    }
}
```

Example 2: To set the default UI customization for all app clients

The following `set-ui-customization` example configures the requested user pool for all app clients that don't have a client-specific configuration. The command applies some custom CSS and with the Amazon Cognito logo as the application logo.

```
aws cognito-idp set-ui-customization \
--user-pool-id us-west-2_ywDJHlIfU \
--client-id ALL \
--css ".logo-customizable {\n\tmax-width: 60%;\n\tmax-height: 30%;\n}\n.banner-
customizable {\n\tpadding: 25px 0px 25px 0px;\n\tbackground-color: lightgray;
\n}\n.label-customizable {\n\tfont-weight: 400;\n}\n.textDescription-customizable
 {\n\tpadding-top: 10px;\n\tpadding-bottom: 10px;\n\tdisplay: block;\n\tfont-
size: 16px;\n}\n.idpDescription-customizable {\n\tpadding-top: 10px;\n\tpadding-
bottom: 10px;\n\tdisplay: block;\n\tfont-size: 16px;\n}\n.legalText-customizable
 {\n\tcolor: #747474;\n\tfont-size: 11px;\n}\n.submitButton-customizable {\n\tfont-
size: 11px;\n\tfont-weight: normal;\n\tmargin: 20px -15px 10px -13px;\n\theight:
 40px;\n\twidth: 108%;\n\tcolor: #fff;\n\tbackground-color: #337ab7;\n\ttext-align:
 center;\n}\n.submitButton-customizable:hover {\n\tcolor: #fff;\n\tbackground-color:
 #286090;\n}\n.errorMessage-customizable {\n\tpadding: 5px;\n\tfont-size: 14px;
\n\twidth: 100%;\n\tbackground: #F5F5F5;\n\tborder: 2px solid #D64958;\n\tcolor:
 #D64958;\n}\n.inputField-customizable {\n\twidth: 100%;\n\theight: 34px;\n\tcolor:

```

For more information, see [Hosted UI (classic) branding] in the *Amazon Cognito Developer Guide*.

- For API details, see [SetUiCustomization] in *AWS CLI Command Reference*.

`set-user-mfa-preference`

The following code example shows how to use `set-user-mfa-preference`.

AWS CLI

To set a user's MFA preference

The following `set-user-mfa-preference` example configures the current user to use TOTP MFA and disables all other MFA factors.

```
aws cognito-idp set-user-mfa-preference \
    --access-token eyJra456defEXAMPLE \
    --software-token-mfa-settings Enabled=true,PreferredMfa=true \
    --sms-mfa-settings Enabled=false,PreferredMfa=false \
    --email-mfa-settings Enabled=false,PreferredMfa=false
```

This command produces no output.

For more information, see [Adding MFA] in the *Amazon Cognito Developer Guide*.

- For API details, see [SetUserMfaPreference] in *AWS CLI Command Reference*.

`set-user-pool-mfa-config`

The following code example shows how to use `set-user-pool-mfa-config`.

AWS CLI

To configure user pool MFA and WebAuthn

The following `set-user-pool-mfa-config` example configures the requested user pool with optional MFA with all available MFA methods, and sets the WebAuthn configuration.

```
aws cognito-idp set-user-pool-mfa-config \
    --user-pool-id us-west-2_EXAMPLE \
    --sms-mfa-configuration "SmsAuthenticationMessage=\"Your OTP for MFA or sign-
in: use {####}.\",SmsConfiguration={SnsCallerArn=arn:aws:iam::123456789012:role/
service-role/test-SMS-Role,ExternalId=a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111,SnsRegion=us-west-2}" \
    --software-token-mfa-configuration Enabled=true \
    --email-mfa-configuration "Message=\"Your OTP for MFA or sign-in: use
 {####}\",Subject=\"OTP test\"" \
    --mfa-configuration OPTIONAL \
    --web-authn-
configuration RelyingPartyId=auth.example.com,UserVerification=preferred
```

Output:

```
{
    "EmailMfaConfiguration": {
        "Message": "Your OTP for MFA or sign-in: use {####}",
        "Subject": "OTP test"
    },
    "MfaConfiguration": "OPTIONAL",
    "SmsMfaConfiguration": {
        "SmsAuthenticationMessage": "Your OTP for MFA or sign-in: use {####}.",
        "SmsConfiguration": {
            "ExternalId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "SnsCallerArn": "arn:aws:iam::123456789012:role/service-role/test-SMS-
Role",
            "SnsRegion": "us-west-2"
        }
    },
    "SoftwareTokenMfaConfiguration": {
        "Enabled": true
    },
    "WebAuthnConfiguration": {
        "RelyingPartyId": "auth.example.com",
        "UserVerification": "preferred"
    }
}
```

For more information, see Adding MFA and Passkey sign-in in the *Amazon Cognito Developer Guide*.

- For API details, see SetUserPoolMfaConfig in *AWS CLI Command Reference*.

`set-user-settings`

The following code example shows how to use `set-user-settings`.

AWS CLI

To set user settings

This example sets the MFA delivery preference to EMAIL.

Command:

```
aws cognito-idp set-user-settings --access-token ACCESS_TOKEN --mfa-
options DeliveryMedium=EMAIL
```

- For API details, see SetUserSettings in *AWS CLI Command Reference*.

`sign-up`

The following code example shows how to use `sign-up`.

AWS CLI

To sign up a user

This example signs up jane@example.com.

Command:

```
aws cognito-idp sign-up --client-id 3n4b5urk1ft4fl3mg5e62d9ado --
username jane@example.com --password PASSWORD --user-attributes
 Name="email",Value="jane@example.com" Name="name",Value="Jane"
```

Output:

```
{
  "UserConfirmed": false,
```

```
    "UserSub": "e04d60a6-45dc-441c-a40b-e25a787d4862"
}
```

- For API details, see SignUp in *AWS CLI Command Reference*.

`start-user-import-job`

The following code example shows how to use `start-user-import-job`.

AWS CLI

To start an import job

The following `start-user-import-job` example starts the requested import job in the requested user pool.

```
aws cognito-idp start-user-import-job \
    --user-pool-id us-west-2_EXAMPLE \
    --job-id import-mAgUtd8PMm
```

Output:

```
{
    "UserImportJob": {
        "CloudWatchLogsRoleArn": "arn:aws:iam::123456789012:role/example-cloudwatch-
logs-role",
        "CreationDate": 1736442975.904,
        "FailedUsers": 0,
        "ImportedUsers": 0,
        "JobId": "import-mAgUtd8PMm",
        "JobName": "Customer import",
        "PreSignedUrl": "https://aws-cognito-idp-user-import-pdx.s3.us-

    }
}
```

For more information, see Importing users into a user pool in the *Amazon Cognito Developer Guide*.

- For API details, see StartUserImportJob in *AWS CLI Command Reference*.

`start-web-authn-registration`

The following code example shows how to use `start-web-authn-registration`.

AWS CLI

To get passkey registration information for a signed-in user

The following `start-web-authn-registration` example generates WebAuthn registration options for the current user.

```
aws cognito-idp start-web-authn-registration \
    --access-token eyJra456defEXAMPLE
```

Output:

```
{
    "CredentialCreationOptions": {
        "authenticatorSelection": {
            "requireResidentKey": true,
            "residentKey": "required",
            "userVerification": "preferred"
        },
        "challenge": "wxvbDicyqQqvF2EXAMPLE",
        "excludeCredentials": [
            {

                "type": "public-key"
            }
        ],
        "pubKeyCredParams": [
            {
                "alg": -7,
                "type": "public-key"
            },
            {
                "alg": -257,
```

```
                "type": "public-key"
            }
        ],
        "rp": {
            "id": "auth.example.com",
            "name": "auth.example.com"
        },
        "timeout": 60000,
        "user": {
            "displayName": "testuser",
            "id": "ZWFhZDAyMTktMjExNy00MzlmLThkNDYtNGRiMjBlNEXAMPLE",
            "name": "testuser"
        }
    }
}
```

For more information, see [Passkey sign-in](#) in the *Amazon Cognito Developer Guide*.

- For API details, see [StartWebAuthnRegistration](#) in *AWS CLI Command Reference*.

`stop-user-import-job`

The following code example shows how to use `stop-user-import-job`.

AWS CLI

To stop an import job

The following `stop-user-import-job` example stops the requested running user import job in the requested user pool.

```
aws cognito-idp stop-user-import-job \
    --user-pool-id us-west-2_EXAMPLE \
    --job-id import-mAgUtd8PMm
```

Output:

```
{
    "UserImportJob": {
        "CloudWatchLogsRoleArn": "arn:aws:iam::123456789012:role/example-cloudwatch-
logs-role",
        "CompletionDate": 1736443496.379,
        "CompletionMessage": "The Import Job was stopped by the developer.",
```

```
        "CreationDate": 1736443471.781,
        "FailedUsers": 0,
        "ImportedUsers": 0,
        "JobId": "import-mAgUtd8PMm",
        "JobName": "Customer import",
        "PreSignedUrl": "https://aws-cognito-idp-user-import-pdx.s3.us-
west-2.amazonaws.com/123456789012/us-west-2_EXAMPLE/import-mAgUtd8PMm?
X-Amz-Security-Token=[token]&X-Amz-Algorithm=AWS4-HMAC-SHA256&X-Amz-
Date=20241226T193341Z&X-Amz-SignedHeaders=host%3Bx-amz-server-side-encryption&X-Amz-
Expires=899&X-Amz-Credential=[credential]&X-Amz-Signature=[signature]",
        "SkippedUsers": 0,
        "StartDate": 1736443494.154,
        "Status": "Stopped",
        "UserPoolId": "us-west-2_EXAMPLE"
    }
}
```

For more information, see Importing users into a user pool in the *Amazon Cognito Developer Guide*.

- For API details, see StopUserImportJob in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a user pool

The following `tag-resource` example applies `administrator` and `department` tags to the requested user pool.

```
aws cognito-idp tag-resource \
    --resource-arn arn:aws:cognito-idp:us-west-2:123456789012:userpool/us-
west-2_EXAMPLE \
    --tags administrator=Jie,tenant=ExampleCorp
```

This command produces no output.

For more information, see Tagging Amazon Cognito resources in the *Amazon Cognito Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a user pool

The following `untag-resource` example removes `administrator` and `department` tags from the requested user pool.

```
aws cognito-idp untag-resource \
    --resource-arn arn:aws:cognito-idp:us-west-2:767671399759:userpool/us-
west-2_l5cxwdm2K \
    --tag-keys administrator tenant
```

This command produces no output.

For more information, see Tagging Amazon Cognito resources in the *Amazon Cognito Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-auth-event-feedback`

The following code example shows how to use `update-auth-event-feedback`.

AWS CLI

To update auth event feedback

This example updates authorization event feedback. It marks the event "Valid".

Command:

```
aws cognito-idp update-auth-event-feedback --user-pool-id us-west-2_aaaaaaaaa --
username diego@example.com --event-id EVENT_ID --feedback-token FEEDBACK_TOKEN --
feedback-value "Valid"
```

- For API details, see UpdateAuthEventFeedback in *AWS CLI Command Reference*.

`update-device-status`

The following code example shows how to use `update-device-status`.

AWS CLI

To update device status

This example updates the status for a device to "not_remembered".

Command:

```
aws cognito-idp update-device-status --access-token ACCESS_TOKEN --device-key DEVICE_KEY --device-remembered-status "not_remembered"
```

- For API details, see UpdateDeviceStatus in *AWS CLI Command Reference*.

`update-group`

The following code example shows how to use `update-group`.

AWS CLI

To update a group

This example updates the description and precedence for MyGroup.

Command:

```
aws cognito-idp update-group --user-pool-id us-west-2_aaaaaaaaa --group-name MyGroup
 --description "New description" --precedence 2
```

Output:

`update-identity-provider`

The following code example shows how to use `update-identity-provider`.

AWS CLI

To update a user pool identity provider

The following `update-identity-provider` example updates the OIDC provider "MyOIDCIdP" in the requested user pool.

```
aws cognito-idp update-identity-provider \
    --cli-input-json file://update-identity-provider.json
```

update-managed-login-branding

The following code example shows how to use `update-managed-login-branding`.

AWS CLI

To update a managed login branding style

The following `update-managed-login-branding` example updates the requested app client branding style.

```
aws cognito-idp update-managed-login-branding \
    --cli-input-json file://update-managed-login-branding.json
```

                        }
                    }
                }
            }
        },
        "UseCognitoProvidedValues": false,
        "UserPoolId": "ca-central-1_EXAMPLE"
    }
}
```

For more information, see Apply branding to managed login pages in the *Amazon Cognito Developer Guide*.

- For API details, see UpdateManagedLoginBranding in *AWS CLI Command Reference*.

`update-resource-server`

The following code example shows how to use `update-resource-server`.

AWS CLI

To update a resource server

This example updates the the resource server Weather. It adds a new scope.

Command:

```
aws cognito-idp update-resource-server --user-pool-id us-west-2_aaaaaaaaa
 --identifier weather.example.com --name Weather --scopes
 ScopeName=NewScope,ScopeDescription="New scope description"
```

Output:

```
{
  "ResourceServer": {
      "UserPoolId": "us-west-2_aaaaaaaaa",
      "Identifier": "weather.example.com",
      "Name": "Happy",
      "Scopes": [
          {
              "ScopeName": "NewScope",
              "ScopeDescription": "New scope description"
          }
      ]
  }
}
```

- For API details, see UpdateResourceServer in *AWS CLI Command Reference*.

`update-user-attributes`

The following code example shows how to use `update-user-attributes`.

AWS CLI

To update user attributes

This example updates the user attribute "nickname".

Command:

```
aws cognito-idp update-user-attributes --access-token ACCESS_TOKEN --user-attributes
 Name="nickname",Value="Dan"
```

- For API details, see UpdateUserAttributes in *AWS CLI Command Reference*.

`update-user-pool-client`

The following code example shows how to use `update-user-pool-client`.

AWS CLI

To update an app client

The following `update-user-pool-client` example updates the configuration of the requested app client.

```
aws cognito-idp update-user-pool-client \
    --user-pool-id us-west-2_EXAMPLE \
    --client-id 1example23456789 \
    --client-name my-test-app \
    --refresh-token-validity 30 \
    --access-token-validity 60 \
    --id-token-validity 60 \
    --token-validity-units AccessToken=minutes,IdToken=minutes,RefreshToken=days \
    --read-
attributes "address" "birthdate" "email" "email_verified" "family_name" "gender" "locale" "m
 \
    --write-
attributes "address" "birthdate" "email" "family_name" "gender" "locale" "middle_name" "name
 \
    --explicit-auth-
flows "ALLOW_ADMIN_USER_PASSWORD_AUTH" "ALLOW_CUSTOM_AUTH" "ALLOW_REFRESH_TOKEN_AUTH" "ALLOW
 \
    --supported-identity-providers "MySAML" "COGNITO" "Google" \
    --callback-urls "https://www.example.com" "https://app2.example.com" \
    --logout-urls "https://auth.example.com/login?
client_id=1example23456789&response_type=code&redirect_uri=https%3A%2F
%2Fwww.example.com" "https://example.com/logout" \
```

```
    --default-redirect-uri "https://www.example.com" \
    --allowed-o-auth-flows "code" "implicit" \
    --allowed-o-auth-scopes "openid" "profile" "aws.cognito.signin.user.admin" \
    --allowed-o-auth-flows-user-pool-client \
    --prevent-user-existence-errors ENABLED \
    --enable-token-revocation \
    --no-enable-propagate-additional-user-context-data \
    --auth-session-validity 3
```

Output:

```
{
    "UserPoolClient": {
        "UserPoolId": "us-west-2_EXAMPLE",

            ],
            "AllowedOAuthFlowsUserPoolClient": true,
            "PreventUserExistenceErrors": "ENABLED",
            "EnableTokenRevocation": true,
            "EnablePropagateAdditionalUserContextData": false,
            "AuthSessionValidity": 3
        }
}
```

For more information, see Application-specific settings with app clients in the *Amazon Cognito Developer Guide*.

- For API details, see UpdateUserPoolClient in *AWS CLI Command Reference*.

`update-user-pool-domain`

The following code example shows how to use `update-user-pool-domain`.

AWS CLI

To update a custom domain

The following `update-user-pool-domain` example configures the branding version and certificate for the custom domain the requested user pool.

```
aws cognito-idp update-user-pool-domain \
    --user-pool-id ca-central-1_EXAMPLE \
    --domain auth.example.com \
    --managed-login-version 2 \
    --custom-domain-config CertificateArn=arn:aws:acm:us-
east-1:123456789012:certificate/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
```

```
    "CloudFrontDomain": "example.cloudfront.net",
    "ManagedLoginVersion": 2
}
```

For more information, see Managed login and Configuring a domain in the *Amazon Cognito Developer Guide*.

- For API details, see UpdateUserPoolDomain in *AWS CLI Command Reference*.

`update-user-pool`

The following code example shows how to use `update-user-pool`.

AWS CLI

To update a user pool

The following `update-user-pool` example modifies a user pool with example syntax for each of the available configuration options. To update a user pool, you must specify all previously-configured options or they will reset to a default value.

```
aws cognito-idp update-user-pool --user-pool-id us-west-2_EXAMPLE \
    --policies PasswordPolicy=
\{MinimumLength=6,RequireUppercase=true,RequireLowercase=true,RequireNumbers=true,RequireSym
 \
    --deletion-protection ACTIVE \
    --lambda-config PreSignUp="arn:aws:lambda:us-
west-2:123456789012:function:cognito-test-presignup-
function",PreTokenGeneration="arn:aws:lambda:us-
west-2:123456789012:function:cognito-test-pretoken-function" \
    --auto-verified-attributes "phone_number" "email" \
    --verification-message-template \{\"SmsMessage\":\""Your code is
 {####}"\",\"EmailMessage\":\""Your code is {####}"\",\"EmailSubject\":\""Your
 verification code"\",\"EmailMessageByLink\":\""Click {##here##} to verify
 your email address."\",\"EmailSubjectByLink\":\""Your verification link"\",
\"DefaultEmailOption\":\"CONFIRM_WITH_LINK\"\} \
    --sms-authentication-message "Your code is {####}" \
    --user-attribute-update-settings
 AttributesRequireVerificationBeforeUpdate="email","phone_number" \
    --mfa-configuration "OPTIONAL" \
    --device-
configuration ChallengeRequiredOnNewDevice=true,DeviceOnlyRememberedOnUserPrompt=true
 \
```

```
    --email-configuration SourceArn="arn:aws:ses:us-
west-2:123456789012:identity/admin@example.com",ReplyToEmailAddress="amdin
+noreply@example.com",EmailSendingAccount=DEVELOPER,From="admin@amazon.com",ConfigurationSet
configuration-set" \
    --sms-configuration SnsCallerArn="arn:aws:iam::123456789012:role/service-role/
SNS-SMS-Role",ExternalId="12345",SnsRegion="us-west-2" \
    --admin-create-user-config AllowAdminCreateUserOnly=false,InviteMessageTemplate=
\{SMSMessage=\""Welcome {username}. Your confirmation code is
 {####}"\",EmailMessage=\""Welcome {username}. Your confirmation code is
 {####}"\",EmailSubject=\""Welcome to MyMobileGame"\"\} \
    --user-pool-tags "Function"="MyMobileGame","Developers"="Berlin" \
    --admin-create-user-config AllowAdminCreateUserOnly=false,InviteMessageTemplate=
\{SMSMessage=\""Welcome {username}. Your confirmation code is
 {####}"\",EmailMessage=\""Welcome {username}. Your confirmation code is
 {####}"\",EmailSubject=\""Welcome to MyMobileGame"\"\} \
    --user-pool-add-ons AdvancedSecurityMode="AUDIT" \
    --account-recovery-setting RecoveryMechanisms=
\[\{Priority=1,Name="verified_email"\},\{Priority=2,Name="verified_phone_number"\}\]
```

This command produces no output.

For more information, see Updating user pool configuration in the *Amazon Cognito Developer Guide*.

- For API details, see UpdateUserPool in *AWS CLI Command Reference*.

`verify-software-token`

The following code example shows how to use `verify-software-token`.

AWS CLI

To confirm registration of a TOTP authenticator

The following `verify-software-token` example completes TOTP registration for the current user.

```
aws cognito-idp verify-software-token \
    --access-token eyJra456defEXAMPLE \
    --user-code 123456
```

Output:

```
{
    "Status": "SUCCESS"
}
```

For more information, see Adding MFA to a user pool in the *Amazon Cognito Developer Guide*.

- For API details, see VerifySoftwareToken in *AWS CLI Command Reference*.

`verify-user-attribute`

The following code example shows how to use `verify-user-attribute`.

AWS CLI

To verify an attribute change

The following `verify-user-attribute` example verifies a change to the current user's email attribute.

```
aws cognito-idp verify-user-attribute \
    --access-token eyJra456defEXAMPLE \
    --attribute-name email \
    --code 123456
```

For more information, see Configuring email or phone verification in the *Amazon Cognito Developer Guide*.

- For API details, see VerifyUserAttribute in *AWS CLI Command Reference*.

Amazon Comprehend examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Comprehend.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Actions

batch-detect-dominant-language

The following code example shows how to use `batch-detect-dominant-language`.

AWS CLI

To detect the dominant language of multiple input texts

The following `batch-detect-dominant-language` example analyzes multiple input texts and returns the dominant language of each. The pre-trained models confidence score is also output for each prediction.

```
aws comprehend batch-detect-dominant-language \
    --text-list "Physics is the natural science that involves the study of matter

batch-detect-entities

The following code example shows how to use `batch-detect-entities`.

AWS CLI

To detect entities from multiple input texts

The following `batch-detect-entities` example analyzes multiple input texts and returns the named entities of each. The pre-trained model's confidence score is also output for each prediction.

```
aws comprehend batch-detect-entities \
    --language-code en \
    --text-list "Dear Jane, Your AnyCompany Financial Services LLC credit card
 account 1111-XXXX-1111-XXXX has a minimum payment of $24.53 that is due by July
 31st." "Please send customer feedback to Sunshine Spa, 123 Main St, Anywhere or to
 Alice at AnySpa@example.com."
```

Output:

```

`batch-detect-targeted-sentiment`

The following code example shows how to use `batch-detect-targeted-sentiment`.

AWS CLI

To detect the sentiment and each named entity for multiple input texts

The following `batch-detect-targeted-sentiment` example analyzes multiple input texts and returns the named entities along with the prevailing sentiment attached to each entity. The pre-trained model's confidence score is also output for each prediction.

```
aws comprehend batch-detect-targeted-sentiment \
    --language-code en \
    --text-list "That movie was really boring, the original was way more entertaining" "The trail is extra beautiful today." "My meal was just okay."
```

Output:

```

`classify-document`

The following code example shows how to use `classify-document`.

AWS CLI

To classify document with model-specific endpoint

The following `classify-document` example classifies a document with an endpoint of a custom model. The model in this example was trained on a dataset containing sms messages labeled as spam or non-spam, or, "ham".

```
aws comprehend classify-document \
    --endpoint-arn arn:aws:comprehend:us-west-2:111122223333:document-classifier-endpoint/example-classifier-endpoint \
    --text "CONGRATULATIONS! TXT 1235550100 to win $5000"
```

Output:

```
{
    "Classes": [
        {
            "Name": "spam",
            "Score": 0.9998599290847778
        },
        {
            "Name": "ham",
            "Score": 0.00014001205272506922
        }
    ]
}
```

For more information, see Custom Classification in the *Amazon Comprehend Developer Guide*.

- For API details, see ClassifyDocument in *AWS CLI Command Reference*.

`contains-pii-entities`

The following code example shows how to use `contains-pii-entities`.

AWS CLI

To analyze the input text for the presence of PII information

The following `contains-pii-entities` example analyzes the input text for the presence of personally identifiable information (PII) and returns the labels of identified PII entity types such as name, address, bank account number, or phone number.

```
aws comprehend contains-pii-entities \
    --language-code en \
    --text "Hello Zhang Wei, I am John. Your AnyCompany Financial Services, LLC 
 credit card
        account 1111-XXXX-1111-XXXX has a minimum payment of $24.53 that is due by
 July 31st. Based on your autopay settings,
        we will withdraw your payment on the due date from your bank account number
 XXXXXX1111 with the routing number XXXXX0000.
        Customer feedback for Sunshine Spa, 100 Main St, Anywhere. Send comments to
 Alice at AnySpa@example.com."
```

Output:

```
{
    "Labels": [
        {
            "Name": "NAME",
            "Score": 1.0
        },
        {

                "Score": 1.0
            }
}
```

For more information, see Personally Identifiable Information (PII) in the *Amazon Comprehend Developer Guide*.

- For API details, see ContainsPiiEntities in *AWS CLI Command Reference*.

`create-dataset`

The following code example shows how to use `create-dataset`.

AWS CLI

To create a flywheel dataset

The following `create-dataset` example creates a dataset for a flywheel. This dataset will be used as additional training data as specified by the `--dataset-type` tag.

```
aws comprehend create-dataset \
    --flywheel-arn arn:aws:comprehend:us-west-2:111122223333:flywheel/flywheel-
entity \
    --dataset-name example-dataset \
    --dataset-type "TRAIN" \
    --input-data-config file://inputConfig.json
```

Contents of `file://inputConfig.json`:

```
{
    "DataFormat": "COMPREHEND_CSV",
    "DocumentClassifierInputDataConfig": {
        "S3Uri": "s3://amzn-s3-demo-bucket/training-data.csv"
    }
}
```

Output:

```
{
    "DatasetArn": "arn:aws:comprehend:us-west-2:111122223333:flywheel/flywheel-
entity/dataset/example-dataset"
}
```

For more information, see Flywheel Overview in *Amazon Comprehend Developer Guide*.

- For API details, see CreateDataset in *AWS CLI Command Reference*.

`create-document-classifier`

The following code example shows how to use `create-document-classifier`.

AWS CLI

To create a document classifier to categorize documents

The following `create-document-classifier` example begins the training process for a document classifier model. The training data file, `training.csv`, is located at the `--input-data-config` tag. `training.csv` is a two column document where the labels, or, classifications are provided in the first column and the documents are provided in the second column.

```
aws comprehend create-document-classifier \
    --document-classifier-name example-classifier \
    --data-access-arn arn:aws:comprehend:us-west-2:111122223333:pii-entities-
detection-job/123456abcdeb0e11022f22a11EXAMPLE \
    --input-data-config "S3Uri=s3://amzn-s3-demo-bucket/" \
    --language-code en
```

Output:

```
{
    "DocumentClassifierArn": "arn:aws:comprehend:us-west-2:111122223333:document-
classifier/example-classifier"
}
```

For more information, see Custom Classification in the *Amazon Comprehend Developer Guide*.

- For API details, see CreateDocumentClassifier in *AWS CLI Command Reference*.

`create-endpoint`

The following code example shows how to use `create-endpoint`.

AWS CLI

To create an endpoint for a custom model

The following `create-endpoint` example creates an endpoint for synchronous inference for a previously trained custom model.

```
aws comprehend create-endpoint \
    --endpoint-name example-classifier-endpoint-1 \
    --model-arn arn:aws:comprehend:us-west-2:111122223333:document-classifier/
example-classifier \
    --desired-inference-units 1
```

Output:

```
{
    "EndpointArn": "arn:aws:comprehend:us-west-2:111122223333:document-classifier-
endpoint/example-classifier-endpoint-1"
}
```

For more information, see Managing Amazon Comprehend endpoints in the *Amazon Comprehend Developer Guide*.

- For API details, see CreateEndpoint in *AWS CLI Command Reference*.

`create-entity-recognizer`

The following code example shows how to use `create-entity-recognizer`.

AWS CLI

To create a custom entity recognizer

The following `create-entity-recognizer` example begins the training process for a custom entity recognizer model. This example uses a CSV file containing training documents, `raw_text.csv`, and a CSV entity list, `entity_list.csv` to train the model. `entity-list.csv` contains the following columns: text and type.

```
aws comprehend create-entity-recognizer \
    --recognizer-name example-entity-recognizer
    --data-access-role-arn arn:aws:iam::111122223333:role/service-role/
AmazonComprehendServiceRole-example-role \
    --input-data-config "EntityTypes=[{Type=DEVICE}],Documents={S3Uri=s3://amzn-s3-
demo-bucket/trainingdata/raw_text.csv},EntityList={S3Uri=s3://amzn-s3-demo-bucket/
trainingdata/entity_list.csv}"
    --language-code en
```

Output:

```
{
    "EntityRecognizerArn": "arn:aws:comprehend:us-west-2:111122223333:example-
entity-recognizer/entityrecognizer1"
}
```

For more information, see Custom entity recognition in the *Amazon Comprehend Developer Guide*.

- For API details, see CreateEntityRecognizer in *AWS CLI Command Reference*.

`create-flywheel`

The following code example shows how to use `create-flywheel`.

AWS CLI

To create a flywheel

The following `create-flywheel` example creates a flywheel to orchestrate the ongoing training of either a document classification or entity recognition model. The flywheel in this example is created to manage an existing trained model specified by the `--active-model-arn` tag. When the flywheel is created, a data lake is created at the `--input-data-lake` tag.

```
aws comprehend create-flywheel \
    --flywheel-name example-flywheel \
    --active-model-arn arn:aws:comprehend:us-west-2:111122223333:document-
classifier/example-model/version/1 \
    --data-access-role-arn arn:aws:iam::111122223333:role/service-role/
AmazonComprehendServiceRole-example-role \
    --data-lake-s3-uri "s3://amzn-s3-demo-bucket"
```

Output:

```
{
    "FlywheelArn": "arn:aws:comprehend:us-west-2:111122223333:flywheel/example-
flywheel"
}
```

For more information, see Flywheel Overview in *Amazon Comprehend Developer Guide*.

- For API details, see CreateFlywheel in *AWS CLI Command Reference*.

`delete-document-classifier`

The following code example shows how to use `delete-document-classifier`.

AWS CLI

To delete a custom document classifier

The following `delete-document-classifier` example deletes a custom document classifier model.

```
aws comprehend delete-document-classifier \
    --document-classifier-arn arn:aws:comprehend:us-west-2:111122223333:document-
classifier/example-classifier-1
```

This command produces no output.

For more information, see Managing Amazon Comprehend endpoints in the *Amazon Comprehend Developer Guide*.

- For API details, see DeleteDocumentClassifier in *AWS CLI Command Reference*.

`delete-endpoint`

The following code example shows how to use `delete-endpoint`.

AWS CLI

To delete an endpoint for a custom model

The following `delete-endpoint` example deletes a model-specific endpoint. All endpoints must be deleted in order for the model to be deleted.

```
aws comprehend delete-endpoint \
    --endpoint-arn arn:aws:comprehend:us-west-2:111122223333:document-classifier-endpoint/example-classifier-endpoint-1
```

This command produces no output.

For more information, see Managing Amazon Comprehend endpoints in the *Amazon Comprehend Developer Guide*.

- For API details, see DeleteEndpoint in *AWS CLI Command Reference*.

`delete-entity-recognizer`

The following code example shows how to use `delete-entity-recognizer`.

AWS CLI

To delete a custom entity recognizer model

The following `delete-entity-recognizer` example deletes a custom entity recognizer model.

```
aws comprehend delete-entity-recognizer \
    --entity-recognizer-arn arn:aws:comprehend:us-west-2:111122223333:entity-recognizer/example-entity-recognizer-1
```

This command produces no output.

For more information, see Managing Amazon Comprehend endpoints in the *Amazon Comprehend Developer Guide*.

- For API details, see DeleteEntityRecognizer in *AWS CLI Command Reference*.

`delete-flywheel`

The following code example shows how to use `delete-flywheel`.

AWS CLI

To delete a flywheel

The following `delete-flywheel` example deletes a flywheel. The data lake or the model associated with the flywheel is not deleted.

```
aws comprehend delete-flywheel \
    --flywheel-arn arn:aws:comprehend:us-west-2:111122223333:flywheel/example-flywheel-1
```

This command produces no output.

For more information, see Flywheel overview in the *Amazon Comprehend Developer Guide*.

- For API details, see DeleteFlywheel in *AWS CLI Command Reference*.

`delete-resource-policy`

The following code example shows how to use `delete-resource-policy`.

AWS CLI

To delete a resource-based policy

The following `delete-resource-policy` example deletes a resource-based policy from an Amazon Comprehend resource.

```
aws comprehend delete-resource-policy \
    --resource-arn arn:aws:comprehend:us-west-2:111122223333:document-classifier/example-classifier-1/version/1
```

This command produces no output.

For more information, see Copying custom models between AWS accounts in the *Amazon Comprehend Developer Guide*.

- For API details, see DeleteResourcePolicy in *AWS CLI Command Reference*.

`describe-dataset`

The following code example shows how to use `describe-dataset`.

AWS CLI

To describe a flywheel dataset

The following `describe-dataset` example gets the properties of a flywheel dataset.

```
aws comprehend describe-dataset \
    --dataset-arn arn:aws:comprehend:us-west-2:111122223333:flywheel/flywheel-
entity/dataset/example-dataset
```

Output:

```
{
    "DatasetProperties": {
        "DatasetArn": "arn:aws:comprehend:us-west-2:111122223333:flywheel/flywheel-
entity/dataset/example-dataset",
        "DatasetName": "example-dataset",
        "DatasetType": "TRAIN",

        "Status": "CREATING",
        "CreationTime": "2023-06-16T20:37:10.400000+00:00"
    }
}
```

For more information, see Flywheel Overview in *Amazon Comprehend Developer Guide*.

- For API details, see DescribeDataset in *AWS CLI Command Reference*.

`describe-document-classification-job`

The following code example shows how to use `describe-document-classification-job`.

AWS CLI

To describe a document classification job

The following `describe-document-classification-job` example gets the properties of an asynchronous document classification job.

```
aws comprehend describe-document-classification-job \
    --job-id 123456abcdeb0e11022f22a11EXAMPLE
```

Output:

```
{
    "DocumentClassificationJobProperties": {
        "JobId": "123456abcdeb0e11022f22a11EXAMPLE",
        "JobArn": "arn:aws:comprehend:us-west-2:111122223333:document-

        },
        "DataAccessRoleArn": "arn:aws:iam::111122223333:role/service-role/
AmazonComprehendServiceRole-servicerole"
    }
}
```

For more information, see Custom Classification in the *Amazon Comprehend Developer Guide*.

- For API details, see DescribeDocumentClassificationJob in *AWS CLI Command Reference*.

`describe-document-classifier`

The following code example shows how to use `describe-document-classifier`.

AWS CLI

To describe a document classifier

The following `describe-document-classifier` example gets the properties of a custom document classifier model.

```
aws comprehend describe-document-classifier \
    --document-classifier-arn arn:aws:comprehend:us-west-2:111122223333:document-
classifier/example-classifier-1
```

Output:

    }
}
```

For more information, see Creating and managing custom models in the *Amazon Comprehend Developer Guide*.

- For API details, see DescribeDocumentClassifier in *AWS CLI Command Reference*.

`describe-dominant-language-detection-job`

The following code example shows how to use `describe-dominant-language-detection-job`.

AWS CLI

To describe a dominant language detection detection job.

The following `describe-dominant-language-detection-job` example gets the properties of an asynchronous dominant language detection job.

```
aws comprehend describe-dominant-language-detection-job \
    --job-id 123456abcdeb0e11022f22a11EXAMPLE
```

Output:

```
{
    "DominantLanguageDetectionJobProperties": {
        "JobId": "123456abcdeb0e11022f22a11EXAMPLE",
        "JobArn": "arn:aws:comprehend:us-west-2:111122223333:dominant-language-
detection-job/123456abcdeb0e11022f22a11EXAMPLE",
        "JobName": "languageanalysis1",
        "JobStatus": "IN_PROGRESS",
        "SubmitTime": "2023-06-09T18:10:38.037000+00:00",
        "InputDataConfig": {
            "S3Uri": "s3://amzn-s3-demo-bucket",
            "InputFormat": "ONE_DOC_PER_LINE"
        },
        "OutputDataConfig": {
            "S3Uri": "s3://amzn-s3-demo-destination-bucket/testfolder/111122223333-
LANGUAGE-123456abcdeb0e11022f22a11EXAMPLE/output/output.tar.gz"
        },
        "DataAccessRoleArn": "arn:aws:iam::111122223333:role/service-role/
AmazonComprehendServiceRole-example-role"
    }
}
```

For more information, see Async analysis for Amazon Comprehend insights in the *Amazon Comprehend Developer Guide*.

- For API details, see DescribeDominantLanguageDetectionJob in *AWS CLI Command Reference*.

`describe-endpoint`

The following code example shows how to use `describe-endpoint`.

AWS CLI

To describe a specific endpoint

The following `describe-endpoint` example gets the properties of a model-specific endpoint.

```
aws comprehend describe-endpoint \
    --endpoint-arn arn:aws:comprehend:us-west-2:111122223333:document-classifier-endpoint/example-classifier-endpoint
```

Output:

```
{
    "EndpointProperties": {
        "EndpointArn": "arn:aws:comprehend:us-west-2:111122223333:document-classifier-endpoint/example-classifier-endpoint,
        "Status": "IN_SERVICE",
        "ModelArn": "arn:aws:comprehend:us-west-2:111122223333:document-classifier/exampleclassifier1",
        "DesiredModelArn": "arn:aws:comprehend:us-west-2:111122223333:document-classifier/exampleclassifier1",
        "DesiredInferenceUnits": 1,
        "CurrentInferenceUnits": 1,
        "CreationTime": "2023-06-13T20:32:54.526000+00:00",
        "LastModifiedTime": "2023-06-13T20:32:54.526000+00:00"
    }
}
```

For more information, see Managing Amazon Comprehend endpoints in the *Amazon Comprehend Developer Guide*.

- For API details, see DescribeEndpoint in *AWS CLI Command Reference*.

`describe-entities-detection-job`

The following code example shows how to use `describe-entities-detection-job`.

AWS CLI

To describe an entities detection job

The following `describe-entities-detection-job` example gets the properties of an asynchronous entities detection job.

```
aws comprehend describe-entities-detection-job \
    --job-id 123456abcdeb0e11022f22a11EXAMPLE
```

Output:

```
{
    "EntitiesDetectionJobProperties": {
        "JobId": "123456abcdeb0e11022f22a11EXAMPLE",
        "JobArn": "arn:aws:comprehend:us-west-2:111122223333:entities-detection-
job/123456abcdeb0e11022f22a11EXAMPLE",
        "JobName": "example-entity-detector",
        "JobStatus": "COMPLETED",
        "SubmitTime": "2023-06-08T21:30:15.323000+00:00",
        "EndTime": "2023-06-08T21:40:23.509000+00:00",
        "InputDataConfig": {
            "S3Uri": "s3://amzn-s3-demo-bucket/AsyncBatchJobs/",
            "InputFormat": "ONE_DOC_PER_LINE"
        },
        "OutputDataConfig": {
            "S3Uri": "s3://amzn-s3-demo-bucket/thefolder/111122223333-
NER-123456abcdeb0e11022f22a11EXAMPLE/output/output.tar.gz"
        },
        "LanguageCode": "en",
        "DataAccessRoleArn": "arn:aws:iam::12345678012:role/service-role/
AmazonComprehendServiceRole-example-role"
    }
}
```

For more information, see Async analysis for Amazon Comprehend insights in the *Amazon Comprehend Developer Guide*.

- For API details, see DescribeEntitiesDetectionJob in *AWS CLI Command Reference*.

`describe-entity-recognizer`

The following code example shows how to use `describe-entity-recognizer`.

AWS CLI

To describe an entity recognizer

The following `describe-entity-recognizer` example gets the properties of a custom entity recognizer model.

```
aws comprehend describe-entity-recognizer \
    entity-recognizer-arn arn:aws:comprehend:us-west-2:111122223333:entity-recognizer/business-recongizer-1/version/1
```

Output:

```
{
    "EntityRecognizerProperties": {
        "EntityRecognizerArn": "arn:aws:comprehend:us-west-2:111122223333:entity-recognizer/business-recongizer-1/version/1",
        "LanguageCode": "en",
        "Status": "TRAINED",
        "SubmitTime": "2023-06-14T20:44:59.631000+00:00",
        "EndTime": "2023-06-14T20:59:19.532000+00:00",
        "TrainingStartTime": "2023-06-14T20:48:52.811000+00:00",

}
```

For more information, see Custom entity recognition in the *Amazon Comprehend Developer Guide*.

- For API details, see DescribeEntityRecognizer in *AWS CLI Command Reference*.

`describe-events-detection-job`

The following code example shows how to use `describe-events-detection-job`.

AWS CLI

To describe an events detection job.

The following `describe-events-detection-job` example gets the properties of an asynchronous events detection job.

```
aws comprehend describe-events-detection-job \
    --job-id 123456abcdeb0e11022f22a11EXAMPLE
```

Output:

```
{
```

```
    "EventsDetectionJobProperties": {
        "JobId": "123456abcdeb0e11022f22a11EXAMPLE",
        "JobArn": "arn:aws:comprehend:us-west-2:111122223333:events-detection-
job/123456abcdeb0e11022f22a11EXAMPLE",

            "EMPLOYMENT",
            "CORPORATE_ACQUISITION",
            "CORPORATE_MERGER",
            "INVESTMENT_GENERAL"
        ]
    }
}
```

For more information, see Async analysis for Amazon Comprehend insights in the *Amazon Comprehend Developer Guide*.

- For API details, see DescribeEventsDetectionJob in *AWS CLI Command Reference*.

`describe-flywheel-iteration`

The following code example shows how to use `describe-flywheel-iteration`.

AWS CLI

To describe a flywheel iteration

The following `describe-flywheel-iteration` example gets the properties of a flywheel iteration.

```
aws comprehend describe-flywheel-iteration \
    --flywheel-arn arn:aws:comprehend:us-west-2:111122223333:flywheel/example-flywheel \
    --flywheel-iteration-id 20232222AEXAMPLE
```

Output:

```
{
    "FlywheelIterationProperties": {
        "FlywheelArn": "arn:aws:comprehend:us-west-2:111122223333:flywheel/flywheel-entity",

}
```

For more information, see Flywheel overview in the *Amazon Comprehend Developer Guide*.

- For API details, see DescribeFlywheelIteration in *AWS CLI Command Reference*.

`describe-flywheel`

The following code example shows how to use `describe-flywheel`.

AWS CLI

To describe a flywheel

The following `describe-flywheel` example gets the properties of a flywheel. In this example, the model associated with the flywheel is a custom classifier model that is trained to classify documents as either spam or nonspam, or, "ham".

```
aws comprehend describe-flywheel \
    --flywheel-arn arn:aws:comprehend:us-west-2:111122223333:flywheel/example-
flywheel
```

Output:

```
{
    "FlywheelProperties": {
        "FlywheelArn": "arn:aws:comprehend:us-west-2:111122223333:flywheel/example-
flywheel",
        "ActiveModelArn": "arn:aws:comprehend:us-west-2:111122223333:document-
classifier/example-model/version/1",
        "DataAccessRoleArn": "arn:aws:iam::111122223333:role/service-role/
AmazonComprehendServiceRole-example-role",
        "TaskConfig": {
            "LanguageCode": "en",
            "DocumentClassificationConfig": {
                "Mode": "MULTI_CLASS",
                "Labels": [
                    "ham",
                    "spam"
                ]
            }
        },
        "DataLakeS3Uri": "s3://amzn-s3-demo-bucket/example-flywheel/
schemaVersion=1/20230616T200543Z/",
        "DataSecurityConfig": {},
        "Status": "ACTIVE",
        "ModelType": "DOCUMENT_CLASSIFIER",
        "CreationTime": "2023-06-16T20:05:43.242000+00:00",
```

```
        "LastModifiedTime": "2023-06-16T20:21:43.567000+00:00"
    }
}
```

For more information, see Flywheel Overview in *Amazon Comprehend Developer Guide*.

- For API details, see DescribeFlywheel in *AWS CLI Command Reference*.

`describe-key-phrases-detection-job`

The following code example shows how to use `describe-key-phrases-detection-job`.

AWS CLI

To describe a key phrases detection job

The following `describe-key-phrases-detection-job` example gets the properties of an asynchronous key phrases detection job.

```
aws comprehend describe-key-phrases-detection-job \
    --job-id 123456abcdeb0e11022f22a11EXAMPLE
```

Output:

```
{
    "KeyPhrasesDetectionJobProperties": {
        "JobId": "69aa080c00fc68934a6a98f10EXAMPLE",
        "JobArn": "arn:aws:comprehend:us-west-2:111122223333:key-phrases-detection-
job/69aa080c00fc68934a6a98f10EXAMPLE",
        "JobName": "example-key-phrases-detection-job",
        "JobStatus": "COMPLETED",

    }
}
```

For more information, see Async analysis for Amazon Comprehend insights in the *Amazon Comprehend Developer Guide*.

- For API details, see DescribeKeyPhrasesDetectionJob in *AWS CLI Command Reference*.

`describe-pii-entities-detection-job`

The following code example shows how to use `describe-pii-entities-detection-job`.

AWS CLI

To describe a PII entities detection job

The following `describe-pii-entities-detection-job` example gets the properties of an asynchronous pii entities detection job.

```
aws comprehend describe-pii-entities-detection-job \
    --job-id 123456abcdeb0e11022f22a11EXAMPLE
```

Output:

```
{
    "PiiEntitiesDetectionJobProperties": {
        "JobId": "123456abcdeb0e11022f22a11EXAMPLE",
        "JobArn": "arn:aws:comprehend:us-west-2:111122223333:pii-entities-detection-
job/123456abcdeb0e11022f22a11EXAMPLE",
        "JobName": "example-pii-entities-job",
        "JobStatus": "IN_PROGRESS",
        "SubmitTime": "2023-06-08T21:30:15.323000+00:00",
        "EndTime": "2023-06-08T21:40:23.509000+00:00",
        "InputDataConfig": {
            "S3Uri": "s3://amzn-s3-demo-bucket/AsyncBatchJobs/",
            "InputFormat": "ONE_DOC_PER_LINE"
        },
        "OutputDataConfig": {
            "S3Uri": "s3://amzn-s3-demo-bucket/thefolder/111122223333-

```

```
        },
        "LanguageCode": "en",
        "DataAccessRoleArn": "arn:aws:iam::12345678012:role/service-role/
AmazonComprehendServiceRole-example-role"
    }
}
```

For more information, see Async analysis for Amazon Comprehend insights in the *Amazon Comprehend Developer Guide*.

- For API details, see DescribePiiEntitiesDetectionJob in *AWS CLI Command Reference*.

`describe-resource-policy`

The following code example shows how to use `describe-resource-policy`.

AWS CLI

To describe a resource policy attached to a model

The following `describe-resource-policy` example gets the properties of a resource-based policy attached to a model.

```
aws comprehend describe-resource-policy \
    --resource-arn arn:aws:comprehend:us-west-2:111122223333:document-classifier/
example-classifier/version/1
```

Output:

```
{
    "ResourcePolicy": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect\":
\"Allow\",\"Principal\":{\"AWS\":\"arn:aws:iam::444455556666:root\"},\"Action\":
\"comprehend:ImportModel\",\"Resource\":\"*\"}]}",
    "CreationTime": "2023-06-19T18:44:26.028000+00:00",
    "LastModifiedTime": "2023-06-19T18:53:02.002000+00:00",
    "PolicyRevisionId": "baa675d069d07afaa2aa3106ae280f61"
}
```

For more information, see Copying custom models between AWS accounts in the *Amazon Comprehend Developer Guide*.

- For API details, see DescribeResourcePolicy in *AWS CLI Command Reference*.

`describe-sentiment-detection-job`

The following code example shows how to use `describe-sentiment-detection-job`.

AWS CLI

To describe a sentiment detection job

The following `describe-sentiment-detection-job` example gets the properties of an asynchronous sentiment detection job.

```
aws comprehend describe-sentiment-detection-job \
    --job-id 123456abcdeb0e11022f22a11EXAMPLE
```

Output:

```
{
    "SentimentDetectionJobProperties": {
        "JobId": "123456abcdeb0e11022f22a11EXAMPLE",
        "JobArn": "arn:aws:comprehend:us-west-2:111122223333:sentiment-detection-
job/123456abcdeb0e11022f22a11EXAMPLE",
        "JobName": "movie_review_analysis",
        "JobStatus": "IN_PROGRESS",
        "SubmitTime": "2023-06-09T23:16:15.956000+00:00",
        "InputDataConfig": {
            "S3Uri": "s3://amzn-s3-demo-bucket/MovieData",

`detect-targeted-sentiment`

The following code example shows how to use `detect-targeted-sentiment`.

AWS CLI

To detect the targeted sentiment of named entities in an input text

The following `detect-targeted-sentiment` example analyzes the input text and returns the named entities in addition to the targeted sentiment associated with each entity. The pre-trained models confidence score for each prediction is also output.

```
aws comprehend detect-targeted-sentiment \
    --language-code en \
    --text "I do not enjoy January because it is too cold but August is the perfect temperature"
```

Output:

```
{
    "Entities": [
        {
            "DescriptiveMentionIndex": [
                0

- For API details, see DetectTargetedSentiment in *AWS CLI Command Reference*.

`import-model`

The following code example shows how to use `import-model`.

AWS CLI

To import a model

The following `import-model` example imports a model from a different AWS account. The document classifier model in account 444455556666 has a resource-based policy allowing account 111122223333 to import the model.

```
aws comprehend import-model \
    --source-model-arn arn:aws:comprehend:us-west-2:444455556666:document-
classifier/example-classifier
```

Output:

```
{
    "ModelArn": "arn:aws:comprehend:us-west-2:111122223333:document-classifier/
example-classifier"
```

```
}
```

For more information, see Copying custom models between AWS accounts in the *Amazon Comprehend Developer Guide*.

- For API details, see ImportModel in *AWS CLI Command Reference*.

`list-datasets`

The following code example shows how to use `list-datasets`.

AWS CLI

To list all flywheel datasets

The following `list-datasets` example lists all datasets associated with a flywheel.

```
aws comprehend list-datasets \
    --flywheel-arn arn:aws:comprehend:us-west-2:111122223333:flywheel/flywheel-
entity
```

Output:

```
{
    "DatasetPropertiesList": [
        {
            "DatasetArn": "arn:aws:comprehend:us-west-2:111122223333:flywheel/

`list-dominant-language-detection-jobs`

The following code example shows how to use `list-dominant-language-detection-jobs`.

AWS CLI

To list all dominant language detection jobs

The following `list-dominant-language-detection-jobs` example lists all in-progress and completed asynchronous dominant language detection jobs.

```
aws comprehend list-dominant-language-detection-jobs
```

Output:

```
{
    "DominantLanguageDetectionJobPropertiesList": [
        {
            "JobId": "123456abcdeb0e11022f22a11EXAMPLE",
            "JobArn": "arn:aws:comprehend:us-west-2:111122223333:dominant-language-
detection-job/123456abcdeb0e11022f22a11EXAMPLE",
            "JobName": "languageanalysis1",
```

```

    ]
}
```

For more information, see Entities in the *Amazon Comprehend Developer Guide*.

- For API details, see ListEntitiesDetectionJobs in *AWS CLI Command Reference*.

`list-entity-recognizer-summaries`

The following code example shows how to use `list-entity-recognizer-summaries`.

AWS CLI

To list of summaries for all created entity recognizers

The following `list-entity-recognizer-summaries` example lists all entity recognizer summaries.

```
aws comprehend list-entity-recognizer-summaries
```

Output:

```
{
    "EntityRecognizerSummariesList": [
        {
            "RecognizerName": "entity-recognizer-3",
            "NumberOfVersions": 2,

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for resource

The following `list-tags-for-resource` example lists the tags for an Amazon Comprehend resource.

```
aws comprehend list-tags-for-resource \
    --resource-arn arn:aws:comprehend:us-west-2:111122223333:document-classifier/
example-classifier/version/1
```

Output:

```
{
    "ResourceArn": "arn:aws:comprehend:us-west-2:111122223333:document-classifier/
example-classifier/version/1",
```

```
    "Tags": [
        {
            "Key": "Department",
            "Value": "Finance"
        },
        {
            "Key": "location",
            "Value": "Seattle"
        }
    ]
}
```

For more information, see [Tagging your resources](#) in the *Amazon Comprehend Developer Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

`list-targeted-sentiment-detection-jobs`

The following code example shows how to use `list-targeted-sentiment-detection-jobs`.

AWS CLI

To list all targeted sentiment detection jobs

The following `list-targeted-sentiment-detection-jobs` example lists all in-progress and completed asynchronous targeted sentiment detection jobs.

```
aws comprehend list-targeted-sentiment-detection-jobs
```

Output:

```
{
    "TargetedSentimentDetectionJobPropertiesList": [
        {
            "JobId": "123456abcdeb0e11022f22a11EXAMPLE",
            "JobArn": "arn:aws:comprehend:us-west-2:111122223333:targeted-sentiment-
detection-job/123456abcdeb0e11022f22a11EXAMPLE",
            "JobName": "example-targeted-sentiment-detection-job",
            "JobStatus": "COMPLETED",
            "SubmitTime": "2023-06-09T22:42:20.545000+00:00",
            "EndTime": "2023-06-09T22:52:27.416000+00:00",
            "InputDataConfig": {
```

```
                "S3Uri": "s3://amzn-s3-demo-bucket/MovieData",
                "InputFormat": "ONE_DOC_PER_LINE"
            },

            },
            "NumberOfTopics": 10,
            "DataAccessRoleArn": "arn:aws:iam::111122223333:role/service-role/
AmazonComprehendServiceRole-example-role"
        }
    ]
}
```

For more information, see Async analysis for Amazon Comprehend insights in the *Amazon Comprehend Developer Guide*.

- For API details, see ListTopicsDetectionJobs in *AWS CLI Command Reference*.

`put-resource-policy`

The following code example shows how to use `put-resource-policy`.

AWS CLI

To attach a resource-based policy

The following `put-resource-policy` example attaches a resource-based policy to a model so that can be imported by another AWS account. The policy is attached to the model in account `111122223333` and allows account `444455556666` import the model.

```
aws comprehend put-resource-policy \
    --resource-arn arn:aws:comprehend:us-west-2:111122223333:document-classifier/
example-classifier/version/1 \
    --resource-policy '{"Version":"2012-10-17",       "Statement":
[{"Effect":"Allow","Action":"comprehend:ImportModel","Resource":"*","Principal":
{"AWS":["arn:aws:iam::444455556666:root"]}}]}'
```

Output:

```
{
    "PolicyRevisionId": "aaa111d069d07afaa2aa3106aEXAMPLE"
}
```

For more information, see Copying custom models between AWS accounts in the *Amazon Comprehend Developer Guide*.

- For API details, see PutResourcePolicy in *AWS CLI Command Reference*.

`start-document-classification-job`

The following code example shows how to use `start-document-classification-job`.

AWS CLI

To start document classification job

The following `start-document-classification-job` example starts a document classification job with a custom model on all of the files at the address specified by the `--input-data-config` tag. In this example, the input S3 bucket contains `SampleSMStext1.txt`, `SampleSMStext2.txt`, and `SampleSMStext3.txt`. The model was previously trained on document classifications of spam and non-spam, or, "ham", SMS messages. When the job is complete, `output.tar.gz` is put at the location specified by the `--`

`output-data-config` tag. `output.tar.gz` contains `predictions.jsonl` which lists the classification of each document. The Json output is printed on one line per file, but is formatted here for readability.

```
aws comprehend start-document-classification-job \
    --job-name exampleclassificationjob \
    --input-data-config "S3Uri=s3://amzn-s3-demo-bucket-INPUT/jobdata/" \
    --output-data-config "S3Uri=s3://amzn-s3-demo-destination-bucket/testfolder/" \
    --data-access-role-arn arn:aws:iam::111122223333:role/service-role/
AmazonComprehendServiceRole-example-role \
    --document-classifier-arn arn:aws:comprehend:us-west-2:111122223333:document-
classifier/mymodel/version/12
```

Contents of `SampleSMStext1.txt`:

```
"CONGRATULATIONS! TXT 2155550100 to win $5000"
```

Contents of `SampleSMStext2.txt`:

```
"Hi, when do you want me to pick you up from practice?"
```

Contents of `SampleSMStext3.txt`:

```
"Plz send bank account # to 2155550100 to claim prize!!"
```

Output:

```
{
    "JobId": "e758dd56b824aa717ceab551fEXAMPLE",
    "JobArn": "arn:aws:comprehend:us-west-2:111122223333:document-classification-
job/e758dd56b824aa717ceab551fEXAMPLE",
    "JobStatus": "SUBMITTED"
}
```

Contents of `predictions.jsonl`:

```
{"File": "SampleSMSText1.txt", "Line": "0", "Classes": [{"Name": "spam", "Score":
 0.9999}, {"Name": "ham", "Score": 0.0001}]}
{"File": "SampleSMStext2.txt", "Line": "0", "Classes": [{"Name": "ham", "Score":
 0.9994}, {"Name": "spam", "Score": 0.0006}]}
```

```
{"File": "SampleSMSText3.txt", "Line": "0", "Classes": [{"Name": "spam", "Score":
 0.9999}, {"Name": "ham", "Score": 0.0001}]}
```

For more information, see Custom Classification in the *Amazon Comprehend Developer Guide*.

- For API details, see StartDocumentClassificationJob in *AWS CLI Command Reference*.

`start-dominant-language-detection-job`

The following code example shows how to use `start-dominant-language-detection-job`.

AWS CLI

To start an asynchronous language detection job

The following `start-dominant-language-detection-job` example starts an asynchronous language detection job for all of the files located at the address specified by the `--input-data-config` tag. The S3 bucket in this example contains `Sampletext1.txt`. When the job is complete, the folder, `output`, is placed in the location specified by the `--output-data-config` tag. The folder contains `output.txt` which contains the dominant language of each of the text files as well as the pre-trained model's confidence score for each prediction.

```
aws comprehend start-dominant-language-detection-job \
    --job-name example_language_analysis_job \
    --language-code en \
    --input-data-config "S3Uri=s3://amzn-s3-demo-bucket/" \
    --output-data-config "S3Uri=s3://amzn-s3-demo-destination-bucket/testfolder/" \
    --data-access-role-arn arn:aws:iam::111122223333:role/service-role/
AmazonComprehendServiceRole-example-role \
    --language-code en
```

Contents of Sampletext1.txt:

```
"Physics is the natural science that involves the study of matter and its motion and
 behavior through space and time, along with related concepts such as energy and
 force."
```

Output:

```
{
    "JobId": "123456abcdeb0e11022f22a11EXAMPLE",
```

```
    "JobArn": "arn:aws:comprehend:us-west-2:111122223333:dominant-language-
detection-job/123456abcdeb0e11022f22a11EXAMPLE",
    "JobStatus": "SUBMITTED"
}
```

Contents of `output.txt`:

```
{"File": "Sampletext1.txt", "Languages": [{"LanguageCode": "en", "Score":
 0.9913753867149353}], "Line": 0}
```

For more information, see Async analysis for Amazon Comprehend insights in the *Amazon Comprehend Developer Guide*.

- For API details, see StartDominantLanguageDetectionJob in *AWS CLI Command Reference*.

`start-entities-detection-job`

The following code example shows how to use `start-entities-detection-job`.

AWS CLI

Example 1: To start a standard entity detection job using the pre-trained model

The following `start-entities-detection-job` example starts an asynchronous entities detection job for all files located at the address specified by the `--input-data-config` tag. The S3 bucket in this example contains `Sampletext1.txt`, `Sampletext2.txt`, and `Sampletext3.txt`. When the job is complete, the folder, `output`, is placed in the location specified by the `--output-data-config` tag. The folder contains `output.txt` which lists all of the named entities detected within each text file as well as the pre-trained model's confidence score for each prediction. The Json output is printed on one line per input file, but is formatted here for readability.

```
aws comprehend start-entities-detection-job \
    --job-name entitiestest \
    --language-code en \
    --input-data-config "S3Uri=s3://amzn-s3-demo-bucket/" \
    --output-data-config "S3Uri=s3://amzn-s3-demo-destination-bucket/testfolder/" \
    --data-access-role-arn arn:aws:iam::111122223333:role/service-role/
AmazonComprehendServiceRole-example-role \
    --language-code en
```

Contents of `Sampletext1.txt`:

```
"Hello Zhang Wei, I am John. Your AnyCompany Financial Services, LLC credit card
 account 1111-XXXX-1111-XXXX has a minimum payment of $24.53 that is due by July
 31st."
```

Contents of `Sampletext2.txt`:

```
"Dear Max, based on your autopay settings for your account example1.org account, we
 will withdraw your payment on the due date from your bank account number XXXXXX1111
 with the routing number XXXXX0000. "
```

Contents of `Sampletext3.txt`:

```
"Jane, please submit any customer feedback from this weekend to AnySpa, 123 Main St,
 Anywhere and send comments to Alice at AnySpa@example.com."
```

Output:

```
{
    "JobId": "123456abcdeb0e11022f22a11EXAMPLE",
    "JobArn": "arn:aws:comprehend:us-west-2:111122223333:entities-detection-
job/123456abcdeb0e11022f22a11EXAMPLE",
    "JobStatus": "SUBMITTED"
}
```

Contents of `output.txt` with line indents for readability:

Example 2: To start a custom entity detection job

The following `start-entities-detection-job` example starts an asynchronous custom entities detection job for all files located at the address specified by the `--input-data-config` tag. In this example, the S3 bucket in this example contains `SampleFeedback1.txt`, `SampleFeedback2.txt`, and `SampleFeedback3.txt`. The entity recognizer model was trained on customer support Feedbacks to recognize device names. When the job is complete, an the folder, `output`, is put at the location specified by the `--output-data-config` tag. The folder contains `output.txt`, which lists all of the named entities detected within each text file as well as the pre-trained model's confidence score for each prediction. The Json output is printed on one line per file, but is formatted here for readability.

```
aws comprehend start-entities-detection-job \
    --job-name customentitiestest \
    --entity-recognizer-arn "arn:aws:comprehend:us-west-2:111122223333:entity-
recognizer/entityrecognizer" \
    --language-code en \
```

```
    --input-data-config "S3Uri=s3://amzn-s3-demo-bucket/jobdata/" \
    --output-data-config "S3Uri=s3://amzn-s3-demo-destination-bucket/testfolder/" \
    --data-access-role-arn "arn:aws:iam::111122223333:role/service-role/
AmazonComprehendServiceRole-IOrole"
```

Contents of `SampleFeedback1.txt`:

```
"I've been on the AnyPhone app have had issues for 24 hours when trying to pay bill.
 Cannot make payment. Sigh. | Oh man! Lets get that app up and running. DM me, and
 we can get to work!"
```

Contents of `SampleFeedback2.txt`:

```
"Hi, I have a discrepancy with my new bill. Could we get it sorted out? A rep added
 stuff I didn't sign up for when I did my AnyPhone 10 upgrade. | We can absolutely
 get this sorted!"
```

Contents of `SampleFeedback3.txt`:

```
"Is the by 1 get 1 free AnySmartPhone promo still going on? | Hi Christian! It ended
 yesterday, send us a DM if you have any questions and we can take a look at your
 options!"
```

Output:

```
{
    "JobId": "019ea9edac758806850fa8a79ff83021",
    "JobArn": "arn:aws:comprehend:us-west-2:111122223333:entities-detection-
job/019ea9edac758806850fa8a79ff83021",

`start-events-detection-job`

The following code example shows how to use `start-events-detection-job`.

AWS CLI

To start an asynchronous events detection job

The following `start-events-detection-job` example starts an asynchronous events detection job for all files located at the address specified by the `--input-data-config` tag. Possible target event types include `BANKRUPCTY`, `EMPLOYMENT`, `CORPORATE_ACQUISITION`, `INVESTMENT_GENERAL`, `CORPORATE_MERGER`, `IPO`, `RIGHTS_ISSUE`, `SECONDARY_OFFERING`, `SHELF_OFFERING`, `TENDER_OFFERING`, and `STOCK_SPLIT`. The S3 bucket in this example contains `SampleText1.txt`, `SampleText2.txt`, and `SampleText3.txt`. When the job is complete, the folder, `output`, is placed in the location specified by the `--output-data-config` tag. The folder contains `SampleText1.txt.out`, `SampleText2.txt.out`, and `SampleText3.txt.out`. The JSON output is printed on one line per file, but is formatted here for readability.

```
aws comprehend start-events-detection-job \
    --job-name events-detection-1 \
    --input-data-config "S3Uri=s3://amzn-s3-demo-bucket/EventsData" \
    --output-data-config "S3Uri=s3://amzn-s3-demo-destination-bucket/testfolder/" \
    --data-access-role-arn arn:aws:iam::111122223333:role/service-role/
AmazonComprehendServiceRole-servicerole \
    --language-code en \
    --target-event-
types "BANKRUPTCY" "EMPLOYMENT" "CORPORATE_ACQUISITION" "CORPORATE_MERGER" "INVESTMENT_GENER
```

Contents of `SampleText1.txt`:

```
"Company AnyCompany grew by increasing sales and through acquisitions. After
 purchasing competing firms in 2020, AnyBusiness, a part of the AnyBusinessGroup,
 gave Jane Does firm a going rate of one cent a gallon or forty-two cents a barrel."
```

Contents of `SampleText2.txt`:

```
"In 2021, AnyCompany officially purchased AnyBusiness for 100 billion dollars,
 surprising and exciting the shareholders."
```

Contents of `SampleText3.txt`:

```
"In 2022, AnyCompany stock crashed 50. Eventually later that year they filed for
 bankruptcy."
```

Output:

```
{
    "JobId": "123456abcdeb0e11022f22a11EXAMPLE",
    "JobArn": "arn:aws:comprehend:us-west-2:111122223333:events-detection-

`start-flywheel-iteration`

The following code example shows how to use `start-flywheel-iteration`.

AWS CLI

To start a flywheel iteration

The following `start-flywheel-iteration` example starts a flywheel iteration. This operation uses any new datasets in the flywheel to train a new model version.

```
aws comprehend start-flywheel-iteration \
    --flywheel-arn arn:aws:comprehend:us-west-2:111122223333:flywheel/example-flywheel
```

Output:

```
{
    "FlywheelArn": "arn:aws:comprehend:us-west-2:111122223333:flywheel/example-flywheel",
    "FlywheelIterationId": "12345123TEXAMPLE"
}
```

For more information, see Flywheel overview in the *Amazon Comprehend Developer Guide*.

- For API details, see StartFlywheelIteration in *AWS CLI Command Reference*.

`start-key-phrases-detection-job`

The following code example shows how to use `start-key-phrases-detection-job`.

AWS CLI

To start a key phrases detection job

The following `start-key-phrases-detection-job` example starts an asynchronous key phrases detection job for all files located at the address specified by the `--input-data-config` tag. The S3 bucket in this example contains `Sampletext1.txt`, `Sampletext2.txt`, and `Sampletext3.txt`. When the job is completed, the folder, `output`, is placed in the location specified by the `--output-data-config` tag. The folder contains the file `output.txt` which contains all the key phrases detected within each text file and the pre-trained model's confidence score for each prediction. The Json output is printed on one line per file, but is formatted here for readability.

```
aws comprehend start-key-phrases-detection-job \
```

```
    --job-name keyphrasesanalysistest1 \
    --language-code en \
    --input-data-config "S3Uri=s3://amzn-s3-demo-bucket/" \
    --output-data-config "S3Uri=s3://amzn-s3-demo-destination-bucket/testfolder/" \
    --data-access-role-arn "arn:aws:iam::111122223333:role/service-role/
AmazonComprehendServiceRole-example-role" \
    --language-code en
```

Contents of `Sampletext1.txt`:

```
"Hello Zhang Wei, I am John. Your AnyCompany Financial Services, LLC credit card
 account 1111-XXXX-1111-XXXX has a minimum payment of $24.53 that is due by July
 31st."
```

Contents of `Sampletext2.txt`:

```
"Dear Max, based on your autopay settings for your account Internet.org account, we
 will withdraw your payment on the due date from your bank account number XXXXXX1111
 with the routing number XXXXX0000. "
```

Contents of `Sampletext3.txt`:

```
"Jane, please submit any customer feedback from this weekend to Sunshine Spa, 123
 Main St, Anywhere and send comments to Alice at AnySpa@example.com."
```

Output:

```
{

`start-pii-entities-detection-job`

The following code example shows how to use `start-pii-entities-detection-job`.

AWS CLI

To start an asynchronous PII detection job

The following `start-pii-entities-detection-job` example starts an asynchronous personal identifiable information (PII) entities detection job for all files located at the address specified by the `--input-data-config` tag. The S3 bucket in this example contains `Sampletext1.txt`, `Sampletext2.txt`, and `Sampletext3.txt`. When the job is complete, the folder, `output`, is placed in the location specified by the `--output-data-config` tag. The folder contains `SampleText1.txt.out`, `SampleText2.txt.out`, and `SampleText3.txt.out` which list the named entities within each text file. The Json output is printed on one line per file, but is formatted here for readability.

```
aws comprehend start-pii-entities-detection-job \
    --job-name entities_test \
    --language-code en \
    --input-data-config "S3Uri=s3://amzn-s3-demo-bucket/" \
    --output-data-config "S3Uri=s3://amzn-s3-demo-destination-bucket/testfolder/" \
```

```
    --data-access-role-arn arn:aws:iam::111122223333:role/service-role/
AmazonComprehendServiceRole-example-role \
    --language-code en \
    --mode ONLY_OFFSETS
```

Contents of `Sampletext1.txt`:

```
"Hello Zhang Wei, I am John. Your AnyCompany Financial Services, LLC credit card
 account 1111-XXXX-1111-XXXX has a minimum payment of $24.53 that is due by July
 31st."
```

Contents of `Sampletext2.txt`:

```
"Dear Max, based on your autopay settings for your account Internet.org account, we
 will withdraw your payment on the due date from your bank account number XXXXXX1111
 with the routing number XXXXX0000. "
```

Contents of `Sampletext3.txt`:

```
"Jane, please submit any customer feedback from this weekend to Sunshine Spa, 123
 Main St, Anywhere and send comments to Alice at AnySpa@example.com."
```

Output:

```
{

`start-sentiment-detection-job`

The following code example shows how to use `start-sentiment-detection-job`.

AWS CLI

To start an asynchronous sentiment analysis job

The following `start-sentiment-detection-job` example starts an asynchronous sentiment analysis detection job for all files located at the address specified by the `--input-data-config` tag. The S3 bucket folder in this example contains `SampleMovieReview1.txt`, `SampleMovieReview2.txt`, and `SampleMovieReview3.txt`. When the job is complete, the folder, `output`, is placed at the location specified by the `--output-data-config` tag. The folder contains the file, `output.txt`, which contains the prevailing sentiments for each text file and the pre-trained model's confidence score for each prediction. The Json output is printed on one line per file, but is formatted here for readability.

```
aws comprehend start-sentiment-detection-job \
    --job-name example-sentiment-detection-job \
    --language-code en \
    --input-data-config "S3Uri=s3://amzn-s3-demo-bucket/MovieData" \
    --output-data-config "S3Uri=s3://amzn-s3-demo-destination-bucket/testfolder/" \
    --data-access-role-arn arn:aws:iam::111122223333:role/service-role/

`start-topics-detection-job`

The following code example shows how to use `start-topics-detection-job`.

AWS CLI

To start a topics detection analysis job

The following `start-topics-detection-job` example starts an asynchronous topics detection job for all files located at the address specified by the `--input-data-config` tag. When the job is complete, the folder, `output`, is placed at the location specified by the `--ouput-data-config` tag. `output` contains topic-terms.csv and doc-topics.csv. The first output file, topic-terms.csv, is a list of topics in the collection. For each topic, the list includes, by default, the top terms by topic according to their weight. The second file, `doc-topics.csv`, lists the documents associated with a topic and the proportion of the document that is concerned with the topic.

```
aws comprehend start-topics-detection-job \
    --job-name example_topics_detection_job \
    --language-code en \
    --input-data-config "S3Uri=s3://amzn-s3-demo-bucket/" \
    --output-data-config "S3Uri=s3://amzn-s3-demo-destination-bucket/testfolder/" \
    --data-access-role-arn arn:aws:iam::111122223333:role/service-role/
AmazonComprehendServiceRole-example-role \
    --language-code en
```

Output:

```
{
    "JobId": "123456abcdeb0e11022f22a11EXAMPLE",
    "JobArn": "arn:aws:comprehend:us-west-2:111122223333:key-phrases-detection-
job/123456abcdeb0e11022f22a11EXAMPLE",
    "JobStatus": "SUBMITTED"
}
```

For more information, see Topic Modeling in the *Amazon Comprehend Developer Guide*.

- For API details, see StartTopicsDetectionJob in *AWS CLI Command Reference*.

`stop-dominant-language-detection-job`

The following code example shows how to use `stop-dominant-language-detection-job`.

AWS CLI

To stop an asynchronous dominant language detection job

The following `stop-dominant-language-detection-job` example stops an in-progress, asynchronous dominant language detection job. If the current job state is `IN_PROGRESS` the job is marked for termination and put into the `STOP_REQUESTED` state. If the job completes before it can be stopped, it is put into the `COMPLETED` state.

```
aws comprehend stop-dominant-language-detection-job \
    --job-id 123456abcdeb0e11022f22a11EXAMPLE
```

Output:

```
{
    "JobId": "123456abcdeb0e11022f22a11EXAMPLE,
    "JobStatus": "STOP_REQUESTED"
}
```

For more information, see Async analysis for Amazon Comprehend insights in the *Amazon Comprehend Developer Guide*.

- For API details, see StopDominantLanguageDetectionJob in *AWS CLI Command Reference*.

stop-entities-detection-job

The following code example shows how to use `stop-entities-detection-job`.

AWS CLI

To stop an asynchronous entities detection job

The following `stop-entities-detection-job` example stops an in-progress, asynchronous entities detection job. If the current job state is `IN_PROGRESS` the job is marked for termination and put into the `STOP_REQUESTED` state. If the job completes before it can be stopped, it is put into the `COMPLETED` state.

```
aws comprehend stop-entities-detection-job \
    --job-id 123456abcdeb0e11022f22a11EXAMPLE
```

Output:

```
{
    "JobId": "123456abcdeb0e11022f22a11EXAMPLE,
    "JobStatus": "STOP_REQUESTED"
}
```

For more information, see Async analysis for Amazon Comprehend insights in the *Amazon Comprehend Developer Guide*.

- For API details, see StopEntitiesDetectionJob in *AWS CLI Command Reference*.

`stop-events-detection-job`

The following code example shows how to use `stop-events-detection-job`.

AWS CLI

To stop an asynchronous events detection job

The following `stop-events-detection-job` example stops an in-progress, asynchronous events detection job. If the current job state is `IN_PROGRESS` the job is marked for termination and put into the `STOP_REQUESTED` state. If the job completes before it can be stopped, it is put into the `COMPLETED` state.

```
aws comprehend stop-events-detection-job \
    --job-id 123456abcdeb0e11022f22a11EXAMPLE
```

Output:

```
{
    "JobId": "123456abcdeb0e11022f22a11EXAMPLE,
    "JobStatus": "STOP_REQUESTED"
}
```

For more information, see Async analysis for Amazon Comprehend insights in the *Amazon Comprehend Developer Guide*.

- For API details, see StopEventsDetectionJob in *AWS CLI Command Reference*.

`stop-key-phrases-detection-job`

The following code example shows how to use `stop-key-phrases-detection-job`.

AWS CLI

To stop an asynchronous key phrases detection job

The following `stop-key-phrases-detection-job` example stops an in-progress, asynchronous key phrases detection job. If the current job state is `IN_PROGRESS` the job is marked for termination and put into the `STOP_REQUESTED` state. If the job completes before it can be stopped, it is put into the `COMPLETED` state.

```
aws comprehend stop-key-phrases-detection-job \
    --job-id 123456abcdeb0e11022f22a11EXAMPLE
```

Output:

```
{
    "JobId": "123456abcdeb0e11022f22a11EXAMPLE,
    "JobStatus": "STOP_REQUESTED"
}
```

For more information, see Async analysis for Amazon Comprehend insights in the *Amazon Comprehend Developer Guide*.

- For API details, see StopKeyPhrasesDetectionJob in *AWS CLI Command Reference*.

`stop-pii-entities-detection-job`

The following code example shows how to use `stop-pii-entities-detection-job`.

AWS CLI

To stop an asynchronous pii entities detection job

The following `stop-pii-entities-detection-job` example stops an in-progress, asynchronous pii entities detection job. If the current job state is `IN_PROGRESS` the job is marked for termination and put into the `STOP_REQUESTED` state. If the job completes before it can be stopped, it is put into the `COMPLETED` state.

```
aws comprehend stop-pii-entities-detection-job \
    --job-id 123456abcdeb0e11022f22a11EXAMPLE
```

Output:

```
{
    "JobId": "123456abcdeb0e11022f22a11EXAMPLE,
    "JobStatus": "STOP_REQUESTED"
```

```
}
```

For more information, see Async analysis for Amazon Comprehend insights in the *Amazon Comprehend Developer Guide*.

- For API details, see StopPiiEntitiesDetectionJob in *AWS CLI Command Reference*.

`stop-sentiment-detection-job`

The following code example shows how to use `stop-sentiment-detection-job`.

AWS CLI

To stop an asynchronous sentiment detection job

The following `stop-sentiment-detection-job` example stops an in-progress, asynchronous sentiment detection job. If the current job state is `IN_PROGRESS` the job is marked for termination and put into the `STOP_REQUESTED` state. If the job completes before it can be stopped, it is put into the `COMPLETED` state.

```
aws comprehend stop-sentiment-detection-job \
    --job-id 123456abcdeb0e11022f22a11EXAMPLE
```

Output:

```
{
    "JobId": "123456abcdeb0e11022f22a11EXAMPLE,
    "JobStatus": "STOP_REQUESTED"
}
```

For more information, see Async analysis for Amazon Comprehend insights in the *Amazon Comprehend Developer Guide*.

- For API details, see StopSentimentDetectionJob in *AWS CLI Command Reference*.

`stop-targeted-sentiment-detection-job`

The following code example shows how to use `stop-targeted-sentiment-detection-job`.

AWS CLI

To stop an asynchronous targeted sentiment detection job

The following `stop-targeted-sentiment-detection-job` example stops an in-progress, asynchronous targeted sentiment detection job. If the current job state is `IN_PROGRESS` the job is marked for termination and put into the `STOP_REQUESTED` state. If the job completes before it can be stopped, it is put into the `COMPLETED` state.

```
aws comprehend stop-targeted-sentiment-detection-job \
    --job-id 123456abcdeb0e11022f22a11EXAMPLE
```

Output:

```
{
    "JobId": "123456abcdeb0e11022f22a11EXAMPLE,
    "JobStatus": "STOP_REQUESTED"
}
```

For more information, see Async analysis for Amazon Comprehend insights in the *Amazon Comprehend Developer Guide*.

- For API details, see StopTargetedSentimentDetectionJob in *AWS CLI Command Reference*.

stop-training-document-classifier

The following code example shows how to use `stop-training-document-classifier`.

AWS CLI

To stop the training of a document classifier model

The following `stop-training-document-classifier` example stops the training of a document classifier model while in-progress.

```
aws comprehend stop-training-document-classifier
    --document-classifier-arn arn:aws:comprehend:us-west-2:111122223333:document-classifier/example-classifier
```

This command produces no output.

For more information, see Creating and managing custom models in the *Amazon Comprehend Developer Guide*.

- For API details, see StopTrainingDocumentClassifier in *AWS CLI Command Reference*.

`stop-training-entity-recognizer`

The following code example shows how to use `stop-training-entity-recognizer`.

AWS CLI

To stop the training of an entity recognizer model

The following `stop-training-entity-recognizer` example stops the training of an entity recognizer model while in-progress.

```
aws comprehend stop-training-entity-recognizer
    --entity-recognizer-arn "arn:aws:comprehend:us-west-2:111122223333:entity-
recognizer/examplerecognizer1"
```

This command produces no output.

For more information, see Creating and managing custom models in the *Amazon Comprehend Developer Guide*.

- For API details, see StopTrainingEntityRecognizer in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

Example 1: To tag a resource

The following `tag-resource` example adds a single tag to an Amazon Comprehend resource.

```
aws comprehend tag-resource \
    --resource-arn arn:aws:comprehend:us-west-2:111122223333:document-classifier/
example-classifier/version/1 \
    --tags Key=Location,Value=Seattle
```

This command has no output.

For more information, see Tagging your resources in the *Amazon Comprehend Developer Guide*.

Example 2: To add multiple tags to a resource

The following `tag-resource` example adds multiple tags to an Amazon Comprehend resource.

```
aws comprehend tag-resource \
    --resource-arn "arn:aws:comprehend:us-west-2:111122223333:document-classifier/
example-classifier/version/1" \
    --tags Key=location,Value=Seattle Key=Department,Value=Finance
```

This command has no output.

For more information, see Tagging your resources in the *Amazon Comprehend Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

Example 1: To remove a single tag from a resource

The following `untag-resource` example removes a single tag from an Amazon Comprehend resource.

```
aws comprehend untag-resource \
    --resource-arn arn:aws:comprehend:us-west-2:111122223333:document-classifier/
example-classifier/version/1
    --tag-keys Location
```

This command produces no output.

For more information, see Tagging your resources in the *Amazon Comprehend Developer Guide*.

Example 2: To remove multiple tags from a resource

The following `untag-resource` example removes multiple tags from an Amazon Comprehend resource.

```
aws comprehend untag-resource \
    --resource-arn arn:aws:comprehend:us-west-2:111122223333:document-classifier/
example-classifier/version/1
    --tag-keys Location Department
```

This command produces no output.

For more information, see Tagging your resources in the *Amazon Comprehend Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-endpoint`

The following code example shows how to use `update-endpoint`.

AWS CLI

Example 1: To update an endpoint's inference units

The following `update-endpoint` example updates information about an endpoint. In this example, the number of inference units is increased.

```
aws comprehend update-endpoint \
    --endpoint-arn arn:aws:comprehend:us-west-2:111122223333:document-classifier-endpoint/example-classifier-endpoint
    --desired-inference-units 2
```

This command produces no output.

For more information, see Managing Amazon Comprehend endpoints in the *Amazon Comprehend Developer Guide*.

Example 2: To update an endpoint's actie model

The following `update-endpoint` example updates information about an endpoint. In this example, the active model is changed.

```
aws comprehend update-endpoint \
    --endpoint-arn arn:aws:comprehend:us-west-2:111122223333:document-classifier-endpoint/example-classifier-endpoint
    --active-model-arn arn:aws:comprehend:us-west-2:111122223333:document-classifier/example-classifier-new
```

This command produces no output.

For more information, see Managing Amazon Comprehend endpoints in the *Amazon Comprehend Developer Guide*.

- For API details, see UpdateEndpoint in *AWS CLI Command Reference*.

`update-flywheel`

The following code example shows how to use `update-flywheel`.

AWS CLI

To update a flywheel configuration

The following `update-flywheel` example updates a flywheel configuration. In this example, the active model for the flywheel is updated.

```
aws comprehend update-flywheel \
    --flywheel-arn arn:aws:comprehend:us-west-2:111122223333:flywheel/example-flywheel-1 \
    --active-model-arn arn:aws:comprehend:us-west-2:111122223333:document-classifier/example-classifier/version/new-example-classifier-model
```

Output:

```
{
    "FlywheelProperties": {
        "FlywheelArn": "arn:aws:comprehend:us-west-2:111122223333:flywheel/flywheel-entity",
        "ActiveModelArn": "arn:aws:comprehend:us-west-2:111122223333:document-classifier/example-classifier/version/new-example-classifier-model",
        "DataAccessRoleArn": "arn:aws:iam::111122223333:role/service-role/AmazonComprehendServiceRole-example-role",
        "TaskConfig": {
            "LanguageCode": "en",
            "DocumentClassificationConfig": {
                "Mode": "MULTI_CLASS"
            }
        },
        "DataLakeS3Uri": "s3://amzn-s3-demo-bucket/flywheel-entity/schemaVersion=1/20230616T200543Z/",
        "DataSecurityConfig": {},
        "Status": "ACTIVE",
        "ModelType": "DOCUMENT_CLASSIFIER",
        "CreationTime": "2023-06-16T20:05:43.242000+00:00",
        "LastModifiedTime": "2023-06-19T04:00:43.027000+00:00",
        "LatestFlywheelIteration": "20230619T040032Z"
    }
}
```

For more information, see Flywheel overview in the *Amazon Comprehend Developer Guide*.

- For API details, see UpdateFlywheel in *AWS CLI Command Reference*.

Amazon Comprehend Medical examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Comprehend Medical.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Actions

`describe-entities-detection-v2-job`

The following code example shows how to use `describe-entities-detection-v2-job`.

AWS CLI

To describe an entities detection job

The following `describe-entities-detection-v2-job` example displays the properties associated with an asynchronous entity detection job.

```
aws comprehendmedical describe-entities-detection-v2-job \
    --job-id "ab9887877365fe70299089371c043b96"
```

Output:

```
{
    "ComprehendMedicalAsyncJobProperties": {
        "JobId": "ab9887877365fe70299089371c043b96",
        "JobStatus": "COMPLETED",
        "SubmitTime": "2020-03-18T21:20:15.614000+00:00",
```

```
        "EndTime": "2020-03-18T21:27:07.350000+00:00",
        "ExpirationTime": "2020-07-16T21:20:15+00:00",
        "InputDataConfig": {
            "S3Bucket": "comp-med-input",
            "S3Key": ""
        },
        "OutputDataConfig": {
            "S3Bucket": "comp-med-output",
            "S3Key": "867139942017-EntitiesDetection-
ab9887877365fe70299089371c043b96/"
        },
        "LanguageCode": "en",

    }
}
```

For more information, see Batch APIs in the *Amazon Comprehend Medical Developer Guide*.

- For API details, see DescribeEntitiesDetectionV2Job in *AWS CLI Command Reference*.

`describe-icd10-cm-inference-job`

The following code example shows how to use `describe-icd10-cm-inference-job`.

AWS CLI

To describe an ICD-10-CM inference job

The following `describe-icd10-cm-inference-job` example describes the properties of the requested inference job with the specified job-id.

```
aws comprehendmedical describe-icd10-cm-inference-job \
    --job-id "5780034166536cdb52ffa3295a1b00a7"
```

Output:

```
{
    "ComprehendMedicalAsyncJobProperties": {
        "JobId": "5780034166536cdb52ffa3295a1b00a7",
        "JobStatus": "COMPLETED",
        "SubmitTime": "2020-05-18T21:20:15.614000+00:00",
```

```
        "EndTime": "2020-05-18T21:27:07.350000+00:00",
        "ExpirationTime": "2020-09-16T21:20:15+00:00",
        "InputDataConfig": {
            "S3Bucket": "comp-med-input",
            "S3Key": "AKIAIOSFODNN7EXAMPLE"
        },
        "OutputDataConfig": {
            "S3Bucket": "comp-med-output",
            "S3Key": "AKIAIOSFODNN7EXAMPLE"
        },
        "LanguageCode": "en",
        "DataAccessRoleArn": "arn:aws:iam::867139942017:role/
ComprehendMedicalBatchProcessingRole",
        "ModelVersion":  "0.1.0"
    }
}
```

For more information, see Ontology linking batch analysis in the *Amazon Comprehend Medical Developer Guide*.

- For API details, see DescribeIcd10CmInferenceJob in *AWS CLI Command Reference*.

`describe-phi-detection-job`

The following code example shows how to use `describe-phi-detection-job`.

AWS CLI

To describe a PHI detection job

The following `describe-phi-detection-job` example displays the properties associated with an asynchronous protected health information (PHI) detection job.

```
aws comprehendmedical describe-phi-detection-job \
    --job-id "4750034166536cdb52ffa3295a1b00a3"
```

Output:

```
{
    "ComprehendMedicalAsyncJobProperties": {
        "JobId": "4750034166536cdb52ffa3295a1b00a3",
        "JobStatus": "COMPLETED",
```

        "ExpirationTime": "2020-07-17T20:38:37+00:00",
        "InputDataConfig": {
            "S3Bucket": "comp-med-input",
            "S3Key": ""
        },
        "OutputDataConfig": {
            "S3Bucket": "comp-med-output",
            "S3Key": "867139942017-PHIDetection-4750034166536cdb52ffa3295a1b00a3/"
        },
        "LanguageCode": "en",
        "DataAccessRoleArn": "arn:aws:iam::867139942017:role/
ComprehendMedicalBatchProcessingRole",
        "ModelVersion": "PHIModelV20190903"
    }
}
```

For more information, see Batch APIs in the *Amazon Comprehend Medical Developer Guide*.

- For API details, see DescribePhiDetectionJob in *AWS CLI Command Reference*.

`describe-rx-norm-inference-job`

The following code example shows how to use `describe-rx-norm-inference-job`.

AWS CLI

To describe an RxNorm inference job

The following `describe-rx-norm-inference-job` example describes the properties of the requested inference job with the specified job-id.

```
aws comprehendmedical describe-rx-norm-inference-job \
    --job-id "eg8199877365fc70299089371c043b96"
```

Output:

```
{
    "ComprehendMedicalAsyncJobProperties": {
        "JobId": "g8199877365fc70299089371c043b96",

            "S3Key": "AKIAIOSFODNN7EXAMPLE"
        },
        "OutputDataConfig": {
            "S3Bucket": "comp-med-output",
            "S3Key": "AKIAIOSFODNN7EXAMPLE"
        },
        "LanguageCode": "en",
        "DataAccessRoleArn": "arn:aws:iam::867139942017:role/
ComprehendMedicalBatchProcessingRole",
        "ModelVersion": "0.0.0"
    }
}
```

For more information, see Ontology linking batch analysis in the *Amazon Comprehend Medical Developer Guide*.

- For API details, see DescribeRxNormInferenceJob in *AWS CLI Command Reference*.

`describe-snomedct-inference-job`

The following code example shows how to use `describe-snomedct-inference-job`.

AWS CLI

To describe an SNOMED CT inference job

The following `describe-snomedct-inference-job` example describes the properties of the requested inference job with the specified job-id.

```
aws comprehendmedical describe-snomedct-inference-job \
    --job-id "2630034166536cdb52ffa3295a1b00a7"
```

Output:

```
{
    "ComprehendMedicalAsyncJobProperties": {
        "JobId": "2630034166536cdb52ffa3295a1b00a7",
        "JobStatus": "COMPLETED",
        "SubmitTime": "2021-12-18T21:20:15.614000+00:00",
```

```
        "EndTime": "2021-12-18T21:27:07.350000+00:00",
        "ExpirationTime": "2022-05-16T21:20:15+00:00",
        "InputDataConfig": {
            "S3Bucket": "comp-med-input",
            "S3Key": "AKIAIOSFODNN7EXAMPLE"
        },
        "OutputDataConfig": {
            "S3Bucket": "comp-med-output",
            "S3Key": "AKIAIOSFODNN7EXAMPLE"
        },
        "LanguageCode": "en",
        "DataAccessRoleArn": "arn:aws:iam::867139942017:role/
ComprehendMedicalBatchProcessingRole",
        "ModelVersion":  "0.1.0"
    }
}
```

For more information, see Ontology linking batch analysis in the *Amazon Comprehend Medical Developer Guide*.

- For API details, see DescribeSnomedctInferenceJob in *AWS CLI Command Reference*.

`detect-entities-v2`

The following code example shows how to use `detect-entities-v2`.

AWS CLI

Example 1: To detect entities directly from text

The following `detect-entities-v2` example shows the detected entities and labels them according to type, directly from input text.

```
aws comprehendmedical detect-entities-v2 \
    --text "Sleeping trouble on present dosage of Clonidine. Severe rash on face and
 leg, slightly itchy."
```

Output:

```
{
    "Id": 0,
    "BeginOffset": 38,
    "EndOffset": 47,
```

```
    "Score": 0.9942955374717712,
    "Text": "Clonidine",
    "Category": "MEDICATION",
    "Type": "GENERIC_NAME",
    "Traits": []
}
```

For more information, see Detect Entities Version 2 in the *Amazon Comprehend Medical Developer Guide*.

Example 2: To detect entities from a file path

The following `detect-entities-v2` example shows the detected entities and labels them according to type from a file path.

```
aws comprehendmedical detect-entities-v2 \
    --text file://medical_entities.txt
```

Contents of `medical_entities.txt`:

```
{
    "Sleeping trouble on present dosage of Clonidine. Severe rash on face and leg,
 slightly itchy."
}
```

Output:

```
{
    "Id": 0,
    "BeginOffset": 38,
    "EndOffset": 47,
    "Score": 0.9942955374717712,
    "Text": "Clonidine",
    "Category": "MEDICATION",

    "Traits": []
}
```

For more information, see Detect Entities Version 2 in the *Amazon Comprehend Medical Developer Guide*.

- For API details, see DetectEntitiesV2 in *AWS CLI Command Reference*.

detect-phi

The following code example shows how to use `detect-phi`.

AWS CLI

Example 1: To detect protected health information (PHI) directly from text

The following `detect-phi` example displays the detected protected health information (PHI) entities directly from input text.

```
aws comprehendmedical detect-phi \
    --text "Patient Carlos Salazar presented with rash on his upper extremities and
 dry cough. He lives at 100 Main Street, Anytown, USA where he works from his home
 as a carpenter."
```

Output:

```
{
    "Entities": [
        {
            "Id": 0,
            "BeginOffset": 8,

Example 2: To detect medical condition entities and link to the ICD-10-CM Ontology from a file pathway

The following `infer-icd-10-cm` example labels the detected medical condition entities and links those entities with codes in the 2019 edition of the International Classification of Diseases Clinical Modification (ICD-10-CM).

```
aws comprehendmedical infer-icd10-cm \
    --text file://icd10cm.txt
```

Contents of `icd10cm.txt`:

```
{
    "The patient complains of abdominal pain, has a long-standing history of
 diabetes treated with Micronase daily."
}
```

Output:

```

`start-entities-detection-v2-job`

The following code example shows how to use `start-entities-detection-v2-job`.

AWS CLI

To start an entities detection job

The following `start-entities-detection-v2-job` example starts an asynchronous entity detection job.

```
aws comprehendmedical start-entities-detection-v2-job \
    --input-data-config "S3Bucket=comp-med-input" \
    --output-data-config "S3Bucket=comp-med-output" \
    --data-access-role-arn arn:aws:iam::867139942017:role/
ComprehendMedicalBatchProcessingRole \
    --language-code en
```

Output:

```
{
    "JobId": "ab9887877365fe70299089371c043b96"
}
```

For more information, see Batch APIs in the *Amazon Comprehend Medical Developer Guide*.

- For API details, see StartEntitiesDetectionV2Job in *AWS CLI Command Reference*.

`start-icd10-cm-inference-job`

The following code example shows how to use `start-icd10-cm-inference-job`.

AWS CLI

To start an ICD-10-CM inference job

The following `start-icd10-cm-inference-job` example starts an ICD-10-CM inference batch analysis job.

```
aws comprehendmedical start-icd10-cm-inference-job \
    --input-data-config "S3Bucket=comp-med-input" \
    --output-data-config "S3Bucket=comp-med-output" \
    --data-access-role-arn arn:aws:iam::867139942017:role/
ComprehendMedicalBatchProcessingRole \
    --language-code en
```

Output:

```
{
    "JobId": "ef7289877365fc70299089371c043b96"
```

```
}
```

For more information, see Ontology linking batch analysis in the *Amazon Comprehend Medical Developer Guide*.

- For API details, see StartIcd10CmInferenceJob in *AWS CLI Command Reference*.

`start-phi-detection-job`

The following code example shows how to use `start-phi-detection-job`.

AWS CLI

To start a PHI detection job

The following `start-phi-detection-job` example starts an asynchronous PHI entity detection job.

```
aws comprehendmedical start-phi-detection-job \
    --input-data-config "S3Bucket=comp-med-input" \
    --output-data-config "S3Bucket=comp-med-output" \
    --data-access-role-arn arn:aws:iam::867139942017:role/
ComprehendMedicalBatchProcessingRole \

- For API details, see StartRxNormInferenceJob in *AWS CLI Command Reference*.

`start-snomedct-inference-job`

The following code example shows how to use `start-snomedct-inference-job`.

AWS CLI

To start an SNOMED CT inference job

The following `start-snomedct-inference-job` example starts a SNOMED CT inference batch analysis job.

```
aws comprehendmedical start-snomedct-inference-job \
    --input-data-config "S3Bucket=comp-med-input" \
    --output-data-config "S3Bucket=comp-med-output" \
    --data-access-role-arn arn:aws:iam::867139942017:role/
ComprehendMedicalBatchProcessingRole \
    --language-code en
```

Output:

```
{
    "JobId": "dg7289877365fc70299089371c043b96"
}
```

For more information, see Ontology linking batch analysis in the *Amazon Comprehend Medical Developer Guide*.

- For API details, see StartSnomedctInferenceJob in *AWS CLI Command Reference*.

`stop-entities-detection-v2-job`

The following code example shows how to use `stop-entities-detection-v2-job`.

AWS CLI

To stop an entity detection job

The following `stop-entities-detection-v2-job` example stops an asynchronous entity detection job.

```
aws comprehendmedical stop-entities-detection-v2-job \
    --job-id "ab9887877365fe70299089371c043b96"
```

Output:

```
{
    "JobId": "ab9887877365fe70299089371c043b96"
}
```

For more information, see Batch APIs in the *Amazon Comprehend Medical Developer Guide*.

- For API details, see StopEntitiesDetectionV2Job in *AWS CLI Command Reference*.

`stop-icd10-cm-inference-job`

The following code example shows how to use `stop-icd10-cm-inference-job`.

AWS CLI

To stop an ICD-10-CM inference job

The following `stop-icd10-cm-inference-job` example stops an ICD-10-CM inference batch analysis job.

```
aws comprehendmedical stop-icd10-cm-inference-job \
    --job-id "4750034166536cdb52ffa3295a1b00a3"
```

Output:

```
{
    "JobId": "ef7289877365fc70299089371c043b96",
}
```

For more information, see Ontology linking batch analysis in the *Amazon Comprehend Medical Developer Guide*.

- For API details, see StopIcd10CmInferenceJob in *AWS CLI Command Reference*.

`stop-phi-detection-job`

The following code example shows how to use `stop-phi-detection-job`.

AWS CLI

To stop a protected health information (PHI) detection job

The following `stop-phi-detection-job` example stops an asynchronous protected health information (PHI) detection job.

```
aws comprehendmedical stop-phi-detection-job \
    --job-id "4750034166536cdb52ffa3295a1b00a3"
```

Output:

```
{
    "JobId": "ab9887877365fe70299089371c043b96"
}
```

For more information, see Batch APIs in the *Amazon Comprehend Medical Developer Guide*.

- For API details, see StopPhiDetectionJob in *AWS CLI Command Reference*.

`stop-rx-norm-inference-job`

The following code example shows how to use `stop-rx-norm-inference-job`.

AWS CLI

To stop an RxNorm inference job

The following `stop-rx-norm-inference-job` example stops an ICD-10-CM inference batch analysis job.

```
aws comprehendmedical stop-rx-norm-inference-job \
    --job-id "eg8199877365fc70299089371c043b96"
```

Output:

```
{
    "JobId": "eg8199877365fc70299089371c043b96",
}
```

For more information, see Ontology linking batch analysis in the *Amazon Comprehend Medical Developer Guide*.

- For API details, see StopRxNormInferenceJob in *AWS CLI Command Reference*.

`stop-snomedct-inference-job`

The following code example shows how to use `stop-snomedct-inference-job`.

AWS CLI

To stop a SNOMED CT inference job

The following `stop-snomedct-inference-job` example stops a SNOMED CT inference batch analysis job.

```
aws comprehendmedical stop-snomedct-inference-job \
    --job-id "8750034166436cdb52ffa3295a1b00a1"
```

Output:

```
{
    "JobId": "8750034166436cdb52ffa3295a1b00a1",
}
```

For more information, see [Ontology linking batch analysis]() in the *Amazon Comprehend Medical Developer Guide*.

- For API details, see [StopSnomedctInferenceJob]() in *AWS CLI Command Reference*.

AWS Config examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Config.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions]()

Actions

`delete-config-rule`

The following code example shows how to use `delete-config-rule`.

AWS CLI

To delete an AWS Config rule

The following command deletes an AWS Config rule named `MyConfigRule`:

```
aws configservice delete-config-rule --config-rule-name MyConfigRule
```

- For API details, see [DeleteConfigRule]() in *AWS CLI Command Reference*.

`delete-delivery-channel`

The following code example shows how to use `delete-delivery-channel`.

AWS CLI

To delete a delivery channel

The following command deletes the default delivery channel:

```
aws configservice delete-delivery-channel --delivery-channel-name default
```

- For API details, see DeleteDeliveryChannel in *AWS CLI Command Reference*.

`delete-evaluation-results`

The following code example shows how to use `delete-evaluation-results`.

AWS CLI

To manually delete evaluation results

The following command deletes the current evaluation results for the AWS managed rule s3-bucket-versioning-enabled:

```
aws configservice delete-evaluation-results --config-rule-name s3-bucket-versioning-
enabled
```

- For API details, see DeleteEvaluationResults in *AWS CLI Command Reference*.

`deliver-config-snapshot`

The following code example shows how to use `deliver-config-snapshot`.

AWS CLI

To deliver a configuration snapshot

The following command delivers a configuration snapshot to the Amazon S3 bucket that belongs to the default delivery channel:

```
aws configservice deliver-config-snapshot --delivery-channel-name default
```

Output:

```
{
    "configSnapshotId": "d0333b00-a683-44af-921e-examplefb794"
}
```

- For API details, see DeliverConfigSnapshot in *AWS CLI Command Reference*.

`describe-compliance-by-config-rule`

The following code example shows how to use `describe-compliance-by-config-rule`.

AWS CLI

To get compliance information for your AWS Config rules

The following command returns compliance information for each AWS Config rule that is violated by one or more AWS resources:

```
aws configservice describe-compliance-by-config-rule --compliance-
types NON_COMPLIANT
```

In the output, the value for each `CappedCount` attribute indicates how many resources do not comply with the related rule. For example, the following output indicates that 3 resources do not comply with the rule named `InstanceTypesAreT2micro`.

Output:

```
{
    "ComplianceByConfigRules": [
        {
            "Compliance": {
                "ComplianceContributorCount": {
                    "CappedCount": 3,
                    "CapExceeded": false
                },
                "ComplianceType": "NON_COMPLIANT"
```

```
            },
            "ConfigRuleName": "InstanceTypesAreT2micro"
        },
        {
            "Compliance": {
                "ComplianceContributorCount": {
                    "CappedCount": 10,
                    "CapExceeded": false
                },
                "ComplianceType": "NON_COMPLIANT"
            },
            "ConfigRuleName": "RequiredTagsForVolumes"
        }
    ]
}
```

- For API details, see DescribeComplianceByConfigRule in *AWS CLI Command Reference*.

`describe-compliance-by-resource`

The following code example shows how to use `describe-compliance-by-resource`.

AWS CLI

To get compliance information for your AWS resources

The following command returns compliance information for each EC2 instance that is recorded by AWS Config and that violates one or more rules:

```
aws configservice describe-compliance-by-resource --resource-type AWS::EC2::Instance
 --compliance-types NON_COMPLIANT
```

In the output, the value for each `CappedCount` attribute indicates how many rules the resource violates. For example, the following output indicates that instance `i-1a2b3c4d` violates 2 rules.

Output:

```
{
    "ComplianceByResources": [
        {
            "ResourceType": "AWS::EC2::Instance",
```

```
                "ResourceId": "i-1a2b3c4d",
                "Compliance": {
                    "ComplianceContributorCount": {
                        "CappedCount": 2,
                        "CapExceeded": false
                    },
                    "ComplianceType": "NON_COMPLIANT"
                }
            },
            {
                "ResourceType": "AWS::EC2::Instance",
                "ResourceId": "i-2a2b3c4d ",
                "Compliance": {
                    "ComplianceContributorCount": {
                        "CappedCount": 3,
                        "CapExceeded": false
                    },
                    "ComplianceType": "NON_COMPLIANT"
                }
            }
        ]
}
```

- For API details, see DescribeComplianceByResource in *AWS CLI Command Reference*.

`describe-config-rule-evaluation-status`

The following code example shows how to use `describe-config-rule-evaluation-status`.

AWS CLI

To get status information for an AWS Config rule

The following command returns the status information for an AWS Config rule named `MyConfigRule`:

```
aws configservice describe-config-rule-evaluation-status --config-rule-
names MyConfigRule
```

Output:

```
{
```

```
    "ConfigRulesEvaluationStatus": [
        {
            "ConfigRuleArn": "arn:aws:config:us-east-1:123456789012:config-rule/
config-rule-abcdef",
            "FirstActivatedTime": 1450311703.844,
            "ConfigRuleId": "config-rule-abcdef",
            "LastSuccessfulInvocationTime": 1450314643.156,
            "ConfigRuleName": "MyConfigRule"
        }
    ]
}
```

- For API details, see DescribeConfigRuleEvaluationStatus in *AWS CLI Command Reference*.

`describe-config-rules`

The following code example shows how to use `describe-config-rules`.

AWS CLI

To get details for an AWS Config rule

The following command returns details for an AWS Config rule named `InstanceTypesAreT2micro`:

```
aws configservice describe-config-rules --config-rule-names InstanceTypesAreT2micro
```

Output:

```
{
    "ConfigRules": [
        {
            "ConfigRuleState": "ACTIVE",
            "Description": "Evaluates whether EC2 instances are the t2.micro type.",
            "ConfigRuleName": "InstanceTypesAreT2micro",
            "ConfigRuleArn": "arn:aws:config:us-east-1:123456789012:config-rule/
config-rule-abcdef",
            "Source": {
                "Owner": "CUSTOM_LAMBDA",
                "SourceIdentifier": "arn:aws:lambda:us-
east-1:123456789012:function:InstanceTypeCheck",
                "SourceDetails": [
```

```
                    {
                        "EventSource": "aws.config",
                        "MessageType": "ConfigurationItemChangeNotification"
                    }
                ]
            },
            "InputParameters": "{\"desiredInstanceType\":\"t2.micro\"}",
            "Scope": {
                "ComplianceResourceTypes": [
                    "AWS::EC2::Instance"
                ]
            },
            "ConfigRuleId": "config-rule-abcdef"
        }
    ]
}
```

- For API details, see DescribeConfigRules in *AWS CLI Command Reference*.

`describe-configuration-recorder-status`

The following code example shows how to use `describe-configuration-recorder-status`.

AWS CLI

To get status information for the configuration recorder

The following command returns the status of the default configuration recorder:

```
aws configservice describe-configuration-recorder-status
```

Output:

```
{
    "ConfigurationRecordersStatus": [
        {
            "name": "default",
            "lastStatus": "SUCCESS",
            "recording": true,
            "lastStatusChangeTime": 1452193834.344,
            "lastStartTime": 1441039997.819,
            "lastStopTime": 1441039992.835
```

```
        }
    ]
}
```

- For API details, see DescribeConfigurationRecorderStatus in *AWS CLI Command Reference*.

`describe-configuration-recorders`

The following code example shows how to use `describe-configuration-recorders`.

AWS CLI

To get details about the configuration recorder

The following command returns details about the default configuration recorder:

```
aws configservice describe-configuration-recorders
```

Output:

```
{
    "ConfigurationRecorders": [
        {
            "recordingGroup": {
                "allSupported": true,
                "resourceTypes": [],
                "includeGlobalResourceTypes": true
            },
            "roleARN": "arn:aws:iam::123456789012:role/config-ConfigRole-
A1B2C3D4E5F6",
            "name": "default"
        }
    ]
}
```

- For API details, see DescribeConfigurationRecorders in *AWS CLI Command Reference*.

`describe-delivery-channel-status`

The following code example shows how to use `describe-delivery-channel-status`.

AWS CLI

To get status information for the delivery channel

The following command returns the status of the delivery channel:

```
aws configservice describe-delivery-channel-status
```

Output:

```
{
    "DeliveryChannelsStatus": [
        {
            "configStreamDeliveryInfo": {
                "lastStatusChangeTime": 1452193834.381,
                "lastStatus": "SUCCESS"
            },
            "configHistoryDeliveryInfo": {
                "lastSuccessfulTime": 1450317838.412,
                "lastStatus": "SUCCESS",
                "lastAttemptTime": 1450317838.412
            },
            "configSnapshotDeliveryInfo": {
                "lastSuccessfulTime": 1452185597.094,
                "lastStatus": "SUCCESS",
                "lastAttemptTime": 1452185597.094
            },
            "name": "default"
        }
    ]
}
```

- For API details, see DescribeDeliveryChannelStatus in *AWS CLI Command Reference*.

`describe-delivery-channels`

The following code example shows how to use `describe-delivery-channels`.

AWS CLI

To get details about the delivery channel

The following command returns details about the delivery channel:

```
aws configservice describe-delivery-channels
```

Output:

```
{
    "DeliveryChannels": [
        {
            "snsTopicARN": "arn:aws:sns:us-east-1:123456789012:config-topic",
            "name": "default",
            "s3BucketName": "config-bucket-123456789012"
        }
    ]
}
```

- For API details, see DescribeDeliveryChannels in *AWS CLI Command Reference*.

`get-compliance-details-by-config-rule`

The following code example shows how to use `get-compliance-details-by-config-rule`.

AWS CLI

To get the evaluation results for an AWS Config rule

The following command returns the evaluation results for all of the resources that don't comply with an AWS Config rule named `InstanceTypesAreT2micro`:

```
aws configservice get-compliance-details-by-config-rule --config-rule-
name InstanceTypesAreT2micro --compliance-types NON_COMPLIANT
```

Output:

```
{
    "EvaluationResults": [
        {
            "EvaluationResultIdentifier": {
                "OrderingTimestamp": 1450314635.065,
                "EvaluationResultQualifier": {
```

```
                    "ResourceType": "AWS::EC2::Instance",
                    "ResourceId": "i-1a2b3c4d",
                    "ConfigRuleName": "InstanceTypesAreT2micro"
                }
            },
            "ResultRecordedTime": 1450314645.261,
            "ConfigRuleInvokedTime": 1450314642.948,
            "ComplianceType": "NON_COMPLIANT"
        },
        {
            "EvaluationResultIdentifier": {
                "OrderingTimestamp": 1450314635.065,
                "EvaluationResultQualifier": {
                    "ResourceType": "AWS::EC2::Instance",
                    "ResourceId": "i-2a2b3c4d",
                    "ConfigRuleName": "InstanceTypesAreT2micro"
                }
            },
            "ResultRecordedTime": 1450314645.18,
            "ConfigRuleInvokedTime": 1450314642.902,
            "ComplianceType": "NON_COMPLIANT"
        },
        {
            "EvaluationResultIdentifier": {
                "OrderingTimestamp": 1450314635.065,
                "EvaluationResultQualifier": {
                    "ResourceType": "AWS::EC2::Instance",
                    "ResourceId": "i-3a2b3c4d",
                    "ConfigRuleName": "InstanceTypesAreT2micro"
                }
            },
            "ResultRecordedTime": 1450314643.346,
            "ConfigRuleInvokedTime": 1450314643.124,
            "ComplianceType": "NON_COMPLIANT"
        }
    ]
}
```

- For API details, see GetComplianceDetailsByConfigRule in *AWS CLI Command Reference*.

get-compliance-details-by-resource

The following code example shows how to use `get-compliance-details-by-resource`.

AWS CLI

To get the evaluation results for an AWS resource

The following command returns the evaluation results for each rule with which the EC2 instance `i-1a2b3c4d` does not comply:

```
aws configservice get-compliance-details-by-resource --resource-type AWS::EC2::Instance --resource-id i-1a2b3c4d --compliance-types NON_COMPLIANT
```

Output:

```
{
    "EvaluationResults": [
        {
            "EvaluationResultIdentifier": {
                "OrderingTimestamp": 1450314635.065,
                "EvaluationResultQualifier": {
                    "ResourceType": "AWS::EC2::Instance",
                    "ResourceId": "i-1a2b3c4d",
                    "ConfigRuleName": "InstanceTypesAreT2micro"
                }
            },
            "ResultRecordedTime": 1450314643.288,
            "ConfigRuleInvokedTime": 1450314643.034,
            "ComplianceType": "NON_COMPLIANT"
        },
        {
            "EvaluationResultIdentifier": {
                "OrderingTimestamp": 1450314635.065,
                "EvaluationResultQualifier": {
                    "ResourceType": "AWS::EC2::Instance",
                    "ResourceId": "i-1a2b3c4d",
                    "ConfigRuleName": "RequiredTagForEC2Instances"
                }
            },
            "ResultRecordedTime": 1450314645.261,
            "ConfigRuleInvokedTime": 1450314642.948,
            "ComplianceType": "NON_COMPLIANT"
        }
    ]
}
```

- For API details, see GetComplianceDetailsByResource in *AWS CLI Command Reference*.

get-compliance-summary-by-config-rule

The following code example shows how to use `get-compliance-summary-by-config-rule`.

AWS CLI

To get the compliance summary for your AWS Config rules

The following command returns the number of rules that are compliant and the number that are noncompliant:

```
aws configservice get-compliance-summary-by-config-rule
```

In the output, the value for each `CappedCount` attribute indicates how many rules are compliant or noncompliant.

Output:

```
{
    "ComplianceSummary": {
        "NonCompliantResourceCount": {
            "CappedCount": 3,
            "CapExceeded": false
        },
        "ComplianceSummaryTimestamp": 1452204131.493,
        "CompliantResourceCount": {
            "CappedCount": 2,
            "CapExceeded": false
        }
    }
}
```

- For API details, see GetComplianceSummaryByConfigRule in *AWS CLI Command Reference*.

get-compliance-summary-by-resource-type

The following code example shows how to use `get-compliance-summary-by-resource-type`.

AWS CLI

To get the compliance summary for all resource types

The following command returns the number of AWS resources that are noncompliant and the number that are compliant:

```
aws configservice get-compliance-summary-by-resource-type
```

In the output, the value for each `CappedCount` attribute indicates how many resources are compliant or noncompliant.

Output:

```
{
    "ComplianceSummariesByResourceType": [
        {
            "ComplianceSummary": {
                "NonCompliantResourceCount": {
                    "CappedCount": 16,
                    "CapExceeded": false
                },
                "ComplianceSummaryTimestamp": 1453237464.543,
                "CompliantResourceCount": {
                    "CappedCount": 10,
                    "CapExceeded": false
                }
            }
        }
    ]
}
```

To get the compliance summary for a specific resource type

The following command returns the number of EC2 instances that are noncompliant and the number that are compliant:

```
aws configservice get-compliance-summary-by-resource-type --resource-
types AWS::EC2::Instance
```

In the output, the value for each `CappedCount` attribute indicates how many resources are compliant or noncompliant.

Output:

```
{
    "ComplianceSummariesByResourceType": [
        {
            "ResourceType": "AWS::EC2::Instance",
            "ComplianceSummary": {
                "NonCompliantResourceCount": {
                    "CappedCount": 3,
                    "CapExceeded": false
                },
                "ComplianceSummaryTimestamp": 1452204923.518,
                "CompliantResourceCount": {
                    "CappedCount": 7,
                    "CapExceeded": false
                }
            }
        }
    ]
}
```

- For API details, see GetComplianceSummaryByResourceType in *AWS CLI Command Reference*.

`get-resource-config-history`

The following code example shows how to use `get-resource-config-history`.

AWS CLI

To get the configuration history of an AWS resource

The following command returns a list of configuration items for an EC2 instance with an ID of `i-1a2b3c4d`:

```
aws configservice get-resource-config-history --resource-type AWS::EC2::Instance --
resource-id i-1a2b3c4d
```

- For API details, see GetResourceConfigHistory in *AWS CLI Command Reference*.

`get-status`

The following code example shows how to use `get-status`.

AWS CLI

To get the status for AWS Config

The following command returns the status of the delivery channel and configuration recorder:

```
aws configservice get-status
```

Output:

```
Configuration Recorders:

name: default
recorder: ON
last status: SUCCESS

Delivery Channels:

name: default
last stream delivery status: SUCCESS
last history delivery status: SUCCESS
last snapshot delivery status: SUCCESS
```

- For API details, see GetStatus in *AWS CLI Command Reference*.

`list-discovered-resources`

The following code example shows how to use `list-discovered-resources`.

AWS CLI

To list resources that AWS Config has discovered

The following command lists the EC2 instances that AWS Config has discovered:

```
aws configservice list-discovered-resources --resource-type AWS::EC2::Instance
```

Output:

```
{
    "resourceIdentifiers": [
```

```
        {
            "resourceType": "AWS::EC2::Instance",
            "resourceId": "i-1a2b3c4d"
        },
        {
            "resourceType": "AWS::EC2::Instance",
            "resourceId": "i-2a2b3c4d"
        },
        {
            "resourceType": "AWS::EC2::Instance",
            "resourceId": "i-3a2b3c4d"
        }
    ]
}
```

- For API details, see ListDiscoveredResources in *AWS CLI Command Reference*.

`put-config-rule`

The following code example shows how to use `put-config-rule`.

AWS CLI

To add an AWS managed Config rule

The following command provides JSON code to add an AWS managed Config rule:

```
aws configservice put-config-rule --config-rule file://
RequiredTagsForEC2Instances.json
```

`RequiredTagsForEC2Instances.json` is a JSON file that contains the rule configuration:

```
{
  "ConfigRuleName": "RequiredTagsForEC2Instances",
  "Description": "Checks whether the CostCenter and Owner tags are applied to EC2
 instances.",
  "Scope": {
    "ComplianceResourceTypes": [
      "AWS::EC2::Instance"
    ]
  },
  "Source": {
```

```
    "Owner": "AWS",
    "SourceIdentifier": "REQUIRED_TAGS"
  },
  "InputParameters": "{\"tag1Key\":\"CostCenter\",\"tag2Key\":\"Owner\"}"
}
```

For the `ComplianceResourceTypes` attribute, this JSON code limits the scope to resources of the `AWS::EC2::Instance` type, so AWS Config will evaluate only EC2 instances against the rule. Because the rule is a managed rule, the `Owner` attribute is set to `AWS`, and the `SourceIdentifier` attribute is set to the rule identifier, `REQUIRED_TAGS`. For the `InputParameters` attribute, the tag keys that the rule requires, `CostCenter` and `Owner`, are specified.

If the command succeeds, AWS Config returns no output. To verify the rule configuration, run the describe-config-rules command, and specify the rule name.

To add a customer managed Config rule

The following command provides JSON code to add a customer managed Config rule:

```
aws configservice put-config-rule --config-rule file://InstanceTypesAreT2micro.json
```

`InstanceTypesAreT2micro.json` is a JSON file that contains the rule configuration:

```
{
  "ConfigRuleName": "InstanceTypesAreT2micro",
  "Description": "Evaluates whether EC2 instances are the t2.micro type.",
  "Scope": {
    "ComplianceResourceTypes": [
      "AWS::EC2::Instance"
    ]
  },
  "Source": {
    "Owner": "CUSTOM_LAMBDA",
    "SourceIdentifier": "arn:aws:lambda:us-
east-1:123456789012:function:InstanceTypeCheck",
    "SourceDetails": [
      {
        "EventSource": "aws.config",
        "MessageType": "ConfigurationItemChangeNotification"
      }
    ]
```

```
  },
  "InputParameters": "{\"desiredInstanceType\":\"t2.micro\"}"
}
```

For the `ComplianceResourceTypes` attribute, this JSON code limits the scope to resources of the `AWS::EC2::Instance` type, so AWS Config will evaluate only EC2 instances against the rule. Because this rule is a customer managed rule, the `Owner` attribute is set to `CUSTOM_LAMBDA`, and the `SourceIdentifier` attribute is set to the ARN of the AWS Lambda function. The `SourceDetails` object is required. The parameters that are specified for the `InputParameters` attribute are passed to the AWS Lambda function when AWS Config invokes it to evaluate resources against the rule.

If the command succeeds, AWS Config returns no output. To verify the rule configuration, run the describe-config-rules command, and specify the rule name.

- For API details, see PutConfigRule in *AWS CLI Command Reference*.

put-configuration-recorder

The following code example shows how to use `put-configuration-recorder`.

AWS CLI

Example 1: To record all supported resources

The following command creates a configuration recorder that tracks changes to all supported resource types, including global resource types:

```
aws configservice put-configuration-recorder \
    --configuration-recorder name=default,roleARN=arn:aws:iam::123456789012:role/
config-role \
    --recording-group allSupported=true,includeGlobalResourceTypes=true
```

If the command succeeds, AWS Config returns no output. To verify the settings of your configuration recorder, run the describe-configuration-recorders command.

Example 2: To record specific types of resources

The following command creates a configuration recorder that tracks changes to only those types of resources that are specified in the JSON file for the --recording-group option:

```
aws configservice put-configuration-recorder \
    --configuration-recorder name=default,roleARN=arn:aws:iam::123456789012:role/
config-role \
    --recording-group file://recordingGroup.json
```

recordingGroup.json is a JSON file that specifies the types of resources that AWS Config will record:

```
{
    "allSupported": false,
    "includeGlobalResourceTypes": false,
    "resourceTypes": [
        "AWS::EC2::EIP",
        "AWS::EC2::Instance",
        "AWS::EC2::NetworkAcl",
        "AWS::EC2::SecurityGroup",
        "AWS::CloudTrail::Trail",
        "AWS::EC2::Volume",
        "AWS::EC2::VPC",
        "AWS::IAM::User",
        "AWS::IAM::Policy"
    ]
}
```

Before you can specify resource types for the resourceTypes key, you must set the allSupported and includeGlobalResourceTypes options to false or omit them.

If the command succeeds, AWS Config returns no output. To verify the settings of your configuration recorder, run the describe-configuration-recorders command.

Example 3: To select all supported resources excluding specific types of resources

The following command creates a configuration recorder that tracks changes to all current and future supported resource types excluding those types of resources that are specified in the JSON file for the --recording-group option:

```
aws configservice put-configuration-recorder \
    --configuration-recorder name=default,roleARN=arn:aws:iam::123456789012:role/
config-role \
    --recording-group file://recordingGroup.json
```

recordingGroup.json is a JSON file that specifies the types of resources that AWS Config will record:

```
{
    "allSupported": false,
    "exclusionByResourceTypes": {
        "resourceTypes": [
        "AWS::Redshift::ClusterSnapshot",
        "AWS::RDS::DBClusterSnapshot",
        "AWS::CloudFront::StreamingDistribution"
    ]
    },
        "includeGlobalResourceTypes": false,
        "recordingStrategy": {
        "useOnly": "EXCLUSION_BY_RESOURCE_TYPES"
    },
}
```

Before you can specify resource types to excluding from recording: 1) You must set the allSupported and includeGlobalResourceTypes options to false or omit them, and 2) You must set the useOnly field of RecordingStrategy to EXCLUSION_BY_RESOURCE_TYPES.

If the command succeeds, AWS Config returns no output. To verify the settings of your configuration recorder, run the describe-configuration-recorders command.

- For API details, see PutConfigurationRecorder in *AWS CLI Command Reference*.

`put-delivery-channel`

The following code example shows how to use `put-delivery-channel`.

AWS CLI

To create a delivery channel

The following command provides the settings for the delivery channel as JSON code:

```
aws configservice put-delivery-channel --delivery-channel file://
deliveryChannel.json
```

The `deliveryChannel.json` file specifies the delivery channel attributes:

```
{
    "name": "default",
    "s3BucketName": "config-bucket-123456789012",
    "snsTopicARN": "arn:aws:sns:us-east-1:123456789012:config-topic",
    "configSnapshotDeliveryProperties": {
        "deliveryFrequency": "Twelve_Hours"
    }
}
```

This example sets the following attributes:

`name` - The name of the delivery channel. By default, AWS Config assigns the name `default` to a new delivery channel.You cannot update the delivery channel name with the `put-delivery-channel` command. For the steps to change the name, see Renaming the Delivery Channel.`s3BucketName` - The name of the Amazon S3 bucket to which AWS Config delivers configuration snapshots and configuration history files.If you specify a bucket that belongs to another AWS account, that bucket must have policies that grant access permissions to AWS Config. For more information, see Permissions for the Amazon S3 Bucket.

`snsTopicARN` - The Amazon Resource Name (ARN) of the Amazon SNS topic to which AWS Config sends notifications about configuration changes.If you choose a topic from another account, the topic must have policies that grant access permissions to AWS Config. For more information, see Permissions for the Amazon SNS Topic.

`configSnapshotDeliveryProperties` - Contains the `deliveryFrequency` attribute, which sets how often AWS Config delivers configuration snapshots and how often it invokes evaluations for periodic Config rules.

If the command succeeds, AWS Config returns no output. To verify the settings of your delivery channel, run the describe-delivery-channels command.

- For API details, see PutDeliveryChannel in *AWS CLI Command Reference*.

`start-config-rules-evaluation`

The following code example shows how to use `start-config-rules-evaluation`.

AWS CLI

To run an on-demand evaluation for AWS Config rules

The following command starts an evaluation for two AWS managed rules:

```
aws configservice start-config-rules-evaluation --config-rule-names s3-bucket-versioning-enabled cloudtrail-enabled
```

- For API details, see StartConfigRulesEvaluation in *AWS CLI Command Reference*.

`start-configuration-recorder`

The following code example shows how to use `start-configuration-recorder`.

AWS CLI

To start the configuration recorder

The following command starts the default configuration recorder:

```
aws configservice start-configuration-recorder --configuration-recorder-name default
```

If the command succeeds, AWS Config returns no output. To verify that AWS Config is recording your resources, run the get-status command.

- For API details, see StartConfigurationRecorder in *AWS CLI Command Reference*.

`stop-configuration-recorder`

The following code example shows how to use `stop-configuration-recorder`.

AWS CLI

To stop the configuration recorder

The following command stops the default configuration recorder:

```
aws configservice stop-configuration-recorder --configuration-recorder-name default
```

If the command succeeds, AWS Config returns no output. To verify that AWS Config is not recording your resources, run the get-status command.

- For API details, see StopConfigurationRecorder in *AWS CLI Command Reference*.

`subscribe`

The following code example shows how to use `subscribe`.

AWS CLI

To subscribe to AWS Config

The following command creates the default delivery channel and configuration recorder. The command also specifies the Amazon S3 bucket and Amazon SNS topic to which AWS Config will deliver configuration information:

```
aws configservice subscribe --s3-bucket config-bucket-123456789012
 --sns-topic arn:aws:sns:us-east-1:123456789012:config-topic --iam-
role arn:aws:iam::123456789012:role/ConfigRole-A1B2C3D4E5F6
```

Output:

```
Using existing S3 bucket: config-bucket-123456789012
Using existing SNS topic: arn:aws:sns:us-east-1:123456789012:config-topic
Subscribe succeeded:

Configuration Recorders: [
    {
        "recordingGroup": {
            "allSupported": true,
            "resourceTypes": [],
            "includeGlobalResourceTypes": false
        },
        "roleARN": "arn:aws:iam::123456789012:role/ConfigRole-A1B2C3D4E5F6",
        "name": "default"
    }
]

Delivery Channels: [
    {
        "snsTopicARN": "arn:aws:sns:us-east-1:123456789012:config-topic",
        "name": "default",
        "s3BucketName": "config-bucket-123456789012"
    }
]
```

- For API details, see Subscribe in *AWS CLI Command Reference*.

Amazon Connect examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Connect.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-user`

The following code example shows how to use `create-user`.

AWS CLI

To create a user

The following `create-user` example adds a user with the specified attributes to the specified Amazon Connect instance.

```
aws connect create-user \
    --username Mary \
    --password Pass@Word1 \
    --identity-info FirstName=Mary,LastName=Major \
    --phone-
config PhoneType=DESK_PHONE,AutoAccept=true,AfterContactWorkTimeLimit=60,DeskPhoneNumber=
+15555551212 \
    --security-profile-id 12345678-1111-2222-aaaa-a1b2c3d4f5g7 \
    --routing-profile-id 87654321-9999-3434-abcd-x1y2z3a1b2c3 \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
```

```
    "UserId": "87654321-2222-1234-1234-111234567891",
    "UserArn": "arn:aws:connect:us-west-2:123456789012:instance/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/agent/87654321-2222-1234-1234-111234567891"
}
```

For more information, see Add Users in the *Amazon Connect Administrator Guide*.

- For API details, see CreateUser in *AWS CLI Command Reference*.

`delete-user`

The following code example shows how to use `delete-user`.

AWS CLI

To delete a user

The following `delete-user` example deletes the specified user from the specified Amazon Connect instance.

```
aws connect delete-user \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --user-id 87654321-2222-1234-1234-111234567891
```

This command produces no output.

For more information, see Manage Users in the *Amazon Connect Administrator Guide*.

- For API details, see DeleteUser in *AWS CLI Command Reference*.

`describe-user-hierarchy-group`

The following code example shows how to use `describe-user-hierarchy-group`.

AWS CLI

To display the details for a hierarchy group

The following `describe-user-hierarchy-group` example displays the details for the specified Amazon Connect hierarchy group.

```
aws connect describe-user-hierarchy-group \
```

```
    --hierarchy-group-id 12345678-1111-2222-800e-aaabbb555gg \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
     "HierarchyGroup": {
         "Id": "12345678-1111-2222-800e-a2b3c4d5f6g7",
         "Arn": "arn:aws:connect:us-west-2:123456789012:instance/a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111/agent-group/12345678-1111-2222-800e-a2b3c4d5f6g7",
         "Name": "Example Corporation",
         "LevelId": "1",
         "HierarchyPath": {
             "LevelOne": {
                 "Id": "abcdefgh-3333-4444-8af3-201123456789",
                 "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/agent-group/
abcdefgh-3333-4444-8af3-201123456789",
                 "Name": "Example Corporation"
             }
         }
     }
 }
```

For more information, see Set Up Agent Hierarchies in the *Amazon Connect Administrator Guide*.

- For API details, see DescribeUserHierarchyGroup in *AWS CLI Command Reference*.

`describe-user-hierarchy-structure`

The following code example shows how to use `describe-user-hierarchy-structure`.

AWS CLI

To display the details for a hierarchy structure

The following `describe-user-hierarchy-structure` example displays the details for the hierarchy structure for the specified Amazon Connect instance.

```
aws connect describe-user-hierarchy-group \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
     "HierarchyStructure": {
         "LevelOne": {
             "Id": "12345678-1111-2222-800e-aaabbb555gg",
             "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/agent-group-level/1",
             "Name": "Corporation"
         },
         "LevelTwo": {
             "Id": "87654321-2222-3333-ac99-123456789102",
             "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/agent-group-level/2",
             "Name": "Services Division"
         },
         "LevelThree": {
             "Id": "abcdefgh-3333-4444-8af3-201123456789",
             "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/agent-group-level/3",
             "Name": "EU Site"
         }
     }
 }
```

For more information, see Set Up Agent Hierarchies in the *Amazon Connect Administrator Guide*.

- For API details, see DescribeUserHierarchyStructure in *AWS CLI Command Reference*.

describe-user

The following code example shows how to use `describe-user`.

AWS CLI

To display the details for a user

The following `describe-user` example displays the details for the specified Amazon Connect user.

```
aws connect describe-user \
    --user-id 0c245dc0-0cf5-4e37-800e-2a7481cc8a60
    --instance-id 40c83b68-ea62-414c-97bb-d018e39e158e
```

Output:

```
{
    "User": {
        "Id": "0c245dc0-0cf5-4e37-800e-2a7481cc8a60",
        "Arn": "arn:aws:connect:us-west-2:123456789012:instance/40c83b68-
ea62-414c-97bb-d018e39e158e/agent/0c245dc0-0cf5-4e37-800e-2a7481cc8a60",
        "Username": "Jane",
        "IdentityInfo": {
            "FirstName": "Jane",
            "LastName": "Doe",
            "Email": "example.com"
        },
        "PhoneConfig": {
            "PhoneType": "SOFT_PHONE",
            "AutoAccept": false,
            "AfterContactWorkTimeLimit": 0,
            "DeskPhoneNumber": ""
        },
        "DirectoryUserId": "8b444cf6-b368-4f29-ba18-07af27405658",
        "SecurityProfileIds": [
            "b6f85a42-1dc5-443b-b621-de0abf70c9cf"
        ],
        "RoutingProfileId": "0be36ee9-2b5f-4ef4-bcf7-87738e5be0e5",
        "Tags": {}
    }
}
```

For more information, see Manage Users in the *Amazon Connect Administrator Guide*.

- For API details, see DescribeUser in *AWS CLI Command Reference*.

`get-contact-attributes`

The following code example shows how to use `get-contact-attributes`.

AWS CLI

To retrieve the attributes for a contact

The following `get-contact-attributes` example retrieves the attributes that were set for the specified Amazon Connect contact.

```
aws connect get-contact-attributes \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --initial-contact-id 12345678-1111-2222-800e-a2b3c4d5f6g7
```

Output:

```
{
    "Attributes": {
        "greetingPlayed": "true"
    }
}
```

For more information, see Use Amazon Connect Contact Attributes in the *Amazon Connect Administrator Guide*.

- For API details, see GetContactAttributes in *AWS CLI Command Reference*.

`list-contact-flows`

The following code example shows how to use `list-contact-flows`.

AWS CLI

To list the contact flows in an instance

The following `list-contact-flows` example lists the contact flows in the specified Amazon Connect instance.

```
aws connect list-contact-flows \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
     "ContactFlowSummaryList": [
         {
             "Id": "12345678-1111-2222-800e-a2b3c4d5f6g7",
             "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/contact-flow/12345678-1111-2222-800e-
a2b3c4d5f6g7",
```

```
                "Name": "Default queue transfer",
                "ContactFlowType": "QUEUE_TRANSFER"
            },
            {
                "Id": "87654321-2222-3333-ac99-123456789102",
                "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/contact-flow/87654321-2222-3333-
ac99-123456789102",
                "Name": "Default agent hold",
                "ContactFlowType": "AGENT_HOLD"
            },
            {
                "Id": "abcdefgh-3333-4444-8af3-201123456789",
                    "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/contact-flow/
abcdefgh-3333-4444-8af3-201123456789",
                "Name": "Default customer hold",
                "ContactFlowType": "CUSTOMER_HOLD"
            },
        ]
 }
```

For more information, see Create Amazon Connect Contact Flows in the *Amazon Connect Administrator Guide*.

- For API details, see ListContactFlows in *AWS CLI Command Reference*.

`list-hours-of-operations`

The following code example shows how to use `list-hours-of-operations`.

AWS CLI

To list the hours of operation in an instance

The following `list-hours-of-operations` example lists the hours of operations for the specified Amazon Connect instance.

```
aws connect list-hours-of-operations \
    --instance-id 40c83b68-ea62-414c-97bb-d018e39e158e
```

Output:

```
{
    "HoursOfOperationSummaryList": [
        {
            "Id": "d69f1f84-7457-4924-8fbe-e64875546259",
            "Arn": "arn:aws:connect:us-west-2:123456789012:instance/40c83b68-
ea62-414c-97bb-d018e39e158e/operating-hours/d69f1f84-7457-4924-8fbe-e64875546259",
            "Name": "Basic Hours"
        }
    ]
}
```

For more information, see Set the Hours of Operation for a Queue in the *Amazon Connect Administrator Guide*.

- For API details, see ListHoursOfOperations in *AWS CLI Command Reference*.

`list-phone-numbers`

The following code example shows how to use `list-phone-numbers`.

AWS CLI

To list the phone numbers in an instance

The following `list-phone-numbers` example lists the phone numbers in the specified Amazon Connect instance.

```
aws connect list-phone-numbers \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "PhoneNumberSummaryList": [
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/phone-number/xyz80zxy-xyz1-80zx-
zx80-11111EXAMPLE",
            "PhoneNumber": "+17065551212",
            "PhoneNumberType": "DID",
            "PhoneNumberCountryCode": "US"
```

```
        },
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/phone-number/ccc0ccc-xyz1-80zx-
zx80-22222EXAMPLE",
            "PhoneNumber": "+18555551212",
            "PhoneNumberType": "TOLL_FREE",
            "PhoneNumberCountryCode": "US"
        }
    ]
}
```

For more information, see Set Up Phone Numbers for Your Contact Center in the *Amazon Connect Administrator Guide*.

- For API details, see ListPhoneNumbers in *AWS CLI Command Reference*.

`list-queues`

The following code example shows how to use `list-queues`.

AWS CLI

To list the queues in an instance

The following `list-queues` example lists the queues in the specified Amazon Connect instance.

```
aws connect list-queues \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "QueueSummaryList": [
        {
            "Id": "12345678-1111-2222-800e-a2b3c4d5f6g7",
            "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/queue/agent/12345678-1111-2222-800e-
a2b3c4d5f6g7",
            "QueueType": "AGENT"
```

```
        },
        {
            "Id": "87654321-2222-3333-ac99-123456789102",
            "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/queue/agent/87654321-2222-3333-
ac99-123456789102",
            "QueueType": "AGENT"
        },
        {
            "Id": "abcdefgh-3333-4444-8af3-201123456789",
            "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/queue/agent/
abcdefgh-3333-4444-8af3-201123456789",
            "QueueType": "AGENT"
        },
        {
            "Id": "hgfedcba-4444-5555-a31f-123456789102",
            "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/queue/hgfedcba-4444-5555-a31f-123456789102",
            "Name": "BasicQueue",
            "QueueType": "STANDARD"
        },
    ]
}
```

For more information, see Create a Queue in the *Amazon Connect Administrator Guide*.

- For API details, see ListQueues in *AWS CLI Command Reference*.

`list-routing-profiles`

The following code example shows how to use `list-routing-profiles`.

AWS CLI

To list the routing profiles in an instance

The following `list-routing-profiles` example lists the routing profiles in the specified Amazon Connect instance.

```
aws connect list-routing-profiles \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "RoutingProfileSummaryList": [
        {
            "Id": "12345678-1111-2222-800e-a2b3c4d5f6g7",
            "Arn": "arn:aws:connect:us-west-2:123456789012:instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/routing-profile/12345678-1111-2222-800e-
a2b3c4d5f6g7",
            "Name": "Basic Routing Profile"
        },
    ]
}
```

For more information, see Create a Routing Profile in the *Amazon Connect Administrator Guide*.

- For API details, see ListRoutingProfiles in *AWS CLI Command Reference*.

list-security-profiles

The following code example shows how to use `list-security-profiles`.

AWS CLI

To list the security profiles in an instance

The following `list-security-profiles` example lists the security profiles in the specified Amazon Connect instance.

```
aws connect list-security-profiles \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "SecurityProfileSummaryList": [
        {
            "Id": "12345678-1111-2222-800e-a2b3c4d5f6g7",
            "Arn": "arn:aws:connect:us-west-2:123456789012:instance/

x2y3c4d5fzzzz",
            "Name": "Admin"
        }
    ]
}
```

For more information, see Assign Permissions: Security Profiles in the *Amazon Connect Administrator Guide*.

- For API details, see ListSecurityProfiles in *AWS CLI Command Reference*.

`list-user-hierarchy-groups`

The following code example shows how to use `list-user-hierarchy-groups`.

AWS CLI

To list the user hierarchy groups in an instance

The following `list-user-hierarchy-groups` example lists the user hierarchy groups in the specified Amazon Connect instance.

```
aws connect list-user-hierarchy-groups \
```

```
    --instance-id 40c83b68-ea62-414c-97bb-d018e39e158e
```

Output:

```
{
    "UserHierarchyGroupSummaryList": [
        {
            "Id": "0e2f6d1d-b3ca-494b-8dbc-ba81d9f8182a",
            "Arn": "arn:aws:connect:us-west-2:123456789012:instance/40c83b68-

            "Name": "Example Corporation"
        },
    ]
}
```

For more information, see Set Up Agent Hierarchies in the *Amazon Connect Administrator Guide*.

- For API details, see ListUserHierarchyGroups in *AWS CLI Command Reference*.

`list-users`

The following code example shows how to use `list-users`.

AWS CLI

To list the user hierarchy groups in an instance

The following `list-users` example lists the users in the specified Amazon Connect instance.

```
aws connect list-users \
    --instance-id 40c83b68-ea62-414c-97bb-d018e39e158e
```

Output:

```
{
    "UserSummaryList": [
        {
            "Id": "0c245dc0-0cf5-4e37-800e-2a7481cc8a60",
            "Arn": "arn:aws:connect:us-west-2:123456789012:instance/40c83b68-

            "Username": "JohnS"
        }
    ]
}
```

For more information, see Add Users in the *Amazon Connect Administrator Guide*.

- For API details, see ListUsers in *AWS CLI Command Reference*.

`update-contact-attributes`

The following code example shows how to use `update-contact-attributes`.

AWS CLI

To update a contact's attribute

The following `update-contact-attributes` example updates the `greetingPlayed` attribute for the specified Amazon Connect user.

```
aws connect update-contact-attributes \
    --initial-contact-id 11111111-2222-3333-4444-12345678910 \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --attributes greetingPlayed=false
```

This command produces no output.

For more information, see Use Amazon Connect Contact Attributes in the *Amazon Connect Administrator Guide*.

- For API details, see UpdateContactAttributes in *AWS CLI Command Reference*.

`update-user-hierarchy`

The following code example shows how to use `update-user-hierarchy`.

AWS CLI

To update a user's hierarchy

The following `update-user-hierarchy` example updates the agent hierarchy for the specified Amazon Connect user.

```
aws connect update-user-hierarchy \
    --hierarchy-group-id 12345678-a1b2-c3d4-e5f6-123456789abc \
    --user-id 87654321-2222-1234-1234-111234567891 \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Configure Agent Settings in the *Amazon Connect Administrator Guide*.

- For API details, see UpdateUserHierarchy in *AWS CLI Command Reference*.

`update-user-identity-info`

The following code example shows how to use `update-user-identity-info`.

AWS CLI

To update a user's identity information

The following `update-user-identity-info` example updates the identity information for the specified Amazon Connect user.

```
aws connect update-user-identity-info \
    --identity-info FirstName=Mary,LastName=Major,Email=marym@example.com \
    --user-id 87654321-2222-1234-1234-111234567891 \
```

```
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Configure Agent Settings in the *Amazon Connect Administrator Guide*.

- For API details, see UpdateUserIdentityInfo in *AWS CLI Command Reference*.

`update-user-phone-config`

The following code example shows how to use `update-user-phone-config`.

AWS CLI

To update a user's phone configuration

The following `update-user-phone-config` example updates the phone configuration for the specified user.

```
aws connect update-user-phone-config \
    --phone-
config PhoneType=SOFT_PHONE,AutoAccept=false,AfterContactWorkTimeLimit=60,DeskPhoneNumber=
+18005551212 \
    --user-id 12345678-4444-3333-2222-111122223333 \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Configure Agent Settings in the *Amazon Connect Administrator Guide*.

- For API details, see UpdateUserPhoneConfig in *AWS CLI Command Reference*.

`update-user-routing-profile`

The following code example shows how to use `update-user-routing-profile`.

AWS CLI

To update a user's routing profile

The following `update-user-routing-profile` example updates the routing profile for the specified Amazon Connect user.

```
aws connect update-user-routing-profile \
    --routing-profile-id 12345678-1111-3333-2222-4444EXAMPLE \
    --user-id 87654321-2222-1234-1234-111234567891 \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Configure Agent Settings in the *Amazon Connect Administrator Guide*.

- For API details, see UpdateUserRoutingProfile in *AWS CLI Command Reference*.

`update-user-security-profiles`

The following code example shows how to use `update-user-security-profiles`.

AWS CLI

To update a user's security profiles

The following `update-user-security-profiles` example updates the security profile for the specified Amazon Connect user.

```
aws connect update-user-security-profiles \
    --security-profile-ids 12345678-1234-1234-1234-1234567892111 \
    --user-id 87654321-2222-1234-1234-111234567891 \
    --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Assign Permissions: Security Profiles in the *Amazon Connect Administrator Guide*.

- For API details, see UpdateUserSecurityProfiles in *AWS CLI Command Reference*.

AWS Cost and Usage Report examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Cost and Usage Report.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`delete-report-definition`

The following code example shows how to use `delete-report-definition`.

AWS CLI

To delete an AWS Cost and Usage Report

This example deletes an AWS Cost and Usage Report.

Command:

```
aws cur --region us-east-1 delete-report-definition --report-name "ExampleReport"
```

- For API details, see DeleteReportDefinition in *AWS CLI Command Reference*.

`describe-report-definitions`

The following code example shows how to use `describe-report-definitions`.

AWS CLI

To retrieve a list of AWS Cost and Usage Reports

This example describes a list of AWS Cost and Usage Reports owned by an account.

Command:

```
aws cur --region us-east-1 describe-report-definitions --max-items 5
```

Output:

```
{
```

```
"ReportDefinitions": [
  {
      "ReportName": "ExampleReport",
      "Compression": "ZIP",
      "S3Region": "us-east-1",
      "Format": "textORcsv",
      "S3Prefix": "exampleprefix",
      "S3Bucket": "example-s3-bucket",
      "TimeUnit": "DAILY",
      "AdditionalArtifacts": [
          "REDSHIFT",
          "QUICKSIGHT"
      ],
      "AdditionalSchemaElements": [
          "RESOURCES"
      ]
  }
]
  }
```

- For API details, see DescribeReportDefinitions in *AWS CLI Command Reference*.

`put-report-definition`

The following code example shows how to use `put-report-definition`.

AWS CLI

To create an AWS Cost and Usage Reports

The following `put-report-definition` example creates a daily AWS Cost and Usage Report that you can upload into Amazon Redshift or Amazon QuickSight.

```
aws cur put-report-definition --report-definition file://report-definition.json
```

Contents of `report-definition.json`:

```
{
    "ReportName": "ExampleReport",
    "TimeUnit": "DAILY",
    "Format": "textORcsv",
    "Compression": "ZIP",
```

```
    "AdditionalSchemaElements": [
        "RESOURCES"
    ],
    "S3Bucket": "example-s3-bucket",
    "S3Prefix": "exampleprefix",
    "S3Region": "us-east-1",
    "AdditionalArtifacts": [
        "REDSHIFT",
        "QUICKSIGHT"
    ]
}
```

- For API details, see PutReportDefinition in *AWS CLI Command Reference*.

Cost Explorer Service examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Cost Explorer Service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

`get-cost-and-usage`

The following code example shows how to use `get-cost-and-usage`.

AWS CLI

To retrieve the S3 usage of an account for the month of September 2017

The following `get-cost-and-usage` example retrieves the S3 usage of an account for the month of September 2017.

```
aws ce get-cost-and-usage \
    --time-period Start=2017-09-01,End=2017-10-01 \
    --granularity MONTHLY \
    --metrics "BlendedCost" "UnblendedCost" "UsageQuantity" \
    --group-by Type=DIMENSION,Key=SERVICE Type=TAG,Key=Environment \
    --filter file://filters.json
```

Contents of `filters.json`:

```
{
    "Dimensions": {
        "Key": "SERVICE",
        "Values": [
            "Amazon Simple Storage Service"
        ]
    }
}
```

Output:

```
{
    "GroupDefinitions": [
        {
            "Type": "DIMENSION",
            "Key": "SERVICE"
        },
        {
            "Type": "TAG",
            "Key": "Environment"
        }
    ],
    "ResultsByTime": [
        {
            "Estimated": false,
            "TimePeriod": {
                "Start": "2017-09-01",
                "End": "2017-10-01"
            },
            "Total": {},
            "Groups": [
                {
                    "Keys": [
```

```
                        "Amazon Simple Storage Service",
                        "Environment$"
                    ],
                    "Metrics": {
                        "BlendedCost": {
                            "Amount": "40.3527508453",
                            "Unit": "USD"
                        },
                        "UnblendedCost": {
                            "Amount": "40.3543773134",
                            "Unit": "USD"
                        },
                        "UsageQuantity": {
                            "Amount": "9312771.098461578",
                            "Unit": "N/A"
                        }
                    }
                },
                {
                    "Keys": [
                        "Amazon Simple Storage Service",
                        "Environment$Dev"
                    ],
                    "Metrics": {
                        "BlendedCost": {
                            "Amount": "0.2682364644",
                            "Unit": "USD"
                        },
                        "UnblendedCost": {
                            "Amount": "0.2682364644",
                            "Unit": "USD"
                        },
                        "UsageQuantity": {
                            "Amount": "22403.4395271182",
                            "Unit": "N/A"
                        }
                    }
                }
            ]
        }
    ]
}
```

- For API details, see GetCostAndUsage in *AWS CLI Command Reference*.

get-dimension-values

The following code example shows how to use `get-dimension-values`.

AWS CLI

To retrieve the tags for the dimension SERVICE, with a value of "Elastic"

This example retrieves the tags for the dimension SERVICE, with a value of "Elastic" for January 01 2017 through May 18 2017.

Command:

```
aws ce get-dimension-values --search-string Elastic --time-
period Start=2017-01-01,End=2017-05-18 --dimension SERVICE
```

Output:

```
{
   "TotalSize": 6,
   "DimensionValues": [
        {
            "Attributes": {},
            "Value": "Amazon ElastiCache"
        },
        {
            "Attributes": {},
            "Value": "EC2 - Other"
        },
        {
            "Attributes": {},
            "Value": "Amazon Elastic Compute Cloud - Compute"
        },
        {
            "Attributes": {},
            "Value": "Amazon Elastic Load Balancing"
        },
        {
            "Attributes": {},
            "Value": "Amazon Elastic MapReduce"
        },
        {
            "Attributes": {},
```

```
            "Value": "Amazon Elasticsearch Service"
        }
    ],
    "ReturnSize": 6
}
```

- For API details, see [GetDimensionValues](#) in *AWS CLI Command Reference*.

`get-reservation-coverage`

The following code example shows how to use `get-reservation-coverage`.

AWS CLI

To retrieve the reservation coverage for EC2 t2.nano instances in the us-east-1 region

This example retrieves the reservation coverage for EC2 t2.nano instances in the us-east-1 region for July-September of 2017.

Command:

```
aws ce get-reservation-coverage --time-period Start=2017-07-01,End=2017-10-01 --
group-by Type=Dimension,Key=REGION --filter file://filters.json
```

filters.json:

```
{
   "And": [
     {
       "Dimensions": {
         "Key": "INSTANCE_TYPE",
         "Values": [
           "t2.nano"
         ]
       },
       "Dimensions": {
         "Key": "REGION",
         "Values": [
           "us-east-1"
         ]
       }
```

```
        }
    ]
  }
```

Output:

```
{
   "TotalSize": 6,
   "DimensionValues": [
       {
           "Attributes": {},
           "Value": "Amazon ElastiCache"
       },
       {
           "Attributes": {},
           "Value": "EC2 - Other"
       },
       {
           "Attributes": {},
           "Value": "Amazon Elastic Compute Cloud - Compute"
       },
       {
           "Attributes": {},
           "Value": "Amazon Elastic Load Balancing"
       },
       {
           "Attributes": {},
           "Value": "Amazon Elastic MapReduce"
       },
       {
           "Attributes": {},
           "Value": "Amazon Elasticsearch Service"
       }
   ],
   "ReturnSize": 6
}
```

- For API details, see GetReservationCoverage in *AWS CLI Command Reference*.

`get-reservation-purchase-recommendation`

The following code example shows how to use `get-reservation-purchase-recommendation`.

AWS CLI

To retrieve the reservation recommendations for Partial Upfront EC2 RIs with a three year term

The following `get-reservation-purchase-recommendation` example retrieves recommendations for Partial Upfront EC2 instances with a three-year term, based on the last 60 days of EC2 usage.

```
aws ce get-reservation-purchase-recommendation \
    --service "Amazon Redshift" \
    --lookback-period-in-days SIXTY_DAYS \
    --term-in-years THREE_YEARS \
    --payment-option PARTIAL_UPFRONT
```

Output:

```
{
    "Recommendations": [],
    "Metadata": {
        "GenerationTimestamp": "2018-08-08T15:20:57Z",
        "RecommendationId": "00d59dde-a1ad-473f-8ff2-iexample3330b"
    }
}
```

- For API details, see GetReservationPurchaseRecommendation in *AWS CLI Command Reference*.

`get-reservation-utilization`

The following code example shows how to use `get-reservation-utilization`.

AWS CLI

To retrieve the reservation utilization for your account

The following `get-reservation-utilization` example retrieves the RI utilization for all t2.nano instance types from 2018-03-01 to 2018-08-01 for the account.

```
aws ce get-reservation-utilization \
    --time-period Start=2018-03-01,End=2018-08-01 \
    --filter file://filters.json
```

Contents of `filters.json`:

```
{
    "Dimensions": {
        "Key": "INSTANCE_TYPE",
        "Values": [
            "t2.nano"
        ]
    }
}
```

Output:

```
{
    "Total": {
        "TotalAmortizedFee": "0",
        "UtilizationPercentage": "0",
        "PurchasedHours": "0",
        "NetRISavings": "0",
        "TotalActualHours": "0",
        "AmortizedRecurringFee": "0",
        "UnusedHours": "0",
        "TotalPotentialRISavings": "0",
        "OnDemandCostOfRIHoursUsed": "0",
        "AmortizedUpfrontFee": "0"
    },
    "UtilizationsByTime": []
}
```

- For API details, see GetReservationUtilization in *AWS CLI Command Reference*.

`get-tags`

The following code example shows how to use `get-tags`.

AWS CLI

To retrieve keys and values for a cost allocation tag

This example retrieves all cost allocation tags with a key of "Project" and a value that contains "secretProject".

Command:

```
aws ce get-tags --search-string secretProject --time-
period Start=2017-01-01,End=2017-05-18 --tag-key Project
```

Output:

```
{
  "ReturnSize": 2,
  "Tags": [
    "secretProject1",
    "secretProject2"
  ],
  "TotalSize": 2
}
```

- For API details, see GetTags in *AWS CLI Command Reference*.

Firehose examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Firehose.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Actions

`list-delivery-streams`

The following code example shows how to use `list-delivery-streams`.

AWS CLI

To list the available delivery streams

The following `list-delivery-streams` example lists the available delivery streams in your AWS account.

```
aws firehose list-delivery-streams
```

Output:

```
{
    "DeliveryStreamNames": [
        "my-stream"
    ],
    "HasMoreDeliveryStreams": false
}
```

For more information, see Creating an Amazon Kinesis Data Firehose Delivery Stream in the *Amazon Kinesis Data Firehose Developer Guide*.

- For API details, see ListDeliveryStreams in *AWS CLI Command Reference*.

`put-record-batch`

The following code example shows how to use `put-record-batch`.

AWS CLI

To write multiple records to a stream

The following `put-record-batch` example writes three records to a stream. The data is encoded in Base64 format.

```
aws firehose put-record-batch \
    --delivery-stream-name my-stream \
    --records file://records.json
```

Contents of `myfile.json`:

```
[
    {"Data": "Rmlyc3QgdGhpbmc="},
    {"Data": "U2Vjb25kIHRoaW5n"},
    {"Data": "VGhpcmQgdGhpbmc="}
]
```

Output:

```
{
    "FailedPutCount": 0,
    "Encrypted": false,
    "RequestResponses": [
        {
            "RecordId": "9D2OJ6t2EqCTZTXwGzeSv/EVHxRoRCw89xd+o3+sXg8DhYOaWKPSmZy/

    "Encrypted": false
}
```

For more information, see Sending Data to an Amazon Kinesis Data Firehose Delivery Stream in the *Amazon Kinesis Data Firehose Developer Guide*.

- For API details, see PutRecord in *AWS CLI Command Reference*.

Amazon Data Lifecycle Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Data Lifecycle Manager.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-default-role`

The following code example shows how to use `create-default-role`.

AWS CLI

To create the required IAM role for Amazon DLM

The following `dlm create-default-role` example creates the AWSDataLifecycleManagerDefaultRole default role for managing snapshots.

```
aws dlm create-default-role \
    --resource-type snapshot
```

This command produces no output.

For more information, see Default service roles for Amazon Data Lifecycle Manager in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see CreateDefaultRole in *AWS CLI Command Reference*.

`create-lifecycle-policy`

The following code example shows how to use `create-lifecycle-policy`.

AWS CLI

To create a lifecycle policy

The following `create-lifecycle-policy` example creates a lifecycle policy that creates a daily snapshot of volumes at the specified time. The specified tags are added to the snapshots, and tags are also copied from the volume and added to the snapshots. If creating a new snapshot exceeds the specified maximum count, the oldest snapshot is deleted.

```
aws dlm create-lifecycle-policy \
    --description "My first policy" \
    --state ENABLED \
    --execution-role-arn arn:aws:iam::12345678910:role/
AWSDataLifecycleManagerDefaultRole \
    --policy-details file://policyDetails.json
```

Contents of `policyDetails.json`:

```
{
    "ResourceTypes": [
        "VOLUME"
    ],
    "TargetTags": [
        {
            "Key": "costCenter",
```

```
                "Value": "115"
            }
        ],
        "Schedules":[
            {
                "Name": "DailySnapshots",
                "CopyTags": true,
                "TagsToAdd": [
                    {
                        "Key": "type",
                         "Value": "myDailySnapshot"
                    }
                ],
                "CreateRule": {
                    "Interval": 24,
                    "IntervalUnit": "HOURS",
                    "Times": [
                        "03:00"
                    ]
                },
                "RetainRule": {
                    "Count":5
                }
            }
        ]
}
```

Output:

```
{
    "PolicyId": "policy-0123456789abcdef0"
}
```

- For API details, see CreateLifecyclePolicy in *AWS CLI Command Reference*.

`delete-lifecycle-policy`

The following code example shows how to use `delete-lifecycle-policy`.

AWS CLI

To delete a lifecycle policy

The following example deletes the specified lifecycle policy.:

```
aws dlm delete-lifecycle-policy --policy-id policy-0123456789abcdef0
```

- For API details, see DeleteLifecyclePolicy in *AWS CLI Command Reference*.

`get-lifecycle-policies`

The following code example shows how to use `get-lifecycle-policies`.

AWS CLI

To get a summary of your lifecycle policies

The following `get-lifecycle-policies` example lists all of your lifecycle policies.

```
aws dlm get-lifecycle-policies
```

Output:

```
{
    "Policies": [
        {
            "PolicyId": "policy-0123456789abcdef0",
            "Description": "My first policy",
            "State": "ENABLED"
        }
    ]
}
```

- For API details, see GetLifecyclePolicies in *AWS CLI Command Reference*.

`get-lifecycle-policy`

The following code example shows how to use `get-lifecycle-policy`.

AWS CLI

To describe a lifecycle policy

The following `get-lifecycle-policy` example displays details for the specified lifecycle policy.

```
aws dlm get-lifecycle-policy \
    --policy-id policy-0123456789abcdef0
```

Output:

```
{
    "Policy": {
        "PolicyId": "policy-0123456789abcdef0",
        "Description": "My policy",
        "State": "ENABLED",
        "ExecutionRoleArn": "arn:aws:iam::123456789012:role/
AWSDataLifecycleManagerDefaultRole",
        "DateCreated": "2019-08-08T17:45:42Z",
        "DateModified": "2019-08-08T17:45:42Z",
        "PolicyDetails": {
            "PolicyType": "EBS_SNAPSHOT_MANAGEMENT",
            "ResourceTypes": [
                "VOLUME"
            ],
            "TargetTags": [
              {
                  "Key": "costCenter",
                  "Value": "115"
              }
            ],
            "Schedules": [
              {
                  "Name": "DailySnapshots",
                  "CopyTags": true,
                  "TagsToAdd": [
                    {
                        "Key": "type",

                        "03:00"
                    ]
                  },
                  "RetainRule": {
```

```
                        "Count": 5
                    }
                }
              ]
          }
      }
}
```

- For API details, see GetLifecyclePolicy in *AWS CLI Command Reference*.

`update-lifecycle-policy`

The following code example shows how to use `update-lifecycle-policy`.

AWS CLI

Example 1: To enable a lifecycle policy

The following `update-lifecycle-policy` example enables the specified lifecycle policy.

```
aws dlm update-lifecycle-policy \
    --policy-id policy-0123456789abcdef0 \
    --state ENABLED
```

Example 2: To disable a lifecycle policy

The following `update-lifecycle-policy` example disables the specified lifecycle policy.

```
aws dlm update-lifecycle-policy \
    --policy-id policy-0123456789abcdef0 \
    --state DISABLED
```

Example 3: To update the details for lifecycle policy

The following `update-lifecycle-policy` example updates the target tags for the specified lifecycle policy.

```
aws dlm update-lifecycle-policy \
    --policy-id policy-0123456789abcdef0
    --policy-details file://policyDetails.json
```

Contents of `policyDetails.json`. Other details not referenced in this file are not changed by the command.

```
{
    "TargetTags": [
        {
            "Key": "costCenter",
            "Value": "120"
        },
        {
            "Key": "project",
            "Value": "lima"
        }
    ]
}
```

- For API details, see UpdateLifecyclePolicy in *AWS CLI Command Reference*.

AWS Data Pipeline examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Data Pipeline.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`activate-pipeline`

The following code example shows how to use `activate-pipeline`.

AWS CLI

To activate a pipeline

This example activates the specified pipeline:

```
aws datapipeline activate-pipeline --pipeline-id df-00627471SOVYZEXAMPLE
```

To activate the pipeline at a specific date and time, use the following command:

```
aws datapipeline activate-pipeline --pipeline-id df-00627471SOVYZEXAMPLE --start-
timestamp 2015-04-07T00:00:00Z
```

- For API details, see ActivatePipeline in *AWS CLI Command Reference*.

`add-tags`

The following code example shows how to use `add-tags`.

AWS CLI

To add a tag to a pipeline

This example adds the specified tag to the specified pipeline:

```
aws datapipeline add-tags --pipeline-id df-00627471SOVYZEXAMPLE --
tags key=environment,value=production key=owner,value=sales
```

To view the tags, use the describe-pipelines command. For example, the tags added in the example command appear as follows in the output for describe-pipelines:

```
{
    ...
        "tags": [
            {
                "value": "production",
                "key": "environment"
            },
            {
                "value": "sales",
                "key": "owner"
            }
        ]
    ...
}
```

- For API details, see AddTags in *AWS CLI Command Reference*.

`create-pipeline`

The following code example shows how to use `create-pipeline`.

AWS CLI

To create a pipeline

This example creates a pipeline:

```
aws datapipeline create-pipeline --name my-pipeline --unique-id my-pipeline-token
```

The following is example output:

```
{
    "pipelineId": "df-00627471SOVYZEXAMPLE"
}
```

- For API details, see CreatePipeline in *AWS CLI Command Reference*.

`deactivate-pipeline`

The following code example shows how to use `deactivate-pipeline`.

AWS CLI

To deactivate a pipeline

This example deactivates the specified pipeline:

```
aws datapipeline deactivate-pipeline --pipeline-id df-00627471SOVYZEXAMPLE
```

To deactivate the pipeline only after all running activities finish, use the following command:

```
aws datapipeline deactivate-pipeline --pipeline-id df-00627471SOVYZEXAMPLE --no-
cancel-active
```

- For API details, see DeactivatePipeline in *AWS CLI Command Reference*.

`delete-pipeline`

The following code example shows how to use `delete-pipeline`.

AWS CLI

To delete a pipeline

This example deletes the specified pipeline:

```
aws datapipeline delete-pipeline --pipeline-id df-00627471SOVYZEXAMPLE
```

- For API details, see DeletePipeline in *AWS CLI Command Reference*.

`describe-pipelines`

The following code example shows how to use `describe-pipelines`.

AWS CLI

To describe your pipelines

This example describes the specified pipeline:

```
aws datapipeline describe-pipelines --pipeline-ids df-00627471SOVYZEXAMPLE
```

The following is example output:

```
{
  "pipelineDescriptionList": [
      {
          "fields": [
              {
                  "stringValue": "PENDING",
                  "key": "@pipelineState"
              },
              {
                  "stringValue": "my-pipeline",
                  "key": "name"
              },
              {
                  "stringValue": "2015-04-07T16:05:58",
```

```
                  "key": "@creationTime"
              },
              {
                  "stringValue": "df-00627471SOVYZEXAMPLE",
                  "key": "@id"
              },
              {
                  "stringValue": "123456789012",
                  "key": "pipelineCreator"
              },
              {
                  "stringValue": "PIPELINE",
                  "key": "@sphere"
              },
              {
                  "stringValue": "123456789012",
                  "key": "@userId"
              },
              {
                  "stringValue": "123456789012",
                  "key": "@accountId"
              },
              {
                  "stringValue": "my-pipeline-token",
                  "key": "uniqueId"
              }
          ],
          "pipelineId": "df-00627471SOVYZEXAMPLE",
          "name": "my-pipeline",
          "tags": []
      }
  ]
}
```

- For API details, see DescribePipelines in *AWS CLI Command Reference*.

`get-pipeline-definition`

The following code example shows how to use `get-pipeline-definition`.

AWS CLI

To get a pipeline definition

This example gets the pipeline definition for the specified pipeline:

```
aws datapipeline get-pipeline-definition --pipeline-id df-00627471SOVYZEXAMPLE
```

The following is example output:

```
{
  "parameters": [
      {
          "type": "AWS::S3::ObjectKey",
          "id": "myS3OutputLoc",
          "description": "S3 output folder"
      },
      {
          "default": "s3://us-east-1.elasticmapreduce.samples/pig-apache-logs/data",
          "type": "AWS::S3::ObjectKey",
          "id": "myS3InputLoc",
          "description": "S3 input folder"
      },
      {
          "default": "grep -rc \"GET\" ${INPUT1_STAGING_DIR}/* >
 ${OUTPUT1_STAGING_DIR}/output.txt",
          "type": "String",
          "id": "myShellCmd",
          "description": "Shell command to run"
      }
  ],
  "objects": [
      {
          "type": "Ec2Resource",
          "terminateAfter": "20 Minutes",
          "instanceType": "t1.micro",
          "id": "EC2ResourceObj",
          "name": "EC2ResourceObj"
      },
      {
          "name": "Default",
          "failureAndRerunMode": "CASCADE",
          "resourceRole": "DataPipelineDefaultResourceRole",
          "schedule": {
              "ref": "DefaultSchedule"
          },
          "role": "DataPipelineDefaultRole",
```

```
            "scheduleType": "cron",
            "id": "Default"
        },
        {
            "directoryPath": "#{myS3OutputLoc}/#{format(@scheduledStartTime, 'YYYY-MM-
dd-HH-mm-ss')}",
            "type": "S3DataNode",
            "id": "S3OutputLocation",
            "name": "S3OutputLocation"
        },
        {
            "directoryPath": "#{myS3InputLoc}",
            "type": "S3DataNode",

            "id": "ShellCommandActivityObj",
            "runsOn": {
                "ref": "EC2ResourceObj"
            }
        }
    ],
    "values": {
        "myS3OutputLoc": "s3://amzn-s3-demo-bucket/",
```

```
      "myS3InputLoc": "s3://us-east-1.elasticmapreduce.samples/pig-apache-logs/
data",
      "myShellCmd": "grep -rc \"GET\" ${INPUT1_STAGING_DIR}/* >
 ${OUTPUT1_STAGING_DIR}/output.txt"
    }
}
```

- For API details, see GetPipelineDefinition in *AWS CLI Command Reference*.

`list-pipelines`

The following code example shows how to use `list-pipelines`.

AWS CLI

To list your pipelines

This example lists your pipelines:

```
aws datapipeline list-pipelines
```

The following is example output:

```
{
  "pipelineIdList": [
      {
          "id": "df-00627471SOVYZEXAMPLE",
          "name": "my-pipeline"
      },
      {
          "id": "df-09028963KNVMREXAMPLE",
          "name": "ImportDDB"
      },
      {
          "id": "df-0870198233ZYVEXAMPLE",
          "name": "CrossRegionDDB"
      },
      {
          "id": "df-00189603TB4MZEXAMPLE",
          "name": "CopyRedshift"
      }
  ]
```

```
}
```

- For API details, see ListPipelines in *AWS CLI Command Reference*.

`list-runs`

The following code example shows how to use `list-runs`.

AWS CLI

Example 1: To list your pipeline runs

The following `list-runs` example lists the runs for the specified pipeline.

```
aws datapipeline list-runs --pipeline-id df-00627471SOVYZEXAMPLE
```

Output:

```
    Name                           Scheduled Start        Status                     ID
                                             Started                Ended

 -------------------------------------------------------------------------------------------
1.  EC2ResourceObj             2015-04-12T17:33:02    CREATING
 @EC2ResourceObj_2015-04-12T17:33:02             2015-04-12T17:33:10
2.  S3InputLocation            2015-04-12T17:33:02    FINISHED
      @S3InputLocation_2015-04-12T17:33:02            2015-04-12T17:33:09
 2015-04-12T17:33:09
3.  S3OutputLocation           2015-04-12T17:33:02    WAITING_ON_DEPENDENCIES
 @S3OutputLocation_2015-04-12T17:33:02           2015-04-12T17:33:09
4.  ShellCommandActivityObj    2015-04-12T17:33:02    WAITING_FOR_RUNNER
 @ShellCommandActivityObj_2015-04-12T17:33:02    2015-04-12T17:33:09
```

Example 2: To list the pipeline runs between the specified dates

The following `list-runs` example uses the `--start-interval` to specify the dates to include in the output.

```
aws datapipeline list-runs --pipeline-id df-01434553B58A2SHZUKO5 --start-
interval 2017-10-07T00:00:00,2017-10-08T00:00:00
```

- For API details, see ListRuns in *AWS CLI Command Reference*.

`put-pipeline-definition`

The following code example shows how to use `put-pipeline-definition`.

AWS CLI

To upload a pipeline definition

This example uploads the specified pipeline definition to the specified pipeline:

```
aws datapipeline put-pipeline-definition --pipeline-id df-00627471SOVYZEXAMPLE --
pipeline-definition file://my-pipeline-definition.json
```

The following is example output:

```
{
  "validationErrors": [],
  "errored": false,
  "validationWarnings": []
}
```

- For API details, see PutPipelineDefinition in *AWS CLI Command Reference*.

`remove-tags`

The following code example shows how to use `remove-tags`.

AWS CLI

To remove a tag from a pipeline

This example removes the specified tag from the specified pipeline:

```
aws datapipeline remove-tags --pipeline-id df-00627471SOVYZEXAMPLE --tag-
keys environment
```

- For API details, see RemoveTags in *AWS CLI Command Reference*.

DataSync examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with DataSync.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

`update-location-azure-blob`

The following code example shows how to use `update-location-azure-blob`.

AWS CLI

To update your transfer location with a new agent

The following `update-location-object-storage` example updates your DataSync location for Microsoft Azure Blob Storage with a new agent.

```
aws datasync update-location-azure-blob \
    --location-arn arn:aws:datasync:us-west-2:123456789012:location/loc-abcdef01234567890 \
    --agent-arns arn:aws:datasync:us-west-2:123456789012:agent/agent-1234567890abcdef0 \
    --sas-configuration '{ \
        "Token": "sas-token-for-azure-blob-storage-access" \
    }'
```

This command produces no output.

For more information, see Replacing your agent in the *AWS DataSync User Guide*.

- For API details, see UpdateLocationAzureBlob in *AWS CLI Command Reference*.

`update-location-hdfs`

The following code example shows how to use `update-location-hdfs`.

AWS CLI

To update your transfer location with a new agent

The following `update-location-hdfs` example updates your DataSync HDFS location with a new agent. You only need the `--kerberos-keytab` and `--kerberos-krb5-conf` options if your HDFS cluster uses Kerberos authentication.

```
aws datasync update-location-hdfs \
    --location-arn arn:aws:datasync:us-west-2:123456789012:location/loc-
abcdef01234567890 \
    --agent-arns arn:aws:datasync:us-west-2:123456789012:agent/
agent-1234567890abcdef0 \
    --kerberos-keytab file://hdfs.keytab
    --kerberos-krb5-conf file://krb5.conf
```

Contents of `hdfs.keytab`:

```
N/A. The content of this file is encrypted and not human readable.
```

Contents of `krb5.conf`:

```
[libdefaults]
    default_realm = EXAMPLE.COM
    dns_lookup_realm = false
    dns_lookup_kdc = false
    rdns = true
    ticket_lifetime = 24h
    forwardable = true
    udp_preference_limit = 1000000
    default_tkt_enctypes = aes256-cts-hmac-sha1-96 aes128-cts-hmac-sha1-96 des3-cbc-
sha1
    default_tgs_enctypes = aes256-cts-hmac-sha1-96 aes128-cts-hmac-sha1-96 des3-cbc-
sha1
    permitted_enctypes = aes256-cts-hmac-sha1-96 aes128-cts-hmac-sha1-96 des3-cbc-
sha1

[realms]
```

```
    EXAMPLE.COM = {
      kdc = kdc1.example.com
      admin_server = krbadmin.example.com
      default_domain = example.com
    }

[domain_realm]
    .example.com = EXAMPLE.COM
    example.com = EXAMPLE.COM

[logging]
    kdc = FILE:/var/log/krb5kdc.log
    admin_server = FILE:/var/log/kerberos/kadmin.log
    default = FILE:/var/log/krb5libs.log
```

This command produces no output.

For more information, see Replacing your agent in the *AWS DataSync User Guide*.

- For API details, see UpdateLocationHdfs in *AWS CLI Command Reference*.

`update-location-nfs`

The following code example shows how to use `update-location-nfs`.

AWS CLI

To update your transfer location with a new agent

The following `update-location-nfs` example updates your DataSync NFS location with a new agent.

```
aws datasync update-location-nfs \
    --location-arn arn:aws:datasync:us-west-2:123456789012:location/loc-abcdef01234567890 \
    --on-prem-config AgentArns=arn:aws:datasync:us-west-2:123456789012:agent/agent-1234567890abcdef0
```

This command produces no output.

For more information, see Replacing your agent in the *AWS DataSync User Guide*.

- For API details, see UpdateLocationNfs in *AWS CLI Command Reference*.

`update-location-object-storage`

The following code example shows how to use `update-location-object-storage`.

AWS CLI

To update your transfer location with a new agent

The following `update-location-object-storage` example updates your DataSync object storage location with a new agent.

```
aws datasync update-location-object-storage \
    --location-arn arn:aws:datasync:us-west-2:123456789012:location/loc-
abcdef01234567890 \
    --agent-arns arn:aws:datasync:us-west-2:123456789012:agent/
agent-1234567890abcdef0 \
    --secret-key secret-key-for-object-storage
```

This command produces no output.

For more information, see Replacing your agent in the *AWS DataSync User Guide*.

- For API details, see UpdateLocationObjectStorage in *AWS CLI Command Reference*.

`update-location-smb`

The following code example shows how to use `update-location-smb`.

AWS CLI

To update your transfer location with a new agent

The following `update-location-smb` example updates your DataSync SMB location with a new agent.

```
aws datasync update-location-smb \
    --location-arn arn:aws:datasync:us-west-2:123456789012:location/loc-
abcdef01234567890 \
    --agent-arns arn:aws:datasync:us-west-2:123456789012:agent/
agent-1234567890abcdef0 \
    --password smb-file-server-password
```

This command produces no output.

For more information, see Replacing your agent in the *AWS DataSync User Guide*.

- For API details, see UpdateLocationSmb in *AWS CLI Command Reference*.

DAX examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with DAX.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

`create-cluster`

The following code example shows how to use `create-cluster`.

AWS CLI

To create a DAX cluster

The following `create-cluster` example creates a DAX cluster with the specified settings.

```
aws dax create-cluster \
    --cluster-name daxcluster \
    --node-type dax.r4.large \
    --replication-factor 3 \
    --iam-role-arn roleARN  \
    --sse-specification Enabled=true
```

Output:

```
{
```

```
    "Cluster": {
        "ClusterName": "daxcluster",
        "ClusterArn": "arn:aws:dax:us-west-2:123456789012:cache/daxcluster",
        "TotalNodes": 3,
        "ActiveNodes": 0,
        "NodeType": "dax.r4.large",
        "Status": "creating",
        "ClusterDiscoveryEndpoint": {
            "Port": 8111
        },
        "PreferredMaintenanceWindow": "thu:13:00-thu:14:00",
        "SubnetGroup": "default",
        "SecurityGroups": [
            {
                "SecurityGroupIdentifier": "sg-1af6e36e",
                "Status": "active"
            }
        ],
        "IamRoleArn": "arn:aws:iam::123456789012:role/
DAXServiceRoleForDynamoDBAccess",
        "ParameterGroup": {
            "ParameterGroupName": "default.dax1.0",
            "ParameterApplyStatus": "in-sync",
            "NodeIdsToReboot": []
        },
        "SSEDescription": {
            "Status": "ENABLED"
        }
    }
}
```

For more information, see Step 3: Create a DAX Cluster in the *Amazon DynamoDB Developer Guide*.

- For API details, see CreateCluster in *AWS CLI Command Reference*.

`create-parameter-group`

The following code example shows how to use `create-parameter-group`.

