve a list of tags applied to the specified resource

The following `list-tags-for-resource` example retrieves a list of tags applied to the specified resource in your AWS account.

```
aws accessanalyzer list-tags-for-resource \
    --resource-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account
```

Output:

```
{
    "tags": {
        "Zone-of-trust": "Account",
        "Name": "ConsoleAnalyzer"
    }
}
```

For more information, see IAM Access Analyzer policy generation in the *AWS IAM User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`start-policy-generation`

The following code example shows how to use `start-policy-generation`.

AWS CLI

To start a policy generation request

The following `start-policy-generation` example starts a policy generation request in your AWS account.

```
aws accessanalyzer start-policy-generation \
    --policy-generation-details '{"principalArn":"arn:aws:iam::111122223333:role/
Admin"}' \
    --cloud-trail-details file://myfile.json
```

Contents of `myfile.json`:

```
{
    "accessRole": "arn:aws:iam::111122223333:role/service-role/
AccessAnalyzerMonitorServiceRole",
    "startTime": "2024-02-13T00:30:00Z",
    "trails": [
        {
            "allRegions": true,
            "cloudTrailArn": "arn:aws:cloudtrail:us-west-2:111122223333:trail/my-
trail"
        }
    ]
}
```

Output:

```
{
    "jobId": "c557dc4a-0338-4489-95dd-739014860ff9"
}
```

For more information, see IAM Access Analyzer policy generation in the *AWS IAM User Guide*.

- For API details, see StartPolicyGeneration in *AWS CLI Command Reference*.

`start-resource-scan`

The following code example shows how to use `start-resource-scan`.

AWS CLI

To immediately start a scan of the policies applied to the specified resource

The following `start-resource-scan` example mmediately starts a scan of the policies applied to the specified resource in your AWS account.

```
aws accessanalyzer start-resource-scan \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account \
    --resource-arn arn:aws:iam::111122223333:role/Cognito_testpoolAuth_Role
```

This command produces no output.

For more information, see IAM Access Analyzer policy generation in the *AWS IAM User Guide*.

- For API details, see StartResourceScan in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add a tag to the specified resource

The following `tag-resource` example adds a tag to the specified resource in your AWS account.

```
aws accessanalyzer tag-resource \
    --resource-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account \
    --tags Environment=dev,Purpose=testing
```

This command produces no output.

For more information, see Using AWS Identity and Access Management Access Analyzer in the *AWS IAM User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from the specified resources

The following `untag-resource` example removes tags from the specified resource in your AWS account.

```
aws accessanalyzer untag-resource \
    --resource-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account \
    --tag-keys Environment Purpose
```

This command produces no output.

For more information, see Using AWS Identity and Access Management Access Analyzer in the *AWS IAM User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-archive-rule`

The following code example shows how to use `update-archive-rule`.

AWS CLI

To update the criteria and values for the specified archive rule

The following `update-archive-rule` example updates the criteria and values for the specified archive rule in your AWS account.

```
aws accessanalyzer update-archive-rule \
    --analyzer-name UnusedAccess-ConsoleAnalyzer-organization \
    --rule-name MyArchiveRule \
    --filter '{"resource": {"contains": ["Cognito"]}, "resourceType": {"eq":
 ["AWS::IAM::Role"]}}'
```

This command produces no output.

For more information, see Archive rules in the *AWS IAM User Guide*.

- For API details, see UpdateArchiveRule in *AWS CLI Command Reference*.

`update-findings`

The following code example shows how to use `update-findings`.

AWS CLI

To update the status for the specified findings

The following `update-findings` example updates the status for the specified findings in your AWS account.

```
aws accessanalyzer update-findings \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
UnusedAccess-ConsoleAnalyzer-organization \
    --ids 4f319ac3-2e0c-4dc4-bf51-7013a086b6ae 780d586a-2cce-4f72-aff6-359d450e7500
 \
    --status ARCHIVED
```

This command produces no output.

For more information, see Using AWS Identity and Access Management Access Analyzer in the *AWS IAM User Guide*.

- For API details, see UpdateFindings in *AWS CLI Command Reference*.

`validate-policy`

The following code example shows how to use `validate-policy`.

AWS CLI

To request the validation of a policy and returns a list of findings

The following `validate-policy` example requests the validation of a policy and returns a list of findings. The policy in the example is a role trust policy for an Amazon Cognito role used for web identity federation. The findings generated from the trust policy relate to an empty `Sid` element value and a mismatched policy principal due to the incorrect assume role action being used, `sts:AssumeRole`. The correct assume role action for use with Cognito is `sts:AssumeRoleWithWebIdentity`.

```
aws accessanalyzer validate-policy \
    --policy-document file://myfile.json \
    --policy-type RESOURCE_POLICY
```

Contents of `myfile.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "",
            "Effect": "Allow",
            "Principal": {
                "Federated": "cognito-identity.amazonaws.com"
            },
            "Action": [
                "sts:AssumeRole",
                "sts:TagSession"
            ],
            "Condition": {
                "StringEquals": {
                    "cognito-identity.amazonaws.com:aud": "us-west-2_EXAMPLE"
                }
            }
        }
    ]
}
```

Output:

```
{
    "findings": [
        {
            "findingDetails": "Add a value to the empty string in the Sid element.",
            "findingType": "SUGGESTION",
            "issueCode": "EMPTY_SID_VALUE",
            "learnMoreLink": "https://docs.aws.amazon.com/IAM/latest/UserGuide/
access-analyzer-reference-policy-checks.html#access-analyzer-reference-policy-
checks-suggestion-empty-sid-value",
            "locations": [
                {
                    "path": [
```

```
                        {
                            "value": "Statement"
                        },
                        {
                            "index": 0
                        },
                        {
                            "value": "Sid"

        }
    ]
}
```

For more information, see Checks for validating policies in the *AWS IAM User Guide*.

- For API details, see ValidatePolicy in *AWS CLI Command Reference*.

Image Builder examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Image Builder.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Actions

`create-component`

The following code example shows how to use `create-component`.

AWS CLI

To create a component

The following `create-component` example creates a component that uses a JSON document file and references a component document in YAML format that is uploaded to an Amazon S3 bucket.

```
aws imagebuilder create-component \
    --cli-input-json file://create-component.json
```

Contents of `create-component.json`:

```
{
    "name": "MyExampleComponent",
    "semanticVersion": "2019.12.02",
    "description": "An example component that builds, validates and tests an image",
    "changeDescription": "Initial version.",
    "platform": "Windows",
```

```
    "uri": "s3://s3-bucket-name/s3-bucket-path/component.yaml"
}
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "componentBuildVersionArn": "arn:aws:imagebuilder:us-
west-2:123456789012:component/examplecomponent/2019.12.02/1"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see CreateComponent in *AWS CLI Command Reference*.

`create-distribution-configuration`

The following code example shows how to use `create-distribution-configuration`.

AWS CLI

To create a distribution configuration

The following `create-distribution-configuration` example creates a distribution configuration using a JSON file.

```
aws imagebuilder create-distribution-configuration \
    --cli-input-json file:/create-distribution-configuration.json
```

Contents of `create-distribution-configuration.json`:

```
{
    "name": "MyExampleDistribution",
    "description": "Copies AMI to eu-west-1",
    "distributions": [
        {
            "region": "us-west-2",
            "amiDistributionConfiguration": {
```

```
                "name": "Name {{imagebuilder:buildDate}}",
                "description": "An example image name with parameter references",
                "amiTags": {
                    "KeyName": "{{ssm:parameter_name}}"
                },
                "launchPermission": {
                    "userIds": [
                        "123456789012"
                    ]
                }
            }
        },
        {
            "region": "eu-west-1",
            "amiDistributionConfiguration": {
                "name": "My {{imagebuilder:buildVersion}} image
 {{imagebuilder:buildDate}}",
                "amiTags": {
                    "KeyName": "Value"
                },
                "launchPermission": {
                    "userIds": [
                        "123456789012"
                    ]
                }
            }
        }
    ]
}
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "distributionConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:distribution-configuration/myexampledistribution"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see CreateDistributionConfiguration in *AWS CLI Command Reference*.

`create-image-pipeline`

The following code example shows how to use `create-image-pipeline`.

AWS CLI

To create an image pipeline

The following `create-image-pipeline` example creates an image pipeline using a JSON file.

```
aws imagebuilder create-image-pipeline \
    --cli-input-json file://create-image-pipeline.json
```

Contents of `create-image-pipeline.json`:

```
{
    "name": "MyWindows2016Pipeline",
    "description": "Builds Windows 2016 Images",
    "imageRecipeArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/
mybasicrecipe/2019.12.03",
    "infrastructureConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:infrastructure-configuration/myexampleinfrastructure",
    "distributionConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:distribution-configuration/myexampledistribution",
    "imageTestsConfiguration": {
        "imageTestsEnabled": true,
        "timeoutMinutes": 60
    },
    "schedule": {
        "scheduleExpression": "cron(0 0 * * SUN)",
        "pipelineExecutionStartCondition":
 "EXPRESSION_MATCH_AND_DEPENDENCY_UPDATES_AVAILABLE"
    },
    "status": "ENABLED"
}
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "imagePipelineArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline"
```

```
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see CreateImagePipeline in *AWS CLI Command Reference*.

`create-image-recipe`

The following code example shows how to use `create-image-recipe`.

AWS CLI

To create a recipe

The following `create-image-recipe` example creates an image recipe using a JSON file. Components are installed in the order in which they are specified.

```
aws imagebuilder create-image-recipe \
    --cli-input-json file://create-image-recipe.json
```

Contents of `create-image-recipe.json`:

```
{
    "name": "MyBasicRecipe",
    "description": "This example image recipe creates a Windows 2016 image.",
    "semanticVersion": "2019.12.03",
    "components":
    [
        {
            "componentArn": "arn:aws:imagebuilder:us-west-2:123456789012:component/
myexamplecomponent/2019.12.02/1"
        },
        {
            "componentArn": "arn:aws:imagebuilder:us-west-2:123456789012:component/
myimportedcomponent/1.0.0/1"
        }
    ],
    "parentImage": "arn:aws:imagebuilder:us-west-2:aws:image/windows-server-2016-
english-full-base-x86/xxxx.x.x"
}
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "imageRecipeArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/
mybasicrecipe/2019.12.03"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see CreateImageRecipe in *AWS CLI Command Reference*.

`create-image`

The following code example shows how to use `create-image`.

AWS CLI

To create an image

The following `create-image` example creates an image.

```
aws imagebuilder create-image \
    --image-recipe-arn arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/
mybasicrecipe/2019.12.03 \
    --infrastructure-configuration-arn arn:aws:imagebuilder:us-
west-2:123456789012:infrastructure-configuration/myexampleinfrastructure
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "imageBuildVersionArn": "arn:aws:imagebuilder:us-west-2:123456789012:image/
mybasicrecipe/2019.12.03/1"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see CreateImage in *AWS CLI Command Reference*.

`create-infrastructure-configuration`

The following code example shows how to use `create-infrastructure-configuration`.

AWS CLI

To create an infrastructure configuration

The following `create-infrastructure-configuration` example creates an infrastructure configuration using a JSON file.

```
aws imagebuilder create-infrastructure-configuration \
    --cli-input-json file://create-infrastructure-configuration.json
```

Contents of `create-infrastructure-configuration.json`:

```
{
    "name": "MyExampleInfrastructure",
    "description": "An example that will retain instances of failed builds",
    "instanceTypes": [
        "m5.large", "m5.xlarge"
    ],
    "instanceProfileName": "EC2InstanceProfileForImageBuilder",
    "securityGroupIds": [
        "sg-a1b2c3d4"
    ],
    "subnetId": "subnet-a1b2c3d4",
    "logging": {
        "s3Logs": {
            "s3BucketName": "bucket-name",
            "s3KeyPrefix": "bucket-path"
        }
    },
    "keyPair": "key-pair-name",
    "terminateInstanceOnFailure": false,
    "snsTopicArn": "arn:aws:sns:us-west-2:123456789012:sns-topic-name"
}
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
```

```
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "infrastructureConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:infrastructure-configuration/myexampleinfrastructure"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see CreateInfrastructureConfiguration in *AWS CLI Command Reference*.

`delete-component`

The following code example shows how to use `delete-component`.

AWS CLI

To delete a component

The following `delete-component` example deletes a component build version by specifying its ARN.

```
aws imagebuilder delete-component \
    --component-build-version-arn arn:aws:imagebuilder:us-
west-2:123456789012:component/myexamplecomponent/2019.12.02/1
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "componentBuildVersionArn": "arn:aws:imagebuilder:us-
west-2:123456789012:component/myexamplecomponent/2019.12.02/1"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see DeleteComponent in *AWS CLI Command Reference*.

`delete-image-pipeline`

The following code example shows how to use `delete-image-pipeline`.

AWS CLI

To delete an image pipeline

The following `delete-image-pipeline` example deletes an image pipeline by specifying its ARN.

```
aws imagebuilder delete-image-pipeline \
    --image-pipeline-arn arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
my-example-pipeline
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imagePipelineArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see DeleteImagePipeline in *AWS CLI Command Reference*.

`delete-image-recipe`

The following code example shows how to use `delete-image-recipe`.

AWS CLI

To delete an image recipe

The following `delete-image-recipe` example deletes an image recipe by specifying its ARN.

```
aws imagebuilder delete-image-recipe \
    --image-recipe-arn arn:aws:imagebuilder:us-east-1:123456789012:image-recipe/
mybasicrecipe/2019.12.03
```

Output:

```
{
```

```
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imageRecipeArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/
mybasicrecipe/2019.12.03"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see DeleteImageRecipe in *AWS CLI Command Reference*.

`delete-image`

The following code example shows how to use `delete-image`.

AWS CLI

To delete an image

The following `delete-image` example deletes an image build version by specifying its ARN.

```
aws imagebuilder delete-image \
    --image-build-version-arn arn:aws:imagebuilder:us-west-2:123456789012:image/my-
example-image/2019.12.02/1
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imageBuildVersionArn": "arn:aws:imagebuilder:us-west-2:123456789012:image/
mybasicrecipe/2019.12.03/1"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see DeleteImage in *AWS CLI Command Reference*.

`delete-infrastructure-configuration`

The following code example shows how to use `delete-infrastructure-configuration`.

AWS CLI

To delete an infrastructure configuration

The following `delete-infrastructure-configuration` example deletes an image pipeline by specifying its ARN.

```
aws imagebuilder delete-infrastructure-configuration \
    --infrastructure-configuration-arn arn:aws:imagebuilder:us-
east-1:123456789012:infrastructure-configuration/myexampleinfrastructure
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "infrastructureConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:infrastructure-configuration/myexampleinfrastructure"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see DeleteInfrastructureConfiguration in *AWS CLI Command Reference*.

`get-component-policy`

The following code example shows how to use `get-component-policy`.

AWS CLI

To get component policy details

The following `get-component-policy` example lists the details of a component policy by specifying its ARN.

```
aws imagebuilder get-component-policy \
    --component-arn arn:aws:imagebuilder:us-west-2:123456789012:component/my-
example-component/2019.12.03/1
```

Output:

```
{
```

```
    "Policy": "{ "Version":"2012-10-17",        "Statement": [ { "Effect":
 "Allow", "Principal": { "AWS": [ "123456789012" ] }, "Action":
 [ "imagebuilder:GetComponent", "imagebuilder:ListComponents" ], "Resource":
 [ "arn:aws:imagebuilder:us-west-2:123456789012:component/my-example-
component/2019.12.03/1" ] } ] }"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI <https://docs.aws.amazon.com/imagebuilder/latest/userguide/managing-image-builder-cli.html>`__ in the *EC2 Image Builder Users Guide*.

- For API details, see GetComponentPolicy in *AWS CLI Command Reference*.

get-component

The following code example shows how to use `get-component`.

AWS CLI

To get component details

The following `get-component` example lists the details of a component by specifying its ARN.

```
aws imagebuilder get-component \
    --component-build-version-arn arn:aws:imagebuilder:us-
west-2:123456789012:component/component-name/1.0.0/1
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "component": {
        "arn": "arn:aws:imagebuilder:us-west-2:123456789012:component/component-
name/1.0.0/1",
        "name": "component-name",
        "version": "1.0.0",
        "type": "TEST",
        "platform": "Linux",
        "owner": "123456789012",
        "data": "name: HelloWorldTestingDocument\ndescription: This is hello world
 testing document.\nschemaVersion: 1.0\n\nphases:\n  - name: test\n    steps:\n
   - name: HelloWorldStep\n        action: ExecuteBash\n        inputs:\n
 commands:\n            - echo \"Hello World! Test.\"\n",
```

```
            "encrypted": true,
            "dateCreated": "2020-01-27T20:43:30.306Z",
            "tags": {}
        }
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see GetComponent in *AWS CLI Command Reference*.

`get-distribution-configuration`

The following code example shows how to use `get-distribution-configuration`.

AWS CLI

To get the details of a distribution configuration

The following `get-distribution-configuration` example displays the details of a distribution configuration by specifying its ARN.

```
aws imagebuilder get-distribution-configuration \
    --distribution-configuration-arn arn:aws:imagebuilder:us-
west-2:123456789012:distribution-configuration/myexampledistribution
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "distributionConfiguration": {
        "arn": "arn:aws:imagebuilder:us-west-2:123456789012:distribution-
configuration/myexampledistribution",
        "name": "MyExampleDistribution",
        "description": "Copies AMI to eu-west-1 and exports to S3",
        "distributions": [
            {
                "region": "us-west-2",
                "amiDistributionConfiguration": {
                    "name": "Name {{imagebuilder:buildDate}}",
                    "description": "An example image name with parameter
 references",
```

```
                    "amiTags": {
                        "KeyName": "{{ssm:parameter_name}}"
                    },
                    "launchPermission": {
                        "userIds": [
                            "123456789012"
                        ]
                    }
                }
            },
            {
                "region": "eu-west-1",
                "amiDistributionConfiguration": {
                    "name": "My {{imagebuilder:buildVersion}} image
 {{imagebuilder:buildDate}}",
                    "amiTags": {
                        "KeyName": "Value"
                    },
                    "launchPermission": {
                        "userIds": [
                            "123456789012"
                        ]
                    }
                }
            }
        ],
        "dateCreated": "2020-02-19T18:40:10.529Z",

    }
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see GetDistributionConfiguration in *AWS CLI Command Reference*.

`get-image-pipeline`

The following code example shows how to use `get-image-pipeline`.

AWS CLI

To get image pipeline details

The following `get-image-pipeline` example lists the details of an image pipeline by specifying its ARN.

```
aws imagebuilder get-image-pipeline \
    --image-pipeline-arn arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imagePipeline": {
        "arn": "arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline",
        "name": "MyWindows2016Pipeline",
        "description": "Builds Windows 2016 Images",
        "platform": "Windows",
        "imageRecipeArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/
mybasicrecipe/2019.12.03",
        "infrastructureConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:infrastructure-configuration/myexampleinfrastructure",
        "distributionConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:distribution-configuration/myexampledistribution",
        "imageTestsConfiguration": {
            "imageTestsEnabled": true,
            "timeoutMinutes": 60
        },

 "EXPRESSION_MATCH_AND_DEPENDENCY_UPDATES_AVAILABLE"
        },
        "status": "ENABLED",
        "dateCreated": "2020-02-19T19:04:01.253Z",
        "dateUpdated": "2020-02-19T19:04:01.253Z",
        "tags": {}
    }
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see GetImagePipeline in *AWS CLI Command Reference*.

`get-image-policy`

The following code example shows how to use `get-image-policy`.

AWS CLI

To get image policy details

The following `get-image-policy` example lists the details of an image policy by specifying its ARN.

```
aws imagebuilder get-image-policy \
    --image-arn arn:aws:imagebuilder:us-west-2:123456789012:image/my-example-
image/2019.12.03/1
```

Output:

```
{
    "Policy": "{ "Version":"2012-10-17",        "Statement": [ { "Effect": "Allow",
 "Principal": { "AWS": [ "123456789012" ] }, "Action": [ "imagebuilder:GetImage",
 "imagebuilder:ListImages" ], "Resource": [ "arn:aws:imagebuilder:us-
west-2:123456789012:image/my-example-image/2019.12.03/1" ] } ] }"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see GetImagePolicy in *AWS CLI Command Reference*.

`get-image-recipe-policy`

The following code example shows how to use `get-image-recipe-policy`.

AWS CLI

To get image recipe policy details

The following `get-image-recipe-policy` example lists the details of an image recipe policy by specifying its ARN.

```
aws imagebuilder get-image-recipe-policy \
```

```
    --image-recipe-arn arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/my-example-image-recipe/2019.12.03/1
```

Output:

```
{
    "Policy": "{ "Version":"2012-10-17",        "Statement": [ { "Effect":
 "Allow", "Principal": { "AWS": [ "123456789012" ] }, "Action":
 [ "imagebuilder:GetImageRecipe", "imagebuilder:ListImageRecipes" ], "Resource":
 [ "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/my-example-image-recipe/2019.12.03/1" ] } ] }"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see GetImageRecipePolicy in *AWS CLI Command Reference*.

`get-image`

The following code example shows how to use `get-image`.

AWS CLI

To get image details

The following `get-image` example lists the details of an image by specifying its ARN.

```
aws imagebuilder get-image \
    --image-build-version-arn arn:aws:imagebuilder:us-west-2:123456789012:image/mybasicrecipe/2019.12.03/1
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "image": {
        "arn": "arn:aws:imagebuilder:us-west-2:123456789012:image/mybasicrecipe/2019.12.03/1",

- For API details, see GetImage in *AWS CLI Command Reference*.

get-infrastructure-configuration

The following code example shows how to use `get-infrastructure-configuration`.

AWS CLI

To get infrastructure configuration details

The following `get-infrastructure-configuration` example lists the details of an infrastructure configuration by specifying its ARN.

```
aws imagebuilder get-infrastructure-configuration \
    --infrastructure-configuration-arn arn:aws:imagebuilder:us-
west-2:123456789012:infrastructure-configuration/myexampleinfrastructure
```

Output:

```
{
```

```
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "infrastructureConfiguration": {
        "arn": "arn:aws:imagebuilder:us-west-2:123456789012:infrastructure-
configuration/myexampleinfrastructure",
        "name": "MyExampleInfrastructure",
        "description": "An example that will retain instances of failed builds",
        "instanceTypes": [
            "m5.large",
            "m5.xlarge"
        ],
        "instanceProfileName": "EC2InstanceProfileForImageBuilder",
        "securityGroupIds": [
            "sg-a48c95ef"
        ],
        "subnetId": "subnet-a48c95ef",
        "logging": {
            "s3Logs": {
                "s3BucketName": "bucket-name",
                "s3KeyPrefix": "bucket-path"
            }
        },
        "keyPair": "Name",
        "terminateInstanceOnFailure": false,
        "snsTopicArn": "arn:aws:sns:us-west-2:123456789012:sns-name",
        "dateCreated": "2020-02-19T19:11:51.858Z",
        "tags": {}
    }
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see GetInfrastructureConfiguration in *AWS CLI Command Reference*.

`import-component`

The following code example shows how to use `import-component`.

AWS CLI

To import a component

The following `import-component` example imports a preexisting script using a JSON file.

```
aws imagebuilder import-component \
    --cli-input-json file://import-component.json
```

Contents of `import-component.json`:

```
{
    "name": "MyImportedComponent",
    "semanticVersion": "1.0.0",
    "description": "An example of how to import a component",
    "changeDescription": "First commit message.",
    "format": "SHELL",
    "platform": "Windows",
    "type": "BUILD",
    "uri": "s3://s3-bucket-name/s3-bucket-path/component.yaml"
}
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "componentBuildVersionArn": "arn:aws:imagebuilder:us-
west-2:123456789012:component/myimportedcomponent/1.0.0/1"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see ImportComponent in *AWS CLI Command Reference*.

`list-component-build-versions`

The following code example shows how to use `list-component-build-versions`.

AWS CLI

To list component build versions

The following `list-component-build-versions` example lists the component build versions with a specific semantic version.

```
aws imagebuilder list-component-build-versions --component-
version-arn arn:aws:imagebuilder:us-west-2:123456789012:component/
myexamplecomponent/2019.12.02
```

Output:

```
{

- For API details, see ListComponentBuildVersions in *AWS CLI Command Reference*.

`list-components`

The following code example shows how to use `list-components`.

AWS CLI

To list all of the component semantic versions

The following `list-components` example lists all of the component semantic versions to which you have access. You can optionally filter on whether to list components owned by you, by Amazon, or that have been shared with you by other accounts.

```
aws imagebuilder list-components
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "componentVersionList": [
        {
            "arn": "arn:aws:imagebuilder:us-west-2:123456789012:component/component-
name/1.0.0",
            "name": "component-name",
            "version": "1.0.0",
            "platform": "Linux",
            "type": "TEST",
            "owner": "123456789012",
            "dateCreated": "2020-01-27T20:43:30.306Z"
        }
    ]
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see ListComponents in *AWS CLI Command Reference*.

`list-distribution-configurations`

The following code example shows how to use `list-distribution-configurations`.

AWS CLI

To list distributions

The following `list-distribution-configurations` example lists all of your distributions.

```
aws imagebuilder list-distribution-configurations
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "distributionConfigurationSummaryList": [
        {
            "arn": "arn:aws:imagebuilder:us-west-2:123456789012:distribution-
configuration/myexampledistribution",
            "name": "MyExampleDistribution",
            "description": "Copies AMI to eu-west-1 and exports to S3",
            "dateCreated": "2020-02-19T18:40:10.529Z",
            "tags": {
                "KeyName": "KeyValue"
            }
        }
    ]
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see ListDistributionConfigurations in *AWS CLI Command Reference*.

`list-image-build-versions`

The following code example shows how to use `list-image-build-versions`.

AWS CLI

To list image build versions

The following `list-image-build-versions` example lists all of the image build versions with a semantic version.

```
aws imagebuilder list-image-build-versions \
    --image-version-arn arn:aws:imagebuilder:us-west-2:123456789012:image/
mybasicrecipe/2019.12.03
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imageSummaryList": [
        {
```

```
            "arn": "arn:aws:imagebuilder:us-west-2:123456789012:image/

`list-images`

The following code example shows how to use `list-images`.

AWS CLI

To list images

The following `list-images` example lists all of the semantic versions you have access to.

```
aws imagebuilder list-images
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
```

```
    "imageVersionList": [
        {
            "arn": "arn:aws:imagebuilder:us-west-2:123456789012:image/
mybasicrecipe/2019.12.03",
            "name": "MyBasicRecipe",
            "version": "2019.12.03",
            "platform": "Windows",
            "owner": "123456789012",
            "dateCreated": "2020-02-14T21:29:18.810Z"
        }
    ]
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see ListImages in *AWS CLI Command Reference*.

`list-infrastructure-configurations`

The following code example shows how to use `list-infrastructure-configurations`.

AWS CLI

To list infrastructure configurations

The following `list-infrastructure-configurations` example lists all of your infrastructure configurations.

```
aws imagebuilder list-infrastructure-configurations
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "infrastructureConfigurationSummaryList": [
        {
            "arn": "arn:aws:imagebuilder:us-west-2:123456789012:infrastructure-
configuration/myexampleinfrastructure",
            "name": "MyExampleInfrastructure",
            "description": "An example that will retain instances of failed builds",
```

```
            "dateCreated": "2020-02-19T19:11:51.858Z",
            "tags": {}
        },
        {
            "arn": "arn:aws:imagebuilder:us-west-2:123456789012:infrastructure-
configuration/infrastructureconfiguration-name-a1b2c3d45678",
            "name": "infrastructureConfiguration-name-a1b2c3d45678",
            "dateCreated": "2019-12-16T18:19:01.038Z",
            "tags": {
                "KeyName": "KeyValue"
            }
        }
    ]
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see ListInfrastructureConfigurations in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a specific resource

The following `list-tags-for-resource` example lists all of the tags for a specific resource.

```
aws imagebuilder list-tags-for-resource \
    --resource-arn arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline
```

Output:

```
{
    "tags": {
        "KeyName": "KeyValue"
    }
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`put-component-policy`

The following code example shows how to use `put-component-policy`.

AWS CLI

To apply a resource policy to a component

The following `put-component-policy` command applies a resource policy to a build component to enable cross-account sharing of build components. We recommend you use the RAM CLI command `create-resource-share`. If you use the EC2 Image Builder CLI command `put-component-policy`, you must also use the RAM CLI command `promote-resource-share-create-from-policy` in order for the resource to be visible to all principals with whom the resource is shared.

```
aws imagebuilder put-component-policy \
    --component-arn arn:aws:imagebuilder:us-west-2:123456789012:component/
examplecomponent/2019.12.02/1 \
    --policy '{ "Version":"2012-10-17",        "Statement": [ { "Effect":
 "Allow", "Principal": { "AWS": [ "123456789012" ] }, "Action":
 [ "imagebuilder:GetComponent", "imagebuilder:ListComponents" ],
 "Resource": [ "arn:aws:imagebuilder:us-west-2:123456789012:component/
examplecomponent/2019.12.02/1" ] } ] }'
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "componentArn": "arn:aws:imagebuilder:us-west-2:123456789012:component/
examplecomponent/2019.12.02/1"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see PutComponentPolicy in *AWS CLI Command Reference*.

`put-image-policy`

The following code example shows how to use `put-image-policy`.

AWS CLI

To apply a resource policy to an image

The following `put-image-policy` command applies a resource policy to an image to enable cross-account sharing of images. We recommend you use the RAM CLI command create-resource-share. If you use the EC2 Image Builder CLI command put-image-policy, you must also use the RAM CLI command promote-resource-share-create-from-policy in order for the resource to be visible to all principals with whom the resource is shared.

```
aws imagebuilder put-image-policy \
    --image-arn arn:aws:imagebuilder:us-west-2:123456789012:image/example-
image/2019.12.02/1 \
    --policy '{ "Version":"2012-10-17",        "Statement": [ { "Effect": "Allow",
 "Principal": { "AWS": [ "123456789012" ] }, "Action": [ "imagebuilder:GetImage",
 "imagebuilder:ListImages" ], "Resource": [ "arn:aws:imagebuilder:us-
west-2:123456789012:image/example-image/2019.12.02/1" ] } ] }'
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imageArn": "arn:aws:imagebuilder:us-west-2:123456789012:image/example-
image/2019.12.02/1"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see PutImagePolicy in *AWS CLI Command Reference*.

`put-image-recipe-policy`

The following code example shows how to use `put-image-recipe-policy`.

AWS CLI

To apply a resource policy to an image recipe

The following `put-image-recipe-policy` command applies a resource policy to an image recipe to enable cross-account sharing of image recipes. We recommend that you use the RAM CLI command `create-resource-share`. If you use the EC2 Image Builder CLI command `put-image-recipe-policy`, you must also use the RAM CLI command `promote-resource-share-create-from-policy` in order for the resource to be visible to all principals with whom the resource is shared.

```
aws imagebuilder put-image-recipe-policy \
    --image-recipe-arn arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/
example-image-recipe/2019.12.02 \
    --policy '{ "Version":"2012-10-17",        "Statement": [ { "Effect":
 "Allow", "Principal": { "AWS": [ "123456789012" ] }, "Action":
 [ "imagebuilder:GetImageRecipe", "imagebuilder:ListImageRecipes" ], "Resource":
 [ "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/example-image-
recipe/2019.12.02" ] } ] }'
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imageRecipeArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/
example-image-recipe/2019.12.02/1"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see PutImageRecipePolicy in *AWS CLI Command Reference*.

`start-image-pipeline-execution`

The following code example shows how to use `start-image-pipeline-execution`.

AWS CLI

To start an image pipeline manually

The following `start-image-pipeline-execution` example manually starts an image pipeline.

```
aws imagebuilder start-image-pipeline-execution \
```

```
    --image-pipeline-arn arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "imageBuildVersionArn": "arn:aws:imagebuilder:us-west-2:123456789012:image/
mybasicrecipe/2019.12.03/1"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see StartImagePipelineExecution in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a resource

The following `tag-resource` example adds and tags a resource to EC2 Image Builder using a JSON file.

```
aws imagebuilder tag-resource \
    --cli-input-json file://tag-resource.json
```

Contents of `tag-resource.json`:

```
{
    "resourceArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline",
    "tags": {
        "KeyName: "KeyValue"
    }
}
```

This command produces no output.

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a resource

The following `untag-resource` example removes a tag from a resource using a JSON file.

```
aws imagebuilder untag-resource \
    --cli-input-json file://tag-resource.json
```

Contents of `untag-resource.json`:

```
{
    "resourceArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline",
    "tagKeys": [
        "KeyName"
    ]
}
```

This command produces no output.

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-distribution-configuration`

The following code example shows how to use `update-distribution-configuration`.

AWS CLI

To update a distribution configuration

The following `update-distribution-configuration` example updates a distribution configuration using a JSON file.

```
aws imagebuilder update-distribution-configuration \
    --cli-input-json file://update-distribution-configuration.json
```

Contents of `update-distribution-configuration.json`:

```
{
    "distributionConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:distribution-configuration/myexampledistribution",
    "description": "Copies AMI to eu-west-2 and exports to S3",
    "distributions": [
        {
            "region": "us-west-2",
            "amiDistributionConfiguration": {
                "name": "Name {{imagebuilder:buildDate}}",
                "description": "An example image name with parameter references"
            }
        },
        {
            "region": "eu-west-2",
            "amiDistributionConfiguration": {
                "name": "My {{imagebuilder:buildVersion}} image
 {{imagebuilder:buildDate}}"
            }
        }
    ]
}
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see UpdateDistributionConfiguration in *AWS CLI Command Reference*.

`update-image-pipeline`

The following code example shows how to use `update-image-pipeline`.

AWS CLI

To update an image pipeline

The following `update-image-pipeline` example updates an image pipeline using a JSON file.

```
aws imagebuilder update-image-pipeline \
    --cli-input-json file://update-image-pipeline.json
```

Contents of `update-image-pipeline.json`:

```
{
    "imagePipelineArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline",
    "imageRecipeArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/
mybasicrecipe/2019.12.03",
    "infrastructureConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:infrastructure-configuration/myexampleinfrastructure",
    "distributionConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:distribution-configuration/myexampledistribution",
    "imageTestsConfiguration": {
        "imageTestsEnabled": true,
        "timeoutMinutes": 120
    },
    "schedule": {
        "scheduleExpression": "cron(0 0 * * MON)",
        "pipelineExecutionStartCondition":
 "EXPRESSION_MATCH_AND_DEPENDENCY_UPDATES_AVAILABLE"
    },
    "status": "DISABLED"
}
```

Output:

```
{
```

```
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI]() in the *EC2 Image Builder Users Guide*.

- For API details, see [UpdateImagePipeline]() in *AWS CLI Command Reference*.

`update-infrastructure-configuration`

The following code example shows how to use `update-infrastructure-configuration`.

AWS CLI

To update an infrastructure configuration

The following `update-infrastructure-configuration` example updates an infrastructure configuration using a JSON file.

```
aws imagebuilder update-infrastructure-configuration \
    --cli-input-json file:/update-infrastructure-configuration.json
```

Contents of `update-infrastructure-configuration.json`:

```
{
    "infrastructureConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:infrastructure-configuration/myexampleinfrastructure",
    "description": "An example that will terminate instances of failed builds",
    "instanceTypes": [
        "m5.large", "m5.2xlarge"
    ],
    "instanceProfileName": "EC2InstanceProfileForImageFactory",
    "securityGroupIds": [
        "sg-a48c95ef"
    ],
    "subnetId": "subnet-a48c95ef",
    "logging": {
        "s3Logs": {
            "s3BucketName": "bucket-name",
            "s3KeyPrefix": "bucket-path"
        }
```

```
    },
    "terminateInstanceOnFailure": true,
    "snsTopicArn": "arn:aws:sns:us-west-2:123456789012:sns-name"
}
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see UpdateInfrastructureConfiguration in *AWS CLI Command Reference*.

Incident Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Incident Manager.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-replication-set`

The following code example shows how to use `create-replication-set`.

AWS CLI

To create the replication set

The following `create-replication-set` example creates the replication set Incident Manager uses to replicate and encrypt data in your Amazon Web Services account. This example uses the us-east-1 and us-east-2 Regions while creating the replication set.

```
aws ssm-incidents create-replication-set \
    --regions '{"us-east-1": {"sseKmsKeyId": "arn:aws:kms:us-
east-1:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab"}, "us-east-2":
 {"sseKmsKeyId": "arn:aws:kms:us-
east-1:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab"}}'
```

Output:

```
{
    "replicationSetArns": [
        "arn:aws:ssm-incidents::111122223333:replication-set/c4bcb603-4bf9-
bb3f-413c-08df53673b57"
    ]
}
```

For more information, see Using the Incident Manager replication set in the *Incident Manager User Guide*.

- For API details, see CreateReplicationSet in *AWS CLI Command Reference*.

`create-response-plan`

The following code example shows how to use `create-response-plan`.

AWS CLI

To create a response plan

The following `create-response-plan` example creates a response plan with the specified details.

```
aws ssm-incidents create-response-plan \
    --chat-channel '{"chatbotSns": ["arn:aws:sns:us-
east-1:111122223333:Standard_User"]}' \
    --display-name "Example response plan" \
    --incident-template '{"impact": 5, "title": "example-incident"}' \
    --name "example-response" \
```

```
    --actions '[{"ssmAutomation": {"documentName": "AWSIncidents-
CriticalIncidentRunbookTemplate", "documentVersion": "$DEFAULT",
 "roleArn": "arn:aws:iam::111122223333:role/aws-service-role/ssm-
incidents.amazonaws.com/AWSServiceRoleForIncidentManager", "targetAccount":
 "RESPONSE_PLAN_OWNER_ACCOUNT"}}]' \
    --engagements '["arn:aws:ssm-contacts:us-east-1:111122223333:contact/example"]'
```

Output:

```
{
    "arn": "arn:aws:ssm-incidents::111122223333:response-plan/example-response"
}
```

For more information, see Incident preparation in the *Incident Manager User Guide*.

- For API details, see CreateResponsePlan in *AWS CLI Command Reference*.

`create-timeline-event`

The following code example shows how to use `create-timeline-event`.

AWS CLI

Example 1: To create a custom timeline event

The following `create-timeline-event` example creates a custom timeline event at the specified time on the specified incident.

```
aws ssm-incidents create-timeline-event \
    --event-data "\"example timeline event\"" \
    --event-time 2022-10-01T20:30:00.000 \
    --event-type "Custom Event" \
    --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/
Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4EXAMPLE"
```

Output:

```
{
    "eventId": "c0bcc885-a41d-eb01-b4ab-9d2deEXAMPLE",
    "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/
Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4EXAMPLE"
```

```
}
```

Example 2: To create a timeline event with an incident note

The following `create-timeline-event` example creates a timeline event that is listed in the 'Incident notes' panel.

```
aws ssm-incidents create-timeline-event \
     --event-data "\"New Note\"" \
     --event-type "Note" \
     --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/
Test/6cc46130-ca6c-3b38-68f1-f6abeEXAMPLE" \
     --event-time 2023-06-20T12:06:00.000 \
     --event-references '[{"resource":"arn:aws:ssm-incidents::111122223333:incident-
record/Test/6cc46130-ca6c-3b38-68f1-f6abeEXAMPLE"}]'
```

Output:

```
{
    "eventId": "a41dc885-c0bc-b4ab-eb01-de9d2EXAMPLE",
    "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/
Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4EXAMPLE"
}
```

For more information, see Incident details in the *Incident Manager User Guide*.

- For API details, see CreateTimelineEvent in *AWS CLI Command Reference*.

`delete-incident-record`

The following code example shows how to use `delete-incident-record`.

AWS CLI

To delete an incident record

The following `delete-incident-record` example deletes the specified incident record.

```
aws ssm-incidents delete-incident-record \
    --arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-
Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

This command produces no output.

For more information, see Incident tracking in the *Incident Manager User Guide*.

- For API details, see DeleteIncidentRecord in *AWS CLI Command Reference*.

`delete-replication-set`

The following code example shows how to use `delete-replication-set`.

AWS CLI

To delete the replication set

The following `delete-replication-set` example deletes the replication set from your Amazon Web Services account. Deleting the replication set also deletes all Incident Manager data. This can't be undone.

```
aws ssm-incidents delete-replication-set \
    --arn "arn:aws:ssm-incidents::111122223333:replication-set/c4bcb603-4bf9-
bb3f-413c-08df53673b57"
```

This command produces no output.

For more information, see Using the Incident Manager replication set in the *Incident Manager User Guide*.

- For API details, see DeleteReplicationSet in *AWS CLI Command Reference*.

`delete-resource-policy`

The following code example shows how to use `delete-resource-policy`.

AWS CLI

To delete a resource policy

The following `delete-resource-policy` example deletes a resource policy from a response plan. This will revoke access from the principal or organization that the response plan was shared with.

```
aws ssm-incidents delete-resource-policy \
```

```
    --policy-id "be8b57191f0371f1c6827341aa3f0a03" \
    --resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-
Response-Plan"
```

This command produces no output.

For more information, see [Working with shared contacts and response plans]() in the *Incident Manager User Guide*.

- For API details, see [DeleteResourcePolicy]() in *AWS CLI Command Reference*.

`delete-response-plan`

The following code example shows how to use `delete-response-plan`.

AWS CLI

To delete a response plan

The following `delete-response-plan` example deletes the specified response plan.

```
aws ssm-incidents delete-response-plan \
    --arn "arn:aws:ssm-incidents::111122223333:response-plan/example-response"
```

This command produces no output.

For more information, see [Incident preparation]() in the *Incident Manager User Guide*.

- For API details, see [DeleteResponsePlan]() in *AWS CLI Command Reference*.

`delete-timeline-event`

The following code example shows how to use `delete-timeline-event`.

AWS CLI

To delete a timeline event

The following `delete-timeline-event` example deletes a custom timeline event from the specified incident record.

```
aws ssm-incidents delete-timeline-event \
    --event-id "c0bcc885-a41d-eb01-b4ab-9d2de193643c" \
```

```
    --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/
Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

This command produces no output.

For more information, see [Incident details](#) in the *Incident Manager User Guide*.

- For API details, see [DeleteTimelineEvent](#) in *AWS CLI Command Reference*.

`get-incident-record`

The following code example shows how to use `get-incident-record`.

AWS CLI

To get an incident record

The following `get-incident-record` example gets details about the specified incident record.

```
aws ssm-incidents get-incident-record \
    --arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-
Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

Output:

```
{
    "incidentRecord": {
        "arn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-
Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308",
        "automationExecutions": [],
        "creationTime": "2021-05-21T18:16:57.579000+00:00",
        "dedupeString": "c4bcc812-85e7-938d-2b78-17181176ee1a",
        "impact": 5,
        "incidentRecordSource": {

```

For more information, see [Incident details](#) in the *Incident Manager User Guide*.

- For API details, see [GetIncidentRecord](#) in *AWS CLI Command Reference*.

`get-replication-set`

The following code example shows how to use `get-replication-set`.

AWS CLI

To get the replication set

The following `get-replication-set` example gets the details of the replication set Incident Manager uses to replicate and encrypt data in your Amazon Web Services account.

```
aws ssm-incidents get-replication-set \
    --arn "arn:aws:ssm-incidents::111122223333:replication-set/c4bcb603-4bf9-
bb3f-413c-08df53673b57"
```

Output:

```
{
    "replicationSet": {
        "createdBy": "arn:aws:sts::111122223333:assumed-role/Admin/username",
        "createdTime": "2021-05-14T17:57:22.010000+00:00",
        "deletionProtected": false,
        "lastModifiedBy": "arn:aws:sts::111122223333:assumed-role/Admin/username",
        "lastModifiedTime": "2021-05-14T17:57:22.010000+00:00",
        "regionMap": {
            "us-east-1": {
                "sseKmsKeyId": "DefaultKey",
                "status": "ACTIVE"
            },
            "us-east-2": {
                "sseKmsKeyId": "DefaultKey",
                "status": "ACTIVE",
                "statusMessage": "Tagging inaccessible"
            }
        },
```

```
            "status": "ACTIVE"
        }
}
```

For more information, see [Using the Incident Manager replication set](#) in the *Incident Manager User Guide*.

- For API details, see [GetReplicationSet](#) in *AWS CLI Command Reference*.

`get-resource-policies`

The following code example shows how to use `get-resource-policies`.

AWS CLI

To list resource policies for a response plan

The following `command-name` example lists the resource policies associated with the specified response plan.

```
aws ssm-incidents get-resource-policies \
--resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan"
```

Output:

```
{
    "resourcePolicies": [
        {
            "policyDocument": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Sid
\":\"d901b37a-dbb0-458a-8842-75575c464219-external-principals\",\"Effect\":

incidents:UpdateIncidentRecord\",\"ssm-incidents:GetIncidentRecord\",\"ssm-
incidents:CreateTimelineEvent\",\"ssm-incidents:UpdateTimelineEvent\",\"ssm-
incidents:GetTimelineEvent\",\"ssm-incidents:ListTimelineEvents\",\"ssm-
incidents:UpdateRelatedItems\",\"ssm-incidents:ListRelatedItems\"],\"Resource\":
[\"arn:aws:ssm-incidents:*:111122223333:response-plan/Example-Response-Plan\",
\"arn:aws:ssm-incidents:*:111122223333:incident-record/Example-Response-Plan/*
\"]}]}",
            "policyId": "be8b57191f0371f1c6827341aa3f0a03",
            "ramResourceShareRegion": "us-east-1"
```

```
        }
    ]
}
```

For more information, see Working with shared contacts and response plans in the *Incident Manager User Guide*.

- For API details, see GetResourcePolicies in *AWS CLI Command Reference*.

`get-response-plan`

The following code example shows how to use `get-response-plan`.

AWS CLI

To get details of a response plan

The following `command-name` example gets details about a specified response plan in your AWS account.

```
aws ssm-incidents get-response-plan \
    --arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan"
```

Output:

```
{
    "actions": [
        {
            "ssmAutomation": {
                "documentName": "AWSIncidents-CriticalIncidentRunbookTemplate",
                "documentVersion": "$DEFAULT",
                "roleArn": "arn:aws:iam::111122223333:role/aws-service-role/ssm-
incidents.amazonaws.com/AWSServiceRoleForIncidentManager",
                "targetAccount": "RESPONSE_PLAN_OWNER_ACCOUNT"
            }
        }
    ],
    "arn": "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-
Plan",
    "chatChannel": {
        "chatbotSns": [
            "arn:aws:sns:us-east-1:111122223333:Standard_User"
```

```
        ]
    },
    "displayName": "Example response plan",
    "engagements": [
        "arn:aws:ssm-contacts:us-east-1:111122223333:contact/example"
    ],
    "incidentTemplate": {
        "impact": 5,
        "title": "Example-Incident"
    },
    "name": "Example-Response-Plan"
}
```

For more information, see [Incident preparation](#) in the *Incident Manager User Guide*.

- For API details, see [GetResponsePlan](#) in *AWS CLI Command Reference*.

`get-timeline-event`

The following code example shows how to use `get-timeline-event`.

AWS CLI

To get details of a timeline event

The following `get-timeline-event` example returns details of the specified timeline event.

```
aws ssm-incidents get-timeline-event \
    --event-id 20bcc812-8a94-4cd7-520c-0ff742111424 \
    --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/
Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

Output:

```
{
    "event": {
        "eventData": "\"Incident Started\"",
        "eventId": "20bcc812-8a94-4cd7-520c-0ff742111424",
        "eventTime": "2021-05-21T18:16:57+00:00",
        "eventType": "Custom Event",
        "eventUpdatedTime": "2021-05-21T18:16:59.944000+00:00",
        "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/
Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

```
    }
}
```

For more information, see Incident details in the *Incident Manager User Guide*.

- For API details, see GetTimelineEvent in *AWS CLI Command Reference*.

`list-incident-records`

The following code example shows how to use `list-incident-records`.

AWS CLI

To list incident records

The following `command-name` example lists the incident records in your Amazon Web Services account.

```
aws ssm-incidents list-incident-records
```

Output:

```
{
    "incidentRecordSummaries": [
        {
            "arn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-
Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308",
            "creationTime": "2021-05-21T18:16:57.579000+00:00",
            "impact": 5,
            "incidentRecordSource": {
                "createdBy": "arn:aws:iam::111122223333:user/draliatp",
                "invokedBy": "arn:aws:iam::111122223333:user/draliatp",
                "source": "aws.ssm-incidents.custom"
            },
            "status": "OPEN",
            "title": "Example-Incident"
        }
    ]
}
```

For more information, see Incident list in the *Incident Manager User Guide*.

- For API details, see ListIncidentRecords in *AWS CLI Command Reference*.

`list-related-items`

The following code example shows how to use `list-related-items`.

AWS CLI

To list related items

The following `list-related-items` example lists the related items of the specified incident.

```
aws ssm-incidents list-related-items \
    --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/
Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

Output:

```
{
    "relatedItems": [
        {
            "identifier": {
                "type": "OTHER",
                "value": {
                    "url": "https://console.aws.amazon.com/systems-manager/opsitems/
oi-8ef82158e190/workbench?region=us-east-1"
                }
            },
            "title": "Example related item"
        },
        {
            "identifier": {
                "type": "PARENT",
                "value": {
                    "arn": "arn:aws:ssm:us-east-1:111122223333:opsitem/
oi-8084126392ac"
                }
            },
            "title": "parentItem"
        }
    ]
}
```

For more information, see Incident details in the *Incident Manager User Guide*.

- For API details, see ListRelatedItems in *AWS CLI Command Reference*.

list-replication-sets

The following code example shows how to use `list-replication-sets`.

AWS CLI

To list the replication set

The following `list-replication-set` example lists the replication set Incident Manager uses to replicate and encrypt data in your AWS account.

```
aws ssm-incidents list-replication-sets
```

Output:

```
{
    "replicationSetArns": [
        "arn:aws:ssm-incidents::111122223333:replication-set/c4bcb603-4bf9-
bb3f-413c-08df53673b57"
    ]
}
```

For more information, see Using the Incident Manager replication set in the *Incident Manager User Guide*.

- For API details, see ListReplicationSets in *AWS CLI Command Reference*.

list-response-plans

The following code example shows how to use `list-response-plans`.

AWS CLI

To list the available response plans

The following `list-response-plans` example lists the available response plans in your Amazon Web Services account.

```
aws ssm-incidents list-response-plans
```

Output:

```
{
    "responsePlanSummaries": [
        {
            "arn": "arn:aws:ssm-incidents::111122223333:response-plan/Example-
Response-Plan",
            "displayName": "Example response plan",
            "name": "Example-Response-Plan"
        }
    ]
}
```

For more information, see Incident preparation in the *Incident Manager User Guide*.

- For API details, see ListResponsePlans in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a response plan

The following `list-tags-for-resource` example lists the tags associated with the specified response plan.

```
aws ssm-incidents list-tags-for-resource \
    --resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-
Response-Plan"
```

Output:

```
{
    "tags": {
    "group1": "1"
    }
```

```
}
```

For more information, see Tagging in the *Incident Manager User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`list-timeline-events`

The following code example shows how to use `list-timeline-events`.

AWS CLI

To list timeline events of an incident

The following `command-name` example lists the timeline events of the specified incident.

```
aws ssm-incidents list-timeline-events \
    --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/
Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

Output:

```
{
    "eventSummaries": [
        {
            "eventId": "8cbcc889-35e1-a42d-2429-d6f100799915",
            "eventTime": "2021-05-21T22:36:13.766000+00:00",
            "eventType": "SSM Incident Record Update",
            "eventUpdatedTime": "2021-05-21T22:36:13.766000+00:00",
            "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-
record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
        },
        {
            "eventId": "a2bcc825-aab5-1787-c605-f9bb2640d85b",
            "eventTime": "2021-05-21T18:58:46.443000+00:00",
            "eventType": "SSM Incident Record Update",
            "eventUpdatedTime": "2021-05-21T18:58:46.443000+00:00",
            "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-
record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
        },
        {

            "eventType": "Custom Event",
            "eventUpdatedTime": "2021-05-21T22:28:26.299000+00:00",
            "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-
record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
        }
    ]
}
```

For more information, see Incident details in the *Incident Manager User Guide*.

- For API details, see ListTimelineEvents in *AWS CLI Command Reference*.

`put-resource-policy`

The following code example shows how to use `put-resource-policy`.

AWS CLI

To share a response plan and incidents

The following `command-name` example adds a resource policy to the Example-Response-Plan that shares the response plan and associated incidents with the specified principal.

```
aws ssm-incidents put-resource-policy \
    --resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-
Response-Plan" \
    --policy "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Sid\":
\"ExampleResourcePolciy\",\"Effect\":\"Allow\",\"Principal\":{\"AWS\":
\"arn:aws:iam::222233334444:root\"},\"Action\":[\"ssm-incidents:GetResponsePlan
\",\"ssm-incidents:StartIncident\",\"ssm-incidents:UpdateIncidentRecord
\",\"ssm-incidents:GetIncidentRecord\",\"ssm-incidents:CreateTimelineEvent
\",\"ssm-incidents:UpdateTimelineEvent\",\"ssm-incidents:GetTimelineEvent
\",\"ssm-incidents:ListTimelineEvents\",\"ssm-incidents:UpdateRelatedItems
\",\"ssm-incidents:ListRelatedItems\"],\"Resource\":[\"arn:aws:ssm-
incidents:*:111122223333:response-plan/Example-Response-Plan\",\"arn:aws:ssm-
incidents:*:111122223333:incident-record/Example-Response-Plan/*\"]}]}"
```

Output:

```
{
    "policyId": "be8b57191f0371f1c6827341aa3f0a03"
}
```

For more information, see Working with shared contacts and response plans in the *Incident Manager User Guide*.

- For API details, see PutResourcePolicy in *AWS CLI Command Reference*.

`start-incident`

The following code example shows how to use `start-incident`.

AWS CLI

To start an incident

The following `start-incident` example starts an incident using the specified response plan.

```
aws ssm-incidents start-incident \
    --response-plan-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-
Response-Plan"
```

Output:

```
{
    "incidentRecordArn": "arn:aws:ssm-incidents::682428703967:incident-record/
Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
}
```

For more information, see Incident creation in the *Incident Manager User Guide*.

- For API details, see StartIncident in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a response plan

The following `tag-resource` example tags a specified response plan with the provided tag key-value pair.

```
aws ssm-incidents tag-resource \
    --resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-
Response-Plan" \
    --tags '{"group1":"1"}'
```

This command produces no output.

For more information, see Tagging in the *Incident Manager User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a response plan

The following `untag-resource` example removes the specified tags from the response plan.

```
aws ssm-incidents untag-resource \
    --resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-
Response-Plan" \
    --tag-keys '["group1"]'
```

This command produces no output.

For more information, see Tagging in the *Incident Manager User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-deletion-protection`

The following code example shows how to use `update-deletion-protection`.

AWS CLI

To update replication set deletion protection

The following `update-deletion-protection` example updates the deletion protection in your account to protect you from deleting the last Region in your replication set.

```
aws ssm-incidents update-deletion-protection \
    --arn "arn:aws:ssm-incidents::111122223333:replication-set/
a2bcc5c9-0f53-8047-7fef-c20749989b40" \
    --deletion-protected
```

This command produces no output.

For more information, see Using the Incident Manager replication set in the *Incident Manager User Guide*.

- For API details, see UpdateDeletionProtection in *AWS CLI Command Reference*.

`update-incident-record`

The following code example shows how to use `update-incident-record`.

AWS CLI

To update an incident record

The following `command-name` example resolves the specified incident.

```
aws ssm-incidents update-incident-record \
    --arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-
Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308" \
    --status "RESOLVED"
```

This command produces no output.

For more information, see Incident details in the *Incident Manager User Guide*.

- For API details, see UpdateIncidentRecord in *AWS CLI Command Reference*.

`update-related-items`

The following code example shows how to use `update-related-items`.

AWS CLI

To update an incidents related item

The following `update-related-item` example removes a related item from the specified incident record.

```
aws ssm-incidents update-related-items \
    --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/
Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308" \
    --related-items-update '{"itemToRemove": {"type": "OTHER", "value": {"url":
 "https://console.aws.amazon.com/systems-manager/opsitems/oi-8ef82158e190/workbench?
region=us-east-1"}}}'
```

This command produces no output.

For more information, see Incident details in the *Incident Manager User Guide*.

- For API details, see UpdateRelatedItems in *AWS CLI Command Reference*.

`update-replication-set`

The following code example shows how to use `update-replication-set`.

AWS CLI

To update a replication set

The following `command-name` example deletes the us-east-2 Region from the replication set.

```
aws ssm-incidents update-replication-set \
    --arn "arn:aws:ssm-incidents::111122223333:replication-set/
a2bcc5c9-0f53-8047-7fef-c20749989b40" \
    --actions '[{"deleteRegionAction": {"regionName": "us-east-2"}}]'
```

This command produces no output.

For more information, see Using the Incident Manager replication set in the *Incident Manager User Guide*.

- For API details, see UpdateReplicationSet in *AWS CLI Command Reference*.

`update-response-plan`

The following code example shows how to use `update-response-plan`.

AWS CLI

To update a response plan

The following `update-response-plan` example removes a chat channel from the specified response plan.

```
aws ssm-incidents update-response-plan \
    --arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan"
 \
    --chat-channel '{"empty":{}}'
```

This command produces no output.

For more information, see Incident preparation in the *Incident Manager User Guide*.

- For API details, see UpdateResponsePlan in *AWS CLI Command Reference*.

`update-timeline-event`

The following code example shows how to use `update-timeline-event`.

AWS CLI

To update a timeline event

The following `update-timeline-event` example updates the time that the event occurred.

```
aws ssm-incidents update-timeline-event \
    --event-id 20bcc812-8a94-4cd7-520c-0ff742111424 \
    --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/
Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308" \
    --event-time "2021-05-21T18:10:57+00:00"
```

This command produces no output.

For more information, see Incident details in the *Incident Manager User Guide*.

- For API details, see UpdateTimelineEvent in *AWS CLI Command Reference*.

Incident Manager Contacts examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Incident Manager Contacts.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`accept-page`

The following code example shows how to use `accept-page`.

AWS CLI

To accept a page during and engagement

The following `accept-page` example uses an accept code sent to the contact channel to accept a page.

```
aws ssm-contacts accept-page \
    --page-id "arn:aws:ssm-contacts:us-east-2:682428703967:page/
akuam/94ea0c7b-56d9-46c3-b84a-a37c8b067ad3" \
    --accept-type READ \
    --accept-code 425440
```

This command produces no output

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see AcceptPage in *AWS CLI Command Reference*.

`activate-contact-channel`

The following code example shows how to use `activate-contact-channel`.

AWS CLI

Activate a contact's contact channel

The following `activate-contact-channel` example activates a contact channel and makes it usable as part of an incident.

```
aws ssm-contacts activate-contact-channel \
    --contact-channel-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact-
channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d" \
    --activation-code "466136"
```

This command produces no output.

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see ActivateContactChannel in *AWS CLI Command Reference*.

`command-name`

The following code example shows how to use `command-name`.

AWS CLI

To delete a contact

The following `command-name` example deletes a contact. The contact will no longer be reachable from any escalation plan that refers to them.

```
aws ssm-contacts delete-contact \
    --contact-id "arn:aws:ssm-contacts:us-east-1:682428703967:contact/alejr"
```

This command produces no output.

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see CommandName in *AWS CLI Command Reference*.

`create-contact-channel`

The following code example shows how to use `create-contact-channel`.

AWS CLI

To create a contact channel

Creates a contact channel of type SMS for the contact Akua Mansa. Contact channels can be created of type SMS, EMAIL, or VOICE.

```
aws ssm-contacts create-contact-channel \
    --contact-id "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam" \
    --name "akuas sms-test" \
    --type SMS \
    --delivery-address '{"SimpleAddress": "+15005550199"}'
```

Output:

```
{
    "ContactChannelArn": "arn:aws:ssm-contacts:us-east-1:111122223333:contact-
channel/akuam/02f506b9-ea5d-4764-af89-2daa793ff024"
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see CreateContactChannel in *AWS CLI Command Reference*.

`create-contact`

The following code example shows how to use `create-contact`.

AWS CLI

To create a contact

The following `create-contact` example creates a contact in your environment with a blank plan. The plan can be updated after creating contact channels. Use the create-contact-channel command with the output ARN of this command. After you have created contact channels for this contact use update-contact to update the plan.

```
aws ssm-contacts create-contact \
    --alias "akuam" \
    --display-name "Akua Mansa" \
    --type PERSONAL \
    --plan '{"Stages": []}'
```

Output:

```
{
    "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam"
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see CreateContact in *AWS CLI Command Reference*.

`deactivate-contact-channel`

The following code example shows how to use `deactivate-contact-channel`.

AWS CLI

To deactivate a contact channel

The following `deactivate-contact-channel` example deactivates a contact channel. Deactivating a contact channel means the contact channel will no longer be paged during an incident. You can also reactivate a contact channel at any time using the `activate-contact-channel` command.

```
aws ssm-contacts deactivate-contact-channel \
    --contact-channel-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d"
```

This command produces no output.

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see DeactivateContactChannel in *AWS CLI Command Reference*.

`delete-contact-channel`

The following code example shows how to use `delete-contact-channel`.

AWS CLI

To delete a contact channel

The following `delete-contact-channel` example deletes a contact channel. Deleting a contact channel ensures the contact channel will not be paged during an incident.

```
aws ssm-contacts delete-contact-channel \
    --contact-channel-id "arn:aws:ssm-contacts:us-east-1:111122223333:contact-channel/akuam/13149bad-52ee-45ea-ae1e-45857f78f9b2"
```

This command produces no output.

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see DeleteContactChannel in *AWS CLI Command Reference*.

`delete-contact`

The following code example shows how to use `delete-contact`.

AWS CLI

To delete a contact

The following `delete-contact` example deletes a contact. The contact will no longer be reachable from any escalation plan that refers to them.

```
aws ssm-contacts delete-contact \
    --contact-id "arn:aws:ssm-contacts:us-east-1:111122223333:contact/alejr"
```

This command produces no output.

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see DeleteContact in *AWS CLI Command Reference*.

`describe-engagement`

The following code example shows how to use `describe-engagement`.

AWS CLI

To describe the details of an engagement

The following `describe-engagement` example lists the details of an engagement to a contact or escalation plan. The subject and content are sent to the contact channels.

```
aws ssm-contacts describe-engagement \
    --engagement-id "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/
example_escalation/69e40ce1-8dbb-4d57-8962-5fbe7fc53356"
```

Output:

```
{
    "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
example_escalation",
    "EngagementArn": "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/
example_escalation/69e40ce1-8dbb-4d57-8962-5fbe7fc53356",
    "Sender": "cli",
    "Subject": "cli-test",
    "Content": "Testing engagements via CLI",
    "PublicSubject": "cli-test",
    "PublicContent": "Testing engagements va CLI",
    "StartTime": "2021-05-18T18:25:41.151000+00:00"
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see DescribeEngagement in *AWS CLI Command Reference*.

`describe-page`

The following code example shows how to use `describe-page`.

AWS CLI

To list the details of a page to a contact channel

The following `describe-page` example lists details of a page to a contact channel. The page will include the subject and content provided.

```
aws ssm-contacts describe-page \
    --page-id "arn:aws:ssm-contacts:us-east-2:111122223333:page/akuam/ad0052bd-
e606-498a-861b-25726292eb93"
```

Output:

```
{
    "PageArn": "arn:aws:ssm-contacts:us-east-2:111122223333:page/akuam/ad0052bd-
e606-498a-861b-25726292eb93",
    "EngagementArn": "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/
akuam/78a29753-3674-4ac5-9f83-0468563567f0",
    "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",
    "Sender": "cli",
    "Subject": "cli-test",
    "Content": "Testing engagements via CLI",
    "PublicSubject": "cli-test",
    "PublicContent": "Testing engagements va CLI",
    "SentTime": "2021-05-18T18:43:29.301000+00:00",
    "ReadTime": "2021-05-18T18:43:55.708000+00:00",
    "DeliveryTime": "2021-05-18T18:43:55.265000+00:00"
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see DescribePage in *AWS CLI Command Reference*.

`get-contact-channel`

The following code example shows how to use `get-contact-channel`.

AWS CLI

To list the details of a contact channel

The following `get-contact-channel` example lists the details of a contact channel.

```
aws ssm-contacts get-contact-channel \
    --contact-channel-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d"
```

Output:

```
{
    "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",
    "ContactChannelArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d",
    "Name": "akuas sms",
    "Type": "SMS",
    "DeliveryAddress": {
        "SimpleAddress": "+15005550199"
    },
    "ActivationStatus": "ACTIVATED"
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see GetContactChannel in *AWS CLI Command Reference*.

`get-contact-policy`

The following code example shows how to use `get-contact-policy`.

AWS CLI

To list the resource policies of a contact

The following `get-contact-policy` example lists the resource policies associated with the specified contact.

```
aws ssm-contacts get-contact-policy \
    --contact-arn "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam"
```

Output:

```
{
    "ContactArn": "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam",
    "Policy": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Sid\":
\"SharePolicyForDocumentationDralia\",\"Effect\":\"Allow\",\"Principal\":
{\"AWS\":\"222233334444\"},\"Action\":[\"ssm-contacts:GetContact\",\"ssm-
contacts:StartEngagement\",\"ssm-contacts:DescribeEngagement\",\"ssm-
contacts:ListPagesByEngagement\",\"ssm-contacts:StopEngagement\"],\"Resource
\":[\"arn:aws:ssm-contacts:*:111122223333:contact/akuam\",\"arn:aws:ssm-
contacts:*:111122223333:engagement/akuam/*\"]}]}"
}
```

For more information, see Working with shared contacts and response plans in the *Incident Manager User Guide*.

- For API details, see GetContactPolicy in *AWS CLI Command Reference*.

`get-contact`

The following code example shows how to use `get-contact`.

AWS CLI

Example 1: To describe a contact plan

The following `get-contact` example describes a contact.

```
aws ssm-contacts get-contact \
    --contact-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam"
```

Output:

```
{
    "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",
    "Alias": "akuam",
    "DisplayName": "Akua Mansa",
    "Type": "PERSONAL",
    "Plan": {
        "Stages": [
            {
                "DurationInMinutes": 5,
                "Targets": [
                    {
```

```
                        "ChannelTargetInfo": {
                            "ContactChannelId": "arn:aws:ssm-contacts:us-
east-2:111122223333:contact-channel/akuam/beb25840-5ac8-4644-95cc-7a8de390fa65",
                            "RetryIntervalInMinutes": 1
                        }
                    }
                ]
            },
            {
                "DurationInMinutes": 5,
                "Targets": [
                    {
                        "ChannelTargetInfo": {
                            "ContactChannelId": "arn:aws:ssm-contacts:us-
east-2:111122223333:contact-channel/akuam/49f3c24d-5f9f-4638-ae25-3f49e04229ad",
                            "RetryIntervalInMinutes": 1
                        }
                    }
                ]
            },
            {
                "DurationInMinutes": 5,
                "Targets": [
                    {
                        "ChannelTargetInfo": {
                            "ContactChannelId": "arn:aws:ssm-contacts:us-
east-2:111122223333:contact-channel/akuam/77d4f447-f619-4954-afff-85551e369c2a",
                            "RetryIntervalInMinutes": 1
                        }
                    }
                ]
            }
        ]
    }
}
```

Example 2: To describe an escalation plan

The following `get-contact` example describes an escalation plan.

```
aws ssm-contacts get-contact \
--contact-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
example_escalation"
```

Output:

```
{
    "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
example_escalation",
    "Alias": "example_escalation",
    "DisplayName": "Example Escalation",
    "Type": "ESCALATION",
    "Plan": {
        "Stages": [
            {
                "DurationInMinutes": 5,
                "Targets": [
                    {
                        "ContactTargetInfo": {
                            "ContactId": "arn:aws:ssm-contacts:us-
east-2:111122223333:contact/akuam",
                            "IsEssential": true
                        }
                    }
                ]
            },
            {
                "DurationInMinutes": 5,
                "Targets": [
                    {
                        "ContactTargetInfo": {
                            "ContactId": "arn:aws:ssm-contacts:us-
east-2:111122223333:contact/alejr",
                            "IsEssential": false
                        }
                    }
                ]
            },
            {
                "DurationInMinutes": 0,
                "Targets": [
                    {
                        "ContactTargetInfo": {
                            "ContactId": "arn:aws:ssm-contacts:us-
east-2:111122223333:contact/anasi",
                            "IsEssential": false
                        }
                    }
```

```
                ]
            }
        ]
    }
}
```

For more information, see [Contacts](#) in the *Incident Manager User Guide*.

- For API details, see [GetContact](#) in *AWS CLI Command Reference*.

`list-contact-channels`

The following code example shows how to use `list-contact-channels`.

AWS CLI

To list the contact channels of a contact

The following `list-contact-channels` example lists the available contact channels of the specified contact.

```
aws ssm-contacts list-contact-channels \
    --contact-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam"
```

Output:

```
{
    [
        {
            "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
akuam",
            "Name": "akuas email",
            "Type": "EMAIL",
            "DeliveryAddress": {
                "SimpleAddress": "akuam@example.com"
            },
            "ActivationStatus": "NOT_ACTIVATED"
        },
        {
            "ContactChannelArn": "arn:aws:ssm-contacts:us-
east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d",
            "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
akuam",
```

```
                "Name": "akuas sms",
                "Type": "SMS",
                "DeliveryAddress": {
                    "SimpleAddress": "+15005550100"
                },
                "ActivationStatus": "ACTIVATED"
            }
        ]
}
```

For more information, see [Contacts](#) in the *Incident Manager User Guide*.

- For API details, see [ListContactChannels](#) in *AWS CLI Command Reference*.

`list-contacts`

The following code example shows how to use `list-contacts`.

AWS CLI

To list all escalation plans and contacts

The following `list-contacts` example lists the contacts and escalation plans in your account.

```
aws ssm-contacts list-contacts
```

Output:

```
{
    "Contacts": [
        {
            "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
akuam",
            "Alias": "akuam",
            "DisplayName": "Akua Mansa",
            "Type": "PERSONAL"
        },
        {
            "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
alejr",
            "Alias": "alejr",
            "DisplayName": "Alejandro Rosalez",
            "Type": "PERSONAL"
```

```
        },
        {
            "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
anasi",
            "Alias": "anasi",
            "DisplayName": "Ana Carolina Silva",
            "Type": "PERSONAL"
        },
        {
            "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
example_escalation",
            "Alias": "example_escalation",
            "DisplayName": "Example Escalation",
            "Type": "ESCALATION"
        }
    ]
}
```

For more information, see [Contacts]() in the *Incident Manager User Guide*.

- For API details, see [ListContacts]() in *AWS CLI Command Reference*.

`list-engagements`

The following code example shows how to use `list-engagements`.

AWS CLI

To list all engagements

The following `list-engagements` example lists engagements to escalation plans and contacts. You can also list engagements for a single incident.

```
aws ssm-contacts list-engagements
```

Output:

```
{
    "Engagements": [
        {
            "EngagementArn": "arn:aws:ssm-contacts:us-
east-2:111122223333:engagement/akuam/91792571-0b53-4821-9f73-d25d13d9e529",
```

```
            "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
akuam",
            "Sender": "cli",
            "StartTime": "2021-05-18T20:37:50.300000+00:00"
        },
        {
            "EngagementArn": "arn:aws:ssm-contacts:us-
east-2:111122223333:engagement/akuam/78a29753-3674-4ac5-9f83-0468563567f0",
            "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
akuam",
            "Sender": "cli",
            "StartTime": "2021-05-18T18:40:26.666000+00:00"
        },
        {
            "EngagementArn": "arn:aws:ssm-contacts:us-
east-2:111122223333:engagement/
example_escalation/69e40ce1-8dbb-4d57-8962-5fbe7fc53356",
            "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
example_escalation",
            "Sender": "cli",
            "StartTime": "2021-05-18T18:25:41.151000+00:00"
        },
        {
            "EngagementArn": "arn:aws:ssm-contacts:us-
east-2:111122223333:engagement/akuam/607ced0e-e8fa-4ea7-8958-a237b8803f8f",
            "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
akuam",
            "Sender": "cli",
            "StartTime": "2021-05-18T18:20:58.093000+00:00"
        }
    ]
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see ListEngagements in *AWS CLI Command Reference*.

`list-page-receipts`

The following code example shows how to use `list-page-receipts`.

AWS CLI

To list page receipts

The following `command-name` example lists whether a page was received or not by a contact.

```
aws ssm-contacts list-page-receipts \
    --page-id "arn:aws:ssm-contacts:us-east-2:111122223333:page/
akuam/94ea0c7b-56d9-46c3-b84a-a37c8b067ad3"
```

Output:

```
{
    "Receipts": [
        {
            "ContactChannelArn": "arn:aws:ssm-contacts:us-
east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d",
            "ReceiptType": "DELIVERED",
            "ReceiptInfo": "425440",
            "ReceiptTime": "2021-05-18T20:42:57.485000+00:00"
        },
        {
            "ContactChannelArn": "arn:aws:ssm-contacts:us-
east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d",
            "ReceiptType": "READ",
            "ReceiptInfo": "425440",
            "ReceiptTime": "2021-05-18T20:42:57.907000+00:00"
        },
        {
            "ContactChannelArn": "arn:aws:ssm-contacts:us-
east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d",
            "ReceiptType": "SENT",
            "ReceiptInfo": "SM6656c19132f1465f9c9c1123a5dde7c9",
            "ReceiptTime": "2021-05-18T20:40:52.962000+00:00"
        }
    ]
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see ListPageReceipts in *AWS CLI Command Reference*.

`list-pages-by-contact`

The following code example shows how to use `list-pages-by-contact`.

AWS CLI

To list pages by contact

The following `list-pages-by-contact` example lists all pages to the specified contact.

```
aws ssm-contacts list-pages-by-contact \
    --contact-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam"
```

Output:

```
{
    "Pages": [
        {
            "PageArn": "arn:aws:ssm-contacts:us-east-2:111122223333:page/akuam/
ad0052bd-e606-498a-861b-25726292eb93",
            "EngagementArn": "arn:aws:ssm-contacts:us-
east-2:111122223333:engagement/akuam/78a29753-3674-4ac5-9f83-0468563567f0",
            "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
akuam",
            "Sender": "cli",
            "SentTime": "2021-05-18T18:43:29.301000+00:00",
            "DeliveryTime": "2021-05-18T18:43:55.265000+00:00",
            "ReadTime": "2021-05-18T18:43:55.708000+00:00"
        }
    ]
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see ListPagesByContact in *AWS CLI Command Reference*.

`list-pages-by-engagement`

The following code example shows how to use `list-pages-by-engagement`.

AWS CLI

To list pages to contact channels started from an engagement.

The following `list-pages-by-engagement` example lists the pages that occurred while engaging the defined engagement plan.

```
aws ssm-contacts list-pages-by-engagement \
    --engagement-id "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/
akuam/78a29753-3674-4ac5-9f83-0468563567f0"
```

Output:

```
{
    "Pages": [
        {
            "PageArn": "arn:aws:ssm-contacts:us-east-2:111122223333:page/akuam/
ad0052bd-e606-498a-861b-25726292eb93",
            "EngagementArn": "arn:aws:ssm-contacts:us-
east-2:111122223333:engagement/akuam/78a29753-3674-4ac5-9f83-0468563567f0",
            "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
akuam",
            "Sender": "cli",
            "SentTime": "2021-05-18T18:40:27.245000+00:00"
        }
    ]
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see ListPagesByEngagement in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a contact

The following `list-tags-for-resource` example lists the tags of the specified contact.

```
aws ssm-contacts list-tags-for-resource \
    --resource-arn "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam"
```

Output:

```
{
    "Tags": [
```

```
            {
                "Key": "group1",
                "Value": "1"
            }
        ]
}
```

For more information, see Tagging in the *Incident Manager User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`put-contact-policy`

The following code example shows how to use `put-contact-policy`.

AWS CLI

To share a contact and engagements

The following `put-contact-policy` example adds a resource policy to the contact Akua that shares the contact and related engagements with the principal.

```
aws ssm-contacts put-contact-policy \
    --contact-arn "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam" \
    --policy "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Sid\":
\"ExampleResourcePolicy\",\"Action\":[\"ssm-contacts:GetContact\",\"ssm-
contacts:StartEngagement\",\"ssm-contacts:DescribeEngagement\",\"ssm-
contacts:ListPagesByEngagement\",\"ssm-contacts:StopEngagement\"],
\"Principal\":{\"AWS\":\"222233334444\"},\"Effect\":\"Allow\",\"Resource
\":[\"arn:aws:ssm-contacts:*:111122223333:contact\/akuam\",\"arn:aws:ssm-
contacts:*:111122223333:engagement\/akuam\/*\"]}]}"
```

This command produces no output.

For more information, see Working with shared contacts and response plans in the *Incident Manager User Guide*.

- For API details, see PutContactPolicy in *AWS CLI Command Reference*.

`send-activation-code`

The following code example shows how to use `send-activation-code`.

AWS CLI

To send an activation code

The following `send-activation-code` example sends an activation code and message to the specified contact channel.

```
aws ssm-contacts send-activation-code \
    --contact-channel-id "arn:aws:ssm-contacts:us-east-1:111122223333:contact-channel/akuam/8ddae2d1-12c8-4e45-b852-c8587266c400"
```

This command produces no output.

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see SendActivationCode in *AWS CLI Command Reference*.

`start-engagement`

The following code example shows how to use `start-engagement`.

AWS CLI

Example 1: To page a contact's contact channels

The following `start-engagement` pages contact's contact channels. Sender, subject, public-subject, and public-content are all free from fields. Incident Manager sends the subject and content to the provided VOICE or EMAIL contact channels. Incident Manager sends the public-subject and public-content to the provided SMS contact channels. Sender is used to track who started the engagement.

```
aws ssm-contacts start-engagement \
    --contact-id  "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam" \
    --sender "cli" \
    --subject "cli-test" \
    --content "Testing engagements via CLI" \
    --public-subject "cli-test" \
    --public-content "Testing engagements va CLI"
```

Output:

```
{
```

```
    "EngagementArn": "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/
akuam/607ced0e-e8fa-4ea7-8958-a237b8803f8f"
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

Example 2: To page a contact in the provided escalation plan.

The following `start-engagement` engages contact's through an escalation plan. Each contact is paged according to their engagement plan.

```
aws ssm-contacts start-engagement \
    --contact-id  "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
example_escalation" \
    --sender "cli" \
    --subject "cli-test" \
    --content "Testing engagements via CLI" \
    --public-subject "cli-test" \
    --public-content "Testing engagements va CLI"
```

Output:

```
{
    "EngagementArn": "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/
example_escalation/69e40ce1-8dbb-4d57-8962-5fbe7fc53356"
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see StartEngagement in *AWS CLI Command Reference*.

`stop-engagement`

The following code example shows how to use `stop-engagement`.

AWS CLI

To stop an engagement

The following `stop-engagement` example stops an engagement from paging further contacts and contact channels.

```
aws ssm-contacts stop-engagement \
```

```
    --engagement-id "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/
example_escalation/69e40ce1-8dbb-4d57-8962-5fbe7fc53356"
```

This command produces no output.

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see StopEngagement in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a contact

The following `tag-resource` example tags a specified contact with the provided tag key value pair.

```
aws ssm-contacts tag-resource \
    --resource-arn "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam" \
    --tags '[{"Key":"group1","Value":"1"}]'
```

This command produces no output.

For more information, see Tagging in the *Incident Manager User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a contact

The following `untag-resource` example removes the group1 tag from the specified contact.

```
aws ssm-contacts untag-resource \
    --resource-arn "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam" \
    --tag-keys "group1"
```

This command produces no output.

For more information, see Tagging in the *Incident Manager User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-contact-channel`

The following code example shows how to use `update-contact-channel`.

AWS CLI

To update a contact channel

The following `update-contact-channel` example updates the name and delivery address of a contact channel.

```
aws ssm-contacts update-contact-channel \
    --contact-channel-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/49f3c24d-5f9f-4638-ae25-3f49e04229ad" \
    --name "akuas voice channel" \
    --delivery-address '{"SimpleAddress": "+15005550198"}'
```

This command produces no output.

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see UpdateContactChannel in *AWS CLI Command Reference*.

`update-contact`

The following code example shows how to use `update-contact`.

AWS CLI

To update the engagement plan of contact

The following `update-contact` example updates the engagement plan of the contact Akua to include the three types of contacts channels. This is done after creating contact channels for Akua.

```
aws ssm-contacts update-contact \
    --contact-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam" \
```

```
    --plan '{"Stages": [{"DurationInMinutes": 5, "Targets": [{"ChannelTargetInfo":
 {"ContactChannelId": "arn:aws:ssm-contacts:us-east-2:111122223333:contact-
channel/akuam/beb25840-5ac8-4644-95cc-7a8de390fa65","RetryIntervalInMinutes":
 1 }}]}, {"DurationInMinutes": 5, "Targets": [{"ChannelTargetInfo":
{"ContactChannelId": "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/
akuam/49f3c24d-5f9f-4638-ae25-3f49e04229ad", "RetryIntervalInMinutes": 1}}]},
 {"DurationInMinutes": 5, "Targets": [{"ChannelTargetInfo": {"ContactChannelId":
 "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/77d4f447-
f619-4954-afff-85551e369c2a","RetryIntervalInMinutes": 1 }}]}]}'
```

This command produces no output.

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see UpdateContact in *AWS CLI Command Reference*.

Amazon Inspector examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Inspector.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`add-attributes-to-findings`

The following code example shows how to use `add-attributes-to-findings`.

AWS CLI

To add attributes to findings

The following `add-attribute-to-finding` command assigns an attribute with the key of `Example` and value of `example` to the finding with the ARN of `arn:aws:inspector:us-`

`west-2:123456789012:target/0-0kFIPusq/template/0-8l1VIE0D/run/0-Z02cjjug/finding/0-T8yM9mEU`:

```
aws inspector add-attributes-to-findings --finding-arns arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-8l1VIE0D/run/0-Z02cjjug/finding/0-T8yM9mEU --attributes key=Example,value=example
```

Output:

```
{
    "failedItems": {}
}
```

For more information, see Amazon Inspector Findings in the *Amazon Inspector* guide.

- For API details, see AddAttributesToFindings in *AWS CLI Command Reference*.

`associate-member`

The following code example shows how to use `associate-member`.

AWS CLI

Example: To associate an AWS account with an Amazon Inspector delegated administrator

The following `associate-member` example associates an AWS account with an Amazon Inspector delegated administrator.

```
aws inspector2 associate-member \
    --account-id 123456789012
```

Output:

```
{
    "accountId": "123456789012"
}
```

For more information, see Managing multiple accounts in Amazon Inspector with AWS Organizations in the *Amazon Inspector User Guide*.

- For API details, see AssociateMember in *AWS CLI Command Reference*.

`create-assessment-target`

The following code example shows how to use `create-assessment-target`.

AWS CLI

To create an assessment target

The following `create-assessment-target` command creates an assessment target named `ExampleAssessmentTarget` using the resource group with the ARN of `arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-AB6DMKnv`:

```
aws inspector create-assessment-target --assessment-target-
name ExampleAssessmentTarget --resource-group-arn arn:aws:inspector:us-
west-2:123456789012:resourcegroup/0-AB6DMKnv
```

Output:

```
{
    "assessmentTargetArn": "arn:aws:inspector:us-west-2:123456789012:target/0-
nvgVhaxX"
}
```

For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide.

- For API details, see CreateAssessmentTarget in *AWS CLI Command Reference*.

`create-assessment-template`

The following code example shows how to use `create-assessment-template`.

AWS CLI

To create an assessment template

The following `create-assessment-template` command creates an assessment template called `ExampleAssessmentTemplate` for the assessment target with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX`:

```
aws inspector create-assessment-template --assessment-target-
arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX --assessment-
template-name ExampleAssessmentTemplate --duration-in-seconds 180 --rules-package-
```

```
arns arn:aws:inspector:us-west-2:758058086616:rulespackage/0-9hgA516p --user-
attributes-for-findings key=ExampleTag,value=examplevalue
```

Output:

```
{
    "assessmentTemplateArn": "arn:aws:inspector:us-west-2:123456789012:target/0-
nvgVhaxX/template/0-it5r2S4T"
}
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see CreateAssessmentTemplate in *AWS CLI Command Reference*.

`create-filter`

The following code example shows how to use `create-filter`.

AWS CLI

To create a filter

The following `create-filter` example creates a suppression rule that omits ECR instance type findings.

```
aws inspector2 create-filter \
    --name "ExampleSuppressionRuleECR" \
    --description "This suppression rule omits ECR instance type findings" \
    --action SUPPRESS \
    --filter-criteria 'resourceType=[{comparison="EQUALS",
 value="AWS_ECR_INSTANCE"}]'
```

Output:

```
{
    "arn": "arn:aws:inspector2:us-west-2:123456789012:owner/o-EXAMPLE222/filter/
EXAMPLE444444444"
}
```

For more information, see Filtering Amazon Inspector findings in the *Amazon Inspector User Guide*.

- For API details, see CreateFilter in *AWS CLI Command Reference*.

`create-findings-report`

The following code example shows how to use `create-findings-report`.

AWS CLI

To create a findings report

The following `create-findings-report` example creates a finding report.

```
aws inspector2 create-findings-report \
    --report-format CSV \
    --s3-destination bucketName=inspector-sbom-123456789012,keyPrefix=sbom-key,kmsKeyArn=arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333 \
    --filter-criteria '{"ecrImageRepositoryName":[{"comparison":"EQUALS","value":"debian"}]}'
```

Output:

```
{
    "reportId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333"
}
```

For more information, see Managing findings in Amazon Inspector in the *Amazon Inspector User Guide*.

- For API details, see CreateFindingsReport in *AWS CLI Command Reference*.

`create-resource-group`

The following code example shows how to use `create-resource-group`.

AWS CLI

To create a resource group

The following `create-resource-group` command creates a resource group using the tag key of `Name` and value of `example`:

```
aws inspector create-resource-group --resource-group-tags key=Name,value=example
```

Output:

```
{
   "resourceGroupArn": "arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-
AB6DMKnv"
}
```

For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide.

- For API details, see CreateResourceGroup in *AWS CLI Command Reference*.

`create-sbom-export`

The following code example shows how to use `create-sbom-export`.

AWS CLI

To create a software bill of materials (SBOM) report

The following `create-sbom-export` example creates a software bill of materials (SBOM) report.

```
aws inspector2 create-sbom-export \
    --report-format SPDX_2_3 \
    --resource-filter-criteria
 'ecrRepositoryName=[{comparison="EQUALS",value="debian"}]' \
    --s3-destination bucketName=inspector-sbom-123456789012,keyPrefix=sbom-
key,kmsKeyArn=arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE33333
```

Output:

```
{
    "reportId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333"
}
```

For more information, see Exporting SBOMs with Amazon Inspector in the *Amazon Inspector User Guide*.

- For API details, see CreateSbomExport in *AWS CLI Command Reference*.

`delete-assessment-run`

The following code example shows how to use `delete-assessment-run`.

AWS CLI

To delete an assessment run

The following `delete-assessment-run` command deletes the assessment run with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T/run/0-11LMTAVe`:

```
aws inspector delete-assessment-run --assessment-run-arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T/run/0-11LMTAVe
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see DeleteAssessmentRun in *AWS CLI Command Reference*.

`delete-assessment-target`

The following code example shows how to use `delete-assessment-target`.

AWS CLI

To delete an assessment target

The following `delete-assessment-target` command deletes the assessment target with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq`:

```
aws inspector delete-assessment-target --assessment-target-arn arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq
```

For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide.

- For API details, see DeleteAssessmentTarget in *AWS CLI Command Reference*.

`delete-assessment-template`

The following code example shows how to use `delete-assessment-template`.

AWS CLI

To delete an assessment template

The following `delete-assessment-template` command deletes the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T`:

```
aws inspector delete-assessment-template --assessment-template-
arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see DeleteAssessmentTemplate in *AWS CLI Command Reference*.

`delete-filter`

The following code example shows how to use `delete-filter`.

AWS CLI

To delete a filter

The following `delete-filter` example deletes a filter.

```
aws inspector2 delete-filter \
    --arn "arn:aws:inspector2:us-west-2:123456789012:owner/o-EXAMPLE222/filter/
EXAMPLE444444444"
```

Output:

```
{
    "arn": "arn:aws:inspector2:us-west-2:123456789012:owner/o-EXAMPLE222/filter/
EXAMPLE444444444"
}
```

For more information, see Filtering Amazon Inspector findings in the *Amazon Inspector User Guide*.

- For API details, see DeleteFilter in *AWS CLI Command Reference*.

`describe-assessment-runs`

The following code example shows how to use `describe-assessment-runs`.