AWS CLI

To create a parameter group

The following `` create-parameter-group `` example creates a parameter group with the specified settings.

```
aws dax create-parameter-group \
    --parameter-group-name daxparametergroup \
    --description "A new parameter group"
```

Output:

```
{
    "ParameterGroup": {
        "ParameterGroupName": "daxparametergroup",
        "Description": "A new parameter group"
    }
}
```

For more information, see Managing DAX Clusters in the *Amazon DynamoDB Developer Guide*.

- For API details, see CreateParameterGroup in *AWS CLI Command Reference*.

`create-subnet-group`

The following code example shows how to use `create-subnet-group`.

AWS CLI

To create a DAX subnet group

The following `create-subnet-group` example creates a subnet group with the specified settings.

```
aws dax create-subnet-group \
    --subnet-group-name daxSubnetGroup \
    --subnet-ids subnet-11111111 subnet-22222222
```

Output:

```
{
    "SubnetGroup": {
        "SubnetGroupName": "daxSubnetGroup",
        "VpcId": "vpc-05a1fa8e00c325226",
        "Subnets": [
```

```
                {
                    "SubnetIdentifier": "subnet-11111111",
                    "SubnetAvailabilityZone": "us-west-2b"
                },
                {
                    "SubnetIdentifier": "subnet-22222222",
                    "SubnetAvailabilityZone": "us-west-2c"
                }
            ]
        }
}
```

For more information, see Step 2: Create a Subnet Group in the *Amazon DynamoDB Developer Guide*.

- For API details, see CreateSubnetGroup in *AWS CLI Command Reference*.

`decrease-replication-factor`

The following code example shows how to use `decrease-replication-factor`.

AWS CLI

To remove one or more nodes from the cluster

The following `decrease-replication-factor` example decreases the number of nodes in the specified DAX cluster to one.

```
aws dax decrease-replication-factor \
    --cluster-name daxcluster \
    --new-replication-factor 1
```

Output:

```
{
    "Cluster": {
        "ClusterName": "daxcluster",
        "ClusterArn": "arn:aws:dax:us-west-2:123456789012:cache/daxcluster",
        "TotalNodes": 3,
        "ActiveNodes": 3,
        "NodeType": "dax.r4.large",
        "Status": "modifying",
        "ClusterDiscoveryEndpoint": {
```

```
            "Address": "daxcluster.ey3o9d.clustercfg.dax.usw2.cache.amazonaws.com",
            "Port": 8111
        },
        "Nodes": [
            {
                "NodeId": "daxcluster-a",
                "Endpoint": {
                    "Address": "daxcluster-
a.ey3o9d.0001.dax.usw2.cache.amazonaws.com",
                    "Port": 8111
                },
                "NodeCreateTime": 1576625059.509,
                "AvailabilityZone": "us-west-2c",
                "NodeStatus": "available",
                "ParameterGroupStatus": "in-sync"
            },
            {
                "NodeId": "daxcluster-b",
                "Endpoint": {
                    "Address": "daxcluster-
b.ey3o9d.0001.dax.usw2.cache.amazonaws.com",
                    "Port": 8111
                },

            }
        ],
        "PreferredMaintenanceWindow": "thu:13:00-thu:14:00",
        "SubnetGroup": "default",
        "SecurityGroups": [
```

```
            {
                "SecurityGroupIdentifier": "sg-1af6e36e",
                "Status": "active"
            }
        ],
        "IamRoleArn": "arn:aws:iam::123456789012:role/
DAXServiceRoleForDynamoDBAccess",
        "ParameterGroup": {
            "ParameterGroupName": "default.dax1.0",
            "ParameterApplyStatus": "in-sync",
            "NodeIdsToReboot": []
        },
        "SSEDescription": {
            "Status": "ENABLED"
        }
    }
}
```

For more information, see Managing DAX Clusters in the *Amazon DynamoDB Developer Guide*.

- For API details, see DecreaseReplicationFactor in *AWS CLI Command Reference*.

`delete-cluster`

The following code example shows how to use `delete-cluster`.

AWS CLI

To delete a DAX cluster

The following `delete-cluster` example deletes the specified DAX cluster.

```
aws dax delete-cluster \
    --cluster-name daxcluster
```

Output:

```
{
    "Cluster": {
        "ClusterName": "daxcluster",
        "ClusterArn": "arn:aws:dax:us-west-2:123456789012:cache/daxcluster",
        "TotalNodes": 3,
        "ActiveNodes": 0,
```

```
        "NodeType": "dax.r4.large",
        "Status": "deleting",
        "ClusterDiscoveryEndpoint": {
            "Address": "dd.ey3o9d.clustercfg.dax.usw2.cache.amazonaws.com",
            "Port": 8111
        },
        "PreferredMaintenanceWindow": "fri:06:00-fri:07:00",
        "SubnetGroup": "default",
        "SecurityGroups": [
            {
                "SecurityGroupIdentifier": "sg-1af6e36e",
                "Status": "active"
            }
        ],
        "IamRoleArn": "arn:aws:iam::123456789012:role/
DAXServiceRoleForDynamoDBAccess",
        "ParameterGroup": {
            "ParameterGroupName": "default.dax1.0",
            "ParameterApplyStatus": "in-sync",
            "NodeIdsToReboot": []
        },
        "SSEDescription": {
            "Status": "ENABLED"
        }
    }
}
```

For more information, see Managing DAX Clusters in the *Amazon DynamoDB Developer Guide*.

- For API details, see DeleteCluster in *AWS CLI Command Reference*.

`delete-parameter-group`

The following code example shows how to use `delete-parameter-group`.

AWS CLI

To delete a parameter group

The following `delete-parameter-group` example deletes the specified DAX parameter group.

```
aws dax  delete-parameter-group \
```

```
    --parameter-group-name daxparametergroup
```

Output:

```
{
    "DeletionMessage": "Parameter group daxparametergroup has been deleted."
}
```

For more information, see Managing DAX Clusters in the *Amazon DynamoDB Developer Guide*.

- For API details, see DeleteParameterGroup in *AWS CLI Command Reference*.

`delete-subnet-group`

The following code example shows how to use `delete-subnet-group`.

AWS CLI

To delete a subnet group

The following `delete-subnet-group` example deletes the specified DAX subnet group.

```
aws dax delete-subnet-group \
    --subnet-group-name daxSubnetGroup
```

Output:

```
{
    "DeletionMessage": "Subnet group daxSubnetGroup has been deleted."
}
```

For more information, see Managing DAX Clusters in the *Amazon DynamoDB Developer Guide*.

- For API details, see DeleteSubnetGroup in *AWS CLI Command Reference*.

`describe-clusters`

The following code example shows how to use `describe-clusters`.

AWS CLI

To return information about all provisioned DAX clusters

The following `describe-clusters` example displays details about all provisioned DAX clusters.

```
aws dax describe-clusters
```

Output:

```
{
    "Clusters": [
        {
            "ClusterName": "daxcluster",
            "ClusterArn": "arn:aws:dax:us-west-2:123456789012:cache/daxcluster",
            "TotalNodes": 1,
            "ActiveNodes": 1,
            "NodeType": "dax.r4.large",
            "Status": "available",
            "ClusterDiscoveryEndpoint": {
                "Address":
 "daxcluster.ey3o9d.clustercfg.dax.usw2.cache.amazonaws.com",
                "Port": 8111
            },
            "Nodes": [
                {
                    "NodeId": "daxcluster-a",
                    "Endpoint": {
                        "Address": "daxcluster-
a.ey3o9d.0001.dax.usw2.cache.amazonaws.com",
                        "Port": 8111
                    },
                    "NodeCreateTime": 1576625059.509,
                    "AvailabilityZone": "us-west-2c",
                    "NodeStatus": "available",
                    "ParameterGroupStatus": "in-sync"
                }
            ],
            "PreferredMaintenanceWindow": "thu:13:00-thu:14:00",
            "SubnetGroup": "default",
            "SecurityGroups": [
                {
                    "SecurityGroupIdentifier": "sg-1af6e36e",
                    "Status": "active"
                }
            ],
```

```
            "IamRoleArn": "arn:aws:iam::123456789012:role/
DAXServiceRoleForDynamoDBAccess",
            "ParameterGroup": {
                "ParameterGroupName": "default.dax1.0",
                "ParameterApplyStatus": "in-sync",
                "NodeIdsToReboot": []
            },
            "SSEDescription": {
                "Status": "ENABLED"
            }
        }
    ]
}
```

For more information, see Managing DAX Clusters in the *Amazon DynamoDB Developer Guide*.

- For API details, see DescribeClusters in *AWS CLI Command Reference*.

`describe-default-parameters`

The following code example shows how to use `describe-default-parameters`.

AWS CLI

To return the default system parameter information for DAX

The following `describe-default-parameters` example displays the default system parameter information for DAX.

```
aws dax describe-default-parameters
```

Output:

```
{
    "Parameters": [
        {
            "ParameterName": "query-ttl-millis",
            "ParameterType": "DEFAULT",
            "ParameterValue": "300000",
            "NodeTypeSpecificValues": [],
            "Description": "Duration in milliseconds for queries to remain cached",
            "Source": "user",
            "DataType": "integer",
```

```
                "AllowedValues": "0-",
                "IsModifiable": "TRUE",
                "ChangeType": "IMMEDIATE"
            },
            {
                "ParameterName": "record-ttl-millis",
                "ParameterType": "DEFAULT",
                "ParameterValue": "300000",
                "NodeTypeSpecificValues": [],
                "Description": "Duration in milliseconds for records to remain valid in
 cache (Default: 0 = infinite)",
                "Source": "user",
                "DataType": "integer",
                "AllowedValues": "0-",
                "IsModifiable": "TRUE",
                "ChangeType": "IMMEDIATE"
            }
        ]
}
```

For more information, see Managing DAX Clusters in the *Amazon DynamoDB Developer Guide*.

- For API details, see DescribeDefaultParameters in *AWS CLI Command Reference*.

`describe-events`

The following code example shows how to use `describe-events`.

AWS CLI

To return all events related to DAX clusters and parameter groups

The following `describe-events` example displays details of events that are related to DAX clusters and parameter groups.

```
aws dax describe-events
```

Output:

```
{
    "Events": [
        {
```

```
                "SourceName": "daxcluster",
                "SourceType": "CLUSTER",
                "Message": "Cluster deleted.",
                "Date": 1576702736.706
            },
            {
                "SourceName": "daxcluster",
                "SourceType": "CLUSTER",
                "Message": "Removed node daxcluster-b.",
                "Date": 1576702691.738
            },
            {
                "SourceName": "daxcluster",
                "SourceType": "CLUSTER",
                "Message": "Removed node daxcluster-a.",
                "Date": 1576702633.498
            },
            {
                "SourceName": "daxcluster",
                "SourceType": "CLUSTER",
                "Message": "Removed node daxcluster-c.",
                "Date": 1576702631.329
            },
            {
                "SourceName": "daxcluster",
                "SourceType": "CLUSTER",
                "Message": "Cluster created.",
                "Date": 1576626560.057
            }
        ]
}
```

For more information, see Managing DAX Clusters in the *Amazon DynamoDB Developer Guide*.

- For API details, see DescribeEvents in *AWS CLI Command Reference*.

`describe-parameter-groups`

The following code example shows how to use `describe-parameter-groups`.

AWS CLI

To describe the parameter groups defined in DAX

The following `describe-parameter-groups` example retrieves details about the parameter groups that are defined in DAX.

```
aws dax describe-parameter-groups
```

Output:

```
{
    "ParameterGroups": [
        {
            "ParameterGroupName": "default.dax1.0",
            "Description": "Default parameter group for dax1.0"
        }
    ]
}
```

For more information, see Managing DAX Clusters in the *Amazon DynamoDB Developer Guide*.

- For API details, see DescribeParameterGroups in *AWS CLI Command Reference*.

`describe-parameters`

The following code example shows how to use `describe-parameters`.

AWS CLI

To describe the parameters defined in a DAX parameter group

The following `describe-parameters` example retrieves details about the parameters that are defined in the specified DAX parameter group.

```
aws dax describe-parameters \
    --parameter-group-name default.dax1.0
```

Output:

```
{
    "Parameters": [
        {
            "ParameterName": "query-ttl-millis",
            "ParameterType": "DEFAULT",
```

```
                "ParameterValue": "300000",
                "NodeTypeSpecificValues": [],
                "Description": "Duration in milliseconds for queries to remain cached",
                "Source": "user",
                "DataType": "integer",
                "AllowedValues": "0-",
                "IsModifiable": "TRUE",
                "ChangeType": "IMMEDIATE"
            },
            {
                "ParameterName": "record-ttl-millis",
                "ParameterType": "DEFAULT",
                "ParameterValue": "300000",
                "NodeTypeSpecificValues": [],
                "Description": "Duration in milliseconds for records to remain valid in
 cache (Default: 0 = infinite)",
                "Source": "user",
                "DataType": "integer",
                "AllowedValues": "0-",
                "IsModifiable": "TRUE",
                "ChangeType": "IMMEDIATE"
            }
        ]
}
```

For more information, see Managing DAX Clusters in the *Amazon DynamoDB Developer Guide*.

- For API details, see DescribeParameters in *AWS CLI Command Reference*.

`describe-subnet-groups`

The following code example shows how to use `describe-subnet-groups`.

AWS CLI

To describe subnet groups defined in DAX

The following `describe-subnet-groups` example retrieves details for the subnet groups defined in DAX.

```
aws dax describe-subnet-groups
```

Output:

```
{
    "SubnetGroups": [
        {
            "SubnetGroupName": "default",
            "Description": "Default CacheSubnetGroup",
            "VpcId": "vpc-ee70a196",
            "Subnets": [
                {
                    "SubnetIdentifier": "subnet-874953af",
                    "SubnetAvailabilityZone": "us-west-2d"
                },
                {
                    "SubnetIdentifier": "subnet-bd3d1fc4",
                    "SubnetAvailabilityZone": "us-west-2a"
                },
                {
                    "SubnetIdentifier": "subnet-72c2ff28",
                    "SubnetAvailabilityZone": "us-west-2c"
                },
                {
                    "SubnetIdentifier": "subnet-09e6aa42",
                    "SubnetAvailabilityZone": "us-west-2b"
                }
            ]
        }
    ]
}
```

For more information, see Managing DAX Clusters in the *Amazon DynamoDB Developer Guide*.

- For API details, see DescribeSubnetGroups in *AWS CLI Command Reference*.

`increase-replication-factor`

The following code example shows how to use `increase-replication-factor`.

AWS CLI

To increase the replication factor for a DAX cluster

The following `increase-replication-factor` example increases the specified DAX cluster's replication factor to 3.

```
aws dax increase-replication-factor \
    --cluster-name daxcluster \
    --new-replication-factor 3
```

Output:

```
{
    "Cluster": {
        "ClusterName": "daxcluster",
        "ClusterArn": "arn:aws:dax:us-west-2:123456789012:cache/daxcluster",
        "TotalNodes": 3,
        "ActiveNodes": 1,
        "NodeType": "dax.r4.large",
        "Status": "modifying",
        "ClusterDiscoveryEndpoint": {

        },
        "SSEDescription": {
            "Status": "ENABLED"
        }
    }
}
```

For more information, see Managing DAX Clusters in the *Amazon DynamoDB Developer Guide*.

- For API details, see IncreaseReplicationFactor in *AWS CLI Command Reference*.

`list-tags`

The following code example shows how to use `list-tags`.

AWS CLI

To list tags on a DAX resource

The following `list-tags` example lists the tag keys and values attached to the specified DAX cluster.

```
aws dax list-tags \
    --resource-name arn:aws:dax:us-west-2:123456789012:cache/daxcluster
```

Output:

```
{
    "Tags": [
        {
            "Key": "ClusterUsage",
```

```
                "Value": "prod"
            }
        ]
}
```

For more information, see Managing DAX Clusters in the *Amazon DynamoDB Developer Guide*.

- For API details, see ListTags in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a DAX resource

The following `tag-resource` example attaches the specified tag key name and associated value to the specified DAX cluster to describe the cluster usage.

```
aws dax tag-resource \
    --resource-name arn:aws:dax:us-west-2:123456789012:cache/daxcluster \
    --tags="Key=ClusterUsage,Value=prod"
```

Output:

```
{
    "Tags": [
        {
            "Key": "ClusterUsage",
            "Value": "prod"
        }
    ]
}
```

For more information, see Managing DAX Clusters in the *Amazon DynamoDB Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a DAX resource

The following `untag-resource` example removes the tag with the specified key name from a DAX cluster.

```
aws dax untag-resource  \
    --resource-name arn:aws:dax:us-west-2:123456789012:cache/daxcluster \
    --tag-keys="ClusterUsage"
```

Output:

```
{
    "Tags": []
}
```

For more information, see Managing DAX Clusters in the *Amazon DynamoDB Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

Detective examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Detective.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`accept-invitation`

The following code example shows how to use `accept-invitation`.

AWS CLI

To accept an invitation to become a member account in a behavior graph

The following `accept-invitation` example accepts an invitation to become a member account in behavior graph arn:aws:detective:us-east-1:111122223333:graph:123412341234.

```
aws detective accept-invitation \
    --graph-arn arn:aws:detective:us-east-1:111122223333:graph:123412341234
```

This command produces no output.

For more information, see Responding to a behavior graph invitation in the *Amazon Detective Administration Guide*.

- For API details, see AcceptInvitation in *AWS CLI Command Reference*.

`create-graph`

The following code example shows how to use `create-graph`.

AWS CLI

To enable Amazon Detective and create a new behavior graph

The following `create-graph` example enables Detective for the AWS account that runs the command in the Region where the command is run. A new behavior graph is created that has that account as its administrator account. The command also assigns the value Finance to the Department tag.

```
aws detective create-graph \
    --tags '{"Department": "Finance"}'
```

Output:

```
{
    "GraphArn": "arn:aws:detective:us-
east-1:111122223333:graph:027c7c4610ea4aacaf0b883093cab899"
}
```

For more information, see Enabling Amazon Detective in the *Amazon Detective Administration Guide*.

- For API details, see CreateGraph in *AWS CLI Command Reference*.

`create-members`

The following code example shows how to use `create-members`.

AWS CLI

To invite member accounts to a behavior graph

The following `create-members` example invites two AWS accounts to become member accounts in the behavior graph arn:aws:detective:us-east-1:111122223333:graph:123412341234. For each account, the request provides the AWS account ID and the account root user email address. The request includes a custom message to insert into the invitation email.

```
aws detective create-members \
    --
accounts AccountId=444455556666,EmailAddress=mmajor@example.com AccountId=123456789012,Email
 \
    --graph-arn arn:aws:detective:us-east-1:111122223333:graph:123412341234 \
    --message "This is Paul Santos. I need to add your account to the data we use
 for security investigation in Amazon Detective. If you have any questions, contact
 me at psantos@example.com."
```

Output:

```
{
    "Members": [
    {
        "AccountId": "444455556666",
        "AdministratorId": "111122223333",
        "EmailAddress": "mmajor@example.com",
        "GraphArn": "arn:aws:detective:us-east-1:111122223333:graph:123412341234",
        "InvitedTime": 1579826107000,
        "MasterId": "111122223333",
        "Status": "INVITED",
        "UpdatedTime": 1579826107000
```

```
   },
   {
        "AccountId": "123456789012",
        "AdministratorId": "111122223333",
        "EmailAddress": "jstiles@example.com",
        "GraphArn": "arn:aws:detective:us-east-1:111122223333:graph:123412341234",
        "InvitedTime": 1579826107000,
        "MasterId": "111122223333",
        "Status": "VERIFICATION_IN_PROGRESS",
        "UpdatedTime": 1579826107000
     }
    ],
    "UnprocessedAccounts": [ ]
}
```

For more information, see Inviting member accounts to a behavior graph<https://docs.aws.amazon.com/detective/latest/adminguide/graph-admin-add-member-accounts.html> in the *Amazon Detective Administration Guide*.

To invite member accounts without sending invitation emails

The following `create-members` example invites two AWS accounts to become member accounts in the behavior graph arn:aws:detective:us-east-1:111122223333:graph:123412341234. For each account, the request provides the AWS account ID and the account root user email address. The member accounts do not receive invitation emails.

```
aws detective create-members \
    --
accounts AccountId=444455556666,EmailAddress=mmajor@example.com AccountId=123456789012,Email
 \
    --graph-arn arn:aws:detective:us-east-1:111122223333:graph:123412341234 \
    --disable-email-notification
```

Output:

```
{
    "Members": [
    {
        "AccountId": "444455556666",
        "AdministratorId": "111122223333",
```

```
            "EmailAddress": "mmajor@example.com",
            "GraphArn": "arn:aws:detective:us-east-1:111122223333:graph:123412341234",
            "InvitedTime": 1579826107000,
            "MasterId": "111122223333",
            "Status": "INVITED",
            "UpdatedTime": 1579826107000
      },
      {
            "AccountId": "123456789012",
            "AdministratorId": "111122223333",
            "EmailAddress": "jstiles@example.com",
            "GraphArn": "arn:aws:detective:us-east-1:111122223333:graph:123412341234",
            "InvitedTime": 1579826107000,
            "MasterId": "111122223333",
            "Status": "VERIFICATION_IN_PROGRESS",
            "UpdatedTime": 1579826107000
        }
      ],
    "UnprocessedAccounts": [ ]
}
```

For more information, see Inviting member accounts to a behavior graph<https://docs.aws.amazon.com/detective/latest/adminguide/graph-admin-add-member-accounts.html> in the *Amazon Detective Administration Guide*.

- For API details, see CreateMembers in *AWS CLI Command Reference*.

`delete-graph`

The following code example shows how to use `delete-graph`.

AWS CLI

To disable Detective and delete the behavior graph

The following `delete-graph` example disables Detective and deletes the specified behavior graph.

```
aws detective delete-graph \
    --graph-arn arn:aws:detective:us-east-1:111122223333:graph:123412341234
```

This command produces no output.

For more information, see Disabling Amazon Detective in the *Amazon Detective Administration Guide*.

- For API details, see DeleteGraph in *AWS CLI Command Reference*.

`delete-members`

The following code example shows how to use `delete-members`.

AWS CLI

To remove member accounts from a behavior graph

The following `delete-members` example removes two member accounts from the behavior graph arn:aws:detective:us-east-1:111122223333:graph:123412341234. To identify the accounts, the request provides the AWS account IDs.

```
aws detective delete-members \
    --account-ids 444455556666 123456789012 \
    --graph-arn arn:aws:detective:us-east-1:111122223333:graph:123412341234
```

Output:

```
 {
    "AccountIds": [ "444455556666", "123456789012" ],
    "UnprocessedAccounts": [ ]
}
```

For more information, see Removing member accounts from a behavior graph<https://docs.aws.amazon.com/detective/latest/adminguide/graph-admin-remove-member-accounts.html> in the *Amazon Detective Administration Guide*.

- For API details, see DeleteMembers in *AWS CLI Command Reference*.

`disassociate-membership`

The following code example shows how to use `disassociate-membership`.

AWS CLI

To resign membership from a behavior graph

The following disassociate-membership example removes the AWS account that runs the command from the behavior graph arn:aws:detective:us-east-1:111122223333:graph:123412341234.

```
aws detective disassociate-membership \
     --graph-arn arn:aws:detective:us-east-1:111122223333:graph:123412341234
```

For more information, see Removing your account from a behavior graph<https://docs.aws.amazon.com/detective/latest/adminguide/member-remove-self-from-graph.html> in the *Amazon Detective Administration Guide*.

- For API details, see DisassociateMembership in *AWS CLI Command Reference*.

`get-members`

The following code example shows how to use `get-members`.

AWS CLI

To retrieve information about selected behavior graph member accounts

The following `get-members` example retrieves information about two member accounts in the behavior graph arn:aws:detective:us-east-1:111122223333:graph:123412341234. For the two accounts, the request provides the AWS account IDs.

```
aws detective get-members \
    --account-ids 444455556666 123456789012 \
    --graph-arn arn:aws:detective:us-east-1:111122223333:graph:123412341234
```

Output:

```
{
    "MemberDetails": [
    {
        "AccountId": "444455556666",
        "AdministratorId": "111122223333",
        "EmailAddress": "mmajor@example.com",
        "GraphArn": "arn:aws:detective:us-east-1:111122223333:graph:123412341234",
        "InvitedTime": 1579826107000,
        "MasterId": "111122223333",
        "Status": "INVITED",
```

```
            "UpdatedTime": 1579826107000
        }
        {
            "AccountId": "123456789012",
            "AdministratorId": "111122223333",
            "EmailAddress": "jstiles@example.com",
            "GraphArn": "arn:aws:detective:us-east-1:111122223333:graph:123412341234",
            "InvitedTime": 1579826107000,
            "MasterId": "111122223333",
            "Status": "INVITED",
            "UpdatedTime": 1579826107000
        }
],
    "UnprocessedAccounts": [ ]
}
```

For more information, see Viewing the list of accounts in a behavior graph<https://docs.aws.amazon.com/detective/latest/adminguide/graph-admin-view-accounts.html> in the *Amazon Detective Administration Guide*.

- For API details, see GetMembers in *AWS CLI Command Reference*.

`list-graphs`

The following code example shows how to use `list-graphs`.

AWS CLI

To view a list of behavior graphs that your account is the administrator for

The following `list-graphs` example retrieves the behavior graphs that the calling account is the administrator for within the current Region.

```
aws detective list-graphs
```

Output:

```
{
    "GraphList": [
        {
            "Arn": "arn:aws:detective:us-east-1:111122223333:graph:123412341234",
            "CreatedTime": 1579736111000
```

```
        }
    ]
}
```

- For API details, see ListGraphs in *AWS CLI Command Reference*.

`list-invitations`

The following code example shows how to use `list-invitations`.

AWS CLI

To view a list of behavior graphs that an account is a member of or is invited to

The following `list-invitations` example retrieves the behavior graphs that the calling account has been invited to. The results include only open and accepted invitations. They do not include rejected invitations or removed memberships.

```
aws detective list-invitations
```

Output:

```
{
    "Invitations": [
    {
        "AccountId": "444455556666",
        "AdministratorId": "111122223333",
        "EmailAddress": "mmajor@example.com",
        "GraphArn": "arn:aws:detective:us-east-1:111122223333:graph:123412341234",
        "InvitedTime": 1579826107000,
        "MasterId": "111122223333",
        "Status": "INVITED",
        "UpdatedTime": 1579826107000
    }
]
}
```

For more information, see Viewing your list of behavior graph invitations<https://docs.aws.amazon.com/detective/latest/adminguide/member-view-graph-invitations.html> in the *Amazon Detective Administration Guide*.

- For API details, see ListInvitations in *AWS CLI Command Reference*.

`list-members`

The following code example shows how to use `list-members`.

AWS CLI

To list the member accounts in a behavior graph

The following `list-members` example retrieves the invited and enabled member accounts for the behavior graph `arn:aws:detective:us-east-1:111122223333:graph:123412341234`. The results do not include member accounts that were removed.

```
aws detective list-members \
    --graph-arn arn:aws:detective:us-east-1:111122223333:graph:123412341234
```

Output:

```
{
    "MemberDetails": [
        {
            "AccountId": "444455556666",
            "AdministratorId": "111122223333",
            "EmailAddress": "mmajor@example.com",
            "GraphArn": "arn:aws:detective:us-
east-1:111122223333:graph:123412341234",
            "InvitedTime": 1579826107000,
            "MasterId": "111122223333",
            "Status": "INVITED",
            "UpdatedTime": 1579826107000
        },
        {
            "AccountId": "123456789012",
            "AdministratorId": "111122223333",
            "EmailAddress": "jstiles@example.com",
            "GraphArn": "arn:aws:detective:us-
east-1:111122223333:graph:123412341234",
            "InvitedTime": 1579826107000,
            "MasterId": "111122223333",
            "PercentOfGraphUtilization": 2,
            "PercentOfGraphUtilizationUpdatedTime": 1586287843,
            "Status": "ENABLED",
            "UpdatedTime": 1579973711000,
```

```
                "VolumeUsageInBytes": 200,
                "VolumeUsageUpdatedTime": 1586287843
            }
        ]
    }
```

For more information, see [Viewing the list of accounts in a behavior graph]() in the *Amazon Detective Administration Guide*.

- For API details, see [ListMembers]() in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To retrieve the tags assigned to a behavior graph

The following `list-tags-for-resource` example returns the tags assigned to the specified behavior graph.

```
aws detective list-tags-for-resource \
    --resource-arn arn:aws:detective:us-east-1:111122223333:graph:123412341234
```

Output:

```
{
    "Tags": {
        "Department" : "Finance"
    }
}
```

For more information, see [Managing tags for a behavior graph]() in the *Amazon Detective Administration Guide*.

- For API details, see [ListTagsForResource]() in *AWS CLI Command Reference*.

`reject-invitation`

The following code example shows how to use `reject-invitation`.

AWS CLI

To reject an invitation to become a member account in a behavior graph

The following `reject-invitation` example rejects an invitation to become a member account in the behavior graph arn:aws:detective:us-east-1:111122223333:graph:123412341234.

```
aws detective reject-invitation \
    --graph-arn arn:aws:detective:us-east-1:111122223333:graph:123412341234
```

This command produces no output.

For more information, see Responding to a behavior graph invitation<https://docs.aws.amazon.com/detective/latest/adminguide/member-invitation-response.html> in the *Amazon Detective Administration Guide*.

- For API details, see RejectInvitation in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To assign a tag to a resource

The following `tag-resource` example assigns a value for the Department tag to the specified behavior graph.

```
aws detective tag-resource \
    --resource-arn arn:aws:detective:us-east-1:111122223333:graph:123412341234 \
    --tags '{"Department":"Finance"}'
```

This command produces no output.

For more information, see Managing tags for a behavior graph in the *Amazon Detective Administration Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag value from a resource

The following `untag-resource` example removes the Department tag from the specified behavior graph.

```
aws detective untag-resource \
    --resource-arn arn:aws:detective:us-east-1:111122223333:graph:123412341234 \
    --tag-keys "Department"
```

This command produces no output.

For more information, see Managing tags for a behavior graph in the *Amazon Detective Administration Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

Device Farm examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Device Farm.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Actions

`create-device-pool`

The following code example shows how to use `create-device-pool`.

AWS CLI

To create a device pool

The following command creates an Android device pool for a project:

```
aws devicefarm create-device-pool --name pool1 --rules file://
device-pool-rules.json --project-arn "arn:aws:devicefarm:us-
west-2:123456789012:project:070fc3ca-7ec1-4741-9c1f-d3e044efc506"
```

You can get the project ARN from the output of `create-project` or `list-projects`. The file `device-pool-rules.json` is a JSON document in the current folder that specifies the device platform:

```
[
    {
        "attribute": "PLATFORM",
        "operator": "EQUALS",
        "value": "\"ANDROID\""
    }
]
```

Output:

```
{
    "devicePool": {
        "rules": [
            {
                "operator": "EQUALS",
                "attribute": "PLATFORM",
                "value": "\"ANDROID\""
            }
        ],
        "type": "PRIVATE",
        "name": "pool1",
        "arn": "arn:aws:devicefarm:us-
west-2:123456789012:devicepool:070fc3ca-7ec1-4741-9c1f-
d3e044efc506/2aa8d2a9-5e73-47ca-b929-659cb34b7dcd"
    }
}
```

- For API details, see CreateDevicePool in *AWS CLI Command Reference*.

`create-project`

The following code example shows how to use `create-project`.

AWS CLI

To create a project

The following command creates a new project named `my-project`:

```
aws devicefarm create-project --name my-project
```

Output:

```
{
    "project": {
        "name": "myproject",
        "arn": "arn:aws:devicefarm:us-
west-2:123456789012:project:070fc3ca-7ec1-4741-9c1f-d3e044efc506",
        "created": 1503612890.057
    }
}
```

- For API details, see CreateProject in *AWS CLI Command Reference*.

`create-upload`

The following code example shows how to use `create-upload`.

AWS CLI

To create an upload

The following command creates an upload for an Android app:

```
aws devicefarm create-upload --project-arn "arn:aws:devicefarm:us-
west-2:123456789012:project:070fc3ca-7ec1-4741-9c1f-d3e044efc506" --name app.apk --
type ANDROID_APP
```

You can get the project ARN from the output of create-project or list-projects.

Output:

```
{
    "upload": {
        "status": "INITIALIZED",
        "name": "app.apk",
        "created": 1503614408.769,
        "url": "https://prod-us-west-2-uploads.s3-us-west-2.amazonaws.com/
arn%3Aaws%3Adevicefarm%3Aus-west-2%3A123456789012%3Aproject%3A070fc3ca-
c7e1-4471-91cf-d3e4efc50604/uploads/arn%3Aaws%3Adevicefarm%3Aus-
west-2%3A123456789012%3Aupload%3A070fc3ca-7ec1-4741-9c1f-d3e044efc506/dd72723a-
ae9e-4087-09e6-f4cea3599514/app.apk?X-Amz-Algorithm=AWS4-HMAC-SHA256&X-Amz-
Date=20170824T224008Z&X-Amz-SignedHeaders=host&X-Amz-Expires=86400&X-Amz-
Credential=AKIAEXAMPLEPBUMBC3GA%2F20170824%2Fus-west-2%2Fs3%2Faws4_request&X-Amz-
Signature=05050370c38894ef5bd09f5d009f36fc8f96fa4bb04e1bba9aca71b8dbe49a0f",
        "type": "ANDROID_APP",
        "arn": "arn:aws:devicefarm:us-
west-2:123456789012:upload:070fc3ca-7ec1-4741-9c1f-d3e044efc506/dd72723a-
ae9e-4087-09e6-f4cea3599514"
    }
}
```

Use the signed URL in the output to upload a file to Device Farm:

```
curl -T app.apk "https://prod-us-west-2-uploads.s3-us-west-2.amazonaws.com/
arn%3Aaws%3Adevicefarm%3Aus-west-2%3A123456789012%3Aproject%3A070fc3ca-
c7e1-4471-91cf-d3e4efc50604/uploads/arn%3Aaws%3Adevicefarm%3Aus-
west-2%3A123456789012%3Aupload%3A070fc3ca-7ec1-4741-9c1f-d3e044efc506/dd72723a-
ae9e-4087-09e6-f4cea3599514/app.apk?X-Amz-Algorithm=AWS4-HMAC-SHA256&X-Amz-
Date=20170824T224008Z&X-Amz-SignedHeaders=host&X-Amz-Expires=86400&X-Amz-
Credential=AKIAEXAMPLEPBUMBC3GA%2F20170824%2Fus-west-2%2Fs3%2Faws4_request&X-Amz-
Signature=05050370c38894ef5bd09f5d009f36fc8f96fa4bb04e1bba9aca71b8dbe49a0f"
```

- For API details, see CreateUpload in *AWS CLI Command Reference*.

`get-upload`

The following code example shows how to use `get-upload`.

AWS CLI

To view an upload

The following command retrieves information about an upload:

```
aws devicefarm get-upload --arn "arn:aws:devicefarm:us-
west-2:123456789012:upload:070fc3ca-7ec1-4741-9c1f-d3e044efc506/dd72723a-
ae9e-4087-09e6-f4cea3599514"
```

You can get the upload ARN from the output of `create-upload`.

Output:

```
{
    "upload": {
        "status": "SUCCEEDED",
        "name": "app.apk",
        "created": 1505262773.186,
        "type": "ANDROID_APP",
        "arn": "arn:aws:devicefarm:us-
west-2:123456789012:upload:070fc3ca-7ec1-4741-9c1f-d3e044efc506/dd72723a-
ae9e-4087-09e6-f4cea3599514",
        "metadata": "{\"device_admin\":false,\"activity_name\":
\"ccom.example.client.LauncherActivity\",\"version_name\":\"1.0.2.94\",\"screens
\":[\"small\",\"normal\",\"large\",\"xlarge\"],\"error_type\":null,\"sdk_version
\":\"16\",\"package_name\":\"com.example.client\",\"version_code\":\"20994\",
\"native_code\":[\"armeabi-v7a\"],\"target_sdk_version\":\"25\"}"
    }
}
```

- For API details, see GetUpload in *AWS CLI Command Reference*.

`list-projects`

The following code example shows how to use `list-projects`.

AWS CLI

To list projects

The following retrieves a list of projects:

```
aws devicefarm list-projects
```

Output:

```
{
    "projects": [
        {
            "name": "myproject",
            "arn": "arn:aws:devicefarm:us-
west-2:123456789012:project:070fc3ca-7ec1-4741-9c1f-d3e044efc506",
            "created": 1503612890.057
        },
        {
            "name": "otherproject",
            "arn": "arn:aws:devicefarm:us-
west-2:123456789012:project:a5f5b752-8098-49d1-86bf-5f7682c1c77e",
            "created": 1505257519.337
        }
    ]
}
```

- For API details, see ListProjects in *AWS CLI Command Reference*.

Direct Connect examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Direct Connect.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

`accept-direct-connect-gateway-association-proposal`

The following code example shows how to use `accept-direct-connect-gateway-association-proposal`.

AWS CLI

To accept a gateway association proposal

The following `accept-direct-connect-gateway-association-proposal` accepts the specified proposal.

```
aws directconnect  accept-direct-connect-gateway-association-proposal \
    --direct-connect-gateway-id 11460968-4ac1-4fd3-bdb2-00599EXAMPLE \
    --proposal-id cb7f41cb-8128-43a5-93b1-dcaedEXAMPLE \
    --associated-gateway-owner-account 111122223333

{
    "directConnectGatewayAssociation": {
        "directConnectGatewayId": "11460968-4ac1-4fd3-bdb2-00599EXAMPLE",
        "directConnectGatewayOwnerAccount": "111122223333",
        "associationState": "associating",
        "associatedGateway": {
            "id": "tgw-02f776b1a7EXAMPLE",
            "type": "transitGateway",
            "ownerAccount": "111122223333",
            "region": "us-east-1"
        },
        "associationId": "6441f8bf-5917-4279-ade1-9708bEXAMPLE",
        "allowedPrefixesToDirectConnectGateway": [
            {
                "cidr": "192.168.1.0/30"
            }
        ]

  }
}
```

For more information, see Accepting or Rejecting a Transit Gateway Association Proposal in the *AWS Direct Connect User Guide*.

- For API details, see AcceptDirectConnectGatewayAssociationProposal in *AWS CLI Command Reference*.

`allocate-connection-on-interconnect`

The following code example shows how to use `allocate-connection-on-interconnect`.

AWS CLI

To create a hosted connection on an interconnect

The following `allocate-connection-on-interconnect` command creates a hosted connection on an interconnect:

```
aws directconnect allocate-connection-on-interconnect --bandwidth 500Mbps --
connection-name mydcinterconnect --owner-account 123456789012 --interconnect-
id dxcon-fgktov66 --vlan 101
```

Output:

```
{
    "partnerName": "TIVIT",
    "vlan": 101,
    "ownerAccount": "123456789012",
    "connectionId": "dxcon-ffzc51m1",
    "connectionState": "ordering",
    "bandwidth": "500Mbps",
    "location": "TIVIT",
    "connectionName": "mydcinterconnect",
    "region": "sa-east-1"
}
```

- For API details, see [AllocateConnectionOnInterconnect]() in *AWS CLI Command Reference*.

`allocate-hosted-connection`

The following code example shows how to use `allocate-hosted-connection`.

AWS CLI

To create a hosted connection on an interconnect

The following `allocate-hosted-connection` example creates a hosted connection on the specified interconnect.

```
aws directconnect allocate-hosted-connection \
    --bandwidth 500Mbps \
    --connection-name mydcinterconnect \
    --owner-account 123456789012
```

```
    -connection-id dxcon-fgktov66
    -vlan 101
```

Output:

```
{
    "partnerName": "TIVIT",
    "vlan": 101,
    "ownerAccount": "123456789012",
    "connectionId": "dxcon-ffzc51m1",
    "connectionState": "ordering",
    "bandwidth": "500Mbps",
    "location": "TIVIT",
    "connectionName": "mydcinterconnect",
    "region": "sa-east-1"
}
```

- For API details, see [AllocateHostedConnection](#) in *AWS CLI Command Reference*.

`allocate-private-virtual-interface`

The following code example shows how to use `allocate-private-virtual-interface`.

AWS CLI

To provision a private virtual interface

The following `allocate-private-virtual-interface` command provisions a private virtual interface to be owned by a different customer:

```
aws directconnect allocate-private-virtual-interface --connection-id dxcon-
ffjrkx17 --owner-account 123456789012 --new-private-virtual-interface-
allocation virtualInterfaceName=PrivateVirtualInterface,vlan=1000,asn=65000,authKey=asdf34ex
```

Output:

```
{
    "virtualInterfaceState": "confirming",
    "asn": 65000,
    "vlan": 1000,
    "customerAddress": "192.168.1.2/30",
    "ownerAccount": "123456789012",
```

```
    "connectionId": "dxcon-ffjrkx17",
    "virtualInterfaceId": "dxvif-fgy8orxu",
    "authKey": "asdf34example",
    "routeFilterPrefixes": [],
    "location": "TIVIT",
    "customerRouterConfig": "<?xml version=\"1.0\" encoding=\"UTF-8\"?
>\n  <logical_connection id=\"dxvif-fgy8orxu\">\n  <vlan>1000</
vlan>\n  <customer_address>192.168.1.2/30</customer_address>\n
 <amazon_address>192.168.1.1/30</amazon_address>\n  <bgp_asn>65000</bgp_asn>\n
 <bgp_auth_key>asdf34example</bgp_auth_key>\n  <amazon_bgp_asn>7224</amazon_bgp_asn>
\n  <connection_type>private</connection_type>\n</logical_connection>\n",
    "amazonAddress": "192.168.1.1/30",
    "virtualInterfaceType": "private",
    "virtualInterfaceName": "PrivateVirtualInterface"
}
```

- For API details, see AllocatePrivateVirtualInterface in *AWS CLI Command Reference*.

`allocate-public-virtual-interface`

The following code example shows how to use `allocate-public-virtual-interface`.

AWS CLI

To provision a public virtual interface

The following `allocate-public-virtual-interface` command provisions a public virtual interface to be owned by a different customer:

```
aws directconnect allocate-public-virtual-interface --connection-id dxcon-
ffjrkx17 --owner-account 123456789012 --new-public-virtual-interface-
allocation virtualInterfaceName=PublicVirtualInterface,vlan=2000,asn=65000,authKey=asdf34exa
{cidr=203.0.113.4/30}]
```

Output:

```
{
    "virtualInterfaceState": "confirming",
    "asn": 65000,
    "vlan": 2000,
    "customerAddress": "203.0.113.2/30",
    "ownerAccount": "123456789012",
```

```
    "connectionId": "dxcon-ffjrkx17",
    "virtualInterfaceId": "dxvif-fg9xo9vp",
    "authKey": "asdf34example",
    "routeFilterPrefixes": [
        {
            "cidr": "203.0.113.0/30"
        },
        {
            "cidr": "203.0.113.4/30"
        }
    ],
    "location": "TIVIT",
    "customerRouterConfig": "<?xml version=\"1.0\" encoding=\"UTF-8\"?
>\n<logical_connection id=\"dxvif-fg9xo9vp\">\n  <vlan>2000</
vlan>\n  <customer_address>203.0.113.2/30</customer_address>\n
 <amazon_address>203.0.113.1/30</amazon_address>\n  <bgp_asn>65000</bgp_asn>\n
 <bgp_auth_key>asdf34example</bgp_auth_key>\n  <amazon_bgp_asn>7224</amazon_bgp_asn>
\n  <connection_type>public</connection_type>\n</logical_connection>\n",
    "amazonAddress": "203.0.113.1/30",
    "virtualInterfaceType": "public",
    "virtualInterfaceName": "PublicVirtualInterface"
}
```

- For API details, see AllocatePublicVirtualInterface in *AWS CLI Command Reference*.

`allocate-transit-virtual-interface`

The following code example shows how to use `allocate-transit-virtual-interface`.

AWS CLI

To provision a transit virtual interface to be owned by the specified AWS account

The following `allocate-transit-virtual-interface` example provisions a transit virtual interface for the specified account.

```
aws directconnect allocate-transit-virtual-interface \
    --connection-id dxlag-fEXAMPLE \
    --owner-account 123456789012 \
    --new-transit-virtual-interface-allocation "virtualInterfaceName=Example Transit
 Virtual
 Interface,vlan=126,asn=65110,mtu=1500,authKey=0xzxgA9YoW9h58u8SEXAMPLE,amazonAddress=192.16
```

Output:

```
{
    "virtualInterface": {
        "ownerAccount": "123456789012",
        "virtualInterfaceId": "dxvif-fEXAMPLE",
        "location": "loc1",
        "connectionId": "dxlag-fEXAMPLE",
        "virtualInterfaceType": "transit",
        "virtualInterfaceName": "Example Transit Virtual Interface",
        "vlan": 126,
        "asn": 65110,

                "value": "Example"
            }
        ]
    }
}
```

For more information, see [Creating a Hosted Transit Virtual Interface]() in the *AWS Direct Connect User Guide*.

- For API details, see [AllocateTransitVirtualInterface]() in *AWS CLI Command Reference*.

`associate-connection-with-lag`

The following code example shows how to use `associate-connection-with-lag`.

AWS CLI

To associate a connection with a LAG

The following example associates the specified connection with the specified LAG.

Command:

```
aws directconnect associate-connection-with-lag --lag-id dxlag-fhccu14t --
connection-id dxcon-fg9607vm
```

Output:

```
{
  "ownerAccount": "123456789012",
  "connectionId": "dxcon-fg9607vm",
  "lagId": "dxlag-fhccu14t",
  "connectionState": "requested",
  "bandwidth": "1Gbps",
  "location": "EqDC2",
  "connectionName": "Con2ForLag",
  "region": "us-east-1"
}
```

- For API details, see AssociateConnectionWithLag in *AWS CLI Command Reference*.

`associate-hosted-connection`

The following code example shows how to use `associate-hosted-connection`.

AWS CLI

To associate a hosted connection with a LAG

The following example associates the specified hosted connection with the specified LAG.

Command:

```
aws directconnect associate-hosted-connection --parent-connection-id dxlag-fhccu14t
 --connection-id dxcon-fg9607vm
```

Output:

```
{

}
```

- For API details, see AssociateHostedConnection in *AWS CLI Command Reference*.

`associate-virtual-interface`

The following code example shows how to use `associate-virtual-interface`.

AWS CLI

To associate a virtual interface with a connection

The following example associates the specified virtual interface with the specified LAG. Alternatively, to associate the virtual interface with a connection, specify the ID of an AWS Direct Connect connection for `--connection-id`; for example, `dxcon-ffnikghc`.

Command:

```
aws directconnect associate-virtual-interface --connection-id dxlag-ffjhj9lx --
virtual-interface-id dxvif-fgputw0j
```

Output:

```
{
  "virtualInterfaceState": "pending",
  "asn": 65000,
  "vlan": 123,
  "customerAddress": "169.254.255.2/30",
  "ownerAccount": "123456789012",
  "connectionId": "dxlag-ffjhj9lx",
  "addressFamily": "ipv4",
  "virtualGatewayId": "vgw-38e90b51",
  "virtualInterfaceId": "dxvif-fgputw0j",
  "authKey": "0x123pK5_VBqv.UQ3kJ4123_",
  "routeFilterPrefixes": [],
  "location": "CSVA1",
  "bgpPeers": [
      {
          "bgpStatus": "down",
          "customerAddress": "169.254.255.2/30",
          "addressFamily": "ipv4",
          "authKey": "0x123pK5_VBqv.UQ3kJ4123_",
          "bgpPeerState": "deleting",
          "amazonAddress": "169.254.255.1/30",
          "asn": 65000
      },
      {
          "bgpStatus": "down",
          "customerAddress": "169.254.255.2/30",
          "addressFamily": "ipv4",
          "authKey": "0x123pK5_VBqv.UQ3kJ4123_",
          "bgpPeerState": "pending",
          "amazonAddress": "169.254.255.1/30",
          "asn": 65000
      }
```

```
  ],
  "customerRouterConfig": "<?xml version=\"1.0\" encoding=\"UTF-8\"?

amazon_bgp_asn>\n  <connection_type>private</connection_type>\n</logical_connection>
\n",
  "amazonAddress": "169.254.255.1/30",
  "virtualInterfaceType": "private",
  "virtualInterfaceName": "VIF1A"
}
```

- For API details, see AssociateVirtualInterface in *AWS CLI Command Reference*.

confirm-connection

The following code example shows how to use `confirm-connection`.

AWS CLI

To confirm the creation of a hosted connection on an interconnect

The following `confirm-connection` command confirms the creation of a hosted connection on an interconnect:

```
aws directconnect confirm-connection --connection-id dxcon-fg2wi7hy
```

Output:

```
{
    "connectionState": "pending"
}
```

- For API details, see ConfirmConnection in *AWS CLI Command Reference*.

confirm-private-virtual-interface

The following code example shows how to use `confirm-private-virtual-interface`.

AWS CLI

To accept ownership of a private virtual interface

The following `confirm-private-virtual-interface` command accepts ownership of a private virtual interface created by another customer:

```
aws directconnect confirm-private-virtual-interface --virtual-interface-id dxvif-fgy8orxu --virtual-gateway-id vgw-e4a47df9
```

Output:

```
{
    "virtualInterfaceState": "pending"
}
```

- For API details, see [ConfirmPrivateVirtualInterface]() in *AWS CLI Command Reference*.

`confirm-public-virtual-interface`

The following code example shows how to use `confirm-public-virtual-interface`.

AWS CLI

To accept ownership of a public virtual interface

The following `confirm-public-virtual-interface` command accepts ownership of a public virtual interface created by another customer:

```
aws directconnect confirm-public-virtual-interface --virtual-interface-id dxvif-fg9xo9vp
```

Output:

```
{
    "virtualInterfaceState": "verifying"
}
```

- For API details, see [ConfirmPublicVirtualInterface]() in *AWS CLI Command Reference*.

`confirm-transit-virtual-interface`

The following code example shows how to use `confirm-transit-virtual-interface`.

AWS CLI

To accept ownership of a transit virtual interface

The following `confirm-transit-virtual-interface` accepts ownership of a transit virtual interface created by another customer.

```
aws directconnect confirm-transit-virtual-interface \
    --virtual-interface-id dxvif-fEXAMPLE \
    --direct-connect-gateway-id 4112ccf9-25e9-4111-8237-b6c5dEXAMPLE
```

Output:

```
{
    "virtualInterfaceState": "pending"
}
```

For more information, see Accepting a Hosted Virtual Interface in the *AWS Direct Connect User Guide*.

- For API details, see ConfirmTransitVirtualInterface in *AWS CLI Command Reference*.

`create-bgp-peer`

The following code example shows how to use `create-bgp-peer`.

AWS CLI

To create an IPv6 BGP peering session

The following example creates an IPv6 BGP peering session on private virtual interface `dxvif-fg1vuj3d`. The peer IPv6 addresses are automatically allocated by Amazon.

Command:

```
aws directconnect create-bgp-peer --virtual-interface-id dxvif-fg1vuj3d --new-bgp-peer asn=64600,addressFamily=ipv6
```

Output:

```
{
  "virtualInterface": {
      "virtualInterfaceState": "available",
      "asn": 65000,
      "vlan": 125,
      "customerAddress": "169.254.255.2/30",
      "ownerAccount": "123456789012",
      "connectionId": "dxcon-fguhmqlc",
      "addressFamily": "ipv4",
      "virtualGatewayId": "vgw-f9eb0c90",
      "virtualInterfaceId": "dxvif-fg1vuj3d",
      "authKey": "0xC_ukbCerl6EYA0example",
      "routeFilterPrefixes": [],
      "location": "EqDC2",
      "bgpPeers": [
          {
              "bgpStatus": "down",
              "customerAddress": "169.254.255.2/30",
              "addressFamily": "ipv4",
              "authKey": "0xC_ukbCerl6EYA0uexample",
              "bgpPeerState": "available",
              "amazonAddress": "169.254.255.1/30",
              "asn": 65000
          },
          {
              "bgpStatus": "down",
              "customerAddress": "2001:db8:1100:2f0:0:1:9cb4:4216/125",
              "addressFamily": "ipv6",

 <connection_type>private</connection_type>\n</logical_connection>\n",
      "amazonAddress": "169.254.255.1/30",
      "virtualInterfaceType": "private",
      "virtualInterfaceName": "Test"
  }
}
```

- For API details, see CreateBgpPeer in *AWS CLI Command Reference*.

`create-connection`

The following code example shows how to use `create-connection`.

AWS CLI

To create a connection from your network to an AWS Direct Connect location

The following `create-connection` command creates a connection from your network to an AWS Direct Connect location:

```
aws directconnect create-connection --location TIVIT --bandwidth 1Gbps --connection-
name "Connection to AWS"
```

Output:

```
{
    "ownerAccount": "123456789012",
    "connectionId": "dxcon-fg31dyv6",
    "connectionState": "requested",
    "bandwidth": "1Gbps",
    "location": "TIVIT",
    "connectionName": "Connection to AWS",
    "region": "sa-east-1"
}
```

- For API details, see CreateConnection in *AWS CLI Command Reference*.

`create-direct-connect-gateway-association-proposal`

The following code example shows how to use `create-direct-connect-gateway-association-proposal`.

AWS CLI

To create a proposal to associate the specified transit gateway with the specified Direct Connect gateway

The following `create-direct-connect-gateway-association-proposal` example creates a proposal that associates the specified transit gateway with the specified Direct Connect gateway.

```
aws directconnect create-direct-connect-gateway-association-proposal \
    --direct-connect-gateway-id 11460968-4ac1-4fd3-bdb2-00599EXAMPLE \
    --direct-connect-gateway-owner-account 111122223333 \
    --gateway-id tgw-02f776b1a7EXAMPLE \
    --add-allowed-prefixes-to-direct-connect-gateway cidr=192.168.1.0/30
```

Output:

```
{
    "directConnectGatewayAssociationProposal": {
        "proposalId": "cb7f41cb-8128-43a5-93b1-dcaedEXAMPLE",
        "directConnectGatewayId": "11460968-4ac1-4fd3-bdb2-00599EXAMPLE",
        "directConnectGatewayOwnerAccount": "111122223333",
        "proposalState": "requested",
        "associatedGateway": {
            "id": "tgw-02f776b1a7EXAMPLE",
            "type": "transitGateway",
            "ownerAccount": "111122223333",
            "region": "us-east-1"
        },
        "requestedAllowedPrefixesToDirectConnectGateway": [
            {
                "cidr": "192.168.1.0/30"
            }
        ]
    }
}
```

For more information, see Creating a Transit Gateway Association Proposal in the *AWS Direct Connect User Guide*.

- For API details, see CreateDirectConnectGatewayAssociationProposal in *AWS CLI Command Reference*.

`create-direct-connect-gateway-association`

The following code example shows how to use `create-direct-connect-gateway-association`.

AWS CLI

To associate a virtual private gateway with a Direct Connect gateway

The following example associates virtual private gateway `vgw-6efe725e` with Direct Connect gateway `5f294f92-bafb-4011-916d-9b0bexample`. You must run the command in the region in which the virtual private gateway is located.

Command:

```
aws directconnect create-direct-connect-gateway-association --direct-connect-
gateway-id 5f294f92-bafb-4011-916d-9b0bexample --virtual-gateway-id vgw-6efe725e
```

Output:

```
{
  "directConnectGatewayAssociation": {
      "associationState": "associating",
      "virtualGatewayOwnerAccount": "123456789012",
      "directConnectGatewayId": "5f294f92-bafb-4011-916d-9b0bexample",
      "virtualGatewayId": "vgw-6efe725e",
      "virtualGatewayRegion": "us-east-2"
  }
}
```

- For API details, see CreateDirectConnectGatewayAssociation in *AWS CLI Command Reference*.

`create-direct-connect-gateway`

The following code example shows how to use `create-direct-connect-gateway`.

AWS CLI

To create a Direct Connect gateway

The following example creates a Direct Connect gateway with the name `DxGateway1`.

Command:

```
aws directconnect create-direct-connect-gateway --direct-connect-gateway-
name "DxGateway1"
```

Output:

```
{
  "directConnectGateway": {
      "amazonSideAsn": 64512,
      "directConnectGatewayId": "5f294f92-bafb-4011-916d-9b0bdexample",
      "ownerAccount": "123456789012",
      "directConnectGatewayName": "DxGateway1",
      "directConnectGatewayState": "available"
  }
}
```

- For API details, see CreateDirectConnectGateway in *AWS CLI Command Reference*.

`create-interconnect`

The following code example shows how to use `create-interconnect`.

AWS CLI

To create an interconnect between a partner's network and AWS

The following `create-interconnect` command creates an interconnect between an AWS Direct Connect partner's network and a specific AWS Direct Connect location:

```
aws directconnect create-interconnect --interconnect-name "1G Interconnect to AWS"
 --bandwidth 1Gbps --location TIVIT
```

Output:

```
{
```

```
    "region": "sa-east-1",
    "bandwidth": "1Gbps",
    "location": "TIVIT",
    "interconnectName": "1G Interconnect to AWS",
    "interconnectId": "dxcon-fgktov66",
    "interconnectState": "requested"
}
```

- For API details, see CreateInterconnect in *AWS CLI Command Reference*.

`create-lag`

The following code example shows how to use `create-lag`.

AWS CLI

To create a LAG with new connections

The following example creates a LAG and requests two new AWS Direct Connect connections for the LAG with a bandwidth of 1 Gbps.

Command:

```
aws directconnect create-lag --location CSVA1 --number-of-connections 2 --
connections-bandwidth 1Gbps --lag-name 1GBLag
```

Output:

```
{
  "awsDevice": "CSVA1-23u8tlpaz8iks",
  "numberOfConnections": 2,
  "lagState": "pending",
  "ownerAccount": "123456789012",
  "lagName": "1GBLag",
  "connections": [
      {
          "ownerAccount": "123456789012",
          "connectionId": "dxcon-ffqr6x5q",
          "lagId": "dxlag-ffjhj9lx",
          "connectionState": "requested",
          "bandwidth": "1Gbps",
          "location": "CSVA1",
          "connectionName": "Requested Connection 1 for Lag dxlag-ffjhj9lx",
```

```
            "region": "us-east-1"
        },
        {
            "ownerAccount": "123456789012",
            "connectionId": "dxcon-fflqyj95",
            "lagId": "dxlag-ffjhj9lx",
            "connectionState": "requested",
            "bandwidth": "1Gbps",
            "location": "CSVA1",
            "connectionName": "Requested Connection 2 for Lag dxlag-ffjhj9lx",
            "region": "us-east-1"
        }
    ],
    "lagId": "dxlag-ffjhj9lx",
    "minimumLinks": 0,
    "connectionsBandwidth": "1Gbps",
    "region": "us-east-1",
    "location": "CSVA1"
}
```

To create a LAG using an existing connection

The following example creates a LAG from an existing connection in your account, and requests a second new connection for the LAG with the same bandwidth and location as the existing connection.

Command:

```
aws directconnect create-lag --location EqDC2 --number-of-connections 2 --
connections-bandwidth 1Gbps --lag-name 2ConnLAG --connection-id dxcon-fgk145dr
```

Output:

```
{
    "awsDevice": "EqDC2-4h6ce2r1bes6",
    "numberOfConnections": 2,
    "lagState": "pending",
    "ownerAccount": "123456789012",
    "lagName": "2ConnLAG",
    "connections": [
        {
            "ownerAccount": "123456789012",
            "connectionId": "dxcon-fh6ljcvo",
```

```
          "lagId": "dxlag-fhccu14t",
          "connectionState": "requested",
          "bandwidth": "1Gbps",
          "location": "EqDC2",
          "connectionName": "Requested Connection 1 for Lag dxlag-fhccu14t",
          "region": "us-east-1"
      },
      {
          "ownerAccount": "123456789012",
          "connectionId": "dxcon-fgk145dr",
          "lagId": "dxlag-fhccu14t",
          "connectionState": "down",
          "bandwidth": "1Gbps",
          "location": "EqDC2",
          "connectionName": "VAConn1",
          "region": "us-east-1"
      }
  ],
  "lagId": "dxlag-fhccu14t",
  "minimumLinks": 0,
  "connectionsBandwidth": "1Gbps",
  "region": "us-east-1",
  "location": "EqDC2"
}
```

- For API details, see [CreateLag](#) in *AWS CLI Command Reference*.

`create-private-virtual-interface`

The following code example shows how to use `create-private-virtual-interface`.

AWS CLI

To create a private virtual interface

The following `create-private-virtual-interface` command creates a private virtual interface:

```
aws directconnect create-private-virtual-interface --connection-id dxcon-ffjrkx17 --
new-private-virtual-
interface virtualInterfaceName=PrivateVirtualInterface,vlan=101,asn=65000,authKey=asdf34exam
aba37db6
```

Output:

```
{
    "virtualInterfaceState": "pending",
    "asn": 65000,
    "vlan": 101,
    "customerAddress": "192.168.1.2/30",
    "ownerAccount": "123456789012",
    "connectionId": "dxcon-ffjrkx17",
    "virtualGatewayId": "vgw-aba37db6",
    "virtualInterfaceId": "dxvif-ffhhk74f",
    "authKey": "asdf34example",
    "routeFilterPrefixes": [],
    "location": "TIVIT",
    "customerRouterConfig": "<?xml version=\"1.0\" encoding=
\"UTF-8\"?>\n<logical_connection id=\"dxvif-ffhhk74f\">\n  <vlan>101</
vlan>\n  <customer_address>192.168.1.2/30</customer_address>\n
 <amazon_address>192.168.1.1/30</amazon_address>\n  <bgp_asn>65000</bgp_asn>\n
 <bgp_auth_key>asdf34example</bgp_auth_key>\n  <amazon_bgp_asn>7224</amazon_bgp_asn>
\n  <connection_type>private</connection_type>\n</logical_connection>\n",
    "amazonAddress": "192.168.1.1/30",
    "virtualInterfaceType": "private",
    "virtualInterfaceName": "PrivateVirtualInterface"
}
```

- For API details, see CreatePrivateVirtualInterface in *AWS CLI Command Reference*.

`create-public-virtual-interface`

The following code example shows how to use `create-public-virtual-interface`.

AWS CLI

To create a public virtual interface

The following `create-public-virtual-interface` command creates a public virtual interface:

```
aws directconnect create-public-virtual-interface --connection-id dxcon-ffjrkx17 --
new-public-virtual-
interface virtualInterfaceName=PublicVirtualInterface,vlan=2000,asn=65000,authKey=asdf34exam
{cidr=203.0.113.4/30}]
```

Output:

```
{
    "virtualInterfaceState": "verifying",
    "asn": 65000,
    "vlan": 2000,
    "customerAddress": "203.0.113.2/30",
    "ownerAccount": "123456789012",
    "connectionId": "dxcon-ffjrkx17",
    "virtualInterfaceId": "dxvif-fgh0hcrk",
    "authKey": "asdf34example",
    "routeFilterPrefixes": [
        {
            "cidr": "203.0.113.0/30"
        },
        {
            "cidr": "203.0.113.4/30"
        }
    ],
    "location": "TIVIT",
    "customerRouterConfig": "<?xml version=\"1.0\" encoding=\"UTF-8\"?
>\n<logical_connection id=\"dxvif-fgh0hcrk\">\n  <vlan>2000</
vlan>\n  <customer_address>203.0.113.2/30</customer_address>\n
 <amazon_address>203.0.113.1/30</amazon_address>\n  <bgp_asn>65000</bgp_asn>\n
 <bgp_auth_key>asdf34example</bgp_auth_key>\n  <amazon_bgp_asn>7224</amazon_bgp_asn>
\n  <connection_type>public</connection_type>\n</logical_connection>\n",
    "amazonAddress": "203.0.113.1/30",
    "virtualInterfaceType": "public",
    "virtualInterfaceName": "PublicVirtualInterface"
}
```

- For API details, see CreatePublicVirtualInterface in *AWS CLI Command Reference*.

`create-transit-virtual-interface`

The following code example shows how to use `create-transit-virtual-interface`.

AWS CLI

To create a transit virtual interface

The following `create-transit-virtual-interface` example creates a transit virtual interface for the specified connection.

```
aws directconnect create-transit-virtual-interface \
    --connection-id dxlag-fEXAMPLE \
    --new-transit-virtual-interface "virtualInterfaceName=Example Transit Virtual
 Interface,vlan=126,asn=65110,mtu=1500,authKey=0xzxgA9YoW9h58u8SvEXAMPLE,amazonAddress=192.1
aada-5a1baEXAMPLE,tags=[{key=Tag,value=Example}]"
```

Output:

```
{
    "virtualInterface": {
        "ownerAccount": "1111222233333",
        "virtualInterfaceId": "dxvif-fEXAMPLE",
        "location": "loc1",
        "connectionId": "dxlag-fEXAMPLE",
        "virtualInterfaceType": "transit",
        "virtualInterfaceName": "Example Transit Virtual Interface",
        "vlan": 126,
        "asn": 65110,

For more information, see Creating a Transit Virtual Interface to the Direct Connect Gateway in the *AWS Direct Connect User Guide*.

- For API details, see CreateTransitVirtualInterface in *AWS CLI Command Reference*.

`delete-bgp-peer`

The following code example shows how to use `delete-bgp-peer`.

AWS CLI

To delete a BGP peer from a virtual interface

The following example deletes the IPv6 BGP peer from virtual interface `dxvif-fg1vuj3d`.

Command:

```
aws directconnect delete-bgp-peer --virtual-interface-id dxvif-fg1vuj3d --asn 64600
 --customer-address 2001:db8:1100:2f0:0:1:9cb4:4216/125
```

Output:

```
{
  "virtualInterface": {
      "virtualInterfaceState": "available",
      "asn": 65000,
```

```
      "vlan": 125,
      "customerAddress": "169.254.255.2/30",
      "ownerAccount": "123456789012",
      "connectionId": "dxcon-fguhmqlc",
      "addressFamily": "ipv4",
      "virtualGatewayId": "vgw-f9eb0c90",
      "virtualInterfaceId": "dxvif-fg1vuj3d",
      "authKey": "0xC_ukbCerl6EYA0example",
      "routeFilterPrefixes": [],
      "location": "EqDC2",
      "bgpPeers": [
          {

      "virtualInterfaceName": "Test"
  }
}
```

- For API details, see DeleteBgpPeer in *AWS CLI Command Reference*.

`delete-connection`

The following code example shows how to use `delete-connection`.

AWS CLI

To delete a connection

The following `delete-connection` command deletes the specified connection:

```
aws directconnect delete-connection --connection-id dxcon-fg31dyv6
```

Output:

```
{
    "ownerAccount": "123456789012",
    "connectionId": "dxcon-fg31dyv6",
    "connectionState": "deleted",
    "bandwidth": "1Gbps",
    "location": "TIVIT",
    "connectionName": "Connection to AWS",
    "region": "sa-east-1"
}
```

- For API details, see DeleteConnection in *AWS CLI Command Reference*.

`delete-direct-connect-gateway-association`

The following code example shows how to use `delete-direct-connect-gateway-association`.

AWS CLI

To delete a Direct Connect gateway association

The following `delete-direct-connect-gateway-association` example deletes the Direct Connect gateway association with a transit gateway that has the specified association ID.

```
aws directconnect delete-direct-connect-gateway-association --association-id
  be85116d-46eb-4b43-a27a-da0c2ad648de
```

Output:

```
{
    "directConnectGatewayAssociation": {
        "directConnectGatewayId": "11460968-4ac1-4fd3-bdb2-00599EXAMPlE",
        "directConnectGatewayOwnerAccount": "123456789012",
        "associationState": "disassociating",
        "associatedGateway": {
            "id": "tgw-095b3b0b54EXAMPLE",
            "type": "transitGateway",
            "ownerAccount": "123456789012",
            "region": "us-east-1"
       },
        "associationId": " be85116d-46eb-4b43-a27a-da0c2ad648deEXAMPLE ",
        "allowedPrefixesToDirectConnectGateway": [
            {
                "cidr": "192.0.1.0/28"
            }
        ]
    }
}
```

For more information, see Associating and Disassociating Transit Gateways in the *AWS Direct Connect User Guide*.

- For API details, see DeleteDirectConnectGatewayAssociation in *AWS CLI Command Reference*.

`delete-direct-connect-gateway`

The following code example shows how to use `delete-direct-connect-gateway`.

AWS CLI

To delete a Direct Connect gateway

The following example deletes Direct Connect gateway `5f294f92-bafb-4011-916d-9b0bexample`.

Command:

```
aws directconnect delete-direct-connect-gateway --direct-connect-gateway-
id 5f294f92-bafb-4011-916d-9b0bexample
```

Output:

```
{
  "directConnectGateway": {
      "amazonSideAsn": 64512,
      "directConnectGatewayId": "5f294f92-bafb-4011-916d-9b0bexample",
      "ownerAccount": "123456789012",
      "directConnectGatewayName": "DxGateway1",
      "directConnectGatewayState": "deleting"
  }
}
```

- For API details, see DeleteDirectConnectGateway in *AWS CLI Command Reference*.

`delete-interconnect`

The following code example shows how to use `delete-interconnect`.

AWS CLI

To delete an interconnect

The following `delete-interconnect` command deletes the specified interconnect:

```
aws directconnect delete-interconnect --interconnect-id dxcon-fgktov66
```

Output:

```
{
    "interconnectState": "deleted"
}
```

- For API details, see DeleteInterconnect in *AWS CLI Command Reference*.

`delete-lag`

The following code example shows how to use `delete-lag`.

AWS CLI

To delete a LAG

The following example deletes the specified LAG.

Command:

```
aws directconnect delete-lag --lag-id dxlag-ffrhowd9
```

Output:

```
{
  "awsDevice": "EqDC2-4h6ce2r1bes6",
  "numberOfConnections": 0,
  "lagState": "deleted",
  "ownerAccount": "123456789012",
  "lagName": "TestLAG",
  "connections": [],
  "lagId": "dxlag-ffrhowd9",
  "minimumLinks": 0,
  "connectionsBandwidth": "1Gbps",
  "region": "us-east-1",
  "location": "EqDC2"
}
```

- For API details, see DeleteLag in *AWS CLI Command Reference*.

`delete-virtual-interface`

The following code example shows how to use `delete-virtual-interface`.

AWS CLI

To delete a virtual interface

The following `delete-virtual-interface` command deletes the specified virtual interface:

```
aws directconnect delete-virtual-interface --virtual-interface-id dxvif-ffhhk74f
```

Output:

```
{
    "virtualInterfaceState": "deleting"
}
```

- For API details, see DeleteVirtualInterface in *AWS CLI Command Reference*.

`describe-connection-loa`

The following code example shows how to use `describe-connection-loa`.

AWS CLI

To describe your LOA-CFA for a connection using Linux or Mac OS X

The following example describes your LOA-CFA for connection `dxcon-fh6ayh1d`. The contents of the LOA-CFA are base64-encoded. This command uses the `--output` and `--query` parameters to control the output and extract the contents of the `loaContent` structure. The final part of the command decodes the content using the `base64` utility, and sends the output to a PDF file.

```
aws directconnect describe-connection-loa --connection-id dxcon-fh6ayh1d --
output text --query loa.loaContent|base64 --decode > myLoaCfa.pdf
```

To describe your LOA-CFA for a connection using Windows

The previous example requires the use of the `base64` utility to decode the output. On a Windows computer, you can use `certutil` instead. In the following example, the first command describes your LOA-CFA for connection `dxcon-fh6ayh1d` and uses the `--output` and `--query` parameters to control the output and extract the contents of the `loaContent` structure to a file called `myLoaCfa.base64`. The second command uses the `certutil` utility to decode the file and send the output to a PDF file.

```
aws directconnect describe-connection-loa --connection-id dxcon-fh6ayh1d --
output text --query loa.loaContent > myLoaCfa.base64
```

```
certutil -decode myLoaCfa.base64 myLoaCfa.pdf
```

For more information about controlling AWS CLI output, see Controlling Command Output from the AWS Command Line Interface in the *AWS Command Line Interface User Guide*.

- For API details, see DescribeConnectionLoa in *AWS CLI Command Reference*.

`describe-connections-on-interconnect`

The following code example shows how to use `describe-connections-on-interconnect`.

AWS CLI

To list connections on an interconnect

The following `describe-connections-on-interconnect` command lists connections that have been provisioned on the given interconnect:

```
aws directconnect describe-connections-on-interconnect --interconnect-id dxcon-fgktov66
```

Output:

```
{
    "connections": [
        {
            "partnerName": "TIVIT",
            "vlan": 101,
            "ownerAccount": "123456789012",
            "connectionId": "dxcon-ffzc51m1",
            "connectionState": "ordering",
            "bandwidth": "500Mbps",
            "location": "TIVIT",
            "connectionName": "mydcinterconnect",
            "region": "sa-east-1"
        }
    ]
}
```

- For API details, see DescribeConnectionsOnInterconnect in *AWS CLI Command Reference*.

`describe-connections`

The following code example shows how to use `describe-connections`.

AWS CLI

To list all connections in the current region

The following `describe-connections` command lists all connections in the current region:

```
aws directconnect describe-connections
```

Output:

```
{
  "connections": [
      {
          "awsDevice": "EqDC2-123h49s71dabc",
          "ownerAccount": "123456789012",
          "connectionId": "dxcon-fguhmqlc",
          "lagId": "dxlag-ffrz71kw",
          "connectionState": "down",
          "bandwidth": "1Gbps",
          "location": "EqDC2",
          "connectionName": "My_Connection",
          "loaIssueTime": 1491568964.0,
          "region": "us-east-1"
      }
  ]
}
```

- For API details, see DescribeConnections in *AWS CLI Command Reference*.

`describe-direct-connect-gateway-association-proposals`

The following code example shows how to use `describe-direct-connect-gateway-association-proposals`.

AWS CLI

To describe your Direct Connect gateway association proposals

The following `describe-direct-connect-gateway-association-proposals` example displays details about your Direct Connect gateway association proposals.

```
aws directconnect describe-direct-connect-gateway-association-proposals
```

Output:

```
{
    "directConnectGatewayAssociationProposals": [
        {
            "proposalId": "c2ede9b4-bbc6-4d33-923c-bc4feEXAMPLE",
            "directConnectGatewayId": "11460968-4ac1-4fd3-bdb2-00599EXAMPLE",
```

```
            "directConnectGatewayOwnerAccount": "111122223333",
            "proposalState": "requested",
            "associatedGateway": {
                "id": "tgw-02f776b1a7EXAMPLE",
                "type": "transitGateway",
                "ownerAccount": "111122223333",

                    "cidr": "192.168.4.0/30"
                },
                {
                    "cidr": "192.168.5.0/30"
                }
            ],
            "requestedAllowedPrefixesToDirectConnectGateway": [
                {
                    "cidr": "192.168.5.0/30"
```

```
                }
            ]
        }
    ]
}
```

For more information, see [Associating and Disassociating Transit Gateways]() in the *AWS Direct Connect User Guide*.

- For API details, see [DescribeDirectConnectGatewayAssociationProposals]() in *AWS CLI Command Reference*.

`describe-direct-connect-gateway-associations`

The following code example shows how to use `describe-direct-connect-gateway-associations`.

AWS CLI

To describe Direct Connect gateway associations

The following example describes all the associations with Direct Connect gateway `5f294f92-bafb-4011-916d-9b0bexample`.

Command:

```
aws directconnect describe-direct-connect-gateway-associations --direct-connect-gateway-id 5f294f92-bafb-4011-916d-9b0bexample
```

Output:

```
{
   "nextToken":
  "eyJ2IjoxLCJzIjoxLCJpIjoiOU83OTFodzdycnZCbkN4MExHeHVwQT09IiwiYyI6InIxTEN0UEVHV0I1UFlkaWFnNl

            "virtualGatewayId": "vgw-ebaa27db",
            "virtualGatewayRegion": "us-east-2"
        }
    ]
}
```

- For API details, see DescribeDirectConnectGatewayAssociations in *AWS CLI Command Reference*.

`describe-direct-connect-gateway-attachments`

The following code example shows how to use `describe-direct-connect-gateway-attachments`.

AWS CLI

To describe Direct Connect gateway attachments

The following example describes the virtual interfaces that are attached to Direct Connect gateway `5f294f92-bafb-4011-916d-9b0bexample`.

Command:

```
aws directconnect describe-direct-connect-gateway-attachments --direct-connect-gateway-id 5f294f92-bafb-4011-916d-9b0bexample
```

Output:

```
{
    "directConnectGatewayAttachments": [

            "attachmentState": "attaching",
            "virtualInterfaceId": "dxvif-fg9zyabc"
```

```
        }
    ],
    "nextToken":
   "eyJ2IjoxLCJzIjoxLCJpIjoibEhXdlNpUXF5RzhoL1JyUW52SlV2QT09IiwiYyI6Im5wQjFHQ0RyQUdRS3puNnNXcU
}
```

- For API details, see DescribeDirectConnectGatewayAttachments in *AWS CLI Command Reference*.

`describe-direct-connect-gateways`

The following code example shows how to use `describe-direct-connect-gateways`.

AWS CLI

To describe your Direct Connect gateways

The following example describe all of your Direct Connect gateways.

Command:

```
aws directconnect describe-direct-connect-gateways
```

Output:

```
{
    "directConnectGateways": [
        {
            "amazonSideAsn": 64512,
            "directConnectGatewayId": "cf68415c-f4ae-48f2-87a7-3b52cexample",
            "ownerAccount": "123456789012",
            "directConnectGatewayName": "DxGateway2",
            "directConnectGatewayState": "available"
        },
        {
            "amazonSideAsn": 64512,
            "directConnectGatewayId": "5f294f92-bafb-4011-916d-9b0bdexample",
            "ownerAccount": "123456789012",
            "directConnectGatewayName": "DxGateway1",
            "directConnectGatewayState": "available"
        }
    ]
```

```
}
```

- For API details, see DescribeDirectConnectGateways in *AWS CLI Command Reference*.

`describe-hosted-connections`

The following code example shows how to use `describe-hosted-connections`.

AWS CLI

To list connections on an interconnect

The following example lists connections that have been provisioned on the given interconnect.

Command:

```
aws directconnect describe-hosted-connections --connection-id dxcon-fgktov66
```

Output:

```
{
    "connections": [
        {
            "partnerName": "TIVIT",
            "vlan": 101,
            "ownerAccount": "123456789012",
            "connectionId": "dxcon-ffzc51m1",
            "connectionState": "ordering",
            "bandwidth": "500Mbps",
            "location": "TIVIT",
            "connectionName": "mydcinterconnect",
            "region": "sa-east-1"
        }
    ]
}
```

- For API details, see DescribeHostedConnections in *AWS CLI Command Reference*.

`describe-interconnect-loa`

The following code example shows how to use `describe-interconnect-loa`.

AWS CLI

To describe your LOA-CFA for an interconnect using Linux or Mac OS X

The following example describes your LOA-CFA for interconnect `dxcon-fh6ayh1d`. The contents of the LOA-CFA are base64-encoded. This command uses the `--output` and `--query` parameters to control the output and extract the contents of the `loaContent` structure. The final part of the command decodes the content using the `base64` utility, and sends the output to a PDF file.

```
aws directconnect describe-interconnect-loa --interconnect-id dxcon-fh6ayh1d --
output text --query loa.loaContent|base64 --decode > myLoaCfa.pdf
```

To describe your LOA-CFA for an interconnect using Windows

The previous example requires the use of the `base64` utility to decode the output. On a Windows computer, you can use `certutil` instead. In the following example, the first command describes your LOA-CFA for interconnect `dxcon-fh6ayh1d` and uses the `--output` and `--query` parameters to control the output and extract the contents of the `loaContent` structure to a file called `myLoaCfa.base64`. The second command uses the `certutil` utility to decode the file and send the output to a PDF file.

```
aws directconnect describe-interconnect-loa --interconnect-id dxcon-fh6ayh1d --
output text --query loa.loaContent > myLoaCfa.base64
```

```
certutil -decode myLoaCfa.base64 myLoaCfa.pdf
```

For more information about controlling AWS CLI output, see Controlling Command Output from the AWS Command Line Interface in the *AWS Command Line Interface User Guide*.

- For API details, see DescribeInterconnectLoa in *AWS CLI Command Reference*.

`describe-interconnects`

The following code example shows how to use `describe-interconnects`.

AWS CLI

To list interconnects

The following `describe-interconnects` command lists the interconnects owned by your AWS account:

```
aws directconnect describe-interconnects
```

Output:

```
{
    "interconnects": [
        {
            "region": "sa-east-1",
            "bandwidth": "1Gbps",
            "location": "TIVIT",
            "interconnectName": "1G Interconnect to AWS",
            "interconnectId": "dxcon-fgktov66",
            "interconnectState": "down"
        }
    ]
}
```

- For API details, see DescribeInterconnects in *AWS CLI Command Reference*.

`describe-lags`

The following code example shows how to use `describe-lags`.

AWS CLI

To describe your LAGs

The following command describes all of your LAGs for the current region.

Command:

```
aws directconnect describe-lags
```

Output:

```
{
  "lags": [
```

```
        {
            "awsDevice": "EqDC2-19y7z3m17xpuz",
            "numberOfConnections": 2,
            "lagState": "down",
            "ownerAccount": "123456789012",
            "lagName": "DA-LAG",
            "connections": [
                {
                    "ownerAccount": "123456789012",
                    "connectionId": "dxcon-ffnikghc",
                    "lagId": "dxlag-fgsu9erb",
                    "connectionState": "requested",
                    "bandwidth": "10Gbps",
                    "location": "EqDC2",
                    "connectionName": "Requested Connection 1 for Lag dxlag-fgsu9erb",
                    "region": "us-east-1"
                },
                {
                    "ownerAccount": "123456789012",
                    "connectionId": "dxcon-fglgbdea",
                    "lagId": "dxlag-fgsu9erb",
                    "connectionState": "requested",
                    "bandwidth": "10Gbps",
                    "location": "EqDC2",
                    "connectionName": "Requested Connection 2 for Lag dxlag-fgsu9erb",
                    "region": "us-east-1"
                }
            ],
            "lagId": "dxlag-fgsu9erb",
            "minimumLinks": 0,
            "connectionsBandwidth": "10Gbps",
            "region": "us-east-1",
            "location": "EqDC2"
        }
    ]
}
```

- For API details, see DescribeLags in *AWS CLI Command Reference*.

`describe-loa`

The following code example shows how to use `describe-loa`.

AWS CLI

To describe your LOA-CFA for a connection using Linux or Mac OS X

The following example describes your LOA-CFA for connection `dxcon-fh6ayh1d`. The contents of the LOA-CFA are base64-encoded. This command uses the `--output` and `--query` parameters to control the output and extract the contents of the `loaContent` structure. The final part of the command decodes the content using the `base64` utility, and sends the output to a PDF file.

```
aws directconnect describe-loa --connection-id dxcon-fh6ayh1d --output text --
query loa.loaContent|base64 --decode > myLoaCfa.pdf
```

To describe your LOA-CFA for a connection using Windows

The previous example requires the use of the `base64` utility to decode the output. On a Windows computer, you can use `certutil` instead. In the following example, the first command describes your LOA-CFA for connection `dxcon-fh6ayh1d` and uses the `--output` and `--query` parameters to control the output and extract the contents of the `loaContent` structure to a file called `myLoaCfa.base64`. The second command uses the `certutil` utility to decode the file and send the output to a PDF file.

```
aws directconnect describe-loa --connection-id dxcon-fh6ayh1d --output text --
query loa.loaContent > myLoaCfa.base64
```

```
certutil -decode myLoaCfa.base64 myLoaCfa.pdf
```

For more information about controlling AWS CLI output, see Controlling Command Output from the AWS Command Line Interface in the *AWS Command Line Interface User Guide*.

- For API details, see DescribeLoa in *AWS CLI Command Reference*.

`describe-locations`

The following code example shows how to use `describe-locations`.

AWS CLI

To list AWS Direct Connect partners and locations

The following `describe-locations` command lists AWS Direct Connect partners and locations in the current region:

```
aws directconnect describe-locations
```

Output:

```
{
    "locations": [
        {
            "locationName": "NAP do Brasil, Barueri, Sao Paulo",
            "locationCode": "TNDB"
        },
        {
            "locationName": "Tivit - Site Transamerica (Sao Paulo)",
            "locationCode": "TIVIT"
        }
    ]
}
```

- For API details, see DescribeLocations in *AWS CLI Command Reference*.

`describe-tags`

The following code example shows how to use `describe-tags`.

AWS CLI

To describe tags for your AWS Direct Connect resources

The following command describes the tags for the connection `dxcon-abcabc12`.

Command:

```
aws directconnect describe-tags --resource-arns arn:aws:directconnect:us-east-1:123456789012:dxcon/dxcon-abcabc12
```

Output:

```
{
```

```
  "resourceTags": [
      {
          "resourceArn": "arn:aws:directconnect:us-east-1:123456789012:dxcon/dxcon-
abcabc12",
          "tags": [
              {
                  "value": "VAConnection",
                  "key": "Name"
              }
          ]
      }
  ]
}
```

- For API details, see DescribeTags in *AWS CLI Command Reference*.

`describe-virtual-gateways`

The following code example shows how to use `describe-virtual-gateways`.

AWS CLI

To list virtual private gateways

The following `describe-virtual-gateways` command lists virtual private gateways owned by your AWS account:

```
aws directconnect describe-virtual-gateways
```

Output:

```
{
    "virtualGateways": [
        {
            "virtualGatewayId": "vgw-aba37db6",
            "virtualGatewayState": "available"
        }
    ]
}
```

- For API details, see DescribeVirtualGateways in *AWS CLI Command Reference*.

`describe-virtual-interfaces`

The following code example shows how to use `describe-virtual-interfaces`.

AWS CLI

To list all virtual interfaces

The following `describe-virtual-interfaces` command lists the information about all virtual interfaces associated with your AWS account:

```
aws directconnect describe-virtual-interfaces --connection-id dxcon-ffjrkx17
```

Output:

```
{
    "virtualInterfaces": [
        {
            "virtualInterfaceState": "down",
            "asn": 65000,
            "vlan": 101,
            "customerAddress": "192.168.1.2/30",
            "ownerAccount": "123456789012",
            "connectionId": "dxcon-ffjrkx17",
            "virtualGatewayId": "vgw-aba37db6",
            "virtualInterfaceId": "dxvif-ffhhk74f",
            "authKey": "asdf34example",
            "routeFilterPrefixes": [],
            "location": "TIVIT",
            "customerRouterConfig": "<?xml version=\"1.0\" encoding=
\"UTF-8\"?>\n<logical_connection id=\"dxvif-ffhhk74f\">\n  <vlan>101</
vlan>\n  <customer_address>192.168.1.2/30</customer_address>\n
 <amazon_address>192.168.1.1/30</amazon_address>\n  <bgp_asn>65000</bgp_asn>\n
 <bgp_auth_key>asdf34example</bgp_auth_key>\n  <amazon_bgp_asn>7224</amazon_bgp_asn>
\n  <connection_type>private</connection_type>\n</logical_connection>\n",
            "amazonAddress": "192.168.1.1/30",
            "virtualInterfaceType": "private",
            "virtualInterfaceName": "PrivateVirtualInterface"
        },
        {
            "virtualInterfaceState": "verifying",
            "asn": 65000,
            "vlan": 2000,
```

```
            "customerAddress": "203.0.113.2/30",
            "ownerAccount": "123456789012",
            "connectionId": "dxcon-ffjrkx17",
            "virtualGatewayId": "",
            "virtualInterfaceId": "dxvif-fgh0hcrk",
            "authKey": "asdf34example",
            "routeFilterPrefixes": [
                {
                    "cidr": "203.0.113.4/30"
                },
                {
                    "cidr": "203.0.113.0/30"
                }
            ],
            "location": "TIVIT",
            "customerRouterConfig": "<?xml version=\"1.0\" encoding=
\"UTF-8\"?>\n<logical_connection id=\"dxvif-fgh0hcrk\">\n  <vlan>2000</
vlan>\n  <customer_address>203.0.113.2/30</customer_address>\n
 <amazon_address>203.0.113.1/30</amazon_address>\n  <bgp_asn>65000</bgp_asn>\n
 <bgp_auth_key>asdf34example</bgp_auth_key>\n  <amazon_bgp_asn>7224</amazon_bgp_asn>
\n  <connection_type>public</connection_type>\n</logical_connection>\n",
            "amazonAddress": "203.0.113.1/30",
            "virtualInterfaceType": "public",
            "virtualInterfaceName": "PublicVirtualInterface"
        }
    ]
}
```

- For API details, see DescribeVirtualInterfaces in *AWS CLI Command Reference*.

`disassociate-connection-from-lag`

The following code example shows how to use `disassociate-connection-from-lag`.

AWS CLI

To disassociate a connection from a LAG

The following example disassociates the specified connection from the specified LAG.

Command:

```
aws directconnect disassociate-connection-from-lag --lag-id dxlag-fhccu14t --
connection-id  dxcon-fg9607vm
```

Output:

```
{
  "ownerAccount": "123456789012",
  "connectionId": "dxcon-fg9607vm",
  "connectionState": "requested",
  "bandwidth": "1Gbps",
  "location": "EqDC2",
  "connectionName": "Con2ForLag",
  "region": "us-east-1"
}
```

- For API details, see DisassociateConnectionFromLag in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add a tag to an AWS Direct Connect resource

The following command adds a tag with a key of `Name` and a value of `VAConnection` to the connection `dxcon-abcabc12`. If the command succeeds, no output is returned.

Command:

```
aws directconnect tag-resource --resource-arn arn:aws:directconnect:us-
east-1:123456789012:dxcon/dxcon-abcabc12 --tags "key=Name,value=VAConnection"
```

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from an AWS Direct Connect resource

The following command removes the tag with the key `Name` from connection `dxcon-abcabc12`. If the command succeeds, no output is returned.

Command:

```
aws directconnect untag-resource --resource-arn arn:aws:directconnect:us-
east-1:123456789012:dxcon/dxcon-abcabc12 --tag-keys Name
```

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-direct-connect-gateway-association`

The following code example shows how to use `update-direct-connect-gateway-association`.

AWS CLI

To update the specified attributes of the Direct Connect gateway association

The following `update-direct-connect-gateway-association` example adds the specified CIDR block to a Direct Connect gateway association.

```
aws directconnect update-direct-connect-gateway-association \
    --association-id 820a6e4f-5374-4004-8317-3f64bEXAMPLE \
    --add-allowed-prefixes-to-direct-connect-gateway cidr=192.168.2.0/30
```

Output:

```
{
    "directConnectGatewayAssociation": {
        "directConnectGatewayId": "11460968-4ac1-4fd3-bdb2-00599EXAMPLE",
        "directConnectGatewayOwnerAccount": "111122223333",
        "associationState": "updating",
        "associatedGateway": {
            "id": "tgw-02f776b1a7EXAMPLE",
            "type": "transitGateway",
            "ownerAccount": "111122223333",
            "region": "us-east-1"
```

```
        },
        "associationId": "820a6e4f-5374-4004-8317-3f64bEXAMPLE",
        "allowedPrefixesToDirectConnectGateway": [
            {
                "cidr": "192.168.2.0/30"
            },
            {
                "cidr": "192.168.1.0/30"
            }
        ]
    }
}
```

For more information, see Working with Direct Connect Gateways in the *AWS Direct Connect User Guide*.

- For API details, see UpdateDirectConnectGatewayAssociation in *AWS CLI Command Reference*.

`update-lag`

The following code example shows how to use `update-lag`.

AWS CLI

To update a LAG

The following example changes the name of the specified LAG.

Command:

```
aws directconnect update-lag --lag-id dxlag-ffjhj9lx --lag-name 2ConnLag
```

Output:

```
{
  "awsDevice": "CSVA1-23u8tlpaz8iks",
  "numberOfConnections": 2,
  "lagState": "down",
  "ownerAccount": "123456789012",
  "lagName": "2ConnLag",
  "connections": [
      {
          "ownerAccount": "123456789012",
```

```
            "connectionId": "dxcon-fflqyj95",
            "lagId": "dxlag-ffjhj9lx",
            "connectionState": "requested",
            "bandwidth": "1Gbps",
            "location": "CSVA1",
            "connectionName": "Requested Connection 2 for Lag dxlag-ffjhj9lx",
            "region": "us-east-1"
        },
        {
            "ownerAccount": "123456789012",
            "connectionId": "dxcon-ffqr6x5q",
            "lagId": "dxlag-ffjhj9lx",
            "connectionState": "requested",
            "bandwidth": "1Gbps",
            "location": "CSVA1",
            "connectionName": "Requested Connection 1 for Lag dxlag-ffjhj9lx",
            "region": "us-east-1"
        }
    ],
    "lagId": "dxlag-ffjhj9lx",
    "minimumLinks": 0,
    "connectionsBandwidth": "1Gbps",
    "region": "us-east-1",
    "location": "CSVA1"
}
```

- For API details, see UpdateLag in *AWS CLI Command Reference*.

`update-virtual-interface-attributes`

The following code example shows how to use `update-virtual-interface-attributes`.

AWS CLI

To update the MTU of a virtual interface

The following `update-virtual-interface-attributes` example updates the MTU of the specified virtual interface.

```
aws directconnect update-virtual-interface-attributes \
    --virtual-interface-id dxvif-fEXAMPLE \
    --mtu 1500
```

Output:

```
{
    "ownerAccount": "1111222233333",
    "virtualInterfaceId": "dxvif-fEXAMPLE",
    "location": "loc1",
    "connectionId": "dxlag-fEXAMPLE",

        }
    ],
    "region": "sa-east-1",
    "awsDeviceV2": "loc1-26wz6vEXAMPLE",
```

```
    "tags": []
}
```

For more information, see Setting Network MTU for Private Virtual Interfaces or Transit Virtual Interfaces in the *AWS Direct Connect User Guide*.

- For API details, see UpdateVirtualInterfaceAttributes in *AWS CLI Command Reference*.

Directory Service examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Directory Service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Actions

`describe-directories`

The following code example shows how to use `describe-directories`.

AWS CLI

To get details about your directories

The following `describe-directories` example displays details about the specified directory.

```
aws ds describe-directories \
   --directory-id d-a1b2c3d4e5
```

Output:

```
{
```

```
    "DirectoryDescriptions": [
        {
            "DirectoryId": "d-a1b2c3d4e5",
            "Name": "mydirectory.example.com",

- For API details, see DescribeDirectories in *AWS CLI Command Reference*.

`describe-trusts`

The following code example shows how to use `describe-trusts`.

AWS CLI

To get details about your trust relationships

The following `describe-trusts` example displays details about the trust relationships for the specified directory.

```
aws ds describe-trusts \
   --directory-id d-a1b2c3d4e5
```

Output:

```
{
    "Trusts": [
        {
            "DirectoryId": "d-a1b2c3d4e5",
            "TrustId": "t-9a8b7c6d5e",
            "RemoteDomainName": "other.example.com",
            "TrustType": "Forest",

            "SelectiveAuth": "Disabled"
        }
    ]
}
```

- For API details, see DescribeTrusts in *AWS CLI Command Reference*.

Directory Service Data examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Directory Service Data.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`add-group-member`

The following code example shows how to use `add-group-member`.

AWS CLI

To add a group member to a directory

The following `add-group-member` example adds the specified user to the specified group in the specified directory.

```
aws ds-data add-group-member \
    --directory-id d-1234567890 \
    --group-name 'sales' \
    --member-name 'john.doe'
```

This command produces no output.

For more information, see Adding or removing AWS Managed Microsoft AD members to groups and groups to groups in the *AWS Directory Service Administration Guide*.

- For API details, see AddGroupMember in *AWS CLI Command Reference*.

`create-group`

The following code example shows how to use `create-group`.

AWS CLI

To list the available widgets

The following `create-group` example creates a group in a specified directory.

```
aws ds-data create-group \
    --directory-id d-1234567890 \
    --sam-account-name "sales"
```

Output:

```
{
    "DirectoryId": "d-1234567890",
    "SAMAccountName": "sales",
    "SID": "S-1-2-34-5567891234-5678912345-67891234567-8912"
}
```

For more information, see Creating an AWS Managed Microsoft AD group in the *AWS Directory Service Administration Guide*.

- For API details, see CreateGroup in *AWS CLI Command Reference*.

`create-user`

The following code example shows how to use `create-user`.

AWS CLI

To create a user

The following `create-user` example creates a user in the specified directory.

```
aws ds-data create-user \
    --directory-id d-1234567890 \
    --sam-account-name 'john.doe'
```

Output:

```
{
    "DirectoryId": "d-1234567890",
    "SAMAccountName": "john.doe",
    "SID": "S-1-2-34-5567891234-5678912345-67891234567-8912"
}
```

For more information, see Creating an AWS Managed Microsoft AD user in the *AWS Directory Service Administration Guide*.

- For API details, see CreateUser in *AWS CLI Command Reference*.

`delete-group`

The following code example shows how to use `delete-group`.

AWS CLI

To delete a group

The following `delete-group` example deletes the specified group from the specified directory.

```
aws ds-data delete-group \
    --directory-id d-1234567890 \
    --sam-account-name 'sales'
```

This command produces no output.

For more information, see Deleting an AWS Managed Microsoft AD group in the *AWS Directory Service Administration Guide*.

- For API details, see DeleteGroup in *AWS CLI Command Reference*.

`delete-user`

The following code example shows how to use `delete-user`.

AWS CLI

To delete a user

The following `delete-user` example deletes the specified user from the specified directory.

```
aws ds-data delete-user \
    --directory-id d-1234567890 \
    --sam-account-name 'john.doe'
```

This command produces no output.

For more information, see Deleting an AWS Managed Microsoft AD user in the *AWS Directory Service Administration Guide*.

- For API details, see DeleteUser in *AWS CLI Command Reference*.

`describe-group`

The following code example shows how to use `describe-group`.

AWS CLI

To list details of a group

The following `describe-group` example gets information for the specified group in the specified directory.

```
aws ds-data describe-group \
    --directory-id d-1234567890 \
    --sam-account-name 'sales'
```

Output:

```
{
    "DirectoryId": "d-1234567890",
    "DistinguishedName": "CN=sales,OU=Users,OU=CORP,DC=corp,DC=example,DC=com",
    "GroupScope": "Global",
    "GroupType": "Security",
    "Realm": "corp.example.com",
    "SAMAccountName": "sales",
    "SID": "S-1-2-34-5567891234-5678912345-67891234567-8912"
}
```

For more information, see Viewing and updating an AWS Managed Microsoft AD group's details in the *AWS Directory Service Administration Guide*.

- For API details, see DescribeGroup in *AWS CLI Command Reference*.

`describe-user`

The following code example shows how to use `describe-user`.

AWS CLI

To list information for a user

The following `describe-user` example gets information for the specified user in the specified directory.

```
aws ds-data describe-user command-name \
    --directory-id d-1234567890 \
    --sam-account-name 'john.doe'
```

Output:

```
{
    "DirectoryId": "d-1234567890",
    "DistinguishedName": "CN=john.doe,OU=Users,OU=CORP,DC=corp,DC=example,DC=com",
    "Enabled": false,
    "Realm": "corp.example.com",
    "SAMAccountName": "john.doe",
    "SID": "S-1-2-34-5678901234-5678901234-5678910123-4567",
    "UserPrincipalName": "john.doe@CORP.EXAMPLE.COM"
}
```

For more information, see Viewing and updating an AWS Managed Microsoft AD user in the *AWS Directory Service Administration Guide*.

- For API details, see DescribeUser in *AWS CLI Command Reference*.

`disable-directory-data-access`

The following code example shows how to use `disable-directory-data-access`.

AWS CLI

To disable Directory Service Data API for a directory

The following `disable-directory-data-access` example disables the Directory Service Data API for the specified directory.

```
aws ds disable-directory-data-access \
    --directory-id d-1234567890
```

This command produces no output.

For more information, see Enabling or disabling user and group management or AWS Directory Service Data in the *AWS Directory Service Administration Guide*.

- For API details, see DisableDirectoryDataAccess in *AWS CLI Command Reference*.

`disable-user`

The following code example shows how to use `disable-user`.

AWS CLI

To disable a user

The following `disable-user` example disables the specified user in the specified directory.

```
aws ds-data disable-user \
    --directory-id d-1234567890 \
    --sam-account-name 'john.doe'
```

This command produces no output.

For more information, see Disabling an AWS Managed Microsoft AD user in the *AWS Directory Service Administration Guide*.

- For API details, see DisableUser in *AWS CLI Command Reference*.

`enable-directory-data-access`

The following code example shows how to use `enable-directory-data-access`.

AWS CLI

To enable Directory Service Data API for a directory

The following `enable-directory-data-access` example enables the Directory Service Data API for the specified directory.

```
aws ds enable-directory-data-access \
    --directory-id d-1234567890
```

This command produces no output.

For more information, see Enabling or disabling user and group management or AWS Directory Service Data in the *AWS Directory Service Administration Guide*.

- For API details, see EnableDirectoryDataAccess in *AWS CLI Command Reference*.

`list-group-members`

The following code example shows how to use `list-group-members`.

AWS CLI

To list a directory's group members

The following `list-group-members` example lists the group members for the specified group in the specified directory.

```
aws ds-data list-group-members \
    --directory-id d-1234567890 \
    --sam-account-name 'sales'
```

Output:

```
{
    "Members": [
        {
            "MemberType": "USER",
            "SAMAccountName": "Jane Doe",
            "SID": "S-1-2-34-5678901234-5678901234-5678910123-4568"
        },
        {
            "MemberType": "USER",
            "SAMAccountName": "John Doe",
            "SID": "S-1-2-34-5678901234-5678901234-5678910123-4569"
        }
    ],
    "DirectoryId": "d-1234567890",
    "MemberRealm": "corp.example.com",
    "Realm": "corp.example.com"
}
```

For more information, see Viewing and updating an AWS Managed Microsoft AD group's details in the *AWS Directory Service Administration Guide*.

- For API details, see ListGroupMembers in *AWS CLI Command Reference*.

`list-groups-for-member`

The following code example shows how to use `list-groups-for-member`.

AWS CLI

To list a directory's group membership

The following `list-groups-for-member` example lists group membership for the specified user in the specified directory.

```
aws ds-data list-groups-for-member \
    --directory-id d-1234567890 \
    --sam-account-name 'john.doe'
```

Output:

```
{
    "Groups": [
        {
            "GroupScope": "Global",
            "GroupType": "Security",
            "SAMAccountName": "Domain Users",
            "SID": "S-1-2-34-5678901234-5678901234-5678910123-4567"
        }
    ],
    "DirectoryId": "d-1234567890",
    "MemberRealm": "corp.example.com",
    "Realm": "corp.example.com"
}
```

For more information, see Viewing and updating an AWS Managed Microsoft AD user in the *AWS Directory Service Administration Guide*.

- For API details, see ListGroupsForMember in *AWS CLI Command Reference*.

`list-groups`

The following code example shows how to use `list-groups`.

AWS CLI

To list a directory's groups

The following `list-groups` example lists groups in the specified directory.

```
aws ds-data list-groups \
    --directory-id d-1234567890
```

Output:

```
{
    "Groups": [
        {
            "GroupScope": "BuiltinLocal",
            "GroupType": "Security",
            "SAMAccountName": "Administrators",
            "SID": "S-1-2-33-441"
        },
        {
            "GroupScope": "BuiltinLocal",
            "GroupType": "Security",
            "SAMAccountName": "Users",
            "SID": "S-1-2-33-442"
        },
        {
            "GroupScope": "BuiltinLocal",
            "GroupType": "Security",
            "SAMAccountName": "Guests",
            "SID": "S-1-2-33-443"
        },
        {
            "GroupScope": "BuiltinLocal",
            "GroupType": "Security",
            "SAMAccountName": "Print Operators",
            "SID": "S-1-2-33-444"
        },
        {

                "SID": "S-1-2-34-5678901234-5678901234-5678910123-4599"
            },
            {
                "GroupScope": "Global",
                "GroupType": "Distribution",
                "SAMAccountName": "sales",
                "SID": "S-1-2-34-5678901234-5678901234-5678910123-4567"
            }
        ],
        "DirectoryId": "d-1234567890",
        "Realm": "corp.example.com"
}
```

For more information, see Viewing and updating an AWS Managed Microsoft AD group's details in the *AWS Directory Service Administration Guide*.

- For API details, see ListGroups in *AWS CLI Command Reference*.

`list-users`

The following code example shows how to use `list-users`.

AWS CLI

To list a directory's users

The following `list-users` example lists users in the specified directory.

```
aws ds-data list-users \
```

```
    --directory-id d-1234567890
```

Output:

```
{
    "Users": [
        {
            "Enabled": true,
            "SAMAccountName": "Administrator",
            "SID": "S-1-2-34-5678910123-4567895012-3456789012-345"
        },
        {
            "Enabled": false,
            "SAMAccountName": "Guest",
            "SID": "S-1-2-34-5678910123-4567895012-3456789012-345"
        },
        {
            "Enabled": false,
            "SAMAccountName": "krbtgt",
            "SID": "S-1-2-34-5678910123-4567895012-3456789012-346"
        },
        {
            "Enabled": true,
            "SAMAccountName": "Admin",
            "SID": "S-1-2-34-5678910123-4567895012-3456789012-347"
        },
        {
            "Enabled": true,
            "SAMAccountName": "Richard Roe",
            "SID": "S-1-2-34-5678910123-4567895012-3456789012-348"
        },
        {
            "Enabled": true,
            "SAMAccountName": "Jane Doe",
            "SID": "S-1-2-34-5678910123-4567895012-3456789012-349"
        },
        {
            "Enabled": true,
            "SAMAccountName": "AWS_WGnzYlN6YyY",
            "SID": "S-1-2-34-5678901234-5678901234-5678910123-4567"
        },
        {
            "Enabled": true,
```

```
                "SAMAccountName": "john.doe",
                "SID": "S-1-2-34-5678901234-5678901234-5678910123-4568"
            }
        ],
        "DirectoryId": "d-1234567890",
        "Realm": "corp.example.com"
}
```

For more information, see Viewing and updating an AWS Managed Microsoft AD user in the *AWS Directory Service Administration Guide*.

- For API details, see ListUsers in *AWS CLI Command Reference*.

`remove-group-member`

The following code example shows how to use `remove-group-member`.

AWS CLI

To remove a group member from a directory

The following `remove-group-member` example removes the specified group member from the specified group in the specified directory.

```
aws ds-data remove-group-member \
    --directory-id d-1234567890 \
    --group-name 'sales' \
    --member-name 'john.doe'
```

This command produces no output.

For more information, see Adding and removing AWS Managed Microsoft AD members to groups and groups to groups in the *AWS Directory Service Administration Guide*.

- For API details, see RemoveGroupMember in *AWS CLI Command Reference*.

`reset-user-password`

The following code example shows how to use `reset-user-password`.

AWS CLI

To reset a user password in a directory

The following `reset-user-password` example resets and enables the specified user in the specified directory.

```
aws ds reset-user-password \
    --directory-id d-1234567890 \
    --user-name 'john.doe' \
    --new-password 'password'
```

This command produces no output.

For more information, see [Resetting and enabling an AWS Managed Microsoft AD user's password](#) in the *AWS Directory Service Administration Guide*.

- For API details, see [ResetUserPassword](#) in *AWS CLI Command Reference*.

`search-groups`

The following code example shows how to use `search-groups`.

AWS CLI

To search for a group in a directory

The following `search-groups` example searches for the specified group in the specified directory.

```
aws ds-data search-groups \
    --directory-id d-1234567890 \
    --search-attributes 'SamAccountName' \
    --search-string 'sales'
```

Output:

```
{
    "Groups": [
        {
            "GroupScope": "Global",
            "GroupType": "Distribution",
            "SAMAccountName": "sales",
            "SID": "S-1-2-34-5678901234-5678901234-5678910123-4567"
        }
    ],
```

```
    "DirectoryId": "d-1234567890",
    "Realm": "corp.example.com"
}
```

For more information, see [Viewing and updating an AWS Managed Microsoft AD group's details](#) in the *AWS Directory Service Administration Guide*.

- For API details, see [SearchGroups](#) in *AWS CLI Command Reference*.

`search-users`

The following code example shows how to use `search-users`.

AWS CLI

To search for a user in a directory

The following `search-users` example searches for the specified user in the specified directory.

```
aws ds-data search-users \
    --directory-id d-1234567890 \
    --search-attributes 'SamAccountName' \
    --Search-string 'john.doe'
```

Output:

```
{
    "Users": [
        {
            "Enabled": true,
            "SAMAccountName": "john.doe",
            "SID": "S-1-2-34-5678901234-5678901234-5678910123-4567"
        }
    ],
    "DirectoryId": "d-1234567890",
    "Realm": "corp.example.com"
}
```

For more information, see [Viewing and updating an AWS Managed Microsoft AD user](#) in the *AWS Directory Service Administration Guide*.

- For API details, see [SearchUsers](#) in *AWS CLI Command Reference*.

`update-group`

The following code example shows how to use `update-group`.

AWS CLI

To update a group's attribute in a directory

The following `update-group` example updates the specified attribute for the specified group in the specified directory.

```
aws ds-data update-group \
    --directory-id d-1234567890 \
    --sam-account-name 'sales' \
    --update-type 'REPLACE' \
    --group-type 'Distribution'
```

This command produces no output.

For more information, see Viewing and updating an AWS Managed Microsoft AD group's details in the *AWS Directory Service Administration Guide*.

- For API details, see UpdateGroup in *AWS CLI Command Reference*.

`update-user`

The following code example shows how to use `update-user`.

AWS CLI

To update a user's attribute in a directory

The following `update-user` example updates the specified attribute for the specified user in the specified directory.

```
aws ds-data update-user \
    --directory-id d-1234567890 \
    --sam-account-name 'john.doe' \
    --update-type 'ADD' \
    --email-address 'example.corp.com'
```

This command produces no output.

For more information, see Viewing and updating an AWS Managed Microsoft AD user in the *AWS Directory Service Administration Guide*.

- For API details, see UpdateUser in *AWS CLI Command Reference*.

AWS DMS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS DMS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`add-tags-to-resource`

The following code example shows how to use `add-tags-to-resource`.

AWS CLI

To add tags to a resource

The following `add-tags-to-resource` example adds tags to a replication instance.

```
aws dms add-tags-to-resource \
    --resource-arn arn:aws:dms:us-east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE
 \
    --tags Key=Environment,Value=PROD Key=Project,Value=dbMigration
```

This command produces no output.

For more information, see Tagging Resources in the *AWS Database Migration Service User Guide*.

- For API details, see AddTagsToResource in *AWS CLI Command Reference*.

`create-endpoint`

The following code example shows how to use `create-endpoint`.

AWS CLI

To create an endpoint

The following `create-endpoint` example creates an endpoint for an Amazon S3 source.

```
aws dms create-endpoint \
    --endpoint-type source \
    --engine-name s3 \
    --endpoint-identifier src-endpoint \
    --s3-settings file://s3-settings.json
```

Contents of `s3-settings.json`:

```
{
    "BucketName":"my-corp-data",
    "BucketFolder":"sourcedata",
    "ServiceAccessRoleArn":"arn:aws:iam::123456789012:role/my-s3-access-role"
}
```

Output:

```
{
    "Endpoint": {
        "EndpointIdentifier": "src-endpoint",
        "EndpointType": "SOURCE",
        "EngineName": "s3",
        "EngineDisplayName": "Amazon S3",
        "ExtraConnectionAttributes": "bucketFolder=sourcedata;bucketName=my-corp-
data;compressionType=NONE;csvDelimiter=,;csvRowDelimiter=\\n;",
        "Status": "active",
        "EndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:GUVAFG34EECUOJ6QVZ56DAHT3U",
        "SslMode": "none",
        "ServiceAccessRoleArn": "arn:aws:iam::123456789012:role/my-s3-access-role",
        "S3Settings": {
            "ServiceAccessRoleArn": "arn:aws:iam::123456789012:role/my-s3-access-
role",
```

```
                "CsvRowDelimiter": "\\n",
                "CsvDelimiter": ",",
                "BucketFolder": "sourcedata",
                "BucketName": "my-corp-data",
                "CompressionType": "NONE",
                "EnableStatistics": true
            }
        }
}
```

For more information, see Working with AWS DMS Endpoints in the *AWS Database Migration Service User Guide*.

- For API details, see CreateEndpoint in *AWS CLI Command Reference*.

`create-event-subscription`

The following code example shows how to use `create-event-subscription`.

AWS CLI

To list event subscriptions

The following `create-event-subscription` example creates an event subscription to an Amazon SNS topic (my-sns-topic).

```
aws dms create-event-subscription \
    --subscription-name my-dms-events \
    --sns-topic-arn arn:aws:sns:us-east-1:123456789012:my-sns-topic
```

Output:

```
{
    "EventSubscription": {
        "CustomerAwsId": "123456789012",
        "CustSubscriptionId": "my-dms-events",
        "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:my-sns-topic",
        "Status": "creating",
        "SubscriptionCreationTime": "2020-05-21 21:58:38.598",
        "Enabled": true
    }
}
```

For more information, see Working with Events and Notifications in the *AWS Database Migration Service User Guide*.

- For API details, see CreateEventSubscription in *AWS CLI Command Reference*.

`create-replication-instance`

The following code example shows how to use `create-replication-instance`.

AWS CLI

To create a replication instance

The following `create-replication-instance` example creates a replication instance.

```
aws dms create-replication-instance \
    --replication-instance-identifier my-repl-instance \
    --replication-instance-class dms.t2.micro \
    --allocated-storage 5
```

Output:

```
{
    "ReplicationInstance": {
        "ReplicationInstanceIdentifier": "my-repl-instance",
        "ReplicationInstanceClass": "dms.t2.micro",
        "ReplicationInstanceStatus": "creating",
        "AllocatedStorage": 5,
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sg-f839b688",
                "Status": "active"
            }
        ],
        "ReplicationSubnetGroup": {
            "ReplicationSubnetGroupIdentifier": "default",
            "ReplicationSubnetGroupDescription": "default",
            "VpcId": "vpc-136a4c6a",
            "SubnetGroupStatus": "Complete",
            "Subnets": [
                {
                    "SubnetIdentifier": "subnet-da327bf6",
                    "SubnetAvailabilityZone": {
```

```
                        "Name": "us-east-1a"
                    },
                    "SubnetStatus": "Active"
                },
                {
                    "SubnetIdentifier": "subnet-42599426",
                    "SubnetAvailabilityZone": {
                        "Name": "us-east-1d"
                    },
                    "SubnetStatus": "Active"
                },
                {
                    "SubnetIdentifier": "subnet-bac383e0",
                    "SubnetAvailabilityZone": {
                        "Name": "us-east-1c"
                    },
                    "SubnetStatus": "Active"
                },
                {
                    "SubnetIdentifier": "subnet-6746046b",
                    "SubnetAvailabilityZone": {
                        "Name": "us-east-1f"
                    },
                    "SubnetStatus": "Active"
                },
                {
                    "SubnetIdentifier": "subnet-d7c825e8",
                    "SubnetAvailabilityZone": {
                        "Name": "us-east-1e"
                    },
                    "SubnetStatus": "Active"
                },
                {
                    "SubnetIdentifier": "subnet-cbfff283",
                    "SubnetAvailabilityZone": {
                        "Name": "us-east-1b"
                    },
                    "SubnetStatus": "Active"
                }
            ]
        },
        "PreferredMaintenanceWindow": "sat:12:35-sat:13:05",
        "PendingModifiedValues": {},
        "MultiAZ": false,
```

```
        "EngineVersion": "3.3.2",
        "AutoMinorVersionUpgrade": true,
        "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/f7bc0f8e-1a3a-4ace-9faa-
e8494fa3921a",
        "ReplicationInstanceArn": "arn:aws:dms:us-
east-1:123456789012:rep:ZK2VQBUWFDBAWHIXHAYG5G2PKY",
        "PubliclyAccessible": true
    }
}
```

For more information, see Working with an AWS DMS Replication Instance in the *AWS Database Migration Service User Guide*.

- For API details, see CreateReplicationInstance in *AWS CLI Command Reference*.

`create-replication-subnet-group`

The following code example shows how to use `create-replication-subnet-group`.

AWS CLI

To create a subnet group

The following `create-replication-subnet-group` example creates a group consisting of 3 subnets.

```
aws dms create-replication-subnet-group \
    --replication-subnet-group-identifier my-subnet-group \
    --replication-subnet-group-description "my subnet group" \
    --subnet-ids subnet-da327bf6 subnet-bac383e0 subnet-d7c825e8
```

Output:

```
{
    "ReplicationSubnetGroup": {
        "ReplicationSubnetGroupIdentifier": "my-subnet-group",
        "ReplicationSubnetGroupDescription": "my subnet group",
        "VpcId": "vpc-136a4c6a",
        "SubnetGroupStatus": "Complete",
        "Subnets": [
            {
                "SubnetIdentifier": "subnet-da327bf6",
                "SubnetAvailabilityZone": {
```

```
                        "Name": "us-east-1a"
                    },
                    "SubnetStatus": "Active"
                },
                {
                    "SubnetIdentifier": "subnet-bac383e0",
                    "SubnetAvailabilityZone": {
                        "Name": "us-east-1c"
                    },
                    "SubnetStatus": "Active"
                },
                {
                    "SubnetIdentifier": "subnet-d7c825e8",
                    "SubnetAvailabilityZone": {
                        "Name": "us-east-1e"
                    },
                    "SubnetStatus": "Active"
                }
            ]
        }
}
```

For more information, see Setting Up a Network for a Replication Instance in the *AWS Database Migration Service User Guide*.

- For API details, see CreateReplicationSubnetGroup in *AWS CLI Command Reference*.

`create-replication-task`

The following code example shows how to use `create-replication-task`.

AWS CLI

To create a replication task

The following `create-replication-task` example creates a replication task.

```
aws dms create-replication-task \
    --replication-task-identifier movedata \
    --source-endpoint-arn arn:aws:dms:us-
east-1:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA \
    --target-endpoint-arn arn:aws:dms:us-
east-1:123456789012:endpoint:EOM4SFKCZEYHZBFGAGZT3QEC5U \
```

```
    --replication-instance-arn $RI_ARN \
    --migration-type full-load \
    --table-mappings file://table-mappings.json
```

Contents of `table-mappings.json`:

```
{
    "rules": [
        {
            "rule-type": "selection",
            "rule-id": "1",
            "rule-name": "1",
            "object-locator": {
                "schema-name": "prodrep",
                "table-name": "%"
            },
            "rule-action": "include",
            "filters": []
        }
    ]
}
```

Output:

```
{
    "ReplicationTask": {
        "ReplicationTaskIdentifier": "moveit2",
        "SourceEndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA",
        "TargetEndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:EOM4SFKCZEYHZBFGAGZT3QEC5U",
        "ReplicationInstanceArn": "arn:aws:dms:us-
east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE",
        "MigrationType": "full-load",
        "TableMappings": ...output omitted... ,
        "ReplicationTaskSettings": ...output omitted... ,
        "Status": "creating",
        "ReplicationTaskCreationDate": 1590524772.505,
        "ReplicationTaskArn": "arn:aws:dms:us-
east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII"
    }
}
```

For more information, see Working with AWS DMS Tasks in the *AWS Database Migration Service User Guide*.

- For API details, see CreateReplicationTask in *AWS CLI Command Reference*.

`delete-connection`

The following code example shows how to use `delete-connection`.

AWS CLI

To delete a connection

The following `delete-connection` example disassociates an endpoint from a replication instance.

```
aws dms delete-connection \
    --endpoint-arn arn:aws:dms:us-
east-1:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA \
    --replication-instance-arn arn:aws:dms:us-
east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE
```

Output:

```
{
    "Connection": {
        "ReplicationInstanceArn": "arn:aws:dms:us-
east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE",
        "EndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA",
        "Status": "deleting",
        "EndpointIdentifier": "src-database-1",
        "ReplicationInstanceIdentifier": "my-repl-instance"
    }
}
```

For more information, see https://docs.aws.amazon.com/dms/latest/userguide/CHAP_Endpoints.Creating.html in the *AWS Database Migration Service User Guide*.

- For API details, see DeleteConnection in *AWS CLI Command Reference*.

`delete-endpoint`

The following code example shows how to use `delete-endpoint`.

AWS CLI

To delete an endpoint

The following `delete-endpoint` example deletes an endpoint.

```
aws dms delete-endpoint \
    --endpoint-arn arn:aws:dms:us-
east-1:123456789012:endpoint:OUJJVXO4XZ4CYTSEG5XGMN2R3Y
```

Output:

```
{
    "Endpoint": {
        "EndpointIdentifier": "src-endpoint",
        "EndpointType": "SOURCE",
        "EngineName": "s3",
        "EngineDisplayName": "Amazon S3",
        "ExtraConnectionAttributes": "bucketFolder=sourcedata;bucketName=my-corp-
data;compressionType=NONE;csvDelimiter=,;csvRowDelimiter=\\n;",
        "Status": "deleting",
        "EndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:OUJJVXO4XZ4CYTSEG5XGMN2R3Y",
        "SslMode": "none",
        "ServiceAccessRoleArn": "arn:aws:iam::123456789012:role/my-s3-access-role",
        "S3Settings": {
            "ServiceAccessRoleArn": "arn:aws:iam::123456789012:role/my-s3-access-
role",
            "CsvRowDelimiter": "\\n",
            "CsvDelimiter": ",",
            "BucketFolder": "sourcedata",
            "BucketName": "my-corp-data",
            "CompressionType": "NONE",
            "EnableStatistics": true
        }
    }
}
```

For more information, see Working with AWS DMS Endpoints in the *AWS Database Migration Service User Guide*.

- For API details, see DeleteEndpoint in *AWS CLI Command Reference*.

`delete-event-subscription`

The following code example shows how to use `delete-event-subscription`.

AWS CLI

To delete an event subscription

The following `delete-event-subscription` example deletes a subscription to an Amazon SNS topic.

```
aws dms delete-event-subscription \
    --subscription-name "my-dms-events"
```

Output:

```
{
    "EventSubscription": {
        "CustomerAwsId": "123456789012",
        "CustSubscriptionId": "my-dms-events",
        "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:my-sns-topic",
        "Status": "deleting",
        "SubscriptionCreationTime": "2020-05-21 21:58:38.598",
        "Enabled": true
    }
}
```

For more information, see Working with Events and Notifications in the *AWS Database Migration Service User Guide*.

- For API details, see DeleteEventSubscription in *AWS CLI Command Reference*.

`delete-replication-instance`

The following code example shows how to use `delete-replication-instance`.

AWS CLI

To delete a replication instance

The following `delete-replication-instance` example deletes a replication instance.

```
aws dms delete-replication-instance \
    --replication-instance-arn arn:aws:dms:us-
east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE
```

Output:

```
{
    "ReplicationInstance": {
        "ReplicationInstanceIdentifier": "my-repl-instance",
        "ReplicationInstanceClass": "dms.t2.micro",
        "ReplicationInstanceStatus": "deleting",

            ],
            "ReplicationInstancePrivateIpAddresses": [
                "172.31.30.121",
                "172.31.75.90"
            ],
            "PubliclyAccessible": true,
            "SecondaryAvailabilityZone": "us-east-1b"
        }
}
```

For more information, see Working with an AWS DMS Replication Instance in the *AWS Database Migration Service User Guide*.

- For API details, see DeleteReplicationInstance in *AWS CLI Command Reference*.

`delete-replication-subnet-group`

The following code example shows how to use `delete-replication-subnet-group`.

AWS CLI

To delete a subnet group

The following `delete-replication-subnet-group` example deletes a subnet group.

```
aws dms delete-replication-subnet-group \
--replication-subnet-group-identifier my-subnet-group
```

Output:

```
(none)
```

For more information, see Setting Up a Network for a Replication Instance in the *AWS Database Migration Service User Guide*.

- For API details, see DeleteReplicationSubnetGroup in *AWS CLI Command Reference*.

`delete-replication-task`

The following code example shows how to use `delete-replication-task`.

AWS CLI

To delete a replication task

The following `delete-replication-task` example deletes a replication task.

```
aws dms delete-replication-task \
    --replication-task-arn arn:aws:dms:us-
east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII
```

Output:

```
{
    "ReplicationTask": {
        "ReplicationTaskIdentifier": "moveit2",
        "SourceEndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA",
        "TargetEndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:EOM4SFKCZEYHZBFGAGZT3QEC5U",
        "ReplicationInstanceArn": "arn:aws:dms:us-
east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE",
        "MigrationType": "full-load",
        "TableMappings": ...output omitted...,
        "ReplicationTaskSettings": ...output omitted...,
        "Status": "deleting",
        "StopReason": "Stop Reason FULL_LOAD_ONLY_FINISHED",
        "ReplicationTaskCreationDate": 1590524772.505,
        "ReplicationTaskStartDate": 1590789988.677,
        "ReplicationTaskArn": "arn:aws:dms:us-
east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII"
    }
}
```

For more information, see Working with AWS DMS Tasks in the *AWS Database Migration Service User Guide*.

- For API details, see DeleteReplicationTask in *AWS CLI Command Reference*.

`describe-account-attributes`

The following code example shows how to use `describe-account-attributes`.

AWS CLI

To describe account attributes

The following `describe-account-attributes` example lists the attributes for your AWS account.

```
aws dms describe-account-attributes
```

Output:

```
{
    "AccountQuotas": [
        {
            "AccountQuotaName": "ReplicationInstances",
            "Used": 1,
            "Max": 20
        },
        {
            "AccountQuotaName": "AllocatedStorage",
            "Used": 5,
            "Max": 10000
        },

        ...remaining output omitted...

    ],
    "UniqueAccountIdentifier": "cqahfbfy5xee"
}
```

- For API details, see DescribeAccountAttributes in *AWS CLI Command Reference*.

`describe-certificates`

The following code example shows how to use `describe-certificates`.

AWS CLI

To list the available certificates

The following `describe-certificates` example lists the available certificates in your AWS account.

```
aws dms describe-certificates
```

Output:

```
{
    "Certificates": [
        {
            "CertificateIdentifier": "my-cert",
            "CertificateCreationDate": 1543259542.506,
            "CertificatePem": "-----BEGIN CERTIFICATE-----
\nMIID9DCCAtygAwIBAgIBQjANBgkqhkiG9w0BAQ ...U"

            ... remaining output omittted ...

        }
    ]
}
```

For more information, see Using SSL in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeCertificates in *AWS CLI Command Reference*.

`describe-connections`

The following code example shows how to use `describe-connections`.

AWS CLI

To describe connections

The following `describe-connections` example lists the connections that you have tested between a replication instance and an endpoint.

```
aws dms describe-connections
```

Output:

```
{
    "Connections": [
```

```
        {
            "Status": "successful",
            "ReplicationInstanceIdentifier": "test",
            "EndpointArn": "arn:aws:dms:us-east-arn:aws:dms:us-
east-1:123456789012:endpoint:ZW5UAN6P4E77EC7YWHK4RZZ3BE",
            "EndpointIdentifier": "testsrc1",
            "ReplicationInstanceArn": "arn:aws:dms:us-
east-1:123456789012:rep:6UTDJGBOUS3VI3SUWA66XFJCJQ"
        }
    ]
}
```

For more information, see Creating Source and Target Endpoints in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeConnections in *AWS CLI Command Reference*.

`describe-endpoint-types`

The following code example shows how to use `describe-endpoint-types`.

AWS CLI

To list the available endpoint types

The following `describe-endpoint-types` example lists the MySQL endpoint types that are available.

```
aws dms describe-endpoint-types \
    --filters "Name=engine-name,Values=mysql"
```

Output:

```
{
    "SupportedEndpointTypes": [
        {
            "EngineName": "mysql",
            "SupportsCDC": true,
            "EndpointType": "source",
            "EngineDisplayName": "MySQL"
        },
        {
            "EngineName": "mysql",
```

```
            "SupportsCDC": true,
            "EndpointType": "target",
            "EngineDisplayName": "MySQL"
        }
    ]
}
```

For more information, see Working with AWS DMS Endpoints <https://docs.aws.amazon.com/dms/latest/userguide/CHAP_Endpoints.html>`__ in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeEndpointTypes in *AWS CLI Command Reference*.

`describe-endpoints`

The following code example shows how to use `describe-endpoints`.

AWS CLI

To describe endpoints

The following `describe-endpoints` example lists the endpoints in your AWS account.

```
aws dms describe-endpoints
```

Output:

```
{
    "Endpoints": [
        {
            "Username": "dms",
            "Status": "active",
            "EndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:SF2WOFLWYWKVEOHID2EKLP3SJI",
            "ServerName": "ec2-52-32-48-61.us-west-2.compute.amazonaws.com",
            "EndpointType": "SOURCE",
            "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/94d5c4e7-4e4c-44be-
b58a-c8da7adf57cd",
            "DatabaseName": "test",
            "EngineName": "mysql",
            "EndpointIdentifier": "pri100",
            "Port": 8193
        },
```

```
        {
            "Username": "admin",
            "Status": "active",
            "EndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:TJJZCIH3CJ24TJRU4VC32WEWFR",
            "ServerName": "test.example.com",
            "EndpointType": "SOURCE",
            "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/2431021b-1cf2-
a2d4-77b2-59a9e4bce323",
            "DatabaseName": "EMPL",
            "EngineName": "oracle",
            "EndpointIdentifier": "test",
            "Port": 1521
        }
    ]
}
```

For more information, see Working with AWS DMS Endpoints in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeEndpoints in *AWS CLI Command Reference*.

`describe-event-categories`

The following code example shows how to use `describe-event-categories`.

AWS CLI

To describe event categories

The following `describe-event-categories` example lists the available event categories.

```
aws dms describe-event-categories
```

Output:

```
{
    "EventCategoryGroupList": [
        {
            "SourceType": "replication-instance",
            "EventCategories": [
                "low storage",
                "configuration change",
```

```
                "maintenance",
                "deletion",
                "creation",
                "failover",
                "failure"
            ]
        },
        {
            "SourceType": "replication-task",
            "EventCategories": [
                "configuration change",
                "state change",
                "deletion",
                "creation",
                "failure"
            ]
        }
    ]
}
```

For more information, see Working with Events and Notifications in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeEventCategories in *AWS CLI Command Reference*.

`describe-event-subscriptions`

The following code example shows how to use `describe-event-subscriptions`.

AWS CLI

To describe event subscriptions

The following `describe-event-subscriptions` example lists the event subscriptions to an Amazon SNS topic.

```
aws dms describe-event-subscriptions
```

Output:

```
{
    "EventSubscriptionsList": [
        {
```

```
            "CustomerAwsId": "123456789012",
            "CustSubscriptionId": "my-dms-events",
            "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:my-sns-topic",
            "Status": "deleting",
            "SubscriptionCreationTime": "2020-05-21 22:28:51.924",
            "Enabled": true
        }
    ]
}
```

For more information, see Working with Events and Notifications in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeEventSubscriptions in *AWS CLI Command Reference*.

`describe-events`

The following code example shows how to use `describe-events`.

AWS CLI

To list DMS events

The following `describe-events` example lists the events that originated from a replication instance.

```
aws dms describe-events \
    --source-type "replication-instance"
```

Output:

```
{
    "Events": [
        {
            "SourceIdentifier": "my-repl-instance",
            "SourceType": "replication-instance",
            "Message": "Replication application shutdown",
            "EventCategories": [],
            "Date": 1590771645.776
        }
    ]
}
```

For more information, see Working with Events and Notifications in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeEvents in *AWS CLI Command Reference*.

`describe-orderable-replication-instances`

The following code example shows how to use `describe-orderable-replication-instances`.

AWS CLI

To describe orderable replication instances

The following `describe-orderable-replication-instances` example lists replication instance types that you can order.

```
aws dms describe-orderable-replication-instances
```

Output:

```
{
    "OrderableReplicationInstances": [
        {
            "EngineVersion": "3.3.2",
            "ReplicationInstanceClass": "dms.c4.2xlarge",

- For API details, see DescribeOrderableReplicationInstances in *AWS CLI Command Reference*.

`describe-refresh-schemas-status`

The following code example shows how to use `describe-refresh-schemas-status`.

AWS CLI

To list the refresh status for an endpoint

The following `describe-refresh-schemas-status` example returns the status of a previous refresh request.

```
aws dms describe-refresh-schemas-status \
    --endpoint-arn arn:aws:dms:us-
east-1:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA
```

Output:

```
{
    "RefreshSchemasStatus": {
```

```
        "EndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA",
        "ReplicationInstanceArn": "arn:aws:dms:us-
east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE",
        "Status": "successful",
        "LastRefreshDate": 1590786544.605
    }
}
```

- For API details, see DescribeRefreshSchemasStatus in *AWS CLI Command Reference*.

`describe-replication-instances`

The following code example shows how to use `describe-replication-instances`.

AWS CLI

To describe replication instances

The following `describe-replication-instances` example lists the replication instances in your AWS account.

```
aws dms describe-replication-instances
```

Output:

```
{
    "ReplicationInstances": [
        {
            "ReplicationInstanceIdentifier": "my-repl-instance",
            "ReplicationInstanceClass": "dms.t2.micro",
            "ReplicationInstanceStatus": "available",
            "AllocatedStorage": 5,
            "InstanceCreateTime": 1590011235.952,
            "VpcSecurityGroups": [
                {
                    "VpcSecurityGroupId": "sg-f839b688",
                    "Status": "active"
                }
            ],
            "AvailabilityZone": "us-east-1e",
            "ReplicationSubnetGroup": {
```

```
                "ReplicationSubnetGroupIdentifier": "default",
                "ReplicationSubnetGroupDescription": "default",
                "VpcId": "vpc-136a4c6a",
                "SubnetGroupStatus": "Complete",

For more information, see Working with an AWS DMS Replication Instance in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeReplicationInstances in *AWS CLI Command Reference*.

`describe-replication-subnet-groups`

The following code example shows how to use `describe-replication-subnet-groups`.

AWS CLI

To display the available subnet groups

The following `describe-replication-subnet-groups` example lists the available subnet groups.

```
aws dms describe-replication-subnet-groups \
    --filter "Name=replication-subnet-group-id,Values=my-subnet-group"
```

Output:

```
{
    "ReplicationSubnetGroups": [
        {
            "ReplicationSubnetGroupIdentifier": "my-subnet-group",
            "ReplicationSubnetGroupDescription": "my subnet group",
            "VpcId": "vpc-136a4c6a",
            "SubnetGroupStatus": "Complete",
            "Subnets": [
                {
                    "SubnetIdentifier": "subnet-da327bf6",
                    "SubnetAvailabilityZone": {
                        "Name": "us-east-1a"
                    },
                    "SubnetStatus": "Active"
                },
                {
                    "SubnetIdentifier": "subnet-bac383e0",
                    "SubnetAvailabilityZone": {
                        "Name": "us-east-1c"
                    },
                    "SubnetStatus": "Active"
                },
                {
                    "SubnetIdentifier": "subnet-d7c825e8",
                    "SubnetAvailabilityZone": {
                        "Name": "us-east-1e"
                    },
                    "SubnetStatus": "Active"
                }
            ]
        }
    ]
}
```

For more information, see Setting Up a Network for a Replication Instance in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeReplicationSubnetGroups in *AWS CLI Command Reference*.

`describe-replication-task-assessment-results`

The following code example shows how to use `describe-replication-task-assessment-results`.

AWS CLI

To list the results of replication task assessmentss

The following `describe-replication-task-assessment-results` example lists the results of a prior task assesssment.

```
aws dms describe-replication-task-assessment-results
```

Output:

```
{
    "ReplicationTaskAssessmentResults": [
        {
            "ReplicationTaskIdentifier": "moveit2",
            "ReplicationTaskArn": "arn:aws:dms:us-
east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII",
            "ReplicationTaskLastAssessmentDate": 1590790230.0,
            "AssessmentStatus": "No issues found",
            "AssessmentResultsFile": "moveit2/2020-05-29-22-10"
        }
    ]
}
```

For more information, see Creating a Task Assessment Report in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeReplicationTaskAssessmentResults in *AWS CLI Command Reference*.

`describe-replication-tasks`

The following code example shows how to use `describe-replication-tasks`.

AWS CLI

To describe a replication task

The following `describe-replication-tasks` example describes current replication tasks.

```
aws dms describe-replication-tasks
```

Output:

```
{
    "ReplicationTasks": [
        {
            "ReplicationTaskIdentifier": "moveit2",
            "SourceEndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA",
            "TargetEndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:EOM4SFKCZEYHZBFGAGZT3QEC5U",
            "ReplicationInstanceArn": "arn:aws:dms:us-
east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE",
            "MigrationType": "full-load",
            "TableMappings": ...output omitted... ,
            "ReplicationTaskSettings": ...output omitted... ,
            "Status": "stopped",
            "StopReason": "Stop Reason FULL_LOAD_ONLY_FINISHED",
            "ReplicationTaskCreationDate": 1590524772.505,
            "ReplicationTaskStartDate": 1590619805.212,

                "StartDate": 1590619811.528,
                "StopDate": 1590619842.068
```

```
            }
        }
    ]
}
```

For more information, see Working with AWS DMS Tasks in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeReplicationTasks in *AWS CLI Command Reference*.

`describe-schemas`

The following code example shows how to use `describe-schemas`.

AWS CLI

To describe database schemas

The following `describe-schemas` example lists the available tables at an endpoint.

```
aws dms describe-schemas \
    --endpoint-arn "arn:aws:dms:us-
east-1:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA"
```

Output:

```
{
    "Schemas": [
        "prodrep"
    ]
}
```

For more information, see This is the topic title in the *AWS Database Migration Service User Guide*.

- For API details, see DescribeSchemas in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags for a resource

The following `list-tags-for-resource` example lists the tags for a replication instance.

```
aws dms list-tags-for-resource \
    --resource-arn arn:aws:dms:us-east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE
```

Output:

```
{
    "TagList": [
        {
            "Key": "Project",
            "Value": "dbMigration"
        },
        {
            "Key": "Environment",
            "Value": "PROD"
        }
    ]
}
```

For more information, see Tagging Resources in the *AWS Database Migration Service User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`modify-endpoint`

The following code example shows how to use `modify-endpoint`.

AWS CLI

To modify an endpoint

The following `modify-endpoint` example adds an extra connection attribute to an endpoint.

```
aws dms modify-endpoint \
    --endpoint-arn "arn:aws:dms:us-
east-1:123456789012:endpoint:GUVAFG34EECUOJ6QVZ56DAHT3U" \
```

```
    --extra-connection-attributes "compressionType=GZIP"
```

Output:

```
{
    "Endpoint": {
        "EndpointIdentifier": "src-endpoint",
        "EndpointType": "SOURCE",
        "EngineName": "s3",
        "EngineDisplayName": "Amazon S3",
        "ExtraConnectionAttributes":
 "compressionType=GZIP;csvDelimiter=,;csvRowDelimiter=\\n;",
        "Status": "active",
        "EndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:GUVAFG34EECUOJ6QVZ56DAHT3U",
        "SslMode": "none",
        "ServiceAccessRoleArn": "arn:aws:iam::123456789012:role/my-s3-access-role",
        "S3Settings": {
            "ServiceAccessRoleArn": "arn:aws:iam::123456789012:role/my-s3-access-
role",
            "CsvRowDelimiter": "\\n",
            "CsvDelimiter": ",",
            "BucketFolder": "",
            "BucketName": "",
            "CompressionType": "GZIP",
            "EnableStatistics": true
        }
    }
}
```

For more information, see Working with AWS DMS Endpoints <https://docs.aws.amazon.com/dms/latest/userguide/CHAP_Endpoints.html>`__ in the *AWS Database Migration Service User Guide*.

- For API details, see [ModifyEndpoint](https://docs.aws.amazon.com/goto/aws-cli/dms-2016-01-01/ModifyEndpoint) in *AWS CLI Command Reference*.

`modify-event-subscription`

The following code example shows how to use `modify-event-subscription`.

AWS CLI

To modify an event subscription

The following `modify-event-subscription` example changes the source type of an event subscription.

```
aws dms modify-event-subscription \
    --subscription-name "my-dms-events" \
    --source-type replication-task
```

Output:

```
{
    "EventSubscription": {
        "CustomerAwsId": "123456789012",
        "CustSubscriptionId": "my-dms-events",
        "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:my-sns-topic",
        "Status": "modifying",
        "SubscriptionCreationTime": "2020-05-29 17:04:40.262",
        "SourceType": "replication-task",
        "Enabled": true
    }
}
```

For more information, see Working with Events and Notifications in the *AWS Database Migration Service User Guide*.

- For API details, see ModifyEventSubscription in *AWS CLI Command Reference*.

`modify-replication-instance`

The following code example shows how to use `modify-replication-instance`.

AWS CLI

To modify a replication instance

The following `modify-replication-instance` example modifies a replication instance so that it uses a Multi-AZ deployment.

```
aws dms modify-replication-instance \
     --replication-instance-arn arn:aws:dms:us-
east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE \
     --multi-az
```

Output:

```
{
    "ReplicationInstance": {
        "ReplicationInstanceIdentifier": "my-repl-instance",
        "ReplicationInstanceClass": "dms.t2.micro",
        "ReplicationInstanceStatus": "available",
        "AllocatedStorage": 5,
        "InstanceCreateTime": 1590011235.952,

        ...output omitted...

        "PendingModifiedValues": {
            "MultiAZ": true
        },
        "MultiAZ": false,
        "EngineVersion": "3.3.2",
        "AutoMinorVersionUpgrade": true,
        "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/f7bc0f8e-1a3a-4ace-9faa-
e8494fa3921a",

        ...output omitted...

    }
}
```

For more information, see Working with an AWS DMS Replication Instance in the *AWS Database Migration Service User Guide*.

- For API details, see ModifyReplicationInstance in *AWS CLI Command Reference*.

`modify-replication-subnet-group`

The following code example shows how to use `modify-replication-subnet-group`.

AWS CLI

To modify a subnet group

The following `modify-replication-subnet-group` example changes the lists of subnets associated with a subnet group.

```
aws dms modify-replication-subnet-group \
```

```
    --replication-subnet-group-identifier my-subnet-group \
    --subnet-id subnet-da327bf6 subnet-bac383e0
```

Output:

```
{
    "ReplicationSubnetGroup": {
        "ReplicationSubnetGroupIdentifier": "my-subnet-group",
        "ReplicationSubnetGroupDescription": "my subnet group",
        "VpcId": "vpc-136a4c6a",
        "SubnetGroupStatus": "Complete",
        "Subnets": [
            {
                "SubnetIdentifier": "subnet-da327bf6",
                "SubnetAvailabilityZone": {
                    "Name": "us-east-1a"
                },
                "SubnetStatus": "Active"
            },
            {
                "SubnetIdentifier": "subnet-bac383e0",
                "SubnetAvailabilityZone": {
                    "Name": "us-east-1c"
                },
                "SubnetStatus": "Active"
            }
        ]
    }
}
```

For more information, see Setting Up a Network for a Replication Instance in the *AWS Database Migration Service User Guide*.

- For API details, see ModifyReplicationSubnetGroup in *AWS CLI Command Reference*.

`modify-replication-task`

The following code example shows how to use `modify-replication-task`.

AWS CLI

To modify a replication task

The following `modify-replication-task` example changes the table mappings for a task.

```
aws dms modify-replication-task \
    --replication-task-arn "arn:aws:dms:us-
east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII" \
    --table-mappings file://table-mappings.json
```

Contents of `table-mappings.json`:

```
{
    "rules": [
        {
            "rule-type": "selection",
            "rule-id": "1",
            "rule-name": "1",
            "object-locator": {
                "schema-name": "prodrep",
                "table-name": "ACCT_%"
            },
            "rule-action": "include",
            "filters": []
        }
    ]
}
```

Output:

```
{
    "ReplicationTask": {
        "ReplicationTaskIdentifier": "moveit2",
        "SourceEndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA",
        "TargetEndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:EOM4SFKCZEYHZBFGAGZT3QEC5U",
        "ReplicationInstanceArn": "arn:aws:dms:us-
east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE",
        "MigrationType": "full-load",
        "TableMappings": ...output omitted...,
        "ReplicationTaskSettings": ...output omitted...,
        "Status": "modifying",
        "StopReason": "Stop Reason FULL_LOAD_ONLY_FINISHED",
        "ReplicationTaskCreationDate": 1590524772.505,
```

```
        "ReplicationTaskStartDate": 1590789424.653,
        "ReplicationTaskArn": "arn:aws:dms:us-
east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII"
    }
}
```

For more information, see Working with AWS DMS Tasks in the *AWS Database Migration Service User Guide*.

- For API details, see ModifyReplicationTask in *AWS CLI Command Reference*.

`reboot-replication-instance`

The following code example shows how to use `reboot-replication-instance`.

AWS CLI

To reboot a replication instance

The following `reboot-replication-instance` example reboots a replication instance.

```
aws dms reboot-replication-instance \
    --replication-instance-arn arn:aws:dms:us-
east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE
```

Output:

```
{
    "ReplicationInstance": {
        "ReplicationInstanceIdentifier": "my-repl-instance",
        "ReplicationInstanceClass": "dms.t2.micro",
        "ReplicationInstanceStatus": "rebooting",
        "AllocatedStorage": 5,
        "InstanceCreateTime": 1590011235.952,
    ... output omitted ...
    }
}
```

For more information, see Working with an AWS DMS Replication Instance in the *AWS Database Migration Service User Guide*.

- For API details, see RebootReplicationInstance in *AWS CLI Command Reference*.

`refresh-schemas`

The following code example shows how to use `refresh-schemas`.

AWS CLI

To refresh database schemas

The following `refresh-schemas` example requests that AWS DMS refresh the list of schemas at an endpoint.

```
aws dms refresh-schemas \
    --replication-instance-arn arn:aws:dms:us-
east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE \
    --endpoint-arn "arn:aws:dms:us-
east-1:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA"
```

Output:

```
{
    "RefreshSchemasStatus": {
        "EndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA",
        "ReplicationInstanceArn": "arn:aws:dms:us-
east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE",
        "Status": "refreshing",
        "LastRefreshDate": 1590019949.103
    }
}
```

- For API details, see RefreshSchemas in *AWS CLI Command Reference*.

`reload-tables`

The following code example shows how to use `reload-tables`.

AWS CLI

To refresh the list of tables available at an endpoint

The following `reload-tables` example reloads the list of available tables at an endpoint.

```
aws dms reload-tables \
```

```
    --replication-task-arn "arn:aws:dms:us-
east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII" \
    --tables-to-reload "SchemaName=prodrep,TableName=ACCT_BAL"
```

Output:

```
{
    "ReplicationTaskArn": "arn:aws:dms:us-
east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII"
}
```

- For API details, see ReloadTables in *AWS CLI Command Reference*.

`remove-tags-from-resource`

The following code example shows how to use `remove-tags-from-resource`.

AWS CLI

To remove tags from a replication instance

The following `remove-tags-from-resource` example removes tags from a replication instance.

```
aws dms remove-tags-from-resource \
    --resource-arn arn:aws:dms:us-east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE
 \
    --tag-keys Environment Project
```

This command produces no output.

For more information, see Tagging Resources in the *AWS Database Migration Service User Guide*.

- For API details, see RemoveTagsFromResource in *AWS CLI Command Reference*.

`start-replication-task-assessment`

The following code example shows how to use `start-replication-task-assessment`.

AWS CLI

To start a task assessment

The following `start-replication-task-assessment` example starts a replication task assessment.

```
aws dms start-replication-task-assessment \
    --replication-task-arn arn:aws:dms:us-
east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII
```

Output:

```
{
    "ReplicationTask": {
        "ReplicationTaskIdentifier": "moveit2",
        "SourceEndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA",
        "TargetEndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:EOM4SFKCZEYHZBFGAGZT3QEC5U",
        "ReplicationInstanceArn": "arn:aws:dms:us-
east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE",
        "MigrationType": "full-load",
        "TableMappings": ...output omitted...,
        "ReplicationTaskSettings": ...output omitted...,
        "Status": "testing",
        "StopReason": "Stop Reason FULL_LOAD_ONLY_FINISHED",
        "ReplicationTaskCreationDate": 1590524772.505,
        "ReplicationTaskStartDate": 1590789988.677,
        "ReplicationTaskArn": "arn:aws:dms:us-
east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII"
    }
}
```

For more information, see Creating a Task Assessment Report in the *AWS Database Migration Service User Guide*.

- For API details, see StartReplicationTaskAssessment in *AWS CLI Command Reference*.

`start-replication-task`

The following code example shows how to use `start-replication-task`.

AWS CLI

To start a replication task

The following `command-name` example lists the available widgets in your AWS account.

```
aws dms start-replication-task \
    --replication-task-arn arn:aws:dms:us-
east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII \
    --start-replication-task-type reload-target
```

Output:

```
{
    "ReplicationTask": {
        "ReplicationTaskIdentifier": "moveit2",
        "SourceEndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA",
        "TargetEndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:EOM4SFKCZEYHZBFGAGZT3QEC5U",
        "ReplicationInstanceArn": "arn:aws:dms:us-
east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE",
        "MigrationType": "full-load",
        "TableMappings": ...output omitted... ,
        "ReplicationTaskSettings": ...output omitted... ,
        "Status": "starting",
        "ReplicationTaskCreationDate": 1590524772.505,
        "ReplicationTaskStartDate": 1590619805.212,
        "ReplicationTaskArn": "arn:aws:dms:us-
east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII"
    }
}
```

For more information, see Working with AWS DMS Tasks in the *AWS Database Migration Service User Guide*.

- For API details, see StartReplicationTask in *AWS CLI Command Reference*.

`stop-replication-task`

The following code example shows how to use `stop-replication-task`.

AWS CLI

To stop a task

The following `stop-replication-task` example stops a task.

```
aws dms stop-replication-task \
    --replication-task-arn arn:aws:dms:us-
east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII
```

Output:

```
{
    "ReplicationTask": {
        "ReplicationTaskIdentifier": "moveit2",
        "SourceEndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA",
        "TargetEndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:EOM4SFKCZEYHZBFGAGZT3QEC5U",
        "ReplicationInstanceArn": "arn:aws:dms:us-
east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE",
        "MigrationType": "full-load",
        "TableMappings": ...output omitted...,
        "ReplicationTaskSettings": ...output omitted...,
        "Status": "stopping",
        "ReplicationTaskCreationDate": 1590524772.505,
        "ReplicationTaskStartDate": 1590789424.653,
        "ReplicationTaskArn": "arn:aws:dms:us-
east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII"
    }
}
```

For more information, see Working with AWS DMS Tasks in the *AWS Database Migration Service User Guide*.

- For API details, see StopReplicationTask in *AWS CLI Command Reference*.

`test-connection`

The following code example shows how to use `test-connection`.

AWS CLI

To test a connection to an endpoint

The following `test-connection` example tests whether an endpoint can be accessed from a replication instance.

```
aws dms test-connection \
    --replication-instance-arn arn:aws:dms:us-
east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE \
    --endpoint-arn arn:aws:dms:us-
east-1:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA
```

Output:

```
{
    "Connection": {
        "ReplicationInstanceArn": "arn:aws:dms:us-
east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE",
        "EndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA",
        "Status": "testing",
        "EndpointIdentifier": "src-database-1",
        "ReplicationInstanceIdentifier": "my-repl-instance"
    }
}
```

For more information, see Creating source and target endpoints in the *AWS Database Migration Service User Guide*.

- For API details, see TestConnection in *AWS CLI Command Reference*.

Amazon DocumentDB examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon DocumentDB.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`add-tags-to-resource`

The following code example shows how to use `add-tags-to-resource`.

AWS CLI

To add one or more tags to a specified resource

The following `add-tags-to-resource` example adds three tags to `sample-cluster`. One tag (`CropB`) has a key name but no value.

```
aws docdb add-tags-to-resource \
    --resource-name arn:aws:rds:us-west-2:123456789012:cluster:sample-cluster \
    --tags Key="CropA",Value="Apple" Key="CropB" Key="CropC",Value="Corn"
```

This command produces no output.

For more information, see Tagging Amazon DocumentDB Resources in the *Amazon DocumentDB Developer Guide*.

- For API details, see AddTagsToResource in *AWS CLI Command Reference*.

`apply-pending-maintenance-action`

The following code example shows how to use `apply-pending-maintenance-action`.

AWS CLI

To have pending maintenance actions take place during the next maintenance window

The following `apply-pending-maintenance-action` example causes all system-update actions to be performed during the next scheduled maintenance window.

```
aws docdb apply-pending-maintenance-action \
--resource-identifier arn:aws:rds:us-west-2:123456789012:cluster:sample-cluster \
--apply-action system-update \
--opt-in-type next-maintenance
```

This command produces no output.

For more information, see Applying Amazon DocumentDB Updates in the *Amazon DocumentDB Developer Guide*.

- For API details, see ApplyPendingMaintenanceAction in *AWS CLI Command Reference*.

`copy-db-cluster-parameter-group`

The following code example shows how to use `copy-db-cluster-parameter-group`.

AWS CLI

To duplicate an existing DB cluster parameter group

The following `copy-db-cluster-parameter-group` example makes a copy of the parameter group `custom-docdb3-6` named `custom-docdb3-6-copy`. When making the copy it adds tags to the new parameter group.

```
aws docdb copy-db-cluster-parameter-group \
    --source-db-cluster-parameter-group-identifier custom-docdb3-6 \
    --target-db-cluster-parameter-group-identifier custom-docdb3-6-copy \
    --target-db-cluster-parameter-group-description "Copy of custom-docdb3-6" \
    --tags Key="CopyNumber",Value="1" Key="Modifiable",Value="Yes"
```

Output:

```
{
    "DBClusterParameterGroup": {
        "DBParameterGroupFamily": "docdb3.6",
        "DBClusterParameterGroupArn": "arn:aws:rds:us-east-1:12345678901:cluster-
pg:custom-docdb3-6-copy",
        "DBClusterParameterGroupName": "custom-docdb3-6-copy",
        "Description": "Copy of custom-docdb3-6"
    }
}
```

For more information, see Copying an Amazon DocumentDB Cluster Parameter Group in the *Amazon DocumentDB Developer Guide*.

- For API details, see CopyDbClusterParameterGroup in *AWS CLI Command Reference*.

`copy-db-cluster-snapshot`

The following code example shows how to use `copy-db-cluster-snapshot`.

AWS CLI

To create a copy of a snapshot

The following `copy-db-cluster-snapshot` example makes a copy of `sample-cluster-snapshot` named `sample-cluster-snapshot-copy`. The copy has all the tags of the original plus a new tag with the key name `CopyNumber`.

```
aws docdb copy-db-cluster-snapshot \
    --source-db-cluster-snapshot-identifier sample-cluster-snapshot \
    --target-db-cluster-snapshot-identifier sample-cluster-snapshot-copy \
    --copy-tags \
    --tags Key="CopyNumber",Value="1"
```

This command produces no output.

For more information, see Copying a Cluster Snapshot in the *Amazon DocumentDB Developer Guide*.

- For API details, see CopyDbClusterSnapshot in *AWS CLI Command Reference*.

`create-db-cluster-parameter-group`

The following code example shows how to use `create-db-cluster-parameter-group`.

AWS CLI

To create an Amazon DocumentDB cluster parameter group

The following `create-db-cluster-parameter-group` example creates the DB cluster parameter group `sample-parameter-group` using the `docdb3.6` family.

```
aws docdb create-db-cluster-parameter-group \
    --db-cluster-parameter-group-name sample-parameter-group \
    --db-parameter-group-family docdb3.6 \
    --description "Sample parameter group based on docdb3.6"
```

Output:

```
{
    "DBClusterParameterGroup": {
        "Description": "Sample parameter group based on docdb3.6",
        "DBParameterGroupFamily": "docdb3.6",
        "DBClusterParameterGroupArn": "arn:aws:rds:us-west-2:123456789012:cluster-
pg:sample-parameter-group",
        "DBClusterParameterGroupName": "sample-parameter-group"
    }
}
```

For more information, see Creating an Amazon DocumentDB Cluster Parameter Group in the *Amazon DocumentDB Developer Guide*.

- For API details, see CreateDbClusterParameterGroup in *AWS CLI Command Reference*.

`create-db-cluster-snapshot`

The following code example shows how to use `create-db-cluster-snapshot`.

AWS CLI

To create a manual Amazon DocumentDB cluster snapshot

The following `create-db-cluster-snapshot` example creates an Amazon DB cluster snapshot named sample-cluster-snapshot.

```
aws docdb create-db-cluster-snapshot \
   --db-cluster-identifier sample-cluster \
   --db-cluster-snapshot-identifier sample-cluster-snapshot
```

Output:

```
{
    "DBClusterSnapshot": {
        "MasterUsername": "master-user",
        "SnapshotCreateTime": "2019-03-18T18:27:14.794Z",
        "AvailabilityZones": [
            "us-west-2a",
            "us-west-2b",
            "us-west-2c",
            "us-west-2d",
```

```
                "us-west-2e",
                "us-west-2f"
            ],
            "SnapshotType": "manual",
            "DBClusterSnapshotArn": "arn:aws:rds:us-west-2:123456789012:cluster-
snapshot:sample-cluster-snapshot",
            "EngineVersion": "3.6.0",
            "PercentProgress": 0,
            "DBClusterSnapshotIdentifier": "sample-cluster-snapshot",
            "Engine": "docdb",
            "DBClusterIdentifier": "sample-cluster",
            "Status": "creating",
            "ClusterCreateTime": "2019-03-15T20:29:58.836Z",
            "Port": 0,
            "StorageEncrypted": false,
            "VpcId": "vpc-91280df6"
        }
    }
```

For more information, see Creating a Manual Cluster Snapshot in the *Amazon DocumentDB Developer Guide*.

- For API details, see CreateDbClusterSnapshot in *AWS CLI Command Reference*.

`create-db-cluster`

The following code example shows how to use `create-db-cluster`.

AWS CLI

To create an Amazon DocumentDB cluster

The following `create-db-cluster` example creates an Amazon DocumentDB cluster named `sample-cluster` with the preferred maintenance window on Sundays between 20:30 and 11:00.

```
aws docdb create-db-cluster \
    --db-cluster-identifier sample-cluster \
    --engine docdb \
    --master-username master-user \
    --master-user-password password \
    --preferred-maintenance-window Sun:20:30-Sun:21:00
```

Output:

```
{
    "DBCluster": {
        "DBClusterParameterGroup": "default.docdb3.6",
        "AssociatedRoles": [],
        "DBSubnetGroup": "default",
        "ClusterCreateTime": "2019-03-18T18:06:34.616Z",
        "Status": "creating",
        "Port": 27017,
        "PreferredMaintenanceWindow": "sun:20:30-sun:21:00",
        "HostedZoneId": "ZNKXH85TT8WVW",
        "DBClusterMembers": [],
        "Engine": "docdb",
        "DBClusterIdentifier": "sample-cluster",
        "PreferredBackupWindow": "10:12-10:42",
        "AvailabilityZones": [
            "us-west-2d",
            "us-west-2f",
            "us-west-2e"
        ],
        "MasterUsername": "master-user",
        "BackupRetentionPeriod": 1,
        "ReaderEndpoint": "sample-cluster.cluster-ro-corcjozrlsfc.us-
west-2.docdb.amazonaws.com",
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sg-77186e0d",
                "Status": "active"
            }
        ],
        "StorageEncrypted": false,
        "DBClusterArn": "arn:aws:rds:us-west-2:123456789012:cluster:sample-cluster",
        "DbClusterResourceId": "cluster-L3R4YRSBUYDP4GLMTJ2WF5GH5Q",
        "MultiAZ": false,
        "Endpoint": "sample-cluster.cluster-corcjozrlsfc.us-
west-2.docdb.amazonaws.com",
        "EngineVersion": "3.6.0"
    }
}
```

For more information, see Creating an Amazon DocumentDB Cluster in the *Amazon DocumentDB Developer Guide*.

- For API details, see CreateDbCluster in *AWS CLI Command Reference*.

`create-db-instance`

The following code example shows how to use `create-db-instance`.

AWS CLI

To create an Amazon DocumentDB cluster instance

The following `create-db-instance` example code creates the instance `sample-cluster-instance-2` in the Amazon DocumentDB cluster `sample-cluster`.

```
aws docdb create-db-instance \
    --db-cluster-identifier sample-cluster \
    --db-instance-class db.r4.xlarge \
    --db-instance-identifier sample-cluster-instance-2 \
    --engine docdb
```

Output:

```
{
    "DBInstance": {
        "DBInstanceStatus": "creating",
        "PendingModifiedValues": {
            "PendingCloudwatchLogsExports": {

    }
}
```

For more information, see Adding an Amazon DocumentDB Instance to a Cluster in the *Amazon DocumentDB Developer Guide*.

- For API details, see CreateDbInstance in *AWS CLI Command Reference*.

`create-db-subnet-group`

The following code example shows how to use `create-db-subnet-group`.

AWS CLI

To create an Amazon DocumentDB subnet group

The following `create-db-subnet-group` example creates an Amazon DocumentDB subnet group named `sample-subnet-group`.

```
aws docdb create-db-subnet-group \
    --db-subnet-group-description "a sample subnet group" \
    --db-subnet-group-name sample-subnet-group \
    --subnet-ids "subnet-29ab1025" "subnet-991cb8d0" "subnet-53ab3636"
```

Output:

```
{
    "DBSubnetGroup": {
        "SubnetGroupStatus": "Complete",
        "DBSubnetGroupName": "sample-subnet-group",
        "DBSubnetGroupDescription": "a sample subnet group",
        "VpcId": "vpc-91280df6",
        "DBSubnetGroupArn": "arn:aws:rds:us-west-2:123456789012:subgrp:sample-
subnet-group",
        "Subnets": [
            {
                "SubnetStatus": "Active",
                "SubnetIdentifier": "subnet-53ab3636",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2d"
                }
            },
```

```
                {
                    "SubnetStatus": "Active",
                    "SubnetIdentifier": "subnet-991cb8d0",
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2b"
                    }
                },
                {
                    "SubnetStatus": "Active",
                    "SubnetIdentifier": "subnet-29ab1025",
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2c"
                    }
                }
            ]
        }
}
```

For more information, see Creating an Amazon DocumentDB Subnet Group in the *Amazon DocumentDB Developer Guide*.

- For API details, see CreateDbSubnetGroup in *AWS CLI Command Reference*.

`delete-db-cluster-parameter-group`

The following code example shows how to use `delete-db-cluster-parameter-group`.

AWS CLI

To delete an Amazon DocumentDB cluster parameter group

The following `delete-db-cluster-parameter-group` example deletes the Amazon DocumentDB parameter group `sample-parameter-group`.

```
aws docdb delete-db-cluster-parameter-group \
    --db-cluster-parameter-group-name sample-parameter-group
```

This command produces no output.

For more information, see Deleting an Amazon DocumentDB Cluster Parameter Group in the *Amazon DocumentDB Developer Guide*.

- For API details, see DeleteDbClusterParameterGroup in *AWS CLI Command Reference*.

`delete-db-cluster-snapshot`

The following code example shows how to use `delete-db-cluster-snapshot`.

AWS CLI

To delete an Amazon DocumentDB cluster snapshot

The following `delete-db-cluster-snapshot` example deletes the Amazon DocumentDB cluster snapshot `sample-cluster-snapshot`.

```
aws docdb delete-db-cluster-snapshot \
    --db-cluster-snapshot-identifier sample-cluster-snapshot
```

Output:

```
{
    "DBClusterSnapshot": {
        "DBClusterIdentifier": "sample-cluster",
        "AvailabilityZones": [
            "us-west-2a",
            "us-west-2b",
            "us-west-2c",
            "us-west-2d"
        ],
        "DBClusterSnapshotIdentifier": "sample-cluster-snapshot",
        "VpcId": "vpc-91280df6",
        "DBClusterSnapshotArn": "arn:aws:rds:us-west-2:123456789012:cluster-

        "Port": 0
    }
```

```
}
```

For more information, see Deleting a Cluster Snapshot in the *Amazon DocumentDB Developer Guide*.

- For API details, see DeleteDbClusterSnapshot in *AWS CLI Command Reference*.

`delete-db-cluster`

The following code example shows how to use `delete-db-cluster`.

AWS CLI

To delete an Amazon DocumentDB cluster

The following `delete-db-cluster` example deletes the Amazon DocumentDB cluster `sample-cluster`. No backup of the cluster is made prior to deleting it. NOTE: You must delete all instances associated with the cluster before you can delete it.

```
aws docdb delete-db-cluster \
    --db-cluster-identifier sample-cluster \
    --skip-final-snapshot
```

Output:

```
{
    "DBCluster": {
        "DBClusterIdentifier": "sample-cluster",

}
```

For more information, see Deleting an Amazon DocumentDB Instance in the *Amazon DocumentDB Developer Guide*.

- For API details, see DeleteDbInstance in *AWS CLI Command Reference*.

`delete-db-subnet-group`

The following code example shows how to use `delete-db-subnet-group`.

AWS CLI

To delete an Amazon DocumentDB subnet group

The following `delete-db-subnet-group` example deletes the Amazon DocumentDB subnet group `sample-subnet-group`.

```
aws docdb delete-db-subnet-group \
    --db-subnet-group-name sample-subnet-group
```

This command produces no output.

For more information, see Deleting an Amazon DocumentDB Subnet Group in the *Amazon DocumentDB Developer Guide*.

- For API details, see DeleteDbSubnetGroup in *AWS CLI Command Reference*.

`describe-db-cluster-parameter-groups`

The following code example shows how to use `describe-db-cluster-parameter-groups`.

AWS CLI

To see the details of one or more Amazon DocumentDB cluster parameter groups

The following `describe-db-cluster-parameter-groups` example displays details for the Amazon DocumentDB cluster parameter group `custom3-6-param-grp`.

```
aws docdb describe-db-cluster-parameter-groups \
    --db-cluster-parameter-group-name custom3-6-param-grp
```

Output:

```
{
    "DBClusterParameterGroups": [
        {
            "DBParameterGroupFamily": "docdb3.6",
            "DBClusterParameterGroupArn": "arn:aws:rds:us-
east-1:123456789012:cluster-pg:custom3-6-param-grp",
            "Description": "Custom docdb3.6 parameter group",
            "DBClusterParameterGroupName": "custom3-6-param-grp"
        }
    ]
```

```
}
```

For more information, see Viewing Amazon DocumentDB Cluster Parameter Groups in the *Amazon DocumentDB Developer Guide*.

- For API details, see DescribeDbClusterParameterGroups in *AWS CLI Command Reference*.

`describe-db-cluster-parameters`

The following code example shows how to use `describe-db-cluster-parameters`.

AWS CLI

To view the detailed parameter list for an Amazon DocumentDB cluster parameter group.

The following `describe-db-cluster-parameters` example lists the parameters for the Amazon DocumentDB parameter group custom3-6-param-grp.

```
aws docdb describe-db-cluster-parameters \
     --db-cluster-parameter-group-name custom3-6-param-grp
```

Output:

```
{
    "Parameters": [
        {
            "DataType": "string",
            "ParameterName": "audit_logs",
            "IsModifiable": true,
            "ApplyMethod": "pending-reboot",
            "Source": "system",
            "ApplyType": "dynamic",
            "AllowedValues": "enabled,disabled",
            "Description": "Enables auditing on cluster.",
            "ParameterValue": "disabled"
        },
        {
            "DataType": "string",
            "ParameterName": "tls",
            "IsModifiable": true,
            "ApplyMethod": "pending-reboot",
            "Source": "system",
            "ApplyType": "static",
```

```
                "AllowedValues": "disabled,enabled",
                "Description": "Config to enable/disable TLS",
                "ParameterValue": "enabled"
            },
            {
                "DataType": "string",
                "ParameterName": "ttl_monitor",
                "IsModifiable": true,
                "ApplyMethod": "pending-reboot",
                "Source": "user",
                "ApplyType": "dynamic",
                "AllowedValues": "disabled,enabled",
                "Description": "Enables TTL Monitoring",
                "ParameterValue": "enabled"
            }
        ]
}
```

For more information, see Viewing Amazon DocumentDB Cluster Parameters in the *Amazon DocumentDB Developer Guide*.

- For API details, see DescribeDbClusterParameters in *AWS CLI Command Reference*.

`describe-db-cluster-snapshot-attributes`

The following code example shows how to use `describe-db-cluster-snapshot-attributes`.

AWS CLI

To list an Amazon DocumentDB snapshot attribute names and values

The following `describe-db-cluster-snapshot-attributes` example lists the attribute names and values for the Amazon DocumentDB snapshot `sample-cluster-snapshot`.

```
aws docdb describe-db-cluster-snapshot-attributes \
    --db-cluster-snapshot-identifier sample-cluster-snapshot
```

Output:

```
{
    "DBClusterSnapshotAttributesResult": {
        "DBClusterSnapshotAttributes": [
            {
```

```
                "AttributeName": "restore",
                "AttributeValues": []
            }
        ],
        "DBClusterSnapshotIdentifier": "sample-cluster-snapshot"
    }
}
```

For more information, see DescribeDBClusterSnapshotAttributes in the *Amazon DocumentDB Developer Guide*.

- For API details, see DescribeDbClusterSnapshotAttributes in *AWS CLI Command Reference*.

`describe-db-cluster-snapshots`

The following code example shows how to use `describe-db-cluster-snapshots`.

AWS CLI

To describe Amazon DocumentDB snapshots

The following `describe-db-cluster-snapshots` example displays details for the Amazon DocumentDB snapshot `sample-cluster-snapshot`.

```
aws docdb describe-db-cluster-snapshots \
    --db-cluster-snapshot-identifier sample-cluster-snapshot
```

Output:

```
{
    "DBClusterSnapshots": [
        {
            "AvailabilityZones": [
                "us-west-2a",
                "us-west-2b",
                "us-west-2c",
                "us-west-2d"
            ],

`describe-db-clusters`

The following code example shows how to use `describe-db-clusters`.

AWS CLI

To get detailed information about one or more Amazon DocumentDB clusters.

The following `describe-db-clusters` example displays details for the Amazon DocumentDB cluster `sample-cluster`. By omitting the `--db-cluster-identifier` parameter you can get information of up to 100 clusters.

```
aws docdb describe-db-clusters
    --db-cluster-identifier sample-cluster
```

Output:

```
{
    "DBClusters": [
        {
            "DBClusterParameterGroup": "default.docdb3.6",
            "Endpoint": "sample-cluster.cluster-corcjozrlsfc.us-
west-2.docdb.amazonaws.com",
```

```
            "PreferredBackupWindow": "00:00-00:30",

`describe-db-engine-versions`

The following code example shows how to use `describe-db-engine-versions`.

AWS CLI

To list available Amazon DocumentDB engine versions

The following `describe-db-engine-versions` example lists all available Amazon DocumentDB engine versions.

```
aws docdb describe-db-engine-versions \
    --engine docdb
```

Output:

```
{
    "DBEngineVersions": [
        {
            "DBEngineVersionDescription": "DocDB version 1.0.200837",
            "DBParameterGroupFamily": "docdb3.6",
            "EngineVersion": "3.6.0",
            "ValidUpgradeTarget": [],
            "DBEngineDescription": "Amazon DocumentDB (with MongoDB compatibility)",
            "SupportsLogExportsToCloudwatchLogs": true,
            "Engine": "docdb",
            "ExportableLogTypes": [
                "audit"
```

```
            ]
        }
    ]
}
```

For more information, see DescribeDBEngineVersions in the *Amazon DocumentDB Developer Guide*.

- For API details, see DescribeDbEngineVersions in *AWS CLI Command Reference*.

`describe-db-instances`

The following code example shows how to use `describe-db-instances`.

AWS CLI

To find information about provisioned Amazon DocumentDB instances

The following `describe-db-instances` example displays details for about the Amazon DocumentDB instance `sample-cluster-instance`. By omitting the `--db-instance-identifier` parameter you get information on up to 100 instances.

```
aws docdb describe-db-instances \
    --db-instance-identifier sample-cluster-instance
```

Output:

```
{
    "DBInstances": [
        {
            "Endpoint": {
                "HostedZoneId": "ZNKXH85TT8WVW",
                "Address": "sample-cluster-instance.corcjozrlsfc.us-
west-2.docdb.amazonaws.com",

        ]
}
```

For more information, see Describing Amazon DocumentDB Instances in the *Amazon DocumentDB Developer Guide*.

- For API details, see DescribeDbInstances in *AWS CLI Command Reference*.

`describe-db-subnet-groups`

The following code example shows how to use `describe-db-subnet-groups`.

AWS CLI

To retrieve a list of Amazon DocumentDB subnet descriptions

The following `describe-db-subnet-groups` example describes details for the Amazon DocumentDB subnet named `default`.

```
aws docdb describe-db-subnet-groups \
    --db-subnet-group-name default
```

Output:

```
{
    "DBSubnetGroups": [
```

```
        {
            "VpcId": "vpc-91280df6",
            "DBSubnetGroupArn": "arn:aws:rds:us-west-2:123456789012:subgrp:default",
            "Subnets": [
                {
                    "SubnetIdentifier": "subnet-4e26d263",
                    "SubnetStatus": "Active",
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2a"
                    }
                },
                {
                    "SubnetIdentifier": "subnet-afc329f4",
                    "SubnetStatus": "Active",
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2c"
                    }
                },
                {
                    "SubnetIdentifier": "subnet-53ab3636",
                    "SubnetStatus": "Active",
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2d"
                    }
                },
                {

                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2b"
                    }
                }
            ],
            "DBSubnetGroupName": "default",
            "SubnetGroupStatus": "Complete",
            "DBSubnetGroupDescription": "default"
        }
    ]
}
```

For more information, see Describing Subnet Groups in the *Amazon DocumentDB Developer Guide*.

- For API details, see DescribeDbSubnetGroups in *AWS CLI Command Reference*.

`describe-engine-default-cluster-parameters`

The following code example shows how to use `describe-engine-default-cluster-parameters`.

AWS CLI

To describe the default engine and system parameter information for Amazon DocumentDB

The following `describe-engine-default-cluster-parameters` example displays details for the default engine and system parameter information for the Amazon DocumentDB parameter group `docdb3.6`.

```
aws docdb describe-engine-default-cluster-parameters \
    --db-parameter-group-family docdb3.6
```

Output:

```
{
    "EngineDefaults": {
        "DBParameterGroupFamily": "docdb3.6",
        "Parameters": [
            {
                "ApplyType": "dynamic",
                "ParameterValue": "disabled",
                "Description": "Enables auditing on cluster.",
                "Source": "system",

                "MinimumEngineVersion": "3.6.0",
                "AllowedValues": "enabled,disabled",
                "ParameterName": "audit_logs",
                "IsModifiable": true
            },
            {
                "ApplyType": "static",
                "ParameterValue": "enabled",
                "Description": "Config to enable/disable TLS",
                "Source": "system",
                "DataType": "string",
                "MinimumEngineVersion": "3.6.0",
                "AllowedValues": "disabled,enabled",
                "ParameterName": "tls",
                "IsModifiable": true
```

```
            },
            {
                "ApplyType": "dynamic",
                "ParameterValue": "enabled",
                "Description": "Enables TTL Monitoring",
                "Source": "system",
                "DataType": "string",
                "MinimumEngineVersion": "3.6.0",
                "AllowedValues": "disabled,enabled",
                "ParameterName": "ttl_monitor",
                "IsModifiable": true
            }
        ]
    }
}
```

For more information, see DescribeEngineDefaultClusterParameters in the *Amazon DocumentDB Developer Guide*.

- For API details, see DescribeEngineDefaultClusterParameters in *AWS CLI Command Reference*.

`describe-event-categories`

The following code example shows how to use `describe-event-categories`.

AWS CLI

To describe all Amazon DocumentDB event categories

The following `describe-event-categories` example lists all categories for the Amazon DocumentDB event source type `db-instance`.

```
aws docdb describe-event-categories \
    --source-type db-cluster
```

Output:

```
{
    "EventCategoriesMapList": [
        {
            "SourceType": "db-cluster",
            "EventCategories": [
                "failover",
```

```
                "maintenance",
                "notification",
                "failure"
            ]
        }
    ]
}
```

For more information, see Viewing Event Categories in the *Amazon DocumentDB Developer Guide*.

- For API details, see DescribeEventCategories in *AWS CLI Command Reference*.

`describe-events`

The following code example shows how to use `describe-events`.

AWS CLI

To list Amazon DocumentDB events

The following `describe-events` example list all the Amazon DocumentDB events for the last 24 hours (1440 minutes).

```
aws docdb describe-events \
    --duration 1440
```

This command produces no output. Output:

```
{
    "Events": [
        {
            "EventCategories": [
                "failover"
            ],
            "Message": "Started cross AZ failover to DB instance: sample-cluster",
            "Date": "2019-03-18T21:36:29.807Z",

`describe-orderable-db-instance-options`

The following code example shows how to use `describe-orderable-db-instance-options`.

AWS CLI

To find the Amazon DocumentDB instance options you can order

The following `describe-orderable-db-instance-options` example lists all instance options for Amazon DocumentDB for a region.

```
aws docdb describe-orderable-db-instance-options \
    --engine docdb \
    --region us-east-1
```

Output:

```
{
    "OrderableDBInstanceOptions": [
        {
            "Vpc": true,
            "AvailabilityZones": [
                {
                    "Name": "us-east-1a"
                },
                {
                    "Name": "us-east-1b"
                },
                {
                    "Name": "us-east-1c"
                },
                {
                    "Name": "us-east-1d"
                }
            ],
            "EngineVersion": "3.6.0",
            "DBInstanceClass": "db.r4.16xlarge",

                "Engine": "docdb"
            }
        ]
}
```

For more information, see Adding an Amazon DocumentDB Instance to a Cluster in the *Amazon DocumentDB Developer Guide*.

- For API details, see DescribeOrderableDbInstanceOptions in *AWS CLI Command Reference*.

`describe-pending-maintenance-actions`

The following code example shows how to use `describe-pending-maintenance-actions`.

AWS CLI

To list your pending Amazon DocumentDB maintenance actions

The following `describe-pending-maintenance-actions` example lists all your pending Amazon DocumentDB maintenance actions.

```
aws docdb describe-pending-maintenance-actions
```

Output:

```
{
    "PendingMaintenanceActions": []
}
```

For more information, see Maintaining Amazon DocumentDB in the *Amazon DocumentDB Developer Guide*.

- For API details, see DescribePendingMaintenanceActions in *AWS CLI Command Reference*.

`failover-db-cluster`

The following code example shows how to use `failover-db-cluster`.

AWS CLI

To force an Amazon DocumentDB cluster to failover to a replica

The following `failover-db-cluster` example causes the primary instance in the Amazon DocumentDB cluster sample-cluster to failover to a replica.

```
aws docdb failover-db-cluster \
    --db-cluster-identifier sample-cluster
```

Output:

```
{
    "DBCluster": {
        "AssociatedRoles": [],
        "DBClusterIdentifier": "sample-cluster",

    }
}
```

For more information, see Amazon DocumentDB Failover in the *Amazon DocumentDB Developer Guide*.

- For API details, see FailoverDbCluster in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list all the tags on an Amazon DocumentDB resource

The following `list-tags-for-resource` example lists all tags on the Amazon DocumentDB cluster `sample-cluster`.

```
aws docdb list-tags-for-resource \
    --resource-name arn:aws:rds:us-west-2:123456789012:cluster:sample-cluster
```

Output:

```
{
    "TagList": [
        {
            "Key": "A",
            "Value": "ALPHA"
        },
        {
            "Key": "B",
            "Value": ""
        },
        {
            "Key": "C",
            "Value": "CHARLIE"
        }
    ]
}
```

For more information, see Listing Tags on an Amazon DocumentDB Resource in the *Amazon DocumentDB Developer Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`modify-db-cluster-parameter-group`

The following code example shows how to use `modify-db-cluster-parameter-group`.

AWS CLI

To modify an Amazon DocumentDB DB cluster parameter group

The following `modify-db-cluster-parameter-group` example modifies the Amazon DocumentDB cluster parameter group `custom3-6-param-grp` by setting the two parameters `audit_logs` and `ttl_monitor` to enabled. The changes are applied at the next reboot.

```
aws docdb modify-db-cluster-parameter-group \
    --db-cluster-parameter-group-name custom3-6-param-grp \
    --
parameters ParameterName=audit_logs,ParameterValue=enabled,ApplyMethod=pending-
reboot \

  ParameterName=ttl_monitor,ParameterValue=enabled,ApplyMethod=pending-reboot
```

Output:

```
{
    "DBClusterParameterGroupName": "custom3-6-param-grp"
}
```

For more information, see Modifying an Amazon DocumentDB Cluster Parameter Group in the *Amazon DocumentDB Developer Guide*.

- For API details, see ModifyDbClusterParameterGroup in *AWS CLI Command Reference*.

`modify-db-cluster-snapshot-attribute`

The following code example shows how to use `modify-db-cluster-snapshot-attribute`.

AWS CLI

Example 1: To add an attribute to an Amazon DocumentDB snapshot

The following `modify-db-cluster-snapshot-attribute` example adds four attribute values to an Amazon DocumentDB cluster snapshot.

```
aws docdb modify-db-cluster-snapshot-attribute \
    --db-cluster-snapshot-identifier sample-cluster-snapshot \
    --attribute-name restore \
    --values-to-add 123456789011 123456789012 123456789013
```

Output:

```
{
    "DBClusterSnapshotAttributesResult": {
        "DBClusterSnapshotAttributes": [
            {
                "AttributeName": "restore",
                "AttributeValues": [
                    "123456789011",
                    "123456789012",
                    "123456789013"
                ]
            }
        ],
        "DBClusterSnapshotIdentifier": "sample-cluster-snapshot"
    }
}
```

Example 2: To remove attributes from an Amazon DocumentDB snapshot

The following `modify-db-cluster-snapshot-attribute` example removes two attribute values from an Amazon DocumentDB cluster snapshot.

```
aws docdb modify-db-cluster-snapshot-attribute \
    --db-cluster-snapshot-identifier sample-cluster-snapshot \
    --attribute-name restore \
    --values-to-remove 123456789012
```

Output:

```
{
    "DBClusterSnapshotAttributesResult": {
        "DBClusterSnapshotAttributes": [
            {
                "AttributeName": "restore",
                "AttributeValues": [
                    "123456789011",
                    "123456789013"
                ]
            }
        ],
        "DBClusterSnapshotIdentifier": "sample-cluster-snapshot"
    }
```

```
}
```

For more information, see [ModifyDBClusterSnapshotAttribute](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [ModifyDbClusterSnapshotAttribute](#) in *AWS CLI Command Reference*.

`modify-db-cluster`

The following code example shows how to use `modify-db-cluster`.

AWS CLI

To modify an Amazon DocumentDB cluster

The following `modify-db-cluster` example modifies the Amazon DocumentDB cluster `sample-cluster` by making the retention period for automatic backups 7 days, and changing the preferred windows for both backups and maintenance. All changes are applied at the next maintenance window.

```
aws docdb modify-db-cluster \
    --db-cluster-identifier sample-cluster \
    --no-apply-immediately \
    --backup-retention-period 7 \
    --preferred-backup-window 18:00-18:30 \
    --preferred-maintenance-window sun:20:00-sun:20:30
```

Output:

```
{
    "DBCluster": {
        "Endpoint": "sample-cluster.cluster-corcjozrlsfc.us-
west-2.docdb.amazonaws.com",
        "DBClusterMembers": [

    }
}
```

For more information, see Modifying an Amazon DocumentDB Cluster in the *Amazon DocumentDB Developer Guide*.

- For API details, see ModifyDbCluster in *AWS CLI Command Reference*.

`modify-db-instance`

The following code example shows how to use `modify-db-instance`.

AWS CLI

To modify an Amazon DocumentDB instance

The following `modify-db-instance` example modifies the Amazon DocumentDB instance `sample-cluster2` by changing its instance class to `db.r4.4xlarge` and its promotion tier to 5. The changes are applied immediately but can only be seen after the instances status is available.

```
aws docdb modify-db-instance \
    --db-instance-identifier sample-cluster2 \
    --apply-immediately \
    --db-instance-class db.r4.4xlarge \
    --promotion-tier 5
```

Output:

```
{
    "DBInstance": {
        "EngineVersion": "3.6.0",
        "StorageEncrypted": false,
        "DBInstanceClass": "db.r4.large",

        "PendingModifiedValues": {
            "DBInstanceClass": "db.r4.4xlarge"
        },
        "PubliclyAccessible": false,
        "DBInstanceStatus": "available"
    }
}
```

For more information, see Modifying an Amazon DocumentDB Instance in the *Amazon DocumentDB Developer Guide*.

- For API details, see ModifyDbInstance in *AWS CLI Command Reference*.

`modify-db-subnet-group`

The following code example shows how to use `modify-db-subnet-group`.

AWS CLI

To modify an Amazon DocumentDB subnet group

The following `modify-db-subnet-group` example modifies the subnet group `sample-subnet-group` by adding the specified subnets and a new description.

```
aws docdb modify-db-subnet-group \
    --db-subnet-group-name sample-subnet-group \
    --subnet-ids subnet-b3806e8f subnet-53ab3636 subnet-991cb8d0 \
    --db-subnet-group-description "New subnet description"
```

Output:

```
{
    "DBSubnetGroup": {
        "DBSubnetGroupName": "sample-subnet-group",
```

```
        "SubnetGroupStatus": "Complete",
        "DBSubnetGroupArn": "arn:aws:rds:us-west-2:123456789012:subgrp:sample-
subnet-group",
        "VpcId": "vpc-91280df6",
        "DBSubnetGroupDescription": "New subnet description",
        "Subnets": [
            {
                "SubnetIdentifier": "subnet-b3806e8f",
                "SubnetStatus": "Active",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2a"
                }
            },
            {
                "SubnetIdentifier": "subnet-53ab3636",
                "SubnetStatus": "Active",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2c"
                }
            },
            {
                "SubnetIdentifier": "subnet-991cb8d0",
                "SubnetStatus": "Active",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2b"
                }
            }
        ]
    }
}
```

For more information, see Modifying an Amazon DocumentDB Subnet Group in the *Amazon DocumentDB Developer Guide*.

- For API details, see ModifyDbSubnetGroup in *AWS CLI Command Reference*.

`reboot-db-instance`

The following code example shows how to use `reboot-db-instance`.

AWS CLI

To reboot an Amazon DocumentDB instance

The following `reboot-db-instance` example reboots the Amazon DocumentDB instance `sample-cluster2`.

```
aws docdb reboot-db-instance \
    --db-instance-identifier sample-cluster2
```

This command produces no output. Output:

```
{
    "DBInstance": {
        "PreferredBackupWindow": "18:00-18:30",
        "DBInstanceIdentifier": "sample-cluster2",
        "VpcSecurityGroups": [
            {
                "Status": "active",
                "VpcSecurityGroupId": "sg-77186e0d"
            }
        ],
        "DBSubnetGroup": {
            "VpcId": "vpc-91280df6",
            "Subnets": [
                {
                    "SubnetStatus": "Active",
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2a"
                    },
                    "SubnetIdentifier": "subnet-4e26d263"
                },
                {
                    "SubnetStatus": "Active",
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2c"
                    },
                    "SubnetIdentifier": "subnet-afc329f4"
                },
                {
                    "SubnetStatus": "Active",
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2d"
                    },
                    "SubnetIdentifier": "subnet-53ab3636"
                },
                {
```

```
                     "SubnetStatus": "Active",
                     "SubnetAvailabilityZone": {
                         "Name": "us-west-2b"
                     },
                     "SubnetIdentifier": "subnet-991cb8d0"
                 }
             ],
             "SubnetGroupStatus": "Complete",
             "DBSubnetGroupName": "default",
             "DBSubnetGroupDescription": "default"
         },
         "PendingModifiedValues": {},
         "Endpoint": {
             "Address": "sample-cluster2.corcjozrlsfc.us-west-2.docdb.amazonaws.com",
             "HostedZoneId": "ZNKXH85TT8WVW",
             "Port": 27017
         },
         "EnabledCloudwatchLogsExports": [
             "audit"
         ],
         "StorageEncrypted": false,
         "DbiResourceId": "db-A2GIKUV6KPOHITGGKI2NHVISZA",
         "AutoMinorVersionUpgrade": true,
         "Engine": "docdb",
         "InstanceCreateTime": "2019-03-15T20:36:06.338Z",
         "EngineVersion": "3.6.0",
         "PromotionTier": 5,
         "BackupRetentionPeriod": 7,
         "DBClusterIdentifier": "sample-cluster",
         "PreferredMaintenanceWindow": "mon:08:39-mon:09:09",
         "PubliclyAccessible": false,
         "DBInstanceClass": "db.r4.4xlarge",
         "AvailabilityZone": "us-west-2d",
         "DBInstanceArn": "arn:aws:rds:us-west-2:123456789012:db:sample-cluster2",
         "DBInstanceStatus": "rebooting"
     }
 }
```

For more information, see Rebooting an Amazon DocumentDB ILnstance in the *Amazon DocumentDB Developer Guide*.

- For API details, see RebootDbInstance in *AWS CLI Command Reference*.

`remove-tags-from-resource`

The following code example shows how to use `remove-tags-from-resource`.

AWS CLI

To remove tags from an Amazon DocumentDB resource

The following `remove-tags-from-resource` example removes the tag with the key named B from the Amazon DocumentDB cluster `sample-cluster`.

```
aws docdb remove-tags-from-resource \
    --resource-name arn:aws:rds:us-west-2:123456789012:cluster:sample-cluster \
    --tag-keys B
```

This command produces no output.

For more information, see Removing Tags from an Amazon DocumentDBResource in the *Amazon DocumentDB Developer Guide*.

- For API details, see RemoveTagsFromResource in *AWS CLI Command Reference*.

`reset-db-cluster-parameter-group`

The following code example shows how to use `reset-db-cluster-parameter-group`.

AWS CLI

To reset the specified parameter value to its defaults in an Amazon DocumentDB parameter group

The following `reset-db-cluster-parameter-group` example resets the parameter `ttl_monitor` in the Amazon DocumentDB parameter group `custom3-6-param-grp` to its default value.

```
aws docdb reset-db-cluster-parameter-group \
    --db-cluster-parameter-group-name custom3-6-param-grp \
    --parameters ParameterName=ttl_monitor,ApplyMethod=immediate
```

Output:

```
{
```

```
    "DBClusterParameterGroupName": "custom3-6-param-grp"
}
```

For more information, see title in the *Amazon DocumentDB Developer Guide*.

To reset specified or all parameter values to their defaults in an Amazon DocumentDB parameter group

The following `reset-db-cluster-parameter-group` example resets all parameters in the Amazon DocumentDB parameter group `custom3-6-param-grp` to their default value.

```
aws docdb reset-db-cluster-parameter-group \
    --db-cluster-parameter-group-name custom3-6-param-grp \
    --reset-all-parameters
```

Output:

```
{
    "DBClusterParameterGroupName": "custom3-6-param-grp"
}
```

For more information, see Resetting an Amazon DocumentDB Cluster Parameter Group in the *Amazon DocumentDB Developer Guide*.

- For API details, see ResetDbClusterParameterGroup in *AWS CLI Command Reference*.

`restore-db-cluster-from-snapshot`

The following code example shows how to use `restore-db-cluster-from-snapshot`.

AWS CLI

To restore an Amazon DocumentDB cluster from an automatic or manual snapshot

The following `restore-db-cluster-from-snapshot` example creates a new Amazon DocumentDB cluster named `sample-cluster-2019-03-16-00-01-restored` from the snapshot `rds:sample-cluster-2019-03-16-00-01`.

```
aws docdb restore-db-cluster-from-snapshot \
    --db-cluster-identifier sample-cluster-2019-03-16-00-01-restored \
    --engine docdb \
```

```
    --snapshot-identifier rds:sample-cluster-2019-03-16-00-01
```

Output:

```
{
    "DBCluster": {
        "ClusterCreateTime": "2019-03-19T18:45:01.857Z",
        "HostedZoneId": "ZNKXH85TT8WVW",
        "Engine": "docdb",
        "DBClusterMembers": [],
        "MultiAZ": false,
        "AvailabilityZones": [
            "us-west-2a",
            "us-west-2c",
            "us-west-2b"
        ],
        "StorageEncrypted": false,
        "ReaderEndpoint": "sample-cluster-2019-03-16-00-01-restored.cluster-ro-
corcjozrlsfc.us-west-2.docdb.amazonaws.com",
        "Endpoint": "sample-cluster-2019-03-16-00-01-restored.cluster-
corcjozrlsfc.us-west-2.docdb.amazonaws.com",
        "Port": 27017,
        "PreferredBackupWindow": "00:00-00:30",
        "DBSubnetGroup": "default",
        "DBClusterIdentifier": "sample-cluster-2019-03-16-00-01-restored",
        "PreferredMaintenanceWindow": "sat:04:30-sat:05:00",
        "DBClusterArn": "arn:aws:rds:us-west-2:123456789012:cluster:sample-
cluster-2019-03-16-00-01-restored",
        "DBClusterParameterGroup": "default.docdb3.6",
        "DbClusterResourceId": "cluster-XOO46Q3RH4LWSYNH3NMZKXPISU",
        "MasterUsername": "master-user",
        "EngineVersion": "3.6.0",
        "BackupRetentionPeriod": 3,
        "AssociatedRoles": [],
        "Status": "creating",
        "VpcSecurityGroups": [
            {
                "Status": "active",
                "VpcSecurityGroupId": "sg-77186e0d"
            }
        ]
    }
}
```

For more information, see Restoring from a Cluster Snapshot in the *Amazon DocumentDB Developer Guide*.

- For API details, see RestoreDbClusterFromSnapshot in *AWS CLI Command Reference*.

`restore-db-cluster-to-point-in-time`

The following code example shows how to use `restore-db-cluster-to-point-in-time`.

AWS CLI

To restore an Amazon DocumentDB cluster to a point-in-time from a manual snapshot

The following `restore-db-cluster-to-point-in-time` example uses the `sample-cluster-snapshot` to create a new Amazon DocumentDB cluster, `sample-cluster-pit`, using the latest restorable time.

```
aws docdb restore-db-cluster-to-point-in-time \
    --db-cluster-identifier sample-cluster-pit \
    --source-db-cluster-identifier arn:aws:rds:us-
west-2:123456789012:cluster:sample-cluster \
    --use-latest-restorable-time
```

Output:

```
{
    "DBCluster": {
        "StorageEncrypted": false,
        "BackupRetentionPeriod": 3,
        "MasterUsername": "master-user",
        "HostedZoneId": "ZNKXH85TT8WVW",
        "PreferredBackupWindow": "00:00-00:30",
        "MultiAZ": false,
        "DBClusterIdentifier": "sample-cluster-pit",
        "DBSubnetGroup": "default",
        "ClusterCreateTime": "2019-04-03T15:55:21.320Z",
        "AssociatedRoles": [],
        "DBClusterParameterGroup": "default.docdb3.6",
        "DBClusterMembers": [],
        "Status": "creating",
        "AvailabilityZones": [
            "us-west-2a",
            "us-west-2d",
```

```

`start-db-cluster`

The following code example shows how to use `start-db-cluster`.

AWS CLI

To start a stopped Amazon DocumentDB cluster

The following `start-db-cluster` example starts the specified Amazon DocumentDB cluster.

```
aws docdb start-db-cluster \
    --db-cluster-identifier sample-cluster
```

Output:

```
{
```

```
    "DBCluster": {
        "ClusterCreateTime": "2019-03-19T18:45:01.857Z",
        "HostedZoneId": "ZNKXH85TT8WVW",
        "Engine": "docdb",
        "DBClusterMembers": [],
        "MultiAZ": false,
        "AvailabilityZones": [
            "us-east-1a",
            "us-east-1c",
            "us-east-1f"
        ],
        "StorageEncrypted": false,

- For API details, see StartDbCluster in *AWS CLI Command Reference*.

`stop-db-cluster`

The following code example shows how to use `stop-db-cluster`.

AWS CLI

To stop a running Amazon DocumentDB cluster

The following `stop-db-cluster` example stops the specified Amazon DocumentDB cluster.

```
aws docdb stop-db-cluster \
    --db-cluster-identifier sample-cluster
```

Output:

```
{
    "DBCluster": {
        "ClusterCreateTime": "2019-03-19T18:45:01.857Z",
        "HostedZoneId": "ZNKXH85TT8WVW",

        "DbClusterResourceId": "cluster-XOO46Q3RH4LWSYNH3NMZKXPISU",
        "MasterUsername": "master-user",
        "EngineVersion": "3.6.0",
```

```
            "BackupRetentionPeriod": 3,
            "AssociatedRoles": [],
            "Status": "creating",
            "VpcSecurityGroups": [
                {
                    "Status": "active",
                    "VpcSecurityGroupId": "sg-77186e0d"
                }
            ]
        }
}
```

For more information, see Stopping and Starting an Amazon DocumentDB Cluster in the *Amazon DocumentDB Developer Guide*.

- For API details, see StopDbCluster in *AWS CLI Command Reference*.

DynamoDB examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with DynamoDB.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Actions

`batch-get-item`

The following code example shows how to use `batch-get-item`.

AWS CLI

To retrieve multiple items from a table

The following `batch-get-items` example reads multiple items from the `MusicCollection` table using a batch of three `GetItem` requests, and requests the number of read capacity units consumed by the operation. The command returns only the `AlbumTitle` attribute.

```
aws dynamodb batch-get-item \
    --request-items file://request-items.json \
    --return-consumed-capacity TOTAL
```

Contents of `request-items.json`:

```
{
    "MusicCollection": {
        "Keys": [
            {
                "Artist": {"S": "No One You Know"},
                "SongTitle": {"S": "Call Me Today"}
            },
            {
                "Artist": {"S": "Acme Band"},
                "SongTitle": {"S": "Happy Day"}
            },
            {
                "Artist": {"S": "No One You Know"},
                "SongTitle": {"S": "Scared of My Shadow"}
            }
        ],
        "ProjectionExpression":"AlbumTitle"
    }
}
```

Output:

```
{
    "Responses": {
        "MusicCollection": [
            {
                "AlbumTitle": {
                    "S": "Somewhat Famous"
                }
            },
            {
                "AlbumTitle": {
```

```
                    "S": "Blue Sky Blues"
                }
            },
            {
                "AlbumTitle": {
                    "S": "Louder Than Ever"
                }
            }
        ]
    },
    "UnprocessedKeys": {},
    "ConsumedCapacity": [
        {
            "TableName": "MusicCollection",
            "CapacityUnits": 1.5
        }
    ]
}
```

For more information, see Batch Operations in the *Amazon DynamoDB Developer Guide*.

- For API details, see BatchGetItem in *AWS CLI Command Reference*.

`batch-write-item`

The following code example shows how to use `batch-write-item`.

AWS CLI

To add multiple items to a table

The following `batch-write-item` example adds three new items to the `MusicCollection` table using a batch of three `PutItem` requests. It also requests information about the number of write capacity units consumed by the operation and any item collections modified by the operation.

```
aws dynamodb batch-write-item \
    --request-items file://request-items.json \
    --return-consumed-capacity INDEXES \
    --return-item-collection-metrics SIZE
```

Contents of `request-items.json`:

```
{
    "MusicCollection": [
        {
            "PutRequest": {
                "Item": {
                    "Artist": {"S": "No One You Know"},
                    "SongTitle": {"S": "Call Me Today"},
                    "AlbumTitle": {"S": "Somewhat Famous"}
                }
            }
        },
        {
            "PutRequest": {
                "Item": {
                    "Artist": {"S": "Acme Band"},
                    "SongTitle": {"S": "Happy Day"},
                    "AlbumTitle": {"S": "Songs About Life"}
                }
            }
        },
        {
            "PutRequest": {
                "Item": {
                    "Artist": {"S": "No One You Know"},
                    "SongTitle": {"S": "Scared of My Shadow"},
                    "AlbumTitle": {"S": "Blue Sky Blues"}
                }
            }
        }
    ]
}
```

Output:

```
{
    "UnprocessedItems": {},
    "ItemCollectionMetrics": {
        "MusicCollection": [
            {
                "ItemCollectionKey": {
                    "Artist": {
                        "S": "No One You Know"
                    }
```

```
                },
                "SizeEstimateRangeGB": [
                    0.0,
                    1.0
                ]
            },
            {
                "ItemCollectionKey": {
                    "Artist": {
                        "S": "Acme Band"
                    }
                },
                "SizeEstimateRangeGB": [
                    0.0,
                    1.0
                ]
            }
        ]
    },
    "ConsumedCapacity": [
        {
            "TableName": "MusicCollection",
            "CapacityUnits": 6.0,
            "Table": {
                "CapacityUnits": 3.0
            },
            "LocalSecondaryIndexes": {
                "AlbumTitleIndex": {
                    "CapacityUnits": 3.0
                }
            }
        }
    ]
}
```

For more information, see Batch Operations in the *Amazon DynamoDB Developer Guide*.

- For API details, see BatchWriteItem in *AWS CLI Command Reference*.

`create-backup`

The following code example shows how to use `create-backup`.

AWS CLI

To create a backup for an existing DynamoDB table

The following `create-backup` example creates a backup of the `MusicCollection` table.

```
aws dynamodb create-backup \
    --table-name MusicCollection \
    --backup-name MusicCollectionBackup
```

Output:

```
{
    "BackupDetails": {
        "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/
backup/01576616366715-b4e58d3a",
        "BackupName": "MusicCollectionBackup",
        "BackupSizeBytes": 0,
        "BackupStatus": "CREATING",
        "BackupType": "USER",
        "BackupCreationDateTime": 1576616366.715
    }
}
```

For more information, see On-Demand Backup and Restore for DynamoDB in the *Amazon DynamoDB Developer Guide*.

- For API details, see CreateBackup in *AWS CLI Command Reference*.

`create-global-table`

The following code example shows how to use `create-global-table`.

AWS CLI

To create a global table

The following `create-global-table` example creates a global table from two identical tables in the specified, separate AWS Regions.

```
aws dynamodb create-global-table \
    --global-table-name MusicCollection \
```

```
    --replication-group RegionName=us-east-2 RegionName=us-east-1 \
    --region us-east-2
```

Output:

```
{
    "GlobalTableDescription": {
        "ReplicationGroup": [
            {
                "RegionName": "us-east-2"
            },
            {
                "RegionName": "us-east-1"
            }
        ],
        "GlobalTableArn": "arn:aws:dynamodb::123456789012:global-table/
MusicCollection",
        "CreationDateTime": 1576625818.532,
        "GlobalTableStatus": "CREATING",
        "GlobalTableName": "MusicCollection"
    }
}
```

For more information, see DynamoDB Global Tables in the *Amazon DynamoDB Developer Guide*.

- For API details, see CreateGlobalTable in *AWS CLI Command Reference*.

`create-table`

The following code example shows how to use `create-table`.

AWS CLI

Example 1: To create a table with tags

The following `create-table` example uses the specified attributes and key schema to create a table named `MusicCollection`. This table uses provisioned throughput and is encrypted at rest using the default AWS owned CMK. The command also applies a tag to the table, with a key of `Owner` and a value of `blueTeam`.

```
aws dynamodb create-table \
    --table-name MusicCollection \
```

```
    --attribute-
definitions AttributeName=Artist,AttributeType=S AttributeName=SongTitle,AttributeType=S
 \
    --key-
schema AttributeName=Artist,KeyType=HASH AttributeName=SongTitle,KeyType=RANGE \
    --provisioned-throughput ReadCapacityUnits=5,WriteCapacityUnits=5 \
    --tags Key=Owner,Value=blueTeam
```

Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "Artist",
                "AttributeType": "S"
            },
            {
                "AttributeName": "SongTitle",
                "AttributeType": "S"
            }
        ],
        "ProvisionedThroughput": {
            "NumberOfDecreasesToday": 0,
            "WriteCapacityUnits": 5,
            "ReadCapacityUnits": 5
        },
        "TableSizeBytes": 0,
        "TableName": "MusicCollection",
        "TableStatus": "CREATING",
        "KeySchema": [
            {
                "KeyType": "HASH",
                "AttributeName": "Artist"
            },
            {
                "KeyType": "RANGE",
                "AttributeName": "SongTitle"
            }
        ],
        "ItemCount": 0,
        "CreationDateTime": "2020-05-26T16:04:41.627000-07:00",
        "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
```

```
        "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    }
}
```

For more information, see Basic Operations for Tables in the *Amazon DynamoDB Developer Guide*.

Example 2: To create a table in On-Demand Mode

The following example creates a table called `MusicCollection` using on-demand mode, rather than provisioned throughput mode. This is useful for tables with unpredictable workloads.

```
aws dynamodb create-table \
    --table-name MusicCollection \
    --attribute-
definitions AttributeName=Artist,AttributeType=S AttributeName=SongTitle,AttributeType=S
 \
    --key-
schema AttributeName=Artist,KeyType=HASH AttributeName=SongTitle,KeyType=RANGE \
    --billing-mode PAY_PER_REQUEST
```

Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "Artist",
                "AttributeType": "S"
            },
            {
                "AttributeName": "SongTitle",
                "AttributeType": "S"
            }
        ],
        "TableName": "MusicCollection",
        "KeySchema": [
            {
                "AttributeName": "Artist",
                "KeyType": "HASH"
            },
            {
```

```
                "AttributeName": "SongTitle",
                "KeyType": "RANGE"
            }
        ],
        "TableStatus": "CREATING",
        "CreationDateTime": "2020-05-27T11:44:10.807000-07:00",
        "ProvisionedThroughput": {
            "NumberOfDecreasesToday": 0,
            "ReadCapacityUnits": 0,
            "WriteCapacityUnits": 0
        },
        "TableSizeBytes": 0,
        "ItemCount": 0,
        "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
        "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "BillingModeSummary": {
            "BillingMode": "PAY_PER_REQUEST"
        }
    }
}
```

For more information, see [Basic Operations for Tables]() in the *Amazon DynamoDB Developer Guide*.

Example 3: To create a table and encrypt it with a Customer Managed CMK

The following example creates a table named `MusicCollection` and encrypts it using a customer managed CMK.

```
aws dynamodb create-table \
    --table-name MusicCollection \
    --attribute-
definitions AttributeName=Artist,AttributeType=S AttributeName=SongTitle,AttributeType=S
 \
    --key-
schema AttributeName=Artist,KeyType=HASH AttributeName=SongTitle,KeyType=RANGE \
    --provisioned-throughput ReadCapacityUnits=5,WriteCapacityUnits=5 \
    --sse-specification Enabled=true,SSEType=KMS,KMSMasterKeyId=abcd1234-abcd-1234-
a123-ab1234a1b234
```

Output:

```
{
```

```
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "Artist",
                "AttributeType": "S"
            },
            {
                "AttributeName": "SongTitle",
                "AttributeType": "S"
            }
        ],
        "TableName": "MusicCollection",
        "KeySchema": [
            {

        }
    }
}
```

For more information, see Basic Operations for Tables in the *Amazon DynamoDB Developer Guide*.

Example 4: To create a table with a Local Secondary Index

The following example uses the specified attributes and key schema to create a table named `MusicCollection` with a Local Secondary Index named `AlbumTitleIndex`.

```
aws dynamodb create-table \
    --table-name MusicCollection \
    --attribute-
definitions AttributeName=Artist,AttributeType=S AttributeName=SongTitle,AttributeType=S Att
 \
    --key-
schema AttributeName=Artist,KeyType=HASH AttributeName=SongTitle,KeyType=RANGE \
    --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \
    --local-secondary-indexes \
        "[
            {
                \"IndexName\": \"AlbumTitleIndex\",
                \"KeySchema\": [
                    {\"AttributeName\": \"Artist\",\"KeyType\":\"HASH\"},
                    {\"AttributeName\": \"AlbumTitle\",\"KeyType\":\"RANGE\"}
                ],
                \"Projection\": {
                    \"ProjectionType\": \"INCLUDE\",
                    \"NonKeyAttributes\": [\"Genre\", \"Year\"]
                }
            }
        ]"
```

Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "AlbumTitle",
                "AttributeType": "S"
            },
            {
                "AttributeName": "Artist",
                "AttributeType": "S"
```

```
            },
            {
                "AttributeName": "SongTitle",
                "AttributeType": "S"
            }
        ],
        "TableName": "MusicCollection",
        "KeySchema": [
            {
                "AttributeName": "Artist",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "SongTitle",

                "ItemCount": 0,
                "IndexArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection/index/AlbumTitleIndex"
            }
        ]
    }
}
```

For more information, see [Basic Operations for Tables]() in the *Amazon DynamoDB Developer Guide*.

Example 5: To create a table with a Global Secondary Index

The following example creates a table named `GameScores` with a Global Secondary Index called `GameTitleIndex`. The base table has a partition key of `UserId` and a sort key of `GameTitle`, allowing you to find an individual user's best score for a specific game efficiently, whereas the GSI has a partition key of `GameTitle` and a sort key of `TopScore`, allowing you to quickly find the overall highest score for a particular game.

```
aws dynamodb create-table \
    --table-name GameScores \
    --attribute-
definitions AttributeName=UserId,AttributeType=S AttributeName=GameTitle,AttributeType=S Att
 \
    --key-schema AttributeName=UserId,KeyType=HASH \
                AttributeName=GameTitle,KeyType=RANGE \
    --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \
    --global-secondary-indexes \
        "[
            {
                \"IndexName\": \"GameTitleIndex\",
                \"KeySchema\": [
                    {\"AttributeName\":\"GameTitle\",\"KeyType\":\"HASH\"},
                    {\"AttributeName\":\"TopScore\",\"KeyType\":\"RANGE\"}
                ],
                \"Projection\": {
                    \"ProjectionType\":\"INCLUDE\",
                    \"NonKeyAttributes\":[\"UserId\"]
```

```
                },
                \"ProvisionedThroughput\": {
                    \"ReadCapacityUnits\": 10,
                    \"WriteCapacityUnits\": 5
                }
            }
        ]"
```

Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "GameTitle",
                "AttributeType": "S"
            },
            {
                "AttributeName": "TopScore",
                "AttributeType": "N"
            },
            {
                "AttributeName": "UserId",
                "AttributeType": "S"
            }
        ],
        "TableName": "GameScores",
        "KeySchema": [
            {
                "AttributeName": "UserId",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "GameTitle",
                "KeyType": "RANGE"
            }
        ],
        "TableStatus": "CREATING",

        "ItemCount": 0,
        "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/GameScores",
        "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "GlobalSecondaryIndexes": [
            {
                "IndexName": "GameTitleIndex",
                "KeySchema": [
                    {
                        "AttributeName": "GameTitle",
                        "KeyType": "HASH"
                    },
                    {
                        "AttributeName": "TopScore",
                        "KeyType": "RANGE"
                    }
                ],
                "Projection": {
                    "ProjectionType": "INCLUDE",
                    "NonKeyAttributes": [
                        "UserId"
                    ]
                },
                "IndexStatus": "CREATING",
                "ProvisionedThroughput": {
                    "NumberOfDecreasesToday": 0,
                    "ReadCapacityUnits": 10,
                    "WriteCapacityUnits": 5
                },
                "IndexSizeBytes": 0,
                "ItemCount": 0,
                "IndexArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
GameScores/index/GameTitleIndex"
            }
        ]
    }
}
```

For more information, see Basic Operations for Tables in the *Amazon DynamoDB Developer Guide*.

Example 6: To create a table with multiple Global Secondary Indexes at once

The following example creates a table named `GameScores` with two Global Secondary Indexes. The GSI schemas are passed via a file, rather than on the command line.

```
aws dynamodb create-table \
    --table-name GameScores \
    --attribute-
definitions AttributeName=UserId,AttributeType=S AttributeName=GameTitle,AttributeType=S Att
 \
    --key-
schema AttributeName=UserId,KeyType=HASH AttributeName=GameTitle,KeyType=RANGE \
    --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \
    --global-secondary-indexes file://gsi.json
```

Contents of `gsi.json`:

```
[
    {
        "IndexName": "GameTitleIndex",
        "KeySchema": [
            {
                "AttributeName": "GameTitle",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "TopScore",
                "KeyType": "RANGE"
            }
        ],
        "Projection": {
            "ProjectionType": "ALL"
        },
        "ProvisionedThroughput": {
            "ReadCapacityUnits": 10,
            "WriteCapacityUnits": 5
        }
    },
    {
        "IndexName": "GameDateIndex",
        "KeySchema": [
            {
                "AttributeName": "GameTitle",
                "KeyType": "HASH"
            },
```

```
            {
                "AttributeName": "Date",
                "KeyType": "RANGE"
            }
        ],
        "Projection": {
            "ProjectionType": "ALL"
        },
        "ProvisionedThroughput": {
            "ReadCapacityUnits": 5,
            "WriteCapacityUnits": 5
        }
    }
]
```

Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "Date",
                "AttributeType": "S"
            },
            {
                "AttributeName": "GameTitle",
                "AttributeType": "S"
            },
            {
                "AttributeName": "TopScore",
                "AttributeType": "N"
            },
            {
                "AttributeName": "UserId",

                },
                "IndexSizeBytes": 0,
                "ItemCount": 0,
                "IndexArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
GameScores/index/GameDateIndex"
            }
        ]
    }
}
```

For more information, see Basic Operations for Tables in the *Amazon DynamoDB Developer Guide*.

Example 7: To create a table with Streams enabled

The following example creates a table called `GameScores` with DynamoDB Streams enabled. Both new and old images of each item will be written to the stream.

```
aws dynamodb create-table \
    --table-name GameScores \
    --attribute-
definitions AttributeName=UserId,AttributeType=S AttributeName=GameTitle,AttributeType=S
 \
```

```
    --key-
schema AttributeName=UserId,KeyType=HASH AttributeName=GameTitle,KeyType=RANGE \
    --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \
    --stream-specification StreamEnabled=TRUE,StreamViewType=NEW_AND_OLD_IMAGES
```

Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "GameTitle",
                "AttributeType": "S"
            },
            {
                "AttributeName": "UserId",
                "AttributeType": "S"
            }
        ],
        "TableName": "GameScores",
        "KeySchema": [
            {
                "AttributeName": "UserId",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "GameTitle",
                "KeyType": "RANGE"
            }
        ],
        "TableStatus": "CREATING",
        "CreationDateTime": "2020-05-27T10:49:34.056000-07:00",
        "ProvisionedThroughput": {
            "NumberOfDecreasesToday": 0,
            "ReadCapacityUnits": 10,
            "WriteCapacityUnits": 5
        },
        "TableSizeBytes": 0,
        "ItemCount": 0,
        "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/GameScores",
        "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "StreamSpecification": {
            "StreamEnabled": true,
```

```
                "StreamViewType": "NEW_AND_OLD_IMAGES"
            },
            "LatestStreamLabel": "2020-05-27T17:49:34.056",
            "LatestStreamArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
GameScores/stream/2020-05-27T17:49:34.056"
        }
}
```

For more information, see Basic Operations for Tables in the *Amazon DynamoDB Developer Guide*.

Example 8: To create a table with Keys-Only Stream enabled

The following example creates a table called `GameScores` with DynamoDB Streams enabled. Only the key attributes of modified items are written to the stream.

```
aws dynamodb create-table \
    --table-name GameScores \
    --attribute-
definitions AttributeName=UserId,AttributeType=S AttributeName=GameTitle,AttributeType=S
 \
    --key-
schema AttributeName=UserId,KeyType=HASH AttributeName=GameTitle,KeyType=RANGE \
    --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \
    --stream-specification StreamEnabled=TRUE,StreamViewType=KEYS_ONLY
```

Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "GameTitle",
                "AttributeType": "S"
            },
            {
                "AttributeName": "UserId",
                "AttributeType": "S"
            }
        ],
        "TableName": "GameScores",
        "KeySchema": [
```

```
            {
                "AttributeName": "UserId",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "GameTitle",
                "KeyType": "RANGE"
            }
        ],
        "TableStatus": "CREATING",
        "CreationDateTime": "2023-05-25T18:45:34.140000+00:00",
        "ProvisionedThroughput": {
            "NumberOfDecreasesToday": 0,
            "ReadCapacityUnits": 10,
            "WriteCapacityUnits": 5
        },
        "TableSizeBytes": 0,
        "ItemCount": 0,
        "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/GameScores",
        "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "StreamSpecification": {
            "StreamEnabled": true,
            "StreamViewType": "KEYS_ONLY"
        },
        "LatestStreamLabel": "2023-05-25T18:45:34.140",
        "LatestStreamArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
GameScores/stream/2023-05-25T18:45:34.140",
        "DeletionProtectionEnabled": false
    }
}
```

For more information, see Change data capture for DynamoDB Streams in the *Amazon DynamoDB Developer Guide*.

Example 9: To create a table with the Standard Infrequent Access class

The following example creates a table called `GameScores` and assigns the Standard-Infrequent Access (DynamoDB Standard-IA) table class. This table class is optimized for storage being the dominant cost.

```
aws dynamodb create-table \
    --table-name GameScores \
```

```
    --attribute-
definitions AttributeName=UserId,AttributeType=S AttributeName=GameTitle,AttributeType=S
 \
    --key-
schema AttributeName=UserId,KeyType=HASH AttributeName=GameTitle,KeyType=RANGE \
    --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \
    --table-class STANDARD_INFREQUENT_ACCESS
```

Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "GameTitle",
                "AttributeType": "S"
            },
            {
                "AttributeName": "UserId",
                "AttributeType": "S"
            }
        ],
        "TableName": "GameScores",
        "KeySchema": [
            {
                "AttributeName": "UserId",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "GameTitle",
                "KeyType": "RANGE"
            }
        ],
        "TableStatus": "CREATING",
        "CreationDateTime": "2023-05-25T18:33:07.581000+00:00",
        "ProvisionedThroughput": {
            "NumberOfDecreasesToday": 0,
            "ReadCapacityUnits": 10,
            "WriteCapacityUnits": 5
        },
        "TableSizeBytes": 0,
        "ItemCount": 0,
        "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/GameScores",
```

```
        "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "TableClassSummary": {
            "TableClass": "STANDARD_INFREQUENT_ACCESS"
        },
        "DeletionProtectionEnabled": false
    }
}
```

For more information, see Table classes in the *Amazon DynamoDB Developer Guide*.

Example 10: To Create a table with Delete Protection enabled

The following example creates a table called `GameScores` and enables deletion protection.

```
aws dynamodb create-table \
    --table-name GameScores \
    --attribute-
definitions AttributeName=UserId,AttributeType=S AttributeName=GameTitle,AttributeType=S
 \
    --key-
schema AttributeName=UserId,KeyType=HASH AttributeName=GameTitle,KeyType=RANGE \
    --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \
    --deletion-protection-enabled
```

Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "GameTitle",
                "AttributeType": "S"
            },
            {
                "AttributeName": "UserId",
                "AttributeType": "S"
            }
        ],
        "TableName": "GameScores",
        "KeySchema": [
            {
                "AttributeName": "UserId",
                "KeyType": "HASH"
```

```
            },
            {
                "AttributeName": "GameTitle",
                "KeyType": "RANGE"
            }
        ],
        "TableStatus": "CREATING",
        "CreationDateTime": "2023-05-25T23:02:17.093000+00:00",
        "ProvisionedThroughput": {
            "NumberOfDecreasesToday": 0,
            "ReadCapacityUnits": 10,
            "WriteCapacityUnits": 5
        },
        "TableSizeBytes": 0,
        "ItemCount": 0,
        "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/GameScores",
        "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "DeletionProtectionEnabled": true
    }
}
```

For more information, see Using deletion protection in the *Amazon DynamoDB Developer Guide*.

- For API details, see CreateTable in *AWS CLI Command Reference*.

delete-backup

The following code example shows how to use `delete-backup`.

AWS CLI

To delete an existing DynamoDB backup

The following `delete-backup` example deletes the specified existing backup.

```
aws dynamodb delete-backup \
    --backup-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/
backup/01576616366715-b4e58d3a
```

Output:

```
{
```

```
    "BackupDescription": {
        "BackupDetails": {
            "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection/backup/01576616366715-b4e58d3a",
            "BackupName": "MusicCollectionBackup",
            "BackupSizeBytes": 0,
            "BackupStatus": "DELETED",
            "BackupType": "USER",
            "BackupCreationDateTime": 1576616366.715
        },
        "SourceTableDetails": {
            "TableName": "MusicCollection",
            "TableId": "b0c04bcc-309b-4352-b2ae-9088af169fe2",
            "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection",
            "TableSizeBytes": 0,
            "KeySchema": [
                {
                    "AttributeName": "Artist",
                    "KeyType": "HASH"
                },
                {
                    "AttributeName": "SongTitle",
                    "KeyType": "RANGE"
                }
            ],
            "TableCreationDateTime": 1576615228.571,
            "ProvisionedThroughput": {
                "ReadCapacityUnits": 5,
                "WriteCapacityUnits": 5
            },
            "ItemCount": 0,
            "BillingMode": "PROVISIONED"
        },
        "SourceTableFeatureDetails": {}
    }
}
```

For more information, see On-Demand Backup and Restore for DynamoDB in the *Amazon DynamoDB Developer Guide*.

- For API details, see DeleteBackup in *AWS CLI Command Reference*.

`delete-item`

The following code example shows how to use `delete-item`.

AWS CLI

Example 1: To delete an item

The following `delete-item` example deletes an item from the `MusicCollection` table and requests details about the item that was deleted and the capacity used by the request.

```
aws dynamodb delete-item \
    --table-name MusicCollection \
    --key file://key.json \
    --return-values ALL_OLD \
    --return-consumed-capacity TOTAL \
    --return-item-collection-metrics SIZE
```

Contents of `key.json`:

```
{
    "Artist": {"S": "No One You Know"},
    "SongTitle": {"S": "Scared of My Shadow"}
}
```

Output:

```
{
    "Attributes": {
        "AlbumTitle": {
            "S": "Blue Sky Blues"
        },
        "Artist": {
            "S": "No One You Know"
        },
        "SongTitle": {
            "S": "Scared of My Shadow"
        }
    },
    "ConsumedCapacity": {
        "TableName": "MusicCollection",
        "CapacityUnits": 2.0
```

```
    },
    "ItemCollectionMetrics": {
        "ItemCollectionKey": {
            "Artist": {
                "S": "No One You Know"
            }
        },
        "SizeEstimateRangeGB": [
            0.0,
            1.0
        ]
    }
}
```

For more information, see Writing an Item in the *Amazon DynamoDB Developer Guide*.

Example 2: To delete an item conditionally

The following example deletes an item from the `ProductCatalog` table only if its `ProductCategory` is either `Sporting Goods` or `Gardening Supplies` and its price is between 500 and 600. It returns details about the item that was deleted.

```
aws dynamodb delete-item \
    --table-name ProductCatalog \
    --key '{"Id":{"N":"456"}}' \
    --condition-expression "(ProductCategory IN (:cat1, :cat2)) and (#P between :lo
 and :hi)" \
    --expression-attribute-names file://names.json \
    --expression-attribute-values file://values.json \
    --return-values ALL_OLD
```

Contents of `names.json`:

```
{
    "#P": "Price"
}
```

Contents of `values.json`:

```
{
    ":cat1": {"S": "Sporting Goods"},
    ":cat2": {"S": "Gardening Supplies"},
```

```
    ":lo": {"N": "500"},
    ":hi": {"N": "600"}
}
```

Output:

```
{
    "Attributes": {
        "Id": {
            "N": "456"
        },
        "Price": {
            "N": "550"
        },
        "ProductCategory": {
            "S": "Sporting Goods"
        }
    }
}
```

For more information, see Writing an Item in the *Amazon DynamoDB Developer Guide*.

- For API details, see DeleteItem in *AWS CLI Command Reference*.

`delete-table`

The following code example shows how to use `delete-table`.

AWS CLI

To delete a table

The following `delete-table` example deletes the `MusicCollection` table.

```
aws dynamodb delete-table \
    --table-name MusicCollection
```

Output:

```
{
    "TableDescription": {
        "TableStatus": "DELETING",
```

```
            "TableSizeBytes": 0,
            "ItemCount": 0,
            "TableName": "MusicCollection",
            "ProvisionedThroughput": {
                "NumberOfDecreasesToday": 0,
                "WriteCapacityUnits": 5,
                "ReadCapacityUnits": 5
            }
        }
}
```

For more information, see [Deleting a Table](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DeleteTable](#) in *AWS CLI Command Reference*.

`describe-backup`

The following code example shows how to use `describe-backup`.

AWS CLI

To get information about an existing backup of a table

The following `describe-backup` example displays information about the specified existing backup.

```
aws dynamodb describe-backup \
    --backup-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/
backup/01576616366715-b4e58d3a
```

Output:

```
{
    "BackupDescription": {
        "BackupDetails": {
            "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection/backup/01576616366715-b4e58d3a",
            "BackupName": "MusicCollectionBackup",
            "BackupSizeBytes": 0,
            "BackupStatus": "AVAILABLE",
            "BackupType": "USER",
            "BackupCreationDateTime": 1576616366.715
        },
```

```
        "SourceTableDetails": {
            "TableName": "MusicCollection",
            "TableId": "b0c04bcc-309b-4352-b2ae-9088af169fe2",
            "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection",
            "TableSizeBytes": 0,
            "KeySchema": [
                {
                    "AttributeName": "Artist",
                    "KeyType": "HASH"
                },
                {
                    "AttributeName": "SongTitle",
                    "KeyType": "RANGE"
                }
            ],
            "TableCreationDateTime": 1576615228.571,
            "ProvisionedThroughput": {
                "ReadCapacityUnits": 5,
                "WriteCapacityUnits": 5
            },
            "ItemCount": 0,
            "BillingMode": "PROVISIONED"
        },
        "SourceTableFeatureDetails": {}
    }
}
```

For more information, see On-Demand Backup and Restore for DynamoDB in the *Amazon DynamoDB Developer Guide*.

- For API details, see DescribeBackup in *AWS CLI Command Reference*.

`describe-continuous-backups`

The following code example shows how to use `describe-continuous-backups`.

AWS CLI

To get information about continuous backups for a DynamoDB table

The following `describe-continuous-backups` example displays details about the continuous backup settings for the `MusicCollection` table.

```
aws dynamodb describe-continuous-backups \
    --table-name MusicCollection
```

Output:

```
{
    "ContinuousBackupsDescription": {
        "ContinuousBackupsStatus": "ENABLED",
        "PointInTimeRecoveryDescription": {
            "PointInTimeRecoveryStatus": "DISABLED"
        }
    }
}
```

For more information, see Point-in-Time Recovery for DynamoDB in the *Amazon DynamoDB Developer Guide*.

- For API details, see DescribeContinuousBackups in *AWS CLI Command Reference*.

`describe-contributor-insights`

The following code example shows how to use `describe-contributor-insights`.

AWS CLI

To view Contributor Insights settings for a DynamoDB table

The following `describe-contributor-insights` example displays the Contributor Insights settings for the `MusicCollection` table and the `AlbumTitle-index` global secondary index.

```
aws dynamodb describe-contributor-insights \
    --table-name MusicCollection \
    --index-name AlbumTitle-index
```

Output:

```
{
    "TableName": "MusicCollection",
    "IndexName": "AlbumTitle-index",
    "ContributorInsightsRuleList": [
```

```
            "DynamoDBContributorInsights-PKC-MusicCollection-1576629651520",
            "DynamoDBContributorInsights-SKC-MusicCollection-1576629651520",
            "DynamoDBContributorInsights-PKT-MusicCollection-1576629651520",
            "DynamoDBContributorInsights-SKT-MusicCollection-1576629651520"
        ],
        "ContributorInsightsStatus": "ENABLED",
        "LastUpdateDateTime": 1576629654.78
    }
```

For more information, see Analyzing Data Access Using CloudWatch Contributor Insights for DynamoDB in the *Amazon DynamoDB Developer Guide*.

- For API details, see DescribeContributorInsights in *AWS CLI Command Reference*.

`describe-endpoints`

The following code example shows how to use `describe-endpoints`.

AWS CLI

To view regional endpoint information

The following `describe-endpoints` example displays details about the endpoints for the current AWS Region.

```
aws dynamodb describe-endpoints
```

Output:

```
{
    "Endpoints": [
        {
            "Address": "dynamodb.us-west-2.amazonaws.com",
            "CachePeriodInMinutes": 1440
        }
    ]
}
```

For more information, see Amazon DynamoDB Endpoints and Quotas in the *AWS General Reference*.

- For API details, see DescribeEndpoints in *AWS CLI Command Reference*.

`describe-global-table-settings`

The following code example shows how to use `describe-global-table-settings`.

AWS CLI

To get information about a DynamoDB global table's settings

The following `describe-global-table-settings` example displays the settings for the `MusicCollection` global table.

```
aws dynamodb describe-global-table-settings \
    --global-table-name MusicCollection
```

Output:

```
{
    "GlobalTableName": "MusicCollection",
    "ReplicaSettings": [
        {
            "RegionName": "us-east-1",
            "ReplicaStatus": "ACTIVE",
            "ReplicaProvisionedReadCapacityUnits": 10,
            "ReplicaProvisionedReadCapacityAutoScalingSettings": {
                "AutoScalingDisabled": true
            },
            "ReplicaProvisionedWriteCapacityUnits": 5,
            "ReplicaProvisionedWriteCapacityAutoScalingSettings": {
                "AutoScalingDisabled": true
            }
        },
        {
            "RegionName": "us-east-2",
            "ReplicaStatus": "ACTIVE",
            "ReplicaProvisionedReadCapacityUnits": 10,
            "ReplicaProvisionedReadCapacityAutoScalingSettings": {
                "AutoScalingDisabled": true
            },
            "ReplicaProvisionedWriteCapacityUnits": 5,
            "ReplicaProvisionedWriteCapacityAutoScalingSettings": {
                "AutoScalingDisabled": true
            }
        }
```

```
    ]
}
```

For more information, see DynamoDB Global Tables in the *Amazon DynamoDB Developer Guide*.

- For API details, see DescribeGlobalTableSettings in *AWS CLI Command Reference*.

`describe-global-table`

The following code example shows how to use `describe-global-table`.

AWS CLI

To display information about a DynamoDB global table

The following `describe-global-table` example displays details about the `MusicCollection` global table.

```
aws dynamodb describe-global-table \
    --global-table-name MusicCollection
```

Output:

```
{
    "GlobalTableDescription": {
        "ReplicationGroup": [
            {
                "RegionName": "us-east-2"
            },
            {
                "RegionName": "us-east-1"
            }
        ],
        "GlobalTableArn": "arn:aws:dynamodb::123456789012:global-table/
MusicCollection",
        "CreationDateTime": 1576625818.532,
        "GlobalTableStatus": "ACTIVE",
        "GlobalTableName": "MusicCollection"
    }
}
```

For more information, see DynamoDB Global Tables in the *Amazon DynamoDB Developer Guide*.

- For API details, see DescribeGlobalTable in *AWS CLI Command Reference*.

`describe-limits`

The following code example shows how to use `describe-limits`.

AWS CLI

To view provisioned-capacity limits

The following `describe-limits` example displays provisioned-capacity limits for your account in the current AWS Region.

```
aws dynamodb describe-limits
```

Output:

```
{
    "AccountMaxReadCapacityUnits": 80000,
    "AccountMaxWriteCapacityUnits": 80000,
    "TableMaxReadCapacityUnits": 40000,
    "TableMaxWriteCapacityUnits": 40000
}
```

For more information, see Limits in DynamoDB in the *Amazon DynamoDB Developer Guide*.

- For API details, see DescribeLimits in *AWS CLI Command Reference*.

`describe-table-replica-auto-scaling`

The following code example shows how to use `describe-table-replica-auto-scaling`.

AWS CLI

To view auto scaling settings across replicas of a global table

The following `describe-table-replica-auto-scaling` example displays auto scaling settings across replicas of the `MusicCollection` global table.

```
aws dynamodb describe-table-replica-auto-scaling \
    --table-name MusicCollection
```

Output:

```
{
    "TableAutoScalingDescription": {
        "TableName": "MusicCollection",
        "TableStatus": "ACTIVE",
        "Replicas": [
            {
                "RegionName": "us-east-1",
                "GlobalSecondaryIndexes": [],
                "ReplicaProvisionedReadCapacityAutoScalingSettings": {
                    "MinimumUnits": 5,
                    "MaximumUnits": 40000,
                    "AutoScalingRoleArn": "arn:aws:iam::123456789012:role/
aws-service-role/dynamodb.application-autoscaling.amazonaws.com/
AWSServiceRoleForApplicationAutoScaling_DynamoDBTable",
                    "ScalingPolicies": [
                        {
                            "PolicyName": "DynamoDBReadCapacityUtilization:table/
MusicCollection",
                            "TargetTrackingScalingPolicyConfiguration": {
                                "TargetValue": 70.0
                            }
                        }
                    ]
                },
                "ReplicaProvisionedWriteCapacityAutoScalingSettings": {
                    "MinimumUnits": 5,
                    "MaximumUnits": 40000,

                            "PolicyName": "DynamoDBReadCapacityUtilization:table/
MusicCollection",
                            "TargetTrackingScalingPolicyConfiguration": {
                                "TargetValue": 70.0
                            }
                        }
                    ]
                },
                "ReplicaProvisionedWriteCapacityAutoScalingSettings": {
                    "MinimumUnits": 5,
                    "MaximumUnits": 40000,
                    "AutoScalingRoleArn": "arn:aws:iam::123456789012:role/
aws-service-role/dynamodb.application-autoscaling.amazonaws.com/
AWSServiceRoleForApplicationAutoScaling_DynamoDBTable",
                    "ScalingPolicies": [
                        {
                            "PolicyName": "DynamoDBWriteCapacityUtilization:table/
MusicCollection",
                            "TargetTrackingScalingPolicyConfiguration": {
                                "TargetValue": 70.0
                            }
                        }
                    ]
                },
                "ReplicaStatus": "ACTIVE"
            }
        ]
    }
}
```

For more information, see DynamoDB Global Tables in the *Amazon DynamoDB Developer Guide*.

- For API details, see DescribeTableReplicaAutoScaling in *AWS CLI Command Reference*.

`describe-table`

The following code example shows how to use `describe-table`.

AWS CLI

To describe a table

The following `describe-table` example describes the `MusicCollection` table.

```
aws dynamodb describe-table \
    --table-name MusicCollection
```

Output:

```
{
    "Table": {
        "AttributeDefinitions": [
            {
                "AttributeName": "Artist",
                "AttributeType": "S"
            },
            {
                "AttributeName": "SongTitle",
                "AttributeType": "S"
            }
        ],
        "ProvisionedThroughput": {
            "NumberOfDecreasesToday": 0,
            "WriteCapacityUnits": 5,
            "ReadCapacityUnits": 5
        },
        "TableSizeBytes": 0,
        "TableName": "MusicCollection",
        "TableStatus": "ACTIVE",
        "KeySchema": [
            {
                "KeyType": "HASH",
                "AttributeName": "Artist"
            },
            {
                "KeyType": "RANGE",
                "AttributeName": "SongTitle"
```

```
            }
        ],
        "ItemCount": 0,
        "CreationDateTime": 1421866952.062
    }
}
```

For more information, see Describing a Table in the *Amazon DynamoDB Developer Guide*.

- For API details, see DescribeTable in *AWS CLI Command Reference*.

`describe-time-to-live`

The following code example shows how to use `describe-time-to-live`.

AWS CLI

To view Time to Live settings for a table

The following `describe-time-to-live` example displays Time to Live settings for the `MusicCollection` table.

```
aws dynamodb describe-time-to-live \
    --table-name MusicCollection
```

Output:

```
{
    "TimeToLiveDescription": {
        "TimeToLiveStatus": "ENABLED",
        "AttributeName": "ttl"
    }
}
```

For more information, see Time to Live in the *Amazon DynamoDB Developer Guide*.

- For API details, see DescribeTimeToLive in *AWS CLI Command Reference*.

`get-item`

The following code example shows how to use `get-item`.

AWS CLI

Example 1: To read an item in a table

The following `get-item` example retrieves an item from the `MusicCollection` table. The table has a hash-and-range primary key (`Artist` and `SongTitle`), so you must specify both of these attributes. The command also requests information about the read capacity consumed by the operation.

```
aws dynamodb get-item \
    --table-name MusicCollection \
    --key file://key.json \
    --return-consumed-capacity TOTAL
```

Contents of `key.json`:

```
{
    "Artist": {"S": "Acme Band"},
    "SongTitle": {"S": "Happy Day"}
}
```

Output:

```
{
    "Item": {
        "AlbumTitle": {
            "S": "Songs About Life"
        },
        "SongTitle": {
            "S": "Happy Day"
        },
        "Artist": {
            "S": "Acme Band"
        }
    },
    "ConsumedCapacity": {
        "TableName": "MusicCollection",
        "CapacityUnits": 0.5
    }
}
```

For more information, see Reading an Item in the *Amazon DynamoDB Developer Guide*.

Example 2: To read an item using a consistent read

The following example retrieves an item from the `MusicCollection` table using strongly consistent reads.

```
aws dynamodb get-item \
    --table-name MusicCollection \
    --key file://key.json \
    --consistent-read \
    --return-consumed-capacity TOTAL
```

Contents of `key.json`:

```
{
    "Artist": {"S": "Acme Band"},
    "SongTitle": {"S": "Happy Day"}
}
```

Output:

```
{
    "Item": {
        "AlbumTitle": {
            "S": "Songs About Life"
        },
        "SongTitle": {
            "S": "Happy Day"
        },
        "Artist": {
            "S": "Acme Band"
        }
    },
    "ConsumedCapacity": {
        "TableName": "MusicCollection",
        "CapacityUnits": 1.0
    }
}
```

For more information, see Reading an Item in the *Amazon DynamoDB Developer Guide*.

Example 3: To retrieve specific attributes of an item

The following example uses a projection expression to retrieve only three attributes of the desired item.

```
aws dynamodb get-item \
    --table-name ProductCatalog \
    --key '{"Id": {"N": "102"}}' \
    --projection-expression "#T, #C, #P" \
    --expression-attribute-names file://names.json
```

Contents of `names.json`:

```
{
    "#T": "Title",
    "#C": "ProductCategory",
    "#P": "Price"
}
```

Output:

```
{
    "Item": {
        "Price": {
            "N": "20"
        },
        "Title": {
            "S": "Book 102 Title"
        },
        "ProductCategory": {
            "S": "Book"
        }
    }
}
```

For more information, see Reading an Item in the *Amazon DynamoDB Developer Guide*.

- For API details, see GetItem in *AWS CLI Command Reference*.

`list-backups`

The following code example shows how to use `list-backups`.

AWS CLI

Example 1: To list all existing DynamoDB backups

The following `list-backups` example lists all of your existing backups.

```
aws dynamodb list-backups
```

Output:

```
{
    "BackupSummaries": [
        {
            "TableName": "MusicCollection",
            "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection",
            "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection/backup/01234567890123-a1bcd234",
            "BackupName": "MusicCollectionBackup1",
            "BackupCreationDateTime": "2020-02-12T14:41:51.617000-08:00",
            "BackupStatus": "AVAILABLE",
            "BackupType": "USER",
            "BackupSizeBytes": 170
        },
        {
            "TableName": "MusicCollection",
            "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection",
            "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection/backup/01234567890123-b2abc345",
            "BackupName": "MusicCollectionBackup2",
            "BackupCreationDateTime": "2020-06-26T11:08:35.431000-07:00",
            "BackupStatus": "AVAILABLE",
            "BackupType": "USER",
            "BackupSizeBytes": 400
        }
    ]
}
```

For more information, see On-Demand Backup and Restore for DynamoDB in the *Amazon DynamoDB Developer Guide*.

Example 2: To list user-created backups in a specific time range

The following example lists only backups of the `MusicCollection` table that were created by the user (not those automatically created by DynamoDB) with a creation date between January 1, 2020 and March 1, 2020.

```
aws dynamodb list-backups \
    --table-name MusicCollection \
    --time-range-lower-bound 1577836800 \
    --time-range-upper-bound 1583020800 \
    --backup-type USER
```

Output:

```
{
    "BackupSummaries": [
        {
            "TableName": "MusicCollection",
            "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection",
            "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection/backup/01234567890123-a1bcd234",
            "BackupName": "MusicCollectionBackup1",
            "BackupCreationDateTime": "2020-02-12T14:41:51.617000-08:00",
            "BackupStatus": "AVAILABLE",
            "BackupType": "USER",
            "BackupSizeBytes": 170
        }
    ]
}
```

For more information, see On-Demand Backup and Restore for DynamoDB in the *Amazon DynamoDB Developer Guide*.

Example 3: To limit page size

The following example returns a list of all existing backups, but retrieves only one item in each call, performing multiple calls if necessary to get the entire list. Limiting the page size is useful when running list commands on a large number of resources, which can result in a "timed out" error when using the default page size of 1000.

```
aws dynamodb list-backups \
    --page-size 1
```

Output:

```
{
    "BackupSummaries": [
        {
            "TableName": "MusicCollection",
            "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection",
            "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection/backup/01234567890123-a1bcd234",
            "BackupName": "MusicCollectionBackup1",
            "BackupCreationDateTime": "2020-02-12T14:41:51.617000-08:00",
            "BackupStatus": "AVAILABLE",
            "BackupType": "USER",
            "BackupSizeBytes": 170
        },
        {
            "TableName": "MusicCollection",
            "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection",
            "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection/backup/01234567890123-b2abc345",
            "BackupName": "MusicCollectionBackup2",
            "BackupCreationDateTime": "2020-06-26T11:08:35.431000-07:00",
            "BackupStatus": "AVAILABLE",
            "BackupType": "USER",
            "BackupSizeBytes": 400
        }
    ]
}
```

For more information, see On-Demand Backup and Restore for DynamoDB in the *Amazon DynamoDB Developer Guide*.

Example 4: To limit the number of items returned

The following example limits the number of items returned to 1. The response includes a `NextToken` value with which to retrieve the next page of results.

```
aws dynamodb list-backups \
    --max-items 1
```

Output:

```
{
    "BackupSummaries": [
        {
            "TableName": "MusicCollection",
            "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection",
            "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection/backup/01234567890123-a1bcd234",
            "BackupName": "MusicCollectionBackup1",
            "BackupCreationDateTime": "2020-02-12T14:41:51.617000-08:00",
            "BackupStatus": "AVAILABLE",
            "BackupType": "USER",
            "BackupSizeBytes": 170
        }
    ],
    "NextToken":
 "abCDeFGhiJKlmnOPqrSTuvwxYZ1aBCdEFghijK7LM51nOpqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9"
}
```

For more information, see On-Demand Backup and Restore for DynamoDB in the *Amazon DynamoDB Developer Guide*.

Example 5: To retrieve the next page of results

The following command uses the `NextToken` value from a previous call to the `list-backups` command to retrieve another page of results. Since the response in this case does not include a `NextToken` value, we know that we have reached the end of the results.

```
aws dynamodb list-backups \
    --starting-
token abCDeFGhiJKlmnOPqrSTuvwxYZ1aBCdEFghijK7LM51nOpqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9
```

Output

```
{
    "BackupSummaries": [
        {
            "TableName": "MusicCollection",
            "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection",
            "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection/backup/01234567890123-b2abc345",
            "BackupName": "MusicCollectionBackup2",
            "BackupCreationDateTime": "2020-06-26T11:08:35.431000-07:00",
            "BackupStatus": "AVAILABLE",
            "BackupType": "USER",
            "BackupSizeBytes": 400
        }
    ]
}
```

For more information, see On-Demand Backup and Restore for DynamoDB in the *Amazon DynamoDB Developer Guide*.

- For API details, see ListBackups in *AWS CLI Command Reference*.

`list-contributor-insights`

The following code example shows how to use `list-contributor-insights`.

AWS CLI

Example 1: To view a list of Contributor Insights summaries

The following `list-contributor-insights` example displays a list of Contributor Insights summaries.

```
aws dynamodb list-contributor-insights
```

Output:

```
{
    "ContributorInsightsSummaries": [
        {
            "TableName": "MusicCollection",
```

```
            "IndexName": "AlbumTitle-index",
            "ContributorInsightsStatus": "ENABLED"
        },
        {
            "TableName": "ProductCatalog",
            "ContributorInsightsStatus": "ENABLED"
        },
        {
            "TableName": "Forum",
            "ContributorInsightsStatus": "ENABLED"
        },
        {
            "TableName": "Reply",
            "ContributorInsightsStatus": "ENABLED"
        },
        {
            "TableName": "Thread",
            "ContributorInsightsStatus": "ENABLED"
        }
    ]
}
```

For more information, see Analyzing Data Access Using CloudWatch Contributor Insights for DynamoDB in the *Amazon DynamoDB Developer Guide*.

Example 2: To limit the number of items returned

The following example limits the number of items returned to 4. The response includes a `NextToken` value with which to retrieve the next page of results.

```
aws dynamodb list-contributor-insights \
    --max-results 4
```

Output:

```
{
    "ContributorInsightsSummaries": [
        {
            "TableName": "MusicCollection",
            "IndexName": "AlbumTitle-index",
            "ContributorInsightsStatus": "ENABLED"
        },
```

```
        {
            "TableName": "ProductCatalog",
            "ContributorInsightsStatus": "ENABLED"
        },
        {
            "TableName": "Forum",
            "ContributorInsightsStatus": "ENABLED"
        }
    ],
    "NextToken":
 "abCDeFGhiJKlmnOPqrSTuvwxYZ1aBCdEFghijK7LM51nOpqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9"
}
```

For more information, see [Analyzing Data Access Using CloudWatch Contributor Insights for DynamoDB](#) in the *Amazon DynamoDB Developer Guide*.

Example 3: To retrieve the next page of results

The following command uses the `NextToken` value from a previous call to the `list-contributor-insights` command to retrieve another page of results. Since the response in this case does not include a `NextToken` value, we know that we have reached the end of the results.

```
aws dynamodb list-contributor-insights \
    --max-results 4 \
    --next-
token abCDeFGhiJKlmnOPqrSTuvwxYZ1aBCdEFghijK7LM51nOpqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9
```

Output:

```
{
    "ContributorInsightsSummaries": [
        {
            "TableName": "Reply",
            "ContributorInsightsStatus": "ENABLED"
        },
        {
            "TableName": "Thread",
            "ContributorInsightsStatus": "ENABLED"
        }
    ]
}
```

For more information, see Analyzing Data Access Using CloudWatch Contributor Insights for DynamoDB in the *Amazon DynamoDB Developer Guide*.

- For API details, see ListContributorInsights in *AWS CLI Command Reference*.

`list-global-tables`

The following code example shows how to use `list-global-tables`.

AWS CLI

To list existing DynamoDB global tables

The following `list-global-tables` example lists all of your existing global tables.

```
aws dynamodb list-global-tables
```

Output:

```
{
    "GlobalTables": [
        {
            "GlobalTableName": "MusicCollection",
            "ReplicationGroup": [
                {
                    "RegionName": "us-east-2"
                },
                {
                    "RegionName": "us-east-1"
                }
            ]
        }
    ]
}
```

For more information, see DynamoDB Global Tables in the *Amazon DynamoDB Developer Guide*.

- For API details, see ListGlobalTables in *AWS CLI Command Reference*.

`list-tables`

The following code example shows how to use `list-tables`.

AWS CLI

Example 1: To list tables

The following `list-tables` example lists all of the tables associated with the current AWS account and Region.

```
aws dynamodb list-tables
```

Output:

```
{
    "TableNames": [
        "Forum",
        "ProductCatalog",
        "Reply",
        "Thread"
    ]
}
```

For more information, see Listing Table Names in the *Amazon DynamoDB Developer Guide*.

Example 2: To limit page size

The following example returns a list of all existing tables, but retrieves only one item in each call, performing multiple calls if necessary to get the entire list. Limiting the page size is useful when running list commands on a large number of resources, which can result in a "timed out" error when using the default page size of 1000.

```
aws dynamodb list-tables \
    --page-size 1
```

Output:

```
{
    "TableNames": [
        "Forum",
        "ProductCatalog",
        "Reply",
        "Thread"
```

```
    ]
}
```

For more information, see Listing Table Names in the *Amazon DynamoDB Developer Guide*.

Example 3: To limit the number of items returned

The following example limits the number of items returned to 2. The response includes a `NextToken` value with which to retrieve the next page of results.

```
aws dynamodb list-tables \
    --max-items 2
```

Output:

```
{
    "TableNames": [
        "Forum",
        "ProductCatalog"
    ],
    "NextToken":
 "abCDeFGhiJKlmnOPqrSTuvwxYZ1aBCdEFghijK7LM51nOpqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9"
}
```

For more information, see Listing Table Names in the *Amazon DynamoDB Developer Guide*.

Example 4: To retrieve the next page of results

The following command uses the `NextToken` value from a previous call to the `list-tables` command to retrieve another page of results. Since the response in this case does not include a `NextToken` value, we know that we have reached the end of the results.

```
aws dynamodb list-tables \
    --starting-
token abCDeFGhiJKlmnOPqrSTuvwxYZ1aBCdEFghijK7LM51nOpqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9
```

Output:

```
{
    "TableNames": [
```

```
        "Reply",
        "Thread"
    ]
}
```

For more information, see Listing Table Names in the *Amazon DynamoDB Developer Guide*.

- For API details, see ListTables in *AWS CLI Command Reference*.

`list-tags-of-resource`

The following code example shows how to use `list-tags-of-resource`.

AWS CLI

Example 1: To list tags of a DynamoDB resource

The following `list-tags-of-resource` example displays tags for the `MusicCollection` table.

```
aws dynamodb list-tags-of-resource \
    --resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection
```

Output:

```
{
    "Tags": [
        {
            "Key": "Owner",
            "Value": "blueTeam"
        },
        {
            "Key": "Environment",
            "Value": "Production"
        }
    ]
}
```

For more information, see Tagging for DynamoDB in the *Amazon DynamoDB Developer Guide*.

Example 2: To limit the number of tags returned

The following example limits the number of tags returned to 1. The response includes a `NextToken` value with which to retrieve the next page of results.

```
aws dynamodb list-tags-of-resource \
    --resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection \
    --max-items 1
```

Output:

```
{
    "Tags": [
        {
            "Key": "Owner",
            "Value": "blueTeam"
        }
    ],
    "NextToken":
 "abCDeFGhiJKlmnOPqrSTuvwxYZ1aBCdEFghijK7LM51nOpqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9"
}
```

For more information, see Tagging for DynamoDB in the *Amazon DynamoDB Developer Guide*.

Example 3: To retrieve the next page of results

The following command uses the `NextToken` value from a previous call to the `list-tags-of-resource` command to retrieve another page of results. Since the response in this case does not include a `NextToken` value, we know that we have reached the end of the results.

```
aws dynamodb list-tags-of-resource \
    --resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection \
    --starting-
token abCDeFGhiJKlmnOPqrSTuvwxYZ1aBCdEFghijK7LM51nOpqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9
```

Output:

```
{
    "Tags": [
        {
            "Key": "Environment",
            "Value": "Production"
        }
    ]
```

```
}
```

For more information, see Tagging for DynamoDB in the *Amazon DynamoDB Developer Guide*.

- For API details, see ListTagsOfResource in *AWS CLI Command Reference*.

`put-item`

The following code example shows how to use `put-item`.

AWS CLI

Example 1: To add an item to a table

The following `put-item` example adds a new item to the *MusicCollection* table.

```
aws dynamodb put-item \
    --table-name MusicCollection \
    --item file://item.json \
    --return-consumed-capacity TOTAL \
    --return-item-collection-metrics SIZE
```

Contents of `item.json`:

```
{
    "Artist": {"S": "No One You Know"},
    "SongTitle": {"S": "Call Me Today"},
    "AlbumTitle": {"S": "Greatest Hits"}
}
```

Output:

```
{
    "ConsumedCapacity": {
        "TableName": "MusicCollection",
        "CapacityUnits": 1.0
    },
    "ItemCollectionMetrics": {
        "ItemCollectionKey": {
            "Artist": {
                "S": "No One You Know"
            }
```

```
        },
        "SizeEstimateRangeGB": [
            0.0,
            1.0
        ]
    }
}
```

For more information, see Writing an Item in the *Amazon DynamoDB Developer Guide*.

Example 2: To conditionally overwrite an item in a table

The following `put-item` example overwrites an existing item in the `MusicCollection` table only if that existing item has an `AlbumTitle` attribute with a value of `Greatest Hits`. The command returns the previous value of the item.

```
aws dynamodb put-item \
    --table-name MusicCollection \
    --item file://item.json \
    --condition-expression "#A = :A" \
    --expression-attribute-names file://names.json \
    --expression-attribute-values file://values.json \
    --return-values ALL_OLD
```

Contents of `item.json`:

```
{
    "Artist": {"S": "No One You Know"},
    "SongTitle": {"S": "Call Me Today"},
    "AlbumTitle": {"S": "Somewhat Famous"}
}
```

Contents of `names.json`:

```
{
    "#A": "AlbumTitle"
}
```

Contents of `values.json`:

```
{
```

```
    ":A": {"S": "Greatest Hits"}
}
```

Output:

```
{
    "Attributes": {
        "AlbumTitle": {
            "S": "Greatest Hits"
        },
        "Artist": {
            "S": "No One You Know"
        },
        "SongTitle": {
            "S": "Call Me Today"
        }
    }
}
```

If the key already exists, you should see the following output:

```
A client error (ConditionalCheckFailedException) occurred when calling the PutItem
 operation: The conditional request failed.
```

For more information, see Writing an Item in the *Amazon DynamoDB Developer Guide*.

- For API details, see PutItem in *AWS CLI Command Reference*.

`query`

The following code example shows how to use `query`.

AWS CLI

Example 1: To query a table

The following `query` example queries items in the `MusicCollection` table. The table has a hash-and-range primary key (`Artist` and `SongTitle`), but this query only specifies the hash key value. It returns song titles by the artist named "No One You Know".

```
aws dynamodb query \
```

```
    --table-name MusicCollection \
    --projection-expression "SongTitle" \
    --key-condition-expression "Artist = :v1" \
    --expression-attribute-values file://expression-attributes.json \
    --return-consumed-capacity TOTAL
```

Contents of `expression-attributes.json`:

```
{
    ":v1": {"S": "No One You Know"}
}
```

Output:

```
{
    "Items": [
        {
            "SongTitle": {
                "S": "Call Me Today"
            },
            "SongTitle": {
                "S": "Scared of My Shadow"
            }
        }
    ],
    "Count": 2,
    "ScannedCount": 2,
    "ConsumedCapacity": {
        "TableName": "MusicCollection",
        "CapacityUnits": 0.5
    }
}
```

For more information, see Working with Queries in DynamoDB in the *Amazon DynamoDB Developer Guide*.

Example 2: To query a table using strongly consistent reads and traverse the index in descending order

The following example performs the same query as the first example, but returns results in reverse order and uses strongly consistent reads.

```
aws dynamodb query \
    --table-name MusicCollection \
    --projection-expression "SongTitle" \
    --key-condition-expression "Artist = :v1" \
    --expression-attribute-values file://expression-attributes.json \
    --consistent-read \
    --no-scan-index-forward \
    --return-consumed-capacity TOTAL
```

Contents of `expression-attributes.json`:

```
{
    ":v1": {"S": "No One You Know"}
}
```

Output:

```
{
    "Items": [
        {
            "SongTitle": {
                "S": "Scared of My Shadow"
            }
        },
        {
            "SongTitle": {
                "S": "Call Me Today"
            }
        }
    ],
    "Count": 2,
    "ScannedCount": 2,
    "ConsumedCapacity": {
        "TableName": "MusicCollection",
        "CapacityUnits": 1.0
    }
}
```

For more information, see Working with Queries in DynamoDB in the *Amazon DynamoDB Developer Guide*.

Example 3: To filter out specific results

The following example queries the `MusicCollection` but excludes results with specific values in the `AlbumTitle` attribute. Note that this does not affect the `ScannedCount` or `ConsumedCapacity`, because the filter is applied after the items have been read.

```
aws dynamodb query \
    --table-name MusicCollection \
    --key-condition-expression "#n1 = :v1" \
    --filter-expression "NOT (#n2 IN (:v2, :v3))" \
    --expression-attribute-names file://names.json \
    --expression-attribute-values file://values.json \
    --return-consumed-capacity TOTAL
```

Contents of `values.json`:

```
{
    ":v1": {"S": "No One You Know"},
    ":v2": {"S": "Blue Sky Blues"},
    ":v3": {"S": "Greatest Hits"}
}
```

Contents of `names.json`:

```
{
    "#n1": "Artist",
    "#n2": "AlbumTitle"
}
```

Output:

```
{
    "Items": [
        {
            "AlbumTitle": {
                "S": "Somewhat Famous"
            },
            "Artist": {
                "S": "No One You Know"
            },
            "SongTitle": {
                "S": "Call Me Today"
            }
```

```
        }
    ],
    "Count": 1,
    "ScannedCount": 2,
    "ConsumedCapacity": {
        "TableName": "MusicCollection",
        "CapacityUnits": 0.5
    }
}
```

For more information, see Working with Queries in DynamoDB in the *Amazon DynamoDB Developer Guide*.

Example 4: To retrieve only an item count

The following example retrieves a count of items matching the query, but does not retrieve any of the items themselves.

```
aws dynamodb query \
    --table-name MusicCollection \
    --select COUNT \
    --key-condition-expression "Artist = :v1" \
    --expression-attribute-values file://expression-attributes.json
```

Contents of `expression-attributes.json`:

```
{
    ":v1": {"S": "No One You Know"}
}
```

Output:

```
{
    "Count": 2,
    "ScannedCount": 2,
    "ConsumedCapacity": null
}
```

For more information, see Working with Queries in DynamoDB in the *Amazon DynamoDB Developer Guide*.

Example 5: To query an index

The following example queries the local secondary index `AlbumTitleIndex`. The query returns all attributes from the base table that have been projected into the local secondary index. Note that when querying a local secondary index or global secondary index, you must also provide the name of the base table using the `table-name` parameter.

```
aws dynamodb query \
    --table-name MusicCollection \
    --index-name AlbumTitleIndex \
    --key-condition-expression "Artist = :v1" \
    --expression-attribute-values file://expression-attributes.json \
    --select ALL_PROJECTED_ATTRIBUTES \
    --return-consumed-capacity INDEXES
```

Contents of `expression-attributes.json`:

```
{
    ":v1": {"S": "No One You Know"}
}
```

Output:

```
{
    "Items": [
        {
            "AlbumTitle": {
                "S": "Blue Sky Blues"
            },
            "Artist": {
                "S": "No One You Know"
            },
            "SongTitle": {
                "S": "Scared of My Shadow"
            }
        },
        {
            "AlbumTitle": {
                "S": "Somewhat Famous"
            },
            "Artist": {
                "S": "No One You Know"
```

```
            },
            "SongTitle": {
                "S": "Call Me Today"
            }
        }
    ],
    "Count": 2,
    "ScannedCount": 2,
    "ConsumedCapacity": {
        "TableName": "MusicCollection",
        "CapacityUnits": 0.5,
        "Table": {
            "CapacityUnits": 0.0
        },
        "LocalSecondaryIndexes": {
            "AlbumTitleIndex": {
                "CapacityUnits": 0.5
            }
        }
    }
}
```

For more information, see Working with Queries in DynamoDB in the *Amazon DynamoDB Developer Guide*.

- For API details, see Query in *AWS CLI Command Reference*.

`restore-table-from-backup`

The following code example shows how to use `restore-table-from-backup`.

AWS CLI

To restore a DynamoDB table from an existing backup

The following `restore-table-from-backup` example restores the specified table from an existing backup.

```
aws dynamodb restore-table-from-backup \
    --target-table-name MusicCollection \
    --backup-arnarn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/
backup/01576616366715-b4e58d3a
```

Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "Artist",
                "AttributeType": "S"
            },
            {
                "AttributeName": "SongTitle",
                "AttributeType": "S"
            }
        ],
        "TableName": "MusicCollection2",
        "KeySchema": [
            {
                "AttributeName": "Artist",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "SongTitle",
                "KeyType": "RANGE"
            }
        ],
        "TableStatus": "CREATING",
        "CreationDateTime": 1576618274.326,
        "ProvisionedThroughput": {
            "NumberOfDecreasesToday": 0,
            "ReadCapacityUnits": 5,
            "WriteCapacityUnits": 5
        },

            "RestoreInProgress": true
        }
    }
}
```

For more information, see On-Demand Backup and Restore for DynamoDB in the *Amazon DynamoDB Developer Guide*.

- For API details, see RestoreTableFromBackup in *AWS CLI Command Reference*.

`restore-table-to-point-in-time`

The following code example shows how to use `restore-table-to-point-in-time`.

AWS CLI

To restore a DynamoDB table to a point in time

The following `restore-table-to-point-in-time` example restores the `MusicCollection` table to the specified point in time.

```
aws dynamodb restore-table-to-point-in-time \
    --source-table-name MusicCollection \
    --target-table-name MusicCollectionRestore \
    --restore-date-time 1576622404.0
```

Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "Artist",
                "AttributeType": "S"
            },
            {
                "AttributeName": "SongTitle",
                "AttributeType": "S"
            }
        ],
```

```
        "TableName": "MusicCollectionRestore",
        "KeySchema": [
            {
                "AttributeName": "Artist",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "SongTitle",
                "KeyType": "RANGE"
            }
        ],
        "TableStatus": "CREATING",
        "CreationDateTime": 1576623311.86,
        "ProvisionedThroughput": {
            "NumberOfDecreasesToday": 0,
            "ReadCapacityUnits": 5,
            "WriteCapacityUnits": 5
        },
        "TableSizeBytes": 0,
        "ItemCount": 0,
        "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollectionRestore",
        "TableId": "befd9e0e-1843-4dc6-a147-d6d00e85cb1f",
        "BillingModeSummary": {
            "BillingMode": "PROVISIONED"
        },
        "RestoreSummary": {
            "SourceTableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection",
            "RestoreDateTime": 1576622404.0,
            "RestoreInProgress": true
        }
    }
}
```

For more information, see Point-in-Time Recovery for DynamoDB in the *Amazon DynamoDB Developer Guide*.

- For API details, see RestoreTableToPointInTime in *AWS CLI Command Reference*.

scan

The following code example shows how to use `scan`.

AWS CLI

To scan a table

The following `scan` example scans the entire `MusicCollection` table, and then narrows the results to songs by the artist "No One You Know". For each item, only the album title and song title are returned.

```
aws dynamodb scan \
    --table-name MusicCollection \
    --filter-expression "Artist = :a" \
    --projection-expression "#ST, #AT" \
    --expression-attribute-names file://expression-attribute-names.json \
    --expression-attribute-values file://expression-attribute-values.json
```

Contents of `expression-attribute-names.json`:

```
{
    "#ST": "SongTitle",
    "#AT":"AlbumTitle"
}
```

Contents of `expression-attribute-values.json`:

```
{
    ":a": {"S": "No One You Know"}
}
```

Output:

```
{
    "Count": 2,
    "Items": [
        {
            "SongTitle": {
                "S": "Call Me Today"
            },
            "AlbumTitle": {
                "S": "Somewhat Famous"
            }
        },
```

```
        {
            "SongTitle": {
                "S": "Scared of My Shadow"
            },
            "AlbumTitle": {
                "S": "Blue Sky Blues"
            }
        }
    ],
    "ScannedCount": 3,
    "ConsumedCapacity": null
}
```

For more information, see Working with Scans in DynamoDB in the *Amazon DynamoDB Developer Guide*.

- For API details, see Scan in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add tags to a DynamoDB resource

The following `tag-resource` example adds a tag key/value pair to the `MusicCollection` table.

```
aws dynamodb tag-resource \
    --resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection \
    --tags Key=Owner,Value=blueTeam
```

This command produces no output.

For more information, see Tagging for DynamoDB in the *Amazon DynamoDB Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`transact-get-items`

The following code example shows how to use `transact-get-items`.

AWS CLI

To retrieve multiple items atomically from one or more tables

The following `transact-get-items` example retrieves multiple items atomically.

```
aws dynamodb transact-get-items \
    --transact-items file://transact-items.json \
    --return-consumed-capacity TOTAL
```

Contents of `transact-items.json`:

```
[
    {
        "Get": {
            "Key": {
                "Artist": {"S": "Acme Band"},
                "SongTitle": {"S": "Happy Day"}
            },
            "TableName": "MusicCollection"
        }
    },
    {
        "Get": {
            "Key": {
                "Artist": {"S": "No One You Know"},
                "SongTitle": {"S": "Call Me Today"}
            },
            "TableName": "MusicCollection"
        }
    }
]
```

Output:

```
{
    "ConsumedCapacity": [
        {
            "TableName": "MusicCollection",
            "CapacityUnits": 4.0,
            "ReadCapacityUnits": 4.0
        }
```

```
    ],
    "Responses": [
        {
            "Item": {
                "AlbumTitle": {
                    "S": "Songs About Life"
                },
                "Artist": {
                    "S": "Acme Band"
                },
                "SongTitle": {
                    "S": "Happy Day"
                }
            }
        },
        {
            "Item": {
                "AlbumTitle": {
                    "S": "Somewhat Famous"
                },
                "Artist": {
                    "S": "No One You Know"
                },
                "SongTitle": {
                    "S": "Call Me Today"
                }
            }
        }
    ]
}
```

For more information, see Managing Complex Workflows with DynamoDB Transactions in the *Amazon DynamoDB Developer Guide*.

- For API details, see TransactGetItems in *AWS CLI Command Reference*.

`transact-write-items`

The following code example shows how to use `transact-write-items`.

AWS CLI

Example 1: To write items atomically to one or more tables

The following `transact-write-items` example updates one item and deletes another. The operation fails if either operation fails, or if either item contains a `Rating` attribute.

```
aws dynamodb transact-write-items \
    --transact-items file://transact-items.json \
    --return-consumed-capacity TOTAL \
    --return-item-collection-metrics SIZE
```

Contents of the `transact-items.json` file:

```
[
    {
        "Update": {
            "Key": {
                "Artist": {"S": "Acme Band"},
                "SongTitle": {"S": "Happy Day"}
            },
            "UpdateExpression": "SET AlbumTitle = :newval",
            "ExpressionAttributeValues": {
                ":newval": {"S": "Updated Album Title"}
            },
            "TableName": "MusicCollection",
            "ConditionExpression": "attribute_not_exists(Rating)"
        }
    },
    {
        "Delete": {
            "Key": {
                "Artist": {"S": "No One You Know"},
                "SongTitle": {"S": "Call Me Today"}
            },
            "TableName": "MusicCollection",
            "ConditionExpression": "attribute_not_exists(Rating)"
        }
    }
]
```

Output:

```
{
    "ConsumedCapacity": [
        {
```

```
                "TableName": "MusicCollection",
                "CapacityUnits": 10.0,
                "WriteCapacityUnits": 10.0
            }
        ],
        "ItemCollectionMetrics": {
            "MusicCollection": [
                {
                    "ItemCollectionKey": {
                        "Artist": {
                            "S": "No One You Know"
                        }
                    },
                    "SizeEstimateRangeGB": [
                        0.0,
                        1.0
                    ]
                },
                {
                    "ItemCollectionKey": {
                        "Artist": {
                            "S": "Acme Band"
                        }
                    },
                    "SizeEstimateRangeGB": [
                        0.0,
                        1.0
                    ]
                }
            ]
        }
    }
```

For more information, see Managing Complex Workflows with DynamoDB Transactions in the *Amazon DynamoDB Developer Guide*.

Example 2: To write items atomically using a client request token

The following command uses a client request token to make the call to `transact-write-items` idempotent, meaning that multiple calls have the same effect as one single call.

```
aws dynamodb transact-write-items \
    --transact-items file://transact-items.json \
```

```
    --client-request-token abc123
```

Contents of the `transact-items.json` file:

```
[
    {
        "Update": {
            "Key": {
                "Artist": {"S": "Acme Band"},
                "SongTitle": {"S": "Happy Day"}
            },
            "UpdateExpression": "SET AlbumTitle = :newval",
            "ExpressionAttributeValues": {
                ":newval": {"S": "Updated Album Title"}
            },
            "TableName": "MusicCollection",
            "ConditionExpression": "attribute_not_exists(Rating)"
        }
    },
    {
        "Delete": {
            "Key": {
                "Artist": {"S": "No One You Know"},
                "SongTitle": {"S": "Call Me Today"}
            },
            "TableName": "MusicCollection",
            "ConditionExpression": "attribute_not_exists(Rating)"
        }
    }
]
```

This command produces no output.

For more information, see Managing Complex Workflows with DynamoDB Transactions in the *Amazon DynamoDB Developer Guide*.

- For API details, see TransactWriteItems in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a DynamoDB resource

The following `untag-resource` example removes the tag with the key `Owner` from the `MusicCollection` table.

```
aws dynamodb untag-resource \
    --resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection \
    --tag-keys Owner
```

This command produces no output.

For more information, see Tagging for DynamoDB in the *Amazon DynamoDB Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-continuous-backups`

The following code example shows how to use `update-continuous-backups`.

AWS CLI

To update continuous backup settings for a DynamoDB table

The following `update-continuous-backups` example enables point-in-time recovery for the `MusicCollection` table.

```
aws dynamodb update-continuous-backups \
    --table-name MusicCollection \
    --point-in-time-recovery-specification PointInTimeRecoveryEnabled=true
```

Output:

```
{
    "ContinuousBackupsDescription": {
        "ContinuousBackupsStatus": "ENABLED",
        "PointInTimeRecoveryDescription": {
            "PointInTimeRecoveryStatus": "ENABLED",
            "EarliestRestorableDateTime": 1576622404.0,
            "LatestRestorableDateTime": 1576622404.0
```

```
        }
    }
}
```

For more information, see Point-in-Time Recovery for DynamoDB in the *Amazon DynamoDB Developer Guide*.

- For API details, see UpdateContinuousBackups in *AWS CLI Command Reference*.

`update-contributor-insights`

The following code example shows how to use `update-contributor-insights`.

AWS CLI

To enable Contributor Insights on a table

The following `update-contributor-insights` example enables Contributor Insights on the `MusicCollection` table and the `AlbumTitle-index` global secondary index.

```
aws dynamodb update-contributor-insights \
    --table-name MusicCollection \
    --index-name AlbumTitle-index \
    --contributor-insights-action ENABLE
```

Output:

```
{
    "TableName": "MusicCollection",
    "IndexName": "AlbumTitle-index",
    "ContributorInsightsStatus": "ENABLING"
}
```

For more information, see Analyzing Data Access Using CloudWatch Contributor Insights for DynamoDB in the *Amazon DynamoDB Developer Guide*.

- For API details, see UpdateContributorInsights in *AWS CLI Command Reference*.

`update-global-table-settings`

The following code example shows how to use `update-global-table-settings`.

AWS CLI

To update provisioned write capacity settings on a DynamoDB global table

The following `update-global-table-settings` example sets the provisioned write capacity of the `MusicCollection` global table to 15.

```
aws dynamodb update-global-table-settings \
    --global-table-name MusicCollection \
    --global-table-provisioned-write-capacity-units 15
```

Output:

```
{
    "GlobalTableName": "MusicCollection",
    "ReplicaSettings": [
        {
            "RegionName": "eu-west-1",
            "ReplicaStatus": "UPDATING",
            "ReplicaProvisionedReadCapacityUnits": 10,
            "ReplicaProvisionedReadCapacityAutoScalingSettings": {
                "AutoScalingDisabled": true
            },
            "ReplicaProvisionedWriteCapacityUnits": 10,
            "ReplicaProvisionedWriteCapacityAutoScalingSettings": {
                "AutoScalingDisabled": true
            }
        },
        {
            "RegionName": "us-east-1",
            "ReplicaStatus": "UPDATING",
            "ReplicaProvisionedReadCapacityUnits": 10,
            "ReplicaProvisionedReadCapacityAutoScalingSettings": {
                "AutoScalingDisabled": true
            },
            "ReplicaProvisionedWriteCapacityUnits": 10,
            "ReplicaProvisionedWriteCapacityAutoScalingSettings": {
                "AutoScalingDisabled": true
            }
        },
        {
            "RegionName": "us-east-2",
            "ReplicaStatus": "UPDATING",
```

```
                "ReplicaProvisionedReadCapacityUnits": 10,
                "ReplicaProvisionedReadCapacityAutoScalingSettings": {
                    "AutoScalingDisabled": true
                },
                "ReplicaProvisionedWriteCapacityUnits": 10,
                "ReplicaProvisionedWriteCapacityAutoScalingSettings": {
                    "AutoScalingDisabled": true
                }
            }
        ]
}
```

For more information, see DynamoDB Global Tables in the *Amazon DynamoDB Developer Guide*.

- For API details, see UpdateGlobalTableSettings in *AWS CLI Command Reference*.

`update-global-table`

The following code example shows how to use `update-global-table`.

AWS CLI

To update a DynamoDB global table

The following `update-global-table` example adds a replica in the specified Region to the `MusicCollection` global table.

```
aws dynamodb update-global-table \
    --global-table-name MusicCollection \
    --replica-updates Create={RegionName=eu-west-1}
```

Output:

```
{
    "GlobalTableDescription": {
        "ReplicationGroup": [
            {
                "RegionName": "eu-west-1"
            },
            {
                "RegionName": "us-east-2"
            },
            {
```

```
                "RegionName": "us-east-1"
            }
        ],
        "GlobalTableArn": "arn:aws:dynamodb::123456789012:global-table/
MusicCollection",
        "CreationDateTime": 1576625818.532,
        "GlobalTableStatus": "ACTIVE",
        "GlobalTableName": "MusicCollection"
    }
}
```

For more information, see [DynamoDB Global Tables]() in the *Amazon DynamoDB Developer Guide*.

- For API details, see [UpdateGlobalTable]() in *AWS CLI Command Reference*.

`update-item`

The following code example shows how to use `update-item`.

AWS CLI

Example 1: To update an item in a table

The following `update-item` example updates an item in the `MusicCollection` table. It adds a new attribute (`Year`) and modifies the `AlbumTitle` attribute. All of the attributes in the item, as they appear after the update, are returned in the response.

```
aws dynamodb update-item \
    --table-name MusicCollection \
    --key file://key.json \
    --update-expression "SET #Y = :y, #AT = :t" \
    --expression-attribute-names file://expression-attribute-names.json \
    --expression-attribute-values file://expression-attribute-values.json  \
    --return-values ALL_NEW \
    --return-consumed-capacity TOTAL \
    --return-item-collection-metrics SIZE
```

Contents of `key.json`:

```
{
    "Artist": {"S": "Acme Band"},
    "SongTitle": {"S": "Happy Day"}
```

```
}
```

Contents of `expression-attribute-names.json`:

```
{
    "#Y":"Year", "#AT":"AlbumTitle"
}
```

Contents of `expression-attribute-values.json`:

```
{
    ":y":{"N": "2015"},
    ":t":{"S": "Louder Than Ever"}
}
```

Output:

```
{
    "Attributes": {
        "AlbumTitle": {
            "S": "Louder Than Ever"
        },
        "Awards": {
            "N": "10"
        },
        "Artist": {
            "S": "Acme Band"
        },
        "Year": {
            "N": "2015"
        },
        "SongTitle": {
            "S": "Happy Day"
        }
    },
    "ConsumedCapacity": {
        "TableName": "MusicCollection",
        "CapacityUnits": 3.0
    },
    "ItemCollectionMetrics": {
        "ItemCollectionKey": {
            "Artist": {
```

```
                "S": "Acme Band"
            }
        },
        "SizeEstimateRangeGB": [
            0.0,
            1.0
        ]
    }
}
```

For more information, see Writing an Item in the *Amazon DynamoDB Developer Guide*.

Example 2: To update an item conditionally

The following example updates an item in the `MusicCollection` table, but only if the existing item does not already have a `Year` attribute.

```
aws dynamodb update-item \
    --table-name MusicCollection \
    --key file://key.json \
    --update-expression "SET #Y = :y, #AT = :t" \
    --expression-attribute-names file://expression-attribute-names.json \
    --expression-attribute-values file://expression-attribute-values.json  \
    --condition-expression "attribute_not_exists(#Y)"
```

Contents of `key.json`:

```
{
    "Artist": {"S": "Acme Band"},
    "SongTitle": {"S": "Happy Day"}
}
```

Contents of `expression-attribute-names.json`:

```
{
    "#Y":"Year",
    "#AT":"AlbumTitle"
}
```

Contents of `expression-attribute-values.json`:

```
{
```

```
    ":y":{"N": "2015"},
    ":t":{"S": "Louder Than Ever"}
}
```

If the item already has a `Year` attribute, DynamoDB returns the following output.

```
An error occurred (ConditionalCheckFailedException) when calling the UpdateItem
 operation: The conditional request failed
```

For more information, see Writing an Item in the *Amazon DynamoDB Developer Guide*.

- For API details, see UpdateItem in *AWS CLI Command Reference*.

`update-table-replica-auto-scaling`

The following code example shows how to use `update-table-replica-auto-scaling`.

AWS CLI

To update auto scaling settings across replicas of a global table

The following `update-table-replica-auto-scaling` example updates write capacity auto scaling settings across replicas of the specified global table.

```
aws dynamodb update-table-replica-auto-scaling \
    --table-name MusicCollection \
    --provisioned-write-capacity-auto-scaling-update file://auto-scaling-policy.json
```

Contents of `auto-scaling-policy.json`:

```
{
    "MinimumUnits": 10,
    "MaximumUnits": 100,
    "AutoScalingDisabled": false,
    "ScalingPolicyUpdate": {
        "PolicyName": "DynamoDBWriteCapacityUtilization:table/MusicCollection",
        "TargetTrackingScalingPolicyConfiguration": {
            "TargetValue": 80
        }
    }
}
```

Output:

```
{
    "TableAutoScalingDescription": {
        "TableName": "MusicCollection",
        "TableStatus": "ACTIVE",
        "Replicas": [
            {

    }
}
```

For more information, see DynamoDB Global Tables in the *Amazon DynamoDB Developer Guide*.

- For API details, see UpdateTableReplicaAutoScaling in *AWS CLI Command Reference*.

`update-table`

The following code example shows how to use `update-table`.

AWS CLI

Example 1: To modify a table's billing mode

The following `update-table` example increases the provisioned read and write capacity on the `MusicCollection` table.

```
aws dynamodb update-table \
    --table-name MusicCollection \
    --billing-mode PROVISIONED \
    --provisioned-throughput ReadCapacityUnits=15,WriteCapacityUnits=10
```

Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "AlbumTitle",
                "AttributeType": "S"
            },
            {
                "AttributeName": "Artist",
                "AttributeType": "S"
            },
            {
                "AttributeName": "SongTitle",
                "AttributeType": "S"
            }
        ],
        "TableName": "MusicCollection",
        "KeySchema": [
            {
                "AttributeName": "Artist",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "SongTitle",
                "KeyType": "RANGE"
            }
        ],
        "TableStatus": "UPDATING",
        "CreationDateTime": "2020-05-26T15:59:49.473000-07:00",
```

```
        "ProvisionedThroughput": {
            "LastIncreaseDateTime": "2020-07-28T13:18:18.921000-07:00",
            "NumberOfDecreasesToday": 0,
            "ReadCapacityUnits": 15,
            "WriteCapacityUnits": 10
        },
        "TableSizeBytes": 182,
        "ItemCount": 2,
        "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
        "TableId": "abcd0123-01ab-23cd-0123-abcdef123456",
        "BillingModeSummary": {
            "BillingMode": "PROVISIONED",
            "LastUpdateToPayPerRequestDateTime": "2020-07-28T13:14:48.366000-07:00"
        }
    }
}
```

For more information, see Updating a Table in the *Amazon DynamoDB Developer Guide*.

Example 2: To create a global secondary index

The following example adds a global secondary index to the `MusicCollection` table.

```
aws dynamodb update-table \
    --table-name MusicCollection \
    --attribute-definitions AttributeName=AlbumTitle,AttributeType=S \
    --global-secondary-index-updates file://gsi-updates.json
```

Contents of `gsi-updates.json`:

```
[
    {
        "Create": {
            "IndexName": "AlbumTitle-index",
            "KeySchema": [
                {
                    "AttributeName": "AlbumTitle",
                    "KeyType": "HASH"
                }
            ],
            "ProvisionedThroughput": {
                "ReadCapacityUnits": 10,
                "WriteCapacityUnits": 10
```

```
            },
            "Projection": {
                "ProjectionType": "ALL"
            }
        }
    }
]
```

Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "AlbumTitle",
                "AttributeType": "S"
            },
            {
                "AttributeName": "Artist",
                "AttributeType": "S"
            },
            {
                "AttributeName": "SongTitle",
                "AttributeType": "S"
            }
        ],
        "TableName": "MusicCollection",
        "KeySchema": [
            {
                "AttributeName": "Artist",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "SongTitle",
                "KeyType": "RANGE"
            }
        ],
        "TableStatus": "UPDATING",

                        "NumberOfDecreasesToday": 0,
                        "ReadCapacityUnits": 10,
                        "WriteCapacityUnits": 10
                    },
                    "IndexSizeBytes": 0,
                    "ItemCount": 0,
                    "IndexArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection/index/AlbumTitle-index"
                }
            ]
        }
    }
```

For more information, see Updating a Table in the *Amazon DynamoDB Developer Guide*.

Example 3: To enable DynamoDB Streams on a table

The following command enables DynamoDB Streams on the `MusicCollection` table.

```
aws dynamodb update-table \
    --table-name MusicCollection \
    --stream-specification StreamEnabled=true,StreamViewType=NEW_IMAGE
```

Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "AlbumTitle",
                "AttributeType": "S"
            },
            {
                "AttributeName": "Artist",
                "AttributeType": "S"
            },
            {
                "AttributeName": "SongTitle",
                "AttributeType": "S"
            }
        ],
        "TableName": "MusicCollection",
        "KeySchema": [
            {
                "AttributeName": "Artist",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "SongTitle",
                "KeyType": "RANGE"
            }
        ],
        "TableStatus": "UPDATING",
        "CreationDateTime": "2020-05-26T15:59:49.473000-07:00",
        "ProvisionedThroughput": {
            "LastIncreaseDateTime": "2020-07-28T12:59:17.537000-07:00",
            "NumberOfDecreasesToday": 0,
            "ReadCapacityUnits": 15,
            "WriteCapacityUnits": 10
        },
        "TableSizeBytes": 182,
        "ItemCount": 2,
```

```

Example 4: To enable server-side encryption

The following example enables server-side encryption on the `MusicCollection` table.

```
aws dynamodb update-table \
    --table-name MusicCollection \
    --sse-specification Enabled=true,SSEType=KMS
```

Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "AlbumTitle",
                "AttributeType": "S"
            },
            {
                "AttributeName": "Artist",
```

```
                "AttributeType": "S"
            },
            {
                "AttributeName": "SongTitle",

For more information, see Updating a Table in the *Amazon DynamoDB Developer Guide*.

- For API details, see UpdateTable in *AWS CLI Command Reference*.

`update-time-to-live`

The following code example shows how to use `update-time-to-live`.

AWS CLI

To update Time to Live settings on a table

The following `update-time-to-live` example enables Time to Live on the specified table.

```
aws dynamodb update-time-to-live \
    --table-name MusicCollection \
    --time-to-live-specification Enabled=true,AttributeName=ttl
```

Output:

```
{
    "TimeToLiveSpecification": {
        "Enabled": true,
        "AttributeName": "ttl"
    }
}
```

For more information, see Time to Live in the *Amazon DynamoDB Developer Guide*.

- For API details, see UpdateTimeToLive in *AWS CLI Command Reference*.

DynamoDB Streams examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with DynamoDB Streams.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

- Actions

Actions

`describe-stream`

The following code example shows how to use `describe-stream`.

AWS CLI

To get information about a DynamoDB stream

The following `describe-stream` command displays information about the specific DynamoDB stream.

```
aws dynamodbstreams describe-stream \
    --stream-arn arn:aws:dynamodb:us-west-1:123456789012:table/Music/
stream/2019-10-22T18:02:01.576
```

Output:

```
{
    "StreamDescription": {
        "StreamArn": "arn:aws:dynamodb:us-west-1:123456789012:table/Music/
stream/2019-10-22T18:02:01.576",
        "StreamLabel": "2019-10-22T18:02:01.576",
        "StreamStatus": "ENABLED",
        "StreamViewType": "NEW_AND_OLD_IMAGES",
```

```
            "CreationRequestDateTime": 1571767321.571,
            "TableName": "Music",
            "KeySchema": [
                {
                    "AttributeName": "Artist",
                    "KeyType": "HASH"
                },
                {
                    "AttributeName": "SongTitle",
                    "KeyType": "RANGE"
                }
            ],
            "Shards": [
                {
                    "ShardId": "shardId-00000001571767321804-697ce3d2",
                    "SequenceNumberRange": {
                        "StartingSequenceNumber": "4000000000000642977831",

                    }
                },
                {
                    "ShardId": "shardId-00000001571780995058-40810d86",
                    "SequenceNumberRange": {
                        "StartingSequenceNumber": "757400000000005655171150"
                    },
                    "ParentShardId": "shardId-00000001571767321804-697ce3d2"
                }
            ]
        }
    }
```

For more information, see Capturing Table Activity with DynamoDB Streams in the *Amazon DynamoDB Developer Guide*.

- For API details, see DescribeStream in *AWS CLI Command Reference*.

`get-records`

The following code example shows how to use `get-records`.

AWS CLI

To get records from a Dynamodb stream

The following `get-records` command retrieves records using the specified Amazon DynamoDB shard iterator.

```
aws dynamodbstreams get-records \
    --shard-iterator "arn:aws:dynamodb:us-west-1:123456789012:table/Music/
stream/2019-10-22T18:02:01.576|1|

- For API details, see GetRecords in *AWS CLI Command Reference*.

`get-shard-iterator`

The following code example shows how to use `get-shard-iterator`.

AWS CLI

To get a shard iterator

The following `get-shard-iterator` command retrieves a shard iterator for the specified shard.

```
aws dynamodbstreams get-shard-iterator \
    --stream-arn arn:aws:dynamodb:us-west-1:12356789012:table/Music/
stream/2019-10-22T18:02:01.576 \
    --shard-id shardId-00000001571780995058-40810d86 \
    --shard-iterator-type LATEST
```

Output:

```
{
    "ShardIterator": "arn:aws:dynamodb:us-west-1:123456789012:table/Music/
stream/2019-10-22T18:02:01.576|1|

}
```

For more information, see Capturing Table Activity with DynamoDB Streams in the *Amazon DynamoDB Developer Guide*.

- For API details, see GetShardIterator in *AWS CLI Command Reference*.

`list-streams`

The following code example shows how to use `list-streams`.

AWS CLI

To list DynamoDB streams

The following `list-streams` command lists all existing Amazon DynamoDB streams within the default AWS Region.

```
aws dynamodbstreams list-streams
```

Output:

```
{
    "Streams": [
        {
            "StreamArn": "arn:aws:dynamodb:us-west-1:123456789012:table/Music/
stream/2019-10-22T18:02:01.576",
            "TableName": "Music",
            "StreamLabel": "2019-10-22T18:02:01.576"
        }
    ]
```

```
}
```

For more information, see Capturing Table Activity with DynamoDB Streams in the *Amazon DynamoDB Developer Guide*.

- For API details, see ListStreams in *AWS CLI Command Reference*.

Amazon EC2 examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EC2.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`accept-address-transfer`

The following code example shows how to use `accept-address-transfer`.

AWS CLI

To accept an Elastic IP address transferred to your account

The following `accept-address-transfer` example accepts the transfer of the specified Elastic IP address to your account.

```
aws ec2 accept-address-transfer \
    --address 100.21.184.216
```

Output:

```
{
    "AddressTransfer": {
```

```
            "PublicIp": "100.21.184.216",
            "AllocationId": "eipalloc-09ad461b0d03f6aaf",
            "TransferAccountId": "123456789012",
            "TransferOfferExpirationTimestamp": "2023-02-22T20:51:10.000Z",
            "TransferOfferAcceptedTimestamp": "2023-02-22T22:52:54.000Z",
            "AddressTransferStatus": "accepted"
        }
    }
```

For more information, see Transfer Elastic IP addresses in the *Amazon VPC User Guide*.

- For API details, see AcceptAddressTransfer in *AWS CLI Command Reference*.

`accept-reserved-instances-exchange-quote`

The following code example shows how to use `accept-reserved-instances-exchange-quote`.

AWS CLI

To perform a Convertible Reserved Instance exchange

This example performs an exchange of the specified Convertible Reserved Instances.

Command:

```
aws ec2 accept-reserved-instances-exchange-quote --reserved-
instance-ids 7b8750c3-397e-4da4-bbcb-a45ebexample --target-
configurations OfferingId=b747b472-423c-48f3-8cee-679bcexample
```

Output:

```
{
  "ExchangeId": "riex-e68ed3c1-8bc8-4c17-af77-811afexample"
}
```

- For API details, see AcceptReservedInstancesExchangeQuote in *AWS CLI Command Reference*.

`accept-transit-gateway-peering-attachment`

The following code example shows how to use `accept-transit-gateway-peering-attachment`.

AWS CLI

To accept a transit gateway peering attachment

The following `accept-transit-gateway-peering-attachment` example accepts the specified transit gateway peering attachment. The `--region` parameter specifies the Region that the accepter transit gateway is located in.

```
aws ec2 accept-transit-gateway-peering-attachment \
    --transit-gateway-attachment-id tgw-attach-4455667788aabbccd \
    --region us-east-2
```

Output:

```
{
    "TransitGatewayPeeringAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-4455667788aabbccd",
        "RequesterTgwInfo": {
            "TransitGatewayId": "tgw-123abc05e04123abc",
            "OwnerId": "123456789012",
            "Region": "us-west-2"
        },
        "AccepterTgwInfo": {
            "TransitGatewayId": "tgw-11223344aabbcc112",
            "OwnerId": "123456789012",
            "Region": "us-east-2"
        },
        "State": "pending",
        "CreationTime": "2019-12-09T11:38:31.000Z"
    }
}
```

For more information, see Transit Gateway Peering Attachments in the *Transit Gateways Guide*.

- For API details, see AcceptTransitGatewayPeeringAttachment in *AWS CLI Command Reference*.

`accept-transit-gateway-vpc-attachment`

The following code example shows how to use `accept-transit-gateway-vpc-attachment`.

AWS CLI

To accept a request to attach a VPC to a transit gateway.

The following `accept-transit-gateway-vpc-attachment` example accepts the request forte specified attachment.

```
aws ec2 accept-transit-gateway-vpc-attachment \
    --transit-gateway-attachment-id tgw-attach-0a34fe6b4fEXAMPLE
```

Output:

```
{
    "TransitGatewayVpcAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-0a34fe6b4fEXAMPLE",
        "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
        "VpcId": "vpc-07e8ffd50fEXAMPLE",
        "VpcOwnerId": "123456789012",
        "State": "pending",
        "SubnetIds": [
            "subnet-0752213d59EXAMPLE"
        ],
        "CreationTime": "2019-07-10T17:33:46.000Z",
        "Options": {
            "DnsSupport": "enable",
            "Ipv6Support": "disable"
        }
    }
}
```

For more information, see Transit Gateway Attachments to a VPC in the *Transit Gateways Guide*.

- For API details, see AcceptTransitGatewayVpcAttachment in *AWS CLI Command Reference*.

`accept-vpc-endpoint-connections`

The following code example shows how to use `accept-vpc-endpoint-connections`.

AWS CLI

To accept an interface endpoint connection request

This example accepts the specified endpoint connection request for the specified endpoint service.

Command:

```
aws ec2 accept-vpc-endpoint-connections --service-id vpce-svc-03d5ebb7d9579a2b3 --
vpc-endpoint-ids vpce-0c1308d7312217abc
```

Output:

```
{
  "Unsuccessful": []
}
```

- For API details, see AcceptVpcEndpointConnections in *AWS CLI Command Reference*.

`accept-vpc-peering-connection`

The following code example shows how to use `accept-vpc-peering-connection`.

AWS CLI

To accept a VPC peering connection

This example accepts the specified VPC peering connection request.

Command:

```
aws ec2 accept-vpc-peering-connection --vpc-peering-connection-id pcx-1a2b3c4d
```

Output:

```
{
  "VpcPeeringConnection": {
    "Status": {
      "Message": "Provisioning",
      "Code": "provisioning"
    },
    "Tags": [],
    "AccepterVpcInfo": {
      "OwnerId": "444455556666",
      "VpcId": "vpc-44455566",
      "CidrBlock": "10.0.1.0/28"
    },
    "VpcPeeringConnectionId": "pcx-1a2b3c4d",
    "RequesterVpcInfo": {
      "OwnerId": "444455556666",
```

```
        "VpcId": "vpc-111abc45",
        "CidrBlock": "10.0.0.0/28"
      }
    }
}
```

- For API details, see AcceptVpcPeeringConnection in *AWS CLI Command Reference*.

`advertise-byoip-cidr`

The following code example shows how to use `advertise-byoip-cidr`.

AWS CLI

To advertise an address range

The following `advertise-byoip-cidr` example advertises the specified public IPv4 address range.

```
aws ec2 advertise-byoip-cidr \
    --cidr 203.0.113.25/24
```

Output:

```
{
    "ByoipCidr": {
        "Cidr": "203.0.113.25/24",
        "StatusMessage": "ipv4pool-ec2-1234567890abcdef0",
        "State": "provisioned"
    }
}
```

- For API details, see AdvertiseByoipCidr in *AWS CLI Command Reference*.

`allocate-address`

The following code example shows how to use `allocate-address`.

AWS CLI

Example 1: To allocate an Elastic IP address from Amazon's address pool

The following `allocate-address` example allocates an Elastic IP address. Amazon EC2 selects the address from Amazon's address pool.

```
aws ec2 allocate-address
```

Output:

```
{
    "PublicIp": "70.224.234.241",
    "AllocationId": "eipalloc-01435ba59eEXAMPLE",
    "PublicIpv4Pool": "amazon",
    "NetworkBorderGroup": "us-west-2",
    "Domain": "vpc"
}
```

For more information, see Elastic IP addresses in the *Amazon EC2 User Guide*.

Example 2: To allocate an Elastic IP address and associate it with a network border group

The following `allocate-address` example allocates an Elastic IP address and associates it with the specified network border group.

```
aws ec2 allocate-address \
    --network-border-group us-west-2-lax-1
```

Output:

```
{
    "PublicIp": "70.224.234.241",
    "AllocationId": "eipalloc-e03dd489ceEXAMPLE",
    "PublicIpv4Pool": "amazon",
    "NetworkBorderGroup": "us-west-2-lax-1",
    "Domain": "vpc"
}
```

For more information, see Elastic IP addresses in the *Amazon EC2 User Guide*.

Example 3: To allocate an Elastic IP address from an address pool that you own

The following `allocate-address` example allocates an Elastic IP address from an address pool that you have brought to your Amazon Web Services account. Amazon EC2 selects the address from the address pool.

```
aws ec2 allocate-address \
    --public-ipv4-pool ipv4pool-ec2-1234567890abcdef0
```

Output:

```
{
    "AllocationId": "eipalloc-02463d08ceEXAMPLE",
    "NetworkBorderGroup": "us-west-2",
    "CustomerOwnedIp": "18.218.95.81",
    "CustomerOwnedIpv4Pool": "ipv4pool-ec2-1234567890abcdef0",
    "Domain": "vpc"
    "NetworkBorderGroup": "us-west-2",
}
```

For more information, see Elastic IP addresses in the *Amazon EC2 User Guide*.

Example 4: To allocate an Elastic IP address from an IPAM pool

The following `allocate-address` example allocates a specific /32 Elastic IP address from an Amazon VPC IP Address Manager (IPAM) pool.

```
aws ec2 allocate-address \
    --region us-east-1 \
    --ipam-pool-id ipam-pool-1234567890abcdef0 \
    --address 192.0.2.0
```

Output:

```
{
    "PublicIp": "192.0.2.0",
    "AllocationId": "eipalloc-abcdef01234567890",
    "PublicIpv4Pool": "ipam-pool-1234567890abcdef0",
    "NetworkBorderGroup": "us-east-1",
    "Domain": "vpc"
}
```

For more information, see Allocate sequential Elastic IP addresses from an IPAM pool in the *Amazon VPC IPAM User Guide*.

- For API details, see AllocateAddress in *AWS CLI Command Reference*.

`allocate-hosts`

The following code example shows how to use `allocate-hosts`.

AWS CLI

Example 1: To allocate a Dedicated Host

The following `allocate-hosts` example allocates a single Dedicated Host in the `eu-west-1a` Availability Zone, onto which you can launch `m5.large` instances. By default, the Dedicated Host accepts only target instance launches, and does not support host recovery.

```
aws ec2 allocate-hosts \
    --instance-type m5.large \
    --availability-zone eu-west-1a \
    --quantity 1
```

Output:

```
{
    "HostIds": [
        "h-07879acf49EXAMPLE"
    ]
}
```

Example 2: To allocate a Dedicated Host with auto-placement and host recovery enabled

The following `allocate-hosts` example allocates a single Dedicated Host in the `eu-west-1a` Availability Zone with auto-placement and host recovery enabled.

```
aws ec2 allocate-hosts \
    --instance-type m5.large \
    --availability-zone eu-west-1a \
    --auto-placement on \
    --host-recovery on \
    --quantity 1
```

Output:

```
{
     "HostIds": [
```

```
            "h-07879acf49EXAMPLE"
        ]
}
```

Example 3: To allocate a Dedicated Host with tags

The following `allocate-hosts` example allocates a single Dedicated Host and applies a tag with a key named `purpose` and a value of `production`.

```
aws ec2 allocate-hosts \
    --instance-type m5.large \
    --availability-zone eu-west-1a \
    --quantity 1 \
    --tag-specifications 'ResourceType=dedicated-
host,Tags={Key=purpose,Value=production}'
```

Output:

```
{
    "HostIds": [
        "h-07879acf49EXAMPLE"
    ]
}
```

For more information, see Allocate a Dedicated Host in the *Amazon EC2 User Guide*.

- For API details, see AllocateHosts in *AWS CLI Command Reference*.

`allocate-ipam-pool-cidr`

The following code example shows how to use `allocate-ipam-pool-cidr`.

AWS CLI

To allocate a CIDR from an IPAM pool

The following `allocate-ipam-pool-cidr` example allocates a CIDR from an IPAM pool.

(Linux):

```
aws ec2 allocate-ipam-pool-cidr \
```

```
    --ipam-pool-id ipam-pool-0533048da7d823723 \
    --netmask-length 24
```

(Windows):

```
aws ec2 allocate-ipam-pool-cidr ^
   --ipam-pool-id ipam-pool-0533048da7d823723 ^
   --netmask-length 24
```

Output:

```
{
    "IpamPoolAllocation": {
        "Cidr": "10.0.0.0/24",
        "IpamPoolAllocationId": "ipam-pool-alloc-018ecc28043b54ba38e2cd99943cebfbd",
        "ResourceType": "custom",
        "ResourceOwner": "123456789012"
    }
}
```

For more information, see Manually allocate a CIDR to a pool to reserve IP address space in the *Amazon VPC IPAM User Guide*.

- For API details, see AllocateIpamPoolCidr in *AWS CLI Command Reference*.

`apply-security-groups-to-client-vpn-target-network`

The following code example shows how to use `apply-security-groups-to-client-vpn-target-network`.

AWS CLI

To apply security groups to a target network for a Client VPN endpoint

The following `apply-security-groups-to-client-vpn-target-network` example applies security group `sg-01f6e627a89f4db32` to the association between the specified target network and Client VPN endpoint.

```
aws ec2 apply-security-groups-to-client-vpn-target-network \
    --security-group-ids sg-01f6e627a89f4db32 \
    --vpc-id vpc-0e2110c2f324332e0 \
```

```
    --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```
{
    "SecurityGroupIds": [
        "sg-01f6e627a89f4db32"
    ]
}
```

For more information, see Target Networks in the *AWS Client VPN Administrator Guide*.

- For API details, see ApplySecurityGroupsToClientVpnTargetNetwork in *AWS CLI Command Reference*.

`assign-ipv6-addresses`

The following code example shows how to use `assign-ipv6-addresses`.

AWS CLI

To assign specific IPv6 addresses to a network interface

This example assigns the specified IPv6 addresses to the specified network interface.

Command:

```
aws ec2 assign-ipv6-addresses --network-interface-id eni-38664473 --ipv6-
addresses 2001:db8:1234:1a00:3304:8879:34cf:4071 2001:db8:1234:1a00:9691:9503:25ad:1761
```

Output:

```
{
  "AssignedIpv6Addresses": [
      "2001:db8:1234:1a00:3304:8879:34cf:4071",
      "2001:db8:1234:1a00:9691:9503:25ad:1761"
  ],
  "NetworkInterfaceId": "eni-38664473"
}
```

To assign IPv6 addresses that Amazon selects to a network interface

This example assigns two IPv6 addresses to the specified network interface. Amazon automatically assigns these IPv6 addresses from the available IPv6 addresses in the IPv6 CIDR block range of the subnet.

Command:

```
aws ec2 assign-ipv6-addresses --network-interface-id eni-38664473 --ipv6-address-count 2
```

Output:

```
{
  "AssignedIpv6Addresses": [
      "2001:db8:1234:1a00:3304:8879:34cf:4071",
      "2001:db8:1234:1a00:9691:9503:25ad:1761"
  ],
  "NetworkInterfaceId": "eni-38664473"
}
```

- For API details, see AssignIpv6Addresses in *AWS CLI Command Reference*.

`assign-private-ip-addresses`

The following code example shows how to use `assign-private-ip-addresses`.

AWS CLI

To assign a specific secondary private IP address a network interface

This example assigns the specified secondary private IP address to the specified network interface. If the command succeeds, no output is returned.

Command:

```
aws ec2 assign-private-ip-addresses --network-interface-id eni-e5aa89a3 --private-ip-addresses 10.0.0.82
```

To assign secondary private IP addresses that Amazon EC2 selects to a network interface

This example assigns two secondary private IP addresses to the specified network interface. Amazon EC2 automatically assigns these IP addresses from the available IP addresses in the

CIDR block range of the subnet the network interface is associated with. If the command succeeds, no output is returned.

Command:

```
aws ec2 assign-private-ip-addresses --network-interface-id eni-e5aa89a3 --secondary-private-ip-address-count 2
```

- For API details, see AssignPrivateIpAddresses in *AWS CLI Command Reference*.

`assign-private-nat-gateway-address`

The following code example shows how to use `assign-private-nat-gateway-address`.

AWS CLI

To assign private IP addresses to your private NAT gateway

The following `assign-private-nat-gateway-address` example assigns two private IP addresses to the specified private NAT gateway.

```
aws ec2 assign-private-nat-gateway-address \
    --nat-gateway-id nat-1234567890abcdef0 \
    --private-ip-address-count 2
```

Output:

```
{
    "NatGatewayId": "nat-1234567890abcdef0",
    "NatGatewayAddresses": [
        {
            "NetworkInterfaceId": "eni-0065a61b324d1897a",
            "IsPrimary": false,
            "Status": "assigning"
        },
        {
            "NetworkInterfaceId": "eni-0065a61b324d1897a",
            "IsPrimary": false,
            "Status": "assigning"
        }
    ]
```

```
}
```

For more information, see NAT gateways in the *Amazon VPC User Guide*.

- For API details, see AssignPrivateNatGatewayAddress in *AWS CLI Command Reference*.

`associate-address`

The following code example shows how to use `associate-address`.

AWS CLI

Example 1: To associate an Elastic IP address with an instance

The following `associate-address` example associates an Elastic IP address with the specified EC2 instance.

```
aws ec2 associate-address \
    --instance-id i-0b263919b6498b123 \
    --allocation-id eipalloc-64d5890a
```

Output:

```
{
    "AssociationId": "eipassoc-2bebb745"
}
```

Example 2: To associate an Elastic IP address with a network interface

The following `associate-address` example associates the specified Elastic IP address with the specified network interface.

```
aws ec2 associate-address
    --allocation-id eipalloc-64d5890a \
    --network-interface-id eni-1a2b3c4d
```

Output:

```
{
    "AssociationId": "eipassoc-2bebb745"
```

```
}
```

Example 3: To associate an Elastic IP address with a private IP address

The following `associate-address` example associates the specified Elastic IP address with the specified private IP address in the specified network interface.

```
aws ec2 associate-address \
    --allocation-id eipalloc-64d5890a \
    --network-interface-id eni-1a2b3c4d \
    --private-ip-address 10.0.0.85
```

Output:

```
{
    "AssociationId": "eipassoc-2bebb745"
}
```

For more information, see Elastic IP addresses in the *Amazon EC2 User Guide*.

- For API details, see AssociateAddress in *AWS CLI Command Reference*.

`associate-client-vpn-target-network`

The following code example shows how to use `associate-client-vpn-target-network`.

AWS CLI

To associate a target network with a Client VPN endpoint

The following `associate-client-vpn-target-network` example associates a subnet with the specified Client VPN endpoint.

```
aws ec2 associate-client-vpn-target-network \
    --subnet-id subnet-0123456789abcabca \
    --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```
{
    "AssociationId": "cvpn-assoc-12312312312312312",
```

```
    "Status": {
        "Code": "associating"
    }
}
```

For more information, see Target Networks in the *AWS Client VPN Administrator Guide*.

- For API details, see AssociateClientVpnTargetNetwork in *AWS CLI Command Reference*.

`associate-dhcp-options`

The following code example shows how to use `associate-dhcp-options`.

AWS CLI

To associate a DHCP options set with your VPC

This example associates the specified DHCP options set with the specified VPC. If the command succeeds, no output is returned.

Command:

```
aws ec2 associate-dhcp-options --dhcp-options-id dopt-d9070ebb --vpc-id vpc-a01106c2
```

To associate the default DHCP options set with your VPC

This example associates the default DHCP options set with the specified VPC. If the command succeeds, no output is returned.

Command:

```
aws ec2 associate-dhcp-options --dhcp-options-id default --vpc-id vpc-a01106c2
```

- For API details, see AssociateDhcpOptions in *AWS CLI Command Reference*.

`associate-iam-instance-profile`

The following code example shows how to use `associate-iam-instance-profile`.

AWS CLI

To associate an IAM instance profile with an instance

This example associates an IAM instance profile named `admin-role` with instance `i-123456789abcde123`.

Command:

```
aws ec2 associate-iam-instance-profile --instance-id i-123456789abcde123 --iam-instance-profile Name=admin-role
```

Output:

```
{
  "IamInstanceProfileAssociation": {
      "InstanceId": "i-123456789abcde123",
      "State": "associating",
      "AssociationId": "iip-assoc-0e7736511a163c209",
      "IamInstanceProfile": {
          "Id": "AIPAJBLK7RKJKWDXVHIEC",
          "Arn": "arn:aws:iam::123456789012:instance-profile/admin-role"
      }
  }
}
```

- For API details, see AssociateIamInstanceProfile in *AWS CLI Command Reference*.

`associate-instance-event-window`

The following code example shows how to use `associate-instance-event-window`.

AWS CLI

Example 1: To associate one or more instances with an event window

The following `associate-instance-event-window` example associates one or more instances with an event window.

```
aws ec2 associate-instance-event-window \
    --region us-east-1 \
    --instance-event-window-id iew-0abcdef1234567890 \
    --association-target "InstanceIds=i-1234567890abcdef0,i-0598c7d356eba48d7"
```

Output:

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "AssociationTarget": {
            "InstanceIds": [
                "i-1234567890abcdef0",
                "i-0598c7d356eba48d7"
            ],
            "Tags": [],
            "DedicatedHostIds": []
        },
        "State": "creating"
    }
}
```

For event window constraints, see Considerations in the Scheduled Events section of the *Amazon EC2 User Guide*.

Example 2: To associate instance tags with an event window

The following `associate-instance-event-window` example associates instance tags with an event window. Enter an `instance-event-window-id` parameter to specify the event window. To associate instance tags, specify the `association-target` parameter, and for the parameter value, specify one or more tags.

```
aws ec2 associate-instance-event-window \
    --region us-east-1 \
    --instance-event-window-id iew-0abcdef1234567890 \
    --association-target "InstanceTags=[{Key=k2,Value=v2},{Key=k1,Value=v1}]"
```

Output:

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "AssociationTarget": {
            "InstanceIds": [],
```

```
                "Tags": [
                    {
                        "Key": "k2",
                        "Value": "v2"
                    },
                    {
                        "Key": "k1",
                        "Value": "v1"
                    }
                ],
                "DedicatedHostIds": []
            },
            "State": "creating"
        }
}
```

For event window constraints, see [Considerations](#) in the Scheduled Events section of the *Amazon EC2 User Guide*.

Example 3: To associate a Dedicated Host with an event window

The following `associate-instance-event-window` example associates a Dedicated Host with an event window. Enter an `instance-event-window-id` parameter to specify the event window. To associate a Dedicated Host, specify the `--association-target` parameter, and for the parameter values, specify one of more Dedicated Host IDs.

```
aws ec2 associate-instance-event-window \
    --region us-east-1 \
    --instance-event-window-id iew-0abcdef1234567890 \
    --association-target "DedicatedHostIds=h-029fa35a02b99801d"
```

Output:

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "AssociationTarget": {
            "InstanceIds": [],
            "Tags": [],
            "DedicatedHostIds": [
```

```
                    "h-029fa35a02b99801d"
                ]
            },
            "State": "creating"
        }
}
```

For event window constraints, see Considerations in the Scheduled Events section of the *Amazon EC2 User Guide*.

- For API details, see AssociateInstanceEventWindow in *AWS CLI Command Reference*.

`associate-ipam-resource-discovery`

The following code example shows how to use `associate-ipam-resource-discovery`.

AWS CLI

To associate a resource discovery with an IPAM

In this example, you are an IPAM delegated admin and a resource discovery has been created and shared with you by another AWS account so that you can use IPAM to manage and monitor resource CIDRs owned by the other account.

Note

To complete this request, you'll need the resource discovery ID which you can get with describe-ipam-resource-discoveries and the IPAM ID which you can get with describe-ipams.The resource discovery that you are associating must have first been shared with your account using AWS RAM.The `--region` you enter must match the home Region of the IPAM you are associating it with.

The following `associate-ipam-resource-discovery` example associates a resource discovery with an IPAM.

```
aws ec2 associate-ipam-resource-discovery \
    --ipam-id ipam-005f921c17ebd5107 \
    --ipam-resource-discovery-id ipam-res-disco-03e0406de76a044ee \
    --tag-specifications 'ResourceType=ipam-resource-discovery,Tags=[{Key=cost-
center,Value=cc123}]' \
    --region us-east-1
```

Output:

```
{
    {
        "IpamResourceDiscoveryAssociation": {
            "OwnerId": "320805250157",
            "IpamResourceDiscoveryAssociationId": "ipam-res-disco-
assoc-04382a6346357cf82",
            "IpamResourceDiscoveryAssociationArn": "arn:aws:ec2::320805250157:ipam-
resource-discovery-association/ipam-res-disco-assoc-04382a6346357cf82",
            "IpamResourceDiscoveryId": "ipam-res-disco-0365d2977fc1672fe",
            "IpamId": "ipam-005f921c17ebd5107",
            "IpamArn": "arn:aws:ec2::320805250157:ipam/ipam-005f921c17ebd5107",
            "IpamRegion": "us-east-1",
            "IsDefault": false,
            "ResourceDiscoveryStatus": "active",
            "State": "associate-in-progress",
            "Tags": []
        }
    }
}
```

Once you associate a resource discovery, you can monitor and/or manage the IP addresses of resources created by the other accounts. For more information, see Integrate IPAM with accounts outside of your organization in the *Amazon VPC IPAM User Guide*.

- For API details, see AssociateIpamResourceDiscovery in *AWS CLI Command Reference*.

`associate-nat-gateway-address`

The following code example shows how to use `associate-nat-gateway-address`.

AWS CLI

To associate an Elastic IP address with a public NAT gateway

The following `associate-nat-gateway-address` example associates the specified Elastic IP address with the specified public NAT gateway. AWS automatically assigns a secondary private IPv4 address.

```
aws ec2 associate-nat-gateway-address \
    --nat-gateway-id nat-1234567890abcdef0 \
```

```
    --allocation-ids eipalloc-0be6ecac95EXAMPLE
```

Output:

```
{
    "NatGatewayId": "nat-1234567890abcdef0",
    "NatGatewayAddresses": [
        {
            "AllocationId": "eipalloc-0be6ecac95EXAMPLE",
            "NetworkInterfaceId": "eni-09cc4b2558794f7f9",
            "IsPrimary": false,
            "Status": "associating"
        }
    ]
}
```

For more information, see NAT gateways in the *Amazon VPC User Guide*.

- For API details, see AssociateNatGatewayAddress in *AWS CLI Command Reference*.

`associate-route-table`

The following code example shows how to use `associate-route-table`.

AWS CLI

To associate a route table with a subnet

This example associates the specified route table with the specified subnet.

Command:

```
aws ec2 associate-route-table --route-table-id rtb-22574640 --subnet-
id subnet-9d4a7b6c
```

Output:

```
{
    "AssociationId": "rtbassoc-781d0d1a"
}
```

- For API details, see AssociateRouteTable in *AWS CLI Command Reference*.

`associate-security-group-vpc`

The following code example shows how to use `associate-security-group-vpc`.

AWS CLI

To associate a security group with another VPC

The following `associate-security-group-vpc` example associates the specified security group with the specified VPC.

```
aws ec2 associate-security-group-vpc \
    --group-id sg-04dbb43907d3f8a78 \
    --vpc-id vpc-0bf4c2739bc05a694
```

Output:

```
{
    "State": "associating"
}
```

For more information, see Associate security groups with multiple VPCs in the *Amazon VPC User Guide*.

- For API details, see AssociateSecurityGroupVpc in *AWS CLI Command Reference*.

`associate-subnet-cidr-block`

The following code example shows how to use `associate-subnet-cidr-block`.

AWS CLI

To associate an IPv6 CIDR block with a subnet

This example associates an IPv6 CIDR block with the specified subnet.

Command:

```
aws ec2 associate-subnet-cidr-block --subnet-id subnet-5f46ec3b --ipv6-cidr-
block 2001:db8:1234:1a00::/64
```

Output:

```
{
  "SubnetId": "subnet-5f46ec3b",
  "Ipv6CidrBlockAssociation": {
      "Ipv6CidrBlock": "2001:db8:1234:1a00::/64",
      "AssociationId": "subnet-cidr-assoc-3aa54053",
      "Ipv6CidrBlockState": {
          "State": "associating"
      }
  }
}
```

- For API details, see AssociateSubnetCidrBlock in *AWS CLI Command Reference*.

`associate-transit-gateway-multicast-domain`

The following code example shows how to use `associate-transit-gateway-multicast-domain`.

AWS CLI

To associate a transit gateway with a multicast domain

The following `associate-transit-gateway-multicast-domain` example associates the specified subnet and attachment with the specified multicast domain.

```
aws ec2 associate-transit-gateway-multicast-domain \
    --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef79d6e597 \
    --transit-gateway-attachment-id tgw-attach-028c1dd0f8f5cbe8e \
    --subnet-ids subnet-000de86e3b49c932a \
    --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef7EXAMPLE
```

Output:

```
{
    "Associations": {
        "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef79d6e597",
        "TransitGatewayAttachmentId": "tgw-attach-028c1dd0f8f5cbe8e",
        "ResourceId": "vpc-01128d2c240c09bd5",
        "ResourceType": "vpc",
```

```
            "Subnets": [
                {
                    "SubnetId": "subnet-000de86e3b49c932a",
                    "State": "associating"
                }
            ]
        }
    }
```

For more information, see [Multicast domains](#) in the *Transit Gateways Guide*.

- For API details, see [AssociateTransitGatewayMulticastDomain](#) in *AWS CLI Command Reference*.

`associate-transit-gateway-route-table`

The following code example shows how to use `associate-transit-gateway-route-table`.

AWS CLI

To associate a transit gateway route table with a transit gateway attachment

The following example associates the specified transit gateway route table with the specified VPC attachment.

```
aws ec2 associate-transit-gateway-route-table \
    --transit-gateway-route-table-id tgw-rtb-002573ed1eEXAMPLE \
    --transit-gateway-attachment-id tgw-attach-0b5968d3b6EXAMPLE
```

Output:

```
{
    "Association": {
        "TransitGatewayRouteTableId": "tgw-rtb-002573ed1eEXAMPLE",
        "TransitGatewayAttachmentId": "tgw-attach-0b5968d3b6EXAMPLE",
        "ResourceId": "vpc-0065acced4EXAMPLE",
        "ResourceType": "vpc",
        "State": "associating"
    }
}
```

For more information, see [Associate a Transit Gateway Route Table](#) in the *AWS Transit Gateways Guide*.

- For API details, see AssociateTransitGatewayRouteTable in *AWS CLI Command Reference*.

`associate-vpc-cidr-block`

The following code example shows how to use `associate-vpc-cidr-block`.

AWS CLI

Example 1: To associate an Amazon-provided IPv6 CIDR block with a VPC

The following `associate-vpc-cidr-block` example associates an IPv6 CIDR block with the specified VPC.:

```
aws ec2 associate-vpc-cidr-block \
    --amazon-provided-ipv6-cidr-block \
    --ipv6-cidr-block-network-border-group us-west-2-lax-1  \
    --vpc-id vpc-8EXAMPLE
```

Output:

```
{
    "Ipv6CidrBlockAssociation": {
        "AssociationId": "vpc-cidr-assoc-0838ce7d9dEXAMPLE",
        "Ipv6CidrBlockState": {
            "State": "associating"
        },
        "NetworkBorderGroup": "us-west-2-lax-1"
    },
    "VpcId": "vpc-8EXAMPLE"
}
```

Example 2:To associate an additional IPv4 CIDR block with a VPC

The following `associate-vpc-cidr-block` example associates the IPv4 CIDR block `10.2.0.0/16` with the specified VPC.

```
aws ec2 associate-vpc-cidr-block \
    --vpc-id vpc-1EXAMPLE \
    --cidr-block 10.2.0.0/16
```

Output:

```
{
    "CidrBlockAssociation": {
        "AssociationId": "vpc-cidr-assoc-2EXAMPLE",
        "CidrBlock": "10.2.0.0/16",
        "CidrBlockState": {
            "State": "associating"
        }
    },
    "VpcId": "vpc-1EXAMPLE"
}
```

- For API details, see AssociateVpcCidrBlock in *AWS CLI Command Reference*.

`attach-classic-link-vpc`

The following code example shows how to use `attach-classic-link-vpc`.

AWS CLI

To link (attach) an EC2-Classic instance to a VPC

This example links instance i-1234567890abcdef0 to VPC vpc-88888888 through the VPC security group sg-12312312.

Command:

```
aws ec2 attach-classic-link-vpc --instance-id  i-1234567890abcdef0 --vpc-id vpc-88888888 --groups sg-12312312
```

Output:

```
{
  "Return": true
}
```

- For API details, see AttachClassicLinkVpc in *AWS CLI Command Reference*.

`attach-internet-gateway`

The following code example shows how to use `attach-internet-gateway`.

AWS CLI

To attach an internet gateway to your VPC

The following `attach-internet-gateway` example attaches the specified internet gateway to the specific VPC.

```
aws ec2 attach-internet-gateway \
    --internet-gateway-id igw-0d0fb496b3EXAMPLE \
    --vpc-id vpc-0a60eb65b4EXAMPLE
```

This command produces no output.

For more information, see Internet gateways in the *Amazon VPC User Guide*.

- For API details, see AttachInternetGateway in *AWS CLI Command Reference*.

`attach-network-interface`

The following code example shows how to use `attach-network-interface`.

AWS CLI

Example 1: To attach a network interface to an instance

The following `attach-network-interface` example attaches the specified network interface to the specified instance.

```
aws ec2 attach-network-interface \
    --network-interface-id eni-0dc56a8d4640ad10a \
    --instance-id i-1234567890abcdef0 \
    --device-index 1
```

Output:

```
{
    "AttachmentId": "eni-attach-01a8fc87363f07cf9"
}
```

For more information, see Elastic network interfaces in the *Amazon EC2 User Guide*.

Example 2: To attach a network interface to an instance with multiple network cards

The following `attach-network-interface` example attaches the specified network interface to the specified instance and network card.

```
aws ec2 attach-network-interface \
    --network-interface-id eni-07483b1897541ad83 \
    --instance-id i-01234567890abcdef \
    --network-card-index 1 \
    --device-index 1
```

Output:

```
{
    "AttachmentId": "eni-attach-0fbd7ee87a88cd06c"
}
```

For more information, see Elastic network interfaces in the *Amazon EC2 User Guide*.

- For API details, see AttachNetworkInterface in *AWS CLI Command Reference*.

`attach-verified-access-trust-provider`

The following code example shows how to use `attach-verified-access-trust-provider`.

AWS CLI

To attach a trust provider to an instance

The following `attach-verified-access-trust-provider` example attaches the specified Verified Access trust provider to the specified Verified Access instance.

```
aws ec2 attach-verified-access-trust-provider \
    --verified-access-instance-id vai-0ce000c0b7643abea \
    --verified-access-trust-provider-id vatp-0bb32de759a3e19e7
```

Output:

```
{
    "VerifiedAccessTrustProvider": {
        "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
        "Description": "",
        "TrustProviderType": "user",
        "UserTrustProviderType": "iam-identity-center",
```

```
            "PolicyReferenceName": "idc",

- For API details, see AttachVerifiedAccessTrustProvider in *AWS CLI Command Reference*.

`attach-volume`

The following code example shows how to use `attach-volume`.

AWS CLI

To attach a volume to an instance

This example command attaches a volume (`vol-1234567890abcdef0`) to an instance (`i-01474ef662b89480`) as `/dev/sdf`.

Command:

```
aws ec2 attach-volume --volume-id vol-1234567890abcdef0 --instance-
id i-01474ef662b89480 --device /dev/sdf
```

Output:

```
{
    "AttachTime": "YYYY-MM-DDTHH:MM:SS.000Z",
```

```
    "InstanceId": "i-01474ef662b89480",
    "VolumeId": "vol-1234567890abcdef0",
    "State": "attaching",
    "Device": "/dev/sdf"
}
```

- For API details, see AttachVolume in *AWS CLI Command Reference*.

`attach-vpn-gateway`

The following code example shows how to use `attach-vpn-gateway`.

AWS CLI

To attach a virtual private gateway to your VPC

The following `attach-vpn-gateway` example attaches the specified virtual private gateway to the specified VPC.

```
aws ec2 attach-vpn-gateway \
    --vpn-gateway-id vgw-9a4cacf3 \
    --vpc-id vpc-a01106c2
```

Output:

```
{
    "VpcAttachment": {
        "State": "attaching",
        "VpcId": "vpc-a01106c2"
    }
}
```

- For API details, see AttachVpnGateway in *AWS CLI Command Reference*.

`authorize-client-vpn-ingress`

The following code example shows how to use `authorize-client-vpn-ingress`.

AWS CLI

To add an authorization rule for a Client VPN endpoint

The following `authorize-client-vpn-ingress` example adds an ingress authorization rule that permits all clients to access the internet (`0.0.0.0/0`).

```
aws ec2 authorize-client-vpn-ingress \
    --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \
    --target-network-cidr 0.0.0.0/0 \
    --authorize-all-groups
```

Output:

```
{
    "Status": {
        "Code": "authorizing"
    }
}
```

For more information, see Authorization Rules in the *AWS Client VPN Administrator Guide*.

- For API details, see AuthorizeClientVpnIngress in *AWS CLI Command Reference*.

`authorize-security-group-egress`

The following code example shows how to use `authorize-security-group-egress`.

AWS CLI

Example 1: To add a rule that allows outbound traffic to a specific address range

The following `authorize-security-group-egress` example adds a rule that grants access to the specified address ranges on TCP port 80.

```
aws ec2 authorize-security-group-egress \
    --group-id sg-1234567890abcdef0 \
    --ip-permissions
 'IpProtocol=tcp,FromPort=80,ToPort=80,IpRanges=[{CidrIp=10.0.0.0/16}]'
```

Output:

```
{
    "Return": true,
```

```
    "SecurityGroupRules": [
        {
            "SecurityGroupRuleId": "sgr-0b15794cdb17bf29c",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": true,
            "IpProtocol": "tcp",
            "FromPort": 80,
            "ToPort": 80,
            "CidrIpv4": "10.0.0.0/16"
        }
    ]
}
```

Example 2: To add a rule that allows outbound traffic to a specific security group

The following `authorize-security-group-egress` example adds a rule that grants access to the specified security group on TCP port 80.

```
aws ec2 authorize-security-group-egress \
    --group-id sg-1234567890abcdef0 \
    --ip-permissions
 'IpProtocol=tcp,FromPort=80,ToPort=80,UserIdGroupPairs=[{GroupId=sg-0aad1c26bbeec5c22}]'
```

Output:

```
{
    "Return": true,
    "SecurityGroupRules": [
        {
            "SecurityGroupRuleId": "sgr-0b5dd815afcea9cc3",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": true,
            "IpProtocol": "tcp",
            "FromPort": 80,
            "ToPort": 80,
            "ReferencedGroupInfo": {
                "GroupId": "sg-0aad1c26bbeec5c22",
                "UserId": "123456789012"
            }
        }
```

```
    ]
}
```

For more information, see Security groups in the *Amazon VPC User Guide*.

- For API details, see AuthorizeSecurityGroupEgress in *AWS CLI Command Reference*.

`authorize-security-group-ingress`

The following code example shows how to use `authorize-security-group-ingress`.

AWS CLI

Example 1: To add a rule that allows inbound SSH traffic

The following `authorize-security-group-ingress` example adds a rule that allows inbound traffic on TCP port 22 (SSH).

```
aws ec2 authorize-security-group-ingress \
    --group-id sg-1234567890abcdef0 \
    --protocol tcp \
    --port 22 \
    --cidr 203.0.113.0/24
```

Output:

```
{
    "Return": true,
    "SecurityGroupRules": [
        {
            "SecurityGroupRuleId": "sgr-01afa97ef3e1bedfc",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": false,
            "IpProtocol": "tcp",
            "FromPort": 22,
            "ToPort": 22,
            "CidrIpv4": "203.0.113.0/24"
        }
    ]
}
```

Example 2: To add a rule that allows inbound HTTP traffic from another security group

The following `authorize-security-group-ingress` example adds a rule that allows inbound access on TCP port 80 from the source security group `sg-1a2b3c4d`. The source group must be in the same VPC or in a peer VPC (requires a VPC peering connection). Incoming traffic is allowed based on the private IP addresses of instances that are associated with the source security group (not the public IP address or Elastic IP address).

```
aws ec2 authorize-security-group-ingress \
    --group-id sg-1234567890abcdef0 \
    --protocol tcp \
    --port 80 \
    --source-group sg-1a2b3c4d
```

Output:

```
{
    "Return": true,
    "SecurityGroupRules": [
        {
            "SecurityGroupRuleId": "sgr-01f4be99110f638a7",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": false,
            "IpProtocol": "tcp",
            "FromPort": 80,
            "ToPort": 80,
            "ReferencedGroupInfo": {
                "GroupId": "sg-1a2b3c4d",
                "UserId": "123456789012"
            }
        }
    ]
}
```

Example 3: To add multiple rules in the same call

The following `authorize-security-group-ingress` example uses the `ip-permissions` parameter to add two inbound rules, one that enables inbound access on TCP port 3389 (RDP) and the other that enables ping/ICMP.

```
aws ec2 authorize-security-group-ingress \
```

```
    --group-id sg-1234567890abcdef0 \
    --ip-permissions
 'IpProtocol=tcp,FromPort=3389,ToPort=3389,IpRanges=[{CidrIp=172.31.0.0/16}]'
 'IpProtocol=icmp,FromPort=-1,ToPort=-1,IpRanges=[{CidrIp=172.31.0.0/16}]'
```

Output:

```
{
    "Return": true,
    "SecurityGroupRules": [
        {
            "SecurityGroupRuleId": "sgr-00e06e5d3690f29f3",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": false,
            "IpProtocol": "tcp",
            "FromPort": 3389,
            "ToPort": 3389,
            "CidrIpv4": "172.31.0.0/16"
        },
        {
            "SecurityGroupRuleId": "sgr-0a133dd4493944b87",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": false,
            "IpProtocol": "tcp",
            "FromPort": -1,
            "ToPort": -1,
            "CidrIpv4": "172.31.0.0/16"
        }
    ]
}
```

Example 4: To add a rule for ICMP traffic

The following `authorize-security-group-ingress` example uses the `ip-permissions` parameter to add an inbound rule that allows the ICMP message `Destination Unreachable: Fragmentation Needed and Don't Fragment was Set` (Type 3, Code 4) from anywhere.

```
aws ec2 authorize-security-group-ingress \
    --group-id sg-1234567890abcdef0 \
```

```
    --ip-permissions
 'IpProtocol=icmp,FromPort=3,ToPort=4,IpRanges=[{CidrIp=0.0.0.0/0}]'
```

Output:

```
{
    "Return": true,
    "SecurityGroupRules": [
        {
            "SecurityGroupRuleId": "sgr-0de3811019069b787",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": false,
            "IpProtocol": "icmp",
            "FromPort": 3,
            "ToPort": 4,
            "CidrIpv4": "0.0.0.0/0"
        }
    ]
}
```

Example 5: To add a rule for IPv6 traffic

The following `authorize-security-group-ingress` example uses the `ip-permissions` parameter to add an inbound rule that allows SSH access (port 22) from the IPv6 range `2001:db8:1234:1a00::/64`.

```
aws ec2 authorize-security-group-ingress \
    --group-id sg-1234567890abcdef0 \
    --ip-permissions
 'IpProtocol=tcp,FromPort=22,ToPort=22,Ipv6Ranges=[{CidrIpv6=2001:db8:1234:1a00::/64}]'
```

Output:

```
{
    "Return": true,
    "SecurityGroupRules": [
        {
            "SecurityGroupRuleId": "sgr-0455bc68b60805563",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": false,
```

```
                "IpProtocol": "tcp",
                "FromPort": 22,
                "ToPort": 22,
                "CidrIpv6": "2001:db8:1234:1a00::/64"
            }
        ]
}
```

Example 6: To add a rule for ICMPv6 traffic

The following `authorize-security-group-ingress` example uses the `ip-permissions` parameter to add an inbound rule that allows ICMPv6 traffic from anywhere.

```
aws ec2 authorize-security-group-ingress \
    --group-id sg-1234567890abcdef0 \
    --ip-permissions 'IpProtocol=icmpv6,Ipv6Ranges=[{CidrIpv6=::/0}]'
```

Output:

```
{
    "Return": true,
    "SecurityGroupRules": [
        {
            "SecurityGroupRuleId": "sgr-04b612d9363ab6327",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": false,
            "IpProtocol": "icmpv6",
            "FromPort": -1,
            "ToPort": -1,
            "CidrIpv6": "::/0"
        }
    ]
}
```

Example 7: Add a rule with a description

The following `authorize-security-group-ingress` example uses the `ip-permissions` parameter to add an inbound rule that allows RDP traffic from the specified IPv4 address range. The rule includes a description to help you identify it later.

```
aws ec2 authorize-security-group-ingress \
```

```
    --group-id sg-1234567890abcdef0 \
    --ip-permissions
 'IpProtocol=tcp,FromPort=3389,ToPort=3389,IpRanges=[{CidrIp=203.0.113.0/24,Description='RDP
 office'}]'
```

Output:

```
{
    "Return": true,
    "SecurityGroupRules": [
        {
            "SecurityGroupRuleId": "sgr-0397bbcc01e974db3",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": false,
            "IpProtocol": "tcp",
            "FromPort": 3389,
            "ToPort": 3389,
            "CidrIpv4": "203.0.113.0/24",
            "Description": "RDP access from NY office"
        }
    ]
}
```

Example 8: To add an inbound rule that uses a prefix list

The following `authorize-security-group-ingress` example uses the `ip-permissions` parameter to add an inbound rule that allows all traffic for the CIDR ranges in the specified prefix list.

```
aws ec2 authorize-security-group-ingress \
    --group-id sg-04a351bfe432d4e71 \
    --ip-permissions
 'IpProtocol=all,PrefixListIds=[{PrefixListId=pl-002dc3ec097de1514}]'
```

Output:

```
{
    "Return": true,
    "SecurityGroupRules": [
        {
            "SecurityGroupRuleId": "sgr-09c74b32f677c6c7c",
```

```
                "GroupId": "sg-1234567890abcdef0",
                "GroupOwnerId": "123456789012",
                "IsEgress": false,
                "IpProtocol": "-1",
                "FromPort": -1,
                "ToPort": -1,
                "PrefixListId": "pl-0721453c7ac4ec009"
            }
        ]
}
```

For more information, see Security groups in the *Amazon VPC User Guide*.

- For API details, see AuthorizeSecurityGroupIngress in *AWS CLI Command Reference*.

`bundle-instance`

The following code example shows how to use `bundle-instance`.

AWS CLI

To bundle an instance

This example bundles instance `i-1234567890abcdef0` to a bucket called `bundletasks`. Before you specify values for your access key IDs, review and follow the guidance in Best Practices for Managing AWS Access Keys.

Command:

```
aws ec2 bundle-instance --instance-id i-1234567890abcdef0 --bucket bundletasks --
prefix winami --owner-akid AK12AJEXAMPLE --owner-sak example123example
```

Output:

```
{
  "BundleTask": {
    "UpdateTime": "2015-09-15T13:30:35.000Z",
    "InstanceId": "i-1234567890abcdef0",
    "Storage": {
      "S3": {
        "Prefix": "winami",
        "Bucket": "bundletasks"
      }
```

```
    },
    "State": "pending",
    "StartTime": "2015-09-15T13:30:35.000Z",
    "BundleId": "bun-294e041f"
  }
}
```

- For API details, see BundleInstance in *AWS CLI Command Reference*.

`cancel-bundle-task`

The following code example shows how to use `cancel-bundle-task`.

AWS CLI

To cancel a bundle task

This example cancels bundle task `bun-2a4e041c`.

Command:

```
aws ec2 cancel-bundle-task --bundle-id bun-2a4e041c
```

Output:

```
{
  "BundleTask": {
    "UpdateTime": "2015-09-15T13:27:40.000Z",
    "InstanceId": "i-1234567890abcdef0",
    "Storage": {
      "S3": {
        "Prefix": "winami",
        "Bucket": "bundletasks"
      }
    },
    "State": "cancelling",
    "StartTime": "2015-09-15T13:24:35.000Z",
    "BundleId": "bun-2a4e041c"
  }
}
```

- For API details, see CancelBundleTask in *AWS CLI Command Reference*.

`cancel-capacity-reservation-fleets`

The following code example shows how to use `cancel-capacity-reservation-fleets`.

AWS CLI

To cancel a Capacity Reservation Fleet

The following `cancel-capacity-reservation-fleets` example cancels the specified Capacity Reservation Fleet and the capacity it reserves. When you cancel a Fleet, its status changes to `cancelled`, and it can no longer create new Capacity Reservations. Additionally, all of the individual Capacity Reservations in the Fleet are cancelled, and the instances that were previously running in the reserved capacity continue to run normally in shared capacity.

```
aws ec2 cancel-capacity-reservation-fleets \
    --capacity-reservation-fleet-ids crf-abcdef01234567890
```

Output:

```
{
    "SuccessfulFleetCancellations": [
        {
            "CurrentFleetState": "cancelling",
            "PreviousFleetState": "active",
            "CapacityReservationFleetId": "crf-abcdef01234567890"
        }
    ],
    "FailedFleetCancellations": []
}
```

For more information about Capacity Reservation Fleets, see Capacity Reservation Fleets in the *Amazon EC2 User Guide*.

- For API details, see CancelCapacityReservationFleets in *AWS CLI Command Reference*.

`cancel-capacity-reservation`

The following code example shows how to use `cancel-capacity-reservation`.

AWS CLI

To cancel a capacity reservation

The following `cancel-capacity-reservation` example cancels the specified capacity reservation.

```
aws ec2 cancel-capacity-reservation \
    --capacity-reservation-id cr-1234abcd56EXAMPLE
```

Output:

```
{
    "Return": true
}
```

For more information, see Cancel a Capacity Reservation in the *Amazon EC2 User Guide*.

- For API details, see CancelCapacityReservation in *AWS CLI Command Reference*.

`cancel-conversion-task`

The following code example shows how to use `cancel-conversion-task`.

AWS CLI

To cancel an active conversion of an instance or a volume

This example cancels the upload associated with the task ID import-i-fh95npoc. If the command succeeds, no output is returned.

Command:

```
aws ec2 cancel-conversion-task --conversion-task-id import-i-fh95npoc
```

- For API details, see CancelConversionTask in *AWS CLI Command Reference*.

`cancel-export-task`

The following code example shows how to use `cancel-export-task`.

AWS CLI

To cancel an active export task

This example cancels an active export task with the task ID export-i-fgelt0i7. If the command succeeds, no output is returned.

Command:

```
aws ec2 cancel-export-task --export-task-id export-i-fgelt0i7
```

- For API details, see CancelExportTask in *AWS CLI Command Reference*.

`cancel-image-launch-permission`

The following code example shows how to use `cancel-image-launch-permission`.

AWS CLI

To cancel having an AMI shared with your Amazon Web Services account

The following `cancel-image-launch-permission` example removes your account from the specified AMI's launch permissions.

```
aws ec2 cancel-image-launch-permission \
    --image-id ami-0123456789example \
    --region us-east-1
```

Output:

```
{
    "Return": true
}
```

For more information, see Cancel having an AMI shared with your Amazon Web Services account in the *Amazon EC2 User Guide*.

- For API details, see CancelImageLaunchPermission in *AWS CLI Command Reference*.

`cancel-import-task`

The following code example shows how to use `cancel-import-task`.

AWS CLI

To cancel an import task

The following `cancel-import-task` example cancels the specified import image task.

```
aws ec2 cancel-import-task \
    --import-task-id import-ami-1234567890abcdef0
```

Output:

```
{
    "ImportTaskId": "import-ami-1234567890abcdef0",
    "PreviousState": "active",
    "State": "deleting"
}
```

- For API details, see CancelImportTask in *AWS CLI Command Reference*.

cancel-reserved-instances-listing

The following code example shows how to use `cancel-reserved-instances-listing`.

AWS CLI

To cancel a Reserved Instance listing

The following `cancel-reserved-instances-listing` example cancels the specified Reserved Instance listing.

```
aws ec2 cancel-reserved-instances-listing \
    --reserved-instances-listing-id 5ec28771-05ff-4b9b-aa31-9e57dexample
```

- For API details, see CancelReservedInstancesListing in *AWS CLI Command Reference*.

cancel-spot-fleet-requests

The following code example shows how to use `cancel-spot-fleet-requests`.

AWS CLI

Example 1: To cancel a Spot fleet request and terminate the associated instances

The following `cancel-spot-fleet-requests` example cancels a Spot Fleet request and terminates the associated On-Demand Instances and Spot Instances.

```
aws ec2 cancel-spot-fleet-requests \
    --spot-fleet-request-ids sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE \
    --terminate-instances
```

Output:

```
{
    "SuccessfulFleetRequests": [
        {
            "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE",
            "CurrentSpotFleetRequestState": "cancelled_terminating",
            "PreviousSpotFleetRequestState": "active"
        }
    ],
    "UnsuccessfulFleetRequests": []
}
```

Example 2: To cancel a Spot fleet request without terminating the associated instances

The following `cancel-spot-fleet-requests` example cancels a Spot Fleet request without terminating the associated On-Demand Instances and Spot Instances.

```
aws ec2 cancel-spot-fleet-requests \
    --spot-fleet-request-ids sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE \
    --no-terminate-instances
```

Output:

```
{
    "SuccessfulFleetRequests": [
        {
            "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE",
            "CurrentSpotFleetRequestState": "cancelled_running",
            "PreviousSpotFleetRequestState": "active"
        }
    ],
    "UnsuccessfulFleetRequests": []
}
```

For more information, see Cancel a Spot Fleet request in the *Amazon EC2 User Guide*.

- For API details, see CancelSpotFleetRequests in *AWS CLI Command Reference*.

`cancel-spot-instance-requests`

The following code example shows how to use `cancel-spot-instance-requests`.

AWS CLI

To cancel Spot Instance requests

This example command cancels a Spot Instance request.

Command:

```
aws ec2 cancel-spot-instance-requests --spot-instance-request-ids sir-08b93456
```

Output:

```
{
    "CancelledSpotInstanceRequests": [
        {
            "State": "cancelled",
            "SpotInstanceRequestId": "sir-08b93456"
        }
    ]
}
```

- For API details, see CancelSpotInstanceRequests in *AWS CLI Command Reference*.

`confirm-product-instance`

The following code example shows how to use `confirm-product-instance`.

AWS CLI

To confirm the product instance

This example determines whether the specified product code is associated with the specified instance.

Command:

```
aws ec2 confirm-product-instance --product-code 774F4FF8 --instance-
id i-1234567890abcdef0
```

Output:

```
{
  "OwnerId": "123456789012"
}
```

- For API details, see ConfirmProductInstance in *AWS CLI Command Reference*.

`copy-fpga-image`

The following code example shows how to use `copy-fpga-image`.

AWS CLI

To copy an Amazon FPGA image

This example copies the specified AFI from the `us-east-1` region to the current region (`eu-west-1`).

Command:

```
aws ec2 copy-fpga-image --name copy-afi --source-fpga-image-id afi-0d123e123bfc85abc
 --source-region us-east-1 --region eu-west-1
```

Output:

```
{
  "FpgaImageId": "afi-06b12350a123fbabc"
}
```

- For API details, see CopyFpgaImage in *AWS CLI Command Reference*.

`copy-image`

The following code example shows how to use `copy-image`.

AWS CLI

Example 1: To copy an AMI to another Region

The following `copy-image` example command copies the specified AMI from the `us-west-2` Region to the `us-east-1` Region and adds a short description.

```
aws ec2 copy-image \
    --region us-east-1 \
    --name ami-name \
    --source-region us-west-2 \
    --source-image-id ami-066877671789bd71b \
    --description "This is my copied image."
```

Output:

```
{
    "ImageId": "ami-0123456789abcdefg"
}
```

For more information, see Copy an AMI in the *Amazon EC2 User Guide*.

Example 2: To copy an AMI to another Region and encrypt the backing snapshot

The following `copy-image` command copies the specified AMI from the `us-west-2` Region to the current Region and encrypts the backing snapshot using the specified KMS key.

```
aws ec2 copy-image \
    --source-region us-west-2 \
    --name ami-name \
    --source-image-id ami-066877671789bd71b \
    --encrypted \
    --kms-key-id alias/my-kms-key
```

Output:

```
{
    "ImageId": "ami-0123456789abcdefg"
}
```

For more information, see Copy an AMI in the *Amazon EC2 User Guide*.

Example 3: To include your user-defined AMI tags when copying an AMI

The following `copy-image` command uses the `--copy-image-tags` parameter to copy your user-defined AMI tags when copying the AMI.

```
aws ec2 copy-image \
    --region us-east-1 \
    --name ami-name \
    --source-region us-west-2 \
    --source-image-id ami-066877671789bd71b \
    --description "This is my copied image." 
    --copy-image-tags
```

Output:

```
{
    "ImageId": "ami-0123456789abcdefg"
}
```

For more information, see Copy an AMI in the *Amazon EC2 User Guide*.

- For API details, see CopyImage in *AWS CLI Command Reference*.

`copy-snapshot`

The following code example shows how to use `copy-snapshot`.

AWS CLI

Example 1: To copy a snapshot to another Region

The following `copy-snapshot` example command copies the specified snapshot from the `us-west-2` Region to the `us-east-1` Region and adds a short description.

```
aws ec2 copy-snapshot \
    --region us-east-1 \
    --source-region us-west-2 \
    --source-snapshot-id snap-066877671789bd71b \
    --description 'This is my copied snapshot.'
```

Output:

```
{
```

```
    "SnapshotId": "snap-066877671789bd71b"
}
```

Example 2: To copy an unencrypted snapshot and encrypt the new snapshot

The following `copy-snapshot` command copies the specified unencrypted snapshot from the `us-west-2` Region to the current Region and encrypts the new snapshot using the specified KMS key.

```
aws ec2 copy-snapshot \
    --source-region us-west-2 \
    --source-snapshot-id snap-066877671789bd71b \
    --encrypted \
    --kms-key-id alias/my-kms-key
```

Output:

```
{
    "SnapshotId": "snap-066877671789bd71b"
}
```

For more information, see Copy an Amazon EBS snapshot in the *Amazon EBS User Guide*.

- For API details, see CopySnapshot in *AWS CLI Command Reference*.

`create-capacity-reservation-fleet`

The following code example shows how to use `create-capacity-reservation-fleet`.

AWS CLI

To create a Capacity Reservation Fleet

The following `create-capacity-reservation-fleet` example creates a Capacity Reservation Fleet for the instance type specified in the request, up to the specified total target capacity. The number of instances for which the Capacity Reservation Fleet reserves capacity depends on the total target capacity and instance type weights that you specify in the request. Specify the instance types to use and a priority for each of the designated instance types.

```
aws ec2 create-capacity-reservation-fleet \
--total-target-capacity 24 \
```

```
--allocation-strategy prioritized \
--instance-match-criteria open \
--tenancy default \
--end-date 2022-12-31T23:59:59.000Z \
--instance-type-specifications file://instanceTypeSpecification.json
```

Contents of `instanceTypeSpecification.json`:

```
[
    {
        "InstanceType": "m5.xlarge",
        "InstancePlatform": "Linux/UNIX",
        "Weight": 3.0,
        "AvailabilityZone":"us-east-1a",
        "EbsOptimized": true,
        "Priority" : 1
    }
]
```

Output:

```
{
    "Status": "submitted",
    "TotalFulfilledCapacity": 0.0,
    "CapacityReservationFleetId": "crf-abcdef01234567890",
    "TotalTargetCapacity": 24
}
```

For more information about Capacity Reservation Fleets, see Capacity Reservation Fleets in the *Amazon EC2 User Guide*.

For more information about instance type weight and total target capacity, see Instance type weight and Total target capacity in the *Amazon EC2 User Guide*.

For more information about designating priority for specified instance types, see Allocation strategy and Instance type priority in the *Amazon EC2 User Guide*.

- For API details, see CreateCapacityReservationFleet in *AWS CLI Command Reference*.

`create-capacity-reservation`

The following code example shows how to use `create-capacity-reservation`.

AWS CLI

Example 1: To create a Capacity Reservation

The following `create-capacity-reservation` example creates a capacity reservation in the `eu-west-1a` Availability Zone, into which you can launch three `t2.medium` instances running a Linux/Unix operating system. By default, the capacity reservation is created with open instance matching criteria and no support for ephemeral storage, and it remains active until you manually cancel it.

```
aws ec2 create-capacity-reservation \
    --availability-zone eu-west-1a \
    --instance-type t2.medium \
    --instance-platform Linux/UNIX \
    --instance-count 3
```

Output:

```
{
    "CapacityReservation": {
        "CapacityReservationId": "cr-1234abcd56EXAMPLE ",
        "EndDateType": "unlimited",
        "AvailabilityZone": "eu-west-1a",
        "InstanceMatchCriteria": "open",
        "EphemeralStorage": false,
        "CreateDate": "2019-08-16T09:27:35.000Z",
        "AvailableInstanceCount": 3,
        "InstancePlatform": "Linux/UNIX",
        "TotalInstanceCount": 3,
        "State": "active",
        "Tenancy": "default",
        "EbsOptimized": false,
        "InstanceType": "t2.medium"
    }
}
```

Example 2: To create a Capacity Reservation that automatically ends at a specified date/time

The following `create-capacity-reservation` example creates a capacity reservation in the `eu-west-1a` Availability Zone, into which you can launch three `m5.large` instances running a

Linux/Unix operating system. This capacity reservation automatically ends on 08/31/2019 at 23:59:59.

```
aws ec2 create-capacity-reservation \
    --availability-zone eu-west-1a \
    --instance-type m5.large \
    --instance-platform Linux/UNIX \
    --instance-count 3 \
    --end-date-type limited \
    --end-date 2019-08-31T23:59:59Z
```

Output:

```
{
    "CapacityReservation": {
        "CapacityReservationId": "cr-1234abcd56EXAMPLE ",
        "EndDateType": "limited",
        "AvailabilityZone": "eu-west-1a",
        "EndDate": "2019-08-31T23:59:59.000Z",
        "InstanceMatchCriteria": "open",
        "EphemeralStorage": false,
        "CreateDate": "2019-08-16T10:15:53.000Z",
        "AvailableInstanceCount": 3,
        "InstancePlatform": "Linux/UNIX",
        "TotalInstanceCount": 3,
        "State": "active",
        "Tenancy": "default",
        "EbsOptimized": false,
        "InstanceType": "m5.large"
    }
}
```

Example 3: To create a Capacity Reservation that accepts only targeted instance launches

The following `create-capacity-reservation` example creates a capacity reservation that accepts only targeted instance launches.

```
aws ec2 create-capacity-reservation \
    --availability-zone eu-west-1a \
    --instance-type m5.large \
    --instance-platform Linux/UNIX \
    --instance-count 3 \
```

```
    --instance-match-criteria targeted
```

Output:

```
{
    "CapacityReservation": {
        "CapacityReservationId": "cr-1234abcd56EXAMPLE ",
        "EndDateType": "unlimited",
        "AvailabilityZone": "eu-west-1a",
        "InstanceMatchCriteria": "targeted",
        "EphemeralStorage": false,
        "CreateDate": "2019-08-16T10:21:57.000Z",
        "AvailableInstanceCount": 3,
        "InstancePlatform": "Linux/UNIX",
        "TotalInstanceCount": 3,
        "State": "active",
        "Tenancy": "default",
        "EbsOptimized": false,
        "InstanceType": "m5.large"
    }
}
```

For more information, see Create a Capacity Reservation in the *Amazon EC2 User Guide*.

- For API details, see CreateCapacityReservation in *AWS CLI Command Reference*.

`create-carrier-gateway`

The following code example shows how to use `create-carrier-gateway`.

AWS CLI

To create a carrier gateway

The following `create-carrier-gateway` example creates a carrier gateway for the specified VPC.

```
aws ec2 create-carrier-gateway \
    --vpc-id vpc-0c529aEXAMPLE1111
```

Output:

```
{
    "CarrierGateway": {
        "CarrierGatewayId": "cagw-0465cdEXAMPLE1111",
        "VpcId": "vpc-0c529aEXAMPLE1111",
        "State": "pending",
        "OwnerId": "123456789012"
    }
}
```

For more information, see Carrier gateways in the *AWS Wavelength User Guide*.

- For API details, see CreateCarrierGateway in *AWS CLI Command Reference*.

`create-client-vpn-endpoint`

The following code example shows how to use `create-client-vpn-endpoint`.

AWS CLI

To create a Client VPN endpoint

The following `create-client-vpn-endpoint` example creates a Client VPN endpoint that uses mutual authentication and specifies a value for the client CIDR block.

```
aws ec2 create-client-vpn-endpoint \
    --client-cidr-block "172.31.0.0/16" \
    --server-certificate-arn arn:aws:acm:ap-south-1:123456789012:certificate/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE \
    --authentication-options Type=certificate-
authentication,MutualAuthentication={ClientRootCertificateChainArn=arn:aws:acm:ap-
south-1:123456789012:certificate/a1b2c3d4-5678-90ab-cdef-22222EXAMPLE} \
    --connection-log-options Enabled=false
```

Output:

```
{
    "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
    "Status": {
        "Code": "pending-associate"
    },
    "DnsName": "cvpn-endpoint-123456789123abcde.prod.clientvpn.ap-
south-1.amazonaws.com"
```

```
}
```

For more information, see Client VPN Endpoints in the *AWS Client VPN Administrator Guide*.

- For API details, see CreateClientVpnEndpoint in *AWS CLI Command Reference*.

create-client-vpn-route

The following code example shows how to use `create-client-vpn-route`.

AWS CLI

To create a route for a Client VPN endpoint

The following `create-client-vpn-route` example adds a route to the internet (`0.0.0.0/0`) for the specified subnet of the Client VPN endpoint.

```
aws ec2 create-client-vpn-route \
    --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \
    --destination-cidr-block 0.0.0.0/0  \
    --target-vpc-subnet-id subnet-0123456789abcabca
```

Output:

```
{
    "Status": {
        "Code": "creating"
    }
}
```

For more information, see Routes in the *AWS Client VPN Administrator Guide*.

- For API details, see CreateClientVpnRoute in *AWS CLI Command Reference*.

create-coip-cidr

The following code example shows how to use `create-coip-cidr`.

AWS CLI

To create a range of customer-owned IP (CoIP) addresses

The following `create-coip-cidr` example creates the specified range of CoIP addresses in the specified CoIP pool.

```
aws ec2 create-coip-cidr \
    --cidr 15.0.0.0/24 \
    --coip-pool-id ipv4pool-coip-1234567890abcdefg
```

Output:

```
{
    "CoipCidr": {
        "Cidr": "15.0.0.0/24",
        "CoipPoolId": "ipv4pool-coip-1234567890abcdefg",
        "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890"
    }
}
```

For more information, see Customer-owned IP addresses in the *AWS Outposts User Guide*.

- For API details, see CreateCoipCidr in *AWS CLI Command Reference*.

`create-coip-pool`

The following code example shows how to use `create-coip-pool`.

AWS CLI

To create a pool of customer-owned IP (CoIP) addresses

The following `create-coip-pool` example creates a CoIP pool for CoIP addresses in the specified local gateway route table.