AWS CLI

To describe assessment runs

The following `describe-assessment-run` command describes an assessment run with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE`:

```
aws inspector describe-assessment-runs --assessment-run-arns arn:aws:inspector:us-
west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE
```

Output:

```
{
        "assessmentRuns": [
          {
                "arn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-4r1V2mAw/run/0-MKkpXXPE",
                "assessmentTemplateArn": "arn:aws:inspector:us-
west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw",
                "completedAt": 1458680301.4,
                "createdAt": 1458680170.035,
                "dataCollected": true,
                "durationInSeconds": 3600,
                "name": "Run 1 for ExampleAssessmentTemplate",
                "notifications": [],
                "rulesPackageArns": [
                  "arn:aws:inspector:us-west-2:758058086616:rulespackage/0-X1KXtawP"
                ],
                "startedAt": 1458680170.161,
                "state": "COMPLETED",
                "stateChangedAt": 1458680301.4,
                "stateChanges": [
                  {
                        "state": "CREATED",
                        "stateChangedAt": 1458680170.035
                  },
                  {
```

```
                        "state": "START_DATA_COLLECTION_PENDING",
                        "stateChangedAt": 1458680170.065
                  },
                  {
                        "state": "START_DATA_COLLECTION_IN_PROGRESS",
                        "stateChangedAt": 1458680170.096
                  },
                  {
                        "state": "COLLECTING_DATA",
                        "stateChangedAt": 1458680170.161
                  },
                  {
                        "state": "STOP_DATA_COLLECTION_PENDING",
                        "stateChangedAt": 1458680239.883
                  },
                  {
                        "state": "DATA_COLLECTED",
                        "stateChangedAt": 1458680299.847
                  },
                  {
                        "state": "EVALUATING_RULES",
                        "stateChangedAt": 1458680300.099
                  },
                  {
                        "state": "COMPLETED",
                        "stateChangedAt": 1458680301.4
                  }
                ],
                "userAttributesForFindings": []
          }
        ],
        "failedItems": {}
}
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see DescribeAssessmentRuns in *AWS CLI Command Reference*.

`describe-assessment-targets`

The following code example shows how to use `describe-assessment-targets`.

AWS CLI

To describe assessment targets

The following `describe-assessment-targets` command describes the assessment target with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq`:

```
aws inspector describe-assessment-targets --assessment-target-
arns arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq
```

Output:

```
{
      "assessmentTargets": [
        {
              "arn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq",
              "createdAt": 1458074191.459,
              "name": "ExampleAssessmentTarget",
              "resourceGroupArn": "arn:aws:inspector:us-
west-2:123456789012:resourcegroup/0-PyGXopAI",
              "updatedAt": 1458074191.459
        }
      ],
      "failedItems": {}
}
```

For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide.

- For API details, see DescribeAssessmentTargets in *AWS CLI Command Reference*.

`describe-assessment-templates`

The following code example shows how to use `describe-assessment-templates`.

AWS CLI

To describe assessment templates

The following `describe-assessment-templates` command describes the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw`:

```
aws inspector describe-assessment-templates --assessment-template-
arns arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw
```

Output:

```
{
      "assessmentTemplates": [
        {
              "arn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-4r1V2mAw",
              "assessmentTargetArn": "arn:aws:inspector:us-
west-2:123456789012:target/0-0kFIPusq",
              "createdAt": 1458074191.844,
              "durationInSeconds": 3600,
              "name": "ExampleAssessmentTemplate",
              "rulesPackageArns": [
                "arn:aws:inspector:us-west-2:758058086616:rulespackage/0-X1KXtawP"
              ],
              "userAttributesForFindings": []
        }
      ],
      "failedItems": {}
}
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see DescribeAssessmentTemplates in *AWS CLI Command Reference*.

`describe-cross-account-access-role`

The following code example shows how to use `describe-cross-account-access-role`.

AWS CLI

To describe the cross account access role

The following `describe-cross-account-access-role` command describes the IAM role that enables Amazon Inspector to access your AWS account:

```
aws inspector describe-cross-account-access-role
```

Output:

```
{
        "registeredAt": 1458069182.826,
        "roleArn": "arn:aws:iam::123456789012:role/inspector",
        "valid": true
}
```

For more information, see Setting up Amazon Inspector in the *Amazon Inspector* guide.

- For API details, see DescribeCrossAccountAccessRole in *AWS CLI Command Reference*.

`describe-findings`

The following code example shows how to use `describe-findings`.

AWS CLI

To describe findings

The following `describe-findings` command describes the finding with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE/finding/0-HwPnsDm4`:

```
aws inspector describe-findings --finding-arns arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE/finding/0-HwPnsDm4
```

Output:

```
{
      "failedItems": {},
      "findings": [
        {
              "arn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE/finding/0-HwPnsDm4",
              "assetAttributes": {
                "ipv4Addresses": [],
                "schemaVersion": 1
              },
              "assetType": "ec2-instance",
```

```
                "attributes": [],
                "confidence": 10,
                "createdAt": 1458680301.37,
                "description": "Amazon Inspector did not find any potential security
 issues during this assessment.",
                "indicatorOfCompromise": false,
                "numericSeverity": 0,
                "recommendation": "No remediation needed.",
                "schemaVersion": 1,
                "service": "Inspector",
                "serviceAttributes": {
                  "assessmentRunArn": "arn:aws:inspector:us-
west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE",
                  "rulesPackageArn": "arn:aws:inspector:us-
west-2:758058086616:rulespackage/0-X1KXtawP",
                  "schemaVersion": 1
                },
                "severity": "Informational",
                "title": "No potential security issues found",
                "updatedAt": 1458680301.37,
                "userAttributes": []
        }
      ]
}
```

For more information, see Amazon Inspector Findings in the *Amazon Inspector* guide.

- For API details, see DescribeFindings in *AWS CLI Command Reference*.

`describe-resource-groups`

The following code example shows how to use `describe-resource-groups`.

AWS CLI

To describe resource groups

The following `describe-resource-groups` command describes the resource group with the ARN of `arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-PyGXopAI`:

```
aws inspector describe-resource-groups --resource-group-arns arn:aws:inspector:us-
west-2:123456789012:resourcegroup/0-PyGXopAI
```

Output:

```
{
      "failedItems": {},
      "resourceGroups": [
        {
              "arn": "arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-
PyGXopAI",
              "createdAt": 1458074191.098,
              "tags": [
                {
                      "key": "Name",
                      "value": "example"
                }
              ]
        }
      ]
}
```

For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide.

- For API details, see [DescribeResourceGroups](#) in *AWS CLI Command Reference*.

`describe-rules-packages`

The following code example shows how to use `describe-rules-packages`.

AWS CLI

To describe rules packages

The following `describe-rules-packages` command describes the rules package with the ARN of `arn:aws:inspector:us-west-2:758058086616:rulespackage/0-9hgA516p`:

```
aws inspector describe-rules-packages --rules-package-arns arn:aws:inspector:us-
west-2:758058086616:rulespackage/0-9hgA516p
```

Output:

```
{
      "failedItems": {},
```

```
      "rulesPackages": [
        {
              "arn": "arn:aws:inspector:us-
west-2:758058086616:rulespackage/0-9hgA516p",
              "description": "The rules in this package help verify whether the EC2
 instances in your application are exposed to Common Vulnerabilities and
              Exposures (CVEs). Attacks can exploit unpatched vulnerabilities to
 compromise the confidentiality, integrity, or availability of your service
              or data. The CVE system provides a reference for publicly known
 information security vulnerabilities and exposures. For more information, see
              [https://cve.mitre.org/](https://cve.mitre.org/). If a particular CVE
 appears in one of the produced Findings at the end of a completed
              Inspector assessment, you can search [https://cve.mitre.org/](https://
cve.mitre.org/) using the CVE's ID (for example, \"CVE-2009-0021\") to
              find detailed information about this CVE, its severity, and how to
 mitigate it. ",
              "name": "Common Vulnerabilities and Exposures",
              "provider": "Amazon Web Services, Inc.",
              "version": "1.1"
        }
      ]
}
```

For more information, see Amazon Inspector Rules Packages and Rules in the *Amazon Inspector* guide.

- For API details, see DescribeRulesPackages in *AWS CLI Command Reference*.

`disassociate-member`

The following code example shows how to use `disassociate-member`.

AWS CLI

Example: To disassociate a member account from an Amazon Inspector delegated administrator

The following `disassociate-member` example disassociates an AWS account from an Amazon Inspector delegated administrator.

```
aws inspector2 disassociate-member \
    --account-id 123456789012
```

Output:

```
{
    "accountId": "123456789012"
}
```

For more information, see Managing multiple accounts in Amazon Inspector with AWS Organizations in the *Amazon Inspector User Guide*.

- For API details, see DisassociateMember in *AWS CLI Command Reference*.

`get-configuration`

The following code example shows how to use `get-configuration`.

AWS CLI

To get the setting configuration for Inspector scans

The following `get-configuration` example gets the setting configuration for Inspector scans.

```
aws inspector2 get-configuration
```

Output:

```
{
    "ec2Configuration": {
        "scanModeState": {
            "scanMode": "EC2_HYBRID",
            "scanModeStatus": "SUCCESS"
        }
    },
    "ecrConfiguration": {
        "rescanDurationState": {
            "pullDateRescanDuration": "DAYS_90",
            "rescanDuration": "DAYS_30",
            "status": "SUCCESS",
            "updatedAt": "2024-05-14T21:16:20.237000+00:00"
        }
     }
}
```

For more information, see Automated resource scanning with Amazon Inspector in the *Amazon Inspector User Guide*.

- For API details, see GetConfiguration in *AWS CLI Command Reference*.

`get-member`

The following code example shows how to use `get-member`.

AWS CLI

Example: To get member information for your organization

aws inspector2 get-member --account-id 123456789012

Output:

```
{
        "member": {
        "accountId": "123456789012",
        "delegatedAdminAccountId": "123456789012",
        "relationshipStatus": "ENABLED",
        "updatedAt": "2023-09-11T09:57:20.520000-07:00"
    }
}
```

For more information, see Managing multiple accounts in Amazon Inspector with AWS Organizations in the *Amazon Inspector User Guide*.

- For API details, see GetMember in *AWS CLI Command Reference*.

`get-telemetry-metadata`

The following code example shows how to use `get-telemetry-metadata`.

AWS CLI

To get the telemetry metadata

The following `get-telemetry-metadata` command generates information about the data that is collected for the assessment run with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE`:

```
aws inspector get-telemetry-metadata --assessment-run-arn arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE
```

Output:

```
{
      "telemetryMetadata": [
        {
              "count": 2,
              "dataSize": 345,
              "messageType": "InspectorDuplicateProcess"
        },
        {
              "count": 3,
              "dataSize": 255,
              "messageType": "InspectorTimeEventMsg"
        },
        {
              "count": 4,
              "dataSize": 1082,
              "messageType": "InspectorNetworkInterface"
        },
        {
              "count": 2,
              "dataSize": 349,
              "messageType": "InspectorDnsEntry"
        },
        {
              "count": 11,
              "dataSize": 2514,
              "messageType": "InspectorDirectoryInfoMsg"
        },
        {
              "count": 1,

    ]
}
```

- For API details, see GetTelemetryMetadata in *AWS CLI Command Reference*.

`list-account-permissions`

The following code example shows how to use `list-account-permissions`.

AWS CLI

To list account permissions

The following `list-account-permissions` example lists your account permissions.

```
aws inspector2 list-account-permissions
```

Output:

```
{
    "permissions": [
```

```
        {
            "operation": "ENABLE_SCANNING",
            "service": "ECR"
        },
        {
            "operation": "DISABLE_SCANNING",
            "service": "ECR"
        },
        {
            "operation": "ENABLE_REPOSITORY",
            "service": "ECR"
        },
        {
            "operation": "DISABLE_REPOSITORY",
            "service": "ECR"
        },
        {
            "operation": "ENABLE_SCANNING",
            "service": "EC2"
        },
        {
            "operation": "DISABLE_SCANNING",
            "service": "EC2"
        },
        {
            "operation": "ENABLE_SCANNING",
            "service": "LAMBDA"
        },
        {
            "operation": "DISABLE_SCANNING",
            "service": "LAMBDA"
        }
    ]
}
```

For more information, see Identity and Access Management for Amazon Inspector in the *Amazon Inspector User Guide*.

- For API details, see ListAccountPermissions in *AWS CLI Command Reference*.

`list-assessment-run-agents`

The following code example shows how to use `list-assessment-run-agents`.

AWS CLI

To list assessment run agents

The following `list-assessment-run-agents` command lists the agents of the assessment run with the specified ARN.

```
aws inspector list-assessment-run-agents \
    --assessment-run-arn arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-4r1V2mAw/run/0-MKkpXXPE
```

Output:

```
{
    "assessmentRunAgents": [
        {
            "agentHealth": "HEALTHY",
            "agentHealthCode": "HEALTHY",
            "agentId": "i-49113b93",
            "assessmentRunArn": "arn:aws:inspector:us-
west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE",
            "telemetryMetadata": [
                {
                    "count": 2,
                    "dataSize": 345,
                    "messageType": "InspectorDuplicateProcess"
                },
                {

                }
            ]
        }
    ]
}
```

For more information, see AWS Agents in the *Amazon Inspector User Guide*.

- For API details, see ListAssessmentRunAgents in *AWS CLI Command Reference*.

`list-assessment-runs`

The following code example shows how to use `list-assessment-runs`.

AWS CLI

To list assessment runs

The following `list-assessment-runs` command lists all existing assessment runs.

```
aws inspector list-assessment-runs
```

Output:

```
{
    "assessmentRunArns": [
        "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-4r1V2mAw/run/0-MKkpXXPE",
        "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-4r1V2mAw/run/0-v5D6fI3v"
    ]
}
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector User Guide*.

- For API details, see ListAssessmentRuns in *AWS CLI Command Reference*.

`list-assessment-targets`

The following code example shows how to use `list-assessment-targets`.

AWS CLI

To list assessment targets

The following `list-assessment-targets` command lists all existing assessment targets:

```
aws inspector list-assessment-targets
```

Output:

```
{
        "assessmentTargetArns": [
        "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq"
        ]
}
```

For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide.

- For API details, see ListAssessmentTargets in *AWS CLI Command Reference*.

`list-assessment-templates`

The following code example shows how to use `list-assessment-templates`.

AWS CLI

To list assessment templates

The following `list-assessment-templates` command lists all existing assessment templates:

```
aws inspector list-assessment-templates
```

Output:

```
{
        "assessmentTemplateArns": [
        "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-4r1V2mAw",
        "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-
Uza6ihLh"
        ]
}
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see ListAssessmentTemplates in *AWS CLI Command Reference*.

`list-coverage-statistics`

The following code example shows how to use `list-coverage-statistics`.

AWS CLI

Example 1: To list coverage statistics by groups

The following `list-coverage-statistics` example lists the coverage statistics of your AWS environment by groups.

```
aws inspector2 list-coverage-statistics \
   --group-by RESOURCE_TYPE
```

Output:

```
{
    "countsByGroup": [
        {
            "count": 56,
            "groupKey": "AWS_LAMBDA_FUNCTION"
        },
        {
            "count": 27,
            "groupKey": "AWS_ECR_REPOSITORY"
        },
        {
            "count": 18,
            "groupKey": "AWS_EC2_INSTANCE"
        },
        {
            "count": 3,
            "groupKey": "AWS_ECR_CONTAINER_IMAGE"
        },
        {
            "count": 1,
            "groupKey": "AWS_ACCOUNT"
        }
    ],
    "totalCounts": 105
}
```

For more information, see Assessing Amazon Inspector coverage of your AWS environment in the *Amazon Inspector User Guide*.

Example 2: To list coverage statistics by resource type

The following `list-coverage-statistics` example lists the coverage statistics of your AWS environment by resource type.

```
aws inspector2 list-coverage-statistics
    --filter-criteria '{"resourceType":
[{"comparison":"EQUALS","value":"AWS_ECR_REPOSITORY"}]}'
    --group-by SCAN_STATUS_REASON
```

Output:

```
{
    "countsByGroup": [
        {
            "count": 27,
            "groupKey": "SUCCESSFUL"
        }
    ],
    "totalCounts": 27
}
```

For more information, see Assessing Amazon Inspector coverage of your AWS environment in the *Amazon Inspector User Guide*.

Example 3: To list coverage statistics by ECR repository name

The following `list-coverage-statistics` example lists the coverage statistics of your AWS environment by ECR repository name.

```
aws inspector2 list-coverage-statistics
   --filter-criteria '{"ecrRepositoryName":
[{"comparison":"EQUALS","value":"debian"}]}'
   --group-by SCAN_STATUS_REASON
```

Output:

```
{
    "countsByGroup": [
        {
            "count": 3,
            "groupKey": "SUCCESSFUL"
        }
```

```
    ],
    "totalCounts": 3
}
```

For more information, see [Assessing Amazon Inspector coverage of your AWS environment]() in the *Amazon Inspector User Guide*.

- For API details, see [ListCoverageStatistics]() in *AWS CLI Command Reference*.

`list-coverage`

The following code example shows how to use `list-coverage`.

AWS CLI

Example 1: To list coverage details about your environment

The following `list-coverage` example lists your environment's coverage details.

```
aws inspector2 list-coverage
```

Output:

```
{
    "coveredResources": [
        {
            "accountId": "123456789012",
            "lastScannedAt": "2024-05-20T16:23:20-07:00",
            "resourceId": "i-EXAMPLE55555555555",
            "resourceMetadata": {
                "ec2": {
                    "amiId": "ami-EXAMPLE6666666666",
                    "platform": "LINUX"
                }
            },
            "resourceType": "AWS_EC2_INSTANCE",
            "scanStatus": {
                "reason": "SUCCESSFUL",
                "statusCode": "ACTIVE"
            },
            "scanType": "PACKAGE"
        }
```

```
    ]
}
```

Example 2: To list coverage details about the Lambda function resource type

The following `list-coverage` example lists your Lambda function resource type details.

```
aws inspector2 list-coverage
    --filter-criteria '{"resourceType":
[{"comparison":"EQUALS","value":"AWS_LAMBDA_FUNCTION"}]}'
```

Output:

```
{
    "coveredResources": [
        {
            "accountId": "123456789012",
            "resourceId": "arn:aws:lambda:us-west-2:123456789012:function:Eval-
container-scan-results:$LATEST",
            "resourceMetadata": {
                "lambdaFunction": {
                    "functionName": "Eval-container-scan-results",
                    "functionTags": {},
                    "layers": [],
                    "runtime": "PYTHON_3_7"
                }
            },
            "resourceType": "AWS_LAMBDA_FUNCTION",
            "scanStatus": {
                "reason": "SUCCESSFUL",
                "statusCode": "ACTIVE"
            },
            "scanType": "CODE"
        }
    ]
}
```

- For API details, see ListCoverage in *AWS CLI Command Reference*.

`list-delegated-admin-accounts`

The following code example shows how to use `list-delegated-admin-accounts`.

AWS CLI

To list information about the delegated administrator account of your organization

The following `list-delegated-admin-accounts` example lists information about the delegated administrator account of your organization.

```
aws inspector2 list-delegated-admin-accounts
```

Output:

```
{
    "delegatedAdminAccounts": [
        {
            "accountId": "123456789012",
            "status": "ENABLED"
        }
    ]
}
```

For more information, see Designating a delegated administrator for Amazon Inspector in the *Amazon Inspector User Guide*.

- For API details, see ListDelegatedAdminAccounts in *AWS CLI Command Reference*.

`list-event-subscriptions`

The following code example shows how to use `list-event-subscriptions`.

AWS CLI

To list event subscriptions

The following `list-event-subscriptions` command lists all the event subscriptions for the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0`:

```
aws inspector list-event-subscriptions --resource-arn arn:aws:inspector:us-
west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0
```

Output:

```
{
      "subscriptions": [
        {
              "eventSubscriptions": [
                {
                      "event": "ASSESSMENT_RUN_COMPLETED",
                      "subscribedAt": 1459455440.867
                }
              ],
              "resourceArn": "arn:aws:inspector:us-west-2:123456789012:target/0-
nvgVhaxX/template/0-7sbz2Kz0",
              "topicArn": "arn:aws:sns:us-west-2:123456789012:exampletopic"
        }
      ]
}
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see ListEventSubscriptions in *AWS CLI Command Reference*.

`list-filters`

The following code example shows how to use `list-filters`.

AWS CLI

To list filters associated with the account that you used to activated Amazon Inspector

The following `list-filters` examples lists filters associated with the account that you used to activated Amazon Inspector.

```
aws inspector2 list-filters
```

Output:

```
{
    "filters": [
        {
            "action": "SUPPRESS",
            "arn": "arn:aws:inspector2:us-west-2:123456789012:owner/o-EXAMPLE222/
filter/EXAMPLE444444444",
```

```
            "createdAt": "2024-05-15T21:11:08.602000+00:00",
            "criteria": {
                "resourceType": [
                    {
                        "comparison": "EQUALS",
                        "value": "AWS_EC2_INSTANCE"
                    },
                ]
            },
            "description": "This suppression rule omits EC2 instance type findings",
            "name": "ExampleSuppressionRuleEC2",
            "ownerId": "o-EXAMPLE222",
            "tags": {},
            "updatedAt": "2024-05-15T21:11:08.602000+00:00"
        },
        {
            "action": "SUPPRESS",
            "arn": "arn:aws:inspector2:us-east-1:813737243517:owner/o-EXAMPLE222/
filter/EXAMPLE444444444",
            "createdAt": "2024-05-15T21:28:27.054000+00:00",
            "criteria": {
                "resourceType": [
                    {
                        "comparison": "EQUALS",
                        "value": "AWS_ECR_INSTANCE"
                    }
                ]
            },
            "description": "This suppression rule omits ECR instance type findings",
            "name": "ExampleSuppressionRuleECR",
            "ownerId": "o-EXAMPLE222",
            "tags": {},
            "updatedAt": "2024-05-15T21:28:27.054000+00:00"
        }
    ]
}
```

For more information, see Filtering Amazon Inspector findings in the *Amazon Inspector User Guide*.

- For API details, see ListFilters in *AWS CLI Command Reference*.

`list-findings`

The following code example shows how to use `list-findings`.

AWS CLI

To list findings

The following `list-findings` command lists all of the generated findings:

```
aws inspector list-findings
```

Output:

```
{
        "findingArns": [
        "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-4r1V2mAw/run/0-MKkpXXPE/finding/0-HwPnsDm4",
        "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-4r1V2mAw/run/0-v5D6fI3v/finding/0-tyvmqBLy"
      ]
}
```

For more information, see Amazon Inspector Findings in the *Amazon Inspector* guide.

- For API details, see ListFindings in *AWS CLI Command Reference*.

`list-members`

The following code example shows how to use `list-members`.

AWS CLI

Example 1: To list all member accounts associated with the Amazon Inspector delegated administrator for your organization

aws inspector2 list-members --only-associated

Output:

```
{
        {
```

```
             "members": [
        {
             "accountId": "123456789012",
             "delegatedAdminAccountId": "123456789012",
             "relationshipStatus": "ENABLED",
             "updatedAt": "2023-09-11T09:57:20.520000-07:00"
        },
        {
             "accountId": "123456789012",
             "delegatedAdminAccountId": "123456789012",
             "relationshipStatus": "ENABLED",
             "updatedAt": "2024-08-12T10:13:01.472000-07:00"
        },
        {
             "accountId": "625032911453",
             "delegatedAdminAccountId": "123456789012",
             "relationshipStatus": "ENABLED",
             "updatedAt": "2023-09-11T09:57:20.438000-07:00"
        },
        {
            "accountId": "715411239211",
            "delegatedAdminAccountId": "123456789012",
            "relationshipStatus": "ENABLED",
            "updatedAt": "2024-04-24T09:14:57.471000-07:00"
        }
    ]
}
```

For more information, see Managing multiple accounts in Amazon Inspector with AWS Organizations in the *Amazon Inspector User Guide*.

Example 2: To list all member accounts associated with and disassociated from the Amazon Inspector delegated administrator for your organization

aws inspector2 list-members --no-only-associated

Output:

```
{
        {
            "members": [
        {
            "accountId": "123456789012",
```

```
            "delegatedAdminAccountId": "123456789012",
            "relationshipStatus": "REMOVED",
            "updatedAt": "2024-05-15T11:34:53.326000-07:00"
        },
        {
            "accountId": "123456789012",
            "delegatedAdminAccountId": "123456789012",
            "relationshipStatus": "ENABLED",
            "updatedAt": "2023-09-11T09:57:20.520000-07:00"
        },
        {
            "accountId": "123456789012",
            "delegatedAdminAccountId": "123456789012",
            "relationshipStatus": "ENABLED",
            "updatedAt": "2024-08-12T10:13:01.472000-07:00"
        },
        {
            "accountId": "123456789012",
            "delegatedAdminAccountId": "123456789012",
            "relationshipStatus": "ENABLED",
            "updatedAt": "2023-09-11T09:57:20.438000-07:00"
        },
        {
            "accountId": "123456789012",
            "delegatedAdminAccountId": "123456789012",
            "relationshipStatus": "ENABLED",
            "updatedAt": "2024-04-24T09:14:57.471000-07:00"
        }
    ]
}
```

For more information, see Managing multiple accounts in Amazon Inspector with AWS Organizations in the *Amazon Inspector User Guide*.

- For API details, see ListMembers in *AWS CLI Command Reference*.

`list-rules-packages`

The following code example shows how to use `list-rules-packages`.

AWS CLI

To list rules packages

The following `list-rules-packages` command lists all available Inspector rules packages:

```
aws inspector list-rules-packages
```

Output:

```
{
       "rulesPackageArns": [
         "arn:aws:inspector:us-west-2:758058086616:rulespackage/0-9hgA516p",
         "arn:aws:inspector:us-west-2:758058086616:rulespackage/0-H5hpSawc",
         "arn:aws:inspector:us-west-2:758058086616:rulespackage/0-JJOtZiqQ",
         "arn:aws:inspector:us-west-2:758058086616:rulespackage/0-vg5GGHSD"
       ]
 }
```

For more information, see Amazon Inspector Rules Packages and Rules in the *Amazon Inspector* guide.

- For API details, see ListRulesPackages in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for resource

The following `list-tags-for-resource` command lists all tags associated with the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-gcwFliYu`:

```
aws inspector list-tags-for-resource --resource-arn arn:aws:inspector:us-
west-2:123456789012:target/0-0kFIPusq/template/0-gcwFliYu
```

Output:

```
{
      "tags": [
        {
              "key": "Name",
```

```
                "value": "Example"
            }
        ]
}
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`list-usage-totals`

The following code example shows how to use `list-usage-totals`.

AWS CLI

To list usage totals over the last 30 days

The following `list-usage-totals` examples lists usage totals over the last 30 days.

```
aws inspector2 list-usage-totals
```

Output:

```
{
    "totals": [
        {
            "accountId": "123456789012",
            "usage": [
                {
                    "currency": "USD",
                    "estimatedMonthlyCost": 4.6022044647,
                    "total": 1893.4784083333334,
                    "type": "EC2_AGENTLESS_INSTANCE_HOURS"
                },
                {
                    "currency": "USD",
                    "estimatedMonthlyCost": 18.892449279,
                    "total": 10882.050784722222,
                    "type": "EC2_INSTANCE_HOURS"
                },
                {
                    "currency": "USD",
```

```
                    "estimatedMonthlyCost": 5.4525363736,
                    "total": 6543.043648333333,
                    "type": "LAMBDA_FUNCTION_CODE_HOURS"
                },
                {
                    "currency": "USD",
                    "estimatedMonthlyCost": 3.9064080309,
                    "total": 9375.379274166668,
                    "type": "LAMBDA_FUNCTION_HOURS"
                },
                {
                    "currency": "USD",
                    "estimatedMonthlyCost": 0.06,
                    "total": 6.0,
                    "type": "ECR_RESCAN"
                },
                {
                    "currency": "USD",
                    "estimatedMonthlyCost": 0.09,
                    "total": 1.0,
                    "type": "ECR_INITIAL_SCAN"
                }
            ]
        }
    ]
}
```

For more information, see Monitoring usage and cost in Amazon Inspector in the *Amazon Inspector User Guide*.

- For API details, see ListUsageTotals in *AWS CLI Command Reference*.

`preview-agents`

The following code example shows how to use `preview-agents`.

AWS CLI

To preview agents

The following `preview-agents` command previews the agents installed on the EC2 instances that are part of the assessment target with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq`:

```
aws inspector preview-agents --preview-agents-arn arn:aws:inspector:us-
west-2:123456789012:target/0-0kFIPusq
```

Output:

```
{
      "agentPreviews": [
        {
              "agentId": "i-49113b93"
        }
      ]
}
```

For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide.

- For API details, see PreviewAgents in *AWS CLI Command Reference*.

`register-cross-account-access-role`

The following code example shows how to use `register-cross-account-access-role`.

AWS CLI

To register the cross account access role

The following `register-cross-account-access-role` command registers the IAM role with the ARN of `arn:aws:iam::123456789012:role/inspector` that Amazon Inspector uses to list your EC2 instances at the start of the assessment run of when you call the preview-agents command:

```
aws inspector register-cross-account-access-role --role-
arn arn:aws:iam::123456789012:role/inspector
```

For more information, see Setting up Amazon Inspector in the *Amazon Inspector* guide.

- For API details, see RegisterCrossAccountAccessRole in *AWS CLI Command Reference*.

`remove-attributes-from-findings`

The following code example shows how to use `remove-attributes-from-findings`.

AWS CLI

To remove attributes from findings

The following `remove-attributes-from-finding` command removes the attribute with the key of `Example` and value of `example` from the finding with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-8l1VIE0D/run/0-Z02cjjug/finding/0-T8yM9mEU`:

```
aws inspector remove-attributes-from-findings --finding-arns arn:aws:inspector:us-
west-2:123456789012:target/0-0kFIPusq/template/0-8l1VIE0D/run/0-Z02cjjug/finding/0-
T8yM9mEU --attribute-keys key=Example,value=example
```

Output:

```
{
      "failedItems": {}
}
```

For more information, see Amazon Inspector Findings in the *Amazon Inspector* guide.

- For API details, see RemoveAttributesFromFindings in *AWS CLI Command Reference*.

`set-tags-for-resource`

The following code example shows how to use `set-tags-for-resource`.

AWS CLI

To set tags for a resource

The following `set-tags-for-resource` command sets the tag with the key of `Example` and value of `example` to the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0`:

```
aws inspector set-tags-for-resource --resource-arn arn:aws:inspector:us-
west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0 --
tags key=Example,value=example
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see SetTagsForResource in *AWS CLI Command Reference*.

`start-assessment-run`

The following code example shows how to use `start-assessment-run`.

AWS CLI

To start an assessment run

The following `start-assessment-run` command starts the assessment run named `examplerun` using the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T`:

```
aws inspector start-assessment-run --assessment-run-name examplerun --assessment-template-arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T
```

Output:

```
{
      "assessmentRunArn": "arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T/run/0-jOoroxyY"
}
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see StartAssessmentRun in *AWS CLI Command Reference*.

`stop-assessment-run`

The following code example shows how to use `stop-assessment-run`.

AWS CLI

To stop an assessment run

The following `stop-assessment-run` command stops the assessment run with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T/run/0-jOoroxyY`:

```
aws inspector stop-assessment-run --assessment-run-arn arn:aws:inspector:us-
west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T/run/0-jOoroxyY
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see StopAssessmentRun in *AWS CLI Command Reference*.

`subscribe-to-event`

The following code example shows how to use `subscribe-to-event`.

AWS CLI

To subscribe to an event

The following example enables the process of sending Amazon SNS notifications about the `ASSESSMENT_RUN_COMPLETED` event to the topic with the ARN of `arn:aws:sns:us-west-2:123456789012:exampletopic`

```
aws inspector subscribe-to-event \
    --event ASSESSMENT_RUN_COMPLETED \
    --resource-arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/
template/0-7sbz2Kz0 \
    --topic-arn arn:aws:sns:us-west-2:123456789012:exampletopic
```

This command produces no output.

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see SubscribeToEvent in *AWS CLI Command Reference*.

`unsubscribe-from-event`

The following code example shows how to use `unsubscribe-from-event`.

AWS CLI

To unsubscribe from an event

The following `unsubscribe-from-event` command disables the process of sending Amazon SNS notifications about the `ASSESSMENT_RUN_COMPLETED` event to the topic with the ARN of `arn:aws:sns:us-west-2:123456789012:exampletopic`:

```
aws inspector unsubscribe-from-event --event ASSESSMENT_RUN_COMPLETED --resource-arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0 --topic arn:aws:sns:us-west-2:123456789012:exampletopic
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see UnsubscribeFromEvent in *AWS CLI Command Reference*.

`update-assessment-target`

The following code example shows how to use `update-assessment-target`.

AWS CLI

To update an assessment target

The following `update-assessment-target` command updates the assessment target with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX` and the name of `Example`, and the resource group with the ARN of `arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-yNbgL5Pt`:

```
aws inspector update-assessment-target --assessment-target-arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX --assessment-target-name Example --resource-group-arn arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-yNbgL5Pt
```

For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide.

- For API details, see UpdateAssessmentTarget in *AWS CLI Command Reference*.

`update-filter`

The following code example shows how to use `update-filter`.

AWS CLI

To update a filter

The following `update-filter` example updates a filter to omit Lambda findings instead of ECR instance findings.

```
aws inspector2 update-filter \
   --filter-arn "arn:aws:inspector2:us-west-2:123456789012:owner/o-EXAMPLE222/
filter/EXAMPLE444444444" \
   --name "ExampleSuppressionRuleLambda" \
   --description "This suppression rule omits Lambda instance findings" \
   --reason "Updating filter to omit Lambda instance findings instead of ECR
 instance findings"
```

Output:

```
{
    "filters": [
        {
            "action": "SUPPRESS",
            "arn": "arn:aws:inspector2:us-west-2:123456789012:owner/o-EXAMPLE222/
filter/EXAMPLE444444444",
            "createdAt": "2024-05-15T21:28:27.054000+00:00",
            "criteria": {
                "resourceType": [
                    {
                        "comparison": "EQUALS",
                        "value": "AWS_ECR_INSTANCE"
                    }
                ]
            },
            "description": "This suppression rule omits Lambda instance findings",
            "name": "ExampleSuppressionRuleLambda",
            "ownerId": "o-EXAMPLE222",
            "reason": "Updating filter to omit Lambda instance findings instead of
 ECR instance findings",
            "tags": {},
            "updatedAt": "2024-05-15T22:23:13.665000+00:00"
        }
    ]
}
```

For more information, see Managing findings in Amazon Inspector in the *Amazon Inspector User Guide*.

- For API details, see UpdateFilter in *AWS CLI Command Reference*.

AWS IoT examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`accept-certificate-transfer`

The following code example shows how to use `accept-certificate-transfer`.

AWS CLI

To accept a device certificate transferred from a different AWS account

The following `accept-certificate-transfer` example accepts a device certificate transferred from another AWS account. The certificate is identified by its ID.

```
aws iot accept-certificate-transfer \
    --certificate-
id 488b6a7f2acdeb00a77384e63c4e40b18bEXAMPLEe57b7272ba44c45e3448142
```

This command does not produce any output.

For more information, see Transfer a certificate to another account in the *AWS IoT Core Developer Guide*.

- For API details, see AcceptCertificateTransfer in *AWS CLI Command Reference*.

`add-thing-to-billing-group`

The following code example shows how to use `add-thing-to-billing-group`.

AWS CLI

Example 1: To add a thing by name to a billing group

The following `add-thing-to-billing-group` example adds the thing named `MyLightBulb` to the billing group named `GroupOne`.

```
aws iot add-thing-to-billing-group \
    --billing-group-name GroupOne \
    --thing-name MyLightBulb
```

This command produces no output.

Example 2: To add a thing by ARN to a billing group

The following `add-thing-to-billing-group` example adds a thing with a specified ARN to a billing group with the specified ARN. Specifying an ARN is helpful if you work with multiple AWS Regions or accounts. It can help ensure that you are adding to the right Region and account.

```
aws iot add-thing-to-thing-group \
    --billing-group-arn "arn:aws:iot:us-west-2:123456789012:billinggroup/GroupOne" \
    --thing-arn "arn:aws:iot:us-west-2:123456789012:thing/MyOtherLightBulb"
```

This command produces no output.

For more information, see Billing Groups in the *AWS IoT Developers Guide*.

- For API details, see AddThingToBillingGroup in *AWS CLI Command Reference*.

`add-thing-to-thing-group`

The following code example shows how to use `add-thing-to-thing-group`.

AWS CLI

To add a thing to a group

The following `add-thing-to-thing-group` example adds the specified thing to the specified thing group.

```
aws iot add-thing-to-thing-group \
```

```
    --thing-name MyLightBulb \
    --thing-group-name LightBulbs
```

This command produces no output.

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see AddThingToThingGroup in *AWS CLI Command Reference*.

`associate-targets-with-job`

The following code example shows how to use `associate-targets-with-job`.

AWS CLI

To associate a thing group with a continuous job

The following `associate-targets-with-job` example associates the specified thing group with the specified continuous job.

```
aws iot associate-targets-with-job \
    --targets "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs" \
    --job-id "example-job-04"
```

Output:

```
{
    "jobArn": "arn:aws:iot:us-west-2:123456789012:job/example-job-04",
    "jobId": "example-job-04",
    "description": "example continuous job"
}
```

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see AssociateTargetsWithJob in *AWS CLI Command Reference*.

`attach-policy`

The following code example shows how to use `attach-policy`.

AWS CLI

Example 1: To attach a policy to a thing group

The following `attach-policy` example attaches the specified policy to a thing group identified by its ARN.

```
aws iot attach-policy \
    --target "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs" \
    --policy-name "UpdateDeviceCertPolicy"
```

This command does not produce any output.

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

Example 2: To attach a policy to a certificate

The following `attach-policy` example attaches the policy `UpdateDeviceCertPolicy` to the principal specified by a certificate.

```
aws iot attach-policy \
    --policy-name UpdateDeviceCertPolicy \
    --target "arn:aws:iot:us-
west-2:123456789012:cert/4f0ba725787aa94d67d2fca420eca022242532e8b3c58e7465c7778b443fd65e"
```

This command does not produce any output.

For more information, see Attach an AWS IoT Policy to a Device Certificate in the *AWS IoT Developers Guide*.

- For API details, see AttachPolicy in *AWS CLI Command Reference*.

`attach-security-profile`

The following code example shows how to use `attach-security-profile`.

AWS CLI

To associate a security profile with all unregistered devices

The following `attach-security-profile` example associates the AWS IoT Device Defender security profile named `Testprofile` with all unregistered devices in the `us-west-2` region for this AWS account.

```
aws iot attach-security-profile \
    --security-profile-name Testprofile \
```

```
    --security-profile-target-arn "arn:aws:iot:us-west-2:123456789012:all/
unregistered-things"
```

This command produces no output.

For more information, see [Detect Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [AttachSecurityProfile](#) in *AWS CLI Command Reference*.

`attach-thing-principal`

The following code example shows how to use `attach-thing-principal`.

AWS CLI

To attach a certificate to your thing

The following `attach-thing-principal` example attaches a certificate to the MyTemperatureSensor thing. The certificate is identified by an ARN. You can find the ARN for a certificate in the AWS IoT console.

```
aws iot attach-thing-principal \
    --thing-name MyTemperatureSensor \
    --principal arn:aws:iot:us-
west-2:123456789012:cert/2e1eb273792174ec2b9bf4e9b37e6c6c692345499506002a35159767055278e8
```

This command produces no output.

For more information, see [How to Manage Things with the Registry](#) in the *AWS IoT Developers Guide*.

- For API details, see [AttachThingPrincipal](#) in *AWS CLI Command Reference*.

`cancel-audit-mitigation-actions-task`

The following code example shows how to use `cancel-audit-mitigation-actions-task`.

AWS CLI

To cancel an audit mitigation actions task

The following `cancel-audit-mitigations-action-task` example cancels the application of mitigation actions for the specified task. You cannot cancel tasks that are already completed.

```
aws iot cancel-audit-mitigation-actions-task
    --task-id "myActionsTaskId"
```

This command produces no output.

For more information, see CancelAuditMitigationActionsTask (Mitigation Action Commands) in the *AWS IoT Developer Guide*.

- For API details, see CancelAuditMitigationActionsTask in *AWS CLI Command Reference*.

`cancel-audit-task`

The following code example shows how to use `cancel-audit-task`.

AWS CLI

To cancel an audit task

The following `cancel-audit-task` example cancels an audit task with the specified task ID. You cannot cancel a task that is complete.

```
aws iot cancel-audit-task \
    --task-id a3aea009955e501a31b764abe1bebd3d
```

This command produces no output.

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see CancelAuditTask in *AWS CLI Command Reference*.

`cancel-certificate-transfer`

The following code example shows how to use `cancel-certificate-transfer`.

AWS CLI

To cancel the transfer a certificate to a different AWS account

The following `cancel-certificate-transfer` example cancels the transfer of the specified certificate transfer. The certificate is identified by a certificate ID. You can find the ID for a certificate in the AWS IoT console.

```
aws iot cancel-certificate-transfer \
    --certificate-
id f0f33678c7c9a046e5cc87b2b1a58dfa0beec26db78addd5e605d630e05c7fc8
```

This command produces no output.

For more information, see Transfer a certificate to another account in the *AWS IoT Core Developer Guide*.

- For API details, see CancelCertificateTransfer in *AWS CLI Command Reference*.

`cancel-job-execution`

The following code example shows how to use `cancel-job-execution`.

AWS CLI

To cancel a job execution on a device

The following `cancel-job-execution` example cancels the execution of the specified job on a device. If the job is not in the `QUEUED` state, you must add the `--force` parameter.

```
aws iot cancel-job-execution \
    --job-id "example-job-03" \
    --thing-name "MyRPi"
```

This command produces no output.

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see CancelJobExecution in *AWS CLI Command Reference*.

`cancel-job`

The following code example shows how to use `cancel-job`.

AWS CLI

To cancel a job

The following `cancel-job` example cancels the specified job.

```
aws iot cancel-job \
    --job-job "example-job-03"
```

Output:

```
{
    "jobArn": "arn:aws:iot:us-west-2:123456789012:job/example-job-03",
    "jobId": "example-job-03",
    "description": "example job test"
}
```

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see CancelJob in *AWS CLI Command Reference*.

`clear-default-authorizer`

The following code example shows how to use `clear-default-authorizer`.

AWS CLI

To clear the default authorizer

The following `clear-default-authorizer` example clears the currently configured default custom authorizer. After you run this command, there is no default authorizer. When you use a custom authorizer, you must specify it by name in the HTTP request headers.

```
aws iot clear-default-authorizer
```

This command produces no output.

For more information, see ClearDefaultAuthorizer in the *AWS IoT API Reference*.

- For API details, see ClearDefaultAuthorizer in *AWS CLI Command Reference*.

`confirm-topic-rule-destination`

The following code example shows how to use `confirm-topic-rule-destination`.

AWS CLI

To confirm a topic rule destination

The following `confirm-topic-rule-destination` example confirms a topic rule destination with a confirmation token received at an HTTP endpoint.

```
aws iot confirm-topic-rule-destination \
    --confirmation-token "AYADeIcmtq-
ZkxfpiWIQqHWM5ucAXwABABVhd3MtY3J5cHRvLXB1YmxpYy1rZXkAREFxY1E0UmlGeDg0V21BZWZ1VjZtZWFRVUJJUkt
aywpPqg8YEsa1lD4B40aJ2s1wEHKMybiF1RoOZzYisI0IvslzQY5UmCkqq3tV-3f7-

iufgrzTePl8RZYOWr0O6Aj9DiVzJZx-1iD6Pu-
G6PUw1kaO7Knzs2B4AD0qfrHUF4pYRTvyUgBnMGUCMQC8ZRmhKqntd_c6Kgrow3bMUDBvNqo2qZr8Z8Jm2rzgseR0lAn
PIetJ803Z4IlIlF8xXlcdPGP-PV1dOXFemyL8g"
```

This command produces no output.

For more information, see [Confirming a topic rule destination]() in the *AWS IoT Developer Guide*.

- For API details, see [ConfirmTopicRuleDestination]() in *AWS CLI Command Reference*.

`create-audit-suppression`

The following code example shows how to use `create-audit-suppression`.

AWS CLI

To create an audit finding suppression

The following `create-audit-suppression` example creates an audit finding suppression for a policy named "virtualMachinePolicy" that has been flagged for being overly permissive.

```
aws iot create-audit-suppression \
    --check-name IOT_POLICY_OVERLY_PERMISSIVE_CHECK \
    --resource-identifier
 policyVersionIdentifier={"policyName"="virtualMachinePolicy","policyVersionId"="1"}
 \
    --no-suppress-indefinitely \
    --expiration-date 2020-10-20
```

This command produces no output.

For more information, see [Audit finding suppressions]() in the *AWS IoT Developers Guide*.

- For API details, see [CreateAuditSuppression]() in *AWS CLI Command Reference*.

`create-authorizer`

The following code example shows how to use `create-authorizer`.

AWS CLI

To create a custom authorizer

The following `create-authorizer` example creates a custom authorizer that uses the specified Lambda function as part of a custom authentication service.

```
   aws iot create-authorizer \
       --authorizer-name "CustomAuthorizer" \
       --authorizer-function-arn "arn:aws:lambda:us-
west-2:123456789012:function:CustomAuthorizerFunction" \
       --token-key-name "MyAuthToken" \
       --status ACTIVE \
       --token-signing-public-keys FIRST_KEY="-----BEGIN PUBLIC KEY-----
MIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEA1uJOB4lQPgG/lM6ZfIwo

lQIDAQAB
-----END PUBLIC KEY-----"
```

Output:

```
{
    "authorizerName": "CustomAuthorizer",
    "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/
CustomAuthorizer2"
}
```

For more information, see CreateAuthorizer in the *AWS IoT API Reference*.

- For API details, see CreateAuthorizer in *AWS CLI Command Reference*.

`create-billing-group`

The following code example shows how to use `create-billing-group`.

AWS CLI

To create a billing group

The following `create-billing-group` example creates a simple billing group named `GroupOne`.

```
aws iot create-billing-group \
    --billing-group-name GroupOne
```

Output:

```
{
    "billingGroupName": "GroupOne",
    "billingGroupArn": "arn:aws:iot:us-west-2:123456789012:billinggroup/GroupOne",
    "billingGroupId": "103de383-114b-4f51-8266-18f209ef5562"
}
```

For more information, see Billing Groups in the *AWS IoT Developers Guide*.

- For API details, see CreateBillingGroup in *AWS CLI Command Reference*.

`create-certificate-from-csr`

The following code example shows how to use `create-certificate-from-csr`.

AWS CLI

To create a device certificate from a certificate signing request (CSR)

The following `create-certificate-from-csr` example creates a device certificate from a CSR. You can use the `openssl` command to create a CSR.

```
aws iot create-certificate-from-csr \
    --certificate-signing-request=file://certificate.csr
```

Output:

```
{
    "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/
c0c57bbc8baaf4631a9a0345c957657f5e710473e3ddbee1428d216d54d53ac9",
```

```
        "certificateId": 
"c0c57bbc8baaf4631a9a0345c957657f5e710473e3ddbee1428d216d54d53ac9",
        "certificatePem": "<certificate-text>"
}
```

For more information, see CreateCertificateFromCSR in the *AWS IoT API Reference*.

- For API details, see CreateCertificateFromCsr in *AWS CLI Command Reference*.

`create-custom-metric`

The following code example shows how to use `create-custom-metric`.

AWS CLI

To create a custom metric published by your devices to Device Defender

The following `create-custom-metric` example creates a custom metric that measures battery percentage.

```
aws iot create-custom-metric \
    --metric-name "batteryPercentage" \
    --metric-type "number" \
    --display-name "Remaining battery percentage." \
    --region us-east-1 \
    --client-request-token "02ccb92b-33e8-4dfa-a0c1-35b181ed26b0"
```

Output:

```
{
    "metricName": "batteryPercentage",
    "metricArn": "arn:aws:iot:us-east-1:1234564789012:custommetric/
batteryPercentage"
}
```

For more information, see Custom metrics in the *AWS IoT Core Developer Guide*.

- For API details, see CreateCustomMetric in *AWS CLI Command Reference*.

`create-dimension`

The following code example shows how to use `create-dimension`.

AWS CLI

To create a dimension

The following `create-dimension` creates a dimension with a single topic filter called `TopicFilterForAuthMessages`.

```
aws iot create-dimension \
    --name TopicFilterForAuthMessages \
    --type TOPIC_FILTER \
    --string-values device/+/auth
```

Output:

```
{
    "name": "TopicFilterForAuthMessages",
    "arn": "arn:aws:iot:eu-west-2:123456789012:dimension/TopicFilterForAuthMessages"
}
```

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see CreateDimension in *AWS CLI Command Reference*.

`create-domain-configuration`

The following code example shows how to use `create-domain-configuration`.

AWS CLI

To create a domain configuration

The following `create-domain-configuration` example creates an AWS-managed domain configuration with a service type of DATA.

```
aws iot create-domain-configuration \
    --domain-configuration-name "additionalDataDomain" \
    --service-type "DATA"
```

Output:

```
{
    "domainConfigurationName": "additionalDataDomain",
```

```
    "domainConfigurationArn": "arn:aws:iot:us-west-2:123456789012:domainconfiguration/additionalDataDomain/dikMh"
}
```

For more information, see [Configurable Endpoints](#) in the *AWS IoT Developer Guide*.

- For API details, see [CreateDomainConfiguration](#) in *AWS CLI Command Reference*.

`create-dynamic-thing-group`

The following code example shows how to use `create-dynamic-thing-group`.

AWS CLI

To create a dynamic thing group

The following `create-dynamic-thing-group` example creates a dynamic thing group that contains any thing with a temperature attribute that is greater than 60 degrees. You must enable AWS IoT fleet indexing before you can use dynamic thing groups.

```
aws iot create-dynamic-thing-group \
    --thing-group-name "RoomTooWarm" \
    --query-string "attributes.temperature>60"
```

Output:

```
{
    "thingGroupName": "RoomTooWarm",
    "thingGroupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/RoomTooWarm",
    "thingGroupId": "9d52492a-fc87-43f4-b6e2-e571d2ffcad1",
    "indexName": "AWS_Things",
    "queryString": "attributes.temperature>60",
    "queryVersion": "2017-09-30"
}
```

For more information, see [Dynamic Thing Groups](#) in the *AWS IoT Developers Guide*.

- For API details, see [CreateDynamicThingGroup](#) in *AWS CLI Command Reference*.

`create-job`

The following code example shows how to use `create-job`.

AWS CLI

Example 1: To create a job

The following `create-job` example creates a simple AWS IoT job that sends a JSON document to the `MyRaspberryPi` device.

```
aws iot create-job \
    --job-id "example-job-01" \
    --targets "arn:aws:iot:us-west-2:123456789012:thing/MyRaspberryPi" \
    --document file://example-job.json \
    --description "example job test" \
    --target-selection SNAPSHOT
```

Output:

```
{
    "jobArn": "arn:aws:iot:us-west-2:123456789012:job/example-job-01",
    "jobId": "example-job-01",
    "description": "example job test"
}
```

Example 2: To create a continuous job

The following `create-job` example creates a job that continues to run after the things specified as targets have completed the job. In this example, the target is a thing group, so when new devices are added to the group, the continuous job runs on those new things.

aws iot create-job --job-id "example-job-04" --targets "arn:aws:iot:us-west-2:123456789012:thinggroup/DeadBulbs" --document file://example-job.json --description "example continuous job" --target-selection CONTINUOUS

Output:

```
{
    "jobArn": "arn:aws:iot:us-west-2:123456789012:job/example-job-04",
    "jobId": "example-job-04",
    "description": "example continuous job"
}
```

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see CreateJob in *AWS CLI Command Reference*.

`create-keys-and-certificate`

The following code example shows how to use `create-keys-and-certificate`.

AWS CLI

To create an RSA key pair and issue an X.509 certificate

The following `create-keys-and-certificate` creates a 2048-bit RSA key pair and issues an X.509 certificate using the issued public key. Because this is the only time that AWS IoT provides the private key for this certificate, be sure to keep it in a secure location.

```
aws iot create-keys-and-certificate \
    --certificate-pem-outfile "myTest.cert.pem" \
    --public-key-outfile "myTest.public.key" \
    --private-key-outfile "myTest.private.key"
```

Output:

```
{
    "certificateArn": "arn:aws:iot:us-
west-2:123456789012:cert/9894ba17925e663f1d29c23af4582b8e3b7619c31f3fbd93adcb51ae54b83dc2",
    "certificateId":
 "9894ba17925e663f1d29c23af4582b8e3b7619c31f3fbd93adcb51ae54b83dc2",
    "certificatePem": "

```

For more information, see Create and Register an AWS IoT Device Certificate in the **AWS IoT Developer Guide**.

- For API details, see CreateKeysAndCertificate in *AWS CLI Command Reference*.

`create-mitigation-action`

The following code example shows how to use `create-mitigation-action`.

AWS CLI

To create a mitigation action

The following `create-mitigation-action` example defines a mitigation action named `AddThingsToQuarantineGroup1Action` that, when applied, moves things into the thing group named `QuarantineGroup1`. This action overrides dynamic thing groups.

```
aws iot create-mitigation-action --cli-input-json file::params.json
```

Contents of `params.json`:

```
{
    "actionName": "AddThingsToQuarantineGroup1Action",
    "actionParams": {
        "addThingsToThingGroupParams": {
            "thingGroupNames": [
                "QuarantineGroup1"
```

```
            ],
            "overrideDynamicGroups": true
        }
    },
    "roleArn": "arn:aws:iam::123456789012:role/service-role/
MoveThingsToQuarantineGroupRole"
}
```

Output:

```
{
    "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
AddThingsToQuarantineGroup1Action",
    "actionId": "992e9a63-a899-439a-aa50-4e20c52367e1"
}
```

For more information, see CreateMitigationAction (Mitigation Action Commands) in the *AWS IoT Developer Guide*.

- For API details, see CreateMitigationAction in *AWS CLI Command Reference*.

`create-ota-update`

The following code example shows how to use `create-ota-update`.

AWS CLI

To create an OTA update for use with Amazon FreeRTOS

The following `create-ota-update` example creates an AWS IoT OTAUpdate on a target group of things or groups. This is part of an Amazon FreeRTOS over-the-air update which makes it possible for you to deploy new firmware images to a single device or a group of devices.

```
aws iot create-ota-update \
    --cli-input-json file://create-ota-update.json
```

Contents of `create-ota-update.json`:

```
{
    "otaUpdateId": "ota12345",
    "description": "A critical update needed right away.",
    "targets": [
```

```
            "device1",
            "device2",
            "device3",
            "device4"
        ],
        "targetSelection": "SNAPSHOT",
        "awsJobExecutionsRolloutConfig": {
            "maximumPerMinute": 10
        },
        "files": [
            {
              "fileName": "firmware.bin",
              "fileLocation": {
                "stream": {
                  "streamId": "004",
                  "fileId":123
                }
              },
              "codeSigning": {
                "awsSignerJobId": "48c67f3c-63bb-4f92-a98a-4ee0fbc2bef6"
              }
            }
        ]
        "roleArn": "arn:aws:iam:123456789012:role/service-role/my_ota_role"
    }
```

Output:

```
{
     "otaUpdateId": "ota12345",
     "awsIotJobId": "job54321",
     "otaUpdateArn": "arn:aws:iot:us-west-2:123456789012:otaupdate/itsaupdate",
     "awsIotJobArn": "arn:aws:iot:us-west-2:123456789012:job/itsajob",
     "otaUpdateStatus": "CREATE_IN_PROGRESS"
}
```

For more information, see CreateOTAUpdate in the *AWS IoT API Reference*.

- For API details, see CreateOtaUpdate in *AWS CLI Command Reference*.

`create-policy-version`

The following code example shows how to use `create-policy-version`.

AWS CLI

To update a policy with a new version

The following `create-policy-version` example updates a policy definition, creating a new policy version. This example also makes the new version the default.

```
aws iot create-policy-version \
    --policy-name UpdateDeviceCertPolicy \
    --policy-document file://policy.json \
    --set-as-default
```

Contents of `policy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action":  "iot:UpdateCertificate",
            "Resource": "*"
        }
    ]
}
```

Output:

```
{
    "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/UpdateDeviceCertPolicy",
    "policyDocument": "{ \"Version\": \"2012-10-17\", \"Statement\": [ { \"Effect\":
 \"Allow\", \"Action\":  \"iot:UpdateCertificate\", \"Resource\": \"*\" } ] }",
    "policyVersionId": "2",
    "isDefaultVersion": true
}
```

For more information, see AWS IoT Policies in the *AWS IoT Developers Guide*.

- For API details, see CreatePolicyVersion in *AWS CLI Command Reference*.

`create-policy`

The following code example shows how to use `create-policy`.

AWS CLI

To create an AWS IoT policy

The following `create-policy` example creates an AWS IoT policy named TemperatureSensorPolicy. The `policy.json` file contains statements that allow AWS IoT policy actions.

```
aws iot create-policy \
    --policy-name TemperatureSensorPolicy \
    --policy-document file://policy.json
```

Contents of `policy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "iot:Publish",
                "iot:Receive"
            ],
            "Resource": [
                "arn:aws:iot:us-west-2:123456789012:topic/topic_1",
                "arn:aws:iot:us-west-2:123456789012:topic/topic_2"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "iot:Subscribe"
            ],
            "Resource": [
                "arn:aws:iot:us-west-2:123456789012:topicfilter/topic_1",
                "arn:aws:iot:us-west-2:123456789012:topicfilter/topic_2"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "iot:Connect"
            ],
```

```
                "Resource": [
                    "arn:aws:iot:us-west-2:123456789012:client/basicPubSub"
                ]
            }
        ]
    }
```

Output:

```
{
    "policyName": "TemperatureSensorPolicy",
    "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/
TemperatureSensorPolicy",
    "policyDocument": "{
        \"Version\": \"2012-10-17\",
        \"Statement\": [
            {
                \"Effect\": \"Allow\",
                \"Action\": [
                    \"iot:Publish\",
                    \"iot:Receive\"
                ],
                \"Resource\": [
                    \"arn:aws:iot:us-west-2:123456789012:topic/topic_1\",
                    \"arn:aws:iot:us-west-2:123456789012:topic/topic_2\"
                ]
            },
            {
                \"Effect\": \"Allow\",
                \"Action\": [
                    \"iot:Subscribe\"
                ],
                \"Resource\": [
                    \"arn:aws:iot:us-west-2:123456789012:topicfilter/topic_1\",
                    \"arn:aws:iot:us-west-2:123456789012:topicfilter/topic_2\"
                ]
            },
            {
                \"Effect\": \"Allow\",
                \"Action\": [
                    \"iot:Connect\"
                ],
                \"Resource\": [
```

```
                    \"arn:aws:iot:us-west-2:123456789012:client/basicPubSub\"
                ]
            }
        ]
    }",
    "policyVersionId": "1"
}
```

For more information, see [AWS IoT Policies]() in the *AWS IoT Developers Guide*.

- For API details, see [CreatePolicy]() in *AWS CLI Command Reference*.

`create-provisioning-claim`

The following code example shows how to use `create-provisioning-claim`.

AWS CLI

To create a provisioning claim

The following `create-provisioning-claim` example creates a provisioning claim from a provisioning template.

```
aws iot create-provisioning-claim \
    --template-name MyTestProvisioningTemplate
```

Output:

```
{
    "certificateId":
 "78de02184b2ce80cf8fb709bda59e62b19fb83513590483eb0434589476ab09f",

For more information, see Provisioning by trusted user in the *AWS IoT Core Developers Guide*.

- For API details, see CreateProvisioningClaim in *AWS CLI Command Reference*.

create-provisioning-template-version

The following code example shows how to use `create-provisioning-template-version`.

AWS CLI

To create a provisioning template version

The following example creates a version for the specified provisioning template. The body of the new version is supplied in the file `template.json`.

```
aws iot create-provisioning-template-version \
```

```
    --template-name widget-template \
    --template-body file://template.json
```

Contents of `template.json`:

```
{
    "Parameters" : {
        "DeviceLocation": {
            "Type": "String"
        }
    },
    "Mappings": {
        "LocationTable": {
            "Seattle": {
                "LocationUrl": "https://example.aws"
            }
        }
    },
    "Resources" : {
        "thing" : {
            "Type" : "AWS::IoT::Thing",
            "Properties" : {
                "AttributePayload" : {
                    "version" : "v1",
                    "serialNumber" : "serialNumber"
                },
                "ThingName" : {"Fn::Join":["",["ThingPrefix_",
{"Ref":"SerialNumber"}]]},
                "ThingTypeName" : {"Fn::Join":["",["ThingTypePrefix_",
{"Ref":"SerialNumber"}]]},
                "ThingGroups" : ["widgets", "WA"],
                "BillingGroup": "BillingGroup"
            },
            "OverrideSettings" : {
                "AttributePayload" : "MERGE",
                "ThingTypeName" : "REPLACE",
                "ThingGroups" : "DO_NOTHING"
            }
        },
        "certificate" : {
            "Type" : "AWS::IoT::Certificate",
            "Properties" : {
                "CertificateId": {"Ref": "AWS::IoT::Certificate::Id"},
```

```
                "Status" : "Active"
            }
        },
        "policy" : {
            "Type" : "AWS::IoT::Policy",
            "Properties" : {
                "PolicyDocument" : {
                    "Version":"2012-10-17",
                    "Statement": [{
                        "Effect": "Allow",
                        "Action":["iot:Publish"],
                        "Resource": ["arn:aws:iot:us-east-1:123456789012:topic/foo/
bar"]
                    }]
                }
            }
        }
    },
    "DeviceConfiguration": {
        "FallbackUrl": "https://www.example.com/test-site",
        "LocationUrl": {
            "Fn::FindInMap": ["LocationTable",{"Ref": "DeviceLocation"},
 "LocationUrl"]}
        }
    }
}
```

Output:

```
{
    "templateArn": "arn:aws:iot:us-east-1:123456789012:provisioningtemplate/widget-
template",
    "templateName": "widget-template",
    "versionId": 2,
    "isDefaultVersion": false
}
```

For more information, see AWS IoT Secure Tunneling in the *AWS IoT Core Developer Guide*.

- For API details, see CreateProvisioningTemplateVersion in *AWS CLI Command Reference*.

`create-provisioning-template`

The following code example shows how to use `create-provisioning-template`.

AWS CLI

To create a provisioning template

The following `create-provisioning-template` example creates a provisioning template as defined by the file `template.json`.

```
aws iot create-provisioning-template \
    --template-name widget-template \
    --description "A provisioning template for widgets" \
    --provisioning-role-arn arn:aws:iam::123456789012:role/Provision_role \
    --template-body file://template.json
```

Contents of `template.json`:

```
{
    "Parameters" : {
        "DeviceLocation": {
            "Type": "String"
        }
    },
    "Mappings": {
        "LocationTable": {
            "Seattle": {
                "LocationUrl": "https://example.aws"
            }
        }
    },
    "Resources" : {
        "thing" : {
            "Type" : "AWS::IoT::Thing",
            "Properties" : {
                "AttributePayload" : {
                    "version" : "v1",
                    "serialNumber" : "serialNumber"
                },
                "ThingName" : {"Fn::Join":["",["ThingPrefix_",
{"Ref":"SerialNumber"}]]},
```

```
                "ThingTypeName" : {"Fn::Join":["",["ThingTypePrefix_",
{"Ref":"SerialNumber"}]]},
                "ThingGroups" : ["widgets", "WA"],
                "BillingGroup": "BillingGroup"
            },
            "OverrideSettings" : {
                "AttributePayload" : "MERGE",
                "ThingTypeName" : "REPLACE",
                "ThingGroups" : "DO_NOTHING"
            }
        },
        "certificate" : {
            "Type" : "AWS::IoT::Certificate",
            "Properties" : {
                "CertificateId": {"Ref": "AWS::IoT::Certificate::Id"},
                "Status" : "Active"
            }
        },
        "policy" : {
            "Type" : "AWS::IoT::Policy",
            "Properties" : {
                "PolicyDocument" : {
                    "Version":"2012-10-17",
                    "Statement": [{
                        "Effect": "Allow",
                        "Action":["iot:Publish"],
                        "Resource": ["arn:aws:iot:us-east-1:504350838278:topic/foo/
bar"]
                    }]
                }
            }
        }
    },
    "DeviceConfiguration": {
        "FallbackUrl": "https://www.example.com/test-site",
        "LocationUrl": {
            "Fn::FindInMap": ["LocationTable",{"Ref": "DeviceLocation"},
 "LocationUrl"]}
        }
    }
}
```

Output:

```
{
    "templateArn": "arn:aws:iot:us-east-1:123456789012:provisioningtemplate/widget-template",
    "templateName": "widget-template",
    "defaultVersionId": 1
}
```

For more information, see AWS IoT Secure Tunneling in the *AWS IoT Core Developer Guide*.

- For API details, see CreateProvisioningTemplate in *AWS CLI Command Reference*.

`create-role-alias`

The following code example shows how to use `create-role-alias`.

AWS CLI

To create a role alias

The following `create-role-alias` example creates a role alias called `LightBulbRole` for the specified role.

```
aws iot create-role-alias \
    --role-alias LightBulbRole \
    --role-arn arn:aws:iam::123456789012:role/lightbulbrole-001
```

Output:

```
{
    "roleAlias": "LightBulbRole",
    "roleAliasArn": "arn:aws:iot:us-west-2:123456789012:rolealias/LightBulbRole"
}
```

For more information, see CreateRoleAlias in the *AWS IoT API Reference*.

- For API details, see CreateRoleAlias in *AWS CLI Command Reference*.

`create-scheduled-audit`

The following code example shows how to use `create-scheduled-audit`.

AWS CLI

To create a scheduled audit

The following `create-scheduled-audit` example creates a scheduled audit that runs weekly, on Wednesday, to check if CA certificates or device certificates are expiring.

```
aws iot create-scheduled-audit \
    --scheduled-audit-name WednesdayCertCheck \
    --frequency WEEKLY \
    --day-of-week WED \
    --target-check-
names CA_CERTIFICATE_EXPIRING_CHECK DEVICE_CERTIFICATE_EXPIRING_CHECK
```

Output:

```
{
    "scheduledAuditArn": "arn:aws:iot:us-west-2:123456789012:scheduledaudit/
WednesdayCertCheck"
}
```

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see CreateScheduledAudit in *AWS CLI Command Reference*.

`create-security-profile`

The following code example shows how to use `create-security-profile`.

AWS CLI

To create a security profile

The following `create-security-profile` example creates a security profile that checks if cellular bandwidth exceeds a threshold or if more than 10 authorization failures occur within a five-minute period.

```
aws iot create-security-profile \
    --security-profile-name PossibleIssue \
    --security-profile-description "Check to see if authorization fails 10 times in
 5 minutes or if cellular bandwidth exceeds 128"  \
```

```
    --behaviors "[{\"name\":\"CellularBandwidth\",\"metric\":\"aws:message-byte-size
\",\"criteria\":{\"comparisonOperator\":\"greater-than\",\"value\":{\"count\":128},
\"consecutiveDatapointsToAlarm\":1,\"consecutiveDatapointsToClear\":1}},{\"name
\":\"Authorization\",\"metric\":\"aws:num-authorization-failures\",\"criteria\":
{\"comparisonOperator\":\"less-than\",\"value\":{\"count\":10},\"durationSeconds
\":300,\"consecutiveDatapointsToAlarm\":1,\"consecutiveDatapointsToClear\":1}}]"
```

Output:

```
{
    "securityProfileName": "PossibleIssue",
    "securityProfileArn": "arn:aws:iot:us-west-2:123456789012:securityprofile/
PossibleIssue"
}
```

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see CreateSecurityProfile in *AWS CLI Command Reference*.

`create-stream`

The following code example shows how to use `create-stream`.

AWS CLI

To create a stream for delivering one or more large files in chunks over MQTT

The following `create-stream` example creates a stream for delivering one or more large files in chunks over MQTT. A stream transports data bytes in chunks or blocks packaged as MQTT messages from a source like S3. You can have one or more files associated with a stream.

```
aws iot create-stream \
    --cli-input-json file://create-stream.json
```

Contents of `create-stream.json`:

```
{
    "streamId": "stream12345",
    "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",
    "files": [
        {
            "fileId": 123,
```

```
                "s3Location": {
                    "bucket":"codesign-ota-bucket",
                    "key":"48c67f3c-63bb-4f92-a98a-4ee0fbc2bef6"
                }
            }
        ],
        "roleArn": "arn:aws:iam:123456789012:role/service-role/my_ota_stream_role"
}
```

Output:

```
{
     "streamId": "stream12345",
     "streamArn": "arn:aws:iot:us-west-2:123456789012:stream/stream12345",
     "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",
     "streamVersion": "1"
}
```

For more information, see CreateStream in the *AWS IoT API Reference*.

- For API details, see CreateStream in *AWS CLI Command Reference*.

`create-thing-group`

The following code example shows how to use `create-thing-group`.

AWS CLI

Example 1: To create a thing group

The following `create-thing-group` example creates a thing group named `LightBulbs` with a description and two attributes.

```
aws iot create-thing-group \
    --thing-group-name LightBulbs \
    --thing-group-properties "thingGroupDescription=\"Generic bulb group\",
 attributePayload={attributes={Manufacturer=AnyCompany,wattage=60}}"
```

Output:

```
{
    "thingGroupName": "LightBulbs",
```

```
    "thingGroupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs",
    "thingGroupId": "9198bf9f-1e76-4a88-8e8c-e7140142c331"
}
```

Example 2: To create a thing group that's part of a parent group

The following `create-thing-group` creates a thing group named `HalogenBulbs` that has a parent thing group named `LightBulbs`.

```
aws iot create-thing-group \
    --thing-group-name HalogenBulbs \
    --parent-group-name LightBulbs
```

Output:

```
{
    "thingGroupName": "HalogenBulbs",
    "thingGroupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/HalogenBulbs",
    "thingGroupId": "f4ec6b84-b42b-499d-9ce1-4dbd4d4f6f6e"
}
```

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see CreateThingGroup in *AWS CLI Command Reference*.

`create-thing-type`

The following code example shows how to use `create-thing-type`.

AWS CLI

To define a thing type

The following `create-thing-type` example defines a thing type and associated attributes.

```
aws iot create-thing-type \
    --thing-type-name "LightBulb" \
    --thing-type-properties "thingTypeDescription=light bulb type,
 searchableAttributes=wattage,model"
```

Output:

```
{
    "thingTypeName": "LightBulb",
    "thingTypeArn": "arn:aws:iot:us-west-2:123456789012:thingtype/LightBulb",
    "thingTypeId": "ce3573b0-0a3c-45a7-ac93-4e0ce14cd190"
}
```

For more information, see Thing Types in the *AWS IoT Developers Guide*.

- For API details, see CreateThingType in *AWS CLI Command Reference*.

`create-thing`

The following code example shows how to use `create-thing`.

AWS CLI

Example 1: To create a thing record in the registry

The following `create-thing` example creates an entry for a device in the AWS IoT thing registry.

```
aws iot create-thing \
    --thing-name SampleIoTThing
```

Output:

```
{
    "thingName": "SampleIoTThing",
    "thingArn": "arn:aws:iot:us-west-2: 123456789012:thing/SampleIoTThing",
    "thingId": " EXAMPLE1-90ab-cdef-fedc-ba987EXAMPLE "
}
```

Example 2: To define a thing that is associated with a thing type

The following `create-thing` example create a thing that has the specified thing type and its attributes.

```
aws iot create-thing \
    --thing-name "MyLightBulb" \
    --thing-type-name "LightBulb" \
```

```
    --attribute-payload "{"attributes": {"wattage":"75", "model":"123"}}"
```

Output:

```
{
    "thingName": "MyLightBulb",
    "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyLightBulb",
    "thingId": "40da2e73-c6af-406e-b415-15acae538797"
}
```

For more information, see How to Manage Things with the Registry and Thing Types in the *AWS IoT Developers Guide*.

- For API details, see CreateThing in *AWS CLI Command Reference*.

`create-topic-rule-destination`

The following code example shows how to use `create-topic-rule-destination`.

AWS CLI

To create a topic rule destination

The following `create-topic-rule-destination` example creates a topic rule destination for an HTTP endpoint.

```
aws iot create-topic-rule-destination \
    --destination-configuration httpUrlConfiguration={confirmationUrl=https://
example.com}
```

Output:

```
{
    "topicRuleDestination": {
        "arn": "arn:aws:iot:us-west-2:123456789012:ruledestination/http/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
        "status": "IN_PROGRESS",
        "statusReason": "Awaiting confirmation. Confirmation message sent on
 2020-07-09T22:47:54.154Z; no response received from the endpoint.",
        "httpUrlProperties": {
            "confirmationUrl": "https://example.com"
```

```
        }
    }
}
```

For more information, see Creating a topic rule destination in the *AWS IoT Developer Guide*.

- For API details, see CreateTopicRuleDestination in *AWS CLI Command Reference*.

`create-topic-rule`

The following code example shows how to use `create-topic-rule`.

AWS CLI

To create a rule that sends an Amazon SNS alert

The following `create-topic-rule` example creates a rule that sends an Amazon SNS message when soil moisture level readings, as found in a device shadow, are low.

```
aws iot create-topic-rule \
    --rule-name "LowMoistureRule" \
    --topic-rule-payload file://plant-rule.json
```

The example requires the following JSON code to be saved to a file named `plant-rule.json`:

```
{
    "sql": "SELECT * FROM '$aws/things/MyRPi/shadow/update/accepted' WHERE
 state.reported.moisture = 'low'\n",
    "description": "Sends an alert whenever soil moisture level readings are too
 low.",
    "ruleDisabled": false,
    "awsIotSqlVersion": "2016-03-23",
    "actions": [{
            "sns": {
                "targetArn": "arn:aws:sns:us-
west-2:123456789012:MyRPiLowMoistureTopic",
                "roleArn": "arn:aws:iam::123456789012:role/service-role/
MyRPiLowMoistureTopicRole",
                "messageFormat": "RAW"
            }
    }]
}
```

This command produces no output.

For more information, see Creating an AWS IoT Rule in the *AWS IoT Developers Guide*.

- For API details, see CreateTopicRule in *AWS CLI Command Reference*.

`delete-account-audit-configuration`

The following code example shows how to use `delete-account-audit-configuration`.

AWS CLI

To disable all audit checks for your AWS account

The following `delete-account-audit-configuration` example restores the default settings for AWS IoT Device Defender for this account, disabling all audit checks and clearing configuration data. It also deletes any scheduled audits for this account. **Use this command with caution.**

```
aws iot delete-account-audit-configuration \
    --delete-scheduled-audits
```

This command produces no output.

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see DeleteAccountAuditConfiguration in *AWS CLI Command Reference*.

`delete-audit-suppression`

The following code example shows how to use `delete-audit-suppression`.

AWS CLI

To delete an audit finding suppression

The following `delete-audit-suppression` example deletes an audit finding suppression for DEVICE_CERTIFICATE_EXPIRING_CHECK.

```
aws iot delete-audit-suppression \
    --check-name DEVICE_CERTIFICATE_EXPIRING_CHECK \
```

```
    --resource-identifier deviceCertificateId="c7691e<shortened>"
```

This command produces no output.

For more information, see Audit finding suppressions in the *AWS IoT Developers Guide*.

- For API details, see DeleteAuditSuppression in *AWS CLI Command Reference*.

`delete-authorizer`

The following code example shows how to use `delete-authorizer`.

AWS CLI

To delete a custom authorizer

The following `delete-authorizer` example deletes the authorizer named `CustomAuthorizer`. A custom authorizer must be in the `INACTIVE` state before you can delete it.

```
aws iot delete-authorizer \
    --authorizer-name CustomAuthorizer
```

This command produces no output.

For more information, see DeleteAuthorizer in the *AWS IoT Developer Guide*.

- For API details, see DeleteAuthorizer in *AWS CLI Command Reference*.

`delete-billing-group`

The following code example shows how to use `delete-billing-group`.

AWS CLI

To delete a billing group

The following `delete-billing-group` example deletes the specified billing group. You can delete a billing group even if it contains one or more things.

```
aws iot delete-billing-group \
```

```
    --billing-group-name BillingGroupTwo
```

This command does not produce any output.

For more information, see Billing Groups in the *AWS IoT Developers Guide*.

- For API details, see DeleteBillingGroup in *AWS CLI Command Reference*.

`delete-ca-certificate`

The following code example shows how to use `delete-ca-certificate`.

AWS CLI

To delete a CA certificate

The following `delete-ca-certificate` example deletes the CA certificate with the specified certificate ID.

```
aws iot delete-ca-certificate \
    --certificate-
id f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467
```

This command produces no output.

For more information, see DeleteCACertificate in the *AWS IoT API Reference*.

- For API details, see DeleteCaCertificate in *AWS CLI Command Reference*.

`delete-certificate`

The following code example shows how to use `delete-certificate`.

AWS CLI

To delete a device certificate

The following `delete-certificate` example deletes the device certificate with the specified ID.

```
aws iot delete-certificate \
```

```
    --certificate-
id c0c57bbc8baaf4631a9a0345c957657f5e710473e3ddbee1428d216d54d53ac9
```

This command produces no output.

For more information, see DeleteCertificate in the *AWS IoT API Reference*.

- For API details, see DeleteCertificate in *AWS CLI Command Reference*.

`delete-custom-metric`

The following code example shows how to use `delete-custom-metric`.

AWS CLI

To delete a custom metric

The following `delete-custom-metric` example deletes a custom metric.

```
aws iot delete-custom-metric \
    --metric-name batteryPercentage \
    --region us-east-1
```

Output:

```
HTTP 200
```

For more information, see Custom metrics in the *AWS IoT Core Developer Guide*.

- For API details, see DeleteCustomMetric in *AWS CLI Command Reference*.

`delete-dimension`

The following code example shows how to use `delete-dimension`.

AWS CLI

To delete a dimension

The following `delete-dimension` example deletes a dimension called `TopicFilterForAuthMessages`.

```
aws iot delete-dimension \
    --name TopicFilterForAuthMessages
```

This command produces no output.

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see DeleteDimension in *AWS CLI Command Reference*.

`delete-domain-configuration`

The following code example shows how to use `delete-domain-configuration`.

AWS CLI

To delete a domain configuration

The following `delete-domain-configuration` example deletes a domain configuration named `additionalDataDomain` from your AWS account.

```
aws iot delete-domain-configuration \
    --domain-configuration-name "additionalDataDomain" \
    --domain-configuration-status "OK"
```

This command produces no output.

For more information, see Configurable Endpoints in the *AWS IoT Developer Guide*.

- For API details, see DeleteDomainConfiguration in *AWS CLI Command Reference*.

`delete-dynamic-thing-group`

The following code example shows how to use `delete-dynamic-thing-group`.

AWS CLI

To delete a dynamic thing group

The following `delete-dynamic-thing-group` example deletes the specified dynamic thing group.

```
aws iot delete-dynamic-thing-group \
```

```
    --thing-group-name "RoomTooWarm"
```

This command produces no output.

For more information, see Dynamic Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see DeleteDynamicThingGroup in *AWS CLI Command Reference*.

`delete-job-execution`

The following code example shows how to use `delete-job-execution`.

AWS CLI

To delete a job execution

The following `delete-job-execution` example deletes the job execution of the specified job on a device. Use `describe-job-execution` to get the execution number.

```
aws iot delete-job-execution
    --job-id "example-job-02"
    --thing-name "MyRaspberryPi"
    --execution-number 1
```

This command produces no output.

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see DeleteJobExecution in *AWS CLI Command Reference*.

`delete-job`

The following code example shows how to use `delete-job`.

AWS CLI

To delete a job

The following `delete-job` example deletes the specified job. By specifying the `--force` option, the job is deleted even if the status is `IN_PROGRESS`.

```
aws iot delete-job \
```

```
    --job-id "example-job-04" \
    --force
```

This command produces no output.

For more information, see [Creating and Managing Jobs (CLI)](#) in the *AWS IoT Developer Guide*.

- For API details, see [DeleteJob](#) in *AWS CLI Command Reference*.

`delete-mitigation-action`

The following code example shows how to use `delete-mitigation-action`.

AWS CLI

To delete a mitigation action

The following `delete-mitigation-action` example deletes the specified mitigation action.

```
aws iot delete-mitigation-action \
    --action-name AddThingsToQuarantineGroup1Action
```

This command produces no output.

For more information, see [DeleteMitigationAction (Mitigation Action Commands)](#) in the *AWS IoT Developer Guide*.

- For API details, see [DeleteMitigationAction](#) in *AWS CLI Command Reference*.

`delete-ota-update`

The following code example shows how to use `delete-ota-update`.

AWS CLI

To delete an OTA update

The following `delete-ota-update` example deletes the specified OTA update.

```
aws iot delete-ota-update \
    --ota-update-id ota12345 \
```

```
    --delete-stream \
    --force-delete-aws-job
```

This command produces no output.

For more information, see DeleteOTAUpdate in the *AWS IoT API Reference*.

- For API details, see DeleteOtaUpdate in *AWS CLI Command Reference*.

`delete-policy-version`

The following code example shows how to use `delete-policy-version`.

AWS CLI

To delete a version of policy

The following `delete-policy-version` example deletes version 2 of the specified policy from your AWS account.

```
aws iot delete-policy-version \
    --policy-name UpdateDeviceCertPolicy \
    --policy-version-id 2
```

This command produces no output.

For more information, see AWS IoT Policies in the *AWS IoT Developer Guide*.

- For API details, see DeletePolicyVersion in *AWS CLI Command Reference*.

`delete-policy`

The following code example shows how to use `delete-policy`.

AWS CLI

To delete a policy

The following `delete-policy` example deletes the specified policy from your AWS account.

```
aws iot delete-policy --policy-name UpdateDeviceCertPolicy
```

This command produces no output.

For more information, see AWS IoT Policies in the *AWS IoT Developers Guide*.

- For API details, see DeletePolicy in *AWS CLI Command Reference*.

`delete-provisioning-template-version`

The following code example shows how to use `delete-provisioning-template-version`.

AWS CLI

To delete a provisioning template version

The following `delete-provisioning-template-version` example deletes version 2 of the specified provisioning template.

```
aws iot delete-provisioning-template-version \
    --version-id 2 \
    --template-name "widget-template"
```

This command produces no output.

For more information, see AWS IoT Secure Tunneling in the *AWS IoT Core Developer Guide*.

- For API details, see DeleteProvisioningTemplateVersion in *AWS CLI Command Reference*.

`delete-provisioning-template`

The following code example shows how to use `delete-provisioning-template`.

AWS CLI

To delete a provisioning template

The following `delete-provisioning-template` example deletes the specified provisioning template.

```
aws iot delete-provisioning-template \
    --template-name widget-template
```

This command produces no output.

For more information, see [AWS IoT Secure Tunneling](#) in the *AWS IoT Core Developer Guide*.

- For API details, see [DeleteProvisioningTemplate](#) in *AWS CLI Command Reference*.

`delete-registration-code`

The following code example shows how to use `delete-registration-code`.

AWS CLI

To delete your registration cod

The following `delete-registration-code` example deletes an AWS IoT account-specific registration code.

```
aws iot delete-registration-code
```

This command produces no output.

For more information, see [Use Your Own Certificate](#) in the *AWS IoT Developer Guide*.

- For API details, see [DeleteRegistrationCode](#) in *AWS CLI Command Reference*.

`delete-role-alias`

The following code example shows how to use `delete-role-alias`.

AWS CLI

To delete an AWS IoT role alias

The following `delete-role-alias` example deletes an AWS IoT role alias named `LightBulbRole`.

```
aws iot delete-role-alias \
    --role-alias LightBulbRole
```

This command produces no output.

For more information, see Authorizing Direct Calls to AWS Services in the *AWS IoT Developer Guide*.

- For API details, see DeleteRoleAlias in *AWS CLI Command Reference*.

`delete-scheduled-audit`

The following code example shows how to use `delete-scheduled-audit`.

AWS CLI

To delete a scheduled audit

The following `delete-scheduled-audit` example deletes the AWS IoT Device Defender scheduled audit named `AWSIoTDeviceDefenderDailyAudit`.

```
aws iot delete-scheduled-audit \
    --scheduled-audit-name AWSIoTDeviceDefenderDailyAudit
```

This command produces no output.

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see DeleteScheduledAudit in *AWS CLI Command Reference*.

`delete-security-profile`

The following code example shows how to use `delete-security-profile`.

AWS CLI

To delete a security profile

The following `delete-security-profile` example deletes a security profile named `PossibleIssue`.

```
aws iot delete-security-profile \
    --security-profile-name PossibleIssue
```

This command produces no output.

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see DeleteSecurityProfile in *AWS CLI Command Reference*.

`delete-stream`

The following code example shows how to use `delete-stream`.

AWS CLI

To delete a stream

The following `delete-stream` example deletes the specified stream.

```
aws iot delete-stream \
    --stream-id stream12345
```

This command produces no output.

For more information, see DeleteStream in the *AWS IoT API Reference*.

- For API details, see DeleteStream in *AWS CLI Command Reference*.

`delete-thing-group`

The following code example shows how to use `delete-thing-group`.

AWS CLI

To delete a thing group

The following `delete-thing-group` example deletes the specified thing group. You cannot delete a thing group if it contains child thing groups.

```
aws iot delete-thing-group \
    --thing-group-name DefectiveBulbs
```

This command produces no output.

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see DeleteThingGroup in *AWS CLI Command Reference*.

`delete-thing-type`

The following code example shows how to use `delete-thing-type`.

AWS CLI

Example 1: To delete a thing type

The following `delete-thing-type` example deletes a deprecated thing type.

```
aws iot delete-thing-type \
    --thing-type-name "obsoleteThingType"
```

This command produces no output.

For more information, see Thing Types in the *AWS IoT Developers Guide*.

- For API details, see DeleteThingType in *AWS CLI Command Reference*.

`delete-thing`

The following code example shows how to use `delete-thing`.

AWS CLI

To display detailed information about a thing

The following `delete-thing` example deletes a thing from the AWS IoT registry for your AWS account.

aws iot delete-thing --thing-name "FourthBulb"

This command produces no output.

For more information, see How to Manage Things with the Registry in the *AWS IoT Developers Guide*.

- For API details, see DeleteThing in *AWS CLI Command Reference*.

`delete-topic-rule-destination`

The following code example shows how to use `delete-topic-rule-destination`.

AWS CLI

To delete a topic rule destination

The following `delete-topic-rule-destination` example deletes the specified topic rule destination.

```
aws iot delete-topic-rule-destination \
    --arn "arn:aws:iot:us-west-2:123456789012:ruledestination/http/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE"
```

This command produces no output.

For more information, see Deleting a topic rule destination in the *AWS IoT Developer Guide*.

- For API details, see DeleteTopicRuleDestination in *AWS CLI Command Reference*.

`delete-topic-rule`

The following code example shows how to use `delete-topic-rule`.

AWS CLI

To delete a rule

The following `delete-topic-rule` example deletes the specified rule.

```
aws iot delete-topic-rule \
    --rule-name "LowMoistureRule"
```

This command produces no output.

For more information, see Deleting a Rule in the *AWS IoT Developers Guide*.

- For API details, see DeleteTopicRule in *AWS CLI Command Reference*.

`delete-v2-logging-level`

The following code example shows how to use `delete-v2-logging-level`.

AWS CLI

To delete the logging level for a thing group

The following `delete-v2-logging-level` example deletes the logging level for the specified thing group.

```
aws iot delete-v2-logging-level \
    --target-type THING_GROUP \
    --target-name LightBulbs
```

This command produces no output.

- For API details, see DeleteV2LoggingLevel in *AWS CLI Command Reference*.

deprecate-thing-type

The following code example shows how to use `deprecate-thing-type`.

AWS CLI

Example 1: To deprecate a thing type

The following `deprecate-thing-type` example deprecates a thing type so that users can't associate any new things with it.

```
aws iot deprecate-thing-type \
    --thing-type-name "obsoleteThingType"
```

This command produces no output.

Example 2: To reverse the deprecation of a thing type

The following `deprecate-thing-type` example reverses the deprecation of a thing type, which makes it possible for users to associate new things with it again.

```
aws iot deprecate-thing-type \
    --thing-type-name "obsoleteThingType" \
    --undo-deprecate
```

This command produces no output.

For more information, see Thing Types in the *AWS IoT Developers Guide*.

- For API details, see DeprecateThingType in *AWS CLI Command Reference*.

`describe-account-audit-configuration`

The following code example shows how to use `describe-account-audit-configuration`.

AWS CLI

To view current audit configuration settings

The following `describe-account-audit-configuration` example lists the current settings for your AWS IoT Device Defender audit configuration.

```
aws iot describe-account-audit-configuration
```

Output:

```
{
    "roleArn": "arn:aws:iam::123456789012:role/service-role/
AWSIoTDeviceDefenderAudit_1551201085996",
    "auditNotificationTargetConfigurations": {
        "SNS": {
            "targetArn": "arn:aws:sns:us-west-2:123456789012:ddaudits",
            "roleArn": "arn:aws:iam::123456789012:role/service-role/
AWSIoTDeviceDefenderAudit",
            "enabled": true
        }
    },
    "auditCheckConfigurations": {
        "AUTHENTICATED_COGNITO_ROLE_OVERLY_PERMISSIVE_CHECK": {
            "enabled": true
        },
        "CA_CERTIFICATE_EXPIRING_CHECK": {
            "enabled": true
        },
        "CONFLICTING_CLIENT_IDS_CHECK": {
            "enabled": true
        },
        "DEVICE_CERTIFICATE_EXPIRING_CHECK": {
            "enabled": true
        },
        "DEVICE_CERTIFICATE_SHARED_CHECK": {
            "enabled": true
        },

                "enabled": true
            },
            "LOGGING_DISABLED_CHECK": {
                "enabled": true
            },
            "REVOKED_CA_CERTIFICATE_STILL_ACTIVE_CHECK": {
                "enabled": true
            },
            "REVOKED_DEVICE_CERTIFICATE_STILL_ACTIVE_CHECK": {
                "enabled": true
            },
            "UNAUTHENTICATED_COGNITO_ROLE_OVERLY_PERMISSIVE_CHECK": {
                "enabled": true
            }
        }
}
```

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see DescribeAccountAuditConfiguration in *AWS CLI Command Reference*.

`describe-audit-finding`

The following code example shows how to use `describe-audit-finding`.

AWS CLI

To list details for an audit finding

The following `describe-audit-finding` example lists the details for the specified AWS IoT Device Defender audit finding. An audit can produce multiple findings. Use the `list-audit-findings` command to get a list of the findings from an audit to get the `findingId`.

```
aws iot describe-audit-finding \
    --finding-id "ef4826b8-e55a-44b9-b460-5c485355371b"
```

Output:

```
{
    "finding": {
        "findingId": "ef4826b8-e55a-44b9-b460-5c485355371b",
```

```
        "taskId": "873ed69c74a9ec8fa9b8e88e9abc4661",
        "checkName": "IOT_POLICY_OVERLY_PERMISSIVE_CHECK",
        "taskStartTime": 1576012045.745,

        "severity": "CRITICAL",
        "nonCompliantResource": {
            "resourceType": "IOT_POLICY",
            "resourceIdentifier": {
                "policyVersionIdentifier": {
                    "policyName": "smp-ggrass-group_Core-policy",
                    "policyVersionId": "1"
                }
            }
         },
        "reasonForNonCompliance": "Policy allows broad access to IoT data plane
 actions: [iot:Subscribe, iot:Connect, iot:GetThingShadow, iot:DeleteThingShadow,
 iot:UpdateThingShadow, iot:Publish].",
        "reasonForNonComplianceCode":
 "ALLOWS_BROAD_ACCESS_TO_IOT_DATA_PLANE_ACTIONS"
    }
}
```

For more information, see Check Audit Results (Audit Commands) in the *AWS IoT Developer Guide*.

- For API details, see DescribeAuditFinding in *AWS CLI Command Reference*.

`describe-audit-mitigation-actions-task`

The following code example shows how to use `describe-audit-mitigation-actions-task`.

AWS CLI

To show the details of an audit mitigation actions task

The following `describe-audit-mitigation-actions-task` example shows the details for the specified task, where the `ResetPolicyVersionAction` was applied to a finding. The results include when the task started and ended, how many findings were targeted (and the outcome), and the definition of the action that is applied as part of this task.