```
aws ec2 create-coip-pool \
    --local-gateway-route-table-id lgw-rtb-abcdefg1234567890
```

Output:

```
{
    "CoipPool": {
        "PoolId": "ipv4pool-coip-1234567890abcdefg",
```

```
        "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890",
        "PoolArn": "arn:aws:ec2:us-west-2:123456789012:coip-pool/ipv4pool-
coip-1234567890abcdefg"
    }
}
```

For more information, see Customer-owned IP addresses in the *AWS Outposts User Guide*.

- For API details, see CreateCoipPool in *AWS CLI Command Reference*.

`create-customer-gateway`

The following code example shows how to use `create-customer-gateway`.

AWS CLI

To create a customer gateway

This example creates a customer gateway with the specified IP address for its outside interface.

Command:

```
aws ec2 create-customer-gateway --type ipsec.1 --public-ip 12.1.2.3 --bgp-asn 65534
```

Output:

```
{
    "CustomerGateway": {
        "CustomerGatewayId": "cgw-0e11f167",
        "IpAddress": "12.1.2.3",
        "State": "available",
        "Type": "ipsec.1",
        "BgpAsn": "65534"
    }
}
```

- For API details, see CreateCustomerGateway in *AWS CLI Command Reference*.

`create-default-subnet`

The following code example shows how to use `create-default-subnet`.

AWS CLI

To create a default subnet

This example creates a default subnet in Availability Zone `us-east-2a`.

Command:

```
aws ec2 create-default-subnet --availability-zone us-east-2a

{
   "Subnet": {
       "AvailabilityZone": "us-east-2a",
       "Tags": [],
       "AvailableIpAddressCount": 4091,
       "DefaultForAz": true,
       "Ipv6CidrBlockAssociationSet": [],
       "VpcId": "vpc-1a2b3c4d",
       "State": "available",
       "MapPublicIpOnLaunch": true,
       "SubnetId": "subnet-1122aabb",
       "CidrBlock": "172.31.32.0/20",
       "AssignIpv6AddressOnCreation": false
   }
 }
```

- For API details, see CreateDefaultSubnet in *AWS CLI Command Reference*.

`create-default-vpc`

The following code example shows how to use `create-default-vpc`.

AWS CLI

To create a default VPC

This example creates a default VPC.

Command:

```
aws ec2 create-default-vpc
```

Output:

```
{
   "Vpc": {
       "VpcId": "vpc-8eaae5ea",
       "InstanceTenancy": "default",
       "Tags": [],
       "Ipv6CidrBlockAssociationSet": [],
       "State": "pending",
       "DhcpOptionsId": "dopt-af0c32c6",
       "CidrBlock": "172.31.0.0/16",
       "IsDefault": true
   }
 }
```

- For API details, see CreateDefaultVpc in *AWS CLI Command Reference*.

`create-dhcp-options`

The following code example shows how to use `create-dhcp-options`.

AWS CLI

To create a set of DHCP options

The following `create-dhcp-options` example creates a set of DHCP options that specifies the domain name, the domain name servers, and the NetBIOS node type.

```
aws ec2 create-dhcp-options \
    --dhcp-configuration \
        "Key=domain-name-servers,Values=10.2.5.1,10.2.5.2" \
        "Key=domain-name,Values=example.com" \
        "Key=netbios-node-type,Values=2"
```

Output:

```
{
    "DhcpOptions": {
        "DhcpConfigurations": [
            {
                "Key": "domain-name",
```

```
                    "Values": [
                        {
                            "Value": "example.com"
                        }
                    ]
                },
                {
                    "Key": "domain-name-servers",
                    "Values": [
                        {
                            "Value": "10.2.5.1"
                        },
                        {
                            "Value": "10.2.5.2"
                        }
                    ]
                },
                {
                    "Key": "netbios-node-type",
                    "Values": [
                        {
                            "Value": "2"
                        }
                    ]
                }
            ],
            "DhcpOptionsId": "dopt-06d52773eff4c55f3"
        }
}
```

- For API details, see CreateDhcpOptions in *AWS CLI Command Reference*.

`create-egress-only-internet-gateway`

The following code example shows how to use `create-egress-only-internet-gateway`.

AWS CLI

To create an egress-only Internet gateway

This example creates an egress-only Internet gateway for the specified VPC.

Command:

```
aws ec2 create-egress-only-internet-gateway --vpc-id vpc-0c62a468
```

Output:

```
{
  "EgressOnlyInternetGateway": {
      "EgressOnlyInternetGatewayId": "eigw-015e0e244e24dfe8a",
      "Attachments": [
          {
              "State": "attached",
              "VpcId": "vpc-0c62a468"
          }
      ]
  }
}
```

- For API details, see CreateEgressOnlyInternetGateway in *AWS CLI Command Reference*.

`create-fleet`

The following code example shows how to use `create-fleet`.

AWS CLI

Example 1: To create an EC2 Fleet that launches Spot Instances as the default purchasing model

The following `create-fleet` example creates an EC2 Fleet using the minimum parameters required to launch a fleet: a launch template, target capacity, and default purchasing model. The launch template is identified by its launch template ID and version number. The target capacity for the fleet is 2 instances, and the default purchasing model is `spot`, which results in the fleet launching 2 Spot Instances.

When you create an EC2 Fleet, use a JSON file to specify information about the instances to launch.

```
aws ec2 create-fleet \
    --cli-input-json file://file_name.json
```

Contents of file_name.json:

```
{
    "LaunchTemplateConfigs": [
    {
        "LaunchTemplateSpecification": {
        "LaunchTemplateId": "lt-0e8c754449b27161c",
        "Version": "1"
        }
    }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 2,
        "DefaultTargetCapacityType": "spot"
    }
}
```

Output:

```
{
    "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
}
```

Example 2: To create an EC2 Fleet that launches On-Demand Instances as the default purchasing model

The following `create-fleet` example creates an EC2 Fleet using the minimum parameters required to launch a fleet: a launch template, target capacity, and default purchasing model. The launch template is identified by its launch template ID and version number. The target capacity for the fleet is 2 instances, and the default purchasing model is `on-demand`, which results in the fleet launching 2 On-Demand Instances.

When you create an EC2 Fleet, use a JSON file to specify information about the instances to launch.

```
aws ec2 create-fleet \
    --cli-input-json file://file_name.json
```

Contents of file_name.json:

```
{
    "LaunchTemplateConfigs": [
```

```
    {
        "LaunchTemplateSpecification": {
        "LaunchTemplateId": "lt-0e8c754449b27161c",
        "Version": "1"
        }
    }
    ],
    "TargetCapacitySpecification": {
    "TotalTargetCapacity": 2,
    "DefaultTargetCapacityType": "on-demand"
    }
}
```

Output:

```
{
    "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
}
```

Example 3: To create an EC2 Fleet that launches On-Demand Instances as the primary capacity

The following `create-fleet` example creates an EC2 Fleet that specifies the total target capacity of 2 instances for the fleet, and a target capacity of 1 On-Demand Instance. The default purchasing model is `spot`. The fleet launches 1 On-Demand Instance as specified, but needs to launch one more instance to fulfil the total target capacity. The purchasing model for the difference is calculated as `TotalTargetCapacity` - `OnDemandTargetCapacity` = `DefaultTargetCapacityType`, which results in the fleet launching 1 Spot Instance.

When you create an EC2 Fleet, use a JSON file to specify information about the instances to launch.

```
aws ec2 create-fleet \
    --cli-input-json file://file_name.json
```

Contents of file_name.json:

```
{
    "LaunchTemplateConfigs": [
    {
        "LaunchTemplateSpecification": {
```

```
        "LaunchTemplateId": "lt-0e8c754449b27161c",
        "Version": "1"
        }
    }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 2,
        "OnDemandTargetCapacity":1,
        "DefaultTargetCapacityType": "spot"
    }
}
```

Output:

```
{
    "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
}
```

Example 4: To create an EC2 Fleet that launches Spot Instances using the lowest-price allocation strategy

If the allocation strategy for Spot Instances is not specified, the default allocation strategy, which is `lowest-price`, is used. The following `create-fleet` example creates an EC2 Fleet using the `lowest-price` allocation strategy. The three launch specifications, which override the launch template, have different instance types but the same weighted capacity and subnet. The total target capacity is 2 instances and the default purchasing model is `spot`. The EC2 Fleet launches 2 Spot Instances using the instance type of the launch specification with the lowest price.

When you create an EC2 Fleet, use a JSON file to specify information about the instances to launch.

```
aws ec2 create-fleet \
    --cli-input-json file://file_name.jsonContents of file_name.json::

{
    "LaunchTemplateConfigs": [
    {
        "LaunchTemplateSpecification": {
        "LaunchTemplateId": "lt-0e8c754449b27161c",
        "Version": "1"
```

```
        },
        "Overrides": [
            {
                "InstanceType": "c4.large",
                "WeightedCapacity": 1,
                "SubnetId": "subnet-a4f6c5d3"
            },
            {
                "InstanceType": "c3.large",
                "WeightedCapacity": 1,
                "SubnetId": "subnet-a4f6c5d3"
            },
            {
                "InstanceType": "c5.large",
                "WeightedCapacity": 1,
                "SubnetId": "subnet-a4f6c5d3"
            }
        ]
    }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 2,
        "DefaultTargetCapacityType": "spot"

  }
}
```

Output:

```
{
    "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
}
```

- For API details, see CreateFleet in *AWS CLI Command Reference*.

`create-flow-logs`

The following code example shows how to use `create-flow-logs`.

AWS CLI

Example 1: To create a flow log

The following `create-flow-logs` example creates a flow log that captures all rejected traffic for the specified network interface. The flow logs are delivered to a log group in CloudWatch Logs using the permissions in the specified IAM role.

```
aws ec2 create-flow-logs \
    --resource-type NetworkInterface \
    --resource-ids eni-11223344556677889 \
    --traffic-type REJECT \
    --log-group-name my-flow-logs \
    --deliver-logs-permission-arn arn:aws:iam::123456789101:role/publishFlowLogs
```

Output:

```
{
    "ClientToken": "so0eNA2uSHUNlHI0S2cJ305GuIX1CezaRdGtexample",
    "FlowLogIds": [
        "fl-12345678901234567"
    ],
    "Unsuccessful": []
}
```

For more information, see VPC Flow Logs in the *Amazon VPC User Guide*.

Example 2: To create a flow log with a custom format

The following `create-flow-logs` example creates a flow log that captures all traffic for the specified VPC and delivers the flow logs to an Amazon S3 bucket. The `--log-format` parameter specifies a custom format for the flow log records. To run this command on Windows, change the single quotes (') to double quotes (").

```
aws ec2 create-flow-logs \
    --resource-type VPC \
    --resource-ids vpc-00112233344556677 \
    --traffic-type ALL \
    --log-destination-type s3 \
    --log-destination arn:aws:s3:::flow-log-bucket/my-custom-flow-logs/ \
    --log-format '${version} ${vpc-id} ${subnet-id} ${instance-id} ${srcaddr}
 ${dstaddr} ${srcport} ${dstport} ${protocol} ${tcp-flags} ${type} ${pkt-srcaddr}
 ${pkt-dstaddr}'
```

For more information, see VPC Flow Logs in the *Amazon VPC User Guide*.

Example 3: To create a flow log with a one-minute maximum aggregation interval

The following `create-flow-logs` example creates a flow log that captures all traffic for the specified VPC and delivers the flow logs to an Amazon S3 bucket. The `--max-aggregation-interval` parameter specifies a maximum aggregation interval of 60 seconds (1 minute).

```
aws ec2 create-flow-logs \
    --resource-type VPC \
    --resource-ids vpc-00112233344556677 \
    --traffic-type ALL \
    --log-destination-type s3 \
    --log-destination arn:aws:s3:::flow-log-bucket/my-custom-flow-logs/ \
    --max-aggregation-interval 60
```

For more information, see VPC Flow Logs in the *Amazon VPC User Guide*.

- For API details, see CreateFlowLogs in *AWS CLI Command Reference*.

`create-fpga-image`

The following code example shows how to use `create-fpga-image`.

AWS CLI

To create an Amazon FPGA image

This example creates an AFI from the specified tarball in the specified bucket.

Command:

```
aws ec2 create-fpga-image --name my-afi --description test-afi --input-storage-location Bucket=my-fpga-bucket,Key=dcp/17_12_22-103226.Developer_CL.tar --logs-storage-location Bucket=my-fpga-bucket,Key=logs
```

Output:

```
{
  "FpgaImageId": "afi-0d123e123bfc85abc",
  "FpgaImageGlobalId": "agfi-123cb27b5e84a0abc"
}
```

- For API details, see CreateFpgaImage in *AWS CLI Command Reference*.

`create-image`

The following code example shows how to use `create-image`.

AWS CLI

Example 1: To create an AMI from an Amazon EBS-backed instance

The following `create-image` example creates an AMI from the specified instance.

```
aws ec2 create-image \
    --instance-id i-1234567890abcdef0 \
    --name "My server" \
    --description "An AMI for my server"
```

Output:

```
{
    "ImageId": "ami-abcdef01234567890"
}
```

For more information about specifying a block device mapping for your AMI, see Specifying a block device mapping for an AMI in the *Amazon EC2 User Guide*.

Example 2: To create an AMI from an Amazon EBS-backed instance without reboot

The following `create-image` example creates an AMI and sets the --no-reboot parameter, so that the instance is not rebooted before the image is created.

```
aws ec2 create-image \
    --instance-id i-1234567890abcdef0 \
    --name "My server" \
    --no-reboot
```

Output:

```
{
    "ImageId": "ami-abcdef01234567890"
}
```

For more information about specifying a block device mapping for your AMI, see Specifying a block device mapping for an AMI in the *Amazon EC2 User Guide*.

Example 3: To tag an AMI and snapshots on creation

The following `create-image` example creates an AMI, and tags the AMI and the snapshots with the same tag `cost-center=cc123`

```
aws ec2 create-image \
    --instance-id i-1234567890abcdef0 \
    --name "My server" \
    --tag-specifications "ResourceType=image,Tags=[{Key=cost-
center,Value=cc123}]" "ResourceType=snapshot,Tags=[{Key=cost-center,Value=cc123}]"
```

Output:

```
{
    "ImageId": "ami-abcdef01234567890"
}
```

For more information about tagging your resources on creation, see Add tags on resource creation in the *Amazon EC2 User Guide*.

- For API details, see CreateImage in *AWS CLI Command Reference*.

`create-instance-connect-endpoint`

The following code example shows how to use `create-instance-connect-endpoint`.

AWS CLI

To create an EC2 Instance Connect Endpoint

The following `create-instance-connect-endpoint` example creates an EC2 Instance Connect Endpoint in the specified subnet.

```
aws ec2 create-instance-connect-endpoint \
    --region us-east-1 \
    --subnet-id subnet-0123456789example
```

Output:

```
{
    "VpcId": "vpc-0123abcd",
    "InstanceConnectEndpointArn": "arn:aws:ec2:us-east-1:111111111111:instance-
connect-endpoint/eice-0123456789example",
    "AvailabilityZone": "us-east-1a",
    "NetworkInterfaceIds": [
        "eni-0123abcd"
    ],
    "PreserveClientIp": true,
    "Tags": [],
    "FipsDnsName": "eice-0123456789example.0123abcd.fips.ec2-instance-connect-
endpoint.us-east-1.amazonaws.com",
    "StateMessage": "",
    "State": "create-complete",
    "DnsName": "eice-0123456789example.0123abcd.ec2-instance-connect-endpoint.us-
east-1.amazonaws.com",
    "SubnetId": "subnet-0123abcd",
    "OwnerId": "111111111111",
    "SecurityGroupIds": [
        "sg-0123abcd"
    ],
    "InstanceConnectEndpointId": "eice-0123456789example",
    "CreatedAt": "2023-04-07T15:43:53.000Z"
}
```

For more information, see Create an EC2 Instance Connect Endpoint in the *Amazon EC2 User Guide*.

- For API details, see CreateInstanceConnectEndpoint in *AWS CLI Command Reference*.

`create-instance-event-window`

The following code example shows how to use `create-instance-event-window`.

AWS CLI

Example 1: To create an event window with a time range

The following `create-instance-event-window` example creates an event window with a time range. You can't also specify the `cron-expression` parameter.

```
aws ec2 create-instance-event-window \
```

```
    --region us-east-1 \
    --time-range StartWeekDay=monday,StartHour=2,EndWeekDay=wednesday,EndHour=8 \
    --tag-specifications "ResourceType=instance-event-
window,Tags=[{Key=K1,Value=V1}]" \
    --name myEventWindowName
```

Output:

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "TimeRanges": [
            {
                "StartWeekDay": "monday",
                "StartHour": 2,
                "EndWeekDay": "wednesday",
                "EndHour": 8
            }
        ],
        "Name": "myEventWindowName",
        "State": "creating",
        "Tags": [
            {
                "Key": "K1",
                "Value": "V1"
            }
        ]
    }
}
```

For event window constraints, see Considerations in the Scheduled Events section of the *Amazon EC2 User Guide*.

Example 2: To create an event window with a cron expression

The following `create-instance-event-window` example creates an event window with a cron expression. You can't also specify the `time-range` parameter.

```
aws ec2 create-instance-event-window \
    --region us-east-1 \
    --cron-expression "* 21-23 * * 2,3" \
    --tag-specifications "ResourceType=instance-event-
window,Tags=[{Key=K1,Value=V1}]" \
```

```
    --name myEventWindowName
```

Output:

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "State": "creating",
        "Tags": [
            {
                "Key": "K1",
                "Value": "V1"
            }
        ]
    }
}
```

For event window constraints, see Considerations in the Scheduled Events section of the *Amazon EC2 User Guide*.

- For API details, see CreateInstanceEventWindow in *AWS CLI Command Reference*.

create-instance-export-task

The following code example shows how to use `create-instance-export-task`.

AWS CLI

To export an instance

This example command creates a task to export the instance i-1234567890abcdef0 to the Amazon S3 bucket myexportbucket.

Command:

```
aws ec2 create-instance-export-task --description "RHEL5 instance" --
instance-id i-1234567890abcdef0 --target-environment vmware --export-to-s3-
task DiskImageFormat=vmdk,ContainerFormat=ova,S3Bucket=myexportbucket,S3Prefix=RHEL5
```

Output:

```
{
    "ExportTask": {
        "State": "active",
        "InstanceExportDetails": {
            "InstanceId": "i-1234567890abcdef0",
            "TargetEnvironment": "vmware"
        },
        "ExportToS3Task": {
            "S3Bucket": "myexportbucket",
            "S3Key": "RHEL5export-i-fh8sjjsq.ova",
            "DiskImageFormat": "vmdk",
            "ContainerFormat": "ova"
        },
        "Description": "RHEL5 instance",
        "ExportTaskId": "export-i-fh8sjjsq"
    }
}
```

- For API details, see CreateInstanceExportTask in *AWS CLI Command Reference*.

`create-internet-gateway`

The following code example shows how to use `create-internet-gateway`.

AWS CLI

To create an internet gateway

The following `create-internet-gateway` example creates an internet gateway with the tag `Name=my-igw`.

```
aws ec2 create-internet-gateway \
    --tag-specifications ResourceType=internet-gateway,Tags=[{Key=Name,Value=my-igw}]
```

Output:

```
{
    "InternetGateway": {
        "Attachments": [],
        "InternetGatewayId": "igw-0d0fb496b3994d755",
```

```
            "OwnerId": "123456789012",
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "my-igw"
                }
            ]
        }
}
```

For more information, see [Internet gateways](#) in the *Amazon VPC User Guide*.

- For API details, see [CreateInternetGateway](#) in *AWS CLI Command Reference*.

`create-ipam-pool`

The following code example shows how to use `create-ipam-pool`.

AWS CLI

To create an IPAM pool

The following `create-ipam-pool` example creates an IPAM pool.

(Linux):

```
aws ec2 create-ipam-pool \
    --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 \
    --address-family ipv4 \
    --auto-import \
    --allocation-min-netmask-length 16 \
    --allocation-max-netmask-length 26 \
    --allocation-default-netmask-length 24 \
    --allocation-resource-tags "Key=Environment,Value=Preprod" \
    --tag-specifications 'ResourceType=ipam-pool,Tags=[{Key=Name,Value="Preprod
 pool"}]'
```

(Windows):

```
aws ec2 create-ipam-pool ^
    --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 ^
    --address-family ipv4 ^
```

```
    --auto-import ^
    --allocation-min-netmask-length 16 ^
    --allocation-max-netmask-length 26 ^
    --allocation-default-netmask-length 24 ^
    --allocation-resource-tags "Key=Environment,Value=Preprod" ^
    --tag-specifications ResourceType=ipam-pool,Tags=[{Key=Name,Value="Preprod
 pool"}]
```

Output:

```
{
    "IpamPool": {
        "OwnerId": "123456789012",
        "IpamPoolId": "ipam-pool-0533048da7d823723",
        "IpamPoolArn": "arn:aws:ec2::123456789012:ipam-pool/ipam-
pool-0533048da7d823723",
        "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-
scope-02fc38cd4c48e7d38",
        "IpamScopeType": "private",
        "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
        "IpamRegion": "us-east-1",
        "Locale": "None",
        "PoolDepth": 1,
        "State": "create-in-progress",
        "AutoImport": true,
        "AddressFamily": "ipv4",
        "AllocationMinNetmaskLength": 16,
        "AllocationMaxNetmaskLength": 26,
        "AllocationDefaultNetmaskLength": 24,
        "AllocationResourceTags": [
            {
                "Key": "Environment",
                "Value": "Preprod"
            }
        ],
        "Tags": [
            {
                "Key": "Name",
                "Value": "Preprod pool"
            }
        ]
    }
}
```

For more information, see Plan for IP address provisioning in the *Amazon VPC IPAM User Guide*.

- For API details, see CreateIpamPool in *AWS CLI Command Reference*.

`create-ipam-resource-discovery`

The following code example shows how to use `create-ipam-resource-discovery`.

AWS CLI

To create a resource discovery

In this example, you're a delegated IPAM admin who wants to create and share a resource discovery with the IPAM admin in another AWS Organization so that the admin in the other organization can manage and monitor the IP addresses of resources in your organization.

Important

This example includes both the `--region` and `--operating-regions` options because, while they are optional, they must be configured in a particular way to successfully integrate a resource discovery with an IPAM. * `--operating-regions` must match the Regions where you have resources that you want IPAM to discover. If there are Regions where you do not want IPAM to manage the IP addresses (for example for compliance reasons), do not include them. * `--region` must match the home Region of the IPAM you want to associate it with. You must create the resource discovery in the same Region that the IPAM was created in. For example, if the IPAM you are associating with was created in us-east-1, include `--region us-east-1` in the request.Both the `--region` and `--operating-regions` options default to the Region you're running the command in if you don't specify them.

In this example, the operating Regions of the IPAM we're integrating with include `us-west-1`, `us-west-2`, and `ap-south-1`. When we create the resource discovery, we want IPAM to discover the resource IP addresses in `us-west-1` and `us-west-2` but not `ap-south-1`. So we are including only `--operating-regions RegionName='us-west-1' RegionName='us-west-2'` in the request.

The following `create-ipam-resource-discovery` example creates an IPAM resource discovery.

```
aws ec2 create-ipam-resource-discovery \
    --description 'Example-resource-discovery' \
```

```
    --tag-specifications 'ResourceType=ipam-resource-discovery,Tags=[{Key=cost-center,Value=cc123}]' \
    --operating-regions RegionName='us-west-1' RegionName='us-west-2' \
    --region us-east-1
```

Output:

```
{
    "IpamResourceDiscovery":{
        "OwnerId": "149977607591",
        "IpamResourceDiscoveryId": "ipam-res-disco-0257046d8aa78b8bc",
        "IpamResourceDiscoveryArn": "arn:aws:ec2::149977607591:ipam-resource-discovery/ipam-res-disco-0257046d8aa78b8bc",
        "IpamResourceDiscoveryRegion": "us-east-1",
        "Description": "'Example-resource-discovery'",
        "OperatingRegions":[
            {"RegionName": "us-west-1"},
            {"RegionName": "us-west-2"},
            {"RegionName": "us-east-1"}
        ],
        "IsDefault": false,
        "State": "create-in-progress",
        "Tags": [
            {
                "Key": "cost-center",
                "Value": "cc123"
            }
        ]
}
```

Once you create a resource discovery, you may want to share it with another IPAM delegated admin, which you can do with create-resource-share. For more information, see Integrate IPAM with accounts outside of your organization in the *Amazon VPC IPAM User Guide*.

- For API details, see CreateIpamResourceDiscovery in *AWS CLI Command Reference*.

`create-ipam-scope`

The following code example shows how to use `create-ipam-scope`.

AWS CLI

To create an IPAM scope

The following `create-ipam-scope` example creates an IPAM scope.

(Linux):

```
aws ec2 create-ipam-scope \
    --ipam-id ipam-08440e7a3acde3908 \
    --description "Example description" \
    --tag-specifications 'ResourceType=ipam-scope,Tags=[{Key=Name,Value="Example
 name value"}]'
```

(Windows):

```
aws ec2 create-ipam-scope ^
    --ipam-id ipam-08440e7a3acde3908 ^
    --description "Example description" ^
    --tag-specifications ResourceType=ipam-scope,Tags=[{Key=Name,Value="Example name
 value"}]
```

Output:

```
{
    "IpamScope": {
        "OwnerId": "123456789012",
        "IpamScopeId": "ipam-scope-01c1ebab2b63bd7e4",
        "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-
scope-01c1ebab2b63bd7e4",
        "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
        "IpamRegion": "us-east-1",
        "IpamScopeType": "private",
        "IsDefault": false,
        "Description": "Example description",
        "PoolCount": 0,
        "State": "create-in-progress",
        "Tags": [
            {
                "Key": "Name",
                "Value": "Example name value"
            }
        ]
    }
}
```

For more information, see Create additional scopes in the *Amazon VPC IPAM User Guide*.

- For API details, see CreateIpamScope in *AWS CLI Command Reference*.

`create-ipam`

The following code example shows how to use `create-ipam`.

AWS CLI

To create an IPAM

The following `create-ipam` example creates an IPAM.

(Linux):

```
aws ec2 create-ipam \
    --description "Example description" \
    --operating-regions "RegionName=us-east-2" "RegionName=us-west-1" \
    --tag-specifications 'ResourceType=ipam,Tags=[{Key=Name,Value=ExampleIPAM}]'
```

(Windows):

```
aws ec2 create-ipam ^
    --description "Example description" ^
    --operating-regions "RegionName=us-east-2" "RegionName=us-west-1" ^
    --tag-specifications ResourceType=ipam,Tags=[{Key=Name,Value=ExampleIPAM}]
```

Output:

```
{
    "Ipam": {
        "OwnerId": "123456789012",
        "IpamId": "ipam-036486dfa6af58ee0",
        "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-036486dfa6af58ee0",
        "IpamRegion": "us-east-1",
        "PublicDefaultScopeId": "ipam-scope-071b8042b0195c183",
        "PrivateDefaultScopeId": "ipam-scope-0807405dece705a30",
        "ScopeCount": 2,
        "OperatingRegions": [
            {
                "RegionName": "us-east-2"
```

```
            },
            {
                "RegionName": "us-west-1"
            },
            {
                "RegionName": "us-east-1"
            }
        ],
        "State": "create-in-progress",
        "Tags": [
            {
                "Key": "Name",
                "Value": "ExampleIPAM"
            }
        ]
    }
}
```

For more information, see Create an IPAM in the *Amazon VPC IPAM User Guide*.

- For API details, see CreateIpam in *AWS CLI Command Reference*.

`create-key-pair`

The following code example shows how to use `create-key-pair`.

AWS CLI

To create a key pair

This example creates a key pair named `MyKeyPair`.

Command:

```
aws ec2 create-key-pair --key-name MyKeyPair
```

The output is an ASCII version of the private key and key fingerprint. You need to save the key to a file.

For more information, see Using Key Pairs in the *AWS Command Line Interface User Guide*.

- For API details, see CreateKeyPair in *AWS CLI Command Reference*.

`create-launch-template-version`

The following code example shows how to use `create-launch-template-version`.

AWS CLI

To create a launch template version

This example creates a new launch template version based on version 1 of the launch template and specifies a different AMI ID.

Command:

```
aws ec2 create-launch-template-version --launch-template-id lt-0abcd290751193123
 --version-description WebVersion2 --source-version 1 --launch-template-data
 '{"ImageId":"ami-c998b6b2"}'
```

Output:

```
{
  "LaunchTemplateVersion": {
      "VersionDescription": "WebVersion2",
      "LaunchTemplateId": "lt-0abcd290751193123",
      "LaunchTemplateName": "WebServers",
      "VersionNumber": 2,
      "CreatedBy": "arn:aws:iam::123456789012:root",
      "LaunchTemplateData": {
          "ImageId": "ami-c998b6b2",
          "InstanceType": "t2.micro",
          "NetworkInterfaces": [
              {
                  "Ipv6Addresses": [
                      {
                          "Ipv6Address": "2001:db8:1234:1a00::123"
                      }
                  ],
                  "DeviceIndex": 0,
                  "SubnetId": "subnet-7b16de0c",
                  "AssociatePublicIpAddress": true
              }
          ]
      },
      "DefaultVersion": false,
      "CreateTime": "2017-12-01T13:35:46.000Z"
```

```
    }
}
```

- For API details, see CreateLaunchTemplateVersion in *AWS CLI Command Reference*.

`create-launch-template`

The following code example shows how to use `create-launch-template`.

AWS CLI

Example 1: To create a launch template

The following `create-launch-template` example creates a launch template that specifies the subnet in which to launch the instance , assigns a public IP address and an IPv6 address to the instance, and creates a tag for the instance.

```
aws ec2 create-launch-template \
    --launch-template-name TemplateForWebServer \
    --version-description WebVersion1 \
    --launch-template-data '{"NetworkInterfaces":
[{"AssociatePublicIpAddress":true,"DeviceIndex":0,"Ipv6AddressCount":1,"SubnetId":"subnet-7b
[{"ResourceType":"instance","Tags":[{"Key":"purpose","Value":"webserver"}]}]}'
```

Output:

```
{
    "LaunchTemplate": {
        "LatestVersionNumber": 1,
        "LaunchTemplateId": "lt-01238c059e3466abc",
        "LaunchTemplateName": "TemplateForWebServer",
        "DefaultVersionNumber": 1,
        "CreatedBy": "arn:aws:iam::123456789012:user/Bob",
        "CreateTime": "2019-01-27T09:13:24.000Z"
    }
}
```

For more information, see Launching an Instance from a Launch Template in the *Amazon Elastic Compute Cloud User Guide*. For information about quoting JSON-formatted parameters, see Quoting Strings in the *AWS Command Line Interface User Guide*.

Example 2: To create a launch template for Amazon EC2 Auto Scaling

The following `create-launch-template` example creates a launch template with multiple tags and a block device mapping to specify an additional EBS volume when an instance launches. Specify a value for `Groups` that corresponds to security groups for the VPC that your Auto Scaling group will launch instances into. Specify the VPC and subnets as properties of the Auto Scaling group.

```
aws ec2 create-launch-template \
    --launch-template-name TemplateForAutoScaling \
    --version-description AutoScalingVersion1 \
    --launch-template-data '{"NetworkInterfaces":
[{"DeviceIndex":0,"AssociatePublicIpAddress":true,"Groups":
["sg-7c227019,sg-903004f8"],"DeleteOnTermination":true}],"ImageId":"ami-
b42209de","InstanceType":"m4.large","TagSpecifications":
[{"ResourceType":"instance","Tags":[{"Key":"environment","Value":"production"},
{"Key":"purpose","Value":"webserver"}]},{"ResourceType":"volume","Tags":
[{"Key":"environment","Value":"production"},{"Key":"cost-
center","Value":"cc123"}]}],"BlockDeviceMappings":[{"DeviceName":"/dev/sda1","Ebs":
{"VolumeSize":100}}]}' --region us-east-1
```

Output:

```
{
    "LaunchTemplate": {
        "LatestVersionNumber": 1,
        "LaunchTemplateId": "lt-0123c79c33a54e0abc",
        "LaunchTemplateName": "TemplateForAutoScaling",
        "DefaultVersionNumber": 1,
        "CreatedBy": "arn:aws:iam::123456789012:user/Bob",
        "CreateTime": "2019-04-30T18:16:06.000Z"
    }
}
```

For more information, see Creating a Launch Template for an Auto Scaling Group in the *Amazon EC2 Auto Scaling User Guide*. For information about quoting JSON-formatted parameters, see Quoting Strings in the *AWS Command Line Interface User Guide*.

Example 3: To create a launch template that specifies encryption of EBS volumes

The following `create-launch-template` example creates a launch template that includes encrypted EBS volumes created from an unencrypted snapshot. It also tags the volumes during creation. If encryption by default is disabled, you must specify the `"Encrypted"` option as shown in the following example. If you use the "`KmsKeyId`" option to specify a customer managed CMK, you also must specify the "`Encrypted`" option even if encryption by default is enabled.

```
aws ec2 create-launch-template \
  --launch-template-name TemplateForEncryption \
  --launch-template-data file://config.json
```

Contents of `config.json`:

```
{
    "BlockDeviceMappings":[
        {
            "DeviceName":"/dev/sda1",
            "Ebs":{
                "VolumeType":"gp2",
                "DeleteOnTermination":true,
                "SnapshotId":"snap-066877671789bd71b",
                "Encrypted":true,
                "KmsKeyId":"arn:aws:kms:us-east-1:012345678910:key/abcd1234-
a123-456a-a12b-a123b4cd56ef"
            }
        }
    ],
    "ImageId":"ami-00068cd7555f543d5",
    "InstanceType":"c5.large",
    "TagSpecifications":[
        {
            "ResourceType":"volume",
            "Tags":[
                {
                    "Key":"encrypted",
                    "Value":"yes"
                }
            ]
        }
    ]
}
```

Output:

```
{
```

```
    "LaunchTemplate": {
        "LatestVersionNumber": 1,
        "LaunchTemplateId": "lt-0d5bd51bcf8530abc",
        "LaunchTemplateName": "TemplateForEncryption",
        "DefaultVersionNumber": 1,
        "CreatedBy": "arn:aws:iam::123456789012:user/Bob",
        "CreateTime": "2020-01-07T19:08:36.000Z"
    }
}
```

For more information, see Restoring an Amazon EBS Volume from a Snapshot and Encryption by Default in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see CreateLaunchTemplate in *AWS CLI Command Reference*.

`create-local-gateway-route-table-virtual-interface-group-association`

The following code example shows how to use `create-local-gateway-route-table-virtual-interface-group-association`.

AWS CLI

To associate a local gateway route table with a virtual interfaces (VIFs) group

The following `create-local-gateway-route-table-virtual-interface-group-association` example creates an association between the specified local gateway route table and VIF group.

```
aws ec2 create-local-gateway-route-table-virtual-interface-group-association \
    --local-gateway-route-table-id lgw-rtb-exampleidabcd1234 \
    --local-gateway-virtual-interface-group-id lgw-vif-grp-exampleid0123abcd
```

Output:

```
{
    "LocalGatewayRouteTableVirtualInterfaceGroupAssociation": {
        "LocalGatewayRouteTableVirtualInterfaceGroupAssociationId": "lgw-vif-grp-
assoc-exampleid12345678",
        "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-exampleid0123abcd",
        "LocalGatewayId": "lgw-exampleid11223344",
        "LocalGatewayRouteTableId": "lgw-rtb-exampleidabcd1234",
```

```
        "LocalGatewayRouteTableArn": "arn:aws:ec2:us-west-2:111122223333:local-
gateway-route-table/lgw-rtb-exampleidabcd1234",
        "OwnerId": "111122223333",
        "State": "pending",
        "Tags": []
    }
}
```

For more information, see VIF group associations in the *AWS Outposts User Guide*.

- For API details, see CreateLocalGatewayRouteTableVirtualInterfaceGroupAssociation in *AWS CLI Command Reference*.

`create-local-gateway-route-table-vpc-association`

The following code example shows how to use `create-local-gateway-route-table-vpc-association`.

AWS CLI

To associate a VPC with a route table

The following `create-local-gateway-route-table-vpc-association` example associates the specified VPC with the specified local gateway route table.

```
aws ec2 create-local-gateway-route-table-vpc-association \
    --local-gateway-route-table-id lgw-rtb-059615ef7dEXAMPLE \
    --vpc-id vpc-07ef66ac71EXAMPLE
```

Output:

```
{
    "LocalGatewayRouteTableVpcAssociation": {
        "LocalGatewayRouteTableVpcAssociationId": "lgw-vpc-assoc-0ee765bcc8EXAMPLE",
        "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE",
        "LocalGatewayId": "lgw-09b493aa7cEXAMPLE",
        "VpcId": "vpc-07ef66ac71EXAMPLE",
        "State": "associated"
    }
}
```

- For API details, see CreateLocalGatewayRouteTableVpcAssociation in *AWS CLI Command Reference*.

`create-local-gateway-route-table`

The following code example shows how to use `create-local-gateway-route-table`.

AWS CLI

To create a local gateway route table

The following `create-local-gateway-route-table` example creates a local gateway route table with the direct VPC routing mode.

```
aws ec2 create-local-gateway-route-table \
    --local-gateway-id lgw-1a2b3c4d5e6f7g8h9 \
    --mode direct-vpc-routing
```

Output:

```
{
    "LocalGatewayRouteTable": {
        "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890",
        "LocalGatewayRouteTableArn": "arn:aws:ec2:us-west-2:111122223333:local-
gateway-route-table/lgw-rtb-abcdefg1234567890",
        "LocalGatewayId": "lgw-1a2b3c4d5e6f7g8h9",
        "OutpostArn": "arn:aws:outposts:us-west-2:111122223333:outpost/
op-021345abcdef67890",
        "OwnerId": "111122223333",
        "State": "pending",
        "Tags": [],
        "Mode": "direct-vpc-routing"
    }
}
```

For more information, see Local gateway route tables in the *AWS Outposts User Guide*.

- For API details, see CreateLocalGatewayRouteTable in *AWS CLI Command Reference*.

`create-local-gateway-route`

The following code example shows how to use `create-local-gateway-route`.

AWS CLI

To create a static route for a local gateway route table

The following `create-local-gateway-route` example creates the specified route in the specified local gateway route table.

```
aws ec2 create-local-gateway-route \
    --destination-cidr-block 0.0.0.0/0 \
    --local-gateway-route-table-id lgw-rtb-059615ef7dEXAMPLE
```

Output:

```
{
    "Route": {
        "DestinationCidrBlock": "0.0.0.0/0",
        "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-07145b276bEXAMPLE",
        "Type": "static",
        "State": "deleted",
        "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE"
    }
}
```

- For API details, see CreateLocalGatewayRoute in *AWS CLI Command Reference*.

`create-managed-prefix-list`

The following code example shows how to use `create-managed-prefix-list`.

AWS CLI

To create a prefix list

The following `create-managed-prefix-list` example creates an IPv4 prefix list with a maximum of 10 entries, and creates 2 entries in the prefix list.

```
aws ec2 create-managed-prefix-list \
    --address-family IPv4 \
    --max-entries 10 \
    --entries Cidr=10.0.0.0/16,Description=vpc-a Cidr=10.2.0.0/16,Description=vpc-b
 \
    --prefix-list-name vpc-cidrs
```

Output:

```
{
    "PrefixList": {
        "PrefixListId": "pl-0123456abcabcabc1",
        "AddressFamily": "IPv4",
        "State": "create-in-progress",
        "PrefixListArn": "arn:aws:ec2:us-west-2:123456789012:prefix-list/
pl-0123456abcabcabc1",
        "PrefixListName": "vpc-cidrs",
        "MaxEntries": 10,
        "Version": 1,
        "Tags": [],
        "OwnerId": "123456789012"
    }
}
```

For more information, see Managed prefix lists in the *Amazon VPC User Guide*.

- For API details, see CreateManagedPrefixList in *AWS CLI Command Reference*.

`create-nat-gateway`

The following code example shows how to use `create-nat-gateway`.

AWS CLI

Example 1: To create a public NAT gateway

The following `create-nat-gateway` example creates a public NAT gateway in the specified subnet and associates the Elastic IP address with the specified allocation ID. When you create a public NAT gateway, you must associate an Elastic IP address.

```
aws ec2 create-nat-gateway \
    --subnet-id subnet-0250c25a1fEXAMPLE \
    --allocation-id eipalloc-09ad461b0dEXAMPLE
```

Output:

```
{
    "NatGateway": {
        "CreateTime": "2021-12-01T22:22:38.000Z",
```

```
            "NatGatewayAddresses": [
                {
                    "AllocationId": "eipalloc-09ad461b0dEXAMPLE"
                }
            ],
            "NatGatewayId": "nat-0c61bf8a12EXAMPLE",
            "State": "pending",
            "SubnetId": "subnet-0250c25a1fEXAMPLE",
            "VpcId": "vpc-0a60eb65b4EXAMPLE",
            "ConnectivityType": "public"
        }
    }
```

For more information, see NAT gateways in the *Amazon VPC User Guide*.

Example 2: To create a private NAT gateway

The following `create-nat-gateway` example creates a private NAT gateway in the specified subnet. A private NAT gateway does not have an associated Elastic IP address.

```
aws ec2 create-nat-gateway \
    --subnet-id subnet-0250c25a1fEXAMPLE \
    --connectivity-type private
```

Output:

```
{
    "NatGateway": {
        "CreateTime": "2021-12-01T22:26:00.000Z",
        "NatGatewayAddresses": [
            {}
        ],
        "NatGatewayId": "nat-011b568379EXAMPLE",
        "State": "pending",
        "SubnetId": "subnet-0250c25a1fEXAMPLE",
        "VpcId": "vpc-0a60eb65b4EXAMPLE",
        "ConnectivityType": "private"
    }
}
```

For more information, see NAT gateways in the *Amazon VPC User Guide*.

- For API details, see CreateNatGateway in *AWS CLI Command Reference*.

`create-network-acl-entry`

The following code example shows how to use `create-network-acl-entry`.

AWS CLI

To create a network ACL entry

This example creates an entry for the specified network ACL. The rule allows ingress traffic from any IPv4 address (0.0.0.0/0) on UDP port 53 (DNS) into any associated subnet. If the command succeeds, no output is returned.

Command:

```
aws ec2 create-network-acl-entry --network-acl-id acl-5fb85d36 --ingress --rule-number 100 --protocol udp --port-range From=53,To=53 --cidr-block 0.0.0.0/0 --rule-action allow
```

This example creates a rule for the specified network ACL that allows ingress traffic from any IPv6 address (::/0) on TCP port 80 (HTTP).

Command:

```
aws ec2 create-network-acl-entry --network-acl-id acl-5fb85d36 --ingress --rule-number 120 --protocol tcp --port-range From=80,To=80 --ipv6-cidr-block ::/0 --rule-action allow
```

- For API details, see CreateNetworkAclEntry in *AWS CLI Command Reference*.

`create-network-acl`

The following code example shows how to use `create-network-acl`.

AWS CLI

To create a network ACL

This example creates a network ACL for the specified VPC.

Command:

```
aws ec2 create-network-acl --vpc-id vpc-a01106c2
```

Output:

```
{
    "NetworkAcl": {
        "Associations": [],
        "NetworkAclId": "acl-5fb85d36",
        "VpcId": "vpc-a01106c2",
        "Tags": [],
        "Entries": [
            {
                "CidrBlock": "0.0.0.0/0",
                "RuleNumber": 32767,
                "Protocol": "-1",
                "Egress": true,
                "RuleAction": "deny"
            },
            {
                "CidrBlock": "0.0.0.0/0",
                "RuleNumber": 32767,
                "Protocol": "-1",
                "Egress": false,
                "RuleAction": "deny"
            }
        ],
        "IsDefault": false
    }
}
```

- For API details, see CreateNetworkAcl in *AWS CLI Command Reference*.

`create-network-insights-access-scope`

The following code example shows how to use `create-network-insights-access-scope`.

AWS CLI

To create a Network Access Scope

The following `create-network-insights-access-scope` example creates a Network Access Scope.

```
aws ec2 create-network-insights-access-scope \
```

```
    --cli-input-json file://access-scope-file.json
```

Contents of `access-scope-file.json`:

```
{
    "MatchPaths": [
        {
            "Source": {
                "ResourceStatement": {
                    "Resources": [
                        "vpc-abcd12e3"
                    ]
                }
            }
         }
    ],
    "ExcludePaths": [
        {
            "Source": {
                "ResourceStatement": {
                    "ResourceTypes": [
                        "AWS::EC2::InternetGateway"
                    ]
                }
            }
        }
    ]
}
```

Output:

```
{
    "NetworkInsightsAccessScope": {
        "NetworkInsightsAccessScopeId": "nis-123456789abc01234",
        "NetworkInsightsAccessScopeArn": "arn:aws:ec2:us-
east-1:123456789012:network-insights-access-scope/nis-123456789abc01234",
        "CreatedDate": "2022-01-25T19:20:28.796000+00:00",
        "UpdatedDate": "2022-01-25T19:20:28.797000+00:00"
    },
    "NetworkInsightsAccessScopeContent": {
        "NetworkInsightsAccessScopeId": "nis-123456789abc01234",
        "MatchPaths": [
            {
```

```
                "Source": {
                    "ResourceStatement": {
                        "Resources": [
                            "vpc-abcd12e3"
                        ]
                    }
                }
            }
        ],
        "ExcludePaths": [
            {
                "Source": {
                    "ResourceStatement": {
                        "ResourceTypes": [
                            "AWS::EC2::InternetGateway"
                        ]
                    }
                }
            }
        ]
    }
}
```

For more information, see Getting started with Network Access Analyzer using the AWS CLI in the *Network Access Analyzer Guide*.

- For API details, see CreateNetworkInsightsAccessScope in *AWS CLI Command Reference*.

`create-network-insights-path`

The following code example shows how to use `create-network-insights-path`.

AWS CLI

To create a path

The following `create-network-insights-path` example creates a path. The source is the specified internet gateway and the destination is the specified EC2 instance. To determine whether the destination is reachable using the specified protocol and port, analyze the path using the `start-network-insights-analysis` command.

```
aws ec2 create-network-insights-path \
    --source igw-0797cccdc9d73b0e5 \
```

```
    --destination i-0495d385ad28331c7 \
    --destination-port 22 \
    --protocol TCP
```

Output:

```
{
    "NetworkInsightsPaths": {
        "NetworkInsightsPathId": "nip-0b26f224f1d131fa8",
        "NetworkInsightsPathArn": "arn:aws:ec2:us-east-1:123456789012:network-
insights-path/nip-0b26f224f1d131fa8",
        "CreatedDate": "2021-01-20T22:43:46.933Z",
        "Source": "igw-0797cccdc9d73b0e5",
        "Destination": "i-0495d385ad28331c7",
        "Protocol": "tcp"
    }
}
```

For more information, see Getting started using the AWS CLI in the *Reachability Analyzer Guide*.

- For API details, see CreateNetworkInsightsPath in *AWS CLI Command Reference*.

`create-network-interface-permission`

The following code example shows how to use `create-network-interface-permission`.

AWS CLI

To create a network interface permission

This example grants permission to account `123456789012` to attach network interface `eni-1a2b3c4d` to an instance.

Command:

```
aws ec2 create-network-interface-permission --network-interface-id eni-1a2b3c4d --
aws-account-id 123456789012 --permission INSTANCE-ATTACH
```

Output:

```
{
  "InterfacePermission": {
      "PermissionState": {
```

```
            "State": "GRANTED"
        },
        "NetworkInterfacePermissionId": "eni-perm-06fd19020ede149ea",
        "NetworkInterfaceId": "eni-1a2b3c4d",
        "Permission": "INSTANCE-ATTACH",
        "AwsAccountId": "123456789012"
    }
}
```

- For API details, see CreateNetworkInterfacePermission in *AWS CLI Command Reference*.

`create-network-interface`

The following code example shows how to use `create-network-interface`.

AWS CLI

Example 1: To specify an IPv4 address for a network interface

The following `create-network-interface` example creates a network interface for the specified subnet with the specified primary IPv4 address.

```
aws ec2 create-network-interface \
    --subnet-id subnet-00a24d0d67acf6333 \
    --description "my network interface" \
    --groups sg-09dfba7ed20cda78b \
    --private-ip-address 10.0.8.17
```

Output:

```
{
    "NetworkInterface": {
        "AvailabilityZone": "us-west-2a",
        "Description": "my network interface",
        "Groups": [
            {
                "GroupName": "my-security-group",
                "GroupId": "sg-09dfba7ed20cda78b"
            }
        ],
        "InterfaceType": "interface",
        "Ipv6Addresses": [],
```

```
        "MacAddress": "06:6a:0f:9a:49:37",
        "NetworkInterfaceId": "eni-0492b355f0cf3b3f8",
        "OwnerId": "123456789012",
        "PrivateDnsName": "ip-10-0-8-18.us-west-2.compute.internal",
        "PrivateIpAddress": "10.0.8.17",
        "PrivateIpAddresses": [
            {
                "Primary": true,
                "PrivateDnsName": "ip-10-0-8-17.us-west-2.compute.internal",
                "PrivateIpAddress": "10.0.8.17"
            }
        ],
        "RequesterId": "AIDA4Z3Y7GSXTMEXAMPLE",
        "RequesterManaged": false,
        "SourceDestCheck": true,
        "Status": "pending",
        "SubnetId": "subnet-00a24d0d67acf6333",
        "TagSet": [],
        "VpcId": "vpc-02723a0feeeb9d57b"
    }
}
```

Example 2: To create a network interface with an IPv4 address and an IPv6 address

The following `create-network-interface` example creates a network interface for the specified subnet with an IPv4 address and an IPv6 address that are selected by Amazon EC2.

```
aws ec2 create-network-interface \
    --subnet-id subnet-00a24d0d67acf6333 \
    --description "my dual stack network interface" \
    --ipv6-address-count 1 \
    --groups sg-09dfba7ed20cda78b
```

Output:

```
{
    "NetworkInterface": {
        "AvailabilityZone": "us-west-2a",
        "Description": "my dual stack network interface",
        "Groups": [
            {
                "GroupName": "my-security-group",
                "GroupId": "sg-09dfba7ed20cda78b"
```

```
            }
        ],
        "InterfaceType": "interface",
        "Ipv6Addresses": [
            {
                "Ipv6Address": "2600:1f13:cfe:3650:a1dc:237c:393a:4ba7",
                "IsPrimaryIpv6": false
            }
        ],
        "MacAddress": "06:b8:68:d2:b2:2d",
        "NetworkInterfaceId": "eni-05da417453f9a84bf",
        "OwnerId": "123456789012",
        "PrivateDnsName": "ip-10-0-8-18.us-west-2.compute.internal",
        "PrivateIpAddress": "10.0.8.18",
        "PrivateIpAddresses": [
            {
                "Primary": true,
                "PrivateDnsName": "ip-10-0-8-18.us-west-2.compute.internal",
                "PrivateIpAddress": "10.0.8.18"
            }
        ],
        "RequesterId": "AIDA4Z3Y7GSXTMEXAMPLE",
        "RequesterManaged": false,
        "SourceDestCheck": true,
        "Status": "pending",
        "SubnetId": "subnet-00a24d0d67acf6333",
        "TagSet": [],
        "VpcId": "vpc-02723a0feeeb9d57b",
        "Ipv6Address": "2600:1f13:cfe:3650:a1dc:237c:393a:4ba7"
    }
}
```

Example 3: To create a network interface with connection tracking configuration options

The following `create-network-interface` example creates a network interface and configures the idle connection tracking timeouts.

```
aws ec2 create-network-interface \
    --subnet-id subnet-00a24d0d67acf6333 \
    --groups sg-02e57dbcfe0331c1b \
    --connection-tracking-specification TcpEstablishedTimeout=86400,UdpTimeout=60
```

Output:

```
{
    "NetworkInterface": {
        "AvailabilityZone": "us-west-2a",
        "ConnectionTrackingConfiguration": {
            "TcpEstablishedTimeout": 86400,
            "UdpTimeout": 60
        },
        "Description": "",
        "Groups": [
            {
                "GroupName": "my-security-group",
                "GroupId": "sg-02e57dbcfe0331c1b"
            }
        ],
        "InterfaceType": "interface",
        "Ipv6Addresses": [],
        "MacAddress": "06:4c:53:de:6d:91",
        "NetworkInterfaceId": "eni-0c133586e08903d0b",
        "OwnerId": "123456789012",
        "PrivateDnsName": "ip-10-0-8-94.us-west-2.compute.internal",
        "PrivateIpAddress": "10.0.8.94",
        "PrivateIpAddresses": [
            {
                "Primary": true,
                "PrivateDnsName": "ip-10-0-8-94.us-west-2.compute.internal",
                "PrivateIpAddress": "10.0.8.94"
            }
        ],
        "RequesterId": "AIDA4Z3Y7GSXTMEXAMPLE",
        "RequesterManaged": false,
        "SourceDestCheck": true,
        "Status": "pending",
        "SubnetId": "subnet-00a24d0d67acf6333",
        "TagSet": [],
        "VpcId": "vpc-02723a0feeeb9d57b"
    }
}
```

Example 4: To create an Elastic Fabric Adapter

The following `create-network-interface` example creates an EFA.

```
aws ec2 create-network-interface \
```

```
    --interface-type efa \
    --subnet-id subnet-00a24d0d67acf6333 \
    --description "my efa" \
    --groups sg-02e57dbcfe0331c1b
```

Output:

```
{
    "NetworkInterface": {
        "AvailabilityZone": "us-west-2a",
        "Description": "my efa",
        "Groups": [
            {
                "GroupName": "my-efa-sg",
                "GroupId": "sg-02e57dbcfe0331c1b"
            }
        ],
        "InterfaceType": "efa",
        "Ipv6Addresses": [],
        "MacAddress": "06:d7:a4:f7:4d:57",
        "NetworkInterfaceId": "eni-034acc2885e862b65",
        "OwnerId": "123456789012",
        "PrivateDnsName": "ip-10-0-8-180.us-west-2.compute.internal",
        "PrivateIpAddress": "10.0.8.180",
        "PrivateIpAddresses": [
            {
                "Primary": true,
                "PrivateDnsName": "ip-10-0-8-180.us-west-2.compute.internal",
                "PrivateIpAddress": "10.0.8.180"
            }
        ],
        "RequesterId": "AIDA4Z3Y7GSXTMEXAMPLE",
        "RequesterManaged": false,
        "SourceDestCheck": true,
        "Status": "pending",
        "SubnetId": "subnet-00a24d0d67acf6333",
        "TagSet": [],
        "VpcId": "vpc-02723a0feeeb9d57b"
    }
}
```

For more information, see Elastic network interfaces in the *Amazon EC2 User Guide*.

- For API details, see CreateNetworkInterface in *AWS CLI Command Reference*.

`create-placement-group`

The following code example shows how to use `create-placement-group`.

AWS CLI

To create a placement group

This example command creates a placement group with the specified name.

Command:

```
aws ec2 create-placement-group --group-name my-cluster --strategy cluster
```

To create a partition placement group

This example command creates a partition placement group named `HDFS-Group-A` with five partitions.

Command:

```
aws ec2 create-placement-group --group-name HDFS-Group-A --strategy partition --
partition-count 5
```

- For API details, see CreatePlacementGroup in *AWS CLI Command Reference*.

`create-replace-root-volume-task`

The following code example shows how to use `create-replace-root-volume-task`.

AWS CLI

Example 1: To restore a root volume to its initial launch state

The following `create-replace-root-volume-task` example restores the root volume of instance i-0123456789abcdefa to its initial launch state.

```
aws ec2 create-replace-root-volume-task \
    --instance-id i-0123456789abcdefa
```

Output:

```
{
    "ReplaceRootVolumeTask":
    {
        "InstanceId": "i-0123456789abcdefa",
            "ReplaceRootVolumeTaskId": "replacevol-0111122223333abcd",
            "TaskState": "pending",
            "StartTime": "2022-03-14T15:06:38Z",
            "Tags": []
    }
}
```

Example 2: To restore a root volume to a specific snapshot

The following `create-replace-root-volume-task` example restores the root volume of instance i-0123456789abcdefa to snapshot snap-0abcdef1234567890.

```
aws ec2 create-replace-root-volume-task \
    --instance-id i-0123456789abcdefa \
    --snapshot-id  snap-0abcdef1234567890
```

Output:

```
{
    "ReplaceRootVolumeTask":
    {
        "InstanceId": "i-0123456789abcdefa",
        "ReplaceRootVolumeTaskId": "replacevol-0555566667777abcd",
        "TaskState": "pending",
        "StartTime": "2022-03-14T15:16:28Z",
        "Tags": []
    }
}
```

For more information, see Replace a root volume in the *Amazon EC2 User Guide*.

- For API details, see CreateReplaceRootVolumeTask in *AWS CLI Command Reference*.

`create-reserved-instances-listing`

The following code example shows how to use `create-reserved-instances-listing`.

AWS CLI

To list a Reserved Instance in the Reserved Instance Marketplace

The following `create-reserved-instances-listing` example creates a listing for the specified Reserved Instance in the Reserved Instance Marketplace.

```
aws ec2 create-reserved-instances-listing \
    --reserved-instances-id 5ec28771-05ff-4b9b-aa31-9e57dexample \
    --instance-count 3 \
    --price-schedules CurrencyCode=USD,Price=25.50 \
    --client-token 550e8400-e29b-41d4-a716-446655440000
```

- For API details, see CreateReservedInstancesListing in *AWS CLI Command Reference*.

`create-restore-image-task`

The following code example shows how to use `create-restore-image-task`.

AWS CLI

To restore an AMI from an S3 bucket

The following `create-restore-image-task` example restores an AMI from an S3 bucket. Use the values for `S3ObjectKey `` and ``Bucket` from the `describe-store-image-tasks` output, specify the object key of the AMI and the name of the S3 bucket to which the AMI was copied, and specify the name for the restored AMI. The name must be unique for AMIs in the Region for this account. The restored AMI will receive a new AMI ID.

```
aws ec2 create-restore-image-task \
    --object-key ami-1234567890abcdef0.bin \
    --bucket my-ami-bucket \
    --name 'New AMI Name'
```

Output:

```
{
    "ImageId": "ami-0eab20fe36f83e1a8"
}
```

For more information, see Store and restore an AMI using S3 in the *Amazon EC2 User Guide*.

- For API details, see CreateRestoreImageTask in *AWS CLI Command Reference*.

`create-route-table`

The following code example shows how to use `create-route-table`.

AWS CLI

To create a route table

This example creates a route table for the specified VPC.

Command:

```
aws ec2 create-route-table --vpc-id vpc-a01106c2
```

Output:

```
{
    "RouteTable": {
        "Associations": [],
        "RouteTableId": "rtb-22574640",
        "VpcId": "vpc-a01106c2",
        "PropagatingVgws": [],
        "Tags": [],
        "Routes": [
            {
                "GatewayId": "local",
                "DestinationCidrBlock": "10.0.0.0/16",
                "State": "active"
            }
        ]
    }
}
```

- For API details, see CreateRouteTable in *AWS CLI Command Reference*.

`create-route`

The following code example shows how to use `create-route`.

AWS CLI

To create a route

This example creates a route for the specified route table. The route matches all IPv4 traffic (`0.0.0.0/0`) and routes it to the specified Internet gateway. If the command succeeds, no output is returned.

Command:

```
aws ec2 create-route --route-table-id rtb-22574640 --destination-cidr-block 0.0.0.0/0 --gateway-id igw-c0a643a9
```

This example command creates a route in route table rtb-g8ff4ea2. The route matches traffic for the IPv4 CIDR block 10.0.0.0/16 and routes it to VPC peering connection, pcx-111aaa22. This route enables traffic to be directed to the peer VPC in the VPC peering connection. If the command succeeds, no output is returned.

Command:

```
aws ec2 create-route --route-table-id rtb-g8ff4ea2 --destination-cidr-block 10.0.0.0/16 --vpc-peering-connection-id pcx-1a2b3c4d
```

This example creates a route in the specified route table that matches all IPv6 traffic (`::/0`) and routes it to the specified egress-only Internet gateway.

Command:

```
aws ec2 create-route --route-table-id rtb-dce620b8 --destination-ipv6-cidr-block ::/0 --egress-only-internet-gateway-id eigw-01eadbd45ecd7943f
```

- For API details, see CreateRoute in *AWS CLI Command Reference*.

`create-security-group`

The following code example shows how to use `create-security-group`.

AWS CLI

To create a security group for EC2-Classic

This example creates a security group named `MySecurityGroup`.

Command:

```
aws ec2 create-security-group --group-name MySecurityGroup --description "My
 security group"
```

Output:

```
{
    "GroupId": "sg-903004f8"
}
```

To create a security group for EC2-VPC

This example creates a security group named `MySecurityGroup` for the specified VPC.

Command:

```
aws ec2 create-security-group --group-name MySecurityGroup --description "My
 security group" --vpc-id vpc-1a2b3c4d
```

Output:

```
{
    "GroupId": "sg-903004f8"
}
```

For more information, see Using Security Groups in the *AWS Command Line Interface User Guide*.

- For API details, see CreateSecurityGroup in *AWS CLI Command Reference*.

`create-snapshot`

The following code example shows how to use `create-snapshot`.

AWS CLI

To create a snapshot

This example command creates a snapshot of the volume with a volume ID of `vol-1234567890abcdef0` and a short description to identify the snapshot.

Command:

```
aws ec2 create-snapshot --volume-id vol-1234567890abcdef0 --description "This is my
 root volume snapshot"
```

Output:

```
{
    "Description": "This is my root volume snapshot",
    "Tags": [],
    "Encrypted": false,
    "VolumeId": "vol-1234567890abcdef0",
    "State": "pending",
    "VolumeSize": 8,
    "StartTime": "2018-02-28T21:06:01.000Z",
    "Progress": "",
    "OwnerId": "012345678910",
    "SnapshotId": "snap-066877671789bd71b"
}
```

To create a snapshot with tags

This example command creates a snapshot and applies two tags: purpose=prod and costcenter=123.

Command:

```
aws ec2 create-snapshot --volume-id vol-1234567890abcdef0 --description 'Prod
 backup' --tag-specifications 'ResourceType=snapshot,Tags=[{Key=purpose,Value=prod},
{Key=costcenter,Value=123}]'
```

Output:

```
{
    "Description": "Prod backup",
    "Tags": [
        {
            "Value": "prod",
            "Key": "purpose"
```

```
        },
        {
            "Value": "123",
            "Key": "costcenter"
        }
    ],
    "Encrypted": false,
    "VolumeId": "vol-1234567890abcdef0",
    "State": "pending",
    "VolumeSize": 8,
    "StartTime": "2018-02-28T21:06:06.000Z",
    "Progress": "",
    "OwnerId": "012345678910",
    "SnapshotId": "snap-09ed24a70bc19bbe4"
}
```

- For API details, see CreateSnapshot in *AWS CLI Command Reference*.

`create-snapshots`

The following code example shows how to use `create-snapshots`.

AWS CLI

Example 1: To create a multi-volume snapshot

The following `create-snapshots` example creates snapshots of all volumes attached to the specified instance.

```
aws ec2 create-snapshots \
    --instance-specification InstanceId=i-1234567890abcdef0 \
    --description "This is snapshot of a volume from my-instance"
```

Output:

```
{
    "Snapshots": [
        {
            "Description": "This is a snapshot of a volume from my-instance",
            "Tags": [],
            "Encrypted": false,
            "VolumeId": "vol-0a01d2d5a34697479",
```

```
                "State": "pending",
                "VolumeSize": 16,
                "StartTime": "2019-08-05T16:58:19.000Z",
                "Progress": "",
                "OwnerId": "123456789012",
                "SnapshotId": "snap-07f30e3909aa0045e"
            },
            {
                "Description": "This is a snapshot of a volume from my-instance",
                "Tags": [],
                "Encrypted": false,
                "VolumeId": "vol-02d0d4947008cb1a2",
                "State": "pending",
                "VolumeSize": 20,
                "StartTime": "2019-08-05T16:58:19.000Z",
                "Progress": "",
                "OwnerId": "123456789012",
                "SnapshotId": "snap-0ec20b602264aad48"
            },
            ...
    ]
}
```

Example 2: To create a multi-volume snapshot with tags from the source volume

The following `create-snapshots` example creates snapshots of all volumes attached to the specified instance and copies the tags from each volume to its corresponding snapshot.

```
aws ec2 create-snapshots \
    --instance-specification InstanceId=i-1234567890abcdef0 \
    --copy-tags-from-source volume \
    --description "This is snapshot of a volume from my-instance"
```

Output:

```
{
    "Snapshots": [
        {
            "Description": "This is a snapshot of a volume from my-instance",
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "my-volume"
```

```
                }
            ],
            "Encrypted": false,
            "VolumeId": "vol-02d0d4947008cb1a2",
            "State": "pending",
            "VolumeSize": 20,
            "StartTime": "2019-08-05T16:53:04.000Z",
            "Progress": "",
            "OwnerId": "123456789012",
            "SnapshotId": "snap-053bfaeb821a458dd"
        }
        ...
    ]
}
```

Example 3: To create a multi-volume snapshot not including the root volume

The following `create-snapshots` example creates a snapshot of all volumes attached to the specified instance except for the root volume.

```
aws ec2 create-snapshots \
    --instance-specification InstanceId=i-1234567890abcdef0,ExcludeBootVolume=true
```

See example 1 for sample output.

Example 4: To create a multi-volume snapshot and add tags

The following `create-snapshots` example creates snapshots of all volumes attached to the specified instance and adds two tags to each snapshot.

```
aws ec2 create-snapshots \
    --instance-specification InstanceId=i-1234567890abcdef0 \
    --tag-specifications 'ResourceType=snapshot,Tags=[{Key=Name,Value=backup},
{Key=costcenter,Value=123}]'
```

See example 1 for sample output.

- For API details, see CreateSnapshots in *AWS CLI Command Reference*.

`create-spot-datafeed-subscription`

The following code example shows how to use `create-spot-datafeed-subscription`.

AWS CLI

To create a Spot Instance data feed

The following `create-spot-datafeed-subscription` example creates a Spot Instance data feed.

```
aws ec2 create-spot-datafeed-subscription \
    --bucket amzn-s3-demo-bucket \
    --prefix spot-data-feed
```

Output:

```
{
    "SpotDatafeedSubscription": {
        "Bucket": "amzn-s3-demo-bucket",
        "OwnerId": "123456789012",
        "Prefix": "spot-data-feed",
        "State": "Active"
    }
}
```

The data feed is stored in the Amazon S3 bucket that you specified. The file names for this data feed have the following format.

```
amzn-s3-demo-bucket.s3.amazonaws.com/spot-data-feed/123456789012.YYYY-MM-DD-
HH.n.abcd1234.gz
```

For more information, see Spot Instance data feed in the *Amazon EC2 User Guide*.

- For API details, see CreateSpotDatafeedSubscription in *AWS CLI Command Reference*.

`create-store-image-task`

The following code example shows how to use `create-store-image-task`.

AWS CLI

To store an AMI in an S3 bucket

The following `create-store-image-task` example stores an AMI in an S3 bucket. Specify the ID of the AMI and the name of the S3 bucket in which to store the AMI.

```
aws ec2 create-store-image-task \
  --image-id ami-1234567890abcdef0 \
  --bucket my-ami-bucket
```

Output:

```
{
    "ObjectKey": "ami-1234567890abcdef0.bin"
}
```

For more information, see Store and restore an AMI using S3 in the *Amazon EC2 User Guide*.

- For API details, see CreateStoreImageTask in *AWS CLI Command Reference*.

`create-subnet-cidr-reservation`

The following code example shows how to use `create-subnet-cidr-reservation`.

AWS CLI

To create a subnet CIDR reservation

The following `create-subnet-cidr-reservation` example creates a subnet CIDR reservation for the specified subnet and CIDR range.

```
aws ec2 create-subnet-cidr-reservation \
    --subnet-id subnet-03c51e2eEXAMPLE \
    --reservation-type prefix \
    --cidr 10.1.0.20/26
```

Output:

```
{
    "SubnetCidrReservation": {
        "SubnetCidrReservationId": "scr-044f977c4eEXAMPLE",
        "SubnetId": "subnet-03c51e2e6cEXAMPLE",
        "Cidr": "10.1.0.16/28",
        "ReservationType": "prefix",
        "OwnerId": "123456789012"
    }
}
```

For more information, see Subnet CIDR reservations in the *Amazon VPC User Guide*.

- For API details, see CreateSubnetCidrReservation in *AWS CLI Command Reference*.

`create-subnet`

The following code example shows how to use `create-subnet`.

AWS CLI

Example 1: To create a subnet with an IPv4 CIDR block only

The following `create-subnet` example creates a subnet in the specified VPC with the specified IPv4 CIDR block.

```
aws ec2 create-subnet \
    --vpc-id vpc-081ec835f3EXAMPLE \
    --cidr-block 10.0.0.0/24 \
    --tag-specifications ResourceType=subnet,Tags=[{Key=Name,Value=my-ipv4-only-subnet}]
```

Output:

```
{
    "Subnet": {
        "AvailabilityZone": "us-west-2a",
        "AvailabilityZoneId": "usw2-az2",
        "AvailableIpAddressCount": 251,
        "CidrBlock": "10.0.0.0/24",
        "DefaultForAz": false,
        "MapPublicIpOnLaunch": false,
        "State": "available",
        "SubnetId": "subnet-0e99b93155EXAMPLE",
        "VpcId": "vpc-081ec835f3EXAMPLE",
        "OwnerId": "123456789012",
        "AssignIpv6AddressOnCreation": false,
        "Ipv6CidrBlockAssociationSet": [],
        "Tags": [
            {
                "Key": "Name",
                "Value": "my-ipv4-only-subnet"
            }
        ],
```

```
        "SubnetArn": "arn:aws:ec2:us-west-2:123456789012:subnet/
subnet-0e99b93155EXAMPLE"
    }
}
```

Example 2: To create a subnet with both IPv4 and IPv6 CIDR blocks

The following `create-subnet` example creates a subnet in the specified VPC with the specified IPv4 and IPv6 CIDR blocks.

```
aws ec2 create-subnet \
    --vpc-id vpc-081ec835f3EXAMPLE \
    --cidr-block 10.0.0.0/24 \
    --ipv6-cidr-block 2600:1f16:cfe:3660::/64 \
    --tag-specifications ResourceType=subnet,Tags=[{Key=Name,Value=my-ipv4-ipv6-
subnet}]
```

Output:

```
{
    "Subnet": {
        "AvailabilityZone": "us-west-2a",
        "AvailabilityZoneId": "usw2-az2",
        "AvailableIpAddressCount": 251,
        "CidrBlock": "10.0.0.0/24",
        "DefaultForAz": false,
        "MapPublicIpOnLaunch": false,
        "State": "available",
        "SubnetId": "subnet-0736441d38EXAMPLE",
        "VpcId": "vpc-081ec835f3EXAMPLE",
        "OwnerId": "123456789012",
        "AssignIpv6AddressOnCreation": false,
        "Ipv6CidrBlockAssociationSet": [
            {
                "AssociationId": "subnet-cidr-assoc-06c5f904499fcc623",
                "Ipv6CidrBlock": "2600:1f13:cfe:3660::/64",
                "Ipv6CidrBlockState": {
                    "State": "associating"
                }
            }
        ],
        "Tags": [
            {
```

```
                "Key": "Name",
                "Value": "my-ipv4-ipv6-subnet"
            }
        ],
        "SubnetArn": "arn:aws:ec2:us-west-2:123456789012:subnet/
subnet-0736441d38EXAMPLE"
    }
}
```

Example 3: To create a subnet with an IPv6 CIDR block only

The following `create-subnet` example creates a subnet in the specified VPC with the specified IPv6 CIDR block.

```
aws ec2 create-subnet \
    --vpc-id vpc-081ec835f3EXAMPLE \
    --ipv6-native \
    --ipv6-cidr-block 2600:1f16:115:200::/64 \
    --tag-specifications ResourceType=subnet,Tags=[{Key=Name,Value=my-ipv6-only-
subnet}]
```

Output:

```
{
    "Subnet": {
        "AvailabilityZone": "us-west-2a",
        "AvailabilityZoneId": "usw2-az2",
        "AvailableIpAddressCount": 0,
        "DefaultForAz": false,
        "MapPublicIpOnLaunch": false,
        "State": "available",
        "SubnetId": "subnet-03f720e7deEXAMPLE",
        "VpcId": "vpc-081ec835f3EXAMPLE",
        "OwnerId": "123456789012",
        "AssignIpv6AddressOnCreation": true,
        "Ipv6CidrBlockAssociationSet": [
            {
                "AssociationId": "subnet-cidr-assoc-01ef639edde556709",
                "Ipv6CidrBlock": "2600:1f13:cfe:3660::/64",
                "Ipv6CidrBlockState": {
                    "State": "associating"
                }
            }
```

```
        ],
        "Tags": [
            {
                "Key": "Name",
                "Value": "my-ipv6-only-subnet"
            }
        ],
        "SubnetArn": "arn:aws:ec2:us-west-2:123456789012:subnet/
subnet-03f720e7deEXAMPLE"
    }
}
```

For more information, see VPCs and subnets in the *Amazon VPC User Guide*.

- For API details, see CreateSubnet in *AWS CLI Command Reference*.

`create-tags`

The following code example shows how to use `create-tags`.

AWS CLI

Example 1: To add a tag to a resource

The following `create-tags` example adds the tag `Stack=production` to the specified image, or overwrites an existing tag for the AMI where the tag key is `Stack`.

```
aws ec2 create-tags \
    --resources ami-1234567890abcdef0 \
    --tags Key=Stack,Value=production
```

This command produces no output

Example 2: To add tags to multiple resources

The following `create-tags` example adds (or overwrites) two tags for an AMI and an instance. One of the tags has a key (`webserver`) but no value (value is set to an empty string). The other tag has a key (`stack`) and a value (`Production`).

```
aws ec2 create-tags \
    --resources ami-1a2b3c4d i-1234567890abcdef0 \
    --tags Key=webserver,Value=   Key=stack,Value=Production
```

This command produces no output

Example 3: To add tags containing special characters

The following `create-tags` examples add the tag `[Group]=test` for an instance. The square brackets ([and]) are special characters, and must be escaped. The following examples also use the line continuation character appropriate for each environment.

If you are using Windows, surround the element that has special characters with double quotes ("), and then precede each double quote character with a backslash (\) as follows.

```
aws ec2 create-tags ^
    --resources i-1234567890abcdef0 ^
    --tags Key=\"[Group]\",Value=test
```

If you are using Windows PowerShell, surround the element the value that has special characters with double quotes ("), precede each double quote character with a backslash (\), and then surround the entire key and value structure with single quotes (') as follows.

```
aws ec2 create-tags `
    --resources i-1234567890abcdef0 `
    --tags 'Key=\"[Group]\",Value=test'
```

If you are using Linux or OS X, surround the element that has special characters with double quotes ("), and then surround the entire key and value structure with single quotes (') as follows.

```
aws ec2 create-tags \
    --resources i-1234567890abcdef0 \
    --tags 'Key="[Group]",Value=test'
```

For more information, see Tag your Amazon EC2 resources in the *Amazon EC2 User Guide*.

- For API details, see CreateTags in *AWS CLI Command Reference*.

`create-traffic-mirror-filter-rule`

The following code example shows how to use `create-traffic-mirror-filter-rule`.

AWS CLI

To create a filter rule for incoming TCP traffic

The following `create-traffic-mirror-filter-rule` example creates a rule that you can use to mirror all incoming TCP traffic. Before you run this command, use `create-traffic-mirror-filter` to create the the traffic mirror filter.

```
aws ec2 create-traffic-mirror-filter-rule \
    --description 'TCP Rule' \
    --destination-cidr-block 0.0.0.0/0  \
    --protocol 6 \
    --rule-action accept \
    --rule-number 1 \
    --source-cidr-block 0.0.0.0/0 \
    --traffic-direction ingress \
    --traffic-mirror-filter-id tmf-04812ff784b25ae67
```

Output:

```
{
    "TrafficMirrorFilterRule": {
        "DestinationCidrBlock": "0.0.0.0/0",
        "TrafficMirrorFilterId": "tmf-04812ff784b25ae67",
        "TrafficMirrorFilterRuleId": "tmfr-02d20d996673f3732",
        "SourceCidrBlock": "0.0.0.0/0",
        "TrafficDirection": "ingress",
        "Description": "TCP Rule",
        "RuleNumber": 1,
        "RuleAction": "accept",
        "Protocol": 6
    },
    "ClientToken": "4752b573-40a6-4eac-a8a4-a72058761219"
}
```

For more information, see Create a traffic mirror filter in the *Traffic Mirroring Guide*.

- For API details, see CreateTrafficMirrorFilterRule in *AWS CLI Command Reference*.

`create-traffic-mirror-filter`

The following code example shows how to use `create-traffic-mirror-filter`.

AWS CLI

To create a traffic mirror filter

The following `create-traffic-mirror-filter` example creates a traffic mirror filter. After you create the filter, use `create-traffic-mirror-filter-rule` to add rules.

```
aws ec2 create-traffic-mirror-filter \
    --description 'TCP Filter'
```

Output:

```
{
    "ClientToken": "28908518-100b-4987-8233-8c744EXAMPLE",
    "TrafficMirrorFilter": {
        "TrafficMirrorFilterId": "tmf-04812ff784EXAMPLE",
        "Description": "TCP Filter",
        "EgressFilterRules": [],
        "IngressFilterRules": [],
        "Tags": [],
        "NetworkServices": []
    }
}
```

For more information, see Create a traffic mirror filter in the *Traffic Mirroring Guide*.

- For API details, see CreateTrafficMirrorFilter in *AWS CLI Command Reference*.

`create-traffic-mirror-session`

The following code example shows how to use `create-traffic-mirror-session`.

AWS CLI

To create a traffic mirror session

The following `create-traffic-mirror-session` command creates a traffic mirror session for the specified source and target for 25 bytes of the packet.

```
aws ec2 create-traffic-mirror-session \
    --description 'example session' \
    --traffic-mirror-target-id tmt-07f75d8feeEXAMPLE \
    --network-interface-id eni-070203f901EXAMPLE \
    --session-number 1  \
    --packet-length 25 \
    --traffic-mirror-filter-id tmf-04812ff784EXAMPLE
```

Output:

```
{
    "TrafficMirrorSession": {
        "TrafficMirrorSessionId": "tms-08a33b1214EXAMPLE",
        "TrafficMirrorTargetId": "tmt-07f75d8feeEXAMPLE",
        "TrafficMirrorFilterId": "tmf-04812ff784EXAMPLE",
        "NetworkInterfaceId": "eni-070203f901EXAMPLE",
        "OwnerId": "111122223333",
        "PacketLength": 25,
        "SessionNumber": 1,
        "VirtualNetworkId": 7159709,
        "Description": "example session",
        "Tags": []
    },
    "ClientToken": "5236cffc-ee13-4a32-bb5b-388d9da09d96"
}
```

For more information, see Create a traffic mirror session in the *Traffic Mirroring Guide*.

- For API details, see CreateTrafficMirrorSession in *AWS CLI Command Reference*.

`create-traffic-mirror-target`

The following code example shows how to use `create-traffic-mirror-target`.

AWS CLI

To create a a Network Load Balancer traffic mirror target

The following `create-traffic-mirror-target` example creates a Network Load Balancer traffic mirror target.

```
aws ec2 create-traffic-mirror-target \
    --description 'Example Network Load Balancer Target' \
    --network-load-balancer-arn arn:aws:elasticloadbalancing:us-
east-1:111122223333:loadbalancer/net/NLB/7cdec873EXAMPLE
```

Output:

```
{
    "TrafficMirrorTarget": {
```

```
        "Type": "network-load-balancer",
        "Tags": [],
        "Description": "Example Network Load Balancer Target",
        "OwnerId": "111122223333",
        "NetworkLoadBalancerArn": "arn:aws:elasticloadbalancing:us-
east-1:724145273726:loadbalancer/net/NLB/7cdec873EXAMPLE",
        "TrafficMirrorTargetId": "tmt-0dabe9b0a6EXAMPLE"
    },
    "ClientToken": "d5c090f5-8a0f-49c7-8281-72c796a21f72"
}
```

To create a network traffic mirror target

The following `create-traffic-mirror-target` example creates a network interface Traffic Mirror target.

```
aws ec2 create-traffic-mirror-target \
    --description 'Network interface target' \
    --network-interface-id eni-eni-01f6f631eEXAMPLE
```

Output:

```
{
    "ClientToken": "5289a345-0358-4e62-93d5-47ef3061d65e",
    "TrafficMirrorTarget": {
        "Description": "Network interface target",
        "NetworkInterfaceId": "eni-01f6f631eEXAMPLE",
        "TrafficMirrorTargetId": "tmt-02dcdbe2abEXAMPLE",
        "OwnerId": "111122223333",
        "Type": "network-interface",
        "Tags": []
    }
}
```

For more information, see Create a traffic mirror target in the *Traffic Mirroring Guide*.

- For API details, see CreateTrafficMirrorTarget in *AWS CLI Command Reference*.

`create-transit-gateway-connect-peer`

The following code example shows how to use `create-transit-gateway-connect-peer`.

AWS CLI

To create a Transit Gateway Connect peer

The following `create-transit-gateway-connect-peer` example creates a Connect peer.

```
aws ec2 create-transit-gateway-connect-peer \
    --transit-gateway-attachment-id tgw-attach-0f0927767cEXAMPLE \
    --peer-address 172.31.1.11 \
    --inside-cidr-blocks 169.254.6.0/29
```

Output:

```
{
    "TransitGatewayConnectPeer": {
        "TransitGatewayAttachmentId": "tgw-attach-0f0927767cEXAMPLE",
        "TransitGatewayConnectPeerId": "tgw-connect-peer-0666adbac4EXAMPLE",
        "State": "pending",
        "CreationTime": "2021-10-13T03:35:17.000Z",
        "ConnectPeerConfiguration": {
            "TransitGatewayAddress": "10.0.0.234",
            "PeerAddress": "172.31.1.11",
            "InsideCidrBlocks": [
                "169.254.6.0/29"
            ],
            "Protocol": "gre",
            "BgpConfigurations": [
                {
                    "TransitGatewayAsn": 64512,
                    "PeerAsn": 64512,
                    "TransitGatewayAddress": "169.254.6.2",
                    "PeerAddress": "169.254.6.1",
                    "BgpStatus": "down"
                },
                {
                    "TransitGatewayAsn": 64512,
                    "PeerAsn": 64512,
                    "TransitGatewayAddress": "169.254.6.3",
                    "PeerAddress": "169.254.6.1",
                    "BgpStatus": "down"
                }
            ]
        }
```

```
    }
}
```

For more information, see [Transit gateway Connect attachments and Transit Gateway Connect peers]() in the *Transit Gateways Guide*.

- For API details, see [CreateTransitGatewayConnectPeer]() in *AWS CLI Command Reference*.

`create-transit-gateway-connect`

The following code example shows how to use `create-transit-gateway-connect`.

AWS CLI

To create a transit gateway Connect attachment

The following `create-transit-gateway-connect` example creates a Connect attachment, with the "gre" protocol, for the specified attachment.

```
aws ec2 create-transit-gateway-connect \
    --transport-transit-gateway-attachment-id tgw-attach-0a89069f57EXAMPLE \
    --options "Protocol=gre"
```

Output:

```
{
    "TransitGatewayConnect": {
        "TransitGatewayAttachmentId": "tgw-attach-037012e5dcEXAMPLE",
        "TransportTransitGatewayAttachmentId": "tgw-attach-0a89069f57EXAMPLE",
        "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
        "State": "pending",
        "CreationTime": "2021-03-09T19:59:17+00:00",
        "Options": {
            "Protocol": "gre"
        }
    }
}
```

For more information, see [Transit gateway Connect attachments and Transit Gateway Connect peers]() in the *Transit Gateways Guide*.

- For API details, see [CreateTransitGatewayConnect]() in *AWS CLI Command Reference*.

`create-transit-gateway-multicast-domain`

The following code example shows how to use `create-transit-gateway-multicast-domain`.

AWS CLI

Example 1: To create an IGMP multicast domain

The following `create-transit-gateway-multicast-domain` example creates a multicast domain for the specified transit gateway. With static sources disabled, any instances in subnets associated with the multicast domain can send multicast traffic. If at least one member uses the IGMP protocol, you must enable IGMPv2 support.

```
aws ec2 create-transit-gateway-multicast-domain \
    --transit-gateway-id tgw-0bf0bffefaEXAMPLE \
    --options StaticSourcesSupport=disable,Igmpv2Support=enable
```

Output:

```
{
    "TransitGatewayMulticastDomain": {
        "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c9e29e2a7EXAMPLE",
        "TransitGatewayId": "tgw-0bf0bffefaEXAMPLE",
        "TransitGatewayMulticastDomainArn": "arn:aws:ec2:us-
west-2:123456789012:transit-gateway-multicast-domain/tgw-mcast-
domain-0c9e29e2a7EXAMPLE",
        "OwnerId": "123456789012",
        "Options": {
            "Igmpv2Support": "enable",
            "StaticSourcesSupport": "disable",
            "AutoAcceptSharedAssociations": "disable"
        },
        "State": "pending",
        "CreationTime": "2021-09-29T22:17:13.000Z"
    }
}
```

Example 2: To create a static multicast domain

The following `create-transit-gateway-multicast-domain` example creates a multicast domain for the specified transit gateway. With static sources enabled, you must statically add sources.

```
aws ec2 create-transit-gateway-multicast-domain \
    --transit-gateway-id tgw-0bf0bffefaEXAMPLE \
    --options StaticSourcesSupport=enable,Igmpv2Support=disable
```

Output:

```
{
    "TransitGatewayMulticastDomain": {
        "TransitGatewayMulticastDomainId": "tgw-mcast-domain-000fb24d04EXAMPLE",
        "TransitGatewayId": "tgw-0bf0bffefaEXAMPLE",
        "TransitGatewayMulticastDomainArn": "arn:aws:ec2:us-
west-2:123456789012:transit-gateway-multicast-domain/tgw-mcast-
domain-000fb24d04EXAMPLE",
        "OwnerId": "123456789012",
        "Options": {
            "Igmpv2Support": "disable",
            "StaticSourcesSupport": "enable",
            "AutoAcceptSharedAssociations": "disable"
        },
        "State": "pending",
        "CreationTime": "2021-09-29T22:20:19.000Z"
    }
}
```

For more information, see Managing multicast domains in the *Transit Gateways Guide*.

- For API details, see CreateTransitGatewayMulticastDomain in *AWS CLI Command Reference*.

`create-transit-gateway-peering-attachment`

The following code example shows how to use `create-transit-gateway-peering-attachment`.

AWS CLI

To create a transit gateway peering attachment

The following `create-transit-gateway-peering-attachment` example creates a peering attachment request between the two specified transit gateways.

```
aws ec2 create-transit-gateway-peering-attachment \
```

```
    --transit-gateway-id tgw-123abc05e04123abc \
    --peer-transit-gateway-id tgw-11223344aabbcc112 \
    --peer-account-id 123456789012 \
    --peer-region us-east-2
```

Output:

```
{
    "TransitGatewayPeeringAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-4455667788aabbccd",
        "RequesterTgwInfo": {
            "TransitGatewayId": "tgw-123abc05e04123abc",
            "OwnerId": "123456789012",
            "Region": "us-west-2"
        },
        "AccepterTgwInfo": {
            "TransitGatewayId": "tgw-11223344aabbcc112",
            "OwnerId": "123456789012",
            "Region": "us-east-2"
        },
        "State": "initiatingRequest",
        "CreationTime": "2019-12-09T11:38:05.000Z"
    }
}
```

For more information, see Transit Gateway Peering Attachments in the *Transit Gateways Guide*.

- For API details, see CreateTransitGatewayPeeringAttachment in *AWS CLI Command Reference*.

`create-transit-gateway-policy-table`

The following code example shows how to use `create-transit-gateway-policy-table`.

AWS CLI

To create a transit gateway policy table

The following `create-transit-gateway-policy-table` example creates a transit gateway policy table for the specified transit gateway.

```
aws ec2 create-transit-gateway-policy-table \
    --transit-gateway-id tgw-067f8505c18f0bd6e
```

Output:

```
{
    "TransitGatewayPolicyTable": {
        "TransitGatewayPolicyTableId": "tgw-ptb-0a16f134b78668a81",
        "TransitGatewayId": "tgw-067f8505c18f0bd6e",
        "State": "pending",
        "CreationTime": "2023-11-28T16:36:43+00:00"
    }
}
```

For more information, see [Transit gateway policy tables]() in the *Transit Gateway User Guide*.

- For API details, see [CreateTransitGatewayPolicyTable]() in *AWS CLI Command Reference*.

`create-transit-gateway-prefix-list-reference`

The following code example shows how to use `create-transit-gateway-prefix-list-reference`.

AWS CLI

To create a reference to a prefix list

The following `create-transit-gateway-prefix-list-reference` example creates a reference to the specified prefix list in the specified transit gateway route table.

```
aws ec2 create-transit-gateway-prefix-list-reference \
    --transit-gateway-route-table-id tgw-rtb-0123456789abcd123 \
    --prefix-list-id pl-11111122222222333 \
    --transit-gateway-attachment-id tgw-attach-aaaaaabbbbbb11111
```

Output:

```
{
    "TransitGatewayPrefixListReference": {
        "TransitGatewayRouteTableId": "tgw-rtb-0123456789abcd123",
        "PrefixListId": "pl-11111122222222333",
        "PrefixListOwnerId": "123456789012",
        "State": "pending",
        "Blackhole": false,
```

```
        "TransitGatewayAttachment": {
            "TransitGatewayAttachmentId": "tgw-attach-aaaaaabbbbbb11111",
            "ResourceType": "vpc",
            "ResourceId": "vpc-112233445566aabbc"
        }
    }
}
```

For more information, see Create a prefix list reference in the *Transit Gateways Guide*.

- For API details, see CreateTransitGatewayPrefixListReference in *AWS CLI Command Reference*.

`create-transit-gateway-route-table`

The following code example shows how to use `create-transit-gateway-route-table`.

AWS CLI

To create a Transit Gateway Route Table

The following `create-transit-gateway-route-table` example creates a route table for the specified transit gateway.

```
aws ec2 create-transit-gateway-route-table \
    --transit-gateway-id tgw-0262a0e521EXAMPLE
```

Output:

```
{
    "TransitGatewayRouteTable": {
        "TransitGatewayRouteTableId": "tgw-rtb-0960981be7EXAMPLE",
        "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
        "State": "pending",
        "DefaultAssociationRouteTable": false,
        "DefaultPropagationRouteTable": false,
        "CreationTime": "2019-07-10T19:01:46.000Z"
    }
}
```

For more information, see Create a transit gateway route table in the *Transit Gateways Guide*.

- For API details, see CreateTransitGatewayRouteTable in *AWS CLI Command Reference*.

`create-transit-gateway-route`

The following code example shows how to use `create-transit-gateway-route`.

AWS CLI

To create a transit gateway route

The following `create-transit-gateway-route` example creates a route, with the specified destination, for the specified route table.

```
aws ec2 create-transit-gateway-route \
    --destination-cidr-block 10.0.2.0/24 \
    --transit-gateway-route-table-id tgw-rtb-0b6f6aaa01EXAMPLE \
    --transit-gateway-attachment-id tgw-attach-0b5968d3b6EXAMPLE
```

Output:

```
{
    "Route": {
        "DestinationCidrBlock": "10.0.2.0/24",
        "TransitGatewayAttachments": [
            {
                "ResourceId": "vpc-0065acced4EXAMPLE",
                "TransitGatewayAttachmentId": "tgw-attach-0b5968d3b6EXAMPLE",
                "ResourceType": "vpc"
            }
        ],
        "Type": "static",
        "State": "active"
    }
}
```

For more information, see Transit gateway route tables in the *Transit Gateways Guide*.

- For API details, see CreateTransitGatewayRoute in *AWS CLI Command Reference*.

`create-transit-gateway-vpc-attachment`

The following code example shows how to use `create-transit-gateway-vpc-attachment`.

AWS CLI

Example 1: To associate a transit gateway with a VPC

The following `create-transit-gateway-vpc-attachment` example creates a transit gateway attachment to the specified VPC.

```
aws ec2 create-transit-gateway-vpc-attachment \
    --transit-gateway-id tgw-0262a0e521EXAMPLE \
    --vpc-id vpc-07e8ffd50f49335df \
    --subnet-id subnet-0752213d59EXAMPLE
```

Output:

```
{
    "TransitGatewayVpcAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-0a34fe6b4fEXAMPLE",
        "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
        "VpcId": "vpc-07e8ffd50fEXAMPLE",
        "VpcOwnerId": "111122223333",
        "State": "pending",
        "SubnetIds": [
            "subnet-0752213d59EXAMPLE"
        ],
        "CreationTime": "2019-07-10T17:33:46.000Z",
        "Options": {
            "DnsSupport": "enable",
            "Ipv6Support": "disable"
        }
    }
}
```

For more information, see Create a transit gateway attachment to a VPC in the *Transit Gateways Guide*.

Example 2: To associate a transit gateway with multiple subnets in a VPC

The following `create-transit-gateway-vpc-attachment` example creates a transit gateway attachment to the specified VPC and subnets.

```
aws ec2 create-transit-gateway-vpc-attachment \
```

```
    --transit-gateway-id tgw-02f776b1a7EXAMPLE  \
    --vpc-id vpc-3EXAMPLE \
    --subnet-ids "subnet-dEXAMPLE" "subnet-6EXAMPLE"
```

Output:

```
{
    "TransitGatewayVpcAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-0e141e0bebEXAMPLE",
        "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
        "VpcId": "vpc-3EXAMPLE",
        "VpcOwnerId": "111122223333",
        "State": "pending",
        "SubnetIds": [
            "subnet-6EXAMPLE",
            "subnet-dEXAMPLE"
        ],
        "CreationTime": "2019-12-17T20:07:52.000Z",
        "Options": {
            "DnsSupport": "enable",
            "Ipv6Support": "disable"
        }
    }
}
```

For more information, see Create a transit gateway attachment to a VPC in the *Transit Gateways Guide*.

- For API details, see CreateTransitGatewayVpcAttachment in *AWS CLI Command Reference*.

`create-transit-gateway`

The following code example shows how to use `create-transit-gateway`.

AWS CLI

To create a transit gateway

The following `create-transit-gateway` example creates a transit gateway.

```
aws ec2 create-transit-gateway \
    --description MyTGW \
```

```
    --
options AmazonSideAsn=64516,AutoAcceptSharedAttachments=enable,DefaultRouteTableAssociation=
```

Output:

```
{
    "TransitGateway": {
        "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
        "TransitGatewayArn": "arn:aws:ec2:us-east-2:111122223333:transit-gateway/
tgw-0262a0e521EXAMPLE",
        "State": "pending",
        "OwnerId": "111122223333",
        "Description": "MyTGW",
        "CreationTime": "2019-07-10T14:02:12.000Z",
        "Options": {
            "AmazonSideAsn": 64516,
            "AutoAcceptSharedAttachments": "enable",
            "DefaultRouteTableAssociation": "enable",
            "AssociationDefaultRouteTableId": "tgw-rtb-018774adf3EXAMPLE",
            "DefaultRouteTablePropagation": "enable",
            "PropagationDefaultRouteTableId": "tgw-rtb-018774adf3EXAMPLE",
            "VpnEcmpSupport": "enable",
            "DnsSupport": "enable"
        }
    }
}
```

For more information, see Create a transit gateway in the *Transit Gateways Guide*.

- For API details, see CreateTransitGateway in *AWS CLI Command Reference*.

`create-verified-access-endpoint`

The following code example shows how to use `create-verified-access-endpoint`.

AWS CLI

To create a Verified Access endpoint

The following `create-verified-access-endpoint` example creates a Verified Access endpoint for the specified Verified Access group. The specified network interface and security group must belong to the same VPC.

```
aws ec2 create-verified-access-endpoint \
    --verified-access-group-id vagr-0dbe967baf14b7235 \
    --endpoint-type network-interface \
    --attachment-type vpc \
    --domain-certificate-arn arn:aws:acm:us-east-2:123456789012:certificate/
eb065ea0-26f9-4e75-a6ce-0a1a7EXAMPLE \
    --application-domain example.com \
    --endpoint-domain-prefix my-ava-app \
    --security-group-ids sg-004915970c4c8f13a \
    --network-interface-
options NetworkInterfaceId=eni-0aec70418c8d87a0f,Protocol=https,Port=443 \
    --tag-specifications ResourceType=verified-access-
endpoint,Tags=[{Key=Name,Value=my-va-endpoint}]
```

Output:

```
{
    "VerifiedAccessEndpoint": {
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
        "VerifiedAccessEndpointId": "vae-066fac616d4d546f2",
        "ApplicationDomain": "example.com",
        "EndpointType": "network-interface",
        "AttachmentType": "vpc",
        "DomainCertificateArn": "arn:aws:acm:us-east-2:123456789012:certificate/
eb065ea0-26f9-4e75-a6ce-0a1a7EXAMPLE",
        "EndpointDomain": "my-ava-

`create-verified-access-group`

The following code example shows how to use `create-verified-access-group`.

AWS CLI

To create a Verified Access group

The following `create-verified-access-group` example creates a Verified Access group for the specified Verified Access instance.

```
aws ec2 create-verified-access-group \
    --verified-access-instance-id vai-0ce000c0b7643abea \
    --tag-specifications ResourceType=verified-access-
group,Tags=[{Key=Name,Value=my-va-group}]
```

Output:

```
{
    "VerifiedAccessGroup": {
        "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "Description": "",
        "Owner": "123456789012",
        "VerifiedAccessGroupArn": "arn:aws:ec2:us-east-2:123456789012:verified-
access-group/vagr-0dbe967baf14b7235",
        "CreationTime": "2023-08-25T19:55:19",
        "LastUpdatedTime": "2023-08-25T19:55:19",
        "Tags": [
```

```
            {
                "Key": "Name",
                "Value": "my-va-group"
            }
        ]
    }
}
```

For more information, see Verified Access groups in the *AWS Verified Access User Guide*.

- For API details, see CreateVerifiedAccessGroup in *AWS CLI Command Reference*.

`create-verified-access-instance`

The following code example shows how to use `create-verified-access-instance`.

AWS CLI

To create a Verified Access instance

The following `create-verified-access-instance` example creates a Verified Access instance with a Name tag.

```
aws ec2 create-verified-access-instance \
    --tag-specifications ResourceType=verified-access-
instance,Tags=[{Key=Name,Value=my-va-instance}]
```

Output:

```
{
    "VerifiedAccessInstance": {
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "Description": "",
        "VerifiedAccessTrustProviders": [],
        "CreationTime": "2023-08-25T18:27:56",
        "LastUpdatedTime": "2023-08-25T18:27:56",
        "Tags": [
            {
                "Key": "Name",
                "Value": "my-va-instance"
            }
        ]
    }
```

```
}
```

For more information, see Verified Access instances in the *AWS Verified Access User Guide*.

- For API details, see CreateVerifiedAccessInstance in *AWS CLI Command Reference*.

`create-verified-access-trust-provider`

The following code example shows how to use `create-verified-access-trust-provider`.

AWS CLI

To create a Verified Access trust provider

The following `create-verified-access-trust-provider` example sets up a Verified Access trust provider using AWS Identity Center.

```
aws ec2 create-verified-access-trust-provider \
    --trust-provider-type user \
    --user-trust-provider-type iam-identity-center \
    --policy-reference-name idc \
    --tag-specifications ResourceType=verified-access-trust-provider,Tags=[{Key=Name,Value=my-va-trust-provider}]
```

Output:

```
{
    "VerifiedAccessTrustProvider": {
        "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
        "Description": "",
        "TrustProviderType": "user",
        "UserTrustProviderType": "iam-identity-center",
        "PolicyReferenceName": "idc",
        "CreationTime": "2023-08-25T18:40:36",
        "LastUpdatedTime": "2023-08-25T18:40:36",
        "Tags": [
            {
                "Key": "Name",
                "Value": "my-va-trust-provider"
            }
        ]
    }
```

```
}
```

For more information, see Trust providers for Verified Access in the *AWS Verified Access User Guide*.

- For API details, see CreateVerifiedAccessTrustProvider in *AWS CLI Command Reference*.

`create-volume`

The following code example shows how to use `create-volume`.

AWS CLI

To create an empty General Purpose SSD (gp2) volume

The following `create-volume` example creates an 80 GiB General Purpose SSD (gp2) volume in the specified Availability Zone. Note that the current Region must be `us-east-1`, or you can add the `--region` parameter to specify the Region for the command.

```
aws ec2 create-volume \
    --volume-type gp2 \
    --size 80 \
    --availability-zone us-east-1a
```

Output:

```
{
    "AvailabilityZone": "us-east-1a",
    "Tags": [],
    "Encrypted": false,
    "VolumeType": "gp2",
    "VolumeId": "vol-1234567890abcdef0",
    "State": "creating",
    "Iops": 240,
    "SnapshotId": "",
    "CreateTime": "YYYY-MM-DDTHH:MM:SS.000Z",
    "Size": 80
}
```

If you do not specify a volume type, the default volume type is gp2.

```
aws ec2 create-volume \
```

```
    --size 80 \
    --availability-zone us-east-1a
```

Example 2: To create a Provisioned IOPS SSD (io1) volume from a snapshot

The following `create-volume` example creates a Provisioned IOPS SSD (io1) volume with 1000 provisioned IOPS in the specified Availability Zone using the specified snapshot.

```
aws ec2 create-volume \
    --volume-type io1 \
    --iops 1000 \
    --snapshot-id snap-066877671789bd71b \
    --availability-zone us-east-1a
```

Output:

```
{
    "AvailabilityZone": "us-east-1a",
    "Tags": [],
    "Encrypted": false,
    "VolumeType": "io1",
    "VolumeId": "vol-1234567890abcdef0",
    "State": "creating",
    "Iops": 1000,
    "SnapshotId": "snap-066877671789bd71b",
    "CreateTime": "YYYY-MM-DDTHH:MM:SS.000Z",
    "Size": 500
}
```

Example 3: To create an encrypted volume

The following `create-volume` example creates an encrypted volume using the default CMK for EBS encryption. If encryption by default is disabled, you must specify the `--encrypted` parameter as follows.

```
aws ec2 create-volume \
    --size 80 \
    --encrypted \
    --availability-zone us-east-1a
```

Output:

```
{
    "AvailabilityZone": "us-east-1a",
    "Tags": [],
    "Encrypted": true,
    "VolumeType": "gp2",
    "VolumeId": "vol-1234567890abcdef0",
    "State": "creating",
    "Iops": 240,
    "SnapshotId": "",
    "CreateTime": "YYYY-MM-DDTHH:MM:SS.000Z",
    "Size": 80
}
```

If encryption by default is enabled, the following example command creates an encrypted volume, even without the `--encrypted` parameter.

```
aws ec2 create-volume \
    --size 80 \
    --availability-zone us-east-1a
```

If you use the `--kms-key-id` parameter to specify a customer managed CMK, you must specify the `--encrypted` parameter even if encryption by default is enabled.

```
aws ec2 create-volume \
    --volume-type gp2 \
    --size 80 \
    --encrypted \
    --kms-key-id 0ea3fef3-80a7-4778-9d8c-1c0c6EXAMPLE \
    --availability-zone us-east-1a
```

Example 4: To create a volume with tags

The following `create-volume` example creates a volume and adds two tags.

```
aws ec2 create-volume \
    --availability-zone us-east-1a \
    --volume-type gp2 \
    --size 80 \
    --tag-specifications 'ResourceType=volume,Tags=[{Key=purpose,Value=production},
{Key=cost-center,Value=cc123}]'
```

- For API details, see CreateVolume in *AWS CLI Command Reference*.

`create-vpc-endpoint-connection-notification`

The following code example shows how to use `create-vpc-endpoint-connection-notification`.

AWS CLI

To create an endpoint connection notification

This example creates a notification for a specific endpoint service that alerts you when interface endpoints have connected to your service and when endpoints have been accepted for your service.

Command:

```
aws ec2 create-vpc-endpoint-connection-notification --connection-notification-
arn arn:aws:sns:us-east-2:123456789012:VpceNotification --connection-
events Connect Accept --service-id vpce-svc-1237881c0d25a3abc
```

Output:

```
{
   "ConnectionNotification": {
       "ConnectionNotificationState": "Enabled",
       "ConnectionNotificationType": "Topic",
       "ServiceId": "vpce-svc-1237881c0d25a3abc",
       "ConnectionEvents": [
           "Accept",
           "Connect"
       ],
       "ConnectionNotificationId": "vpce-nfn-008776de7e03f5abc",
       "ConnectionNotificationArn": "arn:aws:sns:us-
east-2:123456789012:VpceNotification"
   }
 }
```

- For API details, see CreateVpcEndpointConnectionNotification in *AWS CLI Command Reference*.

`create-vpc-endpoint-service-configuration`

The following code example shows how to use `create-vpc-endpoint-service-configuration`.

AWS CLI

Example 1: To create an endpoint service configuration for an interface endpoint

The following `create-vpc-endpoint-service-configuration` example creates a VPC endpoint service configuration using the Network Load Balancer `nlb-vpce`. This example also specifies that requests to connect to the service through an interface endpoint must be accepted.

```
aws ec2 create-vpc-endpoint-service-configuration \
    --network-load-balancer-arns arn:aws:elasticloadbalancing:us-
east-1:123456789012:loadbalancer/net/nlb-vpce/e94221227f1ba532 \
    --acceptance-required
```

Output:

```
{
   "ServiceConfiguration": {
       "ServiceType": [
           {
               "ServiceType": "Interface"
           }
       ],
       "NetworkLoadBalancerArns": [
           "arn:aws:elasticloadbalancing:us-east-1:123456789012:loadbalancer/net/
nlb-vpce/e94221227f1ba532"
       ],
       "ServiceName": "com.amazonaws.vpce.us-east-1.vpce-svc-03d5ebb7d9579a2b3",
       "ServiceState": "Available",
       "ServiceId": "vpce-svc-03d5ebb7d9579a2b3",
       "AcceptanceRequired": true,
       "AvailabilityZones": [
           "us-east-1d"
       ],
       "BaseEndpointDnsNames": [
           "vpce-svc-03d5ebb7d9579a2b3.us-east-1.vpce.amazonaws.com"
       ]
   }
```

```
}
```

For more information, see [Create an endpoint service](#) in the *AWS PrivateLink User Guide*.

Example 2: To create an endpoint service configuration for a Gateway Load Balancer endpoint

The following `create-vpc-endpoint-service-configuration` example creates a VPC endpoint service configuration using the Gateway Load Balancer `GWLBService`. Requests to connect to the service through a Gateway Load Balancer endpoint are automatically accepted.

```
aws ec2 create-vpc-endpoint-service-configuration \
    --gateway-load-balancer-arns arn:aws:elasticloadbalancing:us-
east-1:123456789012:loadbalancer/gwy/GWLBService/123123123123abcc \
    --no-acceptance-required
```

Output:

```
{
    "ServiceConfiguration": {
        "ServiceType": [
            {
                "ServiceType": "GatewayLoadBalancer"
            }
        ],
        "ServiceId": "vpce-svc-123123a1c43abc123",
        "ServiceName": "com.amazonaws.vpce.us-east-1.vpce-svc-123123a1c43abc123",
        "ServiceState": "Available",
        "AvailabilityZones": [
            "us-east-1d"
        ],
        "AcceptanceRequired": false,
        "ManagesVpcEndpoints": false,
        "GatewayLoadBalancerArns": [
            "arn:aws:elasticloadbalancing:us-east-1:123456789012:loadbalancer/gwy/
GWLBService/123123123123abcc"
        ]
    }
}
```

For more information, see [Create a Gateway Load Balancer endpoint service](#) in the *AWS PrivateLink User Guide*.

- For API details, see CreateVpcEndpointServiceConfiguration in *AWS CLI Command Reference*.

`create-vpc-endpoint`

The following code example shows how to use `create-vpc-endpoint`.

AWS CLI

Example 1: To create a gateway endpoint

The following `create-vpc-endpoint` example creates a gateway VPC endpoint between VPC `vpc-1a2b3c4d` and Amazon S3 in the `us-east-1` region, and associates route table `rtb-11aa22bb` with the endpoint.

```
aws ec2 create-vpc-endpoint \
    --vpc-id vpc-1a2b3c4d \
    --service-name com.amazonaws.us-east-1.s3 \
    --route-table-ids rtb-11aa22bb
```

Output:

```
{
    "VpcEndpoint": {
        "PolicyDocument": "{\"Version\":\"2008-10-17\",\"Statement\":[{\"Sid\":\"\",
\"Effect\":\"Allow\",\"Principal\":\"\*\",\"Action\":\"\*\",\"Resource\":\"\*\"}]}",
        "VpcId": "vpc-1a2b3c4d",
        "State": "available",
        "ServiceName": "com.amazonaws.us-east-1.s3",
        "RouteTableIds": [
            "rtb-11aa22bb"
        ],
        "VpcEndpointId": "vpc-1a2b3c4d",
        "CreationTimestamp": "2015-05-15T09:40:50Z"
    }
}
```

For more information, see Create a gateway endpoint in the *AWS PrivateLink User Guide*.

Example 2: To create an interface endpoint

The following `create-vpc-endpoint` example creates an interface VPC endpoint between VPC `vpc-1a2b3c4d` and Amazon S3 in the `us-east-1` region. The command creates the endpoint in subnet `subnet-1a2b3c4d`, associates it with security group `sg-1a2b3c4d`, and adds a tag with a key of "Service" and a Value of "S3".

```
aws ec2 create-vpc-endpoint \
    --vpc-id vpc-1a2b3c4d \
    --vpc-endpoint-type Interface \
    --service-name com.amazonaws.us-east-1.s3 \
    --subnet-ids subnet-7b16de0c \
    --security-group-id sg-1a2b3c4d \
    --tag-specifications ResourceType=vpc-endpoint,Tags=[{Key=service,Value=S3}]
```

Output:

```
{
    "VpcEndpoint": {
        "VpcEndpointId": "vpce-1a2b3c4d5e6f1a2b3",
        "VpcEndpointType": "Interface",
        "VpcId": "vpc-1a2b3c4d",
        "ServiceName": "com.amazonaws.us-east-1.s3",
        "State": "pending",
        "RouteTableIds": [],
        "SubnetIds": [
            "subnet-1a2b3c4d"
        ],
        "Groups": [
            {
                "GroupId": "sg-1a2b3c4d",
                "GroupName": "default"
            }
        ],
        "PrivateDnsEnabled": false,
        "RequesterManaged": false,
        "NetworkInterfaceIds": [
            "eni-0b16f0581c8ac6877"
        ],
        "DnsEntries": [
            {
                "DnsName": "*.vpce-1a2b3c4d5e6f1a2b3-9hnenorg.s3.us-
east-1.vpce.amazonaws.com",
                "HostedZoneId": "Z7HUB22UULQXV"
            },
            {
```

```
                "DnsName": "*.vpce-1a2b3c4d5e6f1a2b3-9hnenorg-us-east-1c.s3.us-
east-1.vpce.amazonaws.com",
                "HostedZoneId": "Z7HUB22UULQXV"
            }
        ],
        "CreationTimestamp": "2021-03-05T14:46:16.030000+00:00",
        "Tags": [
            {
                "Key": "service",
                "Value": "S3"
            }
        ],
        "OwnerId": "123456789012"
    }
}
```

For more information, see Create an interface VPC endpoint in the *AWS PrivateLink User Guide*.

Example 3: To create a Gateway Load Balancer endpoint

The following `create-vpc-endpoint` example creates a Gateway Load Balancer endpoint between VPC `vpc-111122223333aabbc` and and a service that is configured using a Gateway Load Balancer.

```
aws ec2 create-vpc-endpoint \
    --service-name com.amazonaws.vpce.us-east-1.vpce-svc-123123a1c43abc123 \
    --vpc-endpoint-type GatewayLoadBalancer \
    --vpc-id vpc-111122223333aabbc \
    --subnet-ids subnet-0011aabbcc2233445
```

Output:

```
{
    "VpcEndpoint": {
        "VpcEndpointId": "vpce-aabbaabbaabbaabba",
        "VpcEndpointType": "GatewayLoadBalancer",
        "VpcId": "vpc-111122223333aabbc",
        "ServiceName": "com.amazonaws.vpce.us-east-1.vpce-svc-123123a1c43abc123",
        "State": "pending",
        "SubnetIds": [
            "subnet-0011aabbcc2233445"
        ],
```

```
            "RequesterManaged": false,
            "NetworkInterfaceIds": [
                "eni-01010120203030405"
            ],
            "CreationTimestamp": "2020-11-11T08:06:03.522Z",
            "OwnerId": "123456789012"
        }
    }
```

For more information, see Gateway Load Balancer endpoints in the *AWS PrivateLink User Guide*.

Example 4: To create a resource endpoint

The following `create-vpc-endpoint` example creates a resource endpoint.

```
aws ec2 create-vpc-endpoint \
    --vpc-endpoint-type Resource \
    --vpc-id vpc-111122223333aabbc \
    --subnet-ids subnet-0011aabbcc2233445 \
    --resource-configuration-arn arn:aws:vpc-lattice-us-
east-1:123456789012:resourceconfiguration/rcfg-0123abcde98765432
```

Output:

```
{
    "VpcEndpoint": {
        "VpcEndpointId": "vpce-00939a7ed9EXAMPLE",
        "VpcEndpointType": "Resource",
        "VpcId": "vpc-111122223333aabbc",
        "State": "Pending",
        "SubnetIds": [
            "subnet-0011aabbcc2233445"
        ],
        "Groups": [
            {
                "GroupId": "sg-03e2f15fbfc09b000",
                "GroupName": "default"
            }
        ],
        "IpAddressType": "IPV4",
        "PrivateDnsEnabled": false,
        "CreationTimestamp": "2025-02-06T23:38:49.525000+00:00",
```

```
        "Tags": [],
        "OwnerId": "123456789012",
        "ResourceConfigurationArn": "arn:aws:vpc-lattice:us-
east-1:123456789012:resourceconfiguration/rcfg-0123abcde98765432"
    }
}
```

For more information, see Resource endpoints in the *AWS PrivateLink User Guide*.

Example 5: To create a service network endpoint

The following `create-vpc-endpoint` example creates a service network endpoint.

```
aws ec2 create-vpc-endpoint \
    --vpc-endpoint-type ServiceNetwork \
    --vpc-id vpc-111122223333aabbc \
    --subnet-ids subnet-0011aabbcc2233445 \
    --service-network-arn arn:aws:vpc-lattice:us-east-1:123456789012:servicenetwork/
sn-0101abcd5432abcd0 \
    --security-group-ids sg-0123456789012abcd
```

Output:

```
{

`create-vpc-peering-connection`

The following code example shows how to use `create-vpc-peering-connection`.

AWS CLI

To create a VPC peering connection between your VPCs

This example requests a peering connection between your VPCs vpc-1a2b3c4d and vpc-11122233.

Command:

```
aws ec2 create-vpc-peering-connection --vpc-id vpc-1a2b3c4d --peer-vpc-
id vpc-11122233
```

Output:

```
{
    "VpcPeeringConnection": {
        "Status": {
            "Message": "Initiating Request to 444455556666",
            "Code": "initiating-request"
        },
        "Tags": [],
        "RequesterVpcInfo": {
            "OwnerId": "444455556666",
            "VpcId": "vpc-1a2b3c4d",
            "CidrBlock": "10.0.0.0/28"
        },
        "VpcPeeringConnectionId": "pcx-111aaa111",
        "ExpirationTime": "2014-04-02T16:13:36.000Z",
        "AccepterVpcInfo": {
```

```
                "OwnerId": "444455556666",
                "VpcId": "vpc-11122233"
            }
        }
    }
```

To create a VPC peering connection with a VPC in another account

This example requests a peering connection between your VPC (vpc-1a2b3c4d), and a VPC (vpc-11122233) that belongs AWS account 123456789012.

Command:

```
aws ec2 create-vpc-peering-connection --vpc-id vpc-1a2b3c4d --peer-vpc-
id vpc-11122233 --peer-owner-id 123456789012
```

To create a VPC peering connection with a VPC in a different region

This example requests a peering connection between your VPC in the current region (vpc-1a2b3c4d), and a VPC (vpc-11122233) in your account in the `us-west-2` region.

Command:

```
aws ec2 create-vpc-peering-connection --vpc-id vpc-1a2b3c4d --peer-vpc-
id vpc-11122233 --peer-region us-west-2
```

This example requests a peering connection between your VPC in the current region (vpc-1a2b3c4d), and a VPC (vpc-11122233) that belongs AWS account 123456789012 that's in the `us-west-2` region.

Command:

```
aws ec2 create-vpc-peering-connection --vpc-id vpc-1a2b3c4d --peer-vpc-
id vpc-11122233 --peer-owner-id 123456789012 --peer-region us-west-2
```

- For API details, see CreateVpcPeeringConnection in *AWS CLI Command Reference*.

`create-vpc`

The following code example shows how to use `create-vpc`.

AWS CLI

Example 1: To create a VPC

The following `create-vpc` example creates a VPC with the specified IPv4 CIDR block and a Name tag.

```
aws ec2 create-vpc \
    --cidr-block 10.0.0.0/16 \
    --tag-specifications ResourceType=vpc,Tags=[{Key=Name,Value=MyVpc}]
```

Output:

```
{
    "Vpc": {
        "CidrBlock": "10.0.0.0/16",
        "DhcpOptionsId": "dopt-5EXAMPLE",
        "State": "pending",
        "VpcId": "vpc-0a60eb65b4EXAMPLE",
        "OwnerId": "123456789012",
        "InstanceTenancy": "default",
        "Ipv6CidrBlockAssociationSet": [],
        "CidrBlockAssociationSet": [
            {
                "AssociationId": "vpc-cidr-assoc-07501b79ecEXAMPLE",
                "CidrBlock": "10.0.0.0/16",
                "CidrBlockState": {
                    "State": "associated"
                }
            }
        ],
        "IsDefault": false,
        "Tags": [
            {
                "Key": "Name",
                "Value": MyVpc"
            }
        ]
    }
}
```

Example 2: To create a VPC with dedicated tenancy

The following `create-vpc` example creates a VPC with the specified IPv4 CIDR block and dedicated tenancy.

```
aws ec2 create-vpc \
    --cidr-block 10.0.0.0/16 \
    --instance-tenancy dedicated
```

Output:

```
{
    "Vpc": {
        "CidrBlock": "10.0.0.0/16",
        "DhcpOptionsId": "dopt-19edf471",
        "State": "pending",
        "VpcId": "vpc-0a53287fa4EXAMPLE",
        "OwnerId": "111122223333",
        "InstanceTenancy": "dedicated",
        "Ipv6CidrBlockAssociationSet": [],
        "CidrBlockAssociationSet": [
            {
                "AssociationId": "vpc-cidr-assoc-00b24cc1c2EXAMPLE",
                "CidrBlock": "10.0.0.0/16",
                "CidrBlockState": {
                    "State": "associated"
                }
            }
        ],
        "IsDefault": false
    }
}
```

Example 3: To create a VPC with an IPv6 CIDR block

The following `create-vpc` example creates a VPC with an Amazon-provided IPv6 CIDR block.

```
aws ec2 create-vpc \
    --cidr-block 10.0.0.0/16 \
    --amazon-provided-ipv6-cidr-block
```

Output:

```
{
```

```
    "Vpc": {
        "CidrBlock": "10.0.0.0/16",
        "DhcpOptionsId": "dopt-dEXAMPLE",
        "State": "pending",
        "VpcId": "vpc-0fc5e3406bEXAMPLE",
        "OwnerId": "123456789012",
        "InstanceTenancy": "default",
        "Ipv6CidrBlockAssociationSet": [
            {
                "AssociationId": "vpc-cidr-assoc-068432c60bEXAMPLE",
                "Ipv6CidrBlock": "",
                "Ipv6CidrBlockState": {
                    "State": "associating"
                },
                "Ipv6Pool": "Amazon",
                "NetworkBorderGroup": "us-west-2"
            }
        ],
        "CidrBlockAssociationSet": [
            {
                "AssociationId": "vpc-cidr-assoc-0669f8f9f5EXAMPLE",
                "CidrBlock": "10.0.0.0/16",
                "CidrBlockState": {
                    "State": "associated"
                }
            }
        ],
        "IsDefault": false
    }
}
```

Example 4: To create a VPC with a CIDR from an IPAM pool

The following `create-vpc` example creates a VPC with a CIDR from an Amazon VPC IP Address Manager (IPAM) pool.

Linux and macOS:

```
aws ec2 create-vpc \
    --ipv4-ipam-pool-id ipam-pool-0533048da7d823723 \
    --tag-specifications ResourceType=vpc,Tags='[{Key=Environment,Value="Preprod"},
{Key=Owner,Value="Build Team"}]'
```

Windows:

```
aws ec2 create-vpc ^
    --ipv4-ipam-pool-id ipam-pool-0533048da7d823723 ^
    --tag-specifications ResourceType=vpc,Tags=[{Key=Environment,Value="Preprod"},
{Key=Owner,Value="Build Team"}]
```

Output:

```
{
    "Vpc": {
        "CidrBlock": "10.0.1.0/24",
        "DhcpOptionsId": "dopt-2afccf50",
        "State": "pending",
        "VpcId": "vpc-010e1791024eb0af9",
        "OwnerId": "123456789012",
        "InstanceTenancy": "default",
        "Ipv6CidrBlockAssociationSet": [],
        "CidrBlockAssociationSet": [
            {
                "AssociationId": "vpc-cidr-assoc-0a77de1d803226d4b",
                "CidrBlock": "10.0.1.0/24",
                "CidrBlockState": {
                    "State": "associated"
                }
            }
        ],
        "IsDefault": false,
        "Tags": [
            {
                "Key": "Environment",
                "Value": "Preprod"
            },
            {
                "Key": "Owner",
                "Value": "Build Team"
            }
        ]
    }
}
```

For more information, see Create a VPC that uses an IPAM pool CIDR in the *Amazon VPC IPAM User Guide*.

- For API details, see CreateVpc in *AWS CLI Command Reference*.

`create-vpn-connection-route`

The following code example shows how to use `create-vpn-connection-route`.

AWS CLI

To create a static route for a VPN connection

This example creates a static route for the specified VPN connection. If the command succeeds, no output is returned.

Command:

```
aws ec2 create-vpn-connection-route --vpn-connection-id vpn-40f41529 --destination-cidr-block 11.12.0.0/16
```

- For API details, see CreateVpnConnectionRoute in *AWS CLI Command Reference*.

`create-vpn-connection`

The following code example shows how to use `create-vpn-connection`.

AWS CLI

Example 1: To create a VPN connection with dynamic routing

The following `create-vpn-connection` example creates a VPN connection between the specified virtual private gateway and the specified customer gateway, and applies tags to the VPN connection. The output includes the configuration information for your customer gateway device, in XML format.

```
aws ec2 create-vpn-connection \
    --type ipsec.1 \
    --customer-gateway-id cgw-001122334455aabbc \
    --vpn-gateway-id vgw-1a1a1a1a1a1a2b2b2 \
    --tag-specification 'ResourceType=vpn-connection,Tags=[{Key=Name,Value=BGP-VPN}]'
```

Output:

```
{
    "VpnConnection": {
        "CustomerGatewayConfiguration": "...configuration information...",
        "CustomerGatewayId": "cgw-001122334455aabbc",
        "Category": "VPN",
        "State": "pending",
        "VpnConnectionId": "vpn-123123123123abcab",
        "VpnGatewayId": "vgw-1a1a1a1a1a1a2b2b2",
        "Options": {
            "EnableAcceleration": false,
            "StaticRoutesOnly": false,
            "LocalIpv4NetworkCidr": "0.0.0.0/0",
            "RemoteIpv4NetworkCidr": "0.0.0.0/0",
            "TunnelInsideIpVersion": "ipv4",
            "TunnelOptions": [
                {},
                {}
            ]
        },
        "Routes": [],
        "Tags": [
             {
                "Key": "Name",
                "Value": "BGP-VPN"
            }
        ]
    }
}
```

For more information, see How AWS Site-to-Site VPN works in the *AWS Site-to-Site VPN User Guide*.

Example 2: To create a VPN connection with static routing

The following `create-vpn-connection` example creates a VPN connection between the specified virtual private gateway and the specified customer gateway. The options specify static routing. The output includes the configuration information for your customer gateway device, in XML format.

```
aws ec2 create-vpn-connection \
    --type ipsec.1 \
```

```
    --customer-gateway-id cgw-001122334455aabbc \
    --vpn-gateway-id vgw-1a1a1a1a1a1a2b2b2 \
    --options "{\"StaticRoutesOnly\":true}"
```

Output:

```
{
    "VpnConnection": {
        "CustomerGatewayConfiguration": "..configuration information...",
        "CustomerGatewayId": "cgw-001122334455aabbc",
        "Category": "VPN",
        "State": "pending",
        "VpnConnectionId": "vpn-123123123123abcab",
        "VpnGatewayId": "vgw-1a1a1a1a1a1a2b2b2",
        "Options": {
            "EnableAcceleration": false,
            "StaticRoutesOnly": true,
            "LocalIpv4NetworkCidr": "0.0.0.0/0",
            "RemoteIpv4NetworkCidr": "0.0.0.0/0",
            "TunnelInsideIpVersion": "ipv4",
            "TunnelOptions": [
                {},
                {}
            ]
        },
        "Routes": [],
        "Tags": []
    }
}
```

For more information, see [How AWS Site-to-Site VPN works](#) in the *AWS Site-to-Site VPN User Guide*.

Example 3: To create a VPN connection and specify your own inside CIDR and pre-shared key

The following `create-vpn-connection` example creates a VPN connection and specifies the inside IP address CIDR block and a custom pre-shared key for each tunnel. The specified values are returned in the `CustomerGatewayConfiguration` information.

```
aws ec2 create-vpn-connection \
    --type ipsec.1 \
    --customer-gateway-id cgw-001122334455aabbc \
```

```
    --vpn-gateway-id vgw-1a1a1a1a1a1a2b2b2 \
    --options
 TunnelOptions='[{TunnelInsideCidr=169.254.12.0/30,PreSharedKey=ExamplePreSharedKey1},
{TunnelInsideCidr=169.254.13.0/30,PreSharedKey=ExamplePreSharedKey2}]'
```

Output:

```
{
    "VpnConnection": {
        "CustomerGatewayConfiguration": "..configuration information...",
        "CustomerGatewayId": "cgw-001122334455aabbc",
        "Category": "VPN",
        "State": "pending",
        "VpnConnectionId": "vpn-123123123123abcab",
        "VpnGatewayId": "vgw-1a1a1a1a1a1a2b2b2",
        "Options": {
            "EnableAcceleration": false,
            "StaticRoutesOnly": false,
            "LocalIpv4NetworkCidr": "0.0.0.0/0",
            "RemoteIpv4NetworkCidr": "0.0.0.0/0",
            "TunnelInsideIpVersion": "ipv4",
            "TunnelOptions": [
                {
                    "OutsideIpAddress": "203.0.113.3",
                    "TunnelInsideCidr": "169.254.12.0/30",
                    "PreSharedKey": "ExamplePreSharedKey1"
                },
                {
                    "OutsideIpAddress": "203.0.113.5",
                    "TunnelInsideCidr": "169.254.13.0/30",
                    "PreSharedKey": "ExamplePreSharedKey2"
                }
            ]
        },
        "Routes": [],
        "Tags": []
    }
}
```

For more information, see How AWS Site-to-Site VPN works in the *AWS Site-to-Site VPN User Guide*.

Example 4: To create a VPN connection that supports IPv6 traffic

The following `create-vpn-connection` example creates a VPN connection that supports IPv6 traffic between the specified transit gateway and specified customer gateway. The tunnel options for both tunnels specify that AWS must initiate the IKE negotiation.

```
aws ec2 create-vpn-connection \
    --type ipsec.1 \
    --transit-gateway-id tgw-12312312312312312 \
    --customer-gateway-id cgw-001122334455aabbc \
    --options TunnelInsideIpVersion=ipv6,TunnelOptions=[{StartupAction=start},
{StartupAction=start}]
```

Output:

```
{
    "VpnConnection": {
        "CustomerGatewayConfiguration": "..configuration information...",
        "CustomerGatewayId": "cgw-001122334455aabbc",
        "Category": "VPN",
        "State": "pending",
        "VpnConnectionId": "vpn-11111111122222222",
        "TransitGatewayId": "tgw-12312312312312312",
        "Options": {
            "EnableAcceleration": false,
            "StaticRoutesOnly": false,
            "LocalIpv6NetworkCidr": "::/0",
            "RemoteIpv6NetworkCidr": "::/0",
            "TunnelInsideIpVersion": "ipv6",
            "TunnelOptions": [
                {
                    "OutsideIpAddress": "203.0.113.3",
                    "StartupAction": "start"
                },
                {
                    "OutsideIpAddress": "203.0.113.5",
                    "StartupAction": "start"
                }
            ]
        },
        "Routes": [],
        "Tags": []
    }
}
```

For more information, see How AWS Site-to-Site VPN works in the *AWS Site-to-Site VPN User Guide*.

- For API details, see CreateVpnConnection in *AWS CLI Command Reference*.

`create-vpn-gateway`

The following code example shows how to use `create-vpn-gateway`.

AWS CLI

To create a virtual private gateway

This example creates a virtual private gateway.

Command:

```
aws ec2 create-vpn-gateway --type ipsec.1
```

Output:

```
{
    "VpnGateway": {
        "AmazonSideAsn": 64512,
        "State": "available",
        "Type": "ipsec.1",
        "VpnGatewayId": "vgw-9a4cacf3",
        "VpcAttachments": []
    }
}
```

To create a virtual private gateway with a specific Amazon-side ASN

This example creates a virtual private gateway and specifies the Autonomous System Number (ASN) for the Amazon side of the BGP session.

Command:

```
aws ec2 create-vpn-gateway --type ipsec.1 --amazon-side-asn 65001
```

Output:

```
{
    "VpnGateway": {
        "AmazonSideAsn": 65001,
        "State": "available",
        "Type": "ipsec.1",
        "VpnGatewayId": "vgw-9a4cacf3",
        "VpcAttachments": []
    }
}
```

- For API details, see [CreateVpnGateway]() in *AWS CLI Command Reference*.

`delete-carrier-gateway`

The following code example shows how to use `delete-carrier-gateway`.

AWS CLI

To delete your carrier gateway

The following `delete-carrier-gateway` example deletes the specified carrier gateway.

```
aws ec2 delete-carrier-gateway \
    --carrier-gateway-id cagw-0465cdEXAMPLE1111
```

Output:

```
{
    "CarrierGateway": {
        "CarrierGatewayId": "cagw-0465cdEXAMPLE1111",
        "VpcId": "vpc-0c529aEXAMPLE1111",
        "State": "deleting",
        "OwnerId": "123456789012"
    }
}
```

For more information, see [Carrier gateways]() in the *Amazon Virtual Private Cloud User Guide*.

- For API details, see [DeleteCarrierGateway]() in *AWS CLI Command Reference*.

`delete-client-vpn-endpoint`

The following code example shows how to use `delete-client-vpn-endpoint`.

AWS CLI

To delete a Client VPN endpoint

The following `delete-client-vpn-endpoint` example deletes the specified Client VPN endpoint.

```
aws ec2 delete-client-vpn-endpoint \
    --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```
{
    "Status": {
        "Code": "deleting"
    }
}
```

For more information, see Client VPN Endpoints in the *AWS Client VPN Administrator Guide*.

- For API details, see DeleteClientVpnEndpoint in *AWS CLI Command Reference*.

`delete-client-vpn-route`

The following code example shows how to use `delete-client-vpn-route`.

AWS CLI

To delete a route for a Client VPN endpoint

The following `delete-client-vpn-route` example deletes the `0.0.0.0/0` route for the specified subnet of a Client VPN endpoint.

```
aws ec2 delete-client-vpn-route \
    --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \
    --destination-cidr-block 0.0.0.0/0 \
```

```
    --target-vpc-subnet-id subnet-0123456789abcabca
```

Output:

```
{
    "Status": {
        "Code": "deleting"
    }
}
```

For more information, see Routes in the *AWS Client VPN Administrator Guide*.

- For API details, see DeleteClientVpnRoute in *AWS CLI Command Reference*.

`delete-coip-cidr`

The following code example shows how to use `delete-coip-cidr`.

AWS CLI

To delete a range of customer-owned IP (CoIP) addresses

The following `delete-coip-cidr` example deletes the specified range of CoIP addresses in the specified CoIP pool.

```
aws ec2 delete-coip-cidr \
    --cidr 14.0.0.0/24 \
    --coip-pool-id ipv4pool-coip-1234567890abcdefg
```

Output:

```
{
    "CoipCidr": {
        "Cidr": "14.0.0.0/24",
        "CoipPoolId": "ipv4pool-coip-1234567890abcdefg",
        "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890"
    }
}
```

For more information, see Customer-owned IP addresses in the *AWS Outposts User Guide*.

- For API details, see DeleteCoipCidr in *AWS CLI Command Reference*.

`delete-coip-pool`

The following code example shows how to use `delete-coip-pool`.

AWS CLI

To delete a pool of customer-owned IP (CoIP) addresses

The following `delete-coip-pool` example deletes a CoIP pool of CoIP addresses.

```
aws ec2 delete-coip-pool \
    --coip-pool-id ipv4pool-coip-1234567890abcdefg
```

Output:

```
{
    "CoipPool": {
        "PoolId": "ipv4pool-coip-1234567890abcdefg",
        "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890",
        "PoolArn": "arn:aws:ec2:us-west-2:123456789012:coip-pool/ipv4pool-
coip-1234567890abcdefg"
    }
}
```

For more information, see Customer-owned IP addresses in the *AWS Outposts User Guide*.

- For API details, see DeleteCoipPool in *AWS CLI Command Reference*.

`delete-customer-gateway`

The following code example shows how to use `delete-customer-gateway`.

AWS CLI

To delete a customer gateway

This example deletes the specified customer gateway. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-customer-gateway --customer-gateway-id cgw-0e11f167
```

- For API details, see DeleteCustomerGateway in *AWS CLI Command Reference*.

`delete-dhcp-options`

The following code example shows how to use `delete-dhcp-options`.

AWS CLI

To delete a DHCP options set

This example deletes the specified DHCP options set. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-dhcp-options --dhcp-options-id dopt-d9070ebb
```

- For API details, see DeleteDhcpOptions in *AWS CLI Command Reference*.

`delete-egress-only-internet-gateway`

The following code example shows how to use `delete-egress-only-internet-gateway`.

AWS CLI

To delete an egress-only Internet gateway

This example deletes the specified egress-only Internet gateway.

Command:

```
aws ec2 delete-egress-only-internet-gateway --egress-only-internet-gateway-
id eigw-01eadbd45ecd7943f
```

Output:

```
{
```

```
    "ReturnCode": true
}
```

- For API details, see DeleteEgressOnlyInternetGateway in *AWS CLI Command Reference*.

`delete-fleets`

The following code example shows how to use `delete-fleets`.

AWS CLI

Example 1: To delete an EC2 Fleet and terminate the associated instances

The following `delete-fleets` example deletes the specified EC2 Fleet and terminates the associated On-Demand Instances and Spot Instances.

```
aws ec2 delete-fleets \
    --fleet-ids fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE \
    --terminate-instances
```

Output:

```
{
    "SuccessfulFleetDeletions": [
        {
            "CurrentFleetState": "deleted_terminating",
            "PreviousFleetState": "active",
            "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
        }
    ],
    "UnsuccessfulFleetDeletions": []
}
```

For more information, see Delete an EC2 Fleet in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

Example 2: To delete an EC2 Fleet without terminating the associated instances

The following `delete-fleets` example deletes the specified EC2 Fleet without terminating the associated On-Demand Instances and Spot Instances.

```
aws ec2 delete-fleets \
    --fleet-ids fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE \
    --no-terminate-instances
```

Output:

```
{
    "SuccessfulFleetDeletions": [
        {
            "CurrentFleetState": "deleted_running",
            "PreviousFleetState": "active",
            "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
        }
    ],
    "UnsuccessfulFleetDeletions": []
}
```

For more information, see Delete an EC2 Fleet in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see DeleteFleets in *AWS CLI Command Reference*.

`delete-flow-logs`

The following code example shows how to use `delete-flow-logs`.

AWS CLI

To delete a flow log

The following `delete-flow-logs` example deletes the specified flow log.

```
aws ec2 delete-flow-logs --flow-log-id fl-11223344556677889
```

Output:

```
{
    "Unsuccessful": []
}
```

- For API details, see DeleteFlowLogs in *AWS CLI Command Reference*.

`delete-fpga-image`

The following code example shows how to use `delete-fpga-image`.

AWS CLI

To delete an Amazon FPGA image

This example deletes the specified AFI.

Command:

```
aws ec2 delete-fpga-image --fpga-image-id afi-06b12350a123fbabc
```

Output:

```
{
  "Return": true
}
```

- For API details, see DeleteFpgaImage in *AWS CLI Command Reference*.

`delete-instance-connect-endpoint`

The following code example shows how to use `delete-instance-connect-endpoint`.

AWS CLI

To delete an EC2 Instance Connect Endpoint

The following `delete-instance-connect-endpoint` example deletes the specified EC2 Instance Connect Endpoint.

```
aws ec2 delete-instance-connect-endpoint \
    --instance-connect-endpoint-id eice-03f5e49b83924bbc7
```

Output:

```
{
    "InstanceConnectEndpoint": {
        "OwnerId": "111111111111",
        "InstanceConnectEndpointId": "eice-0123456789example",
```

```
        "InstanceConnectEndpointArn": "arn:aws:ec2:us-east-1:111111111111:instance-
connect-endpoint/eice-0123456789example",
        "State": "delete-in-progress",
        "StateMessage": "",
        "NetworkInterfaceIds": [],
        "VpcId": "vpc-0123abcd",
        "AvailabilityZone": "us-east-1d",
        "CreatedAt": "2023-02-07T12:05:37+00:00",
        "SubnetId": "subnet-0123abcd"
    }
}
```

For more information, see Remove EC2 Instance Connect Endpoint in the *Amazon EC2 User Guide*.

- For API details, see DeleteInstanceConnectEndpoint in *AWS CLI Command Reference*.

`delete-instance-event-window`

The following code example shows how to use `delete-instance-event-window`.

AWS CLI

Example 1: To delete an event window

The following `delete-instance-event-window` example deletes an event window.

```
aws ec2 delete-instance-event-window \
    --region us-east-1 \
    --instance-event-window-id iew-0abcdef1234567890
```

Output:

```
{
    "InstanceEventWindowState": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "State": "deleting"
    }
}
```

For event window constraints, see Considerations in the Scheduled Events section of the *Amazon EC2 User Guide*.

Example 2: To force delete an event window

The following `delete-instance-event-window` example force deletes an event window if the event window is currently associated with targets.

```
aws ec2 delete-instance-event-window \
    --region us-east-1 \
    --instance-event-window-id iew-0abcdef1234567890 \
    --force-delete
```

Output:

```
{
    "InstanceEventWindowState": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "State": "deleting"
    }
}
```

For event window constraints, see Considerations in the Scheduled Events section of the *Amazon EC2 User Guide*.

- For API details, see DeleteInstanceEventWindow in *AWS CLI Command Reference*.

`delete-internet-gateway`

The following code example shows how to use `delete-internet-gateway`.

AWS CLI

To delete an internet gateway

The following `delete-internet-gateway` example deletes the specified internet gateway.

```
aws ec2 delete-internet-gateway \
    --internet-gateway-id igw-0d0fb496b3EXAMPLE
```

This command produces no output.

For more information, see Internet gateways in the *Amazon VPC User Guide*.

- For API details, see DeleteInternetGateway in *AWS CLI Command Reference*.

`delete-ipam-pool`

The following code example shows how to use `delete-ipam-pool`.

AWS CLI

To delete an IPAM pool

In this example, you're a IPAM delegated admin who wants to delete an IPAM pool that you no longer need, but the pool has a CIDR provisioned to it. You cannot delete a pool if it has CIDRs provisioned to it unless you use the `--cascade` option, so you'll use `--cascade`.

To complete this request:

You'll need the IPAM pool ID which you can get with describe-ipam-pools.The `--region` must be the IPAM home Region.

The following `delete-ipam-pool` example deletes an IPAM pool in your AWS account.

```
aws ec2 delete-ipam-pool \
    --ipam-pool-id ipam-pool-050c886a3ca41cd5b \
    --cascade \
    --region us-east-1
```

Output:

```
{
    "IpamPool": {
        "OwnerId": "320805250157",
        "IpamPoolId": "ipam-pool-050c886a3ca41cd5b",
        "IpamPoolArn": "arn:aws:ec2::320805250157:ipam-pool/ipam-
pool-050c886a3ca41cd5b",
        "IpamScopeArn": "arn:aws:ec2::320805250157:ipam-scope/ipam-
scope-0a158dde35c51107b",
        "IpamScopeType": "private",
        "IpamArn": "arn:aws:ec2::320805250157:ipam/ipam-005f921c17ebd5107",
        "IpamRegion": "us-east-1",
        "Locale": "None",
        "PoolDepth": 1,
        "State": "delete-in-progress",
        "Description": "example",
        "AutoImport": false,
        "AddressFamily": "ipv4",
```

```
        "AllocationMinNetmaskLength": 0,
        "AllocationMaxNetmaskLength": 32
    }
}
```

For more information, see [Delete a pool](#) in the *Amazon VPC IPAM User Guide*.

- For API details, see [DeleteIpamPool](#) in *AWS CLI Command Reference*.

`delete-ipam-resource-discovery`

The following code example shows how to use `delete-ipam-resource-discovery`.

AWS CLI

To delete a resource discovery

In this example, you're a IPAM delegated admin who wants to delete a non-default resource discovery that you created to share with another IPAM admin during the process of integrating IPAM with accounts outside of your organization.

To complete this request:

The `--region` must be the Region where you created the resource discovery.You cannot delete a default resource discovery if `"IsDefault": true`. A default resource discovery is one that is created automatically in the account that creates an IPAM. To delete a default resource discovery, you have to delete the IPAM.

The following `delete-ipam-resource-discovery` example deletes a resource discovery.

```
aws ec2 delete-ipam-resource-discovery \
    --ipam-resource-discovery-id ipam-res-disco-0e39761475298ee0f \
    --region us-east-1
```

Output:

```
{
    "IpamResourceDiscovery": {
        "OwnerId": "149977607591",
        "IpamResourceDiscoveryId": "ipam-res-disco-0e39761475298ee0f",
        "IpamResourceDiscoveryArn": "arn:aws:ec2::149977607591:ipam-resource-
discovery/ipam-res-disco-0e39761475298ee0f",
```

```
        "IpamResourceDiscoveryRegion": "us-east-1",
        "OperatingRegions": [
            {
                "RegionName": "us-east-1"
            }
        ],
        "IsDefault": false,
        "State": "delete-in-progress"
    }
}
```

For more information about resource discoveries, see Work with resource discoveries in the *Amazon VPC IPAM User Guide*.

- For API details, see DeleteIpamResourceDiscovery in *AWS CLI Command Reference*.

`delete-ipam-scope`

The following code example shows how to use `delete-ipam-scope`.

AWS CLI

To delete an IPAM scope

The following `delete-ipam-scope` example deletes an IPAM.

```
aws ec2 delete-ipam-scope \
    --ipam-scope-id ipam-scope-01c1ebab2b63bd7e4
```

Output:

```
{
    "IpamScope": {
        "OwnerId": "123456789012",
        "IpamScopeId": "ipam-scope-01c1ebab2b63bd7e4",
        "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-
scope-01c1ebab2b63bd7e4",
        "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
        "IpamRegion": "us-east-1",
        "IpamScopeType": "private",
        "IsDefault": false,
        "Description": "Example description",
        "PoolCount": 0,
```

```
        "State": "delete-in-progress"
    }
}
```

For more information, see Delete a scope in the *Amazon VPC IPAM User Guide*.

- For API details, see DeleteIpamScope in *AWS CLI Command Reference*.

`delete-ipam`

The following code example shows how to use `delete-ipam`.

AWS CLI

To delete an IPAM

The following `delete-ipam` example deletes an IPAM.

```
aws ec2 delete-ipam \
    --ipam-id ipam-036486dfa6af58ee0
```

Output:

```
{
    "Ipam": {
        "OwnerId": "123456789012",
        "IpamId": "ipam-036486dfa6af58ee0",
        "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-036486dfa6af58ee0",
        "IpamRegion": "us-east-1",
        "PublicDefaultScopeId": "ipam-scope-071b8042b0195c183",
        "PrivateDefaultScopeId": "ipam-scope-0807405dece705a30",
        "ScopeCount": 2,
        "OperatingRegions": [
            {
                "RegionName": "us-east-1"
            },
            {
                "RegionName": "us-east-2"
            },
            {
                "RegionName": "us-west-1"
            }
        ],
```

```
            "State": "delete-in-progress"
        }
    }
```

For more information, see Delete an IPAM in the *Amazon VPC IPAM User Guide*.

- For API details, see DeleteIpam in *AWS CLI Command Reference*.

`delete-key-pair`

The following code example shows how to use `delete-key-pair`.

AWS CLI

To delete a key pair

The following `delete-key-pair` example deletes the specified key pair.

```
aws ec2 delete-key-pair \
    --key-name my-key-pair
```

Output:

```
{
    "Return": true,
    "KeyPairId": "key-03c8d3aceb53b507"
}
```

For more information, see Create and delete key pairs in the *AWS Command Line Interface User Guide*.

- For API details, see DeleteKeyPair in *AWS CLI Command Reference*.

`delete-launch-template-versions`

The following code example shows how to use `delete-launch-template-versions`.

AWS CLI

To delete a launch template version

This example deletes the specified launch template version.

Command:

```
aws ec2 delete-launch-template-versions --launch-template-id lt-0abcd290751193123 --
versions 1
```

Output:

```
{
  "UnsuccessfullyDeletedLaunchTemplateVersions": [],
  "SuccessfullyDeletedLaunchTemplateVersions": [
      {
          "LaunchTemplateName": "TestVersion",
          "VersionNumber": 1,
          "LaunchTemplateId": "lt-0abcd290751193123"
      }
  ]
}
```

- For API details, see DeleteLaunchTemplateVersions in *AWS CLI Command Reference*.

`delete-launch-template`

The following code example shows how to use `delete-launch-template`.

AWS CLI

To delete a launch template

This example deletes the specified launch template.

Command:

```
aws ec2 delete-launch-template --launch-template-id lt-0abcd290751193123
```

Output:

```
{
  "LaunchTemplate": {
      "LatestVersionNumber": 2,
      "LaunchTemplateId": "lt-0abcd290751193123",
      "LaunchTemplateName": "TestTemplate",
      "DefaultVersionNumber": 2,
```

```
        "CreatedBy": "arn:aws:iam::123456789012:root",
        "CreateTime": "2017-11-23T16:46:25.000Z"
    }
}
```

- For API details, see DeleteLaunchTemplate in *AWS CLI Command Reference*.

`delete-local-gateway-route-table-virtual-interface-group-association`

The following code example shows how to use `delete-local-gateway-route-table-virtual-interface-group-association`.

AWS CLI

To disassociate a local gateway route table from a virtual interfaces (VIFs) group

The following `delete-local-gateway-route-table-virtual-interface-group-association` example deletes the association between the specified local gateway route table and VIF group.

```
aws ec2 delete-local-gateway-route-table-virtual-interface-group-association \
    --local-gateway-route-table-virtual-interface-group-association-id lgw-vif-grp-
assoc-exampleid12345678
```

Output:

```
{
    "LocalGatewayRouteTableVirtualInterfaceGroupAssociation": {
        "LocalGatewayRouteTableVirtualInterfaceGroupAssociationId": "lgw-vif-grp-
assoc-exampleid12345678",
        "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-exampleid0123abcd",
        "LocalGatewayId": "lgw-exampleid11223344",
        "LocalGatewayRouteTableId": "lgw-rtb-exampleidabcd1234",
        "LocalGatewayRouteTableArn": "arn:aws:ec2:us-west-2:111122223333:local-
gateway-route-table/lgw-rtb-exampleidabcd1234",
        "OwnerId": "111122223333",
        "State": "disassociating",
        "Tags": []
    }
}
```

For more information, see VIF group associations in the *AWS Outposts User Guide*.

- For API details, see DeleteLocalGatewayRouteTableVirtualInterfaceGroupAssociation in *AWS CLI Command Reference*.

`delete-local-gateway-route-table-vpc-association`

The following code example shows how to use `delete-local-gateway-route-table-vpc-association`.

AWS CLI

To disassociate a local gateway route table from a VPC

The following `delete-local-gateway-route-table-vpc-association` example deletes the association between the specified local gateway route table and VPC.

```
aws ec2 delete-local-gateway-route-table-vpc-association \
    --local-gateway-route-table-vpc-association-id vpc-example0123456789
```

Output:

```
{
    "LocalGatewayRouteTableVpcAssociation": {
        "LocalGatewayRouteTableVpcAssociationId": "lgw-vpc-assoc-abcd1234wxyz56789",
        "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890",
        "LocalGatewayRouteTableArn": "arn:aws:ec2:us-west-2:555555555555:local-
gateway-route-table/lgw-rtb-abcdefg1234567890",
        "LocalGatewayId": "lgw-exampleid01234567",
        "VpcId": "vpc-example0123456789",
        "OwnerId": "555555555555",
        "State": "disassociating"
    }
}
```

For more information, see VPC associations in the *AWS Outposts User Guide*.

- For API details, see DeleteLocalGatewayRouteTableVpcAssociation in *AWS CLI Command Reference*.

`delete-local-gateway-route-table`

The following code example shows how to use `delete-local-gateway-route-table`.

AWS CLI

To delete a local gateway route table

The following `delete-local-gateway-route-table` example creates a local gateway route table with the direct VPC routing mode.

```
aws ec2 delete-local-gateway-route-table \
    --local-gateway-route-table-id lgw-rtb-abcdefg1234567890
```

Output:

```
{
    "LocalGatewayRouteTable": {
        "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890",
        "LocalGatewayRouteTableArn": "arn:aws:ec2:us-west-2:111122223333:local-
gateway-route-table/lgw-rtb-abcdefg1234567890",
        "LocalGatewayId": "lgw-1a2b3c4d5e6f7g8h9",
        "OutpostArn": "arn:aws:outposts:us-west-2:111122223333:outpost/
op-021345abcdef67890",
        "OwnerId": "111122223333",
        "State": "deleting",
        "Tags": [],
        "Mode": "direct-vpc-routing"
    }
}
```

For more information, see Local gateway route tables in the *AWS Outposts User Guide*.

- For API details, see DeleteLocalGatewayRouteTable in *AWS CLI Command Reference*.

`delete-local-gateway-route`

The following code example shows how to use `delete-local-gateway-route`.

AWS CLI

To delete a route from a local gateway route table

The following `delete-local-gateway-route` example deletes the specified route from the specified local gateway route table.

```
aws ec2 delete-local-gateway-route \
```

```
    --destination-cidr-block 0.0.0.0/0 \
    --local-gateway-route-table-id lgw-rtb-059615ef7dEXAMPLE
```

Output:

```
{
    "Route": {
        "DestinationCidrBlock": "0.0.0.0/0",
        "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-07145b276bEXAMPLE",
        "Type": "static",
        "State": "deleted",
        "LocalGatewayRouteTableId": "lgw-rtb-059615ef7EXAMPLE"
    }
}
```

- For API details, see DeleteLocalGatewayRoute in *AWS CLI Command Reference*.

delete-managed-prefix-list

The following code example shows how to use `delete-managed-prefix-list`.

AWS CLI

To delete a prefix list

The following `delete-managed-prefix-list` example deletes the specified prefix list.

```
aws ec2 delete-managed-prefix-list \
    --prefix-list-id pl-0123456abcabcabc1
```

Output:

```
{
    "PrefixList": {
        "PrefixListId": "pl-0123456abcabcabc1",
        "AddressFamily": "IPv4",
        "State": "delete-in-progress",
        "PrefixListArn": "arn:aws:ec2:us-west-2:123456789012:prefix-list/
pl-0123456abcabcabc1",
        "PrefixListName": "test",
        "MaxEntries": 10,
        "Version": 1,
```

```
            "OwnerId": "123456789012"
        }
}
```

For more information, see Managed prefix lists in the *Amazon VPC User Guide*.

- For API details, see DeleteManagedPrefixList in *AWS CLI Command Reference*.

`delete-nat-gateway`

The following code example shows how to use `delete-nat-gateway`.

AWS CLI

To delete a NAT gateway

This example deletes NAT gateway `nat-04ae55e711cec5680`.

Command:

```
aws ec2 delete-nat-gateway --nat-gateway-id nat-04ae55e711cec5680
```

Output:

```
{
   "NatGatewayId": "nat-04ae55e711cec5680"
}
```

- For API details, see DeleteNatGateway in *AWS CLI Command Reference*.

`delete-network-acl-entry`

The following code example shows how to use `delete-network-acl-entry`.

AWS CLI

To delete a network ACL entry

This example deletes ingress rule number 100 from the specified network ACL. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-network-acl-entry --network-acl-id acl-5fb85d36 --ingress --rule-
number 100
```

- For API details, see DeleteNetworkAclEntry in *AWS CLI Command Reference*.

`delete-network-acl`

The following code example shows how to use `delete-network-acl`.

AWS CLI

To delete a network ACL

This example deletes the specified network ACL. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-network-acl --network-acl-id acl-5fb85d36
```

- For API details, see DeleteNetworkAcl in *AWS CLI Command Reference*.

`delete-network-insights-access-scope-analysis`

The following code example shows how to use `delete-network-insights-access-scope-analysis`.

AWS CLI

To delete a Network Access Scope analysis

The following `delete-network-insights-access-scope-analysis` example deletes the specified Network Access Scope analysis.

```
aws ec2 delete-network-insights-access-scope-analysis \
    --network-insights-access-scope-analysis-id nisa-01234567891abcdef
```

Output:

```
{
    "NetworkInsightsAccessScopeAnalysisId": "nisa-01234567891abcdef
```

```
}
```

For more information, see Getting started with Network Access Analyzer using the AWS CLI in the *Network Access Analyzer Guide*.

- For API details, see DeleteNetworkInsightsAccessScopeAnalysis in *AWS CLI Command Reference*.

delete-network-insights-access-scope

The following code example shows how to use `delete-network-insights-access-scope`.

AWS CLI

To delete a Network Access Scope

The following `delete-network-insights-access-scope` example deletes the specified Network Access Scope.

```
aws ec2 delete-network-insights-access-scope \
    --network-insights-access-scope-id nis-123456789abc01234
```

Output:

```
{
    "NetworkInsightsAccessScopeId": "nis-123456789abc01234"
}
```

For more information, see Getting started with Network Access Analyzer using the AWS CLI in the *Network Access Analyzer Guide*.

- For API details, see DeleteNetworkInsightsAccessScope in *AWS CLI Command Reference*.

delete-network-insights-analysis

The following code example shows how to use `delete-network-insights-analysis`.

AWS CLI

To delete a path analysis

The following `delete-network-insights-analysis` example deletes the specified analysis.

```
aws ec2 delete-network-insights-analysis \
    --network-insights-analysis-id nia-02207aa13eb480c7a
```

Output:

```
{
    "NetworkInsightsAnalysisId": "nia-02207aa13eb480c7a"
}
```

For more information, see Getting started using the AWS CLI in the *Reachability Analyzer Guide*.

- For API details, see DeleteNetworkInsightsAnalysis in *AWS CLI Command Reference*.

`delete-network-insights-path`

The following code example shows how to use `delete-network-insights-path`.

AWS CLI

To delete a path

The following `delete-network-insights-path` example deletes the specified path. Before you can delete a path, you must delete all its analyses using the `delete-network-insights-analysis` command.

```
aws ec2 delete-network-insights-path \
    --network-insights-path-id nip-0b26f224f1d131fa8
```

Output:

```
{
    "NetworkInsightsPathId": "nip-0b26f224f1d131fa8"
}
```

For more information, see Getting started using the AWS CLI in the *Reachability Analyzer Guide*.

- For API details, see DeleteNetworkInsightsPath in *AWS CLI Command Reference*.

`delete-network-interface-permission`

The following code example shows how to use `delete-network-interface-permission`.

AWS CLI

To delete a network interface permission

This example deletes the specified network interface permission.

Command:

```
aws ec2 delete-network-interface-permission --network-interface-permission-id eni-perm-06fd19020ede149ea
```

Output:

```
{
  "Return": true
}
```

- For API details, see DeleteNetworkInterfacePermission in *AWS CLI Command Reference*.

`delete-network-interface`

The following code example shows how to use `delete-network-interface`.

AWS CLI

To delete a network interface

This example deletes the specified network interface. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-network-interface --network-interface-id eni-e5aa89a3
```

- For API details, see DeleteNetworkInterface in *AWS CLI Command Reference*.

`delete-placement-group`

The following code example shows how to use `delete-placement-group`.

AWS CLI

To delete a placement group

This example command deletes the specified placement group.

Command:

```
aws ec2 delete-placement-group --group-name my-cluster
```

- For API details, see DeletePlacementGroup in *AWS CLI Command Reference*.

`delete-queued-reserved-instances`

The following code example shows how to use `delete-queued-reserved-instances`.

AWS CLI

To delete a queued purchase

The following `delete-queued-reserved-instances` example deletes the specified Reserved Instance, which was queued for purchase.

```
aws ec2 delete-queued-reserved-instances \
    --reserved-instances-ids af9f760e-6f91-4559-85f7-4980eexample
```

Output:

```
{
    "SuccessfulQueuedPurchaseDeletions": [
        {
            "ReservedInstancesId": "af9f760e-6f91-4559-85f7-4980eexample"
        }
    ],
    "FailedQueuedPurchaseDeletions": []
}
```

- For API details, see DeleteQueuedReservedInstances in *AWS CLI Command Reference*.

`delete-route-table`

The following code example shows how to use `delete-route-table`.

AWS CLI

To delete a route table

This example deletes the specified route table. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-route-table --route-table-id rtb-22574640
```

- For API details, see DeleteRouteTable in *AWS CLI Command Reference*.

`delete-route`

The following code example shows how to use `delete-route`.

AWS CLI

To delete a route

This example deletes the specified route from the specified route table. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-route --route-table-id rtb-22574640 --destination-cidr-
block 0.0.0.0/0
```

- For API details, see DeleteRoute in *AWS CLI Command Reference*.

`delete-security-group`

The following code example shows how to use `delete-security-group`.

AWS CLI

[EC2-Classic] To delete a security group

This example deletes the security group named `MySecurityGroup`. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-security-group --group-name MySecurityGroup
```

[EC2-VPC] To delete a security group

This example deletes the security group with the ID `sg-903004f8`. Note that you can't reference a security group for EC2-VPC by name. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-security-group --group-id sg-903004f8
```

For more information, see Using Security Groups in the *AWS Command Line Interface User Guide*.

- For API details, see DeleteSecurityGroup in *AWS CLI Command Reference*.

`delete-snapshot`

The following code example shows how to use `delete-snapshot`.

AWS CLI

To delete a snapshot

This example command deletes a snapshot with the snapshot ID of `snap-1234567890abcdef0`. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-snapshot --snapshot-id snap-1234567890abcdef0
```

- For API details, see DeleteSnapshot in *AWS CLI Command Reference*.

`delete-spot-datafeed-subscription`

The following code example shows how to use `delete-spot-datafeed-subscription`.

AWS CLI

To cancel a Spot Instance data feed subscription

This example command deletes a Spot data feed subscription for the account. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-spot-datafeed-subscription
```

- For API details, see DeleteSpotDatafeedSubscription in *AWS CLI Command Reference*.

`delete-subnet-cidr-reservation`

The following code example shows how to use `delete-subnet-cidr-reservation`.

AWS CLI

To delete a subnet CIDR reservation

The following `delete-subnet-cidr-reservation` example deletes the specified subnet CIDR reservation.

```
aws ec2 delete-subnet-cidr-reservation \
    --subnet-cidr-reservation-id scr-044f977c4eEXAMPLE
```

Output:

```
{
    "DeletedSubnetCidrReservation": {
        "SubnetCidrReservationId": "scr-044f977c4eEXAMPLE",
        "SubnetId": "subnet-03c51e2e6cEXAMPLE",
        "Cidr": "10.1.0.16/28",
        "ReservationType": "prefix",
        "OwnerId": "123456789012"
    }
}
```

For more information, see Subnet CIDR reservations in the *Amazon VPC User Guide*.

- For API details, see DeleteSubnetCidrReservation in *AWS CLI Command Reference*.

`delete-subnet`

The following code example shows how to use `delete-subnet`.

AWS CLI

To delete a subnet

This example deletes the specified subnet. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-subnet --subnet-id subnet-9d4a7b6c
```

- For API details, see DeleteSubnet in *AWS CLI Command Reference*.

`delete-tags`

The following code example shows how to use `delete-tags`.

AWS CLI

Example 1: To delete a tag from a resource

The following `delete-tags` example deletes the tag `Stack=Test` from the specified image. When you specify both a value and a key name, the tag is deleted only if the tag's value matches the specified value.

```
aws ec2 delete-tags \
    --resources ami-1234567890abcdef0 \
    --tags Key=Stack,Value=Test
```

It's optional to specify the value for a tag. The following `delete-tags` example deletes the tag with the key name `purpose` from the specified instance, regardless of the tag value for the tag.

```
aws ec2 delete-tags \
    --resources i-1234567890abcdef0 \
    --tags Key=purpose
```

If you specify the empty string as the tag value, the tag is deleted only if the tag's value is the empty string. The following `delete-tags` example specifies the empty string as the tag value for the tag to delete.

```
aws ec2 delete-tags \
    --resources i-1234567890abcdef0 \
```

```
    --tags Key=Name,Value=
```

Example 2: To delete a tag from multiple resources

The following `delete-tags` example deletes the tag``Purpose=Test`` from both an instance and an AMI. As shown in the previous example, you can omit the tag value from the command.

```
aws ec2 delete-tags \
    --resources i-1234567890abcdef0 ami-1234567890abcdef0 \
    --tags Key=Purpose
```

- For API details, see DeleteTags in *AWS CLI Command Reference*.

`delete-traffic-mirror-filter-rule`

The following code example shows how to use `delete-traffic-mirror-filter-rule`.

AWS CLI

To delete a traffic mirror filter rule

The following `delete-traffic-mirror-filter-rule` example deletes the specified traffic mirror filter rule.

```
aws ec2 delete-traffic-mirror-filter-rule \
    --traffic-mirror-filter-rule-id tmfr-081f71283bEXAMPLE
```

Output:

```
{
    "TrafficMirrorFilterRuleId": "tmfr-081f71283bEXAMPLE"
}
```

For more information, see Modify Your Traffic Mirror Filter Rules in the *AWS Traffic Mirroring Guide*.

- For API details, see DeleteTrafficMirrorFilterRule in *AWS CLI Command Reference*.

`delete-traffic-mirror-filter`

The following code example shows how to use `delete-traffic-mirror-filter`.

AWS CLI

To delete a traffic mirror filter

The following `delete-traffic-mirror-filter` example deletes the specified traffic mirror filter.

```
aws ec2 delete-traffic-mirror-filter \
    --traffic-mirror-filter-id tmf-0be0b25fcdEXAMPLE
```

Output:

```
{
    "TrafficMirrorFilterId": "tmf-0be0b25fcdEXAMPLE"
}
```

For more information, see Delete a Traffic Mirror Filter in the *AWS Traffic Mirroring Guide*.

- For API details, see DeleteTrafficMirrorFilter in *AWS CLI Command Reference*.

`delete-traffic-mirror-session`

The following code example shows how to use `delete-traffic-mirror-session`.

AWS CLI

To delete a traffic mirror session

The following `delete-traffic-mirror-session` example deletes the specified traffic mirror-session.

```
aws ec2 delete-traffic-mirror-session \
    --traffic-mirror-session-id tms-0af3141ce5EXAMPLE
```

Output:

```
{
    "TrafficMirrorSessionId": "tms-0af3141ce5EXAMPLE"
}
```

For more information, see Delete a Traffic Mirror Session in the *AWS Traffic Mirroring Guide*.

- For API details, see DeleteTrafficMirrorSession in *AWS CLI Command Reference*.

`delete-traffic-mirror-target`

The following code example shows how to use `delete-traffic-mirror-target`.

AWS CLI

To delete a traffic mirror target

The following `delete-traffic-mirror-target` example deletes the specified traffic mirror target.

```
aws ec2 delete-traffic-mirror-target \
    --traffic-mirror-target-id tmt-060f48ce9EXAMPLE
```

Output:

```
{
    "TrafficMirrorTargetId": "tmt-060f48ce9EXAMPLE"
}
```

For more information, see Delete a Traffic Mirror Target in the *AWS Traffic Mirroring Guide*.

- For API details, see DeleteTrafficMirrorTarget in *AWS CLI Command Reference*.

`delete-transit-gateway-connect-peer`

The following code example shows how to use `delete-transit-gateway-connect-peer`.

AWS CLI

To delete a Transit Gateway Connect peer

The following `delete-transit-gateway-connect-peer` example deletes the specified Connect peer.

```
aws ec2 delete-transit-gateway-connect-peer \
    --transit-gateway-connect-peer-id tgw-connect-peer-0666adbac4EXAMPLE
```

Output:

```
{
    "TransitGatewayConnectPeer": {
        "TransitGatewayAttachmentId": "tgw-attach-0f0927767cEXAMPLE",
        "TransitGatewayConnectPeerId": "tgw-connect-peer-0666adbac4EXAMPLE",
        "State": "deleting",
        "CreationTime": "2021-10-13T03:35:17.000Z",
        "ConnectPeerConfiguration": {
            "TransitGatewayAddress": "10.0.0.234",
            "PeerAddress": "172.31.1.11",
            "InsideCidrBlocks": [
                "169.254.6.0/29"
            ],
            "Protocol": "gre",
            "BgpConfigurations": [
                {
                    "TransitGatewayAsn": 64512,
                    "PeerAsn": 64512,
                    "TransitGatewayAddress": "169.254.6.2",
                    "PeerAddress": "169.254.6.1",
                    "BgpStatus": "down"
                },
                {
                    "TransitGatewayAsn": 64512,
                    "PeerAsn": 64512,
                    "TransitGatewayAddress": "169.254.6.3",
                    "PeerAddress": "169.254.6.1",
                    "BgpStatus": "down"
                }
            ]
        }
    }
}
```

For more information, see Transit gateway Connect attachments and Transit Gateway Connect peers in the *Transit Gateways Guide*.

- For API details, see DeleteTransitGatewayConnectPeer in *AWS CLI Command Reference*.

`delete-transit-gateway-connect`

The following code example shows how to use `delete-transit-gateway-connect`.

AWS CLI

To delete a transit gateway Connect attachment

The following `delete-transit-gateway-connect` example deletes the specified Connect attachment.

```
aws ec2 delete-transit-gateway-connect \
    --transit-gateway-attachment-id tgw-attach-037012e5dcEXAMPLE
```

Output:

```
{
    "TransitGatewayConnect": {
        "TransitGatewayAttachmentId": "tgw-attach-037012e5dcEXAMPLE",
        "TransportTransitGatewayAttachmentId": "tgw-attach-0a89069f57EXAMPLE",
        "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
        "State": "deleting",
        "CreationTime": "2021-03-09T19:59:17+00:00",
        "Options": {
            "Protocol": "gre"
        }
    }
}
```

For more information, see Transit gateway Connect attachments and Transit Gateway Connect peers in the *Transit Gateways Guide*.

- For API details, see DeleteTransitGatewayConnect in *AWS CLI Command Reference*.

`delete-transit-gateway-multicast-domain`

The following code example shows how to use `delete-transit-gateway-multicast-domain`.

AWS CLI

To delete a transit gateway multicast domain

The following `delete-transit-gateway-multicast-domain` example deletes the specified multicast domain.

```
aws ec2 delete-transit-gateway-multicast-domain \
```

```
    --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef7EXAMPLE
```

Output:

```
{
    "TransitGatewayMulticastDomain": {
        "TransitGatewayMulticastDomainId": "tgw-mcast-domain-02bb79002bEXAMPLE",
        "TransitGatewayId": "tgw-0d88d2d0d5EXAMPLE",
        "State": "deleting",
        "CreationTime": "2019-11-20T22:02:03.000Z"
    }
}
```

For more information, see Managing multicast domains in the *Transit Gateways Guide*.

- For API details, see DeleteTransitGatewayMulticastDomain in *AWS CLI Command Reference*.

`delete-transit-gateway-peering-attachment`

The following code example shows how to use `delete-transit-gateway-peering-attachment`.

AWS CLI

To delete a transit gateway peering attachment

The following `delete-transit-gateway-peering-attachment` example deletes the specified transit gateway peering attachment.

```
aws ec2 delete-transit-gateway-peering-attachment \
    --transit-gateway-attachment-id tgw-attach-4455667788aabbccd
```

Output:

```
{
    "TransitGatewayPeeringAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-4455667788aabbccd",
        "RequesterTgwInfo": {
            "TransitGatewayId": "tgw-123abc05e04123abc",
            "OwnerId": "123456789012",
```

```
            "Region": "us-west-2"
        },
        "AccepterTgwInfo": {
            "TransitGatewayId": "tgw-11223344aabbcc112",
            "OwnerId": "123456789012",
            "Region": "us-east-2"
        },
        "State": "deleting",
        "CreationTime": "2019-12-09T11:38:31.000Z"
    }
}
```

For more information, see Transit Gateway Peering Attachments in the *Transit Gateways Guide*.

- For API details, see DeleteTransitGatewayPeeringAttachment in *AWS CLI Command Reference*.

delete-transit-gateway-policy-table

The following code example shows how to use `delete-transit-gateway-policy-table`.

AWS CLI

To delete a transit gateway policy table

The following `delete-transit-gateway-policy-table` example deletes the specified transit gateway policy table.

```
aws ec2 delete-transit-gateway-policy-table \
    --transit-gateway-policy-table-id tgw-ptb-0a16f134b78668a81
```

Output:

```
{
    "TransitGatewayPolicyTables": [
        {
            "TransitGatewayPolicyTableId": "tgw-ptb-0a16f134b78668a81",
            "TransitGatewayId": "tgw-067f8505c18f0bd6e",
            "State": "deleting",
            "CreationTime": "2023-11-28T16:36:43+00:00",
            "Tags": []
        }
    ]
```

```
}
```

For more information, see Transit gateway policy tables in the *Transit Gateway User Guide*.

- For API details, see DeleteTransitGatewayPolicyTable in *AWS CLI Command Reference*.

delete-transit-gateway-prefix-list-reference

The following code example shows how to use `delete-transit-gateway-prefix-list-reference`.

AWS CLI

To delete a prefix list reference

The following `delete-transit-gateway-prefix-list-reference` example deletes the specified prefix list reference.

```
aws ec2 delete-transit-gateway-prefix-list-reference \
    --transit-gateway-route-table-id tgw-rtb-0123456789abcd123 \
    --prefix-list-id pl-11111122222222333
```

Output:

```
{
    "TransitGatewayPrefixListReference": {
        "TransitGatewayRouteTableId": "tgw-rtb-0123456789abcd123",
        "PrefixListId": "pl-11111122222222333",
        "PrefixListOwnerId": "123456789012",
        "State": "deleting",
        "Blackhole": false,
        "TransitGatewayAttachment": {
            "TransitGatewayAttachmentId": "tgw-attach-aabbccddaabbccaab",
            "ResourceType": "vpc",
            "ResourceId": "vpc-112233445566aabbc"
        }
    }
}
```

For more information, see Prefix list references in the *Transit Gateways Guide*.

- For API details, see DeleteTransitGatewayPrefixListReference in *AWS CLI Command Reference*.

`delete-transit-gateway-route-table`

The following code example shows how to use `delete-transit-gateway-route-table`.

AWS CLI

To delete a transit gateway route table

The following `delete-transit-gateway-route-table` example deletes the specified transit gateway route table.

```
aws ec2  delete-transit-gateway-route-table \
    --transit-gateway-route-table-id tgw-rtb-0b6f6aaa01EXAMPLE
```

Output:

```
{
    "TransitGatewayRouteTable": {
        "TransitGatewayRouteTableId": "tgw-rtb-0b6f6aaa01EXAMPLE",
        "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
        "State": "deleting",
        "DefaultAssociationRouteTable": false,
        "DefaultPropagationRouteTable": false,
        "CreationTime": "2019-07-17T20:27:26.000Z"
    }
}
```

For more information, see Delete a transit gateway route table in the *Transit Gateways Guide*.

- For API details, see DeleteTransitGatewayRouteTable in *AWS CLI Command Reference*.

`delete-transit-gateway-route`

The following code example shows how to use `delete-transit-gateway-route`.

AWS CLI

To delete a CIDR block from a route table

The following `delete-transit-gateway-route` example deletes the CIDR block from the specified transit gateway route table.

```
aws ec2 delete-transit-gateway-route \
    --transit-gateway-route-table-id tgw-rtb-0b6f6aaa01EXAMPLE \
    --destination-cidr-block 10.0.2.0/24
```

Output:

```
{
    "Route": {
        "DestinationCidrBlock": "10.0.2.0/24",
        "TransitGatewayAttachments": [
            {
                "ResourceId": "vpc-0065acced4EXAMPLE",
                "TransitGatewayAttachmentId": "tgw-attach-0b5968d3b6EXAMPLE",
                "ResourceType": "vpc"
            }
        ],
        "Type": "static",
        "State": "deleted"
    }
}
```

For more information, see Delete a static route in the *Transit Gateways Guide*.

- For API details, see DeleteTransitGatewayRoute in *AWS CLI Command Reference*.

`delete-transit-gateway-vpc-attachment`

The following code example shows how to use `delete-transit-gateway-vpc-attachment`.

AWS CLI

To delete a transit gateway VPC attachment

The following `delete-transit-gateway-vpc-attachment` example deletes the specified VPC attachment.

```
aws ec2 delete-transit-gateway-vpc-attachment \
    --transit-gateway-attachment-id tgw-attach-0d2c54bdbEXAMPLE
```

Output:

```
{
```

```
    "TransitGatewayVpcAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-0d2c54bdb3EXAMPLE",
        "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
        "VpcId": "vpc-0065acced4f61c651",
        "VpcOwnerId": "111122223333",
        "State": "deleting",
        "CreationTime": "2019-07-17T16:04:27.000Z"
    }
}
```

For more information, see Delete a VPC attachment in the *Transit Gateways Guide*.

- For API details, see DeleteTransitGatewayVpcAttachment in *AWS CLI Command Reference*.

`delete-transit-gateway`

The following code example shows how to use `delete-transit-gateway`.

AWS CLI

To delete a transit gateway

The following `delete-transit-gateway` example deletes the specified transit gateway.

```
aws ec2  delete-transit-gateway \
    --transit-gateway-id tgw-01f04542b2EXAMPLE
```

Output:

```
{
    "TransitGateway": {
        "TransitGatewayId": "tgw-01f04542b2EXAMPLE",
        "State": "deleting",
        "OwnerId": "123456789012",
        "Description": "Example Transit Gateway",
        "CreationTime": "2019-08-27T15:04:35.000Z",
        "Options": {
            "AmazonSideAsn": 64515,
            "AutoAcceptSharedAttachments": "disable",
            "DefaultRouteTableAssociation": "enable",
            "AssociationDefaultRouteTableId": "tgw-rtb-0ce7a6948fEXAMPLE",
            "DefaultRouteTablePropagation": "enable",
            "PropagationDefaultRouteTableId": "tgw-rtb-0ce7a6948fEXAMPLE",
```

```
                "VpnEcmpSupport": "enable",
                "DnsSupport": "enable"
            }
        }
}
```

For more information, see [Delete a transit gateway](#) in the *Transit Gateways Guide*.

- For API details, see [DeleteTransitGateway](#) in *AWS CLI Command Reference*.

`delete-verified-access-endpoint`

The following code example shows how to use `delete-verified-access-endpoint`.

AWS CLI

To delete a Verified Access endpoint

The following `delete-verified-access-endpoint` example deletes the specified Verified Access endpoint.

```
aws ec2 delete-verified-access-endpoint \
    --verified-access-endpoint-id vae-066fac616d4d546f2
```

Output:

```
{
    "VerifiedAccessEndpoint": {
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
        "VerifiedAccessEndpointId": "vae-066fac616d4d546f2",
        "ApplicationDomain": "example.com",
        "EndpointType": "network-interface",
        "AttachmentType": "vpc",
        "DomainCertificateArn": "arn:aws:acm:us-east-2:123456789012:certificate/
eb065ea0-26f9-4e75-a6ce-0a1a7EXAMPLE",
        "EndpointDomain": "my-ava-
app.edge-00c3372d53b1540bb.vai-0ce000c0b7643abea.prod.verified-access.us-
east-2.amazonaws.com",
        "SecurityGroupIds": [
            "sg-004915970c4c8f13a"
        ],
```

```
        "NetworkInterfaceOptions": {
            "NetworkInterfaceId": "eni-0aec70418c8d87a0f",
            "Protocol": "https",
            "Port": 443
        },
        "Status": {
            "Code": "deleting"
        },
        "Description": "Testing Verified Access",
        "CreationTime": "2023-08-25T20:54:43",
        "LastUpdatedTime": "2023-08-25T22:46:32"
    }
}
```

For more information, see Verified Access endpoints in the *AWS Verified Access User Guide*.

- For API details, see DeleteVerifiedAccessEndpoint in *AWS CLI Command Reference*.

delete-verified-access-group

The following code example shows how to use `delete-verified-access-group`.

AWS CLI

To delete a Verified Access group

The following `delete-verified-access-group` example deletes the specified Verified Access group.

```
aws ec2 delete-verified-access-group \
    --verified-access-group-id vagr-0dbe967baf14b7235
```

Output:

```
{
    "VerifiedAccessGroup": {
        "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "Description": "Testing Verified Access",
        "Owner": "123456789012",
        "VerifiedAccessGroupArn": "arn:aws:ec2:us-east-2:123456789012:verified-
access-group/vagr-0dbe967baf14b7235",
        "CreationTime": "2023-08-25T19:55:19",
```

```
        "LastUpdatedTime": "2023-08-25T22:49:03",
        "DeletionTime": "2023-08-26T00:58:31"
    }
}
```

For more information, see Verified Access groups in the *AWS Verified Access User Guide*.

- For API details, see DeleteVerifiedAccessGroup in *AWS CLI Command Reference*.

`delete-verified-access-instance`

The following code example shows how to use `delete-verified-access-instance`.

AWS CLI

To delete a Verified Access instance

The following `delete-verified-access-instance` example deletes the specified Verified Access instance.

```
aws ec2 delete-verified-access-instance \
    --verified-access-instance-id vai-0ce000c0b7643abea
```

Output:

```
{
    "VerifiedAccessInstance": {
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "Description": "Testing Verified Access",
        "VerifiedAccessTrustProviders": [],
        "CreationTime": "2023-08-25T18:27:56",
        "LastUpdatedTime": "2023-08-26T01:00:18"
    }
}
```

For more information, see Verified Access instances in the *AWS Verified Access User Guide*.

- For API details, see DeleteVerifiedAccessInstance in *AWS CLI Command Reference*.

`delete-verified-access-trust-provider`

The following code example shows how to use `delete-verified-access-trust-provider`.

AWS CLI

To delete a Verified Access trust provider

The following `delete-verified-access-trust-provider` example deletes the specified Verified Access trust provider.

```
aws ec2 delete-verified-access-trust-provider \
    --verified-access-trust-provider-id vatp-0bb32de759a3e19e7
```

Output:

```
{
    "VerifiedAccessTrustProvider": {
        "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
        "Description": "Testing Verified Access",
        "TrustProviderType": "user",
        "UserTrustProviderType": "iam-identity-center",
        "PolicyReferenceName": "idc",
        "CreationTime": "2023-08-25T18:40:36",
        "LastUpdatedTime": "2023-08-25T18:40:36"
    }
}
```

For more information, see Trust providers for Verified Access in the *AWS Verified Access User Guide*.

- For API details, see DeleteVerifiedAccessTrustProvider in *AWS CLI Command Reference*.

`delete-volume`

The following code example shows how to use `delete-volume`.

AWS CLI

To delete a volume

This example command deletes an available volume with the volume ID of `vol-049df61146c4d7901`. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-volume --volume-id vol-049df61146c4d7901
```

- For API details, see DeleteVolume in *AWS CLI Command Reference*.

`delete-vpc-endpoint-connection-notifications`

The following code example shows how to use `delete-vpc-endpoint-connection-notifications`.

AWS CLI

To delete an endpoint connection notification

This example deletes the specified endpoint connection notification.

Command:

```
aws ec2 delete-vpc-endpoint-connection-notifications --connection-notification-
ids vpce-nfn-008776de7e03f5abc
```

Output:

```
{
  "Unsuccessful": []
}
```

- For API details, see DeleteVpcEndpointConnectionNotifications in *AWS CLI Command Reference*.

`delete-vpc-endpoint-service-configurations`

The following code example shows how to use `delete-vpc-endpoint-service-configurations`.

AWS CLI

To delete an endpoint service configuration

This example deletes the specified endpoint service configuration.

Command:

```
aws ec2 delete-vpc-endpoint-service-configurations --service-ids vpce-
svc-03d5ebb7d9579a2b3
```

Output:

```
{
   "Unsuccessful": []
}
```

- For API details, see DeleteVpcEndpointServiceConfigurations in *AWS CLI Command Reference*.

delete-vpc-endpoints

The following code example shows how to use `delete-vpc-endpoints`.

AWS CLI

To delete an endpoint

This example deletes endpoints vpce-aa22bb33 and vpce-1a2b3c4d. If the command is partially successful or unsuccessful, a list of unsuccessful items is returned. If the command succeeds, the returned list is empty.

Command:

```
aws ec2 delete-vpc-endpoints --vpc-endpoint-ids vpce-aa22bb33 vpce-1a2b3c4d
```

Output:

```
{
  "Unsuccessful": []
}
```

- For API details, see DeleteVpcEndpoints in *AWS CLI Command Reference*.

delete-vpc-peering-connection

The following code example shows how to use `delete-vpc-peering-connection`.

AWS CLI

To delete a VPC peering connection

This example deletes the specified VPC peering connection.

Command:

```
aws ec2 delete-vpc-peering-connection --vpc-peering-connection-id pcx-1a2b3c4d
```

Output:

```
{
    "Return": true
}
```

- For API details, see DeleteVpcPeeringConnection in *AWS CLI Command Reference*.

`delete-vpc`

The following code example shows how to use `delete-vpc`.

AWS CLI

To delete a VPC

This example deletes the specified VPC. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-vpc --vpc-id vpc-a01106c2
```

- For API details, see DeleteVpc in *AWS CLI Command Reference*.

`delete-vpn-connection-route`

The following code example shows how to use `delete-vpn-connection-route`.

AWS CLI

To delete a static route from a VPN connection

This example deletes the specified static route from the specified VPN connection. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-vpn-connection-route --vpn-connection-id vpn-40f41529 --destination-cidr-block 11.12.0.0/16
```

- For API details, see DeleteVpnConnectionRoute in *AWS CLI Command Reference*.

`delete-vpn-connection`

The following code example shows how to use `delete-vpn-connection`.

AWS CLI

To delete a VPN connection

This example deletes the specified VPN connection. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-vpn-connection --vpn-connection-id vpn-40f41529
```

- For API details, see DeleteVpnConnection in *AWS CLI Command Reference*.

`delete-vpn-gateway`

The following code example shows how to use `delete-vpn-gateway`.

AWS CLI

To delete a virtual private gateway

This example deletes the specified virtual private gateway. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-vpn-gateway --vpn-gateway-id vgw-9a4cacf3
```

- For API details, see DeleteVpnGateway in *AWS CLI Command Reference*.

`deprovision-byoip-cidr`

The following code example shows how to use `deprovision-byoip-cidr`.

AWS CLI

To remove an IP address range from use

The following example removes the specified address range from use with AWS.

```
aws ec2 deprovision-byoip-cidr \
    --cidr 203.0.113.25/24
```

Output:

```
{
    "ByoipCidr": {
        "Cidr": "203.0.113.25/24",
        "State": "pending-deprovision"
    }
}
```

- For API details, see DeprovisionByoipCidr in *AWS CLI Command Reference*.

`deprovision-ipam-pool-cidr`

The following code example shows how to use `deprovision-ipam-pool-cidr`.

AWS CLI

To deprovision an IPAM pool CIDR

The following `deprovision-ipam-pool-cidr` example deprovisions a CIDR provisioned to an IPAM pool.

(Linux):

```
aws ec2 deprovision-ipam-pool-cidr \
    --ipam-pool-id ipam-pool-02ec043a19bbe5d08 \
```

```
    --cidr 11.0.0.0/16
```

(Windows):

```
aws ec2 deprovision-ipam-pool-cidr ^
    --ipam-pool-id ipam-pool-02ec043a19bbe5d08 ^
    --cidr 11.0.0.0/16
```

Output:

```
{
    "IpamPoolCidr": {
        "Cidr": "11.0.0.0/16",
        "State": "pending-deprovision"
    }
}
```

For more information, see Deprovision pool CIDRs in the *Amazon VPC IPAM User Guide*.

- For API details, see DeprovisionIpamPoolCidr in *AWS CLI Command Reference*.

`deregister-image`

The following code example shows how to use `deregister-image`.

AWS CLI

To deregister an AMI

This example deregisters the specified AMI. If the command succeeds, no output is returned.

Command:

```
aws ec2 deregister-image --image-id ami-4fa54026
```

- For API details, see DeregisterImage in *AWS CLI Command Reference*.

`deregister-instance-event-notification-attributes`

The following code example shows how to use `deregister-instance-event-notification-attributes`.

AWS CLI

Example 1: To remove all tags from event notifications

The following `deregister-instance-event-notification-attributes` example removes `IncludeAllTagsOfInstance=true`, which has the effect of setting `IncludeAllTagsOfInstance` to `false`.

```
aws ec2 deregister-instance-event-notification-attributes \
    --instance-tag-attribute IncludeAllTagsOfInstance=true
```

Output:

```
{
    "InstanceTagAttribute": {
        "InstanceTagKeys": [],
        "IncludeAllTagsOfInstance": true
    }
}
```

For more information, see Scheduled events for your instances in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

Example 2: To remove specific tags from event notifications

The following `deregister-instance-event-notification-attributes` example removes the specified tag from the tags included in event notifications. To describe the remaining tags included in event notifications, use `describe-instance-event-notification-attributes`.

```
aws ec2 deregister-instance-event-notification-attributes \
    --instance-tag-attribute InstanceTagKeys="tag-key2"
```

Output:

```
{
    "InstanceTagAttribute": {
        "InstanceTagKeys": [
            "tag-key2"
        ],
        "IncludeAllTagsOfInstance": false
    }
```

```
}
```

For more information, see Scheduled events for your instances in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see DeregisterInstanceEventNotificationAttributes in *AWS CLI Command Reference*.

`deregister-transit-gateway-multicast-group-members`

The following code example shows how to use `deregister-transit-gateway-multicast-group-members`.

AWS CLI

To deregister group members from a multicast group

This example deregisters the specified network interface group member from the transit gateway multicast group.

```
aws ec2 deregister-transit-gateway-multicast-group-members \
    --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef7EXAMPLE \
    --group-ip-address 224.0.1.0 \
    --network-interface-ids eni-0e246d3269EXAMPLE
```

Output:

```
{
    "DeregisteredMulticastGroupMembers": {
        "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef7EXAMPLE",
        "RegisteredNetworkInterfaceIds": [
            "eni-0e246d3269EXAMPLE"
        ],
        "GroupIpAddress": "224.0.1.0"
    }
}
```

For more information, see Deregister Members from a Multicast Group in the *AWS Transit Gateways Users Guide*.

- For API details, see DeregisterTransitGatewayMulticastGroupMembers in *AWS CLI Command Reference*.

`deregister-transit-gateway-multicast-group-source`

The following code example shows how to use `deregister-transit-gateway-multicast-group-source`.

AWS CLI

To deregister a source from the transit gateway multicast group

This example deregisters the specified network interface group source from the multicast group.

```
aws ec2 register-transit-gateway-multicast-group-sources \
    --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef79d6e597 \
    --group-ip-address 224.0.1.0 \
    --network-interface-ids eni-07f290fc3c090cbae
```

Output:

```
{
    "DeregisteredMulticastGroupSources": {
        "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef79d6e597",
        "DeregisteredNetworkInterfaceIds": [
            "eni-07f290fc3c090cbae"
        ],
        "GroupIpAddress": "224.0.1.0"
    }
}
```

For more information, see Deregister Sources from a Multicast Group in the *AWS Transit Gateways User Guide*.

- For API details, see DeregisterTransitGatewayMulticastGroupSource in *AWS CLI Command Reference*.

`describe-account-attributes`

The following code example shows how to use `describe-account-attributes`.

AWS CLI

To describe all the attributes for your AWS account

This example describes the attributes for your AWS account.

Command:

```
aws ec2 describe-account-attributes
```

Output:

```
{
    "AccountAttributes": [
        {
            "AttributeName": "vpc-max-security-groups-per-interface",
            "AttributeValues": [
                {
                    "AttributeValue": "5"
                }
            ]
        },
        {
            "AttributeName": "max-instances",
            "AttributeValues": [
                {
                    "AttributeValue": "20"
                }
            ]
        },
        {
            "AttributeName": "supported-platforms",
            "AttributeValues": [
                {
                    "AttributeValue": "EC2"
                },
                {
                    "AttributeValue": "VPC"
                }
            ]
        },
        {
            "AttributeName": "default-vpc",
            "AttributeValues": [
                {
                    "AttributeValue": "none"
                }
```

```
                ]
            },
            {
                "AttributeName": "max-elastic-ips",
                "AttributeValues": [
                    {
                        "AttributeValue": "5"
                    }
                ]
            },
            {
                "AttributeName": "vpc-max-elastic-ips",
                "AttributeValues": [
                    {
                        "AttributeValue": "5"
                    }
                ]
            }
        ]
}
```

To describe a single attribute for your AWS account

This example describes the `supported-platforms` attribute for your AWS account.

Command:

```
aws ec2 describe-account-attributes --attribute-names supported-platforms
```

Output:

```
{
    "AccountAttributes": [
        {
            "AttributeName": "supported-platforms",
            "AttributeValues": [
                {
                    "AttributeValue": "EC2"
                },
                {
                    "AttributeValue": "VPC"
                }
            ]
```

```
        }
    ]
}
```

- For API details, see [DescribeAccountAttributes]() in *AWS CLI Command Reference*.

`describe-address-transfers`

The following code example shows how to use `describe-address-transfers`.

AWS CLI

To describe an Elastic IP address transfer

The following `describe-address-transfers` example describes the Elastic IP address transfer for the specified Elastic IP address.

```
aws ec2 describe-address-transfers \
    --allocation-ids eipalloc-09ad461b0d03f6aaf
```

Output:

```
{
    "AddressTransfers": [
        {
            "PublicIp": "100.21.184.216",
            "AllocationId": "eipalloc-09ad461b0d03f6aaf",
            "TransferAccountId": "123456789012",
            "TransferOfferExpirationTimestamp": "2023-02-22T22:51:01.000Z",
            "AddressTransferStatus": "pending"
        }
    ]
}
```

For more information, see [Transfer Elastic IP addresses]() in the *Amazon VPC User Guide*.

- For API details, see [DescribeAddressTransfers]() in *AWS CLI Command Reference*.

`describe-addresses-attribute`

The following code example shows how to use `describe-addresses-attribute`.

AWS CLI

To view the attributes of the domain name associated with an elastic IP address

The following `describe-addresses-attribute` examples return the attributes of the domain name associated with the elastic IP address.

Linux:

```
aws ec2 describe-addresses-attribute \
    --allocation-ids eipalloc-abcdef01234567890 \
    --attribute domain-name
```

Windows:

```
aws ec2 describe-addresses-attribute ^
    --allocation-ids eipalloc-abcdef01234567890 ^
    --attribute domain-name
```

Output:

```
{
    "Addresses": [
        {
            "PublicIp": "192.0.2.0",
            "AllocationId": "eipalloc-abcdef01234567890",
            "PtrRecord": "example.com."
        }
    ]
}
```

To view the attributes of an elastic IP address, you must have first associated a domain name with the elastic IP address. For more information, see Use reverse DNS for email applications in the *Amazon EC2 User Guide* or modify-address-attribute in the *AWS CLI Command Reference*.

- For API details, see DescribeAddressesAttribute in *AWS CLI Command Reference*.

`describe-addresses`

The following code example shows how to use `describe-addresses`.

AWS CLI

Example 1: To retrieve details about all of your Elastic IP addresses

The following `describe addresses` example displays details about your Elastic IP addresses.

```
aws ec2 describe-addresses
```

Output:

```
{
    "Addresses": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "PublicIp": "198.51.100.0",
            "PublicIpv4Pool": "amazon",
            "Domain": "standard"
        },
        {
            "Domain": "vpc",
            "PublicIpv4Pool": "amazon",
            "InstanceId": "i-1234567890abcdef0",
            "NetworkInterfaceId": "eni-12345678",
            "AssociationId": "eipassoc-12345678",
            "NetworkInterfaceOwnerId": "123456789012",
            "PublicIp": "203.0.113.0",
            "AllocationId": "eipalloc-12345678",
            "PrivateIpAddress": "10.0.1.241"
        }
    ]
}
```

Example 2: To retrieve details your Elastic IP addresses for EC2-VPC

The following `describe-addresses` example displays details about your Elastic IP addresses for use with instances in a VPC.

```
aws ec2 describe-addresses \
    --filters "Name=domain,Values=vpc"
```

Output:

```
{
    "Addresses": [
        {
            "Domain": "vpc",
            "PublicIpv4Pool": "amazon",
            "InstanceId": "i-1234567890abcdef0",
            "NetworkInterfaceId": "eni-12345678",
            "AssociationId": "eipassoc-12345678",
            "NetworkInterfaceOwnerId": "123456789012",
            "PublicIp": "203.0.113.0",
            "AllocationId": "eipalloc-12345678",
            "PrivateIpAddress": "10.0.1.241"
        }
    ]
}
```

Example 3: To retrieve details about an Elastic IP address specified by allocation ID

The following `describe-addresses` example displays details about the Elastic IP address with the specified allocation ID, which is associated with an instance in EC2-VPC.

```
aws ec2 describe-addresses \
    --allocation-ids eipalloc-282d9641
```

Output:

```
{
    "Addresses": [
        {
            "Domain": "vpc",
            "PublicIpv4Pool": "amazon",
            "InstanceId": "i-1234567890abcdef0",
            "NetworkInterfaceId": "eni-1a2b3c4d",
            "AssociationId": "eipassoc-123abc12",
            "NetworkInterfaceOwnerId": "1234567891012",
            "PublicIp": "203.0.113.25",
            "AllocationId": "eipalloc-282d9641",
            "PrivateIpAddress": "10.251.50.12"
        }
    ]
}
```

Example 4: To retrieve details about an Elastic IP address specified by its VPC private IP address

The following `describe-addresses` example displays details about the Elastic IP address associated with a particular private IP address in EC2-VPC.

```
aws ec2 describe-addresses \
    --filters "Name=private-ip-address,Values=10.251.50.12"
```

Example 5: To retrieve details about Elastic IP addresses in EC2-Classic

The following `describe-addresses` example displays details about your Elastic IP addresses for use in EC2-Classic.

```
aws ec2 describe-addresses \
    --filters "Name=domain,Values=standard"
```

Output:

```
{
    "Addresses": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "PublicIp": "203.0.110.25",
            "PublicIpv4Pool": "amazon",
            "Domain": "standard"
        }
    ]
}
```

Example 6: To retrieve details about an Elastic IP addresses specified by its public IP address

The following `describe-addresses` example displays details about the Elastic IP address with the value `203.0.110.25`, which is associated with an instance in EC2-Classic.

```
aws ec2 describe-addresses \
    --public-ips 203.0.110.25
```

Output:

```
{
```

```
    "Addresses": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "PublicIp": "203.0.110.25",
            "PublicIpv4Pool": "amazon",
            "Domain": "standard"
        }
    ]
}
```

- For API details, see DescribeAddresses in *AWS CLI Command Reference*.

`describe-aggregate-id-format`

The following code example shows how to use `describe-aggregate-id-format`.

AWS CLI

To describe the longer ID format settings for all resource types in a Region

The following `describe-aggregate-id-format` example describes the overall long ID format status for the current Region. The `Deadline` value indicates that the deadlines for these resources to permanently switch from the short ID format to the long ID format expired. The `UseLongIdsAggregated` value indicates that all IAM users and IAM roles are configured to use long ID format for all resource types.

```
aws ec2 describe-aggregate-id-format
```

Output:

```
{
    "UseLongIdsAggregated": true,
    "Statuses": [
        {
            "Deadline": "2018-08-13T02:00:00.000Z",
            "Resource": "network-interface-attachment",
            "UseLongIds": true
        },
        {
            "Deadline": "2016-12-13T02:00:00.000Z",
            "Resource": "instance",
```

```
                "UseLongIds": true
            },
            {
                "Deadline": "2018-08-13T02:00:00.000Z",
                "Resource": "elastic-ip-association",
                "UseLongIds": true
            },
            ...
        ]
}
```

- For API details, see DescribeAggregateIdFormat in *AWS CLI Command Reference*.

`describe-availability-zones`

The following code example shows how to use `describe-availability-zones`.

AWS CLI

To describe your Availability Zones

The following example `describe-availability-zones` displays details for the Availability Zones that are available to you. The response includes Availability Zones only for the current Region. In this example, it uses the profiles default `us-west-2` (Oregon) Region.

```
aws ec2 describe-availability-zones
```

Output:

```
{
    "AvailabilityZones": [
        {
            "State": "available",
            "OptInStatus": "opt-in-not-required",
            "Messages": [],
            "RegionName": "us-west-2",
            "ZoneName": "us-west-2a",
            "ZoneId": "usw2-az1",
            "GroupName": "us-west-2",
            "NetworkBorderGroup": "us-west-2"
        },
```

```
        {
            "State": "available",
            "OptInStatus": "opt-in-not-required",
            "Messages": [],
            "RegionName": "us-west-2",
            "ZoneName": "us-west-2b",
            "ZoneId": "usw2-az2",
            "GroupName": "us-west-2",
            "NetworkBorderGroup": "us-west-2"
        },
        {
            "State": "available",
            "OptInStatus": "opt-in-not-required",
            "Messages": [],
            "RegionName": "us-west-2",
            "ZoneName": "us-west-2c",
            "ZoneId": "usw2-az3",
            "GroupName": "us-west-2",
            "NetworkBorderGroup": "us-west-2"
        },
        {
            "State": "available",
            "OptInStatus": "opt-in-not-required",
            "Messages": [],
            "RegionName": "us-west-2",
            "ZoneName": "us-west-2d",
            "ZoneId": "usw2-az4",
            "GroupName": "us-west-2",
            "NetworkBorderGroup": "us-west-2"
        },
        {
            "State": "available",
            "OptInStatus": "opted-in",
            "Messages": [],
            "RegionName": "us-west-2",
            "ZoneName": "us-west-2-lax-1a",
            "ZoneId": "usw2-lax1-az1",
            "GroupName": "us-west-2-lax-1",
            "NetworkBorderGroup": "us-west-2-lax-1"
        }
    ]
}
```

- For API details, see DescribeAvailabilityZones in *AWS CLI Command Reference*.

`describe-aws-network-performance-metric-subscription`

The following code example shows how to use `describe-aws-network-performance-metric-subscription`.

AWS CLI

To describe your metric subscriptions

The following `describe-aws-network-performance-metric-subscriptions` example describes your metric subscriptions.

```
aws ec2 describe-aws-network-performance-metric-subscriptions
```

Output:

```
{
    "Subscriptions": [
        {
            "Source": "us-east-1",
            "Destination": "eu-west-1",
            "Metric": "aggregate-latency",
            "Statistic": "p50",
            "Period": "five-minutes"
        }
    ]
}
```

For more information, see Manage subscriptions in the *Infrastructure Performance User Guide*.

- For API details, see DescribeAwsNetworkPerformanceMetricSubscription in *AWS CLI Command Reference*.

`describe-aws-network-performance-metric-subscriptions`

The following code example shows how to use `describe-aws-network-performance-metric-subscriptions`.

AWS CLI

To describe your metric subscriptions

The following `describe-aws-network-performance-metric-subscriptions` example describes your metric subscriptions.

```
aws ec2 describe-aws-network-performance-metric-subscriptions
```

Output:

```
{
    "Subscriptions": [
        {
            "Source": "us-east-1",
            "Destination": "eu-west-1",
            "Metric": "aggregate-latency",
            "Statistic": "p50",
            "Period": "five-minutes"
        }
    ]
}
```

For more information, see Manage subscriptions in the *Infrastructure Performance User Guide*.

- For API details, see DescribeAwsNetworkPerformanceMetricSubscriptions in *AWS CLI Command Reference*.

`describe-bundle-tasks`

The following code example shows how to use `describe-bundle-tasks`.

AWS CLI

To describe your bundle tasks

This example describes all of your bundle tasks.

Command:

```
aws ec2 describe-bundle-tasks
```

Output:

```
{
  "BundleTasks": [
```

```
    {
      "UpdateTime": "2015-09-15T13:26:54.000Z",
      "InstanceId": "i-1234567890abcdef0",
      "Storage": {
        "S3": {
            "Prefix": "winami",
            "Bucket": "bundletasks"
        }
      },
      "State": "bundling",
      "StartTime": "2015-09-15T13:24:35.000Z",
      "Progress": "3%",
      "BundleId": "bun-2a4e041c"
    }
  ]
}
```

- For API details, see DescribeBundleTasks in *AWS CLI Command Reference*.

`describe-byoip-cidrs`

The following code example shows how to use `describe-byoip-cidrs`.

AWS CLI

To describe your provisioned address ranges

The following `describe-byoip-cidrs` example displays details about the public IPv4 address ranges that you provisioned for use by AWS.

```
aws ec2 describe-byoip-cidrs
```

Output:

```
{
    "ByoipCidrs": [
        {
            "Cidr": "203.0.113.25/24",
            "StatusMessage": "ipv4pool-ec2-1234567890abcdef0",
            "State": "provisioned"
        }
    ]
```

```
}
```

- For API details, see DescribeByoipCidrs in *AWS CLI Command Reference*.

`describe-capacity-reservation-fleets`

The following code example shows how to use `describe-capacity-reservation-fleets`.

AWS CLI

To view a Capacity Reservation Fleet

The following `describe-capacity-reservation-fleets` example lists configuration and capacity information for the specified Capacity Reservation Fleet. It also lists details about the individual Capacity Reservations that are inside the Fleet.

```
aws ec2 describe-capacity-reservation-fleets \
    --capacity-reservation-fleet-ids crf-abcdef01234567890
```

Output:

```
{
    "CapacityReservationFleets": [
        {
            "State": "active",
            "EndDate": "2022-12-31T23:59:59.000Z",
            "InstanceMatchCriteria": "open",
            "Tags": [],
            "CapacityReservationFleetId": "crf-abcdef01234567890",
            "Tenancy": "default",
            "InstanceTypeSpecifications": [
                {
                    "CapacityReservationId": "cr-1234567890abcdef0",
                    "AvailabilityZone": "us-east-1a",
                    "FulfilledCapacity": 5.0,
                    "Weight": 1.0,
                    "CreateDate": "2022-07-02T08:34:33.398Z",
                    "InstancePlatform": "Linux/UNIX",
                    "TotalInstanceCount": 5,
                    "Priority": 1,
                    "EbsOptimized": true,
                    "InstanceType": "m5.xlarge"
```

```
                }
            ],
            "TotalTargetCapacity": 5,
            "TotalFulfilledCapacity": 5.0,
            "CreateTime": "2022-07-02T08:34:33.397Z",
            "AllocationStrategy": "prioritized"
        }
    ]
}
```

For more information about Capacity Reservation Fleets, see Capacity Reservation Fleets in the *Amazon EC2 User Guide*.

- For API details, see DescribeCapacityReservationFleets in *AWS CLI Command Reference*.

`describe-capacity-reservations`

The following code example shows how to use `describe-capacity-reservations`.

AWS CLI

Example 1: To describe one or more of your capacity reservations

The following `describe-capacity-reservations` example displays details about all of your capacity reservations in the current AWS Region.

```
aws ec2 describe-capacity-reservations
```

Output:

```
{
    "CapacityReservations": [
        {
            "CapacityReservationId": "cr-1234abcd56EXAMPLE ",
            "OwnerId": "123456789111",
            "CapacityReservationArn": "arn:aws:ec2:us-east-1:123456789111:capacity-
reservation/cr-1234abcd56EXAMPLE",
            "AvailabilityZoneId": "use1-az2",
            "InstanceType": "c5.large",
            "InstancePlatform": "Linux/UNIX",
            "AvailabilityZone": "us-east-1a",
            "Tenancy": "default",
```

```
            "TotalInstanceCount": 1,
            "AvailableInstanceCount": 1,
            "EbsOptimized": true,
            "EphemeralStorage": false,
            "State": "active",
            "StartDate": "2024-10-23T15:00:24+00:00",
            "EndDateType": "unlimited",
            "InstanceMatchCriteria": "open",
            "CreateDate": "2024-10-23T15:00:24+00:00",
            "Tags": [],
            "CapacityAllocations": []
        },
        {
            "CapacityReservationId": "cr-abcdEXAMPLE9876ef ",
            "OwnerId": "123456789111",
            "CapacityReservationArn": "arn:aws:ec2:us-east-1:123456789111:capacity-
reservation/cr-abcdEXAMPLE9876ef",
            "AvailabilityZoneId": "use1-az2",
            "InstanceType": "c4.large",
            "InstancePlatform": "Linux/UNIX",
            "AvailabilityZone": "us-east-1a",
            "Tenancy": "default",
            "TotalInstanceCount": 1,
            "AvailableInstanceCount": 1,
            "EbsOptimized": true,
            "EphemeralStorage": false,
            "State": "cancelled",
            "StartDate": "2024-10-23T15:01:03+00:00",
            "EndDateType": "unlimited",
            "InstanceMatchCriteria": "open",
            "CreateDate": "2024-10-23T15:01:02+00:00",
            "Tags": [],
            "CapacityAllocations": []
        }
    ]
}
```

Example 2: To describe one or more of your capacity reservations

The following `describe-capacity-reservations` example displays details about the specified capacity reservation.

```
aws ec2 describe-capacity-reservations \
```

```
    --capacity-reservation-ids cr-1234abcd56EXAMPLE
```

Output:

```
{
    "CapacityReservations": [
        {
            "CapacityReservationId": "cr-abcdEXAMPLE9876ef ",
            "OwnerId": "123456789111",
            "CapacityReservationArn": "arn:aws:ec2:us-east-1:123456789111:capacity-reservation/cr-abcdEXAMPLE9876ef",
            "AvailabilityZoneId": "use1-az2",
            "InstanceType": "c4.large",
            "InstancePlatform": "Linux/UNIX",
            "AvailabilityZone": "us-east-1a",
            "Tenancy": "default",
            "TotalInstanceCount": 1,
            "AvailableInstanceCount": 1,
            "EbsOptimized": true,
            "EphemeralStorage": false,
            "State": "active",

            "Tags": [],
            "CapacityAllocations": []
        }
    ]
}
```

For more information, see Viewing a Capacity Reservation in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see DescribeCapacityReservations in *AWS CLI Command Reference*.

`describe-carrier-gateways`

The following code example shows how to use `describe-carrier-gateways`.

AWS CLI

To describe all carrier gateways

The following `describe-carrier-gateways` example lists all your carrier gateways.

```
aws ec2 describe-carrier-gateways
```

Output:

```
{
    "CarrierGateways": [
        {
            "CarrierGatewayId": "cagw-0465cdEXAMPLE1111",
            "VpcId": "vpc-0c529aEXAMPLE",
            "State": "available",
            "OwnerId": "123456789012",
            "Tags": [
                {

                    "Key": "example",
                    "Value": "tag"
                }
            ]
        }
    ]
}
```

For more information, see Carrier gateways<https://docs.aws.amazon.com/vpc/latest/userguide/Carrier_Gateway.html> in the *Amazon Virtual Private Cloud User Guide*.

- For API details, see DescribeCarrierGateways in *AWS CLI Command Reference*.

`describe-classic-link-instances`

The following code example shows how to use `describe-classic-link-instances`.

AWS CLI

To describe linked EC2-Classic instances

This example lists all of your linked EC2-Classic instances.

Command:

```
aws ec2 describe-classic-link-instances
```

Output:

```
{
        "Instances": [
                {
                        "InstanceId": "i-1234567890abcdef0",
                        "VpcId": "vpc-88888888",
                        "Groups": [
                                {
                                        "GroupId": "sg-11122233"
                                }
                        ],
                        "Tags": [
                                {
                                        "Value": "ClassicInstance",
                                        "Key": "Name"
                                }
                        ]
                },
                {
                        "InstanceId": "i-0598c7d356eba48d7",
                        "VpcId": "vpc-12312312",
                        "Groups": [
                                {
                                        "GroupId": "sg-aabbccdd"
                                }
                        ],
                        "Tags": [
                                {
                                        "Value": "ClassicInstance2",
                                        "Key": "Name"
                                }
                        ]
                }
        ]
}
```

This example lists all of your linked EC2-Classic instances, and filters the response to include only instances that are linked to VPC vpc-88888888.

Command:

```
aws ec2 describe-classic-link-instances --filter "Name=vpc-id,Values=vpc-88888888"
```

Output:

```
{
        "Instances": [
                {
                        "InstanceId": "i-1234567890abcdef0",
                        "VpcId": "vpc-88888888",
                        "Groups": [
                                {
                                        "GroupId": "sg-11122233"
                                }
                        ],
                        "Tags": [
                                {
                                        "Value": "ClassicInstance",
                                        "Key": "Name"
                                }
                        ]
                }
        ]
}
```

- For API details, see [DescribeClassicLinkInstances]() in *AWS CLI Command Reference*.

`describe-client-vpn-authorization-rules`

The following code example shows how to use `describe-client-vpn-authorization-rules`.

AWS CLI

To describe the authorization rules for a Client VPN endpoint

The following `describe-client-vpn-authorization-rules` example displays details about the authorization rules for the specified Client VPN endpoint.

```
aws ec2 describe-client-vpn-authorization-rules \
    --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```
{
    "AuthorizationRules": [
```

```
        {
            "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
            "GroupId": "",
            "AccessAll": true,
            "DestinationCidr": "0.0.0.0/0",
            "Status": {
                "Code": "active"
            }
        }
    ]
}
```

For more information, see Authorization Rules in the *AWS Client VPN Administrator Guide*.

- For API details, see DescribeClientVpnAuthorizationRules in *AWS CLI Command Reference*.

describe-client-vpn-connections

The following code example shows how to use `describe-client-vpn-connections`.

AWS CLI

To describe the connections to a Client VPN endpoint

The following `describe-client-vpn-connections` example displays details about the client connections to the specified Client VPN endpoint.

```
aws ec2 describe-client-vpn-connections \
    --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```
{
    "Connections": [
        {
            "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
            "Timestamp": "2019-08-12 07:58:34",

            "IngressBytes": "32302",
            "EgressBytes": "5696",
            "IngressPackets": "332",
```

```
                "EgressPackets": "67",
                "ClientIp": "172.31.0.225",
                "CommonName": "client1.domain.tld",
                "Status": {
                    "Code": "terminated"
                },
                "ConnectionEndTime": "2019-08-12 07:58:34"
            },
            {
                "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
                "Timestamp": "2019-08-12 08:02:54",
                "ConnectionId": "cvpn-connection-00668867a40f18253",
                "ConnectionEstablishedTime": "2019-08-12 08:02:53",
                "IngressBytes": "2951",
                "EgressBytes": "2611",
                "IngressPackets": "9",
                "EgressPackets": "6",
                "ClientIp": "172.31.0.226",
                "CommonName": "client1.domain.tld",
                "Status": {
                    "Code": "active"
                },
                "ConnectionEndTime": "-"
            }
        ]
}
```

For more information, see Client Connections in the *AWS Client VPN Administrator Guide*.

- For API details, see DescribeClientVpnConnections in *AWS CLI Command Reference*.

`describe-client-vpn-endpoints`

The following code example shows how to use `describe-client-vpn-endpoints`.

AWS CLI

To describe your Client VPN endpoints

The following `describe-client-vpn-endpoints` example displays details about all of your Client VPN endpoints.

```
aws ec2 describe-client-vpn-endpoints
```

Output:

```
{
    "ClientVpnEndpoints": [
        {
            "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",

        ]
}
```

For more information, see Client VPN Endpoints in the *AWS Client VPN Administrator Guide*.

- For API details, see DescribeClientVpnEndpoints in *AWS CLI Command Reference*.

`describe-client-vpn-routes`

The following code example shows how to use `describe-client-vpn-routes`.

AWS CLI

To describe the routes for a Client VPN endpoint

The following `describe-client-vpn-routes` example displays details about the routes for the specified Client VPN endpoint.

```
aws ec2 describe-client-vpn-routes \
    --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```
{
    "Routes": [
        {
            "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
            "DestinationCidr": "10.0.0.0/16",
            "TargetSubnet": "subnet-0123456789abcabca",
            "Type": "Nat",
            "Origin": "associate",
            "Status": {
```

```
                "Code": "active"
            },
            "Description": "Default Route"
        },
        {
            "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
            "DestinationCidr": "0.0.0.0/0",
            "TargetSubnet": "subnet-0123456789abcabca",
            "Type": "Nat",
            "Origin": "add-route",
            "Status": {
                "Code": "active"
            }
        }
    ]
}
```

For more information, see Routes in the *AWS Client VPN Administrator Guide*.

- For API details, see DescribeClientVpnRoutes in *AWS CLI Command Reference*.

`describe-client-vpn-target-networks`

The following code example shows how to use `describe-client-vpn-target-networks`.

AWS CLI

To describe the target networks for a Client VPN endpoint

The following `describe-client-vpn-target-networks` example displays details about the target networks for the specified Client VPN endpoint.

```
aws ec2 describe-client-vpn-target-networks \
    --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```
{
    "ClientVpnTargetNetworks": [
        {
            "AssociationId": "cvpn-assoc-012e837060753dc3d",
            "VpcId": "vpc-11111222222333333",
```

```
                "TargetNetworkId": "subnet-0123456789abcabca",
                "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
                "Status": {
                    "Code": "associating"
                },
                "SecurityGroups": [
                    "sg-012345678910abcab"
                ]
            }
        ]
    }
```

For more information, see [Target Networks](#) in the *AWS Client VPN Administrator Guide*.

- For API details, see [DescribeClientVpnTargetNetworks](#) in *AWS CLI Command Reference*.

`describe-coip-pools`

The following code example shows how to use `describe-coip-pools`.

AWS CLI

To describe customer-owned IP address pools

The following `describe-coip-pools` example describes the customer-owned IP address pools in your AWS account.

```
aws ec2 describe-coip-pools
```

Output:

```
{
    "CoipPools": [
        {
            "PoolId": "ipv4pool-coip-123a45678bEXAMPLE",
            "PoolCidrs": [
                "0.0.0.0/0"
            ],
            "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE",
            "PoolArn": "arn:aws:ec2:us-west-2:123456789012:coip-pool/ipv4pool-
coip-123a45678bEXAMPLE"
        }
    ]
```

```
}
```

For more information, see Customer-owned IP addresses in the *AWS Outposts User Guide*.

- For API details, see DescribeCoipPools in *AWS CLI Command Reference*.

`describe-conversion-tasks`

The following code example shows how to use `describe-conversion-tasks`.

AWS CLI

To view the status of a conversion task

This example returns the status of a conversion task with the ID import-i-ffvko9js.

Command:

```
aws ec2 describe-conversion-tasks --conversion-task-ids import-i-ffvko9js
```

Output:

```
{
    "ConversionTasks": [
        {
            "ConversionTaskId": "import-i-ffvko9js",
            "ImportInstance": {
                "InstanceId": "i-1234567890abcdef0",
                "Volumes": [
                    {
                        "Volume": {
                            "Id": "vol-049df61146c4d7901",
                            "Size": 16
                        },
                        "Status": "completed",
                        "Image": {
                            "Size": 1300687360,
                            "ImportManifestUrl": "https://s3.amazonaws.com/
myimportbucket/411443cd-d620-4f1c-9d66-13144EXAMPLE/RHEL5.vmdkmanifest.xml?

%2FJvEXAMPLE",
                            "Format": "VMDK"
                        },
```

```
                        "BytesConverted": 1300682960,
                        "AvailabilityZone": "us-east-1d"
                    }
                ]
            },
            "ExpirationTime": "2014-05-14T22:06:23Z",
            "State": "completed"
        }
    ]
}
```

- For API details, see DescribeConversionTasks in *AWS CLI Command Reference*.

`describe-customer-gateways`

The following code example shows how to use `describe-customer-gateways`.

AWS CLI

To describe your customer gateways

This example describes your customer gateways.

Command:

```
aws ec2 describe-customer-gateways
```

Output:

```
{
    "CustomerGateways": [
        {
            "CustomerGatewayId": "cgw-b4dc3961",
            "IpAddress": "203.0.113.12",
            "State": "available",
            "Type": "ipsec.1",
            "BgpAsn": "65000"
        },
        {
            "CustomerGatewayId": "cgw-0e11f167",
            "IpAddress": "12.1.2.3",
            "State": "available",
```

```
            "Type": "ipsec.1",
            "BgpAsn": "65534"
        }
    ]
}
```

To describe a specific customer gateway

This example describes the specified customer gateway.

Command:

```
aws ec2 describe-customer-gateways --customer-gateway-ids cgw-0e11f167
```

Output:

```
{
    "CustomerGateways": [
        {
            "CustomerGatewayId": "cgw-0e11f167",
            "IpAddress": "12.1.2.3",
            "State": "available",
            "Type": "ipsec.1",
            "BgpAsn": "65534"
        }
    ]
}
```

- For API details, see DescribeCustomerGateways in *AWS CLI Command Reference*.

`describe-dhcp-options`

The following code example shows how to use `describe-dhcp-options`.

AWS CLI

Example 1: To describe your DHCP options

The following `describe-dhcp-options` example retrieves details about your DHCP options.

```
aws ec2 describe-dhcp-options
```

Output:

```
{
    "DhcpOptions": [
        {
            "DhcpConfigurations": [
                {
                    "Key": "domain-name",
                    "Values": [
                        {
                            "Value": "us-east-2.compute.internal"
                        }
                    ]
                },
                {
                    "Key": "domain-name-servers",
                    "Values": [
                        {
                            "Value": "AmazonProvidedDNS"
                        }
                    ]
                }
            ],
            "DhcpOptionsId": "dopt-19edf471",
            "OwnerId": "111122223333"
        },
        {
            "DhcpConfigurations": [
                {
                    "Key": "domain-name",
                    "Values": [
                        {
                            "Value": "us-east-2.compute.internal"
                        }
                    ]
                },
                {
                    "Key": "domain-name-servers",
                    "Values": [
                        {
                            "Value": "AmazonProvidedDNS"
                        }
                    ]
                }
```

```
                ],
                "DhcpOptionsId": "dopt-fEXAMPLE",
                "OwnerId": "111122223333"
            }
        ]
}
```

For more information, see Working with DHCP Option Sets in the *AWS VPC User Guide*.

Example 2: To describe your DHCP options and filter the output

The following `describe-dhcp-options` example describes your DHCP options and uses a filter to return only DHCP options that have `example.com` for the domain name server. The example uses the `--query` parameter to display only the configuration information and ID in the output.

```
aws ec2 describe-dhcp-options \
    --filters Name=key,Values=domain-name-servers Name=value,Values=example.com \
    --query "DhcpOptions[*].[DhcpConfigurations,DhcpOptionsId]"
```

Output:

```
[
    [
        [
            {
                "Key": "domain-name",
                "Values": [
                    {
                        "Value": "example.com"
                    }
                ]
            },
            {
                "Key": "domain-name-servers",
                "Values": [
                    {
                        "Value": "172.16.16.16"
                    }
                ]
            }
        ],
        "dopt-001122334455667ab"
```

```
    ]
]
```

For more information, see Working with DHCP Option Sets in the *AWS VPC User Guide*.

- For API details, see DescribeDhcpOptions in *AWS CLI Command Reference*.

`describe-egress-only-internet-gateways`

The following code example shows how to use `describe-egress-only-internet-gateways`.

AWS CLI

To describe your egress-only Internet gateways

This example describes your egress-only Internet gateways.

Command:

```
aws ec2 describe-egress-only-internet-gateways
```

Output:

```
{
  "EgressOnlyInternetGateways": [
      {
          "EgressOnlyInternetGatewayId": "eigw-015e0e244e24dfe8a",
          "Attachments": [
              {
                  "State": "attached",
                  "VpcId": "vpc-0c62a468"
              }
          ]
      }
  ]
}
```

- For API details, see DescribeEgressOnlyInternetGateways in *AWS CLI Command Reference*.

`describe-elastic-gpus`

The following code example shows how to use `describe-elastic-gpus`.

AWS CLI

To describe an Elastic GPU

Command:

```
aws ec2 describe-elastic-gpus --elastic-gpu-
ids egpu-12345678901234567890abcdefghijkl
```

- For API details, see DescribeElasticGpus in *AWS CLI Command Reference*.

`describe-export-image-tasks`

The following code example shows how to use `describe-export-image-tasks`.

AWS CLI

To monitor an export image task

The following `describe-export-image-tasks` example checks the status of the specified export image task. The resulting image file in Amazon S3 is `my-export-bucket/exports/export-ami-1234567890abcdef0.vmdk`.

```
aws ec2 describe-export-image-tasks \
    --export-image-task-ids export-ami-1234567890abcdef0
```

Output for an export image task that is in progress.

```
{
    "ExportImageTasks": [
        {
            "ExportImageTaskId": "export-ami-1234567890abcdef0"
            "Progress": "21",
            "S3ExportLocation": {
                "S3Bucket": "my-export-bucket",
                "S3Prefix": "exports/"
            },
            "Status": "active",
            "StatusMessage": "updating"
        }
    ]
```

```
}
```

Output for an export image task that is completed.

```
{
    "ExportImageTasks": [
        {
            "ExportImageTaskId": "export-ami-1234567890abcdef0"
            "S3ExportLocation": {
                "S3Bucket": "my-export-bucket",
                "S3Prefix": "exports/"
            },
            "Status": "completed"
        }
    ]
}
```

For more information, see Export a VM from an AMI in the *VM Import/Export User Guide*.

- For API details, see DescribeExportImageTasks in *AWS CLI Command Reference*.

describe-export-tasks

The following code example shows how to use `describe-export-tasks`.

AWS CLI

To list details about an instance export task

This example describes the export task with ID export-i-fh8sjjsq.

Command:

```
aws ec2 describe-export-tasks --export-task-ids export-i-fh8sjjsq
```

Output:

```
{
    "ExportTasks": [
        {
            "State": "active",
            "InstanceExportDetails": {
                "InstanceId": "i-1234567890abcdef0",
```

```
                "TargetEnvironment": "vmware"
            },
            "ExportToS3Task": {
                "S3Bucket": "myexportbucket",
                "S3Key": "RHEL5export-i-fh8sjjsq.ova",
                "DiskImageFormat": "vmdk",
                "ContainerFormat": "ova"
            },
            "Description": "RHEL5 instance",
            "ExportTaskId": "export-i-fh8sjjsq"
        }
    ]
}
```

- For API details, see DescribeExportTasks in *AWS CLI Command Reference*.

`describe-fast-launch-images`

The following code example shows how to use `describe-fast-launch-images`.

AWS CLI

To describe the details for Windows AMIs that are configured for faster launching

The following `describe-fast-launch-images` example describes the details for each of the AMIs in your account that are configured for faster launching, including the resource type, the snapshot configuration, the launch template details, the maximum number of parallel launches, the AMI owner ID, the state of the fast launch configuration, the reason the state was changed, and the time that the state change occurred.

```
aws ec2 describe-fast-launch-images
```

Output:

```
{
    "FastLaunchImages": [
        {
            "ImageId": "ami-01234567890abcedf",
            "ResourceType": "snapshot",
            "SnapshotConfiguration": {},
            "LaunchTemplate": {
                "LaunchTemplateId": "lt-01234567890abcedf",
```

```
                "LaunchTemplateName": "EC2FastLaunchDefaultResourceCreation-
a8c6215d-94e6-441b-9272-dbd1f87b07e2",
                "Version": "1"
            },
            "MaxParallelLaunches": 6,
            "OwnerId": "0123456789123",
            "State": "enabled",
            "StateTransitionReason": "Client.UserInitiated",
            "StateTransitionTime": "2022-01-27T22:20:06.552000+00:00"
        }
    ]
}
```

For more information about configuring a Windows AMI for faster launching, see Configure your AMI for faster launching in the *Amazon EC2 User Guide*.

- For API details, see DescribeFastLaunchImages in *AWS CLI Command Reference*.

`describe-fast-snapshot-restores`

The following code example shows how to use `describe-fast-snapshot-restores`.

AWS CLI

To describe fast snapshot restores

The following `describe-fast-snapshot-restores` example displays details for all fast snapshot restores with a state of `disabled`.

```
aws ec2 describe-fast-snapshot-restores \
    --filters Name=state,Values=disabled
```

Output:

```
{
    "FastSnapshotRestores": [
        {
            "SnapshotId": "snap-1234567890abcdef0",
            "AvailabilityZone": "us-west-2c",
            "State": "disabled",
            "StateTransitionReason": "Client.UserInitiated - Lifecycle state
 transition",
```

```
                "OwnerId": "123456789012",
                "EnablingTime": "2020-01-25T23:57:49.596Z",
                "OptimizingTime": "2020-01-25T23:58:25.573Z",
                "EnabledTime": "2020-01-25T23:59:29.852Z",
                "DisablingTime": "2020-01-26T00:40:56.069Z",
                "DisabledTime": "2020-01-26T00:41:27.390Z"
            }
    ]
}
```

The following `describe-fast-snapshot-restores` example describes all fast snapshot restores.

```
aws ec2 describe-fast-snapshot-restores
```

- For API details, see DescribeFastSnapshotRestores in *AWS CLI Command Reference*.

`describe-fleet-history`

The following code example shows how to use `describe-fleet-history`.

AWS CLI

To describe EC2 Fleet history

The following `describe-fleet-history` example returns the history for the specified EC2 Fleet starting at the specified time. The output is for an EC2 Fleet with two running instances.

```
aws ec2 describe-fleet-history \
    --fleet-id fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE \
    --start-time 2020-09-01T00:00:00Z
```

Output:

```
{
    "HistoryRecords": [
        {
            "EventInformation": {
                "EventSubType": "submitted"
            },
            "EventType": "fleetRequestChange",
            "Timestamp": "2020-09-01T18:26:05.000Z"
```

```
        },
        {
            "EventInformation": {
                "EventSubType": "active"
            },
            "EventType": "fleetRequestChange",
            "Timestamp": "2020-09-01T18:26:15.000Z"
        },
        {
            "EventInformation": {
                "EventDescription": "t2.small, ami-07c8bc5c1ce9598c3, ...",
                "EventSubType": "progress"
            },
            "EventType": "fleetRequestChange",
            "Timestamp": "2020-09-01T18:26:17.000Z"
        },
        {
            "EventInformation": {
                "EventDescription": "{\"instanceType\":\"t2.small\", ...}",
                "EventSubType": "launched",
                "InstanceId": "i-083a1c446e66085d2"
            },
            "EventType": "instanceChange",
            "Timestamp": "2020-09-01T18:26:17.000Z"
        },
        {
            "EventInformation": {
                "EventDescription": "{\"instanceType\":\"t2.small\", ...}",
                "EventSubType": "launched",
                "InstanceId": "i-090db02406cc3c2d6"
            },
            "EventType": "instanceChange",
            "Timestamp": "2020-09-01T18:26:17.000Z"
        }
    ],
    "LastEvaluatedTime": "2020-09-01T19:10:19.000Z",
    "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE",
    "StartTime": "2020-08-31T23:53:20.000Z"
}
```

For more information, see Managing an EC2 Fleet in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see DescribeFleetHistory in *AWS CLI Command Reference*.

`describe-fleet-instances`

The following code example shows how to use `describe-fleet-instances`.

AWS CLI

To describe the running instances for an EC2 Fleet

The following `describe-fleet-instances` example describes the running instances for the specified EC2 Fleet.

```
aws ec2 describe-fleet-instances \
    --fleet-id 12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE
```

Output:

```
{
    "ActiveInstances": [
        {
            "InstanceId": "i-090db02406cc3c2d6",
            "InstanceType": "t2.small",
            "SpotInstanceRequestId": "sir-a43gtpfk",
            "InstanceHealth": "healthy"
        },
        {
            "InstanceId": "i-083a1c446e66085d2",
            "InstanceType": "t2.small",
            "SpotInstanceRequestId": "sir-iwcit2nj",
            "InstanceHealth": "healthy"
        }
    ],
    "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
}
```

For more information, see Managing an EC2 Fleet in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see DescribeFleetInstances in *AWS CLI Command Reference*.

`describe-fleets`

The following code example shows how to use `describe-fleets`.

AWS CLI

To describe an EC2 Fleet

The following `describe-fleets` example describes the specified EC2 Fleet.

```
aws ec2 describe-fleets \
    --fleet-ids fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE
```

Output:

```
{
    "Fleets": [
        {
            "ActivityStatus": "pending_fulfillment",
            "CreateTime": "2020-09-01T18:26:05.000Z",
            "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE",
            "FleetState": "active",
            "ExcessCapacityTerminationPolicy": "termination",
            "FulfilledCapacity": 0.0,
            "FulfilledOnDemandCapacity": 0.0,
            "LaunchTemplateConfigs": [
                {
                    "LaunchTemplateSpecification": {
                        "LaunchTemplateId": "lt-0e632f2855a979cd5",
                        "Version": "1"
                    }
                }
            ],
            "TargetCapacitySpecification": {
                "TotalTargetCapacity": 2,
                "OnDemandTargetCapacity": 0,
                "SpotTargetCapacity": 2,
                "DefaultTargetCapacityType": "spot"
            },
            "TerminateInstancesWithExpiration": false,
            "Type": "maintain",
            "ReplaceUnhealthyInstances": false,
            "SpotOptions": {
                "AllocationStrategy": "lowestPrice",
                "InstanceInterruptionBehavior": "terminate",
                "InstancePoolsToUseCount": 1
            },
```

```
                "OnDemandOptions": {
                    "AllocationStrategy": "lowestPrice"
                }
            }
        ]
}
```

For more information, see Managing an EC2 Fleet in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see DescribeFleets in *AWS CLI Command Reference*.

`describe-flow-logs`

The following code example shows how to use `describe-flow-logs`.

AWS CLI

Example 1: To describe all of your flow logs

The following `describe-flow-logs` example displays details for all of your flow logs.

```
aws ec2 describe-flow-logs
```

Output:

```
{
    "FlowLogs": [
        {
            "CreationTime": "2018-02-21T13:22:12.644Z",
            "DeliverLogsPermissionArn": "arn:aws:iam::123456789012:role/flow-logs-
role",
            "DeliverLogsStatus": "SUCCESS",
            "FlowLogId": "fl-aabbccdd112233445",
            "MaxAggregationInterval": 600,

 ${action} ${tcp-flags} ${log-status}"
        }
    ]
}
```

Example 2: To describe a subset of your flow logs

The following `describe-flow-logs` example uses a filter to display details for only those flow logs that are in the specified log group in Amazon CloudWatch Logs.

```
aws ec2 describe-flow-logs \
    --filter "Name=log-group-name,Values=MyFlowLogs"
```

- For API details, see DescribeFlowLogs in *AWS CLI Command Reference*.

`describe-fpga-image-attribute`

The following code example shows how to use `describe-fpga-image-attribute`.

AWS CLI

To describe the attributes of an Amazon FPGA image

This example describes the load permissions for the specified AFI.

Command:

```
aws ec2 describe-fpga-image-attribute --fpga-image-id afi-0d123e123bfc85abc --
attribute loadPermission
```

Output:

```
{
  "FpgaImageAttribute": {
      "FpgaImageId": "afi-0d123e123bfc85abc",
      "LoadPermissions": [
          {
              "UserId": "123456789012"
          }
      ]
  }
}
```

- For API details, see [DescribeFpgaImageAttribute](#) in *AWS CLI Command Reference*.

describe-fpga-images

The following code example shows how to use `describe-fpga-images`.

AWS CLI

To describe Amazon FPGA images

This example describes AFIs that are owned by account `123456789012`.

Command:

```
aws ec2 describe-fpga-images --filters Name=owner-id,Values=123456789012
```

Output:

```
{
  "FpgaImages": [
      {
          "UpdateTime": "2017-12-22T12:09:14.000Z",
          "Name": "my-afi",
          "PciId": {
              "SubsystemVendorId": "0xfedd",
              "VendorId": "0x1d0f",
```

```
                "DeviceId": "0xf000",
                "SubsystemId": "0x1d51"
            },
            "FpgaImageGlobalId": "agfi-123cb27b5e84a0abc",
            "Public": false,
            "State": {
                "Code": "available"
            },
            "ShellVersion": "0x071417d3",
            "OwnerId": "123456789012",
            "FpgaImageId": "afi-0d123e123bfc85abc",
            "CreateTime": "2017-12-22T11:43:33.000Z",
            "Description": "my-afi"
        }
    ]
}
```

- For API details, see DescribeFpgaImages in *AWS CLI Command Reference*.

`describe-host-reservation-offerings`

The following code example shows how to use `describe-host-reservation-offerings`.

AWS CLI

To describe Dedicated Host Reservation offerings

This example describes the Dedicated Host Reservations for the M4 instance family that are available to purchase.

Command:

```
aws ec2 describe-host-reservation-offerings --filter Name=instance-family,Values=m4
```

Output:

```
{
  "OfferingSet": [
      {
          "HourlyPrice": "1.499",
          "OfferingId": "hro-03f707bf363b6b324",
          "InstanceFamily": "m4",
          "PaymentOption": "NoUpfront",
```

```
            "UpfrontPrice": "0.000",
            "Duration": 31536000
        },
        {
            "HourlyPrice": "1.045",
            "OfferingId": "hro-0ef9181cabdef7a02",
            "InstanceFamily": "m4",
            "PaymentOption": "NoUpfront",
            "UpfrontPrice": "0.000",
            "Duration": 94608000
        },
        {
            "HourlyPrice": "0.714",
            "OfferingId": "hro-04567a15500b92a51",
            "InstanceFamily": "m4",
            "PaymentOption": "PartialUpfront",
            "UpfrontPrice": "6254.000",
            "Duration": 31536000
        },
        {
            "HourlyPrice": "0.484",
            "OfferingId": "hro-0d5d7a9d23ed7fbfe",
            "InstanceFamily": "m4",
            "PaymentOption": "PartialUpfront",
            "UpfrontPrice": "12720.000",
            "Duration": 94608000
        },
        {
            "HourlyPrice": "0.000",
            "OfferingId": "hro-05da4108ca998c2e5",
            "InstanceFamily": "m4",
            "PaymentOption": "AllUpfront",
            "UpfrontPrice": "23913.000",
            "Duration": 94608000
        },
        {
            "HourlyPrice": "0.000",
            "OfferingId": "hro-0a9f9be3b95a3dc8f",
            "InstanceFamily": "m4",
            "PaymentOption": "AllUpfront",
            "UpfrontPrice": "12257.000",
            "Duration": 31536000
        }
    ]
```

```
}
```

- For API details, see DescribeHostReservationOfferings in *AWS CLI Command Reference*.

`describe-host-reservations`

The following code example shows how to use `describe-host-reservations`.

AWS CLI

To describe Dedicated Host Reservations in your account

This example describes the Dedicated Host Reservations in your account.

Command:

```
aws ec2 describe-host-reservations
```

Output:

```
{
  "HostReservationSet": [
      {
          "Count": 1,
          "End": "2019-01-10T12:14:09Z",
          "HourlyPrice": "1.499",
          "InstanceFamily": "m4",
          "OfferingId": "hro-03f707bf363b6b324",
          "PaymentOption": "NoUpfront",
          "State": "active",
          "HostIdSet": [
              "h-013abcd2a00cbd123"
          ],
          "Start": "2018-01-10T12:14:09Z",
          "HostReservationId": "hr-0d418a3a4ffc669ae",
          "UpfrontPrice": "0.000",
          "Duration": 31536000
      }
  ]
}
```

- For API details, see DescribeHostReservations in *AWS CLI Command Reference*.

`describe-hosts`

The following code example shows how to use `describe-hosts`.

AWS CLI

To view details about Dedicated Hosts

The following `describe-hosts` example displays details for the `available` Dedicated Hosts in your AWS account.

```
aws ec2 describe-hosts --filter "Name=state,Values=available"
```

Output:

```
{
    "Hosts": [
        {
            "HostId": "h-07879acf49EXAMPLE",
            "Tags": [
                {
                    "Value": "production",
                    "Key": "purpose"
                }
            ],
            "HostProperties": {
                "Cores": 48,
                "TotalVCpus": 96,
                "InstanceType": "m5.large",
                "Sockets": 2
            },
            "Instances": [],
            "State": "available",
            "AvailabilityZone": "eu-west-1a",
            "AvailableCapacity": {
                "AvailableInstanceCapacity": [
                    {
                        "AvailableCapacity": 48,
                        "InstanceType": "m5.large",
                        "TotalCapacity": 48
                    }
                ],
                "AvailableVCpus": 96
```

```
            },
            "HostRecovery": "on",
            "AllocationTime": "2019-08-19T08:57:44.000Z",
            "AutoPlacement": "off"
        }
    ]
}
```

For more information, see Viewing Dedicated Hosts in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see DescribeHosts in *AWS CLI Command Reference*.

`describe-iam-instance-profile-associations`

The following code example shows how to use `describe-iam-instance-profile-associations`.

AWS CLI

To describe IAM instance profile associations

This example describes all of your IAM instance profile associations.

Command:

```
aws ec2 describe-iam-instance-profile-associations
```

Output:

```
{
  "IamInstanceProfileAssociations": [
      {
          "InstanceId": "i-09eb09efa73ec1dee",
          "State": "associated",
          "AssociationId": "iip-assoc-0db249b1f25fa24b8",
          "IamInstanceProfile": {
              "Id": "AIPAJVQN4F5WVLGCJDRGM",
              "Arn": "arn:aws:iam::123456789012:instance-profile/admin-role"
          }
      },
      {
```

```
            "InstanceId": "i-0402909a2f4dffd14",
            "State": "associating",
            "AssociationId": "iip-assoc-0d1ec06278d29f44a",
            "IamInstanceProfile": {
                "Id": "AGJAJVQN4F5WVLGCJABCM",
                "Arn": "arn:aws:iam::123456789012:instance-profile/user1-role"
            }
        }
    ]
}
```

- For API details, see DescribeIamInstanceProfileAssociations in *AWS CLI Command Reference*.

`describe-id-format`

The following code example shows how to use `describe-id-format`.

AWS CLI

Example 1: To describe the ID format of a resource

The following `describe-id-format` example describes the ID format for security groups.

```
aws ec2 describe-id-format \
    --resource security-group
```

In the following example output, the `Deadline` value indicates that the deadline for this resource type to permanently switch from the short ID format to the long ID format expired at 00:00 UTC on August 15, 2018.

```
{
    "Statuses": [
        {
            "Deadline": "2018-08-15T00:00:00.000Z",
            "Resource": "security-group",
            "UseLongIds": true
        }
    ]
}
```

Example 2: To describe the ID format for all resources

The following `describe-id-format` example describes the ID format for all resource types. All resource types that supported the short ID format were switched to use the long ID format.

```
aws ec2 describe-id-format
```

- For API details, see [DescribeIdFormat](#) in *AWS CLI Command Reference*.

`describe-identity-id-format`

The following code example shows how to use `describe-identity-id-format`.

AWS CLI

To describe the ID format for an IAM role

The following `describe-identity-id-format` example describes the ID format received by instances created by the IAM role `EC2Role` in your AWS account.

```
aws ec2 describe-identity-id-format \
    --principal-arn arn:aws:iam::123456789012:role/my-iam-role \
    --resource instance
```

The following output indicates that instances created by this role receive IDs in long ID format.

```
{
    "Statuses": [
        {
            "Deadline": "2016-12-15T00:00:00Z",
            "Resource": "instance",
            "UseLongIds": true
        }
    ]
}
```

To describe the ID format for an IAM user

The following `describe-identity-id-format` example describes the ID format received by snapshots created by the IAM user `AdminUser` in your AWS account.

```
aws ec2 describe-identity-id-format \
    --principal-arn arn:aws:iam::123456789012:user/AdminUser \
```

```
    --resource snapshot
```

The output indicates that snapshots created by this user receive IDs in long ID format.

```
{
    "Statuses": [
        {
            "Deadline": "2016-12-15T00:00:00Z",
            "Resource": "snapshot",
            "UseLongIds": true
        }
    ]
}
```

- For API details, see DescribeIdentityIdFormat in *AWS CLI Command Reference*.

`describe-image-attribute`

The following code example shows how to use `describe-image-attribute`.

AWS CLI

To describe the launch permissions for an AMI

This example describes the launch permissions for the specified AMI.

Command:

```
aws ec2 describe-image-attribute --image-id ami-5731123e --
attribute launchPermission
```

Output:

```
{
    "LaunchPermissions": [
        {
            "UserId": "123456789012"
        }
    ],
    "ImageId": "ami-5731123e",
}
```

To describe the product codes for an AMI

This example describes the product codes for the specified AMI. Note that this AMI has no product codes.

Command:

```
aws ec2 describe-image-attribute --image-id ami-5731123e --attribute productCodes
```

Output:

```
{
    "ProductCodes": [],
    "ImageId": "ami-5731123e",
}
```

- For API details, see DescribeImageAttribute in *AWS CLI Command Reference*.

`describe-images`

The following code example shows how to use `describe-images`.

AWS CLI

Example 1: To describe an AMI

The following `describe-images` example describes the specified AMI in the specified Region.

```
aws ec2 describe-images \
    --region us-east-1 \
    --image-ids ami-1234567890EXAMPLE
```

Output:

```
{
    "Images": [
        {
            "VirtualizationType": "hvm",
            "Description": "Provided by Red Hat, Inc.",
            "PlatformDetails": "Red Hat Enterprise Linux",
            "EnaSupport": true,
```

```
            "Hypervisor": "xen",
            "State": "available",
            "SriovNetSupport": "simple",
            "ImageId": "ami-1234567890EXAMPLE",
            "UsageOperation": "RunInstances:0010",
            "BlockDeviceMappings": [
                {
                    "DeviceName": "/dev/sda1",
                    "Ebs": {
                        "SnapshotId": "snap-111222333444aaabb",
                        "DeleteOnTermination": true,
                        "VolumeType": "gp2",
                        "VolumeSize": 10,
                        "Encrypted": false
                    }
                }
            ],
            "Architecture": "x86_64",
            "ImageLocation": "123456789012/RHEL-8.0.0_HVM-20190618-x86_64-1-Hourly2-
GP2",
            "RootDeviceType": "ebs",
            "OwnerId": "123456789012",
            "RootDeviceName": "/dev/sda1",
            "CreationDate": "2019-05-10T13:17:12.000Z",
            "Public": true,
            "ImageType": "machine",
            "Name": "RHEL-8.0.0_HVM-20190618-x86_64-1-Hourly2-GP2"
        }
    ]
}
```

For more information, see Amazon Machine Images (AMI) in the *Amazon EC2 User Guide*.

Example 2: To describe AMIs based on filters

The following `describe-images` example describes Windows AMIs provided by Amazon that are backed by Amazon EBS.

```
aws ec2 describe-images \
    --owners amazon \
    --filters "Name=platform,Values=windows" "Name=root-device-type,Values=ebs"
```

For an example of the output for `describe-images`, see Example 1.

For additional examples using filters, see Listing and filtering your resources in the *Amazon EC2 User Guide*.

Example 3: To describe AMIs based on tags

The following `describe-images` example describes all AMIs that have the tag `Type=Custom`. The example uses the `--query` parameter to display only the AMI IDs.

```
aws ec2 describe-images \
    --filters "Name=tag:Type,Values=Custom" \
    --query 'Images[*].[ImageId]' \
    --output text
```

Output:

```
ami-1234567890EXAMPLE
ami-0abcdef1234567890
```

For additional examples using tag filters, see Working with tags in the *Amazon EC2 User Guide*.

- For API details, see DescribeImages in *AWS CLI Command Reference*.

`describe-import-image-tasks`

The following code example shows how to use `describe-import-image-tasks`.

AWS CLI

To monitor an import image task

The following `describe-import-image-tasks` example checks the status of the specified import image task.

```
aws ec2 describe-import-image-tasks \
    --import-task-ids import-ami-1234567890abcdef0
```

Output for an import image task that is in progress.

```
{
    "ImportImageTasks": [
        {
```

```
            "ImportTaskId": "import-ami-1234567890abcdef0",
            "Progress": "28",
            "SnapshotDetails": [
                {
                    "DiskImageSize": 705638400.0,
                    "Format": "ova",
                    "Status": "completed",
                    "UserBucket": {
                        "S3Bucket": "my-import-bucket",
                        "S3Key": "vms/my-server-vm.ova"
                    }
                }
            ],
            "Status": "active",
            "StatusMessage": "converting"
        }
    ]
}
```

Output for an import image task that is completed. The ID of the resulting AMI is provided by `ImageId`.

```
{
    "ImportImageTasks": [
        {
            "ImportTaskId": "import-ami-1234567890abcdef0",
            "ImageId": "ami-1234567890abcdef0",
            "SnapshotDetails": [
                {
                    "DiskImageSize": 705638400.0,
                    "Format": "ova",
                    "SnapshotId": "snap-1234567890abcdef0"
                    "Status": "completed",
                    "UserBucket": {
                        "S3Bucket": "my-import-bucket",
                        "S3Key": "vms/my-server-vm.ova"
                    }
                }
            ],
            "Status": "completed"
        }
    ]
}
```

- For API details, see DescribeImportImageTasks in *AWS CLI Command Reference*.

`describe-import-snapshot-tasks`

The following code example shows how to use `describe-import-snapshot-tasks`.

AWS CLI

To monitor an import snapshot task

The following `describe-import-snapshot-tasks` example checks the status of the specified import snapshot task.

```
aws ec2 describe-import-snapshot-tasks \
    --import-task-ids import-snap-1234567890abcdef0
```

Output for an import snapshot task that is in progress:

```
{
    "ImportSnapshotTasks": [
        {
            "Description": "My server VMDK",
            "ImportTaskId": "import-snap-1234567890abcdef0",
            "SnapshotTaskDetail": {
                "Description": "My server VMDK",
                "DiskImageSize": "705638400.0",
                "Format": "VMDK",
                "Progress": "42",
                "Status": "active",
                "StatusMessage": "downloading/converting",
                "UserBucket": {
                    "S3Bucket": "my-import-bucket",
                    "S3Key": "vms/my-server-vm.vmdk"
                }
            }
        }
    ]
}
```

Output for an import snapshot task that is completed. The ID of the resulting snapshot is provided by `SnapshotId`.

```
{
    "ImportSnapshotTasks": [
        {
            "Description": "My server VMDK",
            "ImportTaskId": "import-snap-1234567890abcdef0",
            "SnapshotTaskDetail": {
                "Description": "My server VMDK",
                "DiskImageSize": "705638400.0",
                "Format": "VMDK",
                "SnapshotId": "snap-1234567890abcdef0"
                "Status": "completed",
                "UserBucket": {
                    "S3Bucket": "my-import-bucket",
                    "S3Key": "vms/my-server-vm.vmdk"
                }
            }
        }
    ]
}
```

- For API details, see DescribeImportSnapshotTasks in *AWS CLI Command Reference*.

`describe-instance-attribute`

The following code example shows how to use `describe-instance-attribute`.

AWS CLI

To describe the instance type

This example describes the instance type of the specified instance.

Command:

```
aws ec2 describe-instance-attribute --instance-id i-1234567890abcdef0 --
attribute instanceType
```

Output:

```
{
    "InstanceId": "i-1234567890abcdef0"
    "InstanceType": {
```

```
        "Value": "t1.micro"
    }
}
```

To describe the disableApiTermination attribute

This example describes the `disableApiTermination` attribute of the specified instance.

Command:

```
aws ec2 describe-instance-attribute --instance-id i-1234567890abcdef0 --
attribute disableApiTermination
```

Output:

```
{
"InstanceId": "i-1234567890abcdef0"
    "DisableApiTermination": {
        "Value": "false"
    }
}
```

To describe the block device mapping for an instance

This example describes the `blockDeviceMapping` attribute of the specified instance.

Command:

```
aws ec2 describe-instance-attribute --instance-id i-1234567890abcdef0 --
attribute blockDeviceMapping
```

Output:

```
{
    "InstanceId": "i-1234567890abcdef0"
    "BlockDeviceMappings": [
        {
            "DeviceName": "/dev/sda1",
            "Ebs": {
                "Status": "attached",
                "DeleteOnTermination": true,
```

```
                "VolumeId": "vol-049df61146c4d7901",
                "AttachTime": "2013-05-17T22:42:34.000Z"
            }
        },
        {
            "DeviceName": "/dev/sdf",
            "Ebs": {
                "Status": "attached",
                "DeleteOnTermination": false,
                "VolumeId": "vol-049df61146c4d7901",
                "AttachTime": "2013-09-10T23:07:00.000Z"
            }
        }
    ],
}
```

- For API details, see DescribeInstanceAttribute in *AWS CLI Command Reference*.

`describe-instance-connect-endpoints`

The following code example shows how to use `describe-instance-connect-endpoints`.

AWS CLI

To describe an EC2 Instance Connect Endpoint

The following `describe-instance-connect-endpoints` example describes the specified EC2 Instance Connect Endpoint.

```
aws ec2 describe-instance-connect-endpoints \
    --region us-east-1 \
    --instance-connect-endpoint-ids eice-0123456789example
```

Output:

```
{
    "InstanceConnectEndpoints": [
        {
            "OwnerId": "111111111111",
            "InstanceConnectEndpointId": "eice-0123456789example",
            "InstanceConnectEndpointArn": "arn:aws:ec2:us-
east-1:111111111111:instance-connect-endpoint/eice-0123456789example",
```

```
            "State": "create-complete",
            "StateMessage": "",
            "DnsName": "eice-0123456789example.b67b86ba.ec2-instance-connect-
endpoint.us-east-1.amazonaws.com",
            "NetworkInterfaceIds": [
                "eni-0123456789example"
            ],
            "VpcId": "vpc-0123abcd",
            "AvailabilityZone": "us-east-1d",
            "CreatedAt": "2023-02-07T12:05:37+00:00",
            "SubnetId": "subnet-0123abcd",
            "Tags": []
        }
    ]
}
```

For more information, see Create an EC2 Instance Connect Endpoint in the *Amazon EC2 User Guide*.

- For API details, see DescribeInstanceConnectEndpoints in *AWS CLI Command Reference*.

`describe-instance-credit-specifications`

The following code example shows how to use `describe-instance-credit-specifications`.

AWS CLI

To describe the credit option for CPU usage of one or more instances

The following `describe-instance-credit-specifications` example describes the CPU credit option for the specified instance.

```
aws ec2 describe-instance-credit-specifications \
    --instance-ids i-1234567890abcdef0
```

Output:

```
{
    "InstanceCreditSpecifications": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "CpuCredits": "unlimited"
```

```
        }
    ]
}
```

For more information, see Work with burstable performance instances in the *Amazon EC2 User Guide*.

- For API details, see DescribeInstanceCreditSpecifications in *AWS CLI Command Reference*.

`describe-instance-event-notification-attributes`

The following code example shows how to use `describe-instance-event-notification-attributes`.

AWS CLI

To describe the tags for scheduled event notifications

The following `describe-instance-event-notification-attributes` example describes the tags to appear in scheduled event notifications.

```
aws ec2 describe-instance-event-notification-attributes
```

Output:

```
{
    "InstanceTagAttribute": {
        "InstanceTagKeys": [],
        "IncludeAllTagsOfInstance": true
    }
}
```

For more information, see Scheduled events for your instances in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see DescribeInstanceEventNotificationAttributes in *AWS CLI Command Reference*.

`describe-instance-event-windows`

The following code example shows how to use `describe-instance-event-windows`.

AWS CLI

Example 1: To describe all event windows

The following `describe-instance-event-windows` example describes all event windows in the specified Region.

```
aws ec2 describe-instance-event-windows \
    --region us-east-1
```

Output:

```
{
    "InstanceEventWindows": [
        {
            "InstanceEventWindowId": "iew-0abcdef1234567890",
            "Name": "myEventWindowName",
            "CronExpression": "* 21-23 * * 2,3",
            "AssociationTarget": {
                "InstanceIds": [
                    "i-1234567890abcdef0",
                    "i-0598c7d356eba48d7"
                ],
                "Tags": [],
                "DedicatedHostIds": []
            },
            "State": "active",
            "Tags": []
        }

        ...

    ],
    "NextToken": "9d624e0c-388b-4862-a31e-a85c64fc1d4a"
}
```

Example 2: To describe a specific event window

The following `describe-instance-event-windows` example describes a specific event by using the `instance-event-window` parameter to describe a specific event window.

```
aws ec2 describe-instance-event-windows \
    --region us-east-1 \
```

```
    --instance-event-window-ids iew-0abcdef1234567890
```

Output:

```
{
    "InstanceEventWindows": [
        {
            "InstanceEventWindowId": "iew-0abcdef1234567890",
            "Name": "myEventWindowName",
            "CronExpression": "* 21-23 * * 2,3",
            "AssociationTarget": {
                "InstanceIds": [
                    "i-1234567890abcdef0",
                    "i-0598c7d356eba48d7"
                ],
                "Tags": [],
                "DedicatedHostIds": []
            },
            "State": "active",
            "Tags": []
        }
}
```

Example 3: To describe event windows that match one or more filters

The following `describe-instance-event-windows` example describes event windows that match one or more filters using the `filter` parameter. The `instance-id` filter is used to describe all of the event windows that are associated with the specified instance. When a filter is used, it performs a direct match. However, the `instance-id` filter is different. If there is no direct match to the instance ID, then it falls back to indirect associations with the event window, such as the tags of the instance or Dedicated Host ID (if the instance is a Dedicated Host).

```
aws ec2 describe-instance-event-windows \
    --region us-east-1 \
    --filters Name=instance-id,Values=i-1234567890abcdef0 \
    --max-results 100 \
    --next-token <next-token-value>
```

Output:

```
{
    "InstanceEventWindows": [
```

```
        {
            "InstanceEventWindowId": "iew-0dbc0adb66f235982",
            "TimeRanges": [
                {
                    "StartWeekDay": "sunday",
                    "StartHour": 2,
                    "EndWeekDay": "sunday",
                    "EndHour": 8
                }
            ],
            "Name": "myEventWindowName",
            "AssociationTarget": {
                "InstanceIds": [],
                "Tags": [],
                "DedicatedHostIds": [
                    "h-0140d9a7ecbd102dd"
                ]
            },
            "State": "active",
            "Tags": []
        }
    ]
}
```

In the example output, the instance is on a Dedicated Host, which is associated with the event window.

For event window constraints, see Considerations in the *Amazon EC2 User Guide*.

- For API details, see DescribeInstanceEventWindows in *AWS CLI Command Reference*.

`describe-instance-image-metadata`

The following code example shows how to use `describe-instance-image-metadata`.

AWS CLI

Example 1: To describe the AMI metadata for all instances

The following `describe-instance-image-metadata` example describes the AMI metadata of all the instances in your AWS account in the specified Region.

```
aws ec2 describe-instance-image-metadata \
```

```
    --region us-east-1
```

Output:

```
{
    "InstanceImageMetadata": [
        {
            "InstanceId": "i-1234567890EXAMPLE",
            "InstanceType": "t2.micro",
            "LaunchTime": "2024-08-28T11:25:45+00:00",
            "AvailabilityZone": "us-east-1a",
            "State": {
                "Code": 16,
                "Name": "running"
            },
            "OwnerId": "123412341234",
            "Tags": [
                {
                    "Key": "MyTagName",
                    "Value": "my-tag-value"
                }
            ],
            "ImageMetadata": {
                "ImageId": "ami-0b752bf1df193a6c4",
                "Name": "al2023-ami-2023.5.20240819.0-kernel-6.1-x86_64",
                "OwnerId": "137112412989",
                "State": "available",
                "ImageOwnerAlias": "amazon",
                "CreationDate": "2023-01-25T17:20:40Z",
                "DeprecationTime": "2025-01-25T17:20:40Z",
                "IsPublic": true
            }
        }
    ],
    "NextToken": "...EXAMPLEwIAABAA2JHaFxLnEXAMPLE..."
}
```

For more information, see Amazon Machine Images in Amazon EC2 in the *Amazon EC2 User Guide*.

Example 2: To describe the AMI metadata for the specified instances

The following `describe-instance-image-metadata` example describes the AMI metadata for the specified instances.

```
aws ec2 describe-instance-image-metadata \
    --region us-east-1 \
    --instance-ids i-1234567890EXAMPLE i-0987654321EXAMPLE
```

Output:

```
{
    "InstanceImageMetadata": [
        {
            "InstanceId": "i-1234567890EXAMPLE",
            "InstanceType": "t2.micro",
            "LaunchTime": "2024-08-28T11:25:45+00:00",
            "AvailabilityZone": "us-east-1a",
            "State": {
                "Code": 16,
                "Name": "running"
            },
            "OwnerId": "123412341234",
            "Tags": [
                {
                    "Key": "MyTagName",
                    "Value": "my-tag-value"
                }
            ],
            "ImageMetadata": {
                "ImageId": "ami-0b752bf1df193a6c4",
                "Name": "al2023-ami-2023.5.20240819.0-kernel-6.1-x86_64",
                "OwnerId": "137112412989",
                "State": "available",
                "ImageOwnerAlias": "amazon",
                "CreationDate": "2023-01-25T17:20:40Z",
                "DeprecationTime": "2025-01-25T17:20:40Z",
                "IsPublic": true
            }
        },
        {
            "InstanceId": "i-0987654321EXAMPLE",
            "InstanceType": "t2.micro",
            "LaunchTime": "2024-08-28T11:25:45+00:00",
            "AvailabilityZone": "us-east-1a",
```

```
            "State": {
                "Code": 16,
                "Name": "running"
            },
            "OwnerId": "123412341234",
            "Tags": [
                {
                    "Key": "MyTagName",
                    "Value": "my-tag-value"
                }
            ],
            "ImageMetadata": {
                "ImageId": "ami-0b752bf1df193a6c4",
                "Name": "al2023-ami-2023.5.20240819.0-kernel-6.1-x86_64",
                "OwnerId": "137112412989",
                "State": "available",
                "ImageOwnerAlias": "amazon",
                "CreationDate": "2023-01-25T17:20:40Z",
                "DeprecationTime": "2025-01-25T17:20:40Z",
                "IsPublic": true
            }
        }
    ]
}
```

For more information, see [Amazon Machine Images in Amazon EC2](#) in the *Amazon EC2 User Guide*.

Example 3: To describe the AMI metadata for instances based on filters

The following `describe-instance-image-metadata` example describes the AMI metadata for `t2.nano` and `t2.micro` instances in the `us-east-1a` Availability Zone.

```
aws ec2 describe-instance-image-metadata \
    --region us-east-1 \
    --filters Name=availability-zone,Values=us-east-1a Name=instance-
type,Values=t2.nano,t2.micro
```

Output:

```
{
    "InstanceImageMetadata": [
        {
```

```
            "InstanceId": "i-1234567890EXAMPLE",
            "InstanceType": "t2.micro",
            "LaunchTime": "2024-08-28T11:25:45+00:00",
            "AvailabilityZone": "us-east-1a",
            "State": {
                "Code": 16,
                "Name": "running"
            },
            "OwnerId": "123412341234",
            "Tags": [
                {
                    "Key": "MyTagName",
                    "Value": "my-tag-value"
                }
            ],
            "ImageMetadata": {

`describe-instance-status`

The following code example shows how to use `describe-instance-status`.

AWS CLI

To describe the status of an instance

The following `describe-instance-status` example describes the current status of the specified instance.

```
aws ec2 describe-instance-status \
    --instance-ids i-1234567890abcdef0
```

Output:

```
{
    "InstanceStatuses": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "InstanceState": {
                "Code": 16,
                "Name": "running"
            },
            "AvailabilityZone": "us-east-1d",
```

```
                "SystemStatus": {
                    "Status": "ok",
                    "Details": [
                        {
                            "Status": "passed",
                            "Name": "reachability"
                        }
                    ]
                },
                "InstanceStatus": {
                    "Status": "ok",
                    "Details": [
                        {
                            "Status": "passed",
                            "Name": "reachability"
                        }
                    ]
                }
            }
        ]
}
```

For more information, see [Monitor the status of your instances](#) in the *Amazon EC2 User Guide*.

- For API details, see [DescribeInstanceStatus](#) in *AWS CLI Command Reference*.

`describe-instance-topology`

The following code example shows how to use `describe-instance-topology`.

AWS CLI

To describe the instance topology of all your instances

The following `describe-instance-topology` example describes the topology of all your instances that match the supported instance types for this command.

```
aws ec2 describe-instance-topology \
    --region us-west-2
```

Output:

```
{
```

```
    "Instances": [
        {
            "InstanceId": "i-1111111111example",
            "InstanceType": "p4d.24xlarge",
            "GroupName": "my-ml-cpg",
            "NetworkNodes": [
                "nn-1111111111example",
                "nn-2222222222example",
                "nn-3333333333example"
            ],
            "ZoneId": "usw2-az2",
            "AvailabilityZone": "us-west-2a"
        },
        {
            "InstanceId": "i-2222222222example",
            "InstanceType": "p4d.24xlarge",
            "NetworkNodes": [
                "nn-1111111111example",
                "nn-2222222222example",
                "nn-3333333333example"
            ],
            "ZoneId": "usw2-az2",
            "AvailabilityZone": "us-west-2a"
        },
        {
            "InstanceId": "i-3333333333example",
            "InstanceType": "trn1.32xlarge",
            "NetworkNodes": [
                "nn-1212121212example",
                "nn-1211122211example",
                "nn-1311133311example"
            ],
            "ZoneId": "usw2-az4",
            "AvailabilityZone": "us-west-2d"
        },
        {
            "InstanceId": "i-444444444example",
            "InstanceType": "trn1.2xlarge",
            "NetworkNodes": [
                "nn-1111111111example",
                "nn-5434334334example",
                "nn-1235301234example"
            ],
            "ZoneId": "usw2-az2",
```

```
                "AvailabilityZone": "us-west-2a"
            }
        ],
        "NextToken": "SomeEncryptedToken"
}
```

For more information, including more examples, see Amazon EC2 instance topology in the *Amazon EC2 User Guide*.

- For API details, see DescribeInstanceTopology in *AWS CLI Command Reference*.

`describe-instance-type-offerings`

The following code example shows how to use `describe-instance-type-offerings`.

AWS CLI

Example 1: To list the instance types offered in a Region

The following `describe-instance-type-offerings` example lists the instance types offered in the Region configured as the default Region for the AWS CLI.

```
aws ec2 describe-instance-type-offerings
```

To list the instance types offered in a different Region, specify the Region using the `--region` parameter.

```
aws ec2 describe-instance-type-offerings \
    --region us-east-2
```

Output:

```
{
  "InstanceTypeOfferings": [
      {
          "InstanceType": "m5.2xlarge",
          "LocationType": "region",
          "Location": "us-east-2"
      },
      {
          "InstanceType": "t3.micro",
          "LocationType": "region",
```

```
            "Location": "us-east-2"
        },
        ...
    ]
}
```

Example 2: To list the instance types offered in an Availability Zone

The following `describe-instance-type-offerings` example lists the instance types offered in the specified Availability Zone. The Availability Zone must be in the specified Region.

```
aws ec2 describe-instance-type-offerings \
    --location-type availability-zone \
    --filters Name=location,Values=us-east-2a \
    --region us-east-2
```

Example 3: To check whether an instance type is supported

The following `describe-instance-type-offerings` command indicates whether the `c5.xlarge` instance type is supported in the specified Region.

```
aws ec2 describe-instance-type-offerings \
    --filters Name=instance-type,Values=c5.xlarge \
    --region us-east-2
```

The following `describe-instance-type-offerings` example lists all C5 instance types that are supported in the specified Region.

```
aws ec2 describe-instance-type-offerings \
    --filters Name=instance-type,Values=c5* \
    --query "InstanceTypeOfferings[].InstanceType" \
    --region us-east-2
```

Output:

```
[
    "c5d.12xlarge",
    "c5d.9xlarge",
    "c5n.xlarge",
    "c5.xlarge",
    "c5d.metal",
    "c5n.metal",
```

```
    "c5.large",
    "c5d.2xlarge",
    "c5n.4xlarge",
    "c5.2xlarge",
    "c5n.large",
    "c5n.9xlarge",
    "c5d.large",
    "c5.18xlarge",
    "c5d.18xlarge",
    "c5.12xlarge",
    "c5n.18xlarge",
    "c5.metal",
    "c5d.4xlarge",
    "c5.24xlarge",
    "c5d.xlarge",
    "c5n.2xlarge",
    "c5d.24xlarge",
    "c5.9xlarge",
    "c5.4xlarge"
]
```

- For API details, see DescribeInstanceTypeOfferings in *AWS CLI Command Reference*.

`describe-instance-types`

The following code example shows how to use `describe-instance-types`.

AWS CLI

Example 1: To describe an instance type

The following `describe-instance-types` example displays details for the specified instance type.

```
aws ec2 describe-instance-types \
    --instance-types t2.micro
```

Output:

```
{
    "InstanceTypes": [
        {
```

```
            "InstanceType": "t2.micro",
            "CurrentGeneration": true,
            "FreeTierEligible": true,
            "SupportedUsageClasses": [
                "on-demand",
                "spot"
            ],
            "SupportedRootDeviceTypes": [
                "ebs"
            ],
            "BareMetal": false,
            "Hypervisor": "xen",
            "ProcessorInfo": {
                "SupportedArchitectures": [
                    "i386",
                    "x86_64"
                ],
                "SustainedClockSpeedInGhz": 2.5
            },
            "VCpuInfo": {
                "DefaultVCpus": 1,
                "DefaultCores": 1,
                "DefaultThreadsPerCore": 1,

            "EbsInfo": {
                "EbsOptimizedSupport": "unsupported",
                "EncryptionSupport": "supported"
            },
            "NetworkInfo": {
                "NetworkPerformance": "Low to Moderate",
                "MaximumNetworkInterfaces": 2,
                "Ipv4AddressesPerInterface": 2,
                "Ipv6AddressesPerInterface": 2,
                "Ipv6Supported": true,
```

```
                "EnaSupport": "unsupported"
            },
            "PlacementGroupInfo": {
                "SupportedStrategies": [
                    "partition",
                    "spread"
                ]
            },
            "HibernationSupported": false,
            "BurstablePerformanceSupported": true,
            "DedicatedHostsSupported": false,
            "AutoRecoverySupported": true
        }
    ]
}
```

For more information, see [Instance Types]() in *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

Example 2: To filter the available instance types

You can specify a filter to scope the results to instance types that have a specific characteristic. The following `describe-instance-types` example lists the instance types that support hibernation.

```
aws ec2 describe-instance-types \
    --filters Name=hibernation-supported,Values=true --query
 'InstanceTypes[*].InstanceType'
```

Output:

```
[
    "m5.8xlarge",
    "r3.large",
    "c3.8xlarge",
    "r5.large",
    "m4.4xlarge",
    "c4.large",
    "m5.xlarge",
    "m4.xlarge",
    "c3.large",
    "c4.8xlarge",
    "c4.4xlarge",
```

```
    "c5.xlarge",
    "c5.12xlarge",
    "r5.4xlarge",
    "c5.4xlarge"
]
```

For more information, see Instance Types in *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see DescribeInstanceTypes in *AWS CLI Command Reference*.

`describe-instances`

The following code example shows how to use `describe-instances`.

AWS CLI

Example 1: To describe an instance

The following `describe-instances` example describes the specified instance.

```
aws ec2 describe-instances \
    --instance-ids i-1234567890abcdef0
```

Output:

```
{
    "Reservations": [
        {
            "Groups": [],
            "Instances": [
                {
                    "AmiLaunchIndex": 0,
                    "ImageId": "ami-0abcdef1234567890",
                    "InstanceId": "i-1234567890abcdef0",

                        "AutoRecovery": "default"
                    }
                }
            ],
            "OwnerId": "111111111111",
            "ReservationId": "r-1234567890abcdefg"
        }
    ]
}
```

Example 2: To filter for instances with the specified type

The following `describe-instances` example uses filters to scope the results to instances of the specified type.

```
aws ec2 describe-instances \
    --filters Name=instance-type,Values=m5.large
```

For example output, see Example 1.

For more information, see List and filter using the CLI in the *Amazon EC2 User Guide*.

Example 3: To filter for instances with the specified type and Availability Zone

The following `describe-instances` example uses multiple filters to scope the results to instances with the specified type that are also in the specified Availability Zone.

```
aws ec2 describe-instances \
    --filters Name=instance-type,Values=t2.micro,t3.micro Name=availability-
zone,Values=us-east-2c
```

For example output, see Example 1.

Example 4: To filter for instances with the specified type and Availability Zone using a JSON file

The following `describe-instances` example uses a JSON input file to perform the same filtering as the previous example. When filters get more complicated, they can be easier to specify in a JSON file.

```
aws ec2 describe-instances \
    --filters file://filters.json
```

Contents of `filters.json`:

```
[
    {
        "Name": "instance-type",
        "Values": ["t2.micro", "t3.micro"]
    },
    {
        "Name": "availability-zone",
        "Values": ["us-east-2c"]
    }
]
```

For example output, see Example 1.

Example 5: To filter for instances with the specified Owner tag

The following `describe-instances` example uses tag filters to scope the results to instances that have a tag with the specified tag key (Owner), regardless of the tag value.

```
aws ec2 describe-instances \
    --filters "Name=tag-key,Values=Owner"
```

For example output, see Example 1.

Example 6: To filter for instances with the specified my-team tag value

The following `describe-instances` example uses tag filters to scope the results to instances that have a tag with the specified tag value (my-team), regardless of the tag key.

```
aws ec2 describe-instances \
    --filters "Name=tag-value,Values=my-team"
```

For example output, see Example 1.

Example 7: To filter for instances with the specified Owner tag and my-team value

The following `describe-instances` example uses tag filters to scope the results to instances that have the specified tag (Owner=my-team).

```
aws ec2 describe-instances \
    --filters "Name=tag:Owner,Values=my-team"
```

For example output, see Example 1.

Example 8: To display only instance and subnet IDs for all instances

The following `describe-instances` examples use the `--query` parameter to display only the instance and subnet IDs for all instances, in JSON format.

Linux and macOS:

```
aws ec2 describe-instances \
    --query 'Reservations[*].Instances[*].{Instance:InstanceId,Subnet:SubnetId}' \
    --output json
```

Windows:

```
aws ec2 describe-instances ^
    --query "Reservations[*].Instances[*].{Instance:InstanceId,Subnet:SubnetId}" ^
    --output json
```

Output:

```
[
    {
        "Instance": "i-057750d42936e468a",
        "Subnet": "subnet-069beee9b12030077"
    },
    {
        "Instance": "i-001efd250faaa6ffa",
        "Subnet": "subnet-0b715c6b7db68927a"
    },
    {
        "Instance": "i-027552a73f021f3bd",
        "Subnet": "subnet-0250c25a1f4e15235"
    }
    ...
```

```
]
```

Example 9: To filter instances of the specified type and only display their instance IDs

The following `describe-instances` example uses filters to scope the results to instances of the specified type and the `--query` parameter to display only the instance IDs.

```
aws ec2 describe-instances \
    --filters "Name=instance-type,Values=t2.micro" \
    --query "Reservations[*].Instances[*].[InstanceId]" \
    --output text
```

Output:

```
i-031c0dc19de2fb70c
i-00d8bff789a736b75
i-0b715c6b7db68927a
i-0626d4edd54f1286d
i-00b8ae04f9f99908e
i-0fc71c25d2374130c
```

Example 10: To filter instances of the specified type and only display their instance IDs, Availability Zone, and the specified tag value

The following `describe-instances` examples display the instance ID, Availability Zone, and the value of the `Name` tag for instances that have a tag with the name `tag-key`, in table format.

Linux and macOS:

```
aws ec2 describe-instances \
    --filters Name=tag-key,Values=Name \
    --query 'Reservations[*].Instances[*].
{Instance:InstanceId,AZ:Placement.AvailabilityZone,Name:Tags[?Key==`Name`]|
[0].Value}' \
    --output table
```

Windows:

```
aws ec2 describe-instances ^
```

```
    --filters Name=tag-key,Values=Name ^
    --query "Reservations[*].Instances[*].
{Instance:InstanceId,AZ:Placement.AvailabilityZone,Name:Tags[?Key=='Name']|
[0].Value}" ^
    --output table
```

Output:

```
-------------------------------------------------------------
|                    DescribeInstances                      |
+--------------+-----------------------+--------------------+
|      AZ      |       Instance        |        Name        |
+--------------+-----------------------+--------------------+
|  us-east-2b  |  i-057750d42936e468a  |  my-prod-server    |
|  us-east-2a  |  i-001efd250faaa6ffa  |  test-server-1     |
|  us-east-2a  |  i-027552a73f021f3bd  |  test-server-2     |
+--------------+-----------------------+--------------------+
```

Example 11: To describe instances in a partition placement group

The following `describe-instances` example describes the specified instance. The output includes the placement information for the instance, which contains the placement group name and the partition number for the instance.

```
aws ec2 describe-instances \
    --instance-ids i-0123a456700123456 \
    --query "Reservations[*].Instances[*].Placement"
```

Output:

```
[
    [
        {
            "AvailabilityZone": "us-east-1c",
            "GroupName": "HDFS-Group-A",
            "PartitionNumber": 3,
            "Tenancy": "default"
        }

    ]
]
```

For more information, see Describing instances in a placement group in the *Amazon EC2 User Guide*.

Example 12: To filter to instances with the specified placement group and partition number

The following `describe-instances` example filters the results to only those instances with the specified placement group and partition number.

```
aws ec2 describe-instances \
    --filters "Name=placement-group-name,Values=HDFS-Group-A" "Name=placement-partition-number,Values=7"
```

The following shows only the relevant information from the output.

```
"Instances": [
    {
        "InstanceId": "i-0123a456700123456",
        "InstanceType": "r4.large",
        "Placement": {
            "AvailabilityZone": "us-east-1c",
            "GroupName": "HDFS-Group-A",
            "PartitionNumber": 7,
            "Tenancy": "default"
        }
    },
    {
        "InstanceId": "i-9876a543210987654",
        "InstanceType": "r4.large",
        "Placement": {
            "AvailabilityZone": "us-east-1c",
            "GroupName": "HDFS-Group-A",
            "PartitionNumber": 7,
            "Tenancy": "default"
        }
    ],
```

For more information, see Describing instances in a placement group in the *Amazon EC2 User Guide*.

Example 13: To filter to instances that are configured to allow access to tags from instance metadata

The following `describe-instances` example filters the results to only those instances that are configured to allow access to instance tags from instance metadata.

```
aws ec2 describe-instances \
    --filters "Name=metadata-options.instance-metadata-tags,Values=enabled" \
    --query "Reservations[*].Instances[*].InstanceId" \
    --output text
```

The following shows the expected output.

```
i-1234567890abcdefg
i-abcdefg1234567890
i-11111111aaaaaaaaa
i-aaaaaaaa111111111
```

For more information, see Work with instance tags in instance metadata in the *Amazon EC2 User Guide*.

- For API details, see DescribeInstances in *AWS CLI Command Reference*.

`describe-internet-gateways`

The following code example shows how to use `describe-internet-gateways`.

AWS CLI

To describe an internet gateway

The following `describe-internet-gateways` example describes the specified internet gateway.

```
aws ec2 describe-internet-gateways \
    --internet-gateway-ids igw-0d0fb496b3EXAMPLE
```

Output:

```
{
    "InternetGateways": [
        {
            "Attachments": [
```

```
                {
                    "State": "available",
                    "VpcId": "vpc-0a60eb65b4EXAMPLE"
                }
            ],
            "InternetGatewayId": "igw-0d0fb496b3EXAMPLE",
            "OwnerId": "123456789012",
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "my-igw"
                }
            ]
        }
    ]
}
```

For more information, see Internet gateways in the *Amazon VPC User Guide*.

- For API details, see DescribeInternetGateways in *AWS CLI Command Reference*.

`describe-ipam-pools`

The following code example shows how to use `describe-ipam-pools`.

AWS CLI

To view the details for an IPAM pool

The following `describe-ipam-pools` example shows the details for pools.

(Linux):

```
aws ec2 describe-ipam-pools \
    --filters Name=owner-id,Values=123456789012 Name=ipam-scope-id,Values=ipam-
scope-02fc38cd4c48e7d38
```

(Windows):

```
aws ec2 describe-ipam-pools ^
    --filters Name=owner-id,Values=123456789012 Name=ipam-scope-id,Values=ipam-
scope-02fc38cd4c48e7d38
```

Output:

```
{
    "IpamPools": [
        {
            "OwnerId": "123456789012",
            "IpamPoolId": "ipam-pool-02ec043a19bbe5d08",
            "IpamPoolArn": "arn:aws:ec2::123456789012:ipam-pool/ipam-
pool-02ec043a19bbe5d08",
            "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-
scope-02fc38cd4c48e7d38",
            "IpamScopeType": "private",
            "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
            "IpamRegion": "us-east-1",
            "Locale": "None",
            "PoolDepth": 1,
            "State": "create-complete",
            "AutoImport": true,
            "AddressFamily": "ipv4",
            "AllocationMinNetmaskLength": 16,
            "AllocationMaxNetmaskLength": 26,
            "AllocationDefaultNetmaskLength": 24,
            "AllocationResourceTags": [
                {
                    "Key": "Environment",
                    "Value": "Preprod"
                }
            ],
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "Preprod pool"
                }
            ]
        }
    ]
}
```

- For API details, see DescribeIpamPools in *AWS CLI Command Reference*.

`describe-ipam-resource-discoveries`

The following code example shows how to use `describe-ipam-resource-discoveries`.

AWS CLI

Example 1: View complete details of resource discoveries

In this example, you're a delegated IPAM admin who wants to create and share a resource discovery with the IPAM admin in another AWS Organization so that the admin can manage and monitor the IP addresses of resources in your organization.

This example may be useful if:

You tried to create a resource discovery, but you got an error that you've reached your limit of 1. You realize that you may have already created a resource discovery and you want to view it in your account.You have resources in a Region that are not being discovered by the IPAM. You want to view the `--operating-regions` defined for the resource and ensure that you've added the right Region as an operating Region so that the resources there can be discovered.

The following `describe-ipam-resource-discoveries` example lists the details of the resource discovery in your AWS account. You can have one resource discovery per AWS Region.

```
aws ec2 describe-ipam-resource-discoveries \
    --region us-east-1
```

Output:

```
{
    "IpamResourceDiscoveries": [
        {
            "OwnerId": "149977607591",
            "IpamResourceDiscoveryId": "ipam-res-disco-0f8bdee9067137c0d",
            "IpamResourceDiscoveryArn": "arn:aws:ec2::149977607591:ipam-resource-
discovery/ipam-res-disco-0f8bdee9067137c0d",
            "IpamResourceDiscoveryRegion": "us-east-1",
            "OperatingRegions": [
                {
                    "RegionName": "us-east-1"
                }
            ],
            "IsDefault": false,
            "State": "create-complete",
            "Tags": []
    }
]
```

```
}
```

For more information, see Integrate IPAM with accounts outside of your organization in the *Amazon VPC IPAM User Guide*.

Example 2: View only resource discovery IDs

The following `describe-ipam-resource-discoveries` example lists the ID of the resource discovery in your AWS account. You can have one resource discovery per AWS Region.

```
aws ec2 describe-ipam-resource-discoveries \
    --query "IpamResourceDiscoveries[*].IpamResourceDiscoveryId" \
    --output text
```

Output:

```
ipam-res-disco-0481e39b242860333
```

For more information, see Integrate IPAM with accounts outside of your organization in the *Amazon VPC IPAM User Guide*.

- For API details, see DescribeIpamResourceDiscoveries in *AWS CLI Command Reference*.

`describe-ipam-resource-discovery-associations`

The following code example shows how to use `describe-ipam-resource-discovery-associations`.

AWS CLI

To view all resource discovery associations with your IPAM

In this example, you're a IPAM delegated admin who has associated resource discoveries with your IPAM to integrate other accounts with your IPAM. You've noticed that your IPAM is not discovering the resources in the operating Regions of the resource discovery as expected. You want to check the status and state of the resource discovery to ensure that the account that created it is still active and the resource discovery is still being shared.

The `--region` must be the home Region of your IPAM.

The following `describe-ipam-resource-discovery-associations` example lists the resource discovery associations in your AWS account.

```
aws ec2 describe-ipam-resource-discovery-associations \
    --region us-east-1
```

Output:

```
{
    "IpamResourceDiscoveryAssociations": [
        {
            "OwnerId": "320805250157",
            "IpamResourceDiscoveryAssociationId": "ipam-res-disco-
assoc-05e6b45eca5bf5cf7",
            "IpamResourceDiscoveryAssociationArn": "arn:aws:ec2::320805250157:ipam-
resource-discovery-association/ipam-res-disco-assoc-05e6b45eca5bf5cf7",
            "IpamResourceDiscoveryId": "ipam-res-disco-0f4ef577a9f37a162",
            "IpamId": "ipam-005f921c17ebd5107",
            "IpamArn": "arn:aws:ec2::320805250157:ipam/ipam-005f921c17ebd5107",
            "IpamRegion": "us-east-1",
            "IsDefault": true,
            "ResourceDiscoveryStatus": "active",
            "State": "associate-complete",
            "Tags": []
        },
        {
            "OwnerId": "149977607591",
            "IpamResourceDiscoveryAssociationId": "ipam-res-disco-
assoc-0dfd21ae189ab5f62",
            "IpamResourceDiscoveryAssociationArn": "arn:aws:ec2::149977607591:ipam-
resource-discovery-association/ipam-res-disco-assoc-0dfd21ae189ab5f62",
            "IpamResourceDiscoveryId": "ipam-res-disco-0365d2977fc1672fe",
            "IpamId": "ipam-005f921c17ebd5107",
            "IpamArn": "arn:aws:ec2::149977607591:ipam/ipam-005f921c17ebd5107",
            "IpamRegion": "us-east-1",
            "IsDefault": false,
            "ResourceDiscoveryStatus": "active",
            "State": "create-complete",
            "Tags": []
        }
    ]
}
```

In this example, after running this command, you notice that you have one non-default resource discovery (`"IsDefault": false ``) that is ``"ResourceDiscoveryStatus":`

`"not-found"` and `"State": "create-complete"`. The resource discovery owner's account has been closed. If, in another case, you notice that is `"ResourceDiscoveryStatus": "not-found"` and `"State": "associate-complete"`, this indicates that one of the following has happened:

The resource discovery was deleted by the resource discovery owner.The resource discovery owner unshared the resource discovery.

For more information, see Integrate IPAM with accounts outside of your organization in the *Amazon VPC IPAM User Guide*.

- For API details, see DescribeIpamResourceDiscoveryAssociations in *AWS CLI Command Reference*.

`describe-ipam-scopes`

The following code example shows how to use `describe-ipam-scopes`.

AWS CLI

To view the details for an IPAM scope

The following `describe-ipam-scopes` example shows the details for scopes.

```
aws ec2 describe-ipam-scopes \
    --filters Name=owner-id,Values=123456789012 Name=ipam-id,Values=ipam-08440e7a3acde3908
```

Output:

```
{
    "IpamScopes": [
        {
            "OwnerId": "123456789012",
            "IpamScopeId": "ipam-scope-02fc38cd4c48e7d38",
            "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-scope-02fc38cd4c48e7d38",
            "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
            "IpamRegion": "us-east-1",
            "IpamScopeType": "private",
            "IsDefault": true,
            "PoolCount": 2,
```

```
            "State": "create-complete",
            "Tags": []
        },
        {
            "OwnerId": "123456789012",
            "IpamScopeId": "ipam-scope-0b9eed026396dbc16",
            "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-
scope-0b9eed026396dbc16",
            "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
            "IpamRegion": "us-east-1",
            "IpamScopeType": "public",
            "IsDefault": true,
            "PoolCount": 0,
            "State": "create-complete",
            "Tags": []
        },
        {
            "OwnerId": "123456789012",
            "IpamScopeId": "ipam-scope-0f1aff29486355c22",
            "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-
scope-0f1aff29486355c22",
            "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
            "IpamRegion": "us-east-1",
            "IpamScopeType": "private",
            "IsDefault": false,
            "Description": "Example description",
            "PoolCount": 0,
            "State": "create-complete",
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "Example name value"
                }
            ]
        }
    ]
}
```

- For API details, see DescribeIpamScopes in *AWS CLI Command Reference*.

`describe-ipams`

The following code example shows how to use `describe-ipams`.

AWS CLI

To view the details for an IPAM

The following `describe-ipams` example shows the details of an IPAM.

```
aws ec2 describe-ipams \
    --filters Name=owner-id,Values=123456789012
```

Output:

```
{
    "Ipams": [
        {
            "OwnerId": "123456789012",
            "IpamId": "ipam-08440e7a3acde3908",
            "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
            "IpamRegion": "us-east-1",
            "PublicDefaultScopeId": "ipam-scope-0b9eed026396dbc16",
            "PrivateDefaultScopeId": "ipam-scope-02fc38cd4c48e7d38",
            "ScopeCount": 3,
            "OperatingRegions": [
                {
                    "RegionName": "us-east-1"
                },
                {
                    "RegionName": "us-east-2"
                },
                {
                    "RegionName": "us-west-1"
                }
            ],
            "State": "create-complete",
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "ExampleIPAM"
                }
            ]
        }
    ]
}
```

- For API details, see [DescribeIpams](#) in *AWS CLI Command Reference*.

`describe-ipv6-pools`

The following code example shows how to use `describe-ipv6-pools`.

AWS CLI

To describe your IPv6 address pools

The following `describe-ipv6-pools` example displays details for all of your IPv6 address pools.

```
aws ec2 describe-ipv6-pools
```

Output:

```
{
    "Ipv6Pools": [
        {
            "PoolId": "ipv6pool-ec2-012345abc12345abc",
            "PoolCidrBlocks": [
                {
                    "Cidr": "2001:db8:123::/48"
                }
            ],
            "Tags": [
                {
                    "Key": "pool-1",
                    "Value": "public"
                }
            ]
        }
    ]
}
```

- For API details, see [DescribeIpv6Pools](#) in *AWS CLI Command Reference*.

`describe-key-pairs`

The following code example shows how to use `describe-key-pairs`.

AWS CLI

To display a key pair

The following `describe-key-pairs` example displays information about the specified key pair.

```
aws ec2 describe-key-pairs \
    --key-names my-key-pair
```

Output:

```
{
    "KeyPairs": [
        {
            "KeyPairId": "key-0b94643da6EXAMPLE",
            "KeyFingerprint":
 "1f:51:ae:28:bf:89:e9:d8:1f:25:5d:37:2d:7d:b8:ca:9f:f5:f1:6f",
            "KeyName": "my-key-pair",
            "KeyType": "rsa",
            "Tags": [],
            "CreateTime": "2022-05-27T21:51:16.000Z"
        }
    ]
}
```

For more information, see Describe public keys in the *Amazon EC2 User Guide*.

- For API details, see DescribeKeyPairs in *AWS CLI Command Reference*.

`describe-launch-template-versions`

The following code example shows how to use `describe-launch-template-versions`.

AWS CLI

To describe launch template versions

This example describes the versions of the specified launch template.

Command:

```
aws ec2 describe-launch-template-versions --launch-template-id lt-068f72b72934aff71
```

Output:

```
{
  "LaunchTemplateVersions": [
      {
          "LaunchTemplateId": "lt-068f72b72934aff71",
          "LaunchTemplateName": "Webservers",
          "VersionNumber": 3,
          "CreatedBy": "arn:aws:iam::123456789102:root",
          "LaunchTemplateData": {
              "KeyName": "kp-us-east",
              "ImageId": "ami-6057e21a",
              "InstanceType": "t2.small",
              "NetworkInterfaces": [
                  {
                      "SubnetId": "subnet-7b16de0c",
                      "DeviceIndex": 0,
                      "Groups": [
                          "sg-7c227019"
                      ]
                  }
              ]
          },
          "DefaultVersion": false,
          "CreateTime": "2017-11-20T13:19:54.000Z"
      },
      {
          "LaunchTemplateId": "lt-068f72b72934aff71",
          "LaunchTemplateName": "Webservers",
          "VersionNumber": 2,
          "CreatedBy": "arn:aws:iam::123456789102:root",
          "LaunchTemplateData": {
              "KeyName": "kp-us-east",
              "ImageId": "ami-6057e21a",
              "InstanceType": "t2.medium",
              "NetworkInterfaces": [
                  {
                      "SubnetId": "subnet-1a2b3c4d",
                      "DeviceIndex": 0,
                      "Groups": [
                          "sg-7c227019"
                      ]
                  }
              ]
```

```
            },
            "DefaultVersion": false,
            "CreateTime": "2017-11-20T13:12:32.000Z"
        },
        {
            "LaunchTemplateId": "lt-068f72b72934aff71",
            "LaunchTemplateName": "Webservers",
            "VersionNumber": 1,
            "CreatedBy": "arn:aws:iam::123456789102:root",
            "LaunchTemplateData": {
                "UserData": "",
                "KeyName": "kp-us-east",
                "ImageId": "ami-aabbcc11",
                "InstanceType": "t2.medium",
                "NetworkInterfaces": [
                    {
                        "SubnetId": "subnet-7b16de0c",

                        "DeleteOnTermination": false,
                        "Groups": [
                            "sg-7c227019"
                        ],
                        "AssociatePublicIpAddress": true
                    }
                ]
            },
            "DefaultVersion": true,
            "CreateTime": "2017-11-20T12:52:33.000Z"
        }
    ]
}
```

- For API details, see DescribeLaunchTemplateVersions in *AWS CLI Command Reference*.

`describe-launch-templates`

The following code example shows how to use `describe-launch-templates`.

AWS CLI

To describe launch templates

This example describes your launch templates.

Command:

```
aws ec2 describe-launch-templates
```

Output:

```
{
  "LaunchTemplates": [
      {
          "LatestVersionNumber": 2,
          "LaunchTemplateId": "lt-0e06d290751193123",
          "LaunchTemplateName": "TemplateForWebServer",
          "DefaultVersionNumber": 2,
          "CreatedBy": "arn:aws:iam::123456789012:root",
          "CreateTime": "2017-11-27T09:30:23.000Z"
      },
      {
          "LatestVersionNumber": 6,
          "LaunchTemplateId": "lt-0c45b5e061ec98456",
          "LaunchTemplateName": "DBServersTemplate",
          "DefaultVersionNumber": 1,
          "CreatedBy": "arn:aws:iam::123456789012:root",
          "CreateTime": "2017-11-20T09:25:22.000Z"
      },
      {
          "LatestVersionNumber": 1,
          "LaunchTemplateId": "lt-0d47d774e8e52dabc",
          "LaunchTemplateName": "MyLaunchTemplate2",
          "DefaultVersionNumber": 1,
          "CreatedBy": "arn:aws:iam::123456789012:root",
          "CreateTime": "2017-11-02T12:06:21.000Z"
      },
      {
          "LatestVersionNumber": 3,
          "LaunchTemplateId": "lt-01e5f948eb4f589d6",
          "LaunchTemplateName": "testingtemplate2",
          "DefaultVersionNumber": 1,
          "CreatedBy": "arn:aws:sts::123456789012:assumed-role/AdminRole/
i-03ee35176e2e5aabc",
          "CreateTime": "2017-12-01T08:19:48.000Z"
      },
  ]
}
```

- For API details, see DescribeLaunchTemplates in *AWS CLI Command Reference*.

`describe-local-gateway-route-table-virtual-interface-group-associations`

The following code example shows how to use `describe-local-gateway-route-table-virtual-interface-group-associations`.

AWS CLI

To describe associations between virtual interface groups and local gateway route tables

The following `describe-local-gateway-route-table-virtual-interface-group-associations` example describes the associations between virtual interface groups and local gateway route tables in your AWS account.

```
aws ec2 describe-local-gateway-route-table-virtual-interface-group-associations
```

Output:

```
{
    "LocalGatewayRouteTableVirtualInterfaceGroupAssociations": [
        {
            "LocalGatewayRouteTableVirtualInterfaceGroupAssociationId": "lgw-vif-
grp-assoc-07145b276bEXAMPLE",
            "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-07145b276bEXAMPLE",
            "LocalGatewayId": "lgw-0ab1c23d4eEXAMPLE",
            "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE",
            "LocalGatewayRouteTableArn": "arn:aws:ec2:us-west-2:123456789012:local-
gateway-route-table/lgw-rtb-059615ef7dEXAMPLE",
            "OwnerId": "123456789012",
            "State": "associated",
            "Tags": []
        }
    ]
}
```

For more information, see Working with local gateways in the *AWS Outposts User Guide*.

- For API details, see DescribeLocalGatewayRouteTableVirtualInterfaceGroupAssociations in *AWS CLI Command Reference*.

`describe-local-gateway-route-table-vpc-associations`

The following code example shows how to use `describe-local-gateway-route-table-vpc-associations`.

AWS CLI

To describe the associations between VPCs and local gateway route tables

The following `describe-local-gateway-route-table-vpc-associations` example displays information about the specified association between VPCs and local gateway route tables.

```
aws ec2 describe-local-gateway-route-table-vpc-associations \
    --local-gateway-route-table-vpc-association-ids lgw-vpc-assoc-0e0f27af15EXAMPLE
```

Output:

```
{
    "LocalGatewayRouteTableVpcAssociation": {
        "LocalGatewayRouteTableVpcAssociationId": "lgw-vpc-assoc-0e0f27af1EXAMPLE",
        "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE",
        "LocalGatewayId": "lgw-09b493aa7cEXAMPLE",
        "VpcId": "vpc-0efe9bde08EXAMPLE",
        "State": "associated"
    }
}
```

For more information, see Local gateway route tables in the *Outposts User Guide*.

- For API details, see DescribeLocalGatewayRouteTableVpcAssociations in *AWS CLI Command Reference*.

`describe-local-gateway-route-tables`

The following code example shows how to use `describe-local-gateway-route-tables`.

AWS CLI

To describe your Local Gateway Route Tables

The following `describe-local-gateway-route-tables` example displays details about the local gateway route tables.

```
aws ec2 describe-local-gateway-route-tables
```

Output:

```
{
    "LocalGatewayRouteTables": [
        {
            "LocalGatewayRouteTableId": "lgw-rtb-059615ef7deEXAMPLE",
            "LocalGatewayId": "lgw-09b493aa7cEXAMPLE",
            "OutpostArn": "arn:aws:outposts:us-west-2:111122223333:outpost/
op-0dc11b66edEXAMPLE",
            "State": "available"
        }
    ]
}
```

- For API details, see DescribeLocalGatewayRouteTables in *AWS CLI Command Reference*.

`describe-local-gateway-virtual-interface-groups`

The following code example shows how to use `describe-local-gateway-virtual-interface-groups`.

AWS CLI

To describe local gateway virtual interface groups

The following `describe-local-gateway-virtual-interface-groups` example describes the local gateway virtual interface groups in your AWS account.

```
aws ec2 describe-local-gateway-virtual-interface-groups
```

Output:

```
{
    "LocalGatewayVirtualInterfaceGroups": [
        {
            "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-07145b276bEXAMPLE",
```

```
                "LocalGatewayVirtualInterfaceIds": [
                    "lgw-vif-01a23bc4d5EXAMPLE",
                    "lgw-vif-543ab21012EXAMPLE"
                ],
                "LocalGatewayId": "lgw-0ab1c23d4eEXAMPLE",
                "OwnerId": "123456789012",
                "Tags": []
            }
        ]
}
```

For more information, see [Working with local gateways](#) in the *AWS Outposts User Guide*.

- For API details, see [DescribeLocalGatewayVirtualInterfaceGroups](#) in *AWS CLI Command Reference*.

`describe-local-gateway-virtual-interfaces`

The following code example shows how to use `describe-local-gateway-virtual-interfaces`.

AWS CLI

To describe local gateway virtual interfaces

The following `describe-local-gateway-virtual-interfaces` example describes the local gateway virtual interfaces in your AWS account.

```
aws ec2 describe-local-gateway-virtual-interfaces
```

Output:

```
{
    "LocalGatewayVirtualInterfaces": [
        {
            "LocalGatewayVirtualInterfaceId": "lgw-vif-01a23bc4d5EXAMPLE",
            "LocalGatewayId": "lgw-0ab1c23d4eEXAMPLE",
            "Vlan": 2410,
            "LocalAddress": "0.0.0.0/0",
            "PeerAddress": "0.0.0.0/0",
            "LocalBgpAsn": 65010,
            "PeerBgpAsn": 65000,
```

```
                "OwnerId": "123456789012",
                "Tags": []
            },
            {
                "LocalGatewayVirtualInterfaceId": "lgw-vif-543ab21012EXAMPLE",
                "LocalGatewayId": "lgw-0ab1c23d4eEXAMPLE",
                "Vlan": 2410,
                "LocalAddress": "0.0.0.0/0",
                "PeerAddress": "0.0.0.0/0",
                "LocalBgpAsn": 65010,
                "PeerBgpAsn": 65000,
                "OwnerId": "123456789012",
                "Tags": []
            }
        ]
}
```

For more information, see Working with local gateways in the *AWS Outposts User Guide*.

- For API details, see DescribeLocalGatewayVirtualInterfaces in *AWS CLI Command Reference*.

`describe-local-gateways`

The following code example shows how to use `describe-local-gateways`.

AWS CLI

To describe your Local Gateways

The following `describe-local-gateways` example displays details for the local gateways that are available to you.

```
aws ec2 describe-local-gateways
```

Output:

```
{
    "LocalGateways": [
        {
            "LocalGatewayId": "lgw-09b493aa7cEXAMPLE",
            "OutpostArn": "arn:aws:outposts:us-west-2:123456789012:outpost/
op-0dc11b66ed59f995a",
```

```
                "OwnerId": "123456789012",
                "State": "available"
            }
        ]
}
```

- For API details, see DescribeLocalGateways in *AWS CLI Command Reference*.

`describe-locked-snapshots`

The following code example shows how to use `describe-locked-snapshots`.

AWS CLI

To describe the lock status of a snapshot

The following `describe-locked-snapshots` example describes the lock status of the specified snapshot.

```
aws ec2 describe-locked-snapshots \
    --snapshot-ids snap-0b5e733b4a8df6e0d
```

Output:

```
{
    "Snapshots": [
        {
            "OwnerId": "123456789012",
            "SnapshotId": "snap-0b5e733b4a8df6e0d",
            "LockState": "governance",
            "LockDuration": 365,
            "LockCreatedOn": "2024-05-05T00:56:06.208000+00:00",
            "LockDurationStartTime": "2024-05-05T00:56:06.208000+00:00",
            "LockExpiresOn": "2025-05-05T00:56:06.208000+00:00"
        }
    ]
}
```

For more information, see Snapshot lock in the *Amazon EBS User Guide*.

- For API details, see DescribeLockedSnapshots in *AWS CLI Command Reference*.

`describe-managed-prefix-lists`

The following code example shows how to use `describe-managed-prefix-lists`.

AWS CLI

To describe managed prefix lists

The following `describe-managed-prefix-lists` example describes the prefix lists owned by AWS account 123456789012.

```
aws ec2 describe-managed-prefix-lists \
    --filters Name=owner-id,Values=123456789012
```

Output:

```
{
    "PrefixLists": [
        {
            "PrefixListId": "pl-11223344556677aab",
            "AddressFamily": "IPv6",
            "State": "create-complete",
            "PrefixListArn": "arn:aws:ec2:us-west-2:123456789012:prefix-list/
pl-11223344556677aab",
            "PrefixListName": "vpc-ipv6-cidrs",
            "MaxEntries": 25,
            "Version": 1,
            "Tags": [],
            "OwnerId": "123456789012"
        },
        {
            "PrefixListId": "pl-0123456abcabcabc1",
            "AddressFamily": "IPv4",
            "State": "active",
            "PrefixListArn": "arn:aws:ec2:us-west-2:123456789012:prefix-list/
pl-0123456abcabcabc1",
            "PrefixListName": "vpc-cidrs",
            "MaxEntries": 10,
            "Version": 1,
            "Tags": [],
            "OwnerId": "123456789012"
      }
  ]
```

```
}
```

For more information, see Managed prefix lists in the *Amazon VPC User Guide*.

- For API details, see DescribeManagedPrefixLists in *AWS CLI Command Reference*.

`describe-moving-addresses`

The following code example shows how to use `describe-moving-addresses`.

AWS CLI

To describe your moving addresses

This example describes all of your moving Elastic IP addresses.

Command:

```
aws ec2 describe-moving-addresses
```

Output:

```
{
  "MovingAddressStatuses": [
    {
      "PublicIp": "198.51.100.0",
      "MoveStatus": "MovingToVpc"
    }
  ]
}
```

This example describes all addresses that are moving to the EC2-VPC platform.

Command:

```
aws ec2 describe-moving-addresses --filters Name=moving-status,Values=MovingToVpc
```

- For API details, see DescribeMovingAddresses in *AWS CLI Command Reference*.

`describe-nat-gateways`

The following code example shows how to use `describe-nat-gateways`.

AWS CLI

Example 1: To describe a public NAT gateway

The following `describe-nat-gateways` example describes the specified public NAT gateway.

```
aws ec2 describe-nat-gateways \
    --nat-gateway-id nat-01234567890abcdef
```

Output:

```
{
    "NatGateways": [
        {
            "CreateTime": "2023-08-25T01:56:51.000Z",
            "NatGatewayAddresses": [
                {
                    "AllocationId": "eipalloc-0790180cd2EXAMPLE",
                    "NetworkInterfaceId": "eni-09cc4b2558794f7f9",
                    "PrivateIp": "10.0.0.211",
                    "PublicIp": "54.85.121.213",
                    "AssociationId": "eipassoc-04d295cc9b8815b24",
                    "IsPrimary": true,
                    "Status": "succeeded"
                },
                {
                    "AllocationId": "eipalloc-0be6ecac95EXAMPLE",
                    "NetworkInterfaceId": "eni-09cc4b2558794f7f9",
                    "PrivateIp": "10.0.0.74",
                    "PublicIp": "3.211.231.218",
                    "AssociationId": "eipassoc-0f96bdca17EXAMPLE",
                    "IsPrimary": false,
                    "Status": "succeeded"
                }
            ],
            "NatGatewayId": "nat-01234567890abcdef",
            "State": "available",
            "SubnetId": "subnet-655eab5f08EXAMPLE",
            "VpcId": "vpc-098eb5ef58EXAMPLE",
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "public-nat"
```

```
                }
            ],
            "ConnectivityType": "public"
        }
    ]
}
```

Example 2: To describe a private NAT gateway

The following `describe-nat-gateways` example describes the specified private NAT gateway.

```
aws ec2 describe-nat-gateways \
    --nat-gateway-id nat-1234567890abcdef0
```

Output:

```
{
    "NatGateways": [
        {
            "CreateTime": "2023-08-25T00:50:05.000Z",
            "NatGatewayAddresses": [
                {
                    "NetworkInterfaceId": "eni-0065a61b324d1897a",
                    "PrivateIp": "10.0.20.240",
                    "IsPrimary": true,
                    "Status": "succeeded"
                },
                {
                    "NetworkInterfaceId": "eni-0065a61b324d1897a",
                    "PrivateIp": "10.0.20.33",
                    "IsPrimary": false,
                    "Status": "succeeded"
                },
                {
                    "NetworkInterfaceId": "eni-0065a61b324d1897a",
                    "PrivateIp": "10.0.20.197",
                    "IsPrimary": false,
                    "Status": "succeeded"
                }
            ],
            "NatGatewayId": "nat-1234567890abcdef0",
            "State": "available",
```

```
                "SubnetId": "subnet-08fc749671EXAMPLE",
                "VpcId": "vpc-098eb5ef58EXAMPLE",
                "Tags": [
                    {
                        "Key": "Name",
                        "Value": "private-nat"
                    }
                ],
                "ConnectivityType": "private"
            }
        ]
}
```

For more information, see NAT gateways in the *Amazon VPC User Guide*.

- For API details, see DescribeNatGateways in *AWS CLI Command Reference*.

`describe-network-acls`

The following code example shows how to use `describe-network-acls`.

AWS CLI

To describe your network ACLs

The following `describe-network-acls` example retrieves details about your network ACLs.

```
aws ec2 describe-network-acls
```

Output:

```
{
    "NetworkAcls": [
        {
            "Associations": [
                {
                    "NetworkAclAssociationId": "aclassoc-0c1679dc41EXAMPLE",
                    "NetworkAclId": "acl-0ea1f54ca7EXAMPLE",
                    "SubnetId": "subnet-0931fc2fa5EXAMPLE"
                }
            ],
            "Entries": [
                {
```

```
                    "CidrBlock": "0.0.0.0/0",

         }
     ]
 }
```

For more information, see Network ACLs in the *AWS VPC User Guide*.

- For API details, see DescribeNetworkAcls in *AWS CLI Command Reference*.

`describe-network-insights-access-scope-analyses`

The following code example shows how to use `describe-network-insights-access-scope-analyses`.

AWS CLI

To describe Network Insights access scope analyses

The following `describe-network-insights-access-scope-analyses` example describes the access scope analysis in your AWS account.

```
aws ec2 describe-network-insights-access-scope-analyses \
    --region us-east-1
```

Output:

```
{
    "NetworkInsightsAccessScopeAnalyses": [
        {
            "NetworkInsightsAccessScopeAnalysisId": "nisa-123456789111",
            "NetworkInsightsAccessScopeAnalysisArn": "arn:aws:ec2:us-
east-1:123456789012:network-insights-access-scope-analysis/nisa-123456789111",
            "NetworkInsightsAccessScopeId": "nis-123456789222",
```

```
                "Status": "succeeded",
                "StartDate": "2022-01-25T19:45:36.842000+00:00",
                "FindingsFound": "true",
                "Tags": []
            }
        ]
}
```

For more information, see [Getting started with Network Access Analyzer using the AWS CLI](#) in the *Network Access Analyzer Guide*.

- For API details, see [DescribeNetworkInsightsAccessScopeAnalyses](#) in *AWS CLI Command Reference*.

`describe-network-insights-access-scopes`

The following code example shows how to use `describe-network-insights-access-scopes`.

AWS CLI

To describe Network Insights access scopes

The following `describe-network-insights-access-scopes` example describes the access-scope analyses in your AWS account.

```
aws ec2 describe-network-insights-access-scopes \
    --region us-east-1
```

Output:

```
{
    "NetworkInsightsAccessScopes": [
        {
            "NetworkInsightsAccessScopeId": "nis-123456789111",
            "NetworkInsightsAccessScopeArn": "arn:aws:ec2:us-
east-1:123456789012:network-insights-access-scope/nis-123456789111",
            "CreatedDate": "2021-11-29T21:12:41.416000+00:00",
            "UpdatedDate": "2021-11-29T21:12:41.416000+00:00",
            "Tags": []
        }
    ]
}
```

For more information, see Getting started with Network Access Analyzer using the AWS CLI in the *Network Access Analyzer Guide*.

- For API details, see DescribeNetworkInsightsAccessScopes in *AWS CLI Command Reference*.

`describe-network-insights-analyses`

The following code example shows how to use `describe-network-insights-analyses`.

AWS CLI

To view the results of a path analysis

The following `describe-network-insights-analyses` example describes the specified analysis. In this example, the source is an internet gateway, the destination is an EC2 instance, and the protocol is TCP. The analysis succeeded (`Status` is `succeeded`) and the path is not reachable (`NetworkPathFound` is `false`). The explanation code `ENI_SG_RULES_MISMATCH` indicates that the security group for the instance does not contain a rule that allows traffic on the destination port.

```
aws ec2 describe-network-insights-analyses \
    --network-insights-analysis-ids nia-02207aa13eb480c7a
```

Output:

```
{
    "NetworkInsightsAnalyses": [
        {
            "NetworkInsightsAnalysisId": "nia-02207aa13eb480c7a",
            "NetworkInsightsAnalysisArn": "arn:aws:ec2:us-
east-1:123456789012:network-insights-analysis/nia-02207aa13eb480c7a",
            "NetworkInsightsPathId": "nip-0b26f224f1d131fa8",
            "StartDate": "2021-01-20T22:58:37.495Z",
            "Status": "succeeded",
            "NetworkPathFound": false,
            "Explanations": [
                {
                    "Direction": "ingress",
                    "ExplanationCode": "ENI_SG_RULES_MISMATCH",
                    "NetworkInterface": {
                        "Id": "eni-0a25edef15a6cc08c",

f1663d98ad28331c7"
                    }
                }
            ],
            "Tags": []
        }
    ]
}
```

For more information, see Getting started using the AWS CLI in the *Reachability Analyzer Guide*.

- For API details, see DescribeNetworkInsightsAnalyses in *AWS CLI Command Reference*.

`describe-network-insights-paths`

The following code example shows how to use `describe-network-insights-paths`.

AWS CLI

To describe a path

The following `describe-network-insights-paths` example describes the specified path.

```
aws ec2 describe-network-insights-paths \
    --network-insights-path-ids nip-0b26f224f1d131fa8
```

Output:

```
{
    "NetworkInsightsPaths": [
        {
            "NetworkInsightsPathId": "nip-0b26f224f1d131fa8",
            "NetworkInsightsPathArn": "arn:aws:ec2:us-east-1:123456789012:network-
insights-path/nip-0b26f224f1d131fa8",
            "CreatedDate": "2021-01-20T22:43:46.933Z",
            "Source": "igw-0797cccdc9d73b0e5",
            "Destination": "i-0495d385ad28331c7",
            "Protocol": "tcp"
        }
    ]
}
```

For more information, see Getting started using the AWS CLI in the *Reachability Analyzer Guide*.

- For API details, see DescribeNetworkInsightsPaths in *AWS CLI Command Reference*.

`describe-network-interface-attribute`

The following code example shows how to use `describe-network-interface-attribute`.

AWS CLI

To describe the attachment attribute of a network interface

This example command describes the `attachment` attribute of the specified network interface.

Command:

```
aws ec2 describe-network-interface-attribute --network-interface-id eni-686ea200 --
attribute attachment
```

Output:

```
{
  "NetworkInterfaceId": "eni-686ea200",
  "Attachment": {
      "Status": "attached",
      "DeviceIndex": 0,
      "AttachTime": "2015-05-21T20:02:20.000Z",
```

```
        "InstanceId": "i-1234567890abcdef0",
        "DeleteOnTermination": true,
        "AttachmentId": "eni-attach-43348162",
        "InstanceOwnerId": "123456789012"
    }
}
```

To describe the description attribute of a network interface

This example command describes the `description` attribute of the specified network interface.

Command:

```
aws ec2 describe-network-interface-attribute --network-interface-id eni-686ea200 --
attribute description
```

Output:

```
{
    "NetworkInterfaceId": "eni-686ea200",
    "Description": {
        "Value": "My description"
    }
}
```

To describe the groupSet attribute of a network interface

This example command describes the `groupSet` attribute of the specified network interface.

Command:

```
aws ec2 describe-network-interface-attribute --network-interface-id eni-686ea200 --
attribute groupSet
```

Output:

```
{
    "NetworkInterfaceId": "eni-686ea200",
    "Groups": [
        {
            "GroupName": "my-security-group",
```

```
            "GroupId": "sg-903004f8"
        }
    ]
}
```

To describe the sourceDestCheck attribute of a network interface

This example command describes the `sourceDestCheck` attribute of the specified network interface.

Command:

```
aws ec2 describe-network-interface-attribute --network-interface-id eni-686ea200 --
attribute sourceDestCheck
```

Output:

```
{
  "NetworkInterfaceId": "eni-686ea200",
  "SourceDestCheck": {
      "Value": true
  }
}
```

- For API details, see DescribeNetworkInterfaceAttribute in *AWS CLI Command Reference*.

`describe-network-interface-permissions`

The following code example shows how to use `describe-network-interface-permissions`.

AWS CLI

To describe your network interface permissions

This example describes all of your network interface permissions.

Command:

```
aws ec2 describe-network-interface-permissions
```

Output:

```
{
  "NetworkInterfacePermissions": [
      {
          "PermissionState": {
              "State": "GRANTED"
          },
          "NetworkInterfacePermissionId": "eni-perm-06fd19020ede149ea",
          "NetworkInterfaceId": "eni-b909511a",
          "Permission": "INSTANCE-ATTACH",
          "AwsAccountId": "123456789012"
      }
  ]
}
```

- For API details, see DescribeNetworkInterfacePermissions in *AWS CLI Command Reference*.

`describe-network-interfaces`

The following code example shows how to use `describe-network-interfaces`.

AWS CLI

To describe your network interfaces

This example describes all your network interfaces.

Command:

```
aws ec2 describe-network-interfaces
```

Output:

```
{
  "NetworkInterfaces": [
      {
          "Status": "in-use",
          "MacAddress": "02:2f:8f:b0:cf:75",
          "SourceDestCheck": true,
          "VpcId": "vpc-a01106c2",
          "Description": "my network interface",
          "Association": {
              "PublicIp": "203.0.113.12",
```

```
            "AssociationId": "eipassoc-0fbb766a",
            "PublicDnsName": "ec2-203-0-113-12.compute-1.amazonaws.com",
            "IpOwnerId": "123456789012"
        },
        "NetworkInterfaceId": "eni-e5aa89a3",
        "PrivateIpAddresses": [
            {
                "PrivateDnsName": "ip-10-0-1-17.ec2.internal",

                    }
                ],
                "PrivateIpAddress": "10.0.1.55"
            }
        ]
}
```

- For API details, see DescribeNetworkInterfaces in *AWS CLI Command Reference*.

`describe-placement-groups`

The following code example shows how to use `describe-placement-groups`.

AWS CLI

To describe your placement groups

This example command describes all of your placement groups.

Command:

```
aws ec2 describe-placement-groups
```

Output:

```
{
    "PlacementGroups": [
        {
            "GroupName": "my-cluster",
            "State": "available",
            "Strategy": "cluster"
        },
        ...
    ]
}
```

- For API details, see DescribePlacementGroups in *AWS CLI Command Reference*.

describe-prefix-lists

The following code example shows how to use `describe-prefix-lists`.

AWS CLI

To describe prefix lists

This example lists all available prefix lists for the region.

Command:

```
aws ec2 describe-prefix-lists
```

Output:

```
{
  "PrefixLists": [
    {
      "PrefixListName": "com.amazonaws.us-east-1.s3",
      "Cidrs": [
        "54.231.0.0/17"
      ],
      "PrefixListId": "pl-63a5400a"
    }
  ]
}
```

- For API details, see DescribePrefixLists in *AWS CLI Command Reference*.

describe-principal-id-format

The following code example shows how to use `describe-principal-id-format`.

AWS CLI

To describe the ID format for IAM users and roles with long ID format enabled

The following `describe-principal-id-format` example describes the ID format for the root user, all IAM roles, and all IAM users with long ID format enabled.

```
aws ec2 describe-principal-id-format \
    --resource instance
```

Output:

```
{
    "Principals": [
        {
            "Arn": "arn:aws:iam::123456789012:root",
            "Statuses": [
                {
                    "Deadline": "2016-12-15T00:00:00.000Z",
                    "Resource": "reservation",
                    "UseLongIds": true
                },
                {
                    "Deadline": "2016-12-15T00:00:00.000Z",
                    "Resource": "instance",
                    "UseLongIds": true
                },
                {
                    "Deadline": "2016-12-15T00:00:00.000Z",
                    "Resource": "volume",
                    "UseLongIds": true
                },
            ]
        },
        ...
    ]
}
```

- For API details, see DescribePrincipalIdFormat in *AWS CLI Command Reference*.

`describe-public-ipv4-pools`

The following code example shows how to use `describe-public-ipv4-pools`.

AWS CLI

To describe your public IPv4 address pools

The following `describe-public-ipv4-pools` example displays details about the address pools that were created when you provisioned public IPv4 address ranges using Bring Your Own IP Addresses (BYOIP).

```
aws ec2 describe-public-ipv4-pools
```

Output:

```
{
    "PublicIpv4Pools": [
        {
            "PoolId": "ipv4pool-ec2-1234567890abcdef0",
            "PoolAddressRanges": [
                {
                    "FirstAddress": "203.0.113.0",
                    "LastAddress": "203.0.113.255",
                    "AddressCount": 256,
                    "AvailableAddressCount": 256
                }
            ],
            "TotalAddressCount": 256,
            "TotalAvailableAddressCount": 256
        }
    ]
}
```

- For API details, see DescribePublicIpv4Pools in *AWS CLI Command Reference*.

`describe-regions`

The following code example shows how to use `describe-regions`.

AWS CLI

Example 1: To describe all of your enabled Regions

The following `describe-regions` example describes all of the Regions that are enabled for your account.

```
aws ec2 describe-regions
```

Output:

```
{
    "Regions": [
        {
            "Endpoint": "ec2.eu-north-1.amazonaws.com",
            "RegionName": "eu-north-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.ap-south-1.amazonaws.com",
            "RegionName": "ap-south-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.eu-west-3.amazonaws.com",
            "RegionName": "eu-west-3",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.eu-west-2.amazonaws.com",
            "RegionName": "eu-west-2",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.eu-west-1.amazonaws.com",
            "RegionName": "eu-west-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.ap-northeast-3.amazonaws.com",
            "RegionName": "ap-northeast-3",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.ap-northeast-2.amazonaws.com",
            "RegionName": "ap-northeast-2",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.ap-northeast-1.amazonaws.com",
            "RegionName": "ap-northeast-1",
            "OptInStatus": "opt-in-not-required"
        },
```

```
        {
            "Endpoint": "ec2.sa-east-1.amazonaws.com",
            "RegionName": "sa-east-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.ca-central-1.amazonaws.com",
            "RegionName": "ca-central-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.ap-southeast-1.amazonaws.com",
            "RegionName": "ap-southeast-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.ap-southeast-2.amazonaws.com",
            "RegionName": "ap-southeast-2",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.eu-central-1.amazonaws.com",
            "RegionName": "eu-central-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.us-east-1.amazonaws.com",
            "RegionName": "us-east-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.us-east-2.amazonaws.com",
            "RegionName": "us-east-2",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.us-west-1.amazonaws.com",
            "RegionName": "us-west-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.us-west-2.amazonaws.com",
            "RegionName": "us-west-2",
            "OptInStatus": "opt-in-not-required"
```

```
        }
    ]
}
```

For more information, see Regions and Zones in the *Amazon EC2 User Guide*.

Example 2: To describe enabled Regions with an endpoint whose name contains a specific string

The following `describe-regions` example describes all Regions that you have enabled that have the string "us" in the endpoint.

```
aws ec2 describe-regions \
    --filters "Name=endpoint,Values=*us*"
```

Output:

```
{
    "Regions": [
        {
            "Endpoint": "ec2.us-east-1.amazonaws.com",
            "RegionName": "us-east-1"
        },
        {
            "Endpoint": "ec2.us-east-2.amazonaws.com",
            "RegionName": "us-east-2"
        },
        {
            "Endpoint": "ec2.us-west-1.amazonaws.com",
            "RegionName": "us-west-1"
        },
        {
            "Endpoint": "ec2.us-west-2.amazonaws.com",
            "RegionName": "us-west-2"
        }
    ]
}
```

For more information, see Regions and Zones in the *Amazon EC2 User Guide*.

Example 3: To describe all Regions

The following `describe-regions` example describes all available Regions, including Regions that are disabled.

```
aws ec2 describe-regions \
    --all-regions
```

Output:

```
{
    "Regions": [
        {
            "Endpoint": "ec2.eu-north-1.amazonaws.com",
            "RegionName": "eu-north-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.ap-south-1.amazonaws.com",
            "RegionName": "ap-south-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.eu-west-3.amazonaws.com",
            "RegionName": "eu-west-3",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.eu-west-2.amazonaws.com",
            "RegionName": "eu-west-2",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.eu-west-1.amazonaws.com",
            "RegionName": "eu-west-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.ap-northeast-3.amazonaws.com",
            "RegionName": "ap-northeast-3",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.me-south-1.amazonaws.com",
            "RegionName": "me-south-1",
```

```
            "OptInStatus": "not-opted-in"
        },
        {
            "Endpoint": "ec2.ap-northeast-2.amazonaws.com",
            "RegionName": "ap-northeast-2",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.ap-northeast-1.amazonaws.com",
            "RegionName": "ap-northeast-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.sa-east-1.amazonaws.com",
            "RegionName": "sa-east-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.ca-central-1.amazonaws.com",
            "RegionName": "ca-central-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.ap-east-1.amazonaws.com",
            "RegionName": "ap-east-1",
            "OptInStatus": "not-opted-in"
        },
        {
            "Endpoint": "ec2.ap-southeast-1.amazonaws.com",
            "RegionName": "ap-southeast-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.ap-southeast-2.amazonaws.com",
            "RegionName": "ap-southeast-2",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.eu-central-1.amazonaws.com",
            "RegionName": "eu-central-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.us-east-1.amazonaws.com",
```

```
            "RegionName": "us-east-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.us-east-2.amazonaws.com",
            "RegionName": "us-east-2",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.us-west-1.amazonaws.com",
            "RegionName": "us-west-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.us-west-2.amazonaws.com",
            "RegionName": "us-west-2",
            "OptInStatus": "opt-in-not-required"
        }
    ]
}
```

For more information, see Regions and Zones in the *Amazon EC2 User Guide*.

Example 4: To list the Region names only

The following `describe-regions` example uses the `--query` parameter to filter the output and return only the names of the Regions as text.

```
aws ec2 describe-regions \
    --all-regions \
    --query "Regions[].{Name:RegionName}" \
    --output text
```

Output:

```
eu-north-1
ap-south-1
eu-west-3
eu-west-2
eu-west-1
ap-northeast-3
ap-northeast-2
me-south-1
```

```
ap-northeast-1
sa-east-1
ca-central-1
ap-east-1
ap-southeast-1
ap-southeast-2
eu-central-1
us-east-1
us-east-2
us-west-1
us-west-2
```

For more information, see Regions and Zones in the *Amazon EC2 User Guide*.

- For API details, see DescribeRegions in *AWS CLI Command Reference*.

`describe-replace-root-volume-tasks`

The following code example shows how to use `describe-replace-root-volume-tasks`.

AWS CLI

Example 1: To view information about a specific root volume replacement task

The following `describe-replace-root-volume-tasks` example describes root volume replacement task replacevol-0111122223333abcd.

```
aws ec2 describe-replace-root-volume-tasks \
    --replace-root-volume-task-ids replacevol-0111122223333abcd
```

Output:

```
{
    "ReplaceRootVolumeTasks": [
        {
            "ReplaceRootVolumeTaskId": "replacevol-0111122223333abcd",
            "Tags": [],
            "InstanceId": "i-0123456789abcdefa",
            "TaskState": "succeeded",
            "StartTime": "2022-03-14T15:16:28Z",
            "CompleteTime": "2022-03-14T15:16:52Z"
        }
```

```
    ]
}
```

For more information, see Replace a root volume in the *Amazon Elastic Compute Cloud User Guide*.

Example 2: To view information about all root volume replacement tasks for a specific instance

The following `describe-replace-root-volume-tasks` example describes all of the root volume replacement tasks for instance i-0123456789abcdefa.

```
aws ec2 describe-replace-root-volume-tasks \
    --filters Name=instance-id,Values=i-0123456789abcdefa
```

Output:

```
{
    "ReplaceRootVolumeTasks": [
        {
            "ReplaceRootVolumeTaskId": "replacevol-0111122223333abcd",
            "Tags": [],
            "InstanceId": "i-0123456789abcdefa",
            "TaskState": "succeeded",
            "StartTime": "2022-03-14T15:06:38Z",
            "CompleteTime": "2022-03-14T15:07:03Z"
        },
        {
            "ReplaceRootVolumeTaskId": "replacevol-0444455555555abcd",
            "Tags": [],
            "InstanceId": "i-0123456789abcdefa",
            "TaskState": "succeeded",
            "StartTime": "2022-03-14T15:16:28Z",
            "CompleteTime": "2022-03-14T15:16:52Z"
        }
    ]
}
```

For more information, see Replace a root volume in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see DescribeReplaceRootVolumeTasks in *AWS CLI Command Reference*.

`describe-reserved-instances-listings`

The following code example shows how to use `describe-reserved-instances-listings`.

AWS CLI

To describe a Reserved Instance listing

The following `describe-reserved-instances-listings` example retrieves information about the specified Reserved Instance listing.

```
aws ec2 describe-reserved-instances-listings \
    --reserved-instances-listing-id 5ec28771-05ff-4b9b-aa31-9e57dexample
```

This command produces no output.

- For API details, see DescribeReservedInstancesListings in *AWS CLI Command Reference*.

`describe-reserved-instances-modifications`

The following code example shows how to use `describe-reserved-instances-modifications`.

AWS CLI

To describe Reserved Instances modifications

This example command describes all the Reserved Instances modification requests that have been submitted for your account.

Command:

```
aws ec2 describe-reserved-instances-modifications
```

Output:

```
{
    "ReservedInstancesModifications": [
        {
            "Status": "fulfilled",
            "ModificationResults": [
                {
                    "ReservedInstancesId": "93bbbca2-62f1-4d9d-b225-16bada29e6c7",
```

```
                    "TargetConfiguration": {
                        "AvailabilityZone": "us-east-1b",
                        "InstanceType": "m1.large",
                        "InstanceCount": 3
                    }
                },
                {
                     "ReservedInstancesId": "1ba8e2e3-aabb-46c3-bcf5-3fe2fda922e6",
                     "TargetConfiguration": {
                         "AvailabilityZone": "us-east-1d",
                         "InstanceType": "m1.xlarge",
                         "InstanceCount": 1
                     }
                 }
            ],
            "EffectiveDate": "2015-08-12T17:00:00.000Z",
            "CreateDate": "2015-08-12T17:52:52.630Z",
            "UpdateDate": "2015-08-12T18:08:06.698Z",
            "ClientToken": "c9adb218-3222-4889-8216-0cf0e52dc37e:
            "ReservedInstancesModificationId": "rimod-d3ed4335-b1d3-4de6-
ab31-0f13aaf46687",
            "ReservedInstancesIds": [
                {
                    "ReservedInstancesId": "b847fa93-e282-4f55-b59a-1342f5bd7c02"
                }
            ]
        }
    ]
}
```

- For API details, see DescribeReservedInstancesModifications in *AWS CLI Command Reference*.

`describe-reserved-instances-offerings`

The following code example shows how to use `describe-reserved-instances-offerings`.

AWS CLI

To describe Reserved Instances offerings

This example command describes all Reserved Instances available for purchase in the region.

Command:

```
aws ec2 describe-reserved-instances-offerings
```

Output:

```
{
  "ReservedInstancesOfferings": [
      {

```

To describe your Reserved Instances offerings using options

This example lists Reserved Instances offered by AWS with the following specifications: t1.micro instance types, Windows (Amazon VPC) product, and Heavy Utilization offerings.

Command:

```
aws ec2 describe-reserved-instances-offerings --no-include-marketplace --instance-type "t1.micro" --product-description "Windows (Amazon VPC)" --offering-type "no upfront"
```

Output:

```
{
    "ReservedInstancesOfferings": [
      {
          "OfferingType": "No Upfront",
          "AvailabilityZone": "us-east-1b",

            "InstanceType": "t1.micro"
        }
      ]
}
```

- For API details, see DescribeReservedInstancesOfferings in *AWS CLI Command Reference*.

`describe-reserved-instances`

The following code example shows how to use `describe-reserved-instances`.

AWS CLI

To describe your Reserved Instances

This example command describes the Reserved Instances that you own.

Command:

```
aws ec2 describe-reserved-instances
```

Output:

```
{
  "ReservedInstances": [
```

```
        {
            "ReservedInstancesId": "b847fa93-e282-4f55-b59a-1342fexample",
            "OfferingType": "No Upfront",
            "AvailabilityZone": "us-west-1c",
            "End": "2016-08-14T21:34:34.000Z",
            "ProductDescription": "Linux/UNIX",
            "UsagePrice": 0.00,
            "RecurringCharges": [
                {
                    "Amount": 0.104,
                    "Frequency": "Hourly"
                }
            ],
            "Start": "2015-08-15T21:34:35.086Z",
            "State": "active",
            "FixedPrice": 0.0,
            "CurrencyCode": "USD",
            "Duration": 31536000,
            "InstanceTenancy": "default",
            "InstanceType": "m3.medium",
            "InstanceCount": 2
        },
        ...
    ]
}
```

To describe your Reserved Instances using filters

This example filters the response to include only three-year, t2.micro Linux/UNIX Reserved Instances in us-west-1c.

Command:

```
aws ec2 describe-reserved-instances --filters Name=duration,Values=94608000 Name=instance-type,Values=t2.micro Name=product-description,Values=Linux/UNIX Name=availability-zone,Values=us-east-1e
```

Output:

```
{
    "ReservedInstances": [
        {
```

```
                "ReservedInstancesId": "f127bd27-edb7-44c9-a0eb-0d7e09259af0",
                "OfferingType": "All Upfront",
                "AvailabilityZone": "us-east-1e",
                "End": "2018-03-26T21:34:34.000Z",
                "ProductDescription": "Linux/UNIX",
                "UsagePrice": 0.00,
                "RecurringCharges": [],
                "Start": "2015-03-27T21:34:35.848Z",
                "State": "active",
                "FixedPrice": 151.0,
                "CurrencyCode": "USD",
                "Duration": 94608000,
                "InstanceTenancy": "default",
                "InstanceType": "t2.micro",
                "InstanceCount": 1
            }
        ]
}
```

For more information, see Using Amazon EC2 Instances in the *AWS Command Line Interface User Guide*.

- For API details, see DescribeReservedInstances in *AWS CLI Command Reference*.

`describe-route-tables`

The following code example shows how to use `describe-route-tables`.

AWS CLI

To describe your route tables

The following `describe-route-tables` example retrieves the details about your route tables

```
aws ec2 describe-route-tables
```

Output:

```
{
    "RouteTables": [
        {
            "Associations": [
                {
```

```
                    "Main": true,
                    "RouteTableAssociationId": "rtbassoc-0df3f54e06EXAMPLE",
                    "RouteTableId": "rtb-09ba434c1bEXAMPLE"
                }
            ],
            "PropagatingVgws": [],
            "RouteTableId": "rtb-09ba434c1bEXAMPLE",
            "Routes": [
                {
                    "DestinationCidrBlock": "10.0.0.0/16",

                }
            ],
            "Tags": [],
            "VpcId": "vpc-0065acced4EXAMPLE",
            "OwnerId": "111122223333"
        }
    ]
}
```

For more information, see Working with Route Tables in the *AWS VPC User Guide*.

- For API details, see DescribeRouteTables in *AWS CLI Command Reference*.

`describe-scheduled-instance-availability`

The following code example shows how to use `describe-scheduled-instance-availability`.

AWS CLI

To describe an available schedule

This example describes a schedule that occurs every week on Sunday, starting on the specified date.

Command:

```
aws ec2 describe-scheduled-instance-availability --
recurrence Frequency=Weekly,Interval=1,OccurrenceDays=[1] --first-slot-start-time-
range EarliestTime=2016-01-31T00:00:00Z,LatestTime=2016-01-31T04:00:00Z
```

Output:

```
{
  "ScheduledInstanceAvailabilitySet": [
    {
        "AvailabilityZone": "us-west-2b",
        "TotalScheduledInstanceHours": 1219,
        "PurchaseToken": "eyJ2IjoiMSIsInMiOjEsImMiOi...",
        "MinTermDurationInDays": 366,
        "AvailableInstanceCount": 20,
        "Recurrence": {
            "OccurrenceDaySet": [
                1
            ],
            "Interval": 1,
            "Frequency": "Weekly",
            "OccurrenceRelativeToEnd": false
        },
        "Platform": "Linux/UNIX",
        "FirstSlotStartTime": "2016-01-31T00:00:00Z",
        "MaxTermDurationInDays": 366,
        "SlotDurationInHours": 23,
        "NetworkPlatform": "EC2-VPC",
        "InstanceType": "c4.large",
        "HourlyPrice": "0.095"
```

```
    },
    ...
  ]
}
```

To narrow the results, you can add filters that specify the operating system, network, and instance type.

Command:

--filters Name=platform,Values=Linux/UNIX Name=network-platform,Values=EC2-VPC Name=instance-type,Values=c4.large

- For API details, see DescribeScheduledInstanceAvailability in *AWS CLI Command Reference*.

`describe-scheduled-instances`

The following code example shows how to use `describe-scheduled-instances`.

AWS CLI

To describe your Scheduled Instances

This example describes the specified Scheduled Instance.

Command:

```
aws ec2 describe-scheduled-instances --scheduled-instance-ids sci-1234-1234-1234-1234-123456789012
```

Output:

```
{
  "ScheduledInstanceSet": [
      {
          "AvailabilityZone": "us-west-2b",
          "ScheduledInstanceId": "sci-1234-1234-1234-1234-123456789012",
          "HourlyPrice": "0.095",
          "CreateDate": "2016-01-25T21:43:38.612Z",
          "Recurrence": {
              "OccurrenceDaySet": [
                  1
              ],
```

```
                "Interval": 1,
                "Frequency": "Weekly",
                "OccurrenceRelativeToEnd": false,
                "OccurrenceUnit": ""
            },
            "Platform": "Linux/UNIX",
            "TermEndDate": "2017-01-31T09:00:00Z",
            "InstanceCount": 1,
            "SlotDurationInHours": 32,
            "TermStartDate": "2016-01-31T09:00:00Z",
            "NetworkPlatform": "EC2-VPC",
            "TotalScheduledInstanceHours": 1696,
            "NextSlotStartTime": "2016-01-31T09:00:00Z",
            "InstanceType": "c4.large"
        }
    ]
}
```

This example describes all your Scheduled Instances.

Command:

```
aws ec2 describe-scheduled-instances
```

- For API details, see DescribeScheduledInstances in *AWS CLI Command Reference*.

`describe-security-group-references`

The following code example shows how to use `describe-security-group-references`.

AWS CLI

To describe security group references

This example describes the security group references for `sg-bbbb2222`. The response indicates that security group `sg-bbbb2222` is being referenced by a security group in VPC `vpc-aaaaaaaa`.

Command:

```
aws ec2 describe-security-group-references --group-id sg-bbbbb22222
```

Output:

```
{
  "SecurityGroupsReferenceSet": [
    {
      "ReferencingVpcId": "vpc-aaaaaaaa ",
      "GroupId": "sg-bbbbb22222",
      "VpcPeeringConnectionId": "pcx-b04deed9"
    }
  ]
}
```

- For API details, see [DescribeSecurityGroupReferences](https://docs.aws.amazon.com/goto/aws-cli/ec2-2016-11-15/DescribeSecurityGroupReferences) in *AWS CLI Command Reference*.

`describe-security-group-rules`

The following code example shows how to use `describe-security-group-rules`.

AWS CLI

Example 1: To describe the security group rules for a security group

The following `describe-security-group-rules` example describes the security group rules of a specified security group. Use the `filters` option to scope the results to a specific security group.

```
aws ec2 describe-security-group-rules \
    --filters Name="group-id",Values="sg-1234567890abcdef0"
```

Output:

```
{
    "SecurityGroupRules": [
        {
            "SecurityGroupRuleId": "sgr-abcdef01234567890",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "111122223333",
            "IsEgress": false,
            "IpProtocol": "-1",
            "FromPort": -1,
            "ToPort": -1,
            "ReferencedGroupInfo": {
```

```
                "GroupId": "sg-1234567890abcdef0",
                "UserId": "111122223333"
            },
            "Tags": []
        },
        {
            "SecurityGroupRuleId": "sgr-bcdef01234567890a",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "111122223333",
            "IsEgress": true,
            "IpProtocol": "-1",
            "FromPort": -1,
            "ToPort": -1,
            "CidrIpv6": "::/0",
            "Tags": []
        },
        {
            "SecurityGroupRuleId": "sgr-cdef01234567890ab",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "111122223333",
            "IsEgress": true,
            "IpProtocol": "-1",
            "FromPort": -1,
            "ToPort": -1,
            "CidrIpv4": "0.0.0.0/0",
            "Tags": []
        }
    ]
}
```

Example 2: To describe a security group rule

The following `describe-security-group-rules` example describes the specified security group rule.

```
aws ec2 describe-security-group-rules \
    --security-group-rule-ids sgr-cdef01234567890ab
```

Output:

```
{
    "SecurityGroupRules": [
        {
```

```
                "SecurityGroupRuleId": "sgr-cdef01234567890ab",
                "GroupId": "sg-1234567890abcdef0",
                "GroupOwnerId": "111122223333",
                "IsEgress": true,
                "IpProtocol": "-1",
                "FromPort": -1,
                "ToPort": -1,
                "CidrIpv4": "0.0.0.0/0",
                "Tags": []
            }
        ]
}
```

For more information, see Security group rules in the *Amazon VPC User Guide*.

- For API details, see DescribeSecurityGroupRules in *AWS CLI Command Reference*.

`describe-security-group-vpc-associations`

The following code example shows how to use `describe-security-group-vpc-associations`.

AWS CLI

To describe VPC associations

The following `describe-security-group-vpc-associations` example describes the VPC associations for the specified security group.

```
aws ec2 describe-security-group-vpc-associations \
    --filters Name=group-id,Values=sg-04dbb43907d3f8a78
```

Output:

```
{
    "SecurityGroupVpcAssociations": [
        {
            "GroupId": "sg-04dbb43907d3f8a78",
            "VpcId": "vpc-0bf4c2739bc05a694",
            "VpcOwnerId": "123456789012",
            "State": "associated"
        }
```

```
    ]
}
```

For more information, see Associate security groups with multiple VPCs in the *Amazon VPC User Guide*.

- For API details, see DescribeSecurityGroupVpcAssociations in *AWS CLI Command Reference*.

`describe-security-groups`

The following code example shows how to use `describe-security-groups`.

AWS CLI

Example 1: To describe a security group

The following `describe-security-groups` example describes the specified security group.

```
aws ec2 describe-security-groups \
    --group-ids sg-903004f8
```

Output:

```
{
    "SecurityGroups": [
        {
            "IpPermissionsEgress": [
                {
                    "IpProtocol": "-1",
                    "IpRanges": [
                        {
                            "CidrIp": "0.0.0.0/0"
                        }
                    ],
                    "UserIdGroupPairs": [],
                    "PrefixListIds": []
                }
            ],
            "Description": "My security group",
            "Tags": [
                {
                    "Value": "SG1",
```

```
                    "Key": "Name"
                }
            ],
            "IpPermissions": [
                {
                    "IpProtocol": "-1",
                    "IpRanges": [],
                    "UserIdGroupPairs": [
                        {
                            "UserId": "123456789012",
                            "GroupId": "sg-903004f8"
                        }
                    ],
                    "PrefixListIds": []
                },
                {
                    "PrefixListIds": [],
                    "FromPort": 22,
                    "IpRanges": [
                        {
                            "Description": "Access from NY office",
                            "CidrIp": "203.0.113.0/24"
                        }
                    ],
                    "ToPort": 22,
                    "IpProtocol": "tcp",
                    "UserIdGroupPairs": []
                    }
            ],
            "GroupName": "MySecurityGroup",
            "VpcId": "vpc-1a2b3c4d",
            "OwnerId": "123456789012",
            "GroupId": "sg-903004f8",
        }
    ]
}
```

Example 2: To describe security groups that have specific rules

The following `describe-security-groups` example uses filters to scope the results to security groups that have a rule that allows SSH traffic (port 22) and a rule that allows traffic from all addresses (`0.0.0.0/0`). The example uses the `--query` parameter to display only the names of the security groups. Security groups must match all filters to be returned in the results; however, a single rule does not have to match all filters. For example, the output returns a security group with a rule that allows SSH traffic from a specific IP address and another rule that allows HTTP traffic from all addresses.

```
aws ec2 describe-security-groups \
    --filters Name=ip-permission.from-port,Values=22 Name=ip-permission.to-
port,Values=22 Name=ip-permission.cidr,Values='0.0.0.0/0' \
    --query "SecurityGroups[*].[GroupName]" \
    --output text
```

Output:

```
default
my-security-group
web-servers
launch-wizard-1
```

Example 3: To describe security groups based on tags

The following `describe-security-groups` example uses filters to scope the results to security groups that include `test` in the security group name, and that have the tag `Test=To-delete`. The example uses the `--query` parameter to display only the names and IDs of the security groups.

```
aws ec2 describe-security-groups \
    --filters Name=group-name,Values=*test* Name=tag:Test,Values=To-delete \
    --query "SecurityGroups[*].{Name:GroupName,ID:GroupId}"
```

Output:

```
[
    {
        "Name": "testfornewinstance",
        "ID": "sg-33bb22aa"
    },
    {
        "Name": "newgrouptest",
        "ID": "sg-1a2b3c4d"
    }
]
```

For additional examples using tag filters, see Working with tags in the *Amazon EC2 User Guide*.

- For API details, see DescribeSecurityGroups in *AWS CLI Command Reference*.

describe-snapshot-attribute

The following code example shows how to use `describe-snapshot-attribute`.

AWS CLI

To describe the snapshot attributes for a snapshot

The following `describe-snapshot-attribute` example lists the accounts with which a snapshot is shared.

```
aws ec2 describe-snapshot-attribute \
    --snapshot-id snap-01234567890abcedf \
    --attribute createVolumePermission
```

Output:

```
{
    "SnapshotId": "snap-01234567890abcedf",
    "CreateVolumePermissions": [
        {
            "UserId": "123456789012"
        }
    ]
}
```

For more information, see Share an Amazon EBS snapshot in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see DescribeSnapshotAttribute in *AWS CLI Command Reference*.

describe-snapshot-tier-status

The following code example shows how to use `describe-snapshot-tier-status`.

AWS CLI

To view archival information about an archived snapshot

The following `describe-snapshot-tier-status` example provides archival information about an archived snapshot.

```
aws ec2 describe-snapshot-tier-status \
    --filters "Name=snapshot-id, Values=snap-01234567890abcedf"
```

Output:

```
{
    "SnapshotTierStatuses": [
        {
            "Status": "completed",
            "ArchivalCompleteTime": "2021-09-15T17:33:16.147Z",
            "LastTieringProgress": 100,
            "Tags": [],
            "VolumeId": "vol-01234567890abcedf",
            "LastTieringOperationState": "archival-completed",
            "StorageTier": "archive",
            "OwnerId": "123456789012",
            "SnapshotId": "snap-01234567890abcedf",
            "LastTieringStartTime": "2021-09-15T16:44:37.574Z"
        }
    ]
}
```

For more information, see View archived snapshots in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see DescribeSnapshotTierStatus in *AWS CLI Command Reference*.

`describe-snapshots`

The following code example shows how to use `describe-snapshots`.

AWS CLI

Example 1: To describe a snapshot

The following `describe-snapshots` example describes the specified snapshot.

```
aws ec2 describe-snapshots \
    --snapshot-ids snap-1234567890abcdef0
```

Output:

```
{
    "Snapshots": [
        {
            "Description": "This is my snapshot",
            "Encrypted": false,
            "VolumeId": "vol-049df61146c4d7901",
            "State": "completed",
            "VolumeSize": 8,
            "StartTime": "2019-02-28T21:28:32.000Z",
            "Progress": "100%",
            "OwnerId": "012345678910",
            "SnapshotId": "snap-01234567890abcdef",
            "Tags": [
                {
                    "Key": "Stack",
                    "Value": "test"
                }
            ]
        }
    ]
}
```

For more information, see Amazon EBS snapshots in the *Amazon EC2 User Guide*.

Example 2: To describe snapshots based on filters

The following `describe-snapshots` example uses filters to scope the results to snapshots owned by your AWS account that are in the `pending` state. The example uses the `--query` parameter to display only the snapshot IDs and the time the snapshot was started.

```
aws ec2 describe-snapshots \
    --owner-ids self \
    --filters Name=status,Values=pending \
    --query "Snapshots[*].{ID:SnapshotId,Time:StartTime}"
```

Output:

```
[
    {
        "ID": "snap-1234567890abcdef0",
```

```
        "Time": "2019-08-04T12:48:18.000Z"
    },
    {
        "ID": "snap-066877671789bd71b",
        "Time": "2019-08-04T02:45:16.000Z
    },
    ...
]
```

The following `describe-snapshots` example uses filters to scope the results to snapshots created from the specified volume. The example uses the `--query` parameter to display only the snapshot IDs.

```
aws ec2 describe-snapshots \
    --filters Name=volume-id,Values=049df61146c4d7901 \
    --query "Snapshots[*].[SnapshotId]" \
    --output text
```

Output:

```
snap-1234567890abcdef0
snap-08637175a712c3fb9
...
```

For additional examples using filters, see Listing and filtering your resources in the *Amazon EC2 User Guide*.

Example 3: To describe snapshots based on tags

The following `describe-snapshots` example uses tag filters to scope the results to snapshots that have the tag `Stack=Prod`.

```
aws ec2 describe-snapshots \
    --filters Name=tag:Stack,Values=prod
```

For an example of the output for `describe-snapshots`, see Example 1.

For additional examples using tag filters, see Working with tags in the *Amazon EC2 User Guide*.

Example 4: To describe snapshots based on age

The following `describe-snapshots` example uses JMESPath expressions to describe all snapshots created by your AWS account before the specified date. It displays only the snapshot IDs.

```
aws ec2 describe-snapshots \
    --owner-ids 012345678910 \
    --query "Snapshots[?(StartTime<='2020-03-31')].[SnapshotId]"
```

For additional examples using filters, see Listing and filtering your resources in the *Amazon EC2 User Guide*.

Example 5: To view only archived snapshots

The following `describe-snapshots` example lists only snapshots that are stored in the archive tier.

```
aws ec2 describe-snapshots \
    --filters "Name=storage-tier,Values=archive"
```

Output:

```
{
    "Snapshots": [
        {
            "Description": "Snap A",
            "Encrypted": false,
            "VolumeId": "vol-01234567890aaaaaa",
            "State": "completed",
            "VolumeSize": 8,
            "StartTime": "2021-09-07T21:00:00.000Z",
            "Progress": "100%",
            "OwnerId": "123456789012",
            "SnapshotId": "snap-01234567890aaaaaa",
            "StorageTier": "archive",
            "Tags": []
        },
    ]
}
```

For more information, see View archived snapshots in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see DescribeSnapshots in *AWS CLI Command Reference*.

`describe-spot-datafeed-subscription`

The following code example shows how to use `describe-spot-datafeed-subscription`.

AWS CLI

To describe Spot Instance datafeed subscription for an account

This example command describes the data feed for the account.

Command:

```
aws ec2 describe-spot-datafeed-subscription
```

Output:

```
{
    "SpotDatafeedSubscription": {
        "OwnerId": "123456789012",
        "Prefix": "spotdata",
        "Bucket": "amzn-s3-demo-bucket",
        "State": "Active"
    }
}
```

- For API details, see DescribeSpotDatafeedSubscription in *AWS CLI Command Reference*.

`describe-spot-fleet-instances`

The following code example shows how to use `describe-spot-fleet-instances`.

AWS CLI

To describe the Spot Instances associated with a Spot fleet

This example command lists the Spot instances associated with the specified Spot fleet.

Command:

```
aws ec2 describe-spot-fleet-instances --spot-fleet-request-id sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE
```

Output:

```
{
  "ActiveInstances": [
      {
          "InstanceId": "i-1234567890abcdef0",
          "InstanceType": "m3.medium",
          "SpotInstanceRequestId": "sir-08b93456"
      },
      ...
  ],
  "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE"
}
```

- For API details, see DescribeSpotFleetInstances in *AWS CLI Command Reference*.

`describe-spot-fleet-request-history`

The following code example shows how to use `describe-spot-fleet-request-history`.

AWS CLI

To describe Spot fleet history

This example command returns the history for the specified Spot fleet starting at the specified time.

Command:

```
aws ec2 describe-spot-fleet-request-history --spot-fleet-request-id sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE --start-time 2015-05-26T00:00:00Z
```

The following example output shows the successful launches of two Spot Instances for the Spot fleet.

Output:

```
{
  "HistoryRecords": [
```

```
      {
          "Timestamp": "2015-05-26T23:17:20.697Z",
          "EventInformation": {
              "EventSubType": "submitted"
          },
          "EventType": "fleetRequestChange"
      },
      {
          "Timestamp": "2015-05-26T23:17:20.873Z",
          "EventInformation": {
              "EventSubType": "active"
          },
          "EventType": "fleetRequestChange"
      },
      {
          "Timestamp": "2015-05-26T23:21:21.712Z",
          "EventInformation": {
              "InstanceId": "i-1234567890abcdef0",
              "EventSubType": "launched"
          },
          "EventType": "instanceChange"
      },
      {
          "Timestamp": "2015-05-26T23:21:21.816Z",
          "EventInformation": {
              "InstanceId": "i-1234567890abcdef1",
              "EventSubType": "launched"
          },
          "EventType": "instanceChange"
      }
  ],
  "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE",
  "NextToken": "CpHNsscimcV5oH7bSbub03CI2Qms5+ypNpNm

  "StartTime": "2015-05-26T00:00:00Z"
}
```

- For API details, see DescribeSpotFleetRequestHistory in *AWS CLI Command Reference*.

`describe-spot-fleet-requests`

The following code example shows how to use `describe-spot-fleet-requests`.

AWS CLI

To describe your Spot fleet requests

This example describes all of your Spot fleet requests.

Command:

```
aws ec2 describe-spot-fleet-requests
```

Output:

```
{
  "SpotFleetRequestConfigs": [
      {
          "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE",
          "SpotFleetRequestConfig": {
              "TargetCapacity": 20,
              "LaunchSpecifications": [
                  {
                      "EbsOptimized": false,
                      "NetworkInterfaces": [
                          {
                              "SubnetId": "subnet-a61dafcf",
                              "DeviceIndex": 0,
                              "DeleteOnTermination": false,
                              "AssociatePublicIpAddress": true,
                              "SecondaryPrivateIpAddressCount": 0
                          }
                      ],
                      "InstanceType": "cc2.8xlarge",
                      "ImageId": "ami-1a2b3c4d"
                  },
                  {
                      "EbsOptimized": false,
                      "NetworkInterfaces": [
                          {

}
```

- For API details, see DescribeSpotFleetRequests in *AWS CLI Command Reference*.

`describe-spot-instance-requests`

The following code example shows how to use `describe-spot-instance-requests`.

AWS CLI

Example 1: To describe a Spot Instance request

The following `describe-spot-instance-requests` example describes the specified Spot Instance request.

```
aws ec2 describe-spot-instance-requests \
    --spot-instance-request-ids sir-08b93456
```

Output:

```
{
    "SpotInstanceRequests": [
        {
            "CreateTime": "2018-04-30T18:14:55.000Z",
            "InstanceId": "i-1234567890abcdef1",
            "LaunchSpecification": {
                "InstanceType": "t2.micro",
                "ImageId": "ami-003634241a8fcdec0",
                "KeyName": "my-key-pair",
                "SecurityGroups": [
                    {
                        "GroupName": "default",
                        "GroupId": "sg-e38f24a7"
                    }
                ],
                "BlockDeviceMappings": [
                    {
```

```
                            "DeviceName": "/dev/sda1",
                            "Ebs": {
                                "DeleteOnTermination": true,

                            "SubnetId": "subnet-049df61146c4d7901"
                        }
                    ],
                    "Placement": {
                        "AvailabilityZone": "us-east-2b",
                        "Tenancy": "default"
                    },
                    "Monitoring": {
                        "Enabled": false
                    }
                },
                "LaunchedAvailabilityZone": "us-east-2b",
                "ProductDescription": "Linux/UNIX",
                "SpotInstanceRequestId": "sir-08b93456",
                "SpotPrice": "0.010000"
                "State": "active",
                "Status": {
                    "Code": "fulfilled",
                    "Message": "Your Spot request is fulfilled.",
                    "UpdateTime": "2018-04-30T18:16:21.000Z"
                },
                "Tags": [],
                "Type": "one-time",
                "InstanceInterruptionBehavior": "terminate"
            }
        ]
}
```

Example 2: To describe Spot Instance requests based on filters

The following `describe-spot-instance-requests` example uses filters to scope the results to Spot Instance requests with the specified instance type in the specified Availability Zone. The example uses the `--query` parameter to display only the instance IDs.