```
aws iot describe-audit-mitigation-actions-task \
    --task-id ResetPolicyTask01
```

Output:

```
{
    "taskStatus": "COMPLETED",
    "startTime": "2019-12-10T15:13:19.457000-08:00",
    "endTime": "2019-12-10T15:13:19.947000-08:00",
    "taskStatistics": {
        "IOT_POLICY_OVERLY_PERMISSIVE_CHECK": {
            "totalFindingsCount": 1,
            "failedFindingsCount": 0,
            "succeededFindingsCount": 1,
            "skippedFindingsCount": 0,
            "canceledFindingsCount": 0
        }
    },
    "target": {
        "findingIds": [
            "ef4826b8-e55a-44b9-b460-5c485355371b"
        ]
    },
    "auditCheckToActionsMapping": {
        "IOT_POLICY_OVERLY_PERMISSIVE_CHECK": [
            "ResetPolicyVersionAction"
        ]
    },
    "actionsDefinition": [
        {
            "name": "ResetPolicyVersionAction",
            "id": "1ea0b415-bef1-4a01-bd13-72fb63c59afb",
            "roleArn": "arn:aws:iam::123456789012:role/service-role/
ReplacePolicyVersionRole",
            "actionParams": {
                "replaceDefaultPolicyVersionParams": {
                    "templateName": "BLANK_POLICY"
                }
            }
        }
    ]
}
```

For more information, see DescribeAuditMitigationActionsTask (Mitigation Action Commands) in the *AWS IoT Developer Guide*.

- For API details, see DescribeAuditMitigationActionsTask in *AWS CLI Command Reference*.

`describe-audit-suppression`

The following code example shows how to use `describe-audit-suppression`.

AWS CLI

To get details about an audit finding suppression

The following `describe-audit-suppression` example lists details about an audit finding suppression.

```
aws iot describe-audit-task \
    --task-id "787ed873b69cb4d6cdbae6ddd06996c5"
```

Output:

```
{
    "taskStatus": "COMPLETED",
    "taskType": "SCHEDULED_AUDIT_TASK",
    "taskStartTime": 1596168096.157,
    "taskStatistics": {
        "totalChecks": 1,
        "inProgressChecks": 0,
        "waitingForDataCollectionChecks": 0,
        "compliantChecks": 0,
        "nonCompliantChecks": 1,
        "failedChecks": 0,
        "canceledChecks": 0
    },
    "scheduledAuditName": "AWSIoTDeviceDefenderDailyAudit",
    "auditDetails": {
        "DEVICE_CERTIFICATE_EXPIRING_CHECK": {
            "checkRunStatus": "COMPLETED_NON_COMPLIANT",
            "checkCompliant": false,
            "totalResourcesCount": 195,
            "nonCompliantResourcesCount": 2
        }
    }
}
```

For more information, see Audit finding suppressions in the *AWS IoT Developers Guide*.

- For API details, see DescribeAuditSuppression in *AWS CLI Command Reference*.

`describe-audit-task`

The following code example shows how to use `describe-audit-task`.

AWS CLI

To get information about an audit instance

The following `describe-audit-task` example gets information about an instance of an AWS IoT Device Defender audit. If the audit is complete, summary statistics for the run are included in the results.

```
aws iot describe-audit-task \
    --task-id a3aea009955e501a31b764abe1bebd3d
```

Output:

```
{
    "taskStatus": "COMPLETED",
    "taskType": "ON_DEMAND_AUDIT_TASK",
    "taskStartTime": 1560356923.434,
    "taskStatistics": {
        "totalChecks": 3,
        "inProgressChecks": 0,
        "waitingForDataCollectionChecks": 0,
        "compliantChecks": 3,
        "nonCompliantChecks": 0,
        "failedChecks": 0,
        "canceledChecks": 0
    },
    "auditDetails": {
        "CA_CERTIFICATE_EXPIRING_CHECK": {
            "checkRunStatus": "COMPLETED_COMPLIANT",
            "checkCompliant": true,
            "totalResourcesCount": 0,
            "nonCompliantResourcesCount": 0
        },
        "DEVICE_CERTIFICATE_EXPIRING_CHECK": {
            "checkRunStatus": "COMPLETED_COMPLIANT",
            "checkCompliant": true,
            "totalResourcesCount": 6,
            "nonCompliantResourcesCount": 0
```

```
        },
        "REVOKED_CA_CERTIFICATE_STILL_ACTIVE_CHECK": {
            "checkRunStatus": "COMPLETED_COMPLIANT",
            "checkCompliant": true,
            "totalResourcesCount": 0,
            "nonCompliantResourcesCount": 0
        }
    }
}
```

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see DescribeAuditTask in *AWS CLI Command Reference*.

`describe-authorizer`

The following code example shows how to use `describe-authorizer`.

AWS CLI

To get information about a custom authorizer

The following `describe-authorizer` example displays details for the specified custom authorizer.

```
aws iot describe-authorizer \
    --authorizer-name CustomAuthorizer
```

Output:

```
{
    "authorizerDescription": {
        "authorizerName": "CustomAuthorizer",
        "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/
CustomAuthorizer",
        "authorizerFunctionArn": "arn:aws:lambda:us-
west-2:123456789012:function:CustomAuthorizerFunction",
        "tokenKeyName": "MyAuthToken",
        "tokenSigningPublicKeys": {
            "FIRST_KEY": "-----BEGIN PUBLIC KEY-----

        },
        "status": "ACTIVE",
        "creationDate": 1571245658.069,
        "lastModifiedDate": 1571245658.069
    }
}
```

For more information, see DescribeAuthorizer in the *AWS IoT API Reference*.

- For API details, see DescribeAuthorizer in *AWS CLI Command Reference*.

describe-billing-group

The following code example shows how to use `describe-billing-group`.

AWS CLI

To get information about a billing group

The following `describe-billing-group` example gets information for the specified billing group.

```
aws iot describe-billing-group --billing-group-name GroupOne
```

Output:

```
{
    "billingGroupName": "GroupOne",
    "billingGroupId": "103de383-114b-4f51-8266-18f209ef5562",

```

For more information, see Billing Groups in the *AWS IoT Developers Guide*.

- For API details, see DescribeBillingGroup in *AWS CLI Command Reference*.

`describe-ca-certificate`

The following code example shows how to use `describe-ca-certificate`.

AWS CLI

To get details about a CA certificate

The following `describe-ca-certificate` example displays the details for the specified CA certificate.

```
aws iot describe-ca-certificate \
    --certificate-
id f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467
```

Output:

```
{
    "certificateDescription": {
        "certificateArn": "arn:aws:iot:us-west-2:123456789012:cacert/

For more information, see DescribeCertificate in the *AWS IoT API Reference*.

- For API details, see DescribeCertificate in *AWS CLI Command Reference*.

`describe-custom-metric`

The following code example shows how to use `describe-custom-metric`.

AWS CLI

To get information about a Device Defender custom metric

The following `describe-custom-metric` example gets information about a custom metric named `myCustomMetric`.

```
aws iot describe-custom-metric \
    --metric-name myCustomMetric
```

Output:

```
{
    "metricName": "myCustomMetric",
    "metricArn": "arn:aws:iot:us-east-1:1234564789012:custommetric/myCustomMetric",
    "metricType": "number",
    "displayName": "My custom metric",
    "creationDate": 2020-11-17T23:02:12.879000-09:00,
    "lastModifiedDate": 2020-11-17T23:02:12.879000-09:00
}
```

For more information, see Custom metrics in the *AWS IoT Core Developer Guide*.

- For API details, see DescribeCustomMetric in *AWS CLI Command Reference*.

`describe-default-authorizer`

The following code example shows how to use `describe-default-authorizer`.

AWS CLI

To get information about the default custom authorizer

The following `describe-default-authorizer` example displays details for the default custom authorizer.

```
aws iot describe-default-authorizer
```

Output:

```
{
    "authorizerName": "CustomAuthorizer",
    "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/
CustomAuthorizer"
}
```

For more information, see DescribeDefaultAuthorizer in the *AWS IoT API Reference*.

- For API details, see DescribeDefaultAuthorizer in *AWS CLI Command Reference*.

`describe-dimension`

The following code example shows how to use `describe-dimension`.

AWS CLI

To get information about a dimension

The following `describe-dimension` example gets information about a dimension named `TopicFilterForAuthMessages`.

```
aws iot describe-dimension \
    --name TopicFilterForAuthMessages
```

Output:

```
{
    "name": "TopicFilterForAuthMessages",
    "arn": "arn:aws:iot:eu-west-2:123456789012:dimension/
TopicFilterForAuthMessages",
    "type": "TOPIC_FILTER",
    "stringValues": [
        "device/+/auth"
    ],
    "creationDate": 1578620223.255,
    "lastModifiedDate": 1578620223.255
}
```

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see DescribeDimension in *AWS CLI Command Reference*.

`describe-domain-configuration`

The following code example shows how to use `describe-domain-configuration`.

AWS CLI

To describe a domain configuration

The following `describe-domain-configuration` example displays details about the specified domain configuration.

```
aws iot describe-domain-configuration \
    --domain-configuration-name "additionalDataDomain"
```

Output:

```
{
    "domainConfigurationName": "additionalDataDomain",
    "domainConfigurationArn": "arn:aws:iot:us-
east-1:758EXAMPLE143:domainconfiguration/additionalDataDomain/norpw",
    "domainName": "d055exampleed74y71zfd-ats.beta.us-east-1.iot.amazonaws.com",
    "serverCertificates": [],
    "domainConfigurationStatus": "ENABLED",
    "serviceType": "DATA",
    "domainType": "AWS_MANAGED",
    "lastStatusChangeDate": 1601923783.774
}
```

For more information, see Configurable Endpoints in the *AWS IoT Developer Guide*.

- For API details, see DescribeDomainConfiguration in *AWS CLI Command Reference*.

`describe-endpoint`

The following code example shows how to use `describe-endpoint`.

AWS CLI

Example 1: To get your current AWS endpoint

The following `describe-endpoint` example retrieves the default AWS endpoint to which all commands are applied.

```
aws iot describe-endpoint
```

Output:

```
{
    "endpointAddress": "abc123defghijk.iot.us-west-2.amazonaws.com"
}
```

For more information, see DescribeEndpoint in the *AWS IoT Developer Guide*.

Example 2: To get your ATS endpoint

The following `describe-endpoint` example retrieves the Amazon Trust Services (ATS) endpoint.

```
aws iot describe-endpoint \
    --endpoint-type iot:Data-ATS
```

Output:

```
{
    "endpointAddress": "abc123defghijk-ats.iot.us-west-2.amazonaws.com"
}
```

For more information, see X.509 Certificates and AWS IoT in the *AWS IoT Developer Guide*.

- For API details, see DescribeEndpoint in *AWS CLI Command Reference*.

`describe-event-configurations`

The following code example shows how to use `describe-event-configurations`.

AWS CLI

To show which event types are published

The following `describe-event-configurations` example lists the configuration that controls which events are generated when something is added, updated, or deleted.

```
aws iot describe-event-configurations
```

Output:

```
{
    "eventConfigurations": {
        "CA_CERTIFICATE": {
            "Enabled": false
        },
        "CERTIFICATE": {
            "Enabled": false
        },
```

```
        "JOB": {
            "Enabled": false
        },
        "JOB_EXECUTION": {
            "Enabled": false
        },
        "POLICY": {
            "Enabled": false
        },
        "THING": {
            "Enabled": false
        },
        "THING_GROUP": {
            "Enabled": false
        },
        "THING_GROUP_HIERARCHY": {
            "Enabled": false
        },
        "THING_GROUP_MEMBERSHIP": {
            "Enabled": false
        },
        "THING_TYPE": {
            "Enabled": false
        },
        "THING_TYPE_ASSOCIATION": {
            "Enabled": false
        }
    }
}
```

For more information, see Event Messages in the *AWS IoT Developer Guide*.

- For API details, see DescribeEventConfigurations in *AWS CLI Command Reference*.

`describe-index`

The following code example shows how to use `describe-index`.

AWS CLI

To retrieve the current status of the thing index

The following `describe-index` example retrieves the current status of the thing index.

```
aws iot describe-index \
    --index-name "AWS_Things"
```

Output:

```
{
    "indexName": "AWS_Things",
    "indexStatus": "ACTIVE",
    "schema": "REGISTRY_AND_SHADOW_AND_CONNECTIVITY_STATUS"
}
```

For more information, see Managing Thing Indexing in the *AWS IoT Developer Guide*.

- For API details, see DescribeIndex in *AWS CLI Command Reference*.

`describe-job-execution`

The following code example shows how to use `describe-job-execution`.

AWS CLI

To get execution details for a job on a device

The following `describe-job-execution` example gets execution details for the specified job.

```
aws iot describe-job-execution \
    --job-id "example-job-01" \
    --thing-name "MyRaspberryPi"
```

Output:

```
{
    "execution": {
        "jobId": "example-job-01",
        "status": "QUEUED",
        "statusDetails": {},
        "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyRaspberryPi",
        "queuedAt": 1560787023.636,
        "lastUpdatedAt": 1560787023.636,
        "executionNumber": 1,
        "versionNumber": 1
    }
```

```
}
```

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see DescribeJobExecution in *AWS CLI Command Reference*.

`describe-job`

The following code example shows how to use `describe-job`.

AWS CLI

To get detailed status for a job

The following `describe-job` example gets detailed status for the job whose ID is `example-job-01`.

```
aws iot describe-job \
    --job-id "example-job-01"
```

Output:

```
{
    "job": {
        "jobArn": "arn:aws:iot:us-west-2:123456789012:job/example-job-01",
        "jobId": "example-job-01",
        "targetSelection": "SNAPSHOT",
        "status": "IN_PROGRESS",
        "targets": [
            "arn:aws:iot:us-west-2:123456789012:thing/MyRaspberryPi"
        ],
        "description": "example job test",
        "presignedUrlConfig": {},
        "jobExecutionsRolloutConfig": {},
        "createdAt": 1560787022.733,
        "lastUpdatedAt": 1560787026.294,
        "jobProcessDetails": {
            "numberOfCanceledThings": 0,
            "numberOfSucceededThings": 0,
            "numberOfFailedThings": 0,
            "numberOfRejectedThings": 0,
            "numberOfQueuedThings": 1,
```

```
                "numberOfInProgressThings": 0,
                "numberOfRemovedThings": 0,
                "numberOfTimedOutThings": 0
            },
            "timeoutConfig": {}
        }
    }
```

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see DescribeJob in *AWS CLI Command Reference*.

`describe-mitigation-action`

The following code example shows how to use `describe-mitigation-action`.

AWS CLI

To view the details for a defined mitigation action

The following `describe-mitigation-action` example displays details for the specified mitigation action.

```
aws iot describe-mitigation-action \
    --action-name AddThingsToQuarantineGroupAction
```

Output:

```
{
    "actionName": "AddThingsToQuarantineGroupAction",
    "actionType": "ADD_THINGS_TO_THING_GROUP",
    "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
AddThingsToQuarantineGroupAction",
    "actionId": "2fd2726d-98e1-4abf-b10f-09465ccd6bfa",
    "roleArn": "arn:aws:iam::123456789012:role/service-role/
MoveThingsToQuarantineGroupRole",
    "actionParams": {
        "addThingsToThingGroupParams": {
            "thingGroupNames": [
                "QuarantineGroup1"
            ],
            "overrideDynamicGroups": true
        }
```

```
    },
    "creationDate": "2019-12-10T11:09:35.999000-08:00",
    "lastModifiedDate": "2019-12-10T11:09:35.999000-08:00"
}
```

For more information, see DescribeMitigationAction (Mitigation Action Commands) in the *AWS IoT Developer Guide*.

- For API details, see DescribeMitigationAction in *AWS CLI Command Reference*.

`describe-provisioning-template-version`

The following code example shows how to use `describe-provisioning-template-version`.

AWS CLI

To describe a provisioning template version

The following `describe-provisioning-template-version` example describes a provisioning template version.

```
aws iot describe-provisioning-template-version \
    --template-name MyTestProvisioningTemplate \
    --version-id 1
```

Output:

```
{
    "versionId": 1,
    "creationDate": 1589308310.574,
    "templateBody": "{
        \"Parameters\":{
            \"SerialNumber\":{
                \"Type\":\"String\"
            },
            \"AWS::IoT::Certificate::Id\":{
                \"Type\":\"String\"
            }
        },
        \"Resources\":{
            \"certificate\":{
                \"Properties\":{
```

```
                    \"CertificateId\":{
                        \"Ref\":\"AWS::IoT::Certificate::Id\"
                    },
                    \"Status\":\"Active\"
                },

                            [
                                \"DemoGroup_\",
                                {\"Ref\":\"SerialNumber\"}
                            ]
                        ]
                    },
                    \"ThingTypeName\":\"VirtualThings\"
                },
                \"Type\":\"AWS::IoT::Thing\"
            }
        }
    }",
    "isDefaultVersion": true
}
```

For more information, see Provisioning devices that don't have device certificates using fleet provisioning in the *AWS IoT Core Developers Guide*.

- For API details, see DescribeProvisioningTemplateVersion in *AWS CLI Command Reference*.

`describe-provisioning-template`

The following code example shows how to use `describe-provisioning-template`.

AWS CLI

To describe a provisioning template

The following `describe-provisioning-template` example describes a provisioning template.

```
aws iot describe-provisioning-template \
    --template-name MyTestProvisioningTemplate
```

Output:

```
{
    "templateArn": "arn:aws:iot:us-west-2:57EXAMPLE833:provisioningtemplate/
MyTestProvisioningTemplate",
    "templateName": "MyTestProvisioningTemplate",
    "creationDate": 1589308310.574,

For more information, see Provisioning devices that don't have device certificates using fleet provisioning in the *AWS IoT Core Developers Guide*.

- For API details, see DescribeProvisioningTemplate in *AWS CLI Command Reference*.

describe-role-alias

The following code example shows how to use `describe-role-alias`.

AWS CLI

To get information about an AWS IoT role alias

The following `describe-role-alias` example displays details for the specified role alias.

```
aws iot describe-role-alias \
    --role-alias LightBulbRole
```

Output:

```
{
    "roleAliasDescription": {
        "roleAlias": "LightBulbRole",
        "roleAliasArn": "arn:aws:iot:us-west-2:123456789012:rolealias/
LightBulbRole",
        "roleArn": "arn:aws:iam::123456789012:role/light_bulb_role_001",
        "owner": "123456789012",
        "credentialDurationSeconds": 3600,
        "creationDate": 1570558643.221,
        "lastModifiedDate": 1570558643.221
    }
}
```

For more information, see DescribeRoleAlias in the *AWS IoT API Reference*.

- For API details, see DescribeRoleAlias in *AWS CLI Command Reference*.

`describe-scheduled-audit`

The following code example shows how to use `describe-scheduled-audit`.

AWS CLI

To get information about a scheduled audit

The following `describe-scheduled-audit` example gets detailed information about an AWS IOT Device Defender scheduled audit named `AWSIoTDeviceDefenderDailyAudit`.

```
aws iot describe-scheduled-audit \
    --scheduled-audit-name AWSIoTDeviceDefenderDailyAudit
```

Output:

```
{
    "frequency": "DAILY",
    "targetCheckNames": [
        "AUTHENTICATED_COGNITO_ROLE_OVERLY_PERMISSIVE_CHECK",
        "CONFLICTING_CLIENT_IDS_CHECK",
        "DEVICE_CERTIFICATE_SHARED_CHECK",
        "IOT_POLICY_OVERLY_PERMISSIVE_CHECK",
        "REVOKED_CA_CERTIFICATE_STILL_ACTIVE_CHECK",
        "UNAUTHENTICATED_COGNITO_ROLE_OVERLY_PERMISSIVE_CHECK"
    ],
    "scheduledAuditName": "AWSIoTDeviceDefenderDailyAudit",
    "scheduledAuditArn": "arn:aws:iot:us-west-2:123456789012:scheduledaudit/
AWSIoTDeviceDefenderDailyAudit"
}
```

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see DescribeScheduledAudit in *AWS CLI Command Reference*.

`describe-security-profile`

The following code example shows how to use `describe-security-profile`.

AWS CLI

To get information about a security profile

The following `describe-security-profile` example gets information about the AWS IoT Device Defender security profile named `PossibleIssue.`

```
aws iot describe-security-profile \
    --security-profile-name PossibleIssue
```

Output:

```
{
    "securityProfileName": "PossibleIssue",
    "securityProfileArn": "arn:aws:iot:us-west-2:123456789012:securityprofile/
PossibleIssue",
    "securityProfileDescription": "check to see if authorization fails 10 times in 5
 minutes or if cellular bandwidth exceeds 128",
    "behaviors": [
```

```
        {
            "name": "CellularBandwidth",
            "metric": "aws:message-byte-size",
            "criteria": {
                "comparisonOperator": "greater-than",
                "value": {
                    "count": 128
                },

                "consecutiveDatapointsToClear": 1
            }
        },
        {
            "name": "Authorization",
            "metric": "aws:num-authorization-failures",
            "criteria": {
                "comparisonOperator": "greater-than",
                "value": {
                    "count": 10
                },
                "durationSeconds": 300,
                "consecutiveDatapointsToAlarm": 1,
                "consecutiveDatapointsToClear": 1
            }
        }
    ],
    "version": 1,
    "creationDate": 1560278102.528,
    "lastModifiedDate": 1560278102.528
}
```

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see DescribeSecurityProfile in *AWS CLI Command Reference*.

`describe-stream`

The following code example shows how to use `describe-stream`.

AWS CLI

To get information about a stream

The following `describe-stream` example displays the details about the specified stream.

```
aws iot describe-stream \
    --stream-id stream12345
```

Output:

```
{
    "streamInfo": {
        "streamId": "stream12345",
        "streamArn": "arn:aws:iot:us-west-2:123456789012:stream/stream12345",
        "streamVersion": 1,
        "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",
        "files": [
            {
                "fileId": "123",
                "s3Location": {
                    "bucket":"codesign-ota-bucket",
                    "key":"48c67f3c-63bb-4f92-a98a-4ee0fbc2bef6"
                }
            }
        ],
        "createdAt": 1557863215.995,
        "lastUpdatedAt": 1557863215.995,
        "roleArn": "arn:aws:iam:123456789012:role/service-role/my_ota_stream_role"
    }
}
```

For more information, see DescribeStream in the *AWS IoT API Reference*.

- For API details, see DescribeStream in *AWS CLI Command Reference*.

`describe-thing-group`

The following code example shows how to use `describe-thing-group`.

AWS CLI

To get information about a thing group

The following `describe-thing-group` example gets information about the thing group named `HalogenBulbs`.

```
aws iot describe-thing-group \
```

```
    --thing-group-name HalogenBulbs
```

Output:

```
{
    "thingGroupName": "HalogenBulbs",
    "thingGroupId": "f4ec6b84-b42b-499d-9ce1-4dbd4d4f6f6e",
    "thingGroupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/HalogenBulbs",
    "version": 1,
    "thingGroupProperties": {},
    "thingGroupMetadata": {
        "parentGroupName": "LightBulbs",
        "rootToParentThingGroups": [
            {
                "groupName": "LightBulbs",
                "groupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/
LightBulbs"
            }
        ],
        "creationDate": 1559927609.897
    }
}
```

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see DescribeThingGroup in *AWS CLI Command Reference*.

describe-thing-type

The following code example shows how to use `describe-thing-type`.

AWS CLI

To get information about a thing type

The following `describe-thing-type` example display information about the specified thing type defined in your AWS account.

```
aws iot describe-thing-type \
    --thing-type-name "LightBulb"
```

Output:

```
{
    "thingTypeName": "LightBulb",
    "thingTypeId": "ce3573b0-0a3c-45a7-ac93-4e0ce14cd190",
    "thingTypeArn": "arn:aws:iot:us-west-2:123456789012:thingtype/LightBulb",
    "thingTypeProperties": {
        "thingTypeDescription": "light bulb type",
        "searchableAttributes": [
            "model",
            "wattage"
        ]
    },
    "thingTypeMetadata": {
        "deprecated": false,
        "creationDate": 1559772562.498
    }
}
```

For more information, see Thing Types in the *AWS IoT Developers Guide*.

- For API details, see DescribeThingType in *AWS CLI Command Reference*.

`describe-thing`

The following code example shows how to use `describe-thing`.

AWS CLI

To display detailed information about a thing

The following `describe-thing` example display information about a thing (device) that is defined in the AWS IoT registry for your AWS account.

aws iot describe-thing --thing-name "MyLightBulb"

Output:

```
{
    "defaultClientId": "MyLightBulb",
    "thingName": "MyLightBulb",
    "thingId": "40da2e73-c6af-406e-b415-15acae538797",
    "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyLightBulb",
    "thingTypeName": "LightBulb",
    "attributes": {
```

```
        "model": "123",
        "wattage": "75"
    },
    "version": 1
}
```

For more information, see How to Manage Things with the Registry in the *AWS IoT Developers Guide*.

- For API details, see DescribeThing in *AWS CLI Command Reference*.

`detach-policy`

The following code example shows how to use `detach-policy`.

AWS CLI

Example 1: To detach an AWS IoT policy from a thing group

The following `detach-policy` example detaches the specified policy from a thing group and, by extension, from all things in that group and any of the group's child groups.

```
aws iot detach-policy \
    --target "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs" \
    --policy-name "MyFirstGroup_Core-policy"
```

This command produces no output.

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

Example 2: To detach an AWS IoT policy from a device certificate

The following `detach-policy` example detaches the TemperatureSensorPolicy policy from a device certificate identified by ARN.

```
aws iot detach-policy \
    --policy-name TemperatureSensorPolicy \
    --target arn:aws:iot:us-
west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142
```

This command produces no output.

- For API details, see DetachPolicy in *AWS CLI Command Reference*.

`detach-security-profile`

The following code example shows how to use `detach-security-profile`.

AWS CLI

To disassociate a security profile from a target

The following `detach-security-profile` example removes the association between the AWS IoT Device Defender security profile named `Testprofile` and the all registered things target.

```
aws iot detach-security-profile \
    --security-profile-name Testprofile \
    --security-profile-target-arn "arn:aws:iot:us-west-2:123456789012:all/
registered-things"
```

This command produces no output.

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see DetachSecurityProfile in *AWS CLI Command Reference*.

`detach-thing-principal`

The following code example shows how to use `detach-thing-principal`.

AWS CLI

To detach a certificate/principal from a thing

The following `detach-thing-principal` example removes a certificate that represents a principal from the specified thing.

```
aws iot detach-thing-principal \
    --thing-name "MyLightBulb" \
    --principal "arn:aws:iot:us-
west-2:123456789012:cert/604c48437a57b7d5fc5d137c5be75011c6ee67c9a6943683a1acb4b1626bac36"
```

This command produces no output.

For more information, see How to Manage Things with the Registry in the *AWS IoT Developers Guide*.

- For API details, see DetachThingPrincipal in *AWS CLI Command Reference*.

`disable-topic-rule`

The following code example shows how to use `disable-topic-rule`.

AWS CLI

To disable a topic rule

The following `disable-topic-rule` example disables the specified topic rule.

```
aws iot disable-topic-rule \
    --rule-name "MyPlantPiMoistureAlertRule"
```

This command produces no output.

For more information, see Viewing Your Rules in the *AWS IoT Developer Guide*.

- For API details, see DisableTopicRule in *AWS CLI Command Reference*.

`enable-topic-rule`

The following code example shows how to use `enable-topic-rule`.

AWS CLI

To enable a topic rule

The following `enable-topic-rule` example enables (or re-enables) the specified topic rule.

```
aws iot enable-topic-rule \
    --rule-name "MyPlantPiMoistureAlertRule"
```

This command produces no output.

For more information, see Viewing Your Rules in the *AWS IoT Developer Guide*.

- For API details, see EnableTopicRule in *AWS CLI Command Reference*.

`get-behavior-model-training-summaries`

The following code example shows how to use `get-behavior-model-training-summaries`.

AWS CLI

To list a Device Defender's ML Detect Security Profile training model's status

The following `get-behavior-model-training-summaries` example lists model training status for the configured behaviors in the chosen Security Profile. For each behavior, the name, model status, and percentage of datapoints collected are listed.

```
aws iot get-behavior-model-training-summaries \
    --security-profile-name MySecuirtyProfileName
```

Output:

```
{
    "summaries": [
        {
            "securityProfileName": "MySecuirtyProfileName",
            "behaviorName": "Messages_sent_ML_behavior",
            "modelStatus": "PENDING_BUILD",
            "datapointsCollectionPercentage": 0.0
        },
        {
            "securityProfileName": "MySecuirtyProfileName",
            "behaviorName": "Messages_received_ML_behavior",
            "modelStatus": "PENDING_BUILD",
            "datapointsCollectionPercentage": 0.0
        },
        {
            "securityProfileName": "MySecuirtyProfileName",
            "behaviorName": "Authorization_failures_ML_behavior",
            "modelStatus": "PENDING_BUILD",
            "datapointsCollectionPercentage": 0.0
        },
        {
            "securityProfileName": "MySecuirtyProfileName",
            "behaviorName": "Message_size_ML_behavior",
            "modelStatus": "PENDING_BUILD",
            "datapointsCollectionPercentage": 0.0
        },
        {
            "securityProfileName": "MySecuirtyProfileName",
            "behaviorName": "Connection_attempts_ML_behavior",
            "modelStatus": "PENDING_BUILD",
```

```
                "datapointsCollectionPercentage": 0.0
            },
            {
                "securityProfileName": "MySPNoALerts",
                "behaviorName": "Disconnects_ML_behavior",
                "modelStatus": "PENDING_BUILD",
                "datapointsCollectionPercentage": 0.0
            }
        ]
}
```

For more information, see GetBehaviorModelTrainingSummaries (Detect Commands) in the *AWS IoT Developer Guide*.

- For API details, see GetBehaviorModelTrainingSummaries in *AWS CLI Command Reference*.

`get-cardinality`

The following code example shows how to use `get-cardinality`.

AWS CLI

To return the approximate count of unique values that match the query

You can use the following setup script to create 10 things representing 10 temperature sensors. Each new thing has 3 attributes.

```
# Bash script. If in other shells, type `bash` before running
Temperatures=(70 71 72 73 74 75 47 97 98 99)
Racks=(Rack1 Rack1 Rack2 Rack2 Rack3 Rack4 Rack5 Rack6 Rack6 Rack6)
IsNormal=(true true true true true true false false false false)
for ((i=0; i<10 ; i++))
do
  thing=$(aws iot create-thing --thing-name "TempSensor$i" --attribute-payload
 attributes="{temperature=${Temperatures[i]},rackId=${Racks[i]},stateNormal=
${IsNormal[i]}}")
  aws iot describe-thing --thing-name "TempSensor$i"
done
```

Example output of the setup script:

```
{
    "version": 1,
```

```
    "thingName": "TempSensor0",
    "defaultClientId": "TempSensor0",
    "attributes": {
        "rackId": "Rack1",
        "stateNormal": "true",
        "temperature": "70"
    },
    "thingArn": "arn:aws:iot:us-east-1:123456789012:thing/TempSensor0",
    "thingId": "example1-90ab-cdef-fedc-ba987example"
}
```

The following `get-cardinality` example queries the 10 sensors created by the setup script and returns the number of racks that have temperature sensors reporting abnormal temperature values. If the temperature value is below 60 or above 80, the temperature sensor is in an abnormal state.

```
aws iot get-cardinality \
    --aggregation-field "attributes.rackId" \
    --query-string "thingName:TempSensor* AND attributes.stateNormal:false"
```

Output:

```
{
    "cardinality": 2
}
```

For more information, see Querying for Aggregate Data<https://docs.aws.amazon.com/iot/latest/developerguide/index-aggregate.html> in the *AWS IoT Developer Guide*.

- For API details, see GetCardinality in *AWS CLI Command Reference*.

`get-effective-policies`

The following code example shows how to use `get-effective-policies`.

AWS CLI

To list the policies that effect a thing

The following `get-effective-policies` example lists the policies that effect the specified thing, including policies attached to any groups to which it belongs.

```
aws iot get-effective-policies \
    --thing-name TemperatureSensor-001 \
    --principal arn:aws:iot:us-
west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142
```

Output:

```
{
    "effectivePolicies": [
        {
            "policyName": "TemperatureSensorPolicy",
            "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/
TemperatureSensorPolicy",
            "policyDocument": "{
                \"Version\": \"2012-10-17\",
                \"Statement\": [
                    {
                        \"Effect\": \"Allow\",
                        \"Action\": [
                            \"iot:Publish\",
                            \"iot:Receive\"
                        ],
                        \"Resource\": [
                            \"arn:aws:iot:us-west-2:123456789012:topic/topic_1\",
                            \"arn:aws:iot:us-west-2:123456789012:topic/topic_2\"
                        ]
                    },
                    {
                        \"Effect\": \"Allow\",
                        \"Action\": [
                            \"iot:Subscribe\"
                        ],
                        \"Resource\": [
                            \"arn:aws:iot:us-west-2:123456789012:topicfilter/
topic_1\",
                            \"arn:aws:iot:us-west-2:123456789012:topicfilter/
topic_2\"
                        ]
                    },
                    {
                        \"Effect\": \"Allow\",
                        \"Action\": [
                            \"iot:Connect\"
```

```
                        ],
                        \"Resource\": [
                            \"arn:aws:iot:us-west-2:123456789012:client/basicPubSub
\"
                        ]
                    }
                ]
            }"
        }
    ]
}
```

For more information, see Get Effective Policies for a Thing in the *AWS IoT Developers Guide*.

- For API details, see GetEffectivePolicies in *AWS CLI Command Reference*.

`get-indexing-configuration`

The following code example shows how to use `get-indexing-configuration`.

AWS CLI

To get the thing indexing configuration

The following `get-indexing-configuration` example gets the current configuration data for AWS IoT fleet indexing.

```
aws iot get-indexing-configuration
```

Output:

```
{
    "thingIndexingConfiguration": {
        "thingIndexingMode": "OFF",
        "thingConnectivityIndexingMode": "OFF"
    },
    "thingGroupIndexingConfiguration": {
        "thingGroupIndexingMode": "OFF"
    }
}
```

For more information, see Managing Thing Indexing in the *AWS IoT Developers Guide*.

- For API details, see GetIndexingConfiguration in *AWS CLI Command Reference*.

`get-job-document`

The following code example shows how to use `get-job-document`.

AWS CLI

To retrieve the document for a job

The following `get-job-document` example displays details about the document for the job whose ID is `example-job-01`.

```
aws iot get-job-document \
    --job-id "example-job-01"
```

Output:

```
{
    "document": "\n{\n    \"operation\":\"customJob\",\n    \"otherInfo\":
\"someValue\"\n}\n"
}
```

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see GetJobDocument in *AWS CLI Command Reference*.

`get-logging-options`

The following code example shows how to use `get-logging-options`.

AWS CLI

To get the logging options

The following `get-logging-options` example gets the current logging options for your AWS account.

```
aws iot get-logging-options
```

Output:

```
{
    "roleArn": "arn:aws:iam::123456789012:role/service-role/iotLoggingRole",
    "logLevel": "ERROR"
}
```

For more information, see title in the *AWS IoT Developer Guide*.

- For API details, see GetLoggingOptions in *AWS CLI Command Reference*.

get-ota-update

The following code example shows how to use `get-ota-update`.

AWS CLI

To retrieve information about an OTA Update

The following `get-ota-update` example displays details about the specified OTA Update.

```
aws iot get-ota-update \
    --ota-update-id ota12345
```

Output:

```
{
    "otaUpdateInfo": {
        "otaUpdateId": "ota12345",
        "otaUpdateArn": "arn:aws:iot:us-west-2:123456789012:otaupdate/itsaupdate",
        "creationDate": 1557863215.995,
        "lastModifiedDate": 1557863215.995,
        "description": "A critical update needed right away.",
        "targets": [
           "device1",
           "device2",
           "device3",
           "device4"
        ],
        "targetSelection": "SNAPSHOT",
        "protocols": ["HTTP"],
        "awsJobExecutionsRolloutConfig": {
```

```
            "maximumPerMinute": 10
        },
        "otaUpdateFiles": [
            {
                "fileName": "firmware.bin",
                "fileLocation": {
                    "stream": {
                        "streamId": "004",
                        "fileId":123
                    }
                },
                "codeSigning": {
                    "awsSignerJobId": "48c67f3c-63bb-4f92-a98a-4ee0fbc2bef6"
                }
            }
        ],
        "roleArn": "arn:aws:iam:123456789012:role/service-role/my_ota_role"
        "otaUpdateStatus": "CREATE_COMPLETE",
        "awsIotJobId": "job54321",
        "awsIotJobArn": "arn:aws:iot:us-west-2:123456789012:job/job54321",
        "errorInfo": {
        }
    }
}
```

For more information, see GetOTAUpdate in the *AWS IoT API Reference*.

- For API details, see GetOtaUpdate in *AWS CLI Command Reference*.

`get-percentiles`

The following code example shows how to use `get-percentiles`.

AWS CLI

To group the aggregated values that match the query into percentile groupings

You can use the following setup script to create 10 things representing 10 temperature sensors. Each new thing has 1 attribute.

```
# Bash script. If in other shells, type `bash` before running
Temperatures=(70 71 72 73 74 75 47 97 98 99)
for ((i=0; i<10 ; i++))
```

```
do
    thing=$(aws iot create-thing --thing-name "TempSensor$i" --attribute-payload
 attributes="{temperature=${Temperatures[i]}}")
    aws iot describe-thing --thing-name "TempSensor$i"
done
```

Example output of the setup script:

```
{
    "version": 1,
    "thingName": "TempSensor0",
    "defaultClientId": "TempSensor0",
    "attributes": {
        "temperature": "70"
    },
    "thingArn": "arn:aws:iot:us-east-1:123456789012:thing/TempSensor0",
    "thingId": "example1-90ab-cdef-fedc-ba987example"
}
```

The following `get-percentiles` example queries the 10 sensors created by the setup script and returns a value for each percentile group specified. The percentile group "10" contains the aggregated field value that occurs in approximately 10 percent of the values that match the query. In the following output, {"percent": 10.0, "value": 67.7} means approximately 10.0% of the temperature values are below 67.7.

```
aws iot get-percentiles \
    --aggregation-field "attributes.temperature" \
    --query-string "thingName:TempSensor*" \
    --percents 10 25 50 75 90
```

Output:

```
{
    "percentiles": [
        {
            "percent": 10.0,
            "value": 67.7
        },
        {
            "percent": 25.0,
            "value": 71.25
```

```
        },
        {
            "percent": 50.0,
            "value": 73.5
        },
        {
            "percent": 75.0,
            "value": 91.5
        },
        {
            "percent": 90.0,
            "value": 98.1
        }
    ]
}
```

For more information, see Querying for Aggregate Data in the *AWS IoT Developer Guide*.

- For API details, see GetPercentiles in *AWS CLI Command Reference*.

get-policy-version

The following code example shows how to use `get-policy-version`.

AWS CLI

To get information about a specific version of a policy

The following `get-policy-version` example gets information about the first version of the specified policy.

```
aws iot get-policy \
    --policy-name UpdateDeviceCertPolicy
    --policy-version-id "1"
```

Output:

```
{
    "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/UpdateDeviceCertPolicy",
    "policyName": "UpdateDeviceCertPolicy",
    "policyDocument": "{ \"Version\": \"2012-10-17\", \"Statement\": [ { \"Effect\":
 \"Allow\", \"Action\":  \"iot:UpdateCertificate\", \"Resource\": \"*\" } ] }",
```

```
    "policyVersionId": "1",
    "isDefaultVersion": false,
    "creationDate": 1559925941.924,
    "lastModifiedDate": 1559926175.458,
    "generationId":
 "5066f1b6712ce9d2a1e56399771649a272d6a921762fead080e24fe52f24e042"
}
```

For more information, see AWS IoT Policies in the *AWS IoT Developers Guide*.

- For API details, see GetPolicyVersion in *AWS CLI Command Reference*.

`get-policy`

The following code example shows how to use `get-policy`.

AWS CLI

To get information about the default version of a policy

The following `get-policy` example retrieves information about the default version of the specified policy.

```
aws iot get-policy \
    --policy-name UpdateDeviceCertPolicy
```

Output:

```
{
    "policyName": "UpdateDeviceCertPolicy",
    "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/UpdateDeviceCertPolicy",
    "policyDocument": "{ \"Version\": \"2012-10-17\", \"Statement\": [ { \"Effect\":
 \"Allow\", \"Action\":  \"iot:UpdateCertificate\", \"Resource\": \"*\" } ] }",
    "defaultVersionId": "2",
    "creationDate": 1559925941.924,
    "lastModifiedDate": 1559925941.924,
    "generationId":
 "5066f1b6712ce9d2a1e56399771649a272d6a921762fead080e24fe52f24e042"
}
```

For more information, see AWS IoT Policies in the *AWS IoT Developers Guide*.

- For API details, see GetPolicy in *AWS CLI Command Reference*.

`get-registration-code`

The following code example shows how to use `get-registration-code`.

AWS CLI

To get your AWS account-specific registration code

The following `get-registration-code` example retrieves your AWS account-specific registration code.

```
aws iot get-registration-code
```

Output:

```
{
    "registrationCode":
 "15c51ae5e36ba59ba77042df1115862076bea4bd15841c838fcb68d5010a614c"
}
```

For more information, see Use Your Own Certificate in the *AWS IoT Developer Guide*.

- For API details, see GetRegistrationCode in *AWS CLI Command Reference*.

`get-statistics`

The following code example shows how to use `get-statistics`.

AWS CLI

To search the device index for aggregate data

The following `get-statistics` example returns the number of things that have a property called `connectivity.connected` set to `false` (that is, the number of devices that are not connected) in their device shadow.

```
aws iot get-statistics \
    --index-name AWS_Things \
    --query-string "connectivity.connected:false"
```

Output:

```
{
    "statistics": {
        "count": 6
    }
}
```

For more information, see Getting Statistics About Your Device Fleet in the *AWS IoT Developer Guide*.

- For API details, see GetStatistics in *AWS CLI Command Reference*.

`get-topic-rule-destination`

The following code example shows how to use `get-topic-rule-destination`.

AWS CLI

To get a topic rule destination

The following `get-topic-rule-destination` example gets information about a topic rule destination.

```
aws iot get-topic-rule-destination \
    --arn "arn:aws:iot:us-west-2:123456789012:ruledestination/http/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE"
```

Output:

```
{
    "topicRuleDestination": {
        "arn": "arn:aws:iot:us-west-2:123456789012:ruledestination/http/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
        "status": "DISABLED",
        "httpUrlProperties": {
            "confirmationUrl": "https://example.com"
        }
    }
}
```

For more information, see Working with topic rule destinations in the *AWS IoT Developer Guide*.

- For API details, see GetTopicRuleDestination in *AWS CLI Command Reference*.

`get-topic-rule`

The following code example shows how to use `get-topic-rule`.

AWS CLI

To get information about a rule

The following `get-topic-rule` example gets information about the specified rule.

```
aws iot get-topic-rule \
    --rule-name MyRPiLowMoistureAlertRule
```

Output:

```
{
    "ruleArn": "arn:aws:iot:us-west-2:123456789012:rule/MyRPiLowMoistureAlertRule",
    "rule": {
        "ruleName": "MyRPiLowMoistureAlertRule",
        "sql": "SELECT * FROM '$aws/things/MyRPi/shadow/update/accepted' WHERE
 state.reported.moisture = 'low'\n                    ",
        "description": "Sends an alert whenever soil moisture level readings are too
 low.",
        "createdAt": 1558624363.0,
        "actions": [
            {
                "sns": {
                    "targetArn": "arn:aws:sns:us-
west-2:123456789012:MyRPiLowMoistureTopic",
                    "roleArn": "arn:aws:iam::123456789012:role/service-role/
MyRPiLowMoistureTopicRole",
                    "messageFormat": "RAW"
                }
            }
        ],
        "ruleDisabled": false,
        "awsIotSqlVersion": "2016-03-23"
    }
}
```

For more information, see Viewing Your Rules in the *AWS IoT Developers Guide*.

- For API details, see GetTopicRule in *AWS CLI Command Reference*.

`get-v2-logging-options`

The following code example shows how to use `get-v2-logging-options`.

AWS CLI

To list the current logging options

The following `get-v2-logging-options` example lists the current logging options for AWS IoT.

```
aws iot get-v2-logging-options
```

Output:

```
{
    "roleArn": "arn:aws:iam::094249569039:role/service-role/iotLoggingRole",
    "defaultLogLevel": "WARN",
    "disableAllLogs": false
}
```

For more information, see title in the *AWS IoT Developer Guide*.

- For API details, see GetV2LoggingOptions in *AWS CLI Command Reference*.

`list-active-violations`

The following code example shows how to use `list-active-violations`.

AWS CLI

To list the active violations

The following `list-active-violations` example lists all violations for the specified security profile.

```
aws iot list-active-violations \
    --security-profile-name Testprofile
```

Output:

```
{
    "activeViolations": [
        {
            "violationId": "174db59167fa474c80a652ad1583fd44",
            "thingName": "iotconsole-1560269126751-1",
            "securityProfileName": "Testprofile",
            "behavior": {
                "name": "Authorization",

            },
            "lastViolationTime": 1560369000.0,
            "violationStartTime": 1560276600.0
        }
    ]
}
```

- For API details, see ListActiveViolations in *AWS CLI Command Reference*.

`list-attached-policies`

The following code example shows how to use `list-attached-policies`.

AWS CLI

Example 1: To list the policies attached to a group

The following `list-attached-policies` example lists the policies that are attached to the specified group.

```
aws iot list-attached-policies \
    --target "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs"
```

Output:

```
{
    "policies": [
        {
            "policyName": "UpdateDeviceCertPolicy",
            "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/
UpdateDeviceCertPolicy"
        }
    ]
}
```

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

Example 2: To list the policies attached to a device certificate

The following `list-attached-policies` example lists the AWS IoT policies attached to the device certificate. The certificate is identified by its ARN.

```
aws iot list-attached-policies \
    --target arn:aws:iot:us-
west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142
```

Output:

```
{
    "policies": [
        {
            "policyName": "TemperatureSensorPolicy",
            "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/
TemperatureSensorPolicy"
        }
    ]
}
```

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see ListAttachedPolicies in *AWS CLI Command Reference*.

`list-audit-findings`

The following code example shows how to use `list-audit-findings`.

AWS CLI

Example 1: To list all findings from an audit

The following `list-audit-findings` example lists all findings from an AWS IoT Device Defender audit with a specified task ID.

```
aws iot list-audit-findings \
    --task-id a3aea009955e501a31b764abe1bebd3d
```

Output:

```
{
    "findings": []
```

```
}
```

Example 2: To list findings for an audit check type

The following `list-audit-findings` example shows findings from AWS IoT Device Defender audits that ran between June 5, 2019 and June 19, 2019 in which devices are sharing a device certificate. When you specify a check name, you must provide a start and end time.

```
aws iot list-audit-findings \
    --check-name DEVICE_CERTIFICATE_SHARED_CHECK \
    --start-time 1559747125 \
    --end-time 1560962028
```

Output:

```
{
    "findings": [
        {
            "taskId": "eeef61068b0eb03c456d746c5a26ee04",
            "checkName": "DEVICE_CERTIFICATE_SHARED_CHECK",
            "taskStartTime": 1560161017.172,

        ]
}
```

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see ListAuditFindings in *AWS CLI Command Reference*.

`list-audit-mitigation-actions-executions`

The following code example shows how to use `list-audit-mitigation-actions-executions`.

AWS CLI

To list the details of an audit mitigation action execution

An audit mitigation action task applies a mitigation action to one or more findings from an AWS IoT Device Defender audit. The following `list-audit-mitigation-actions-executions` example lists the details for the mitigation action task with the specified `taskId` and for the specified finding.

```
aws iot list-audit-mitigation-actions-executions \
    --task-id myActionsTaskId \
    --finding-id 0edbaaec-2fe1-4cf5-abc9-d4c3e51f7464
```

Output:

```
{
    "actionsExecutions": [
        {
            "taskId": "myActionsTaskId",
            "findingId": "0edbaaec-2fe1-4cf5-abc9-d4c3e51f7464",
            "actionName": "ResetPolicyVersionAction",
            "actionId": "1ea0b415-bef1-4a01-bd13-72fb63c59afb",
```

```
                "status": "COMPLETED",
                "startTime": "2019-12-10T15:19:13.279000-08:00",
                "endTime": "2019-12-10T15:19:13.337000-08:00"
            }
        ]
    }
```

For more information, see ListAuditMitigationActionsExecutions (Mitigation Action Commands) in the *AWS IoT Developer Guide*.

- For API details, see ListAuditMitigationActionsExecutions in *AWS CLI Command Reference*.

`list-audit-mitigation-actions-tasks`

The following code example shows how to use `list-audit-mitigation-actions-tasks`.

AWS CLI

To list audit mitigation action tasks

The following `list-audit-mitigation-actions-tasks` example lists the mitigation actions that were applied to findings within the specified time period.

```
aws iot list-audit-mitigation-actions-tasks \
    --start-time 1594157400 \
    --end-time 1594157430
```

Output:

```
{
    "tasks": [
        {
                "taskId": "0062f2d6-3999-488f-88c7-bef005414103",
                "startTime": "2020-07-07T14:30:15.172000-07:00",
            "taskStatus": "COMPLETED"
        }
    ]
}
```

For more information, see ListAuditMitigationActionsTasks (Mitigation Action Commands) in the *AWS IoT Developer Guide*.

- For API details, see ListAuditMitigationActionsTasks in *AWS CLI Command Reference*.

`list-audit-suppressions`

The following code example shows how to use `list-audit-suppressions`.

AWS CLI

To list all audit finding suppressions

The following `list-audit-suppressions` example lists all active audit finding suppressions.

```
aws iot list-audit-suppressions
```

Output:

```
{
    "suppressions": [
        {
        "checkName": "DEVICE_CERTIFICATE_EXPIRING_CHECK",
            "resourceIdentifier": {
                "deviceCertificateId": "c7691e<shortened>"
            },
        "expirationDate": 1597881600.0,
        "suppressIndefinitely": false
        }
    ]
}
```

For more information, see Audit finding suppressions in the *AWS IoT Developers Guide*.

- For API details, see ListAuditSuppressions in *AWS CLI Command Reference*.

`list-audit-tasks`

The following code example shows how to use `list-audit-tasks`.

AWS CLI

To list all findings from an audit

The following `list-audit-tasks` example lists the audit tasks that ran between June 5, 2019 and June 12, 2019.

```
aws iot list-audit-tasks \
    --start-time 1559747125 \
    --end-time 1560357228
```

Output:

```
{
    "tasks": [
        {
            "taskId": "a3aea009955e501a31b764abe1bebd3d",
            "taskStatus": "COMPLETED",
            "taskType": "ON_DEMAND_AUDIT_TASK"
        },
        {
            "taskId": "f76b4b5102b632cd9ae38a279c266da1",
            "taskStatus": "COMPLETED",
            "taskType": "SCHEDULED_AUDIT_TASK"
        },
        {
            "taskId": "51d9967d9f9ff4d26529505f6d2c444a",
            "taskStatus": "COMPLETED",
            "taskType": "SCHEDULED_AUDIT_TASK"
        },
        {
            "taskId": "eeef61068b0eb03c456d746c5a26ee04",
            "taskStatus": "COMPLETED",
            "taskType": "SCHEDULED_AUDIT_TASK"
        },
        {
            "taskId": "041c49557b7c7b04c079a49514b55589",
            "taskStatus": "COMPLETED",
            "taskType": "SCHEDULED_AUDIT_TASK"
        },
        {
            "taskId": "82c7f2afac1562d18a4560be73998acc",
            "taskStatus": "COMPLETED",
            "taskType": "SCHEDULED_AUDIT_TASK"
        },
        {
            "taskId": "bade6b5efd2e1b1569822f6021b39cf5",
```

```
                "taskStatus": "COMPLETED",
                "taskType": "SCHEDULED_AUDIT_TASK"
            },
            {
                "taskId": "c23f6233ba2d35879c4bb2810fb5ffd6",
                "taskStatus": "COMPLETED",
                "taskType": "SCHEDULED_AUDIT_TASK"
            },
            {
                "taskId": "ac9086b7222a2f5e2e17bb6fd30b3aeb",
                "taskStatus": "COMPLETED",
                "taskType": "SCHEDULED_AUDIT_TASK"
            }
        ]
}
```

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see ListAuditTasks in *AWS CLI Command Reference*.

`list-authorizers`

The following code example shows how to use `list-authorizers`.

AWS CLI

To list your custom authorizer

The following `list-authorizers` example lists the custom authorizers in your AWS account.

```
aws iot list-authorizers
```

Output:

```
{
    "authorizers": [
        {
            "authorizerName": "CustomAuthorizer",
            "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/
CustomAuthorizer"
        },
        {
```

```
            "authorizerName": "CustomAuthorizer2",
            "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/
CustomAuthorizer2"
        },
        {
            "authorizerName": "CustomAuthorizer3",
            "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/
CustomAuthorizer3"
        }
    ]
}
```

For more information, see ListAuthorizers in the *AWS IoT API Reference*.

- For API details, see ListAuthorizers in *AWS CLI Command Reference*.

`list-billing-groups`

The following code example shows how to use `list-billing-groups`.

AWS CLI

To list the billing groups for your AWS account and region

The following `list-billing-groups` example lists all billing groups that are defined for your AWS account and AWS Region.

```
aws iot list-billing-groups
```

Output:

```
{
    "billingGroups": [
        {
            "groupName": "GroupOne",
            "groupArn": "arn:aws:iot:us-west-2:123456789012:billinggroup/GroupOne"
        }
    ]
}
```

For more information, see Billing Groups in the *AWS IoT Developers Guide*.

- For API details, see ListBillingGroups in *AWS CLI Command Reference*.

`list-ca-certificates`

The following code example shows how to use `list-ca-certificates`.

AWS CLI

To list the CA certificates registered in your AWS account

The following `list-ca-certificates` example lists the CA certificates registered in your AWS account.

```
aws iot list-ca-certificates
```

Output:

```
{
    "certificates": [
        {
            "certificateArn": "arn:aws:iot:us-west-2:123456789012:cacert/
f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467",
            "certificateId":
 "f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467",
            "status": "INACTIVE",
            "creationDate": 1569365372.053
        }
    ]
}
```

For more information, see Use Your Own Certificate in the *AWS IoT Developer Guide*.

- For API details, see ListCaCertificates in *AWS CLI Command Reference*.

`list-certificates-by-ca`

The following code example shows how to use `list-certificates-by-ca`.

AWS CLI

To list all device certificates signed with a CA certificate

The following `list-certificates-by-ca` example lists all device certificates in your AWS account that are signed with the specified CA certificate.

```
aws iot list-certificates-by-ca \
    --ca-certificate-
id f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467
```

Output:

```
{
    "certificates": [
        {
            "certificateArn": "arn:aws:iot:us-
west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142",
            "certificateId":
 "488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142",
            "status": "ACTIVE",
            "creationDate": 1569363250.557
        }
    ]
}
```

For more information, see ListCertificatesByCA in the *AWS IoT API Reference*.

- For API details, see ListCertificatesByCa in *AWS CLI Command Reference*.

`list-certificates`

The following code example shows how to use `list-certificates`.

AWS CLI

Example 1: To list the certificates registered in your AWS account

The following `list-certificates` example lists all certificates registered in your account. If you have more than the default paging limit of 25, you can use the `nextMarker` response value from this command and supply it to the next command to get the next batch of results. Repeat until `nextMarker` returns without a value.

```
aws iot list-certificates
```

Output:

```
{
    "certificates": [
        {
            "certificateArn": "arn:aws:iot:us-
west-2:123456789012:cert/604c48437a57b7d5fc5d137c5be75011c6ee67c9a6943683a1acb4b1626bac36",
            "certificateId":
 "604c48437a57b7d5fc5d137c5be75011c6ee67c9a6943683a1acb4b1626bac36",
            "status": "ACTIVE",
            "creationDate": 1556810537.617
        },
        {
            "certificateArn": "arn:aws:iot:us-

            "creationDate": 1541022751.983
        }
    ]
}
```

- For API details, see ListCertificates in *AWS CLI Command Reference*.

`list-custom-metrics`

The following code example shows how to use `list-custom-metrics`.

AWS CLI

To list your custom metrics

The following `list-custom-metrics` example lists all of your custom metrics.

```
aws iot list-custom-metrics \
    --region us-east-1
```

Output:

```
{
    "metricNames": [
        "batteryPercentage"
    ]
}
```

For more information, see Custom metrics in the *AWS IoT Core Developer Guide*.

- For API details, see ListCustomMetrics in *AWS CLI Command Reference*.

`list-dimensions`

The following code example shows how to use `list-dimensions`.

AWS CLI

To list the dimensions for your AWS account

The following `list-dimensions` example lists all AWS IoT Device Defender dimensions that are defined in your AWS account.

```
aws iot list-dimensions
```

Output:

```
{
    "dimensionNames": [
        "TopicFilterForAuthMessages",
        "TopicFilterForActivityMessages"
    ]
}
```

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see ListDimensions in *AWS CLI Command Reference*.

`list-domain-configurations`

The following code example shows how to use `list-domain-configurations`.

AWS CLI

To list domain configurations

The following `list-domain-configurations` example lists the domain configurations in your AWS account that have the specified service type.

```
aws iot list-domain-configurations \
    --service-type "DATA"
```

Output:

```
{
    "domainConfigurations":
```

```
    [
        {
            "domainConfigurationName": "additionalDataDomain",
            "domainConfigurationArn": "arn:aws:iot:us-
west-2:123456789012:domainconfiguration/additionalDataDomain/dikMh",
            "serviceType": "DATA"
        },

        {
            "domainConfigurationName": "iot:Jobs",
            "domainConfigurationArn": "arn:aws:iot:us-
west-2:123456789012:domainconfiguration/iot:Jobs",
            "serviceType": "JOBS"
        },
        {
            "domainConfigurationName": "iot:Data-ATS",
            "domainConfigurationArn": "arn:aws:iot:us-
west-2:123456789012:domainconfiguration/iot:Data-ATS",
            "serviceType": "DATA"
        },
        {
            "domainConfigurationName": "iot:CredentialProvider",
            "domainConfigurationArn": "arn:aws:iot:us-
west-2:123456789012:domainconfiguration/iot:CredentialProvider",
            "serviceType": "CREDENTIAL_PROVIDER"
        }
    ]
}
```

For more information, see Configurable Endpoints in the *AWS IoT Developer Guide*.

- For API details, see ListDomainConfigurations in *AWS CLI Command Reference*.

`list-indices`

The following code example shows how to use `list-indices`.

AWS CLI

To list the configured search indices

The following `list-indices` example lists all configured search indices in your AWS account. If you have not enabled thing indexing, you might not have any indices.

```
aws iot list-indices
```

Output:

```
{
    "indexNames": [
        "AWS_Things"
    ]
}
```

For more information, see Managing Thing Indexing in the *AWS IoT Developer Guide*.

- For API details, see ListIndices in *AWS CLI Command Reference*.

`list-job-executions-for-job`

The following code example shows how to use `list-job-executions-for-job`.

AWS CLI

To list the jobs in your AWS account

The following `list-job-executions-for-job` example lists all job executions for a job in your AWS account, specified by the jobId.

```
aws iot list-job-executions-for-job \
    --job-id my-ota-job
```

Output:

```
{
     "executionSummaries": [
         {
             "thingArn": "arn:aws:iot:us-east-1:123456789012:thing/my_thing",
             "jobExecutionSummary": {
                 "status": "QUEUED",
                 "queuedAt": "2022-03-07T15:58:42.195000-08:00",
                 "lastUpdatedAt": "2022-03-07T15:58:42.195000-08:00",
                 "executionNumber": 1,
                 "retryAttempt": 0
```

```
            }
        }
    ]
}
```

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see ListJobExecutionsForJob in *AWS CLI Command Reference*.

`list-job-executions-for-thing`

The following code example shows how to use `list-job-executions-for-thing`.

AWS CLI

To list the jobs that were executed for a thing

The following `list-job-executions-for-thing` example lists all jobs that were executed for the thing named `MyRaspberryPi`.

```
aws iot list-job-executions-for-thing \
    --thing-name "MyRaspberryPi"
```

Output:

```
{
    "executionSummaries": [
        {
            "jobId": "example-job-01",
            "jobExecutionSummary": {
                "status": "QUEUED",
                "queuedAt": 1560787023.636,
                "lastUpdatedAt": 1560787023.636,
                "executionNumber": 1
            }
        }
    ]
}
```

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see ListJobExecutionsForThing in *AWS CLI Command Reference*.

`list-jobs`

The following code example shows how to use `list-jobs`.

AWS CLI

To list the jobs in your AWS account

The following `list-jobs` example lists all jobs in your AWS account, sorted by the job status.

```
aws iot list-jobs
```

Output:

```
{
    "jobs": [
        {
            "jobArn": "arn:aws:iot:us-west-2:123456789012:job/example-job-01",
            "jobId": "example-job-01",
            "targetSelection": "SNAPSHOT",
            "status": "IN_PROGRESS",
            "createdAt": 1560787022.733,
            "lastUpdatedAt": 1560787026.294
        }
    ]
}
```

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see ListJobs in *AWS CLI Command Reference*.

`list-mitigation-actions`

The following code example shows how to use `list-mitigation-actions`.

AWS CLI

To list all defined mitigation actions

The following `list-mitigation-actions` example lists all defined mitigation actions for your AWS account and Region. For each action, the name, ARN, and creation date are listed.

```
aws iot list-mitigation-actions
```

Output:

```
{
    "actionIdentifiers": [
        {
            "actionName": "DeactivateCACertAction",
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
DeactivateCACertAction",
            "creationDate": "2019-12-10T11:12:47.574000-08:00"
        },
        {
            "actionName": "ResetPolicyVersionAction",
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
ResetPolicyVersionAction",
            "creationDate": "2019-12-10T11:11:48.920000-08:00"
        },
        {
            "actionName": "PublishFindingToSNSAction",
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
PublishFindingToSNSAction",
            "creationDate": "2019-12-10T11:10:49.546000-08:00"
        },
        {
            "actionName": "AddThingsToQuarantineGroupAction",
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
AddThingsToQuarantineGroupAction",
            "creationDate": "2019-12-10T11:09:35.999000-08:00"
        },
        {
            "actionName": "UpdateDeviceCertAction",
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
UpdateDeviceCertAction",
            "creationDate": "2019-12-10T11:08:44.263000-08:00"
        },
        {
            "actionName": "SampleMitigationAction",
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
SampleMitigationAction",
            "creationDate": "2019-12-10T11:03:41.840000-08:00"
        }
    ]
```

```
}
```

For more information, see ListMitigationActions (Mitigation Action Commands) in the *AWS IoT Developer Guide*.

- For API details, see ListMitigationActions in *AWS CLI Command Reference*.

`list-mitigations-actions`

The following code example shows how to use `list-mitigations-actions`.

AWS CLI

To list all defined mitigation actions

The following `list-mitigations-actions` example lists all defined mitigation actions for your AWS account and Region. For each action, the name, ARN, and creation date are listed.

```
aws iot list-mitigation-actions
```

Output:

```
{
    "actionIdentifiers": [
        {
            "actionName": "DeactivateCACertAction",
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
DeactivateCACertAction",
            "creationDate": "2019-12-10T11:12:47.574000-08:00"
        },
        {
            "actionName": "ResetPolicyVersionAction",
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
ResetPolicyVersionAction",
            "creationDate": "2019-12-10T11:11:48.920000-08:00"
        },
        {
            "actionName": "PublishFindingToSNSAction",
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
PublishFindingToSNSAction",
            "creationDate": "2019-12-10T11:10:49.546000-08:00"
        },
        {
```

```
            "actionName": "AddThingsToQuarantineGroupAction",
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
AddThingsToQuarantineGroupAction",
            "creationDate": "2019-12-10T11:09:35.999000-08:00"
        },
        {
            "actionName": "UpdateDeviceCertAction",
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
UpdateDeviceCertAction",
            "creationDate": "2019-12-10T11:08:44.263000-08:00"
        },
        {
            "actionName": "SampleMitigationAction",
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
SampleMitigationAction",
            "creationDate": "2019-12-10T11:03:41.840000-08:00"
        }
    ]
}
```

For more information, see ListMitigationActions (Mitigation Action Commands) in the *AWS IoT Developer Guide*.

- For API details, see ListMitigationsActions in *AWS CLI Command Reference*.

`list-ota-updates`

The following code example shows how to use `list-ota-updates`.

AWS CLI

To list OTA Updates for the account

The following `list-ota-updates` example lists the available OTA updates.

```
aws iot list-ota-updates
```

Output:

```
{
    "otaUpdates": [
        {
            "otaUpdateId": "itsaupdate",
```

```
            "otaUpdateArn": "arn:aws:iot:us-west-2:123456789012:otaupdate/
itsaupdate",
            "creationDate": 1557863215.995
        }
    ]
}
```

For more information, see ListOTAUpdates in the *AWS IoT API Reference*.

- For API details, see ListOtaUpdates in *AWS CLI Command Reference*.

`list-outgoing-certificates`

The following code example shows how to use `list-outgoing-certificates`.

AWS CLI

To list certificates being transferred to a different AWS account

The following `list-outgoing-certificates` example lists all device certificates that are in the process of being transferred to a different AWS account using the `transfer-certificate` command.

```
aws iot list-outgoing-certificates
```

Output:

```
{
    "outgoingCertificates": [
        {
            "certificateArn": "arn:aws:iot:us-
west-2:030714055129:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142",
            "certificateId":
 "488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142",
            "transferredTo": "030714055129",
            "transferDate": 1569427780.441,
            "creationDate": 1569363250.557
        }
    ]
}
```

For more information, see ListOutgoingCertificates in the *AWS IoT API Reference*.

- For API details, see ListOutgoingCertificates in *AWS CLI Command Reference*.

`list-policies`

The following code example shows how to use `list-policies`.

AWS CLI

To list the policies defined in your AWS account

The following `list-policies` example lists all policies defined in your AWS account.

```
aws iot list-policies
```

Output:

```
{
    "policies": [
        {
            "policyName": "UpdateDeviceCertPolicy",
            "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/
UpdateDeviceCertPolicy"
        },
        {
            "policyName": "PlantIoTPolicy",
            "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/PlantIoTPolicy"
        },
        {
            "policyName": "MyPiGroup_Core-policy",
            "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/MyPiGroup_Core-
policy"
        }
    ]
}
```

For more information, see AWS IoT Policies in the *AWS IoT Developers Guide*.

- For API details, see ListPolicies in *AWS CLI Command Reference*.

`list-policy-versions`

The following code example shows how to use `list-policy-versions`.

AWS CLI

Example 1: To see all versions of a policy

The following `list-policy-versions` example lists all versions of the specified policy and their creation dates.

```
aws iot list-policy-versions \
    --policy-name LightBulbPolicy
```

Output:

```
{
    "policyVersions": [
        {
            "versionId": "2",
            "isDefaultVersion": true,
            "createDate": 1559925941.924
        },
        {
            "versionId": "1",
            "isDefaultVersion": false,
            "createDate": 1559925941.924
        }
    ]
}
```

For more information, see AWS IoT Policies in the *AWS IoT Developers Guide*.

- For API details, see ListPolicyVersions in *AWS CLI Command Reference*.

`list-principal-things`

The following code example shows how to use `list-principal-things`.

AWS CLI

To list the things attached with a principal

The following `list-principal-things` example lists the things attached to the principal specified by an ARN.

```
aws iot list-principal-things \
    --principal arn:aws:iot:us-
west-2:123456789012:cert/2e1eb273792174ec2b9bf4e9b37e6c6c692345499506002a35159767055278e8
```

Output:

```
{
    "things": [
        "DeskLamp",
        "TableLamp"
    ]
}
```

For more information, see ListPrincipalThings in the *AWS IoT API Reference*.

- For API details, see ListPrincipalThings in *AWS CLI Command Reference*.

`list-provisioning-template-versions`

The following code example shows how to use `list-provisioning-template-versions`.

AWS CLI

To list provisioning template versions

The following `list-provisioning-template-versions` example lists the available versions of the specified provisioning template.

```
aws iot list-provisioning-template-versions \
    --template-name "widget-template"
```

Output:

```
{
    "versions": [
        {
            "versionId": 1,
            "creationDate": 1574800471.339,
            "isDefaultVersion": true
        },
        {
```

```
            "versionId": 2,
            "creationDate": 1574801192.317,
            "isDefaultVersion": false
        }
    ]
}
```

For more information, see AWS IoT Secure Tunneling in the *AWS IoT Core Developer Guide*.

- For API details, see ListProvisioningTemplateVersions in *AWS CLI Command Reference*.

`list-provisioning-templates`

The following code example shows how to use `list-provisioning-templates`.

AWS CLI

To list provisioning templates

The following `list-provisioning-templates` example lists all of the provisioning templates in your AWS account.

```
aws iot list-provisioning-templates
```

Output:

```
{
    "templates": [
        {
            "templateArn": "arn:aws:iot:us-east-1:123456789012:provisioningtemplate/
widget-template",
            "templateName": "widget-template",
            "description": "A provisioning template for widgets",
            "creationDate": 1574800471.367,
            "lastModifiedDate": 1574801192.324,
            "enabled": false
        }
    ]
}
```

For more information, see AWS IoT Secure Tunneling in the *AWS IoT Core Developer Guide*.

- For API details, see ListProvisioningTemplates in *AWS CLI Command Reference*.

`list-role-aliases`

The following code example shows how to use `list-role-aliases`.

AWS CLI

To list the AWS IoT role aliases in your AWS account

The following `list-role-aliases` example lists the AWS IoT role aliases in your AWS account.

```
aws iot list-role-aliases
```

Output:

```
{
    "roleAliases": [
        "ResidentAlias",
        "ElectricianAlias"
    ]
}
```

For more information, see ListRoleAliases in the *AWS IoT API Reference*.

- For API details, see ListRoleAliases in *AWS CLI Command Reference*.

`list-scheduled-audits`

The following code example shows how to use `list-scheduled-audits`.

AWS CLI

To list the scheduled audits for your AWS account

The following `list-scheduled-audits` example lists any audits scheduled for your AWS account.

```
aws iot list-scheduled-audits
```

Output:

```
{
    "scheduledAudits": [
        {
            "scheduledAuditName": "AWSIoTDeviceDefenderDailyAudit",
            "scheduledAuditArn": "arn:aws:iot:us-west-2:123456789012:scheduledaudit/
AWSIoTDeviceDefenderDailyAudit",
            "frequency": "DAILY"
        },
        {
            "scheduledAuditName": "AWSDeviceDefenderWeeklyAudit",
            "scheduledAuditArn": "arn:aws:iot:us-west-2:123456789012:scheduledaudit/
AWSDeviceDefenderWeeklyAudit",
            "frequency": "WEEKLY",
            "dayOfWeek": "SUN"
        }
    ]
}
```

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see ListScheduledAudits in *AWS CLI Command Reference*.

`list-security-profiles-for-target`

The following code example shows how to use `list-security-profiles-for-target`.

AWS CLI

To list the security profiles attached to a target

The following `list-security-profiles-for-target` example lists the AWS IoT Device Defender security profiles that are attached to unregistered devices.

```
aws iot list-security-profiles-for-target  \
    --security-profile-target-arn "arn:aws:iot:us-west-2:123456789012:all/
unregistered-things"
```

Output:

```
{
    "securityProfileTargetMappings": [
        {
```

```
            "securityProfileIdentifier": {
                "name": "Testprofile",
                "arn": "arn:aws:iot:us-west-2:123456789012:securityprofile/
Testprofile"
            },
            "target": {
                "arn": "arn:aws:iot:us-west-2:123456789012:all/unregistered-things"
            }
        }
    ]
}
```

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see ListSecurityProfilesForTarget in *AWS CLI Command Reference*.

`list-security-profiles`

The following code example shows how to use `list-security-profiles`.

AWS CLI

To list the security profiles for your AWS account

The following `list-security-profiles` example lists all AWS IoT Device Defender security profiles that are defined in your AWS account.

```
aws iot list-security-profiles
```

Output:

```
{
    "securityProfileIdentifiers": [
        {
            "name": "Testprofile",
            "arn": "arn:aws:iot:us-west-2:123456789012:securityprofile/Testprofile"
        }
    ]
}
```

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see ListSecurityProfiles in *AWS CLI Command Reference*.

`list-streams`

The following code example shows how to use `list-streams`.

AWS CLI

To list the streams in the account

The following `list-streams` example lists all of the streams in your AWS account.

```
aws iot list-streams
```

Output:

```
{
    "streams": [
        {
            "streamId": "stream12345",
            "streamArn": "arn:aws:iot:us-west-2:123456789012:stream/stream12345",
            "streamVersion": 1,
            "description": "This stream is used for Amazon FreeRTOS OTA Update
 12345."
        },
        {
            "streamId": "stream54321",
            "streamArn": "arn:aws:iot:us-west-2:123456789012:stream/stream54321",
            "streamVersion": 1,
            "description": "This stream is used for Amazon FreeRTOS OTA Update
 54321."
        }
    ]
}
```

For more information, see ListStreams in the *AWS IoT API Reference*.

- For API details, see ListStreams in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To display the tags and their values associated with a resource

The following `list-tags-for-resource` example displays the tags and values associated with the thing group `LightBulbs`.

```
aws iot list-tags-for-resource \
    --resource-arn "arn:aws:iot:us-west-2:094249569039:thinggroup/LightBulbs"
```

Output:

```
{
    "tags": [
        {
            "Key": "Assembly",
            "Value": "Fact1NW"
        },
        {
            "Key": "MyTag",
            "Value": "777"
        }
    ]
}
```

For more information, see Tagging Your AWS IoT Resources in the *AWS IoT Developer Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`list-targets-for-policy`

The following code example shows how to use `list-targets-for-policy`.

AWS CLI

To list the principals associated with an AWS IoT policy

The following `list-targets-for-policy` example lists the device certificates to which the specified policy is attached.

```
aws iot list-targets-for-policy \
```

```
    --policy-name UpdateDeviceCertPolicy
```

Output:

```
{
    "targets": [
        "arn:aws:iot:us-
west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142",
        "arn:aws:iot:us-west-2:123456789012:cert/
d1eb269fb55a628552143c8f96eb3c258fcd5331ea113e766ba0c82bf225f0be"
    ]
}
```

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see ListTargetsForPolicy in *AWS CLI Command Reference*.

`list-targets-for-security-profile`

The following code example shows how to use `list-targets-for-security-profile`.

AWS CLI

To list the targets to which a security profile is applied

The following `list-targets-for-security-profile` example lists the targets to which the AWS IoT Device Defender security profile named `PossibleIssue` is applied.

```
aws iot list-targets-for-security-profile \
    --security-profile-name Testprofile
```

Output:

```
{
    "securityProfileTargets": [
        {
            "arn": "arn:aws:iot:us-west-2:123456789012:all/unregistered-things"
        },
        {
            "arn": "arn:aws:iot:us-west-2:123456789012:all/registered-things"
        }
    ]
```

```
}
```

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see ListTargetsForSecurityProfile in *AWS CLI Command Reference*.

`list-thing-groups-for-thing`

The following code example shows how to use `list-thing-groups-for-thing`.

AWS CLI

To list the groups that a thing belongs to

The following `list-thing-groups-for-thing` example lists the groups to which the specified thing belongs.

```
aws iot list-thing-groups-for-thing \
    --thing-name MyLightBulb
```

Output:

```
{
    "thingGroups": [
        {
            "groupName": "DeadBulbs",
            "groupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/DeadBulbs"
        },
        {
            "groupName": "LightBulbs",
            "groupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs"
        }
    ]
}
```

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see ListThingGroupsForThing in *AWS CLI Command Reference*.

`list-thing-groups`

The following code example shows how to use `list-thing-groups`.

AWS CLI

To list the thing groups defined in your AWS account

The following `describe-thing-group` example lists all thing groups defined in your AWS account.

```
aws iot list-thing-groups
```

Output:

```
{
    "thingGroups": [
        {
            "groupName": "HalogenBulbs",
            "groupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/HalogenBulbs"
        },
        {
            "groupName": "LightBulbs",
            "groupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs"
        }
    ]
}
```

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see ListThingGroups in *AWS CLI Command Reference*.

`list-thing-principals`

The following code example shows how to use `list-thing-principals`.

AWS CLI

To list the principals associated with a thing

The following `list-thing-principals` example lists the principals (X.509 certificates, IAM users, groups, roles, Amazon Cognito identities, or federated identities) associated with the specified thing.

```
aws iot list-thing-principals \
    --thing-name MyRaspberryPi
```

Output:

```
{
    "principals": [
        "arn:aws:iot:us-
west-2:123456789012:cert/33475ac865079a5ffd5ecd44240640349293facc760642d7d8d5dbb6b4c86893"
    ]
}
```

For more information, see [ListThingPrincipals](#) in the *AWS IoT API Reference*.

- For API details, see [ListThingPrincipals](#) in *AWS CLI Command Reference*.

`list-thing-types`

The following code example shows how to use `list-thing-types`.

AWS CLI

To list the defined thing types

The following `list-thing-types` example displays a list of thing types defined in your AWS account.

```
aws iot list-thing-types
```

Output:

```
{
    "thingTypes": [
        {
            "thingTypeName": "LightBulb",
            "thingTypeArn": "arn:aws:iot:us-west-2:123456789012:thingtype/
LightBulb",
            "thingTypeProperties": {
                "thingTypeDescription": "light bulb type",
                "searchableAttributes": [
                    "model",
                    "wattage"
                ]
            },
            "thingTypeMetadata": {
```

```
                "deprecated": false,
                "creationDate": 1559772562.498
                }
            }
        ]
}
```

For more information, see Thing Types in the *AWS IoT Developers Guide*.

- For API details, see ListThingTypes in *AWS CLI Command Reference*.

`list-things-in-billing-group`

The following code example shows how to use `list-things-in-billing-group`.

AWS CLI

To list the things in a billing group

The following `list-things-in-billing-group` example lists the things that are in the specified billing group.

```
aws iot list-things-in-billing-group \
    --billing-group-name GroupOne
```

Output:

```
{
    "things": [
        "MyOtherLightBulb",
        "MyLightBulb"
    ]
}
```

For more information, see Billing Groups in the *AWS IoT Developers Guide*.

- For API details, see ListThingsInBillingGroup in *AWS CLI Command Reference*.

`list-things-in-thing-group`

The following code example shows how to use `list-things-in-thing-group`.

AWS CLI

To list the things that belong to a group

The following `list-things-in-thing-group` example lists the things that belong to the specified thing group.

```
aws iot list-things-in-thing-group \
    --thing-group-name LightBulbs
```

Output:

```
{
    "things": [
        "MyLightBulb"
    ]
}
```

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see ListThingsInThingGroup in *AWS CLI Command Reference*.

`list-things`

The following code example shows how to use `list-things`.

AWS CLI

Example 1: To list all things in the registry

The following `list-things` example lists the things (devices) that are defined in the AWS IoT registry for your AWS account.

```
aws iot list-things
```

Output:

```
{
    "things": [
        {
            "thingName": "ThirdBulb",
            "thingTypeName": "LightBulb",
```

```
                "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/ThirdBulb",
                "attributes": {
                    "model": "123",
                    "wattage": "75"
                },
                "version": 2
            },
            {
                "thingName": "MyOtherLightBulb",
                "thingTypeName": "LightBulb",
                "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyOtherLightBulb",
                "attributes": {
                    "model": "123",
                    "wattage": "75"
                },
                "version": 3
            },
            {
                "thingName": "MyLightBulb",
                "thingTypeName": "LightBulb",
                "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyLightBulb",
                "attributes": {
                    "model": "123",
                    "wattage": "75"
                },
                "version": 1
            },
            {
            "thingName": "SampleIoTThing",
            "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/SampleIoTThing",
            "attributes": {},
            "version": 1
            }
        ]
}
```

Example 2: To list the defined things that have a specific attribute

The following `list-things` example displays a list of things that have an attribute named `wattage`.

```
aws iot list-things \
    --attribute-name wattage
```

Output:

```
{
    "things": [
        {
            "thingName": "MyLightBulb",
            "thingTypeName": "LightBulb",
            "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyLightBulb",
            "attributes": {
                "model": "123",
                "wattage": "75"
            },
            "version": 1
        },
        {
            "thingName": "MyOtherLightBulb",
            "thingTypeName": "LightBulb",
            "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyOtherLightBulb",
            "attributes": {
                "model": "123",
                "wattage": "75"
            },
            "version": 3
        }
    ]
}
```

For more information, see How to Manage Things with the Registry in the *AWS IoT Developers Guide*.

- For API details, see ListThings in *AWS CLI Command Reference*.

`list-topic-rule-destinations`

The following code example shows how to use `list-topic-rule-destinations`.

AWS CLI

To list your topic rule destinations

The following `list-topic-rule-destinations` example lists all topic rule destinations that you have defined in the current AWS Region.

```
aws iot list-topic-rule-destinations
```

Output:

```
{
    "destinationSummaries": [
        {
            "arn": "arn:aws:iot:us-west-2:123456789012:ruledestination/http/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
            "status": "ENABLED",
            "httpUrlSummary": {
                "confirmationUrl": "https://example.com"
            }
        }
    ]
}
```

For more information, see Working with topic rule destinations in the *AWS IoT Developer Guide*.

- For API details, see ListTopicRuleDestinations in *AWS CLI Command Reference*.

`list-topic-rules`

The following code example shows how to use `list-topic-rules`.

AWS CLI

To list your rules

The following `list-topic-rules` example lists all rules that you have defined.

```
aws iot list-topic-rules
```

Output:

```
{
    "rules": [
        {
            "ruleArn": "arn:aws:iot:us-west-2:123456789012:rule/
MyRPiLowMoistureAlertRule",
            "ruleName": "MyRPiLowMoistureAlertRule",
            "topicPattern": "$aws/things/MyRPi/shadow/update/accepted",
```

```
                "createdAt": 1558624363.0,
                "ruleDisabled": false
            },
            {
                "ruleArn": "arn:aws:iot:us-west-2:123456789012:rule/
MyPlantPiMoistureAlertRule",
                "ruleName": "MyPlantPiMoistureAlertRule",
                "topicPattern": "$aws/things/MyPlantPi/shadow/update/accepted",
                "createdAt": 1541458459.0,
                "ruleDisabled": false
            }
        ]
}
```

For more information, see Viewing Your Rules in the *AWS IoT Developers Guide*.

- For API details, see ListTopicRules in *AWS CLI Command Reference*.

`list-v2-logging-levels`

The following code example shows how to use `list-v2-logging-levels`.

AWS CLI

To list logging levels

The following `list-v2-logging-levels` example lists the configured logging levels. If logging levels were not set, a `NotConfiguredException` occurs when you run this command.

```
aws iot list-v2-logging-levels
```

Output:

```
{
    "logTargetConfigurations": [
        {
            "logTarget": {
                "targetType": "DEFAULT"
            },
            "logLevel": "ERROR"
        }
    ]
```

```
}
```

- For API details, see ListV2LoggingLevels in *AWS CLI Command Reference*.

`list-violation-events`

The following code example shows how to use `list-violation-events`.

AWS CLI

To list the security profile violations during a time period

The following `list-violation-events` example lists violations that occurred between June 5, 2019 and June 12, 2019 for all AWS IoT Device Defender security profiles for the current AWS account and AWS Region.

```
aws iot list-violation-events \
    --start-time 1559747125 \
    --end-time 1560351925
```

Output:

```
{
    "violationEvents": [
        {
            "violationId": "174db59167fa474c80a652ad1583fd44",

            }
        ]
}
```

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see ListViolationEvents in *AWS CLI Command Reference*.

`register-ca-certificate`

The following code example shows how to use `register-ca-certificate`.

AWS CLI

To register a certificate authority (CA) certificate

The following `register-ca-certificate` example registers a CA certificate. The command supplies the CA certificate and a key verification certificate that proves you own the private key associated with the CA certificate.

```
aws iot register-ca-certificate \
    --ca-certificate file://rootCA.pem \
    --verification-cert file://verificationCert.pem
```

Output:

```
{
    "certificateArn": "arn:aws:iot:us-west-2:123456789012:cacert/
f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467",
    "certificateId":
 "f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467"
 }
```

For more information, see RegisterCACertificate in the *AWS IoT API Reference*.

- For API details, see RegisterCaCertificate in *AWS CLI Command Reference*.

`register-certificate`

The following code example shows how to use `register-certificate`.

AWS CLI

To register a self signed device certificate

The following `register-certificate` example registers the `deviceCert.pem` device certificate signed by the `rootCA.pem` CA certificate. The CA certificate must be registered before you use it to register a self-signed device certificate. The self-signed certificate must be signed by the same CA certificate you pass to this command.

```
aws iot register-certificate \
    --certificate-pem file://deviceCert.pem \
    --ca-certificate-pem file://rootCA.pem
```

Output:

```
{
```

```
    "certificateArn": "arn:aws:iot:us-
west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142",
    "certificateId":
 "488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142"
 }
```

For more information, see RegisterCertificate in the *AWS IoT API Reference*.

- For API details, see RegisterCertificate in *AWS CLI Command Reference*.

`register-thing`

The following code example shows how to use `register-thing`.

AWS CLI

To register a thing

The following `register-thing` example registers a thing using a provisioning template.

```
aws iot register-thing \
    --template-body '{"Parameters":{"ThingName":
{"Type":"String"},"AWS::IoT::Certificate::Id":{"Type":"String"}},"Resources":
 {"certificate":{"Properties":{"CertificateId":
{"Ref":"AWS::IoT::Certificate::Id"},"Status":"Active"},"Type":"AWS::IoT::Certificate"},"poli
{"Properties":{"PolicyName":"MyIotPolicy"},"Type":"AWS::IoT::Policy"},"thing":
{"OverrideSettings":
{"AttributePayload":"MERGE","ThingGroups":"DO_NOTHING","ThingTypeName":"REPLACE"},"Propertie
{"AttributePayload":{},"ThingGroups":[],"ThingName":
{"Ref":"ThingName"},"ThingTypeName":"VirtualThings"},"Type":"AWS::IoT::Thing"}}}' \
    --parameters '{"ThingName":"Register-thing-
trial-1","AWS::IoT::Certificate::Id":"799a9ea048a1e6aea42b55EXAMPLEf8697b4bafcd77a318a3068e3
```

Output:

```
{
    "certificatePem": "-----BEGIN CERTIFICATE-----

```

For more information, see Provisioning by trusted user in the *AWS IoT Core Developers Guide*.

- For API details, see RegisterThing in *AWS CLI Command Reference*.

`reject-certificate-transfer`

The following code example shows how to use `reject-certificate-transfer`.

AWS CLI

To reject a certificate transfer

The following `reject-certificate-transfer` example rejects the transfer of the specified device certificate from another AWS account.

```
aws iot reject-certificate-transfer \
    --certificate-id f0f33678c7c9a046e5cc87b2b1a58dfa0beec26db78addd5e605d630e05c7fc8
```

This command produces no output.

For more information, see Transfer a certificate to another account in the *AWS IoT Core Developer Guide*.

- For API details, see RejectCertificateTransfer in *AWS CLI Command Reference*.

`remove-thing-from-billing-group`

The following code example shows how to use `remove-thing-from-billing-group`.

AWS CLI

To remove a thing from a billing group

The following `remove-thing-from-billing-group` example removes the specified thing from a billing group.

```
aws iot remove-thing-from-billing-group \
    --billing-group-name GroupOne \
    --thing-name MyOtherLightBulb
```

This command produces no output.

For more information, see Billing Groups in the *AWS IoT Developers Guide*.

- For API details, see RemoveThingFromBillingGroup in *AWS CLI Command Reference*.

`remove-thing-from-thing-group`

The following code example shows how to use `remove-thing-from-thing-group`.

AWS CLI

To remove a thing from a thing group

The following `remove-thing-from-thing-group` example removes the specified thing from a thing group.

```
aws iot remove-thing-from-thing-group \
    --thing-name bulb7 \
    --thing-group-name DeadBulbs
```

This command produces no output.

For more information, see Thing Groups <https://docs.aws.amazon.com/iot/latest/developerguide/thing-groups.html > in the *AWS IoT Developer Guide*.

- For API details, see RemoveThingFromThingGroup in *AWS CLI Command Reference*.

`replace-topic-rule`

The following code example shows how to use `replace-topic-rule`.

AWS CLI

To update a topic's rule definition

The following `replace-topic-rule` example updates the specified rule to send an SNS alert when soil moisture level readings are too low.

```
aws iot replace-topic-rule \
    --rule-name MyRPiLowMoistureAlertRule \
    --topic-rule-payload "{\"sql\": \"SELECT * FROM '$aws/things/MyRPi/shadow/
update/accepted' WHERE state.reported.moisture = 'low'\", \"description\": \"Sends
 an alert when soil moisture level readings are too low.\",\"actions\": [{\"sns
\":{\"targetArn\":\"arn:aws:sns:us-west-2:123456789012:MyRPiLowMoistureTopic\",
\"roleArn\":\"arn:aws:iam::123456789012:role/service-role/MyRPiLowMoistureTopicRole
\",\"messageFormat\": \"RAW\"}}],\"ruleDisabled\": false,\"awsIotSqlVersion\":
\"2016-03-23\"}"
```

This command produces no output.

For more information, see Creating an AWS IoT Rule in the *AWS IoT Developer Guide*.

- For API details, see ReplaceTopicRule in *AWS CLI Command Reference*.

`search-index`

The following code example shows how to use `search-index`.

AWS CLI

To query the thing index

The following `search-index` example queries the `AWS_Things` index for things that have a type of `LightBulb`.