```
aws ec2 describe-spot-instance-requests \
    --filters Name=launch.instance-type,Values=m3.medium Name=launched-availability-zone,Values=us-east-2a \
    --query "SpotInstanceRequests[*].[InstanceId]" \
    --output text
```

Output:

```
i-057750d42936e468a
i-001efd250faaa6ffa
i-027552a73f021f3bd
...
```

For additional examples using filters, see Listing and filtering your resources in the *Amazon Elastic Compute Cloud User Guide*.

Example 3: To describe Spot Instance requests based on tags

The following `describe-spot-instance-requests` example uses tag filters to scope the results to Spot Instance requests that have the tag `cost-center=cc123`.

```
aws ec2 describe-spot-instance-requests \
    --filters Name=tag:cost-center,Values=cc123
```

For an example of the output for `describe-spot-instance-requests`, see Example 1.

For additional examples using tag filters, see Working with tags in the *Amazon EC2 User Guide*.

- For API details, see DescribeSpotInstanceRequests in *AWS CLI Command Reference*.

`describe-spot-price-history`

The following code example shows how to use `describe-spot-price-history`.

AWS CLI

To describe Spot price history

This example command returns the Spot Price history for m1.xlarge instances for a particular day in January.

Command:

```
aws ec2 describe-spot-price-history --instance-types m1.xlarge --start-
time 2014-01-06T07:08:09 --end-time 2014-01-06T08:09:10
```

Output:

```
{
  "SpotPriceHistory": [
          {
              "Timestamp": "2014-01-06T07:10:55.000Z",
              "ProductDescription": "SUSE Linux",
              "InstanceType": "m1.xlarge",
              "SpotPrice": "0.087000",
              "AvailabilityZone": "us-west-1b"
          },
          {
              "Timestamp": "2014-01-06T07:10:55.000Z",
              "ProductDescription": "SUSE Linux",
              "InstanceType": "m1.xlarge",
              "SpotPrice": "0.087000",
              "AvailabilityZone": "us-west-1c"
          },
          {
              "Timestamp": "2014-01-06T05:42:36.000Z",
              "ProductDescription": "SUSE Linux (Amazon VPC)",
              "InstanceType": "m1.xlarge",
              "SpotPrice": "0.087000",
              "AvailabilityZone": "us-west-1a"
      },
      ...
}
```

To describe Spot price history for Linux/UNIX Amazon VPC

This example command returns the Spot Price history for m1.xlarge, Linux/UNIX Amazon VPC instances for a particular day in January.

Command:

```
aws ec2 describe-spot-price-history --instance-types m1.xlarge --product-
description "Linux/UNIX (Amazon VPC)" --start-time 2014-01-06T07:08:09 --end-
time 2014-01-06T08:09:10
```

Output:

```
{
  "SpotPriceHistory": [
      {
          "Timestamp": "2014-01-06T04:32:53.000Z",
          "ProductDescription": "Linux/UNIX (Amazon VPC)",
          "InstanceType": "m1.xlarge",
          "SpotPrice": "0.080000",
          "AvailabilityZone": "us-west-1a"
      },
      {
          "Timestamp": "2014-01-05T11:28:26.000Z",
          "ProductDescription": "Linux/UNIX (Amazon VPC)",
          "InstanceType": "m1.xlarge",
          "SpotPrice": "0.080000",
          "AvailabilityZone": "us-west-1c"
      }
  ]
}
```

- For API details, see DescribeSpotPriceHistory in *AWS CLI Command Reference*.

`describe-stale-security-groups`

The following code example shows how to use `describe-stale-security-groups`.

AWS CLI

To describe stale security groups

This example describes stale security group rules for `vpc-11223344`. The response shows that sg-5fa68d3a in your account has a stale ingress SSH rule that references `sg-279ab042` in the peer VPC, and that `sg-fe6fba9a` in your account has a stale egress SSH rule that references `sg-ef6fba8b` in the peer VPC.

Command:

```
aws ec2 describe-stale-security-groups --vpc-id vpc-11223344
```

Output:

```
{
  "StaleSecurityGroupSet": [
      {
          "VpcId": "vpc-11223344",
          "StaleIpPermissionsEgress": [
              {
                  "ToPort": 22,
                  "FromPort": 22,
                  "UserIdGroupPairs": [
                      {
                          "VpcId": "vpc-7a20e51f",
                          "GroupId": "sg-ef6fba8b",
                          "VpcPeeringConnectionId": "pcx-b04deed9",
                          "PeeringStatus": "active"
                      }
                  ],
                  "IpProtocol": "tcp"
              }
          ],
          "GroupName": "MySG1",
          "StaleIpPermissions": [],
          "GroupId": "sg-fe6fba9a",
          "Description": MySG1"
      },
      {
          "VpcId": "vpc-11223344",
          "StaleIpPermissionsEgress": [],
          "GroupName": "MySG2",
          "StaleIpPermissions": [
              {
                  "ToPort": 22,
                  "FromPort": 22,
                  "UserIdGroupPairs": [
                      {
                          "VpcId": "vpc-7a20e51f",
                          "GroupId": "sg-279ab042",
                          "Description": "Access from pcx-b04deed9",
                          "VpcPeeringConnectionId": "pcx-b04deed9",
                          "PeeringStatus": "active"
```

```
                        }
                    ],
                    "IpProtocol": "tcp"
                }
            ],
            "GroupId": "sg-5fa68d3a",
            "Description": "MySG2"
        }
    ]
}
```

- For API details, see [DescribeStaleSecurityGroups](#) in *AWS CLI Command Reference*.

`describe-store-image-tasks`

The following code example shows how to use `describe-store-image-tasks`.

AWS CLI

To describe the progress of an AMI store task

The following `describe-store-image-tasks` example describes the progress of an AMI store task.

```
aws ec2 describe-store-image-tasks
```

Output:

```
{
    "StoreImageTaskResults": [
        {
            "AmiId": "ami-1234567890abcdef0",
            "Bucket": "my-ami-bucket",
            "ProgressPercentage": 17,
            "S3objectKey": "ami-1234567890abcdef0.bin",
            "StoreTaskState": "InProgress",
            "StoreTaskFailureReason": null,
            "TaskStartTime": "2022-01-01T01:01:01.001Z"
        }
    ]
}
```

For more information about storing and restoring an AMI using S3, see Store and restore an AMI using S3 <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ami-store-restore.html> in the *Amazon EC2 User Guide*.

- For API details, see DescribeStoreImageTasks in *AWS CLI Command Reference*.

`describe-subnets`

The following code example shows how to use `describe-subnets`.

AWS CLI

Example 1: To describe all your subnets

The following `describe-subnets` example displays the details of your subnets.

```
aws ec2 describe-subnets
```

Output:

```
{
    "Subnets": [
        {
            "AvailabilityZone": "us-east-1d",
            "AvailabilityZoneId": "use1-az2",

            "Ipv6Native": false,
            "PrivateDnsNameOptionsOnLaunch": {
                "HostnameType": "ip-name",
                "EnableResourceNameDnsARecord": false,
                "EnableResourceNameDnsAAAARecord": false
            }
        }
    ]
}
```

For more information, see Working with VPCs and Subnets in the *AWS VPC User Guide*.

Example 2: To describe the subnets of a specific VPC

The following `describe-subnets` example uses a filter to retrieve details for the subnets of the specified VPC.

```
aws ec2 describe-subnets \
    --filters "Name=vpc-id,Values=vpc-3EXAMPLE"
```

Output:

```
{
    "Subnets": [
        {
            "AvailabilityZone": "us-east-1d",
            "AvailabilityZoneId": "use1-az2",
            "AvailableIpAddressCount": 4089,
            "CidrBlock": "172.31.80.0/20",
            "DefaultForAz": true,
            "MapPublicIpOnLaunch": true,
            "MapCustomerOwnedIpOnLaunch": false,
            "State": "available",
            "SubnetId": "subnet-8EXAMPLE",
            "VpcId": "vpc-3EXAMPLE",
            "OwnerId": "1111222233333",
            "AssignIpv6AddressOnCreation": false,
            "Ipv6CidrBlockAssociationSet": [],
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "MySubnet"
                }
            ],
            "SubnetArn": "arn:aws:ec2:us-east-1:111122223333:subnet/
subnet-8EXAMPLE",
            "EnableDns64": false,
            "Ipv6Native": false,
            "PrivateDnsNameOptionsOnLaunch": {
                "HostnameType": "ip-name",
                "EnableResourceNameDnsARecord": false,
                "EnableResourceNameDnsAAAARecord": false
            }
        }
    ]
}
```

For more information, see Working with VPCs and Subnets in the *AWS VPC User Guide*.

Example 3: To describe the subnets with a specific tag

The following `describe-subnets` example uses a filter to retrieve the details of those subnets with the tag `CostCenter=123` and the `--query` parameter to display the subnet IDs of the subnets with this tag.

```
aws ec2 describe-subnets \
    --filters "Name=tag:CostCenter,Values=123" \
    --query "Subnets[*].SubnetId" \
    --output text
```

Output:

```
subnet-0987a87c8b37348ef
subnet-02a95061c45f372ee
subnet-03f720e7de2788d73
```

For more information, see Working with VPCs and Subnets in the *Amazon VPC User Guide*.

- For API details, see DescribeSubnets in *AWS CLI Command Reference*.

`describe-tags`

The following code example shows how to use `describe-tags`.

AWS CLI

Example 1: To describe all tags for a single resource

The following `describe-tags` example describes the tags for the specified instance.

```
aws ec2 describe-tags \
    --filters "Name=resource-id,Values=i-1234567890abcdef8"
```

Output:

```
{
    "Tags": [
        {
            "ResourceType": "instance",
            "ResourceId": "i-1234567890abcdef8",
            "Value": "Test",
            "Key": "Stack"
```

```
        },
        {
            "ResourceType": "instance",
            "ResourceId": "i-1234567890abcdef8",
            "Value": "Beta Server",
            "Key": "Name"
        }
    ]
}
```

Example 2: To describe all tags for a resource type

The following `describe-tags` example describes the tags for your volumes.

```
aws ec2 describe-tags \
    --filters "Name=resource-type,Values=volume"
```

Output:

```
{
    "Tags": [
        {
            "ResourceType": "volume",
            "ResourceId": "vol-1234567890abcdef0",
            "Value": "Project1",
            "Key": "Purpose"
        },
        {
            "ResourceType": "volume",
            "ResourceId": "vol-049df61146c4d7901",
            "Value": "Logs",
            "Key": "Purpose"
        }
    ]
}
```

Example 3: To describe all your tags

The following `describe-tags` example describes the tags for all your resources.

```
aws ec2 describe-tags
```

Example 4: To describe the tags for your resources based on a tag key

The following `describe-tags` example describes the tags for your resources that have a tag with the key `Stack`.

```
aws ec2 describe-tags \
    --filters Name=key,Values=Stack
```

Output:

```
{
    "Tags": [
        {
            "ResourceType": "volume",
            "ResourceId": "vol-027552a73f021f3b",
            "Value": "Production",
            "Key": "Stack"
        },
        {
            "ResourceType": "instance",
            "ResourceId": "i-1234567890abcdef8",
            "Value": "Test",
            "Key": "Stack"
        }
    ]
}
```

Example 5: To describe the tags for your resources based on a tag key and tag value

The following `describe-tags` example describes the tags for your resources that have the tag `Stack=Test`.

```
aws ec2 describe-tags \
    --filters Name=key,Values=Stack Name=value,Values=Test
```

Output:

```
{
    "Tags": [
        {
```

```
                "ResourceType": "image",
                "ResourceId": "ami-3ac336533f021f3bd",
                "Value": "Test",
                "Key": "Stack"
            },
            {
                "ResourceType": "instance",
                "ResourceId": "i-1234567890abcdef8",
                "Value": "Test",
                "Key": "Stack"
            }
        ]
}
```

The following `describe-tags` example uses alternate syntax to describe resources with the tag `Stack=Test`.

```
aws ec2 describe-tags \
    --filters "Name=tag:Stack,Values=Test"
```

The following `describe-tags` example describes the tags for all your instances that have a tag with the key `Purpose` and no value.

```
aws ec2 describe-tags \
    --filters "Name=resource-
type,Values=instance" "Name=key,Values=Purpose" "Name=value,Values="
```

Output:

```
{
    "Tags": [
        {
            "ResourceType": "instance",
            "ResourceId": "i-1234567890abcdef5",
            "Value": null,
            "Key": "Purpose"
        }
    ]
}
```

- For API details, see DescribeTags in *AWS CLI Command Reference*.

`describe-traffic-mirror-filters`

The following code example shows how to use `describe-traffic-mirror-filters`.

AWS CLI

To view your traffic mirror filters

The following `describe-traffic-mirror-filters` example displays details for all of your traffic mirror filters.

```
aws ec2 describe-traffic-mirror-filters
```

Output:

```
{
    "TrafficMirrorFilters": [
        {
            "TrafficMirrorFilterId": "tmf-0293f26e86EXAMPLE",
            "IngressFilterRules": [
                {
                    "TrafficMirrorFilterRuleId": "tmfr-0ca76e0e08EXAMPLE",
                    "TrafficMirrorFilterId": "tmf-0293f26e86EXAMPLE",
                    "TrafficDirection": "ingress",
                    "RuleNumber": 100,
                    "RuleAction": "accept",
                    "Protocol": 6,
                    "DestinationCidrBlock": "10.0.0.0/24",
                    "SourceCidrBlock": "10.0.0.0/24",
                    "Description": "TCP Rule"
                }
            ],
            "EgressFilterRules": [],
            "NetworkServices": [],
            "Description": "Example filter",
            "Tags": []
        }
    ]
}
```

For more information, see View your traffic mirror filters in the *Traffic Mirroring Guide*.

- For API details, see DescribeTrafficMirrorFilters in *AWS CLI Command Reference*.

`describe-traffic-mirror-sessions`

The following code example shows how to use `describe-traffic-mirror-sessions`.

AWS CLI

To describe a Traffic Mirror Session

The following `describe-traffic-mirror-sessions` example displays details of the your Traffic Mirror sessions.

```
aws ec2 describe-traffic-mirror-sessions
```

Output:

```
{
    "TrafficMirrorSessions": [
        {
            "Tags": [],
            "VirtualNetworkId": 42,
            "OwnerId": "111122223333",
            "Description": "TCP Session",
            "NetworkInterfaceId": "eni-0a471a5cf3EXAMPLE",
            "TrafficMirrorTargetId": "tmt-0dabe9b0a6EXAMPLE",
            "TrafficMirrorFilterId": "tmf-083e18f985EXAMPLE",
            "PacketLength": 20,
            "SessionNumber": 1,
            "TrafficMirrorSessionId": "tms-0567a4c684EXAMPLE"
        },
        {
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "tag test"
                }
            ],
            "VirtualNetworkId": 13314501,
            "OwnerId": "111122223333",
            "Description": "TCP Session",
            "NetworkInterfaceId": "eni-0a471a5cf3EXAMPLE",
            "TrafficMirrorTargetId": "tmt-03665551cbEXAMPLE",
            "TrafficMirrorFilterId": "tmf-06c787846cEXAMPLE",
            "SessionNumber": 2,
```

```
            "TrafficMirrorSessionId": "tms-0060101cf8EXAMPLE"
        }
    ]
}
```

For more information, see [View Traffic Mirror Session Details]() in the *AWS Traffic Mirroring Guide*.

- For API details, see [DescribeTrafficMirrorSessions]() in *AWS CLI Command Reference*.

`describe-traffic-mirror-targets`

The following code example shows how to use `describe-traffic-mirror-targets`.

AWS CLI

To describe a traffic mirror target

The following `describe-traffic-mirror-targets` example displays information about the specified traffic mirror target.

```
aws ec2 describe-traffic-mirror-targets \
    --traffic-mirror-target-ids tmt-0dabe9b0a6EXAMPLE
```

Output:

```
{
    "TrafficMirrorTargets": [
        {
            "TrafficMirrorTargetId": "tmt-0dabe9b0a6EXAMPLE",
            "NetworkLoadBalancerArn": "arn:aws:elasticloadbalancing:us-
east-1:111122223333:loadbalancer/net/NLB/7cdec873fEXAMPLE",
            "Type": "network-load-balancer",
            "Description": "Example Network Load Balancer target",
            "OwnerId": "111122223333",
            "Tags": []
        }
    ]
}
```

For more information, see [Traffic mirror targets]() in the *Amazon VPC Traffic Mirroring Guide*.

- For API details, see [DescribeTrafficMirrorTargets]() in *AWS CLI Command Reference*.

`describe-transit-gateway-attachments`

The following code example shows how to use `describe-transit-gateway-attachments`.

AWS CLI

To view your transit gateway attachments

The following `describe-transit-gateway-attachments` example displays details for your transit gateway attachments.

```
aws ec2 describe-transit-gateway-attachments
```

Output:

```
{
    "TransitGatewayAttachments": [
        {
            "TransitGatewayAttachmentId": "tgw-attach-01f8100bc7EXAMPLE",
            "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
            "TransitGatewayOwnerId": "123456789012",
            "ResourceOwnerId": "123456789012",
            "ResourceType": "vpc",
            "ResourceId": "vpc-3EXAMPLE",
            "State": "available",
            "Association": {
                "TransitGatewayRouteTableId": "tgw-rtb-002573ed1eEXAMPLE",
                "State": "associated"
            },
            "CreationTime": "2019-08-26T14:59:25.000Z",
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "Example"
                }
            ]
        },
        {
            "TransitGatewayAttachmentId": "tgw-attach-0b5968d3b6EXAMPLE",

            "Association": {
                "TransitGatewayRouteTableId": "tgw-rtb-002573ed1eEXAMPLE",
                "State": "associated"
            },
            "CreationTime": "2019-08-14T20:33:02.000Z",
            "Tags": []
        }
    ]
}
```

For more information, see Work with transit gateways in the *Transit Gateways Guide*.

- For API details, see DescribeTransitGatewayAttachments in *AWS CLI Command Reference*.

`describe-transit-gateway-connect-peers`

The following code example shows how to use `describe-transit-gateway-connect-peers`.

AWS CLI

To describe a Transit Gateway Connect peer

The following `describe-transit-gateway-connect-peers` example describes the specified Connect peer.

```
aws ec2 describe-transit-gateway-connect-peers \
    --transit-gateway-connect-peer-ids tgw-connect-peer-0666adbac4EXAMPLE
```

Output:

```
{
    "TransitGatewayConnectPeers": [
        {
            "TransitGatewayAttachmentId": "tgw-attach-0f0927767cEXAMPLE",
            "TransitGatewayConnectPeerId": "tgw-connect-peer-0666adbac4EXAMPLE",
            "State": "available",

            "ConnectPeerConfiguration": {
                "TransitGatewayAddress": "10.0.0.234",
                "PeerAddress": "172.31.1.11",
                "InsideCidrBlocks": [
                    "169.254.6.0/29"
                ],
                "Protocol": "gre",
                "BgpConfigurations": [
                    {
                        "TransitGatewayAsn": 64512,
                        "PeerAsn": 64512,
                        "TransitGatewayAddress": "169.254.6.2",
                        "PeerAddress": "169.254.6.1",
                        "BgpStatus": "down"
                    },
                    {
                        "TransitGatewayAsn": 64512,
```

```
                            "PeerAsn": 64512,
                            "TransitGatewayAddress": "169.254.6.3",
                            "PeerAddress": "169.254.6.1",
                            "BgpStatus": "down"
                        }
                    ]
                },
                "Tags": []
            }
        ]
    }
```

For more information, see Transit gateway Connect attachments and Transit Gateway Connect peers in the *Transit Gateways Guide*.

- For API details, see DescribeTransitGatewayConnectPeers in *AWS CLI Command Reference*.

`describe-transit-gateway-connects`

The following code example shows how to use `describe-transit-gateway-connects`.

AWS CLI

To describe a transit gateway Connect attachment

The following `describe-transit-gateway-connects` example describes the specified Connect attachment.

```
aws ec2 describe-transit-gateway-connects \
    --transit-gateway-attachment-ids tgw-attach-037012e5dcEXAMPLE
```

Output:

```
{
    "TransitGatewayConnects": [
        {
            "TransitGatewayAttachmentId": "tgw-attach-037012e5dcEXAMPLE",
            "TransportTransitGatewayAttachmentId": "tgw-attach-0a89069f57EXAMPLE",
            "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
            "State": "available",
            "CreationTime": "2021-03-09T19:59:17+00:00",
            "Options": {
```

```
                "Protocol": "gre"
            },
            "Tags": []
        }
    ]
}
```

For more information, see Transit gateway Connect attachments and Transit Gateway Connect peers in the *Transit Gateways Guide*.

- For API details, see DescribeTransitGatewayConnects in *AWS CLI Command Reference*.

`describe-transit-gateway-multicast-domains`

The following code example shows how to use `describe-transit-gateway-multicast-domains`.

AWS CLI

To describe your transit gateway multicast domains

The following `describe-transit-gateway-multicast-domains` example displays details for all of your transit gateway multicast domains.

```
aws ec2 describe-transit-gateway-multicast-domains
```

Output:

```
{

    "TransitGatewayMulticastDomains": [
        {
            "TransitGatewayMulticastDomainId": "tgw-mcast-domain-000fb24d04EXAMPLE",
            "TransitGatewayId": "tgw-0bf0bffefaEXAMPLE",
            "TransitGatewayMulticastDomainArn": "arn:aws:ec2:us-
east-1:123456789012:transit-gateway-multicast-domain/tgw-mcast-
domain-000fb24d04EXAMPLE",
            "OwnerId": "123456789012",
            "Options": {
                "Igmpv2Support": "disable",
                "StaticSourcesSupport": "enable",
                "AutoAcceptSharedAssociations": "disable"
```

```
            },
            "State": "available",
            "CreationTime": "2019-12-10T18:32:50+00:00",
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "mc1"
                }
            ]
        }
    ]
}
```

For more information, see [Managing multicast domains](#) in the *Transit Gateways Guide*.

- For API details, see [DescribeTransitGatewayMulticastDomains](#) in *AWS CLI Command Reference*.

`describe-transit-gateway-peering-attachments`

The following code example shows how to use `describe-transit-gateway-peering-attachments`.

AWS CLI

To describe your transit gateway peering attachments

The following `describe-transit-gateway-peering-attachments` example displays details for all of your transit gateway peering attachments.

```
aws ec2 describe-transit-gateway-peering-attachments
```

Output:

```
{
    "TransitGatewayPeeringAttachments": [
        {
            "TransitGatewayAttachmentId": "tgw-attach-4455667788aabbccd",
            "RequesterTgwInfo": {
                "TransitGatewayId": "tgw-123abc05e04123abc",
                "OwnerId": "123456789012",
                "Region": "us-west-2"
            },
```

```
            "AccepterTgwInfo": {
                "TransitGatewayId": "tgw-11223344aabbcc112",
                "OwnerId": "123456789012",
                "Region": "us-east-2"
            },
            "State": "pendingAcceptance",
            "CreationTime": "2019-12-09T11:38:05.000Z",
            "Tags": []
        }
    ]
}
```

For more information, see Transit Gateway Peering Attachments in the *Transit Gateways Guide*.

- For API details, see DescribeTransitGatewayPeeringAttachments in *AWS CLI Command Reference*.

`describe-transit-gateway-policy-tables`

The following code example shows how to use `describe-transit-gateway-policy-tables`.

AWS CLI

To describe a transit gateway policy table

The following `describe-transit-gateway-policy-tables` example describes the specified transit gateway policy table.

```
aws ec2 describe-transit-gateway-policy-tables \
    --transit-gateway-policy-table-ids tgw-ptb-0a16f134b78668a81
```

Output:

```
{
    "TransitGatewayPolicyTables": [
        {
            "TransitGatewayPolicyTableId": "tgw-ptb-0a16f134b78668a81",
            "TransitGatewayId": "tgw-067f8505c18f0bd6e",
            "State": "available",
            "CreationTime": "2023-11-28T16:36:43+00:00",
            "Tags": []
        }
```

```
    ]
}
```

For more information, see Transit gateway policy tables in the *Transit Gateway User Guide*.

- For API details, see DescribeTransitGatewayPolicyTables in *AWS CLI Command Reference*.

describe-transit-gateway-route-tables

The following code example shows how to use `describe-transit-gateway-route-tables`.

AWS CLI

To describe your transit gateway route tables

The following `describe-transit-gateway-route-tables` example displays details for your transit gateway route tables.

```
aws ec2 describe-transit-gateway-route-tables
```

Output:

```
{
    "TransitGatewayRouteTables": [
        {
            "TransitGatewayRouteTableId": "tgw-rtb-0ca78a549EXAMPLE",
            "TransitGatewayId": "tgw-0bc994abffEXAMPLE",
            "State": "available",
            "DefaultAssociationRouteTable": true,
            "DefaultPropagationRouteTable": true,
            "CreationTime": "2018-11-28T14:24:49.000Z",
            "Tags": []
        },
        {
            "TransitGatewayRouteTableId": "tgw-rtb-0e8f48f148EXAMPLE",
            "TransitGatewayId": "tgw-0043d72bb4EXAMPLE",
            "State": "available",
            "DefaultAssociationRouteTable": true,
            "DefaultPropagationRouteTable": true,
            "CreationTime": "2018-11-28T14:24:00.000Z",
            "Tags": []
        }
```

```
    ]
}
```

For more information, see [View transit gateway route tables](#) in the *Transit Gateways Guide*.

- For API details, see [DescribeTransitGatewayRouteTables](#) in *AWS CLI Command Reference*.

`describe-transit-gateway-vpc-attachments`

The following code example shows how to use `describe-transit-gateway-vpc-attachments`.

AWS CLI

To describe your transit gateway VPC attachments

The following `describe-transit-gateway-vpc-attachments` example displays details for your transit gateway VPC attachments.

```
aws ec2 describe-transit-gateway-vpc-attachments
```

Output:

```
{
    "TransitGatewayVpcAttachments": [
        {
            "TransitGatewayAttachmentId": "tgw-attach-0a08e88308EXAMPLE",
            "TransitGatewayId": "tgw-0043d72bb4EXAMPLE",
            "VpcId": "vpc-0f501f7ee8EXAMPLE",
            "VpcOwnerId": "111122223333",
            "State": "available",
            "SubnetIds": [
                "subnet-045d586432EXAMPLE",
                "subnet-0a0ad478a6EXAMPLE"
            ],
            "CreationTime": "2019-02-13T11:04:02.000Z",
            "Options": {
                "DnsSupport": "enable",
                "Ipv6Support": "disable"
            },
            "Tags": [
                {
```

```
                    "Key": "Name",
                    "Value": "attachment name"
                }
            ]
        }
    ]
}
```

For more information, see [View your VPC attachments](#) in the *Transit Gateways Guide*.

- For API details, see [DescribeTransitGatewayVpcAttachments](#) in *AWS CLI Command Reference*.

`describe-transit-gateways`

The following code example shows how to use `describe-transit-gateways`.

AWS CLI

To describe your transit gateways

The following `describe-transit-gateways` example retrieves details about your transit gateways.

```
aws ec2 describe-transit-gateways
```

Output:

```
{
    "TransitGateways": [
        {
            "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
            "TransitGatewayArn": "arn:aws:ec2:us-east-2:111122223333:transit-
gateway/tgw-0262a0e521EXAMPLE",
            "State": "available",
            "OwnerId": "111122223333",
            "Description": "MyTGW",
            "CreationTime": "2019-07-10T14:02:12.000Z",
            "Options": {

                }
            ]
        }
    ]
}
```

- For API details, see DescribeTransitGateways in *AWS CLI Command Reference*.

`describe-verified-access-endpoints`

The following code example shows how to use `describe-verified-access-endpoints`.

AWS CLI

To describe a Verified Access endpoint

The following `describe-verified-access-endpoints` example describes the specified Verified Access endpoint.

```
aws ec2 describe-verified-access-endpoints \
    --verified-access-endpoint-ids vae-066fac616d4d546f2
```

Output:

```
{
    "VerifiedAccessEndpoints": [
        {
            "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
            "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
            "VerifiedAccessEndpointId": "vae-066fac616d4d546f2",
            "ApplicationDomain": "example.com",

            "Tags": [
                {
                    "Key": "Name",
                    "Value": "my-va-endpoint"
                }
            ]
        }
```

```
    ]
}
```

For more information, see Verified Access endpoints in the *AWS Verified Access User Guide*.

- For API details, see DescribeVerifiedAccessEndpoints in *AWS CLI Command Reference*.

`describe-verified-access-groups`

The following code example shows how to use `describe-verified-access-groups`.

AWS CLI

To describe a Verified Access group

The following `describe-verified-access-groups` example describes the specified Verified Access group.

```
aws ec2 describe-verified-access-groups \
    --verified-access-group-ids vagr-0dbe967baf14b7235
```

Output:

```
{
    "VerifiedAccessGroups": [
        {
            "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
            "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
            "Description": "Testing Verified Access",
            "Owner": "123456789012",
            "VerifiedAccessGroupArn": "arn:aws:ec2:us-east-2:123456789012:verified-
access-group/vagr-0dbe967baf14b7235",
            "CreationTime": "2023-08-25T19:55:19",
            "LastUpdatedTime": "2023-08-25T22:17:25",
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "my-va-group"
                }
            ]
        }
    ]
```

```
}
```

For more information, see Verified Access groups in the *AWS Verified Access User Guide*.

- For API details, see DescribeVerifiedAccessGroups in *AWS CLI Command Reference*.

`describe-verified-access-instance-logging-configurations`

The following code example shows how to use `describe-verified-access-instance-logging-configurations`.

AWS CLI

To describe the logging configuration for a Verified Access instance

The following `describe-verified-access-instance-logging-configurations` example describes the logging configuration for the specified Verified Access instance.

```
aws ec2 describe-verified-access-instance-logging-configurations \
    --verified-access-instance-ids vai-0ce000c0b7643abea
```

Output:

```
{
    "LoggingConfigurations": [
        {
            "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
            "AccessLogs": {
                "S3": {
                    "Enabled": false
                },
                "CloudWatchLogs": {
                    "Enabled": true,
                    "DeliveryStatus": {
                        "Code": "success"
                    },
                    "LogGroup": "my-log-group"
                },
                "KinesisDataFirehose": {
                    "Enabled": false
                },
                "LogVersion": "ocsf-1.0.0-rc.2",
```

```
                "IncludeTrustContext": false
            }
        }
    ]
}
```

For more information, see [Verified Access logs](#) in the *AWS Verified Access User Guide*.

- For API details, see [DescribeVerifiedAccessInstanceLoggingConfigurations](#) in *AWS CLI Command Reference*.

`describe-verified-access-instances`

The following code example shows how to use `describe-verified-access-instances`.

AWS CLI

To describe a Verified Access instance

The following `describe-verified-access-instances` example describes the specified Verified Access instance.

```
aws ec2 describe-verified-access-instances \
    --verified-access-instance-ids vai-0ce000c0b7643abea
```

Output:

```
{
    "VerifiedAccessInstances": [
        {
            "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
            "Description": "Testing Verified Access",
            "VerifiedAccessTrustProviders": [
                {
                    "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
                    "TrustProviderType": "user",
                    "UserTrustProviderType": "iam-identity-center"
                }
            ],

            "LastUpdatedTime": "2023-08-25T19:03:32",
            "Tags": [
                {
```

```
                    "Key": "Name",
                    "Value": "my-ava-instance"
                }
            ]
        }
    ]
}
```

For more information, see [Verified Access instances](#) in the *AWS Verified Access User Guide*.

- For API details, see [DescribeVerifiedAccessInstances](#) in *AWS CLI Command Reference*.

`describe-verified-access-trust-providers`

The following code example shows how to use `describe-verified-access-trust-providers`.

AWS CLI

To describe a Verified Access trust provider

The following `describe-verified-access-trust-providers` example describes the specified Verified Access trust provider.

```
aws ec2 describe-verified-access-trust-providers \
    --verified-access-trust-provider-ids vatp-0bb32de759a3e19e7
```

Output:

```
{
    "VerifiedAccessTrustProviders": [
        {
            "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
            "Description": "Testing Verified Access",
            "TrustProviderType": "user",
            "UserTrustProviderType": "iam-identity-center",
            "PolicyReferenceName": "idc",
            "CreationTime": "2023-08-25T19:00:38",
            "LastUpdatedTime": "2023-08-25T19:03:32",
            "Tags": [
                {
                    "Key": "Name",
```

```
                        "Value": "my-va-trust-provider"
                    }
                ]
            }
        ]
}
```

For more information, see [Trust providers for Verified Access](#) in the *AWS Verified Access User Guide*.

- For API details, see [DescribeVerifiedAccessTrustProviders](#) in *AWS CLI Command Reference*.

`describe-volume-attribute`

The following code example shows how to use `describe-volume-attribute`.

AWS CLI

To describe a volume attribute

This example command describes the `autoEnableIo` attribute of the volume with the ID `vol-049df61146c4d7901`.

Command:

```
aws ec2 describe-volume-attribute --volume-id vol-049df61146c4d7901 --
attribute autoEnableIO
```

Output:

```
{
    "AutoEnableIO": {
        "Value": false
    },
    "VolumeId": "vol-049df61146c4d7901"
}
```

- For API details, see [DescribeVolumeAttribute](#) in *AWS CLI Command Reference*.

`describe-volume-status`

The following code example shows how to use `describe-volume-status`.

AWS CLI

To describe the status of a single volume

This example command describes the status for the volume `vol-1234567890abcdef0`.

Command:

```
aws ec2 describe-volume-status --volume-ids vol-1234567890abcdef0
```

Output:

```
{
    "VolumeStatuses": [
        {
            "VolumeStatus": {
                "Status": "ok",
                "Details": [
                    {
                        "Status": "passed",
                        "Name": "io-enabled"
                    },
                    {
                        "Status": "not-applicable",
                        "Name": "io-performance"
                    }
                ]
            },
            "AvailabilityZone": "us-east-1a",
            "VolumeId": "vol-1234567890abcdef0",
            "Actions": [],
            "Events": []
        }
    ]
}
```

To describe the status of impaired volumes

This example command describes the status for all volumes that are impaired. In this example output, there are no impaired volumes.

Command:

```
aws ec2 describe-volume-status --filters Name=volume-status.status,Values=impaired
```

Output:

```
{
    "VolumeStatuses": []
}
```

If you have a volume with a failed status check (status is impaired), see Working with an Impaired Volume in the *Amazon EC2 User Guide*.

- For API details, see DescribeVolumeStatus in *AWS CLI Command Reference*.

`describe-volumes-modifications`

The following code example shows how to use `describe-volumes-modifications`.

AWS CLI

To describe the modification status for a volume

The following `describe-volumes-modifications` example describes the volume modification status of the specified volume.

```
aws ec2 describe-volumes-modifications \
    --volume-ids vol-1234567890abcdef0
```

Output:

```
{
    "VolumeModification": {
        "TargetSize": 150,
        "TargetVolumeType": "io1",
        "ModificationState": "optimizing",
        "VolumeId": " vol-1234567890abcdef0",
        "TargetIops": 100,
        "StartTime": "2019-05-17T11:27:19.000Z",
        "Progress": 70,
        "OriginalVolumeType": "io1",
        "OriginalIops": 100,
        "OriginalSize": 100
```

```
    }
}
```

- For API details, see DescribeVolumesModifications in *AWS CLI Command Reference*.

`describe-volumes`

The following code example shows how to use `describe-volumes`.

AWS CLI

Example 1: To describe a volume

The following `describe-volumes` example describes the specified volumes in the current Region.

```
aws ec2 describe-volumes \
    --volume-ids vol-049df61146c4d7901 vol-1234567890abcdef0
```

Output:

```
{
    "Volumes": [
        {
            "AvailabilityZone": "us-east-1a",
            "Attachments": [
                {
                    "AttachTime": "2013-12-18T22:35:00.000Z",
                    "InstanceId": "i-1234567890abcdef0",
                    "VolumeId": "vol-049df61146c4d7901",
                    "State": "attached",
                    "DeleteOnTermination": true,
                    "Device": "/dev/sda1"
                }
            ],
            "Encrypted": true,
            "KmsKeyId": "arn:aws:kms:us-east-2a:123456789012:key/8c5b2c63-b9bc-45a3-
a87a-5513eEXAMPLE,
            "VolumeType": "gp2",
            "VolumeId": "vol-049df61146c4d7901",
            "State": "in-use",
            "Iops": 100,
```

```
                "SnapshotId": "snap-1234567890abcdef0",
                "CreateTime": "2019-12-18T22:35:00.084Z",
                "Size": 8
            },
            {
                "AvailabilityZone": "us-east-1a",
                "Attachments": [],
                "Encrypted": false,
                "VolumeType": "gp2",
                "VolumeId": "vol-1234567890abcdef0",
                "State": "available",
                "Iops": 300,
                "SnapshotId": "",
                "CreateTime": "2020-02-27T00:02:41.791Z",
                "Size": 100
            }
        ]
}
```

Example 2: To describe volumes that are attached to a specific instance

The following `describe-volumes` example describes all volumes that are both attached to the specified instance and set to delete when the instance terminates.

```
aws ec2 describe-volumes \
    --region us-east-1 \
    --filters Name=attachment.instance-
id,Values=i-1234567890abcdef0 Name=attachment.delete-on-termination,Values=true
```

For an example of the output for `describe-volumes`, see Example 1.

Example 3: To describe available volumes in a specific Availability Zone

The following `describe-volumes` example describes all volumes that have a status of `available` and are in the specified Availability Zone.

```
aws ec2 describe-volumes \
    --filters Name=status,Values=available Name=availability-zone,Values=us-east-1a
```

For an example of the output for `describe-volumes`, see Example 1.

Example 4: To describe volumes based on tags

The following `describe-volumes` example describes all volumes that have the tag key `Name` and a value that begins with `Test`. The output is then filtered with a query that displays only the tags and IDs of the volumes.

```
aws ec2 describe-volumes \
    --filters Name=tag:Name,Values=Test* \
    --query "Volumes[*].{ID:VolumeId,Tag:Tags}"
```

Output:

```
[
    {
       "Tag": [
           {
               "Value": "Test2",
               "Key": "Name"
           }
       ],
       "ID": "vol-1234567890abcdef0"
   },
   {
       "Tag": [
           {
               "Value": "Test1",
               "Key": "Name"
           }
       ],
       "ID": "vol-049df61146c4d7901"
    }
]
```

For additional examples using tag filters, see Working with tags in the *Amazon EC2 User Guide*.

- For API details, see DescribeVolumes in *AWS CLI Command Reference*.

`describe-vpc-attribute`

The following code example shows how to use `describe-vpc-attribute`.

AWS CLI

To describe the enableDnsSupport attribute

This example describes the `enableDnsSupport` attribute. This attribute indicates whether DNS resolution is enabled for the VPC. If this attribute is `true`, the Amazon DNS server resolves DNS hostnames for your instances to their corresponding IP addresses; otherwise, it does not.

Command:

```
aws ec2 describe-vpc-attribute --vpc-id vpc-a01106c2 --attribute enableDnsSupport
```

Output:

```
{
    "VpcId": "vpc-a01106c2",
    "EnableDnsSupport": {
        "Value": true
    }
}
```

To describe the enableDnsHostnames attribute

This example describes the `enableDnsHostnames` attribute. This attribute indicates whether the instances launched in the VPC get DNS hostnames. If this attribute is `true`, instances in the VPC get DNS hostnames; otherwise, they do not.

Command:

```
aws ec2 describe-vpc-attribute --vpc-id vpc-a01106c2 --attribute enableDnsHostnames
```

Output:

```
{
    "VpcId": "vpc-a01106c2",
    "EnableDnsHostnames": {
        "Value": true
    }
}
```

- For API details, see DescribeVpcAttribute in *AWS CLI Command Reference*.

`describe-vpc-classic-link-dns-support`

The following code example shows how to use `describe-vpc-classic-link-dns-support`.

AWS CLI

To describe ClassicLink DNS support for your VPCs

This example describes the ClassicLink DNS support status of all of your VPCs.

Command:

```
aws ec2 describe-vpc-classic-link-dns-support
```

Output:

```
{
  "Vpcs": [
    {
      "VpcId": "vpc-88888888",
      "ClassicLinkDnsSupported": true
    },
    {
      "VpcId": "vpc-1a2b3c4d",
      "ClassicLinkDnsSupported": false
    }
  ]
}
```

- For API details, see DescribeVpcClassicLinkDnsSupport in *AWS CLI Command Reference*.

`describe-vpc-classic-link`

The following code example shows how to use `describe-vpc-classic-link`.

AWS CLI

To describe the ClassicLink status of your VPCs

This example lists the ClassicLink status of vpc-88888888.

Command:

```
aws ec2 describe-vpc-classic-link --vpc-id vpc-88888888
```

Output:

```
{
  "Vpcs": [
    {
      "ClassicLinkEnabled": true,
      "VpcId": "vpc-88888888",
      "Tags": [
        {
          "Value": "classiclinkvpc",
          "Key": "Name"
        }
      ]
    }
  ]
}
```

This example lists only VPCs that are enabled for Classiclink (the filter value of `is-classic-link-enabled` is set to `true`).

Command:

```
aws ec2 describe-vpc-classic-link --filter "Name=is-classic-link-
enabled,Values=true"
```

- For API details, see DescribeVpcClassicLink in *AWS CLI Command Reference*.

describe-vpc-endpoint-associations

The following code example shows how to use `describe-vpc-endpoint-associations`.

AWS CLI

To describe VPC endpoint associations

The following `describe-vpc-endpoint-associations` example describes your VPC endpoint associations.

```
aws ec2 describe-vpc-endpoint-associations
```

Output:

```
{
    "VpcEndpointAssociations": [
        {
            "Id": "vpce-rsc-asc-0a810ca6ac8866bf9",
            "VpcEndpointId": "vpce-019b90d6f16d4f958",
            "AssociatedResourceAccessibility": "Accessible",
            "DnsEntry": {
                "DnsName":
 "vpce-019b90d6f16d4f958.rcfg-07129f3acded87625.4232ccc.vpc-lattice-rsc.us-
east-2.on.aws",
                "HostedZoneId": "Z03265862FOUNWMZOKUF4"
            },
            "AssociatedResourceArn": "arn:aws:vpc-lattice:us-
east-1:123456789012:resourceconfiguration/rcfg-07129f3acded87625"
        }
    ]
}
```

For more information, see Manage VPC endpoint associations in the *AWS PrivateLink User Guide*.

- For API details, see DescribeVpcEndpointAssociations in *AWS CLI Command Reference*.

`describe-vpc-endpoint-connection-notifications`

The following code example shows how to use `describe-vpc-endpoint-connection-notifications`.

AWS CLI

To describe endpoint connection notifications

The following `describe-vpc-endpoint-connection-notifications` example describes all of your endpoint connection notifications.

```
aws ec2 describe-vpc-endpoint-connection-notifications
```

Output:

```
{
   "ConnectionNotificationSet": [
       {
```

```
           "ConnectionNotificationState": "Enabled",
           "ConnectionNotificationType": "Topic",
           "ConnectionEvents": [
               "Accept",
               "Reject",
               "Delete",
               "Connect"
           ],
           "ConnectionNotificationId": "vpce-nfn-04bcb952bc8af7abc",
           "ConnectionNotificationArn": "arn:aws:sns:us-east-1:123456789012:VpceNotification",
           "VpcEndpointId": "vpce-0324151a02f327123"
       }
   ]
 }
```

- For API details, see DescribeVpcEndpointConnectionNotifications in *AWS CLI Command Reference*.

`describe-vpc-endpoint-connections`

The following code example shows how to use `describe-vpc-endpoint-connections`.

AWS CLI

To describe VPC endpoint connections

This example describes the interface endpoint connections to your endpoint service and filters the results to display endpoints that are `PendingAcceptance`.

Command:

```
aws ec2 describe-vpc-endpoint-connections --filters Name=vpc-endpoint-state,Values=pendingAcceptance
```

Output:

```
{
  "VpcEndpointConnections": [
      {
          "VpcEndpointId": "vpce-0abed31004e618123",
```

```
            "ServiceId": "vpce-svc-0abced088d20def56",
            "CreationTimestamp": "2017-11-30T10:00:24.350Z",
            "VpcEndpointState": "pendingAcceptance",
            "VpcEndpointOwner": "123456789012"
        }
    ]
}
```

- For API details, see DescribeVpcEndpointConnections in *AWS CLI Command Reference*.

`describe-vpc-endpoint-service-configurations`

The following code example shows how to use `describe-vpc-endpoint-service-configurations`.

AWS CLI

To describe endpoint service configurations

The following `describe-vpc-endpoint-service-configurations` example describes your endpoint service configurations.

```
aws ec2 describe-vpc-endpoint-service-configurations
```

Output:

```
{
    "ServiceConfigurations": [
        {
            "ServiceType": [
                {
                    "ServiceType": "GatewayLoadBalancer"
                }
            ],
            "ServiceId": "vpce-svc-012d33a1c4321cabc",
            "ServiceName": "com.amazonaws.vpce.us-east-1.vpce-
svc-012d33a1c4321cabc",
            "ServiceState": "Available",
            "AvailabilityZones": [
                "us-east-1d"
            ],
            "AcceptanceRequired": false,
```

```
            "ManagesVpcEndpoints": false,
            "GatewayLoadBalancerArns": [
                "arn:aws:elasticloadbalancing:us-east-1:123456789012:loadbalancer/
gwy/GWLBService/123210844e429123"
            ],
            "Tags": []
        },
        {
            "ServiceType": [
                {
                    "ServiceType": "Interface"
                }
            ],
            "ServiceId": "vpce-svc-123cabc125efa123",
            "ServiceName": "com.amazonaws.vpce.us-east-1.vpce-svc-123cabc125efa123",
            "ServiceState": "Available",
            "AvailabilityZones": [
                "us-east-1a"
            ],
            "AcceptanceRequired": true,
            "ManagesVpcEndpoints": false,
            "NetworkLoadBalancerArns": [
                "arn:aws:elasticloadbalancing:us-east-1:123456789012:loadbalancer/
net/NLBforService/1238753950b25123"
            ],
            "BaseEndpointDnsNames": [
                "vpce-svc-123cabc125efa123.us-east-1.vpce.amazonaws.com"
            ],
            "PrivateDnsName": "example.com",
            "PrivateDnsNameConfiguration": {
                "State": "failed",
                "Type": "TXT",
                "Value": "vpce:qUAth3FdeABCApUiXabc",
                "Name": "_1d367jvbg34znqvyefrj"
            },
            "Tags": []
        }
    ]
}
```

For more information, see Concepts in the *AWS PrivateLink User Guide*.

- For API details, see DescribeVpcEndpointServiceConfigurations in *AWS CLI Command Reference*.

`describe-vpc-endpoint-service-permissions`

The following code example shows how to use `describe-vpc-endpoint-service-permissions`.

AWS CLI

To describe endpoint service permissions

This example describes the permissions for the specified endpoint service.

Command:

```
aws ec2 describe-vpc-endpoint-service-permissions --service-id vpce-svc-03d5ebb7d9579a2b3
```

Output:

```
{
   "AllowedPrincipals": [
       {
           "PrincipalType": "Account",
           "Principal": "arn:aws:iam::123456789012:root"
       }
   ]
}
```

- For API details, see DescribeVpcEndpointServicePermissions in *AWS CLI Command Reference*.

`describe-vpc-endpoint-services`

The following code example shows how to use `describe-vpc-endpoint-services`.

AWS CLI

Example 1: To describe all VPC endpoint services

The following `describe-vpc-endpoint-services` example lists all VPC endpoint services for an AWS Region.

```
aws ec2 describe-vpc-endpoint-services
```

Output:

```
{
    "ServiceDetails": [
        {
            "ServiceType": [
                {
                    "ServiceType": "Gateway"
                }
            ],
            "AcceptanceRequired": false,
            "ServiceName": "com.amazonaws.us-east-1.dynamodb",
            "VpcEndpointPolicySupported": true,
            "Owner": "amazon",
            "AvailabilityZones": [
                "us-east-1a",
                "us-east-1b",
                "us-east-1c",
                "us-east-1d",
                "us-east-1e",
                "us-east-1f"
            ],
            "BaseEndpointDnsNames": [
                "dynamodb.us-east-1.amazonaws.com"
            ]
        },
        {
            "ServiceType": [
                {
                    "ServiceType": "Interface"
                }
            ],
            "PrivateDnsName": "ec2.us-east-1.amazonaws.com",

                "us-east-1d",
                "us-east-1e"
            ],
            "AcceptanceRequired": false,
            "BaseEndpointDnsNames": [
                "ssm.us-east-1.vpce.amazonaws.com"
            ]
        }
    ],
    "ServiceNames": [
        "com.amazonaws.us-east-1.dynamodb",
        "com.amazonaws.us-east-1.ec2",
        "com.amazonaws.us-east-1.ec2messages",
        "com.amazonaws.us-east-1.elasticloadbalancing",
        "com.amazonaws.us-east-1.kinesis-streams",
        "com.amazonaws.us-east-1.s3",
        "com.amazonaws.us-east-1.ssm"
    ]
}
```

Example 2: To describe the details about an endpoint service

The following `describe-vpc-endpoint-services` example lists the details of the Amazon S3 interface endpoint service.

```
aws ec2 describe-vpc-endpoint-services \
    --filter 'Name=service-type,Values=Interface' Name=service-
name,Values=com.amazonaws.us-east-1.s3
```

Output:

```
{
    "ServiceDetails": [
        {
            "ServiceName": "com.amazonaws.us-east-1.s3",
            "ServiceId": "vpce-svc-081d84efcdEXAMPLE",
            "ServiceType": [
                {
                    "ServiceType": "Interface"
                }
            ],
            "AvailabilityZones": [
                "us-east-1a",
                "us-east-1b",
                "us-east-1c",
                "us-east-1d",
                "us-east-1e",
            "us-east-1f"
            ],
            "Owner": "amazon",
            "BaseEndpointDnsNames": [
                "s3.us-east-1.vpce.amazonaws.com"
            ],
            "VpcEndpointPolicySupported": true,
            "AcceptanceRequired": false,
            "ManagesVpcEndpoints": false,
            "Tags": []
        }
    ],
    "ServiceNames": [
        "com.amazonaws.us-east-1.s3"
    ]
}
```

For more information, see View available AWS service names in the *AWS PrivateLink User Guide*.

- For API details, see DescribeVpcEndpointServices in *AWS CLI Command Reference*.

`describe-vpc-endpoints`

The following code example shows how to use `describe-vpc-endpoints`.

AWS CLI

To describe your VPC endpoints

The following `describe-vpc-endpoints` example displays details for all of your VPC endpoints.

```
aws ec2 describe-vpc-endpoints
```

Output:

```
{
    "VpcEndpoints": [
        {
            "PolicyDocument": "{\"Version\":\"2008-10-17\",\"Statement\":[{\"Effect

`describe-vpc-peering-connections`

The following code example shows how to use `describe-vpc-peering-connections`.

AWS CLI

To describe your VPC peering connections

This example describes all of your VPC peering connections.

Command:

```
aws ec2 describe-vpc-peering-connections
```

Output:

```
{
    "VpcPeeringConnections": [
        {
            "Status": {
                "Message": "Active",
                "Code": "active"
            },
            "Tags": [
```

```
                {
                    "Value": "Peering-1",
                    "Key": "Name"
                }
            ],
            "AccepterVpcInfo": {
                "OwnerId": "111122223333",
                "VpcId": "vpc-1a2b3c4d",
                "CidrBlock": "10.0.1.0/28"
            },
            "VpcPeeringConnectionId": "pcx-11122233",
            "RequesterVpcInfo": {
                "PeeringOptions": {
                    "AllowEgressFromLocalVpcToRemoteClassicLink": false,
                    "AllowEgressFromLocalClassicLinkToRemoteVpc": false
                },
                "OwnerId": "444455556666",
                "VpcId": "vpc-123abc45",
                "CidrBlock": "192.168.0.0/16"
            }
        },
        {
            "Status": {
                "Message": "Pending Acceptance by 444455556666",
                "Code": "pending-acceptance"
            },
            "Tags": [],
            "RequesterVpcInfo": {
                "PeeringOptions": {
                    "AllowEgressFromLocalVpcToRemoteClassicLink": false,
                    "AllowEgressFromLocalClassicLinkToRemoteVpc": false
                },
                "OwnerId": "444455556666",
                "VpcId": "vpc-11aa22bb",
                "CidrBlock": "10.0.0.0/28"
            },
            "VpcPeeringConnectionId": "pcx-abababab",
            "ExpirationTime": "2014-04-03T09:12:43.000Z",
            "AccepterVpcInfo": {
                "OwnerId": "444455556666",
                "VpcId": "vpc-33cc44dd"
            }
        }
    ]
```

```
}
```

To describe specific VPC peering connections

This example describes all of your VPC peering connections that are in the pending-acceptance state.

Command:

```
aws ec2 describe-vpc-peering-connections --filters Name=status-code,Values=pending-acceptance
```

This example describes all of your VPC peering connections that have the tag Owner=Finance.

Command:

```
aws ec2 describe-vpc-peering-connections --filters Name=tag:Owner,Values=Finance
```

This example describes all of the VPC peering connections you requested for the specified VPC, vpc-1a2b3c4d.

Command:

```
aws ec2 describe-vpc-peering-connections --filters Name=requester-vpc-info.vpc-id,Values=vpc-1a2b3c4d
```

- For API details, see DescribeVpcPeeringConnections in *AWS CLI Command Reference*.

`describe-vpcs`

The following code example shows how to use `describe-vpcs`.

AWS CLI

Example 1: To describe all of your VPCs

The following `describe-vpcs` example retrieves details about your VPCs.

```
aws ec2 describe-vpcs
```

Output:

```
{
    "Vpcs": [
        {
            "CidrBlock": "30.1.0.0/16",
            "DhcpOptionsId": "dopt-19edf471",
            "State": "available",
            "VpcId": "vpc-0e9801d129EXAMPLE",
            "OwnerId": "111122223333",
            "InstanceTenancy": "default",

                {
                    "AssociationId": "vpc-cidr-assoc-062c64cfafEXAMPLE",
                    "CidrBlock": "30.1.0.0/16",
                    "CidrBlockState": {
                        "State": "associated"
                    }
                }
            ],
            "IsDefault": false,
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "Not Shared"
                }
            ]
        },
        {
            "CidrBlock": "10.0.0.0/16",
            "DhcpOptionsId": "dopt-19edf471",
            "State": "available",
            "VpcId": "vpc-06e4ab6c6cEXAMPLE",
            "OwnerId": "222222222222",
            "InstanceTenancy": "default",
            "CidrBlockAssociationSet": [
                {
                    "AssociationId": "vpc-cidr-assoc-00b17b4eddEXAMPLE",
                    "CidrBlock": "10.0.0.0/16",
                    "CidrBlockState": {
                        "State": "associated"
                    }
                }
            ],
```

```
                "IsDefault": false,
                "Tags": [
                    {
                        "Key": "Name",
                        "Value": "Shared VPC"
                    }
                ]
            }
        ]
    }
```

Example 2: To describe a specified VPC

The following `describe-vpcs` example retrieves details for the specified VPC.

```
aws ec2 describe-vpcs \
    --vpc-ids vpc-06e4ab6c6cEXAMPLE
```

Output:

```
{
    "Vpcs": [
        {
            "CidrBlock": "10.0.0.0/16",
            "DhcpOptionsId": "dopt-19edf471",
            "State": "available",
            "VpcId": "vpc-06e4ab6c6cEXAMPLE",
            "OwnerId": "111122223333",
            "InstanceTenancy": "default",
            "CidrBlockAssociationSet": [
                {
                    "AssociationId": "vpc-cidr-assoc-00b17b4eddEXAMPLE",
                    "CidrBlock": "10.0.0.0/16",
                    "CidrBlockState": {
                        "State": "associated"
                    }
                }
            ],
            "IsDefault": false,
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "Shared VPC"
```

```
                }
            ]
        }
    ]
}
```

- For API details, see DescribeVpcs in *AWS CLI Command Reference*.

`describe-vpn-connections`

The following code example shows how to use `describe-vpn-connections`.

AWS CLI

Example 1: To describe your VPN connections

The following `describe-vpn-connections` example describes all of your Site-to-Site VPN connections.

```
aws ec2 describe-vpn-connections
```

Output:

```
{
    "VpnConnections": [
        {
            "CustomerGatewayConfiguration": "...configuration information...",
            "CustomerGatewayId": "cgw-01234567abcde1234",
            "Category": "VPN",
            "State": "available",
            "Type": "ipsec.1",
            "VpnConnectionId": "vpn-1122334455aabbccd",
            "TransitGatewayId": "tgw-00112233445566aab",
            "Options": {
                "EnableAcceleration": false,
                "StaticRoutesOnly": true,
                "LocalIpv4NetworkCidr": "0.0.0.0/0",
                "RemoteIpv4NetworkCidr": "0.0.0.0/0",
                "TunnelInsideIpVersion": "ipv4"
            },
            "Routes": [],
```

```
                "Tags": [
                    {
                        "Key": "Name",
                        "Value": "CanadaVPN"
                    }
                ],
                "VgwTelemetry": [
                    {
                        "AcceptedRouteCount": 0,
                        "LastStatusChange": "2020-07-29T10:35:11.000Z",
                        "OutsideIpAddress": "203.0.113.3",
                        "Status": "DOWN",
                        "StatusMessage": ""
                    },
                    {
                        "AcceptedRouteCount": 0,
                        "LastStatusChange": "2020-09-02T09:09:33.000Z",
                        "OutsideIpAddress": "203.0.113.5",
                        "Status": "UP",
                        "StatusMessage": ""
                    }
                ]
            }
        ]
}
```

For more information, see How AWS Site-to-Site VPN works in the *AWS Site-to-Site VPN User Guide*.

Example 2: To describe your available VPN connections

The following `describe-vpn-connections` example describes your Site-to-Site VPN connections with a state of `available`.

```
aws ec2 describe-vpn-connections \
    --filters "Name=state,Values=available"
```

For more information, see How AWS Site-to-Site VPN works in the *AWS Site-to-Site VPN User Guide*.

- For API details, see DescribeVpnConnections in *AWS CLI Command Reference*.

`describe-vpn-gateways`

The following code example shows how to use `describe-vpn-gateways`.

AWS CLI

To describe your virtual private gateways

This example describes your virtual private gateways.

Command:

```
aws ec2 describe-vpn-gateways
```

Output:

```
{
    "VpnGateways": [
        {
            "State": "available",
            "Type": "ipsec.1",
            "VpnGatewayId": "vgw-f211f09b",
            "VpcAttachments": [
                {
                    "State": "attached",
                    "VpcId": "vpc-98eb5ef5"
                }
            ]
        },
        {
            "State": "available",
            "Type": "ipsec.1",
            "VpnGatewayId": "vgw-9a4cacf3",
            "VpcAttachments": [
                {
                    "State": "attaching",
                    "VpcId": "vpc-a01106c2"
                }
            ]
        }
    ]
}
```

- For API details, see DescribeVpnGateways in *AWS CLI Command Reference*.

`detach-classic-link-vpc`

The following code example shows how to use `detach-classic-link-vpc`.

AWS CLI

To unlink (detach) an EC2-Classic instance from a VPC

This example unlinks instance i-0598c7d356eba48d7 from VPC vpc-88888888.

Command:

```
aws ec2 detach-classic-link-vpc --instance-id i-0598c7d356eba48d7 --vpc-
id vpc-88888888
```

Output:

```
{
  "Return": true
}
```

- For API details, see DetachClassicLinkVpc in *AWS CLI Command Reference*.

`detach-internet-gateway`

The following code example shows how to use `detach-internet-gateway`.

AWS CLI

To detach an internet gateway from your VPC

The following `detach-internet-gateway` example detaches the specified internet gateway from the specific VPC.

```
aws ec2 detach-internet-gateway \
    --internet-gateway-id igw-0d0fb496b3EXAMPLE \
    --vpc-id vpc-0a60eb65b4EXAMPLE
```

This command produces no output.

For more information, see Internet gateways in the *Amazon VPC User Guide*.

- For API details, see DetachInternetGateway in *AWS CLI Command Reference*.

`detach-network-interface`

The following code example shows how to use `detach-network-interface`.

AWS CLI

To detach a network interface from your instance

This example detaches the specified network interface from the specified instance. If the command succeeds, no output is returned.

Command:

```
aws ec2 detach-network-interface --attachment-id eni-attach-66c4350a
```

- For API details, see DetachNetworkInterface in *AWS CLI Command Reference*.

`detach-verified-access-trust-provider`

The following code example shows how to use `detach-verified-access-trust-provider`.

AWS CLI

To detach a trust provider from an instance

The following `detach-verified-access-trust-provider` example detaches the specified Verified Access trust provider from the specified Verified Access instance.

```
aws ec2 detach-verified-access-trust-provider \
    --verified-access-instance-id vai-0ce000c0b7643abea \
    --verified-access-trust-provider-id vatp-0bb32de759a3e19e7
```

Output:

```
{
    "VerifiedAccessTrustProvider": {
        "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
```

```
            "Description": "Testing Verified Access",
            "TrustProviderType": "user",
            "UserTrustProviderType": "iam-identity-center",
            "PolicyReferenceName": "idc",
            "CreationTime": "2023-08-25T19:00:38",
            "LastUpdatedTime": "2023-08-25T19:00:38"
        },
        "VerifiedAccessInstance": {
            "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
            "Description": "Testing Verified Access",
            "VerifiedAccessTrustProviders": [],
            "CreationTime": "2023-08-25T18:27:56",
            "LastUpdatedTime": "2023-08-25T18:27:56"
        }
    }
```

For more information, see Verified Access instances in the *AWS Verified Access User Guide*.

- For API details, see DetachVerifiedAccessTrustProvider in *AWS CLI Command Reference*.

`detach-volume`

The following code example shows how to use `detach-volume`.

AWS CLI

To detach a volume from an instance

This example command detaches the volume (`vol-049df61146c4d7901`) from the instance it is attached to.

Command:

```
aws ec2 detach-volume --volume-id vol-1234567890abcdef0
```

Output:

```
{
    "AttachTime": "2014-02-27T19:23:06.000Z",
    "InstanceId": "i-1234567890abcdef0",
    "VolumeId": "vol-049df61146c4d7901",
    "State": "detaching",
    "Device": "/dev/sdb"
```

```
}
```

- For API details, see DetachVolume in *AWS CLI Command Reference*.

`detach-vpn-gateway`

The following code example shows how to use `detach-vpn-gateway`.

AWS CLI

To detach a virtual private gateway from your VPC

This example detaches the specified virtual private gateway from the specified VPC. If the command succeeds, no output is returned.

Command:

```
aws ec2 detach-vpn-gateway --vpn-gateway-id vgw-9a4cacf3 --vpc-id vpc-a01106c2
```

- For API details, see DetachVpnGateway in *AWS CLI Command Reference*.

`disable-address-transfer`

The following code example shows how to use `disable-address-transfer`.

AWS CLI

To disable an Elastic IP address transfer

The following `disable-address-transfer` example disables Elastic IP address transfer for the specified Elastic IP address.

```
aws ec2 disable-address-transfer \
    --allocation-id eipalloc-09ad461b0d03f6aaf
```

Output:

```
{
    "AddressTransfer": {
        "PublicIp": "100.21.184.216",
        "AllocationId": "eipalloc-09ad461b0d03f6aaf",
        "AddressTransferStatus": "disabled"
```

```
    }
}
```

For more information, see Transfer Elastic IP addresses in the *Amazon VPC User Guide*.

- For API details, see DisableAddressTransfer in *AWS CLI Command Reference*.

`disable-aws-network-performance-metric-subscription`

The following code example shows how to use `disable-aws-network-performance-metric-subscription`.

AWS CLI

To disable a metric subscription

The following `disable-aws-network-performance-metric-subscription` example disables the monitoring of aggregate network latency between the specified source and destination Regions.

```
aws ec2 disable-aws-network-performance-metric-subscription \
    --source us-east-1 \
    --destination eu-west-1 \
    --metric aggregate-latency \
    --statistic p50
```

Output:

```
{
    "Output": true
}
```

For more information, see Manage CloudWatch subscriptions using the CLI in the *Infrastructure Performance User Guide*.

- For API details, see DisableAwsNetworkPerformanceMetricSubscription in *AWS CLI Command Reference*.

`disable-ebs-encryption-by-default`

The following code example shows how to use `disable-ebs-encryption-by-default`.

AWS CLI

To disable EBS encryption by default

The following `disable-ebs-encryption-by-default` example disables EBS encryption by default for your AWS account in the current Region.

```
aws ec2 disable-ebs-encryption-by-default
```

Output:

```
{
    "EbsEncryptionByDefault": false
}
```

- For API details, see DisableEbsEncryptionByDefault in *AWS CLI Command Reference*.

`disable-fast-launch`

The following code example shows how to use `disable-fast-launch`.

AWS CLI

To discontinue fast launching for an image

The following `disable-fast-launch` example discontinues Fast Launch for the specified AMI, and cleans up existing pre-provisioned snapshots.

```
aws ec2 disable-fast-launch \
    --image-id ami-01234567890abcedf
```

Output:

```
{
    "ImageId": "ami-01234567890abcedf",
    "ResourceType": "snapshot",
    "SnapshotConfiguration": {},
    "LaunchTemplate": {
        "LaunchTemplateId": "lt-01234567890abcedf",
        "LaunchTemplateName": "EC2FastLaunchDefaultResourceCreation-
a8c6215d-94e6-441b-9272-dbd1f87b07e2",
```

```
        "Version": "1"
    },
    "MaxParallelLaunches": 6,
    "OwnerId": "0123456789123",
    "State": "disabling",
    "StateTransitionReason": "Client.UserInitiated",
    "StateTransitionTime": "2022-01-27T22:47:29.265000+00:00"
}
```

For more information, see Configure EC2 Fast Launch settings for your Windows AMI in the *Amazon EC2 User Guide*.

- For API details, see DisableFastLaunch in *AWS CLI Command Reference*.

`disable-fast-snapshot-restores`

The following code example shows how to use `disable-fast-snapshot-restores`.

AWS CLI

To disable fast snapshot restore

The following `disable-fast-snapshot-restores` example disables fast snapshot restore for the specified snapshot in the specified Availability Zone.

```
aws ec2 disable-fast-snapshot-restores \
    --availability-zones us-east-2a \
    --source-snapshot-ids snap-1234567890abcdef0
```

Output:

```
{
    "Successful": [
        {
            "SnapshotId": "snap-1234567890abcdef0"
            "AvailabilityZone": "us-east-2a",
            "State": "disabling",
            "StateTransitionReason": "Client.UserInitiated",
            "OwnerId": "123456789012",
            "EnablingTime": "2020-01-25T23:57:49.602Z"
        }
    ],
```

```
    "Unsuccessful": []
}
```

- For API details, see DisableFastSnapshotRestores in *AWS CLI Command Reference*.

`disable-image-block-public-access`

The following code example shows how to use `disable-image-block-public-access`.

AWS CLI

To disable block public access for AMIs in the specified Region

The following `disable-image-block-public-access` example disables block public access for AMIs at the account level in the specified Region.

```
aws ec2 disable-image-block-public-access \
    --region us-east-1
```

Output:

```
{
    "ImageBlockPublicAccessState": "unblocked"
}
```

For more information, see Block public access to your AMIs in the *Amazon EC2 User Guide*.

- For API details, see DisableImageBlockPublicAccess in *AWS CLI Command Reference*.

`disable-image-deprecation`

The following code example shows how to use `disable-image-deprecation`.

AWS CLI

To cancel the deprecation of an AMI

The following `disable-image-deprecation` example cancels the deprecation of an AMI, which removes the `DeprecationTime` field from the `describe-images` output. You must be the AMI owner to perform this procedure.

```
aws ec2 disable-image-deprecation \
    --image-id ami-1234567890abcdef0
```

Output:

```
{
    "RequestID": "11aabb229-4eac-35bd-99ed-be587EXAMPLE",
    "Return": "true"
}
```

For more information, see Deprecate an AMI in the *Amazon EC2 User Guide*.

- For API details, see DisableImageDeprecation in *AWS CLI Command Reference*.

`disable-image-deregistration-protection`

The following code example shows how to use `disable-image-deregistration-protection`.

AWS CLI

To disable deregistration protection

The following `disable-image-deregistration-protection` example disables deregistration protection for the specified image.

```
aws ec2 disable-image-deregistration-protection \
    --image-id ami-0b1a928a144a74ec9
```

Output:

```
{
    "Return": "disabled"
}
```

For more information, see Protect an AMI from deregistration in the *Amazon EC2 User Guide*.

- For API details, see DisableImageDeregistrationProtection in *AWS CLI Command Reference*.

`disable-image`

The following code example shows how to use `disable-image`.

AWS CLI

To disable an AMI

The following `disable-image` example disables the specified AMI.

```
aws ec2 disable-image \
    --image-id ami-1234567890abcdef0
```

Output:

```
{
    "Return": "true"
}
```

For more information, see Disable an AMI in the *Amazon EC2 User Guide*.

- For API details, see DisableImage in *AWS CLI Command Reference*.

`disable-ipam-organization-admin-account`

The following code example shows how to use `disable-ipam-organization-admin-account`.

AWS CLI

To disable the delegated IPAM admin

In certain scenarios, you'll integrate IPAM with AWS Organizations. When you do that, the AWS Organizations management account delegates an AWS Organizations member account as the IPAM admin.

In this example, you are the AWS Organizations management account that delegated the IPAM admin account and you want to disable that account from being the IPAM admin.

You can use any AWS Region for `--region` when making this request. You don't have to use the Region where you originally delegated the admin, where the IPAM was created, or an IPAM operating Region. If you disable the delegated admin account, you can re-enable it at any time or delegate a new account as IPAM admin.

The following `disable-ipam-organization-admin-account` example disables the delegated IPAM admin in your AWS account.

```
aws ec2 disable-ipam-organization-admin-account \
    --delegated-admin-account-id 320805250157 \
    --region ap-south-1
```

Output:

```
{
    "Success": true
}
```

For more information, see Integrate IPAM with accounts in an AWS Organization in the *Amazon VPC IPAM User Guide*.

- For API details, see DisableIpamOrganizationAdminAccount in *AWS CLI Command Reference*.

`disable-serial-console-access`

The following code example shows how to use `disable-serial-console-access`.

AWS CLI

To disable access to the EC2 serial console for your account

The following `disable-serial-console-access` example disables account access to the serial console.

```
aws ec2 disable-serial-console-access
```

Output:

```
{
    "SerialConsoleAccessEnabled": false
}
```

For more information, see EC2 Serial Console in the *Amazon EC2 User Guide*.

- For API details, see DisableSerialConsoleAccess in *AWS CLI Command Reference*.

`disable-snapshot-block-public-access`

The following code example shows how to use `disable-snapshot-block-public-access`.

AWS CLI

To disable block public access for snapshots

The following `disable-snapshot-block-public-access` example disables block public access for snapshots to allow public sharing of your snapshots.

```
aws ec2 disable-snapshot-block-public-access
```

Output:

```
{
    "State": "unblocked"
}
```

For more information, see Block public access for snapshots in the *Amazon EBS User Guide*.

- For API details, see DisableSnapshotBlockPublicAccess in *AWS CLI Command Reference*.

`disable-transit-gateway-route-table-propagation`

The following code example shows how to use `disable-transit-gateway-route-table-propagation`.

AWS CLI

To disable a transit gateway attachment to propagate routes to the specified propagation route table

The following `disable-transit-gateway-route-table-propagation` example disables the specified attachment to propagate routes to the specified propagation route table.

```
aws ec2 disable-transit-gateway-route-table-propagation \
    --transit-gateway-route-table-id tgw-rtb-0a823edbdeEXAMPLE \
    --transit-gateway-attachment-id tgw-attach-09b52ccdb5EXAMPLE
```

Output:

```
{
    "Propagation": {
        "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
        "ResourceId": "vpc-4d7de228",
```

```
            "ResourceType": "vpc",
            "TransitGatewayRouteTableId": "tgw-rtb-0a823edbdeEXAMPLE",
            "State": "disabled"
        }
}
```

For more information, see Transit gateway route tables in the *Transit Gateways Guide*.

- For API details, see DisableTransitGatewayRouteTablePropagation in *AWS CLI Command Reference*.

`disable-vgw-route-propagation`

The following code example shows how to use `disable-vgw-route-propagation`.

AWS CLI

To disable route propagation

This example disables the specified virtual private gateway from propagating static routes to the specified route table. If the command succeeds, no output is returned.

Command:

```
aws ec2 disable-vgw-route-propagation --route-table-id rtb-22574640 --gateway-id vgw-9a4cacf3
```

- For API details, see DisableVgwRoutePropagation in *AWS CLI Command Reference*.

`disable-vpc-classic-link-dns-support`

The following code example shows how to use `disable-vpc-classic-link-dns-support`.

AWS CLI

To disable ClassicLink DNS support for a VPC

This example disables ClassicLink DNS support for `vpc-88888888`.

Command:

```
aws ec2 disable-vpc-classic-link-dns-support --vpc-id vpc-88888888
```

Output:

```
{
  "Return": true
}
```

- For API details, see DisableVpcClassicLinkDnsSupport in *AWS CLI Command Reference*.

disable-vpc-classic-link

The following code example shows how to use `disable-vpc-classic-link`.

AWS CLI

To disable ClassicLink for a VPC

This example disables ClassicLink for vpc-8888888.

Command:

```
aws ec2 disable-vpc-classic-link --vpc-id vpc-88888888
```

Output:

```
{
  "Return": true
}
```

- For API details, see DisableVpcClassicLink in *AWS CLI Command Reference*.

disassociate-address

The following code example shows how to use `disassociate-address`.

AWS CLI

To disassociate an Elastic IP addresses in EC2-Classic

This example disassociates an Elastic IP address from an instance in EC2-Classic. If the command succeeds, no output is returned.

Command:

```
aws ec2 disassociate-address --public-ip 198.51.100.0
```

To disassociate an Elastic IP address in EC2-VPC

This example disassociates an Elastic IP address from an instance in a VPC. If the command succeeds, no output is returned.

Command:

```
aws ec2 disassociate-address --association-id eipassoc-2bebb745
```

- For API details, see DisassociateAddress in *AWS CLI Command Reference*.

`disassociate-client-vpn-target-network`

The following code example shows how to use `disassociate-client-vpn-target-network`.

AWS CLI

To disassociate a network from a Client VPN endpoint

The following `disassociate-client-vpn-target-network` example disassociates the target network that's associated with the `cvpn-assoc-12312312312312312` association ID for the specified Client VPN endpoint.

```
aws ec2 disassociate-client-vpn-target-network \
    --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \
    --association-id cvpn-assoc-12312312312312312
```

Output:

```
{
    "AssociationId": "cvpn-assoc-12312312312312312",
    "Status": {
        "Code": "disassociating"
    }
}
```

For more information, see Target Networks in the *AWS Client VPN Administrator Guide*.

- For API details, see DisassociateClientVpnTargetNetwork in *AWS CLI Command Reference*.

`disassociate-iam-instance-profile`

The following code example shows how to use `disassociate-iam-instance-profile`.

AWS CLI

To disassociate an IAM instance profile

This example disassociates an IAM instance profile with the association ID `iip-assoc-05020b59952902f5f`.

Command:

```
aws ec2 disassociate-iam-instance-profile --association-id iip-
assoc-05020b59952902f5f
```

Output:

```
{
  "IamInstanceProfileAssociation": {
      "InstanceId": "i-123456789abcde123",
      "State": "disassociating",
      "AssociationId": "iip-assoc-05020b59952902f5f",
      "IamInstanceProfile": {
          "Id": "AIPAI5IVIHMFFYY2DKV5Y",
          "Arn": "arn:aws:iam::123456789012:instance-profile/admin-role"
      }
  }
}
```

- For API details, see DisassociateIamInstanceProfile in *AWS CLI Command Reference*.

`disassociate-instance-event-window`

The following code example shows how to use `disassociate-instance-event-window`.

AWS CLI

Example 1: To disassociate one or more instances from an event window

The following `disassociate-instance-event-window` example disassociates one or more instances from an event window. Specify the `instance-event-window-id` parameter to specify the event window. To disassociate instances, specify the `association-target` parameter, and for the parameter values, specify one or more instance IDs.

```
aws ec2 disassociate-instance-event-window \
    --region us-east-1 \
    --instance-event-window-id iew-0abcdef1234567890 \
    --association-target "InstanceIds=i-1234567890abcdef0,i-0598c7d356eba48d7"
```

Output:

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "AssociationTarget": {
            "InstanceIds": [],
            "Tags": [],
            "DedicatedHostIds": []
        },
        "State": "creating"
    }
}
```

For event window constraints, see Considerations in the Scheduled Events section of the *Amazon EC2 User Guide*.

Example 2: To disassociate instance tags from an event window

The following `disassociate-instance-event-window` example disassociates instance tags from an event window. Specify the `instance-event-window-id` parameter to specify the event window. To disassociate instance tags, specify the `association-target` parameter, and for the parameter values, specify one or more tags.

```
aws ec2 disassociate-instance-event-window \
    --region us-east-1 \
    --instance-event-window-id iew-0abcdef1234567890 \
    --association-target "InstanceTags=[{Key=k2,Value=v2},{Key=k1,Value=v1}]"
```

Output:

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "AssociationTarget": {
            "InstanceIds": [],
            "Tags": [],
            "DedicatedHostIds": []
        },
        "State": "creating"
    }
}
```

For event window constraints, see Considerations in the Scheduled Events section of the *Amazon EC2 User Guide*.

Example 3: To disassociate a Dedicated Host from an event window

The following `disassociate-instance-event-window` example disassociates a Dedicated Host from an event window. Specify the `instance-event-window-id` parameter to specify the event window. To disassociate a Dedicated Host, specify the `association-target` parameter, and for the parameter values, specify one or more Dedicated Host IDs.

```
aws ec2 disassociate-instance-event-window \
    --region us-east-1 \
    --instance-event-window-id iew-0abcdef1234567890 \
    --association-target DedicatedHostIds=h-029fa35a02b99801d
```

Output:

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "AssociationTarget": {
            "InstanceIds": [],
            "Tags": [],
            "DedicatedHostIds": []
        },
        "State": "creating"
```

```
    }
}
```

For event window constraints, see Considerations in the Scheduled Events section of the *Amazon EC2 User Guide*.

- For API details, see DisassociateInstanceEventWindow in *AWS CLI Command Reference*.

`disassociate-ipam-resource-discovery`

The following code example shows how to use `disassociate-ipam-resource-discovery`.

AWS CLI

To disassociate a resource discovery from an IPAM

In this example, you are an IPAM delegated admin account and you want to disassociate an IPAM resource discovery from your IPAM. You ran the describe command and noticed that the `"ResourceDiscoveryStatus": "not-found"` and you want to disassociate it from your IPAM to make room for other associations.

The following `disassociate-ipam-resource-discovery` example disassociates an IPAM resource discovery in your AWS account.

```
aws ec2 disassociate-ipam-resource-discovery \
    --ipam-resource-discovery-association-id ipam-res-disco-assoc-04382a6346357cf82
 \
    --region us-east-1
```

Output:

```
{
    "IpamResourceDiscoveryAssociation": {
        "OwnerId": "320805250157",
        "IpamResourceDiscoveryAssociationId": "ipam-res-disco-
assoc-04382a6346357cf82",
        "IpamResourceDiscoveryAssociationArn":
 "arn:aws:ec2::320805250157:ipam-resource-discovery-association/ipam-res-disco-
assoc-04382a6346357cf82",
        "IpamResourceDiscoveryId": "ipam-res-disco-0365d2977fc1672fe",
        "IpamId": "ipam-005f921c17ebd5107",
        "IpamArn": "arn:aws:ec2::320805250157:ipam/ipam-005f921c17ebd5107",
```

```
        "IpamRegion": "us-east-1",
        "IsDefault": false,
        "ResourceDiscoveryStatus": "not-found",
        "State": "disassociate-in-progress"
    }
}
```

For more information, see [Integrate IPAM with accounts outside of your organization]() in the *Amazon VPC IPAM User Guide*.

- For API details, see [DisassociateIpamResourceDiscovery]() in *AWS CLI Command Reference*.

`disassociate-nat-gateway-address`

The following code example shows how to use `disassociate-nat-gateway-address`.

AWS CLI

To disassociate an Elastic IP address from a public NAT gateway

The following `disassociate-nat-gateway-address` example disassociates the specified Elastic IP address from the specified public NAT gateway.

```
aws ec2 disassociate-nat-gateway-address \
    --nat-gateway-id nat-1234567890abcdef0 \
    --association-ids eipassoc-0f96bdca17EXAMPLE
```

Output:

```
{
    "NatGatewayId": "nat-1234567890abcdef0",
    "NatGatewayAddresses": [
        {
            "AllocationId": "eipalloc-0be6ecac95EXAMPLE",
            "NetworkInterfaceId": "eni-09cc4b2558794f7f9",
            "PrivateIp": "10.0.0.74",
            "PublicIp": "3.211.231.218",
            "AssociationId": "eipassoc-0f96bdca17EXAMPLE",
            "IsPrimary": false,
            "Status": "disassociating"
        }
    ]
```

```
}
```

For more information, see NAT gateways in the *Amazon VPC User Guide*.

- For API details, see DisassociateNatGatewayAddress in *AWS CLI Command Reference*.

`disassociate-route-table`

The following code example shows how to use `disassociate-route-table`.

AWS CLI

To disassociate a route table

This example disassociates the specified route table from the specified subnet. If the command succeeds, no output is returned.

Command:

```
aws ec2 disassociate-route-table --association-id rtbassoc-781d0d1a
```

- For API details, see DisassociateRouteTable in *AWS CLI Command Reference*.

`disassociate-security-group-vpc`

The following code example shows how to use `disassociate-security-group-vpc`.

AWS CLI

To disassociate a security group from a VPC

The following `disassociate-security-group-vpc` example disassociates the specified security group from the specified VPC.

```
aws ec2 disassociate-security-group-vpc \
    --group-id sg-04dbb43907d3f8a78 \
    --vpc-id vpc-0bf4c2739bc05a694
```

Output:

```
{
    "State": "disassociating"
```

```
}
```

For more information, see [Associate security groups with multiple VPCs](#) in the *Amazon VPC User Guide*.

- For API details, see [DisassociateSecurityGroupVpc](#) in *AWS CLI Command Reference*.

`disassociate-subnet-cidr-block`

The following code example shows how to use `disassociate-subnet-cidr-block`.

AWS CLI

To disassociate an IPv6 CIDR block from a subnet

This example disassociates an IPv6 CIDR block from a subnet using the association ID for the CIDR block.

Command:

```
aws ec2 disassociate-subnet-cidr-block --association-id subnet-cidr-assoc-3aa54053
```

Output:

```
{
  "SubnetId": "subnet-5f46ec3b",
  "Ipv6CidrBlockAssociation": {
      "Ipv6CidrBlock": "2001:db8:1234:1a00::/64",
      "AssociationId": "subnet-cidr-assoc-3aa54053",
      "Ipv6CidrBlockState": {
          "State": "disassociating"
      }
  }
}
```

- For API details, see [DisassociateSubnetCidrBlock](#) in *AWS CLI Command Reference*.

`disassociate-transit-gateway-multicast-domain`

The following code example shows how to use `disassociate-transit-gateway-multicast-domain`.

AWS CLI

To disassociate subnets from a multicast domain

The following `disassociate-transit-gateway-multicast-domain` example disassociates a subnet from the specified multicast domain.

```
aws ec2 disassociate-transit-gateway-multicast-domain \
    --transit-gateway-attachment-id tgw-attach-070e571cd1EXAMPLE \
    --subnet-id subnet-000de86e3bEXAMPLE \
    --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef7EXAMPLE
```

Output:

```
{
    "Associations": {
        "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef7EXAMPLE",
        "TransitGatewayAttachmentId": "tgw-attach-070e571cd1EXAMPLE",
        "ResourceId": "vpc-7EXAMPLE",
        "ResourceType": "vpc",
        "Subnets": [
            {
                "SubnetId": "subnet-000de86e3bEXAMPLE",
                "State": "disassociating"
            }
        ]
    }
}
```

For more information, see Multicast domains in the *Transit Gateways Guide*'.

- For API details, see DisassociateTransitGatewayMulticastDomain in *AWS CLI Command Reference*.

`disassociate-transit-gateway-route-table`

The following code example shows how to use `disassociate-transit-gateway-route-table`.

AWS CLI

To disassociate a transit gateway route table from a resource attachment

The following `disassociate-transit-gateway-route-table` example disassociates the specified attachment from the transit gateway route table.

```
aws ec2 disassociate-transit-gateway-route-table \
    --transit-gateway-route-table-id tgw-rtb-002573ed1eEXAMPLE \
    --transit-gateway-attachment-id tgw-attach-08e0bc912cEXAMPLE
```

Output:

```
{
    "Association": {
        "TransitGatewayRouteTableId": "tgw-rtb-002573ed1eEXAMPLE",
        "TransitGatewayAttachmentId": "tgw-attach-08e0bc912cEXAMPLE",
        "ResourceId": "11460968-4ac1-4fd3-bdb2-00599EXAMPLE",
        "ResourceType": "direct-connect-gateway",
        "State": "disassociating"
    }
}
```

For more information, see Transit gateway route tables in the *Transit Gateways Guide*.

- For API details, see DisassociateTransitGatewayRouteTable in *AWS CLI Command Reference*.

`disassociate-vpc-cidr-block`

The following code example shows how to use `disassociate-vpc-cidr-block`.

AWS CLI

To disassociate an IPv6 CIDR block from a VPC

This example disassociates an IPv6 CIDR block from a VPC using the association ID for the CIDR block.

Command:

```
aws ec2 disassociate-vpc-cidr-block --association-id vpc-cidr-assoc-eca54085
```

Output:

```
{
  "Ipv6CidrBlockAssociation": {
```

```
        "Ipv6CidrBlock": "2001:db8:1234:1a00::/56",
        "AssociationId": "vpc-cidr-assoc-eca54085",
        "Ipv6CidrBlockState": {
            "State": "disassociating"
        }
    },
    "VpcId": "vpc-a034d6c4"
}
```

To disassociate an IPv4 CIDR block from a VPC

This example disassociates an IPv4 CIDR block from a VPC.

Command:

```
aws ec2 disassociate-vpc-cidr-block --association-id vpc-cidr-assoc-0287ac6b
```

Output:

```
{
    "CidrBlockAssociation": {
        "AssociationId": "vpc-cidr-assoc-0287ac6b",
        "CidrBlock": "172.18.0.0/16",
        "CidrBlockState": {
            "State": "disassociating"
        }
    },
    "VpcId": "vpc-27621243"
}
```

- For API details, see DisassociateVpcCidrBlock in *AWS CLI Command Reference*.

`enable-address-transfer`

The following code example shows how to use `enable-address-transfer`.

AWS CLI

To enable an Elastic IP address transfer

The following `enable-address-transfer` example enables Elastic IP address transfer for the specified Elastic IP address to the specified account.

```
aws ec2 enable-address-transfer \
    --allocation-id eipalloc-09ad461b0d03f6aaf \
    --transfer-account-id 123456789012
```

Output:

```
{
     "AddressTransfer": {
        "PublicIp": "100.21.184.216",
        "AllocationId": "eipalloc-09ad461b0d03f6aaf",
        "TransferAccountId": "123456789012",
        "TransferOfferExpirationTimestamp": "2023-02-22T20:51:01.000Z",
        "AddressTransferStatus": "pending"
    }
}
```

For more information, see Transfer Elastic IP addresses in the *Amazon VPC User Guide*.

- For API details, see EnableAddressTransfer in *AWS CLI Command Reference*.

enable-aws-network-performance-metric-subscription

The following code example shows how to use `enable-aws-network-performance-metric-subscription`.

AWS CLI

To enable a metric subscription

The following `enable-aws-network-performance-metric-subscription` example enables the monitoring of aggregate network latency between the specified source and destination Regions.

```
aws ec2 enable-aws-network-performance-metric-subscription \
    --source us-east-1 \
    --destination eu-west-1 \
    --metric aggregate-latency \
    --statistic p50
```

Output:

```
{
    "Output": true
}
```

For more information, see Manage subscriptions in the *Infrastructure Performance User Guide*.

- For API details, see EnableAwsNetworkPerformanceMetricSubscription in *AWS CLI Command Reference*.

`enable-ebs-encryption-by-default`

The following code example shows how to use `enable-ebs-encryption-by-default`.

AWS CLI

To enable EBS encryption by default

The following `enable-ebs-encryption-by-default` example enables EBS encryption by default for your AWS account in the current Region.

```
aws ec2 enable-ebs-encryption-by-default
```

Output:

```
{
    "EbsEncryptionByDefault": true
}
```

- For API details, see EnableEbsEncryptionByDefault in *AWS CLI Command Reference*.

`enable-fast-launch`

The following code example shows how to use `enable-fast-launch`.

AWS CLI

To start fast launching for an image

The following `enable-fast-launch` example configures the specified AMI for Fast Launch and sets the maximum number of parallel instances to launch to 6. The type of resource to use to pre-provision the AMI is set to `snapshot`, which is also the default value.

```
aws ec2 enable-fast-launch \
    --image-id ami-01234567890abcedf \
    --max-parallel-launches 6 \
    --resource-type snapshot
```

Output:

```
{
    "ImageId": "ami-01234567890abcedf",
    "ResourceType": "snapshot",
    "SnapshotConfiguration": {
        "TargetResourceCount": 10
    },
    "LaunchTemplate": {},
    "MaxParallelLaunches": 6,
    "OwnerId": "0123456789123",
    "State": "enabling",
    "StateTransitionReason": "Client.UserInitiated",
    "StateTransitionTime": "2022-01-27T22:16:03.199000+00:00"
}
```

For more information, see Configure EC2 Fast Launch settings for your Windows AMI in the *Amazon EC2 User Guide*.

- For API details, see EnableFastLaunch in *AWS CLI Command Reference*.

`enable-fast-snapshot-restores`

The following code example shows how to use `enable-fast-snapshot-restores`.

AWS CLI

To enable fast snapshot restore

The following `enable-fast-snapshot-restores` example enables fast snapshot restore for the specified snapshot in the specified Availability Zones.

```
aws ec2 enable-fast-snapshot-restores \
    --availability-zones us-east-2a us-east-2b \
    --source-snapshot-ids snap-1234567890abcdef0
```

Output:

```
{
    "Successful": [
        {
            "SnapshotId": "snap-1234567890abcdef0"
            "AvailabilityZone": "us-east-2a",
            "State": "enabling",
            "StateTransitionReason": "Client.UserInitiated",
            "OwnerId": "123456789012",
            "EnablingTime": "2020-01-25T23:57:49.602Z"
        },
        {
            "SnapshotId": "snap-1234567890abcdef0"
            "AvailabilityZone": "us-east-2b",
            "State": "enabling",
            "StateTransitionReason": "Client.UserInitiated",
            "OwnerId": "123456789012",
            "EnablingTime": "2020-01-25T23:57:49.596Z"
        }
    ],
    "Unsuccessful": []
}
```

- For API details, see EnableFastSnapshotRestores in *AWS CLI Command Reference*.

`enable-image-block-public-access`

The following code example shows how to use `enable-image-block-public-access`.

AWS CLI

To enable block public access for AMIs in the specified Region

The following `enable-image-block-public-access` example enables block public access for AMIs at the account level in the specified Region.

```
aws ec2 enable-image-block-public-access \
    --region us-east-1 \
    --image-block-public-access-state block-new-sharing
```

Output:

```
{
```

```
    "ImageBlockPublicAccessState": "block-new-sharing"
}
```

For more information, see Block public access to your AMIs in the *Amazon EC2 User Guide*.

- For API details, see EnableImageBlockPublicAccess in *AWS CLI Command Reference*.

`enable-image-deprecation`

The following code example shows how to use `enable-image-deprecation`.

AWS CLI

To deprecate an AMI

The following `enable-image-deprecation` example deprecates an AMI on a specific date and time. If you specify a value for seconds, Amazon EC2 rounds the seconds to the nearest minute. You must be the AMI owner to perform this procedure.

```
aws ec2 enable-image-deprecation \
    --image-id ami-1234567890abcdef0 \
    --deprecate-at '2022-10-15T13:17:12.000Z'
```

Output:

```
{
    "RequestID": "59dbff89-35bd-4eac-99ed-be587EXAMPLE",
    "Return": "true"
}
```

For more information, see Deprecate an AMI in the *Amazon EC2 User Guide*.

- For API details, see EnableImageDeprecation in *AWS CLI Command Reference*.

`enable-image-deregistration-protection`

The following code example shows how to use `enable-image-deregistration-protection`.

AWS CLI

To enable deregistration protection

The following `enable-image-deregistration-protection` example enables deregistration protection for the specified image.

```
aws ec2 enable-image-deregistration-protection \
    --image-id ami-0b1a928a144a74ec9
```

Output:

```
{
    "Return": "enabled-without-cooldown"
}
```

For more information, see Protect an EC2 AMI from deregistration in the *Amazon EC2 User Guide*.

- For API details, see EnableImageDeregistrationProtection in *AWS CLI Command Reference*.

`enable-image`

The following code example shows how to use `enable-image`.

AWS CLI

To enable an AMI

The following `enable-image` example enables the specified AMI.

```
aws ec2 enable-image \
    --image-id ami-1234567890abcdef0
```

Output:

```
{
    "Return": "true"
}
```

For more information, see Disable an AMI in the *Amazon EC2 User Guide*.

- For API details, see EnableImage in *AWS CLI Command Reference*.

`enable-ipam-organization-admin-account`

The following code example shows how to use `enable-ipam-organization-admin-account`.

AWS CLI

To integrate with AWS Organizations and delegate a member account as the IPAM account

The following `enable-ipam-organization-admin-account` example integrates IPAM with AWS Organizations and delegates a member account as the IPAM account.

```
aws ec2 enable-ipam-organization-admin-account \
    --delegated-admin-account-id 320805250157
```

Output:

```
{
    "Success": true
}
```

For more information, see Integrate IPAM with AWS Organizations in the *Amazon VPC IPAM User Guide*.

- For API details, see EnableIpamOrganizationAdminAccount in *AWS CLI Command Reference*.

`enable-reachability-analyzer-organization-sharing`

The following code example shows how to use `enable-reachability-analyzer-organization-sharing`.

AWS CLI

To enable trusted access for Reachability Analyzer

The following `enable-reachability-analyzer-organization-sharing` example enables trusted access for Reachability Analyzer.

```
aws ec2 enable-reachability-analyzer-organization-sharing
```

This command produces no output.

For more information, see Cross-account analyses in the *Reachability Analyzer User Guide*.

- For API details, see EnableReachabilityAnalyzerOrganizationSharing in *AWS CLI Command Reference*.

`enable-serial-console-access`

The following code example shows how to use `enable-serial-console-access`.

AWS CLI

To enable access to the serial console for your account

The following `enable-serial-console-access` example enables account access to the serial console.

```
aws ec2 enable-serial-console-access
```

Output:

```
{
    "SerialConsoleAccessEnabled": true
}
```

For more information, see EC2 Serial Console in the *Amazon EC2 User Guide*.

- For API details, see EnableSerialConsoleAccess in *AWS CLI Command Reference*.

`enable-snapshot-block-public-access`

The following code example shows how to use `enable-snapshot-block-public-access`.

AWS CLI

To enable block public access for snapshots

The following `enable-snapshot-block-public-access` example blocks all public sharing of your snapshots.

```
aws ec2 enable-snapshot-block-public-access \
    --state block-all-sharing
```

Output:

```
{
    "State": "block-all-sharing"
}
```

For more information, see Block public access for snapshots in the *Amazon EBS User Guide*.

- For API details, see EnableSnapshotBlockPublicAccess in *AWS CLI Command Reference*.

`enable-transit-gateway-route-table-propagation`

The following code example shows how to use `enable-transit-gateway-route-table-propagation`.

AWS CLI

To enable a transit gateway attachment to propagate routes to the specified propagation route table

The following `enable-transit-gateway-route-table-propagation` example enables the specified attachment to propagate routes to the specified propagation route table.

```
aws ec2 enable-transit-gateway-route-table-propagation \
    --transit-gateway-route-table-id tgw-rtb-0a823edbdeEXAMPLE \
    --transit-gateway-attachment-id tgw-attach-09b52ccdb5EXAMPLE
```

Output:

```
{
    "Propagation": {
        "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
        "ResourceId": "vpc-4d7de228",
        "ResourceType": "vpc",
        "TransitGatewayRouteTableId": "tgw-rtb-0a823edbdeEXAMPLE",
        "State": "disabled"
    }
}
```

For more information, see Transit gateway route tables in the *Transit Gateways Guide*.

- For API details, see EnableTransitGatewayRouteTablePropagation in *AWS CLI Command Reference*.

enable-vgw-route-propagation

The following code example shows how to use `enable-vgw-route-propagation`.

AWS CLI

To enable route propagation

This example enables the specified virtual private gateway to propagate static routes to the specified route table. If the command succeeds, no output is returned.

Command:

```
aws ec2 enable-vgw-route-propagation --route-table-id rtb-22574640 --gateway-id vgw-9a4cacf3
```

- For API details, see EnableVgwRoutePropagation in *AWS CLI Command Reference*.

enable-volume-io

The following code example shows how to use `enable-volume-io`.

AWS CLI

To enable I/O for a volume

This example enables I/O on volume `vol-1234567890abcdef0`.

Command:

```
aws ec2 enable-volume-io --volume-id vol-1234567890abcdef0
```

Output:

```
{
  "Return": true
}
```

- For API details, see EnableVolumeIo in *AWS CLI Command Reference*.

`enable-vpc-classic-link-dns-support`

The following code example shows how to use `enable-vpc-classic-link-dns-support`.

AWS CLI

To enable ClassicLink DNS support for a VPC

This example enables ClassicLink DNS support for `vpc-88888888`.

Command:

```
aws ec2 enable-vpc-classic-link-dns-support --vpc-id vpc-88888888
```

Output:

```
{
  "Return": true
}
```

- For API details, see EnableVpcClassicLinkDnsSupport in *AWS CLI Command Reference*.

`enable-vpc-classic-link`

The following code example shows how to use `enable-vpc-classic-link`.

AWS CLI

To enable a VPC for ClassicLink

This example enables vpc-8888888 for ClassicLink.

Command:

```
aws ec2 enable-vpc-classic-link --vpc-id vpc-88888888
```

Output:

```
{
  "Return": true
}
```

- For API details, see EnableVpcClassicLink in *AWS CLI Command Reference*.

`export-client-vpn-client-certificate-revocation-list`

The following code example shows how to use `export-client-vpn-client-certificate-revocation-list`.

AWS CLI

To export a client certificate revocation list

The following `export-client-vpn-client-certificate-revocation-list` example exports the client certificate revocation list for the specified Client VPN endpoint. In this example, the output is returned in text format to make it easier to read.

```
aws ec2 export-client-vpn-client-certificate-revocation-list \
    --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \
    --output text
```

Output:

For more information, see Client Certificate Revocation Lists in the *AWS Client VPN Administrator Guide*.

- For API details, see [ExportClientVpnClientCertificateRevocationList]() in *AWS CLI Command Reference*.

export-client-vpn-client-configuration

The following code example shows how to use `export-client-vpn-client-configuration`.

AWS CLI

To export the client configuration

The following `export-client-vpn-client-configuration` example exports the client configuration for the specified Client VPN endpoint. In this example, the output is returned in text format to make it easier to read.

```
aws ec2 export-client-vpn-client-configuration \
    --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \
    --output text
```

Output:

For more information, see Client VPN endpoint configuration file export in the *AWS Client VPN Administrator Guide*.

- For API details, see ExportClientVpnClientConfiguration in *AWS CLI Command Reference*.

`export-image`

The following code example shows how to use `export-image`.

AWS CLI

To export a VM from an AMI

The following `export-image` example exports the specified AMI to the specified bucket in the specified format.

```
aws ec2 export-image \
    --image-id ami-1234567890abcdef0 \
    --disk-image-format VMDK \
    --s3-export-location S3Bucket=my-export-bucket,S3Prefix=exports/
```

Output:

```
{
    "DiskImageFormat": "vmdk",
    "ExportImageTaskId": "export-ami-1234567890abcdef0"
    "ImageId": "ami-1234567890abcdef0",
    "RoleName": "vmimport",
    "Progress": "0",
    "S3ExportLocation": {
        "S3Bucket": "my-export-bucket",
        "S3Prefix": "exports/"
```

```
    },
    "Status": "active",
    "StatusMessage": "validating"
}
```

- For API details, see [ExportImage](#) in *AWS CLI Command Reference*.

`get-associated-ipv6-pool-cidrs`

The following code example shows how to use `get-associated-ipv6-pool-cidrs`.

AWS CLI

To get the associations for an IPv6 address pool

The following `get-associated-ipv6-pool-cidrs` example gets the associations for the specified IPv6 address pool.

```
aws ec2 get-associated-ipv6-pool-cidrs \
    --pool-id ipv6pool-ec2-012345abc12345abc
```

Output:

```
{
    "Ipv6CidrAssociations": [
        {
            "Ipv6Cidr": "2001:db8:1234:1a00::/56",
            "AssociatedResource": "vpc-111111222222333ab"
        }
    ]
}
```

- For API details, see [GetAssociatedIpv6PoolCidrs](#) in *AWS CLI Command Reference*.

`get-aws-network-performance-data`

The following code example shows how to use `get-aws-network-performance-data`.

AWS CLI

To get network performance data

The following `get-aws-network-performance-data` example retrieves data about the network performance between the specified Regions in the specified time period.

```
aws ec2 get-aws-network-performance-data \
    --start-time 2022-10-26T12:00:00.000Z \
    --end-time 2022-10-26T12:30:00.000Z \
    --data-queries Id=my-query,Source=us-east-1,Destination=eu-
west-1,Metric=aggregate-latency,Statistic=p50,Period=five-minutes
```

Output:

```
{
    "DataResponses": [
        {
            "Id": "my-query",
            "Source": "us-east-1",
            "Destination": "eu-west-1",
            "Metric": "aggregate-latency",
            "Statistic": "p50",
            "Period": "five-minutes",
            "MetricPoints": [
                {
                    "StartDate": "2022-10-26T12:00:00+00:00",
                    "EndDate": "2022-10-26T12:05:00+00:00",
                    "Value": 62.44349,
                    "Status": "OK"
                },
                {
                    "StartDate": "2022-10-26T12:05:00+00:00",
                    "EndDate": "2022-10-26T12:10:00+00:00",
                    "Value": 62.483498,
                    "Status": "OK"
                },
                {
                    "StartDate": "2022-10-26T12:10:00+00:00",
                    "EndDate": "2022-10-26T12:15:00+00:00",
                    "Value": 62.51248,
                    "Status": "OK"
                },
                {
                    "StartDate": "2022-10-26T12:15:00+00:00",
                    "EndDate": "2022-10-26T12:20:00+00:00",
                    "Value": 62.635475,
```

```
                    "Status": "OK"
                },
                {
                    "StartDate": "2022-10-26T12:20:00+00:00",
                    "EndDate": "2022-10-26T12:25:00+00:00",
                    "Value": 62.733974,
                    "Status": "OK"
                },
                {
                    "StartDate": "2022-10-26T12:25:00+00:00",
                    "EndDate": "2022-10-26T12:30:00+00:00",
                    "Value": 62.773975,
                    "Status": "OK"
                },
                {
                    "StartDate": "2022-10-26T12:30:00+00:00",
                    "EndDate": "2022-10-26T12:35:00+00:00",
                    "Value": 62.75349,
                    "Status": "OK"
                }
            ]
        }
    ]
}
```

For more information, see Monitor network performance in the *Infrastructure Performance User Guide*.

- For API details, see GetAwsNetworkPerformanceData in *AWS CLI Command Reference*.

`get-capacity-reservation-usage`

The following code example shows how to use `get-capacity-reservation-usage`.

AWS CLI

To view capacity reservation usage across AWS accounts

The following `get-capacity-reservation-usage` example displays usage information for the specified capacity reservation.

```
aws ec2 get-capacity-reservation-usage \
    --capacity-reservation-id cr-1234abcd56EXAMPLE
```

Output:

```
{
    "CapacityReservationId": "cr-1234abcd56EXAMPLE ",
    "InstanceUsages": [
        {
            "UsedInstanceCount": 1,
            "AccountId": "123456789012"
        }
    ],
    "AvailableInstanceCount": 4,
    "TotalInstanceCount": 5,
    "State": "active",
    "InstanceType": "t2.medium"
}
```

For more information, see Shared Capacity Reservations in the *Amazon EC2 User Guide*.

- For API details, see GetCapacityReservationUsage in *AWS CLI Command Reference*.

`get-coip-pool-usage`

The following code example shows how to use `get-coip-pool-usage`.

AWS CLI

To get customer-owned IP address pool usage

The following `get-coip-pool-usage` example gets the usage details for the specified customer-owned IP address pool.

```
aws ec2 get-coip-pool-usage \
    --pool-id ipv4pool-coip-123a45678bEXAMPLE
```

Output:

```
{
    "CoipPoolId": "ipv4pool-coip-123a45678bEXAMPLE",
    "CoipAddressUsages": [
        {
            "CoIp": "0.0.0.0"
        },
```

```
        {
            "AllocationId": "eipalloc-123ab45c6dEXAMPLE",
            "AwsAccountId": "123456789012",
            "CoIp": "0.0.0.0"
        },
        {
            "AllocationId": "eipalloc-123ab45c6dEXAMPLE",
            "AwsAccountId": "123456789111",
            "CoIp": "0.0.0.0"
        }
    ],
    "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE"
}
```

For more information, see Customer-owned IP addresses in the *AWS Outposts User Guide for Outposts racks*.

- For API details, see GetCoipPoolUsage in *AWS CLI Command Reference*.

`get-console-output`

The following code example shows how to use `get-console-output`.

AWS CLI

Example 1: To get the console output

The following `get-console-output` example gets the console output for the specified Linux instance.

```
aws ec2 get-console-output \
    --instance-id i-1234567890abcdef0
```

Output:

```
{
    "InstanceId": "i-1234567890abcdef0",
    "Timestamp": "2013-07-25T21:23:53.000Z",
    "Output": "..."
}
```

For more information, see Instance console output in the *Amazon EC2 User Guide*.

Example 2: To get the latest console output

The following `get-console-output` example gets the latest console output for the specified Linux instance.

```
aws ec2 get-console-output \
    --instance-id i-1234567890abcdef0 \
    --latest \
    --output text
```

Output:

```
i-1234567890abcdef0 [    0.000000] Command line: root=LABEL=/ console=tty1
 console=ttyS0 selinux=0 nvme_core.io_timeout=4294967295

Amazon Linux AMI release 2018.03
Kernel 4.14.26-46.32.amzn1.x
```

For more information, see Instance console output in the *Amazon EC2 User Guide*.

- For API details, see GetConsoleOutput in *AWS CLI Command Reference*.

`get-console-screenshot`

The following code example shows how to use `get-console-screenshot`.

AWS CLI

To retrieve a screenshot of a running instance

The following `get-console-screenshot` example retrieves a screenshot of the specified instance in .jpg format. The screenshot is returned as a Base64-encoded string.

```
aws ec2 get-console-screenshot \
    --instance-id i-1234567890abcdef0
```

Output:

```
{
    "ImageData": "997987/8kgj49ikjhewkwwe0008084EXAMPLE",
    "InstanceId": "i-1234567890abcdef0"
}
```

- For API details, see GetConsoleScreenshot in *AWS CLI Command Reference*.

`get-default-credit-specification`

The following code example shows how to use `get-default-credit-specification`.

AWS CLI

To describe the default credit option

The following `get-default-credit-specification` example describes the default credit option for T2 instances.

```
aws ec2 get-default-credit-specification \
    --instance-family t2
```

Output:

```
{
    "InstanceFamilyCreditSpecification": {
        "InstanceFamily": "t2",
        "CpuCredits": "standard"
    }
}
```

- For API details, see GetDefaultCreditSpecification in *AWS CLI Command Reference*.

`get-ebs-default-kms-key-id`

The following code example shows how to use `get-ebs-default-kms-key-id`.

AWS CLI

To describe your default CMK for EBS encryption

The following `get-ebs-default-kms-key-id` example describes the default CMK for EBS encryption for your AWS account.

```
aws ec2 get-ebs-default-kms-key-id
```

The output shows the default CMK for EBS encryption, which is an AWS managed CMK with the alias `alias/aws/ebs`.

```
{
    "KmsKeyId": "alias/aws/ebs"
}
```

The following output shows a custom CMK for EBS encryption.

```
{
    "KmsKeyId": "arn:aws:kms:us-
west-2:123456789012:key/0ea3fef3-80a7-4778-9d8c-1c0c6EXAMPLE"
}
```

- For API details, see GetEbsDefaultKmsKeyId in *AWS CLI Command Reference*.

`get-ebs-encryption-by-default`

The following code example shows how to use `get-ebs-encryption-by-default`.

AWS CLI

To describe whether EBS encryption by default is enabled

The following `get-ebs-encryption-by-default` example indicates whether EBS encryption by default is enabled for your AWS account in the current Region.

```
aws ec2 get-ebs-encryption-by-default
```

The following output indicates that EBS encryption by default is disabled.

```
{
    "EbsEncryptionByDefault": false
```

```
}
```

The following output indicates that EBS encryption by default is enabled.

```
{
    "EbsEncryptionByDefault": true
}
```

- For API details, see GetEbsEncryptionByDefault in *AWS CLI Command Reference*.

get-flow-logs-integration-template

The following code example shows how to use `get-flow-logs-integration-template`.

AWS CLI

To create a CloudFormation template to automate the integration of VPC flow logs with Amazon Athena

The following `get-flow-logs-integration-template` examples create a CloudFormation template to automate the integration of VPC flow logs with Amazon Athena.

Linux:

```
aws ec2 get-flow-logs-integration-template \
    --flow-log-id fl-1234567890abcdef0 \
    --config-delivery-s3-destination-arn arn:aws:s3:::amzn-s3-demo-bucket \
    --integrate-services
 AthenaIntegrations='[{IntegrationResultS3DestinationArn=arn:aws:s3:::amzn-s3-demo-
bucket,PartitionLoadFrequency=none,PartitionStartDate=2021-07-21T00:40:00,PartitionEndDate=2
{IntegrationResultS3DestinationArn=arn:aws:s3:::amzn-s3-demo-
bucket,PartitionLoadFrequency=none,PartitionStartDate=2021-07-21T00:40:00,PartitionEndDate=2
```

Windows:

```
aws ec2 get-flow-logs-integration-template ^
    --flow-log-id fl-1234567890abcdef0 ^
    --config-delivery-s3-destination-arn arn:aws:s3:::amzn-s3-demo-bucket ^
    --integrate-
services AthenaIntegrations=[{IntegrationResultS3DestinationArn=arn:aws:s3:::amzn-
s3-demo-
bucket,PartitionLoadFrequency=none,PartitionStartDate=2021-07-21T00:40:00,PartitionEndDate=2
```

```
{IntegrationResultS3DestinationArn=arn:aws:s3:::amzn-s3-demo-
bucket,PartitionLoadFrequency=none,PartitionStartDate=2021-07-21T00:40:00,PartitionEndDate=2
```

Output:

```
{
    "Result": "https://amzn-s3-demo-bucket.s3.us-east-2.amazonaws.com/
VPCFlowLogsIntegrationTemplate_fl-1234567890abcdef0_Wed%20Jul
%2021%2000%3A57%3A56%20UTC%202021.yml"
}
```

For information on using CloudFormation templates, see Working with AWS CloudFormation templates in the *AWS CloudFormation User Guide*.

For information on using Amazon Athena and flow logs, see Query flow logs using Amazon Athena in the *Amazon Virtual Private Cloud User Guide*.

- For API details, see GetFlowLogsIntegrationTemplate in *AWS CLI Command Reference*.

`get-groups-for-capacity-reservation`

The following code example shows how to use `get-groups-for-capacity-reservation`.

AWS CLI

To list the resource groups with a Capacity Reservation

The following `get-groups-for-capacity-reservation` example lists the resource groups to which the specified Capacity Reservation was added.

```
aws ec2 get-groups-for-capacity-reservation \
    --capacity-reservation-id cr-1234abcd56EXAMPLE
```

Output:

```
{
    "CapacityReservationsGroup": [
        {
            "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/my-
resource-group",
            "OwnerId": "123456789012"
        }
```

```
    ]
}
```

For more information, see Capacity Reservation groups in the *Amazon EC2 User Guide*.

- For API details, see GetGroupsForCapacityReservation in *AWS CLI Command Reference*.

`get-host-reservation-purchase-preview`

The following code example shows how to use `get-host-reservation-purchase-preview`.

AWS CLI

To get a purchase preview for a Dedicated Host Reservation

This example provides a preview of the costs for a specified Dedicated Host Reservation for the specified Dedicated Host in your account.

Command:

```
aws ec2 get-host-reservation-purchase-preview --offering-id hro-03f707bf363b6b324 --
host-id-set h-013abcd2a00cbd123
```

Output:

```
{
  "TotalHourlyPrice": "1.499",
  "Purchase": [
      {
          "HourlyPrice": "1.499",
          "InstanceFamily": "m4",
          "PaymentOption": "NoUpfront",
          "HostIdSet": [
              "h-013abcd2a00cbd123"
          ],
          "UpfrontPrice": "0.000",
          "Duration": 31536000
      }
  ],
  "TotalUpfrontPrice": "0.000"
}
```

- For API details, see GetHostReservationPurchasePreview in *AWS CLI Command Reference*.

`get-image-block-public-access-state`

The following code example shows how to use `get-image-block-public-access-state`.

AWS CLI

To get the block public access state for AMIs in the specified Region

The following `get-image-block-public-access-state` example gets the block public access state for AMIs at the account level in the specified Region.

```
aws ec2 get-image-block-public-access-state \
    --region us-east-1
```

Output:

```
{
    "ImageBlockPublicAccessState": "block-new-sharing"
}
```

For more information, see Block public access to your AMIs in the *Amazon EC2 User Guide*.

- For API details, see GetImageBlockPublicAccessState in *AWS CLI Command Reference*.

`get-instance-types-from-instance-requirements`

The following code example shows how to use `get-instance-types-from-instance-requirements`.

AWS CLI

To preview the instance types that match specified attributes

The following `get-instance-types-from-instance-requirements` example first generates a list of all of the possible attributes that can be specified using the `--generate-cli-skeleton` parameter, and saves the list to a JSON file. Then, the JSON file is used to customize the attributes for which to preview matched instance types.

To generate all possible attributes and save the output directly to a JSON file, use the following command.

```
aws ec2 get-instance-types-from-instance-requirements \
    --region us-east-1 \
    --generate-cli-skeleton input > attributes.json
```

Output:

```
{
    "DryRun": true,
    "ArchitectureTypes": [
        "x86_64_mac"
    ],
    "VirtualizationTypes": [
        "paravirtual"
    ],
    "InstanceRequirements": {
        "VCpuCount": {
            "Min": 0,
            "Max": 0
        },
        "MemoryMiB": {
            "Min": 0,
            "Max": 0
        },
        "CpuManufacturers": [
            "intel"
        ],
        "MemoryGiBPerVCpu": {
            "Min": 0.0,
            "Max": 0.0
        },
        "ExcludedInstanceTypes": [
            ""
        ],
        "InstanceGenerations": [
            "current"
        ],
        "SpotMaxPricePercentageOverLowestPrice": 0,
        "OnDemandMaxPricePercentageOverLowestPrice": 0,
        "BareMetal": "included",
        "BurstablePerformance": "excluded",
        "RequireHibernateSupport": true,
        "NetworkInterfaceCount": {
            "Min": 0,
```

```
            "Max": 0
        },
        "LocalStorage": "required",
        "LocalStorageTypes": [
            "hdd"
        ],
        "TotalLocalStorageGB": {
            "Min": 0.0,
            "Max": 0.0
        },
        "BaselineEbsBandwidthMbps": {
            "Min": 0,
            "Max": 0
        },
        "AcceleratorTypes": [
            "inference"
        ],
        "AcceleratorCount": {
            "Min": 0,
            "Max": 0
        },
        "AcceleratorManufacturers": [
            "xilinx"

}
```

Configure the JSON file. You must provide values for `ArchitectureTypes`, `VirtualizationTypes`, `VCpuCount`, and `MemoryMiB`. You can omit the other attributes. When omitted, default values are used. For a description of each attribute and their default values, see get-instance-types-from-instance-requirements <https://docs.aws.amazon.com/cli/latest/reference/ec2/get-instance-types-from-instance-requirements.html>.

Preview the instance types that have the attributes specified in `attributes.json`. Specify the name and path to your JSON file by using the `--cli-input-json` parameter. In the following request, the output is formatted as a table.

```
aws ec2 get-instance-types-from-instance-requirements \
    --cli-input-json file://attributes.json \
    --output table
```

Contents of `attributes.json` file:

```
{

    "ArchitectureTypes": [
        "x86_64"
    ],
    "VirtualizationTypes": [
        "hvm"
    ],
    "InstanceRequirements": {
        "VCpuCount": {
            "Min": 4,
            "Max": 6
        },
        "MemoryMiB": {
            "Min": 2048
        },
        "InstanceGenerations": [
            "current"
        ]
    }
}
```

Output:

```
------------------------------------------
|GetInstanceTypesFromInstanceRequirements|
+----------------------------------------+
||             InstanceTypes            ||
|+--------------------------------------+|
||             InstanceType             ||
|+--------------------------------------+|
||  c4.xlarge                           ||
```

```
||  c5.xlarge                           ||
||  c5a.xlarge                          ||
||  c5ad.xlarge                         ||
||  c5d.xlarge                          ||
||  c5n.xlarge                          ||
||  d2.xlarge                           ||
...
```

For more information about attribute-based instance type selection, see How attribute-based instance type selection works in the *Amazon EC2 User Guide*.

- For API details, see GetInstanceTypesFromInstanceRequirements in *AWS CLI Command Reference*.

`get-instance-uefi-data`

The following code example shows how to use `get-instance-uefi-data`.

AWS CLI

To retrieve UEFI data from an instance

The following `get-instance-uefi-data` example retrieves UEFI data from an instance. If the output is empty, the instance does not contain UEFI data.

```
aws ec2 get-instance-uefi-data \
    --instance-id i-0123456789example
```

Output:

```
{
    "InstanceId": "i-0123456789example",
    "UefiData": "QU1aTlVFRkkf+uLXAAAAAHj5a7fZ9+3dBzxXb/.
    <snipped>
    AAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAD4L/J/AODshho="
}
```

For more information, see UEFI Secure Boot in the *Amazon EC2 User Guide*.

- For API details, see GetInstanceUefiData in *AWS CLI Command Reference*.

`get-ipam-address-history`

The following code example shows how to use `get-ipam-address-history`.

AWS CLI

To get the history of a CIDR

The following `get-ipam-address-history` example gets the history of a CIDR.

(Linux):

```
aws ec2 get-ipam-address-history \
   --cidr 10.0.0.0/16 \
   --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 \
   --start-time 2021-12-08T01:00:00.000Z \
   --end-time 2021-12-10T01:00:00.000Z
```

(Windows):

```
aws ec2 get-ipam-address-history ^
   --cidr 10.0.0.0/16 ^
   --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 ^
   --start-time 2021-12-08T01:00:00.000Z ^
   --end-time 2021-12-10T01:00:00.000Z
```

Output:

```
{
    "HistoryRecords": [
        {
            "ResourceOwnerId": "123456789012",
            "ResourceRegion": "us-west-1",

                "VpcId": "vpc-042702f474812c9ad",
                "SampledStartTime": "2021-12-08T19:54:59.019000+00:00"
            },
            {
                "ResourceOwnerId": "123456789012",
                "ResourceRegion": "us-east-2",
                "ResourceType": "vpc",
                "ResourceId": "vpc-042b8a44f64267d67",
                "ResourceCidr": "10.0.0.0/16",
                "ResourceName": "tester",
                "ResourceComplianceStatus": "unmanaged",
                "ResourceOverlapStatus": "overlapping",
                "VpcId": "vpc-042b8a44f64267d67",
                "SampledStartTime": "2021-12-08T19:54:59.019000+00:00"
            }
        ]
    }
```

For more information, see View the history of IP addresses in the *Amazon VPC IPAM User Guide*.

- For API details, see GetIpamAddressHistory in *AWS CLI Command Reference*.

`get-ipam-discovered-accounts`

The following code example shows how to use `get-ipam-discovered-accounts`.

AWS CLI

To view the accounts discovered by an IPAM

In this scenario, you're a IPAM delegated admin who wants to view the AWS accounts that own resources that the IPAM is discovering.

The `--discovery-region` is the IPAM operating Region you want to view the monitored account statuses in. For example, if you have three IPAM operating Regions, you may want to make this request three times to view the timestamps specific to discovery in each of those particular Regions.

The following `get-ipam-discovered-accounts` example lists the AWS accounts that own resources that the IPAM is discovering.

```
aws ec2 get-ipam-discovered-accounts \
   --ipam-resource-discovery-id ipam-res-disco-0365d2977fc1672fe \
   --discovery-region us-east-1
```

Output:

```
{
    "IpamDiscoveredAccounts": [
        {
            "AccountId": "149977607591",
            "DiscoveryRegion": "us-east-1",
            "LastAttemptedDiscoveryTime": "2024-02-09T19:04:31.379000+00:00",
            "LastSuccessfulDiscoveryTime": "2024-02-09T19:04:31.379000+00:00"
        }
    ]
}
```

For more information, see Integrate IPAM with accounts outside of your organization in the *Amazon VPC IPAM User Guide*.

- For API details, see GetIpamDiscoveredAccounts in *AWS CLI Command Reference*.

`get-ipam-discovered-public-addresses`

The following code example shows how to use `get-ipam-discovered-public-addresses`.

AWS CLI

To view discovered public IP addresses

In this example, you are an IPAM delegated admin and you want to view the IP addresses of resources discovered by IPAM. You can get the resource discovery ID with describe-ipam-resource-discoveries.

The following `get-ipam-discovered-public-addresses` example shows the discovered public IP addresses for a resource discovery.

```
aws ec2 get-ipam-discovered-public-addresses \
    --ipam-resource-discovery-id ipam-res-disco-0f4ef577a9f37a162 \
    --address-region us-east-1 \
    --region us-east-1
```

Output:

```
{
    "IpamDiscoveredPublicAddresses": [
        {
           "IpamResourceDiscoveryId": "ipam-res-disco-0f4ef577a9f37a162",
            "AddressRegion": "us-east-1",
            "Address": "54.208.155.7",
            "AddressOwnerId": "320805250157",
            "AssociationStatus": "associated",
            "AddressType": "ec2-public-ip",
            "VpcId": "vpc-073b294916198ce49",
            "SubnetId": "subnet-0b6c8a8839e9a4f15",
            "NetworkInterfaceId": "eni-081c446b5284a5e06",
            "NetworkInterfaceDescription": "",
            "InstanceId": "i-07459a6fca5b35823",
            "Tags": {},
            "NetworkBorderGroup": "us-east-1c",
            "SecurityGroups": [
                {
                    "GroupName": "launch-wizard-2",

                }
            ],
            "SampleTime": "2024-04-05T15:13:59.228000+00:00"
        },
        {
            "IpamResourceDiscoveryId": "ipam-res-disco-0f4ef577a9f37a162",
            "AddressRegion": "us-east-1",
            "Address": "44.201.251.218",
            "AddressOwnerId": "470889052923",
            "AssociationStatus": "associated",
            "AddressType": "ec2-public-ip",
            "VpcId": "vpc-6c31a611",
            "SubnetId": "subnet-062f47608b99834b1",
            "NetworkInterfaceId": "eni-024845359c2c3ae9b",
            "NetworkInterfaceDescription": "",
            "InstanceId": "i-04ef786d9c4e03f41",
```

```
                "Tags": {},
                "NetworkBorderGroup": "us-east-1a",
                "SecurityGroups": [
                    {
                        "GroupName": "launch-wizard-32",
                        "GroupId": "sg-0ed1a426e96a68374"
                    }
                ],
                "SampleTime": "2024-04-05T15:13:59.145000+00:00"
            }
}
```

For more information, see View public IP insights in the *Amazon VPC IPAM User Guide*.

- For API details, see GetIpamDiscoveredPublicAddresses in *AWS CLI Command Reference*.

`get-ipam-discovered-resource-cidrs`

The following code example shows how to use `get-ipam-discovered-resource-cidrs`.

AWS CLI

To view the IP address CIDRs discovered by an IPAM

In this example, you're a IPAM delegated admin who wants to view details related to the IP address CIDRs for resources that the IPAM is discovering.

To complete this request:

The resource discovery you choose must be associated with the IPAM.The `--resource-region` is the AWS Region where resource was created.

The following `get-ipam-discovered-resource-cidrs` example lists the IP addresses for resources that the IPAM is discovering.

```
aws ec2 get-ipam-discovered-resource-cidrs \
   --ipam-resource-discovery-id ipam-res-disco-0365d2977fc1672fe \
   --resource-region us-east-1
```

Output:

```
{
```

```
    {
        "IpamDiscoveredResourceCidrs": [
        {
            "IpamResourceDiscoveryId": "ipam-res-disco-0365d2977fc1672fe",
            "ResourceRegion": "us-east-1",
            "ResourceId": "vpc-0c974c95ca7ceef4a",
            "ResourceOwnerId": "149977607591",
            "ResourceCidr": "172.31.0.0/16",
            "ResourceType": "vpc",
            "ResourceTags": [],
            "IpUsage": 0.375,
            "VpcId": "vpc-0c974c95ca7ceef4a",
            "SampleTime": "2024-02-09T19:15:16.529000+00:00"
        },
        {
            "IpamResourceDiscoveryId": "ipam-res-disco-0365d2977fc1672fe",
            "ResourceRegion": "us-east-1",
            "ResourceId": "subnet-07fe028119082a8c1",
            "ResourceOwnerId": "149977607591",
            "ResourceCidr": "172.31.0.0/20",
            "ResourceType": "subnet",
            "ResourceTags": [],
            "IpUsage": 0.0012,
            "VpcId": "vpc-0c974c95ca7ceef4a",
            "SampleTime": "2024-02-09T19:15:16.529000+00:00"
        },
        {
            "IpamResourceDiscoveryId": "ipam-res-disco-0365d2977fc1672fe",
            "ResourceRegion": "us-east-1",
            "ResourceId": "subnet-0a96893763984cc4e",
            "ResourceOwnerId": "149977607591",
            "ResourceCidr": "172.31.64.0/20",
            "ResourceType": "subnet",
            "ResourceTags": [],
            "IpUsage": 0.0012,
            "VpcId": "vpc-0c974c95ca7ceef4a",
            "SampleTime": "2024-02-09T19:15:16.529000+00:00"
        }
    }
}
```

For more information, see Monitor CIDR usage by resource in the *Amazon VPC IPAM User Guide*.

- For API details, see GetIpamDiscoveredResourceCidrs in *AWS CLI Command Reference*.

`get-ipam-pool-allocations`

The following code example shows how to use `get-ipam-pool-allocations`.

AWS CLI

To get the CIDRs allocated from an IPAM pool

The following `get-ipam-pool-allocations` example gets the CIDRs allocated from an IPAM pool.

(Linux):

```
aws ec2 get-ipam-pool-allocations \
    --ipam-pool-id ipam-pool-0533048da7d823723 \
    --filters Name=ipam-pool-allocation-id,Values=ipam-pool-
alloc-0e6186d73999e47389266a5d6991e6220
```

(Windows):

```
aws ec2 get-ipam-pool-allocations ^
    --ipam-pool-id ipam-pool-0533048da7d823723 ^
    --filters Name=ipam-pool-allocation-id,Values=ipam-pool-
alloc-0e6186d73999e47389266a5d6991e6220
```

Output:

```
{
    "IpamPoolAllocations": [
        {
            "Cidr": "10.0.0.0/16",
            "IpamPoolAllocationId": "ipam-pool-
alloc-0e6186d73999e47389266a5d6991e6220",
            "ResourceType": "custom",
            "ResourceOwner": "123456789012"
        }
    ]
}
```

- For API details, see GetIpamPoolAllocations in *AWS CLI Command Reference*.

`get-ipam-pool-cidrs`

The following code example shows how to use `get-ipam-pool-cidrs`.

AWS CLI

To get the CIDRs provisioned to an IPAM pool

The following `get-ipam-pool-cidrs` example gets the CIDRs provisioned to an IPAM pool.

(Linux):

```
aws ec2 get-ipam-pool-cidrs \
    --ipam-pool-id ipam-pool-0533048da7d823723 \
    --filters 'Name=cidr,Values=10.*'
```

(Windows):

```
aws ec2 get-ipam-pool-cidrs ^
    --ipam-pool-id ipam-pool-0533048da7d823723 ^
    --filters Name=cidr,Values=10.*
```

Output:

```
{
    "IpamPoolCidr": {
        "Cidr": "10.0.0.0/24",
        "State": "provisioned"
    }
}
```

- For API details, see GetIpamPoolCidrs in *AWS CLI Command Reference*.

`get-ipam-resource-cidrs`

The following code example shows how to use `get-ipam-resource-cidrs`.

AWS CLI

To get the CIDRs allocated to a resource

The following `get-ipam-resource-cidrs` example gets the CIDRs allocated to a resource.

(Linux):

```
aws ec2 get-ipam-resource-cidrs \
    --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 \
    --filters Name=management-state,Values=unmanaged
```

(Windows):

```
aws ec2 get-ipam-resource-cidrs ^
    --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 ^
    --filters Name=management-state,Values=unmanaged
```

Output:

```
{
    "IpamResourceCidrs": [
        {
            "IpamId": "ipam-08440e7a3acde3908",
            "IpamScopeId": "ipam-scope-02fc38cd4c48e7d38",
            "ResourceRegion": "us-east-2",
            "ResourceOwnerId": "123456789012",
            "ResourceId": "vpc-621b8709",
            "ResourceName": "Default AWS VPC",
            "ResourceCidr": "172.33.0.0/16",
            "ResourceType": "vpc",
            "ResourceTags": [
                {
                    "Key": "Environment",
                    "Value": "Test"
                },
                {
                    "Key": "Name",
                    "Value": "Default AWS VPC"
                }
            ],
            "IpUsage": 0.0039,
            "ComplianceStatus": "unmanaged",
            "ManagementState": "unmanaged",
            "OverlapStatus": "nonoverlapping",
            "VpcId": "vpc-621b8709"
        }
    ]
```

```
}
```

For more information, see Monitor CIDR usage by resource in the *Amazon VPC IPAM User Guide*.

- For API details, see GetIpamResourceCidrs in *AWS CLI Command Reference*.

`get-launch-template-data`

The following code example shows how to use `get-launch-template-data`.

AWS CLI

To get instance data for a launch template

This example gets data about the specified instance and uses the `--query` option to return the contents in `LaunchTemplateData`. You can use the output as a base to create a new launch template or launch template version.

Command:

```
aws ec2 get-launch-template-data --instance-id i-0123d646e8048babc --query
 'LaunchTemplateData'
```

Output:

```
{
      "Monitoring": {},

get-managed-prefix-list-associations

The following code example shows how to use `get-managed-prefix-list-associations`.

AWS CLI

To get prefix list associations

The following `get-managed-prefix-list-associations` example gets the resources that are associated with the specified prefix list.

```
aws ec2 get-managed-prefix-list-associations \
    --prefix-list-id pl-0123456abcabcabc1
```

Output:

```
{
    "PrefixListAssociations": [
        {
            "ResourceId": "sg-0abc123456abc12345",
            "ResourceOwner": "123456789012"
        }
    ]
}
```

For more information, see Managed prefix lists in the *Amazon VPC User Guide*.

- For API details, see GetManagedPrefixListAssociations in *AWS CLI Command Reference*.

`get-managed-prefix-list-entries`

The following code example shows how to use `get-managed-prefix-list-entries`.

AWS CLI

To get the entries for a prefix list

The following `get-managed-prefix-list-entries` gets the entries for the specified prefix list.

```
aws ec2 get-managed-prefix-list-entries \
    --prefix-list-id pl-0123456abcabcabc1
```

Output:

```
{
    "Entries": [
        {
            "Cidr": "10.0.0.0/16",
            "Description": "vpc-a"
        },
        {
            "Cidr": "10.2.0.0/16",
            "Description": "vpc-b"
        }
    ]
}
```

For more information, see Managed prefix lists in the *Amazon VPC User Guide*.

- For API details, see GetManagedPrefixListEntries in *AWS CLI Command Reference*.

`get-network-insights-access-scope-analysis-findings`

The following code example shows how to use `get-network-insights-access-scope-analysis-findings`.

AWS CLI

To get the findings of Network Insights access scope analysis

The following `get-network-insights-access-scope-analysis-findings` example gets the selected scope analysis findings in your AWS account.

```
aws ec2 get-network-insights-access-scope-analysis-findings \
    --region us-east-1 \
    --network-insights-access-scope-analysis-id nis \
    --nis-123456789111
```

Output:

```
{
    "NetworkInsightsAccessScopeAnalysisId": "nisa-123456789222",
    "AnalysisFindings": [
        {
            "NetworkInsightsAccessScopeAnalysisId": "nisa-123456789222",
            "NetworkInsightsAccessScopeId": "nis-123456789111",
            "FindingComponents": [

                        "SourcePortRanges": [
                            {
                                "From": 0,
                                "To": 65535
                            }
                        ]
                    }, [etc]
                ]
            }
        }
    ]
}
```

For more information, see Getting started with Network Access Analyzer using the AWS CLI in the *Network Access Analyzer Guide*.

- For API details, see GetNetworkInsightsAccessScopeAnalysisFindings in *AWS CLI Command Reference*.

`get-network-insights-access-scope-content`

The following code example shows how to use `get-network-insights-access-scope-content`.

AWS CLI

To get Network Insights access scope content

The following `get-network-insights-access-scope-content` example gets the content of the selected scope analysis ID in your AWS account.

```
aws ec2 get-network-insights-access-scope-content \
    --region us-east-1 \
    --network-insights-access-scope-id nis-123456789222
```

Output:

```
{
    "NetworkInsightsAccessScopeContent": {
        "NetworkInsightsAccessScopeId": "nis-123456789222",
        "MatchPaths": [
            {
                "Source": {
                    "ResourceStatement": {
                        "ResourceTypes": [
                            "AWS::EC2::NetworkInterface"
                        ]
                    }
                },
                "Destination": {
                    "ResourceStatement": {
                        "ResourceTypes": [
                            "AWS::EC2::InternetGateway"
                        ]
                    }
                }
            }
        ]
    }
}
```

For more information, see Getting started with Network Access Analyzer using the AWS CLI in the *Network Access Analyzer Guide*.

- For API details, see GetNetworkInsightsAccessScopeContent in *AWS CLI Command Reference*.

`get-password-data`

The following code example shows how to use `get-password-data`.

AWS CLI

To get the encrypted password

This example gets the encrypted password.

Command:

```
aws ec2 get-password-data --instance-id i-1234567890abcdef0
```

Output:

```
{
    "InstanceId": "i-1234567890abcdef0",
    "Timestamp": "2013-08-07T22:18:38.000Z",
    "PasswordData": "gSlJFq+VpcZXqy+iktxMF6NyxQ4qCrT4+gaOuNOenX1MmgXPTj7XEXAMPLE

DPGzKrF5yLlf3etP2L4ZR6CvG7K1hx7VKOQVN32Dajw=="
}
```

To get the decrypted password

This example gets the decrypted password.

Command:

```
aws ec2 get-password-data --instance-id  i-1234567890abcdef0 --priv-launch-key C:
\Keys\MyKeyPair.pem
```

Output:

```
{
    "InstanceId": "i-1234567890abcdef0",
    "Timestamp": "2013-08-30T23:18:05.000Z",
    "PasswordData": "&ViJ652e*u"
}
```

- For API details, see GetPasswordData in *AWS CLI Command Reference*.

`get-reserved-instances-exchange-quote`

The following code example shows how to use `get-reserved-instances-exchange-quote`.

AWS CLI

To get a quote for exchanging a Convertible Reserved Instance

This example gets the exchange information for the specified Convertible Reserved Instances.

Command:

```
aws ec2 get-reserved-instances-exchange-quote --reserved-
instance-ids 7b8750c3-397e-4da4-bbcb-a45ebexample --target-
configurations OfferingId=6fea5434-b379-434c-b07b-a7abexample
```

Output:

```
{
  "CurrencyCode": "USD",
  "ReservedInstanceValueSet": [
      {
          "ReservedInstanceId": "7b8750c3-397e-4da4-bbcb-a45ebexample",
          "ReservationValue": {
              "RemainingUpfrontValue": "0.000000",
              "HourlyPrice": "0.027800",
              "RemainingTotalValue": "730.556200"
          }
      }
  ],
  "PaymentDue": "424.983828",

      {
          "TargetConfiguration": {
              "InstanceCount": 5,
              "OfferingId": "6fea5434-b379-434c-b07b-a7abexample"
          },
          "ReservationValue": {
              "RemainingUpfrontValue": "424.983828",
              "HourlyPrice": "0.016000",
              "RemainingTotalValue": "845.447828"
          }
      }
```

```
  ],
  "IsValidExchange": true,
  "OutputReservedInstancesWillExpireAt": "2020-10-01T13:03:39Z",
  "ReservedInstanceValueRollup": {
      "RemainingUpfrontValue": "0.000000",
      "HourlyPrice": "0.027800",
      "RemainingTotalValue": "730.556200"
  },
  "TargetConfigurationValueRollup": {
      "RemainingUpfrontValue": "424.983828",
      "HourlyPrice": "0.016000",
      "RemainingTotalValue": "845.447828"
  }
}
```

- For API details, see GetReservedInstancesExchangeQuote in *AWS CLI Command Reference*.

`get-security-groups-for-vpc`

The following code example shows how to use `get-security-groups-for-vpc`.

AWS CLI

To view security groups that can be associated with network interfaces in a specified VPC.

The following `get-security-groups-for-vpc` example shows the security groups that can be associated with network interfaces in the VPC.

```
aws ec2 get-security-groups-for-vpc \
    --vpc-id vpc-6c31a611 \
    --region us-east-1
```

Output:

```
{
    "SecurityGroupForVpcs": [
        {
            "Description": "launch-wizard-36 created 2022-08-29T15:59:35.338Z",
            "GroupName": "launch-wizard-36",
            "OwnerId": "470889052923",
            "GroupId": "sg-007e0c3027ee885f5",
            "Tags": [],
```

```
            "PrimaryVpcId": "vpc-6c31a611"
        },
        {
            "Description": "launch-wizard-18 created 2024-01-19T20:22:27.527Z",
            "GroupName": "launch-wizard-18",
            "OwnerId": "470889052923",
            "GroupId": "sg-0147193bef51c9eef",
            "Tags": [],
            "PrimaryVpcId": "vpc-6c31a611"
        }
}
```

- For API details, see GetSecurityGroupsForVpc in *AWS CLI Command Reference*.

`get-serial-console-access-status`

The following code example shows how to use `get-serial-console-access-status`.

AWS CLI

To view the status of account access to the serial console

The following `get-serial-console-access-status` example determines whether serial console access is enabled for your account.

```
aws ec2 get-serial-console-access-status
```

Output:

```
{
    "SerialConsoleAccessEnabled": true
}
```

For more information, see EC2 Serial Console in the *Amazon EC2 User Guide*.

- For API details, see GetSerialConsoleAccessStatus in *AWS CLI Command Reference*.

`get-snapshot-block-public-access-state`

The following code example shows how to use `get-snapshot-block-public-access-state`.

AWS CLI

To get the current state of block public access for snapshots

The following `get-snapshot-block-public-access-state` example gets the current state of block public access for snapshots.

```
aws ec2 get-snapshot-block-public-access-state
```

Output:

```
{
    "State": "block-all-sharing"
}
```

For more information, see Block public access for snapshots in the *Amazon EBS User Guide*.

- For API details, see GetSnapshotBlockPublicAccessState in *AWS CLI Command Reference*.

`get-spot-placement-scores`

The following code example shows how to use `get-spot-placement-scores`.

AWS CLI

To calculate the Spot placement score for specified requirements

The following `get-spot-placement-scores` example first generates a list of all of the possible parameters that can be specified for the Spot placement score configuration using the `--generate-cli-skeleton` parameter, and saves the list to a JSON file. Then, the JSON file is used to configure the requirements to use to calculate the Spot placement score.

To generate all possible parameters that can be specified for the Spot placement score configuration, and save the output directly to a JSON file.

```
aws ec2 get-spot-placement-scores \
    --region us-east-1 \
    --generate-cli-skeleton input > attributes.json
```

Output:

```
{
```

```
    "InstanceTypes": [
        ""
    ],
    "TargetCapacity": 0,
    "TargetCapacityUnitType": "vcpu",

        }
    },
    "DryRun": true,
    "MaxResults": 0,
    "NextToken": ""
}
```

Configure the JSON file. You must provide a value for `TargetCapacity`. For a description of each parameter and their default values, see Calculate the Spot placement score (AWS CLI) <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/spot-placement-score.html#calculate-sps-cli>.

Calculate the Spot placement score for the requirements specified in `attributes.json`. Specify the name and path to your JSON file by using the `--cli-input-json` parameter.

```
aws ec2 get-spot-placement-scores \
    --region us-east-1 \
    --cli-input-json file://attributes.json
```

Output if `SingleAvailabilityZone` is set to `false` or omitted (if omitted, it defaults to `false`). A scored list of Regions is returned.

```
"Recommendation": [
    {
        "Region": "us-east-1",
        "Score": 7
    },
    {
        "Region": "us-west-1",
        "Score": 5
    },
   ...
```

Output if `SingleAvailabilityZone` is set to `true`. A scored list of SingleAvailability Zones is returned.

```
"Recommendation": [
    {
        "Region": "us-east-1",
        "AvailabilityZoneId": "use1-az1"
        "Score": 8

```

For more information about calculating a Spot placement score, and for example configurations, see Calculate a Spot placement score in the *Amazon EC2 User Guide*.

- For API details, see GetSpotPlacementScores in *AWS CLI Command Reference*.

`get-subnet-cidr-reservations`

The following code example shows how to use `get-subnet-cidr-reservations`.

AWS CLI

To get information about a subnet CIDR reservation

The following `get-subnet-cidr-reservations` example displays information about the specified subnet CIDR reservation.

```
aws ec2 get-subnet-cidr-reservations \
    --subnet-id subnet-03c51e2e6cEXAMPLE
```

Output:

```
{
    "SubnetIpv4CidrReservations": [
        {
            "SubnetCidrReservationId": "scr-044f977c4eEXAMPLE",
            "SubnetId": "subnet-03c51e2e6cEXAMPLE",
            "Cidr": "10.1.0.16/28",
            "ReservationType": "prefix",
            "OwnerId": "123456789012"
        }
    ],
    "SubnetIpv6CidrReservations": []
}
```

For more information, see Subnet CIDR reservations in the *Amazon VPC User Guide*.

- For API details, see GetSubnetCidrReservations in *AWS CLI Command Reference*.

`get-transit-gateway-attachment-propagations`

The following code example shows how to use `get-transit-gateway-attachment-propagations`.

AWS CLI

To list the route tables to which the specified resource attachment propagates routes

The following `get-transit-gateway-attachment-propagations` example lists the route table to which the specified resource attachment propagates routes.

```
aws ec2 get-transit-gateway-attachment-propagations \
    --transit-gateway-attachment-id tgw-attach-09fbd47ddfEXAMPLE
```

Output:

```
{
    "TransitGatewayAttachmentPropagations": [
        {
            "TransitGatewayRouteTableId": "tgw-rtb-0882c61b97EXAMPLE",
            "State": "enabled"
        }
    ]
}
```

For more information, see Transit gateway route tables in the *Transit Gateways Guide*.

- For API details, see GetTransitGatewayAttachmentPropagations in *AWS CLI Command Reference*.

get-transit-gateway-multicast-domain-associations

The following code example shows how to use `get-transit-gateway-multicast-domain-associations`.

AWS CLI

To view the information about the transit gateway multicast domain associations

The following `get-transit-gateway-multicast-domain-associations` example returns the associations for the specified multicast domain.

```
aws ec2 get-transit-gateway-multicast-domain-associations \
    --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef7EXAMPLE
```

Output:

```
{
    "MulticastDomainAssociations": [
        {
```

```
                "TransitGatewayAttachmentId": "tgw-attach-028c1dd0f8EXAMPLE",
                "ResourceId": "vpc-01128d2c24EXAMPLE",
                "ResourceType": "vpc",
                "Subnet": {
                    "SubnetId": "subnet-000de86e3bEXAMPLE",
                    "State": "associated"
                }
            },
            {
                "TransitGatewayAttachmentId": "tgw-attach-070e571cd1EXAMPLE",
                "ResourceId": "vpc-7EXAMPLE",
                "ResourceType": "vpc",
                "Subnet": {
                    "SubnetId": "subnet-4EXAMPLE",
                    "State": "associated"
                }
            },
            {
                "TransitGatewayAttachmentId": "tgw-attach-070e571cd1EXAMPLE",
                "ResourceId": "vpc-7EXAMPLE",
                "ResourceType": "vpc",
                "Subnet": {
                    "SubnetId": "subnet-5EXAMPLE",
                    "State": "associated"
                }
            },
            {
                "TransitGatewayAttachmentId": "tgw-attach-070e571cd1EXAMPLE",
                "ResourceId": "vpc-7EXAMPLE",
                "ResourceType": "vpc",
                "Subnet": {
                    "SubnetId": "subnet-aEXAMPLE",
                    "State": "associated"
                }
            },
            {
                "TransitGatewayAttachmentId": "tgw-attach-070e571cd1EXAMPLE",
                "ResourceId": "vpc-7EXAMPLE",
                "ResourceType": "vpc",
                "Subnet": {
                    "SubnetId": "subnet-fEXAMPLE",
                    "State": "associated"
                }
            }
```

```
    ]
}
```

For more information, see Multicast domains in the *Transit Gateways Guide*.

- For API details, see GetTransitGatewayMulticastDomainAssociations in *AWS CLI Command Reference*.

get-transit-gateway-prefix-list-references

The following code example shows how to use `get-transit-gateway-prefix-list-references`.

AWS CLI

To get prefix list references in a transit gateway route table

The following `get-transit-gateway-prefix-list-references` example gets the prefix list references for the specified transit gateway route table, and filters by the ID of a specific prefix list.

```
aws ec2 get-transit-gateway-prefix-list-references \
    --transit-gateway-route-table-id tgw-rtb-0123456789abcd123 \
    --filters Name=prefix-list-id,Values=pl-11111122222222333
```

Output:

```
{
    "TransitGatewayPrefixListReferences": [
        {
            "TransitGatewayRouteTableId": "tgw-rtb-0123456789abcd123",
            "PrefixListId": "pl-11111122222222333",
            "PrefixListOwnerId": "123456789012",
            "State": "available",
            "Blackhole": false,
            "TransitGatewayAttachment": {
                "TransitGatewayAttachmentId": "tgw-attach-aabbccddaabbccaab",
                "ResourceType": "vpc",
                "ResourceId": "vpc-112233445566aabbc"
            }
        }
```

```
    ]
}
```

For more information, see Prefix list references in the *Transit Gateways Guide*.

- For API details, see GetTransitGatewayPrefixListReferences in *AWS CLI Command Reference*.

`get-transit-gateway-route-table-associations`

The following code example shows how to use `get-transit-gateway-route-table-associations`.

AWS CLI

To get information about the associations for the specified transit gateway route table

The following `get-transit-gateway-route-table-associations` example displays information about the associations for the specified transit gateway route table.

```
aws ec2 get-transit-gateway-route-table-associations \
    --transit-gateway-route-table-id tgw-rtb-0a823edbdeEXAMPLE
```

Output:

```
{
    "Associations": [
        {
            "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
            "ResourceId": "vpc-4d7de228",
            "ResourceType": "vpc",
            "State": "associating"
        }
    ]
}
```

For more information, see Transit gateway route tables in the *Transit Gateways Guide*.

- For API details, see GetTransitGatewayRouteTableAssociations in *AWS CLI Command Reference*.

`get-transit-gateway-route-table-propagations`

The following code example shows how to use `get-transit-gateway-route-table-propagations`.

AWS CLI

To display information about the route table propagations for the specified transit gateway route table

The following `get-transit-gateway-route-table-propagations` example returns the route table propagations for the specified route table.

```
aws ec2 get-transit-gateway-route-table-propagations \
    --transit-gateway-route-table-id tgw-rtb-002573ed1eEXAMPLE
```

Output:

```
{
    "TransitGatewayRouteTablePropagations": [
        {
            "TransitGatewayAttachmentId": "tgw-attach-01f8100bc7EXAMPLE",
            "ResourceId": "vpc-3EXAMPLE",
            "ResourceType": "vpc",
            "State": "enabled"
        },
        {
            "TransitGatewayAttachmentId": "tgw-attach-08e0bc912cEXAMPLE",
            "ResourceId": "11460968-4ac1-4fd3-bdb2-00599EXAMPLE",
            "ResourceType": "direct-connect-gateway",
            "State": "enabled"
        },
        {
            "TransitGatewayAttachmentId": "tgw-attach-0a89069f57EXAMPLE",
            "ResourceId": "8384da05-13ce-4a91-aada-5a1baEXAMPLE",
            "ResourceType": "direct-connect-gateway",
            "State": "enabled"
        }
    ]
}
```

For more information, see Transit gateway route tables in the *Transit Gateways Guide*.

- For API details, see GetTransitGatewayRouteTablePropagations in *AWS CLI Command Reference*.

`get-verified-access-endpoint-policy`

The following code example shows how to use `get-verified-access-endpoint-policy`.

AWS CLI

To get the Verified Access policy of an endpoint

The following `get-verified-access-endpoint-policy` example gets the Verified Access policy of the specified endpoint.

```
aws ec2 get-verified-access-endpoint-policy \
    --verified-access-endpoint-id vae-066fac616d4d546f2
```

Output:

```
{
    "PolicyEnabled": true,
    "PolicyDocument": "permit(principal,action,resource)\nwhen
 {\n    context.identity.groups.contains(\"finance\") &&\n
 context.identity.email_verified == true\n};"
}
```

For more information, see Verified Access policies in the *AWS Verified Access User Guide*.

- For API details, see GetVerifiedAccessEndpointPolicy in *AWS CLI Command Reference*.

`get-verified-access-group-policy`

The following code example shows how to use `get-verified-access-group-policy`.

AWS CLI

To get the Verified Access policy of a group

The following `get-verified-access-group-policy` example gets the Verified Access policy of the specified group.

```
aws ec2 get-verified-access-group-policy \
    --verified-access-group-id vagr-0dbe967baf14b7235
```

Output:

```
{
    "PolicyEnabled": true,
    "PolicyDocument": "permit(principal,action,resource)\nwhen
 {\n    context.identity.groups.contains(\"finance\") &&\n
 context.identity.email_verified == true\n};"
}
```

For more information, see Verified Access groups in the *AWS Verified Access User Guide*.

- For API details, see GetVerifiedAccessGroupPolicy in *AWS CLI Command Reference*.

`get-vpn-connection-device-sample-configuration`

The following code example shows how to use `get-vpn-connection-device-sample-configuration`.

AWS CLI

To download a sample configuration file

The following `get-vpn-connection-device-sample-configuration` example downloads the specified sample configuration file. To list the gateway devices with a sample configuration file, call the `get-vpn-connection-device-types` command.

```
aws ec2 get-vpn-connection-device-sample-configuration \
    --vpn-connection-id vpn-123456789abc01234 \
    --vpn-connection-device-type-id 5fb390ba
```

Output:

```
{
    "VpnConnectionDeviceSampleConfiguration": "contents-of-the-sample-configuration-
file"
}
```

For more information, see Download the configuration file in the *AWS Site-to-Site VPN User Guide*.

- For API details, see GetVpnConnectionDeviceSampleConfiguration in *AWS CLI Command Reference*.

`get-vpn-connection-device-types`

The following code example shows how to use `get-vpn-connection-device-types`.

AWS CLI

To list gateway devices with a sample configuration file

The following `get-vpn-connection-device-types` example lists the gateway devices from Palo Alto Networks that have sample configuration files.

```
aws ec2 get-vpn-connection-device-types \
    --query "VpnConnectionDeviceTypes[?Vendor==`Palo Alto Networks`]"
```

Output:

```
[
    {
        "VpnConnectionDeviceTypeId": "754a6372",
        "Vendor": "Palo Alto Networks",
        "Platform": "PA Series",
        "Software": "PANOS 4.1.2+"
    },
    {
        "VpnConnectionDeviceTypeId": "9612cbed",
        "Vendor": "Palo Alto Networks",
        "Platform": "PA Series",
        "Software": "PANOS 4.1.2+ (GUI)"
    },
    {
        "VpnConnectionDeviceTypeId": "5fb390ba",
        "Vendor": "Palo Alto Networks",
        "Platform": "PA Series",
        "Software": "PANOS 7.0+"
    }
]
```

For more information, see Download the configuration file in the *AWS Site-to-Site VPN user Guide*.

- For API details, see GetVpnConnectionDeviceTypes in *AWS CLI Command Reference*.

`import-client-vpn-client-certificate-revocation-list`

The following code example shows how to use `import-client-vpn-client-certificate-revocation-list`.

AWS CLI

To import a client certificate revocation list

The following `import-client-vpn-client-certificate-revocation-list` example imports a client certificate revocation list to the Client VPN endpoint by specifying the location of the file on the local computer.

```
aws ec2 import-client-vpn-client-certificate-revocation-list \
    --certificate-revocation-list file:///path/to/crl.pem \
    --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```
{
    "Return": true
}
```

For more information, see Client Certificate Revocation Lists in the *AWS Client VPN Administrator Guide*.

- For API details, see ImportClientVpnClientCertificateRevocationList in *AWS CLI Command Reference*.

`import-image`

The following code example shows how to use `import-image`.

AWS CLI

To import a VM image file as an AMI

The following `import-image` example imports the specified OVA.

```
aws ec2 import-image \
  --disk-containers Format=ova,UserBucket="{S3Bucket=my-import-bucket,S3Key=vms/my-server-vm.ova}"
```

Output:

```
{
    "ImportTaskId": "import-ami-1234567890abcdef0",
    "Progress": "2",
    "SnapshotDetails": [
        {
            "DiskImageSize": 0.0,
            "Format": "ova",
            "UserBucket": {
                "S3Bucket": "my-import-bucket",
                "S3Key": "vms/my-server-vm.ova"
            }
        }
    ],
    "Status": "active",
    "StatusMessage": "pending"
}
```

- For API details, see ImportImage in *AWS CLI Command Reference*.

`import-key-pair`

The following code example shows how to use `import-key-pair`.

AWS CLI

To import a public key

First, generate a key pair with the tool of your choice. For example, use this ssh-keygen command:

Command:

```
ssh-keygen -t rsa -C "my-key" -f ~/.ssh/my-key
```

Output:

```
Generating public/private rsa key pair.
Enter passphrase (empty for no passphrase):
Enter same passphrase again:
Your identification has been saved in /home/ec2-user/.ssh/my-key.
Your public key has been saved in /home/ec2-user/.ssh/my-key.pub.
...
```

This example command imports the specified public key.

Command:

```
aws ec2 import-key-pair --key-name "my-key" --public-key-material fileb://~/.ssh/my-key.pub
```

Output:

```
{
  "KeyName": "my-key",
  "KeyFingerprint": "1f:51:ae:28:bf:89:e9:d8:1f:25:5d:37:2d:7d:b8:ca"
}
```

- For API details, see ImportKeyPair in *AWS CLI Command Reference*.

`import-snapshot`

The following code example shows how to use `import-snapshot`.

AWS CLI

To import a snapshot

The following `import-snapshot` example imports the specified disk as a snapshot.

```
aws ec2 import-snapshot \
    --description "My server VMDK" \
    --disk-container Format=VMDK,UserBucket={'S3Bucket=my-import-bucket,S3Key=vms/my-server-vm.vmdk'}
```

Output:

```
{
    "Description": "My server VMDK",
    "ImportTaskId": "import-snap-1234567890abcdef0",
    "SnapshotTaskDetail": {
        "Description": "My server VMDK",
        "DiskImageSize": "0.0",
        "Format": "VMDK",
        "Progress": "3",
        "Status": "active",
        "StatusMessage": "pending"
        "UserBucket": {
            "S3Bucket": "my-import-bucket",
            "S3Key": "vms/my-server-vm.vmdk"
        }
    }
}
```

- For API details, see ImportSnapshot in *AWS CLI Command Reference*.

`list-images-in-recycle-bin`

The following code example shows how to use `list-images-in-recycle-bin`.

AWS CLI

To list the images in the Recycle Bin

The following `list-images-in-recycle-bin` example lists all of the images that are currently retained in the Recycle Bin.

```
aws ec2 list-images-in-recycle-bin
```

Output:

```
{
    "Images": [
        {
            "RecycleBinEnterTime": "2022-03-14T15:35:08.000Z",
            "Description": "Monthly AMI One",
            "RecycleBinExitTime": "2022-03-15T15:35:08.000Z",
            "Name": "AMI_01",
```

```
                "ImageId": "ami-0111222333444abcd"
            }
        ]
    }
```

For more information, see [Recover deleted AMIs from the Recycle Bin](#) in the *Amazon EBS User Guide*.

- For API details, see [ListImagesInRecycleBin](#) in *AWS CLI Command Reference*.

`list-snapshots-in-recycle-bin`

The following code example shows how to use `list-snapshots-in-recycle-bin`.

AWS CLI

To view snapshots in the Recycle Bin

The following `list-snapshots-in-recycle-bin` example lists information about snapshots in the Recycle Bin, including the snapshot ID, a description of the snapshot, The ID of the volume from which the snapshot was created, the date and time when the snapshot was deleted and it entered the Recycle Bin, and the date and time when the retention period expires.

```
aws ec2 list-snapshots-in-recycle-bin \
    --snapshot-id snap-01234567890abcdef
```

Output:

```
{
    "SnapshotRecycleBinInfo": [
        {
            "Description": "Monthly data backup snapshot",
            "RecycleBinEnterTime": "2022-12-01T13:00:00.000Z",
            "RecycleBinExitTime": "2022-12-15T13:00:00.000Z",
            "VolumeId": "vol-abcdef09876543210",
            "SnapshotId": "snap-01234567890abcdef"
        }
    ]
}
```

For more information about Recycle Bin, see Recover deleted snapshots from the Recycle Bin in the *Amazon EBS User Guide*.

- For API details, see ListSnapshotsInRecycleBin in *AWS CLI Command Reference*.

`lock-snapshot`

The following code example shows how to use `lock-snapshot`.

AWS CLI

Example 1: To lock a snapshot in governance mode

The following `lock-snapshot` example locks the specified snapshot in governance mode.

```
aws ec2 lock-snapshot \
    --snapshot-id snap-0b5e733b4a8df6e0d \
    --lock-mode governance \
    --lock-duration 365
```

Output:

```
{
    "SnapshotId": "snap-0b5e733b4a8df6e0d",
    "LockState": "governance",
    "LockDuration": 365,
    "LockCreatedOn": "2024-05-05T00:56:06.208000+00:00",
    "LockExpiresOn": "2025-05-05T00:56:06.208000+00:00",
    "LockDurationStartTime": "2024-05-05T00:56:06.208000+00:00"
}
```

For more information, see Snapshot lock in the *Amazon EBS User Guide*.

Example 2: To lock a snapshot in compliance mode

The following `lock-snapshot` example lock the specified snapshot in compliance mode.

```
aws ec2 lock-snapshot \
    --snapshot-id snap-0163a8524c5b9901f \
    --lock-mode compliance \
    --cool-off-period 24 \
    --lock-duration 365
```

Output:

```
{
    "SnapshotId": "snap-0b5e733b4a8df6e0d",
    "LockState": "compliance-cooloff",
    "LockDuration": 365,
    "CoolOffPeriod": 24,
    "CoolOffPeriodExpiresOn": "2024-05-06T01:02:20.527000+00:00",
    "LockCreatedOn": "2024-05-05T01:02:20.527000+00:00",
    "LockExpiresOn": "2025-05-05T01:02:20.527000+00:00",
    "LockDurationStartTime": "2024-05-05T01:02:20.527000+00:00"
}
```

For more information, see Snapshot lock in the *Amazon EBS User Guide*.

- For API details, see LockSnapshot in *AWS CLI Command Reference*.

`modify-address-attribute`

The following code example shows how to use `modify-address-attribute`.

AWS CLI

To modify the domain name attribute associated with an elastic IP address

The following `modify-address-attribute` examples modify the domain name attribute of an elastic IP address.

Linux:

```
aws ec2 modify-address-attribute \
    --allocation-id eipalloc-abcdef01234567890 \
    --domain-name example.com
```

Windows:

```
aws ec2 modify-address-attribute ^
    --allocation-id eipalloc-abcdef01234567890 ^
    --domain-name example.com
```

Output:

```
{
    "Addresses": [
        {
            "PublicIp": "192.0.2.0",
            "AllocationId": "eipalloc-abcdef01234567890",
            "PtrRecord": "example.net."
            "PtrRecordUpdate": {
                "Value": "example.com.",
                "Status": "PENDING"
        }
    ]
}
```

To monitor the pending change and to view the modified attributes of an elastic IP address, see describe-addresses-attribute in the *AWS CLI Command Reference*.

- For API details, see ModifyAddressAttribute in *AWS CLI Command Reference*.

`modify-availability-zone-group`

The following code example shows how to use `modify-availability-zone-group`.

AWS CLI

To enable a zone group

The following `modify-availability-zone-group` example enables the specified zone group.

```
aws ec2 modify-availability-zone-group \
    --group-name us-west-2-lax-1 \
    --opt-in-status opted-in
```

Output:

```
{
    "Return": true
}
```

For more information, see Regions and Zones in the *Amazon EC2 User Guide*.

- For API details, see ModifyAvailabilityZoneGroup in *AWS CLI Command Reference*.

`modify-capacity-reservation-fleet`

The following code example shows how to use `modify-capacity-reservation-fleet`.

AWS CLI

Example 1: To modify the total target capacity of a Capacity Reservation Fleet

The following `modify-capacity-reservation-fleet` example modifies the total target capacity of the specified Capacity Reservation Fleet. When you modify the total target capacity of a Capacity Reservation Fleet, the Fleet automatically creates new Capacity Reservations, or modifies or cancels existing Capacity Reservations in the Fleet to meet the new total target capacity. You can't attempt additional modifications to a Fleet while it is in the `modifying` state.

```
aws ec2 modify-capacity-reservation-fleet \
    --capacity-reservation-fleet-id crf-01234567890abcedf \
    --total-target-capacity 160
```

Output:

```
{
    "Return": true
}
```

Example 2: To modify the end date of a Capacity Reservation Fleet

The following `modify-capacity-reservation-fleet` example modifies the end date of the specified Capacity Reservation Fleet. When you modify the end date for the Fleet, the end dates for all of the individual Capacity Reservations are updated accordingly. You can't attempt additional modifications to a Fleet while it is in the `modifying` state.

```
aws ec2 modify-capacity-reservation-fleet \
    --capacity-reservation-fleet-id crf-01234567890abcedf \
    --end-date 2022-07-04T23:59:59.000Z
```

Output:

```
{
    "Return": true
```

```
}
```

For more information about Capacity Reservation Fleets, see Capacity Reservation Fleets in the *Amazon EC2 User Guide*.

- For API details, see ModifyCapacityReservationFleet in *AWS CLI Command Reference*.

`modify-capacity-reservation`

The following code example shows how to use `modify-capacity-reservation`.

AWS CLI

Example 1: To change the number of instances reserved by an existing capacity reservation

The following `modify-capacity-reservation` example changes the number of instances for which the capacity reservation reserves capacity.

```
aws ec2 modify-capacity-reservation \
    --capacity-reservation-id cr-1234abcd56EXAMPLE \
    --instance-count 5
```

Output:

```
{
    "Return": true
}
```

For more information, see Modify a Capacity Reservation in the *Amazon EC2 User Guide*.

Example 2: To change the end date and time for an existing capacity reservation

The following `modify-capacity-reservation` example modifies an existing capacity reservation to end at the specified date and time.

```
aws ec2 modify-capacity-reservation \
    --capacity-reservation-id cr-1234abcd56EXAMPLE \
    --end-date-type limited \
    --end-date 2019-08-31T23:59:59Z
```

For more information, see Modify a Capacity Reservation in the *Amazon EC2 User Guide*.

- For API details, see ModifyCapacityReservation in *AWS CLI Command Reference*.

`modify-client-vpn-endpoint`

The following code example shows how to use `modify-client-vpn-endpoint`.

AWS CLI

To modify a Client VPN endpoint

The following `modify-client-vpn-endpoint` example enables client connection logging for the specified Client VPN endpoint.

```
aws ec2 modify-client-vpn-endpoint \
    --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \
    --connection-log-options Enabled=true,CloudwatchLogGroup=ClientVPNLogs
```

Output:

```
{
    "Return": true
}
```

For more information, see Client VPN Endpoints in the *AWS Client VPN Administrator Guide*.

- For API details, see ModifyClientVpnEndpoint in *AWS CLI Command Reference*.

`modify-default-credit-specification`

The following code example shows how to use `modify-default-credit-specification`.

AWS CLI

To modify the default credit option

The following `modify-default-credit-specification` example modifies the default credit option for T2 instances.

```
aws ec2 modify-default-credit-specification \
    --instance-family t2 \
    --cpu-credits unlimited
```

Output:

```
{
    "InstanceFamilyCreditSpecification": {
        "InstanceFamily": "t2",
        "CpuCredits": "unlimited"
    }
}
```

- For API details, see [ModifyDefaultCreditSpecification]() in *AWS CLI Command Reference*.

`modify-ebs-default-kms-key-id`

The following code example shows how to use `modify-ebs-default-kms-key-id`.

AWS CLI

To set your default CMK for EBS encryption

The following `modify-ebs-default-kms-key-id` example sets the specified CMK as the default CMK for EBS encryption for your AWS account in the current Region.

```
aws ec2 modify-ebs-default-kms-key-id \
    --kms-key-id alias/my-cmk
```

Output:

```
{
    "KmsKeyId": "arn:aws:kms:us-
west-2:123456789012:key/0ea3fef3-80a7-4778-9d8c-1c0c6EXAMPLE"
}
```

- For API details, see [ModifyEbsDefaultKmsKeyId]() in *AWS CLI Command Reference*.

`modify-fleet`

The following code example shows how to use `modify-fleet`.

AWS CLI

To scale an EC2 Fleet

The following `modify-fleet` example modifies the target capacity of the specified EC2 Fleet. If the specified value is greater than the current capacity, the EC2 Fleet launches additional instances. If the specified value is less than the current capacity, the EC2 Fleet cancels any open requests and if the termination policy is `terminate`, the EC2 fleet terminates any instances that exceed the new target capacity.

```
aws ec2 modify-fleet \
    --fleet-ids fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE \
    --target-capacity-specification TotalTargetCapacity=5
```

Output:

```
{
    "Return": true
}
```

For more information, see Manage an EC2 Fleet in the *Amazon EC2 User Guide*.

- For API details, see ModifyFleet in *AWS CLI Command Reference*.

`modify-fpga-image-attribute`

The following code example shows how to use `modify-fpga-image-attribute`.

AWS CLI

To modify the attributes of an Amazon FPGA image

This example adds load permissions for account ID `123456789012` for the specified AFI.

Command:

```
aws ec2 modify-fpga-image-attribute --attribute loadPermission --fpga-image-id afi-0d123e123bfc85abc --load-permission Add=[{UserId=123456789012}]
```

Output:

```
{
  "FpgaImageAttribute": {
      "FpgaImageId": "afi-0d123e123bfc85abc",
      "LoadPermissions": [
```

```
                {
                    "UserId": "123456789012"
                }
            ]
        }
    }
```

- For API details, see ModifyFpgaImageAttribute in *AWS CLI Command Reference*.

`modify-hosts`

The following code example shows how to use `modify-hosts`.

AWS CLI

Example 1: To enable auto-placement for a Dedicated Host

The following `modify-hosts` example enables auto-placement for a Dedicated Host so that it accepts any untargeted instance launches that match its instance type configuration.

```
aws ec2 modify-hosts \
    --host-id h-06c2f189b4EXAMPLE \
    --auto-placement on
```

Output:

```
{
    "Successful": [
        "h-06c2f189b4EXAMPLE"
    ],
    "Unsuccessful": []
}
```

For more information, see Modify the auto-placement setting for a Dedicated Host in the *Amazon EC2 User Guide*.

Example 2: To enable host recovery for a Dedicated Host

The following `modify-hosts` example enables host recovery for the specified Dedicated Host.

```
aws ec2 modify-hosts \
```

```
    --host-id h-06c2f189b4EXAMPLE \
    --host-recovery on
```

Output:

```
{
    "Successful": [
        "h-06c2f189b4EXAMPLE"
    ],
    "Unsuccessful": []
}
```

For more information, see Modify the auto-placement setting for a Dedicated Host in the *Amazon EC2 User Guide*.

- For API details, see ModifyHosts in *AWS CLI Command Reference*.

`modify-id-format`

The following code example shows how to use `modify-id-format`.

AWS CLI

To enable the longer ID format for a resource

The following `modify-id-format` example enables the longer ID format for the `instance` resource type.

```
aws ec2 modify-id-format \
    --resource instance \
    --use-long-ids
```

To disable the longer ID format for a resource

The following `modify-id-format` example disables the longer ID format for the `instance` resource type.

```
aws ec2 modify-id-format \
    --resource instance \
    --no-use-long-ids
```

The following `modify-id-format` example enables the longer ID format for all supported resource types that are within their opt-in period.

```
aws ec2 modify-id-format \
    --resource all-current \
    --use-long-ids
```

- For API details, see [ModifyIdFormat](#) in *AWS CLI Command Reference*.

modify-identity-id-format

The following code example shows how to use `modify-identity-id-format`.

AWS CLI

To enable an IAM role to use longer IDs for a resource

The following `modify-identity-id-format` example enables the IAM role `EC2Role` in your AWS account to use long ID format for the `instance` resource type.

```
aws ec2 modify-identity-id-format \
    --principal-arn arn:aws:iam::123456789012:role/EC2Role \
    --resource instance \
    --use-long-ids
```

To enable an IAM user to use longer IDs for a resource

The following `modify-identity-id-format` example enables the IAM user `AdminUser` in your AWS account to use the longer ID format for the `volume` resource type.

```
aws ec2 modify-identity-id-format \
    --principal-arn arn:aws:iam::123456789012:user/AdminUser \
    --resource volume \
    --use-long-ids
```

The following `modify-identity-id-format` example enables the IAM user `AdminUser` in your AWS account to use the longer ID format for all supported resource types that are within their opt-in period.

```
aws ec2 modify-identity-id-format \
```

```
    --principal-arn arn:aws:iam::123456789012:user/AdminUser \
    --resource all-current \
    --use-long-ids
```

- For API details, see ModifyIdentityIdFormat in *AWS CLI Command Reference*.

`modify-image-attribute`

The following code example shows how to use `modify-image-attribute`.

AWS CLI

Example 1: To make an AMI public

The following `modify-instance-attribute` example makes the specified AMI public.

```
aws ec2 modify-image-attribute \
    --image-id ami-5731123e \
    --launch-permission "Add=[{Group=all}]"
```

This command produces no output.

Example 2: To make an AMI private

The following `modify-instance-attribute` example makes the specified AMI private.

```
aws ec2 modify-image-attribute \
    --image-id ami-5731123e \
    --launch-permission "Remove=[{Group=all}]"
```

This command produces no output.

Example 3: To grant launch permission to an AWS account

The following `modify-instance-attribute` example grants launch permissions to the specified AWS account.

```
aws ec2 modify-image-attribute \
    --image-id ami-5731123e \
    --launch-permission "Add=[{UserId=123456789012}]"
```

This command produces no output.

Example 4: To remove launch permission from an AWS account

The following `modify-instance-attribute` example removes launch permissions from the specified AWS account.

```
aws ec2 modify-image-attribute \
    --image-id ami-5731123e \
    --launch-permission "Remove=[{UserId=123456789012}]"
```

- For API details, see ModifyImageAttribute in *AWS CLI Command Reference*.

`modify-instance-attribute`

The following code example shows how to use `modify-instance-attribute`.

AWS CLI

Example 1: To modify the instance type

The following `modify-instance-attribute` example modifies the instance type of the specified instance. The instance must be in the `stopped` state.

```
aws ec2 modify-instance-attribute \
    --instance-id i-1234567890abcdef0 \
    --instance-type "{\"Value\": \"m1.small\"}"
```

This command produces no output.

Example 2: To enable enhanced networking on an instance

The following `modify-instance-attribute` example enables enhanced networking for the specified instance. The instance must be in the `stopped` state.

```
aws ec2 modify-instance-attribute \
    --instance-id i-1234567890abcdef0 \
    --sriov-net-support simple
```

This command produces no output.

Example 3: To modify the sourceDestCheck attribute

The following `modify-instance-attribute` example sets the `sourceDestCheck` attribute of the specified instance to `true`. The instance must be in a VPC.

```
aws ec2 modify-instance-attribute --instance-id i-1234567890abcdef0 --source-dest-check "{\"Value\": true}"
```

This command produces no output.

Example 4: To modify the deleteOnTermination attribute of the root volume

The following `modify-instance-attribute` example sets the `deleteOnTermination` attribute for the root volume of the specified Amazon EBS-backed instance to `false`. By default, this attribute is `true` for the root volume.

Command:

```
aws ec2 modify-instance-attribute \
  --instance-id i-1234567890abcdef0 \
  --block-device-mappings "[{\"DeviceName\": \"/dev/sda1\",\"Ebs\":
{\"DeleteOnTermination\":false}}]"
```

This command produces no output.

Example 5: To modify the user data attached to an instance

The following `modify-instance-attribute` example adds the contents of the file `UserData.txt` as the UserData for the specified instance.

Contents of original file `UserData.txt`:

```
#!/bin/bash
yum update -y
service httpd start
chkconfig httpd on
```

The contents of the file must be base64 encoded. The first command converts the text file to base64 and saves it as a new file.

Linux/macOS version of the command:

```
base64 UserData.txt > UserData.base64.txt
```

This command produces no output.

Windows version of the command:

```
certutil -encode UserData.txt tmp.b64 && findstr /v /c:- tmp.b64 >
 UserData.base64.txt
```

Output:

```
Input Length = 67
Output Length = 152
CertUtil: -encode command completed successfully.
```

Now you can reference that file in the CLI command that follows:

```
aws ec2 modify-instance-attribute \
    --instance-id=i-09b5a14dbca622e76 \
    --attribute userData --value file://UserData.base64.txt
```

This command produces no output.

For more information, see User Data and the AWS CLI in the *EC2 User Guide*.

- For API details, see ModifyInstanceAttribute in *AWS CLI Command Reference*.

`modify-instance-capacity-reservation-attributes`

The following code example shows how to use `modify-instance-capacity-reservation-attributes`.

AWS CLI

Example 1: To modify an instance's capacity reservation targeting settings

The following `modify-instance-capacity-reservation-attributes` example modifies a stopped instance to target a specific capacity reservation.

```
aws ec2 modify-instance-capacity-reservation-attributes \
    --instance-id i-EXAMPLE8765abcd4e \
    --capacity-reservation-specification
 'CapacityReservationTarget={CapacityReservationId= cr-1234abcd56EXAMPLE }'
```

Output:

```
{
    "Return": true
}
```

For more information, see Modify the Capacity Reservation settings of your instance in the *Amazon EC2 User Guide*.

Example 2: To modify an instance's capacity reservation targeting settings

The following `modify-instance-capacity-reservation-attributes` example modifies a stopped instance that targets the specified capacity reservation to launch in any capacity reservation that has matching attributes (instance type, platform, Availability Zone) and that has open instance matching criteria.

```
aws ec2 modify-instance-capacity-reservation-attributes \
    --instance-id i-EXAMPLE8765abcd4e \
    --capacity-reservation-specification 'CapacityReservationPreference=open'
```

Output:

```
{
    "Return": true
}
```

For more information, see Modify the Capacity Reservation settings of your instance in the *Amazon EC2 User Guide*.

- For API details, see ModifyInstanceCapacityReservationAttributes in *AWS CLI Command Reference*.

`modify-instance-credit-specification`

The following code example shows how to use `modify-instance-credit-specification`.

AWS CLI

To modify the credit option for CPU usage of an instance

This example modifies the credit option for CPU usage of the specified instance in the specified region to "unlimited". Valid credit options are "standard" and "unlimited".