```
aws iot search-index \
    --index-name "AWS_Things" \
    --query-string "thingTypeName:LightBulb"
```

Output:

```
{
    "things": [
        {
            "thingName": "MyLightBulb",
            "thingId": "40da2e73-c6af-406e-b415-15acae538797",
            "thingTypeName": "LightBulb",
            "thingGroupNames": [
                "LightBulbs",
                "DeadBulbs"
            ],
            "attributes": {
                "model": "123",
                "wattage": "75"
            },
            "connectivity": {
                "connected": false
            }
        },
        {
            "thingName": "ThirdBulb",
            "thingId": "615c8455-33d5-40e8-95fd-3ee8b24490af",
            "thingTypeName": "LightBulb",
            "attributes": {
                "model": "123",
                "wattage": "75"
            },
            "connectivity": {
                "connected": false
            }
        },
```

```
        {
            "thingName": "MyOtherLightBulb",
            "thingId": "6dae0d3f-40c1-476a-80c4-1ed24ba6aa11",
            "thingTypeName": "LightBulb",
            "attributes": {
                "model": "123",
                "wattage": "75"
            },
            "connectivity": {
                "connected": false
            }
        }
    ]
}
```

For more information, see Managing Thing Indexing in the *AWS IoT Developer Guide*.

- For API details, see SearchIndex in *AWS CLI Command Reference*.

`set-default-authorizer`

The following code example shows how to use `set-default-authorizer`.

AWS CLI

To set a default authorizer

The following `set-default-authorizer` example sets the custom authorizer named `CustomAuthorizer` as the default authorizer.

```
aws iot set-default-authorizer \
    --authorizer-name CustomAuthorizer
```

Output:

```
{
    "authorizerName": "CustomAuthorizer",
    "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/
CustomAuthorizer"
}
```

For more information, see CreateDefaultAuthorizer in the *AWS IoT API Reference*.

- For API details, see SetDefaultAuthorizer in *AWS CLI Command Reference*.

`set-default-policy-version`

The following code example shows how to use `set-default-policy-version`.

AWS CLI

To set the default version for a policy

The following `set-default-policy-version` example sets the default version to 2 for the policy named `UpdateDeviceCertPolicy`.

```
aws iot set-default-policy-version \
    --policy-name UpdateDeviceCertPolicy \
    --policy-version-id 2
```

This command produces no output.

- For API details, see SetDefaultPolicyVersion in *AWS CLI Command Reference*.

`set-v2-logging-level`

The following code example shows how to use `set-v2-logging-level`.

AWS CLI

To set the logging level for a thing group

The following `set-v2-logging-level` example sets the logging level to log warnings for the specified thing group.

```
aws iot set-v2-logging-level \
    --log-target "{\"targetType\":\"THING_GROUP\",\"targetName\":\"LightBulbs\"}" \
    --log-level WARN
```

This command produces no output.

- For API details, see SetV2LoggingLevel in *AWS CLI Command Reference*.

`set-v2-logging-options`

The following code example shows how to use `set-v2-logging-options`.

AWS CLI

To set the logging options

The following `set-v2-logging-options` example sets the default logging verbosity level to ERROR and specifies the ARN to use for logging.

```
aws iot set-v2-logging-options \
    --default-log-level ERROR \
    --role-arn "arn:aws:iam::094249569039:role/service-role/iotLoggingRole"
```

This command produces no output.

- For API details, see SetV2LoggingOptions in *AWS CLI Command Reference*.

`start-audit-mitigation-actions-task`

The following code example shows how to use `start-audit-mitigation-actions-task`.

AWS CLI

To apply a mitigation action to the findings from an audit

The following `start-audit-mitigation-actions-task` example applies the `ResetPolicyVersionAction` action (which clears the policy) to the specified single finding.

```
aws iot start-audit-mitigation-actions-task \
    --task-id "myActionsTaskId" \
    --target "findingIds=[\"0edbaaec-2fe1-4cf5-abc9-d4c3e51f7464\"]" \
    --audit-check-to-actions-mapping
 "IOT_POLICY_OVERLY_PERMISSIVE_CHECK=[\"ResetPolicyVersionAction\"]" \
    --client-request-token "adhadhahda"
```

Output:

```
{
    "taskId": "myActionsTaskId"
```

```
}
```

For more information, see StartAuditMitigationActionsTask (Mitigation Action Commands) in the *AWS IoT Developer Guide*.

- For API details, see StartAuditMitigationActionsTask in *AWS CLI Command Reference*.

`start-on-demand-audit-task`

The following code example shows how to use `start-on-demand-audit-task`.

AWS CLI

To start an audit right away

The following `start-on-demand-audit-task` example starts an AWS IoT Device Defender audit and performs three certificate checks.

```
aws iot start-on-demand-audit-task \
    --target-check-
names CA_CERTIFICATE_EXPIRING_CHECK DEVICE_CERTIFICATE_EXPIRING_CHECK REVOKED_CA_CERTIFICATE
```

Output:

```
{
    "taskId": "a3aea009955e501a31b764abe1bebd3d"
}
```

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see StartOnDemandAuditTask in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To specify a tag key and value for a resource

The following `tag-resource` example applies the tag with a key `Assembly` and the value `Fact1NW` to the thing group `LightBulbs`.

```
aws iot tag-resource \
    --tags Key=Assembly,Value="Fact1NW" \
    --resource-arn "arn:aws:iot:us-west-2:094249569039:thinggroup/LightBulbs"
```

This command produces no output.

For more information, see Tagging Your AWS IoT Resources in the *AWS IoT Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`test-authorization`

The following code example shows how to use `test-authorization`.

AWS CLI

To test your AWS IoT policies

The following `test-authorization` example tests the AWS IoT policies associated with the specified principal.

```
aws iot test-authorization \
    --auth-infos actionType=CONNECT,resources=arn:aws:iot:us-
east-1:123456789012:client/client1 \
    --principal arn:aws:iot:us-west-2:123456789012:cert/
aab1068f7f43ac3e3cae4b3a8aa3f308d2a750e6350507962e32c1eb465d9775
```

Output:

```
{
    "authResults": [
        {
            "authInfo": {
                "actionType": "CONNECT",
                "resources": [
                    "arn:aws:iot:us-east-1:123456789012:client/client1"
                ]
            },
            "allowed": {
                "policies": [
                    {
                        "policyName": "TestPolicyAllowed",
```

```
                        "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/
TestPolicyAllowed"
                    }
                ]
            },
            "denied": {
                "implicitDeny": {
                    "policies": [
                        {
                            "policyName": "TestPolicyDenied",
                            "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/
TestPolicyDenied"
                        }
                    ]
                },
                "explicitDeny": {
                    "policies": [
                        {
                            "policyName": "TestPolicyExplicitDenied",
                            "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/
TestPolicyExplicitDenied"
                        }
                    ]
                }
            },
            "authDecision": "IMPLICIT_DENY",
            "missingContextValues": []
        }
    ]
}
```

For more information, see TestAuthorization in the *AWS IoT API Reference*.

- For API details, see TestAuthorization in *AWS CLI Command Reference*.

`test-invoke-authorizer`

The following code example shows how to use `test-invoke-authorizer`.

AWS CLI

To test your custom authorizer

The following `test-invoke-authorizer` example testS your custom authorizer.

```
aws iot test-invoke-authorizer \
    --authorizer-name IoTAuthorizer \
    --token allow \
    --token-signature "mE0GvaHqy9nER/
FdgtJX5lXYEJ3b3vE7t1gEszc0TKGgLKWXTnPkb2AbKnOAZ8lGyoN5dVtWDWVmr25m7+
+zjbYIMk2TBvyGXhOmvKFBPkdgyA43KL6SiZy0cTqlPMcQDsP7VX2rXr7CTowCxSNKphGXdQe0/
I5dQ+JO6KUaHwCmupt0/MejKtaNwiia064j6wprOAUwG5S1IYFuRd0X
+wfo8pb0DubAIX1Ua705kuhRUcTx4SxUShEYKmN4IDEvLB6FsIr0B2wvB7y4iPmcajxzGl02ExvyCUNctCV9dYlRRGJj
```

Output:

```
{
    "isAuthenticated": true,
    "principalId": "principalId",
    "policyDocuments": [
        "{"Version":"2012-10-17",       "Statement":
[{"Action":"iot:Publish","Effect":"Allow","Resource":"arn:aws:iot:us-
west-2:123456789012:topic/customauthtesting"}]}"
    ],
    "refreshAfterInSeconds": 600,
    "disconnectAfterInSeconds": 3600
}
```

For more information, see TestInvokeAuthorizer in the *AWS IoT API Reference*.

- For API details, see TestInvokeAuthorizer in *AWS CLI Command Reference*.

`transfer-certificate`

The following code example shows how to use `transfer-certificate`.

AWS CLI

To transfer a device certificate to a different AWS account

The following `transfer-certificate` example transfers a device certificate to another AWS account. The certificate and AWS account are identified by ID.

```
aws iot transfer-certificate \
    --certificate-
id 488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142 \
    --target-aws-account 030714055129
```

Output:

```
{
    "transferredCertificateArn": "arn:aws:iot:us-
west-2:030714055129:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142"
}
```

For more information, see Transfer a certificate to another account in the *AWS IoT Core Developer Guide*.

- For API details, see TransferCertificate in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag key from a resource

The following `untag-resource` example removes the tag `MyTag` and its value from the thing group `LightBulbs`.

```
command
```

This command produces no output.

For more information, see Tagging Your AWS IoT Resources in the *AWS IoT Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-account-audit-configuration`

The following code example shows how to use `update-account-audit-configuration`.

AWS CLI

Example 1: To enable Amazon SNS notifications for audit notifications

The following `update-account-audit-configuration` example enables Amazon SNS notifications for AWS IoT Device Defender audit notifications, specifying a target and the role used to write to that target.

```
aws iot update-account-audit-configuration \
    --audit-notification-target-configurations "SNS={targetArn=\"arn:aws:sns:us-
west-2:123456789012:ddaudits\",roleArn=\"arn:aws:iam::123456789012:role/service-
role/AWSIoTDeviceDefenderAudit\",enabled=true}"
```

This command produces no output.

Example 2: To enable an audit check

The following `update-account-audit-configuration` example enables the AWS IoT Device Defender audit check named `AUTHENTICATED_COGNITO_ROLE_OVERLY_PERMISSIVE_CHECK`. You cannot disable an audit check if it is part of the `targetCheckNames` for one or more scheduled audits for the AWS account.

```
aws iot update-account-audit-configuration \
    --audit-check-configurations
 "{\"AUTHENTICATED_COGNITO_ROLE_OVERLY_PERMISSIVE_CHECK\":{\"enabled\":true}}"
```

This command produces no output.

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see UpdateAccountAuditConfiguration in *AWS CLI Command Reference*.

update-audit-suppression

The following code example shows how to use `update-audit-suppression`.

AWS CLI

To update an audit finding suppression

The following `update-audit-suppression` example updates an audit finding suppression's expiration date to 2020-09-21.

```
aws iot update-audit-suppression \
    --check-name DEVICE_CERTIFICATE_EXPIRING_CHECK \
    --resource-identifier deviceCertificateId=c7691e<shortened> \
    --no-suppress-indefinitely \
    --expiration-date 2020-09-21
```

This command produces no output.

For more information, see Audit finding suppressions in the *AWS IoT Developers Guide*.

- For API details, see UpdateAuditSuppression in *AWS CLI Command Reference*.

update-authorizer

The following code example shows how to use `update-authorizer`.

AWS CLI

To update a custom authorizer

The following `update-authorizer` example he state of `CustomAuthorizer2` to `INACTIVE`.

```
aws iot update-authorizer \
    --authorizer-name CustomAuthorizer2 \
    --status INACTIVE
```

Output:

```
{
    "authorizerName": "CustomAuthorizer2",
    "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/
CustomAuthorizer2"
}
```

For more information, see UpdateAuthorizer in the *AWS IoT API Reference*.

- For API details, see UpdateAuthorizer in *AWS CLI Command Reference*.

update-billing-group

The following code example shows how to use `update-billing-group`.

AWS CLI

To update information about a billing group

The following `update-billing-group` example updates the description for the specified billing group.

```
aws iot update-billing-group \
    --billing-group-name GroupOne \
    --billing-group-properties "billingGroupDescription=\"Primary bulb billing group
\""
```

Output:

```
{
    "version": 2
}
```

For more information, see Billing Groups in the *AWS IoT Developers Guide*.

- For API details, see UpdateBillingGroup in *AWS CLI Command Reference*.

`update-ca-certificate`

The following code example shows how to use `update-ca-certificate`.

AWS CLI

To update a certificate authority (CA) certificate

The following `update-ca-certificate` example sets the specified CA certificate to ACTIVE status.

```
aws iot update-ca-certificate \
    --certificate-
id f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467 \
    --new-status ACTIVE
```

This command produces no output.

For more information, see UpdateCACertificate in the *AWS IoT API Reference*.

- For API details, see UpdateCaCertificate in *AWS CLI Command Reference*.

`update-certificate`

The following code example shows how to use `update-certificate`.

AWS CLI

To update a device certificate

The following `update-certificate` example sets the specified device certificate to INACTIVE status.

```
aws iot update-certificate \
    --certificate-
id d1eb269fb55a628552143c8f96eb3c258fcd5331ea113e766ba0c82bf225f0be \
    --new-status INACTIVE
```

This command produces no output.

For more information, see UpdateCertificate in the *AWS IoT API Reference*.

- For API details, see UpdateCertificate in *AWS CLI Command Reference*.

`update-custom-metric`

The following code example shows how to use `update-custom-metric`.

AWS CLI

To update a custom metric

The following `update-custom-metric` example updates a custom metric to have a new `display-name`.

```
aws iot update-custom-metric \
    --metric-name batteryPercentage \
    --display-name 'remaining battery percentage on device' \
    --region us-east-1
```

Output:

```
{
    "metricName": "batteryPercentage",
    "metricArn": "arn:aws:iot:us-east-1:1234564789012:custommetric/
batteryPercentage",
    "metricType": "number",
```

```
    "displayName": "remaining battery percentage on device",
    "creationDate": "2020-11-17T23:01:35.110000-08:00",
    "lastModifiedDate": "2020-11-17T23:02:12.879000-08:00"
}
```

For more information, see Custom metrics in the *AWS IoT Core Developer Guide*.

- For API details, see UpdateCustomMetric in *AWS CLI Command Reference*.

`update-dimension`

The following code example shows how to use `update-dimension`.

AWS CLI

To update a dimension

The following `update-dimension` example updates a dimension.

```
aws iot update-dimension \
    --name TopicFilterForAuthMessages \
    --string-values device/${iot:ClientId}/auth
```

Output:

```
{
    "name": "TopicFilterForAuthMessages",
    "lastModifiedDate": 1585866222.317,
    "stringValues": [
        "device/${iot:ClientId}/auth"
    ],
    "creationDate": 1585854500.474,
    "type": "TOPIC_FILTER",
    "arn": "arn:aws:iot:us-west-2:1234564789012:dimension/
TopicFilterForAuthMessages"
}
```

For more information, see Scoping metrics in security profiles using dimensions in the *AWS IoT Core Developer Guide*.

- For API details, see UpdateDimension in *AWS CLI Command Reference*.

`update-domain-configuration`

The following code example shows how to use `update-domain-configuration`.

AWS CLI

To update a domain configuration

The following `update-domain-configuration` example disables the specified domain configuration.

```
aws iot update-domain-configuration \
    --domain-configuration-name "additionalDataDomain" \
    --domain-configuration-status "DISABLED"
```

Output:

```
{
    "domainConfigurationName": "additionalDataDomain",
    "domainConfigurationArn": "arn:aws:iot:us-
west-2:123456789012:domainconfiguration/additionalDataDomain/dikMh"
}
```

For more information, see Configurable Endpoints in the *AWS IoT Developer Guide*.

- For API details, see UpdateDomainConfiguration in *AWS CLI Command Reference*.

`update-dynamic-thing-group`

The following code example shows how to use `update-dynamic-thing-group`.

AWS CLI

To update a dynamic thing group

The following `update-dynamic-thing-group` example updates the specified dynamic thing group. It provides a description and updates the query string to change the group membership criteria.

```
aws iot update-dynamic-thing-group \
    --thing-group-name "RoomTooWarm"
```

```
    --thing-group-properties "thingGroupDescription=\"This thing group contains
 rooms warmer than 65F.\"" \
    --query-string "attributes.temperature>65"
```

Output:

```
{
    "version": 2
}
```

For more information, see Dynamic Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see UpdateDynamicThingGroup in *AWS CLI Command Reference*.

`update-event-configurations`

The following code example shows how to use `update-event-configurations`.

AWS CLI

To show which event types are published

The following `update-event-configurations` example updates the configuration to enable messages when the CA certificate is added, updated, or deleted.

```
aws iot update-event-configurations \
    --event-configurations "{\"CA_CERTIFICATE\":{\"Enabled\":true}}"
```

This command produces no output.

For more information, see Event Messages in the *AWS IoT Developer Guide*.

- For API details, see UpdateEventConfigurations in *AWS CLI Command Reference*.

`update-indexing-configuration`

The following code example shows how to use `update-indexing-configuration`.

AWS CLI

To enable thing indexing

The following `update-indexing-configuration` example enables thing indexing to support searching registry data, shadow data, and thing connectivity status using the AWS_Things index.

```
aws iot update-indexing-configuration
    --thing-indexing-
configuration thingIndexingMode=REGISTRY_AND_SHADOW,thingConnectivityIndexingMode=STATUS
```

This command produces no output.

For more information, see Managing Thing Indexing in the *AWS IoT Developers Guide*.

- For API details, see UpdateIndexingConfiguration in *AWS CLI Command Reference*.

`update-job`

The following code example shows how to use `update-job`.

AWS CLI

To get detailed status for a job

The following `update-job` example gets detailed status for the job whose ID is `example-job-01`.

```
aws iot describe-job \
    --job-id "example-job-01"
```

Output:

```
{
    "job": {
        "jobArn": "arn:aws:iot:us-west-2:123456789012:job/example-job-01",
        "jobId": "example-job-01",
        "targetSelection": "SNAPSHOT",
        "status": "IN_PROGRESS",
        "targets": [
            "arn:aws:iot:us-west-2:123456789012:thing/MyRaspberryPi"
        ],
        "description": "example job test",
        "presignedUrlConfig": {},
```

```
            "jobExecutionsRolloutConfig": {},
            "createdAt": 1560787022.733,
            "lastUpdatedAt": 1560787026.294,
            "jobProcessDetails": {
                "numberOfCanceledThings": 0,
                "numberOfSucceededThings": 0,
                "numberOfFailedThings": 0,
                "numberOfRejectedThings": 0,
                "numberOfQueuedThings": 1,
                "numberOfInProgressThings": 0,
                "numberOfRemovedThings": 0,
                "numberOfTimedOutThings": 0
            },
            "timeoutConfig": {}
        }
}
```

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see UpdateJob in *AWS CLI Command Reference*.

`update-mitigation-action`

The following code example shows how to use `update-mitigation-action`.

AWS CLI

To update a mitigation action

The following `update-mitigation-action` example updates the specified mitigation action named `AddThingsToQuarantineGroupAction`, changes the thing group name, and sets `overrideDynamicGroups` to `false`. You can verify your changes by using the `describe-mitigation-action` command.

```
aws iot update-mitigation-action \
    --cli-input-json "{ \"actionName\": \"AddThingsToQuarantineGroupAction\",
 \"actionParams\": { \"addThingsToThingGroupParams\": {\"thingGroupNames\":
[\"QuarantineGroup2\"],\"overrideDynamicGroups\": false}}}"
```

Output:

```
{
```

```
    "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
AddThingsToQuarantineGroupAction",
    "actionId": "2fd2726d-98e1-4abf-b10f-09465ccd6bfa"
}
```

For more information, see UpdateMitigationAction (Mitigation Action Commands) in the *AWS IoT Developer Guide*.

- For API details, see UpdateMitigationAction in *AWS CLI Command Reference*.

update-provisioning-template

The following code example shows how to use `update-provisioning-template`.

AWS CLI

To update a provisioning template

The following `update-provisioning-template` example modifies the description and role arn for the specified provisioning template and enables the template.

```
aws iot update-provisioning-template \
    --template-name widget-template \
    --enabled \
    --description "An updated provisioning template for widgets" \
    --provisioning-role-arn arn:aws:iam::504350838278:role/Provision_role
```

This command produces no output.

For more information, see AWS IoT Secure Tunneling in the *AWS IoT Core Developer Guide*.

- For API details, see UpdateProvisioningTemplate in *AWS CLI Command Reference*.

update-role-alias

The following code example shows how to use `update-role-alias`.

AWS CLI

To update a role alias

The following `update-role-alias` example updates the `LightBulbRole` role alias.

```
aws iot update-role-alias \
    --role-alias LightBulbRole \
    --role-arn arn:aws:iam::123456789012:role/lightbulbrole-001
```

Output:

```
{
    "roleAlias": "LightBulbRole",
    "roleAliasArn": "arn:aws:iot:us-west-2:123456789012:rolealias/LightBulbRole"
}
```

For more information, see UpdateRoleAlias in the *AWS IoT API Reference*.

- For API details, see UpdateRoleAlias in *AWS CLI Command Reference*.

`update-scheduled-audit`

The following code example shows how to use `update-scheduled-audit`.

AWS CLI

To update a scheduled audit definition

The following `update-scheduled-audit` example changes the target check names for an AWS IoT Device Defender scheduled audit.

```
aws iot update-scheduled-audit \
    --scheduled-audit-name WednesdayCertCheck \
    --target-check-
names CA_CERTIFICATE_EXPIRING_CHECK DEVICE_CERTIFICATE_EXPIRING_CHECK REVOKED_CA_CERTIFICATE
```

Output:

```
{
    "scheduledAuditArn": "arn:aws:iot:us-west-2:123456789012:scheduledaudit/
WednesdayCertCheck"
}
```

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see UpdateScheduledAudit in *AWS CLI Command Reference*.

`update-security-profile`

The following code example shows how to use `update-security-profile`.

AWS CLI

To change a security profile

The following `update-security-profile` example updates both the description and the behaviors for an AWS IoT Device Defender security profile.

```
aws iot update-security-profile \
    --security-profile-name PossibleIssue \
    --security-profile-description "Check to see if authorization fails 12 times in
 5 minutes or if cellular bandwidth exceeds 128"  \
    --behaviors "[{\"name\":\"CellularBandwidth\",\"metric\":\"aws:message-byte-size
\",\"criteria\":{\"comparisonOperator\":\"greater-than\",\"value\":{\"count\":128},
\"consecutiveDatapointsToAlarm\":1,\"consecutiveDatapointsToClear\":1}},{\"name
\":\"Authorization\",\"metric\":\"aws:num-authorization-failures\",\"criteria\":
{\"comparisonOperator\":\"less-than\",\"value\":{\"count\":12},\"durationSeconds
\":300,\"consecutiveDatapointsToAlarm\":1,\"consecutiveDatapointsToClear\":1}}]"
```

Output:

```
{
    "securityProfileName": "PossibleIssue",
    "securityProfileArn": "arn:aws:iot:us-west-2:123456789012:securityprofile/
PossibleIssue",
    "securityProfileDescription": "check to see if authorization fails 12 times in 5
 minutes or if cellular bandwidth exceeds 128",
    "behaviors": [
        {
            "name": "CellularBandwidth",
            "metric": "aws:message-byte-size",
            "criteria": {
                "comparisonOperator": "greater-than",
                "value": {
                    "count": 128
                },
                "consecutiveDatapointsToAlarm": 1,
                "consecutiveDatapointsToClear": 1
            }
        },
```

```
        {
            "name": "Authorization",
            "metric": "aws:num-authorization-failures",
            "criteria": {
                "comparisonOperator": "less-than",
                "value": {
                    "count": 12
                },
                "durationSeconds": 300,
                "consecutiveDatapointsToAlarm": 1,
                "consecutiveDatapointsToClear": 1
            }
        }
    ],
    "version": 2,
    "creationDate": 1560278102.528,
    "lastModifiedDate": 1560352711.207
}
```

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see UpdateSecurityProfile in *AWS CLI Command Reference*.

`update-stream`

The following code example shows how to use `update-stream`.

AWS CLI

To update a stream

The following `update-stream` example updates an existing stream. The stream version is incremented by one.

```
aws iot update-stream \
    --cli-input-json file://update-stream.json
```

Contents of `update-stream.json`:

```
{
    "streamId": "stream12345",
    "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",
    "files": [
```

```
        {
            "fileId": 123,
            "s3Location": {
                "bucket":"codesign-ota-bucket",
                "key":"48c67f3c-63bb-4f92-a98a-4ee0fbc2bef6"
            }
        }
    ]
    "roleArn": "arn:aws:iam:us-west-2:123456789012:role/service-role/
my_ota_stream_role"
}
```

Output:

```
{
    "streamId": "stream12345",
    "streamArn": "arn:aws:iot:us-west-2:123456789012:stream/stream12345",
    "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",
    "streamVersion": 2
}
```

For more information, see UpdateStream in the *AWS IoT API Reference*.

- For API details, see UpdateStream in *AWS CLI Command Reference*.

`update-thing-group`

The following code example shows how to use `update-thing-group`.

AWS CLI

To update the definition for a thing group

The following `update-thing-group` example updates the definition for the specified thing group, changing the description and two attributes.

```
aws iot update-thing-group \
    --thing-group-name HalogenBulbs \
    --thing-group-properties "thingGroupDescription=\"Halogen bulb group\",
 attributePayload={attributes={Manufacturer=AnyCompany,wattage=60}}"
```

Output:

```
{
    "version": 2
}
```

For more information, see [Thing Groups]() in the *AWS IoT Developers Guide*.

- For API details, see [UpdateThingGroup]() in *AWS CLI Command Reference*.

`update-thing-groups-for-thing`

The following code example shows how to use `update-thing-groups-for-thing`.

AWS CLI

To change the groups to which a thing belongs

The following `update-thing-groups-for-thing` example removes the thing named `MyLightBulb` from the group named `DeadBulbs` and adds it to the group named `replaceableItems` at the same time.

```
aws iot update-thing-groups-for-thing \
    --thing-name MyLightBulb \
    --thing-groups-to-add "replaceableItems" \
    --thing-groups-to-remove "DeadBulbs"
```

This command produces no output.

For more information, see [Thing Groups]() in the *AWS IoT Developer Guide*.

- For API details, see [UpdateThingGroupsForThing]() in *AWS CLI Command Reference*.

`update-thing`

The following code example shows how to use `update-thing`.

AWS CLI

To associate a thing with a thing type

The following `update-thing` example associates a thing in the AWS IoT registry with a thing type. When you make the association, you provide values for the attributes defined by the thing type.

```
aws iot update-thing \
    --thing-name "MyOtherLightBulb" \
    --thing-type-name "LightBulb" \
    --attribute-payload "{"attributes": {"wattage":"75", "model":"123"}}"
```

This command does not produce output. Use the `describe-thing` command to see the result.

For more information, see Thing Types in the *AWS IoT Developers Guide*.

- For API details, see UpdateThing in *AWS CLI Command Reference*.

`update-topic-rule-destination`

The following code example shows how to use `update-topic-rule-destination`.

AWS CLI

Example 1: To enable a topic rule destination

The following `update-topic-rule-destination` example enables traffic to a topic rule destination.

```
aws iot update-topic-rule-destination \
    --arn "arn:aws:iot:us-west-2:123456789012:ruledestination/http/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE" \
    --status ENABLED
```

This command produces no output.

For more information, see Enabling a topic rule destination in the *AWS IoT Developer Guide*.

Example 2: To disable a topic rule destination

The following `update-topic-rule-destination` example disables traffic to a topic rule destination.

```
aws iot update-topic-rule-destination \
    --arn "arn:aws:iot:us-west-2:123456789012:ruledestination/http/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE" \
    --status DISABLED
```

This command produces no output.

For more information, see [Disabling a topic rule destination]() in the *AWS IoT Developer Guide*.

Example 3: To send a new confirmation message

The following `update-topic-rule-destination` example sends a new confirmation message for a topic rule destination.

```
aws iot update-topic-rule-destination \
    --arn "arn:aws:iot:us-west-2:123456789012:ruledestination/http/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE" \
    --status IN_PROGRESS
```

This command produces no output.

For more information, see [Sending a new confirmation message]() in the *AWS IoT Developer Guide*.

- For API details, see [UpdateTopicRuleDestination]() in *AWS CLI Command Reference*.

`validate-security-profile-behaviors`

The following code example shows how to use `validate-security-profile-behaviors`.

AWS CLI

Example 1: To validate the behaviors parameters for a security profile

The following `validate-security-profile-behaviors` example validates a well-formed and correct set of behaviors for an AWS IoT Device Defender security profile.

```
aws iot validate-security-profile-behaviors \
    --behaviors "[{\"name\":\"CellularBandwidth\",\"metric\":\"aws:message-byte-size
\",\"criteria\":{\"comparisonOperator\":\"greater-than\",\"value\":{\"count\":128},
\"consecutiveDatapointsToAlarm\":1,\"consecutiveDatapointsToClear\":1}},{\"name
\":\"Authorization\",\"metric\":\"aws:num-authorization-failures\",\"criteria\":
{\"comparisonOperator\":\"greater-than\",\"value\":{\"count\":12},\"durationSeconds
\":300,\"consecutiveDatapointsToAlarm\":1,\"consecutiveDatapointsToClear\":1}}]"
```

Output:

```
{
```

```
    "valid": true,
    "validationErrors": []
}
```

Example 2: To validate incorrect behaviors parameters for a security profile

The following `validate-security-profile-behaviors` example validates a set of behaviors that contains an error for an AWS IoT Device Defender security profile.

```
aws iot validate-security-profile-behaviors \
    --behaviors "[{\"name\":\"CellularBandwidth\",\"metric\":\"aws:message-byte-size
\",\"criteria\":{\"comparisonOperator\":\"greater-than\",\"value\":{\"count\":128},
\"consecutiveDatapointsToAlarm\":1,\"consecutiveDatapointsToClear\":1}},{\"name
\":\"Authorization\",\"metric\":\"aws:num-authorization-failures\",\"criteria\":
{\"comparisonOperator\":\"greater-than\",\"value\":{\"count\":12},\"durationSeconds
\":300,\"consecutiveDatapointsToAlarm\":100000,\"consecutiveDatapointsToClear
\":1}}]"
```

Output:

```
{
    "valid": false,
    "validationErrors": [
        {
            "errorMessage": "Behavior Authorization is malformed.
 consecutiveDatapointsToAlarm 100000 should be in range[1,10]"
        }
    ]
}
```

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see ValidateSecurityProfileBehaviors in *AWS CLI Command Reference*.

Device Advisor examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Device Advisor.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-suite-definition`

The following code example shows how to use `create-suite-definition`.

AWS CLI

Example 1: To create an IoT Device Advisor test suite

The following `create-suite-definition` example creates a device advisor test suite in the AWS IoT with the specified suite definition configuration.

```
aws iotdeviceadvisor create-suite-definition \
    --suite-definition-configuration '{ \
        "suiteDefinitionName": "TestSuiteName", \
        "devices": [{"thingArn":"arn:aws:iot:us-east-1:123456789012:thing/
MyIotThing"}], \
        "intendedForQualification": false, \
        "rootGroup": "{\"configuration\":{},\"tests\":[{\"name\":\"MQTT Connect\",
\"configuration\":{\"EXECUTION_TIMEOUT\":120},\"tests\":[{\"name\":\"MQTT_Connect\",
\"configuration\":{},\"test\":{\"id\":\"MQTT_Connect\",\"testCase\":null,\"version
\":\"0.0.0\"}}]}]}", \
        "devicePermissionRoleArn": "arn:aws:iam::123456789012:role/Myrole"}'
```

Output:

```
{
    "suiteDefinitionId": "0jtsgio7yenu",
    "suiteDefinitionArn": "arn:aws:iotdeviceadvisor:us-
east-1:123456789012:suitedefinition/0jtsgio7yenu",
    "suiteDefinitionName": "TestSuiteName",
    "createdAt": "2022-12-02T11:38:13.263000-05:00"
}
```

For more information, see Create a test suite definition in the *AWS IoT Core Developer Guide*.

Example 2: To create an IoT Device Advisor Latest Qualification test suite

The following `create-suite-definition` example creates a device advisor qualification test suite with the latest version in the AWS IoT with the specified suite definition configuration.

```
aws iotdeviceadvisor create-suite-definition \
    --suite-definition-configuration '{ \
        "suiteDefinitionName": "TestSuiteName", \
        "devices": [{"thingArn":"arn:aws:iot:us-east-1:123456789012:thing/
MyIotThing"}], \
        "intendedForQualification": true, \
        "rootGroup": "", \
        "devicePermissionRoleArn": "arn:aws:iam::123456789012:role/Myrole"}'
```

Output:

```
{
    "suiteDefinitionId": "txgsuolk2myj",
    "suiteDefinitionArn": "arn:aws:iotdeviceadvisor:us-
east-1:123456789012:suitedefinition/txgsuolk2myj",
    "suiteDefinitionName": "TestSuiteName",
    "createdAt": "2022-12-02T11:38:13.263000-05:00"
}
```

For more information, see Create a test suite definition in the *AWS IoT Core Developer Guide*.

- For API details, see CreateSuiteDefinition in *AWS CLI Command Reference*.

`delete-suite-definition`

The following code example shows how to use `delete-suite-definition`.

AWS CLI

To delete the IoT Device Advisor test suite

The following `delete-suite-definition` example deletes the device advisor test suite with the specified suite definition ID.

```
aws iotdeviceadvisor delete-suite-definition \
```

```
    --suite-definition-id 0jtsgio7yenu
```

This command produces no output.

For more information, see DeleteSuiteDefinition in the *AWS IoT API Reference*.

- For API details, see DeleteSuiteDefinition in *AWS CLI Command Reference*.

get-endpoint

The following code example shows how to use `get-endpoint`.

AWS CLI

Example 1: To get the information about an IoT Device Advisor Account-level endpoint

The following `get-endpoint` example gets the information about a device advisor Account-level test endpoint.

```
aws iotdeviceadvisor get-endpoint
```

Output:

```
{
    "endpoint": "t6y4c143x9sfo.deviceadvisor.iot.us-east-1.amazonaws.com"
}
```

Example 2: To get the information about an IoT Device Advisor Device-level endpoint

The following `get-endpoint` example gets the information about a device advisor device-level test endpoint with the specified thing-arn or certificate-arn.

```
aws iotdeviceadvisor get-endpoint \
    --thing-arn arn:aws:iot:us-east-1:123456789012:thing/MyIotThing
```

Output:

```
{
    "endpoint": "tdb7719be5t6y4c143x9sfo.deviceadvisor.iot.us-east-1.amazonaws.com"
}
```

For more information, see Get a test endpoint in the *AWS IoT Core Developer Guide*.

- For API details, see GetEndpoint in *AWS CLI Command Reference*.

`get-suite-definition`

The following code example shows how to use `get-suite-definition`.

AWS CLI

To get the information about an IoT Device Advisor test suite

The following `get-suite-definition` example get the information about a aevice advisor test suite with the specified suite definition ID.

```
aws iotdeviceadvisor get-suite-definition \
    --suite-definition-id qqcsmtyyjabl
```

Output:

```
{
    "suiteDefinitionId": "qqcsmtyyjabl",
    "suiteDefinitionArn": "arn:aws:iotdeviceadvisor:us-
east-1:123456789012:suitedefinition/qqcsmtyyjabl",
    "suiteDefinitionVersion": "v1",
    "latestVersion": "v1",
    "suiteDefinitionConfiguration": {
        "suiteDefinitionName": "MQTT connection",
        "devices": [],
        "intendedForQualification": false,
        "isLongDurationTest": false,
        "rootGroup": "{\"configuration\":{},\"tests\":[{\"id\":\"uta5d9j1kvwc\",
\"name\":\"Test group 1\",\"configuration\":{},\"tests\":[{\"id\":\"awr8pq5vc9yp\",
\"name\":\"MQTT Connect\",\"configuration\":{},\"test\":{\"id\":\"MQTT_Connect\",
\"testCase\":null,\"version\":\"0.0.0\"}}]}]}",
        "devicePermissionRoleArn": "arn:aws:iam::123456789012:role/Myrole",
        "protocol": "MqttV3_1_1"
    },
    "createdAt": "2022-11-11T22:28:52.389000-05:00",
    "lastModifiedAt": "2022-11-11T22:28:52.389000-05:00",
    "tags": {}
}
```

For more information, see Get a test suite definition in the *AWS IoT Core Developer Guide*.

- For API details, see GetSuiteDefinition in *AWS CLI Command Reference*.

`get-suite-run-report`

The following code example shows how to use `get-suite-run-report`.

AWS CLI

To get the information about an IoT Device Advisor qualifying test suite run report

The following `get-suite-run-report` example gets the report download link for a successful device advisor qualifying test suite run with the specified suite definition ID and suite run ID.

```
aws iotdeviceadvisor get-suite-run-report \
    --suite-definition-id ztvb5aek4w4x \
    --suite-run-id p6awv83nre6v
```

Output:

```
{
    "qualificationReportDownloadUrl": "https://senate-apn-reports-us-east-1-
prod.s3.amazonaws.com/report.downloadlink"
}
```

For more information, see Get a qualification report for a successful qualification test suite run in the *AWS IoT Core Developer Guide*.

- For API details, see GetSuiteRunReport in *AWS CLI Command Reference*.

`get-suite-run`

The following code example shows how to use `get-suite-run`.

AWS CLI

To get the information about an IoT Device Advisor test suite run status

The following `get-suite-run` example gets the information about a device advisor test suite run status with the specified suite definition ID and suite run ID.

```
aws iotdeviceadvisor get-suite-run \
    --suite-definition-id qqcsmtyyjabl \
    --suite-run-id nzlfyhaa18oa
```

Output:

```
{
    "suiteDefinitionId": "qqcsmtyyjabl",
    "suiteDefinitionVersion": "v1",
    "suiteRunId": "nzlfyhaa18oa",
    "suiteRunArn": "arn:aws:iotdeviceadvisor:us-east-1:123456789012:suiterun/
qqcsmtyyjabl/nzlfyhaa18oa",
    "suiteRunConfiguration": {
        "primaryDevice": {
            "thingArn": "arn:aws:iot:us-east-1:123456789012:thing/MyIotThing",
            "certificateArn": "arn:aws:iot:us-east-1:123456789012:cert/certFile"
        },
        "parallelRun": false
    },
    "testResult": {
        "groups": [
            {
                "groupId": "uta5d9j1kvwc",
                "groupName": "Test group 1",
                "tests": [
                    {
                        "testCaseRunId": "2ve2twrqyr0s",
                        "testCaseDefinitionId": "awr8pq5vc9yp",
                        "testCaseDefinitionName": "MQTT Connect",
                        "status": "PASS",
                        "startTime": "2022-11-12T00:01:53.693000-05:00",
                        "endTime": "2022-11-12T00:02:15.443000-05:00",
                        "logUrl": "https://console.aws.amazon.com/
cloudwatch/home?region=us-east-1#logEventViewer:group=/aws/iot/deviceadvisor/
qqcsmtyyjabl;stream=nzlfyhaa18oa_2ve2twrqyr0s",
                        "warnings": "null",
                        "failure": "null"
                    }
                ]
            }
        ]
    },
    "startTime": "2022-11-12T00:01:52.673000-05:00",
```

```
    "endTime": "2022-11-12T00:02:16.496000-05:00",
    "status": "PASS",
    "tags": {}
}
```

For more information, see Get a test suite run in the *AWS IoT Core Developer Guide*.

- For API details, see GetSuiteRun in *AWS CLI Command Reference*.

`list-suite-definitions`

The following code example shows how to use `list-suite-definitions`.

AWS CLI

Example 1: To list the IoT Device Advisor test suites you created

The following `list-suite-definitions` example lists up to 25 device advisor test suites you created in AWS IoT. If you have more than 25 test suites, the "nextToken" will be shown in the output. You can use this "nextToken" to show the rest of the test suites you created.

```
aws iotdeviceadvisor list-suite-definitions
```

Output:

```
{
    "suiteDefinitionInformationList": [
        {
            "suiteDefinitionId": "3hsn88h4p2g5",
            "suiteDefinitionName": "TestSuite1",
            "defaultDevices": [
                {
                    "thingArn": "arn:aws:iot:us-east-1:123456789012:thing/
MyIotThing"
                }
            ],
            "intendedForQualification": false,
            "isLongDurationTest": false,
            "protocol": "MqttV3_1_1",
            "createdAt": "2022-11-17T14:15:56.830000-05:00"
        },
        {
```

```
            ......
        }
    ],
    "nextToken": "nextTokenValue"
}
```

Example 2: To list the IoT Device Advisor test suites you created with the specified settings

The following `list-suite-definitions` example lists device advisor test suites you created in AWS IoT with the specified max-result number. If you have more test suites than the max number, the "nextToken" will be shown in the output. If you have "nextToken", you can use "nextToken" to show the test suites you created that weren't shown before.

```
aws iotdeviceadvisor list-suite-definitions \
    --max-result 1 \
    --next-token "nextTokenValue"
```

Output:

```
{
    "suiteDefinitionInformationList": [
        {
            "suiteDefinitionId": "ztvb5aew4w4x",
            "suiteDefinitionName": "TestSuite2",
            "defaultDevices": [],
            "intendedForQualification": true,
            "isLongDurationTest": false,
            "protocol": "MqttV3_1_1",
            "createdAt": "2022-11-17T14:15:56.830000-05:00"
        }
    ],
    "nextToken": "nextTokenValue"
}
```

For more information, see ListSuiteDefinitions in the *AWS IoT API Reference*.

- For API details, see ListSuiteDefinitions in *AWS CLI Command Reference*.

`list-suite-runs`

The following code example shows how to use `list-suite-runs`.

AWS CLI

Example 1: To list all information about the specified IoT Device Advisor test suite runs status

The following `list-suite-runs` example lists all information about a device advisor test suite runs status with the specified suite definition ID. If you have more than 25 test suite runs, the "nextToken" will be shown in the output. You can use this "nextToken" to show the rest of the test suite runs.

```
aws iotdeviceadvisor list-suite-runs \
    --suite-definition-id ztvb5aew4w4x
```

Output:

```
{
    "suiteRunsList": [
        {
            "suiteDefinitionId": "ztvb5aew4w4x",
            "suiteDefinitionVersion": "v1",
            "suiteDefinitionName": "TestSuite",
            "suiteRunId": "p6awv89nre6v",
            "createdAt": "2022-12-01T16:33:14.212000-05:00",
            "startedAt": "2022-12-01T16:33:15.710000-05:00",
            "endAt": "2022-12-01T16:42:03.323000-05:00",
            "status": "PASS",
            "passed": 6,
            "failed": 0
        }
    ]
}
```

Example 2: To list information about the specified IoT Device Advisor test suite runs status with the specified settings

The following `list-suite-runs` example lists information about a device advisor test suite runs status with the specified suite definition ID and the specified max-result number. If you have more test suite runs than the max number, the "nextToken" will be shown in the output. If you have "nextToken", you can use "nextToken" to show the test suite runs that weren't shown before.

```
aws iotdeviceadvisor list-suite-runs \
    --suite-definition-id qqcsmtyyjaml \
    --max-result 1 \
    --next-token "nextTokenValue"
```

Output:

```
{
    "suiteRunsList": [
        {
            "suiteDefinitionId": "qqcsmtyyjaml",
            "suiteDefinitionVersion": "v1",
            "suiteDefinitionName": "MQTT connection",
            "suiteRunId": "gz9vm2s6d2jy",
            "createdAt": "2022-12-01T20:10:27.079000-05:00",
            "startedAt": "2022-12-01T20:10:28.003000-05:00",
            "endAt": "2022-12-01T20:10:45.084000-05:00",
            "status": "STOPPED",
            "passed": 0,
            "failed": 0
        }
    ],
    "nextToken": "nextTokenValue"
}
```

For more information, see ListSuiteRuns in the *AWS IoT API Reference*.

- For API details, see ListSuiteRuns in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags attached to an IoT Device Advisor resource

The following `list-tags-for-resource` example lists the tags attached to a device advisor resource. The device advisor resource can be a Suitedefinition-Arn or a Suiterun-Arn.

```
aws iotdeviceadvisor list-tags-for-resource \
```

```
    --resource-arn arn:aws:iotdeviceadvisor:us-east-1:123456789012:suitedefinition/
ba0uyjpg38ny
```

Output:

```
{
    "tags": {
        "TestTagKey": "TestTagValue"
    }
}
```

For more information, see ListTagsForResource in the *AWS IoT API Reference* and Resource types defined by AWS IoT Core Device Advisor in the *Service Authorization Reference*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`start-suite-run`

The following code example shows how to use `start-suite-run`.

AWS CLI

To start an IoT Device Advisor test suite run

The following `start-suite-run` example lists the available widgets in your AWS account.

```
aws iotdeviceadvisor start-suite-run \
    --suite-definition-id qqcsmtyyjabl \
    --suite-definition-version v1 \
    --suite-run-configuration '{"primaryDevice":{"thingArn": "arn:aws:iot:us-
east-1:123456789012:thing/MyIotThing","certificateArn":"arn:aws:iot:us-
east-1:123456789012:cert/certFile"}}'
```

Output:

```
{
    "suiteRunId": "pwmucgw7lt9s",
    "suiteRunArn": "arn:aws:iotdeviceadvisor:us-east-1:123456789012:suiterun/
qqcsmtyyjabl/pwmucgw7lk9s",
    "createdAt": "2022-12-02T15:43:05.581000-05:00"
}
```

For more information, see Start a test suite run in the *AWS IoT Core Developer Guide*.

- For API details, see StartSuiteRun in *AWS CLI Command Reference*.

`stop-suite-run`

The following code example shows how to use `stop-suite-run`.

AWS CLI

To stop an IoT Device Advisor test suite that is currently running

The following `stop-suite-run` example stops a device advisor test suite that is currently running with the specified suite definition ID and suite run ID.

```
aws iotdeviceadvisor stop-suite-run \
    --suite-definition-id qqcsmtyyjabl \
    --suite-run-id nzlfyhaa18oa
```

This command produces no output.

For more information, see Stop a test suite run in the *AWS IoT Core Developer Guide*.

- For API details, see StopSuiteRun in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add to and modify the existing tags of an IoT Device Advisor resource

The following `tag-resource` example adds to and modifies the existing tags of a device advisor resource with the specified resource arn and tags. The device advisor resource can be a Suitedefinition-Arn or a Suiterun-Arn.

```
aws iotdeviceadvisor tag-resource \
    --resource-arn arn:aws:iotdeviceadvisor:us-east-1:123456789012:suitedefinition/
ba0uyjpg38ny \
    --tags '{"TagKey": "TagValue"}'
```

This command produces no output.

For more information, see TagResource in the *AWS IoT API Reference* and Resource types defined by AWS IoT Core Device Advisor in the *Service Authorization Reference*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove the existing tags from an IoT Device Advisor resource

The following `untag-resource` example removes the existing tags from a device advisor resource with the specified resource arn and tag key. The device advisor resource can be a Suitedefinition-Arn or a Suiterun-Arn.

```
aws iotdeviceadvisor untag-resource \
    --resource-arn arn:aws:iotdeviceadvisor:us-east-1:123456789012:suitedefinition/
ba0uyjpg38ny \
    --tag-keys "TagKey"
```

This command produces no output.

For more information, see UntagResource in the *AWS IoT API Reference* and Resource types defined by AWS IoT Core Device Advisor in the *Service Authorization Reference*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-suite-definition`

The following code example shows how to use `update-suite-definition`.

AWS CLI

Example 1: To update an IoT Device Advisor test suite

The following `update-suite-definition` example updates a device advisor test suite in the AWS IoT with the specified suite definition ID and suite definition configuration.

```
aws iotdeviceadvisor update-suite-definition \
    --suite-definition-id 3hsn88h4p2g5 \
    --suite-definition-configuration '{ \
        "suiteDefinitionName": "TestSuiteName", \
        "devices": [{"thingArn":"arn:aws:iot:us-east-1:123456789012:thing/
MyIotThing"}], \
        "intendedForQualification": false, \
        "rootGroup": "{\"configuration\":{},\"tests\":[{\"name\":\"MQTT Connect\",
\"configuration\":{\"EXECUTION_TIMEOUT\":120},\"tests\":[{\"name\":\"MQTT_Connect\",
\"configuration\":{},\"test\":{\"id\":\"MQTT_Connect\",\"testCase\":null,\"version
\":\"0.0.0\"}}]}]}", \
        "devicePermissionRoleArn": "arn:aws:iam::123456789012:role/Myrole"}'
```

Output:

```
{
    "suiteDefinitionId": "3hsn88h4p2g5",
    "suiteDefinitionName": "TestSuiteName",
    "suiteDefinitionVersion": "v3",
    "createdAt": "2022-11-17T14:15:56.830000-05:00",
    "lastUpdatedAt": "2022-12-02T16:02:45.857000-05:00"
}
```

Example 2: To update an IoT Device Advisor Qualification test suite

The following `update-suite-definition` example updates a device advisor qualification test suite in the AWS IoT with the specified suite definition ID and suite definition configuration.

```
aws iotdeviceadvisor update-suite-definition \
    --suite-definition-id txgsuolk2myj \
    --suite-definition-configuration '{
        "suiteDefinitionName": "TestSuiteName", \
        "devices": [{"thingArn":"arn:aws:iot:us-east-1:123456789012:thing/
MyIotThing"}], \
        "intendedForQualification": true, \
        "rootGroup": "", \
        "devicePermissionRoleArn": "arn:aws:iam::123456789012:role/Myrole"}'
```

Output:

```
{
```

```
    "suiteDefinitionId": "txgsuolk2myj",
    "suiteDefinitionName": "TestSuiteName",
    "suiteDefinitionVersion": "v3",
    "createdAt": "2022-11-17T14:15:56.830000-05:00",
    "lastUpdatedAt": "2022-12-02T16:02:45.857000-05:00"
}
```

For more information, see UpdateSuiteDefinition in the *AWS IoT API Reference*.

- For API details, see UpdateSuiteDefinition in *AWS CLI Command Reference*.

AWS IoT data examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT data.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`delete-thing-shadow`

The following code example shows how to use `delete-thing-shadow`.

AWS CLI

To delete a device's shadow document

The following `delete-thing-shadow` example deletes the entire shadow document for the device named `MyRPi`.

```
aws iot-data delete-thing-shadow \
    --thing-name MyRPi \
```

```
    "output.txt"
```

The command produces no output on the display, but `output.txt` contains information that confirms the version and timestamp of the shadow document that you deleted.

```
{"version":2,"timestamp":1560270384}
```

For more information, see Using Shadows in the *AWS IoT Developers Guide*.

- For API details, see DeleteThingShadow in *AWS CLI Command Reference*.

get-thing-shadow

The following code example shows how to use `get-thing-shadow`.

AWS CLI

To get a thing shadow document

The following `get-thing-shadow` example gets the thing shadow document for the specified IoT thing.

```
aws iot-data get-thing-shadow \
    --thing-name MyRPi \
    output.txt
```

The command produces no output on the display, but the following shows the contents of `output.txt`:

```
{
  "state":{
    "reported":{
    "moisture":"low"
    }
  },
  "metadata":{
    "reported":{
      "moisture":{
        "timestamp":1560269319
      }
    }
```

```
  },
  "version":1,"timestamp":1560269405
}
```

For more information, see [Device Shadow Service Data Flow](#) in the *AWS IoT Developers Guide*.

- For API details, see [GetThingShadow](#) in *AWS CLI Command Reference*.

`update-thing-shadow`

The following code example shows how to use `update-thing-shadow`.

AWS CLI

To update a thing shadow

The following `update-thing-shadow` example modifies the current state of the device shadow for the specified thing and saves it to the file `output.txt`.

```
aws iot-data update-thing-shadow \
    --thing-name MyRPi \
    --payload "{"state":{"reported":{"moisture":"okay"}}}" \
    "output.txt"
```

The command produces no output on the display, but the following shows the contents of `output.txt`:

```
{
    "state": {
        "reported": {
            "moisture": "okay"
        }
    },
    "metadata": {
        "reported": {
            "moisture": {
                "timestamp": 1560270036
            }
        }
    },
    "version": 2,
    "timestamp": 1560270036
```

```
}
```

For more information, see Device Shadow Service Data Flow in the *AWS IoT Developers Guide*.

- For API details, see UpdateThingShadow in *AWS CLI Command Reference*.

AWS IoT Events examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Events.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`batch-put-message`

The following code example shows how to use `batch-put-message`.

AWS CLI

To send messages (inputs) to AWS IoT Events

The following `batch-put-message` example sends a set of messages to the AWS IoT Events system. Each message payload is transformed into the input you specify (`inputName`) and ingested into any detectors that monitor that input. If multiple messages are sent, the order in which the messages are processed isn't guaranteed. To guarantee ordering, you must send messages one at a time and wait for a successful response.

```
aws iotevents-data batch-put-message \
    --cli-input-json file://highPressureMessage.json
```

Contents of `highPressureMessage.json`:

```
{
    "messages": [
        {
            "messageId": "00001",
            "inputName": "PressureInput",
            "payload": "{\"motorid\": \"Fulton-A32\", \"sensorData\": {\"pressure\":
 80, \"temperature\": 39} }"
        }
    ]
}
```

Output:

```
{
    "BatchPutMessageErrorEntries": []
}
```

For more information, see BatchPutMessage in the *AWS IoT Events API Reference*.

- For API details, see BatchPutMessage in *AWS CLI Command Reference*.

`batch-update-detector`

The following code example shows how to use `batch-update-detector`.

AWS CLI

To update a detector (instance)

The following `batch-update-detector` example updates the state, variable values, and timer settings of one or more detectors (instances) of a specified detector model.

```
aws iotevents-data batch-update-detector \
    --cli-input-json file://budFulton-A32.json
```

Contents of `budFulton-A32.json`:

```
{
    "detectors": [
        {
```

```
                "messageId": "00001",
                "detectorModelName": "motorDetectorModel",
                "keyValue": "Fulton-A32",
                "state": {
                    "stateName": "Normal",
                    "variables": [
                        {
                            "name": "pressureThresholdBreached",
                            "value": "0"
                        }
                    ],
                    "timers": [
                    ]
                }
            }
        ]
}
```

Output:

```
{
    "batchUpdateDetectorErrorEntries": []
}
```

For more information, see BatchUpdateDetector in the *AWS IoT Events API Reference*.

- For API details, see BatchUpdateDetector in *AWS CLI Command Reference*.

`create-detector-model`

The following code example shows how to use `create-detector-model`.

AWS CLI

To create a detector model

The following `create-detector-model` example creates a detector model with its configuration specified by a parameter file.

```
aws iotevents create-detector-model  \
    --cli-input-json file://motorDetectorModel.json
```

Contents of `motorDetectorModel.json`:

```
{
    "detectorModelName": "motorDetectorModel",
    "detectorModelDefinition": {
        "states": [
            {
                "stateName": "Normal",
                "onEnter": {
                    "events": [
                        {
                            "eventName": "init",
                            "condition": "true",
                            "actions": [
                                {
                                    "setVariable": {
                                        "variableName": "pressureThresholdBreached",
                                        "value": "0"
                                    }
                                }
                            ]
                        }
                    ]
                },
                "onInput": {
                    "transitionEvents": [
                        {
                            "eventName": "Overpressurized",
                            "condition": "$input.PressureInput.sensorData.pressure
 &gt; 70",
                            "actions": [
                                {
                                    "setVariable": {
                                        "variableName": "pressureThresholdBreached",
                                        "value":
 "$variable.pressureThresholdBreached + 3"
                                    }
                                }
                            ],
                            "nextState": "Dangerous"
                        }
                    ]
                }
            },
```

```
            {
                "stateName": "Dangerous",
                "onEnter": {
                    "events": [
                        {
                            "eventName": "Pressure Threshold Breached",
                            "condition": "$variable.pressureThresholdBreached &gt;
 1",
                            "actions": [
                                {
                                    "sns": {

 &lt;= 70 &amp;&amp; $variable.pressureThresholdBreached &lt;= 1",
                            "nextState": "Normal"
                        }
                    ]
                },
                "onExit": {
                    "events": [
                        {
                            "eventName": "Normal Pressure Restored",
                            "condition": "true",
                            "actions": [
                                {
                                    "sns": {
                                        "targetArn": "arn:aws:sns:us-
east-1:123456789012:pressureClearedAction"
                                    }
                                }
                            ]
                        }
                    ]
                }
            }
        ],
        "initialStateName": "Normal"
    },
    "key": "motorid",
    "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole"
}
```

Output:

```
{
    "detectorModelConfiguration": {
        "status": "ACTIVATING",
```

```
        "lastUpdateTime": 1560796816.077,
        "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
        "creationTime": 1560796816.077,
        "detectorModelArn": "arn:aws:iotevents:us-west-2:123456789012:detectorModel/
motorDetectorModel",
        "key": "motorid",
        "detectorModelName": "motorDetectorModel",
        "detectorModelVersion": "1"
    }
}
```

For more information, see CreateDetectorModel in the *AWS IoT Events API Reference*.

- For API details, see CreateDetectorModel in *AWS CLI Command Reference*.

`create-input`

The following code example shows how to use `create-input`.

AWS CLI

To create an input

The following `create-input` example creates an input.

```
aws iotevents create-input  \
    --cli-input-json file://pressureInput.json
```

Contents of `pressureInput.json`:

```
{
    "inputName": "PressureInput",
    "inputDescription": "Pressure readings from a motor",
    "inputDefinition": {
        "attributes": [
            { "jsonPath": "sensorData.pressure" },
            { "jsonPath": "motorid" }
        ]
    }
}
```

Output:

```
{
    "inputConfiguration": {
        "status": "ACTIVE",
        "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
        "lastUpdateTime": 1560795312.542,
        "creationTime": 1560795312.542,
        "inputName": "PressureInput",
        "inputDescription": "Pressure readings from a motor"
    }
}
```

For more information, see CreateInput in the *AWS IoT Events API Reference*.

- For API details, see CreateInput in *AWS CLI Command Reference*.

`delete-detector-model`

The following code example shows how to use `delete-detector-model`.

AWS CLI

To delete a detector model

The following `delete-detector-model` example deletes the specified detector model. Any active instances of the detector model are also deleted.

```
aws iotevents delete-detector-model \
    --detector-model-name motorDetectorModel
```

This command produces no output.

For more information, see DeleteDetectorModel in the *AWS IoT Events API Reference*.

- For API details, see DeleteDetectorModel in *AWS CLI Command Reference*.

`delete-input`

The following code example shows how to use `delete-input`.

AWS CLI

To delete an input

The following `delete-input` example deletes the specified input.

```
aws iotevents delete-input \
    --input-name PressureInput
```

This command produces no output.

For more information, see [DeleteInput](#) in the *AWS IoT Events API Reference*.

- For API details, see [DeleteInput](#) in *AWS CLI Command Reference*.

`describe-detector-model`

The following code example shows how to use `describe-detector-model`.

AWS CLI

To get information about a detector model

The following `describe-detector-model` example displays details for the specified detector model. Because the `version` parameter is not specified, information about the latest version is returned.

```
aws iotevents describe-detector-model \
    --detector-model-name motorDetectorModel
```

Output:

```
{
    "detectorModel": {
        "detectorModelConfiguration": {
            "status": "ACTIVE",
            "lastUpdateTime": 1560796816.077,
            "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
            "creationTime": 1560796816.077,
            "detectorModelArn": "arn:aws:iotevents:us-
west-2:123456789012:detectorModel/motorDetectorModel",
            "key": "motorid",
            "detectorModelName": "motorDetectorModel",
            "detectorModelVersion": "1"
        },
        "detectorModelDefinition": {
            "states": [
```

```
                {
                    "onInput": {
                        "transitionEvents": [
                            {

                                    }
                                ],
                                "condition": "true"
                            }
                        ]
                    }
                }
            ],
            "initialStateName": "Normal"
        }
    }
}
```

For more information, see DescribeDetectorModel in the *AWS IoT Events API Reference*.

- For API details, see DescribeDetectorModel in *AWS CLI Command Reference*.

`describe-detector`

The following code example shows how to use `describe-detector`.

AWS CLI

To get information about a detector (instance).

The following `describe-detector` example displays details for the specified detector (instance).

```
aws iotevents-data describe-detector \
    --detector-model-name motorDetectorModel \
    --key-value "Fulton-A32"
```

Output:

```
{
    "detector": {
        "lastUpdateTime": 1560797852.776,
        "creationTime": 1560797852.775,
        "state": {
            "variables": [
                {
                    "name": "pressureThresholdBreached",
                    "value": "3"
                }
            ],
            "stateName": "Dangerous",
            "timers": []
        },
        "keyValue": "Fulton-A32",
        "detectorModelName": "motorDetectorModel",
        "detectorModelVersion": "1"
    }
}
```

For more information, see DescribeDetector in the *AWS IoT Events API Reference*.

- For API details, see DescribeDetector in *AWS CLI Command Reference*.

`describe-input`

The following code example shows how to use `describe-input`.

AWS CLI

To get information about an input

The following `describe-input` example displays details for the specified input.

```
aws iotevents describe-input \
    --input-name PressureInput
```

Output:

```
{
    "input": {
        "inputConfiguration": {
            "status": "ACTIVE",
            "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/
PressureInput",
            "lastUpdateTime": 1560795312.542,
            "creationTime": 1560795312.542,
            "inputName": "PressureInput",
            "inputDescription": "Pressure readings from a motor"
        },
        "inputDefinition": {
            "attributes": [
                {
                    "jsonPath": "sensorData.pressure"
                },
                {
                    "jsonPath": "motorid"
                }
            ]
        }
    }
}
```

For more information, see DescribeInput in the *AWS IoT Events API Reference*.

- For API details, see DescribeInput in *AWS CLI Command Reference*.

`describe-logging-options`

The following code example shows how to use `describe-logging-options`.

AWS CLI

To get information about logging settings

The following `describe-logging-options` example retrieves the current settings of the AWS IoT Events logging options.

```
aws iotevents describe-logging-options
```

Output:

```
{
    "loggingOptions": {
        "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
        "enabled": false,
        "level": "ERROR"
    }
}
```

For more information, see DescribeLoggingOptions in the *AWS IoT Events API Reference*.

- For API details, see DescribeLoggingOptions in *AWS CLI Command Reference*.

`list-detector-model-versions`

The following code example shows how to use `list-detector-model-versions`.

AWS CLI

To get information about versions of a detector model

The following `list-detector-model-versions` example Lists all the versions of a detector model. Only the metadata associated with each detector model version is returned.

```
aws iotevents list-detector-model-versions \
    --detector-model-name motorDetectorModel
```

Output:

```
{
    "detectorModelVersionSummaries": [
        {
            "status": "ACTIVE",
            "lastUpdateTime": 1560796816.077,
            "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
            "creationTime": 1560796816.077,
            "detectorModelArn": "arn:aws:iotevents:us-
west-2:123456789012:detectorModel/motorDetectorModel",
            "detectorModelName": "motorDetectorModel",
            "detectorModelVersion": "1"
        }
    ]
}
```

For more information, see ListDetectorModelVersions in the *AWS IoT Events API Reference*.

- For API details, see ListDetectorModelVersions in *AWS CLI Command Reference*.

`list-detector-models`

The following code example shows how to use `list-detector-models`.

AWS CLI

To get a list of your detector models

The following `list-detector-models` example Lists the detector models you have created. Only the metadata associated with each detector model is returned.

```
aws iotevents list-detector-models
```

Output:

```
{
    "detectorModelSummaries": [
        {
            "detectorModelName": "motorDetectorModel",
            "creationTime": 1552072424.212
            "detectorModelDescription": "Detect overpressure in a motor."
```

```
        }
    ]
}
```

For more information, see ListDetectorModels in the *AWS IoT Events API Reference*.

- For API details, see ListDetectorModels in *AWS CLI Command Reference*.

`list-detectors`

The following code example shows how to use `list-detectors`.

AWS CLI

To get a list of detectors for a detector model

The following `list-detectors` example lists the detectors (the instances of a detector model) in your account.

```
aws iotevents-data list-detectors \
    --detector-model-name motorDetectorModel
```

Output:

```
{
    "detectorSummaries": [
        {
            "lastUpdateTime": 1558129925.2,
            "creationTime": 1552073155.527,
            "state": {
                "stateName": "Normal"
            },
            "keyValue": "Fulton-A32",
            "detectorModelName": "motorDetectorModel",
            "detectorModelVersion": "1"
        }
    ]
}
```

For more information, see ListDetectors in the *AWS IoT Events API Reference*.

- For API details, see ListDetectors in *AWS CLI Command Reference*.

`list-inputs`

The following code example shows how to use `list-inputs`.

AWS CLI

To list inputs

The following `list-inputs` example lists the inputs you have created in your account.

```
aws iotevents list-inputs
```

This command produces no output. Output:

```
{
    {
        "status": "ACTIVE",
        "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
        "lastUpdateTime": 1551742986.768,
        "creationTime": 1551742986.768,
        "inputName": "PressureInput",
        "inputDescription": "Pressure readings from a motor"
    }
}
```

For more information, see ListInputs in the *AWS IoT Events API Reference*.

- For API details, see ListInputs in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags assigned to a resource.

The following `list-tags-for-resource` example lists the tag key names and values you have assigned to the resource.

```
aws iotevents list-tags-for-resource \
```

```
    --resource-arn "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput"
```

Output:

```
{
    "tags": [
        {
            "value": "motor",
            "key": "deviceType"
        }
    ]
}
```

For more information, see ListTagsForResource in the *AWS IoT Events API Reference*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

put-logging-options

The following code example shows how to use `put-logging-options`.

AWS CLI

To set logging options

The following `put-logging-options` example sets or updates the AWS IoT Events logging options. If you update the value of any `loggingOptions` field, it can take up to one minute for the change to take effect. Also, if you change the policy attached to the role you specified in the ``roleArn` field (for example, to correct an invalid policy) it can take up to five minutes for that change to take effect.

```
aws iotevents put-logging-options \
    --cli-input-json file://logging-options.json
```

Contents of `logging-options.json`:

```
{
    "loggingOptions": {
        "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
        "level": "DEBUG",
```

```
        "enabled": true,
        "detectorDebugOptions": [
            {
                "detectorModelName": "motorDetectorModel",
                "keyValue": "Fulton-A32"
            }
        ]
    }
}
```

This command produces no output.

For more information, see PutLoggingOptions in the *AWS IoT Events API Reference*.

- For API details, see PutLoggingOptions in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add tags to a resource

The following `tag-resource` example adds or modifies (if key `deviceType` already exists) the tag attached the specified resource.

```
aws iotevents tag-resource \
    --cli-input-json file://pressureInput.tag.json
```

Contents of `pressureInput.tag.json`:

```
{
    "resourceArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
    "tags": [
        {
            "key": "deviceType",
            "value": "motor"
        }
    ]
}
```

This command produces no output.

For more information, see TagResource in the *AWS IoT Events API Reference*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a resource

The following `untag-resource` example removes the tag with the specified key name from the specified resource.

```
aws iotevents untag-resource \
    --resource-arn arn:aws:iotevents:us-west-2:123456789012:input/PressureInput \
    --tagkeys deviceType
```

This command produces no output.

For more information, see UntagResource in the *AWS IoT Events API Reference*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-detector-model`

The following code example shows how to use `update-detector-model`.

AWS CLI

To update a detector model

The following `update-detector-model` example updates the specified detector model. Detectors (instances) spawned by the previous version are deleted and then re-created as new inputs arrive.

```
aws iotevents update-detector-model \
    --cli-input-json file://motorDetectorModel.update.json
```

Contents of `motorDetectorModel.update.json`:

```
{
    "detectorModelName": "motorDetectorModel",
    "detectorModelDefinition": {
        "states": [
            {
                "stateName": "Normal",

        "detectorModelVersion": "2"
    }
}
```

For more information, see UpdateDetectorModel in the *AWS IoT Events API Reference*.

- For API details, see UpdateDetectorModel in *AWS CLI Command Reference*.

`update-input`

The following code example shows how to use `update-input`.

AWS CLI

To update an input

The following `update-input` example updates the specified input with a new description and definition.

```
aws iotevents update-input \
    --cli-input-json file://pressureInput.json
```

Contents of `pressureInput.json`:

```
{
    "inputName": "PressureInput",
    "inputDescription": "Pressure readings from a motor",
    "inputDefinition": {
        "attributes": [
            { "jsonPath": "sensorData.pressure" },
            { "jsonPath": "motorid" }
        ]
    }
}
```

Output:

```
{
    "inputConfiguration": {
        "status": "ACTIVE",
        "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
        "lastUpdateTime": 1560795976.458,
        "creationTime": 1560795312.542,
        "inputName": "PressureInput",
        "inputDescription": "Pressure readings from a motor"
    }
}
```

For more information, see UpdateInput in the *AWS IoT Events API Reference*.

- For API details, see UpdateInput in *AWS CLI Command Reference*.

AWS IoT Events-Data examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Events-Data.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`batch-put-message`

The following code example shows how to use `batch-put-message`.

AWS CLI

To send messages (inputs) to AWS IoT Events

The following `batch-put-message` example sends a set of messages to the AWS IoT Events system. Each message payload is transformed into the input you specify (`inputName`) and ingested into any detectors that monitor that input. If multiple messages are sent, the order in which the messages are processed isn't guaranteed. To guarantee ordering, you must send messages one at a time and wait for a successful response.

```
aws iotevents-data batch-put-message \
    --cli-binary-format raw-in-base64-out \
    --cli-input-json file://highPressureMessage.json
```

Contents of `highPressureMessage.json`:

```
{
    "messages": [
        {
            "messageId": "00001",
            "inputName": "PressureInput",
            "payload": "{\"motorid\": \"Fulton-A32\", \"sensorData\": {\"pressure\":
 80, \"temperature\": 39} }"
        }
    ]
}
```

Output:

```
{
    "BatchPutMessageErrorEntries": []
}
```

For more information, see BatchPutMessage in the *AWS IoT Events Developer Guide**.

- For API details, see BatchPutMessage in *AWS CLI Command Reference*.

`batch-update-detector`

The following code example shows how to use `batch-update-detector`.

AWS CLI

To update a detector (instance)

The following `batch-update-detector` example updates the state, variable values, and timer settings of one or more detectors (instances) of a specified detector model.

```
aws iotevents-data batch-update-detector \
    --cli-input-json file://budFulton-A32.json
```

Contents of `budFulton-A32.json`:

```
{
    "detectors": [
        {
            "messageId": "00001",
            "detectorModelName": "motorDetectorModel",
            "keyValue": "Fulton-A32",
            "state": {
                "stateName": "Normal",
                "variables": [
                    {
                        "name": "pressureThresholdBreached",
                        "value": "0"
                    }
                ],
                "timers": [
                ]
            }
        }
    ]
}
```

Output:

```
{
    "batchUpdateDetectorErrorEntries": []
}
```

For more information, see BatchUpdateDetector in the *AWS IoT Events Developer Guide**.

- For API details, see BatchUpdateDetector in *AWS CLI Command Reference*.

`create-detector-model`

The following code example shows how to use `create-detector-model`.

AWS CLI

To create a detector model

The following `create-detector-model` example creates a detector model.

```
aws iotevents create-detector-model \
    --cli-input-json file://motorDetectorModel.json
```

Contents of `motorDetectorModel.json`:

```
{
    "detectorModelName": "motorDetectorModel",
    "detectorModelDefinition": {
        "states": [
            {
                "stateName": "Normal",
                "onEnter": {
                    "events": [
                        {
                            "eventName": "init",
                            "condition": "true",
                            "actions": [
                                {
                                    "setVariable": {
                                        "variableName": "pressureThresholdBreached",
                                        "value": "0"
                                    }
                                }
                            ]
                        }
                    ]
                },
                "onInput": {
                    "transitionEvents": [
                        {
                            "eventName": "Overpressurized",
                            "condition": "$input.PressureInput.sensorData.pressure
 &gt; 70",
                            "actions": [
                                {
                                    "setVariable": {
                                        "variableName": "pressureThresholdBreached",
```

```
                                        "value":
 "$variable.pressureThresholdBreached + 3"
                                    }
                                }
                            ],
                            "nextState": "Dangerous"
                        }
                    ]
                }
            },

        "detectorModelVersion": "1"
    }
}
```

For more information, see CreateDetectorModel in the *AWS IoT Events Developer Guide**.

- For API details, see CreateDetectorModel in *AWS CLI Command Reference*.

`create-input`

The following code example shows how to use `create-input`.

AWS CLI

To create an input

The following `create-input` example creates an input.

```
aws iotevents create-input \
    --cli-input-json file://pressureInput.json
```

Contents of `pressureInput.json`:

```
{
    "inputName": "PressureInput",
    "inputDescription": "Pressure readings from a motor",
    "inputDefinition": {
```

```
        "attributes": [
                { "jsonPath": "sensorData.pressure" },
                { "jsonPath": "motorid" }
            ]
    }
}
```

Output:

```
{
    "inputConfiguration": {
        "status": "ACTIVE",
        "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
        "lastUpdateTime": 1560795312.542,
        "creationTime": 1560795312.542,
        "inputName": "PressureInput",
        "inputDescription": "Pressure readings from a motor"
    }
}
```

For more information, see CreateInput in the *AWS IoT Events Developer Guide**.

- For API details, see CreateInput in *AWS CLI Command Reference*.

`delete-detector-model`

The following code example shows how to use `delete-detector-model`.

AWS CLI

To delete a detector model

The following `delete-detector-model` example deletes a detector model. Any active instances of the detector model are also deleted.

```
aws iotevents delete-detector-model \
    --detector-model-name motorDetectorModel*
```

This command produces no output.

For more information, see DeleteDetectorModel in the *AWS IoT Events Developer Guide**.

- For API details, see DeleteDetectorModel in *AWS CLI Command Reference*.

`delete-input`

The following code example shows how to use `delete-input`.

AWS CLI

To delete an input

The following `delete-input` example deletes an input.

```
aws iotevents delete-input \
    --input-name PressureInput
```

This command produces no output.

For more information, see DeleteInput in the *AWS IoT Events Developer Guide**.

- For API details, see DeleteInput in *AWS CLI Command Reference*.

`describe-detector-model`

The following code example shows how to use `describe-detector-model`.

AWS CLI

To get information about a detector model

The following `describe-detector-model` example describes a detector model. If the `version` parameter is not specified, the command returns information about the latest version.

```
aws iotevents describe-detector-model \
    --detector-model-name motorDetectorModel
```

Output:

```
{
    "detectorModel": {
        "detectorModelConfiguration": {
            "status": "ACTIVE",
            "lastUpdateTime": 1560796816.077,
            "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
            "creationTime": 1560796816.077,
```

```
            "detectorModelArn": "arn:aws:iotevents:us-
west-2:123456789012:detectorModel/motorDetectorModel",
            "key": "motorid",
            "detectorModelName": "motorDetectorModel",
            "detectorModelVersion": "1"
        },
        "detectorModelDefinition": {
            "states": [

- For API details, see [DescribeDetectorModel](#) in *AWS CLI Command Reference*.

`describe-detector`

The following code example shows how to use `describe-detector`.

AWS CLI

To get information about a detector (instance)

The following `describe-detector` example returns information about the specified detector (instance).

```
aws iotevents-data describe-detector \
    --detector-model-name motorDetectorModel \
    --key-value "Fulton-A32"
```

Output:

```
{
    "detector": {
        "lastUpdateTime": 1560797852.776,
        "creationTime": 1560797852.775,
        "state": {
            "variables": [
                {
                    "name": "pressureThresholdBreached",
                    "value": "3"
                }
            ],
            "stateName": "Dangerous",
            "timers": []
        },
        "keyValue": "Fulton-A32",
        "detectorModelName": "motorDetectorModel",
```

```
        "detectorModelVersion": "1"
    }
}
```

For more information, see DescribeDetector in the *AWS IoT Events Developer Guide**.

- For API details, see DescribeDetector in *AWS CLI Command Reference*.

`describe-input`

The following code example shows how to use `describe-input`.

AWS CLI

To get information about an input

The following `describe-input` example retrieves the details of an input.

```
aws iotevents describe-input \
    --input-name PressureInput
```

Output:

```
{
    "input": {
        "inputConfiguration": {
            "status": "ACTIVE",
            "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/
PressureInput",
            "lastUpdateTime": 1560795312.542,
            "creationTime": 1560795312.542,
            "inputName": "PressureInput",
            "inputDescription": "Pressure readings from a motor"
        },
        "inputDefinition": {
            "attributes": [
                {
                    "jsonPath": "sensorData.pressure"
                },
                {
                    "jsonPath": "motorid"
                }
            ]
```

```
        }
    }
}
```

For more information, see DescribeInput in the *AWS IoT Events Developer Guide**.

- For API details, see DescribeInput in *AWS CLI Command Reference*.

`describe-logging-options`

The following code example shows how to use `describe-logging-options`.

AWS CLI

To get information about logging settings

The following `describe-logging-options` example retrieves the current AWS IoT Events logging options.

```
aws iotevents describe-logging-options
```

Output:

```
{
    "loggingOptions": {
        "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
        "enabled": false,
        "level": "ERROR"
    }
}
```

For more information, see DescribeLoggingOptions in the *AWS IoT Events Developer Guide**.

- For API details, see DescribeLoggingOptions in *AWS CLI Command Reference*.

`list-detector-model-versions`

The following code example shows how to use `list-detector-model-versions`.

AWS CLI

To get information about versions of a detector model

The following `list-detector-model-versions` example lists all the versions of a detector model. Only the metadata associated with each detector model version is returned.

```
aws iotevents list-detector-model-versions \
    --detector-model-name motorDetectorModel
```

Output:

```
{
    "detectorModelVersionSummaries": [
        {
            "status": "ACTIVE",
            "lastUpdateTime": 1560796816.077,
            "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
            "creationTime": 1560796816.077,
            "detectorModelArn": "arn:aws:iotevents:us-
west-2:123456789012:detectorModel/motorDetectorModel",
            "detectorModelName": "motorDetectorModel",
            "detectorModelVersion": "1"
        }
    ]
}
```

For more information, see ListDetectorModelVersions in the *AWS IoT Events Developer Guide**.

- For API details, see ListDetectorModelVersions in *AWS CLI Command Reference*.

`list-detector-models`

The following code example shows how to use `list-detector-models`.

AWS CLI

To get a list of your detector models

The following `list-detector-models` example lists the detector models you have created. Only the metadata associated with each detector model is returned.

```
aws iotevents list-detector-models
```

Output:

```
{
    "detectorModelSummaries": [
        {
            "detectorModelName": "motorDetectorModel",
            "creationTime": 1552072424.212
            "detectorModelDescription": "Detect overpressure in a motor."
        }
    ]
}
```

For more information, see ListDetectorModels in the *AWS IoT Events Developer Guide**.

- For API details, see ListDetectorModels in *AWS CLI Command Reference*.

`list-detectors`

The following code example shows how to use `list-detectors`.

AWS CLI

To get a list of detectors for a detector model

The following `list-detectors` example lists detectors (the instances of a detector model).

```
aws iotevents-data list-detectors \
    --detector-model-name motorDetectorModel
```

Output:

```
{
    "detectorSummaries": [
        {
            "lastUpdateTime": 1558129925.2,
            "creationTime": 1552073155.527,
            "state": {
                "stateName": "Normal"
            },
            "keyValue": "Fulton-A32",
            "detectorModelName": "motorDetectorModel",
            "detectorModelVersion": "1"
        }
    ]
```

```
}
```

For more information, see ListDetectors in the *AWS IoT Events Developer Guide**.

- For API details, see ListDetectors in *AWS CLI Command Reference*.

`list-inputs`

The following code example shows how to use `list-inputs`.

AWS CLI

To list inputs

The following `list-inputs` example lists the inputs that you've created.

```
aws iotevents list-inputs
```

Output:

```
{
    "status": "ACTIVE",
    "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
    "lastUpdateTime": 1551742986.768,
    "creationTime": 1551742986.768,
    "inputName": "PressureInput",
    "inputDescription": "Pressure readings from a motor"
}
```

For more information, see ListInputs in the *AWS IoT Events Developer Guide**.

- For API details, see ListInputs in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags assigned to a resource

The following `list-tags-for-resource` example lists the tags (metadata) you have assigned to the resource.

```
aws iotevents list-tags-for-resource \
    --resource-arn "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput"
```

Output:

```
{
    "tags": [
        {
            "value": "motor",
            "key": "deviceType"
        }
    ]
}
```

For more information, see ListTagsForResource in the *AWS IoT Events Developer Guide**.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`put-logging-options`

The following code example shows how to use `put-logging-options`.

AWS CLI

To set logging options

The following `list-tags-for-resource` example sets or updates the AWS IoT Events logging options. If you update the value of any `loggingOptions` field, it takes up to one minute for the change to take effect. Also, if you change the policy attached to the role you specified in the `roleArn` field (for example, to correct an invalid policy) it takes up to five minutes for that change to take effect.

```
aws iotevents put-logging-options \
    --cli-input-json file://logging-options.json
```

Contents of `logging-options.json`:

```
{
    "loggingOptions": {
        "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
        "level": "DEBUG",
```

```
        "enabled": true,
        "detectorDebugOptions": [
            {
                "detectorModelName": "motorDetectorModel",
                "keyValue": "Fulton-A32"
            }
        ]
    }
}
```

This command produces no output.

For more information, see PutLoggingOptions in the *AWS IoT Events Developer Guide**.

- For API details, see PutLoggingOptions in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add tags to a resource

The following `tag-resource` example adds to or modifies the tags of the given resource. Tags are metadata that can be used to manage a resource.

```
aws iotevents tag-resource \
    --cli-input-json file://pressureInput.tag.json
```

Contents of `pressureInput.tag.json`:

```
{
    "resourceArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
    "tags": [
        {
            "key": "deviceType",
            "value": "motor"
        }
    ]
}
```

This command produces no output.

For more information, see TagResource in the *AWS IoT Events Developer Guide**.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a resource

The following `untag-resource` example removes the specified tags from the resource.

```
aws iotevents untag-resource \
    --cli-input-json file://pressureInput.untag.json
```

Contents of `pressureInput.untag.json`:

```
{
    "resourceArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
    "tagKeys": [
            "deviceType"
    ]
}
```

This command produces no output.

For more information, see UntagResource in the *AWS IoT Events Developer Guide**.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-detector-model`

The following code example shows how to use `update-detector-model`.

AWS CLI

To update a detector model

The following `update-detector-model` example updates a detector model. Detectors (instances) spawned by the previous version are deleted and then re-created as new inputs arrive.

```
aws iotevents update-detector-model \
    --cli-input-json file://motorDetectorModel.update.json
```

Contents of motorDetectorModel.update.json:

```
{
  "detectorModelName": "motorDetectorModel",
  "detectorModelDefinition": {
    "states": [
      {
        "stateName": "Normal",
        "onEnter": {
          "events": [
            {
              "eventName": "init",
              "condition": "true",
              "actions": [
                {
                  "setVariable": {
                    "variableName": "pressureThresholdBreached",
                    "value": "0"
                  }
                }
              ]
            }
          ]
        },
        "onInput": {
          "transitionEvents": [
            {
              "eventName": "Overpressurized",
              "condition": "$input.PressureInput.sensorData.pressure > 70",
              "actions": [
                {
                  "setVariable": {
                    "variableName": "pressureThresholdBreached",
                    "value": "$variable.pressureThresholdBreached + 3"
                  }
                }
              ],
              "nextState": "Dangerous"
            }
          ]
```

```
    }
   },
   {
    "stateName": "Dangerous",
    "onEnter": {
     "events": [
      {
       "eventName": "Pressure Threshold Breached",
       "condition": "$variable.pressureThresholdBreached > 1",
       "actions": [
        {
         "sns": {
          "targetArn": "arn:aws:sns:us-
east-1:123456789012:underPressureAction"
         }
        }
       ]
      }
     ]
    },
    "onInput": {
     "events": [
      {
       "eventName": "Overpressurized",
       "condition": "$input.PressureInput.sensorData.pressure > 70",
       "actions": [
        {
         "setVariable": {
          "variableName": "pressureThresholdBreached",
          "value": "3"
         }
        }
       ]
      },
      {
       "eventName": "Pressure Okay",
       "condition": "$input.PressureInput.sensorData.pressure <= 70",
       "actions": [
        {
         "setVariable": {
          "variableName": "pressureThresholdBreached",
          "value": "$variable.pressureThresholdBreached - 1"
         }
        }
```

```
              ]
            }
          ],
          "transitionEvents": [
            {
              "eventName": "BackToNormal",
              "condition": "$input.PressureInput.sensorData.pressure <= 70 &&
 $variable.pressureThresholdBreached <= 1",
              "nextState": "Normal"
            }
          ]
        },
        "onExit": {
          "events": [
            {
              "eventName": "Normal Pressure Restored",
              "condition": "true",
              "actions": [
                {
                  "sns": {
                    "targetArn": "arn:aws:sns:us-
east-1:123456789012:pressureClearedAction"
                  }
                }
              ]
            }
          ]
        }
      }
    ],
    "initialStateName": "Normal"
  },
  "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole"
}
```

Output:

```
{
    "detectorModelConfiguration": {
        "status": "ACTIVATING",
        "lastUpdateTime": 1560799387.719,
        "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
        "creationTime": 1560799387.719,
```

```
        "detectorModelArn": "arn:aws:iotevents:us-west-2:123456789012:detectorModel/
motorDetectorModel",
        "key": "motorid",
        "detectorModelName": "motorDetectorModel",
        "detectorModelVersion": "2"
    }
}
```

For more information, see UpdateDetectorModel in the *AWS IoT Events Developer Guide**.

- For API details, see UpdateDetectorModel in *AWS CLI Command Reference*.

`update-input`

The following code example shows how to use `update-input`.

AWS CLI

To update an input

The following `update-input` example updates an input.

```
aws iotevents update-input \
    --cli-input-json file://pressureInput.json
```

Contents of `pressureInput.json`:

```
{
    "inputName": "PressureInput",
    "inputDescription": "Pressure readings from a motor",
    "inputDefinition": {
        "attributes": [
            { "jsonPath": "sensorData.pressure" },
            { "jsonPath": "motorid" }
        ]
    }
}
```

Output:

```
{
```

```
    "inputConfiguration": {
        "status": "ACTIVE",
        "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
        "lastUpdateTime": 1560795976.458,
        "creationTime": 1560795312.542,
        "inputName": "PressureInput",
        "inputDescription": "Pressure readings from a motor"
    }
}
```

For more information, see UpdateInput in the *AWS IoT Events Developer Guide**.

- For API details, see UpdateInput in *AWS CLI Command Reference*.

AWS IoT Greengrass examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Greengrass.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`associate-role-to-group`

The following code example shows how to use `associate-role-to-group`.

AWS CLI

To associate a role with a Greengrass group

The following `associate-role-to-group` example associates the specified IAM role with a Greengrass group. The group role is used by local Lambda functions and connectors to access

AWS services. For example, your group role might grant permissions required for CloudWatch Logs integration.

```
aws greengrass associate-role-to-group \
    --group-id 2494ee3f-7f8a-4e92-a78b-d205f808b84b \
    --role-arn arn:aws:iam::123456789012:role/GG-Group-Role
```

Output:

```
{
    "AssociatedAt": "2019-09-10T20:03:30Z"
}
```

For more information, see Configure the Group Role in the *AWS IoT Greengrass Developer Guide*.

- For API details, see AssociateRoleToGroup in *AWS CLI Command Reference*.

`associate-service-role-to-account`

The following code example shows how to use `associate-service-role-to-account`.

AWS CLI

To associate a service role with your AWS account

The following `associate-service-role-to-account` example associates an IAM service role, specified by its ARN, with AWS IoT Greengrass in your AWS account. You must have previously created the service role in IAM, and you must associate a policy document with it that allows AWS IoT Greengrass to assume this role.

```
aws greengrass associate-service-role-to-account \
    --role-arn "arn:aws:iam::123456789012:role/service-role/Greengrass_ServiceRole"
```

Output:

```
{
    "AssociatedAt": "2019-06-25T18:12:45Z"
}
```

For more information, see Greengrass Service Role in the *AWS IoT Greengrass Developer Guide*.

- For API details, see AssociateServiceRoleToAccount in *AWS CLI Command Reference*.

`create-connector-definition-version`

The following code example shows how to use `create-connector-definition-version`.

AWS CLI

To create a connector definition version

The following `create-connector-definition-version` example creates a connector definition version and associates it with the specified connector definition. All connectors in a version define values for their parameters.

```
aws greengrass create-connector-definition-version \
    --connector-definition-id "55d0052b-0d7d-44d6-b56f-21867215e118" \
    --connectors "[{\"Id\": \"MyTwilioNotificationsConnector\",
 \"ConnectorArn\": \"arn:aws:greengrass:us-west-2::/connectors/
TwilioNotifications/versions/2\", \"Parameters\": {\"TWILIO_ACCOUNT_SID
\": \"AC1a8d4204890840d7fc482aab38090d57\", \"TwilioAuthTokenSecretArn\":
 \"arn:aws:secretsmanager:us-west-2:123456789012:secret:greengrass-TwilioAuthToken-
ntSlp6\", \"TwilioAuthTokenSecretArn-ResourceId\": \"TwilioAuthToken\",
 \"DefaultFromPhoneNumber\": \"4254492999\"}}]"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
connectors/55d0052b-0d7d-44d6-b56f-21867215e118/versions/33f709a0-c825-49cb-9eea-
dc8964fbd635",
    "CreationTimestamp": "2019-06-24T20:46:30.134Z",
    "Id": "55d0052b-0d7d-44d6-b56f-21867215e118",
    "Version": "33f709a0-c825-49cb-9eea-dc8964fbd635"
}
```

- For API details, see CreateConnectorDefinitionVersion in *AWS CLI Command Reference*.

`create-connector-definition`

The following code example shows how to use `create-connector-definition`.

AWS CLI

To create a connector definition

The following `create-connector-definition` example example creates a connector definition and an initial connector definition version. The initial version contains one connector. All connectors in a version define values for their parameters.

```
aws greengrass create-connector-definition \
    --name MySNSConnector \
    --initial-version "{\"Connectors\": [{\"Id\":\"MySNSConnector\",\"ConnectorArn
\":\"arn:aws:greengrass:us-west-2::/connectors/SNS/versions/1\",\"Parameters\":
 {\"DefaultSNSArn\":\"arn:aws:sns:us-west-2:123456789012:GGConnectorTopic\"}}]}"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
connectors/b5c4ebfd-f672-49a3-83cd-31c7216a7bb8",
    "CreationTimestamp": "2019-06-19T19:30:01.300Z",
    "Id": "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8",
    "LastUpdatedTimestamp": "2019-06-19T19:30:01.300Z",
    "LatestVersion": "63c57963-c7c2-4a26-a7e2-7bf478ea2623",
    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/connectors/b5c4ebfd-f672-49a3-83cd-31c7216a7bb8/versions/63c57963-
c7c2-4a26-a7e2-7bf478ea2623",
    "Name": "MySNSConnector"
}
```

For more information, see Getting Started with Greengrass Connectors (CLI) in the **AWS IoT Greengrass Developer Guide**.

- For API details, see CreateConnectorDefinition in *AWS CLI Command Reference*.

`create-core-definition-version`

The following code example shows how to use `create-core-definition-version`.

AWS CLI

To create a core definition version

The following `create-core-definition-version` example creates a core definition version and associates it with the specified core definition. The version can contain one core only. Before you can create a core, you must first create and provision the corresponding AWS IoT thing. This process includes the following `iot` commands, which return the `ThingArn` and `CertificateArn` required for the `create-core-definition-version` command.

Create the AWS IoT thing that corresponds to the core device:

```
aws iot create-thing \
    --thing-name "MyCoreDevice"
```

Output:

```
{
    "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyCoreDevice",
    "thingName": "MyCoreDevice",
    "thingId": "cb419a19-9099-4515-9cec-e9b0e760608a"
}
```

Create public and private keys and the core device certificate for the thing. This example uses the `create-keys-and-certificate` command and requires write permissions to the current directory. Alternatively, you can use the `create-certificate-from-csr` command.

```
aws iot create-keys-and-certificate \
    --set-as-active \
    --certificate-pem-outfile "myCore.cert.pem" \
    --public-key-outfile "myCore.public.key" \
    --private-key-outfile "myCore.private.key"
```

Output:

```
{
    "certificateArn": "arn:aws:iot:us-
west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz",
    "certificatePem": "-----BEGIN CERTIFICATE-----
\nMIIDWTCAkGgAwIBATgIUCgq6EGqou6zFqWgIZRndgQEFW+gwDQYJKoZIhvc...KdGewQS\n-----END
 CERTIFICATE-----\n",
    "keyPair": {
        "PublicKey": "-----BEGIN PUBLIC KEY-----
\nMIIBIjANBzrqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEAqKpRgnn6yq26U3y...wIDAQAB\n-----END
 PUBLIC KEY-----\n",
        "PrivateKey": "-----BEGIN RSA PRIVATE KEY-----
\nMIIEowIABAKCAQEAqKpRgnn6yq26U3yt5YFZquyukfRjbMXDcNOK4rMCxDR...fvY4+te\n-----END
 RSA PRIVATE KEY-----\n"
    },
```

```
    "certificateId":
 "123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz"
}
```

Create an AWS IoT policy that allows `iot` and `greengrass` actions. For simplicity, the following policy allows actions on all resources, but your policy should be more restrictive.

```
aws iot create-policy \
    --policy-name "Core_Devices" \
    --policy-document "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect
\":\"Allow\",\"Action\":[\"iot:Publish\",\"iot:Subscribe\",\"iot:Connect
\",\"iot:Receive\"],\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":
[\"iot:GetThingShadow\",\"iot:UpdateThingShadow\",\"iot:DeleteThingShadow\"],
\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":[\"greengrass:*\"],\"Resource
\":[\"*\"]}]}"
```

Output:

```
{
    "policyName": "Core_Devices",
    "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/Core_Devices",
    "policyDocument": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect
\":\"Allow\",\"Action\":[\"iot:Publish\",\"iot:Subscribe\",\"iot:Connect
\",\"iot:Receive\"],\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":
[\"iot:GetThingShadow\",\"iot:UpdateThingShadow\",\"iot:DeleteThingShadow\"],
\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":[\"greengrass:*\"],\"Resource
\":[\"*\"]}]}",
    "policyVersionId": "1"
}
```

Attach the policy to the certificate:

```
aws iot attach-policy \
    --policy-name "Core_Devices" \
    --target "arn:aws:iot:us-
west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz"
```

This command produces no output.

Attach the thing to the certificate:

```
aws iot attach-thing-principal \
```

```
    --thing-name "MyCoreDevice" \
    --principal "arn:aws:iot:us-
west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz"
```

This command produces no output.

Create the core definition version:

```
aws greengrass create-core-definition-version \
    --core-definition-id "582efe12-b05a-409e-9a24-a2ba1bcc4a12" \
    --cores "[{\"Id\":\"MyCoreDevice\",\"ThingArn\":\"arn:aws:iot:us-
west-2:123456789012:thing/MyCoreDevice\",\"CertificateArn\":\"arn:aws:iot:us-
west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz
\",\"SyncShadow\":true}]"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
cores/582efe12-b05a-409e-9a24-a2ba1bcc4a12/versions/3fdc1190-2ce5-44de-b98b-
eec8f9571014",
    "Version": "3fdc1190-2ce5-44de-b98b-eec8f9571014",
    "CreationTimestamp": "2019-09-18T00:15:09.838Z",
    "Id": "582efe12-b05a-409e-9a24-a2ba1bcc4a12"
}
```

For more information, see Configure the AWS IoT Greengrass Core in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateCoreDefinitionVersion in *AWS CLI Command Reference*.

`create-core-definition`

The following code example shows how to use `create-core-definition`.

AWS CLI

Example 1: To create an empty core definition

The following `create-core-definition` example creates an empty (no initial version) Greengrass core definition. Before the core is usable, you must use the `create-core-definition-version` command to provide the other parameters for the core.

```
aws greengrass create-core-definition \
    --name cliGroup_Core
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/cores/
b5c08008-54cb-44bd-9eec-c121b04283b5",
    "CreationTimestamp": "2019-06-25T18:23:22.106Z",
    "Id": "b5c08008-54cb-44bd-9eec-c121b04283b5",
    "LastUpdatedTimestamp": "2019-06-25T18:23:22.106Z",
    "Name": "cliGroup_Core"
}
```

Example 2: To create a core definition with an initial version

The following `create-core-definition` example creates a core definition that contains an initial core definition version. The version can contain one core only. Before you can create a core, you must first create and provision the corresponding AWS IoT thing. This process includes the following `iot` commands, which return the `ThingArn` and `CertificateArn` required for the `create-core-definition` command.

Create the AWS IoT thing that corresponds to the core device:

```
aws iot create-thing \
    --thing-name "MyCoreDevice"
```

Output:

```
{
    "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyCoreDevice",
    "thingName": "MyCoreDevice",
    "thingId": "cb419a19-9099-4515-9cec-e9b0e760608a"
}
```

Create public and private keys and the core device certificate for the thing. This example uses the `create-keys-and-certificate` command and requires write permissions to the current directory. Alternatively, you can use the `create-certificate-from-csr` command.

```
aws iot create-keys-and-certificate \
```

```
    --set-as-active \
    --certificate-pem-outfile "myCore.cert.pem" \
    --public-key-outfile "myCore.public.key" \
    --private-key-outfile "myCore.private.key"
```

Output:

```
{
    "certificateArn": "arn:aws:iot:us-
west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz",
    "certificatePem": "-----BEGIN CERTIFICATE-----
\nMIIDWTCAkGgAwIBATgIUCgq6EGqou6zFqWgIZRndgQEFW+gwDQYJKoZIhvc...KdGewQS\n-----END
 CERTIFICATE-----\n",
    "keyPair": {
        "PublicKey": "-----BEGIN PUBLIC KEY-----
\nMIIBIjANBzrqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEAqKpRgnn6yq26U3y...wIDAQAB\n-----END
 PUBLIC KEY-----\n",
        "PrivateKey": "-----BEGIN RSA PRIVATE KEY-----
\nMIIEowIABAKCAQEAqKpRgnn6yq26U3yt5YFZquyukfRjbMXDcNOK4rMCxDR...fvY4+te\n-----END
 RSA PRIVATE KEY-----\n"
    },
    "certificateId":
 "123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz"
}
```

Create an AWS IoT policy that allows `iot` and `greengrass` actions. For simplicity, the following policy allows actions on all resources, but your policy should be more restrictive.

```
aws iot create-policy \
    --policy-name "Core_Devices" \
    --policy-document "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect
\":\"Allow\",\"Action\":[\"iot:Publish\",\"iot:Subscribe\",\"iot:Connect
\",\"iot:Receive\"],\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":
[\"iot:GetThingShadow\",\"iot:UpdateThingShadow\",\"iot:DeleteThingShadow\"],
\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":[\"greengrass:*\"],\"Resource
\":[\"*\"]}]}"
```

Output:

```
{
    "policyName": "Core_Devices",
    "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/Core_Devices",
```

```
    "policyDocument": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect
\":\"Allow\",\"Action\":[\"iot:Publish\",\"iot:Subscribe\",\"iot:Connect
\",\"iot:Receive\"],\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":
[\"iot:GetThingShadow\",\"iot:UpdateThingShadow\",\"iot:DeleteThingShadow\"],
\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":[\"greengrass:*\"],\"Resource
\":[\"*\"]}]}",
    "policyVersionId": "1"
}
```

Attach the policy to the certificate:

```
aws iot attach-policy \
    --policy-name "Core_Devices" \
    --target "arn:aws:iot:us-
west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz"
```

This command produces no output.

Attach the thing to the certificate:

```
aws iot attach-thing-principal \
    --thing-name "MyCoreDevice" \
    --principal "arn:aws:iot:us-
west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz"
```

This command produces no output.

Create the core definition:

```
aws greengrass create-core-definition \
    --name "MyCores" \
    --initial-version "{\"Cores\":[{\"Id\":\"MyCoreDevice\",\"ThingArn\":
\"arn:aws:iot:us-west-2:123456789012:thing/MyCoreDevice\",\"CertificateArn\":
\"arn:aws:iot:us-
west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz
\",\"SyncShadow\":true}]}"
```

Output:

```
{
```

```
    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/cores/582efe12-b05a-409e-9a24-a2ba1bcc4a12/versions/
cc87b5b3-8f4b-465d-944c-1d6de5dbfcdb",
    "Name": "MyCores",
    "LastUpdatedTimestamp": "2019-09-18T00:11:06.197Z",
    "LatestVersion": "cc87b5b3-8f4b-465d-944c-1d6de5dbfcdb",
    "CreationTimestamp": "2019-09-18T00:11:06.197Z",
    "Id": "582efe12-b05a-409e-9a24-a2ba1bcc4a12",
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
cores/582efe12-b05a-409e-9a24-a2ba1bcc4a12"
}
```

For more information, see Configure the AWS IoT Greengrass Core in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateCoreDefinition in *AWS CLI Command Reference*.

`create-deployment`

The following code example shows how to use `create-deployment`.

AWS CLI

To create a deployment for a version of a Greengrass group

The following `create-deployment` example deploys the specified version of a Greengrass group.

```
aws greengrass create-deployment \
    --deployment-type NewDeployment \
    --group-id "ce2e7d01-3240-4c24-b8e6-f6f6e7a9eeca" \
    --group-version-id "dc40c1e9-e8c8-4d28-a84d-a9cad5f599c9"
```

Output:

```
{
    "DeploymentArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
groups/ce2e7d01-3240-4c24-b8e6-f6f6e7a9eeca/deployments/bfceb608-4e97-45bc-
af5c-460144270308",
    "DeploymentId": "bfceb608-4e97-45bc-af5c-460144270308"
}
```

For more information, see Getting Started with Connectors (CLI) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateDeployment in *AWS CLI Command Reference*.

`create-device-definition-version`

The following code example shows how to use `create-device-definition-version`.

AWS CLI

To create a device definition version

The following `create-device-definition-version` example creates a device definition version and associates it with the specified device definition. The version defines two devices. Before you can create a Greengrass device, you must first create and provision the corresponding AWS IoT thing. This process includes the following `iot` commands that you must run to get the required information for the Greengrass command:

Create the AWS IoT thing that corresponds to the device:

```
aws iot create-thing \
    --thing-name "InteriorTherm"
```

Output:

```
{
    "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/InteriorTherm",
    "thingName": "InteriorTherm",
    "thingId": "01d4763c-78a6-46c6-92be-7add080394bf"
}
```

Create public and private keys and the device certificate for the thing. This example uses the `create-keys-and-certificate` command and requires write permissions to the current directory. Alternatively, you can use the `create-certificate-from-csr` command:

```
aws iot create-keys-and-certificate \
    --set-as-active \
    --certificate-pem-outfile "myDevice.cert.pem" \
    --public-key-outfile "myDevice.public.key" \
```

```
    --private-key-outfile "myDevice.private.key"
```

Output:

```
{
    "certificateArn": "arn:aws:iot:us-
west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92",
    "certificatePem": "-----BEGIN CERTIFICATE-----
\nMIIDWTCAkGgAwIBATgIUCgq6EGqou6zFqWgIZRndgQEFW+gwDQYJKoZIhvc...KdGewQS\n-----END
 CERTIFICATE-----\n",
    "keyPair": {
        "PublicKey": "-----BEGIN PUBLIC KEY-----
\nMIIBIjANBzrqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEAqKpRgnn6yq26U3y...wIDAQAB\n-----END
 PUBLIC KEY-----\n",
        "PrivateKey": "-----BEGIN RSA PRIVATE KEY-----
\nMIIEowIABAKCAQEAqKpRgnn6yq26U3yt5YFZquyukfRjbMXDcNOK4rMCxDR...fvY4+te\n-----END
 RSA PRIVATE KEY-----\n"
    },
    "certificateId":
 "66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92"
}
```

Create an AWS IoT policy that allows `iot` and `greengrass` actions. For simplicity, the following policy allows actions on all resources, but your policy can be more restrictive:

```
aws iot create-policy \
    --policy-name "GG_Devices" \
    --policy-document "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect
\":\"Allow\",\"Action\":[\"iot:Publish\",\"iot:Subscribe\",\"iot:Connect
\",\"iot:Receive\"],\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":
[\"iot:GetThingShadow\",\"iot:UpdateThingShadow\",\"iot:DeleteThingShadow\"],
\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":[\"greengrass:*\"],\"Resource
\":[\"*\"]}]}"
```

Output:

```
{
    "policyName": "GG_Devices",
    "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/GG_Devices",
    "policyDocument": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect
\":\"Allow\",\"Action\":[\"iot:Publish\",\"iot:Subscribe\",\"iot:Connect
\",\"iot:Receive\"],\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":
```

```
[\"iot:GetThingShadow\",\"iot:UpdateThingShadow\",\"iot:DeleteThingShadow\"],
\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":[\"greengrass:*\"],\"Resource
\":[\"*\"]}]}",
    "policyVersionId": "1"
}
```

Attach the policy to the certificate:

```
aws iot attach-policy \
    --policy-name "GG_Devices" \
    --target "arn:aws:iot:us-
west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92"
```

Attach the thing to the certificate

```
aws iot attach-thing-principal \
    --thing-name "InteriorTherm" \
    --principal "arn:aws:iot:us-
west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92"
```

After you create and configure the IoT thing as shown above, use the `ThingArn` and `CertificateArn` from the first two commands in the following example.

```
aws greengrass create-device-definition-version \
    --device-definition-id "f9ba083d-5ad4-4534-9f86-026a45df1ccd" \
    --devices "[{\"Id\":\"InteriorTherm\",\"ThingArn\":\"arn:aws:iot:us-
west-2:123456789012:thing/InteriorTherm\",\"CertificateArn\":\"arn:aws:iot:us-
west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92\",
\"SyncShadow\":true},{\"Id\":\"ExteriorTherm\",\"ThingArn\":\"arn:aws:iot:us-
west-2:123456789012:thing/ExteriorTherm\",\"CertificateArn\":\"arn:aws:iot:us-
west-2:123456789012:cert/6c52ce1b47bde88a637e9ccdd45fe4e4c2c0a75a6866f8f63d980ee22fa51e02\",
\"SyncShadow\":true}]"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/devices/f9ba083d-5ad4-4534-9f86-026a45df1ccd/
versions/83c13984-6fed-447e-84d5-5b8aa45d5f71",
    "Version": "83c13984-6fed-447e-84d5-5b8aa45d5f71",
    "CreationTimestamp": "2019-09-11T00:15:09.838Z",
```

```
    "Id": "f9ba083d-5ad4-4534-9f86-026a45df1ccd"
}
```

- For API details, see [CreateDeviceDefinitionVersion](#) in *AWS CLI Command Reference*.

`create-device-definition`

The following code example shows how to use `create-device-definition`.

AWS CLI

To create a device definition

The following `create-device-definition` example creates a device definition that contains an initial device definition version. The initial version defines two devices. Before you can create a Greengrass device, you must first create and provision the corresponding AWS IoT thing. This process includes the following `iot` commands that you must run to get the required information for the Greengrass command:

Create the AWS IoT thing that corresponds to the device:

```
aws iot create-thing \
    --thing-name "InteriorTherm"
```

Output:

```
{
    "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/InteriorTherm",
    "thingName": "InteriorTherm",
    "thingId": "01d4763c-78a6-46c6-92be-7add080394bf"
}
```

Create public and private keys and the device certificate for the thing. This example uses the `create-keys-and-certificate` command and requires write permissions to the current directory. Alternatively, you can use the `create-certificate-from-csr` command:

```
aws iot create-keys-and-certificate \
    --set-as-active \
    --certificate-pem-outfile "myDevice.cert.pem" \
```

```
    --public-key-outfile "myDevice.public.key" \
    --private-key-outfile "myDevice.private.key"
```

Output:

```
{
    "certificateArn": "arn:aws:iot:us-
west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92",
    "certificatePem": "-----BEGIN CERTIFICATE-----
\nMIIDWTCAkGgAwIBATgIUCgq6EGqou6zFqWgIZRndgQEFW+gwDQYJKoZIhvc...KdGewQS\n-----END
 CERTIFICATE-----\n",
    "keyPair": {
        "PublicKey": "-----BEGIN PUBLIC KEY-----
\nMIIBIjANBzrqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEAqKpRgnn6yq26U3y...wIDAQAB\n-----END
 PUBLIC KEY-----\n",
        "PrivateKey": "-----BEGIN RSA PRIVATE KEY-----
\nMIIEowIABAKCAQEAqKpRgnn6yq26U3yt5YFZquyukfRjbMXDcNOK4rMCxDR...fvY4+te\n-----END
 RSA PRIVATE KEY-----\n"
    },
    "certificateId":
 "66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92"
}
```

Create an AWS IoT policy that allows `iot` and `greengrass` actions. For simplicity, the following policy allows actions on all resources, but your policy can be more restrictive:

```
aws iot create-policy \
    --policy-name "GG_Devices" \
    --policy-document "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect
\":\"Allow\",\"Action\":[\"iot:Publish\",\"iot:Subscribe\",\"iot:Connect
\",\"iot:Receive\"],\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":
[\"iot:GetThingShadow\",\"iot:UpdateThingShadow\",\"iot:DeleteThingShadow\"],
\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":[\"greengrass:*\"],\"Resource
\":[\"*\"]}]}"
```

Output:

```
{
    "policyName": "GG_Devices",
    "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/GG_Devices",
    "policyDocument": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect
\":\"Allow\",\"Action\":[\"iot:Publish\",\"iot:Subscribe\",\"iot:Connect
```

```
\",\"iot:Receive\"],\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":
[\"iot:GetThingShadow\",\"iot:UpdateThingShadow\",\"iot:DeleteThingShadow\"],
\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":[\"greengrass:*\"],\"Resource
\":[\"*\"]}]}",
    "policyVersionId": "1"
}
```

Attach the policy to the certificate:

```
aws iot attach-policy \
    --policy-name "GG_Devices" \
    --target "arn:aws:iot:us-
west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92"
```

Attach the thing to the certificate

```
aws iot attach-thing-principal \
    --thing-name "InteriorTherm" \
    --principal "arn:aws:iot:us-
west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92"
```

After you create and configure the IoT thing as shown above, use the `ThingArn` and `CertificateArn` from the first two commands in the following example.

```
aws greengrass create-device-definition \
    --name "Sensors" \
    --initial-version "{\"Devices\":[{\"Id\":\"InteriorTherm
\",\"ThingArn\":\"arn:aws:iot:us-west-2:123456789012:thing/
InteriorTherm\",\"CertificateArn\":\"arn:aws:iot:us-
west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92\",
\"SyncShadow\":true},{\"Id\":\"ExteriorTherm\",\"ThingArn\":\"arn:aws:iot:us-
west-2:123456789012:thing/ExteriorTherm\",\"CertificateArn\":\"arn:aws:iot:us-
west-2:123456789012:cert/6c52ce1b47bde88a637e9ccdd45fe4e4c2c0a75a6866f8f63d980ee22fa51e02\",
\"SyncShadow\":true}]}"
```

Output:

```
{
    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/devices/f9ba083d-5ad4-4534-9f86-026a45df1ccd/
versions/3b5cc510-58c1-44b5-9d98-4ad858ffa795",
```

```
    "Name": "Sensors",

- For API details, see CreateDeviceDefinition in *AWS CLI Command Reference*.

`create-function-definition-version`

The following code example shows how to use `create-function-definition-version`.

AWS CLI

To create a version of the function definition

The following `create-function-definition-version` example creates a new version of the specified function definition. This version specifies a single function whose ID is `Hello-World-function`, allows access to the file system, and specifies a maximum memory size and timeout period.

```
aws greengrass create-function-definition-version \
    --cli-input-json "{\"FunctionDefinitionId\": \"e626e8c9-3b8f-4bf3-9cdc-
d26ecdeb9fa3\",\"Functions\": [{\"Id\": \"Hello-World-function\", \"FunctionArn\":
 \""arn:aws:lambda:us-
west-2:123456789012:function:Greengrass_HelloWorld_Counter:gghw-alias"\",
\"FunctionConfiguration\": {\"Environment\": {\"AccessSysfs\": true},\"Executable\":
 \"greengrassHelloWorldCounter.function_handler\",\"MemorySize\": 16000,\"Pinned\":
 false,\"Timeout\": 25}}]}"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/functions/e626e8c9-3b8f-4bf3-9cdc-d26ecdeb9fa3/
versions/74abd1cc-637e-4abe-8684-9a67890f4043",
    "CreationTimestamp": "2019-06-25T22:03:43.376Z",
    "Id": "e626e8c9-3b8f-4bf3-9cdc-d26ecdeb9fa3",
```

```
    "Version": "74abd1cc-637e-4abe-8684-9a67890f4043"
}
```

- For API details, see [CreateFunctionDefinitionVersion]() in *AWS CLI Command Reference*.

`create-function-definition`

The following code example shows how to use `create-function-definition`.

AWS CLI

To create a Lambda function definition

The following `create-function-definition` example creates a Lambda function definition and an initial version by providing a list of Lambda functions (in this case, a list of just one function named `TempMonitorFunction`) and their configurations. Before you can create the function definition, you need the Lambda function ARN. To create the function and its alias, use Lambda's `create-function` and `publish-version` commands. Lambda's `create-function` command requires the ARN of the execution role, even though AWS IoT Greengrass doesn't use that role because permissions are specified in the Greengrass group role. You can use the IAM `create-role` command to create an empty role to get an ARN to use with Lambda's `create-function` or you can use an existing execution role.

```
aws greengrass create-function-definition \
    --name MyGreengrassFunctions \
    --initial-version "{\"Functions\": [{\"Id\": \"TempMonitorFunction\",
 \"FunctionArn\": \"arn:aws:lambda:us-
west-2:123456789012:function:TempMonitor:GG_TempMonitor\", \"FunctionConfiguration
\": {\"Executable\": \"temp_monitor.function_handler\", \"MemorySize\": 16000,
\"Timeout\": 5}}]}"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
functions/3b0d0080-87e7-48c6-b182-503ec743a08b",
    "CreationTimestamp": "2019-06-19T22:24:44.585Z",
    "Id": "3b0d0080-87e7-48c6-b182-503ec743a08b",
    "LastUpdatedTimestamp": "2019-06-19T22:24:44.585Z",
    "LatestVersion": "67f918b9-efb4-40b0-b87c-de8c9faf085b",
```

```
    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/functions/3b0d0080-87e7-48c6-b182-503ec743a08b/versions/67f918b9-
efb4-40b0-b87c-de8c9faf085b",
    "Name": "MyGreengrassFunctions"
}
```

For more information, see How to Configure Local Resource Access Using the AWS Command Line Interface in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateFunctionDefinition in *AWS CLI Command Reference*.

`create-group-certificate-authority`

The following code example shows how to use `create-group-certificate-authority`.

AWS CLI

To create a certificate authority (CA) for a group

The following `create-group-certificate-authority` example creates or rotates a CA for the specified group.

```
aws greengrass create-group-certificate-authority \
    --group-id "8eaadd72-ce4b-4f15-892a-0cc4f3a343f1"
```

Output:

```
{
    "GroupCertificateAuthorityArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/groups/8eaadd72-ce4b-4f15-892a-0cc4f3a343f1/certificateauthorities/
d31630d674c4437f6c5dbc0dca56312a902171ce2d086c38e509c8EXAMPLEcc5"
}
```

For more information, see AWS IoT Greengrass Security in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateGroupCertificateAuthority in *AWS CLI Command Reference*.

`create-group-version`

The following code example shows how to use `create-group-version`.

AWS CLI

To create a version of a Greengrass group

The following `create-group-version` example creates a group version and associates it with the specified group. The version references the core, resource, connector, function, and subscription versions that contain the entities to include in this group version. You must create these entities before you can create the group version.

To create a resource definition with an initial version, use the `create-resource-definition` command.To create a connector definition with an initial version, use the `create-connector-definition` command.To create a function definition with an initial version, use the `create-function-definition` command.To create a subscription definition with an initial version, use the `create-subscription-definition` command.To retrieve the ARN of the latest core definition version, use the `get-group-version` command and specify the ID of the latest group version.

```
aws greengrass create-group-version \
    --group-id "ce2e7d01-3240-4c24-b8e6-f6f6e7a9eeca" \
    --core-definition-version-arn "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/cores/6a630442-8708-4838-ad36-eb98849d975e/
versions/6c87151b-1fb4-4cb2-8b31-6ee715d8f8ba" \
    --resource-definition-version-arn "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/resources/c8bb9ebc-c3fd-40a4-9c6a-568d75569d38/versions/
a5f94d0b-f6bc-40f4-bb78-7a1c5fe13ba1" \
    --connector-definition-version-arn "arn:aws:greengrass:us-west-2:123456789012:/

    --function-definition-version-arn "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/functions/3b0d0080-87e7-48c6-b182-503ec743a08b/
versions/67f918b9-efb4-40b0-b87c-de8c9faf085b" \
    --subscription-definition-version-arn "arn:aws:greengrass:us-
west-2:123456789012:/greengrass/definition/subscriptions/9d611d57-5d5d-44bd-a3b4-
feccbdd69112/versions/aa645c47-ac90-420d-9091-8c7ffa4f103f"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/
ce2e7d01-3240-4c24-b8e6-f6f6e7a9eeca/versions/e10b0459-4345-4a09-88a4-1af1f5d34638",
    "CreationTimestamp": "2019-06-20T18:42:47.020Z",
```

```
    "Id": "ce2e7d01-3240-4c24-b8e6-f6f6e7a9eeca",
    "Version": "e10b0459-4345-4a09-88a4-1af1f5d34638"
}
```

For more information, see Overview of the AWS IoT Greengrass Group Object Model in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateGroupVersion in *AWS CLI Command Reference*.

`create-group`

The following code example shows how to use `create-group`.

AWS CLI

To create a Greeengrass group

The following `create-group` example creates a group named `cli-created-group`.

```
aws greengrass create-group \
    --name cli-created-group
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
groups/4e22bd92-898c-436b-ade5-434d883ff749",
    "CreationTimestamp": "2019-06-25T18:07:17.688Z",
    "Id": "4e22bd92-898c-436b-ade5-434d883ff749",
    "LastUpdatedTimestamp": "2019-06-25T18:07:17.688Z",
    "Name": "cli-created-group"
}
```

For more information, see Overview of the AWS IoT Greengrass Group Object Model in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateGroup in *AWS CLI Command Reference*.

`create-logger-definition-version`

The following code example shows how to use `create-logger-definition-version`.

AWS CLI

To create a logger definition version

The following `create-logger-definition-version` example creates a logger definition version and associates it with a logger definition. The version defines four logging configurations: 1) system component logs on the file system of the core device, 2) user-defined Lambda function logs on the file system of the core device, 3) system component logs in Amazon CloudWatch Logs, and 4) user-defined Lambda function logs in Amazon CloudWatch Logs. Note: For CloudWatch Logs integration, your group role must grant appropriate permissions.

```
aws greengrass create-logger-definition-version \
    --logger-definition-id "a454b62a-5d56-4ca9-bdc4-8254e1662cb0" \
    --loggers "[{\"Id\":\"1\",\"Component\":\"GreengrassSystem\",\"Level\":\"ERROR
\",\"Space\":10240,\"Type\":\"FileSystem\"},{\"Id\":\"2\",\"Component\":\"Lambda
\",\"Level\":\"INFO\",\"Space\":10240,\"Type\":\"FileSystem\"},{\"Id\":\"3\",
\"Component\":\"GreengrassSystem\",\"Level\":\"WARN\",\"Type\":\"AWSCloudWatch\"},
{\"Id\":\"4\",\"Component\":\"Lambda\",\"Level\":\"INFO\",\"Type\":\"AWSCloudWatch
\"}]"
```

Output:

```
{
 "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/loggers/
a454b62a-5d56-4ca9-bdc4-8254e1662cb0/versions/49aedb1e-01a3-4d39-9871-3a052573f1ea",
 "Version": "49aedb1e-01a3-4d39-9871-3a052573f1ea",
 "CreationTimestamp": "2019-07-24T00:04:48.523Z",
 "Id": "a454b62a-5d56-4ca9-bdc4-8254e1662cb0"
}
```

For more information, see Monitoring with AWS IoT Greengrass Logs in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateLoggerDefinitionVersion in *AWS CLI Command Reference*.

`create-logger-definition`

The following code example shows how to use `create-logger-definition`.

AWS CLI

To create a logger definition

The following `create-logger-definition` example creates a logger definition that contains an initial logger definition version. The initial version defines three logging configurations: 1) system component logs on the file system of the core device, 2) user-defined Lambda function logs on the file system of the core device, and 3) user-defined Lambda function logs in Amazon CloudWatch Logs. Note: For CloudWatch Logs integration, your group role must grant appropriate permissions.

```
aws greengrass create-logger-definition \
    --name "LoggingConfigs" \
    --initial-version "{\"Loggers\":[{\"Id\":\"1\",\"Component\":\"GreengrassSystem
\",\"Level\":\"ERROR\",\"Space\":10240,\"Type\":\"FileSystem\"},{\"Id\":
\"2\",\"Component\":\"Lambda\",\"Level\":\"INFO\",\"Space\":10240,\"Type\":
\"FileSystem\"},{\"Id\":\"3\",\"Component\":\"Lambda\",\"Level\":\"INFO\",\"Type\":
\"AWSCloudWatch\"}]}"
```

Output:

```
{
    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/loggers/a454b62a-5d56-4ca9-bdc4-8254e1662cb0/versions/de1d9854-1588-4525-
b25e-b378f60f2322",
    "Name": "LoggingConfigs",
    "LastUpdatedTimestamp": "2019-07-23T23:52:17.165Z",
    "LatestVersion": "de1d9854-1588-4525-b25e-b378f60f2322",
    "CreationTimestamp": "2019-07-23T23:52:17.165Z",
    "Id": "a454b62a-5d56-4ca9-bdc4-8254e1662cb0",
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
loggers/a454b62a-5d56-4ca9-bdc4-8254e1662cb0"
}
```

For more information, see Monitoring with AWS IoT Greengrass Logs in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateLoggerDefinition in *AWS CLI Command Reference*.

`create-resource-definition-version`

The following code example shows how to use `create-resource-definition-version`.

AWS CLI

To create a version of a resource definition

The following `create-resource-definition-version` example creates a new version of a TwilioAuthToken.

```
aws greengrass create-resource-definition-version \
    --resource-definition-id "c8bb9ebc-c3fd-40a4-9c6a-568d75569d38" \
    --resources "[{\"Id\": \"TwilioAuthToken\",\"Name\": \"MyTwilioAuthToken
\",\"ResourceDataContainer\": {\"SecretsManagerSecretResourceData\": {\"ARN\":
 \"arn:aws:secretsmanager:us-west-2:123456789012:secret:greengrass-TwilioAuthToken-
ntSlp6\"}}}]"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
resources/c8bb9ebc-c3fd-40a4-9c6a-568d75569d38/versions/b3bcada0-5fb6-42df-
bf0b-1ee4f15e769e",
    "CreationTimestamp": "2019-06-24T21:17:25.623Z",
    "Id": "c8bb9ebc-c3fd-40a4-9c6a-568d75569d38",
    "Version": "b3bcada0-5fb6-42df-bf0b-1ee4f15e769e"
}
```

- For API details, see CreateResourceDefinitionVersion in *AWS CLI Command Reference*.

`create-resource-definition`

The following code example shows how to use `create-resource-definition`.

AWS CLI

To create a resource definition

The following `create-resource-definition` example creates a resource definition that contains a list of resources to be used in a Greengrass group. In this example, an initial version of the resource definition is included by providing a list of resources. The list includes one resource for a Twilio authorization token and the ARN for a secret stored in AWS Secrets Manager. You must create the secret before you can create the resource definition.

```
aws greengrass create-resource-definition \
    --name MyGreengrassResources \
    --initial-version "{\"Resources\": [{\"Id\": \"TwilioAuthToken
\",\"Name\": \"MyTwilioAuthToken\",\"ResourceDataContainer\":
 {\"SecretsManagerSecretResourceData\": {\"ARN\": \"arn:aws:secretsmanager:us-
west-2:123456789012:secret:greengrass-TwilioAuthToken-ntSlp6\"}}}]}"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
resources/c8bb9ebc-c3fd-40a4-9c6a-568d75569d38",
    "CreationTimestamp": "2019-06-19T21:51:28.212Z",
    "Id": "c8bb9ebc-c3fd-40a4-9c6a-568d75569d38",
    "LastUpdatedTimestamp": "2019-06-19T21:51:28.212Z",
    "LatestVersion": "a5f94d0b-f6bc-40f4-bb78-7a1c5fe13ba1",
    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/resources/c8bb9ebc-c3fd-40a4-9c6a-568d75569d38/versions/a5f94d0b-
f6bc-40f4-bb78-7a1c5fe13ba1",
    "Name": "MyGreengrassResources"
}
```

For more information, see How to Configure Local Resource Access Using the AWS Command Line Interface in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateResourceDefinition in *AWS CLI Command Reference*.

`create-software-update-job`

The following code example shows how to use `create-software-update-job`.

AWS CLI

To create a software update job for a core

The following `create-software-update-job` example creates an over-the-air (OTA) update job to update the AWS IoT Greengrass Core software on the core whose name is `MyFirstGroup_Core`. This command requires an IAM role that allows access to software update packages in Amazon S3 and includes `iot.amazonaws.com` as a trusted entity.

```
aws greengrass create-software-update-job \
```

```
    --update-targets-architecture armv7l \
    --update-targets [\"arn:aws:iot:us-west-2:123456789012:thing/MyFirstGroup_Core
\"] \
    --update-targets-operating-system raspbian \
    --software-to-update core \
    --s3-url-signer-role arn:aws:iam::123456789012:role/OTA_signer_role \
    --update-agent-log-level WARN
```

Output:

```
{
    "IotJobId": "GreengrassUpdateJob_30b353e3-3af7-4786-be25-4c446663c09e",
    "IotJobArn": "arn:aws:iot:us-west-2:123456789012:job/
GreengrassUpdateJob_30b353e3-3af7-4786-be25-4c446663c09e",
    "PlatformSoftwareVersion": "1.9.3"
}
```

For more information, see OTA Updates of AWS IoT Greengrass Core Software in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateSoftwareUpdateJob in *AWS CLI Command Reference*.

`create-subscription-definition-version`

The following code example shows how to use `create-subscription-definition-version`.

AWS CLI

To create a new version of a subscription definition

The following `create-subscription-definition-version` example creates a new version of a subscription definition that contains three subscriptions: a trigger notification, a temperature input, and an output status.

```
aws greengrass create-subscription-definition-version \
    --subscription-definition-id "9d611d57-5d5d-44bd-a3b4-feccbdd69112" \
    --subscriptions "[{\"Id\": \"TriggerNotification\", \"Source\":
 \"arn:aws:lambda:us-west-2:123456789012:function:TempMonitor:GG_TempMonitor
\", \"Subject\": \"twilio/txt\", \"Target\": \"arn:aws:greengrass:us-west-2::/
connectors/TwilioNotifications/versions/1\"},{\"Id\": \"TemperatureInput\", \"Source
\": \"cloud\", \"Subject\": \"temperature/input\", \"Target\": \"arn:aws:lambda:us-
west-2:123456789012:function:TempMonitor:GG_TempMonitor\"},{\"Id\": \"OutputStatus
```

```
\", \"Source\": \"arn:aws:greengrass:us-west-2::/connectors/TwilioNotifications/
versions/1\", \"Subject\": \"twilio/message/status\", \"Target\": \"cloud\"}]"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
subscriptions/9d611d57-5d5d-44bd-a3b4-feccbdd69112/versions/7b65dfae-50b6-4d0f-
b3e0-27728bfb0620",
    "CreationTimestamp": "2019-06-24T21:21:33.837Z",
    "Id": "9d611d57-5d5d-44bd-a3b4-feccbdd69112",
    "Version": "7b65dfae-50b6-4d0f-b3e0-27728bfb0620"
}
```

- For API details, see CreateSubscriptionDefinitionVersion in *AWS CLI Command Reference*.

`create-subscription-definition`

The following code example shows how to use `create-subscription-definition`.

AWS CLI

To create a subscription definition

The following `create-subscription-definition` example creates a subscription definition and specifies its initial version. The initial version contains three subscriptions: one for the MQTT topic to which the connector subscribes, one to allow a function to receive temperature readings from AWS IoT, and one to allow AWS IoT to receive status information from the connector. The example provides the ARN for the Lambda function alias that was created earlier by using Lambda's `create-alias` command.

```
aws greengrass create-subscription-definition \
    --initial-version "{\"Subscriptions\": [{\"Id\":
 \"TriggerNotification\", \"Source\": \"arn:aws:lambda:us-
west-2:123456789012:function:TempMonitor:GG_TempMonitor\", \"Subject\":
 \"twilio/txt\", \"Target\": \"arn:aws:greengrass:us-west-2::/connectors/
TwilioNotifications/versions/1\"},{\"Id\": \"TemperatureInput\", \"Source\":
 \"cloud\", \"Subject\": \"temperature/input\", \"Target\": \"arn:aws:lambda:us-
west-2:123456789012:function:TempMonitor:GG_TempMonitor\"},{\"Id\": \"OutputStatus
\", \"Source\": \"arn:aws:greengrass:us-west-2::/connectors/TwilioNotifications/
versions/1\", \"Subject\": \"twilio/message/status\", \"Target\": \"cloud\"}]}"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
subscriptions/9d611d57-5d5d-44bd-a3b4-feccbdd69112",
    "CreationTimestamp": "2019-06-19T22:34:26.677Z",
    "Id": "9d611d57-5d5d-44bd-a3b4-feccbdd69112",
    "LastUpdatedTimestamp": "2019-06-19T22:34:26.677Z",
    "LatestVersion": "aa645c47-ac90-420d-9091-8c7ffa4f103f",
    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/subscriptions/9d611d57-5d5d-44bd-a3b4-feccbdd69112/versions/aa645c47-
ac90-420d-9091-8c7ffa4f103f"
}
```

For more information, see Getting Started with Connectors (CLI) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateSubscriptionDefinition in *AWS CLI Command Reference*.

`delete-connector-definition`

The following code example shows how to use `delete-connector-definition`.

AWS CLI

To delete a connector definition

The following `delete-connector-definition` example deletes the specified Greengrass connector definition. If you delete a connector definition that is used by a group, that group can't be deployed successfully.

```
aws greengrass delete-connector-definition \
    --connector-definition-id "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8"
```

This command produces no output.

- For API details, see DeleteConnectorDefinition in *AWS CLI Command Reference*.

`delete-core-definition`

The following code example shows how to use `delete-core-definition`.

AWS CLI

To delete a core definition

The following `delete-core-definition` example deletes the specified Greengrass core definition, including all versions. If you delete a core that is associated with a Greengrass group, that group can't be deployed successfully.

```
aws greengrass delete-core-definition \
    --core-definition-id "ff36cc5f-9f98-4994-b468-9d9b6dc52abd"
```

This command produces no output.

- For API details, see DeleteCoreDefinition in *AWS CLI Command Reference*.

`delete-device-definition`

The following code example shows how to use `delete-device-definition`.

AWS CLI

To delete a device definition

The following `delete-device-definition` example deletes the specified device definition, including all of its versions. If you delete a device definition version that is used by a group version, the group version cannot be deployed successfully.

```
aws greengrass delete-device-definition \
    --device-definition-id "f9ba083d-5ad4-4534-9f86-026a45df1ccd"
```

This command produces no output.

- For API details, see DeleteDeviceDefinition in *AWS CLI Command Reference*.

`delete-function-definition`

The following code example shows how to use `delete-function-definition`.

AWS CLI

To delete a function definition

The following `delete-function-definition` example deletes the specified Greengrass function definition. If you delete a function definition that is used by a group, that group can't be deployed successfully.

```
aws greengrass delete-function-definition \
    --function-definition-id "fd4b906a-dff3-4c1b-96eb-52ebfcfac06a"
```

This command produces no output.

- For API details, see DeleteFunctionDefinition in *AWS CLI Command Reference*.

`delete-group`

The following code example shows how to use `delete-group`.

AWS CLI

To delete a group

The following `delete-group` example deletes the specified Greengrass group.

```
aws greengrass delete-group \
    --group-id "4e22bd92-898c-436b-ade5-434d883ff749"
```

This command produces no output.

- For API details, see DeleteGroup in *AWS CLI Command Reference*.

`delete-logger-definition`

The following code example shows how to use `delete-logger-definition`.

AWS CLI

To delete a logger definition

The following `delete-logger-definition` example deletes the specified logger definition, including all logger definition versions. If you delete a logger definition version that is used by a group version, the group version cannot be deployed successfully.

```
aws greengrass delete-logger-definition \
    --logger-definition-id "a454b62a-5d56-4ca9-bdc4-8254e1662cb0"
```

This command produces no output.

For more information, see Monitoring with AWS IoT Greengrass Logs in the *AWS IoT Greengrass Developer Guide*.

- For API details, see DeleteLoggerDefinition in *AWS CLI Command Reference*.

`delete-resource-definition`

The following code example shows how to use `delete-resource-definition`.

AWS CLI

To delete a resource definition

The following `delete-resource-definition` example deletes the specified resource definition, including all resource versions. If you delete a resource definition that is used by a group, that group can't be deployed successfully.

```
aws greengrass delete-resource-definition \
    --resource-definition-id "ad8c101d-8109-4b0e-b97d-9cc5802ab658"
```

This command produces no output.

- For API details, see DeleteResourceDefinition in *AWS CLI Command Reference*.

`delete-subscription-definition`

The following code example shows how to use `delete-subscription-definition`.

AWS CLI

To delete a subscription definition

The following `delete-subscription-definition` example deletes the specified Greengrass subscription definition. If you delete a subscription that is being used by a group, that group can't be deployed successfully.

```
aws greengrass delete-subscription-definition \
    --subscription-definition-id "cd6f1c37-d9a4-4e90-be94-01a7404f5967"
```

This command produces no output.

- For API details, see DeleteSubscriptionDefinition in *AWS CLI Command Reference*.

`disassociate-role-from-group`

The following code example shows how to use `disassociate-role-from-group`.

AWS CLI

To disassociate the role from a Greengrass group

The following `disassociate-role-from-group` example disassociates the IAM role from the specified Greengrass group.

```
aws greengrass disassociate-role-from-group \
    --group-id 2494ee3f-7f8a-4e92-a78b-d205f808b84b
```

Output:

```
{
    "DisassociatedAt": "2019-09-10T20:05:49Z"
}
```

For more information, see Configure the Group Role in the *AWS IoT Greengrass Developer Guide*.

- For API details, see DisassociateRoleFromGroup in *AWS CLI Command Reference*.

`disassociate-service-role-from-account`

The following code example shows how to use `disassociate-service-role-from-account`.

AWS CLI

To disassociate a service role from your AWS account

The following `disassociate-service-role-from-account` example removes the service role that is associated with your AWS account. If you are not using the service role in any AWS Region, use the `delete-role-policy` command to detach the `AWSGreengrassResourceAccessRolePolicy` managed policy from the role, and then use the `delete-role` command to delete the role.

```
aws greengrass disassociate-service-role-from-account
```

Output:

```
{
    "DisassociatedAt": "2019-06-25T22:12:55Z"
}
```

For more information, see Greengrass Service Role in the **AWS IoT Greengrass Developer Guide**.

- For API details, see DisassociateServiceRoleFromAccount in *AWS CLI Command Reference*.

`get-associated-role`

The following code example shows how to use `get-associated-role`.

AWS CLI

To get the role associated with a Greengrass group

The following `get-associated-role` example gets the IAM role that's associated with the specified Greengrass group. The group role is used by local Lambda functions and connectors to access AWS services.

```
aws greengrass get-associated-role \
    --group-id 2494ee3f-7f8a-4e92-a78b-d205f808b84b
```

Output:

```
{
    "RoleArn": "arn:aws:iam::123456789012:role/GG-Group-Role",
    "AssociatedAt": "2019-09-10T20:03:30Z"
}
```

For more information, see Configure the Group Role in the *AWS IoT Greengrass Developer Guide*.

- For API details, see GetAssociatedRole in *AWS CLI Command Reference*.

`get-bulk-deployment-status`

The following code example shows how to use `get-bulk-deployment-status`.

AWS CLI

To check the status of your bulk deployment

The following `get-bulk-deployment-status` example retrieves status information for the specified bulk deployment operation. In this example, the file that specified the groups to be deployed has an invalid input record.

```
aws greengrass get-bulk-deployment-status \
    --bulk-deployment-id "870fb41b-6288-4e0c-bc76-a7ba4b4d3267"
```

Output:

```
{
    "BulkDeploymentMetrics": {
        "InvalidInputRecords": 1,
        "RecordsProcessed": 1,
        "RetryAttempts": 0
    },
    "BulkDeploymentStatus": "Completed",
    "CreatedAt": "2019-06-25T16:11:33.265Z",
    "tags": {}
}
```

For more information, see Create Bulk Deployments for Groups in the *AWS IoT Greengrass Developer Guide*.

- For API details, see GetBulkDeploymentStatus in *AWS CLI Command Reference*.

`get-connectivity-info`

The following code example shows how to use `get-connectivity-info`.

AWS CLI

To get the connectivity information for a Greengrass core

The following `get-connectivity-info` example displays the endpoints that devices can use to connect to the specified Greengrass core. Connectivity information is a list of IP addresses or domain names, with corresponding port numbers and optional customer-defined metadata.

```
aws greengrass get-connectivity-info \
```

```
    --thing-name "MyGroup_Core"
```

Output:

```
{
    "ConnectivityInfo": [
        {
            "Metadata": "",
            "PortNumber": 8883,
            "HostAddress": "127.0.0.1",
            "Id": "AUTOIP_127.0.0.1_0"
        },
        {
            "Metadata": "",
            "PortNumber": 8883,
            "HostAddress": "192.168.1.3",
            "Id": "AUTOIP_192.168.1.3_1"
        },
        {
            "Metadata": "",
            "PortNumber": 8883,
            "HostAddress": "::1",
            "Id": "AUTOIP_::1_2"
        },
        {
            "Metadata": "",
            "PortNumber": 8883,
            "HostAddress": "fe80::1e69:ed93:f5b:f6d",
            "Id": "AUTOIP_fe80::1e69:ed93:f5b:f6d_3"
        }
    ]
}
```

- For API details, see GetConnectivityInfo in *AWS CLI Command Reference*.

`get-connector-definition-version`

The following code example shows how to use `get-connector-definition-version`.

AWS CLI

To retrieve information about a specific version of a connector definition

The following `get-connector-definition-version` example retrieves information about the specified version of the specified connector definition. To retrieve the IDs of all versions of the connector definition, use the `list-connector-definition-versions` command. To retrieve the ID of the last version added to the connector definition, use the `get-connector-definition` command and check the `LatestVersion` property.

```
aws greengrass get-connector-definition-version \
    --connector-definition-id "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8" \
    --connector-definition-version-id "63c57963-c7c2-4a26-a7e2-7bf478ea2623"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
connectors/b5c4ebfd-f672-49a3-83cd-31c7216a7bb8/versions/63c57963-c7c2-4a26-
a7e2-7bf478ea2623",
    "CreationTimestamp": "2019-06-19T19:30:01.300Z",
    "Definition": {
        "Connectors": [
            {
                "ConnectorArn": "arn:aws:greengrass:us-west-2::/connectors/SNS/
versions/1",
                "Id": "MySNSConnector",
                "Parameters": {
                    "DefaultSNSArn": "arn:aws:sns:us-
west-2:123456789012:GGConnectorTopic"
                }
            }
        ]
    },
    "Id": "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8",
    "Version": "63c57963-c7c2-4a26-a7e2-7bf478ea2623"
}
```

For more information, see Integrate with Services and Protocols Using Greengrass Connectors in the **AWS IoT Greengrass Developer Guide**.

- For API details, see GetConnectorDefinitionVersion in *AWS CLI Command Reference*.

`get-connector-definition`

The following code example shows how to use `get-connector-definition`.

AWS CLI

To retrieve information about a connector definition

The following `get-connector-definition` example retrieves information about the specified connector definition. To retrieve the IDs of your connector definitions, use the `list-connector-definitions` command.

```
aws greengrass get-connector-definition \
    --connector-definition-id "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
connectors/b5c4ebfd-f672-49a3-83cd-31c7216a7bb8",
    "CreationTimestamp": "2019-06-19T19:30:01.300Z",
    "Id": "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8",
    "LastUpdatedTimestamp": "2019-06-19T19:30:01.300Z",

    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/connectors/b5c4ebfd-f672-49a3-83cd-31c7216a7bb8/versions/63c57963-
c7c2-4a26-a7e2-7bf478ea2623",
    "Name": "MySNSConnector",
    "tags": {}
}
```

For more information, see Integrate with Services and Protocols Using Greengrass Connectors in the **AWS IoT Greengrass Developer Guide**.

- For API details, see GetConnectorDefinition in *AWS CLI Command Reference*.

`get-core-definition-version`

The following code example shows how to use `get-core-definition-version`.

AWS CLI

To retrieve details about a specific version of the Greengrass core definition

The following `get-core-definition-version` example retrieves information about the specified version of the specified core definition. To retrieve the IDs of all versions of the core definition, use the `list-core-definition-versions` command. To retrieve the ID of the last version added to the core definition, use the `get-core-definition` command and check the `LatestVersion` property.

```
aws greengrass get-core-definition-version \
    --core-definition-id "c906ed39-a1e3-4822-a981-7b9bd57b4b46"  \
    --core-definition-version-id "42aeeac3-fd9d-4312-a8fd-ffa9404a20e0"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/cores/
c906ed39-a1e3-4822-a981-7b9bd57b4b46/versions/42aeeac3-fd9d-4312-a8fd-ffa9404a20e0",
    "CreationTimestamp": "2019-06-18T16:21:21.351Z",
    "Definition": {
        "Cores": [
            {
                "CertificateArn": "arn:aws:iot:us-
west-2:123456789012:cert/928dea7b82331b47c3ff77b0e763fc5e64e2f7c884e6ef391baed9b6b8e21b45",
                "Id": "1a39aac7-0885-4417-91f6-23e4cea6c511",
                "SyncShadow": false,
                "ThingArn": "arn:aws:iot:us-west-2:123456789012:thing/

            }
        ]
    },
    "Id": "c906ed39-a1e3-4822-a981-7b9bd57b4b46",
    "Version": "42aeeac3-fd9d-4312-a8fd-ffa9404a20e0"
}
```

- For API details, see GetCoreDefinitionVersion in *AWS CLI Command Reference*.

`get-core-definition`

The following code example shows how to use `get-core-definition`.

AWS CLI

To retrieve details for a Greengrass core definition

The following `get-core-definition` example retrieves information about the specified core definition. To retrieve the IDs of your core definitions, use the `list-core-definitions` command.

```
aws greengrass get-core-definition \
    --core-definition-id "c906ed39-a1e3-4822-a981-7b9bd57b4b46"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
cores/237d6916-27cf-457f-ba0c-e86cfb5d25cd",
    "CreationTimestamp": "2018-10-18T04:47:06.721Z",

    "tags": {}
}
```

- For API details, see GetCoreDefinition in *AWS CLI Command Reference*.

`get-deployment-status`

The following code example shows how to use `get-deployment-status`.

AWS CLI

To retrieve the status of a deployment

The following `get-deployment-status` example retrieves the status for the specified deployment of the specified Greengrass group. To get the deployment ID, use the `list-deployments` command and specify the group ID.

```
aws greengrass get-deployment-status \
    --group-id "1013db12-8b58-45ff-acc7-704248f66731" \
    --deployment-id "1065b8a0-812b-4f21-9d5d-e89b232a530f"
```

Output:

```
{
    "DeploymentStatus": "Success",
    "DeploymentType": "NewDeployment",
    "UpdatedAt": "2019-06-18T17:04:44.761Z"
}
```

- For API details, see GetDeploymentStatus in *AWS CLI Command Reference*.

`get-device-definition-version`

The following code example shows how to use `get-device-definition-version`.

AWS CLI

To get a device definition version

The following `get-device-definition-version` example retrieves information about the specified version of the specified device definition. To retrieve the IDs of all versions of the device definition, use the `list-device-definition-versions` command. To retrieve the ID of the last version added to the device definition, use the `get-device-definition` command and check the `LatestVersion` property.

```
aws greengrass get-device-definition-version \
    --device-definition-id "f9ba083d-5ad4-4534-9f86-026a45df1ccd" \
    --device-definition-version-id "83c13984-6fed-447e-84d5-5b8aa45d5f71"
```

Output:

```
{
    "Definition": {
        "Devices": [
            {
                "CertificateArn": "arn:aws:iot:us-

}
```

- For API details, see GetDeviceDefinitionVersion in *AWS CLI Command Reference*.

`get-device-definition`

The following code example shows how to use `get-device-definition`.

AWS CLI

To get a device definition

The following `get-device-definition` example retrieves information about the specified device definition. To retrieve the IDs of your device definitions, use the `list-device-definitions` command.

```
aws greengrass get-device-definition \
    --device-definition-id "f9ba083d-5ad4-4534-9f86-026a45df1ccd"
```

Output:

```
{
    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/devices/f9ba083d-5ad4-4534-9f86-026a45df1ccd/
versions/83c13984-6fed-447e-84d5-5b8aa45d5f71",
    "Name": "TemperatureSensors",

    "Id": "f9ba083d-5ad4-4534-9f86-026a45df1ccd",
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
devices/f9ba083d-5ad4-4534-9f86-026a45df1ccd"
}
```

- For API details, see GetDeviceDefinition in *AWS CLI Command Reference*.

get-function-definition-version

The following code example shows how to use `get-function-definition-version`.

AWS CLI

To retrieve details about a specific version of a Lambda function

The following `get-function-definition-version` retrieves information about the specified version of the specified function definition. To retrieve the IDs of all versions of the function definition, use the `list-function-definition-versions` command. To retrieve the ID of the last version added to the function definition, use the `get-function-definition` command and check the `LatestVersion` property.

```
aws greengrass get-function-definition-version \
    --function-definition-id "063f5d1a-1dd1-40b4-9b51-56f8993d0f85" \
    --function-definition-version-id "9748fda7-1589-4fcc-ac94-f5559e88678b"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/

```

- For API details, see GetFunctionDefinitionVersion in *AWS CLI Command Reference*.

`get-function-definition`

The following code example shows how to use `get-function-definition`.

AWS CLI

To retrieve a function definition

The following `get-function-definition` example displays details for the specified function definition. To retrieve the IDs of your function definitions, use the `list-function-definitions` command.

```
aws greengrass get-function-definition \
```

```
    --function-definition-id "063f5d1a-1dd1-40b4-9b51-56f8993d0f85"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
functions/063f5d1a-1dd1-40b4-9b51-56f8993d0f85",
    "CreationTimestamp": "2019-06-18T16:21:21.431Z",
    "Id": "063f5d1a-1dd1-40b4-9b51-56f8993d0f85",

versions/9748fda7-1589-4fcc-ac94-f5559e88678b",
    "tags": {}
}
```

- For API details, see GetFunctionDefinition in *AWS CLI Command Reference*.

`get-group-certificate-authority`

The following code example shows how to use `get-group-certificate-authority`.

AWS CLI

To retrieve the CA associated with a Greengrass group

The following `get-group-certificate-authority` example retrieves the certificate authority (CA) that is associated with the specified Greengrass group. To get the certificate authority ID, use the `list-group-certificate-authorities` command and specify the group ID.

```
aws greengrass get-group-certificate-authority \
    --group-id "1013db12-8b58-45ff-acc7-704248f66731" \
    --certificate-authority-
id "f0430e1736ea8ed30cc5d5de9af67a7e3586bad9ae4d89c2a44163f65fdd8cf6"
```

Output:

```
{
```

```
    "GroupCertificateAuthorityArn": "arn:aws:greengrass:us-west-2:123456789012:/

`get-group-certificate-configuration`

The following code example shows how to use `get-group-certificate-configuration`.

AWS CLI

To retrieve the configuration for the certificate authority used by the Greengrass group

The following `get-group-certificate-configuration` example retrieves the configuration for the certificate authority (CA) used by the specified Greengrass group.

```
aws greengrass get-group-certificate-configuration \
    --group-id "1013db12-8b58-45ff-acc7-704248f66731"
```

Output:

```
{
```

```
    "CertificateAuthorityExpiryInMilliseconds": 2524607999000,
    "CertificateExpiryInMilliseconds": 604800000,
    "GroupId": "1013db12-8b58-45ff-acc7-704248f66731"
}
```

- For API details, see GetGroupCertificateConfiguration in *AWS CLI Command Reference*.

get-group-version

The following code example shows how to use `get-group-version`.

AWS CLI

To retrieve information about a version of a Greengrass group

The following `get-group-version` example retrieves information about the specified version of the specified group. To retrieve the IDs of all versions of the group, use the `list-group-versions` command. To retrieve the ID of the last version added to the group, use the `get-group` command and check the `LatestVersion` property.

```
aws greengrass get-group-version \
    --group-id "1013db12-8b58-45ff-acc7-704248f66731"  \
    --group-version-id "115136b3-cfd7-4462-b77f-8741a4b00e5e"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/

```

- For API details, see GetGroupVersion in *AWS CLI Command Reference*.

`get-group`

The following code example shows how to use `get-group`.

AWS CLI

To retrieve information about a Greengrass group

The following `get-group` example retrieves information about the specified Greengrass group. To retrieve the IDs of your groups, use the `list-groups` command.

```
aws greengrass get-group \
    --group-id "1013db12-8b58-45ff-acc7-704248f66731"
```

Output:

```
{

    "Name": "GGGroup4Pi3",
    "tags": {}
}
```

- For API details, see GetGroup in *AWS CLI Command Reference*.

`get-logger-definition-version`

The following code example shows how to use `get-logger-definition-version`.

AWS CLI

To retrieve information about a version of a logger definition

The following `get-logger-definition-version` example retrieves information about the specified version of the specified logger definition. To retrieve the IDs of all versions of the logger definition, use the `list-logger-definition-versions` command. To retrieve the ID of the last version added to the logger definition, use the `get-logger-definition` command and check the `LatestVersion` property.

```
aws greengrass get-logger-definition-version \
    --logger-definition-id "49eeeb66-f1d3-4e34-86e3-3617262abf23" \
    --logger-definition-version-id "5e3f6f64-a565-491e-8de0-3c0d8e0f2073"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/

- For API details, see GetLoggerDefinition in *AWS CLI Command Reference*.

`get-resource-definition-version`

The following code example shows how to use `get-resource-definition-version`.

AWS CLI

To retrieve information about a specific version of a resource definition

The following `get-resource-definition-version` example retrieves information about the specified version of the specified resource definition. To retrieve the IDs of all versions of the resource definition, use the `list-resource-definition-versions` command. To retrieve the ID of the last version added to the resource definition, use the `get-resource-definition` command and check the `LatestVersion` property.

```
aws greengrass get-resource-definition-version \
    --resource-definition-id "ad8c101d-8109-4b0e-b97d-9cc5802ab658" \
    --resource-definition-version-id "26e8829a-491a-464d-9c87-664bf6f6f2be"
```

Output:

    "tags": {}
}
```

- For API details, see GetResourceDefinition in *AWS CLI Command Reference*.

`get-service-role-for-account`

The following code example shows how to use `get-service-role-for-account`.

AWS CLI

To retrieve the details for the service role that is attached to your account

The following `get-service-role-for-account` example retrieves information about the service role that is attached to your AWS account.

```
aws greengrass get-service-role-for-account
```

Output:

```
{
    "AssociatedAt": "2018-10-18T15:59:20Z",
    "RoleArn": "arn:aws:iam::123456789012:role/service-role/Greengrass_ServiceRole"
}
```

For more information, see Greengrass Service Role in the **AWS IoT Greengrass Developer Guide**.

- For API details, see GetServiceRoleForAccount in *AWS CLI Command Reference*.

`get-subscription-definition-version`

The following code example shows how to use `get-subscription-definition-version`.

AWS CLI

To retrieve information about a specific version of a subscription definition

The following `get-subscription-definition-version` example retrieves retrieves information about the specified version of the specified subscription definition. To retrieve the IDs of all versions of the subscription definition, use the `list-subscription-definition-versions` command. To retrieve the ID of the last version added to the subscription definition, use the `get-subscription-definition` command and check the `LatestVersion` property.

```
aws greengrass get-subscription-definition-version \
    --subscription-definition-id "70e49321-83d5-45d2-bc09-81f4917ae152" \
    --subscription-definition-version-id "88ae8699-12ac-4663-ba3f-4d7f0519140b"
```

Output:

```

    "tags": {}
}
```

- For API details, see GetSubscriptionDefinition in *AWS CLI Command Reference*.

`get-thing-runtime-configuration`

The following code example shows how to use `get-thing-runtime-configuration`.

AWS CLI

To retrieve the runtime configuration of a Greengrass core

The following `get-thing-runtime-configuration` example retrieves the runtime configuration of a Greengrass core. Before you can retrieve the runtime configuration, you must use the `update-thing-runtime-configuration` command to create a runtime configuration for the core.

```
aws greengrass get-thing-runtime-configuration \
    --thing-name SampleGreengrassCore
```

Output:

```
{
    "RuntimeConfiguration": {
        "TelemetryConfiguration": {
            "ConfigurationSyncStatus": "OutOfSync",
            "Telemetry": "On"
        }
    }
}
```

For more information, see Configuring telemetry settings in the *AWS IoT Greengrass Developer Guide*.

- For API details, see GetThingRuntimeConfiguration in *AWS CLI Command Reference*.

`list-bulk-deployment-detailed-reports`

The following code example shows how to use `list-bulk-deployment-detailed-reports`.

AWS CLI

To list information about individual deployments in a bulk deployment

The following `list-bulk-deployment-detailed-reports` example displays information about the individual deployments in a bulk deployment operation, including status.

```
aws greengrass list-bulk-deployment-detailed-reports \
    --bulk-deployment-id 42ce9c42-489b-4ed4-b905-8996aa50ef9d
```

Output:

```
{
    "Deployments": [
        {
```

```
            "DeploymentType": "NewDeployment",
            "DeploymentStatus": "Success",
            "DeploymentId": "123456789012:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",

EXAMPLE66666",
            "CreatedAt": "2020-01-21T21:34:16.486Z"
        },
        ...
    ]
}
```

For more information, see Create Bulk Deployments for Groups in the *AWS IoT Greengrass Developer Guide*.

- For API details, see ListBulkDeploymentDetailedReports in *AWS CLI Command Reference*.

`list-bulk-deployments`

The following code example shows how to use `list-bulk-deployments`.

AWS CLI

To list bulk deployments

The following `list-bulk-deployments` example lists all bulk deployments.

```
aws greengrass list-bulk-deployments
```

Output:

```
{
    "BulkDeployments": [
        {
            "BulkDeploymentArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/bulk/deployments/870fb41b-6288-4e0c-bc76-a7ba4b4d3267",
            "BulkDeploymentId": "870fb41b-6288-4e0c-bc76-a7ba4b4d3267",
            "CreatedAt": "2019-06-25T16:11:33.265Z"
        }
    ]
}
```

For more information, see Create Bulk Deployments for Groups in the *AWS IoT Greengrass Developer Guide*.

- For API details, see ListBulkDeployments in *AWS CLI Command Reference*.

`list-connector-definition-versions`

The following code example shows how to use `list-connector-definition-versions`.

AWS CLI

To list the versions that are available for a connector definition

The following `list-connector-definition-versions` example lists the versions that are available for the specified connector definition. Use the `list-connector-definitions` command to get the connector definition ID.

```
aws greengrass list-connector-definition-versions \
    --connector-definition-id "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8"
```

Output:

```
{
    "Versions": [
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/connectors/b5c4ebfd-f672-49a3-83cd-31c7216a7bb8/versions/63c57963-
c7c2-4a26-a7e2-7bf478ea2623",
```

```
            "CreationTimestamp": "2019-06-19T19:30:01.300Z",
            "Id": "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8",
            "Version": "63c57963-c7c2-4a26-a7e2-7bf478ea2623"
        }
    ]
}
```

For more information, see Integrate with Services and Protocols Using Greengrass Connectors in the **AWS IoT Greengrass Developer Guide**.

- For API details, see ListConnectorDefinitionVersions in *AWS CLI Command Reference*.

`list-connector-definitions`

The following code example shows how to use `list-connector-definitions`.

AWS CLI

To list the Greengrass connectors that are defined

The following `list-connector-definitions` example lists all of the Greengrass connectors that are defined for your AWS account.

```
aws greengrass list-connector-definitions
```

Output:

```
{
    "Definitions": [
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/connectors/b5c4ebfd-f672-49a3-83cd-31c7216a7bb8",
            "CreationTimestamp": "2019-06-19T19:30:01.300Z",
            "Id": "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8",
            "LastUpdatedTimestamp": "2019-06-19T19:30:01.300Z",

            "Name": "MySNSConnector"
        }
    ]
```

```
}
```

For more information, see Integrate with Services and Protocols Using Greengrass Connectors in the **AWS IoT Greengrass Developer Guide**.

- For API details, see ListConnectorDefinitions in *AWS CLI Command Reference*.

`list-core-definition-versions`

The following code example shows how to use `list-core-definition-versions`.

AWS CLI

To list the versions of a Greengrass core definition

The following `list-core-definitions` example lists all versions of the specified Greengrass core definition. You can use the `list-core-definitions` command to get the version ID.

```
aws greengrass list-core-definition-versions \
    --core-definition-id "eaf280cb-138c-4d15-af36-6f681a1348f7"
```

Output:

```
{
    "Versions": [
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/

- For API details, see ListCoreDefinitions in *AWS CLI Command Reference*.

`list-deployments`

The following code example shows how to use `list-deployments`.

AWS CLI

To list the deployments for a Greengrass group

The following `list-deployments` example lists the deployments for the specified Greengrass group. You can use the `list-groups` command to look up your group ID.

```
aws greengrass list-deployments \
    --group-id "1013db12-8b58-45ff-acc7-704248f66731"
```

Output:

```
{
    "Deployments": [
        {
            "CreatedAt": "2019-06-18T17:04:32.702Z",
            "DeploymentId": "1065b8a0-812b-4f21-9d5d-e89b232a530f",
            "DeploymentType": "NewDeployment",
```

```
            "GroupArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
groups/1013db12-8b58-45ff-acc7-704248f66731/versions/115136b3-cfd7-4462-
b77f-8741a4b00e5e"
        }
    ]
}
```

- For API details, see ListDeployments in *AWS CLI Command Reference*.

`list-device-definition-versions`

The following code example shows how to use `list-device-definition-versions`.

AWS CLI

To list the versions of a device definition

The following `list-device-definition-versions` example displays the device definition versions associated with the specified device definition.

```
aws greengrass list-device-definition-versions \
    --device-definition-id "f9ba083d-5ad4-4534-9f86-026a45df1ccd"
```

Output:

```
{
    "Versions": [
        {
            "Version": "83c13984-6fed-447e-84d5-5b8aa45d5f71",
            "CreationTimestamp": "2019-09-11T00:15:09.838Z",
            "Id": "f9ba083d-5ad4-4534-9f86-026a45df1ccd",
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/

versions/3b5cc510-58c1-44b5-9d98-4ad858ffa795"
```

```
        }
    ]
}
```

- For API details, see ListDeviceDefinitionVersions in *AWS CLI Command Reference*.

`list-device-definitions`

The following code example shows how to use `list-device-definitions`.

AWS CLI

To list your device definitions

The following `list-device-definitions` example displays details about the device definitions in your AWS account in the specified AWS Region.

```
aws greengrass list-device-definitions \
    --region us-west-2
```

Output:

```
{
    "Definitions": [
        {

`list-function-definitions`

The following code example shows how to use `list-function-definitions`.

AWS CLI

To list Lambda functions

The following `list-function-definitions` example lists all of the Lambda functions defined for your AWS account.

```
aws greengrass list-function-definitions
```

Output:

```
{
    "Definitions": [
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/

`list-resource-definitions`

The following code example shows how to use `list-resource-definitions`.

AWS CLI

To list the resources that are defined

The following `list-resource-definitions` example lists the resources that are defined for AWS IoT Greengrass to use.

```
aws greengrass list-resource-definitions
```

Output:

```
{
    "Definitions": [
```

```
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/

    ]
}
```

- For API details, see ListResourceDefinitions in *AWS CLI Command Reference*.

`list-subscription-definition-versions`

The following code example shows how to use `list-subscription-definition-versions`.

AWS CLI

To list the versions of a subscription definition

The following `list-subscription-definition-versions` example lists all versions of the specified subscription. You can use the `list-subscription-definitions` command to look up the subscription ID.

```
aws greengrass list-subscription-definition-versions \
    --subscription-definition-id "70e49321-83d5-45d2-bc09-81f4917ae152"
```

Output:

```
{
    "Versions": [
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/subscriptions/70e49321-83d5-45d2-bc09-81f4917ae152/
versions/88ae8699-12ac-4663-ba3f-4d7f0519140b",
            "CreationTimestamp": "2019-06-18T17:03:52.499Z",
            "Id": "70e49321-83d5-45d2-bc09-81f4917ae152",
            "Version": "88ae8699-12ac-4663-ba3f-4d7f0519140b"
        },
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/

            "Id": "70e49321-83d5-45d2-bc09-81f4917ae152",
            "Version": "7e320ba3-c369-4069-a2f0-90acb7f219d6"
        }
    ]
}
```

- For API details, see ListSubscriptionDefinitionVersions in *AWS CLI Command Reference*.

`list-subscription-definitions`

The following code example shows how to use `list-subscription-definitions`.

AWS CLI

To get a list subscription definitions

The following `list-subscription-definitions` example lists all of the AWS IoT Greengrass subscriptions that are defined in your AWS account.

```
aws greengrass list-subscription-definitions
```

Output:

```
{
```

```
    "Definitions": [
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/

            "LatestVersion": "086d1b08-b25a-477c-a16f-6f9b3a9c295a",
            "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/subscriptions/fa81bc84-3f59-4377-a84b-5d0134da359b/
versions/086d1b08-b25a-477c-a16f-6f9b3a9c295a"
        }
    ]
}
```

- For API details, see ListSubscriptionDefinitions in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags attached to a resource

The following `list-tags-for-resource` example lists the tags and their values that are attached to the specified resource.

```
aws greengrass list-tags-for-resource \
    --resource-arn "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/resources/ad8c101d-8109-4b0e-b97d-9cc5802ab658"
```

Output:

```
{
    "tags": {
        "ResourceSubType": "USB",
        "ResourceType": "Device"
    }
}
```

For more information, see Tagging Your Greengrass Resources in the **AWS IoT Greengrass Developer Guide**.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`reset-deployments`

The following code example shows how to use `reset-deployments`.

AWS CLI

To clean up deployment information for a Greengrass group

The following `reset-deployments` example cleans up deployment information for the specified Greengrass group. When you add the `--force option`, the deployment information is reset without waiting for the core device to respond.

```
aws greengrass reset-deployments \
    --group-id "1402daf9-71cf-4cfe-8be0-d5e80526d0d8" \
    --force
```

Output:

```
{
    "DeploymentArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/groups/1402daf9-71cf-4cfe-8be0-d5e80526d0d8/
deployments/7dd4e356-9882-46a3-9e28-6d21900c011a",
    "DeploymentId": "7dd4e356-9882-46a3-9e28-6d21900c011a"
}
```

For more information, see Reset Deployments in the *AWS IoT Greengrass Developer Guide*.

- For API details, see ResetDeployments in *AWS CLI Command Reference*.

`start-bulk-deployment`

The following code example shows how to use `start-bulk-deployment`.

AWS CLI

To start a bulk deployment operation

The following `start-bulk-deployment` example starts a bulk deployment operation, using a file stored in an S3 bucket to specify the groups to be deployed.

```
aws greengrass start-bulk-deployment \
    --cli-input-json "{\"InputFileUri\":\"https://gg-group-deployment1.s3-us-
west-2.amazonaws.com/MyBulkDeploymentInputFile.txt\", \"ExecutionRoleArn\":
\"arn:aws:iam::123456789012:role/ggCreateDeploymentRole\",\"AmznClientToken\":
\"yourAmazonClientToken\"}"
```

Output:

```
{
    "BulkDeploymentArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
bulk/deployments/870fb41b-6288-4e0c-bc76-a7ba4b4d3267",
    "BulkDeploymentId": "870fb41b-6288-4e0c-bc76-a7ba4b4d3267"
}
```

For more information, see Create Bulk Deployments for Groups in the *AWS IoT Greengrass Developer Guide*.

- For API details, see StartBulkDeployment in *AWS CLI Command Reference*.

`stop-bulk-deployment`

The following code example shows how to use `stop-bulk-deployment`.

AWS CLI

To stop a bulk deployment

The following `stop-bulk-deployment` example stops the specified bulk deployment. If you try to stop a bulk deployment that is complete, you receive an error: `InvalidInputException: Cannot change state of finished execution.`

```
aws greengrass stop-bulk-deployment \
    --bulk-deployment-id "870fb41b-6288-4e0c-bc76-a7ba4b4d3267"
```

This command produces no output.

For more information, see Create Bulk Deployments for Groups in the *AWS IoT Greengrass Developer Guide*.

- For API details, see StopBulkDeployment in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To apply tags to a resource

The following `tag-resource` example applies two tags, `ResourceType` and `ResourceSubType`, to the specified Greengrass resource. This operation can both add new tags and values or update the value for existing tags. Use the `untag-resource` command to remove a tag.

```
aws greengrass tag-resource \
    --resource-arn "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/resources/ad8c101d-8109-4b0e-b97d-9cc5802ab658" \
    --tags "ResourceType=Device,ResourceSubType=USB"
```

This command produces no output.

For more information, see Tagging Your Greengrass Resources in the **AWS IoT Greengrass Developer Guide**.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag and its value from a resource

The following `untag-resource` example removes the tag whose key is `Category` from the specified Greengrass group. If the key `Category` does not exist for the specified resource, no error is returned.

```
aws greengrass untag-resource \
    --resource-arn "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
groups/1013db12-8b58-45ff-acc7-704248f66731" \
    --tag-keys "Category"
```

This command produces no output.

For more information, see Tagging Your Greengrass Resources in the **AWS IoT Greengrass Developer Guide**.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-connectivity-info`

The following code example shows how to use `update-connectivity-info`.

AWS CLI

To update the connectivity information for a Greengrass core

The following `update-connectivity-info` example changes the endpoints that devices can use to connect to the specified Greengrass core. Connectivity information is a list of IP addresses or domain names, with corresponding port numbers and optional customer-defined metadata. You might need to update connectivity information when the local network changes.

```
aws greengrass update-connectivity-info \
    --thing-name "MyGroup_Core" \
    --connectivity-info "[{\"Metadata\":\"\",\"PortNumber\":8883,\"HostAddress\":
\"127.0.0.1\",\"Id\":\"localhost_127.0.0.1_0\"},{\"Metadata\":\"\",\"PortNumber
\":8883,\"HostAddress\":\"192.168.1.3\",\"Id\":\"localIP_192.168.1.3\"}]"
```

Output:

```
{
    "Version": "312de337-59af-4cf9-a278-2a23bd39c300"
}
```

- For API details, see UpdateConnectivityInfo in *AWS CLI Command Reference*.

`update-connector-definition`

The following code example shows how to use `update-connector-definition`.

AWS CLI

To update the name for a connector definition

The following `update-connector-definition` example updates the name for the specified connector definition. If you want to update the details for the connector, use the `create-connector-definition-version` command to create a new version.

```
aws greengrass update-connector-definition \
    --connector-definition-id "55d0052b-0d7d-44d6-b56f-21867215e118" \
    --name "GreengrassConnectors2019"
```

For more information, see Integrate with Services and Protocols Using Connectors in the *AWS IoT Greengrass Developer Guide*.

- For API details, see UpdateConnectorDefinition in *AWS CLI Command Reference*.

`update-core-definition`

The following code example shows how to use `update-core-definition`.

AWS CLI

To update a core definition

The following `update-core-definition` example changes the name of the specified core definition. You can update only the `name` property of a core definition.

```
aws greengrass update-core-definition \
    --core-definition-id "582efe12-b05a-409e-9a24-a2ba1bcc4a12" \
    --name "MyCoreDevices"
```

This command produces no output.

For more information, see Configure the AWS IoT Greengrass Core in the *AWS IoT Greengrass Developer Guide*.

- For API details, see UpdateCoreDefinition in *AWS CLI Command Reference*.

`update-device-definition`

The following code example shows how to use `update-device-definition`.

AWS CLI

To update a device definition

The following `update-device-definition` example changes the name of the specified device definition. You can only update the `name` property of a device definition.

```
aws greengrass update-device-definition \
    --device-definition-id "f9ba083d-5ad4-4534-9f86-026a45df1ccd" \
    --name "TemperatureSensors"
```

This command produces no output.

- For API details, see UpdateDeviceDefinition in *AWS CLI Command Reference*.

`update-function-definition`

The following code example shows how to use `update-function-definition`.

AWS CLI

To update the name for a function definition

The following `update-function-definition` example updates the name for the specified function definition. If you want to update the details for the function, use the `create-function-definition-version` command to create a new version.

```
aws greengrass update-function-definition \
    --function-definition-id "e47952bd-dea9-4e2c-a7e1-37bbe8807f46" \
    --name ObsoleteFunction
```

This command produces no output.

For more information, see Run Local Lambda Functions in the *AWS IoT Greengrass Developer Guide*.

- For API details, see UpdateFunctionDefinition in *AWS CLI Command Reference*.

`update-group-certificate-configuration`

The following code example shows how to use `update-group-certificate-configuration`.

AWS CLI

To update the expiry of a group's certificates

The following `update-group-certificate-configuration` example sets a 10-day expiry for the certificates generated for the specified group.

```
aws greengrass update-group-certificate-configuration \
    --group-id "8eaadd72-ce4b-4f15-892a-0cc4f3a343f1" \
    --certificate-expiry-in-milliseconds 864000000
```

Output:

```
{
    "CertificateExpiryInMilliseconds": 864000000,
    "CertificateAuthorityExpiryInMilliseconds": 2524607999000,
    "GroupId": "8eaadd72-ce4b-4f15-892a-0cc4f3a343f1"
}
```

For more information, see AWS IoT Greengrass Security in the *AWS IoT Greengrass Developer Guide*.

- For API details, see UpdateGroupCertificateConfiguration in *AWS CLI Command Reference*.

update-group

The following code example shows how to use `update-group`.

AWS CLI

To update the group name

The following `update-group` example updates the name of the specified Greengrass group. If you want to update the details for the group, use the `create-group-version` command to create a new version.

```
aws greengrass update-group \
    --group-id "1402daf9-71cf-4cfe-8be0-d5e80526d0d8" \
    --name TestGroup4of6
```

For more information, see Configure AWS IoT Greengrass on AWS IoT in the *AWS IoT Greengrass Developer Guide*.

- For API details, see UpdateGroup in *AWS CLI Command Reference*.

update-logger-definition

The following code example shows how to use `update-logger-definition`.

AWS CLI

To update a logger definition

The following `update-logger-definition` example changes the name of the specified logger definition. You can only update the `name` property of a logger definition.

```
aws greengrass update-logger-definition \
    --logger-definition-id "a454b62a-5d56-4ca9-bdc4-8254e1662cb0" \
    --name "LoggingConfigsForSensors"
```

This command produces no output.

For more information, see Monitoring with AWS IoT Greengrass Logs in the *AWS IoT Greengrass Developer Guide*.

- For API details, see UpdateLoggerDefinition in *AWS CLI Command Reference*.

`update-resource-definition`

The following code example shows how to use `update-resource-definition`.

AWS CLI

To update the name for a resource definition

The following `update-resource-definition` example updates the name for the specified resource definition. If you want to change the details for the resource, use the `create-resource-definition-version` command to create a new version.

```
aws greengrass update-resource-definition \
    --resource-definition-id "c8bb9ebc-c3fd-40a4-9c6a-568d75569d38" \
    --name GreengrassConnectorResources
```

This command produces no output.

For more information, see Access Local Resources with Lambda Functions and Connectors in the *AWS IoT Greengrass Developer Guide*.

- For API details, see UpdateResourceDefinition in *AWS CLI Command Reference*.

`update-subscription-definition`

The following code example shows how to use `update-subscription-definition`.

AWS CLI

To update the name for a subscription definition

The following `update-subscription-definition` example updates the name for the specified subscription definition. If you want to change details for the subscription, use the `create-subscription-definition-version` command to create a new version.

```
aws greengrass update-subscription-definition \
    --subscription-definition-id "fa81bc84-3f59-4377-a84b-5d0134da359b" \
```

```
    --name "ObsoleteSubscription"
```

This command produces no output.

For more information, see title in the *guide*.

- For API details, see UpdateSubscriptionDefinition in *AWS CLI Command Reference*.

`update-thing-runtime-configuration`

The following code example shows how to use `update-thing-runtime-configuration`.

AWS CLI

To turn on telemetry in the runtime configuration of a Greengrass core

The following `update-thing-runtime-configuration` example updates the runtime configuration of a Greengrass core to turn on telemetry.

```
aws greengrass update-thing-runtime-configuration \
    --thing-name SampleGreengrassCore \
    --telemetry-configuration {\"Telemetry\":\"On\"}
```

This command produces no output.

For more information, see Configuring telemetry settings in the *AWS IoT Greengrass Developer Guide*.

- For API details, see UpdateThingRuntimeConfiguration in *AWS CLI Command Reference*.

AWS IoT Greengrass V2 examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Greengrass V2.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`associate-service-role-to-account`

The following code example shows how to use `associate-service-role-to-account`.

AWS CLI

To associate the Greengrass service role to your AWS account

The following `associate-service-role-to-account` example associates a service role with AWS IoT Greengrass for your AWS account.

```
aws greengrassv2 associate-service-role-to-account \
    --role-arn arn:aws:iam::123456789012:role/service-role/Greengrass_ServiceRole
```

Output:

```
{
    "associatedAt": "2022-01-19T19:21:53Z"
}
```

For more information, see Greengrass service role in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see AssociateServiceRoleToAccount in *AWS CLI Command Reference*.

`batch-associate-client-device-with-core-device`

The following code example shows how to use `batch-associate-client-device-with-core-device`.

AWS CLI

To associate client devices with a core device

The following `batch-associate-client-device-with-core-device` example associates two client devices with a core device.

```
aws greengrassv2 batch-associate-client-device-with-core-device \
  --core-device-thing-name MyGreengrassCore \
  --entries thingName=MyClientDevice1 thingName=MyClientDevice2
```

Output:

```
{
    "errorEntries": []
}
```

For more information, see Interact with local IoT devices in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see BatchAssociateClientDeviceWithCoreDevice in *AWS CLI Command Reference*.

`batch-disassociate-client-device-from-core-device`

The following code example shows how to use `batch-disassociate-client-device-from-core-device`.

AWS CLI

To disassociate client devices from a core device

The following `batch-disassociate-client-device-from-core-device` example disassociates two client devices from a core device.

```
aws greengrassv2 batch-disassociate-client-device-from-core-device \
  --core-device-thing-name MyGreengrassCore \
  --entries thingName=MyClientDevice1 thingName=MyClientDevice2
```

Output:

```
{
    "errorEntries": []
}
```

For more information, see Interact with local IoT devices in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see BatchDisassociateClientDeviceFromCoreDevice in *AWS CLI Command Reference*.

`cancel-deployment`

The following code example shows how to use `cancel-deployment`.

AWS CLI

To cancel a deployment

The following `cancel-deployment` example stops a continuous deployment to a thing group.

```
aws greengrassv2 cancel-deployment \
    --deployment-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "message": "SUCCESS"
}
```

For more information, see Cancel deployments in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see CancelDeployment in *AWS CLI Command Reference*.

`create-component-version`

The following code example shows how to use `create-component-version`.

AWS CLI

Example 1: To create a component version from a recipe

The following `create-component-version` example creates a version of a Hello World component from a recipe file.

```
aws greengrassv2 create-component-version \
    --inline-recipe fileb://com.example.HelloWorld-1.0.0.json
```

Contents of `com.example.HelloWorld-1.0.0.json`:

```
{
    "RecipeFormatVersion": "2020-01-25",
    "ComponentName": "com.example.HelloWorld",
    "ComponentVersion": "1.0.0",
    "ComponentDescription": "My first AWS IoT Greengrass component.",
    "ComponentPublisher": "Amazon",
    "ComponentConfiguration": {
        "DefaultConfiguration": {
            "Message": "world"
        }
    },
    "Manifests": [
        {
            "Platform": {
                "os": "linux"
            },
            "Lifecycle": {
                "Run": "echo 'Hello {configuration:/Message}'"
            }
        }
    ]
}
```

Output:

```
{
    "arn": "arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld:versions:1.0.0",
    "componentName": "com.example.HelloWorld",
    "componentVersion": "1.0.0",
    "creationTimestamp": "2021-01-07T16:24:33.650000-08:00",
    "status": {
        "componentState": "REQUESTED",
        "message": "NONE",
        "errors": {}
    }
}
```

For more information, see Create custom components and Upload components to deploy in the *AWS IoT Greengrass V2 Developer Guide*.

Example 2: To create a component version from an AWS Lambda function

The following `create-component-version` example creates a version of a Hello World component from an AWS Lambda function.

```
aws greengrassv2 create-component-version \
    --cli-input-json file://lambda-function-component.json
```

Contents of `lambda-function-component.json`:

```
{
    "lambdaFunction": {
        "lambdaArn": "arn:aws:lambda:us-
west-2:123456789012:function:HelloWorldPythonLambda:1",
        "componentName": "com.example.HelloWorld",
        "componentVersion": "1.0.0",
        "componentLambdaParameters": {
            "eventSources": [
                {
                    "topic": "hello/world/+",
                    "type": "IOT_CORE"
                }
            ]
        }
    }
}
```

Output:

```
{
    "arn": "arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld:versions:1.0.0",
    "componentName": "com.example.HelloWorld",
    "componentVersion": "1.0.0",
    "creationTimestamp": "2021-01-07T17:05:27.347000-08:00",
    "status": {
        "componentState": "REQUESTED",
        "message": "NONE",
        "errors": {}
    }
}
```

For more information, see Run AWS Lambda functions in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see CreateComponentVersion in *AWS CLI Command Reference*.

`create-deployment`

The following code example shows how to use `create-deployment`.

AWS CLI

Example 1: To create a deployment

The following `create-deployment` example deploys the AWS IoT Greengrass Command Line Interface to a core device.

```
aws greengrassv2 create-deployment \
    --cli-input-json file://cli-deployment.json
```

Contents of `cli-deployment.json`:

```
{
    "targetArn": "arn:aws:iot:us-west-2:123456789012:thing/MyGreengrassCore",
    "deploymentName": "Deployment for MyGreengrassCore",
    "components": {
        "aws.greengrass.Cli": {
            "componentVersion": "2.0.3"
        }
    },
    "deploymentPolicies": {
        "failureHandlingPolicy": "DO_NOTHING",
        "componentUpdatePolicy": {
            "timeoutInSeconds": 60,
            "action": "NOTIFY_COMPONENTS"
        },
        "configurationValidationPolicy": {
            "timeoutInSeconds": 60
        }
    },
    "iotJobConfiguration": {}
}
```

Output:

```
{
```

```
    "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Create deployments in the *AWS IoT Greengrass V2 Developer Guide*.

Example 2: To create a deployment that updates component configurations

The following `create-deployment` example deploys the AWS IoT Greengrass nucleus component to a group of core devices. This deployment applies the following configuration updates for the nucleus component:

Reset the target devices' proxy settings to their default no proxy settings.Reset the target devices' MQTT settings to their defaults.Sets the JVM options for the nucleus' JVM.Sets the logging level for the nucleus.

```
aws greengrassv2 create-deployment \
    --cli-input-json file://nucleus-deployment.json
```

Contents of `nucleus-deployment.json`:

```
{
    "targetArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/
MyGreengrassCoreGroup",
    "deploymentName": "Deployment for MyGreengrassCoreGroup",
    "components": {
        "aws.greengrass.Nucleus": {
            "componentVersion": "2.0.3",
            "configurationUpdate": {
                "reset": [
                    "/networkProxy",
                    "/mqtt"
                ],
                "merge": "{\"jvmOptions\":\"-Xmx64m\",\"logging\":{\"level\":\"WARN
\"}}"
            }
        }
    },
    "deploymentPolicies": {
        "failureHandlingPolicy": "ROLLBACK",
        "componentUpdatePolicy": {
            "timeoutInSeconds": 60,
            "action": "NOTIFY_COMPONENTS"
```

```
        },
        "configurationValidationPolicy": {
            "timeoutInSeconds": 60
        }
    },
    "iotJobConfiguration": {}
}
```

Output:

```
{
    "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "iotJobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "iotJobArn": "arn:aws:iot:us-west-2:123456789012:job/a1b2c3d4-5678-90ab-cdef-
EXAMPLE22222"
}
```

For more information, see Create deployments and Update component configurations in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see CreateDeployment in *AWS CLI Command Reference*.

`delete-component`

The following code example shows how to use `delete-component`.

AWS CLI

To delete a component version

The following `delete-component` example deletes a Hello World component.

```
aws greengrassv2 delete-component \
    --arn arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld:versions:1.0.0
```

This command produces no output.