Command:

```
aws ec2 modify-instance-credit-specification --instance-credit-
specification "InstanceId=i-1234567890abcdef0,CpuCredits=unlimited"
```

Output:

```
{
  "SuccessfulInstanceCreditSpecifications": [
    {
      "InstanceId": "i-1234567890abcdef0"
    }
  ],
  "UnsuccessfulInstanceCreditSpecifications": []
}
```

- For API details, see ModifyInstanceCreditSpecification in *AWS CLI Command Reference*.

`modify-instance-event-start-time`

The following code example shows how to use `modify-instance-event-start-time`.

AWS CLI

To modify the event start time for an instance

The following `modify-instance-event-start-time` command shows how to modify the event start time for the specified instance. Specify the event ID by using the `--instance-event-id` parameter. Specify the new date and time by using the `--not-before` parameter.

```
aws ec2 modify-instance-event-start-time --instance-id i-1234567890abcdef0
 --instance-event-id instance-event-0abcdef1234567890 --not-
before 2019-03-25T10:00:00.000
```

Output:

```
"Event": {
    "InstanceEventId": "instance-event-0abcdef1234567890",
```

```
        "Code": "system-reboot",
        "Description": "scheduled reboot",
        "NotAfter": "2019-03-25T12:00:00.000Z",
        "NotBefore": "2019-03-25T10:00:00.000Z",
        "NotBeforeDeadline": "2019-04-22T21:00:00.000Z"
}
```

For more information, see Working with Instances Scheduled for Reboot in the *Amazon Elastic Compute Cloud User Guide*

- For API details, see ModifyInstanceEventStartTime in *AWS CLI Command Reference*.

`modify-instance-event-window`

The following code example shows how to use `modify-instance-event-window`.

AWS CLI

Example 1: To modify the time range of an event window

The following `modify-instance-event-window` example modifies the time range of an event window. Specify the `time-range` parameter to modify the time range. You can't also specify the `cron-expression` parameter.

```
aws ec2 modify-instance-event-window \
    --region us-east-1 \
    --instance-event-window-id iew-0abcdef1234567890
    --time-range StartWeekDay=monday,StartHour=2,EndWeekDay=wednesday,EndHour=8
```

Output:

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "TimeRanges": [
            {
                "StartWeekDay": "monday",
                "StartHour": 2,
                "EndWeekDay": "wednesday",
                "EndHour": 8
            }
        ],
```

```
        "Name": "myEventWindowName",
        "AssociationTarget": {
            "InstanceIds": [
                "i-0abcdef1234567890",
                "i-0be35f9acb8ba01f0"
            ],
            "Tags": [],
            "DedicatedHostIds": []
        },
        "State": "creating",
        "Tags": [
            {
                "Key": "K1",
                "Value": "V1"
            }
        ]
    }
}
```

For event window constraints, see Considerations in the Scheduled Events section of the *Amazon EC2 User Guide*.

Example 2: To modify a set of time ranges for an event window

The following `modify-instance-event-window` example modifies the time range of an event window. Specify the `time-range` parameter to modify the time range. You can't also specify the `cron-expression` parameter.

```
aws ec2 modify-instance-event-window \
    --region us-east-1 \
    --instance-event-window-id iew-0abcdef1234567890 \
    --time-range '[{"StartWeekDay": "monday", "StartHour": 2, "EndWeekDay":
 "wednesday", "EndHour": 8},
        {"StartWeekDay": "thursday", "StartHour": 2, "EndWeekDay": "friday",
 "EndHour": 8}]'
```

Output:

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "TimeRanges": [
```

```
            {
                "StartWeekDay": "monday",
                "StartHour": 2,
                "EndWeekDay": "wednesday",
                "EndHour": 8
            },
            {
                "StartWeekDay": "thursday",
                "StartHour": 2,
                "EndWeekDay": "friday",
                "EndHour": 8
            }
        ],
        "Name": "myEventWindowName",
        "AssociationTarget": {
            "InstanceIds": [
                "i-0abcdef1234567890",
                "i-0be35f9acb8ba01f0"
            ],
            "Tags": [],
            "DedicatedHostIds": []
        },
        "State": "creating",
        "Tags": [
            {
                "Key": "K1",
                "Value": "V1"
            }
        ]
    }
}
```

For event window constraints, see Considerations in the Scheduled Events section of the *Amazon EC2 User Guide*.

Example 3: To modify the cron expression of an event window

The following `modify-instance-event-window` example modifies the cron expression of an event window. Specify the `cron-expression` parameter to modify the cron expression. You can't also specify the `time-range` parameter.

```
aws ec2 modify-instance-event-window \
    --region us-east-1 \
```

```
    --instance-event-window-id iew-0abcdef1234567890 \
    --cron-expression "* 21-23 * * 2,3"
```

Output:

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "AssociationTarget": {
            "InstanceIds": [
                "i-0abcdef1234567890",
                "i-0be35f9acb8ba01f0"
            ],
            "Tags": [],
            "DedicatedHostIds": []
        },
        "State": "creating",
        "Tags": [
            {
                "Key": "K1",
                "Value": "V1"
            }
        ]
    }
}
```

For event window constraints, see Considerations in the Scheduled Events section of the *Amazon EC2 User Guide*.

- For API details, see ModifyInstanceEventWindow in *AWS CLI Command Reference*.

`modify-instance-maintenance-options`

The following code example shows how to use `modify-instance-maintenance-options`.

AWS CLI

Example 1: To disable the recovery behavior of an instance

The following `modify-instance-maintenance-options` example disables simplified automatic recovery for a running or stopped instance.

```
aws ec2 modify-instance-maintenance-options \
    --instance-id i-0abcdef1234567890 \
    --auto-recovery disabled
```

Output:

```
{
    "InstanceId": "i-0abcdef1234567890",
    "AutoRecovery": "disabled"
}
```

For more information, see Configure simplified automatic recovery in the *Amazon EC2 User Guide*.

Example 2: To set the recovery behavior of an instance to default

The following `modify-instance-maintenance-options` example sets the automatic recovery behavior to default which enables simplified automatic recovery for supported instance types.

```
aws ec2 modify-instance-maintenance-options \
    --instance-id i-0abcdef1234567890 \
    --auto-recovery default
```

Output:

```
{
    "InstanceId": "i-0abcdef1234567890",
    "AutoRecovery": "default"
}
```

For more information, see Configure simplified automatic recovery in the *Amazon EC2 User Guide*.

- For API details, see ModifyInstanceMaintenanceOptions in *AWS CLI Command Reference*.

`modify-instance-metadata-options`

The following code example shows how to use `modify-instance-metadata-options`.

AWS CLI

Example 1: To enable IMDSv2

The following `modify-instance-metadata-options` example configures the use of IMDSv2 on the specified instance.

```
aws ec2 modify-instance-metadata-options \
    --instance-id i-1234567898abcdef0 \
    --http-tokens required \
    --http-endpoint enabled
```

Output:

```
{
    "InstanceId": "i-1234567898abcdef0",
    "InstanceMetadataOptions": {
        "State": "pending",
        "HttpTokens": "required",
        "HttpPutResponseHopLimit": 1,
        "HttpEndpoint": "enabled"
    }
}
```

For more information, see Instance metadata in the *Amazon EC2 User Guide*.

Example 2: To disable instance metadata

The following `modify-instance-metadata-options` example disables the use of all versions of instance metadata on the specified instance.

```
aws ec2 modify-instance-metadata-options \
    --instance-id i-1234567898abcdef0 \
    --http-endpoint disabled
```

Output:

```
{
    "InstanceId": "i-1234567898abcdef0",
    "InstanceMetadataOptions": {
```

```
        "State": "pending",
        "HttpTokens": "required",
        "HttpPutResponseHopLimit": 1,
        "HttpEndpoint": "disabled"
    }
}
```

For more information, see Instance metadata in the *Amazon EC2 User Guide*.

Example 3: To enable instance metadata IPv6 endpoint for your instance

The following `modify-instance-metadata-options` example shows you how to turn on the IPv6 endpoint for the instance metadata service. By default, the IPv6 endpoint is disabled. This is true even if you have launched an instance into an IPv6-only subnet. The IPv6 endpoint for IMDS is only accessible on instances built on the Nitro System.

```
aws ec2 modify-instance-metadata-options \
    --instance-id i-1234567898abcdef0 \
    --http-protocol-ipv6 enabled \
    --http-endpoint enabled
```

Output:

```
{
    "InstanceId": "i-1234567898abcdef0",
    "InstanceMetadataOptions": {
        "State": "pending",
        "HttpTokens": "required",
        "HttpPutResponseHopLimit": 1,
        "HttpEndpoint": "enabled",
        HttpProtocolIpv6": "enabled"
    }
}
```

For more information, see Instance metadata in the *Amazon EC2 User Guide*.

- For API details, see ModifyInstanceMetadataOptions in *AWS CLI Command Reference*.

`modify-instance-placement`

The following code example shows how to use `modify-instance-placement`.

AWS CLI

Example 1: To remove an instance's affinity with a Dedicated Host

The following `modify-instance-placement` example removes an instance's affinity with a Dedicated Host and enables it to launch on any available Dedicated Host in your account that supports its instance type.

```
aws ec2 modify-instance-placement \
    --instance-id i-0e6ddf6187EXAMPLE \
    --affinity default
```

Output:

```
{
    "Return": true
}
```

Example 2: To establish affinity between an instance and the specified Dedicated Host

The following `modify-instance-placement` example establishes a launch relationship between an instance and a Dedicated Host. The instance is only able to run on the specified Dedicated Host.

```
aws ec2 modify-instance-placement \
    --instance-id i-0e6ddf6187EXAMPLE \
    --affinity host \
    --host-id i-0e6ddf6187EXAMPLE
```

Output:

```
{
    "Return": true
}
```

Example 3: To move an instance to a placement group

The following `modify-instance-placement` example moves an instance to a placement group, stop the instance, modify the instance placement, and then restart the instance.

```
aws ec2 stop-instances \
```

```
    --instance-ids i-0123a456700123456

aws ec2 modify-instance-placement \
    --instance-id i-0123a456700123456 \
    --group-name MySpreadGroup

aws ec2 start-instances \
    --instance-ids i-0123a456700123456
```

Example 4: To remove an instance from a placement group

The following `modify-instance-placement` example removes an instance from a placement group by stopping the instance, modifying the instance placement, and then restarting the instance. The following example specifies an empty string ("") for the placement group name to indicate that the instance is not to be located in a placement group.

Stop the instance:

```
aws ec2 stop-instances \
    --instance-ids i-0123a456700123456
```

Modify the placement (Windows Command Prompt):

```
aws ec2 modify-instance-placement \
    --instance-id i-0123a456700123456 \
    --group-name ""
```

Modify the placement (Windows PowerShell, Linux, and macOS):

```
aws ec2 modify-instance-placement `
    --instance-id i-0123a456700123456 `
    --group-name ''
```

Restart the instance:

```
aws ec2 start-instances \
    --instance-ids i-0123a456700123456
```

Output:

```
{
```

```
    "Return": true
}
```

For more information, see Modify Dedicated Host tenancy and affinity in the *Amazon EC2 User Guide*.

- For API details, see ModifyInstancePlacement in *AWS CLI Command Reference*.

`modify-ipam-pool`

The following code example shows how to use `modify-ipam-pool`.

AWS CLI

To modify an IPAM pool

The following `modify-ipam-pool` example modifies an IPAM pool.

(Linux):

```
aws ec2 modify-ipam-pool \
    --ipam-pool-id ipam-pool-0533048da7d823723 \
    --add-allocation-resource-tags "Key=Owner,Value=Build Team" \
    --clear-allocation-default-netmask-length \
    --allocation-min-netmask-length 14
```

(Windows):

```
aws ec2 modify-ipam-pool ^
    --ipam-pool-id ipam-pool-0533048da7d823723 ^
    --add-allocation-resource-tags "Key=Owner,Value=Build Team" ^
    --clear-allocation-default-netmask-length ^
    --allocation-min-netmask-length 14
```

Output:

```
{
    "IpamPool": {
        "OwnerId": "123456789012",
        "IpamPoolId": "ipam-pool-0533048da7d823723",
        "IpamPoolArn": "arn:aws:ec2::123456789012:ipam-pool/ipam-
pool-0533048da7d823723",
```

```
        "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-
scope-02fc38cd4c48e7d38",
        "IpamScopeType": "private",
        "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
        "IpamRegion": "us-east-1",
        "Locale": "None",
        "PoolDepth": 1,
        "State": "modify-complete",
        "AutoImport": true,
        "AddressFamily": "ipv4",
        "AllocationMinNetmaskLength": 14,
        "AllocationMaxNetmaskLength": 26,
        "AllocationResourceTags": [
            {
                "Key": "Environment",
                "Value": "Preprod"
            },
            {
                "Key": "Owner",
                "Value": "Build Team"
            }
        ]
    }
}
```

For more information, see Edit a pool in the *Amazon VPC IPAM User Guide*.

- For API details, see ModifyIpamPool in *AWS CLI Command Reference*.

`modify-ipam-resource-cidr`

The following code example shows how to use `modify-ipam-resource-cidr`.

AWS CLI

To modify the CIDR allocated to a resource

The following `modify-ipam-resource-cidr` example modifies a resource CIDR.

(Linux):

```
aws ec2 modify-ipam-resource-cidr \
    --current-ipam-scope-id ipam-scope-02fc38cd4c48e7d38 \
```

```
    --destination-ipam-scope-id ipam-scope-0da34c61fd189a141 \
    --resource-id vpc-010e1791024eb0af9 \
    --resource-cidr 10.0.1.0/24 \
    --resource-region us-east-1 \
    --monitored
```

(Windows):

```
aws ec2 modify-ipam-resource-cidr ^
    --current-ipam-scope-id ipam-scope-02fc38cd4c48e7d38 ^
    --destination-ipam-scope-id ipam-scope-0da34c61fd189a141 ^
    --resource-id vpc-010e1791024eb0af9 ^
    --resource-cidr 10.0.1.0/24 ^
    --resource-region us-east-1 ^
    --monitored
```

Output:

```
{
    "IpamResourceCidr": {
        "IpamId": "ipam-08440e7a3acde3908",
        "IpamScopeId": "ipam-scope-0da34c61fd189a141",
        "IpamPoolId": "ipam-pool-0533048da7d823723",
        "ResourceRegion": "us-east-1",
        "ResourceOwnerId": "123456789012",
        "ResourceId": "vpc-010e1791024eb0af9",
        "ResourceCidr": "10.0.1.0/24",
        "ResourceType": "vpc",
        "ResourceTags": [
            {
                "Key": "Environment",
                "Value": "Preprod"
            },
            {
                "Key": "Owner",
                "Value": "Build Team"
            }
        ],
        "IpUsage": 0.0,
        "ComplianceStatus": "noncompliant",
        "ManagementState": "managed",
        "OverlapStatus": "overlapping",
        "VpcId": "vpc-010e1791024eb0af9"
```

```
    }
}
```

For more information on moving resources, see Move resource CIDRs between scopes in the *Amazon VPC IPAM User Guide*.

For more information on changing monitoring states, see Change the monitoring state of resource CIDRs in the *Amazon VPC IPAM User Guide*.

- For API details, see ModifyIpamResourceCidr in *AWS CLI Command Reference*.

`modify-ipam-resource-discovery`

The following code example shows how to use `modify-ipam-resource-discovery`.

AWS CLI

To modify the operating regions of a resource discovery

In this example, you're an IPAM delegated admin who wants to modify the operating regions of a resource discovery.

To complete this request:

You cannot modify a default resource discovery and you must be the owner of the resource discovery.You need the resource discovery ID, which you can get with describe-ipam-resource-discoveries.

The following `modify-ipam-resource-discovery` example modifies a non-default resource discovery in your AWS account.

```
aws ec2 modify-ipam-resource-discovery \
    --ipam-resource-discovery-id ipam-res-disco-0f4ef577a9f37a162 \
    --add-operating-regions RegionName='us-west-1' \
    --remove-operating-regions RegionName='us-east-2' \
    --region us-east-1
```

Output:

```
{
    "IpamResourceDiscovery": {
        "OwnerId": "149977607591",
```

```
        "IpamResourceDiscoveryId": "ipam-res-disco-0365d2977fc1672fe",
        "IpamResourceDiscoveryArn": "arn:aws:ec2::149977607591:ipam-resource-
discovery/ipam-res-disco-0365d2977fc1672fe",
        "IpamResourceDiscoveryRegion": "us-east-1",
        "Description": "Example",
        "OperatingRegions": [
            {
                "RegionName": "us-east-1"
            },
            {
                "RegionName": "us-west-1"
            }
        ],
        "IsDefault": false,
        "State": "modify-in-progress"
    }
}
```

For more information, see Work with resource discoveries in the *Amazon VPC IPAM User Guide*.

- For API details, see ModifyIpamResourceDiscovery in *AWS CLI Command Reference*.

`modify-ipam-scope`

The following code example shows how to use `modify-ipam-scope`.

AWS CLI

To modify the description of a scope

In this scenario, you're an IPAM delegated admin who wants to modify the description of an IPAM scope.

To complete this request, you'll need the scope ID, which you can get with describe-ipam-scopes.

The following `modify-ipam-scope` example updates the description of the scope.

```
aws ec2 modify-ipam-scope \
    --ipam-scope-id ipam-scope-0d3539a30b57dcdd1 \
    --description example \
    --region us-east-1
```

Output:

```
{
"IpamScope": {
        "OwnerId": "320805250157",
        "IpamScopeId": "ipam-scope-0d3539a30b57dcdd1",
        "IpamScopeArn": "arn:aws:ec2::320805250157:ipam-scope/ipam-
scope-0d3539a30b57dcdd1",
        "IpamArn": "arn:aws:ec2::320805250157:ipam/ipam-005f921c17ebd5107",
        "IpamRegion": "us-east-1",
        "IpamScopeType": "public",
        "IsDefault": true,
        "Description": "example",
        "PoolCount": 1,
        "State": "modify-in-progress"
    }
}
```

For more information about scopes, see How IPAM works in the *Amazon VPC IPAM User Guide*.

- For API details, see ModifyIpamScope in *AWS CLI Command Reference*.

`modify-ipam`

The following code example shows how to use `modify-ipam`.

AWS CLI

To modify an IPAM

The following `modify-ipam` example modifies an IPAM by adding an Operating Region.

(Linux):

```
aws ec2 modify-ipam \
    --ipam-id ipam-08440e7a3acde3908 \
    --add-operating-regions RegionName=us-west-2
```

(Windows):

```
aws ec2 modify-ipam ^
    --ipam-id ipam-08440e7a3acde3908 ^
```

```
    --add-operating-regions RegionName=us-west-2
```

Output:

```
{
    "Ipam": {
        "OwnerId": "123456789012",
        "IpamId": "ipam-08440e7a3acde3908",
        "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
        "IpamRegion": "us-east-1",
        "PublicDefaultScopeId": "ipam-scope-0b9eed026396dbc16",
        "PrivateDefaultScopeId": "ipam-scope-02fc38cd4c48e7d38",
        "ScopeCount": 3,
        "OperatingRegions": [
            {
                "RegionName": "us-east-1"
            },
            {
                "RegionName": "us-east-2"
            },
            {
                "RegionName": "us-west-1"
            },
            {
                "RegionName": "us-west-2"
            }
        ],
        "State": "modify-in-progress"
    }
}
```

- For API details, see ModifyIpam in *AWS CLI Command Reference*.

`modify-launch-template`

The following code example shows how to use `modify-launch-template`.

AWS CLI

To change the default launch template version

This example specifies version 2 of the specified launch template as the default version.

Command:

```
aws ec2 modify-launch-template --launch-template-id lt-0abcd290751193123 --default-
version 2
```

Output:

```
{
  "LaunchTemplate": {
      "LatestVersionNumber": 2,
      "LaunchTemplateId": "lt-0abcd290751193123",
      "LaunchTemplateName": "WebServers",
      "DefaultVersionNumber": 2,
      "CreatedBy": "arn:aws:iam::123456789012:root",
      "CreateTime": "2017-12-01T13:35:46.000Z"
  }
}
```

- For API details, see ModifyLaunchTemplate in *AWS CLI Command Reference*.

`modify-managed-prefix-list`

The following code example shows how to use `modify-managed-prefix-list`.

AWS CLI

To modify a prefix list

The following `modify-managed-prefix-list` example adds an entry to the specified prefix list.

```
aws ec2 modify-managed-prefix-list \
    --prefix-list-id pl-0123456abcabcabc1 \
    --add-entries Cidr=10.1.0.0/16,Description=vpc-c \
    --current-version 1
```

Output:

```
{
    "PrefixList": {
        "PrefixListId": "pl-0123456abcabcabc1",
```

```
        "AddressFamily": "IPv4",
        "State": "modify-in-progress",
        "PrefixListArn": "arn:aws:ec2:us-west-2:123456789012:prefix-list/
pl-0123456abcabcabc1",
        "PrefixListName": "vpc-cidrs",
        "MaxEntries": 10,
        "Version": 1,
        "OwnerId": "123456789012"
    }
}
```

For more information, see Managed prefix lists in the *Amazon VPC User Guide*.

- For API details, see ModifyManagedPrefixList in *AWS CLI Command Reference*.

`modify-network-interface-attribute`

The following code example shows how to use `modify-network-interface-attribute`.

AWS CLI

To modify the attachment attribute of a network interface

This example command modifies the `attachment` attribute of the specified network interface.

Command:

```
aws ec2 modify-network-interface-attribute --network-interface-id eni-686ea200 --
attachment AttachmentId=eni-attach-43348162,DeleteOnTermination=false
```

To modify the description attribute of a network interface

This example command modifies the `description` attribute of the specified network interface.

Command:

```
aws ec2 modify-network-interface-attribute --network-interface-id eni-686ea200 --
description "My description"
```

To modify the groupSet attribute of a network interface

This example command modifies the `groupSet` attribute of the specified network interface.

Command:

```
aws ec2 modify-network-interface-attribute --network-interface-id eni-686ea200 --
groups sg-903004f8 sg-1a2b3c4d
```

To modify the sourceDestCheck attribute of a network interface

This example command modifies the `sourceDestCheck` attribute of the specified network interface.

Command:

```
aws ec2 modify-network-interface-attribute --network-interface-id eni-686ea200 --no-
source-dest-check
```

- For API details, see ModifyNetworkInterfaceAttribute in *AWS CLI Command Reference*.

`modify-private-dns-name-options`

The following code example shows how to use `modify-private-dns-name-options`.

AWS CLI

To modify the options for instance hostnames

The following `modify-private-dns-name-options` example disables the option to respond to DNS queries for instance hostnames with DNS A records.

```
aws ec2 modify-private-dns-name-options \
    --instance-id i-1234567890abcdef0 \
    --no-enable-resource-name-dns-a-record
```

Output:

```
{
    "Return": true
}
```

For more information, see Amazon EC2 instance hostname types in the *Amazon EC2 User Guide*.

- For API details, see ModifyPrivateDnsNameOptions in *AWS CLI Command Reference*.

`modify-reserved-instances`

The following code example shows how to use `modify-reserved-instances`.

AWS CLI

To modify Reserved Instances

This example command moves a Reserved Instance to another Availability Zone in the same region.

Command:

```
aws ec2 modify-reserved-instances --reserved-instances-ids b847fa93-e282-4f55-
b59a-1342f5bd7c02 --target-configurations AvailabilityZone=us-west-1c,Platform=EC2-
Classic,InstanceCount=10
```

Output:

```
{
  "ReservedInstancesModificationId": "rimod-d3ed4335-b1d3-4de6-ab31-0f13aaf46687"
}
```

To modify the network platform of Reserved Instances

This example command converts EC2-Classic Reserved Instances to EC2-VPC.

Command:

```
aws ec2 modify-reserved-instances --reserved-instances-ids f127bd27-edb7-44c9-
a0eb-0d7e09259af0 --target-configurations AvailabilityZone=us-west-1c,Platform=EC2-
VPC,InstanceCount=5
```

Output:

```
{
  "ReservedInstancesModificationId": "rimod-82fa9020-668f-4fb6-945d-61537009d291"
```

```
}
```

For more information, see Modifying Your Reserved Instances in the *Amazon EC2 User Guide*.

To modify the instance size of Reserved Instances

This example command modifies a Reserved Instance that has 10 m1.small Linux/UNIX instances in us-west-1c so that 8 m1.small instances become 2 m1.large instances, and the remaining 2 m1.small become 1 m1.medium instance in the same Availability Zone. Command:

```
aws ec2 modify-reserved-instances --reserved-instances-ids 1ba8e2e3-3556-4264-949e-63ee671405a9 --target-configurations AvailabilityZone=us-west-1c,Platform=EC2-Classic,InstanceCount=2,InstanceType=m1.large AvailabilityZone=us-west-1c,Platform=EC2-Classic,InstanceCount=1,InstanceType=m1.medium
```

Output:

```
{
    "ReservedInstancesModificationId": "rimod-acc5f240-080d-4717-b3e3-1c6b11fa00b6"
}
```

For more information, see Modifying the Instance Size of Your Reservations in the *Amazon EC2 User Guide*.

- For API details, see ModifyReservedInstances in *AWS CLI Command Reference*.

`modify-security-group-rules`

The following code example shows how to use `modify-security-group-rules`.

AWS CLI

To modify a security group rules to update the rule description, the IP protocol, and the CidrIpv4 address range

The following `modify-security-group-rules` example updates the description, the IP protocol, and the IPV4 CIDR range of a specified security group rule. Use the `security-group-rules` parameter to enter the updates for the specified security group rules. `-1` specifies all protocols.

```
aws ec2 modify-security-group-rules \
    --group-id sg-1234567890abcdef0 \
    --security-group-rules SecurityGroupRuleId=sgr-
abcdef01234567890,SecurityGroupRule='{Description=test,IpProtocol=-1,CidrIpv4=0.0.0.0/0}'
```

Output:

```
{
    "Return": true
}
```

For more information about security group rules, see Security group rules in the *Amazon EC2 User Guide*.

- For API details, see ModifySecurityGroupRules in *AWS CLI Command Reference*.

`modify-snapshot-attribute`

The following code example shows how to use `modify-snapshot-attribute`.

AWS CLI

Example 1: To modify a snapshot attribute

The following `modify-snapshot-attribute` example updates the `createVolumePermission` attribute for the specified snapshot, removing volume permissions for the specified user.

```
aws ec2 modify-snapshot-attribute \
    --snapshot-id snap-1234567890abcdef0 \
    --attribute createVolumePermission \
    --operation-type remove \
    --user-ids 123456789012
```

Example 2: To make a snapshot public

The following `modify-snapshot-attribute` example makes the specified snapshot public.

```
aws ec2 modify-snapshot-attribute \
    --snapshot-id snap-1234567890abcdef0 \
```

```
    --attribute createVolumePermission \
    --operation-type add \
    --group-names all
```

- For API details, see ModifySnapshotAttribute in *AWS CLI Command Reference*.

`modify-snapshot-tier`

The following code example shows how to use `modify-snapshot-tier`.

AWS CLI

To archive a snapshot

The following `modify-snapshot-tier` example archives the specified snapshot. The `TieringStartTime` response parameter indicates the date and time at which the archive process was started, in UTC time format (YYYY-MM-DDTHH:MM:SSZ).

```
aws ec2 modify-snapshot-tier \
    --snapshot-id snap-01234567890abcedf \
    --storage-tier archive
```

Output:

```
{
    "SnapshotId": "snap-01234567890abcedf",
    "TieringStartTime": "2021-09-15T16:44:37.574Z"
}
```

For more information about snapshot archiving, see Archive Amazon EBS snapshots in the *Amazon EBS User Guide*.

- For API details, see ModifySnapshotTier in *AWS CLI Command Reference*.

`modify-spot-fleet-request`

The following code example shows how to use `modify-spot-fleet-request`.

AWS CLI

To modify a Spot fleet request

This example command updates the target capacity of the specified Spot fleet request.

Command:

```
aws ec2 modify-spot-fleet-request --target-capacity 20 --spot-fleet-request-id sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE
```

Output:

```
{
    "Return": true
}
```

This example command decreases the target capacity of the specified Spot fleet request without terminating any Spot Instances as a result.

Command:

```
aws ec2 modify-spot-fleet-request --target-capacity 10 --excess-capacity-termination-policy NoTermination --spot-fleet-request-ids sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE
```

Output:

```
{
    "Return": true
}
```

- For API details, see ModifySpotFleetRequest in *AWS CLI Command Reference*.

`modify-subnet-attribute`

The following code example shows how to use `modify-subnet-attribute`.

AWS CLI

To change a subnet's public IPv4 addressing behavior

This example modifies subnet-1a2b3c4d to specify that all instances launched into this subnet are assigned a public IPv4 address. If the command succeeds, no output is returned.

Command:

```
aws ec2 modify-subnet-attribute --subnet-id subnet-1a2b3c4d --map-public-ip-on-launch
```

To change a subnet's IPv6 addressing behavior

This example modifies subnet-1a2b3c4d to specify that all instances launched into this subnet are assigned an IPv6 address from the range of the subnet.

Command:

```
aws ec2 modify-subnet-attribute --subnet-id subnet-1a2b3c4d --assign-ipv6-address-on-creation
```

For more information, see IP Addressing in Your VPC in the *AWS Virtual Private Cloud User Guide*.

- For API details, see ModifySubnetAttribute in *AWS CLI Command Reference*.

`modify-traffic-mirror-filter-network-services`

The following code example shows how to use `modify-traffic-mirror-filter-network-services`.

AWS CLI

To add network services to a Traffic Mirror filter

The following `modify-traffic-mirror-filter-network-services` example adds the Amazon DNS network services to the specified filter.

```
aws ec2 modify-traffic-mirror-filter-network-services \
    --traffic-mirror-filter-id tmf-04812ff784EXAMPLE \
    --add-network-service amazon-dns
```

Output:

```
{
    "TrafficMirrorFilter": {
        "Tags": [
```

```
                {
                    "Key": "Name",
                    "Value": "Production"
                }
            ],
            "EgressFilterRules": [],
            "NetworkServices": [
                "amazon-dns"
            ],
            "TrafficMirrorFilterId": "tmf-04812ff784EXAMPLE",
            "IngressFilterRules": [
                {
                    "SourceCidrBlock": "0.0.0.0/0",
                    "RuleNumber": 1,
                    "DestinationCidrBlock": "0.0.0.0/0",
                    "Description": "TCP Rule",
                    "Protocol": 6,
                    "TrafficDirection": "ingress",
                    "TrafficMirrorFilterId": "tmf-04812ff784EXAMPLE",
                    "RuleAction": "accept",
                    "TrafficMirrorFilterRuleId": "tmf-04812ff784EXAMPLE"
                }
            ]
        }
}
```

For more information, see Modify Traffic Mirror Filter Network Services in the *AWS Traffic Mirroring Guide*.

- For API details, see ModifyTrafficMirrorFilterNetworkServices in *AWS CLI Command Reference*.

`modify-traffic-mirror-filter-rule`

The following code example shows how to use `modify-traffic-mirror-filter-rule`.

AWS CLI

To modify a traffic mirror filter rule

The following `modify-traffic-mirror-filter-rule` example modifies the description of the specified traffic mirror filter rule.

```
aws ec2 modify-traffic-mirror-filter-rule \
```

```
    --traffic-mirror-filter-rule-id tmfr-0ca76e0e08EXAMPLE \
    --description "TCP Rule"
```

Output:

```
{
    "TrafficMirrorFilterRule": {
        "TrafficMirrorFilterRuleId": "tmfr-0ca76e0e08EXAMPLE",
        "TrafficMirrorFilterId": "tmf-0293f26e86EXAMPLE",
        "TrafficDirection": "ingress",
        "RuleNumber": 100,
        "RuleAction": "accept",
        "Protocol": 6,
        "DestinationCidrBlock": "10.0.0.0/24",
        "SourceCidrBlock": "10.0.0.0/24",
        "Description": "TCP Rule"
    }
}
```

For more information, see Modify Your Traffic Mirror Filter Rules in the *AWS Traffic Mirroring Guide*.

- For API details, see ModifyTrafficMirrorFilterRule in *AWS CLI Command Reference*.

`modify-traffic-mirror-session`

The following code example shows how to use `modify-traffic-mirror-session`.

AWS CLI

To modify a traffic mirror session

The following `modify-traffic-mirror-session` example changes the traffic mirror session description and the number of packets to mirror.

```
aws ec2 modify-traffic-mirror-session \
    --description "Change packet length" \
    --traffic-mirror-session-id tms-08a33b1214EXAMPLE \
    --remove-fields "packet-length"
```

Output:

```
{
    "TrafficMirrorSession": {
        "TrafficMirrorSessionId": "tms-08a33b1214EXAMPLE",
        "TrafficMirrorTargetId": "tmt-07f75d8feeEXAMPLE",
        "TrafficMirrorFilterId": "tmf-04812ff784EXAMPLE",
        "NetworkInterfaceId": "eni-070203f901EXAMPLE",
        "OwnerId": "111122223333",
        "SessionNumber": 1,
        "VirtualNetworkId": 7159709,
        "Description": "Change packet length",
        "Tags": []
    }
}
```

For more information, see Modify your traffic mirror session in the *Traffic Mirroring Guide*.

- For API details, see ModifyTrafficMirrorSession in *AWS CLI Command Reference*.

`modify-transit-gateway-prefix-list-reference`

The following code example shows how to use `modify-transit-gateway-prefix-list-reference`.

AWS CLI

To modify a reference to a prefix list

The following `modify-transit-gateway-prefix-list-reference` example modifies the prefix list reference in the specified route table by changing the attachment to which traffic is routed.

```
aws ec2 modify-transit-gateway-prefix-list-reference \
    --transit-gateway-route-table-id tgw-rtb-0123456789abcd123 \
    --prefix-list-id pl-11111122222222333 \
    --transit-gateway-attachment-id tgw-attach-aabbccddaabbccaab
```

Output:

```
{
    "TransitGatewayPrefixListReference": {
        "TransitGatewayRouteTableId": "tgw-rtb-0123456789abcd123",
```

```
            "PrefixListId": "pl-11111122222222333",
            "PrefixListOwnerId": "123456789012",
            "State": "modifying",
            "Blackhole": false,
            "TransitGatewayAttachment": {
                "TransitGatewayAttachmentId": "tgw-attach-aabbccddaabbccaab",
                "ResourceType": "vpc",
                "ResourceId": "vpc-112233445566aabbc"
            }
        }
}
```

For more information, see Prefix list references in the *Transit Gateways Guide*.

- For API details, see ModifyTransitGatewayPrefixListReference in *AWS CLI Command Reference*.

modify-transit-gateway-vpc-attachment

The following code example shows how to use `modify-transit-gateway-vpc-attachment`.

AWS CLI

To modify a transit gateway VPC attachment

The following `modify-transit-gateway-vpc-attachment` example adds a subnet to the specified transit gateway VPC attachment.

```
aws ec2 modify-transit-gateway-vpc-attachment \
    --transit-gateway-attachment-id tgw-attach-09fbd47ddfEXAMPLE \
    --add-subnet-ids subnet-0e51f45802EXAMPLE
```

Output:

```
{
    "TransitGatewayVpcAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-09fbd47ddfEXAMPLE",
        "TransitGatewayId": "tgw-0560315ccfEXAMPLE",
        "VpcId": "vpc-5eccc927",
        "VpcOwnerId": "111122223333",
        "State": "modifying",
        "SubnetIds": [
            "subnet-0e51f45802EXAMPLE",
```

```
                "subnet-1EXAMPLE"
            ],
            "CreationTime": "2019-08-08T16:47:38.000Z",
            "Options": {
                "DnsSupport": "enable",
                "Ipv6Support": "disable"
            }
        }
}
```

For more information, see Transit gateway attachments to a VPC in the *Transit Gateways Guide*.

- For API details, see ModifyTransitGatewayVpcAttachment in *AWS CLI Command Reference*.

modify-transit-gateway

The following code example shows how to use `modify-transit-gateway`.

AWS CLI

To modify a transit gateway

The following `modify-transit-gateway` example modifies the specified transit gateway by enabling ECMP support for VPN attachments.

```
aws ec2 modify-transit-gateway \
    --transit-gateway-id tgw-111111222222aaaaa \
    --options VpnEcmpSupport=enable
```

Output:

```
{
    "TransitGateway": {
        "TransitGatewayId": "tgw-111111222222aaaaa",
        "TransitGatewayArn": "64512",
        "State": "modifying",
        "OwnerId": "123456789012",
        "CreationTime": "2020-04-30T08:41:37.000Z",
        "Options": {
            "AmazonSideAsn": 64512,
            "AutoAcceptSharedAttachments": "disable",
            "DefaultRouteTableAssociation": "enable",
```

```
                "AssociationDefaultRouteTableId": "tgw-rtb-0123456789abcd123",
                "DefaultRouteTablePropagation": "enable",
                "PropagationDefaultRouteTableId": "tgw-rtb-0123456789abcd123",
                "VpnEcmpSupport": "enable",
                "DnsSupport": "enable"
            }
        }
}
```

For more information, see Transit gateways in the *Transit Gateways Guide*.

- For API details, see ModifyTransitGateway in *AWS CLI Command Reference*.

`modify-verified-access-endpoint-policy`

The following code example shows how to use `modify-verified-access-endpoint-policy`.

AWS CLI

To configure the Verified Access policy for an endpoint

The following `modify-verified-access-endpoint-policy` example adds the specified Verified Access policy to the specified Verified Access endpoint.

```
aws ec2 modify-verified-access-endpoint-policy \
    --verified-access-endpoint-id vae-066fac616d4d546f2 \
    --policy-enabled \
    --policy-document file://policy.txt
```

Contents of `policy.txt`:

```
permit(principal,action,resource)
when {
    context.identity.groups.contains("finance") &&
    context.identity.email.verified == true
};
```

Output:

```
{
    "PolicyEnabled": true,
```

```
    "PolicyDocument": "permit(principal,action,resource)\nwhen
 {\n    context.identity.groups.contains(\"finance\") &&\n
 context.identity.email_verified == true\n};"
}
```

For more information, see [Verified Access policies](#) in the *AWS Verified Access User Guide*.

- For API details, see [ModifyVerifiedAccessEndpointPolicy](#) in *AWS CLI Command Reference*.

`modify-verified-access-endpoint`

The following code example shows how to use `modify-verified-access-endpoint`.

AWS CLI

To modify the configuration of a Verified Access endpoint

The following `modify-verified-access-endpoint` example adds the specified description to the specified Verified Access endpoint.

```
aws ec2 modify-verified-access-endpoint \
    --verified-access-endpoint-id vae-066fac616d4d546f2 \
    --description 'Testing Verified Access'
```

Output:

```
{
    "VerifiedAccessEndpoint": {
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
        "VerifiedAccessEndpointId": "vae-066fac616d4d546f2",
        "ApplicationDomain": "example.com",
        "EndpointType": "network-interface",
        "AttachmentType": "vpc",
        "DomainCertificateArn": "arn:aws:acm:us-east-2:123456789012:certificate/
eb065ea0-26f9-4e75-a6ce-0a1a7EXAMPLE",
        "EndpointDomain": "my-ava-
app.edge-00c3372d53b1540bb.vai-0ce000c0b7643abea.prod.verified-access.us-
east-2.amazonaws.com",
        "SecurityGroupIds": [
            "sg-004915970c4c8f13a"
        ],
```

```
        "NetworkInterfaceOptions": {
            "NetworkInterfaceId": "eni-0aec70418c8d87a0f",
            "Protocol": "https",
            "Port": 443
        },
        "Status": {
            "Code": "updating"
        },
        "Description": "Testing Verified Access",
        "CreationTime": "2023-08-25T20:54:43",
        "LastUpdatedTime": "2023-08-25T22:46:32"
    }
}
```

For more information, see Verified Access endpoints in the *AWS Verified Access User Guide*.

- For API details, see ModifyVerifiedAccessEndpoint in *AWS CLI Command Reference*.

`modify-verified-access-group-policy`

The following code example shows how to use `modify-verified-access-group-policy`.

AWS CLI

To configure a Verified Access policy for a group

The following `modify-verified-access-group-policy` example adds the specified Verified Access policy to the specified Verified Access group.

```
aws ec2 modify-verified-access-group-policy \
    --verified-access-group-id vagr-0dbe967baf14b7235 \
    --policy-enabled \
    --policy-document file://policy.txt
```

Contents of `policy.txt`:

```
permit(principal,action,resource)
when {
    context.identity.groups.contains("finance") &&
    context.identity.email.verified == true
};
```

Output:

```
{
    "PolicyEnabled": true,
    "PolicyDocument": "permit(principal,action,resource)\nwhen
 {\n    context.identity.groups.contains(\"finance\") &&\n
 context.identity.email_verified == true\n};"
}
```

For more information, see Verified Access groups in the *AWS Verified Access User Guide*.

- For API details, see ModifyVerifiedAccessGroupPolicy in *AWS CLI Command Reference*.

modify-verified-access-group

The following code example shows how to use `modify-verified-access-group`.

AWS CLI

To modify the configuration of a Verified Access group

The following `modify-verified-access-group` example adds the specified description to the specified Verified Access group.

```
aws ec2 modify-verified-access-group \
    --verified-access-group-id vagr-0dbe967baf14b7235 \
    --description "Testing Verified Access"
```

Output:

```
{
    "VerifiedAccessGroup": {
        "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "Description": "Testing Verified Access",
        "Owner": "123456789012",
        "VerifiedAccessGroupArn": "arn:aws:ec2:us-east-2:123456789012:verified-
access-group/vagr-0dbe967baf14b7235",
        "CreationTime": "2023-08-25T19:55:19",
        "LastUpdatedTime": "2023-08-25T22:17:25"
    }
}
```

For more information, see Verified Access groups in the *AWS Verified Access User Guide*.

- For API details, see ModifyVerifiedAccessGroup in *AWS CLI Command Reference*.

`modify-verified-access-instance-logging-configuration`

The following code example shows how to use `modify-verified-access-instance-logging-configuration`.

AWS CLI

To enable logging for a Verified Access instance

The following `modify-verified-access-instance-logging-configuration` example enables access logging for the specified Verified Access instance. The logs will be delivered to the specified CloudWatch Logs log group.

```
aws ec2 modify-verified-access-instance-logging-configuration \
    --verified-access-instance-id vai-0ce000c0b7643abea \
    --access-logs CloudWatchLogs={Enabled=true,LogGroup=my-log-group}
```

Output:

```
{
    "LoggingConfiguration": {
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "AccessLogs": {
            "S3": {
                "Enabled": false
            },
            "CloudWatchLogs": {
                "Enabled": true,
                "DeliveryStatus": {
                    "Code": "success"
                },
                "LogGroup": "my-log-group"
            },
            "KinesisDataFirehose": {
                "Enabled": false
            },
            "LogVersion": "ocsf-1.0.0-rc.2",
            "IncludeTrustContext": false
```

```
        }
    }
}
```

For more information, see [Verified Access logs](#) in the *AWS Verified Access User Guide*.

- For API details, see [ModifyVerifiedAccessInstanceLoggingConfiguration](#) in *AWS CLI Command Reference*.

`modify-verified-access-instance`

The following code example shows how to use `modify-verified-access-instance`.

AWS CLI

To modify the configuration of a Verified Access instance

The following `modify-verified-access-instance` example adds the specified description to the specified Verified Access instance.

```
aws ec2 modify-verified-access-instance \
    --verified-access-instance-id vai-0ce000c0b7643abea \
    --description "Testing Verified Access"
```

Output:

```
{
    "VerifiedAccessInstance": {
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "Description": "Testing Verified Access",
        "VerifiedAccessTrustProviders": [
            {
                "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
                "TrustProviderType": "user",
                "UserTrustProviderType": "iam-identity-center"
            }
        ],
        "CreationTime": "2023-08-25T18:27:56",
        "LastUpdatedTime": "2023-08-25T22:41:04"
    }
}
```

For more information, see Verified Access instances in the *AWS Verified Access User Guide*.

- For API details, see ModifyVerifiedAccessInstance in *AWS CLI Command Reference*.

`modify-verified-access-trust-provider`

The following code example shows how to use `modify-verified-access-trust-provider`.

AWS CLI

To modify the configuration of a Verified Access trust provider

The following `modify-verified-access-trust-provider` example adds the specified description to the specified Verified Access trust provider.

```
aws ec2 modify-verified-access-trust-provider \
    --verified-access-trust-provider-id vatp-0bb32de759a3e19e7 \
    --description "Testing Verified Access"
```

Output:

```
{
    "VerifiedAccessTrustProvider": {
        "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
        "Description": "Testing Verified Access",
        "TrustProviderType": "user",
        "UserTrustProviderType": "iam-identity-center",
        "PolicyReferenceName": "idc",
        "CreationTime": "2023-08-25T19:00:38",
        "LastUpdatedTime": "2023-08-25T19:18:21"
    }
}
```

For more information, see Trust providers for Verified Access in the *AWS Verified Access User Guide*.

- For API details, see ModifyVerifiedAccessTrustProvider in *AWS CLI Command Reference*.

`modify-volume-attribute`

The following code example shows how to use `modify-volume-attribute`.

AWS CLI

To modify a volume attribute

This example sets the `autoEnableIo` attribute of the volume with the ID `vol-1234567890abcdef0` to `true`. If the command succeeds, no output is returned.

Command:

```
aws ec2 modify-volume-attribute --volume-id vol-1234567890abcdef0 --auto-enable-io
```

- For API details, see ModifyVolumeAttribute in *AWS CLI Command Reference*.

`modify-volume`

The following code example shows how to use `modify-volume`.

AWS CLI

Example 1: To modify a volume by changing its size

The following `modify-volume` example changes the size of the specified volume to 150GB.

Command:

```
aws ec2 modify-volume --size 150 --volume-id vol-1234567890abcdef0
```

Output:

```
{
    "VolumeModification": {
        "TargetSize": 150,
        "TargetVolumeType": "io1",
        "ModificationState": "modifying",
        "VolumeId": " vol-1234567890abcdef0",
        "TargetIops": 100,
        "StartTime": "2019-05-17T11:27:19.000Z",
        "Progress": 0,
        "OriginalVolumeType": "io1",
        "OriginalIops": 100,
        "OriginalSize": 100
    }
```

```
}
```

Example 2: To modify a volume by changing its type, size, and IOPS value

The following `modify-volume` example changes the volume type to Provisioned IOPS SSD, sets the target IOPS rate to 10000, and sets the volume size to 350GB.

```
aws ec2 modify-volume \
    --volume-type io1 \
    --iops 10000 \
    --size 350 \
    --volume-id vol-1234567890abcdef0
```

Output:

```
{
    "VolumeModification": {
        "TargetSize": 350,
        "TargetVolumeType": "io1",
        "ModificationState": "modifying",
        "VolumeId": "vol-0721c1a9d08c93bf6",
        "TargetIops": 10000,
        "StartTime": "2019-05-17T11:38:57.000Z",
        "Progress": 0,
        "OriginalVolumeType": "gp2",
        "OriginalIops": 150,
        "OriginalSize": 50
    }
}
```

- For API details, see ModifyVolume in *AWS CLI Command Reference*.

`modify-vpc-attribute`

The following code example shows how to use `modify-vpc-attribute`.

AWS CLI

To modify the enableDnsSupport attribute

This example modifies the `enableDnsSupport` attribute. This attribute indicates whether DNS resolution is enabled for the VPC. If this attribute is `true`, the Amazon DNS server resolves DNS hostnames for your instances to their corresponding IP addresses; otherwise, it does not. If the command succeeds, no output is returned.

Command:

```
aws ec2 modify-vpc-attribute --vpc-id vpc-a01106c2 --enable-dns-support "{\"Value
\":false}"
```

To modify the enableDnsHostnames attribute

This example modifies the `enableDnsHostnames` attribute. This attribute indicates whether instances launched in the VPC get DNS hostnames. If this attribute is `true`, instances in the VPC get DNS hostnames; otherwise, they do not. If the command succeeds, no output is returned.

Command:

```
aws ec2 modify-vpc-attribute --vpc-id vpc-a01106c2 --enable-dns-hostnames "{\"Value
\":false}"
```

- For API details, see ModifyVpcAttribute in *AWS CLI Command Reference*.

`modify-vpc-endpoint-connection-notification`

The following code example shows how to use `modify-vpc-endpoint-connection-notification`.

AWS CLI

To modify an endpoint connection notification

This example changes the SNS topic for the specified endpoint connection notification.

Command:

```
aws ec2 modify-vpc-endpoint-connection-notification --connection-notification-
id vpce-nfn-008776de7e03f5abc --connection-events Accept Reject --connection-
notification-arn arn:aws:sns:us-east-2:123456789012:mytopic
```

Output:

```
{
   "ReturnValue": true
}
```

- For API details, see ModifyVpcEndpointConnectionNotification in *AWS CLI Command Reference*.

modify-vpc-endpoint-service-configuration

The following code example shows how to use `modify-vpc-endpoint-service-configuration`.

AWS CLI

To modify an endpoint service configuration

This example changes the acceptance requirement for the specified endpoint service.

Command:

```
aws ec2 modify-vpc-endpoint-service-configuration --service-id vpce-svc-09222513e6e77dc86 --no-acceptance-required
```

Output:

```
{
   "ReturnValue": true
}
```

- For API details, see ModifyVpcEndpointServiceConfiguration in *AWS CLI Command Reference*.

modify-vpc-endpoint-service-payer-responsibility

The following code example shows how to use `modify-vpc-endpoint-service-payer-responsibility`.

AWS CLI

To modify the payer responsibility

The following `modify-vpc-endpoint-service-payer-responsibility` example modifies the payer responsibility of the specified endpoint service.

```
aws ec2 modify-vpc-endpoint-service-payer-responsibility \
    --service-id vpce-svc-071afff70666e61e0 \
    --payer-responsibility ServiceOwner
```

This command produces no output.

- For API details, see ModifyVpcEndpointServicePayerResponsibility in *AWS CLI Command Reference*.

modify-vpc-endpoint-service-permissions

The following code example shows how to use `modify-vpc-endpoint-service-permissions`.

AWS CLI

To modify endpoint service permissions

This example adds permission for an AWS account to connect to the specified endpoint service.

Command:

```
aws ec2 modify-vpc-endpoint-service-permissions --service-id vpce-svc-03d5ebb7d9579a2b3 --add-allowed-principals '["arn:aws:iam::123456789012:root"]'
```

Output:

```
{
   "ReturnValue": true
}
```

This example adds permission for a specific IAM user (`admin`) to connect to the specified endpoint service.

Command:

```
aws ec2 modify-vpc-endpoint-service-permissions --service-id vpce-svc-03d5ebb7d9579a2b3 --add-allowed-principals '["arn:aws:iam::123456789012:user/admin"]'
```

- For API details, see ModifyVpcEndpointServicePermissions in *AWS CLI Command Reference*.

`modify-vpc-endpoint`

The following code example shows how to use `modify-vpc-endpoint`.

AWS CLI

To modify a gateway endpoint

This example modifies gateway endpoint `vpce-1a2b3c4d` by associating route table `rtb-aaa222bb` with the endpoint, and resetting the policy document.

Command:

```
aws ec2 modify-vpc-endpoint --vpc-endpoint-id vpce-1a2b3c4d --add-route-table-ids rtb-aaa222bb --reset-policy
```

Output:

```
{
  "Return": true
}
```

To modify an interface endpoint

This example modifies interface endpoint `vpce-0fe5b17a0707d6fa5` by adding subnet `subnet-d6fcaa8d` to the endpoint.

Command:

```
aws ec2 modify-vpc-endpoint --vpc-endpoint-id vpce-0fe5b17a0707d6fa5 --add-subnet-id subnet-d6fcaa8d
```

Output:

```
{
  "Return": true
}
```

- For API details, see ModifyVpcEndpoint in *AWS CLI Command Reference*.

`modify-vpc-peering-connection-options`

The following code example shows how to use `modify-vpc-peering-connection-options`.

AWS CLI

To enable communication over a VPC peering connection from your local ClassicLink connection

In this example, for peering connection `pcx-aaaabbb`, the owner of the requester VPC modifies the VPC peering connection options to enable a local ClassicLink connection to communicate with the peer VPC.

Command:

```
aws ec2 modify-vpc-peering-connection-options --vpc-peering-
connection-id pcx-aaaabbbb --requester-peering-connection-
options AllowEgressFromLocalClassicLinkToRemoteVpc=true
```

Output:

```
{
  "RequesterPeeringConnectionOptions": {
      "AllowEgressFromLocalClassicLinkToRemoteVpc": true
  }
}
```

To enable communication over a VPC peering connection from your local VPC to a remote ClassicLink connection

In this example, the owner of the accepter VPC modifies the VPC peering connection options to enable the local VPC to communicate with the ClassicLink connection in the peer VPC.

Command:

```
aws ec2 modify-vpc-peering-connection-options --vpc-peering-
connection-id pcx-aaaabbbb --accepter-peering-connection-
options AllowEgressFromLocalVpcToRemoteClassicLink=true
```

Output:

```
{
  "AccepterPeeringConnectionOptions": {
    "AllowEgressFromLocalVpcToRemoteClassicLink": true
  }
}
```

To enable DNS resolution support for the VPC peering connection

In this example, the owner of the requester VPC modifies the VPC peering connection options for `pcx-aaaabbbb` to enable the local VPC to resolve public DNS hostnames to private IP addresses when queried from instances in the peer VPC.

Command:

```
aws ec2 modify-vpc-peering-connection-options --vpc-peering-connection-id pcx-aaaabbbb --requester-peering-connection-options AllowDnsResolutionFromRemoteVpc=true
```

Output:

```
{
  "RequesterPeeringConnectionOptions": {
      "AllowDnsResolutionFromRemoteVpc": true
  }
}
```

- For API details, see ModifyVpcPeeringConnectionOptions in *AWS CLI Command Reference*.

`modify-vpc-tenancy`

The following code example shows how to use `modify-vpc-tenancy`.

AWS CLI

To modify the tenancy of a VPC

This example modifies the tenancy of VPC `vpc-1a2b3c4d` to `default`.

Command:

```
aws ec2 modify-vpc-tenancy --vpc-id vpc-1a2b3c4d --instance-tenancy default
```

Output:

```
{
  "Return": true
}
```

- For API details, see ModifyVpcTenancy in *AWS CLI Command Reference*.

`modify-vpn-connection-options`

The following code example shows how to use `modify-vpn-connection-options`.

AWS CLI

To modify your VPN connection options

The following `modify-vpn-connection-options` example modifies the local IPv4 CIDR on the customer gateway side of the specified VPN connection.

```
aws ec2 modify-vpn-connection-options \
    --vpn-connection-id vpn-1122334455aabbccd \
    --local-ipv4-network-cidr 10.0.0.0/16
```

Output:

```
{
    "VpnConnections": [
        {
            "CustomerGatewayConfiguration": "...configuration information...",
            "CustomerGatewayId": "cgw-01234567abcde1234",
            "Category": "VPN",
            "State": "modifying",
            "Type": "ipsec.1",
            "VpnConnectionId": "vpn-1122334455aabbccd",
            "TransitGatewayId": "tgw-00112233445566aab",
            "Options": {
                "EnableAcceleration": false,
                "StaticRoutesOnly": true,
                "LocalIpv4NetworkCidr": "10.0.0.0/16",
                "RemoteIpv4NetworkCidr": "0.0.0.0/0",
                "TunnelInsideIpVersion": "ipv4"
```

```
            },
            "Routes": [],
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "CanadaVPN"
                }
            ],
            "VgwTelemetry": [
                {
                    "AcceptedRouteCount": 0,
                    "LastStatusChange": "2020-07-29T10:35:11.000Z",
                    "OutsideIpAddress": "203.0.113.3",
                    "Status": "DOWN",
                    "StatusMessage": ""
                },
                {
                    "AcceptedRouteCount": 0,
                    "LastStatusChange": "2020-09-02T09:09:33.000Z",
                    "OutsideIpAddress": "203.0.113.5",
                    "Status": "UP",
                    "StatusMessage": ""
                }
            ]
        }
    ]
}
```

For more information, see Modifying Site-to-Site VPN connection options in the *AWS Site-to-Site VPN User Guide*.

- For API details, see ModifyVpnConnectionOptions in *AWS CLI Command Reference*.

`modify-vpn-connection`

The following code example shows how to use `modify-vpn-connection`.

AWS CLI

To modify a VPN connection

The following `modify-vpn-connection` example changes the target gateway for VPN connection `vpn-12345678901234567` to virtual private gateway `vgw-11223344556677889`:

```
aws ec2 modify-vpn-connection \
    --vpn-connection-id vpn-12345678901234567 \
    --vpn-gateway-id vgw-11223344556677889
```

Output:

```
{
    "VpnConnection": {
        "CustomerGatewayConfiguration": "...configuration information...",
        "CustomerGatewayId": "cgw-aabbccddee1122334",
        "Category": "VPN",
        "State": "modifying",
        "Type": "ipsec.1",
        "VpnConnectionId": "vpn-12345678901234567",
        "VpnGatewayId": "vgw-11223344556677889",
        "Options": {
            "StaticRoutesOnly": false
        },
        "VgwTelemetry": [
            {
                "AcceptedRouteCount": 0,
                "LastStatusChange": "2019-07-17T07:34:00.000Z",
                "OutsideIpAddress": "18.210.3.222",
                "Status": "DOWN",
                "StatusMessage": "IPSEC IS DOWN"
            },
            {
                "AcceptedRouteCount": 0,
                "LastStatusChange": "2019-07-20T21:20:16.000Z",
                "OutsideIpAddress": "34.193.129.33",
                "Status": "DOWN",
                "StatusMessage": "IPSEC IS DOWN"
            }
        ]
    }
}
```

- For API details, see ModifyVpnConnection in *AWS CLI Command Reference*.

`modify-vpn-tunnel-certificate`

The following code example shows how to use `modify-vpn-tunnel-certificate`.

AWS CLI

To rotate a VPN tunnel certificate

The following `modify-vpn-tunnel-certificate` example rotates the certificate for the specified tunnel for a VPN connection

```
aws ec2 modify-vpn-tunnel-certificate \
    --vpn-tunnel-outside-ip-address 203.0.113.17 \
    --vpn-connection-id vpn-12345678901234567
```

Output:

```
{
    "VpnConnection": {
        "CustomerGatewayConfiguration": ...configuration information...,
        "CustomerGatewayId": "cgw-aabbccddee1122334",
        "Category": "VPN",
        "State": "modifying",
        "Type": "ipsec.1",
        "VpnConnectionId": "vpn-12345678901234567",
        "VpnGatewayId": "vgw-11223344556677889",
        "Options": {
            "StaticRoutesOnly": false
        },
        "VgwTelemetry": [
            {
                "AcceptedRouteCount": 0,
                "LastStatusChange": "2019-09-11T17:27:14.000Z",
                "OutsideIpAddress": "203.0.113.17",
                "Status": "DOWN",
                "StatusMessage": "IPSEC IS DOWN",
                "CertificateArn": "arn:aws:acm:us-east-1:123456789101:certificate/
c544d8ce-20b8-4fff-98b0-example"
            },
            {
                "AcceptedRouteCount": 0,
                "LastStatusChange": "2019-09-11T17:26:47.000Z",
                "OutsideIpAddress": "203.0.114.18",
                "Status": "DOWN",
                "StatusMessage": "IPSEC IS DOWN",
                "CertificateArn": "arn:aws:acm:us-
east-1:123456789101:certificate/5ab64566-761b-4ad3-b259-example"
```

```
            }
        ]
    }
}
```

- For API details, see [ModifyVpnTunnelCertificate]() in *AWS CLI Command Reference*.

`modify-vpn-tunnel-options`

The following code example shows how to use `modify-vpn-tunnel-options`.

AWS CLI

To modify the tunnel options for a VPN connection

The following `modify-vpn-tunnel-options` example updates the Diffie-Hellman groups that are permitted for the specified tunnel and VPN connection.

```
aws ec2 modify-vpn-tunnel-options \
    --vpn-connection-id vpn-12345678901234567 \
    --vpn-tunnel-outside-ip-address 203.0.113.17 \
    --tunnel-options Phase1DHGroupNumbers=[{Value=14},{Value=15},{Value=16},
{Value=17},{Value=18}],Phase2DHGroupNumbers=[{Value=14},{Value=15},{Value=16},
{Value=17},{Value=18}]
```

Output:

```
{
    "VpnConnection": {
        "CustomerGatewayConfiguration": "...configuration information...",
        "CustomerGatewayId": "cgw-aabbccddee1122334",
        "Category": "VPN",
        "State": "available",
        "Type": "ipsec.1",
        "VpnConnectionId": "vpn-12345678901234567",
        "VpnGatewayId": "vgw-11223344556677889",
        "Options": {
            "StaticRoutesOnly": false,
            "TunnelOptions": [
                {
                    "OutsideIpAddress": "203.0.113.17",
                    "Phase1DHGroupNumbers": [
```

```
                        {
                            "Value": 14
                        },
                        {
                            "Value": 15
                        },
                        {
                            "Value": 16
                        },
                        {
                            "Value": 17
                        },
                        {
                            "Value": 18
                        }
                    ],
                    "Phase2DHGroupNumbers": [
                        {
                            "Value": 14
                        },
                        {
                            "Value": 15
                        },
                        {
                            "Value": 16
                        },
                        {
                            "Value": 17
                        },
                        {
                            "Value": 18
                        }
                    ]
                },
                {
                    "OutsideIpAddress": "203.0.114.19"
                }
            ]
        },
        "VgwTelemetry": [
            {
                "AcceptedRouteCount": 0,
                "LastStatusChange": "2019-09-10T21:56:54.000Z",
                "OutsideIpAddress": "203.0.113.17",
```

```
                    "Status": "DOWN",
                    "StatusMessage": "IPSEC IS DOWN"
                },
                {
                    "AcceptedRouteCount": 0,
                    "LastStatusChange": "2019-09-10T21:56:43.000Z",
                    "OutsideIpAddress": "203.0.114.19",
                    "Status": "DOWN",
                    "StatusMessage": "IPSEC IS DOWN"
                }
            ]
        }
    }
```

- For API details, see ModifyVpnTunnelOptions in *AWS CLI Command Reference*.

`monitor-instances`

The following code example shows how to use `monitor-instances`.

AWS CLI

To enable detailed monitoring for an instance

This example command enables detailed monitoring for the specified instance.

Command:

```
aws ec2 monitor-instances --instance-ids i-1234567890abcdef0
```

Output:

```
{
  "InstanceMonitorings": [
      {
          "InstanceId": "i-1234567890abcdef0",
          "Monitoring": {
              "State": "pending"
          }
      }
  ]
```

```
}
```

- For API details, see MonitorInstances in *AWS CLI Command Reference*.

`move-address-to-vpc`

The following code example shows how to use `move-address-to-vpc`.

AWS CLI

To move an address to EC2-VPC

This example moves Elastic IP address 54.123.4.56 to the EC2-VPC platform.

Command:

```
aws ec2 move-address-to-vpc --public-ip 54.123.4.56
```

Output:

```
{
  "Status": "MoveInProgress"
}
```

- For API details, see MoveAddressToVpc in *AWS CLI Command Reference*.

`move-byoip-cidr-to-ipam`

The following code example shows how to use `move-byoip-cidr-to-ipam`.

AWS CLI

To transfer a BYOIP CIDR to IPAM

The following `move-byoip-cidr-to-ipam` example transfers a BYOIP CIDR to IPAM.

(Linux):

```
aws ec2 move-byoip-cidr-to-ipam \
    --region us-west-2 \
```

```
    --ipam-pool-id ipam-pool-0a03d430ca3f5c035 \
    --ipam-pool-owner 111111111111 \
    --cidr 130.137.249.0/24
```

(Windows):

```
aws ec2 move-byoip-cidr-to-ipam ^
    --region us-west-2 ^
    --ipam-pool-id ipam-pool-0a03d430ca3f5c035 ^
    --ipam-pool-owner 111111111111 ^
    --cidr 130.137.249.0/24
```

Output:

```
{
    "ByoipCidr": {
        "Cidr": "130.137.249.0/24",
        "State": "pending-transfer"
    }
}
```

For more information, see Tutorial: Transfer an existing BYOIP IPv4 CIDR to IPAM in the *Amazon VPC IPAM User Guide*.

- For API details, see MoveByoipCidrToIpam in *AWS CLI Command Reference*.

`network-insights-access-scope`

The following code example shows how to use `network-insights-access-scope`.

AWS CLI

To create Network Insights access scopes

The following `create-network-insights-access-scope` example creates a network insights access scope in your AWS account.

```
aws ec2 create-network-insights-access-scope \
    --cli-input-json file://access-scope-file.json
```

Contents of `access-scope-file.json`:

```
{
    {
        "MatchPaths": [
            {
                "Source": {
                    "ResourceStatement": {
                         "Resources": [
                            "vpc-abcd12e3"
                        ]
                    }
                }
            }
        ],
        "ExcludePaths": [
            {
                "Source": {
                    "ResourceStatement": {
                        "ResourceTypes": [
                            "AWS::EC2::InternetGateway"
                        ]
                    }
                }
            }
        ]
    }
}
```

Output:

```
{
    "NetworkInsightsAccessScopeAnalysisId": "nisa-123456789111"
    }{
    "NetworkInsightsAccessScope": {
        "NetworkInsightsAccessScopeId": "nis-123456789222",
        "NetworkInsightsAccessScopeArn": "arn:aws:ec2:us-
east-1:123456789222:network-insights-access-scope/nis-123456789222",
        "CreatedDate": "2022-01-25T19:20:28.796000+00:00",

    },
    "NetworkInsightsAccessScopeContent": {
        "NetworkInsightsAccessScopeId": "nis-04c0c0fbca737c404",
        "MatchPaths": [
            {
```

```
                "Source": {
                    "ResourceStatement": {
                        "Resources": [
                            "vpc-abcd12e3"
                        ]
                    }
                }
            }
        ],
        "ExcludePaths": [
            {
                "Source": {
                    "ResourceStatement": {
                        "ResourceTypes": [
                            "AWS::EC2::InternetGateway"
                        ]
                    }
                }
            }
        ]
    }
}
```

For more information, see Getting started with Network Access Analyzer using the AWS CLI in the *Network Access Analyzer Guide*.

- For API details, see NetworkInsightsAccessScope in *AWS CLI Command Reference*.

provision-byoip-cidr

The following code example shows how to use `provision-byoip-cidr`.

AWS CLI

To provision an address range

The following `provision-byoip-cidr` example provisions a public IP address range for use with AWS.

```
aws ec2 provision-byoip-cidr \
    --cidr 203.0.113.25/24 \
    --cidr-authorization-context Message="$text_message",Signature="$signed_message"
```

Output:

```
{
    "ByoipCidr": {
        "Cidr": "203.0.113.25/24",
        "State": "pending-provision"
    }
}
```

For more information about creating the messages strings for the authorization context, see Bring Your Own IP Addresses in the *Amazon EC2 User Guide*.

- For API details, see ProvisionByoipCidr in *AWS CLI Command Reference*.

`provision-ipam-pool-cidr`

The following code example shows how to use `provision-ipam-pool-cidr`.

AWS CLI

To provision a CIDR to an IPAM pool

The following `provision-ipam-pool-cidr` example provisions a CIDR to an IPAM pool.

(Linux):

```
aws ec2 provision-ipam-pool-cidr \
    --ipam-pool-id ipam-pool-0533048da7d823723 \
    --cidr 10.0.0.0/24
```

(Windows):

```
aws ec2 provision-ipam-pool-cidr ^
    --ipam-pool-id ipam-pool-0533048da7d823723 ^
    --cidr 10.0.0.0/24
```

Output:

```
{
    "IpamPoolCidr": {
```

```
        "Cidr": "10.0.0.0/24",
        "State": "pending-provision"
    }
}
```

For more information, see Provision CIDRs to a pool in the *Amazon VPC IPAM User Guide*.

- For API details, see ProvisionIpamPoolCidr in *AWS CLI Command Reference*.

`purchase-host-reservation`

The following code example shows how to use `purchase-host-reservation`.

AWS CLI

To purchase a Dedicated Host Reservation

This example purchases the specified Dedicated Host Reservation offering for the specified Dedicated Host in your account.

Command:

```
aws ec2 purchase-host-reservation --offering-id hro-03f707bf363b6b324 --host-id-set h-013abcd2a00cbd123
```

Output:

```
{
  "TotalHourlyPrice": "1.499",
  "Purchase": [
      {
          "HourlyPrice": "1.499",
          "InstanceFamily": "m4",
          "PaymentOption": "NoUpfront",
          "HostIdSet": [
              "h-013abcd2a00cbd123"
          ],
          "HostReservationId": "hr-0d418a3a4ffc669ae",
          "UpfrontPrice": "0.000",
          "Duration": 31536000
      }
  ],
```

```
  "TotalUpfrontPrice": "0.000"
}
```

- For API details, see PurchaseHostReservation in *AWS CLI Command Reference*.

purchase-reserved-instances-offering

The following code example shows how to use `purchase-reserved-instances-offering`.

AWS CLI

To purchase a Reserved Instance offering

This example command illustrates a purchase of a Reserved Instances offering, specifying an offering ID and instance count.

Command:

```
aws ec2 purchase-reserved-instances-offering --reserved-instances-offering-
id ec06327e-dd07-46ee-9398-75b5fexample --instance-count 3
```

Output:

```
{
  "ReservedInstancesId": "af9f760e-6f91-4559-85f7-4980eexample"
}
```

- For API details, see PurchaseReservedInstancesOffering in *AWS CLI Command Reference*.

purchase-scheduled-instances

The following code example shows how to use `purchase-scheduled-instances`.

AWS CLI

To purchase a Scheduled Instance

This example purchases a Scheduled Instance.

Command:

```
aws ec2 purchase-scheduled-instances --purchase-requests file://purchase-request.json
```

Purchase-request.json:

```
[
    {
        "PurchaseToken": "eyJ2IjoiMSIsInMiOjEsImMiOi...",
        "InstanceCount": 1
    }
]
```

Output:

```
{
  "ScheduledInstanceSet": [
      {
          "AvailabilityZone": "us-west-2b",
          "ScheduledInstanceId": "sci-1234-1234-1234-1234-123456789012",
          "HourlyPrice": "0.095",
          "CreateDate": "2016-01-25T21:43:38.612Z",
          "Recurrence": {
              "OccurrenceDaySet": [
                  1
              ],
              "Interval": 1,
              "Frequency": "Weekly",
              "OccurrenceRelativeToEnd": false,
              "OccurrenceUnit": ""
          },
          "Platform": "Linux/UNIX",
          "TermEndDate": "2017-01-31T09:00:00Z",
          "InstanceCount": 1,
          "SlotDurationInHours": 32,
          "TermStartDate": "2016-01-31T09:00:00Z",
          "NetworkPlatform": "EC2-VPC",
          "TotalScheduledInstanceHours": 1696,
          "NextSlotStartTime": "2016-01-31T09:00:00Z",
          "InstanceType": "c4.large"
      }
  ]
}
```

- For API details, see PurchaseScheduledInstances in *AWS CLI Command Reference*.

`reboot-instances`

The following code example shows how to use `reboot-instances`.

AWS CLI

To reboot an Amazon EC2 instance

This example reboots the specified instance. If the command succeeds, no output is returned.

Command:

```
aws ec2 reboot-instances --instance-ids i-1234567890abcdef5
```

For more information, see Reboot Your Instance in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see RebootInstances in *AWS CLI Command Reference*.

`register-image`

The following code example shows how to use `register-image`.

AWS CLI

Example 1: To register an AMI using a manifest file

The following `register-image` example registers an AMI using the specified manifest file in Amazon S3.

```
aws ec2 register-image \
    --name my-image \
    --image-location amzn-s3-demo-bucket/myimage/image.manifest.xml
```

Output:

```
{
    "ImageId": "ami-1234567890EXAMPLE"
```

```
}
```

For more information, see Amazon Machine Images (AMI) in the *Amazon EC2 User Guide*.

Example 2: To register an AMI using a snapshot of a root device

The following `register-image` example registers an AMI using the specified snapshot of an EBS root volume as device `/dev/xvda`. The block device mapping also includes an empty 100 GiB EBS volume as device `/dev/xvdf`.

```
aws ec2 register-image \
    --name my-image \
    --root-device-name /dev/xvda \
    --block-device-mappings DeviceName=/dev/
xvda,Ebs={SnapshotId=snap-0db2cf683925d191f} DeviceName=/dev/
xvdf,Ebs={VolumeSize=100}
```

Output:

```
{
    "ImageId": "ami-1a2b3c4d5eEXAMPLE"
}
```

For more information, see Amazon Machine Images (AMI) in the *Amazon EC2 User Guide*.

- For API details, see RegisterImage in *AWS CLI Command Reference*.

`register-instance-event-notification-attributes`

The following code example shows how to use `register-instance-event-notification-attributes`.

AWS CLI

Example 1: To include all tags in event notifications

The following `register-instance-event-notification-attributes` example includes all tags in event notifications.

```
aws ec2 register-instance-event-notification-attributes \
    --instance-tag-attribute IncludeAllTagsOfInstance=true
```

Output:

```
{
    "InstanceTagAttribute": {
        "InstanceTagKeys": [],
        "IncludeAllTagsOfInstance": true
    }
}
```

For more information, see Scheduled events for your instances in the *Amazon EC2 User Guide*.

Example 2: To include specific tags in event notifications

The following `register-instance-event-notification-attributes` example includes the specified tags in event notifications. You cannot specify tags if `IncludeAllTagsOfInstance` is `true`.

```
aws ec2 register-instance-event-notification-attributes \
    --instance-tag-attribute InstanceTagKeys="tag-key1","tag-key2"
```

Output:

```
{
    "InstanceTagAttribute": {
        "InstanceTagKeys": [
            "tag-key1",
            "tag-key2"
        ],
        "IncludeAllTagsOfInstance": false
    }
}
```

For more information, see Scheduled events for your instances in the *Amazon EC2 User Guide*.

- For API details, see RegisterInstanceEventNotificationAttributes in *AWS CLI Command Reference*.

`register-transit-gateway-multicase-group-sources`

The following code example shows how to use `register-transit-gateway-multicase-group-sources`.

AWS CLI

To register a source with a transit gateway multicast group.

The following `register-transit-gateway-multicast-group-sources` example registers the specified network interface group source with a multicast group.

```
aws ec2 register-transit-gateway-multicast-group-sources \
    --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef79d6e597 \
    --group-ip-address 224.0.1.0 \
    --network-interface-ids eni-07f290fc3c090cbae
```

Output:

```
{
    "RegisteredMulticastGroupSources": {
        "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef79d6e597",
        "RegisteredNetworkInterfaceIds": [
            "eni-07f290fc3c090cbae"
        ],
        "GroupIpAddress": "224.0.1.0"
    }
}
```

For more information, see Register Sources with a Multicast Group in the *AWS Transit Gateways User Guide*.

- For API details, see RegisterTransitGatewayMulticaseGroupSources in *AWS CLI Command Reference*.

`register-transit-gateway-multicast-group-members`

The following code example shows how to use `register-transit-gateway-multicast-group-members`.

AWS CLI

To view the information about the transit gateway multicast domain associations

The following `register-transit-gateway-multicast-group-members` example returns the associations for the specified multicast domain.

```
aws ec2 register-transit-gateway-multicast-group-members \
    --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef79d6e597 \
    --group-ip-address 224.0.1.0 \
    --network-interface-ids eni-0e246d32695012e81
```

Output:

```
{
    "RegisteredMulticastGroupMembers": {
        "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef79d6e597",
        "RegisteredNetworkInterfaceIds": [
            "eni-0e246d32695012e81"
        ],
        "GroupIpAddress": "224.0.1.0"
    }
}
```

For more information, see Multicast domains in the *Transit Gateways User Guide*.

- For API details, see RegisterTransitGatewayMulticastGroupMembers in *AWS CLI Command Reference*.

`register-transit-gateway-multicast-group-sources`

The following code example shows how to use `register-transit-gateway-multicast-group-sources`.

AWS CLI

To register a source with a transit gateway multicast group.

The following `register-transit-gateway-multicast-group-sources` example registers the specified network interface group source with a multicast group.

```
aws ec2 register-transit-gateway-multicast-group-sources \
    --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef79d6e597 \
    --group-ip-address 224.0.1.0 \
    --network-interface-ids eni-07f290fc3c090cbae
```

Output:

```
{
    "RegisteredMulticastGroupSources": {
        "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef79d6e597",
        "RegisteredNetworkInterfaceIds": [
            "eni-07f290fc3c090cbae"
        ],
        "GroupIpAddress": "224.0.1.0"
    }
}
```

For more information, see Multicast domains in the *Transit Gateways Guide*.

- For API details, see RegisterTransitGatewayMulticastGroupSources in *AWS CLI Command Reference*.

`reject-transit-gateway-peering-attachment`

The following code example shows how to use `reject-transit-gateway-peering-attachment`.

AWS CLI

To reject a transit gateway peering attachment

The following `reject-transit-gateway-peering-attachment` example rejects the specified transit gateway peering attachment request. The `--region` parameter specifies the Region that the accepter transit gateway is located in.

```
aws ec2 reject-transit-gateway-peering-attachment \
    --transit-gateway-attachment-id tgw-attach-4455667788aabbccd \
    --region us-east-2
```

Output:

```
{
    "TransitGatewayPeeringAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-4455667788aabbccd",
        "RequesterTgwInfo": {
            "TransitGatewayId": "tgw-123abc05e04123abc",
            "OwnerId": "123456789012",
            "Region": "us-west-2"
```

```
        },
        "AccepterTgwInfo": {
            "TransitGatewayId": "tgw-11223344aabbcc112",
            "OwnerId": "123456789012",
            "Region": "us-east-2"
        },
        "State": "rejecting",
        "CreationTime": "2019-12-09T11:50:31.000Z"
    }
}
```

For more information, see Transit Gateway Peering Attachments in the *Transit Gateways Guide*.

- For API details, see RejectTransitGatewayPeeringAttachment in *AWS CLI Command Reference*.

`reject-transit-gateway-vpc-attachment`

The following code example shows how to use `reject-transit-gateway-vpc-attachment`.

AWS CLI

To reject a transit gateway VPC attachment

The following `reject-transit-gateway-vpc-attachment` example rejects the specified transit gateway VPC attachment.

```
aws ec2 reject-transit-gateway-vpc-attachment \
    --transit-gateway-attachment-id tgw-attach-0a34fe6b4fEXAMPLE
```

Output:

```
{
    "TransitGatewayVpcAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-0a34fe6b4fEXAMPLE",
        "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
        "VpcId": "vpc-07e8ffd50fEXAMPLE",
        "VpcOwnerId": "111122223333",
        "State": "pending",
        "SubnetIds": [
            "subnet-0752213d59EXAMPLE"
        ],
        "CreationTime": "2019-07-10T17:33:46.000Z",
```

```
        "Options": {
            "DnsSupport": "enable",
            "Ipv6Support": "disable"
        }
    }
}
```

For more information, see Transit gateway attachments to a VPC in the *Transit Gateways Guide*.

- For API details, see RejectTransitGatewayVpcAttachment in *AWS CLI Command Reference*.

`reject-transit-gateway-vpc-attachments`

The following code example shows how to use `reject-transit-gateway-vpc-attachments`.

AWS CLI

To reject a transit gateway VPC attachment

The following `reject-transit-gateway-vpc-attachment` example rejects the specified transit gateway VPC attachment.

```
aws ec2 reject-transit-gateway-vpc-attachment \
    --transit-gateway-attachment-id tgw-attach-0a34fe6b4fEXAMPLE
```

Output:

```
{
    "TransitGatewayVpcAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-0a34fe6b4fEXAMPLE",
        "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
        "VpcId": "vpc-07e8ffd50fEXAMPLE",
        "VpcOwnerId": "111122223333",
        "State": "pending",
        "SubnetIds": [
            "subnet-0752213d59EXAMPLE"
        ],
        "CreationTime": "2019-07-10T17:33:46.000Z",
        "Options": {
            "DnsSupport": "enable",
            "Ipv6Support": "disable"
        }
```

```
    }
}
```

For more information, see Transit gateway attachments to a VPC in the *Transit Gateways Guide*.

- For API details, see RejectTransitGatewayVpcAttachments in *AWS CLI Command Reference*.

`reject-vpc-endpoint-connections`

The following code example shows how to use `reject-vpc-endpoint-connections`.

AWS CLI

To reject an interface endpoint connection request

This example rejects the specified endpoint connection request for the specified endpoint service.

Command:

```
aws ec2 reject-vpc-endpoint-connections --service-id vpce-svc-03d5ebb7d9579a2b3 --
vpc-endpoint-ids vpce-0c1308d7312217abc
```

Output:

```
{
  "Unsuccessful": []
}
```

- For API details, see RejectVpcEndpointConnections in *AWS CLI Command Reference*.

`reject-vpc-peering-connection`

The following code example shows how to use `reject-vpc-peering-connection`.

AWS CLI

To reject a VPC peering connection

This example rejects the specified VPC peering connection request.

Command:

```
aws ec2 reject-vpc-peering-connection --vpc-peering-connection-id pcx-1a2b3c4d
```

Output:

```
{
    "Return": true
}
```

- For API details, see RejectVpcPeeringConnection in *AWS CLI Command Reference*.

`release-address`

The following code example shows how to use `release-address`.

AWS CLI

To release an Elastic IP addresses for EC2-Classic

This example releases an Elastic IP address for use with instances in EC2-Classic. If the command succeeds, no output is returned.

Command:

```
aws ec2 release-address --public-ip 198.51.100.0
```

To release an Elastic IP address for EC2-VPC

This example releases an Elastic IP address for use with instances in a VPC. If the command succeeds, no output is returned.

Command:

```
aws ec2 release-address --allocation-id eipalloc-64d5890a
```

- For API details, see ReleaseAddress in *AWS CLI Command Reference*.

`release-hosts`

The following code example shows how to use `release-hosts`.

AWS CLI

To release a Dedicated host from your account

To release a Dedicated host from your account. Instances that are on the host must be stopped or terminated before the host can be released.

Command:

```
aws ec2 release-hosts --host-id=h-0029d6e3cacf1b3da
```

Output:

```
{
    "Successful":  [
        "h-0029d6e3cacf1b3da"
         ],
  "Unsuccessful": []

 }
```

- For API details, see ReleaseHosts in *AWS CLI Command Reference*.

`release-ipam-pool-allocation`

The following code example shows how to use `release-ipam-pool-allocation`.

AWS CLI

To release an IPAM pool allocation

In this example, you're an IPAM delegated admin who tried to delete an IPAM pool but received an error that you cannot delete the pool while the pool has allocations. You are using this command to release a pool allocation.

Note the following:

You can only use this command for custom allocations. To remove an allocation for a resource without deleting the resource, set its monitored state to false using modify-ipam-resource-cidr.To complete this request, you'll need the IPAM pool ID, which you can get with describe-ipam-pools. You'll also need the allocation ID, which you can get with get-ipam-pool-allocations.If you do not want to remove allocations one by one, you can use the `--cascade option` when you delete an IPAM pool to automatically release any allocations in the pool before deleting it.There are a number of prerequisites before running this command. For more information, see Release an allocation in the *Amazon VPC IPAM User Guide*.The `--region` in which you run this command must be the locale of the IPAM pool where the allocation is.

The following `release-ipam-pool-allocation` example releases an IPAM pool allocation.

```
aws ec2 release-ipam-pool-allocation \
    --ipam-pool-id ipam-pool-07bdd12d7c94e4693 \
    --cidr 10.0.0.0/23 \
    --ipam-pool-allocation-id ipam-pool-alloc-0e66a1f730da54791b99465b79e7d1e89 \
    --region us-west-1
```

Output:

```
{
    "Success": true
}
```

Once you release an allocation, you may want to run delete-ipam-pool.

- For API details, see ReleaseIpamPoolAllocation in *AWS CLI Command Reference*.

`replace-iam-instance-profile-association`

The following code example shows how to use `replace-iam-instance-profile-association`.

AWS CLI

To replace an IAM instance profile for an instance

This example replaces the IAM instance profile represented by the association `iip-assoc-060bae234aac2e7fa` with the IAM instance profile named `AdminRole`.

```
aws ec2 replace-iam-instance-profile-association \
    --iam-instance-profile Name=AdminRole \
    --association-id iip-assoc-060bae234aac2e7fa
```

Output:

```
{
    "IamInstanceProfileAssociation": {
        "InstanceId": "i-087711ddaf98f9489",
        "State": "associating",
        "AssociationId": "iip-assoc-0b215292fab192820",
        "IamInstanceProfile": {
            "Id": "AIPAJLNLDX3AMYZNWYYAY",
            "Arn": "arn:aws:iam::123456789012:instance-profile/AdminRole"
        }
    }
}
```

- For API details, see ReplaceIamInstanceProfileAssociation in *AWS CLI Command Reference*.

replace-network-acl-association

The following code example shows how to use `replace-network-acl-association`.

AWS CLI

To replace the network ACL associated with a subnet

This example associates the specified network ACL with the subnet for the specified network ACL association.

Command:

```
aws ec2 replace-network-acl-association --association-id aclassoc-e5b95c8c --
network-acl-id acl-5fb85d36
```

Output:

```
{
    "NewAssociationId": "aclassoc-3999875b"
}
```

- For API details, see ReplaceNetworkAclAssociation in *AWS CLI Command Reference*.

replace-network-acl-entry

The following code example shows how to use `replace-network-acl-entry`.

AWS CLI

To replace a network ACL entry

This example replaces an entry for the specified network ACL. The new rule 100 allows ingress traffic from 203.0.113.12/24 on UDP port 53 (DNS) into any associated subnet.

Command:

```
aws ec2 replace-network-acl-entry --network-acl-id acl-5fb85d36 --ingress --rule-number 100 --protocol udp --port-range From=53,To=53 --cidr-block 203.0.113.12/24 --rule-action allow
```

- For API details, see ReplaceNetworkAclEntry in *AWS CLI Command Reference*.

`replace-route-table-association`

The following code example shows how to use `replace-route-table-association`.

AWS CLI

To replace the route table associated with a subnet

This example associates the specified route table with the subnet for the specified route table association.

Command:

```
aws ec2 replace-route-table-association --association-id rtbassoc-781d0d1a --route-table-id rtb-22574640
```

Output:

```
{
    "NewAssociationId": "rtbassoc-3a1f0f58"
}
```

- For API details, see ReplaceRouteTableAssociation in *AWS CLI Command Reference*.

`replace-route`

The following code example shows how to use `replace-route`.

AWS CLI

To replace a route

This example replaces the specified route in the specified route table. The new route matches the specified CIDR and sends the traffic to the specified virtual private gateway. If the command succeeds, no output is returned.

Command:

```
aws ec2 replace-route --route-table-id rtb-22574640 --destination-cidr-
block 10.0.0.0/16 --gateway-id vgw-9a4cacf3
```

- For API details, see [ReplaceRoute](#) in *AWS CLI Command Reference*.

`replace-transit-gateway-route`

The following code example shows how to use `replace-transit-gateway-route`.

AWS CLI

To replace the specified route in the specified transit gateway route table

The following `replace-transit-gateway-route` example replaces the route in the specified transit gateway route table.

```
aws ec2 replace-transit-gateway-route \
    --destination-cidr-block 10.0.2.0/24 \
    --transit-gateway-attachment-id tgw-attach-09b52ccdb5EXAMPLE \
    --transit-gateway-route-table-id tgw-rtb-0a823edbdeEXAMPLE
```

Output:

```
{
    "Route": {
        "DestinationCidrBlock": "10.0.2.0/24",
        "TransitGatewayAttachments": [
            {
                "ResourceId": "vpc-4EXAMPLE",
                "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
                "ResourceType": "vpc"
```

```
            }
        ],
        "Type": "static",
        "State": "active"
    }
}
```

For more information, see [Transit gateway route tables](#) in the *Transit Gateways Guide*.

- For API details, see [ReplaceTransitGatewayRoute](#) in *AWS CLI Command Reference*.

`report-instance-status`

The following code example shows how to use `report-instance-status`.

AWS CLI

To report status feedback for an instance

This example command reports status feedback for the specified instance.

Command:

```
aws ec2 report-instance-status --instances i-1234567890abcdef0 --status impaired --
reason-codes unresponsive
```

- For API details, see [ReportInstanceStatus](#) in *AWS CLI Command Reference*.

`request-spot-fleet`

The following code example shows how to use `request-spot-fleet`.

AWS CLI

To request a Spot fleet in the subnet with the lowest price

This example command creates a Spot fleet request with two launch specifications that differ only by subnet. The Spot fleet launches the instances in the specified subnet with the lowest price. If the instances are launched in a default VPC, they receive a public IP address by default. If the instances are launched in a nondefault VPC, they do not receive a public IP address by default.

Note that you can't specify different subnets from the same Availability Zone in a Spot fleet request.

Command:

```
aws ec2 request-spot-fleet --spot-fleet-request-config file://config.json
```

Config.json:

```
{
  "SpotPrice": "0.04",
  "TargetCapacity": 2,
  "IamFleetRole": "arn:aws:iam::123456789012:role/my-spot-fleet-role",
  "LaunchSpecifications": [
      {
          "ImageId": "ami-1a2b3c4d",
          "KeyName": "my-key-pair",
          "SecurityGroups": [
              {
                  "GroupId": "sg-1a2b3c4d"
              }
          ],
          "InstanceType": "m3.medium",
          "SubnetId": "subnet-1a2b3c4d, subnet-3c4d5e6f",
          "IamInstanceProfile": {
              "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
          }
      }
  ]
}
```

Output:

```
{
  "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE"
}
```

To request a Spot fleet in the Availability Zone with the lowest price

This example command creates a Spot fleet request with two launch specifications that differ only by Availability Zone. The Spot fleet launches the instances in the specified Availability Zone with the lowest price. If your account supports EC2-VPC only, Amazon EC2 launches the Spot instances in the default subnet of the Availability Zone. If your account supports EC2-Classic, Amazon EC2 launches the instances in EC2-Classic in the Availability Zone.

Command:

```
aws ec2 request-spot-fleet --spot-fleet-request-config file://config.json
```

Config.json:

```
{
  "SpotPrice": "0.04",
  "TargetCapacity": 2,
  "IamFleetRole": "arn:aws:iam::123456789012:role/my-spot-fleet-role",
  "LaunchSpecifications": [
      {
          "ImageId": "ami-1a2b3c4d",
          "KeyName": "my-key-pair",
          "SecurityGroups": [
              {
                  "GroupId": "sg-1a2b3c4d"
              }
          ],
          "InstanceType": "m3.medium",
          "Placement": {
              "AvailabilityZone": "us-west-2a, us-west-2b"
          },
          "IamInstanceProfile": {
              "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
          }
      }
  ]
}
```

To launch Spot instances in a subnet and assign them public IP addresses

This example command assigns public addresses to instances launched in a nondefault VPC. Note that when you specify a network interface, you must include the subnet ID and security group ID using the network interface.

Command:

```
aws ec2 request-spot-fleet --spot-fleet-request-config file://config.json
```

Config.json:

```
{
  "SpotPrice": "0.04",
  "TargetCapacity": 2,
  "IamFleetRole": "arn:aws:iam::123456789012:role/my-spot-fleet-role",
  "LaunchSpecifications": [
      {
          "ImageId": "ami-1a2b3c4d",
          "KeyName": "my-key-pair",
          "InstanceType": "m3.medium",
          "NetworkInterfaces": [
              {
                  "DeviceIndex": 0,
                  "SubnetId": "subnet-1a2b3c4d",
                  "Groups": [ "sg-1a2b3c4d" ],
                  "AssociatePublicIpAddress": true
              }
          ],
          "IamInstanceProfile": {
              "Arn": "arn:aws:iam::880185128111:instance-profile/my-iam-role"
          }
      }
  ]
}
```

To request a Spot fleet using the diversified allocation strategy

This example command creates a Spot fleet request that launches 30 instances using the diversified allocation strategy. The launch specifications differ by instance type. The Spot fleet distributes the instances across the launch specifications such that there are 10 instances of each type.

Command:

```
aws ec2 request-spot-fleet --spot-fleet-request-config file://config.json
```

Config.json:

```
{
  "SpotPrice": "0.70",
  "TargetCapacity": 30,
```

```
  "AllocationStrategy": "diversified",
  "IamFleetRole": "arn:aws:iam::123456789012:role/my-spot-fleet-role",
  "LaunchSpecifications": [
      {
          "ImageId": "ami-1a2b3c4d",
          "InstanceType": "c4.2xlarge",
          "SubnetId": "subnet-1a2b3c4d"
      },
      {
          "ImageId": "ami-1a2b3c4d",
          "InstanceType": "m3.2xlarge",
          "SubnetId": "subnet-1a2b3c4d"
      },
      {
          "ImageId": "ami-1a2b3c4d",
          "InstanceType": "r3.2xlarge",
          "SubnetId": "subnet-1a2b3c4d"
      }
  ]
}
```

For more information, see Spot Fleet Requests in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see RequestSpotFleet in *AWS CLI Command Reference*.

`request-spot-instances`

The following code example shows how to use `request-spot-instances`.

AWS CLI

To request Spot Instances

This example command creates a one-time Spot Instance request for five instances in the specified Availability Zone. If your account supports EC2-VPC only, Amazon EC2 launches the instances in the default subnet of the specified Availability Zone. If your account supports EC2-Classic, Amazon EC2 launches the instances in EC2-Classic in the specified Availability Zone.

Command:

```
aws ec2 request-spot-instances --spot-price "0.03" --instance-count 5 --type "one-time" --launch-specification file://specification.json
```

Specification.json:

```
{
  "ImageId": "ami-1a2b3c4d",
  "KeyName": "my-key-pair",
  "SecurityGroupIds": [ "sg-1a2b3c4d" ],
  "InstanceType": "m3.medium",
  "Placement": {
    "AvailabilityZone": "us-west-2a"
  },
  "IamInstanceProfile": {
      "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
  }
}
```

Output:

```
{
  "SpotInstanceRequests": [
      {
          "Status": {
              "UpdateTime": "2014-03-25T20:54:21.000Z",
              "Code": "pending-evaluation",
              "Message": "Your Spot request has been submitted for review, and is
 pending evaluation."
          },
          "ProductDescription": "Linux/UNIX",
          "SpotInstanceRequestId": "sir-df6f405d",
          "State": "open",
          "LaunchSpecification": {
              "Placement": {
                  "AvailabilityZone": "us-west-2a"
              },
              "ImageId": "ami-1a2b3c4d",
              "KeyName": "my-key-pair",
              "SecurityGroups": [
                  {
                      "GroupName": "my-security-group",
                      "GroupId": "sg-1a2b3c4d"
                  }
              ],
              "Monitoring": {
                  "Enabled": false
```

```
                },
                "IamInstanceProfile": {
                    "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
                },
                "InstanceType": "m3.medium"
            },
            "Type": "one-time",
            "CreateTime": "2014-03-25T20:54:20.000Z",
            "SpotPrice": "0.050000"
        },
        ...
    ]
}
```

This example command creates a one-time Spot Instance request for five instances in the specified subnet. Amazon EC2 launches the instances in the specified subnet. If the VPC is a nondefault VPC, the instances do not receive a public IP address by default.

Command:

```
aws ec2 request-spot-instances --spot-price "0.050" --instance-count 5 --type "one-time" --launch-specification file://specification.json
```

Specification.json:

```
{
  "ImageId": "ami-1a2b3c4d",
  "SecurityGroupIds": [ "sg-1a2b3c4d" ],
  "InstanceType": "m3.medium",
  "SubnetId": "subnet-1a2b3c4d",
  "IamInstanceProfile": {
      "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
  }
}
```

Output:

```
{
  "SpotInstanceRequests": [
      {
          "Status": {
             "UpdateTime": "2014-03-25T22:21:58.000Z",
```

```
              "Code": "pending-evaluation",
              "Message": "Your Spot request has been submitted for review, and is
 pending evaluation."
           },
           "ProductDescription": "Linux/UNIX",
           "SpotInstanceRequestId": "sir-df6f405d",
           "State": "open",
           "LaunchSpecification": {
              "Placement": {
                  "AvailabilityZone": "us-west-2a"
              }
              "ImageId": "ami-1a2b3c4d"
              "SecurityGroups": [
                  {
                      "GroupName": "my-security-group",
                      "GroupID": "sg-1a2b3c4d"
                  }
              ]
              "SubnetId": "subnet-1a2b3c4d",
              "Monitoring": {
                  "Enabled": false
              },
              "IamInstanceProfile": {
                  "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
              },
              "InstanceType": "m3.medium",
          },
          "Type": "one-time",
          "CreateTime": "2014-03-25T22:21:58.000Z",
          "SpotPrice": "0.050000"
       },
       ...
   ]
}
```

This example assigns a public IP address to the Spot Instances that you launch in a nondefault VPC. Note that when you specify a network interface, you must include the subnet ID and security group ID using the network interface.

Command:

```
aws ec2 request-spot-instances --spot-price "0.050" --instance-count 1 --type "one-
time" --launch-specification file://specification.json
```

Specification.json:

```
{
  "ImageId": "ami-1a2b3c4d",
  "KeyName": "my-key-pair",
  "InstanceType": "m3.medium",
  "NetworkInterfaces": [
    {
      "DeviceIndex": 0,
      "SubnetId": "subnet-1a2b3c4d",
      "Groups": [ "sg-1a2b3c4d" ],
      "AssociatePublicIpAddress": true
    }
  ],
  "IamInstanceProfile": {
      "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
  }
}
```

- For API details, see RequestSpotInstances in *AWS CLI Command Reference*.

`reset-address-attribute`

The following code example shows how to use `reset-address-attribute`.

AWS CLI

To reset the domain name attribute associated with an elastic IP address

The following `reset-address-attribute` examples reset the domain name attribute of an elastic IP address.

Linux:

```
aws ec2 reset-address-attribute \
    --allocation-id eipalloc-abcdef01234567890 \
    --attribute domain-name
```

Windows:

```
aws ec2 reset-address-attribute ^
    --allocation-id eipalloc-abcdef01234567890 ^
```

```
    --attribute domain-name
```

Output:

```
{
    "Addresses": [
        {
            "PublicIp": "192.0.2.0",
            "AllocationId": "eipalloc-abcdef01234567890",
            "PtrRecord": "example.com."
            "PtrRecordUpdate": {
                "Value": "example.net.",
                "Status": "PENDING"
        }
    ]
}
```

To monitor the pending change, see describe-addresses-attribute in the *AWS CLI Command Reference*.

- For API details, see ResetAddressAttribute in *AWS CLI Command Reference*.

`reset-ebs-default-kms-key-id`

The following code example shows how to use `reset-ebs-default-kms-key-id`.

AWS CLI

To reset your default CMK for EBS encryption

The following `reset-ebs-default-kms-key-id` example resets the default CMK for EBS encryption for your AWS account in the current Region.

```
aws ec2 reset-ebs-default-kms-key-id
```

Output:

```
{
   "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/8c5b2c63-b9bc-45a3-
a87a-5513eEXAMPLE"
}
```

- For API details, see ResetEbsDefaultKmsKeyId in *AWS CLI Command Reference*.

`reset-fpga-image-attribute`

The following code example shows how to use `reset-fpga-image-attribute`.

AWS CLI

To reset the attributes of an Amazon FPGA image

This example resets the load permissions for the specified AFI.

Command:

```
aws ec2 reset-fpga-image-attribute --fpga-image-id afi-0d123e123bfc85abc --
attribute loadPermission
```

Output:

```
{
  "Return": true
}
```

- For API details, see ResetFpgaImageAttribute in *AWS CLI Command Reference*.

`reset-image-attribute`

The following code example shows how to use `reset-image-attribute`.

AWS CLI

To reset the launchPermission attribute

This example resets the `launchPermission` attribute for the specified AMI to its default value. By default, AMIs are private. If the command succeeds, no output is returned.

Command:

```
aws ec2 reset-image-attribute --image-id ami-5731123e --attribute launchPermission
```

- For API details, see ResetImageAttribute in *AWS CLI Command Reference*.

`reset-instance-attribute`

The following code example shows how to use `reset-instance-attribute`.

AWS CLI

To reset the sourceDestCheck attribute

This example resets the `sourceDestCheck` attribute of the specified instance. The instance must be in a VPC. If the command succeeds, no output is returned.

Command:

```
aws ec2 reset-instance-attribute --instance-id i-1234567890abcdef0 --
attribute sourceDestCheck
```

To reset the kernel attribute

This example resets the `kernel` attribute of the specified instance. The instance must be in the `stopped` state. If the command succeeds, no output is returned.

Command:

```
aws ec2 reset-instance-attribute --instance-id i-1234567890abcdef0 --
attribute kernel
```

To reset the ramdisk attribute

This example resets the `ramdisk` attribute of the specified instance. The instance must be in the `stopped` state. If the command succeeds, no output is returned.

Command:

```
aws ec2 reset-instance-attribute --instance-id i-1234567890abcdef0 --
attribute ramdisk
```

- For API details, see ResetInstanceAttribute in *AWS CLI Command Reference*.

`reset-network-interface-attribute`

The following code example shows how to use `reset-network-interface-attribute`.

AWS CLI

To reset a network interface attribute

The following `reset-network-interface-attribute` example resets the value of the source/destination checking attribute to `true`.

```
aws ec2 reset-network-interface-attribute \
    --network-interface-id eni-686ea200 \
    --source-dest-check
```

This command produces no output.

- For API details, see ResetNetworkInterfaceAttribute in *AWS CLI Command Reference*.

`reset-snapshot-attribute`

The following code example shows how to use `reset-snapshot-attribute`.

AWS CLI

To reset a snapshot attribute

This example resets the create volume permissions for snapshot `snap-1234567890abcdef0`. If the command succeeds, no output is returned.

Command:

```
aws ec2 reset-snapshot-attribute --snapshot-id snap-1234567890abcdef0 --
attribute createVolumePermission
```

- For API details, see ResetSnapshotAttribute in *AWS CLI Command Reference*.

`restore-address-to-classic`

The following code example shows how to use `restore-address-to-classic`.

AWS CLI

To restore an address to EC2-Classic

This example restores Elastic IP address 198.51.100.0 to the EC2-Classic platform.

Command:

```
aws ec2 restore-address-to-classic --public-ip 198.51.100.0
```

Output:

```
{
  "Status": "MoveInProgress",
  "PublicIp": "198.51.100.0"
}
```

- For API details, see [RestoreAddressToClassic]() in *AWS CLI Command Reference*.

`restore-image-from-recycle-bin`

The following code example shows how to use `restore-image-from-recycle-bin`.

AWS CLI

To restore an image from the Recycle Bin

The following `restore-image-from-recycle-bin` example restores AMI ami-0111222333444abcd from the Recycle Bin.

```
aws ec2 restore-image-from-recycle-bin \
    --image-id ami-0111222333444abcd
```

Output:

```
{
    "Return": true
}
```

For more information, see [Recover deleted AMIs from the Recycle Bin]() in the *Amazon EBS User Guide*.

- For API details, see [RestoreImageFromRecycleBin]() in *AWS CLI Command Reference*.

`restore-managed-prefix-list-version`

The following code example shows how to use `restore-managed-prefix-list-version`.

AWS CLI

us-west-2**To restore a prefix list version**

The following `restore-managed-prefix-list-version` restores the entries from version 1 of the specified prefix list.

```
aws ec2 restore-managed-prefix-list-version \
    --prefix-list-id pl-0123456abcabcabc1 \
    --current-version 2 \
    --previous-version 1
```

Output:

```
{
    "PrefixList": {
        "PrefixListId": "pl-0123456abcabcabc1",
        "AddressFamily": "IPv4",
        "State": "restore-in-progress",
        "PrefixListArn": "arn:aws:ec2:us-west-2:123456789012:prefix-list/
pl-0123456abcabcabc1",
        "PrefixListName": "vpc-cidrs",
        "MaxEntries": 10,
        "Version": 2,
        "OwnerId": "123456789012"
    }
}
```

For more information, see Managed prefix lists in the *Amazon VPC User Guide*.

- For API details, see RestoreManagedPrefixListVersion in *AWS CLI Command Reference*.

`restore-snapshot-from-recycle-bin`

The following code example shows how to use `restore-snapshot-from-recycle-bin`.

AWS CLI

To restore snapshots from the Recycle Bin

The following `restore-snapshot-from-recycle-bin` example restores a snapshot from the Recycle Bin. When you restore a snapshot from the Recycle Bin, the snapshot is immediately available for use, and it is removed from the Recycle Bin. You can use a restored snapshot in the same way that you use any other snapshot in your account.

```
aws ec2 restore-snapshot-from-recycle-bin \
    --snapshot-id snap-01234567890abcdef
```

This command produces no output.

For more information about Recycle Bin, see Recover deleted snapshots from the Recycle Bin in the *Amazon EBS User Guide*.

- For API details, see RestoreSnapshotFromRecycleBin in *AWS CLI Command Reference*.

`restore-snapshot-tier`

The following code example shows how to use `restore-snapshot-tier`.

AWS CLI

Example 1: To permanently restore an archived snapshot

The following `restore-snapshot-tier` example permanently restores the specified snapshot. Specify the `--snapshot-id` and include the `permanent-restore` option.

```
aws ec2 restore-snapshot-tier \
    --snapshot-id snap-01234567890abcedf \
    --permanent-restore
```

Output:

```
{
    "SnapshotId": "snap-01234567890abcedf",
    "IsPermanentRestore": true
}
```

For more information about snapshot archiving, see Archive Amazon EBS snapshots in the *Amazon EBS User Guide*.

Example 2: To temporarily restore an archived snapshot

The following `restore-snapshot-tier` example temporarily restores the specified snapshot. Omit the `--permanent-restore` option. Specify the `--snapshot-id` and, for `temporary-`

`restore-days`, specify the number of days for which to restore the snapshot. `temporary-restore-days` must be specified in days. The allowed range is 1 to `180`. If you do not specify a value, it defaults to 1 day.

```
aws ec2 restore-snapshot-tier \
    --snapshot-id snap-01234567890abcedf \
    --temporary-restore-days 5
```

Output:

```
{
    "SnapshotId": "snap-01234567890abcedf",
    "RestoreDuration": 5,
    "IsPermanentRestore": false
}
```

For more information about snapshot archiving, see Archive Amazon EBS snapshots in the *Amazon EBS User Guide*.

Example 3: To modify the restore period

The following `restore-snapshot-tier` example changes the restore period for the specified snapshot to `10` days.

```
aws ec2 restore-snapshot-tier \
    --snapshot-id snap-01234567890abcedf
    --temporary-restore-days 10
```

Output:

```
{
    "SnapshotId": "snap-01234567890abcedf",
    "RestoreDuration": 10,
    "IsPermanentRestore": false
}
```

For more information about snapshot archiving, see Archive Amazon EBS snapshots in the *Amazon EBS User Guide*.

Example 4: To modify the restore type

The following `restore-snapshot-tier` example changes the restore type for the specified snapshot from temporary to permanent.

```
aws ec2 restore-snapshot-tier \
    --snapshot-id snap-01234567890abcedf
    --permanent-restore
```

Output:

```
{
    "SnapshotId": "snap-01234567890abcedf",
    "IsPermanentRestore": true
}
```

For more information about snapshot archiving, see Archive Amazon EBS snapshots in the *Amazon EBS User Guide*.

- For API details, see RestoreSnapshotTier in *AWS CLI Command Reference*.

`revoke-client-vpn-ingress`

The following code example shows how to use `revoke-client-vpn-ingress`.

AWS CLI

To revoke an authorization rule for a Client VPN endpoint

The following `revoke-client-vpn-ingress` example revokes a rule for internet access (`0.0.0.0/0`) for all groups.

```
aws ec2 revoke-client-vpn-ingress \
    --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \
    --target-network-cidr 0.0.0.0/0 --revoke-all-groups
```

Output:

```
{
    "Status": {
        "Code": "revoking"
    }
}
```

For more information, see Authorization Rules in the *AWS Client VPN Administrator Guide*.

- For API details, see RevokeClientVpnIngress in *AWS CLI Command Reference*.

`revoke-security-group-egress`

The following code example shows how to use `revoke-security-group-egress`.

AWS CLI

Example 1: To remove the rule that allows outbound traffic to a specific address range

The following `revoke-security-group-egress` example command removes the rule that grants access to the specified address ranges on TCP port 80.

```
aws ec2 revoke-security-group-egress \
    --group-id sg-026c12253ce15eff7 \
    --ip-
permissions [{IpProtocol=tcp,FromPort=80,ToPort=80,IpRanges=[{CidrIp=10.0.0.0/16}]
```

This command produces no output.

For more information, see Security groups in the *Amazon EC2 User Guide*.

Example 2: To remove the rule that allows outbound traffic to a specific security group

The following `revoke-security-group-egress` example command removes the rule that grants access to the specified security group on TCP port 80.

```
aws ec2 revoke-security-group-egress \
    --group-id sg-026c12253ce15eff7 \
    --ip-permissions '[{"IpProtocol": "tcp", "FromPort": 443, "ToPort":
 443,"UserIdGroupPairs": [{"GroupId": "sg-06df23a01ff2df86d"}]}]'
```

This command produces no output.

For more information, see Security groups in the *Amazon EC2 User Guide*.

- For API details, see RevokeSecurityGroupEgress in *AWS CLI Command Reference*.

`revoke-security-group-ingress`

The following code example shows how to use `revoke-security-group-ingress`.

AWS CLI

Example 1: To remove a rule from a security group

The following `revoke-security-group-ingress` example removes TCP port 22 access for the `203.0.113.0/24` address range from the specified security group for a default VPC.

```
aws ec2 revoke-security-group-ingress \
    --group-name mySecurityGroup
    --protocol tcp \
    --port 22 \
    --cidr 203.0.113.0/24
```

This command produces no output if it succeeds.

For more information, see Security groups in the *Amazon EC2 User Guide*.

Example 2: To remove a rule using the IP permissions set

The following `revoke-security-group-ingress` example uses the `ip-permissions` parameter to remove an inbound rule that allows the ICMP message `Destination Unreachable: Fragmentation Needed and Don't Fragment was Set` (Type 3, Code 4).

```
aws ec2 revoke-security-group-ingress \
    --group-id sg-026c12253ce15eff7 \
    --ip-
permissions IpProtocol=icmp,FromPort=3,ToPort=4,IpRanges=[{CidrIp=0.0.0.0/0}]
```

This command produces no output if it succeeds.

For more information, see Security groups in the *Amazon EC2 User Guide*.

- For API details, see RevokeSecurityGroupIngress in *AWS CLI Command Reference*.

`run-instances`

The following code example shows how to use `run-instances`.

AWS CLI

Example 1: To launch an instance into a default subnet

The following `run-instances` example launches a single instance of type `t2.micro` into the default subnet for the current Region and associates it with the default subnet for the default VPC for the Region. The key pair is optional if you do not plan to connect to your instance using SSH (Linux) or RDP (Windows).

```
aws ec2 run-instances \
    --image-id ami-0abcdef1234567890 \
    --instance-type t2.micro \
    --key-name MyKeyPair
```

Output:

```
{
    "Instances": [
        {
            "AmiLaunchIndex": 0,
            "ImageId": "ami-0abcdef1234567890",
            "InstanceId": "i-1231231230abcdef0",
            "InstanceType": "t2.micro",
            "KeyName": "MyKeyPair",

                "HttpTokens": "optional",
                "HttpPutResponseHopLimit": 1,
                "HttpEndpoint": "enabled"
            }
        }
    ],
    "OwnerId": "123456789012",
    "ReservationId": "r-02a3f596d91211712"
}
```

Example 2: To launch an instance into a non-default subnet and add a public IP address

The following `run-instances` example requests a public IP address for an instance that you're launching into a nondefault subnet. The instance is associated with the specified security group.

```
aws ec2 run-instances \
    --image-id ami-0abcdef1234567890 \
    --instance-type t2.micro \
    --subnet-id subnet-08fc749671b2d077c \
    --security-group-ids sg-0b0384b66d7d692f9 \
    --associate-public-ip-address \
    --key-name MyKeyPair
```

For an example of the output for `run-instances`, see Example 1.

Example 3: To launch an instance with additional volumes

The following `run-instances` example uses a block device mapping, specified in mapping.json, to attach additional volumes at launch. A block device mapping can specify EBS volumes, instance store volumes, or both EBS volumes and instance store volumes.

```
aws ec2 run-instances \
    --image-id ami-0abcdef1234567890 \
    --instance-type t2.micro \
    --subnet-id subnet-08fc749671b2d077c \
    --security-group-ids sg-0b0384b66d7d692f9 \
    --key-name MyKeyPair \
    --block-device-mappings file://mapping.json
```

Contents of `mapping.json`. This example adds `/dev/sdh` an empty EBS volume with a size of 100 GiB.

```
[
    {
        "DeviceName": "/dev/sdh",
        "Ebs": {
            "VolumeSize": 100
        }
    }
]
```

Contents of `mapping.json`. This example adds `ephemeral1` as an instance store volume.

```
[
    {
        "DeviceName": "/dev/sdc",
        "VirtualName": "ephemeral1"
    }
]
```

For an example of the output for `run-instances`, see Example 1.

For more information about block device mappings, see Block device mapping in the *Amazon EC2 User Guide*.

Example 4: To launch an instance and add tags on creation

The following `run-instances` example adds a tag with a key of `webserver` and value of `production` to the instance. The command also applies a tag with a key of `cost-center` and a value of `cc123` to any EBS volume that's created (in this case, the root volume).

```
aws ec2 run-instances \
    --image-id ami-0abcdef1234567890 \
    --instance-type t2.micro \
    --count 1 \
    --subnet-id subnet-08fc749671b2d077c \
    --key-name MyKeyPair \
    --security-group-ids sg-0b0384b66d7d692f9 \
    --tag-specifications
 'ResourceType=instance,Tags=[{Key=webserver,Value=production}]'
 'ResourceType=volume,Tags=[{Key=cost-center,Value=cc123}]'
```

For an example of the output for `run-instances`, see Example 1.

Example 5: To launch an instance with user data

The following `run-instances` example passes user data in a file called `my_script.txt` that contains a configuration script for your instance. The script runs at launch.

```
aws ec2 run-instances \
    --image-id ami-0abcdef1234567890 \
    --instance-type t2.micro \
    --count 1 \
    --subnet-id subnet-08fc749671b2d077c \
    --key-name MyKeyPair \
    --security-group-ids sg-0b0384b66d7d692f9 \
    --user-data file://my_script.txt
```

For an example of the output for `run-instances`, see Example 1.

For more information about instance user data, see Working with instance user data in the *Amazon EC2 User Guide*.

Example 6: To launch a burstable performance instance

The following `run-instances` example launches a t2.micro instance with the `unlimited` credit option. When you launch a T2 instance, if you do not specify `--credit-`

`specification`, the default is the `standard` credit option. When you launch a T3 instance, the default is the `unlimited` credit option.

```
aws ec2 run-instances \
    --image-id ami-0abcdef1234567890 \
    --instance-type t2.micro \
    --count 1 \
    --subnet-id subnet-08fc749671b2d077c \
    --key-name MyKeyPair \
    --security-group-ids sg-0b0384b66d7d692f9 \
    --credit-specification CpuCredits=unlimited
```

For an example of the output for `run-instances`, see Example 1.

For more information about burstable performance instances, see Burstable performance instances in the *Amazon EC2 User Guide*.

- For API details, see RunInstances in *AWS CLI Command Reference*.

`run-scheduled-instances`

The following code example shows how to use `run-scheduled-instances`.

AWS CLI

To launch a Scheduled Instance

This example launches the specified Scheduled Instance in a VPC.

Command:

```
aws ec2 run-scheduled-instances --scheduled-instance-
id sci-1234-1234-1234-1234-123456789012 --instance-count 1 --launch-
specification file://launch-specification.json
```

Launch-specification.json:

```
{
  "ImageId": "ami-12345678",
  "KeyName": "my-key-pair",
  "InstanceType": "c4.large",
```

```
  "NetworkInterfaces": [
    {
        "DeviceIndex": 0,
        "SubnetId": "subnet-12345678",
        "AssociatePublicIpAddress": true,
        "Groups": ["sg-12345678"]
    }
  ],
  "IamInstanceProfile": {
      "Name": "my-iam-role"
  }
}
```

Output:

```
{
  "InstanceIdSet": [
      "i-1234567890abcdef0"
  ]
}
```

This example launches the specified Scheduled Instance in EC2-Classic.

Command:

```
aws ec2 run-scheduled-instances --scheduled-instance-id sci-1234-1234-1234-1234-123456789012 --instance-count 1 --launch-specification file://launch-specification.json
```

Launch-specification.json:

```
{
  "ImageId": "ami-12345678",
  "KeyName": "my-key-pair",
  "SecurityGroupIds": ["sg-12345678"],
  "InstanceType": "c4.large",
  "Placement": {
    "AvailabilityZone": "us-west-2b"
  }
  "IamInstanceProfile": {
      "Name": "my-iam-role"
  }
```

```
}
```

Output:

```
{
  "InstanceIdSet": [
      "i-1234567890abcdef0"
  ]
}
```

- For API details, see RunScheduledInstances in *AWS CLI Command Reference*.

`search-local-gateway-routes`

The following code example shows how to use `search-local-gateway-routes`.

AWS CLI

To search for routes in a local gateway route table

The following `search-local-gateway-routes` example searches for static routes in the specified local gateway route table.

```
aws ec2 search-local-gateway-routes \
    --local-gateway-route-table-id lgw-rtb-059615ef7dEXAMPLE \
    --filters "Name=type,Values=static"
```

Output:

```
{
    "Route": {
        "DestinationCidrBlock": "0.0.0.0/0",
        "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-07145b276bEXAMPLE",
        "Type": "static",
        "State": "deleted",
        "LocalGatewayRouteTableId": "lgw-rtb-059615ef7EXAMPLE"
    }
}
```

- For API details, see SearchLocalGatewayRoutes in *AWS CLI Command Reference*.

`search-transit-gateway-multicast-groups`

The following code example shows how to use `search-transit-gateway-multicast-groups`.

AWS CLI

To search one or more transit gateway multicast groups and return the group membership information

The following `search-transit-gateway-multicast-groups` example returns the group membership of the specified multicast group.

```
aws ec2 search-transit-gateway-multicast-groups \
    --transit-gateway-multicast-domain-id tgw-mcast-domain-000fb24d04EXAMPLE
```

Output:

```
{
    "MulticastGroups": [
        {
            "GroupIpAddress": "224.0.1.0",
            "TransitGatewayAttachmentId": "tgw-attach-0372e72386EXAMPLE",
            "SubnetId": "subnet-0187aff814EXAMPLE",
            "ResourceId": "vpc-0065acced4EXAMPLE",
            "ResourceType": "vpc",
            "NetworkInterfaceId": "eni-03847706f6EXAMPLE",
            "GroupMember": false,
            "GroupSource": true,
            "SourceType": "static"
        }
    ]
}
```

For more information, see Multicast on transit gateways in the *Transit Gateways Guide*.

- For API details, see SearchTransitGatewayMulticastGroups in *AWS CLI Command Reference*.

`search-transit-gateway-routes`

The following code example shows how to use `search-transit-gateway-routes`.

AWS CLI

To search for routes in the specified transit gateway route table

The following `search-transit-gateway-routes` example returns all the routes that are of type `static` in the specified route table.

```
aws ec2 search-transit-gateway-routes \
    --transit-gateway-route-table-id tgw-rtb-0a823edbdeEXAMPLE \
    --filters "Name=type,Values=static"
```

Output:

```
{
    "Routes": [
        {
            "DestinationCidrBlock": "10.0.2.0/24",
            "TransitGatewayAttachments": [
                {
                    "ResourceId": "vpc-4EXAMPLE",
                    "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
                    "ResourceType": "vpc"
                }
            ],
            "Type": "static",
            "State": "active"
        },
        {
            "DestinationCidrBlock": "10.1.0.0/24",
            "TransitGatewayAttachments": [
                {
                    "ResourceId": "vpc-4EXAMPLE",
                    "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
                    "ResourceType": "vpc"
                }
            ],
            "Type": "static",
            "State": "active"
        }
    ],
    "AdditionalRoutesAvailable": false
}
```

For more information, see Transit gateway route tables in the *Transit Gateways Guide*.

- For API details, see SearchTransitGatewayRoutes in *AWS CLI Command Reference*.

`send-diagnostic-interrupt`

The following code example shows how to use `send-diagnostic-interrupt`.

AWS CLI

To send a diagnostic interrupt

The following `send-diagnostic-interrupt` example sends a diagnostic interrupt to the specified instance.

```
aws ec2 send-diagnostic-interrupt \
    --instance-id i-1234567890abcdef0
```

This command produces no output.

- For API details, see SendDiagnosticInterrupt in *AWS CLI Command Reference*.

`start-instances`

The following code example shows how to use `start-instances`.

AWS CLI

To start an Amazon EC2 instance

This example starts the specified Amazon EBS-backed instance.

Command:

```
aws ec2 start-instances --instance-ids i-1234567890abcdef0
```

Output:

```
{
    "StartingInstances": [
        {
```

```
                "InstanceId": "i-1234567890abcdef0",
                "CurrentState": {
                    "Code": 0,
                    "Name": "pending"
                },
                "PreviousState": {
                    "Code": 80,
                    "Name": "stopped"
                }
            }
        ]
}
```

For more information, see Stop and Start Your Instance in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see StartInstances in *AWS CLI Command Reference*.

`start-network-insights-access-scope-analysis`

The following code example shows how to use `start-network-insights-access-scope-analysis`.

AWS CLI

To start a Network Insights access scope analysis

The following `start-network-insights-access-scope-analysis` example starts the scope analysis in your AWS account.

```
aws ec2 start-network-insights-access-scope-analysis \
    --region us-east-1 \
    --network-insights-access-scope-id nis-123456789111
```

Output:

```
{
    "NetworkInsightsAccessScopeAnalysis": {
        "NetworkInsightsAccessScopeAnalysisId": "nisa-123456789222",
        "NetworkInsightsAccessScopeAnalysisArn": "arn:aws:ec2:us-
east-1:123456789012:network-insights-access-scope-analysis/nisa-123456789222",
```

```
        "NetworkInsightsAccessScopeId": "nis-123456789111",
        "Status": "running",
        "StartDate": "2022-01-26T00:47:06.814000+00:00"
    }
}
```

For more information, see [Getting started with Network Access Analyzer using the AWS CLI]() in the *Network Access Analyzer Guide*.

- For API details, see [StartNetworkInsightsAccessScopeAnalysis]() in *AWS CLI Command Reference*.

`start-network-insights-analysis`

The following code example shows how to use `start-network-insights-analysis`.

AWS CLI

To analyze a path

The following `start-network-insights-analysis` example analyzes the path between the source and destination. To view the results of the path analysis, use the `describe-network-insights-analyses` command.

```
aws ec2 start-network-insights-analysis \
    --network-insights-path-id nip-0b26f224f1d131fa8
```

Output:

```
{
    "NetworkInsightsAnalysis": {
        "NetworkInsightsAnalysisId": "nia-02207aa13eb480c7a",
        "NetworkInsightsAnalysisArn": "arn:aws:ec2:us-east-1:123456789012:network-
insights-analysis/nia-02207aa13eb480c7a",
        "NetworkInsightsPathId": "nip-0b26f224f1d131fa8",
        "StartDate": "2021-01-20T22:58:37.495Z",
        "Status": "running"
    }
}
```

For more information, see [Getting started using the AWS CLI]() in the *Reachability Analyzer Guide*.

- For API details, see StartNetworkInsightsAnalysis in *AWS CLI Command Reference*.

`start-vpc-endpoint-service-private-dns-verification`

The following code example shows how to use `start-vpc-endpoint-service-private-dns-verification`.

AWS CLI

To initiate the DNS verification process

The following `start-vpc-endpoint-service-private-dns-verification` example initiates the DNS verification process for the specified endpoint service.

```
aws ec2 start-vpc-endpoint-service-private-dns-verification \
    --service-id vpce-svc-071afff70666e61e0
```

This command produces no output.

For more information, see Manage DNS names in the *AWS PrivateLink User Guide*.

- For API details, see StartVpcEndpointServicePrivateDnsVerification in *AWS CLI Command Reference*.

`stop-instances`

The following code example shows how to use `stop-instances`.

AWS CLI

Example 1: To stop an Amazon EC2 instance

The following `stop-instances` example stops the specified Amazon EBS-backed instance.

```
aws ec2 stop-instances \
    --instance-ids i-1234567890abcdef0
```

Output:

```
{
```

```
    "StoppingInstances": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "CurrentState": {
                "Code": 64,
                "Name": "stopping"
            },
            "PreviousState": {
                "Code": 16,
                "Name": "running"
            }
        }
    ]
}
```

For more information, see Stop and Start Your Instance in the *Amazon Elastic Compute Cloud User Guide*.

Example 2: To hibernate an Amazon EC2 instance

The following `stop-instances` example hibernates Amazon EBS-backed instance if the instance is enabled for hibernation and meets the hibernation prerequisites. After the instance is put into hibernation the instance is stopped.

```
aws ec2 stop-instances \
    --instance-ids i-1234567890abcdef0 \
    --hibernate
```

Output:

```
{
    "StoppingInstances": [
        {
            "CurrentState": {
                "Code": 64,
                "Name": "stopping"
            },
            "InstanceId": "i-1234567890abcdef0",
            "PreviousState": {
                "Code": 16,
                "Name": "running"
            }
```

```
        }
    ]
}
```

For more information, see Hibernate your On-Demand Linux instance in the *Amazon Elastic Cloud Compute User Guide*.

- For API details, see StopInstances in *AWS CLI Command Reference*.

`terminate-client-vpn-connections`

The following code example shows how to use `terminate-client-vpn-connections`.

AWS CLI

To terminate a connection to a Client VPN endpoint

The following `terminate-client-vpn-connections` example terminates the specified connection to the Client VPN endpoint.

```
aws ec2 terminate-client-vpn-connections \
    --client-vpn-endpoint-id vpn-endpoint-123456789123abcde \
    --connection-id cvpn-connection-04edd76f5201e0cb8
```

Output:

```
{
    "ClientVpnEndpointId": "vpn-endpoint-123456789123abcde",
    "ConnectionStatuses": [
        {
            "ConnectionId": "cvpn-connection-04edd76f5201e0cb8",
            "PreviousStatus": {
                "Code": "active"
            },
            "CurrentStatus": {
                "Code": "terminating"
            }
        }
    ]
}
```

For more information, see Client Connections in the *AWS Client VPN Administrator Guide*.

- For API details, see TerminateClientVpnConnections in *AWS CLI Command Reference*.

terminate-instances

The following code example shows how to use `terminate-instances`.

AWS CLI

To terminate an Amazon EC2 instance

This example terminates the specified instance.

Command:

```
aws ec2 terminate-instances --instance-ids i-1234567890abcdef0
```

Output:

```
{
    "TerminatingInstances": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "CurrentState": {
                "Code": 32,
                "Name": "shutting-down"
            },
            "PreviousState": {
                "Code": 16,
                "Name": "running"
            }
        }
    ]
}
```

For more information, see Using Amazon EC2 Instances in the *AWS Command Line Interface User Guide*.

- For API details, see TerminateInstances in *AWS CLI Command Reference*.

unassign-ipv6-addresses

The following code example shows how to use `unassign-ipv6-addresses`.

AWS CLI

To unassign an IPv6 address from a network interface

This example unassigns the specified IPv6 address from the specified network interface.

Command:

```
aws ec2 unassign-ipv6-addresses --ipv6-
addresses 2001:db8:1234:1a00:3304:8879:34cf:4071 --network-interface-id eni-23c49b68
```

Output:

```
{
  "NetworkInterfaceId": "eni-23c49b68",
  "UnassignedIpv6Addresses": [
      "2001:db8:1234:1a00:3304:8879:34cf:4071"
  ]
}
```

- For API details, see UnassignIpv6Addresses in *AWS CLI Command Reference*.

`unassign-private-ip-addresses`

The following code example shows how to use `unassign-private-ip-addresses`.

AWS CLI

To unassign a secondary private IP address from a network interface

This example unassigns the specified private IP address from the specified network interface. If the command succeeds, no output is returned.

Command:

```
aws ec2 unassign-private-ip-addresses --network-interface-id eni-e5aa89a3 --private-
ip-addresses 10.0.0.82
```

- For API details, see UnassignPrivateIpAddresses in *AWS CLI Command Reference*.

`unassign-private-nat-gateway-address`

The following code example shows how to use `unassign-private-nat-gateway-address`.

AWS CLI

To unassign a private IP address from your private NAT gateway

The following `unassign-private-nat-gateway-address` example unassigns the specified IP address from the specified private NAT gateway.

```
aws ec2 unassign-private-nat-gateway-address \
    --nat-gateway-id nat-1234567890abcdef0 \
    --private-ip-addresses 10.0.20.197
```

Output:

```
{
    "NatGatewayId": "nat-0ee3edd182361f662",
    "NatGatewayAddresses": [
        {
            "NetworkInterfaceId": "eni-0065a61b324d1897a",
            "PrivateIp": "10.0.20.197",
            "IsPrimary": false,
            "Status": "unassigning"
        }
    ]
}
```

For more information, see NAT gateways in the *Amazon VPC User Guide*.

- For API details, see UnassignPrivateNatGatewayAddress in *AWS CLI Command Reference*.

`unlock-snapshot`

The following code example shows how to use `unlock-snapshot`.

AWS CLI

To unlock a snapshot

The following `unlock-snapshot` example unlocks the specified snapshot.

```
aws ec2 unlock-snapshot \
    --snapshot-id snap-0b5e733b4a8df6e0d
```

Output:

```
{
    "SnapshotId": "snap-0b5e733b4a8df6e0d"
}
```

For more information, see Snapshot lock in the *Amazon EBS User Guide*.

- For API details, see UnlockSnapshot in *AWS CLI Command Reference*.

`unmonitor-instances`

The following code example shows how to use `unmonitor-instances`.

AWS CLI

To disable detailed monitoring for an instance

This example command disables detailed monitoring for the specified instance.

Command:

```
aws ec2 unmonitor-instances --instance-ids i-1234567890abcdef0
```

Output:

```
{
  "InstanceMonitorings": [
      {
          "InstanceId": "i-1234567890abcdef0",
          "Monitoring": {
              "State": "disabling"
          }
      }
  ]
}
```

- For API details, see UnmonitorInstances in *AWS CLI Command Reference*.

`update-security-group-rule-descriptions-egress`

The following code example shows how to use `update-security-group-rule-descriptions-egress`.

AWS CLI

To update the description of an outbound security group rule

The following `update-security-group-rule-descriptions-egress` example updates the description for the security group rule for the specified port and IPv4 address range. The description '`Outbound HTTP access to server 2`' replaces any existing description for the rule.

```
aws ec2 update-security-group-rule-descriptions-egress \
    --group-id sg-02f0d35a850ba727f \
    --ip-permissions
 IpProtocol=tcp,FromPort=80,ToPort=80,IpRanges=[{CidrIp=203.0.113.0/24,Description="Outbound
 HTTP access to server 2"}]
```

Output:

```
{
    "Return": true
}
```

For more information, see Security group rules in the *Amazon EC2 User Guide*.

- For API details, see UpdateSecurityGroupRuleDescriptionsEgress in *AWS CLI Command Reference*.

`update-security-group-rule-descriptions-ingress`

The following code example shows how to use `update-security-group-rule-descriptions-ingress`.

AWS CLI

Example 1: To update the description of an inbound security group rule with a CIDR source

The following `update-security-group-rule-descriptions-ingress` example updates the description for the security group rule for the specified port and IPv4 address range. The description '`SSH access from ABC office`' replaces any existing description for the rule.

```
aws ec2 update-security-group-rule-descriptions-ingress \
    --group-id sg-02f0d35a850ba727f \
    --ip-permissions
 IpProtocol=tcp,FromPort=22,ToPort=22,IpRanges='[{CidrIp=203.0.113.0/16,Description="SSH
 access from corpnet"}]'
```

Output:

```
{
    "Return": true
}
```

For more information, see [Security group rules](#) in the *Amazon EC2 User Guide*.

Example 2: To update the description of an inbound security group rule with a prefix list source

The following `update-security-group-rule-descriptions-ingress` example updates the description for the security group rule for the specified port and prefix list. The description '`SSH access from ABC office`' replaces any existing description for the rule.

```
aws ec2 update-security-group-rule-descriptions-ingress \
    --group-id sg-02f0d35a850ba727f \
    --ip-permissions
 IpProtocol=tcp,FromPort=22,ToPort=22,PrefixListIds='[{PrefixListId=pl-12345678,Description=
 access from corpnet"}]'
```

Output:

```
{
    "Return": true
}
```

For more information, see [Security group rules](#) in the *Amazon EC2 User Guide*.

- For API details, see [UpdateSecurityGroupRuleDescriptionsIngress](#) in *AWS CLI Command Reference*.

`withdraw-byoip-cidr`

The following code example shows how to use `withdraw-byoip-cidr`.

AWS CLI

To stop advertising an address range

The following `withdraw-byoip-cidr` example stops advertising the specified address range.

```
aws ec2 withdraw-byoip-cidr
    --cidr 203.0.113.25/24
```

Output:

```
{
    "ByoipCidr": {
        "Cidr": "203.0.113.25/24",
        "StatusMessage": "ipv4pool-ec2-1234567890abcdef0",
        "State": "advertised"
    }
}
```

- For API details, see WithdrawByoipCidr in *AWS CLI Command Reference*.

Amazon EC2 Instance Connect examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EC2 Instance Connect.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`send-ssh-public-key`

The following code example shows how to use `send-ssh-public-key`.

AWS CLI

To send a an SSH public key to an instance

The following `send-ssh-public-key` example sends the specified SSH public key to the specified instance. The key is used to authenticate the specified user.

```
aws ec2-instance-connect send-ssh-public-key \
    --instance-id i-1234567890abcdef0 \
    --instance-os-user ec2-user \
    --availability-zone us-east-2b \
    --ssh-public-key file://path/my-rsa-key.pub
```

This command produces no output.

- For API details, see SendSshPublicKey in *AWS CLI Command Reference*.

Amazon ECR examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon ECR.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

batch-check-layer-availability

The following code example shows how to use `batch-check-layer-availability`.

AWS CLI

To check the availability of a layer

The following `batch-check-layer-availability` example checks the availability of a layer with the digest `sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed` in the `cluster-autoscaler` repository.

```
aws ecr batch-check-layer-availability \
    --repository-name cluster-autoscaler \
    --layer-
digests sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed
```

Output:

```
{
    "layers": [
        {
            "layerDigest":
 "sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed",
            "layerAvailability": "AVAILABLE",
            "layerSize": 2777,
            "mediaType": "application/vnd.docker.container.image.v1+json"
        }
    ],
    "failures": []
}
```

- For API details, see BatchCheckLayerAvailability in *AWS CLI Command Reference*.

batch-delete-image

The following code example shows how to use `batch-delete-image`.

AWS CLI

Example 1: To delete an image

The following `batch-delete-image` example deletes an image with the tag `precise` in the specified repository in the default registry for an account.

```
aws ecr batch-delete-image \
    --repository-name ubuntu \
    --image-ids imageTag=precise
```

Output:

```
{
    "failures": [],
    "imageIds": [
        {
            "imageTag": "precise",
            "imageDigest":
 "sha256:19665f1e6d1e504117a1743c0a3d3753086354a38375961f2e665416ef4b1b2f"
        }
    ]
}
```

Example 2: To delete multiple images

The following `batch-delete-image` example deletes all images tagged with `prod` and `team1` in the specified repository.

```
aws ecr batch-delete-image \
    --repository-name MyRepository \
    --image-ids imageTag=prod imageTag=team1
```

Output:

```
{
    "imageIds": [
        {
            "imageDigest": "sha256:123456789012",
            "imageTag": "prod"
        },
        {
```

```
            "imageDigest": "sha256:567890121234",
            "imageTag": "team1"
        }
    ],
    "failures": []
}
```

For more information, see Deleting an Image in the *Amazon ECR User Guide*.

- For API details, see BatchDeleteImage in *AWS CLI Command Reference*.

`batch-get-image`

The following code example shows how to use `batch-get-image`.

AWS CLI

Example 1: To get an image

The following `batch-get-image` example gets an image with the tag `v1.13.6` in a repository called `cluster-autoscaler` in the default registry for an account.

```
aws ecr batch-get-image \
    --repository-name cluster-autoscaler \
    --image-ids imageTag=v1.13.6
```

Output:

```
{
    "images": [
        {
            "registryId": "012345678910",
            "repositoryName": "cluster-autoscaler",
            "imageId": {
                "imageDigest":
 "sha256:4a1c6567c38904384ebc64e35b7eeddd8451110c299e3368d2210066487d97e5",
                "imageTag": "v1.13.6"
            },
            "imageManifest": "{\n   \"schemaVersion\": 2,\n
 \"mediaType\": \"application/vnd.docker.distribution.manifest.v2+json
\",\n   \"config\": {\n      \"mediaType\": \"application/

   }\n   ]\n}"
        }
    ],
    "failures": []
}
```

Example 2: To get multiple images

The following `batch-get-image` example displays details of all images tagged with `prod` and `team1` in the specified repository.

```
aws ecr batch-get-image \
    --repository-name MyRepository \
    --image-ids imageTag=prod imageTag=team1
```

Output:

```
{
    "images": [
        {
            "registryId": "123456789012",
            "repositoryName": "MyRepository",
            "imageId": {
                "imageDigest": "sha256:123456789012",
                "imageTag": "prod"
            },
            "imageManifest": "manifestExample1"
```

```
        },
        {
            "registryId": "567890121234",
            "repositoryName": "MyRepository",
            "imageId": {
                "imageDigest": "sha256:123456789012",
                "imageTag": "team1"
            },
            "imageManifest": "manifestExample2"
        }
    ],
    "failures": []
}
```

For more information, see Images in the *Amazon ECR User Guide*.

- For API details, see BatchGetImage in *AWS CLI Command Reference*.

`complete-layer-upload`

The following code example shows how to use `complete-layer-upload`.

AWS CLI

To complete an image layer upload

The following `complete-layer-upload` example completes an image layer upload to the `layer-test` repository.

```
aws ecr complete-layer-upload \
    --repository-name layer-test \
    --upload-id 6cb64b8a-9378-0e33-2ab1-b780fab8a9e9 \
    --layer-digests 6cb64b8a-9378-0e33-2ab1-
b780fab8a9e9:48074e6d3a68b39aad8ccc002cdad912d4148c0f92b3729323e
```

Output:

```
{
    "uploadId": "6cb64b8a-9378-0e33-2ab1-b780fab8a9e9",
    "layerDigest":
 "sha256:9a77f85878aa1906f2020a0ecdf7a7e962d57e882250acd773383224b3fe9a02",
    "repositoryName": "layer-test",
    "registryId": "130757420319"
```

```
}
```

- For API details, see CompleteLayerUpload in *AWS CLI Command Reference*.

`create-repository`

The following code example shows how to use `create-repository`.

AWS CLI

Example 1: To create a repository

The following `create-repository` example creates a repository inside the specified namespace in the default registry for an account.

```
aws ecr create-repository \
    --repository-name project-a/sample-repo
```

Output:

```
{
    "repository": {
        "registryId": "123456789012",
        "repositoryName": "project-a/sample-repo",
        "repositoryArn": "arn:aws:ecr:us-west-2:123456789012:repository/project-a/
sample-repo"
    }
}
```

For more information, see Creating a Repository in the *Amazon ECR User Guide*.

Example 2: To create a repository configured with image tag immutability

The following `create-repository` example creates a repository configured for tag immutability in the default registry for an account.

```
aws ecr create-repository \
    --repository-name project-a/sample-repo \
    --image-tag-mutability IMMUTABLE
```

Output:

```
{
    "repository": {
        "registryId": "123456789012",
        "repositoryName": "project-a/sample-repo",
        "repositoryArn": "arn:aws:ecr:us-west-2:123456789012:repository/project-a/
sample-repo",
        "imageTagMutability": "IMMUTABLE"
    }
}
```

For more information, see Image Tag Mutability in the *Amazon ECR User Guide*.

Example 3: To create a repository configured with a scanning configuration

The following `create-repository` example creates a repository configured to perform a vulnerability scan on image push in the default registry for an account.

```
aws ecr create-repository \
    --repository-name project-a/sample-repo \
    --image-scanning-configuration scanOnPush=true
```

Output:

```
{
    "repository": {
        "registryId": "123456789012",
        "repositoryName": "project-a/sample-repo",
        "repositoryArn": "arn:aws:ecr:us-west-2:123456789012:repository/project-a/
sample-repo",
        "imageScanningConfiguration": {
            "scanOnPush": true
        }
    }
}
```

For more information, see Image Scanning in the *Amazon ECR User Guide*.

- For API details, see CreateRepository in *AWS CLI Command Reference*.

`delete-lifecycle-policy`

The following code example shows how to use `delete-lifecycle-policy`.

AWS CLI

To delete the lifecycle policy for a repository

The following `delete-lifecycle-policy` example deletes the lifecycle policy for the `hello-world` repository.

```
aws ecr delete-lifecycle-policy \
    --repository-name hello-world
```

Output:

```
{
    "registryId": "012345678910",
    "repositoryName": "hello-world",
    "lifecyclePolicyText": "{\"rules\":[{\"rulePriority\":1,\"description\":\"Remove
 untagged images.\",\"selection\":{\"tagStatus\":\"untagged\",\"countType\":
\"sinceImagePushed\",\"countUnit\":\"days\",\"countNumber\":10},\"action\":{\"type
\":\"expire\"}}]}",
    "lastEvaluatedAt": 0.0
}
```

- For API details, see DeleteLifecyclePolicy in *AWS CLI Command Reference*.

`delete-repository-policy`

The following code example shows how to use `delete-repository-policy`.

AWS CLI

To delete the repository policy for a repository

The following `delete-repository-policy` example deletes the repository policy for the `cluster-autoscaler` repository.

```
aws ecr delete-repository-policy \
    --repository-name cluster-autoscaler
```

Output:

```
{
    "registryId": "012345678910",
```

```
    "repositoryName": "cluster-autoscaler",
    "policyText": "{\n  \"Version\" : \"2008-10-17\",\n  \"Statement\" : [ {\n
 \"Sid\" : \"allow public pull\",\n    \"Effect\" : \"Allow\",\n    \"Principal\" :
 \"*\",\n    \"Action\" : [ \"ecr:BatchCheckLayerAvailability\", \"ecr:BatchGetImage
\", \"ecr:GetDownloadUrlForLayer\" ]\n  } ]\n}"
}
```

- For API details, see DeleteRepositoryPolicy in *AWS CLI Command Reference*.

`delete-repository`

The following code example shows how to use `delete-repository`.

AWS CLI

To delete a repository

The following `delete-repository` example command force deletes the specified repository in the default registry for an account. The `--force` flag is required if the repository contains images.

```
aws ecr delete-repository \
    --repository-name ubuntu \
    --force
```

Output:

```
{
    "repository": {
        "registryId": "123456789012",
        "repositoryName": "ubuntu",
        "repositoryArn": "arn:aws:ecr:us-west-2:123456789012:repository/ubuntu"
    }
}
```

For more information, see Deleting a Repository in the *Amazon ECR User Guide*.

- For API details, see DeleteRepository in *AWS CLI Command Reference*.

`describe-image-scan-findings`

The following code example shows how to use `describe-image-scan-findings`.

AWS CLI

To describe the scan findings for an image

The following `describe-image-scan-findings` example returns the image scan findings for an image using the image digest in the specified repository in the default registry for an account.

```
aws ecr describe-image-scan-findings \
    --repository-name sample-repo \
    --image-
id imageDigest=sha256:74b2c688c700ec95a93e478cdb959737c148df3fbf5ea706abe0318726e885e6
```

Output:

```
{
    "imageScanFindings": {
      "findings": [
          {
              "name": "CVE-2019-5188",
              "description": "A code execution vulnerability exists in the directory
 rehashing functionality of E2fsprogs e2fsck 1.45.4. A specially crafted ext4
 directory can cause an out-of-bounds write on the stack, resulting in code
 execution. An attacker can corrupt a partition to trigger this vulnerability.",
              "uri": "http://people.ubuntu.com/~ubuntu-security/cve/CVE-2019-5188",
              "severity": "MEDIUM",
              "attributes": [
                  {
                      "key": "package_version",
                      "value": "1.44.1-1ubuntu1.1"
                  },
                  {
                      "key": "package_name",

    },
    "imageScanStatus": {
        "status": "COMPLETE",
        "description": "The scan was completed successfully."
    }
}
```

For more information, see Image Scanning in the *Amazon ECR User Guide*.

- For API details, see DescribeImageScanFindings in *AWS CLI Command Reference*.

describe-images

The following code example shows how to use `describe-images`.

AWS CLI

To describe an image in a repository

The following `describe-images` example displays details about an image in the `cluster-autoscaler` repository with the tag `v1.13.6`.

```
aws ecr describe-images \
    --repository-name cluster-autoscaler \
    --image-ids imageTag=v1.13.6
```

Output:

```
{
```

```
    "imageDetails": [
        {
            "registryId": "012345678910",
            "repositoryName": "cluster-autoscaler",
            "imageDigest":
 "sha256:4a1c6567c38904384ebc64e35b7eeddd8451110c299e3368d2210066487d97e5",
            "imageTags": [
                "v1.13.6"
            ],
            "imageSizeInBytes": 48318255,
            "imagePushedAt": 1565128275.0
        }
    ]
}
```

- For API details, see DescribeImages in *AWS CLI Command Reference*.

`describe-repositories`

The following code example shows how to use `describe-repositories`.

AWS CLI

To describe the repositories in a registry

This example describes the repositories in the default registry for an account.

Command:

```
aws ecr describe-repositories
```

Output:

```
{
    "repositories": [
        {
            "registryId": "012345678910",
            "repositoryName": "ubuntu",
            "repositoryArn": "arn:aws:ecr:us-west-2:012345678910:repository/ubuntu"
        },
        {
            "registryId": "012345678910",
            "repositoryName": "test",
```

```
            "repositoryArn": "arn:aws:ecr:us-west-2:012345678910:repository/test"
        }
    ]
}
```

- For API details, see DescribeRepositories in *AWS CLI Command Reference*.

`get-authorization-token`

The following code example shows how to use `get-authorization-token`.

AWS CLI

To get an authorization token for your default registry

The following `get-authorization-token` example command gets an authorization token for your default registry.

```
aws ecr get-authorization-token
```

Output:

```
{
    "authorizationData": [
        {
            "authorizationToken": "QVdTOkN...",
            "expiresAt": 1448875853.241,
            "proxyEndpoint": "https://123456789012.dkr.ecr.us-west-2.amazonaws.com"
        }
    ]
}
```

- For API details, see GetAuthorizationToken in *AWS CLI Command Reference*.

`get-download-url-for-layer`

The following code example shows how to use `get-download-url-for-layer`.

AWS CLI

To get the download URL of a layer

The following `get-download-url-for-layer` example displays the download URL of a layer with the digest `sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed` in the `cluster-autoscaler` repository.

```
aws ecr get-download-url-for-layer \
    --repository-name cluster-autoscaler  \
    --layer-
digest sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed
```

Output:

```
{
    "downloadUrl": "https://prod-us-west-2-starport-layer-bucket.s3.us-
west-2.amazonaws.com/e501-012345678910-9cb60dc0-7284-5643-3987-
da6dac0465f0/04620aac-66a5-4167-8232-55ee7ef6d565?X-Amz-Algorithm=AWS4-HMAC-
SHA256&X-Amz-Date=20190814T220617Z&X-Amz-SignedHeaders=host&X-Amz-Expires=3600&X-
Amz-Credential=AKIA32P3D2JDNMVAJLGF%2F20190814%2Fus-west-2%2Fs3%2Faws4_request&X-
Amz-Signature=9161345894947a1672467a0da7a1550f2f7157318312fe4941b59976239c3337",
    "layerDigest":
 "sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed"
}
```

- For API details, see GetDownloadUrlForLayer in *AWS CLI Command Reference*.

`get-lifecycle-policy-preview`

The following code example shows how to use `get-lifecycle-policy-preview`.

AWS CLI

To retrieve details for a lifecycle policy preview

The following `get-lifecycle-policy-preview` example retrieves the result of a lifecycle policy preview for the specified repository in the default registry for an account.

Command:

```
aws ecr get-lifecycle-policy-preview \
    --repository-name "project-a/amazon-ecs-sample"
```

Output:

```
{
    "registryId": "012345678910",
    "repositoryName": "project-a/amazon-ecs-sample",
    "lifecyclePolicyText": "{\n    \"rules\": [\n        {\n
 \"rulePriority\": 1,\n            \"description\": \"Expire images older than 14
 days\",\n            \"selection\": {\n                \"tagStatus\": \"untagged\",
\n                \"countType\": \"sinceImagePushed\",\n                \"countUnit
\": \"days\",\n                \"countNumber\": 14\n            },\n
 \"action\": {\n                \"type\": \"expire\"\n            }\n        }\n
  ]\n}\n",
    "status": "COMPLETE",
    "previewResults": [],
    "summary": {
        "expiringImageTotalCount": 0
    }
}
```

For more information, see Lifecycle Policies in the *Amazon ECR User Guide*.

- For API details, see GetLifecyclePolicyPreview in *AWS CLI Command Reference*.

`get-lifecycle-policy`

The following code example shows how to use `get-lifecycle-policy`.

AWS CLI

To retrieve a lifecycle policy

The following `get-lifecycle-policy` example displays details of the lifecycle policy for the specified repository in the default registry for the account.

```
aws ecr get-lifecycle-policy \
    --repository-name "project-a/amazon-ecs-sample"
```

Output:

```
{
     "registryId": "123456789012",
     "repositoryName": "project-a/amazon-ecs-sample",
```

```
    "lifecyclePolicyText": "{\"rules\":[{\"rulePriority\":1,\"description\":
\"Expire images older than 14 days\",\"selection\":{\"tagStatus\":\"untagged\",
\"countType\":\"sinceImagePushed\",\"countUnit\":\"days\",\"countNumber\":14},
\"action\":{\"type\":\"expire\"}}]}",
    "lastEvaluatedAt": 1504295007.0
}
```

For more information, see Lifecycle Policies in the *Amazon ECR User Guide*.

- For API details, see GetLifecyclePolicy in *AWS CLI Command Reference*.

`get-login-password`

The following code example shows how to use `get-login-password`.

AWS CLI

To retrieve a password to authenticate to a registry

The following `get-login-password` displays a password that you can use with a container client of your choice to authenticate to any Amazon ECR registry that your IAM principal has access to.

```
aws ecr get-login-password
```

Output:

```
<password>
```

To use with the Docker CLI, pipe the output of the `get-login-password` command to the `docker login` command. When retrieving the password, ensure that you specify the same Region that your Amazon ECR registry exists in.

```
aws ecr get-login-password \
    --region <region>
 \
| docker login \
    --username AWS \
    --password-stdin <aws_account_id>.dkr.ecr.<region>.amazonaws.com
```

For more information, see Registry Authentication in the *Amazon ECR User Guide*.

- For API details, see GetLoginPassword in *AWS CLI Command Reference*.

`get-login`

The following code example shows how to use `get-login`.

AWS CLI

To retrieve a Docker login command to your default registry

This example prints a command that you can use to log in to your default Amazon ECR registry.

Command:

```
aws ecr get-login
```

Output:

```
docker login -u AWS -p <password> -e none https://
<aws_account_id>.dkr.ecr.<region>.amazonaws.com
```

To log in to another account's registry

This example prints one or more commands that you can use to log in to Amazon ECR registries associated with other accounts.

Command:

```
aws ecr get-login --registry-ids 012345678910 023456789012
```

Output:

```
docker login -u <username> -p <token-1> -e none <endpoint-1>
docker login -u <username> -p <token-2> -e none <endpoint-2>
```

- For API details, see GetLogin in *AWS CLI Command Reference*.

`get-repository-policy`

The following code example shows how to use `get-repository-policy`.

AWS CLI

To retrieve the repository policy for a repository

The following `get-repository-policy` example displays details about the repository policy for the `cluster-autoscaler` repository.

```
aws ecr get-repository-policy \
    --repository-name cluster-autoscaler
```

Output:

```
{
    "registryId": "012345678910",
    "repositoryName": "cluster-autoscaler",
    "policyText": "{\n  \"Version\" : \"2008-10-17\",\n  \"Statement\" : [ {\n
 \"Sid\" : \"allow public pull\",\n    \"Effect\" : \"Allow\",\n    \"Principal\" :
 \"*\",\n    \"Action\" : [ \"ecr:BatchCheckLayerAvailability\", \"ecr:BatchGetImage
\", \"ecr:GetDownloadUrlForLayer\" ]\n  } ]\n}"
}
```

- For API details, see GetRepositoryPolicy in *AWS CLI Command Reference*.

`initiate-layer-upload`

The following code example shows how to use `initiate-layer-upload`.

AWS CLI

To initiate an image layer upload

The following `initiate-layer-upload` example initiates an image layer upload to the `layer-test` repository.

```
aws ecr initiate-layer-upload \
    --repository-name layer-test
```

Output:

```
{
    "partSize": 10485760,
```

```
    "uploadId": "6cb64b8a-9378-0e33-2ab1-b780fab8a9e9"
}
```

- For API details, see InitiateLayerUpload in *AWS CLI Command Reference*.

`list-images`

The following code example shows how to use `list-images`.

AWS CLI

To list the images in a repository

The following `list-images` example displays a list of the images in the `cluster-autoscaler` repository.

```
aws ecr list-images \
    --repository-name cluster-autoscaler
```

Output:

```
{
    "imageIds": [
        {
            "imageDigest":
 "sha256:99c6fb4377e9a420a1eb3b410a951c9f464eff3b7dbc76c65e434e39b94b6570",
            "imageTag": "v1.13.8"
        },
        {
            "imageDigest":
 "sha256:99c6fb4377e9a420a1eb3b410a951c9f464eff3b7dbc76c65e434e39b94b6570",
            "imageTag": "v1.13.7"
        },
        {
            "imageDigest":
 "sha256:4a1c6567c38904384ebc64e35b7eeddd8451110c299e3368d2210066487d97e5",
            "imageTag": "v1.13.6"
        }
    ]
}
```

- For API details, see ListImages in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags for repository

The following `list-tags-for-resource` example displays a list of the tags associated with the `hello-world` repository.

```
aws ecr list-tags-for-resource \
    --resource-arn arn:aws:ecr:us-west-2:012345678910:repository/hello-world
```

Output:

```
{
    "tags": [
        {
            "Key": "Stage",
            "Value": "Integ"
        }
    ]
}
```

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`put-image-scanning-configuration`

The following code example shows how to use `put-image-scanning-configuration`.

AWS CLI

To update the image scanning configuration for a repository

The following `put-image-scanning-configuration` example updates the image scanning configuration for the specified repository.

```
aws ecr put-image-scanning-configuration \
    --repository-name sample-repo \
```

```
    --image-scanning-configuration scanOnPush=true
```

Output:

```
{
   "registryId": "012345678910",
   "repositoryName": "sample-repo",
   "imageScanningConfiguration": {
     "scanOnPush": true
   }
}
```

For more information, see Image Scanning in the *Amazon ECR User Guide*.

- For API details, see PutImageScanningConfiguration in *AWS CLI Command Reference*.

`put-image-tag-mutability`

The following code example shows how to use `put-image-tag-mutability`.

AWS CLI

To update the image tag mutability setting for a repository

The following `put-image-tag-mutability` example configures the specified repository for tag immutability. This prevents all image tags within the repository from being overwritten.

```
aws ecr put-image-tag-mutability \
    --repository-name hello-repository \
    --image-tag-mutability IMMUTABLE
```

Output:

```
{
   "registryId": "012345678910",
   "repositoryName": "sample-repo",
   "imageTagMutability": "IMMUTABLE"
}
```

For more information, see Image Tag Mutability in the *Amazon ECR User Guide*.

- For API details, see PutImageTagMutability in *AWS CLI Command Reference*.

`put-image`

The following code example shows how to use `put-image`.

AWS CLI

To retag an image with its manifest

The following `put-image` example creates a new tag in the `hello-world` repository with an existing image manifest.

```
aws ecr put-image \
    --repository-name hello-world \
    --image-tag 2019.08 \
    --image-manifest file://hello-world.manifest.json
```

Contents of `hello-world.manifest.json`:

```
{
    "schemaVersion": 2,
    "mediaType": "application/vnd.docker.distribution.manifest.v2+json",
    "config": {

    }
}
```

- For API details, see PutImage in *AWS CLI Command Reference*.

put-lifecycle-policy

The following code example shows how to use `put-lifecycle-policy`.

AWS CLI

To create a lifecycle policy

The following `put-lifecycle-policy` example creates a lifecycle policy for the specified repository in the default registry for an account.

```
aws ecr put-lifecycle-policy \
    --repository-name "project-a/amazon-ecs-sample" \
    --lifecycle-policy-text "file://policy.json"
```

Contents of `policy.json`:

```
{
   "rules": [
       {
```

```
            "rulePriority": 1,
            "description": "Expire images older than 14 days",
            "selection": {
                "tagStatus": "untagged",
                "countType": "sinceImagePushed",
                "countUnit": "days",
                "countNumber": 14
            },
            "action": {
                "type": "expire"
            }
        }
    ]
}
```

Output:

```
{
   "registryId": "<aws_account_id>",
   "repositoryName": "project-a/amazon-ecs-sample",
   "lifecyclePolicyText": "{\"rules\":[{\"rulePriority\":1,\"description\":\"Expire
 images older than 14 days\",\"selection\":{\"tagStatus\":\"untagged\",\"countType
\":\"sinceImagePushed\",\"countUnit\":\"days\",\"countNumber\":14},\"action\":
{\"type\":\"expire\"}}]}"
}
```

For more information, see Lifecycle Policies in the *Amazon ECR User Guide*.

- For API details, see PutLifeCyclePolicy in *AWS CLI Command Reference*.

`set-repository-policy`

The following code example shows how to use `set-repository-policy`.

AWS CLI

To set the repository policy for a repository

The following `set-repository-policy` example attaches a repository policy contained in a file to the `cluster-autoscaler` repository.

```
aws ecr set-repository-policy \
```

```
    --repository-name cluster-autoscaler \
    --policy-text file://my-policy.json
```

Contents of `my-policy.json`:

```
{
    "Version":"2012-10-17",
    "Statement" : [
        {
            "Sid" : "allow public pull",
            "Effect" : "Allow",
            "Principal" : "*",
            "Action" : [
                "ecr:BatchCheckLayerAvailability",
                "ecr:BatchGetImage",
                "ecr:GetDownloadUrlForLayer"
            ]
        }
    ]
}
```

Output:

```
{
    "registryId": "012345678910",
    "repositoryName": "cluster-autoscaler",
    "policyText": "{\n  \"Version\" : \"2008-10-17\",\n  \"Statement\" : [ {\n
 \"Sid\" : \"allow public pull\",\n    \"Effect\" : \"Allow\",\n    \"Principal\" :
 \"*\",\n    \"Action\" : [ \"ecr:BatchCheckLayerAvailability\", \"ecr:BatchGetImage
\", \"ecr:GetDownloadUrlForLayer\" ]\n  } ]\n}"
}
```

- For API details, see SetRepositoryPolicy in *AWS CLI Command Reference*.

`start-image-scan`

The following code example shows how to use `start-image-scan`.

AWS CLI

To start an image vulnerability scan

The following `start-image-scan` example starts an image scan for and specified by the image digest in the specified repository.

```
aws ecr start-image-scan \
    --repository-name sample-repo \
    --image-
id imageDigest=sha256:74b2c688c700ec95a93e478cdb959737c148df3fbf5ea706abe0318726e885e6
```

Output:

```
{
   "registryId": "012345678910",
   "repositoryName": "sample-repo",
   "imageId": {
       "imageDigest":
 "sha256:74b2c688c700ec95a93e478cdb959737c148df3fbf5ea706abe0318726e885e6"
   },
   "imageScanStatus": {
       "status": "IN_PROGRESS"
   }
}
```

For more information, see Image Scanning in the *Amazon ECR User Guide*.

- For API details, see StartImageScan in *AWS CLI Command Reference*.

`start-lifecycle-policy-preview`

The following code example shows how to use `start-lifecycle-policy-preview`.

AWS CLI

To create a lifecycle policy preview

The following `start-lifecycle-policy-preview` example creates a lifecycle policy preview defined by a JSON file for the specified repository.

```
aws ecr start-lifecycle-policy-preview \
    --repository-name "project-a/amazon-ecs-sample" \
    --lifecycle-policy-text "file://policy.json"
```

Contents of `policy.json`:

```
{
   "rules": [
       {
           "rulePriority": 1,
           "description": "Expire images older than 14 days",
           "selection": {
               "tagStatus": "untagged",
               "countType": "sinceImagePushed",
               "countUnit": "days",
               "countNumber": 14
           },
           "action": {
               "type": "expire"
           }
       }
   ]
}
```

Output:

```
{
   "registryId": "012345678910",
   "repositoryName": "project-a/amazon-ecs-sample",
   "lifecyclePolicyText": "{\n    \"rules\": [\n        {\n           
 \"rulePriority\": 1,\n            \"description\": \"Expire images older than 14
 days\",\n            \"selection\": {\n                \"tagStatus\": \"untagged\",
\n                \"countType\": \"sinceImagePushed\",\n                \"countUnit
\": \"days\",\n                \"countNumber\": 14\n            },\n           
 \"action\": {\n                \"type\": \"expire\"\n            }\n        }\n
  ]\n}\n",
   "status": "IN_PROGRESS"
}
```

- For API details, see StartLifecyclePolicyPreview in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a repository

The following `tag-resource` example sets a tag with key `Stage` and value `Integ` on the `hello-world` repository.

```
aws ecr tag-resource \
    --resource-arn arn:aws:ecr:us-west-2:012345678910:repository/hello-world \
    --tags Key=Stage,Value=Integ
```

This command produces no output.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To untag a repository

The following `untag-resource` example removes the tag with the key `Stage` from the `hello-world` repository.

```
aws ecr untag-resource \
    --resource-arn arn:aws:ecr:us-west-2:012345678910:repository/hello-world \
    --tag-keys Stage
```

This command produces no output.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`upload-layer-part`

The following code example shows how to use `upload-layer-part`.

AWS CLI

To upload a layer part

This following `upload-layer-part` uploads an image layer part to the `layer-test` repository.

```
aws ecr upload-layer-part \
    --repository-name layer-test \
    --upload-id 6cb64b8a-9378-0e33-2ab1-b780fab8a9e9 \
    --part-first-byte 0 \
    --part-last-byte 8323314 \
    --layer-part-blob file:///var/lib/docker/image/overlay2/layerdb/sha256/
ff986b10a018b48074e6d3a68b39aad8ccc002cdad912d4148c0f92b3729323e/layer.b64
```

Output:

```
{
    "uploadId": "6cb64b8a-9378-0e33-2ab1-b780fab8a9e9",
    "registryId": "012345678910",
    "lastByteReceived": 8323314,
    "repositoryName": "layer-test"
}
```

- For API details, see UploadLayerPart in *AWS CLI Command Reference*.

Amazon ECR Public examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon ECR Public.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`batch-delete-image`

The following code example shows how to use `batch-delete-image`.

AWS CLI

Example 1: To delete an image by using image digest ids, the image and all of its tags are deleted within a repository in a public registry

The following `batch-delete-image` example deletes an image by specifying the image digest.:

```
aws ecr-public batch-delete-image \
    --repository-name project-a/nginx-web-app \
    --image-
ids imageDigest=sha256:b1f9deb5fe3711a3278379ebbcaefbc5d70a2263135db86bd27a0dae150546c2
```

Output:

```
{
"imageIds": [
    {
        "imageDigest":
 "sha256:b1f9deb5fe3711a3278379ebbcaefbc5d70a2263135db86bd27a0dae150546c2",
        "imageTag": "latest"
    }
],
"failures": []
}
```

For more information, see Deleting an image in a public repository in the *Amazon ECR Public User Guide*.

Example 2: To delete any image by specifying the tag associated with the image you want to delete from the repository.

The following `batch-delete-image` example deletes an image by specifying the tag associated with the image repository named `project-a/nginx-web-app` in a public registry. If you have only one tag and execute this command, it will remove the image. Otherwise, if you have multiple tags for the same image, specify one, and only the tag is removed from repository and not the image.

```
aws ecr-public batch-delete-image \
    --repository-name project-a/nginx-web-app \
    --image-ids imageTag=_temp
```

Output:

```
{
    "imageIds": [
        {
            "imageDigest":
 "sha256:f7a86a0760e2f8d7eff07e515fc87bf4bac45c35376c06f9a280f15ecad6d7e0",
            "imageTag": "_temp"
        }
    ],
    "failures": []
}
```

For more information, see [Deleting an image in a public repository](#) in the *Amazon ECR Public User Guide*.

Example 3: To delete multiple images, you can specify multiple image tags or image digests in the request for a repository in a public registry.

The following `batch-delete-image` example delete multiple images from a repository named project-a/nginx-web-app by specifying multiple image tags or image digests in the request.

```
aws ecr-public batch-delete-image \
    --repository-name project-a/nginx-web-app \
    --image-ids imageTag=temp2.0
  imageDigest=sha256:47ba980bc055353d9c0af89b1894f68faa43ca93856917b8406316be86f01278
```

Output:

```
{
     "imageIds": [
         {
             "imageDigest":
 "sha256:47ba980bc055353d9c0af89b1894f68faa43ca93856917b8406316be86f01278"
         },
         {
             "imageDigest":
 "sha256:f7a86a0760e2f8d7eff07e515fc87bf4bac45c35376c06f9a280f15ecad6d7e0",
             "imageTag": "temp2.0"
         }
     ],
```

```
    "failures": []
}
```

For more information, see [Deleting an image in a public repository]() in the *Amazon ECR Public User Guide*.

Example 4: To delete an image in cross AWS Account using registry-id and imagedigest ids, the image and all of its tags are deleted within a repository in a public registry

The following `batch-delete-image` example deletes an image by specifying the image digest in the cross AWS Account.:

```
aws ecr-public batch-delete-image \
    --registry-id 123456789098 \
    --repository-name project-a/nginx-web-app \
    --image-
ids imageDigest=sha256:b1f9deb5fe3711a3278379ebbcaefbc5d70a2263135db86bd27a0dae150546c2
 \
    --region us-east-1
```

Output:

```
{
    "imageIds": [
        {
            "imageDigest":
 "sha256:b1f9deb5fe3711a3278379ebbcaefbc5d70a2263135db86bd27a0dae150546c2",
            "imageTag": "temp2.0"
        }
    ],
    "failures": []
}
```

For more information, see [Deleting an image in a public repository]() in the *Amazon ECR Public User Guide*.

- For API details, see [BatchDeleteImage]() in *AWS CLI Command Reference*.

`create-repository`

The following code example shows how to use `create-repository`.

AWS CLI

Example 1: To create a repository in a public registry

The following `create-repository` example creates a repository named project-a/nginx-web-app in a public registry.

```
aws ecr-public create-repository \
    --repository-name project-a/nginx-web-app
```

Output:

```
{
    "repository": {
        "repositoryArn": "arn:aws:ecr-public::123456789012:repository/project-a/
nginx-web-app",
        "registryId": "123456789012",
        "repositoryName": "project-a/nginx-web-app",
        "repositoryUri": "public.ecr.aws/public-registry-custom-alias/project-a/
nginx-web-app",
        "createdAt": "2024-07-01T21:08:55.131000+00:00"
    },
    "catalogData": {}
}
```

For more information, see Creating a public repository in the *Amazon ECR Public User Guide*.

Example 2: To create a repository in a public registry with short description of the contents of the repository, system and operating architecture that the images in the repository are compatible with

The following `create-repository` example creates a repository named project-a/nginx-web-app in a public registry with short description of the contents of the repository, system and operating architecture that the images in the repository are compatible with.

```
aws ecr-public create-repository \
    --repository-name project-a/nginx-web-app \
    --catalog-data 'description=My project-a ECR Public
 Repository,architectures=ARM,ARM 64,x86,x86-64,operatingSystems=Linux'
```

Output:

```
{
    "repository": {
        "repositoryArn": "arn:aws:ecr-public::123456789012:repository/project-a/
nginx-web-app",
        "registryId": "123456789012",
        "repositoryName": "project-a/nginx-web-app",
        "repositoryUri": "public.ecr.aws/public-registry-custom-alias/project-a/
nginx-web-app",
        "createdAt": "2024-07-01T21:23:20.455000+00:00"
    },
    "catalogData": {
        "description": "My project-a ECR Public Repository",
        "architectures": [
            "ARM",
            "ARM 64",
            "x86",
            "x86-64"
        ],
        "operatingSystems": [
            "Linux"
        ]
    }
}
```

For more information, see Creating a public repository in the *Amazon ECR Public User Guide*.

Example 3: To create a repository in a public registry, along with logoImageBlob, aboutText, usageText and tags information

The following `create-repository` example creates a repository named project-a/nginx-web-app in a public registry, along with logoImageBlob, aboutText, usageText and tags information.

```
aws ecr-public create-repository \
    --cli-input-json file://myfile.json
```

Contents of `myfile.json`:

```
{
    "repositoryName": "project-a/nginx-web-app",
    "catalogData": {
        "description": "My project-a ECR Public Repository",
        "architectures": [
```

```
            "ARM",
            "ARM 64",
            "x86",
            "x86-64"
        ],
        "operatingSystems": [
            "Linux"
        ],
        "logoImageBlob": "iVBORw0KGgoA<<truncated-for-better-reading>>ErkJggg==",
        "aboutText": "## Quick reference\n\nMaintained by: [the Amazon Linux Team]

 Linux?\n\nAmazon Linux is provided by Amazon Web Services (AWS). It is designed
 to provide a stable, secure, and high-performance execution environment for
 applications running on Amazon EC2. The full distribution includes packages that
 enable easy integration with AWS, including launch configuration tools and many
 popular AWS libraries and tools. AWS provides ongoing security and maintenance
 updates to all instances running Amazon Linux.\n\nThe Amazon Linux container image
 contains a minimal set of packages. To install additional packages, [use `yum`]
(https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/managing-software.html).\n\nAWS
 provides two versions of Amazon Linux: [Amazon Linux 2](https://aws.amazon.com/
amazon-linux-2/) and [Amazon Linux AMI](https://aws.amazon.com/amazon-linux-ami/).
\n\nFor information on security updates for Amazon Linux, please refer to [Amazon
 Linux 2 Security Advisories](https://alas.aws.amazon.com/alas2.html) and [Amazon
 Linux AMI Security Advisories](https://alas.aws.amazon.com/). Note that Docker
 Hub's vulnerability scanning for Amazon Linux is currently based on RPM versions,
 which does not reflect the state of backported patches for vulnerabilities.\n
\n## Where can I run Amazon Linux container images?\n\nYou can run Amazon Linux
 container images in any Docker based environment. Examples include, your laptop,
 in Amazon EC2 instances, and Amazon ECS clusters.\n\n## License\n\nAmazon Linux is
 available under the [GNU General Public License, version 2.0](https://github.com/
aws/amazon-linux-docker-images/blob/master/LICENSE). Individual software packages
 are available under their own licenses; run `rpm -qi [package name]` or check
```

```
 `/usr/share/doc/[package name]-*` and `/usr/share/licenses/[package name]-*` for
 details.\n\nAs with all Docker images, these likely also contain other software
 which may be under other licenses (such as Bash, etc from the base distribution,
 along with any direct or indirect dependencies of the primary software being
 contained).\n\nSome additional license information which was able to be auto-
detected might be found in [the `repo-info` repository's `amazonlinux/` directory]
(https://github.com/docker-library/repo-info/tree/master/repos/amazonlinux).\n\n##
 Security\n\nFor information on security updates for Amazon Linux, please refer
 to [Amazon Linux 2 Security Advisories](https://alas.aws.amazon.com/alas2.html)
 and [Amazon Linux AMI Security Advisories](https://alas.aws.amazon.com/). Note
 that Docker Hub's vulnerability scanning for Amazon Linux is currently based
 on RPM versions, which does not reflect the state of backported patches for
 vulnerabilities.",
        "usageText": "## Supported architectures\n\namd64, arm64v8\n\n## Where
 can I run Amazon Linux container images?\n\nYou can run Amazon Linux container
 images in any Docker based environment. Examples include, your laptop, in Amazon
 EC2 instances, and ECS clusters.\n\n## How do I install a software package from
 Extras repository in Amazon Linux 2?\n\nAvailable packages can be listed with the
 `amazon-linux-extras` command. Packages can be installed with the `amazon-linux-
extras install <package>` command. Example: `amazon-linux-extras install rust1`\n
\n## Will updates be available for Amazon Linux containers?\n\nSimilar to the Amazon
 Linux images for Amazon EC2 and on-premises use, Amazon Linux container images will
 get ongoing updates from Amazon in the form of security updates, bug fix updates,
 and other enhancements. Security bulletins for Amazon Linux are available at
 https://alas.aws.amazon.com/\n\n## Will AWS Support the current version of Amazon
 Linux going forward?\n\nYes; in order to avoid any disruption to your existing
 applications and to facilitate migration to Amazon Linux 2, AWS will provide
 regular security updates for Amazon Linux 2018.03 AMI and container image for 2
 years after the final LTS build is announced. You can also use all your existing
 support channels such as AWS Support and Amazon Linux Discussion Forum to continue
 to submit support requests."

 images in any Docker based environment. Examples include, your laptop, in Amazon
 EC2 instances, and ECS clusters.\n\n## How do I install a software package from
 Extras repository in Amazon Linux 2?\n\nAvailable packages can be listed with the
 `amazon-linux-extras` command. Packages can be installed with the `amazon-linux-
extras install <package>` command. Example: `amazon-linux-extras install rust1`\n
\n## Will updates be available for Amazon Linux containers?\n\nSimilar to the Amazon
 Linux images for Amazon EC2 and on-premises use, Amazon Linux container images will
 get ongoing updates from Amazon in the form of security updates, bug fix updates,
 and other enhancements. Security bulletins for Amazon Linux are available at
 https://alas.aws.amazon.com/\n\n## Will AWS Support the current version of Amazon
 Linux going forward?\n\nYes; in order to avoid any disruption to your existing
 applications and to facilitate migration to Amazon Linux 2, AWS will provide
 regular security updates for Amazon Linux 2018.03 AMI and container image for 2
```

```
 years after the final LTS build is announced. You can also use all your existing
 support channels such as AWS Support and Amazon Linux Discussion Forum to continue
 to submit support requests."
    }
}
```

For more information, see [Creating a public repository]() in the *Amazon ECR Public User Guide* and [Repository catalog data]() in the *Amazon ECR Public User Guide*.

- For API details, see [CreateRepository]() in *AWS CLI Command Reference*.

`delete-repository-policy`

The following code example shows how to use `delete-repository-policy`.

AWS CLI

To delete a repository policy in a public registry

The following `delete-repository-policy` example delete repository policy for the ECR Public repository in your AWS account.

```
aws ecr-public delete-repository-policy \
     --repository-name project-a/nginx-web-app \
     --region us-east-1
```

Output:

```
{
    "registryId": "123456789012",
    "repositoryName": "project-a/nginx-web-app",
    "policyText": "{\n  \"Version\" : \"2008-10-17\",\n  \"Statement\" : [ {\n
    \"Sid\" : \"AllowPush\",\n    \"Effect\" : \"Allow\",\n    \"Principal
\" : {\n      \"AWS\" : [ \"arn:aws:iam:"123456789012":user/eksuser1\",
 \"arn:aws:iam:"123456789012":user/admin\" ]\n    },\n    \"Action\" :
 [ \"ecr-public:BatchCheckLayerAvailability\", \"ecr-public:PutImage\",
 \"ecr-public:InitiateLayerUpload\", \"ecr-public:UploadLayerPart\", \"ecr-
public:CompleteLayerUpload\" ]\n  } ]\n}"
}
```

For more information, see [Deleting a public repository policy statement]() in the *Amazon ECR Public User Guide*.

- For API details, see DeleteRepositoryPolicy in *AWS CLI Command Reference*.

`delete-repository`

The following code example shows how to use `delete-repository`.

AWS CLI

To delete a repository in a public registry

The following `delete-repository` example deletes a repository named `project-a/nginx-web-app` from your public registry.

```
aws ecr-public delete-repository \
    --repository-name project-a/nginx-web-app
```

Output:

```
{
    "repository": {
        "repositoryArn": "arn:aws:ecr-public::123456789012:repository/project-a/
nginx-web-app",
        "registryId": "123456789012",
        "repositoryName": "project-a/nginx-web-app",
        "repositoryUri": "public.ecr.aws/public-registry-custom-alias/project-a/
nginx-web-app",
        "createdAt": "2024-07-01T22:14:50.103000+00:00"
    }
}
```

For more information, see Deleting a public repository in the *Amazon ECR Public*.

- For API details, see DeleteRepository in *AWS CLI Command Reference*.

`describe-image-tags`

The following code example shows how to use `describe-image-tags`.

AWS CLI

Example 1: To describe image tag details in public repository

The following `describe-image-tags` example describe imagetags in the `project-a/nginx-web-app` sample repository.