For more information, see Manage components in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see DeleteComponent in *AWS CLI Command Reference*.

`delete-core-device`

The following code example shows how to use `delete-core-device`.

AWS CLI

To delete a core device

The following `delete-core-device` example deletes an AWS IoT Greengrass core device.

```
aws greengrassv2 delete-core-device \
    --core-device-thing-name MyGreengrassCore
```

This command produces no output.

For more information, see Uninstall the AWS IoT Greengrass Core software in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see DeleteCoreDevice in *AWS CLI Command Reference*.

`describe-component`

The following code example shows how to use `describe-component`.

AWS CLI

To describe a component version

The following `describe-component` example describes a Hello World component.

```
aws greengrassv2 describe-component \
    --arn arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld:versions:1.0.0
```

Output:

```
{
    "arn": "arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld:versions:1.0.0",
    "componentName": "com.example.HelloWorld",
    "componentVersion": "1.0.0",
    "creationTimestamp": "2021-01-07T17:12:11.133000-08:00",
    "publisher": "Amazon",
```

```
    "description": "My first AWS IoT Greengrass component.",
    "status": {
        "componentState": "DEPLOYABLE",
        "message": "NONE",
        "errors": {}
    },
    "platforms": [
        {
            "attributes": {
                "os": "linux"
            }
        }
    ]
}
```

For more information, see Manage components in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see DescribeComponent in *AWS CLI Command Reference*.

`disassociate-service-role-from-account`

The following code example shows how to use `disassociate-service-role-from-account`.

AWS CLI

To disassociate the Greengrass service role from your AWS account

The following `disassociate-service-role-from-account` example disassociates the Greengrass service role from AWS IoT Greengrass for your AWS account.

```
aws greengrassv2 disassociate-service-role-from-account
```

Output:

```
{
    "disassociatedAt": "2022-01-19T19:26:09Z"
}
```

For more information, see Greengrass service role in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see DisassociateServiceRoleFromAccount in *AWS CLI Command Reference*.

`get-component-version-artifact`

The following code example shows how to use `get-component-version-artifact`.

AWS CLI

To get a URL to download a component artifact

The following `get-component-version-artifact` example gets a URL to download the local debug console component's JAR file.

```
aws greengrassv2 get-component-version-artifact \
    --arn arn:aws:greengrass:us-
west-2:aws:components:aws.greengrass.LocalDebugConsole:versions:2.0.3 \
    --artifact-name "Uvt6ZEzQ9TKiAuLbfXBX_APdY0TWks3uc46tHFHTzBM=/
aws.greengrass.LocalDebugConsole.jar"
```

Output:

```
{
    "preSignedUrl": "https://evergreencomponentmanageme-
artifactbucket7410c9ef-g18n1iya8kwr.s3.us-west-2.amazonaws.com/public/
aws.greengrass.LocalDebugConsole/2.0.3/s3/ggv2-component-releases-prod-pdx/
EvergreenHttpDebugView/2ffc496ba41b39568968b22c582b4714a937193ee7687a45527238e696672521/
aws.greengrass.LocalDebugConsole/aws.greengrass.LocalDebugConsole.jar?X-Amz-
Security-Token=KwfLKSdEXAMPLE..."
}
```

For more information, see Manage components in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see GetComponentVersionArtifact in *AWS CLI Command Reference*.

`get-component`

The following code example shows how to use `get-component`.

AWS CLI

Example 1: To download a component's recipe in YAML format (Linux, macOS, or Unix)

The following `get-component` example downloads a Hello World component's recipe to a file in YAML format. This command does the following:

Uses the `--output` and `--query` parameters to control the command's output. These parameters extract the recipe blob from the command's output. For more information about controlling output, see Controlling Command Output in the *AWS Command Line Interface User Guide*.Uses the `base64` utility. This utility decodes the extracted blob to the original text. The blob that is returned by a successful `get-component` command is base64-encoded text. You must decode this blob to obtain the original text.Saves the decoded text to a file. The final section of the command (`> com.example.HelloWorld-1.0.0.json`) saves the decoded text to a file.

```
aws greengrassv2 get-component \
    --arn arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld:versions:1.0.0 \
    --recipe-output-format YAML \
    --query recipe \
    --output text | base64 --decode > com.example.HelloWorld-1.0.0.json
```

For more information, see Manage components in the *AWS IoT Greengrass V2 Developer Guide*.

Example 2: To download a component's recipe in YAML format (Windows CMD)

The following `get-component` example downloads a Hello World component's recipe to a file in YAML format. This command uses the `certutil` utility.

```
aws greengrassv2 get-component ^
    --arn arn:aws:greengrass:us-
west-2:675946970638:components:com.example.HelloWorld:versions:1.0.0 ^
    --recipe-output-format YAML ^
    --query recipe ^
    --output text > com.example.HelloWorld-1.0.0.yaml.b64

certutil -
decode com.example.HelloWorld-1.0.0.yaml.b64 com.example.HelloWorld-1.0.0.yaml
```

For more information, see Manage components in the *AWS IoT Greengrass V2 Developer Guide*.

Example 3: To download a component's recipe in YAML format (Windows PowerShell)

The following `get-component` example downloads a Hello World component's recipe to a file in YAML format. This command uses the `certutil` utility.

```
aws greengrassv2 get-component `
```

```
    --arn arn:aws:greengrass:us-
west-2:675946970638:components:com.example.HelloWorld:versions:1.0.0 `
    --recipe-output-format YAML `
    --query recipe `
    --output text > com.example.HelloWorld-1.0.0.yaml.b64

certutil -
decode com.example.HelloWorld-1.0.0.yaml.b64 com.example.HelloWorld-1.0.0.yaml
```

For more information, see Manage components in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see GetComponent in *AWS CLI Command Reference*.

`get-connectivity-info`

The following code example shows how to use `get-connectivity-info`.

AWS CLI

To get the connectivity information for a Greengrass core device

The following `get-connectivity-info` example gets the connectivity information for a Greengrass core device. Client devices use this information to connect to the MQTT broker that runs on this core device.

```
aws greengrassv2 get-connectivity-info \
    --thing-name MyGreengrassCore
```

Output:

```
{
    "connectivityInfo": [
        {
            "id": "localIP_192.0.2.0",
            "hostAddress": "192.0.2.0",
            "portNumber": 8883
        }
    ]
}
```

For more information, see Manage core device endpoints in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see GetConnectivityInfo in *AWS CLI Command Reference*.

`get-core-device`

The following code example shows how to use `get-core-device`.

AWS CLI

To get a core device

The following `get-core-device` example gets information about an AWS IoT Greengrass core device.

```
aws greengrassv2 get-core-device \
    --core-device-thing-name MyGreengrassCore
```

Output:

```
{
    "coreDeviceThingName": "MyGreengrassCore",
    "coreVersion": "2.0.3",
    "platform": "linux",
    "architecture": "amd64",
    "status": "HEALTHY",
    "lastStatusUpdateTimestamp": "2021-01-08T04:57:58.838000-08:00",
    "tags": {}
}
```

For more information, see Check core device status in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see GetCoreDevice in *AWS CLI Command Reference*.

`get-deployment`

The following code example shows how to use `get-deployment`.

AWS CLI

To get a deployment

The following `get-deployment` example gets information about the deployment of the AWS IoT Greengrass nucleus component to a group of core devices.

```
aws greengrassv2 get-deployment \
    --deployment-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "targetArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/
MyGreengrassCoreGroup",
    "revisionId": "14",
    "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "deploymentName": "Deployment for MyGreengrassCoreGroup",
    "deploymentStatus": "ACTIVE",
    "iotJobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "iotJobArn": "arn:aws:iot:us-west-2:123456789012:job/a1b2c3d4-5678-90ab-cdef-
EXAMPLE22222",
    "components": {
        "aws.greengrass.Nucleus": {
            "componentVersion": "2.0.3",
            "configurationUpdate": {
                "merge": "{\"jvmOptions\":\"-Xmx64m\",\"logging\":{\"level\":\"WARN
\"}}",
                "reset": [
                    "/networkProxy",
                    "/mqtt"
                ]
            }
        }
    },
    "deploymentPolicies": {
        "failureHandlingPolicy": "ROLLBACK",
        "componentUpdatePolicy": {
            "timeoutInSeconds": 60,
            "action": "NOTIFY_COMPONENTS"
        },
        "configurationValidationPolicy": {
            "timeoutInSeconds": 60
        }
    },
    "iotJobConfiguration": {},
    "creationTimestamp": "2021-01-07T17:21:20.691000-08:00",
```

```
    "isLatestForTarget": false,
    "tags": {}
}
```

For more information, see [Deploy components to devices](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [GetDeployment](#) in *AWS CLI Command Reference*.

`get-service-role-for-account`

The following code example shows how to use `get-service-role-for-account`.

AWS CLI

To get the Greengrass service role for your AWS account

The following `get-service-role-for-account` example gets the service role that's associated with AWS IoT Greengrass for your AWS account.

```
aws greengrassv2 get-service-role-for-account
```

Output:

```
{
    "associatedAt": "2022-01-19T19:21:53Z",
    "roleArn": "arn:aws:iam::123456789012:role/service-role/Greengrass_ServiceRole"
}
```

For more information, see [Greengrass service role](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [GetServiceRoleForAccount](#) in *AWS CLI Command Reference*.

`list-client-devices-associated-with-core-device`

The following code example shows how to use `list-client-devices-associated-with-core-device`.

AWS CLI

To list the client devices associated with a core device

The following `list-client-devices-associated-with-core-device` example lists all client devices associated with a core device.

```
aws greengrassv2 list-client-devices-associated-with-core-device \
  --core-device-thing-name MyTestGreengrassCore
```

Output:

```
{
    "associatedClientDevices": [
        {
            "thingName": "MyClientDevice2",
            "associationTimestamp": "2021-07-12T16:33:55.843000-07:00"
        },
        {
            "thingName": "MyClientDevice1",
            "associationTimestamp": "2021-07-12T16:33:55.843000-07:00"
        }
    ]
}
```

For more information, see Interact with local IoT devices in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see ListClientDevicesAssociatedWithCoreDevice in *AWS CLI Command Reference*.

`list-component-versions`

The following code example shows how to use `list-component-versions`.

AWS CLI

To list the versions of a component

The following `list-component-versions` example lists all versions of a Hello World component.

```
aws greengrassv2 list-component-versions \
    --arn arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld
```

Output:

```
{
    "componentVersions": [
        {
            "componentName": "com.example.HelloWorld",
            "componentVersion": "1.0.1",
            "arn": "arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld:versions:1.0.1"
        },
        {
            "componentName": "com.example.HelloWorld",
            "componentVersion": "1.0.0",
            "arn": "arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld:versions:1.0.0"
        }
    ]
}
```

For more information, see Manage components in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see ListComponentVersions in *AWS CLI Command Reference*.

`list-components`

The following code example shows how to use `list-components`.

AWS CLI

To list components

The following `list-components` example lists each component and its latest version defined in your AWS account in the current Region.

```
aws greengrassv2 list-components
```

Output:

```
{
    "components": [
        {
            "arn": "arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld",
```

```
                "componentName": "com.example.HelloWorld",
                "latestVersion": {
                    "arn": "arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld:versions:1.0.1",
                    "componentVersion": "1.0.1",
                    "creationTimestamp": "2021-01-08T16:51:07.352000-08:00",
                    "description": "My first AWS IoT Greengrass component.",
                    "publisher": "Amazon",
                    "platforms": [
                        {
                            "attributes": {
                                "os": "linux"
                            }
                        }
                    ]
                }
            }
    ]
}
```

For more information, see Manage components in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see ListComponents in *AWS CLI Command Reference*.

`list-core-devices`

The following code example shows how to use `list-core-devices`.

AWS CLI

To list core devices

The following `list-core-devices` example lists the AWS IoT Greengrass core devices in your AWS account in the current Region.

```
aws greengrassv2 list-core-devices
```

Output:

```
{
    "coreDevices": [
        {
            "coreDeviceThingName": "MyGreengrassCore",
```

```
            "status": "HEALTHY",
            "lastStatusUpdateTimestamp": "2021-01-08T04:57:58.838000-08:00"
        }
    ]
}
```

For more information, see Check core device status in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see ListCoreDevices in *AWS CLI Command Reference*.

`list-deployments`

The following code example shows how to use `list-deployments`.

AWS CLI

To list deployments

The following `list-deployments` example lists the latest revision of each deployment defined in your AWS account in the current Region.

```
aws greengrassv2 list-deployments
```

Output:

```
{
    "deployments": [
        {
            "targetArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/
MyGreengrassCoreGroup",
            "revisionId": "14",
            "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "deploymentName": "Deployment for MyGreengrassCoreGroup",
            "creationTimestamp": "2021-01-07T17:21:20.691000-08:00",
            "deploymentStatus": "ACTIVE",
            "isLatestForTarget": false
        },
        {
            "targetArn": "arn:aws:iot:us-west-2:123456789012:thing/
MyGreengrassCore",
            "revisionId": "1",
```

```
                "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
                "deploymentName": "Deployment for MyGreengrassCore",
                "creationTimestamp": "2021-01-06T16:10:42.407000-08:00",
                "deploymentStatus": "COMPLETED",
                "isLatestForTarget": false
            }
        ]
    }
```

For more information, see Deploy components to devices in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see ListDeployments in *AWS CLI Command Reference*.

`list-effective-deployments`

The following code example shows how to use `list-effective-deployments`.

AWS CLI

To list deployment jobs

The following `list-effective-deployments` example lists the deployments that apply to an AWS IoT Greengrass core device.

```
aws greengrassv2 list-effective-deployments \
    --core-device-thing-name MyGreengrassCore
```

Output:

```
{
    "effectiveDeployments": [
        {
            "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "deploymentName": "Deployment for MyGreengrassCore",
            "iotJobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "targetArn": "arn:aws:iot:us-west-2:123456789012:thing/
MyGreengrassCore",
            "coreDeviceExecutionStatus": "COMPLETED",
            "reason": "SUCCESSFUL",
            "creationTimestamp": "2021-01-06T16:10:42.442000-08:00",
            "modifiedTimestamp": "2021-01-08T17:21:27.830000-08:00"
```

```
        },
        {
            "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "deploymentName": "Deployment for MyGreengrassCoreGroup",
            "iotJobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "iotJobArn": "arn:aws:iot:us-west-2:123456789012:job/a1b2c3d4-5678-90ab-
cdef-EXAMPLE44444",
            "targetArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/
MyGreengrassCoreGroup",
            "coreDeviceExecutionStatus": "SUCCEEDED",
            "reason": "SUCCESSFUL",
            "creationTimestamp": "2021-01-07T17:19:20.394000-08:00",
            "modifiedTimestamp": "2021-01-07T17:21:20.721000-08:00"
        }
    ]
}
```

For more information, see Check core device status in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see ListEffectiveDeployments in *AWS CLI Command Reference*.

`list-installed-components`

The following code example shows how to use `list-installed-components`.

AWS CLI

To list components installed on a core device

The following `list-installed-components` example lists the components that are installed on an AWS IoT Greengrass core device.

```
aws greengrassv2 list-installed-components \
    --core-device-thing-name MyGreengrassCore
```

Output:

```
{
    "installedComponents": [
        {
            "componentName": "aws.greengrass.Cli",
```

```
                "componentVersion": "2.0.3",
                "lifecycleState": "RUNNING",
                "isRoot": true
            },
            {
                "componentName": "aws.greengrass.Nucleus",
                "componentVersion": "2.0.3",
                "lifecycleState": "FINISHED",
                "isRoot": true
            }
        ]
    }
```

For more information, see Check core device status in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see ListInstalledComponents in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a resource

The following `list-tags-for-resource` example lists all tags for an AWS IoT Greengrass core device.

```
aws greengrassv2 list-tags-for-resource \
    --resource-arn arn:aws:greengrass:us-
west-2:123456789012:coreDevices:MyGreengrassCore
```

Output:

```
{
    "tags": {
        "Owner": "richard-roe"
    }
}
```

For more information, see Tag your resources in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add a tag to a resource

The following `tag-resource` example adds an owner tag to an AWS IoT Greengrass core device. You can use this tag to control access to the core device based on who owns it.

```
aws greengrassv2 tag-resource \
    --resource-arn arn:aws:greengrass:us-
west-2:123456789012:coreDevices:MyGreengrassCore \
    --tags Owner=richard-roe
```

This command produces no output.

For more information, see Tag your resources in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a resource

The following `untag-resource` example removes an owner tag from an AWS IoT Greengrass core device.

```
aws iotsitewise untag-resource \
    --resource-arn arn:aws:greengrass:us-
west-2:123456789012:coreDevices:MyGreengrassCore \
    --tag-keys Owner
```

This command produces no output.

For more information, see Tag your resources in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-connectivity-info`

The following code example shows how to use `update-connectivity-info`.

AWS CLI

To update connectivity information for a Greengrass core device

The following `update-connectivity-info` example gets the connectivity information for a Greengrass core device. Client devices use this information to connect to the MQTT broker that runs on this core device.

```
aws greengrassv2 update-connectivity-info \
    --thing-name MyGreengrassCore \
    --cli-input-json file://core-device-connectivity-info.json
```

Contents of `core-device-connectivity-info.json`:

```
{
    "connectivityInfo": [
        {
            "hostAddress": "192.0.2.0",
            "portNumber": 8883,
            "id": "localIP_192.0.2.0"
        }
    ]
}
```

Output:

```
{
    "version": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Manage core device endpoints in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see UpdateConnectivityInfo in *AWS CLI Command Reference*.

AWS IoT Jobs SDK release examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Jobs SDK release.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Actions

`describe-job-execution`

The following code example shows how to use `describe-job-execution`.

AWS CLI

To get the details of a job execution

The following `describe-job-execution` example retrieves the details of the latest execution of the specified job and thing.

```
aws iot-jobs-data describe-job-execution \
    --job-id SampleJob \
    --thing-name MotionSensor1 \
    --endpoint-url https://1234567890abcd.jobs.iot.us-west-2.amazonaws.com
```

Output:

```
{
    "execution": {
        "approximateSecondsBeforeTimedOut": 88,
        "executionNumber": 2939653338,
        "jobId": "SampleJob",
        "lastUpdatedAt": 1567701875.743,
        "queuedAt": 1567701902.444,
        "status": "QUEUED",
```

```
            "thingName": "MotionSensor1 ",
            "versionNumber": 3
       }
   }
```

For more information, see Devices and Jobs in the *AWS IoT Developer Guide*.

- For API details, see DescribeJobExecution in *AWS CLI Command Reference*.

`get-pending-job-executions`

The following code example shows how to use `get-pending-job-executions`.

AWS CLI

To get a list of all jobs that are not in a terminal status for a thing

The following `get-pending-job-executions` example displays a list of all jobs that aren't in a terminal state for the specified thing.

```
aws iot-jobs-data get-pending-job-executions \
    --thing-name MotionSensor1
    --endpoint-url https://1234567890abcd.jobs.iot.us-west-2.amazonaws.com
```

Output:

```
{
    "inProgressJobs": [
    ],
    "queuedJobs": [
        {
            "executionNumber": 2939653338,
            "jobId": "SampleJob",
            "lastUpdatedAt": 1567701875.743,
            "queuedAt": 1567701902.444,
            "versionNumber": 3
      }
    ]
}
```

For more information, see Devices and Jobs in the *AWS IoT Developer Guide*.

- For API details, see GetPendingJobExecutions in *AWS CLI Command Reference*.

`start-next-pending-job-execution`

The following code example shows how to use `start-next-pending-job-execution`.

AWS CLI

To get and start the next pending job execution for a thing

The following `start-next-pending-job-execution` example retrieves and starts the next job execution whose status is IN_PROGRESS or QUEUED for the specified thing.

```
aws iot-jobs-data start-next-pending-job-execution \
    --thing-name MotionSensor1
    --endpoint-url https://1234567890abcd.jobs.iot.us-west-2.amazonaws.com
```

Output:

```
{
    "execution": {
        "approximateSecondsBeforeTimedOut": 88,
        "executionNumber": 2939653338,
        "jobId": "SampleJob",
        "lastUpdatedAt": 1567714853.743,
        "queuedAt": 1567701902.444,
        "startedAt": 1567714871.690,
        "status": "IN_PROGRESS",
        "thingName": "MotionSensor1 ",
        "versionNumber": 3
   }
}
```

For more information, see Devices and Jobs in the *AWS IoT Developer Guide*.

- For API details, see StartNextPendingJobExecution in *AWS CLI Command Reference*.

`update-job-execution`

The following code example shows how to use `update-job-execution`.

AWS CLI

To update the status of a job execution

The following `update-job-execution` example updates the status of the specified job and thing.

```
aws iot-jobs-data update-job-execution \
    --job-id SampleJob \
    --thing-name MotionSensor1 \
    --status REMOVED \
    --endpoint-url https://1234567890abcd.jobs.iot.us-west-2.amazonaws.com
```

Output:

```
{
    "executionState": {
        "status": "REMOVED",
        "versionNumber": 3
    },
}
```

For more information, see Devices and Jobs in the *AWS IoT Developer Guide*.

- For API details, see UpdateJobExecution in *AWS CLI Command Reference*.

AWS IoT SiteWise examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT SiteWise.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Actions

`associate-assets`

The following code example shows how to use `associate-assets`.

AWS CLI

To associate a child asset to a parent asset

The following `associate-assets` example associates a wind turbine asset to a wind farm asset, where the wind turbine asset model exists as a hierarchy in the wind farm asset model.

```
aws iotsitewise associate-assets \
    --asset-id a1b2c3d4-5678-90ab-cdef-44444EXAMPLE \
    --hierarchy-id a1b2c3d4-5678-90ab-cdef-77777EXAMPLE \
    --child-asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE
```

This command produces no output.

For more information, see Associating assets in the *AWS IoT SiteWise User Guide*.

- For API details, see AssociateAssets in *AWS CLI Command Reference*.

`batch-associate-project-assets`

The following code example shows how to use `batch-associate-project-assets`.

AWS CLI

To associate an asset to a project

The following `batch-associate-project-assets` example associates a wind farm asset to a project.

```
aws iotsitewise batch-associate-project-assets \
    --project-id a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE \
    --asset-ids a1b2c3d4-5678-90ab-cdef-44444EXAMPLE
```

This command produces no output.

For more information, see Adding assets to projects in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see BatchAssociateProjectAssets in *AWS CLI Command Reference*.

`batch-disassociate-project-assets`

The following code example shows how to use `batch-disassociate-project-assets`.

AWS CLI

To disassociate an asset from a project

The following `batch-disassociate-project-assets` example disassociates a wind farm asset from a project.

```
aws iotsitewise batch-disassociate-project-assets \
    --project-id a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE \
    --asset-ids a1b2c3d4-5678-90ab-cdef-44444EXAMPLE
```

This command produces no output.

For more information, see Adding assets to projects in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see BatchDisassociateProjectAssets in *AWS CLI Command Reference*.

`batch-put-asset-property-value`

The following code example shows how to use `batch-put-asset-property-value`.

AWS CLI

To send data to asset properties

The following `batch-put-asset-property-value` example sends power and temperature data to the asset properties identified by property aliases.

```
aws iotsitewise batch-put-asset-property-value \
    --cli-input-json file://batch-put-asset-property-value.json
```

Contents of `batch-put-asset-property-value.json`:

```
{
    "entries": [
        {
            "entryId": "1575691200-company-windfarm-3-turbine-7-power",
            "propertyAlias": "company-windfarm-3-turbine-7-power",
            "propertyValues": [
                {
                    "value": {
                        "doubleValue": 4.92
```

```
                    },
                    "timestamp": {
                        "timeInSeconds": 1575691200
                    },
                    "quality": "GOOD"
                }
            ]
        },
        {
            "entryId": "1575691200-company-windfarm-3-turbine-7-temperature",
            "propertyAlias": "company-windfarm-3-turbine-7-temperature",
            "propertyValues": [
                {
                    "value": {
                        "integerValue": 38
                    },
                    "timestamp": {
                        "timeInSeconds": 1575691200
                    }
                }
            ]
        }
    ]
}
```

Output:

```
{
    "errorEntries": []
}
```

For more information, see Ingesting data using the AWS IoT SiteWise API in the *AWS IoT SiteWise User Guide*.

- For API details, see BatchPutAssetPropertyValue in *AWS CLI Command Reference*.

`create-access-policy`

The following code example shows how to use `create-access-policy`.

AWS CLI

Example 1: To grant a user administrative access to a portal

The following `create-access-policy` example creates an access policy that grants a user administrative access to a web portal for a wind farm company.

```
aws iotsitewise create-access-policy \
    --cli-input-json file://create-portal-administrator-access-policy.json
```

Contents of `create-portal-administrator-access-policy.json`:

```
{
    "accessPolicyIdentity": {
        "user": {
            "id": "a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbEXAMPLE"
        }
    },
    "accessPolicyPermission": "ADMINISTRATOR",
    "accessPolicyResource": {
        "portal": {
            "id": "a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE"
        }
    }
}
```

Output:

```
{
    "accessPolicyId": "a1b2c3d4-5678-90ab-cdef-cccccEXAMPLE",
    "accessPolicyArn": "arn:aws:iotsitewise:us-west-2:123456789012:access-policy/
a1b2c3d4-5678-90ab-cdef-cccccEXAMPLE"
}
```

For more information, see Adding or removing portal administrators in the *AWS IoT SiteWise User Guide*.

Example 2: To grant a user read-only access to a project

The following `create-access-policy` example creates an access policy that grants a user read-only access to a wind farm project.

```
aws iotsitewise create-access-policy \
    --cli-input-json file://create-project-viewer-access-policy.json
```

Contents of `create-project-viewer-access-policy.json`:

```
{
    "accessPolicyIdentity": {
        "user": {
            "id": "a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbEXAMPLE"
        }
    },
    "accessPolicyPermission": "VIEWER",
    "accessPolicyResource": {
        "project": {
            "id": "a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE"
        }
    }
}
```

Output:

```
{
    "accessPolicyId": "a1b2c3d4-5678-90ab-cdef-dddddEXAMPLE",
    "accessPolicyArn": "arn:aws:iotsitewise:us-west-2:123456789012:access-policy/
a1b2c3d4-5678-90ab-cdef-dddddEXAMPLE"
}
```

For more information, see Assigning project viewers in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see CreateAccessPolicy in *AWS CLI Command Reference*.

`create-asset-model`

The following code example shows how to use `create-asset-model`.

AWS CLI

To create an asset model

The following `create-asset-model` example creates an asset model that defines a wind turbine with the following properties:

Serial number - The serial number of a wind turbineGenerated power - The generated power data stream from a wind turbineTemperature C - The temperature data stream from a wind turbine in CelsiusTemperature F - The mapped temperature data points from Celsius to Fahrenheit

```
aws iotsitewise create-asset-model \
    --cli-input-json file://create-wind-turbine-model.json
```

Contents of `create-wind-turbine-model.json`:

```
{
    "assetModelName": "Wind Turbine Model",
    "assetModelDescription": "Represents a wind turbine",
    "assetModelProperties": [
        {
            "name": "Serial Number",
            "dataType": "STRING",

    "assetModelStatus": {
```

```
        "state": "CREATING"
    }
}
```

For more information, see Defining asset models in the *AWS IoT SiteWise User Guide*.

- For API details, see CreateAssetModel in *AWS CLI Command Reference*.

`create-asset`

The following code example shows how to use `create-asset`.

AWS CLI

To create an asset

The following `create-asset` example creates a wind turbine asset from a wind turbine asset model.

```
aws iotsitewise create-asset \
    --asset-model-id a1b2c3d4-5678-90ab-cdef-11111EXAMPLE \
    --asset-name "Wind Turbine 1"
```

Output:

```
{
    "assetId": "a1b2c3d4-5678-90ab-cdef-33333EXAMPLE",
    "assetArn": "arn:aws:iotsitewise:us-west-2:123456789012:asset/
a1b2c3d4-5678-90ab-cdef-33333EXAMPLE",
    "assetStatus": {
        "state": "CREATING"
    }
}
```

For more information, see Creating assets in the *AWS IoT SiteWise User Guide*.

- For API details, see CreateAsset in *AWS CLI Command Reference*.

`create-dashboard`

The following code example shows how to use `create-dashboard`.

AWS CLI

To create a dashboard

The following `create-dashboard` example creates a dashboard with a line chart that displays total generated power for a wind farm.

```
aws iotsitewise create-dashboard \
    --project-id a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE \
    --dashboard-name "Wind Farm" \
    --dashboard-definition file://create-wind-farm-dashboard.json
```

Contents of `create-wind-farm-dashboard.json`:

```
{
    "widgets": [
        {
            "type": "monitor-line-chart",
            "title": "Generated Power",
            "x": 0,
            "y": 0,
            "height": 3,
            "width": 3,
            "metrics": [
                {
                    "label": "Power",
                    "type": "iotsitewise",
                    "assetId": "a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",
                    "propertyId": "a1b2c3d4-5678-90ab-cdef-99999EXAMPLE"
                }
            ]
        }
    ]
}
```

Output:

```
{
    "dashboardId": "a1b2c3d4-5678-90ab-cdef-fffffEXAMPLE",
    "dashboardArn": "arn:aws:iotsitewise:us-west-2:123456789012:dashboard/
a1b2c3d4-5678-90ab-cdef-fffffEXAMPLE"
}
```

For more information, see Creating dashboards (CLI) in the *AWS IoT SiteWise User Guide*.

- For API details, see CreateDashboard in *AWS CLI Command Reference*.

`create-gateway`

The following code example shows how to use `create-gateway`.

AWS CLI

To create a gateway

The following `create-gateway` example creates a gateway that runs on AWS IoT Greengrass.

```
aws iotsitewise create-gateway \
    --gateway-name ExampleCorpGateway \
    --gateway-platform greengrass={groupArn=arn:aws:greengrass:us-
west-2:123456789012:/greengrass/groups/a1b2c3d4-5678-90ab-cdef-1b1b1EXAMPLE}
```

Output:

```
{
    "gatewayId": "a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE",
    "gatewayArn": "arn:aws:iotsitewise:us-west-2:123456789012:gateway/
a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE"
}
```

For more information, see Configuring a gateway in the *AWS IoT SiteWise User Guide*.

- For API details, see CreateGateway in *AWS CLI Command Reference*.

`create-portal`

The following code example shows how to use `create-portal`.

AWS CLI

To create a portal

The following `create-portal` example creates a web portal for a wind farm company. You can create portals only in the same Region where you enabled AWS Single Sign-On.

```
aws iotsitewise create-portal \
    --portal-name WindFarmPortal \
    --portal-description "A portal that contains wind farm projects for Example
 Corp." \
    --portal-contact-email support@example.com \
    --role-arn arn:aws:iam::123456789012:role/service-role/
MySiteWiseMonitorServiceRole
```

Output:

```
{
    "portalId": "a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE",
    "portalArn": "arn:aws:iotsitewise:us-west-2:123456789012:portal/
a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE",
    "portalStartUrl": "https://a1b2c3d4-5678-90ab-cdef-
aaaaaEXAMPLE.app.iotsitewise.aws",
    "portalStatus": {
        "state": "CREATING"
    },
    "ssoApplicationId": "ins-a1b2c3d4-EXAMPLE"
}
```

For more information, see Getting started with AWS IoT SiteWise Monitor in the *AWS IoT SiteWise User Guide* and Enabling AWS SSO in the *AWS IoT SiteWise User Guide*..

- For API details, see CreatePortal in *AWS CLI Command Reference*.

`create-project`

The following code example shows how to use `create-project`.

AWS CLI

To create a project

The following `create-project` example creates a wind farm project.

```
aws iotsitewise create-project \
    --portal-id a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE \
    --project-name "Wind Farm 1" \
    --project-description "Contains asset visualizations for Wind Farm #1 for
 Example Corp."
```

Output:

```
{
    "projectId": "a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE",
    "projectArn": "arn:aws:iotsitewise:us-west-2:123456789012:project/
a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE"
}
```

For more information, see Creating projects in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see CreateProject in *AWS CLI Command Reference*.

delete-access-policy

The following code example shows how to use `delete-access-policy`.

AWS CLI

To revoke a user's access to a project or portal

The following `delete-access-policy` example deletes an access policy that grants a user administrative access to a portal.

```
aws iotsitewise delete-access-policy \
    --access-policy-id a1b2c3d4-5678-90ab-cdef-cccccEXAMPLE
```

This command produces no output.

For more information, see Adding or removing portal administrators in the *AWS IoT SiteWise User Guide*.

- For API details, see DeleteAccessPolicy in *AWS CLI Command Reference*.

delete-asset-model

The following code example shows how to use `delete-asset-model`.

AWS CLI

To delete an asset model

The following `delete-asset-model` example deletes a wind turbine asset model.

```
aws iotsitewise delete-asset-model \
    --asset-model-id a1b2c3d4-5678-90ab-cdef-11111EXAMPLE
```

Output:

```
{
    "assetModelStatus": {
        "state": "DELETING"
    }
}
```

For more information, see Deleting asset models in the *AWS IoT SiteWise User Guide*.

- For API details, see DeleteAssetModel in *AWS CLI Command Reference*.

`delete-asset`

The following code example shows how to use `delete-asset`.

AWS CLI

To delete an asset

The following `delete-asset` example deletes a wind turbine asset.

```
aws iotsitewise delete-asset \
    --asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE
```

Output:

```
{
    "assetStatus": {
        "state": "DELETING"
    }
}
```

For more information, see Deleting assets in the *AWS IoT SiteWise User Guide*.

- For API details, see DeleteAsset in *AWS CLI Command Reference*.

`delete-dashboard`

The following code example shows how to use `delete-dashboard`.

AWS CLI

To delete a dashboard

The following `delete-dashboard` example deletes a wind turbine dashboard.

```
aws iotsitewise delete-dashboard \
    --dashboard-id a1b2c3d4-5678-90ab-cdef-fffffEXAMPLE
```

This command produces no output.

For more information, see Deleting dashboards in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see DeleteDashboard in *AWS CLI Command Reference*.

`delete-gateway`

The following code example shows how to use `delete-gateway`.

AWS CLI

To delete a gateway

The following `delete-gateway` example deletes a gateway.

```
aws iotsitewise delete-gateway \
    --gateway-id a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE
```

This command produces no output.

For more information, see Ingesting data using a gateway in the *AWS IoT SiteWise User Guide*.

- For API details, see DeleteGateway in *AWS CLI Command Reference*.

`delete-portal`

The following code example shows how to use `delete-portal`.

AWS CLI

To delete a portal

The following `delete-portal` example deletes a web portal for a wind farm company.

```
aws iotsitewise delete-portal \
    --portal-id a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE
```

Output:

```
{
    "portalStatus": {
        "state": "DELETING"
    }
}
```

For more information, see Deleting a portal in the *AWS IoT SiteWise User Guide*.

- For API details, see DeletePortal in *AWS CLI Command Reference*.

`delete-project`

The following code example shows how to use `delete-project`.

AWS CLI

To delete a project

The following `delete-project` example deletes a wind farm project.

```
aws iotsitewise delete-project \
    --project-id a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE
```

This command produces no output.

For more information, see Deleting projects in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see DeleteProject in *AWS CLI Command Reference*.

`describe-access-policy`

The following code example shows how to use `describe-access-policy`.

AWS CLI

To describe an access policy

The following `describe-access-policy` example describes an access policy that grants a user administrative access to a web portal for a wind farm company.

```
aws iotsitewise describe-access-policy \
    --access-policy-id a1b2c3d4-5678-90ab-cdef-cccccEXAMPLE
```

Output:

```
{
    "accessPolicyId": "a1b2c3d4-5678-90ab-cdef-cccccEXAMPLE",
    "accessPolicyArn": "arn:aws:iotsitewise:us-west-2:123456789012:access-policy/
a1b2c3d4-5678-90ab-cdef-cccccEXAMPLE",
    "accessPolicyIdentity": {
        "user": {
            "id": "a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbEXAMPLE"
        }
    },
    "accessPolicyResource": {
        "portal": {
            "id": "a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE"
        }
    },
    "accessPolicyPermission": "ADMINISTRATOR",
    "accessPolicyCreationDate": "2020-02-20T22:35:15.552880124Z",
    "accessPolicyLastUpdateDate": "2020-02-20T22:35:15.552880124Z"
}
```

For more information, see Adding or removing portal administrators in the *AWS IoT SiteWise User Guide*.

- For API details, see DescribeAccessPolicy in *AWS CLI Command Reference*.

`describe-asset-model`

The following code example shows how to use `describe-asset-model`.

AWS CLI

To describe an asset model

The following `describe-asset-model` example describes a wind farm asset model.

```
aws iotsitewise describe-asset-model \
    --asset-model-id a1b2c3d4-5678-90ab-cdef-22222EXAMPLE
```

Output:

```
{
    "assetModelId": "a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
    "assetModelArn": "arn:aws:iotsitewise:us-west-2:123456789012:asset-model/

    }
}
```

For more information, see Describing a specific asset model in the *AWS IoT SiteWise User Guide*.

- For API details, see DescribeAssetModel in *AWS CLI Command Reference*.

`describe-asset-property`

The following code example shows how to use `describe-asset-property`.

AWS CLI

To describe an asset property

The following `describe-asset-property` example describes a wind farm asset's total generated power property.

```
aws iotsitewise describe-asset-property \
    --asset-id a1b2c3d4-5678-90ab-cdef-44444EXAMPLE \
    --property-id a1b2c3d4-5678-90ab-cdef-99999EXAMPLE
```

Output:

```
{
    "assetId": "a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",
    "assetName": "Wind Farm 1",
    "assetModelId": "a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
    "assetProperty": {
        "id": "a1b2c3d4-5678-90ab-cdef-99999EXAMPLE",
        "name": "Total Generated Power",
        "notification": {
            "topic": "$aws/sitewise/asset-models/a1b2c3d4-5678-90ab-

                ],
                "window": {
                    "tumbling": {
                        "interval": "1h"
                    }
                }
            }
        }
```

```
    }
}
```

For more information, see [Describing a specific asset property] in the *AWS IoT SiteWise User Guide*.

- For API details, see [DescribeAssetProperty] in *AWS CLI Command Reference*.

`describe-asset`

The following code example shows how to use `describe-asset`.

AWS CLI

To describe an asset

The following `describe-asset` example describes a wind farm asset.

```
aws iotsitewise describe-asset \
    --asset-id a1b2c3d4-5678-90ab-cdef-44444EXAMPLE
```

Output:

```
{
    "assetId": "a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",
    "assetArn": "arn:aws:iotsitewise:us-west-2:123456789012:asset/
a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",
    "assetName": "Wind Farm 1",
    "assetModelId": "a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
    "assetProperties": [
        {

    }
}
```

For more information, see Describing a specific asset in the *AWS IoT SiteWise User Guide*.

- For API details, see DescribeAsset in *AWS CLI Command Reference*.

describe-dashboard

The following code example shows how to use `describe-dashboard`.

AWS CLI

To describe a dashboard

The following `describe-dashboard` example describes the specified wind farm dashboard.

```
aws iotsitewise describe-dashboard \
    --dashboard-id a1b2c3d4-5678-90ab-cdef-fffffEXAMPLE
```

Output:

```
{
    "dashboardId": "a1b2c3d4-5678-90ab-cdef-fffffEXAMPLE",
    "dashboardArn": "arn:aws:iotsitewise:us-west-2:123456789012:dashboard/
a1b2c3d4-5678-90ab-cdef-fffffEXAMPLE",
    "dashboardName": "Wind Farm",
    "projectId": "a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE",
    "dashboardDefinition": "{\"widgets\":[{\"type\":\"monitor-line-chart\",\"title
\":\"Generated Power\",\"x\":0,\"y\":0,\"height\":3,\"width\":3,\"metrics\":
[{\"label\":\"Power\",\"type\":\"iotsitewise\",\"assetId\":\"a1b2c3d4-5678-90ab-
cdef-44444EXAMPLE\",\"propertyId\":\"a1b2c3d4-5678-90ab-cdef-99999EXAMPLE\"}]}]}",
    "dashboardCreationDate": "2020-05-01T20:32:12.228476348Z",
```

```
    "dashboardLastUpdateDate": "2020-05-01T20:32:12.228476348Z"
}
```

For more information, see Viewing dashboards in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see DescribeDashboard in *AWS CLI Command Reference*.

`describe-gateway-capability-configuration`

The following code example shows how to use `describe-gateway-capability-configuration`.

AWS CLI

To describe a gateway capability

The following `describe-gateway-capability-configuration` example describes an OPC-UA source capability.

```
aws iotsitewise describe-gateway-capability-configuration \
    --gateway-id a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE \
    --capability-namespace "iotsitewise:opcuacollector:1"
```

Output:

```
{
    "gatewayId": "a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE",
    "capabilityNamespace": "iotsitewise:opcuacollector:1",
    "capabilityConfiguration": "{\"sources\":[{\"name\":\"Wind Farm #1\",
\"endpoint\":{\"certificateTrust\":{\"type\":\"TrustAny\"},\"endpointUri
\":\"opc.tcp://203.0.113.0:49320\",\"securityPolicy\":\"BASIC256\",
\"messageSecurityMode\":\"SIGN_AND_ENCRYPT\",\"identityProvider\":
{\"type\":\"Username\",\"usernameSecretArn\":\"arn:aws:secretsmanager:us-
east-1:123456789012:secret:greengrass-factory1-auth-3QNDmM\"},\"nodeFilterRules\":
[]},\"measurementDataStreamPrefix\":\"\"}]}",
    "capabilitySyncStatus": "IN_SYNC"
}
```

For more information, see Configuring data sources in the *AWS IoT SiteWise User Guide*.

- For API details, see DescribeGatewayCapabilityConfiguration in *AWS CLI Command Reference*.

`describe-gateway`

The following code example shows how to use `describe-gateway`.

AWS CLI

To describe a gateway

The following `describe-gateway` example describes a gateway.

```
aws iotsitewise describe-gateway \
    --gateway-id a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE
```

Output:

```
{
    "gatewayId": "a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE",
    "gatewayName": "ExampleCorpGateway",
    "gatewayArn": "arn:aws:iotsitewise:us-west-2:123456789012:gateway/
a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE",
    "gatewayPlatform": {
        "greengrass": {
            "groupArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
groups/a1b2c3d4-5678-90ab-cdef-1b1b1EXAMPLE"
        }
    },
    "gatewayCapabilitySummaries": [
        {
            "capabilityNamespace": "iotsitewise:opcuacollector:1",
            "capabilitySyncStatus": "IN_SYNC"
        }
    ],
    "creationDate": 1588369971.457,
    "lastUpdateDate": 1588369971.457
}
```

For more information, see Ingesting data using a gateway in the *AWS IoT SiteWise User Guide*.

- For API details, see DescribeGateway in *AWS CLI Command Reference*.

`describe-logging-options`

The following code example shows how to use `describe-logging-options`.

AWS CLI

To retrieve the current AWS IoT SiteWise logging options

The following `describe-logging-options` example retrieves the current AWS IoT SiteWise logging options for your AWS account in the current Region.

```
aws iotsitewise describe-logging-options
```

Output:

```
{
    "loggingOptions": {
        "level": "INFO"
    }
}
```

For more information, see Monitoring AWS IoT SiteWise with Amazon CloudWatch Logs in the *AWS IoT SiteWise User Guide*.

- For API details, see DescribeLoggingOptions in *AWS CLI Command Reference*.

`describe-portal`

The following code example shows how to use `describe-portal`.

AWS CLI

To describe a portal

The following `describe-portal` example describes a web portal for a wind farm company.

```
aws iotsitewise describe-portal \
    --portal-id a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE
```

Output:

```
{
    "portalId": "a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE",
    "portalArn": "arn:aws:iotsitewise:us-west-2:123456789012:portal/
a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE",
    "portalName": "WindFarmPortal",
```

```
    "portalDescription": "A portal that contains wind farm projects for Example
 Corp.",
    "portalClientId": "E-a1b2c3d4e5f6_a1b2c3d4e5f6EXAMPLE",
    "portalStartUrl": "https://a1b2c3d4-5678-90ab-cdef-
aaaaaEXAMPLE.app.iotsitewise.aws",
    "portalContactEmail": "support@example.com",
    "portalStatus": {
        "state": "ACTIVE"
    },
    "portalCreationDate": "2020-02-04T23:01:52.90248068Z",
    "portalLastUpdateDate": "2020-02-04T23:01:52.90248078Z",
    "roleArn": "arn:aws:iam::123456789012:role/MySiteWiseMonitorServiceRole"
}
```

For more information, see Administering your portals in the *AWS IoT SiteWise User Guide*.

- For API details, see DescribePortal in *AWS CLI Command Reference*.

`describe-project`

The following code example shows how to use `describe-project`.

AWS CLI

To describe a project

The following `describe-project` example describes a wind farm project.

```
aws iotsitewise describe-project \
    --project-id a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE
```

Output:

```
{
    "projectId": "a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE",
    "projectArn": "arn:aws:iotsitewise:us-west-2:123456789012:project/
a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE",
    "projectName": "Wind Farm 1",
    "portalId": "a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE",
    "projectDescription": "Contains asset visualizations for Wind Farm #1 for
 Example Corp.",
    "projectCreationDate": "2020-02-20T21:58:43.362246001Z",
    "projectLastUpdateDate": "2020-02-20T21:58:43.362246095Z"
```

```
}
```

For more information, see Viewing project details in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see DescribeProject in *AWS CLI Command Reference*.

`disassociate-assets`

The following code example shows how to use `disassociate-assets`.

AWS CLI

To disassociate a child asset from a parent asset

The following `disassociate-assets` example disassociates a wind turbine asset from a wind farm asset.

```
aws iotsitewise disassociate-assets \
    --asset-id a1b2c3d4-5678-90ab-cdef-44444EXAMPLE \
    --hierarchy-id a1b2c3d4-5678-90ab-cdef-77777EXAMPLE \
    --child-asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE
```

This command produces no output.

For more information, see Associating assets in the *AWS IoT SiteWise User Guide*.

- For API details, see DisassociateAssets in *AWS CLI Command Reference*.

`get-asset-property-aggregates`

The following code example shows how to use `get-asset-property-aggregates`.

AWS CLI

To retrieve an asset property's aggregated average and count values

The following `get-asset-property-aggregates` example retrieves a wind turbine asset's average total power and count of total power data points for a 1 hour period in time.

```
aws iotsitewise get-asset-property-aggregates \
    --asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \
```

```
    --property-id a1b2c3d4-5678-90ab-cdef-66666EXAMPLE \
    --start-date 1580849400 \
    --end-date 1580853000 \
    --aggregate-types AVERAGE COUNT \
    --resolution 1h
```

Output:

```
{
    "aggregatedValues": [
        {
            "timestamp": 1580850000.0,
            "quality": "GOOD",
            "value": {
                "average": 8723.46538886233,
                "count": 12.0
            }
        }
    ]
}
```

For more information, see Querying asset property aggregates in the *AWS IoT SiteWise User Guide*.

- For API details, see GetAssetPropertyAggregates in *AWS CLI Command Reference*.

`get-asset-property-value-history`

The following code example shows how to use `get-asset-property-value-history`.

AWS CLI

To retrieve an asset property's historical values

The following `get-asset-property-value-history` example retrieves a wind turbine asset's total power values for a 20 minute period in time.

```
aws iotsitewise get-asset-property-value-history \
    --asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \
    --property-id a1b2c3d4-5678-90ab-cdef-66666EXAMPLE \
    --start-date 1580851800 \
    --end-date 1580853000
```

Output:

```
{
    "assetPropertyValueHistory": [
        {
            "value": {
                "doubleValue": 7217.787046814844
            },
            "timestamp": {
                "timeInSeconds": 1580852100,
                "offsetInNanos": 0
            },
            "quality": "GOOD"
        },
        {
            "value": {
                "doubleValue": 6941.242811875451
            },
            "timestamp": {
                "timeInSeconds": 1580852400,
                "offsetInNanos": 0
            },
            "quality": "GOOD"
        },
        {
            "value": {
                "doubleValue": 6976.797662266717
            },
            "timestamp": {
                "timeInSeconds": 1580852700,
                "offsetInNanos": 0
            },
            "quality": "GOOD"
        },
        {
            "value": {
                "doubleValue": 6890.8677520453875
            },
            "timestamp": {
                "timeInSeconds": 1580853000,
                "offsetInNanos": 0
            },
            "quality": "GOOD"
        }
```

```
    ]
}
```

For more information, see Querying historical asset property values in the *AWS IoT SiteWise User Guide*.

- For API details, see GetAssetPropertyValueHistory in *AWS CLI Command Reference*.

`get-asset-property-value`

The following code example shows how to use `get-asset-property-value`.

AWS CLI

To retrieve an asset property's current value

The following `get-asset-property-value` example retrieves a wind turbine asset's current total power.

```
aws iotsitewise get-asset-property-value \
    --asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \
    --property-id a1b2c3d4-5678-90ab-cdef-66666EXAMPLE
```

Output:

```
{
    "propertyValue": {
        "value": {
            "doubleValue": 6890.8677520453875
        },
        "timestamp": {
            "timeInSeconds": 1580853000,
            "offsetInNanos": 0
        },
        "quality": "GOOD"
    }
}
```

For more information, see Querying current asset property values in the *AWS IoT SiteWise User Guide*.

- For API details, see GetAssetPropertyValue in *AWS CLI Command Reference*.

list-access-policies

The following code example shows how to use `list-access-policies`.

AWS CLI

To list all access policies

The following `list-access-policies` example lists all access policies for a user who is a portal administrator.

```
aws iotsitewise list-access-policies \
    --identity-type USER \
    --identity-id a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbEXAMPLE
```

Output:

```
{
    "accessPolicySummaries": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-cccccEXAMPLE",
            "identity": {
                "user": {
                    "id": "a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbEXAMPLE"
                }
            },
            "resource": {
                "portal": {
                    "id": "a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE"
                }
            },
            "permission": "ADMINISTRATOR"
        }
    ]
}
```

For more information, see Administering your portals in the *AWS IoT SiteWise User Guide*.

- For API details, see ListAccessPolicies in *AWS CLI Command Reference*.

list-asset-models

The following code example shows how to use `list-asset-models`.

AWS CLI

To list all asset models

The following `list-asset-models` example lists all asset models that are defined in your AWS account in the current Region.

```
aws iotsitewise list-asset-models
```

Output:

```
{
    "assetModelSummaries": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
            "arn": "arn:aws:iotsitewise:us-west-2:123456789012:asset-model/
a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
            "name": "Wind Farm Model",
            "description": "Represents a wind farm that comprises many wind
 turbines",
            "creationDate": 1575671284.0,
            "lastUpdateDate": 1575671988.0,
            "status": {
                "state": "ACTIVE"
            }
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
            "arn": "arn:aws:iotsitewise:us-west-2:123456789012:asset-model/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
            "name": "Wind Turbine Model",
            "description": "Represents a wind turbine manufactured by Example Corp",
            "creationDate": 1575671207.0,
            "lastUpdateDate": 1575686273.0,
            "status": {
                "state": "ACTIVE"
            }
        }
    ]
}
```

For more information, see Listing all asset models in the *AWS IoT SiteWise User Guide*.

- For API details, see ListAssetModels in *AWS CLI Command Reference*.

`list-assets`

The following code example shows how to use `list-assets`.

AWS CLI

Example 1: To list all top-level assets

The following `list-assets` example lists all assets that are top-level in the asset hierarchy tree and defined in your AWS account in the current Region.

```
aws iotsitewise list-assets \
    --filter TOP_LEVEL
```

Output:

```
{
    "assetSummaries": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",
            "arn": "arn:aws:iotsitewise:us-west-2:123456789012:asset/
a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",
            "name": "Wind Farm 1",
            "assetModelId": "a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
            "creationDate": 1575672453.0,
            "lastUpdateDate": 1575672453.0,
            "status": {
                "state": "ACTIVE"
            },
            "hierarchies": [
                {
                    "id": "a1b2c3d4-5678-90ab-cdef-77777EXAMPLE",
                    "name": "Wind Turbines"
                }
            ]
        }
    ]
}
```

For more information, see Listing assets in the *AWS IoT SiteWise User Guide*.

Example 2: To list all assets based on an asset model

The following `list-assets` example lists all assets based on an asset model and defined in your AWS account in the current Region.

```
aws iotsitewise list-assets \
    --asset-model-id a1b2c3d4-5678-90ab-cdef-11111EXAMPLE
```

Output:

```
{
    "assetSummaries": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-33333EXAMPLE",
            "arn": "arn:aws:iotsitewise:us-west-2:123456789012:asset/
a1b2c3d4-5678-90ab-cdef-33333EXAMPLE",
            "name": "Wind Turbine 1",
            "assetModelId": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
            "creationDate": 1575671550.0,
            "lastUpdateDate": 1575686308.0,
            "status": {
                "state": "ACTIVE"
            },
            "hierarchies": []
        }
    ]
}
```

For more information, see Listing assets in the *AWS IoT SiteWise User Guide*.

- For API details, see ListAssets in *AWS CLI Command Reference*.

`list-associated-assets`

The following code example shows how to use `list-associated-assets`.

AWS CLI

To list all assets associated to an asset in a specific hierarchy

The following `list-associated-assets` example lists all wind turbine assets associated to the specified wind farm asset.

```
aws iotsitewise list-associated-assets \
    --asset-id a1b2c3d4-5678-90ab-cdef-44444EXAMPLE \
    --hierarchy-id a1b2c3d4-5678-90ab-cdef-77777EXAMPLE
```

Output:

```
{
    "assetSummaries": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-33333EXAMPLE",
            "arn": "arn:aws:iotsitewise:us-west-2:123456789012:asset/
a1b2c3d4-5678-90ab-cdef-33333EXAMPLE",
            "name": "Wind Turbine 1",
            "assetModelId": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
            "creationDate": 1575671550.0,
            "lastUpdateDate": 1575686308.0,
            "status": {
                "state": "ACTIVE"
            },
            "hierarchies": []
        }
    ]
}
```

For more information, see Listing assets associated to a specific asset in the *AWS IoT SiteWise User Guide*.

- For API details, see ListAssociatedAssets in *AWS CLI Command Reference*.

`list-dashboards`

The following code example shows how to use `list-dashboards`.

AWS CLI

To list all dashboards in a project

The following `list-dashboards` example lists all dashboards that are defined in a project.

```
aws iotsitewise list-dashboards \
    --project-id a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE
```

Output:

```
{
    "dashboardSummaries": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-fffffEXAMPLE",
            "name": "Wind Farm",
            "creationDate": "2020-05-01T20:32:12.228476348Z",
            "lastUpdateDate": "2020-05-01T20:32:12.228476348Z"
        }
    ]
}
```

For more information, see Viewing dashboards in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see ListDashboards in *AWS CLI Command Reference*.

`list-gateways`

The following code example shows how to use `list-gateways`.

AWS CLI

To list all gateways

The following `list-gateways` example lists all gateways that are defined in your AWS account in the current Region.

```
aws iotsitewise list-gateways
```

Output:

```
{
    "gatewaySummaries": [
        {
            "gatewayId": "a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE",
            "gatewayName": "ExampleCorpGateway",
            "gatewayCapabilitySummaries": [
                {
                    "capabilityNamespace": "iotsitewise:opcuacollector:1",
                    "capabilitySyncStatus": "IN_SYNC"
```

```
                }
            ],
            "creationDate": 1588369971.457,
            "lastUpdateDate": 1588369971.457
        }
    ]
}
```

For more information, see Ingesting data using a gateway in the *AWS IoT SiteWise User Guide*.

- For API details, see ListGateways in *AWS CLI Command Reference*.

`list-portals`

The following code example shows how to use `list-portals`.

AWS CLI

To list all portals

The following `list-portals` example lists all portals that are defined in your AWS account in the current Region.

```
aws iotsitewise list-portals
```

Output:

```
{
    "portalSummaries": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE",
            "name": "WindFarmPortal",
            "description": "A portal that contains wind farm projects for Example
 Corp.",
            "startUrl": "https://a1b2c3d4-5678-90ab-cdef-
aaaaaEXAMPLE.app.iotsitewise.aws",
            "creationDate": "2020-02-04T23:01:52.90248068Z",
            "lastUpdateDate": "2020-02-04T23:01:52.90248078Z",
            "roleArn": "arn:aws:iam::123456789012:role/service-role/
MySiteWiseMonitorServiceRole"
        }
    ]
```

```
}
```

For more information, see Administering your portals in the *AWS IoT SiteWise User Guide*.

- For API details, see ListPortals in *AWS CLI Command Reference*.

`list-project-assets`

The following code example shows how to use `list-project-assets`.

AWS CLI

To list all assets associated to a project

The following `list-project-assets` example lists all assets that are associated to a wind farm project.

```
aws iotsitewise list-projects \
    --project-id a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE
```

Output:

```
{
    "assetIds": [
        "a1b2c3d4-5678-90ab-cdef-44444EXAMPLE"
    ]
}
```

For more information, see Adding assets to projects in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see ListProjectAssets in *AWS CLI Command Reference*.

`list-projects`

The following code example shows how to use `list-projects`.

AWS CLI

To list all projects in a portal

The following `list-projects` example lists all projects that are defined in a portal.

```
aws iotsitewise list-projects \
    --portal-id a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE
```

Output:

```
{
    "projectSummaries": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE",
            "name": "Wind Farm 1",
            "description": "Contains asset visualizations for Wind Farm #1 for
 Example Corp.",
            "creationDate": "2020-02-20T21:58:43.362246001Z",
            "lastUpdateDate": "2020-02-20T21:58:43.362246095Z"
        }
    ]
}
```

For more information, see Viewing project details in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see ListProjects in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list all tags for a resource

The following `list-tags-for-resource` example lists all tags for a wind turbine asset.

```
aws iotsitewise list-tags-for-resource \
    --resource-arn arn:aws:iotsitewise:us-west-2:123456789012:asset/
a1b2c3d4-5678-90ab-cdef-33333EXAMPLE
```

Output:

```
{
    "tags": {
```

```
            "Owner": "richard-roe"
        }
}
```

For more information, see [Tagging your resources](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

`put-logging-options`

The following code example shows how to use `put-logging-options`.

AWS CLI

To specify the level of logging

The following `put-logging-options` example enables `INFO` level logging in AWS IoT SiteWise. Other levels include `DEBUG` and `OFF`.

```
aws iotsitewise put-logging-options \
    --logging-options level=INFO
```

This command produces no output.

For more information, see [Monitoring AWS IoT SiteWise with Amazon CloudWatch Logs](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [PutLoggingOptions](#) in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add a tag to a resource

The following `tag-resource` example adds an owner tag to a wind turbine asset. This lets you control access to the asset based on who owns it.

```
aws iotsitewise tag-resource \
```

```
    --resource-arn arn:aws:iotsitewise:us-west-2:123456789012:asset/
a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \
    --tags Owner=richard-roe
```

This command produces no output.

For more information, see Tagging your resources in the *AWS IoT SiteWise User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a resource

The following `untag-resource` example removes an owner tag from a wind turbine asset.

```
aws iotsitewise untag-resource \
    --resource-arn arn:aws:iotsitewise:us-west-2:123456789012:asset/
a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \
    --tag-keys Owner
```

This command produces no output.

For more information, see Tagging your resources in the *AWS IoT SiteWise User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-access-policy`

The following code example shows how to use `update-access-policy`.

AWS CLI

To grant a project viewer ownership of a project

The following `update-access-policy` example updates an access policy that grants a project viewer ownership of a project.

```
aws iotsitewise update-access-policy \
    --access-policy-id a1b2c3d4-5678-90ab-cdef-dddddEXAMPLE \
    --cli-input-json file://update-project-viewer-access-policy.json
```

Contents of `update-project-viewer-access-policy.json`:

```
{
    "accessPolicyIdentity": {
        "user": {
            "id": "a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbEXAMPLE"
        }
    },
    "accessPolicyPermission": "ADMINISTRATOR",
    "accessPolicyResource": {
        "project": {
            "id": "a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE"
        }
    }
}
```

This command produces no output.

For more information, see Assigning project owners in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see UpdateAccessPolicy in *AWS CLI Command Reference*.

`update-asset-model`

The following code example shows how to use `update-asset-model`.

AWS CLI

To update an asset model

The following `update-asset-model` example updates a wind farm asset model's description. This example includes the model's existing IDs and definitions, because `update-asset-model` overwrites the existing model with the new model.

```
aws iotsitewise update-asset-model \
    --cli-input-json file://update-wind-farm-model.json
```

Contents of `update-wind-farm-model.json`:

```
{
    "assetModelName": "Wind Farm Model",
    "assetModelDescription": "Represents a wind farm that comprises many wind
 turbines",
    "assetModelProperties": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-88888EXAMPLE",
            "name": "Region",
            "dataType": "STRING",
            "type": {
                "attribute": {}
            }
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-99999EXAMPLE",
            "name": "Total Generated Power",
            "dataType": "DOUBLE",
            "unit": "kW",
            "type": {
                "metric": {
                    "expression": "sum(power)",
                    "variables": [
                        {
                            "name": "power",
                            "value": {
                                "hierarchyId": "a1b2c3d4-5678-90ab-
cdef-77777EXAMPLE",
                                "propertyId": "a1b2c3d4-5678-90ab-cdef-66666EXAMPLE"
                            }
                        }
                    ],
                    "window": {
                        "tumbling": {
                            "interval": "1h"
                        }
                    }
                }
            }
        }
    ],
    "assetModelHierarchies": [
        {
```

```
                "id": "a1b2c3d4-5678-90ab-cdef-77777EXAMPLE",
                "name": "Wind Turbines",
                "childAssetModelId": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE"
            }
        ]
}
```

Output:

```
{
    "assetModelId": "a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
    "assetModelArn": "arn:aws:iotsitewise:us-west-2:123456789012:asset-model/
a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
    "assetModelStatus": {
        "state": "CREATING"
    }
}
```

For more information, see Updating asset models in the *AWS IoT SiteWise User Guide*.

- For API details, see UpdateAssetModel in *AWS CLI Command Reference*.

`update-asset-property`

The following code example shows how to use `update-asset-property`.

AWS CLI

Example 1: To update an asset property's alias

The following `update-asset-property` example updates a wind turbine asset's power property alias.

```
aws iotsitewise update-asset-property \
    --asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \
    --property-id a1b2c3d4-5678-90ab-cdef-55555EXAMPLE \
    --property-alias "/examplecorp/windfarm/1/turbine/1/power" \
    --property-notification-state DISABLED
```

This command produces no output.

For more information, see Mapping industrial data streams to asset properties in the *AWS IoT SiteWise User Guide*.

Example 2: To enable asset property notifications

The following `update-asset-property` example enables asset property update notifications for a wind turbine asset's power property. Property value updates are published to the MQTT topic `$aws/sitewise/asset-models/<assetModelId>/assets/<assetId>/properties/<propertyId>`, where each ID is replaced by the property, asset, and model ID of the asset property.

```
aws iotsitewise update-asset-property \
    --asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \
    --property-id a1b2c3d4-5678-90ab-cdef-66666EXAMPLE \
    --property-notification-state ENABLED \
    --property-alias "/examplecorp/windfarm/1/turbine/1/power"
```

This command produces no output.

For more information, see Interacting with other services in the *AWS IoT SiteWise User Guide*.

- For API details, see UpdateAssetProperty in *AWS CLI Command Reference*.

`update-asset`

The following code example shows how to use `update-asset`.

AWS CLI

To update an asset's name

The following `update-asset` example updates a wind turbine asset's name.

```
aws iotsitewise update-asset \
    --asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \
    --asset-name "Wind Turbine 2"
```

Output:

```
{
    "assetStatus": {
        "state": "UPDATING"
```

```
    }
}
```

For more information, see Updating assets in the *AWS IoT SiteWise User Guide*.

- For API details, see UpdateAsset in *AWS CLI Command Reference*.

`update-dashboard`

The following code example shows how to use `update-dashboard`.

AWS CLI

To update a dashboard

The following `update-dashboard` example changes the title of a dashboard's line chart that displays total generated power for a wind farm.

```
aws iotsitewise update-dashboard \
    --project-id a1b2c3d4-5678-90ab-cdef-fffffEXAMPLE \
    --dashboard-name "Wind Farm" \
    --dashboard-definition file://update-wind-farm-dashboard.json
```

Contents of `update-wind-farm-dashboard.json`:

```
{
    "widgets": [
        {
            "type": "monitor-line-chart",
            "title": "Total Generated Power",
            "x": 0,
            "y": 0,
            "height": 3,
            "width": 3,
            "metrics": [
                {
                    "label": "Power",
                    "type": "iotsitewise",
                    "assetId": "a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",
                    "propertyId": "a1b2c3d4-5678-90ab-cdef-99999EXAMPLE"
                }
            ]
```

```
        }
    ]
}
```

This command produces no output.

For more information, see Creating dashboards (CLI) in the *AWS IoT SiteWise User Guide*.

- For API details, see UpdateDashboard in *AWS CLI Command Reference*.

`update-gateway-capability-configuration`

The following code example shows how to use `update-gateway-capability-configuration`.

AWS CLI

To update a gateway capability

The following `update-gateway-capability-configuration` example configures an OPC-UA source with the following properties:

Trusts any certificate.Uses the Basic256 algorithm to secure messages.Uses the SignAndEncrypt mode to secure connections.Uses authentication credentials stored in an AWS Secrets Manager secret.

```
aws iotsitewise update-gateway-capability-configuration \
    --gateway-id a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE \
    --capability-namespace "iotsitewise:opcuacollector:1" \
    --capability-configuration file://opc-ua-capability-configuration.json
```

Contents of `opc-ua-capability-configuration.json`:

```
{
    "sources": [
        {
            "name": "Wind Farm #1",
            "endpoint": {
                "certificateTrust": {
                    "type": "TrustAny"
                },
                "endpointUri": "opc.tcp://203.0.113.0:49320",
                "securityPolicy": "BASIC256",
```

```
                "messageSecurityMode": "SIGN_AND_ENCRYPT",
                "identityProvider": {
                    "type": "Username",
                    "usernameSecretArn": "arn:aws:secretsmanager:us-
west-2:123456789012:secret:greengrass-windfarm1-auth-1ABCDE"
                },
                "nodeFilterRules": []
            },
            "measurementDataStreamPrefix": ""
        }
    ]
}
```

Output:

```
{
    "capabilityNamespace": "iotsitewise:opcuacollector:1",
    "capabilitySyncStatus": "OUT_OF_SYNC"
}
```

For more information, see Configuring data sources in the *AWS IoT SiteWise User Guide*.

- For API details, see UpdateGatewayCapabilityConfiguration in *AWS CLI Command Reference*.

`update-gateway`

The following code example shows how to use `update-gateway`.

AWS CLI

To update a gateway's name

The following `update-gateway` example updates a gateway's name.

```
aws iotsitewise update-gateway \
    --gateway-id a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE \
    --gateway-name ExampleCorpGateway1
```

This command produces no output.

For more information, see Ingesting data using a gateway in the *AWS IoT SiteWise User Guide*.

- For API details, see UpdateGateway in *AWS CLI Command Reference*.

`update-portal`

The following code example shows how to use `update-portal`.

AWS CLI

To update a portal's details

The following `update-portal` example updates a web portal for a wind farm company.

```
aws iotsitewise update-portal \
    --portal-id a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE \
    --portal-name WindFarmPortal \
    --portal-description "A portal that contains wind farm projects for Example
 Corp." \
    --portal-contact-email support@example.com \
    --role-arn arn:aws:iam::123456789012:role/MySiteWiseMonitorServiceRole
```

Output:

```
{
    "portalStatus": {
        "state": "UPDATING"
    }
}
```

For more information, see Administering your portals in the *AWS IoT SiteWise User Guide*.

- For API details, see UpdatePortal in *AWS CLI Command Reference*.

`update-project`

The following code example shows how to use `update-project`.

AWS CLI

To update a project's details

The following `update-project` example updates a wind farm project.

```
aws iotsitewise update-project \
    --project-id a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE \
    --project-name "Wind Farm 1" \
```

```
    --project-description "Contains asset visualizations for Wind Farm #1 for 
Example Corp."
```

This command produces no output.

For more information, see Changing project details in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see UpdateProject in *AWS CLI Command Reference*.

AWS IoT Things Graph examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Things Graph.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`associate-entity-to-thing`

The following code example shows how to use `associate-entity-to-thing`.

AWS CLI

To associate a thing with a device

The following `associate-entity-to-thing` example associates a thing with a device. The example uses a motion sensor device that is in the public namespace.

```
aws iotthingsgraph associate-entity-to-thing \
    --thing-name "MotionSensorName" \
    --entity-id "urn:tdm:aws/examples:Device:HCSR501MotionSensor"
```

This command produces no output.

For more information, see Creating and Uploading Models in the *AWS IoT Things Graph User Guide*.

- For API details, see AssociateEntityToThing in *AWS CLI Command Reference*.

`create-flow-template`

The following code example shows how to use `create-flow-template`.

AWS CLI

To create a flow

The following `create-flow-template` example creates a flow (workflow). The value of `MyFlowDefinition` is the GraphQL that models the flow.

```
aws iotthingsgraph create-flow-template \
    --definition language=GRAPHQL,text="MyFlowDefinition"
```

Output:

```
{
    "summary": {
        "createdAt": 1559248067.545,
        "id": "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow",
        "revisionNumber": 1
    }
}
```

For more information, see Working with Flows in the *AWS IoT Things Graph User Guide*.

- For API details, see CreateFlowTemplate in *AWS CLI Command Reference*.

`create-system-instance`

The following code example shows how to use `create-system-instance`.

AWS CLI

To create a system instance

The following `create-system-instance` example creates a system instance. The value of `MySystemInstanceDefinition` is the GraphQL that models the system instance.

```
aws iotthingsgraph create-system-instance -\
    -definition language=GRAPHQL,text="MySystemInstanceDefinition" \
    --target CLOUD \
    --flow-actions-role-arn myRoleARN
```

Output:

```
{
    "summary": {

    }
}
```

For more information, see Working with Systems and Flow Configurations in the *AWS IoT Things Graph User Guide*.

- For API details, see CreateSystemInstance in *AWS CLI Command Reference*.

`create-system-template`

The following code example shows how to use `create-system-template`.

AWS CLI

To create a system

The following `create-system-template` example creates a system. The value of MySystemDefinition is the GraphQL that models the system.

```
aws iotthingsgraph create-system-template \
    --definition language=GRAPHQL,text="MySystemDefinition"
```

Output:

```
{
    "summary": {
        "createdAt": 1559249776.254,
        "id": "urn:tdm:us-west-2/123456789012/default:System:MySystem",
        "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:System/default/
MySystem",
        "revisionNumber": 1
    }
}
```

For more information, see Creating Systems in the *AWS IoT Things Graph User Guide*.

- For API details, see CreateSystemTemplate in *AWS CLI Command Reference*.

`delete-flow-template`

The following code example shows how to use `delete-flow-template`.

AWS CLI

To delete a flow

The following `delete-flow-template` example deletes a flow (workflow).

```
aws iotthingsgraph delete-flow-template \
    --id "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow"
```

This command produces no output.

For more information, see Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments in the *AWS IoT Things Graph User Guide*.

- For API details, see DeleteFlowTemplate in *AWS CLI Command Reference*.

`delete-namespace`

The following code example shows how to use `delete-namespace`.

AWS CLI

To delete a namespace

The following `delete-namespace` example deletes a namespace.

```
aws iotthingsgraph delete-namespace
```

Output:

```
{
   "namespaceArn": "arn:aws:iotthingsgraph:us-west-2:123456789012",
   "namespaceName": "us-west-2/123456789012/default"
}
```

For more information, see Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments in the *AWS IoT Things Graph User Guide*.

- For API details, see DeleteNamespace in *AWS CLI Command Reference*.

`delete-system-instance`

The following code example shows how to use `delete-system-instance`.

AWS CLI

To delete a system instance

The following `delete-system-instance` example deletes a system instance.

```
aws iotthingsgraph delete-system-instance \
    --id "urn:tdm:us-west-2/123456789012/default:Deployment:Room218"
```

This command produces no output.

For more information, see Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments in the *AWS IoT Things Graph User Guide*.

- For API details, see DeleteSystemInstance in *AWS CLI Command Reference*.

`delete-system-template`

The following code example shows how to use `delete-system-template`.

AWS CLI

To delete a system

The following `delete-system-template` example deletes a system.

```
aws iotthingsgraph delete-system-template \
    --id "urn:tdm:us-west-2/123456789012/default:System:MySystem"
```

This command produces no output.

For more information, see Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments in the *AWS IoT Things Graph User Guide*.

- For API details, see DeleteSystemTemplate in *AWS CLI Command Reference*.

`deploy-system-instance`

The following code example shows how to use `deploy-system-instance`.

AWS CLI

To deploy a system instance

The following `delete-system-template` example deploys a system instance.

```
aws iotthingsgraph deploy-system-instance \
    --id "urn:tdm:us-west-2/123456789012/default:Deployment:Room218"
```

Output:

```
{
   "summary": {
      "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment:Room218",
      "createdAt": 1559249776.254,
      "id": "urn:tdm:us-west-2/123456789012/default:Deployment:Room218",
      "status": "DEPLOYED_IN_TARGET",
      "target": "CLOUD",
      "updatedAt": 1559249776.254
   }
}
```

For more information, see Working with Systems and Flow Configurations in the *AWS IoT Things Graph User Guide*.

- For API details, see DeploySystemInstance in *AWS CLI Command Reference*.

`deprecate-flow-template`

The following code example shows how to use `deprecate-flow-template`.

AWS CLI

To deprecate a flow

The following `deprecate-flow-template` example deprecates a flow (workflow).

```
aws iotthingsgraph deprecate-flow-template \
    --id "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow"
```

This command produces no output.

For more information, see Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments in the *AWS IoT Things Graph User Guide*.

- For API details, see DeprecateFlowTemplate in *AWS CLI Command Reference*.

`deprecate-system-template`

The following code example shows how to use `deprecate-system-template`.

AWS CLI

To deprecate a system

The following `deprecate-system-template` example deprecates a system.

```
aws iotthingsgraph deprecate-system-template \
    --id "urn:tdm:us-west-2/123456789012/default:System:MySystem"
```

This command produces no output.

For more information, see Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments in the *AWS IoT Things Graph User Guide*.

- For API details, see DeprecateSystemTemplate in *AWS CLI Command Reference*.

`describe-namespace`

The following code example shows how to use `describe-namespace`.

AWS CLI

To get a description of your namespace

The following `describe-namespace` example gets a description of your namespace.

```
aws iotthingsgraph describe-namespace
```

Output:

```
{
    "namespaceName": "us-west-2/123456789012/default",
    "trackingNamespaceName": "aws",
    "trackingNamespaceVersion": 1,
    "namespaceVersion": 5
}
```

For more information, see Namespaces in the *AWS IoT Things Graph User Guide*.

- For API details, see DescribeNamespace in *AWS CLI Command Reference*.

`dissociate-entity-from-thing`

The following code example shows how to use `dissociate-entity-from-thing`.

AWS CLI

To dissociate a thing from a device

The following `dissociate-entity-from-thing` example dissociates a thing from a device.

```
aws iotthingsgraph dissociate-entity-from-thing \
    --thing-name "MotionSensorName" \
    --entity-type "DEVICE"
```

This command produces no output.

For more information, see Creating and Uploading Models in the *AWS IoT Things Graph User Guide*.

- For API details, see DissociateEntityFromThing in *AWS CLI Command Reference*.

get-entities

The following code example shows how to use `get-entities`.

AWS CLI

To get definitions for entities

The following `get-entities` example gets a definition for a device model.

```
aws iotthingsgraph get-entities \
    --ids "urn:tdm:aws/examples:DeviceModel:MotionSensor"
```

Output:

```
{
    "descriptions": [
        {
            "id": "urn:tdm:aws/examples:DeviceModel:MotionSensor",
            "type": "DEVICE_MODEL",
            "createdAt": 1559256190.599,
            "definition": {
                "language": "GRAPHQL",
                "text": "##\n# Specification of motion sensor devices interface.\n##
\ntype MotionSensor @deviceModel(id: \"urn:tdm:aws/examples:deviceModel:MotionSensor
\",\n        capability: \"urn:tdm:aws/examples:capability:MotionSensorCapability\")
 {ignore:void}"
            }
        }
    ]
}
```

For more information, see Creating and Uploading Models in the *AWS IoT Things Graph User Guide*.

- For API details, see GetEntities in *AWS CLI Command Reference*.

`get-flow-template-revisions`

The following code example shows how to use `get-flow-template-revisions`.

AWS CLI

To get revision information about a flow

The following `get-flow-template-revisions` example gets revision information about a flow (workflow).

```
aws iotthingsgraph get-flow-template-revisions \
    --id urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow
```

Output:

```
{
    "summaries": [
        {
            "id": "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow",
            "revisionNumber": 1,
            "createdAt": 1559247540.292
        }
    ]
}
```

For more information, see Working with Flows in the *AWS IoT Things Graph User Guide*.

- For API details, see GetFlowTemplateRevisions in *AWS CLI Command Reference*.

`get-flow-template`

The following code example shows how to use `get-flow-template`.

AWS CLI

To get a flow definition

The following `get-flow-template` example gets a definition for a flow (workflow).

```
aws iotthingsgraph get-flow-template \
```

```
    --id "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow"
```

Output:

```
{
    "description": {
        "summary": {
            "id": "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow",
            "revisionNumber": 1,
            "createdAt": 1559247540.292
        },
        "definition": {
            "language": "GRAPHQL",
            "text": "{\nquery MyFlow($camera: string!, $screen: string!)
 @workflowType(id: \"urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow\")

        },
        "validatedNamespaceVersion": 5
    }
}
```

For more information, see Working with Flows in the *AWS IoT Things Graph User Guide*.

- For API details, see GetFlowTemplate in *AWS CLI Command Reference*.

`get-namespace-deletion-status`

The following code example shows how to use `get-namespace-deletion-status`.

AWS CLI

To get the status of the namespace deletion task

The following `get-namespace-deletion-status` example gets the status of the namespace deletion task.

```
aws iotthingsgraph get-namespace-deletion-status
```

Output:

```
{
   "namespaceArn": "arn:aws:iotthingsgraph:us-west-2:123456789012",
   "namespaceName": "us-west-2/123456789012/default"
   "status": "SUCCEEDED "
}
```

For more information, see Namespaces in the *AWS IoT Things Graph User Guide*.

- For API details, see GetNamespaceDeletionStatus in *AWS CLI Command Reference*.

`get-system-instance`

The following code example shows how to use `get-system-instance`.

AWS CLI

To get a system instance

The following `get-system-instance` example gets a definition for a system instance.

```
aws iotthingsgraph get-system-instance \
    --id "urn:tdm:us-west-2/123456789012/default:Deployment:Room218"
```

Output:

```
{
    "description": {
        "summary": {
            "id": "urn:tdm:us-west-2/123456789012/default:Deployment:Room218",
            "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/
default/Room218",
```

```
            "status": "NOT_DEPLOYED",
            "target": "CLOUD",
            "createdAt": 1559249315.208,
            "updatedAt": 1559249315.208
        },
        "definition": {
            "language": "GRAPHQL",
            "text": "{\r\nquery Room218 @deployment(id: \"urn:tdm:us-
west-2/123456789012/default:Deployment:Room218\", systemId: \"urn:tdm:us-

 bindings[name == 'screen'].deviceId)\")\r\n    }\r\n   }\r\n  }\r\n  }"
        },
        "metricsConfiguration": {
            "cloudMetricEnabled": false
        },
        "validatedNamespaceVersion": 5,
        "flowActionsRoleArn": "arn:aws:iam::123456789012:role/ThingsGraphRole"
    }
}
```

For more information, see Working with Systems and Flow Configurations in the *AWS IoT Things Graph User Guide*.

- For API details, see GetSystemInstance in *AWS CLI Command Reference*.

`get-system-template-revisions`

The following code example shows how to use `get-system-template-revisions`.

AWS CLI

To get revision information about a system

The following `get-system-template-revisions` example gets revision information about a system.

```
aws iotthingsgraph get-system-template-revisions \
```

```
    --id "urn:tdm:us-west-2/123456789012/default:System:MySystem"
```

Output:

```
{
    "summaries": [
        {
            "id": "urn:tdm:us-west-2/123456789012/default:System:MySystem",
            "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:System/default/
MySystem",
            "revisionNumber": 1,
            "createdAt": 1559247540.656
        }
    ]
}
```

For more information, see Working with Systems and Flow Configurations in the *AWS IoT Things Graph User Guide*.

- For API details, see GetSystemTemplateRevisions in *AWS CLI Command Reference*.

`get-system-template`

The following code example shows how to use `get-system-template`.

AWS CLI

To get a system

The following `get-system-template` example gets a definition for a system.

```
aws iotthingsgraph get-system-template \
    --id "urn:tdm:us-west-2/123456789012/default:System:MySystem"
```

Output:

```
{
    "description": {
        "summary": {
            "id": "urn:tdm:us-west-2/123456789012/default:System:MySystem",
            "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:System/default/
MyFlow",
```

```
            "revisionNumber": 1,
            "createdAt": 1559247540.656
        },
        "definition": {
            "language": "GRAPHQL",
            "text": "{\ntype MySystem @systemType(id: \"urn:tdm:us-
west-2/123456789012/default:System:MySystem\", description: \"\") {\n  camera:
 Camera @thing(id: \"urn:tdm:aws/examples:deviceModel:Camera\")\n  screen:
 Screen @thing(id: \"urn:tdm:aws/examples:deviceModel:Screen\")\n  motionSensor:
 MotionSensor @thing(id: \"urn:tdm:aws/examples:deviceModel:MotionSensor
\")\n  MyFlow: MyFlow @workflow(id: \"urn:tdm:us-west-2/123456789012/
default:Workflow:MyFlow\")\n}\n}"
        },
        "validatedNamespaceVersion": 5
    }
}
```

For more information, see Working with Systems and Flow Configurations in the *AWS IoT Things Graph User Guide*.

- For API details, see GetSystemTemplate in *AWS CLI Command Reference*.

`get-upload-status`

The following code example shows how to use `get-upload-status`.

AWS CLI

To get the status of your entity upload

The following `get-upload-status` example gets the status of your entity upload operation. The value of `MyUploadId` is the ID value returned by the `upload-entity-definitions` operation.

```
aws iotthingsgraph get-upload-status \
    --upload-id "MyUploadId"
```

Output:

```
{
    "namespaceName": "us-west-2/123456789012/default",
```

```
    "namespaceVersion": 5,
    "uploadId": "f6294f1e-b109-4bbe-9073-f451a2dda2da",
    "uploadStatus": "SUCCEEDED"
}
```

For more information, see [Modeling Entities](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [GetUploadStatus](#) in *AWS CLI Command Reference*.

`list-flow-execution-messages`

The following code example shows how to use `list-flow-execution-messages`.

AWS CLI

To get information about events in a flow execution

The following `list-flow-execution-messages` example gets information about events in a flow execution.

```
aws iotthingsgraph list-flow-execution-messages \
    --flow-execution-id "urn:tdm:us-west-2/123456789012/
default:Workflow:SecurityFlow_2019-05-11T19:39:55.317Z_MotionSensor_69b151ad-
a611-42f5-ac21-fe537f9868ad"
```

Output:

```
{
    "messages": [
        {
         "eventType": "EXECUTION_STARTED",
         "messageId": "f6294f1e-b109-4bbe-9073-f451a2dda2da",
         "payload": "Flow execution started",
         "timestamp": 1559247540.656
        }
    ]
}
```

For more information, see [Working with Flows](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [ListFlowExecutionMessages](#) in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list all tags for a resource

The following `list-tags-for-resource` example list all tags for an AWS IoT Things Graph resource.

```
aws iotthingsgraph list-tags-for-resource \
    --resource-arn "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/
default/Room218"
```

Output:

```
{
   "tags": [
      {
         "key": "Type",
         "value": "Residential"
      }
   ]
}
```

For more information, see Tagging Your AWS IoT Things Graph Resources in the *AWS IoT Things Graph User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`search-entities`

The following code example shows how to use `search-entities`.

AWS CLI

To search for entities

The following `search-entities` example searches for all entities of type EVENT.

```
aws iotthingsgraph search-entities \
```

```
    --entity-types "EVENT"
```

Output:

```
{
    "descriptions": [
        {
            "id": "urn:tdm:aws/examples:Event:MotionSensorEvent",
            "type": "EVENT",
            "definition": {
                "language": "GRAPHQL",
                "text": "##\n# Description of events emitted by motion
 sensor.\n##\ntype MotionSensorEvent @eventType(id: \"urn:tdm:aws/
examples:event:MotionSensorEvent\",\n            payload: \"urn:tdm:aws/
examples:property:MotionSensorStateProperty\") {ignore:void}"
            }
        },
        {
            "id": "urn:tdm:us-west-2/123456789012/
default:Event:CameraClickedEventV2",
            "type": "EVENT",
            "definition": {
                "language": "GRAPHQL",
                "text": "type CameraClickedEventV2 @eventType(id: \"urn:tdm:us-
west-2/123456789012/default:event:CameraClickedEventV2\",\r\npayload:
 \"urn:tdm:aws:Property:Boolean\"){ignore:void}"
            }
        },
        {
            "id": "urn:tdm:us-west-2/123456789012/
default:Event:MotionSensorEventV2",
            "type": "EVENT",
            "definition": {
                "language": "GRAPHQL",
                "text": "# Event emitted by the motion sensor.\r\ntype
 MotionSensorEventV2 @eventType(id: \"urn:tdm:us-west-2/123456789012/
default:event:MotionSensorEventV2\",\r\npayload: \"urn:tdm:us-west-2/123456789012/
default:property:MotionSensorStateProperty2\") {ignore:void}"
            }
        }
    ],
    "nextToken": "urn:tdm:us-west-2/123456789012/default:Event:MotionSensorEventV2"
}
```

For more information, see AWS IoT Things Graph Data Model Reference in the *AWS IoT Things Graph User Guide*.

- For API details, see SearchEntities in *AWS CLI Command Reference*.

`search-flow-executions`

The following code example shows how to use `search-flow-executions`.

AWS CLI

To search for flow executions

The following `search-flow-executions` example search for all executions of a flow in a specified system instance.

```
aws iotthingsgraph search-flow-executions \
    --system-instance-id "urn:tdm:us-west-2/123456789012/default:Deployment:Room218"
```

Output:

```
{
   "summaries": [

      }
   ]
}
```

For more information, see Working with Systems and Flow Configurations in the *AWS IoT Things Graph User Guide*.

- For API details, see SearchFlowExecutions in *AWS CLI Command Reference*.

`search-flow-templates`

The following code example shows how to use `search-flow-templates`.

AWS CLI

To search for flows (or workflows)

The following `search-flow-templates` example searches for all flows (workflows) that contain the Camera device model.

```
aws iotthingsgraph search-flow-templates \
    --filters name="DEVICE_MODEL_ID",value="urn:tdm:aws/examples:DeviceModel:Camera"
```

Output:

```
{
    "summaries": [
        {
            "id": "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow",
            "revisionNumber": 1,
            "createdAt": 1559247540.292
        },
        {
            "id": "urn:tdm:us-west-2/123456789012/default:Workflow:SecurityFlow",
            "revisionNumber": 3,
            "createdAt": 1548283099.27
        }
    ]
}
```

For more information, see Working with Flows in the *AWS IoT Things Graph User Guide*.

- For API details, see SearchFlowTemplates in *AWS CLI Command Reference*.

`search-system-instances`

The following code example shows how to use `search-system-instances`.

AWS CLI

To search for system instances

The following `search-system-instances` example searches for all system instances that contain the specified system.

```
aws iotthingsgraph search-system-instances \
    --filters name="SYSTEM_TEMPLATE_ID",value="urn:tdm:us-west-2/123456789012/
default:System:SecurityFlow"
```

Output:

```
{
    "summaries": [
        {
            "id": "urn:tdm:us-west-2/123456789012/
default:Deployment:DeploymentForSample",
            "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/

            "status": "NOT_DEPLOYED",
            "target": "CLOUD",
            "createdAt": 1559249315.208,
            "updatedAt": 1559249315.208
        }
    ]
}
```

For more information, see Working with Systems and Flow Configurations in the *AWS IoT Things Graph User Guide*.

- For API details, see SearchSystemInstances in *AWS CLI Command Reference*.

`search-system-templates`

The following code example shows how to use `search-system-templates`.

AWS CLI

To search for system

The following `search-system-templates` example searches for all systems that contain the specified flow.

```
aws iotthingsgraph search-system-templates \
    --filters name="FLOW_TEMPLATE_ID",value="urn:tdm:us-west-2/123456789012/
default:Workflow:SecurityFlow"
```

Output:

```
{
    "summaries": [
        {
            "id": "urn:tdm:us-west-2/123456789012/default:System:SecurityFlow",
            "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:System/default/
SecurityFlow",
            "revisionNumber": 1,
            "createdAt": 1548283099.433
        }
    ]
}
```

For more information, see Working with Flows in the *AWS IoT Things Graph User Guide*.

- For API details, see SearchSystemTemplates in *AWS CLI Command Reference*.

`search-things`

The following code example shows how to use `search-things`.

AWS CLI

To search for things associated with devices and device models

The following `search-things` example searches for all things that are associated with the HCSR501MotionSensor device.

```
aws iotthingsgraph search-things \
    --entity-id "urn:tdm:aws/examples:Device:HCSR501MotionSensor"
```

Output:

```
{
    "things": [
```

```
        {
            "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MotionSensor1",
            "thingName": "MotionSensor1"
        },
        {
            "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/TG_MS",
            "thingName": "TG_MS"
        }
    ]
}
```

For more information, see Creating and Uploading Models in the *AWS IoT Things Graph User Guide*.

- For API details, see SearchThings in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To create a tag for a resource

The following `tag-resource` example creates a tag for the specified resource.

```
aws iotthingsgraph tag-resource \
    --resource-arn "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/
default/Room218" \
    --tags key="Type",value="Residential"
```

This command produces no output.

For more information, see Tagging Your AWS IoT Things Graph Resources in the *AWS IoT Things Graph User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`undeploy-system-instance`

The following code example shows how to use `undeploy-system-instance`.

AWS CLI

To undeploy a system instance from its target

The following `undeploy-system-instance` example removes a system instance from its target.

```
aws iotthingsgraph undeploy-system-instance \
    --id "urn:tdm:us-west-2/123456789012/default:Deployment:Room215"
```

Output:

```
{
    "summary": {
        "id": "urn:tdm:us-west-2/123456789012/default:Deployment:Room215",
        "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/default/
Room215",
        "status": "PENDING_DELETE",
        "target": "GREENGRASS",
        "greengrassGroupName": "ThingsGraphGrnGr",
        "createdAt": 1553189694.255,
        "updatedAt": 1559344549.601,
        "greengrassGroupId": "01d04b07-2a51-467f-9d03-0c90b3cdcaaf",
        "greengrassGroupVersionId": "731b371d-d644-4b67-ac64-3934e99b75d7"
    }
}
```

For more information, see Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments in the *AWS IoT Things Graph User Guide*.

- For API details, see UndeploySystemInstance in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag for a resource

The following `untag-resource` example removes a tag for the specified resource.

```
aws iotthingsgraph untag-resource \
    --resource-arn "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/
default/Room218" \
    --tag-keys "Type"
```

This command produces no output.

For more information, see Tagging Your AWS IoT Things Graph Resources in the *AWS IoT Things Graph User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-flow-template`

The following code example shows how to use `update-flow-template`.

AWS CLI

To update a flow

The following `update-flow-template` example updates a flow (workflow). The value of `MyFlowDefinition` is the GraphQL that models the flow.

```
aws iotthingsgraph update-flow-template \
    --id "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow" \
    --definition language=GRAPHQL,text="MyFlowDefinition"
```

Output:

```
{
    "summary": {
        "createdAt": 1559248067.545,
        "id": "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow",
        "revisionNumber": 2
    }
}
```

For more information, see Working with Flows in the *AWS IoT Things Graph User Guide*.

- For API details, see UpdateFlowTemplate in *AWS CLI Command Reference*.

`update-system-template`

The following code example shows how to use `update-system-template`.

AWS CLI

To update a system

The following `update-system-template` example updates a system. The value of `MySystemDefinition` is the GraphQL that models the system.

```
aws iotthingsgraph update-system-template \
    --id "urn:tdm:us-west-2/123456789012/default:System:MySystem" \
    --definition language=GRAPHQL,text="MySystemDefinition"
```

Output:

```
{
    "summary": {
        "createdAt": 1559249776.254,
        "id": "urn:tdm:us-west-2/123456789012/default:System:MySystem",
        "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:System/default/
MySystem",
        "revisionNumber": 2
    }
}
```

For more information, see Creating Systems in the *AWS IoT Things Graph User Guide*.

- For API details, see UpdateSystemTemplate in *AWS CLI Command Reference*.

`upload-entity-definitions`

The following code example shows how to use `upload-entity-definitions`.

AWS CLI

To upload entity definitions

The following `upload-entity-definitions` example uploads entity definitions to your namespace. The value of `MyEntityDefinitions` is the GraphQL that models the entities.

```
aws iotthingsgraph upload-entity-definitions \
    --document language=GRAPHQL,text="MyEntityDefinitions"
```

Output:

```
{
    "uploadId": "f6294f1e-b109-4bbe-9073-f451a2dda2da"
}
```

For more information, see Modeling Entities in the *AWS IoT Things Graph User Guide*.

- For API details, see UploadEntityDefinitions in *AWS CLI Command Reference*.

AWS IoT Wireless examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Wireless.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`associate-aws-account-with-partner-account`

The following code example shows how to use `associate-aws-account-with-partner-account`.

AWS CLI

To associate a partner account with your AWS account

The following `associate-aws-account-with-partner-account` example associates the following Sidewalk account credentials with your AWS account.

```
aws iotwireless associate-aws-account-with-partner-account \
    --sidewalk
 AmazonId="12345678901234",AppServerPrivateKey="a123b45c6d78e9f012a34cd5e6a7890b12c3d45e6f78
```

Output:

```
{
    "Sidewalk": {
        "AmazonId": "12345678901234",
        "AppServerPrivateKey":
 "a123b45c6d78e9f012a34cd5e6a7890b12c3d45e6f78a1b234c56d7e890a1234"
    }
}
```

For more information, see Amazon Sidewalk Integration for AWS IoT Core in the *AWS IoT Developers Guide*.

- For API details, see AssociateAwsAccountWithPartnerAccount in *AWS CLI Command Reference*.

`associate-wireless-device-with-thing`

The following code example shows how to use `associate-wireless-device-with-thing`.

AWS CLI

To associate a thing to a wireless device

The following `associate-wireless-device-with-thing` example associates a thing to your wireless device that has the specified ID.

```
aws iotwireless associate-wireless-device-with-thing \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d" \
    --thing-arn "arn:aws:iot:us-east-1:123456789012:thing/MyIoTWirelessThing"
```

This command produces no output.

For more information, see Add your gateways and wireless devices to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see AssociateWirelessDeviceWithThing in *AWS CLI Command Reference*.

`associate-wireless-gateway-with-certificate`

The following code example shows how to use `associate-wireless-gateway-with-certificate`.

AWS CLI

To associate the certificate with the wireless gateway

The following `associate-wireless-gateway-with-certificate` associates a wireless gateway with a certificate.

```
aws iotwireless associate-wireless-gateway-with-certificate \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d" \
    --iot-certificate-
id "a123b45c6d78e9f012a34cd5e6a7890b12c3d45e6f78a1b234c56d7e890a1234"
```

Output:

```
{
    "IotCertificateId":
 "a123b45c6d78e9f012a34cd5e6a7890b12c3d45e6f78a1b234c56d7e890a1234"
}
```

For more information, see Add your gateways and wireless devices to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see AssociateWirelessGatewayWithCertificate in *AWS CLI Command Reference*.

`associate-wireless-gateway-with-thing`

The following code example shows how to use `associate-wireless-gateway-with-thing`.

AWS CLI

To associate a thing to a wireless gateway

The following `associate-wireless-gateway-with-thing` example associates a thing to a wireless gateway.

```
aws iotwireless associate-wireless-gateway-with-thing \
```

```
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d" \
    --thing-arn "arn:aws:iot:us-east-1:123456789012:thing/MyIoTWirelessThing"
```

This command produces no output.

For more information, see Add your gateways and wireless devices to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see AssociateWirelessGatewayWithThing in *AWS CLI Command Reference*.

`create-destination`

The following code example shows how to use `create-destination`.

AWS CLI

To create an IoT wireless destination

The following `create-destination` example creates a destination for mapping a device message to an AWS IoT rule. Before you run this command, you must have created an IAM role that gives AWS IoT Core for LoRaWAN the permissions necessary to send data to the AWS IoT rule.

```
aws iotwireless create-destination \
    --name IoTWirelessDestination \
    --expression-type RuleName \
    --expression IoTWirelessRule \
    --role-arn arn:aws:iam::123456789012:role/IoTWirelessDestinationRole
```

Output:

```
{
    "Arn": "arn:aws:iotwireless:us-east-1:123456789012:Destination/
IoTWirelessDestination",
    "Name": "IoTWirelessDestination"
}
```

For more information, see Add destinations to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see CreateDestination in *AWS CLI Command Reference*.

`create-device-profile`

The following code example shows how to use `create-device-profile`.

AWS CLI

To create a new device profile

The following `create-device-profile` example creates a new IoT wireless device profile.

```
aws iotwireless create-device-profile
```

Output:

```
{
    "Arn": "arn:aws:iotwireless:us-east-1:123456789012:DeviceProfile/12345678-
a1b2-3c45-67d8-e90fa1b2c34d",
    "Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
}
```

For more information, see Add profiles to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see CreateDeviceProfile in *AWS CLI Command Reference*.

`create-service-profile`

The following code example shows how to use `create-service-profile`.

AWS CLI

To create a new service profile

The following `create-service-profile` example creates a new IoT wireless service profile.

```
aws iotwireless create-service-profile
```

Output:

```
{
```

```
    "Arn": "arn:aws:iotwireless:us-east-1:123456789012:ServiceProfile/12345678-
a1b2-3c45-67d8-e90fa1b2c34d",
    "Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
}
```

For more information, see Add profiles to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see CreateServiceProfile in *AWS CLI Command Reference*.

`create-wireless-device`

The following code example shows how to use `create-wireless-device`.

AWS CLI

To create an IoT wireless device

The following `create-wireless-device` example creates a wireless device resource of the type LoRaWAN.

```
aws iotwireless create-wireless-device \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "Description": "My LoRaWAN wireless device"
    "DestinationName": "IoTWirelessDestination"
    "LoRaWAN": {
        "DeviceProfileId": "ab0c23d3-b001-45ef-6a01-2bc3de4f5333",
        "ServiceProfileId": "fe98dc76-cd12-001e-2d34-5550432da100",
        "OtaaV1_1": {
            "AppKey": "3f4ca100e2fc675ea123f4eb12c4a012",
            "JoinEui": "b4c231a359bc2e3d",
            "NwkKey": "01c3f004a2d6efffe32c4eda14bcd2b4"
        },
        "DevEui": "ac12efc654d23fc2"
    },
    "Name": "SampleIoTWirelessThing"
    "Type": LoRaWAN
```

```
}
```

Output:

```
{
    "Arn": "arn:aws:iotwireless:us-
east-1:123456789012:WirelessDevice/1ffd32c8-8130-4194-96df-622f072a315f",
    "Id": "1ffd32c8-8130-4194-96df-622f072a315f"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see CreateWirelessDevice in *AWS CLI Command Reference*.

`create-wireless-gateway-task-definition`

The following code example shows how to use `create-wireless-gateway-task-definition`.

AWS CLI

To create a wireless gateway task definition

The following `create-wireless-gateway-task-definition` automatically creates tasks using this task definition for all gateways with the specified current version.

```
aws iotwireless create-wireless-gateway-task-definition \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "AutoCreateTasks": true,
    "Name": "TestAutoUpdate",
    "Update":{
        "UpdateDataSource" : "s3://cupsalphagafirmwarebin/station",
        "UpdateDataRole" : "arn:aws:iam::001234567890:role/SDK_Test_Role",
        "LoRaWAN" :{
            "CurrentVersion" :{
                "PackageVersion" : "1.0.0",
                "Station" : "2.0.5",
```

```
                "Model" : "linux"
            },
            "UpdateVersion" :{
                "PackageVersion" : "1.0.1",
                "Station" : "2.0.5",
                "Model" : "minihub"
            }
        }
    }
}
```

Output:

```
{
    "Id": "b7d3baad-25c7-35e7-a4e1-1683a0d61da9"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see CreateWirelessGatewayTaskDefinition in *AWS CLI Command Reference*.

`create-wireless-gateway-task`

The following code example shows how to use `create-wireless-gateway-task`.

AWS CLI

To create the task for a wireless gateway

The following `create-wireless-gateway-task` example creates a task for a wireless gateway.

```
aws iotwireless create-wireless-gateway-task \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d" \
    --wireless-gateway-task-definition-id "aa000102-0304-b0cd-ef56-a1b23cde456a"
```

Output:

```
{
    "WirelessGatewayTaskDefinitionId": "aa204003-0604-30fb-ac82-a4f95aaf450a",
```

```
    "Status": "Success"
}
```

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN]() in the *AWS IoT Developers Guide*.

- For API details, see [CreateWirelessGatewayTask]() in *AWS CLI Command Reference*.

`create-wireless-gateway`

The following code example shows how to use `create-wireless-gateway`.

AWS CLI

To create a wireless gateway

The following `create-wireless-gateway` example creates a wireless LoRaWAN device gateway.

```
aws iotwireless create-wireless-gateway \
    --lorawan GatewayEui="a1b2c3d4567890ab",RfRegion="US915" \
    --name "myFirstLoRaWANGateway" \
    --description "Using my first LoRaWAN gateway"
```

Output:

```
{
    "Arn": "arn:aws:iotwireless:us-east-1:123456789012:WirelessGateway/12345678-
a1b2-3c45-67d8-e90fa1b2c34d",
    "Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
}
```

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN]() in the *AWS IoT Developers Guide*.

- For API details, see [CreateWirelessGateway]() in *AWS CLI Command Reference*.

`delete-destination`

The following code example shows how to use `delete-destination`.

AWS CLI

To delete an IoT wireless destination

The following `delete-destination` example deletes the wireless destination resource with the name `IoTWirelessDestination` that you created.

```
aws iotwireless delete-destination \
    --name "IoTWirelessDestination"
```

This command produces no output.

For more information, see Add destinations to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see DeleteDestination in *AWS CLI Command Reference*.

`delete-device-profile`

The following code example shows how to use `delete-device-profile`.

AWS CLI

To delete a device profile

The following `delete-device-profile` example deletes a device profile with the specified ID that you created.

```
aws iotwireless delete-device-profile \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see Add profiles to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see DeleteDeviceProfile in *AWS CLI Command Reference*.

`delete-service-profile`

The following code example shows how to use `delete-service-profile`.

AWS CLI

To delete a service profile

The following `delete-service-profile` example deletes a service profile with the specified ID that you created.

```
aws iotwireless delete-service-profile \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see Add profiles to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see DeleteServiceProfile in *AWS CLI Command Reference*.

`delete-wireless-device`

The following code example shows how to use `delete-wireless-device`.

AWS CLI

To delete a wireless device

The following `delete-wireless-device` example deletes a wireless device that has the specified ID.

```
aws iotwireless delete-wireless-device \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see DeleteWirelessDevice in *AWS CLI Command Reference*.

`delete-wireless-gateway-task-definition`

The following code example shows how to use `delete-wireless-gateway-task-definition`.

AWS CLI

To delete a wireless gateway task definition

The following `delete-wireless-gateway-task-definition` example deletes the wireless gateway task definition that you created with the following ID.

```
aws iotwireless delete-wireless-gateway-task-definition \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see DeleteWirelessGatewayTaskDefinition in *AWS CLI Command Reference*.

`delete-wireless-gateway-task`

The following code example shows how to use `delete-wireless-gateway-task`.

AWS CLI

To delete a wireless gateway task

The following `delete-wireless-gateway-task` example deletes the wireless gateway task that has the specified ID.

```
aws iotwireless delete-wireless-gateway-task \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see DeleteWirelessGatewayTask in *AWS CLI Command Reference*.

`delete-wireless-gateway`

The following code example shows how to use `delete-wireless-gateway`.

AWS CLI

To delete a wireless gateway

The following `delete-wireless-gateway` example deletes a wireless gateway that has the specified ID.

```
aws iotwireless delete-wireless-gateway \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see DeleteWirelessGateway in *AWS CLI Command Reference*.

`disassociate-aws-account-from-partner-account`

The following code example shows how to use `disassociate-aws-account-from-partner-account`.

AWS CLI

To disassociate the partner account from the AWS account

The following `disassociate-aws-account-from-partner-account` example disassociates a partner account from your currently associated AWS account.

```
aws iotwireless disassociate-aws-account-from-partner-account \
    --partner-account-id "12345678901234" \
    --partner-type "Sidewalk"
```

This command produces no output.

For more information, see Add your gateways and wireless devices to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see DisassociateAwsAccountFromPartnerAccount in *AWS CLI Command Reference*.

`disassociate-wireless-device-from-thing`

The following code example shows how to use `disassociate-wireless-device-from-thing`.

AWS CLI

To disassociate the thing from the wireless device

The following `disassociate-wireless-device-from-thing` example disassociates a wireless device from its currently associated thing.

```
aws iotwireless disassociate-wireless-device-from-thing \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see Add your gateways and wireless devices to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see DisassociateWirelessDeviceFromThing in *AWS CLI Command Reference*.

`disassociate-wireless-gateway-from-certificate`

The following code example shows how to use `disassociate-wireless-gateway-from-certificate`.

AWS CLI

To disassociate the certificate from the wireless gateway

The following `disassociate-wireless-gateway-from-certificate` disassociates a wireless gateway from its currently associated certificate.

```
aws iotwireless disassociate-wireless-gateway-from-certificate \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see Add your gateways and wireless devices to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see DisassociateWirelessGatewayFromCertificate in *AWS CLI Command Reference*.

`disassociate-wireless-gateway-from-thing`

The following code example shows how to use `disassociate-wireless-gateway-from-thing`.

AWS CLI

To disassociate the thing from the wireless gateway

The following `disassociate-wireless-gateway-from-thing` example disassociates a wireless gateway from its currently associated thing.

```
aws iotwireless disassociate-wireless-gateway-from-thing \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see Add your gateways and wireless devices to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see DisassociateWirelessGatewayFromThing in *AWS CLI Command Reference*.

`get-destination`

The following code example shows how to use `get-destination`.

AWS CLI

To get information about an IoT wireless destination

The following `get-destination` example gets information about the destination resource with the name `IoTWirelessDestination` that you created.

```
aws iotwireless get-destination \
    --name "IoTWirelessDestination"
```

Output:

```
{
    "Arn": "arn:aws:iotwireless:us-east-1:123456789012:Destination/
IoTWirelessDestination",
    "Name": "IoTWirelessDestination",
    "Expression": "IoTWirelessRule",
    "ExpressionType": "RuleName",
    "RoleArn": "arn:aws:iam::123456789012:role/IoTWirelessDestinationRole"
}
```

For more information, see Add destinations to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see GetDestination in *AWS CLI Command Reference*.

`get-device-profile`

The following code example shows how to use `get-device-profile`.

AWS CLI

To get information about a device profile

The following `get-device-profile` example gets information about the device profile with the specified ID that you created.

```
aws iotwireless get-device-profile \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

Output:

```
{
    "Arn": "arn:aws:iotwireless:us-east-1:123456789012:DeviceProfile/12345678-
a1b2-3c45-67d8-e90fa1b2c34d",
    "Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d",
    "LoRaWAN": {
    "MacVersion": "1.0.3",
    "MaxDutyCycle": 10,
    "Supports32BitFCnt": false,
    "RegParamsRevision": "RP002-1.0.1",
    "SupportsJoin": true,
    "RfRegion": "US915",
```

```
    "MaxEirp": 13,
    "SupportsClassB": false,
    "SupportsClassC": false
    }
}
```

For more information, see [Add profiles to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [GetDeviceProfile](#) in *AWS CLI Command Reference*.

`get-partner-account`

The following code example shows how to use `get-partner-account`.

AWS CLI

To get the partner account information

The following `get-partner-account` example gets information about your Sidewalk account that has the following ID.

```
aws iotwireless get-partner-account \
    --partner-account-id "12345678901234" \
    --partner-type "Sidewalk"
```

Output:

```
{
    "Sidewalk": {
        "AmazonId": "12345678901234",
        "Fingerprint":
 "a123b45c6d78e9f012a34cd5e6a7890b12c3d45e6f78a1b234c56d7e890a1234"
    },
    "AccountLinked": false
}
```

For more information, see [Amazon Sidewalk Integration for AWS IoT Core](#) in the *AWS IoT Developers Guide*.

- For API details, see [GetPartnerAccount](#) in *AWS CLI Command Reference*.

`get-service-endpoint`

The following code example shows how to use `get-service-endpoint`.

AWS CLI

To get the service endpoint

The following `get-service-endpoint` example gets the account-specific endpoint for CUPS protocol.

```
aws iotwireless get-service-endpoint
```

Output:

```
{
    "ServiceType": "CUPS",
    "ServiceEndpoint": "https://A1RMKZ37ACAGOT.cups.lorawan.us-
east-1.amazonaws.com:443",
    "ServerTrust": "-----BEGIN CERTIFICATE-----\n

`get-service-profile`

The following code example shows how to use `get-service-profile`.

AWS CLI

To get information about a service profile

The following `get-service-profile` example gets information about the service profile with the specified ID that you created.

```
aws iotwireless get-service-profile \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

Output:

```
{
    "Arn": "arn:aws:iotwireless:us-east-1:651419225604:ServiceProfile/538185bb-
d7e7-4b95-96a0-c51aa4a5b9a0",

```

```
            "TargetPer": 5,
            "UlRate": 60
        }
}
```

For more information, see Add profiles to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see GetServiceProfile in *AWS CLI Command Reference*.

`get-wireless-device-statistics`

The following code example shows how to use `get-wireless-device-statistics`.

AWS CLI

To get operating information about a wireless device

The following `get-wireless-device-statistics` example gets operating information about a wireless device.

```
aws iotwireless get-wireless-device-statistics \
    --wireless-device-id "1ffd32c8-8130-4194-96df-622f072a315f"
```

Output:

```
{
    "WirelessDeviceId": "1ffd32c8-8130-4194-96df-622f072a315f"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see GetWirelessDeviceStatistics in *AWS CLI Command Reference*.

`get-wireless-device`

The following code example shows how to use `get-wireless-device`.

AWS CLI

To get information about the wireless device

The following `get-wireless-device` example lists the available widgets in your AWS account.

```
aws iotwireless get-wireless-device \
    --identifier "1ffd32c8-8130-4194-96df-622f072a315f" \
    --identifier-type WirelessDeviceID
```

Output:

```
{
    "Name": "myLoRaWANDevice",
    "ThingArn": "arn:aws:iot:us-east-1:123456789012:thing/44b87eb4-9bce-423d-

    "DestinationName": "IoTWirelessDestination",
    "Id": "1ffd32c8-8130-4194-96df-622f072a315f",
    "ThingName": "44b87eb4-9bce-423d-b5fc-973f5ecc358b",
    "Type": "LoRaWAN",
    "LoRaWAN": {
        "DeviceProfileId": "ab0c23d3-b001-45ef-6a01-2bc3de4f5333",
        "ServiceProfileId": "fe98dc76-cd12-001e-2d34-5550432da100",
        "OtaaV1_1": {
            "AppKey": "3f4ca100e2fc675ea123f4eb12c4a012",
            "JoinEui": "b4c231a359bc2e3d",
            "NwkKey": "01c3f004a2d6efffe32c4eda14bcd2b4"
        },
        "DevEui": "ac12efc654d23fc2"
    },
    "Arn": "arn:aws:iotwireless:us-
east-1:123456789012:WirelessDevice/1ffd32c8-8130-4194-96df-622f072a315f",
    "Description": "My LoRaWAN wireless device"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see GetWirelessDevice in *AWS CLI Command Reference*.

`get-wireless-gateway-certificate`

The following code example shows how to use `get-wireless-gateway-certificate`.

AWS CLI

To get the ID of a certificate associated with a wireless gateway

The following `get-wireless-gateway-certificate` example gets the certificate ID associated with a wireless gateway that has the specified ID.

```
aws iotwireless get-wireless-gateway-certificate \
    --id "6c44ab31-8b4d-407a-bed3-19b6c7cda551"
```

Output:

```
{
    "IotCertificateId": 
 "8ea4aeae3db34c78cce75d9abd830356869ead6972997e0603e5fd032c804b6f"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see GetWirelessGatewayCertificate in *AWS CLI Command Reference*.

`get-wireless-gateway-firmware-information`

The following code example shows how to use `get-wireless-gateway-firmware-information`.

AWS CLI

To get firmware information about a wireless gateway

The following `get-wireless-gateway-firmware-information` example gets firmware version and other information about a wireless gateway.

```
aws iotwireless get-wireless-gateway-firmware-information \
    --id "3039b406-5cc9-4307-925b-9948c63da25b"
```

Output:

```
{
    "LoRaWAN" :{
```

```
        "CurrentVersion" :{
            "PackageVersion" : "1.0.0",
            "Station" : "2.0.5",
            "Model" : "linux"
        }
    }
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see GetWirelessGatewayFirmwareInformation in *AWS CLI Command Reference*.

`get-wireless-gateway-statistics`

The following code example shows how to use `get-wireless-gateway-statistics`.

AWS CLI

To get operating information about a wireless gateway

The following `get-wireless-gateway-statistics` example gets operating information about a wireless gateway.

```
aws iotwireless get-wireless-gateway-statistics \
    --wireless-gateway-id "3039b406-5cc9-4307-925b-9948c63da25b"
```

Output:

```
{
    "WirelessGatewayId": "3039b406-5cc9-4307-925b-9948c63da25b"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see GetWirelessGatewayStatistics in *AWS CLI Command Reference*.

`get-wireless-gateway-task-definition`

The following code example shows how to use `get-wireless-gateway-task-definition`.

AWS CLI

To get information about a wireless gateway task definition

The following `get-wireless-gateway-task-definition` example gets information about the wireless task definition with the specified ID.

```
aws iotwireless get-wireless-gateway-task-definition \
    --id "b7d3baad-25c7-35e7-a4e1-1683a0d61da9"
```

Output:

```
{
    "AutoCreateTasks": true,
    "Name": "TestAutoUpdate",
    "Update":{
        "UpdateDataSource" : "s3://cupsalphagafirmwarebin/station",
        "UpdateDataRole" : "arn:aws:iam::001234567890:role/SDK_Test_Role",
        "LoRaWAN" :{
            "CurrentVersion" :{
                "PackageVersion" : "1.0.0",
                "Station" : "2.0.5",
                "Model" : "linux"
            },
            "UpdateVersion" :{
                "PackageVersion" : "1.0.1",
                "Station" : "2.0.5",
                "Model" : "minihub"
            }
        }
    }
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see GetWirelessGatewayTaskDefinition in *AWS CLI Command Reference*.

`get-wireless-gateway-task`

The following code example shows how to use `get-wireless-gateway-task`.

AWS CLI

To get information about the wireless gateway task

The following `get-wireless-gateway-task` example gets information about the wireless gateway task with the specified ID.

```
aws iotwireless get-wireless-gateway-task \
    --id "11693a46-6866-47c3-a031-c9a616e7644b"
```

Output:

```
{
    "WirelessGatewayId": "6c44ab31-8b4d-407a-bed3-19b6c7cda551",
    "WirelessGatewayTaskDefinitionId": "b7d3baad-25c7-35e7-a4e1-1683a0d61da9",
    "Status": "Success"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see GetWirelessGatewayTask in *AWS CLI Command Reference*.

`get-wireless-gateway`

The following code example shows how to use `get-wireless-gateway`.

AWS CLI

To get information about a wireless gateway

The following `get-wireless-gateway` example gets information about the wireless gateway `myFirstLoRaWANGateway`.

```
aws iotwireless get-wireless-gateway \
    --identifier "12345678-a1b2-3c45-67d8-e90fa1b2c34d" \
    --identifier-type WirelessGatewayId
```

Output:

```
{
```

```
    "Description": "My first LoRaWAN gateway",
    "ThingArn": "arn:aws:iot:us-east-1:123456789012:thing/a1b2c3d4-5678-90ab-
cdef-12ab345c67de",
    "LoRaWAN": {
        "RfRegion": "US915",
        "GatewayEui": "a1b2c3d4567890ab"
    },
    "ThingName": "a1b2c3d4-5678-90ab-cdef-12ab345c67de",
    "Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d",
    "Arn": "arn:aws:iotwireless:us-
east-1:123456789012:WirelessGateway/6c44ab31-8b4d-407a-bed3-19b6c7cda551",
    "Name": "myFirstLoRaWANGateway"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see GetWirelessGateway in *AWS CLI Command Reference*.

`list-destinations`

The following code example shows how to use `list-destinations`.

AWS CLI

To list the wireless destinations

The following `list-destinations` example lists the available destinations registered to your AWS account.

```
aws iotwireless list-destinations
```

Output:

```
{
    "DestinationList": [
        {
            "Arn": "arn:aws:iotwireless:us-east-1:123456789012:Destination/
IoTWirelessDestination",
            "Name": "IoTWirelessDestination",
            "Expression": "IoTWirelessRule",
```

```
            "Description": "Destination for messages processed using
 IoTWirelessRule",
            "RoleArn": "arn:aws:iam::123456789012:role/IoTWirelessDestinationRole"
        },
        {
            "Arn": "arn:aws:iotwireless:us-east-1:123456789012:Destination/
IoTWirelessDestination2",
            "Name": "IoTWirelessDestination2",
            "Expression": "IoTWirelessRule2",
            "RoleArn": "arn:aws:iam::123456789012:role/IoTWirelessDestinationRole"
        }
    ]
}
```

For more information, see Add destinations to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see ListDestinations in *AWS CLI Command Reference*.

`list-device-profiles`

The following code example shows how to use `list-device-profiles`.

AWS CLI

To list the device profiles

The following `list-device-profiles` example lists the available device profiles registered to your AWS account.

```
aws iotwireless list-device-profiles
```

Output:

```
{
    "DeviceProfileList": [
        {
            "Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d",
            "Arn": "arn:aws:iotwireless:us-
east-1:123456789012:DeviceProfile/12345678-a1b2-3c45-67d8-e90fa1b2c34d"
        },
```

```
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-12ab345c67de",
            "Arn": "arn:aws:iotwireless:us-east-1:123456789012:DeviceProfile/
a1b2c3d4-5678-90ab-cdef-12ab345c67de"
        }
    ]
}
```

For more information, see Add profiles to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see ListDeviceProfiles in *AWS CLI Command Reference*.

`list-partner-accounts`

The following code example shows how to use `list-partner-accounts`.

AWS CLI

To list the partner accounts

The following `list-partner-accounts` example lists the available partner accounts associated with your AWS account.

```
aws iotwireless list-partner-accounts
```

Output:

```
{
    "Sidewalk": [
        {
            "AmazonId": "78965678771228",
            "Fingerprint":
 "bd96d8ef66dbfd2160eb60e156849e82ad7018b8b73c1ba0b4fc65c32498ee35"
        },
        {
            "AmazonId": "89656787651228",
            "Fingerprint":
 "bc5e99e151c07be14be7e6603e4489c53f858b271213a36ebe3370777ba06e9b"
        }
    ]
```

```
}
```

For more information, see Amazon Sidewalk Integration for AWS IoT Core in the *AWS IoT Developers Guide*.

- For API details, see ListPartnerAccounts in *AWS CLI Command Reference*.

`list-service-profiles`

The following code example shows how to use `list-service-profiles`.

AWS CLI

To list the service profiles

The following `list-service-profiles` example lists the available service profiles registered to your AWS account.

```
aws iotwireless list-service-profiles
```

Output:

```
{
    "ServiceProfileList": [
        {
            "Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d",
            "Arn": "arn:aws:iotwireless:us-
east-1:123456789012:ServiceProfile/538185bb-d7e7-4b95-96a0-c51aa4a5b9a0"
        },
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-12ab345c67de",
            "Arn": "arn:aws:iotwireless:us-east-1:123456789012:ServiceProfile/
ea8bc823-5d13-472e-8d26-9550737d8100"
        }
    ]
}
```

For more information, see Add profiles to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see ListServiceProfiles in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags assigned to the resource

The following `list-tags-for-resource` example lists the tags assigned to a wireless destination resource.

```
aws iotwireless list-tags-for-resource \
    --resource-arn "arn:aws:iotwireless:us-east-1:123456789012:Destination/
IoTWirelessDestination"
```

Output:

```
{
    "Tags": [
        {
            "Value": "MyValue",
            "Key": "MyTag"
        }
    ]
}
```

For more information, see Describe your AWS IoT Core for LoRaWAN resources in the *AWS IoT Developers Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`list-wireless-devices`

The following code example shows how to use `list-wireless-devices`.

AWS CLI

To list the available wireless devices

The following `list-wireless-devices` example lists the available wireless devices registered to your AWS account.

```
aws iotwireless list-wireless-devices
```

Output:

```
{
    "WirelessDeviceList": [
        {
            "Name": "myLoRaWANDevice",
            "DestinationName": "IoTWirelessDestination",
            "Id": "1ffd32c8-8130-4194-96df-622f072a315f",
            "Type": "LoRaWAN",
            "LoRaWAN": {
                "DevEui": "ac12efc654d23fc2"
            },
            "Arn": "arn:aws:iotwireless:us-
east-1:123456789012:WirelessDevice/1ffd32c8-8130-4194-96df-622f072a315f"
        }
    ]
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see ListWirelessDevices in *AWS CLI Command Reference*.

`list-wireless-gateway-task-definitions`

The following code example shows how to use `list-wireless-gateway-task-definitions`.

AWS CLI

To list the wireless gateway task definitions

The following `list-wireless-gateway-task-definitions` example lists the available wireless gateway task definitions registered to your AWS account.

```
aws iotwireless list-wireless-gateway-task-definitions
```

Output:

```
{
```

```
    "TaskDefinitions": [
        {
            "Id": "b7d3baad-25c7-35e7-a4e1-1683a0d61da9",
            "LoRaWAN" :
                {
                "CurrentVersion" :{
                    "PackageVersion" : "1.0.0",
                    "Station" : "2.0.5",
                    "Model" : "linux"
                },
                "UpdateVersion" :{
                    "PackageVersion" : "1.0.1",
                    "Station" : "2.0.5",
                    "Model" : "minihub"
                }
            }
        }
    ]
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see ListWirelessGatewayTaskDefinitions in *AWS CLI Command Reference*.

`list-wireless-gateways`

The following code example shows how to use `list-wireless-gateways`.

AWS CLI

To list the wireless gateways

The following `list-wireless-gateways` example lists the available wireless gateways in your AWS account.

```
aws iotwireless list-wireless-gateways
```

Output:

```
{
    "WirelessGatewayList": [
```

```
        {
            "Description": "My first LoRaWAN gateway",
            "LoRaWAN": {
                "RfRegion": "US915",
                "GatewayEui": "dac632ebc01d23e4"
            },
            "Id": "3039b406-5cc9-4307-925b-9948c63da25b",
            "Arn": "arn:aws:iotwireless:us-
east-1:123456789012:WirelessGateway/3039b406-5cc9-4307-925b-9948c63da25b",
            "Name": "myFirstLoRaWANGateway"
        },
        {
            "Description": "My second LoRaWAN gateway",
            "LoRaWAN": {
                "RfRegion": "US915",
                "GatewayEui": "cda123fffe92ecd2"
            },
            "Id": "3285bdc7-5a12-4991-84ed-dadca65e342e",
            "Arn": "arn:aws:iotwireless:us-
east-1:123456789012:WirelessGateway/3285bdc7-5a12-4991-84ed-dadca65e342e",
            "Name": "mySecondLoRaWANGateway"
        }
    ]
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see ListWirelessGateways in *AWS CLI Command Reference*.

`send-data-to-wireless-device`

The following code example shows how to use `send-data-to-wireless-device`.

AWS CLI

To send data to the wireless device

The following `send-data-to-wireless-device` example sends a decrypted application data frame to the wireless device.

```
aws iotwireless send-data-to-wireless-device \
    --id "11aa5eae-2f56-4b8e-a023-b28d98494e49" \
```

```
    --transmit-mode "1" \
    --payload-data "SGVsbG8gVG8gRGV2c2lt" \
    --wireless-metadata LoRaWAN={FPort=1}
```

Output:

```
{
    MessageId: "6011dd36-0043d6eb-0072-0008"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see SendDataToWirelessDevice in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To specify a tag key and value for a resource

The following `tag-resource` example tags the wireless destination `IoTWirelessDestination` with the key `MyTag` and value `MyValue`.

```
aws iotwireless tag-resource \
    --resource-arn "arn:aws:iotwireless:us-east-1:651419225604:Destination/
IoTWirelessDestination" \
    --tags Key="MyTag",Value="MyValue"
```

This command produces no output.

For more information, see Describe your AWS IoT Core for LoRaWAN resources in the *AWS IoT Developers Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`test-wireless-device`

The following code example shows how to use `test-wireless-device`.

AWS CLI

To test the wireless device

The following `test-wireless-device` example sends uplink data of `Hello` to a device with specified ID.

```
aws iotwireless test-wireless-device \
    --id "11aa5eae-2f56-4b8e-a023-b28d98494e49"
```

Output:

```
{
    Result: "Test succeeded. one message is sent with payload: hello"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see TestWirelessDevice in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove one or more tags from a resource

The following `untag-resource` example removes the tag `MyTag` and its value from the wireless destination `IoTWirelessDestination`.

```
aws iotwireless untag-resource \
    --resource-arn "arn:aws:iotwireless:us-east-1:123456789012:Destination/
IoTWirelessDestination" \
    --tag-keys "MyTag"
```

This command produces no output.

For more information, see Describe your AWS IoT Core for LoRaWAN resources in the *AWS IoT Developers Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-destination`

The following code example shows how to use `update-destination`.

AWS CLI

To update the properties of a destination

The following `update-destination` example updates the description property of a wireless destination.

```
aws iotwireless update-destination \
    --name "IoTWirelessDestination" \
    --description "Destination for messages processed using IoTWirelessRule"
```

This command produces no output.

For more information, see Add destinations to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see UpdateDestination in *AWS CLI Command Reference*.

`update-partner-account`

The following code example shows how to use `update-partner-account`.

AWS CLI

To update the properties of a partner account

The following `update-partner-account` updates the `AppServerPrivateKey` for the account that has the specified ID.

```
aws iotwireless update-partner-account \
    --partner-account-id "78965678771228" \
    --partner-type "Sidewalk" \
    --sidewalk
 AppServerPrivateKey="f798ab4899346a88599180fee9e14fa1ada7b6df989425b7c6d2146dd6c815bb"
```

This command produces no output.

For more information, see Amazon Sidewalk Integration for AWS IoT Core in the *AWS IoT Developers Guide*.

- For API details, see UpdatePartnerAccount in *AWS CLI Command Reference*.

update-wireless-device

The following code example shows how to use `update-wireless-device`.

AWS CLI

To update the properties of a wireless device

The following `update-wireless-device` example updates the properties of a wireless device registered to your AWS account.

```
aws iotwireless update-wireless-device \
    --id "1ffd32c8-8130-4194-96df-622f072a315f" \
    --destination-name IoTWirelessDestination2 \
    --description "Using my first LoRaWAN device"
```

This command produces no output.

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see UpdateWirelessDevice in *AWS CLI Command Reference*.

update-wireless-gateway

The following code example shows how to use `update-wireless-gateway`.

AWS CLI

To update the wireless gateway

The following `update-wireless-gateway` example updates the description of your wireless gateway.

```
aws iotwireless update-wireless-gateway \
```

```
    --id "3285bdc7-5a12-4991-84ed-dadca65e342e" \
    --description "Using my LoRaWAN gateway"
```

This command produces no output.

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see UpdateWirelessGateway in *AWS CLI Command Reference*.

Amazon IVS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon IVS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`batch-get-channel`

The following code example shows how to use `batch-get-channel`.

AWS CLI

To get channel configuration information about multiple channels

The following `batch-get-channel` example lists information about the specified channels.

```
aws ivs batch-get-channel \
    --arns arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \
        arn:aws:ivs:us-west-2:123456789012:channel/efghEFGHijkl
```

Output:

```
{
    "channels": [
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",

                "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
                "passphrase":
 "BA1C2defGHijkLMNo3PqQRstUvwxyzaBCDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
            },
            "tags": {},
            "type": "STANDARD"
        }
    ]
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see BatchGetChannel in *AWS CLI Command Reference*.

batch-get-stream-key

The following code example shows how to use `batch-get-stream-key`.

AWS CLI

To get information about multiple stream keys

The following `batch-get-stream-key` example gets information about the specified stream keys.

```
aws ivs batch-get-stream-key \
    --arns arn:aws:ivs:us-west-2:123456789012:stream-key/skSKABCDefgh \
       arn:aws:ivs:us-west-2:123456789012:stream-key/skSKIJKLmnop
```

Output:

```
{
    "streamKeys": [
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/skSKABCDefgh",
```

```
            "value": "sk_us-west-2_abcdABCDefgh_567890abcdef",
            "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
            "tags": {}
        },
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/skSKIJKLmnop",
            "value": "sk_us-west-2_abcdABCDefgh_567890ghijkl",
            "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
            "tags": {}
        }
    ]
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see BatchGetStreamKey in *AWS CLI Command Reference*.

batch-start-viewer-session-revocation

The following code example shows how to use `batch-start-viewer-session-revocation`.

AWS CLI

To revoke viewer sessions for multiple channel-ARN and viewer-ID pairs

The following `batch-start-viewer-session-revocation` example performs session revocation on multiple channel-ARN and viewer-ID pairs simultaneously. The request may complete normally but return values in the errors field if the caller does not have permission to revoke specified session.

```
aws ivs batch-start-viewer-session-revocation \
    --viewer-sessions '[{"channelArn":"arn:aws:ivs:us-west-2:123456789012:channel/
abcdABCDefgh1","viewerId":"abcdefg1","viewerSessionVersionsLessThanOrEqualTo":1234567890},
 \
      {"channelArn":"arn:aws:ivs:us-west-2:123456789012:channel/
abcdABCDefgh2","viewerId":"abcdefg2","viewerSessionVersionsLessThanOrEqualTo":1234567890}]'
```

Output:

```
{
    "errors": [
```

```
        {
            "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/
abcdABCDefgh1",
            "viewerId": "abcdefg1",
            "code": "403",
            "message": "not authorized",
        },
        {
            "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/
abcdABCDefgh2",
            "viewerId": "abcdefg2",
            "code": "403",
            "message": "not authorized",
        }
    ]
}
```

For more information, see Setting Up Private Channels in the *Amazon Interactive Video Service User Guide*.

- For API details, see BatchStartViewerSessionRevocation in *AWS CLI Command Reference*.

`create-channel`

The following code example shows how to use `create-channel`.

AWS CLI

Example 1: To create a channel with no recording

The following `create-channel` example creates a new channel and an associated stream key to start streaming.

```
aws ivs create-channel \
    --name 'test-channel' \
    --no-insecure-ingest
```

Output:

```
{
    "channel": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
```

```
        "authorized": false,
        "containerFormat": "TS",
        "name": "test-channel",
        "latencyMode": "LOW",
        "multitrackInputConfiguration": {
            "enabled": false,
            "maximumResolution": "FULL_HD",
            "policy": "ALLOW"
        },
        "playbackRestrictionPolicyArn": "",
        "recordingConfigurationArn": "",
        "srt": {
            "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
            "passphrase":
 "AB1C2defGHijkLMNo3PqQRstUvwxyzaBCDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
        },
        "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
        "insecureIngest": false,
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "preset": "",
        "tags": {},
        "type": "STANDARD"
    },
    "streamKey": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/g1H2I3j4k5L6",
        "value": "sk_us-west-2_abcdABCDefgh_567890abcdef",
        "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "tags": {}
    }
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

Example 2: To create a channel with recording enabled, using the RecordingConfiguration resource specified by its ARN

The following `create-channel` example creates a new channel and an associated stream key to start streaming, and sets up recording for the channel:

```
aws ivs create-channel \
    --name test-channel-with-recording \
    --insecure-ingest \
```

```
    --recording-configuration-arn 'arn:aws:ivs:us-west-2:123456789012:recording-
configuration/ABCD12cdEFgh'
```

Output:

```
{
    "channel": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "containerFormat": "TS",
        "name": "test-channel-with-recording",
        "latencyMode": "LOW",
        "multitrackInputConfiguration": {
            "enabled": false,
            "maximumResolution": "FULL_HD",
            "policy": "ALLOW"
        },
        "type": "STANDARD",
        "playbackRestrictionPolicyArn": "",
        "recordingConfigurationArn": "arn:aws:ivs:us-west-2:123456789012:recording-
configuration/ABCD12cdEFgh",
        "srt": {
            "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
            "passphrase":
 "BA1C2defGHijkLMNo3PqQRstUvwxyzaBCDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
        },
        "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
        "insecureIngest": true,
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "preset": "",
        "authorized": false,
        "tags": {},
        "type": "STANDARD"
    },
    "streamKey": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/abcdABCDefgh",
        "value": "sk_us-west-2_abcdABCDefgh_567890abcdef",
        "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "tags": {}
    }
}
```

For more information, see Record to Amazon S3 in the *IVS Low-Latency User Guide*.

Example 3: To create a channel with a playback restriction policy specified by its ARN

The following `create-channel` example creates a new channel and an associated stream key to start streaming, and sets up a playback restriction policy for the channel:

```
aws ivs create-channel \
    --name test-channel-with-playback-restriction-policy\
    --insecure-ingest \
    --playback-restriction-policy-arn 'arn:aws:ivs:us-west-2:123456789012:playback-
restriction-policy/ABcdef34ghIJ'
```

Output:

```
{
    "channel": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "containerFormat": "TS",
        "name": "test-channel-with-playback-restriction-policy",
        "latencyMode": "LOW",
        "multitrackInputConfiguration": {
            "enabled": false,
            "maximumResolution": "FULL_HD",
            "policy": "ALLOW"
        },
        "type": "STANDARD",
        "playbackRestrictionPolicyArn": "arn:aws:ivs:us-
west-2:123456789012:playback-restriction-policy/ABcdef34ghIJ",
        "recordingConfigurationArn": "",
        "srt": {
            "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
            "passphrase":
 "AB1C2edfGHijkLMNo3PqQRstUvwxyzaBCDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
        },
        "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
        "insecureIngest": true,
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "preset": "",
        "authorized": false,
        "tags": {},
        "type": "STANDARD"
    },
    "streamKey": {
```

```
        "arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/abcdABCDefgh",
        "value": "sk_us-west-2_abcdABCDefgh_567890abcdef",
        "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "tags": {}
    }
}
```

For more information, see Undesired Content and Viewers in the *IVS Low-Latency User Guide*.

Example 4: To create a channel with multitrack enabled

The following `create-channel` example creates a new channel and an associated stream key to start streaming, and enables multitrack.

```
aws ivs create-channel \
    --name 'test-channel' \
    --no-insecure-ingest \
    --container-format 'FRAGMENTED_MP4' \
    --multitrack-input-configuration '{"enabled": true,"maximumResolution":
 "FULL_HD","policy": "ALLOW"}'
```

Output:

```
{
    "channel": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "authorized": false,
        "containerFormat": "FRAGMENTED_MP4",
        "name": "test-channel",
        "latencyMode": "LOW",
        "multitrackInputConfiguration": {
            "enabled": true,
            "maximumResolution": "FULL_HD",
            "policy": "ALLOW"
        },
        "playbackRestrictionPolicyArn": "",
        "recordingConfigurationArn": "",
        "srt": {
            "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
            "passphrase":
 "AB1C2defGHijkLMNo3PqQRstUvwxyzaBCDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
        },
```

```
        "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
        "insecureIngest": false,
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "preset": "",
        "tags": {},
        "type": "STANDARD"
    },
    "streamKey": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/g1H2I3j4k5L6",
        "value": "sk_us-west-2_abcdABCDefgh_567890abcdef",
        "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "tags": {}
    }
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see CreateChannel in *AWS CLI Command Reference*.

`create-playback-restriction-policy`

The following code example shows how to use `create-playback-restriction-policy`.

AWS CLI

To create a playback restriction policy

The following `create-playback-restriction-policy` example creates a new playback resriction policy.

```
aws ivs create-playback-restriction-policy \
    --name "test-playback-restriction-policy" \
    --enable-strict-origin-enforcement \
    --tags "key1=value1, key2=value2" \
    --allowed-countries US MX \
    --allowed-origins https://www.website1.com https://www.website2.com
```

Output:

```
{
    "playbackRestrictionPolicy": {
```

```
        "arn": "arn:aws:ivs:us-west-2:123456789012:playback-restriction-policy/
ABcdef34ghIJ",
        "allowedCountries": [
            "US",
            "MX"
        ],
        "allowedOrigins": [
            "https://www.website1.com",
            "https://www.website2.com"
        ],
        "enableStrictOriginEnforcement": true,
        "name": "test-playback-restriction-policy",
        "tags": {
            "key1": "value1",
            "key2": "value2"
        }
    }
}
```

For more information, see Undesired Content and Viewers in the *IVS Low-Latency User Guide*.

- For API details, see CreatePlaybackRestrictionPolicy in *AWS CLI Command Reference*.

`create-recording-configuration`

The following code example shows how to use `create-recording-configuration`.

AWS CLI

To create a RecordingConfiguration resource

The following `create-recording-configuration` example creates a RecordingConfiguration resource to enable recording to Amazon S3.

```
aws ivs create-recording-configuration \
    --name "test-recording-config" \
    --recording-reconnect-window-seconds 60 \
    --tags "key1=value1, key2=value2" \
    --rendition-configuration renditionSelection="CUSTOM",renditions="HD" \
    --thumbnail-configuration
 recordingMode="INTERVAL",targetIntervalSeconds=1,storage="LATEST",resolution="LOWEST_RESOLU
 \
    --destination-configuration s3={bucketName=demo-recording-bucket}
```

Output:

```
{
    "recordingConfiguration": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:recording-configuration/
ABcdef34ghIJ",
        "name": "test-recording-config",
        "destinationConfiguration": {
            "s3": {
                "bucketName": "demo-recording-bucket"
            }
        },
        "state": "CREATING",
        "tags": {
            "key1": "value1",
            "key2": "value2"
        },
        "thumbnailConfiguration": {
            "recordingMode": "INTERVAL",
            "targetIntervalSeconds": 1,
            "resolution": "LOWEST_RESOLUTION",
            "storage": [
                "LATEST"
            ]
        },
        "recordingReconnectWindowSeconds": 60,
        "renditionConfiguration": {
            "renditionSelection": "CUSTOM",
            "renditions": [
                "HD"
            ]
        }
    }
}
```

For more information, see Record to Amazon S3 in the *Amazon Interactive Video Service User Guide*.

- For API details, see CreateRecordingConfiguration in *AWS CLI Command Reference*.

`create-stream-key`

The following code example shows how to use `create-stream-key`.

AWS CLI

To create a stream key

The following `create-stream-key` example creates a stream key for a specified ARN (Amazon Resource Name).

```
aws ivs create-stream-key \
    --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh
```

Output:

```
{
    "streamKey": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/abcdABCDefgh",
        "value": "sk_us-west-2_abcdABCDefgh_567890abcdef",
        "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "tags": {}
    }
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see CreateStreamKey in *AWS CLI Command Reference*.

`delete-channel`

The following code example shows how to use `delete-channel`.

AWS CLI

To delete a channel and its associated stream keys

The following `delete-channel` example deletes the channel with the specified ARN (Amazon Resource Name).

```
aws ivs delete-channel \
    --arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh
```

This command produces no output.

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see DeleteChannel in *AWS CLI Command Reference*.

`delete-playback-key-pair`

The following code example shows how to use `delete-playback-key-pair`.

AWS CLI

To delete a specified playback key pair

The following `delete-playback-key-pair` example returns the fingerprint of the specified key pair.

```
aws ivs delete-playback-key-pair \
    --arn arn:aws:ivs:us-west-2:123456789012:playback-key/abcd1234efgh
```

This command produces no output.

For more information, see Setting Up Private Channels in the *Amazon Interactive Video Service User Guide*.

- For API details, see DeletePlaybackKeyPair in *AWS CLI Command Reference*.

`delete-playback-restriction-policy`

The following code example shows how to use `delete-playback-restriction-policy`.

AWS CLI

To delete a playback restriction policy

The following `delete-playback-restriction-policy` example deletes the playback resriction policy with the specified policy ARN (Amazon Resource Name).

```
aws ivs delete-playback-restriction-policy \
    --arn "arn:aws:ivs:us-west-2:123456789012:playback-restriction-policy/
ABcdef34ghIJ"
```

This command produces no output.

For more information, see Undesired Content and Viewers in the *IVS Low-Latency User Guide*.

- For API details, see DeletePlaybackRestrictionPolicy in *AWS CLI Command Reference*.

`delete-recording-configuration`

The following code example shows how to use `delete-recording-configuration`.

AWS CLI

To delete the RecordingConfiguration resource specified by its ARN

The following `delete-recording-configuration` example deletes the RecordingConfiguration resource with the specified ARN.

```
aws ivs delete-recording-configuration \
    --arn "arn:aws:ivs:us-west-2:123456789012:recording-configuration/ABcdef34ghIJ"
```

This command produces no output.

For more information, see Record to Amazon S3 in the *Amazon Interactive Video Service User Guide*.

- For API details, see DeleteRecordingConfiguration in *AWS CLI Command Reference*.

`delete-stream-key`

The following code example shows how to use `delete-stream-key`.

AWS CLI

To delete a stream key

The following `delete-stream-key` example deletes the stream key for a specified ARN (Amazon Resource Name), so it can no longer be used to stream.

```
aws ivs delete-stream-key \
    --arn arn:aws:ivs:us-west-2:123456789012:stream-key/g1H2I3j4k5L6
```

This command produces no output.

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see [DeleteStreamKey](#) in *AWS CLI Command Reference*.

`get-channel`

The following code example shows how to use `get-channel`.

AWS CLI

To get a channel's configuration information

The following `get-channel` example gets the channel configuration for a specified channel ARN (Amazon Resource Name).

```
aws ivs get-channel \
    --arn 'arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh'
```

Output:

```
{
    "channel": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "authorized": false,
        "containerFormat": "TS",
        "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
        "insecureIngest": false,
        "latencyMode": "LOW",
        "multitrackInputConfiguration": {
            "enabled": false,
            "maximumResolution": "FULL_HD",
            "policy": "ALLOW"
        },
        "name": "channel-1",
        "playbackRestrictionPolicyArn": "",
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "preset": "",
        "recordingConfigurationArn": "",
        "srt": {
            "endpoint": "a1b2c3d4e5f6.srt.live-video.net",

```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see GetChannel in *AWS CLI Command Reference*.

get-playback-key-pair

The following code example shows how to use `get-playback-key-pair`.

AWS CLI

To get a specified playback key pair

The following `get-playback-key-pair` example returns the fingerprint of the specified key pair.

```
aws ivs get-playback-key-pair \
    --arn arn:aws:ivs:us-west-2:123456789012:playback-key/abcd1234efgh
```

Output:

```
{
    "keyPair": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:playback-key/abcd1234efgh",
        "name": "my-playback-key",
        "fingerprint": "0a:1b:2c:ab:cd:ef:34:56:70:b1:b2:71:01:2a:a3:72",
        "tags": {}
    }
}
```

For more information, see Setting Up Private Channels in the *Amazon Interactive Video Service User Guide*.

- For API details, see GetPlaybackKeyPair in *AWS CLI Command Reference*.

get-playback-restriction-policy

The following code example shows how to use `get-playback-restriction-policy`.

AWS CLI

To get a playback restriction policy's configuration information

The following `get-playback-restriction-policy` example gets the playback restriciton policy configuration with the specified policy ARN (Amazon Resource Name).

```
aws ivs get-playback-restriction-policy \
    --arn "arn:aws:ivs:us-west-2:123456789012:playback-restriction-policy/
ABcdef34ghIJ"
```

Output:

```
{
    "playbackRestrictionPolicy": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:playback-restriction-policy/
ABcdef34ghIJ",
        "allowedCountries": [
            "US",
            "MX"
        ],
        "allowedOrigins": [
            "https://www.website1.com",
            "https://www.website2.com"
        ],
        "enableStrictOriginEnforcement": true,
        "name": "test-playback-restriction-policy",
        "tags": {
            "key1": "value1",
            "key2": "value2"
        }
    }
}
```

For more information, see Undesired Content and Viewers in the *IVS Low-Latency User Guide*.

- For API details, see GetPlaybackRestrictionPolicy in *AWS CLI Command Reference*.

`get-recording-configuration`

The following code example shows how to use `get-recording-configuration`.

AWS CLI

To get information about a RecordingConfiguration resource

The following `get-recording-configuration` example gets information about the RecordingConfiguration resource for the specified ARN.

```
aws ivs get-recording-configuration \
    --arn "arn:aws:ivs:us-west-2:123456789012:recording-configuration/ABcdef34ghIJ"
```

Output:

```
{
    "recordingConfiguration": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:recording-configuration/
ABcdef34ghIJ",
        "destinationConfiguration": {
            "s3": {
                "bucketName": "demo-recording-bucket"
            }
        },
        "name": "test-recording-config",
        "recordingReconnectWindowSeconds": 60,
        "state": "ACTIVE",
        "tags": {
            "key1" : "value1",
            "key2" : "value2"
        },
        "thumbnailConfiguration": {
            "recordingMode": "INTERVAL",
            "targetIntervalSeconds": 1,
            "resolution": "LOWEST_RESOLUTION",
            "storage": [
                "LATEST"
            ]
        },
        "renditionConfiguration": {
            "renditionSelection": "CUSTOM",
            "renditions": [
                "HD"
            ]
        }
    }
```

```
}
```

For more information, see Record to Amazon S3 in the *Amazon Interactive Video Service User Guide*.

- For API details, see GetRecordingConfiguration in *AWS CLI Command Reference*.

`get-stream-key`

The following code example shows how to use `get-stream-key`.

AWS CLI

To get information about a stream

The following `get-stream-key` example gets information about the specified stream key.

```
aws ivs get-stream-key \
    --arn arn:aws:ivs:us-west-2:123456789012:stream-key/skSKABCDefgh --region=us-west-2
```

Output:

```
{
    "streamKey": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/skSKABCDefgh",
        "value": "sk_us-west-2_abcdABCDefgh_567890abcdef",
        "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "tags": {}
    }
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see GetStreamKey in *AWS CLI Command Reference*.

`get-stream-session`

The following code example shows how to use `get-stream-session`.

AWS CLI

To get metadata for a specified stream

The following `get-stream-session` example gets the metadata configuration for the specified channel ARN (Amazon Resource Name) and the specified stream; if `streamId` is not provided, the most recent stream for the channel is selected.

```
aws ivs get-stream-session \
    --channel-arn 'arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh' \
    --stream-id 'mystream'
```

Output:

```
{
    "streamSession": {
        "streamId": "mystream1",
        "startTime": "2023-06-26T19:09:28+00:00",
        "channel": {
            "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
            "name": "mychannel",
            "latencyMode": "LOW",
            "type": "STANDARD",
            "recordingConfigurationArn": "arn:aws:ivs:us-
west-2:123456789012:recording-configuration/ABcdef34ghIJ",
            "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
            "playbackUrl": "url-string",
            "authorized": false,
            "insecureIngest": false,
            "preset": ""
        },
        "ingestConfiguration": {
            "audio": {
                "channels": 2,

        ]
```

```
    }
}
```

For more information, see [Create a Channel](#) in the *IVS Low-Latency User Guide*.

- For API details, see [GetStreamSession](#) in *AWS CLI Command Reference*.

`get-stream`

The following code example shows how to use `get-stream`.

AWS CLI

To get information about a stream

The following `get-stream` example gets information about the stream for the specified channel.

```
aws ivs get-stream \
    --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh
```

Output:

```
{
    "stream": {
        "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "startTime": "2020-05-05T21:55:38Z",
        "state": "LIVE",
        "health": "HEALTHY",
        "streamId": "st-ABCDEfghij01234KLMN5678",
        "viewerCount": 1
    }
}
```

For more information, see [Create a Channel](#) in the *IVS Low-Latency User Guide*.

- For API details, see [GetStream](#) in *AWS CLI Command Reference*.

`import-playback-key-pair`

The following code example shows how to use `import-playback-key-pair`.

AWS CLI

To import the public portion of a new key pair

The following `import-playback-key-pair` example imports the specified public key (specified as a string in PEM format) and returns the arn and fingerprint of the new key pair.

```
aws ivs import-playback-key-pair \
    --name "my-playback-key" \
    --public-key-material "G1lbnQxOTA3BgNVBAMMMFdoeSBhcmUgeW91IGRl..."
```

Output:

```
{
    "keyPair": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:playback-key/abcd1234efgh",
        "name": "my-playback-key",
        "fingerprint": "0a:1b:2c:ab:cd:ef:34:56:70:b1:b2:71:01:2a:a3:72",
        "tags": {}
    }
}
```

For more information, see Setting Up Private Channels in the *Amazon Interactive Video Service User Guide*.

- For API details, see ImportPlaybackKeyPair in *AWS CLI Command Reference*.

`list-channels`

The following code example shows how to use `list-channels`.

AWS CLI

Example 1: To get summary information about all channels

The following `list-channels` example lists all channels for your AWS account.

```
aws ivs list-channels
```

Output:

```
{
    "channels": [
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
            "name": "channel-1",
            "latencyMode": "LOW",
            "authorized": false,
            "insecureIngest": false,
            "preset": "",
            "playbackRestrictionPolicyArn": "",
            "recordingConfigurationArn": "arn:aws:ivs:us-
west-2:123456789012:recording-configuration/ABCD12cdEFgh",
            "tags": {},
            "type": "STANDARD"
        },
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:channel/efghEFGHijkl",
            "name": "channel-2",
            "latencyMode": "LOW",
            "authorized": false,
            "preset": "",
            "playbackRestrictionPolicyArn": "arn:aws:ivs:us-
west-2:123456789012:playback-restriction-policy/ABcdef34ghIJ",
            "recordingConfigurationArn": "",
            "tags": {},
            "type": "STANDARD"
        }
    ]
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

Example 2: To get summary information about all channels, filtered by the specified RecordingConfiguration ARN

The following `list-channels` example lists all channels for your AWS account, that are associated with the specified RecordingConfiguration ARN.

```
aws ivs list-channels \
```

```
    --filter-by-recording-configuration-arn "arn:aws:ivs:us-west-2:123456789012:recording-configuration/ABCD12cdEFgh"
```

Output:

```
{
    "channels": [
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
            "name": "channel-1",
            "latencyMode": "LOW",
            "authorized": false,
            "insecureIngest": false,
            "preset": "",
            "playbackRestrictionPolicyArn": "",
            "recordingConfigurationArn": "arn:aws:ivs:us-west-2:123456789012:recording-configuration/ABCD12cdEFgh",
            "tags": {},
            "type": "STANDARD"
        }
    ]
}
```

For more information, see Record to Amazon S3 in the *IVS Low-Latency User Guide*.

Example 3: To get summary information about all channels, filtered by the specified PlaybackRestrictionPolicy ARN

The following `list-channels` example lists all channels for your AWS account, that are associated with the specified PlaybackRestrictionPolicy ARN.

```
aws ivs list-channels \
    --filter-by-playback-restriction-policy-arn "arn:aws:ivs:us-west-2:123456789012:playback-restriction-policy/ABcdef34ghIJ"
```

Output:

```
{
    "channels": [
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:channel/efghEFGHijkl",
```

```
            "name": "channel-2",
            "latencyMode": "LOW",
            "authorized": false,
            "preset": "",
            "playbackRestrictionPolicyArn": "arn:aws:ivs:us-
west-2:123456789012:playback-restriction-policy/ABcdef34ghIJ",
            "recordingConfigurationArn": "",
            "tags": {},
            "type": "STANDARD"
        }
    ]
}
```

For more information, see Undesired Content and Viewers in the *IVS Low-Latency User Guide*.

- For API details, see ListChannels in *AWS CLI Command Reference*.

`list-playback-key-pairs`

The following code example shows how to use `list-playback-key-pairs`.

AWS CLI

To get summary information about all playback key pairs

The following `list-playback-key-pairs` example returns information about all key pairs.

```
aws ivs list-playback-key-pairs
```

Output:

```
{
    "keyPairs": [
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:playback-key/abcd1234efgh",
            "name": "test-key-0",
            "tags": {}
        },
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:playback-key/ijkl5678mnop",
            "name": "test-key-1",
            "tags": {}
```

```
        }
    ]
}
```

For more information, see Setting Up Private Channels in the *Amazon Interactive Video Service User Guide*.

- For API details, see ListPlaybackKeyPairs in *AWS CLI Command Reference*.

`list-playback-restriction-policies`

The following code example shows how to use `list-playback-restriction-policies`.

AWS CLI

To get summary information about all playback restriction policies

The following `list-playback-restriction-policies` example lists all playback restriction policies for your AWS account.

```
aws ivs list-playback-restriction-policies
```

Output:

```
{
    "playbackRestrictionPolicies": [
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:playback-restriction-policy/
ABcdef34ghIJ",
            "allowedCountries": [
                "US",
                "MX"
            ],
            "allowedOrigins": [
                "https://www.website1.com",

        }
    ]
}
```

For more information, see [Undesired Content and Viewers](#) in the *IVS Low-Latency User Guide*.

- For API details, see [ListPlaybackRestrictionPolicies](#) in *AWS CLI Command Reference*.

`list-recording-configurations`

The following code example shows how to use `list-recording-configurations`.

AWS CLI

To list all the RecordingConfiguration resources created in this account

The following `list-recording-configurations` example gets information about all RecordingConfiguration resources in your account.

```
aws ivs list-recording-configurations
```

Output:

```
{
    "recordingConfigurations": [
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:recording-configuration/
ABcdef34ghIJ",
            "name": "test-recording-config-1",
            "destinationConfiguration": {
                "s3": {
                    "bucketName": "demo-recording-bucket-1"
                }
            },
            "state": "ACTIVE",
            "tags": {}
        },
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:recording-configuration/
CD12abcdGHIJ",
```

```
                "name": "test-recording-config-2",
                "destinationConfiguration": {
                    "s3": {
                        "bucketName": "demo-recording-bucket-2"
                    }
                },
                "state": "ACTIVE",
                "tags": {}
            }
        ]
}
```

For more information, see Record to Amazon S3 in the *Amazon Interactive Video Service User Guide*.

- For API details, see ListRecordingConfigurations in *AWS CLI Command Reference*.

`list-stream-keys`

The following code example shows how to use `list-stream-keys`.

AWS CLI

To get a list of stream keys

The following `list-stream-keys` example lists all stream keys for a specified ARN (Amazon Resource Name).

```
aws ivs list-stream-keys \
    --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh
```

Output:

```
{
    "streamKeys": [
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/abcdABCDefgh",
            "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
            "tags": {}
        }
    ]
```

```
}
```

FFor more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see ListStreamKeys in *AWS CLI Command Reference*.

`list-stream-sessions`

The following code example shows how to use `list-stream-sessions`.

AWS CLI

To get a summary of current and previous streams for a specified channel in the current AWS region

The following `list-stream-sessions` example reports summary information for streams for a specified channel ARN (Amazon Resource Name).

```
aws ivs list-stream-sessions \
    --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \
    --max-results 25 \
    --next-token ""
```

Output:

```
{
    "nextToken": "set-2",
    "streamSessions": [
        {
            "startTime": 1641578182,
            "endTime": 1641579982,
            "hasErrorEvent": false,
            "streamId": "mystream"
        }
        ...
    ]
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see ListStreamSessions in *AWS CLI Command Reference*.

`list-streams`

The following code example shows how to use `list-streams`.

AWS CLI

To get a list of live streams and their state

The following `list-streams` example lists all live streams for your AWS account.

```
aws ivs list-streams
```

Output:

```
{
   "streams": [
        {
            "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
            "state": "LIVE",
            "health": "HEALTHY",
            "streamId": "st-ABCDEfghij01234KLMN5678",
            "viewerCount": 1
        }
    ]
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see ListStreams in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list all tags for an AWS resource (for example: channel, stream key)

The following `list-tags-for-resource` example lists all tags for a specified resource ARN (Amazon Resource Name).

```
aws ivs list-tags-for-resource \
```

```
    --resource-arn arn:aws:ivs:us-west-2:12345689012:channel/abcdABCDefgh
```

Output:

```
{
    "tags":
    {
        "key1": "value1",
        "key2": "value2"
    }
}
```

For more information, see Tagging in the *Amazon Interactive Video Service API Reference*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`put-metadata`

The following code example shows how to use `put-metadata`.

AWS CLI

To insert metadata into the active stream for a specified channel

The following `put-metadata` example inserts the given metadata into the stream for the specified channel.

```
aws ivs put-metadata \
    --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \
    --metadata '{"my": "metadata"}'
```

This command produces no output.

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see PutMetadata in *AWS CLI Command Reference*.

`start-viewer-session-revocation`

The following code example shows how to use `start-viewer-session-revocation`.

AWS CLI

To revoke a viewer session for a given multiple channel-ARN and viewer-ID pair

The following `start-viewer-session-revocation` example starts the process of revoking the viewer session associated with a specified channel ARN and viewer ID, up to and including the specified session version number. If the version is not provided, it defaults to 0.

```
aws ivs batch-start-viewer-session-revocation \
    --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \
    --viewer-id abcdefg \
    --viewer-session-versions-less-than-or-equal-to 1234567890
```

This command produces no output.

For more information, see Setting Up Private Channels in the *Amazon Interactive Video Service User Guide*.

- For API details, see StartViewerSessionRevocation in *AWS CLI Command Reference*.

`stop-stream`

The following code example shows how to use `stop-stream`.

AWS CLI

To stop a specified stream

The following `stop-stream` example stops the stream on the specified channel.

```
aws ivs stop-stream \
    --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh
```

This command produces no output.

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see StopStream in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add or update tags for an AWS resource (for example: channel, stream key)

The following `tag-resource` example adds or updates tags for a specified resource ARN (Amazon Resource Name).

```
aws ivs tag-resource \
    --resource-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \
    --tags "tagkey1=tagvalue1, tagkey2=tagvalue2"
```

This command produces no output.

For more information, see Tagging in the *Amazon Interactive Video Service API Reference*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags for an AWS resource (for example: channel, stream key)

The following `untag-resource` example removes the specified tags for a specified resource ARN (Amazon Resource Name).

```
aws ivs untag-resource \
    --resource-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \
    --tag-keys "tagkey1, tagkey2"
```

This command produces no output.

For more information, see Tagging in the *Amazon Interactive Video Service API Reference*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-channel`

The following code example shows how to use `update-channel`.

AWS CLI

Example 1: To update a channel's configuration information

The following `update-channel` example updates the channel configuration for a specified channel ARN to change the channel name. This does not affect an ongoing stream of this channel; you must stop and restart the stream for the changes to take effect.

```
aws ivs update-channel \
    --arn 'arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh' \
    --name 'channel-1' \
    --insecure-ingest
```

Output:

```
{
    "channel": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "name": "channel-1",
        "latencyMode": "LOW",
        "containerFormat": "TS",
        "multitrackInputConfiguration": {
            "enabled": false,
            "maximumResolution": "FULL_HD",
            "policy": "ALLOW"
        },
        "type": "STANDARD",
        "playbackRestrictionPolicyArn": "",
        "recordingConfigurationArn": "",
        "srt": {
            "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
            "passphrase":
 "AB1C2defGHijkLMNo3PqQRstUvwxyzaBCDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
        },
        "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
        "insecureIngest": true,
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "preset": "",
        "authorized": false,
        "tags": {}
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

Example 2: To update a channel's configuration to enable recording

The following `update-channel` example updates the channel configuration for a specified channel ARN to enable recording. This does not affect an ongoing stream of this channel; you must stop and restart the stream for the changes to take effect.

```
aws ivs update-channel \
    --arn 'arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh' \
    --no-insecure-ingest \
    --recording-configuration-arn 'arn:aws:ivs:us-west-2:123456789012:recording-
configuration/ABCD12cdEFgh'
```

Output:

```
{
    "channel": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "name": "test-channel-with-recording",
        "latencyMode": "LOW",
        "containerFormat": "TS",
        "multitrackInputConfiguration": {
            "enabled": false,
            "maximumResolution": "FULL_HD",
            "policy": "ALLOW"
        },
        "type": "STANDARD",
        "playbackRestrictionPolicyArn": "",
        "recordingConfigurationArn": "arn:aws:ivs:us-west-2:123456789012:recording-
configuration/ABCD12cdEFgh",
        "srt": {
            "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
            "passphrase":
 "BA1C2defGHijkLMNo3PqQRstUvwxyzaBCDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
        },
        "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
        "insecureIngest": false,
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "preset": "",
        "authorized": false,
        "tags": {}
```

```
    }
}
```

For more information, see Record to Amazon S3 in the *IVS Low-Latency User Guide*.

Example 3: To update a channel's configuration to disable recording

The following `update-channel` example updates the channel configuration for a specified channel ARN to disable recording. This does not affect an ongoing stream of this channel; you must stop and restart the stream for the changes to take effect.

```
aws ivs update-channel \
    --arn 'arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh' \
    --recording-configuration-arn ''
```

Output:

```
{
    "channel": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "name": "test-channel-with-recording",
        "latencyMode": "LOW",
        "containerFormat": "TS",
        "multitrackInputConfiguration": {
            "enabled": false,
            "maximumResolution": "FULL_HD",
            "policy": "ALLOW"
        },
        "type": "STANDARD",
        "playbackRestrictionPolicyArn": "",
        "recordingConfigurationArn": "",
        "srt": {
            "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
            "passphrase":
 "AB1C2edfGHijkLMNo3PqQRstUvwxyzaBCDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
        },
        "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
        "insecureIngest": false,
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "preset": "",
        "authorized": false,
```

```
        "tags": {}
    }
}
```

For more information, see [Record to Amazon S3](#) in the *IVS Low-Latency User Guide*.

Example 4: To update a channel's configuration to enable playback restriction

The following `update-channel` example updates the channel configuration for a specified channel ARN to apply a playback restriction policy. This does not affect an ongoing stream of this channel; you must stop and restart the stream for the changes to take effect.

```
aws ivs update-channel \
    --arn 'arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh' \
    --no-insecure-ingest \
    --playback-restriction-policy-arn 'arn:aws:ivs:us-west-2:123456789012:playback-restriction-policy/ABcdef34ghIJ'
```

Output:

```
{
    "channel": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "name": "test-channel-with-playback-restriction-policy",
        "latencyMode": "LOW",
        "containerFormat": "TS",
        "multitrackInputConfiguration": {
            "enabled": false,
            "maximumResolution": "FULL_HD",
            "policy": "ALLOW"
        },
        "type": "STANDARD",
        "playbackRestrictionPolicyArn": "arn:aws:ivs:us-
west-2:123456789012:playback-restriction-policy/ABcdef34ghIJ",
        "recordingConfigurationArn": "",
        "srt": {
            "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
            "passphrase":
 "AB1C2defGHijkLMNo3PqQRstUvwxyzaCBDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
        },
        "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
        "insecureIngest": false,
```

```
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "preset": "",
        "authorized": false,
        "tags": {}
    }
}
```

For more information, see Undesired Content and Viewers in the *IVS Low-Latency User Guide*.

Example 5: To update a channel's configuration to disable playback restriction

The following `update-channel` example updates the channel configuration for a specified channel ARN to disable playback restriction. This does not affect an ongoing stream of this channel; you must stop and restart the stream for the changes to take effect.

```
aws ivs update-channel \
    --arn 'arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh' \
    --playback-restriction-policy-arn ''
```

Output:

```
{
    "channel": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "name": "test-channel-with-playback-restriction-policy",
        "latencyMode": "LOW",
        "containerFormat": "TS",
        "multitrackInputConfiguration": {
            "enabled": false,
            "maximumResolution": "FULL_HD",
            "policy": "ALLOW"
        },
        "type": "STANDARD",
        "playbackRestrictionPolicyArn": "",
        "recordingConfigurationArn": "",
        "srt": {
            "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
            "passphrase":
 "AB1C2defGHijkLMNo3PqQRstUvwxyzaBCDeFghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
        },
        "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
        "insecureIngest": false,
```

```
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "preset": "",
        "authorized": false,
        "tags": {}
    }
}
```

For more information, see Undesired Content and Viewers in the *IVS Low-Latency User Guide*.

Example 6: To update a channel's configuration to enable multitrack

The following `update-channel` example updates the channel configuration for a specified channel ARN to enable multitrack. This does not affect an ongoing stream of this channel; you must stop and restart the stream for the changes to take effect.

```
aws ivs update-channel \
    --arn 'arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh' \
    --container-format 'FRAGMENTED_MP4' \
    --multitrack-input-configuration '{"enabled": true,"maximumResolution":
 "FULL_HD","policy": "ALLOW"}'
```

Output:

```
{
    "channel": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "containerFormat": "FRAGMENTED_MP4",
        "name": "test-channel-with-multitrack",
        "latencyMode": "LOW",
        "multitrackInputConfiguration": {
            "enabled": true,
            "maximumResolution": "FULL_HD",
            "policy": "ALLOW"
        },
        "type": "STANDARD",
        "playbackRestrictionPolicyArn": "",
        "recordingConfigurationArn": "",
        "srt": {
            "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
            "passphrase":
 "AB1C2defGHijkLMNo3PqQRstUvwxyzaCBDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
        },
```

```
        "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
        "insecureIngest": false,
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "preset": "",
        "authorized": false,
        "tags": {}
    }
}
```

For more information, see Undesired Content and Viewers in the *IVS Low-Latency User Guide*.

Example 7: To update a channel's configuration to disable playback restriction

The following `update-channel` example updates the channel configuration for a specified channel ARN to disable multitrack. This does not affect an ongoing stream of this channel; you must stop and restart the stream for the changes to take effect.

```
aws ivs update-channel \
    --arn 'arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh' \
    --container-format 'TS' \
    --multitrack-input-configuration '{"enabled": false}'
```

Output:

```
{
    "channel": {
        ""arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "containerFormat": "TS",
        "name": "test-channel-with-multitrack",
        "latencyMode": "LOW",
        "multitrackInputConfiguration": {
            "enabled": false,
            "maximumResolution": "FULL_HD",

    }
}
```

For more information, see Undesired Content and Viewers in the *IVS Low-Latency User Guide*.

- For API details, see UpdateChannel in *AWS CLI Command Reference*.

`update-playback-restriction-policy`

The following code example shows how to use `update-playback-restriction-policy`.

AWS CLI

To update a playback restriction policy

The following `update-playback-restriction-policy` example updates the playback restriction policy with the specified policy ARN to disable strict origin enforcement. This does not affect an ongoing stream of the associated channel; you must stop and restart the stream for the changes to take effect.

```
aws ivs update-playback-restriction-policy \
    --arn "arn:aws:ivs:us-west-2:123456789012:playback-restriction-policy/
ABcdef34ghIJ" \
    --no-enable-strict-origin-enforcement
```

Output:

```
{
    "playbackRestrictionPolicy": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:playback-restriction-policy/
ABcdef34ghIJ",
        "allowedCountries": [
            "US",
            "MX"
```

```
        ],
        "allowedOrigins": [
            "https://www.website1.com",
            "https://www.website2.com"
        ],
        "enableStrictOriginEnforcement": false,
        "name": "test-playback-restriction-policy",
        "tags": {
            "key1": "value1",
            "key2": "value2"
        }
    }
}
```

For more information, see Undesired Content and Viewers in the *IVS Low-Latency User Guide*.

- For API details, see UpdatePlaybackRestrictionPolicy in *AWS CLI Command Reference*.

Amazon IVS Chat examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon IVS Chat.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-chat-token`

The following code example shows how to use `create-chat-token`.

AWS CLI

To create a chat token

The following `create-chat-token` example creates an encrypted chat token that is used to establish an individual WebSocket connection to a room. The token is valid for one minute, and a connection (session) established with the token is valid for the specified duration.

```
aws ivschat create-chat-token \
    --roomIdentifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6", \
    --userId" "11231234" \
    --capabilities "SEND_MESSAGE", \
    --sessionDurationInMinutes" 30
```

Output:

```
{
    "token": "ACEGmnoq#1rstu2...BDFH3vxwy!4hlm!#5",
    "sessionExpirationTime": "2022-03-16T04:44:09+00:00"
    "state": "CREATING",
    "tokenExpirationTime": "2022-03-16T03:45:09+00:00"
}
```

For more information, see Step 3: Authenticate and Authorize Chat Clients in the *Amazon Interactive Video Service User Guide*.

- For API details, see CreateChatToken in *AWS CLI Command Reference*.

`create-logging-configuration`

The following code example shows how to use `create-logging-configuration`.

AWS CLI

To create a chat LoggingConfiguration resource

The following `create-logging-configuration` example creates a LoggingConfiguration resource that allows clients to store and record sent messages.

```
aws ivschat create-logging-configuration \
    --destination-configuration s3={bucketName=demo-logging-bucket} \
    --name "test-logging-config" \
    --tags "key1=value1, key2=value2"
```

Output:

```
{
    "arn": "arn:aws:ivschat:us-west-2:123456789012:logging-configuration/
ABcdef34ghIJ",
    "createTime": "2022-09-14T17:48:00.653000+00:00",
    "destinationConfiguration": {
        "s3": {
            "bucketName": "demo-logging-bucket"
        }
    },
    "id": "ABcdef34ghIJ",
    "name": "test-logging-config",
    "state": "ACTIVE",
    "tags": { "key1" : "value1", "key2" : "value2" },
    "updateTime": "2022-09-14T17:48:01.104000+00:00"
}
```

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see CreateLoggingConfiguration in *AWS CLI Command Reference*.

`create-room`

The following code example shows how to use `create-room`.

AWS CLI

To create a room

The following `create-room` example creates a new room.

```
aws ivschat create-room \
    --name "test-room-1" \
    --logging-configuration-identifiers "arn:aws:ivschat:us-
west-2:123456789012:logging-configuration/ABcdef34ghIJ" \
    --maximum-message-length 256 \
    --maximum-message-rate-per-second 5
```

Output:

```
{
    "arn": "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6",
```

```
    "id": "g1H2I3j4k5L6",
    "createTime": "2022-03-16T04:44:09+00:00",
    "loggingConfigurationIdentifiers": ["arn:aws:ivschat:us-
west-2:123456789012:logging-configuration/ABcdef34ghIJ"],
    "maximumMessageLength": 256,
    "maximumMessageRatePerSecond": 5,
    "name": "test-room-1",
    "tags": {}
    "updateTime": "2022-03-16T07:22:09+00:00"
}
```

For more information, see Step 2: Create a Chat Room in the *Amazon Interactive Video Service User Guide*.

- For API details, see CreateRoom in *AWS CLI Command Reference*.

`delete-logging-configuration`

The following code example shows how to use `delete-logging-configuration`.

AWS CLI

To delete a chat LoggingConfiguration resource

The following `delete-logging-configuration` example deletes the LoggingConfiguration resource for the specified ARN.

```
aws ivschat delete-logging-configuration \
    --identifier "arn:aws:ivschat:us-west-2:123456789012:logging-configuration/
ABcdef34ghIJ"
```

This command produces no output.

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see DeleteLoggingConfiguration in *AWS CLI Command Reference*.

`delete-message`

The following code example shows how to use `delete-message`.

AWS CLI

To delete messages from a specified room

The following `delete-message` example sends an even to the specified room, which directs clients to delete the specified message: that is, unrender it from view and delete it from the client's chat history.

```
aws ivschat delete-message \
    --roomIdentifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6" \
    --id "ABC123def456" \
    --reason "Message contains profanity"
```

Output:

```
{
    "id": "12345689012"
}
```

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see DeleteMessage in *AWS CLI Command Reference*.

`delete-room`

The following code example shows how to use `delete-room`.

AWS CLI

To delete a room

The following `delete-room` example deletes the specified room. Connected clients are disconnected. On success it returns HTTP 204 with an empty response body.

```
aws ivschat delete-room \
    --identifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6"
```

This command produces no output.

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see DeleteRoom in *AWS CLI Command Reference*.

`disconnect-user`

The following code example shows how to use `disconnect-user`.

AWS CLI

To disconnect a user from a room

The following `disconnect-user` example disconnects all connections for the specified user from the specified room. On success it returns HTTP 200 with an empty response body.

```
aws ivschat disconnect-user \
    --roomIdentifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6" \
    --userId "ABC123def456" \
    --reason "Violated terms of service"
```

This command produces no output.

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see DisconnectUser in *AWS CLI Command Reference*.

`get-logging-configuration`

The following code example shows how to use `get-logging-configuration`.

AWS CLI

To get information about a LoggingConfiguration resource

The following `get-logging-configuration` example gets information about the LoggingConfiguration resource for the specified ARN.

```
aws ivschat get-logging-configuration \
    --identifier "arn:aws:ivschat:us-west-2:123456789012:logging-configuration/
ABcdef34ghIJ"
```

Output:

```
{
    "arn": "arn:aws:ivschat:us-west-2:123456789012:logging-configuration/
ABcdef34ghIJ",
    "createTime": "2022-09-14T17:48:00.653000+00:00",
    "destinationConfiguration": {
        "s3": {
            "bucketName": "demo-logging-bucket"
        }
    },
    "id": "ABcdef34ghIJ",
    "name": "test-logging-config",
    "state": "ACTIVE",
    "tags": { "key1" : "value1", "key2" : "value2" },
    "updateTime": "2022-09-14T17:48:01.104000+00:00"
}
```

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see GetLoggingConfiguration in *AWS CLI Command Reference*.

`get-room`

The following code example shows how to use `get-room`.

AWS CLI

To get the specified room

The following `get-room` example gets information about the specified room.

```
aws ivschat get-room \
    --identifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6"
```

Output:

```
{
    "arn": "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6",
    "createTime": "2022-03-16T04:44:09+00:00",
    "id": "g1H2I3j4k5L6",
    "loggingConfigurationIdentifiers": ["arn:aws:ivschat:us-
west-2:123456789012:logging-configuration/ABcdef34ghIJ"],
```

```
    "maximumMessageLength": 256,
    "maximumMessageRatePerSecond": 5,
    "name": "test-room-1",
    "tags": {},
    "updateTime": "2022-03-16T07:22:09+00:00"
}
```

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see GetRoom in *AWS CLI Command Reference*.

`list-logging-configurations`

The following code example shows how to use `list-logging-configurations`.

AWS CLI

To get summary information about all logging configurations for the user in the AWS region where the API request is processed

The following `list-logging-configurations` example lists information about all LoggingConfiguration resources for the user in the AWS region where the API request is processed.

```
aws ivschat list-logging-configurations \
    --max-results 2 \
    --next-token ""
```

Output:

```
{
    "nextToken": "set-2",
    "loggingConfigurations": [
        {
            "arn": "arn:aws:ivschat:us-west-2:123456789012:logging-configuration/
ABcdef34ghIJ",
            "createTime": "2022-09-14T17:48:00.653000+00:00",
            "destinationConfiguration": {
                "s3": {
                    "bucketName": "demo-logging-bucket"
```

```
                }
            },
            "id": "ABcdef34ghIJ",
            "name": "test-logging-config",
            "state": "ACTIVE",
            "tags": { "key1" : "value1", "key2" : "value2" },
            "updateTime": "2022-09-14T17:48:01.104000+00:00"
        }
        ...
    ]
}
```

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see ListLoggingConfigurations in *AWS CLI Command Reference*.

`list-rooms`

The following code example shows how to use `list-rooms`.

AWS CLI

To get summary information about all your rooms in the current region

The following `list-rooms` example gets summary information about all the rooms in the AWS region where the request is processed. Results are sorted in descending order of updateTime.

```
aws ivschat list-rooms \
    --logging-configuration-identifier "arn:aws:ivschat:us-west-2:123456789012:logging-configuration/ABcdef34ghIJ" \
    --max-results 10 \
    --next-token ""
```

Output:

```
{
    "nextToken": "page3",
    "rooms": [
        {
            "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6",
            "createTime": "2022-03-16T04:44:09+00:00",
```

```
            "id": "g1H2I3j4k5L6",
            "loggingConfigurationIdentifiers": ["arn:aws:ivschat:us-
west-2:123456789012:logging-configuration/ABcdef34ghIJ"],
            "name": "test-room-1",
            "tags": {},
            "updateTime": "2022-03-16T07:22:09+00:00"
        }
    ]
}
```

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see ListRooms in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list all tags for an AWS resource (for example: Room)

The following `list-tags-for-resource` example lists all tags for a specified resource ARN (Amazon Resource Name).

```
aws ivschat list-tags-for-resource \
    --resource-arn arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6
```

Output:

```
{
    "tags":
    {
        "key1": "value1",
        "key2": "value2"
    }
}
```

For more information, see Tagging in the *Amazon Interactive Video Service API Reference*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`send-event`

The following code example shows how to use `send-event`.

AWS CLI

To send an event to a room

The following `send-event` example sends the given event to the specified room.

```
aws ivschat send-event \
    --roomIdentifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6" \
    --eventName "SystemMessage" \
    --attributes \
        "msgType"="user-notification", \
        "msgText"="This chat room will close in 15 minutes."
```

Output:

```
{
    "id": "12345689012"
}
```

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see SendEvent in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add or update tags for an AWS resource (for example: Room)

The following `tag-resource` example adds or updates tags for a specified resource ARN (Amazon Resource Name). On success it returns HTTP 200 with an empty response body.

```
aws ivschat tag-resource \
    --resource-arn arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6 \
    --tags "tagkey1=tagkeyvalue1, tagkey2=tagkeyvalue2"
```

This command produces no output.

For more information, see Tagging in the *Amazon Interactive Video Service API Reference*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags for an AWS resource (for example: Room)

The following `untag-resource` example removes the specified tags for a specified resource ARN (Amazon Resource Name). On success it returns HTTP 200 with an empty response body.

```
aws ivschat untag-resource \
    --resource-arn arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6 \
    --tag-keys "tagkey1, tagkey2"
```

This command produces no output.

For more information, see Tagging in the *Amazon Interactive Video Service API Reference*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-logging-configuration`

The following code example shows how to use `update-logging-configuration`.

AWS CLI

To update a room's logging configuration

The following `update-logging-configuration` example updates a LoggingConfiguration resource with the given data.

```
aws ivschat update-logging-configuration \
    --destination-configuration s3={bucketName=demo-logging-bucket} \
    --identifier "arn:aws:ivschat:us-west-2:123456789012:logging-configuration/
ABcdef34ghIJ" \
    --name "test-logging-config"
```

Output:

```
{
    "arn": "arn:aws:ivschat:us-west-2:123456789012:logging-configuration/
ABcdef34ghIJ",
    "createTime": "2022-09-14T17:48:00.653000+00:00",
    "destinationConfiguration": {
        "s3": {
            "bucketName": "demo-logging-bucket"
        }
    },
    "id": "ABcdef34ghIJ",
    "name": "test-logging-config",
    "state": "ACTIVE",
    "tags": { "key1" : "value1", "key2" : "value2" },
    "updateTime": "2022-09-14T17:48:01.104000+00:00"
}
```

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see UpdateLoggingConfiguration in *AWS CLI Command Reference*.

`update-room`

The following code example shows how to use `update-room`.

AWS CLI

To update a room's configuration

The following `update-room` example updates the specified room's configuration with the given data.

```
aws ivschat update-room \
    --identifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6" \
    --logging-configuration-identifiers "arn:aws:ivschat:us-
west-2:123456789012:logging-configuration/ABcdef34ghIJ" \
    --name "chat-room-a" \
    --maximum-message-length 256 \
    --maximum-message-rate-per-second 5
```

Output:

```
{
    "arn": "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6",
    "createTime": "2022-03-16T04:44:09+00:00",
    "id": "g1H2I3j4k5L6",
    "loggingConfigurationIdentifiers": ["arn:aws:ivschat:us-
west-2:123456789012:logging-configuration/ABcdef34ghIJ"],
    "maximumMessageLength": 256,
    "maximumMessageRatePerSecond": 5,
    "name": "chat-room-a",
    "tags": {},
    "updateTime": "2022-03-16T07:22:09+00:00"
}
```

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see UpdateRoom in *AWS CLI Command Reference*.

Amazon IVS Real-Time Streaming examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon IVS Real-Time Streaming.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-encoder-configuration`

The following code example shows how to use `create-encoder-configuration`.