```
aws ecr-public describe-image-tags \
    --repository-name project-a/nginx-web-app \
    --region us-east-1
```

Output:

```
{
    "imageTagDetails": [
        {
            "imageTag": "latest",
            "createdAt": "2024-07-10T22:29:00-05:00",
            "imageDetail": {
                "imageDigest":
 "sha256:b1f9deb5fe3711a3278379ebbcaefbc5d70a2263135db86bd27a0dae150546c2",
                "imageSizeInBytes": 121956548,
                "imagePushedAt": "2024-07-10T22:29:00-05:00",
                "imageManifestMediaType": "application/
vnd.docker.distribution.manifest.v2+json",
                "artifactMediaType": "application/
vnd.docker.container.image.v1+json"
            }
        }
    ]
}
```

- For API details, see DescribeImageTags in *AWS CLI Command Reference*.

`describe-images`

The following code example shows how to use `describe-images`.

AWS CLI

Example 1: To describe images in a public registry repository

The following `describe-images` example describes imagesDetails in a repository named `project-a/nginx-web-app` in a public registry.

```
aws ecr-public describe-images \
```

```
    --repository-name project-a/nginx-web-app \
    --region us-east-1
```

Output:

```
{
    "imageDetails": [
        {
            "registryId": "123456789012",
            "repositoryName": "project-a/nginx-web-app",
            "imageDigest":
 "sha256:0d8c93e72e82fa070d49565c00af32abbe8ddfd7f75e39f4306771ae0628c7e8",
            "imageTags": [
                "temp1.0"
            ],
            "imageSizeInBytes": 123184716,
            "imagePushedAt": "2024-07-23T11:32:49-05:00",
            "imageManifestMediaType": "application/
vnd.docker.distribution.manifest.v2+json",
            "artifactMediaType": "application/vnd.docker.container.image.v1+json"
        },
        {
            "registryId": "123456789012",
            "repositoryName": "project-a/nginx-web-app",
            "imageDigest":
 "sha256:b1f9deb5fe3711a3278379ebbcaefbc5d70a2263135db86bd27a0dae150546c2",
            "imageTags": [
                "temp2.0"
            ],
            "imageSizeInBytes": 121956548,
            "imagePushedAt": "2024-07-23T11:39:38-05:00",
            "imageManifestMediaType": "application/
vnd.docker.distribution.manifest.v2+json",
            "artifactMediaType": "application/vnd.docker.container.image.v1+json"
        },
        {
            "registryId": "123456789012",
            "repositoryName": "project-a/nginx-web-app",
            "imageDigest":
 "sha256:f7a86a0760e2f8d7eff07e515fc87bf4bac45c35376c06f9a280f15ecad6d7e0",
            "imageTags": [
                "temp3.0",
                "latest"
```

```
            ],
            "imageSizeInBytes": 232108879,
            "imagePushedAt": "2024-07-22T00:54:34-05:00",
            "imageManifestMediaType": "application/
vnd.docker.distribution.manifest.v2+json",
            "artifactMediaType": "application/vnd.docker.container.image.v1+json"
        }
    ]
}
```

For more information, see [Describe an image in a public repository]() in the *Amazon ECR Public*.

Example 2: To describe images from the repository by sort imageTags & imagePushedAt

The following `describe-images` example describe images within repository named project-a/nginx-web-app in a public registry.

```
aws ecr-public describe-images \
    --repository-name project-a/nginx-web-app \
    --query 'sort_by(imageDetails,& imagePushedAt)[*].imageTags[*]' \
    --output text
```

Output:

```
temp3.0 latest
temp1.0
temp2.0
```

Example 3: To describe images from the repository to generate the last 2 image tags pushed in the repository

The following `describe-images` example gets imagetags details from the repository named `project-a/nginx-web-app` in a public registry and queries the result to display only the first two records.

```
aws ecr-public describe-images \
    --repository-name project-a/nginx-web-app  \
    --query 'sort_by(imageDetails,& imagePushedAt)[*].imageTags[*] | [0:2]' \
    --output text
```

Output:

```
temp3.0 latest
temp1.0
```

- For API details, see [DescribeImages]() in *AWS CLI Command Reference*.

`describe-registries`

The following code example shows how to use `describe-registries`.

AWS CLI

To describe all registries in a public registry

The following `describe-registries` example describes all registries in your account.

```
aws ecr-public describe-registries
```

Output:

```
{
 "registries": [
     {
         "registryId": "123456789012",
         "registryArn": "arn:aws:ecr-public::123456789012:registry/123456789012",
         "registryUri": "public.ecr.aws/publicregistrycustomalias",
         "verified": false,
         "aliases": [
             {
                 "name": "publicregistrycustomalias",
                 "status": "ACTIVE",
                 "primaryRegistryAlias": true,
                 "defaultRegistryAlias": true
             }
         ]
     }
     ]
 }
```

- For API details, see [DescribeRegistries]() in *AWS CLI Command Reference*.

`describe-repository`

The following code example shows how to use `describe-repository`.

AWS CLI

Example 1: To describe a repository in a public registry

The following `describe-repositories` example describes a repository named `project-a/nginx-web-app` in a public registry.

```
aws ecr-public describe-repositories \
    --repository-name project-a/nginx-web-app
```

Output:

```
{
    "repositories": [
        {
            "repositoryArn": "arn:aws:ecr-public::123456789012:repository/project-a/
nginx-web-app",
            "registryId": "123456789012",
            "repositoryName": "project-a/nginx-web-app",
            "repositoryUri": "public.ecr.aws/public-registry-custom-alias/project-a/
nginx-web-app",
            "createdAt": "2024-07-07T00:07:56.526000-05:00"
        }
    ]
}
```

Example 2: To describe all repositories in a public registry in a table

The following `describe-repositories` example describes all repositories in a public registry and then outputs the repository names into a table format.

```
aws ecr-public describe-repositories \
    --region us-east-1 \
    --output table \
    --query "repositories[*].repositoryName"
```

Output:

```
-----------------------------
|   DescribeRepositories    |
+---------------------------+
|  project-a/nginx-web-app  |
|  nginx                    |
|  myfirstrepo1             |
|  helm-test-chart          |
|  test-ecr-public          |
|  nginx-web-app            |
|  sample-repo              |
+---------------------------+
```

- For API details, see [DescribeRepository](#) in *AWS CLI Command Reference*.

`get-authorization-token`

The following code example shows how to use `get-authorization-token`.

AWS CLI

Example 1: To retrieve an authorization token for any Amazon ECR public registry that the IAM principal has access

The following `get-authorization-token` example gets an authorization token with the AWS CLI and sets it to an environment variable.

```
aws ecr-public get-authorization-token \
    --region us-east-1
```

Output:

```
{
    "authorizationData": {
        "authorizationToken":
 "QVdTOmV5SndZWGxzYjJKJFHDSFKJHERWUY65IOU36TRYEGFNSDLRIUOTUYTHJKLDFGOcmFUQk9OSFV2UVV4a0x6Sm1
        "expiresAt": "2024-07-25T21:37:26.301000-04:00"
    }
}
```

For more information, see [Amazon ECR public registries](#) in the *Amazon ECR Public*.

Example 2: To retrieve an authorization token for any Amazon ECR public registry that the IAM principal has access

The following `get-authorization-token` example gets an authorization token with the AWS CLI and sets it to an environment variable.

```
aws ecr-public get-authorization-token \
    --region us-east-1 \
    --output=text \
    --query 'authorizationData.authorizationToken'
```

Output:

```
QVdTOmV5SndZWGxzYjJKJFHDSFKJHERWUY65IOU36TRYEGFNSDLRIUOTUYTHJKLDFGOcmFUQk9OSFV2UVV4a0x6Sm1ZV
```

For more information, see Amazon ECR public registries in the *Amazon ECR Public*.

- For API details, see GetAuthorizationToken in *AWS CLI Command Reference*.

`get-login-password`

The following code example shows how to use `get-login-password`.

AWS CLI

Example 1: To authenticate docker to an Amazon ECR public registry

The following `get-login-password` example retrieves and displays an authentication token using the GetAuthorizationToken API that you can use to authenticate to an Amazon ECR public registry.

```
aws ecr-public get-login-password \
    --region us-
east-1
| docker login \
    --username AWS \
    --password-stdin public.ecr.aws
```

This command produces no output in the terminal but instead pipes the output to Docker.

For more information, see Authenticate to the public registry in the *Amazon ECR Public*.

Example 2: To authenticate docker to your own custom AmazonECR public registry

The following `get-login-password` example retrieves and displays an authentication token using the GetAuthorizationToken API that you can use to authenticate to your own custom Amazon ECR public registry.

```
 aws ecr-public get-login-password \
    --region us-east-1 \
| docker login \
    --username AWS \
    --password-stdin public.ecr.aws/<your-public-registry-custom-alias>
```

This command produces no output in the terminal but insteads pipes the output to Docker.

For more information, see Authenticate to your own Amazon ECR Public in the *Amazon ECR Public*.

- For API details, see GetLoginPassword in *AWS CLI Command Reference*.

`get-registry-catalog-data`

The following code example shows how to use `get-registry-catalog-data`.

AWS CLI

To retrieve catalog metadata for a public ECR registry

The following `get-registry-catalog-data` retrieves catalog metadata for an ECR public registry.

```
aws ecr-public get-registry-catalog-data \
    --region us-east-1
```

Output:

```
{
    "registryCatalogData": {
        "displayName": "YourCustomPublicRepositoryalias"
    }
}
```

- For API details, see GetRegistryCatalogData in *AWS CLI Command Reference*.

`get-repository-catalog-data`

The following code example shows how to use `get-repository-catalog-data`.

AWS CLI

To retrieve catalog metadata for a repository in a public registry

The following `get-repository-catalog-data` example lists the catalog metadata for the repository `project-a/nginx-web-app` in a public registry.

```
aws ecr-public get-repository-catalog-data \
    --repository-name project-a/nginx-web-app \
    --region us-east-1
```

Output:

```
{
    "catalogData": {
        "description": "My project-a ECR Public Repository",
        "architectures": [
            "ARM",
            "ARM 64",
            "x86",
            "x86-64"
        ],
        "operatingSystems": [
            "Linux"
        ],
        "logoUrl": "https://d3g9o9u8re44ak.cloudfront.net/logo/491d3846-8f33-4d8b-
a10c-c2ce271e6c0d/4f09d87c-2569-4916-a932-5c296bf6f88a.png",
        "aboutText": "## Quick reference\n\nMaintained <truncated>",
        "usageText": "## Supported architectures\n\namd64, arm64v8\n\n##
 <truncated>"
    }
}
```

For more information, see Repository catalog data in the *Amazon ECR Public*.

- For API details, see GetRepositoryCatalogData in *AWS CLI Command Reference*.

`get-repository-policy`

The following code example shows how to use `get-repository-policy`.

AWS CLI

To get a repository policy associated with the repository

The following `get-repository-policy` example gets a repository policy associated with the repository.

```
aws ecr-public get-repository-policy \
    --repository-name project-a/nginx-web-app \
    --region us-east-1
```

Output:

```
{
    "registryId": "123456789012",
    "repositoryName": "project-a/nginx-web-app",
    "policyText": "{\n  \"Version\" : \"2008-10-17\",\n  \"Statement\" : [ {\n
    \"Sid\" : \"AllowPush\",\n    \"Effect\" : \"Allow\",\n    \"Principal
\" : {\n      \"AWS\" : [ \"arn:aws:iam::123456789012:user/eksuser1\",
 \"arn:aws:iam::123456789012:user/admin\" ]\n    },\n    \"Action\" :
 [ \"ecr-public:BatchCheckLayerAvailability\", \"ecr-public:PutImage\",
 \"ecr-public:InitiateLayerUpload\", \"ecr-public:UploadLayerPart\", \"ecr-
public:CompleteLayerUpload\" ]\n  } ]\n}"
}
```

For more information, see Use GetRepositoryPolicy with an AWS SDK or CLI in the *Amazon ECR Public User Guide*.

- For API details, see GetRepositoryPolicy in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a public repository in a public registry

The following `list-tags-for-resource` example lists the tags for a resource named `project-a/nginx-web-app` in a public registry.

```
aws ecr-public list-tags-for-resource \
    --resource-arn arn:aws:ecr-public::123456789012:repository/project-a/nginx-web-app \
    --region us-east-1
```

Output:

```
{
    "tags": [
        {
            "Key": "Environment",
            "Value": "Prod"
        },
        {
            "Key": "stack",
            "Value": "dev1"
        },
        {
            "Key": "Name",
            "Value": "project-a/nginx-web-app"
        }
    ]
}
```

For more information, see List tags for a public repository in the *Amazon ECR Public*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

put-registry-catalog-data

The following code example shows how to use `put-registry-catalog-data`.

AWS CLI

To create or update catalog metadata for a public ECR registry

The following `put-registry-catalog-data` creates or updates catalog metadata for an ECR public registry. Only accounts that have the verified account badge can have a registry display name.

```
aws ecr-public put-registry-catalog-data \
    --region us-east-1 \
    --display-name <YourCustomPublicRepositoryalias>
```

Output:

```
{
    "registryCatalogData": {
        "displayName": "YourCustomPublicRepositoryalias"
    }
}
```

- For API details, see PutRegistryCatalogData in *AWS CLI Command Reference*.

put-repository-catalog-data

The following code example shows how to use `put-repository-catalog-data`.

AWS CLI

To create or update the catalog data for a repository in a public registry

The following `put-repository-catalog-data` example creates or update catalog data for reposiotry named project-a/nginx-web-app in a public registry, along with logoImageBlob, aboutText, usageText and tags information.

```
aws ecr-public put-repository-catalog-data \
    --repository-name project-a/nginx-web-app \
    --cli-input-json file://repository-catalog-data.json \
    --region us-east-1
```

Contents of `repository-catalog-data.json`:

```
{
    "repositoryName": "project-a/nginx-web-app",
    "catalogData": {
        "description": "My project-a ECR Public Repository",
        "architectures": [
            "ARM",
            "ARM 64",
            "x86",
```

```
                "x86-64"
            ],
            "operatingSystems": [
                "Linux"
            ],
            "logoImageBlob": "iVBORw0KGgoA<<truncated-for-better-reading>>ErkJggg==",
            "aboutText": "## Quick reference.",
            "usageText": "## Supported architectures are as follows."
        }
}
```

Output:

```
{
    "catalogData": {
        "description": "My project-a ECR Public Repository",
        "architectures": [
            "ARM",
            "ARM 64",
            "x86",
            "x86-64"
        ],
        "operatingSystems": [
            "Linux"
        ],
        "logoUrl": "https://d3g9o9u8re44ak.cloudfront.net/logo/df86cf58-ee60-4061-
b804-0be24d97ccb1/4a9ed9b2-69e4-4ede-b924-461462d20ef0.png",
        "aboutText": "## Quick reference.",
        "usageText": "## Supported architectures are as follows."
    }
}
```

For more information, see Repository catalog data in the *Amazon ECR Public*.

- For API details, see PutRepositoryCatalogData in *AWS CLI Command Reference*.

`set-repository-policy`

The following code example shows how to use `set-repository-policy`.

AWS CLI

Example 1: To set a repository policy to allow a pull on the repository

The following `set-repository-policy` example applies an ECR public repository policy to the specified repository to control access permissions.

```
aws ecr-public set-repository-policy \
    --repository-name project-a/nginx-web-app \
    --policy-text file://my-repository-policy.json
```

Contents of `my-repository-policy.json`:

```
{
    "Version":"2012-10-17",
    "Statement" : [
        {
            "Sid" : "allow public pull",
            "Effect" : "Allow",
            "Principal" : "*",
            "Action" : [
                "ecr:BatchCheckLayerAvailability",
                "ecr:BatchGetImage",
                "ecr:GetDownloadUrlForLayer"
            ]
        }
    ]
}
```

Output:

```
{
    "registryId": "12345678901",
    "repositoryName": "project-a/nginx-web-app",
    "policyText": "{\n  \"Version\" : \"2008-10-17\",\n  \"Statement\" : [ {\n
  \"Sid\" : \"allow public pull\",\n    \"Effect\" : \"Allow\",\n    \"Principal\" :
  \"*\",\n    \"Action\" : [ \"ecr:BatchCheckLayerAvailability\", \"ecr:BatchGetImage
\", \"ecr:GetDownloadUrlForLayer\" ]\n  } ]\n}"
}
```

For more information, see Setting a repository policy statement in the *Amazon ECR Public User Guide*.

Example 2: To set a repository policy to allow an IAM user within your account to push images

The following `set-repository-policy` example allows an IAM user within your account to push images using to an ECR repository in your AWS account using the input file named `file://my-repository-policy.json` as policy text.

```
aws ecr-public set-repository-policy \
    --repository-name project-a/nginx-web-app \
    --policy-text file://my-repository-policy.json
```

Contents of `my-repository-policy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "AllowPush",
            "Effect": "Allow",
            "Principal": {
                "AWS": [
                    "arn:aws:iam::account-id:user/push-pull-user-1",
                    "arn:aws:iam::account-id:user/push-pull-user-2"
                ]
            },
            "Action": [
                "ecr-public:BatchCheckLayerAvailability",
                "ecr-public:PutImage",
                "ecr-public:InitiateLayerUpload",
                "ecr-public:UploadLayerPart",
                "ecr-public:CompleteLayerUpload"
            ]
        }
    ]
}
```

Output:

```
{
    "registryId": "12345678901",
    "repositoryName": "project-a/nginx-web-app",
    "policyText": "{\n  \"Version\" : \"2008-10-17\",\n  \"Statement\" :
 [ {\n    \"Sid\" : \"AllowPush\",\n    \"Effect\" : \"Allow\",\n
 \"Principal\" : {\n      \"AWS\" : [ \"arn:aws:iam::12345678901:user/admin
\", \"arn:aws:iam::12345678901:user/eksuser1\" ]\n    },\n    \"Action\" :
```

```
 [ \"ecr-public:BatchCheckLayerAvailability\", \"ecr-public:PutImage\",
 \"ecr-public:InitiateLayerUpload\", \"ecr-public:UploadLayerPart\", \"ecr-
public:CompleteLayerUpload\" ]\n  } ]\n}"
}
```

For more information, see Setting a repository policy statement in the *Amazon ECR Public User Guide*.

Example 3: To set a repository policy to allow an IAM user from different account to push images

The following `set-repository-policy` example allows a specific account to push images using cli input file://my-repository-policy.json in your AWS account.

```
aws ecr-public set-repository-policy \
    --repository-name project-a/nginx-web-app \
    --policy-text file://my-repository-policy.json
```

Contents of `my-repository-policy.json`:

```
 {
     "Version":"2012-10-17",
     "Statement": [
         {
             "Sid": "AllowCrossAccountPush",
             "Effect": "Allow",
             "Principal": {
                 "AWS": "arn:aws:iam::other-or-same-account-id:role/RoleName"
             },
             "Action": [
                 "ecr-public:BatchCheckLayerAvailability",
                 "ecr-public:PutImage",
                 "ecr-public:InitiateLayerUpload",
                 "ecr-public:UploadLayerPart",
                 "ecr-public:CompleteLayerUpload"
             ]
         }
     ]
}
```

Output:

```
{
    "registryId": "12345678901",
    "repositoryName": "project-a/nginx-web-app",
    "policyText": "{\n  \"Version\" : \"2008-10-17\",\n  \"Statement\" : [ {\n
 \"Sid\" : \"AllowCrossAccountPush\",\n    \"Effect\" : \"Allow\",\n    \"Principal
\" : {\n      \"AWS\" : \"arn:aws:iam::12345678901:role/RoleName\"\n    },\n
 \"Action\" : [ \"ecr-public:BatchCheckLayerAvailability\", \"ecr-public:PutImage
\", \"ecr-public:InitiateLayerUpload\", \"ecr-public:UploadLayerPart\", \"ecr-
public:CompleteLayerUpload\" ]\n  } ]\n}"
}
```

For more information, see Public repository policy examples in the *Amazon ECR Public User Guide*.

- For API details, see SetRepositoryPolicy in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

Example 1: To tags an existing public repository in a public registry

The following `tag-resource` example tags a repository named `project-a/nginx-web-app` in a public registry.

```
aws ecr-public tag-resource \
    --resource-arn arn:aws:ecr-public::123456789012:repository/project-a/nginx-web-
app \
    --tags Key=stack,Value=dev \
    --region us-east-1
```

For more information, see Using Tags for a public repository in the *Amazon ECR Public*.

Example 2: To tag an existing public repository with multiple tags in a public registry.

The following `tag-resource` example tags an existing repository with multiple tags.

```
aws ecr-public tag-resource \
    --resource-arn arn:aws:ecr-public::890517186334:repository/project-a/nginx-web-
app  \
```

```
    --tags Key=key1,Value=value1 Key=key2,Value=value2 Key=key3,Value=value3 \
    --region us-east-1
```

For more information, see Using Tags for a public repository in the *Amazon ECR Public*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

Example 1: To untags an existing public repository in a public registry

The following `untag-resource` example tags a repository named `project-a/nginx-web-app` in a public registry.

```
aws ecr-public untag-resource \
    --resource-arn arn:aws:ecr-public::123456789012:repository/project-a/nginx-web-
app \
    --tag-keys stack \
    --region us-east-1
```

This command produces no output.

For more information, see Using Tags for a public repository in the *Amazon ECR Public*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

Amazon ECS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon ECS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

capacity-provider-update

The following code example shows how to use `capacity-provider-update`.

AWS CLI

Update the capacity provider in an ECS cluster

The following `update-capacity-provider` example shows how we can modify the parameters of the capacity provider in an ECS cluster.

```
aws ecs update-capacity-provider \
    --name Infra-ECS-Cluster-ECS-project-update-cluster-d6bb6d5b-
EC2CapacityProvider-3fIpdkLywwFt \
    --auto-scaling-group-
provider "managedScaling={status=DISABLED,targetCapacity=50,minimumScalingStepSize=2,maximum
```

Output:

```
{
    "capacityProvider": {
        "capacityProviderArn": "arn:aws:ecs:us-west-2:123456789012:capacity-
provider/Infra-ECS-Cluster-ECS-project-update-cluster-d6bb6d5b-
EC2CapacityProvider-3fIpdkLywwFt",
        "name": "Infra-ECS-Cluster-ECS-project-update-cluster-d6bb6d5b-
EC2CapacityProvider-3fIpdkLywwFt",
        "status": "ACTIVE",
        "autoScalingGroupProvider": {
            "autoScalingGroupArn": "arn:aws:autoscaling:us-
west-2:123456789012:autoScalingGroup:424941d1-b43f-4a17-
adbb-08b6a6e397e1:autoScalingGroupName/Infra-ECS-Cluster-ECS-project-update-cluster-
d6bb6d5b-ECSAutoScalingGroup-f44jrQHS2nRB",
            "managedScaling": {
                "status": "ENABLED",
                "targetCapacity": 100,
                "minimumScalingStepSize": 1,
                "maximumScalingStepSize": 10000,
                "instanceWarmupPeriod": 300
```

```
            },
            "managedTerminationProtection": "DISABLED",
            "managedDraining": "ENABLED"
        },
        "updateStatus": "UPDATE_IN_PROGRESS",
        "tags": []
    }
}
```

For more information on Capacity Provider, see [Amazon ECS capacity providers for the EC2 launch type]() in the *Amazon ECS Developer Guide*.

- For API details, see [CapacityProviderUpdate]() in *AWS CLI Command Reference*.

`create-capacity-provider`

The following code example shows how to use `create-capacity-provider`.

AWS CLI

To create a capacity provider

The following create-capacity-provider example creates a capacity provider that uses an Auto Scaling group named MyASG, has managed scaling and managed termination protection enabled. This configuration is used for Amazon ECS cluster auto scaling.

```
aws ecs create-capacity-provider \
    --name "MyCapacityProvider" \
    --auto-scaling-group-provider "autoScalingGroupArn=arn:aws:autoscaling:us-
east-1:123456789012:autoScalingGroup:57ffcb94-11f0-4d6d-
bf60-3bac5EXAMPLE:autoScalingGroupName/
MyASG,managedScaling={status=ENABLED,targetCapacity=100},managedTerminationProtection=ENABLE
```

Output:

```
{
    "capacityProvider": {
    "capacityProviderArn": "arn:aws:ecs:us-east-1:123456789012:capacity-provider/
MyCapacityProvider",
    "name": "MyCapacityProvider",
    "status": "ACTIVE",
    "autoScalingGroupProvider": {
```

```
        "autoScalingGroupArn": "arn:aws:autoscaling:us-
east-1:132456789012:autoScalingGroup:57ffcb94-11f0-4d6d-
bf60-3bac5EXAMPLE:autoScalingGroupName/MyASG",
        "managedScaling": {
            "status": "ENABLED",
            "targetCapacity": 100,
            "minimumScalingStepSize": 1,
            "maximumScalingStepSize": 10000,
            "instanceWarmupPeriod": 300
        },
        "managedTerminationProtection": "ENABLED"
    },
    "tags": []
}
```

For more information, see Amazon ECS cluster auto scaling in the *Amazon ECS Developer Guide*.

- For API details, see CreateCapacityProvider in *AWS CLI Command Reference*.

`create-cluster`

The following code example shows how to use `create-cluster`.

AWS CLI

Example 1: To create a new cluster

The following `create-cluster` example creates a cluster named `MyCluster` and enables CloudWatch Container Insights with enhanced observability.

```
aws ecs create-cluster \
    --cluster-name MyCluster \
    --settings name=containerInsights,value=enhanced
```

Output:

```
{
    "cluster": {
        "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster",
        "clusterName": "MyCluster",
        "status": "ACTIVE",
        "registeredContainerInstancesCount": 0,
        "pendingTasksCount": 0,
```

```
        "runningTasksCount": 0,
        "activeServicesCount": 0,
        "statistics": [],
        "settings": [
            {
                "name": "containerInsights",
                "value": "enhanced"
            }
        ],
        "tags": []
    }
}
```

For more information, see Creating a Cluster in the *Amazon ECS Developer Guide*.

Example 2: To create a new cluster using capacity providers

The following `create-cluster` example creates a cluster and associates two existing capacity providers with it. The `create-capacity-provider` command is used to create a capacity provider. Specifying a default capacity provider strategy is optional, but recommended. In this example, we create a cluster named `MyCluster` and associate the `MyCapacityProvider1` and `MyCapacityProvider2` capacity providers with it. A default capacity provider strategy is specified that spreads the tasks evenly across both capacity providers.

```
aws ecs create-cluster \
    --cluster-name MyCluster \
    --capacity-providers MyCapacityProvider1 MyCapacityProvider2 \
    --default-capacity-provider-
strategy capacityProvider=MyCapacityProvider1,weight=1 capacityProvider=MyCapacityProvider2,
```

Output:

```
{
    "cluster": {
        "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster",
        "clusterName": "MyCluster",
        "status": "PROVISIONING",
        "registeredContainerInstancesCount": 0,
        "pendingTasksCount": 0,
        "runningTasksCount": 0,
        "activeServicesCount": 0,
        "statistics": [],
```

```
        "settings": [
            {
                "name": "containerInsights",
                "value": "enabled"
            }
        ],
        "capacityProviders": [
            "MyCapacityProvider1",
            "MyCapacityProvider2"
        ],
        "defaultCapacityProviderStrategy": [
            {
                "capacityProvider": "MyCapacityProvider1",
                "weight": 1,
                "base": 0
            },
            {
                "capacityProvider": "MyCapacityProvider2",
                "weight": 1,
                "base": 0
            }
        ],
        "attachments": [
           {

                       "value": "MyCapacityProvider1"
                   },
                   {
                       "name": "scalingPlanName",
                       "value": "ECSManagedAutoScalingPlan-a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111"
                   }
                ]
            },
            {
                "id": "ae592060-2382-4663-9476-b015c685593c",
                "type": "asp",
                "status": "PRECREATED",
                "details": [
```

```
                    {
                        "name": "capacityProviderName",
                        "value": "MyCapacityProvider2"
                    },
                    {
                        "name": "scalingPlanName",
                        "value": "ECSManagedAutoScalingPlan-a1b2c3d4-5678-90ab-cdef-
EXAMPLE22222"
                    }
                ]
            }
        ],
        "attachmentsStatus": "UPDATE_IN_PROGRESS"
    }
}
```

For more information, see [Cluster capacity providers](#) in the *Amazon ECS Developer Guide*.

Example 3: To create a new cluster with multiple tags

The following `create-cluster` example creates a cluster with multiple tags. For more information about adding tags using shorthand syntax, see [Using Shorthand Syntax with the AWS Command Line Interface](#) in the *AWS CLI User Guide*.

```
aws ecs create-cluster \
    --cluster-name MyCluster \
    --tags key=key1,value=value1 key=key2,value=value2
```

Output:

```
{
    "cluster": {
        "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster",
        "clusterName": "MyCluster",
        "status": "ACTIVE",
        "registeredContainerInstancesCount": 0,
        "pendingTasksCount": 0,
        "runningTasksCount": 0,
        "activeServicesCount": 0,
        "statistics": [],
        "tags": [
            {
                "key": "key1",
```

```
                "value": "value1"
            },
            {
                "key": "key2",
                "value": "value2"
            }
        ]
    }
}
```

For more information, see [Creating a Cluster](#) in the *Amazon ECS Developer Guide*.

- For API details, see [CreateCluster](#) in *AWS CLI Command Reference*.

`create-service`

The following code example shows how to use `create-service`.

AWS CLI

Example 1: To create a service with a Fargate task

The following `create-service` example shows how to create a service using a Fargate task.

```
aws ecs create-service \
    --cluster MyCluster \
    --service-name MyService \
    --task-definition sample-fargate:1 \
    --desired-count 2 \
    --launch-type FARGATE \
    --platform-version LATEST \
    --network-configuration
 'awsvpcConfiguration={subnets=[subnet-12344321],securityGroups=[sg-12344321],assignPublicIp
 \
    --tags key=key1,value=value1 key=key2,value=value2 key=key3,value=value3
```

Output:

```
{
    "service": {
        "serviceArn": "arn:aws:ecs:us-west-2:123456789012:service/MyCluster/
MyService",
        "serviceName": "MyService",
```

        "enableECSManagedTags": false,
        "propagateTags": "NONE"
    }
}
```

For more information, see Creating a Service in the *Amazon ECS Developer Guide*.

Example 2: To create a service using the EC2 launch type

The following `create-service` example shows how to create a service called `ecs-simple-service` with a task that uses the EC2 launch type. The service uses the `sleep360` task definition and it maintains 1 instantiation of the task.

```
aws ecs create-service \
```

```
    --cluster MyCluster \
    --service-name ecs-simple-service \
    --task-definition sleep360:2 \
    --desired-count 1
```

Output:

```
{
    "service": {
        "serviceArn": "arn:aws:ecs:us-west-2:123456789012:service/MyCluster/ecs-
simple-service",
        "serviceName": "ecs-simple-service",
        "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster",
        "loadBalancers": [],
        "serviceRegistries": [],
        "status": "ACTIVE",
        "desiredCount": 1,
        "runningCount": 0,
        "pendingCount": 0,
        "launchType": "EC2",
        "taskDefinition": "arn:aws:ecs:us-west-2:123456789012:task-definition/
sleep360:2",
        "deploymentConfiguration": {
            "maximumPercent": 200,
            "minimumHealthyPercent": 100
        },
        "deployments": [
            {
                "id": "ecs-svc/12345678901234567890",
                "status": "PRIMARY",
                "taskDefinition": "arn:aws:ecs:us-west-2:123456789012:task-
definition/sleep360:2",
                "desiredCount": 1,
                "pendingCount": 0,
                "runningCount": 0,
                "createdAt": 1557206498.798,
                "updatedAt": 1557206498.798,
                "launchType": "EC2"
            }
        ],
        "events": [],
        "createdAt": 1557206498.798,
        "placementConstraints": [],
```

```
        "placementStrategy": [],
        "schedulingStrategy": "REPLICA",
        "enableECSManagedTags": false,
        "propagateTags": "NONE"
    }
}
```

For more information, see [Creating a Service](#) in the *Amazon ECS Developer Guide*.

Example 3: To create a service that uses an external deployment controller

The following `create-service` example creates a service that uses an external deployment controller.

```
aws ecs create-service \
    --cluster MyCluster \
    --service-name MyService \
    --deployment-controller type=EXTERNAL \
    --desired-count 1
```

Output:

```
{
    "service": {
        "serviceArn": "arn:aws:ecs:us-west-2:123456789012:service/MyCluster/
MyService",
        "serviceName": "MyService",
        "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster",
        "loadBalancers": [],
        "serviceRegistries": [],
        "status": "ACTIVE",
        "desiredCount": 1,
        "runningCount": 0,
        "pendingCount": 0,
        "launchType": "EC2",
        "deploymentConfiguration": {
            "maximumPercent": 200,
            "minimumHealthyPercent": 100
        },
        "taskSets": [],
        "deployments": [],
        "roleArn": "arn:aws:iam::123456789012:role/aws-service-role/
ecs.amazonaws.com/AWSServiceRoleForECS",
```

```
        "events": [],
        "createdAt": 1557128207.101,
        "placementConstraints": [],
        "placementStrategy": [],
        "schedulingStrategy": "REPLICA",
        "deploymentController": {
            "type": "EXTERNAL"
        },
        "enableECSManagedTags": false,
        "propagateTags": "NONE"
    }
}
```

For more information, see Creating a Service in the *Amazon ECS Developer Guide*.

Example 4: To create a new service behind a load balancer

The following `create-service` example shows how to create a service that is behind a load balancer. You must have a load balancer configured in the same Region as your container instance. This example uses the `--cli-input-json` option and a JSON input file called `ecs-simple-service-elb.json` with the following content.

```
aws ecs create-service \
    --cluster MyCluster \
    --service-name ecs-simple-service-elb \
    --cli-input-json file://ecs-simple-service-elb.json
```

Contents of `ecs-simple-service-elb.json`:

```
 {
    "serviceName": "ecs-simple-service-elb",
    "taskDefinition": "ecs-demo",
    "loadBalancers": [
        {
            "loadBalancerName": "EC2Contai-EcsElast-123456789012",
            "containerName": "simple-demo",
            "containerPort": 80
        }
    ],
    "desiredCount": 10,
    "role": "ecsServiceRole"
}
```

Output:

```
{
    "service": {
        "status": "ACTIVE",
        "taskDefinition": "arn:aws:ecs:us-west-2:123456789012:task-definition/ecs-
demo:1",
        "pendingCount": 0,
        "loadBalancers": [
            {
                "containerName": "ecs-demo",
                "containerPort": 80,
                "loadBalancerName": "EC2Contai-EcsElast-123456789012"
            }
        ],
        "roleArn": "arn:aws:iam::123456789012:role/ecsServiceRole",
        "desiredCount": 10,
        "serviceName": "ecs-simple-service-elb",
        "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster",
        "serviceArn": "arn:aws:ecs:us-west-2:123456789012:service/ecs-simple-
service-elb",
        "deployments": [
            {
                "status": "PRIMARY",
                "pendingCount": 0,
                "createdAt": 1428100239.123,
                "desiredCount": 10,
                "taskDefinition": "arn:aws:ecs:us-west-2:123456789012:task-
definition/ecs-demo:1",
                "updatedAt": 1428100239.123,
                "id": "ecs-svc/12345678901234567890",
                "runningCount": 0
            }
        ],
        "events": [],
        "runningCount": 0
    }
}
```

For more information, see Use load balancing to distribute Amazon ECS service traffic in the *Amazon ECS Developer Guide*.

Example 5: To configure Amazon EBS volumes at service creation

The following `create-service` example shows how to configure Amazon EBS volumes for each task managed by the service. You must have an Amazon ECS infrastructure role configured with the `AmazonECSInfrastructureRolePolicyForVolumes` managed policy attached. You must specify a task definition with the same volume name as in the `create-service` request. This example uses the `--cli-input-json` option and a JSON input file called `ecs-simple-service-ebs.json` with the following content.

```
aws ecs create-service \
    --cli-input-json file://ecs-simple-service-ebs.json
```

Contents of `ecs-simple-service-ebs.json`:

```
{
    "cluster": "mycluster",
    "taskDefinition": "mytaskdef",
    "serviceName": "ecs-simple-service-ebs",
    "desiredCount": 2,
    "launchType": "FARGATE",
    "networkConfiguration":{
        "awsvpcConfiguration":{
            "assignPublicIp": "ENABLED",
            "securityGroups": ["sg-12344321"],
            "subnets":["subnet-12344321"]
        }
    },
    "volumeConfigurations": [
        {
            "name": "myEbsVolume",
            "managedEBSVolume": {
                "roleArn":"arn:aws:iam::123456789012:role/ecsInfrastructureRole",
                "volumeType": "gp3",
                "sizeInGiB": 100,
                "iops": 3000,
                "throughput": 125,
                "filesystemType": "ext4"
            }
        }
   ]
}
```

Output:

```
{
    "service": {
        "serviceArn": "arn:aws:ecs:us-west-2:123456789012:service/mycluster/ecs-
simple-service-ebs",
        "serviceName": "ecs-simple-service-ebs",
        "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/mycluster",
        "loadBalancers": [],
        "serviceRegistries": [],
        "status": "ACTIVE",

For more information, see Use Amazon EBS volumes with Amazon ECS in the *Amazon ECS Developer Guide*.

- For API details, see CreateService in *AWS CLI Command Reference*.

`create-task-set`

The following code example shows how to use `create-task-set`.

AWS CLI

To create a task set

The following `create-task-set` example creates a task set in a service that uses an external deployment controller.

```
aws ecs create-task-set \
    --cluster MyCluster \
    --service MyService \
    --task-definition MyTaskDefinition:2 \
    --network-
configuration "awsvpcConfiguration={subnets=[subnet-12344321],securityGroups=[sg-12344321]}"
```

Output:

```
{
    "taskSet": {
        "id": "ecs-svc/1234567890123456789",
        "taskSetArn": "arn:aws:ecs:us-west-2:123456789012:task-set/MyCluster/
MyService/ecs-svc/1234567890123456789",
        "status": "ACTIVE",
        "taskDefinition": "arn:aws:ecs:us-west-2:123456789012:task-definition/
MyTaskDefinition:2",
```

```
            "computedDesiredCount": 0,
            "pendingCount": 0,
            "runningCount": 0,
            "createdAt": 1557128360.711,
            "updatedAt": 1557128360.711,
            "launchType": "EC2",
            "networkConfiguration": {
                "awsvpcConfiguration": {
                    "subnets": [
                        "subnet-12344321"
                    ],
                    "securityGroups": [
                        "sg-12344321"
                    ],
                    "assignPublicIp": "DISABLED"
                }
            },
            "loadBalancers": [],
            "serviceRegistries": [],
            "scale": {
                "value": 0.0,
                "unit": "PERCENT"
            },
            "stabilityStatus": "STABILIZING",
            "stabilityStatusAt": 1557128360.711
        }
}
```

- For API details, see CreateTaskSet in *AWS CLI Command Reference*.

`delete-account-setting`

The following code example shows how to use `delete-account-setting`.

AWS CLI

To delete the account settings for a specific IAM user or IAM role

The following example `delete-account-setting` deletes the account settings for the specific IAM user or IAM role.

```
aws ecs delete-account-setting \
    --name serviceLongArnFormat \
```

```
    --principal-arn arn:aws:iam::123456789012:user/MyUser
```

Output:

```
{
    "setting": {
        "name": "serviceLongArnFormat",
        "value": "enabled",
        "principalArn": "arn:aws:iam::123456789012:user/MyUser"
    }
}
```

For more information, see Amazon Resource Names (ARNs) and IDs in the *Amazon ECS Developer Guide*.

- For API details, see DeleteAccountSetting in *AWS CLI Command Reference*.

`delete-attributes`

The following code example shows how to use `delete-attributes`.

AWS CLI

To delete one or more custom attributes from an Amazon ECS resource

The following `delete-attributes` deletes an attribute with the name `stack` from a container instance.

```
aws ecs delete-attributes \
    --attributes name=stack,targetId=arn:aws:ecs:us-west-2:130757420319:container-
instance/1c3be8ed-df30-47b4-8f1e-6e68ebd01f34
```

Output:

```
{
    "attributes": [
        {
            "name": "stack",
            "targetId": "arn:aws:ecs:us-west-2:130757420319:container-
instance/1c3be8ed-df30-47b4-8f1e-6e68ebd01f34",
            "value": "production"
```

```
        }
    ]
}
```

- For API details, see DeleteAttributes in *AWS CLI Command Reference*.

`delete-capacity-provider`

The following code example shows how to use `delete-capacity-provider`.

AWS CLI

Example 1: To delete a capacity provider using the Amazon Resource Name (ARN)

The following `delete-capacity-provider` example deletes a capacity provider by specifying the Amazon Resource Name (ARN) of the capacity provider. The ARN as well as the status of the capacity provider deletion can be retrieved using the `describe-capacity-providers` command.

```
aws ecs delete-capacity-provider \
    --capacity-provider arn:aws:ecs:us-west-2:123456789012:capacity-provider/
ExampleCapacityProvider
```

Output:

```
{
    "capacityProvider": {
        "capacityProviderArn": "arn:aws:ecs:us-west-2:123456789012:capacity-
provider/ExampleCapacityProvider",
        "name": "ExampleCapacityProvider",
        "status": "ACTIVE",
        "autoScalingGroupProvider": {
            "autoScalingGroupArn": "arn:aws:autoscaling:us-

For more information, see [Cluster capacity providers]() in the *Amazon ECS Developer Guide*.

Example 2: To delete a capacity provider using the name

The following `delete-capacity-provider` example deletes a capacity provider by specifying the short name of the capacity provider. The short name as well as the status of the capacity provider deletion can be retrieved using the `describe-capacity-providers` command.

```
aws ecs delete-capacity-provider \
    --capacity-provider ExampleCapacityProvider
```

Output:

```
{
    "capacityProvider": {
        "capacityProviderArn": "arn:aws:ecs:us-west-2:123456789012:capacity-
provider/ExampleCapacityProvider",
        "name": "ExampleCapacityProvider",
        "status": "ACTIVE",
        "autoScalingGroupProvider": {
            "autoScalingGroupArn": "arn:aws:autoscaling:us-
west-2:123456789012:autoScalingGroup:a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111:autoScalingGroupName/MyAutoScalingGroup",
            "managedScaling": {
                "status": "ENABLED",
                "targetCapacity": 100,
                "minimumScalingStepSize": 1,
                "maximumScalingStepSize": 10000
            },

        },
        "updateStatus": "DELETE_IN_PROGRESS",
        "tags": []
    }
}
```

For more information, see Cluster capacity providers in the *Amazon ECS Developer Guide*.

- For API details, see DeleteCapacityProvider in *AWS CLI Command Reference*.

`delete-cluster`

The following code example shows how to use `delete-cluster`.

AWS CLI

To delete an empty cluster

The following `delete-cluster` example deletes the specified empty cluster.

```
aws ecs delete-cluster --cluster MyCluster
```

Output:

```
{
    "cluster": {
        "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster",
        "status": "INACTIVE",
        "clusterName": "MyCluster",
        "registeredContainerInstancesCount": 0,
        "pendingTasksCount": 0,
        "runningTasksCount": 0,
        "activeServicesCount": 0
        "statistics": [],
        "tags": []
    }
}
```

For more information, see Deleting a Cluster in the *Amazon ECS Developer Guide*.

- For API details, see DeleteCluster in *AWS CLI Command Reference*.

`delete-service`

The following code example shows how to use `delete-service`.

AWS CLI

To delete a service

The following `ecs delete-service` example deletes the specified service from a cluster. You can include the `--force` parameter to delete a service even if it has not been scaled to zero tasks.

```
aws ecs delete-service --cluster MyCluster --service MyService1 --force
```

For more information, see Deleting a Service in the *Amazon ECS Developer Guide*.

- For API details, see DeleteService in *AWS CLI Command Reference*.

`delete-task-definitions`

The following code example shows how to use `delete-task-definitions`.

AWS CLI

To delete a task definition

The following `delete-task-definitions` example deletes an INACTIVE task definition.

```
aws ecs delete-task-definitions \
    --task-definition curltest:1
```

Output:

```
{
"taskDefinitions": [
    {
        "taskDefinitionArn": "arn:aws:ecs:us-east-1:123456789012:task-definition/

For more information, see Amazon ECS Task Definitions in the *Amazon ECS Developer Guide*.

- For API details, see DeleteTaskDefinitions in *AWS CLI Command Reference*.

`delete-task-set`

The following code example shows how to use `delete-task-set`.

AWS CLI

To delete a task set

The following `delete-task-set` example shows how to delete a task set. You can include the `--force` parameter to delete a task set even if it has not been scaled to zero.

```
aws ecs delete-task-set \
    --cluster MyCluster \
    --service MyService \
    --task-set arn:aws:ecs:us-west-2:123456789012:task-set/MyCluster/MyService/ecs-
svc/1234567890123456789 \
    --force
```

Output:

```
{
    "taskSet": {
        "id": "ecs-svc/1234567890123456789",
        "taskSetArn": "arn:aws:ecs:us-west-2:123456789012:task-set/MyCluster/

}
```

- For API details, see DeleteTaskSet in *AWS CLI Command Reference*.

`deregister-container-instance`

The following code example shows how to use `deregister-container-instance`.

AWS CLI

To deregister a container instance from a cluster

The following `deregister-container-instance` example deregisters a container instance from the specified cluster. If there are still tasks running in the container instance, you must either stop those tasks before deregistering, or use the `--force` option.

```
aws ecs deregister-container-instance \
    --cluster arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster \
    --container-instance arn:aws:ecs:us-west-2:123456789012:container-instance/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE \
    --force
```

Output:

```
{
    "containerInstance": {
        "remainingResources": [
            {
                "integerValue": 1024,
                "doubleValue": 0.0,
                "type": "INTEGER",
```

```
                "longValue": 0,
                "name": "CPU"
            },
            {
                "integerValue": 985,
                "doubleValue": 0.0,

For more information, see Deregister a Container Instance in the *ECS Developer Guide*.

- For API details, see DeregisterContainerInstance in *AWS CLI Command Reference*.

deregister-task-definition

The following code example shows how to use `deregister-task-definition`.

AWS CLI

To deregister a task definition

The following `deregister-task-definition` example deregisters the first revision of the `curler` task definition in your default region.

```
aws ecs deregister-task-definition --task-definition curler:1
```

Note that in the resulting output, the task definition status shows `INACTIVE`:

```
{
    "taskDefinition": {
        "status": "INACTIVE",
        "family": "curler",
        "volumes": [],
        "taskDefinitionArn": "arn:aws:ecs:us-west-2:123456789012:task-definition/
curler:1",
        "containerDefinitions": [
            {
                "environment": [],
                "name": "curler",
                "mountPoints": [],
                "image": "curl:latest",
                "cpu": 100,

                "entryPoint": [],
                "memory": 256,
                "command": [
                    "curl -v http://example.com/"
                ],
                "essential": true,
                "volumesFrom": []
            }
        ],
        "revision": 1
    }
}
```

For more information, see Amazon ECS Task Definitions in the *Amazon ECS Developer Guide*.

- For API details, see DeregisterTaskDefinition in *AWS CLI Command Reference*.

`describe-capacity-providers`

The following code example shows how to use `describe-capacity-providers`.

AWS CLI

Example 1: To describe all capacity providers

The following `describe-capacity-providers` example retrieves details about all capacity providers.

```
aws ecs describe-capacity-providers
```

Output:

```
{
    "capacityProviders": [
        {
            "capacityProviderArn": "arn:aws:ecs:us-west-2:123456789012:capacity-
provider/MyCapacityProvider",
            "name": "MyCapacityProvider",
            "status": "ACTIVE",
            "autoScalingGroupProvider": {
                "autoScalingGroupArn": "arn:aws:autoscaling:us-
west-2:123456789012:autoScalingGroup:a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111:autoScalingGroupName/MyAutoScalingGroup",
                "managedScaling": {
                    "status": "ENABLED",
                    "targetCapacity": 100,
                    "minimumScalingStepSize": 1,
                    "maximumScalingStepSize": 1000
                },
                "managedTerminationProtection": "ENABLED"
            },
            "tags": []
        },
        {
            "capacityProviderArn": "arn:aws:ecs:us-west-2:123456789012:capacity-
provider/FARGATE",
            "name": "FARGATE",
            "status": "ACTIVE",
            "tags": []
        },
        {
            "capacityProviderArn": "arn:aws:ecs:us-west-2:123456789012:capacity-
provider/FARGATE_SPOT",
            "name": "FARGATE_SPOT",
            "status": "ACTIVE",
            "tags": []
        }
    ]
}
```

For more information, see Cluster capacity providers in the *Amazon ECS Developer Guide*.

Example 2: To describe a specific capacity providers

The following `describe-capacity-providers` example retrieves details about a specific capacity provider. Using the `--include TAGS` parameter will add the tags associated with the capacity provider to the output.

```
aws ecs describe-capacity-providers \
    --capacity-providers MyCapacityProvider \
    --include TAGS
```

Output:

```
{
    "capacityProviders": [
        {
            "capacityProviderArn": "arn:aws:ecs:us-west-2:123456789012:capacity-
provider/MyCapacityProvider",
            "name": "MyCapacityProvider",
            "status": "ACTIVE",
            "autoScalingGroupProvider": {
                "autoScalingGroupArn": "arn:aws:autoscaling:us-
west-2:123456789012:autoScalingGroup:a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111:autoScalingGroupName/MyAutoScalingGroup",
                "managedScaling": {
                    "status": "ENABLED",
                    "targetCapacity": 100,
                    "minimumScalingStepSize": 1,
                    "maximumScalingStepSize": 1000
                },
                "managedTerminationProtection": "ENABLED"
            },
            "tags": [
                {
                    "key": "environment",
                    "value": "production"
                }
            ]
        }
    ]
}
```

For more information, see Cluster capacity providers in the *Amazon ECS Developer Guide*.

- For API details, see DescribeCapacityProviders in *AWS CLI Command Reference*.

`describe-clusters`

The following code example shows how to use `describe-clusters`.

AWS CLI

Example 1: To describe a cluster

The following `describe-clusters` example retrieves details about the specified cluster.

```
aws ecs describe-clusters \
    --cluster default
```

Output:

```
{
    "clusters": [
        {
            "status": "ACTIVE",
            "clusterName": "default",
            "registeredContainerInstancesCount": 0,
            "pendingTasksCount": 0,
            "runningTasksCount": 0,
            "activeServicesCount": 1,
            "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/default"
        }
    ],
    "failures": []
}
```

For more information, see Amazon ECS Clusters in the *Amazon ECS Developer Guide*.

Example 2: To describe a cluster with the attachment option

The following `describe-clusters` example specifies the ATTACHMENTS option. It retrieves details about the specified cluster and a list of resources attached to the cluster in the form of attachments. When using a capacity provider with a cluster, the resources, either AutoScaling plans or scaling policies, will be represented as asp or as_policy ATTACHMENTS.

```
aws ecs describe-clusters \
    --include ATTACHMENTS \
    --clusters sampleCluster
```

Output:

```
{
    "clusters": [
        {
            "clusterArn": "arn:aws:ecs:af-south-1:123456789222:cluster/
sampleCluster",
            "clusterName": "sampleCluster",
            "status": "ACTIVE",
            "registeredContainerInstancesCount": 0,
            "runningTasksCount": 0,
            "pendingTasksCount": 0,
            "activeServicesCount": 0,
            "statistics": [],
            "tags": [],
            "settings": [],
            "capacityProviders": [
                "sampleCapacityProvider"
            ],
            "defaultCapacityProviderStrategy": [],
            "attachments": [
                {
                    "id": "a1b2c3d4-5678-901b-cdef-EXAMPLE22222",
                    "type": "as_policy",
                    "status": "CREATED",
                    "details": [
                        {
                            "name": "capacityProviderName",
                            "value": "sampleCapacityProvider"
                        },
                        {
                            "name": "scalingPolicyName",
                            "value": "ECSManagedAutoScalingPolicy-3048e262-
fe39-4eaf-826d-6f975d303188"
                        }
                    ]
                }
            ],
            "attachmentsStatus": "UPDATE_COMPLETE"
```

```
        }
    ],
    "failures": []
}
```

For more information, see Amazon ECS Clusters in the *Amazon ECS Developer Guide*.

- For API details, see DescribeClusters in *AWS CLI Command Reference*.

`describe-container-instances`

The following code example shows how to use `describe-container-instances`.

AWS CLI

To describe container instance

The following `describe-container-instances` example retrieves details for a container instance in the `update` cluster, using the container instance UUID as an identifier.

```
aws ecs describe-container-instances \
    --cluster update \
    --container-instances a1b2c3d4-5678-90ab-cdef-11111EXAMPLE
```

Output:

```
{
    "failures": [],
    "containerInstances": [
        {
            "status": "ACTIVE",
            "registeredResources": [

`describe-service-deployments`

The following code example shows how to use `describe-service-deployments`.

AWS CLI

To describe service deployment details

The following `describe-service-deployments` example returns the service deployment details for the service deployment with the ARN `arn:aws:ecs:us-east-1:123456789012:service-deployment/example-cluster/example-service/ejGvqq2ilnbKT9qj0vLJe`.

```
aws ecs describe-service-deployments \
    --service-deployment-arn arn:aws:ecs:us-east-1:123456789012:service-deployment/
example-cluster/example-service/ejGvqq2ilnbKT9qj0vLJe
```

Output:

```
{
    "serviceDeployments": [
```

```
        {
            "serviceDeploymentArn": "arn:aws:ecs:us-east-1:123456789012:service-

`describe-service-revisions`

The following code example shows how to use `describe-service-revisions`.

AWS CLI

To describe service revision details

The following `describe-service-revisions` example returns the service revision details for the service revision with the ARN `arn:aws:ecs:us-east-1:123456789012:service-revision/example-cluster/example-service/1485800978477494678`.

```
aws ecs describe-service-revisions \
    --service-revision-arns arn:aws:ecs:us-east-1:123456789012:service-revision/
example-cluster/example-service/1485800978477494678
```

Output:

```
{
    "serviceRevisions": [
        {
            "serviceRevisionArn": "arn:aws:ecs:us-east-1:123456789012:service-
revision/example-cluster/example-service/1485800978477494678",
            "serviceArn": "arn:aws:ecs:us-east-1:123456789012:service/example-
cluster/example-service",

`describe-services`

The following code example shows how to use `describe-services`.

AWS CLI

To describe a service

The following `describe-services` example retrieves details for the `my-http-service` service in the default cluster.

```
aws ecs describe-services --services my-http-service
```

Output:

```
{
    "services": [
        {
            "status": "ACTIVE",
            "taskDefinition": "arn:aws:ecs:us-west-2:123456789012:task-definition/
amazon-ecs-sample:1",

`describe-task-sets`

The following code example shows how to use `describe-task-sets`.

AWS CLI

To describe a task set

The following `describe-task-sets` example describes a task set in a service that uses an external deployer.

```
aws ecs describe-task-sets \
    --cluster MyCluster \
    --service MyService \
    --task-sets arn:aws:ecs:us-west-2:123456789012:task-set/MyCluster/MyService/ecs-
svc/1234567890123456789
```

Output:

```
{
    "taskSets": [
        {
            "id": "ecs-svc/1234567890123456789",
            "taskSetArn": "arn:aws:ecs:us-west-2:123456789012:task-set/MyCluster/
MyService/ecs-svc/1234567890123456789",
            "status": "ACTIVE",
            "taskDefinition": "arn:aws:ecs:us-west-2:123456789012:task-definition/
sample-fargate:2",
            "computedDesiredCount": 0,
            "pendingCount": 0,

        }
    ],
    "failures": []
}
```

- For API details, see DescribeTaskSets in *AWS CLI Command Reference*.

`describe-tasks`

The following code example shows how to use `describe-tasks`.

AWS CLI

Example 1: To describe a single task tasks

The following `describe-tasks` example retrieves the details of a task in a cluster. You can specify the task by using either the ID or full ARN of the task. This example uses the full ARN of the task.

```
aws ecs describe-tasks \
    --cluster MyCluster \
    --tasks arn:aws:ecs:us-east-1:123456789012:task/
MyCluster/4d590253bb114126b7afa7b58EXAMPLE
```

Output:

```
{
    "tasks": [
        {
            "attachments": [],
            "attributes": [
                {
                    "name": "ecs.cpu-architecture",
                    "value": "x86_64"
                }
            ],
            "availabilityZone": "us-east-1b",
            "clusterArn": "arn:aws:ecs:us-east-1:123456789012:cluster/MyCluster",
            "connectivity": "CONNECTED",

    "failures": []
}
```

For more information, see Amazon ECS Task Definitions in the *Amazon ECS Developer Guide*.

- For API details, see DescribeTasks in *AWS CLI Command Reference*.

`execute-command`

The following code example shows how to use `execute-command`.

AWS CLI

To run an interactive /bin/sh command

The following `execute-command` example runs an interactive /bin/sh command against a container named MyContainer for a task with an id of `arn:aws:ecs:us-east-1:123456789012:task/MyCluster/d789e94343414c25b9f6bd59eEXAMPLE`.

```
aws ecs execute-command \
    --cluster MyCluster \
    --task arn:aws:ecs:us-east-1:123456789012:task/MyCluster/
d789e94343414c25b9f6bd59eEXAMPLE \
    --container MyContainer \
    --interactive \
```

```
    --command "/bin/sh"
```

This command produces no output.

For more information, see Using Amazon ECS Exec for debugging in the *Amazon ECS Developer Guide*.

- For API details, see ExecuteCommand in *AWS CLI Command Reference*.

get-task-protection

The following code example shows how to use `get-task-protection`.

AWS CLI

Retrieve the protection status of task in ECS service

The following `get-task-protection` provides the protection status of ECS tasks that belong to Amazon ECS service.

```
aws ecs get-task-protection \
    --cluster ECS-project-update-cluster \
    --tasks c43ed3b1331041f289316f958adb6a24
```

Output:

```
{
    "protectedTasks": [
        {
            "taskArn": "arn:aws:ecs:us-west-2:123456789012:task/
c43ed3b1331041f289316f958adb6a24",
            "protectionEnabled": false
        }
    ],
    "failures": []
}
```

For more formation on task protection, see Protect your Amazon ECS tasks from being terminated by scale-in events in the *Amazon ECS Developer Guide*.

- For API details, see GetTaskProtection in *AWS CLI Command Reference*.

`list-account-settings`

The following code example shows how to use `list-account-settings`.

AWS CLI

Example 1: To view the account settings for an account

The following `list-account-settings` example displays the effective account settings for an account.

```
aws ecs list-account-settings --effective-settings
```

Output:

```
{
    "settings": [
        {
            "name": "containerInstanceLongArnFormat",
            "value": "enabled",
            "principalArn": "arn:aws:iam::123456789012:root"
        },
        {
            "name": "serviceLongArnFormat",
            "value": "enabled",
            "principalArn": "arn:aws:iam::123456789012:root"
        },
        {
            "name": "taskLongArnFormat",
            "value": "enabled",
            "principalArn": "arn:aws:iam::123456789012:root"
        }
    ]
}
```

Example 2: To view the account settings for a specific IAM user or IAM role

The following `list-account-settings` example displays the account settings for the specified IAM user or IAM role.

```
aws ecs list-account-settings --principal-arn arn:aws:iam::123456789012:user/MyUser
```

Output:

```
{
    "settings": [
        {
            "name": "serviceLongArnFormat",
            "value": "enabled",
            "principalArn": "arn:aws:iam::123456789012:user/MyUser"
        }
    ]
}
```

For more information, see Amazon Resource Names (ARNs) and IDs in the *Amazon ECS Developer Guide*.

- For API details, see ListAccountSettings in *AWS CLI Command Reference*.

`list-attributes`

The following code example shows how to use `list-attributes`.

AWS CLI

To list the container instances that contain a specific attribute

The following example lists the attributes for container instances that have the `stack=production` attribute in the default cluster.

```
aws ecs list-attributes \
    --target-type container-instance \
    --attribute-name stack \
    --attribute-value production \
    --cluster default
```

Output:

```
{
    "attributes": [
        {
            "name": "stack",
            "targetId": "arn:aws:ecs:us-west-2:130757420319:container-
instance/1c3be8ed-df30-47b4-8f1e-6e68ebd01f34",
```

```
                "value": "production"
            }
        ]
    }
```

For more information, see [Amazon ECS Container Agent Configuration](#) in the *Amazon ECS Developer Guide*.

- For API details, see [ListAttributes](#) in *AWS CLI Command Reference*.

`list-clusters`

The following code example shows how to use `list-clusters`.

AWS CLI

To list your available clusters

The following `list-clusters` example lists all of the available clusters.

```
aws ecs list-clusters
```

Output:

```
{
    "clusterArns": [
        "arn:aws:ecs:us-west-2:123456789012:cluster/MyECSCluster1",
        "arn:aws:ecs:us-west-2:123456789012:cluster/AnotherECSCluster"
    ]
}
```

For more information, see [Amazon ECS Clusters](#) in the *Amazon ECS Developer Guide*.

- For API details, see [ListClusters](#) in *AWS CLI Command Reference*.

`list-container-instances`

The following code example shows how to use `list-container-instances`.

AWS CLI

To list the container instances in a cluster

The following `list-container-instances` example lists all of the available container instances in a cluster.

```
aws ecs list-container-instances --cluster MyCluster
```

Output:

```
{
    "containerInstanceArns": [
        "arn:aws:ecs:us-west-2:123456789012:container-instance/MyCluster/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
        "arn:aws:ecs:us-west-2:123456789012:container-instance/MyCluster/
a1b2c3d4-5678-90ab-cdef-22222EXAMPLE"
    ]
}
```

For more information, see Amazon ECS Container Instances in the *Amazon ECS Developer Guide*.

- For API details, see ListContainerInstances in *AWS CLI Command Reference*.

`list-service-deployments`

The following code example shows how to use `list-service-deployments`.

AWS CLI

To list service deployments

The following `list-service-deployments` example retrieves the service deployments for the service named `example-service`.

```
aws ecs list-service-deployments \
    --service arn:aws:ecs:us-east-1:123456789012:service/example-cluster/example-
service
```

Output:

```
{
    "serviceDeployments": [
        {
            "serviceDeploymentArn": "arn:aws:ecs:us-east-1:123456789012:service-
deployment/example-cluster/example-service/ejGvqq2ilnbKT9qj0vLJe",
```

```
            "serviceArn": "arn:aws:ecs:us-east-1:123456789012:service/example-
cluster/example-service",
            "clusterArn": "arn:aws:ecs:us-east-1:123456789012:cluster/example-
cluster",
            "startedAt": "2024-10-31T08:03:32.510000-04:00",
            "createdAt": "2024-10-31T08:03:30.917000-04:00",
            "finishedAt": "2024-10-31T08:05:04.527000-04:00",
            "targetServiceRevisionArn": "arn:aws:ecs:us-east-1:123456789012:service-
revision/example-cluster/example-service/1485800978477494678",
            "status": "SUCCESSFUL"
        }
    ]
}
```

For more information, see View service history using Amazon ECS service deployments in the *Amazon ECS Developer Guide*.

- For API details, see ListServiceDeployments in *AWS CLI Command Reference*.

`list-services-by-namespace`

The following code example shows how to use `list-services-by-namespace`.

AWS CLI

To list the services in a namespace

The following `list-services-by-namespace` example lists all of the services configured for the specified namespace in your default Region.

```
aws ecs list-services-by-namespace \
    --namespace service-connect
```

Output:

```
{
    "serviceArns": [
        "arn:aws:ecs:us-west-2:123456789012:service/MyCluster/MyService",
        "arn:aws:ecs:us-west-2:123456789012:service/tutorial/service-connect-nginx-
service"
    ]
}
```

For more information, see Service Connect in the *Amazon ECS Developer Guide*.

- For API details, see ListServicesByNamespace in *AWS CLI Command Reference*.

`list-services`

The following code example shows how to use `list-services`.

AWS CLI

To list the services in a cluster

The following `list-services` example shows how to list the services running in a cluster.

```
aws ecs list-services --cluster MyCluster
```

Output:

```
 {
     "serviceArns": [
         "arn:aws:ecs:us-west-2:123456789012:service/MyCluster/MyService"
     ]
}
```

For more information, see Services in the *Amazon ECS Developer Guide*.

- For API details, see ListServices in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags for a resource

The following `list-tags-for-resource` example lists the tags for a specific cluster.

```
aws ecs list-tags-for-resource \
    --resource-arn arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster
```

Output:

```
{
    "tags": [
        {
            "key": "key1",
            "value": "value1"
        },
        {
            "key": "key2",
            "value": "value2"
        },
        {
            "key": "key3",
            "value": "value3"
        }
    ]
}
```

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`list-task-definition-families`

The following code example shows how to use `list-task-definition-families`.

AWS CLI

Example 1: To list the registered task definition families

The following `list-task-definition-families` example lists all of the registered task definition families.

```
aws ecs list-task-definition-families
```

Output:

```
{
    "families": [
        "node-js-app",
        "web-timer",
        "hpcc",
        "hpcc-c4-8xlarge"
    ]
```

```
}
```

Example 2: To filter the registered task definition families

The following `list-task-definition-families` example lists the task definition revisions that start with "hpcc".

```
aws ecs list-task-definition-families --family-prefix hpcc
```

Output:

```
{
    "families": [
        "hpcc",
        "hpcc-c4-8xlarge"
    ]
}
```

For more information, see Task Definition Parameters in the *Amazon ECS Developer Guide*.

- For API details, see ListTaskDefinitionFamilies in *AWS CLI Command Reference*.

`list-task-definitions`

The following code example shows how to use `list-task-definitions`.

AWS CLI

Example 1: To list the registered task definitions

The following `list-task-definitions` example lists all of the registered task definitions.

```
aws ecs list-task-definitions
```

Output:

```
{
    "taskDefinitionArns": [
        "arn:aws:ecs:us-west-2:123456789012:task-definition/sleep300:2",
        "arn:aws:ecs:us-west-2:123456789012:task-definition/sleep360:1",
        "arn:aws:ecs:us-west-2:123456789012:task-definition/wordpress:3",
```

```
        "arn:aws:ecs:us-west-2:123456789012:task-definition/wordpress:4",
        "arn:aws:ecs:us-west-2:123456789012:task-definition/wordpress:5",
        "arn:aws:ecs:us-west-2:123456789012:task-definition/wordpress:6"
    ]
}
```

Example 2: To list the registered task definitions in a family

The following list-task-definitions example lists the task definition revisions of a specified family.

```
aws ecs list-task-definitions --family-prefix wordpress
```

Output:

```
{
    "taskDefinitionArns": [
        "arn:aws:ecs:us-west-2:123456789012:task-definition/wordpress:3",
        "arn:aws:ecs:us-west-2:123456789012:task-definition/wordpress:4",
        "arn:aws:ecs:us-west-2:123456789012:task-definition/wordpress:5",
        "arn:aws:ecs:us-west-2:123456789012:task-definition/wordpress:6"
    ]
}
```

For more information, see Amazon ECS Task Definitions in the *Amazon ECS Developer Guide*.

- For API details, see ListTaskDefinitions in *AWS CLI Command Reference*.

`list-tasks`

The following code example shows how to use `list-tasks`.

AWS CLI

Example 1: To list the tasks in a cluster

The following `list-tasks` example lists all of the tasks in a cluster.

```
aws ecs list-tasks --cluster default
```

Output:

```
{
    "taskArns": [
        "arn:aws:ecs:us-west-2:123456789012:task/a1b2c3d4-5678-90ab-
cdef-11111EXAMPLE",
        "arn:aws:ecs:us-west-2:123456789012:task/a1b2c3d4-5678-90ab-
cdef-22222EXAMPLE"
    ]
}
```

Example 2: To list the tasks on a particular container instance

The following `list-tasks` example lists the tasks on a container instance, using the container instance UUID as a filter.

```
aws ecs list-tasks --cluster default --container-instance a1b2c3d4-5678-90ab-
cdef-33333EXAMPLE
```

Output:

```
{
    "taskArns": [
        "arn:aws:ecs:us-west-2:123456789012:task/a1b2c3d4-5678-90ab-
cdef-44444EXAMPLE"
    ]
}
```

For more information, see Amazon ECS Task Definitions in the *Amazon ECS Developer Guide*.

- For API details, see ListTasks in *AWS CLI Command Reference*.

`put-account-setting-default`

The following code example shows how to use `put-account-setting-default`.

AWS CLI

To modify the default account settings

The following `put-account-setting-default` example modifies the default account setting for all IAM users or roles on your account. These changes apply to the entire AWS account unless an IAM user or role explicitly overrides these settings for themselves.

```
aws ecs put-account-setting-default --name serviceLongArnFormat --value enabled
```

Output:

```
{
    "setting": {
        "name": "serviceLongArnFormat",
        "value": "enabled",
        "principalArn": "arn:aws:iam::123456789012:root"
    }
}
```

For more information, see Amazon Resource Names (ARNs) and IDs in the *Amazon ECS Developer Guide*.

- For API details, see PutAccountSettingDefault in *AWS CLI Command Reference*.

`put-account-setting`

The following code example shows how to use `put-account-setting`.

AWS CLI

To modify the account setting for your IAM user account

The following `put-account-setting` example sets the `containerInsights` account setting to `enhanced` for your IAM user account. This turns on Container Insights with enhanced observability.

```
aws ecs put-account-setting \
    --name containerInsights \
    --value enhanced
```

Output:

```
{
    "setting": {
        "name": "containerInsights",
        "value": "enhanced",
        "principalArn": "arn:aws:iam::123456789012:user/johndoe",
        "type": "user"
```

```
    }
}
```

For more information, see Modifying Account Settings in the *Amazon ECS Developer Guide*.

- For API details, see PutAccountSetting in *AWS CLI Command Reference*.

put-account-settings

The following code example shows how to use `put-account-settings`.

AWS CLI

To modify the account settings for an IAM user or IAM role

The following `put-account-setting` example modifies the account settings for the specified IAM user or IAM role.

```
aws ecs put-account-setting \
    --name serviceLongArnFormat \
    --value enabled \
    --principal-arn arn:aws:iam::123456789012:user/MyUser
```

Output:

```
{
    "setting": {
        "name": "serviceLongArnFormat",
        "value": "enabled",
        "principalArn": "arn:aws:iam::123456789012:user/MyUser"
    }
}
```

- For API details, see PutAccountSettings in *AWS CLI Command Reference*.

put-attributes

The following code example shows how to use `put-attributes`.

AWS CLI

To create an attribute and associate it with an Amazon ECS resource

The following `put-attributes` applies an attribute with the name stack and the value production to a container instance.

```
aws ecs put-attributes \
    --attributes name=stack,value=production,targetId=arn:aws:ecs:us-west-2:130757420319:container-instance/1c3be8ed-df30-47b4-8f1e-6e68ebd01f34
```

Output:

```
{
    "attributes": [
        {
            "name": "stack",
            "targetId": "arn:aws:ecs:us-west-2:130757420319:container-instance/1c3be8ed-df30-47b4-8f1e-6e68ebd01f34",
            "value": "production"
        }
    ]
}
```

- For API details, see PutAttributes in *AWS CLI Command Reference*.

`put-cluster-capacity-providers`

The following code example shows how to use `put-cluster-capacity-providers`.

AWS CLI

Example 1: To add an existing capacity provider to a cluster

The following `put-cluster-capacity-providers` example adds an existing capacity provider to a cluster. The `create-capacity-provider` command is used to create a capacity provider. The `describe-clusters` command is used to describe the current capacity providers and the default capacity provider strategy associated with a cluster. When adding a new capacity provider to a cluster, you must specify all existing capacity providers in addition to the new capacity provider you want to associate with the cluster. You must also specify the default capacity provider strategy to associate with the cluster. In this example, the `MyCluster` cluster has the `MyCapacityProvider1` capacity provider associated with it and you want to add the `MyCapacityProvider2` capacity provider and include it in the default capacity provider strategy so tasks are spread evenly across both capacity providers.

```
aws ecs put-cluster-capacity-providers \
    --cluster MyCluster \
    --capacity-providers MyCapacityProvider1 MyCapacityProvider2 \
    --default-capacity-provider-
strategy capacityProvider=MyCapacityProvider1,weight=1 capacityProvider=MyCapacityProvider2,
```

Output:

```
{
    "cluster": {
        "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster",
        "clusterName": "MyCluster",
        "status": "ACTIVE",
        "registeredContainerInstancesCount": 0,
        "runningTasksCount": 0,
        "pendingTasksCount": 0,
        "activeServicesCount": 0,
        "statistics": [],
        "tags": [],
        "settings": [
            {
                "name": "containerInsights",
                "value": "enabled"
            }
        ],
        "capacityProviders": [
            "MyCapacityProvider1",
            "MyCapacityProvider2"
        ],
        "defaultCapacityProviderStrategy": [
            {
                "capacityProvider": "MyCapacityProvider1",
                "weight": 1,
                "base": 0
            },
            {
                "capacityProvider": "MyCapacityProvider2",
                "weight": 1,
                "base": 0
            }
        ],
        "attachments": [
           {
```

```
                "id": "0fb0c8f4-6edd-4de1-9b09-17e470ee1918",
                "type": "as_policy",
                "status": "ACTIVE",
                "details": [
                    {
                        "name": "capacityProviderName",
                        "value": "MyCapacityProvider1"
                    },
                    {
                        "name": "scalingPolicyName",
                        "value": "ECSManagedAutoScalingPolicy-a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111"
                    }
                ]
            },
            {
                "id": "ae592060-2382-4663-9476-b015c685593c",
                "type": "as_policy",
                "status": "ACTIVE",
                "details": [
                    {
                        "name": "capacityProviderName",
                        "value": "MyCapacityProvider2"
                    },
                    {
                        "name": "scalingPolicyName",
                        "value": "ECSManagedAutoScalingPolicy-a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222"
                    }
                ]
            }
        ],
        "attachmentsStatus": "UPDATE_IN_PROGRESS"
    }
}
```

For more information, see Cluster capacity providers in the *Amazon ECS Developer Guide*.

Example 2: To remove a capacity provider from a cluster

The following `put-cluster-capacity-providers` example removes a capacity provider from a cluster. The `describe-clusters` command is used to describe the current capacity providers associated with a cluster. When removing a capacity provider from a cluster, you must specify the capacity providers you want to remain associated with the cluster as well as the default capacity provider strategy to associate with the cluster. In this example, the cluster has the `MyCapacityProvider1` and `MyCapacityProvider2` capacity providers associated with it and you want to remove the `MyCapacityProvider2` capacity provider, so you specify only `MyCapacityProvider1` in the command along with the updated default capacity provider strategy.

```
aws ecs put-cluster-capacity-providers \
    --cluster MyCluster \
    --capacity-providers MyCapacityProvider1 \
    --default-capacity-provider-
strategy capacityProvider=MyCapacityProvider1,weight=1,base=0
```

Output:

```
{
    "cluster": {
        "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster",
        "clusterName": "MyCluster",
        "status": "ACTIVE",
        "registeredContainerInstancesCount": 0,
        "runningTasksCount": 0,
        "pendingTasksCount": 0,
        "activeServicesCount": 0,
        "statistics": [],
        "tags": [],
        "settings": [
            {
                "name": "containerInsights",
                "value": "enabled"
            }
        ],
        "capacityProviders": [
            "MyCapacityProvider1"
        ],
        "defaultCapacityProviderStrategy": [
            "capacityProvider": "MyCapacityProvider1",
            "weight": 1,
            "base": 0
        ],
        "attachments": [
           {
```

```
                "id": "0fb0c8f4-6edd-4de1-9b09-17e470ee1918",
                "type": "as_policy",
                "status": "ACTIVE",
                "details": [
                    {
                        "name": "capacityProviderName",
                        "value": "MyCapacityProvider1"
                    },
                    {
                        "name": "scalingPolicyName",
                        "value": "ECSManagedAutoScalingPolicy-a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111"
                    }
                ]
            },
            {
                "id": "ae592060-2382-4663-9476-b015c685593c",
                "type": "as_policy",
                "status": "DELETING",
                "details": [
                    {
                        "name": "capacityProviderName",
                        "value": "MyCapacityProvider2"
                    },
                    {
                        "name": "scalingPolicyName",
                        "value": "ECSManagedAutoScalingPolicy-a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222"
                    }
                ]
            }
        ],
        "attachmentsStatus": "UPDATE_IN_PROGRESS"
    }
}
```

For more information, see Cluster capacity providers in the *Amazon ECS Developer Guide*.

Example 3: To remove all capacity providers from a cluster

The following `put-cluster-capacity-providers` example removes all existing capacity providers from the cluster.

```
aws ecs put-cluster-capacity-providers \
    --cluster MyCluster \
    --capacity-providers [] \
    --default-capacity-provider-strategy []
```

Output:

```
{
    "cluster": {
        "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster",
        "clusterName": "MyCluster",
        "status": "ACTIVE",
        "registeredContainerInstancesCount": 0,
        "runningTasksCount": 0,
        "pendingTasksCount": 0,
        "activeServicesCount": 0,
        "statistics": [],
        "tags": [],
        "settings": [
            {
                "name": "containerInsights",
                "value": "enabled"
            }
        ],
        "capacityProviders": [],
        "defaultCapacityProviderStrategy": [],
        "attachments": [
           {
                "id": "0fb0c8f4-6edd-4de1-9b09-17e470ee1918",
                "type": "as_policy",
                "status": "DELETING",
                "details": [
                    {
                        "name": "capacityProviderName",
                        "value": "MyCapacityProvider1"
                    },
                    {
                        "name": "scalingPolicyName",
                        "value": "ECSManagedAutoScalingPolicy-a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111"
                    }
                ]
            },
```

```
            {
                "id": "ae592060-2382-4663-9476-b015c685593c",
                "type": "as_policy",
                "status": "DELETING",
                "details": [
                    {
                        "name": "capacityProviderName",
                        "value": "MyCapacityProvider2"
                    },
                    {
                        "name": "scalingPolicyName",
                        "value": "ECSManagedAutoScalingPolicy-a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222"
                    }
                ]
            }
        ],
        "attachmentsStatus": "UPDATE_IN_PROGRESS"
    }
}
```

For more information, see Cluster capacity providers in the *Amazon ECS Developer Guide*.

- For API details, see PutClusterCapacityProviders in *AWS CLI Command Reference*.

`register-task-definition`

The following code example shows how to use `register-task-definition`.

AWS CLI

Example 1: To register a task definition with a JSON file

The following `register-task-definition` example registers a task definition to the specified family. The container definitions are saved in JSON format at the specified file location.

```
aws ecs register-task-definition \
    --cli-input-json file://<path_to_json_file>/sleep360.json
```

Contents of `sleep360.json`:

```
{
```

```
    "containerDefinitions": [
        {
            "name": "sleep",
            "image": "busybox",
            "cpu": 10,
            "command": [
                "sleep",
                "360"
            ],
            "memory": 10,
            "essential": true
        }
    ],
    "family": "sleep360"
}
```

Output:

```
{
    "taskDefinition": {
        "status": "ACTIVE",
        "family": "sleep360",
        "placementConstraints": [],
        "compatibilities": [
                "EXTERNAL",
                "EC2"
        ],
        "volumes": [],
        "taskDefinitionArn": "arn:aws:ecs:us-east-1:123456789012:task-definition/
sleep360:1",
        "containerDefinitions": [
            {
                "environment": [],
                "name": "sleep",
                "mountPoints": [],
                "image": "busybox",
                "cpu": 10,
                "portMappings": [],
                "command": [
                    "sleep",
                    "360"
                ],
        "memory": 10,
```

```
            "essential": true,
            "volumesFrom": []
            }
        ],
            "revision": 1
        }
}
```

For more information, see [Example task definitions](#) in the *Amazon ECS Developer Guide*.

Example 2: To register a task definition with a JSON string parameter

The following `register-task-definition` example registers a task definition using container definitions provided as a JSON string parameter with escaped double quotes.

```
aws ecs register-task-definition \
    --family sleep360 \
    --container-definitions "[{\"name\":\"sleep\",\"image\":\"busybox\",\"cpu\":10,
\"command\":[\"sleep\",\"360\"],\"memory\":10,\"essential\":true}]"
```

The output is identical to the previous example.

For more information, see [Creating a Task Definition](#) in the *Amazon ECS Developer Guide*.

- For API details, see [RegisterTaskDefinition](#) in *AWS CLI Command Reference*.

`run-task`

The following code example shows how to use `run-task`.

AWS CLI

Example 1: To run a task on your default cluster

The following `run-task` example runs a task on the default cluster and uses a client token.

```
aws ecs run-task \
    --cluster default \
    --task-definition sleep360:1 \
    --client-token 550e8400-e29b-41d4-a716-446655440000
```

Output:

```
{
    "tasks": [
        {
            "attachments": [],
            "attributes": [
                {
                    "name": "ecs.cpu-architecture",

    ],
    "failures": []
}
```

For more information, see Running an application as a standalone task in the *Amazon ECS Developer Guide*.

Example 2: To configure an Amazon EBS volume for a standalone task

The following `run-task` example configures an encrypted Amazon EBS volume for a Fargate task on the default cluster. You must have an Amazon ECS infrastructure role configured with the `AmazonECSInfrastructureRolePolicyForVolumes` managed policy attached. You must specify a task definition with the same volume name as in the `run-task` request. This example uses the `--cli-input-json` option and a JSON input file called `ebs.json`.

```
aws ecs run-task \
    --cli-input-json file://ebs.json
```

Contents of `ebs.json`:

```
{
   "cluster": "default",
   "taskDefinition": "mytaskdef",
   "launchType": "FARGATE",
   "networkConfiguration":{
        "awsvpcConfiguration":{
            "assignPublicIp": "ENABLED",
            "securityGroups": ["sg-12344321"],
            "subnets":["subnet-12344321"]
        }
    },
   "volumeConfigurations": [
        {
```

```
            "name": "myEBSVolume",
            "managedEBSVolume": {
                "volumeType": "gp3",
                "sizeInGiB": 100,
                "roleArn":"arn:aws:iam::1111222333:role/ecsInfrastructureRole",
                "encrypted": true,
                "kmsKeyId":
 "arn:aws:kms:region:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab"
            }
        }
    ]
}
```

Output:

```
{
    "tasks": [
        {
            "attachments": [
                {
                    "id": "ce868693-15ca-4083-91ac-f782f64000c9",
                    "type": "ElasticNetworkInterface",

For more information, see Use Amazon EBS volumes with Amazon ECS in the *Amazon ECS Developer Guide*.

- For API details, see RunTask in *AWS CLI Command Reference*.

`start-task`

The following code example shows how to use `start-task`.

AWS CLI

Example 1: To start a new task

The following `start-task` example starts a task using the latest revision of the `sleep360` task definition on the specified container instance in the default cluster.

```
aws ecs start-task \
    --task-definition sleep360 \
    --container-instances 765936fadbdd46b5991a4bd70c2a43d4
```

Output:

```
{
```

```
    "tasks": [
        {
            "taskArn": "arn:aws:ecs:us-west-2:123456789012:task/
default/666fdccc2e2d4b6894dd422f4eeee8f8",
            "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/default",
            "taskDefinitionArn": "arn:aws:ecs:us-west-2:123456789012:task-
definition/sleep360:3",
            "containerInstanceArn": "arn:aws:ecs:us-west-2:123456789012:container-
instance/default/765936fadbdd46b5991a4bd70c2a43d4",
            "overrides": {
                "containerOverrides": [
                    {
                        "name": "sleep"
                    }
                ]
            },
            "lastStatus": "PENDING",
            "desiredStatus": "RUNNING",
            "cpu": "128",
            "memory": "128",
            "containers": [
                {
                    "containerArn": "arn:aws:ecs:us-

}
```

For more information, see Schedule your containers on Amazon ECS in the *Amazon ECS Developer Guide*.

Example 2: To configure an Amazon EBS volume at task start

The following `start-task` example configures an encrypted Amazon EBS volume for a task on the specified container instance. You must have an Amazon ECS infrastructure role configured with the `AmazonECSInfrastructureRolePolicyForVolumes` managed policy attached. You must specify a task definition with the same volume name as in the `start-task` request. This example uses the `--cli-input-json` option and a JSON input file called `ebs.json` with the following content.

```
aws ecs start-task \
    --cli-input-json file://ebs.json \
    --container-instances 765936fadbdd46b5991a4bd70c2a43d4
```

Contents of `ebs.json`:

```
{
   "cluster": "default",
   "taskDefinition": "mytaskdef",
   "networkConfiguration":{
        "awsvpcConfiguration":{
            "assignPublicIp": "ENABLED",
            "securityGroups": ["sg-12344321"],
            "subnets":["subnet-12344321"]
        }
    },
   "volumeConfigurations": [
        {
            "name": "myEBSVolume",
            "managedEBSVolume": {
                "volumeType": "gp3",
                "sizeInGiB": 100,
                "roleArn":"arn:aws:iam::123456789012:role/ecsInfrastructureRole",
                "encrypted": true,
                "kmsKeyId":
 "arn:aws:kms:region:123456789012:key/1234abcd-12ab-34cd-56ef-1234567890ab"
            }
        }
    ]
}
```

Output:

```
{
    "tasks": [
        {
            "attachments": [
                {
                    "id": "aea29489-9dcd-49f1-8164-4d91566e1113",
                    "type": "ElasticNetworkInterface",

`stop-task`

The following code example shows how to use `stop-task`.

AWS CLI

To stop a task

The following `stop-task` stops the specified task from running in the default cluster.

```
aws ecs stop-task \
    --task 666fdccc2e2d4b6894dd422f4eeee8f8
```

Output:

```
{
    "task": {
        "taskArn": "arn:aws:ecs:us-west-2:130757420319:task/
default/666fdccc2e2d4b6894dd422f4eeee8f8",

        "launchType": "EC2",
        "attachments": [],
        "tags": []
    }
}
```

- For API details, see StopTask in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a resource

The following `tag-resource` example adds a single tag to the specified resource.

```
aws ecs tag-resource \
    --resource-arn arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster
    --tags key=key1,value=value1
```

This command produces no output.

To add multiple tags to a resource

The following `tag-resource` example adds multiple tags to the specified resource.

```
aws ecs tag-resource \
--resource-arn arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster \
--tags key=key1,value=value1 key=key2,value=value2 key=key3,value=value3
```

This command produces no output.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a resource

The following `untag-resource` example removes the listed tags from the specified resource.

```
aws ecs untag-resource \
    --resource-arn arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster \
    --tag-keys key1,key2
```

This command produces no output.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-cluster-settings`

The following code example shows how to use `update-cluster-settings`.

AWS CLI

To modify the settings for your cluster

The following `update-cluster-settings` example enables CloudWatch Container Insights with enhanced observability for the `MyCluster` cluster.

```
aws ecs update-cluster-settings \
    --cluster MyCluster \
    --settings name=containerInsights,value=enhanced
```

Output:

```
{
    "cluster": {
        "clusterArn": "arn:aws:ecs:us-esat-1:123456789012:cluster/MyCluster",
        "clusterName": "default",
        "status": "ACTIVE",
        "registeredContainerInstancesCount": 0,
        "runningTasksCount": 0,
        "pendingTasksCount": 0,
```

```
            "activeServicesCount": 0,
            "statistics": [],
            "tags": [],
            "settings": [
                {
                    "name": "containerInsights",
                    "value": "enhanced"
                }
            ]
        }
}
```

For more information, see [Modifying Account Settings](#) in the *Amazon ECS Developer Guide*.

- For API details, see [UpdateClusterSettings](#) in *AWS CLI Command Reference*.

`update-cluster`

The following code example shows how to use `update-cluster`.

AWS CLI

Example 1: Update ECS cluster enabling containerInsights

The following `update-cluster` updates the containerInsights value to `enabled` in an already created cluster. By default, it is disabled.

```
aws ecs update-cluster \
    --cluster ECS-project-update-cluster \
    --settings name=containerInsights,value=enabled
```

Output:

```
"cluster": {
    "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/ECS-project-update-
cluster",
    "clusterName": "ECS-project-update-cluster",

```

Example 2: Update ECS cluster to set a default Service Connect namespace

The following `update-cluster` updates ECS cluster by setting a default Service Connect namespace.

```
aws ecs update-cluster \
    --cluster ECS-project-update-cluster \
    --service-connect-defaults namespace=test
```

Output:

```
 {
     "cluster": {

}
```

For more information on Service Connect, see Use Service Connect to connect Amazon ECS services with short names in the *Amazon ECS Developer Guide*.

- For API details, see UpdateCluster in *AWS CLI Command Reference*.

`update-container-agent`

The following code example shows how to use `update-container-agent`.

AWS CLI

To update the container agent on an Amazon ECS container instance

The following `update-container-agent` example updates the container agent on the specified container instance in the default cluster.

```
aws ecs update-container-agent --cluster default --container-instance a1b2c3d4-5678-90ab-cdef-11111EXAMPLE
```

Output:

```
{
    "containerInstance": {
        "status": "ACTIVE",
...
        "agentUpdateStatus": "PENDING",
        "versionInfo": {
            "agentVersion": "1.0.0",
            "agentHash": "4023248",
            "dockerVersion": "DockerVersion: 1.5.0"
        }
    }
}
```

For more information, see Updating the Amazon ECS Container Agent in the *Amazon ECS Developer Guide*.

- For API details, see UpdateContainerAgent in *AWS CLI Command Reference*.

`update-container-instances-state`

The following code example shows how to use `update-container-instances-state`.

AWS CLI

To update the state of a container instance

The following `update-container-instances-state` updates the state of the specified container instance to `DRAINING` which will remove it from the cluster is it registered to.

```
aws ecs update-container-instances-state \
    --container-instances 765936fadbdd46b5991a4bd70c2a43d4 \
    --status DRAINING
```

Output:

```
{
    "containerInstances": [
        {
            "containerInstanceArn": "arn:aws:ecs:us-west-2:130757420319:container-

`update-service-primary-task-set`

The following code example shows how to use `update-service-primary-task-set`.

AWS CLI

To update the primary task set for a service

The following `update-service-primary-task-set` example updates the primary task set for the specified service.

```
aws ecs update-service-primary-task-set \
    --cluster MyCluster \
    --service MyService \
    --primary-task-set arn:aws:ecs:us-west-2:123456789012:task-set/MyCluster/
MyService/ecs-svc/1234567890123456789
```

Output:

```
{
    "taskSet": {
        "id": "ecs-svc/1234567890123456789",
        "taskSetArn": "arn:aws:ecs:us-west-2:123456789012:task-set/MyCluster/
MyService/ecs-svc/1234567890123456789",
        "status": "PRIMARY",
        "taskDefinition": "arn:aws:ecs:us-west-2:123456789012:task-definition/
sample-fargate:2",
        "computedDesiredCount": 1,

`update-service`

The following code example shows how to use `update-service`.

AWS CLI

Example 1: To change the task definition used in a service

The following `update-service` example updates the `my-http-service` service to use the `amazon-ecs-sample` task definition.

```
aws ecs update-service \
    --cluster test \
    --service my-http-service \
    --task-definition amazon-ecs-sample
```

Output:

```
{
    "service": {
        "serviceArn": "arn:aws:ecs:us-west-2:123456789012:service/test/my-http-
service",

For more information, see [Update an Amazon ECS service using the console](#) in the *Amazon ECS Developer Guide*.

Example 2: To change the number of tasks in a service

The following `update-service` example updates the desired task count of the service `my-http-service` from to 2.

```
aws ecs update-service \
    --cluster MyCluster \
    --service my-http-service \
    --desired-count 2
```

Output:

```
{
    "service": {
        "serviceArn": "arn:aws:ecs:us-east-1:123456789012:service/MyCluster/my-http-
service",

```

For more information, see Updating an Amazon ECS service using the console in the *Amazon ECS Developer Guide*.

Example 3: To configure Amazon EBS volumes for attachment at service update

The following `update-service` example updates the service `my-http-service` to use Amazon EBS volumes. You must have an Amazon ECS infrastructure role configured with the `AmazonECSInfrastructureRolePolicyForVolumes` managed policy attached. You must also specify a task definition with the same volume name as in the `update-service` request and with `configuredAtLaunch` set to `true`. This example uses the `--cli-input-json` option and a JSON input file called `ebs.json`.

```
aws ecs update-service \
    --cli-input-json file://ebs.json
```

Contents of `ebs.json`:

```
{
   "cluster": "mycluster",
   "taskDefinition": "mytaskdef",
   "service": "my-http-service",
   "desiredCount": 2,
   "volumeConfigurations": [
        {
            "name": "myEbsVolume",
            "managedEBSVolume": {
                "roleArn":"arn:aws:iam::123456789012:role/ecsInfrastructureRole",
                "volumeType": "gp3",
                "sizeInGiB": 100,
                "iops": 3000,
```

```
                "throughput": 125,
                "filesystemType": "ext4"
            }
        }
    ]
}
```

Output:

```
{
    "service": {
        "serviceArn": "arn:aws:ecs:us-west-2:123456789012:service/mycluster/my-http-
service",

For more information, see Use Amazon EBS volumes with Amazon ECS in the *Amazon ECS Developer Guide*.

Example 4: To update a service to no longer use Amazon EBS volumes

The following `update-service` example updates the service `my-http-service` to no longer use Amazon EBS volumes. You must specify a task definition revision with `configuredAtLaunch` set to `false`.

```
aws ecs update-service \
    --cluster mycluster \
    --task-definition mytaskdef \
```

```
    --service my-http-service \
    --desired-count 2 \
    --volume-configurations "[]"
```

Output:

```
{
    "service": {
        "serviceArn": "arn:aws:ecs:us-west-2:123456789012:service/mycluster/my-http-
service",

For more information, see Updating an Amazon ECS service using the console in the *Amazon ECS Developer Guide*.

- For API details, see UpdateService in *AWS CLI Command Reference*.

`update-task-protection`

The following code example shows how to use `update-task-protection`.

AWS CLI

Example 1: Enable task protection for ECS tasks

The following `update-task-protection` protects your ECS task from termination during scale-in from Deployments or Service AutoScaling. You can specify custom expiration period for task protection from 1 up to 2,880 minutes (48 hours). If you do not specify expiration period, enabling task protection default time is 2 hours.

```
aws ecs update-task-protection \
    --cluster ECS-project-update-cluster \
    --tasks c43ed3b1331041f289316f958adb6a24 \
    --protection-enabled \
    --expires-in-minutes 300
```

Output:

```
{
"protectedTasks": [
```

```
    {
        "taskArn": "arn:aws:ecs:us-west-2:123456789012:task/
c43ed3b1331041f289316f958adb6a24",
        "protectionEnabled": true,
        "expirationDate": "2024-09-14T19:53:36.687000-05:00"
    }
],
"failures": []
}
```

Example 2: Disable task protection for ECS tasks

The following `update-task-protection` disables the tasks protected from scale in from Deployments or Service AutoScaling.

```
aws ecs update-task-protection \
    --cluster ECS-project-update-cluster \
    --tasks c43ed3b1331041f289316f958adb6a24 \
    --no-protection-enabled
```

Output:

```
{
    "protectedTasks": [
        {
            "taskArn": "arn:aws:ecs:us-west-2:123456789012:task/
c43ed3b1331041f289316f958adb6a24",
            "protectionEnabled": false
        }
    ],
    "failures": []
}
```

For more formation on task protection, see Protect your Amazon ECS tasks from being terminated by scale-in events in the *Amazon ECS Developer Guide*.

- For API details, see UpdateTaskProtection in *AWS CLI Command Reference*.

`update-task-set`

The following code example shows how to use `update-task-set`.

AWS CLI

To update a task set

The following `update-task-set` example updates a task set to adjust the scale.

```
aws ecs update-task-set \
    --cluster MyCluster \
    --service MyService \
    --task-set arn:aws:ecs:us-west-2:123456789012:task-set/MyCluster/MyService/ecs-
svc/1234567890123456789 \
    --scale value=50,unit=PERCENT
```

Output:

```
{
    "taskSet": {
        "id": "ecs-svc/1234567890123456789",
        "taskSetArn": "arn:aws:ecs:us-west-2:123456789012:task-set/MyCluster/
MyService/ecs-svc/1234567890123456789",
        "status": "ACTIVE",

            "awsvpcConfiguration": {
                "subnets": [
                    "subnet-12344321"
                ],
                "securityGroups": [
                    "sg-12344321"
                ],
                "assignPublicIp": "DISABLED"
            }
        },
        "loadBalancers": [],
        "serviceRegistries": [],
        "scale": {
```

```
                "value": 50.0,
                "unit": "PERCENT"
            },
            "stabilityStatus": "STABILIZING",
            "stabilityStatusAt": 1557129279.914
        }
}
```

- For API details, see UpdateTaskSet in *AWS CLI Command Reference*.

Amazon EFS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EFS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-file-system`

The following code example shows how to use `create-file-system`.

AWS CLI

To create an encrypted file system

The following `create-file-system` example creates an encrypted file system using the default CMK. It also adds the tag `Name=my-file-system`.

```
aws efs create-file-system \
    --performance-mode generalPurpose \
```

```
    --throughput-mode bursting \
    --encrypted \
    --tags Key=Name,Value=my-file-system
```

Output:

```
{
    "OwnerId": "123456789012",
    "CreationToken": "console-d7f56c5f-e433-41ca-8307-9d9c0example",
    "FileSystemId": "fs-c7a0456e",
    "FileSystemArn": "arn:aws:elasticfilesystem:us-west-2:123456789012:file-system/
fs-48499b4d",
    "CreationTime": 1595286880.0,
    "LifeCycleState": "creating",
    "Name": "my-file-system",
    "NumberOfMountTargets": 0,
    "SizeInBytes": {
        "Value": 0,
        "ValueInIA": 0,
        "ValueInStandard": 0
    },
    "PerformanceMode": "generalPurpose",
    "Encrypted": true,
    "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/a59b3472-e62c-42e4-
adcf-30d92example",
    "ThroughputMode": "bursting",
    "Tags": [
        {
            "Key": "Name",
            "Value": "my-file-system"
        }
    ]
}
```

For more information, see Creating Amazon EFS file systems in the *Amazon Elastic File System User Guide*.

- For API details, see CreateFileSystem in *AWS CLI Command Reference*.

`create-mount-target`

The following code example shows how to use `create-mount-target`.

AWS CLI

To create a mount target

The following `create-mount-target` example creates a mount target for the specified file system.

```
aws efs create-mount-target \
    --file-system-id fs-c7a0456e \
    --subnet-id subnet-02bf4c428bexample \
    --security-groups sg-068f739363example
```

Output:

```
{
    "OwnerId": "123456789012",
    "MountTargetId": "fsmt-f9a14450",
    "FileSystemId": "fs-c7a0456e",
    "SubnetId": "subnet-02bf4c428bexample",
    "LifeCycleState": "creating",
    "IpAddress": "10.0.1.24",
    "NetworkInterfaceId": "eni-02d542216aexample",
    "AvailabilityZoneId": "use2-az2",
    "AvailabilityZoneName": "us-east-2b",
    "VpcId": "vpc-0123456789abcdef0"
}
```

For more information, see Creating mount targets in the *Amazon Elastic File System User Guide*.

- For API details, see CreateMountTarget in *AWS CLI Command Reference*.

`delete-file-system`

The following code example shows how to use `delete-file-system`.

AWS CLI

To delete a file system

The following `delete-file-system` example deletes the specified file system.

```
aws efs delete-file-system \
```

```
    --file-system-id fs-c7a0456e
```

This command produces no output.

For more information, see Deleting an Amazon EFS file system in the *Amazon Elastic File System User Guide*.

- For API details, see DeleteFileSystem in *AWS CLI Command Reference*.

`delete-mount-target`

The following code example shows how to use `delete-mount-target`.

AWS CLI

To delete a mount target

The following `delete-mount-target` example deletes the specified mount target.

```
aws efs delete-mount-target \
    --mount-target-id fsmt-f9a14450
```

This command produces no output.

For more information, see Creating mount targets in the *Amazon Elastic File System User Guide*.

- For API details, see DeleteMountTarget in *AWS CLI Command Reference*.

`describe-file-systems`

The following code example shows how to use `describe-file-systems`.

AWS CLI

To describe a file system

The following `describe-file-systems` example describes the specified file system.

```
aws efs describe-file-systems \
    --file-system-id fs-c7a0456e
```

Output:

```
{
    "FileSystems": [
        {
            "OwnerId": "123456789012",
            "CreationToken": "console-d7f56c5f-e433-41ca-8307-9d9c0example",
            "FileSystemId": "fs-c7a0456e",
            "FileSystemArn": "arn:aws:elasticfilesystem:us-west-2:123456789012:file-
system/fs-48499b4d",
            "CreationTime": 1595286880.0,
            "LifeCycleState": "available",
            "Name": "my-file-system",
            "NumberOfMountTargets": 3,
            "SizeInBytes": {
                "Value": 6144,
                "Timestamp": 1600991437.0,
                "ValueInIA": 0,
                "ValueInStandard": 6144
            },
            "PerformanceMode": "generalPurpose",
            "Encrypted": true,
            "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/a59b3472-e62c-42e4-
adcf-30d92example",
            "ThroughputMode": "bursting",
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "my-file-system"
                }
            ]
        }
    ]
}
```

For more information, see Managing Amazon EFS file systems in the *Amazon Elastic File System User Guide*.

- For API details, see DescribeFileSystems in *AWS CLI Command Reference*.

`describe-mount-targets`

The following code example shows how to use `describe-mount-targets`.

AWS CLI

To describe a mount target

The following `describe-mount-targets` example describes the specified mount target.

```
aws efs describe-mount-targets \
    --mount-target-id fsmt-f9a14450
```

Output:

```
{
    "MountTargets": [
        {
            "OwnerId": "123456789012",
            "MountTargetId": "fsmt-f9a14450",
            "FileSystemId": "fs-c7a0456e",
            "SubnetId": "subnet-02bf4c428bexample",
            "LifeCycleState": "creating",
            "IpAddress": "10.0.1.24",
            "NetworkInterfaceId": "eni-02d542216aexample",
            "AvailabilityZoneId": "use2-az2",
            "AvailabilityZoneName": "us-east-2b",
            "VpcId": "vpc-0123456789abcdef0"
        }
    ]
}
```

For more information, see Creating mount targets in the *Amazon Elastic File System User Guide*.

- For API details, see DescribeMountTargets in *AWS CLI Command Reference*.

`describe-tags`

The following code example shows how to use `describe-tags`.

AWS CLI

To describe the tags for a file system

The following `describe-tags` example describes the tags for the specified file system.

```
aws efs describe-tags \
```

```
    --file-system-id fs-c7a0456e
```

Output:

```
{
    "Tags": [
        {
            "Key": "Name",
            "Value": "my-file-system"
        },
        {
            "Key": "Department",
            "Value": "Business Intelligence"
        }
    ]
}
```

For more information, see Managing file system tags in the *Amazon Elastic File System User Guide*.

- For API details, see DescribeTags in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To retrieve the tags for a resource

The following `list-tags-for-resource` example retrieves the tags associated with the specified file system.

```
aws efs list-tags-for-resource \
    --resource-id fs-c7a0456e
```

Output:

```
{
    "Tags": [
        {
            "Key": "Name",
```

```
                "Value": "my-file-system"
            },
            {
                "Key": "Department",
                "Value": "Business Intelligence"
            }
        ]
}
```

For more information, see Managing file system tags in the *Amazon Elastic File System User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a resource

The following `tag-resource` example adds the tag `Department=Business Intelligence` to the specified file system.

```
aws efs tag-resource \
    --resource-id fs-c7a0456e \
    --tags Key=Department,Value="Business Intelligence"
```

This command produces no output.

For more information, see Managing file system tags in the *Amazon Elastic File System User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a resource

The following `untag-resource` example removes the tag with the `Department` tag key from the specified file system.

```
aws efs untag-resource \
    --resource-id fs-c7a0456e \
    --tag-keys Department
```

This command produces no output.

For more information, see Managing file system tags in the *Amazon Elastic File System User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

Amazon EKS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EKS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

`associate-access-policy`

The following code example shows how to use `associate-access-policy`.

AWS CLI

To associate an access policy and its scope to the access entry of the cluster

The following `associate-access-policy` associates an access policy and its scope to the access entry of the specified cluster.

```
aws eks associate-access-policy \
    --cluster-name eks-customer \
    --principal-arn arn:aws:iam::111122223333:role/Admin \
    --policy-arn arn:aws:eks::aws:cluster-access-policy/AmazonEKSEditPolicy \
    --access-scope type=namespace,namespaces=default
```

Output:

```
{
    "clusterName": "eks-customer",
    "principalArn": "arn:aws:iam::111122223333:role/Admin",
    "associatedAccessPolicy": {
        "policyArn": "arn:aws:eks::aws:cluster-access-policy/AmazonEKSEditPolicy",
        "accessScope": {
            "type": "namespace",
            "namespaces": [
                "default"
            ]
        },
        "associatedAt": "2025-05-24T15:59:51.981000-05:00",
        "modifiedAt": "2025-05-24T15:59:51.981000-05:00"
    }
}
```

For more information, see Associate access policies with access entries in the *Amazon EKS User Guide*.

- For API details, see AssociateAccessPolicy in *AWS CLI Command Reference*.

`associate-encryption-config`

The following code example shows how to use `associate-encryption-config`.

AWS CLI

To associates an encryption configuration to an existing cluster

The following `associate-encryption-config` example enable's encryption on an existing EKS clusters that do not already have encryption enabled.

```
aws eks associate-encryption-config \
    --cluster-name my-eks-cluster \
```

```
    --encryption-config '[{"resources":["secrets"],"provider":
{"keyArn":"arn:aws:kms:region-code:account:key/key"}}]'
```

Output:

```
{
    "update": {
        "id": "3141b835-8103-423a-8e68-12c2521ffa4d",

        "type": "AssociateEncryptionConfig",
        "params": [
            {
                "type": "EncryptionConfig",
                "value": "[{\"resources\":[\"secrets\"],\"provider\":{\"keyArn\":
\"arn:aws:kms:region-code:account:key/key\"}}]"
            }
        ],
        "createdAt": "2024-03-14T11:01:26.297000-04:00",
        "errors": []
    }
}
```

For more information, see Enabling secret encryption on an existing cluster in the *Amazon EKS User Guide*.

- For API details, see AssociateEncryptionConfig in *AWS CLI Command Reference*.

`associate-identity-provider-config`

The following code example shows how to use `associate-identity-provider-config`.

AWS CLI

Associate identity provider to your Amazon EKS Cluster

The following `associate-identity-provider-config` example associates an identity provider to your Amazon EKS Cluster.

```
aws eks associate-identity-provider-config \
    --cluster-name my-eks-cluster \
    --oidc 'identityProviderConfigName=my-identity-provider,issuerUrl=https://
oidc.eks.us-east-2.amazonaws.com/
```

```
id/38D6A4619A0A69E342B113ED7F1A7652,clientId=kubernetes,usernameClaim=email,usernamePrefix=m
username-prefix,groupsClaim=my-claim,groupsPrefix=my-groups-
prefix,requiredClaims={Claim1=value1,Claim2=value2}' \
    --tags env=dev
```

Output:

```
{
    "update": {
        "id": "8c6c1bef-61fe-42ac-a242-89412387b8e7",
        "status": "InProgress",
        "type": "AssociateIdentityProviderConfig",
        "params": [
            {
                "type": "IdentityProviderConfig",
                "value": "[{\"type\":\"oidc\",\"name\":\"my-identity-provider\"}]"
            }
        ],
        "createdAt": "2024-04-11T13:46:49.648000-04:00",
        "errors": []
    },
    "tags": {
        "env": "dev"
    }
}
```

For more information, see Authenticate users for your cluster from an OpenID Connect identity provider - Associate an OIDC identity provider in the *Amazon EKS User Guide*.

- For API details, see AssociateIdentityProviderConfig in *AWS CLI Command Reference*.

`create-access-entry`

The following code example shows how to use `create-access-entry`.

AWS CLI

Example 1: To create the access entry for EKS cluster

The following `create-access-entry` example creates an access entry that allows an IAM principal to access the EKS cluster.

```
aws eks create-access-entry \
```

```
    --cluster-name eks-customer \
    --principal-arn arn:aws:iam::111122223333:user/eks-user
```

Output:

```
{
    "accessEntry": {
        "clusterName": "eks-customer",
        "principalArn": "arn:aws:iam::111122223333:user/eks-user",
        "kubernetesGroups": [],
        "accessEntryArn": "arn:aws:eks:us-west-2:111122223333:access-entry/eks-
customer/user/111122223333/eks-user/a1b2c3d4-5678-90ab-cdef-a6506e3d36p0",
        "createdAt": "2025-04-14T22:45:48.097000-05:00",
        "modifiedAt": "2025-04-14T22:45:48.097000-05:00",
        "tags": {},
        "username": "arn:aws:iam::111122223333:user/eks-user",
        "type": "STANDARD"
    }
}
```

For more information, see Create access entries in the *Amazon EKS User Guide*.

Example 2: To create the access entry for EKS cluster by specifying the type of access entry

The following `create-access-entry` example creates an access entry of type `EC2_LINUX` in the EKS cluster. By default, a type `STANDARD` access entry is created. Apart from the default, if we specify any other access entry types, an IAM role ARN needs to be passed in the CLI.

```
aws eks create-access-entry \
    --cluster-name eks-customer \
    --principal-arn arn:aws:iam::111122223333:role/admin-test-ip \
    --type EC2_LINUX
```

Output:

```
{
    "accessEntry": {
        "clusterName": "eks-customer",
        "principalArn": "arn:aws:iam::111122223333:role/admin-test-ip",
        "kubernetesGroups": [
            "system:nodes"
        ],
```

```
        "accessEntryArn": "arn:aws:eks:us-west-2:111122223333:access-entry/eks-
customer/role/111122223333/admin-test-ip/accb5418-f493-f390-3e6e-c3f19f725fcp",
        "createdAt": "2025-05-06T19:42:45.453000-05:00",
        "modifiedAt": "2025-05-06T19:42:45.453000-05:00",
        "tags": {},
        "username": "system:node:{{EC2PrivateDNSName}}",
        "type": "EC2_LINUX"
    }
}
```

For more information, see Create access entries in the *Amazon EKS User Guide*.

- For API details, see CreateAccessEntry in *AWS CLI Command Reference*.

`create-addon`

The following code example shows how to use `create-addon`.

AWS CLI

Example 1: To create an Amazon EKS add-on with default compatible version for the respective EKS cluster version

The following `create-addon` example command creates an Amazon EKS add-on with default compatible version for the respective EKS cluster version.

```
aws eks create-addon \
    --cluster-name my-eks-cluster \
    --addon-name my-eks-addon \
    --service-account-role-arn arn:aws:iam::111122223333:role/role-name
```

Output:

```
{
    "addon": {
        "addonName": "my-eks-addon",
        "clusterName": "my-eks-cluster",
        "status": "CREATING",
        "addonVersion": "v1.15.1-eksbuild.1",
        "health": {
            "issues": []
        },
```

```
        "addonArn": "arn:aws:eks:us-east-2:111122223333:addon/my-eks-cluster/my-eks-addon/1ec71ee1-b9c2-8915-4e17-e8be0a55a149",
        "createdAt": "2024-03-14T12:20:03.264000-04:00",
        "modifiedAt": "2024-03-14T12:20:03.283000-04:00",
        "serviceAccountRoleArn": "arn:aws:iam::111122223333:role/role-name",
        "tags": {}
    }
}
```

For more information, see Managing Amazon EKS add-ons - Creating an add-on in the *Amazon EKS User Guide*.

Example 2: To create an Amazon EKS add-on with specific add-on version

The following `create-addon` example command creates an Amazon EKS add-on with specific add-on version.

```
aws eks create-addon \
    --cluster-name my-eks-cluster \
    --addon-name my-eks-addon \
    --service-account-role-arn arn:aws:iam::111122223333:role/role-name \
    --addon-version v1.16.4-eksbuild.2
```

Output:

```
{
    "addon": {
        "addonName": "my-eks-addon",
        "clusterName": "my-eks-cluster",
        "status": "CREATING",
        "addonVersion": "v1.16.4-eksbuild.2",
        "health": {
            "issues": []
        },
        "addonArn": "arn:aws:eks:us-east-2:111122223333:addon/my-eks-cluster/my-eks-addon/34c71ee6-7738-6c8b-c6bd-3921a176b5ff",
        "createdAt": "2024-03-14T12:30:24.507000-04:00",
        "modifiedAt": "2024-03-14T12:30:24.521000-04:00",
        "serviceAccountRoleArn": "arn:aws:iam::111122223333:role/role-name",
        "tags": {}
    }
}
```

For more information, see Managing Amazon EKS add-ons - Creating an add-on in the *Amazon EKS User Guide*.

Example 3: To create an Amazon EKS add-on with custom configuration values and resolve conflicts details

The following `create-addon` example command creates an Amazon EKS add-on with custom configuration values and resolves conflicts details.

```
aws eks create-addon \
    --cluster-name my-eks-cluster \
    --addon-name my-eks-addon \
    --service-account-role-arn arn:aws:iam::111122223333:role/role-name \
    --addon-version v1.16.4-eksbuild.2 \
    --configuration-values '{"resources":{"limits":{"cpu":"100m"}}}' \
    --resolve-conflicts OVERWRITE
```

Output:

```
{
    "addon": {
        "addonName": "my-eks-addon",
        "clusterName": "my-eks-cluster",
        "status": "CREATING",
        "addonVersion": "v1.16.4-eksbuild.2",
        "health": {
            "issues": []
        },
        "addonArn": "arn:aws:eks:us-east-2:111122223333:addon/my-eks-cluster/my-eks-
addon/a6c71ee9-0304-9237-1be8-25af1b0f1ffb",
        "createdAt": "2024-03-14T12:35:58.313000-04:00",
        "modifiedAt": "2024-03-14T12:35:58.327000-04:00",
        "serviceAccountRoleArn": "arn:aws:iam::111122223333:role/role-name",
        "tags": {},
        "configurationValues": "{\"resources\":{\"limits\":{\"cpu\":\"100m\"}}}"
    }
}
```

For more information, see Managing Amazon EKS add-ons - Creating an add-on in the *Amazon EKS User Guide*.

Example 4: To create an Amazon EKS add-on with custom JSON configuration values file

The following `create-addon` example command creates an Amazon EKS add-on with custom configuration values and resolve conflicts details.

```
aws eks create-addon \
    --cluster-name my-eks-cluster \
    --addon-name my-eks-addon \
    --service-account-role-arn arn:aws:iam::111122223333:role/role-name \
    --addon-version v1.16.4-eksbuild.2 \
    --configuration-values 'file://configuration-values.json' \
    --resolve-conflicts OVERWRITE \
    --tags '{"eks-addon-key-1": "value-1" , "eks-addon-key-2": "value-2"}'
```

Contents of `configuration-values.json`:

```
{
    "resources": {
        "limits": {
            "cpu": "150m"
        }
    },
    "env": {
        "AWS_VPC_K8S_CNI_LOGLEVEL": "ERROR"
    }
}
```

Output:

```
{
    "addon": {
        "addonName": "my-eks-addon",
        "clusterName": "my-eks-cluster",
        "status": "CREATING",
        "addonVersion": "v1.16.4-eksbuild.2",
        "health": {
            "issues": []
        },
        "addonArn": "arn:aws:eks:us-east-2:111122223333:addon/my-eks-cluster/my-eks-
addon/d8c71ef8-fbd8-07d0-fb32-6a7be19ececd",
        "createdAt": "2024-03-14T13:10:51.763000-04:00",
        "modifiedAt": "2024-03-14T13:10:51.777000-04:00",
        "serviceAccountRoleArn": "arn:aws:iam::111122223333:role/role-name",
        "tags": {
```

```
            "eks-addon-key-1": "value-1",
            "eks-addon-key-2": "value-2"
        },
        "configurationValues": "{\n    \"resources\": {\n        \"limits\":
 {\n            \"cpu\": \"150m\"\n        }\n    },\n    \"env\": {\n
 \"AWS_VPC_K8S_CNI_LOGLEVEL\": \"ERROR\"\n    }\n}"
    }
}
```

For more information, see [Managing Amazon EKS add-ons - Creating an add-on]() in the *Amazon EKS User Guide*.

Example 5: To create an Amazon EKS add-on with custom YAML configuration values file

The following `create-addon` example command creates an Amazon EKS add-on with custom configuration values and resolve conflicts details.

```
aws eks create-addon \
    --cluster-name my-eks-cluster \
    --addon-name my-eks-addon \
    --service-account-role-arn arn:aws:iam::111122223333:role/role-name \
    --addon-version v1.16.4-eksbuild.2 \
    --configuration-values 'file://configuration-values.yaml' \
    --resolve-conflicts OVERWRITE \
    --tags '{"eks-addon-key-1": "value-1" , "eks-addon-key-2": "value-2"}'
```

Contents of `configuration-values.yaml`:

```
resources:
    limits:
        cpu: '100m'
env:
    AWS_VPC_K8S_CNI_LOGLEVEL: 'DEBUG'
```

Output:

```
{
    "addon": {
        "addonName": "my-eks-addon",
        "clusterName": "my-eks-cluster",
        "status": "CREATING",
```

```
        "addonVersion": "v1.16.4-eksbuild.2",
        "health": {
            "issues": []
        },
        "addonArn": "arn:aws:eks:us-east-2:111122223333:addon/my-eks-cluster/my-eks-addon/d4c71efb-3909-6f36-a548-402cd4b5d59e",
        "createdAt": "2024-03-14T13:15:45.220000-04:00",
        "modifiedAt": "2024-03-14T13:15:45.237000-04:00",
        "serviceAccountRoleArn": "arn:aws:iam::111122223333:role/role-name",
        "tags": {
            "eks-addon-key-3": "value-3",
            "eks-addon-key-4": "value-4"
        },
        "configurationValues": "resources:\n    limits:\n        cpu: '100m'\nenv:\n    AWS_VPC_K8S_CNI_LOGLEVEL: 'INFO'"
    }
}
```

For more information, see Managing Amazon EKS add-ons - Creating an add-on in the *Amazon EKS User Guide*.

- For API details, see CreateAddon in *AWS CLI Command Reference*.

`create-cluster`

The following code example shows how to use `create-cluster`.

AWS CLI

To create a new cluster

This example command creates a cluster named `prod` in your default region.

Command:

```
aws eks create-cluster --name prod \
--role-arn arn:aws:iam::012345678910:role/eks-service-role-AWSServiceRoleForAmazonEKS-J7ONKE3BQ4PI \
--resources-vpc-config subnetIds=subnet-6782e71e,subnet-e7e761ac,securityGroupIds=sg-6979fe18
```

Output:

```
{
    "cluster": {
        "name": "prod",
        "arn": "arn:aws:eks:us-west-2:012345678910:cluster/prod",
        "createdAt": 1527808069.147,
        "version": "1.10",
        "roleArn": "arn:aws:iam::012345678910:role/eks-service-role-
AWSServiceRoleForAmazonEKS-J7ONKE3BQ4PI",
        "resourcesVpcConfig": {
            "subnetIds": [
                "subnet-6782e71e",
                "subnet-e7e761ac"
            ],
            "securityGroupIds": [
                "sg-6979fe18"
            ],
            "vpcId": "vpc-950809ec"
        },
        "status": "CREATING",
        "certificateAuthority": {}
    }
}
```

To create a new cluster with private endpoint access and logging enabled

This example command creates a cluster named `example` in your default region with public endpoint access disabled, private endpoint access enabled, and all logging types enabled.

Command:

```
aws eks create-cluster --name example --kubernetes-version 1.12 \
--role-arn arn:aws:iam::012345678910:role/example-cluster-ServiceRole-1XWBQWYSFRE2Q
 \
--resources-vpc-
config subnetIds=subnet-0a188dccd2f9a632f,subnet-09290d93da4278664,subnet-0f21dd86e0e91134a,
 \
--logging '{"clusterLogging":[{"types":
["api","audit","authenticator","controllerManager","scheduler"],"enabled":true}]}'
```

Output:

```
{
```

```
    "cluster": {
        "name": "example",
        "arn": "arn:aws:eks:us-west-2:012345678910:cluster/example",
        "createdAt": 1565804921.901,
        "version": "1.12",
        "roleArn": "arn:aws:iam::012345678910:role/example-cluster-
ServiceRole-1XWBQWYSFRE2Q",
        "resourcesVpcConfig": {
            "subnetIds": [
                "subnet-0a188dccd2f9a632f",
                "subnet-09290d93da4278664",
                "subnet-0f21dd86e0e91134a",
                "subnet-0173dead68481a583",
                "subnet-051f70a57ed6fcab6",
                "subnet-01322339c5c7de9b4"
            ],
            "securityGroupIds": [
                "sg-0c5b580845a031c10"
            ],
            "vpcId": "vpc-0f622c01f68d4afec",
            "endpointPublicAccess": false,
            "endpointPrivateAccess": true
        },
        "logging": {
            "clusterLogging": [
                {
                    "types": [
                        "api",
                        "audit",
                        "authenticator",
                        "controllerManager",
                        "scheduler"
                    ],
                    "enabled": true
                }
            ]
        },
        "status": "CREATING",
        "certificateAuthority": {},
        "platformVersion": "eks.3"
    }
}
```

- For API details, see CreateCluster in *AWS CLI Command Reference*.

`create-fargate-profile`

The following code example shows how to use `create-fargate-profile`.

AWS CLI

Example 1: Create EKS Fargate Profile for a selector with a namespace

The following `create-fargate-profile` example creates an EKS Fargate Profile for a selector with a namespace.

```
aws eks create-fargate-profile \
    --cluster-name my-eks-cluster \
    --pod-execution-role-arn arn:aws:iam::111122223333:role/role-name \
    --fargate-profile-name my-fargate-profile \
    --selectors '[{"namespace": "default"}]'
```

Output:

```
{
    "fargateProfile": {
        "fargateProfileName": "my-fargate-profile",
        "fargateProfileArn": "arn:aws:eks:us-east-2:111122223333:fargateprofile/my-
eks-cluster/my-fargate-profile/a2c72bca-318e-abe8-8ed1-27c6d4892e9e",
        "clusterName": "my-eks-cluster",
        "createdAt": "2024-03-19T12:38:47.368000-04:00",
        "podExecutionRoleArn": "arn:aws:iam::111122223333:role/role-name",
        "subnets": [
            "subnet-09d912bb63ef21b9a",
            "subnet-04ad87f71c6e5ab4d",
            "subnet-0e2907431c9988b72"
        ],
        "selectors": [
            {
                "namespace": "default"
            }
        ],
        "status": "CREATING",
        "tags": {}
    }
}
```

For more information, see [AWS Fargate profile - Creating a Fargate profile]() in the *Amazon EKS User Guide*.

Example 2: Create EKS Fargate Profile for a selector with a namespace and labels

The following `create-fargate-profile` example creates an EKS Fargate Profile for a selector with a namespace and labels.

```
aws eks create-fargate-profile \
    --cluster-name my-eks-cluster \
    --pod-execution-role-arn arn:aws:iam::111122223333:role/role-name \
    --fargate-profile-name my-fargate-profile \
    --selectors '[{"namespace": "default", "labels": {"labelname1":
 "labelvalue1"}}]'
```

Output:

```
{
    "fargateProfile": {
        "fargateProfileName": "my-fargate-profile",
        "fargateProfileArn": "arn:aws:eks:us-east-2:111122223333:fargateprofile/my-
eks-cluster/my-fargate-profile/88c72bc7-e8a4-fa34-44e4-2f1397224bb3",

                "namespace": "default",
                "labels": {
                    "labelname1": "labelvalue1"
                }
            }
        ],
        "status": "CREATING",
        "tags": {}
    }
}
```

For more information, see [AWS Fargate profile - Creating a Fargate profile]() in the *Amazon EKS User Guide*.

Example 3: Create EKS Fargate Profile for a selector with a namespace and labels, along with IDs of subnets to launch a Pod into.

The following `create-fargate-profile` example create EKS Fargate Profile for a selector with a namespace and labels, along with IDs of subnets to launch a Pod into.

```
aws eks create-fargate-profile \
    --cluster-name my-eks-cluster \
    --pod-execution-role-arn arn:aws:iam::111122223333:role/role-name \
    --fargate-profile-name my-fargate-profile \
    --selectors '[{"namespace": "default", "labels": {"labelname1":
 "labelvalue1"}}]' \
    --subnets '["subnet-09d912bb63ef21b9a", "subnet-04ad87f71c6e5ab4d",
 "subnet-0e2907431c9988b72"]'
```

Output:

```
{
    "fargateProfile": {
        "fargateProfileName": "my-fargate-profile",
        "fargateProfileArn": "arn:aws:eks:us-east-2:111122223333:fargateprofile/my-
eks-cluster/my-fargate-profile/e8c72bc8-e87b-5eb6-57cb-ed4fe57577e3",
        "clusterName": "my-eks-cluster",
        "createdAt": "2024-03-19T12:35:58.640000-04:00",
        "podExecutionRoleArn": "arn:aws:iam::111122223333:role/role-name",
        "subnets": [
            "subnet-09d912bb63ef21b9a",
            "subnet-04ad87f71c6e5ab4d",
            "subnet-0e2907431c9988b72"
        ],
        "selectors": [
            {
                "namespace": "default",
                "labels": {
                    "labelname1": "labelvalue1"
                }
            }
        ],
        "status": "CREATING",
        "tags": {}
```

```
    }
}
```

For more information, see AWS Fargate profile - Creating a Fargate profile in the *Amazon EKS User Guide*.

Example 4: Create EKS Fargate Profile for a selector with multiple namespace and labels, along with IDs of subnets to launch a Pod into

The following `create-fargate-profile` example creates an EKS Fargate Profile for a selector with multiple namespace and labels, along with IDs of subnets to launch a Pod into.

```
aws eks create-fargate-profile \
    --cluster-name my-eks-cluster \
    --pod-execution-role-arn arn:aws:iam::111122223333:role/role-name \
    --fargate-profile-name my-fargate-profile \
    --selectors '[{"namespace": "default1", "labels": {"labelname1": "labelvalue1",
 "labelname2": "labelvalue2"}}, {"namespace": "default2", "labels": {"labelname1":
 "labelvalue1", "labelname2": "labelvalue2"}}]' \
    --subnets '["subnet-09d912bb63ef21b9a", "subnet-04ad87f71c6e5ab4d",
 "subnet-0e2907431c9988b72"]' \
    --tags '{"eks-fargate-profile-key-1": "value-1" , "eks-fargate-profile-key-2":
 "value-2"}'
```

Output:

```
{
    "fargateProfile": {
        "fargateProfileName": "my-fargate-profile",
        "fargateProfileArn": "arn:aws:eks:us-east-2:111122223333:fargateprofile/my-

        "clusterName": "my-eks-cluster",
        "createdAt": "2024-03-19T12:15:55.271000-04:00",
        "podExecutionRoleArn": "arn:aws:iam::111122223333:role/role-name",
        "subnets": [
            "subnet-09d912bb63ef21b9a",
            "subnet-04ad87f71c6e5ab4d",
            "subnet-0e2907431c9988b72"
        ],
        "selectors": [
            {
                "namespace": "default1",
```

```
                "labels": {
                    "labelname2": "labelvalue2",
                    "labelname1": "labelvalue1"
                }
            },
            {
                "namespace": "default2",
                "labels": {
                    "labelname2": "labelvalue2",
                    "labelname1": "labelvalue1"
                }
            }
        ],
        "status": "CREATING",
        "tags": {
            "eks-fargate-profile-key-2": "value-2",
            "eks-fargate-profile-key-1": "value-1"
        }
    }
}
```

For more information, see AWS Fargate profile - Creating a Fargate profile in the *Amazon EKS User Guide*.

Example 5: Create EKS Fargate Profile with a wildcard selector for namespaces and labels, along with IDs of subnets to launch a Pod into

The following `create-fargate-profile` example creates an EKS Fargate Profile for a selector with multiple namespace and labels, along with IDs of subnets to launch a Pod into.

```
aws eks create-fargate-profile \
    --cluster-name my-eks-cluster \
    --pod-execution-role-arn arn:aws:iam::111122223333:role/role-name \
    --fargate-profile-name my-fargate-profile \
    --selectors '[{"namespace": "prod*", "labels": {"labelname*?": "*value1"}},
 {"namespace": "*dev*", "labels": {"labelname*?": "*value*"}}]' \
    --subnets '["subnet-09d912bb63ef21b9a", "subnet-04ad87f71c6e5ab4d",
 "subnet-0e2907431c9988b72"]' \
    --tags '{"eks-fargate-profile-key-1": "value-1" , "eks-fargate-profile-key-2":
 "value-2"}'
```

Output:

```
{
    "fargateProfile": {
        "fargateProfileName": "my-fargate-profile",
        "fargateProfileArn": "arn:aws:eks:us-east-2:111122223333:fargateprofile/my-

`create-nodegroup`

The following code example shows how to use `create-nodegroup`.

AWS CLI

Example 1: Creates a managed node group for an Amazon EKS cluster

The following `create-nodegroup` example creates a managed node group for an Amazon EKS cluster.

```
aws eks create-nodegroup \
    --cluster-name my-eks-cluster \
    --nodegroup-name my-eks-nodegroup \
    --node-role arn:aws:iam::111122223333:role/role-name \
    --
subnets "subnet-0e2907431c9988b72" "subnet-04ad87f71c6e5ab4d" "subnet-09d912bb63ef21b9a"
 \
    --scaling-config minSize=1,maxSize=3,desiredSize=1 \
    --region us-east-2
```

Output:

```
{
    "nodegroup": {
        "nodegroupName": "my-eks-nodegroup",
        "nodegroupArn": "arn:aws:eks:us-east-2:111122223333:nodegroup/my-eks-
cluster/my-eks-nodegroup/bac7550f-b8b8-5fbb-4f3e-7502a931119e",
        "clusterName": "my-eks-cluster",
        "version": "1.26",
        "releaseVersion": "1.26.12-20240329",
        "createdAt": "2024-04-04T13:19:32.260000-04:00",
        "modifiedAt": "2024-04-04T13:19:32.260000-04:00",
        "status": "CREATING",
        "capacityType": "ON_DEMAND",
        "scalingConfig": {
            "minSize": 1,
            "maxSize": 3,
            "desiredSize": 1
        },
        "instanceTypes": [
            "t3.medium"
        ],
        "subnets": [
            "subnet-0e2907431c9988b72, subnet-04ad87f71c6e5ab4d,

        },
        "tags": {}
    }
}
```

For more information, see [Creating a managed node group](#) in the *Amazon EKS User Guide*.

Example 2: Creates a managed node group for an Amazon EKS cluster with custom instance-types and disk-size

The following `create-nodegroup` example creates a managed node group for an Amazon EKS cluster with custom instance-types and disk-size.

```
aws eks create-nodegroup \
    --cluster-name my-eks-cluster \
    --nodegroup-name my-eks-nodegroup \
    --node-role arn:aws:iam::111122223333:role/role-name \
    --
subnets "subnet-0e2907431c9988b72" "subnet-04ad87f71c6e5ab4d" "subnet-09d912bb63ef21b9a"
 \
    --scaling-config minSize=1,maxSize=3,desiredSize=1 \
    --capacity-type ON_DEMAND \
    --instance-types 'm5.large' \
    --disk-size 50 \
    --region us-east-2
```

Output:

```
{
    "nodegroup": {
        "nodegroupName": "my-eks-nodegroup",
        "nodegroupArn": "arn:aws:eks:us-east-2:111122223333:nodegroup/my-eks-
cluster/my-eks-nodegroup/c0c7551b-e4f9-73d9-992c-a450fdb82322",
        "clusterName": "my-eks-cluster",
```

        "status": "CREATING",
        "capacityType": "ON_DEMAND",
        "scalingConfig": {
            "minSize": 1,
            "maxSize": 3,
            "desiredSize": 1
        },
        "instanceTypes": [
            "m5.large"
        ],
        "subnets": [
            "subnet-0e2907431c9988b72",
            "subnet-04ad87f71c6e5ab4d",
            "subnet-09d912bb63ef21b9a"
        ],
        "amiType": "AL2_x86_64",
        "nodeRole": "arn:aws:iam::111122223333:role/role-name",
        "diskSize": 50,
        "health": {
            "issues": []
        },
        "updateConfig": {
            "maxUnavailable": 1
        },
        "tags": {}
    }
}
```

For more information, see Creating a managed node group in the *Amazon EKS User Guide*.

Example 3: Creates a managed node group for an Amazon EKS cluster with custom instance-types, disk-size, ami-type, capacity-type, update-config, labels, taints and tags.

The following `create-nodegroup` example creates a managed node group for an Amazon EKS cluster with custom instance-types, disk-size, ami-type, capacity-type, update-config, labels, taints and tags.

```
aws eks create-nodegroup  \
    --cluster-name my-eks-cluster \
```

```
    --nodegroup-name my-eks-nodegroup \
    --node-role arn:aws:iam::111122223333:role/role-name \
    --
subnets "subnet-0e2907431c9988b72" "subnet-04ad87f71c6e5ab4d" "subnet-09d912bb63ef21b9a"
 \
    --scaling-config minSize=1,maxSize=5,desiredSize=4 \
    --instance-types 't3.large' \
    --disk-size 50 \
    --ami-type AL2_x86_64 \
    --capacity-type SPOT \
    --update-config maxUnavailable=2 \
    --labels '{"my-eks-nodegroup-label-1": "value-1" , "my-eks-nodegroup-label-2":
 "value-2"}' \
    --taints '{"key": "taint-key-1" , "value": "taint-value-1", "effect":
 "NO_EXECUTE"}' \
    --tags '{"my-eks-nodegroup-key-1": "value-1" , "my-eks-nodegroup-key-2":
 "value-2"}'
```

Output:

```
{
    "nodegroup": {
        "nodegroupName": "my-eks-nodegroup",
        "nodegroupArn": "arn:aws:eks:us-east-2:111122223333:nodegroup/my-eks-

            "health": {
                "issues": []
            },
            "updateConfig": {
                "maxUnavailable": 2
            },
            "tags": {
                "my-eks-nodegroup-key-1": "value-1",
                "my-eks-nodegroup-key-2": "value-2"
            }
        }
}
```

For more information, see Creating a managed node group in the *Amazon EKS User Guide*.

- For API details, see CreateNodegroup in *AWS CLI Command Reference*.

`create-pod-identity-association`

The following code example shows how to use `create-pod-identity-association`.

AWS CLI

Example 1: To create an EKS Pod Identity association in EKS cluster

The following `create-pod-identity-association` example creates an EKS Pod Identity association between a service account in the EKS cluster and an IAM role.

```
aws eks create-pod-identity-association \
    --cluster-name eks-customer \
    --namespace default \
    --service-account default \
    --role-arn arn:aws:iam::111122223333:role/my-role
```

Output:

```
{
    "association": {
        "clusterName": "eks-customer",
        "namespace": "default",
        "serviceAccount": "default",
        "roleArn": "arn:aws:iam::111122223333:role/my-role",
        "associationArn": "arn:aws:eks:us-
west-2:111122223333:podidentityassociation/eks-customer/a-8mvwvh57cu74mgcst",
        "associationId": "a-8mvwvh57cu74mgcst",
        "tags": {},
        "createdAt": "2025-05-24T19:40:13.961000-05:00",
        "modifiedAt": "2025-05-24T19:40:13.961000-05:00"
    }
}
```

For more information, see Learn how EKS Pod Identity grants pods access to AWS services in the *Amazon EKS User Guide*.

Example 2: To create an EKS Pod Identity association in EKS cluster with tags

The following `create-pod-identity-association` creates an EKS Pod Identity association between a service account and an IAM role in the EKS cluster with tags.

```
aws eks create-pod-identity-association \
    --cluster-name eks-customer \
    --namespace default \
    --service-account default \
    --role-arn arn:aws:iam::111122223333:role/my-role \
    --tags Key1=value1,Key2=value2
```

Output:

```
{
```

```
    "association": {

    }
}
```

For more information, see Learn how EKS Pod Identity grants pods access to AWS services in the *Amazon EKS User Guide*.

- For API details, see CreatePodIdentityAssociation in *AWS CLI Command Reference*.

`delete-access-entry`

The following code example shows how to use `delete-access-entry`.

AWS CLI

To delete an access entry associated with the cluster

The following `delete-access-entry` deletes an access entry associated with the EKS cluster named `eks-customer`.

```
aws eks delete-access-entry \
    --cluster-name eks-customer \
    --principal-arn arn:aws:iam::111122223333:role/Admin
```

This command produces no output.

For more information, see Delete access entries in the *Amazon EKS User Guide*.

- For API details, see DeleteAccessEntry in *AWS CLI Command Reference*.

`delete-addon`

The following code example shows how to use `delete-addon`.

AWS CLI

Example 1. To deletes an Amazon EKS add-on but preserve the add-on software on the EKS Cluster

The following `delete-addon` example command deletes an Amazon EKS add-on but preserve the add-on software on the EKS Cluster.

```
aws eks delete-addon \
    --cluster-name my-eks-cluster \
    --addon-name my-eks-addon \
    --preserve
```

Output:

```
{
    "addon": {
        "addonName": "my-eks-addon",
        "clusterName": "my-eks-cluster",
        "status": "DELETING",
        "addonVersion": "v1.9.3-eksbuild.7",
        "health": {
            "issues": []
        },
        "addonArn": "arn:aws:eks:us-east-2:111122223333:addon/my-eks-cluster/my-eks-
addon/a8c71ed3-944e-898b-9167-c763856af4b8",
        "createdAt": "2024-03-14T11:49:09.009000-04:00",
        "modifiedAt": "2024-03-14T12:03:49.776000-04:00",
        "tags": {}
    }
}
```

For more information, see Managing Amazon EKS add-ons - Deleting an add-on in the *Amazon EKS*.

Example 2. To deletes an Amazon EKS add-on and also delete the add-on software from the EKS Cluster

The following `delete-addon` example command deletes an Amazon EKS add-on and also delete the add-on software from the EKS Cluster.

```
aws eks delete-addon \
    --cluster-name my-eks-cluster \
    --addon-name my-eks-addon
```

Output:

```
{
    "addon": {
        "addonName": "my-eks-addon",
        "clusterName": "my-eks-cluster",
        "status": "DELETING",
        "addonVersion": "v1.15.1-eksbuild.1",
        "health": {
            "issues": []
        },
        "addonArn": "arn:aws:eks:us-east-2:111122223333:addon/my-eks-cluster/my-eks-
addon/bac71ed1-ec43-3bb6-88ea-f243cdb58954",

        "tags": {}
    }
}
```

For more information, see Managing Amazon EKS add-ons - Deleting an add-on in the *Amazon EKS*.

- For API details, see DeleteAddon in *AWS CLI Command Reference*.

`delete-cluster`

The following code example shows how to use `delete-cluster`.

AWS CLI

Delete an Amazon EKS cluster control plane

The following `delete-cluster` example deletes an Amazon EKS cluster control plane.

```
aws eks delete-cluster \
    --name my-eks-cluster
```

Output:

```
{
    "cluster": {
        "name": "my-eks-cluster",
        "arn": "arn:aws:eks:us-east-2:111122223333:cluster/my-eks-cluster",

`delete-fargate-profile`

The following code example shows how to use `delete-fargate-profile`.

AWS CLI

Example 1: Create EKS Fargate Profile for a selector with a namespace

The following `delete-fargate-profile` example creates an EKS Fargate Profile for a selector with a namespace.

```
aws eks delete-fargate-profile \
    --cluster-name my-eks-cluster \
    --fargate-profile-name my-fargate-profile
```

Output:

```
{
    "fargateProfile": {
        "fargateProfileName": "my-fargate-profile",
        "fargateProfileArn": "arn:aws:eks:us-east-2:111122223333:fargateprofile/my-

                }
            }
        ],
```

```
        "status": "DELETING",
        "tags": {}
    }
}
```

For more information, see [AWS Fargate profile - Deleting a Fargate]() in the *Amazon EKS User Guide*.

- For API details, see [DeleteFargateProfile]() in *AWS CLI Command Reference*.

`delete-nodegroup`

The following code example shows how to use `delete-nodegroup`.

AWS CLI

Example 1: Delete a managed node group for an Amazon EKS cluster

The following `delete-nodegroup` example deletes a managed node group for an Amazon EKS cluster.

```
aws eks delete-nodegroup \
    --cluster-name my-eks-cluster \
    --nodegroup-name my-eks-nodegroup
```

Output:

```
{
    "nodegroup": {
        "nodegroupName": "my-eks-nodegroup",
        "nodegroupArn": "arn:aws:eks:us-east-2:111122223333:nodegroup/my-eks-

                "my-eks-nodegroup-key-2": "value-2"
            }
        }
}
```

- For API details, see DeleteNodegroup in *AWS CLI Command Reference*.

`delete-pod-identity-association`

The following code example shows how to use `delete-pod-identity-association`.

AWS CLI

To delete the EKS Pod Identity association

The following `delete-pod-identity-association` example deletes the EKS Pod Identity association with association ID `a-9njjin9gfghecgocd` from the EKS cluster named `eks-customer`.

```
aws eks delete-pod-identity-association \
    --cluster-name eks-customer \
    --association-id a-9njjin9gfghecgocd
```

Output:

```
{
    "association": {
        "clusterName": "eks-customer",
        "namespace": "default",
        "serviceAccount": "default",
        "roleArn": "arn:aws:iam::111122223333:role/s3-role",
        "associationArn": "arn:aws:eks:us-
west-2:111122223333:podidentityassociation/eks-customer/a-9njjin9gfghecgocd",
        "associationId": "a-9njjin9gfghecgocd",
        "tags": {
            "Key2": "value2",
            "Key1": "value1"
        },
        "createdAt": "2025-05-24T19:52:14.135000-05:00",
        "modifiedAt": "2025-05-25T21:10:56.923000-05:00"
    }
}
```

For more information, see Learn how EKS Pod Identity grants pods access to AWS services in the *Amazon EKS User Guide*.

- For API details, see DeletePodIdentityAssociation in *AWS CLI Command Reference*.

`deregister-cluster`

The following code example shows how to use `deregister-cluster`.

AWS CLI

To deregisters a connected cluster to remove it from the Amazon EKS control plane

The following `deregister-cluster` example deregisters a connected cluster to remove it from the Amazon EKS control plane.

```
aws eks deregister-cluster \
    --name my-eks-anywhere-cluster
```

Output:

```
{
    "cluster": {
        "name": "my-eks-anywhere-cluster",
        "arn": "arn:aws:eks:us-east-2:111122223333:cluster/my-eks-anywhere-cluster",
        "createdAt": "2024-04-12T12:38:37.561000-04:00",
        "status": "DELETING",
        "tags": {},
        "connectorConfig": {
            "activationId": "dfb5ad28-13c3-4e26-8a19-5b2457638c74",
            "activationExpiry": "2024-04-15T12:38:37.082000-04:00",
            "provider": "EKS_ANYWHERE",
            "roleArn": "arn:aws:iam::111122223333:role/AmazonEKSConnectorAgentRole"
        }
    }
}
```

For more information, see Deregistering a cluster in the *Amazon EKS User Guide*.

- For API details, see DeregisterCluster in *AWS CLI Command Reference*.

`describe-access-entry`

The following code example shows how to use `describe-access-entry`.

AWS CLI

To describe the access entry for EKS cluster

The following `describe-access-entry` example describes an access entry for the EKS cluster.

```
aws eks describe-access-entry \
    --cluster-name eks-customer \
    --principal-arn arn:aws:iam::111122223333:user/eks-admin-user
```

Output:

```
{
    "accessEntry": {
        "clusterName": "eks-customer",
        "principalArn": "arn:aws:iam::111122223333:user/eks-admin-user",
        "kubernetesGroups": [],
        "accessEntryArn": "arn:aws:eks:us-west-2:111122223333:access-entry/eks-
customer/user/111122223333/eks-admin-user/0acb1bc6-cb0a-ede6-11ae-a6506e3d36p0",
        "createdAt": "2025-04-14T22:45:48.097000-05:00",
        "modifiedAt": "2025-04-14T22:45:48.097000-05:00",
        "tags": {},
        "username": "arn:aws:iam::111122223333:user/eks-admin-user",
        "type": "STANDARD"
    }
}
```

For more information, see Grant IAM users access to Kubernetes with EKS access entries in the *Amazon EKS User Guide*.

- For API details, see DescribeAccessEntry in *AWS CLI Command Reference*.

`describe-addon-configuration`

The following code example shows how to use `describe-addon-configuration`.

AWS CLI

Example 1: Configuration options available when creating or updating Amazon vpc-cni AddOns

The following `describe-addon-configuration` example returns the all the available configuration schema you use when an add-on is created or updated for vpc-cni add-on with respective version.

```
aws eks describe-addon-configuration \
    --addon-name vpc-cni \
```

```
    --addon-version v1.15.1-eksbuild.1
```

Output:

```
{
    "addonName": "vpc-cni",
    "addonVersion": "v1.15.1-eksbuild.1",
    "configurationSchema": "{\"$ref\":\"#/definitions/VpcCni\",\"$schema\":\"http://

Example 2: Configuration options available when creating or updating Amazon coredns AddOns

The following `describe-addon-configuration` example returns all the available configuration schema you use when an add-on is created or updated for coredns add-on with respective version.

```
aws eks describe-addon-configuration \
    --addon-name coredns \
    --addon-version v1.8.7-eksbuild.4
```

Output:

```
{
    "addonName": "coredns",
    "addonVersion": "v1.8.7-eksbuild.4",
    "configurationSchema": "{\"$ref\":\"#/definitions/Coredns\",\"$schema
\":\"http://json-schema.org/draft-06/schema#\",\"definitions\":{\"Coredns\":
{\"additionalProperties\":false,\"properties\":{\"computeType\":{\"type\":
\"string\"},\"corefile\":{\"description\":\"Entire corefile contents to use with
 installation\",\"type\":\"string\"},\"nodeSelector\":{\"additionalProperties\":
{\"type\":\"string\"},\"type\":\"object\"},\"replicaCount\":{\"type\":\"integer
\"},\"resources\":{\"$ref\":\"#/definitions/Resources\"}},\"title\":\"Coredns\",
\"type\":\"object\"},\"Limits\":{\"additionalProperties\":false,\"properties\":
{\"cpu\":{\"type\":\"string\"},\"memory\":{\"type\":\"string\"}},\"title\":\"Limits
\",\"type\":\"object\"},\"Resources\":{\"additionalProperties\":false,\"properties
\":{\"limits\":{\"$ref\":\"#/definitions/Limits\"},\"requests\":{\"$ref\":\"#/
definitions/Limits\"}},\"title\":\"Resources\",\"type\":\"object\"}}}"
}
```

For more information, see [Creating or updating a kubeconfig file for an Amazon EKS cluster]() in the *Amazon EKS*.

- For API details, see [DescribeAddonConfiguration]() in *AWS CLI Command Reference*.

`describe-addon-versions`

The following code example shows how to use `describe-addon-versions`.

AWS CLI

Example 1: List all the available addons for EKS Cluster

The following `describe-addon-versions` example list all the available AWS addons.

```
aws eks describe-addon-versions  \
    --query 'sort_by(addons  &owner)[].{publisher: publisher, owner: owner,
 addonName: addonName, type: type}' \
    --output table
```

Output:

```
--------------------------------------------------------------------------------------------
|                                               DescribeAddonVersions

`describe-fargate-profile`

The following code example shows how to use `describe-fargate-profile`.

AWS CLI

Describe a Fargate profile

The following `describe-fargate-profile` example describes a Fargate profile.

```
aws eks describe-fargate-profile \
    --cluster-name my-eks-cluster \
    --fargate-profile-name my-fargate-profile
```

Output:

```
{
    "fargateProfile": {
        "fargateProfileName": "my-fargate-profile",
        "fargateProfileArn": "arn:aws:eks:us-east-2:111122223333:fargateprofile/my-

            }
        }
}
```

- For API details, see DescribeFargateProfile in *AWS CLI Command Reference*.

`describe-identity-provider-config`

The following code example shows how to use `describe-identity-provider-config`.

AWS CLI

Describe an identity provider configuration associated to your Amazon EKS Cluster

The following `describe-identity-provider-config` example describes an identity provider configuration associated to your Amazon EKS Cluster.

```
aws eks describe-identity-provider-config \
    --cluster-name my-eks-cluster \
    --identity-provider-config type=oidc,name=my-identity-provider
```

Output:

```
{
```

```
    "identityProviderConfig": {
        "oidc": {
            "identityProviderConfigName": "my-identity-provider",
            "identityProviderConfigArn": "arn:aws:eks:us-
east-2:111122223333:identityproviderconfig/my-eks-cluster/oidc/my-identity-
provider/8ac76722-78e4-cec1-ed76-d49eea058622",
            "clusterName": "my-eks-cluster",
            "issuerUrl": "https://oidc.eks.us-east-2.amazonaws.com/

            "usernameClaim": "email",
            "usernamePrefix": "my-username-prefix",
            "groupsClaim": "my-claim",
            "groupsPrefix": "my-groups-prefix",
            "requiredClaims": {
                "Claim1": "value1",
                "Claim2": "value2"
            },
            "tags": {
                "env": "dev"
            },
            "status": "ACTIVE"
        }
    }
}
```

For more information, see Authenticate users for your cluster from an OpenID Connect identity provider in the *Amazon EKS User Guide*.

- For API details, see DescribeIdentityProviderConfig in *AWS CLI Command Reference*.

`describe-insight`

The following code example shows how to use `describe-insight`.

AWS CLI

To get the details of an insight for an EKS cluster using its ID

The following `describe-insight` example returns the details about the insight specified using the cluster name and insight ID.

```
aws eks describe-insight \
```

```
    --cluster-name eks-customer \
    --id 38ea7a64-a14f-4e0e-95c7-8dbcab3c3623
```

Output:

```
{
    "insight": {
        "id": "38ea7a64-a14f-4e0e-95c7-8dbcab3c3623",
        "name": "Kubelet version skew",

            "deprecationDetails": []
        }
    }
}
```

For more information, see View cluster insights in the *Amazon EKS User Guide*.

- For API details, see DescribeInsight in *AWS CLI Command Reference*.

`describe-nodegroup`

The following code example shows how to use `describe-nodegroup`.

AWS CLI

Describe a managed node group for an Amazon EKS cluster

The following `describe-nodegroup` example describes a managed node group for an Amazon EKS cluster.

```
aws eks describe-nodegroup \
    --cluster-name my-eks-cluster \
    --nodegroup-name my-eks-nodegroup
```

Output:

```
{
    "nodegroup": {
        "nodegroupName": "my-eks-nodegroup",
        "nodegroupArn": "arn:aws:eks:us-east-2:111122223333:nodegroup/my-eks-

}
```

- For API details, see [DescribeNodegroup](#) in *AWS CLI Command Reference*.

`describe-pod-identity-association`

The following code example shows how to use `describe-pod-identity-association`.

AWS CLI

To provide the details about Pod Identity association

The following `describe-pod-identity-association` example describes a Pod Identity association in the EKS cluster.

```
aws eks describe-pod-identity-association \
    --cluster-name eks-customer \
    --association-id a-9njjin9gfghecgocd
```

Output:

```
{
    "association": {
        "clusterName": "eks-customer",
        "namespace": "default",
        "serviceAccount": "default",
        "roleArn": "arn:aws:iam::111122223333:role/my-role",
```

```
        "associationArn": "arn:aws:eks:us-
west-2:111122223333:podidentityassociation/eks-customer/a-9njjin9gfghecgocd",
        "associationId": "a-9njjin9gfghecgocd",
        "tags": {
            "Key2": "value2",
            "Key1": "value1"
        },
        "createdAt": "2025-05-24T19:52:14.135000-05:00",
        "modifiedAt": "2025-05-24T19:52:14.135000-05:00"
    }
}
```

For more information, see Learn how EKS Pod Identity grants pods access to AWS services in the *Amazon EKS User Guide*.

- For API details, see DescribePodIdentityAssociation in *AWS CLI Command Reference*.

`describe-update`

The following code example shows how to use `describe-update`.

AWS CLI

Example 1: To describe an update for a cluster

The following `describe-update` example describes an update for a cluster named.

```
aws eks describe-update \
    --name my-eks-cluster \
    --update-id 10bddb13-a71b-425a-b0a6-71cd03e59161
```

Output:

```
{
    "update": {
        "id": "10bddb13-a71b-425a-b0a6-71cd03e59161",
        "status": "Successful",
        "type": "EndpointAccessUpdate",
        "params": [
            {
                "type": "EndpointPublicAccess",
                "value": "false"
            },
```

```
                {
                    "type": "EndpointPrivateAccess",
                    "value": "true"
                }
            ],
            "createdAt": "2024-03-14T10:01:26.297000-04:00",
            "errors": []
        }
}
```

For more information, see [Updating an Amazon EKS cluster Kubernetes version](#) in the *Amazon EKS User Guide*.

Example 2: To describe an update for a cluster

The following `describe-update` example describes an update for a cluster named.

```
aws eks describe-update \
    --name my-eks-cluster \
    --update-id e4994991-4c0f-475a-a040-427e6da52966
```

Output:

```
{
    "update": {
        "id": "e4994991-4c0f-475a-a040-427e6da52966",
        "status": "Successful",
        "type": "AssociateEncryptionConfig",
        "params": [
            {
                "type": "EncryptionConfig",
                "value": "[{\"resources\":[\"secrets\"],\"provider\":{\"keyArn\":
\"arn:aws:kms:region-code:account:key/key\"}}]"
            }
        ],
        "createdAt": "2024-03-14T11:01:26.297000-04:00",
        "errors": []
    }
}
```

For more information, see [Updating an Amazon EKS cluster Kubernetes version](#) in the *Amazon EKS User Guide*.

Example 3: To describe an update for a cluster

The following `describe-update` example describes an update for a cluster named.

```
aws eks describe-update \
    --name my-eks-cluster \
    --update-id b5f0ba18-9a87-4450-b5a0-825e6e84496f
```

Output:

```
{
    "update": {
        "id": "b5f0ba18-9a87-4450-b5a0-825e6e84496f",
        "status": "Successful",
        "type": "VersionUpdate",
        "params": [
            {
                "type": "Version",
                "value": "1.29"
            },
            {
                "type": "PlatformVersion",
                "value": "eks.1"
            }
        ],
        "createdAt": "2024-03-14T12:05:26.297000-04:00",
        "errors": []
    }
}
```

For more information, see Updating an Amazon EKS cluster Kubernetes version in the *Amazon EKS User Guide*.

- For API details, see DescribeUpdate in *AWS CLI Command Reference*.

`disassociate-access-policy`

The following code example shows how to use `disassociate-access-policy`.

AWS CLI

To disassociate the access policy from an access entry

The following `disassociate-access-policy` removes the access policy associated with the access entry.

```
aws eks disassociate-access-policy \
    --cluster-name eks-customer \
    --principal-arn arn:aws:iam::111122223333:role/Admin \
    --policy-arn arn:aws:eks::aws:cluster-access-policy/AmazonEKSEditPolicy
```

This command produces no output.

For more information, see Associate access policies with access entries in the *Amazon EKS User Guide*.

- For API details, see DisassociateAccessPolicy in *AWS CLI Command Reference*.

`disassociate-identity-provider-config`

The following code example shows how to use `disassociate-identity-provider-config`.

AWS CLI

Disassociate identity provider to your Amazon EKS Cluster

The following `disassociate-identity-provider-config` example disassociates an identity provider to your Amazon EKS Cluster.

```
aws eks disassociate-identity-provider-config \
    --cluster-name my-eks-cluster \
    --identity-provider-config 'type=oidc,name=my-identity-provider'
```

Output:

```
{
    "update": {
        "id": "5f78d14e-c57b-4857-a3e4-cf664ae20949",
        "status": "InProgress",
        "type": "DisassociateIdentityProviderConfig",
        "params": [
            {
                "type": "IdentityProviderConfig",
                "value": "[]"
```

```
                }
            ],
            "createdAt": "2024-04-11T13:53:43.314000-04:00",
            "errors": []
        }
}
```

For more information, see Authenticate users for your cluster from an OpenID Connect identity provider - Disassociate an OIDC identity provider from your cluster in the *Amazon EKS User Guide*.

- For API details, see DisassociateIdentityProviderConfig in *AWS CLI Command Reference*.

`get-token`

The following code example shows how to use `get-token`.

AWS CLI

Example 1: Get an authentication token for an Amazon EKS Cluster named `my-eks-cluster`

The following `get-token` example gets an authentication token for an Amazon EKS Cluster named my-eks-cluster.

```
aws eks get-token \
    --cluster-name my-eks-cluster
```

Output:

```
{
    "kind": "ExecCredential",
    "apiVersion": "client.authentication.k8s.io/v1beta1",
    "spec": {},
    "status": {
        "expirationTimestamp": "2024-04-11T20:59:56Z",
        "token": "k8s-aws-v1.EXAMPLE_TOKEN_DATA_STRING..."
    }
}
```

Example 2: Gets an authentication token for an Amazon EKS Cluster named `my-eks-cluster` by assuming this roleARN for credentials when signing the token

The following `get-token` example gets an authentication token for an Amazon EKS Cluster named my-eks-cluster by assuming this roleARN for credentials when signing the token.

```
aws eks get-token \
    --cluster-name my-eks-cluster \
    --role-arn arn:aws:iam::111122223333:role/eksctl-EKS-Linux-Cluster-v1-24-
cluster-ServiceRole-j1k7AfTIQtnM
```

Output:

```
{
    "kind": "ExecCredential",
    "apiVersion": "client.authentication.k8s.io/v1beta1",
    "spec": {},
    "status": {
        "expirationTimestamp": "2024-04-11T21:05:26Z",
        "token": "k8s-aws-v1.EXAMPLE_TOKEN_DATA_STRING..."
    }
}
```

- For API details, see GetToken in *AWS CLI Command Reference*.

`list-access-entries`

The following code example shows how to use `list-access-entries`.

AWS CLI

To list the access entries for an EKS cluster

The following `list-access-entries` returns the list of access entries associated with the EKS cluster `eks-customer`.

```
aws eks list-access-entries \
    --cluster-name eks-customer
```

Output:

```
{
    "accessEntries": [
        "arn:aws:iam::111122223333:role/Admin",
```

```
            "arn:aws:iam::111122223333:role/admin-test-ip",
            "arn:aws:iam::111122223333:role/assume-worker-node-role",
            "arn:aws:iam::111122223333:user/eks-admin-user"
        ]
}
```

For more information, see Grant IAM users access to Kubernetes with EKS access entries in the *Amazon EKS User Guide*.

- For API details, see ListAccessEntries in *AWS CLI Command Reference*.

`list-access-policies`

The following code example shows how to use `list-access-policies`.

AWS CLI

To list all available access policies

This `list-access-policies` example returns the list of all available access policies.

```
aws eks list-access-policies
```

Output:

```
{
    "accessPolicies": [
        {
            "name": "AmazonEKSAdminPolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/AmazonEKSAdminPolicy"
        },
        {
            "name": "AmazonEKSAdminViewPolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/AmazonEKSAdminViewPolicy"
        },
        {
            "name": "AmazonEKSAutoNodePolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/AmazonEKSAutoNodePolicy"
        },
        {
            "name": "AmazonEKSBlockStorageClusterPolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/
AmazonEKSBlockStorageClusterPolicy"
```

```
        },
        {
            "name": "AmazonEKSBlockStoragePolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/
AmazonEKSBlockStoragePolicy"
        },
        {
            "name": "AmazonEKSClusterAdminPolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/
AmazonEKSClusterAdminPolicy"
        },
        {
            "name": "AmazonEKSComputeClusterPolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/
AmazonEKSComputeClusterPolicy"
        },
        {
            "name": "AmazonEKSComputePolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/AmazonEKSComputePolicy"
        },
        {
            "name": "AmazonEKSEditPolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/AmazonEKSEditPolicy"
        },
        {
            "name": "AmazonEKSHybridPolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/AmazonEKSHybridPolicy"
        },
        {
            "name": "AmazonEKSLoadBalancingClusterPolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/
AmazonEKSLoadBalancingClusterPolicy"
        },
        {
            "name": "AmazonEKSLoadBalancingPolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/
AmazonEKSLoadBalancingPolicy"
        },
        {
            "name": "AmazonEKSNetworkingClusterPolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/
AmazonEKSNetworkingClusterPolicy"
        },
        {
```

```
            "name": "AmazonEKSNetworkingPolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/
AmazonEKSNetworkingPolicy"
        },
        {
            "name": "AmazonEKSViewPolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/AmazonEKSViewPolicy"
        },
        {
            "name": "AmazonEMRJobPolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/AmazonEMRJobPolicy"
        },
        {
            "name": "AmazonSagemakerHyperpodClusterPolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/
AmazonSagemakerHyperpodClusterPolicy"
        },
        {
            "name": "AmazonSagemakerHyperpodControllerPolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/
AmazonSagemakerHyperpodControllerPolicy"
        },
        {
            "name": "AmazonSagemakerHyperpodSystemNamespacePolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/
AmazonSagemakerHyperpodSystemNamespacePolicy"
        }
    ]
}
```

For more information, see Associate access policies with access entries in the *Amazon EKS User Guide*.

- For API details, see ListAccessPolicies in *AWS CLI Command Reference*.

`list-addons`

The following code example shows how to use `list-addons`.

AWS CLI

List all the installed add-ons in your Amazon EKS cluster named `my-eks-cluster`

The following `list-addons` example lists all the installed add-ons in your Amazon EKS cluster named my-eks-cluster.

```
aws eks list-addons \
    --cluster-name my-eks-cluster
```

Output:

```
{
    "addons": [
        "kube-proxy",
        "vpc-cni"
    ]
}
```

- For API details, see ListAddons in *AWS CLI Command Reference*.

`list-associated-access-policies`

The following code example shows how to use `list-associated-access-policies`.

AWS CLI

To list the access policies associated with an access entry

The following `list-associated-access-policies` example returns the list of access policies associated with an access entry in the EKS cluster.

```
aws eks list-associated-access-policies \
    --cluster-name eks-customer \
    --principal-arn arn:aws:iam::111122223333:role/Admin
```

Output:

```
{
    "associatedAccessPolicies": [
        {
            "policyArn": "arn:aws:eks::aws:cluster-access-policy/
AmazonEKSAdminPolicy",
            "accessScope": {
```

```
                "type": "cluster",
                "namespaces": []
            },
            "associatedAt": "2025-05-24T17:26:22.935000-05:00",
            "modifiedAt": "2025-05-24T17:26:22.935000-05:00"
        }
    ],
    "clusterName": "eks-customer",
    "principalArn": "arn:aws:iam::111122223333:role/Admin"
}
```

For more information, see Grant IAM users access to Kubernetes with EKS access entries in the *Amazon EKS User Guide*.

- For API details, see ListAssociatedAccessPolicies in *AWS CLI Command Reference*.

`list-clusters`

The following code example shows how to use `list-clusters`.

AWS CLI

To list all the installed add-ons in your Amazon EKS cluster named `my-eks-cluster`

The following `list-clusters` example lists all the installed add-ons in your Amazon EKS cluster named my-eks-cluster.

```
aws eks list-clusters
```

Output:

```
{
    "clusters": [
        "prod",
        "qa",
        "stage",
        "my-eks-cluster"
    ]
}
```

- For API details, see ListClusters in *AWS CLI Command Reference*.

`list-fargate-profiles`

The following code example shows how to use `list-fargate-profiles`.

AWS CLI

To list all the fargate profiles in your Amazon EKS cluster named `my-eks-cluster`

The following `list-fargate-profiles` example lists all the fargate profiles in your Amazon EKS cluster named my-eks-cluster.

```
aws eks list-fargate-profiles \
    --cluster-name my-eks-cluster
```

Output:

```
{
    "fargateProfileNames": [
        "my-fargate-profile"
    ]
}
```

- For API details, see ListFargateProfiles in *AWS CLI Command Reference*.

`list-identity-provider-configs`

The following code example shows how to use `list-identity-provider-configs`.

AWS CLI

List identity providers associated to an Amazon EKS Cluster

The following `list-identity-provider-configs` example lists identity provider associated to an Amazon EKS Cluster.

```
aws eks list-identity-provider-configs \
    --cluster-name my-eks-cluster
```

Output:

```
{
    "identityProviderConfigs": [
```

```
        {
            "type": "oidc",
            "name": "my-identity-provider"
        }
    ]
}
```

For more information, see Authenticate users for your cluster from an OpenID Connect identity provider in the *Amazon EKS User Guide*.

- For API details, see ListIdentityProviderConfigs in *AWS CLI Command Reference*.

`list-insights`

The following code example shows how to use `list-insights`.

AWS CLI

To list all insights for the specified cluster

The following `list-insights` example returns the list of all insights checked against the specified cluster.

```
aws eks list-insights \
--cluster-name eks-customer
```

Output:

```
{
    "insights": [
        {
            "id": "38ea7a64-a14f-4e0e-95c7-8dbcab3c3616",
            "name": "Kubelet version skew",

                "reason": "kube-proxy versions match the cluster control plane
 version."
            }
        }
    ]
}
```

For more information, see [View cluster insights](#) in the *Amazon EKS User Guide*.

- For API details, see [ListInsights](#) in *AWS CLI Command Reference*.

`list-nodegroups`

The following code example shows how to use `list-nodegroups`.

AWS CLI

List all the node groups in an Amazon EKS cluster

The following `list-nodegroups` example list all the node groups in an Amazon EKS cluster.

```
aws eks list-nodegroups \
    --cluster-name my-eks-cluster
```

Output:

```
{
    "nodegroups": [
        "my-eks-managed-node-group",
        "my-eks-nodegroup"
    ]
}
```

- For API details, see [ListNodegroups](#) in *AWS CLI Command Reference*.

`list-pod-identity-associations`

The following code example shows how to use `list-pod-identity-associations`.

AWS CLI

Example 1: To list the Pod Identity associations in an EKS cluster

The following `list-pod-identity-associations` returns the list of Pod Identity associations associated with the EKS cluster named `eks-customer` in all namespaces and service accounts.

```
aws eks list-pod-identity-associations \
    --cluster-name eks-customer
```

Output:

```
{
    "associations": [
        {
            "clusterName": "eks-customer",
            "namespace": "default",
            "serviceAccount": "default",
            "associationArn": "arn:aws:eks:us-
west-2:111122223333:podidentityassociation/eks-customer/a-9njjin9gfghecgocd",
            "associationId": "a-9njjin9gfghecgocd"
        },
        {
            "clusterName": "eks-customer",
            "namespace": "kube-system",
            "serviceAccount": "eks-customer",
            "associationArn": "arn:aws:eks:us-
west-2:111122223333:podidentityassociation/eks-customer/a-dvtacahdvjn01ffbc",
            "associationId": "a-dvtacahdvjn01ffbc"
        },
        {
            "clusterName": "eks-customer",
            "namespace": "kube-system",
            "serviceAccount": "coredns",
            "associationArn": "arn:aws:eks:us-
west-2:111122223333:podidentityassociation/eks-customer/a-yrpsdroc4ei7k6xps",
            "associationId": "a-yrpsdroc4ei7k6xps"
        }
    ]
}
```

For more information, see Learn how EKS Pod Identity grants pods access to AWS services in the *Amazon EKS User Guide*.

Example 2: To list the Pod Identity associations in an EKS cluster based on namespace and service account

The following `list-pod-identity-associations` returns the list of Pod Identity associations in the EKS cluster based on namespace and service account.

```
aws eks list-pod-identity-associations \
    --cluster-name eks-customer \
    --namespace kube-system \
    --service-account eks-customer
```

Output:

```
{
    "associations": [
        {
            "clusterName": "eks-customer",
            "namespace": "kube-system",
            "serviceAccount": "eks-customer",
            "associationArn": "arn:aws:eks:us-
west-2:111122223333:podidentityassociation/eks-customer/a-dvtacahdvjn01ffbc",
            "associationId": "a-dvtacahdvjn01ffbc"
        }
    ]
}
```

For more information, see Learn how EKS Pod Identity grants pods access to AWS services in the *Amazon EKS User Guide*.

- For API details, see ListPodIdentityAssociations in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

Example 1: To list all the tags for an Amazon EKS Cluster ARN

The following `list-tags-for-resource` example lists all the tags for an Amazon EKS Cluster ARN.

```
aws eks list-tags-for-resource \
    --resource-arn arn:aws:eks:us-east-2:111122223333:cluster/my-eks-cluster
```

Output:

```
{
    "tags": {
        "aws:cloudformation:stack-name": "eksctl-my-eks-cluster-cluster",
        "alpha.eksctl.io/cluster-name": "my-eks-cluster",
        "karpenter.sh/discovery": "my-eks-cluster",
        "aws:cloudformation:stack-id": "arn:aws:cloudformation:us-
east-2:111122223333:stack/eksctl-my-eks-cluster-cluster/e752ea00-e217-11ee-
beae-0a9599c8c7ed",
        "auto-delete": "no",
        "eksctl.cluster.k8s.io/v1alpha1/cluster-name": "my-eks-cluster",
        "EKS-Cluster-Name": "my-eks-cluster",
        "alpha.eksctl.io/cluster-oidc-enabled": "true",
        "aws:cloudformation:logical-id": "ControlPlane",
        "alpha.eksctl.io/eksctl-version": "0.173.0-dev
+a7ee89342.2024-03-01T03:40:57Z",
        "Name": "eksctl-my-eks-cluster-cluster/ControlPlane"
    }
}
```

Example 2: To list all the tags for an Amazon EKS Node group ARN

The following `list-tags-for-resource` example lists all the tags for an Amazon EKS Node group ARN.

```
aws eks list-tags-for-resource \
    --resource-arn arn:aws:eks:us-east-2:111122223333:nodegroup/my-eks-cluster/my-
eks-managed-node-group/60c71ed2-2cfb-020f-a5f4-ad32477f198c
```

Output:

```
{
    "tags": {
        "aws:cloudformation:stack-name": "eksctl-my-eks-cluster-nodegroup-my-eks-
managed-node-group",
```

```
        "aws:cloudformation:stack-id": "arn:aws:cloudformation:us-
east-2:111122223333:stack/eksctl-my-eks-cluster-nodegroup-my-eks-managed-node-group/
eaa20310-e219-11ee-b851-0ab9ad8228ff",
        "eksctl.cluster.k8s.io/v1alpha1/cluster-name": "my-eks-cluster",
        "EKS-Cluster-Name": "my-eks-cluster",
        "alpha.eksctl.io/nodegroup-type": "managed",
        "NodeGroup Name 1": "my-eks-managed-node-group",
        "k8s.io/cluster-autoscaler/enabled": "true",
        "nodegroup-role": "worker",
        "alpha.eksctl.io/cluster-name": "my-eks-cluster",
        "alpha.eksctl.io/nodegroup-name": "my-eks-managed-node-group",
        "karpenter.sh/discovery": "my-eks-cluster",
        "NodeGroup Name 2": "AmazonLinux-Linux-Managed-NG-v1-26-v1",
        "auto-delete": "no",
        "k8s.io/cluster-autoscaler/my-eks-cluster": "owned",
        "aws:cloudformation:logical-id": "ManagedNodeGroup",
        "alpha.eksctl.io/eksctl-version": "0.173.0-dev
+a7ee89342.2024-03-01T03:40:57Z"
    }
}
```

Example 3: To list all the tags on an Amazon EKS Fargate profil ARNe

The following `list-tags-for-resource` example lists all the tags for an Amazon EKS Fargate profile ARN.

```
aws eks list-tags-for-resource  \
    --resource-arn arn:aws:eks:us-east-2:111122223333:fargateprofile/my-eks-cluster/
my-fargate-profile/d6c76780-e541-0725-c816-36754cab734b
```

Output:

```
{
    "tags": {
        "eks-fargate-profile-key-2": "value-2",
        "eks-fargate-profile-key-1": "value-1"
    }
}
```

Example 4: To list all the tags for an Amazon EKS Add-on ARN

The following `list-tags-for-resource` example lists all the tags for an Amazon EKS Add-on ARN.

```
aws eks list-tags-for-resource \
    --resource-arn arn:aws:eks:us-east-2:111122223333:addon/my-eks-cluster/vpc-
cni/0ec71efc-98dd-3203-60b0-4b939b2a5e5f
```

Output:

```
{
    "tags": {
        "eks-addon-key-2": "value-2",
        "eks-addon-key-1": "value-1"
    }
}
```

Example 5: To list all the tags for an Amazon EKS OIDC identity provider ARN

The following `list-tags-for-resource` example lists all the tags for an Amazon EKS OIDC identity provider ARN.

```
aws eks list-tags-for-resource \
    --resource-arn arn:aws:eks:us-east-2:111122223333:identityproviderconfig/my-eks-
cluster/oidc/my-identity-provider/8ac76722-78e4-cec1-ed76-d49eea058622
```

Output:

```
{
    "tags": {
        "my-identity-provider": "test"
    }
}
```

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`list-update`

The following code example shows how to use `list-update`.

AWS CLI

Example 1: To lists the updates associated with an Amazon EKS Cluster name

The following `list-updates` example lists all the update IDs for an Amazon EKS Cluster name.

```
aws eks list-updates \
    --name my-eks-cluster
```

Output:

```
{
    "updateIds": [
        "5f78d14e-c57b-4857-a3e4-cf664ae20949",
        "760e5a3f-adad-48c7-88d3-7ac283c09c26",
        "cd4ec863-bc55-47d5-a377-3971502f529b",
        "f12657ce-e869-4f17-b158-a82ab8b7d937"
    ]
}
```

Example 2: To list all the update IDs for an Amazon EKS Node group

The following `list-updates` example lists all the update IDs for an Amazon EKS Node group.

```
aws eks list-updates \
    --name my-eks-cluster \
    --nodegroup-name my-eks-managed-node-group
```

Output:

```
{
    "updateIds": [
        "8c6c1bef-61fe-42ac-a242-89412387b8e7"
    ]
}
```

Example 3: To list all the update IDs on an Amazon EKS Add-one

The following `list-updates` example lists all the update IDs for an Amazon EKS Add-on.

```
aws eks list-updates \
```

```
    --name my-eks-cluster \
    --addon-name vpc-cni
```

Output:

```
{
    "updateIds": [
        "9cdba8d4-79fb-3c83-afe8-00b508d33268"
    ]
}
```

- For API details, see ListUpdate in *AWS CLI Command Reference*.

`list-updates`

The following code example shows how to use `list-updates`.

AWS CLI

To list the updates for a cluster

This example command lists the current updates for a cluster named `example` in your default region.

Command:

```
aws eks list-updates --name example
```

Output:

```
{
    "updateIds": [
        "10bddb13-a71b-425a-b0a6-71cd03e59161"
    ]
}
```

- For API details, see ListUpdates in *AWS CLI Command Reference*.

`register-cluster`

The following code example shows how to use `register-cluster`.

AWS CLI

Example 1: Register an external EKS_ANYWHERE Kubernetes cluster to Amazon EKS

The following `register-cluster` example registers an external EKS_ANYWHERE Kubernetes cluster to Amazon EKS.

```
aws eks register-cluster \
    --name my-eks-anywhere-cluster \
    --connector-config 'roleArn=arn:aws:iam::111122223333:role/
AmazonEKSConnectorAgentRole,provider=EKS_ANYWHERE'
```

Output:

```
{
    "cluster": {
        "name": "my-eks-anywhere-cluster",
        "arn": "arn:aws:eks:us-east-2:111122223333:cluster/my-eks-anywhere-cluster",
        "createdAt": "2024-04-12T12:38:37.561000-04:00",
        "status": "PENDING",
        "tags": {},
        "connectorConfig": {
            "activationId": "xxxxxxxxACTIVATION_IDxxxxxxxx",
            "activationCode": "xxxxxxxxACTIVATION_CODExxxxxxxx",
            "activationExpiry": "2024-04-15T12:38:37.082000-04:00",
            "provider": "EKS_ANYWHERE",
            "roleArn": "arn:aws:iam::111122223333:role/AmazonEKSConnectorAgentRole"
        }
    }
}
```

For more information, see Connecting an external cluster in the *Amazon EKS User Guide*.

Example 2: Register any external Kubernetes cluster to Amazon EKS

The following `register-cluster` example registers an external EKS_ANYWHERE Kubernetes cluster to Amazon EKS.

```
aws eks register-cluster \
    --name my-eks-anywhere-cluster \
    --connector-config 'roleArn=arn:aws:iam::111122223333:role/
AmazonEKSConnectorAgentRole,provider=OTHER'
```

Output:

```
{