AWS CLI

To create a composition encoder configuration

The following `create-encoder-configuration` example creates a composition encoder configuration with the specified properties.

```
aws ivs-realtime create-encoder-configuration \
    --name test-ec --video bitrate=3500000,framerate=30.0,height=1080,width=1920
```

Output:

```
{
    "encoderConfiguration": {
        "arn": "arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/
ABabCDcdEFef",
        "name": "test-ec",
        "tags": {},
        "video": {
            "bitrate": 3500000,
            "framerate": 30,
            "height": 1080,
            "width": 1920
        }
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see CreateEncoderConfiguration in *AWS CLI Command Reference*.

`create-ingest-configuration`

The following code example shows how to use `create-ingest-configuration`.

AWS CLI

To create an ingest configuration

The following `create-ingest-configuration` example creates an ingest configuration using RTMPS protocol.

```
aws ivs-realtime create-ingest-configuration \
    --name ingest1 \
    --ingest-protocol rtmps
```

Output:

```
{
    "ingestConfiguration": {
        "name": "ingest1",
        "arn": "arn:aws:ivs:us-west-2:123456789012:ingest-configuration/
AbCdEfGh1234",
        "ingestProtocol": "RTMPS",
        "streamKey": "rt_123456789012_us-
west-2_AbCdEfGh1234_abcd1234efgh5678ijkl9012MNOP34",
        "stageArn": "",
        "participantId": "xyZ654abC321",
        "state": "INACTIVE",
        "userId": "",
        "tags": {}
    }
}
```

For more information, see IVS Stream Ingest | Real-Time Streaming in the *Amazon Interactive Video Service User Guide*.

- For API details, see CreateIngestConfiguration in *AWS CLI Command Reference*.

`create-participant-token`

The following code example shows how to use `create-participant-token`.

AWS CLI

To create a stage participant token

The following `create-participant-token` example creates a participant toke for the specified stage.

```
aws ivs-realtime create-participant-token \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --user-id bob
```

Output:

```
{
    "participantToken": {
```

```
            "expirationTime": "2023-03-07T09:47:43+00:00",
            "participantId": "ABCDEfghij01234KLMN6789",
            "token": "abcd1234defg5678"
        }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see CreateParticipantToken in *AWS CLI Command Reference*.

`create-stage`

The following code example shows how to use `create-stage`.

AWS CLI

Example 1: To create a stage

The following `create-stage` example creates a stage and stage participant token for a specified user.

```
aws ivs-realtime create-stage \
    --name stage1 \
    --participant-token-configurations userId=alice
```

Output:

```
{
    "participantTokens": [
        {
            "participantId": "ABCDEfghij01234KLMN5678",
            "token": "a1b2c3d4567890ab",
            "userId": "alice"
        }
    ],
    "stage": {
        "activeSessionId": "st-a1b2c3d4e5f6g",
        "arn": "arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh",
        "autoParticipantRecordingConfiguration": {
            "storageConfigurationArn": "",
            "mediaTypes": [
```

```
                "AUDIO_VIDEO"
            ],
            "thumbnailConfiguration": {
                "targetIntervalSeconds": 60,
                "storage": [
                    "SEQUENTIAL"
                ],
                "recordingMode": "DISABLED"
            },
            "recordingReconnectWindowSeconds": 0,
            "hlsConfiguration": {
                "targetSegmentDurationSeconds": 6
            },
            "recordParticipantReplicas": true
        },
        "endpoints": {
            "events": "wss://global.events.live-video.net",
            "rtmp": "rtmp://9x0y8z7s6t5u.global-contribute-staging.live-video.net/
app/",
            "rtmps": "rtmps://9x0y8z7s6t5u.global-contribute-staging.live-
video.net:443/app/",
            "whip": "https://9x0y8z7s6t5u.global-bm.whip.live-video.net"
        },
        "name": "stage1",
        "tags": {}
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon IVS Low-Latency Streaming User Guide*.

Example 2: To create a stage and configure individual participant recording

The following `create-stage` example creates a stage and configures individual participant recording.

```
aws ivs-realtime create-stage \
    --name stage1 \
    --auto-participant-recording-configuration '{"mediaTypes":
 ["AUDIO_VIDEO"],"storageConfigurationArn": "arn:aws:ivs:us-
west-2:123456789012:storage-configuration/abcdABCDefgh",
 "recordingReconnectWindowSeconds": 100, \
        "hlsConfiguration": {"targetSegmentDurationSeconds": 5}}'
```

Output:

```
{
    "stage": {
        "activeSessionId": "st-a1b2c3d4e5f6g",
        "arn": "arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh",
        "autoParticipantRecordingConfiguration": {
            "storageConfigurationArn": "arn:aws:ivs:us-west-2:123456789012:storage-
configuration/abcdABCDefgh"
            "mediaTypes": [
                "AUDIO_VIDEO"
            ],
            "thumbnailConfiguration": {
                "targetIntervalSeconds": 60,
                "storage": [
                    "SEQUENTIAL"
                ],
                "recordingMode": "DISABLED"
            },
            "recordingReconnectWindowSeconds": 100,
            "hlsConfiguration": {
                "targetSegmentDurationSeconds": 5
            },
            "recordParticipantReplicas": true
        },
        "endpoints": {
            "events": "wss://global.events.live-video.net",
            "rtmp": "rtmp://9x0y8z7s6t5u.global-contribute-staging.live-video.net/
app/",
            "rtmps": "rtmps://9x0y8z7s6t5u.global-contribute-staging.live-
video.net:443/app/",
            "whip": "https://9x0y8z7s6t5u.global-bm.whip.live-video.net"
        },
        "name": "stage1",
        "tags": {}
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon IVS Low-Latency Streaming User Guide*.

Example 3: To create a stage and configure individual participant recording with thumbnail recording enabled

The following `create-stage` example creates a stage and configures individual participant recording with thumbnail recording enabled.

```
aws ivs-realtime create-stage \
    --name stage1 \
    --auto-participant-recording-configuration '{"mediaTypes":
 ["AUDIO_VIDEO"],"storageConfigurationArn": "arn:aws:ivs:us-
west-2:123456789012:storage-configuration/abcdABCDefgh", \
        "thumbnailConfiguration": {"recordingMode": "INTERVAL","storage":
 ["SEQUENTIAL"],"targetIntervalSeconds": 60}}'
```

Output:

```
{
    "stage": {
        "activeSessionId": "st-a1b2c3d4e5f6g",
        "arn": "arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh",
        "autoParticipantRecordingConfiguration": {
            "storageConfigurationArn": "arn:aws:ivs:us-west-2:123456789012:storage-
configuration/abcdABCDefgh",
            "mediaTypes": [
                "AUDIO_VIDEO"
            ],
            "thumbnailConfiguration": {
                "targetIntervalSeconds": 60,
                "storage": [
                    "SEQUENTIAL"
                ],
                "recordingMode": "INTERVAL"
            },
            "recordingReconnectWindowSeconds": 0,
            "hlsConfiguration": {
                "targetSegmentDurationSeconds": 6
            },
            "recordParticipantReplicas": true
        },
        "endpoints": {
            "events": "wss://global.events.live-video.net",
            "rtmp": "rtmp://9x0y8z7s6t5u.global-contribute-staging.live-video.net/
app/",
            "rtmps": "rtmps://9x0y8z7s6t5u.global-contribute-staging.live-
video.net:443/app/",
            "whip": "https://9x0y8z7s6t5u.global-bm.whip.live-video.net"
```

```
        },
        "name": "stage1",
        "tags": {}
    }
}
```

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](#) in the *Amazon IVS Low-Latency Streaming User Guide*.

- For API details, see [CreateStage](#) in *AWS CLI Command Reference*.

`create-storage-configuration`

The following code example shows how to use `create-storage-configuration`.

AWS CLI

To create a composition storage configuration

The following `create-storage-configuration` example creates a composition storage configuration with the specified properties.

```
aws ivs-realtime create-storage-configuration \
    --name "test-sc" --s3 "bucketName=amzn-s3-demo-bucket"
```

Output:

```
{
    "storageConfiguration": {
        "arn": "arn:aws:ivs:ap-northeast-1:123456789012:storage-configuration/
ABabCDcdEFef",
        "name": "test-sc",
        "s3": {
            "bucketName": "amzn-s3-demo-bucket"
        },
        "tags": {}
    }
}
```

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [CreateStorageConfiguration](#) in *AWS CLI Command Reference*.

`delete-encoder-configuration`

The following code example shows how to use `delete-encoder-configuration`.

AWS CLI

To delete a composition encoder configuration

The following `delete-encoder-configuration` deletes the composition encoder configuration specified by the given ARN (Amazon Resource Name).

```
aws ivs-realtime delete-encoder-configuration \
    --arn "arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/
ABabCDcdEFef"
```

This command produces no output.

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see DeleteEncoderConfiguration in *AWS CLI Command Reference*.

`delete-ingest-configuration`

The following code example shows how to use `delete-ingest-configuration`.

AWS CLI

Example 1: To delete an inactive ingest configuration

The following `delete-ingest-configuration` example deletes the inactive ingest configuration for a specified ingest-configuration ARN (Amazon Resource Name).

```
aws ivs-realtime delete-ingest-configuration \
    --arn arn:aws:ivs:us-west-2:123456789012:ingest-configuration/AbCdEfGh1234
```

This command produces no output.

For more information, see IVS Stream Ingest | Real-Time Streaming in the *Amazon Interactive Video Service User Guide*.

Example 2: To force delete an active ingest configuration

The following `delete-ingest-configuration` example forces deletion of the active ingest configuration for a specified ingest-configuration ARN (Amazon Resource Name).

```
aws ivs-realtime delete-ingest-configuration \
    --arn arn:aws:ivs:us-west-2:123456789012:ingest-configuration/AbCdEfGh1234 \
    --force
```

This command produces no output.

For more information, see IVS Stream Ingest | Real-Time Streaming in the *Amazon Interactive Video Service User Guide*.

- For API details, see DeleteIngestConfiguration in *AWS CLI Command Reference*.

`delete-public-key`

The following code example shows how to use `delete-public-key`.

AWS CLI

To delete a public key

The following `delete-public-key` deletes the specified public key.

```
aws ivs-realtime delete-public-key \
    --arn arn:aws:ivs:us-west-2:123456789012:public-key/abcdABC1efg2
```

This command produces no output.

For more information, see Distribute Participant Tokens in the *Amazon IVS Real-Time Streaming User Guide*.

- For API details, see DeletePublicKey in *AWS CLI Command Reference*.

`delete-stage`

The following code example shows how to use `delete-stage`.

AWS CLI

To delete a stage

The following `delete-stage` example deletes the specified stage.

```
aws ivs-realtime delete-stage \
    --arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh
```

This command produces no output.

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see DeleteStage in *AWS CLI Command Reference*.

`delete-storage-configuration`

The following code example shows how to use `delete-storage-configuration`.

AWS CLI

To delete a composition storage configuration

The following `delete-storage-configuration` deletes the composition storage configuration specified by the given ARN (Amazon Resource Name).

```
aws ivs-realtime delete-storage-configuration \
    --arn "arn:aws:ivs:ap-northeast-1:123456789012:storage-configuration/
ABabCDcdEFef"
```

This command produces no output.

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see DeleteStorageConfiguration in *AWS CLI Command Reference*.

`disconnect-participant`

The following code example shows how to use `disconnect-participant`.

AWS CLI

To disconnect a stage participant

The following `disconnect-participant` example disconnects the specified participant from the specified stage.

```
aws ivs-realtime disconnect-participant \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --participant-id ABCDEfghij01234KLMN5678
```

This command produces no output.

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see DisconnectParticipant in *AWS CLI Command Reference*.

`get-composition`

The following code example shows how to use `get-composition`.

AWS CLI

Example 1: To get a composition with default layout settings

The following `get-composition` example gets the composition for the ARN (Amazon Resource Name) specified.

```
aws ivs-realtime get-composition \
    --arn "arn:aws:ivs:ap-northeast-1:123456789012:composition/abcdABCDefgh"
```

Output:

```
{
    "composition": {
        "arn": "arn:aws:ivs:ap-northeast-1:123456789012:composition/abcdABCDefgh",
        "destinations": [
            {
                "configuration": {
                    "channel": {
                        "channelArn": "arn:aws:ivs:ap-
northeast-1:123456789012:channel/abcABCdefDEg",
                        "encoderConfigurationArn": "arn:aws:ivs:ap-
northeast-1:123456789012:encoder-configuration/ABabCDcdEFef"
                    },
                    "name": ""
                },
                "id": "AabBCcdDEefF",
```

```
                "startTime": "2023-10-16T23:26:00+00:00",
                "state": "ACTIVE"
            },
            {
                "configuration": {
                    "name": "",
                    "s3": {
                        "encoderConfigurationArns": [
                            "arn:aws:ivs:arn:aws:ivs:ap-
northeast-1:123456789012:encoder-configuration/ABabCDcdEFef"
                        ],
                        "recordingConfiguration": {
                            "format": "HLS",
                            "hlsConfiguration": {
                                "targetSegmentDurationSeconds": 2
                            }
                        },
                        "storageConfigurationArn": "arn:arn:aws:ivs:ap-
northeast-1:123456789012:storage-configuration/FefABabCDcdE",
                    }
                },
                "detail": {
                    "s3": {
                        "recordingPrefix": "aBcDeFgHhGfE/AbCdEfGhHgFe/GHFabcgefABC/
composite"
                    }
                },
                "id": "GHFabcgefABC",
                "startTime": "2023-10-16T23:26:00+00:00",
                "state": "STARTING"
            }
        ],
        "layout": {
            "grid": {
                "featuredParticipantAttribute": "",
                "gridGap": 2,
                "omitStoppedVideo": false,
                "participantOrderAttribute": "",
                "videoAspectRatio": "VIDEO",
                "videoFillMode": ""
            }
        },
        "stageArn": "arn:aws:ivs:ap-northeast-1:123456789012:stage/defgABCDabcd",
        "startTime": "2023-10-16T23:24:00+00:00",
```

```
        "state": "ACTIVE",
        "tags": {}
    }
}
```

For more information, see IVS Composite Recording | Real-Time Streaming in the *Amazon Interactive Video Service User Guide*.

Example 2: To get a composition with PiP layout

The following `get-composition` example gets the composition for the ARN (Amazon Resource Name) specified, which uses PiP layout.

```
aws ivs-realtime get-composition \
    --arn "arn:aws:ivs:ap-northeast-1:123456789012:composition/wxyzWXYZpqrs"
```

Output:

```
{
    "composition": {
        "arn": "arn:aws:ivs:ap-northeast-1:123456789012:composition/wxyzWXYZpqrs",
        "destinations": [
            {
                "configuration": {
                    "channel": {
                        "channelArn": "arn:aws:ivs:ap-
northeast-1:123456789012:channel/abcABCdefDEg",
                        "encoderConfigurationArn": "arn:aws:ivs:ap-
northeast-1:123456789012:encoder-configuration/ABabCDcdEFef"
                    },
                    "name": ""
                },
                "id": "AabBCcdDEefF",
                "startTime": "2023-10-16T23:26:00+00:00",

        },
        "stageArn": "arn:aws:ivs:ap-northeast-1:123456789012:stage/defgABCDabcd",
        "startTime": "2023-10-16T23:24:00+00:00",
        "state": "ACTIVE",
        "tags": {}
    }
}
```

For more information, see [IVS Composite Recording | Real-Time Streaming]() in the *Amazon Interactive Video Service User Guide*.

Example 3: To get a composition with thumbnail recording enabled

The following `get-composition` example gets the composition for the ARN (Amazon Resource Name) specified, which has thumbnail recording enabled with default settings.

```
aws ivs-realtime get-composition \
    --arn "arn:aws:ivs:ap-northeast-1:123456789012:composition/abcdABCDefgh"
```

Output:

```
{
    "composition": {
        "arn": "arn:aws:ivs:ap-northeast-1:123456789012:composition/abcdABCDefgh",
        "destinations": [
            {
                "configuration": {
                    "channel": {
                        "channelArn": "arn:aws:ivs:ap-
northeast-1:123456789012:channel/abcABCdefDEg",
                        "encoderConfigurationArn": "arn:aws:ivs:ap-
northeast-1:123456789012:encoder-configuration/ABabCDcdEFef"
                    },
                    "name": ""
                },
                "id": "AabBCcdDEefF",
                "startTime": "2023-10-16T23:26:00+00:00",

    }
}
```

For more information, see IVS Composite Recording | Real-Time Streaming in the *Amazon Interactive Video Service User Guide*.

- For API details, see GetComposition in *AWS CLI Command Reference*.

`get-encoder-configuration`

The following code example shows how to use `get-encoder-configuration`.

AWS CLI

To get a composition encoder configuration

The following `get-encoder-configuration` example gets the composition encoder configuration specified by the given ARN (Amazon Resource Name).

```
aws ivs-realtime get-encoder-configuration \
    --arn "arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/
abcdABCDefgh"
```

Output:

```
{
    "encoderConfiguration": {
        "arn": "arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/
abcdABCDefgh",
        "name": "test-ec",
        "tags": {},
        "video": {
            "bitrate": 3500000,
            "framerate": 30,
            "height": 1080,
            "width": 1920
        }
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see GetEncoderConfiguration in *AWS CLI Command Reference*.

`get-ingest-configuration`

The following code example shows how to use `get-ingest-configuration`.

AWS CLI

To get ingest configuration information

The following `get-ingest-configuration` example gets the ingest configuration for a specified ingest-configuration ARN (Amazon Resource Name).

```
aws ivs-realtime get-ingest-configuration \
    --arn arn:aws:ivs:us-west-2:123456789012:ingest-configuration/AbCdEfGh1234
```

Output:

```
{
    "ingestConfiguration": {
        "name": "ingest1",
        "arn": "arn:aws:ivs:us-west-2:123456789012:ingest-configuration/
AbCdEfGh1234",
        "ingestProtocol": "RTMPS",
        "streamKey": "rt_123456789012_us-
west-2_AbCdEfGh1234_abcd1234efgh5678ijkl9012MNOP34",
        "stageArn": "",
        "participantId": "xyZ654abC321",
        "state": "INACTIVE",
        "userId": "",
        "tags": {}
    }
}
```

For more information, see IVS Stream Ingest | Real-Time Streaming in the *Amazon Interactive Video Service User Guide*.

- For API details, see GetIngestConfiguration in *AWS CLI Command Reference*.

`get-participant`

The following code example shows how to use `get-participant`.

AWS CLI

Example 1: To get a stage participant

The following `get-participant` example gets the stage participant for a specified participant ID and session ID in the specified stage ARN (Amazon Resource Name).

```
aws ivs-realtime get-participant \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --session-id st-a1b2c3d4e5f6g \
    --participant-id abCDEf12GHIj
```

Output:

```
{
    "participant": {
        "browserName": "Google Chrome",
        "browserVersion": "116",
        "firstJoinTime": "2023-04-26T20:30:34+00:00",
        "ispName": "Comcast",
        "osName": "Microsoft Windows 10 Pro",
        "osVersion": "10.0.19044",
        "participantId": "abCDEf12GHIj",
        "published": true,
        "recordingS3BucketName": "bucket-name",
        "recordingS3Prefix": "abcdABCDefgh/st-a1b2c3d4e5f6g/
abCDEf12GHIj/1234567890",
        "recordingState": "ACTIVE",
        "sdkVersion": "",
        "state": "CONNECTED",
        "userId": ""
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon IVS Low-Latency Streaming User Guide*.

Example 2: To get a stage participant that has been replicated to another stage

The following `get-participant` example gets the stage participant for a specified participant ID and session ID in the specified stage ARN (Amazon Resource Name), when the participant has also been replicated to another stage.

```
aws ivs-realtime get-participant \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --session-id st-a1b2c3d4e5f6g \
    --participant-id abCDEf12GHIj
```

Output:

```
{
    "participant": {
        "browserName": "Google Chrome",
        "browserVersion": "116",
        "firstJoinTime": "2023-04-26T20:30:34+00:00",
        "ispName": "Comcast",
        "osName": "Microsoft Windows 10 Pro",
        "osVersion": "10.0.19044",
        "participantId": "abCDEf12GHIj",
        "published": true,
        "recordingS3BucketName": "bucket-name",
        "recordingS3Prefix": "abcdABCDefgh/st-a1b2c3d4e5f6g/
abCDEf12GHIj/1234567890",
        "recordingState": "ACTIVE",
        "replicationState": "ACTIVE",
        "replicationType": "SOURCE",
        "sdkVersion": "",
        "state": "CONNECTED",
        "userId": ""
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon IVS Low-Latency Streaming User Guide*.

Example 3: To get a stage participant that has been replicated from another stage

The following `get-participant` example gets the stage participant for a specified participant ID and session ID in the specified stage ARN (Amazon Resource Name), when the participant has been replicated from another stage.

```
aws ivs-realtime get-participant \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --session-id st-a1b2c3d4e5f6g \
    --participant-id abCDEf12GHIj
```

Output:

```
{
    "participant": {
        "browserName": "Google Chrome",
```

```
        "browserVersion": "116",
        "firstJoinTime": "2023-04-26T20:30:34+00:00",
        "ispName": "Comcast",
        "osName": "Microsoft Windows 10 Pro",
        "osVersion": "10.0.19044",
        "participantId": "abCDEf12GHIj",
        "published": true,
        "recordingS3BucketName": "bucket-name",
        "recordingS3Prefix": "abcdABCDefgh/st-a1b2c3d4e5f6g/
abCDEf12GHIj/1234567890",
        "recordingState": "ACTIVE",
        "replicationState": "ACTIVE",
        "replicationType": "REPLICA",
        "sdkVersion": "",
        "state": "CONNECTED",
        "userId": ""
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon IVS Low-Latency Streaming User Guide*.

- For API details, see GetParticipant in *AWS CLI Command Reference*.

get-public-key

The following code example shows how to use `get-public-key`.

AWS CLI

To get an existing public key used to sign stage participant tokens

The following `get-public-key` example gets a public key specified by the provided ARN, for sigining stage participant tokens.

```
aws ivs-realtime get-public-key \
    --arn arn:aws:ivs:us-west-2:123456789012:public-key/abcdABC1efg2
```

Output:

```
{
```

```
    "publicKey": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:public-key/abcdABC1efg2",
        "name": "",
        "publicKeyMaterial": "-----BEGIN PUBLIC KEY-----

\n0UAb8NdD4tUE0At4a9hYP9IETEXAMPLE\n-----END PUBLIC KEY-----",
        "fingerprint": "12:a3:44:56:bc:7d:e8:9f:10:2g:34:hi:56:78:90:12",
        "tags": {}
    }
}
```

For more information, see Distribute Participant Tokens in the *Amazon IVS Real-Time Streaming User Guide*.

- For API details, see GetPublicKey in *AWS CLI Command Reference*.

`get-stage-session`

The following code example shows how to use `get-stage-session`.

AWS CLI

To get a stage session

The following `get-stage-session` example gets the stage session for a specified session ID of a specified stage ARN (Amazon Resource Name).

```
aws ivs-realtime get-stage-session \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --session-id st-a1b2c3d4e5f6g
```

Output:

```
{
    "stageSession": {
        "endTime": "2023-04-26T20:36:29+00:00",
        "sessionId": "st-a1b2c3d4e5f6g",
        "startTime": "2023-04-26T20:30:29.602000+00:00"
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see GetStageSession in *AWS CLI Command Reference*.

`get-stage`

The following code example shows how to use `get-stage`.

AWS CLI

To get a stage's configuration information

The following `get-stage` example gets the stage configuration for a specified stage ARN (Amazon Resource Name).

```
aws ivs-realtime get-stage \
    --arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh
```

Output:

```
{
    "stage": {
        "activeSessionId": "st-a1b2c3d4e5f6g",
        "arn": "arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh",
        "autoParticipantRecordingConfiguration": {
            "storageConfigurationArn": "",
            "mediaTypes": [
                "AUDIO_VIDEO"
            ],
            "thumbnailConfiguration": {
                "targetIntervalSeconds": 60,
                "storage": [
                    "SEQUENTIAL"
                ],
                "recordingMode": "DISABLED"
            },
            "recordingReconnectWindowSeconds": 0,
            "hlsConfiguration": {
                "targetSegmentDurationSeconds": 6
            },
            "recordParticipantReplicas": true
```

```
        },
        "endpoints": {
            "events": "wss://global.events.live-video.net",

app/",
            "rtmps": "rtmps://9x0y8z7s6t5u.global-contribute-staging.live-
video.net:443/app/",
            "whip": "https://9x0y8z7s6t5u.global-bm.whip.live-video.net"
        },
        "name": "test",
        "tags": {}
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon IVS Low-Latency Streaming User Guide*.

- For API details, see GetStage in *AWS CLI Command Reference*.

`get-storage-configuration`

The following code example shows how to use `get-storage-configuration`.

AWS CLI

To get a composition storage configuration

The following `get-storage-configuration` example gets the composition storage configuration specified by the given ARN (Amazon Resource Name).

```
aws ivs-realtime get-storage-configuration \
    --name arn "arn:aws:ivs:ap-northeast-1:123456789012:storage-configuration/
abcdABCDefgh"
```

Output:

```
{
    "storageConfiguration": {
        "arn": "arn:aws:ivs:ap-northeast-1:123456789012:storage-configuration/
abcdABCDefgh",
        "name": "test-sc",
        "s3": {
```

```
                "bucketName": "amzn-s3-demo-bucket"
            },
            "tags": {}
        }
    }
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see GetStorageConfiguration in *AWS CLI Command Reference*.

`import-public-key`

The following code example shows how to use `import-public-key`.

AWS CLI

To import an existing public key to be used to sign stage participant tokens

The following `import-public-key` example imports a public key from a material file, to be used for sigining stage participant tokens.

```
aws ivs-realtime import-public-key \
    --public-key-material="`cat public.pem`"
```

Output:

```
{
    "publicKey": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:public-key/abcdABC1efg2",
        "name": "",
        "publicKeyMaterial": "-----BEGIN PUBLIC KEY-----
\nMHYwEAYHKoZIzj0CAQYFK4EEACIDYgAEqVWUtqs6EktQMR1sCYmEzGvRwtaycI16\n9pmzcpiWu/

\n0UAb8NdD4tUE0At4a9hYP9IETEXAMPLE\n-----END PUBLIC KEY-----",
        "fingerprint": "12:a3:44:56:bc:7d:e8:9f:10:2g:34:hi:56:78:90:12",
        "tags": {}
    }
}
```

For more information, see Distribute Participant Tokens in the *Amazon IVS Real-Time Streaming User Guide*.

- For API details, see ImportPublicKey in *AWS CLI Command Reference*.

`list-compositions`

The following code example shows how to use `list-compositions`.

AWS CLI

To get a list of compositions

The following `list-compositions` lists all compositions for your AWS account, in the AWS region where the API request is processed.

```
aws ivs-realtime list-compositions
```

Output:

```
{
    "compositions": [
        {
            "arn": "arn:aws:ivs:ap-northeast-1:123456789012:composition/
abcdABCDefgh",
            "destinations": [
                {
                    "id": "AabBCcdDEefF",
                    "startTime": "2023-10-16T23:25:23+00:00",
                    "state": "ACTIVE"
                }
            ],
            "stageArn": "arn:aws:ivs:ap-northeast-1:123456789012:stage/
defgABCDabcd",
            "startTime": "2023-10-16T23:25:21+00:00",
            "state": "ACTIVE",
            "tags": {}
        },
        {
            "arn": "arn:aws:ivs:ap-northeast-1:123456789012:composition/
ABcdabCDefgh",
            "destinations": [
                {
                    "endTime": "2023-10-16T23:25:00.786512+00:00",
                    "id": "aABbcCDdeEFf",
```

```
                    "startTime": "2023-10-16T23:24:01+00:00",
                    "state": "STOPPED"
                },
                {
                    "endTime": "2023-10-16T23:25:00.786512+00:00",

                    "state": "STOPPED"
                }
            ],
            "endTime": "2023-10-16T23:25:00+00:00",
            "stageArn": "arn:aws:ivs:ap-northeast-1:123456789012:stage/
efghabcdABCD",
            "startTime": "2023-10-16T23:24:00+00:00",
            "state": "STOPPED",
            "tags": {}
        }
    ]
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see ListCompositions in *AWS CLI Command Reference*.

`list-encoder-configurations`

The following code example shows how to use `list-encoder-configurations`.

AWS CLI

To list composition encoder configurations

The following `list-encoder-configurations` lists all composition encoder configurations for your AWS account, in the AWS region where the API request is processed.

```
aws ivs-realtime list-encoder-configurations
```

Output:

```
{
```

```
    "encoderConfigurations": [
        {
            "arn": "arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/
abcdABCDefgh",
            "name": "test-ec-1",
            "tags": {}
        },
        {
            "arn": "arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/
ABCefgEFGabc",
            "name": "test-ec-2",
            "tags": {}
        }
    ]
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see ListEncoderConfigurations in *AWS CLI Command Reference*.

`list-ingest-configurations`

The following code example shows how to use `list-ingest-configurations`.

AWS CLI

To get summary information about all ingest configurations

The following `list-ingest-configurations` example lists all ingest configurations for your AWS account, in the AWS region where the API request is processed.

```
aws ivs-realtime list-ingest-configurations
```

Output:

```
{
    "ingestConfigurations": [
        {
            "name": "",
            "arn": "arn:aws:ivs:us-west-2:123456789012:ingest-configuration/
XYZuvwSt4567",
```

```
                "ingestProtocol": "RTMPS",
                "stageArn": "arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh",
                "participnatId": "abC789Xyz456",
                "state": "INACTIVE"
                "userId": "",
            }
        ]
}
```

For more information, see IVS Stream Ingest | Real-Time Streaming in the *Amazon Interactive Video Service User Guide*.

- For API details, see ListIngestConfigurations in *AWS CLI Command Reference*.

`list-participant-events`

The following code example shows how to use `list-participant-events`.

AWS CLI

Example 1: To get a list of stage participant events

The following `list-participant-events` example lists all participant events for a specified participant ID and session ID of a specified stage ARN (Amazon Resource Name).

```
aws ivs-realtime list-participant-events \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --session-id st-a1b2c3d4e5f6g \
    --participant-id abCDEf12GHIj
```

Output:

```
{
    "events": [
        {
            "eventTime": "2023-04-26T20:36:28+00:00",
            "name": "LEFT",
            "participantId": "abCDEf12GHIj"
        },
        {
            "eventTime": "2023-04-26T20:36:28+00:00",
            "name": "PUBLISH_STOPPED",
```

```
            "participantId": "abCDEf12GHIj"
        },
        {
            "eventTime": "2023-04-26T20:30:34+00:00",
            "name": "JOINED",
            "participantId": "abCDEf12GHIj"
        },
        {
            "eventTime": "2023-04-26T20:30:34+00:00",
            "name": "PUBLISH_STARTED",
            "participantId": "abCDEf12GHIj"
        }
    ]
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon IVS Low-Latency Streaming User Guide*.

Example 2: To get a list of stage participant events, including participant replication stop and start

The following `list-participant-events` example lists all participant events for a specified session ID of a specified stage ARN (Amazon Resource Name), where a participant is replicated to another stage.

```
aws ivs-realtime list-participant-events \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --session-id st-a1b2c3d4e5f6g \
    --participant-id abCDEf12GHIj
```

Output:

```
{
    "events": [
        {
            "eventTime": "2025-04-26T20:36:28+00:00",
            "name": "LEFT",
            "participantId": "abCDEf12GHIj"
        },
        {
            "eventTime": "2025-04-26T20:36:28+00:00",
            "name": "PUBLISH_STOPPED",
```

```
            "participantId": "abCDEf12GHIj"
        },
        {
            "eventTime": "2025-04-26T20:30:34+00:00",
            "name": "JOINED",
            "participantId": "abCDEf12GHIj"
        },
        {
            "eventTime": "2025-04-26T20:30:34+00:00",
            "name": "PUBLISH_STARTED",
            "participantId": "abCDEf12GHIj"
        },
        {
            "name": "REPLICATION_STARTED",
            "participantId": "abCDEf12GHIj",
            "eventTime": "2025-04-26T20:30:34+00:00",
            "destinationStageArn": "arn:aws:ivs:us-west-2:12345678901:stage/
ABCDabcdefgh",
            "destinationSessionId": "st-b1c2d3e4f5g6a"
        },
        {
            "name": "REPLICATION_STOPPED",
            "participantId": "abCDEf12GHIj",
            "eventTime": "2025-04-26T20:32:34+00:00",
            "destinationStageArn": "arn:aws:ivs:us-west-2:12345678901:stage/
ABCDabcdefgh",
            "destinationSessionId": "st-b1c2d3e4f5g6a"
        }
    ]
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon IVS Low-Latency Streaming User Guide*.

- For API details, see ListParticipantEvents in *AWS CLI Command Reference*.

`list-participant-replicas`

The following code example shows how to use `list-participant-replicas`.

AWS CLI

To get a list of stage participant replicas

The following `list-participant-replicas` example lists all stage participants replicated from the specified source stage ARN (Amazon Resource Name) to another stage.

```
aws ivs-realtime list-participant-replicas \
    --source-stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --participant-id abCDEf12GHIj
```

Output:

```
{
    "replicas": [
        {
            "sourceStageArn": "arn:aws:ivs:us-west-2:123456789012:stage/
abcdABCDefgh",
            "participantId": "abCDEf12GHIj",
            "sourceSessionId": "st-a1b2c3d4e5f6g",
            "destinationStageArn": "arn:aws:ivs:us-west-2:012345678901:stage/
ABCDabcdefgh",
            "destinationSessionId": "st-b1c2d3e4f5g6a",
            "replicationState": "ACTIVE"
        }
    ]
}
```

For more information, see IVS Participant Replication in the *Amazon IVS Real-Time Streaming User Guide*.

- For API details, see ListParticipantReplicas in *AWS CLI Command Reference*.

`list-participants`

The following code example shows how to use `list-participants`.

AWS CLI

Example 1: To get a list of stage participants

The following `list-participants` example lists all participants for a specified session ID of a specified stage ARN (Amazon Resource Name).

```
aws ivs-realtime list-participants \
```

```
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --session-id st-a1b2c3d4e5f6g
```

Output:

```
{
    "participants": [
        {
            "firstJoinTime": "2023-04-26T20:30:34+00:00",
            "participantId": "abCDEf12GHIj",
            "published": true,
            "recordingState": "STOPPED",
            "state": "DISCONNECTED",
            "userId": ""
        }
    ]
}
```

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream]() in the *Amazon IVS Low-Latency Streaming User Guide*.

Example 2: To get a list of stage participants, when a participant has been replicated to another stage

The following `list-participants` example lists all participants for a specified session ID of a specified stage ARN (Amazon Resource Name), when a participant has been replicated to another stage.

```
aws ivs-realtime list-participants \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --session-id st-a1b2c3d4e5f6g
```

Output:

```
{
    "participants": [
        {
            "firstJoinTime": "2023-04-26T20:30:34+00:00",
            "participantId": "abCDEf12GHIj",
            "published": true,
            "recordingState": "STOPPED",
```

```
            "state": "DISCONNECTED",
            "userId": "",
            "replicationState": "ACTIVE",
            "replicationType": "SOURCE",
            "sourceStageArn": "",
            "sourceSessionId": ""
        }
    ]
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon IVS Low-Latency Streaming User Guide*.

Example 3: To get a list of stage participants, when a participant has been replicated from another stage

The following `list-participants` example lists all participants for a specified session ID of a specified stage ARN (Amazon Resource Name), when a participant has been replicated from another stage.

```
aws ivs-realtime list-participants \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --session-id st-a1b2c3d4e5f6g
```

Output:

```
{
    "participants": [
        {
            "firstJoinTime": "2023-04-26T20:30:34+00:00",
            "participantId": "abCDEf12GHIj",
            "published": true,
            "recordingState": "STOPPED",
            "state": "DISCONNECTED",
            "userId": "",
            "replicationState": "ACTIVE",
            "replicationType": "REPLICA",
            "sourceStageArn": "arn:aws:ivs:us-west-2:123456789012:stage/
abcdABCDefgh",
            "sourceSessionId": "st-a1b2c3d4e5f6g"
        }
    ]
```

```
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon IVS Low-Latency Streaming User Guide*.

- For API details, see ListParticipants in *AWS CLI Command Reference*.

`list-public-keys`

The following code example shows how to use `list-public-keys`.

AWS CLI

To list existing public keys available to sign stage participant tokens

The following `list-public-keys` example lists all public keys available for sigining stage participant tokens, in the AWS region where the API request is processed.

```
aws ivs-realtime list-public-keys
```

Output:

```
{
    "publicKeys": [
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:public-key/abcdABC1efg2",
            "name": "",
            "tags": {}
        },
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:public-key/3bcdABCDefg4",
            "name": "",
            "tags": {}
        }
    ]
}
```

For more information, see Distribute Participant Tokens in the *Amazon IVS Real-Time Streaming User Guide*.

- For API details, see ListPublicKeys in *AWS CLI Command Reference*.

`list-stage-sessions`

The following code example shows how to use `list-stage-sessions`.

AWS CLI

To get a list of stage sessions

The following `list-stage-sessions` example lists all sessions for a specified stage ARN (Amazon Resource Name).

```
aws ivs-realtime list-stage-sessions \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh
```

Output:

```
{
    "stageSessions": [
        {
            "endTime": "2023-04-26T20:36:29+00:00",
            "sessionId": "st-a1b2c3d4e5f6g",
            "startTime": "2023-04-26T20:30:29.602000+00:00"
        }
    ]
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see ListStageSessions in *AWS CLI Command Reference*.

`list-stages`

The following code example shows how to use `list-stages`.

AWS CLI

To get summary information about all stages

The following `list-stages` example lists all stages for your AWS account, in the AWS region where the API request is processed.

```
aws ivs-realtime list-stages
```

Output:

```
{
    "stages": [
        {
            "activeSessionId": "st-a1b2c3d4e5f6g",
            "arn": "arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh",
            "name": "stage1",
            "tags": {}
        },
        {
            "activeSessionId": "st-a123bcd456efg",
            "arn": "arn:aws:ivs:us-west-2:123456789012:stage/abcd1234ABCD",
            "name": "stage2",
            "tags": {}
        },
        {
            "activeSessionId": "st-abcDEF1234ghi",
            "arn": "arn:aws:ivs:us-west-2:123456789012:stage/ABCD1234efgh",
            "name": "stage3",
            "tags": {}
        }
    ]
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see ListStages in *AWS CLI Command Reference*.

`list-storage-configurations`

The following code example shows how to use `list-storage-configurations`.

AWS CLI

To list composition storage configurations

The following `list-storage-configurations` lists all composition storage configurations for your AWS account, in the AWS region where the API request is processed.

```
aws ivs-realtime list-storage-configurations
```

Output:

```
{
    "storageConfigurations": [
        {
            "arn": "arn:aws:ivs:ap-northeast-1:123456789012:storage-configuration/
abcdABCDefgh",
            "name": "test-sc-1",
            "s3": {
                "bucketName": "amzn-s3-demo-bucket-1"
            },
            "tags": {}
        },
        {
            "arn": "arn:aws:ivs:ap-northeast-1:123456789012:storage-configuration/
ABCefgEFGabc",
            "name": "test-sc-2",
            "s3": {
                "bucketName": "amzn-s3-demo-bucket-2"
            },
            "tags": {}
        }
    ]
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see ListStorageConfigurations in *AWS CLI Command Reference*.

`start-composition`

The following code example shows how to use `start-composition`.

AWS CLI

Example 1: To start a composition with default layout settings

The following `start-composition` example starts a composition for the specified stage to be streamed to the specified locations.

```
aws ivs-realtime start-composition \
    --stage-arn arn:aws:ivs:ap-northeast-1:123456789012:stage/defgABCDabcd \
    --destinations '[{"channel": {"channelArn": "arn:aws:ivs:ap-
northeast-1:123456789012:channel/abcABCdefDEg", \
        "encoderConfigurationArn": "arn:aws:ivs:ap-northeast-1:123456789012:encoder-
configuration/ABabCDcdEFef"}}, \
        {"s3":{"encoderConfigurationArns":["arn:aws:ivs:ap-
northeast-1:123456789012:encoder-configuration/ABabCDcdEFef"], \
        "recordingConfiguration": {"hlsConfiguration":
 {"targetSegmentDurationSeconds": 5}}, \
        "storageConfigurationArn":"arn:aws:ivs:ap-northeast-1:123456789012:storage-
configuration/FefABabCDcdE"}}]'
```

Output:

```
{
    "composition": {
        "arn": "arn:aws:ivs:ap-northeast-1:123456789012:composition/abcdABCDefgh",
        "destinations": [
            {
                "configuration": {
                    "channel": {
                        "channelArn": "arn:aws:ivs:ap-
northeast-1:123456789012:channel/abcABCdefDEg",
                        "encoderConfigurationArn": "arn:aws:ivs:ap-
northeast-1:123456789012:encoder-configuration/ABabCDcdEFef"
                    },
                    "name": ""
                },
                "id": "AabBCcdDEefF",
                "state": "STARTING"
            },
            {
                "configuration": {
                    "name": "",
                    "s3": {
                        "encoderConfigurationArns": [
                            "arn:aws:ivs:arn:aws:ivs:ap-

            }
        ],
        "layout": {
            "grid": {
                "featuredParticipantAttribute": ""
                "gridGap": 2,
                "omitStoppedVideo": false,
                "participantOrderAttribute": "",
                "videoAspectRatio": "VIDEO",
                "videoFillMode": ""
            }
        },
        "stageArn": "arn:aws:ivs:ap-northeast-1:123456789012:stage/defgABCDabcd",
        "startTime": "2023-10-16T23:24:00+00:00",
        "state": "STARTING",
        "tags": {}
    }
}
```

For more information, see IVS Composite Recording | Real-Time Streaming in the *Amazon Interactive Video Service User Guide*.

Example 2: To start a composition with PiP layout

The following `start-composition` example starts a composition for the specified stage to be streamed to the specified locations using PiP layout.

```
aws ivs-realtime start-composition \
```

```
    --stage-arn arn:aws:ivs:ap-northeast-1:123456789012:stage/defgABCDabcd \
    --destinations '[{"channel": {"channelArn": "arn:aws:ivs:ap-
northeast-1:123456789012:channel/abcABCdefDEg", \
        "encoderConfigurationArn": "arn:aws:ivs:ap-northeast-1:123456789012:encoder-
configuration/ABabCDcdEFef"}}, \
        {"s3":{"encoderConfigurationArns":["arn:aws:ivs:ap-
northeast-1:123456789012:encoder-configuration/ABabCDcdEFef"], \
        "storageConfigurationArn":"arn:aws:ivs:ap-northeast-1:123456789012:storage-
configuration/FefABabCDcdE"}}]' \
    --layout pip='{featuredParticipantAttribute="abcdefg"}'
```

Output:

```
{
    "composition": {
        "arn": "arn:aws:ivs:ap-northeast-1:123456789012:composition/wxyzWXYZpqrs",
        "destinations": [
            {
                "configuration": {

        "tags": {}
    }
}
```

For more information, see IVS Composite Recording | Real-Time Streaming in the *Amazon Interactive Video Service User Guide*.

Example 3: To start a composition with thumbnail recording enabled

The following `start-composition` example starts a composition for the specified stage to be streamed to the specified locations with thumbnail recording enabled.

```
aws ivs-realtime start-composition \
    --stage-arn arn:aws:ivs:ap-northeast-1:123456789012:stage/defgABCDabcd \
    --destinations '[{"channel": {"channelArn": "arn:aws:ivs:ap-
northeast-1:123456789012:channel/abcABCdefDEg", \
        "encoderConfigurationArn": "arn:aws:ivs:ap-northeast-1:123456789012:encoder-
configuration/ABabCDcdEFef"}}, \
        {"s3": {"encoderConfigurationArns": ["arn:aws:ivs:ap-
northeast-1:123456789012:encoder-configuration/ABabCDcdEFef"], \
        "storageConfigurationArn": "arn:aws:ivs:ap-northeast-1:123456789012:storage-
configuration/FefABabCDcdE", \
        "thumbnailConfigurations": [{"storage":
 ["SEQUENTIAL"],"targetIntervalSeconds": 60}]}}]'
```

Output:

```
{
    "composition": {
        "arn": "arn:aws:ivs:ap-northeast-1:123456789012:composition/abcdABCDefgh",
        "destinations": [
            {

        "state": "STARTING",
        "tags": {}
    }
}
```

For more information, see Composite Recording (Real-Time Streaming) in the *Amazon Interactive Video Service User Guide*.

Example 4: To start a composition using grid layout with custom participant ordering

The following `start-composition` example starts a composition for the specified stage to be streamed to the specified locations using grid layout with custom participant ordering.

```
aws ivs-realtime start-composition \
    --stage-arn arn:aws:ivs:ap-northeast-1:123456789012:stage/defgABCDabcd \
    --destinations '[{"channel": {"channelArn": "arn:aws:ivs:ap-
northeast-1:123456789012:channel/abcABCdefDEg", \
        "encoderConfigurationArn": "arn:aws:ivs:ap-northeast-1:123456789012:encoder-
configuration/ABabCDcdEFef"}}, \
        {"s3": {"encoderConfigurationArns": ["arn:aws:ivs:ap-
northeast-1:123456789012:encoder-configuration/ABabCDcdEFef"], \
        "storageConfigurationArn": "arn:aws:ivs:ap-northeast-1:123456789012:storage-
configuration/FefABabCDcdE", \
        "thumbnailConfigurations": [{"storage":
 ["SEQUENTIAL"],"targetIntervalSeconds": 60}]}}]' \
    --layout grid='{participantOrderAttribute="abcdefg"}'
```

Output:

```
{
    "composition": {
        "arn": "arn:aws:ivs:ap-northeast-1:123456789012:composition/abcdABCDefgh",
        "destinations": [
            {
                "configuration": {

`start-participant-replication`

The following code example shows how to use `start-participant-replication`.

AWS CLI

To start replicating a participant from one stage to another stage

The following `start-participant-replication` example replicates a participant from a source stage to a destination stage, with each stage specified by its ARN (Amazon Resource Name).

```
aws ivs-realtime start-participant-replication \
    --source-stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --destination-stage-arn arn:aws:ivs:us-west-2:234567890123:stage/bcdABCDefghi \
    --participant-id abCDEf12GHIj
```

Output:

```
{
    "accessControlAllowOrigin": "*",
    "accessControlExposeHeaders": "Access-Control-Allow-Origin,Access-Control-
Expose-Headers,Cache-Control,Content-Length, \
    Content-Security-Policy,Content-Type,date,Strict-Transport-Security,x-amz-apigw-
id,x-amzn-errormessage,x-amzn-errortype, \
    x-amzn-requestid,x-amzn-trace-id,X-Content-Type-Options,X-Frame-Options",
    "cacheControl": "no-store, no-cache",
    "contentSecurityPolicy": "default-src 'self'; upgrade-insecure-requests;",
    "strictTransportSecurity": "max-age:47304000; includeSubDomains",
```

```
    "xContentTypeOptions": "nosniff",
    "xFrameOptions": "DENY"
}
```

For more information, see IVS Participant Replication in the *Amazon IVS Real-Time Streaming User Guide*.

- For API details, see StartParticipantReplication in *AWS CLI Command Reference*.

`stop-composition`

The following code example shows how to use `stop-composition`.

AWS CLI

To stop a composition

The following `stop-composition` stops the composition specified by the given ARN (Amazon Resource Name).

```
aws ivs-realtime stop-composition \
    --arn "arn:aws:ivs:ap-northeast-1:123456789012:composition/abcdABCDefgh"
```

This command produces no output.

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see StopComposition in *AWS CLI Command Reference*.

`stop-participant-replication`

The following code example shows how to use `stop-participant-replication`.

AWS CLI

To stop replicating a participant from one stage to another stage

The following `stop-participant-replication` example stops replicating a participant from a source stage to a destination stage, with each stage specified by its ARN (Amazon Resource Name).

```
aws ivs-realtime stop-participant-replication \
    --source-stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --destination-stage-arn arn:aws:ivs:us-west-2:234567890123:stage/bcdABCDefghi \
    --participant-id abCDEf12GHIj
```

Output:

```
{
    "accessControlAllowOrigin": "*",
    "accessControlExposeHeaders": "Access-Control-Allow-Origin,Access-Control-
Expose-Headers,Cache-Control,Content-Length, \
    Content-Security-Policy,Content-Type,date,Strict-Transport-Security,x-amz-apigw-
id,x-amzn-errormessage,x-amzn-errortype, \
    x-amzn-requestid,x-amzn-trace-id,X-Content-Type-Options,X-Frame-Options",
    "cacheControl": "no-store, no-cache",
    "contentSecurityPolicy": "default-src 'self'; upgrade-insecure-requests;",
    "strictTransportSecurity": "max-age:47304000; includeSubDomains",
    "xContentTypeOptions": "nosniff",
    "xFrameOptions": "DENY"
}
```

For more information, see IVS Participant Replication in the *Amazon IVS Real-Time Streaming User Guide*.

- For API details, see StopParticipantReplication in *AWS CLI Command Reference*.

`update-ingest-configuration`

The following code example shows how to use `update-ingest-configuration`.

AWS CLI

To update an ingest configuration

The following `update-inegst-configuration` example updates an ingest configuration to attach it to a stage.

```
aws ivs-realtime update-ingest-configuration \
    --arn arn:aws:ivs:us-west-2:123456789012:ingest-configuration/AbCdEfGh1234 \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh
```

Output:

```
{
    "ingestConfiguration": {
        "name": "ingest1",
        "arn": "arn:aws:ivs:us-west-2:123456789012:ingest-configuration/
AbCdEfGh1234",
        "ingestProtocol": "RTMPS",
        "streamKey": "rt_123456789012_us-
west-2_AbCdEfGh1234_abcd1234efgh5678ijkl9012MNOP34",

        "participantId": "xyZ654abC321",
        "state": "INACTIVE",
        "userId": "",
        "tags": {}
    }
}
```

For more information, see IVS Stream Ingest | Real-Time Streaming in the *Amazon Interactive Video Service User Guide*.

- For API details, see UpdateIngestConfiguration in *AWS CLI Command Reference*.

`update-stage`

The following code example shows how to use `update-stage`.

AWS CLI

Example 1: To update a stage's configuration

The following `update-stage` example updates a stage for a specified stage ARN to update the stage name and configure individual participant recording with thumbnail recording enabled.

```
aws ivs-realtime update-stage \
    --arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --auto-participant-recording-configuration '{"mediaTypes":
 ["AUDIO_VIDEO"],"storageConfigurationArn": "arn:aws:ivs:us-
west-2:123456789012:storage-configuration/abcdABCDefgh",
 "recordingReconnectWindowSeconds": 100, \
        "thumbnailConfiguration": {"recordingMode": "INTERVAL","storage":
 ["SEQUENTIAL"],"targetIntervalSeconds": 60}} \
```

```
        "hlsConfiguration": {"targetSegmentDurationSeconds": 5}}' \
    --name stage1a
```

Output:

```
{
    "stage": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh",
        "autoParticipantRecordingConfiguration": {
            "mediaTypes": [
                "AUDIO_VIDEO"
            ],
            "storageConfigurationArn": "arn:aws:ivs:us-west-2:123456789012:storage-
configuration/abcdABCDefgh",
            "thumbnailConfiguration": {
                "targetIntervalSeconds": 60,
                "storage": [
                    "SEQUENTIAL"
                ],
                "recordingMode": "INTERVAL"
            },
            "recordingReconnectWindowSeconds": 100,
            "hlsConfiguration": {
                "targetSegmentDurationSeconds": 5
            },
            "recordParticipantReplicas": true
        },
        "endpoints": {
            "events": "wss://global.events.live-video.net",
            "rtmp": "rtmp://9x0y8z7s6t5u.global-contribute-staging.live-video.net/
app/",
            "rtmps": "rtmps://9x0y8z7s6t5u.global-contribute-staging.live-
video.net:443/app/",
            "whip": "https://1a2b3c4d5e6f.global-bm.whip.live-video.net"
        },
        "name": "stage1a",
        "tags": {}
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon IVS Low-Latency Streaming User Guide*.

Example 2: To update a stage's configuration, including disabling participant replica recording

The following `update-stage` example updates a stage for a specified stage ARN to update the stage name and configure individual participant recording with thumbnail recording enabled and participant replica recording disabled.

```
aws ivs-realtime update-stage \
    --arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --auto-participant-recording-configuration '{"mediaTypes":
 ["AUDIO_VIDEO"],"storageConfigurationArn": "arn:aws:ivs:us-
west-2:123456789012:storage-configuration/abcdABCDefgh",
 "recordingReconnectWindowSeconds": 100, \
        "thumbnailConfiguration": {"recordingMode": "INTERVAL","storage":
 ["SEQUENTIAL"],"targetIntervalSeconds": 60}, "recordParticipantReplicas":false} \
        "hlsConfiguration": {"targetSegmentDurationSeconds": 5}}' \
    --name stage1a
```

Output:

```
{
    "stage": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh",
        "autoParticipantRecordingConfiguration": {
            "mediaTypes": [
                "AUDIO_VIDEO"
            ],
            "storageConfigurationArn": "arn:aws:ivs:us-west-2:123456789012:storage-
configuration/abcdABCDefgh",
            "thumbnailConfiguration": {
                "targetIntervalSeconds": 60,
                "storage": [
                    "SEQUENTIAL"
                ],
                "recordingMode": "INTERVAL"
            },
            "recordingReconnectWindowSeconds": 100,
            "hlsConfiguration": {
                "targetSegmentDurationSeconds": 5
            },
            "recordParticipantReplicas": false
        },
        "endpoints": {
```

```
            "events": "wss://global.events.live-video.net",
            "rtmp": "rtmp://9x0y8z7s6t5u.global-contribute-staging.live-video.net/
app/",
            "rtmps": "rtmps://9x0y8z7s6t5u.global-contribute-staging.live-
video.net:443/app/",
            "whip": "https://1a2b3c4d5e6f.global-bm.whip.live-video.net"
        },
        "name": "stage1a",
        "tags": {}
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon IVS Low-Latency Streaming User Guide*.

Amazon Kendra examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Kendra.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-data-source`

The following code example shows how to use `create-data-source`.

AWS CLI

To create an Amazon Kendra data source connector

The following `create-data-source` creates and configures an Amazon Kendra data source connector. You can use `describe-data-source` to view the status of a data source connector, and read any error messages if the status shows a data source connector "FAILED" to completely create.

```
aws kendra create-data-source \
    --name "example data source 1" \
    --description "Example data source 1 for example index 1 contains the first set
 of example documents" \
    --tags '{"Key": "test resources", "Value": "kendra"}, {"Key": "test resources",
 "Value": "aws"}' \
    --role-arn "arn:aws:iam::my-account-id:role/
KendraRoleForS3TemplateConfigDataSource" \
    --index-id exampleindex1 \
    --language-code "es" \
    --schedule "0 0 18 ? * TUE,MON,WED,THU,FRI,SAT *" \
    --configuration '{"TemplateConfiguration": {"Template": file://
s3schemaconfig.json}}' \
    --type "TEMPLATE" \
    --custom-document-enrichment-configuration '{"PostExtractionHookConfiguration":
 {"LambdaArn": "arn:aws:iam::my-account-id:function/my-function-ocr-docs",
 "S3Bucket": "s3://amzn-s3-demo-bucket/scanned-image-text-example-docs"}, "RoleArn":
 "arn:aws:iam:my-account-id:role/KendraRoleForCDE"}' \
    --vpc-configuration '{"SecurityGroupIds": ["sg-1234567890abcdef0"], "SubnetIds":
 ["subnet-1c234","subnet-2b134"]}'
```

Output:

```
{
    "Id": "exampledatasource1"
}
```

For more information, see Getting started with an Amazon Kendra index and data source connector in the *Amazon Kendra Developer Guide*.

- For API details, see CreateDataSource in *AWS CLI Command Reference*.

`create-index`

The following code example shows how to use `create-index`.

AWS CLI

To create an Amazon Kendra index

The following `create-index` creates and configures an Amazon Kendra index. You can use `describe-index` to view the status of an index, and read any error messages if the status shows an index "FAILED" to completely create.

```
aws kendra create-index \
    --name "example index 1" \
    --description "Example index 1 contains the first set of example documents" \
    --tags '{"Key": "test resources", "Value": "kendra"}, {"Key": "test resources", 
 "Value": "aws"}' \
    --role-arn "arn:aws:iam::my-account-id:role/KendraRoleForExampleIndex" \
    --edition "DEVELOPER_EDITION" \
    --server-side-encryption-configuration '{"KmsKeyId": "my-kms-key-id"}' \
    --user-context-policy "USER_TOKEN" \
    --user-token-configurations '{"JsonTokenTypeConfiguration": 
 {"GroupAttributeField": "groupNameField", "UserNameAttributeField": 
 "userNameField"}}'
```

Output:

```
{
   "Id": index1
}
```

For more information, see Getting started with an Amazon Kendra index and data source connector in the *Amazon Kendra Developer Guide*.

- For API details, see CreateIndex in *AWS CLI Command Reference*.

`describe-data-source`

The following code example shows how to use `describe-data-source`.

AWS CLI

To get information about an Amazon Kendra data source connector

The following `describe-data-source` gets information about an Amazon Kendra data source connector. You can view the configuration of a data source connector, and read any error messages if the status shows a data source connector "FAILED" to completely create.

```
aws kendra describe-data-source \
    --id exampledatasource1 \
    --index-id exampleindex1
```

Output:

```
{
    "Configuration": {
        "TemplateConfiguration": {
            "Template": {

`update-data-source`

The following code example shows how to use `update-data-source`.

AWS CLI

To update an Amazon Kendra data source connector

The following `update-data-source` updates the configuration of an Amazon Kendra data source connector. If the action is successful, the service either sends back no output, the HTTP status code 200, or the AWS CLI return code 0. You can use `describe-data-source` to view the configuration and status of a data source connector.

```
aws kendra update-data-source \
    --id exampledatasource1 \
    --index-id exampleindex1 \
    --name "new name for example data source 1" \
    --description "new description for example data source 1" \
    --role-arn arn:aws:iam::my-account-id:role/KendraNewRoleForExampleDataSource \
    --configuration '{"TemplateConfiguration": {"Template": file://
s3schemanewconfig.json}}' \
    --custom-document-enrichment-configuration '{"PostExtractionHookConfiguration":
 {"LambdaArn": "arn:aws:iam::my-account-id:function/my-function-ocr-docs",
 "S3Bucket": "s3://amzn-s3-demo-bucket/scanned-image-text-example-docs"}, "RoleArn":
 "arn:aws:iam:my-account-id:role/KendraNewRoleForCDE"}' \
    --language-code "es" \
    --schedule "0 0 18 ? * MON,WED,FRI *" \
    --vpc-configuration '{"SecurityGroupIds": ["sg-1234567890abcdef0"], "SubnetIds":
 ["subnet-1c234","subnet-2b134"]}'
```

This command produces no output.

For more information, see Getting started with an Amazon Kendra index and data source connector in the *Amazon Kendra Developer Guide*.

- For API details, see UpdateDataSource in *AWS CLI Command Reference*.

`update-index`

The following code example shows how to use `update-index`.

AWS CLI

To update an Amazon Kendra index

The following `update-index` updates the configuration of an Amazon Kendra index. If the action is successful, the service either sends back no output, the HTTP status code 200, or the

AWS CLI return code 0. You can use `describe-index` to view the configuration and status of an index.

```
aws kendra update-index \
    --id enterpriseindex1 \
    --name "new name for Enterprise Edition index 1" \
    --description "new description for Enterprise Edition index 1" \
    --role-arn arn:aws:iam::my-account-id:role/KendraNewRoleForEnterpriseIndex \
    --capacity-units '{"QueryCapacityUnits": 2, "StorageCapacityUnits": 1}' \
    --document-metadata-configuration-updates '{"Name": "_document_title",
 "Relevance": {"Importance": 6}}, {"Name": "_last_updated_at", "Relevance":
 {"Importance": 8}}' \
    --user-context-policy "USER_TOKEN" \
    --user-token-configurations '{"JsonTokenTypeConfiguration":
 {"GroupAttributeField": "groupNameField", "UserNameAttributeField":
 "userNameField"}}'
```

This command produces no output.

For more information, see Getting started with an Amazon Kendra index and data source connector in the *Amazon Kendra Developer Guide*.

- For API details, see UpdateIndex in *AWS CLI Command Reference*.

`add-tags-to-stream`

The following code example shows how to use `add-tags-to-stream`.

AWS CLI

To add tags to a data stream

The following `add-tags-to-stream` example assigns a tag with the key `samplekey` and value `example` to the specified stream.

```
aws kinesis add-tags-to-stream \
    --stream-name samplestream \
    --tags samplekey=example
```

This command produces no output.

For more information, see Tagging Your Streams in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see AddTagsToStream in *AWS CLI Command Reference*.

`create-stream`

The following code example shows how to use `create-stream`.

AWS CLI

To create a data stream

The following `create-stream` example creates a data stream named samplestream with 3 shards.

```
aws kinesis create-stream \
    --stream-name samplestream \
    --shard-count 3
```

This command produces no output.

For more information, see Creating a Stream in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see CreateStream in *AWS CLI Command Reference*.

`decrease-stream-retention-period`

The following code example shows how to use `decrease-stream-retention-period`.

AWS CLI

To decrease data stream retention period

The following `decrease-stream-retention-period` example decreases the retention period (the length of time data records are accessible after they are added to the stream) of a stream named samplestream to 48 hours.

```
aws kinesis decrease-stream-retention-period \
    --stream-name samplestream \
    --retention-period-hours 48
```

This command produces no output.

For more information, see Changing the Data Retention Period in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see DecreaseStreamRetentionPeriod in *AWS CLI Command Reference*.

`delete-stream`

The following code example shows how to use `delete-stream`.

AWS CLI

To delete a data stream

The following `delete-stream` example deletes the specified data stream.

```
aws kinesis delete-stream \
    --stream-name samplestream
```

This command produces no output.

For more information, see Deleting a Stream in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see DeleteStream in *AWS CLI Command Reference*.

`deregister-stream-consumer`

The following code example shows how to use `deregister-stream-consumer`.

AWS CLI

To deregister a data stream consumer

The following `deregister-stream-consumer` example deregisters the specified consumer from the specified data stream.

```
aws kinesis deregister-stream-consumer \
    --stream-arn arn:aws:kinesis:us-west-2:123456789012:stream/samplestream \
    --consumer-name KinesisConsumerApplication
```

This command produces no output.

For more information, see Developing Consumers with Enhanced Fan-Out Using the Kinesis Data Streams API in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see DeregisterStreamConsumer in *AWS CLI Command Reference*.

`describe-limits`

The following code example shows how to use `describe-limits`.

AWS CLI

To describe shard limits

The following `describe-limits` example displays the shard limits and usage for the current AWS account.

```
aws kinesis describe-limits
```

Output:

```
{
    "ShardLimit": 500,
    "OpenShardCount": 29
}
```

For more information, see Resharding a Stream in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see DescribeLimits in *AWS CLI Command Reference*.

`describe-stream-consumer`

The following code example shows how to use `describe-stream-consumer`.

AWS CLI

To describe a data stream consumer

The following `describe-stream-consumer` example returns the description of the specified consumer, registered with the specified data stream.

```
aws kinesis describe-stream-consumer \
    --stream-arn arn:aws:kinesis:us-west-2:012345678912:stream/samplestream \
    --consumer-name KinesisConsumerApplication
```

Output:

```
{
    "ConsumerDescription": {
        "ConsumerName": "KinesisConsumerApplication",
        "ConsumerARN": "arn:aws:kinesis:us-west-2:123456789012:stream/samplestream/
consumer/KinesisConsumerApplication:1572383852",
        "ConsumerStatus": "ACTIVE",
        "ConsumerCreationTimestamp": 1572383852.0,
        "StreamARN": "arn:aws:kinesis:us-west-2:123456789012:stream/samplestream"
    }
}
```

For more information, see Reading Data from Amazon Kinesis Data Streams in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see DescribeStreamConsumer in *AWS CLI Command Reference*.

`describe-stream-summary`

The following code example shows how to use `describe-stream-summary`.

AWS CLI

To describe a data stream summary

The following `describe-stream-summary` example provides a summarized description (without the shard list) of the specified data stream.

```
aws kinesis describe-stream-summary \
    --stream-name samplestream
```

Output:

```
{
    "StreamDescriptionSummary": {
        "StreamName": "samplestream",
        "StreamARN": "arn:aws:kinesis:us-west-2:123456789012:stream/samplestream",
        "StreamStatus": "ACTIVE",
        "RetentionPeriodHours": 48,
        "StreamCreationTimestamp": 1572297168.0,
        "EnhancedMonitoring": [
            {
                "ShardLevelMetrics": []
            }
        ],
        "EncryptionType": "NONE",
        "OpenShardCount": 3,
        "ConsumerCount": 0
    }
}
```

For more information, see Creating and Managing Streams in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see DescribeStreamSummary in *AWS CLI Command Reference*.

`describe-stream`

The following code example shows how to use `describe-stream`.

AWS CLI

To describe a data stream

The following `describe-stream` example returns the details of the specified data stream.

```
aws kinesis describe-stream \
    --stream-name samplestream
```

Output:

```
{
    "StreamDescription": {
        "Shards": [
            {
                "ShardId": "shardId-000000000000",
                "HashKeyRange": {
                    "StartingHashKey": "0",
                    "EndingHashKey": "113427455640312821154458202477256070484"
                },
                "SequenceNumberRange": {
                    "StartingSequenceNumber":
 "49600871682957036442365024926191073437251060580128653314"
                }
            },
            {
                "ShardId": "shardId-000000000001",
                "HashKeyRange": {
                    "StartingHashKey": "113427455640312821154458202477256070485",
                    "EndingHashKey": "226854911280625642308916404954512140969"
                },
                "SequenceNumberRange": {
                    "StartingSequenceNumber":

                }
            },
            {
                "ShardId": "shardId-000000000002",
                "HashKeyRange": {
                    "StartingHashKey": "226854911280625642308916404954512140970",
                    "EndingHashKey": "340282366920938463463374607431768211455"
                },
                "SequenceNumberRange": {
```

```
                    "StartingSequenceNumber": 
"49600871683001637932762086172474144873796357303140614178"
                }
            }
        ],
        "StreamARN": "arn:aws:kinesis:us-west-2:123456789012:stream/samplestream",
        "StreamName": "samplestream",
        "StreamStatus": "ACTIVE",
        "RetentionPeriodHours": 24,
        "EnhancedMonitoring": [
            {
                "ShardLevelMetrics": []
            }
        ],
        "EncryptionType": "NONE",
        "KeyId": null,
        "StreamCreationTimestamp": 1572297168.0
    }
}
```

For more information, see Creating and Managing Streams in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see DescribeStream in *AWS CLI Command Reference*.

`disable-enhanced-monitoring`

The following code example shows how to use `disable-enhanced-monitoring`.

AWS CLI

To disable enhanced monitoring for shard-level metrics

The following `disable-enhanced-monitoring` example disables enhanced Kinesis data stream monitoring for shard-level metrics.

```
aws kinesis disable-enhanced-monitoring \
    --stream-name samplestream --shard-level-metrics ALL
```

Output:

```
{
    "StreamName": "samplestream",
```

```
    "CurrentShardLevelMetrics": [
        "IncomingBytes",
        "OutgoingRecords",
        "IteratorAgeMilliseconds",
        "IncomingRecords",
        "ReadProvisionedThroughputExceeded",
        "WriteProvisionedThroughputExceeded",
        "OutgoingBytes"
    ],
    "DesiredShardLevelMetrics": []
}
```

For more information, see Monitoring Streams in Amazon Kinesis Data Streams in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see DisableEnhancedMonitoring in *AWS CLI Command Reference*.

`enable-enhanced-monitoring`

The following code example shows how to use `enable-enhanced-monitoring`.

AWS CLI

To enable enhanced monitoring for shard-level metrics

The following `enable-enhanced-monitoring` example enables enhanced Kinesis data stream monitoring for shard-level metrics.

```
aws kinesis enable-enhanced-monitoring \
    --stream-name samplestream \
    --shard-level-metrics ALL
```

Output:

```
{
    "StreamName": "samplestream",
    "CurrentShardLevelMetrics": [],
    "DesiredShardLevelMetrics": [
        "IncomingBytes",
        "OutgoingRecords",
        "IteratorAgeMilliseconds",
        "IncomingRecords",
        "ReadProvisionedThroughputExceeded",
```

```
        "WriteProvisionedThroughputExceeded",
        "OutgoingBytes"
    ]
}
```

For more information, see [Monitoring Streams in Amazon Kinesis Data Streams]() in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [EnableEnhancedMonitoring]() in *AWS CLI Command Reference*.

`get-records`

The following code example shows how to use `get-records`.

AWS CLI

To obtain records from a shard

The following `get-records` example gets data records from a Kinesis data stream's shard using the specified shard iterator.

```
aws kinesis get-records \
    --shard-iterator AAAAAAAAAAF7/0mWD7IuHj1yGv/
TKuNgx2ukD5xipCY4cy4gU96orWwZwcSXh3K9tAmGYeOZyLZrvzzeOFVf9iN99hUPw/w/
b0YWYeehfNvnf1DYt5XpDJghLKr3DzgznkTmMymDP3R+3wRKeuEw6/kdxY2yKJH0veaiekaVc4N2VwK/
GvaGP2Hh9Fg7N++q0Adg6fIDQPt4p8RpavDbk+A4sL9SWGE1
```

Output:

```
{
    "Records": [],
    "MillisBehindLatest": 80742000
}
```

For more information, see [Developing Consumers Using the Kinesis Data Streams API with the AWS SDK for Java]() in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [GetRecords]() in *AWS CLI Command Reference*.

`get-shard-iterator`

The following code example shows how to use `get-shard-iterator`.

AWS CLI

To obtain a shard iterator

The following `get-shard-iterator` example uses the `AT_SEQUENCE_NUMBER` shard iterator type and generates a shard iterator to start reading data records exactly from the position denoted by the specified sequence number.

```
aws kinesis get-shard-iterator \
    --stream-name samplestream \
    --shard-id shardId-000000000001 \
    --shard-iterator-type LATEST
```

Output:

```
{
    "ShardIterator": "AAAAAAAAAAFEvJjIYI+3jw/4aqgH9FifJ+n48XWTh/
IFIsbILP6o5eDueD39NXNBfpZ10WL5K6ADXk8w+5H+Qhd9cFA9k268CPXCz/kebq1TGYI7Vy
+1UkA9BuN3xvATxMBGxRY3zYK05gqgvaIRn94O8SqeEqwhigwZxNWxID3Ej7YYYcxQi8Q/fIrCjGAy/
n2r5Z9G864YpWDfN9upNNQAR/iiOWKs"
}
```

For more information, see Developing Consumers Using the Kinesis Data Streams API with the AWS SDK for Java in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see GetShardIterator in *AWS CLI Command Reference*.

`increase-stream-retention-period`

The following code example shows how to use `increase-stream-retention-period`.

AWS CLI

To increase data stream retention period

The following `increase-stream-retention-period` example increases the retention period (the length of time data records are accessible after they are added to the stream) of the specified stream to 168 hours.

```
aws kinesis increase-stream-retention-period \
    --stream-name samplestream \
```

```
    --retention-period-hours 168
```

This command produces no output.

For more information, see [Changing the Data Retention Period]() in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [IncreaseStreamRetentionPeriod]() in *AWS CLI Command Reference*.

`list-shards`

The following code example shows how to use `list-shards`.

AWS CLI

To list shards in a data stream

The following `list-shards` example lists all shards in the specified stream starting with the shard whose ID immediately follows the specified `exclusive-start-shard-id` of `shardId-000000000000`.

```
aws kinesis list-shards \
    --stream-name samplestream \
    --exclusive-start-shard-id shardId-000000000000
```

Output:

```
{
    "Shards": [
        {
            "ShardId": "shardId-000000000001",
            "HashKeyRange": {
                "StartingHashKey": "113427455640312821154458202477256070485",
                "EndingHashKey": "226854911280625642308916404954512140969"
            },
            "SequenceNumberRange": {
                "StartingSequenceNumber":
 "49600871682979337187563555549332609155523708941634633746"
            }
        },
        {
```

```
            "ShardId": "shardId-000000000002",
            "HashKeyRange": {
                "StartingHashKey": "226854911280625642308916404954512140970",
                "EndingHashKey": "340282366920938463463374607431768211455"
            },
            "SequenceNumberRange": {
                "StartingSequenceNumber":
 "49600871683001637932762086172474144873796357303140614178"
            }
        }
    ]
}
```

For more information, see [Listing Shards](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [ListShards](#) in *AWS CLI Command Reference*.

`list-streams`

The following code example shows how to use `list-streams`.

AWS CLI

To list data streams

The following `list-streams` example lists all active data streams in the current account and region.

```
aws kinesis list-streams
```

Output:

```
{
    "StreamNames": [
        "samplestream",
        "samplestream1"
    ]
}
```

For more information, see [Listing Streams](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [ListStreams](#) in *AWS CLI Command Reference*.

`list-tags-for-stream`

The following code example shows how to use `list-tags-for-stream`.

AWS CLI

To list tags for a data stream

The following `list-tags-for-stream` example lists the tags attached to the specified data stream.

```
aws kinesis list-tags-for-stream \
    --stream-name samplestream
```

Output:

```
{
    "Tags": [
        {
            "Key": "samplekey",
            "Value": "example"
        }
    ],
    "HasMoreTags": false
}
```

For more information, see Tagging Your Streams in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see ListTagsForStream in *AWS CLI Command Reference*.

`merge-shards`

The following code example shows how to use `merge-shards`.

AWS CLI

To merge shards

The following `merge-shards` example merges two adjacent shards with IDs of shardId-000000000000 and shardId-000000000001 in the specified data stream and combines them into a single shard.

```
aws kinesis merge-shards \
    --stream-name samplestream \
    --shard-to-merge shardId-000000000000 \
    --adjacent-shard-to-merge shardId-000000000001
```

This command produces no output.

For more information, see Merging Two Shards in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see MergeShards in *AWS CLI Command Reference*.

`put-record`

The following code example shows how to use `put-record`.

AWS CLI

To write a record into a data stream

The following `put-record` example writes a single data record into the specified data stream using the specified partition key.

```
aws kinesis put-record \
    --stream-name samplestream \
    --data sampledatarecord \
    --partition-key samplepartitionkey
```

Output:

```
{
    "ShardId": "shardId-000000000009",
    "SequenceNumber": "49600902273357540915989931256901506243878407835297513618",
    "EncryptionType": "KMS"
}
```

For more information, see Developing Producers Using the Amazon Kinesis Data Streams API with the AWS SDK for Java in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see PutRecord in *AWS CLI Command Reference*.

`put-records`

The following code example shows how to use `put-records`.

AWS CLI

To write multiple records into a data stream

The following `put-records` example writes a data record using the specified partition key and another data record using a different partition key in a single call.

```
aws kinesis put-records \
    --stream-name samplestream \
    --
records Data=blob1,PartitionKey=partitionkey1 Data=blob2,PartitionKey=partitionkey2
```

Output:

```
{
    "FailedRecordCount": 0,
    "Records": [
        {
            "SequenceNumber":
 "49600883331171471519674795588238531498465399900093808706",
            "ShardId": "shardId-000000000004"
        },
        {
            "SequenceNumber":
 "49600902273357540915989931256902715169698037101720764562",
            "ShardId": "shardId-000000000009"
        }
    ],
    "EncryptionType": "KMS"
}
```

For more information, see Developing Producers Using the Amazon Kinesis Data Streams API with the AWS SDK for Java in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see PutRecords in *AWS CLI Command Reference*.

`register-stream-consumer`

The following code example shows how to use `register-stream-consumer`.

AWS CLI

To register a data stream consumer

The following `register-stream-consumer` example registers a consumer called `KinesisConsumerApplication` with the specified data stream.

```
aws kinesis register-stream-consumer \
    --stream-arn arn:aws:kinesis:us-west-2:012345678912:stream/samplestream \
    --consumer-name KinesisConsumerApplication
```

Output:

```
{
    "Consumer": {
        "ConsumerName": "KinesisConsumerApplication",
        "ConsumerARN": "arn:aws:kinesis:us-west-2: 123456789012:stream/samplestream/
consumer/KinesisConsumerApplication:1572383852",
        "ConsumerStatus": "CREATING",
        "ConsumerCreationTimestamp": 1572383852.0
    }
}
```

For more information, see Developing Consumers with Enhanced Fan-Out Using the Kinesis Data Streams API in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see RegisterStreamConsumer in *AWS CLI Command Reference*.

`remove-tags-from-stream`

The following code example shows how to use `remove-tags-from-stream`.

AWS CLI

To remove tags from a data stream

The following `remove-tags-from-stream` example removes the tag with the specified key from the specified data stream.

```
aws kinesis remove-tags-from-stream \
    --stream-name samplestream \
    --tag-keys samplekey
```

This command produces no output.

For more information, see Tagging Your Streams in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see RemoveTagsFromStream in *AWS CLI Command Reference*.

`split-shard`

The following code example shows how to use `split-shard`.

AWS CLI

To split shards

The following `split-shard` example splits the specified shard into two new shards using a new starting hash key of 10.

```
aws kinesis split-shard \
    --stream-name samplestream \
    --shard-to-split shardId-000000000000 \
    --new-starting-hash-key 10
```

This command produces no output.

For more information, see Splitting a Shard in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see SplitShard in *AWS CLI Command Reference*.

`start-stream-encryption`

The following code example shows how to use `start-stream-encryption`.

AWS CLI

To enable data stream encryption

The following `start-stream-encryption` example enables server-side encryption for the specified stream, using the specified AWS KMS key.

```
aws kinesis start-stream-encryption \
    --encryption-type KMS \
```

```
    --key-id arn:aws:kms:us-west-2:012345678912:key/a3c4a7cd-728b-45dd-
b334-4d3eb496e452 \
    --stream-name samplestream
```

This command produces no output.

For more information, see [Data Protection in Amazon Kinesis Data Streams](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [StartStreamEncryption](#) in *AWS CLI Command Reference*.

`stop-stream-encryption`

The following code example shows how to use `stop-stream-encryption`.

AWS CLI

To disable data stream encryption

The following `stop-stream-encryption` example disables server-side encryption for the specified stream, using the specified AWS KMS key.

```
aws kinesis start-stream-encryption \
    --encryption-type KMS \
    --key-id arn:aws:kms:us-west-2:012345678912:key/a3c4a7cd-728b-45dd-
b334-4d3eb496e452 \
    --stream-name samplestream
```

This command produces no output.

For more information, see [Data Protection in Amazon Kinesis Data Streams](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [StopStreamEncryption](#) in *AWS CLI Command Reference*.

`update-shard-count`

The following code example shows how to use `update-shard-count`.

AWS CLI

To update the shard count in a data stream

The following `update-shard-count` example updates the shard count of the specified data stream to 6. This example uses uniform scaling, which creates shards of equal size.

```
aws kinesis update-shard-count \
    --stream-name samplestream \
    --scaling-type UNIFORM_SCALING \
    --target-shard-count 6
```

Output:

```
{
    "StreamName": "samplestream",
    "CurrentShardCount": 3,
    "TargetShardCount": 6
}
```

For more information, see Resharding a Stream in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see UpdateShardCount in *AWS CLI Command Reference*.

AWS KMS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS KMS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`cancel-key-deletion`

The following code example shows how to use `cancel-key-deletion`.

AWS CLI

To cancel the scheduled deletion of a customer managed KMS key

The following `cancel-key-deletion` example cancels the scheduled deletion of a customer managed KMS key.

```
aws kms cancel-key-deletion \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
    "KeyId": "arn:aws:kms:us-
west-2:123456789012:key/1234abcd-12ab-34cd-56ef-1234567890ab"
}
```

When the `cancel-key-deletion` command succeeds, the scheduled deletion is canceled. However, the key state of the KMS key is `Disabled`, so you can't use the KMS key in cryptographic operations. To restore its functionality, use the `enable-key` command .

For more information, see Scheduling and canceling key deletion in the *AWS Key Management Service Developer Guide*.

- For API details, see CancelKeyDeletion in *AWS CLI Command Reference*.

`connect-custom-key-store`

The following code example shows how to use `connect-custom-key-store`.

AWS CLI

To connect a custom key store

The following `connect-custom-key-store` example reconnects the specified custom key store. You can use a command like this one to connect a custom key store for the first time or to reconnect a key store that was disconnected.

You can use this command to connect an AWS CloudHSM key store or an external key store.

```
aws kms connect-custom-key-store \
```

```
    --custom-key-store-id cks-1234567890abcdef0
```

This command does not return any output. To verify that the command was effective, use the `describe-custom-key-stores` command.

For information about connecting an AWS CloudHSM key store, see Connecting and disconnecting an AWS CloudHSM key store in the *AWS Key Management Service Developer Guide*.

For information about connecting an external key store, see Connecting and disconnecting an external key store in the *AWS Key Management Service Developer Guide*.

- For API details, see ConnectCustomKeyStore in *AWS CLI Command Reference*.

`create-alias`

The following code example shows how to use `create-alias`.

AWS CLI

To create an alias for a KMS key

The following `create-alias` command creates an alias named `example-alias` for the KMS key identified by key ID `1234abcd-12ab-34cd-56ef-1234567890ab`.

Alias names must begin with `alias/`. Do not use alias names that begin with `alias/aws`; these are reserved for use by AWS.

```
aws kms create-alias \
    --alias-name alias/example-alias \
    --target-key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

This command doesn't return any output. To see the new alias, use the `list-aliases` command.

For more information, see Using aliases in the *AWS Key Management Service Developer Guide*.

- For API details, see CreateAlias in *AWS CLI Command Reference*.

`create-custom-key-store`

The following code example shows how to use `create-custom-key-store`.

AWS CLI

Example 1: To create an AWS CloudHSM key store

The following `create-custom-key-store` example creates an AWS CloudHSM key store backed by an AWS CloudHSM cluster using the required parameters. You can also add the `custom-key-store-type``parameter with the default value: ``AWS_CLOUDHSM`.

To specify the file input for the `trust-anchor-certificate` command in the AWS CLI, the `file://` prefix is required.

```
aws kms create-custom-key-store \
    --custom-key-store-name ExampleCloudHSMKeyStore \
    --cloud-hsm-cluster-id cluster-1a23b4cdefg \
    --key-store-password kmsPswd \
    --trust-anchor-certificate file://customerCA.crt
```

Output:

```
{
    "CustomKeyStoreId": cks-1234567890abcdef0
}
```

For more information, see Creating an AWS CloudHSM key store in the *AWS Key Management Service Developer Guide*.

Example 2: To create an external key store with public endpoint connectivity

The following `create-custom-key-store` example creates an external key store (XKS) that communicates with AWS KMS over the internet.

In this example, the `XksProxyUriPath` uses an optional prefix of `example-prefix`.

NOTE: If you use AWS CLI version 1.0, run the following command before specifying a parameter with an HTTP or HTTPS value, such as the XksProxyUriEndpoint parameter.

```
aws configure set cli_follow_urlparam false
```

Otherwise, AWS CLI version 1.0 replaces the parameter value with the content found at that URI address.

```
aws kms create-custom-key-store \
    --custom-key-store-name ExamplePublicEndpointXKS \
    --custom-key-store-type EXTERNAL_KEY_STORE \
    --xks-proxy-connectivity PUBLIC_ENDPOINT \
    --xks-proxy-uri-endpoint "https://myproxy.xks.example.com" \
    --xks-proxy-uri-path "/example-prefix/kms/xks/v1" \
    --xks-proxy-authentication-credential "AccessKeyId=ABCDE12345670EXAMPLE,
 RawSecretAccessKey=DXjSUawnel2fr6SKC7G25CNxTyWKE5PF9XX6H/u9pSo="
```

Output:

```
{
    "CustomKeyStoreId": cks-2234567890abcdef0
}
```

For more information, see Creating an external key store in the *AWS Key Management Service Developer Guide*.

Example 3: To create an external key store with VPC endpoint service connectivity

The following `create-custom-key-store` example creates an external key store (XKS) that uses an Amazon VPC endpoint service to communicate with AWS KMS.

NOTE: If you use AWS CLI version 1.0, run the following command before specifying a parameter with an HTTP or HTTPS value, such as the XksProxyUriEndpoint parameter.

```
aws configure set cli_follow_urlparam false
```

Otherwise, AWS CLI version 1.0 replaces the parameter value with the content found at that URI address.

```
aws kms create-custom-key-store \
    --custom-key-store-name ExampleVPCEndpointXKS \
    --custom-key-store-type EXTERNAL_KEY_STORE \
    --xks-proxy-connectivity VPC_ENDPOINT_SERVICE \
    --xks-proxy-uri-endpoint "https://myproxy-private.xks.example.com" \
    --xks-proxy-uri-path "/kms/xks/v1" \
    --xks-proxy-vpc-endpoint-service-name "com.amazonaws.vpce.us-east-1.vpce-svc-
example1" \
    --xks-proxy-authentication-credential "AccessKeyId=ABCDE12345670EXAMPLE,
 RawSecretAccessKey=DXjSUawnel2fr6SKC7G25CNxTyWKE5PF9XX6H/u9pSo="
```

Output:

```
{
    "CustomKeyStoreId": cks-3234567890abcdef0
}
```

For more information, see Creating an external key store in the *AWS Key Management Service Developer Guide*.

- For API details, see CreateCustomKeyStore in *AWS CLI Command Reference*.

`create-grant`

The following code example shows how to use `create-grant`.

AWS CLI

To create a grant

The following `create-grant` example creates a grant that allows the `exampleUser` user to use the `decrypt` command on the `1234abcd-12ab-34cd-56ef-1234567890ab` example KMS key. The retiring principal is the `adminRole` role. The grant uses the `EncryptionContextSubset` grant constraint to allow this permission only when the encryption context in the `decrypt` request includes the `"Department": "IT"` key-value pair.

```
aws kms create-grant \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --grantee-principal arn:aws:iam::123456789012:user/exampleUser \
    --operations Decrypt \
    --constraints EncryptionContextSubset={Department=IT} \
    --retiring-principal arn:aws:iam::123456789012:role/adminRole
```

Output:

```
{
    "GrantId": "1a2b3c4d2f5e69f440bae30eaec9570bb1fb7358824f9ddfa1aa5a0dab1a59b2",
    "GrantToken": "<grant token here>"
}
```

To view detailed information about the grant, use the `list-grants` command.

For more information, see Grants in AWS KMS in the *AWS Key Management Service Developer Guide*.

- For API details, see CreateGrant in *AWS CLI Command Reference*.

`create-key`

The following code example shows how to use `create-key`.

AWS CLI

Example 1: To create a customer managed KMS key in AWS KMS

The following `create-key` example creates a symmetric encryption KMS key.

To create the basic KMS key, a symmetric encryption key, you do not need to specify any parameters. The default values for those parameters create a symmetric encryption key.

Because this command doesn't specify a key policy, the KMS key gets the default key policy for programmatically created KMS keys. To view the key policy, use the `get-key-policy` command. To change the key policy, use the `put-key-policy` command.

```
aws kms create-key
```

The `create-key` command returns the key metadata, including the key ID and ARN of the new KMS key. You can use these values to identify the KMS key in other AWS KMS operations. The output does not include the tags. To view the tags for a KMS key, use the `list-resource-tags command`.

Output:

```
{
    "KeyMetadata": {
        "AWSAccountId": "111122223333",
        "Arn": "arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
        "CreationDate": "2017-07-05T14:04:55-07:00",
        "CurrentKeyMaterialId":
 "0b7fd7ddbac6eef27907413567cad8c810e2883dc8a7534067a82ee1142fc1e6",
        "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
        "Description": "",
```

```
        "Enabled": true,
        "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
        "KeyManager": "CUSTOMER",
        "KeySpec": "SYMMETRIC_DEFAULT",
        "KeyState": "Enabled",
        "KeyUsage": "ENCRYPT_DECRYPT",
        "MultiRegion": false,
        "Origin": "AWS_KMS"
        "EncryptionAlgorithms": [
            "SYMMETRIC_DEFAULT"
        ]
    }
}
```

Note: The `create-key` command does not let you specify an alias, To create an alias for the new KMS key, use the `create-alias` command.

For more information, see Creating keys in the *AWS Key Management Service Developer Guide*.

Example 2: To create an asymmetric RSA KMS key for encryption and decryption

The following `create-key` example creates a KMS key that contains an asymmetric RSA key pair for encryption and decryption. The key spec and key usage can't be changed after the key is created.:

```
aws kms create-key \
   --key-spec RSA_4096 \
   --key-usage ENCRYPT_DECRYPT
```

Output:

```
{
    "KeyMetadata": {
        "Arn": "arn:aws:kms:us-
east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
        "AWSAccountId": "111122223333",
        "CreationDate": "2021-04-05T14:04:55-07:00",
        "CustomerMasterKeySpec": "RSA_4096",
        "Description": "",
        "Enabled": true,
        "EncryptionAlgorithms": [
            "RSAES_OAEP_SHA_1",
```

```
            "RSAES_OAEP_SHA_256"
        ],
        "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
        "KeyManager": "CUSTOMER",
        "KeySpec": "RSA_4096",
        "KeyState": "Enabled",
        "KeyUsage": "ENCRYPT_DECRYPT",
        "MultiRegion": false,
        "Origin": "AWS_KMS"
    }
}
```

For more information, see [Asymmetric keys in AWS KMS](#) in the *AWS Key Management Service Developer Guide*.

Example 3: To create an asymmetric elliptic curve KMS key for signing and verification

To create an asymmetric KMS key that contains an asymmetric elliptic curve (ECC) key pair for signing and verification. The `--key-usage` parameter is required even though `SIGN_VERIFY` is the only valid value for ECC KMS keys. The key spec and key usage can't be changed after the key is created.:

```
aws kms create-key \
    --key-spec ECC_NIST_P521 \
    --key-usage SIGN_VERIFY
```

Output:

```
{
    "KeyMetadata": {
        "Arn": "arn:aws:kms:us-
east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
        "AWSAccountId": "111122223333",
        "CreationDate": "2019-12-02T07:48:55-07:00",
        "CustomerMasterKeySpec": "ECC_NIST_P521",
        "Description": "",
        "Enabled": true,
        "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
        "KeyManager": "CUSTOMER",
        "KeySpec": "ECC_NIST_P521",
        "KeyState": "Enabled",
        "KeyUsage": "SIGN_VERIFY",
```

```
        "MultiRegion": false,
        "Origin": "AWS_KMS",
        "SigningAlgorithms": [
            "ECDSA_SHA_512"
        ]
    }
}
```
